THE NORFOLK & WESTERN is asking for prices on 2,000 hopper car bodies also on 2,000 all-steel gondola car bodies of 57½ tons capacity.

THE PAULISTA RAILWAY (Brazil) is inquiring through the car builders for 120 gondola cars of 50-tons capacity and 60 box cars of 40-tons capacity.

THE UNION PACIFIC, reported in the *Railway Age* of December 3, as expecting to be in the market soon for automobile cars is now inquiring for 500, 40-ft. automobile cars, also for 500, 50-ft. all steel automobile cars.

THE PERE MARQUETTE, reported in the *Railway Age* of November 19, as inquiring for from 500 to 2,000 box cars has ordered from the Western Steel Car & Foundry Co., 500 box cars, with an option for 500 additional cars.

THE MATHIESON ALKALI WORKS, Niagara Falls, N. Y., reported in the *Railway Age* of September 3, as inquiring for 20, 30-ton cars for handling tanks, has ordered this equipment from the Standard Steel Car Company.

THE CHESAPEAKE & OHIO has given contracts for the repair of 200 composite cars to the Raiston Steel Car Company, 500 steel cars to the Illinois Car & Manufacturing Company, Chicago Heights, Ill., and 300 composite cars to the American Car & Foundry Company's shops at Huntington, W. Va.

### Passenger Cars

THE WABASH is inquiring for a number of passenger train cars.

THE UNION PACIFIC is inquiring for 70 cars for passenger train service.

THE CANADIAN NATIONAL, contemplates buying 6 or more passenger cars for branch line service.

THE NORTHERN PACIFIC is having repairs made to a number of passenger cars at the shops of the Pullman Company.

THE PHILADELPHIA & READING is inquiring for from 45 to 90 passenger cars and from 6 to 10 passenger and baggage cars.

THE NEW YORK, ONTARIO & WESTERN, reported in the *Railway Age* of November 5, as inquiring for cars for passenger train service, has given an order to the Standard Steel Car Company for 20, 70-ft. coaches; 4 70-ft. combination smoking and baggage cars; 3, 60-ft. baggage cars and 3, 60-ft. combination baggage and mail cars. These will be all steel cars, equipped with Commonwealth trucks.

### Iron and Steel

THE NEW YORK CENTRAL LINES have placed contracts for 125,000 tons of rail with an option of 25,000 tons additional.

THE CANADIAN NATIONAL recently placed an order for about 40,000 tons of rail, equally divided between the Algoma Steel Corporation and the Dominion Steel Corporation, Sydney.

### Machinery and Tools

THE SEABOARD AIR LINE is preparing a list of machine tool requirements, comprising about 25 tools.

THE MISSOURI, KANSAS & TEXAS has ordered a 60-in. duplex control, horizontal boring machine, also a lathe and a shaper from the Niles-Bement-Pond Company.

THE VIRGINIAN RAILWAY has placed orders for machine tools as follows: 1, 5-ft. motor driven radial drill; 1, 28 by 48-in. motor driven gap lathe and 1, crank planer.

THE ERIE inquiry for various machine shop tools to cost about \$300,000 includes car wheel presses; boring mills; lathes; air compressors; electric welders; shapers and air tools.

### Miscellaneous

THE SALT LAKE, GARFIELD & WESTERN is inquiring for 10 trailer trucks.

THE NEW YORK CENTRAL will receive bids until 12 o'clock noon, December 20, 1921, for its present requirements on galvanized tie dating nails.

THE NEW YORK, NEW HAVEN & HARTFORD is asking for bids until 12 o'clock noon December 20, at New Haven, Conn., for its requirements during 1922 of couplers, malleable castings and steel castings.

THE NEW SABINAS COMPANY, LTD., a coal interest of the Vickers Company, London, England, has awarded the contract for the design and construction of a fireproof, reinforced concrete and steel, coal washing plant and power plant at the Cloete mines, near Sabinas, Coah., Mex., to the Roberts & Schaefer Company, Chicago. Work has started on the project which is to cost approximately \$300,000.

THE INTERSTATE COMMERCE COMMISSION has issued an annual report for the year ending June 30, 1921, showing, by totals for each railroad company, instances in which employees were on duty for periods other than those provided by the Federal Hours of Service Act; to which is added a comparison of these data with totals for the preceding four years.

Causes of delays to trains are tabulated in accordance with the statements presented by the railroad companies, these having, however, no relation to the question of whether or not any given case was excusable.

For 1921 the number of cases where employees in train service were on duty for longer periods than 10 consecutive hours was 39,934 as compared with 67,468 in the year preceding, and larger totals for the years before that. The total number of cases where telegraph operators (at offices continually operated, day and night), were on duty more than nine hours was 25,164, as compared with 33,566 in the year preceding, and about twice the latter number in the second year preceding. The total number of instances of excess work, counting both trainmen and telegraphers, in 1921, including the foregoing and the other and smaller classes, was 67,680. This is only a little more than one-fourth the total number reported in 1918.

Roads reporting fewer than 25 cases in a year are not shown in the five-year comparison.

## Supply Trade News

The **Osgood Company**, Marion, Ohio, has opened a branch sales office at 1211 Conway building, Chicago, in charge of **Arthur B. Sonneborn**, as manager.

The **Blaw-Knox Company**, Pittsburgh, Pa., has moved its New York office from the City Investing building to the Carbide & Carbon building, 30 East 42nd street, effective December 15.

The **Enterprise Railway Equipment Company**, Chicago, has purchased all patents and trade mark "Ingoldsby" of the Ingoldsby Automatic Car Company, a corporation organized under the laws of the State of West Virginia.

The stockholders of the **Haskell & Barker Car Company** will meet in New York on January 4, for the purpose of voting upon a proposition to dissolve the corporation and authorize the directors to sell their plant to the Pullman Company.

The **Okonite Company**, Passaic, N. J., has opened a branch office at Atlanta, Ga., in the Candler building. **E. A. Thornwell** is southeastern sales representative and **John L. Phillips**, manager for the territory including North and South Carolina, Georgia, Alabama, Florida, Tennessee, and the city of New Orleans, La.

The **Whiting Corporation**, Harvey, Ill., has bought a controlling interest in the Grindle Fuel Equipment Company, manufacturers of complete powdered coal plants, for use in connection with malleable furnaces, annealing ovens, steam boilers, billet heating and various other types of furnaces. The Grindle Fuel Equipment Company has moved its offices to Harvey, and will continue its business under the same name. Whiting Corporation will manufacture all Grindle equipment. The officers are as follows: **B. H. Whiting**, president; **T. S. Hammond**, secretary and treasurer and **A. J. Grindle**, vice-president and general manager; and the board of directors includes the above officers and **J. H. Whiting**, **R. H. Bourne**, **N. S. Lawrence** and **A. H. McDougall**.

### U. S. Light & Heat Not Involved In

#### Willys Corporation Receivership

The recent receivership of the Willys Corporation has caused some inquiries to be made of the U. S. Light & Heat Corporation, Niagara Falls, N. Y., as to what effect, if any, the proceedings will have respecting the latter company; and certain publicity in connection with the receivership has erroneously carried the idea that the U. S. Light & Heat Corporation is one of the component parts of the Willys Corporation and would, therefore, be affected in its operation by the receivership. These inquiries have led **C. O. Miniger**, president of the U. S. Light & Heat Corporation and who is one of the receivers appointed by the U. S. District Court at Toledo, to make the statement that the receivership in no way affects the business of the U. S. company. His appointment as receiver was made by virtue of his connection with the Electric Auto Lite Company of Toledo, which company is one of the divisions of the Willys Corporation.

The only connection between the Niagara Falls company and the Willys Corporation is that of preferred stock ownership by the Willys Corporation. The corporations and the managements are entirely distinct and the operation of the U. S. L. Company will continue exactly as heretofore.

### Obituary

**Henry C. Barlow**, Traffic director of the Chicago Association of Commerce and chairman of the executive committee of the National Industrial Traffic League, died at his home in Chicago on November 6, at the age of 71. He had been prominent in transportation circles in Chicago for 17 years, having been a leader in the Chicago Shippers Association in 1904. Before that

he was in railroad service, having begun in 1866 on the Illinois Central as office boy and clerk. He was clerk and telegrapher on the Chicago & North Western, held various freight traffic offices on the Santa Fe, the Mexican Central and the Wisconsin Central, and for seven years, ending with 1901, he was president of the Evansville & Terre Haute.

**B. E. D. Stafford**, general manager of the Flannery Bolt Company, Pittsburgh, Pa., whose death on November 30, at Atlantic City, N. J., was noted in the *Railway Age* of December 3, was born in 1866 in Brooklyn, N. Y., and was educated in the public and night schools. At the age of 15 he took up patent office drawing and soon became an expert penman. In order to better himself for mechanical drawing he acquired a practical knowledge of the machine, tool and screw making trades and within a few years ranked as one of the few expert operators in America of the universal type of milling machine and the automatic screw machine. At the age of 21 he was made foreman of the tool shop of a large manufacturer of cotton machinery at Hopedale, Mass., and built most of the automatic machinery for the plant. Later he became a specialist in reducing shop costs and in 1895 was engaged by **B. M. Jones & Company** to demonstrate the uses of self-hardening steels. Five years later he was employed as a staybolt salesman by the Ewald Iron Company. In the fall of 1904, Mr. Stafford was engaged by the Flannery Bolt Company to develop and market the Tate flexible staybolt for locomotive firebox service. During the time he has been identified with that concern, Mr. Stafford has done much to advance the methods of locomotive firebox construction. Mr. Stafford lived in Millville, N. J., and funeral services and burial were in Vineland on the morning of December 3.

B. E. D. Stafford

### Trade Publications

**FUEL OIL ENGINE.**—The Hadfield-Penfield Steel Company, Bucyrus, Ohio, has issued a 29-page booklet illustrating and describing its vertical and horizontal type fuel oil engines. These engines are amply illustrated in the booklet, both by photographs and sectional drawings. The booklet gives the dimensions for engines from two-cylinder to six-cylinder sizes and includes a chart giving the fuel consumption at different loads and speeds.

**STATIONARY STEAM ENGINES.**—The Vacuum Oil Company, New York, has issued a large 32-page, illustrated booklet dealing with the subject of steam valve and cylinder lubrication of stationary steam engines. This booklet is along educational lines showing, as it does, by text and illustrations, the various types of stationary steam engines, their method or methods of operation, proper methods of lubrication and the selection of oils. In addition to this, considerable information is given regarding boiler plant and steam production, covering such details as steam quality, exhaust steam, oil in exhaust steam, extraction of oil and feed water treatment.

**START THE JOB RIGHT.**—An 8-page illustrated folder has been issued by the National Hoisting Engine Company, Harrison, N. J., descriptive of the line of steam hammers, hoists, cableways and derricks manufactured by this company. The folder is well illustrated showing photographs of equipment in actual work driving piles and sheeting and in doing other miscellaneous work under varying conditions and surroundings.

## Railway Construction

**ATCHISON, TOPEKA & SANTA FE.**—This company, which was noted in the *Railway Age* of November 5 (page 911), as receiving bids for the construction of an addition to its Alvarado Hotel at Albuquerque, N. M., to cost approximately \$300,000, has awarded the contract for this work to Charles Fellows, Los Angeles, Cal. The same company will also construct a new laundry building, and repair the old one, at Albuquerque.

**CANADIAN NATIONAL.**—This company contemplates extending its Vancouver Island line approximately ten miles into the Cowichan Lake territory.

**CHICAGO & ALTON.**—This company contemplates the construction of a subway at Division street, Bloomington, Ill.

**CHICAGO, ROCK ISLAND & PACIFIC.**—This company has awarded a contract to T. S. Leake & Company, Chicago, for the construction of a car repair shed, 87 ft. by 200 ft., at Pratt, Kan., estimated to cost \$20,000.

**CHICAGO UNION STATION.**—This company which was noted in *Railway Age* of December 3 as accepting bids for 3,600 tons of steel to be used in the widening of Canal street from Jackson boulevard to Washington street and the Monroe street viaduct has awarded the contract to the American Bridge Company, Chicago.

**CUMBERLAND & MANCHESTER.**—This road has recently purchased and is equipping a new ballast plant at a quarry along its line. It is also enlarging its shop facilities and installing new hump scales and additional side tracks at Heidrick, Ky. These improvements will cost approximately \$250,000 and are expected to be completed during the first part of 1922. The road has also closed contracts for equipment covering three locomotives, recently noted in the *Railway Age*, three steel underframe box cars, 25 steel coal cars, 10 wooden coal cars and some other miscellaneous equipment.

**ILLINOIS CENTRAL.**—This company, which was noted in the *Railway Age* of November 26 (page 1069), as receiving bids for the construction of a frame storehouse at Clinton, Ill., has awarded the contract for this work to Joseph E. Nelson & Sons, Chicago. This work is estimated to cost approximately \$20,000.

**MIDLAND VALLEY.**—This company, which was noted in the *Railway Age* of December 3 (page 1121), as the Osage Railway Company which had recently applied to the Interstate Commerce Commission for permission to construct about 11 miles of railroad extending from Foraker, Okla., into the Osage County oil field, has awarded the contract for this work to R. L. Plunkett, Pawhuska, Okla.

**OREGON-WASHINGTON R. R. & NAVIGATION Co.**—This company has been ordered by the city council of Seattle, Wash., to construct a temporary trestle over its Argo yards at First avenue in that city.

**SABINE & NECHES.**—This company, with a capital stock of \$100,000, has been incorporated to build a railroad from Ruliff, Tex., westward via Deweyville to Gist, a distance of about 16 miles. The directors of this new road are R. J. Wilson, J. P. Hall, and C. C. Smith of Deweyville; A. J. Peavy, R. T. Moore and C. C. Cary of Shreveport, La.; J. B. Smythe and C. E. Walden, of Beaumont, Tex., and W. H. Mangen, of Westlake, La.

**TEMISKAMING & NORTHERN ONTARIO.**—This company, which was noted in the *Railway Age* of October 22 (page 804), as planning the early extension of its line 70 miles northward, will soon receive bids for this work, according to Vice-Consul J. H. Wetmore, North Bay, Ontario. The vice-consul offers to furnish the specifications for the work to any responsible contracting firm upon request as soon as they are available and will also undertake to deliver to the railway commissioners any bids sent in his care.

## Railway Financial News

**ASHLAND COAL & IRON.**—*Authorized to Issue Notes.*—This company has been authorized by the Interstate Commerce Commission to issue its promissory notes to the amount of \$180,000, payable to the order of the Ashland Iron & Mining Company.

**ATLANTA, BIRMINGHAM & ATLANTIC.**—*Bondholders' Committee.*—A committee has been formed to represent the holders of the 5 per cent 15-year income mortgage gold bonds, because of default on the road's first mortgage bonds. The committee consists of G. E. Warren, chairman; J. P. Bradshaw, F. R. Dick, E. P. Maynard and A. W. Hutchins, secretary. The Columbia Trust Company, 60 Broadway, New York, is depository.

**BALTIMORE & OHIO.**—*Annual Report.*—See article on another page of this issue entitled, "Baltimore & Ohio Shows Marked Improvement in 1921."

**CHICAGO & EASTERN ILLINOIS.**—*Pere Marquette May Buy Brazil Branch.*—See Pere Marquette.

**CHICAGO & ILLINOIS WESTERN.**—*Authorized to Issue Stock.*—This company has been authorized by the Interstate Commerce Commission to issue \$600,000 of 7 per cent non-cumulative preferred capital stock and deliver it to Dolese & Shepard Company in liquidation of interest-bearing indebtedness due that company amounting to \$600,000.

**CHICAGO, BURLINGTON & QUINCY.**—*Declares Dividends of \$20 a Share.*—This company has declared a semi-annual dividend of 5 per cent, and an extra dividend of 15 per cent, payable December 27 to stock of record December 17. In June last the company paid a dividend of 5 per cent (for no stated period).

As the Northern Pacific and the Great Northern each own \$82,933,700 Burlington stock, the extra dividend declared in Chicago on December 1 will mean additional income to each of the controlling roads of \$12,440,000, equivalent to 5 per cent on the Northern Pacific's \$248,000,000 stock and 4.97 per cent on Great Northern's \$250,000,000 stock.

See also Colorado & Southern.

**CHICAGO, MILWAUKEE & ST. PAUL.**—*Provision for Maturing Obligations.*—The Wall Street Journal quotes President H. E. Byram as saying that the road's cash position is strong, it has no bank loans, and funds are in hand to cover its interest requirements for several months ahead.

Mr. Byram is quoted further as follows:

As an indication of our sound position it might be mentioned that we are going to anticipate the January 15 instalment of the principal of our equipment trusts held by the Railroad Administration. The instalment is something over \$1,000,000. We applied to the Railroad Administration for permission to do this several days ago, and have received its approval. The advantage is that we will save a month's interest.

The company's \$25,000,000 note to the government, maturing on March 1, next, is well secured, as well and even better than bankers would require, so that there is no occasion to anticipate that the Commerce Commission, which administers the revolving loan fund, would refuse to refund it if borrowing the money elsewhere involved paying a higher interest rate than the 6 per cent which it bears. We are not at all worried about that.

Current traffic conditions in the West show the effect of the forthcoming reduction in rates on agricultural products. The reduction of 10 per cent proposed by the carriers, to be effective probably January 1, would coincide with remission of the 1 per cent federal tax on freight bills, making a difference of 13 per cent in charges to shippers. There is an evident disposition among the farmers to withhold their shipments until they can obtain the benefit of this reduction. For that reason, and on account of failure of coal users to stock up seasonably, November traffic had fallen off distinctly, in comparison with that of October, and was also below that of November, 1920.

After the first of the year it is expected that farmers would ship grain more freely, as no further reduction in freight rates would then lie in prospect for some time in the future, and that coal would move in greater volume. Industrial users of coal must soon appreciate the necessity of stocking up against the probable interruption of mining at the end of March, when the present wage agreements expire.

**COLORADO & SOUTHERN.**—*Resumes Common Dividend.*—A dividend of 3 per cent has been declared on the \$31,000,000 of outstanding common stock, par \$100, the first since 1912, when 1 per cent was paid. The company has also declared the regular annual dividend of 4 per cent on the second preferred, and semi-annual dividend of 2 per cent on the first preferred. All dividends are payable December 31 to stock of record December 17.

The Chicago, Burlington & Quincy owns \$23,667,500 of \$31,000,000 common stock outstanding, \$1,130,000 of \$8,500,000 first preferred, and \$6,078,700 of \$8,500,000 second preferred stock outstanding.

**KANSAS CITY, MEXICO & ORIENT.—Granted Loan from Revolving Fund.**—The Interstate Commerce Commission has approved a loan of \$2,500,000 to the receiver for the purpose of meeting the maturity of a previous loan of like amount certified by the commission on October 11, 1920, which the receiver says he is unable to pay. The property has failed to earn any sum applicable to the payment of the loan, it has been impossible to procure funds from those already financially interested in the property, notably certain residents of Great Britain, and he does not know of any source from which he can at this time secure the necessary funds with which to meet the obligations. Commissioner Daniels wrote a strong dissenting opinion on the ground that for some time to come it is certain that this carrier as it stands today is unlikely to earn its operating expenses. For 1920 there was a deficit of \$1,321,304 and for the first nine months of 1921 there has been an operating deficit for every month except July and August. Mr. Daniels says it may well be argued that for a carrier of this length serving numerous communities solely dependent upon it for service, there is strong reason why the government should undertake to defray the deficit until the road can be made self-sustaining; but the commission has no authority to do this and the facts do not give reasonable assurance of the repayment of the loan. He believes the remedy required by this situation should be directly applied by Congress. The commission has also granted authority to issue a receiver's certificate for the amount of the loan for pledge with the Secretary of the Treasury as security.

**NEW YORK CENTRAL.—Acquisition of Cleveland Union Terminals Company Authorized.**—Upon re-hearing the Interstate Commerce Commission has reversed its previous conclusions in the Cleveland passenger terminal case and has authorized the acquisition by the New York Central, Cleveland, Cincinnati, Chicago & St. Louis and the New York, Chicago & St. Louis of control of the Cleveland Union Terminals Company by the purchase of its capital stock. The commission also issued a certificate authorizing these roads through the control of the Cleveland Union Terminals Company to construct and operate the proposed terminal station and line of railroad constituting the purchase thereof in the city of Cleveland.

**NEW YORK CENTRAL.—Advance Repaid.**—This company has repaid to the War Finance Corporation an advance of \$17,500,000 made on January 23, 1919.

**OREGON SHORT LINE.—Bond Sale.**—Kuhn, Loeb & Co. have received subscriptions for \$16,424,000 consolidated first mortgage 5 per cent bonds, due July 1, 1946, guaranteed principal and interest by the Union Pacific Railroad Company. The purpose of the sale of these bonds is to provide the funds needed to retire the Oregon Short Line first mortgage 6 per cent bonds, due February 1, 1922. The new bonds are issued under the company's consolidated mortgage dated March 1, 1897. Their sale is subject to the approval of the Interstate Commerce Commission.

**PENNSYLVANIA.—President Rea Asks Stockholders' Aid.**—In a circular letter to the stockholders mailed with their dividend checks President Samuel Rea says in part:

Through the efforts of the Railroad Labor Board, the threatened railroad strike of the railroad brotherhoods was averted. We have made a large number of reductions in freight rates in individual cases, but we are still receiving requests for reductions on all classes of freight. The published earnings statement of the company show the results for each month, and from comparisons with the year 1920, it is quite evident that a general rate reduction cannot be made until operating expenses are substantially lowered, which can only be accomplished by a reduction in wages. Such wage reduction has been proposed, and if we are unable to agree with our employees, application will be made to the Labor Board to authorize such reductions in accordance with the terms of the present act.

The company urgently wishes to impress this thought upon you, that the prosperity of your company depends largely and directly upon your personal sympathetic support and co-operation. Therefore, you should ship your freight via the Pennsylvania system and direct that shipments to you be made over this system.

The company in which you are financially interested should have your fullest patronage and support and that of your business alliances and friends.

**PERE MARQUETTE.—Declares 10 Per Cent Dividend.**—The directors on Wednesday declared a dividend of 10 per cent on the 5 per cent preferred stock, payable January 3 to stock of

record December 15. The regular quarterly dividend of 1¼ per cent on the prior preference stock also was declared, payable February 1 to stock of record January 14.

After the meeting the following statement was issued:

The 10 per cent dividend on the preferred stock is the first dividend declared upon that stock since the organization of the railway company in 1917. The dividends upon the preferred stock are cumulative at a rate of 5 per cent per annum from January 1, 1919, so that on December 31, 1921, there will have accrued dividends to the amount of 15 per cent, of which there will remain 5 per cent after payment of the above dividend. The preferred stock of the railway company was issued upon the reorganization of the Pere Marquette in 1917 and represents bonds of the old company. Although the dividend upon the preferred stock has been earned by the present company in each year since the above dividend was effected, no dividends have previously been paid thereon as the directors have considered it more prudent not to do so owing to conditions arising out of the war and the federal control of railroads by the government. The company's claim against the government has recently been settled and the directors feel that the condition of the company is now such as to permit the above distribution to be made to the holders of its preferred stock on account of the accumulated dividends to which said stockholders are entitled.

**May Purchase C. & E. I. Brazil Branch.**—Officials of the Pere Marquette have inspected the Brazil branch of the Chicago & Eastern Illinois with a view to purchasing the property when it is offered for sale on December 16. This branch extends between Mokena, Ill., and Brazil, Ind., about 130 miles.

**PITTSBURGH & WEST VIRGINIA.—Asks Authority to Acquire Control.**—This company has applied to the Interstate Commerce Commission for authority to acquire control of the West Side Belt through an agreement providing for the joint operation of both properties by the Pittsburgh & West Virginia for the respective accounts of said companies.

**READING COMPANY.—Reports on Dissolution.**—Reports saying they have complied with the orders of the United States District Court for the dissolution of the Reading Company and its allied rail and coal subsidiaries were filed on December 5 in the Federal Court at Philadelphia by the Reading Company, the Philadelphia & Reading Company, the Philadelphia & Reading Railway Company and the Central Railroad Company of New Jersey.

Judges Buffington, Davis and Thompson, after reading the reports, directed that they be "filed," and made the additional provision in the case of the Jersey Central that the report be held for "further consideration and action as the court may deem proper."

The Jersey Central said it had sold all its stock holdings in the Lehigh & Wilkes-Barre Coal Company, 169,788 shares, under the plan approved by the court, to Jackson E. Reynolds, syndicate manager, of New York, for approximately \$32,500,000. The report stated there were 88 subscribers for the stock, each of whom has made an initial payment of 20 per cent. In conformity with the court's order, the report added, the stock was sold to persons not stockholders in any of the companies affected by the segregation plan, and affidavits that they were not in the class precluded from purchasing the stock have been filed by all the subscribers.

The report of the Reading companies consisted chiefly of a resume of the work of the trustees appointed by the court to receive from the Reading Company its interests in the Jersey Central.

The time for filing the reports expired December 5.

**SACRAMENTO NORTHERN.—Acquisition by Western Pacific.**—See Western Pacific.

**TENNESSEE CENTRAL.—Sole Postponed.**—The sale of this road has again been postponed, until January 10.

**UNION PACIFIC.—Directors Resign.**—Mortimer L. Schiff and Otto H. Kahn, of Kuhn, Loeb & Co., have resigned as directors in compliance with Section 10 of the Clayton Act.

**WABASH, CLEVELAND & WESTERN.—Asks Loan from Revolving Fund.**—This company has applied to the Interstate Commerce Commission for a loan of \$500,000 for 15 years.

**WESTERN PACIFIC.—Asks Authority to Acquire Control.**—This company has applied to the Interstate Commerce Commission for authority to acquire control of the Sacramento Northern through the purchase of its stock. The Western Pacific was authorized by the commission last May to issue \$4,180,000 first mortgage 5 per cent bonds. It was proposed to use these bonds for the purpose of acquiring bonds of the Sacramento Northern, but the commission ordered that steps to acquire or control the

property should not be taken until such acquisition had been approved by the commission. See *Railway Age*, May 27, 1921, page 1249.

### Tentative Valuations

The Interstate Commerce Commission has recently issued the tentative valuations giving the final value of railroad properties as follows:

	Property Used	Property Owned
L'Angeville River .....	\$16,538	\$12,500
Lake Erie & Ft. Wayne.....	41,759	37,626
Elwood, Anderson & Lapelle.....	109,089	108,510
Lexington Terminal.....	28,500	.....
Little Rock, Maumelle & Western.....	325,162	300,530

### Additional Sales Equipment Trust Certificates

The director general of railroads has, with the consent of the President, confirmed additional sales, at par plus accrued interest, of railroad equipment trust certificates now held by the government, as follows:

To a syndicate consisting of the Guaranty Company and Potter Brothers & Co., of New York; the Union Trust Company of Pittsburgh; The First Trust and Savings Bank of Chicago; The Fifth-Third Bank of Cincinnati; and the Union Trust Company of Cleveland:	
Cleveland, Cincinnati, Chicago & St. Louis, 1923 to 1935, inclusive .....	\$4,507,100
To The Illinois Trust and Savings Bank, the Merchants Loan and Trust Company, the First Trust and Savings Bank, and the Continental and Commercial Trust and Savings Bank, all of Chicago:	
Delaware & Hudson, 1922 to 1927, incl.....	\$1,592,400
New York Central, 1925 to 1927, incl.....	2,768,100
Chicago & Northwestern, 1925-1927, incl.....	1,994,700
Michigan Central, 1925 to 1927, incl.....	1,039,200
Chicago, St. Paul, Minneapolis and Omaha, 1922 to 1927, incl.....	940,800
Total .....	8,335,200
Total amount of these sales is.....	\$12,842,300

The total amount of equipment trust certificates sold by the government to date, at par plus accrued interest, is \$132,910,600. "With reference to the sale of railroad equipment trust certificates to the syndicate of Chicago banks, totalling \$8,335,200, it is interesting to note that the investment demand for these securities, which at first was confined to the Eastern territory, is gradually spreading westward," said Eugene Meyer, Jr., managing director of the War Finance Corporation. "It appears to indicate that the general improvement in money market conditions is following precedent, and is gradually moving westward. It means that there will be a better market for farm mortgages in the not distant future, and that the agricultural sections will soon begin to feel the benefit of improving financial conditions."

### Dividends Declared

Aetehson, Topeka & Santa Fe.—Preferred, 2½ per cent, semi-annually, payable February 1 to holders of record December 30.  
Beech Creek.—\$0.50, quarterly, payable January 3 to holders of record December 15.  
Boston & Providence.—2½ per cent, quarterly, payable January 2 to holders of record December 20.  
Buffalo & Susquehanna.—Common, 1½ per cent, quarterly; preferred, 2 per cent, semi-annually; both payable December 30, to holders of record December 15.  
Chicago, Burlington & Quincy.—5 per cent, semi-annually; 15 per cent, both payable December 27 to holders of record December 17.  
Colorado & Southern.—Common, 3 per cent; first preferred, 2 per cent, semi-annually; second preferred, 4 per cent, annually; all payable December 31 to holders of record December 17.  
Great Northern.—Preferred, 1½ per cent, quarterly, payable February 1 to holders of record December 21.  
Lackawanna Railroad of New Jersey.—1 per cent, quarterly, payable January 3 to holders of record December 6.  
New York & Harlem.—Common, \$2.50, semi-annually; preferred, \$2.50, semi-annually; both payable January 3 to holders of record December 15.  
New York, Chicago & St. Louis.—Common, 5 per cent, payable December 31 to holders of record December 16.  
New York, Lackawanna & Western.—\$1.25, quarterly, payable January 3 to holders of record December 14.  
Philadelphia, Baltimore & Washington.—3 per cent, semi-annually, payable December 31 to holders of record December 15.  
Pittsburgh, McKeesport & Youghiogheny.—1½ per cent, semi-annually, payable January 3 to holders of record December 15.  
Rensselaer & Schenectady.—\$4, semi-annually, payable January 3 to holders of record December 14.  
St. Louis, Rocky Mountain & Pacific.—Common, 1 per cent, quarterly; preferred, 1½ per cent, quarterly; both payable December 31 to holders of record December 17.  
Valley Railroad (N. Y.).—2½ per cent, semi-annually, payable January 1 to holders of record December 17.

POLAND has great supplies of oak timber suitable for railway ties, according to a report from Fayette W. Allport, secretary to the trade commissioner at Warsaw.

## Railway Officers

### Executive

George T. Reid, assistant to the president and western counsel of the Northern Pacific, with headquarters at Tacoma, Wash., has been elected vice-president and western counsel, with the same headquarters.

Chas. D. Quinn, assistant general freight agent of the Louisville & Nashville, with headquarters at Louisville, Ky., has been promoted to assistant to the vice-president in charge of traffic, with the same headquarters. Mr. Quinn was born at Louisville. He entered railroad service on March 16, 1895, as a stenographer in the traffic department of the Louisville & Nashville, and was later transferred to the rate department, where he successively held the positions of rate clerk, chief rate clerk, and chief clerk. On October 1, 1919, he was promoted to assistant general freight agent, with headquarters at Louisville, which position he was holding at the time of his recent promotion.

H. R. Safford, assistant to the president of the Chicago, Burlington & Quincy, with headquarters at Chicago, Ill., has been elected vice-president with the same headquarters.

H. R. Safford

He will continue in his present duties and will, in addition, have jurisdiction over all capital improvements and expenditures; the valuation, real estate, and industrial departments, insurance, and such other matters as may from time to time be assigned to him. Mr. Safford was born at Madison, Ind. After graduating from Purdue University, he began railway service in 1895 as a rodman on the Illinois Central. From 1897 to 1900, he was resident engineer in charge of construction work, and in the

latter year he was promoted to roadmaster. From May, 1903, to March, 1905, he was principal assistant engineer, and on the latter date he was promoted to assistant chief engineer. In July, 1906, he was promoted to chief engineer, maintenance of way, which position he held until May, 1910, when he left railroad service to become assistant to the president of the Edgar Allen Manganese Steel Company. The following year he was appointed chief engineer of the Grand Trunk, which position he held until 1918, when he entered the service of the United States Railroad Administration and was appointed engineering assistant to the regional director of the Central Western region. In February, 1920, he was appointed assistant to the president of the Chicago, Burlington & Quincy, which position he was holding at the time of his recent promotion. Mr. Safford has also taken an active interest in association work, having been president of the American Railway Engineering Association last year. He was also a member of the Committee on Development of the American Society of Civil Engineers.

### Financial, Legal and Accounting

J. F. Wolfenden has been appointed auditor of valuation of the Southern Pacific, with headquarters at San Francisco, Cal.

**Robert S. Henry** has been appointed to the newly created position of associate counsel and director of public relations of the Nashville, Chattanooga & St. Louis, with headquarters at Nashville, Tenn.

### Operating

**J. R. Skillen**, chief dispatcher of the Atchison, Topeka & Santa Fe, with headquarters at Raton, N. M., has been promoted to trainmaster, with the same headquarters. **T. C. Looney** will succeed Mr. Skillen as chief dispatcher.

**E. C. Blanchard**, assistant general manager of the Northern Pacific, with headquarters at Tacoma, Wash., has been promoted to general manager of the lines west of Paradise, Mont., with the same headquarters. **C. L. Nichols**, assistant general manager, with headquarters at St. Paul, Minn., has been promoted to general manager of the lines east of Paradise with the same headquarters. The position of assistant general manager at both St. Paul and Tacoma has been abolished.

**E. E. McCarty**, trainmaster of the Atchison, Topeka & Santa Fe, with headquarters at Needles, Cal., has been transferred to San Bernardino, Cal., succeeding **J. D. McCully**, promoted, as noted in the *Railway Age* of December 3 (page 1123). **R. S. Goodrich**, trainmaster, with headquarters at Gallup, N. M., has been transferred to succeed Mr. McCarty, and **O. W. Schlueter**, chief dispatcher, with headquarters at Winslow, Ariz., has been promoted to succeed Mr. Goodrich. **W. P. Arntz**, chief clerk to the superintendent at San Francisco, has been promoted to trainmaster, with headquarters at Prescott, Ariz., succeeding **H. C. Storey**, deceased.

### Traffic

**C. E. Jenney** has been appointed general agent, passenger department, of the Canadian National with headquarters at New York.

**A. B. Chown**, general agent of the passenger department, of the Grand Trunk, with headquarters at New York, has been promoted to assistant general passenger agent, with headquarters at Chicago.

**H. N. Roberts** has been appointed general freight and passenger agent of the Wichita Falls, Ranger & Fort Worth, with headquarters at Ranger, Tex., succeeding **J. M. Strupper**, who left to enter the service of another company.

**C. F. White**, commercial agent of the Chicago & Alton, with headquarters at Denver, Colo., has been transferred to St. Louis, Mo., succeeding **C. W. Wheeler**, who has resigned to enter the service of another company.

**H. D. Landry**, assistant general freight agent of the St. Louis Southwestern, with headquarters at St. Louis, Mo., has been transferred to Little Rock, Ark. He will be succeeded by **W. F. Knobloch**. **T. L. Hershman** has been appointed general agent of the freight department, with headquarters at St. Louis.

**John M. Dewberry**, assistant to the vice-president in charge of traffic of the Louisville & Nashville, with headquarters at Louisville, Ky., has been promoted to general coal and coke agent, with the same headquarters. **C. D. Quinn**, assistant general freight agent, with headquarters at Louisville, will succeed Mr. Dewberry as assistant to the vice-president, and will be succeeded as assistant general freight agent by **Henry E. Kremer**.

**L. G. Lucia**, general agent of the freight department of the Chicago & Eastern Illinois, with headquarters at St. Louis, Mo., has been transferred to Milwaukee, Wis. **H. J. Dentzman**, division freight agent, with headquarters at Salem, Ill., has been promoted to succeed Mr. Lucia, and **C. C. King** will succeed Mr. Dentzman. **N. C. Calvert**, southwestern passenger agent, with headquarters at Dallas, Tex., has been promoted to general agent, with the same headquarters, and **Harry A. Perkins**, southwestern freight agent, with headquarters at Dallas, has been promoted to general agent of the freight department, with headquarters at Memphis, Tenn.

### Mechanical

**H. W. Salmon, Jr.**, acting fuel agent of the Missouri Pacific, with headquarters at St. Louis, Mo., has been promoted to fuel agent.

**W. N. Foster** has been appointed master mechanic of the Iowa division of the Chicago, Milwaukee & St. Paul, with headquarters at Marion, Iowa, succeeding **E. L. Nottley**, who has been assigned to other duties.

**J. A. Marshall** has been appointed acting master mechanic of the Lake Superior division of the Northern Pacific, with headquarters at Duluth, Minn., succeeding **J. E. Goodman**, who has been granted a leave of absence.

**W. R. Harrison**, master mechanic of the Atchison, Topeka & Santa Fe, with headquarters at Chanute, Kan., has been transferred to Argentine, Kan., succeeding **E. E. Machovec**, who was promoted to acting mechanical superintendent as noted in the *Railway Age* of November 19.

**George M. Davidson**, chemist and engineer of tests of the Chicago & North Western, with headquarters at Chicago, has been appointed industrial engineer, with the same headquarters. He will have general supervision of the laboratories, water supply, timber preservation, fuel consumption and other duties assigned to him by the president. **H. D. Browne** will succeed Mr. Davidson as engineer of tests.

### Engineering, Maintenance of Way and Signaling

**M. B. Clark**, division engineer of the Atchison, Topeka & Santa Fe, with headquarters at Needles, Cal., has been transferred to San Bernardino, Cal., succeeding **W. W. Kelly**, promoted, as noted in the *Railway Age* of December 3 (page 1124). **O. R. West**, assistant division engineer at San Francisco, has been promoted to succeed Mr. Clark. **F. D. Kinney**, assistant division engineer at Winslow, Ariz., has been transferred to succeed Mr. West, and **R. E. Chambers**, roadmaster, with headquarters at Prescott, Ariz., has been promoted to succeed Mr. Kinney. **F. S. Purdy**, roadmaster, with headquarters at Los Angeles, Cal., has been promoted to inspector of track and roadway, with the same headquarters, succeeding **J. E. McNeil**, who has been disabled.

### Obituary

**Edward H. Kennedy**, who retired as auditor of the Pittsburgh & Lake Erie on January 17, 1921, died on December 2, at his home at Westfield, N. Y. Mr. Kennedy was

E. H. Kennedy

born at New Brighton, Penn., March 1, 1866, and was connected with the Pittsburgh & Lake Erie for 32 years. In 1888 he began his railroad work as a clerk in the accounting department; in 1890 he became chief freight clerk and, in 1893, chief traffic clerk. Later in the same year he was promoted to travelling auditor for the road. In 1900 he was appointed general bookkeeper, advanced in 1902 to assistant auditor and, in 1904, he was appointed auditor. In 1919 Mr. Kennedy was named federal auditor of five lines—the Pittsburgh & Lake Erie, the Monongahela, the Pittsburgh & West Virginia, the Lake Erie & Eastern and the West Side Belt. Because of ill health he retired from service on January 17, 1921.

## Machine Tools Affect The Operating Ratio

What does replacing obsolete inadequate shop equipment with Ryerson-Conradson machine tools mean to railroad operation?

It means power ready for the road when it's needed.

It means fewer engine failures on the road, for nothing makes for good workmanship more than good tools.

It means lower, more continuous service and lower maintenance costs—therefore a better operating ratio.

Ryerson-Conradson machine tools are an investment that vitally concerns railroad operation. Ask about them.

The changes made by the Railway Labor Board in the national agreement for maintenance-of-way employees, effective

### A Change for the Better

December 16, 1921, mark a definite improvement. While minor changes have been made all through this instrument, there are two modifications of primary importance. One is the elimination of overtime for the ninth and tenth hours and the other comprises those changes which allow a reasonable degree of local adjustment of arrangements between employer and employee. The adoption of the ten-hour basic day marks a definite recognition of the difference between conditions under which maintenance-of-way men are employed and those that hold in nearly all other lines of employment. A large part of the maintenance-of-way men are employed in camps with little opportunity for diversion during hours not employed. Consequently, the average man would rather be at work earning money than be sitting around idle. The section man, on the other hand, rides to his work on a motor car or hand car on company time, whereas the average city worker would be spending his own time on a street car. For this reason ten hours employment for the section man involves very little more time away from home than eight hours with the average workman in other lines. The railroads will welcome this change for two reasons. It will enable them to accomplish the same amount of work with a smaller number of men, while the proportionate time spent in traveling to and from work will be a relatively smaller part of the total time paid for. The new rules are also an improvement in that they make an appreciable reduction in the minutia of regulations governing the relation of the railroads to their men.

Few governmental agencies have paid larger returns to the railways and other users of timber on the appropriations than

### More Funds for the Laboratory

has the Forest Products Laboratory at Madison, Wis., in the years of its existence. However, its usefulness has been seriously curtailed of late for lack of sufficient funds with which to disseminate adequately the results of the investigations and tests made under its direction. Instead of publishing pamphlets or booklets available to anyone who had use for them the efforts to obtain publicity for its findings have been restricted largely to the presentation of technical papers by members of the staff before technical societies or in the pages of engineering and trade journals and through the publication of a small number of so-called technical notes. As a consequence, the general public is not obtaining the full benefit of the investment which the government is making in this laboratory. It is true that certain manufacturers and others have obtained valuable information from the laboratory by sending representatives to Madison to co-operate with members of the laboratory staff in developing practical applications for the facts ascertained as a result of research. While much good has been accomplished through this procedure, it is at best undemocratic in that the benefits are in large measure restricted to the small number of individuals who have the funds and inclination to go to this trouble. The current

annual appropriation for Forest Products research amounts to \$325,000, or less than 25 cents for every \$1,000 of raw manufactured value for the total annual cut of wood. This sum is only sufficient for the laboratory to continue its current research work and should be supplemented by at least \$100,000 more if the results of the research are to receive the widespread dissemination that they should have.

In the purchase of locomotives, price is often one of the most important considerations. Usually the number of locomotives required is settled first, a rough estimate of the price is made, and the officers of the road proceed by trying

### First Cost of Locomotives vs. Operating Cost

to get the motive power for the minimum expenditure. If a fixed sum is available for new power, it would be far better to reduce the number of locomotives bought than to cut down the price by revising the design and eliminating all but the bare essentials. The fixed charges on the first cost of motive power is a relatively unimportant item in operating expenses as was brought out in the paper by William Elmer published in the issue of December 3. Mr. Elmer cites the case of a locomotive costing \$50,000 for which the fixed charges are 60 cents an hour for the 24 hours, or about \$1.30 an hour for the time it is on the road only. This locomotive consumes about 7,000 lb. of coal an hour. At the unit prices for the various regions given in the Interstate Commerce Commission's report for the month of September, the cost of fuel would vary from \$11.10 to \$23 per hour. The wages of the engine and train crew for this locomotive amount to \$4 an hour. It is evident from these values that even a small saving in fuel or wages would justify a relatively large increase in the first cost of the locomotive. For example, so far as fixed charges are concerned, it would be economical to double the cost of the locomotive if necessary in order to save 15 per cent of the fuel. This is a thought that is seldom emphasized but should be kept in mind whenever the purchase of locomotives or locomotive appliances is considered.

In view of the unusually mild weather during the late fall months, little difficulty has been experienced in performing

### Protection for Outside Car Repairmen

car repair work outdoors even in sections of the country quite far north. During the winter, however, repair shops located in northern latitudes are subject to cold, rain, sleet and snow, which often materially delay the repairing of cars not under cover. It is impossible for men exposed to adverse weather conditions to work with the same degree of efficiency as when protected and sometimes it is impossible to work at all. This fact was emphasized by the recent severe sleet storm in New England which broke down trees and literally put out of commission hundreds of miles of telephone, telegraph and electric power lines. From Utah also comes word that car shops are being extended and sheds built so that car repair work can be done under cover. Certain states have

made it compulsory to erect structures which will afford a protection to workmen on this class of work and the railroads would do well to consider whether they should not, in the interest of efficiency and economy, provide these facilities before they are compelled to by the state authorities. Not only should provision be made for the protection of car repair men, but in specific instances it has proved a paying investment to provide firing-up sheds outside of locomotive shops. These sheds should be well lighted and equipped with steam lines to operate blowers and air lines for use with pneumatic tools. The final operations in locomotive repair work, including firing up and such adjustments as are always necessary after test runs, can then be performed by workmen protected from inclement weather conditions. The degree of protection needed at a given point will depend largely on its latitude but if this protection is furnished, repairmen can then concentrate on the work at hand irrespective of the weather and with a noticeably favorable result on output.

In the inquiry following a recent rear end collision the engineman testified that he had received a yellow or caution signal indication. An examination of the signal at the time of the accident showed that it was in the stop position and displayed a red light. At the investigation the engineman's vision was

#### Home Brew and Color Blindness

found to be perfect, but upon being asked whether he drank any "home brew" before starting on that particular run, he admitted having had a couple of glasses. He was then given some "home brew" to determine what effect, if any, it would have on his vision and on being examined four or five hours later he was found to be absolutely color blind. This effect, however, wore off in the course of 12 or 15 hours and the engineman's vision was again normal. Thus another problem presents itself to further harass our over-worked railway managements

The insistent demand for economies in locomotive operation which has resulted from the advancing cost of coal in the

#### Is the Turbine Locomotive Coming?

past few years has caused thoughtful engineers in several parts of the world to consider the possibilities of radical modifications in steam locomotive design. The present type of locomotive with its reciprocating steam engine forms a remarkable power plant, distinguished by unusual capacity for its small space and weight, and of great simplicity. It possesses to a high degree these characteristics that are of prime importance but unfortunately it does not compare favorably with some other engines when consideration is given to the amount of fuel burned to produce a given amount of work.

In casting about for a more economical means for converting the energy of steam into work, it is natural that the steam turbine which has given such excellent results in other fields should be one of the first devices considered. A number of designers are now devoting their energies to a solution of the problem of the adoption of the turbine to the driving of the locomotive. The turbine to show its best efficiency must run at a high speed and the exhaust instead of passing direct to the atmosphere must be led to a condenser where a high vacuum is maintained. The fact that the starting torque is relatively small, that the power is reduced as the speed is decreased and that the ordinary turbine is non-reversing introduces other problems that may delay the application of the turbine to the locomotive. It is too much, however, to say that these difficulties are insurmountable.

As the experiments which are now being made in several European countries indicate a coal consumption some 20 per cent less than that obtained with a steam engine the results will be watched with the interest that their importance demands.

The development of the highly efficient modern locomotive has been a gradual process, produced by a large number of

#### An Example of Progress

changes, each in itself apparently of minor importance, but contributing its part toward the attainment of the final result. Because these changes occur so gradually they pass almost unnoticed. The introduction of a new wheel arrangement, or the building of an engine which establishes new records for weight or tractive effort overshadows in popular interest the less conspicuous, but more important advances in the art of locomotive design. It is only by definite comparison with past performance that progress can be measured. It is for this reason primarily that the description of the performance of the Rock Island Mountain type locomotives in this issue is of interest. It furnishes a comparison with a similar engine built in 1914 which is an impressive exposition of the progress in design that has taken place even in the short period of six years.

The Interstate Commerce Commission has changed its mind and the New York Central, the Cleveland, Cincinnati, Chi-

#### The Cleveland Terminal

cago & St. Louis and the New York, Chicago & St. Louis will be permitted to build a passenger terminal at Cleveland according to their original plans. Previously the commission had dismissed the application of the carriers for the authority they asked and the reversal of the decision comes as the result of further hearings. The proposed station is to be located on the public square in the heart of the city and will involve the building of a new passenger line through the city. This line and the station will be below the level of the city streets and electrification will be necessary. The station is proposed as a solution to the severe freight congestion in Cleveland and as a substitute for the antiquated stations now provided. Objection to the plan is strongest apparently on the part of certain local interveners who advocated as an alternative the construction of a station near the present union station on the lake front, the new station to form one of a group of monumental public buildings already standing there. Under such a plan the objectors estimated that by four-tracking the Cleveland Short Line (the New York Central's freight line south of the business section of the city) and by effecting certain other improvements the congestion could be relieved and that their plan would be much less costly than the public square station project. There was also some objection to the proposed methods of financing the project, whereby a traction line terminal is to be combined with the new station under arrangements which the objectors seemed to think prejudicial to the best interest of the railroads and to the fact that, under the plan, valuable air rights over the station are not retained by the railroads. The decision of the Interstate Commerce Commission in approving the application would seem, however, a wise one. Congestion at Cleveland presents a situation challenging solution and the interested carriers should be the best judges of what methods should be followed in tackling the problem. No alternative plan was presented, the lake front proposal being an idea, pure and simple, with no bona fide rail carriers as its proponents. At the same time it is to be regretted that the other carriers in Cleveland—

the Baltimore & Ohio, the Pennsylvania, the Wheeling & Lake Erie and the Erie—have not joined in on the project. These roads may, however, come in later under contract.

## Plumb Plan Villification of Officers of Railways

THE KIND OF PROPAGANDA which is being used by the railway labor unions to promote the Plumb plan is strikingly illustrated by testimony recently given by Frank J. Warne, an "economist and statistician" for the train service brotherhoods, before the Senate Committee on Interstate Commerce. The headlines over the story regarding Mr. Warne's testimony published in "Labor," the official organ of the railway labor unions and the Plumb Plan League, in its issue for December 10 read: "Rail Officials 'Milking' Carriers with Supply Contract Rakeoffs." "Managers Fatten Concerns in Which They Have Financial Interest." "Earnings are Dissipated in Extravagant Deals—Hundreds of Guilty Officers Named."

In the article in "Labor" Warne is quoted as having made the following statements, among others:

"It is common knowledge among those familiar with the facts that railway supply companies in which railroad officers are peculiarly interested have been and are fattening off purchases from them made by the railroads. . . . A Congressional investigation, or an investigation by the Interstate Commerce Commission, will undoubtedly disclose the significant fact that in recent years all the railway supply companies, and they number into thousands, have reported huge surplus earnings to be added to their already accumulated surpluses secured through high prices to the railroads for the supplies purchased. . . . It should not need the authority of a statute to establish the commonplace principle of right conduct that the plain duty of a railroad official forbids him to gain a personal profit at the expense of the railroad company through contracts with it or sales to it by supply companies. . . . Such profit is gained through participation in interest payments on bonds or dividends on stocks of supply companies to which the railway lets its contract at high prices, just as much as if an out-and-out bribe were given the railway official. . . . Railway managers are holding on to their sources of graft while they are pleading with the public to demand wage cuts for workers to prevent insolvency of carriers."

Although these charges were made by Mr. Warne in testifying before the Senate Committee, they received almost no publicity through the press generally. The obvious reason was that he offered no real evidence in support of them. "Labor" says he gave the names of hundreds of railway officials who have been getting graft, but with commendable regard for the laws of libel "Labor" refrained from publishing any of these names. The article in "Labor" indicates that Mr. Warne based his charges almost wholly on the ground that within recent years the railways have paid high prices for fuel, materials and equipment, and that the coal, equipment and supply companies have made large profits. But what relationship to charges of graft has evidence showing that the coal and supply companies have recently charged high prices and made large profits? What business concerns, except railways and public utilities, have not within recent years charged high prices and made large profits?

He said, as quoted in "Labor," that "in 1920 the railroads paid two-and-a-half times the pre-war price for locomotives, more than three times the pre-war price for steel cars, and 313 per cent more for composite cars. Passenger coach prices increased 218 per cent." The source of these figures is apparent. They are based on statistics published by the *Railway Age* in its issue for January 7, 1921. But some of the *Railway Age's* statistics are grossly misquoted. Our figures showed that between 1910-1914 and 1920 the average price of composite freight cars increased not 313 per cent, but 213 per cent, and that passenger coach prices increased not 218 per cent, but 118 per cent. We do not know whether Mr. Warne misstated the statistics given in the *Railway Age* or "Labor" misquoted Mr. Warne. At any rate "Labor" is published by the same labor organiza-

tions that employ Mr. Warne and through it these garbled figures were disseminated among railway employees.

The actual increases in the prices of equipment were surely great enough without being exaggerated. But if they are to be used as evidence of graft, what is to be said about some other increases in prices which occurred at the same time? In 1920 the price of wheat rose to a point where it was 252 per cent higher than in 1913. The price of leather became 335 per cent higher, of shoes 208 per cent; brick 281 per cent; Douglas fir lumber, 307 per cent; sugar, 423 per cent; potatoes, 620 per cent. If the advances in the prices the railroads paid to the coal companies and the equipment and supply companies are evidence of graft, then those who participated in this graft are the veriest pickers compared with those who grafted in the buying and selling of wheat, potatoes, shoes, lumber, leather and sugar. In May, 1920, the average wholesale price of all commodities was 172 per cent more than in 1913, while the average price of bituminous coal was 173 per cent higher, of pig iron 157 per cent higher and of steel billets 133 per cent higher. The railways are large purchasers directly and indirectly of coal, pig iron and steel billets and yet the prices of these commodities had increased only as much as, or less than as much as, the average price of all other commodities.

A man who will make the sweeping charges of grafting relations between railway officers and supply companies that Mr. Warne has made upon such flimsy grounds as he has based them is a reckless propagandist who disgraces the titles of "economist" and "statistician" in which he masquerades. He does, however, offer one suggestion which the *Railway Age* hopes will be promptly adopted. This is for an investigation by a congressional committee or the Interstate Commerce Commission of the relations between railway officers and concerns which sell to railways. The Interstate Commerce Commission is charged with the duty of seeing that the railways are economically and honestly managed. The commission has just begun an investigation to determine whether a general reduction of rates at the present time would be justifiable. Charges that the railways are wasting hundreds of millions of dollars through inefficient management and graft are being peddled all over the country by Glenn E. Plumb, W. Jett Lauck, Frank J. Warne and other paid employees of the railway labor unions. If these charges were true it would be the duty of the Interstate Commerce Commission to find that the railways could afford to make large general reductions of rates and to order them to do so. Therefore, it is the commission's plain duty to call these men before it in the present investigation and compel them to prove their charges of wholesale grafting, or admit that they are willfully disseminating among railway employees and the public the most reckless and baseless libels.

Meantime, the railway officers should not overlook the significance of the publication of Warne's charges in "Labor." Warne is employed and this paper is published and circulated by the railway labor unions. Therefore, the heads of the labor unions stand sponsor for everything that Warne charges and that "Labor" publishes. The effect of the publication of Warne's charges is to convey to hundreds of thousands of railway employees the impression that most of the officers of the railways, and especially the higher officers, are crooks who are stealing vast amounts of money from the railways and are trying to reduce the wages of employees so that there may be more money for them to steal. A large part of the employees accept as gospel the propaganda disseminated by the heads of the 12 unions through "Labor" and in turn disseminate it on every train on which they work and in every community in which they live. The effects produced upon the attitude and morale of the employees and upon public sentiment

are obvious. The necessity for combating this propaganda in every possible way is even more obvious.

Railway employees complain because the railways seek to reduce their wages; and at the same time the heads of their unions and Lauck, Warne, Plumb and other paid spokesmen are constantly engaged by the foulest misrepresentation in trying to create a public sentiment which will force down the rates of the railways and thereby make necessary reductions in wages. The leaders of the labor unions constantly complain that some railway officers try to avoid dealing with the unions, and at the same time use the unions as agencies for blackening the reputation of railway officers and to carry on propaganda aimed at the destruction of private ownership and management.

"Men cry 'peace, peace,' when there is no peace!" How can there ever be anything but war between the railway companies and the labor unions as long as the labor unions, to promote their egregious Plumb plan, persist in carrying on a nation-wide campaign of misrepresentation of private management of railways and vilification against railway officers?

## The Bryn Athyn Collision

THE DISASTER at Bryn Athyn, Pa., on December 5, reported in our last issue, is of a character to focus attention on all phases of the collision problem. It is almost three years since the notable collisions at South Byron, N. Y., and Fort Washington, Pa. (January, 1919) and, except for Schenectady in June, 1920, there has been no such disaster of the first magnitude since that time anywhere in the country; and the block signal problem has been no exception among the various questions of railroad maintenance which, during these three years, have been almost totally smothered by the general financial paralysis in the railroad world, the causes of which are all too well known.

For it is the block signal problem, mainly, that is here at issue. Between the electric train staff, in perfect form, or automatic block signals, maintained at their highest perfection, on the one hand, and the simplest manual block system (as it is operated on thousands of miles of road) on the other, there is a very wide gap; and where the best is not attainable, this gap is bridged, more or less effectively, by a chain of less satisfactory precautions and safeguards; and in this case two weak links in the chain broke simultaneously.

A certain brilliant superintendent, of the old school, who had not much money for signals and whose company had not very high ideals in such matters, had in one location a lone semaphore, set high on a bank, outside of a siding, though it governed the main track. Criticized by a young signal engineer, he replied, with vigor, "My signals mean what I say they mean!" He could not afford to move that signal just to comply with some highbrow theory of uniformity. His runners all understood that signal; what more could be asked? But, some day, with some engineman, under some peculiar combination of circumstances which could be expected to occur not once in a hundred years, the principle of uniformity, at that signal, would be the one link—perhaps we should say the one thread—holding things together and preventing a disastrous collision. This principle, demonstrable in logic, but often so evasive that the operating officer is not able to sustain it wholly on the basis of experience, was illustrated at Bryn Athyn.

Nothing could be simpler, on paper, than to require the conductor and the engineman, when they are allowed to pass a signal in the stop position, to bear in mind that they have been allowed to pass it only by a suspension of the rules, and that to move beyond it at full speed they must first look back and see that it has not been changed; or else get

special written permission to go on. And this is particularly plausible at places where trains always make a station stop and the difficulties of fog and of high speed are therefore absent. But in point of fact no one has yet been able to insure enginemen against absent-mindedness, and the placing of signals immediately in front of the engineman's eyes is one of the safeguards which have been universally approved as a provision against that weakness.

So much for what is, without doubt, the one glaring broken link in the safety chain at Bryn Athyn. Depending on the conductor to check the engineman who fixes in his mind "154" for "156"; or who ignores words and figures on paper and identifies opposing trains by some rule-of-thumb process, is another weak link that has been proved weak a hundred times; notably at Nashville, Tenn., in July, 1918, when 101 persons were killed. Depending on firemen and brakemen to check the errors of their superiors is a weaker one, and the very words in the rule-book usually give evidence of its weakness. The futility of trying to hold a train by a fixed signal which is behind the locomotive is so well settled in the minds of all train dispatchers that the point has become one of the cardinal elements in their creed. This will have been noticed as a prominent element in the recent discussion in these columns concerning the use of train-order Form 19. That conductors and brakemen often will not carefully co-operate in reading orders; that firemen often prove ignorant or careless are facts of experience too common to need proof. We say that these weaknesses occur "often." Making comparisons with normal operations, this may seem a harsh word. The *percentage* of errors in train operation is so small that the mind does not grasp the fractions. The chance that a passenger will be killed in a collision, or even injured, is so small that we all enter the cars daily without thinking of it. But "often" is the proper word. As we have said, it is almost 36 months since the last country-wide proclamation on this subject; but the certainty that other disasters will occur is absolute.

We have spoken of the general paralysis of railroad treasuries. This collision illustrates a difficulty of a more permanent nature; the attempt to give good service for a poor income. The Philadelphia, Newtown & New York Railroad is one of the poverty-stricken members of the Reading family, never earning a profit. The government has laid down the principles of good block signaling, but it has not insisted that these should be adopted—at least not on a short branch doing a light business; while through another department it has put arbitrary limitations on railroad incomes. The government calls for the exclusive use of steel cars for transporting passengers; but its deliverances shed no light on how to get rich enough to throw away the thousands of wooden cars that are in service. Neither the government departments nor the railroads have the courage to reduce the dangers of travel by a reduction of speeds—and so we go on risking our lives.

The government, to be consistent, should adjust its financial requirements to its safety requirements. The railroads, generally speaking, try to be consistent in their appropriations for their profitable lines and for those which are unprofitable; but they have little success except as they favor the poor ones far beyond the reasonable limits of equity. In the meantime the keepers of the railroad treasuries have to contemplate the grim reality that when passengers are killed and injured, the drain on their companies' funds is usually the same, whether the wreck occurs on a poor branch or on the main line.

AT A CONFERENCE of petroleum shippers and railroad men of the Mississippi Valley at Memphis, Tenn., on November 28, a rate of 36 cents per 100 lbs. on petroleum shipped from New Orleans and from Louisville, was asked by the oil companies. The railroads suggested a rate of 38 cents.

## Letters to the Editor

[The RAILWAY AGE welcomes letters from its readers and especially those containing constructive suggestions for improvements in the railway field. Short letters—about 250 words—are particularly appreciated.]

### Why Not a Service Reduction?

OMAHA, Neb.

TO THE EDITOR:

Railway executives are clamoring for wage reductions and the employees, of course, are fighting this to a finish. Sometimes hard times are produced by over-production. Over-production means lower prices for the over-produced articles. Did it ever occur to railway executives that the "service" may be over-produced?

Just because a passenger representative may hear a drummer say that the I. X. L. has it all over the X. Y. Z. in train service and equipment and reports this to his passenger traffic manager, is it necessary for the latter to importune the general manager to place a rival train on his line although the earnings will not pay engine and car mileage, let alone the other expenses? Competing roads run many competing trains out of Chicago to large cities in every direction—trains de luxe which of course means a first class hotel on wheels. Railway managers know the cost of running these royally equipped trains and that many of them do not pay. It is said that competition is the life of trade. So it is, when the trade permits, but when the trade does not exist and cannot yet be built to fill the service, why keep up the service? Other businesses do not. They get together and close out the non-paying operations.

Then why should not railway executives get together and instead of fighting for a wage reduction, make it an operation or service reduction? This in itself means a wage saving as less trains operated means less men required. No objection can be made by the employee as he cannot expect pay when his services are not required. Let the executives take off each of their lines one or two trains and distribute the movement of the remainder to the best advantage for all. The public may kick, but inasmuch as it is demanding lower rates, it should accept less train service. E. H. B.

### Advantages of the Mallet Type As Compared With the 2-10-2

KANSAS CITY, Mo.

TO THE EDITOR:

One reads a lot about the efforts of the railroads to economize in the use of coal; while much has been done in the last few years along that line, it seems to me that the compound engine must be adopted if any big saving is expected. I noticed a description of some 2-10-2 type locomotives for the Southern Pacific in a recent issue of the *Railway Age* having cylinders 29½ in. by 32 in., a tractive effort of 75,150 lb. and a total weight of 385,900 lb. Contrasting this with some Great Northern Mallets used in road service, built about 12 years ago, of 2-6-8-0 type with 23 in. by 35 in. cylinders, tractive effort 74,000 lb. working compound and a total of 378,300 lb., one wonders why the Mallet is not used to a greater extent in road service. In the instances noted above the steam consumption of the Mallet is about 10 per cent less than that of the 2-10-2 of practically the same power. The Mallet also has the great

advantage of being able to increase its tractive effort about 20 per cent in starting and also on hills where there is danger of stalling.

The first cost of the Mallet would be higher than for a 2-10-2 of the same power, but if properly designed and with the use of high grade materials as are generally used, the yearly upkeep should not be so much more but that the amount saved by more economical operation would still be sufficient to show a good profit by its use. On a road using large numbers of such locomotives, the profits would be considerable.

The Mallet would also be easier on roadbed and bridges, owing to its short rigid wheelbase but greater total wheelbase, the one making it easier on curves than the long rigid wheelbase of the 2-10-2 and the other by distributing the total weight over a greater amount of track. As regards speed, the Mallet can make 25 to 30 miles per hour which is fast enough for ordinary traffic.

P. D. ANDERSON.

### "Man Failures"

NEW YORK CITY.

TO THE EDITOR:

Your report of the terrible collision on the Reading Railway in Pennsylvania on the 5th of December gives the cause of the deplorable loss of life (so far as known) as failure of the human agency; that is, a "man-failure"; and, as usual, those railroad officers who express themselves (what extreme silence prevails, generally, among the higher officers, at such times!) seem to resignedly accept that as the complete and sufficient explanation.

But what a number of failures! It appears that in this, as in most cases, to put the responsibility on one man would be badly out of line with the facts. I understand that the engineer and the conductor who broke down were men of high morale, experienced, and with good records. They both failed. The fireman and the rear brakeman failed.

There must have been a bad man failure when the location of that semaphore signal was decided upon.

Your account indicates that the southbound train entered the block at 7:45, while the dispatcher's order to the northbound was not completed until 7:46. Is there a man-failure at that point also?

Knowing that the public demands steel cars, why do not the railroads, when they must use the old wooden cars, move their trains slower? An old-fashioned railroad would have held them down to 20 miles an hour through that narrow and steep-sided cut. This is a man-failure, though we are not honest enough to call it so.

The Interstate Commerce Commission has for years advocated steel cars, and numerous congressmen endorse the position of the commission; they even introduce bills on the subject; but it all ends in talk. Why do they not *do* something? This is a man-failure. Blaming nine commissioners and 400 congressmen is very cold comfort, I admit; but men fail, and we must face the facts.

For still longer years the commissioners have advocated the block system—the real and effective block system, not a makeshift such as was disclosed in this case—and one congressman, Mr. Esch, of Wisconsin, has ably backed them; *but nothing has been done*. Here is another glaring man-failure. When shall we ever realize the sorely needed accession of "sand" in our public men? Man-failures are so common all around us that one is almost driven to pessimism.

But the true term, alas! is "men-failure." A dozen individuals (not counting congressmen) can, if they search their hearts, accuse themselves for inaction which has helped to produce the conditions that result in collisions like this one at Bryn Athyn. One could almost pray that some of the

ugly qualities of Senators La Follette and Borah might agitate the breasts of some of the conservative congressmen. As long as the safety of our passenger trains depends on the actions of boards of railroad directors, we shall have the present situation continued indefinitely; not perhaps a man-failure, but man-action by men so extremely conservative that in effect they (the directors) are just as tragic failures as were the conductor and engineer at Bryn Athyn.

It behooves us to consider these things right here in

WALL STREET.

## Prices of Rails, Salaries of Executives, and Other Things

NEW YORK.

TO THE EDITOR:

You may be interested in the following extracts from a letter which I have sent to the Senate Committee on Interstate Commerce:

"Much publicity has been occasioned by a letter or statement which the newspapers report to have been placed in your hands by Dr. Frank J. Warne in behalf of the union railroad employees of the United States, in which Dr. Warne lays blame for the plight of the railroads upon the United States Steel Corporation. He cites in support of his contention a letter written last February by John Skelton Williams, then Comptroller of the Treasury. Mr. Williams claimed that steel prices could have been cut very severely without detriment to the position of the corporation.

"The statement by Dr. Warne, together with the statement of Mr. Williams, referred to the war-time profits of the Steel Corporation as "swollen and unconscionable." As you undoubtedly know, the prices for steel products during the war were fixed by a government commission, at a figure considerably higher than the Steel Corporation thought was just and proper. They were fixed at that higher figure, however, because smaller steel companies, lacking the corporation's financial strength, and lacking its ability to produce steel at low cost, would have been frozen out of the market at figures lower than those which were fixed. In other words, that was a war measure pure and simple, which was put into effect for the purpose of obtaining the largest possible steel production from all steel producers, even though some of those producers might reap excessive profits.

"Now, what was done with those excessive profits? You know and I know that the government took the greater part of them in the form of taxes. If these hundreds of millions of dollars thus taken had not been obtained from this source, they must necessarily have been obtained from the body of the American public. So much for the excess war profits.

"Open-hearth steel rails today are sold to the railroads at \$40 per gross ton. For a long period of years, beginning in the spring of 1901 and ending in the spring of 1916, open-hearth steel rails were sold regularly at \$30 per gross ton. (The \$28 price which we see mentioned so frequently was for Bessemer rails, which are now practically out of the market, and which for many years have been produced in smaller and smaller quantities, because most of the railroads will not accept them.) Now \$40 is 33 per cent above \$30, but the railroads' average charge for freight per ton-mile for the first six months of 1921 is 78 per cent above the average for 1913 and the railroads now charge 57 per cent more per passenger mile than in 1913. In fact, if you consider single fares in states where the old 2c. statute rates were in effect, such as New York, Illinois and others, the present price is 94 per cent above the old.

"It seems idle to charge a 33 per cent increase in steel rail prices with responsibility for continuing an increase varying from 57 to 94 per cent. If you extend the inquiry beyond

steel rails, you will find that other forms of steel are relatively lower than rails. As a matter of fact, steel bars are today lower than they were in 1913, and plates and beams are on identically the same basis as in 1913. Hence, the present price of steel has practically nothing whatever to do with the plight of the railroads. Perhaps the fact that railroad employees (not including the general officers) received, on the average, 106 per cent more in 1920 than in 1915, may have something to do with it.

"The same Dr. Warne has stated, in a way which has caused the newspapers to give it considerable publicity, that railroads have padded their payroll figures to show that the present average wage of railroad employees is higher than it should be. He states that this padding consists in the inclusion, in the average, of salaries of railroad presidents and other high officials, known ordinarily as general officers. It may interest Dr. Warne and others to learn that if all the general officers were to have their salaries cut to \$1 per year per man, and the amount so saved from the railroad salary list were to be distributed equally among all the other employees, each man would receive from this distribution an average of 6 2/3c. per day.

"If, on the other hand, the general officers were to receive identically the same average salaries as the average of all other employees, down through the minor clerks, section hands and common laborers, and the amounts so saved from the railroad salary lists were to be equally distributed to all railroad employees, each employee would from this source have his wages increased to the extent of 4 1/4c. per day.

"As a parting thought, it might be stated that the 1920 consumption of steel rails in this country, which was 2,055,172 gross tons, would amount at the present price of \$40 per ton to \$82,206,880, which is about one-tenth of the estimated annual advance in wages made to railroad employees in 1920. Thus, if that advance were cut only 10 per cent (and this does not mean that the whole wages should be cut 10 per cent) the railroads would save from that one source alone enough money to provide them with as many tons of rails as they bought last year."

SIDNEY G. KOON,  
Associate Editor Iron Age.

## Interior Boiler Treatment as an Alternative

ST. LOUIS, MO.

TO THE EDITOR:

Permit me to add a word to the excellent article by C. R. Knowles, published in your issue of November 12, entitled "The Interior Treatment of Boiler Waters," with special attention to the letter by L. F. Wilson in your issue of December 3.

The article by Mr. Knowles brought out many good suggestions. The complete treatment of water for boiler purposes is clean-cut chemical reaction and although it does not purify the water from a distillation or bacteriological standpoint, it does, where properly managed, remove the objectionable scaling matter before the water is given to the locomotives. There are points where this is clearly necessary and also others where the expenditure for complete treating plants is not warranted. Under the latter conditions, as but very few perfect boiler waters are encountered, the "internal treatment" is often advisable to promote the economical operation and maintenance of locomotives with the most efficient handling of traffic.

The problem of railroad water supply is a complex one and involves the combination of a suitable source with ample production and attention to quality. The railroads use a larger amount, by volume, of water than of any other single material required for train operation, hence the importance of the quality.

The majority of the larger railroads have found it advisable to give this phase of railroading careful attention, and the results which have been secured, both in the elimination of water waste and the saving by the permanent improvement of quality conditions, fully justify the study given. It is not believed that any appreciable number of those "who have authorized expenditures of hundreds of thousands of dollars for treating plants" will be other than agreeably "shocked" by the perusal of the reports covering the results secured by these expenditures.

The quality of railroad water supply varies considerably. In the case of surface supplies this is readily evident, but even the mineral content of well waters frequently fluctuates. Only by frequent check and careful, intelligent attention can the best results be secured. "Complete treatment" is much more easily regulated than "internal treatment" as the check tests are simple and certain. However, very good results can be obtained with "internal treatment" when due allowance is made for the co-ordinating agencies.

Mr. Wilson wrongly infers that the "internal treatment" to which Mr. Knowles refers, applies exclusively to proprietary boiler compounds. There is no particular mystery in the composition of boiler compounds and very good results are being obtained with "compounds" prepared by railroad chemists in the company laboratories, as has been clearly demonstrated on roads where this feature has been given study and supervision. Of course, when railroads are not equipped, either with laboratory or technical staff, the boiler compound companies, at the present time, offer a very convenient solution. Several of these companies have efficient staffs and if they will give the water supply problem the careful attention and frequent check that is necessary, with co-operation by the railroad forces, good results will be secured. In either case, under the present conditions of necessity for conservation of material and resources, the possible economy by improvement of water supply cannot be well overlooked.

R. C. BARDWELL,  
Engineer of Water Service, Missouri Pacific

## Corrosion in Service Tests and in Actual Service

Mundtstown, Ohio.

### TO THE EDITOR:

There has recently been considerable discussion of the relative corrosion of various kinds of iron and steel with particular reference to the life of sheets in freight cars. In this connection you may be interested in the enclosed table of comparative analyses of various metals which has just come to my attention.

The strange thing about it is that the famous old Baltimore & Ohio iron box car built in 1862 was made of high-

coppered puddled iron. And yet practically the same kind of material from which this car was made failed in the Pittsburgh test of the American Society for Testing Materials in 22 months. What I would like to know is, if a railroad engineer 60 years ago had been in a position to base his opinion upon the results of the Pittsburgh test, would he have said "no good" to this time-honored relic of high-coppered puddled iron which gave 60 years of faithful service?

And that is not all that bothers me. There is another wonderful old relic that has attracted the admiration and interest of railroad engineers. It is the old powder car of the Nashville, Chattanooga & St. Louis. Unlike its companion, the iron in this car contained practically no copper and the material compares favorably with the commercially pure iron of today. This car, too, saw more than 60 years of actual service, and yet iron sheets practically of the same analyses as the plates from which this old car was constructed, when subjected to the atmospheric corrosion test in the Pittsburgh district, failed in 28 months.

Years of actual service proved these two iron box cars, one made of coppered iron and the other made of pure iron, to be extremely durable, irrespective of the showing of the Pittsburgh test. What does all this mean? It means, to quote from a report of the Committee of the Institute of Engineers of Great Britain of 1920, just this: "That the only satisfactory method (of testing) lies in exposing the metals to corroding influences under conditions precisely similar to those to which the metals would be exposed in practice."

BENNETT CHAPPEL,  
American Rolling Mill Company

## Fire Protection in Lumber Yards

NEW YORK CITY

### TO THE EDITOR:

Referring to the issue of your magazine dated December 10, and the article on The Care and Protection of Lumber in Storage. Under the section dealing with fire protection, the following statement is made: "The water in the barrels can be kept from becoming stagnant or from freezing by dissolving in each barrel from 100 lb. to 150 lb. of calcium chloride (common salt)."

Calcium chloride and common salt are entirely different substances, the technical term for common salt being sodium chloride. I am calling this to your attention as common salt is no longer recommended for use in fire barrels because of not protecting the water from freezing at low temperatures and also due to the increased cost of its use in fire casks over that of calcium chloride. The table and notes here-with give information on the use of calcium chloride.

Calcium chloride will, as the article states, keep the water from becoming stagnant, will also protect water from

Material	Copper	Sulphur	Phosph.	Carbon	Manganese	Silicon	Life of material
Iron powder car N. C. & St. L. Ry.	Trace	.042	.332	.24	.048	.210	In service 60 years

Sunk in 1862.							

freezing at lower temperatures, practically prevents loss from evaporation and requires no care once the calcium chloride has been put into solution.

#### FREEZING POINT AND GRAVITY OF CALCIUM CHLORIDE SOLUTION.

Temp., Fahr.	Lbs. per gallon of water	Specific gravity	Degrees, Baume
+25	1 1/4	1.07	10
+10°	2 1/2	1.134	18
0°	3	1.178	23
-10°	3 3/4	1.206	26
-15°	4	1.216	27
-20°	4 1/4	1.226	28
-25°	4 1/2	1.236	29
-30°	4 3/4	1.246	30
-40°	5	1.267	32
-50°	5 1/2	1.277	33

The solution should be made of granulated 75 per cent calcium chloride, free from magnesium chloride, and should preferably be mixed in a vat before being placed in fire casks, care being taken to see that the calcium chloride is entirely dissolved by thorough stirring.

If wooden barrels are used, they must first be well coated inside with asphaltum, and all containers should be kept covered.

Containers should be examined at regular intervals to see that they are full and in good condition.

In cold weather, hydrometer tests should be made to make sure that the solution is of correct strength for temperatures likely to be encountered. Sufficient calcium chloride should be kept on hand in airtight receptacles to refill containers after use.

Calcium Chloride is far superior to salt, being non-corrosive, does not evaporate nor become foul, remains in solution without constant stirring, and has much lower freezing point.

Another paragraph to which I wish to take exception is as follows: "Where such apparatus is not available water barrels should be distributed throughout the yard at convenient points and strategically disposed so as to be most effective in an emergency."

When the major equipment is installed it is also essential to add minor equipment. Many times during the course of the 24 hours, only the watchman may be at hand who could not handle the fire hose, especially where high pressures are used, but who could accomplish results with fire pails or extinguishers on any incipient fire.

I notice that no mention has been made of the extreme exposure which lumber yards offer to the surrounding properties. This is a point which many railroads seem to ignore and they pile their lumber in close proximity to adjoining buildings. Lumber yards should be at least 200 ft. distant for safety.

Due to my extreme interest in matters of fire protection, I could not see this article published in your magazine without calling to your attention the additional points which I have stressed.

G. W. H. THOMAS.

## About Seniority

RAVENNA, KY.

TO THE EDITOR:

The Illinois Central advertisement stating that railroad-ing is as attractive for the young man as ever was well answered, when the "Ohio State University Student" (*Railway Age*, November 5, page 865) said college men were deterred from entering railroad service because of "an ancient system of seniority." The seniority system as forced on the railroads by the unions has produced stagnation and fosters inefficiency and disinterestedness. Like a stroke of paralysis it has hit the railroad organizations and where once men vied with one another for promotion, today they are content to sit back with their rights and let other forces than their own efforts push them ahead. More than any other thing, it turns intelligent young men away from the railroad field.

Strange to say, I am in favor of a seniority rule, but not the way the present one is written—i. e., ability being sufficient, seniority shall prevail. This puts grey hairs ahead of brains and makes you keep the weak brother in line

ahead of you. It takes all ambition out of a man for he knows that no matter how hard he works it will not count for the vacancy will go to the man longest in the service. Yet you say he should do his work well so as to gain an official position which is not controlled by seniority. This is well and good, but one must have years of experience properly to fill these and a young man placed in the present atmosphere of indifference, where all his little hopes are stifled, will leave the service long before he is able to be an officer. This forces the railroads to pick for their minor officials old fogies who have been content to dilly-dally along for years under this obnoxious rule.

Let us rewrite the rule—"Ability being the same, seniority shall prevail and between similar positions where the hours or location vary, let seniority rule." To illustrate: In train service let seniority govern as long as you remain a brakeman, so the oldest men can have the day work, best runs, and live at the terminal of their preference. But when we come to promotion to the positions of conductors, promote those who not only pass the best examination, but those whom the trainmaster readily feels he can trust with responsibility.

Take the clerical positions, where most officials in the operating department have to get a good part of their grounding. There are many different degrees of work in an office, all the way from mail clerk to chief clerk. Let seniority prevail between similar work, such as between the stenographic jobs, timekeepers, accountants, etc., and if a man's rights cover a group of offices let him choose as to the one in which he wishes to work and as to the more favorable hours.

Our friend from "Ohio State" talks about favoritism. I think it is generally admitted that there is no field where there is less favoritism than in the railroad. Just compare it to the industries which are run by the owners and you will have no "come back." When the Brotherhood of Railroad Clerks say that invariably where seniority does not exist the boss will go outside the office to fill the vacancy, they only admit that the average railroad clerk is listless and incompetent. All the officials I have known would first look for promising material in their own office before going elsewhere. They know that to reward the competent is the best stimulus for morale.

As the railroads no longer control the conditions under which their employees work, if the Labor Board does not wake up and change this vicious system the railroads will be driven to the point where "an effort to get good official material, they will have to adopt the cadet system, obnoxious as it is to Americans. They will have to take the college graduate who has been more fortunate in education than his fellows and move him over the system, through jobs created for the purpose and out of the reach of the unions, and thus over a period of several years of intensive training fit him for the minor official positions. The unions by insisting on this rule will in the long run only keep their able members out of places of responsibility and set up a class system, such as exists in older countries where the ambitious worker has no chance for advancement.

ALBERT FINK MILTON,  
Clerk, L. & N.

THE EAST ST. LOUIS & SUBURBAN, as a part of its safety first campaign, has painted one of its passenger cars white and covered its entire exterior surface with admonitions to the people to "watch their step." This car is run over the entire system, alternating over the 17 different lines which connect St. Louis with more than 20 Illinois towns, and thus carries its message to every part of the territory which the company serves. Each passenger using the car is given printed matter in support of the campaign.

Rocky Mountain Limited Leaving Rock Island Station

# Rock Island Mountain Type Handles Heavy Train

Latest Design Demonstrates Worth in Exacting Service—Excellent Fuel Performance

THE Rock Island lines traverse in general a section of the country which has been intensively developed by the railroads. Practically every important city reached by the road is a competitive point and in passenger service especially it is necessary to meet strong competition. For in-

tended primarily for service on the difficult Colorado division, where by consolidating two trains they effected a reduction of 180,310 passenger train miles per year. To determine whether these locomotives were suitable for use under other conditions they were tried on the Iowa division between Rock Island and Des Moines, where they were entirely successful.

The subsequent increase in the size of trains made it difficult at times to maintain schedule speeds with the heaviest Rock Island Pacific type locomotives, which have a rated tractive effort of 40,000 lb. For this reason the road's last order for locomotives included 10 engines of the Mountain type with 74 in. wheels and a tractive effort of 50,400 lb. These locomotives, which were designed with particular regard for the conditions existing on the Iowa and Missouri divisions, were described in the *Railway Age* for February 28, 1921, page 447.

Since being placed in service these locomotives have made enviable records hauling the Rock Island's fastest and heaviest passenger trains. On the Missouri division they are assigned to the Golden State Limited, making an average speed of 45 miles an hour, including stops. The westbound

Profile of Missouri Division Between Trenton and Kansas City

stance, between Chicago and Kansas City five roads provide trains making approximately the same running time. Between Chicago and Omaha there are four competing lines.

Profile of Missouri Division Between Rock Island and Trenton

A similar situation exists between the midwestern cities and points on the Pacific Coast and in the Rocky mountains. It naturally follows under these conditions that the road should

est passenger trains. On the Missouri division they are assigned to the Golden State Limited, making an average speed of 45 miles an hour, including stops. The westbound

Profile of Iowa Division Between Rock Island and Des Moines

make every effort to provide the most modern equipment and fast, dependable service.

To meet the exacting requirements for passenger motive power the Rock Island has in recent years introduced exceptionally heavy locomotives. It will be recalled that in 1914 the road ordered its first Mountain type engines. These were

train, No. 3, carries 12 to 16 cars, and No. 4, eastbound, 11 to 15 cars. While in general the contour of this line is a succession of minor rises and descents it will be seen by reference to the profile that there are numerous rather heavy grades, some as steep as 1.5 per cent. Under such conditions it is difficult to maintain fast schedules unless the locomotive

has ample power to permit sustained high speed on the ascending grades.

On the westbound trips the coal consumption of these trains averages 104 lb. per train mile and on the eastbound trips 102 lb. This is an excellent performance as shown by comparison with the figures for the country as a whole. In the nine months ending September 30, 1921, the coal consumption per locomotive mile in passenger service was 108 lb., although the average number of cars per train was but 6.36. It should be borne in mind also that these locomotives operate on an unusually fast schedule and haul heavy steel cars, two factors which tend to increase the coal consumption.

In the operation of the Rocky Mountain Limited between Rock Island, Ill., and Valley Junction, Ia., four miles west

The effect of the syphons is well shown by a comparison with the Rock Island's first Mountain type. The earlier design had 28 in. by 28 in. cylinders and 185 lb. boiler pressure, the cylinder horsepower being 2,613. The boiler horsepower was 2,450, or 93.8 per cent of the cylinder horsepower. The latest locomotives have 28 in. by 28 in. cylinders, but the boiler pressure is 200 lb., which increases the cylinder horsepower to 2,824. The boiler horsepower is 2,840, giving a 101 per cent boiler, a remarkable achievement in a Mountain type locomotive. Without the syphons the boiler horsepower would have been only 90 per cent of the cylinder horsepower. The syphon also decreases the weight per horsepower as shown by the comparison of the weight per boiler horsepower with that for the engines built in 1914.

One of the Heavy Mountain Type Locomotives

of Des Moines, these locomotives also encounter difficult operating conditions. This train is usually made up of 13 cars during the Summer period and is scheduled at 39 miles an hour over a division of 181 miles. On different occasions these locomotives have made up as much as 45 min. on the running time. On this train the coal consumption averages 105 lb. per mile.

Engineers and road foremen of engines have commented on the ease with which trains are handled over one per cent grades at 40 and 45 miles an hour with these locomotives, indicating that the reserve steaming capacity is far more than ample to take care of any ordinary requirements with trains of 15 or 16 cars. The officers of the railroad have been highly pleased with the splendid steaming qualities of the Mountain type engines and also the economical fuel performance. Much of the credit for these results is attributed to the Nicholson thermic syphons with which they are equipped. The syphons improve combustion conditions and also increase the heating surface of the firebox.

This figure is 136 lb. for the earlier design and 129.3 lb. for the newest engines.

Another reason for the excellent performance of these locomotives is no doubt found in the fact that they are working well within the limits of their capacity over most of the runs. The average fuel consumption is 4,680 lb. per hour, or slightly under 75 lb. per sq. ft. of grate per hour. This is a fairly low rate for bituminous coal and under these conditions spark losses should be small, front end temperature low and boiler efficiency quite high.

One of the characteristics of this class of power which has been especially pleasing to those actually operating them is their consistent performance. In the year they have been in service the locomotives averaged 5,000 miles per month each. Not one delay has been experienced on account of hot bearings or rod bushings and a steam failure is unknown even under the most trying conditions. Roadmasters have commented on the fact that these locomotives are unusually easy on track.

# Superpower Advocates Strive to Answer Criticisms\*

## Take Issue with Railway Age Editorials and Allege Failure to Give Report "Careful Perusal"

THE ATTITUDE of the *Railway Age* with regard to the electric operation of trains is one which favors the adoption of such operation in cases where it is advisable. This policy has led to the publication recently of four editorials commenting on and criticizing the Superpower Survey Report.\* The criticism was called forth largely because it was felt that by exaggeration, real and implied, the report would tend more to retard the adoption of electric operation than to further it.

The authors of the report have taken exception to the criticism and their answers to the editorials are set forth in the letter which follows. An answer by the *Railway Age* follows the letter.

### TO THE EDITOR:

1—Your editorial comments on the railway section of the Superpower Report, of November 5, 19 and 26 and December 3, call for a reply.

2—Your editorial of November 5, page 862, reads, "For example, it is assumed in the report that 7.5 lb. of coal are required by a steam locomotive to do the work at the rim of the drivers equal to one kilowatt-hour."

3—We expected that the "careful perusal of the report" which you claim to have made would bring forth a prompt correction of that statement, but on the contrary, the same statement is repeated in your editorial of November 26, where you state, "The coal consumption of the steam locomotive is assumed to be 7.5 pounds per kilowatt-hour."

4—There is nothing in the report to justify this statement. The paragraph you refer to is doubtless that on page 62 which is a mere statement of opinions of others tending to show that the figures arrived at in the report are in substantial agreement with those arrived at by others. On the other hand, it is clearly stated on page 59 that the coal charged to the steam railways is taken "from the reports of the railroads to the questions of Form A." The report would in effect be worthless as a comparison of operations were it based on any "assumption" of coal used by the railways.

5—Further, in the same editorial you have the following sentence: "Spoken of in report as 'full-jewelled' movement," which you say savors of partisanship. At this point it would seem fair to refer to your own paper which on page 1100, December 24, 1920, contains the following, attributed to Mr. McManamy, the assistant general director of railroads: "So many complicated specialties are now being applied to locomotives that it is now common to refer to these locomotives as being 'full-jewelled' and in many instances the application of these specialties has proved a detriment because the roads did not have adequate terminal facilities to insure their maintenance." This is one of many similar statements that might be quoted on the part of prominent railway authorities.

6—Your "careful perusal" should have disclosed to you that the report is not at all concerned with what might be done, in the opinion of its ardent advocates, who, of course, are entirely unbiased, by a "full-jewelled" locomotive equipment,—but solely and entirely with the actual operation of the railways in this zone, as reported to us by their responsible operating officers. Therefore, your statement Nov. 26: "In fact the failure to obtain accurate and up-to-date information regarding the steam locomotive wholly invalidates the conclusions regarding the possible saving in fuel," is either inaccurate or implies that the railways of the zone have not modern equipment. That may be left to the Pennsylvania or the New York Central for reply.

7—The principal cause of your befogging is your failure to differentiate between the actual operations of a railway system and the claims and tests of the extreme advocates of the "full-jewelled" locomotive. You ignore the human element; the electric locomotive eliminates it.

8—Your "broad-minded attitude" also is convincingly displayed in your editorial of November 19 in the words: "Large expenditures are admitted to be necessary to put the several plans

in effect, but the savings claimed put to shame the promises of a salesmen of oil securities." The expenditures are not "admitted" but are proclaimed and set forth in detail; and you must have a singular conception of oil salesmen if you think 14 per cent to be their part!

9—Nor do we, as you state we do (p. 968) "compare operation with the most modern up-to-date electric locomotive working on mountain grades with the operation of the old steam locomotive displaced on these electrified sections." We have made no comparison even remotely resembling this, but we have compared the actual 1919 operation of the most modern, best-equipped and operated railways in the United States with what we know can be done with electric locomotives.

10—We think in view of these quotations that the statement in your editorial of November 19 that the "Methods are not quite as clear as might be expected" find a ready explanation in your failure to study the report. There is no statement in the report for which the reasons are not given; an explanation of all the methods of analysis is given. Details were necessarily omitted in many cases as space was lacking; nevertheless, our contention is that there is not a single point from beginning to end for which reasons are not stated.

11—Your editorial of December 3 shows the same misconception of the methods of the report: "The cost of repairs, including engine-house expenses for steam locomotives is assumed to average 42.6 cents per locomotive mile." Again, you err; it is not "assumed" but is the figure reported by the aforementioned responsible operating officers of the roads.

12—In conclusion, we deny that anything in the report is of the nature of "unfair propaganda;" that you can even hint at a connection of the report with propaganda fairly accurately locates the "unfairness."

W. S. MURRAY,

Formerly "Chairman, Superpower Survey."

CARY T. HUTCHINSON,

Formerly "Division-Engineer of Railroads, Superpower Survey."

### The Editors of the *Railway Age* Reply

Having quoted in full the communication from Mr. Murray and Mr. Hutchinson, we feel called upon to answer it. By way of assisting in making the answer clearer to the reader, we have numbered the paragraphs of their letter. Because of the reference in the fourth paragraph, and the importance it plays in the discussion, we reproduce the excerpt from page 62 of the report which under the title of "Coal Saved" reads as follows:

"The quantity of coal burned in a steam locomotive equivalent in work done to 1 kilowatt-hour delivered to an electric locomotive is estimated by the electrical engineer of the Baltimore & Ohio Railroad at 7.5 lb. and by the electrical engineer of the Chicago, Milwaukee & St. Paul at 8.4 lb. A committee of the American Electric Railway Association has published data for a modern Mallet locomotive with superheater, which makes the equivalent coal per kilowatt-hour with stand-by losses 7.5 lb. The same authority elsewhere gives 6.5 lb. as the equivalent of 1 kilowatt-hour at the power station, equal to 8.1 lb. per kilowatt-hour at the locomotive. Other electrical authorities give materially larger figures—some as much as 12 lbs. The weight of expert opinion is, then, that not less than 7.5 lbs. of coal is required to do the work of 1 kilowatt-hour at the locomotive."

### A Question as to an Assumption

As is noted in the second paragraph of the communication, the *Railway Age* in its editorial of November 5 stated "For example, it is assumed in the report that 7.5 lb. of coal are required by a steam locomotive to do work at the rim of the drivers equal to one kilowatt-hour." This statement, as noted in Paragraph 3, was repeated in the editorial of November 26 in the words "The coal consump-

\*The Superpower Report was abstracted in the *Railway Age* of November 5, in an article, beginning on page 881, entitled "Plan for Electrifying Sections of 11 Railroads." Editorial comment criticizing the conclusions given in the report appeared in the issues of the *Railway Age* as follows: November 5, page 967, "Why Tinker with an Inefficient Machine?" November 26, page 1072, "Extravagant Claims for Electrification;" and December 3, page 1073, "Electric vs. Steam Locomotive Maintenance."

tion of the steam locomotive is assumed to be 7.5 lb. per kilowatt-hour."

The communication declares in Paragraph 4—"There is nothing in the report to justify this statement." That issue will be taken up presently. In the meantime, we should like to draw attention to the sentence in Paragraph 4 reading "It is clearly stated on page 59 that the coal charged to the steam railways is taken 'from the reports of the railroads to the questions of Form A.'" We must point out that Mr. Murray and Mr. Hutchinson fail entirely to understand the point we were trying to bring out. Form A, it is true, gives the total amount of coal used. It, however, contains no references to equivalent coal consumption on the basis of kilowatt-hours. The assumption mentioned in the *Railway Age* did not relate to the total tons of coal consumed. It related rather to the idea that 7.5 lb. of coal are required by the steam locomotive to do the work at the rim of the drivers equivalent to one kilowatt-hour. Now, were we correct as to that 7.5 lb. of coal?

### How Much Coal Would Be Saved?

The editorial in the issue of November 26 is an attempt to apply to the steam locomotive one of the methods used in computing the equivalent coal for electric operation, in order to get the two figures on a comparable basis. The coal for steam operation given in the report is taken from the actual records of the railroads. The method applied to any particular division to get the electrical equivalent is nowhere revealed. In some cases the energy required was "determined from the records of lines already electrified" (page 60 of the report). The other method consists in calculating the work required for hauling the traffic due to train resistance, grades, curvature and acceleration (page 61). From the watt-hour output needed at the locomotive, as thus computed, the sub-station input was calculated, and from this in turn the equivalent coal was deduced.

The authors of the report have used these two methods and have reached the remarkable conclusion that electric operation would save 64.1 per cent of the coal used in freight service, 67.2 per cent in passenger service and 74.4 per cent in switcher service, or a weighted average of 66.8 per cent. To bolster up this conclusion the figure of 7.5 lb. of coal was cited as the amount required by the steam locomotive to do one kilowatt-hour of work. This, as mentioned in the issue of November 26, would give a saving of 57.6 per cent per unit of work done as compared with the coal rate assumed for the Superpower system.

The power output required at the head car of any train would be the same irrespective of the type of motive power and would furnish a comparative basis for comparing coal consumption. Information regarding the fuel consumption per unit of work done is available for various types of steam locomotives. In the issue of November 26 data for a modern locomotive were used to draw a comparison which showed that theoretically the Superpower system would save only 23 per cent in coal as compared with efficient up-to-date engines. The actual figure for coal saving by electrification on the Norfolk & Western is only 28 per cent as compared with the 66.8 per cent estimate in this report.

### They Have Done Something Worse

Messrs. Murray and Hutchinson protest that they have not assumed the coal consumption of the steam locomotive to be 7.5 lb. per kilowatt-hour. We agree with them; they have not done this, but something worse. Even the extravagant rate of 7.5 lb. with a steam locomotive would give a saving of only 57.6 per cent; the Superpower report claims 66.8!

Thus from the figures set forth in the report we must conclude that either the figures for the amount of power used by the electric locomotives are wrong or the steam

locomotive performance on the eastern roads included in the report is decidedly inferior to the performance of Prairie type locomotives without fuel saving devices used on the St. Paul in 1910.

### Or Was It 9.57 lb. of Coal?

This conclusion may be reached as follows: The report states "Item 12 on Form C, 'equivalent coal' is uniformly taken at 2 lb. per kilowatt-hour for energy delivered at sub-station." It also states that the output of the locomotive would be 63 per cent of this amount, which is equivalent to stating that the electric locomotive would deliver one kilowatt-hour of work to the rail for 3.18 lb. of coal burned. This value is apparently then multiplied by the total amount of work done by locomotives in the superpower zone with the product which indicates that 4,423,300 tons of coal per year would be sufficient for electric operation of the zone. At the same time they show that 13,313,500 tons are now required by steam locomotives. In other words, the steam locomotives are now, according to the report (see page 82 of

report), using  $3.18 \times \frac{13,313,500}{4,423,300} = 9.57$  pounds of coal

per kilowatt-hour of work done, which is as stated before a performance decidedly inferior to that obtained by tests of Prairie locomotives used on the St. Paul in 1910. Which is the logical conclusion: that the power used on these eastern roads is comparable to that used on the St. Paul in about 1905, or that there is some discrepancy in the report with regard to power consumption?

Quoting again from the letter—Paragraph 4—the authors say "the report would in effect be worthless as a comparison of operations were it based on any 'assumption' of coal used by the railroads." Much of the report including the conclusions suffers because it is based on a broad assumption, the assumption that theoretical results can be duplicated in practice. This is a fallacy, as the officers of some of our electrified roads know only too well.

At another point in the letter—Paragraph 6—appears this statement: "The report is not at all concerned with what might be done, in the opinion of its ardent advocates who, of course, are entirely unbiased by a 'full-jewelled' locomotive equipment, but solely and entirely with the actual operation of the railways in this zone." If the authors had used the same commendable discretion in dealing with the electric locomotive and had likewise confined themselves to the actual results secured with electrification, they would undoubtedly not have described electric operation in such glowing terms, but they might have made the report of some value in outlining the real field for electrification. Any implication that we have made "that the railways of the zone have not modern equipment" hardly needs comment. We do not understand that every locomotive on the Pennsylvania or the New York Central is of the most modern type. Each of these roads has several locomotives which were built and put in service prior to the present year.

### The "Full-Jewelled" Locomotive and Its Terminals

The fifth paragraph of the letter from Messrs. Murray and Hutchinson contains a quotation from Mr. McManamy with a statement that is taken from page 1100 of the *Railway Age* of December 24, 1920. No such statement occurs on the page referred to, but this is immaterial. The important point is that the authors of the Superpower report have failed entirely to grasp the significance of Mr. McManamy's statement. If they had been more conversant with railroad conditions, they would have known that the criticism was directed not at the specialties, but at the inadequate facilities which made it impossible for the railroads to obtain the full benefit from these appliances.

### An Electric Locomotive Driven By a Mule

Paragraph 7 of the letter states that the electric locomotive eliminates the human element. If we believed that any one of us would just as willingly ride behind an electric locomotive driven by a mule as behind one driven by a careful and intelligent locomotive driver. Seriously, the human element has not been removed from electric street car operation and any experienced railway operating man knows how many complicated problems requiring human skill for solution present themselves while a long and heavy train is being taken over a division. Furthermore, an electric locomotive in some cases is more subject to damage by careless handling than is a steam locomotive. For example; if a steam locomotive is loaded beyond its capacity, it stalls; if an electric locomotive is loaded beyond its rated capacity, it does not stall—it continues to pull the load, but if the load is maintained, serious damage due to overheating may result. This damage may appear immediately or it may develop to the point of failure at some later date. Certainly the human element is not to be disregarded, still less eliminated.

### They Do Not "Admit"; They "Proclaim"

The eighth paragraph quotes from the editorial in the *Railway Age* of November 19 a statement reading "Large expenditures are admitted to be necessary to put the several plans in effect, but the savings claimed put to shame the promises of a salesman of oil securities." The expenditures, say Mr. Murray and Mr. Hutchinson, are not *admitted*, but are proclaimed and set forth in detail. Now, the Century Dictionary gives as one of the definitions of admit "to grant in argument; receive as true; concede; allow; as, the argument or fact is admitted." Another definition is "To acknowledge; own; confess; as, he admitted his guilt." Judging by what Mr. Murray and Mr. Hutchinson say and in the light of the definitions of the word *admit*, the *Railway Age's* statement was not strong enough. The superpower advocates not only "concede," "allow" or "acknowledge" that large sums of money will be necessary to put the several plans of the superpower report in effect; they proclaim it. They are, it would seem, proud of it. A singular attitude, indeed, for people proposing to railroad men the expenditure of large amounts of money under present conditions of railroad finance.

The communication from our Superpower survey friends continues, "You must have a singular conception of oil (securities) salesmen if you think 14 per cent to be their part!" None of the editors of the *Railway Age* has to our knowledge ever bought any so-called oil securities, still less have they engaged in their sale, so perhaps our ignorance of the salesmen's part is to be excused. Nevertheless, any financial student will agree that a security offering 14 per cent return would look like—what shall we say—a wild cat.

### That Matter of Comparisons

The reference to comparisons—in Paragraph 9—has been answered, it is believed, in what has already been brought out. It may be worth while, however, to refer again to the paragraph from page 62 which is quoted above. This paragraph is meant to give the results of investigations by other authorities and is introduced in the report as a check. The paragraph says among other things "The quantity of coal burned in a steam locomotive equivalent in work done to 1 kilowatt-hour, delivered to an electric locomotive is estimated . . . by the electrical engineer of the Chicago, Milwaukee & St. Paul at 8.4 lb." Steam railroad men will appreciate the reasons for our asserting that the report compares electric operation "with the operation of the old steam locomotive displaced on these electrified sections" when we point out that the steam locomotive in the St. Paul comparisons was of the Prairie type (2-6-2) without fuel saving devices. The communication from Mr. Murray and Mr.

Hutchinson says, "we have made no comparison even remotely resembling this, . . . ." The *Railway Age* maintains that the bringing in of the St. Paul comparisons even in the form of a check quite closely resembles it and is certainly much nearer than "even remotely."

### With a Measure of Authority

The communication from Mr. Hutchinson and Mr. Murray contains various aspersions as to our "careful perusal" of the report. In Paragraph 10 they quote a sentence in the editorial in the issue of November 19, in which we said the methods are not quite as clear "as might be desired" and say that they think this statement finds, to quote their own communication, "a ready explanation in your failure to study the report." Our Superpower survey friends when they make this statement fail to realize two important things. One is that the editors of the paper are accustomed to reading and studying reports. The other is that the *Railway Age* would hardly commit itself as it has in the four editorials if it had not given the report careful perusal and study. We very much doubt if there are many outside of the writers of Appendix C who have given it more careful perusal than we have. When we say therefore that the methods are not as clear "as might be desired," we speak, we believe with a measure of authority. If, furthermore, it is not clear to us, what must it be to the railway operating man whose interest is much less than ours, but who is the man in the last analysis who will sign the contracts or at any rate propose electrification to his higher officers?

With these things in mind it is easy to answer the remainder of Paragraph 10. The writers say: "Nevertheless, our contention is that there is not a single point from beginning to end for which reasons are not stated." We will admit that the reasons are all given, but we maintain as we have maintained from the first that the reasons and the argument as a whole are not as clear as might be desired.

### Electrification Advocates Not Familiar

#### With Steam Operation

In the editorial in the *Railway Age* of November 19, the statement was made "It is very evident that the investigators tackled the problem of electrification with a decided prejudice against steam operation. A careful perusal of the report, and more particularly of that section dealing with electrification, Appendix C, may possibly excuse them. It is only too apparent that they were not sufficiently familiar with (steam) railway operation to be at all interested in its favor." This assertion has not been controverted in the letter from Messrs. Murray and Hutchinson, nor is it even referred to. The presumption is, we believe, that they must have felt this criticism to be justified.

The *Railway Age* editorial in question quoted a reference to double-time for overtime work in train service which appeared in the report, but which certainly could not have gotten by anyone familiar with actual railway operating conditions. We also commented on the statement made in the report that no more skill is required to operate an electric locomotive than is demanded of an ordinary chauffeur—which statement is actually ludicrous. There are many other similar statements.

On page 51 of the report appears this remark. "The effectiveness of the devices for increasing efficiency and capacity, such as brick arches, superheaters, stokers, siphons, automatic fire doors and power reverses necessarily depends on the intelligence and faithfulness of the average engineer, and in consequence the average results are low." We cannot believe that anyone speaking thus disparagingly of the intelligence and faithfulness of the American railroad man is well informed concerning railway operating conditions. It may be admitted that sometimes full use is not made of fuel saving devices—the reasons are, however, not the lack of

intelligence and faithfulness of the engineer. We must be charitable enough to believe that the Superpower advocates have not meant what they have said.

### How About the Albany Division

#### of the Boston & Albany?

There is another thing about the report that is of interest, although it has not received attention in any of our editorials. That is the fact that the report includes among the divisions proposed to be electrified the Boston division of the Boston & Albany, but not the Albany division of that road. This solution of the Boston & Albany's problem will no doubt be of special interest to New England railroad men who know somewhat more about the Boston & Albany's operating conditions than did the writers of the Superpower report.

The Boston & Albany is one of the busiest roads in the country—its tons of revenue freight carried one mile per mile of road in 1920 being 3,931,376. Nevertheless, the report says "The low percentage of saving shown by the divisions not included in the selected group except those of the New York Central, is due to light traffic." The Albany division has considerably more and considerably worse grades than the Boston division. Whereas the Boston division has ruling grades of about 40 ft. to the mile, the Albany division in crossing the Berkshires has to overcome grades of 80 ft., or 1½ per cent. Helper operation is frequently resorted to. The line is, of course, double-track and a feature of the division is the large mileage of third track provided for use by tonnage trains on the up grades. It would surprise New England railroad men to see the Boston division electrified prior to the much more difficult Albany division, particularly in view of all that has been said by electrification advocates concerning the advantages of mountain grade electric operation.

The inclusion of the Boston division of the Boston & Albany among the lines which it is proposed to electrify and the exclusion of the Albany division raises a question as to whether the logic used in the report is right and correct after all. At any rate it again raises the question as to whether the Superpower survey investigators knew as much about actual railway operating conditions as might be desired.

### Conclusions

In conclusion let us repeat from the editorial in the issue of November 19 our statement that "As has been said again and again in these columns, there are presumably few railway men left who do not believe that electrification is the proper development in situations suitable for it." We want to emphasize, however, our belief that the steam locomotive has progressed rather faster in recent years than the electrification advocates have given it credit for. We want to express our belief also that the more ardent advocates of electrification, at least, have as yet failed to get the steam man's point of view. They have still to realize that the steam man is the one whose point of view they have got to obtain. When they finally do obtain it, it is our firm belief that they will have a more willing audience and that their arguments will be much more effective. We do not believe that the Superpower survey report is going to help the situation—for reasons which we have now given—as much as its writers had hoped. That in the final analysis, is the reason for all we have said about it.

THE SOUTHERN PACIFIC reminds "hoboes" of the dangers of their traveling habits, by showing that in the period from January 1, 1921, to October 31, ten months, sixty trespassers were killed on its lines. Of this number 22 persons were killed as a result of falling under the wheels while stealing rides or while attempting to get on or off moving trains. Thirty-eight trespassers were killed by being struck by engines or cars.

## Says High Freight Rates Impose Burden on Farmers

WASHINGTON, D. C.

PICKING UP an agricultural state, transporting it one to three hundred miles from its natural market and setting it down again, is accomplished in economical effect, says the Secretary of Agriculture in his annual report, by "the simple process of marking up the transportation cost a few cents per hundred pounds." The effect of high freight rates on the farmers of the country during the past year or more of radical downward readjustment of farm produce prices is outlined by the secretary.

"The cost of getting farm products from the farm to the consumer's table has increased tremendously during the past three years. The freight charge is very nearly doubled, and in some cases more than doubled. When wheat was selling at \$2.50 per bushel, corn at \$1.75, cattle and hogs at \$16 to \$22 per hundred, cotton at 30 cents per pound, the increased freight rate was not a serious matter. It amounted to but few cents relatively and was a small item in the total price. But with wheat at \$1, corn at 48 cents, cattle and hogs at \$7 to \$10 per hundred, cotton at 17 to 20 cents (all these being primary market prices, not farm prices), the addition of even 10 cents per bushel or per hundred pounds imposes a burden grievous to be borne. When farm prices are ruinously low, any addition to the freight charge means added distress. At the present time the cost of getting some farm products to market is greater than the amount the farmer himself receives in net return. And the heaviest freight burden naturally falls on those farmers who live in our great surplus-producing States.

"Not only do the very large advances in freight rates impose a heavy burden on the producers of grain and live stock, cotton and wool, but on the growers of vegetables and fruits as well. Indeed, some of the latter have been compelled to see their products waste in the fields because the prices offered at the consuming markets were not large enough to pay the cost of packing and transportation.

"This transportation matter is one of vital importance to agriculture. The country has been developed on the low long haul. Land values, crops, and farming practices in general have been adjusted to this development. Large advances in freight rates, therefore, while bearable in a time of high prices, if continued are bound to involve a remaking of our agricultural map. Agriculture is depressed until the rates are lowered or until population and industry shift to meet this new condition.

"More than this, inasmuch as our heavy consuming population is massed so largely near the eastern coast and our surplus is produced long distances in the interior, substantial advances in transportation costs have the effect of imposing a differential against our own producers in favor of their competitors in foreign lands, especially to the south of us, who have the benefit of cheap water transportation, and who, in many cases, can lay down their products on our eastern coast more cheaply than our own people can ship their products to the same points by rail.

"Rail transportation is essential to our agricultural production. Good rail service is of tremendous importance. Our farmers realize that our railroads can not be maintained and operated efficiently unless permitted to charge rates which will cover all fair operating costs, maintain their roadbeds and equipment, and pay a fair rate on the money invested. No one has a greater interest than the farmer in efficient transportation. At the same time, the economic aspects of material changes in railroad rates must be considered more carefully than in the past. If these changes are made without due consideration of their effect on agricultural production, inevitably they will create profound disturbance and impose great injustice."

# Cleveland Passenger Terminal Project Approved

Interstate Commerce Commission Reverses Previous Decision  
Thus Making Possible Fulfillment of Plans

ON REHEARING the Cleveland passenger terminal case upon which it had reported adversely, on August 12, 1921, the Interstate Commerce Commission reversed its previous decision and by this reversal, announced December 6, 1921, made possible the fulfillment of the proposed terminal project for the city of Cleveland, Ohio. Through this decision the acquisition of the New York Central, the Cleveland, Cincinnati, Chicago & St. Louis and the New York, Chicago & St. Louis of the control of the Cleveland Union Terminals Company by purchase of capital stock, is approved and authorized. Also these companies are authorized to construct and operate a terminal station and

union passenger station on the lake front at what is called the Mall site. This structure was to have replaced the old union station located on the lake front and was to be an addition to and part of a group plan for a number of monumental public buildings. The old station is used by the New York Central, the Pennsylvania and the Big Four and is both antiquated and inadequate.

In the meantime a suburban residential district had been developed and an electric line built for a part of the distance into that district. This led the Van Sweringens, who had developed the residential district and had built the Cleveland & Youngstown—the electric line—and had also

A Map Showing the Relation of the Railroads to the Terminal Project

line by and through the control of the terminal company mentioned.

The terminal which is planned consists of a large, through-type passenger station with different floor levels above a common train level for steam and interurban railway lines, and necessary approaches, coach yards, etc. It will be situated in the center of the business section of the city of Cleveland, the station building facing the southwest corner of the Cleveland Public Square. The two approaches in connection with the station tracks form a large "U", the two legs of which extend to the south on the opposite sides of the Cuyahoga valley. It is a project which has been under consideration by the city and the railroads for a number of years, the negotiations between the city and the railroads culminating into something definite in 1915 when an ordinance was passed providing for the erection of a

gained control of the Nickel Plate, to introduce a plan for a stub-end passenger station at the Public Square for all electric lines and three railways, the Nickel Plate, the Erie and the Wheeling & Lake Erie. With this in view the Cleveland Union Terminals Company was organized. The plan was not acceptable to the Erie or the Wheeling & Lake Erie and upon suggestion of the New York Central, it was developed for a through passenger station for all roads.

A later ordinance, approved by popular vote contemplated the substitution of this station on the square for the one on the Mall but required the commitment of the three companies involved in the first plan to use the substituted facilities. One of the roads, the Pennsylvania declined to do this and after investigation the ordinance was amended so that the commitment of two companies would suffice. The ordinance covering the change in station sites was sub-

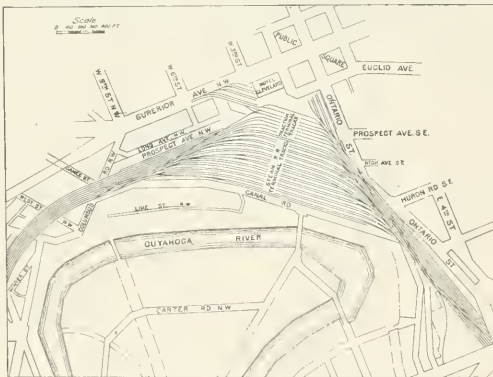

mitted to the people of Cleveland and approved by them in January, 1919. The status of the project up to that time, as well as a description of the project as it stood then, appears in considerable detail on page 755 of the March 21, 1919, issue of the *Railway Age*.

At the present time, only the New York Central, the Big Four and the Nickel Plate are committed to the use of the new terminal which is to be constructed by the terminal company and financed by the sale of bonds issued by it and guaranteed by the three roads. Provision has been made, however, for the use of the facilities by other roads by agreement, the layout being sufficient in size and character to take care of the passenger traffic of all the roads for a long term of years through proper extensions. At present the Pennsylvania uses the old union station on the lake front but as this station will be abandoned the Pennsylvania will probably make use of an outlying station at East Fifty-fifth street and Euclid avenue.

### Railroad Operation and Construction Difficult

The topography of the city is such that the development of industries and railway lines has resulted in a complex situation, the seriousness of which was not thoroughly realized until the war. The land on which Cleveland is built rises abruptly from the shore of Lake Erie except where it is cut by the valley of the Cuyahoga river and tributary gullies. The river while narrow and winding has considerable shipping on it and the valley is well developed industrially.

Arrangement of the Tracks at the Station

The New York Central and the Nickel Plate are the only lines passing through Cleveland, while of the remaining roads, the Big Four is the only one entering with its main line, the remainder having short branches into the city from their main lines to the south. The main line of the New York Central along the lake front is generally four tracks east of the Cuyahoga river and passes through a highly developed industrial district, most of which lies to the south of the tracks. Such yard development as there is in this section is between the main line and the waterfront with the be carried on across the main line. As the tracks are used for passenger traffic, there is a large amount of congestion and interference to both switching and train movement, chiefly the former. At the Cuyahoga river the New York Central crosses on a single-track drawbridge of so low an elevation that it must be opened for nearly all boats. The Pennsylvania connects with the New York Central near the old union passenger station to the east of the river. Just west of the bridge the Pennsylvania has extensive ore docks

and its ore trains use the bridge and cross the tracks of the New York Central at grade. The Big Four also crosses at grade. Owing to the congestion of its main line, the New York Central built the Cleveland Short Line in 1904 as a cut-off, extending from Collingwood on the east to a point on the main line on the west of the city, to be used as a double track through freight line.

The terminal plans provide for 23 station tracks for the steam roads, of which 10 are to be constructed initially and a system of interurban tracks of which nine are to be included in the first construction. Differing from the original designs these tracks will all be on one level and about 30 ft. below the street at the Public Square. The main station facilities will be up one floor or level and will include separate concourses, ticket offices, waiting rooms, etc., for the two classes of travel. This covers the station proper, for above this level the building to be constructed will be used by the owner of the air rights. There are, however, two levels more included in the plans for handling passengers and non-passengers, connected by a well-planned system of ramps and stairways to the streets, concourses and train platforms, all designed to facilitate the passage of people in, out and through the station and to separate inbound and outbound passengers or passengers waiting for trains from persons merely passing through on other business.

### Operation of Terminal Calls for Electrification

The station will be flanked to the east and west by approaches built on a new right-of-way and having four tracks each for railway passenger trains and interurban electric. Two of these approach tracks for each class of service are to be a part of the initial construction, the line extending from about West Twenty-fifth street on the west where the connection will be made with the Big Four, around a U-shaped loop to about East Fortieth street on the east where it will connect with tracks to be laid on the right-of-way of the Nickel Plate. The length of the terminal between these limits will be about  $3\frac{1}{2}$  miles. This trackage is to be electrified and the electrification of the steam railroad lines is to extend beyond these limits over the trackage to be provided along existing rights-of-way.

In the case of the New York Central, it will probably electrify from Collingwood on the east to somewhere in the vicinity of the connection with it of the Big Four and the Cleveland Short Line. East of the terminal limits, the necessary trackage is to be provided on the rights-of-way of the Nickel Plate and the Cleveland Short Line, connecting with the main line of the New York Central just west of the Collingwood yard. West of the terminal, the New York Central and the Big Four are to run over the latter's right-of-way to the connection of the two roads at Berea, Ohio.

In operation the New York Central will route all of its passenger travel over the Big Four from and to the west of the station and over the Cleveland Short Line and the Nickel Plate rights-of-way to the east. The lake front line will be used exclusively for westbound freight and switching movements. Eastbound freight will be sent over the Cleveland Short Line and a part of the Nickel Plate where the two roads parallel for a short distance east of the terminal. Both lines at this point are double track and will probably be operated jointly, plus such additional double track construction by the Cleveland Short Line as it will be found necessary to carry out. The connection of the Big Four with the New York Central on the lake front will remain as it now is, the terminal tracks passing over it.

The terminal plans have been worked out by the parties concerned represented by George A. Harwood, assistant to the president, and H. D. Jouett, terminal engineer, both of the New York Central, and W. E. Pease, chief engineer of the Cleveland Union Terminals Company.

# Asks Congress to Investigate Plumb Plan League

Estimated That League Expended \$1,000,000 to Defeat Candidates  
Who Voted for Esch-Cummins Bill

F. J. LISMAN, investment banker, in testifying before the Senate Committee on Interstate Commerce in the hearings on the Capper and Nicholson bills on Tuesday stated that: "Congress has prescribed the expenditures for elections of candidates. I have not the proofs, but it is within the purview and power of Congress to investigate this. And I claim that large sums—I believe upwards of a million dollars—were expended by the Plumb Plan League in the last general election, to defeat candidates who voted for the Esch-Cummins bill; and this was to serve also a notice to future candidates that, if they opposed labor unions, they would be left at home. I think Congress ought to investigate that situation."

Mr. Lisman suggested also that the only mistake in the Transportation Act is in the labor provision which divides responsibility. He believes that the functions of the Labor Board should be transferred to the Interstate Commerce Commission.

## Criticises Labor Provision of Transportation Act

The Interstate Commerce Commission, said Mr. Lisman, really does not wish to handle this matter for the following reasons:

- "1. It is grossly overworked already.
- "2. The performance of the duties connected with such a function would bring about further political pressure on it, which is sufficiently burdensome already.
- "3. Whenever the commission should reduce wages it would probably be expected to reduce rates; and vice versa; if wages were advanced, the railroads would insist on equivalent rate advances.
- "As a matter of fact, it is not necessary for the Interstate Commerce Commission to adjust wages. The companies and their employees should be allowed to work this out for themselves, but a labor bureau should be created under the supervision of the commission, the function of which should be as follows:

- "1. To lay down rules for the election of the labor union officials, which shall be by secret ballot, and to supervise such elections.

- "2. If there appears to be any dissatisfaction or disagreement between a railroad corporation and its employees, the points of difference shall be submitted to the Labor Bureau, which shall clearly define them. In case five per cent of the employees or members of any union shall sign a petition favoring a strike, then the Labor Bureau shall order a secret strike vote, which shall be supervised by it. The names on such a petition should be kept secret.

- "3. It shall prescribe a form of accounting, in accordance with which all books of such labor unions are to be kept.

- "4. The accounts of the labor unions shall be audited by a certified accountant employed by the bureau, said reports to be printed and open to inspection by the public.

"Everyone knows that strikes are generally declared by a small minority of more or less irresponsible and restless young men who want excitement, while the majority of the loyal, steady employees are passive in these matters and merely go on strike because they fear that they or their families will be molested. The union leaders will vociferously object to such legislation, but I am convinced that if this proposed legislation were to be voted on, not only most working people but also a great proportion of union labor would favor it by a large majority.

"The result of such an act would be that there could be no secret funds which might be used for the hiring of ruffians for the purpose of destroying or damaging property or which could be used in other illegal ways. The profits or fancy salaries paid to labor union leaders would be made public, which would in turn result in a closer supervision of union activity by the men who are paying the dues. When the issues were clearly defined the demagogic, loud-mouthed, professional agitator could no longer succeed and a very much better class of men would come forward for leadership. It is perfectly absurd that men should be asked to vote on the question whether there should be a strike or not without knowing the issue on which they are voting. It is clearly obvious that most of the strike votes today, which are taken on glittering generalities, are meaningless.

"This suggestion for the regulation of unions is exactly in conformity with President Harding's recent message. If the capital of the companies should be regulated—and it is right that it should—the employees are just as much a part of the transportation system, and their organization should be supervised, so that they shall act within the law.

## Capper Bill and Railway Securities

It is now over five years since any substantial railroad financing has been done by the sale of stock. In the meantime, the bonded debt has increased; the proportion of bonds to stocks has greatly increased. Today there are only four railroad stocks left which are selling at a premium. That is, only four railroad companies could sell their stock under the law—the Union Pacific, the Delaware, Lackawanna & Western, the Louisville & Nashville and the Chicago, Burlington & Quincy Railroads. A large number of companies whose stock used to sell at a premium, cannot now sell their stock at par. The Chicago & Northwestern, the Southern Pacific, the Atchison, Topeka & Santa Fe, the Northern Pacific, the Great Northern, and other railroads can no longer sell their stock for their additional capital needs, and they have constantly to increase their bond burden. It is only possible to sell the bonds of the very best companies. For instance, the Union Pacific sold its securities last week on a 5-40 basis. This is probably the strongest railroad company that we have.

The market for securities is practically only for first mortgage bonds. We have had what is in effect a panic, although it has not had the exciting features of an ordinary one. And now, as a normal sequence, we are having a cheaper money market, which means that business is poor; that the working capital of a great many manufacturers, merchants and banks is lying idle in the banks, and seeking investment in other channels. In times like these, people are willing to buy the very best of securities, but they are not willing to buy any security about which there is the least doubt, because when business is poor, people fear further depression, and do not know how far the effects of such depression may affect securities which are the least doubtful. If this bill were passed, it would be impossible for any but a very few railroads to sell securities at any price.

Railroad mileage in the United States has been steadily reduced now for the last three years, at an average rate of over 1,000 miles per year. Money is utterly unobtainable for new enterprises, and it will be unobtainable even for existing lines. This year, if the railroads earn \$700,000,000, the net earnings will approximate 13 per cent of the

gross. To go under this will be absolutely suicidal. In order to make it possible for the public to get additional railroad facilities the remaining 80-odd per cent of the gross earnings will have to be cut into somewhere, or reduced somehow. Now, this 80-odd per cent consists of labor and supplies. I am not prepared to go into the question of whether labor is getting more than it should, or whether materials are higher than they should be.

There are, roughly speaking, about 200,000 more bad order cars than there were 12 months ago. Assuming—and I think that is conservative—that it cost \$250 per car to put these bad order cars into good shape, would mean an additional \$50,000,000, which is deferred maintenance.

I furthermore contend that I am not putting it too high at all when I say that the deferred maintenance on rails approximates 500,000 tons. That, at 125 tons per mile, would be about 4,000 miles of track which are to be relaid, or only about  $1\frac{3}{4}$  per cent of the present mileage. There has been a deferring of the putting in of new rails now for some years. So that there we have another \$30,000,000. In addition to that, you have the deferred maintenance on locomotives, and ties, and ballast, and other things. Deferred maintenance is unquestionably in excess of \$100,000,000. If that were deducted from the \$700,000,000 you would have barely  $2\frac{1}{2}$  per cent earned on the capitalization.

## Regulations Regarding Tax Cancellations and Refunds

**D**ETAILS concerning the procedure to be followed by the railways in the matter of the cancellation of the taxes on transportation charges are embodied in circulars sent out to members of the Railway Accounting Officers Association, dated December 7 and 9. The circular dated December 7 contains a copy of a letter written to Secretary E. R. Woodson by A. C. Holden, acting deputy commissioner of internal revenue. The letter gives an application of the principles to be followed by the carriers in complying with the provisions of the new revenue bill cancelling the taxes on freight and passenger charges imposed by the Revenue Act of 1918. The letter follows:

The following is an application of the principals enunciated in T. D. 3255 and 3256, dealing with the repeal of Subdivisions (a), (b), (c), (d) and (e) of Section 500 of the Revenue Act of 1918, by the Revenue Act of 1921, effective January 1, 1922:

- (1) **PREPAID FREIGHT SHIPMENTS.** On all freight accepted for shipment up to midnight December 31, 1921, on which the transportation charges are prepaid or contracted for prepaid, the tax shall be collected on basis of the transportation charges to destination, regardless of when the transportation service is completed.
- (2) **"COLLECT" FREIGHT SHIPMENTS.** Where the transportation service is completed on or after January 1, 1922, with transportation charges to be collected at destination, the tax does not apply on such transportation charges.
- (3) **DIVERTED FREIGHT SHIPMENTS.** When freight is diverted or reconsigned en route in accordance with the tariff provisions, in determining whether the tax is applicable, such transportation shall be regarded as a continuous movement from point of origin to ultimate destination.
- (4) **TRANSIT PRIVILEGES.** When freight shipments are accorded transit privileges, such as milling in transit, dressing in transit, refining in transit, compression in transit, etc., such shipments in determining whether the tax is applicable, shall be regarded as involving two separate and distinct transportation movements; one into the point where the transit privilege is accorded, and a separate and distinct movement of the product out of such point.
- (5) **EXPORT SHIPMENTS.** On freight consigned from a point in the United States for export to a foreign country, where the transportation within the United States is completed before midnight, December 31, 1921, the existing instructions of the Internal Revenue Bureau (Regulations No. 49) are applicable and the temporary and permanent exemption certificates must be furnished as evidence of the right to exempt such shipments from the tax.
- (6) **IMPORT SHIPMENTS.** For the purpose of determining the application of the tax, an import shipment is regarded the same as a domestic shipment.
- (7) **MISCELLANEOUS TRANSPORTATION SERVICES.** On miscellaneous transportation services completed before midnight, December 31, 1921, the tax is applicable. On warfare, storage, demurrage, etc., the date of delivery of the freight, or release of equipment, shall determine the application of the tax.
- (8) **UNDERCHARGES, DELAYED COLLECTIONS, ETC.** When the whole, or

any part of the transportation charges for freight transportation services, completed before midnight, December 31, 1921, are collected, the tax applies on such charges, and shall be collected by the carrier from the person making such payments, regardless of the date on which collection is effected.

(9) **REFUNDS.** In adjusting freight overcharges, and in redeeming unused, and partially used, passage tickets and scrip books, no carrier and no agent, officer, or employee of any carrier, shall make any refunds or adjustments of the tax on and after January 1, 1922.

The requirement is that the claim for refund of tax must be filed on U. S. Treasury Department Form 46, with the Commissioner of Internal Revenue, within four years from the time the tax was paid, claim being barred by Statute of Limitation, if received after such time. In the event the transportation companies retain the freight receipts, express receipts, redeemed tickets, or mileage books, as part of their files on a claim, the papers filed by the taxpayer with the Commissioner of Internal Revenue for refund of tax must be accompanied by a statement or certificate from the proper officer of the carrier, issued to the taxpayer when the transportation charges is adjusted by the carrier, copy of such statement or certificate being retained as a part of the files of the carrier; both the original furnished to the patron, and the carbon copy in the carrier's files containing the following information:

- (a) Number assigned claim by transportation company, which is the claim number or file reference.
- (b) Amount of transportation charges refunded by the carrier on the claim.
- (c) Amount of tax actually collected on the transportation charges which are refunded by the carrier.
- (d) Date (or dates) on which tax was collected.

There is no objection on the part of the Internal Revenue Bureau to the carriers adding such other information as may be necessary or desirable for their own purposes.

The Bureau of Internal Revenue requires that the claimant furnish to the Commissioner of Internal Revenue, in applying for refund of tax on freight transportation charges, either the original receipts evidencing payment of the tax, or the above statement or certificate in lieu thereof.

(10) **PASSAGE TICKETS SOLD DURING DECEMBER, 31, 1921.** All passage tickets or scrip books sold up to midnight December 31, 1921, that are for use or are susceptible of use before midnight, December 31, 1921, the tax shall be collected, except as specifically exempted under the existing instructions of the Internal Revenue Bureau.

(11) **PASSAGE TICKETS FOR USE ON AND AFTER JANUARY 1, 1922.** In the case of tickets or scrip tickets sold during December that cannot, under any circumstances, be used before January 1, 1922, no tax is to be collected.

(12) **UNUSED PORTION OF PASSAGE TICKETS AS OF JANUARY 1, 1922.** Where there is an unused portion of a passage ticket or scrip book in the possession of the public on January 1, 1922, on which tax has been collected, the Internal Revenue Bureau requires that claim for refund must be filed direct with the Commissioner of Internal Revenue by the person paying the tax, using U. S. Treasury Department Form 46, which should show the following:

- (a) Statement of the facts on which claim is based.
- (b) Statement that no claim is pending nor will any be filed with the transportation company for adjustment of the tax.
- (c) Statement that the unused portion of the ticket or scrip book, in connection with which refund is requested, if in hands of claimant when claim is filed, has been marked to show the amount of tax for which claim has been filed.

The claim for such refund must also be supported by a written statement from an agent of the transportation company (or from a collector of internal revenue if such information can be furnished by him) giving the following data concerning the ticket or scrip book in connection with which refund is requested:

- (a) The number
  - (b) Date of purchase
  - (c) Price paid
  - (d) The proportionate part remaining unused on January 1, 1922, and
  - (e) The proportionate amount of tax applicable to the unused part.
- (13) **EXPRESS SHIPMENTS AND SLEEPING CAR TICKETS.** The term "freight" as used in this letter is intended to comprise, also, shipments by express, and the term "passage ticket" as used in this letter is intended to comprise, also, sleeping car and parlor car tickets.
- (14) **PASSAGE TICKETS BY VESSEL TO FOREIGN COUNTRIES.** Title XI, Schedule A, Paragraph 9 of the new revenue bill continues, after January 1, 1922, the stamp taxes now applicable to passage ticket one way or round trip for each passenger, sold or issued in the United States for passage by any vessel to a port or place not in the United States, Canada, or Mexico.
- (15) **TAX ON TELEGRAPH AND TELEPHONE MESSAGES.** Title V, Section 500 of the new revenue bill continues certain taxes on telegraph and telephone messages now in effect.

Under the interpretations of the Internal Revenue Bureau as contained in the letter reproduced above, it will be necessary for the carriers to have two forms; one for passenger service and one for freight service, relating to information required by the bureau for refund claims filed by the shipper with the bureau on and after January 1, 1922. The Railway Accounting Officers Association has prepared standard forms adaptable for that purpose for use of the carriers. These forms are R. A. O. A. Standard Forms Nos. 195 and 50. Form 195 relates to refunds of the tax on freight transportation charges and No. 50 to refunds on passenger charges. The two forms are given in a circular issued by the R. A. O. A. under date of December 9.

# Hooper Addresses New York Railroad Club

## Labor Board Vice-Chairman Analyzes Board Activities and Makes Plea for Co-operation

"It is indispensable that a magnified spirit of co-operation shall exist between the carriers and their employees" . . . "I am not going to ask you to assume that the Railroad Labor Board is essential to the public weal." For the consummation of this spirit of co-operation between officers and men, "the Railroad Labor Board pledges its earnest efforts." These were among the leading points brought out by Ben W. Hooper, vice-chairman of the Railroad Labor Board, in an address before the members and guests of the New York Railroad Club assembled at the third annual dinner of that organization at the Hotel Commodore, New York, on Thursday evening, December 15. Mr. Hooper analyzed the work that had been done by the Board since its organization; he pointed out the difficulties which it had had to overcome; he presented also for consideration the many criticisms of the work of the Board and in an interesting and pointed manner answered these criticisms. He also offered some opinions concerning labor union policies, particularly with reference to the recent strike threat. "The right of labor to organize," he said, "is based on sound principles." The evils of labor unionism "are merely the abuses of a thing inherently good." Discussing the point that labor has no moral right to tie up the railroads by a strike, he presented a plea for co-operation between officers and employees. In conclusion, he expressed his optimism of the present situation.

Over 2,000 were in attendance at the dinner. In addition to Governor Hooper, six other members of the Labor Board were present as guests of the club; they were R. M. Barton, chairman; J. H. Elliott, G. W. W. Hanger, Samuel Higgins, W. L. McMenimen and A. O. Wharton. The president of the club, J. A. Droege, general superintendent of the New York, New Haven & Hartford, opened the after dinner program and turned the meeting over to the toastmaster, Frank Hedley, of the Interborough Rapid Transit Company.

Mr. Hooper's address follows in part:

### Mr. Hooper's Address

For the purposes of this occasion, I am going to assume that the regulative legislation enacted by Congress prior to 1920 is not in excess of what it ought to be. I am going to take it for granted that the Interstate Commerce Commission, created away back in 1887, has justified its right to existence and to the exercise of the powers conferred upon it by Congress. But I am not going to ask you to assume that this new fangled tribunal, the Railroad Labor Board, is essential to the public weal. It is such a recent experiment that no arbitrary or conclusive presumptions stand in its favor. But, with your indulgence, I am going to present a few facts, upon which you may base an opinion, as to whether the Railroad Labor Board is entitled to your approval and that of the public in general. I shall not be such a daredevil, however, as to invite any expression of that opinion at this time.

The labor section of the Transportation Act of 1920 was enacted by a republican congress and signed by a democratic President, because they had a full realization of the dangers of the post-war conditions that surrounded the railways and involved the public. Railroad working rules and wages had been greatly influenced by the war and by Federal Control of the roads. The carriers contended that the labor conditions that existed at the termination of the war were artificial, unreasonable, uneconomic and burdensome, and that the roads could not live under them. The employees insisted that their

wages were among the last to be increased, that this increase was insufficient, and that the working rules established during Federal Control had given them little or nothing to which they were not entitled. Add to this sharp dispute the disturbed and uncertain industrial conditions that existed throughout the country, and you have enough explosives and combustibles to have rendered a conflagration inevitable.

It was at this juncture that Congress said through the Transportation Act, let us see if a way cannot be found to settle these railroad labor disputes, by the establishment of an impartial tribunal, before which they can be tried like any other lawsuit. This step was not taken by Congress because the people desired to intermeddle either with the affairs of the carriers or their employees. It was because the people knew that they would otherwise be ground to pieces between the upper and nether mill-stone.

Thus the Railroad Labor Board began to function at a most critical period, and there was immediately dumped upon the work bench in front of it more work than ever confronted any other government agency. Before it could scarcely perfect its organization, the wages of every railroad employee of every class in the Union were brought into dispute and the rules and working conditions of these two million men were likewise submitted to the Board. In addition to these two great controversies involving, in fact, several hundred disputes, scores of questions of secondary importance and hundreds of grievances have poured in upon the Board in a steady stream.

The Adjustment Boards, which the Transportation Act contemplated should be set up by the mutual agreement of the carriers and employees, to act as an inferior court for the trial of these grievance cases, were not established. Only recently, the first few Adjustment Boards began to function. The lack of them made the prompt and satisfactory action of our Board impossible. Under the strain of this crushing load the Board has been compelled to double back on the eight hour law, working eight hours before lunch and eight afterwards. For all this, we have received no punitive overtime, but much punitive maledictions for sins of omission and commission.

### Not a "Board of Mediation"

During these 21 months, the Board has disposed of two essential readjustments of wages, the revision of the rules of the six shop crafts and of the maintenance of way employees, has stopped one general strike, and decided 950 miscellaneous disputes. And despite all this, a newspaper punster has referred to us as a "board of meditation."

At any rate, we are not liable to the charge of having restricted the output.

There is one thing, however, that has given the Board a soothing feeling of self-satisfaction, and that is, the fine team work manifested by the carriers and their employees in "cussin" the Board. This has been accepted as conclusive evidence of the Board's fairness and impartiality. If only one side had criticized our decisions, we might have been suspicious of ourselves. This enflaming fire of criticism has been peculiarly beneficial to the public members of the Board in that it has removed all danger, if any existed, of their entertaining any feelings of partiality for either side. Of course, I mean that it has caused us to love both sides with equal fervor.

Returning to a serious discussion of the Board's work, it has been truly remarkable to see with what unanimity and

alacrity both the carriers and the employees have brought their differences to the Board for adjustment in accordance with the law. It is worthy of further emphatic notation that both parties in a vast majority of instances have respected and obeyed the decisions of the Board. On account of the fact that the holiday season of peace and good will is so near, I will not mention anybody that has violated the Board's decisions. It is not in good taste to hang lemons on the Christmas tree.

The law creating the Railroad Labor Board is a unique piece of legislation in this country, but has numerous counterparts in other lands, including Canada, Australasia and several European countries. It is an odd combination of voluntary and compulsory arbitration. Public attention has not been directed to the fact that there is anything compulsory in the law, but there is. There are three mandatory provisions in the statute, binding alike upon the carrier and the employee. The law says, in effect, that: *First.* The carrier and the employee, in case of a dispute, *shall* endeavor to settle the matter by conference and negotiation. *Second.* If they fail to reach an agreement by direct conference and negotiation, they *shall* submit the dispute to the Railroad Labor Board.

*Third.* The Railroad Labor Board *shall* decide the dispute.

If, upon investigation, the Board finds this final decision is violated by either party, the Board "may make public its decision in such manner as it may determine."

#### Finger of Scorn Only Penalty

In other words there is no penalty attached to a violation of the Board decision, except that the Board may point the finger of scorn at the violator. The Transportation Act, as it passed the United States Senate, contained a mild anti-strike provision, as well as penalties for the railroad officials violating the law. This provision was eliminated by the House, and the Board was left dependent on public sentiment for the enforcement of its decisions. By the way, it is an item of curious interest that the State of Texas, in the suit against the Board, takes the position that this power to direct public attention to a violation of the Board's decision conflicts with that provision of the United States Constitution which forbids "cruel and unusual punishments."

The train and engine brotherhoods in their recent strike ballots served to draw a sharp distinction between those provisions of the Transportation Act which they considered imperative and those which they did not consider imperative. The public, at the time, did not appear to grasp this idea. The Brotherhoods were really protesting against a further reduction and the change in rules which the carriers sought, but I could not get them to say so at the strike hearing. They shrewdly confined themselves to the July wage reduction, already accomplished; on the theory, I take it, that the law did not forbid their striking against the Board's final decision, but that it did command them to go through all the preliminary steps leading up to a decision before they struck, and that they would therefore be violating the law if they struck against a possible, future decision of the Board toward which the mandatory preliminary steps had not yet been taken. This must be noted as an interesting and important development in connection with the practical application of this new law.

It is proper to say just here, not in a controversial way, but as a matter of abstract interest to all students of the Transportation Act, that it is the contention of the Board that the Pennsylvania System in its dealings with the Shop Crafts, fell into this pitfall which the Brotherhoods sidestepped. The Pennsylvania, however, has very able counsel who do not accept this dictum of mine, and it remains to be seen whether or not the courts will accept it. Personally, I am glad that this honest difference of opinion as to the mean-

ing of law is to be judicially settled. The Labor Board is not sensitive about law suits brought against it. The only thing which really grates upon the delicate nerves of the Board is the resolutions occasionally adopted by ill-advised persons, favoring the abolition of the Board. It is now generally conceded that such resolutions are contrary to public policy, and they have grown gratifyingly few and far between.

#### The Group Make-Up of the Board

There is another feature of the Transportation Act that aroused debate at the time of its enactment, and that is the group make-up of the Board. Recently there has been a revival of the unfriendly criticism of this provision, which gives to the carriers three representatives, to the employees three, and to the public three.

As a member of the public group, I have watched at close range the actual test of this provision, and I am convinced of its wisdom. The usual objection to it is that it is an incongruous thing to place upon a quasi-judicial tribunal, advocates of the litigants. It is frequently stated that these two expert groups uniformly line up with the respective interests from which they came. This is not true. While such would be the obviously natural tendency of these men under ordinary conditions, it must be remembered that they are under the sanction of an official oath. A day rarely passes in the proceedings of the Board when one or more of the members of these two expert groups does not cross over the line and vote with the opposing interest. It cannot possibly happen that either the carrier or the employee is invariably in the right, and these expert groups are experimentally aware of this fact. Moreover, the Board, by reason of the presence of these gentlemen among its membership, constantly has at its command a wealth of information relative to all phases of the railroad labor question.

#### A Shower of Verbal Brickbats

At the end of October, the strike threat of the train and engine service brotherhoods came to a focus. The public thereupon suddenly awakened to the fact that there was a Transportation Act and a Labor Board. Without stopping to inquire whether or not the Board had teeth, it was enthusiastically admonished from all sides that somebody must be bitten. The Board officially and some of its members personally took steps that averted the strike. As soon as this was accomplished the Board was treated to a shower of verbal brickbats because it had, forsooth, violated the quasi-properties of a quasi-judicial tribunal.

There was one thing that a few sophisticated and hard-boiled individuals never could believe and that was that I did not promise the brotherhood officers, when addressing them, to take something away from the carriers and give it to them, and yet this was literally true. The memorandum which was adopted by the Board and, which was finally the means of averting the strike, merely called attention to the fact that it was premature to start a row about another reduction in wages, because the Board did not propose to readjust the wages of any class of labor, until the rules and working conditions of that particular class had been passed upon.

I maintain that this was a sensible, just and proper course for the Board to pursue, and it will finally receive the approval of both the carriers and the employees. Wages cannot be intelligently fixed, without having a known and established schedule of working rules to which to apply them. But many people were misled by erroneous statements in the press to the effect that I had definitely promised for the Board that the wages of the brotherhoods should not be touched for a year or until July next. No such statement was made and none was necessary. No statement was made that amounted to a prejudgment of any question that might

thereafter come before the Board. But it was said further that the Board's memorandum, in effect, closed the door in the face of the carriers and the employees who might want to ask for a readjustment of wages, because there would be an interminable delay in completing rules. On this point the Board has been thoroughly vindicated, because it has already issued its decision of shop craft rules, effective December 1st, and its decision of maintenance of way rules, effective December 16th, and it will be weeks and possibly months before any petition for a wage revision is filed with the Board. So the carriers and the employees are not waiting on the Board in this matter, but the Board is waiting on them.

Some of the carriers may not be altogether pleased with the rules handed down by the Board. Doubtless the Board has made a few scattering mistakes, but it has tried very hard to protect the rights of the employees, and, at the same time, interfere as little as possible with the discretion and judgment of the management in the operation of the roads. I am sure all of you would be surprised if you could examine the submissions on rules made by the various carriers, and see what a very wide diversity of plan, purpose and opinion is reflected by them. There is an entire absence of anything resembling co-ordination. That which one carrier strenuously opposed another as cordially approved, and that too, when it was a question of general application, unaffected by local conditions. While this situation served to add to the labor of the Board, it was considered creditable to the carriers in one respect, for it showed that they had not prearranged a hard and fast set of irreducible demands.

### No Such Thing as Good Time for Strike

Reverting to the strike episode for a moment, there was a section of public opinion, outside of railroad circles, that wanted a strike. At least, they thought they wanted it. Their argument was that, if the railroad employees wanted to strike, they should not be hindered, that it was a good time for a strike, and that the railroad organizations could be crushed and union labor, in general, given a set back.

There were several weak spots in this argument. In the first place, there is no such thing as a good time for a railroad strike.

While this may have been an opportune time to fight labor union, the price of the fight would have staggered the Nation. This country has never experienced a general railroad strike, and but few men have any adequate conception of the ruin and misery it would bring to the people, not only the poor, but the well to do.

For the last few months, tens of thousands of men have been straining their credit and husbanding their resources in an effort to pass through this period of post war depression without bankruptcy. They have stood on the brink of a precipice and looked ruin in the face. A general railroad strike would have pushed them over the edge and plunged them into the abyss. They were not able to stand anything more.

Then another thought occurs to me, would it have been wise to crush the railroad unions, even if it could have been done? What would have taken their place? Is any man so blind to all the aspects of modern industry as to believe that the time will ever return when railroad labor is not organized?

If the brotherhoods had been crushed, rest assured that organizations of some character would have sprung up in their stead, and their successors, in all probability, would not have been animated by motives half so conservative and patriotic as those which control the brotherhoods.

The right of labor to organize is based on sound principles, recognized by Congress and sanctioned by the courts of the land.

The problem in this country today is not how to stamp out and destroy organized labor, but how to deal with its just demands fairly and humanely, and how to curb its unjust demands and control such of its activities as threaten the public welfare.

In my judgment, the survival of this republic depends upon the wisdom with which this question is handled.

Friendly as I am to theory and principle of organized labor, I am profoundly awed when I contemplate its possibilities for evil. If organized labor is to be permitted to throttle individuality, destroy initiative, exact inefficiency, dominate management, limit production, ignore the rights of the public, and set up a class government, then, indeed, is this country headed toward Bolshevism and death.

All of these things are the possible, but not the inevitable results of organized labor. They are merely the abuses of a thing inherently good.

On the other hand, if organized labor confines its efforts to the legitimate advancement of the cause of the workingman, by the procurement of a just and reasonable wage, the establishment of desirable working rules and conditions, the maintenance of an increasingly good standard of living, and the preservation of the political and civil rights of labor, then will organized labor not only serve its own interests, but it will constitute one of the bulwarks of the American republic.

### No Moral Right to Tie Up Railroads

In the regulation of railroad labor there are certain principles involved which do not apply to labor in general. The people of the United States must have efficient and uninterrupted railway traffic. The employees must share with the carriers the execution of this public trust. When a man enters the employ of a railroad and every day that he is so engaged, he should understand that in a high sense he is serving the public. He should understand that whatever rights men may have to strike and tie up a strictly private business, they have no such right, morally at least, to tie up the railroads and destroy the property, business, health, comfort, and lives of innocent men, women and children.

This does not mean involuntary servitude. It would not mean that the railway employee would be compelled to work for a railroad. It would simply mean that he would have no right to conspire with his fellow employees to destroy, by concerted action, the transportation of the country for the purpose of enforcing his demands against the carrier. If this is not now the law, it ought to be, and it will be.

In consideration of such a legal regulation, it would be the duty of the public to make sure that an absolutely impartial tribunal was provided for the adjudication of all matters of dispute between the carriers and the employees, and this tribunal should place an exalted estimate upon the supreme importance of an honorable and patriotic discharge of this official duty.

The public should realize that a living wage means something more to an American citizen than a bare existence, and that highly skilled men into whose care the lives of millions are constantly entrusted are entitled to a wage commensurate with their skill, hazard and responsibility.

The employees would be expected to recognize the fact there is a limit to the ability of a carrier to pay wages and that there is no mysterious and miraculous fountain of inexhaustible gold flowing into the coffers of a railroad. Every cent of its revenues must come from the pockets of the people. It is not to the interest of either the employee or the public that wages should be made so high as to overburden the carrier. It is obvious, however, that the ability of the carrier to pay cannot be treated as a controlling consideration in fixing wages, for this might result, in some instances, in requiring the employee to work for little or nothing.

## St. Paul Union Station Work Enters Third Stage

Traffic Was Thrown on First Six Tracks on Nov. 21—Headhouse Was Completed Last Year

By G. H. Wilsey

Assistant Engineer in Charge of Design, St. Paul Union Depot Company, St. Paul, Minn.

THE SECOND PERIOD of construction work on the new passenger terminal of the St. Paul Union Depot Company is complete, traffic being thrown on the first six elevated tracks at noon on November 21. As described in the *Railway Age* of May 21, 1920, page 1442, the project under construction involves the complete rebuilding of the terminal, much of it on the ground occupied by the old layout, at an expenditure of \$15,000,000. The new station yard is located about 20 ft. above the old; and as the present facilities are inadequate to take care of existing traffic, it is essential that there be provided at all times at least as many tracks as there were at the beginning of the work, viz., 14. This necessitated building in sections. The headhouse, being located on new ground, was built first and was opened for traffic on April 5, 1920. This permitted of vacating the old warehouse that had been used as a depot since October, 1913, when the original station was destroyed by fire, and the building of structures and the laying of six stub tracks to the north of the old train shed.

The third period of work will involve the removal of six northerly tracks and the train shed of the old layout, together with the walls and foundations of the old depot, and constructing the necessary retaining walls and elevated structures for six more elevated tracks, four of which will be through ones. At the same time that portion of the waiting room over these new tracks will be built. In like manner the remainder of the yard will be built in the fourth and fifth periods. The sixth period will be for the construction of a signaling and interlocking system.

St. Paul is the clearing house of the Northwest for passengers, baggage, mail and express. It is necessary, therefore, to make provision for a much larger volume of business than is ordinarily encountered in a city of 250,000 inhabitants. This has been accomplished by building the waiting room over the tracks and providing baggage, mail and express rooms under the tracks. The station yard will contain 8 stub and 14 through tracks, with a seven-track throat on the east end and a four-track throat on the west end, the latter being used by through trains only.

The main floor plan of the completed headhouse and wait-

ing room is shown in one of the drawings. The part just completed extends from the headhouse across Third street and over the first six tracks. The smoking room, baggage-checking counter and the concourse leading to the waiting room, as well as direct access to the new tracks, are thus provided. The concourse is finished on the inside with buff Kittanning brick, with a timbrel tile arch ceiling. This portion of the building contains two stories, the upper part being used as a terminal railway post office. The waiting room, yet to be built, 80 ft. by 360 ft., will have a high arched ceiling, springing from about the ceiling line of the concourse, lighted by skylights, through ceiling lights curved to the radius of the arch. A row of columns across the building, which supports a terra cotta lintel, marks the northerly end of the waiting room. The baggage check counter is connected with the baggage room beneath with a spiral chute and dumbwaiter for handling hand baggage and a pneumatic tube for checks. Until the waiting room is built, the business lobby in the headhouse will continue to be used as a temporary waiting room.

The floor of the concourse and waiting room is built of two concrete slabs, with an air space about 18 in. deep between them, in which radiation has been placed for warming the floor.

The lower slab gives a smooth ceiling so that smoke and gases from locomotive exhaust will not collect. Cast iron plates, 30 in. wide, have been imbedded in this slab directly over the center lines of tracks, to protect the concrete against the direct blast from locomotives.

A separate door for each track, with a train indicator alongside, opens into a corridor from the waiting room to the track platform. Each pair of tracks is served by a stairway and passenger elevator, the latter being six feet square. The two large elevators shown at the northerly end are for mail, traveling from the undertrack rooms to the mail room on the second floor.

The platforms are 19 ft. 6 in. wide in the main portion of the yard, tapering to 8 ft. at the ends, where the tracks converge. Curbs are 8 in. and the crown 10 in. above the top of the rail. The platforms are built on cinder fill, and

Track Sheds Under Construction

Looking Northeast. Old Train Shed in the Foreground

consist of a 5-in. slab of 1 : 2 : 4 concrete, finished with cement and granite screenings.

The train sheds are of the butterfly type, built of steel framing, and with a wooden deck extending to within 18 in. of the center line of track. This shed is unique in that no plates, except small gussets at the top of columns, are used in its construction. Columns and cross girders are 12-in. Bethlehem I-beams, the girder being bent to give pitch to the roof. All columns are alike; the girders are simply shortened as the shed narrows, the bend being the same in all cases. The roof is covered with three-ply tar and gravel composition. The cornice is galvanized Armco iron. The sheds are narrowed and curved to follow the tracks and platforms, the outside channels being kept a constant distance from the cornice. The sheds are stopped where the platform width is 11 ft.

At the end of the stub tracks, an arrival concourse has been built, with doors opening at the street level for the use of those who do not wish to pass through the station on

All new track is laid with 90-lb. A. R. A. type A rail, on white oak ties, ballasted with gravel. One of the drawings shows a plan of the temporary connections at the east end. As it is necessary to maintain traffic in both the old and new yards at present, the old throat being left intact for low level movements, and as the final throat will be placed on the ground now occupied by the old one, this layout, not at all desirable from any standpoint, was the only solution possible. The ground now occupied by the leads to the new tracks will, when the project is complete, be used as a teamyard for baggage, mail and express cars, approached from the east by a 14 deg. curve on a 2 per cent grade, while the main leads will pass to the south with 6 deg. curves on a 0.75 per cent grade. The present connections are thus forced into the future teamyard location, with the resulting conditions shown, although the grade has been reduced to about 1½ per cent by using a longer run-off from the junction with the permanent grade.

In the station yard each pair of tracks is three inches

Track Layout for Temporary Connections at the East End of the Station

arriving. The doors are secured against opening from the outside, so that passengers may not gain access to the platforms without being checked by the gatemen in the station. Along Sibley street the arrival concourse is enclosed by a brick wall with windows. This wall is continued along Third street to the main building at the same height. The remainder of the yard has a brick fence about four feet high along the north side as far as the platforms extend, beyond which a handrail will be placed.

Bumping posts at the ends of stub tracks are large concrete monoliths, in which have been imbedded the structural frames of Ellis posts. An Ellis rubber buffer is placed on the face of each post.

lower than the pair to the north, brought about by the desirability of gaining access to the space under the tracks at the north side, and the reduction of the hump in the freight tracks at the southerly side to a minimum and yet permit of grade separation at Sibley and Jackson streets. The final grade for passenger tracks will be 0.75 per cent maximum at the east end and 0.3 per cent on the west; for freight tracks the grade will be 0.3 per cent at both ends. (See article before mentioned.)

A considerable portion of the fill now in place was obtained from debris and excavation from the wrecked buildings that occupied the site of the headhouse and station yard. The remainder was obtained by train-haul from strip-

ping operations in a gravel pit about five miles away. Gravity walls were built to retain the fill, with expansion joints every 30 ft. A complete surface and sub-surface drainage system is provided for the whole yard.

From Broadway to Sibley street, about 930 ft., and from Third street south a distance of 264 ft., the station yard is

street to a line 10 ft. 6 in. north of the northerly wall of the truckway.

The track structure is designed according to the Chicago ruling as a flat slab for Cooper's class E-60 loading, with 25 per cent added for impact. Columns are spaced on 21 ft. centers in both directions, except at expansion joints and

Floor Plan on the Level Below the Tracks

supported on a reinforced-concrete structure, thus providing for handling baggage, mail and express in rooms beneath the tracks. One of the drawings shows a plan of these rooms, the part built being about 140 ft. wide, extending from Third

under the concourse and waiting room, and are 30 in. in diameter. Depressed heads are 9 ft. 3 in. square and 11 in. deep. The slab is 1 ft. 9 in. deep. Each rectangular band of reinforcing consists of nineteen  $\frac{3}{4}$  in. round rods on 6 in.

Looking Southeast at the New Track Structure, Old Trainshed in the Background

centers; each diagonal band has thirteen  $\frac{3}{4}$  in. round rods on 9 in. centers; the proportions of the slab and depressed head are such that, by bending up half of each band at each end, no additional steel is required over the column heads. All rods are bent to dimension before placing. Expansion is

### Cross Section of Platform and Trainshed

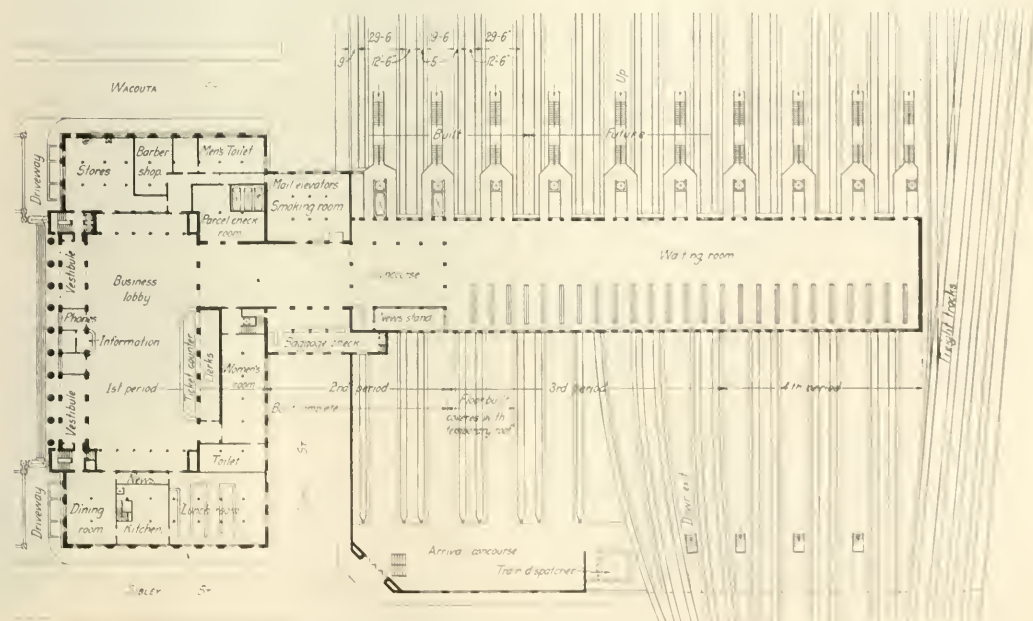

provided at three lines by leaving a 2 in. space between two 6 ft. 6 in. cantilevers. A typical section through the structure is shown in one of the drawings. Foundations are supported on piles driven through the outlying muck and fill to river sand. Steel columns supporting the concourse

and waiting rooms rest directly on the track slab, concentric with the reinforced concrete columns beneath, which are increased in size, up to 42 in., to take care of the added load.

For the construction of this slab, a fixed concreting plant was used, located at the east end of the work. Sand and gravel or crushed stone were delivered on an elevated track, or by auto truck at times, and dumped into receiving hoppers beneath, with capacity for nine carloads. A belt conveyor and vertical elevator discharged the material into storage bins, having gravity feed through automatic measuring hoppers to a one-yard mixer. A 200-ft. Insley steel tower, with quick-shift hopper and 100-ft. spout, was used for distribution near the plant. Beyond reach of the spout, one-yard industrial cars were used, hauled by gasoline locomotives. An accompanying view shows clearly the method of distribution. For the track structure a system of collapsible and movable forms, designed and built by the Blaw-Knox Company, was used. Each section, 21 ft. square, was a separate unit, which could be lowered and moved ahead on a track without disturbing the forms in front of it. Enough sections were supplied to form a strip across the structure three panels wide. The forms were supported on 8 in. by 8 in. timber posts at the corners of the depressed heads in such a manner that when they were collapsed the posts were not disturbed. This permitted of removing the forms in from four days to a week. The posts remained in place three weeks or more.

Waterproofing consists of four plies of asbestos fabric and one of cotton duck, each layer being mopped with asphalt. This membrane is protected by 1½ in. of sand mastic. The waterproofing sheet is continuous under the platforms and train-shed anchorages. At expansion joints the fabric is looped into the space between sections and reinforced with copper. Drains are provided for the slab and train shed at about 42-ft. centers.

Each pair of tracks is served by an elevator at each end. These elevators are 6 ft. by 16 ft. in plan; have a capacity of 7,500 lb. at a speed of 100 ft. per minute; and are driven

Floor Plan at the Waiting Room or Concourse Level, Also Part Plan of the Track Level

by traction type, micro-leveling engines, with two-to-one roping, connected by worm-gears to alternating circuit-motors. Full automatic control is provided. Doors open automatically when the car reaches the level to which it has been sent, and are closed by pressing a push-button. The car cannot be moved when the doors are open; nor can the doors be opened unless the car is at the level in question.

The baggage and mail rooms are connected with the baggage checking counter and railway post office by spiral chutes, one blade serving the former and four the latter. Trucking and pipe tunnels under Third street connect these rooms with the headhouse and a trucking tunnel under Sibley street connects them with the distribution building of the St. Paul post office. To provide the driveways shown, it was necessary to lower the grades of Sibley street and Third street as much as five feet in places. Ten feet clear headroom under all pipes and other obstructions is provided in these rooms, and 12½ ft. is provided in the driveways. The floors of all rooms are finished with 1½ in. of asphalt

The Tracks Are Supported on Reinforced Concrete Flat Slab Construction

mastic. The driveways are paved with brick. All doors are steel rolling shutters, 7 ft. wide and 10 ft. high.

A large toilet and locker room is provided for baggage and mail employees, containing shower baths and individual steel lockers. No toilet provisions have been made for the express rooms as yet. All rooms are heated by overhead radiation and the small rooms are artificially ventilated. Heat, light and power are obtained from a public service corporation.

Temporary construction work, preparatory to starting work on the third period, is now in progress.

W. C. Armstrong is in charge of the project as chief engineer. The writer is assistant engineer in charge of design and O. L. Hoebel assistant engineer in charge of construction. Charles S. Frost is architect for the headhouse and waiting room. Neiler, Rich and Company are the consulting mechanical and electrical engineers. Morris, Shepard and Dougherty and Geo. J. Grant Construction Company, a co-partnership for this work only, are the general contractor, for whom W. R. Powrie is superintendent.

ON THE PIEDMONT & NORTHERN, an electric road in North Carolina and South Carolina, doing a good deal of freight business, the station agent and the commercial agent are eligible each month to a prize, Vice-President E. Thomason having offered \$100 for agents in class A, \$50 to those in class B and \$25 for class X. In each case the prize goes to the agency showing the largest percentage of increase in business in the month, and it is divided between the agent and the commercial agent. Under a somewhat different plan prizes have been given for some time past, and J. P. King, general agent at Spartanburg, S. C., recently received \$100.

## Zoelly Turbine Locomotive for Swiss Federal Railways

THE INCREASING operating expenses resulting from the rising costs of fuel have given an added importance to locomotive efficiency. Careful study is not only being made of the means for securing an increase in the amount of work obtainable from the fuel used by locomotives of the usual type, but consideration is being given also to the possible substitution of locomotives of a radically different character. The high efficiency of the steam turbine and its rapidly increasing adoption in the stationary and marine fields has caused a number of designers to attack the problem of adapting a steam turbine to the driving of a locomotive.

One of the most notable efforts now being made in this direction is that of Dr. Zoelly, the well-known turbine engineer and general manager of Escher, Wyss and Company, Zurich, Switzerland. A 4-6-0 type locomotive of the Federal Swiss Railways has been converted by the Swiss Locomotive Works at Winterthur from a standard type locomotive with the usual reciprocating steam engine to a turbine-driven engine.

A Zoelly turbine of special reversible type was placed forward of the smokebox, the power being transmitted from the rotor by means of 30 to 1 gearing to a transverse jack shaft above the front truck. The connecting rods were extended forward and coupled to crank pins on discs located on either end of the jack shaft. The turbine was designed for a speed of 8,000 r.p.m. which corresponds to a running speed of 48½ m.p.h.

The boiler is provided with a superheater and a condenser is located between the frames. The cooling water is taken from the tender and after passing through the condenser is returned to a longitudinal pipe underneath an elevated hood built over the tender, from which it is sprayed in narrow streams. The air currents formed by the moving locomotive furnish an effective means of recooling the water.

The condensate, which is pure and free from oil, is pumped back into the boiler, it being necessary to add only sufficient fresh water to make up for the losses from the safety valves, whistle and leakage. By continually using the condensed water for feeding the boiler, the formation of scale is practically eliminated. The condensate which is at a temperature of about 125 deg. F. is passed through a preheater and raised to about 250 deg. F. before it goes into the boiler.

As there is no exhaust pipe a blower is used to furnish the necessary draft. The control is by means of three valves, one for the ordinary forward operation, another for starting and for heavy pulls on grades and a third for running backward. The water capacity of the tender is comparatively small as the evaporation of the water while being cooled is only a small loss.

The trial runs which have thus far been made are reported to have shown a saving of some 25 per cent over similar compound locomotives handling the same trains. It is also reported that the running was remarkably smooth, due doubtless to the absence of reciprocating parts. The results of these experiments as well as those now being made by others in Sweden and other European countries will be watched with interest by American engineers.

THE BURLINGTON has recently completed at Montgomery, Ill., 40 miles west of Chicago, what is believed to be the largest sheep shelter in the United States. It consists of seven barns, each 450 ft. long and 130 ft. wide. These are surrounded by 1,000 acres of pasture and farm land; and there is a hay barn, a feed barn, a granary and a modern concrete grain elevator with a capacity of 100,000 bushels. The plant will accommodate 70,000 head of sheep and has been constructed for the accommodation of sheep in transit.

# Walker D. Hines Defends Transportation Act

## Gives Special Attention to Section 15a and to Intrastate Rates and State Commissions

WASHINGTON, D. C.

**W**ALKER D. HINES, former director general of railroads, testified before the Senate Committee on Interstate Commerce on December 9 in opposition to the repeal of the rate-making provisions of the Transportation Act as proposed in the Capper and other bills pending before the committee. Mr. Hines appeared at the request of Chairman Cummins and said that he was testifying merely as a citizen and not on behalf of any client. Before he began, Senator Cummins pointed out that he had conferred with Mr. Hines on many occasions while the Transportation Act was under consideration.

Discussing first the principle involved in the proposal to repeal Section 15a of the interstate commerce act, which provides for a net return of 5½ to 6 per cent, Mr. Hines said that this section constitutes the first affirmative dealing by Congress with the regulation of railroad rates and the corner-stone of the new policy which was adopted in the Transportation Act. It would be indescribably unfortunate, he said, to take a backward step at the present time by repealing that section. If it is repealed, the interstate commerce act will stand as a scheme of negative and restrictive regulation, the very scheme that 33 years have proved to be wholly inadequate. Thirty-three years of federal railroad regulation beginning in 1887 had finally led public opinion to the conclusion that an affirmative and constructive policy was necessary.

### An Affirmative Policy of Regulation

"I fully realize," Mr. Hines said, "that for the time being the new scheme has not produced an adequate revenue for the railroads or rates that are satisfactory to the public, and I appreciate that the rates have been especially unsatisfactory to the great agricultural interests, which have seen the prices of their products deflated far in advance of deflation of other prices and of wages. But this situation cannot be corrected by abandoning the affirmative policy of railroad regulation and returning to the purely negative and restrictive policy of the past. Indeed, in the long run the agricultural interests would suffer as seriously as any other interest could possibly suffer through the impairment of railroad service which would result from the abandonment of an affirmative policy of railroad regulation.

"The fact that the present scheme has not worked with satisfaction is not because a scheme of negative and restrictive regulation would have worked better, but is because conditions have been so completely upset by the war that no scheme whatever could give satisfaction for the time being. It is of the highest importance to give a reasonable time for the trial of the new plan and not to engage in the costly step of abandoning this plan simply because of temporary difficulties. These difficulties are the outgrowth of the war and are not the outgrowth of the policy of Section 15a.

"Adequate railroad service in this country in the future is dependent upon greatly enlarging the railroad facilities of the country, and this will demand enormous quantities of capital. In view of the fact that the war has necessitated the postponement of many sorely needed railroad additions and betterments, I should think that the annual expenditures for capital purposes ought to be considerably in excess of a billion dollars per year for many years to come. This universally recognized need for raising tremendous amounts of additional capital was the principal reason for adopting the new policy embodied in Section 15a of the Transportation Act. To a greater extent than ever before it is necessary to

stabilize railroad conditions and to give some encouraging basis for the investment of the needed additional funds in railroad facilities.

"I do not claim that the scheme of the Transportation Act by itself will prove a permanent solution of the railroad problems of the country, but I do claim that the affirmative policy embodied in Section 15a represents an important forward step in the evolution of the country's railroad policy."

### Intrastate Rates

Mr. Hines then discussed the principle involved in the proposal to repeal the authority which the commission now possesses to modify intrastate rates when necessary to prevent discrimination against interstate commerce. "The practical application of this principle is indispensable to any orderly control and development of the railroads of the country," he said. "There cannot be two supreme governmental masters with respect to the same subject-matter. If anything is practically clear as the result of our experience during the last quarter of a century it is that the railroad problem of this country is, in a broad sense, a single and indivisible subject-matter. The theory that the whole railroad plant can be so separated as to look at intrastate traffic entirely separate and apart from interstate traffic is wholly opposed to the indisputable physical facts. From a financial standpoint the inseparability of the railroad problem is equally apparent. The vital thing that supports railroad credit and admits of raising funds to provide facilities for both interstate and intrastate business is the net operating income, and it is a single thing. It would be utterly destructive of any orderly regulation to give two different sets of tribunals independent final authority to deal with that net operating income.

"Congress has been forced to legislate to secure adequate railroad service for the country. To prevent interruptions to railroad transportation it has provided an elaborate plan for the regulation of labor questions, has indicated the standards to be taken into consideration in the fixing of wages, and has created a situation where the view of the Labor Board is practically final as to railroad wages. This view is not confined to interstate railroad wages because there is no such thing. It applies to the wages of all the employees who operate railroads and therefore embraces intrastate services indiscriminately with interstate services. How can any federal tribunal deal with any degree of confidence with this subject if a very large part of the net operating income is finally controlled, regardless of federal intervention, by a state authority?

"Likewise, Congress has legislated to compel adequate facilities and has adopted exclusive legislation to control the issue of railroad securities and to determine the reasonable rates of interest that may be paid thereon. How can these things be effectively accomplished if tribunals, entirely independent of federal authority, are free to determine with finality an important part of the net operating income of the railroad companies?"

The fact that federal courts could set aside as confiscatory rates fixed by state commissions, Mr. Hines said, would be no satisfactory protection in this matter. Many of the influences of intrastate rates could not be met at all by such processes and, besides, the railroad business of this country cannot be properly developed through a series of law suits. Experience has shown that there must be an affirmative and constructive policy, and that policy cannot be successfully realized unless there can be one final and supreme authority

to reconcile differences of view between state authorities and federal authorities.

"As I look at it," he continued, "the original provision of Section 3 of the Interstate Commerce Act is broad enough to correct intrastate rates which defeat the policy of Congress by creating a prejudice to interstate traffic, which is certainly a particular description of traffic within the meaning of Section 3. Therefore, I do not think any new principle needed to be involved in order to accomplish the result which has been produced under the Transportation Act. The express language of that act, referring to unjust discrimination against interstate traffic, is more emphatic and therefore more desirable. Certainly it is at least as strong as the expression 'burden upon interstate traffic,' and probably stronger.

"There is a curiously inverted view involved in assuming that an intrastate rate ought to be corrected by federal authority if it appears that it hurts the business of a particular interstate shipper, but that all intrastate rates ought not to be corrected if it appears that as a whole they defeat a salutary policy of Congress. Such a contention amounts to saying that Congress intended by the Interstate Commerce Act to prevent a series of little wrongs but deliberately restricted what it did so as to avoid the possibility of correcting a vastly greater wrong if it should be committed.

"As I view it, the present situation really arises not out of any new principle which has been incorporated in the act, but out of an extraordinarily difficult emergency which has resulted from the war. When it became necessary after the war to increase rates, it at once became clear that the maintenance of intrastate rates on the old level, in conjunction with such heavy increases in interstate rates, would bring about the most widespread undue prejudice against interstate traffic and undue preference in favor of intrastate traffic. It was this unprecedented state of facts that has produced the conditions which have caused the existing complaints.

"I have examined the various decisions of the commission in these intrastate cases and I believe these decisions constitute a complete defense to the attacks which have been made upon them, and I urge the committee to examine the decisions themselves. They do not show any purpose to usurp the functions of the state commissions, but they do show the purpose to avoid what would have been an obvious undue prejudice against interstate commerce if the intrastate rates had not been corrected.

"I understand the view has been urged upon the committee that the action of the Interstate Commerce Commission has resulted in 'freezing' the intrastate rates so as to render the state commissions incapable of dealing with them. I take it that exactly the same result existed in cases like the Shreveport case prior to the war. In other words, where the state adjustment violated the Interstate Commerce Act and the Interstate Commerce Commission had to prescribe a remedy, this necessarily hampered the state commissions in thereafter dealing with these adjustments. This is a natural consequence arising from the necessity of correcting the state adjustment, but this is no reason for not making the correction. If it were, it would mean that a remedy could not be afforded, no matter how obvious the evil, and indeed the more extensive the wrong the more impossible it would be to give a remedy.

"But as a practical matter I do not believe these embarrassments will arise in the future. The Interstate Commerce Commission has been called upon in a great crisis to exercise a very grave responsibility in order to carry out a highly important Congressional policy. I think the Interstate Commerce Commission in the decisions which it has rendered has shown the most earnest desire to preserve unimpaired, as far as possible, the activities of the state commissions, and I believe that if once this question can be set at rest by Congress adhering to the established policy of the Interstate Commerce Act, the Interstate Commerce Commis-

sion and the states commissions should find no difficulty in getting together upon plans which will give every possible element of freedom to state action, but always consistent with the fundamental proposition that in dealing with an indivisible subject-matter there must be one paramount authority in the last analysis and that this paramount authority must be the federal authority.

#### Co-operation Between I. C. C. and State Commissions

"I make these remarks with the liveliest appreciation of the necessity for local assistance in dealing with these great problems. No one appreciates better than I do, or has said more positively than I have said, that these local questions ought to be handled locally just as far as possible and that it is highly undesirable to have them centralized at Washington, except so far as is unavoidable in making effective the paramount federal authority. It seems to me the logical events, as well as what I believe to be the entirely sympathetic attitude of the Interstate Commerce Commission with the necessity for local assistance, will bring about a most beneficial co-operation between that commission and the state commissions, provided only the question of principle shall be settled emphatically in favor of the ultimate paramount authority of the federal government.

"I might add that I not only think local attention to local intrastate rates is desirable, but also to local interstate rates. I trust that there may be an evolution of the regulation under the Interstate Commerce Act so as to bring about this enlarged local attention to all local rates, both interstate and intrastate. Perhaps this can be accomplished by associating members of state commissions in adjoining states with local representatives of the Interstate Commerce Commission so as to pass, in the first instance, on purely local rates in that portion of the country, whether interstate or intrastate. Certainly the local intrastate rates are no more in need of local attention than the local interstate rates. But whatever is done to secure adequate local attention to rates, it seems to me indispensable that this should be done without impairing the exclusive paramount authority of the federal tribunal. It seems to me any revision in this direction must be in the nature of an evolution from the existing status and cannot successfully be in the direction of destroying the existing status."

Replying to questions by Senator Pittman, Mr. Hines said that where the Interstate Commerce Commission has made no order the state is entirely free to make adjustments in its intrastate rates without in any way undermining the general rate level or prejudicing interstate commerce, but where it has been necessary for the Interstate Commerce Commission to make an order the state commission's hands are naturally somewhat tied. But that is only a temporary matter.

"But," said Senator Pittman, "the state commission cannot lower the general rate level fixed by the Interstate Commerce Commission."

"Not if this discriminates against interstate commerce," replied Mr. Hines, "and the Interstate Commerce Commission must be the final authority. There may be adequate reasons for a difference, but if there is a difference of opinion there must be final authority to decide."

Mr. Pittman said that the proposition then comes down to the point that the state commission has no right to lower the general rate level in its state below the level fixed by the Interstate Commerce Commission.

Mr. Hines said this was true, but that it has nevertheless the power to make a great many readjustments and if there are rates above the general level it has the right to reduce them.

Mr. Pittman said the Interstate Commerce Commission would do that, but Mr. Hines said it would hardly undertake to do so unless the rates were such as to constitute an undue prejudice against interstate commerce. There will be

found in every state, he said, many variations in rates that make it important that there should be corrections and the state body has an important field there without in any way prejudicing interstate commerce. The Interstate Commerce Commission, he said, would not have authority to raise state rates directly in the first instance in order to produce a given income.

Enactment of pending legislation repealing the so-called rate-making section and amending the Transportation Act so as to specifically provide that the Interstate Commerce Commission shall have no control over intrastate rates would undoubtedly force the government to take over the railroads of the country through the resulting inability of the carriers to establish credit by which they could provide for the transportation needs of the nation, Daniel Willard, president of the Baltimore and Ohio, told the committee on December 12.

The passage of the Transportation Act, Mr. Willard said, made possible the future successful operation of the railroads under private ownership. If the two amendments are adopted, however, it would result in the inability of the roads to establish adequate credit, thus preventing them from being able to keep in condition to handle the traffic of the United States.

He said that the provision in the act relative to the right of the Interstate Commerce Commission to regulate intrastate rates that discriminate against interstate commerce is as important as 15a, the rate-making section.

"Section 15a made private ownership possible," he continued, "but it can't make it possible if the right of the Interstate Commerce Commission to establish rates necessary to bring the return provided for in the law is taken away. I am opposed to anything being done to change the efficacy of the Transportation Act."

Mr. Willard said a return of 5½ per cent on the property investment can not be considered unreasonable as the carriers have been forced to pay 7 per cent on loans made to them while the government has refused to loan money to the railroads at less than 6 per cent and then only on good collateral.

Alfred P. Thom, general counsel of the Association of Railway Executives, told the committee that the act has left to the state commissions initial power over state rates as well as every power "except to discriminate unjustly against

of the United States to have adequate transportation facilities. That is to be done, he said by machinery established under Section 15a, which specifies that rates shall be fixed so as to provide a certain return to the carriers based on the aggregate value of the property used for transportation purposes. Neither the Transportation Act nor the Valuation Act makes any attempt to separate the valuation of the property used in interstate or intrastate commerce, Mr. Thom declared.

Regarding criticisms that have been made as to the grouping of railroads for the purpose of making rates, Mr. Thom said this plan has been followed by the Interstate Commerce Commission for many years. It has become universally recognized, he added, that one rate can not be made for one railroad and another rate for another road.

F. J. Lisman also appeared in opposition to the bills because of the effect on the ability of the roads to finance themselves. Only the best bonds are now salable, he said, and the bills would make it even more difficult to sell securities.

The testimony on behalf of the railroads was concluded with Mr. Thom's statement and the committee expected to conclude the hearings at the end of this week or the first of next by hearing from one of the Interstate Commerce Commissioners.

## Freight Car Loading

WASHINGTON, D. C.

THE LOADING of revenue freight for the week ended December 3, was 747,454 cars, according to the weekly report of the Car Service Division of the American Railway Association, an increase as compared with the previous week, which included the Thanksgiving holiday, of 73,627. For the corresponding weeks of 1920 and 1919 the loading was 882,604 and 789,286 cars, respectively. The report shows a decrease as compared with the week before Thanksgiving of 39,000 cars. There were increases as compared with the previous week in the loading of all classes of commodities except coal and ore.

The summary for the week of November 26 is as follows:

REVENUE FREIGHT LOADED WEEK ENDED SATURDAY, NOVEMBER 26, 1921

District	Year	Grain and grain products	Live stock	Coal	Coke	Forest products	Ore	Misc. L. C. L.	Miscellaneous	Total revenue freight loaded

interstate commerce." "They didn't have that power before, did they?" inquired Senator Kellogg. "No," was the reply.

Mr. Thom said that Congress in the Transportation Act declared its policy to be "to foster and preserve in full vigor both rail and water transportation" while the act provides that revenues must be provided to enable the people

Lessening demand for freight cars is also resulting in an increase in the number of cars idle because of business conditions. For the period ending November 30, the surplus cars averaged 282,962. Surplus box cars in good repair totaled 113,874, or an increase of 24,050 within a week, while surplus coal cars numbered 132,693, which

was an increase of 43,648 cars. Surplus stock cars increased within that time 922 cars while coke cars increased 69.

The following is taken from the Information Bulletin published by the Car Service Division.

A recent government report of commercial stocks of coal on hand November 1, 1921, says "The steel industry in particular illustrates how greatly the size of the stocks necessary for safety is affected by the rate of consumption. Measured in terms of days' supply at the present diminished rate, the stocks of both coking coal and steam and gas coal appear greater than ever before. Measured in tons actually on hand, however, the present stocks at steel plants are barely half of those in January, 1919. To re-accumulate the reserve on hand at that time would require putting in storage another million and a third tons of coking coal, and nearly two million tons of gas and steam coal."

It is of interest in connection with this report of stocks, to observe the trend of blast furnace operation during the years 1920 and 1921, and the contemporaneous production of bituminous coal. A fairly close relation between the two will be noted and it is of especial interest that blast furnace operation fell off from the peak two months before any marked decline occurred in the production of bituminous coal.

As compared with the second week previous, that ending November 19, all commodities declined except grain and grain products, with respect to which the last week reported showed an increase of over 25 per cent. The especially heavy decline was in the loading of coal, ore and miscellaneous. It is of interest to note that the report of the U. S. Geological Survey showing bituminous production for the

week ending December 3, states that the production of the mines "touched the lowest level reached at any time since last April." April being almost uniformly and by long odds the month of lowest coal production year by year.

The number of cars reported in bad order as of December 1, all classes, totalled 320,292. Of these box cars numbered 153,666 and gondolas 135,050, a decrease respectively over the figure for November 15 of 5,988 and 5,616 cars. The total reduction of 13,324 cars in bad order December 1 as compared with November 15 represents a percentage reduction of four tenths or from 14.4 per cent November 15 to 14.0 per cent December 1.

The Car Service Division has compiled a series of charts showing the trend of loading of the classified commodities in 1920 and 1921 which displays with the exception of the switchmen's strike period in April 1920, a remarkable degree of uniformity in respect to the extent to which the total loading of all commodities in 1921 is below the figure for the same period of 1920. That uniformity of trend as to the total revenue freight loading does not obtain with respect to each classification. Concerning these, the outstanding features are the heavier grain loading in the present year, particularly since the harvesting of the new crop began in July, and the regularly heavier loading of L. C. L. merchandise. The former is generally attributed to the rapid marketing of this year's crop by the farmers, and the latter to the tendency in 1921, to do business in smaller units than in the previous year. The other outstanding feature of these charts is the decline in 1921 of the loading of coal, coke and ore, none of which have at any time sustained any approach to the totals reached in the previous year.

The summary for the week of December 3 follows:

#### REVENUE FREIGHT LOADED—WEEK ENDED SATURDAY, DECEMBER 3, 1921

District	Year	Grain and grain products	Live stock	Coal	Coke	Forest products	Ore	Merchandise L. C. L.	Miscellaneous	Total revenue freight loaded		
										This year 1921	Corresponding year 1920	Corresponding year 1919

Car Surpluses and Shortages, 1907 to 1921

weights and dimensions of the two locomotives, both of which have practically the same rated tractive effort. The total weight of the Shay locomotive, including tender, is 308,000 lb., all of which is used for adhesion. The locomotive alone of the U. S. R. A. heavy Mikado weighs 325,000 lb., of which 240,000 lb. is used for adhesion and 85,000 lb. is dead weight. The tender weighs 172,000 lb. in addition,

tender used for adhesion, and high sustained tractive effort at low speeds on heavy grades make them a desirable type of locomotive under certain conditions. There are many places in main line service where pushers are required and also in

TABLE 1—COMPARATIVE WEIGHTS AND DIMENSIONS OF 150-TON SHAY AND U. S. R. A. HEAVY MIKADO

	U.S.R.A. Heavy Mikado	150-Ton Shay

Lightest rail advised.....	90 lb.	80 lb.	89

noted by comparing the drawbar pull on various grades as shown in Table 2. While both locomotives have practically the same train starting capacity on a level track, the Shay locomotive is capable of exerting 28 per cent greater pull on a 4 per cent grade and more than double the pull on an 8 per cent grade. Furthermore, on a 4 per cent grade the drawbar pull of the Shay locomotive is still 77 per cent of the rated tractive effort, while the pull of the Mikado has fallen to 60 per cent, and the difference is still more marked as the grade increases.

The advantages of the characteristics of the Shay locomotive, low total weight, all the weight of the locomotive and

End Elevation of Shay Locomotive

branch line traffic where a Shay geared locomotive could be used with advantage instead of the heavy direct-connected locomotives commonly employed.

# Commission Begins General Rate Investigation

## Endeavor to Determine Whether and to What Extent Further Rate Reductions Are Justified

WASHINGTON, D. C.

**A**FTER A DECADE of intermittent proceedings in which the railroads have sought general advances in freight rates, the Interstate Commerce Commission began a hearing at Washington on December 14 in a general investigation, the purpose of which is, if possible, to bring about reductions in rates. According to the commission's order, the investigation is to determine whether and to what extent, if any, further general reductions in rates can lawfully be required by order of the commission in accordance with the provisions of the interstate commerce act upon any commodities or descriptions of traffic, and by an amendment to the order the proceeding is also to determine what will constitute the percentage of fair return after March 1. The railroads indicated, however, that they expected to show that further extensive reductions will not be justified until there has been a further reduction in wages.

Preceding the general hearing and connected with it in a way, although the two were officially separated by the commission just before the hearing began, arguments were heard by the commission on the petition filed by the railroads asking for a reopening of the case in which the commission ordered general reductions in the rates on grain, grain products and hay in the western districts. This argument was held in the morning before the full commission and the general investigation was begun in the afternoon before Commissioners Aitchison, Esch, Hall and Lewis. After an opening statement by Howard Elliott, chairman of the Northern Pacific, the hearing was adjourned until the following morning, when George M. Shriver, vice-president of the Baltimore & Ohio, was to present the statistical testimony for the eastern roads and to some extent for the railroads of the country. The plan was to have testimony presented by an accounting and traffic witness for each of the three territories, east, south and west. The hearing room of the commission was crowded as it never had been before except possibly at the opening of the general rate advance case of 1920. Hundreds of representatives of the railroads and of the shippers were present, but the first week of the hearings was to be devoted to testimony on behalf of the railroads. Adjournment was then to be taken until January 9, after which there will be opportunity for testimony by shippers and cross-examination by them of the railroad witnesses.

### Opening Statement by Howard Elliott

Mr. Elliott said in part:

"The owners and managers of the carriers welcome this opportunity afforded by the commerce commission to lay the entire situation before the commission and, through them, before the country.

"The carriers are here to help in every way they can. We are most anxious to

"1. Give to you and to the country all the facts we can.

"2. Impress upon you and the country that while we are anxious to co-operate in every reasonable way, through readjustments of rates, with agriculture, industry and labor so as to bring about better economic conditions, we believe that the carriers must be allowed to live and grow in the interest of the country as a whole.

"3. Point out to you that there was practically no inflation in the transportation business during the war and, therefore, there is now a very small opportunity for deflation.

"4. Point out there is danger of giving too much weight to the freight rate itself and its effect on business. Reductions

below the limit of adequacy may do the country more harm than good.

"5. Suggest that the principles adopted, after long discussion and debate, in the Transportation Act are pretty safe guides to be followed at this time.

"6. Assure you that we are each day doing all we can with our powers (limited in our dealings with the men by the Transportation Act) to manage the property entrusted to our care, honestly, efficiently and economically.

"7. Bring about as rapidly as we can with proper regard to maintaining the properties entrusted to our care, reductions in rates that will be helpful to agriculture, manufacturing, and commerce generally.

"8. Urge upon you that the greatest speed consistent with the complete examination of the facts and conditions be made in conducting these hearings, so that a prompt decision may be reached. The present uncertainties and the constant talk about reduced rates are having a very substantial interest in deterring business more so than the rate itself.

"The payments made by the country through rates for transportation service are large; so is the country and the amount of transportation service furnished. The production of the service is costly and today there is no adequate return to the plant that furnishes the service. Rates for many years prior to the war were not on a high enough basis to protect the national industry of transportation and there was danger to all in its not being adequate for the needs of the country. Present rates are higher than they were before the war, but they were far too low then for safety, and we are comparing today with an indefensible basis.

"A sweeping reduction in all rates would not, in my judgment, at this time increase business and many other things must be settled before we obtain what we all want—a complete revival of industry in this country.

"Railroad officers realize that under the extraordinary economic conditions now confronting the world, the principles laid down by the Transportation Act cannot be carried out to an exact arithmetical conclusion. This spirit has been shown already by the voluntary reductions already made by the railroads generally."

Pointing out that the country is now going through a period of deflation, Mr. Elliott said:

"All must bear the burden if the country is to go ahead again on a sound economic basis. The farmer has felt the full force of this. It naturally hurts him and it hurts the situation.

"Manufacturing enterprises are also deflating and the same may be said about the jobbing and distributing business. What is called 'Labor' has already been hurt by unemployment and by some reduction in wages, which, however, has not affected the great transportation interests to the extent that it should. A sound policy with the great labor leaders would seem to be to admit that deflation must come and allow lower wage scales on the railroads, in the mines and in the building trades, all of which would mean greater employment of men and a lower unit price on many articles that are used by all, thus reducing the cost of living and helping to break all the present endless chain of expense."

### Carriers Ask Six Months' Suspension of Grain Order

Alfred P. Thom, counsel for the Association of Railway Executives, opened the argument in the grain case on behalf of the railroads, asking the commission to postpone its order

in the grain case, which becomes effective on December 27, for six months or for the period during which the railroads have proposed an experimental general 10 per cent reduction on agricultural products except in New England, for the purpose of extending more widespread relief to the agricultural industry. Mr. Thom also announced that the railroads had decided to add to the list of commodities to be covered by this reduction so that it would amount to a reduction in revenues estimated at approximately \$94,000,000, including any reductions that have been made in these rates since the general advance of last year. The reduction ordered by the commission on hay and grain rates, which is confined to the western districts, he estimated at \$32,000,000 to \$33,000,000 a year.

Mr. Thom also declared that the proposal for the general reduction was in no way contingent upon the postponement of the commission's order, and that the carriers proposed to put it into effect on December 31. This, he said, represents an earnest effort on the part of the railroads to help toward the restoration of general business in the country and to relieve the particularly acute condition in the agricultural industry which they consider far beyond their power to offer as far as justified by present conditions, but have based on their hopes for the future. If the commission will suspend the grain order for six months, he said, it would be in a position to put it into effect at the end of that period if it sees fit. Meanwhile, while its investigation is going on it can see what the situation is and make a full review of the railroad and rate situation in order to determine what should be done for the future. Mr. Thom also pointed out that the reduction proposed by the railroads is their attempt to comply with the wishes expressed to the railroads by the highest authorities of the Government at the conferences which the executive committee of the Association of Railway Executives held in Washington about the first of October.

Representatives of the state railroad commissions interested in the grain case and the American Farm Bureau Federation vigorously opposed the request for a suspension and insisted that the order be allowed to go into effect in addition to the more general 10 per cent cut. Mr. Thom said the railroads were urged by the highest authority to disregard their ordinary business judgment, take a hopeful view of the situation and take a risk that a rate reduction would improve business so that it would not reduce their revenues. He pointed out, however, that traffic increased for four months under the new rates and that the movement of grain in 1921 had been larger than ever before. The railroads felt that a reduction of rates could not be depended upon to create an increase in traffic under present market conditions; it would be only an experiment and if it failed it would be at the expense of the efficiency and adequacy of the transportation facilities of the country. The carriers, however, undertook to see what they could do but the recommendation of the executive committee made to the general meeting of the roads in Chicago on October 14 that agricultural rates be reduced 10 per cent was not adopted because many roads felt it would be disastrous to them. That was before the commission issued its order. After the order the subject was taken up again and the new proposal was made. It was decided, Mr. Thom said, that the agricultural industry was entitled to special treatment.

When Commissioner Potter asked if the roads considered the suspension of the grain order necessary to enable them to make the 10 per cent reduction Mr. Thom replied in the affirmative but said the general cut had not been made contingent; the railroads had taken an irretrievable step in offering it. Commissioner Aitchison remarked that the commission had received thousands of inquiries on that point which it had not been able to answer.

The commission, Mr. Thom said, is going to have applications for reductions from all sorts of industries and should

not be hampered by its grain decision until it has had an opportunity to consider the entire subject.

Mr. Thom told the commission that the labor situation was one of the principal "obstacles to a fair adjustment of railroad costs."

"We have hoped with the support of public opinion and the shippers to obtain a readjustment of labor costs," he added. "We have hoped that the shippers would come to see that that is the chief obstacle and that the present level of rates is due more to that than anything else. We have hoped that they would come to see that it is to their benefit as well as the railroads to see that a readjustment in wages is made."

"We have given notice that we will apply to the Labor Board for a reduction of that cost, but we find that a member of the Board had presented to the unions a program that would put off for many months such a readjustment and would delay consideration of this matter by the Board. Because of that, the unions postponed their strike. The necessity is for an early and fair consideration of the labor bill of the railroads and if it is too high, it ought to be cut down, but the railroads cannot control that matter or when it is to be considered by the board."

Reviewing the financial situation of the carriers, Mr. Thom said that since the Government took over the roads on January 1, 1918, there had been an increase in the wage bill of approximately \$2,250,000,000. In 1920, he said, the net operating income of the carriers was only \$21,000,000 out of more than six billion dollars gross revenues, and during the first ten months of this year the net operating income was approximately \$494,500,000, or at the annual rate of return on their valuation of 3.2 per cent while their interest charges for the year are approximately \$475,000,000. For the twelve-month period which ended on September 30, 1921, their return on the basis of their tentative valuation fixed by the commission was at the rate of 23 1/2 per cent. In October this year it was 5.4 per cent, but for November, owing to a reduction in traffic, estimates place it at 4 per cent.

Commissioner Potter asked as to what was being done relative to bringing the wage situation before the Labor Board. Mr. Thom replied that this was being done as rapidly as compliance with the Transportation Act would permit.

"I understand that the railroads gave the unions assurance that there would be no reductions until the wage matter was taken up with the Labor Board," said Mr. Potter.

"Yes, we did that for the peace of the country," replied Mr. Thom.

## State Commissions and Shippers

### Want Both Reductions

John E. Benton, solicitor for the National Association of Railway and Utilities Commissioners, appeared on behalf of 16 commissions. His argument was that the railroads were disregarding the rule of law that all transportation charges shall be just and reasonable and that, the commission having declared by formal order that the present rates are unjust and unreasonable, the commission cannot unmake its order and the rates thus come within the condemnation of the law. He said the railroads' petition for rehearing alleges no error of law or of fact and it is not sufficient to deprive the shippers of the rights that have accrued to them under the decision. He characterized the carriers' proposition as a trading proposition after the time for trading has gone by, saying that it might have been possible to reach a compromise before the decision was issued. Commissioner Potter asked Mr. Benton whether, assuming the commission accepted his argument, but did not feel that the railroads could afford to stand both reductions, the commission could order the carriers not to make the 10 per cent reduction. Mr. Benton replied that if other shippers are entitled to reductions they are entitled to

them in their own right and not at the expense of the rates already adjudicated.

Clifford Thorne, representing the American Farm Bureau Federation, asked that the grain case be not reopened on the ground that grain today is bearing more than its fair share of the transportation cost, because grain is one of the two basic food products, because the prices of agricultural products have been forced down to the pre-war level and the present condition of the industry cannot continue. He said that to make the reductions ordered by the commission, in addition to those proposed by the carriers, would involve a reduction of only \$14,000,000 to \$16,000,000 more than that proposed by the roads, but he said he did not see how the additional list of commodities proposed by the roads can possibly add \$40,000,000 to their previous estimate of \$55,000,000. On the other hand, he pointed out that the railroads had already made large reductions in export grain rates in the East, and that they claim to have made reductions during the past year amounting to \$175,000,000 to \$200,000,000 for the benefit of other shippers. Mr. Thorne said that with only two exceptions the Class I railroads in the West have paid this year dividends at the regular rate which they paid in the test period and three had paid dividends last year that had failed to pay in one or more years of the test period. He said the railroads in the western district in September had earned 4.76 per cent on their property investment and in October 5.4 per cent, while most of the farmers are making no return on their investment, and agriculture is in a prostrate condition. Commissioner Potter also asked Mr. Thorne whether, if the commission, which has a general responsibility for railroad revenues, felt that the carriers could not afford both reductions, it would be its duty to suspend the 10 per cent reduction. Mr. Thorne said that the idea that the carriers could not stand both was preposterous in view of the fact that they have received a wage reduction of \$400,000,000.

Clyde M. Reed, chairman of the Kansas Public Utilities Commission, objected to any further delay in the enforcement of the grain reduction. He said when the reduction was asked early in July it was agreed that time was of the essence and that the commission expedited the hearing. After the hearing, however, he said, the expedition stopped, although he thought that was not the fault of the commission. He ridiculed the claim of the railroads that they cannot afford a \$38,000,000 reduction while offering a \$90,000,000 reduction, on the ground that the western carriers are the most prosperous. He rather belittled the 10 per cent reduction, however, on the ground that grain rates in the East have already been reduced more than 10 per cent. Mr. Reed also derided the assertions of the railroads that the more favorable showing they have recently made is largely due to deferred maintenance. He said the proportion of maintenance expenditures to total operating expenditures during the past year has been only a fraction of a per cent under the average for a series of years and only shows a reduction as compared with 1920, when, he said, the maintenance expenditures were extravagant for the purpose of influencing the general rate advance case. He referred to this as "persistent misrepresentation on the part of the carriers of the plain facts involving hundreds of millions of dollars" and said that they had already delayed the grain reduction for six months because when they were asked last June to make the reduction they were unwilling even to discount the wage reduction which had just been ordered to become effective on July 1.

Mr. Thom made a brief statement in rebuttal, saying there was a singular confusion of argument when it was asserted both that the railroads are offering too much and that what they are offering is insignificant. "We were appealed to," he said, "by the most responsible parties to try and do something to help the restoration of the country to more normal conditions, and when we have tried to do something instead of receiving any recognition from these gentlemen, they come

as opponents and impediments in the way of our efforts to carry out what we were urged to do. We are trying to do as big a thing as we were asked to do, and in a way which should meet the approval of the public. We should have the help and support of these people instead of their denunciation."

Mr. Thom said that he could challenge the legal soundness of the commission's order and the theory that one industry must give up for the support of another when it is already receiving an inadequate return itself, but he did not choose to make that kind of an argument. Mr. Thorne said he did not want any impression left that the American Farm Bureau Federation does not appreciate the offers of the railroads but that it merely opposes the method proposed.

Chairman McChord announced that it would be impossible for the full commission to sit during the general rate hearing and that Commissioners Aitchison, Esch, Hall and Lewis had been selected to hear the testimony. A full digest of the testimony will, however, be made for the benefit of the other commissioners, who will attend the hearings whenever possible. They will receive copies of the exhibits and the whole commission will, of course, hear final arguments in the case.

## Director General Reports on Railroad Settlements

WASHINGTON, D. C.

A COMPREHENSIVE REPORT on the status of the accounts of the Railroad Administration with reference to the settlement of the claims of the railroads growing out of federal control was transmitted to the Senate on December 10 by Director General James C. Davis in response to a resolution adopted by the Senate on November 22 on motion of Senator La Follette. In this the amount due the carriers from the government as of December 1 on accounts growing out of federal control, including compensation, money taken over, maintenance, materials and supplies, depreciation and all other accounts, exclusive of additions and betterments, was estimated by the Railroad Administration at \$750,670,589, while the railroads owed the government a balance of \$507,628,508 on account of additions and betterments disposed of as of December 1, leaving a balance of cash required for final settlement, based on the estimate of the Railroad Administration and assuming that the balance due on additions and betterments would be collected by deduction from the indebtedness of the government to the roads, of \$243,042,080.

The available cash assets of the Railroad Administration were \$152,380,880 on December 1, and it also held securities of the roads including equipment trust certificates which the President has express authority to sell and of which \$109,000,000 had been sold up to December. "While general authority to sell other obligations may exist," Mr. Davis said, "no express authority is found granting this power." Up to December 1, final settlement had been made with the carriers of claims aggregating \$436,145,307, representing 107,063 miles of road or 44 per cent of the entire mileage (exclusive of short lines) under federal control. There was paid in final settlement of these claims \$132,221,840. The number of final settlements was 151 but these included 64 subsidiary companies so that final settlement has actually been made of the accounts of 215 federally controlled carriers. The total claims filed up to December 1 in final settlement aggregated \$940,587,257, representing 208,721 miles of road. If the remaining roads, 32,473 miles, file claims on the same basis it is estimated that the total amount of claims will be about \$1,100,000,000. The report did not, however, include the information called for in the resolution as to the itemized details of all final settlements made with

individual carriers. Mr. Davis said that presenting this would hinder him and delay the progress of the work of the Railroad Administration and that he had been instructed by the President to respectfully submit that it is against public interest to furnish it other than in a general way.

The expenditures of the Railroad Administration for additions and betterments for the carriers as shown by its books aggregated \$1,144,681,582. Of this, \$381,649,957 represents the standard equipment, which has been taken care of partly in cash and mainly by equipment trust certificates, and \$42,250,000 had been funded prior to final settlement, leaving a balance to be adjusted in the course of final settlement of \$720,781,625.

In the settlements that have been made \$179,710,117 of additions and betterments were charged to the carriers and \$33,443,000 was funded, leaving a balance of additions and betterments yet to be adjusted of \$507,628,508, either to be funded in such an amount as the administration may refrain from settling off those claims against amounts due the carriers from the government, or deducted from the amounts due from the government to the carriers.

The estimated balance of \$243,042,080 is based on future adjustments being made upon the Railroad Administration's construction of the standard contract and on the assumption that future settlements will be perfected upon the same general lines as those which have heretofore been made, as well as that final judgment decrees and awards in actions, suits or reparation claims will be paid out of the special appropriation made for that purpose in connection with the \$300,000,000 revolving fund provided in Section 210 of the act.

This report by the director general shows that by selling some additional equipment trust certificates the Railroad Administration would have funds with which to make all final settlements according to its estimate, without the use of the authority provided for in the Winslow bill to the War Finance Corporation to purchase and carry for a time its railroad obligations. Additional funds would be needed, however, if it were to fund any large proportion of the \$507,000,000 of additions and betterments yet unadjusted. One possibility is understood to be the sale of the obligations of the railroads now held or to be acquired in case of further funding, direct to the investment bankers without the intervening purchase by the War Finance Corporation, but if this could be done on favorable terms, many of the railroads could also place their own securities to cover the additions and betterments and complete their settlements with the government.

## Illinois Central to Rebuild Ohio River Bridge

THE LATEST PROJECT to involve a railway bridge of first magnitude contemplates the renewal of the superstructure of the Illinois Central crossing over the Ohio river at Cairo, Ill. The railroad obtained approval of this plan from the Secretary of War on November 10 after a formal hearing held at Cairo on September 28. The work involves the replacement of the existing single-track spans with double track and the enlargement or alteration of the piers so as to adapt them to the new superstructure. The total cost is estimated at \$8,500,000.

The present bridge was built between April, 1887, and October, 1889, and was opened for traffic on March 1, 1890. At the time of its completion it was the longest metal bridge in the world with the single exception of the Tay bridge. The length was 20,460 ft., divided into a south approach of 7,850 ft., a north approach of 7,963 ft. and a main crossing 4,646 ft. A subsequent filling shortened the bridge to 7,597 ft., consisting from north to south of a single 50-ft. deck girder span in the north approach, 12 truss spans in the main river crossing and 22 spans in the south approach. The river crossing comprises nine through truss spans of which two are 523.5 ft. spans and seven are 405 ft. spans, as well as three 250 ft. deck truss spans. The south approach consists

Proposed Method of Enlarging the Piers

of twenty-one 150-ft. deck truss spans and one 106-ft. deck truss span. The truss spans are composed of pin-connected, Whipple trusses.

The substructure of the river span consists of stone masonry piers carried to a depth of 75 ft. below the low water level of the river and supported on sand foundation, it being impossible to carry the piers to bedrock although the pneumatic process was used. The approach spans on the south end of the bridge are carried on steel cylinder piers filled with concrete.

Analyses has demonstrated the feasibility of supporting the new river spans on the existing piers without excess foundation pressure under the double-track loading. Therefore to accommodate the new spans, it is proposed to lengthen the piers at the top from 43 ft. to 52 ft. and widen them from 14 ft. to 17 3/4 ft. by rebuilding or jacketing the old stone masonry from the level of the belt course at the top of the starling. The piers at that level are of sufficient dimensions

Elevation of the Main Spans of the Present Bridge

in plan so that a reconstruction above that elevation with the faces of the piers vertical or nearly so will afford the necessary increase in length and breadth at the top. Provision for new superstructures for the south approach will probably entail the construction of a new substructure.

Plans for the renewal of the present bridge had their inception as early as 1902 when increased train loading and increased volume of traffic pointed to the need of a more adequate structure. However, it was not until 1914 that application was finally made to the United States War Department for authority to build a new bridge. This was denied at that time on the grounds that the government would not accept a plan providing for a channel span less than 800 to 1,000 ft. clear opening. As the officers of the road concluded that they would not be justified in making the greater expenditure that this would entail, steps were taken to strengthen the bridge so as to use heavier locomotives and thus relieve congestion by handling the freight traffic over the bridge in longer trains. This consisted in the introduction of some additional counters in the trusses and two additional lines of stringers in the floor system and was completed in 1915.

Since the completion of this work the traffic over the

bridge has greatly increased so that at the present time the need for double track is far more urgent than it was at the time that the previous plan was submitted to the War Department. In the meantime, there has also been a gradual change in the character of the river traffic, the large tows of coal barges being no longer operated on the river. It was believed, therefore, that river conditions no longer demanded the great length of clear span imposed as a requirement by the War Department in 1914. Accordingly, the proposal for replacement of the bridge was again submitted to the War Department and approval subsequently obtained.

The superstructure of the new bridge will probably consist of simple spans as at present, although studies have not been carried far enough to determine whether the advantage to accrue from the elimination of a portion of the falsework would warrant the complications incident to the adoption of a cantilever or continuous type of superstructure. The loading will probably be the equivalent of Cooper's E-60 or heavier. The plans under consideration also contemplate the reduction of the grade on the Kentucky approach from 0.75 per cent to 0.5 per cent.

The permit for the construction of the new bridge requires that the work is to be started within one year.

## Labor Board Announces Another National Agreement

### Maintenance of Way Employees to Get Punitive Overtime After Ten Hours Instead of Eight

PUNITIVE OVERTIME for all employees "performing work properly recognized as work belonging to and coming under the jurisdiction of the maintenance of way department" will start after the tenth hour instead of the eighth hour as has been the case under the provisions of the maintenance of way national agreement, according to one rule of a new code promulgated by the Railroad Labor Board to govern the working conditions of these employees. Furthermore many of the iron-clad provisions of the old national agreement are remanded to negotiation between the individual carriers and their own employees or so revised as to leave the points covered subject to local adjustment. These are the outstanding features of the new code of rules which the Labor Board handed down on December 14, as the result of the long controversy over the continuation of the national agreements. The new rules are to be placed in effect on December 16 wherever the carriers and their employees have been unable to reach agreements. They are not to be applied where agreements have already been reached. If, for instance, a carrier has reached an agreement with its maintenance of way workers as to discipline rules, the new rules on this point are not to supersede the rules agreed upon, but if the same carrier could not reach an agreement as to the rules governing overtime, the new provisions are to be applied as the decision of the Labor Board on that disagreement. It is true on the other hand that eventually these new rules will be incorporated in all agreements between the carriers and their maintenance of way employees. Revisions of the rules already agreed upon to conform to the rules promulgated by the Board will undoubtedly be asked by either the carrier or the employees depending upon which the Board's rulings favor as compared with the existing provisions. The net result will be the establishment of a new "national agreement."

The principle of paying punitive overtime after the tenth hour was recognized by the maintenance of way national agreement as applicable to "laborers in extra or floating gangs

whose work is seasonable or temporary in character, when engaged in work not customarily done by regular section gangs." The Board's ruling extends this principle to all employees in the maintenance of way department as the result of the objections of the carriers to the old rule and of the employers of similar labor in other industries, particularly farmers. At the same time the Board has included in the new "national agreement" a specific recognition of the eight hour day stating that "eight consecutive hours exclusive of the meal period, shall constitute a day's work."

#### Large Part of National Agreement

##### Remanded or Readjusted

The national agreement with the maintenance of way employees was composed of six articles dealing with (1) the scope, (2) seniority, (3) promotions, (4) discipline and grievances, (5) hours of service, overtime and calls and (6) general conditions. Of these articles, two, those dealing with seniority and promotions, are remanded by the Board because of the fact that almost all of the carriers were able to reach agreements with their employees on the new provisions to cover these subjects. Article IV, dealing with discipline and grievances is approved in toto for the same reason. As a matter of fact, there were marked disputes on only six of the rules of the national agreement on the majority of the carriers. On some roads complete agreements between the managements and the men were reached; on many others agreements were reached on the bulk of the points covered by the national agreement. In those cases where but one or two carriers were unable to reach satisfactory agreements with their men on some particular rule the Board merely remanded the disputes to further negotiation between the parties involved.

Comparison of the new rules with the similar rules of the national agreement indicates the modifications which have been made and the character and extent of the relief which may be derived from the application of some of these

rules now and their eventual application on all carriers.

Article I of the national agreement dealing with the scope of the agreement is changed in that instead of excluding employees in the signal, telegraph and telephone maintenance department, workers subject to the national agreement with the shop crafts, certain clerical forces and boarding car and camp employees, the new rules apply to "all other employees performing work properly recognized as work belonging to and coming under the jurisdiction of the maintenance of way department."

Articles II and III, of the national agreement dealing respectively with seniority and promotions have been remanded for further negotiation as noted before. Likewise Article IV, dealing with discipline and grievances has been adopted in toto. Article V of the national agreement dealing with hours of service, overtime and calls has been changed as outlined below:

That portion of the clause providing for the payment of punitive overtime where the reassignment of hours gave an employee more than ten hours' service is eliminated, making the payment of but pro rata rates necessary.

The clause requiring the payment of punitive overtime for working through regular meal periods is changed to provide for the payment of but pro rata rates.

The clause providing for the computation of the hourly rate of monthly paid employees on the basis of the number of days in the calendar year, multiplied by eight and divided by the total hours worked (exclusive of overtime and disregarding time absent on vacations, sick leave, holidays or for any other cause) is changed so that the hourly rate is derived by dividing the monthly salary by 204.

The provisions for paying one half time to employees traveling in boarding cars between 10 p. m. and 6 a. m. are eliminated.

The clause providing that "gangs will not be laid off for short periods when proper reduction of expenses can be accomplished by first laying off the junior men" is qualified by the statement that "this will not operate against men in the same gang dividing time."

The provisions for paying straight time for overtime hours of employees not in the outfit cars but traveling by train are changed to necessitate the payment of but one half time for overtime hours.

The section requiring the payment for a full day of the rate applicable to the class of work an employee may have performed for the "perponderating" part of a day is made more specific by changing "perponderating" to "four hours." A "protection" clause, part of this section, reading "this rule not to permit using regularly assigned employees of a lower rate of pay for less than half of a work day period, to avoid payment of higher rates" is also eliminated.

The iron clad and restrictive clauses dealing with the starting and ending time of shifts, meal periods and provisions prohibiting the reduction of working hours to avoid reductions in forces are changed to permit local adjustment.

In addition to these changes many of the clauses of this Article and of Article VI, have been eliminated or changed to conform to the revisions already noted.

#### S. M. Felton Comments on

#### New "National Agreement"

In commenting on the new rules, S. M. Felton, president of the Chicago Great Western said:

"It is evident from a hurried reading of the new rules to govern the working conditions of railway employees in the maintenance of way department that they are merely revisions to eliminate many of the onerous effects of the old national agreements. The provisions calling for the payment of punitive overtime after ten hours instead of after eight hours and for the local adjustment of several disputed points promise an improvement over existing conditions. It should

be remembered, however, that these new rules unless otherwise agreed upon will be applied on all railroads throughout the country and it was against the effects produced by the universal application of rules regardless of varying local conditions that the carriers' fight was largely directed. The benefit that may or may not ensue from their application is entirely a matter of guess work until they have actually been in effect in a period when extensive work is being done."

This entire code of rules was considered and decided upon by the Board in less than a week. Within 45 days of the withdrawal of the recent strike orders of the train service organizations, the Board has disposed of the controversies over the national agreements with the shop crafts and with the maintenance of way employees, leaving but comparatively little to do before the consideration and disposal of all disputes regarding the rules and working conditions of all classes of employees. From this it may safely be inferred that the decks will soon be cleared for the consideration of the requests of the carriers for further wage reductions.

#### Pennsylvania Obtains Injunction

#### Against Labor Board

Another chapter in the controversy between the Pennsylvania and the Labor Board as to the right of the latter to rule as to how and with whom negotiations between that carrier and its employees should be conducted was opened in Chicago on December 9, when Federal Judge K. M. Landis issued a temporary injunction restraining the Labor Board from publishing a decision which was expected to charge the carrier with violation of the order of the Board. The petition of the carrier to the federal court closely follows the position of the Pennsylvania as outlined before the Board in the several hearings in this case, all of which have been reported in previous issues of the *Railway Age*. The move was not made as an attack upon the Board, but with the approval of several members who are anxious to have the Board's legal status definitely determined by the courts.

The following day when arguments on a plea for a permanent restraining order were to be heard, members of the Labor Board appeared before Judge Landis and asked for sufficient time to consult with the Department of Justice. The arguments in the case were subsequently set for December 21. It was pointed out at that time by members of the Board that if the Pennsylvania is able to prevent the issuing of decrees, statements or announcements of violations, the Board will be bereft of all power, inasmuch as the only means of curbing willful violation of its orders is by the force of public opinion formed as a result of the publication of decrees. Counsel for the carrier contended on the other hand that the case is one involving only interpretation of the Transportation Act.

It was announced later that when arguments are heard on December 21, United States Solicitor General J. M. Beck would represent the Board and at the same time prepare a defense in the action which has been brought against the Board by the state of Texas which also contends in substance that the Board is without jurisdiction in that state.

R. M. Barton, chairman of the Board, in discussing the case said:

"I welcome any judicial proceeding that will define and settle the proper limitations of the Board's power. The Board certainly has no desire to exceed the power conferred upon it by law. The Board also has no desire to exceed or shirk the full performance of any duty imposed upon it.

"There are two conflicting views as to the proper construction and effect of the labor section of the Transportation Act. One is that the Board has only advisory powers, and that its decisions can only be made effective so far as approved and enforced by public opinion. The other is that they are legally binding, and can be enforced. While this is a debatable question, I hold the latter view."

# General News Department

The American Wholesale Lumber Association will hold its second annual convention at the Congress Hotel, Chicago, on March 9 and 10, 1922.

The directors of the Chicago, Burlington & Quincy have authorized a pension plan for the employees of that road. Prior to the announcement of the plan, a study is being made of the pension systems of other roads.

## D. L. & W. Again Asking for Electrification Bids

The Delaware, Lackawanna & Western has asked the General Electric Company and the Westinghouse Electric and Manufacturing Company to prepare estimates for the electrification of about 40 miles of gradients near Scranton, Pa. The work will cost over \$5,000,000 and has been contemplated for some time. Bids were received for the work last summer, but these were all rejected.

## A Correction

In the issue of December 10, the discussion of a paper presented by James Partington at the Railroad Session of the annual meeting of the American Society of Mechanical Engineers was published. The first discussion of this paper beginning with the second paragraph on page 1151, was contributed by John L. Nicholson of the Locomotive Firebox Company. Through an oversight Mr. Nicholson's name was omitted.

## Wage Conferences on Eastern Roads

January 16 has been set as the date on which the managements of the eastern railroads will meet employees to discuss proposed reductions in wages. Notices to this effect were mailed on December 15. These conferences were delayed until January 16 because of a ruling by the Labor Board requiring the carriers to set forth in detail the reductions proposed when calling conferences of this character. The maintenance and shop forces propose to counter the roads' requests for a reduction by demands for an increase in wages.

## Government Ownership of Cape Cod Canal Proposed

Purchase by the federal government of the Cape Cod Canal was recommended to Congress in a report submitted by the Secretaries of War, Navy and Commerce submitted to Congress on December 12 by the budget director. The report said that \$11,500,000 would be a reasonable price for the property, of which \$5,500,000 would be paid in cash, while the government would assume \$6,000,000 in bonds now outstanding. A value of \$16,801,000 for the canal and the franchises of the operating company was set in condemnation proceedings at one time by the federal district court in Massachusetts, but the judgment was later set aside by a higher court.

## I. C. C. and Labor Board Appropriations

An appropriation of \$5,194,970 for the Interstate Commerce Commission for the fiscal year ended June 30, 1923, is recommended in the budget submitted to Congress by President Harding with the report of the director of the bureau of the budget. The director made some reductions in the amounts requested by the commission. The commission asked \$2,400,000 for general expenses and \$2,330,470 is recommended; \$600,000 for enforcement of Section 20 and \$575,000 is recommended; \$380,000 for enforcement of the safety acts and \$350,000 is recommended; \$350,000 for locomotive inspection and \$300,000 is recommended; \$1,630,000 for the valuation work and \$1,500,000 is recommended. The recommendation for salaries of commissioners is \$139,500. For the Railroad Labor Board the budget carries an appropriation of \$400,000 as against \$370,000 in the preceding fiscal year.

## "Take a Chance—You Can Make It"

This is the title given to advertisements which are being published by the Louisville & Nashville in the territory served by its lines in order to bring the hazards at railroad crossings to the attention of the public. In addition cards of warning are being distributed along the line of the road and posters are being displayed prominently in freight and passenger stations, designed to impress the public that: "The average American railroad train goes approximately 88 ft. in one second and cannot be stopped in less than a quarter of a mile; that the driver of an automobile should not be traveling at any such rate of speed, and that crossing signs are so located that it is possible for him to come to a dead stop long before he reaches the danger zone."

## One Hundred Tons of Paper Weights

A press dispatch from Tokio says that the fiftieth anniversary of the inauguration of railway service in Japan was celebrated recently with appropriate ceremonies in a large pavilion in front of the Central Station in that city, about 3,000 persons participating. The first rail of the present system was laid in 1871, the line from Tokio to Yokohama, eighteen miles, having been opened for traffic June 12, 1872.

As a souvenir for those attending there was distributed to each a thin section of rail, bound in brass, for use as a paper weight, cut from the first rails laid. More than 100 tons of such rails were cut into 170,000 slices for this purpose.

The first locomotive used in Japan, with types of other early equipment were on exhibition, together with the imperial coaches of the early days. There are now 8,500 miles of railway in Japan proper and 11,400 miles counting the lines in South Saghalien, Corea, Formosa and South Manchuria.

## Accident on the Oregon-Washington

Six persons killed and 22 injured is the record of a head-on collision of passenger trains on the Oregon-Washington Railroad near Celilo, Ore., 96 miles east of Portland, on December 1. The trains were the Oregon-Washington limited, No. 17, westbound and eastbound train No. 12. Train No. 12, because of washouts east of Portland, had been

Photo from Underwood & Underwood

## Collision on the Oregon-Washington Near Celilo, Oregon

routed over the Spokane, Portland & Seattle to the crossing of the Columbia river at Fallbridge, Wash. It had just crossed the river to Celilo, and started east over its own line, on the Oregon side of the river, when the collision occurred. Three of the killed were passengers and one was a soldier (marine) acting as mail guard.

### A Correction

In the article in the *Railway Age* of December 10 bearing the title, "Baltimore & Ohio Shows Much Improvement in 1921," there was an error in the make-up of the table relating to charges for repairs, etc., to locomotives and cars which appeared on page 1166. The error occurred in the next to the last column headed "Average per car." The column is included in the bracket designated "passenger," but it is believed that those who read the article observed that it should have been included under the bracket designated "freight." In other words, the figures quoted in the next to the last column in the table represent the average cost per car of repairs, retirements and depreciation, of "freight" and not of "passenger" cars.

### Some Senate Views on Rates

Senator Kendrick, of Wyoming, made a speech in the Senate on December 8, in support of an amendment which he had proposed to the railroad funding bill to repeal that provision of Section 15-a of the interstate commerce act providing for rates to enable the railroads to earn 5½ to 6 per cent. As the law stands today, he said, "the commission has no choice but to levy a toll upon all industry sufficient to pay the railroads a fixed profit, though every other industry in the land may operate at a loss." If his amendment is adopted, he said, the commission in passing upon any proposed modification of the rates will be free to determine whether the charge can be made without imposing an unreasonable burden upon shippers and consumers. The result of the advance made in Ex Parte 74, he said, is "nothing less than ruin to producers in many sections of the West." To indicate that the rate increase was not justified on the ground of necessity so far as the western transcontinental lines are concerned, he submitted a table showing the dividends paid from 1915 to 1920 by the Southern Pacific, Union Pacific, Chicago, Burlington & Quincy, Atchison, Topeka & Santa Fe, Great Northern and Northern Pacific.

As a sample of the kind of reasoning that is often used in the Senate in discussing freight rates, Senator Trammell of Florida, who has been advocating a modification of a law to provide for a lower percentage of return to the railroads, remarked that according to his understanding, the railroads prior to the enactment of this law had earned 2¼ per cent. That being true," he said, "when you raise it to 5½ per cent, you are practically doubling your transportation charges."

### Telephoning on Railroad Power Wires

On a trolley railroad near Schenectady, N. Y., on Thursday, December 1, the General Electric Company gave a demonstration of its "carrier current" system of communication by telephone over the propulsion wire of an electric railroad, conversation being held between different trains on the same track, and from trains to operators in stations and vice versa. A second current is superimposed on the trolley wire and the message is conveyed to any desired distance, being picked up at any convenient point and made to energize a telephone instrument. The telephone current is generated at higher frequency than the power supply. Experiments in this line have been carried on by the General Electric Company for a number of years, and on the Chicago, Milwaukee & St. Paul electrified line communication has been carried on in this way for a distance of 60 miles.

In telephoning from the train to the station, the message was amplified, in the waiting room of the station, by a loud speaking telephone instrument. On the St. Paul road extensive tests were made; and, with the great length of some of the trains on that road, the facility with which conversation could be carried on between the front and the rear end of the same train was demonstrated with marked satisfaction. The apparatus used for the carrier current is simple, consisting essentially of vacuum tubes used as oscillators, rectifiers and detectors.

Among those who witnessed the Schenectady demonstration was J. D. Jones, superintendent of telegraph and signals of the Eastern Region of the Pennsylvania Railroad, who is chairman of committee No. 12 of the Telegraph and Telephone Section

of the American Railway Association; S. L. VanAkin, Jr., assistant superintendent of telegraph of the New York Central, and other officers of the Pennsylvania and the New York Central.

### Conference on Standard Contract Forms

At the instance of Herbert Hoover, secretary of commerce, a conference of constructors, architects and engineers is being held in Washington to consider the adoption of a standard contract form. Those appointed to attend this conference include: William S. Parker, secretary, American Institute of Architects, Boston; W. D. Faucett, chief engineer, Seaboard Air Line, Norfolk, Va., representing the American Railway Engineering Association; H. Eltinge Breed, New York, representing the American Society of Civil Engineers; J. Waldo Smith, chief engineer, New York Board of Water Supply, representing the American Water Works Association; A. P. Davis, director, United States Reclamation Service, representing the American Engineering Council; Onward Bates, consulting engineer, Chicago, representing Western Society of Engineers; J. W. Cowper, president, John W. Cowper Company, Buffalo, N. Y., representing the Associated General Contractors of America; E. W. Reaugh, president, Reaugh Construction Company, Cleveland, N. Y., representing the National Association of Builders' Exchanges. The object of this conference is to develop a form of contract containing standard provisions that will be applicable to all classes of construction work and also to establish individual standard forms for the special clauses applicable to particular classes of work. It is believed that the successful conclusion of this work will be effective in reducing the expense of preparing contracts, in effecting a better safeguard of the rights and privileges of the parties to contract and in improving construction service throughout the country.

### Interstate Commerce Commission Authorizes

#### Interlocking Directors and Officers

The Interstate Commerce Commission has issued a large number of orders authorizing until further order of the commission the holding of positions as officers or directors in more than one company and the press table in the secretary's office, where applications to the commission and announcements and orders of various kinds by the commission are made public, is daily crowded with additional applications for this authority under Paragraph 12 of Section 20-a of the interstate commerce act. Among the orders that have been thus far issued a large number authorize interlocking officers and the directors among the subsidiary companies of large systems and on smaller roads in various parts of the country which are in no way in competition. Several of the orders also authorize men to hold offices or directorates in two or more of the larger systems which are not in direct competition.

As examples of some of the orders, Festus J. Wade has been authorized to continue as director of the St. Louis-San Francisco and also of the Cleveland, Cincinnati, Chicago & St. Louis; officers of the Chicago, Rock Island & Pacific have been authorized to hold similar positions with various subsidiary companies, most of which are leased by the Rock Island; officers of the Chesapeake & Ohio have been authorized to hold similar positions with the Chesapeake & Ohio Northern, Chesapeake & Ohio of Indiana and the Hocking Valley, also in various subsidiary and terminal companies; officers of the St. Louis-San Francisco have been authorized to hold similar positions with various subsidiaries; Howard Elliott has been authorized to hold his position as chairman and director of the Northern Pacific, director of the Chicago, Burlington & Quincy and the Colorado & Southern and various subsidiaries of the Northern Pacific, while also being assistant to the president of the New York, New Haven & Hartford and director of that company and subsidiary and affiliated companies. A. C. Rearick has been authorized to retain his position as director and counsel of the Chesapeake & Ohio and subsidiary and affiliated companies, while being a director of the Chicago, Rock Island & Pacific and the Missouri, Kansas & Texas and as counsel for the receiver of the Missouri, Kansas & Texas. The order provides, however, that it is effective after the receivership of the Missouri, Kansas & Texas only as to the other corporations mentioned.

The commission, however, has ordered further investigation in the case of the applications of M. L. Bell, L. C. Fritch,

Charles Hayden and William F. Peter, who hold offices with the Chicago, Rock Island & Pacific and also with the Minneapolis & St. Louis. Mr. Hayden is also director of the Pere Marquette and several other companies. Objection to common officers on the Rock Island and the Minneapolis & St. Louis was made at the recent hearing before the commission by Newman Erb. The applications are assigned for hearing before an examiner at Washington on January 30, but the applicants are authorized to hold their positions until further order of the commission.

## R. B. A. Dinner February 1 To Be

Addressed by Meyer and Fish

February 1 at the Waldorf-Astoria, New York, is announced for the annual meeting and dinner of the Railway Business Association. The dinner speakers will be Eugene Meyer, Jr., of New York and Frederick P. Fish of Boston.

In announcing the meeting President Alba B. Johnson says:

Business recovery through resumption of railway purchases is the obvious subject for our 1921 annual meeting. The problem presents itself almost if not quite as a national crisis. In 1920 the federal government declared its responsibility for the financial results of railway regulation. It authorized sanction of rates designed to yield adequate income. It also authorized regulation of railway wages and working conditions to yield the employees fair compensation. Since the act went into effect the country has come to question whether the labor clause comprises a lasting solution in respect of adjusting labor cost to income requirements, while a formidable revelation is revealed to retract the government's declaration of responsibility for the financial results of regulation and to break down by clamor the orderly processes of negotiating and adjudicating rate revisions.

The leading feature of our business sessions will be reports setting forth this situation how the association has acted to meet it and plans for continuing activity to the same end.

In accordance with our custom the utterances at the dinner will deal with problems the most pressing and the speakers will be eminent authorities on the timely aspects which they discuss.

EUGENE MEYER, JR.

Eugene Meyer, Jr., managing director of the War Finance Corporation, is a dollar-a-year war volunteer who, like General Dawes, after retiring to private business was reallocated for a reconstruction period. As an investment banker, Mr. Meyer conceived a War Finance Corporation as a federal instrument for giving timely and essential aid to business, agriculture and transportation with negligible cost or none to the government. Author of the so-called railroad funding bill, its postponement found him promptly and actively applying in the most enterprising business spirit the means for attainment in part of the same purpose—release of funds for government remittances on accounts due the railways. What government policy is now essential if the credit of the railways is to be strengthened and stabilized? What program for railways and the distributors of securities is required if the public power to purchase railway stocks and bonds is to be more fully converted into railway improvements and hence into national prosperity? Answers to these questions have been requested of Mr. Meyer, whose oral delivery before committees of Congress and addresses on other public occasions have won him high esteem as an expositor and as a speaker.

FREDERICK P. FISH

Frederick P. Fish, former president of the American Telephone & Telegraph Company, outstanding lawyer, pioneer in conservative social progress, has for a number of years as chairman of the National Industrial Conference Board led an enterprise of systematic research concerning relations of employees to employers and to the public. Sturdy in his independence, bold in his insistence of local conditions, Mr. Fish occupies a distinctive position of influence by reason of his tolerance of spirit and his moderation of utterance. Taking as it stands the federal railway labor legislation of 1920, what course is it essential for citizens and other organizations to pursue in order that the administration of the labor clause may fully protect the public as well as the employers and the employees? If it at all should the law be amended for future performance of the functions committed in 1920 in the Labor Board? Responses to these inquiries have been requested of Mr. Fish, who has a high reputation as a robust extemporaneous orator before large assemblages.

## A Direct Appeal

The San Diego & Arizona has an employees' club, which is bestirring itself to stimulate the road's business. Already an increase in the volume of freight is evident.

A postal card sent by the club to business men in San Diego reads as follows:

### THE SAN DIEGO & ARIZONA RY. WANTS YOUR BUSINESS

Its Reasons are as follows:

- It represents an investment of more than \$18,000,000.
- It paid in taxes in California in 1920 \$77,372.
- It paid in taxes in San Diego County in 1920 \$24,878.
- It spent for supplies in San Diego in 1920 \$322,838.
- It employs 316 men in San Diego.
- It pays these men \$45,000 a month.
- Its employees spend their earnings in San Diego.
- Its earnings are materially affected by auto truck and bus competition.
- It endeavors to serve effectively.
- Its employees aim to be contented.
- It maintains its own roadbed.
- It is *The Short Line Fast*.
- We, therefore, solicit your close cooperation with us for our mutual benefit. Prosperity to the road means prosperity to you and our city.

## Traffic News

George A. Schroeder, secretary of the Milwaukee Traffic Club and formerly traffic manager for the Milwaukee Chamber of Commerce, died at Milwaukee, Wisconsin, on November 28, 1921.

Western roads have announced a special holiday rate of a fare and one-half for the round trip for fares of \$25 or less one way, effective on December 22, 23 and 24, with a return limit of January 4.

E. H. Poetter, for the past sixteen years traffic manager and export manager of the Barrett Company, has been elected vice-president of Thomas T. Bond & Co., freight forwarders, 11 Broadway, New York.

The St. Louis-San Francisco has notified the Public Utilities Commission of Kansas that it will establish a rate of 21 cents per 100 lb. from Kansas fields to St. Louis, Mo., on salt of low grades used by the packers and ice makers. The new rate is a reduction of five cents.

A committee to enlist the aid of other Illinois cities in bringing down freight rates on the materials used in public improvements was authorized by the City Council of Decatur, Ill., on November 28. The city is just completing a \$2,000,000 water impounding project and is also constructing a \$1,500,000 sewerage disposal plant.

At a conference of petroleum shippers and railroad men of the Mississippi Valley at Memphis, Tenn., on November 28, a rate of 36 cents per 100 lbs. on petroleum shipped from New Orleans and from Louisville, was asked by the oil companies. The railroads suggested a rate of 38 cents. A decision is not expected until the question of petroleum rates to the southeast has been settled.

The North Carolina Traffic Association has entered a complaint before the Corporation Commission of that state against the Atlantic Coast Line and two of its subsidiaries, charging that freight rates on these smaller roads are maintained at too high a basis; under which shippers are made to pay unreasonable prices. The tariffs are made out as though these were separate companies, whereas, it is charged that, being really part of the Atlantic Coast Line, they should figure as branches of the system; and, under the law, this would necessitate making the rates lower than they are now. The two lines in question are the East Carolina Railway, 39 miles long, and using three locomotives, and the Washington & Vandemere, 41 miles long, with two locomotives.

## Coal Production

Production of soft coal in the week ended November 26 dropped to 7,093,000 net tons. The decrease of 1,811,000 tons below the output of the week preceding was mainly due, according to the weekly bulletin of the Geological Survey, to the occurrence of Thanksgiving Day and to slackening demand for coal.

Production of soft coal continued to plunge downward, and during the week ended December 3 touched the lowest level reached at any time since last April, according to the weekly bulletin of the Geological Survey. The total output, including lignite and coal coked, was approximately 7,077,000 net tons. The daily rate—1,179,000 tons—showed a decrease of 16 per cent in comparison with the rate in Thanksgiving week.

In comparison with production in late October, the decrease was 36 per cent. The present slump is in large part a reaction against the artificial stimulus lent by the apprehension of consumers over a possible stoppage of transportation. While that apprehension was felt, coal was flowing into

storage. Now that it is for the moment allayed, coal is flowing out of storage. How acute is the present depression may be judged by the fact that the output of 7,077,000 tons was the smallest in any full-time week since that of April 30, when 6,984,000 tons were produced.

### Anthracite Shipments—November, 1921

The shipments of anthracite for November as reported to the Anthracite Bureau of Information at Philadelphia, amounted to 5,314,014 gross tons against 5,872,783 tons the preceding month, and with 5,765,347 tons in November, 1920. The decrease last month as compared with the other two periods is accounted for by the fewer number of working days in November as compared with October, of this year, and by a decided falling off in the washery tonnage from November, 1920, with an additional holiday on Armistice Day last month.

Shipments by initiating carriers were as follows:

	November 1921	October 1921		November 1921	October 1921
P. & R.....	1,017,409	1,104,828	Penna. ....	429,638	492,632
L. V.....	913,737	1,048,995	Eric.....	503,488	618,034
C. of N. J.....	512,613	570,189	N. Y. O. & W.	136,945	126,925
D. L. & W.....	814,131	759,492	L. & N. E.....	229,455	253,311
D. & H.....	756,598	898,376		5,314,014	5,872,783

### Commission Prescribes Through Export Bill of Lading

The Interstate Commerce Commission on December 2 made public its decision prescribing a form of through export bill of lading to be issued by carriers subject to the interstate commerce act for the transportation of property in connection with ocean carriers whose vessels are registered under the laws of the United States, from points in the United States to points in non-adjacent foreign countries.

In its report of April 14, 1919, the commission prescribed a uniform domestic bill of lading and a uniform export bill of lading. This order was suspended by an injunction of the district court for the Southern district of New York in which the majority held that the commission had no authority to prescribe bills of lading for either domestic or export traffic. An appeal was taken to the Supreme Court, which held that the passage of the transportation act made the case a moot case and reversed the order of the district court.

In August, 1920, the commission reopened the proceeding, forms of through export bills of lading having been submitted by the Southern, Eastern and Western carriers.

There was conflict of view among the parties as to the commission's jurisdiction. The question is one of law, but the commission says that pending judicial interpretation of the pertinent provisions of the act it must construe them in endeavoring to perform the administrative duties which they impose. The inland carriers, more particularly the Eastern carriers, challenged the commission's power to do more than prescribe the form, as distinguished from the substance, of the bill of lading. Counsel for American ocean carriers claimed that the commission has no power to prescribe any condition applicable to them without their consent. A representative of the United States Shipping Board who was present at the hearings did not think that the commission has jurisdiction over water carriers and on behalf of the Shipping Board saved any proper objections and exceptions to the jurisdiction of the commission and exceptions to the evidence.

The commission in its report holds that it has power to prescribe rules and regulations, which shall determine the form of the bill of lading, and, as to the transportation until delivery to the ocean carrier, will be adequate and complete; for the intent of Congress to require a uniform through export bill of lading and to have the terms prescribed by the commission seems clear. At the hearing the discussion centered principally upon the forms proposed by the National Industrial Traffic League and by the Eastern carriers. In discussing these the commission says:

"The shippers seek the benefit of full common-carrier liability from starting point to final destination. The carriers wish to restrict their liability to the lowest degree consistent with the law.

"In view of the confusion which appears to exist it is appropriate to point out the difference between our functions and

those of the courts respecting bills of lading. There are innumerable provisions which, if agreed to by the parties and incorporated in a bill of lading, might be sustained by the courts as reasonable, and the variations of language in which such provisions might be expressed are almost infinite. The courts determine the validity of such provisions just as they do in the case of other contracts, and do not consider whether or not particular provisions, not contrary to the law, should be included or omitted. We, on the other hand, must deal with the terms of the bill of lading as rules and regulations which affect the value of the service rendered to the shipper in the same way as it is affected by rules and regulations published in the carriers' tariffs.

"Viewed as an administrative matter, the question of what rules and regulations are reasonable, or will be reasonable for the future, in connection with the transportation covered by the bill of lading, depends principally upon the adjustment of the carrier's compensation to the degree of risk which it incurs. That degree of risk is reflected in operating expenses. The greater the risk, the greater is the value to the shipper of the service rendered, which should be rewarded correspondingly. A lesser compensation is appropriate in cases where the carrier is to a large extent relieved from the full liability of common carriers.

In other words, the question before us is not merely whether certain provisions would or would not be valid if incorporated in a contract between the parties, but is rather: What should be the terms of the contract of carriage, the charges for which we are authorized and required to regulate? It must be borne in mind that section 15a of the Interstate Commerce Act imposes upon us the duty of initiating rates which shall yield to the carriers . . . a fair return upon the value of their property."

A form is prescribed (Appendix D) with rules applying to the service "until delivery at the port of export," in connection with ocean carriers whose vessels are registered under the laws of the United States, for the transportation of property from points within the United States . . . to points in non-adjacent foreign countries.

### No Early Reduction in Coal Rates To Be Expected

J. D. A. Morrow, vice-president of the National Coal Association, has issued a statement characterizing as "baseless" reports in various parts of the country to the effect that a reduction in freight rates on coal might be expected within the next few days.

"There is absolutely no foundation for these reports," said Mr. Morrow. "Careful inquiry here from all official sources concerned justifies the definite statement that no freight reductions on coal shipments may be expected while general rate reductions are under consideration by the Interstate Commerce Commission. This precludes the slightest probability of any such coal freight reductions before next Spring at the earliest.

"The commission, which begins its general hearings today, will not finish with the shippers alone, it is understood, until January 9 and not until after that time can there be definite consideration of reductions. It is quite clear, with the time needed to prepare tariffs and put them into effect, that no freight reduction on coal shipments in the United States can be expected before next April. Shipments of bituminous coal from the mines are going out at the rate of only about 7,000,000 tons a week, an extremely low output. A part of the explanation for this decrease in the movement of coal has been the circulation of rumors that the rates on coal were to be immediately reduced.

"Every coal producer and distributor will perform a service to his customers if he will make these facts unquestionably clear to them and let them understand the danger to their own interests in paying any attention to groundless rumors of imminent coal freight reductions."

SIX ELECTRIC LOCOMOTIVES left for foreign markets during October. Five of these valued at \$228,345, went to Brazil for the new electrification equipment being installed there; one, invoiced at \$8,500, went to British South Africa.—Bureau of Foreign and Domestic Commerce.

## Commission and Court News

### Interstate Commerce Commission

The commission has suspended until April 9, the operation of items published in a supplement to Agent W. J. Kelly's tariff, insofar as they effect reductions in the rates on sub-limed lead from Central Freight Association territory to Trunk Line territory.

The commission has suspended from December 15 until April 14, 1922, the operation of certain schedules published in a supplement to Agent J. J. Cottrell's tariff which propose increased rates on refined sulphate of magnesium (epsom salts) from Eastern and Virginia cities to Johnson City, Tenn.

The commission has suspended until April 9, the cancellation of commodity rates on wooden paving block material from Alabama, Florida and Georgia to Norfolk, Va., etc., as published in supplements to Agent J. H. Glenn's tariff, effective December 10. After the date of cancellation it is proposed to apply the existing rate on lumber.

The commission has issued a decision modifying the rules and regulations made in its previous order prescribing the form of a uniform domestic bill of lading to conform to the regulations of the interstate commerce act as amended by the transportation act and also prescribing rules and regulations for the form of a uniform livestock contract.

The commission has suspended until April 8, the operation of certain schedules published in a supplement to a Central of Georgia, reducing by tariff 5 cents a ton the rates on coal from Alabama mines to Gulf Ports when for hunkerage or for export, or when for points in Florida and Texas accessible by water, but an increase of 20 cents a ton when handled through tippie for other purposes.

The commission has further suspended until February 2 the operation of schedules published by the Chicago, Rock Island & Pacific which provide that the rates on forest products, carloads, from points in Arkansas and Louisiana to destinations in Central Freight Association territory and Canada, applying through Memphis, Tenn., and Louisville, Ky., will not be subject to transit privileges such as yarding, grading, drying, dressing or further manufacture en route between points of origin and destinations, subjecting shipments accorded such privileges to local rates to and from transit points, the operation of which was suspended until January 3, 1922, by an order previously entered.

### Commission Declines to Allow Continuation of Reduced Ore Rates

The Interstate Commerce Commission on December 12 declined to issue special permissions under the sixth section of the interstate commerce act to allow carriers in eastern territory to continue, to March 31, reduced rates on iron ore. Shippers at Buffalo, Cleveland, Erie, Chicago and other lake ports protest that the proposed rates result in undue discrimination against them and preference for competing furnace interests at Pittsburgh and other interior points.

The commission issued a notice saying:

"Coal and iron ore are two of the important elements entering into steel manufacture. Most of the iron ore used in the east comes from Minnesota by lake. Lake front furnaces, therefore, pay no rail freight charges on ore but transport their coal by rail from Pittsburgh and other interior points. Interior furnaces on the other hand, while paying rail freight from Lake Erie ports on ore, are in most cases located in close proximity to the coal fields and pay only short haul rates on coal.

"In 1917, iron ore was transported from Lake Erie ports to Pittsburgh for 82 cents a ton, whereas coal was charged

\$1.40 from Pittsburgh to Buffalo. Iron ore rates in the east were not increased during federal control, but coal rates were increased approximately 25 per cent. Rates on both commodities were increased in August, 1920, resulting in rates on ore and coal of \$1.14 and \$2.51, respectively.

"Under the adjustment now proposed by eastern railroads the ore rate would be 82 cents or the same as in 1917, whereas the coal rate would continue \$2.51, including the increases of 1918 and 1920 and being higher by \$1.69, or 206 per cent, than the ore rate. The rates on iron ore which will apply after January 1, 1922, will include materially less increase over the pre-war basis than rates on commodities generally—even less than the reduced rates on farm products soon to be made effective.

"The action of the commission is in no sense to be interpreted as a disinclination to approve justifiably lower rate levels, but is based upon the continuance of premature reductions confined to certain rates, the outcome of which is to unduly prejudice iron and steel manufacturers located on the lake front to the advantage of competing interior furnaces."

### I. C. C. Prescribes Form of Time and Train Records, Beginning Next July

The Interstate Commerce Commission has issued an order prescribing the method and form of records to be kept by carriers relating to the time on duty of employees and the movement of trains, including time return and delay report of engine and train employees; daily time report of employees who use the telegraph for orders, etc., pertaining to train movements; dispatcher's record of movement of trains (the regular daily train sheet) and station record of train movements. This latter, like the other records, requires each employee to enter the times at which he goes on and off duty.

The order goes into effect on July 1, 1922, and the order of the commission concerning train delay reports, issued on June 12, 1912, is rescinded upon the taking effect of the new order.

## State Commissions

The Public Utilities Commission of the State of Michigan has set January 18, 1922, for a hearing on the application of the Pere Marquette for authority to abandon its branch lines from White Cloud to Big Rapids; from Haynor to Sheridan; from Leota to Harrison, and from Ionia to Lyons.

The Public Utilities Commission of the State of Michigan at a hearing on December 6 at which were present representatives of the Michigan Manufacturers' Association and of more than 20 railroads, decided to defer, until next month, consideration of the association's petition for a substantial reduction in intra-state freight rates.

## Court News

### Escape of Livestock Before Loading

A railroad maintained stockyards, and also a plot of ground on which cattle were customarily held preparatory to shipment and where prospective shippers were directed to feed, water and hold their cattle while awaiting access to the stockyards. While there, 60 head of cattle wandered through unprotected openings in spoil banks of an artificial reservoir maintained by the railroad, and off steep banks into an open space of thin ice and deeper water, causing the loss of 44 head. In an action against the Agent in charge of railroads, a North Dakota jury returned a verdict for the plaintiffs for \$2,640. The trial court, on motion, ordered judgment for the defendant notwithstanding the verdict. The North Dakota Supreme Court reverses the order and orders judgment on the verdict, holding that the railroad's breach of duty and the shippers' contributory negligence were questions of fact for the jury.—*Booke & Olson v. Payne*, 184 N. W. 803.

## Louisville & Nashville Not Bound

### To Provide Telegraphic Service

A telegraph company having by decree been required to remove its poles, etc. from a right of way, and having sold the poles, etc., to the railroad, which used them only in the operation of its road, the Alabama Supreme Court holds that the sale did not require the approval of the Public Service Commission, being the legitimate result of the decree following upon section 3867 of the Alabama Code, in effect declaring it to be the public policy of the state that the telegraph company should no longer be allowed to maintain its lines on the right of way; and the railroad could not be required by the Commission to maintain a public telegraph service to the towns and villages affected by the sale.—Alabama P. S. C. v. L. & N. (Ala.), 89 So. 524

### Decisions Under Federal Employers' Liability Act

The Minnesota Supreme Court holds that an engineman who was taking a number of empty cars from a point on a spur line to a yard on the main line in the same state, where they were to be put upon a siding used where convenience required, the cars having no further present destination, was not within the act.—Kraemer v. Chicago & N. W. (Minn.) 181 N. W. 847.

The New York Appellate Division holds that an engineman, injured by the escape of carbon monoxide gas when returning from performing an interstate service with his engine, which he was about to put up for the night, was within the federal act and not within the state Workmen's Compensation Act.—O'Brien v. U. S. R. A., 194 App. Div. 63, 185 N. Y. Supp. 447.

The Court of Appeals of Kentucky holds that, where an engineman was called for an interstate trip and began preparations, during which he went through the yards to procure oil for the journey and was killed on returning, he was engaged in interstate commerce, so that action for his death must be brought under the federal act.—Hines v. Burns' Adm. (Ky.) 226 S. W. 109.

The Delaware Superior Court holds that an employee injured while directing the moving of a coal car from one point to another in a yard connecting with the sleeping car company by which he was employed, was not within the act.—Pullman Car Lines v. Riley (Del.) 114 Atl. 920.

The California District Court of Appeals, Second District, holds that an employee, in general shops, repairing an engine, which had been used in interstate commerce, who, while tapping the boiler, was injured in the eye by a piece of steel blown from the exhaust of a compressed air motor operated by men working near him, was within the federal act and not within the state Workmen's Compensation Act.—Payne v. Industrial Accident Commission of California (Cal.) 195 Pac. 81.

The Pennsylvania Supreme Court holds that where a train engaged in interstate commerce is disabled and taken to a repair shop before continuing in such service, the delay in the repair shop does not suspend the interstate character, and an employee injured while working on the train in the repair shop is engaged in interstate commerce.—Koons v. P. & R. (Pa.) 114 Atl. 262.

The Pennsylvania Supreme Court holds that a claimant under the state Workmen's Compensation Act for the death of a train inspector killed while returning from work after inspecting several trains, some of which were interstate, has the burden of proving that the last train inspected was an intrastate train; following *Polk v. Philadelphia & Reading*, 41 Sup. Ct. 518, and *Di Donata v. Same*, 41 Sup. Ct. 516, holding that there is no presumption, that the duties performed in works partaking of interstate and intrastate commerce were performed in the latter.—Scanlon v. Payne (Pa.) 114 Atl. 493.

The New York Court of Appeals holds that a terminal railroad, switching indiscriminately foreign and domestic cars, must be classed, when handling interstate or foreign shipments, as an instrumentality of interstate or foreign commerce, subject to the act, whether or not it knows that the particular cars are interstate or foreign.—Cott v. Erie (N. Y.) 131 N. E. 737.

The Texas Court of Civil Appeals holds that an employee engaged in the repair of an engine in the roundhouse after completion of its round trip, was not within the act, although the engine was used in interstate and intrastate commerce both before and after being placed in the roundhouse for repairs.—Payne v. Wythe (Tex.) 233 S. W. 609.

The New York Appellate Division holds that a trackman on a

railroad incidentally engaged in interstate commerce, in a gravel pit not on the railroad's premises, hurt while loading gravel for ballast for the right of way, was not engaged in interstate commerce.—Malandrino v. Southern New York Power & R. Co., 190 App. Div. 735.

The California Supreme Court holds that a train which carried mail coming from and destined to points outside the state was engaged in interstate commerce.—Baker v. Southern Pacific (Cal.) 193 Pac. 765.

## United States Supreme Court

### Failure to Allow Creosoting-in-Transit

#### Held Not Discriminating

The Supreme Court of the United States has reversed the decree of the federal district court for New Jersey, denying, without written opinion, the application of the Central Railroad of New Jersey, the Pennsylvania and 21 other railroads to enjoin the enforcement of an order of the Interstate Commerce Commission. The defendants in the suit were the United States and the Interstate Commerce Commission. The Commission, upon a petition of the American Creosoting Company ordered these 21 carriers to establish the creosoting-in-transit privilege at Newark, N. J. (*American Creosoting Co. v. Director General*, 61 I. C. C. 145). The petitioner had a creosoting plant which was connected by tracks with the Central and the Pennsylvania; these carriers had failed to establish there the privilege known as creosoting-in-transit; this failure was claimed to be unjust and unreasonable and also unjustly discriminatory in violation of section 3. The Commission found that failure to establish this transit privilege was not unjust or unreasonable and denied relief under section 1. But it found that this failure subjected the Creosoting company to unjust discrimination; and granting relief under section 3, the Commission directed that the discrimination be removed by the railroads, the appellants before the Supreme Court.

The Supreme Court's opinion, by Mr. Justice Brandeis, reads, in part:

"It is urged (by the creosoting company) that while the undue prejudice found results directly from the individual acts of southern and mid-western carriers in granting the privilege locally, the appellants (the railroads), as their partners, make the prejudice possible by becoming the instruments through which it is applied. Discrimination may, of course, be practiced by a combination of connecting carriers as well as by an individual railroad; and the commission has ample power under section 3 to remove discrimination so practiced. The *St. Louis & Southwestern v. United States*, 245 U. S. 136, 144. But participation merely in joint rates does not make connecting carriers partners. They can be held jointly and severally responsible for unjust discrimination only if each carrier has participated in some way in that which causes the unjust discrimination; as where a lower joint rate is given to one locality than to another similarly situated [citing cases]. If this were not so, the legality or illegality of a carrier's practice would depend not on its own act, but on the acts of its connecting carriers. If that rule should prevail, only uniformity in local privileges and practices or the cancellation of all joint rates could afford to carriers the assurance that they were not in some way violating the provisions of section 3.

"What Congress sought to prevent by section 3, as originally enacted, was not differences between localities in transportation rates, facilities and privileges, but unjust discrimination between them by the same carrier or carriers. Neither the Transportation Act, 1920, nor any earlier amendatory legislation has changed, in this respect, the purpose or scope of section 3."—*Central Railroad of New Jersey et al. v. United States et al.* Decided December 5, 1921.

THE DIRECTORS of the Chicago, Burlington & Quincy have authorized a pension plan for the employees of that road. Prior to the announcement of the plan, a study is being made of the pension systems of other roads.

## Foreign Railway News

### Serbia to Receive German Locomotives

LONDON.

The kingdom of the Serbs, Croats and Slovenes will receive on account of reparation 50 locomotives and 2,500 freight cars from Germany.

### Austrian Cars Allotted to Italy

LONDON.

The conference of the states of the former Austro-Hungarian Monarchy at Cortorose has decided that 2,000 Austrian cars are to be transferred to the Italian State Railway Administration.

### Stinnes a Locomotive Builder

LONDON.

It is reported that the factories purchased by Hugo Stinnes in Rumania have begun the construction of 2,000 locomotives for the Russian Soviet Government.

### Italy to Reorganize the South Russian Railways

LONDON.

According to the new Italian-Russian economic treaty, the Italian Government is to undertake the reorganization of the railways in South Russia and will send to Odessa 100 Italian locomotives and a large number of Italian workmen and engineers.

### Rumania to Build Rolling Stock

LONDON.

The Societe Franco-Roumaine du Materiel du Chemin de Fer has been formed in Bucharest for the construction of railway rolling stock. On the other hand, the Rumanian State Railway Administration has ordered 150 locomotives and 1,500 freight cars from Germany.

### Construction in Argentina

Work continues on the Salta-Huatiquina Railway, in Argentina, according to Commerce Reports. Consul General Robertson at Buenos Aires reports that the Chilean government has informed the Argentine government that construction on the Antofagasta-Huatiquina section is receiving preferred consideration. It is expected that work will soon begin on the line from Embarcacion to Yacuiba on the eastern frontier of Bolivia.

### Electrification of Hungarian State Railways

LONDON.

The Hungarian State Railway Administration has decided to electrify 870 miles of line. The plans for the electrification call for completion in about four years. By electrifying these lines the Hungarian State Railway will, it is said, save 800,000 tons of coal yearly and reduce the consumption of coal to 1,500,000 tons. It is estimated that if all the railways are electrified there will be no need for Hungary to import coal.

### Daniels' Automatic Train Stop

J. J. Daniels is the inventor of a mechanical trip automatic train stop which has been installed, for experiment, on the track of the Great Eastern Railway of England, at Bruce Grove, on the Enfield branch. The apparatus is described in the *Railway Gazette* (London) of November 4. The track member is enclosed within a case, sandproof and snowproof; and the engine member is a jointed rod, carrying at its lower end a rubber tired wheel. There are three engine members, arranged side by side, these members coming in contact with different track members arranged for different indications.

### Britain Active in Peru

British-Canadian interests and the Peruvian government are approaching an agreement whereby the Britons are to construct some 1,500 miles of railway in various parts of Peru and receive in return large grants of agricultural and mineral lands, according to the *Times* (London). Negotiations are reported to have gone so far that the government is prepared to send the contracts to congress for ratification as soon as assurance is given by the enterprisers of their financial ability to complete the undertaking.

### Boiler Explosions in Great Britain

According to the annual railway accident reports of roads in Great Britain during the 20 years, 1901 to 1920 inclusive, 99 cases of bursting of boilers or tubes of locomotives occurred in that period, resulting in seven railway employees being killed and 111 injured. According to *The Engineer*, from which these figures are taken, the reports do not distinguish between explosions of boilers and explosions of tubes but as in all but six cases employees were injured, the consequences were apparently serious on each occasion.

### Locomotive Exports in October

Because of a shipment of 52 locomotives to Mexico during October, the month's total mounted to 92. The September total was but 36. The detailed figures by countries as prepared by the Bureau of Foreign and Domestic Commerce are as follows:

Countries	Number	Dollars
Salvador .....	3	75,000
Mexico .....	52	1,870,270
Cuba .....	2	70,000
Dominican Republic .....	1	11,800
Brazil .....	10	334,300
Colombia .....	3	89,000
China .....	19	1,027,000
Japan .....	1	13,250
Philippine Islands .....	1	18,820
Total .....	92	3,509,440

### Exports of Car Wheels and Axles in October

Exports of car wheels and axles in October were valued at \$142,895 in October, as compared with only \$90,574 during the previous month. Detailed figures by countries, as compiled by the Bureau of Foreign and Domestic Commerce, follow:

Countries	Dollars	Countries	Dollars
Canada .....	33,736	Peru .....	3,463
Costa Rica .....	2,287	Uruguay .....	865
Honduras .....	1,961	Venezuela .....	876

Dominican Republic .....	2,537	Philippine Islands .....	332
Argentina .....	100	British East Africa .....	834
Brazil .....	470		
Chile .....	189	Total .....	142,895
Colombia .....	1,480		

### Stinnes' Visit to London Calls Forth Comment

The visit of Hugo Stinnes, the German capitalist, to London has called forth much comment in the German Press, according to the *Economic Review* (London). The papers of the Left (i. e. radical) are somewhat violent, the "Freiheit" calling Stinnes a megalomaniac and reproaching him with having attempted to wreck Spa negotiations. Its present intention, says the journal, is to mobilize the Entente against Germany in order to carry out his plan of having the German railways transferred to his management. The *Frankfurter Zeitung*, while deprecating personal attack, considers that Stinnes will make use of his stay in London to justify to Germany's powerful creditors the plausibility of the intention of the German industries with regard to the railways. One of Stinnes' own journals, the *Deutsche Allgemeine Zeitung*, openly pleads for the transference of the railways to private management. The state, it claims, lacks the three pre-requisites for carrying on great undertakings—discipline, credit and permanent economic conditions. It is not a matter of pure expediency, but under the circumstances that have developed a matter of stern necessity that the state

should relinquish its present form of management of large undertakings. When once it has been realized that the deficit in the budget is largely due to the state undertakings, Germany must have the courage to put an end to this disastrous state of affairs. Meanwhile the minister of railways, Herr Groener, at an interview accorded to press representatives in Berlin on November 19, expressed himself as resolutely opposed to the denationalization of the railways.

### Car Exports in October

No passenger cars were exported in October and but 83 freight cars, valued at \$278,412. Parts of cars shipped totaled \$425,750. Detailed figures by countries, as compiled by the Bureau of Foreign and Domestic Commerce, follow:

Countries	Freight and Other		Parts of Cars Dollars
	Number	Dollars	
Belgium .....	..	..	4,967
France .....	..	..	569

### Paulista Railway Begins Electric Operation

The freight locomotives recently shipped by the Westinghouse Electric & Manufacturing Company to the Paulista Railway of Brazil are now in service in that country between Jundiahy and Louveira. These locomotives haul trains of from 43 to 45 units over grades as steep as 1.5 per cent. The so-called "unit car" is of 10 tons gross weight and the term refers to the old wooden car of 30 years ago. Modern cars are said to be two, three or four units according to their size and load. Thus a train of 45 units represents 450 tons weight and is approximately 675 ft. long.

Under former steam operation such trains could not be carried over a 1.5 per cent grade at a speed greater than about nine miles an hour. The electric locomotives make such grades at 29 miles an hour.

### Locomotive Repairing in Soviet Russia

One day I suggested to Lenin that better transport would mean better food and raw material; more food and material would mean better workmen; better workmen would mean better production; better production would mean better locomotives; and better locomotives would mean better transport; also that without better transport there could be no hope of industrial betterment, that better transport required better locomotives and better locomotives again depended upon locomotive repair, so that the fundamental and first step in betterment should be locomotive repair. That, like electrification later, became a slogan of the administration. An order was issued that locomotives requiring repair should be taken into all factories, and that for every locomotive repaired the crew of workmen should receive a bonus in Soviet cash and in addition be permitted to take the locomotive for a trip into the country and bring food for themselves.

As a result we had the strange spectacle of locomotive repairing shoved into all kinds of plants where previously

there had been no spur tracks, no pits and no appropriate equipment or skilled workmen. At the same time, all the locomotive building and repair plants of Russia were standing practically idle. The order was that locomotive repairing should be taken only where it did not interfere with regular production. As there was no regular production worth mentioning, that was not a serious consideration, but if there had been it would have been destroyed by the upheaval. In sight of the bonus and the trip to the country, the locomotives got only a lick and a promise with the further advantage to the workers that they were soon back for a further bonus and another trip to the country—Royal R. Keely in the American Machinist.

### Track Material Exports in October

Exports of track materials dwindled to small totals in October—1,035,484 lb. of spikes, valued at \$41,780; 9,976 tons of steel rails, valued at \$362,527, and switches, frogs, etc., valued at \$194,855. The totals by countries, as compiled by the Bureau of Foreign and Domestic Commerce, are as given below:

Countries	Railroad spikes Pounds	Rails of steel Tons	Switches, frogs, splice bars, etc. Dollars
Denmark .....	..	..	830
France .....	..	..	12
Norway .....	..	..	503
England .....	..	..	787

## Equipment and Supplies

### Locomotives

THE CENTRAL OF NEW JERSEY is asking for prices, it is reported, on 25 Mikado type locomotives.

THE SIERRA RAILWAY OF CALIFORNIA has ordered 1 Mogul type locomotive from the Baldwin Locomotive Works.

### Freight Cars

THE GRAND TRUNK is inquiring for 250 refrigerator cars of 30-ton capacity.

THE VERDE TUNNEL & SMELTER RAILROAD is inquiring for 100 or more, hopper ore cars, of 60-ton capacity.

THE WARNER SUGAR REFINING COMPANY, 79 Wall street, New York City, is inquiring for 10 steel logging cars to be 36 feet long and to have a capacity of 30 tons.

THE CENTRAL OF GEORGIA, reported in the *Railway Age* of December 10 as contemplating the purchase of freight cars is now inquiring for 500 box cars of 40-ton capacity.

THE SEABOARD AIR LINE is now inquiring for prices on 1,500 ventilated box cars of 40-ton capacity, 200 flat cars with steel underframes, of 40-ton capacity and 300 steel phosphate cars of 50-ton capacity.

THE NORTHERN PACIFIC reported in the *Railway Age* of December 3, as inquiring for 1,200 steel center frame constructions, has ordered this equipment from the Western Steel Car & Foundry Co. These are to be applied to box cars in the railroad company's shops.

### Passenger Cars

THE HUDSON & MANHATTAN is inquiring for 25 steel motor cars.

THE LONG ISLAND is inquiring for 40 motor cars for electric service, and 10 steel coaches for steam service.

THE ILLINOIS CENTRAL is inquiring for 5, 72-ft. steel suburban cars.

THE BOSTON & MAINE will apply Commonwealth platforms and steel underframes to 100 passenger cars in its own shops.

THE PERE MARQUETTE is inquiring for 2 steel dining cars and contemplates asking for prices in the near future on additional cars for passenger service.

THE PHILADELPHIA & READING has ordered 30 coaches and 5 combination baggage and smoking cars from the Bethlehem Shipbuilding Corporation, Harlan Plant, and 15 coaches from the Standard Steel Car Company.

### Machinery and Tools

THE CHICAGO, ROCK ISLAND & PACIFIC has issued a list of about 70 machines, many of large type, which may aggregate in value about \$800,000 on which it is inviting bids. The list includes presses, cutters, grinders, lathes, shapers and two power hack saws.

### Signaling

THE PENNSYLVANIA has awarded a contract for one 56 lever Model 2 unit lever type electric interlocking machine and one operating switchboard for installation at Rochester, Pa., to the General Railway Signal Company. The machine will have 38 working levers and 18 spare spaces and the installation will be made by railroad forces.

## Supply Trade News

THE General Contracting & Engineering Company has removed its office from 280 Broadway to new and larger offices in the Barrett building, 40 Rector street, New York City.

Andrew Fletcher, president of the American Locomotive Company, has been elected a director of the American Car & Foundry Company to fill the vacancy on the board caused by the resignation some time ago of Walter G. Oakman.

Charles F. Smith has been elected chairman of the board of directors of the New Britain Machine Company, New Britain, Conn., succeeding F. G. Platt, who resigned on account of ill health. Mr. Smith is chairman of the board of directors of Landers, Frary & Clark, New Britain, and was formerly chairman of the board of the American Hardware Corporation.

The Greenfield Tap & Die Corporation, Greenfield, Mass., has consolidated its small tool and drill divisions. P. T. Irvin, formerly manager of its drill division, is in charge of the consolidation, which will be called the small tool division. Mr. Irvin has for the past three years been sales manager of the Lincoln Twist Drill Company and prior to that was sales manager of Wells Brothers Company, Greenfield.

Arthur P. Bowen, whose election as vice-president of the Ryan Car Company, Chicago, was noted in the *Railway Age* of December 3 (page 1120), was born in Chicago on February

A. P. Bowen

27, 1864, and entered business in 1881 as a clerk in the Continental National Bank of that city. Five years later he left the banking field to enter the retail coal business. After a wide experience in the coal business, both in the promotion and selling branches, Mr. Bowen became purchasing agent of the Western Steel Car & Foundry Company, Chicago, in 1904, continuing his duties with the Pressed Steel Car Company as director of purchases, when the last named company acquired the former interests. In 1910, he resigned from the Pressed Steel Car Company to enter the service of the Republic Iron & Steel Company, and one year later was appointed director of purchases and stores of the Pullman Company. During the last year of the war, Mr. Bowen served as acting treasurer of the Pullman Company.

The Cincinnati Shaper Company and its subsidiary, the Cincinnati Gear Cutting Machine Company, have arranged for a branch sales office in Indianapolis, Ind., with headquarters at 940 Lemcke annex. T. C. McDonald, who has been appointed local representative at Indianapolis, will cover the Indianapolis and Louisville districts, also certain states in the southwest, and will continue as local representative of the Reed-Prentice Company.

Anton Becker, for 15 years connected in official capacities with The Ralston Steel Car Company, Columbus, Ohio, has resigned to enter the railroad supply business. He has organized The Becker Sales Company with office in the Union Central building, Cincinnati, Ohio. In connection with railroad specialties The Becker Sales Company will also have the sales representation of The Ralston Steel Car Company, in certain territory in middle western states.

## Railway Construction

**BALTIMORE & OHIO**—This company, in conjunction with the Pennsylvania and the Erie, contemplates the elimination of the crossing of Forge street at Akron, Ohio.

**CANADIAN NATIONAL**—This company has awarded a contract to G. M. McLeod, Winnipeg, Man., for the construction of a pedestrian subway under its tracks at Dauphin, Man. This same company has awarded a contract to J. H. Simmons, Winnipeg, Man., for the construction of a frame warehouse at Prince Rupert, B. C.

**CANADIAN PACIFIC**—This company contemplates the reconstruction of a station at Schreiber, Ont., to cost about \$80,000. The former station was destroyed by fire last winter, since which time business has been carried on in a temporary frame structure.

**CHAFFEE RAILROAD**—The Interstate Commerce Commission has issued a certificate authorizing this company to operate a line from Vindex, Md., to a connection with the Western Maryland at Chaffee, W. Va., approximately  $3\frac{1}{2}$  miles, formerly operated by the Chaffee Coal Company as a plant facility.

**CHICAGO & NORTH WESTERN**—This company contemplates the construction of a station at Sterling, Ill.

**CHICAGO, BURLINGTON & QUINCY**—This company contemplates the construction of a freight and passenger station at Aurora, Ill.

**ERIE**—This company has applied to the New York authorities for permission to construct a pier, 100 ft. by 800 ft., two stories high, at Weehawken, N. J., replacing one of four recently destroyed by fire.

**GULF, COLORADO & SANTE FE**—This company has started the construction of a subway under its three tracks at South Adams street, Fort Worth, Tex., the work involving the placing of 1,000 yards of concrete, 9,000 yards of embankment for the raising of the grade and 7,000 yards of excavation.

**HOLLY SUGAR CORP., DENVER, COLO.**—This corporation contemplates the construction of a 15-mile railroad extending from Hardin, Mont., to Foster, at an estimated cost of \$300,000. This will open an area where this corporation has a large sugar beet acreage. The Chicago, Burlington & Quincy has been considering the possibility of building this extension in connection with a new line it will construct in that vicinity.

**NEW YORK CENTRAL**—This company will receive bids until 12 o'clock, noon, December 20, for two complete 100 ft. turntables with circular rims. It will also receive bids until the same time for overhead contact supports for its suspension bridge at Corning, N. Y.

**NEW YORK, NEW HAVEN & HARTFORD**—This company has awarded a contract to the Roberts & Schaeffer Company, Chicago, for two 1,200-ton capacity, three-track automatic electric coaling plants to be erected at East Hartford, Conn., and Providence, R. I., at cost of \$110,000.

**PACIFIC GREAT EASTERN**—This company contemplates the reconstruction of its wharves at Squamish, B. C., which were recently washed away by heavy floods. The work is estimated to cost about \$120,000.

**SOUTHERN**—This company contemplates the construction of a station at Riceville, Tenn.

**SOUTHERN PACIFIC**—This company contemplates the construction of a station at Currie, Tex., with company forces.

**SOUTHERN PACIFIC**—This company, which was noted in the RAILWAY AGE of December 3 (page 1121), as contemplating the construction of a levee fronting its yard at Algiers (New Orleans), La., has reached a final agreement with the Orleans Parish Levee Board, and will begin construction about February 1, 1922. The project is estimated to cost \$185,000, of which, \$25,000 will be contributed by the Levee Board in consideration of the public interest in the levee.

## Railway Financial News

**ALABAMA, TENNESSEE & NORTHERN**—*Authorized to Issue Securities*—The Interstate Commerce Commission has granted authority for the issuance of \$100,000 of prior lien mortgage 30-year, 6 per cent gold bonds, \$372,000 of 6 per cent equipment trust notes and for the pledge of these securities, together with \$100,000 of similar bonds as security for a loan from the revolving fund.

**CENTRAL NEW JERSEY**—*Petition Against Sale of Coal Stock*—A petition was filed in the United States District Court at Philadelphia on December 9 by the Continental Insurance Company and the Fidelity-Phoenix Insurance Company of New York asking the court to set aside the sale of the Lehigh & Wilkes-Barre Coal Company stock to the Reynolds syndicate, and to order the sale of the stock to the Franklin Securities Corporation, whose bid, the petitioners assert, exceeded the Reynolds offer by at least \$2,000,000. The petition asserts that if the sale to the Reynolds syndicate is confirmed, it will result in great and irreparable damage and injury to the Jersey Central stockholders.

The sale of the stock of the Lehigh & Wilkes-Barre Coal Company was noted in the *Railway Age* in the issue of November 26, 1921, page 1059.

**CHICAGO, INDIANAPOLIS & LOUISVILLE**—*Dividends Declared*—This company has declared a dividend of  $1\frac{1}{2}$  per cent on the common stock and the regular semi-annual dividend of 2 per cent on the preferred stock, both payable December 29 to stock of record December 21. The last dividend on the common stock was  $1\frac{1}{2}$  per cent declared in June, 1920, and before that none had been declared since December, 1917.

**GREAT NORTHERN**—*Asks Authority to Issue Bonds*—This company has filed an application with the Interstate Commerce Commission for authority to issue \$30,000,000 of general mortgage 5½ per cent gold bonds dated January 1, 1922, and maturing in 1952, not to be redeemable before maturity. It is proposed to sell the bonds prior to March 1 to a banking syndicate for the purpose of providing funds to repay a loan of \$15,000,000 from the United States Government maturing March 1, to pay \$2,800,000 of first mortgage bonds of the Minneapolis Union maturing July 1, \$5,040,000 for new equipment and improvements to existing equipment and the balance for additions and betterments.

**MANCHESTER & ONEIDA**—*Authorized to Issue Bonds*—The Interstate Commerce Commission has authorized the issuance of \$65,000 of new first mortgage 6 per cent bonds to be exchanged for a like amount of first mortgage 5 per cent bonds now outstanding.

**MINNEAPOLIS, ST. PAUL & SAULT STE. MARIE**—*Authorized to Abandon Line*—The Interstate Commerce Commission has issued a certificate authorizing the abandonment of a branch line of 3.9 miles in Crow Wing County, Minn.

**MISSOURI & NORTH ARKANSAS**—*Application for Loan*—Application has been made to the Interstate Commerce Commission for a loan of \$3,500,000 to pay receivers' certificates and floating indebtedness and to provide \$750,000 for expenditures on the road.

**OREGON SHORT LINE**—*Asks Authority to Issue Bonds*—This company and the Union Pacific have filed an application with the Interstate Commerce Commission for authority to issue \$16,424,000 of 5 per cent bonds under the consolidated mortgage of the Oregon Short Line, maturing July 1, 1946, to be guaranteed by the Union Pacific, to provide for the payment and refunding of \$14,931,000 of first mortgage bonds of the Oregon Short Line maturing February 1.

**TERMINAL RAILROAD ASSOCIATION OF ST. LOUIS**—*Asks Authority to Sell Bonds*—This company has applied to the Interstate Commerce Commission for authority to sell \$65,000 of its general mortgage 4 per cent bonds.

**UNION PACIFIC**—*Guaranty of Oregon Short Line Bonds*—See Oregon Short Line.

### More Equipment Trusts Sold

The director-general of railroads has announced additional sales of railroad equipment trust certificates, held by the government as follows:

To Alfred Borden and Farmers Loan & Trust Company, of New York, Ft. Worth & Denver City, 1922 to 1935, inclusive, \$474,600; to Robinson & Co., of New York, Kanawha & Michigan, 1922 to 1925, \$966,000; to Third National Bank of Cincinnati and Potter Bros. & Co., New York, Cincinnati, New Orleans & Texas Pacific, 1922 to 1927, \$382,800; to Cassatt & Co., of Philadelphia, Atlantic Coast Line and Louisville & Nashville, lessees of Georgia R. R., 1920 to 1927, inclusive, \$473,400; to Poe & Davies, of Baltimore, Atlantic Coast Line, 1929, \$425,300; making a total of \$2,722,100.

The total of equipment trust certificates sold by the government to date at par plus accrued interest is \$135,632,700.

### Treasury Department Payments

The Treasury Department has issued a statement showing its payments to the railroads under the Transportation Act as of December 1 since its previous statement on November 1. Under section 209 (advance of guaranty) \$16,543 has been paid to the Alabama & Mississippi; under section 212 (partial payments on guaranty) \$10,000 to the Carolina & Northeastern. Under section 210 (loans) payments have been made as follows: Central Vermont, \$128,000; Chicago & Eastern Illinois, \$785,000; Evansville, Indianapolis & Terre Haute, \$50,000; National Railway Service Corporation on account of the Chicago, Rock Island & Pacific, \$460,000; New York, New Haven & Hartford, \$400,000; Norfolk Southern, \$50,000; Western Maryland, \$200,000; Wheeling & Lake Erie, \$260,000. Total payments made by the Treasury under the Transportation Act amounted to \$693,452,894. Repayments of loans from the revolving fund have been made by 12 railroads to the amount of \$21,466,067.

### Tentative Valuations

The Interstate Commerce Commission has issued tentative valuations in which it states the final value of the property owned and used, as follows:

Norwood & St. Lawrence, 1917, property used, \$533,973; property owned, \$533,078.

Louisville & Jeffersonville Bridge Company, 1915, property used, \$2,977,210.

Narragansett Pier, 1916, owned, \$310,000.

Nelson & Albemarle, 1916, used, \$259,960; owned, \$141,825.

Norfolk & Portsmouth Belt, 1916, used, \$1,010,881; owned, \$971,881.

Pecos Valley Southern, 1917, used, \$373,672; owned, \$373,409.

### Railroad Administration Settlements

The United States Railroad Administration reports the following final settlements, and has paid out to the several roads the following amounts: Nashville, Chattanooga & St. Louis, \$700,000.00; Woodstock & Blocton, \$19,000.00; High Point, Randleman, Asheboro & Southern, \$25,000.00. The payment of these claims on final settlement is largely made up of balance of compensation due, but includes all other disputed items as between the Railroad Companies and the administration during the 26 months of federal control.

### Dividends Declared

Chicago & North Western.—Common, 2½ per cent, semi-annually, preferred, 3½ per cent, semi-annually; both payable January 16 to holders of record December 22.

Chicago, Indianapolis & Louisville.—Common, 1½ per cent; preferred, 2 per cent, semi-annually; both payable December 29 to holders of record December 21.

Chicago, St. Paul, Minneapolis & Omaha.—Common, 2½ per cent, semi-annually; preferred, 2½ per cent, semi-annually; both payable February 20 to holders of record February 1.

Joliet & Chicago.—1½ per cent, quarterly, payable January 3 to holders of record December 20.

Lehigh Valley.—Common, 1¾ per cent, quarterly; preferred, 2½ per cent, quarterly; both payable January 7 to holders of record December 17.

Michigan Central.—4 per cent, payable January 28 to holders of record December 30.

Northern Pacific.—1¾ per cent, quarterly, payable February 1 to holders of record December 30.

Pere Marquette.—Prior preferred, 1¾ per cent, quarterly, payable February 1 to holders of record January 14; preferred, 10 per cent, payable January 2 to holders of record December 15.

Western Pacific.—Preferred, 1½ per cent, quarterly, payable January 3 to holders of record December 19.

## Railway Officers

### Executive

Howard Elliott, executive assistant of the American Sugar Refining Company and editor of the New York Traffic club bulletin, has been appointed editor of the Union Pacific

H. Elliott

Magazine, with headquarters at Omaha, Neb. Mr. Elliott was born in Indianapolis, Ind., in 1883, and was educated in the public schools of that city and at the college of law of the University of Southern California, after graduation from which he was admitted to the Los Angeles bar. He entered railway service in 1901 as a messenger for the Illinois Car Service Association and during the next nine years held clerical positions with various western roads. From 1910 to 1917 he was in the service of the Los Angeles & Salt Lake consecutively as secretary to the general manager, secretary of the central safety and efficiency committee and inspector of transportation. From 1915 to 1917 he served as a member of the A. R. A. special committee on grade crossing accidents and of the special committee on the relation of railway operation to legislation in Utah.

Edward W. Mason, whose appointment as vice-president and general manager in charge of operation and maintenance of the Western Pacific, with headquarters at San Francisco,

E. W. Mason

Cal., was announced in the *Railway Age* of November 26 (page 1071), was born at Moberly, Mo., on March 23, 1877. He entered railroad service in June, 1893, as a call boy on the Northern Pacific. After learning telegraphy, he worked as an operator at various stations on the line from the fall of 1895 to 1898. From 1898 to 1899 he was a dispatcher at Missoula, Mont., and from June, 1899, to September, 1900, an operator and ticket clerk at Helena, Mont. From the latter date until September, 1902, he was a dispatcher and night chief dispatcher at Tacoma, Wash., following which he was made trainmaster of the Seattle-Tacoma Interurban, with headquarters at Kent, Wash. He returned to the Northern Pacific in May, 1903, as night chief dispatcher at Missoula, Mont., and in May, 1904, was promoted to chief dispatcher and trainmaster with headquarters at Seattle, Wash. He entered the service of the Western Pacific on November 28, 1909, as car accountant and superintendent of telegraph, and was soon after appointed division superintendent with headquarters at Sacramento, Cal. On August 1, 1916, he was promoted to general super-

intendent with headquarters at San Francisco, which position he held until June 1, 1918, when he left to enter the army as a major in the engineers, serving overseas in the transport corps. He returned to the Western Pacific in September, 1919, as general manager with headquarters at San Francisco, which position he was holding at the time of his recent promotion.

**Edward E. Bashford** has been elected executive vice-president of the National Railways of Mexico with headquarters at New York.

**L. C. Gunter** has been elected president of the Knoxville & Carolina, with headquarters at Knoxville, Tenn. **S. B. Luttrell** was elected vice-president, and **J. A. Wallace**, secretary and treasurer, with the same headquarters. This company was recently organized to take over the Knoxville, Sevierville & Eastern.

### Operating

**F. A. Rutherford**, trainmaster of the Grand Trunk with headquarters at London, Ont., has been appointed to passenger trainmaster with the same headquarters. He will be succeeded by **A. F. Sharpe**, chief dispatcher, who in turn will be succeeded by **W. M. Doherty**.

**R. A. Gamble**, trainmaster of the Winnipeg terminal division of the Canadian Pacific, with headquarters at Winnipeg, Man., has been appointed acting superintendent of that division with the same headquarters, succeeding **R. C. Morgan** who has been granted a leave of absence. **F. W. Stone** has been appointed acting trainmaster to succeed Mr. Gamble. **W. J. Stinson**, assistant superintendent of the Trenton division, with headquarters at Havelock, Ont., has been transferred to London, Ont., succeeding **R. G. Edwards**, and he will be succeeded by **N. McMillan**. **G. M. Cordingley**, dispatcher, has been promoted to chief dispatcher, with headquarters at Saskatoon, Sask., succeeding **A. B. Harshaw**.

**June C. Browne**, assistant superintendent of telegraph of the Missouri Pacific, with headquarters at St. Louis, Mo., has been promoted to superintendent of telegraph, with the same headquarters, succeeding **E. A. Chenery**, deceased. Mr. Browne was born at Richmond, Va., on July 13, 1866. He entered railroad service on December 22, 1882, as a telegraph operator on the Missouri Pacific. On November 7, 1887, he was promoted to manager of the telegraph office. He was made general foreman of telegraph on July 1, 1907, and supervisor of telegraph December 10, 1908. On December 1, 1918, he was promoted to assistant superintendent of telegraph, which position he was holding at the time of his recent promotion.

**C. L. Nichols**, whose appointment as general manager of the Northern Pacific, Lines East of Paradise, Mont., with headquarters at St. Paul, Minn., was announced in the *Railway Age* of December 10 (page 1178), was born at Wyand, Ill. He began railroad work in the service of the Chicago, Burlington & Quincy and since that time has successively been chief dispatcher of the Atchison, Topeka & Santa Fe at Emporia, Kan., trainmaster, with headquarters at Topeka, Kan., and division superintendent, with headquarters at Fort Madison, Iowa; superintendent of the Elgin, Joliet & Eastern, with headquarters at Joliet, Ill.; dispatcher of the Chesapeake & Ohio at Huntington, W. Va.; dispatcher of the Missouri, Kansas & Texas at Sedalia, Mo.; chief dispatcher of the Chicago, Rock Island & Pacific at Horton, Kan., and at Blue Island, Ill., and division superintendent with headquarters at Fairbury, Neb.; superintendent of the Chicago, Cincinnati & Louisville (Chesapeake & Ohio of Indiana), with headquarters at Richmond, Ind., and later at Peru, Ind., and general superintendent, with headquarters at Cincinnati, Ohio; division superintendent of the Chicago Great Western, with headquarters at Des Moines, Iowa; superintendent of the Montana division of the Northern Pacific with headquarters at Livingston, Mont., in 1908, superintendent of the Central district from 1908 to 1912 and general superintendent with headquarters at St. Paul, Minn., from 1912 to

1919. During the latter year he was promoted to assistant to the general manager, with headquarters at St. Paul, which position he was holding at the time of his recent promotion.

**Edwin C. Blanchard**, whose appointment as general manager of the Northern Pacific, Lines West of Paradise, Mont., with headquarters at Tacoma, Wash., was announced in the *Railway Age* of December 10 (page 1178), was born on July 29, 1854, at Wapello, Iowa. He entered railroad service in December, 1874, as a telegraph operator on the Burlington, Cedar Rapids & Northern, now a part of the Chicago, Rock Island & Pacific, which position he held until 1876, when he left to become a telegraph operator on the Kansas Pacific, now a part of the Atchison, Topeka & Santa Fe. He was later promoted to train dispatcher, and from 1882 to 1883 he was a dispatcher on the Denver & South Park. He entered the service of the Northern Pacific in 1883, on which road he has successively held the positions of dispatcher, from 1883 to 1885; chief dispatcher, to 1897; division superintendent, with headquarters at Minneapolis, Minn., to September 1, 1903; division superintendent with headquarters at Duluth, Minn., to April 25, 1909; general superintendent of the eastern district, with headquarters at St. Paul, Minn., to April 25, 1912; and assistant general manager of the lines west of Paradise, with headquarters at Tacoma, up to the time of his recent promotion. The position of assistant general manager has been abolished.

### Traffic

**H. H. Bolton** has been appointed agricultural agent of the Alabama, Tennessee & Northern with headquarters at Mobile, Ala.

**H. R. Bullen** has been appointed assistant general agent, passenger department, of the Canadian National with headquarters at Los Angeles, California.

**J. V. Lanigan**, whose appointment as general passenger agent of the Illinois Central, with headquarters at Chicago, Ill., was announced in the *Railway Age* of December 3 (page

1123), was born at St. Louis, Mo. He entered railroad service as a clerk in the passenger department of the Chicago, Burlington & Quincy, and held various clerical positions with that road until 1904, when he left to become rate clerk in the passenger department of the Missouri, Kansas & Texas. In 1906, he entered the service of the Illinois Central as a rate clerk in the passenger department, and in January, 1908, he was promoted to chief rate clerk of that department. On April 15, 1911, Mr.

Lanigan was promoted to assistant general passenger agent with headquarters at Chicago, which position he was holding at the time of his recent promotion.

**S. G. Reed**, assistant general freight agent of the Southern Pacific, Texas lines, with headquarters at Houston, Tex., has been promoted to assistant to the traffic manager with the same headquarters.

**P. W. Clarkin** has been appointed acting division freight agent of the Canadian National at Charlottetown, Prince Edward Island, succeeding **A. McDonald**, on leave of absence on account of ill health.

**G. E. Bunting** has been appointed general traffic manager of the Canadian National with supervision over all freight

J. V. Lanigan

and passenger traffic in New Zealand and Australia, with headquarters at Auckland, N. Z.

**H. E. MacDonnell** has been appointed special freight traffic representative of the Canadian Pacific. **W. C. Bowles** has been appointed assistant freight traffic manager, Eastern lines, succeeding Mr. MacDonnell.

**Charles P. Gaither** has been appointed foreign freight agent of the Seaboard Air Line with headquarters at Norfolk, Va., with supervision over export and import traffic, including Pacific Coast traffic via the Panama Canal, effective January 1.

**J. F. Hogan**, general agent of the El Paso & Southwestern, and the Morenci Southern, with headquarters at San Francisco, Cal., has been transferred, with headquarters at Chicago, Ill., succeeding F. W. Pullen, who has left to enter other business.

**William Haywood**, whose appointment as general freight agent of the Illinois Central, with headquarters at Chicago, Ill., was announced in the *Railway Age* of December 3 (page 1123), was born at

Lanchester, England, on May 30, 1884. He entered railroad service in October, 1901, as a messenger boy in the office of the traffic manager of the Illinois Central. He was later appointed secretary to various traffic officers, including the vice-president in charge of traffic, and from September 21, 1909, to July 1, 1912, he was secretary to the president. On the latter date he was promoted to chief clerk to the vice-president in charge of traffic, which position he held until April 1, 1917,

when he was promoted to assistant general freight agent of the Northern and Western lines, with headquarters at Chicago. On March 1, 1920, he was promoted to assistant to the traffic manager, with the same headquarters, which position he was holding at the time of his recent promotion. The activities of the general freight department of the Northern and Western lines have been segregated. Mr. Haywood's newly created office will have charge of solicitation and matters related thereto, while C. C. Cameron, general freight agent, with headquarters at Chicago, will have charge of rate adjustments, rate quotations, tariffs, division and other relative subjects, with the exception of coal and coke traffic.

**J. C. Peterson**, general agent of the Minneapolis, St. Paul & Sault Ste. Marie, with headquarters at Winnipeg, Man., has been transferred to Minneapolis, Minn., and will be succeeded at Winnipeg by **C. F. Ronnan**, commercial agent, with present headquarters at Minneapolis.

**Stanton Curtis**, division passenger agent of the Southern, with headquarters at St. Louis, Mo., has been appointed general passenger agent of the Mobile & Ohio, with the same headquarters, succeeding Charles Rudolph, resigned. **D. L. Jones** has been appointed commercial agent, with headquarters at Memphis, Tenn.

**J. L. McCloskey** has been appointed acting general agent of the Canadian Pacific, with headquarters at Juneau, Alaska, succeeding R. F. Richardson, deceased. **T. McNeil**, traffic agent, with headquarters at Liverpool, England, has been promoted to general agent, with the same headquarters. **R. E. Swain** will succeed Mr. McNeil.

**Henry E. Kremer**, whose appointment as assistant general freight agent of the Louisville & Nashville, with headquarters at Louisville, Ky., was announced in the *Railway Age* of

December 10 (page 1178), began railroad service as a clerk in the mailing department of the Louisville & Nashville, at Louisville. Since that time he has been promoted successively through various positions in the rate and tariff departments, including chief tariff clerk, assistant chief clerk and chief clerk to the general freight agent at Louisville, which latter position he was holding at the time of his recent promotion.

**J. W. Stevenson**, whose appointment as assistant general passenger agent of the Illinois Central, with headquarters at Chicago, Ill., was announced in the *Railway Age* of December 3 (page 1123), was born in that city on September 17, 1888. He entered railroad service on July 1, 1903, as a clerk in the offices of the Western Passenger Association at Chicago. On October 7, 1909, he left to become a rate clerk in the passenger department of the Chicago Great Western, which position he held until November 13, 1912, when he entered the service of the Illinois Central as a rate clerk in the passenger department. He was promoted to assistant chief clerk of that department on March 16, 1914, and to chief clerk on May 13 of that year. On March 1, 1920, Mr. Stevenson was promoted to district passenger agent, with headquarters at Chicago, and on April 1, of that year, to chief clerk of the traffic department with the same headquarters, which position he was holding at the time of his recent promotion.

**B. A. Rogers**, whose appointment as assistant general freight agent of the Kansas City Southern, with headquarters at Kansas City, Mo., was announced in the *Railway Age* of November 19 (page 1018), entered railroad service on July 4, 1900, in the general freight office of the Atchison, Topeka & Santa Fe at Topeka, Kan., and through various promotions became rate clerk in the same office. In May, 1904, he was transferred to Chicago as rate clerk, which position he held until May, 1905, when he left to become rate clerk in the vice-president's office of the Chicago & Eastern Illinois. He entered the service of the St. Louis-San Francisco on March 1, 1906, as clerk to the traffic manager, and he was tariff clerk for that road from July 1, 1907, to February 1, 1908. On the latter date he went to the Kansas City Southern as tariff clerk and was promoted to assistant chief clerk on June 1, 1910, and to chief clerk on June 16, 1916. He was promoted to general agent, with headquarters at St. Louis, Mo., on January 5, 1920, which position he was holding at the time of his recent promotion.

### Mechanical

**G. W. Lillie**, whose appointment as superintendent of motive power of the Denver & Salt Lake, with headquarters at Denver, Colo., was announced in the *Railway Age* of

November 26 (page 1071), was born at Omaha, Neb., in 1868. He entered railroad service as an apprentice in the Omaha shops of the Union Pacific and was later promoted to draftsman. He became chief draftsman of the Oregon Short Line at Salt Lake City, Utah, in 1897. In 1899, he left railroad service to become mechanical draftsman for the United States naval construction base at Newport, Va. He re-entered the service at the Oregon Short Line in 1901 in the mechanical department. In

1907 he left to become superintendent of the St. Louis-San Francisco, with headquarters at St. Louis, Mo., and in 1908, he was promoted to superintendent of the Springfield shops with headquarters at Springfield, Mo.

W. Haywood

G. W. Lillie

again returned to the Oregon Short Line in 1910 as master mechanic with headquarters at Pocatello, Idaho. He left again in 1913, to become mechanical superintendent of the second district of the Chicago, Rock Island & Pacific, with headquarters at Topeka, Kan. In 1915 he entered the service of the Bingham & Garfield as master mechanic, with headquarters at Salt Lake City.

**P. G. Feick**, formerly general foreman at Oklahoma City and other points on the St. Louis-San Francisco, has been appointed district foreman of the Oregon Short Line with headquarters at Nampa, Idaho.

**E. W. Lostrom** has been appointed road foreman of engines of the Northern Pacific, with headquarters at Duluth, Minn., succeeding J. A. Marshall, promoted, as was noted in the *Railway Age* of December 10 (page 1178).

### Purchasing and Stores

**Robert J. Elliott**, whose appointment as purchasing agent of the Northern Pacific, with headquarters at St. Paul, Minnesota, was announced in the *Railway Age* of November 26 (page 1071), was born at Louisville, Kentucky. He entered railroad service in March, 1892, as a clerk in the accounting department of the Northern Pacific. Later he was transferred to the general manager's office, and after serving the company in various capacities he was in 1905 promoted to general storekeeper, with headquarters at St. Paul, Minnesota. In 1907, he was appointed assistant purchasing agent, with the same headquarters, which position he held at the time of his recent promotion.

R. J. Elliott

### Engineering, Maintenance of Way and Signaling

**J. F. George** has been elected treasurer of the Norfolk Southern, succeeding Captain Matthias Manly, deceased.

**S. H. Carroll** has been appointed roadmaster of the Alabama, Tennessee & Northern with headquarters at York, Ala.

**B. F. Beckman** has been appointed chief engineer of the Fort Smith & Western, with headquarters at Fort Smith, Ark., succeeding W. J. Rider, resigned to enter business.

**W. W. Kelly**, whose appointment as engineer of the Grand Division of the Atchison, Topeka & Santa Fe, with headquarters at Los Angeles, Cal., was announced in the *Railway Age* of December 3 (page 1124), was born at Winfield, Kan., on November 30, 1885. After graduating in engineering from Rose Polytechnic Institute, he entered railroad service as a chairman on the Illinois division of the Atchison, Topeka & Santa Fe, in July, 1903, and was chairman and rodman on maintenance and construction work until September, 1906. He left in 1907 to accept a position as instrument man on the Chicago, Milwaukee & St. Paul, at Milwaukee, Wis., returning to the Atchison, Topeka & Santa Fe as transitman in September, 1907. He was successively transitman, inspector, assistant engineer, and chief pilot engineer on valuation until May, 1917, when he was promoted to engineer of the Albuquerque division, with headquarters at Winslow, Ariz. In September, 1919, he was transferred to the Los Angeles division, with headquarters at San Bernardino, Cal., which position he was holding at the time of his recent promotion.

### Obituary

**Walter H. Oliver**, engineer of the Grand Division of the Atchison, Topeka & Santa Fe Coast Lines, with headquarters at Los Angeles, Cal., whose death was mentioned in the *Railway Age* of November 26 (page 1061), was born at Fergussonville, New York, on March 11, 1886. He entered railroad service on June 4, 1895, as a transitman on the Los Angeles division of the Atchison, Topeka & Santa Fe. In 1900 he left to become a draftsman of the Mexican Central, and later was successively levelman, transitman on location, and assistant engineer on construction on the line from Papotlan, Mexico, to Colimo. He re-entered the service of the Atchison, Topeka & Santa Fe on January 1, 1902, as a transitman on the Los Angeles division. He was promoted to assistant engineer of that division in January, 1905, and to engineer of the Arizona division, with headquarters at Needles, Cal., in March, 1906. He was transferred to the Los Angeles division in June, 1915, with headquarters at San Bernardino, Cal., and in October, 1919, he was promoted to engineer of the Grand division which position he held up to the time of his death caused by a motor car accident which occurred on November 22.

W. H. Oliver

**William Matthie**, superintendent of the Albuquerque division of the Atchison, Topeka & Santa Fe, with headquarters at Winslow, Ariz., whose death was mentioned in the *Railway Age* of November 26 (page 1061), was born at Lindsay, Ontario, on August 2, 1868. He began railroad work on the Canadian Pacific in the north western part of Canada in 1885. He entered the service of the Great Northern in 1887, and worked on construction projects between Minot, N. D., and Great Falls, Mont. He left in 1888, to become an agent on the Northern Pacific, which position he held until 1889 when he entered the service of the Chicago Great Western as an operator at Dubuque, Iowa. From this position he was promoted successively to dispatcher, night chief dispatcher, day chief dispatcher and trainmaster. In 1904, he was promoted to superintendent of terminals, with headquarters at Oelwein, Iowa, which position he held until 1906, when he left to become an agent on the Atchison, Topeka & Santa Fe, at Barstow, Cal. He was promoted to chief dispatcher at Needles, Cal., in 1907 and to trainmaster with the same headquarters in 1909. He was transferred to San Bernardino, Cal., on July 10, 1918, and was promoted next to the position of superintendent of the Albuquerque division on January 1, 1920, which position he was holding at the time of his recent death in a motor car accident on November 22.

Wm. Matthie

¶ All glory be to God on high,  
And to the earth be peace;  
Good-will henceforth from heaven to men  
Begin and never cease."

Entered at the Post Office of New York, N. Y., as mail matter of the second class.

The Railway Age is a member of the Associated Business Papers (A. B. P.) and of the Audit Bureau of Circulation (A. B. C.)

Subscriptions, including 52 regular weekly issues and special daily editions published from time to time in New York, or in places other than New York, payable in advance and postage free, United States, Mexico and Canada, \$6.00. Foreign Countries (excepting daily editions), \$8.00. Foreign subscriptions may be paid through any London office in £ s. d. Single copies, 25 cents each.

WE GUARANTEE, that of this issue 8,850 copies were printed, that of these 8,850 copies 7,955 were mailed to regular paid subscribers, 34 were provided for counter and news company sales, 37 were mailed to advertisers, 65 were mailed to employees and correspondents and 447 were provided for new subscribers, sample copies lost in the mail and office use; that the total copies printed this year to date were 479,400, an average of 9,400 copies a week.

Roughing down a knuckle pin on a Ryerson-Conradson lathe from an engine truck axle, taking a 15/16 inch cut at a .083 inch feed—a thing you have to do sometimes.

## Are your Locomotives earning Dividends?

Locomotives spend over half their time in the hands of the mechanical department.

During that time money invested in them earns no returns.

To reduce the idle time of expensive power is the purpose of the modern machine tool.

In the lathe this is best exemplified by the Ryerson-Conradson machine.

Among its time-saving features are centralized apron control, unusual range of feeds and speeds, direct motor drive, constant meshing of all gears permitting rapid shifting, and many others, such as plenty of power at the tool.

The operating statistics for October of roads with annual operating revenues above \$25,000,000 are somewhat more interesting than has been the case with the figures for previous months. The statistics in question have been issued this week by the Bureau of Statistics and appear on another page of this issue. The net ton-miles—including both revenue and non-revenue freight—for October will unquestionably show that much less traffic was handled in that month this year than in October, 1920. However, perusal of the October statistics will show that there are five roads which handled more net ton-miles in October this year than in October last year. These are the Long Island, the Louisville & Nashville, the Oregon-Washington, the Chicago, Rock Island & Pacific and the Oregon Short Line. In addition, the traffic handled by the Atchison, Topeka & Santa Fe and the Union Pacific was practically on a par with the 1920 figure. One must, of course, not grant too much importance to these details because presumably a decided falling off in traffic will be evidenced when the November totals are issued. Nevertheless, the fact that five roads in October this year had traffic in excess of, and two on a par with, that for October last year—particularly when one considers that October, 1920, was with the single exception of August, 1920, the busiest in the railroad's history—will not serve to encourage the pessimists.

### October Operating Statistics

The sale in the United States market of \$25,000,000 Canadian Pacific consolidated 4 per cent coupon debenture stock formally announced on Monday, December 19, is worth more than passing notice. The technical name given the securities is somewhat unfamiliar, but the debenture stock is what we in the United States would call a prior lien bond. The Canadian Pacific balance sheet as of December 31, 1920, showed ordinary stock of \$260,000,000; four per cent preference stock amounting to \$80,681,921 and the four per cent consolidated debenture stock amounting to \$216,284,882. The latter stock—or, as noted, what we would call prior lien bonds—has no maturity date. It has paid its 4 per cent regularly since its issuance in 1885. The Canadian Pacific is truly a British company as indicated by the ownership of the common stock. Of the 2,600,000 shares outstanding on March 1, 1921, 1,242,837 shares or 47.8 per cent were held in the United Kingdom; 460,838 or 17.73 per cent in Canada and 626,510 or 24.1 per cent in the United States. Insofar as concerns this coupon debenture stock, it is pointed out by the bankers that this is the first issue of the debentures which has been placed directly in the United States. Heretofore, it is noted, the road has gone to London. There is an additional point in that the stock is to be issued with coupons; hitherto the practice has been to issue the stock as a registered stock. There can be no question about the reception the stock will be given by American investors. The Canadian Pacific is truly an American railroad. Students of the American railroad situation will give due appreciation to the fact that while Canada had a heavy burden to carry during the war, the C. P. R. was excused from 26 months of government control.

### C. P. R. Sells Stock in New York

A press despatch under a Detroit date line appeared in last Saturday's papers as follows: "Henry Ford's railroad, the Detroit, Toledo & Ironton, which has objected to the present system of railroad reports prescribed by the Interstate Commerce Commission, has presented a simplified proposal to the commission. Ford's officials believe that adoption of the plan would save thousands of dollars to the country's railroads and at the same time be adequate for all public needs. The commission is now studying the proposal." The news in this item is in the last sentence, "The commission is now studying the proposal." The commission has been studying such proposals since 1887.

### Ford Proposes Simplified Reports

Probably few of the readers of the *Railway Age* outside of Canada are familiar with the extensive application of automatic connectors described in an article in this issue. The development of this device has gone on steadily for several years and the fact that the road which has the largest installation is continually equipping more cars is conclusive evidence that the connector has passed the experimental stage. As it is now coming into general use on a number of roads, the question of interchange naturally presents itself. Up to this time the designers of connectors have contented themselves with devising arrangements for interchanging with the standard air and steam hose. The time is approaching when interchange between various types of connectors must be considered. If conflicting types are developed, employees will resort to unsatisfactory make-shifts to permit cars to be interchanged. The connector performs the important function of conveying the air upon which depends the control of the train and hence the safety of its passengers. Even more important than the expense that would result from the use of varying contours for the coupling parts of connectors is the dangerous inefficiency of the brake system which such a situation would involve. This is a matter which ultimately may involve nearly 60,000 passenger cars and 3,000,000 freight cars. The magnitude of the problem makes it worthy of thorough consideration by the railroads and by the American Railway Association with a view to establishing standards for the interconnecting parts of various makes of connectors.

### Standardizing Train Line Connectors

The Department of Commerce is a unique governmental institution in that its activities are directed primarily in furthering the interests of industry and business. The ninth annual report of the Secretary of Commerce is of particular interest because it is the first report to be made by the present secretary, Herbert Hoover. In view of the fact that the object of this department is to aid rather than to hamper business and in the light of the enormous gross appropriation for our national government, the estimated requirements for the Department of Commerce for the fiscal year of 1923, namely, \$24,641,000, is indeed modest. In justifying this estimate

### Support the Technical Bureaus

1923

which is \$7,051,000 in excess of the appropriation for the fiscal year 1922, the report places particular stress on the difficulties experienced because of restriction of previous appropriations. As a minor illustration, a master track scale purchased by the Bureau of Standards several years ago as an adjunct to its work of testing railroad track scales, is still of no use owing to the lack of a building in which to house it. The United States Coast and Geodetic Survey, which is responsible for the skeleton work of highly accurate surveys and levels that form the primary basis for much of the survey and map work conducted by the railroads and others, has been seriously hampered by a low salary scale in recruiting the technically trained men required for its exacting work. It is only with extreme difficulty that the high standard of its performance has been maintained. Another technical bureau, although outside of the Department of Commerce, which has suffered from the starvation policy as to salaries is the Patent office, which is now admittedly incapable of coping with the work imposed on it. The result has been to retard invention and development work and the railways and railway industries are by no means the least of the sufferers. The appropriation requirements of these technical departments, as with those of the Forest Products Laboratory previously referred to in these columns, are small as compared with allotments to activities enjoying a greater popular demand, but the business and industrial interests of the country can ill afford to see their work throttled for want of adequate support.

## Net Income of Ford's Railroad Steadily Declines

REPORTS of the earnings and expenses of the Detroit, Toledo & Ironton Railroad for September and October, which have just been filed with the Interstate Commerce Commission after considerable delay, indicate that Henry Ford is learning that it is not so easy to operate a railroad at a profit as it appeared last spring. Not only has the net operating income of the road since April been less each month than in the preceding month, but for the last three months reported, which are the months since his wage increase took effect, it has been less than it was in the month during which the Ford management took charge. For the month of October it was only \$15,191, as compared with \$77,985 for March, when the Ford management was installed. This is in marked contrast with the showing made by the railroads generally, whose net operating income has increased almost steadily throughout the year.

The reports of the Detroit, Toledo & Ironton for September and October have been delayed while Mr. Ford's accountants have been trying to convince the commission that the amount of detailed information which the commission requires of Class I roads to report to it monthly is unnecessary. Mr. Ford has let it be known that he has some ideas on the subject of simplified bookkeeping and while he has been arguing with the commission on the subject it has gone to press with its monthly summaries for September and October covering only 200 roads instead of 201 and with a footnote saying that the D. T. & I. report had not been filed. The commission apparently, however, has let Mr. Ford understand that even he is subject to its requirements and the reports reached the files on Monday morning. Mr. Ford's reports of his railroad operations have been awaited with unusual interest because he has been going around the country giving interviews as to how he could revolutionize railroading if he were in charge of all the railroads of the country.

As has been previously shown, Mr. Ford's newspaper reputation as a railroad wizard was based primarily on the sud-

den jump in his net operating income for the month of April, which was nearly \$200,000 greater than it was for March, as the result of the diversion of Ford tonnage to the line and an increase of \$258,000 in the earnings with an increase of only \$42,000 in operating expenses. These results were made public at about the same time that Mr. Ford announced an increase in wages to become effective on July 1 and a 20 per cent reduction in rates, which except as to local intrastate traffic in Ohio was suspended by the Interstate Commerce Commission. The gross earnings continued to increase for several months but the handling of increased tonnage also brought an increase in expenses, which was accentuated by the wage increase in July, and the net operating income has continued to fall ever since. For August it had been reduced to \$70,643, or less than it was in March. For September it was only \$46,749 and for October only \$15,191, or \$261,000 less than it was in April. The revenues, expenses, operating ratio and net operating income for the eight months during which the Ford management has been operating the road as shown by the reports to the Interstate Commerce Commission, have been as follows:

Month	Operating Revenues	Operating Expenses	Oper. Ratio Per Cent	Net Oper. Increase
March, 1921.....	\$439,052	\$352,970	80.4	\$77,985
April .....	697,491	393,816	56.7	276,452
May .....	744,406	422,328	56.7	263,291
June .....	713,527	376,383	52.7	261,259
July .....	744,498	444,794	59.7	187,395
August .....	763,840	548,246	71.8	70,643
September .....	759,737	572,378	75.3	46,749
October .....	652,438	514,504	78.8	15,191

It will be noted that the increase in revenues did not keep up after August and that the expenses were somewhat reduced in October after the earnings had fallen, but that the reduction in net was in spite of an increase of \$213,386 in earnings in October as compared with March. In addition to the increases in expenses, the reports show a large debit balance of equipment rents.

It is true that the D. T. & I. has made a much better showing this year than it did in 1920. For the ten months, January to October, 1921, the net operating income was \$887,596 as compared with a deficit of \$1,097,265 in the ten months of 1920. In this connection it will be recalled that the D. T. & I. in common with other roads had a 40 per cent increase in freight rates on August 26, 1920, and the railroads generally have been earning some return this year, in spite of a decrease of revenues, whereas they earned practically no return last year. The roads generally, however, have been gaining throughout the year up to and including October, which was their best month so far as net operating income is concerned. For the ten months' period the Detroit, Toledo & Ironton had \$5,953,606 of operating revenues, an increase of \$1,722,699 as compared with 1920, or 40 per cent, while the railroads generally had a decrease in earnings of eight per cent. Its operating expenses were \$4,292,418, a decrease of \$707,321, or 14 per cent, while the railroads generally reduced their expenses 17 per cent. The increase in the D. T. & I. earnings was entirely in freight revenue and represents just the amount of the rate increase, which, however, was also in effect in September and October last year. Passenger and other revenues decreased. In expenses most of the decrease was in maintenance, which was \$470,679 less than for 1920, or 19 per cent. On the railroads as a whole the maintenance expenses were 21.7 per cent less than in 1920. Transportation expenses were reduced by \$220,137, or about ten per cent. The net operating revenues for the ten months were \$1,661,188 as compared with a deficit of \$768,832 in 1920. Equipment rents paid showed an increase of \$394,831 and the net operating income was \$887,596 as compared with a deficit of \$1,097,265 in 1920. As the freight revenues for the ten months were \$5,701,734, a 20 per cent reduction in rates would have amounted to \$1,140,000, and would have completely wiped out the net operating income unless it would

have induced Mr. Ford as a shipper to buy more transportation from his own railroad.

Mr. Ford has said in an interview that he could operate all of the railways of the United States just as well as he does the D., T. & I. Since he has reduced the net operating income of the D., T. & I. 95 per cent in six months, while the other railways of the country have been gradually improving their net returns, his statement of what he could do with the railroads as a whole can be accepted as unquestionably correct.

## Concerning the Supervisory Officers

UNFORTUNATE as it is, it must be admitted that within recent years there has been a serious increase in the controversies and antagonisms between railway managements and railway employees. The labor situation on the railways was very unsatisfactory before government control. The labor policies followed by the Railroad Administration aggravated the situation by taking the settlement of almost all matters affecting labor out of the hands of the officers of the individual railways and their employees, and centralizing it in Washington. There was a large increase in the number and strength of railway labor unions, and, whatever may be said for or against the organization of labor, there can be no question that since the railways were returned to private operation this increase of unionism has increased the difficulty of establishing harmonious relations between them and their employees.

It long has been, and still is, a question whether the various classes of supervisory officers of the railways finally will identify themselves with the managements and act according to the principle that they have the full duties and responsibilities of officers, or will decide to regard themselves merely as employees and organize themselves into full-fledged labor unions and employ the methods of labor unions. This is a question of great importance, both to the railways and the supervisory officers.

The main reason why there is any doubt as to the future attitude and conduct of supervisory officers is that many of them honestly believe the railway managements have not treated the various classes of them fairly. They believe the managements have granted many concessions to organized employees because they were forced to; that in consequence many classes of employees have been treated relatively better than the supervisory officers; and that the only way the supervisory officers can get what they are entitled to is by organizing and employing similar coercive methods.

We publish elsewhere in this issue an article on the situation of the supervisory officers by J. L. Eldridge, vice-president of the Yardmasters' Association of America. Mr. Eldridge is one of the fairest and most intelligent of the leaders of these supervisory officers' organizations. He discusses principally the duties and responsibilities of the yardmasters and the way in which he feels they have been dealt with, but undoubtedly what he says expresses the views of supervisory officers of other classes. His article is temperately written and well worth reading.

The supervisory officers are the points of contact between the railway managements and the employees. They can do much to increase the efficiency of the work of the employees. They can do much to determine the attitude of employees toward the managements. If the supervisory officers are given wages and working conditions which are reasonably satisfactory to them they are sure to perform their duties and to deal with the employees in a manner which will be much more beneficial to the railways than if they are required to work for wages and under conditions which they strongly feel are unfair as compared with those of the employees below them or the other officers above them.

There is another point of great importance which should be considered in this connection. The railways should recruit a very large part of the higher officers in the mechanical, maintenance-of-way and transportation departments from the supervisory officers. Therefore they should make the wages and working conditions of these officers such as to secure and develop in supervisory positions men who will be fit for promotion, and who, when promoted, will be able efficiently to perform the duties of higher, and even of the highest official positions.

Unquestionably, mistakes have been made in dealing with the various classes of supervisory officers in the past. In many cases their wages and working conditions have been made such that they have not been attractive to men of ability and promise. The very fact that organizations which are practically labor unions have been formed among them indicates a state of mind which is far from healthy.

While there have been evidences of serious discontent among the supervisory officers, there also have been afforded in certain recent trying periods some striking evidences that the old spirit of loyalty to the railways is still dominant among them. In every instance within recent years, when the railways have had to fight strikes in their shops and yards, a large part, or even a great majority, of the supervisory officers have not only stuck to their work, but have done it efficiently, courageously, and regardless of the hours they were supposed to be on duty. Since there is nothing the railways need more than efficiency and loyalty among their supervisory officers, they should spare no reasonable effort to restore and maintain these qualities among them.

## Central of Georgia

THE CENTRAL of Georgia operates 1,914 miles of line, of which 1,423 is owned, 476 is leased and 15 is trackage rights. Of the total mileage, 1,333 is in Georgia, 577 in Alabama and 4 in Tennessee. The road is one of the most prosperous in the South; it has paid the six per cent on the cumulative preferred regularly since that stock was issued in 1912 and has maintained a rate of five per cent on its common stock since 1913. All of the stock of both issues is owned by the Illinois Central. The latter in 1920 received dividends on its Central of Georgia stock amounting to \$900,000 on the \$15,000,000 preferred and \$249,925 on its \$5,000,000 (or to be exact \$4,998,500) common.

The fact that the Central of Georgia is controlled by the Illinois Central is of great importance outside of the income which is brought to the parent company. The Illinois Central system by its control of the Central of Georgia is given access to southeastern Alabama and central Georgia as well as an outlet at the important port of Savannah. The fact that the Illinois Central's high standards of operation and service are reflected in the activities of the Central of Georgia is further a factor of no small importance to the territory which the latter serves.

*Dividend Income Makes Big Difference in 1920.*—The Central of Georgia's line into Savannah is the leading line serving that port. The Ocean Steamship Company which operates out of Savannah to New York and Boston is controlled through ownership of the entire stock. For a period of years the steamship company has been paying regular dividends of 16 per cent and in addition extra dividends from time to time. In 1920 an extra dividend of 40 per cent was paid, the railroad company receiving \$799,640. The Central of Georgia owns also a majority of the stock of the Wrightsville & Tennille, all of the stock of the Wadley Southern and one-half that of the Western of Alabama. In 1920, as shown in the income account which appears on another page of this issue, the Central of Georgia had a net corporate income of \$1,516,707 as compared with \$1,282,650

in 1919. The 1920 income included the standard return for January and February, the last two months of federal control, and the guaranty for the guaranty period. It will be noted, however, that in 1920 there was an item of dividend income of \$1,477,826, or \$1,031,654 more than in 1919.

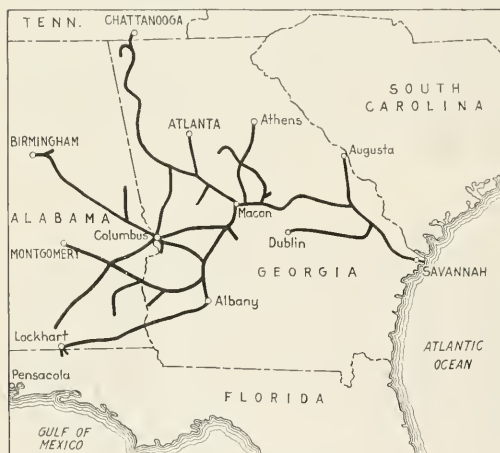

**Record Traffic in 1920.**—Insofar as railway operations alone were concerned, 1920 was not a very successful year. The road handled a record traffic. It carried 7,517,302 tons of revenue freight. Its revenue ton-mileage was 1,283,298,476 which compared with a figure for 1918, the best previous year, of 1,143,774,783. The net railway operating income for the year as reported in the December, 1920, monthly statement to the Interstate Commerce Commission was but \$23,969. It was only as a result of the good earnings of the last two months of the year that a net operating deficit was avoided. The standard return based on operations for the three years ended June 30, 1917—which figure we introduce by way of comparison—was \$3,450,903. In 1918 the road had a net railway operating income of \$3,894,069; in 1919, \$1,551,954.

**Results to Date in 1921.**—Inasmuch as the figures for 1920 are now several months old, we are interested rather

**Diversified Traffic.**—The Central of Georgia's traffic is rather diversified. In 1920 products of agriculture made up 14.92 per cent; products of animals, 1.38 per cent; products of mines, 28.33 per cent (bituminous coal 20.38 per cent); products of forests, 16.32 per cent; and manufactures, 31.34 per cent. In view of this diversification and the present more optimistic attitude of the South, it is a bit difficult to understand the reason for the falling off in traffic in August and September; but the figures of net railway operating income which have been given, as also the operating ratio of 75.6 for October, indicate that the road has its situation in hand. Plainly, it should evidence continued improvement in following months.

**Some Operating Statistics.**—The Central of Georgia in its 1920 annual report shows a figure of "tons of freight carried per revenue freight and mixed train-mile." The figure given for 1920 is 487.43, this comparing with figures for previous years as follows: 1916, 343.61; 1917, 370.85; 1918, 388.75; 1919, 467.19. This increased train loading is noteworthy. In the first nine months of 1921, in spite of the falling off in traffic, the road had secured an average of net tons per train of 476. During 1920 the road secured seven new Mountain type locomotives; at the end of the year the tractive effort of all locomotives was 314,938 lb. in excess of what it was at the end of 1919.

A progressive increase has taken place in car loading similar to that in train loading. The figure for 1920 was 24.74; in 1916 it was 19.74. For the first nine months of 1921 an average of 23.9 has been maintained. During a part of 1921 the Central of Georgia showed a rather large percentage of bad order cars. Whereas the average for 1919 was but 5.2 per cent or for 1920 but 5.4 per cent, in May, 1921, it averaged 22.1 per cent. The bad order car situation has since been taken in hand. The percentage on November 15, the latest date for which figures are at this writing available, was 14.1 per cent. The average for the country on November 15 was 14.4 per cent.

The Central of Georgia

more in the figures for 1921 insofar as they are available. We find first that the road's traffic has held up rather well during the year. The latest figures available are those for the ten months ending September 30. In the first ten months of 1921 the net ton-miles carried—including both revenue and non-revenue freight—were 1,108,439,000 as against 1,226,087,000 in the same period of 1920. The two lowest months in 1921 were August and September; October was much better than either of these months. Insofar as concerns earnings, figures are available for ten months. The gross to the end of October, 1921, was \$18,835,161 as compared with \$21,169,584 in the first ten months of 1920. The net railway operating income for the first ten months of 1921 was \$1,036,317 as compared with a deficit to the end of October last year of \$1,159,912. It has been noted that from the standpoint of traffic August and September, 1921, have shown a falling off in traffic. On the other hand, the net railway operating income in September was considerably in excess of that of any other previous month except July. It totaled \$249,217. The net in October was \$424,844. For that month the road had an operating ratio of 75.6; for the first ten months of 1921, of 90.6. The transportation ratio in October was but 36.05.

## New Books

**Coal Manual.** F. R. Wodleigh. 184 pages, 4½ in. by 6 in. Published by the National Coal Mining News, Cincinnati, Ohio.

Numerous books dealing with the subject of fuels and coal have been issued from time to time, but they usually have been written from the technical viewpoint of the engineer or chemist, or to meet the needs of the man in charge of power plants or locomotives. Few books have been available, however, which gave in a concise and accurate manner the general elementary information desired by a large number of men, such as purchasing agents, storekeepers and others who are more or less interested in some phase of the coal question other than that of actual mining. This manual has been prepared by a man who evidently knew his subject and in addition recognized the wants of the men for whom he was writing.

The subject matter has been well arranged and by the use of frequent subheads and an excellent index any information desired can be found readily—features which will increase the usefulness of the book for reference purposes.

Among the subjects covered are: kinds and commercial grades of coal; information in regard to the location of coal fields and the essential differences in the character of coal from various fields and seams; the preparation of coal; coke and gas manufacture; the use of coal in locomotives, stationary boilers and furnaces; storage and prevention of spontaneous combustion; specifications and their use; analyses and effects of various impurities, together with a brief bibliography on the subject of coal.

## Letters to the Editor

[The RAILWAY AGE welcomes letters from its readers and especially those containing constructive suggestions for improvements in the railway field. Short letters—about 250 words—are particularly appreciated.]

### A Question of Priority

SAULT STE MARIE, ONT.

#### TO THE EDITOR:

The enginehouse built at Hornepayne, Ont., by the Canadian National, as described in the *Railway Age* of November 26, is a duplicate in general design of the enginehouse in the Algoma Central terminal at Sault Ste. Marie, built in 1912 by the writer. This enginehouse was described in the *Railway Age Gazette* of October 16, 1914, and the general idea covering this locomotive house is original on this railway. This house was designed by P. L. Battey, then chief engineer of the industrial department of the Arnold Company, in conjunction with the writer, and was constructed by the Arnold Company, acting as general contractors in the construction of the terminal buildings of the Algoma Central terminals at this point.

R. S. McCORMICK,

General superintendent and chief engineer,  
Algoma Central & Hudson Bay.

### The Interior Treatment of Boiler Waters—A Criticism

CHICAGO.

#### TO THE EDITOR:

The article with the above title which appeared in the *Railway Age* of November 12, page 935, and so appropriately illustrated on page 936, can be understood by reference to the editorial page which helps to explain its meaning. But it is a step backward. It reads like a paper of 20 years ago, and there has been much progress since then.

Today there is no more controversy between the advocates of water treating plants and of boiler compounds than there is between the advocates of locomotives and of mules. We are all advocates of each in its place. Where water is 12 grains per gallon hard, or more, railway water engineers advise water treating plants to keep scale out of boilers, if there is money to build them and ordinary traffic to use them, and in the meantime use soda ash or a boiler compound to keep the scale soft. Every honest boiler compound man advises the same thing.

Nor is there controversy as to the relative costs of using hard water alone, hard water with soda ash or an anti-scale compound, or water treated before use. Hard water alone is very costly in use; a good anti-scale compound used with such water saves much more than it costs; and a complete set of water treating plants will pay for themselves every year over and above all the good that the best anti-scale compound can do. This has been proved on several railroads during the past ten years.

The two expressions to which the author of the paper takes exception, "A boiler is designed to produce steam, not chemical reactions" and "The only thing to put into a boiler is pure water," are not to be criticised lightly. They are classics in the creed of the American Railway Master Mechanics' Association. They were first used by that association in 1871—just 50 years ago—in the report of the

Committee on Better Water for Locomotives; they have never been rescinded by that association nor any of its committees, and they are still the guide to intelligent work on the improvement of boiler water. They were used in a discussion of the advantage of softening hard water before it went to the boiler; they referred only to what are now called anti-scale compounds and ought not to be quoted in a paper devoted mostly to the value of anti-foam compounds.

Twenty years ago it was commonly said, as now by this author, "Water softening consists of adding lime and soda ash to the water, which is then allowed to stand until chemical reaction has taken place." Nowadays all experienced men say "Water softening consists of adding lime and soda ash to the water, which is then stirred until chemical reaction has taken place."

Twenty years ago it used to be said "an increased tendency to foam is characteristic of all water treated with soda ash." Nowadays we know that the tendency of most treated waters to foam is caused by the sludge in the boiler—the flocculent precipitated limestone, the last three grains per gallon of calcium carbonate which most treating plants do not precipitate from cold water but which the heat of the boiler precipitates at once. But this sludge is not left by the soda ash treatment but by the lime treatment.

The amount of sludge left in a boiler by well-treated water is so much less than that produced by the action of soda ash or any other anti-scale compound on the hard water inside the boiler that, in treated water districts, the amount of anti-foam compound used is usually much less than that previously used.

All this ancient talk of sodium salts causing foaming started from a test once made of the value of soda ash to precipitate incrusting matter from the water and to loosen the scale already in the boiler. When a certain amount of sludge and of fine scale had been set loose, the boiler began to foam; and because it happened that the soda ash then in the water amounted to 200 grains per gallon, it was announced that 200 grains of sodium salts per gallon of water in a boiler would cause foaming. But I can show you boilers fed with water containing sodium salts but no limestone, in which the concentration of sodium salts usually amounts to 1,000 grains per gallon and in which there is no sign of foaming.

The object of an anti-scale compound is not to put sludge in the boiler bottom but merely so to act on the water as to cause a deposition of soft scale instead of hard scale. If sludge is deposited so that the boiler foams, too much compound is being used. And since soda ash is more than twice as effective as any of the compounds of which it forms a part, less of it should be used if foaming is to be avoided.

Much is made by this author and others of the fact that the use of anti-foam compound reduces the frequency of boiler washing, and of course at less expense. But I believe that any experienced boiler man will say that it is an expensive saving. The real charges in boiler maintenance are not on account of washing or of any roundhouse expense, but on account of the deterioration of the metal of the boiler. The ends of the flues in boilers which are washed frequently last much longer than those in boilers in which washing is skimmed. Furthermore, on roads where water is free from acid, pitting takes place only in waters carrying sodium sulphate or sodium chloride, and at a rate determined by the amount of these materials; and it is evident that if such water is not changed with some frequency concentration of these salts will take place and increased pitting will follow.

Lastly, there is no such thing as boiler water of "too high purity." These waters of imaginary too high purity are merely waters from vegetation districts, containing little mineral matter but a small amount of organic acid; or, in

the case of distilled sea water, containing a little magnesium chloride which under the heat of the boiler soon becomes magnesium and free hydrochloric acid.

I quote you again the guiding principle laid down by the Committee of the American Master Mechanics' Association of 1871-3, and still adhered to by its successors. "Get, if possible, a supply of clean, soft, natural water." "If a natural supply of soft water is not available, the only way to prevent incrustation and corrosion is to purify the water before it enters the boiler, and the accomplishment of this result will be the '*ne plus ultra*' of this important subject."

C. H. KOYL,

Engineer Water Service, Chicago, Milwaukee & St. Paul.

## The Public's Right to Steel Cars

NEW YORK CITY.

TO THE EDITOR:

A great hue and cry has been raised down in Philadelphia because of the use of wooden coaches on the Newtown branch of the Reading. An outburst of this sort naturally follows an accident such as that at Bryn Athyn, but the unreasoning virulence of the Philadelphia papers on the subject of the wooden car calls for an answer.

Wooden cars taken out of service have practically no market value, whereas used in trains they earn the same revenue for the railroads as steel cars, and that with considerably less interest charges. These cars can be economically replaced by steel cars only when unfit for further service. Is the railroad's income from the Newtown branch sufficient to pay operating expenses, fixed charges, a reasonable return to capital, the carrying charges on all-steel equipment and, in addition, interest charges on serviceable wooden cars thus relegated to the scrap heap? I should guess the contrary.

Passengers are riding in wooden cars because they, as a whole, are not paying for all-steel equipment. If citizens of Pennsylvania want to ride in steel cars, how about having their state government buy the necessary equipment and reimburse itself by taxation? The people would be paying for modern equipment and would have a right to expect it. They have no such right now.

FAIR PLAY.

2. How can we arrange to have all of our locomotives constantly loaded, up and down hill?

3. How can we insure that all locomotives will be loaded at the most efficient rating at all times?

4. How can we convince all of the motive power officials to accept the constant cut-off and other mechanical details developed by the Pennsylvania Railroad?

5. How can we manually fire a locomotive of this size and compete with a stoker?

6. If we put on two firemen, how much additional coal could we purchase with the wages of the second man?

7. How are we to maintain a steam locomotive constantly in 100 per cent operating condition with respect to valve motion, leaky valve rings, and leaky piston rings?

I might add innumerable other things. I mention the above as some of the details which your editorial writer has no doubt forgotten or overlooked. The figures given in the super-power report may or may not be wrong, but even granting that they are wrong, I feel that the error is not one so glaring as your *Railway Age* writer would have us believe. A mechanical engineer who has been designing steam locomotives for over 20 years states that 4 lb. of coal per horsepower hour is a very good figure indeed.

While the matter is still in mind, I would like to inject another thought into the argument. That is, after the details are threshed out and before everybody is tired of reading the "hot air" and opinions of all kinds, let someone rise up and drive home the fact that had the so-called American Railway Association, particularly the Mechanical Division, been on the job as it should have been years ago, such a situation as we now have before us could not have possibly come about. If you can persuade some of your "big guns" in the editorial field to come out good and hard and follow it up with some well-placed criticism of the conspicuous apathy with which the average S. M. P. and some of the other folks higher up seem to have toward this subject and you can succeed in arousing the same amount of interest in this phase of the work as you already have in other phases, I am sure that untold benefit will result to the railroads in general and to a lot of individuals in particular. ELECTRICAL ENGINEER.

## Railroad Statistics

ST. LOUIS, MO.

TO THE EDITOR:

Statistics are compiled showing the sources of income and the channels of expenses. An equal interest in both is paramount to a healthful situation. These statistics should be used to the greatest advantage looking toward greater sources of revenue and economies in operation.

Many know the extent of the earnings, but I dare say few realize the magnitude of the expenditures—where the money goes after it is earned. The figures are rarely published in an understandable way. These facts may be learned through operating statistics now compiled, if advantage is taken of them. Aside from this, they are valuable analysis of existing conditions but furnish little information as to what would happen under different conditions.

The predetermination of operating results, which is most important from the standpoint of orderly and improved operation, is largely dependent upon the researches of the individual and a co-ordinated organization. Vast numbers of both related and unrelated figures are compiled, but they are not a panacea to the solution of general problems. A statement of the expenses under fixed conditions will not ultimately suffice, but the rate of change of expenses under certain varying conditions, such as trainload and speed, is needed. If such data were available, the study and analysis of operating results would be made more truly a diagnosis, rather than a post mortem.

C. D. HICKS.

## Practical Questions About Steam Locomotive Operation

NEW YORK CITY.

TO THE EDITOR:

There seems to be a lot of necessary missionary work to be done among our steam locomotive friends. I refer rather generally to the exponents of the steam locomotives including apparently some of your own staff. The following statement commenting on the super-power survey report appeared in the November 26 issue of the *Railway Age*, page 1019: "An efficient modern locomotive uses about 2.5 lb. of coal per horsepower hour while working. Standby losses, firing up, etc., increases this to 3.1 lb."

I often wonder if the chap that wrote the script expected it to go down with one swallow. Personally, I recall the information published by the Pennsylvania Railroad covering a test plant run with a special hand-fired set-up on one of their modern locomotives. The information was based on the supposed relative rating of the locomotive when stoker fired. What I wish to bring out are answers to the following questions:

If we are to base our locomotive ratings on  $2\frac{1}{2}$  lb. of coal per horsepower hour:

1. How are we to instill in the average locomotive crew the skill and supervision of the test crew of the locomotive testing plant?

*The Tankhannock Viaduct on the Clarks Summit-Hallstead Line*

## Justifying Expenditures for Grade Reductions\*

Clarks Summit-Hallstead Line of the Lackawanna Fully  
Warranted by Operating Results

By George J. Ray

Chief Engineer, Delaware, Lackawanna & Western

THE OLDER PORTIONS of the Delaware, Lackawanna & Western, like many of the other railroads built through rough country in the early days, were constructed with many sharp curves and heavy grades. The main line crosses the Pocono mountains at an elevation of approximately 2,000 ft. above sea level. At Scranton, in the center of the anthracite coal fields, where much of the railroad's traffic originates, the elevation of the main track is about 735 ft. above sea level. Scranton is a terminal point for both passenger and freight service. The distance from Scranton to Hoboken, the eastern terminal, is now 135 miles. The middle operating division extending from Scranton west to Elmira had a length of 119 miles prior to the completion of the Clarks Summit-Hallstead cut-off. The first 50 miles west of Scranton to the New York state line was built in the early fifties. The western end of the road from Binghamton to Elmira was constructed in the early eighties with fairly good alignment and a maximum grade of approximately 13 ft. per mile.

The topography of the country in the vicinity of Scranton is such that heavy grades are required for both east and westbound traffic from that point. The lowest available summit westbound is approximately 500 ft. above the tracks at Scranton and is so located that a  $1\frac{1}{2}$  per cent grade is necessary from Scranton to this point which is known as Clarks Summit. For 40 miles west of Clarks Summit the old line traversed a very broken country approximately at right angles to the water sheds, with the result that the line was built with heavy grades against both east and westbound movement as indicated by the profile, Fig. 1. These grades consisted of two stretches of uncompensated 65-ft. grade and one 46-ft. grade against eastbound movement, one

21-ft. and one 28-ft. grade against westbound movement. As the tonnage increased this line became more and more difficult to operate. It will readily be seen that where an engine handled full tonnage over the line between Hallstead and Elmira, either east or westbound, pusher service was necessary on that part of the line between Hallstead and Clarks Summit. Because of unbalanced traffic, the great variation between the east and westbound pusher grades, and of a very bad tunnel at one summit east of Nicholson, pusher engines could not be used economically. As a result a very low mileage for the pusher engines was obtained. Not only was it necessary to push freight trains both east and west, but it was also necessary to use puller engines on passenger trains eastbound between Nicholson and Clarks Summit.

Through this same territory the old line was very crooked, the total amount of curvature in the 41 miles between Clarks Summit and Hallstead being 3,845 deg. Four to six degree curves predominated.

### Transportation Problems

The net tons of coal and freight handled by the Lackawanna in 1910 amounted to approximately 21,750,000. The total number of passengers handled was 26,245,000. All anthracite coal westbound from Scranton, whether going over the main line to Buffalo or to Syracuse and Lake Ontario, passes over this line as does all eastbound tonnage originating west of Scranton. Fig. 2 shows the net tons of freight and coal carried per year from 1900 to 1920 inclusive. The broken line represents the actual tonnage carried; the dotted straight line indicates the average increase from 1900 to 1909. This line extended was used as a basis of estimating probable future tonnage. It will be noted that the estimated tonnage fits the actual in 1910 but was

\*Abstracted from a paper presented before the Western Society of Engineers, Chicago, December 15, 1921.

high for the later years excepting for the three war years, 1916-17-18.

The old line was expensive to operate and maintain. The heavy tonnage over sharp curves and heavy grades caused extensive rail wear and the track was expensive to maintain from every standpoint. In the 40 miles there were 29 public grade crossings, which could be eliminated only at a very material expense. The problem to be solved therefore was one which required the best possible alignment with grades over which increased tonnage could be handled and at the same time reduce pusher service in both directions to the utmost. The tonnage had reached such a point that additional main running tracks would soon have been required on the heavy grades in order to avoid excessive delay to fast freight and passenger trains due to the long time required for slow freight trains to get over the road. Additional passing tracks would not have solved the trouble and would only have caused additional delay to slow freight. To build additional tracks along the old alignment would have been expensive, and the construction would have greatly interfered with traffic. Incidentally the construction of a new line would provide an up-to-date roadbed and eliminate all grade crossings. Study demonstrated that it was impossible to locate a new line which would be a big improvement as to curves, grades, etc., without encountering very heavy construction.

Thirteen feet per mile was fixed as the maximum grade against westbound movement, in order to eliminate the pusher service westbound and permit full tonnage to be

the reduction of gradient. After an extended study of all available information covering the savings in operation to be expected by such a change in line, the conclusion was reached that it was absolutely necessary to work the problem out in a more or less independent way, being governed by the conditions at hand. In cases where important improvements had been made on other lines, the conditions dealt with were so very different that the conclusions reached could not be consistently used without a very careful examination as to whether or not they were applicable to the case in hand.

**Grade.** Where a reduction in grade is made which will enable an engine to pull a heavier train and thus reduce the number of train miles required to handle a given tonnage, we must arrive at the possible saving due to the elimination of one train. It is evident that the elimination of one train

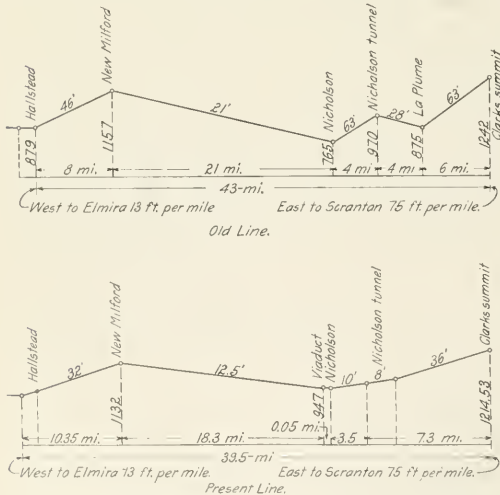

Fig. 1. The Profiles of the New and Old Lines Compared

handled west over the entire division. The eastbound pusher grades were determined by actual test on other parts of the line where it was possible to pick out a grade on which the required tonnage could be handled with one engine and a pusher (See Fig. 3.) Grades were compensated for curvature by using 0.03 per cent per degree of curve. This allowance was used for curvature on a change of line made at another point on the road in 1908 and proved to be about the correct allowance.

After the surveys had been completed and the estimates prepared for the various proposed lines, extensive calculations were made to determine the probable saving to be expected in operation and maintenance costs due to the reduction of distance, elimination of curvature, rise and fall, and

Fig. 2. The Actual Traffic in the Years 1909 to 1920 as Compared with the Estimated Growth of Traffic

in handling a given tonnage will entirely eliminate certain expenditures such as coal for fuel and wages of enginemen and trainmen. The wear on the rail, ties, ballast, and other track materials, will be less because of eliminating the engine. On the other hand such items of expense as superintendence, cost of traffic department, floating equipment, etc., will in no way be reduced by the change.

**Distance.** In like manner the reduction of one mile in distance will eliminate one train mile for every train run, hence we must calculate the probable saving due to the elimination of one mile in distance. It is also evident that the cost of maintaining one mile of track is eliminated and likewise the trainmen's wages.

**Pusher Engines.** Where the grade is reduced so as to reduce the number of pusher engines, our problem is to calculate the saving due to the elimination of one pusher-mile.

**Curvature.** The total value of reducing curvature cannot be readily reduced to a basis of dollars and cents, but some features of the value of curve reduction such as rail wear can be determined fairly accurately. In order to arrive at a fair value for the elimination of curvature it is necessary to make a comparison of known conditions on the various parts of the line where the general operating conditions are the same. In a general way the amount of rail wear due to curvature on any given territory depends upon the total curvature and not so much on the degree of the curves. In other words the total rail wear due to 30 deg. of central angle in a mile of level track will be about the same whether the curvature consists of 500 ft. of 6 deg. curve or 3,000 ft. of 1 deg. curve. What is true with respect to rail wear is also more or less true with all other items of roadway expense affected by the elimination of curvature. Damage to equipment and loss and damage to freight due to curvature is greater with sharp curves, but in general the additional wear on rolling stock due to curvature depends, like the

TABLE 1 EFFECT OF CHANGES IN GRADE, CURVATURE, DISTANCE AND RISE AND FALL ON MAINTENANCE AND OPERATING EXPENSE

Item	1920 maintenance and operating expenses		Grade		Distance		Helper		Curvature

Saving in dollars per train mile										

as reported to the I. C. C.

Note—Figures for grade are based on the addition or elimination of one train in handling a given business.

Figures for distance are based on the elimination of one mile.

Figures for helper engines are based on the elimination of one helper mile.

Figures for curvature are based on one mile of 5-deg curve compared with the average curvature of 50 min.

Figures for rise and fall are based on the comparison between two miles of level tangent track and two miles of tangent track with a hump of 264 ft. in the middle.

While the elimination of rise and fall will slightly affect track maintenance, locomotive and car repairs, etc., the main item affected and the only one amounting to a considerable saving is reduction in fuel, water and lubrication for locomotives. These items would be affected approximately 5% = 5% of items affected = 5.31. Say 5% X cost per train mile \$6.02 = 30 savings in dollars per train mile.

the life of the tie primarily depends upon its ability to stand mechanical wear this life is shortened as the number of engines passing over it increases. Since the per cent of road freight engines to the total number of engines is approximately 60 per cent, the ties would be affected about 12 per cent by the elimination of one train.

Account 214—Rails. Account 216—Other Track Materials and Account 218—Ballast will likewise be affected about 12 per cent. Before the change was made on the line in question all traffic was handled on two tracks, with high speed first-class passenger trains and both slow and fast freight service on the same tracks. About 40 per cent of the freight service consists of coal trains and a large part of the other freight is manifest traffic which is moved over the road at high speed. It is very hard to keep high grade tracks for passenger service where all sorts of freight trains are handled over the same tracks at both slow and high speed. It is thought by those best qualified to know that many heavy loaded freight cars with small diameter wheels do more damage to rails and the rest of the track structure than the engines, although the latter have much heavier wheel loads.

As a result it is very expensive to maintain track where many heavy loaded large capacity freight cars are handled. Originally I placed a higher percentage on the effect of eliminating the engine than I now believe warranted. As a result I have fixed 20 per cent as a fair amount for rail ties, other track materials and ballast. Since only 60 per cent of the power is used in road freight service the above percentage is reduced to 12 per cent.

Account 249—Signals and Interlockers. A total of 31 per cent is allowed for this account on the ground that about 50 per cent of the expense of maintaining signals and interlocking is directly due to train movements. The life of an automatic signal depends upon its use. The cost of maintenance increases with the number of train movements and as the train movements increase the signals must be placed closer together.

Accounts 308, 309 and 310—Steam Locomotive Repairs, Depreciation and Retirement will be affected about 62 per cent, this being the ratio that road freight engines bear to the total engines in service.

Account 392—Train Enginemen: This is affected about

74 per cent, this being the ratio of the freight train enginesmen to the total.

Accounts 394, 397, 398 and 399—Fuel, Water, Lubricants and Other Supplies for Train Locomotives: These items are made 100 per cent on the ground that a reduction in grade entirely eliminating a freight locomotive will also make a marked decrease in the amount of coal, water, etc., consumed by the passenger locomotives.

Account 400—Enginehouse Expenses Train: This account will be affected 100 per cent.

Account 401—Trainmen: This will be affected 69 per cent or the ratio that the wages of freight trainmen bear to the wages of all trainmen.

*Elimination of Distance.*—Account 405—Crossing Protection: If the charges to this account were uniform over

TABLE II. ESTIMATED SAVINGS OF CLARKS SUMMIT-HALL-STEAD CUT-OFF OVER OLD LINE BASED ON 1908 TRAFFIC

Savings due to grade reduction.

27,176 x 1.259.....		34,214.60
Savings due to rise and fall eliminated.		
24,497 x 475 x 0.30 divided by 26.4.....		132,228.12
Total savings.....		\$1,508,368.00
Savings capitalized at 6 per cent.....		25,139,466.67
Total cost of new line.....	\$14,259,340.21	
Less savings on account of the elimination of flagmen on 29 crossings, the elimination of the necessity of additional third track on old line, value of salvage old line, etc.....	1,905,900.00	\$12,353,440.21
Net gain.....		\$12,786,026.46

Note: If the savings are capitalized at 4 per cent as figured in 1909 the net gain becomes \$25,355,760.

the entire road, this item would be affected 100 per cent. As a matter of fact it cannot be so considered. For the territory in question there were 29 public grade crossings and numerous private crossings at the time of the change. For the crossings which were at that time protected by gatemen 50 crossing watchmen would now be required and the wages and other expenses in this connection would amount to the interest on not less than one million dollars. Therefore the saving in connection with the elimination of crossings has been considered as a separate item.

Account 202—Roadway Maintenance; 208—Bridges, Trestles and Culverts; 212—Ties; 214—Rails; 216—Other Track Materials, and 218—Ballast: All the track laying and surfacing subdivisions; roadway buildings and damage to live stock on right-of-way will be affected 100 per cent. These items will be entirely eliminated.

Account 249—Signals and Interlockers will be affected 50 per cent on the ground that the automatic signals will be eliminated, but the number of interlocking plants will not be affected.

Accounts 308, 309, 310—Steam Locomotive Repairs, Depreciation and Retirements: These items will be affected 80 per cent for the reason that 80 per cent of all locomotives are in road service.

Accounts 314, 315, 316—Freight Train Car Repairs, Depreciation and Retirements will be affected 65 per cent on the basis that 65 per cent of all repairs are due to road service. In like manner Accounts 317, 318 and 319—Passenger Train Car Repairs, Depreciation and Retirements will be affected 75 per cent.

Accounts 392 and 401—Train Enginesmen and Trainmen will be affected 95 per cent on the basis that 5 per cent of the total expenditure is made up of constructive mileage.

Accounts 394, 397, 398 and 399—Fuel Water, Lubricants and Other Locomotive Supplies will be affected 90 per cent on the basis that 10 per cent of the expenditure is due to supplies paid for while trains are standing on the sidetracks, stations, etc.

Account 400—Enginehouse Expense Train will be affected 100 per cent.

*Helper Engines.*—Assuming that one-half the pusher mileage is light and that a light engine will do one-half as much damage to the track and to itself as it will do when handling tonnage, we can apply 75 per cent to all the items of roadway maintenance and maintenance of equipment which will be affected by a change in grade as shown in Table I.

Account 392—Train Enginesmen will be affected 74 per cent, this being the ratio of freight enginesmen's expense to the total expense of train enginesmen.

Accounts 394 and 397—Fuel and Water will be affected about 60 per cent owing to the fact that the engines are running light part of the time.

Accounts 398, 399 and 400—Lubricants, Other Supplies for Train Locomotives and Enginehouse Expenses (Train) will be affected 100 per cent.

Account 401—Trainmen will be affected about 25 per cent since only one trainman is required for each pusher. As a matter of fact at the present time trainmen are not used on pusher engines.

*Curvature.*—Account 212—Ties is affected 50 per cent on the basis that a better grade of tie is required on a five-degree curve than on a straight track, costing in the neighborhood of 25 per cent more money. Furthermore, the life of ties on straight track is approximately 30 per cent longer than on a five-degree curve.

Account 214—Rails is affected 400 per cent based upon records of rail renewal.

Account 216—Other Track Material is affected 200 per cent or one-half that applied to rail on a basis that new bars, bolts and spikes are required when rail is relaid, whereas the same tie-plates can be continued in service.

Account 218—Ballast is affected 30 per cent on account of the increased amount of ballast being required to form a shoulder and to provide for the elevation. There is also a greater wear on the ballast and consequently a shorter life on account of necessary additional tamping.

Account 220—Track Laying and Surfacing is affected 100 per cent, this being a fair average of the percentage applied to Ties, Rails, Ballast, etc.

Accounts 308, 309 and 310 are affected 30 per cent on the basis that 15 per cent of the cost of engine repairs and renewals is chargeable to drivers and ties and this expense will be at least twice as much on a five-degree curve as on the average alignment.

Accounts 314, 315, 316, 317, 318 and 319, Freight and Passenger Car Repairs, Depreciation and Retirements will be affected 20 per cent.

*Rise and Fall.*—While several items of the accounts will be affected in a slight manner by rise and fall, the only one that amounts to any considerable sum is the question of fuel for locomotives. We have considered this item as 50 per cent affected due to the fact that there is considerable loss when the engine is working at low efficiency while pulling a heavy load, say at ten miles per hour; also a loss due to poor combustion at low speed. A very considerable increased amount of coal is necessary where engines are operating at low rates of speed. Furthermore, more steam is consumed and more or less energy wasted in braking down the train on descending grades.

### The Summary of Savings to Be Expected

In order to apply the total percentages arrived at, and as shown in detail on Table I, it is necessary to estimate the number of trains which would be required to handle the 1908 business over the proposed new line and thus determine the total train miles saved per annum on account of reduced grades. It is likewise necessary to determine the number of pusher engine miles saved. In arriving at the number of train miles saved, care was used to give full consideration to the movement of light engines over the road because of unbalanced traffic. It was also necessary to consider carefully the total distance over which the increased tonnage per train would be handled. While that part of the old line revised was only 43 miles long, all fast freights would be affected from Scranton to Binghamton, a distance of 61 miles, and part of these trains would be affected from Binghamton to Elmira, an additional distance of 57 miles. It was only a matter of multiplication to determine the net saving per annum.

In figuring the total amount saved on account of eliminating curvature, the total reduction of curvature is reduced to miles of five-degree curve. The result in miles is multiplied by the total number of trains per annum.

In Table II, attached, will be found the estimated savings for the Clarks Summit-Hallstead Cut-off as compared with the old line, based upon the traffic of 1908, and also on the actual traffic for 1920. The savings as computed for the 1908 business as given in Table II, are exactly as figured in 1910.

It will be noted that the total saving figured on 1908 business is \$365,284.04, which, capitalized at four per cent, is \$9,132,101. The actual cost of constructing the line was \$14,259,340.21. This amount can be reduced by \$1,000,000 for the cost of eliminating the grade crossings which would have been necessary if the old line had been retained. The cost of building a third track on the old line, together with the credits for rail amounted to \$905,900, making a total credit of \$1,905,900. Therefore, the net savings to be expected based on 1908 business would fall short of building the new line by about \$3,221,339.

The other computation at the foot of Table II is based on actual traffic on the new line for 1920 compared with the estimated traffic that would be necessary to take care of the 1920 business on the old line, taking into account the increase in tonnage per train mile in 1920 as compared with 1908. The total net saving as figured is \$1,508,368 which, capitalized at six per cent, amounts to \$25,139,466.67; deducting the net cost of construction leaves \$12,786,026.46. This latter figure is increased to \$25,355,760 if we use four per cent as the interest rate, as was done in 1909.

### The Tunkhannock Viaduct

This paper is not complete without a word about the Tunkhannock viaduct and the reasons for building a concrete structure in preference to a steel one. In order to construct the line with the established grades it was found necessary to cross Tunkhannock creek at an elevation of approximately 240 ft. above the water, which would require

a structure from 2,500 to 3,000 ft. in length. After spending much time in arriving at what was considered the most economical design for a concrete viaduct, plans and specifications were submitted to contractors for bids. At the same time five or six bridge companies were asked to submit bids on a steel structure. The bridge companies were all requested to submit bids both on the design made by the railroad and on their own designs, thus giving each bridge company an opportunity to work out the most economical design for a steel structure.

When the bids were received it was found that the first cost of a steel viaduct consisting of an 8-in. reinforced concrete floor slab supported on transverse I-beams which in turn were supported by three lines of deck and two lines of through plate girders carried on towers, was slightly over a million dollars. It was estimated that a \$200,000 sinking fund at four per cent interest was necessary to paint, inspect and otherwise maintain the steel viaduct. It was assumed that 50 years would be the maximum life of a steel viaduct and that a sinking fund of approximately \$150,000 would be required to replace the structure in 50 years, provided that the viaduct could be rebuilt as cheaply at that time. The total cost of the steel viaduct, therefore, on the 50-year life basis, amounted to approximately \$1,350,000. The estimate for the concrete structure, based upon the figures received from contractors, was \$1,349,000. The actual cost of the concrete viaduct including all extras, waterproofing, etc., was \$1,424,950.

Several points in favor of the concrete viaduct caused it to be adopted in preference to steel. These may be summarized as follows:

1. With any future increase in live load up to 50 per cent over the loads of 1912 the unit stresses will not be increased over ten per cent.

2. The concrete structure, as designed and built, is a more substantial structure and less liable to be damaged by derailment or a wreck of any kind. In the case of an engine or car falling over the side of the structure no damage could possibly be done to the concrete viaduct, whereas a steel viaduct might be very seriously injured and traffic tied up for an indefinite time. With the concrete viaduct, there is little possibility of a derailed car or engine ever falling over the side of the structure. A very substantial retaining wall was provided on both sides and will act as a guard in case of derailment. Such a guard could not be provided on a steel structure without a very large increase in the cost.

3. It would be impracticable to rebuild the steel structure in the future on the original foundations when necessary to replace. This would require a change in line with increased cost for rock excavation and embankment.

Careful consideration was also given to the possibility of constructing a fill across the valley, but this was found to be exceedingly expensive. Nearly 7,000,000 cu. yd. of fill would have been required and a very large quantity of masonry for arches to carry Tunkhannock creek and the public highway on the west side of the valley.

### Conclusions

Finally, in considering the advantages gained by the construction of this new line, it must not be overlooked that with the exception of the tunnel and the Tunkhannock viaduct, the roadbed for the entire line was constructed for three tracks. Three tracks were built from the tunnel to Clarks Summit and four tracks on the western 10 miles from New Milford to Hallstead.

On the old line there were two narrow, single track, poorly ventilated tunnels with insufficient side and overhead clearance. The one tunnel, 3,600 ft. in length, on the new line, affords standard clearances, two good ventilating shafts and was lined with vitrified brick throughout. The cost of maintaining this tunnel is materially less than the cost of main-

taining the old tunnels, to say nothing of the more satisfactory operation.

While the new line cost somewhat more than was originally estimated, it was not anticipated that a four-track railroad would be built over any portion of the line and a third track was only provided on the heavy grades. A very material change was also made at Clarks Summit where westbound slow trains pass under the main tracks in order to avoid crossing these tracks at grade at the summit as was the practice on the old line.

The year 1920 cannot be considered a safe year as a basis for computing transportation costs. Nevertheless the figures indicate that there would still be a wide margin in favor of the new line if the cost per train mile should be cut in two, to say nothing of increased traffic in the future.

In conclusion I wish to give full credit to M. H. Doughty and L. L. Tallyn, division engineers, who worked with me in all the computations and deserve much credit for the vast amount of work which was necessary in order to reach the conclusions. I also wish to mention F. L. Wheaton, now division engineer of the Buffalo division, who had charge of the construction work.

## Freight Car Loading

WASHINGTON, D. C.

**L**OADING of revenue freight totaled 742,926 cars during the week ended on December 10, as compared with 747,454 cars during the previous week, or a reduction of 4,528, according to reports received by the car Service Division of the American Railway Association. This was a decrease of 95,027 cars compared with the corresponding week last year and 19,014 cars less than were loaded during the corresponding week in 1919.

Small increases were reported in the loading of all commodities during the week compared with the week before, except merchandise and miscellaneous freight, which includes manufactured products. Loading of this last named class of freight totaled 461,741 cars compared with 470,914 the week before or a reduction of 9,173 cars. It was, however, an increase of 3,500 over the total for the corresponding week in 1920 but 18,000 cars less than were loaded during the same week in 1919.

Loading of grain and grain products amounted to 48,680 cars, 1,453 cars more than were loaded during the preceding week and 12,955 cars more than were loaded during the same week last year. It also was an increase of 11,551 cars over the corresponding week in 1919.

There were 32,159 cars loaded with live stock, an increase

of 204 cars over the previous week and within 66 cars of reaching the total for the corresponding week last year. An increase over the previous week of 533 cars was reported for coal, the total being 137,836 cars, while coke, with a total of 6,638 cars, showed a gain of 293 over the same period. Forest products totaled 49,744 cars, an increase within a week of 1,341 cars and a gain of 151 cars over the same week last year. Ore also showed an increase of 811 cars over the week before, the total being 6,128 cars.

Compared by districts, the Pocahontas and Southern were the only ones to report an increase in loadings over the week before while all showed reductions compared with the corresponding week last year.

Freight cars idle because of business conditions totaled 528,158 on December 8, compared with 455,376 on December 1 or an increase of 72,782 cars within that period.

Of the total, 368,042 were surplus cars, an increase within a week of 85,116. The remaining 160,116 were idle freight cars in need of repairs over and above the number normally in bad order.

Surplus box cars totaled 129,995, which was an increase of 16,121 over the total on December 1, while surplus coal cars numbered 166,063, an increase of 33,370 within the same period. An increase within a week of 2,412 was reported for stock cars, but a reduction of 64 in the number of surplus coke cars.

While there was an increase in the number of surplus cars, the reports showed a reduction in the number of bad order cars, the total number needing repairs on December 1, the latest date available, being 320,292 or 14 per cent of 2,288,228, the total number of cars on line on that date. This compares with 333,616 or 14.4 per cent reported in bad order on November 15. Assuming 7 per cent of the cars on line to represent the number normally in need of repairs, this would leave 160,116 as the number of bad order cars which are idle because of business conditions.

THE GOLDENDALE BRANCH of the Spokane, Portland & Seattle, from Lyle, Wash., north to Goldendale, 42 miles, and the line of the Oregon Trunk, from Fallbridge, Oregon, south to Bend, 155 miles, resumed service on December 10, after a suspension of three weeks on account of snow blockades.

A VETERANS' ASSOCIATION, for the Metropolitan District, is proposed by the New York Central to its employees in New York City and Weehawken, N. J., in a circular inviting the employees and their families to attend a meeting to be held on Sunday afternoon, January 8. President A. H. Smith and other officers will address the meeting.

# First Part of Rate Hearing Concluded

## Preliminary Testimony Given by Railroads Who Oppose Further Rate Reductions at Present

WASHINGTON, D. C.

THE FIRST STAGE of the hearings before Commissioners Aitchison, Esch, Hall and Lewis of the Interstate Commerce Commission in its investigation as to what, if any, further reductions in rates may lawfully be required and the future percentage of net return to be allowed, was completed on December 17. Four days had been consumed in introducing the preliminary testimony of the carriers of the eastern, southern and western districts in response to the questions propounded in advance by the commission, when the hearing was adjourned to January 9. The commission had allotted seven days for this testimony but the roads had been unable to complete the compilations requested in time and additional statistical information will be presented when the hearing is resumed. R. H. Aishton, president of the American Railway Association, is also to testify on efficiency and economy of operation, J. G. Walber, secretary of the Bureau of Information of the Eastern Railroads, on the wage question, and various executives on the percentage to be prescribed by the commission as constituting a fair return after March 1.

The preliminary testimony consisted of statistical statements from the three districts showing the present financial condition of the railways and the results attained under the advanced rates as well as under the reduction in wages and in other expenses made in recent months. This showed that for the 12 months ended September 30, 1921, the eastern roads had earned a net operating income of 2.75 per cent on the tentative valuation prescribed by the commission (as adjusted to cover only Class 1 roads and to include additions and betterments made during 1920), while the Southern roads had earned 1.8 per cent and the Western roads 3.04 per cent. While it was shown that these percentages had been considerably exceeded since July, and in October had reached an average of 5.4 per cent for the roads as a whole, it was also shown that traffic had fallen off considerably in November and December and it was estimated that the net return for those months would show reductions.

The attitude of the carriers toward further rate reductions was stated by the traffic executives, who all testified that the present rates are yielding the railroads an inadequate return and in the aggregate are not unreasonably high, considering the cost of transportation; that thousands of reductions had already been made, many of considerable extent by way of readjustment and to meet the requests of shippers, and that in general rates should not be further reduced until the roads have had further opportunity to reduce their expenses. They asserted that freight rates have not been the cause of the depression in business and that, in general, further decreases would not stimulate business materially because of the many other factors that tend to retard the restoration of traffic.

### Postponement of Grain Reduction Denied

While the hearing was in progress the commission on December 16 surprised the carriers by denying their petition for a rehearing of the case in which the commission had ordered a general reduction in the rates on grain and grain products and hay in the western district, effective on December 16, which, it is estimated, will reduce the revenues by about \$33,000,000 a year. While the petition of the carriers, in which they had also asked for a general rate investigation and had proposed the 10 per cent general reduction on agricultural products, had been technically for a rehearing

of the case, at the argument on December 14 they had asked that the order be suspended for six months pending the outcome of the investigation. While the 10 per cent reduction on agricultural products for six months had been proposed as a substitute for the larger reduction on grain and products and hay confined to the west, and it had been generally understood that it was contingent upon a postponement of the grain order, Alfred P. Thom, counsel for the Association of Railway Executives, had burned the bridges behind him in his argument for a six months' suspension by stating that the 10 per cent reduction was in no way dependent upon the action in the grain case and that the roads had taken "an irretrievable step." The railroads had been very hopeful that their plan would be accepted but a great deal of pressure had been brought to bear on the commission to put its order into effect. Originally the commission had directed the roads to make the reduction on or before November 20, without issuing a formal order, and the order was only issued on November 21, after the roads had failed to file the tariffs, but had proposed the more general 10 per cent reduction as an alternative which would afford a broader relief to the agricultural industry.

### Geo. M. Shriver Presents Comparative Statements for the Roads As a Whole

George M. Shriver, vice-president of the Baltimore & Ohio, presented the general statistical testimony for the roads as a whole and for the eastern district. Mr. Shriver's statement was summarized as follows:

It is shown that the net railway operating income of the Class 1 railroads of the United States for the 12 months to September 30, 1921, was \$542,409,582, or 2.75 per cent on the property investment; that because of decreased operating income and increased charges and taxes, the net corporate income has been so diminished that some carriers have been compelled to suspend, and others to reduce, the customary dividends, while some have maintained customary dividends only by drawing upon surplus earned in previous years, consequently, of course, the surplus and margin to sustain credit has been reduced.

That because of lowered rates, and falling off in traffic, the railroads have failed to earn more than one-half the anticipated 5 1/2 per cent and nothing towards the one-half of one per cent contemplated as a contribution towards additions and betterments and to sustain credit, that the railroads have large accounts pending settlement with the government, and the manner in which these are disposed of will have a material bearing upon their cash position.

The Eastern carriers have shown that their operating income for the 12 months to October 31, 1921, was \$234,594,277, or 2.07 per cent on the property investment, and fell short of meeting the fixed charges of these carriers by \$700,000,000. That when the operating results of this year are restated to reflect the effect of lowered rates and lowered costs to do over again the business of 1921, the estimated net operating income of the Class 1 railroads would be, say, \$473,984,331, affording a return of about 3.40 per cent, but without having made any provision for many important items of maintenance which were deferred in that period.

That it will require extensive work to fully restore the condition of the properties, particularly equipment to meet the demands under normal traffic, and that large sums must be raised for additions and betterments, if the railroads are to be enabled to help, and not to hinder, the future commercial and industrial expansion of the country.

### Roads Not in a Position to Experiment

In this situation the railroads are not in a position to experiment (beyond what they have already done by lowering of rates at this time), and having in mind the prime importance of the country of having a strong and effective transportation system, it does not appear in the interest of the public that the roads should do so

unless and until the processes now operating towards a pre-war level of costs have been more completely realized.

While the preliminary figures for November show again a sharp falling off in traffic, and the car movement reported so far for December indicates an even more serious decline, this is believed to be only temporary (influenced perhaps by the actual decrease in charges with the cancellation of the transportation tax at January 1, 1922, and no doubt in part pending conclusion of this hearing), as the underlying conditions in the United States and the world at large appear to be improving generally; while currently railroad operating costs are on a basis which affords an inadequate return, the basic elements of cost are declining and will no doubt continue, so that in the not distant future railroad transportation can again be brought to the relative position it had heretofore occupied of being the lowest priced commodity in the country, and continue—as it now is—lower than in any other country.

### 1920 Operations Compared with 1916

Mr. Shriver in his testimony said in part:

It is almost inconceivable to the average person that the railroads, which in 1916 earned a net operating income of \$1,040,085,517, should in 1920, with 71.77 per cent more gross revenues, have earned net of only \$21,661,782. It is true both of these years were exceptional, 1916 in that it was a year of substantial traffic handled under favorable operating conditions, while 1920 was exceptional in that for the first two months the properties were operated under federal control, and these two months no doubt carried some extraordinary expenses incident to the conclusion of such operation; for the months from March to October the railroads were called upon to perform the largest traffic movement in their history under particular pressure, and with their properties, especially cars, in a more or less depleted condition. This period was followed by two months in which there was a sharp falling off in business, so sudden and so general that it was impossible for the carriers to at once adjust their operations accordingly. These and other reasons rendered their operations for 1920 unusually expensive.

The comparison of these two years illustrates in a striking manner how the upward trend in expenses had exceeded the increase in revenues:

Comparing the year ended December 31, 1920, with the year 1916, it will be noted that the passengers one mile increased 35.46 per cent, and the net ton miles increased 12.84 per cent. Notwithstanding the increase in passenger and net ton miles handled, there was an actual decrease in the total train mileage of 2.34 per cent.

The total hours on duty of all employees in 1920 was 7.68 per cent larger than in 1916, while total wages paid in 1920 was 149.39 per cent greater than in 1916.

Taking the business as a whole, revenues increased only 71.77 per cent during the same period, while total expenses increased 147.37 per cent. For 1916 the total operating revenues were..... \$3,596,865,766 And the net railway operating income applicable to interest and other corporate purposes was..... \$1,040,084,517

The increase in revenue 1920 over 1916, due both to increased traffic and increased rates and charges aggregated..... \$1,581,522,280 Total wages increased..... \$2,193,967,278 Cost of fuel increased..... 452,229,229

Total increased cost of wages and fuel..... \$2,646,196,507 (or for these two items alone more than the entire increase in revenues). Other expenses inc..... 827,870,197

A total increase in expenses of..... 3,474,066,704

Or an increase in expenses in 1920 over 1916 in excess of increase in revenues of..... \$892,544,424

And correspondingly reduced the net operating income, which becomes..... \$147,540,093 From this there is to be further deducted increases in taxes, hire of equipment and rents, etc..... 125,878,311

Leaving the net operating income in 1920 available for interest and other corporate purposes..... \$21,661,782 As compared with that earned in 1916 of..... \$1,040,084,517

### Results Following Decision in Ex Parte 74

The commission authorized increases in rates and charges, designed to meet the expense basis existing at the time of the decision and to produce a net railway operating income equal to 6 per cent upon the value of the properties. For the months of September and October traffic continued to move in a volume so large that it taxed the ability of the railroads to handle it. While the rates were not effective in their entirety, owing to the delays in securing the concurrence of several of the state commissions, etc., and notwithstanding the expense of operation continued to rise, reaching perhaps the peak in this period, the operating income for these two months (September and October, 1920.) was \$75,310,311 and \$86,455,487, respectively, an aggregate of \$161,765,798, or on an annual basis of return of about 4.20 per cent when related to the tentative valuation fixed by the Interstate Commerce Commission.

Many of the increases in freight and passenger rates authorized

by the commission did not become effective until perhaps January 1, and some not until later periods, so that the results for the two months, even if it were proper to use so short a period for projecting, do not fully reflect the returns that might have been expected under the increased basis of rates.

### Calendar Year 1921

The falling off in traffic noted in November and December, 1920, continued with some seasonal variations, through the months of January to October, 1921.

In comparing the income for 1921 with that of the test period, consideration must be given to the fact that more than \$2,000,000,000 has been added to the property investment since.

Following the establishment of the new rate basis in August, 1920, it became necessary almost immediately to make various adjustments in rates, and up to the present time thousands have been made, most of them involving lower charges; some of them being so substantial as to result in large decreases in the earnings.

Because certain of the expenses are inelastic, however, and because of the impossibility of reducing maintenance expenditures below the limit of safety, the railroads were unable to bring their expenses down in proportion to the falling off in revenue, and consequently there was a narrowing of net railway operating income for the period which fell far short of meeting the anticipations following the rate adjustments authorized in Ex Parte 74.

A number of roads have reduced their rate of dividend and several have been compelled to suspend payments entirely, all of which has of course a very direct bearing upon the credit of the carriers. It is not surprising under such circumstances, to note that practically all new financing has been done by increasing the funded debt of the carriers, and that the ratio of debt to capital has risen from 54.5 in 1919 to 56.1 in 1920.

### Official Classification Territory

Referring to the situation in Official Classification Territory, Mr. Shriver filed an exhibit showing the result of operations for the years 1911 to 1920, inclusive, and for 12 months to September 30, 1921, the operating ratio during the six years 1911-1916 averaged 71.12 per cent. From a ratio of 67.39 per cent in 1916 the ratio mounted to 74.20 per cent in 1917, 84.82 per cent in 1918, 88.19 per cent in 1919, and reached the highest in history in 1920 when it became 98.68 per cent. To indicate the outstanding facts which operate to bring about the high operating ratio of 1920, as compared with the year 1916, Mr. Shriver said:

The increase in revenues, 1920 over 1916, was 69.4 per cent, or..... \$1,210,440,168 The increase in expenses for the same period was 148.0 per cent, or..... \$1,740,379,263 Increase in taxes, rents, etc..... 40,259,794 Total increase in expenses, taxes, etc..... 1,780,639,057

An increase in expenses, taxes and rents in excess of increase in revenues of..... \$570,198,889 So that the net railway operating income in 1916..... 462,851,984 Actually became in 1920 a deficit of..... 107,346,905 During this period of vanishing income there was actually expended for additions and betterments to road and equipment the sum of..... 1,379,040,928 With consequent increase in fixed charges.

This is the situation which confronted the carriers in the eastern district in 1920, and placed a severe strain on even those of the strongest financial credit. For the year to September 30, 1921, the operating ratio is 86.46 per cent, a drop compared with the year 1920 of over 12 points, reflecting the advance in rates for transportation granted August 26, 1920; and reduction in wages July 1, 1921, as well as substantial reductions in cost of fuel and materials.

The ratio was also affected by the curtailment in maintenance, but even with all these factors the ratio is 15 points higher than the average for the six years ending with 1916.

### Twelve Months to September 30, 1921

When we review the returns for the 12 months to September 30, 1921, we find October, 1920, as a month in which a large volume of traffic moved with a fair net operating income. The decrease in volume of traffic became noticeable in the latter part of this month, and quite pronounced in November and December, 1920, and has so continued with only seasonal increases.

Preliminary reports for October, 1921, show a somewhat improved situation (due apparently to temporary causes), but in November there has again been a sharp decline in traffic and is becoming even more pronounced in December. The net railway operating income for the 12 months to September 30, 1921, was \$228,873,760, or 2.72 per cent on the property investment, and fell short of meeting fixed charges of the roads in the eastern district by over \$75,000,000.

Mr. Shriver showed that net railway operating income from January to October, 1921, was \$204,233,484, compared with \$336,890,219 for the same months of the average test period year. This \$204,233,484 is equal to 2.43 per cent on property investment (excluding materials and supplies) as of December 31, 1920. These carriers during the test period, or the three years ended June 30, 1917, earned 8.47 per cent of their annual net railway operating income in the 10 months, January to October, inclusive, and projecting the income for the remaining two months, on this basis, shows a rate of return of 2.87 per cent for the calendar year 1921.

### Freight Rates in Relation to Commodity Prices

Mr. Shriver in reference to the matter of freight rates in relation to commodity prices said:

The carriers are not unmindful of the fact that, even with the reductions in rates already made and those now under consideration, the charges generally are high; that is, high as compared with what they were formerly. Some statisticians have shown the average rate per ton per mile in relation to the average prices of commodities, and by confining such comparison to the period 1913 to 1917, inclusive, have indicated that the increase in rates has in recent periods exceeded the average increase in commodity prices. A comparison over so short a period, however, cannot be considered as conclusive, particularly when the year 1913, taken as a base, was one during which railroad rates were generally recognized as having been low, and in the case of the eastern district, where substantially 50 per cent of the traffic of the country is handled, the rates were found by the commission in 1914, and again in 1917, to have been lower than they should be in the public interest.

The *Railway Age* has recently published a detail statement and chart covering such statistics over a period of more than 30 years, which indicates, even without taking into consideration the decreases recently made and arranged for, that freight rates were not relatively higher than the average commodity prices. This statement and chart also shows that the railroads for a number of years were compensated on a much lower basis than were the producers of other commodities, and that the railroads did not relatively participate in the high prices prevailing from 1915 to 1920. In other words, the railroads did not realize abnormal prices or profits, and were so less able to respond with lower rates when prices generally declined.

A copy of this statement and chart was filed as an exhibit.

Referring to the request of the commission for data as to the effect upon the carriers' operating income of the reduction in rates so far made, as well as the changes which have come about in the operating costs due to lower rates of pay and lower costs of fuel, material, etc., Mr. Shriver said that detailed questionnaires have been submitted to the various carriers in a form which it is believed will develop some reliable data bearing on this question.

"Under the most favorable circumstances, it is extremely difficult with the best of data available to measure the effect of the changing conditions as applied to the traffic and operations of a given period," he said. "However, in an effort to present this situation in some tangible form, information was secured by telegraph from the various railroads in the Eastern District covering data with respect to the more important items, and using the result of these returns for the purpose of estimating, an adjusted or constructive year has been arrived at."

Continuing, he said:

The adjustment indicates that to do over again the identical business that was done in the 12 months period to October 31, 1921, upon the basis of rates and costs in effect at November 1, 1921, would show a reduction in revenues due to lower rates, etc., of \$60,000,000, and a decrease in expenses due to lower rates of pay, reduction in costs of fuel and material, and miscellaneous expenses of \$24,320,054, a difference of \$264,320,054. Less estimated increased taxes, \$25,000,000, or a net increase in income of \$239,320,054, which, added to the operating income as audited, \$234,594,277, would show a total income for the adjusted year of \$473,914,331, and when related to the property value, as tentatively determined by the commission, afford a return of 5.40 per cent.

In making this estimate we have endeavored to be more than conservative in minimizing the lowering of rates and by using the maximum for lessened expenses, and so it is believed to reflect

the maximum railway operating income which can be earned on the traffic of 1921 under present conditions. In this connection the fact should not be overlooked that a considerable proportion of the net railway operating income for the year 1921 has been realized only through the postponement of many important items of maintenance, which curtailment is, of course, also reflected in the adjusted figures.

### Benjamin Campbell for New England Lines

Benjamin Campbell, vice-president of the New York, New Haven & Hartford, appeared on behalf of the New England roads. He said that based on the return to the carriers present rates in the aggregate are not unreasonable because they fall far short of a reasonable return and if searching investigation were made, a great many of the rates might be found unreasonably low. As nearly as can be forecast, he said, there is small prospect for a substantial increase in business until spring. Since August, 1920, the New England roads had originated 1390 rate proposals, many of which affected many rates, of which 93 were advances and 1297 were reductions. They have also participated in many joint rate reductions. The reductions that have been made have not resulted in increased traffic, but in some instances they hold some business that otherwise would be lost. Practically no new reductions should be made in New England under present conditions, he said, and when the time arrives for a general reduction of rates, it should only be made after an improved rate structure has been made for the New England territory, including an improved relation between classes and commodities and between trade centers. In future general reductions should be confined to carload traffic and the car load minimums should be increased. The reduction should be on raw materials.

Mr. Campbell also referred to the inadequate mail rates in New England, which, he said, are less than the actual cost of transportation. He read a supplemental statement prepared by Gerrit Fort, vice-president of the Boston & Maine, giving the results of a general canvass of the shippers of New England. This said that there was considerable objection because the proposed 10 per cent reduction on agricultural products is not to apply in New England, but explained that the railroads cannot give adequate service if their revenues are to be further reduced. Mr. Fort expressed the opinion that rail rates are only one of many factors that have resulted in depressed business in New England.

### T. C. Powell for Eastern Trunk Lines

T. C. Powell, vice-president of the Erie, was the traffic witness for the Eastern trunk lines. He produced detailed statistics as to various crops and industries to show that the depressed conditions in many lines are due to world conditions and have been very slightly affected by freight rates and, therefore, that the assertion that reduced freight rates would restore business is founded on an illusory hope. He said that the prices of many crops are controlled by the demand for the service and while the people of Europe need many of these products they are unable to buy because of the low value of their money in exchange. On the other hand, increased production of grain outside the United States has decreased the demand for our surplus. While he showed that the carriers have made many and extensive reductions in rates during the past year, he said they have been deterred from making some reductions because of the fear that shippers of unrelated products would ask similar reductions.

"The conditions," he said, "at the present time differ from any preceding depression in history. Heretofore business depressions, panics and disturbances have, from the standpoint of international trade, been localized and restricted in their effects."

"These world-wide conditions are the direct result of the world war. If it were not for this fact, and if the United States could stand by itself we would be in a prosperous condition."

In relation to many of the most important basic products, Mr. Powell said that existing conditions showed low relative production which normally would make for high prices, but that prices were low because of the lack of purchasing power and that therefore freight rates had practically no effect in reducing international trade.

Mr. Powell pointed out that the major part of the surplus corn had already been sold and that, as with cotton, it was the lack of purchasing power rather than freight rates which had brought about the low prices. He also showed similar conditions in wheat.

As a contrast to this he gave the data showing a condition of prosperity in fruits and vegetables. He closed this line of testimony in relation to barley, rye, rice, hay, potatoes, apples, peaches, sweet potatoes, flax, seed, tobacco, peanuts and sugar beets by saying, "If we were independent of world conditions the prices on all of these commodities should be on a scale that would ensure a profitable return to the producer."

Mr. Powell then added that appreciating the harmful effect upon business of such uncertainty, the eastern traffic executives had recently announced that no reductions would be made in trunk line or central freight association territory on coal, coke, fluxing stone or dolomite.

### Readjustments Since Ex Parte 74

Mr. Powell filed exhibits describing the various readjustments and reductions in rates that have been made in eastern territory since Ex Parte 74 and on being pressed for an estimate of the extent of the reductions, he placed it roughly at \$100,000,000 a year on the basis of a normal volume of traffic. After having been led into making this guess, he was pressed by many of the shippers present for a detailed statement as to how he arrived at it and as to how much of this reduction represented a real loss to the carriers in view of the fact that some reductions were made to prevent the loss of business. Mr. Powell denied that most of the reductions had been made for the purpose of retaining business, saying many of them had been made only under pressure and had had no effect on the traffic, while they had reduced the railroad revenues.

Mr. Powell pointed out that substantial reductions had been made in export grain rates to meet Gulf and Canadian competition and that the 28 cent reduction on lake cargo coal had been originally made to meet the increased competition in the Northwest of coal from Illinois territory. The reduction had subsequently been applied to coal moving from all lake ports west of the Detroit river. Some of the reductions had been made to meet motor truck competition but very few, as the railroads were not generally attempting to meet that competition on short haul traffic. He pointed out that the export rates on iron and steel had been reduced 25 per cent at the request of the iron and steel shippers who desired to stimulate their export business, but that no marked increase in shipments had resulted, while on the other hand, the effect had been to cause reductions in the export rates via the Pacific coast. The Panama Canal competition also led to many reductions in transcontinental rates.

It is the belief of traffic officials, Mr. Powell said, that the restoration of business does not depend primarily on railroad purchases, but that the increased consumption must come from the general public. He pointed out that prices for building materials have been high out of all proportion to the rates, and that the depressed condition of the building industry has reduced the demand for iron and steel.

### W. C. Maxwell for C. F. A. Lines

W. C. Maxwell, vice-president of the Wabash, testified on behalf of the Central Freight Association lines and said that as the present rates in the aggregate in the east do not yield a reasonable return based on the present operating cost, they are not, in his opinion, unreasonably high. No increases

have been made since Ex Parte 74 except slight readjustments and he filed several detailed exhibits to show the extent of the reductions that have been made, in many cases by amounts as great or greater than the increases made in Ex Parte 74. Hardly a commodity has not been touched.

Mr. Maxwell presented estimates that the proposed 10 per cent reduction on farm products would reduce the revenues of the Wabash \$1,233,034 a year on the basis of the 1921 traffic. For the Pennsylvania, the reduction was estimated at \$5,800,000, for the New York Central at \$3,053,353 and for the Erie at \$1,250,000. Mr. Maxwell also pointed out that many reductions have been made since the compilation made by the Interstate Commerce Commission which was published as a Congressional document. He said the 10 per cent reduction would affect the C. F. A. roads more than it would the eastern roads generally and he thought it would prove burdensome. The dockets of the traffic association are now loaded with applications for reductions which the carriers are trying hard to dispose of. John S. Burchmore, attorney for shippers, made a formal objection to the filing of Mr. Maxwell's exhibits which showed reductions made by state commissions in intrastate rates as being outside the scope of the hearing. Commissioner Hall overruled on the ground that while the investigation deals primarily with interstate rates, the commission cannot be asked to ignore the effect of changes in intrastate rates.

### Passenger Fares

Discussing passenger fares, Mr. Maxwell said the principle of the surcharge is right and it should be continued. "It has been a crime against the common people, who ride 65 to 75 in a day coach, to let a dozen or so plutocrats occupy a magnificent Pullman car at no higher rate of fare," he said.

It is the general opinion of passenger men, he said, that the rate of fare has had no material effect on passenger travel, but that the falling off in traffic has been due to general business conditions. He said the effect of the automobile on passenger traffic has been increasing every year and is getting to be serious but he thought the effect may be offset through the increased freight traffic which comes from the automobile business. Auto trucks have taken a good deal of short haul and l. c. l. traffic, but "they are welcome to it," he said. They have had little effect on carload traffic.

When Mr. Maxwell said he thought the estimate made by Mr. Shriver that the reductions in rates made in eastern territory would amount to \$80,000,000 a year is conservative. Mr. Burchmore asked if many of the reductions had not saved revenue for the roads. Mr. Maxwell said that in some cases they had had that effect.

### G. W. Lamb Testifies for Southern Lines

George W. Lamb, representing the railroads in the southern district, testified that those carriers during the year ended on September 30, 1921, had a net operating income of \$42,805,000, which was at an annual rate of 1.80 per cent return on their property investment. This, he said, was not sufficient to enable them to pay the interest on their bonds. For the ten months ended on October 31, Mr. Lamb testified that the southern roads had fallen short \$66,135,000 of realizing a return of 6 per cent on their tentative valuation. Since the test period the rates have been increased 50 per cent but expenses have increased so that the return for 1920 was \$58,000,000 less than the average for the test period. For the four months, July to October, since the wage reduction, the southern roads had earned at the rate of 4 per cent. Since last November there has been a steady decline in traffic except in October, when the business was increased by the threat of a strike. In November and December it has fallen off again. Mr. Lamb agreed with the other witnesses that the present rates cannot be considered unreasonably high since they produce less than an adequate return.

## Shippers Ask Definition of Scope of Investigation

At the opening of the Saturday morning session, John S. Burchmore addressed a question to the commission regarding the scope of the investigation. He said it was expected that the principal purpose was an early determination as to the reasonableness of the entire rate structure, the ability of the carriers to reduce rates, the needs of the public, and whether any reduction should be general or limited to basic commodities. However, he said, many of the shippers are uncertain as to how broad the inquiry may be and the character of the showing that will be permitted to be made as to any commodity, so that groups of shippers may determine to what extent they should participate, he asked the commission to make clear the extent to which evidence will be received on particular commodities or groups of commodities or the extent to which shippers should expect to resort to formal complaints. C. E. Elmquist, chairman of the general committee appointed by the shippers at the hearing, said the shippers had selected a steering committee that would endeavor to reach some sort of agreement regarding the division of time but other shippers said they did not understand it would be the province of the steering committee to decide the extent to which questions of particular commodities can be gone into and that they would appreciate a ruling from the commission. Commissioner Hall said Mr. Burchmore's request would be considered, but that the commission had supposed the scope of the investigation had been made clear in the order, and that it was a general survey, but that the order does not preclude the filing of a formal complaint and counsel should judge for themselves whether their interests would be best protected by a formal complaint. He hoped the proceeding would not continue indefinitely, but the commission wanted definite concrete information as to groups of commodities so that it shall better understand the situation and ability of the carriers to respond.

## Southern Lines in No Financial Condition to Make Reductions, Says Capps

Testimony to show that the railroads in the Southern district are in no financial condition to make any general rate reductions and that business prospects in the South are not promising at present was introduced by C. R. Capps, first vice-president of the Seaboard Air Line. Of 80 blast furnaces in the South, Mr. Capps said only 11 are now in operation. He also said the Southern railroads moved 2,250,000 tons less of fertilizer in 1921 than during 1920, while reports indicate no prospects of an improvement in 1922. He said in his opinion a reduction in fertilizer rates would not stimulate movement.

"I do not think conditions in the South are in any way chargeable to the present level of freight rates," said Mr. Capps. "I do not know of any business in that territory that would be stimulated by a reduction in rates."

He estimated that a 10 per cent reduction in the rates on the principal agricultural products would reduce the gross revenues of the carriers in the Southern district from January to June, 1922, by approximately \$6,000,000.

In response to an inquiry by Commissioner Lewis, relative to the cost of watermelons shipped north from Georgia and other southern states, Mr. Capps said that while those melons sell in the South for from 20 to 25 cents each, the retail price last summer in Washington was \$1.75.

"What was the average freight rate per melon," inquired Commissioner Lewis.

"About eight cents apiece," was the reply.

Mr. Capps said that during the 12 months ended September 30 the southern roads had earned \$88,000,000 less than a 6 per cent return. Commissioner Aitchison asked if the real question is not what the prospects are for earning in the future. Mr. Capps replied that it is necessary to give some consideration to the shortage of return in the past.

Commissioner Aitchison asked if it was understood that the commission was expected to make up in the future for any deficiency in the past. Mr. Capps did not reply definitely. He said he did not know of any rate that is now unreasonable, but that it is quite likely that some one would come into his office on Monday and point out one and an effort would be made to correct it if possible. He filed an exhibit of 1,000 pages, showing the changes in rates, practically all reductions, which have been made during the past year, but stated that it was impossible to estimate whether these reductions represented a loss in revenues to the carriers or the extent of the loss.

## L. E. Wettling Shows Condition of Western Lines

L. E. Wettling, of Chicago, manager of the statistical bureau of the western lines, testified as to the financial condition of those roads. For the first 10 months of 1921, he said, the net operating income of the western roads was \$249,383,000, which was at an annual rate of 3.7 per cent on the tentative valuation. That this was realized at the expense of the properties is shown, Mr. Wettling said, by the fact that the western carriers had reduced their expenditures for maintenance of way and structures 30.8 per cent and for maintenance of equipment 16.7 per cent as compared with 1920, while the reduction in operating expenses as a whole was only 18.7 per cent. During the last four months for which returns are available, there was a large increase in traffic as compared with the early part of the year and the net return was at the rate of 5.7 per cent; but the traffic was under that of 1920 and 1919 and reached its peak in October. For the year ending September 30, the net return of the western roads was only 3.4 per cent.

## Traffic Testimony for Western Lines

Given by Edward Chambers

Edward Chambers, vice-president of the Atchison, Topeka & Santa Fe, presented the traffic testimony for the western roads. He said in part:

The net revenues of carriers in western territory as a whole are not sufficient to meet their financial requirement, and are not up to what the law entitles them to receive. Therefore, we must assume that the rate structure as a whole, both freight and passenger, is not at this time unreasonably high.

As to passenger fares, it is also our judgment that the present level is not unreasonable, and that a reduction would not stimulate traffic to the extent that the possible increase in travel would offset the losses in revenues that would result.

## Surcharges

The surcharge is an extra charge due to the fact that the cost of transporting passengers in sleeping or parlor cars is relatively higher than in coaches. The surcharge figures about one-third of a cent per mile and, for convenience, is made one-half of the charge for sleeping or parlor car accommodations. The surcharge was established after a careful study had developed that sleeping and parlor car passengers were not paying their proper share of transportation costs. The average load carried in sleeping or parlor cars is 15 persons and the average for coaches is 25. The average weight of a coach is about 100,000 lb.; sleeping and parlor cars weigh from 130,000 to 150,000 lb. With an average load of 15 passengers in sleeping or parlor cars, and 25 passengers in coaches—and these are the averages for all cars—the railroads carry about 9,500 lb of weight per sleeping or parlor car passenger, and 4,000 lb weight per coach passenger. Based upon the relative capacity and weight of equipment, the average weight per passenger in sleeping or parlor cars approximates two and one-half times the weight per coach passenger, and while the weight is not the sole measure of expense, it is a very large part of it.

## Changes in Individual Rates

There have been a great many changes in specific individual freight rates, and some changes in sets of freight rates. Practically all these changes have been reductions and are the results of every-day considerations by freight traffic officers and some by orders of the Interstate Commerce Commission. Some of the reductions are due to readjustments; some to restoration of former relationships, and others to the usual reasons which always have controlled in the making of freight rates.

### Reductions in Passenger Fares

In keeping with the practice that existed when the basic fare was three cents per mile or less, the carriers have continued the policy of making concessions for seasonal excursions. These excursion fares cover practically the entire country, as, for instance, summer excursion fares to Pacific Coast, Colorado, Utah, New Mexico, Texas, Florida, Minnesota, Wisconsin, Michigan, etc., and to Atlantic coast resorts, and national parks. The basis for summer excursion fares has generally been one and one-third fares for the round trip, yielding approximately 2.4 cents per mile.

Another large class of reductions, following the previous practice, has been made for conventions of all kinds, many of them national in scope. Convention fares have been made for a total of some 1,500 of these conventions since September 1, 1920, approximately 1,300 of which were at points in the western district, and two hundred at points outside of the western district. For the Grand Army of the Republic, United Confederate Veterans and the American Legion, a rate of one cent per mile was made, which, in our judgment, is not sufficient to pay the cost of service. The carriers, however, as a matter of public policy, contributed toward the success of the national conventions referred to.

### Decrease in Gross from Reduced Rates

It is very difficult to arrive at the figures even approximately because of changes in the movement of particular commodities in one period as compared with another. To arrive at anything like actual figures would require investigation as to actual tonnage moving in connection with each rate reduction. Our estimate as to the reduction in gross freight revenue resulting from rate changes since August 25, 1920, using tonnage for the year ended September 30, 1921, as a basis for the estimate, is \$537,500,000 in western territory, and our estimate for the reduction per annum in the event the 10 per cent reduction on agricultural products is made effective, is an additional \$45,000,000 per annum, which would make the total reduction, based on a year's tonnage in western territory, \$82,500,000. The order in the grain case will increase this about \$14,000,000.

In arriving at these estimates we addressed an inquiry to each of the 35 important lines in western territory, asking them to make an individual estimate in each instance covering their own line.

### Changes in Volume of Traffic

The traffic increased for several months after August, 1920, then began to go down and has been dropping more or less since, although at times it has shown an increase, but rarely up to the previous year. The prospects for the immediate future are not very encouraging for any considerable increase in traffic. While we hope that the bottom has now been reached, the November and December reports are very discouraging and we anticipate no substantial increase in tonnage before the coming of spring. The volume of traffic has not been materially affected, one way or another, by rate changes since August, 1920. Economic conditions are very largely responsible for the shrinkage in the volume of traffic. For example, building operations at Chicago, where practically all the necessary materials except lumber are produced within the city limits, are no different than in the country generally.

Increased passenger rates have not lessened travel to the extent of lowering net revenue. People paying full tariff rates today are largely those who can afford to do so and those traveling on business. The greater falling off in regular passenger traffic is in the coach travel where comparatively short hauls are involved and where the volume of the increase is in no way burdensome.

### Economic Conditions Most Important Factor

The economic conditions that have obtained in this country and in the world at large since the great war have been the most important factor in retarding the movement of traffic.

### Readjustments

The long established and generally recognized relationships in freight rates which were forced out of line by Ex Parte 74 percentage increase have, with but few exceptions, been readjusted. The unadjusted relationships are having active consideration. We do not consider that a mere difference in cents per 100 lb. in rates, when increased, is a relationship that should necessarily be readjusted. A recognized relationship or differential is such as fixed by agreement between carriers and shippers, or between the carriers themselves, or prescribed by state commissions or the Interstate Commerce Commission.

The carriers are not likely to be in position for some time to consider a general reduction in all rates. When the financial condition of the carriers will permit, it is our judgment that first consideration should be applied to specified commodities, among the great staples which are recognized as most important to the

economic situation of the country and where the reduction would result in the greatest benefit to the public. It is true that the carriers are now proposing to reduce the rates 10 per cent on the most important agricultural products, but this proposition has not been submitted as warranted by our financial situation, but because we realize that the agricultural industry is in dire need and in the interest of all concerned we are proposing to make a contribution toward the anticipated rehabilitation of that industry.

To decide fairly what might be done, it would be necessary that the entire rate structure be analyzed, both class and commodity, to determine what rates, if any, are unreasonably low and should be advanced, and what rates, if any, are unreasonably high and should be reduced.

Commissioner Aitchison asked Mr. Chambers whether the roads expected, if the 10 per cent reduction on agricultural products results in a decrease in revenue below fair return, that it will be recouped to them out of future rates when traffic becomes normal. Mr. Chambers replied that the roads are willing to take their own chances for the six months period and hope within that time to get expenses down.

### Hearing Adjourned Until January 9

At the close of the hearing on Saturday it was decided to adjourn until January 9, when the roads would complete their presentation of statistical testimony. It had been proposed to call Mr. Aishton on Monday, but it was decided that his testimony could be postponed until January 9 so that those who had come to Washington from long distances need not remain over Sunday. Before the adjournment the representatives of shippers asked for a large amount of statistical information to be furnished by the railroads. Some of the information the roads agreed to furnish, but as to some they referred the question to the commission as to whether it should be furnished.

Commissioner Hall said that S. H. Cowan on behalf of Texas cattle shippers had presented a petition for a rehearing and modification of the decision in Ex Parte 74 but that such an application, applying to another proceeding, could not properly be made in this proceeding. Mr. Hall said that the commission had considered before ordering this investigation a proposal to reopen Ex Parte 74 and had decided not to do it, but to order this investigation instead. If, in view of this statement, Mr. Cowan desired to file his petition, it should be filed in Ex Parte 74 in the usual way and copies served on the other parties.

The commission later announced that the further hearing had been postponed from January 9 to January 11, and that the further program will be as follows:

- Jan. 11-14 Direct testimony of carriers.
- Jan. 16-18 Cross examination of carriers' witnesses.
- Jan. 19-20 Coal and coke.
- Jan. 21-23 Ore, furnace materials and iron and steel articles.
- Jan. 24-25 Sand and gravel, brick, lime, cement, gypsum and asphalt.
- Jan. 26-27 Lumber and forest products.
- Jan. 28 Fertilizer and materials, sulphuric acid, phosphate rock.
- Jan. 30-Feb. 4 Testimony of public and shippers as to general aspects of case.
- Feb. 8 Vegetable oil and soap.
- Feb. 9 Grain, flour and agricultural products.
- Feb. 10 Live stock and packing-house products.
- Feb. 11 Petroleum and petroleum products.
- Feb. 15 Canned goods and wholesale groceries.
- Feb. 16-17 Fruits and vegetables.
- Feb. 18 Milk, cream and dairy products.
- Feb. 20 Beverages and beverage containers, waste material.
- Feb. 21-22 Other commodities.

Announcement will be made of dates for carriers' rebuttal evidence and for oral argument during but before the hearing is closed.

# Accounts for Six Months Guaranty to Be Closed

December 31, 1921, Set as Date and Statements to Be Filed on or  
Before March 1, 1922

SIX MONTHS' guaranty in which December 31, 1921, is fixed as the date as of which all accounts pertaining to the guaranty period shall be considered closed for the purpose of computing the guaranty.

All carriers which accepted the provisions of section 209 of the transportation act, 1920, are required to file on or before March 1, 1922, final statements of amounts due to them or to the United States thereunder. Forms for rendition of statements are prescribed.

In the computation of railway operating income or any deficit therein for the guaranty period for the purposes of section 209 of the transportation act, 1920, the order says, the provisions of subdivision (f) of the section are provisions limiting the inclusion in guaranty computation of charges to operating expenses or revenues actually entered on the carrier's books of account under the accounting rules of the commission and do not contemplate any increase of or addition to such charges for the purposes of the guaranty settlement.

For the purpose of the guaranty, charges to operating expenses for maintenance will be limited to those applying to work done between March 1 and August 31, 1920, inclusive, and to charges accrued or equalized in accordance with the commission's accounting rules. No charges for deferred maintenance will be considered. Estimates of the net effect of deferred debit and credit items made by the commission and agreed to by carriers under the authority of paragraph (b) of section 212 will be considered in computing the guaranty.

A general rule is announced for the adjustment of differences in cost of labor and material in establishing the maximum amounts to be included in operating expenses for maintenance of way and structures and for maintenance of equipment for the purposes of the guaranty, and methods of adjustment for differences in amount and use of property are separately indicated for maintenance of way and structures and for maintenance of equipment.

At hearings before the commission counsel for the railroads had asked that the maintenance allowance be made on the basis of the expenditures necessary to keep up to the standard of the test period, although the work may not all have been done in the guaranty period but was postponed to some extent because of shortage of earnings or other reasons. They also contended for an allowance to cover the so-called inefficiency of labor, which was not sustained in a special report on that subject issued by the commission earlier in the year.

The report shows that \$429,808,649 has already been paid on account of the guaranty and in its annual report the commission estimated that a balance of \$105,000,000 is still due.

## Report of Division 4

The report by Division 4 of the commission says in part:

The general rules for computing railway operating income or any deficit therein for the purposes of the guaranty are set forth in section 209 of the act, and, having under consideration the manner in which the railway operating income applicable to the guaranty period is to be determined for such purposes, we issued our order of June 10, 1920. In that order we provided, among other things, for the distribution of items of railway operating income or deficit between the guaranty period and other periods, and with respect to all carriers we required that all items of income classable under any of the accounts comprising the standard return, which under our instructions pertain to the guaranty period, audited during the guaranty period, and similar items

audited in the accounts for the months subsequent to August, 1920, shall be distributed upon the corporate books to the appropriate primary accounts for the months in which audited, but that items pertaining to the guaranty period audited subsequent to August, 1920, shall be so recorded as to readily permit the totals thereof for each month to be separately stated.

We directed attention to the fact that carriers might state their income accounts on the basis of accruals and ordered that in computing railway operating income or any deficit therein for the guaranty period for the purposes of section 209, no charges to income will be permitted which relate to transactions originating prior to March 1, 1920, or subsequent to August 31, 1920, whether such charges represent actual expenditures or credits to reserve accounts created to reflect accruals. The carriers were informed that reserve accounts created to reflect accruals pertaining to guaranty period transactions would be closed out or adjusted on the basis of actual expenditures within such reasonable time after August 31, 1920, as we might determine.

More than a year has elapsed since the close of the guaranty period and there appears no reason why for the purpose of final settlement of the guaranty, reserve accounts created to reflect accruals pertaining to guaranty period transactions should not now be closed out by adjustment to the basis of actual expenditures pertaining to the guaranty period or corrected to reflect such estimates and adjustments as we are authorized to make under section 212 of the transportation act, 1920.

In our order of June 10, 1920, carriers were cautioned that while we are required to eliminate and restate operating expenses and revenues for the guaranty period to the extent necessary to correct and exclude any disproportionate or unreasonable charge to such expenses or revenues for such period, or any charge to such expenses or revenues for such a period, which, under a proper system of accounting, is attributable to another period, we are not authorized to initiate or include any charge applicable to the guaranty period which does not appear on the carrier's books of account at the time of the guaranty settlement. But in the adjustments proposed by carriers in the return to our order of October 18, 1920, as well as in correspondence and conferences concerning formulae or plans for determining maintenance and other allowances under subdivision (f) of section 209, many carriers have disregarded the principles which we then announced.

This error is apparently attributable not only to a lack of appreciation, on the part of some of the carriers, of the fundamental differences between the federal control period and the guaranty period in the method of settlement, but also to the failure to realize the fact that the adjustments of paragraphs (3) and (5) of subdivision (f) are solely provisions of limitation of amounts which may be charged by the carriers in computing railway operating income or any deficit therein for the purposes of the guaranty and do not in any sense contemplate allowances for such purposes in excess of amounts actually entered.

With the exception of showing separately items audited in the guaranty period which pertain to other periods and items audited in other periods which pertain to the guaranty period, for which provision is made in our order of June 10, 1920, the accounts for the guaranty period and for items audited in other periods which pertain to the guaranty period should be kept exactly as they should have been kept if there had been no guaranty in effect. In the computation of railway operating income or any deficit therein for the guaranty period for the purposes of section 209 we shall treat the provisions of subdivision (f) of that section as provisions limiting our consideration to the amounts actually charged on the carrier's books of account under the accounting rules prescribed by us pursuant to section 20 of the interstate commerce act, and we shall not for the purposes of the guaranty make or permit any increase of or addition to charges actually on the books in accordance with our rules.

In the case of deferred debits and credits which cannot as of December 31, 1921, be definitely determined, carriers will be required to submit estimates of the net effect of any and all of such items for our action under paragraph (b) of section 212 of the transportation act, 1920.

Under the provisions of subdivision (h) of section 209 of the transportation act, we have certified to carriers advances amounting to and under the provisions of section 212 of the act we have certified partial payments in the amount of .....	\$263,935,874.00
making a total for advances and partial payments combined of .....	165,872,775.05
	\$429,808,649.05

### Final Statements to Be Filed Before March 1, 1922

The sum of advances and partial payments so certified is more than two-thirds of the total amount by us estimated as necessary to make good the guaranty to all carriers. We are required to make a definite ascertainment for partial payment purposes as clearly as we are required to make a definite ascertainment in final settlements. We shall require all carriers which accepted the provisions of section 209 of the transportation act, 1920, to file with us on or before March 1, 1922, final statements of amounts due to them or to the United States, as the case may be, under the provisions of section 209, and as a general rule no further partial payments will be certified until the information necessary for a final settlement is at hand. A complete set of forms for making the final returns required is hereto attached.

Upon consideration of the returns to our orders of October 18, 1920, and January 5, 1921, and as a result of investigations made for the purposes of the definite determinations required for partial payments under section 212 of the act, in addition to the facts considered in Finance Docket No. 1176, *Maintenance Expenses Under Section 209*, we are of the opinion that the allowances for differences that may exist between the cost of labor and material for the test period and for the guaranty period, respectively, cannot practicably be made upon the basis of any rigid rule or formula, but these allowances must be fixed by us in the exercise of a reasonable judgment upon consideration of all the relevant facts and circumstances.

### Differences in Cost of Labor and Material

As we have pointed out in our report in Finance Docket No. 1176, there are some items of maintenance for which no allowance should be made on account of changes in cost of labor and material. We therefore announce the following rule for adjustment of differences in cost of labor and material in establishing the amounts which will be fixed by us as amounts which shall not be exceeded in charges to operating expenses for maintenance of way and structures and for maintenance of equipment, for the purposes of the guaranty:

There shall first be deducted from the maintenance expenses of the test period all amounts included therein for

- (a) Depreciation,
- (b) Retirements,
- (c) Insurance.

The remainder, after being adjusted for differences in amount and use of property maintained, shall be multiplied by a factor representing the increase in the general level of cost of labor and material for the territories in which the lines of railway of the carrier are situated. To the product thus arrived at shall be added back the deductions hereinabove provided for, adjusted for differences in amount and/or use of property maintained. The resulting sum will be the amount to be fixed by us as that which shall not be exceeded in charges to operating expenses for the purposes of the guaranty for the aggregate of maintenance of way and structures and maintenance of equipment. The methods of adjustment for differences in amount and use of property are indicated separately for maintenance of way and structures and for maintenance of equipment in forms annexed.

Carriers in presenting their claims or statements of amounts due to or from the United States under the guaranty will be required to state under oath the increase in cost of labor and material for their respective territories and may support these statements by such statistics and representations as may to them appear proper. In the presentation of such cases it should be borne in mind that the fact that certain prices were actually paid for units of labor or units of material in the test period and the guaranty period, respectively, is not conclusive evidence that those prices indicate or measure increases in cost of labor or material for which "due allowance shall be made." The prices actually paid in either period may be affected by the relative competence of management, by standards of maintenance adopted, or by other causes not attributable to increased costs.

The allowances for increased compensation provided for in section 4 of the federal control act will be computed upon rates definitely approved by the President in each case. The treatment to be accorded such allowances in respect of retirements will be that contemplated by section 4 of the federal control act and not that provided by the "standard contract" if in any case the provisions of the "standard contract" do not agree with the provisions of the act. The additional allowance will be limited to additions and betterments to road, made with the approval of or by order of the President and completed and in operation on or before midnight on February 29, 1920, and to equipment delivered and in operation on or before said date. The benefits of section 4 will be extended to those carriers which were released from federal control prior to March 1, 1920, as well as to those which were under federal control until that date.

The provisions of this report and of the order to be issued

in connection therewith will apply with the necessary changes, to settlement of the guaranty with the American Railway Express Company under subdivision (i) of section 209.

### Some Interlocking Officers and Directors Authorized

THE INTERSTATE COMMERCE COMMISSION has issued a large number of additional orders authorizing railroad officers and directors to hold positions with more than one carrier. One of these orders authorizing common officers and directors among the companies comprising the New York Central System consisted of 42 typewritten pages. In the case of three directors of the New York Central, however, George F. Baker, William Rockefeller and Harold S. Vanderbilt, the commission declined to authorize them to retain at the same time directorships in competing lines and gave them until December 31 to make their elections as to which position or positions they will hold under the authority granted in the alternative and to report to the commission all pertinent facts in connection therewith.

George F. Baker was authorized to hold until further order of the commission the position of director of the New York & Long Branch and chairman and director of the Central of New Jersey and the position of director of either the New York Central and a list of subsidiaries named, or the Delaware, Lackawanna & Western, the Erie, and its subsidiary, the New York, Susquehanna & Western, or the Lehigh Valley.

William Rockefeller was authorized to hold until further order the position of director and member of the executive committee of the Chicago, Milwaukee & St. Paul and the position either of director of the New York Central and its subsidiaries named, or director and member of the executive committee of the Delaware, Lackawanna & Western, and director of its subsidiary, the Greene Railroad.

Harold S. Vanderbilt was authorized to hold until further order the position of director of the Chicago, St. Paul, Minneapolis & Omaha and of the Chicago and North Western and the position of director of either the New York Central and subsidiaries or the Delaware, Lackawanna & Western.

Among the other orders issued by the commission were those authorizing common officers and directors of the lines subsidiary to or affiliated with the Northern Pacific: authorizing Thomas De Witt Cuyler to hold the position of director with the Pennsylvania, the Long Island, the Atchison, Topeka & Santa Fe, the New York, New Haven & Hartford, the New York, Ontario & Western and the Rutland; authorizing Robert S. Lovett to be director of the New York Central and affiliated lines, the Illinois Central, the Yazoo & Mississippi Valley and the Central of Georgia, and director and chairman of the executive committee of the Chicago & Alton and of the lines comprising the Union Pacific System; authorizing officers and directors of lines in the Southern Pacific System to hold offices with different companies: authorizing James Speyer to be director and member of the finance committee of the Chicago, Rock Island & Pacific and the Baltimore & Ohio; authorizing James A. Peabody to be chairman of the executive committee and director of the Illinois Central, vice-president and director of the Delaware & Hudson and the Pittsburgh, Fort Wayne & Chicago, and director of a large number of non-competing roads, the American Railway Express Company and Wells, Fargo & Co.

George T. Slade was authorized to hold until further order the position of director of the Northern Pacific and of the Southern and the position of director of either the Lehigh Valley and its subsidiary, the Lehigh & New York, or the Erie and its subsidiary, the New York, Susquehanna & Western.

# The Development of the Robinson Connector

Latest Type Incorporates Improvements Suggested by Extensive Service of Earlier Design

THE COUPLING and uncoupling of cars, either passenger or freight, involves two operations; the engaging or disengaging of the couplers and the connecting or disconnecting of the train lines. The former operations are semi-automatic and are controlled by levers conveniently located at the sides of the car; the latter, however, must still be performed by hand, a method which involves some danger to the employees because it is necessary for them to go between the cars. Coupling train lines is one of the duties of the car inspector which consumes a considerable share of his time. Uncoupling the train line, which should be done by hand, is often neglected and the hose are allowed to pull apart when the cars are separated.

The loss of time in connecting hose and the bad effects of pulling them apart have led railroad officers to look to the automatic train line connector as the solution of these and other difficulties. In discussing the automatic connector a leading railway master car builder said: "There appears to be no room for argument about the need of such a device. The greater life of hose, the absence of broken train pipes resulting from uncoupling cars without first disconnecting the hose, the saving of time and labor in making up trains, and the reduction in the cost of pumping air, all of which might be classed as direct or apparent economies, would undoubtedly justify the cost of application alone, but the writer is even more impressed with the benefits that would be secured indirectly. Numerous leaks are found in hose and gaskets at all seasons of the year, almost entirely the

and leakage and breaks are cut down to such an extent that it is possible to run longer trains."

The problem of the automatic connector was considered by the Master Car Builders' Association in 1908. A committee on this subject submitted a report which recommended a butting type connector with pin and funnel gathering device. From the time this report was issued until the present the Master Car Builders' Association and its successor, the Mechanical Division of the American Railway Association, have given little attention to this subject, although a sub-committee was organized in 1919. In this interval, however, there had been a remarkable development in train line connectors. Since 1910 over 1,000 cars have been equipped with the Robinson connector. Its present performance is such as to command careful consideration and as a history of the development of the device is essential to an understanding of the present state of the art, an account of the successive stages through which it passed will accordingly be given.

## History and Extent of Service

In 1910 the first design of Robinson connector was applied to a passenger work train operating on the lines of the Washington Terminal Company, Washington, D. C. This connector was of the pin and funnel type, in accordance with the recommendations of the M. C. B. committee of 1908. Its service extended over a period of ten months and was satisfactory to the railroad officers in charge. Representatives of the Interstate Commerce Commission watched the installation and were so well pleased with it that the commission arranged for an official test of the connector on the lines of the Great Northern at Grand Forks, B. C.

The test was made on the Marcus division of this road, extending between Grand Forks and Phenix, B. C. The trains hauled were heavily loaded ore trains. Fifty cars were equipped and run interchangeably with 140 unequipped cars. The grade was 3.5 per cent and the curvature in some places excessive, curves of 22 deg. being commonly encountered. Railway officers from various parts of the country were present; the Board of Railway Commissioners at Ottawa delegated representatives, and every conceivable test was made of the connector, each of which it met successfully. These tests definitely established at least one important fact; that this connector made and maintained a perfectly tight joint, thus greatly increasing the effectiveness of the air brake.

In submitting its official report on this test the Interstate Commerce Commission concluded as follows: "From information obtained in this test the conclusion is reached that the Robinson connector is a safe and practical device, which if properly installed and maintained, will meet the need for an automatic connector in general freight service and add to safety in train operation on the railroad using it.

"It is mechanically simple in construction and composed of few parts which are easily assembled. It is comparatively light in weight, and of ample strength to withstand all shocks to which it is likely to be subjected in ordinary service. Its gathering range is sufficient to meet all variations between cars in service where car couplers can be made to operate, and it will withstand severe distortion without damage when heads are forced together under conditions where car couplers will not operate.

"It will maintain a tight joint between connector faces, even when gaskets are worn to such an extent that they could

The First Robinson Connector, of the Pin and Funnel Type. Applied in 1910

result of the practice referred to above; viz., pulling the hose apart, thereby injuring the fabric and inner tube. In the cold weather, however, when the hose freezes, the difficulty in preventing air leakage becomes a controlling factor in the operation of long freight trains and they have to be reduced in length to a point where the air pressure can be maintained irrespective of the tonnage rating or the ability of locomotives to haul them. Even at the best, this factor is responsible for a very great amount of terminal detention and labor on the part of car men trying to stop leaks.

"The connector increases the life of hose because it eliminates all mechanical wear. The hose is never jerked or strained. Frozen hose does not interfere with its operation

would not be used with the standard hose coupling, and its use would materially reduce train pipe leakage."

#### Freight Connectors Installed on Canadian Northern

In view of this report by the Interstate Commerce Commission and in view of the favorable opinion of the connector expressed by its representatives, the Canadian Board of Railway Commissioners became interested in the device and requested the Canadian Pacific, Grand Trunk Pacific and the Canadian Northern to look into it.

As a result of this request four all-steel hopper cars on the Canadian Northern were equipped with freight connectors. Experience with the first design indicated that the pin and funnel type was deficient in gathering range and undesirable because the dimensions once fixed could not be altered. Consequently a new design, known as type B, was prepared using a gathering arrangement of the wing type. These connectors were installed by the Canadian Northern at its Winnipeg shops in May, 1914, and put in continuous service handling gypsum rock from Steep Rock to Winnipeg during the summer and in coal service between Port Arthur and Winnipeg during the winter months. These cars ran in this service for three years under the most severe track and weather conditions, especially in winter, the temperature from December to March ranging from 10 deg. to 45 deg. below zero. The test came to an end through a wreck on the Steep Rock line, destroying all four cars. No change of hose or gaskets had been made during the whole period and these parts were in good condition at the completion of the test. Reports issued each trip by the train crews handling these cars show no train leakage whatever and all concerned were greatly pleased with the device.

The second installation in Canada was made by the Canadian Pacific, which equipped one passenger train in service between Montreal and Ottawa in February, 1915, with type

Type B Robinson Connector, with Wing Gathering Arrangement

B connectors. This test proved satisfactory and resulted in equipping 125 passenger cars operating out of Place Viger terminal, Montreal, to Quebec, Ottawa, and Eastern Quebec points. These cars were equipped with the type C, an improved type resulting from experience with types A and B.

The Grand Trunk Pacific in April, 1915, equipped one passenger train in service between Winnipeg and Transcona, and three Hart cars in freight service between Fort William, Ont., and Transcona, Man., type B connectors being used. These tests were satisfactory and reports show the high esteem in which the connector was held by Grand Trunk Pacific officers.

#### Type C Connector in Passenger and Freight Service

In May, 1915, the Canadian Northern equipped a passenger train running between Winnipeg, Man., and Edmonton, Alta., which continued in service until March, 1917, under the most severe track and weather conditions to be found in America. During the winter of 1915 and 1916 temperature went as low as 55 deg. below zero in parts of Saskatchewan. This test proved so satisfactory that the Canadian Northern ordered equipment for 250 passenger cars and 200 freight cars, the latter to be used on the Duluth, Winnipeg & Pacific out of Virginia, Minn.

The new type C connector was supplied for these installations and the freight cars were equipped in February and

Type C Robinson Connector for Passenger Service

March, 1917. The 200 cars equipped were steel flat cars in log service between lumber camps of the Virginia & Rainy Lake Lumber Company and Virginia Mill. On the lumber company's lines cars were handled over skeleton track, an abnormally severe condition not to be duplicated in railway service, but the connectors operated satisfactorily without any sign of leakage. Between Virginia and Cusson, on the Duluth, Winnipeg & Pacific main line, cars were handled in complete trains of 40 cars and showed such a remarkable decrease in troubles due to train line leakage that all concerned were impressed with the advantages of the connector, especially in winter weather. No leakage whatever was found in the connectors, whereas similar trains operated over the same line and equipped with ordinary hose couplers showed continual delays on account of creeping brakes and poor brake operation due to train line leakage.

In 1920 two New York Central passenger trains and three locomotives on the Valley division at Dunkirk, N. Y., were equipped with type C connectors, where they continue to give satisfactory service. At about the same time 50 steel hopper cars, engaged in copper ore trade, were equipped on the Mineral Range at Calumet, Mich. The installation operated under extreme climatic conditions, such as excessively deep snow and very cold weather, and was discontinued only because the mines were forced to close through bad market conditions. The officers of the road who came in contact with the connector were greatly pleased with its service.

### Extensive Installation in Through Passenger Service

From March, 1917, type C passenger connectors continued to be installed on all Canadian Northern trains operating west from Winnipeg, and further orders were placed by this road during 1919 and 1920, when all passenger equipment west of Montreal to Vancouver, B. C., was equipped. This covered trunk line operation amounting to 12,000 miles of railway and included transcontinental trains of 12 to 14 cars each, operating between Montreal and the Pacific Coast, a distance of 3,000 miles. This large installation was the first real trunk line operation ever attempted with any connector and resulted in experience with regard to the requirements for automatic connectors never before obtained.

As the result of this extensive experience, and the study given to connector design for more than 12 years, the Rob-

fittings and suitably mounted in the head, as in the case of the air brake port. These dimensions will readily accommodate any size of port which future developments in the air or steam line are likely to require. The air and signal ports may be increased to  $1\frac{1}{2}$  in., and the steam port to 2 in. opening without affecting interchange with previous heads.

### Flexibility of Gathering Range

Another important feature of this type of coupling head is the flexibility of its gathering range dimensions. While there is very little about connector design that is not now known to connector manufacturers and to railroad men who have studied the question, it has not yet been determined what gathering range a connector should have to accommodate most efficiently the varied requirements of service. It is known, of course, that the passenger connector requires a greater gathering range than the freight. The passenger car being much longer, with a considerably greater overhang from truck center to end sill of car, the angle at which the connectors approach is more acute, and hence the gathering range must be greater. But since the conditions under which passenger cars operate are practically known factors, it is not a difficult matter to determine what gathering range the passenger connector should have.

With the freight car conditions are different, however. There are a great many different types and many different lengths of freight cars. They operate under the most severe conditions, being commonly hauled over track on which it would be impossible to run a modern passenger car. Moreover, freight cars receive the minimum of maintenance. These factors complicate the problem of determining what

Latest Design of Passenger Connector, Type 2 H

inson Connector Company has developed a standard connector, embodying advanced features and refinements of design which only long and varied experience could make possible. While differing in refinement of details from the old type C connector, the same fundamentals of connector construction are found in it. It is stronger and more rugged; the gaskets are removable from the rear of the coupling head without parting the cars and the head is somewhat larger in anticipation of changes in the steam heating system now being advocated by many railways.

### Objects of the New Design

The objects which the Robinson Connector Company has sought to attain in the new connector are primarily the following: (a) a coupling head of size adequate to permit such needed developments in the head as time may demonstrate to be desirable, without affecting interchange with previous heads; (b) simplicity and speed in the renewal of defective gaskets without parting the cars; (c) a more rugged and powerful bracket and lug foundation for the connector; (d) a spring compression sufficient to compensate for the excessive wear between car coupler knuckles occasionally encountered; (e) increased size in the steam port opening; (f) a reduction in the number of gaskets used; (g) a greater gasket life; (h) to convey the air and steam through the connector head without it contacting with the head, thereby eliminating the necessity of making the head of air-tight material; (i) simplification of interchangeable manufacture.

The first of these objects has been attained by increasing the length and width of the head to  $11\frac{1}{2}$  in. and 5 in. respectively. Within this space the three ports may be arranged in any one of several ways. They may, for instance, be cored in the head or they may be formed of separate

Type 2 H Connectors in Coupled Position

gathering range is most suitable for the freight connector. A dimension has been developed that has so far proved satisfactory, but how it would meet general freight service on hundreds of thousands of cars, only extensive installation can reliably tell.

The magnitude of the field for the freight connector and this inherent element of uncertainty as to one of its most important dimensions, point with emphasis to the necessity for a gathering range which may be varied at will without affecting interchange with previous units of the equipment.

This cannot be done with any type of pin and funnel connector. It is an inherent limitation in all pin and funnel heads that a gathering range once set cannot be changed. The freight and passenger gathering range cannot be dealt with separately with the pin and funnel head. The freight head must be as large as the passenger head, otherwise they will not interchange. A great waste of material and unnecessary bulk to the freight connector arises from this fact.

These are among the reasons which led this company to discard the pin and funnel head.

Flexibility of the gathering range dimensions is an inherent advantage of the wing type of head. The spread of the wings may be increased or decreased at will, with a corresponding change in the gathering range without affecting interchange with previous heads. The freight head, having but a single port, may be made to size and be given a gathering range best suited to freight operations, and yet interchange perfectly with the passenger head. The only dimension common to the two heads is the width of the face and the location of the wings with respect to the ports.

A great economy in first cost and maintenance results from this flexibility of design which avoids the necessity of putting metal that is not required into the freight head simply to get it to interchange with the passenger head.

#### All Gaskets Readily Removable

The second object, simplicity and speed in the renewal of defective gaskets without parting the cars, is attained in the new connector by mounting the signal and steam port gaskets in the face of the head and backing them up by the curved fittings *A* and *B* shown in the illustration. These are removably mounted in the head by a bayonet joint comprising dogs, *a*, on the head behind which the lips, *b*, on the fittings are rotated. The unions, *C* and *D*, for connecting the hose to these fittings are formed in a similar manner.

When it is desired to remove a signal or steam gasket the hose unions are opened and the fittings *A* and *B* are rotated out of the head. This exposes the gaskets which may then be readily removed through the rear of the head. Normally, each of these gaskets is under slight initial compression; in

rear end of the fitting. This produces a simple and efficient air line arrangement.

#### Improved Design of Bracket and Lug

The third object, a more rugged and powerful bracket and lug foundation for the connector, is accomplished by lengthening the lug by which the connector bracket is supported

Steam Connection Removed to Change Gasket

from the car coupler. In the previous connector the lug was short and hence required a bracket of considerable length. The bolts attaching the bracket to the lug were spaced approximately 2 in. apart, while the distance from the center

Details of Steam Heat and Air Signal Connections, with Removable Gaskets

design they are of the air-expanded type. Thus, when the air or steam is admitted the gasket swells into absolutely air tight engagement with its seat in the head and against the front face of the fittings *A* and *B*.

The removal of the brake port gasket is accomplished by a somewhat different process. Here the gasket is mounted in the forward end of a curved fitting, *E*, removably held in the connector pipe, *F*, which is pressed with the head, by a pin, *G*. When removal is desired, the pin is lifted and the entire fitting is removed from the connector. To accomplish this it is not necessary to open the union, *H*, by which the brake hose is attached to its fitting. This union is employed solely to facilitate interchange with a car not equipped with the connector. When the interchange period is over the union will be eliminated and the hose mounted directly upon the

of these bolts to the center of the connector pipe was, for the Sharon coupler, 12 in.

This arrangement imposed rather high stresses upon the bolts in the lug and on the adjacent walls of the bracket, which sometimes loosened the joint between these parts. In the new connector the leverage ratio on the lug bolts has been reduced from 6 to 1 to 2 to 1, and instead of two bolts, four are used. The result is a dependable and powerful foundation for the bracket, a most important consideration.

The fourth object, a spring compression sufficient to compensate for the excessive wear occasionally encountered between car coupler knuckles, is attained by the use of a longer buffer spring and by increasing the length of the connector pipe. In the previous connector this compression was 1½ in., but long experience demonstrated that on account of excessive

wear occurring in some coupler knuckles, this was insufficient. It was therefore increased to  $2\frac{1}{2}$  in., which permits of the maximum wear on the car coupler knuckles without affecting the rigidity and tightness of the joint between the connector heads in the slightest degree.

The fifth object desired was increased size in the steam

Details of Removable Brake Pipe Connection

port opening. In the previous connector this opening was  $1\frac{1}{2}$  in., which is the dimension widely employed for the present hand-hose coupling. The difficulty incident to properly heating long trains in excessively cold weather has brought about considerable discussion looking to a greater steam port opening. Since many railroad men are of the opinion that the steam port opening must ultimately be increased, an opening of  $1\frac{3}{4}$  in. has been adopted in the new

giving greater body to the gaskets. In the previous connector the air gasket had a face width and a depth of  $\frac{1}{4}$  in., while the width of the steam gasket face was  $\frac{3}{8}$  in., and the depth of this gasket was  $\frac{1}{4}$  in. In the new connector, the air gasket has a face of  $\frac{3}{8}$  in. wide and the steam gasket a face  $\frac{1}{2}$  in. wide. The gaskets are also deeper than the previous design, and the general increase in size and resiliency insures a much greater life.

The eighth object, to convey the air and steam through the connector head without bringing it in contact with the metal of the head, is attained by the improvements previously mentioned. It will be observed from the drawings that the contents of each of the train lines is carried through the head without imposing any fluid pressure on the metal in the head and hence the requirement for an air-tight casting in the head is eliminated. In the case of the brake line, always, of course, the most important line, the air is carried through the head by the fitting *E*. Eliminating the necessity for making the head of air-tight material not only greatly facilitates its production and lowers its manufacturing cost, but makes it a much more efficient part.

The ninth object, simplification of interchangeable manufacture, is brought about mainly by the dimensions and design of the head of the new connector. Various developments may be made within the head without affecting interchange with previous units of the equipment. Forming the gasket seats in the manner shown and mounting the fittings in the head instead of making them an integral part of the head, not only simplifies foundry procedure, but greatly simplifies and reduces machining costs. From this simplification greater ease in maintaining interchangeable dimensions in the several parts naturally results.

## Railroads May Not Evade Consolidation Provisions of Law

WASHINGTON, D. C.

IN DENYING the application of the Pittsburgh & West Virginia to issue its capital stock and assume obligation and liability in respect of certain securities in connection with the purchase of the property and franchises of the West Side Belt, the Interstate Commerce Commission takes occasion to discuss at some length the provision of the law relating to railroad consolidations. The application was denied upon the ground that the issue and assumption are not for a lawful object since the applicant has not obtained authority for the acquisition under Section 5 of the interstate commerce act, which is the section relating to consolidations, directing the commission to prepare a tentative plan of consolidation and providing that a proposed consolidation must be in harmony with this complete plan. The effect of the decision, therefore, is to declare that railroads desiring to effect what amounts to a consolidation in advance of the promulgation of the commission's complete plan may not accomplish their object indirectly by failing to make application under Section 5, but by basing it upon other sections of the act.

The Pittsburgh & West Virginia owns all the stock of the Belt Company and is now operating the road jointly with its own. An agreement between the companies dated September 1 provides that the Pittsburgh & West Virginia shall purchase all the franchises, corporate property, rights and credits of the Belt Company and in payment therefor deliver its own securities and assume the contingent liabilities and remaining indebtedness of the Belt Company. The stock so delivered to the Belt Company was then to be returned by it to the applicant in payment of indebtedness approximating \$6,333,000 and in exchange for the stock

Robinson Connector Fitted for Interchange with Standard Hose Couplings

connector. This dimension, however, permits perfectly satisfactory interchange with a connector head having a steam port opening of  $1\frac{1}{2}$  in.

The sixth object, a reduction in the number of gaskets used, is attained by using in the steam union the same gasket that is used in the steam port, and by using in the signal port, the brake port, and the brake union a common form of gasket. Thus in the freight connector but one type of gasket is used, a convenience of much practical importance.

The seventh object, a greater gasket life, is attained by

of the Belt Company. Thereafter the corporate existence of the latter was to be terminated.

The commission's report points out that the applicant had previously asked for a certificate of public convenience and necessity for the acquisition and operation of the railroad of the Belt Company, but the proceeding was dismissed on the ground that the proposals did not fall within the prohibition of paragraph 18, section 1. The applicant has not sought approval or authority for the acquisition under any other provision of the act. The commission says that under Section 20-a as a pre-requisite to the granting of the authority sought for the issuance of securities, it must find that the proposed issue is for some lawful object and the question, therefore, is whether the purchase and sale may lawfully be made without authority or approval under the provisions of Section 5. Section 5 gives authority to the commission to approve the acquisition by one carrier of the control of another in any manner not involving the consolidation of such carriers into a single system for ownership and operation. It then provides in paragraphs 4 and 5 for the preparation by the commission of a plan of consolidation and paragraph 6 authorizes consolidations which are in harmony with and in furtherance of this plan with the approval of the commission. The report of the commission then continues:

In the instant case it appears that the purchase by applicant and the sale by the Belt Company of the franchises and property of the latter are within the corporate powers of both companies and may lawfully be accomplished under the laws of the commonwealth of Pennsylvania. Nor is the acquisition within the prohibition of the "antitrust laws," for the two carriers do not compete, are connecting lines, and for some time have been under common control and management. The sole question, so far as this phase of the matter is concerned, is whether the purchase and sale may lawfully be made without authority or approval from us under the provisions of Section 5.

Paragraph (6), Section 5, uses the word "consolidate." Technically, a consolidation is sometimes defined as a union of companies where a new corporation is created to take over the powers and property of the consolidating corporations. We are of the opinion, however, that the word "consolidate" is not used in Paragraph (6) in a narrow sense, but that the language of the paragraph is broad enough to cover any form of union under which "properties theretofore in separate ownership, management, and operation" pass into the possession of a single corporation for ownership, management and operation. This matter is not of immediate importance, for if the proposed purchase falls outside the terms of Paragraph (6), it is certainly covered by Paragraph (2) which deals with the acquisition by one carrier of the control of another "either under a lease or by the purchase of stock or in any other manner not involving the consolidation of such carriers into a single system for ownership and operation." The question has a prospective importance, however, if we decide that authorization of the purchase is necessary under Section 5, for no such authority may be granted under Paragraph (6) until we have adopted a plan of consolidation under Paragraphs (4) and (5), while there is no similar limitation upon action under Paragraph (2).

But applicant has not sought authority for the purchase and sale under Section 5, and the immediate question, as aforesaid, is whether the transaction can lawfully be consummated without such authorization. Two constructions of the above-quoted provisions of that section are possible. One interpretation is that they represent an attempt on the part of Congress to place in our hands complete control over the union of carriers engaged in interstate commerce; the other is that they are merely a means of affording relief from the operation of the "antitrust laws," or other restraining state or federal statutes.

Section 5 is a unit, its separately-numbered paragraphs dealing with analogous matters. Paragraph (1), which has to do with the pooling of freights and the division of earnings, begins as follows:

"That, except upon specific approval by order of the Commission as in this section provided, and except as provided in Paragraph (16) of Section 1 of this Act, it shall be unlawful for any common carrier subject to this Act to enter into any contract, etc."

It is thus definitely and unmistakably provided that an agreement for the pooling of freights or the division of earnings shall be unlawful unless and until it receives our specific approval. The corresponding language of Paragraph (2), which deals with union of carriers not involving consolidation into a single system for ownership, management, and operation, is not so easily con-

strued. It contains no specific prohibition, but provides that whenever we are of opinion that it will be in the public interest, we shall have authority by order to approve and authorize such union. The language of Paragraph (6) is similar, for while it specifies the conditions under which consolidations "shall be lawful," it does not in terms state the conditions under which they shall be unlawful.

The provisions in question were made a part of the interstate commerce act by the transportation act, 1920. In case of ambiguity it is permissible, in interpreting a statute, to refer to the reports of Congress.

Aside from this extraneous evidence, the intent of the provisions may, we think, be determined by reference to internal evidence. Paragraphs (4) and (5) provide most elaborately for the preparation and adoption by the Commission of a "plan for the consolidation of the railway properties of the continental United States into a limited number of systems." When we have agreed upon a tentative plan of this character, it must be given "due publicity," including notice to the Governor of each state, and all persons must be heard who may file or present objections. Thereafter, and not until then, the final plan may be adopted and published.

Obviously, the preparation and adoption of a plan of consolidation under such instructions from Congress require deliberate and careful consideration of every railway property of the "Continental United States" from competitive, financial, commercial, and other points of view, so that each such property may with nicety be fitted into its appropriate place in the final scheme. Obviously, also, many consolidations which are not barred by the restraining provisions of the "antitrust laws" or other federal or state statutes may be wholly inconsistent with the plan and destructive of its purpose. Yet, if consolidations of this kind can now be lawfully effected without our approval, the conclusion is inevitable that the carriers may ignore Section 5 with impunity under similar circumstances, after the plan has finally been adopted, and thus bring quick disaster to its entire structure. It is impossible to believe that it was the intent of Congress to prescribe with such care the method by which this elaborate and comprehensive program shall be formulated and the principles by which it shall be governed, and at the same time leave open a door by which at any time it may be wrecked.

Beyond question, in the development of the transportation act, 1920, as a constructive measure for the solution of the railroad problem, great importance was attached by Congress to the ultimate consolidation of the carriers into a limited number of great systems, well balanced financially and of similar earning power but competing with each other and maintaining the existing channels of trade and commerce. In our opinion it was the intent of Congress that complete control over the situation should be in our hands, so that the working out of this constructive policy might be safeguarded in every possible way, and so that consolidations or other union of interests might not be effected without our consent.

Nor is the language of Section 5 inconsistent with this conclusion. In *Lexis' Sutherland on Statutory Construction* it is said, at pages 1149-1150:

A direction contained in a statute, though couched in merely permissive language, will not be construed as leaving compliance optional, when the good sense of the entire enactment requires its provisions to be deemed compulsory.

But it is unnecessary to rely upon this principle of construction, for when, in Paragraph (6), it is provided that "it shall be lawful" to consolidate under certain conditions, this is but another way of saying that consolidations in disregard of those conditions shall be unlawful. And in like manner, when it is provided in Paragraph (2) that we may authorize the acquisition by one carrier of control of another in any manner falling short of consolidation, whenever we are of opinion that such acquisition "will be in the public interest," this is equivalent to saying that authority for the acquisition shall not exist under other conditions.

If it had been intended that these provisions of Section 5 should merely afford a means of escaping from the restraints of the "anti-trust laws" and other state or federal statutes, much simpler machinery would have been devised for accomplishing the purpose. The "plan of consolidation" is incompatible with such an interpretation of the section and embodies a policy of far greater breadth and vision.

We conclude and find, therefore, that the proposed issue of stock and the proposed assumption of obligation and liability are for an object,—namely, the purchase by applicant and the sale by the Belt Company of the property and franchises of the latter,—which can not lawfully be accomplished without our authority under the provisions of Section 5 of the interstate commerce act. Until such authority is secured the application must be denied. This conclusion makes it unnecessary to consider in other respects the propriety of what is proposed.

Commissioner Potter dissented.

# A Plea in Behalf of the Supervisory Officers

## Railroads' Treatment of Supervisory Forces Singularly Out of Line with Their Merits

By J. L. Eldridge

Vice-President, Yardmasters' Association of America

**A**N EVENT occurred shortly after the railways came under government control which should have afforded the railway executives considerable material for thought, and that was the formation of organizations of supervisory officials—yardmasters, train dispatchers, station agents and mechanical supervisors. Organizations of these classes of railway employees came into existence practically over night.

The old stock argument about silver-tongued orators arousing the spirit of discontent and unrest among these men for the purpose of furnishing themselves with jobs will manifestly not apply in this case, for these organizations arose almost spontaneously as soon as coercive pressure was removed.

How are we to explain this singular phenomenon? The explanation is simple, and constitutes a grave indictment against the prescience and foresight of the railway executives as a whole.

During the progress of railway development the interests of these men and their peculiar importance in the railway industry had been lost to sight in the maze of a bureaucratic official organization. The yardmaster who, in the original railway organizations had been the right arm of the division executive now found himself removed to a great distance by the intervention of numerous minor staff officers, who in many instances had no practical knowledge of his problems, but who nevertheless exercised practically untrammelled authority over him.

During all these years he was made the victim of any number of manifestly unjust conditions, unjust differentials in wages, unjust discriminations in hours and petty tyrannies and exaction on the part of his immediate superiors from which there was no escape.

How often have we known of good, competent yardmasters who have thrown up the job and "gone back to the foot-board," as the saying is, because the constant ragging by some minor operating official, who could not if his life depended upon it fill the yardmaster's job, made life miserable, and produced a mental attitude which detracted from the efficient performance of his work.

It was these abuses and acts of injustice arising perhaps from the indifference rather than the intention of the managements and which had been accumulating during a long period that finally resulted in the formation of national organizations of yardmasters, and other supervisory officers.

We have said at the opening of this article that the appearance of these organizations of supervisors should have furnished the railway executives with food for thought. One would imagine that they would at least have made some effort to analyze the factors which had operated to bring about such a situation, and having arrived at the cause of the trouble would have taken some steps to alter or palliate the offending conditions.

One would naturally suppose that they would have been astounded, not to say alarmed, to see the men who were directly responsible for the operation of their railways, suddenly grouping themselves in labor organizations. It is not in the records that they indulged in any such thoughts, at least so far as attempting to change the conditions which led up to this revolt are concerned. On the contrary, they reverted to past practices, only more so, as one might say.

On October 3, 1918, committees of yardmasters from all parts of the country, except the Pacific slope, met with the regional directors in Chicago. They asked for an eight-hour day and \$250 per month.

President A. H. Smith of the New York Central, who acted as chairman, advanced the argument that it would be impossible owing to the shortage of man power to grant an eight-hour day at that time, and the yardmasters finding this unanswerable went back to their twelve-hour day.

Shortly after this meeting, there was issued by the director general a schedule of wages and working conditions for yardmasters. The wages were placed at a maximum of \$250 and minimum of \$200 per month for yardmasters, and a maximum of \$240 and \$175 per month for assistant yardmasters, and the application of the maximum or the minimum was left to the discretion of the executives on the individual properties.

My readers will doubtless say this was the time when the executives grasped their opportunity to challenge by a fair and just application of this award the necessity for the existence of labor organizations of supervisory officials. They did nothing of the sort, or at least in only a few instances.

The following is an example of what they really did. On several railways men who had carried the title of yardmasters for years were suddenly reclassified as assistant yardmasters and paid the minimum rate.

On one large Eastern carrier where the yardmasters had never been granted vacations, a vacation for the year 1918 was refused, although the director general's order granted it, and was not allowed until months afterward and then only after an appeal had been taken to the regional director. From all over the country came complaints to the effect that the award of the director general was being applied without any proper regard for the duties or responsibilities of the men involved. Some of these cases were straightened out on the property, others by the regional directors, but many of them owing to obstructionist tactics on the part of the local officials, and the then imperfect organizations of the yardmasters' association, dragged along until the railways went back to private management, and consequently, there are yardmasters in this country who have just claims arising from the improper application of the director general's award which run into thousands of dollars.

Is it any wonder when all of these things are considered, that the yardmasters and the other supervisory officials' organizations were able to present to the members of the Congress during the winter of 1919-1920, evidence sufficient to convince them of the necessity of including these classes in the labor sections of the Transportation Act?

It was once remarked to the writer that the supervisory officials were the non-commissioned officers in the railway army. With this we do not agree, but resorting to the same analogy we should say that at least two classes of these employees could with more justice be compared to the line officers in military organizations. These classes are the agent and the yardmaster. The general manager and his aides, which designation would cover all classes down to and including the trainmaster, constitute the general staff of the railway army in which the agent and the yardmaster are the

line officers. These are the men who are constantly in command on the firing line, and who are working day and night to execute successfully the orders which are being passed on to them by the various "aide de camps" of the general staff.

Marshal Foch in one of his lectures on the Principles of Modern War delivered many years before the late European conflict, defined a good corps commander "as one who could successfully carry out the instructions of his superiors under circumstances of which he was frequently the sole judge." One would have to search a long while before he could find a better definition of a good yardmaster. And then, to carry the military analogy further, the yardmaster is constantly faced by the two factors which form the basis of all strategy—time and space—and like the strategist, all his work and its results are based upon and conditioned by these factors.

If the railway terminals of the country were of a size proportionate to the maximum traffic, his problems would not only be easier, but he would be able to attain to complete victory, or in other words entirely eliminate congestion, rehandling and delay. But such is not the case, and so the best that he can hope to attain is only a partial victory, or a minimizing of the factors of delay and congestion. In this position he is like some strategist, whose combinations are perfect, but who is, owing to conditions of terrain, insufficient reserves, or other factors beyond his control, always robbed of the complete fruits of victory. He can checkmate his antagonist, and deal him staggering blows, but he is unable to annihilate him. Obviously, such a situation would call for the highest order of military talent, for the slightest error would be fatal.

It is the business of the yardmaster to move cars, and his ability to do this within the smallest possible pace and in the shortest duration of time determines his success or failure. Consequently, it is necessary that he should be first of all a competent switchman, and the business of switching cars, like golf, rifle shooting or horseback riding, cannot be learned by watching some one else perform. One must have the actual experience. And now right here, we wish to say a word for the yardmen employed in the terminals of this country. It has become almost a habit within recent years to assume that the railway workers no longer have a pride in their work, but are interested only in their pay checks. This is untrue of railway workers in general, and is particularly unjust to the men working in our terminals; for if there is one thing eagerly coveted by these men it is the reputation of being a good switchman, that is the ability to perform a given amount of work with the least number of moves, and consequently, in the shortest possible period of time.

In making yardmasters, the managements of some carriers overlook this class of employee entirely; with the thought perhaps that men taken from other branches of the service would be more loyal in case of labor trouble. In this we believe they make a grave error, for while the loyalty they have in mind will be called upon very infrequently, the efficiency which comes only from knowledge and experience is needed every day.

It is a fact well known to all who are conversant with the situation that the terminals constitute the weakest link in our transportation system. It was in these that the breakdown which occurred during the early years of the war was most serious in its results, and we are willing to predict that a resumption of anything like the traffic handled during the years 1915-1920 will result in a similar condition of blockade and delay in the movement of freight.

The reason for this is, of course, very simple and that is that railway traffic has outgrown the capacity and facilities of the terminals many-fold, and this condition cannot be improved at this time without the expenditure of many millions of dollars. The growth of cities and towns has resulted in restricting railway terminals to a size proportionate

to the traffic of 30 or 40 years ago, and it is only by the purchase of much valuable real estate and costly engineering projects that this condition can now be overcome.

Imagine the expense incurred by reason of delay and damage in a terminal when a dozen classifications are made, and only three or four tracks available to make them.

Imagine the expense incurred by reason of trains standing outside terminals for hours because of the lack of available track room. The writer making a trip over one of our largest carriers during the winter of 1919-1920, counted 14 trains standing outside one of their biggest terminals.

And now we would ask the candid reader if he does not believe that the men who are entrusted with the duty of getting the best results under such conditions should be considered in the light of something more than a corporal in the railway army? Or whether he is not entitled to something more than five cents per hour more than a yard foreman, which is the basic rate recently offered the yardmasters by one of the largest carriers in the country?

## Amendment to Transportation Act Opposed

WASHINGTON, D. C.

ALBA B. JOHNSON, president of the Railway Business Association, and Professor Emory R. Johnson of the University of Pennsylvania, representing the railroad committee of the Chamber of Commerce of the United States, testified before the Senate committee on interstate commerce on December 15 in opposition to an amendment of the transportation act to repeal the rate-making section as proposed in the Capper and Nicholson bills. Mr. Johnson opposed the Capper bill as a direct attack upon the earning capacity of the railroads, both in the proposed repeal of Section 15a and in that part of the bill which would restore to the states complete control over intrastate rates. Repeal of Section 15a, he said, would leave the commission without instructions as to rates that would yield an adequate income. The Railway Business Association, he said, believes that anything tending to destroy the full authority of the commission as conferred by the Transportation Act is contrary to public opinion. Inadequacy of revenue, he said, would inevitably in time bring about government operation and ownership of the railroads, which, in his opinion, would be the greatest calamity that could happen to the United States. The railroads must have adequate revenues, not only to maintain the railroad properties, but also to attract new capital, and the inability of the railroads to get new capital will continue so long as the return from railroad investment does not rise to the level of the return from competing securities. Moreover, he said, prosperity will not be restored until the purchasing power of the railroads has been restored. When the railroads are in prosperous condition, the entire business of the country is stimulated.

Professor Johnson asked a fair trial of the act. Repeal of sections which give the Interstate Commerce Commission authority to correct state rates when they discriminate unduly against interstate commerce, would limit the commission's ability to maintain rates permitting a free flow of interstate commerce, he said.

"The Chamber of Commerce of the United States holds," said Dr. Johnson, "that none of the provisions of the act should be repealed or amended at the present time. The Capper bill would cut the rule of rate-making out of the act, and would take away from the Interstate Commerce Commission the power it has been given to correct state rates that unreasonably discriminate against interstate commerce and interstate railroad rates.

"The rule of rate-making was put into the law because

of the belief that it was necessary for the maintenance of efficient railroad service and for the restoration of railroad credit. Manufacturers, shippers, and producers of all kinds had reached the conviction before the act was passed that the Interstate Commerce Commission should so regulate rates as to enable the carriers to earn enough each year upon the value of their properties to enable them to maintain them and to develop their facilities along with the growth of the business of the country.

"The Chamber of Commerce of the United States through its railroad committee and by a vote taken among the 1,400 business organizations within the chamber, formulated a rule of rate-making in 1919 which was similar to the one incorporated in the Transportation Act of 1920. These business organizations voted six to one for the rule.

"As early as 1917 the national chamber declared by referendum in favor of giving the Interstate Commerce Commission authority to regulate rates when these rates affect interstate commerce. This action of the chamber was reaffirmed in 1919. The chamber recommended that this principle be incorporated in the Transportation Act of 1920.

"The exercise of power by the Interstate Commerce Commission to correct unjustly discriminatory state rates is in the public interest. The statute does not take away from the state commissions their power to initiate rates, nor are the states prevented from adjusting railroad charges within the reasonable limits established by the federal act. The chamber believes that the Transportation Act should be given full and fair trial, and that when the act is changed it should be supplemented and rounded out."

## Contract Work Under Fire Before Labor Board

### Roads Defend Practice of "Farming Out" Maintenance Requirements as Legal and Economical

THE RIGHT OF RAILROADS to contract car and locomotive repair and maintenance work has been the subject of vigorous and at times bitter attack and defense during the past week in hearings before the Railroad Labor Board. Twelve cases, involving nine carriers which have contracted for either part or all of their repair or maintenance work and the labor organizations representing the classes of employees affected by the changes in management, were consolidated by the Board and hearings on the complaints of the organizations that these contracts were made solely to evade the rulings of the Board and the provisions of the Transportation Act began on December 19.

The first complaint to be heard by the Board, considered by both carriers and employees as more or less of a "test case," was that brought by the Railway Employees Department of the American Federation of Labor against the Indiana Harbor Belt, because that carrier had contracted with the Burnham Car Repair Company for the operation of all of its repair tracks and shop facilities. The Board's synopsis of the case, as presented to the Board by representatives of the Federated Shop Crafts, outlines the salient points in the complaint. It says:

It appears that in January, 1921, the carrier contracted with the Burnham Car Company to take over and operate the repair tracks of the Indiana Harbor Belt, the railroad company retaining the car inspectors under their supervision. Immediately upon the assumption of supervision by the car company a reduction in wages was made and some of the work placed on a piece work basis. Seventeen men were laid off. The employees contend that the carrier's action was for the purpose of enabling them to avoid the payment of the rates established by the Board and that their action was in violation of the provisions of the National Agreement.

#### Frank P. Walsh Calls Contracts "Legal Frauds"

Frank P. Walsh, who will be remembered as the cross-examiner in the national agreements case, opened the employee's presentation by terming the contract made between the Indiana Harbor Belt and the Burnham Car Repair Company as a "legal fraud." The presentation of specific charges against both the carrier and the repair company was made by C. J. McGowan, vice-president of the Brotherhood of Railway Carmen, who alleged that the Indiana Harbor Belt had violated the national agreement with shopmen by: (1) declining to discuss grievances with the men or their representatives; (2) refusing to negotiate a new agreement with the representatives of the shopmen; (3) refusing to continue

the national agreement until a new agreement could be negotiated; (4) forcing an individual agreement with the car inspectors; (5) changing the hours and wages of car inspectors without proper authority and without negotiation with the union's representatives or reference to the Labor Board; and (6) discharging men without proper cause and investigation.

At the same time he charged the Burnham Car Repair Company with: (1) refusing to deal with the local officers of the men's union; (2) relieving men without reference to their seniority; (3) discharging men without investigation; (4) changing the work day from eight hours to nine; (5) reducing the hourly rates of carmen to 66 2/3 cents; and, (6) installing piecework without an agreement with the men or their representatives.

#### George Hannauer Cross Examined

Mr. Walsh then commenced the cross-examination of George Hannauer, vice-president and general manager of the Indiana Harbor Belt, continuing for the greater portion of the Board's sessions on December 19 and 20 in an effort to prove that the contractors in this case were "dummy" contractors and that the only motive for "farming out" the work was the desire of the carrier to evade the orders of the Board and the provisions of the Transportation Act. Mr. Hannauer pointed out that the contractors had performed many jobs for the carrier in the past and were financially responsible, that they had solicited the repair work without word from him, that there was no connection whatever between the carrier or any of its officers and the contracting company, that he had conceived the idea of contracting this work and had not talked with anyone except the chief mechanical officer of the road before signing the contract, that the repair work at different points was contracted for at different times, culminating in a period of three months in the contracting of all of the road's car repair work, and that the carrier exercised no unusual or illegal control over the contractor's employees, the carrier's representatives in the contract shops being present merely to lay out the work desired by the carrier and inspect the work turned out. This move was made, he said, entirely in the interests of economy and efficiency, citing that the labor costs of the contractors on certain work averaged \$17,497 a month, whereas the same work, estimated on the basis of the Master Car Builders' charges, would have cost the railroad \$24,937 a month. The yearly

savings under the contract arrangement would amount to about \$75,000, he added.

### I. H. B. Contends Board Has No Jurisdiction in Case

The carrier's presentation in the case was directed by Mr. Murray who, in opening his remarks, filed a brief with the Board setting forth that it was the contention of the carrier that the Board had no jurisdiction in this case. In support of this position the brief pointed out that the labor provisions of the Transportation Act apply to disputes between the carriers and employees or subordinate officials *directly interested in these disputes*. The organization bringing this case before the Board is not directly interested in the dispute, it asserted, and therefore the Board had no jurisdiction in the case.

"While not admitting the jurisdiction of the Board," the brief continued in substance, "the Indiana Harbor Belt denies that the agreement with the Burnham Car Repair Company for the contracting out of the repairing of its car equipment was done to avoid payment of the rates of pay established by the Board, and denies that the contracting out of its repair work is in violation of any rule or working condition legally in effect between the Indiana Harbor Belt and its employees; but asserts that this agreement was made to accomplish economies and improvements in the operation of the carrier and is accomplishing and will accomplish these results. The Indiana Harbor Belt asserts that the Board has no jurisdiction over the Burnham Car Repair Company or the employees of that company, their wages or conditions of employment. The employees of the Burnham Car Repair Company under this agreement are not the employees of the carrier and there is no dispute likely substantially to interrupt commerce between the Federated Shop Crafts and the Indiana Harbor Belt arising out of the contracting of equipment repair.

"It is the position of the Indiana Harbor Belt that:

"(1) No jurisdiction has been vested in the Board to determine when and under what circumstances and upon what conditions the carrier may employ independent contractors to do work for it;

"(2) even if the men employed by the contractors under this agreement were construed by the Board to be the employees of the carrier, the employing of these men by the carrier on terms satisfactory to them would not create and could not constitute any dispute between the carrier and its former employees in whose behalf the complaint in this case has been filed;

"(3) the Board, by the terms of the act of Congress creating it, can only entertain jurisdiction upon the complaint of employees, organized or unorganized, where there exists an unadjudged dispute which can substantially interrupt the operation of the carrier; and such dispute must be one between the complaining employees and the carrier in which the complaining employees are directly interested.

### Board May Become "Welfare

#### Agency of the Employees"

"The phrase 'directly interested in the dispute,' occurring and recurring as a controlling condition wherever the jurisdiction of adjustment boards or of the Labor Board is defined in the Transportation Act, is manifestly placed in the Act with deliberate and mature intent. By the express terms of these sections, no employees or organization of employees can act or interfere or require action by the carrier or set in motion action by the Labor Board in respect to grievances, rules or working conditions, or wages or salaries, which do not directly interest such employees or organization of employees—it is not sufficient to create a right of such employees or organization of employees to act or interfere or complain to the Labor Board that they are indirectly or sympathetically interested in the grievances, rules

or working conditions or in the wages or salaries of *other* employees or organizations of employees. The jurisdiction of the Board is confined to disputes between the carrier and its own existing employees in respect to the rules, working conditions, wages or salaries of their *own* employment—it does not cover the relations or obligations of the carrier to ex-employees. It does not affect the free will of the carrier to discharge an employee, nor the free will of the carrier to engage an employee. It does not confer upon the Board power to dictate whom the carrier shall discharge or retain or whom the carrier shall employ. It does not affect the right of the carrier, in any department of work, to accomplish that work through an agreement with a contractor who furnishes the labor therefor—in fact, where the carrier can achieve economies by so doing, it is its clear duty to follow that policy. That the carrier has discharged a particular employee or has engaged a particular employee, or accomplishes the performance of work through a contractor of labor rather than by direct employment of labor, may sentimentally or sympathetically or from the standpoint of the maintenance or advancement of labor unions or labor welfare, *interest* the employees of the carriers, but it does not *directly interest* the employees of the carrier in respect to the rules, working conditions, wages or salaries of their *own* employment.

"There is danger that the Board may assert, or may by the employees be asked to assert, in exercising its jurisdiction, a too broad interpretation of this word 'interest' as used in this Act.

"If the mere existence of a concern or desire to accomplish a class advantage in the conflict between capital and labor is sufficient to justify a complaint to the Board by employees, then the functions of the Board in respect to the relations between the carrier and its employees are practically unlimited, and the Board becomes a welfare agency of the employees.

"It is respectfully suggested that this Act does not design to give the Board jurisdiction to adjust any disputes which may arise between the carrier and its employees in respect to any grievances which the employees may arbitrarily set up in their desire to promote their class welfare—and that the grievances referred to in this Act are grievances in direct respect to the employees' *own* working conditions, or in direct respect to the rules affecting the employees' *own* employment, or in respect to the employees' *own* wages or salaries—and that the word 'interest,' as it occurs in this Act, is used in a legal sense and not in a layman sense. If grievance under this Act is to be construed as embracing any strategic demands, which the employees as a matter of class interest may make and fortify by threat of a strike, as to whom the carrier discharges or employs, or as to whether the carrier procures its labor through a contractor or by direct employment, then the Board becomes in reality the supreme supervisor of the carriers in all matters pertaining to employment—and practically, through the weapon of a threatened strike, the employees of the carrier may confer or thrust upon the Labor Board jurisdiction of any issue whatsoever."

### Former and Present I. H. B. Employees

#### Satisfied With New Conditions

Under the subsequent direct examination of Mr. Hannauer by Mr. Murray, the history of contract work on the Indiana Harbor Belt was outlined and emphasises placed on the fact that the carrier has been since 1915 contracting part of its operation, notably its icing facilities, and always without criticism on the part of the employees. In reply to one question, Mr. Hannauer said that he believed that it was his duty under Section 404 of the Transportation Act to contract work wherever savings could be made by so doing.

In closing the carrier's case, Mr. Murray presented a petition of the car inspectors now on the Indiana Harbor Belt to the Board and stating that they were satisfied with their wages and working conditions, that they desired no change and that they were not opposed to the company's contracting its repair work. Another petition signed by all of the carmen employed by the contractors and stating practically the same facts, plus the statement that they desired no one to protest their situation, was also presented by Mr. Murray.

After vainly trying to establish the possibility of future collusion between the contractors and Mr. Hannauer to bring the costs of repair work up, Mr. Walsh presented numerous affidavits of former employees of the carrier to prove that the petition presented on behalf of the carrier's car inspectors was obtained from the men under threat of losing their position. It developed, however, that the affidavits were dated in April whereas the petition of the men was dated in August, six months later.

### Mr. Walsh Summarizes Employees' Case

The salient points in the carriers' and the employees' positions in all of these controversies were brought out in the closing arguments of Mr. Walsh and Mr. Murray in Indiana Harbor Belt case.

Mr. Walsh in an impassioned plea for a decision declaring the employees of the contractor to be still the employees of the carrier and therefore subject to the rulings of the Board and the provisions of the Transportation Act and terming the contracts already made as illegal, said that this case deals with the fundamentals for which the Board was created, the insuring of justice to railway employees. The form of the contract, he added, indicated that it follows "a form of contract used by the railroads throughout the country as part of a general plan to evade the rulings of the Board and the provisions of the Transportation Act." Should this contract be adjudged legal by the Board there will be nothing to prevent the carriers from contracting all of their operations, thus nullifying the labor provisions of the Transportation Act, he pointed out.

### S. C. Murray Presents Carriers' Case

Mr. Murray, in closing the carrier's case, pointed out that the labor organizations represented by Mr. Walsh could have no standing before the Board in this case inasmuch as the employees of the contractor had specifically stated that they did not want their case brought before the Board and the men who were formerly in the employ of the company and who had gone on a strike when the change was announced had no right to representation before the Board according to its previous rulings. The contract itself was defended by Mr. Murray under the "independent contractor" laws of the country. He cited many decisions of the Supreme Court and rulings made under the Federal Employers Liability Act in support of this defense. These decisions showed that railroad foremen could direct the work of the contractor's employees without changing the relations between the contractor and his employees and the railroad and its employees. Furthermore, he added, the contract does not violate the national agreement for there is nothing in the national agreement holding that the railroads have no right to contract work. Mr. Walsh's "fraud" charge was refuted by reference to the contract made in 1919 by the road for the operation of its icing plant. Then, Mr. Murray said, there was no reason for evading either the rulings of the Board or the provisions of the Transportation Act for neither were in existence at the time.

### Whole Controversy, Based on I. H. B. Presentations

With the close of arguments in the Indiana Harbor Belt case, on which both employees and carriers had concentrated their respective arguments on the principles involved, the

presentation of evidence in similar cases between other carriers and the organizations representing the men affected by the changes, was given rapidly. In every case the testimony closely followed the attack of the employees and the defense of the carriers in the Indiana Harbor Belt controversy.

The complaints of the United Brotherhood of Maintenance of Way Employees and Railroad Shop Laborers against the Chicago Great Western, the St. Louis-San Francisco, the Colorado & Southern, the Indiana Harbor Belt, the Chicago, Milwaukee and St. Paul, the Chicago & North Western and the Great Northern and the complaint of the Federated Shop Crafts against the Gulf Coast Lines were quickly disposed of in this manner.

E. F. Grable, president of the maintenance of way organization, in stating his contentions, brought forth the additional charge that the carriers in contracting their maintenance of way work were not only violating the Board's orders and the provisions of the Transportation Act, but were also evading the supervision of the I. C. C. over expenditures.

In defense of the Indiana Harbor Belt's contract for maintenance of way work, Mr. Hannauer presented statistics to show that although more actual work has been done on its right of way in the period from April 1 to September 30, 1921, under the contract arrangement than in the corresponding period of 1920, when the work was done by railroad forces, the man hours expended decreased from 691,080 to 374,068, and the cost to the carrier decreased from \$359,015 to \$133,104.

L. K. Silcox, general superintendent of motive power of the Chicago, Milwaukee & St. Paul, testifying in defense of that carrier's contract for unskilled laborers' work at four engine terminals, stated that under the terms of the contract the carrier saved \$47,714 per year. Under cross examination, Mr. Silcox stated that largely because of the restrictive rules of the national agreement and the wage rates fixed by the Board it was impossible to do the necessary work for less than \$11.20 per engine whereas the contractor arbitrarily offered to do the work for \$9 per engine. The contract was made, he added, to effect this saving and under the requirement of the Transportation Act for economical operation.

### The Erie's Contract Shop Work

Hearings on complaints of shopmen on Erie against that carrier's contracting of its shop work at Hornell, N. Y., to the Hornell Construction and Repair Company and at Marion, O., to the Railway Service Company were before the Board on December 20. The testimony in this case was comparatively brief and followed in general the testimony given by both carriers and employees in the previous case. Ben B. Hooper, vice-chairman of the Board, asked H. A. Taylor, general solicitor of the Erie, if it was the carrier's position that legally it could contract all of its operations. Mr. Taylor, however, refused to express an opinion on points which were not before the Board, but called attention to the fact that there might be a dividing line based on the character of the work which would make impossible theoretical or practical contracting of all railway operations.

### Walsh Closes Hearings for Employees

In closing this series of hearings for employees Mr. Walsh cited two reasons why he believes the railroads cannot successfully contract work: First, because stockholders of railways would not stand for allowing property to get out of their legal grasp; second, the alleged admission of efficiency on the part of the railway executives through giving work to outside companies would bring the railroads before the government and they would lose their charters.

Hearing on the temporary injunction granted to the Pennsylvania against the Labor Board, described in the *Railway Age* of December 17, page 1210, scheduled for

December 21, has been postponed until January 3 by mutual agreement.

### Missouri & North Arkansas Before Board

J. C. Murray, receiver for the Missouri & North Arkansas, filed a petition with the Labor Board on December 21 asking for authority to cut the wages of employees 25 per cent in order to resume operation of that road. The road ceased operations on July 31 after a long controversy with its employees and between the courts and the Labor Board. In filing this petition Mr. Murray outlined a special wage reduction plan which he had submitted to the employees in October and which they turned down. This proposal was to resume operations immediately with a 25 per cent wage cut with the understanding that if at the end of the year there was any surplus left, after paying expenses, taxes and interest this surplus will be divided among the employees up to the point where their wages are comparable with the wages paid on other carriers.

## The Seriousness of the Egg Claim Situation

By Albert L. Green

Special Representative, Freight Claim Prevention,  
American Railway Association

FOR THE FIRST SIX MONTHS of this year the amount paid out in egg claims by the railroad companies averaged \$90,000 a month, and by the American Railway Express Company, \$50,000 a month. Approximately 80 per cent of these amounts represent damage which could easily have been avoided by the more careful handling of egg crates on the part of the transportation employees, and by closer attention to the packing and loading of the crates in cars by the shippers. Only a fraction of the damage was due to wrecks and derailments, the exact amount reported by the railways for this six months' period being \$9,049 or less than 2 per cent of the total. The remainder may, therefore, be said to be wholly within the control of the shippers and the carriers.

Comparing this year's figures with those of 1920, when extraordinary conditions, such as peak prices and the switchmen's strike, contributed to the record figure of \$2,500,000 in egg claims, the lower prices and more favorable transportation conditions now prevailing would seem to point to a greater reduction than is now in sight. Much encouragement, however, is to be drawn from the decided improvement noted in the preparation of shipments for movement by express and, in certain localities, by freight. In Tennessee, for instance, a particularly serious egg claim situation has been almost entirely adjusted, and eggs from that territory are now reaching the market in first-class condition.

By no means do the carriers claim that all of the trouble is due to the lack of care on the part of the shipper. They recognize that the majority of claims arise from causes for which the carriers alone are responsible, and we think it is safe to say that there is not a freight or express carrier in the country that is not putting forth its best efforts to render safe and satisfactory service.

It is clear, however, that the shippers do share some responsibility in the matter. To insure safe transportation, eggs must be packed right. What constitutes "right" packing is open to discussion. Heretofore it has been considered that the honeycomb filler, when new and of standard quality and packed with excelsior pads of the proper weight, should protect the eggs with the minimum of damage under ordinary conditions. But a study of the reports of inspections made by the railroads and express companies at the market

points, develops a serious question whether the point of maximum safety has actually been reached.

The egg case pad was first introduced to the trade in 1903, and shortly thereafter its use was officially recognized by the Consolidated Freight Classification. The pad at that time weighed 145 lb. to the thousand. It was then thought merely necessary to use a quantity of loose excelsior which had ordinarily been used in the packing of eggs, and no particular thought was given to the necessity of compressing or tying the fillers within the case so as to prevent the shifting of the contents. From time to time suggestions came to the manufacturers from the trade that thicker pads would offer greater resistance to breakage, and accordingly the weight of the pad was increased, first to 160 lb., then to 180 lb., and finally to 235 lb. per thousand, which is the weight now in general use. Two years ago it was found that the introduction of a third pad, usually inserted beneath the top filler, was effective in reducing damage and it was not long before the majority of shippers adopted the 6-pad pack in preference to the 4-pad pack previously used.

On October 12 and 13, at the research laboratory of the Chicago Mill & Lumber Company, Chicago, a series of tests were made under the observation of representatives of the National Railway & Express Committee on Egg Breakage; the Freight Container Bureau; the U. S. Department of Agriculture; the Live Poultry and Dairy Shippers' Traffic Association; the National Association of Egg Case and Egg Case Filler Manufacturers; and the National Poultry, Butter and Egg Association. The objects of the test were, (1) to determine whether the present honeycomb filler should be strengthened; (2) to measure the comparative protection afforded by the excelsior pad now in use as against a thicker and heavier pad; and (3) to compare the 4-pad pack versus the 6-pad pack. Egg cases of standard construction and of standard fillers, flats and pads taken from the regular stock, and only sound eggs were used. All cases, with a single exception, were subjected to a 20-min. test on a shaker machine.

At the conclusion of the tests the newly organized National Railway and Express Committee on Egg Breakage held its first meeting and discussed all phases of the egg claim problem. This committee recommended that a pad weighing not less than 250 lb. per thousand should be prescribed by the Freight and Express Classifications; that the trade marking of fillers would help prevent the use of under-standard fillers, since it would enable the carriers' inspectors to identify the manufacturer of fillers below grade, which would lead to the product being condemned for transportation purposes; that the present standard honeycomb filler, when used with six pads, affords all the necessary protection, and until the heavier pad has been thoroughly tried out in practice, consideration should not be given to increasing the weight of the filler; also that much better results would be secured if all shippers now using the 4-pad pack would follow the practice of the majority and use 6 pads to the case.

The extensive use of second-hand fillers presented the most complicated problem which came before the conference. Many schemes for eliminating their use were discussed and the subject has been left open for consideration at a future meeting.

THE CANADIAN PACIFIC, for the first time, is planning to use New York as a port of departure for its passenger steamers. During the war twelve of the company's steamers carried troops and supplies from New York. The "Empress of Scotland," 25,000 tons, leaves on February 4, and the "Empress of France," 18,500 tons, on February 11, both on Mediterranean cruises. The "Empress of Britain," 15,850 tons, which brought home the 27th Division of the American Expeditionary Forces, will go on two West Indian cruises, one on January 21 and the other on Feb. 21.

# Loading Guides Solve Difficulties of L. C. L. Freight

## Pennsylvania Aids Shippers by Introducing Improved Method for This Service

**T**O EXPEDITE the forwarding of less-than-carload freight in so-called trap or ferry car service from points in the central region to all points on the system and connecting railroads loading guides have been prepared by the Pennsylvania Railroad, which show in a simplified manner the correct loading to be followed. These guides have been distributed to all ferry or trap-car shippers in the central region and after six months' trial the majority of shippers served by the road have permanently adopted them. Efforts are now being made to secure the co-operation of all others using the trap or ferry car service.

The results already accomplished have exceeded expectations. The railroad men and the shippers who have adopted

loaded to secure the best possible service. With this information they are able to assemble their shipments and so regulate their loading that the car can be forwarded to the transfer which will accord the best service. This direct loading greatly reduces the handling of the shipments at intermediate points and eliminates the delay previously experienced with the indiscriminate loading.

A feature of prime importance is that shippers have found that the simplicity of the guide renders its use general throughout their loading departments. Moreover, shippers find that it is advantageous to them to hold their shipments several days and assemble a load for a proper transfer, because of the improved service that accrues by such arrange-

Markers Indicating Routes Simplifies the Sorting of Freight

the plan feel assured that it provides an efficient and expeditious method for the handling of miscellaneous freight in less-than-carload quantities which, unless loaded in a systematic way as regards destination and intermediate transfer points, is necessarily subject to frequent handling and delay en route.

### The Plan

Freight cars which are loaded by shippers at their plants with miscellaneous less-than-carload shipments are known as ferry or trap cars. Prior to the preparation of the loading guides this freight was loaded indiscriminately; shipments destined to eastern points, for instance, were loaded in the same car with miscellaneous shipments destined to western points or southern points. This indiscriminate loading made it necessary to move cars to adjacent freight stations or nearby transfers where they had to be unloaded, the shipments sorted and then reloaded either to more distant transfer points or destinations.

By using the loading guide the shippers can readily ascertain the proper transfer to which their shipments should be

ment in that the shipments reach their destinations more promptly when compared with the old plan.

### Advantages of the Plan

Industrial plants which have adopted the new plan report from the viewpoint of the shipper, the following advantages.

Shipments reach customers in much less time as delays at local stations and transfers are eliminated.

Owing to reduced handling at transfer points goods not only arrive at destination more quickly but also with the package in better condition.

There is less opportunity for incorrect loading and freight going astray.

The improved service and reduction of errors in loading have virtually eliminated the necessity for tracing.

It affords the shipper an intelligent system for supervising his own loading.

The plan is so flexible that the individual shipper can set up a ferry-car program to meet his own peculiar needs.

From the point of view of the railroad the new loading plan offers the following advantages:

The indiscriminate loading of miscellaneous freight is in a large measure eliminated.

Important economies are made possible because of reduced handling of freight at origin freight stations and intermediate transfers.

Less handling of freight has resulted in a marked decrease in claims for loss and damage.

By reducing the number of days ferry cars are detained while awaiting unloading the car supply situation is improved. This is a very important factor particularly during times of car shortage.

Congestion is relieved at many local stations which, as a rule, are without facilities for reclassification of less-than-carload freight.

### Actual Results Shown

There are 24 guides covering 180 ferry car shipping points in the central region. Each guide contains some 40 pages of loading instructions.

A report shows that of the 16,498 ferry cars forwarded from the stations of the central region during the first six months of this year more than one-half—8,425 cars to be exact—were hauled to the proper transfer, direct to the connecting lines, or direct to destination without the former intermediate rehandling. The remaining 8,093 cars were loaded to preferred intermediate transfers, in many instances, in conformity with the ferry car guides.

Some details of the practical advantages for the shipper under the new method of loading and routing freight are summarized in the following statement:

"This ferry car loading arrangement has resulted in a 100-per cent improvement in the prompt delivery of goods to our

packages, stow them securely in the cars and give his outgoing freight much more careful attention than one could expect from a congested railroad transfer point where many consignments of freight have to be sorted and re-shipped every 24 hours.

"Prior to the installation of the present system a delay of a week or more in getting freight reclassified and forwarded to the transfer was not uncommon. All such delays are eliminated by using the new ferry car guide. Frequently a delay of a few days on our shipping platform is more than offset by the saving of from 10 days to two weeks in time of arrival of the consignment at the ultimate destination."

The following summarizes a report on the handling of ferry cars from central region stations between January 1 and June 30, 1921:

Direct to destination	Direct to connecting lines	To proper transfer	To first preferred transfer	To second preferred transfer	To third preferred transfer	Total cars handled
3,904	1,487	5,634	5,286	1,156	1,651	16,518

Loading Ferry Cars at a Manufacturing Plant After Freight Has Been Sorted on the Loading Platform

From Pittsburgh district stations—i. e., those within a 50-mile radius from the city—the following results were shown for the month of June, 1921:

Direct to destination	Direct to connecting lines	To proper transfer	To first preferred transfer	To second preferred transfer	To third preferred transfer	Total cars handled
324	133	329	495	113	164	1,558

### How the Guides Are Used

Copies of the guides have been distributed to more than 500 shippers. Each guide contains an alphabetical list of agency stations on the Pennsylvania System, together with assigned station numbers and loading directions showing the proper transfer to which freight from that territory should be loaded. Column 1 names the proper transfers serving destination direct. Shipments so loaded will be transferred only once en route to destination. Columns 2, 3 and 4 name, respectively, the intermediate transfers in order of their preference in case industries are unable to assemble sufficient tonnage to justify loading to the proper transfer named in column 1.

To promote the widest possible use of the ferry car guides, each division freight agent in the central region has been instructed to give personal attention to the following program:

"First—See that every ferry car shipper in his territory has a copy of the guide.

"Second—Be certain that every shipper clearly understands the purpose of the guide, how to use it, and the advantages to be derived.

"Third—Make careful observation of ferry car operations in his territory to determine whether or not the guide is being used properly.

Loading a Ferry Car at Jacob Dold Packing Company's Plant, Buffalo, N. Y.

customers. Furthermore, since we rearranged our shipping platforms in accordance with the ferry car guide for this district the requests for tracers from our customers have been practically eliminated.

"The fact that our tracers will decrease, this year, from 2,000 to less than 500 indicates that the new arrangement works to prevent incorrect loading and freight going astray. Because the goods are transported with much-reduced handlings at transfer points the shipments not only arrive at destination more quickly but they also arrive with the packages in better condition.

"Another advantage of the plan is that it offers the shipper an intelligent system for supervising his own loading. Through his own shipping department he can classify his

"Fourth—When reports indicate that shippers are not loading their shipments to best advantage, an analysis of their tonnage will be made to develop in what way an improvement can be made, and a personal interview arranged with shippers."

With practically all ferry car shippers in the central region loading their freight in accordance with the guides it is confidently expected that all ferry car freight can be handled without delays at transfer points even during times when the movement of freight is very heavy. This expeditious movement of less-than-carload freight will bring about greatly improved service to consignees.

The loading guide contains an alphabetical list of agency stations on the Pennsylvania System. Opposite the name of each station is an assigned station number. Loading directions are then given for the various station numbers which show the proper transfers to which less-than-carload freight should be loaded to insure the most expeditious and efficient handling.

The following extract from loading guide No. 1 illustrates

The Larkin Company, Buffalo, N. Y., Uses Colored Shipping Orders and Tags to Identify Freight to Be Shipped in Ferry Cars

the alphabetical arrangement of the stations and their assigned numbers:

ALPHABETICAL LIST OF STATIONS			
Station Number	Station		Division
639	Merchantville.....	N. J.	Trenton
6109	Merrill.....	Pa.	C. & P.
6843	Merritt.....	Mich.	Mackinaw
8228	Merritt.....	Ohio	Wheeling
6561	Metham.....	Ohio	Akron
248	Metuchen.....	N. J.	New York
247	Metuchen Interchange.....	N. J.	New York
6512	Metz.....	Ohio	Akron
7858	Mexico.....	Ind.	Fort Wayne
1115	Mexico.....	Pa.	Middle
8055	Miami City.....	Ohio	Cincinnati
8020	Miamsville.....	Ohio	Cincinnati
6846	Michelson.....	Mich.	Mackinaw
5087	Mickleton.....	N. J.	W. J. & S.
3177	Middleburg.....	Pa.	Sunbury
262	Middlebush.....	N. T.	New York
7689	Middle Fork.....	Ind.	Louisville
6000	Middlepoint.....	Ohio	Mansfield
2755	Middletown.....	Del.	Delaware
7424	Middletown.....	Ind.	Richmond
8125	Middletown.....	Ohio	C. L. & N.
1057	Middletown.....	Pa.	Philadelphia

How the proper loading directions for any given point on the Pennsylvania may be ascertained by means of its assigned number is indicated in the following extract from the loading instructions of Guide No. 1:

Stations	Proper transfer	First preferred	Second preferred	Third preferred
56 to 264.....	Harrisburg	Pittsburgh		
268 to 547.....	Philadelphia	Harrisburg	Pittsburgh	
550 to 746.....	Camden	Philadelphia	Harrisburg	Pittsburgh
758 to 810.....	Philadelphia	Harrisburg	Pittsburgh	
826 to 1074.....	Harrisburg	Pittsburgh		
1081.....	Altoona	Pittsburgh		
1084 to 1091.....	Harrisburg	Pittsburgh		

Column 1 names the proper transfers serving destination direct. Shipments so loaded will be transferred only once en route to destination.

Columns 2, 3 and 4 name the intermediate transfers in order of their preference. If industries are unable to assemble sufficient tonnage to justify loading to the proper transfer named in column 1, freight should be loaded to the transfer named in column 2. If insufficient to load to transfer named in column 2, then load to point named in column 3, and so on.

If an industry is unable to assemble sufficient freight to warrant loading a car direct to a connecting line via the proper junction, freight should then be loaded the same as provided for the station at which the Pennsylvania System delivers the shipment to such connecting line.

### Instructions for Shippers

Directions for use of the loading guides include the following:

"When an industry has sufficient freight to forward a car daily, tri-weekly, semi-weekly or weekly to one destination station or for loading in station order to one division, freight should be loaded and forwarded direct. This arrangement will avoid rehandling at a transfer station, thus resulting in improved service and eliminating to a great extent liability of loss and damage to freight.

"An industry should load direct to destination station freight in quantities as follows:

10,000 lb. or more for one destination within a radius of 150 miles;

15,000 lb. or more for one destination within a radius of 250 miles;

20,000 lb. or more for any destination.

"Heavy or bulky shipments should be loaded in such a manner that rehandling at transfer station is not required."

## Economic Speeds for Freight Operation

By H. Ashton

CONSIDERATION of the effects of different train speeds upon locomotive drawbar pull and normal train resistance brings out an interesting problem in the development of an economic speed for slow freight. M. L. Byers in "Economics of Railway Operation," gives a table of percentage changes in engine tractive power and train resistance for different speeds. From the relation of these two factors to each other he deduces the allowable weight of train for each speed. The relations are developed on a percentage basis with the values of the various factors at a speed of 15 miles an hour assumed as 100 per cent. H. S. Haines in "Efficient Railway Operation" (Appendix VII) gives a similar compilation on this subject. The percentage changes in effective drawbar pull for various speeds, however, are copied from Byers; and in computing the corresponding train loads no account is taken of variations in train resistances. Prof. C. E. Crandall considers the variations in train resistance as negligible also between the speeds of 15 and 30 miles an hour. This, of course, increases the economic speed as the allowable weight of train would vary directly with the locomotive drawbar pull.

If the problem is extended to the consideration of the most economical method of hauling a given amount of freight between two given terminals (leaving out of consideration the cost of fuel) the controlling factors are time and tonnage; in other words, at what average speed will the greatest number of tons be hauled in a given time, or what speed will give the greatest number of ton-miles an hour?

Using Byers' figures referred to above for a Consolidation locomotive weighing 113,000 lb. on the drivers, with 20 in

by 28 in. cylinders, 50 in. drivers, and 150 lb. boiler pressure, the greatest number of ton-miles an hour was produced at a speed of approximately 12½ miles an hour. The writer made a similar tabulation of effective drawbar pulls for varying speeds from actual tests for three superheater locomotives of the following dimensions:

	Type A	Type B	Type C
Weight on drivers...	175,700 lb.	223,300 lb.	240,200 lb.
Cylinders.....	23 in. by 28 in.	25 in. by 28 in.	27 in. by 30 in.
Drivers, diameter....	50 in.	62 in.	62 in.
Boiler pressure.....	200 lb.	200 lb.	200 lb.

Types A and B were Consolidation locomotives, and type C a Mikado. Using the same variations in train resistance as Byers, which are based on a 40-ton car with a resistance of 3.2 lb. per ton at a speed of 15 miles an hour (assumed as 100 per cent), calculations were made to determine the allowable weight of train; the curves in Fig. 1 were plotted to show the percentage of ton-miles moved an hour for train velocities ranging from 5 miles an hour to 30 miles an hour. Each of these locomotives attained a maximum efficiency at a speed of approximately 17 miles an hour.

Assuming a unit cost (per train-hour on the road), including locomotive expenses and wages for a full crew, the relative costs per ton-mile was plotted for each type of locomotive. The curves in Fig. 2 show a very sharp reduction in the cost per ton-mile as the speed is increased from 5 miles an hour to 9 or 10 miles an hour, after which the curve flattens as it approaches the minimum point. On the ascending side of the curve, as the speed is increased beyond 17 miles an hour, the increase in the operating cost is much more

TABULATION FOR MIKADO, TYPE C

Speed	Tractive Effort, Per cent	Train Resistance, Per cent	Allowable Wt. of Train		Ton-Miles per Hour	Cost per Ton-mile, Mills
			Per cent	Tons		
5	116.9	90.0	129.9	9,093	45,465	.0319
6	116.7	90.0	129.8	9,086	54,516	.0266
7	116.4	90.5	128.6	9,002	63,014	.0230
8	115.7	91.0	127.1	8,897	71,176	.0200
9	114.2	92.0	124.1	8,687	78,183	.0185
10	112.1	93.0	120.5	8,435	84,350	.0172
11	109.9	94.0	116.9	8,183	90,013	.0161
12	107.4	95.0	113.1	7,917	95,004	.0153
13	104.9	97.0	108.1	7,567	98,371	.0148
14	102.5	99.0	103.5	7,245	101,430	.0142
15	100.0	100.0	100.0	7,000	105,000	.0138
16	97.4	101.0	96.4	6,748	107,968	.0134
17	94.8	102.0	92.9	6,503	110,551	.0131
18	92.1	105.0	87.7	6,139	110,502	.0131
20	86.4	110.0	78.5	5,495	109,900	.0132
25	73.5	120.0	61.3	4,291	107,275	.0135
29	64.3	130.0	49.5	3,465	100,485	.0145

Notes: Col. 4 equals Col. 2 divided by Col. 3.  
Col. 6 equals Col. 1 multiplied by Col. 5.  
Col. 7 is based on an assumed cost of \$14.50 per train-hour.

The controlling factors in the development of an economic speed are not, however, merely a matter of variation in ef-

Fig. 1. Relative Ton-Miles Per Hour at Different Speeds

gradual for all three types of locomotive, and particularly so for the heavy Mikado.

As stated above, the variations in train resistance as taken from Byers are on a 40-ton car basis. As the size of equipment is increased the variations would become less pronounced, the normal resistance being greater at the start and increasing less rapidly as the train speed is increased. This would result in a higher economic speed.

The accompanying tabulation, giving the data for the Mikado locomotive, type C, shows how the information was prepared for the plotting of the curves. Similar tables were also made up for the two Consolidation locomotives.

Fig. 2. Relative Operating Costs at Different Speeds

fective drawbar pull and train resistance, but also of the physical characteristics to be encountered in any given case, and the density and kind of traffic. In many instances, however, the train performance is permitted to fall below 10 miles an hour, either through attempts to crowd the engine ratings, congestion, or other causes.

It is quite plainly evident from the curves that operating costs mount very rapidly as the speed of trains is reduced below this figure, and the necessity of keeping the motive power in first class condition is plain if economy is to be attained.

A GREAT NORTHERN mail train plunged through a bridge, which had been weakened by floods, near Index, Wash., on December 11, killing two men—fireman and mail clerk—and injuring several others.

THE PANAMA RAILROAD employed 1,898 persons in October, 1921, as compared with 2,077 in September, 1921, and 3,564 in October, 1920. Of the 1,898 employees in October this year, 301 were paid in gold and 1,597 in silver.

## Railroad Administration Accounts

WASHINGTON, D. C.

A TOTAL of \$344,379,238 definitive or permanent obligations of carriers was held by the Railroad Administration on December 1, according to the report of the director general to the Senate, which was abstracted in last week's issue. This included \$26,389,900 of bonds, \$102,475,038 of notes (secured by \$138,998,000 of collateral), \$1,400,000 of receivers' certificates and \$214,114,300 of equipment trust obligations. In addition, \$95,848,124 of temporary obligations of carriers and securities deposited by carriers was held. These were taken while the government was in control of the railroads and when the accounts between the administration and the carriers could not be determined, these obligations being taken to insure the government against any possible loss by overpayment. They will be disposed of in final settlement and therefore are not to be considered as fixed assets of the Railroad Administration. The notes included are secured by \$182,012,120 of collateral.

One of the exhibits gave the following statement of the receipts and disbursements of the Railroad Administration, not including those of the individual railroads, as shown in the following:

### Statement of receipts and disbursements Jan. 1, 1918, to Nov. 30, 1921

Appropriations by Congress:	
Sixty-fifth Congress, S. 3752, Federal control act, approved March 21, 1918.....	\$500,000,000
Sixty-sixth Congress—	
H. R. 5312, deficiency appropriation act, approved June 30, 1919.....	750,000,000
H. R. 10453, transportation act, 1920 (sec. 202), approved March 28, 1920.....	200,000,000
H. R. 13677, deficiency appropriation act, approved May 8, 1920.....	300,000,000
	\$1,750,000,000
Loans repaid by carrier corporation, securities sold, and interest collections.....	315,931,019
Indebtedness of non-federally controlled railroads.....	1,147,520
Funds transferred from federal managers and carrier corporations as trustees for the director general.....	800,738,859
Loan from War Finance Corporation.....	50,000,000
Transportation collected:	
War Department.....	\$221,705,986
Navy Department.....	11,359,796
Post Office Department.....	65,575,832
	298,641,614
American Railway Express Co.....	184,392,117
Adams Express Co.....	2,800,300
American Express Co.....	3,000,000
Wells, Fargo & Co.....	1,759,000
Cash payments by carrier corporations for additions and betterments.....	14,462,522
Cash payments by carrier corporations for allocated equipment.....	8,216,077
Interest on bank balances.....	2,381,923
Liberty loan bonds transferred to War Finance Corporation.....	32,592,554
Miscellaneous.....	7,809,571
	\$3,478,872,520
Payments to carrier corporations and receivers:	
Loans, including funding.....	\$285,122,347
Advances on compensation.....	1,482,679,809
Open accounts and miscellaneous.....	141,749,210
Final settlements with carriers under federal control.....	130,908,412
Final settlements with other carriers.....	1,170,845
	2,041,630,623
Funds transferred to federal managers and to carrier corporations as trustees for the director general, for payment of his obligations.....	802,714,797
Acquisition of equipment.....	381,834,524
Inland waterways.....	18,511,140
Repayment of loan from War Finance Corporation and interest thereon.....	50,929,452
Interline balances, Canadian railroads.....	2,139,388
Car hire, bureau.....	2,405,100
Administration pay roll.....	15,816,510
Rents, traveling expenses, stationery, supplies and miscellaneous.....	10,510,300
Balances.....	
In Treasury and banks to credit of director general.....	\$43,664,022
Unexpended balance of appropriations.....	108,716,858
	152,380,880
Grand total.....	\$3,478,872,520

<sup>1</sup> Does not include the disbursements in settlement of the judgments, decrees and awards for which provision was made in sections 206 (c) and 210 (c) of the transportation act, 1920 (H. R. 10453). Such disbursements, to Nov. 30, 1921, aggregated \$5,746,859.23.

<sup>2</sup> Does not include final settlements agreed upon but not yet paid, amounting to \$1,313,428.09. Total settlements agreed upon to Nov. 30, 1921, \$132,221,839.89.

The estimated amounts due to carriers in final settlement as of December 1 were stated as follows:

Unpaid compensation.....	\$2,376,377
Cash taken over from the working capital of the carriers at the commencement of federal control.....	183,907,781
Depreciation.....	185,801,888
Equipment retirements.....	15,188,108
Materials and supplies.....	49,228,641
Net liability on account of maintenance and betterments claims.....	51,476,32
Gross amount due.....	787,775,588
Less additions and betterments to be accounted for and settlements.....	63,400,000
Balance due to carriers.....	724,375,588

## New Wall Unit Simplifies Standardized Buildings

THE TRUSCON STEEL COMPANY recently incorporated a new development in its line of standardized buildings that permits of greater flexibility in the application of this type of structure to various uses. The change also permits of a considerable reduction in the number of stock parts

A Shop Building for the Santa Fe at Chicago

required, thereby accomplishing a saving which naturally accrues to the advantage of the user. These buildings are of the steel frame, sheet-steel-sheathed, ready-to-erect type with unit wall sections which frame into structural steel mul-

Express Building and Platform Sheds for the Chicago & North Western at Chicago

lions of a special section rolled especially for this purpose. The roof is also of a special unit steel construction with a unique form of assembly that assures a thoroughly watertight cover.

The new feature which has been incorporated in this form

of construction is the adoption of a wall unit 4 ft. wide by 2 ft. 8 in. high with provision that all special units shall be multiples of this height. The number of special units, however, is limited to five sash units which are one, two, three, four and five times the height of the standard wall unit respectively. These five sash units are sufficient to provide almost any arrangement of windows that could be desired. There are no special wall units since solid wall areas are made up entirely by using enough 2-ft. 8-in. units to make up the desired height of wall.

One object of this change in the wall unit standard has been to permit a greater flexibility in the height of the walls, thereby making this form of construction definitely applicable to car repair sheds which require greater side wall heights than has been necessary for most buildings previously built according to this form of construction. The height of 2 ft. 8 in. has been adopted because it is exactly two-thirds of the

The Wall Unit and Four of the Standard Sash Units

standard width of 4 ft. and because all gable or inclined roof truss buildings are designed with a one-third pitch roof. Thus a single incline or gable wall unit is all that is required in conjunction with the standard unit to fill in the end wall under the roof. This applies also to saw-tooth roofs and to the roofs of monitors.

Another new feature of the standard building is the use of 18-gage copper-bearing steel in the side wall units, thereby adding appreciably to the corrosion resistance of these structures. The roof trusses of the smaller buildings are of pressed steel while buildings of over 40-ft. span have structural steel trusses. The sash units in these buildings are of the regular Truscon standard.

While buildings of this type are designed for maximum convenience or speed of erection and facility for knocking down and reconstructing on another site, the manufacturer takes the position that they should not be considered simply as portable buildings. The manner of assembly is such that they form a thoroughly stable and permanent form of construction adaptable to the usual industrial requirements. The photographs illustrate examples of railway installations of the Truscon buildings of the older type. A contract for one of the new type structures for use as a shop building was recently awarded by the Sewell Valley Railway.

## Recent Improvements in Adjustable Crosshead

EXTENDED use on several classes of large freight and passenger locomotives has demonstrated the value of the adjustable crosshead, made by the Rogatchoff Company, Baltimore, Md., and described on page 1619 of the June 9, 1920, *Railway Age*. Since the publication of that article the crosshead has been altered in two respects.

Fig. 1. General View of Rogatchoff Adjustable Crosshead

Reference to the original description of the Rogatchoff crosshead shows that only one adjustable taper wedge was used, this being provided on the bottom shoe. To increase the possible range of adjustment and compensate for a greater wear of both guide and crosshead shoe, a second case-hard-

Fig. 2. Drawing Showing Alterations in Adjustable Crosshead

ened wedge has been applied to the upper crosshead shoe as shown in Fig. 1. An adjustment of approximately  $7/16$  in. can be obtained by these two taper wedges.

Reference to the end view in Fig. 2 shows that the part of the shoe extending between the crosshead sides has been machined with straight parallel sides, whereas the original shoe was provided with taper sides at this point. The elimination of the taper is a considerable advantage in reducing the machining cost and in the greater ease in applying the shoes.

# General News Department

One man was killed, another severely injured and a score of other persons slightly hurt, when an Illinois Central suburban coach was derailed because of the failure of a drawbar and then was struck in the side by another suburban train, at Chicago on December 14.

## Daring Hold-Up of B. & O. Train at Chicago

A lone bandit swung over the rear railing of the observation car of Baltimore & Ohio train No. 6 for Washington, as it left 63rd street station, Chicago, on the night of December 20. A dozen persons in the observation car were held up and the loot amounted to approximately \$1,000. The bandit pulled the bell cord and when the conductor appeared dropped from train, and escaped.

## Philadelphia Meeting Place of Next Foreign Trade Convention

The Ninth Annual Foreign Trade Convention of the National Foreign Trade Council will be held in Philadelphia on May 10, 11 and 12, 1922. In making this announcement, O. K. Davis, secretary of the Council, called attention to the fact that, despite the great decline in our foreign trade, nevertheless our exports during the last six months have been 63 per cent more in value and 15 per cent more in quantity than during the similar period of 1913.

## Freight Claim Payments Reduced in August

The freight claim division of the American Railway Association has recently issued a summarized statement classifying by the principal causes and commodities the expenditures made by member railroads for freight loss and damage for August, 1921. The statement shows a decrease of \$280,737, from the \$8,004,007 total loss and damage account of the previous month. Rough handling (coupled with unlocated damage), robbery (coupled with loss of entire packages and unlocated loss), delay and defective equipment represent 82 per cent of the total payments.

## Pennsylvania to Safeguard Mails

The Pennsylvania Railroad, to better co-operate with the Post Office Department in the prevention of mail depredations, has issued instructions through the vice presidents in charge of each of the four operating regions of the Pennsylvania System looking to renewed safeguards for the protection of the mails while in the custody of railroad employees. These employees, when not in uniform, must identify themselves at the mail car door before entering. Railroad employees, especially at larger points, while engaged in handling mail will be required to wear the established cap, badge or other means of identification, so that supervisory officers and mail guards can readily determine whether authorized employees only are handling the mails.

## Middle Tennessee to Resume Operation

The Middle Tennessee Railroad, on which no trains have been run for several months, is to be put in operation within a few weeks, according to news items in local papers. The line extends from Mt. Pleasant, Tenn., on the Louisville & Nashville, northward 41 miles to Franklin. At Franklin connection is to be made with the Nashville Interurban, for Nashville, 19 miles farther north. It is proposed to run a combination gasoline car two round trips daily between Mt. Pleasant and Franklin, carrying both freight and passengers. There will be no agents or ticket sellers at the way stations. Freight will be carried, within the limits of the capacity of the car, or train, but the charges must be prepaid.

## Delegates to the International Railway Congress

To attend the sessions of the International Railway Congress at Rome, Italy, next April, the Interstate Commerce Commission has appointed C. C. McChord (chairman of the commission), and Winthrop M. Daniels; and the American Railway Association has chosen the following: Daniel Willard, chairman of the board of directors (president of the Baltimore & Ohio); R. H. Aishton, president of the association; W. G. Besler, first vice president (president of the Central of New Jersey), and J. E. Fairbanks, general secretary of the association.

Individual railroad companies, members of the International Association, are expected soon to announce names of delegates appointed by them.

## Coroner's Jury Holds Conductor and Engineman for Bryn Athyn Collision

The coroner's jury, meeting at Norristown, Pa., on December 20, in the case of the Philadelphia & Reading collision at Bryn Athyn, Pa., on December 5 (*Railway Age*, December 10, page 1163), returned a verdict of criminal negligence against the conductor and engineman of No. 151, the northbound train involved. These two men have been apprehended and released on \$5,000 bail. The engineman is still in the hospital suffering from injuries sustained in the collision. The conductor attended the inquest, although he did not testify. The cause of the collision was the failure of No. 151 to obey a meet order and to heed a manual block signal set at stop.

## St. Paul Makes Drastic Cut in Pay Roll

In order to keep within its allotment, all employees of the Chicago, Milwaukee & St. Paul, other than those engaged in actual operation, were placed on half time for the last two weeks of the present year. Officers of the road are not excepted in the economy order and, from the president down, will sacrifice one week's salary. In some of the departments the employees are working half time, while in other departments the plan is to work a week and then lay off a week. It is expected that the forces will be put back on a full time basis the first of the year but the order will not be revoked until business makes the full force necessary. Other cuts in forces or working hours have been made by the Louisville & Nashville, which has placed its shopmen on a five-day week basis, the Mobile & Ohio, the Southern, the Nashville, Chattanooga & St. Louis and the Baltimore & Ohio.

## Air Brake Association to Hold Convention in Washington

At a meeting of the Executive Committee of the Air Brake Association held at the Hotel Sherman, Chicago, on December 13, it was unanimously voted to hold the regular annual convention of the association at Washington, D. C., May 9, 10, 11 and 12, 1922. Overflow accommodations will be provided in the new Ebbitt Hotel in the adjacent block. All sessions will be held in the convention hall on the top floor of the Hotel Washington and all exhibits will be erected on the mezzanine floor of that hotel.

The officers of the association hope for a large attendance at the convention because of the necessity for educational work on matters pertaining to the air brake at this time. Many new men have been taken into railroad service during the war years and since who need air brake instruction and numerous air brake devices have been developed which remain to be explained to the older men and to those more recently employed.

## Operating Statistics of Large Steam Roads—Selected Items for the Month of October, 1921.

Region, road and year	Average miles of road operated	Train-miles	Locomotive-miles		Car-miles		Ton-miles (thousands)		Average number of locomotives on line daily				
			Principal and helper	Light	Loaded (thous. cars)	Per cent loaded	Gross Excluding locomotive and tender	Net Revenue and non-revenue	Serv-ice-able	Un-serv-ice-able	Per cent un-serv-ice-able	Stored	
New England Region:

26	Ratio of expenses to revenues (per cent) .....	74.20	82.04	83.04	94.50

<sup>1</sup> Does not include Boston & Albany, the revenues and expenses of which are included in New York Central report.

<sup>2</sup> Includes \$2,662,719, sleeping and parlor car surcharge.

<sup>3</sup> Includes \$2,338,348, sleeping and parlor car surcharge.

<sup>4</sup> Includes \$27,357,169, sleeping and parlor car surcharge.

<sup>5</sup> Includes \$5,021,812, sleeping and parlor car surcharge.

Note.—Excludes Detroit, Toledo & Ironton, report not having been filed at date of compilation.

## Markham Asks Employees to

### Repudiate Labor Propagandists

C. H. Markham, president of the Illinois Central, in an open letter, addressed to the employees of that road, asks for a show-down on charges made against the railroads by representatives of railroad employees.

He asks that either the employees back these accusations or repudiate them, and adds that if they know of any irregularities or mismanagement on the Illinois Central it is their duty to bring them to his attention.

The letter contains the names, dates and a resume of charges made by labor representatives such as Frank J. Warne, W. Jett Lauck and Glen E. Flumb. Mr. Markham says: "I cannot believe that these men, calling themselves your spokesmen, reflect the true sentiment of the men of the Illinois Central System, who have worked with the management so faithfully and wholeheartedly in building up a railway system which we pride ourselves in believing is one of the greatest railway systems in the world.

But, frankly, I have been disappointed that these men have been permitted to continue to pour out unchecked torrents of false accusations without even a word of public protest from the men whom they claim to represent and whose money makes their activities possible."

## The Southern Pacific's Hospitals

The first hospital building exclusively devoted to the care of railroad employees was built on the Central Pacific in 1867 and this road, now the Southern Pacific, operates through its hospital department today, a general hospital in San Francisco, Cal., and 14 emergency hospitals located in six cities. The work of the department is in a large measure sustained through the collection of hospital dues from officers and employees of the company. Employees receiving \$85 a month pay 50 cents monthly; those receiving over \$85 and under \$125 pay 65 cents monthly and those receiving \$125 or over pay 75 cents a month. For these

into the bill of expense when misfortune in the way of sickness or accident befalls them.

THREE MEN WERE KILLED and one injured by the explosion of the boiler of a freight locomotive on the Atchison, Topeka & Santa Fe at Carrolton, Mo., on December 16.

THE ON-TIME ARRIVAL record of all passenger trains on the Illinois Central for the first 10 months in 1921, averaged 98.6 per cent, as against 95.5 for the 12 months of 1920.

Getting Ready for Winter on the Philadelphia & Reading

### Gasolene Motor Car of the Northern Pacific

A specially designed gasolene rail car has recently made several trips on the Northern Pacific. This car consists of the International Motor Company's Mack truck chassis mounted on steel flanged wheels so that it can be operated on standard railroad track. The body of the car has accommodations for 17 passengers and a baggage compartment. The trial trips were made between St. Paul and White Bear, a distance of about 12 miles, over a line which includes a steep and winding grade almost two miles long. Twenty-three passengers were carried on the first trip and the car quickly climbed the steep grade. On a second trip a few days later

Group of Railroad Officers at Trial of Gasolene Driven Passenger Car

the distance was covered in 29½ minutes, whereas the schedule time of fast passenger trains between these points is 25 minutes.

The Northern Pacific is now operating the Mack rail car in regular service on a branch line and expects soon to install more equipment of the same kind, as it has been found that the costs are much lower than those for steam operated equipment. It is reported that the Great Northern is also planning to install the gas-propelled rail cars on various branch lines.

### New Interchange Rules, Loading Rules and Tank Car Specifications

The reports of the Arbitration Committee and the Committee on Prices for Labor and Materials, as printed in Circulars Nos. D, V, 210 and 205, have been approved by the General Committee of the Mechanical Division and by the board of directors of the American Railway Association, with the exception of recommended changes in Rules 32, 43 and 70. The revised Rules of Interchange, effective January 1, 1922, are now ready for distribution. Particular attention is called to the abrogation of Section D of Interchange Rule 112, which is retroactive to cover all unsettled cases under the 1920 Code of Rules.

The committee has also rendered decisions in Arbitration Cases 1184 and 1214, inclusive, which decisions have been ordered to be printed and issued to the members as Circular No. D, V, 221.

The recommendations contained in the report of the Committee on Loading Rules, issued in Circular No. D, V, 209, have been approved by letter ballot of the members and by the American Railway Association and have been prepared in the form of a supplement to the rules governing the loading of lumber, logs, stone, etc., and loading and carrying structural materials, plates, rails, girders, etc., effective January 1, 1922.

The recommendations contained in the report of the Committee on Tank Cars, issued in Circular No. D, V, 207, have been approved by letter ballot of the members and by the American Railway Association and have been prepared in the form of a supplement to the tank car specifications, effective January 1, 1922.

## Traffic News

The Traffic Club of Akron, Ohio, held its first annual banquet on December 12. S. J. Witt, general freight and passenger agent of the Akron, Canton & Youngstown, was the principal speaker.

The Traffic Study Club of Akron, Ohio, held its first annual dinner on Monday evening, December 12 with 50 members and guests present and John Lhot, president, presiding. S. J. Witt, general freight and passenger agent of the Akron, Canton & Youngstown, spoke on the procedure of handling rate adjustments before various committees of the railroads.

R. C. Fullbright, of Houston, Tex., was the principal speaker at the first annual dinner of the Dallas Traffic Club on December 10. His subject was "Shippers' Interest in Railroad Problems." Other speakers were George T. Atkins; I. S. McConnell, president of the Fort Worth Traffic Club; W. E. Edgar, president of the Waco Traffic Club; and Tom Finty, Jr. Officers were elected as follows: President, Paul Junkin; vice-presidents, A. C. Valentine, Julian Nance and Elbert Blair; secretary-treasurer, H. C. Eargle; board of governors, J. B. Jones, Frank Osborne, Grant S. Maxwell, P. A. Richardson, Seth Tate and Don Allen.

At the annual meeting of the Transportation Club of Tulsa, Okla., on December 12, the following officers were elected: President, A. C. Holmes, traffic manager, Empire Refineries, Inc.; first vice-president, A. C. Wilson, city freight agent, St. Louis-San Francisco; second vice-president, E. C. Kitching, division freight agent, Atchison, Topeka & Santa Fe; secretary, J. W. Klein, general freight agent, Midland Valley; treasurer, J. M. C. Usher, treasurer, Price Sand Company; directors, H. M. Moon, traffic manager, Pure Oil Company; L. M. Klein and I. G. Fidler, division freight agent, St. Louis-San Francisco.

"Industrial Opportunities in New Jersey" is a booklet which has been issued by the Department of Conservation and Development of that State. New Jersey's yearly output of manufactured products is valued at one billion four hundred million. Outside the highly developed industrial areas, centering in Jersey City, Newark, Camden and Trenton, there are many towns which offer cheap land, reasonable taxes and agreeable living conditions. A list of cities and towns of over 500 inhabitants shows that there are 357 such communities in the State. Copies of the booklet may be had from L. G. Gillam, chief of land registry, State House, Trenton.

### Coal Production

The total output of bituminous coal during the week of December 10 is estimated by the Geological Survey at 7,235,000 net tons as against 7,104,000 tons in the week preceding. The bulletin says that although soft coal production is normally at a maximum at this season, it has in fact dropped back to the level of last April, normally the lowest month of the year. A year ago production was 12,813,000 tons. The bulletin calls attention to the fact that the movement of coal up the lakes has now virtually ceased and also that during October with a rail strike in prospect consumers hastened to increase their stocks.

### Commission Issues Special Permission for 10 Per Cent Reduction in Agricultural Rates

The Interstate Commerce Commission has issued a special permission order, No. 56,150, cancelling the previous order issued on the same subject, revising the authority it had issued to the railroads to put into effect on short notice and by simplified tariffs the proposed 10 per cent reduction in freight rates on agricultural products for six months. The primary purpose of the new order is to include the greatly enlarged list of commodities proposed by the railroads. The commission's Decem-

ber 18 denied the petition of the railroads for a rehearing of the case in which it ordered general reductions of rates on grain, grain products and hay in the western district.

The Senate on December 15 adopted a resolution offered by Senator Pittman of Nevada, directing the Interstate Commerce Commission to inquire into the organization, management and control of the Transcontinental Freight Bureau and report for what purpose it was organized, its duties and activities, the carriers it represents and the influence it exercises in the publication of rates, and whether its operation in any manner stifles competition.

### Conference With Shippers at Washington

An improvement in the relations between the railroads and certain large organizations or groups of shippers is expected to result from a meeting held in Washington on December 9, attended by a number of railway executives and representatives of various industries at which numerous questions pertaining to pending issues in the transportation field were thoroughly discussed. Following this meeting a transportation committee for agriculture and industry was appointed, an executive committee of seven to represent the larger committee, to deal with the roads in seeking to bring about better economic conditions in the field of transportation. The executive committee consists of J. R. Howard, president of the American Farm Bureau Federation; S. J. Lowell, master of the National Grange; J. A. Campbell, president of the Youngstown Sheet & Tube Company; Ernest T. Trigg, president of the National Federation of Construction Industries; Charles Hill, of the Southern Pine Sales Corporation; J. D. A. Morrow, vice-president of the National Coal Association; and F. R. Todd, vice-president of Deere & Co., James A. Emery, counsel for the National Association of Manufacturers, was appointed counsel for the committee. In a statement regarding the conference Mr. Emery said:

"The railroad representatives evidenced their intention to give the benefit of further reduction in operating expenses concurrent with cost adjustments. The committee hopes to reach sound economic conclusions not only upon the rate question, but upon pending issues relating to the control of our national system of transportation."

### Joint Commission on Agricultural Inquiry

The work of the Transportation Division of the Congressional Joint Commission of Agricultural Inquiry has developed to a degree that an advisory committee, representative of the three great economic branches of commerce has been appointed, and Chairman Anderson has announced the following personnel of this advisory committee, which is to meet in Washington when the Transportation Division has compiled the facts:

*Representing Agriculture.*—J. R. Howard, president, American Farm Bureau Federation; Gray Silver, Washington representative, American Farm Bureau Federation; S. J. Lowell, master, National Grange; Milo D. Campbell, president, National Milk Producers' Association, and A. U. Chaney, general manager, American Cranberry Exchange.

*Representing Industry.*—F. R. Todd, vice-president, Deere & Co.; J. A. Emery, general counsel, National Association of Manufacturers; Thomas A. McCann, vice-president-general manager, Shevlin, Carpenter, Clarke & Co.; A. J. Campbell, president, Youngstown Sheet & Tube Company.

*Representing Transportation.*—Daniel Willard, president, Baltimore & Ohio; Howard Elliott, chairman, Northern Pacific; L. F. Loree, president, Delaware & Hudson; C. H. Markham, president, Illinois Central; H. M. Adams, vice-president, Union Pacific, and T. C. Powell, vice-president, Erie.

It is proposed that the transportation question shall be considered under six main divisions, as follows: (1) physical property; (2) transportation service; (3) economic relationship to agriculture and industry; (4) finance; (5) administration, and (6) governmental regulation. The work of the committees representing the railroads and producers carried on during the last six months will be reviewed.

The joint commission has submitted a preliminary report to Congress saying it believes an immediate reduction in freight rates on agricultural products is absolutely necessary to a renewal of normal agricultural operations and pros-

perity; and it recommends prompt action by the railroads and constituted public authorities to that end. It is added, however, that since this recommendation was agreed to, certain reductions in freight rates upon agricultural products have been made.

### Railroads Asked to Reduce Export Coal Rates

Railroads were requested to make a reduction of \$1 a ton in the freight rates on coal to Atlantic ports for export in order to allow American producers to meet increased competition from English coal, at a conference held at the office of the Interstate Commerce Commission on December 14 for the purpose of discussing ways to meet the British competition. The conference was held under the auspices of Chairman McChord of the Interstate Commerce Commission, Secretary Hoover of the Department of Commerce and Commissioner Thompson of the Shipping Board. It was stated at the conference that British coal is coming into American harbors and being sold at prices below those which American operators can meet under present freight rates and also that British coal is depriving American coal of a market in the Mediterranean and in the West Indies islands. The request for a rate reduction was made by W. L. Andrews, vice-president of the Consolidation Coal Company, speaking on behalf of the mine operators. The railroad traffic executives present had previously declined to make such a reduction on the ground it was too heavy a sacrifice to ask the railroads to make and they said they were not in a position to make definite answers at the conference on the ground that they had recommended against it to their superior officers. Secretary Hoover said the question to be solved was what Americans can do to preserve the markets they had before the war. He said the British had made offers in the West Indies which were lower than can be made by the Americans even with a reduction of \$1 in the freight rates. He suggested that if the railroads, the shippers and the mine operators all join in making the sacrifice, it would be possible to retain some of the business. Commissioner Thompson said the Shipping Board would make charters to the mine operators barely high enough to meet the cost of operation as soon as they showed they were ready to go into the business of competing with the British. A committee to consider the whole matter was arranged, consisting of W. V. Hardie, director of traffic of the Interstate Commerce Commission; J. B. Smull, vice-president of the Emergency Fleet Corporation; F. R. Wadleigh, of the Department of Commerce; F. M. Whitaker, vice-president of the Chesapeake & Ohio, and T. F. Farrell, representing coal operators. A report was to be made at a meeting of the committee on Thursday.

G. J. CHURCHWARD, chief mechanical engineer of the Great Western Railway (England), will retire at the end of the present year, and C. B. Collett, the deputy chief mechanical engineer, will succeed him.

## Commission and Court News

### Interstate Commerce Commission

The commission has suspended until April 17 the operation of certain schedules contained in W. P. Emerson's and J. H. Glenn's tariffs which propose reduced rates on sugar from Southeastern and Gulf Ports to St. Louis, Mo., and related points.

### State Commissions

The Public Service Commission of West Virginia has notified the railroads of the state to appear on January 17 to show cause why there should not be a reduction in the freight rates on building materials, road making materials, fertilizers and certain other articles.

The Railroad Commission of the State of California on December 14, authorized a reduction of 10 per cent in the freight rates on the principal farm products of the State. The authorization follows the order of the Interstate Commerce Commission requiring the carriers to make a reduction of 12½ per cent in interstate rates on hay and grain products only. In making the general 10 per cent reduction the California Commission held that that would be more beneficial to the farmers of that State as a whole than a slightly greater reduction on grain and hay alone.

The Louisiana Public Service Commission, holding that the present through train service on the Kansas City Southern's line between Shreveport, La., and Lake Charles, is inadequate for the accommodation of local travel, has ordered the railroad to operate an additional daily passenger train making all local stops between the above mentioned points. This commission has denied the application of the St. Louis Southwestern to discontinue its motor car service between Shreveport, La., and Lewisville, Ark., believing that its discontinuance would cause grave inconvenience and hardship on the communities served by this line.

### Personnel of Commissions

Hugh White, heretofore assistant district attorney-general of the state, has been appointed secretary of the Alabama Public Service Commission, in place of Atticus Mullin, resigned.

Orville F. Berry, former chairman of the Illinois Railroad & Warehouse Commission, died suddenly of heart disease in a private hospital at Jacksonville, Ill., on December 19. Mr. Berry was sixty-nine years of age and was a well-known political leader. He was appointed chairman of the Commission in 1909, which position he held for four years.

### Interstate Commerce Commissioners Reappointed

The President on December 19 sent to the Senate the nominations of Henry C. Hall and Clyde B. Aitchison for re-appointment as members of the Interstate Commerce Commission for terms of seven years. President Harding has now appointed seven of the eleven members of the commission.

### Court News

#### Consignee's Receipt Conclusive Evidence of Delivery

A carload of goods was unloaded by the railroad at destination and the goods were placed in its warehouse. Next day another car to the same consignee was placed for unloading and a portion of the shipment removed by the consignee, who signed receipts for both cars. The following day the warehouse and the freight car and their contents were destroyed by fire. The Colorado Supreme Court holds that the signing of the receipts was a delivery of the goods, re-

lieving the railroad from liability for the loss.—*D. & R. G. v. Johnson* (Colo.), 193 Pac. 729.

#### Tariff Provisions As to Diversion Cannot Be Waived

The New York Appellate Division, Fourth Department, holds that the ordering of a car by a shipper, the sealing of it by the railroad's agent, the issuing of a waybill and shipping directions, the fixing of freight at a lower rate, and its payment by the shipper, brings a shipment within (interstate) tariffs and classifications, whether an actual bill of lading was made out by the railroad's agent or not. The shipping contract is closed, and if the shipper desires to divert the shipment he must do it according to the tariff regulations, which provided that a reconsignment or diversion could only be made if requested in writing.—*Porter v. Lehigh Valley*, 184 N. Y. Supp. 870.

#### Rental of Materials for Spur Recoverable

##### After Removal of Connection Track

A railroad company contracted to lease rail and materials to a mining company for its spur track at an agreed rental of a percentage of the market value, with right to terminate the rental by acquiring the materials within a certain time. The railroad also agreed in the same contract to furnish the use of a connection track at the cost of maintenance. The Virginia Supreme Court of Appeals holds that the railroad's removal of the connection track on lessee's discontinuance of the spur did not defeat recovery for the rails and materials, the covenants in the contract being independent.—*Miller v. Southern* (Va.), 108 S. E. 838.

#### Burden of Proof in Derailment Cases

In a passenger's action for injuries in a derailment, the Virginia Supreme Court of Appeals holds that an instruction that the passenger need not point out any specific act of negligence, and that there was a presumption the accident was caused by the railroad's negligence, which presumption might be rebutted by evidence that the railroad exercised the highest degree of care to prevent the accident, and inspected the cars by competent persons to see that they were in good order, was erroneous, where the uncontradicted testimony was that immediately after the derailment a careful examination was made of the wheels and every part of the running gear which could have contributed to the derailment, and they were found in excellent condition. A prior inspection, therefore, would have disclosed nothing for the railroad to remedy, and it was error to tell the jury that if it was not made, they must find for the plaintiff.

The court holds the proper application of the maxim *res ipsa loquitur* to derailment cases to be that if it is just as probable that the derailment is due to some other cause as to the defendant's negligence, there can be no recovery.—*Hines v. Beard* (Va.), 107 S. E. 717.

## Foreign Railway News

### New Mechanical Chief on the

#### Great Western of England LONDON.

G. J. Churchward, chief mechanical engineer of the Great Western Railway (England), will retire at the end of the present year and C. B. Collett, the deputy chief mechanical engineer, will succeed him.

### English Road Uses "Shopping Tickets"

#### to Foster Suburban Business LONDON.

The Great Eastern, the South Eastern & Chatham and the London Brighton & South Coast have introduced "shopping tickets," to be issued from certain stations to London on any day of the week except Saturday and Sunday between 10.30 a. m. and 4.30 p. m., and available to return the same day before 5 p. m. or after 6 p. m., to encourage travel on suburban trains in non-rush hours.

### Railway Standard for China

LONDON.

The Bulletin of the Federation of British Industries states that the Chinese Standardization Commission, which was appointed to agree and fix permanent standards for rolling stock and materials throughout the whole government railway system of China, has now agreed to the standards to be adopted for rails and fastenings; sleepers or ties, both ordinary and for bridges; cuts and fills; formation and ballasting; tunnels; clearance and minimum structure gauges. Specifications for bridge steel were also accepted.

As regards rolling stock, standard designs were adopted for heavy locomotives the Pacific type for passenger and the "Mikado" for freight service—with certain alterations to conform to the views of the locomotive superintendents of the various Chinese government railways. Agreement was also reached on standard designs for wheels, axles, trucks, bodies, frames, couplers and so forth for passenger and freight cars, the latter of a capacity of 40-ton, 30-ton and 20-ton and of both steel and wood construction.

### Argentine and Chilean Transandine to Combine

The Chilean and Argentine sections of the Transandine Railway, from Los Andes on the western slope of the Cordilleras, by way of Caracoles on the Chilean frontier, to Mendoza on the eastern or Argentine side, will be consolidated under a single management, according to Commerce Reports. This project, presented to the Argentine government by a delegation from Chile in 1919, was approved on the part of Argentina and has recently been sanctioned by the Chilean government.

The Chilean Transandine Railway has never been considered a paying investment, and its financial condition has been such as to discourage the investment of further capital. Prior to the passage of the new law by the Chilean government in September, 1921, bonds were outstanding to the amount of some \$7,000,000, of which the principal was guaranteed by a mortgage on the railroad property, and interest at the rate of 5 per cent was guaranteed by the Chilean government for a period of 20 years. The new law provides for replacing these bonds with Chilean government bonds to the value of some \$4,000,000, with guaranteed interest at the rate of 8 per cent. The state will receive 70 per cent of the stock of the company and will take an active part in the administration of the road. The Chilean Transandine proposes to issue new bonds to the extent of about \$2,500,000, to be used in making the necessary improvements in connection with the consolidation.

A marked improvement in traffic conditions and facilities

may be looked for as a result of this important step. In passing over the Andes the railway crosses a rough and rugged country. In the winter months the heavy snow and avalanches make continuous traffic impossible, notwithstanding the protection offered by numerous avalanche sheds along the line. The right of way is blockaded for months at a time by snows; in 1914 traffic was interrupted for 190 days, in 1915 for 131 days, and in 1919 for 156 days.

The financial arrangements made by the two governments will permit of needed improvements which it is hoped will result in a steady and uninterrupted service. Tunnels are to be lengthened and more adequate protection against avalanches constructed; new and modern rolling stock and equipment will be purchased, the railway shops will be modernized, and electrification of the line will be undertaken section by section.

The free interchange of traffic between the two nations, heretofore impeded by protective tariffs, will be encouraged and fostered by the establishment of new and liberal tariff regulations which will permit the natural flow of international trade between the territories served by the lines. All material used for construction, as well as rolling stock and equipment imported into Chile, will be exempt from custom duties. The rates on traffic will be fixed by agreement between the Chilean and Argentine governments.

### British Railwaymen and the Eight-Hour Day

LONDON.

The locomotive branches of the National Union of Railwaymen have been raising the question of the eight-hour day in connection with enginemen and firemen and resolutions have been passed by branches of the Associated Society of Locomotive Engineers and Firemen refusing to work systematic overtime. The character of the work of enginemen, it seems to be agreed, may make it necessary to work occasionally for a longer period than eight hours, and there is apparently no objection to overtime arising from the difficulty of arranging duties so that the eight-hour day shall not be exceeded. The object of the action which is now being taken by the unions is to abolish systematic overtime.

C. T. Cramp, industrial secretary of the National Union of Railwaymen, speaking at a meeting, said that there was one thing on which they would not give way—the principle of the eight-hour day. He would also say candidly and fearlessly that the eight-hour day meant eight hours of honest work per day. Let them, as railwaymen, endeavor by co-operation to make the railways so remunerative that the companies could afford to give the best of working conditions.

THE CANADIAN PACIFIC, for the first time, is planning to use New York as a port of departure for its passenger steamers. During the war twelve of the company's steamers carried troops and supplies from New York. The "Empress of Scotland," 25,000 tons, leaves on February 4, and the "Empress of France," 18,500 tons, on February 11, both on Mediterranean cruises.

## Equipment and Supplies

### Locomotives

THE UNION PACIFIC has ordered 1 Mountain type locomotive from the American Locomotive Company.

THE CENTRAL OF NEW JERSEY, reported in the *Railway Age* of December 17, as asking for prices on 25 Mikado type locomotives, has ordered these locomotives from the American Locomotive Company.

### Freight Cars

THE RUTLAND is inquiring for 100 steel underframes or center constructions for flat cars.

THE STANDARD OIL COMPANY, New York, is inquiring for 2 low side gondola or flat cars of 50-ton capacity.

THE LAKE CHAMPLAIN & MORIAH is inquiring for from 6 to 10 center dump, hopper ore cars, of 50-ton capacity.

THE UNION PACIFIC has awarded a contract for the repairs on 500 freight cars to the Pacific Car & Foundry Company, Seattle, Wash.

THE GRAND TRUNK, reported in the *Railway Age* of December 17, as inquiring for 250 refrigerator cars, is also inquiring for 400 refrigerator cars additional.

THE NEW YORK STEEL EXCHANGE, 233 Broadway, New York City, is inquiring for a number of tank cars for export, to include cars of 1 meter, 1.35 meter and 1.676 meter gage.

### Passenger Cars

THE CHICAGO GREAT WESTERN is inquiring for one combination observation, parlor and buffet car.

THE UNION PACIFIC, inquiry for cars for passenger service noted in the *Railway Age* of December 10, includes twenty-five 69-ft. baggage cars, 20 all-steel coaches and 18 all-steel observation cars.

THE SPOKANE, PORTLAND & SEATTLE has purchased one Mack A C. rail car, a combination gasoline passenger and baggage coach, from the International Motor Company, 25 Broadway, New York.

### Iron and Steel

THE KANSAS CITY TERMINAL is in the market for 1,000 tons of 90-lb. rails and 3,000 angle bars.

THE ERIE will let contracts in the near future for 37,500 tons of rail for its 1922 requirements.

THE GRAND TRUNK ordered recently 15,000 tons of rail from the Dominion Iron & Steel Company, and 14,000 tons from the Algoma Steel Corporation.

THE KANSAS, OKLAHOMA & GULF has awarded a contract for 473 tons of steel to be used for a bridge in Muskogee County, Oklahoma, to the Pan-American Bridge Company, Newcastle, Indiana.

THE CHICAGO, BURLINGTON & QUINCY is negotiating with the Illinois Steel company and the Colorado Fuel & Iron Company for approximately 25,000 tons of rails for delivery during the year 1922.

THE ST. LOUIS SOUTHWESTERN, reported in the *Railway Age* of October 22, as inquiring for 10,000 tons of rails for 1922 delivery, has ordered this tonnage from the Illinois Steel Company.

## Machinery and Tools

THE ERIE has bought a 25-ton gantry crane from the Niles-Bement-Pond Company.

THE NEW YORK CENTRAL has bought a 53-in. boring mill from the Niles-Bement-Pond Company.

THE DELAWARE & HUDSON is inquiring for a 22 in. engine lathe, also a 30-in. engine lathe, 1, 16-in. portable lathe, 1 00-in. planer and 1, 8-spindle automatic valve grinder.

THE SEABOARD AIR LINE is inquiring for machine shop tools as follows: 2, 30-in. engine lathes, also a 20-in. engine lathe; 1, portable crank pin truing machine; 1, 36-in. draw-cut shaper; 1, 3,000-lb. steam hammer; 1, 42-in. car wheel borer; 1, 48-in., 400-ton double end wheel press; 1, 2 in. by 26 in. turret lathe; 1, 36-in. vertical turret lathe; 1, 28-48 in. gap lathe, and 1 turret lathe arranged for bar stock.

THE KANSAS CITY SOUTHERN will make extensions to the power plant at its Pittsburg, Kan., shops, including the installation of a 500 k. w. generator unit, 3,000 cu. ft. air compressor, 350 h. p. boiler and the equipping of new and existing boilers with superheaters, soot blowers and powdered coal preparing, handling and burning equipment, all of which work is being done under the supervision of the company's consulting engineer, John E. Muhlfeld, New York City.

### Miscellaneous

THE CHICAGO, ROCK ISLAND & PACIFIC has closed bids on 2,500,000 ft. of lumber for various purposes.

THE JAPANESE GOVERNMENT RAILWAYS are inquiring through a New York Japanese export house for 6,500 axles, for railway freight cars.

THE SOUTH MANCHURIAN RAILWAY, Korean Lines, is inquiring through New York export houses for various types of fittings for passenger cars.

THE NEW YORK CENTRAL will receive bids until 12 o'clock noon, December 28, for its requirements until April 1, 1922, of gasoline, kerosene and all grades of oil.

THE CHICAGO, MILWAUKEE & ST. PAUL is inquiring for approximately 8,000 gal. of kerosene, 9,000 gal. of gasoline and 2,000 gal. of distillate, bids to be submitted on or before December 26, 1921.

THE ATCHAFALYA, TOPEKA & SANTA FE, reported in the *Railway Age* of December 3, as receiving bids for three oil storage tanks, including pipe connection and unloading facilities at Argentine, Kansas, has awarded this contract to the Federal Engineering Company, Chicago.

THE NORFOLK & WESTERN will receive bids until 12 o'clock noon, January 4, at Roanoke, Va., for 500 gross tons steel rail, 120 rods wire fencing, parts for electrical apparatus, 100 steel zees and its requirements from January 1 to June 30, 1922, of steel locomotive driving, truck and tender tires, and also steel springs.

THE CLEVELAND, CINCINNATI, CHICAGO & ST. LOUIS is inquiring for bolts and nuts of different sizes; also iron bars, billets, plates, shapes, steel sheets, locomotive tires, nails, wire and fencing wire for the period from January 1, 1922, to April 1, 1922, bids to be closed at noon January 3, 1922. This company is also inquiring for requirements of ship machinery oils for the period from January 1, 1922, to April 1, 1922, bids to be in before 12 o'clock noon of December 27, 1921.

### Signaling

THE GRAND TRUNK has awarded a contract for one 24-lever Saxby & Farmer mechanical interlocking machine and other materials for installation at Mack avenue, Detroit, Mich., to the General Railway Signal Company. The machine will have 18 working levers and 6 spare spaces and the installation will be made by railroad forces.

## Supply Trade News

The **Combustion Engineering Corporation**, New York, has opened a new branch office at 806 First National Bank building, Pittsburgh, Pa., in charge of W. C. Stripe, formerly manager of the Philadelphia office.

**Arthur P. Bowen** has been elected assistant to the vice-president of the **Ryan Car Company**, Chicago, and not to the office of vice-president, as was incorrectly reported in the *Railway Age* of December 3 (page 1120) and December 17 (page 1231).

**H. O. Garman**, who was for a period of 14 years chief engineer of the Public Service Commission and the Railroad Commission of the State of Indiana, has entered private practice in consulting engineering and the management and operation of public utilities, with headquarters at Indianapolis, Indiana.

The merger of the **Haskell & Barker Car Company, Inc.**, with the **Pullman Company**, was approved by the stockholders of the Pullman Company at Chicago, on December 20. The directors have been increased from nine to twelve by the election of Edward F. Carry, president of the Haskell & Barker Car Company; John R. Morrow, and Arthur O. Choate. The plan which has been approved appeared in the *Railway Age* of November 26, page 1068.

The **Richardson-Phenix Company**, Milwaukee, Wis., and the **S. F. Bowser & Co., Inc.**, Fort Wayne, Ind., have consolidated and will henceforth be known as the **S. F. Bowser & Co., Inc.**, with headquarters at Fort Wayne. The filtration and lubrication appliance business of both companies will be conducted by the Richardson-Phenix division, S. F. Bowser & Co., Inc. **J. William Peterson**, president of the Richardson-Phenix Company, will assume the office of vice-president of the S. F. Bowser & Co., Inc., and will be in charge of the Richardson-Phenix division.

**John W. Duntley**, one of the founders of the **Chicago Pneumatic Tool Company** and from 1895 to 1909 president of that concern, was killed by an automobile truck at Chicago on December 15. Mr. Duntley was born at Wyandotte, Mich., on August 16, 1863, and entered business as a foundryman in 1878. From 1884 to 1895 he was engaged in the railway supply business and upon the latter date he organized the Chicago Pneumatic Tool Company. From this date to 1909 he was engaged in expanding this organization, enlarging the scope of the business at the same time by absorption and amalgamation both in this country and abroad. In 1909 he organized and became president of the Duntley Manufacturing Company, manufacturers of the pneumatic cleaners. Of late years he devoted his energy to the Duntley Automobile Accessory Company, Chicago, of which he was president. He was also president of the Libertad Mining & Smelting Company. In 1900, he was decorated with the cross of the Legion of Honor by the president of France.

## Obituary

**Clarence E. Rood**, sales manager of the Gould Coupler Company, New York, died on December 11 after a brief illness, at his home at the Algonquin Hotel, New York City. Mr. Rood was born in Erie, Pa., and early in his career was general manager of the American Express Company in St. Louis, Mo. Later he went to Buffalo where for a time he was a member of Rood & Brown, car wheel builders. He subsequently owned and operated the Rood Malleable Iron Company, Lancaster, N. Y. About 12 years ago he entered the service of the Gould Coupler Company as a representative at New York and at the time of his death was sales manager of that company.

## Railway Construction

**CHICAGO, BURLINGTON & QUINCY.**—This company contemplates the construction of the first unit of a locomotive shop at Denver.

**CHICAGO, MILWAUKEE & GARY.**—This company has applied to the Interstate Commerce Commission for a certificate authorizing the construction of an extension between Aurora and Joliet, Ill., where the company now operates over the tracks of the Elgin, Joliet & Eastern.

**GREAT NORTHERN.**—This company contemplates the construction of a second main track between Lamona, Wash., and Bluestem, a distance of 22 miles.

**ILLINOIS CENTRAL.**—This company is receiving bids for the construction of a car shed at McComb, Miss. The same company is also receiving bids for the construction of a frame viaduct over its tracks at Fulton, Ky.

**LOUISVILLE & NASHVILLE.**—This company contemplates the construction of a reinforced concrete viaduct over its tracks on Lebanon avenue, Belleville, Ill. Plans for this work have been submitted to the city for approval.

**MISSOURI PACIFIC.**—This company contemplates the construction of a station at Harrisburg, Ark., and one at Hoxie. Plans for the work have been submitted to the Arkansas Railroad Commission.

**MISSOURI PACIFIC.**—This company has awarded a contract to Gillespie & Daly for the construction of a two-story interlocking and signal tower at Hiawatha, Kansas.

**MORGAN'S LOUISIANA & TEXAS.**—This company has been ordered by the Louisiana Public Service Commission to construct a station at Franklin, La. Plans are to be submitted to the commission for its approval within one year and the work must be commenced within sixty days thereafter.

**NASHVILLE, CHATTANOOGA & ST. LOUIS.**—This company contemplates the construction of an underpass at the intersection of the state highway and the company's tracks at White Bluff, Tenn.

**NEW ORLEANS, TEXAS & MEXICO.**—This company has been authorized by the Louisiana Public Service Commission to continue the construction of a station at Krotz Springs, La. Work had just been started on this station the latter part of November when citizens at Krotz Springs petitioned the commission to have the location of the station changed.

**TEXAS & PACIFIC.**—This company has been ordered by the Louisiana Public Service Commission to construct a station at Innis, La., plans of which must be submitted to the commission for its approval by February 11, 1922.

**UNION STATION, LOS ANGELES, CAL.**—The Atchison, Topeka & Santa Fe, the Southern Pacific, and the Los Angeles & Salt Lake, have been ordered by the Railroad Commission of California to erect a union station on the Plaza site, Los Angeles, Cal. This order is contained in a decision on the rehearing of the Los Angeles terminal case which, with certain modifications, reaffirmed the former ruling by that body. The commission also upheld its former ruling requiring the separation of grades by the construction of viaducts over crossings adjacent to the Los Angeles river at Aliso, Macy and East Seventh streets. In connection with the latter order, the city of Los Angeles will bear a share in the expense of the grade crossing elimination.

**WENATCHEE SOUTHERN.**—This company, which has been organized recently to construct a railroad from Wenatchee, Wash., to Kennewick, a distance of about 132 miles, has completed a survey and has purchased almost all the right of way necessary for the construction of the line. The road will follow the Columbia river connecting at Pasco, Wash., with the Northern Pacific and the Spokane, Portland & Seattle, and at Kennewick with the same roads, and the Oregon-Washington Railroad & Navigation. At Wenatchee it will connect with the Great Northern,

## Railway Financial News

**ATLANTA & ST. ANDREWS BAY.—Order to Abandon.**—After rehearing the case in which this company was authorized to abandon a part of its line, the Interstate Commerce Commission has extended until further order the experimental period of abandonment provided for in the original order.

**BOSTON & MAINE.—Stock offer.**—An offer by a minority group of Boston & Maine stockholders to buy the shares of that company now held by the New York, New Haven & Hartford, was made at a hearing held by Attorney General Dagherty in Boston, Mass., on December 13. See New York, New Haven & Hartford below.

**BUFFALO, ROCHESTER & PITTSBURGH.—Authorized to Issue Bonds.**—The Interstate Commerce Commission has authorized the sale of \$3,949,000 of consolidated mortgage 4½ per cent bonds at not less than 82½ per cent of par and accrued interest.

**CANADIAN PACIFIC.—Sells \$25,000,000 Stock.**—A banking syndicate, headed by the National City Company, New York, has purchased \$25,000,000 Canadian Pacific Railway Company 4 per cent coupon consolidated debenture stock, and is offering the new issue at 78, to yield 5.13 per cent. All previous issues of debenture stock have been placed in London.

See editorial comment in this issue.

**CAROLINA, CINCINNATI & OHIO.—Asks Authority to Pledge Bonds.**—This company has applied to the Interstate Commerce Commission for authority to pledge with the Secretary of the Treasury as collateral security for a loan of \$6,000,000, which it had applied for, \$1,000,000 of its first mortgage 5 per cent 30-year gold bonds and \$6,000,000 of 5 per cent Elkhorn first mortgage gold notes. The company some time ago applied for authority to issue bonds for refunding purposes but later withdrew the application and substituted the application for a loan.

**CENTRAL OF GEORGIA.—Annual Report.**—A review of this company's annual report for 1920 appears on another page of this issue.

**CHESAPEAKE & OHIO.—Authorized to Lease Subsidiary.**—The Interstate Commerce Commission has issued an order approving the acquisition of control of the railroad of the Chesapeake & Ohio of Indiana by lease. The Chesapeake & Ohio was also authorized to assume obligation and liability as lessee in respect of \$7,711,000 of first mortgage gold bonds of the Chesapeake & Ohio of Indiana.

**CHICAGO & EASTERN ILLINOIS.—New Securities Ready.**—Kuhn, Loeb & Co., reorganization managers, have announced to holders of certificates of deposit, representing bonds of the various companies deposited under or subject to the plan and agreement of reorganization, that the general mortgage, 5 per cent gold bonds in denominations of \$1,000, \$500 and \$100, and preferred and common stock certificates of the new company, together with cash payments specified in the plan, will be ready for distribution on and after December 27, 1921.

The details of the reorganization plan were given in the *Railway Age* of April 8, 1921, page 913.

**To Pay Off Receiver's Certificates.** W. J. Jackson, receiver, has announced that he will pay in full at the Equitable Trust Company, New York, on and after December 23, the \$6,000,000 receiver's certificates issued under date of July 1, 1916.

**CISCO & NORTHEASTERN.—Asks a Loan.**—This company has applied to the Interstate Commerce Commission for a loan of \$300,000 for five years to retire existing obligations.

**CHICAGO & NORTH WESTERN.—Authorized to Procure Authentication of Bonds.**—The Interstate Commerce Commission has granted authority to this company to procure the authentication and delivery of \$375,000 of general mortgage gold bonds to be held in the Treasury until the further order of the commission. Action on a request for authority to issue bonds in 1922 and subsequent years was deferred, the commission saying that it

does not appear to be necessary at this time to grant the authority requested. The company was also authorized to procure the authentication and delivery of \$1,000,000 of general mortgage gold bonds of 1917 and \$3,000,000 of first and refunding mortgage gold bonds to be held in the Treasury until the further order of the commission.

**CHICAGO, BURLINGTON & QUINCY.—Asks Authority to Issue Bonds.**—This company has filed an application with the Interstate Commerce Commission for approval of a mortgage to the First National Bank and Frazier L. Ford, of New York and the issue of \$30,000,000 first and refunding mortgage bonds with interest not to exceed 5 per cent to be dated August 1, 1921, maturing August 1, 1971, for the purpose of providing funds for the company's estimated requirements for additions and betterments in 1922. This application was filed as a supplement to the company's application filed a year or so ago, on which the commission refused to authorize an issue of \$80,000,000 of bonds for dividend purposes, but granted the right to have considered on the same record an application to issue bonds for other purposes.

**CHICAGO, INDIANAPOLIS & LOUISVILLE.—Asks Authority to Exchange Bonds.**—This company has applied to the Interstate Commerce Commission for authority to exchange \$3,493,000 of first and general mortgage 5 per cent gold bonds, series A, for an equal amount of series B bonds at 6 per cent, dated January 2, 1922, and maturing May 1, 1966.

**CLEVELAND, CINCINNATI, CHICAGO & ST. LOUIS.—New York Central Offers to Buy Stock.**—See New York Central.

**CUBA RAILROAD.—Bonds Sold.**—The National City Company, New York, has sold at 99½, to yield over 7½ per cent, \$4,000,000 first lien and refunding mortgage gold bonds, Series A, non-callable, dated December 1, 1921, due December 1, 1936.

**DELTA SOUTHERN.—Sold.**—This road, formerly operated as a branch of the Southern Railway, was sold in three sections at Greenville, Miss., on December 6. Bids were offered for the entire road. G. B. Kellogg bought the section between Richey and Percy for \$20,000; W. A. Swift and associates bid in the section between Itabena and Belzoni for \$50,000, and V. A. Denslow bought the Napanee branch for \$10,000.

**DETROIT, TOLEDO & IRONTON.—Earnings in September and October.**—The figures follow:

	September 1921	October 1921
Operating revenues		
Freight	\$732,783	\$627,072
Passenger	13,172	11,412
Total (inc. misc.)	759,757	652,438
Operating expenses		
Maintenance of way and structures	161,425	145,314
Maintenance of equipment	142,897	61,889
Traffic	8,089	7,079
Transportation	237,336	277,976
General	22,537	22,849
Total	572,284	514,501
Operating ratio	75.3	78.9
Net from railway operations	187,472	137,934
Operating income	176,260	120,711
Net after rentals	46,749	15,112
Net after rentals, 10 months, 1921		\$87,596
Net after rentals, 10 months, 1920		det. 1,097,265

See also editorial in this issue entitled "Net Income of Ford's Railroad Steadily Declines."

**DULUTH, MISSAIE & NORTHERN.—Authorized to Issue Bonds.**—The Interstate Commerce Commission has authorized an issue of \$1,174,000 of general mortgage 5 per cent gold bonds for the purpose of refunding a like amount of first division mortgage bonds which mature January 1.

**ERIC & PITTSBURGH.—Plans Stock Increase.** The stockholders will vote February 10 on increasing the special guaranteed first term stock from \$2,500,000 to \$7,500,000. A portion of the funds to be derived from the new stock will be paid to the lessee of the road, the Pennsylvania Railroad Company, for improvements on and additions to the leased property made by the lessee and approved by the Directors of the Eric & Pittsburgh.

**KANAWHA & MICHIGAN.—Lease to New York Central.**—See New York Central.

**KANAWHA & WEST VIRGINIA.—Lease to New York Central.**—See New York Central.

**LOUISVILLE & NASHVILLE.**—*Authorized to Issue Bonds.*—The Interstate Commerce Commission has authorized the issue by selling at not less than 96 and accrued interest of \$12,753,000 of first and refunding mortgage 5½ per cent gold bonds and has also granted authority to procure the authentication and delivery by the trustee of \$15,862,000 of the bonds. The company's application also asked authority to issue \$53,000,000 of capital stock as a stock dividend. Consideration of this has been held in abeyance by the commission.

**LUFKIN, HEMPHILL & GULF.**—*Acquisition.*—This road, extending from Bronson, Texas, to Hemphill, 11 miles, has been acquired by T. L. L. Temple and associates, who own the controlling interest in the Texas South-Eastern Railroad. The Lufkin, Hemphill & Gulf connects with the Gulf, Colorado & Santa Fe at Bronson, Tex.

**NEW YORK CENTRAL.**—*Asks Authority to Acquire Big Four Stock.*—This company has filed an application with the Interstate Commerce Commission asking authority to acquire the remaining outstanding capital stock of the Cleveland, Cincinnati, Chicago & St. Louis, which it does not already own, and also to issue its own capital stock to the amount of \$23,478,880, to be exchanged from time to time in payment for the stock of the Big Four, on the following basis: \$13,478,880 for the common stock on the basis of 80 for 100, and \$10,000,000, par for par, for the 5 per cent preferred stock of the Big Four. Of the common stock of the Big Four the New York Central owns \$30,207,700 and \$16,456,821 is outstanding in the hands of the public. Of the preferred stock \$9,588,600 is outstanding and none is owned by the New York Central. The application states that the purchase "will bind the two carriers, which are component parts of a single system, more closely together and tend toward a unification of their properties." The Big Four has also asked authority to guarantee \$2,118,000 of the 4½ per cent 50-year first mortgage gold bonds of the Evansville, Mt. Carmel & Northern, now held in its treasury, with which it proposes to acquire stocks and bonds of the Peoria & Eastern.

**To Lease Toledo & Ohio Central.**—Authorization of a lease of the Toledo & Ohio Central, including with it the Zanesville & Western, the Kanawha & Michigan and the Kanawha & West Virginia, to the New York Central, for a rental of fixed charges and taxes and in addition thereto an amount equal to the net earnings of the Toledo & Ohio Central for the year 1921, and in the case of the Kanawha & Michigan of 6 per cent on its stock, was also announced.

The making of the leases is subject to the approval of the Interstate Commerce Commission, for which application is about to be made.

The New York Central controls all of the stock of the lesser companies except a few shares of the stock of the Kanawha & Michigan.

**NEW YORK, NEW HAVEN & HARTFORD.**—*Attorney General's Hearing.*—Attorney General Harry M. Daugherty has taken under advisement the results of his investigation at Hartford, Conn., and at Boston, Mass., on December 12 and 13, respectively, preliminary to enforcement or modification of the federal decree of dissolution of 1914, which directed the road to sell various trolley lines and the Boston & Maine Railroad holdings.

**PITTSBURGH & WEST VIRGINIA.**—*Application Denied.*—The Interstate Commerce Commission has denied the application of this company to issue capital stock and to assume obligation and liability in respect of certain securities in connection with the purchase of the property and franchise of the West Side Belt upon the ground that the issue and assumption is not for a lawful object since the applicant has not obtained authority for the acquisition under section 5 of the Interstate Commerce Act, which applies to consolidations. Applicant owns all the stock of the Belt Company and is operating the road jointly with its own. Section 5 authorizes the commission to approve the acquisition by one carrier of the control of another in any manner not involving the consolidation of such carriers into a single system for ownership and operation. The opinion contains a lengthy discussion of the interpretation of the section. Commissioner Potter dissented.

**SOUTHERN.**—*Asks Authority to Issue Bonds.*—Application has been filed with the Interstate Commerce Commission for authority

to issue \$30,000,000 development and general mortgage 6½ per cent gold bonds, series A, payable April 1, 1956, including \$5,225,000 of bonds already nominally issued, the proceeds to be used for the payment of \$22,588,000 of three-year 6 per cent secured gold notes maturing March 1, a demand loan of \$2,355,270 from the War Finance Corporation and to reimburse the treasury for capital expenditures.

**SOUTHERN.**—*Authorized to Procure Authentication of Bonds.*—This company has been authorized by the Interstate Commerce Commission to procure the authentication and delivery of \$5,225,000 of development and general mortgage 4 per cent gold bonds to be held in the Treasury until the further order of the commission.

**TENNESSEE MIDLAND.**—*Asks Authority to Issue Securities.*—Caldwell & Co., of Nashville, Tenn., reorganization managers, have filed an application with the Interstate Commerce Commission on behalf of the Tennessee Midland Railroad, which is proposed to be organized to acquire the property of the Tennessee Central, to issue bonds and stocks for that purpose, for the purpose of acquiring the property.

**TEXAS SOUTH-EASTERN.**—*Acquisition.*—See Lufkin, Hemphill & Gulf.

**TOLEDO & OHIO CENTRAL.**—*Lease to New York Central.*—See New York Central.

**WISCONSIN CENTRAL.**—*Asks Authority to Issue Notes.*—This company has applied to the Interstate Commerce Commission for authority to issue promissory notes to the Minneapolis, St. Paul & Sault Ste. Marie in the amount of \$2,305,822 for ten years at 6 per cent for money advanced by the Soo. It also asks permission to assign and deliver to the Soo \$3,547,000 of its first and refunding mortgage bonds as security for the notes.

### Tentative Valuations

The Interstate Commerce Commission has issued tentative valuation reports in which it states the final value as follows:

Southern Illinois & Missouri Bridge Company, 1915....	\$3,182,660
Waukegan-Green Bay, 1916.....	114,201

### Dividends Declared

Albany & Susquehanna.—Special, 2 per cent, payable January 7 to holders of record December 24.	
Allentown & Western.—3 per cent, semi-annually, payable January 3 to holders of record December 22.	
Atlantic Coast Line.—Common, 3½ per cent, semi-annually, payable January 10 to holders of record December 23.	
Canada Southern.—1½ per cent, semi-annually, payable February 1 to holders of record December 30.	
Cleveland, Cincinnati, Chicago & St. Louis.—Preferred, 1¼ per cent, quarterly, payable January 30 to holders of record December 30.	
Louisville & Nashville.—3½ per cent, semi-annually, payable February 10 to holders of record January 13.	
New York Central.—1¼ per cent, quarterly, payable February 1 to holders of record December 30.	

A Mikado on the Paris-Orleans (France)

# Annual Report

## Central of Georgia Railway Company—Twenty-sixth Annual Report

SAVANNAH, GA., April 7, 1921.

### To the Stockholders

The Board of Directors submits its report for the year ended December 31, 1920.

### RELEASE FROM FEDERAL CONTROL

Federal control continued to midnight of February 29, 1920, when your company resumed possession and operation of its transportation properties for its own account. The income account herein shown does not include operating revenues, operating expenses and taxes of the United States Railroad Administration for the months of January and February, but to facilitate comparison we submit tables of operating revenues, operating expenses and taxes, and show comparisons with previous years, which include operations for the two months of Federal control.

### ACCOUNTS WITH DIRECTOR GENERAL

Settlement with United States Railroad Administration of accounts growing out of Federal control is in progress but not completed. The amounts shown on the balance sheet as due to and from your company are subject to this final settlement.

### TRANSPORTATION ACT, 1920

The Transportation Act, 1920, was approved by the President on February 28, 1922. It contains much new legislation and many material changes in laws previously enacted.

### GOVERNMENT GUARANTY

The amount accrued to your company by the Government under the six months' guaranty given by the Transportation Act, has not yet been ascertained and certified by the Interstate Commerce Commission; but, pending final audit and approval of the accounts submitted, substantial advances and partial payments have been collected. Income account as submitted includes an estimated credit of the amount payable under the terms of the guaranty.

### MILES OF ROAD OPERATED

The miles operated as of December 31, 1920, were 1,913.67.

The miles operated as of December 31, 1919, were 1,918.29.

### INCOME

The income for year 1920, compared with the previous year was as follows:

	1920	1919	Increase or Decrease
Railway operating revenues	\$20,676,551.05	\$20,676,551.05	
Railway operating expenses	21,102,368.50	\$52,858.97	21,049,509.53
Net revenue railway operations	(R) \$425,817.45	(R) \$52,858.97	—\$372,958.48
Railway tax accruals	\$795,151.18	\$126,929.88	\$668,221.30
Uncollectible railway revenues	5,584.69		5,584.69
Total	\$800,735.87	\$126,929.88	\$673,805.99
Railway operating income (R)	\$1,226,553.32	(R) \$179,788.85	—\$1,046,764.47
Net revenue—Miscellaneous operations	8,768.46	13,118.24	1,349.78
Total operating income (R)	\$1,217,784.86	(R) \$166,670.61	—\$1,051,114.25
Compensation from U. S.			
Railroad Act	\$732,892.77	\$346,808.94	—\$386,083.83
Non-operating income	5,116,916.37	8,094,012	\$4,887,095.63
Total	\$5,849,809.14	\$4,239,749.06	\$1,610,060.08
Gross income	\$4,632,024.28	\$4,073,078.45	\$558,945.83
Deductions from gross income	3,115,316.83	2,790,417.98	314,898.85
Net corporate income	\$1,516,707.45	\$1,282,660.47	\$234,046.98

(R)—Red.

### OPERATING REVENUES

(12 Months)

There was an increase of \$2,349,383.54 or 17.88 percent in freight revenue; \$304,343.95 or 4.66 percent in passenger revenue; \$732,249.97 or 38.22 percent in other operating revenues; or \$3,885,777.35 or 15.61 percent in railway operating revenues.

### OPERATING EXPENSES

(12 Months)

Operating Ratio  
The operating ratio was 102.60, an increase of 13.70 points or 15.40 percent.

### Maintenance of Way and Structures

Expenditures for maintenance of way and structures were \$4,942,898.33 or 1.64 percent, or 13.14 percent.

### Maintenance of Equipment

Expenditures for maintenance of equipment were \$6,163,735.93, an increase of \$1,691,962.49, or 37.84 percent.

Charges for depreciation of equipment were \$606,068.42, a decrease of \$22,649.85, or 3.69 percent.

The average miles per serviceable locomotive were 35,720, an increase of 1,925 miles, or 5.69 percent. The average use of locomotives was 17.3 years, compared with 16.7 years for the preceding year.

### Transportation Expenses

Transportation expenses were \$12,008,739.14, an increase of \$3,666,619.02, or 39.67 percent.

### TAXES

(12 Months)

Accrued taxes were \$925,198.85, a decrease of \$17,453.36, or 1.85 percent.

### FINANCIAL

The General Balance Sheet, Table 4, shows the financial condition of your company at December 31, 1920.

### Capital Stock

There has been no change in capital stock.

### Unpaid Debt

Since December 31, 1919, equipment trust obligations aggregating \$100,000 and Greenville and Newnan Main Line Bonds and Upper Cahaba Branch Bonds aggregating \$60,000 matured and were paid.

### Consolidated Balance Sheet

Pending calls for bonds from the Government under the six months' guaranty, and from the United States Railroad Administration, your company borrowed from banks in December, 1920, \$75,000 for a short period. The notes have been paid since December 31st.

Non-Convertible Debt to Affiliated Companies

The increase of \$553,180.33 in this item is due in part to the same as above and in part to the purchase of \$75,000 of Fourth National Bank Bonds to use as collateral security in connection with an advance loan by the United States on account of the six months' guaranty.

### Securities Owned

The increase in Other Investments Bonds reflects the above noted purchase of Liberty Bonds.

### Dividends

During the year preferred dividends, Nos. 14 and 15 (\$90,000.00) and a stipulated rate of six percent, per annum, and common dividends Nos. 9 and 10 (\$250,000.00) at a rate of five percent per annum were declared.

### Dividends Receivable

During the year Ocean Steamship Company of Savannah paid from accumulated surplus an extra dividend of \$40.00 per share, of which your company received \$7,940.00.

### Guaranty of Ocean Steamship Company Bonds

On July 1, 1920, the First Mortgage Twenty-Year Five Percent Bonds of Ocean Steamship Company of Savannah aggregating \$1,000,000 matured and were, by arrangement with the holders and after being unconditionally guaranteed as to principal and interest by this company, extended at seven per cent, for five years until July 1, 1925.

### ROAD AND EQUIPMENT

The expenditures for road and equipment, including additions and betterments on leased railway property during the twelve months ended December 31, 1920, were as follows:

	Corporate	Federal	Total
Engineering	\$9,547.79	\$3,570.11	\$13,117.90
Land for transportation purposes	15,408.25	22.00	15,430.25
Grading	6,167.14	(R)17,262.46	49,434.68
Bridges, trestles and culverts	43,363.89	(R)11,834.19	32,449.70
Ties	24,068.30	(R)29,327.65	(R)4,259.35
Rails	64,514.10	(R)50.46	64,463.64
Other track material	147,58.71	(R)9,149.24	(R)1,561.53
Ballast	25,667.90	(R)1,246.45	4,141.40
Track cleaning and surfacing	39,250.38	(R)11,066.52	28,183.86
Right of way fences	1,334.92	15.34	1,350.26
Crossings and signs	19,388.67	1,314.63	70,376.67
Station and office buildings	42,849.53	3,285.79	24,855.31
Roadway utilities	8,276.64	(R)4,856.26	12,132.90
Water stations	4,687.94	592.58	1,570.52
Fuel stations	16,695.87	(R)1,045.53	(R)1,561.53
Shops and enginehouses	69,831.05	(R)1,727.00	6,121.38
Telegraph and telephone lines	757.24	(R)45.97	7,827.27
Signals and interlockers	4,968.75	2,425.94	5,394.69
Power line poles and fixtures			5,394.69
Miscellaneous structures	246.44	(R)157.37	4,311.41
Paving	1,449.92		1,449.92
Roadway machines	4,507.75	(R)495.39	14,750.39
Assessments for public improvements	9,678.65	916.65	9,474.74
Shop machinery	28,838.02	(R)913.47	7,155.47
Power sub-station apparatus		(R)313.67	R 2,116.67
Total way and structures (less property reared)	8837,55.21	(R)318,227.80	\$613,877.34
Steam locomotives	2,306.43	(R)517.25	2,800.00
Freight train cars	17,742.87	5,714.68	5,800.00
Passenger train cars	13,431.10	(R)1,088.13	13,343.27
Work equipment	9,355.38	(R)744.70	88,406.68
Miscellaneous		583.14	780.14

Total net road and equipment \$773,733.19 (R)244,833.31 \$528,900.88

(R)—Red.

### PHYSICAL CHANGES

#### Railway and Structures

There were 58,370 miles of track relaid with 90 pound new steel rail, 0.0094 miles with 80 pound new steel rail, and 0.381 miles with 70 pound new steel rail; which includes 10,029 miles of track relaid with new steel rail; which includes 10,029 miles of track relaid with new steel rail of the same weight. 26,558 miles of track were relaid with second hand steel rail, replacing rail of lighter pattern. 4,606 miles of track were relaid with second hand steel rail, replacing rail of same pattern. Total mileage of track relaid with new and second hand steel rail was 80,547 miles.

In addition 5,666 miles of track between East Point and Atlanta were laid with 90 pound new steel rail, replacing 80 pound steel rail, for account of the Atlanta and West Point Railroad Company, which track is operated as a second main line between Atlanta and Jacksonville.

69 new industrial tracks were added, aggregating 2.2 miles in length while 19 tracks were removed, aggregating 1.67 miles, making net increase of 50 tracks and 0.53 miles.

37 new company sidings were added, aggregating 6.12 miles in length while 26 sidings were removed, aggregating 2.63 miles, making net increase of 11 sidings and 3.49 miles.

There were 14,695 miles of track ballasted with gravel laid to a depth of 4 inches.

\$165,357.76 were expended in the purchase of 2.12 acres of land at Columbus, Georgia.

\$165,357.76 were expended in the construction of a new reinforced concrete out-bound freight house, transfer platforms and driveways at Macon, Georgia.

\$4,045.73 were expended in moving to Dennis, Georgia, and erecting depot formerly located at East Newnan, Georgia.

Standard passenger shed was erected at East Newnan, Georgia.  
\$2,857.12 were expended in installing train order signals at Bolingbroke, Forsyth, Goggins, Milner, and Barnesville, Georgia.  
1,014 lineal ft. of frame and pile trestles were replaced by embankments and suitable waterways provided.

\$25,909.92 were expended in constructing a double 8x10 reinforced concrete box to replace the stone arch near Birmingham, Alabama.  
\$7,051.14 were expended in widening Elm street bridge, Macon, Georgia.  
\$2,394.56 were expended in constructing wagon bridge, Enfield, Alabama.  
\$1,172.08 were expended for paving at Andalusia, Alabama.  
\$1,948.92 were expended for paving East Main street, Statesboro, Ga.  
\$916.05 were expended for paving Broad street, Griffin, Georgia.  
\$4,175.29 were expended for paving North street, Albany, Georgia.  
\$936.75 were expended for paving at Troy, Alabama.  
\$14,291.06 were expended in the purchase of 51 motor cars for use of supervisors, section foremen, and bridge gang foremen.  
\$48,674.14 were expended in the purchase of 16 electric trucks for handling cotton on Savannah terminals.  
\$12,744.85 were expended in the purchase of one American Railroad Ditching Machine.

\$4,222.06 were expended in the purchase of two rail loading machines.  
Contract was let and work commenced on the construction of a reinforced concrete roundhouse and shop at Columbus, Georgia; total expenditure to date of \$98,375.40.  
\$31,794 were expended in equipping Macon shops with additional water connections to wash basins.  
\$2,756.01 were expended in the purchase of one pneumatic flanging machine for Macon shops.

\$1,018.60 were expended in the purchase of one electric arc-welding machine for Savannah shops.  
\$3,955.87 were expended for an electric turntable tractor on turntable at Savannah roundhouse.

**Equipment.**  
Seven new Mountain Type locomotives, built by American Locomotive Company, were used under temporary lease during a portion of the year, and arrangements made for their eventual acquisition by your company under Equipment Trust No. 1. No locomotives were sold or retired. There is under Equipment Trust No. 1 an increase over previous year of 314,938 pounds of tractive power, in total locomotives.

Arrangements were made for acquiring under Equipment Trust No. 17 all-steel passenger train cars to be built by The Pullman Company, and arrangements made for their eventual acquisition by your company. \$19,630.53 were expended in the application of superheaters, valve gear, piston valves and other improvements to locomotives.  
\$4,974.07 were expended in additions and betterments to passenger train cars.

There were no freight train cars acquired. 434 freight and work cars were sold, destroyed or retired, and 145 freight train cars were converted to work equipment.

The average capacity of freight cars at the close of the year was 38.0 tons and the total capacity was 336,600 tons.  
\$19,630.53 were expended in reinforcement of draft gear, application of safety appliances, and other additions and betterments to freight cars.  
\$39,709.53 were expended in the purchase and converting of Illinois Central sun parlor car into office car.

#### 8. Equipment.

#### OPERATIONS

To maintain the continuity of historical and statistical data there are included in an appendix the result of operations of your property for the two months under Federal control; six months guaranty period; the four months solely for corporate account operations; and the twelve months' operation.

#### GENERAL REMARKS

The Board takes pleasure in acknowledging the fidelity, efficiency and united efforts displayed by your officers and employees in the discharge of their duties.

By order of the Board of Directors.

CHARLES H. MARKHAM,  
Chairman of the Board.

## Railway Officers

### Executive

**George T. Reid**, whose appointment as vice-president and western counsel of the Northern Pacific, with headquarters at Tacoma, Wash., was announced in the *Railway Age* of December 10 (page 1177), was born at Etna Green, Indiana, April 2, 1871. He began railroad work on January 6, 1906, in the service of the Portland & Seattle (now the Spokane, Portland & Seattle). He resigned from that position on November 1, 1908, to become a division counsel for the Northern Pacific and on May 23, 1912, he was appointed assistant to the president and western counsel with headquarters at Tacoma, Washington, which position he

G. T. Reid

was holding at the time of his recent promotion.

### Financial, Legal and Accounting

**Albert J. Raynes** has been appointed comptroller of the Maine Central, effective December 14, succeeding Arthur P. Foss, assigned to other duties.

### Operating

**C. B. Ragon** has been appointed assistant to the vice-president and general manager of the Fort Worth & Denver City and the Wichita Valley, with headquarters at Fort Worth, Texas, effective December 15.

**C. C. Barnard**, assistant superintendent of the Western division of the Union Pacific with headquarters at Green River, Wyoming, has been appointed acting superintendent with the same headquarters. **H. A. Connett** has been appointed acting assistant superintendent to succeed Mr. Barnard.

### Traffic

**F. M. Millson** has been appointed traffic manager of the Omaha, Lincoln & Beatrice, with headquarters at Lincoln, Neb.

**E. H. Golden** has been appointed general agent of the Cisco & Northeastern, with headquarters at Breckenridge, Texas.

**C. E. Jefferson** has been appointed general freight agent of the Canadian Pacific, Western Lines, succeeding W. C. Bowles, promoted.

**C. B. Curlee** has been appointed general freight agent of the Alabama Northern, with headquarters at Birmingham, Ala., succeeding Roy Pope, resigned.

**A. E. Crocker** will on January 1 become general agent, freight department, of the New York Central at New Haven, Conn., succeeding **D. A. Gerlach**, granted a leave of absence on account of ill health.

**L. H. Trimble**, general agent of the El Paso & Southwestern and the Morenci Southern at Phoenix, Ariz., has been

transferred in a similar capacity to Los Angeles, Cal., effective January 1. **R. P. Kyle** will succeed Mr. Trimble at Phoenix.

**C. E. Stailey**, commercial agent of the Illinois Central and the Yazoo & Mississippi Valley, with headquarters at Kansas City, Mo., has been appointed assistant general freight agent with headquarters at Memphis, Tenn. **Hugh Hardin**, traveling freight and passenger agent at Kansas City will succeed Mr. Stailey.

**LeRoy Morris**, general agent of the Mississippi Central, with headquarters at Mobile, Ala., has been promoted to the newly created position of assistant general freight agent,

LeRoy Morris

with headquarters at Hattiesburg, Miss. Mr. Morris entered railroad service in 1911 as a rate clerk in the local freight office of the Southern Railway, at Selma, Ala., and was later promoted to chief clerk to the division freight agent in the same office. In 1915, he left to become rate clerk in the freight traffic manager's office of the Alabama Great Southern, at Birmingham, Ala. He entered the service of the Mississippi Central on February 1, 1916, as chief clerk to the general freight agent at Hattiesburg, and since that time he has been successively, traveling freight and passenger agent, with headquarters at Hattiesburg, and general agent, with headquarters at Mobile, Ala., which latter position he was holding at the time of his recent promotion.

**C. G. Pennington** has been appointed assistant general passenger agent of the Long Island, with headquarters at New York City, effective January 1. Mr. Pennington was

C. G. Pennington

born at Hollis, Queensboro, New York City, and was educated in the public and business schools of Long Island. He entered the service of the Long Island in 1900 as a clerk in the office of the traffic manager. When this office was abolished in 1902 and separated into the freight and passenger departments, Mr. Pennington went with the latter under the general passenger agent. In 1907 Mr. Pennington took charge of the road's advertising, supervising the preparation of newspaper and magazine advertising, booklets and other literature. During the war and until the demobilization and abandonment of the camps on Long Island, Mr. Pennington's time was devoted almost entirely as representative of the passenger department in connection with the movement of troops.

**B. H. Dally**, assistant general freight agent of the Pennsylvania, with headquarters at St. Louis, Mo., has been promoted to general freight agent, with the same headquarters, succeeding **P. C. Sprague**, resigned. Mr. Dally will

be succeeded by **F. W. Nash**. These appointments become effective January 1, 1922.

**Stanton Curtis**, whose appointment as general passenger agent of the Mobile & Ohio, with headquarters at St. Louis, Mo., was announced in the *Railway Age* of December 17 (page 1235), began railroad work in January, 1895, as a clerk to the ticket accountant of the Michigan Central at Detroit, Mich. He held various clerical positions with railroads until January, 1903, when he entered the service of the Southern as a clerk in the general passenger office at Washington, D. C. He was promoted successively to passenger agent at Norfolk, Va., in September, 1905; chief clerk to the assistant general passenger agent at Chicago, in March, 1907; northwestern passenger agent at Chicago, in December, 1909, and assistant general passenger agent, with headquarters at Chicago, in September, 1913. He was transferred to St. Louis in January, 1917, his title being changed to division passenger agent on March 1, 1920, which position he was holding at the time of his recent appointment.

**Robert E. Greene**, whose appointment as traffic manager of the Salina Northern, with headquarters at Salina, Kan., was announced in the *Railway Age* of November 12 (page 964), was born at Longford, Kan., on February 23, 1872. He entered railroad service in March, 1891, in the maintenance of way department of the Chicago, Rock Island & Pacific. He became a station clerk in 1895, serving in that capacity at various stations on the Kansas and Nebraska divisions until 1896 when he was made agent and operator at Valencia, Kan. He was transferred to Morganville, Kan., in 1899, and promoted to local freight agent at Clay Center, Kan., 1901, which position he held until 1907, when he was promoted to agent in the freight department at Wichita, Kan. He left in 1917 to enter the service of the Salina Northern as agent and dispatcher, with headquarters at Salina. He was promoted to car accountant in 1918 and to general freight and passenger agent in 1919, which position he was holding at the time of his recent promotion.

R. E. Greene

### Mechanical

**J. D. Young** has been appointed acting master mechanic of the Central of New Jersey, with headquarters at Ashley, Pa., succeeding **A. B. Enbody**, who has been granted a leave of absence on account of ill health.

### Engineering, Maintenance of Way and Signaling

**J. Telford** has been appointed roadmaster of the Canadian Pacific, with headquarters at McAdam, New Brunswick, succeeding **W. H. Noyes**, transferred.

**A. C. Harvey**, engineer of grade elimination of the New York, Chicago & St. Louis, with headquarters at Cleveland, Ohio, has been promoted to assistant chief engineer, with the same headquarters and the position of engineer of grade elimination has been abolished.

### Purchasing and Stores

**G. W. Hanegan**, storekeeper of the central and western divisions of the Minneapolis & St. Louis, with headquarters at Minneapolis, Minn., has been promoted to general storekeeper, with the same headquarters.

**B. W. Griffith**, district storekeeper of the New York Central, lines west, with headquarters at Collinwood, Ohio, has been promoted to assistant general storekeeper, with the same headquarters, and will be succeeded by **F. J. McMahon**. **A. L. Prentice**, division storekeeper, with headquarters at Elkhart, Ind., has been promoted to assistant general storekeeper, with headquarters at Collinwood, and he will be succeeded by **C. F. Heidenreich**.

**J. F. McAuley** has been appointed division storekeeper of the Portland division of the Southern Pacific, with headquarters at Portland, Ore., succeeding **H. J. Smith**, who has become chief clerk to the general storekeeper at San Francisco, Cal., succeeding **G. M. Betterton**, promoted. **J. Neph** storekeeper of the San Joaquin division, with headquarters at Bakersfield, Cal., has been transferred to the Los Angeles division, with headquarters at Los Angeles, succeeding **J. H. Collins**, deceased. He will be succeeded by **J. F. Brown**, storekeeper of the Shasta division, with headquarters at Dunsmuir, Cal., who will be succeeded by **F. L. Doss**.

## Obituary

**Matthais Manly**, since 1905 treasurer of the Norfolk Southern and its predecessors, died on November 28.

**John S. Love**, general agent of the Chicago, Milwaukee & St. Paul at Milwaukee, Wisconsin, died there on December 20, after a brief illness.

**John D. Besler**, of the vice-president's staff of the Chicago, Burlington & Quincy, with headquarters at Galesburg, Ill., died suddenly on the evening of December 19 at his home at Galesburg. Mr. Besler was born on April 10, 1833. He entered railroad service in November, 1855, as a track laborer on the Chicago, Burlington & Quincy at Galva, Ill. He was promoted successively to section foreman, conductor of a construction train, roadmaster, assistant division superintendent, division superintendent, and, in 1882, superintendent of the Illinois lines. Three years later (1885) he was promoted to general superintendent, which position he held until August 1, 1902, when he was assigned to special duties on the staff of the vice-president in charge of operation. He was engaged in the latter work at the time of his death. Mr. Besler was the father of **W. G. Besler**, president and general manager of the Central of New Jersey.

J. D. Besler

THE BULLETIN of the Federation of British Industries states that the Chinese Standardization Commission, which was appointed to agree and fix permanent standards for rolling stock and materials throughout the whole government railway system of China, has now agreed to the standards to be adopted for rails and fastenings; sleepers or ties, both ordinary and for bridges; cuts and fills; formation and ballasting; tunnels; clearance and minimum structure gages. Specifications for bridge steel were also accepted.

As regards rolling stock, standard designs were adopted for heavy locomotives—the Pacific type for passenger and the "Mikado" for freight service—with certain alterations to conform to the views of the locomotive superintendents of the various Chinese government railways. Agreement was also reached on standard designs for wheels, axles, trucks, bodies, frames, etc.

Centralized controls speed production on the Ryerson-Conradson Railroad Lathe

## Protect Locomotive Investments

No. 2 Universal Milling Machine

Twin Motor Driven Radial Drill

Successful manufacturing plants protect their investment in manufacturing equipment by facilities for quick, accurate repairs to keep the direct money earning machines in service and in good condition.

Does any establishment need this protection more than a railroad needs it?

By putting locomotives back into service in less time Ryerson-Conradson Machine Tools increase the earnings of the entire railroad investment.

Have them in your shops when the repair load comes on again.

*Every tool has surprising features. Ask about them.*

## Ten years of melting snow and heavy rains

—rushing with a violence that only a mountainous district can produce, have caused no damage to this sturdy 48-inch Armco Culvert. Year after year, in all parts of the country, hundreds of Armco Culverts, subjected to the deteriorating action of all kinds of soil and climate, are duplicating this record of service.

If only one Armco Culvert had given so many years of service, their enduring qualities might be questioned, but when thousands of them show not the slightest sign of deterioration after ten or more years of service, the rust-resisting and enduring qualities of Armco Ingot Iron are proven beyond the shadow of a doubt.

The increasing use of Armco Culverts by experienced engineers and Highway Commissioners is authentic approval of their ease of installation and enduring qualities.

There is a manufacturer in nearly every state, and in Canada, making genuine rust-resisting ARMCO CULVERTS and other products of Armco Ingot Iron such as flumes, siphons, tanks, road signs, roofing, etc. Write for full information and nearest shipping point on products in which you are interested.

## Insurance and Protection

Insurance is one thing—protection another. A man may be insured for ten thousand dollars but he is not protected without a body-guard.

The best travel insurance available does not protect a man when he is in one train that happens to be hit by another. It may protect his family but money gives little satisfaction when it is received as payment for human life.

### The Miller Train Control

does more than insure

**It protects!**

SEAUNTON, VA.

**Miller Train Control**

DANVILLE, ILL.

The American Wood Preserver's Association (Committee on Car Construction) emphasize the economic need for preservative treatment of car lumber. See Proceedings 1919-1920.

Some shops brush-treat contact points of sills with products ranging from glue and asphalt to ordinary paint. This is bad as it creates a false sense of security. A wood preservative must be sufficiently toxic (poisonous) to kill wood-destroying organisms (fungus growths) and inhibit their development.

## Carbosota Will Not Taint Lading

The first step in applying wood preservation to car construction is the protection against decay of the points of contact.

Surface treatment with Carbosota Liquid Creosote Oil, applied by brushing or spraying, is the one method that can immediately be employed in every car shop and repair yard. The objection is sometimes made that the surface treatment of sills may taint the lading. However, this is unfounded. Wherever preservative treatments have been properly applied, results have been universally satisfactory, and in no case have contents of cars or lading been damaged. Evidence in support of this statement is readily available.

Carbosota Liquid Creosote Oil, because of its superior physical characteristics, is undoubtedly most suitable for this sort of work. When requisitioned by its trade-mark—"Carbosota"—absolute uniformity

is assured, no matter from where obtained. Carbosota is liquid at 41 deg. F. (5 deg. C.)—a most important feature particularly when applied in Surface treatments.

Further information about Carbosota may be obtained by addressing our nearest office.

(Green wood cannot be effectively creosoted by non-pressure processes. It should be seasoned. All framing, drilling of bolt holes, etc., should be done before treatment. If this is impossible, two brush coats of Carbosota should be applied to all untreated surfaces exposed by subsequent cutting or drilling.)

### BILTMORE RIVETERS QUIET. COURT BACK IN OLD ROOM

Noise of "clous" and "hookers-up" forced Judge to Move.

Although to disturb a session of the Municipal Court is generally a serious offense, the disturbance that forced Judge Stone to quit the convenient courtroom on the top floor of the City Hall a while ago, and hold sessions in the council chamber on the second floor, was not considered contempt of court, and the offenders were not haled before his honor to be reprimanded.

Anyway, it's all over now, and the daily of the riveters working on the lower part with the "clous" of the proceedings as he held his hammer against the "hookers-up" so much as it was.

Then again, laying a new cement floor in the courtroom was not a help to the proceedings; hence the temporary change of quarters.

Now that the enterprising riveter isn't riveting quite so much and the cement layer not pursuing his splashy occupation the court has moved back into its regular quarters. Judge Stone says he never could get used to the seats in the council chamber.

## All Plant Managers } Greetings— Contractors and Engineers }

**N**OTICE is hereby given that the Boyer Riveting Hammers used in erecting this hotel did more than merely make a noise—they drove perfect rivets in record time, as do all Boyers. Boyers drive from seven to ten rivets per minute—depending upon rivet size.

Not only on this important job, but on all exacting riveting operations—where speed,

perfect rivets, air and maintenance economy are essential—Boyers are usually standard.

Good tools + contented workmen = efficient work at a minimum cost per rivet driven. A Boyer pays for itself every twenty to thirty days. Then why figure or experiment further? Your final choice will be: Boyers + more Boyers. Ask for Bulletin 810.

## Your Urgent Need is To Eliminate Waste

## Material Handling Cyclopedia

### Ready for Timely Service

**L**ACK of adequate facilities in your terminals, warehouses and at transfer points as the present and future cause of congestion on your lines can be largely overcome by the right selection of efficient mechanical handling devices and methods. It is a case of knowing what machines are available, how they operate and where to buy them. This information and a knowledge of the application of the various machines themselves is now and will be the premier need. Exactly these things comprise the contents of 1921 Material Handling Cyclopedia.

Success in these times depends upon eliminating waste, cutting costs, multiplying man-power and conserving time and labor by the use of modern mechanical handling machinery. There's no comparison between antiquated tools and later inventions. *Be certain.* Consult the Cyclopedia and make sure that you are using the latest equipment and applied knowledge.

Cranes, hoists, winches, derricks, excavators, buckets, steam shovels, scoops, magnets, car load and unloading machinery, tiering machines, industrial trucks, tractors and trailers—these are but a few of the devices described and illustrated in the 1921 MATERIAL HANDLING CYCLOPEDIA. It is the first book of its kind published.

#### **A Single Purpose**

A single purpose has guided us—to produce in one volume a book that gives the user the material handling information he needs most in an easily accessible form.

## **Simmons - Boardman Publishing Co.**

Enclosed is { check } for \$.....  
                                  { order }

Please send prepaid a copy of the Material Handling Cyclopedia  
Buckram binding, \$10.00. Leather binding, \$15.00.

Name .....

Address .....

City..... State.....

Position..... R. R. or Co.....

(Sent prepaid in the United States, Canada and Mexico only.)

#### **Definition Section—150 Pages**

Terse, clear-cut definitions of the principal terms used in connection with material handling methods and equipment and unusually full and complete descriptions of the mechanisms of the various devices are given.

#### **Technical Section—550 Pages**

Principal types of material handling machines are taken up under classified headings. Transference principles are discussed at length showing the advantages of the various types of machines for specific lines of work. Carefully chosen photographs, together with line drawings, charts, curves, etc. render the text easily understood.

#### **Catalog Section—150 Pages**

Enlarges and completes the other two sections. Leading manufacturers illustrate and describe their own products pointing out the particular advantages of their devices for certain branches of industrial service. These pages are grouped according to the nature of service the devices perform. All three sections are cross referenced so that you can find any information you need in a moment.

#### **Important Features**

A *Directory of Products*, a *Trade Name Index* and an *Alphabetical Index of Manufacturers* are included for ready reference.

You can have this cyclopedia on your desk, ready to serve you, promptly. Just make out your check for \$10.00, if you like a durable Buckram binding or \$15.00 if you prefer Full Leather. **Hand it with the coupon to your secretary.**

## Everyday performance is the guarantor of Galena Oil economy.

On hundreds of railroads—east, west, north and south, under their widely varying conditions of climate, grade and equipment—Galena Oils are delivering a lubrication service never equalled in efficiency or economy.

Characterized by quality and uniformity, these justly celebrated products have become the standard for railroad lubrication the world over.

The trite saying "Figures don't lie" is nevertheless a true one when applied to railroad cost records, and they are the kind of figures that testify with indisputable authority to the ability of Galena Oils to give greatest mileage, and reduce repairs and replacements of bearing parts to a minimum.

These economic advantages are supplemented by a feeling of security and satisfaction in the operation of Galena Service that is beyond price.

## PORTABLE RAIL SAW

If handicapped by the slowness of adequate appropriations, the success and economy of rail sawing experienced by the many roads using "INDUSTRIAL" Portable Rail Saws presents a solution to the present day needs of placing the roadways in good condition.

An "INDUSTRIAL" Portable Rail Saw is a big factor in reducing the cost of railway extension and maintenance. It eliminates the long hauls of rails required by the stationary plant.

The "INDUSTRIAL" Portable Rail Saw comprises a complete and very efficient plant for sawing off the worn ends of rails and redrilling them preparatory to relaying. The plant develops a capacity of 500 rails or more per day and rails up to and including 100 pounds per yard may be handled with the standard machine.

After calipering and matching the ends of re-sawed rails engineers state that the re-sawed rails make as smooth a track as new rails from the rolling mills.

*We will gladly supply you with further information regarding "Industrial" Portable Rail Saws.*

## Bulletin No. 188

### *Engineers:*

As information, will advise that *the \*oil issued engines NOW* for lubrication purposes will be oil of better quality and higher flash.

The valve oil issued to all engines is a high grade superheat oil instead of the valve oil *FORMERLY* used. This oil has a very heavy body and only runs about one-half as many drops to the pint as the former oil. The engine oil also is of a heavy body and will cling to the surface better than the old oil.

By careful handling of the new oils you should be able to note a marked improvement, and the necessity of excess oil tickets is removed.

We want the cooperation of all in our efforts to give you a good oil that will answer every purpose and hold our lubricating costs within reasonable bounds.

*Health, housing and happiness—these three factors in the modern industrial life are dependent upon rapid transportation to counteract the evils of congestion.*

## The World's Greatest Suburban Electrification

As long ago as 1896 the General Electric Company suggested the electrification of the many-miled steam rapid-transit systems of "Melbourne the Magnificent." But it was March, 1913 before the contracts were placed by the State of Victoria, Australia.

With the experience of the world to draw from, Merz and McLellan, the engineers, recommended 1500 volts direct current and the use of G-E motor and control equipment for the 400 motor cars and 400 trailers to operate over 335 miles of single track. They found the high-

tension direct current was the lowest in both first and continuing costs.

Electrification at Melbourne is making possible a great increase over the old steam schedule range of 13 to 18 miles per hour, thus helping to sustain the reputation of this metropolis as a city without congestion.

### "Welcome the Coming, Speed the Parting Guest"

**W**ELL, ANYWAY, a lot of railroads as well as a lot of people are still alive on the last day of the year 1921, which is the date of publication of this issue of the *Railway Age*.

Our Annual Review Number, giving in detail the railway history of this year, will be published next week. It will be a statement of facts, which, if carefully read, will convince any reader that the railways are justified in being glad to see the tail light of the year 1921 disappearing in the darkness.

It's been a hard old year—a year of turmoil, controversies, struggles, deficits, unemployment, apprehension and gloom. It runs true to form right to the close of its race. It ends with a slump in traffic and earnings. Nobody can be very sorry to see it go.

We have been told through all the ages, though, in both prose and poetry, that adversity is a very good teacher—in fact, one of the best. "Prosperity," said Lord Bacon, "is not without many fears and distastes; and adversity is not without comforts and hopes." He was a wise man, who had known both great prosperity and adversity. The railways have got about as well acquainted with adversity in 1921 as they, or any other industry, ever did.

But, like Lord Bacon's, their adversity has not been without its comforts and hopes. Real progress has been made toward restoring efficiency and economy in operation. The public mind seems to be more understanding and friendly right at the end of the year than it was some weeks ago.

Many men have had physical and mental breakdowns. Some of them fully recovered from the effects and greatly profited by the lesson. We know some men who went bankrupt two or three times, and thereby learned lessons from which they subsequently coined millions.

The true test of the will and ability of every man, of the management of every industry, of every nation, comes not when everything goes well, but when "everything goes dead wrong." Most things have gone dead wrong in the railroad business in 1921. The experience was replete with lessons, as such experience always is. We don't pretend to know just what all the lessons were, but experience is the best teacher, and in a year when experience is so unprecedentedly busy in teaching, a lot of lessons must have been taught.

How many of them were both taught and learned, we shall be able to judge better perhaps several years hence. One thing is certain. Never did the railways at the end of any year "welcome the coming, speed the parting guest" with more sincerity and fervor

### Important to Subscribers

The *Railway Age* will print at the end of the present volume only a sufficient number of indexes to meet direct requests from its subscribers. Those desiring indexes should, therefore, advise the New York office, 2201 Woolworth Building, New York.

"Poor Richard's Almanac" is out of print and "Poor Richard" himself is dead. But his "If wishes were horses all

#### "If Wishes Were Horses"

beggars might ride," like the soul of John Brown's body continues "marching on." There has been a week or more of wishing,—by each and everybody for somebody else; a new year being almost here. Men everywhere, catching the spirit of the season, have postponed routine for the moment to extend goodwill and to receive it, and having done so, feel the better for it. Like rest and food after a laborious march it has revived us. But there it stops. Concerning the future there is work to be done which wishes will not perform, marches to be made which greetings will not accomplish, problems to be overcome which goodwill will not solve. To know this is not to enjoy the spirit of the occasion any the less, but to realize our position concerning the new year all the more. In reviving us the season has done its part and it now remains for us to do ours. Remembering this, and that a new year is again upon us, and that time waits for no man, why should not all of us, revived in spirit "fall in." "right dress," "call off" and "forward" to the march!

It is a disputed question and one now pending before the courts as to whether the United States Railroad Labor Board

#### Public Invited to Inspect Engine Terminal

has or has not the power to enforce its decisions. However that case may be decided, the real power which lies behind the successful enforcement of any law is public opinion and this fact is coming to be more fully realized not only by politicians and industrial leaders but railroad men as well. The real reason, for example, for the recent decision of the railroad brotherhoods not to strike undoubtedly was their feeling that a very large proportion of the American public would strongly oppose any such action. The railroad managements also realize the importance of favorable public opinion. It is probable that a desire to show the difficulties of engine terminal operation and the facilities for meeting those difficulties caused the Lehigh Valley recently to arrange for a public inspection of its terminal at Ashmore, Pa. This

terminal is a comparatively new development, having been taken over for operation by the railroad in July, 1920. Recently the Lehigh Valley invited the Chamber of Commerce and Rotary Club of Hazleton, Pa., to visit the Ashmore terminal, transportation to and from Hazleton being provided, and every effort was made for the comfort of guests and for the ready inspection of the plant. The idea was to enable business men of Hazleton to become better acquainted with the railroad officers and understand something of the work involved in maintaining locomotive running repairs, cleaning fires, bundling ashes and supplying coal, water and sand. The Lehigh Valley has taken a step in the right direction in this case and one which can profitably be followed by other roads.

Commerce Reports, the official publication of the Bureau of Foreign and Domestic Commerce, has in a recent issue an

### Free Service to Exporters

interesting compilation of the various trade associations and individual companies which are co-operating with its newly-created commodity divisions in the effort to make more effective the Bureau's work in fostering America's foreign trade. No less than eight associations of manufacturers of textiles are working with the Bureau's Textile Division. Manufacturers of many other commodities also are included in the list as being in close touch with the various divisions which have to do with collecting information regarding the foreign sales of their products. In the whole list, however, there is no mention whatever of any individual manufacturer or association of manufacturers who are working with the Bureau's Industrial Machinery Division. This is the division which is working in the interest of our foreign trade in railway equipment and supplies. Unless there has been some omission from the published list, then, it would seem that manufacturers of industrial machinery have been somewhat slower in realizing the value of the free service offered them by the Bureau than have the producers of other commodities. All the Bureau seeks from the manufacturer is the opportunity to serve and it should be accorded this opportunity wherever possible.

One of the most important advantages of the steam locomotive is its reliability. It is inherently a very flexible machine;

### Abusing the Steam Locomotive

the load can be varied over a wide range and the power output adjusted to take care of it. The steam locomotive can stand a tremendous amount of abuse. It may have numerous mechanical defects and yet will pull its load where a less sturdy machine would fail. Railroad men are so familiar with this fact that they are apt to regard the ability of the locomotive to produce results under unfavorable conditions as a matter of course and to take advantage of it by operating power that is not in the best condition. This may be permissible in an emergency, but the practice of persistently running locomotives with minor defects to keep down maintenance charges cannot be too strongly condemned. No machine can be expected to operate economically unless it is maintained in first-class condition and laxity of inspection or maintenance practices which permits defective locomotives to continue to operate without repairs is false economy. Yet this condition probably exists to a considerable extent. In some cases maintenance standards are very high, but inspection inadequate. For example, a locomotive was taken from regular service to be tested and a thorough examination showed the superheater joints had been leaking badly for some time. On another road, indicator tests showed locomotives were

performing without complaints from the crews that had valves improperly set; after the defect was corrected they burned 25 per cent less fuel. When such conditions exist would it not be advisable to develop methods for preventing these losses by the use of superheat pyrometers and steam engine indicators and by thorough, consistent inspection?

The railways of France are to be brought into much closer union under a recent enactment of both houses of the French

### Reorganizing the Railways of France

Parliament. During the war and since, the private companies have sustained heavy deficits which have been met in large part by the government. Under the new legislation the railways will be permitted to pay only their pre-war guaranteed dividends and all additional earnings will go into a common fund to be used in meeting the expenses of the railways showing deficits. Rates under the new plan are to be fixed at a level sufficiently high to meet expenses, including dividends. These rates, however, are subject to approval by Parliament which must take into consideration the general economic situation. Consequently if rates high enough to meet expenses are not allowed the government will have to make good the deficit. Such advances from the government are, however, to be repaid from the common fund upon the return of normal business conditions. In any event a surplus in the common fund will revert to the government. The existing railway companies are to remain intact, but their actions are to be largely circumscribed by two administrative bodies, the Higher Railway Council and the Executive Committee. The Council is to be made up of some sixty members, representing management employees and public. Its function is mainly to act as an advisor to the Minister of Public Works. The Executive Committee is made up entirely of representatives of the managements and its duty is to put into effect the decisions of the minister and the Council on all the railways. Relations with labor are to be taken care of by an arbitration tribunal, half of the membership of which is to be composed of representatives of the railways and half of representatives of the employees, all of whom must be members of the Council. This tribunal will be presided over by a member nominated by the public group on the Council. Some incentive to efficient operation is provided for by a provision allowing a management premium and an employees' premium on any road showing substantial increases in operating efficiency. This is practically the only feature of the legislation which makes the new plan essentially different from out-and-out government operation. The railways, however, were apparently not opposed to the plan.

A gentleman has written to the New York Tribune suggesting that the price of upper berths is too high and that it

### Are Upper Berths Too High?

should be not 20 per cent below the price of lower berths but 50 per cent less. His argument is based on the fact that few persons like to take an upper berth with the result that sleeping cars run too frequently with many of the upper berths unoccupied. He might have added that if the car is fully occupied the majority of the passengers in the upper berths, are disgruntled and dissatisfied at the service they get. This is an old problem which thus far has found no solution. An attempt was made to solve it some time ago by the use of the aisle light. The latter did make the uppers less undesirable but came far from making them entirely desirable, as the actual results have shown. It is rudimentary economics that if a concern is manufacturing, let us say, two commodities—one its main product and the other a by-product—

the respective prices should be such that both can be sold. This is not the practice with sleeping car berths. The lower berths are in most demand, but only in exceptional cases are a good share of the uppers sold. If our New York Tribune friend is right, the price of the uppers must be wrong. In other words, the contention is that it is the price of the upper berth and not the berth that is too high. This is not a simple matter to decide. We have attempted above to suggest a solution on the basis of the law of supply and demand. The trouble even with that is that some people have proposed an agitation to repeal that law and we understand from some of the more brilliant embryo writers on economic subjects that the law, like the eighteenth amendment, has fallen into disrepute. However, the fact remains that even with all that has been done and said, upper berths are not particularly desired by railroad travelers.

When winter comes the railroads are by no means the last to know it. Lubrication everywhere becomes less effective.

### When Winter Comes

Wheels slip. Track equipment, becoming clogged with snow, requires immediate and constant attention, and ice forming on surface water makes it less suitable for boiler use. Outside work becomes exceedingly disagreeable and snow drifts in the path of traffic add the more to the multitude of forces and effects which conspire to delay traffic, antagonize a fastidious public and increase the already heavy expense of transportation. Thus, it has always been and to some extent always will be. For winter will not cease to come. And yet, do railroads, encountering winter, apply themselves creditably in all respects to become less affected by it? A drain which must be kept open freezes and like water tanks or locomotive tenders which are permitted to overflow in their filling, occasions large expenditures for removing ice which never should have formed. A shipment of coal, gravel, earth or cinders, loaded into cars wet and delayed in disposition, or left unprotected from the thawing and subsequent freezing of a snow to which it was exposed, necessitates expenditures in its removal toward which dumping facilities of cars offer little assistance. A pumping station or water treating plant succumbing to the cold becomes temporarily inoperative at a time when perhaps it is needed most, and expenses are thereupon involved in effecting its repair; or open cracks in these or other buildings make themselves apparent at an inopportune time and make additional demands on overtime and coal. A passenger train, its passengers already nettled by irregular temperatures attributable to the susceptibility of unprotected heating pipes to cold, or aggravated by previous delays however unavoidable, is again delayed until a hose line is sufficiently thawed out to permit of supplying the necessary water to the several cars. It is in incidents like these that the question advanced has a natural origin for when such incidents occur they are suggestive more of neglect than of "providential visitation." The fact that incidents of this kind do occur and arise from forces which often permit of complete control, constitutes an aspect of railroading which not only merits but challenges attention.

When the Delaware, Lackawanna & Western spent over \$14,000,000 on the revision of 40 miles of its line west of

### Spending Money Wisely

Scranton, Pa., a few years ago, it was said by some that only a wealthy road could afford to undertake improvements of this character. However, in 1920 the operating economies effected by this improvement yielded a return of over 12 per cent on this expenditure of more than \$300,000 per mile, whereas the money itself was secured at a rate of less than 4 per

cent. This is another example of the returns which are awaiting the expenditure of large sums for the improvement of railway properties in all parts of the country. The old saying that nothing succeeds like success applies with special directness to the railways. It is frequently the case that the roads which are confronted with the highest operating costs and are in the greatest need of those improvements which will enable them to reduce those costs, do not have the credit which will enable them to make these expenditures. The result is that their costs continue to rise and their credit to fall. On the other hand, the road which can raise sufficient money to finance a major improvement can use the returns from this improvement to finance still other work. A glance at the operating returns of the railways of this country will show that those roads which have added most liberally to their facilities in recent years are today making the best showings. E. H. Harriman's well-known foresight in this direction brought the Union Pacific from bankruptcy to its present high position. E. P. Ripley accomplished the same transformation with the Santa Fe by pouring large quantities of money into the property. The Burlington, and, in recent years the Illinois Central, are examples of the results which come from the continued improvement of a property to enable it to keep pace with or in advance of the demands of traffic and to handle this traffic with the maximum economy. The growth of our country has been and still is such that the demands for transportation are increasing constantly. Therefore, instead of waiting until the present facilities are outgrown to rebuild or enlarge under the burden of an overload, it is more economical to prepare reasonably in advance and then to reap the reward of economical operation as business increases. It is the history of transportation in this country that traffic comes to the road which is prepared to handle it. It is the management which is just a little more courageous than the rest that sees this opportunity and does its best to grasp it.

## Abolition of Transportation Taxes

THE ABOLITION of federal taxes on transportation on January 1 will result in reducing the amount of money the public pays to the railways between \$200,000,000 and \$300,000,000 annually, the amount of the reduction depending on the amount of traffic handled. While the railways have collected this tax they have not, of course, received any of the money derived from it, having turned it all over to the federal government. The tax on freight revenues is 3 per cent, and on passenger revenues 8 per cent. The freight tax of the Class 1 railways in 1921 has amounted to about \$108,500,000, and the passenger tax to about \$92,500,000, a total of about \$201,000,000. The total in 1920, when a much larger traffic was handled, was about \$233,000,000. While these taxes have gone to the government, and not to the railways, their abolition will of course have exactly the same effect as would the reduction of freight and passenger rates by corresponding amounts.

In addition to having collected these transportation taxes for the federal government, the Class 1 railways this year have paid taxes levied upon them by the federal, state and other governments of about \$290,000,000. The amount paid in dividends to all their stockholders in 1920 was only \$271,500,000, and will be substantially less this year. In other words, the governments are now taking more of the earnings of the railways in taxes each year than the stockholders are receiving in dividends.

The transportation taxes collected by the Class 1 railways for the federal government, and the taxes paid by them to federal, state and other governments, will together amount this year to over \$490,000,000. The total net operating in-

come earned by them in the first 10 months of the year was less than \$497,000,000, which shows that, directly and indirectly, the taxes levied by the government upon transportation during the year will fall not far behind the total net return earned by the railways with which to pay the interest on all their bonds and other evidences of indebtedness, as well as dividends on all their stock.

From 1912 to 1921 the taxes paid by the railways from their earnings have increased from \$109,500,000 to about \$290,000,000, or 164 per cent. On the other hand, between 1912 and 1920 the total dividends declared declined from \$340,000,000 to \$271,500,000, and, as already indicated, those paid in 1921 have been still smaller, although the exact amount is not known. While, as a result of government regulation and control, the railways have been a source of declining income to their owners, they have been a source of very rapidly increasing income to the governments that regulate them.

Including both the taxes levied on the railways themselves and taken from their earnings, and those levied by the government on the traffic handled by them, the total taxes derived by the various governments from railway transportation increased by \$380,500,000, or 348 per cent, between 1912 and 1921. Meantime, freight rates have been increased only about 75 per cent, and passenger rates less than 60 per cent. Plainly, it was the government's turn to move toward reducing the "burden of transportation costs."

## The American Roads Are More Progressive

THE DEVELOPMENT of reinforced concrete construction practice in North America is admittedly an outgrowth of prior scientific studies on the continent of Europe, notably in France. Therefore, it is a matter of no little satisfaction to American structural engineers, particularly those engaged in railroad work, to know that the use of reinforced concrete by the railroads of this country and Canada has been carried far beyond anything accomplished in Europe.

Bulletins of the International Railway Association issued during the past year present some interesting data on this subject. The report by the late C. A. Carlidge, formerly bridge engineer of the Chicago, Burlington & Quincy, prepared in 1914 and a 1920 supplement by his successor, G. A. Haggander, summarize American practice, the latter showing that 26 out of 29 railroads report making use of reinforced concrete slab spans to carry railroad traffic. This is in sharp contrast to European custom. While concrete has been applied extensively abroad for the construction of piers, overhead bridges, buildings, fences, platforms, etc., its use in beams, slabs and arches, to carry railway traffic, has been extremely limited.

Thus the report by Marcel Castieu on Belgian, French, Italian, Spanish and Russian railways, states that "It is practically only in Italy that subways having spans of more than 15 ft. 5 in. or 19 ft. 8 in. have been built wholly (floors and girders) of reinforced concrete." Similar comments are made by the reporters for the English and Dutch railways.

It is true that European practice, as reported, represents the status as of 1914 because of the virtual suspension of permanent construction during the war period. It is also a fact, as reported in articles by Major O. F. Allen appearing in the *Railway Age* during the past year, that more extended use is being made of concrete in the restoring of the French railroads in the devastated areas. But even there the concrete work is largely in the nature of arch spans rather than of the slab construction which has had such extended development in America.

Such wide disparity between American and European practice must have a logical explanation. One reason is apparent in the text of the International Railway Association bulletins, namely, a lack of confidence abroad in concrete for carrying the heavy and rapidly moving loads of railway trains. Another objection to concrete is based on aesthetics—a feeling that better appearance may be obtained with cut stone masonry and brickwork. Another is perhaps the greater adaptability of the American workman to employment in a new craft. Whatever the prejudices and objections in Europe, it is clear to all who are thoroughly conversant with American experience that they do not apply on this continent. There have been failures here in great numbers, but they can all be explained by improper design, workmanship or material, and there is now no hesitancy on the part of American railroads to spend great sums for bridges built of concrete.

## Why Repair Foreign Cars?

THAT THE HABITUAL neglect of the foreign freight car is a source of dissatisfaction to officers of the transportation department as well as those of the car department was clearly brought out by N. D. Ballantine, superintendent of transportation of the Union Pacific, in his paper before the last meeting of the Western Railway Club. Mr. Ballantine, whose paper will be found elsewhere in this issue, has performed an invaluable service in drawing attention to and analyzing the effect of a number of transportation factors influencing the decision as to the advisability of making foreign car repairs which have not generally been considered in discussions of this subject. Two of these factors—the per diem rate and the cost of switching to and from the repair tracks—have a direct influence on car repair costs. Mr. Ballantine's conclusion with respect to these two items is that they constitute fixed charges—in the one case against the amount of direct expenditure per day and in the other against the total amount of direct expenditure for shopping and hence, whenever a car is placed on the repair track it is desirable that the maximum practicable amount of work be done and done expeditiously, in order that the amount of these two fixed charges to be carried by each dollar of direct expenditure may be reduced to a minimum.

Here, then, is a conclusion which would seem to justify a material increase in the extent of the repairs made to foreign cars. Unfortunately, however, one other condition must be taken into consideration before this conclusion can be fully accepted. That condition is the adequacy of the surcharge included in the billing price for labor as well as the adequacy of the billing prices of materials to completely cover both their direct and indirect cost. The present labor allowance of \$1.20 an hour was established to include a surcharge of about 15 per cent for direct supervision, 35 per cent for shop expense, switching and superintendence and 6 per cent for fixed charges, a total of about 55 per cent on the basis of 77 cents an hour direct labor charge. At the present time, with a labor rate of 72 cents an hour, the total surcharge has been increased to 66.6 per cent, but with shop overhead in many cases conceded to be over 70 per cent and probably, if all legitimate items of overhead were known, coming nearer to 100 per cent. An increase in the extent of foreign car repairs necessarily involves an increase in the loss to the repairing line, although the rate at which that loss increases may be less than the rate of increase in the direct labor charges. Furthermore, any extensive increase in the amount of repairs made to the foreign car must tend to increase the proportion of fixed charges which must be covered by the total surcharge, because of the fact that more shop work will be required, thus taking up the time of shop

facilities when otherwise only the repair track facilities would be involved.

It would seem, therefore, that the costs of labor and materials are still the key to the situation and that until a road is satisfied that the prices for materials involve no direct loss on that item and that the labor surcharge includes a margin above its average overhead cost which may be applied to absorb some part of the transportation switching costs and the per diem accruing while the car is out of service, there is little incentive for that road to make more than the necessary minimum repairs to foreign cars.

## Unified Railroad

### Electrical Engineering

MANY OF THE smaller railroads can effect economies by the proper unified supervision of the installation and operation of electrical devices. The telegraph was the first application of electricity on the railroads. As electrically-operated highway crossing alarms were introduced the telegraph department naturally took charge of these devices on many roads. However, as the installation of interlockers and automatic signals became extensive, the larger roads established separate signal departments to handle these facilities and also the highway crossing bells. Another department grew up soon after to take charge of the electric lighting of buildings, and the installation of motors in shops, pumping plants, etc.

These three applications of electricity are distinctly separate and the larger railroads can well afford to employ experts for each of them. However, the smaller roads require only a comparatively small part of a highly specialized man's time for each of these separate lines. The problem was solved by one such road by the consolidation of all work of this character in one office. Such a position might carry the title of "superintendent of communication and signals" or "signal and electrical engineer." If the majority of the telegraph plant is operated by the Western Union under contract, his problem in railroad communication is mainly to provide adequate telephone train dispatching and conversational circuits. The maintenance of such equipment has, in several important cases, already been combined economically with the maintenance of automatic signal apparatus. The installation of the wiring and fixtures for the electrical illumination of buildings is to a great extent fixed by standard rules of the insurance underwriters and, whether installed by contractors or railroad forces, is largely an inspection problem. The selection of the motors for shop machinery, pumping plants or coal chutes is limited in most cases to a few types recommended by the manufacturers of the machinery.

One may question how one man can become efficient in all of these several departments. The first requisite is that he confine his energies principally to the engineering of these installations. By participating in the activities of the different sections of the American Railroad Association, the Association of Railroad Electrical Engineers and kindred organizations, and by studying various installations on other railroads, it has been demonstrated that one man can master these kindred subjects.

With the installation of any equipment properly engineered, the maintenance resolves itself into a routine, the efficiency of which can be checked readily by men trained in the department. As stated above, a few roads have already seen this opportunity. It would seem advisable for other roads which require only a limited amount of such equipment to investigate their future needs with the idea of educating one man to handle these allied electrical problems.

## Letters to the Editor

[The RAILWAY AGE welcomes letters from its readers and especially those containing constructive suggestions for improvements in the railway field. Short letters—about 250 words—are particularly appreciated.]

### An Undergraduate

#### Defends College Training

CAMBRIDGE, MASS.

TO THE EDITOR:

As an undergraduate I cannot allow to go unanswered the letter by "One Who Has Seen," published in the *Railway Age* of December 12. If one were to accept this writer's judgment as final, it would be to conclude that a college education, for its benefits in post-graduation days, is worthless; that "call boys" make better railroaders than college men; that a modern technical education is merely the learning of a trade, and that college graduates are only a conceited bunch of good-for-nothings.

It would be pitiful if it were true, but it is not. As I pointed out in a previous letter (*Railway Age*, September 17) college graduates are in increasing demand in every important industry—except the railroads. Such being the case, it proves that either these industries are all wrong in their misplaced confidence in the college trained man, or else they are asleep.

It might be conceded that the "call boy" makes a better railroader under the present system of the subordination of the individualism of a man, but to claim that this is due to the wider experience of a "Call Boy" seems unreasonable. It means there is something wrong with the individual, if a man can go through any large educational institution and not have a more diversified knowledge and a more open mind than the man who has grown up in the atmosphere of specialization, which railroading professedly demands. It is the men with this ability to view the situation from more than one angle that the railroads now feel the lack of, and it is this ability the college man should be able to bring them.

A modern college education is not learning a trade. The individual may make it such if he wishes, if he confines himself solely to his books. But if he enters into the life of the institution, puts in something besides his tuition fee by virtue of his entry into college activities, and takes away something besides his degree in the form of friendships with his classmates and a knowledge of human nature, he has learned something far more than a trade. And as for any undergraduate course of study limiting the individual's field after graduation, this is ridiculous in face of the facts. Graduate records of the Massachusetts Institute of Technology show less than 60 per cent of its graduates follow the kind of work they specialized in as undergraduates.

Is the college man really a conceited prig? It is a fallacy of the newspaper public to judge the rank and file of college men by the *faux pas* of a few. The average college man who is in search of a job upon graduation has invested from \$3,000 to \$5,000 in an education, and he feels justified in his investment. He is as much entitled to pride in his investment as the man who has bought a \$5,000 automobile, rather more so, as the college education gives the man the advantage over his fellows in increasing the wealth of the community, an advantage the automobile cannot give. But the education cannot benefit the community to its full advantage if spotted behind a clerk's desk any more than one can the automobile if left out-of-doors in a blizzard.

To be sure, the college man must learn the game from the

ground up, but why make him wait till the end of his career to do it? Let the railroads encourage men to spend their summer vacations learning the rudiments. In this way, both parties can choose their paths without undue expense or either hand. The old-time fascination still exists, and I believe it is increasing among college men. Let the railroads show their share of interest, and we shall see if "One Who Has Seen" has seen it all.

LEANDER H. POOR.  
"Boston Tech" '23.

## Some of Mr. Ford's Ideas May Be Sound

NORTHERN REGION

TO THE EDITOR:

The articles in recent issues of the *Railway Age* concerning Mr. Ford's railroad are of interest to all railroad men. There are many claims of important changes that have been brought about on the T. D. & L., among which are the eight-hour day for everybody, no Sunday work, the speeding up of the movement of both loaded and empty cars, and getting a full day's work for a day's pay, etc.

I know there are many old-time railroad men who will not agree with me that it is practical to operate a railroad on an eight-hour basis and without Sunday work, but I claim that such a thing is possible and that the railroads of this country would save millions each year if they would come to an eight-hour day, six days a week, from the president to the section laborer. During federal control many lines tried in a half-hearted manner to cut out Sunday work. At that time I was a general yardmaster on one of the lines in the Western region, which practically tied up from seven o'clock Sunday morning until midnight. The result was that by Monday night we were just about as far ahead as if we had worked every engine in the terminal on Sunday and had run a race with ourselves to see how many drags we could operate. Have you ever noticed how light business is on Monday, regardless of how many engines you may have taken off Sunday? During the past summer the line that I am now with ran only live stock and perishable trains on Sunday. The result was that in this terminal, instead of working 42 switch engines, only 12 were operated, thus saving 30 switch engine days, and Monday night found us in excellent shape as far as the general condition of the terminals was concerned.

The prompt movement of freight and the speeding up of the car movement is another thing that every railroad should give more consideration to. The amount of time it takes to get cars through district terminals on several lines upon which I have worked is excessive, especially in times of car shortage. The terminal superintendent or trainmaster who demands of his organization that every car which has completed loading on industries in his own yard must move in the night, and who demands that his yard shall at all times be properly classified, with the rough box, grain box, auto cars, coal cars, stock cars and other classes of cars kept separated and always ready for movement, has the key to successful and speedy car movement. The general superintendent or general manager who does not demand these things is weak when he lets his terminal organization tell him that such operation is impossible.

Another point brought out in article is that Mr. Ford is demanding a full day's work for a day's pay. Is there any reason why every railroad should not demand as much or why they should not get it? The only reason that I can see for not getting a full day's work from every man is that we are not insisting upon it. The minute a yardmaster or trainmaster commences to get after his men, to get more out of them, he, of course, gets in wrong with the drones, and the result is that it isn't long until the general chairman is told

all about how so-and-so is trying to make a record for himself and is spoiling all the good jobs. The general chairman talks to the general superintendent or general manager and the result is that you are put down as a disturber, called antagonistic and told that you do not have the good-will of your men. The first thing you know the general superintendent, who has lost his nerve, tells you not to crowd things too far and the result is that the yardmaster, trainmaster or superintendent lets things drift. As a matter of fact, if the general officers had the nerve they need to let you alone for a short time until some of the drones or loafers have either been started to work or cleaned out, they would find that things would quiet down, the men would get into the game and give good service, and instead of knockers, everyone would be proud of the record made on the division.

When the order comes to reduce expenses, you can't speed up the work to do it, but must pull off a few section men and let your track go to the bad, or lay off a few clerks and let the check of the yard and your demurrage records get behind, or pull off an engine or a yardmaster and let the service suffer. If we had 100 per cent efficient operation and were getting a full day's work from every employee instead of having to reduce expenses spasmodically as is done at present, we would find that our expenses would be reduced automatically with the falling off of business. These are the conditions I have found on some of the railroads on which I have been employed.

ASSISTANT SUPERINTENDENT.

## Keep Trains Moving

CUTLAC, CAL.

TO THE EDITOR:

Considerable thought is being given today to the better movement of trains. The modern advertising of signal apparatus is, "Signals Keep Trains Moving." "Why stop a moving train to tell it to proceed?" One writer has humorously and aptly given the definition of a siding as, "The kiddy in which most of the dividends are dropped." It is obvious that the economical operation of railroads prohibits the unnecessary stopping and standing of trains, and the thinking signal engineer is bending his efforts toward keeping trains moving.

Some splendid results have been accomplished in the elimination of standing trains by signaling tracks in both directions and changing the current of traffic during certain hours. Unnecessary stops are being considered and the chief offender (the stop-and-proceed automatic signal indication) is being weighed in the balance. Can this stop at an automatic signal be eliminated? Lack of confidence in the engineman's proper observance of signals seems to be the only question of doubt.

Observation of the actual speed at which many enginemen run their trains, after passing signals in the caution position, does not make one particularly optimistic about what would happen if they were allowed to pass the next signal without a stop when it indicates "block occupied"; and in most cases the engineman is observing signals as he understands them. He is approaching the next signal prepared to stop, expecting all the time to find a stop unnecessary, and applies the brakes only when he must do so to avoid overrunning a stop signal.

It is true that many enginemen do reduce speed immediately after passing a caution signal, and some of them are very skillful about giving the block ahead time to clear, thus avoiding a stop; but we have with us always the engineman, whose chief thought is to make a good run and who is willing to take the chance to continue at a high rate of speed, feeling that he can make a stop if forced to do so. He is often pulling a high class train which he knows the dis-

patcher is anxious to get over the road, and his main thought is speed.

It was to take care of this fellow that a stop was insisted on before allowing a train to proceed into an occupied block, and if we remove the stop we must be sure that we have some other check on our man. We have been trying to educate him and have been more or less successful, but the fact that the majority of us are still insisting on the stop is proof that we are not sure of him yet.

Now suppose that we make the meaning of our caution signal more specific and *insist on a definite speed restriction* which cannot be exceeded after passing a signal in the caution position. It may be necessary to consider a three-block indication system to be sure of our man and to be able to check him up properly. This system has proved successful on busy lines and in congested terminal territory, and has made it possible to use short blocks safely. It has a great advantage in providing a distant indication for every caution signal and definitely indicating the speed at which a caution signal must be passed.

The modern light signal may make it possible to obtain

Proposed Signaling Scheme

simpler aspects for this system as we are able to make the semaphore arm equivalent vanish at will. We could accomplish the purpose with a marker light if a unit of a light signal were used, displaying the marker light only when better speeds were permitted. For instance, a signal displaying a yellow light or in the 45-deg. position in combination with a marker light, could be used as a distant for a caution signal and would indicate to the engineman—pass the next signal at restricted speed. The caution signal would then display a yellow light or the 45-deg. position without a marker light, and would indicate to the engineman proceed at restricted speed prepared to stop at next signal. The next signal, if displaying a red light or a horizontal position without a marker light, would indicate stop, but if a marker light were displayed, would indicate proceed at slow speed prepared to stop short of a train or obstruction. The clear position would display a green light or a vertical position only. The interlocking signal would then normally display but one light or one horizontal position; if clear, one green light or one vertical position; if at approach restricting, a yellow light or a 45-deg. position in combination with a marker light; if a caution, a yellow light or a 45-deg. position only; if at restricted speed, a green light under a red or a vertical position under a horizontal one; if at slow speed, a yellow light under a red or a 45-deg. position under a horizontal one; if set for a call-on move, a red light or a horizontal position in combination with a marker light.

These are just a few of the possibilities and could, no doubt, be improved upon, but they give a mark to shoot at.

We are headed more and more toward speed control, so why not begin to make all our signals talk speeds to the engineman. *A great many accidents would have been prevented* if the meaning of a caution signal had carried with it a definite speed restriction. Let's make our signal systems such that, if obeyed, all enginemen will keep their trains running smoothly and efficiently, reducing speed by shutting off steam rather than by applying brakes, and stopping only when the route is not set or when they reach a train or obstruction. Let's keep our trains moving.

T. H.

## Extend the Budget System

C. H. HARRIS

TO THE EDITOR:

The use of the budget system is becoming more widespread among executives who control and direct the systematic conduct of business affairs; even the United States government has become interested in the subject. It is not new to the carriers who estimate their future expenditures for varying periods, and towards the end of the year prepare estimates for the costs of additions and betterments for road and equipment proposed by the various departments as part of the program for the ensuing year, and authorize such work as may be deemed necessary or expedient.

It would be well to go a step further at this time when the ablest minds are striving to solve the question of the best way to further the return to normalcy. I would suggest that budgets be prepared covering materials and supplies that may be needed for maintenance and repairs during the year 1922, or at least for the first six-months' period, said schedules to show estimated quantities or tonnage of such articles or materials that may be used regularly, provided they are standard or the quality or grade is satisfactory; and it would be advantageous to purchase under contract instead of in the open market when needed or sufficiently in advance to permit of manufacture and delivery; and that formal contracts be made or letter agreements be drawn up to cover the purchase of the items in question.

By thus making commitments covering either a definite quantity or tonnage—or naming an estimated figure or the range between a maximum and minimum of requirements—the manufacturer could go ahead and arrange for the purchase and assembly of necessary raw materials and manufacture to meet required deliveries. This will set the wheels of commerce in motion, and with many orders placed the effect would be far-reaching and the railroads would be benefited thereby; unemployment would be lessened, and market conditions would be stabilized.

I am not unmindful of the conditions under which the railroads are working, and that as traffic falls off expenditures are gaged accordingly; also that certain maintenance as well as new work is seasonal, and that the various roads have and follow certain well-defined policies with respect to making contracts for materials and supplies. But in view of the unusual conditions prevailing at this time, I believe that it is an opportune moment to invite consideration of the extension of the contract program.

The question may be raised as to the wisdom of making extensive purchases at this time when the market is unsettled and, generally speaking, on a higher level than it should be normally, but I believe that it will be conceded that prices have gradually receded from wartime levels and will not likely be any higher. Such commitments as are made could provide for price protection to the buyer in the event of decline in cost on unshipped material due on contract.

Under present conditions the price named in a contract

should be considered as a maximum figure in view of the business given the seller at this time instead of deferring the placing of the order until prices may be lower; and in justice to the buyer who may not need the articles or materials at this time, price protection should be afforded him as above suggested.

There is another advantage worthy of consideration with respect to making contracts in advance of immediate requirements, and that is the fellow who takes time by the forelock will be assured of delivery of a definite supply when he needs it.

These are personal views only, and I hope at least a discussion of the suggestions will follow.

I. N. T. ROBERTS,

Special Assistant, Purchasing Department, Illinois Central.

## A Mature Student on College Men and the Railroads

COLLEGE STATION, TEXAS.

TO THE EDITOR:

I have followed with much interest the discussions in your columns of the college man and his chances on the railroads. I agree with both sides in this discussion. I agree with "One Who Has Seen" in the December 10 issue, when he says, in substance, that the college man, as a rule, is egotistic.

I happen to be a student of civil engineering in the Texas Agricultural and Mechanical College, and, being a close student of human nature, I can see a large amount of ego in my classmates. I say this in all candor and back it up with the statement that there cannot be a finer bunch of young men in any college. It is just a superior air that one will adopt, if one is not careful, when one attends college. I am twenty-eight years old, and having worked in the engineering profession before coming to college, I have seen this trait in many young engineers. This same superior feeling prevents the college man from rubbing elbows with what he terms "rough necks." This has the disadvantage of preventing him from learning little tricks here and there, because the working man has no patience with a "dude" and will therefore refuse to help him. It is this same know-it-all spirit that keeps the college man from taking advice from the experienced non-college man.

There is another phase of why the college man fails in railroading. When he goes, or is sent, to college, the average boy has not the remotest idea of what course to take. Perhaps he has a friend who enrolls in the civil engineering course. So he takes the same course to be with his friend. There are nine chances to one that, should he go into railroading after graduation, he does it in the same haphazard way that he chose civil engineering in his freshman year at college. Now, even though such a man may have ranked high in his studies at school, he cannot make as efficient a workman as the man who merely passed all subjects but chose railroading because he liked it and because the call of the rail was in his blood. No man can hope to succeed if he takes just a passing interest in his work and does not put the drive and "pep" into it that he used to see in the old football team back at college. And, if he does not like the game of railroading, he cannot put that fight into it.

Now may I ask a question? Why did the Southern Pacific do away with their training course for college graduates? James J. Hill had his "kindergarten" for college men on the Great Northern. Were not these courses a success? Surely there are being graduated nowadays college men who have the inborn desire to railroad, and who would only be too glad of such an opportunity.

A TEXAS "AGGIE."

## Another Viewpoint on the Chief Clerk Question

DOWN-SOUTH.

TO THE EDITOR:

I have read with interest the articles which have recently appeared in the *Railway Age*, pertaining to the chief clerk and the relation, feeling or attitude existent between him and his superior officer. On divisions or in departments where both the officer and the chief clerk are really able men, I venture to say that any feeling of antagonism is almost entirely absent, each appreciating the value and importance of the other, with a reciprocation of confidence and esteem.

In the different letters the word "recognition" is used frequently, which I infer means that the chief clerk should be regarded as an officer, rather than one whose existence is brought into the limelight only in cases of embarrassment.

A few days since we were on the verge of an eruption of organized labor, and more than ever we heard business men discussing the problem and freely expressing their views on the subject, which were briefly, "that all railroad men are overpaid." It is admitted, in fact generally known, that certain classes or crafts are over-rated, but let's be fair and not say *all*, for a little investigation would be necessary to prove that it is not the chief clerk.

For the sake of comparison, take a car foreman and a chief clerk. In 1915 the former received \$60 per month and the latter \$100. Today the foreman receives \$260 and the chief clerk \$185. Further, the office manager in almost any commercial concern receives at least one-and-one-half times as much as a chief clerk whose duties certainly carry more responsibilities, his activity and accountability not being confined to the operation of the office alone, but on the contrary involving his passing upon matters of importance in the shop, on the division, or on the system.

Call him what you will, confine his name to the counter-signature on passes, if it is felt that in this way he can best serve, but when his name is placed on the pay rolls, take into consideration that the education which he must necessarily have cost time and money, and unlike other occupations he cannot expect to be a master car builder, etc., but must continue "to serve" faithfully in his position of trust and confidence until his superior passes to broader fields, and his successor brings along "his man" as chief clerk; or perchance, opportunity knocks upon his door and takes him to some commercial firm or corporation that recognizes ability, even in office men, and compensates them accordingly.

ICH DIEN.

## New Sleeping Cars for the Canadian Pacific

Composite Cars of 12-Section and Compartment Types  
Have Special Facilities for Comfort of Passengers

**I**N HANDLING its through passenger business the Canadian Pacific is confronted with some interesting problems. The road has the advantage of a fine scenic route and with a line extending from coast to coast, is well situated to secure transcontinental passengers. On the other hand, the competition for Pacific Coast traffic is very keen. Furthermore, the

facility for the comfort of travelers. These conditions were carefully considered by the railroad in drawing up the designs of the latest order of 12-section and compartment sleeping cars. As a result the cars have been fitted with numerous conveniences not found in the ordinary sleeping car.

One of the notable features of the 12-section type sleeping

cars is the provision made for the comfort of women passengers. This is particularly desirable in the transcontinental service on account of the length of the runs and because the proportion of women in tourist traffic is greater than where the cars are used principally for business trips. The ladies' dressing room is unusually commodious. It is fitted with three wash stands, each of which has a light above it, and is provided with a three panel, adjustable mirror. A long mirror is also fitted in the saloon door. One of the innovations which should contribute materially to the comfort of women passengers is a couch which has been installed in the dressing rooms on some of these cars. This provides an opportunity for relaxation that would seem highly desirable in view of the somewhat uncomfortable form of the usual sleeping car seat.

The new equipment consists of 69 sleeping cars, 56 of the 12-section type and 13 of the 10-com-

partment type. All the cars are constructed with steel frames and wood interior finish. The frames and trucks were built by the Canadian Car & Foundry Company at Montreal and the interior fittings were applied at the Angus shops of the Canadian Pacific.

On account of the special features of the design, the 12-section sleeping cars are extremely long, the length over the

*Interior of the Twelve-Section Sleeper*

prospect of the journey of 2,886 miles between Vancouver and Montreal, requiring four and one half days to complete, might seem unpleasant to inexperienced travelers. The hotels conducted by the company at intervals along the route afford an opportunity for breaking up the journey, but even so the character of the traffic demands that the passenger equipment be of the highest grade, provided with every

fastened to the inside of the clerestory. The upper carlines are of  $\frac{1}{8}$  in. steel of Z section,  $4\frac{3}{8}$  in. high at the center and are placed directly above the lower deck carlines wherever possible. They are riveted to the inside deck plate and to the lower carlines. The body corner posts are built up of a 3 in. by 4 in. angle forming the corner with a 4 in. by 3 in. by 3 in. Z-bar riveted to the inwardly extending flange of the

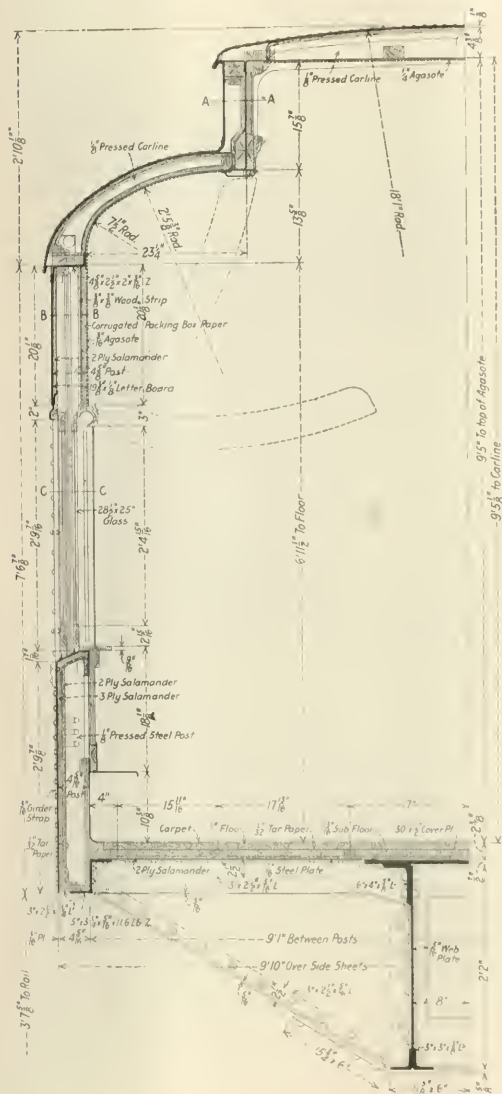

corner posts are made up of pressed steel with a wood filler.

The outside plates below the windows are 3/16 in. thick and meet the window ledge under the belt rail. The letter board and the pier plates are 1/8 in. thick and the outer deck plates 1/16 in. thick. The roof sheets are 1/16 in. thick excepting the hood sheets, which are No. 12 gage galvanized.

The exterior of the cars is finished in Tuscan red, the railway company's standard colors.

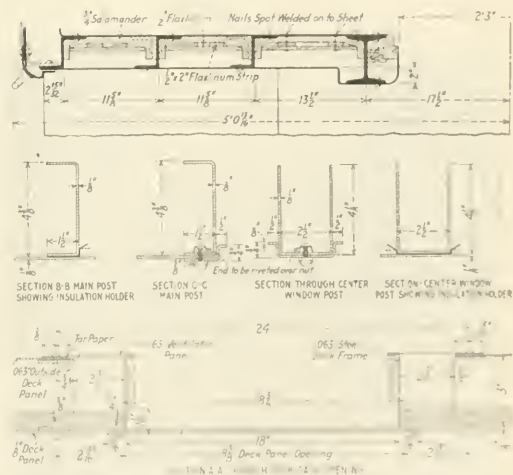

### Interior Finish

The fittings in the interior of the car have been designed to give a pleasing appearance and also to afford adequate insulation for the extremely cold weather encountered in Canada. Three thicknesses of insulation are used in the side walls and two thicknesses in the roof and the deck. The method of fastening the insulation in the deck is worthy of mention. Wire nails are attached to the sheets by spot welding the heads. The insulation is driven over the nails which are then bent over. The floor has one layer of insulation over which a double wood floor is laid, except in the passageways which have rubber floors and the saloons where tile is used. Steel plates form the inside of the wall up to the seat level and a

### Transverse Section Through the Car Body

angle and forming a point of attachment for the end plates. The door posts are 6 in. I-beams to which wooden door frames are fitted.<sup>4</sup> There are two intermediate posts on each side made up of 4 in. by 3 in. by 3 in. Z-bars, reinforced up to about two feet above the floor by 3 in. by 3 in. angles. The vestibule diaphragm posts are of 6 in. I-beams and are braced to the end posts of the body by 6 in. channels. The vestibule

### Horizontal Sections Through the Car Body

third layer of the Salamander insulation is carried up to that point. The inside of the walls above are covered with wood wainscoting up to the lower edge of the berths. The side walls within the berths and the headlining are of Agasote. The berths, the deck molding and the interior partitions are of wood.

All the woodwork is mahogany or mahogany finished, except in the men's smoking room where either English oak or black walnut has been used. All parts above the deck molding are painted greenish gray. Little ornamentation is used. The ceiling and deck panels have a conventional border and marquetry borders are set into the berths and bulkheads. The seats are upholstered in green figured friezette plush and the carpet also is green. In the staterooms Biltmore plush is used for upholstery.

The men's smoking compartment has three wash basins, a dental lavatory and seats for six persons, upholstered in leather. The entrance to the men's saloon is from the hall instead of through the smoking room.

The cars are heated by a combined vapor and hot water system with a Frumveller heater. The main piping has separate controls for each side of the car, for the stateroom and

the smoking and dressing rooms. Additional heating pipes are provided which have individual regulation for each section. Twenty-one Mudge ventilators are applied to insure adequate air circulation.

The lighting systems are of the Safety and Stone-Franklin types. The batteries have a capacity of 600 ampere hours. The main lighting fixtures have semi-opaque bowls, five of this type being used over the berths and one in the stateroom. The usual arrangement of small lamps in the berths and aisle night lights is followed. The smoking room is fitted with a two-light ceiling cluster and individual lamps over the mirrors, while in the ladies' dressing room wall fixtures only are used. The conduits for the piping are set inside the walls and the roof.

The cars are carried on Commonwealth six-wheel trucks, with 5 in. by 9 in. journals, having a wheel base of 11 ft. They are equipped with steel tired wheels and clasp brakes. The brake equipment is the schedule LN1812 designed for 90 per cent braking power. Miner hand brakes are used with a sheave wheel between the drum and the brake rigging to increase the force.

### Compartment Cars

In general design the compartment cars are quite similar to the 12-section sleeping cars. The body is two feet shorter

Interior of One of the Compartments

and changes have been made in the spacing of posts to fit the altered floor plan. The interior woodwork is mahogany and the upholstery is Biltmore plush. Care has been taken in fitting the compartments to afford the maximum of comfort and convenience for the passengers. Individual regulation of heat and ventilation is provided. A long baggage rack, an umbrella rack, trays and numerous hooks are facilities that will appeal to the traveler with a large amount of luggage. Space at one end of the car has been utilized for a saloon while the other end carries the heater, linen locker and porter's room.

Both types of cars are equipped with safety appliances to meet the United States and Canadian standards. The hand-folds are attached so that they can be removed without dis-

turbing the car framing, flooring or lining. Other appliances include bottom operating lower couplers, Miner A5P draft gear, Acme single web type diaphragms with rubber hoods, JM expander rings, Miner buffer and Woods single roller side bearings.

## Freight Car Loading

WASHINGTON, D. C.

**L**OADING of revenue freight during the week ended on December 17 totaled 727,003 cars, as compared with 742,926 the previous week, or a reduction of 15,923 cars, according to reports compiled by the Car Service Division of the American Railway Association. This was a reduction of 75,268 cars compared with the corresponding week last year and 79,731 cars, compared with the corresponding week in 1919.

Livestock and coke were the only commodities to show increases over the week before, the former totaling 33,861 cars, which was an increase of 1,702 cars over the week of December 10 and 3,389 cars more than were loaded during the corresponding week in 1920. Coke increased 507 cars within a week, bringing the total to 7,145.

The decrease in the total loading was due principally to a falling off compared with the week before of 12,194 in the number of cars loaded with merchandise and miscellaneous freight, the total being 449,547 cars. This was, however, 11,615 cars more than were loaded during the same week in 1920 but 18,300 less than during the same week in 1919.

Coal loadings totaled 134,842 cars, 2,994 less than the week before and more than 90,000 cars below the corresponding week last year. Grain and grain products amounted to 47,383 cars, 1,297 cars less than the week before but 12,152 cars more than during the same week one year ago and 9,839 cars more than during the corresponding week in 1919.

Shipments of forest products, compared with the week before, also fell off 1,054 cars, the total being 48,690 cars. This was, however, 1,942 more than were loaded one year ago but 3,058 less than during that week in 1919. Ore loadings amounted to 5,535 cars, a decrease of 593 cars compared with the week before.

Compared by districts, the Southern and Southwestern districts reported increases in the loading of all commodities over the week before, but all showed decreases compared with the corresponding week in 1920.

For the period ending December 15 the freight car surplus increased to 371,221, as compared with 339,532 on December 8. Surplus box cars totaled 138,214, an increase of 8,219 compared with the total on December 8, while surplus coal cars numbered 186,508, an increase of 20,445 within the same period. An increase of 1,384, which brought the total to 17,814, was reported for stock cars while there was an increase of 405 within a week in the number of surplus coke cars.

T. H. DAVIS, general chairman of the Association of Shop Craft Employees, Eastern Region, Pennsylvania Railroad, in a letter sent to all shop craft employees in his territory, says: "The railroad officials have many troublesome questions confronting them, but they have shown every disposition to try to strain a point in our favor when we were able to show them the justice of our claims; and, as co-operation is a two-sided thing, we feel that we ought to show our appreciation by helping them in every way we can. . . . What we need now is good business, to enable us to improve our conditions, and if every employee would just speak a good word for the old P. R. R., it would mean more business, and more business means more money to all of us. . . . It would be a very short time until the Pennsylvania could pay better wages and have better conditions than any other railroad in America."

# The Railway Situation and General Business\*

## Why Premature Reductions of Rates Will in the Long Run Cost Shippers Far More Than They Will Benefit Them

By Samuel O. Dunn

Editor of the *Railway Age*

I HAVE COME to talk to you about a condition of affairs which should be known and given grave consideration by every farmer, business man and public man. This condition is a serious maladjustment in the relations between the railroad system of the country and its industrial, commercial and financial systems. For over ten years, and especially within recent years, the capacity of our industries for producing commodities, the capacity of our commercial concerns for marketing them and the capacity of our financial institutions for financing their production and marketing, have been rapidly outgrowing the capacity of our railways for transporting them. If we follow that road much longer we shall all participate in a disaster which the exercise of ordinary intelligence and foresight would avoid.

The pessimist is always unpopular. He is never less popular than in a period of business depression and losses, of widespread unemployment and suffering, such as the present. In such times the man who is heard gladly is he who essays to tell how we may escape from the conditions immediately oppressing us, and who speaks cheerfully about the early future. No man can hope to ingratiate himself with busy people whose time he takes to paint gloomy pictures of evil developments which seem sure not to occur for some time, and which most of those who hear him may believe will never occur at all.

But every successful man in his own business looks farther ahead than the next few months, otherwise he would not succeed. Likewise, if our people as a whole are to be successful in their business as a whole and after the present depression are to enjoy a period of prolonged prosperity, they must look farther ahead than a few months. Now at present the railways could handle much more business. But you know why that is. The amount of traffic offered to them depends on how much production and commerce are being carried on by other concerns; and the production and commerce being carried on now are abnormally small.

The conditions to which this is due will soon pass—in fact, are passing. On that point I can speak as optimistically as anyone. Just when a substantial revival of general business will occur few would venture to predict. That it will come comparatively soon almost everybody who speaks with any authority does predict.

### Great Shortage of Transportation Probable

The question I urge business men to consider now is the effect the railroad situation probably is going to have when this improvement in general business does come. We have always had a great revival of business after every period of profound depression in the past. We never had such a revival of business which did not result in the railways being offered a much larger traffic than they had ever handled before. In almost every such period we have had traffic congestions and large "shortages of cars," as we have called them, because the railways met difficulty in handling the increased business. If we judge by what has been done and not done in the railroad and other businesses within recent years, and by what is being done and not done now, we must conclude that the losses caused by transportation condi-

tions in the next period of active business will exceed all the losses that ever were caused by such conditions in our past history.

If you are sceptical, as I suspect many of you are, as to whether this prognostication of evil is based on facts, let me recall some recent history. Have you forgotten what occurred in 1917 and 1918? We entered the Great War in 1917. Under its stern stimulus the productive activity of the country was raised to the highest pitch, and it was speedily found that although they handled more traffic than ever before the railways could not handle all that was offered them. In 1918, under government control, the amount of business taken by the railways was constantly restricted by the policies of the Fuel Administration in limiting the amount of coal that "non-essential" industries could have, and of the Railroad Administration in making use of embargoes to prevent freight from coming too fast. Again, in the latter part of 1919 and almost throughout 1920 there was constant complaint from shippers that the railways were unequal to the demands, although then also they were handling more traffic than ever before. You can hardly have forgotten that in 1920 there was great alarm lest the amount of coal produced and transported would be insufficient for the country's needs. To prevent a coal famine the Interstate Commerce Commission issued an order giving priority in the use of open top cars to coal over all other commodities. The result was that construction work of all kinds was seriously interfered with.

These and other facts that could be mentioned show that during most of the four years from 1917 to 1920 the capacity of the railways proved unequal to the demands of commerce. Why was this? It was because for some years their development had been slowing down, while that of other industries had been going forward with unprecedented rapidity. In the seven years ending with 1913 the total freight handled by the railways increased 39 per cent. In those years they increased the number of their freight cars by 315,000, and the number of their freight locomotives by 8,100. In the seven years ending with 1920 the freight handled increased 38 per cent, while the number of freight cars increased only 143,000, and the number of freight locomotives only 4,200.

Why did the development of the railways slow down while that of other industries was accelerating? It was because the amount of new capital invested in the railways greatly declined, while the amount invested in other industries greatly increased. This, in turn, was due to the fact that different classes of our business concerns were dealt with so differently by our state and national governments that while the profits of the railways increased very little those of other classes of concerns increased enormously. In the three years ending with 1911 the net income of the railways, after paying interest and taxes, averaged \$430,000,000 a year. In the next three years it declined. In the three years ending with 1917 it averaged \$558,000,000, or 30 per cent more than in the three years ending with 1911. The government guarantees while they were under government control were based on their net return in the three years ending with 1917. Therefore, for purposes of comparison it is fair to say that their net income in the five years ending with 1919 averaged 30 per cent more than in the three years ending with 1911.

\*An address delivered on December 16, before the Lions' Club, and Chamber of Commerce at Dallas, Tex.

Since the value of the dollar had greatly depreciated, this increase in net income, measured by what it would buy, really was a decline.

### Vast Profits in Other Businesses

What was occurring, meantime, in other lines of business? The returns of all the corporations of the United States to the Bureau of Internal Revenue show that in the three years ending with 1911 their net income, after paying interest and taxes, averaged a little over three billion dollars a year. In the three years ending with 1914, while railway net income declined, the net income of other corporations increased. In the five years ending with 1919 the net income of all corporations averaged seven billion dollars a year, an increase of 120 per cent, or four billion dollars a year.\* This increase in net income for that five years aggregated twenty billion dollars—an amount exceeding the valuation placed by the Interstate Commerce Commission upon all the railways of the United States in the great rate case last year.

I do not criticise these vast profits of general business. I cite them in contrast to those of the railways merely to show there was such a large difference in profits in the railway and in other industries during these years as made it inevitable that the development of other industries should far outstrip that of the railways. Some indication of how much greater the development of other industries was than that of the railways is given by statistics regarding the amounts of securities issued. In the three years ending with 1914 the total amounts of securities issued by railroad and industrial corporations were about the same, being for each about two and a quarter billion dollars. On the other hand, in the three years ending with 1920 the total securities issued by the railways were less than a billion dollars, while the total issued by industrial corporations exceeded six billion dollars.

### Can Other Industries Produce to Their Capacity?

Can anybody reflect upon such facts without being apprehensive as to what will occur when business revives again and the industries of the country begin to try to produce to their capacity? We shall be confronted with a situation the like of which never existed. We shall have a system of railways the capacity of which has been within the last ten years, and especially within the last five years, increased relatively less than at any time since the first rail was laid. We shall have productive industries whose capacity probably has been increased relatively more within those same years than ever before. How can we draw any conclusion other than that when that time comes the traffic offered to the railways will far exceed what they can handle? But the amount of production and commerce that can be done depends on the amount of farm products, of fuel, raw materials and finished products that can be transported; and for transportation we are chiefly dependent on the railroads. Therefore, instead of being able to operate and produce to their capacity, the industries of the country will have to limit their production to the basis of the amount of traffic the railways can handle. But the vastly increased investment which has been made in these productive industries has been made on the assumption that they will be able to produce to their capacity. If they are not able to do so they will not be able to earn a return upon all the great investment which has been made in them. Prolonged inability of our productive industries to utilize a large part of their productive capacity would cause disaster to many of them and to many of our commercial and financial institutions.

Is it not plain there is a real danger in this situation for all of us? If there is a real danger in it, what should be done to avoid it? It would seem the only effective thing that can be done is to give the development of the railways

a chance to catch up with the development of other industries. That, in turn, cannot be done in any way under private ownership except by allowing them to earn a net return sufficient to attract more investors. You know as well as I do that no large new investments are now being made in the railways. In the interest of the public welfare they should be strenuously engaged in increasing their facilities. They are doing nothing of the kind because since they were returned to private operation the percentage of net return they have earned has been the smallest in over 30 years, and they have had to retrench in every way to earn that.

Perhaps you will agree that the railway situation menaces the future prosperity and welfare of the country, but you will add that it is the fault of the railways themselves that within recent years they have not earned larger profits and got into better condition, physically and financially. You may say they would be all right if they had been as efficiently managed as other concerns. There are, however, certain facts which demonstrate that the difference between the profits made by the railways and by other concerns within recent years have not been due to differences in management. These facts have a very direct bearing upon the high rates of the railways which are now the objects of so much attack.

### Great Increases of Prices Explain Profits

The statistics of the Interstate Commerce Commission show that the average freight rate in this country steadily declined until it reached the lowest point in history in the years 1916 and 1917. On the other hand, the statistics of the Bureau of Labor show that in the years 1916 and 1917, before there had been any advance in freight rates throughout the country, the average wholesale price of all commodities was 70 per cent higher than in the years 1900 to 1910. There were large general advances of freight rates in 1918 and again in 1920. But even the advances granted in 1920 made the average railway rate only 70 per cent more than it was in the years from 1900 to 1910, while in 1920 the average price of all commodities was 175 per cent more than in the years 1900 to 1910. There can be no disguising the fact that the enormous increase in the profits of other industries from 1915 until the present severe depression began was due mainly to great increases in prices; or the further fact that the failure of the railways to participate in these large increases in profits was due to rigid systems of government regulation and government control which made it impossible for them to increase their rates and profits when other concerns were so greatly increasing theirs.

After this long period of years when the railways were restricted to net returns which were positively beggarly compared with those made in other lines of business, and when in consequence the development of the railways fell far behind that of other industries, we might not unreasonably expect to find the farmers and business men of the country unitedly demanding a government policy in dealing with the railways in future which would insure rapid and adequate increases in their capacity. And what do we find? We find ourselves in the midst of a great agitation for general reductions of freight rates which is supported by the argument that the present rates are so high that they are insupportably burdensome to business. We see numerous bills being introduced in Congress to repeal all the provisions of the Transportation Act which were adopted to reform the restrictive and destructive system of railway regulation we had before the war. We have had even the spectacle presented of large business interests threatening to ask Congress to pass legislation to compel the railways to reduce their rates, if they did not voluntarily reduce them, without the reasonableness of reductions being first passed on by the Interstate Commerce Commission.

A stranger to the facts would infer from what is being widely said and published that the present rates of the rail-

\*These statistics regarding net income of all corporations are based on data given by Prof. David Friday in his recent very illuminating and valuable book, entitled "Profits, Wages and Prices," page 15.

ways are relatively very much higher than the present prices of most commodities. And what are the facts? In July, 1921, the latest month for which we have complete statistics, the average freight rate per ton per mile in the entire United States was  $65\frac{1}{2}$  per cent higher than the average rate from 1900 to 1910, while the average wholesale price of all commodities was 66.7 per cent higher than the average wholesale price of commodities in the ten years from 1900 to 1910. Are the present rates unreasonably high in proportion to prices in general? Are they so high that they are really preventing the movement of traffic? The present average freight rate is almost exactly as high in proportion to the present average wholesale price of commodities as it was in the years 1900 to 1910; and in those years the industrial activity and the prosperity of the country were so great that the total freight handled by the railways increased 80 per cent. Since the traffic of the railways increased 80 per cent when the relations between the average railway rate and the average wholesale price of commodities was almost exactly the same as now, how can it be rationally contended that the present relationship between rates and prices is so burdensome that it is preventing a revival of business?

### Most Commodity Prices Still Higher Than Rates

As a matter of fact, however, the present relationships between railway rates and the prices of individual commodities are not the same as from 1900 to 1910. There are some commodities, such as farm products and metals and implements, the present prices of which are relatively much lower compared with freight rates than they were then. On the other hand, the average prices of those things which the Bureau of Labor classifies as cloths and clothing are 93 per cent higher than then, of fuel and lighting 98 per cent higher, of drugs and chemicals 82 per cent higher, of lumber and building materials 130 per cent higher, of house furnishings 147 per cent higher, and of miscellaneous commodities 72 per cent higher. Is it fair to say it is high railway rates that are imposing an insupportable burden on business when the average prices of most important groups of commodities are still higher in proportion than the railway rates charged for transporting those same commodities?

I do not attack the present prices of any commodities. Perhaps there is justification for all of them. I am not defending all the present railway rates. Many of them are too high and should be reduced, and since the last general advance in 1920 many rates have been reduced, some under irresistible political pressure from Washington, and some to enable the railways to move traffic which they otherwise would not have had a chance to move. When it is said, as it frequently is said, that the railways ought to reduce all their rates in their own interest, because if they would reduce them they would get to handle more traffic and make more money, there is attributed to railway officers too little knowledge of and interest in their own business. They are more anxious than anybody else to increase net earnings; and they are quite as able as anybody else to decide what changes in rates will increase net earnings. They can be relied on to reduce as rapidly as possible every rate whose reduction will increase net earnings.

### Our Most Important Railroad Problem

But from the standpoint of the farmer, the manufacturer, the merchant, the banker, the working man and every other class of our people the most important question regarding the railroads at present is not whether, by how much, or when, their rates should or will be reduced. Our most important problem affecting the railroads is that of devising and carrying out of a policy which at the earliest possible time will cause a renewal on a large scale of increases in their capacity. An immediate general reduction of rates might confer temporary benefits by temporarily stimulating

general business. But it would inevitably make the net operating income of the railways less than it otherwise would be. That would postpone the time when the railways could begin rehabilitating and enlarging their facilities.

Because the capacity of the railways was inadequate in 1920 many farmers could not get their grain to market when grain prices were high. The coal operators complained they could not operate their mines to capacity because they could not get enough cars. Construction concerns complained bitterly because the giving of priority in the use of open top cars to the coal operators made it impossible to do all the construction work they wanted to do. The manufacturers had to send hundreds of thousands of automobiles over the country under their own power because the railways could not haul them. The railways already are increasing their purchases of equipment; and rates which will enable them to maintain and increase their net returns will enable them to increase their capacity so that when a revival of business comes they will at least be less unequal to the demands than they would be if premature reductions of rates were made. On the other hand, if premature general reductions of rates are made the railways will be unable even to start to reduce the great disparity between their capacity and the productive capacity of the country's other industries. Therefore, premature general reductions of rates seem as certain, by preventing increases in the capacity of the railways, to prepare the way for a very serious crisis in the relations between our transportation system and our industrial, commercial and financial systems when general business revives as anything that could be done. What will it profit the farmers and business interests to secure comparatively small reductions in their rates and comparatively small increases in the business done by them now, if these transient benefits are obtained at the cost of far greater losses extending over much longer periods?

The other business interests of the country are far better able to stand the present rates than the railways are to stand general reductions of them. The other business interests have suffered heavy losses during the present depression, but so have the railways. And while other business interests entered this period after having earned for over five years a net income more than twice as great as before the war, the railways entered it after having during those same years received a net income which, by comparison, was very little greater than before the war. When you are disposed to say that railway rates should go down along with prices, do not forget that prices were increased long before rates were, and that when rates had been advanced a maximum average of 70 per cent the average wholesale prices of all commodities had been advanced 175 per cent.

### How to Get Rates Down

While premature general reductions of rates would be immediately disastrous to many railways and in the long run would be harmful to business of all kinds, it cannot be questioned that in future the general tendency of rates should be downward, although this is equally true of the prices of many commodities. But these reductions of rates, in the interest not only of the railways but of the entire nation, should be preceded, or at least accompanied, by corresponding reductions in railway operating costs. Much the largest part of railway operating expenses consists of the cost of labor. Compared with the present costs of living and the wages now being paid in other industries, the wages of most railway employees are too high. The railways are preparing to ask the Railroad Labor Board for a further reduction of wages. But the Labor Board is a government body. As such it represents the public. Therefore, indirectly, the labor costs imposed by it are imposed by the public. Farmers and business men are a majority of the public. Therefore, indirectly, the farmers and business men determine the largest part of

the operating expenses of the railways. Have they any right to complain against the managements of the railways if, through the Railroad Labor Board, they themselves impose labor costs on the railways which make it necessary to maintain relatively high rates? The public's recourse, if high labor costs compel high rates, is not to the railway managers, but to the Railroad Labor Board and to the Congress under whose legislation the Railroad Labor Board acts.

Another of the very largest items of railway expenses is the cost of fuel. This item is, and for many months has been, excessive because of the high prices of coal. The high prices of coal have been mainly due to the high wages of the miners. The present wages of union miners were fixed by a government commission to remain in effect until March 1, 1922. The railways are not responsible for high freight rates in so far as they are due to high prices of coal.

Since the present rates were made necessary, and since their continuance has been made necessary chiefly by high labor costs and high prices of coal, the railway managements have a right, and it is their duty, to say to the farmers and business interests that they must help to secure reasonable reductions of railway operating costs if general reductions in rates are to be made under conditions which will not in the long run injure more than they will benefit the farmers and business interests themselves. And in this connection it is relevant to point out that the Railroad Labor Board, in fixing wages, is required by law to consider the cost of living; that the cost of living is mainly determined by the general level of prices; and that the present high prices of some classes of commodities and the high rentals in our cities are the principal obstacles to securing a really large further reduction of railway wages.

#### Government Regulation Centers Attacks on Railroads

We are in the midst of a period of severe and even violent readjustment of business and economic conditions. This readjustment has been made necessary by the war. The war caused enormous increases of prices and wages and temporarily created new relationships between different classes of industrial, commercial and financial enterprises. It was inevitably followed by a period of worldwide depression which has caused great reductions of prices and wages, and is establishing still other new relationships not only between the industries and commerce of different nations, but also between different classes of industrial, commercial and financial concerns in our own country. Today those in all lines of enterprise are struggling fiercely not only to minimize immediate losses, but also to put their various houses in order so that after the present period of stress and distress they may again do a large business and make large profits. In this period of struggling back to "normalcy" the railways have peculiar difficulties to contend with. They have to work through it without being able to draw upon large surplus profits made during the war years. They have to work through it with every rate they can charge subject to regulation by government bodies, and with the wages and working conditions of every one of their employees controlled by a government body. The managers of other business concerns are comparatively free to use such means as they see fit for getting out of their difficulties. The railways must use such means as government authorities will permit. Unfortunately, also, the very circumstance that their rates and wages are regulated by the government concentrates upon them pressure and attacks of a kind from which most other business concerns are exempt.

The policies that the government bodies which regulate the railways will adopt and follow will depend mainly upon public sentiment. If public sentiment demands that railway rates and wages shall be regulated largely regardless of both the immediate and later effects upon the net return the railways are able to earn, the capital they can raise and the

extent to which they can prepare for rendering adequate service, then rates and wages will be so regulated. On the other hand, if public sentiment demands that both railway rates and wages shall be regulated with due regard to the net returns that the railways can earn, and to the effects that will be produced in the long run upon the service they can render to the public, rates and wages doubtless will be so regulated. Public sentiment in this country is omnipotent, and in the long run, regardless of statutes and courts, dictates the policies followed by the government in reference to any industry over which the government extends its regulating authority. Therefore, the farmers and business men of the country can call the tune to be played by government regulation. They can call a tune which will prevent or one which will cause revival of the development of the railways. In reaching a decision as to what tune they shall call, however, they should not overlook one fact of very great importance to themselves. This is, that those who call the tune will finally have to pay the piper, and that upon what tune they call will depend how large the piper's bill will be.

It is hard to believe a people who have used so much sagacity and foresight as the American people have in respect to many other great matters should persist in using so little sagacity and foresight in dealing with the railroad problem as they have used thus far. Surely we have learned too well the costly lessons taught by our experience with government regulation and government control to renew the policy of railway restriction, and even confiscation, which we systematically pursued for years, and which we so gladly and even enthusiastically abandoned when we passed the Transportation Act. If we return to the old pre-war policy of constantly restricting the railways to the lowest rates and least earnings which the courts will not declare confiscatory, we had just as well reconcile ourselves to the expectation that sooner or later private ownership and management of railroads will fail and the public will adopt government ownership and management or Mr. Plumb's famous plan; it will do so from sheer desperation and disgust at the natural and unavoidable results of its own mistaken and shortsighted regulation.

This railroad problem is not merely the railroads' problem. In a much more real sense it is the public's problem. Government regulation makes it necessary for the public to participate in solving it, and the public will be injured or benefited much more by the way it is solved than the owners and managers of the railways. It will never be solved right until business men direct their influence upon government regulation by the same intelligence and foresight that they use in managing their own affairs. If business men ever do apply to the railroad problem the same intelligence and foresight that they use in solving the problems of their own businesses. Then, and not until then, will the railroad problem be solved and solved right.

---

MISS A. I. DEWAR, operator for the Canadian Pacific at Heron Bay, Ont., finds her name in the general superintendent's "educational" (discipline) record for November, with 25 merit marks for special efficiency on a very cold night. She received a telegram at 11:15 p. m., addressed to a man who was hunting four miles out in the bush, advising him of the death of his brother, in Port Arthur. She, when relieved at midnight, took the message and, accompanied by her sister, braved the dangers of a lonely tramp through the bush, in which wolves could be heard, and walked the four miles, the mercury at the time standing at 5 degrees below zero. By her prompt action the recipient of the telegram was enabled to take train No. 1 to Port Arthur before morning. Whether or not the Ottawa government, like that at Washington, has men out hunting for chances to impose penalties (on the railroad, not on the operator) when telegraphers work overtime, is a point on which no information is given.

# Western Maryland 1921 Net in Sharp Contrast

Almost Back at Pre-War Level—Turn-Around Operation Saves  
50 Per Cent in Time of Tonnage Trains

THE ANNUAL REPORT of the Western Maryland for 1920 was issued to the public on Monday, December 5.

The meat of the report is largely contained in the concluding remarks of Lawrence Greer, chairman of the board. The statement says:

The plans of the company, interrupted during the period of federal control, for the establishment and maintenance of its railroads as an efficient transportation system of modern type, were resumed upon the restoration of private operation, and have been followed during the present fiscal year and since its close. To this end, particular attention has been directed toward the enlargement of the terminal facilities at Baltimore through the acquisition of additional contiguous property, the completion of a new steel coal pier with modern mechanical unloading apparatus, the substantial expansion of storage and handling facilities at the grain elevator at Port Covington, and the acquisition of steel carfloats of large capacity for service in Baltimore harbor. The transportation capacity of the property has also been increased by the addition of 40 Consolidation freight locomotives, and attention has been given to the maintenance of track and structures so that, with the return of normal business conditions, every de-

an item of \$1,000,000 partial payment on account of the guaranty, but not the full amount accrued. This compared with the net corporate income in 1919 of \$231,665; in 1918, of \$342,527. There is a wealth of interesting detail in the annual report and a perusal of it will give a complete story of what the road has been doing month by month since the beginning of 1917. The comparative tables showing the cost of locomotive performance per 100 miles run, etc., for the years 1917 to 1920 and the detailed figures relative to maintenance for the years 1912 to 1920 will be found especially interesting.

## Present Monthly Net About \$250,000

Immediate interest in the railroad lies naturally in what the carrier is doing at present. The figures for operations in 1921, so far as they are available, afford an interesting study in contrasts as compared with 1920. At present the road's net railway operating income is running at the rate of

One of the Heavy Consolidation Locomotives Which the Western Maryland Is Using in the Turn Around Service Between Hagerstown and Cumberland

These locomotives are among the heaviest of their type ever built. They have 27 by 32 in. cylinders, a total weight of engine of 294,900 lb. and of 565,000 lb. including the tender. The weight on drivers is 268,200 lb. and the tractive effort 68,200 lb. The tender, which has six-wheel trucks, carries 15,000 gallons of water and 16 tons of coal. Built by the Baldwin Locomotive Works.

partment of the transportation system may be properly equipped to provide efficient service for the handling with economical results of the business which may be offered.

## Results of Operations in 1920

The annual report of the Western Maryland is issued so late and the changes have been so great in the period which has intervened since the close of the year with which it deals, that interest lies less in the details given in the report than in the operating results which are being secured at present. In 1920, nevertheless, the road handled a record business. It moved 18,335,345 revenue tons of freight and its revenue ton-miles totaled 2,289,370,222. The best previous year was 1918 when 17,156,884 tons were moved and the ton-mileage totaled 2,185,961,077. The average haul in 1920 was 125 miles; in 1918, 127.

The property in 1920 had a net railway operating income of \$675,975, which figure was as large as it was because of a large credit per diem balance. The 1920 net compared with deficits in 1918 and 1919, during the federal control period. For purposes of comparison also it may be noted that the standard return based on the results for the three years ended June 30, 1917, was \$3,079,593. The corporate income account for 1920, including government rental for January and February and the guaranty for the following six months, showed a net for the year of \$57,735, including

over \$250,000 monthly and has been running at that rate all the year. The net railway operating income for the first ten months of 1921 has been \$2,512,328 as compared with a deficit of \$235,085 in the first ten months of 1920. The traffic handled this year has been considerably below that of last year. The latest figures available as this is written are those for September. The net ton-miles in the first nine months of 1921, including both revenue and non-revenue freight, totaled 1,555,688,000. The figure for the first nine months of 1920 was 1,703,157,000. In October the road's operating ratio was 73.6, for the ten months it was 79.5. An even more interesting figure is the transportation ratio; the figure for the first ten months of 1921 was 37.4. The few roads that have been able to better that figure are the ones that are inclined to feel most optimistic about present railway conditions.

## Coal Traffic 60 to 65 Per Cent

The Western Maryland operates 804 miles of line of which 114 is trackage rights. The main line extends from Baltimore to Connellsville, Pa., where connection is made with the Pittsburgh & Lake Erie, thereby supplying a route to Pittsburgh. Another important line extends from Cumberland to Elkins, W. Va., and a third from Hagerstown to Shippensburg, Pa., where traffic is turned over to the Phila-

delphia & Reading. The road's most important traffic is bituminous coal, the percentage of that commodity to the total traffic averaging about 60 to 65 per cent. This coal is obtained from the Somerset, Georges Creek, Gauley and Fairmont fields. The Somerset and Fairmont fields are served by lines operated but not owned by the Western Maryland; connection with them is secured through trackage rights over the Baltimore & Ohio. The larger part of the coal is moved eastward, principally to Baltimore. A considerable tonnage moves via Shippensburg, Pa., and thence over the P. & R. including the sizeable quantity received from the B. & O. at Cherry Run. So important is the movement via Shippensburg that the Western Maryland and P. & R. have worked out a method whereby locomotives of either road are used between Hagerstown and Harrisburg.

#### Capacity of Grain Elevator to Be Doubled

The Western Maryland has extensive tide-water facilities at Port Covington, Baltimore. These include a new coal pier, a large grain elevator, etc. The road handles a considerable quantity of grain, received principally from the Pittsburgh & Lake Erie at Connellsville. The present elevator has a capacity of about 1,500,000 bushels. So fast has the grain traffic grown in recent years that the road has had to expand its grain handling facilities. Contracts have just been let for additions which will about double the capacity of the present elevator at Port Covington.

#### Making Human Nature Work for the Railroad

The Western Maryland in 1920 had a revenue train load of 1,064 tons, this comparing with 909 in 1917, 956 in 1918 and 985 in 1919. The road is required to use helper engines on every operating division in one direction and on all but two divisions in both directions. One of the busiest divisions is that from Cumberland to Hagerstown. It is on this division that the road has worked out what the officers describe as a method of "Making human nature work for the railroad." The district in question is 80 miles in length. Trains are handled to Williamsport, 73 miles

The following details concerning the operation of this division have been supplied by an officer of the road: Prior to the calendar year 1919, tonnage freight trains were handled between Hagerstown and Cumberland by dispatching the crews from their home terminal at Hagerstown to Cumberland and tying up for rest at Cumberland. When the crews' rest was up and they were available for service, they were called for the first tonnage train leaving Cumberland for Hagerstown.

This plan was objectionable due to the fact that the men were required to take their rest away from their home terminal and frequently there resulted considerable terminal delay to the Hagerstown crews, after their eight hours' rest was up at Cumberland, before an eastbound tonnage train was ready to start the return movement to Hagerstown. Naturally the men would prefer spending their spare time at home rather than at a distant terminal, and their expenses would also be less if the service could be arranged so that they could return promptly upon arrival at Cumberland.

#### Operation Before Adoption of Turn-Around Service

The following statement shows by months the average time on duty for all tonnage trains operated from Hagerstown to Cumberland, and Cumberland to Hagerstown for the calendar year 1918, which indicates the results before the turn-around service was made effective:

Calendar year 1918	Average time on duty west-bound to Cumberland		Average time on duty east-bound to Hagerstown		Average total time on duty for round trip between Hagerstown and Cumberland	
	Hrs.	Min.	Hrs.	Min.	Hrs.	Min.
February	14	30	14	30	29	05
March	14	12	12	06	26	18
April	12	37	11	36	24	13
May	12	17	10	56	23	13
June	11	56	12	07	24	03
July	12	25	11	44	24	09
August	12	33	13	08	26	01
September	12	57	13	46	26	43
October	12	55	13	04	25	59
November	12	59	12	17	25	16
December	14	00	14	23	28	23

The Western Maryland

up a grade of 0.3 per cent with a single Consolidation locomotive—one of the heaviest of its type in use. From Williamsport to Hagerstown, 7 miles, a helper is required to assist the train up a 1.1 per cent grade. The line is single track and equipped with automatic block signals operated on the absolute permissive principle, under which the block sections for opposing movements extend from siding to siding, and for following movements the block extends from signal to signal. All train dispatching is by telephone. In the automatic block section territory Form 19 train orders are used to restrict the rights of trains where formerly 31 orders were used exclusively for this purpose. The difficulty in stopping and starting 100-car trains without damaging draw bars was very great. By delivering train orders without stopping the train a great deal of damage and delay was eliminated with a marked improvement in the facility of operation.

When the turn-around service was started, it was found that by close co-operation between the Hagerstown and Elkins division trains would not be started westbound from Hagerstown until such eastbound tonnage was available at Cumberland to permit of a quick turn-around upon arrival of the crew at Cumberland.

After the train reached Cumberland on the westbound movement the engine was sent to the engine terminal and relieved for 1 hr. 30 min. for the purpose of cleaning the fire, ash pan, and also furnishing the necessary fuel, water, sand, and supplies. The crew was relieved for this period and used the opportunity to rest and eat.

#### Time Reduced One-Half

The turn-around plan has been in operation since 1918, and by months to date, since January, 1921, the following statement shows the average time on duty, eastbound and westbound, in handling the same character of traffic by turn-around service that was formerly moved by tying the crews up at Cumberland for rest:

Calendar year 1921	Average time on duty west-bound to Cumberland		Average time on duty east-bound to Hagerstown		Average total time on duty for turn-around trip between Hagerstown and Cumberland	
	Hrs.	Min.	Hrs.	Min.	Hrs.	Min.
January	7	57	10	06	18	03
February	7	30	9	12	16	42
March	6	54	8	31	15	25
April	6	48	7	44	14	32
May	6	36	7	36	14	12
June	6	13	7	09	13	22
July	6	10	7	14	13	24
August	6	13	7	33	13	46
September	6	22	7	43	14	10
October	6	47	7	47	14	34

In all of the figures given above the total time on duty includes the initial and terminal delay as well as road time. In cases where the trains do not turn, on account of engine failures or for other reasons, the total time on duty is included so that the figures represent the actual facts. The reduction of approximately one-half as between the old method and the new will indicate the manner in which the crews work to get their trains over the division in both directions. It shows the result of "Making human nature work for the railroad."

#### A Record Performance

The best performance of record was made during June,

1921, when the following results were obtained for the month:

Average time on duty westbound.....	6 hr. 13 min.
Average time on duty eastbound.....	7 hr. 09 min.
Total average time on duty.....	13 hr. 22 min.
Average eastbound loads handled per train.....	94
Average actual gross tons handled per train.....	6,186

An arbitrary limit of 100 cars or 7,000 actual gross tons eastbound is in effect.

The best performance for the month of June was by Western Maryland Consolidation engine 803 as follows:

Train consisted of.....	100 loads
Actual gross tons handled.....	7,312
Actual time on duty eastbound.....	6 hr. 19 min.
Distance run.....	80 miles

## Agreement on Reorganization of French Railways

### Private Companies to Work Under Joint Financial Arrangements with Dividends Guaranteed

By M. Peschaud

Secretary, Paris-Orleans Railway

THE REORGANIZATION of the French railways has at last been accomplished by the passage of the Railway Act by the French Parliament. The promulgation of the act was a difficult proposition in view of the complexity of the situation in which the railways found themselves after the war. The problem has been solved by retaining the operating concessions of the private companies with certain revisions to meet the new conditions. All surpluses, after payment of guaranteed dividends, are to pass into a general fund for the benefit of all roads and increases in dividends are only possible by a "management premium" based upon efficiency of operation.

The present mileage of these principal lines is as follows:

	Miles
Paris, Lyons & Mediterranean.....	6,078
State.....	5,599
Paris-Orleans.....	4,844
Est.....	3,071
Midi.....	2,546
Nord.....	2,358

Since the war France has also acquired the Alsace-Lorraine railway system, in the north, which is being run, as a second government railway.

#### Present Organization

All of the above railways, except of course the State, are operated as incorporated joint stock companies under certain concessions which will expire between 1950 and 1960. At the end of that time they will be turned over to the government on payment by the government of an indemnity covering rolling stock, stores and other movable property. At the same time the government has the right to take over the companies at any time on payment of an indemnity equal to the average yield of the five best years during a period of seven years prior to the time of purchase.

The five private companies' freedom of administration has only been limited, up to the present time, by the terms of their concessions and the powers reposed in the Minister of Public Works, the latter being fixed by law and founded on the right of the government to regulate railway traffic in the interests of public safety. The companies have been allowed to fix rates, within the limits of fixed maximums, subject to the approval of the Minister.

As regards finance, each of the five companies had its own budget. In accordance with the existing agreement, the government guaranteed in case of a deficit the interest

and principal of their capital, both bonds and shares, and the payment to the share capital of a minimum dividend. These amounts, which were advanced by the government in the form of a loan, paid 4 per cent interest and were to be repaid out of future profits first of all, then out of the sums payable for the recovery of equipment when the concession should come to an end, or in case of repurchase. When the profits reached a certain limit the government received a share. The revenue between the guaranteed minimum and the dividend which gave the government a right to a share was reserved to the stockholders.

In the case of three of these companies this government guaranty was only temporary—and for two of them, the Nord and the Paris, Lyons & Mediterranean, it had expired on December 31, 1914,—just the time, in fact, when it was most required. The guaranty in the case of the Est was due to expire in 1934. For the other companies (Orleans and Midi), it held good until their concession should come to an end.

To enable the Nord and the P. L. M. to carry on during the war an act was passed authorizing the companies to charge the deficiencies previously guaranteed to the original account—in other words to have recourse to a loan to meet their liabilities.

In 1914 one company, the Nord, had never applied for the government guaranty. Two other companies, the P. L. M. and the Est, had repaid their debts and the former had even been in a position to share its profits with the government. The debt of the two other companies was about 615 million francs (\$125,000,000 at par exchange).

#### The Weak and Strong Roads

The organization, both administrative and financial, of the State railway is entirely different. It is under the direct authority of the Minister of Public Works and has at its head a manager appointed by the Minister, who is assisted by a Railway Board (Conseil de Réseau), which is merely a consulting body. The budget of this railway is attached, as a supplementary budget, to the ordinary government budget. Parliament approves the accounts and votes the credits. The public treasury has to meet the deficits and would have benefited from the profits if there had been any, but as a matter of fact this railway has always had a large deficit.

The various railways are very differently situated. They

all have a large agricultural traffic, for the reason that agriculture is well developed in every district of France, but while the Nord, the Est and the P. L. M. had also, before the war, a large industrial traffic, the Orleans, the Midi and the State were at a great disadvantage in this respect. This explains why the returns for these lines were so much lower than the returns for the first three. The figures of the gross and net returns show this clearly. For 1913 they are as follows:

Railway	Gross income per mile	Net income per mile
P. L. M.	\$19,823	\$8,528
State	11,467	1,628
Paris-Orleans	12,805	5,220
Est	19,767	7,607
Midi	11,936	5,288
Nord	28,187	10,908

At the beginning of the war, the financial position of the French railways, was as follows: In 1913 three companies had shown a surplus—the P. L. M., \$1,600,000 and the Est and Nord about \$1,400,000 each. Two companies had a deficit—the Paris-Orleans \$3,400,000 and the Midi about \$200,000. The State railway alone showed a deficit of \$13,400,000.

### Inferior Management of State Railway

The management of the State railway has always been much inferior to that of the other companies. When in 1913 the operating ratio of the companies rose from 55 per cent to 61 per cent, that of the State railway reached 85 per cent. Although the traffic conditions of the Orleans railway and the State railway were very similar, the first, as we have seen, obtained a net yield per mile of \$5,220 and the second \$1,628 only.

### Conditions During and After the War

With the declaration of war all the railways of France, in accordance with the law, passed into the control of the Minister of Public Works, who operated them as a single railway without altering their financial system, except as mentioned in the case of the Nord and P. L. M. When the railways were returned to their owners in 1919 prevailing conditions did not permit of reverting to the pre-war organization and a temporary system was established until a new scheme could be devised.

The management was restored to the railways but part of the war organization was retained, inasmuch as liaison committees were formed with the object of adjusting the traffic conditions on the different lines.

The railways also suffered financially from the after effects of the war. The restriction of commercial traffic and the continued rise of prices diminished the receipts and greatly increased the operating expenses. This resulted in a deficit which two successive increases of rates (70 to 80 per cent for passenger, 140 per cent for freight) were unable to cover. At the end of the year 1920, the deficit on the whole of the principal French lines since 1914 had risen to \$1,114,600,000. It attained \$1,327,000,000 if the bonuses granted by the government to employees on account of increased cost of living are taken into account.

### The Problem

In 1918 the government entered into negotiations with the companies with a view to deciding upon the basis of a reorganization. The problem was a double one. It was necessary on the one hand to remedy the situation created by the war and on the other hand to establish a new organization for the future. Owing to the conciliatory spirit shown on both sides during these negotiations, they were successful and on May 18, 1920, the government submitted for parliamentary approval the agreement that the Minister of Public Works had drawn up with the approval of the companies.

After minute investigation and long debates in the Chamber of Deputies and the Senate, this agreement has just re-

ceived the approval of both houses, after being subjected to numerous modifications in detail.

The following are the principal provisions of the new railway law:

### Payment of Past Deficits

The provisions of the agreement are as follows: Owing to the fact that during the war the railways were to some extent managed as state railways the agreement provides that the government shall be responsible for the deficits of the companies since the beginning of the war up to January 11, 1921. Therefore the amounts paid by the government to the companies as guaranties of interest will not be repayable. As regards the Nord and P. L. M. whose guaranty of interest came to an end in 1914 and who were authorized to have recourse to a loan to cover their deficits, the government will ensure to them repayment of the sums thus borrowed by payment of annuities.

Moreover, the guaranteed debt in the case of the two railways which still had one was stopped on December 31, 1913, and ceased to bear interest on that date. It cannot be demanded until the end of the concession or in case of repurchase by the government.

Apart from this, the companies renounce all claims on the government both as regards losses caused by the war and events previous to the war. The government acts for them in regard to all reparations from the enemy.

### The Reorganization of the Railways

Two principles were kept in view in drawing up the new scheme:—First, the maintenance of the existing companies, and second, the assurance that they should work in unison, and that there should be a closer association between the railways and the main interests of the nation; also, as a result the attainment of their financial solidarity subject to the rule that their receipts should balance their expenses.

The companies have strictly speaking, been maintained without any alteration in their statutes, their international organization, the powers of the boards of directors or their relations with their shareholders and employees. But new organizations have been formed, which are placed above them. These are the Higher Railway Council (Conseil Supérieur des Chemin de Fer) and the Executive Committee.

### The Higher Railway Council

The Higher Railway Council, which is a consulting body, was formed with the object of ensuring better co-operation between the management of the railways and the general interests of the country. Its duty is to give advice and to keep the public bodies and the managements of the railways informed regarding the requirements of the users of the railways. But this Council has no real powers beyond those that the ministry delegates to it. The Ministry of Public Works retains all the powers which it previously possessed, with two additions. It obtains the right to reduce the rates when they seem contrary to the public interest, and also, in case of refusal or unwillingness on the part of the companies, it can officially carry out the measures which it already had the right of enacting.

It will have to consider all questions of a general character referring to the constitution of the railways, the method of running them, the plant, supplementary works, electrification, rates, etc. The Minister of Public Works cannot make any decision in these matters without being obliged to lay the matter before the Higher Railway Council, and if he does not wish to accept its opinion he must first call a second meeting of the latter.

The Higher Railway Council will include, besides the chairman, 60 members as follows: Eighteen members of the railway executive committee, 12 representatives of the employees (these representatives will be elected by the staff

itself, two for each railway, one to represent the higher grade employees and the other the lower grade employees), 30 representatives of the general interests of the country, nominated by the Minister.

### The Executive Committee

The purpose and powers of the Executive Committee are entirely different. While the Higher Council, by reason of the powers assigned to it, includes, besides the representative of the railways, representatives of the employees and the shipping public, the Executive Committee includes representatives of the railways only.

It is composed of 18 members, namely:—For each company, two directors and the manager, and for the state railways, the president and vice-president of the board of directors and the manager. It will be noticed that it does not include any representatives of the employees. A request was made that they should be included, but the companies did not give their consent to the proposal, as this committee has to make decisions which are binding on the railways, and must not, therefore, include members having no responsibility.

Whereas the duty of the Higher Council is to define the main lines of railway policy, and fix the general rules, the Executive Committee is the managing body of the railways in everything which affects their mutual interests. It was formed to propose and make all resolutions regarding questions which affect the railways as a whole, to put into force the decisions of the Minister of Public Works and the Higher Railway Council and apply them on all the railways.

### Labor Provisions

With the object of putting an end to the disputes between the companies and their employees on questions of wages, pensions and working conditions a tribunal for arbitration purposes has been provided for. Half of this body will be composed of the representatives on the Higher Council of the railway or railways affected, and half of the representatives of the employees of the Council presided over by an arbitrator appointed by the members of the Council representing the public.

Finally we would mention that the agreement makes provision for the eventual incorporation of the Alsace-Lorraine railways into the organization. Judging from recent statements made by the government, this incorporation will shortly take place.

### Financial Organization

The financial co-ordination of the railways leads, as a natural consequence, to their financial solidarity. Under the old system each railway had its own budget and accounts. In 1913 the statements of the railways showed a favorable balance for three of them and a deficit in the case of the other three. It happened thus that the first were able to distribute higher dividends to their shareholders, whereas the deficiencies of the second were a burden on the government, either directly as in the case of the State railway, or indirectly by reason of the guaranty of interest.

The principle of financial solidarity inscribed in the new convention consists, on the contrary, of making the railways as a whole bear the expenses of running them all. From the moment that it was decided to run the various railways as a single railway and the Executive Committee obtained the right to make decisions binding on all the railways, it became necessary for each one of them to feel that they were guaranteed against any injurious consequence of these decisions. Without this guaranty the railways would probably never have consented to accept the new administrative organization nor to bear the expenses of working in unison with the State railway.

Financial solidarity is achieved by the creation of com-

mon funds in which the profits of each railway will be placed, and from which the railways having a deficit will draw in order to make up their deficiencies.

Each railway will draw on its receipts according to its expenses and its financial burdens (interest and dividend payments and retirement of indebtedness). The surplus remaining will be paid into the common fund.

### The Government's Responsibility

Rates must be so fixed as to bring the receipts up to the level of the expenses—subject to parliamentary approval. Every five years Parliament will revise the maximum rates on the advice of the Higher Railway Council. The agreement expressly states that this cannot be done, however, without taking into account the economic situation. It was, therefore, necessary to devise other means of making the common funds balance, and they are as follows: either the treasury will advance directly to the common fund the amount which is lacking, which amount must be repaid from the fund within the space of two years, or else the government will have to fall back upon the credit of the companies, which will each issue on behalf of the government bonds for the amount necessary to cover their deficiencies. Parliament will determine every year the maximum advances which the treasury can make to the common fund and the maximum bonds which can be issued by each railway.

These measures, which are of course temporary, are specially intended to be applied during the first few years when the financial position of the railways will probably still be difficult. When normal conditions arrive, the adjustment of the rates will, very likely, be sufficient to enable the railways to balance their accounts.

When the common fund shows a surplus, this surplus will be applied in the first place to repaying any advances which may have been made to it. They will then be used to form a reserve fund, the maximum amount of which will be fixed by the Minister of Public Works. The surplus, if there is one, will go to the government. In this event the Minister can lower the rates so as to make the receipts and expenditures balance again.

The dividend on the shares of the companies is guaranteed at the minimum fixed by the former agreements, namely, 54 francs for the Nord, 35.50 francs for the Est, 55 francs for the P. L. M., 50 francs for the Midi and 56 francs for the P. O. A nominal dividend has been fixed for the State railway which will be collected by the treasury.

As has been shown, this dividend does not rise or fall on account of the constitution of the common fund, except by means of the management premium.

### The Management Premium

The management of its railways by the companies would have been apt to become entirely disinterested if the amount of the dividend has been uninfluenced by operating results. It was necessary, therefore, to find some means of interesting the companies in the efficient running of the railways. The agreement attains this end by creating a management premium.

It was difficult to find a formula, and the bill was altered several times when it was being drawn up and in its passage through Parliament. To form a basis for the calculation, it was necessary to define as exactly as possible the factors which were supposed to show most definitely the results of good or bad management. Then each of these factors had to be given a relative value, according to existing circumstances.

The two factors decided upon are the following—Development of traffic and economy in operation.

In view of the present financial situation of the railways, which had a deficit, as shown in the 1920 statement of accounts, of no less than \$500,000,000, more weight was at-

tached to the second factor with the object of encouraging economical management on the railways.

Working on these principles, the management premium is calculated as follows. It has two distinct factors:

(A) Three per cent of any surplus receipts shown in the statement of accounts, with reference to the receipts in the 1920 statement of accounts, which will be taken as a basis. In making this calculation, the receipts resulting from the two increases of rates which came into force during the last few years will not be taken into account. This last condition is made with the object of inducing the railway companies to develop their traffic, which is measured by the bare receipts, and not by increases of rates which would swell the total receipts independently of any increase of traffic.

(B) One per cent of any decrease, with reference to the 1920 statement of accounts, in the deficiency of the receipts as compared with the expenses, and further, when the receipts exceed the expenses, one per cent of the total excess. On the other hand, if the statement of accounts shows an increased deficit compared with the 1920 statement, a penalty of two per cent of such increase will be exacted.

Taking into account the fact that the results for 1920 were adversely affected by the price of coal, the decrease in which is already making itself felt, and that the fact of this decrease in price alone will show better results without much credit being due to the companies, the agreement has made certain alterations in the 1920 results. According to expectations the premium will vary round about \$1 per share and may increase later to some extent as regards the first statements of accounts.

### Employees' Premium

It was desired to interest the employees also in the efficient running of the railways and the agreement provides that they shall receive a premium in the same way as the companies. It will be calculated according to the formula which we have just quoted. The factors will, however, be doubled until the total attains a maximum per railway of 1.50 per cent of the receipts forming the basis of the first factor, namely, the bare receipts.

The premium will be divided among the employees in accordance with the rules which the State Council draws up for the application of the act. At first each employee will receive a share of the premium amounting to about \$20.

### New Capital Bonds

The new agreement has altered the system with regard to bonds issued by the companies. Formerly they were obliged to redeem all bonds before they were due. This responsibility became heavier as the date of redemption drew near and even before the war there had been some idea of altering the agreements in this respect. The new convention has decided that the bonds issued under the new system will be redeemable in 60 years and that, when they fall due, the government will be responsible for bonds which are not yet redeemed. This is one of the most interesting financial arrangements made by the new convention.

### Repurchase

Finally, the agreement modifies the terms on which the concessions will eventually be repurchased. We have seen that the government reserved to itself the right of repurchasing the concessions at any time on the following terms:

Payment of an annuity based on the net yield of the last few years, and an indemnity equal to the replacement value of the rolling stock and stores.

The method of arriving at the value of rolling stock has been changed under the agreement. Henceforth value is to be considered original cost less depreciation at 2.5 per cent for each year of service. The stores will be paid for at cost price.

The agreement provides further that when two of the existing companies have turned over their properties to the government on account of the normal expiration of their concession the other companies can also claim their repurchase. The companies could not consent to remain in a combination in which the government would be in the majority.

## President Believes

## Railroads Recuperating

WASHINGTON, D. C.

THE PRESIDENT believes that the railroad situation is now very greatly improved, it was said at the White House on December 27, in response to a question as to the prospects for improved business conditions for 1922 as shown by the reports of government departments. In spite of the failure of the railroad securities bill in the Senate, it was stated that the administration has been able to so handle its railroad securities as to be able to carry out settlements with the railroads and to fund such of the indebtedness of the roads for capital improvements as it desired without asking Congress for any money, and that with the funds available it will be possible to meet the funding situation so as to cover all necessities without asking for additional authority or additional funds. The President looks for a marked recuperation of the railroad condition and is confident that that is likely to result in a recuperation of business generally.

The statement regarding the settlements refers to the fact that the cash resources of the Railroad Administration have been increased by the sale of equipment trust certificates. This has not placed at the disposal of the administration funds enough to do as much funding as was contemplated when the bill to authorize the War Finance Corporation to take over some of the railroad securities up to \$500,000,000 was proposed, but it is understood that many of the railroads are now in a better position to make settlements without funding or by funding less of their indebtedness than they were last summer. The plan as proposed then was to give the railroads additional cash with which to carry out maintenance work and place money in circulation in the hope that it would improve business conditions.

PAYMENT OF EMPLOYEES by check instead of in cash is to be the rule henceforth on the New York, Ontario & Western. Hitherto the pay car has made regular trips over the road twice a month.

## Ferry Cradle at St. Louis Embodies New Features

## Missouri Pacific Builds Barge Transfer for Heavy Loads and Wide Range in River Level

By F. E. Bates

Assistant Bridge Engineer, Missouri Pacific

UNLIKE the other roads which operate lines across the Mississippi river at St. Louis, the Missouri Pacific handles a large part of its traffic by means of a car ferry. As shown on the track diagram (Fig. 1) of the St. Louis terminals of that road, the freight traffic of the Missouri Pacific between St. Louis and points in Arkansas and Louisiana, which is handled on the east side of the Mississippi river by Dupo, may enter and leave St. Louis by way of the ferry transfer without the use of other than Missouri

Fig. 1—Sketch Showing St. Louis Terminals of the Missouri Pacific

Pacific rails. The traffic handled in this manner amounts to as much as 600 cars a day, including a considerable number of hopper-bottom coal cars of 55 to 70 tons capacity. The marine equipment consists of a four-track 26-car steel barge operated by a stern wheel tow boat.

Owing to the wide variation in the stage of water in the Mississippi river, one troublesome detail in the handling of

and shocks of the barge landing against the cradles. Accordingly, Coopers E-55 was used for live loading to provide for an 0-6-0 switch engine with 65,000 lb. on each pair of drivers, the axles being spaced 6 ft. 6 in. center to center. Both cradles are of similar construction and the description will be confined to the west cradle at West Ivory.

The profile in Fig. 3 shows the grades on the cradle and the incline. The incline tracks are carried on a timber trestle with panels 10 to 12 ft. center to center and three ply 8-in. by 16-in. chords. The design and spacing of cradle supports were made to reduce the stresses in the incline trestle as much as possible. The main portion of the cradle is of timber construction with 24-ft. cast steel feather rails at the shore end and a 38-ft. hinged steel apron girder at the river end.

The details of the timber portion of the cradle are shown in Fig. 2. Special attention was given to the reduction of the unit bearing stresses as considerable trouble was experienced in the previous cradle with bearing failures. Caps and sills 16 in. wide were used throughout. Wheels were spaced 7 ft. center to center except at the low end where special construction was required. All wheels are standard solid cast wheels mounted on 5½ in. by 10 in. car axles. The cradle tracks are carried on two-ply 8-in. by 16-in. stringers and sawed oak cross ties with tie plates. Oak ties were used in place of pine on account of occasional derailments, and 4-in. blocks are provided for separators to supplement the notching of the outside guard timber. No drift bolts or dowels were used in assembling the cradle. Threaded bolts were used throughout and these were placed to permit replacing any timber members without disturbing the structure as a whole. In order to provide a certain amount of flexibility in the higher portion of the cradle to accommodate the slight changes in grade of the incline track, the 12-in. by 14-in. wheel timbers were cut and pinned together and the longitudinal bracing omitted in each second panel.

Fig. 2—Part Elevation of the Timber Portion of the Cradle

the ferry traffic concerns the method provided for transferring the cars from the tracks on the river bank to the ferry. This is commonly accomplished with the aid of a cradle consisting of an inclined trestle mounted on wheels that roll on an inclined track laid on the grade of the river bank.

When the Missouri Pacific cradles were renewed in 1920 and 1921, the increase in car loading and power required to handle traffic on the incline grades of from 2.5 to 4 per cent made it necessary to use heavier construction throughout and to provide additional rigidity against the heavy traction

Fig. 3 also shows the special construction of apron girders and supports. To increase the car capacity of the outside or wing tracks on the barge the turnout is placed on the cradle with the frog point at the river end of the apron girders. Additional wing girders are required to support the turnouts. The rear ends of the apron girders are hinged to a heavy steel shoe supported on a six-wheel truck to distribute the loads on the incline. The pin acts only as a guide as the hole is made  $\frac{1}{8}$  in. large, and all vertical loads are carried by the rocker bearing. The pin is placed as high as possible to

reduce the gap in the rails for variations of tilt of the apron girders.

The difference between light and loaded draft of the barge is four feet and during loading and unloading the barge has a maximum list of approximately two feet. To provide for these variations and an allowance for inaccuracy of spotting the cradle, provision is made for a maximum vertical travel of the river end of the apron girders of five feet. The barge is guided to the cradle by cluster piles on the bank side and as it is very hard to maintain these clusters at the proper location provision was made for a lateral movement of two feet in either direction. Lateral movement is provided for by

front of the barge serve as guides to line the cradle and barge accurately.

The counterweight towers are carried on two steel trucks and the load is equalized on the four rails by the use of larger shims under the carrying beams over the inside wheels than over the outside wheels. The connection at the bottom of the towers was made on a slight bevel so that the towers will stand vertical when the carrying beam is deflected under load. The barge, when landed against the cradle, supports the river end of the cradle beams and relieves the counterweights and jacks of all live load.

The adjustment of the cradle to proper elevation is made

Fig. 3—Half Plan, Elevation and Section of the Apron and Its Supports

slotting the pin holes at the shore end in the outside girders of each set.

The apron girders are partially counterweighted from two towers as shown in Fig. 1. They are adjusted by means of one hydraulic oil jack at the top of each tower operated by a small hand force pump. By manipulating the two jacks separately it is possible for the operator to tilt the girders as necessary to line up with barge as it comes in. The "Vs" between the rails on the cradle and corresponding ones at the

by pulling or pushing the cradle up or down the incline. The steel truck frame under the apron girders is provided with heavy lateral bracing, and pulling bars, consisting of old bridge eye bars. These are connected to the two inside girders and are carried to the shore end of the cradle, where double and treble blocks and 1¼ in. steel cable are provided with anchorage to dead men for pulling the cradle up the incline. The power is furnished by switch engines. The cradles are pushed down the incline with a push pole.

Rock Island Yard and Shop, Silvis, Ill.

# Annual Report of the Bureau of Finance I. C. C.

## Enormous Variety of Detail Dealt with by New Bureau; Seven Hundred Miles of Road Abandoned

WASHINGTON, D. C.

THE ANNUAL REPORT of the Interstate Commerce Commission, noticed in our issue of December 10, page 1157, includes the reports of the three new bureaus created by the commission in 1920 in connection with the expansion of its organization which was necessitated by the new functions conferred upon it by the provisions of the transportation act. These are the Bureau of Finance, of which W. A. Colston is director; the Bureau of Traffic, of which W. V. Hardie is director, and the Bureau of Service, F. G. Robbins, director. While these bureaus were organized last year, the report for this year is the first to cover a full year of their activities. The commission's report also includes the usual reports of the work of the older bureaus, which follows the same lines as in previous years.

### Certificates of Public Convenience and Necessity

During the year ended October 31, 1921, 79 applications for certificates of public convenience and necessity were filed. Fifty-one certificates have been issued, and 10 applications have been withdrawn. Of the total applications filed, 39

were for permission to construct new lines of railroad or to extend existing lines, and 40 were for permission to abandon lines of road. The authorization issued during the year covered about 405 miles of new construction and 702 miles of abandonment.

Pursuant to the provisions of section 13 of the act, we have availed ourselves of the co-

The work of the Bureau of Finance represents the most distinctively new phase of the commission's increased authority under the new law. The report deals with the work under the provisions of the transportation act relating to the issuance of certificates of public convenience and necessity, applications for authority for the acquisition of control or for the consolidation of carriers, the regulation of security issues, the six-months guaranty following the termination of federal control, the administration of the \$300,000,000 loan fund and similar matters. It refers to several points on which important questions as to the interpretation of the act have arisen and suggests modifications. An abstract of the report of this bureau is given herewith; and the others will be noticed as available space is found.

operation, services, records, and facilities of the state commissions in disposing of applications for certificates. At our request these commissions have held hearings in 15 such cases, transmitting to us the records thereof together with their recommendations, which, in 13 of the cases, were followed by us.

During the year questions have arisen respecting the proper construction of paragraphs (18) to (22), inclusive, of section 1 as affecting our jurisdiction thereunder.

The question has also arisen whether the provisions in paragraphs (4) to (8) inclusive of section 5 as to consolidation of the railway properties into a limited number of systems are intended to prevent the voluntary consolidation of two or more of such carriers pending ultimate adoption by us of a complete plan of consolidation, as provided in paragraph (5), or whether in the meantime they may effect such voluntary consolidation, either with or without our approval.

The statute does not expressly provide for such consolidations during the interval which must elapse before adoption by us of the complete plan. An interpretation of these provisions which would prohibit all consolidation in the meantime might work hardship and fail to meet the underlying intent of the Congress. It seems desirable that the uncertainty should be resolved by appropriate amendment.

In six cases in which we have authorized the construction of new lines of railroad, permission has been granted under paragraph (18) of section 15a to retain the excess earnings derived from the operation of such new lines.

The cases in which certificates of public convenience and necessity were issued during the year are shown in the double-column table.

### Acquisition of Control and the Consolidation of Carriers

Under the provisions of paragraph (2) of section 5 of the amended interstate commerce act we are authorized to approve, by order, the acquisition by one carrier of control of one or more other carriers, whether by lease, or by purchase of stock, or in any other manner not involving the consolidation of such carriers into a single system. During the year, 25 applications have been filed under this paragraph, and 19 orders have been issued, in each case granting majority requested.

Three applications were filed for authority to effect consolidation, but in each case the applicant was advised that its application could not be considered in advance of the adoption of a complete plan of consolidation as authorized by paragraphs (4) and (5) of section 5.

### Recovery of Excess Net Railway Operating Income

Under the provisions of paragraphs (1) to (16) inclusive, of section 15a of the act, we are required to receive one-half of the annual net railway operating income received by any carrier for any year in excess of 6 per cent of the value of the railway property held for and used

by it in the service of transportation. Forms of questionnaire and return, together with rules and regulations for the determination and recovery of excess income under this section, are in preparation.

### Issuance of Securities —Assumption of Obligations

Since our last annual report 283 applications under section 20a have been received, and the issuance of securities in the following aggregate amounts, largely for refunding purposes, has been authorized:

Stocks .....	\$242,657,500
Bonds .....	1,276,761,616
Notes .....	98,402,195
Miscellaneous .....	97,780,313

Total..... 1,715,601,624

Under the provisions of paragraph (g) of section 20a, certificates of notification of the issuance of notes maturing within two years or less in the aggregate sum of \$137,502,723 were filed.

Some difficulty has arisen in the construction of section 20a in its application to electric lines. Under the law as it now stands, we have no jurisdiction over the issuance of securities of a "street, suburban, or interurban electric railway which is not operated as a part of a general steam railroad system of transportation." Certain electric railways independently operated are engaged in the general transportation of freight in interstate commerce in addition to the transportation of passengers. Some electric lines correspond substantially to the provisions in all important particulars except that of motive power. Under section 15a of the act we are given authority to include in groups of carriers for rate-making purposes such interurban electric lines as are engaged in the general transportation of freight. It seems desirable that section 20a of the interstate commerce act be so amended as to indicate definitely the classes of electric railway companies subject to that section.

Three applications requesting authority to issue shares of capital stock without nominal or par value have been filed with us. One of them, filed by the El Paso & Southwestern Company, involved the exchange of stock without par value for stock having a par value; authority upon this application was granted. The other two applications involved the issue of stock without par value under reorganization plans for railroads previously in receivership. Authority upon one of these, filed by the Denver & Rio Grande Western Railroad Company, was granted. The other is pending.

### Reimbursement of Deficits During Federal Control

In the administration of section 204 of the transportation act, 1920, we have encountered some difference of opinion as to the proper interpretation of the term "deficit" as used in the statute. Paragraph (a) provides that "when used in this section, the term 'carrier' means a carrier by railroad which, during any part of the period of federal control, engaged as a common carrier in general transportation, and competed for traffic, or connected, with a railroad under federal control, and which sustained a deficit in its railway operating income for that portion (as a whole) of the period of federal control during which it operated its own railroad or system of transportation," etc. Paragraph (b) provides that "for the purposes of this section, railway operating income or any deficit therein for the period of federal control shall be computed in a manner similar to that provided for in section 209 with respect to income or deficit for the guaranty period," etc. We have construed this language to limit the application of section 204 to carriers which, in the portion of the period of federal control (as a whole) during which they operated their own lines of railway, sustained actual deficits in railway operating income without reference to the results for any other period, and to limit the extent to which such deficits may be reimbursed to the amounts remaining after the adjustments specified in paragraphs (1) to (5) of subdivision (f) of section 209.

Of 279 carriers for reimbursement of deficits filed with us, no less than 93 fall without this construction of the law in that no actual deficits

were sustained in the portion of the period of federal control during which the respective carriers operated their own lines. Protests against our interpretation of the statute have been lodged by a considerable number of carriers thus excluded from the benefits of the section, who contend that the word "deficit" as used in section 204 means a decrease or falling off in railway operating income for the federal control period, as compared with that of the test period.

The claims of the carriers which are entitled to reimbursements of deficit, under our construction of that word, aggregate \$14,128,455. Owing to necessary corrections and adjustments, it is estimated that the amount to be certified in respect of these claims will be \$11,079,800. Partial payments under section 212 of the transportation act, added February 26, 1921, and final settlements thus far certified, with the estimated amount remaining to be certified, are summarized in the following table, where the amounts payable under paragraphs (f) and (g) of section 204, deductions therefrom on account of traffic balances and other indebtedness due the President, as operator of transportation systems under federal control, and the net amounts actually payable to these carriers are set out in the order mentioned:

Status	Amounts payable under paragraphs (f) and (g)	Deductions	Net payments
Certified:			
Final settlements (20 carriers)* .....	\$992,529	\$230,880	\$761,650
Partial payments.....	2,177,651	820,345	1,357,305
	3,170,180	1,051,225	2,118,955
Remaining to be certified.....	*7,909,619	*3,203,062	*4,706,557
Total.....	*11,079,799	*4,254,287	*6,825,512

\*Estimated.

### Six Months' Guaranty

In our last report we stated that 666 carriers filed acceptances of the provisions of section 209 of the transportation act, 1920 on or before March 15, 1920, as prescribed by law. It has been ascertained that one other "small carrier" accepted the provisions of the act within the time specified and that the total number of carriers accepting is therefore 667. Of this number, 547 have filed returns, showing an aggregate amount of \$818,400,185 as due them under the provisions of the act. Included in this number are the returns of 59 carriers not having a separate status under section 209, although filing separate acceptances. Of the corporations that have not filed returns it has been decided by us that 8 were not carriers as defined in section 209 and that 32 were operated as joint facilities and will not be entitled to any benefits under the provisions of section 209, their revenues and expenses being cleared through the accounts of the operating carriers. The remaining 80 carriers either had excess incomes or are short line carriers, the amount of whose claims will be relatively small.

The addition of section 212 to the transportation act, effective February 26, 1921, authorizes partial payments under section 209, and permits us, in case of deferred debits and credits to railway operating income which cannot at that time be definitely determined, to make a reasonable estimate thereof, and when agreed to by the carrier, to use such estimate in certifying the amount of the final settlement of the guaranty. Since that date, 447 requests for partial payments under subdivision (g) of section 209, as amended by section 212, have been filed by carriers. Returns to our orders of October 18, 1920, and January 5, 1921, after making certain adjustments, have been used as a basis in certifying partial payments, and on the basis of such returns we have certified approximately \$166,000 for payment.

We estimate the total amount payable under the guaranty at about \$536,000,000. Of this amount there have been certified to the carriers:

As advances under section 209(h).....	\$263,935,874
As partial payments under section 209(g) as amended by section 212 .....	165,862,775
In final settlement under section 209(g) .....	721,658
Total.....	\$430,520,307

Leaving an estimated amount still payable to the carriers under section 209 about \$105,500,000.

Final settlements have been made with 5 carriers, as follows:

Name of carrier	Amount certified
Alabama & Mississippi.....	\$16,543
Ann Arbor.....	75,261
Electric Short Line.....	14,993
Electric Short Line Terminal.....	3,158
Norfolk Southern.....	611,700

### Loans to Carriers

Because of the general depression in business during the year and the resulting decline in the costs of materials and labor, some carriers, considering it sound business discretion to defer expenditures of the proceeds of loans certified to them, requested us to cancel our certificates and to consider their applications as withdrawn. Other carriers have requested us to authorize them to expend a portion of the proceeds of their loans for purposes other than those for which the loans were originally made. We have generally approved this policy and have thus been able to extend the benefits of the revolving fund to other carriers more urgently in need of financial help, particularly in respect of matur-

ing indebtedness. Several changes are therefore necessary in the previous statement of loans made.

The amendment to section 210 effected by section 5 of the sundry civil appropriations act, approved June 5, 1920, authorized us to make loans for equipment to or through such organization, car trust or other agency as we might determine upon, approve or organize for the purpose "as most appropriate in the public interest," subject to the provisions of the act. The National Railway Service Corporation, a corporation of the state of Maryland, organized under the auspices of the National Association of Owners of Railroad Securities, has been approved by us as an agency for this purpose, and we have certified to this corporation the following loans for the benefit of carriers named:

Baltimore & Ohio.....	\$5,200,000
New Orleans, Texas & Mexico.....	926,000
Bangor & Aroostook.....	53,106
Chicago, Rock Island & Pacific.....	1,568,540
Minneapolis & St. Louis.....	386,190
Wheeling & Lake Erie.....	3,304,000
Total.....	\$11,437,830

As a condition of the certification of these loans the National Railway Service Corporation and the carriers themselves were required to finance from outside sources \$18,409,765.

Paragraph (a) of section 210, as amended, limits the time within which applications for loans may be filed with us to two years from February 28, 1920. In prescribing this limitation the Congress apparently anticipated that the "transition period" would be of relatively short duration. The progress of readjustment throughout the country has been slower than was generally anticipated.

In addition to the uncertified balance of the revolving fund on October 1, 1921, not including \$40,000,000 tentatively reserved to meet claims, judgments, etc., against the Railroad Administration arising out of federal control, repayments of principal of loans already made, which by their terms require early or serial repayment, and accretions to the fund from semi-annual interest payments during the 2 years following February 28, 1921, are estimated to aggregate \$93,000,000, making an approximate total of \$103,000,000 available for additional loans if the period for filing applications should be extended.

# Does It Pay To Repair Foreign Freight Cars?\*

## Some Relations Between Freight Car Repairs, Transportation Expenses and the Income Account

By N. D. Ballantine

Superintendent Transportation, Union Pacific System

**M**ASTER CAR BUILDER'S Rule No. 1 reads as follows: "Each railroad is responsible for the condition of all cars on its line, and must give to all equal cars as to inspection and repairs, regardless of responsibility for expense of repairs." This rule, however, was not followed even under Federal control. In support of the conclusion that the same condition still exists, a brief consideration of the bad order situation may be worth our while.

We can doubtless agree that mass figures, involving a large number of items, probably reflect a situation more correctly

Data deduced from some records kept while with the Car Service Division of the U. S. Railroad Administration covering the repairs given to freight cars during the years 1918 and 1919, indicates that with about forty-five billion freight car miles produced during the two years, there were about forty million repairs, heavy and light, given to freight cars. This means that each freight car moved an average of 811 loaded and empty miles before being switched to the repair track for repairs. The same factor obtained in each year. The figures also indicated that of the total cars bad ordered, 9.6 per cent were for heavy repairs in 1918, and 9.4 per cent in 1919, or approximately 10 per cent during the period.

Would it not seem reasonable to assume that unless there has been some fundamental change in the methods of making repairs or reporting bad orders, we could safely continue to use for the country as a whole, 811 miles as the average service which will create a bad order car?

In the table, the total freight car miles has been divided by 811 to obtain the column headed "Bad Order Cars Produced." With this exception, the figures shown are taken from statistics furnished by the Bureau of Railway Economics and Car Service Division of the A. R. A.

It will be agreed that we have no absolute basis with which to measure car repairer's efficiency, but during the period of comparison I believe it will generally be conceded that the output per car repairer increased materially.

FACTORS IN THE BAD ORDER CAR SITUATION OF CLASS I RAILWAYS OF THE UNITED STATES

Month, 1920	Home cars on home roads	Average bad order cars on hand	Bad order cars produced	Car repairers
October .....	731,699	177,653	2,657,471	95,068
November .....	749,774	181,595	2,397,046	91,188
December .....	790,933	189,490	2,275,218	84,123
1921				
January .....	1,074,661	209,667	2,118,640	70,307
February .....	1,396,048	234,506	1,772,667	60,319
March .....	1,612,185	260,237	1,923,868	54,537
April .....	1,689,225	296,233	1,821,176	49,051
May .....	1,744,907	329,850	1,969,360	52,910
June .....	1,764,612	351,465	1,980,111	54,410

From time to time we read in the newspapers and lately even in the *Railway Age* reference to the abnormally poor condition of the freight equipment of the country, conclusions generally being drawn, I infer, from a comparison of tabulations made by the Car Service Division as to the bad order cars on hand. The real situation as to condition of freight equipment should not be concealed nor, on the other hand, magnified. However, I feel that the figures for bad order cars on hand, taken alone, are prone to mislead as to the real condition, for the reason that during the period under consideration, a very unusual situation developed in connection with the return of cars to their owners. Had M. C. B. Rule 1 been generally observed in spirit or letter, the effect of relocation of cars to home lines would not have been accompanied by such a substantial increase of bad orders, but surely our mechanical friends who are at all familiar with actual conditions will agree that during the period referred to, and probably up to the present time, their practice was to card a large percentage of system cars "Bad Order," while a foreign car having, as nearly as could be determined, the same defects, but safe to run, was not so carded, but sent home—there to be carded. What really happened, then, is that while there was a substantial decrease in the factors producing bad orders,

Percentage Variations in Car Conditions Since October, 1920

than similar data compiled by an individual carrier. Before proceeding further, however, it may be well to see if we can also agree that there has been no material change in the manner in which roads repair cars or report their bad order situation now, as compared with federal control practices.

\*A paper read before the Western Railway Club, November 21, 1921.

car repairers were decreased somewhat in proportion, slightly more, but their efficiency increased, while bad orders reported mounted at an extremely rapid rate, following the trend of the rapid return of cars to owners.

The chart on the following page, which is self-explanatory, may help to visualize the relations existing, and would seem clearly to indicate that until such time as M.C.B. Rule 1 is generally observed, in proportion as home cars on home roads increase, the bad order reports will show an increasing number of bad orders, although there may be no real difference in the actual physical condition of car conditions as a whole.

Manifestly, M.C.B. Rule 1 will not be observed until such time as allowances for the repairs to foreign cars are equal at least to a sum sufficient to compensate a road for doing such work, including supervision, shop overhead, interest, depreciation, insurance and taxes covering the facilities used in making car repairs, together with the cost for switching and the per diem equivalent while cars are out of revenue service to be repaired. Owing to the widely varying conditions and ideas existing with respect to the cost of overhead and the other items above referred to and lack of sufficiently reliable data covering the matter, this phase of the subject will not be dwelt upon. These factors can only be determined through an actual and careful study of local conditions.

My object will be to point out a basis upon which a study could be made to include some important relations which exist, in order that a proper policy may be adopted, having in mind the best interests of a property as a whole, without regard to departmental lines.

### Direct and Indirect Expense

Let us define direct expenses as all items affecting freight car repairs which can be, and generally are, charged directly to the particular job, and indirect expenses as all other items affecting freight car repairs which can properly be included in the overhead and other items already referred to and which cannot be directly charged.

Owing to the difficulty of determining the "indirect expense," and for want of a better basis from which to draw conclusions, I shall confine myself to some deductions or comparisons from the item, "direct expense."

The relation between the prices allowed under M.C.B. rules and the direct expense involved in doing that particular piece of work should represent the allowance for the indirect expense. For example, if labor costs 72 cents an hour and M.C.B. rules permit billing for labor at \$1.20 an hour, then 66.6 per cent of the direct labor expense is to apply on the indirect expense. A comparison on the above basis, covering labor and various other items which go to make up the principal material used in car repairs might be of interest and value to any road.

### Per Diem

While per diem does not directly affect any operating account nor a road's operating ratio, it does affect a road's net income through the "hire of equipment" account. Therefore time is an important element in the matter of repairs to foreign cars in its effect upon that portion of the M.C.B. allowance covering the indirect expense as the following illustration will show.

Assume that an average of \$15 per day direct expense could be economically applied on a foreign car, and that it had been determined through the method above outlined that 33.3 per cent of its direct expense was available to apply on the indirect expense. Then \$5 would represent the indirect portion. As seven days per diem would be paid covering six working days it would be equivalent to \$1.17 per day and would absorb 23 per cent of the indirect allowance. If, however, it should take two days to spend such a sum, then 46 per cent of the indirect allowance would be absorbed by the per diem paid out while undergoing repairs. Therefore, in

proportion as the labor and material applied per day can be increased, the effect of per diem in absorbing the indirect allowance will diminish. With a little carelessness or delay in handling foreign cars, then the indirect portion of the allowance may be wholly absorbed in this one item.

### Loss of Revenue

During periods of heavy demand for cars, the less time a car spends on the repair track the more time it is available for producing revenue, and its effect upon the net revenue can clearly be shown in the following manner:

Assume that the freight revenue per freight car mile, loaded and empty, is 20 cents, and that the average miles made per car per day is 30. Then such a road would be able to earn on the average a gross freight revenue of \$6 per car per day. If its freight operating ratio was 75 per cent, then \$1.50 per car per day would represent the net revenue from operation. Clearly, then, for every day a car is held out of service in bad order during periods of demand this would be a proper item to consider in the determination of what should or could be done to avoid such delay.

### Switching

I believe it will readily be conceded that the present day cost of a switch engine, including rental and repairs, will vary from \$10 to \$14 per hour. If it is correct in principle to add a percentage to the direct expense for freight car repairs to cover the overhead and plant facilities, and I believe it to be, the same principle should apply in determining the cost of switching. Regardless of agreement with the principle suggested, take any rate you may see fit and measure it with the service actually performed to determine, if practical, what proportion of the indirect allowance switching may absorb. For the purpose of this illustration, let us use \$10 per hour as the cost of a switch engine. Assume the simplest typical case involved in removing just one bad order car from an inbound train or transfer, which we will say consists of 40 cars. On an average 20 cars will need to be handled in cutting out the bad order to be placed upon a temporary hold track, which operation would consume on an average at least five minutes. It would also easily consume an average of five minutes per car to remove a string of cars from the temporary hold track to the repair track and space them a total of at least 10 minutes to put the car on the repair track, and the same amount of time to remove it, or, say, 20 minutes as a minimum. On the basis of \$10 per hour, the cost for the four switches involved in cutting out a bad order and placing it on the repair track would be \$3.33, or 66.6 per cent of the \$5 to apply on the case previously cited, where \$15 direct expense was applied in one day. Therefore, in proportion as the amount of labor and material applied can be increased for each time a car is switched to the repair track, the effect of switching expense in absorbing the indirect allowance will diminish.

It should be clearly borne in mind that the estimates of time consumed by a switch engine in setting out a bad order car is purposely intended to conservatively cover the simplest case, and does not cover those cases where, due to accumulations of bad orders, the cars are switched to outlying tracks and later culled over from time to time, the lightest repairs, etc., being selected, the cost for which latter method of handling is of course much greater than the above estimate.

### Empty Car Mileage

A conservative estimate of the average out-of-pocket cost of the movement of an empty freight car per mile on the railroads of the United States at the present time, I should say, would be 5 cents, not including the per diem or mileage payments.

In proportion as the demand for box cars in good physical condition with which to load flour, sugar, grain, etc., in-

creases, with a given number of rough freight box cars circulating upon a road, the empty mileage and switching is bound to increase. A rough freight car may be suitable for loading l.c.l. or merchandise traffic, say to a branch line point where the outbound business is grain. But if such a car is used it must be hauled away empty and a grain car sent in, producing a cross-haul and unnecessary empty mileage. It is impossible definitely to say just what this item would amount to in dollars or cents, but that it is a vital factor at times is a well-known fact to any practical operating man.

M.C.B. Rule 120 provides that a foreign car in general wornout condition shall be reported to the owner with an estimate of the cost of making repairs. The owner has but two options, viz., to authorize the repairs, or the destruction of the car, wherever it may be located. Nevertheless, many roads, under special agreements between their mechanical departments, are moving such cars home for repairs. Unless such movements are authorized or concurred in by the transportation departments, decidedly uneconomical movements are likely to occur if factors other than the purely mechanical are considered. Before a proper decision can be made as to the economics of a case, the principal factor to be determined is, "Could the car, if repaired where located, be given a load in the direction it would otherwise move empty as a bad order?" If the answer is "Yes," then it is proper to double the mileage the bad order car would make to determine the total unnecessary empty mileage involved.

For example, a Pennsylvania box car at Ogden in bad order, if sent to the owner at Chicago would involve 1,500 empty car miles, and if the excess box car loading were eastbound, it would mean the necessity of moving some other box car empty westbound 1,500 miles, involving 3,000 excess

empty car miles as compared with repairing the car at Ogden and loading it to Chicago. At 5 cents per car mile, this would mean an out-of-pocket expense to the carriers involved of at least \$150. On the other hand, if a Southern Pacific car located at Chicago were safe to run, but otherwise would be considered a bad order, and the movement of empty box cars were westbound, it would be more economical to all concerned to send such car home and let the owners repair it, there being no excess empty car miles involved, and the owner could probably make the repairs for 20 per cent less than it would cost a foreign road to do so.

### Loss and Damage

The A.R.A. Freight Claim Division has recently issued a memorandum indicating that practically 10 per cent of all freight claim payments made during the seven months ending March 31, 1921, aggregating \$5,876,056, was paid on account of defective and unfit equipment; and \$3,243,806, or 55 per cent, of the total payments on account of defective equipment was for grain, flour and sugar, grain alone amounting to \$1,818,664, or 31 per cent.

There are, of course, many factors involved, but suffice it to say that the bad order situation appears to me to be vital, and one which can and should be improved.

When it is necessary to switch a car to a repair track and incur the transportation and per diem expense, regardless of the initials on the car, when practical the required work should be done thoroughly and expeditiously.

In other words, the rules should be made so that the signers of the agreement will observe Rule 1, and coincident therewith I feel sure there will follow reduced cost of freight car repairs and transportation expenses, as well as a reduction in the hire of equipment account

## La Follette Warns Against "Special Interests"

### Opposition to Capper Bill Seen by Senator as Danger to "Consuming and Producing Millions"

SENATOR LA FOLLETTE, in a speech in the Senate on December 22 and in a statement to the press on December 27, has been attacking an agreement said to have been made at a conference at Washington on December 9 attended by representatives of a number of large organizations of shippers and of the railroad executives, at which some sort of understanding was reached that the agricultural organizations, because of rate reductions on agricultural products, would use their influence to oppose or withdraw their support from certain features of proposed legislation adverse to the railroads which they were convinced were also not in the interest of the shippers. Senator La Follette refers to this as a "secret meeting at which high officials of the railroads and the coal, steel and lumber interests attempted to enlist the farmers in an agreement whereby all agitation by the farmer interests for the repeal of section 15-a and for the restoration of state control over intrastate rates should cease." The "special interests," by which he apparently means those other than the farmer or labor interests, he says, were successful. In his speech Senator La Follette said he was reliably informed that an agreement was reached to rewrite the Capper bill so that only the clause directing the commission to make rates to produce as nearly as may be a return of 5½ to 6 per cent should be repealed and the remainder of the rate-making section, directing the commission to try to allow the railroads adequate revenues and to prescribe the percentage of

return after March 1, should be left intact, as well as the provisions under which the commission has power to prevent state discrimination against interstate commerce.

Apparently the La Follette version of the conference reached the Senate before the reversal of the influence of the farm organizations had begun to make itself felt. Senator Capper, the reputed author of the bill which has formed the basis for most of the discussion regarding the proposed changes in the law, asserted that if any attempts were made to rewrite the bill Congress would hear from the farmers of Kansas. In his statement Senator La Follette gave a report of the conference which he called "a conspiracy to betray not only the farmers but the consuming and producing millions of the nation." This report follows in part:

"The great special interests represented at this conference were successful in obtaining the consent of certain of the farm representatives to such an agreement.

"This conference was participated in by the special committee representing the railway executives, of which Mr. Atterbury, of the Pennsylvania railroad, was chairman. It was held at the Racquet Club in Washington on December 9, 1921.

"There had been a previous conference in New York on September 21, of which Mr. J. R. Howard was made chairman. Those present at the Racquet Club meeting were Mr. W. W. Atterbury, of the Pennsylvania railroad; Howard Elliott, of the Northern Pacific; W. J. Harahan, of the

WASHINGTON, D. C.

Chesapeake & Ohio; W. R. Storey, of the Atchison; R. S. Binkerd, who is assistant to the chairman of the Association of Railway Executives, New York.

"The iron and steel industries were represented by J. A. Campbell, of the Youngstown Sheet & Tube Company, of Youngstown, Ohio, and C. E. Bement, of Lansing, Mich., representing the Novo Engine Company.

"Railway supply organizations were represented by A. B. Johnson, president of the Railway Business Association, of Philadelphia, Pa., and Frank W. Noxon, secretary of the same association.

"Lumber interests were represented by Charles Hill, of the Southern Pine and Sales Corporation, of New York; A. B. Hammond, of the Hammond Lumber Company, of San Francisco, Calif.; J. H. Browne, of the Pacific Lumber Company, of New York City.

"Construction companies were represented by R. C. Marshall, Munsey Building, Washington, D. C., and E. T. Trigg, of Philadelphia, Pa.

"The National Industrial Traffic League was represented by W. H. Chandler, Boston, Mass., and J. H. Beck, Chicago, Ill.

"The National Association of Manufacturers was represented by J. A. Emery, of Washington, D. C.

"The agricultural interests were represented by J. R. Howard, Gray Silver; H. C. McKenzie, of New York; Ralph Snyder, of Kansas, and O. E. Bradfute, of Chicago. They were all of the American Farm Bureau Federation, the last three named being members of the legislative committee.

"The agricultural interests were also represented by V. I. Drummond, president of the International Farm Congress, and T. C. Atkeson, of the National Grange.

"Mr. Atterbury stated that the railroads desired the help of the interests represented in securing further wage reductions, and in opposing the amendments pending in Congress proposing repeal of section 15-a.

"After a considerable discussion the agricultural representatives, not being disposed to oppose the amendments absolutely, adjournment was taken for lunch, with the understanding that representatives of the carriers and of the agricultural interests would talk the matter out.

"After lunch Mr. Howard reported that the agricultural representatives were prepared to agree that section 15-a should not be amended, except for the removal of the proviso in paragraph 3, relating to the percentage of return for two years following March 1, 1920, which expires by statutory limitation in March next.

"It was left with a committee composed of Mr. Emery, Mr. Atkeson and Mr. Silver to rewrite the Capper bill, one of the measures proposing repeal of section 15-a."

The Senator did not explain which one of the conspirators was the source of his information or whether he got it second-hand. It is understood from other sources that the meeting in September was called for the purpose of promoting a round table discussion of common problems by leading representatives of the railroads and the shippers which resolved itself, however, into such a strenuous demand for lower rates that the railroads finally agreed to the 10 per cent reduction in rates on agricultural products as the best they could do at this time and promised to put into rate reductions, in accordance with the views of the Interstate Commerce Commission, any savings they may be able to make from a further reduction in wages. This was not entirely satisfactory at first to the shippers other than the agricultural group, and even the railroads had difficulty in reaching an agreement among themselves on the 10 per cent reduction.

At the meeting on December 9 the representatives of the farm organizations are said to have expressed appreciation of this action on the part of the roads and a willingness to

do something to help the roads meet their problems, but when they were reminded that they had been supporting the Capper bill to emasculate the Transportation Act they were insistent upon the repeal of the so-called "guaranty rule." It appeared, however, that they were not so insistent upon repealing other provisions of the law.

A denial that there was anything "secret or unholy" about the Washington conference was made at Cleveland, after the issuance of La Follette's statement, by James R. Howard, president of the Farm Bureau Federation.

"Early in the conference an attempt was made to get an agreement to oppose the Capper bill, which repealed the guarantee clause of the Cummins-Esch bill and re-established the powers of the states in interstate matters," Mr. Howard said. "The farm representatives objected to this, standing firm for the repeal of all guaranteed returns and the integrity of state commissioners.

"Matters pertaining to reduced labor and other operating costs were discussed as well as the railway labor board, but no attempt to reach an agreement was made. This conference grew out of a former conference held at New York, September 21. At this meeting I personally made a plea for reduced rates on basic commodities and the direct result of this conference is the 10 per cent reduction on all agricultural products effective January 1.

"The 10 per cent reduction which the railroads voluntarily granted as a result of this conference will save the farmers approximately \$100,000,000 during the next six months. Senator La Follette is reputed to favor government ownership and operation of railroads. The American Farm Bureau Federation has always advocated private ownership and operation."

Senator La Follette took the position that some of the representatives of agriculture had been "captured" by the railroads and the trusts, but some others are asking if the farmers were the ones who were captured.

The railroads were unable, following the conference in New York in September and the further conferences between the executive committee of the Association of Railway Executives and the President, Secretary Hoover and the chairman of the Interstate Commerce Commission and various Congressional committees about the first of October, to agree on the 10 per cent reduction. The proposal was turned down at a meeting of the executives in Chicago on October 14, but after the Farm Bureau Federation had joined with the western state commissions in a formal case before the Interstate Commerce Commission and the commission had told the roads to make a more extensive reduction in the rates on grain, hay and grain products in the west the plan for a 10 per cent reduction was agreed upon by the roads on November 10. This was after the executive committee had held a conference with the commission at Washington on November 12. While the roads apparently expected to substitute the more general 10 per cent cut for the commission's order, the commission, under great pressure from the west and from Congress, declined to grant the postponement requested by the carriers and both reductions are now scheduled to go into effect.

At the oral argument before the commission on December 14, at which the roads asked that the grain order be suspended for six months, Clifford Thorne, appearing as counsel for the Farm Bureau Federation, urged that both reductions be made.

W. H. Chandler, president of the National Industrial Traffic League, who was present at the meeting, is said to have declined to be a party to any agreement and to have objected to discussing rate questions except in a public way.

In his statement Senator La Follette "warns the country" that the railroads are seeking to perpetuate the "guaranty" after March 1.

*The Locomotive Is European in Appearance but American in Design*

## Locomotives for the Andaluces Railway of Spain

### Consolidation Type of American Design for Use on Heavy Mountain Grades

THE Compania de los Ferrocarril Andaluces, which is the third largest railway in Spain, is located in a very mountainous section of the southern part of the country. Its main shops and the general offices of the director are located at Malaga, a seaport on the Mediterranean

railway. They were designed by the locomotive works along the general lines of a previous lot supplied by a British builder. Spain is dependent on foreign manufacturers for its locomotives, most of which have been made in England, Belgium, France, Italy and Germany. Only a small number

*The Andaluces Railway Runs Through a Picturesque Mountain Country*

Sea. The railway touches on its extremities Belmez on the north, Grenada on the east, Algeciras on the south and Bonanza on the west. It has 1,302 kilometers (810 miles) of track open, having a 5 ft. 5 $\frac{3}{4}$  in. (1.67 m.) gage. Its rolling equipment consists of 198 locomotives, 611 passenger coaches, and 5,170 freight cars. It also operates three steamboats and one motor coach for inspection purposes.

Last year the Baldwin Locomotive Works completed and shipped 15 Consolidation (2-8-0) type locomotives to this

have been furnished by American builders, but, according to reports, these few are giving good service.

The locomotives have copper fireboxes and rocking grates. When the order was placed a plain bar cast iron grate was specified, but on account of the low grade of fuel used, it was later decided to change to the usual American type of rocking grates with a  $\frac{5}{8}$  in. air space between the bar fingers. The wisdom of this decision is borne out by the fact that the railway has reported an unusually low coal consumption

on these locomotives; which is very important as fuel is scarce and expensive. The fuel used is briquettes composed of one-third best English coal, one-third lower grade Spanish coal, the balance of coal dirt and a binder of asphaltum.

The locomotives employ superheated steam. They are equipped with Schlack cylinder lubricators and with Clayton vacuum brakes. The Clayton vacuum brake is manufactured by the Vacuum Brake Company, Ltd., of London and the New York Air Brake Company of New York, which controls the American manufacturing rights. Brakes as made by the two companies are exactly alike and the parts are interchangeable. At the time these Consolidation locomotives were being built, the Vacuum Brake Company of London was unable to furnish their brake apparatus in time for the Baldwin Locomotive Works to put it on and deliver the locomotives at the date specified in the contract so the material was purchased from the New York Air Brake Company. Reports from the railway company indicate their entire satisfaction with Clayton brakes of American manufacture.

Locomotive boilers for Spanish railways are tested under a Spanish law. This law requires the hydraulic test of the boiler to be made at a pressure of 17.25 kilograms per square centimeter (246 lb. per sq. in.) instead of 25 per cent above boiler working pressure as required by the Interstate Commerce Commission of the United States, which latter procedure is the one usually employed by American locomotive manufacturers. These boilers were built according to Baldwin Locomotive Works practice which specifies a test of somewhat greater severity than required by United States law. The Spanish test is most severe and gives testimony to the excellence of the boiler construction. The exact conditions to be met were not known at the time of manufacture and the boilers for these locomotives were given a shop test of 213 lb. per sq. in. The re-test at destination as made under Spanish law was at approximately 245 lb. per sq. in., or an excess of 15 per cent above the manufacturer's test and 22½ per cent above the test necessary under United States laws.

The locomotives were erected in the railway's own shop, which is a combination erecting and boiler shop 65 ft. high, 90 ft. wide, and 425 ft. long. In it are eight erecting pits, each long enough for two engines and served by an electric traveling crane of 30 tons capacity. The minimum erection time for these locomotives was 21 days, the maximum was 41 days and the average was 29.9 days.

The new motive power is now being used on the division between Alora and Gobantes. This route traverses a very

mountainous part of the country, thus making a continuous haul for the locomotives for about 40 miles, several miles of which is a succession of tunnels with the tracks constantly wet from the seepage through the rocks. Most of the steep grades are combined with curves, many occurring in the tunnels where the rails are extremely slippery. In an official test of locomotive No. 467 hauling train No. 201, a load of 270 metric tons (298 short tons) was pulled from Alora to Gobantes, a distance of 19 kilometers (11.8 miles) up a ruling grade of three per cent, gaining 11 minutes on the scheduled time. The train hauled is considered a 15 per cent overload according to the railway company's calculations for tonnage allotment.

The most important dimensions, weights and factors of these locomotives are given in the table herewith.

Locomotive type.....	2-8-0
Service .....	Freight
Gage .....	5 ft. 3¼ in.
Tractive effort (85 per cent).....	23,280 lb.

# Adopts New Methods for Handling Stationery

Describing the System Used by the Chicago, Milwaukee  
& St. Paul at Its Miles City Store

By R. H. Ewry

Stationery Storekeeper, C. M. & St. P., Miles City, Mont.

REORGANIZATION of the stationery department of the Chicago, Milwaukee & St. Paul Railway Company, has been in progress for the past year under the supervision of the general store department, of which stationery is one of the many branches, and has been systematized so that requisitions and supplies will be handled efficiently. There are two stationery supply stores on the system. The stationery storekeeper at Milwaukee Shops, Wis., supplies the points on lines east of Mobridge, S. Dak., and the one at Miles City, Mont., supplies all points west of Mobridge, to the Pacific coast. The Miles City store receives its stock of supplies from Milwaukee Shops, and on direct purchase requisitions.

Forms are arranged on the shelves so that a quick count of stock on hand may be taken at any time. The forms are placed face downward on the shelves as dust and atmospheric changes ruin the top sheets if the latter are exposed for any length of time.

All miscellaneous articles of stationery such as pins, erasers, rubber-bands, pencils, mimeograph ink, etc., are arranged on the shelves around or near the packing counter and are lined up as nearly as possible in the order in which they appear in the stationery stock book.

A stock requisition is placed each month with the general storekeeper by the stationery storekeeper for the supplies for the forthcoming 30 days on Form 1962, when it is a stock

Fig. 1—Wrapping Counter and One of the Stationery Packing Boxes

Fig. 2—An Aisle in the Stationery Stock Room

The stationery stock is arranged on shelves in numerical order according to the stock books. Each bin is tagged. On the tag appears the form number, page and line on which it is listed in the stock book and the price per unit. As a speedy reference to the stock books, for purposes of pricing requisitions, if desired, and in ascertaining all data relative to any form when necessary, this system has proved satisfactory, especially when taking inventory and also when ordering the stock necessary for the next month.

Fig. 1 illustrates the order in which the miscellaneous articles are stored back of the wrapping counter; it also shows one of the stationery packing boxes, in which the larger orders for supplies are shipped. The packing boxes are numbered, and there is a record kept of point of destination. This is important as the box then can be traced and its return to the stationery department thereby assured. Small shipments of stationery are tied up in bundles and a paper placed on the package bears the address of the consignee. Fig. 2 shows an aisle in the stationery stock room.

item, or on Form 1737, when it must be placed direct with the purchasing department. Forms 1962 and 1737 are illustrated in Fig. 3. It will be noticed that whether it is a stock item requisition or a direct purchase requisition, the data listed on these forms gives all the desired information necessary for the general storekeeper to have so that the desired amount can be ordered intelligently.

Form 1737-A (invoice record sheet) and Form 1737-B (receiving record sheet) shown in Fig. 4, are used as a record of invoices and records of shipments of material so that there may be no occasion for an error in passing an invoice. This is the most important part of the storekeeper's work as it prevents the passing of duplicate invoices and avoids passing invoices for material which has never been received.

The stationery storekeeper conducts his department on the same basis as a commercial concern. It is strictly debit and credit business. Nothing is ever delivered without Form 61 or 61-A, as shown in Fig. 5, properly approved, which is the same as cash to the storekeeper. On the return of articles

and forms, a charge-out credit is allowed, as shown in Fig. 5, on Form 1728, which is printed in red, so that disbursements can be made, debiting and crediting the proper accounts.

Requisitions for stationery must be approved by a designated officer of the particular department before they are filled. Form 61 is used by all persons ordering stationery. Form 61A (Fig. 6) has been adopted recently and will be

respective division for approval. This officer signifies his approval of the requisition by entering his name on the last page in the book opposite the name of the month the requisition is placed and forwards it to the traveling auditor of his division for O. K. The traveling auditor after checking, forwards Form 61 and 61-A to the stationer to be filled. The agent cannot order more than what he is allowed for 60 days, as shown in the column marked "Allotment." If an addi-

put into effect at an early date. It is called the "Station Agents Stationery Stock Book." Both of these requisitions forms must be filled in complete by the agent before they are accepted to be filled. The agents' stock book is invaluable as a record of stationery disbursements for auditing and accounting purposes. Form 61 is made out by the agent and is enclosed in Form 61A when requisition is made for supplies. Form 61A is a means of assisting those, con-

tional supply is desired, he must write a letter to the approving officer explaining why the additional amount as shown on the requisition, is needed.

The stock book is considered one of the most important records of the storekeeper, as shown in Fig. 7. In it are listed all the forms and material carried in stock. Each month when an order is placed for supplies, the following data must be shown in spaces provided: "On Hand," "Due

cerned about its use, in the conservation of stationery, as in this book are columns headed, "Form and Number," "Cost; Allotment," and under the caption designating the months of the year are two columns, one headed "On Hand," and the other "Ordered."

These two columns are filled in each time a requisition is placed for supplies, which is every other month or approximately every 60 days, and sent to the superintendent of each

on Requisitions"; "Holding Orders For"; "Used Last 30 Days"; and "Surplus." The amount ordered is placed in the column marked, "Ordered." The requisition number is placed opposite the amount ordered in the column provided, and when supply is received the amount ordered is circled and the date on which it was received is placed under the circle. These stock books are lined up to run for one year without new inserts being placed in the books. This system

Office supplies; all office furniture and fixtures; photographic supplies; ticket cases; blue print machines and postage stamps are requisitioned and supplied by the stationery storekeeper. When the price of these articles is considered together with the cost of stationery and printing at the present time, strict conservation must be practised by each individual during this period of retrenchment, if the money spent annually for these supplies is to be appreciably

When a mistake is made, don't destroy the sheet, but use an eraser; it is furnished for that purpose.

Pencil extensions are furnished to prolong the use of each lead

reduced. The following suggestions are given with that end in view:

Carbon paper is costly—it is hard to obtain. Use each sheet as long as a legible impression can be made. All carbon paper not in actual use should be put in a box or envelope to prevent drying out and be kept away from heat.

All miscellaneous articles such as pencils; rubber bands; paper fasteners; ink and erasers, should be placed in charge of a capable employee in each large office or department who should be held responsible for their care and proper issuance.

NEAR WILLIMANTIC, CONN., on December 21 a collision between a passenger train and a locomotive on the New York, New Haven & Hartford, 14 passengers were injured none seriously.

[illegible]

pencil. When a pencil is half used, slip on the extension, it will serve you as well as a new one.

pencil. When a pencil is half used, slip on the extension, it will serve you as well as a new one.

Departments having mimeograph machines should avail themselves of the saving made possible by the use of Form letters. By so doing, it will reduce the purchases of letter paper, and typewriter ribbons.

It is advisable to ship all waste paper in packing boxes when they are returned to the stationery storekeeper, as the company can

realize an appreciable figure by selling it, as there is a market value for all waste paper.

Save stationery.

Take care of your individual supply.

**All haste makes a waste of stationery forms.**

Top sheet of a pad of forms should be used, not destroyed.

It is the smaller items that run into big figures.

Order only what you need.

Not what you use, but what you save, is what counts.

Every item of stationery wasted is a direct loss.

Regard stationery as a personal representative of your desk.

Y Our allotment of stationery supplies cost money; if you were paying for them you would not waste them.

# General News Department

**Returns of 91 Class I roads** to the Interstate Commerce Commission for November show a net railway operating income of \$38,000,000, an increase of 35 per cent as compared with November last year. The operating revenues show a decrease of 22.2 per cent, while the operating expenses were reduced 29.5 per cent.

## Air Brake Association Convention

In the announcement of the 1922 convention of the Air Brake Association in the issue of December 24, both the Hotel Washington and the Ebbitt Hotel were mentioned, but it was not made clear that the headquarters of the association will be at the Hotel Washington. The new Ebbitt Hotel will be used only to provide accommodation for those who are unable to obtain rooms in the Hotel Washington.

## Rumors of Electrification of the T. & N. O.

The reports which have gained some currency regarding the development of hydro-electric power on the Abitibi river by the Temiskaming & Northern Ontario, are somewhat premature. The extension of this railway will cross the Abitibi river at the Long Sault rapids. It is probable that there will be a development of this water power, but whether it will be as a part of a pulp and paper mill, or simply as a hydro-electric power development is at present uncertain.

The Long Sault has been considered as a source of power in connection with the proposed electrification of the railway. It is not probable that the work of electrification can be commenced under existing financial conditions, but it is probable in any further development of water powers on the Abitibi river, the provincial government will give due regard to the requirements of the pulp and paper, and mining industries, as well as the requirements of the Temiskaming & Northern Ontario for hydro-electric power.

## Wage Statistics for August

The Interstate Commerce Commission has issued the second of its new series of monthly reports of wage statistics giving figures for the month of August, when the number of employees of the Class I steam roads was 1,679,927, as compared with 1,634,872 in July and the total compensation was \$227,745,895, as compared with \$214,339,385. The report says the increase was principally due to an increase in the number of straight time hours per employee, there having been a small decline in the number of overtime hours paid for.

The report gives average earnings for the month, based on the number of employees at the middle of the month, for the various groups of classes of employees as follows:

	Daily Basis	Hourly Basis
Executives, officials and staff assistants.....	\$417	126
Professional, clerical and general.....	178	126
Maintenance of way and structures.....	236	93
Maintenance of equipment and structures.....	248	134
Transportation, other than train engine and yard.....	99	124
Transportation, yardmasters, switch tenders and hostlers.....	258	143
Transportation, train and engine.....	258	181

## Progress on Contract Standardization

Definite progress is recorded for the two-day conference held at Washington on December 15 and 16 for the standardization of construction contracts. Those present included representatives of associations of railway and highway engineers, architects, contractors and others. The meeting was opened with an address by Herbert Hoover, secretary of commerce, who extended the assistance and co-operation of his department in the fullest measure. The conference elected officers as follows: Chairman, Onward Bates of Chicago,

representing the Western Society of Engineers; vice-chairman, J. W. Cowper of Buffalo, N. Y., representing the Associated General Contractors, and secretary, W. P. Christie of Washington, D. C. After a general discussion of the problem of the universal contract form, a committee was appointed to prepare a tentative form for general contract clauses, this committee consisting of General R. C. Marshall, representing the Associated General Contractors; W. S. Parker, representing the architects, and W. D. Faucette, chief engineer of the Seaboard Air Line, representing the railway engineers.

## Floods Causing Trouble

Heavy rains in the Ohio river valley and the state of California have caused the railroads considerable damage and inconveniences at certain points in these regions. The greatest damage was done at San Diego, Cal., which city was completely isolated for several days as it was necessary to suspend traffic on both the Atchison, Topeka & Santa Fe and the San Diego & Arizona on December 25. The Santa Fe lost 1,000 ft. of track and roadway near Sorrento, and in the Rose Canyon and there were small washouts at several other points, while the bridge over the San Diego river was threatened. In the Ohio region, it was necessary for the Cleveland, Cincinnati, Chicago & St. Louis, the Southern and the Baltimore & Ohio to abandon the Central Union station at Cincinnati temporarily because of high water. Service was not resumed at this station, except for one or two local trains operated on a track above the water line, until December 28. While little damage was done at this point the railroads here and at other points on the river experienced a great deal of inconvenience from the high water.

## Report on Collision at Manhattan Transfer

The Interstate Commerce Commission has issued a report, dated November 21, and signed by W. P. Borland, chief of the Bureau of Safety, on the rear collision of westbound passenger trains which occurred on the Pennsylvania Railroad near Manhattan Transfer, N. J., on the morning of October 28, about 12:30 o'clock, when 38 passengers, four Pullman employees and four railroad employees were injured. There was a dense fog at the time, and express train No. 103, consisting of electric Motor No. 11 and 12 sleeping cars, moving at from 10 to 25 miles an hour, ran into the rear of a preceding train, No. 701, which had been brought to a stop about one mile east of Manhattan Transfer station. Train 103 had run past two automatic block signals set against it, one at caution and the other at stop; a second stop signal 271 ft. in the rear of the standing train; and also past a flagman and fusee and torpedo signals; although the flagman and the fusee and torpedoes were not very far back from the standing train.

The flagman is censured for not affording his train proper protection. If his train had been moving at ordinary speed, he had from seven to 10 minutes in which to go back; while if it had been moving slowly, he ought to have thrown off fuses, which he did not do.

The engineman at fault admitted that he passed the two automatic signals without observing their indications; and he did not make a sufficient reduction of speed. The engineman's helper on train 103 is also held at fault for failure to observe the signals and to warn the engineman that signal locations had been passed without the indications being seen.

The line between Pennsylvania Terminal, New York, and Manhattan Transfer, nine miles, double track, is equipped with automatic block signals for the movement of trains in either direction on either track; and, in addition, automatic

stops are provided on that portion of the line which is in tunnel; at the entrances to the tunnel and at the approaches to a drawbridge, about two miles east of the point of collision. The report indicates that no reason was disclosed why automatic stops had not been installed on the track at every block section throughout this nine miles, all electric motors running over the line being equipped with train-stop apparatus; and "to prevent the recurrence of accidents of this character, it is recommended that the installation of the automatic train stop system be extended" to cover the whole of this line.

All of the cars involved in the collision were of steel; and the report declares that if any one of them had been of wood there probably would have been loss of life.

### Wood Preservers' Convention Program

The following is the program of the convention of the American Wood Preservers' Association to be held on January 24-26, at the Hotel Sherman, Chicago:

TUESDAY, JANUARY 24, 10.30 A. M.

Invocation, address of welcome and opening business.

Effect of Heat on Wood-Destroying Fungi in Mills, by Dr. Walter H. Snell.

2 P. M.

Committee report on Preservatives, A. L. Kammerer, chairman.

A Theory on the Mechanism of the Protection of Wood by Preservatives, by Ernest Bateman, chemist, Forest Products Laboratory, Madison, Wis.

Committee report on Utilization and Service: Economics, Kurt C. Barth, chairman; Track, S. D. Cooper, chairman; Flooring and Paving, L. T. Ericson, chairman.

What Constitutes Reliable Service Records, by M. F. Deutsch, statistician, Forest Products Laboratory, Madison, Wis.

The Economics of Cross Tie Renewals, by V. K. Hendricks, Terre Haute, Ind.

Factors Affecting the Cost of Treated Cross Ties, by E. E. Pershall, vice-president, T. J. Moss Tie Company, St. Louis, Mo.

Photography and Wood Preservation, by Henri Strawn, photographer, Atchison, Topeka & Santa Fe, Topeka, Kans.

WEDNESDAY, JANUARY 25, 10 A. M.

Feasibility of Using Tropical Hardwoods for Railroad Ties in this Country, by Nelson C. Brown, American Woods Export Association, New York.

Committee report on Treatments: Ties—Fir, R. H. Rawson, chairman; Lumber—Car, W. J. Smith, chairman; Treated Car Sills and Decking, F. S. Shinn; Poles—Pressure and Non-pressure Treatments, R. P. Hosford, general chairman; Wood Pipe, H. E. Horrocks, chairman; Creosoted Wood Stave Pipe, H. D. Coale, chairman; Inspection, J. R. Keig, chairman.

Should the Increased Cost of Treating Ties be Charged to Maintenance or Capital Account?, by Earl Stimson, chief engineer of maintenance, Baltimore & Ohio, Baltimore, Md.

Lumber Drying by Vacuum, by O. E. Jacobs.

2 P. M.

Growing Need for Preservation of Mine Timbers, by R. R. Horner.

Why Preserve Mine Timbers? by George M. Hunt, chemist, Forest Products Laboratory, Madison, Wis.

Decay of Timber in Mines, by C. J. Humphrey, pathologist, Bureau of Plant Industry, Madison, Wis.

Committee report on Plant Operation: Peeling Ties, F. S. Pooler, chairman; Adzing, Boring and Performing Layouts, D. W. Edwards, chairman; Car Loading, A. E. Larkin, chairman; Insurance, W. E. Doan, chairman, Pressure Machinery, E. E. Alexander, chairman; Material, Handling, A. H. Onstad, chairman.

THURSDAY, JANUARY 26, 10 A. M.

Confidence in the Industry, by R. S. Manly, president, Creosoted Materials Company, New Orleans, La.

Committee report, on San Francisco Bay Marine Piling, F. D. Mattos, chairman.

Committee report on Gulf Coast Marine Piling Survey, E. F. Boehne, chairman.

American Shipworms, by Paul Bartsch.

Closing business.

## Traffic News

H. A. Jones, formerly traffic manager for the Columbian Steel Tank Company, Kansas City, Mo., has been appointed traffic manager for the Rudy-Patrick Steel Company, Kansas City, Mo.

North Pacific Coast traffic representatives met at Seattle, Wash., on December 23, to confer on reductions and revisions in switching rates at all northwest terminal cities, including Portland. The present switching rates came into effect during the war.

The Senate on December 22 adopted a resolution introduced by Senator Ladd of North Dakota directing the Federal Trade Commission to make an investigation and report regarding the facts relating to the exportation of wheat and other grain, including the freight and other costs of handling.

Reductions of rates on coal from Chicago to Pacific Coast points were announced by the Southern Pacific on December 21, the effective date to be set later. The company has also extended the privilege of fabricating in transit of iron and steel tank plates in shipments originating in Chicago and west when shipments are destined for Pacific Coast points.

J. A. McNaughton, formerly traffic manager for the Cudahy Packing Company, Chicago, has been appointed traffic manager for the Stock Yards Company, Los Angeles, Cal. J. W. Robb, succeeds Mr. McNaughton with the Cudahy company. B. E. Reed, assistant traffic manager of the first named company, has been appointed traffic manager for the California Fruit Growers' Exchange, Los Angeles, and has been succeeded by C. O. Cornwall.

In defending the western sugar rate to Chicago at a hearing conducted by the Interstate Commerce Commission at San Francisco, Cal., on December 14, H. R. Howard, sales manager of the Western Sugar Refinery, San Francisco, testified that the lower price of raw products on the Pacific Coast did not handicap the eastern refineries because the eastern refineries, through subsidiary companies, own plantations. Eastern roads maintain that the present freight rates on sugar from the Pacific Coast to Chicago unduly handicap the shipment of Louisiana, Cuba and Porto Rican sugar to the Chicago market.

### Coal Production

Coal production declined again during the week ended December 17, according to the weekly bulletin of the Geological Survey, and established a new low record for this season of the year. The output of bituminous is estimated at 7,046,000 net tons.

### Senate to Take Up Mileage Book Bill

An effort will be made in the Senate on January 11 to pass a bill to require the railroads to sell interchangeable mileage books at 2½ cents a mile. On motion of Senator Robinson of Arkansas on December 22 the Senate entered into a unanimous consent agreement to discharge the committee on Interstate Commerce from further consideration of the bill S. 848, which provides for the issuance of a mileage book at 2½ cents, by amendment of section 22 of the interstate commerce law, and to take up the consideration of the bill on January 11. A number of similar bills have been introduced in Congress but no action has been taken upon them by the committees. An effort was made to attach one of them to the tax bill as a rider but it failed because it was not germane to the bill and also because several senators expressed themselves as greatly opposed to Congress legislating directly to fix a rate of fare itself. Senator Robinson put into the Congressional Record a statement in which he said that "there is no one thing that contributes more to the high cost of living than the high cost of railroad travel and railroad freight and express rates."

## Commission and Court News

### Interstate Commerce Commission

The commission has suspended until April 26 the operation of schedules published by the Erie and the Pennsylvania which provide reductions in the rates on iron ore from Lorain, Toledo and Cleveland, to various destinations in Official Classification territory. For example the present rate on iron ore from Cleveland to Cumberland, Md., is 174½ cents a ton, and the proposed rate 170½ cents.

The commission has further suspended until February 12 the operation of certain schedules published in supplements issued by R. H. Countiss, agent. The suspended schedules in Supplement No. 1 propose to restrict the routing on lumber and articles taking same rates destined to eastern points so as not to apply via any junction in connection with the Atchison, Topeka & Santa Fe, Gulf, Colorado & Santa Fe or Pan-Handle & Santa Fe, from points in California, Nevada and Utah in the Hawley and Truckee groups, leaving applicable instead combination rates; and Supplement No. 2 proposes to substitute, for the combinations proposed to apply, the Coast group rates from points in the Hawley and Truckee groups, the operation of which was suspended until January 13, 1922, by an order previously entered.

### Rate for Grain Rate Reduction Postponed

The Interstate Commerce Commission on December 23 authorized the western railroads to make the reduction in rates on grain, grain products and hay effective on January 7 on one day's notice, instead of on December 27, on five days' notice, as provided in the commission's order. This was done because it appeared to the commission that it was physically impossible for many of the carriers to publish the tariffs by that date even on one day's notice.

### New England Roads Included in

#### Agricultural Rate Cut

The Interstate Commerce Commission on December 22 granted permission to the New England railroads, at their request, to make the general 10 per cent reduction in rates on agricultural products which is to be put into effect on January 1 by the other roads. In the original plan the New England lines were excepted because of their financial condition.

### Coal Rate Reductions Suspended

The commission has suspended until April 24 the operation of certain schedules published by the Chesapeake & Ohio and the Louisville & Nashville which propose reductions in the rates on bituminous coal from mines to destinations on the Southern Railway in Indiana and Illinois. The following shows the present and proposed rates in cents per net ton on bituminous coal from Chesapeake & Ohio mines in the Kanawha and Big Sandy Districts to destinations indicated:

To—	Present	Proposed
Muen, Ind.....	364	347
Oakland City, Ind.....	364	347
Mt. Carmel, Ill.....	378	347
Centralia, Ill.....	413	347
East St. Louis, Ill.....	413	347

### Bingham & Garfield Hearing Closed

The hearing conducted by H. B. Wilson, examiner for the Interstate Commerce Commission in conjunction with three members of the Public Utilities Commission of Utah, to determine whether the Bingham & Garfield is a plant facility of the Utah Copper Company or a common carrier, closed at Salt Lake City on December 18. The copper company, under a contract with the railroad, guarantees the railroad a return of 6 per cent on its investment. The copper company owns the railroad outright, and claims the contract is legal and regular on the ground that to all intents and purposes the railroad is a plant facility. The company, therefore, seeks to avoid payment of one-half of all

over 6 per cent net profits into a common fund of all the railroads of the country as provided for in the Transportation Act. For all years since that ending June 30, 1912, the net railway operating income has been more than 6 per cent of the book value; and as high as 24.35 of that value in the year ending December 31, 1916.

### Reduction in Coal Rates by Ford's

#### Railroad Not Permitted by I. C. C.

The Interstate Commerce Commission has issued its decision on the proposed reduction by the Detroit, Toledo & Ironton in the interstate rates on coal in carloads from mines on its line in the Jackson county and Ironton groups in Ohio to Toledo, Detroit and other destinations, ordering that the tariffs be cancelled on the ground that they are unduly preferential of such mines and unduly prejudicial to mines on other lines in the same and other groups in Ohio and other states. The tariffs had been suspended since September 3.

The opinion, by Commissioner Esch, says that the financial condition of the railroad might warrant the proposed reduction, provided the issue could be decided solely upon that basis; but, a proper relationship between competitive groups is in many respects of greater importance to the shipping public than the measure of the rate itself, and the suspended schedules involved not only respondent's local coal rates, which are but a few of the many coal rates interwoven in the rate structure from the mines. Thus viewed, it is said, the commission would not be warranted in permitting the establishment of rates which would disrupt the rate relationship fixed by the commission and which has existed for many years. The report says the reduction contemplated by the suspended tariffs is merely a part of a general reduction in the interstate and intrastate rates of respondent upon all commodities. All other reductions in its interstate rates have been allowed to become effective.

## State Commissions

The Railroad Commission of Tennessee has summoned all the railroads of the state to appear on January 6 and show cause why the commission should not order the discontinuance of the surcharge of 50 per cent on railroad tickets of passengers riding in parlor and sleeping cars.

The Railway Commission of Nebraska on December 17, sent a protest to the Interstate Commerce Commission against the proposed issue of \$73,000,000 of bonds by the Chicago, Burlington & Quincy to reimburse the company's treasury for money spent in improvements in the years 1916 to 1921, and an issue of \$30,000,000 for additions and betterments to be made in 1922.

The Public Service Commission of Alabama has postponed until February 6 the date for its hearing in connection with proposed reductions in freight rates on the railroads of that state. It is said that the Alabama Shippers' Association requested this postponement because hearings are being held, on the same general subject, by the Interstate Commerce Commission.

The California Railroad Commission has ordered that all auto stages engaged in the transportation of passengers in California shall stop between 50 ft. and 75 ft. from steam railroad or interurban electric tracks, before crossing, and the stage driver must then look up or down the track to be sure there is no train approaching. Within municipalities the rule does not apply either at electric or steam railroad tracks.

## Personnel of Commissions

The Senate committee on interstate commerce on December 20 voted to recommend to the Senate confirmation of the nominations of Commissioners Aitchison and Hall for re-appointment to the Interstate Commerce Commission but the Senate failed to act before taking an adjournment to January 3. As the commissioners' terms expire at the end of the year this will leave vacancies until the Senate acts. It is understood that Senator LaFollette and some of the Southern Senators who think a Southern man should have been appointed will make some opposition to the appointment of Mr. Hall.

## Foreign Railway News

### Golfers as Passengers

LONDON

The Great Western is issuing special facilities for the benefit of golfers on their line. Tickets are issued inclusive of hotel accommodations, rail journey and conveyance from station to hotel and from hotel to golf links. This is a new departure in Great Britain and it is believed will be a valuable attraction to traffic.

### General Manager of North

#### Eastern (England) to Retire

LONDON

Sir Alexander Kaye Butterworth, general manager of the North Eastern Railway, is to retire at the end of the present year. Sir Alexander has held this position since 1906. He will, however, remain in the service of the company until the new amalgamation (North Eastern, Eastern and East Scottish Group) is formed in order that he may give his advice and assistance in all matters relating to the amalgamation. R. L. Wedgwood, C. B., C.M.G. is to be appointed general manager as from January 1, 1922. Mr. Wedgwood has held the position of deputy general manager since August, 1919.

### The Great Western's New Mechanical Chief

LONDON

C. B. Collett, who has been appointed as chief mechanical engineer of the Great Western (England) succeeding G. J. Churchward, C. B. E., who is retiring from that position at the end of the present year, served his apprenticeship with Maudslay Son & Field, of London, and entered the service of the Great Western Railway in 1893 at Swindon as draughtsman. He subsequently filled the position of chief draughtsman and was appointed in 1900 technical inspector of the Swindon locomotive works. In 1901 Mr. Collett was appointed assistant works manager, and in 1913 was promoted locomotive works manager. He has acted as deputy chief mechanical engineer since May, 1919.

### Railway Electrification in South Africa

The South African Railways have decided to defer electrification of the Durban-Pietermaritzburg section of the main railway from Durban to Johannesburg, and to electrify the track between Pietermaritzburg and Glencoe Junction instead, according to the Times (London) Trade Supplement. The section to be converted consists of 171 miles of single track, and preliminary work has already been begun. The change of plans is doubtless due to the lessened urgency of dealing with the coast section resulting from the recent completion of a new route between Pietermaritzburg and Durban, which, with other improvements, provides two tracks from the provincial capital to the port. Further, there are long and severe gradients against down traffic between the coalfields in Northern Natal and Pietermaritzburg, and this, combined with the fact that only one track exists, renders electrification of the inland section more immediately advantageous. It will also avoid the necessity for hauling fuel 240 miles to the generating station, since under the revised scheme the power plant will be built at Glencoe Junction, in the coal-producing district.

TWO MEN caught by the police in Chicago on December 23—one of them being killed—proved to be bandits who had held up Union Pacific passenger train No. 7, near Clearfield, Utah, on August 31. A reward of \$1,000 had been offered by the railroad company.

PASSENGER TRAIN No. 7, of the Southern Railway, was derailed near Anniston, Ala., on December 19, and the engineer, fireman and one mail clerk were killed. The engineer was Rev. Samuel T. Watkins, he having been a clergyman of the Baptist Church for 37 years, devoting a part of his time to religious work. He had spent much time in visiting prisons in Georgia and Alabama

## Equipment and Supplies

### Locomotives

THE DETROIT & MACKINAC is having repairs made to 1 locomotive at the shops of the Baldwin Locomotive Works.

THE LEHIGH & HUDSON RIVER is having repairs made to 2 Consolidation type locomotives at the shops of the Baldwin Locomotive Works.

### Freight Cars

THE PHILADELPHIA & READING is inquiring for from 500 to 2,000, 70-ton hopper cars.

THE BENGAL & NORTH-WESTERN is inquiring through the car builders for 25 timber trucks.

THE ASSAM BENGAL (India) is inquiring through the car builders for 100 covered goods wagons.

THE BANGOR & AROOSTOOK is applying steel underframes to 250 box cars in its shops at Derby, Me.

THE SOUTH INDIAN RAILWAY is inquiring through the car builders for prices on 100 steel covered goods wagons.

### Iron and Steel

THE ILLINOIS CENTRAL has awarded a contract to the Decatur Bridge Company for 675 tons of steel for the repair shop at McComb, Miss.

THE NORFOLK & WESTERN has placed contracts for 40,000 tons of rail for 1922 requirements. The tonnage was divided between several mills.

### Machinery and Tools

THE VIRGINIAN RAILWAY is asking for bids on a 200-ton wrecking crane.

### Miscellaneous

THE NEW YORK CENTRAL and subsidiary lines are asking for bids until 12 o'clock noon, January 10, 1922, for the requirements of these companies for a minimum of 5,000 and a maximum of 6,000 steel wheels for locomotive, passenger car and tender repairs.

THE CHICAGO & NORTH WESTERN is inquiring for 553 barrels of oil of different grades and 60 cases of Polar cup grease. This company is also inquiring for 55,000 gal. of Farmite long-time burning and mineral seal oil for the period ending June 30, 1922; also for its requirements of gasoline and kerosene by tank wagon delivery at various stations on the line in the states of Illinois, Wisconsin, Michigan, Minnesota, South Dakota, Iowa and Nebraska for the period ending December 31, 1922, also inquiring for approximately 100,000 gal. of kerosene in steel drums, 110 deg., and approximately 100,000 gal. of kerosene in tank cars, 110 deg., for the period ending June 30, 1922, all bids to be in before noon of January 3, 1922.

THE NEW YORK CENTRAL will receive bids until 12 o'clock noon, January 10, 1922, for its requirements from January 1, to March 31, 1922, of black, galvanized and blue annealed sheets; driving and truck tires for locomotive service; seamless steel tubes for repairs to locomotive and stationary boilers; wire nails and staples; steel bars, steel shapes and steel plates; steel billets; axles for car and locomotive repairs; and its present requirements of crossing frogs; special frogs; special crossing; spring rail frogs; switch covers; rigid crossine; common movable points; offset splices; rigid manganese frogs; crank stands for double slip; and new metal super-structure for one span complete for one track on bridge No. 22, Western division.

## Supply Trade News

David E. Hamilton has been appointed resident representative in New York City of **Herbert Morris, Inc.**, Buffalo, N. Y.

The **Keller Pneumatic Tool Company**, Grand Haven, Mich., recently changed its corporate name to **William H. Keller, Inc.**

The **Cutler-Hammer Manufacturing Company**, Milwaukee, Wis., has removed its Boston, Mass., office from the Columbian Life building, to rooms 403 and 404 Harvey building, Chancery street. C. W. Yerger is manager of this office.

E. R. Mason has been appointed eastern and export representative of **Brown & Co., Inc.**—Wayne Iron & Steel Works, Pittsburgh, Pa. Mr. Mason's headquarters are at the New York City offices of Brown & Co., Inc., room 2038 Grand Central Terminal.

R. C. Campbell, formerly vice-president of the Duncan Lumber Company, has been appointed manager of the car and railroad material department of the **Burton-Beebe Lumber Company**, Seattle, Wash., with headquarters at Chicago. Mr. Campbell will also handle long leaf yellow pine for J. H. Burton & Co., Inc., of New York and Mobile, Ala. The Burton-Beebe Lumber Company has moved its Chicago office from 53 West Jackson Boulevard to the Lumber Exchange building.

The **Texas Company**, New York City, has consolidated its traffic and railway sales departments into one department known as the railway traffic and sales department. The headquarters of G. L. Noble, vice-president; Wm. Jervis, manager, and W. E. Greenwood, assistant manager, is at 17 Battery Place, New York City, which will also be the headquarters of J. E. Symons, superintendent of the lubricating division of the department. W. H. Barrows has been appointed district manager at Houston, Texas.

## Obituary

William J. Armstrong, assistant treasurer of the Gould Coupler Company, New York City, died suddenly on December 25, at his home in Brooklyn. Mr. Armstrong had been in the service of the Gould Company for the past 25 years.

Thomas Murray, assistant secretary and assistant treasurer of the United States Steel Corporation, at New York, died on December 27, at his home in Sparkill, N. Y. Mr. Murray was also a director of the corporation and of a number of its subsidiaries. He was born in Jersey City, N. J., on December 14, 1867. In May, 1894, he became connected with the Federal Steel Company, and was appointed assistant secretary of the United States Steel Corporation upon its organization in April, 1901. On November 11, 1919, he was appointed also assistant treasurer of the corporation.

Orville C. Mann, inventor of several railroad appliances, died at Oak Park, Ill., on December 15. Mr. Mann was born at Bath, N. H., on July 22, 1859, and entered railway service with the Chicago, Milwaukee & St. Paul in 1878. In 1901, after serving on the Iowa and Dakota divisions of the above road, he moved to Chicago, where he entered the supply trade business as a manufacturer of smoke jacks. He later became associated with E. McCann, superintendent of bridges and buildings of the Atchison, Topeka & Santa Fe, who had perfected a spreader. Later Mr. Mann took over the entire interests in this device, which he has promoted in recent years.

OF THE TOTAL of 1,739 passenger cars owned by the Pacific system of the Southern Pacific, 890 are all-steel, 812 are wood and 37 are of steel underframe construction. The first steel coach, built as an experiment, was completed in the Sacramento shops of the company in 1906, and no wooden passenger cars have been built by the company since 1910.

## Railway Construction

**BENTON & SALINE COUNTY.**—This company has been chartered to construct a railroad line from Benton, Ark., extending beyond Glenville Park along the Saline river, a distance of about three miles.

**CANADIAN PACIFIC.**—This company is preparing plans and estimates for the construction of a new freight shed and team tracks at Windsor, Ont.

**GILMORE & PITTSBURGH.**—This company contemplates the construction of a line of railroad between Whitehall, Mont., and Dillon, using the tracks of the Oregon Short Line from Dillon to Armistead, Mont., where the present terminus of the road is located.

**GULF, COLORADO & SANTA FE.**—This company will construct a two-story brick station at Brenham, Tex., to cost approximately \$40,000.

**ILLINOIS CENTRAL.**—This company will receive bids until January 4, for the construction of a frame passenger and freight station, 96 ft. by 24 ft., at Belmont, Miss.

**MISSOURI, KANSAS & TEXAS.**—This company contemplates the construction of a roundhouse, power plant, locomotive shop, transfer sheds, oil storage tanks and warehouses at Denison, Tex., estimated to cost more than \$3,000,000.

**MISSOURI PACIFIC.**—This company has awarded a contract to T. S. Leake & Co., Chicago, for the construction of a 25-ft. extension to its roundhouse at Hoisington, Kan.

**MISSOURI PACIFIC.**—This company will accept bids until January 9 for the construction of a frame freight and passenger station at Zeigler, Ill. Bids also will be accepted until the same date for remodeling a brick roundhouse at Coffeyville, Kans.

**NEW YORK CITY.**—The municipal government, which has been ordered by the state legislature to construct a railway tunnel under the Narrows from Staten Island to Brooklyn for freight and passenger traffic, as has been previously noted in these columns, has now prepared a proposal to present to the legislature looking toward the furtherance of the project. The city's proposal calls for authority to acquire all railway lines on Staten Island, including the Baltimore & Ohio's subsidiary, the Staten Island Rapid Transit—by condemnation proceedings if necessary. An additional marginal railway on Staten Island is also provided for. The city's plan was promulgated without consultation with the Transit Commission or port authority and the ideas of these two bodies are at variance with those of the city government. The project is one to provide through freight connection between Long Island and the carriers terminating in New Jersey, as well as rapid transit facilities for one of the city's boroughs now dependent entirely upon ferryboat transportation. The necessary expenditure will approximate \$225,000,000.

**OSAGE RAILWAY COMPANY.**—This company, which was noted in the *Railway Age* of December 3 (page 1121), as applying to the Interstate Commerce Commission for permission to construct approximately 11 miles of railroad, extending from Foraker, Okla., to the Osage County oil field in that state, has received official sanction, and has awarded a contract for the grading of the new road to R. L. Plunkett, Pawhuska, Okla., and a contract for the construction of the bridges, trestles and culverts to J. A. Moore, Foraker.

**SOUTHERN PACIFIC.**—This company has been requested by the Board of State Harbor Commissioners of California to remove its trestle across Channel street, just east of the intersection of Seventh street, San Francisco, Cal., and substitute in the place of the trestle a drawbridge or other like facility. The harbor commission claims that the present trestle prevents full and complete use of the street for commerce and navigation. The matter is now before the State Railroad Commission.

**THOMAS GRAVEL COMPANY.**—This company contemplates the construction of a six-mile railroad line at Alexandria, La.

## Railway Financial News

**ATLANTA, BIRMINGHAM & ATLANTIC RAILWAY.—Bondholders' Committee for A. & B. First Mortgage Bonds.**—Default having been made on the July 1, 1921, interest on the outstanding \$4,000,000 first mortgage five per cent 30-year gold coupon bonds of the Atlantic & Birmingham Railway, the committee named below has been formed to protect their interests. Holders are requested to deposit their bonds with the Old Colony Trust Company, Boston, or with the Farmers' Loan & Trust Company, New York depositories. The committee consists of: Francis R. Hart, chairman; James H. Perkins, Percy R. Payne, 2d.; George Bramwell Baker, Walter F. Wyeth, secretary, 17 Court street, Boston, and Pillsbury, Dana & Young, 53 State street, Boston, counsel.

**ALABAMA GREAT SOUTHERN.—Authorized to Procure Authentication of Bonds.**—This company has been authorized by the Interstate Commerce Commission to procure the authentication and delivery to its treasurer of \$1,232,000 of first consolidated mortgage 5 per cent gold bonds, to be held in the treasury.

**CHICAGO & EASTERN ILLINOIS.—Order Amended.**—The Interstate Commerce Commission has made certain modifications of its order authorizing the issue of securities in connection with the reorganization and has extended the time within which the securities may be issued from January 1 to February 28.

**CLEVELAND, CINCINNATI, CHICAGO & ST. LOUIS.—Protective Committee for Preferred Stock.**—A protective committee composed of Edwin G. Merrill, president, New York Life Insurance & Trust Company; George E. Roosevelt and Willis D. Wood has announced to the holders of preferred stock that they consider the offer of the New York Central Railroad to purchase the stock in exchange for equal amounts of New York Central stock inadequate. The committee believes that if the holders act together it will be possible to obtain substantial recognition of the stock's intrinsic value. Holders of preferred stock who are willing to be represented by the committee are requested to communicate promptly with the secretary of the committee, Charles Eldridge, 52 Wall street.

See also New York Central below.

**CHICAGO, INDIANAPOLIS & LOUISVILLE.—Authorized to Issue Bonds.**—This company has been authorized by the Interstate Commerce Commission to issue \$3,493,000 of first and general mortgage gold bonds, series B, in exchange for an equal amount of 5 per cent gold bonds, series A; \$3,000,000 to be sold at not less than 90 and the balance to be pledged as security for short term notes.

**FORT SMITH & WESTERN.—Authorized to Issue Securities.**—This company, recently organized as the Ft. Smith & Western Railway, has been authorized by the Interstate Commerce Commission to issue 62,400 shares of common stock without par value, \$1,500,000 of first mortgage bonds and \$3,744,000 of second mortgage bonds to be exchanged for first mortgage bonds of the Ft. Smith & Western Railroad and to use the last mentioned bonds for the purpose of acquiring at a foreclosure sale the property of the old company.

**GREAT NORTHERN.—Common Officers and Directors Authorized.**—The Interstate Commerce Commission has issued an order authorizing officers and directors of this company to retain their offices while also retaining positions with subsidiary and affiliated companies.

**NEW YORK CENTRAL.—Asks Authority to Lease Roads.**—The Cleveland, Cincinnati, Chicago & St. Louis has filed an application with the Interstate Commerce Commission for authority to acquire the balance of the stock and some bonds of the Peoria & Eastern; and the New York Central, the Toledo & Ohio Central, and the Kanawha & Michigan have applied for authority to enter into leases by which the properties of the Zanesville & Western, Kanawha & Michigan, Kanawha & West Virginia, and Toledo & Ohio Central will be held by the New York Central under lease.

The stockholders, at a special session to follow their annual meeting in Albany, N. Y., on January 27, will be asked to approve the proposals of the directors to lease the Toledo & Ohio Central and the above-mentioned railroads.

**PITTSBURGH, CINCINNATI, CHICAGO & ST. LOUIS.—Dividend Passed.**—The directors have decided that, in view of the financial results for the past year, no dividend would be declared. On June 22, last, the directors postponed action on the 2 per cent semi-annual dividend which had been previously paid.

All of the Panhandle stock except about 1 per cent is now owned by the Pennsylvania Company.

**RIO GRANDE SOUTHERN.—Not to Pay Interest.**—The directors have announced that the interest due January 1 on the first mortgage bonds would not be paid because of inability to meet it.

**ROCK ISLAND SOUTHERN.—Returned to Owners.**—After 22 months' litigation, the United States District Court at Peoria, Ill., on December 23, ordered that the Rock Island Southern be returned to its owners. The road passed into receivership on March 17, 1920, following a complaint heard by the Interstate Commerce Commission.

**ST. LOUIS-SAN FRANCISCO.—Authorized to Issue Bonds.**—The Interstate Commerce Commission has authorized an issue of \$2,122,000 of prior lien mortgage bonds to be pledged and repledged from time to time as collateral security for short term notes.

**WESTERN MARYLAND.—Annual Report.**—See article on another page of this issue entitled "Western Maryland, 1921 Net in Sharp Contrast."

**WICHITA FALLS, RANGER & FORT WORTH.—Receivership Is Asked.**—J. W. Meany has made application in the United States Northern District Court of Texas for the appointment of a receiver for this railway. His claim is for more than \$100,000 in connection with the construction of the line, which extends between Dublin, Tex., and Breckenridge, 67 miles.

### Railroad Administration Settlements

The United States Railroad Administration reports the following final settlements, and has paid out to the several roads the following amounts:

Colorado & Southern	\$1,775,000
Ft. Worth & Denver City	725,000
Copper Range	130,000
Evansville & Indianapolis	235,000
Chicago, Terre Haute & Southeastern	35,000
North Charleston Terminal Co.	20,028.87
Atlantic & Yadkin	120,000
Yadkin	115,000

### SHORT LINE RAILROADS

Tawndale Railway & Industrial Co.	\$88
-----------------------------------	------

The payment of these claims on final settlement is largely made up of balance of compensation due, but includes all other disputed items as between the railroad companies and the administration during the 26 months of federal control.

### Dividends Declared

Central of New Jersey—Special, 2 per cent, payable December 31 to holders of record December 30.  
 Elmira & Williamsport—3/26 per cent, payable January 3 to holders of record December 30.  
 Kansas City Southern—Preferred, 1 per cent, quarterly, payable January 16 to holders of record December 31.  
 Mohile & Ohio—4 per cent, payable December 31 to holders of record December 25.  
 New London Northern—2 1/4 per cent, quarterly, payable January 2 to holders of record December 16.  
 Norfolk & Western—Preferred, 1 per cent, quarterly, payable February 18 to holders of record January 31.  
 Northern Railroad of New Hampshire—1 1/2 per cent, quarterly, payable January 3 to holders of record December 12.  
 Norwich & Worcester—Preferred, 2 per cent, quarterly, payable January 2 to holders of record December 15.  
 Old Colony—1 1/2 per cent, quarterly, payable January 3 to holders of record December 10.  
 Philadelphia & Trenton—2 1/2 per cent, quarterly, payable January 3 to holders of record December 31.  
 Providence & Worcester—2 1/2 per cent, quarterly, payable January 3 to holders of record December 14.  
 Reading Company—Common, 2 per cent, quarterly, payable February 9 to holders of record January 1; second preferred, 1 per cent, quarterly, payable January 12 to holders of record December 30.  
 Richmond, Fredericksburg & Potomac—Common stock and second obligations—4 1/2 per cent, payable December 31 to holders of record December 24.  
 Rome & Clinton—2 1/4 per cent, payable January 1 to holders of record December 22.  
 Troy Union—6 per cent, payable January 16 to holders of record December 30.

## Railway Officers

### Financial, Legal and Accounting

**Hugh Clement** has been appointed assistant treasurer of the Virginian with headquarters at Norfolk, Virginia, to succeed F. W. Russell, resigned to engage in other business.

### Operating

**C. N. Clark** has been appointed superintendent of the Montour with headquarters at Coraopolis, Pa., effective January 1. The position of assistant superintendent has been abolished.

**A. G. Whittington**, formerly general manager of the International & Great Northern, with headquarters at Palestine, Tex., has been appointed general superintendent of the Trinity & Brazos Valley, with headquarters at Teague, Tex.

**John H. McKay**, division superintendent of the Texas & Pacific, with headquarters at Marshall, Tex., will, in addition to his present duties, assume charge of the Louisiana division, with jurisdiction over the line extending from Marshall, Tex., to New Orleans, La., succeeding W. H. DeFrance, superintendent of that division, who has resigned.

### Traffic

**A. L. Burnet**, city freight agent of the Louisville & Nashville, with headquarters at Atlanta, Ga., has been promoted to commercial agent with headquarters at Macon, Ga., succeeding J. C. Willis, transferred.

**W. E. Renneker** has been appointed assistant general freight agent of the Atlantic Coast Line, with headquarters at Rocky Mount, N. C. **W. C. Ragin** has been appointed to a similar position at Wilmington, N. C. and **Hansford Sams** to a similar position at Savannah, Ga.

**E. S. LeGette** has been appointed general agent of the Atlantic Coast Line, with headquarters at Atlanta, Ga. **P. J. Lee** has been appointed commercial agent with headquarters at Nashville, Tenn. **W. G. Dixon** has been appointed commercial agent with headquarters at New York.

**T. A. Matthews**, division freight agent of the Chicago, Rock Island & Pacific with headquarters at Minneapolis, Minn., has been promoted to assistant general freight agent with the same headquarters. **D. O. Leary**, division freight agent with headquarters at Ft. Worth, Tex., has been promoted to general agent with headquarters at San Antonio, Tex. He will be succeeded by A. L. Talkington, freight agent at North Ft. Worth. **F. H. Faus**, division freight agent with headquarters at Colorado Springs, Col., has been promoted to general agent with the same headquarters. These appointments are effective January 1.

### Mechanical

**Roy Skidmore**, erecting foreman of the Kansas City Southern, with headquarters at Pittsburg, Kan., has been promoted to shop superintendent with the same headquarters, succeeding **Charles E. Oakes**, deceased.

**J. C. Rae**, general foreman of the Ann Arbor, with headquarters at Owosso, Mich., has been appointed acting master mechanic, with the same headquarters, assuming charge of the mechanical department, which action was necessitated by the resignation of **J. E. Osmer**, superintendent of motive power and the car department.

### Purchasing and Stores

**I. S. Fairchild** has been appointed storekeeper of the New Orleans Terminal division of the Illinois Central with headquarters at New Orleans, La.

**F. G. Prest**, whose appointment as director of purchases of the Northern Pacific, with headquarters at St. Paul, Minn.,

F. G. Prest

was announced in the *Railway Age* of November 26 (page 1072). was born on a farm near Queenston, Ont., on January 5, 1854. He entered railroad service on August 1, 1880, as a clerk in the purchasing department of the Northern Pacific at St. Paul. One year later he was appointed chief clerk of that department, which position he held until 1891, when he was promoted to assistant purchasing agent, with headquarters at St. Paul. In 1896 he was promoted to purchasing agent with the same head-

quarters and continued in that capacity until his promotion.

## Obituary

**John J. Byrne**, assistant passenger traffic manager of the Atchison, Topeka & Santa Fe, with headquarters at Los Angeles, Cal., died suddenly from heart disease on December

J. J. Byrne

26, at his home in that city. Mr. Byrne was born on January 16, 1859, at Hamilton, Ont. He entered railroad service on April 16, 1873, as a clerk in the auditor's office of the Great Western (Grand Trunk), at Hamilton, since which time he has been consecutively, clerk in the general passenger agent's office of the Chicago & Alton, at Chicago, from December 19, 1877, to October 14, 1880; rate clerk in the general passenger department of the St. Louis, Iron Mountain & Southern (Missouri Pacific),

from October 15, 1880, to October 15, 1881; rate clerk in the general passenger departments of the Missouri Pacific and the Michigan Central, respectively, from the latter date until March, 1883, during which period he became chief rate clerk in the passenger department of the latter company; from March, 1883, to March 31, 1885, he was secretary of the Chicago Railroad Association; from April 1, 1885, to July 1, 1887, he was general passenger and ticket agent of the Oregon Railway & Navigation Company; from August 1, 1887, to December 1, of the same year, he was passenger agent of the Atlantic & Pacific (Atchison, Topeka & Santa Fe), at San Francisco; from December 1, 1887, to September, 1888, he was chief clerk in the passenger department of the Chicago, Santa Fe & California (Atchison, Topeka & Santa Fe), at Chicago; from September, 1888, to December 31, 1889, he was assistant general passenger agent for the same road, working in the same capacity after its amalgamation with the Atchison, Topeka & Santa Fe, until January 1, 1892. He was promoted to assistant passenger traffic manager on January 1, 1892, which position he held until January 31, 1895, when he was made general passenger agent of the Atchison, Topeka & Santa Fe, lines west of Albuquerque, N. M. On October 10, 1905, he again became assistant passenger traffic manager.

## Big Results From Small Investments

Of the total investment of railroads, only eight per cent is in locomotives. In proportion to their cost they are of maximum importance as, upon locomotives, depends the earning power of every rail, bridge, yard switch, station and every individual item necessary on a railroad.

This, therefore, suggests the importance of every factor that increases the working capacity or the potential ton mileage of every locomotive. The capital expense of making it possible for every locomotive to exert its utmost effect upon ton mileage by giving it every capacity increasing improvement known is relatively small. While the investment in equipment is relatively small consider the fact that the cost of power, everything included, is not far from two billions a year. What are a few dollars per engine compared with the effect on the greater cost of the operation of the power.

G. M. BASFORD COMPANY

This train load of company coal need never have been hauled.

## Arches release engines for revenue producing service

For your fuel record—  
have an arch in  
every engine you run.

Hauling company freight never paid dividends.

By saving 10% of the fuel burned by 70 locomotives, a carload of arch brick reduces their fuel consumption by 2100 tons in a month.

Result:—a locomotive released for revenue freight hauling, a train of coal saved, the cost of hauling a train of company material avoided.

With the Arch on every engine there will be less company coal going over the road.

AMERICAN ARCH COMPANY, INC.

# Security Sectional Arch

Franklin Automatic Wedges adjust themselves with every revolution of the drivers

## Stops slack before it starts

Every bearing wears as fast as the wedges.

When slack is noticeable enough to be reported by the engineer it's too late to save the bearings.

But by adjusting itself automatically as wear occurs the Franklin Automatic Wedge takes up the microscopic slack before damage is done by pounding boxes.

That is why Franklin Wedges soon pay for themselves many times over in brass saving alone.

# LIMA LOCOMOTIVES

---

## A LOOK AHEAD

In considering new locomotives it is well to have in mind the reduction in the cost of transportation that more powerful engines will effect. Increased power without increase in fuel consumption is what we mean. By careful design, including the best use of capacity increasing factors, the maximum of pulling capacity or the minimum fuel consumption may be obtained. The roads that go most thoroughly into the details of their new engines before they are ordered will get the most out of their new power. Lima is prepared to co-operate with you.

Building an engine exactly suited to conditions may mean five or ten more cars per train.

## Lima Locomotive Works, Incorporated

Lima, Ohio

17 East 42nd Street, N. Y.

Slow travel over the cooling table gives a beneficial annealing—and a stronger, ductile tube

## Which tube would You use?

A road on which Parkesburg Charcoal Iron Boiler Tubes are now standard formerly used tubes of another material.

Nine months was considered good service from a tube on this road, which has very poor water conditions.

In an effort to reduce flue costs, the road tried Parkesburg Charcoal Iron Boiler Tubes at a slightly higher price per foot.

They use Parkesburg tubes now. Some of them have been in service four years and are good for several more safe ends.

If you were responsible for locomotive maintenance on that road would you go back to the kind of tube that pitted in nine months? Or would you continue to use Parkesburg Charcoal Iron Boiler Tubes which have given four years' service under the same conditions, and are still good?

## LESS WEIGHT

is carried on the trailer wheels of stoker fired locomotives equipped with ELVIN MECHANICAL STOKERS.

The illustration shows the complete stoker unit as applied to the locomotive and it weighs but 2900 lbs.

The feeder and coal breaker on the tender weigh 2400 lbs. No sacrifice of strength, capacity or durability has been made in attaining these weights.

Sounds interesting, doesn't it?

*Why not investigate?*

**The Elvin Mechanical Stoker Company**  
50 Church Street  
New York City

## Showing the Way

**A**MONG the many notable examples of Alco supremacy in recent years, none has surpassed the **Rock Island's Mountain type** locomotives in successful operation and sustained performance.

Some idea of their efficiency may be gained from the following data on the **Golden State Limited**, and other famous Rock Island trains:

These Mountain type locomotives have averaged 5,000 miles per month each. There has not been one delay on account of hot bearings or rod bushings, and steam failures are unknown even under the most trying conditions.

On the Missouri Division, they are assigned to the *Golden State Limited*, making an average schedule of 45 miles per hour, including stops, with 12 to 16 solid steel cars, weight of train ranging from 830 to 1,200 tons.

On the Iowa Division between Valley Junction and Rock Island, a distance of 181 miles, they handle the *Rocky Mountain Limited*, usually a 13 car train scheduled at 39 miles per hour. On different occasions they have made up an average of 45 minutes on this running time.

In one instance engine 4004 between Valley Junction and Omaha, handled twelve 16-compartment stateroom Pullmans and a buffet in less than three hours' running time, an average of 46.6 miles per hour. This trip includes several one per cent grades.

There is a vast difference between the mere purchase of locomotives, and really buying locomotive service.

*When you specify Alco—you get both*

# BARCO 3V CONNECTIONS

Between  
Engines

and  
Tenders

## Safeguard Your Train Service

**B**ARCO All Metal 3V Connections provide that absolutely dependable construction so essential at the most vital point in your train lines—the connections between engine and tender.

It is here that Barco Engine Tender Connections safeguard your train service by eliminating a common cause of delays and failures—defective or burst hose.

Practically indestructible because of their all metal construction, and perfectly flexible under all conditions, Barco 3V Connections are a positive guarantee of a continuous and unobstructed flow of steam and air.

When you equip your locomotives with Barco 3V Connections, you not only safeguard your train service but you are also taking decisive action towards cutting your repair costs by eliminating the continual expense of renewing hose.

To insure safe, dependable, train service and to effect large reductions in your maintenance expense, specify Barco 3V Engine Tender Connections.

# BALDWIN

BALDWIN MOUNTAIN (4-8-2) TYPE LOCOMOTIVE ON THE SANTA FE

## Baldwin Mountain Type Locomotives Meet Requirements on Heaviest Grades

**H**EAVERY passenger traffic on the mountain divisions of the Santa Fe System is handled by Baldwin Locomotives of the 4-8-2 type. These locomotives were designed and built in accordance with specifications furnished by the Railway Company and are designated as the 3700 class. They are equipped to burn either coal or oil, according to the district to which they are assigned.

The illustration shows east-bound passenger train No. 10, hauled by Engine No. 3709, a coal burner, ready to leave Albuquerque for Raton, New Mexico, a run of 243 miles. The maximum grade on this section is 158.4 feet per mile. The locomotive is stoker fired, weighs 367,700 pounds and develops a tractive force of 54,100 pounds.

Under the supervision of John Purcell, Assistant to the Vice President, the Motive Power Department of the Santa Fe, co-operating with The Baldwin Locomotive Works, has developed a series of high power passenger and freight locomotives which are successfully meeting the most difficult operating conditions.

*Baldwin Locomotives are Standard on the Santa Fe*

# 1922

*To our friends, the Railroads, and our esteemed contemporaries in the Railway Supply field.*

## New Year's Greeting

THE Westinghouse Air Brake Company takes this opportunity to extend a courteous New Year's Greeting to its customers and friends in the Railway and the Railway Supply industries.

Present conditions indicate that 1922 will find our common interests advanced as we increase our efforts to serve each other. The splendid co-operation which has existed in the past between the Railroads, the Westinghouse Air Brake Company, and the other Railway Supply Manufacturers, has been a source of mutual satisfaction to all concerned, and stands now as a staunch foundation on which to build for future progress and prosperity.

Service and Co-operation have always been associated with Westinghouse traditions; they remain the keywords of our business creed for 1922.

PRESIDENT

## WESTINGHOUSE AIR BRAKE CO.

GENERAL OFFICES AND WORKS, WILMERDING, PA.

NEW YORK      WASHINGTON      CHICAGO      ST. LOUIS      SAN FRANCISCO

## When You Figure Temperature Tonnage Ratings

In cold weather when you are forced to reduce locomotive tonnage because friction is greater and it is more difficult to keep up steam, it is well to be able to depend on a good, reliable packing to prevent leaks at the piston rod and valve stem. If these vital parts are not steam-tight, the locomotive would be placed at a greater disadvantage and unable to handle even the lower tonnage efficiency.

The application of King Metallic Packing is a precautionary measure in the interest of better locomotive performance, lower fuel consumption, and safety.

# 116,000 MILES- and not a Penny for Repairs

**N**O failures, no delays, no repairs, not even a bushing in 14 months—such is the report on the valve gear mechanism of the locomotive pulling a famous Eastern passenger express covering 400 miles daily and 116,000 miles between shoppings. Not one penny was spent to maintain

## THE BAKER VALVE GEAR

This performance however is not unusual but typical of Baker Service which controls the "Spending" of the coal money in the cylinders.

Beside this great reduction in maintenance charges, the Baker Valve Gear provides for the quick and sharp opening of valve which gives full boiler pressure from admission to cut off. The great advantage of this feature is the fact that quick snappy port openings prevent wire drawing of the steam and loss of effective pressure on the cylinders.

*Apply the Baker Valve Gear  
now—the Savings will follow.*

# Low Maintenance Means Reduced Expense

**Westinghouse  
Turbine-Generator**

**Locomotive  
Headlighters**

being totally enclosed, are not affected by weather conditions, or by dirt and dust to which they are subjected on top of a locomotive.

Their weight and size allow easy handling to and from a locomotive, while their construction will withstand the shocks and strains met with in service.

Operating records on many steam roads show the Westinghouse Headlighter to be most reliable and economical. A solid rotor with milled slots serving as blades, ball bearings, and many other advantages make the unit most desirable. For detailed information write to our nearest office or to the Railway Department.

# GREAT BUILDERS

PORTRAIT BY COURTESY OF THE LOUISVILLE HERALD

## Milton H. Smith

The romance of the life of Milton Hannibal Smith was the doctrine of singleness of purpose—work. His dream of a united South—an industrial empire—doubtless inspired by the chaotic conditions resulting from the Civil War, became a reality, before his death, through the developmental stimulus of the Louisville and Nashville Railroad.

During his association with this road its 185 miles of single track between Louisville and Nashville grew into a system of over 5000 miles dominating the southeastern quarter of the United States. His breadth of vision enabled his road to aid in releasing and developing the coal and iron of Tennessee, Kentucky and Alabama, to which fact may be attributed the virtual creation of the Birmingham district.

*The love of accuracy in the smallest details, for which Milton H. Smith was noted, is representative of the painstaking care which has been used for over three-quarters of a century in the manufacture of Tennessee Charcoal Bloom Staybolt Iron.*

## An Efficient Pipe Covering must not contain Combustible Material

The combustible or inflammable element in some pipe coverings runs as high as 20 to 22 per cent. Under low temperatures such coverings may possibly remain a long time unimpaired but high temperatures will soon char the inner zone or layers. Bulk having been reduced, the covering will sag, air currents will run along the under side of the pipe and a continual loss of heat will take place.

85% Magnesia possesses, in addition to other essential qualities, the virtue of heat-resistance without impairment. There is nothing combustible in 85% Magnesia. Even tests with temperatures from 700 to 900 deg. F., continued for months, show only a calcina-

tion, which actually increased the efficiency of the covering about three per cent.

85% Magnesia taken from pipes after twenty years' use may be placed on other heated surfaces, and will keep on doing its good work.

### Which Lasts Longer— Shoe Leather or Stone Pavements?

The answer is obvious. Likewise the superiority of Asbestos Brake Cylinder Packing Cups over the old leather cups is just as self-evident. For asbestos is rock—a mineral that gives unequalled wearing qualities to a packing cup, and makes it highly resistant to heat, pressure and condensate, and free from the porosity of leather packing cups.

### The Johns-Manville Brake Cylinder Packing Set

which is made up of this impregnated, non-porous Packing Cup and Slip-type Expander Ring, has proved under all service conditions that it reduces brake cylinder leakage to a minimum.

Write for booklet on Brake Cylinder Leakage.

### It Digs More Lineal Feet of Ditch for Less Money

The "AMERICAN" Railroad Ditcher will dig more lineal feet of ditch for a much lower cost per yard than the best hand crew ever mustered. It plugs along steadily and consistently, unaffected by conditions which would put a hand crew out of action.

Ditches full of icy water or sticky gumbo have no terrors for the "AMERICAN;" the plunger—exclusive "AMERICAN" feature—instantly clears the dipper of the stickiest clay.

Where train service is frequent the "AMERICAN" can dig until the last minute and then "clear" at train speed, scuttling back to the job as soon as the train has passed.

The "AMERICAN" digs a uniform ditch with a smooth, well rounded bottom.

If you are not acquainted with the achievements and capacity of the "AMERICAN" Railroad Ditcher ask us for all the facts.

## Sharon "BLUENOSE" Hand Truck

Here's a hand truck built for a life-time of service—a truck you can depend upon to carry more, over a longer period, than any you've had experience with.

The frame, including wheel lugs, is pressed from one piece of  $\frac{1}{8}$ -inch hot rolled open hearth steel—the "Bluenose" is pressed from  $\frac{1}{4}$ -inch stock of the same material. Note how each wheel is enclosed and supported with two lugs with stiffening beads—no weakness here.

You can have the "Bluenose" in two sizes—54 inches, 65 lbs., and 64 $\frac{1}{2}$  inches, 120 lbs.; with straight or curved wood handles; with straight or depressed cross-bars; with square or round nose; with plain wheels, with either plain or roller bearings, or with cushion wheels.

Measure truck values in terms of ton-hour-mileage. Send for specifications of the Sharon "Bluenose" Truck and the Sharon "Brute" Trailer.

## THE MEANING OF A WORD

The word **QUALITY**, through misuse, has lost some of its former prestige, but it is used without fear in describing **DES MOINES STEEL PRODUCTS**, because the basic material is carefully selected for its quality; the individual design for the quality of engineering skill, and the quality of fabrication and erection.

Write to us today for more information.

Pittsburgh-Des Moines Steel Co.

American Brake Shoe & Fdy. Co.

American Locomotive Co.

Baldwin Locomotive Works

Hunt Spiller Mfg. Corp.

Midvale Steel & Ordnance Co.

National Malleable Castings Co.

Ramapo Iron Works

Castings, Malleable Iron.  
Fort Pitt Malleable Iron Co.

McConway & Torley Co.

National Malleable Castings Co.

Pressed Steel Car Co.

Castings, Steel.  
American Locomotive Co.

American Steel Foundries

Edgewater Steel Co.

McConway & Torley Co.

Midvale Steel & Ordnance Co.

Pressed Steel Car Co.

Standard Steel Works

Union Spring & Mfg. Co.

Cement, High Temperature.  
Johns-Manville, Inc.

Center Plate — (See Bearings, Center).

Chain.  
American Chain Co.

Chemicals.  
Dearborn Chemical Co.

Chemists.  
Dearborn Chemical Co.

Hunt & Co., Robert W.

Pittsburgh Testing Laboratories

Chimney, Cast Iron.  
Dickinson, Inc., Paul

Chucks, Drill.  
Chicago Pneumatic Tool Co.

Chucks, Staybolt Driving.  
Chicago Pneumatic Tool Co.

Cinder Handling Plants.  
Conveyors Corp. of America

Roberts & Schaefer Co.

Circuit Breakers.  
General Electric Co.

Westinghouse Elec. & Mfg. Co.

Clamps, Flanging.  
Ryerson & Son, Joseph T.

Clamps, Hose.  
National Malleable Castings Co.

Westinghouse Air Brake Co.

Clamps, Pipe.  
Franklin Ry. Supply Co.

National Malleable Castings Co.

Cleaners, Flue.  
Ryerson & Son, Joseph T.

Closets, Water.  
Dunbar Co.

Coach and Coach Yard Steam Joints—(See Joints, Etc.).
