Subscriptions, including 52 regular weekly issues and special daily editions published from time to time in New York, or in any other than New York, payable in advance and postage free. United States, Mexico and Canada, \$8.00. Foreign, £2.10. Single copies, 25 cents each.

WE GUARANTEE, that of this issue, 9,000 copies were printed, that of these 9,000 copies, 8,084 were mailed to regular subscribers, 72 were provided for counter and news company sales, 25 were mailed to advertisers, 82 were mailed to employees and correspondents, and 386 were provided for new subscriptions. All copies lost in the mail and office use; that the total copies printed this year to date were 257,200, an average of 9,892 copies a week.

Direct Motor Drive  
simplifies the Ryerson-Conradson Lathe  
and reduces power  
consumption.

## QUICK REPAIR LATHES REDUCE IDLE TIME

77  
1  
R2  
v. 71

Only 40% of freight locomotive time is actually spent hauling trains. Speeding up railroad shops with modern machine tools, quickly returns locomotives to revenue service and saves some of this valuable time. On all kinds of locomotive repairs, Ryerson-Conradson Railroad Lathes do a quicker, better job because

1.—Liberal bearings give a firm foundation to take the wide range of work heavy modern motive power calls for.

2.—All controls are on the apron, at the operator's finger tips.

3.—Gears are always in mesh—speed and feed changes are made without stopping the lathe—no chance of gears stripping.

Have this time saver in your shop when the load comes on again.

Production with accuracy results from the new features of Ryerson-Conradson lathe design.

*A Bulletin describes each tool. Ask for copies.*

## Railway Age

The Table of Contents Will Be Found on Page 5 of the Advertising Section

In the *Railway Age* of June 10, page 1304, there was published an editorial calling attention to the importance of making a careful survey of freight car conditions to determine which cars are to be repaired and which replaced with new equipment in view of the recent increases in freight car loading and

### Bad Order Cars Not Included in Surplus Reports

decreases in the freight car surplus. The editorial referred to the large increase in the number of bad order cars, which was 324,969 on May 15 and which has increased to 341,337 on June 1, and to the rapid reduction of the number of surplus cars, which was 450,164 on May 15 and which has since been reduced to 381,746 for the week of June 15. Our statements gave the impression that the bad order cars are included in the surplus cars, but it should be understood that bad order cars as reported by the Car Service Division of the American Railway Association are not included in its count of surplus cars. This is supposed to cover only cars other than those reported as in bad order which are not required for service during the period covered by the report, although as cars are taken from the surplus for service, many are found to be in bad order. The situation as to the number of freight cars not required for service during the present slump in general business conditions is therefore much worse than is generally understood, as the total of the cars out of service both because of their bad condition and because there is no demand for them is over 700,000, or about 28 per cent of the total car equipment. While the large number of bad order cars represents a serious situation, the margin of available surplus cars of most kinds is still very large. Past experience has shown, however, that a substantial revival of general business will wipe out a large car surplus in a short time.

It is said that "any machine that will run" is good enough for a railroad shop and while most railroad men realize the falsity of this statement, it is seemingly borne out by the large number of obsolete, worn-out machines now in use. In many cases, particularly at the present time, it is impossible to get

### Machine Tool

### Depreciation

the capital necessary to replace obsolete machines, but that the fundamental economics of the situation are not fully understood is evidenced by the large number of such machines still in operation. It would be far better practice and less expensive to shut down many of them and transfer the work to other shops where modern machinery is available. Take, for example, a powerful, modern wheel lathe as compared to one built 30 or 40, or maybe 50 years ago. The former, using feeds up to  $\frac{5}{8}$  in., removes all the stock in one cut and on an average turns a pair of tires every hour, depending on the operator's skill and the toughness of the cutting tool. The antiquated machine, however, struggles along under a feed of  $\frac{1}{8}$  in., requires several cuts if the tires are badly worn and has difficulty in turning a pair in three or four hours. It is evidently false economy to run old machines of this type since the resultant cost of labor, power and delayed equipment is three or four times as much as necessary. The difficulty in obtaining capital for new ma-

chinery can be overcome by establishing adequate depreciation accounts, a matter which has been woefully neglected in the past judging by the 1920 statistics of the Bureau of Railway Economics. According to the analysis, 191 Class 1 companies had set aside for shop machinery depreciation the sum of \$236,157, or less than one per cent of the value of all railroad shop machinery. This assumes that machines have an effective life of 100 years and is obviously absurd. Some competitive industries find it necessary to renew machine tools inside of two or three years or be left hopelessly behind in the race and, while conditions are different in the railroad business, some reasonable life should be assumed for machine tools not exceeding 10 or 15 years and 10 per cent, or 6.66 per cent, of the value of railroad shop machinery be set aside annually. Then at the end of 10 or 15 years, as the case may be, it will be possible for the shops and roundhouses to benefit by the installation of new and improved machinery which will not be held up because of difficulty in obtaining the necessary capital.

The vital relation of machinery, equipment and design to efficient locomotive terminal operation is generally conceded.

### Locomotive In- spection and Repairs at Terminals

It is true that no terminal can be operated economically without adequate coal and ash handling facilities, machine tools, boiler washing and refilling systems, drop pits, etc. The arrangement of this equipment also is important as a determining factor in promptly handling locomotives, but it should not be forgotten that the prime object of any terminal development is to maintain locomotives in condition to earn revenue as large a proportion of the time as possible. For the accomplishment of this purpose, methods are fully as important as physical equipment and the methods of handling locomotives at terminals are worthy of the closest study. It is especially important to develop highly trained inspection forces for the careful, periodical inspection of all equipment. To quote a statement made recently by a mechanical officer on the firing line: "The time to cure an engine failure is before, not after it occurs. This is where adequate inspection comes in—to learn to look beneath the surface, to locate the unseen cause, to anticipate a developing weakness." The present opportunity should be taken to develop and train engine terminal inspection forces because at most points more time than usual is available for this purpose. Repair men also should be taught the best methods of doing their work and be shown the need for care and thoroughness. Future savings will be assured by assigning men to the inspection forces to make minor repairs promptly. This will avoid making out work-report slips and hunting up men to attend to small jobs which can be handled more readily at the time of inspection. For the heavier work it has been found advisable to post work-report sheets and issue individual slips to each man who has a defect to repair. This eliminates picking easy jobs and fixes the responsibility. In many cases the work of the outside inspectors, with their assistant repair men, in looking after minor defects as found will make it unnecessary to put certain locomotives over the turntable and will allow for their immediate return

to service, thereby increasing the capacity of the terminal. Unquestionably the present offers a splendid opportunity for the development and training of engine terminal inspection and repair forces, thus establishing a potential engine house capacity which will undoubtedly be needed in the future.

## President Harding's Opportunity

THE RAILROAD situation presents to President Harding his greatest opportunity for rendering speedily a most important public service. Whether his rendering of this service would bring him an immediate increase of popularity is speculative. It would take courage; and the American people admire courage. The doing of what he can quickly do to improve the railroad situation would stimulate a return to normalcy and prosperity more perhaps than anything else he could do. Public men seldom have been hurt by doing things that improved general business.

Under normal conditions the railroads are among the largest purchasers of numerous classes of commodities. For months they practically have been out of the market. Profound depression prevails in every industry which sells a large part of its product to them. With traffic and total earnings increasing and substantial reductions in wages and other expenses coming there is bound to be soon a substantial increase of railway purchases. But the increase should be more than substantial. It should be extremely large. A very large increase in railway purchases would stimulate business of all kinds. Directly, it would cause an increase of employment and production in the iron and steel industry in the lumber industry, in the coal industry, etc. Larger production and employment in these industries would in turn cause increased production and employment in all the industries from which they buy.

Increased purchases by the railroads are needed immediately not only to stimulate general business activity but to enable the carriers to equip themselves to handle the large traffic which will be offered to them when general business does revive, as sooner or later it is bound to revive.

The very small purchases made by the railways for several months have been due, broadly speaking, to two reasons. One of these has been the inadequacy of their earnings because of excessive operating costs and the severe decline of traffic. The other, which is not so obvious and generally understood, is their financial relations to the government.

Under government control the government invested over a billion dollars in the railroads. If the war and government control had not come part or all of this would have been invested by the railroad companies which would have raised most of it by the issuance of securities. The larger part of it now constitutes a debt to the government which sooner or later the companies must pay. They would raise money by the issuance of securities and pay it at once if securities in sufficient amounts could now be sold. Owing, however, to the present bad financial condition of most railways, which is chiefly due to the war and government control, they cannot sell enough securities to pay it.

While the companies owe many millions of dollars to the government, the government in turn owes many millions to the companies. The government guaranteed adequately to maintain the properties while it had them and in addition to pay the same net return the roads earned in the three "test" years. It authorized the companies themselves adequately to maintain the properties during the first six months of private operation and guaranteed in addition to pay them any part of the standard return which they did not earn in those months. The government did not adequately maintain the properties while it had them and under its guarantees it owes the companies large sums, the exact amount of which, however, it will take a long time to determine.

Some officers of the Railroad Administration have taken the position that the indebtedness of the government to the companies should be used currently to offset the indebtedness of the companies to the government—that if, for example, a railway owes the government one million dollars for money invested under government control in permanent improvements, and the government owes the railroad one million dollars for under-maintenance or as part of its standard return they should settle by neither paying the other anything now. The railways contend that the government should loan them, or in effect take their notes, for a period of ten or fifteen years for what they owe it, and determine and pay them as soon as practicable the amounts it owes them for under-maintenance and as standard return.

To many persons the policy favored by some administration officials may seem logical and fair; but it is not logical or fair, and if carried out would have a very bad effect not only on the railroads but on general business. When the government took the railroads their properties were in good physical condition. Their net earnings were as large as in previous years and they had sufficient working capital to do their current business. It returned them in deteriorated physical condition and with greatly reduced working capital; and since the guarantees of net return were withdrawn, owing to excessive operating expenses and the violent decline in traffic, their properties have further deteriorated and they have practically been stripped of working capital. If the government loans them for ten or fifteen years what they owe it and at the same time as rapidly as practicable pays them what it owes them they will be able to begin at once using what it pays them to liquidate their large floating indebtedness to supply and material companies, to replenish their working capital and to make up the large amounts of deferred maintenance which have accrued. They must pay the government interest on what they owe it, and as it is only fair to assume they are to be allowed in the next ten or fifteen years to earn reasonable net returns, it is also only fair to assume that at the end of this time they would be able to raise enough by selling securities to pay the government off.

Since the government ultimately would get back its money, and in the meantime would get interest on it, it would not lose anything. On the other hand, if the railroads are required now to offset what the government owes them with what they owe the government they will be largely deprived for years to come of power adequately to increase their working capital, to pay promptly their debts to material and supply companies, and to rehabilitate and improve their properties.

If the government should adopt the policy of loaning to the railways for a term of years what they owe it and at the same time paying as promptly as practicable what it owes them, it would be necessary for Congress to make a special appropriation to provide funds with which to pay the railroads. Apprehension has been expressed lest Congress would be unwilling to make the appropriation. Why, however, should Congress be unwilling to make an appropriation necessary to do justice to the railways and carry out a sound business policy which would be beneficial to the entire country? For the government to loan to the railways for a period of years the capital invested by it in their properties would be to follow practically the same policy that the government actually is following in not insisting upon payment by foreign governments of the principal or even the interest upon the ten billion dollars which this government loaned to foreign governments to help its allies in the war. Why should the government of the United States deal more leniently with foreign governments in respect to money it loaned them for war purposes than with the railroads of this country respecting money which in effect it loaned them for war purposes?

The President undoubtedly has great influence with Congress. If he should outspokenly and energetically favor a policy in dealing with the railroads which business conditions and the welfare of the public demand he undoubtedly could get Congress to pass the legislation and make the appropriation necessary to carry out that policy. If the right policy in dealing with the railroad situation is adopted under his administration it will do more to restore normalcy and prosperity than anything else that is done. On the other hand, if the right policy in dealing with the railroads is not adopted the restoration of normalcy and prosperity will be hindered far more than most people appreciate.

The great economic problem of President Wilson's administration was the currency problem. It was solved and the country has benefited immeasurably. The great economic problem of the present administration is the railroad problem.

The judgment, courage and leadership of President Harding will be tested by the way he deals with it.

## Future Railway Expenses and Rates

THE GENERAL reduction in railway wages authorized by the Railroad Labor Board went into effect on July 1. On the basis of the number of employees in 1920 this would mean a reduction of expenses of over \$400,000,000 a year. But the number of employees is now less than last year. On the basis of the number on the payroll in the first three months of 1921 it would mean a reduction in operating expenses of about \$365,000,000. Other reductions of expenses are occurring. The prices of materials and supplies and of fuel have declined somewhat. The amount of freight being shipped, and, consequently, the total earnings, are increasing.

These developments are, from a railway standpoint, very favorable. But they do not solve the railway problem. Because of inability to get large amounts of money the government owes them, and of very small net earnings since the guarantees were withdrawn, the railways are extremely short of money.

Furthermore, at present a widespread agitation for general reductions of rates is going on. Many classes of shippers are not in sympathy with it. The National Industrial Traffic League, composed of the traffic managers of the great industrial concerns and commercial organizations, has adopted resolutions opposing any general reductions until the railways have had a chance to get on their feet financially and to make a good start with the rehabilitation and increase of their facilities.

On the other hand, there is widespread discontent among the farmers regarding the present rates. The farmers as a class are suffering severely from present conditions. The prices of their products have declined until, according to government reports, they average only about 15 per cent more than before the war. The prices of most of the things they buy have not declined anywhere near in proportion. Their present situation is due in only a small measure to the present rates. But the farmers and their organizations, especially those in the west and south, for over forty years have tended to attribute a disproportionate part of their troubles to alleged excessive railway rates. Many of them are doing this now.

They are the most important, and, when they exert themselves, the most powerful class of our people. It is probably no exaggeration to say the future of the railways is in their hands. In the long run they will largely dictate the country's policy of regulation and even determine whether we shall have private or public ownership. It would be folly to ignore their attitude. No legitimate effort should be spared by the railways to make plain to the public, and especially

the farmers, the railways' own attitude regarding rates and the reasons for it.

It is not the position of the railways that no reduction of rates should be made. Their spokesmen all concede that owing to the horizontal percentage advances which were made in 1918 under government control, and again in 1920, there are now many rates which are unfairly discriminatory or too high. They agree that these unfair and harmful adjustments of rates should be rapidly eliminated, and chiefly by reductions. They hope and believe that in time increases in traffic and reductions of operating expenses will make practicable and desirable some general reductions of rates. They are opposed to general reductions in the immediate future because they believe they would be not only unfair and harmful to the railways, but contrary to the public welfare.

One argument widely used in favor of general reductions is that the rates are preventing revival of general business and an increase of traffic. But, as heretofore pointed out by the *Railway Age*, the freight being shipped has been increasing as rapidly since the recent slump in traffic as in 1919 before the last advance in rates was made. The increase in car loadings since the end of February has been about 20 per cent.

Even more convincing evidence is afforded by the statistics regarding the shipments of farm products. The prices of these products are relatively lower as compared with pre-war prices than those of any other large class of commodities. The advances in the rates on them were relatively the same as on other commodities. Therefore, comparing with pre-war times, the rates on farm products are higher relatively to present prices than on almost any other commodities. Nevertheless, shipments of farm products have increased more relatively within recent months than almost any others. From January 1 to June 11, 1921, the total carloads of grain shipped was 876,581. This was 61,803 carloads more than in the same part of 1919, and 119,628 carloads more than in the same part of 1920. The number of carloads of fruits and vegetables shipped in the present season up to June 20 was 361,471, an increase over last season of 58,670 carloads. A few weeks ago propaganda was started to show that canteloupes could not be shipped under the present rates from the Imperial Valley of California. Up to June 20 of this year the total shipments were 5,170 carloads, as against 4,497 last year.

Demonstration that commodities can be and are shipped in increased volume under the present rates will not, however, make the producers satisfied with the rates. Many of the producers are not making as large profits as they did last year, or even reasonable profits, because they are receiving much lower prices. Many of them believe these reduced prices are mainly due to the higher rates, and unless shown that this is not the case, and that in the long run early general reductions in rates will be against their interest, they will insist on them.

Valuable testimony regarding the relationship of freight rates to prices of farm products was given recently by W. H. Williams, chairman of the Wabash, in the hearings before the Senate Committee on Interstate Commerce. He showed that on cattle sold in Chicago at \$8.60 per 100 lb., the rate from Sioux City, Iowa, to Chicago, was 44 cents per 100 lb., or only about 5 per cent of the price. On hogs sold at \$9.25 the rate from Des Moines was 40 cents, or about 4 per cent of the price. On a bushel of wheat sold in Chicago for \$1.47, the rate from St. Cloud, Minn., to Chicago was 15.6 cents, or less than 11 per cent of the price. Another example that may be cited is that on a canteloupe selling at retail in Chicago for 35 cents, the freight rate from California was about 4 cents. The consumer paid enough for it to cover the transportation charge, reasonable profits to the retailer and the produce merchant, and a fair price to the grower.

If the grower did not get a fair price this was not due to the railway rate.

On most commodities of general consumption the freight rates, although higher than for years, are still low compared with the value of the commodities. Mr. Williams showed a 40 per cent increase on a box of apples from the State of Washington to Toledo amounted to only 32 cents; on a crate of 30 dozen eggs from Kansas City to Detroit only 18 cents; on a pair of shoes from New England to Chicago only 1.8 cents; on a barrel of flour from Minneapolis to Toledo only 16.33 cents.

Shippers, including the farmers, are as much concerned regarding the service the railways can render as regarding the rates. However low the rates may be in proportion to the prices of commodities, the shippers might in their own interest be justified in demanding immediate general reductions if these would not be practically certain unfavorably to affect the railway service that could be rendered. But the quality and the adequacy of railway service will necessarily depend upon the earnings the railways make. If they are not able to earn enough to maintain their properties and get a net return which will make it possible for them to raise large amounts of new capital to provide additional facilities, they will not be able to give good and adequate service.

Past experience repeatedly has shown that whether traffic can be moved satisfactorily, or even at all, depends more on the ability of the railways to furnish cars and other facilities than on the rates charged. What is the present condition of railway facilities? In every period of active business for years there have been congestions and car shortages. The railways today have about 340,000 freight cars in bad order, because for months they have not earned enough to maintain them. Their net return during the eight months the present rates have been in effect has averaged only 2.4 per cent. Without a large reduction in their operating costs, and a large increase in their net returns, they cannot prepare to render more and better service.

It may be said, the increases in traffic which are occurring, and the reductions of wages and other expenses which are being made, will enable them to rehabilitate their properties, raise new capital, and, in addition, make general reductions of rates. But nobody will know what the total amount of the reductions of expenses, or the effects produced by them on the financial condition of the railways, will be for some time. The farmers and other producers have been suffering greatly from bad business conditions recently, but the railways have been suffering even more. Why, therefore, not refrain from agitating for general reductions in rates until there has been opportunity to find out what financial results the railways can get on the present rates and with reduced expenses? If the outcome justifies reductions of rates, the Interstate Commerce Commission can be relied on to require them.

The advance in rates granted last August was based upon estimates of future operating expenses. These proved so far wrong that even when the railways were handling a large business they were failing at the rate of \$500,000,000 a year to earn the net return expected. This shows the hazards involved in estimates based upon numerous uncertain factors of great importance. A large part of the recent losses the railways have incurred have been due to these mistaken estimates. Any general reduction of rates proposed would have to be based on estimates of future traffic and expenses, which might prove to be equally erroneous.

Fairness to the railways and the welfare of the country demand that future changes in rates shall be based on actual experience, and the only experience on which they can reasonably be based will be experience under the existing general scales of rates and the new scale of expenses which is now in process of being established.

## New Books

*Railway Signal Engineer.* By Leonard P. Lewis, of the *Caledonian Railway (Scotland)*. Cloth, 358 pages, 5½ in. by 8½ in.; 251 illustrations. Published by D. Van Nostrand Company, 25 Park Place, New York.

This is a second edition of the well-known work of Mr. Lewis, lecturer at the Royal Technical College, Glasgow. The first edition was noticed in the *Railway Age* of July 11, 1913. Being a lecturer, Mr. Lewis has a careful habit of anticipating the questions of the reader. As the book is devoted practically to mechanical interlocking and the manual block system, there is nothing about power interlocking nor about automatic block signals, but it is a very careful and detailed treatment of English practice in all parts of the field which is covered.

The preface to the second edition says that the extensive installation of track circuits constitutes the principal advance made in English signaling practice since the publication of the first edition, but only four pages are given to track circuits.

*Fuel Economy on Locomotives.* 51 pages; 3¼ by 5¼, cloth backed paper binding. Published by the American Railway Association, V. R. Hawthorne, Secretary, Mechanical Division, 431 South Dearborn street, Chicago.

The need for a manual of firing practice and of instructions in the principles of fuel economy for locomotive enginemen and firemen has long been recognized. Early in its history the International Railway Fuel Association gave considerable attention to this subject and at the 1912 and 1914 conventions laid the foundation for such a manual which it was proposed later to develop more fully. The first actual results, however, other than the development of such manuals by a few individual railroads, was accomplished by the adoption of the report of the Committee on Fuel Economy of the American Railway Master Mechanics' Association as recommended practice following the 1915 convention of that organization. This manual has stood as the recommended practice of the Master Mechanics' Association and its successor, the Mechanical Division of the American Railway Association, until the revision which was made and adopted by the Mechanical Division in 1920, to be followed by the further revision effected by the Joint Committee on Fuel Conservation of the Operating, Mechanical, and Purchases and Stores divisions this year. The principle revisions are the elimination of the text references to and the illustrations of cross firing and the addition of material concerning the proper firing of anthracite coal and fuel oil, the bringing up to date of the special instructions for the operation of superheater locomotives and the addition of about 15 pages of general information largely dealing with locomotive conditions affecting fuel economy, a small part of which is of more interest to roundhouse forces than to the engine crews and might, therefore, not improperly be omitted from a discussion of the subject intended primarily for distribution among enginemen and firemen. The book is well bound for pocket use, is well illustrated with colored plates showing various firebox conditions affecting proper combustion, and altogether is a material improvement over its predecessor. It is furnished by the association to members in lots of 100 copies or more for \$20 per hundred, in lots of 50 copies for \$12.50 and in less than lots of 50 copies at 30 cents each. Single copies are 60 cents each to non-members. The book will be of particular interest to those roads that have not already developed manuals of their own and any railroad that desires special printing on the cover or title page or wishes to incorporate these rules in a more extensive book in which are included special rules to meet local conditions, may arrange for such special printing.

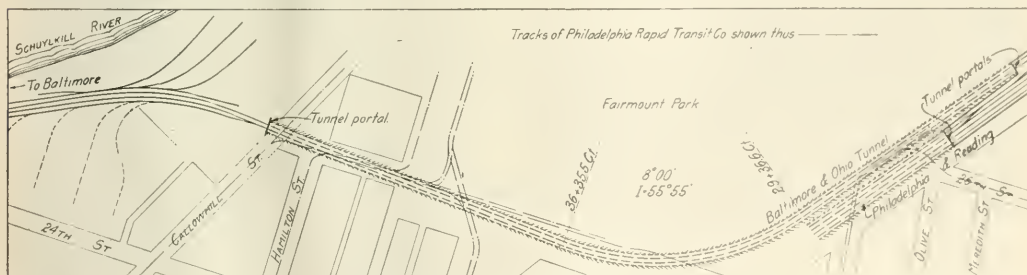

*A General View Showing the Design and Method of Construction*

## Reconstructing a Tunnel With Modern Methods

The Baltimore & Ohio Employed Locomotive Cranes for Complicated Work, Requiring Few Men

THE BALTIMORE & OHIO has recently rebuilt the west end of its tunnel under Fairmount Park at Philadelphia, Pa., and is now engaged in rebuilding the east end. Built under particularly adverse conditions, originally as a double-track tunnel with a central section of six-ring brick arch and end sections of I-beam construction and limited clearance, the ends are being rebuilt in the form of a three-centered arch of more modern design. Since the clearance was restricted by the grades of the streets over the tunnel

between the Baltimore & Ohio and the Philadelphia & Reading, All freight and passenger traffic of the Baltimore & Ohio to and from New York or other points north of Philadelphia as well as the interchange between that road and the Reading is handled over this piece of double track. This connection is about two miles long between the Chestnut street station of the B. & O. and the junction with the Reading and passes through the outskirts of Fairmount Park. The tunnel itself passes under the junction of several of the

**Map Showing the Location of the Tunnel**

an interesting method was devised to construct and handle the forms as well as the materials. New side walls as well as parts of the arches and in some places the complete arch itself were constructed of concrete. Locomotive cranes were utilized to handle and move the materials. As a result of the methods adopted the labor force was kept at a minimum throughout the work of rebuilding. The tunnel was opened from the top and all new work carried on from the level of the surrounding ground.

The tunnel has a total length of 2,300 ft. of which approximately 700 ft. of the central section is on an eight-degree curve. It carries two tracks which form the connecting line

busiest entrances to the Park where it carries street railway lines and an exceptionally heavy automobile traffic.

It was originally constructed and built in two separate and distinct types of tunnel design. The central part, extending from a point 246 ft. from one end to a point 478 ft. from the other or a total length of about 1,576 ft. was built as a six-ring brick arch, supported on masonry walls having a clear width of 30 ft. between faces. The clearance above the top of rail was 20 ft. The two end sections were provided with a roof construction consisting of built-up wrought-iron I-beams spaced three feet center to center and giving an average clearance of 17 ft. 6 in. The tunnel roof itself was

built up of 3-ft. square galvanized steel buckle plates butted against each other and riveted to the I-beams as well as to longitudinal lines of wrought-iron angle bars. A three-inch layer of asphalt had been applied on top of this as a protective covering or waterproofing. When this asphalt covering was removed after 35 years of service, the surface of the plates were found to be in a condition equal to that of new material.

The greatest deterioration and in fact practically the only deterioration was in the I-beams. These had naturally been affected by the locomotive gases and were, as a result, in a condition justifying renewal. While this was an influencing factor in the determination to rebuild the two end sections of the tunnel at this time the chief cause was the decision of the city to extend its limits for Fairmount Park to include the land adjoining and surrounding the line of the tunnel. In order to carry out this work the city planned to fill in and terrace certain sections of this land, making in some cases, a fill of about 13 ft. over parts of the tunnel. While the old roof construction was considered to have a life of at least five or six years longer, there was an element of doubt as to whether it could carry this additional load and still have the same life. In addition there was the certainty that its reconstruction at some future time would have to be carried out from the inside. It was therefore decided to rebuild before the fill was placed.

### Conditions Necessitate Special Design of Arch

The type of arch decided upon varies slightly from the regular standard of the road since it was necessary to secure some increased clearance while at the same time keeping the top of the outside of the roof of the tunnel at about the same grade as before. This led to the adoption of a three-centered arch with radii of 7 ft. 9 in. and 32 ft. The springing line is 9 ft. 5½ in. above the top of rail and marks the line to which the old masonry side walls were removed and replaced

Tearing Out the Old Work with a Crane and Traveler

with concrete. The old walls, constructed of Conshohocken stone, were carried on the solid rock which underlies the ground in this section at about three feet below the top of rail. The inner surface had been given a slight batter while the rear had been carried up in a series of steps. The design adopted required that the old masonry be removed down to the new springing line and that a new concrete wall in the form of a skew-back be carried up to practically the same height as the old walls.

In all sections except under Callohill street, at the extreme west end of the tunnel, the two 7-ft. 9-in. segments were poured with concrete. The 32-ft. radius arch was built up of five rings of brick with a herringbone bond at every fifth brick. The concrete segments were lined with a row of bricks,

every fifth brick being a header. The solid arch under Callohill street was of the same general cross-section. One row of brick was laid with every fifth brick a header as in the 7-ft. 9-in. arches of the main design. However, the entire arch was poured as one unit and reinforced by long 1¼ in. corrugated round iron rods laid 6 in. center to center. Each alternate rod followed the contour of the arch, the remaining rods running comparatively straight across the arch proper.

As stated previously, the west section of the tunnel lies under one of the streets leading into Fairmount Park or specifically under Twenty-fifth street. Two streets also crossed at right angles, one of which had to be kept open at a time. The work was started at the junction of the old

Typical Tunnel Sections

I-beam construction with the original brick arch and proceeded toward the portal. In order to keep one street open, work under an intermediate street, Callohill street being at the portal, was carried on simultaneously with the first part in order that that street could be opened for traffic and the remaining one closed in sufficient time as to not interrupt the continuity of the work.

### Two Cranes Greatly Facilitate the Work

Prior to the beginning of this reconstruction two 15-ton cranes, concrete mixers, one-yard buckets and other equipment were brought to the site. The concrete mixer was fixed in one location and was never moved during the progress of the work. The first crane was brought in alongside the end of the old brick arch, where it remained until it had removed the street car rails, the pavement and other miscellaneous material covering the old tunnel roof. It was also used in removing the old roof structure which it picked up and swung to one side, opening up the tunnel itself. With the tunnel once opened up, the crane was run up on a traveler extending the full width between the tunnel walls and operating upon tracks laid along the old walls. This materially facilitated the work of this crane since it could pick up and deposit either new or old material from a considerable distance on either side of the tunnel.

With a section of the tunnel roof thus removed and one crane mounted on a traveler free to move longitudinally, the work of reconstruction was really begun. The old masonry walls were torn out down to the springing line and forms

constructed for the new. The old masonry was in this case removed by the second crane which operated on a track laid partly on the line of the old wall and partly on the adjoining land. This crane operated between the mixing plant and the section of wall torn out and, after removing the masonry on both sides, placed the concrete in the forms. For this purpose one-yard buckets were used. These were filled at the mixing plant after which they were picked up by the crane,

The Concrete Work Was Kept Close Up to the Masonry

carried to the forms and dumped. As each section of new wall was completed, additional track was laid so that the crane could always operate up to the point where the masonry had been torn out.

#### Light Steel Centering Proves Readily Adaptable

While this work was under way, the first crane on the traveler was continuing to tear out the old roof structure, opening

sary to carry the lagging flush with the surface of the centering rather than over the top, as it is usually done. This was accomplished as follows: The centering was made in sections consisting of four of the steel centers spaced five feet apart and held in these relative positions by means of light steel bracing. Heavy wooden blocks were bolted to the web of the I-beam section, their upper edges being brought to the proper height so that 3-in. by 4-in. lagging notched to fit around the flanges could rest securely on them and at the same time be flush with the surface of the centering. This gave a section 15 ft. long, three such sections being used.

Before work on the new arches was commenced a line of timbering was built along the masonry wall and capped with an eight-inch timber. These lines of timbers, one on each side of the tunnel, supported the centering in position and also acted as runways upon which it could be moved ahead as needed. They were also used as supports for the concrete forms. The steel centers were lowered into position by means of the crane operating on the track along the wall, after which they were tied together and the lagging installed. Eight-inch wedge blocks under each steel arch were used to bring them to the required height. Once in position they were loaded at the center to keep them sprung tightly against the skew-backs, after which forms were erected for each of the 7-ft. 9-in. radius arches. These were then poured and allowed to set, a single row of brick being laid previous to the pouring, as already described in the design. When the concrete had set sufficiently the forms were removed and the remainder of the arch completed in the manner customary for brick arches. As each section was completed, the wedges were knocked out and the centering lowered approximately five inches on to a series of three-inch rollers. At the same time adjustable rollers mounted on the sides of the steel centering were run out to thrust against the concrete side walls, thus steadying the centering and preventing it from binding or

The Centers Were Loaded While Pouring the 7 ft. 9 in. Radius Arches

up more and more of the tunnels. The work of building the new arches then followed. As the clearance was very limited it was necessary to design and build special centering for the work. This consisted of light built-up steel forms, the outer surface of which was made to correspond to the finished curve of the arch down to the line of the haunches. From this point it extended straight down, thus giving a small clearance which, when the forms were dropped, facilitated their being moved readily. Again because of the clearance it was neces-

twisting as it was moved forward. In this way it was possible to drop the centering, move it forward to the next set-up and raise it to position, all in a very short time and with very little labor effort.

At Callohill street a reinforced concrete arch was built. In this case a single row of brick was laid, after which the entire arch was poured at one time, no construction joints being made except at the skew-backs. At this street there were several water, gas and electric light pipes and cables

which had to be carried across on temporary bridges or cables. When the arches were completed these lines were rearranged to follow the sidewalks. As a finishing covering and to waterproof the tunnel construction a three-inch layer of asphalt was spread over the entire roof structure, overlapping the joints between the side walls and the arches.

The force required for this work was very small, chiefly because of the advantageous use of the cranes for handling and placing all the materials, etc. During the period when all classes of work were being carried on at one time only about

A Locomotive Crane Was Used in Placing the Centers

32 unskilled and 15 skilled laborers, including carpenters, hoisting engineers, etc., and a supervising force of approximately 8 men were employed.

This work was designed by and carried out under the direction of the engineering department of the Baltimore & Ohio, H. A. Lane, chief engineer, Richard Mather, district engineer and J. G. Teders, assistant engineer in active charge of the work in the field. The contractor on the work was the Empire Engineering Co., Inc., Baltimore, Md.

## Progress in Rate Reductions

**F**OLLOWING UP the statement recently made before the Senate Committee on Interstate Commerce by Edward Chambers, vice-president of the Atchison, Topeka & Santa Fe, that thousands of rate reductions had been and were being made by the railroads, American Railroads, published by authority of the Association of Railway Executives, has obtained from various freight bureaus further information as to the progress in rate adjustments.

Mr. Chambers' data were to May 1. The reports now published cover the period to June, and show that the process of eliminating rate maladjustments is proceeding at a rapid pace.

The Transcontinental Freight Bureau (Chicago) reports that up to June 9, 1,272 reductions have been made in west-bound domestic rates, 153,319 reductions in eastbound rates, and 120 reductions in export and import rates. The reductions affect grain, iron and steel, food products, lumber and many other commodities.

Since June, 1920, the Western Trunk Line Committee has considered 1,200 subjects; over 90 per cent of these were reductions and nearly all affected rates increased last year. These reductions concern more particularly crushed rock,

gravel, building materials, grain, coal, lumber, live stock feeds and molasses. The reductions range from 5 to 70 per cent, this maximum reduction being on paper and lumber. As representative of the action of this and other traffic associations, the following table is presented:

	Number of applications on which reductions were approved	Range of percentage reduction
Products of agriculture:		
Grain, hay, fruits, vegetables and seeds.....	70	10 to 50
Products of animals:		
Live stock, fresh meats, packing house products and green salted hides.....	16	15 to 33½
Products of mines:		
Coal (hard and soft), ores, sand, gravel and crushed stone.....	70	10 to 60
Products of forests:		
Lumber, logs, sash, doors and blinds.....	13	5 to 70
Manufactures:		
Petroleum oil.....	9	8 to 30
Brick, cement and lime.....	24	7 to 60
Iron and steel rails, structural iron and ferro-manganese.....	15	10 to 50
Sugar and molasses.....	6	12 to 45
Paper and paper articles.....	17	14 to 70
Miscellaneous commodities:		
Not specified above (car-loads).....	73	6 to 70
Less carload rates.....	10	8 to 30
Industrial switching rates.....	20	22 to 50
Total.....	343	

In the month of May, F. A. Leland, chairman of the Southwestern Freight Bureau, says that 159 out of 168 cases acted upon involved rate reductions.

"In this statement," Mr. Leland says, "we have made no effort to multiply the number of rate reductions by reason of the fact that some of the rates apply from a large number of points, or to a large number of points. Technically, a reduction in a rate applying from 10 points to 100 points is 1,000 reductions. Such situations as that we treat as only one reduction."

According to a report, dated June 11, from N. W. Hawkes, chairman, New England Freight Association, for the period August 25, 1920, up to June 1, 1921, that association has considered 695 freight rate proposals, and has in the same period issued 348 recommendation advices, of which it is estimated that 80 per cent are reductions.

The Trunk Line Association (New York) states that in trunk line territory from September 1, 1920, to May 31, 1921, 2,662 rate proposals were taken up, of which 2,463 were approved and recommendation advices issued.

An accurate calculation has been made of the number of reductions in the month of May, which is fairly representative of the whole number of transactions involved. In that month 98 per cent of the changes in rates passed upon by the Trunk Line Association were reductions, according to advices from the secretary of the association.

Commenting upon the rate situation in general, American Railroads says:

"With all the savings that the railroads can hope to make as a result of wage reductions and other economies, it is only with the utmost difficulty that they can hope to earn the \$475,000,000 necessary to meet their fixed charges for 1921. "There can, therefore, be no general reduction of rates this year.

"The best the roads can do is to readjust rates on the existing level so as to remove inequalities and maladjustments that have resulted from successive blanket increases.

"This issue of American Railroads is devoted largely to showing the extent to which—within the lines of possible action—the roads are meeting the needs of shippers."

THE SAFETY DEPARTMENT of the Missouri Pacific, which is conducting a campaign to reduce accidents among its employees, awarded first place in its "Safety First League" to the shops at De Soto, Mo., for the month of May. During this period the 382 employees at the De Soto shops worked without an injury of any kind.

# Settlements With Government Under Consideration

Administration Again Interested in Railroad Situation—I. C. C.  
and U. S. R. A. Apparently Disagree

WASHINGTON, D. C.

THE PRESIDENT and the administration are again interesting themselves in the railroad situation, this time in an effort to bring about an earlier settlement of the claims of the railroads against the Railroad Administration and their claims for the six months' guaranty period, with a view to giving the roads some relief which will enable them to pay their bills, get their equipment in condition for a heavy crop season, and to help put an end to the buyer's strike by resuming purchases. For a long time the administration has been looking at the railroad problem principally from the standpoint of rates, but the frequent postponement of dividends recently and the rapid approach of another interest date has served to draw its attention back to the financial aspect of the situation. The question of the settlements between the railroads and the government was the subject of an extended discussion at a dinner given by President Harding to a group of western bankers on June 23, and it was the main theme at the cabinet meeting the next day, after which the President held a conference on the subject with Director General Davis of the Railroad Administration, Chairman Clark of the Interstate Commerce Commission, Secretary Mellon of the Treasury, and Secretary Hoover of the Department of Commerce. While no definite conclusions were reached, it was stated at the White House that the administration wants to do anything it consistently can to expedite a settlement which will help put the railroads in a position to "break the jam" but that it is a question of negotiating a settlement which the administration thinks fair and that an important question of policy is in dispute. In a formal statement given out after the bankers' dinner it was stated:

"The greater discussion in the conference hinged on the relief of the railroad situation. There was no disguising the serious nature of the railway problem. It was generally reported that unless there was some relief worked out in the settlement of the government's obligations to the railroads, which date from the federal war operation, not only could nothing be expected in the way of a railway contribution to the revival of business, but their own recovery would be long delayed."

## Railroads Key to Resumption of General Business

There was a very general agreement among the bankers that the railroads represent in large measure the key to the resumption of general business and they promised to interest themselves in the matter by joining the government in an effort to expedite a fair settlement. From the Washington viewpoint this apparently means that the railroads will be asked to scale down their claims considerably in return for an agreement that the government will pay them much more promptly than it could if it is necessary to carry on a protracted controversy over the amounts and then take a test case through the courts. In fact, a number of large roads have recently made settlements by which they have accepted much less than the amount of their claims.

The "important question of policy" referred to, which is responsible for much of the delay in settlement, has to do with the interpretation of the contract governing the government's obligation to maintain the railroad property during the period of federal control, and the same standard of maintenance as provided in the contract is, by the transportation act, made the measure of the amount the Interstate Commerce Commission may allow for maintenance expenditures in computing the guaranty for the six months beginning March 1, 1920. The Railroad Administration under

Director General Davis is adhering to the same interpretation of this contract as to maintenance as was adopted by Mr. McAdoo, Mr. Hines and Judge Payne while they held the office of director general, namely, that the government's maintenance obligation was to be measured by the maintenance expenditures of the test period multiplied by a factor to represent the increased wages or increased cost of material. The railroads, on the other hand, are insisting on a basis of the cost of actual physical reparation, which would require an allowance for the inefficiency of labor, because the actual cost of putting a tie in the track, for example, was increased by more than the increased cost of the tie itself and the wage increase. The claims are much more complicated than this when it comes to maintenance of equipment.

The Railroad Administration has estimated on the basis of the claims already filed by the railroads that their total claims will amount to \$1,250,000,000, of which \$700,000,000 to \$800,000,000 is for undermaintenance, and most of this represents the difference between the roads and the Railroad Administration on the interpretation of the contract. The same question is the principal cause of delay in settling the railroad claims for the six months' guaranty period and the difference in interpretation of the maintenance contract for that period is said to represent about \$300,000,000. The commission has already certified partial payments on account of the guaranty amounting to about \$430,000,000.

## Claims for Undermaintenance

The railroads have worked out an elaborate and complicated formula for calculating their claims for undermaintenance, which requires a great deal of time for the preparation of a claim and also would involve a correspondingly long time for the Railroad Administration to check it. Therefore, most of the larger roads have not yet presented their full claims and most of those that have made early settlements have had to settle practically on the administration's theory. It is understood that some of these roads consider that they have received some allowance for undermaintenance, but the amount can not be distinguished in the lump sum settlements. The Railroad Administration is willing to admit that there was some shortage of maintenance such as ties, rails and ballast, which should be compensated for, but it adheres to its theory of paying for them on the basis of "price" rather than of "cost" and will not accept the railroad theory without a court decision and as it naturally considers it necessary to check the claims in detail it would require some time to get a final adjudication.

For the six months' guaranty period the Interstate Commerce Commission is the arbiter as to the amount which the railroads may charge against the government for maintenance. If a road during the six months' period spent more for maintenance than the commission finds was necessary to maintain the standard of the test period the excess is at the expense of the company.

## I. C. C. and Railroad Administration

### Apparently Do Not Agree

Apparently the commission and the Railroad Administration do not agree as to the method of calculating this amount. The commission has not yet issued its ruling on the subject, which is one reason for the delay in settling the guaranty, but Director Colton of the Bureau of Finance has adopted a set of tentative principles which he outlined in an address

before the Railway Accounting Officers Association (*Railway Age*, June 17, page 1403) which in general agrees with the contention of the carriers and it is reported that the commissioners have tentatively approved these principles in general by a vote of 6 to 5.

The commission's decision on this point, however, will not be binding upon the Railroad Administration for the federal control period, although it might encourage the railroads to expect a decision in their favor from the courts, and it would not tend to expedite their settlements with the Railroad Administration. The Interstate Commerce Commission does not have to worry particularly where the money is coming from to pay whatever it decides is due the roads for the guaranty period because the guaranty is payable on the commission's certificate, from an open appropriation, that is, from any funds in the Treasury, otherwise unappropriated, while the Railroad Administration has to get any additional money it needs from Congress by way of a special appropriation. Even if it were inclined to allow the theory of the carriers, it would have to defend its action before a Congressional committee and to convince the committee before getting the appropriation desired. It naturally, therefore, wants to have good proof for any claim that it allows, and it claims to have already saved the government some \$60,000,000 by checking the railroad claims for errors.

A good many people in Washington believe that some of the railroads are filing excessive claims, either as a result of haste in trying to prepare them or in the belief that they will have to trade away a large percentage anyway to get a settlement. It is understood that one large system has a claim of \$75,000,000 for maintenance or at the rate of some \$7,500 per mile after the Railroad Administration had spent about twice as much on its property as the same officers had spent on the average during the test period.

### Root of Trouble Deeper Than Freight Rates

For some time the administration seemed to be actuated by the opinion that the principal cause of the business depression was the high freight rates and that business could be stimulated and the condition of the railroads consequently improved by a reduction of rates. A more intensive study has apparently shown that the root of the trouble is far deeper than that and the present idea seems to be that what is needed is something to stimulate buying and that if the railroads themselves, as large purchasers, can be brought back into the market a great deal will have been done to increase business generally, which will in turn improve the condition of the railroads and make possible later a restoration of rates more nearly normal. For this reason the President would like to see the railroads receive promptly the money that is due them and it is understood that he looked very favorably upon the proposal to fund the capital expenditures charged against the railroads for the federal control period until he learned that, as these amounts have been offset by the Railroad Administration against the sums it owes the railroads, a large appropriation would be required to enable the Railroad Administration to pay the roads in full. In view of the campaign to reduce government expenditures, the President is naturally very reluctant to ask Congress for a very large appropriation but neither the prospect of a return to normalcy or the record of the Republican party would be at all improved by a series of railroad receiverships and if the railroads could be induced to abate their claims the amount of the appropriation required to settle would be so reduced that he might be willing to ask for the money.

If the funding plan is adopted, the government would accept railroad securities for the additions and betterments instead of deducting them from the amounts it owes the roads. The Railroad Administration has been making some payments to the railroads on account.

The net amount due the railroads from the government on May 24 was approximately \$600,000,000, according to an estimate prepared by Julius H. Parmelee, director of the Bureau of Railway Economics, and incorporated in a letter to L. F. Loree, president of the Delaware & Hudson. This amount includes an estimate of \$383,000,000 for the period of federal control and a balance of approximately \$229,000,000 still to be paid for the guaranty period following the return of the carriers to their own management.

Mr. Parmelee's letter says in part:

"The director general estimates that the total claims of the railways against the Railroad Administration will aggregate a little more than \$1,250,000,000. He states that the 44 creditor roads whose accounts with the Railroad Administration have already been settled were allowed in final settlement 43.68 per cent of the amount claimed.

"Three debtor roads, having claims amounting to \$27,000,000, were disposed of by funding on account of additions and betterments to the amount of \$6,800,000. That is, final settlement has been made with 47 roads. The total claims of these roads amounted to \$124,040,867, of which \$35,486,914, or 28.61 per cent, was allowed by the Railroad Administration. Applying this percentage to the total estimated amount of the claims against the Railroad Administration (\$1,250,000,000) it would appear that the Railroad Administration will owe the railroads, above and beyond offsets, approximately \$358,000,000.

"In addition to this \$358,000,000 there is also owed an approximate amount of \$25,000,000 to the short line railroads. This makes a total net debt of the Railroad Administration to the railways of approximately \$383,000,000.

"With reference to the guaranty period the standard return of the roads accepting the guarantee amounted to approximately \$431,000,000. The net railway operating income of these roads for this period was a deficit of \$201,000,000, so there is due from the government approximately \$632,000,000. Of this amount \$403,000,000 has been paid by the treasury up to May 24, leaving a balance due the railways of \$229,000,000.

"It is impossible to obtain exact and definite information as to the actual financial status of the railways and the government as the Railroad Administration and the Interstate Commerce Commission have to this date definitely settled only a relatively small portion of the amounts claimed by both the railway and the government. The foregoing figures, although the most comprehensive and accurate that could be obtained, can be considered at best but rough approximations of the existing situation. There are, in all probability, additional items on both sides which the above estimate does not take into consideration and on this basis it seems logical to conclude that the net amount due the railways from the government is somewhere between \$575,000,000 and \$600,000,000."

T. De Witt Cuyler, Alfred P. Thom, Hale Holden, Howard Elliott, Daniel Willard, Samuel Rea, R. S. Lovett, E. N. Brown and S. T. Bledsoe, members of the steering committee of the Association of Railway Executives, called on the President on Wednesday at his invitation and discussed the entire question of the settlement of the accounts and the funding proposition. No announcement was made of any definite conclusions, but the matter was to be further discussed at a meeting of the executives in New York on Friday.

A TABULATION of 40,804 answers to a questionnaire sent out by the American Farm Bureau Federation to farmers, shows that 96.9 per cent of the farmers believe they will be able "to move a materially large amount of agricultural products" if a reduction on freight rates is secured. The returns are complete from five states and incomplete returns were received from six other states

# Signs of the Times in the American Railroad World\*

## Discriminating Review by a Prominent Operating Officer—Thinks the Corner Has Been Turned

By Elisha Lee

Vice-President of the Pennsylvania Railroad

THE RAILROADS of the United States have cost \$20,000,000,000 and are mortgaged for less than \$10,000,000,000. A man who has helped someone else build a home or a factory by lending the owner half of its original cost and taking a mortgage for security is commonly looked upon as having made a very safe and sure investment; and the legal and moral obligation of the borrower to repay is held to be of the highest order. Any action, governmental or otherwise, calculated to impair his ability to fulfill that duty would be justly and universally resented and condemned. Is the man who has lent his savings to help build a railroad any less deserving of fair treatment? Are the property investment accounts of the railroads, collectively, free from inflation? These accounts have been kept since 1907 under the direct supervision of the Interstate Commerce Commission, and upon a uniform system for all roads. In determining value for rate-making last summer, the Commission accepted practically the maximum sum claimed by the railroads, as appearing upon their books—a remarkable testimony to the reliability of these figures, in view of the Commission's extreme conservatism and the certainty that any utterance favoring the roads would lay the Commission open to immediate and severe political attack. The pending physical valuation of the railroads is pretty sure to show a present worth for the railroads as a whole substantially in excess not only of their capitalization, but of their combined property investment accounts.

### Three Deceptive Phrases

"Watered stock" is one of three widely circulated and glibly repeated phrases that have done the railroads incalculable and unmerited harm. The other two are, "The public be damned" and "What the traffic will bear." The former was a hideous error if ever uttered by a responsible railroad executive. The latter is a clumsy expression of a perfectly sound economic principle: that the total expenses of railroad operation must be apportioned among the articles shipped, with due regard to the proportion of the total cost which each is commercially able to bear.

It is interesting, although not exhilarating, to speculate on the losses which railroad investors have suffered through the misuse, misunderstanding, misquotation and misapplication of these three phrases, but such considerations would lead far afield from the subject we are discussing. There have regrettably been a few cases in which railroad securities have been issued to represent not physical property but prospective or anticipated earning power. I have no desire to appear as an apologist for such practices, but their extent and relative importance have been grossly exaggerated.

Among those who have notably suffered in this respect have been the holders of Pennsylvania Railroad stock who not only paid in more than \$40,000,000 in cash premiums above par value, but have, in the more prosperous past, reinvested in their property, without adding to the capitalization, far larger sums out of net earnings which legally and morally might have been distributed as dividends. It is more than conservative to say that for every dollar of Pennsylvania Railroad stock there are at least two dollars' worth

of equity in tangible property over and above indebtedness, yet Pennsylvania stock is sold today at a depreciation of one-third its par value; and the directors have had no choice but to reduce for the time at least the long-established and moderate dividend of six per cent. The bondholders, too, have suffered with the stockholders through the declining market value of their securities. These injustices reflect in no small measure the effects of the false propaganda which has long been carried on to create the impression that railroad securities as a whole are watered.

In the hearings before the Railroad Labor Board, one of the chief representatives of the labor organizations a few weeks ago presented a list of security issues purporting to show altogether \$500,000,000 of railroad over-capitalization. The representative who submitted the list was one of the most resourceful, highly skilled and highly paid of the labor advocates and we may assume that the list was as good and impressive a one as ingenuity could compile. It went to the public, of course, without any analysis or adequate explanation of its significance. If it left any impression at all in the public mind it was merely a general one of the existence of a large amount of fictitious capitalization; and that, doubtless, was just the impression it was intended to leave. Nothing was said of the fact that the \$500,000,000—even if every penny was correct—represented only about 3 per cent of the total net capitalization of the railroads; nor was attention directed to the fact that the under-capitalization in one single railroad system [the Pennsylvania] would wipe out all the water which the labor representative succeeded in finding in others. It is a fact that there has been invested in the Pennsylvania Railroad system about a half billion dollars more than its net outstanding capitalization.

In all substantial, well-planned railroad systems the supposed over-capitalization will be found to be totally without foundation. You may look over all the balance sheets you please and you will not find any items covering patents or good will or other unrealizable assets. Railroad property is represented by "road and equipment" and its existence is verifiable by the eye.

### Stability of Railroad Investments

Many railroad bonds have long periods to run. Some have been drawn to mature in a century. Have their holders any reason to fear that the railroads are in danger of being superseded by other forms of transportation and their security value thus impaired? My judgment is that we have no cause to prepare against such a contingency, either for ourselves or our dependents. The motor car and the aeroplane are more likely to develop new transportation fields of their own, rather than extensively to invade those of the railroads. The telephone did not wipe out the telegraph; typewriters have not eliminated pens and pencils. Think of the great development of rail transportation; and yet we are greater road builders than were even the Romans of antiquity. Indeed, the permanence of human institutions, once well established, is one of the most interesting phenomena of history. It seems to be a sort of general law of progress that new developments in any useful art or field of endeavor, instead of crowding out the old, often

\*Abstract of an address before the Philadelphia Bond Men's Club, at Philadelphia, June 14.

tend rather to create entirely new fields of usefulness for themselves. To the extent to which motor cars are likely to take over the short-haul freight traffic, the railroads will probably be immediately benefited financially, because short-haul business is becoming increasingly unremunerative on account of the high proportion of terminal costs which it must sustain. Altogether, I am not afraid of motor cars and aeroplanes making railroads obsolete.

I think we are justified in three general conclusions regarding the funded debt of railroads: 1. Outstanding railroad bonds as a whole represent the real investment of real money; 2. They are secured by property worth more than double their face value; 3. The property so pledged may be counted upon to retain its practical value and utility indefinitely. The owners of railroad bonds may justly claim not only the highest conceivable legal but also moral right to expect that the integrity of their investments will be fully protected. The elder J. P. Morgan said that "Character is the best collateral." The fact that the moral character of the American people is the highest in the world appears to me as one of the most dependable and substantial safeguards which railroad investors have, because it must be remembered that under the system of public regulation which has developed in this country, particularly now that its fields extend not only to rates but to wages, the final moral responsibility for the integrity of railroad investments rests with the people as a whole. Most of what I have said applies just as aptly to the stockholders of the railroads as to the bondholders. \* \* \* We must bring about a very different relationship between income and outgo from that which has prevailed in recent years.

### The Outlook

I cannot help feeling that the corner has been turned, and that we can begin to discern something which has at least the appearance of daylight ahead. The Labor Board realizes that substantial downward adjustment is necessary. Its action with respect to the national agreements constitutes a clear recognition of their economic unsoundness. President Harding believes in a fair deal for the railroads and is not afraid to say so. There is a growing friendly and constructive attitude in Congress, particularly exemplified in the present helpful Senate inquiry. Back of all of this and more fundamental in its nature lies the really remarkable change which has taken place in public sentiment toward the railroads. I think it very questionable whether at any time within the last decade it has been really popular to "bait" the railroads, though the volubility of an organized minority may have misled those who have been courting popularity. The press and public were almost unanimous in their condemnation of the Adamson Law of 1916, upon the enactment of which many persons lay the original blame for the subsequent wage and labor troubles of the railroads. Had Congress submitted the Adamson Law to popular referendum it is as near a certainty as anything can be that it would never have gone into effect. Country-wide questionnaires have shown over 80 per cent of the people favoring a return to private ownership and against a continuance of government ownership as a permanent policy.

Since the return of the railroads to their owners the press and people are overwhelmingly for fair treatment of the railroads; for a liberal adjustment of their claims for deterioration sustained while they were being used for war purposes; for prompt payment of the remaining balances of the government guarantees; for funding of their indebtedness on account of permanent investments made by the government during federal control; for complete abrogation of the national agreements; and for a readjustment of railroad wages to reasonable levels. The public has become educated. It realizes that in the end it pays all the costs of railroad operation, including every unnecessary dollar spent as a result of unduly high wages, full crew laws or other uneco-

nomie conditions. And the effect of public sentiment on political action affecting the railroads has not as yet exerted its full force.

The railroads are not seeking additional legislation. The Transportation Act of 1920 is no doubt capable of amendment, but for the present I believe that the law as it stands should receive a more extended trial. Those who blame the business depression on railroad rates forget that it is a world-wide condition, much less severe in this country than in Europe. With respect to railroad wages, we feel that the Labor Board has not ordered as great a reduction as it will be found the circumstances demand, and there is little doubt that conditions will inevitably bring this subject before the Board again. The United States is too big and its population too diversified to have wages and working conditions alike in all parts, and it has never been attempted in any important industry except railroading. If each individual company had clear and unequivocal authority to negotiate wages and working conditions directly with its own employes, half the battle would be won. A large part of our trouble has been due to the belief that legislation or other governmental action can reverse the functioning of economic laws.

In the rarer days of the West it came to the notice of a law-maker in one of the Trans-Mississippi commonwealths that arithmetic was sometimes made troublesome by the fact that the ratio of the circumference of a circle to its diameter can never be expressed exactly either in decimals or common fractions. To get rid of this annoyance, he is said to have introduced a bill decreeing that thenceforth the ratio should be exactly as three is to one. The bill, I believe, was defeated; but it may possibly have provided Mr. Bryan with his inspiration when some years later he sought to revise by Act of Congress the exchange values of gold and silver. Railroad legislation should conform to, and not seek to overthrow, economic law. There will for a long time be abundant need for us to "watch our step," but I think reasons are not wanting to justify a thoughtful man in taking a hopeful view of what is ahead.

# Scope of Wage Reduction Extended in New Order

## Labor Board Makes 92 Carriers Party to Decision 147—National Agreements Continued Temporarily

THE RAILROAD LABOR BOARD on June 27 added 92 carriers and one labor organization as parties to its wage reduction order, Decision No. 147, an abstract of which appeared in the *Railway Age* of June 3 (page 1259). The 12 per cent wage cut decrease now applies to practically all of the larger carriers and all classes of employees and will result, according to the Board, in cutting off approximately \$400,000,000 from the annual pay roll.

Several sections of Decision No. 147 have been enlarged to cover wage reductions for certain workers not specifically noted before. Article X of Decision No. 147 pertaining to floating equipment employees has been enlarged so that the rates of pay in various ports such as New York, Philadelphia, Pa., Hampton Roads, New Orleans, La., Natchez, Miss., Cairo, Ill., St. Louis, Mo., and Duluth, Minn., are fixed according to the conditions prevailing at each point. The rates fixed are highest at Duluth and lowest at St. Louis, the range in the rates between these points being approximately \$60 per month.

Article XII of Decision No. 147 was also enlarged by the addition of the following provisions:

For the specific classes of employees listed in the following sections of this article and named or referred to in connection with a carrier affected by this decision, deduct from the amount of increases granted since February 29, 1920, the following per cent of such increases:

Sec. 3. Chefs in bridge and building department and chefs in extra gangs.....60 per cent.

Sec. 4. (a) *Restaurants*.—Managers, assistant managers, cashiers, head waiters and head waitresses, waiters and waitresses, bus boys and scrub girls, chefs, cooks, bakers, dishwashers, yardmen, carvers and cold-meat men, vegetable man, storeroom man, linenroom man, pantry men and pantry girls, lunch-counter clerk, houseman, housekeeper, maids and porters.....60 per cent.

(b) *Dining cars*.—Stewards, chefs, cooks, waiters, and buffet porters.....60 per cent.

(c) *Laundry Workers*.—Washmen, assistant washmen, foreladies, seamstresses, body ironers and manglers.....60 per cent.

Sec. 5. Cooks in maintenance of way department.....60 per cent.

Sec. 6. Cooks and campmen in extra gangs, cooks in carpenter gangs, and cooks in Russellton Hotel.....60 per cent.

Sec. 7. Dining car stewards.....60 per cent.

Sec. 8. Stewards, cooks, waiters, and porters.....60 per cent.

Sec. 9. (a) *Restaurants and Hotels*.—Stewards, managers, chefs, cooks, dishwashers, pantry men, waiters, porters, bedmakers, and barbers.....60 per cent.

(b) *Ferry Restaurants*.—Stewards, chefs, cooks, waiters, porters, and dishwashers.....60 per cent.

(c) *Dining Cars*.—Stewards, chefs, cooks, pantry men, waiters, bus boys, and cabinet, buffet, and chair car porters.....60 per cent.

(d) *Miscellaneous*.—Commissary helpers, laundry workers, and chauffeurs.....60 per cent.

Sec. 10. (a) *Restaurants*.—Managers, cooks, waiters, maids, and porters.....60 per cent.

(b) *Dining Cars*.—Cooks and waiters.....60 per cent.

Sec. 11. Stewards, chefs, cooks, pantry men and waiters.....60 per cent.

Sec. 12. Waitresses, parlor car chefs, and porters.....60 per cent.

### Many Disputes Over National

#### Agreements Reach Board

The Labor Board during the past week has been flooded with the submission of controversies over rules and working conditions. The character of the submissions made to the Board indicates very clearly that the employees on the majority of roads have submitted the terms of their national agreements as practically the "irreducible minimum" and stood flatly for the perpetuation of the punitive and restrictive clauses against which the railroads have strenuously ob-

jected. In a few cases, particularly those in which smaller roads are concerned, the submissions to the Board indicate that there has been an attempt to negotiate and in these cases the points in controversy are comparatively few.

### Employees Take Referendum on Wage Cuts

The employees' organizations affected by Decision 147 have been taking referendums during the past week, the results of which are to be announced when the general chairmen of the various organizations meet in Chicago on July 1. Labor leaders have consistently declined to comment on the trend of the voting. However, the press has reported that the returns already in indicate a disinclination to accept the wage cuts ordered by the Labor Board. On June 28 it was reported unofficially that the shop men, first of the organizations to complete its vote, had rejected the Board's ruling by a large vote.

### Labor Board Continues National Agreements and Temporarily Ends Punitive Overtime

The Labor Board on June 28 issued a "surprise" order continuing all National Agreements "until such time as such rules are considered and decided by the Labor Board" and ending temporarily the payment of time and one-half for overtime until this point in the controversy between the carriers and their employees is decided by the Board. Overtime in the meantime is to be paid at the pro-rata rates except on those carriers where overtime was paid for at punitive rates prior to federal control.

The Board's order, issued as an addendum to Decision No. 119, said:

Reports of the results of conferences held in accordance with the directions contained in Decision 119 have been and are now being received in considerable number. In some instances the carriers and the employees have arrived at an agreement upon all rules. In a considerable number of instances there remain certain rules upon which no agreement has been reached, while in others conferences have not as yet been begun. Under these circumstances, in order that no misunderstanding may exist or unnecessary controversy arise, it appears necessary, purely as a modus vivendi, that the Labor Board establish a uniform policy to be pursued with regard to the undecided rules until such time as it is possible to make a decision.

In the available reports from the conferences held in accordance with the direction contained in Decision 119, it is found that the principal rules still the subject of dispute are those governing payment of overtime. The Labor Board directs as follows, effective July 1, 1921, with the understanding that if the rules promulgated by the Labor Board to be effective July 1 are more favorable to the employees, adjustment in compensation due the employees will be made by the carrier:

1. All overtime in excess of the established hours of service shall be paid for at the pro rata rate, provided that this will not affect classes of employees on any carrier which have reached an agreement as to overtime rates, nor to classes of employees on any carrier who by agreement or practice were receiving a rate higher than pro rata prior to the promulgation of any general order of the United States Railroad Administration relating to wages and working conditions. Inasmuch as this Board has not as yet given consideration to any dispute on overtime rates, this order should not be construed to indicate the final action and decision of the Labor Board on disputes as to overtime rates which have been or may be referred to the Board.
2. In lieu of any other rules not agreed to in the conferences held under Decision 119, the rules established by or under the authority of the United States Railroad Administration are continued in effect until such time as such rules are considered and decided by the Labor Board.
3. This direction shall not be understood to modify Decision 119

- in any respect other than is specifically provided for herein.
4. Rules agreed upon by carriers and employees to be effective as of July 1.

### Employees in General Offices

Another interpretation of decision 119 was handed down by the Labor Board on June 29, ruling that agreements as to working conditions of employees in the general offices should not be separate from the agreements negotiated with the Brotherhood of Railroad and Steamship Clerks, Freight Handlers, Express and Station Employees. In the negotiations now taking place under decision 119, several disagreements have resulted over the question of the right of the employees in the general offices to negotiate their own agreement independently of the clerks' organization, where this organization represents the majority of all clerks and station employees in the service of the carrier, but not the majority of the general office force. On one carrier the general office force expressed a desire not to be included in the agreement under negotiations between the clerks' organization and the carrier and asked permission of the board to negotiate a separate agreement. The question was referred to the board by the employees and the carrier, the latter favoring such separation on the ground that the general office force is a separate class.

The Labor Board, in its decision, recognized the difference in the character of work performed by the clerks in the general offices, but ruled that but one agreement should be made in which could be incorporated the exceptions in which the general office forces would be included.

The decision of the Board, however, ruled that the employees in the general offices do not constitute a class and, therefore, but one agreement should be made. It added, "This decision will not operate to prevent the exclusion of the personal office force and the confidential positions in the general offices from the application of the agreement."

## The Pennsylvania and Its Employees

NOTICE has been given to the United States Railroad Labor Board that the Pennsylvania Railroad and the representatives of its employees in engine and train service have mutually agreed on regulations and working conditions. These enginemen, firemen, hostlers, conductors, trainmen and switch-tenders, number more than 40,000. Heretofore the men in engine and train service have been working under two different schedules, one for the former lines east and one for the former lines west. The successful outcome of these negotiations is a source of gratification to the Pennsylvania officers, who are endeavoring to establish similar arrangements for employees in other branches of the service, not only for the negotiation of regulations to take the place of the so-called national agreements but also for the amicable settlement of all matters of controversy that may arise.

E. T. Whiter, assistant to the vice-president in charge of personnel, in an address before the Manufacturers' Club at Philadelphia on June 29, discussed at length the labor problems now engaging the attention of railroads and their employees everywhere, and gave interesting data concerning the Pennsylvania. He said in part:

Under the decision of the Labor Board we have asked our employees to select, by secret ballot, representatives from among their own number in each of the various classes, representatives of their own selection, to speak for them in negotiations with the management. We have, already, the "Joint Reviewing Committee of the Pennsylvania System," established early in January of this year, with representatives of the engine and train service, which deals with about 50,000 employees. It has been in operation now for six

months, and the record of its work is one of which not only the management but the men themselves are very proud. It has actually demonstrated what we have been contending for before the Labor Board, namely, that it is possible, if we are permitted to do so, to get together with our own men and to settle our own affairs within the family.

That is what we have in mind for all other classes of employees. We have absolutely no quarrel with the unions. Nothing could be farther from the truth than any statement that the Pennsylvania, in proposing this plan to its employees, is trying to disrupt labor organizations. There are about 185,000 persons now employed on the Pennsylvania System, of whom between 165,000 and 170,000 have been involved in the present controversy. Of these, about 40,000 are in the train service and they have mutually agreed with the company on working conditions.

A majority of the shop employees at Altoona have also agreed on fundamentals, including piece-work, and negotiations between those men and the company are continuing with every prospect of a mutually satisfactory arrangement being consummated. The maintenance of way employees are now voting. The signalmen, the clerks, the telegraphers, and the freight handlers have taken their vote, making in all a total of about 100,000 that have either completed their negotiations or are now choosing their representatives.

Outside of Altoona, a majority of the shop crafts have declined to vote, and the management feels that it can assume no other course than to deal with the committee chosen by those who did vote. Many of the foremen have announced that they consider themselves officers and do not want a committee to represent them.

We have not been blind to the difficulties that obstruct our way, but we feel that, from the result of the voting, substantial progress has been made. We earnestly request co-operation on the part of the public generally in our efforts to reach a basis of harmonious relationship with our employees. Notwithstanding our endeavors, the Labor Board and the public will have this problem before them for some time to come, unless the American public is determined that these national agreements, or schedules based upon the principles of the national agreements, shall not continue to be imposed upon the railroads under some other form. \* \* \* There is an evident disposition on the part of railroad managers, as well as employers in other industries, to recognize the employee as a factor in industry and to treat him fairly; and insofar as there is a spirit of friendliness and co-operation between employers and employees, the country will prosper.

The American Federation of Labor at Denver has just re-affirmed its stand for government ownership of railroads with democratic operation. That means the Plumb Plan. The executive council was instructed to draw up proposed legislation giving railroad workers equal rights and privileges with capital. If their efforts should prove successful, it is only a short step farther to include all industries organized under corporate grants, and again only another step to include all the basic industries, such as coal, iron, steel and perhaps others. Such resolutions are not idle words. They should not be treated lightly. They call for most serious consideration on the part of business men. Railroad managers are trying to operate their properties honestly, efficiently and economically, and have set for themselves a high standard of public service; but they need your support.

NEW ENGLAND must have adequate service from its transportation system, at reasonable rates, or the prosperity of millions of Americans will be imperilled. This was the main point of an address by Vice-president Calvin Coolidge in New York City on June 27. The speaker intimated that this question deserved the serious attention of some railroads outside of New England.

Waiting to Take an Express Train Over the Mountains

## Heavy Locomotives for the Southern Pacific

Pacific Type Handles 11 Passenger Cars on 1.5 Per Cent Grade—  
New Santa Fe Type Increases Tonnage

**D**URING the early part of the year, the Southern Pacific received from the Baldwin Locomotive Works 15 locomotives each of the 4-6-2 and 2-10-2 types. The 4-6-2 type was built particularly for use on heavy passenger trains between Ogden, Utah, and Carlin, Nev.; and the 2-10-2 type on heavy freight trains between Los Angeles, Calif., and Bakersfield.

Between Ogden and Carlin, a distance of 247 miles, the maximum grade is 1.5 per cent, 10 miles of which is encountered going east, and 20 miles going west, the remaining grades varying from 0.15 per cent to 0.6 per cent. These 4-6-2 type locomotives are capable of handling on this district, without helper service, a passenger train consisting of 11 cars, including Pullman cars, which weighs 875 tons. Locomotives of the lighter design of the 4-6-2 type, which the new locomotives displace, require helpers when going west from Montello to Valley Pass and from Wells to Moor going east.

Between Los Angeles and Bakersfield, a distance of 171 miles, there are 64 miles over grades of from 2.2 per cent to 2.37 per cent going west, and 73 miles over grades of from 2.23 per cent to 2.54 per cent going east, the remaining grades varying from 1.0 per cent to 1.5 per cent. The tonnage hauled by these 2-10-2 type locomotives is 1,005 tons going west, and 865 tons going east, or about 13 per cent over that handled by the former lighter 2-10-2 type locomotives.

The specifications and general designs for these locomotives were worked up under the supervision of George McCormick, general superintendent of motive power, and F. E.

Profile of Road Between Bakersfield, Calif., and Los Angeles

Russell, assistant mechanical engineer, the designs being completed and details worked out by the builders.

The 4-6-2 type locomotives have a rated tractive effort of 43,660 lb., with 180,000 lb. on drivers, the ratio of adhesion being 4.12. The total equivalent heating surface is 4,695 sq.

Profile of Road Between Carlin, Nev., and Ogden, Utah

ft., or 1 sq. ft. for each 9.5 lb. of tractive effort, this ratio indicating good steaming capacity. The boiler is of the extended wagontop type with a wide firebox placed back of the drivers and over the rear trucks. A combustion chamber 3 ft. long extends forward into the boiler barrel, and the tubes have a length of 18 ft. The superheater consists of 40 units and has a superheating surface of 836 sq. ft. The cylinders have a stroke of 30 in., which is a departure from the usual practice in passenger locomotive design. The long stroke was based on the results of numerous tests of locomotives

6,933 sq. ft., or 1 sq. ft. for each 10.8 lb. of tractive effort, this ratio likewise indicating excellent steaming capacity. The boiler is of the straight top type with a firebox 90 in. wide placed over the rear truck. The combustion chamber is 5 ft. 4 in. long, and the tubes have a length of 21 ft. The cylinders have a stroke of 32 in. and lateral motion driving boxes are provided on the first pair of drivers.

Among the specialties applied to both types of these locomotives are Commonwealth cast steel tender frames, four-wheel equalizing swing motion tender trucks, Delta type

Santa Fe Type Locomotive for Handling 1,000 Tons on 2.4 Per Cent Grades

with superheaters made by the Southern Pacific, which justified the use of the longer stroke with superheated steam. The performance of these 4-6-2 type locomotives since going into service has proved that no mistake was made in adopting a longer stroke for passenger locomotives.

The 2-10-2 type locomotives have a rated tractive effort of 75,150 lb., with 297,300 lb. on drivers, the ratio of adhesion being 3.96. The total equivalent heating surface is

trailing truck frames, radial buffers, Unit type safety bars, Ragonnet power reverse gears, extended main driving boxes and Nathan non-lifting injectors. A complete installation of F.B.C. flexible staybolts is made in the breaking zone of the firebox and in the combustion chamber around the belly of the boiler.

Both types are oil burners and are equipped with Walchaert valve gear with the link block in the bottom of the

\*Equivalent heating surface equals total evaporating heating surface plus 1.5 times the superheating surface.

link in forward motion, the gear being so arranged as to give equal cut-off at 55 per cent of the stroke. The lead is  $\frac{1}{4}$  in., lap  $1\frac{1}{4}$  in., exhaust clearance  $\frac{1}{8}$  in., and valve travel for the 4-6-2 type  $6\frac{1}{2}$  in. and for the 2-10-2 type, 7 in. These valve events were decided upon from experiments made during the locomotive tests above referred to, proving to be the most efficient of the numerous combinations tried.

The counterbalance is designed to balance only 50 per cent of reciprocating parts and to produce a dynamic augment at diameter speed not exceeding 50 per cent of the static wheel load. The reciprocating parts are very light, the piston heads being of the built-up type with cast iron bull-rings, and the piston rods of open-hearth steel, heat-treated, and hollow bored. The main and side rods are also of very light design, all being of I-section except the side rods on the 2-10-2 type locomotives, which are rectangular. All driving axles and main and forward crank pins are made of open-hearth heat-treated steel, and are also hollow bored. Constant resistance leading trucks are applied to both types of locomotives.

The trailing trucks on the two types of locomotives are interchangeable and are equalized with the drivers by means of equalizing beams which are fulcrumed on the truck frame. With this arrangement, which is a new departure for this type of truck, the load is transferred to the truck frame at the radius bar pin and through two sliding bearings placed on the right and left sides back of the truck wheels. In previous designs the entire weight on the truck was carried on fulcrums between the radius bar pin and the wheels.

The tenders, which are of the Vanderbilt type, are unusually large, having a capacity of 12,000 gal. of water and 4,000 gal. of oil. The tender trucks are of the equalized type with journals  $6\frac{1}{2}$  in. by 12 in.

The following tabulation shows the principal dimensions, weights and ratios of the two new types, and, for comparison, of lighter locomotives of the same types which were superseded by the new power between the points mentioned.

## Railway Business Association Places Railway Problems Before President

WASHINGTON, D. C.

THE FOLLOWING statement was presented to President Harding at the White House on Monday morning, June 27, by Alba B. Johnson, of Philadelphia, president, and associates speaking for the Railway Business Association, the national organization of concerns selling goods or services to railways:

"The Railway Business Association invites your consideration of two important aspects of the railway problem.

"We refer first to the industrial unemployment. This is aggravated and protracted by inability of the railroads to pay the bills of railway supply manufacturers or to order necessities. Without entering into the causes thereof depletion of railway treasuries is due to delay in reaching an adjustment of railway accounts with the government. Railroad orders being held to the minimum, many plants are on part time or closed down, throwing their forces out of work, while local banks carry manufacturers with credit which would ordinarily be available to other borrowers. Measures for relief are reported by the press to be under official consideration. We earnestly urge that proposed appropriations by Congress to expedite adjustments shall be viewed as the fulfillment of a government obligation. For every sum properly appropriated to stabilize the roads and cognate business the people of the country will realize very much more in prosperity and the government treasury in taxes. Meantime the railroads will be preparing to handle the increased volume of traffic which must be expected in due course.

"Second, we refer to the practice, increasingly prevalent among users of transportation during the present business depression, of carrying their proposals for railway rate changes to executive and legislative officers of the federal government and to the public and press, instead of as heretofore to the carriers and on appeal from them when necessary to the Interstate Commerce Commission.

"Rehabilitation of our railways and subsequently their maintenance and operation will depend upon the foresight and business judgment which are applied to the regulation of rates. The problem must be dealt with as a whole in accordance with a comprehensive program steadily pursued. Such a program can be carried forward in no other way except through concentration of responsibility. The Interstate Commerce Commission is the body to which Congress has delegated the task. The commission can serve the whole country in the long run successfully only if it retains the prestige and esteem to which its quasi-judicial character entitles it. The survival of privately owned and operated railways requires general abstinence from agitation and political pressure in connection with any matter over which the commission has jurisdiction.

"We earnestly deprecate appeals by shippers and travelers to the President, his advisers and to members of Congress for relief which under the statute is to be sought from a quasi-judicial administrative tribunal.

"In our judgment this practice if continued will harm every interest. It will bring misfortune upon the political officers whose intervention is enlisted, because they are rarely either chosen or trained for the regulation of railway rates and are not occupied in its daily study; yet if they intervene and the public believes such intervention to have been influential, they will in case of bad results be held to a responsibility which is no part of their official duty. It will break down the regard in which the Interstate Commerce Commission is held and deprive the country of a trusted and indispensable agency which has required 30 years to develop. Upon users of the railways, consumers of things transported, in other words the whole public, it will inflict calamity, since it will make difficult and embarrassing to the commission the task which Congress has delegated to it and to nobody else, that of planning comprehensively and foresightedly the financial rehabilitation of these carriers through a stable rate policy designed to yield in the average year adequate net income and hence the ability to furnish satisfactory facilities and service.

"The Railway Business Association is, as you well know, composed of manufacturers engaged in supplying the railways with their necessities. Comprising a group of industries which in good times employ as many men and probably as much capital as the railways themselves, our members on behalf of their employees, managers and stockholders are deeply concerned in the increase and stability of railway purchasing power which would stimulate not only our own industries but all industry and general business in the interest of the whole public. We believe the Transportation Act of 1920 makes it possible to put the roads on a firm foundation. We equally believe this purpose can be frustrated if through any mischance the administration of the act shall be deprived of its quasi-judicial character and subjected to the pressure of groups through political agencies.

"During many years before federal control the Interstate Commerce Commission was regarded as judicial or semi-judicial. Its dockets were considered litigation. Testimony and argument were conducted as in a court. Its decisions became precedents. Publicity or other campaigns of agitation were deemed improper, and intervention by political personages not to be thought of.

"Federal control absorbed into the political executive this rate-making function which had previously been quasi-judicial. Citizens acquired the habit of employing the same

approaches in the matter of railway rates and practices to which they were accustomed in matters normally within the executive or legislative scope. Upon the relinquishment of the roads and the resumption of regulation, the commission found that principles which had required years to establish and which had been regarded and treated as settled and applicable without argument had been overturned and the whole process had to be started anew. At the same time shippers continued the war-time habit of political pressure.

"From the complaints of shippers discussed in that way a large part of the public has obtained the impression that the regular mechanism of negotiation with carriers or their committees and of appeal to the commission has broken down. Press dispatches purporting to be based upon the official view express satisfaction with the progress already made by the commission in the amelioration of hardships arising out of the horizontal advances of 1920 but the same articles proceed to characterize such adjustment as a problem confronting the administration. It seems inevitable that such interpretations will confirm the idea that rates are to be made in the light of popular opinion instead of in the light of expert and legally responsible opinion, and further encourage shippers of commodities to make their case with executive and legislative officials and in the newspapers instead of with the commission.

"The Railway Business Association from the beginning of large-scale rate advance cases in 1910 to date has refrained from suggesting rate schedules to the commission. Our steadfast attitude was that of urging the public and business organizations to make clear beforehand their acquiescence in whatever judgment the commission might reach. On March 31, 1921, in annual meeting, our association adopted the following resolution:

"The Interstate Commerce Commission on March 1, 1922, under the statute, acquires authority to fix from time to time the rate of return upon railway property which transportation rates are to be designed to yield. It therefore becomes the duty of the commission to define the purposes for which new capital is desirable. The United States needs a transportation program that looks further ahead than a few months, and a financial program upon which to base the rebuilding program. The Interstate Commerce Commission, entering upon a far-reaching experiment with a given level of rates to see whether it will bring to the roads the income, the capital and the improvements which the country requires, those who are tempted to agitate for rate reductions each on his own commodity should bear in mind that if everybody was accorded the reduction he would like, railway facilities would be inevitably diminished below the requirements of our nation's commerce. A broad policy requires the fullest support of all our citizens."

"The National Association of Manufacturers on May 18 in annual convention adopted a resolution which declared, 'It is prudent for shippers to desist from agitation for a general reduction of rates, and instead for each shipper or association of shippers who feel that they have a grievance to endeavor to compose the matter with the carrier involved, and failing that, to take the case in the orderly way to the Interstate Commerce Commission.'

"The National Industrial Traffic League on May 25, in general meeting, adopted a resolution which cites that 'there appears to be a disposition on the part of some shippers and some organizations to bring pressure to bear upon the commission, through political channels, to influence its actions with respect to certain of these adjustments'; hence the league 'respectfully submits to its membership and to the shippers of the country generally, the wisdom of proceeding in all these matters in an orderly manner, as provided in the Act to Regulate Commerce,' and reaffirms 'confidence in the Interstate Commerce Commission to act in this grave situation for the good of all interests and urges that the Interstate Commerce Commission be left free to exercise its judgment in making such readjustments of the rate structure as necessity and conditions warrant.'

"Certainty that the Interstate Commerce Commission will retain its freedom of judgment with respect to proposed rate adjustments will substantially strengthen the tendency toward business resumption. Traffic is increasing. Weekly car loadings show a steady and wholesome gain. Loadings on January 1 had fallen more than 40 per cent below

the October peak. As of the middle of June they have risen to within about 22 per cent of the high point last fall. If shippers could feel sure that the rate policy which is to prevail is the policy known to be that of the commission, such certainty would invigorate and hasten general recovery.

"Not the least item, but perhaps the greatest, is purchases by the railways themselves. July 1 will bring important new factors of encouragement. Labor cost will be reduced in several directions. Increased traffic should bring enlargement of earnings. Convincing signs that shippers and the general public are disposed to acquiesce in the rate program which the commission deems essential will put courage and vigor into railway purchasing. This will do more than any other one thing could to restore general business activity."

## Railroads and Public Utilities

### Urged to Buy Coal

WASHINGTON, D. C.

CHAIRMAN CLARK of the Interstate Commerce Commission has addressed letters to Thomas DeWitt Cuyler, chairman of the Association of Railway Executives; G. W. Elliott, secretary of the National Committee on Gas and Electric Service; M. H. Aylesworth, executive manager of the National Electric Light Association, and C. L. Henry, president of the American Electric Railway Association, urging the importance of having the railroads and other large users of coal acquire a reasonably liberal reserve supply of fuel now in order to prevent a possibly serious situation if all the coal consumers rush into the market at once during the latter part of the year. The letter to Mr. Cuyler, which is similar to that sent to the others, is as follows:

As you doubtless know, the production and transportation of bituminous coal has been disappointingly small this summer and is now at a disappointingly low stage. The commission requests that I write, suggesting the importance, in the interest of the conditions which may exist during the late summer and fall, of having the railroads and other large users of coal acquire now while conditions are easy a reasonably liberal reserve supply. We suggest that this matter be brought to the attention of the members of your association, together with a recommendation that in so far as is practicable they act thereon. We realize, of course, that it is not practicable to store a full winter's supply, but if a reasonable reserve is now accumulated it will help out greatly when and if a period of so-called car shortage occurs later which is in any respects comparable with that which we experienced last year. We are taking this matter up with associations of public utilities, etc., that use large quantities of coal and that need a dependable supply.

Will you kindly act on this suggestion and will you be good enough to advise us of the results?

Production of soft coal fell off sharply during the third week of June, according to the weekly bulletin of the Geological Survey. For five consecutive weeks the output had been about 8,000,000 tons. In the week ended June 18 it dropped back to 7,549,000 net tons, the lowest output reported for any full time week since the middle of May. The Geological Survey says that the cause of the decrease is not yet apparent. Shipments of lake cargo coal, on which a reduction of 28 cents a ton was made some time ago, now stand at 8,019,733 tons. This is in excess of both 1918 and 1920, but is 25,000 tons behind 1919.

TWENTY-THREE PERSONS KILLED and 42 injured, is the record of a derailment, reported on June 25, of an express train at Albert, France, on the line from Lille to Paris.

THE NEW YORK BARGE CANAL, and the problems connected with promoting navigation on the canal, were announced as the subject for discussion at an informal gathering of lake, canal and ocean transportation men, appointed to be held in Buffalo, N. Y., on June 29 and 30. The promoters aim to launch an extensive "ship-by-water" movement.

# Railroad Hearings Before Senate Committee

## Witnesses for Association of Security Owners Outline Economies to Be Effected by Co-operation

WASHINGTON, D. C.

VARIOUS ASPECTS of the Warfield plan for "co-ordinating" the railroads were presented before the Senate Committee on Interstate Commerce on June 23, 24, 27 and 28 by Forney Johnston, of counsel for the National Association of Owners of Railroad Securities and members of its Board of Economics and Engineering.

### Forney Johnston Presents Outline of Legislation Proposed by Security Owners

Mr. Johnston gave an outline of the legislation which the association proposes to provide adequate organization among the railroads themselves for the introduction of economies in railway operation. The proposal calls for organization of the carriers by groups for intensive studies of railway economies and for a central organization, made up of members of the railway officials composing the several group organizations and an equal number of financial representatives, the purpose of the central organization being to systematize and harmonize the functions of the group organizations.

It is proposed that these organizations should have a wide measure of jurisdiction so far as investigations and recommendations are concerned, but without power of direct interference with railway management, which it was stated would not be necessary to make the economies and studies of the organization available. The chief purpose of the organization was to introduce modern methods into the study and development of transportation, regarded from its national standpoint and particularly in respect in which individual railway systems could not be expected to function as serviceably as the proposed method.

### "The War College of American Transportation"

It is proposed that these organizations be authorized to act as agencies of the Interstate Commerce Commission in any matters delegated by the commission. They would constitute, in the language of Mr. Johnston, "the war college of American transportation," affording facilities for intensive laboratory methods in the production of railway economies.

The title of the bill proposed was "An Act to further economies and efficiency in railway transportation." Mr. Johnston also presented a proposed bill for the incorporation of National Railway Service Corporation to take up the work begun by the Maryland corporation bearing the same name, of supplying equipment to carriers. Mr. Johnston stated that the Maryland corporation had gone forward with the financing of railway equipment to the extent of about \$30,000,000 and desired to extend its functions; that it had been designated by the commission as an agency appropriate in the public interest to receive loans from the United States under the Transportation Act, and that its incorporation by Congress as an agency of the United States, to be operated without profit in the interest of transportation, was desirable for a number of reasons stated by Mr. Johnston. This act also proposed an extension of the power of the commission to make or refund loans to carriers out of payments on account of principal made by the carriers in settlement of their liabilities arising out of federal control or upon loans made to carriers out of the revolving fund created by the Transportation Act, as the present act limits the power of the commission to make loans to applications made before March 1, 1922. Mr. Johnston proposed that this be extended to March 1, 1930. The bill provides for the management of the cor-

poration by the present trustees, who are named in the bill, and additional trustees to be selected in accordance with its provisions.

### The Financing of Equipment

The proposed bill also would authorize the recording of equipment trust agreements with the commission, thus avoiding delay and expense and the doubtful legalities arising out of the necessity for filing these instruments in all states in which the railway operates. Mr. Johnston pointed out the diversity of statutes and court opinions as to the effect of equipment trust instruments under existing laws and asserted that if the procedure to give effect to these instruments could be simplified the market for equipment obligations would be very materially extended at a time when the credit of the railroads ordinarily available to produce substantial cash payments on equipment was restricted. For the same purpose, the witness suggested that Congress should exercise its jurisdiction to require equipment obligations to be recognized by receivers in federal courts to the extent that the revenues coming into the hands of the receiver and available for such application may be available, the witness stating that provisions of this character would make it possible for the railroads to market their equipment obligations on terms which would encourage the acquisition of equipment and said that some stimulation of this character was indispensable to invite the purchase of equipment by the carriers sufficient to handle commerce satisfactorily in the event of appreciable increase in the tonnage offered.

Senators Kellogg and Pomerene asked questions indicating that they did not think much of the idea of multiplying existing agencies for dealing with transportation matters.

### What the Proposed Bill Provides

The proposed bill provides that the National Railway Service Corporation shall be an agency of the United States, to be operated in the interest of the commerce of the people of the United States. The objects and purposes for which it would be created and the general powers and functions which it may exercise and discharge are stated as follows:

To aid, assist, further and supplement the service of transportation by carriers by railroad subject to the Interstate Commerce Act.

To assist such carriers in their financial and refunding operations and in the acquisition or use of terminals and other facilities.

To carry on the enterprise and business of constructing, acquiring by purchase or lease or otherwise, selling, leasing, and otherwise contracting with reference to, maintaining, managing, repairing, disposing of and dealing in locomotives, cars, rolling stock, equipment, appliances, materials and supplies required by carriers by railroad.

To acquire, own, and operate terminals and facilities of all kinds useful in or in connection with interstate transportation whenever and on such conditions, if any, as the commission may authorize or prescribe.

To receive, administer, invest, lend or otherwise employ or deal with any fund or other assets which may be loaned or made available to the Corporation by the Interstate Commerce Commission pursuant to the provisions of the Transportation Act, 1920, as now or hereafter amended or any other act, or by the United States or by any other party or from any source.

To act as an agency of the Interstate Commerce Commission in the matter of loans for the purchase of equipment and to act as an agent or agency of, assist or serve the commission in all such matters, to such extent and in such respects as the commission may by general or specific or less provisions

To advise and to co-operate with the commission in the

matter of, and to supplement in whole or in part, refunding or new loans to or for the benefit of carriers from the proceeds of principal paid or repaid from time to time upon indebtedness of carriers to the United States arising out of Federal Control or upon loans made in pursuance of Section 210, Transportation Act, 1920, as amended, which are hereby authorized and directed to be made by the Secretary of the Treasury to such carriers and to the corporation on certificate of the commission on the terms and conditions provided by said Section 210, from time to time as the commission may find desirable in the interest of railway transportation, until March 1, 1930.

To borrow and lend money and to mortgage, pledge or hypothecate any property or interest the corporation may own.

To issue, buy, sell, mortgage, pledge, exchange and deal in the bonds, stock, debentures, certificates, evidence of obligation or indebtedness or representing an interest in or secured by property used or useful in interstate commerce or commonly associated or dealt with in connection therewith; and securities of carriers engaged in interstate commerce or to act as general or special, fiscal or financial agent, trustee, receiver, syndicate manager, underwriter, or of for any carrier or property used in interstate commerce or owned and held as incidental or accessory thereto, such as the properties commonly owned by interstate carriers or described in mortgages of interstate railroads; and to undertake and discharge the functions aforesaid as transactions in interstate commerce or accessory thereto without being required to qualify under the laws of any state for the transaction of local business in respect thereof.

It is made the duty of the corporation to the extent that it may find the same useful and appropriate "to invite and encourage the use of the corporation by all carriers as their common or general agency in all matters of general interest, such as the clearing and interchange of cars, reciprocal service, the clearing of accounts, the settlement and allocation of loss and damage claims, the arbitration of differences, and in all matters in which a common agency would be desirable; to act as a bureau of complaints to which the public may apply for prompt assistance in securing attention to just grievances; to keep constantly informed as to the traffic and operating conditions of the railroads, and to anticipate and make provision for car supply and distribution; to investigate and report to the commission and to the carriers interested plans or suggestions for advancement of the commerce of the United States, for unification of service where beneficial, for joint use of terminals or facilities, for the construction of additional facilities, and in respect to all matters as to which the commission has authority to act; and to provide at all times an efficient organization available for any national or regional emergency affecting interstate commerce."

It would have the right and authority to acquire, condemn, or subordinate private property, easements, or franchises to the public use in such cases and to the extent of such easement and so conditioned and qualified as may have been authorized by the commission as compatible with the interest of the public and the commerce of the nation and consistent with the purposes of the corporation; and "may proceed for the enforcement of such right in any state court having jurisdiction of the property or defendants and jurisdiction of such matters or in any federal district court having jurisdiction of the property or of the adverse interests or any one of them, under direct authority of this act."

## Co-ordinating the Purchase of Coal

Statement by Edwin Ludlow

Edwin Ludlow, president of the American Institute of Mining and Metallurgical Engineers, outlined the advantages of co-ordinating the purchasing of fuel supplies for the railroads by groups as follows:

The allocation to each railroad of a uniform grade of coal.

The avoidance of cross hauls, supplying each road from the most available supply with a minimum of mileage.

Placing of the fuel supply on a scientific basis, with the employment of inspectors to maintain the quality of coal shipped and the checking up of the results from the performances obtained.

The close co-operation that such a committee could have

with the coal operators, obtaining in that way co-operative results of economy and efficiency that cannot be obtained under the individual basis of buying as at present.

Stabilization of the bituminous industry through purchasing greater amounts of coal during the summer months and storing it for use, with diminished shipments in the winter months. The advantages of this may be summarized as follows:

The direct saving to the railroads in the lower cost of their fuel supply, taking into consideration the cost of storing and rehandling.

The direct saving to the operators in the cost of producing the coal, due to steadier work, enabling them to make lower prices for the railroad supply.

The general advantage that will accrue to the whole bituminous industry from the stabilization of production, reducing the amount of idle times at the mines and enabling the mine laborer to have full time employment throughout the year.

The advantage to the railroads in the utilization of the empty cars during the summer and reducing the movement of their own fuel coal during the winter months when the cost of operation is highest and the demand is greatest for coal cars for domestic supply.

By making long-term contracts with producing mines they will be able not only to equip their mines better for the extraction of coal, but also for the housing and welfare of their employees, being sure of a defined all-the-year-round tonnage that will warrant their making the necessary capital expenditures.

## Advantages to the Public

The public will be greatly benefited through an arrangement of this kind, releasing the mines under contract to the railroads from a proportion of their tonnage in the winter months when the coal is needed for domestic purposes. The stabilization of the industry in this way will avoid the serious fluctuations which have occurred in the coal business during the past few years.

Some railroads have fuel agents that are carefully studying the subject, but in the majority of cases the fuel purchases are handled through the purchasing agent, who buys the coal as he buys other supplies—either taking what appears to him to be the cheapest, or else buying some special quality of coal that his operating men consider essential for use on their divisions.

## Locomotives Require Coal of Uniform Grade

In many cases this means that various coaling stations on the same lines of road often receive different qualities of coal, some of it of high volatile and some of it of low, making it impossible for the same locomotive to obtain efficient results, as each type of coal requires special drafting arrangements in order to obtain the most economical consumption. There is also a very large amount of unnecessary mileage used by the various railroads in the purchase of their coal. Some roads in the West, for example, are satisfied that they are obtaining the best results from Illinois coal; other roads in the West consider that Illinois coal is of too poor a quality and that they must purchase their coal in West Virginia or Pennsylvania, necessitating the long haul through states that are producing coal that could be used.

## Advantages of Buying by Groups

If the railroads of the country could be divided into four or more groups in the same manner that they are arranged for tariff purposes and a competent fuel engineer selected in each group to supervise the purchases very large economies could be obtained—

He could, with a competent staff of inspectors under him, give an intensive study of the requirements of the group of which he was in charge and also the sources of supply both as to quantity and quality. The work that has already been done in the way of forming what is known as pools of similar qualities of coals to enable vessels to buy a uniform cargo while receiving coal from many mines will be the greatest assistance in purchasing uniform grades for use on the divisions avoiding the economic loss that occurs when an engine receives a grade of coal different to the kind for which it has been drafted.

The fuel directors in each group will be able to co-operate with each other and the fuel resources can be mapped out and the distribution made from a scientific basis, avoiding unnecessary hauls.

The value of coal will be based on the number of B. T. U.'s that can be purchased for a dollar at the point of delivery considering not only the cost at the mine but the freight haul.

## Storage

The purchasing also is done on a consumption basis and the railroads buy 1,500,000 tons more per month in winter than they do in summer and no attempt is made to store coal except

in a few cases of railroads who have no mines on their own lines and have felt the difficulty and expense of trying to obtain coal during the winter months when the traffic of the railroads is congested and the mines are only working half time for want of cars. The position of the coal operator is that, during the spring and early summer, his mines are running on about half time for want of orders, that he gets his high peak of output about October, and that during the winter months, when the demand for domestic fuel is the greatest, his operating time is cut down for want of empty cars, due to congested transportation, so that his output is again reduced to about 50 per cent of his capacity.

It will be claimed by many roads that they have attempted to put in storage and found it a failure. This matter was also examined into by Eugene McAuliffe when acting for the Fuel Administration, who found that, in spite of the careful instructions that had been sent out as to how this storage was to be accomplished, in 90 per cent of the cases no attention had been paid to the instructions. The coal had simply been thrown out of the cars by section men, without any preparation of the ground, and the result was that in picking up this coal the locomotive crane usually gathered enough of the soft surface on which it was thrown to show a recovery greater than the amount of coal put down.

### Advantages of Long-Term Contracts

If the railroad companies would enter into long-term contracts with mines and would arrange such contracts on a basis of permitting excess shipments during the four dull months of April, May, June, July, and a reduction in shipments during the congested months of November, December, January and February, such companies would be willing to make a very much lower price that would materially decrease the railroad's fuel cost, and if these contracts went over a period of years, with a sliding scale arranged on the basis of the cost of labor, they would have the incentive to equip their mines thoroughly, not only for the most efficient mining of coal, but also for the proper housing of their employees, and with the steadier period of operation throughout the year that such shipments would permit, the working time of the miners and their annual earnings would materially increase, eliminating a great deal of the discontent which now comes where mines are operated for less than 200 days in a year. Such action by the railroads would go a long way to stabilizing the coal industry, as it would not only keep the mines in more continuous operation, but, at the same time, would permit these mines to supply the domestic demand that the country requires during the winter months.

### Increased Freight Earnings

Another advantage to the railroads would be a more uniform freight traffic, and the records show that the earnings of the railroads follow closely as a whole the movement of bituminous coal. They would have during the congested winter months the cars needed for the domestic demand and would, at the same time, have a storage of their own, relieving them from the necessity of confiscation, which is now one of the most demoralizing elements in the coal business and further avoiding the necessity of assigning cars to keep up their fuel supply in winter.

### Conclusion

The whole situation of the purchase of coal should be one of co-operation with the mines and, by helping the mines during the dull summer months to carry their overhead expenses, the railroads would receive their coal at a much lower price not only sufficiently lower to pay for the expenses of storing and picking up, but also at a considerable saving on the total fuel cost, and the whole country would be relieved of the congestion and uncertainty in the coal business, which has happened so frequently in late years, and of which 1920 was our worst example. The stabilizing of the coal industry is recognized as one of the necessities for the real prosperity of this country, and the railroads, using 33 per cent of the entire output of our bituminous mines, are the ones who can do the most towards stabilizing, if they will work in co-operation with the coal miners to that end.

## Joint Terminals and Facilities

Statement by John F. Wallace

John F. Wallace, of Chicago, told the committee that the application of the competitive principle to the development of railway terminal facilities at large commercial and industrial centers has resulted in the duplication of terminal facilities and railroad service, and as a consequence of this, these competitive developments have resulted in the burdening of

the railroads with unnecessary capital expenditures and greatly increased operating expenses. He said in part:

The complete application of the competitive system to railway freight terminals falls of its own weight. Each road cannot secure and maintain terminal facilities covering the entire terminal area. It cannot secure, maintain and operate adequate terminal facilities in each and every section or district within the metropolitan terminal areas where important freight traffic originates. Nevertheless, the attempt is made under existing methods to cover as much as possible of the entire field by separate and competitive terminals, with the resultant complication of facilities and a duplication of financial investment.

In the terminal district of Chicago as a whole—and the same thing applies to other cities—the unnecessary complication and duplications of terminal facilities is so extensive that it is a burden upon the railroads, the shippers and the public.

The investment by railroads in unused or little used property to protect real or fancied present or future competitive conditions is also a source of great expense to the railroads and ultimately to the public—although not often fully realized as such. The interest on these investments is absorbed in the general interest charges on the entire property and is lost sight of as being an expense due to unproductive investments.

### Should Be Treated Co-operatively

If the terminal situation were treated co-operatively instead of competitively there could be a simplification of the tangled network of tracks that now exists, the release to general commercial purposes of large and valuable property now held by railroads for competitive purposes or prospective competitive needs, the reduction of operating costs in the terminal handling of freight, and an increase of efficiency.

To the public this would mean not only the improvement of service to the shippers, but the reduction of street congestion and the removal of existing obstacles to the growth and development of the city.

An outstanding example of the disastrous effect of the application of the competitive principle to railway terminal operations is found at Chicago. This is true, first, because of the size of the Chicago terminal district in point of area covered, number of railroads entering, and volume of traffic; second, because of topographic and geographic conditions.

Chicago is served by 26 trunk line railroads and five major belt lines, besides several small roads performing terminal functions. Railroad developments occurred in all sections of the city and there was nothing in a physical way to prevent a railroad entering the city at one point from attempting to reach and duplicate the facilities of a railroad entering from the opposite side. It is because of this situation at Chicago that more attention has been directed to the terminal problem there, but the same problems exist in a lesser extent at all of the great railroad centers of the country, and the principle which would apply to the proper solution of this terminal problem at Chicago would be equally applicable to the terminal problems at all other large centers. There is practically a unanimous opinion among railroad executives that the unified or co-operative operation of railway terminals is not only desirable, but will eventually be necessary. It is doubtful, however, if the railroads left to their own resources will be able to evolve through independent effort a satisfactory co-operative railway terminal operating plant.

### The Situation at Chicago

During the period of government control, primarily at the suggestion of the Chicago Railway Terminal Commission, the operation of the terminals at Chicago and other large centers was placed in the hands of terminal managers for the purpose of operating these terminals as units and in order to secure the greatest possible efficiency. Economies were secured through the unified operation put into effect by the terminal managers, but the results obtained were not at all indicative of what could be secured through the complete unified operation of the terminals in normal times.

Nevertheless, even under the conditions outlined above, substantial economies were effected and the movement of freight was expedited, and the experience fully justified the argument in favor of unified terminal operation.

The statements herein made are simply my individual conception of the terminal problem and ideas suggested to the Board of Economics and Engineering for investigation. It is the formulated policy of the Board of Economics and Engineering that the individual members thereof shall submit their personal investigations and opinions to the board for its final analysis before any reports are made that will require the sanction of the board as a whole. In other words, it is the plan and policy of the board to act as a unit, and the presentation which I am making

of this subject is merely intended to give your committee a general idea of the scope and purpose of our future investigation, with a few illustrations necessary to clarify the situation.

Mr. Wallace said it was not proposed that the Board of Economics and Engineering should be a disturbing element in the situation in any way. It proposed to analyze the various problems and to try to be helpful by making suggestions. He said there is not a railroad executive in the United States that is not loaded down with routine daily duties which give him little time for the consideration of larger problems. Their staffs are also overloaded, he said, and if Mr. Willard or Mr. Rea or Mr. Smith could "sit down and put their feet on the table and smoke a cigar for two or three hours a day they would be better executives." He thought the board might be able to make some suggestions that the executives would recognize as helpful, but it has no idea of trying to inject another complicating element into the railroad situation.

## The Interest of the Savings Banks

George E. Brock, president of the Home Savings Bank of Boston, and president of the National Association of Mutual Savings Banks, said that these banks own approximately \$900,000,000 of railroad bonds and have been greatly concerned over their investments while scarcely any railroad bonds are being purchased by savings banks now. They are willing to own more railroad bonds if proper safeguards can be placed around railroad investments and for this reason they have supported the work of the National Association of Owners of Railroad Securities which they thought had been very helpful. He expressed the hope that the committee would give careful consideration to the plan suggested by Mr. Warfield, although in reply to a question by Senator Cummins he said he did not consider himself a competent judge of the details of the plan. Mr. Brock said that mutual savings banks and life insurance companies are the two most prominent sources from which future capital for the railroads can come and that under proper circumstances the mutual savings banks might furnish \$100,000,000 a year of new capital. He thought Mr. Warfield's plan applies to the railroad system a plan similar to the Federal Reserve System applied to the banking system, which has worked out well.

## Equipment Standardization

Statement by L. B. Stillwell

L. B. Stillwell, consulting electrical engineer, said that the board has been instructed to report on railroad rolling stock with a view to standardization and improvements in construction and maintenance. He believed that many improvements can be effected, which he outlined, although he said the board had merely begun its study of the subject. He said the American Railway Association, Mechanical Division, has recommended standards which have been adopted to a considerable extent, but the American Railway Association cannot enforce its recommendations and the standardization that has been adopted mainly applied to the parts of cars. He thought that through the medium of the service corporation to acquire new equipment it would be possible to attain results which the railroads have not been able to attain. The board is studying the further standardization of freight and passenger cars, the establishment of a system of periodic repairs, the strengthening of weak cars or their restriction to local lines, and other similar subjects. He said that a limited number of standard types and sizes of cars should be adopted, although he thought the Railroad Administration went too far in the direction of standardization. Very little has been done, he said, in the direction of standardization for the purpose of economy either in construction or maintenance and the present large number of varieties of cars required the keeping of many kinds of repair parts or a delay

until the part needed can be obtained. He referred to the present system of car repairing as "theoretically almost impossible" and said that the fact that cars spend so much of their time on foreign lines where they are inadequately repaired makes them wear out quickly. He said standardization should be accomplished by selecting a few of the best types now in use, possibly with some improvements, such as a design that would give a car of less weight in proportion to the carrying capacity.

Mr. Stillwell's statement follows in part:

From the experience gained in operating these cars, a limited number of standard types and sizes should be selected or developed for interchange service and thereafter adhered to, except in special cases where the reasons for deviation may unquestionably be controlling.

Standardization should not preclude development and improvement in design and material, but should secure interchangeability as regards component parts, and it should define minimum limits of strength of essential parts. This can be done without sacrificing the advantages of competition between manufacturers in the development and sale of their specialties, as the establishment of minimum limits in no way precludes progress by improvement of material or design within the dimension limits fixed by the interchangeability rule.

Standardization will enable the manufacturer to reduce his costs by reducing the number of rolled forms, sizes of plates, special pressed members and also dies and templates which he must provide. It will also reduce his costs by saving time and consequently overhead expense. What is perhaps still more important, it will effect a great saving of time and overhead expense when the cars are repaired.

In selecting or developing standard cars, life and weight are of the greatest economic importance. For illustration, if the country has 2,500,000 freight cars and the average life is 20 years, 125,000 cars per annum must be purchased for replacement. If the average life could be increased to 30 years, by improved design and systematic maintenance, the same result would be accomplished by purchasing 83,000 cars per annum. The difference, namely, 42,000 cars, at present prices would cost about \$100,000,000.

As cars now in use become worn out to a point where it will no longer pay to repair them, they will be replaced in general by cars of larger capacity and less aggregate weight as compared to the load carried.

As regards weight of freight cars, its relation to the cost of operating railroads and the wide divergence of opinion as to what weights are necessary are illustrated by the fact that the standard box car designed by the United States Railroad Administration was criticised in a statement issued by the executive committee of one of our most important railroad companies.

According to the Interstate Commerce Commission Report for 1918, there were at that time on Class 1 roads, 1,038,751 box cars. Within the next 20 or 25 years practically all of these cars will be replaced by new equipment and obviously it is of very great importance that the weight of new cars should receive most careful consideration.

Broadly speaking, durability (life) points toward an increase of weight in design, but weight does not necessarily mean strength, and it is obvious that the interests of the railroads call for a complete study and action which will secure durability without excessive weight.

Much good work has been accomplished by the mechanical departments of the railroads, but it is inevitable that where each railroad practically determines its own standards of design, a considerable variety in the degree of excellency attained must result.

The time certainly has arrived when the state of the art in car design and construction should make it possible to select or design a limited number of the best types and sizes and avoid the losses which must result from further construction of cars of inferior design. Moreover, aside from difference in mechanical excellence, or deficiency, it is obvious that the mere reduction in the number of designs of cars of a given type will tend to secure a reduction in first cost and in cost of maintenance.

Under present conditions, each railroad specifies its own design, which may be good or otherwise, and normally less than one-half of these cars will be found in operation on the lines of the railroad company which owns them, the rest being scattered over the country in interchange service. When traffic is heavy the percentage of cars on lines of the company owning them drops in some cases, as low as 25

per cent. Under these conditions a majority of the repairs must be made by foreign lines and the cost of such repairs in time and money is greatly increased by the variety of designs and of specialties used.

If standardization from the standpoint of the railroads as a whole can be established and sound maintenance and retirement policies fixed, savings very large in the aggregate will undoubtedly be secured. In this connection the mere cost of unloading and re-loading cars which require repairs is a heavy item of expense charged against traffic and frequently involving delay and indirect expense serious to the shipper.

In 1920 the cost of maintaining freight cars owned by Class 1 railroads was over \$600,000,000. Looking to the future, there is every reason to expect that if a policy of standardization can be adopted by the railroads as a whole, a very large saving in cost of maintenance will gradually become effective as present rolling stock is replaced.

Obviously standardization which will secure interchangeability of parts and also establish adequate standards of strength of material and methods of construction will effect important economy in the cost of maintenance. Standardization will also be of great value in reducing the number of cars temporarily out of service for repairs, much time being lost under present conditions by the frequent necessity of awaiting arrival of spare parts at interchange points where repairs are made.

#### STABILIZING ORDERS FOR CARS

A great reduction in builders' costs and in prices to the railroads would result if it were possible to stabilize the placing of orders for both new cars and for replacement parts. Under present practice when railroad earnings fall off, orders for equipment are curtailed, and when earnings increase, orders in large quantity are placed. The very wide fluctuation in output of the manufacturers of equipment which results, operates to increase greatly the average cost.

#### STABILIZING MAINTENANCE

A condition which results in a very great increase in cost of railroad operation exists in present repair practice, each road being supposed to repair all cars which develop the need of repairs while on its lines.

For best results, maintenance should be pushed especially during periods of light traffic. Present methods tend to make repairs keep step with the monthly earnings of the railroads.

If it were possible to carry on repairs systematically at all seasons regardless of the earnings or losses of individual roads, a great saving could be effected. This would not only mean a reduction in the cost of maintenance, but would secure greater reliability of service and freedom from breakdown and would stabilize labor conditions in the shops. On May 15, 1921, the Car Service Division of the American Railway Association reported 324,969 freight cars in bad order. This is approximately 13 per cent of the total number of freight cars in this country. This percentage is abnormally great, but there is little relief in sight.

Obviously the best interests of the railway industry as a whole require that in slack periods when cars are plenty such cars should be put into good condition in order that they may be available when heavy traffic returns. Under present conditions, repairs are often postponed because of lack of available funds.

It has been estimated that 15 per cent of the cars in railroad ownership are structurally too weak for modern service conditions in interchange service. Such cars should either be adequately reinforced or withdrawn from such service, as their maintenance is now abnormally expensive and they are responsible for a large proportion of loss and damage claims.

#### PASSENGER CARS

As regards passenger cars the economies which can be effected by further standardization of design, material and methods of construction are less than in the case of freight cars for the reason that the former are comparatively few in number. Nevertheless, important savings are possible in this department. The wide variation in practice under the present system which permits each railroad to evolve or select that particular steel passenger coach which it may prefer may be illustrated by an example.

Three Class A railroads are today operating between two important points in this country, 70 foot passenger coaches, identical or practically identical in dimensions, having respectively the following weights:

Railroad "A" .....	142,000 lb.
Railroad "B" .....	124,000 lb.
Railroad "C" .....	119,000 lb.

In this instance, the railroad which uses the heaviest car is operating under conditions which in general are less difficult

as regards grades and curves than those of the railroads which operate lighter equipment. The difference between the heaviest car and the lightest is 23,000 pounds, and the cost of hauling this difference of weight on the basis of over 40,000 car miles per annum at high speed becomes a considerable item of expense. The difference in the cost of coal required for the operation of 50,000 cars like those operated by Railroad "C" on the one hand and those operated by Railroad "A" on the other would be approximately \$24,000,000. Without expressing here an opinion as to whether the heavier car is or is not justified, it is obvious that both cannot be right.

As regards the advantages of stabilizing orders for passenger cars and of standardizing and so reducing the number of rolled forms, sizes of plates, pressed members, dies and templates which the manufacturer must provide, the advantages which would result are like in kind with those which apply to freight cars, although less in amount.

#### LOCOMOTIVES

The Board of Economics and Engineering is not prepared at this time to suggest any program relative to locomotive improvements. Its present view is that great caution must be exercised in any attempt to standardize design at this time when under the stimulus of high fuel cost both the manufacturers and some of the railroads are making substantial progress in developing more efficient locomotives. Moreover, the fact that locomotives, except in rare instances, are operated exclusively upon the lines of the company owning them and are repaired in the shops of the company under contract by locomotive builders, avoids in great part the expense and delay which result in the case of freight cars from the fact that more than half of all repairs are made in shops of foreign lines.

#### PROPOSED METHOD OF SECURING THE ECONOMIES

The Board of Economics and Engineering understands that the National Railway Service Corporation, in financing further purchases of equipment, proposes to—

(a) Insist upon the adoption of standards of design approved by it.

(b) Provide systematic and competent inspection during construction of the equipment so financed to ensure the best practicable material and workmanship.

(c) Establish and maintain systematic and competent inspection of repairs to its cars at interchange points, in order that the interests of the equipment note holders may be protected against the losses and delays incident to the methods of maintaining car equipment which now prevail.

It is the opinion of the board that the establishment of such a policy by the Service Corporation will assist materially in financing equipment and can be made effective in securing far-reaching economies.

The board also believes it is reasonable to expect that the establishment of such policies and methods would receive the approval of the Interstate Commerce Commission, and if this is given there can be no question of their general adoption by the railroads.

#### ELECTRIFICATION

The board is not prepared at this time to state any conclusions in regard to electrification of railroads. It recognizes the fact that the economic possibilities of electrification as applied to local conditions of heavy grade and dense traffic and to terminal operation are such as will justify very careful examination, but feels that its attention should be concentrated at present upon other features of the railroad problem which appear to present opportunities for greater saving in operating costs as compared to new capital required. Mr. Stillwell said that to electrify the railroads of the country would cost seven to eight billion dollars and he did not expect to see the whole job undertaken.

#### Director Colston Testifies

At the request of the security owners' association, W. A. Colston, director of the Bureau of Finance of the Interstate Commerce Commission, testified before the committee on June 29 to explain that in his opinion the National Railway Service Corporation had been very helpful in financing purchases of equipment for certain roads with the help of funds provided from the revolving fund. He said that it had enabled some carriers to get loans which otherwise could not have raised the part of the money which it was necessary to

finance outside at a rate of interest which would have been approved by the commission. When a road said it expected to pay more than 7 per cent for outside money, Mr. Colston said, it had been told that Mr. Warfield's corporation would furnish it at 7 per cent, 40 per cent of the cost being provided from the loan fund. Mr. Colston thought that the extension of the powers and scope of the service corporation as proposed by Mr. Warfield would enable it to perform an important service in financing railroad equipment and other improvements and that it could save a large part of the expenses of financing. If this corporation, he said, working in the public interest and under the direction of the Interstate Commerce Commission, could be allowed to administer the \$300,000,000 revolving fund and the various railroad assets now held "frozen" in the United States Treasury or by the Railroad Administration or the War Finance Corporation it could accomplish much more than it had and if to this amount should be added the \$750,000,000 which the carriers now propose that the government fund it would have a capital of about \$1,500,000,000 and on this basis it could probably raise \$3,000,000,000 additional, or a total of \$4,500,000,000, which would be enough to finance all the railroads in the United States at 6 per cent or less. He referred to the large amount of railroad financing carried on during the early part of 1920 at a cost of about 7½ per cent or more and he referred to the recent refunding of the Great Northern-Northern Pacific joint bonds. Two hundred and thirty million dollars of new 6½ per cent bonds, he said, were sold at 91½ to provide the money to pay off \$215,000,000 of the old 4 per cent bonds and nothing was added to the railroad facilities of the country. Whereas the issue of 4 per cent bonds had originally cost \$3,000,000, the cost of the refunding had been \$21,000,000, of which \$11,500,000 went to the syndicate. J. P. Morgan & Co. received 1½ per cent as syndicate manager and the syndicate received a gross profit of 3½ per cent. If the National Railway Service Corporation had been able to handle this transaction, he said, many of the old bonds could have been exchanged for the new without any cost and a great deal of money could have been saved.

### Work of the Bureau of Finance

Mr. Colston, in explaining the work of the Bureau of Finance of the Interstate Commerce Commission since its organization about a year ago, said that it has received 102 applications for certificates authorizing the construction of a new line or the abandonment of an old line, involving 3,318 miles, and it has acted on 56 applications involving 2,310 miles. It has received 9 applications involving 1,056 miles for authority to assume control of roads or to consolidate them, and it has acted on two, involving 503 miles. It has received 308 applications for authority to issue securities, of which 11 have been withdrawn, 245 disposed of and 52 are still pending. The total securities authorized in this way have amounted to \$561,000,000, which, however, include some duplications in the case of bonds to be pledged as security for other bonds. The total includes \$91,000,000 of equipment obligations, \$5,000,000 of debentures, \$2,392,000 of receivers' certificates, \$51,000,000 of notes and \$411,878,000 of bonds. Mr. Colston said that the state of Michigan and several middle western states have protested against the commission's jurisdiction to authorize security issues. He also said that except in matters plainly involving the public interest, the commission had not attempted to substitute its judgment for that of the companies. The commission has issued certificates for approximately \$431,000,000 on account of the six months' guaranty and the administration of the guaranty provisions of the law represent the principal work of the bureau now that most of the loan fund has been exhausted. The \$300,000,000 loan fund, he said, has been increased to \$304,652,000 by interest pay-

ments, etc. Forty million dollars of the amount is reserved for judgments against the Railroad Administration and the commission has certified loans to the amount of \$228,000,000, approved additional loans to the amount of \$10,000,000 not yet certified, and is tentatively committed to \$25,000,000 more, leaving a balance of \$935,000 of the fund now available.

## Shippers Aid in Claim Prevention

THE FREIGHT CLAIM DIVISION of the American Railway Association, which launched a campaign to cut loss and damage claims in half at its 1921 annual session in Chicago, will not work unaided if a recent circular issued by the Illinois Manufacturers' Association is any indication. The substance of the circular, which is entitled "Plugging Up the Loss and Damage Leaks," follows:

"Freight claims against the railroads are a source of endless annoyance to all shippers. Even if shippers ultimately get all the money that is due them, the delay and bother are irritating. Furthermore, it costs the railroads more money than they can afford to pay in these days of high labor costs and diminishing returns. In 1919 the carriers paid out \$107,000,000 in freight claims.

It is in the interest of shippers to avoid damage claims. Here are some of the ways by which injury to shipments can be avoided:

1. Test containers to be sure that they are sufficiently strong to stand ordinary abuses in transit.
2. See that commodities are securely packed in containers.
3. Do not use a crate, where a box should be used; it is more expensive in the long run.
4. Make sure that marking is legible and that it includes all information necessary. It also should include shipment date.
5. See that shipments are securely stowed in your cars when you load them. If necessary, brace with substantial material. This will prevent shifting of the load. A piece of electrical machinery that cost nearly \$200,000 that was shipped to a Chicago firm was practically ruined, because a six-inch space was left in the shaft blocking which caused the load to shift in transit. In this instance the shipper was held responsible for careless blocking.
6. If identification marks will be inclosed inside the package, consisting of the date of shipment, name and address of consignee and the name and address of the shipper, difficulty in tracing shipments will be obviated to a large extent.
7. It is a good idea to put two tags instead of one on bundles, bars, baskets and other shipments which require the marks to be shown on tags. A reinforced tag should be used. Include packing list with shipment where possible.
8. It is suggested that on small packages, freight, express and parcel post shipments the labels be typewritten and made in triplicate, placing the original on the outside of the package, the second copy inside the package, retaining the third copy for future reference. This helps to substantiate claims on shipments. Where there are cities and towns of the same name in more than one state, it frequently happens that the carrier forwards the shipments to the wrong state and then contends that the package was erroneously marked."

THE ILLINOIS CENTRAL transported a record movement of strawberries from the Louisiana district this year, 1,389 cars being moved in 1921, as compared with 967 last year.

THE FIRST MEETING of the New York University Transportation Club was held at the Wall street division of the University, 90 Trinity place, New York, on June 2. The meeting was addressed by the following speakers on the subjects indicated: J. H. Butler, manager loss and damage department, American Railway Express, on the "Right Way" Movement and some of the results it has accomplished; A. J. DeHaas, of the faculty of New York University, on the Relation of Foreign Trade to American Transportation; H. T. Young, general agent, freight department of the Erie, on the Development of Package Car Service. The Transportation Club has been organized for the purpose of enabling those who are or have been connected with New York University to keep closely in touch with all phases of foreign and domestic transportation. The club is under the direction of Asa Colton, lecturer on trade and transportation in the University.

# New Traffic Locking on C. & O. Relieves Congestion

New Signal Facilities Obviated the Necessity of Constructing an Expensive Second Track

By H. E. Johnson

Signal Inspector, Chesapeake & Ohio, Richmond, Va.

**T**RAFFIC HAS BEEN greatly facilitated on congested stretches of track on the Chesapeake & Ohio by the recent installation of a new system of traffic locking. On account of tunnels and narrow gorges the expense of the construction of a second track at certain points was prohibitive. The new system has proved so reliable and free

frequency, the apparatus being immune from the effects of direct current and inoperative on alternating currents having commercial frequencies of 80 cycles or less. It is believed that, as installed, the scheme guarantees absolute integrity of operation and is as nearly foolproof as it can be designed. The apparatus consists primarily of a generator, hand driven where power is not obtainable, a selective switch, a selective frequency lock, a push button and an a.c. buzzer. This apparatus, except the generator and the selective switch, is duplicated for each traffic lever.

The arrangement of the locking segment or slot is such that the indication latch can be raised only when the traffic lever is at the indication position, and that when the lever is returned to the normal position the indication latch is mechanically forced to the de-energized position.

## Cotton Hill to Gauley Installation

Traffic locking of this type was first installed on a four-mile stretch of single track on the Hinton division between Cotton Hill, W. Va., and Gauley, in conjunction with A. P. B. signaling. This single track, which runs through a narrow gorge or canyon, connects the ends of double track at Cotton Hill and at Gauley. The river, which is on one side of the track, is very close throughout the entire length, while on the other side are high cliffs of solid rock. The course of the river, is irregular, making necessary many sharp curves in the track and permitting but few tangents, the longest of which is about 1,000 ft. It was necessary to construct three tunnels on the course of this difficult length of single track.

All main line eastward and westward traffic must pass over this single track, which presented a serious operating problem worthy of careful consideration. It had been proposed at various times to build a second track in order that the "neck of the bottle" might be eliminated, but the cost of the proposed second track was considered prohibitive. Traffic was formerly controlled by means of an absolute train staff system with mechanical interlocking at Cotton Hill and at Gauley, there being no automatic signals on the single track, but with the present installation of A. P. B. signals and traffic locking, operating officers claim that the

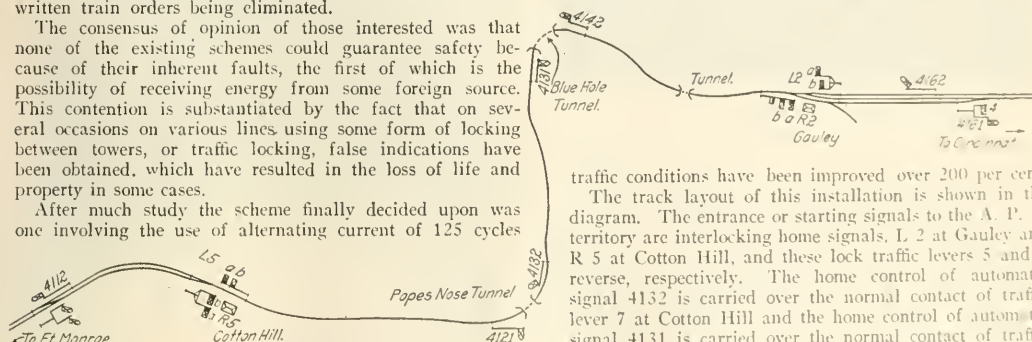

Approaching Cotton Hill Interlocking From the East

from chances of false indications that all classes of traffic are now diverted on double track and controlled in both directions on single track by signal indications exclusively, written train orders being eliminated.

The consensus of opinion of those interested was that none of the existing schemes could guarantee safety because of their inherent faults, the first of which is the possibility of receiving energy from some foreign source. This contention is substantiated by the fact that on several occasions on various lines using some form of locking between towers, or traffic locking, false indications have been obtained, which have resulted in the loss of life and property in some cases.

After much study the scheme finally decided upon was one involving the use of alternating current of 125 cycles

This checks the absolute feature of the A. P. B. circuits. The permissive feature is obtained by the use of a relay of the selector type.

### The Track Plan and Circuit Diagram

One of the novel features of the scheme is that communication and unlocking is accomplished over the same wire. It was also found that, due to the change in tone of the buzzer at the generating end of the circuit when the lever was being unlocked, it was unnecessary for the operator to push the button signaling that the unlock had been obtained. The tone change is caused by the increased amount of current flowing through the buzzer when the traffic lever

The Generator and Selective Switch

is moved to the full reverse position opening the indication contact and closing the reverse contact, causing current to flow over the push button wire to the common wire.

It will be noted that the exciting current of the generator field is carried over a normal contact of the traffic levers. It is, therefore, impossible to generate current unless the traffic lever is normal, which insures that the unlocking energy must in all cases come from the generator at the other tower. As a further check it is mechanically impossible to raise the indication latch except when the lever is at the center or indication position.

Traffic locking has also been installed between Hurricane,

W. Va., Milton and Barboursville, a distance of 20 miles, on double track, for operation of trains in either direction on signal indication. Electric and electro-mechanical interlockings with signals arranged for reverse traffic operation are located at the above points. Traffic is diverted with a minimum reduction of speed by the use of No. 16 crossovers. The circuits and the operation of the apparatus are the same as on the first installation. This installation has not been in service long enough to determine how great a saving has been effected. However, it is proposed to make a further extension of the installation for about 20 miles.

The foregoing method of locking between towers was developed by members of the signal department of the Chesapeake & Ohio. The apparatus was developed and manufactured by the Union Switch & Signal Company and is covered by patent rights.

## Tentative Valuations Issued

WASHINGTON, D. C.

THE INTERSTATE COMMERCE COMMISSION on June 29, issued a tentative valuation of the property of the Central of Georgia and its subsidiaries, in which the final value of the property used by the Central of Georgia including its leased lines was stated as \$79,083,523 and that of the property owned as \$64,231,034 as of the valuation date, June 30, 1915. The outstanding capitalization as of that date is stated as \$57,037,350. The property used covers 2,530 miles and the property owned 1,992. The investment in road and equipment as stated on the company's books is given as \$62,003,324. The commission reports that the original cost cannot be ascertained. The cost of reproduction new of the carrier property other than land is reported as \$75,428,870 for the property used and \$62,252,124 for that owned. The cost of reproduction less depreciation for the property used is given as \$58,826,776 and of that owned as \$48,139,304. The present value of the lands owned is given as \$11,512,915 and the excess cost of acquisition of the land as \$8,801,022. The value of materials and supplies was given as \$1,306,992.

The Interstate Commerce Commission on June 27 made public about 50 supplemental tentative valuations, in which, "after a careful consideration of all the facts contained in the tentative and supplemental tentative valuations, including the excess cost of carrier lines, appreciation, depreciation, going concern value and working capital and materials and supplies, and all other matters which appear to have a bearing upon the values reported," it proceeds to state the final value of the property owned and used and used but not owned devoted to common carrier purposes. The figures given for the final value of the property used as of the valuation dates, June 30, 1914, 1915 or 1916 are as follows:

Tnopak & Tidewater.....	1915	\$2,658,128
Rowden.....	1915	110,383
Georgia, Southern & Florida.....	1915	9,860,191
Georgia Northern.....	1915	877,868
Death Valley.....	1915	387,546
Dover & Southbound.....	1914	170,000
Carolina.....	1914	169,680
Hampton & Branchville.....	1915	198,124
Arizona Southern.....	1915	332,288
New Mexico Midland.....	1916	140,265
Sylvania Central.....	1915	150,882
Texas Midland.....	1914	3,006,231
New Orleans, Texas & Mexico.....	1914	2,495,969
Elgin, Joliet & Eastern.....	1914	39,049,162
Wrightsville & Tennille.....	1915	1,597,924
Toledo Valley.....	1915	230,924
Ashland Central Railway.....	1915	78,095
St. John & Ophir.....	1915	123,951
Missouri Southern.....	1914	920,093
Ray & Gila Valley.....	1915	627,593
Quincy Western.....	1915	80,213
Norfolk Southern.....	1914	24,663,840
Farmers' Grain & Shipping Co.....	1914	742,822
Brandon, Devil's Lake & Southern.....	1914	170,000
Mississippi Railroad.....	1916	576,632
Cape Girardeau & Northern.....	1914	1,257,716
Potomac, Fredericksburg & Piedmont.....	1916	561,234

Evansville & Indianapolis.....	1915	2,250,291
Santa Fe, Raton & Eastern.....	1916	226,227
Savannah & Northwestern.....	1915	1,817,271
Northern Dakota.....	1915	180,468
Tulbott.....	1915	78,957
Teglin Union Depot.....	1914	586,708
Cimarron & Northwestern.....	1916	226,810
St. Francois County.....	1914	190,190
Mississippi River & Bonne Terre.....	1914	3,551,685
Hawkinsville & Florida Southern.....	1915	895,226
Alabama Northern.....	1914	92,400
Central Ry. of Arkansas.....	1916	201,924
Kinston-Carolina.....	1914	166,841
Flint River & Northeastern.....	1915	246,755
Carolina & Yadkin River.....	1915	766,538
Rome & Northern.....	1915	283,425
Greene County.....	1915	152,977
Tampa & Jacksonville.....	1915	500,000
Mississippi Eastern.....	1915	227,225
Macon & Birmingham.....	1915	1,646,967
Albany Passenger Terminal.....	1915	138,901
Louisville & Waller.....	1915	145,201

The commission also served eight tentative valuations giving the corporate history, cost of reproduction new, cost of reproduction less depreciation, original cost, etc., and also the final value as follows:

Bristol.....	1917	108,600
Kennecoe Central.....	1916	70,700
Bellfrog & Goldfield.....	1915	1,463,276
Washington, Potomac & Chesapeake.....	1916	833,750
Fellsmeier.....	1916	110,600
Goldboro Union Station.....	1914	145,000
Hardwick & Wadbury.....	1916	237,906
Menson.....	1916	77,113

The commission has also issued tentative valuations giving the final value of the property used as follows:

Snake Mountain 1915.....	143,794
Norfolk Terminal 1915.....	1,307,387
Spokane and British Columbia 1915.....	722,423

## Freight Station Section of A. R. A. Holds First Meeting

### Former Freight Agents' Association Discusses Means of Reducing Claims and of Operating Houses

HOW TO IMPROVE the station service so as to eliminate many of the errors which are resulting in freight claims, was the principal problem which came before the Freight Station Section, Division I—Operating, of the American Railway Association, at its first annual session, which was held at the Hotel Sherman, Chicago, from June 21 to 23. More than 250 delegates attended the meeting, which was the first since the former Association of Freight Agents amalgamated with the American Railway Association. It was apparent in the discussion of the various subjects which came before the meeting, that those present had in mind the necessity for devising means of cutting down the 1920 freight claim total of \$109,000,000. In addition, it was manifest that the terminal freight agents are in an excellent position to know how this end can be accomplished. Representatives of the Freight Claim Section, A. R. A., as well as visitors from the Railway Accounting Officers' Association, attended throughout the sessions.

A noteworthy feature of the meeting was the presentation of most of the reports by topic. It had been decided that interest would be stimulated and a nation-wide viewpoint obtained, if various local freight associations throughout the country would prepare analyses and recommendations on specific topics. These papers, after being read from the floor, were thrown open for general discussion and action of the gathering.

#### Opening Address by R. H. Aishton

The session was opened by the chairman of the division, C. E. Fish, terminal agent of the Baltimore & Ohio, at Cincinnati, Ohio. Mr. Fish introduced R. H. Aishton, president of the American Railway Association, who said in part:

"There is no factor that is going to be more prominent in the proper settling of the future of the railways than the public's attitude toward them. There is no body of railroad officers or employees which comes in contact with the public as you in this room do, or that is going to be such an important factor in maintaining that public interest in the welfare of the railroads, and that right conception of the railroad transportation situation. Nearly every step in transportation, the solicitation of the freight in the first place, the receipt of it, the seeing that the freight is in good order when it is received, the handling of it from the shipper to the car in which it is transported, the selection of the car in which the freight is transported, its receipt at the other end of the road, the decision that a claim shall be paid or refused, the collection of the revenue, the accounting of

the whole transaction from one end to the other, and the final delivery to the man at the other end, are all in your hands. You have eight or ten different points of contact with the public at either end. A failure to handle a shipment in an efficient and courteous manner results in an enemy for the transportation interests of this country, and what the transportation of this country needs is friends. You are in a position to get them.

"A year before the war, the claims on the railroads for freight, no personal injuries or anything of that kind included, amounted to about \$35,000,000. The last year of federal control, \$106,000,000 was paid out in claims; and last year, in spite of our utmost efforts, the total reached \$109,000,000, and the word that comes from the Freight Claim Prevention Committee is that it will be \$125,000,000 this year. If it had not been for the freight claim prevention movement and for the efforts of the individual railroads, we might have had claims amounting to \$120,000,000 last year, instead of \$109,000,000, and this year, instead of the total being \$130,000,000, it might have been \$160,000,000."

#### Report of Committee on Operating

Two subjects of considerable importance were presented in the report of the Committee on Operating. The first was a paper by the Chicago Association on the "Tractor Method of Handling L. C. L. Freight." It was the consensus of opinion that the success or failure of tractors in this work depends entirely upon the conditions existing at the individual station. In some instances it was established that the use of tractors enabled the stations to load more cars than would otherwise have been possible, while in other cases, where the station itself had not been constructed for this method of operation, the tractors had been a failure. The subject was finally referred to the incoming Committee of Direction, with the provision that the use of tractors was to be recommended only in specific cases where justified by the prevailing conditions, and was not to be favored as a general practice.

The second section of this report, which received considerable attention, dealt with the problems of improving the receiving and delivery personnel at the various stations. This matter had been referred to the Freight Station Section by the secretary of the Freight Claim Division. A majority of the delegates were agreed that while the positions of receiving and delivery clerk are of first importance to the success of handling freight, it has become difficult to secure efficient men for the work for a number of reasons, first among which was the compensation. It appeared from the

discussion that in many instances it was futile to train men carefully for the work, since they were certain to be attracted by the higher pay in other lines. Another difficulty, it seemed, is the lack of avenues for promotion for the man of intelligence and training as an inducement to enter the station service. It was recommended, in consequence, that the incoming Committee on Operating handle the matter directly with the Freight Claim Section.

### Report of Committee on Topics

The remainder of the time was devoted to the report of the Committee on Topics. To facilitate the effective handling of the committee's work, it had been divided into five general classes, as follows: (1) Freight Claim Prevention; (2) Station Settlements; (3) Station Traffic; (4) Operating; (5) General Topics.

It was found possible to refer back a large part of the topics for further investigation and report at the next session. Considerable interest, however, centered around the subject of freight claim prevention as brought out by an article prepared by the Chicago association, dealing with the causes and means of preventing losses of entire packages. The paper presented an exhaustive survey of the conditions, which might result in this type of claim, compiled in the general order of the freight movement, commencing with the errors occurring in the preparations of the package for shipment, and ending with the causes for claims through faulty delivery of the freight to the consignee. The meeting held that two causes in particular could be blamed for the heavy losses of entire packages. One was the faulty sealing devices generally used. For instance, it was established that many seals can be manipulated in as many as 19 different ways. Another cause of trouble, it was agreed, is the comparative ease with which many box car doors can be tampered with. These matters were turned over to the Committee of Direction, with specific instructions to endeavor to establish a higher standard through co-operation with the A. R. A.

### Bonding Receiving Clerks

The St. Paul Association also presented a topic dealing with the proposal to bond receiving and delivery clerks. A part of this paper follows:

"It is claimed that our receiving and delivery clerks are the primary cause of the loss of entire packages, first, in delivering through a house more packages than the billing calls for, and second, in receipting for packages not actually received. Granting that the men do sign or deliver packages as stated above, what action on the part of the officer in charge will minimize the claims from this source? A constant change of employees is not going to bring about the desired results, as a new man has a much greater chance to make this kind of mistake than an older and more experienced man. Constant reminders to the men on this subject will no doubt help greatly. We recommend the bonding of this class of employees to protect the company in case of loss. In addition, this would tend to make the men in charge of these duties much more careful. The method has been tried out in some of the larger stations and found very satisfactory."

The division of opinion on this matter necessitated further investigation and action by the Committee of Direction.

At the final session of the Division, the location of the next meeting was left to the incoming Committee of Direction for decision. At the election of officers, J. C. Gilmore, agent of the Pennsylvania at Philadelphia, and chairman of the former Association of Freight Agents, was elected chairman; C. M. Teschemacher, general agent of the Chicago & Alton, at Chicago, was elected first vice-chairman; H. W. Maynard, Jr., agent of the Central of New Jersey, at Pier 10, North River, New York, was elected second vice-

chairman, and R. O. Wells, agent of the Illinois Central at Chicago, was re-elected secretary. In addition to C. E. Fish, former chairman of the Division, and E. L. Kemp, general agent, Union Stock Yards, Chicago, who will serve as hold-over members, the following were elected to the Committee of Direction: L. J. Brinkman, general agent, Michigan Central, Detroit, Mich.; E. J. Coffey, agent Southern Railway, East St. Louis, Ill.; C. Treat Spear, agent Chicago & North Western, St. Paul, Minn.; Frank Laughlin, agent Erie, Cleveland, Ohio; J. R. Hitchcock, assistant agent, Santa Fe, Kansas City, Mo.; J. L. Harrington, agent Chicago, Burlington & Quincy, Omaha, Neb., and C. E. Cochrane, agent Pennsylvania, Baltimore, Md.

### Seasonal Coal Rates

WASHINGTON, D. C.

THE FRELINGHUYSEN seasonal coal rate bill has been intermittently debated in the Senate for the past week. Senator Frelinghuysen made a long speech on the bill, which he illustrated with charts hung around the walls of the Senate to illustrate the seasonal and yearly fluctuations in the coal business, and he argued that the country is facing a calamity in the coal situation unless steps are taken to stimulate production early in the season.

"The bill aims," he said, "to overcome the present seasonal irregularity in the production and transportation of coal by encouraging the purchase of coal in spring and summer for storage against fall and winter. The bill leaves the widest discretion to the commission in the application of the principle of seasonal rates. Rates may be promulgated to affect the carriers as a whole or to affect differently individual coal fields or rate groups. The commission is, however, instructed so to adjust the seasonal differential that the carrier will receive the same annual revenue as if no seasonal variations were provided."

The Senator said that the months of March, April, May, June and July are low points of production, the output amounting to 21,000,000 tons. The purpose is to take the 21,000,000 tons off the autumn and winter months, the high point of production, and equalize it by increasing the production in the summer months. Senator Willis asked if the benefit of the reduction would not go to the large consumers who have facilities for storing coal, while the small consumer would have the disadvantage of the higher rates in the winter time. Senator Frelinghuysen thought that the storing would be done by the wholesale or retail dealer and that the consumer would get the benefit. Senator Smoot said that a seasonal price on coal has been in effect in Utah for years and while it tends to promote the buying of coal in the summer time, the reduction is just about offset by the cost of storage and handling. Senator Kellogg pointed out that cash coal in Illinois and Indiana has recently been selling for 50 cents to a dollar a ton cheaper than coal for delivery late in the season but that did not cause the mines to be run to capacity. Senator Frelinghuysen said that there are now 150,000 coal cars idle and if the railroads could utilize them now for hauling coal the work would be done at lower cost than if the hauling of the coal were postponed. He said the people are not buying coal now on account of the present freight rates, but the lowering of the freight rates would, in his opinion, induce them to buy. Senator Jones of New Mexico said that one difficulty is that there is no stabilizing market in the bituminous coal industry and that even if there were a reduction of 25 or 50 cents a ton at a given time the consumer would not know whether that would represent a lower price than would be available later. Senator Pomerene pointed out that coal cars are frequently used in the summer time for the handling of construction and road-building materials, but that there are many other consider-

ations that enter into the question besides the rate on coal.

"It looks to me," he said, "as if that would be simply a homeopathic dose, the benefits of which are not going to trickle through the fingers of the dealers to the consumers."

Senator Cummins said he feared some senators are looking at this proposed legislation from the point of view which is hardly warranted. He saw nothing in the bill that will reduce the price of coal, but thought the general purpose of the legislation is an economic and industrial one to enable the coal industry to dismiss 25 per cent of the miners who are employed in the mines 230 days in a year, but who must be maintained at or near the coal mines because at certain seasons of the year there is a demand for the entire capacity of the mines. He would not say that a reduction in freight rates would fully accomplish the object but thought no objection could be found against reposing the authority in the Interstate Commerce Commission.

"I assume," he said, "that if the dealer finds that he can store the coal in the summer and save money he will do it and he will have his coal stored, but I am not convinced that he will reduce the price to the consumer on that account. At any rate, the bill cannot increase the price of coal to any one."

Reference was made to the 28 cents a ton reduction in the rate of lake cargo coal and Senator Frelinghuysen read a letter from Chairman Clark of the Interstate Commerce Commission describing the purpose of the reduction as being largely to correct a competitive adjustment of the rates with relation to the rates from Illinois and Indiana. The Senator also read another letter from Chairman Clark approving the purpose of the bill. He also replied to arguments that many kinds of coal cannot be stored by saying that a large amount of coal is ordinarily stored on the lake docks and that at the end of the war there were some 63,000,000 tons of coal in storage. He also argued that a more even distribution of the coal shipments would reduce the number of coal cars which some of the railroads are obliged to own to accommodate the peak movement. The passage of this bill, he said, with the definite announcement of a seasonal cut in freight rates to be followed at a specific date in the autumn by a restoration of the present rate, would clarify the situation greatly. It would put an end to speculation as to what is going to happen to the transportation cost of coal and would result in the placing of thousands of orders at the mines.

Senator King asked whether Senator Frelinghuysen would consent to an amendment of the bill striking out the words which direct the commission to maintain rates which will provide as nearly as may be the same annual revenue as rates without seasonal variation. Senator Frelinghuysen said he would oppose such an amendment. Senator King asked if it would be an advantage to the railroads to haul the coal in the summer time why they should receive an increased rate in the winter time. Senator Stanley made a similar argument and offered an amendment to the bill to strike out the provision for a corresponding increase in the winter rates. This was opposed by Senator Kellogg, who said it would destroy the effect of the bill.

Senator Underwood of Alabama made a speech against the bill, on the ground that it would constitute another example of government regulation of business and he was unwilling to place so much power to regulate the movement of coal from various districts in the hands of a commission at Washington that might not be in touch with the local conditions. To illustrate this point, he said that during the war three successive officers in the Fuel Administration cut off the coal supply of one of his constituents who needed only 10 tons of coal a month to operate a steam shovel to furnish molder's sand for a number of iron furnaces. On three separate occasions this coal supply was cut off on the ground that sand was used only for houses and it was the policy

of the government to restrict the building of houses during the war. Three times the senator had had to go to the Fuel Administration, he said, and get them to look at the inside of the file to ascertain that the sand was to be used for molding purposes. He also objected to the bill on the ground that it would penalize the domestic consumer who buys his coal in the winter time. Senator Frelinghuysen said that an increase of 25 cents a ton to the man who buys 10 tons of coal would be a small matter if it would prevent the price of coal being run up from \$5 to \$15 a ton because of scarcity.

A number of amendments to the bill were proposed by senators who desired to use it as a vehicle for amendments to the transportation act which they have been unable to get through committee. Senator LaFollette offered a number of bills of this kind, including one to repeal the rate-making provisions of the transportation act and another to prevent the Interstate Commerce Commission from exercising jurisdiction over intrastate rates. Senator Fletcher of Florida took advantage of the opportunity to make a long speech objecting to the present freight rates.

On Wednesday afternoon the bill was referred back to the committee on interstate commerce on motion of Senator Borah by a vote of 36 to 26. The majority vote represents the enemies of the bill and the action is taken as practically killing the bill, as even its friends were not particularly interested in pressing it with the Stanley amendment.

Senator Fletcher was answered at several points by Chairman Cummins of the committee on interstate commerce, who pointed out that many of the effects which the Senator had attributed to high freight rates were due to other causes.

The Senate on June 28 adopted an amendment which the supporters of the bill declared would practically nullify the purpose of the bill, that proposed by Senator Stanley to strike out the provisions which would authorize the Interstate Commerce Commission to advance the rates during the winter months by an amount corresponding to the reduction made in the earlier months. This was adopted by a vote of 33 to 27 after Senator Frelinghuysen had read a letter from Chairman Clark of the Interstate Commerce Commission saying that the amendments proposed by Senators Stanley and King would weaken or complicate the legislation and its administration. He had been authorized by the legislative committee of the commission to say that the amendments are not in harmony with the purpose of the proposed legislation and that there are valid objections to the adoption of any of them.

## What Is a "Living Wage"?

CITING MANY INSTANCES where governors and other high state officials receive lower wages than do engineers, firemen and even negro flagmen on the Nashville, Chattanooga & St. Louis, Fitzgerald Hall, general counsel of that road, in testifying recently before the Railroad Labor Board in a plea for wage reductions exploded a bomb under labor's theory of the "living wage."

"Railroad employees, as a whole," Mr. Hall said, "earn as much, and in some instances more, than the best trained men holding positions of greatest trust and responsibility in the four states through which we operate. The claim that any reduction will deprive railroad employees of a living wage or enough to live according to proper American standards is refuted by the facts."

"When our judges, college and university professors, high school and grammar school teachers, preachers, policemen and fire fighters receive, as a whole, very much less than railroad employees, as a whole, there can be no just claim that a reasonable reduction in compensation will deprive railroad employees of a proper living wage."

"A few examples will be illuminating. The principal of

the high school at Nashville, the capital of Tennessee, the educational center of the South, received \$250 per month, while yardmasters receive \$305 per month. High school teachers at Paducah, Ky., receive \$125 per month; at Chattanooga, Tenn., \$148 per month; at Huntsville, Ala., \$125 per month, while our blacksmiths receive \$185.51 per month and our yard switchmen \$188.56 per month. The average Presbyterian preacher in the South is paid \$1,600 per annum—less than one-half the earnings of yardmasters and passenger engineers; \$662.72 less than yard switch tenders.

"Vanderbilt University at Nashville pays its full professors \$3,750 per annum; the University of Tennessee at Knoxville \$2,684 per annum; the Georgia School of Technology at Atlanta \$3,600 per annum, while the conductor on our Rome branch, 18 miles long, receives \$5,735.88—a sum greater than that received by the judges of the Supreme Court of the State of Tennessee. Assistant professors and instructors in these colleges and universities receive a maximum of \$2,250 per annum—less than a car inspector receives—less than the baggage man on a passenger train receives.

"The judges of the Supreme Court of Tennessee are paid \$5,500 per annum, yet the engineer on our Rome branch, 18 miles long, receives \$5,997.04 per annum. The negro flagman and porter on our Columbia-Decherd branch train receives \$3,146.40 per annum, being \$146.40 more than the district attorney generals of the State of Tennessee, public prosecutors of the state, receive. The fireman on our Columbia-Decherd branch train receives \$3,925 per annum, being \$425 more than the assistant attorney general of the state of Tennessee, the man who represents the people of the state before its Supreme Court in practically every criminal case.

"The engineer on our Tullahoma accommodation receives \$4,371.92 per annum, being \$371.92 more than the salary of the governor of the state of Tennessee. The engineer on our Tracy City branch receives \$373 per month, a sum which is more than either the chief of police or chief of the fire departments at Atlanta, Ga., Memphis, Nashville and Chattanooga or Paducah receive. The fireman on our Pikeville train receives \$291 per month—more than twice as much as any fireman in the fire-fighting service in any city on our entire system is paid. The circuit judges and chancellors of Tennessee are paid \$4,000 per annum, which is over \$100 a year less than the conductor on our Tracy City branch is paid.

"These and similar facts refute the claim that either the

cost of living or maintenance of a proper living wage justify the present enormous wages paid to some classes of railroad employees."

## Freight Car Loading

WASHINGTON, D. C.

**F**REIGHT CAR LOADING for the week ending June 18 showed a decrease of 8,256 cars, as compared with the week before, the total number of cars loaded with revenue freight being 780,741, as compared with 916,736 in 1920 and 807,907 in 1919. The reduction was principally accounted for by the decrease in coal loading.

The report showed 157,243 cars loaded with coal during the week which was 5,845 cars less than were loaded during the previous week and 31,595 below the total for the corresponding week last year. It also was approximately 15,000 cars below the number loaded during the corresponding week in 1919. A total of 20,101 cars of coal were moved into Lake Erie ports for shipment up the lakes as compared with 19,767 cars the week before.

During the week 28,866 cars were loaded with ore which was a reduction of 1,313 compared with the week before. The loading of grain and grain products totaled 40,994 cars, live stock, 28,541 and forest products, 50,472 cars, all of which were slightly below the preceding week. Loading of merchandise and miscellaneous freight, which includes manufactured products, totaled 469,523, an increase of 228 cars over the week before, but more than 50,000 cars below what it was during the corresponding week one year ago. An increase of 314 cars was reported for coke, bringing the total for the week to 5,102 cars.

Compared with the corresponding week in 1920, the loading of grain and grain products was the only commodity to show an increase.

Slight increases in the number of cars loaded with freight were reported in the Pocahontas, Northwestern, Central western and Southwestern districts compared by regions with the previous week but a decrease of 5,500 was reported in the Eastern, 3,700 in the Allegheny and 1,100 in the southern districts. Except for the Pocahontas all were less than during the corresponding week in 1920.

The chart shown below has been compiled by the *Railway Age* to show the trend of net car shortages and surpluses for the past year and a half:

Curve of Net Car Surpluses and Shortages

# War Left Belgian Railways in Fair Condition

Damage from Undermaintenance and Aerial Bombing—  
Improvements Planned and Made Since Armistice

By Oliver F. Allen

Formerly Major of Engineers, American Expeditionary Forces

THE fact that the greater part of Belgium was in the hands of the Germans all during the war and was not the theater of action was of material value in safeguarding the railways from the wholesale destruction which was their lot in northern France. The lines of most of the Belgian railways suffered very little from military destruction prior to the last weeks of the war. Near some industrial and transfer centers there were isolated cases of successful allied air raids and occasionally a German supply train was blown up by airplane bombs with coincident injury to the tracks, but devastation of that sort was easily repaired by the army of occupation. In the western part of Flanders including the Ypres sector, held by the Allies, the railroads were destroyed very much as in northern France, and some extensions were made for military purposes such as those from Dunkirk which were used for supplying the British army in Flanders. There was also extensive war destruction in the industrial district around Mons. The Germans worked the Belgian railways very hard during the war, and naturally made the minimum of repairs, so that the condition of both roadbed and rolling stock was very bad when the Boches moved out.

When the tide turned in the fall of 1918, the Germans destroyed the railways while retreating, as effectively as the time at their disposal permitted, and succeeded in injuring very seriously the lines going down the Sambre and Meuse valleys toward Charleroi and Namur. Much of the track and several bridges between Brussels, Antwerp and Ghent were also destroyed. For miles at a stretch they blew up the tracks in such a way as to injure the roadbed and twist the rails into the most fantastic shapes, making them absolutely worthless for relaying. There was a great deal of such wanton destruction of no military value.

As the Germans fell back the Belgian, British and French army engineers built temporary military bridges and recon-

structed lines to permit transportation of supplies for the rapidly advancing armies along the entire Belgian front. Following the armistice the railroads were used to carry the British army of occupation to Cologne and to provision it there, and as soon as possible the American army of occu-

pation at Coblenz was supplied over the Belgian railways from Antwerp, thus relieving the French railways across the devastated regions of that burden.

In accordance with the armistice, the Germans turned over

to the Belgians a great many freight and passenger cars. A Belgian train during the first year after the armistice was often a mixture of Belgian, French, German and English, and in the case of freight trains, American cars. While the Germans did turn over this large lot of cars they did not send any repair parts with them and the matter of maintenance became very serious. There were many exasperating delays due to accidents to the Boche cars and the difficulty

stations and continue some general improvements planned before the war. This included such things as the rebuilding of the passenger station at Ghent with the entire elimination of grade crossings, improved arrangement of tracks, etc., the project for greater and better terminal and transfer facilities at Brussels and extensions into the new coal fields in the Limbourg district in the Meuse Valley.

The Belgian Government began rebuilding steam locomotives almost immediately after the armistice, utilizing (as is illustrated in Fig. 3, showing the Societe d'Electricite et de Mecanique factory at Ghent) some industrial plants which had not been used for locomotive work before the war. Later they purchased a number of American locomotives and placed contracts for a great many new cars.

While the restoration of the luxuries of passenger travel moved at about the same rate as in France, and the restrictions of poor fuel, roadbed, etc., kept the speeds very much

of setting them out so that the rest of the train could go on. This enemy material has been of much less real use than its tabulation would indicate.

Considering the fact that all Belgium was occupied and used to the utmost by the enemy for over four years, and so

Fig. 5. Assembly Room of the Ghent, Belgium, Factory Showing Societe d'Electricite et de Mecanique on April 1, 1920, in a Plant Which Has Been Used for Building Steam and Oil Engines Before the War and as an Artillery Repair Shop by the Germans During the War. It Is Now Again Building Oil Engines and Has Started the Production of Electrical Machinery

Fig. 4. Sambre Bridge. The Temporary Wooden Structure Shown in Fig. 3 Replaced by a Military Single Track Girder to Permit the Passage of Barges on the River. The Permanent Girder for the Other Track Is Already in Place

was left without the opportunity to plan and start reconstruction like the French, the railway administration and personnel deserve the highest praise for the rapidity with which they were able to resume operations and the promptness with which they moved freight even during 1919. The Belgians were not only able to restore their lines and rebuild their bridges, but to go ahead with the reconstruction of

below pre-war standards, the general restoration of the railway service was perhaps quicker in Belgium than in France. The Belgian railways have not suffered as much as the French from shortage of fuel, although they have been troubled almost as much by its poor quality and it has, perhaps, been easier for the Belgians to get the labor needed for reconstruction work than has been the case in France.

## A Report on the Railroad Situation

A REPORT ON GENERAL economic conditions in America submitted to the International Chamber of Commerce by the American committee of which A. C. Bedford, of the Standard Oil Company, is chairman, contains the following on the railroad situation:

"Such improvement in general business conditions and sentiment as has occurred since the first of the year, has been clouded to a considerable extent by the financial difficulties in which most of our railroads are now involved. It was known that during the time when their income was guaranteed most of the roads were not paying their way, and it was evident that difficulties would arise when the guaranty came to an end. Unfortunately, when this time arrived, business was on the down grade; and naturally railroad earnings were

seriously affected. While the cost of coal and other supplies has declined to some extent, wages have remained at the war level; and it has been impossible to cut down the number of employees sufficiently to reduce payrolls to the requirements of the situation.

"The first quarter of 1921, instead of bringing relief, saw matters go from bad to worse, and developed a situation that seemed to portend an era of receiverships even more serious than that which followed the panic of 1893.

"Fortunately, since the first of April there have been developments which promise relief from excessive labor costs; but, even now, it is a question whether changes can be made in time to avert a number of receiverships. It is a serious defect of our methods of regulating public utilities that relief from intolerable conditions can seldom be secured before deterioration of service and actual or impending bankruptcies force our regulating bodies to appropriate action.

"The present situation is that the country does not want government ownerships of railroads, and that relief from exorbitant wage demands must be had if government ownership and operation (at a huge deficit) is to be averted. Recent developments indicate that relief may be at hand, and justify a more hopeful view of the situation than it would have been reasonable to entertain a few months ago. Relief may not come in time to prevent some receiverships, but there is reason for hoping that it may be secured in time to avert a general collapse of railroad credit. If the next six months can bring a solution of the problem, they will dispel one of the most ominous clouds that now darken a difficult business situation."

## A New Idea In Ticket Cabinets

THE IMPROVED TICKET CASES introduced in the Grand Central Terminal, New York City, two years ago, and described briefly in the *Railway Age* of April 11, 1919, page 964, were but the beginning of a development which has now been amplified into an elaborate system of ticket office

Fig. 1.—Individual Ticket Case Holding 6600 Forms

equipment; and the manufacturers—the Ticket Office Equipment Company, Grand Central Terminal, New York—have made cabinets and other furniture for offices in Chicago, Cleveland, Montreal and other cities which, like those in New York, have demonstrated marked economies for the railroads

and at the same time have ameliorated the condition of the hurried or worried ticket buyer.

It will be recalled that the primary idea was to provide each individual seller, in a large office, with a complete stock of railroad and Pullman tickets, and at the same time a ready means of transferring his job (at the same window), to the

Fig. 2.—Plan of Cabinet Shown in Fig. 1

relieving clerk with no interruption of sales for the purpose of auditing or cash-counting.

The illustration, Fig. 1, shows the general appearance of the cabinet. It is in general the same as was described in the former account, the principal changes since made being

Fig. 3.—A Stack of Folded Tickets

the substitution of metal partitions and other parts, in place of wood, and the construction of two cabinets in one, back to back, as illustrated in the plan, Fig. 2. The different sections slide laterally, and those shown in the perspective (with only a part of each section in view), can each be brought fully

in view by sliding, as indicated in Fig. 2. The entire cabinet revolves on corner casters and a ball bearing center pivot, so that either one of the two stocks of tickets may front the selling window, as desired. The change of front can be made in a moment. Each ticket window thus may be in service two shifts each day, without auditing. The alternate closing of the two stocks allows ample time for making up the day's report and for replenishing stock.

The wings may be opened to any desired angle and the panel doors in front of the drawers in the lower part are connected to the wings above by a channel and pin device so that opening and closing the wings at the same time opens or closes the lower doors. Coupon tickets are machine folded so that they are stacked in vertical compartments in the same way that ordinary card tickets are stacked. The drawers in the lower section are for miscellaneous tickets, rubber stamps

Fig. 4.—Cabinet for Medium Size Station

and stationery. The cabinet shown has a capacity of 1,300 forms of local and Pullman tickets and 2,000 forms of interline and miscellaneous tickets in the side which is in view, and the other side has the same, making in a duplex cabinet a total capacity of 6,600 forms.

The sections of the cabinet devoted to interline tickets consist of vertical racks in which the shelf or horizontal part can be adjusted to different heights to provide for ticket stocks of different size. For example, where 100 tickets are to be kept in stock, the space may be double that allowed for a station which requires only 50 tickets. Interline tickets, of whatever length, are folded by machine to a uniform coupon size, 15 1/8 in. wide, and are kept in stacks as just noted. The folds can be instantly shaken out by the seller, when necessary to write or stamp on the coupons. The cost of folding is said to be no more than that of punching a hole in each ticket as is required in the old style of ticket case where the tickets are hung on pegs. Tickets which are folded keep much

cleaner than is common in the old fashioned racks. The folded system requires only a fraction of the space needed by the old style.

The illustration, Fig. 3, shows, but rather imperfectly, a single stack of folded tickets, one side of the partition being removed. The part holding the label is pivoted, and, when a ticket is pulled out, is pressed outward and downward.

The tin tube containers have a flexible spring lip which is opened by a slight downward pressure of the finger on the

Fig. 5.—Plan of Medium Size Cabinet

front ticket. A ticket which may have been withdrawn by mistake may be quickly replaced. In place of the common marble follower a light wedge is used.

The Ticket Office Equipment Company makes cabinets of various sizes, for large or small stations. For a medium sized station a revolving cabinet is made on the plan shown in Fig. 5. The appearance of this smaller cabinet, when closed, is shown in Fig. 4. One of the two rotating sections is devoted to local and Pullman tickets, and the other to interline and miscellaneous tickets.

The efficiency claims of the makers are summarized as

Fig. 6.—Rock Island Ticket Office, Chicago

follows: All sellers are trained for universal selling service and not limited to special forms only. Elimination of uncomfortable enclosed booths, increasing the morale and therefore the energy of the seller. All windows utilized all the time if required. All tickets at each and every window. Each passenger completes all transactions with one seller at one time. In emergency, as all cabinets are mobile units, a complete ticket office can be transferred to any point and immediately opened up for business. The floor space required for the old style miscellaneous types and sizes of cases is ten times greater than this equipment carrying the same number of forms. All tickets are within arm's length of the seller.

# General News Department

The Chief Interchange Car Inspectors' and Car Foremen's Association convention for this year has been postponed.

The Erie Railroad is preparing to try an automatic train stop of the intermittent electrical contact type, and expects to make tests within the next two weeks. The apparatus is being put in position on the Northern Railroad of New Jersey, near New York City.

The Veterans' Association of the Lackawanna Railroad held its sixth annual reunion at Scranton, Pa., on June 19. The members of this association are those who have been in the employ of the road for 20 years or more; and more than 1,000 were present at the reunion. The president of the association for the ensuing year is John Draney, Jersey City, N. J.

The Tennessee & Cumberland River Railroad, on which regular traffic was long since suspended, is to be finally abandoned, and its track is being torn up. This road connects with the Louisville & Nashville at Tennessee Ridge, Tenn., about 100 miles west of Bowling Green, Ky., and extends thence 14 miles northward to Bear Spring. It was built to develop the timber and mineral properties of the Cumberland River Land Company.

Chairman Clark of the Interstate Commerce Commission has sent a letter to Chairman Norris of the Senate Committee on Agriculture opposing a provision in the bill for the creation of a billion dollar corporation to finance agricultural exports under which the proposed corporation would be authorized to negotiate with the railroads for reduced freight rates on shipments in which it is interested. Mr. Clark said the commission could not endorse any proposal to make the government directly or indirectly a preferred shipper when it is directly or indirectly in commercial competition with citizens who are attempting to carry on the same line of business. Senator Norris in discussing the letter said it would be easy for the commission to remove any such discrimination by reducing the freight rates on the other shipments.

## Railway Earnings for May

\* Preliminary compilations of the returns of 119 railroads operating 150,000 miles to the Interstate Commerce Commission for May show a net operating income of \$21,000,000 as compared with a deficit in May last year of \$6,512,000. The operating revenues of these roads were \$318,000,000, a decrease of 1.2 per cent and the operating expenses were \$268,000,000, a decrease of 14.2 per cent.

## Portraits on Tickets

The New York Central announces that buyers of commutation tickets, for use between New York City and certain points 50 miles or more from the city, are to be required to furnish a photograph, to be pasted on the ticket; this to prevent misuse of tickets, which has become common. On the Hudson division this order applies to Beacon and Poughkeepsie; on the Harlem division to Towns and Patterson, and on the River division to Newburgh.

## Flood on the Northern Pacific

One of the heaviest rainfalls on record occurred on June 16 in the region traversed by the Northern Pacific, between Medora, N. D., and Hathaway, Mont., a section of road 165 miles long. The nature of the soil prevented the water from being absorbed quickly, and this, together with the steep watersheds, caused a wall of water about 10 ft. high to flow through some of the cuts and along the roadbed in many places. Five section men were caught by the flow in one cut and three were drowned. The tracks were washed out at many points and considerable damage

was done to telegraph lines and signals. The line was reopened for traffic on June 25.

## Eastern Railroads to Cooperate

### in New York Port Problem

At a recent meeting of the presidents of the eastern railways a committee was appointed to work with the New York-New Jersey Port Authority in developing its plans toward the solution of the port and terminal problems at New York. The committee consists of the following 11 engineers: R. C. Falconer, assistant to the president and chief engineer, Erie; Edward Gagel, chief engineer, N. Y., N. H. & H.; G. T. Hand, chief engineer, L. V.; G. W. Kittredge, chief engineer, N. Y. C. Lines East; H. A. Lane, chief engineer, B. & O.; L. V. Morris, chief engineer, L. I.; J. H. Nuelle, general manager, N. Y. O. & W.; A. E. Owen, chief engineer, C. of N. J.; G. J. Ray, chief engineer, D., L. & W.; E. B. Temple, assistant chief engineer, Pennsylvania; and S. T. Wagner, chief engineer, P. & R.

## "What Every Employee Should Know"

The Illinois Central has distributed among the workers of that road, a book entitled, "What Every Employee Should Know," which tells how the Illinois Central System had its beginning in 1851, and leads up to the present intensive development of the road. The booklet narrates how the original company was organized and chartered "to build a railroad through central Illinois" and how during the five years following 1851 the charter lines, consisting of 705 miles of road, were completed. The first construction was a 14-mile strip of road between Chicago and Calumet, which was opened to traffic on May 15, 1852. During the next year a 60-mile stretch of road was opened between LaSalle and Bloomington, from which time the southward progress to New Orleans was constant. The road now has more than 8,000 miles of lines representing three and one-half per cent of the total railway mileage of the country; and it serves 15 states.

## Accident Investigations—January, February, March

The seventh quarterly issue of the summary of train-accident investigations, prepared by the Bureau of Safety of the Interstate Commerce Commission, for the months of January, February and March, 1921, has been issued. The 23 accidents reported on occurred as shown below, all except the first one being in the year 1921. The derailment of January 3, 1920, has also been made the subject of a special illustrated report, containing studies, made by the engineer-physicist of the commission, of the rail which broke and caused this derailment, and of other broken rails.

TRAIN ACCIDENTS INVESTIGATED, FIRST QUARTER 1921			
		1920	
Derailement	Chicago Great Western.....Wyeth, Mo.	January	3
1921			
Collision	Tonopah & Tidewater.....Dumont, Cal.	January	14

## Meetings and Conventions

The following list gives names of secretaries, dates of next or regular meetings and places of meetings:

- AIR BRAKE ASSOCIATION.**—F. M. Nellis, 163 Broadway, New York City. Exhibit by Air Brake Appliance Association.
- AIR BRAKE APPLIANCE ASSOCIATION.**—F. W. Venton, 836 So. Michigan Ave., Chicago. Meeting with Air Brake Association.
- AMERICAN ASSOCIATION OF DEMURRAGE OFFICERS.**—F. A. Pontious, Supervisor of Demurrage and Storage, C. & N. W. Ry., Chicago.
- AMERICAN ASSOCIATION OF DINING CAR SUPERINTENDENTS.**—S. W. Derr, Philadelphia & Reading, Philadelphia, Pa. Next meeting, July 12, Chicago.
- AMERICAN ASSOCIATION OF ENGINEERS.**—C. E. Drayer, 29 S. La Salle St., E. I. R. R., 332 South Michigan Ave., Chicago.
- AMERICAN PASSENGER CAR TRAFFIC OFFICERS.**—S. C. Hope, C. R. K. of N. J., 143 Liberty St., New York. Annual meeting, November 21 and 22, Pinehurst, N. C.
- AMERICAN ASSOCIATION OF RAILROAD SUPERINTENDENTS.**—J. Rothschild, Room 400, Union Station, St. Louis, Mo. Next convention, August 24-26, 1921, Kansas City, Mo.
- AMERICAN ELECTRIC RAILWAY ASSOCIATION.**—E. B. Burritt, 8 W. 40th St., New York. Next convention, October 3, Atlantic City. Exhibits this year will be omitted.
- AMERICAN RAILROAD MASTER TINNERS', COPPERSMITHS' AND PIPE FITTERS' ASSOCIATION.**—C. Borchardt, 202 North Hamilton Ave., Chicago, Ill. Next convention September 12-14, Hotel Sherman, Chicago.
- AMERICAN RAILROAD MASTER BLACKSMITHS' SUPPLY MEN'S ASSOCIATION.**—J. E. Fairbanks, General Secretary, 75 Church St., New York, N. Y. Next regular meeting, November 16, 1921.
- Division I—Operating.**  
**Freight Station Section** (including former activities of American Association of Freight Agents). R. O. Wells, Freight Agent, Illinois Central Railroad, Chicago, Ill.  
**Medical and Surgical Section.** J. C. Caviston, 75 Church Street, New York.
- Protective Section** (including former activities of the American Railway Chief Special Agents and Chiefs of Police Association). J. C. Caviston, 75 Church St., New York, N. Y.
- Telegraph and Telephone Section** (including former activities of the Association of Railway Telegraph Superintendents). W. A. Fairbanks, 75 Church St., New York, N. Y.
- Division II—Transportation** (including former activities of the Association of Transportation and Car Accounting Officers). G. W. Covert, 431 South Dearborn St., Chicago, Ill.
- Division III—Traffic.** J. Gottschalk, 143 Liberty St., New York.
- Division IV—Engineering.** E. H. Fritch, 431 South Dearborn St., Chicago, Ill.
- Construction and Maintenance Section.** E. H. Fritch.
- Electrical Section.** E. H. Fritch.
- Signal Section** (including former activities of the Railway Signal Association). B. Wiegand (Chairman); H. S. Balliet, 75 Church St., New York, N. Y.
- Division V—Mechanical** (including former activities of the Master Car Builders' Association and the American Railway Master Mechanics' Association). V. R. Hawthorne, 431 South Dearborn St., Chicago, Ill. Meeting postponed indefinitely.
- Equipment Painting Section** (including former activities of the Master Car and Locomotive Painters' Association). V. R. Hawthorne, 431 South Dearborn St., Chicago, Ill.
- Division VI—Purchases and Stores** (including former activities of the Railway Storekeepers' Association). J. P. Murphy, General Storekeeper, New York Central, Collinwood, Ohio.
- Division VII—Freight Claims** (including former activities of the Freight Claim Association). Lewis Pilcher, 431 South Dearborn St., Chicago, Ill.
- AMERICAN RAILWAY BRIDGE AND BUILDING ASSOCIATION.**—C. A. Lichty, C. & N. W. Ry., 390 W. 42nd St., New York City. Exhibit by Bridge and Building Supply Men's Association.
- AMERICAN RAILWAY DEVELOPMENT ASSOCIATION.**—J. F. Jackson, Central of Georgia, Savannah, Ga. Next meeting, November 1st and 3d, 1921, Chicago.
- AMERICAN RAILWAY ENGINEERING ASSOCIATION.** (Works in co-operation with the American Railway Association, Division IV.) E. H. Fritch, 431 South Dearborn St., Chicago. Exhibit by National Railway Appliances Association.
- AMERICAN RAILWAY MASTER MECHANICS' ASSOCIATION.** (See American Railway Association, Division 5.)
- AMERICAN RAILWAY TOOL FOREMEN'S ASSOCIATION.**—R. D. Fletcher, 1145 East Marquette Road, Chicago. Next convention, which was to have been held August 9-11, Hotel Sherman, Chicago, has been postponed. Exhibit by Supply Association of the American Railway Tool Foremen's Association.
- AMERICAN SUPPLY ASSOCIATION.**—T. F. Whittelsey, Union Trust Bldg., Washington, D. C.
- AMERICAN SOCIETY FOR STEEL TREATING.**—W. H. Eiseaman, 4600 Prospect Ave., Cleveland, Ohio. Next convention, September 19-24, Indianapolis, Ind.
- AMERICAN SOCIETY FOR TESTING MATERIALS.**—C. L. Warwick, University of Pennsylvania, Philadelphia, Pa.
- AMERICAN SOCIETY OF CIVIL ENGINEERS.**—E. M. Chandler (acting secretary), 33 W. 42nd St., New York City. Regular meetings 1st and 3d Wednesdays in month, except July and August, 33 W. 39th St., New York.
- AMERICAN SOCIETY OF MECHANICAL ENGINEERS.**—Calvin W. Rice, 29 W. 39th St., New York City.
- AMERICAN TRAIN DISPATCHERS' ASSOCIATION.**—C. L. Darling, Northern Pacific Ry., Spokane, Wash.
- AMERICAN WOOD PRESERVERS' ASSOCIATION.**—George M. Hunt, Chemist, Forest Products, Madison, Wis.
- ASSOCIATION OF RAILWAY CLAIM AGENTS.**—H. D. Morris, Northern Pacific R. R., St. Paul, Minn. Next annual meeting, May 19, 1922, Montreal.
- ASSOCIATION OF RAILWAY ELECTRICAL ENGINEERS.**—Jos. A. Andreuccetti, C. & N. W. Ry., 41 W. W. Sta., Chicago. Next convention, October 18-21, Hotel La Salle, Chicago. Exhibit by Railway Electrical Supply Manufacturers' Association.
- ASSOCIATION OF RAILWAY EXECUTIVES.**—Thomas De Witt Cuyler (chairman), 61 Broadway, New York, N. Y.
- ASSOCIATION OF RAILWAY SUPPLY MEN.**—A. W. Clokey, 1658 McCormick Bldg., Chicago. Meeting with International Railway General Foremen's Association.
- ASSOCIATION OF RAILWAY TELEGRAPH SUPERINTENDENTS.** (See American Railway Association, Division 1.)
- ASSOCIATION OF TRANSPORTATION AND CAR ACCOUNTING OFFICERS.** (See American Railway Association, Division 2.)
- BRIDGE AND BUILDING MEN'S ASSOCIATION.**—A. J. Filkins, Paul Dickinson Company, Chicago. Meeting with convention of American Railway Bridge and Building Association.
- CANADIAN RAILWAY CLUB.**—W. A. Booth, 131 Charron St., Montreal, Que.
- CAR FOREMEN'S ASSOCIATION OF CHICAGO.**—Aaron Kline, 626 North Pine Ave., Chicago. Regular meetings, 2d Monday in month, except June, July and August, New Morrison Hotel, Chicago.
- CAR FOREMEN'S ASSOCIATION OF ST. LOUIS, MO.**—Thomas B. Korneke, St. Louis, Mo. Meetings, first Tuesday in month at the American Hotel Annex, St. Louis.
- CENTRAL RAILWAY CLUB.**—Harry D. Vought, 95 Liberty St., New York. Regular meetings, 2d Thursday in November and 2d Friday in January, March, May and September, Hotel Statler, Buffalo, N. Y.
- CHIEF INTERCHANGE CAR INSPECTORS' AND CAR FOREMEN'S ASSOCIATION.**—W. P. Elliott, Terminal Railroad Association of St. Louis, East St. Louis, Ill. Convention this year has been postponed.
- CHIEF LOCOMOTIVE CAR INSPECTORS' AND CAR FOREMEN'S SUPPLY MEN'S ASSOCIATION.**—D. B. Wright, 34th St. and Artesian Ave., Chicago, Ill. Meeting with Chief Interchange Car Inspectors' and Car Foremen's Association.
- CINCINNATI RAILWAY CLUB.**—W. C. Cooder, Union Central Bldg., Cincinnati, Ohio.
- EASTERN RAILROAD ASSOCIATION.**—E. N. Bessling, 614 F St., N. W., Washington, D. C.
- FREIGHT CLAIM ASSOCIATION.** (See American Railway Association, Division 7.)
- GENERAL SUPERINTENDENTS' ASSOCIATION OF CHICAGO.**—A. M. Hunter, 321 Grand Central Sta., Chicago. Regular meetings, Wednesday preceding 3d Friday in month, Room 356, Insurance Exchange Bldg., Chicago.
- INTERNATIONAL RAILROAD MASTER BLACKSMITHS' ASSOCIATION.**—W. J. Mayer, Michigan Central R. R., Detroit, Mich. Next convention, which was to have been held August 16-18, 1921, Hotel Sherman, Chicago, has been postponed. Exhibit by International Railroad Master Blacksmiths' Supply Men's Association.
- INTERNATIONAL RAILROAD MASTER BLACKSMITHS' SUPPLY MEN'S ASSOCIATION.**—George J. P. White, Railway Exchange, Chicago. Meeting with International Railroad Master Blacksmiths' Association.
- INTERNATIONAL RAILWAY FUEL ASSOCIATION.**—J. G. Crawford, 702 E. 51st St., Chicago.
- INTERNATIONAL RAILWAY GENERAL FOREMEN'S ASSOCIATION.**—Wm. Hall, 1061 W. Wabasha Ave., Winona, Minn. Next convention, which was to have been held September 12-15, Hotel Sherman, Chicago, has been postponed. Exhibit by Association of Railway Supply Men.
- MAINWAY MASTER PAINTERS' ASSOCIATION.**—E. C. Martin, Union Pacific R. R., Room No. 19, Union Pacific Bldg., Kansas City, Mo. Next convention, October 4-6, 1921, Buffalo, N. Y.
- MASTER BOILER MAKERS' ASSOCIATION.**—Harry D. Vought, 95 Liberty St., New York, N. Y.
- MASTER CAR AND LOCOMOTIVE PAINTERS' ASSOCIATION.** (See A. R. A., Division 5.)
- MASTER CAR BUILDERS' ASSOCIATION.** (See A. R. A., Division 5.)
- NATIONAL ASSOCIATION OF RAILROAD TOOL PRODUCERS.**—E. Pershall, T. J. Moss Tie Company, 720 Security Bldg., St. Louis, Mo.
- NATIONAL ASSOCIATION OF RAILWAY AND UTILITIES COMMISSIONERS.**—James B. Walker, 49 Lafayette St., New York.
- NATIONAL FOREIGN TRADE COUNCIL.**—O. K. Davis, 1 Hanover Square, New York.
- NATIONAL RAILWAY APPLIANCE ASSOCIATION.**—C. W. Kelly, Peoples Gas Bldg., Chicago. Meeting with American Railway Engineering Association.
- NEW ENGLAND RAILROAD CLUB.**—W. E. Cade, Jr., Boston, Mass. Regular meetings, 2d Tuesday in month, excepting June, July, August and September.
- NEW YORK RAILROAD CLUB.**—Harry D. Vought, 95 Liberty St., New York. Regular meeting, 3d Friday in month, except June, July and August, at 29 W. 39th St., New York.
- PACIFIC RAILWAY CLUB.**—W. S. Wollner, 64 Pine St., San Francisco, Cal. Regular meetings, 2d Thursday in month, alternately in San Francisco and Oakland.
- RAILWAY ACCOUNTING OFFICERS' ASSOCIATION.**—E. R. Woodson, 1116 Woodward Building, Washington, D. C.
- RAILWAY BUSINESS ASSOCIATION.**—Frank W. Noxon, 600 Liberty Bldg., Broad and Chestnut Sts., Philadelphia, Pa.
- RAILWAY CLUB OF PITTSBURGH.**—J. D. Conway, 515 Grandview Ave., Pittsburgh, Pa. Regular meetings, 4th Thursday in month, except June, July, August and September, Hotel Pines, Pittsburgh, Pa.
- RAILWAY DEVELOPMENT ASSOCIATION.** (See Am. Ry. Development Assn.)
- RAILWAY ELECTRICAL SUPPLY MANUFACTURERS' ASSOCIATION.**—J. Scribner, General Electric Co., Chicago. Annual meeting with Association of Railway Electrical Engineers.
- RAILWAY EQUIPMENT MANUFACTURERS' ASSOCIATION.**—R. J. Himmelright, 17 East 42nd St., New York. Meeting with Traveling Engineers' Association.
- RAILWAY FIRE PROTECTION ASSOCIATION.**—R. R. Hackett, Baltimore & Ohio R. R., Baltimore, Md. Annual meeting, October 18-20, Hotel Sherman, Chicago.
- RAILWAY REAL ESTATE ASSOCIATION.**—R. H. Morrison, C. & O. Ry., Richmond, Va.
- RAILWAY SIGNAL ASSOCIATION.** (See A. R. A., Division 4, Signal Section.)
- RAILWAY STOREKEEPERS' ASSOCIATION.** (See A. R. A., Division 6.)
- RAILWAY SUPPLY MANUFACTURERS' ASSOCIATION.**—J. D. Corway, 1841 Oliver Bldg., Pittsburgh, Pa. Exhibit at June convention of American Railway Association, has been cancelled.
- RAILWAY TELEGRAPH AND TELEPHONE APPLIANCE ASSOCIATION.**—G. A. Nelson, 30 Church St., New York.
- ROADMASTERS AND MAINTENANCE OF WAY ASSOCIATION.**—P. J. McAndrews, C. N. W. Ry., Sterling, Ill. Next annual convention, September 20-22, 1921, Auditorium Hotel, Chicago. Exhibit by Track Supply Association.
- ST. LOUIS ASSOCIATION OF AMERICAN RAILWAY TOOL FOREMEN'S ASSOCIATION.**—C. N. Thulin, 935 Peoples Gas Bldg., Chicago.
- SIGNAL APPLIANCE ASSOCIATION.**—F. W. Edmunds, Sunbeam Electric Manufacturing Company, New York City. Meeting with American Railway Association, Signal Section.
- SOCIETY OF RAILWAY ELECTRICAL ENGINEERS.**—L. W. Cox, Commercial Trust Bldg., Philadelphia, Pa.
- SOUTHERN AND SOUTHWESTERN RAILWAY CLUB.**—A. J. Merrill, P. O. Box 255, Atlanta, Ga. Regular meetings, 3d Thursday in January, March, May, July, September and November, Piedmont Hotel, Atlanta.
- SOUTHERN ASSOCIATION OF CAR SERVICE OFFICERS.**—E. W. Sandwich, Western Ry., Atlanta, Ga.
- SUPPLY ASSOCIATION OF AMERICAN RAILWAY TOOL FOREMEN'S ASSOCIATION.**—C. N. Thulin, 935 Peoples Gas Bldg., Chicago.
- TRACK SUPPLY ASSOCIATION.**—W. C. Kidd, Ranpaw Iron Works, Hillburn, N. Y. Meets with Roadmasters' and Maintenance of Way Association.
- TRAVELING ENGINEERS' ASSOCIATION.**—H. O. Thompson, 117 East 98th St., Cleveland, Ohio. Exhibit by Railway Equipment Manufacturers' Association.
- WESTERN RAILWAY CLUB.**—Bruce V. Crandall, 14 E. Jackson Boulevard, Chicago. Meeting third Monday each month except June, July and August.

## Traffic News

The boats built by the Federal Government, for use on the New York State Barge Canal, have been sold to a New York and Chicago syndicate. These vessels have an aggregate capacity of 50,000 tons of freight, and are said to have cost the government \$3,695,000.

Tentative plans for a conference of the representatives of the railroads and the citrus fruit shippers of the Pacific Coast on the question of the reduction of transcontinental freight rates were announced at Washington by the "Producers and Shippers of Heavy Tonnage and Perishable Commodities from the Pacific Coast." The conference will be held July 1, according to present plans. The Interstate Commerce Commission has ordered the case of the California Citrus League against the railroads asking for lower rates on citrus fruits reopened. If the railroads and the shippers can come to an agreement a further hearing before the commission on the case will not be necessary. The shippers have objected to the latest increase of 33 1/3 per cent on transcontinental rates on citrus fruit shipments and are asking that this increase be removed so that the old rate of \$1.44 on oranges and \$1.25 on lemons will prevail.

### Conference with Shippers on

#### Proposed Changes in Freight Rates

The "Fourth Section Committee of Southern Carriers" which for several months has been engaged in a general revision of class freight rates, following the amendment of the Fourth Section of the Interstate Commerce law by the Transportation Act of 1920, has invited boards of trade, prominent shippers and others to attend a conference in Atlanta, Ga., beginning on July 11, for the purpose of having a full and free discussion, and to see how well the proposed changes suit the shippers. This invitation is accompanied by statements showing the present and the proposed rates, so arranged that shippers can readily make comparisons. The changes have to do with rates to and from Ohio river crossings, Memphis, Nashville, Gulf ports, Mississippi river crossings, south Atlantic port and Virginian cities.

The chairman of the Fourth Section Committee is G. M. Goodwyn, Transportation building, Atlanta, Ga.

### Southern Names Fast Freight Trains

The fast long-distance freight trains operated by the Southern Railway are now known by names, to enable shippers to identify them. There are 13 of them, as follows:

"Potomac Special."—New Orleans, Birmingham, Atlanta to Potomac Yards (near Washington, D. C.).

"Fruit Special."—Jacksonville, Columbia, Charlotte to Potomac Yards.

"Stock Special."—Chattanooga, Knoxville, Asheville to Potomac Yards.

"Long Leaf Special."—Selma, Anniston, Atlanta to Potomac Yards.

"Clyde Special."—Charleston, Columbia, Spartanburg to Atlanta and West.

"Wiregrass Special."—Atlanta, Macon to South Georgia and Florida points.

"Eastern Special."—Memphis, Chattanooga to Bristol and East over the Norfolk & Western through Hagerstown.

"Southwest Special."—From the East via Hagerstown, over the Norfolk & Western to Bristol; Southern Railway to Memphis.

"Florida-West Indian Special."—Cincinnati and Louisville to Jacksonville.

"Orange Special."—Jacksonville to Cincinnati and Louisville.

"Live Stock Special."—Birmingham to Cincinnati.

"Packing House Special."—Meridian to Atlanta.

"Petroleum Special."—Shreveport via "Vicksburg Route" to Meridian and Southern Railway to Atlanta.

## Commission and Court News

### Interstate Commerce Commission

#### Charges for Wharfage, Handling, Storage, Etc., at South Atlantic and Gulf Ports

The commission is in receipt of numerous inquiries as to whether or not it will give consideration to switching charges and free time allowances at the ports in connection with this proceeding. It has been concluded that the order instituting the investigation will be construed as including within its scope switching charges to and from the water terminals at the ports in question, and free time allowances on ocean traffic while in cars or in storage warehouses at the ports.

### Personnel of Commissions

H. G. Butler, power administrator, and former assistant chief engineer, of the Railroad Commission of California, has resigned and will engage in private practice.

### State Commissions

The legislature of the state of Illinois has passed the state administrations' bill, creating the "Illinois Commerce Commission" in place of the present State Utilities Commission. Although the main purpose of the bill was to provide "home" rule, it provides for appeal to the state body for final decision.

The Public Service Commission of Alabama has extended until October 31 the time within which the railroads of the state will be permitted to charge for freight on intrastate shipments 25 per cent more than the rates prescribed by the commission. This continuation was assented to by the traffic bureau of Montgomery, Mobile and Birmingham. Another hearing will be held on October 3.

The New York State Public Service Commission, W. A. Prendergast, chairman, announces that the work of the commission will be conducted in four divisions—administrative, legal, engineering and accounting. Francis E. Roberts, former assistant secretary of the commission for the second district, has been appointed secretary of the commission, and John J. Hubbard, assistant secretary. The office of Mr. Roberts will be at Albany and that of Mr. Hubbard at New York City.

A hearing began before the State Railroad Commission of California on June 16 on the petition of the railways entering Los Angeles for a re-hearing of the decision handed down by the commission, ordering the railways to build a joint terminal in that city. It is expected that the railroads will contend that the commission has authority only over grade crossings and has no jurisdiction to require joint terminal facilities, which authority, they claim, is delegated to the Interstate Commerce Commission in the Transportation Act.

## Court News

### Decisions Under the Federal

#### Employers' Liability Act

Where cars were loaded and they began to move, destined for another state or country, the New York Appellate Division holds that a railroad employee assisting therein as freight yard conductor was engaged in interstate commerce, although he did not know that the cars were destined for another state or country and although the cars had not yet received their billing, the shipper having arranged directly with another railroad, to which the cars were being delivered, for the shipment and billing.—Cott v. Erie, 179 N. Y. Supp. 488.

The Court of Errors and Appeals of New Jersey holds, the Chancellor and Kalisch, J., dissenting, that a baggage-

room used in handling interstate business, is an instrumentality of interstate commerce, though it was also used for intrastate business and though, at the time of plaintiff's injury while painting it, it contained no interstate baggage.—*Culp v. Atlantic City (N. J.)*, 110 Atl. 115.

The New York Appellate Division holds that a brakeman on an intrastate train, which, however, carried interstate freight, is engaged in interstate commerce when injured in attempting to load a barrel of oil for intrastate shipment.—*Evans v. U. S. R. A. (New York Central)*, 191 App. Div. 704, 182 N. Y. 310.

The Circuit Court of Appeals, Second Circuit, holds that a railroad watchman on a pier used solely for interstate freight, who was injured while assisting in readjusting a door of the pier shed, to allow of delivery of freight to consignees, was engaged in interstate commerce.—*Delaware, L. & W. v. Busse*, 263 Fed. 516.

The Circuit Court of Appeals, Fifth Circuit, holds that a railroad employee, engaged in work on the ground unloading timber to be used by him and others in the reconstruction or repair of a bridge, part of a railroad used in interstate commerce, is within the act.—*Kansas City Southern v. Martin*, 262 Fed. 241.

The Arizona Supreme Court holds that an employee of an interstate railroad was engaged in interstate commerce when installing electric block signals along the main line to protect trains carrying both interstate and intrastate commerce.—*Saxton v. E. P. & S. W. (Ariz.)*, 188 Pac. 257.

The New York Court of Appeals holds that a railroad shop employee, injured in falling against a saw while sawing timbers into pieces to be used for cross-ties, was not within the act, where it did not appear that the ties were prepared for any particular track, place, or work of repair.—*Buynofsky v. L. V.*, 228 N. Y. 249, 126 N. E. 714.

The Pennsylvania Supreme Court holds, while the question has not been directly decided by the United States Supreme Court, and the rulings thereon by other courts are not in harmony, that a crossing watchman while flagging an intrastate train is not employed in interstate commerce, although trains engaged in such commerce use the same track.—*Di Donato v. P. & R.*, 109 Atl. 627.

## United States Supreme Court

### Railroad May, After Merger, Sue for Transportation Balances Payable to Its Predecessor by Government

The Seaboard Air Line sued in the United States Court of Claims to recover balances for transportation services originally payable to the Florida Central & Peninsular, to whose rights it had succeeded through merger or consolidation. That court dismissed the petition, holding that because of Rev. Stat. 3477, declaring null and void transfers and assignments of claims upon the government, except after allowance and the issue of a warrant for payment thereof, the railroad could not maintain the action. The Supreme Court of the United States has reversed that judgment, holding that the case comes within the exceptions to the general language of the section which have been recognized in prior decisions as not within the evil at which the statute aimed, namely, frauds upon the Treasury. The court said in part: "We cannot believe that Congress intended to discourage, hinder or obstruct the orderly merger or consolidation of such corporations as the various States might authorize for the public interest. There is no probability that the United States could suffer injury in respect of outstanding claims from such union of interests and certainly the result would not be more deleterious than would follow their passing to heirs, devisees, assignees in bankruptcy, or receivers, all of which changes of ownership have been declared without the scope of the statute. The same principle which required the exceptions heretofore approved applies here."—*Seaboard Air Line v. United States*. Decided June 6, 1921. Opinion by Mr. Justice McReynolds.

## Foreign Railway News

### Krupps' Output

LONDON.

Recent visitors in Germany report that Krupps is working to capacity in its locomotive and car shops. Their output at present is 20 locomotives per month and it has recently completed its one thousandth freight car. This company is busy on locomotives for Russia and has a contract for tires for Russian locomotives. It is reported that the Prussian State Railways has a financial interest in the locomotive and car building division of the Krupp Works.

### Mexico Receiving Locomotives

Francisco Guerra, inspector general of locomotives of the National Railways of Mexico, has just finished receiving the locomotives which the Mexican Government recently purchased from the Illinois Central Railroad. These locomotives entered Mexico at Matamoros and are being placed in regular service as rapidly as possible.

"Heretofore there has been serious congestion in the yards at Matamoros, Piedras Negras, Nuevo Laredo, Juarez, Monterey, Tampico and the City of Mexico," said Mr. Guerra. "The congestion was caused chiefly by the lack of locomotives to move the freight. However, since the railroads of the United States have come to the aid of the Mexican lines by leasing or selling them a large number of engines we are able to begin relieving the congestion."

"There are now only about one hundred cars on hand in the Matamoros yards and as five locomotives are available these will be dispatched in the next few days. With our lines operating more efficiently we expect a large volume of traffic will go through Brownsville for points on the east coast and also for the interior."

### Another British Road in South America

#### Shows Improved Earnings

The Paraguay Central, a British road, operate 274 miles of line in Paraguay and is the only important road in that country. It runs southward from Asuncion to Encarnacion where it connects with lines in Argentina. On June 30, 1920, this road, according to Vice Consul Seltzer at Asuncion, had 24 locomotives, 46 passenger train cars and 470 freight cars. Its revenues are shown in the following table by fiscal years:

Year	Receipts	Expenses	Net
1913.....	\$712,043	\$391,590	\$320,453
1918.....	759,934	420,860	339,126
1919.....	1,108,624	639,246	469,378
1920.....	1,253,879	738,934	514,936
1920*.....	630,536	340,117	290,419

\*Six months ending December 31, 1920.

This road handled 509,369 passengers in 1920, as against 418,635 in 1919. Freight tonnage in 1920 amounted to 223,228 and in 1919 to 194,090. Forest products make up some 40 per cent of the road's freight tonnage while other agricultural products make up the bulk of the remainder.

### Railway Plans of the Argentine Government

LONDON.

The railway construction scheme decided upon by the Argentine government includes the completion of the State railways to La Quiaca on the Bolivian frontier in conjunction with the Bolivian government, the line from Rosario-de-Lerma in the Province of Salta to Huaytiquina on the Chilean frontier, a line from a station on the Central Northern State railway, near the city of San Juan, running due north to Jachal, passing through a portion of the Province of San Juan, and a railway extension in the Province of Buenos Aires to link up the Provincial Government line leading from San Nicolas, one of the ports on the Parana River to Meridiano Quinto.

This wide scheme is designed to compete more or less with

foreign railway interests, especially British, but it is believed that its completion will bring some economic advantage to the country and may perhaps advance the traffic of some of the foreign lines whose tracks are in the vicinity. There are, however, many difficulties standing in the way of the Argentine government which are unsurmountable at the present time, but it is anticipated that these difficulties will be partially or wholly overcome within a few years.

### April Car Exports

Exports of freight cars showed further declines in April. The total was 572, valued at \$808,982. Six passenger cars were shipped, valued at \$42,298. The totals by countries, as compiled by the Bureau of Foreign and Domestic Commerce, follow:

Countries.	Passenger		Freight and other		Parts of Cars
	Number		Number		
Finland	..	..	..	..	236
France	..	..	..	..	538
Greece	..	..	..	..	5,590
Italy	..	..	..	..	1,853

Total	6	\$42,298	572	\$808,982	\$1,227,696

### April Track Material Exports

Exports of steel rails in April totaled 31,392 tons, valued at \$1,838,002. Shipments of spikes were valued at \$129,313 and of miscellaneous track material at \$544,209. The totals by countries, as compiled by the Bureau of Foreign and Domestic Commerce follow:

Countries.	Railroad Spikes. Pounds	Rails of Steel Tons	Switches, Frogs, Splice Bars, Etc.	
Netherlands	..	840	\$52,998	..
Norway	..	54	3,265	..
Spain	..	1,854	119,953	7,044
England	..	1,870	185,719	2,824
Canada	91,883	\$4,315	487	26,961
Costa Rica	10,900	465	..	15

Total	2,017,806	\$129,313	31,392	\$1,838,002

### Extent of China's Railways

Hsu Shih-chang, president of China, in a recent book entitled "China After the War," discusses the railways of the country at some length. He calls attention to the mileage of the country, 7,000 miles operated as 24 lines. "Of this 2,600 miles are foreign-concession lines, namely, the Chinese Eastern, the South Manchuria, the Kiaochow-Tsinan, the Canton-Kowloon, the Yunnan Railway and the Lung-chen—while the Chinese Government lines number only 18, and extend over about 4,500 miles. This is certainly altogether insufficient. The United States with a territory of about the same size, and with only one-fourth of our population has 266,000 miles of railways, or 60 times as long as ours. Moreover many of our lines, though now nationalized were at first built with foreign capital. The diversity of foreign interests has made it impossible to lay out lines according to some comprehensive plan for the whole country.

"Such being the case, part of the capital seems to have been invested in unimportant routes, while many more important regions are without any modern means of communication. Ever since the first construction of railways in China 40 years ago, no less than \$400,000,000 has been expended. Yet trunk lines are found only north of the Yangtse River and East of the Honan Province, leaving the great plains to the South and West practically untraversed. In this way such portions of the country as Shensi, Kansu, Szechuan and Kweichow, are inaccessible to the coast, and their development is consequently retarded, industrially as well as commercially. Nor is this all, for in recent years railway loans made to China have often partaken of the nature of politico-commercial transactions. This not only hinders the proper industrial development of the country, but it also sows the seeds for future international complications. Therefore, in the interests of all concerned, such arrangements should be modified so as to preclude all undesirable possibilities."

### Importance of Exports of American Locomotives

Exports of locomotives from this country in 1913 amounted to 491, valued at \$4,475,429. In 1919 the total was 959, valued at \$30,275,728. In 1920 the high mark of 1,711, valued at \$53,629,847, was reached. Over one-half of last year's exports (in value) went to European countries—primarily Italy, Poland, Belgium and France. Outside of Europe the most important buyers were Cuba, Brazil, China, South Africa and Argentina. The details by countries are given in the following table prepared by the Bureau of Foreign and Domestic Commerce:

Countries.	Number	Value
Azores and Madeira Islands	3	\$75,200
Belgium	155	\$2,188,188
Denmark	16	619,680
France	162	3,859,417
Italy	175	4,184,947
Poland and Danzig	139	6,348,050
Rumania	25	1,625,000
Spain	45	1,680,505
Sweden	1	18,992
Canada	78	786,108
Honduras	7	21,281
Nicaragua	1	9,400
Panama	5	8,541
Salvador	4	84,875
Mexico	65	866,154
Newfoundland and Labrador	2	39,235
Jamaica	7	191,010
Trinidad and Tobago	6	98,646
Other British West Indies	1	5,785
Cuba	288	8,369,882
Dutch West Indies	2	3,114
French West Indies	2	11,130
Dominican Republic	8	99,340
Argentina	33	1,131,070
Bolivia	1	21,410
Brazil	147	4,277,713
Chile	24	445,669
Colombia	18	417,881
Ecuador	3	8,025
British Guiana	1	22,720
Peru	13	199,991
Venezuela	2	24,465
China	86	3,375,510
Kwantung	11	474,458
Chosen	4	18,900
British India	15	363,921
Dutch East Indies	23	640,286
Japan	26	241,449
Australia	3	82,600
New Zealand	2	2,450
Philippine Islands	30	2,895,99
British West Africa	2	2,662
British South Africa	33	1,811,440
French Africa	10	988,800
Portuguese Africa	4	81,000
Egypt	25	1,847,21
Total	1,711	\$53,629,847

## Equipment and Supplies

### Locomotives

THE FERROCARRIL DE MONTEREY (Mexico) has ordered 4, 2-8-0 type locomotives from the American Locomotive Company.

THE SOUTH AFRICAN RAILWAYS are negotiating with the American Locomotive Company for the purchase of 78 locomotives.

THE PARIS-ORLEANS RAILWAY is negotiating with the American Locomotive Company for the purchase of electrical equipment.

THE SOVIET GOVERNMENT OF RUSSIA has placed orders for about 600 locomotives to be manufactured by the following companies: Nydquist & Holm, Inc., of Trollhattan, and Munktelles Mekaniska Verkstads, Inc., of Eskilstuna, Sweden.

### Freight Cars

THE NEW YORK CENTRAL is asking for prices on the repairs of 1,000 steel hopper or gondola cars of 50 tons' capacity.

THE MONTEREY STEEL COMPANY, Mexico, has ordered 50 all steel hopper cars, from the General American Car Company.

THE ILLINOIS CENTRAL has awarded a contract to the General American Car Company, for rebuilding 600 all steel gondola cars.

THE CHICAGO & ILLINOIS MIDLAND has given a contract to the General American Car Company for rebuilding 725 composite gondola cars.

THE MISSOURI PACIFIC, reported in the *Railway Age* of June 10 as inquiring for prices on the repair of 2,000 cars, will have repairs made to 500 wooden box cars by the Sheffield Car Company.

### Iron and Steel

MITSUI & Co., New York, has ordered from the Consolidated Steel Corporation, 350 tons of 25-lb. rail and accessories, for export to Japan.

THE NEW YORK CENTRAL is asking for bids until 12 o'clock noon, July 6, for 100 gross tons of offset side incline type E, under-running third rail; also 1,500 pairs of angle bars.

### Machinery and Tools

THE CHINESE GOVERNMENT RAILWAYS are inquiring through the New York export houses, for machine tools, to cost about \$200,000.

### Track Specialties

THE NEW YORK CENTRAL will receive bids until 12 o'clock, noon, July 13, for a quantity of frogs and crossings, offset splices, stock and lock rails, center points, switches, repair parts for switch stands, switch tongues, switch box covers and repair parts for switches.

### Miscellaneous

THE NEW YORK CENTRAL will receive bids until 12 o'clock noon, July 12, for bridge parts, steel and material for track scales and bridge repairs.

THE LORAIN STEEL COMPANY, Johnstown, Pa., recently made a shipment of about 1,500 tons of switch crossings and track accessories, to Buenos Aires, for use on the railroads in the Argentine Republic.

THE NEW YORK CENTRAL will receive bids until 12 o'clock, noon, July 14, for a minimum of 300,000 gal. and a maximum of 400,000 gal. of Asphaltum base fuel oil with gravity of 18-20 degree Baume, cold test 10 degree.

THE BOSTON & ALBANY will receive bids until 12 o'clock noon, July 12, at Boston, Mass., for 1 complete type E turntable center; 2 cast steel wheel bearings and caps for turntable wheels, one right and left, for 85 ft. turntable; 16 Bearings B, pattern M-452, and 1 complete type E turntable center with exception of saddle casting.

THE ATCHISON, TOPEKA & SANTA FE has placed an order with the Babcock & Wilcox Company, New York, for boilers to be installed in its proposed power plant at Albuquerque, N. M. The company has also ordered engines to be installed in connection with the same project from the Skinner Company, Erie, Pa.

### Signaling

THE MISSOURI, KANSAS & TEXAS has placed an order with the Union Switch & Signal Co., Swissvale, Pa., for 55 style "S" one-arm three-position semaphore signals and necessary apparatus for installation between Labette, Okla., and Vinita. All work will be carried out by railroad company forces.

### Trade Publications

VISCOSIMETER CONVERSION CHARTS.—The May, 1921, issue of *Lubrication*, published by the Texas Company, contains a chart for converting viscosimeter readings from one standard to another. By means of the diagram, the time or degrees can be read directly for the Saybolt, Engler, Redwood Admiralty, Saybolt Furol, or Barbey instruments.

HOISTING EQUIPMENT.—The Dake Engine Company, Grand Haven, Mich., has recently issued a new catalogue of its complete line of air and steam motor hoisting equipment, steam boilers, etc. This catalogue comprises 72 pages, attractively arranged and bound. The catalogue is devoted chiefly to the describing and illustrating of the Dake steam or air operated motor as an integral part of various hoisting equipment, blower fans and centrifugal pumps.

POWER PLANT PIPING.—Valuable data concerning the design, manufacture and installation of complete power plant piping systems are contained in a 130-page, illustrated book recently issued by the M. W. Kellogg Company, New York. Information on the bending and welding of pipe, valves and fittings is presented in a thorough and interesting manner, as well as considerable tabulated matter on the properties of saturated steam, flow of steam and water in pipes, loss of head in pipe by friction, circumferences and areas of circles, etc. Several conversion tables are included.

THE ILLINOIS CENTRAL made a record for passenger train performance during the month of May, when a total of 13,567 trains were operated, 13,461, or 92.2 per cent, of which maintained scheduled time.

EIGHTY-ONE PER CENT REDUCTION in the number of casualties per 1,000 man-hours worked, was the result of a recent 60-day prevention-of-accident campaign conducted on the Baltimore & Ohio by John T. Broderick, Superintendent of Safety, among employees at the principal terminals and shops. The East Side Terminal at Philadelphia, Pa., and the Toledo Terminal, Toledo, Ohio, were the winners of the banners offered by Vice-president C. W. Galloway. The boiler shop at Mount Clare and the maintenance of equipment department at New York won local banners. During the "drive" a record was kept of all bodily injuries and after each accident there was an investigation. The ratio of casualties to man-hours worked this year, as compared with last year during the same period, was the basis on which the winners were determined. On the whole system there was an increase of 231 per cent in man-hours worked per casualty.

## Supply Trade News

R. H. Blackall, Farmers Bank building, Pittsburgh, Pa., will act as railway representative for Pittsburgh and vicinity, for the Lowe Brothers Company, Dayton, Ohio.

The agency for time and motion study watches and other "instruments of precision," formerly held by M. J. Silberg, Chicago, has been taken over by Stein & Ellbogen Company, 31 N. State street, Chicago.

De Forest Lillis, who has been appointed western representative of the Dressel Manufacturing Corporation, New York, successor to the Dressel Railway Lamp Works, as was

noted in the *Railway Age* of June 3, has opened an office in the Railway Exchange building, Chicago. Mr. Lillis has had several years' experience as salesman of railway supplies, and has acted as eastern representative of various western railway supply manufacturers in New York. Before entering the supply field, he was in railroad service on the New York Central, his last assignment being that of chief clerk to the general superintendent of motive power.

De Forest Lillis

P. L. Laughlin, assistant district sales manager of the Verona Tool Works at Chicago, has been promoted to district sales manager, succeeding John B. Seymour, whose appointment as sales manager of the Superior Supply Company, Chicago, was announced in the *Railway Age* of June 17 (page 1422).

H. A. Paarman, assistant to secretary of the Burden Iron Company, Railroad & Steamship division, 3711 Grand Central Terminal, New York City, has been appointed secretary to succeed W. J. Caton, whose death was noted in our issue of June 24. Mr. Paarman will also continue to serve in the sales department of the Sanitation & Supply Company, New York City.

C. J. Burkholder and Frank H. Cunningham have been appointed special engineers of the Franklin Railway Supply Company, Inc., New York. Mr. Burkholder began railroad work at Tyrone, Pa., and subsequently served first as locomotive fireman and then as locomotive engineman on the Union Pacific. He then went with the Kansas City Southern, as locomotive engineman, later serving consecutively as traveling engineer, trainmaster, general road foreman of engines and division superintendent. He then became mechanical representative of the Economy Devices Corporation, which later merged into the Franklin Railway Supply Company, Inc. In November, 1918, he resigned from the position of western sales manager of the Franklin Railway Supply Company to become master mechanic of the Kansas City Southern, which position he held until his appointment as above noted. Mr. Cunningham was born in Roanoke, Va., on May 23, 1886. After serving an apprenticeship as machinist on the Norfolk & Western, he attended the University of Virginia. Following his graduation with the degree of mechanical engineer, he returned to the Norfolk & Western as machinist, subsequently becoming material inspector, mechanical inspector, assistant engineer of tests and supervisor of locomotive

stokers. In 1914, he went with the Standard Stoker Company as fuel engineer, being appointed later to plant manager at Erie, Pa., and assistant general manager, from which position he now resigned to enter the services of the Franklin Railway Supply Company, Inc., as above noted.

## Obituary

Alvin T. Hert, president of the American Creosoting Company, Louisville, Ky., and affiliated companies, died on June 7.

Will H. Bloss, manager steam railroad sales, of the Ohio Brass Company, Mansfield, Ohio, died suddenly from heart failure at his home in Mansfield on June 22. Mr. Bloss was born on April 4, 1869, and received his engineering training at the Indiana University. He started his career in railroad work and subsequently was division engineer on the Santa Fe. He later served as chief engineer of the Indiana Union Traction Company. In 1906 he went to the Ohio Brass Company from the Buda Company of Chicago and was district sales manager in some of the central states until about a year ago. From that time he had devoted his effort to electrification development and other steam railroad problems.

E. E. Hudson, who was elected president of the Waterbury Battery Company, Waterbury, Conn., in March, 1921, died on June 27, at his home in Maplewood, N. J. Mr.

E. E. Hudson

Hudson for the past 22 years, with the exception of a little over a year's time, had been in the sales and managerial departments of concerns manufacturing primary batteries and had been identified with the installation of the primary battery. In July, 1898, he served as chief clerk in the primary battery sales department of the Edison Manufacturing Company, remaining in that position until June, 1902. Shortly afterward, he served as an accountant in the controller's department of the United States Steel

Company. In December, 1903, he became secretary and treasurer of the Battery Supplies Company, Newark, N. J., and in 1905 was appointed sales manager of that company. When the Edison company absorbed the Battery Supplies Company, in 1908, he was appointed assistant manager of sales in the primary battery department. He became sales manager of that department in February, 1909, and in September, 1913, was elected also vice-president. In October, 1914, in addition to these duties, he was given charge of the manufacturing, as well as the sales, and in March, 1915, was made division manager in general charge of the entire primary battery business of Thomas A. Edison, Inc. In 1914 he was chairman of the Railway Telephone & Telegraph Appliance Association, and in 1916 he was chairman of the Signal Appliance Association, previously having been a director. On January 1, 1917, he was elected vice-president and general manager of the Waterbury Battery Company and since March of this year was president of the same company as above noted.

THE OFFICERS of the Reid-Newfoundland Railway say that all business will have to be suspended at once if the government does not come to their relief. During the war the railroad was taken over by the government. Recently it was returned to its owners, who declare that expenses now so greatly exceed income that it is impossible to continue operation without government aid.

## Railway Construction

**ATCHISON, TOPEKA & SANTA FE.**—This company, which was noted in the *Railway Age* of June 24 (page 1470), as about to accept bids for the installation of a new 120 ft. turntable at Winslow, Ariz., is carrying out this project with company forces.

**CHICAGO, BURLINGTON & QUINCY.**—This company is planning an addition to its yards at Centralia, Ill.

**CHICAGO, BURLINGTON & QUINCY.**—This company has resumed work, with company forces, on the street subway structures in connection with the track elevation project at Aurora, Ill.

**CHICAGO, BURLINGTON & QUINCY.**—This company has awarded a contract to G. A. Johnson & Co., Chicago, for the construction of an addition to its railway mail terminal at Omaha, Neb. The company is also accepting bids for the construction of a new grain elevator at St. Joseph, Mo.

**CHICAGO GREAT WESTERN.**—This company has awarded a contract to Charles Weitz, Des Moines, Iowa, for the construction of a frame freight station with dimensions of 40 ft. by 480 ft., at Des Moines, to cost about \$40,000.

**CHICAGO, INDIANAPOLIS & LOUISVILLE.**—This company contemplates the construction of a new freight station at French Lick, Ind.

**CHICAGO UNION STATION.**—This company will shortly accept bids for wrecking the old Chicago & Alton freight house south of Van Buren street, Chicago. The company will also accept bids shortly for grading the new station site between Madison and Adams streets, and for laying a 12-duct conduit line between Harrison and Van Buren streets.

**GREAT NORTHERN.**—This company is installing, with company forces, a new low voltage power interlocking plant at Bridge A-8, near Saunders, Wis. The new low voltage layout will be controlled from the Saunders interlocking plant, located about one mile away, and will replace the present manual interlocking plant at the bridge.

**ILLINOIS CENTRAL.**—This company is accepting bids for the construction of two water-treating plants, one at La Salle, Ill., and the other at Assumption, Ill.

**ILLINOIS CENTRAL.**—This company, which contemplated the construction of a new pumping station at Amboy, Ill., with company forces, has decided to award a contract for this work and is accepting bids.

**ILLINOIS CENTRAL.**—This company has awarded a contract to the Railway Water & Coal Handling Company, Chicago, for water piping and sewer work in connection with the construction of additions and improvements to its roundhouse at Dubuque, Iowa.

**INTERNATIONAL & GREAT NORTHERN.**—This company is accepting bids for the construction of a new hospital building at Palestine, Tex., to cost about \$100,000.

**LOUISVILLE & NASHVILLE.**—This company has awarded a contract to Rommel Brothers, Louisville, Ky., for the construction of a brick and steel power plant at Paris, Tenn.

**LOUISIANA RAILWAY & NAVIGATION.**—This company contemplates the construction of a new passenger station at Girod and Rampart streets, New Orleans, La., on a site purchased by the road some time ago.

**MISSOURI, KANSAS & TEXAS.**—This company contemplates the enlargement of its terminal at Denison, Tex., including the construction of a new roundhouse, to be used for road locomotives, releasing the present roundhouse for switch engines. The company also plans to enlarge its yard, roundhouse and freight house at Fort Worth; improve its roundhouse facilities at Waco; add to its yards and roundhouse at Smithville; install additional roundhouse facilities at Houston, and add to its freight house at Wichita Falls.

## Railway Financial News

**ATCHISON, TOPEKA & SANTA FE.**—*Asks Authority to Abandon Branch.*—This company has applied to the Interstate Commerce Commission for a certificate authorizing it to abandon its Burnett branch in Kay County, Okla., a distance of 4.67 miles.

**ATLANTA, BIRMINGHAM & ATLANTIC.**—*Special Master Appointed.*—Albert G. Foster, of Madison, Ga., has been appointed special master in the receivership of this road.

**BENNETTSVILLE & CHERAW.**—*Asks Authority to Abandon Line.*—This company has applied to the Interstate Commerce Commission for a certificate authorizing the abandonment of 10½ miles of track between Brownsville and Sellers, S. C.

**BOSTON & MAINE.**—*Application for a Loan.*—This company has applied to the Interstate Commerce Commission for a loan of \$3,049,000 for 15 years to enable it to pay the obligation of subsidiary companies about to fall due.

**CHICAGO, MILWAUKEE & ST. PAUL.**—*Acquisition of C. T. H. & S. Approved.*—See Chicago, Terre Haute & Southeastern.

**CHICAGO, ROCK ISLAND & PACIFIC.**—*Loan for Equipment Approved.*—The Interstate Commerce Commission has approved a loan to this company of \$1,568,540 for equipment to be purchased through the National Railway Service Corporation, including 15 Santa Fe locomotives at a cost of \$78,673 each, 10 Mikado locomotives at \$66,705, 10 mountain type locomotives at \$70,103, 50 cabooses at \$4,463 and 500 50-ton gondolas at \$2,300. The Rock Island had originally asked for a loan of \$17,866,503. Commissioner Daniels wrote a dissenting opinion in which he said the fundamental inherent weakness of the leasing basis of financing proposed is its failure to make allowance for possible, not to say probable, fall in the price of equipment during the early years of the trust duration. Should even a moderate fall in price occur, he said, the value of the assets would become materially short of the certificates outstanding.

**CHICAGO, TERRE HAUTE & SOUTHEASTERN.**—*Acquisition by C. M. & St. P. Approved.*—The Interstate Commerce Commission has approved and authorized the acquisition by the Chicago, Milwaukee & St. Paul of control of this company by lease and by the purchase of its capital stock. Authority was also granted to the Chicago, Milwaukee & St. Paul to assume as liability in respect of the payment of the principal and interest of equipment bonds, promissory notes, and mortgage bonds of the Chicago, Terre Haute & Southeastern and bonds of the Bedford Belt and the Southern Indiana. That part of the application requesting a certificate of public convenience and necessity for the abandonment by the Chicago, Terre Haute & Southeastern of the operation of its line was dismissed as unnecessary.

**CUBA RAILROAD.**—*New Director.*—William H. Woodin, president of the American Car & Foundry Company, has been elected a director, thereby increasing the board from ten to eleven members.

**DELTA SOUTHERN.**—*Asks Authority to Abandon Line.*—This company has applied to the Interstate Commerce Commission for a certificate authorizing it to abandon its line of 52 miles in Mississippi.

**FLINT BELT.**—*Asks Authority to Issue Capital Stock.*—This company has applied to the Interstate Commerce Commission for authority to issue \$1,000,000 of capital stock, the proceeds to be used in the construction of its railroad. The stock is to be acquired by the Pere Marquette.

**GREENE COUNTY.**—*Loan Approved.*—The Interstate Commerce Commission has approved a loan of \$60,000 to this company to assist it in meeting maturing indebtedness.

**ILLINOIS CENTRAL.**—*Bond Issue.*—Kuhn, Loeb & Co. have sold an issue of \$8,000,000 fifteen-year 6½ per cent secured gold bonds. The issue was formally offered for public subscription on Mon-

# Annual Report

## Southern Pacific Company—Thirty-seventh Annual Report

New York, N. Y., June 23, 1921.

TO THE STOCKHOLDERS OF THE SOUTHERN PACIFIC COMPANY:  
Your Board of Directors submits this report of the operations and affairs of the Southern Pacific Company and of its Proprietary Companies for the fiscal year ended December 31, 1920.

As stated in last year's report, the Federal Government, which took over the railroads and steamship lines of your company on December 28, 1917, relinquished control of such properties at 12:01 A.M., March 1, 1920. Your properties, therefore, were operated by the Director General of Railroads during the first two months of the year, and by your company during the last ten months of the year. In the following table showing the net railway operating income of the Southern Pacific Transportation System for the year 1920, compared with that for the year 1919, the figures for 1920 include the results from the operation of your properties for the entire year, regardless of the change in the form of control. To make the figures for 1919 comparable, they have been revised to include, in addition to Federal operations, \$1,457,685.84, corporate operating expenses, and \$2,433,617.90, war taxes, which, in the report for last year, were included in the deductions from Corporate income.

\*Credit.

### FEDERAL OPERATIONS

The Director General of Railroads operated your properties during the months of January and February, 1920. The net income for those months amounted to \$4,869,574.25.

The following table shows the results of Federal operations during the whole period of Federal control—January 1, 1918, to February 29, 1920—compared with the standard return compensation payable by the United States Government for the use of your properties.

	Federal Income in excess of Standard Return	Standard Return in excess of Federal Income
1918 .....	\$7,757,935.04	—
1919 .....	—	\$4,334,355.44
January and February, 1920 .....	—	\$3,173,713.78
*Federal income in excess of Standard Return entire period of Federal control .....	\$249,865.82	—

\*This result may be changed when the accounts between the Director General of Railroads and the various corporations are finally settled.

Operating revenues .....	\$282,269,504.25
Operating expenses .....	242,113,790.06
Net revenue from railway operations .....	40,155,714.19
Operating ratio, per cent. ....	85.77
Total train miles .....	51,890,806
Traffic units (ton miles plus 3 times passenger miles) .....	22,010,457,900

The status of the accounts of your Company and its Proprietary Companies at December 31, 1920, with the United States Railroad Administration, incident to the period of Federal operations, is shown in the balance sheet. The net balance of \$1,695,262.66 due from the Government, as shown by such accounts, is made up as follows:

Due from Government on account of depreciation reserves, and road and equipment retirements .....	\$10,879,165.36
Less:	
Amounts advanced by Government for additions and betterments; expenses prior to January 1, 1918, and other corporate liabilities in excess of cash, agents' and conductors' balances; revenues prior to January 1, 1918; balance due on standard return; and other corporate assets collected .....	\$8,217,508.62
Agents' and conductors' balances at February 29, 1920 .....	594,037.01
Book value of materials and supplies turned over by Director General on February 29, 1920, in excess of the book value of materials and supplies taken over by him on January 1, 1918 (subject to adjustment as noted below) .....	372,357.07
Balance due from Government .....	\$1,695,262.66

Under the contract with the Director General he is required to return to the companies at the end of Federal control, materials and supplies equal in quantity, quality and relative usefulness to the materials and supplies which he received, or to pay for any deficiency at prices prevailing at the end of Federal control. Pending final settlements of the accounts, the Director General's value of the materials and supplies, returned by the Director General on March 1, 1920, has been temporarily credited to the Government accounts. Owing to the high prices prevailing during, and at the end of, Federal control, the value of the materials and supplies returned by the Director General was considerably in excess of the value of the materials and supplies taken over by him; but as the quantity returned was less than a whole, there will be a considerable amount due from the Government on account of materials and supplies, instead of an amount due to the Government, as indicated by the foregoing statement.

### GUARANTY PERIOD OPERATIONS

As stated in last year's report, your company accepted, for itself and all its system lines, the guaranty offered by the Government under the terms of the Transportation Act of 1920, to the effect that the railway operating income for the six months' period beginning March 1, 1920, should not be less than one-half of the annual compensation fixed in the contract made with the Director General of Railroads under the Federal Control Act, including additional compensation for use of additions and betterments.

One of the provisions of such guaranty was, that there should not be included in operating expenses for maintenance of way and structures, or maintenance of equipment, during the guaranty period, more than an amount fixed by the Interstate Commerce Commission. The Commission has not yet fixed the amount of such maintenance expenditures to be included in operating expenses, and in determining the results of operation and the amount due from the Government for the guaranty period as shown below, there have been included in maintenance expenses only the actual expenditures for maintenance during the guaranty period, and the known unaudited expenses attributable to such period.

### AMOUNT DUE FROM U. S. GOVERNMENT UNDER ITS GUARANTY

Amount of Government's guaranty for the six months' period from March 1 to August 31, 1920, being one-half of the annual compensation fixed in the contract of February 19, 1919, with the Director General, as changed by the Interstate Commerce Commission up to December 31, 1920 ..... \$23,979,110.92 || Net railway operating income for the above period as hooked to December 31, 1920 ..... | 3,488,683.42 |

Estimated balance due from the Government, as determined above, taken into the year's income account ..... \$20,490,427.50 |

The amount of the Government's guaranty, as shown above, does not include any additional compensation for the use of additions and betterments, new equipment, and road extensions, as complete data for computing such additional compensation were not available at the time the income account for the year was closed.

Under the Transportation Act the Interstate Commerce Commission is required, as soon as practicable after the expiration of the guaranty period, to ascertain and certify to the Secretary of the Treasury the amount necessary to make good the guaranty to each carrier. In its order the Commission issued an order requiring each carrier which had accepted the guaranty offered by the Government to file a statement showing the amount due to the company by the Government under the latter's guaranty as computed by the Commission. In its order the Commission stated it had adopted no formula for computing the maintenance allowance for the guaranty period, and suggested that each carrier should prepare and submit for the consideration of the Commission such data in connection with the maintenance allowance proposed by the carrier as the latter should consider proper. Since the close of the year your company has prepared and filed its claim in accordance with such order, and it is hoped that an early settlement will be obtained.

Following is a summary of operating revenues, operating expenses and net revenue from railway operations also true value of materials and supplies, the results of transportation operations for 1920 compared with 1919 and 1918 under Federal control, and with 1917, the last year of private operation prior to Government control:

	1920	1919	1918	1917
Operating revenues .....	\$282,269,504.25	\$239,657,272.35	\$221,611,216.61	\$43,000,489.54
Operating expenses .....	242,113,790.06	188,385,172.35	162,722,371.84	120,601,822.82
Net revenue from railway operations .....	40,155,714.19	51,272,100.00	58,888,844.77	73,369,706.72
Operating ratio, per cent. ....	85.77	78.61	73.43	65.8
Total train miles .....	51,890,806	46,865,200	49,701,385	54,904,763
Traffic units (ton miles plus 3 times passenger miles) .....	22,010,457,900	20,198,015,285	20,836,032,662	20,822,863,833

The above table illustrates the constant and enormous growth of operating expenses since 1917, which is the result of changed conditions commencing with Federal control, the net revenue of 1920 being 45.2% less than 1917 despite movement of 5.4% more traffic units with 3.9% less train miles. Average railway wages were increased by governmental agencies, either during or subsequent to Federal control, to a figure 92% above the average for 1917. The expense of operating your property has been profoundly affected by this cause and by increases in prices of fuel, ties, lumber and all other kinds of material used in operation. The net revenues of 1920 were further decreased through the failure to advance freight and passenger rates to cover added prices until the end of August, whereas the large wage award made by the United States Railroad Labor Board was retroactive from May 1, 1920. Expenses of 1920 were augmented through

various agreements of a national character executed by the Director General late in 1919 establishing working rules under which compensation is allowed in excess of the value of services performed, and time and one-half punitive overtime is paid after 8 hours in various classes of service, including operation of freight trains where delay to such trains is rewarded by premium payments for overtime.

Since the return of your lines on March 1, 1920, the initiative of your organization has resumed effect, normal service has been restored, unfair rate relationships have been corrected and progress has been made in recovering diverted traffic.

Comparing 1920 with 1919, ton miles of revenue freight increased 8.53%; revenue passengers carried one mile increased 7%, augmented by increased tourist travel and large conventions on the Pacific Coast, and operating

(a) The \$1,457,689.84 of operating expenses for 1919 (lines 10 to 18) together with the \$32,154.99 of Maintenance of investment organization (line 52) make up the corporate operating expenses reported last year; and the \$2,433,617.90 of Railway tax accruals for 1919 (line 20) are the war taxes reported last year. These figures are reported this year against the figures for 1919 to 20 for comparative purposes. (b) Loss. (c) Credit. (d) Represents the proportion for January and February, 1920, of annual compensation payable by United States Government for use of Southern Pacific Transportation System, as fixed in the agreement with the Director General of Railroads. (e) Represents the approximate amount due from United States Government, under its guaranty, for six months ended August 31, 1920. (f) This year's figures include \$121,432.25 and last year's figures \$414,843.36 representing investment organization for January 1, 1918. (g) This year's figures include \$102,739.05 and last year's figures \$337,856.83 representing expenses prior to January 1, 1918. (h) Includes \$334.00 representing dividends on stocks of Proprietary Companies held by the Public.

revenue increased \$42,612,232 or 18%. These results were adversely affected by a protracted strike of longshoremen (and coastwise steamship lines extending from March until August (in which the demands of the strikers were successfully resisted) and an increasing diversion of trans-continental tonnage to the Panama Canal during the latter part of the year. On the other hand, increased freight and passenger rates were authorized by the Interstate Commerce Commission to become effective August 26, 1920, the benefits of which accrued during the last four months of the year except that some of the states denied corresponding increases on intrastate traffic which (upon appeal to the Interstate Commerce Commission) with unimportant exceptions, have been more recently authorized.

The increase of \$53,728,617.71, or 28.52%, in railway operating expenses was largely due to higher wage schedules effective May 1, 1920, established by the United States Railroad Labor Board, to the national labor agreement before mentioned, and to increases in prices for fuel and other materials, and to the expense of moving 7.28% heavier passenger traffic and 9.90% heavier freight traffic than in previous year, the traffic volume of 1920 having been the greatest in the Company's history.

Maintenance of Way and Structures increased \$13,571,307.95, or 38.89%. Materials used in maintenance include: \$27.76 miles of new steel rail; 4,887,913 ties, equal to 1,704.89 miles of continuous track, and 3,316,915, or 578.46 miles of tie plates.

Maintenance of Equipment increased \$11,536,939.05, or 24.03%, the greater equipment mileage incident to heavier traffic necessitating more maintenance than was expended at higher prices for labor and material. Your Company shares with other railways the disastrous effect of under-maintenance of freight cars during Federal control. These cars were used by the Railroad Administration regardless of ownership and were operated without maintenance, 87.5% of the Company's box cars being away from home when the roads were returned to private management. With the return of these cars to home lines in large numbers at the close of 1920 and the early part of 1921, the greatest extent of their under-maintenance has been developed, and on June 1, 1921, with 80% of our cars on home lines, we find 16% of them are in bad order and require repairs, as compared with 4.6% out of service for repairs when the road went under Federal control at the end of 1918. The work of placing this equipment in good condition must be undertaken during the current year, at very heavy cost.

Traffic Expenses increased \$1,234,045.92, or 54.68%, due to the higher price conditions affecting all expenses and to the restoration of traffic agencies and bureaus of information for the convenience of the public and to regain traffic diverted from the Company's lines during Government control.

Transportation Expenses increased \$23,947,467.13, or 25.67%, incident to an increase of 10.72% in train mileage required to move the greater traffic of 1920 and to higher wages and increased cost of fuel and other materials. The restoration of car and train service of which the public had been deprived during Federal control and to the lack of which they were unwilling to submit when no longer urged by patriotic motives, there was a slight decrease of 0.71% in average freight car load and of 3.89% in average freight train freight, but the passenger train load increased 46%. The gross ton mileage moved per pound of fuel (oil equated to coal on basis of four barrels of oil to one ton of coal) shows a slight decrease in freight service and an increase in passenger service. Compared with 1919, the more efficient use of fuel in 1920 is equivalent to a saving of \$5,478,000 and for the seven years 1914 to 1920, inclusive, the saving amounts to \$18,669,000.

Miscellaneous operations increased \$1,377,769.53, or 32.56%, allocating to dining cars, hotels and restaurants, the increases being generally offset by increased revenue received from these sources. General expenses increased \$2,010,912.07, or 32.96%, due to increased charges for Federal valuation work, increased accounting requirements incident to Government control and guaranty periods, and higher wage scales.

Item No. 23, Equipment Rents, shows an increase of \$4,874,856.86. This increase allocates to rentals received in 1919, but not in 1920, for ocean steamships leased to the United States Government; to increased rental payments made to the Pacific Fruit Express Company, in which this Company has a half interest; and to the omission during Federal control of rentals for cars interchangeably between railways.

The increase shown in Net Railway Operating Income (line 24) is due to the fact that during the year 1919, and for the months of January and February, 1920, your properties were operated by the U. S. Railroad Administration, under the Federal Control Act, and all operating revenues accrued to and all operating expenses were borne by the U. S. Government. For that period your Company received the standard rental, shown on line 31, as fixed in the agreement with the Director General of Railroads. During the ten months, March 1 to December 31, 1920, the properties were operated by your Company, and the amounts reported in column "Year ended December 31, 1920" (lines 1 to 24), represent the operating revenues and operating expenses for those ten months. As the Government received the revenues and paid the expenses during 1919, with the exception of corporate expenses and with some items for which the year 1919 is the accounting year, the increase of \$10,573,078.17 in Railway Tax Accruals (line 20) is due to the fact that during the year 1919, and for the months of January and February, 1920, all taxes except war income taxes were assumed by the U. S. Railroad Administration, while subsequent to March 1, 1920, the date on which the Government relinquished control of your properties, all taxes were borne by the Company.

The decrease of \$5,050,954.82 in Miscellaneous Operating Income (line No. 29) is due to the fact that this year's figures include only two months of operations of the California Fuel Oil Department, the property having been sold to Southern Pacific Land Company on February 29, 1920. There is, however, an increase in dividend income of \$4,000,000 on account of dividends received from Southern Pacific Land Company.

The decrease of \$40,201,372.00 in Income from Lease of Road—Standard Return (line No. 31) is due to the fact that this year's figures include the standard return for the months of January and February only while the property was operated by the Government. This decrease is offset by the increase of \$20,416,249.07 in Net Railway Operating Income (line No. 24) and the estimated amount of \$20,490,427.50 in Miscellaneous Income—U. S. Government Guaranty (line No. 30).

The increase of \$1,014,964.39 in Income from Unfunded Securities and Accounts (line No. 39) represents interest on U. S. Government Certificates of Indebtedness, bank acceptances, and increased bank deposits, resulting principally from the sale of about \$8,500,000 of Liberty Loan bonds in January, 1920, and the unapplied proceeds of the sale in June, 1920, of \$15,000,000 of Series "E" Equipment Trust Certificates.

The decrease of \$20,222.37 in Other Miscellaneous Income (line No. 42) is the result, principally, of a decrease in the credit for lap-over items of revenue prior to January 1, 1918, but not only of the decrease in such items, but also to the fact that since the end of Federal Control such items have been included in the appropriate operating revenue accounts in the Interstate Commerce Commission.

## DEDUCTIONS FROM GROSS INCOME

The decrease of \$40,742.19 in Rent for Leased Roads (line No. 45) is the result, principally, of a payment made last year on account of rental for the year 1918.

The decrease of \$116,766.73 in Miscellaneous Rents (line No. 46) is the result, principally, of a decrease in the rental for pipe line for use of California Fuel Oil Department, the latter having been sold to Southern Pacific Land Company on February 29, 1920.

The increase of \$131,776.02 in Miscellaneous Tax Accruals (line No. 47) is the result, principally, of a general increase in the rate of taxation. Interest on Funded Debt—Bonds and Notes (line No. 48) shows a decrease for the year of \$167,632.93. The interest was increased \$707,221.67 by the issue this year of the \$15,000,000 of Seven Per Cent. Equipment Trust Certificates, Series "E," and of the \$2,814,000 of Six Per Cent. Equipment Trust obligations issued in payment for equipment assigned by the Director General of Railroads. It was decreased \$619,135.11 by the conversion of Southern Pacific Company Four and Five Per Cent. Twenty-year Convertible bonds; \$126,609.56 by the retirement of bonds through sinking funds, etc.; and \$129,109.93 by the acquisition of bonds by Southern Pacific Company and Proprietary Companies.

The decrease of \$223,763.41 in Interest on Unfunded Debt (line No. 50) represents, principally, interest paid last year on funds borrowed for the purchase of Liberty Loan Bonds.

The decrease of \$122,903.13 in Amortization of Discount on Funded Debt (line No. 51) is the result, principally, of the conversion during the year of \$24,656,000 par value, of Five Per Cent. Twenty-year convertible bonds into Common Stock, the unextinguished discount on such bonds having been charged to Profit and Loss.

The increase of \$289,443.88 in Other Miscellaneous Income Charges (line No. 53) is due to an adjustment made this year correcting an erroneous debit to Expense for January 1, 1918, made in December, 1918.

The dividends paid during 1920 were appropriated from the profit and loss surplus, and therefore do not appear in the Income Account. They amount to \$18,209,596.82 for the year, an increase of \$731,137.70. The increase is due to the dividends on stock issued against Five Per Cent. Convertible bonds retired. The figures for this year include \$316,000, and those for last year \$334,000, representing dividends on stocks of Proprietary Companies held by the public.

On December 31, 1920, the principal of advances to the Southern Pacific Railroad Company of Mexico amounted to \$38,799,747.41. The interest accruing on these advances has not been taken into the income of the Southern Pacific Company.

## CAPITAL STOCK

The capital stock of the Southern Pacific Company outstanding at the beginning of the year amounted to..... \$302,024,905.64

Issued during the year.....  
Common stock issued in exchange for a like amount of Five Per Cent. Twenty-year Convertible Gold Bonds surrendered and cancelled..... 24,416,500.00

Amount of Southern Pacific Company capital stock outstanding December 31, 1920..... \$326,441,405.64

There was no change during the year in the capital stocks of the Proprietary Companies.

The amounts outstanding December 31, 1920, were as follows:

Preferred stock .....	\$29,400,000.00
Common stock .....	317,432,400.00
	\$346,832,400.00

Capital stocks of Proprietary Companies outstanding December 31, 1920, were held as follows:

In hands of public.....	\$75,600.00
Owned by Southern Pacific Company.....	\$346,456,800.00
Owned by Morgan's Louisiana & Texas Railroad & Steamship Company.....	300,000.00
	\$346,756,800.00
	\$346,832,400.00

## FUNDED DEBT

On June 1, 1920, to provide for the construction and acquisition of new rolling stock, an equipment trust, known as "Southern Pacific Equipment Trust, Series E," was created and an issue of \$15,000,000, par value, Seven Per Cent. Equipment Trust Certificates authorized, all of which were issued during the year. The certificates are dated June 1, 1920, and mature serially in lots of \$1,250,000 on June 1 of each year from 1924 to 1935, both inclusive. In accordance with the terms of the trust all of the certificates were guaranteed by the Southern Pacific Company.

The \$2,814,000 of Six Per Cent. Equipment Trust Notes to be issued in payment for the 1,000 box cars which the company was compelled to take over from the Director General, as explained in last year's report, were charged to the equipment trust. As the purchase price of such equipment is finally determined upon only slightly exceeding the minimum purchase price, the difference was paid in cash, so that no further equipment notes are to be issued in connection with such equipment.

The funded and other fixed interest-bearing debt of the Southern Pacific Company and of its Proprietary Companies, outstanding December 31, 1919, was as follows:

Southern Pacific Company.....	\$167,608,760.00
Proprietary Companies.....	444,479,901.73

Total outstanding December 31, 1919..... \$612,088,661.73

Issued during the year.....

SOUTHERN PACIFIC COMPANY:	
Seven Per Cent. Equipment Trust Certificates, Series "E".....	\$15,000,000.00
Six Per Cent. Temporary Equipment Gold Notes.....	2,814,000.00
	17,814,000.00

Retired during the year.....

SOUTHERN PACIFIC COMPANY:	
San Francisco Terminal First Mortgage Four Per Cent Bonds:	
Purchased from payments to sinking fund.....	\$7,100.00
Five Per Cent. Twenty-Year Convertible Gold Bonds:	
Retired in exchange for a like amount of common stock issued.....	24,416,500.00

Total liabilities.....	\$1,933,291,369.70	\$1,764,947,577.43	\$168,343,791.27		

(a) The outstanding capital stock and funded debt include capital stocks and funded debt of Proprietary Companies of the par value of \$346,756,500 and \$107,322,900.45, respectively, a total of \$454,079,400.45, which securities are owned by the Southern Pacific Company or by Proprietary Companies, or are held in sinking funds of Proprietary Companies. The cost of these securities is included in the investments shown above. Of the said amount, stocks of the par value of \$249,653,161, which stand charged on the books at \$232,932,667.41, are pledged against the issue of Southern Pacific Company stock and bonds. (d) Represents accrued depreciation on electric power plants and substations, general office building at San Francisco, wood preserving works, Sacramento rolling mill, oil storage plants, grain elevators, and similar facilities. (e) Represents, principally, interest on construction advances which have not been repaid.

#### ADDITIONAL ROLLING STOCK AND FLOATING EQUIPMENT

As indicated in last year's report, the following rolling stock, ordered to provide for increased requirements and to replace vacated equipment, was included in Southern Pacific Equipment Trust, Series E, created June 1, 1920:

72 locomotives  
4,815 freight-train cars  
50 passenger-train cars  
140 electric cars

The total estimated purchase price of such equipment is \$22,500,000. Of this amount the sum of \$15,000,000 has been provided by the equipment trust certificates issued under the above-named trust, and the remaining \$7,500,000 will be provided out of the general funds of the company. A part of such equipment has been placed in service, and it is expected that the remainder will be delivered and placed in service during the calendar year 1921.

In addition to the above equipment there were delivered by outside builders or completed at company's shops during the year 3 locomotives, 16 passenger-train cars, 251 freight-train cars, and 4 electric cars, the total cost of which was \$971,000.

Of the four steamships mentioned in last year's report, the freighter El Estero was placed in service November 24, 1920; the freighter El Iselo, January 20, 1921; and the freighter El Lazo, March 14, 1921. It is expected that the tank steamer Tamiahua will be completed and delivered during the latter part of 1921. The contract price of these four steamers is \$7,430,000.

#### THE SUIT INVOLVING THE RIGHT OF THE SOUTHERN PACIFIC COMPANY TO OWN THE STOCK OF THE CENTRAL PACIFIC RAILWAY COMPANY

In last year's report (page 22) it was stated that this case was pending before the Supreme Court of the United States on an appeal by the Government from a decision against it in the lower Court, and that it was expected that the case would be argued and submitted at the October Term, 1920. The case came up for hearing in the Supreme Court on April 17, 1921; and, after full oral argument, was submitted on April 19th and taken under advisement by the Court. An early decision is expected.

#### CONTROVERSY ARISING OUT OF THE OREGON & CALIFORNIA RAILROAD'S LAND GRANT

This is an accounting suit brought in 1917 by the United States seeking to offset against the compensation of \$2.50 per acre, due the Company for the unsold lands, moneys received by the Company, in excess of \$2.50 per acre, by reason of past sales, leases, and otherwise, as well as taxes levied since the forfeiture decision in 1913 and voluntarily paid by the Federal Government to the State of Oregon. This case is truly far-travelled and will probably be heard and decided in the United States District Court of Oregon some time during 1921.

# SEPARATION OF CALIFORNIA OIL PROPERTIES— INCLUDING STOCKHOLDING IN ASSOCIATED OIL COMPANY— FROM RAILROAD PROPERTIES

At a meeting held December 1, 1920, your board of directors adopted the following plan for the separation of the California oil properties—including the stockholding in the Associated Oil Company—from the railroad properties.

A new company, known as the Pacific Oil Company, was organized under the laws of the State of Delaware with a capital stock of 3,500,000 shares of no par value, and the Southern Pacific Company subscribed for the entire capital stock at \$15.00 per share. Of the \$52,500,000 so realized the new company retained \$8,750,000 as a working capital and expended the remainder, \$43,750,000, in purchasing from the Southern Pacific Land Company (the entire capital stock of which is owned by the Southern Pacific Company)—

- (a) About 259,000 acres of land owned by the Southern Pacific Land Company, situate in the State of California, of which about 25,000 acres are proven oil lands and the remainder lands heretofore withdrawn from sale as possible oil lands, together with existing field improvements and materials and supplies;
- (b) 200,000 shares, par value \$20,000,000, representing 50.48% of the outstanding capital stock of the Associated Oil Company.

Holders of the capital stock of the Southern Pacific Company registered as such on the books of the company at the close of business on January 14, 1921, were given the right to purchase at \$15.00 per share (\$15.00 per share, payment to be made in full on or before March 1, 1921) one share of stock of the new company for each share of Southern Pacific Company stock so held.

The capital stock of the new company was fixed at 3,500,000 shares, to correspond as nearly as possible to the total number of shares of Southern Pacific Company stock outstanding together with the number of shares reserved for conversion of the company's 5% convertible bonds. Holders of \$38,329,500 of these bonds subsequently exchanged their bonds for Southern Pacific Company stock, so that as of January 14, 1921, there were 3,443,809 shares of Southern Pacific Company stock outstanding.

Southern Pacific Company stockholders, or their assigns, purchased an aggregate of 3,414,604 shares of Pacific Oil Company stock, thus leaving in the company's treasury at this date 85,396 shares of such stock, which will be held subject to such disposition as your board of directors may determine.

## Divisions A—MILEAGE OF LINES OPERATED BY SOUTHERN PACIFIC COMPANY:

	First Main Track	Additional Main Track	Sidings	Ferries	Water Lines
1. Owned by Southern Pacific Company:					
Rail lines.....	547.72	15.88	213.22	—	4,400.00
Water lines.....					
2. Leased from Proprietary companies:					
(a) Central Pacific Railway.....	2,288.97	253.43	944.47	9.90	125.00
(b) Oregon & California Railroad.....	701.50	4.60	186.95		
(c) Southern Pacific Railroad.....	3,491.07	207.83	1,525.49	3.00	
(d) South Pacific Coast Railway.....	105.14	20.46	49.12	3.00	

## B—MILEAGE OF LINES OPERATED BY THE FOLLOWING PROPRIETARY COMPANIES:

1. Arizona Eastern R. R. Co. ....	382.66	—	82.52		
2. Houston & Texas Central R. R. Co. ....	932.82	14.56	274.34		
3. Galveston, Harrisburg & San Antonio Ry. Co. ....	1,380.03	45.25	438.44		
4. Texas & New Orleans R. R. Co. ....	475.54	11.83	218.88		
5. Houston East & West Texas Ry. Co. ....	191.69	8.89	12.20		
6. Houston & Shreveport R. R. Co. ....	40.74	.69	6.94		
7. Morgan's Louisiana & Texas R. R. & S. S. Co. ....	400.67	58.35	250.74	3.00	
8. Louisiana Western R. R. Co. ....	207.74	—	87.72		
9. Lake Charles & North R. R. Co. ....	2.66	—	63.32		
10. Iberia & Vermilion R. R. Co. ....	21.44	—	11.21		
11. Southern Pacific Terminal Co. ....	—	—	25.05		
Total.....	11,240.30	633.77	4,392.81	18.90	4,525.00
Less mileage used in connection with property of two or more of above companies and included in mileage of each.....	31.23	29.99	69.07		
Total miles of road operated at December 31, 1920.....	*11,209.07	603.78	4,323.74	18.90	4,525.00
Total miles of road operated at December 31, 1919.....	11,089.68	771.60	4,249.00	18.90	4,525.00
Increase.....	119.39	—	74.74		
Decrease.....	—	167.82			
Average miles of road operated during year 1920.....	11,151.60	618.93			

\*Includes 11.05 miles owned jointly with other companies, 4.37 miles leased from other companies, and 160.63 miles operated under trackage rights, and excludes 41.34 miles of owned lines leased to other companies.

The carrying out of this plan has completely divorced the California oil properties from the railroad properties.

## SOUTHERN PACIFIC RAILROAD COMPANY OF MEXICO

The value of the property damaged or destroyed from the beginning of the Madero revolution in 1910 down to December 31, 1920 (including that damaged or destroyed during the revolution against Carranza) now amounts to \$421,326 pesos, equivalent to \$271,063. While the company has been unable to make any collections this year on account of these depredation claims, the claims were checked during October, November and December, 1920, by representatives of the Government in connection with representatives of the Company and no serious objections were raised to the claims as originally filed. The Company has claims against the Mexican Government aggregating 15,935,586 pesos, equivalent to \$10,267,793, representing amounts due for freight and passenger service performed, for rental of road and equipment, and for materials furnished to or confiscated by the various military authorities. About one-half of these latter claims have been filed with the department of the Government, and the remainder are in the hands of our fiscal representative in the City of Mexico and are being filed as rapidly as the congested condition of the departments will permit. Since the inauguration of President Obregon on December 1, 1920, payments amounting to \$2,560 pesos have been made on account of these latter claims, while additional claims amounting to 587,350 pesos have been approved for payment.

The Company has also filed claims aggregating 5,908,816 pesos equivalent to \$2,954,408, for the cost of restoring the Alamos and Tonichi Branches and the main line from Acaponeta to Tepic, the operation of which were compelled to abandon in the spring of 1913. These claims are, of course, subject to correction when these lines are restored and again placed in operation and the actual cost can be determined.

The average miles of road operated during the year was 1,001.47 miles, and only such maintenance work was carried on as was found necessary for the operation of trains over those portions of the line open for traffic.

## LOS ANGELES UNION TERMINAL COMPANY

The Southern Pacific Company has acquired the entire capital stock, \$3,250,000 par value, of the Los Angeles Union Terminal Co. in exchange for value of lands transferred to the Terminal Company and a part of the construction costs incurred. This enterprise occupies nineteen acres of land at Seventh Street and Central Avenue, being in the heart of the newer wholesale district, and at the intersection of the principal east and west retail street of the city and the lines of your company. The major part of the wholesale produce and fruit business of the city is carried on at this terminal, and in addition a number of important manufacturing and jobbing firms have their plants established there. Two six-story reinforced concrete buildings, with basements, having a rentable floor area of 846,906 square feet, or 19.5 acres, have been erected, and a third is under construction. The market section is of two-story concrete buildings, supplied in part with basements and with a rentable floor area of 405,352 square feet, or 9.3 acres. The completed buildings are at this time 98.8 per cent. rented. The terminal company is served exclusively by the Southern Pacific Company and its subsidiary the Pacific Electric Railway Company, the latter under agreement doing all the switching for both companies. The enterprise is productive of a very large freight traffic for your company.

## LOS ANGELES PUBLIC MARKET COMPANY

Your company has also acquired substantially all the stock of the Los Angeles Public Market Company owning fifteen and one-half acres of land at Second and Alameda Streets, one block from the site of the Los Angeles Union Terminal Company.

This property, formerly the site of the Los Angeles Produce Market until the produce business outgrew its facilities, it is planned eventually to use for railway purposes. At this time the buildings thereon are rented to 85% of capacity, the tenants including overflow from produce section of the Los Angeles Union Terminal Co., the terms of occupancy being such as to permit without delay the use of the property for railway purposes when needed.

## PROPERTIES AND MILEAGE

The transportation lines of the Southern Pacific Company, and of certain affiliated companies herein referred to as "Proprietary Companies," constituting the Southern Pacific Transportation System, operated at December 31, 1920, were as follows:

In addition to the 11,209.07 miles above tabulated, the Southern Pacific

Company solely controls through ownership of capital stock, 854.34 miles of Affiliated Companies and 1,240.52 miles of the Southern Pacific R. R. Co. of Mexico, and jointly controls (through ownership of capital stock in equal proportions) with the Atchison, Topeka & Santa Fe Ry. Co. 534.2 miles of the Southern Pacific Railroad and 39.66 miles of the Sunset Railway and with Messrs. John D. and A. B. Spreckels 156.15 miles of the San Diego & Arizona Railway, A GRAND TOTAL OF 14,054.16 MILES.

## GENERAL

Dividends on the capital stock of your Company were declared during the year, payable as follows:

1 1/2 per cent. paid April 1, 1920.....	\$4,531,054.93
1 1/2 per cent. paid July 1, 1920.....	4,531,303.17
1 1/2 per cent. paid October 1, 1920.....	4,531,311.08
1 1/2 per cent. payable January 3, 1921.....	4,615,611.64

Total.....\$18,209,280.82

On May 15, 1920, the Southern Pacific Equipment Company was organized under the laws of California, for the purpose of constructing and acquiring equipment for Southern Pacific Company and its affiliated companies. All the outstanding capital stock of the new company is owned by Southern Pacific Company. Of the new equipment mentioned on page 20 the Southern Pacific Equipment Company is building 30 locomotives, 2,000 box cars, 1,000 stock cars, 1,000 flat cars, and 65 caboose cars. It is also building 1,000 of the 4,000 new refrigerator included in the Pacific Fruit Express Equipment Trust mentioned in last year's report.

Under the pension system put into effect January 1, 1903, there were carried on the pension rolls at the end of the year 1,022 employees. The payments to pensioners for the year amounted to \$465,566.62.

By order of the Board of Directors,  
JULIUS KRUTTSCHNITT,  
Chairman of the Executive Committee.

(Continued from page 42)

day at 97¼ and accrued interest, to yield about 6.80 per cent, and was twice oversubscribed by midday.

The bonds are not redeemable before maturity and are secured by the deposit as collateral of \$8,225,000 face value Illinois Central refunding mortgage 4 per cent gold bonds, due 1955, and \$3,820,000 face value Illinois Central and Chicago, St. Louis & New Orleans Railroad joint refunding mortgage 5 per cent bonds, due 1963. The issuance of the bonds is subject to the approval of the Interstate Commerce Commission.

**MINNEAPOLIS & ST. LOUIS.—Loan for Equipment Approved.**—The Interstate Commerce Commission has approved a loan of \$386,150 to this company to be used in the purchase of 15 freight locomotives at \$64,365 each through the National Railway Service Corporation. The company had asked for a loan of \$4,398,500. Commissioner Daniels wrote a dissenting opinion similar to that in the case of the Chicago, Rock Island & Pacific above noted.

**MINNEAPOLIS, ST. PAUL & SAULT STE. MARIE.—Authorized to Issue Equipment Notes.**—This company has been authorized by the Interstate Commerce Commission to issue and sell \$2,400,000 of equipment notes.

**NEW YORK, NEW HAVEN & HARTFORD.—Application for a Loan.**—This company has applied to the Interstate Commerce Commission for a loan of \$8,000,000 for 15 years from the revolving fund to reimburse the treasury for payments to retire maturities and to provide for additions and betterments amounting to \$1,401,000.

**ORANGEBURG.—Authorized to Abandon Line.**—This company has been authorized by the Interstate Commerce Commission to abandon its line between Orangeburg and North, S. C., a distance of 17.7 miles.

**READING COMPANY.—Annual Report.**—The annual report for the year ended December 31, 1920, of this company, which is the holding company for the Philadelphia & Reading Railway, the Philadelphia & Reading Coal & Iron Company, etc., shows the following income account as compared with the calendar year 1919:

	1920	1919
Receipts:		
Interest and dividend receipts.....	\$11,942,639	\$11,600,508
Rent of equipment.....	3,773,830	3,772,605
Rent of Delaware River wharves and other property.....	349,864	374,520
	\$16,066,333	\$15,747,633
Expenses:		
Contingent.....	125,988	98,905
	\$15,940,345	\$15,648,728
Deductions from income:		
Interest on funded debt.....	\$3,756,510	\$3,759,930
Interest on unfunded debt.....	192,475	278,834
Interest on Reading Company—Jersey Central Collateral Bonds.....	920,000	920,000
Interest on Wilmington & Northern R. R. stock trust certificates.....	51,800	51,800
Interest on real estate bonds.....	76,184	76,113
Rental of leased equipment.....	442,125	482,625
Taxes.....	779,508	708,125
	\$6,218,602	\$6,277,427
Surplus.....	\$9,721,743	\$9,371,302

**SALT LAKE & UTAH.—Loan Approved.**—The Interstate Commerce Commission has approved a loan to this company of \$700,000 from the revolving fund to provide for additions and betterments and to meet maturing indebtedness.

**SAN DIEGO & ARIZONA.—Asks Authority to Guarantee Trust Certificates.**—This company has applied to the Interstate Commerce Commission for authority to guarantee an issue of \$750,000 of equipment trust certificates signed by the Anglo-California Trust Company.

**SAN DIEGO & ARIZONA.—Asks Authority to Transfer Rolling Stock.**—This company has applied to the Railroad Commission of California for permission to transfer its rolling stock under an equipment trust agreement, and to deliver to the Anglo-California Trust Company of San Francisco, a mortgage on certain real estate in San Diego county.

**SOUTHERN PACIFIC.—Annual Report.**—The combined income account for the year ended December 31, 1920, compares with the previous year as follows:

	1920	1919
Operating income (March 1 to Dec. 31, 1920, inclusive):		
Operating revenues.....	\$240,381,492	
Operating expenses.....	207,186,859	
Net from railway operations.....	33,194,633	

Taxes.....	13,066,696	
Net railway operating income.....	16,524,941	
Total operating income.....	17,718,104	
Non-operating income:		
Income from lease of road—standard return	8,043,288	\$48,244,660
U. S. Government guaranty.....	20,490,428	57,438,020
Dividend income.....	5,251,324	1,182,039
Total non-operating income, including other.....	39,892,612	55,105,210
Gross income.....	55,610,716	
Total deductions from gross income.....	25,340,441	25,909,413
Net income.....	32,070,275	31,548,607
Disposition of net income:		
Income applied to sinking and other reserve funds.....	1,053,945	1,022,864
Dividend appropriations.....		17,478,459
Total appropriations.....	1,053,945	18,501,323
Balance to profit and loss.....	\$31,016,329	\$13,047,284

An abstract of the report appears on adjacent pages. The report will be reviewed editorially in an early issue.

**WHEELING & LAKE ERIE.—Loan for Equipment Approved.**—The Interstate Commerce Commission has approved a loan to this company of \$3,304,000 to be used in the purchase of 2,000 gondolas at \$2,650 each and 1,000 box cars at \$2,960 each through the National Railway Service Corporation. The company had applied for a larger loan. Commissioner Daniels wrote a dissenting opinion similar to that in the case of the Chicago, Rock Island & Pacific above noted.

### Settlements With Railroad Administration

The United States Railroad Administration reports the following final settlements, and has paid out to the several roads the following amounts: Galveston Wharf Company, \$85,000; the Duluth Union Depot & Transfer Company, \$21,000; St. Joseph Belt, \$95,000; Chicago River & Indiana, \$45,000; Chicago Junction, \$380,000; Hudson & Manhattan, \$750,000. The payment of these claims on final settlement is largely made up of balance of compensation due, but includes all other disputed items as between the railroad companies and the administration during the 26 months of federal control.

### Guaranty Certificates Issued

The Interstate Commerce Commission has issued certificates for partial payments on account of the six months' guaranty for 1920 as follows:

Chicago, Peoria & St. Louis.....	\$110,000
Denver & Rio Grande.....	937,500
Grand Canyon.....	9,500
Panhandle & Santa Fe.....	550,000
Rio Grande, El Paso & Santa Fe.....	40,000
Total payments of the Treasury Department under the provisions of the Transportation Act up to June 25 were as follows:	
(a) Under Section 204, for reimbursement of deficits during Federal Control.....	\$1,354,339.74
(b) Under Section 209:	
(1) To carriers to which final payment of the guaranty has been made under paragraph (e), including previous advances under paragraphs (b) and (i).....	1,690,114.71
(2) For advances under paragraphs (b) and (i) to carriers as to which a certificate for final payment has not been received by the Treasury from the Interstate Commerce Commission.....	262,950,874.00
(c) Under Section 212:	
(1) For partial payments in respect to the guaranty provided in Section 209.....	156,874,190.05
(2) For partial payments in respect to the reimbursement for deficits during the period of federal control provided in Section 204.....	562,853.02
(d) Under Section 210, for loans from the revolving fund of \$300,000,000 therein provided.....	197,289,487.00
Total.....	\$620,721,858.52

These figures are exclusive of various settlements and payments on account made by the Railroad Administration.

### Dividends Declared

Atchison, Topeka & Santa Fe.—Common, 1½ per cent, quarterly, payable September 1, to holders of record July 29.  
Central of New Jersey.—2 per cent, quarterly, payable August 1, to holders of record July 30; special, 2 per cent, semi-annually, payable June 30, to holders of record June 27.  
Elmira & Williamsport.—Preferred, 3.16, payable July 1, to holders of record June 20.  
New London Northern.—2 per cent, quarterly, payable July 1, to holders of record June 16.  
Norfolk & Western.—Common, 1½ per cent, quarterly, payable September 19, to holders of record August 31; preferred, 1 per cent, quarterly, payable August 19, to holders of record July 30.  
Norwich & Worcester.—Preferred, 2 per cent, quarterly, payable July 1, to holders of record June 16.  
Pennsylvania Company.—3 per cent, semi-annually, payable June 30, to holders of record June 22.  
Rome & Clinton.—3 per cent, payable July 1, to holders of record June 22.  
Western Pacific R. R. Corp.—Preferred, 1½ per cent, quarterly, payable July 1, to holders of record June 21.

## Railway Officers

### Financial, Legal and Accounting

**John C. Hume**, assistant claim agent of the International & Great Northern, with headquarters at San Antonio, Tex., whose promotion to general claim agent, with headquarters at Palestine, Tex., was announced in the *Railway Age* of June 3 (page 1301), was born at Union City, Ind., on April 23, 1878. He was educated in the public schools of San Antonio, Tex., and entered railway service on July 1, 1895, as a messenger in the service of the International & Great Northern at San Antonio. He has served this company continuously for 26 years. After serving in the local freight offices at San Antonio, he was transferred to the ticket office, where he served until 1904, when he was promoted to assistant claim agent, with the same headquarters. He was serving in this position at the time of his recent promotion, effective in May, following the death of J. S. O'Flynn.

J. C. Hume

**Herbert W. Johnson**, whose election as controller of the Chicago, Burlington & Quincy was announced in the *Railway Age* of June 10 (page 1378), was born at Chicago on November 24, 1879, and entered railroad service on May 1, 1898, in the office of the auditor of ticket accounts of the Burlington. His entire railroad career has been spent in the service of that company. On January 24, 1905, he was appointed traveling auditor, and three years later was made clerk in charge of a department in the office of the auditor of freight accounts at Chicago. He was promoted to chief clerk of claims under the auditor of freight accounts on December 7, 1909, and in November of the following year was appointed assistant auditor of freight accounts. On November 1, 1913, he was appointed assistant auditor of expenditures, and four years later was promoted to auditor of expenditures. At the time of his recent election, Mr. Johnson was serving as assistant controller, with headquarters at Chicago, a position to which he had been promoted on March 1, 1920.

H. W. Johnson

### Operating

**D. E. Beatty**, roadmaster, of the Louisville & Nashville, with headquarters at Nashville, Tenn., has been promoted to superintendent of the Mobile and Montgomery division, with

headquarters at Montgomery, Ala., effective July 1, succeeding J. I. McKinney, retired.

**W. L. Barnes**, superintendent transportation of the Chicago, Burlington & Quincy, with headquarters at Chicago, who has been on leave of absence, permitting him to serve as executive manager, Car Service Division, American Railway Association, with headquarters at Washington, D. C., has returned to his former duties and has been appointed general superintendent transportation. **J. H. Aydelott**, acting superintendent transportation, with headquarters at Chicago, has been promoted to superintendent transportation, with the same headquarters, and the position of assistant superintendent transportation has been abolished. The appointments were effective July 1.

### Traffic

**Roy Pope** has been appointed general freight agent of the Americus & Atlantic with headquarters at Atlanta, Ga.

**Joseph N. Campbell**, whose appointment as general freight and passenger agent of the Louisiana Railway & Navigation, with headquarters at Shreveport, La., was announced in the *Railway Age* of June 3 (page 1301), was born at Pocahontas, Ark., on September 26, 1877, and was educated at Add-Ran University, Tex. For some time Mr. Campbell was engaged in Indian educational work, and as a newspaper man in Indian territory and Oklahoma territory. He entered railroad service on April 3, 1903, in the freight department of the Chicago, Rock Island & Pacific. A year later he took similar service with the Fort Worth & Denver City, and in 1905 took a position in the freight claim department of the Atchison, Topeka & Santa Fe, as chief clerk at Amarillo, Tex. Mr. Campbell entered the service of the Louisiana Railway & Navigation in February, 1906, as chief clerk in the freight claim department. At the time of his recent appointment, he was serving as freight claim agent to which he had been promoted in May, 1919.

THE FROG SHOP of the Lehigh Valley at Weatherby, Pa., is to resume operation on July 5 after a suspension of three months.

Centralized controls speed production on the Ryerson-Conradson Railroad Lathe

## Speeding Up Locomotive Repairs

What is a locomotive hour worth? \$60 or \$100? Who knows?

Every hour saved in locomotive repair increases the time available for locomotive earning power.

In speeding up shop operation, the Ryerson-Conradson Railroad Lathe plays a vital part.

Convenient location of controls on the apron; impossibility of stripping gears in quick shifting and capacity for extra heavy work, all combine to give high production.

You need this modern lathe for high speed repairs.

The Delaware & Hudson rules for handling foreign freight cars, reprinted on another page, have justified themselves as

### Foreign Cars

on the  
D. & H.

a means of economy, and they therefore deserve "preferred attention" at a time when everybody is paying particular attention to savings. Such a code—a code in which every word has an important meaning and yet which clerks are constantly tempted to read hurriedly—is, however, worthy of most careful study if only as one important element in making simple and easy the scores or hundreds of studies in routing which a large yard office may have to make every day. "Studies" is the proper word, though each study may take but a minute; for accuracy is of the first importance, and the country is now so big that the old time yardmaster who kept the whole freight route map of the United States in his head, is pretty nearly extinct. The Delaware & Hudson's combination home route card and empty-car waybill is a sensible device by which Mr. Roberts expects to save thousands of dollars yearly, as compared with the cost of providing separate forms for these two functions.

The peculiar situation of the New England carriers and the necessity for giving them adequate relief has caused F. J.

### Where Are the Greatest Leaks?

Lisman, the investment banker, to attempt to outline a method of getting at the exact cost of handling different commodities in order that there may be a fair division of earnings between the carriers. A situation of this kind naturally leads to a realization of the leaks and losses in railway operations. We are fortunate in being able to present elsewhere in this issue a frank discussion by Mr. Lisman of what, in his opinion, are the great wastes in railroad operation and how they may be remedied. It seems hardly necessary to remind our readers of Mr. Lisman's extensive experiences with railroad properties or to emphasize his fitness for making a study of this kind. He hits some things pretty hard—L. C. L. freight, for instance—and he also suggests a permanent remedy for labor trouble. That he questions the advisability of consolidating railroad properties beyond a reasonable point is clearly indicated in his comments on the elimination of competition. Incidentally, Mr. Lisman invites free and frank criticism of his suggestions and will be disappointed if our readers do not take advantage of this invitation.

Because of the many factors which enter into the consideration of some of the problems of railway operation, it is often difficult for the officer to develop any

### A Conclusive Demonstration

effective demonstration of the economies accruing from policies or improvements which he has initiated. So many independent variables are generally involved that it is hard to prove that they have not vitiated his calculations. Occasionally, however, the results obtained are so overwhelmingly conclusive that the influence of the other factors pale into insignificance and almost any reasonable allowance for any possible effect which they may

have still leaves a large saving to the credit of the improvement, policy or practice under consideration. As a case in point, a certain railroad in the west, in the face of a rapidly rising market, in 1917, bought a two-years' supply of boiler flues on the basis of the average consumption at that time. Since then only a very small number of flues have been bought to take care of certain special needs and yet today after four years, on the basis of the present consumption of flues, this road still has more than two-years' supply on hand. This remarkable reduction in flue consumption on this railroad must be ascribed almost entirely to one condition—the reorganization of the administration of locomotive water supply and treatment on this road at about the time that the flues were purchased in 1917. The case is particularly significant because the saving is not the result of any large capital expenditures. Instead it must be explained by the minute supervision which the water supplies have received under which each case has been solved as an independent engineering problem without any attempt to apply some favorite panacea. It is true that many water softening plants are in service on the road in question and that others will no doubt be installed from time to time, but the important fact is that the use and treatment of water is under the supervision of a staff that knows its business and has the confidence of the management.

The president of a large company performing a transportation service for the railways at an important terminal offered

### Is "Bigness" an Insuperable Obstacle?

as an explanation of the ability of his company to render this service to the roads at a cost less than that for which they could perform it themselves the fact that his officers had an intimate knowledge of every detail of these operations and exercised the closest supervision over them. As a result this company has been able to arrive at the actual cost of each step in these operations. With this information as a basis it has endeavored to reduce its costs in various ways. For example, from the figures which it has collected, it has been able to arrive at the normal amount of time required for various operations and to establish a wage bonus for special performance above this base, thereby stimulating the employee by giving opportunity to increase his earnings. That this has been beneficial is indicated by the fact that the bonus payments run into thousands of dollars weekly. By these same performance records the company can detect and eliminate the shirker, thereby raising the average efficiency. Of equal importance is the fact that the cost of each operation is known in detail on the following morning, thereby bringing unfavorable influences to the attention of the management immediately upon their appearance and affording an opportunity to correct or eliminate them. What this company has done for its own private interest in serving the railways, the railways should be able to do for themselves. One of the most serious handicaps under which the roads are laboring is that of ignorance of the cost of many of their operations. As a result too little attention is given by the average railway officer to unit costs and almost every road is performing many services which are costing more than they should if

data were presented promptly to the officers which they could use in detecting leaks and stopping them. It is said frequently that a railway is so large and its operations so complicated that it is not possible for data of this character to be compiled. If, in performing a transportation service for the railways, a private company finds that it is to its financial advantage to prepare information of this character, it would seem that the railways themselves should be able to so decentralize their accounting as to secure equally valuable results in the various branches of their operations.

## Labor Unions Defy the Labor Board

IT is evident the general public greatly misunderstands the situation with regard to the national agreements. Many newspapers continue to print statements to the effect that the abrogation of the agreements will save the railroads \$300,000,000 a year. The national agreements have not really been abrogated. They were to have gone out of existence on July 1, but they are still in full force and effect because the labor organizations have openly defied the Railroad Labor Board by completely disregarding the spirit and purpose of its decision in the national agreements case, in consequence of which the board has suspended its abrogation order.

These so-called national "agreements" as they exist today are not "agreements" in any sense whatever. They were made by the Railroad Administration with certain labor unions under government control. The railway companies had no part in making them. They never agreed to the rules incorporated in them and the Transportation Act plainly contemplated their abrogation on September 1, 1920. The Labor Board, however, ordered them continued until it could hold hearings and render a decision regarding it. The labor leaders put forth every effort to protract the hearings and get the objectionable rules and working conditions continued.

The Railroad Labor Board finally ordered the national agreements abrogated July 1 and, subject to certain principles it laid down, remanded negotiation of new rules and working conditions to the individual railways and their employees. Among the principles it recognized was that of the eight-hour day. This automatically rendered impossible probably one-half of the savings it had been estimated could be made by restoring the rules and working conditions of 1917. The decision of the board necessarily was a condemnation by it both of the rules and working conditions incorporated in the national agreements and of national rules and working conditions in themselves. The very essence of it was recognition of the principle that rules and working conditions should be made by the individual railways and their own employees in order that they might vary from road to road and thereby be adapted to local conditions.

The first thing the national labor leaders did after the board's decision was rendered was to order the chairmen of their committees on the individual railways to demand continuance practically unchanged of every rule in the national agreements. The local chairmen did this and stuck to it. Of course the railways could not individually accept the rules in the national agreements. This would have been to have left in effect all the rules which have caused the great inefficiency and enormous waste which have resulted from the national agreements. It would have prevented the adaptation of rules and working conditions to local situations and would have disregarded the decision of the Labor Board.

The open defiance of the Labor Board by the national labor leaders, aided and abetted by the local chairmen, has thrown the entire subject of rules and working conditions back into the hands of the board. In these circumstances there are several courses open to the board. It can attempt to write uniform rules and working conditions for all the railways of the United States. Doubtless it would eliminate

some of the more indefensible features of the national agreements. The result, however, would be the application of the same rules and working conditions to all the railroads of the country regardless of local conditions. The board might attempt to write separate rules for each railway. This would improve the existing situation very little indeed.

But neither the Labor Board nor any other body of men is competent to write rules for each individual railway. This would be practically an interminable process. No body of men can know enough about local conditions to do this.

Another course open to the board is to recognize the plain intent of the Transportation Act and proceed accordingly. The Transportation Act plainly intended that when the railways were returned to private operation they should be managed as individual units. It was to get away from policies adopted under government control in furtherance of nationalization of the railways that they were returned to private operation. Only by abandoning these policies could a return to private operation do any good. The most costly and indefensible policies adopted under government control were those for the standardization of wages and rules and working conditions. The Railroad Labor Board might carry out the plain purpose of the Transportation Act by restoring the rules and working conditions of 1917 with such specific exceptions as it may regard as fair and in the public interest.

So far as actual results are concerned, the labor leaders thus far have been completely victorious in the fight over national agreements. The Conference Committee of Managers of the railways presented to the board detailed evidence and concrete examples regarding the operation of the present rules sufficient to convince any fair and rational person of their iniquitousness and that they are imposing a heavy and indefensible burden upon the railroads and the public. This evidence convinced the board itself so completely that it ordered the national agreements abrogated. Nevertheless, the national agreements are still in effect and unless the board has the courage to act as the provisions of the Transportation Act and the logic of the situation dictate the labor leaders will so maneuver that they will be in effect for months to come.

Failure of the individual railways and their employees to reach agreements regarding the rules and working conditions is entirely due to the persistent pursuit by the labor leaders of a policy obviously intended to perpetuate the very rules and working conditions which the Labor Board by its decision has condemned. The situation demands prompt, intelligent and courageous action by the Labor Board. Only by such action can it vindicate the wisdom of Congress in creating it.

## Running Weak Cars a Wasteful Practice

FEW problems affecting railway operation and maintenance are completely encompassed within the bounds of a single department. It is unfortunate that in the solution of these problems the departments having primary jurisdiction often have little recourse except to settle them on the basis of only those factors which come within the scope of their own operations. An important aspect of the continued operation of cars of weak construction is the effect which these cars have in increasing loss and damage claims, in causing wrecks and accidents and in otherwise delaying traffic, all of which add materially to the operating expenses. But these considerations, being beyond the jurisdiction of car department officers, do not receive the weight which their importance deserves in the establishment of policies with respect to the retirement or rehabilitation of these cars.

The cost of renewals and maintenance are the only factors concerning which the car department officers can speak with

full authority. It is doubtful, however, if full consideration were given to these two factors alone whether these cars would long be continued in service. If adequate consideration were given to the reduction in the direct cost of maintenance which rehabilitation or replacement with new equipment would make possible, would not the cost of rehabilitation or retirement be found to be one of the most lucrative investments open to the railroads at the present time? An investigation made by one railroad a few years ago disclosed the fact that the retirement of a large number of cars of all-wood construction, and their replacement with new cars of steel or steel underframe construction, would effect a saving in maintenance alone which in five years it was estimated would amount to about 68 per cent of the entire cost of the new equipment. When adding the service value of the car days saved by the less frequent appearance of the equipment on the repair track and in the shop, the combined saving was estimated to be practically 80 per cent of the total cost of the new equipment. After taking into account the accrued depreciation on the retired cars, the total saving in maintenance cost and in car days for five years amounted to about 130 per cent of the additional capital required plus the interest, depreciation and renewal charges.

How many other investments offer a return which will not only pay the carrying charges but will more than retire the principal in a five-year period? A thorough study of the economics of freight car maintenance and operation today would lead to equally startling conclusions with respect to the 300,000 or 400,000 weak and unsuitable freight cars which are still in service.

## Labor's Restriction of Production

IT SEEMS NOT improbable the historian of the present age will treat as one of its most extraordinary phenomena the persistent efforts made by working men through labor unions to prevent improvement and cause deterioration of the living conditions of the working man and his family. To many persons this statement will sound paradoxical, but it refers to a policy of the labor unions, the inevitable tendency of which should be obvious to every person of intelligence.

The Railroad Labor Board ordered the national agreements abrogated effective on July 1, but has found it necessary to suspend its order. The labor leaders caused the rules and working conditions incorporated in the national agreements to be presented to each individual railway and insisted that they be accepted practically without modification. This made agreement between individual railways and their own employees impossible. Not only is this a defiance of the Labor Board, but it has afforded a striking illustration of the main policy being followed by many labor organizations—that of using every means available to restrict production.

The fundamental objection to practically all the bad rules in the national agreements is that they are intended to reduce, and have the effect of reducing, the efficiency of labor. Labor works with machinery and tools furnished by the employer. Rules, working conditions and practices which reduce the efficiency of labor reduce, or tend to reduce, the output of each worker and of the machinery and tools he uses. It follows that the railway labor unions are engaged in a struggle to reduce the amount of transportation service produced in proportion to the number of men employed and the amount of machinery and tools used.

The same thing is being done in almost every industry where labor is organized. The labor leaders seek to restrict the number of bricks laid by each man and thereby the number of houses built. They seek to restrict the amount of coal mined by each miner and thereby the amount of coal produced. They seek to restrict the number of shirts, suits of clothes and shoes made by each worker, and thereby the

total number of shirts, suits of clothes and pairs of shoes made.

It is easy to understand many things the labor unions do. It is easy to understand why they seek advances and oppose reductions in wages; the incomes of all classes of people are the subject of constant negotiation, and, other things being equal, the most aggressive and skillful negotiators get the largest incomes. It is easy to understand why labor unions for years have sought reductions in the hours of work. Sufficient leisure to rest, enjoy the society of one's family and friends, read and sleep is desired by every normal man. Probably without some kind of organization working men would not get reasonable hours of work and enough money wages to buy their share of the necessities, comforts and luxuries of life, which constitute their true compensation for the work they do. But why does almost every labor union constantly try to restrict, even within the limits of a reasonable working day of eight hours, the amount of work men do, and in consequence the output of industry? Who lives in most of the houses built, eats most of the food produced, wears most of the clothing made, and directly or indirectly uses most of the transportation service rendered? Those who work with their hands. What are the effects of restriction of outputs? First, to restrict or reduce the amount of these things produced; second, to increase their cost and the prices that must be paid for them, thus necessarily and unavoidably restricting the amount of them which working people can get and pay for.

Obviously, it is just as easy for working people to get a fair division of a large product as of a small product. Obviously, if the total product of industry is restricted by inefficiency the amount of the total product labor will get will be smaller than the amount it would get if production were not restricted.

Nevertheless labor unions persist in their policy of restriction of output, and then complain loudly about the inevitable results of it. They restrict the construction of houses and apartment buildings in cities and complain because places to live are scarce and rents are high. They restrict the amount of work done by each railway employee, and then complain because railway operation is expensive and rates are high. They restrict the production of clothing and shoes, and then complain that they cannot buy more clothes and shoes because the prices are high.

In view of such rules and working conditions as the labor unions have got adopted on the railroads and in the building trades, and the still more unreasonable and restrictive rules they constantly seek, one wonders how long it would take labor organizations to destroy modern industrial civilization if there were not employers and leaders of public opinion with intelligence and courage enough to resist and combat them. Many of the labor leaders are men of intelligence and ability in certain respects. There are grafters and scoundrels among them, but a large majority are honorable men. Why, then, do a great majority of them advocate and persistently struggle for methods and principles which if logically carried out would reduce production in this and other progressive countries to an amount per capita no greater than it is in China and bring about the same condition of chronic starvation among working people here which prevails there?

There must be among the numerous labor leaders in this country at least a few who know that there never yet was a house lived in, or a pound of flour eaten, or a shirt worn which was not first produced, and that in the long run labor itself is the chief beneficiary of increased production and the chief sufferer from restriction of production. If there are such labor leaders we have not heard of them giving practical recognition to the fact mentioned by discouraging restriction and encouraging increase of production. The amount of time and energy devoted by labor leaders to attempts to reduce production is beyond intelligent comprehension.

## Illinois Central

THE *Railway Age* essays in the course of a year to analyze in its editorial columns the operations of some 50 odd railroad properties. In its reviews the attempt must be made to make them both informative and interesting. This particular part of the task, in so far as the last two or three years has been concerned, has not been as simple as might appear. It has been to a certain extent difficult to get away from a tendency towards monotony and equally as difficult to point out the differences which characterize one property as compared with another. Nearly every one of the country's railroads has been subjected to the same influences which have been so often referred to in these columns, namely, a great increase in gross earnings, a still greater increase in expenses and the resulting decline in net. The difference as between the roads in this respect has been one of degree rather than of kind and the problem has been to say the same thing in different ways and with different figures in a manner which will prove sufficiently distinctive and, as mentioned above, sufficiently informative and interesting.

In reviewing the operations of a railroad, it is extremely desirous, in fact necessary, to point out insofar as possible what lies ahead, in other words, to indicate if possible what the property may be expected to do in the future. This in itself is also difficult. So much depends upon the Interstate Commerce Commission, upon the Labor Board, upon Congress, upon the President and the administration, and upon the trend of business conditions in general that the future of the railroad seems in large measure to depend less upon what the property will do than upon what the agencies of the government and what industry may do. The railroad's problem is thus subordinated to the entire transportation problem in a degree much greater than has been the case in former periods of trial and stress.

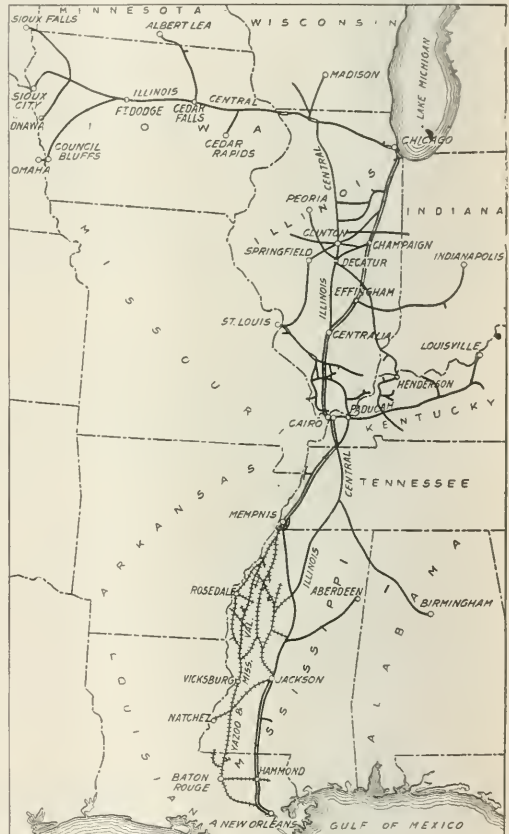

The question naturally arises as to what all this may have to do with the Illinois Central. In that road we have what appears to be somewhat of an exception, to an extent sufficient at least so that in its case one may safely attempt to look forward into the future with the realization that it is in rather a preferred position. Naturally, the fortunes of this property will rise or fall with those of the steam railway carriers in general, but such is the character of the property and of its management, that whatever progress may be made in the general situation will be reflected in special degree in its operations and earnings.

When one's mind turns to the subject of efficiently operated railroads, one of the first carriers that comes to mind is the Illinois Central. This is true not only of students of the railway problem, but of shippers, whose opinion, in these days of restored competitive service, is of equal or greater importance. The Illinois Central today is supplying a service the character of which is bettered by no other carriers and equalled by but few. On the one hand, it furnishes a highly satisfactory fast freight service which delivers traffic in Chicago 62 hours after it leaves New Orleans. On the other, because of efficient management combined with the fact that 45 per cent of its total tonnage is bituminous coal, it secures an average train load considerably in excess of the averages secured on the roads about it. Its suburban service out of Chicago ranks with the best in the country. There are few roads in the country so many of whose officers rank with the leaders in their various departments.

As in the case of certain of the other efficiently operated carriers, such as the Lackawanna, Burlington, etc., efficient operation on the part of the Illinois Central was not sufficient to enable it to overcome the handicaps of federal control and the high wage scales of government control and Decision No. 2 of the Railroad Labor Board. The road received a rental from the government of \$16,282,374 annually. In 1918 it earned for the government a net railway operating income

of \$12,907,466 and in 1919, \$4,191,796. In 1920, it was one of the few roads which increased its net over the 1919 figure, the net railway operating income according to the December monthly report to the Interstate Commerce Commission, being \$6,914,198. The claim against the government covering the guaranty period has been set at \$19,499,887. The Illinois Central, in short, was not a good money maker for the government for the federal control and guaranty periods.

At present the road is not carrying as much traffic as it carried in the first few months of last year. Because it is receiving higher rates on this traffic than it was in the same period of 1920 its gross earnings have been larger. Severe economies have cut down expenses so that in spite of the

The Illinois Central

falling off in traffic, the net railway operating income in the first four months of 1921 was \$6,766,895 as compared with \$4,867,033 for the period from January 1 to April 30, 1920.

The traffic carried by the Illinois Central in 1920 was the largest in its history. In 1920 it handled 49,233,079 tons of revenue freight, the total revenue ton-mileage being 13,724,232,886. The revenue tonnage carried in 1919 was 38,245,714; in 1918, the busiest year previous to 1920, it was 45,853,934 and the revenue ton-mileage, 12,441,047,707. The road secured an average haul on its traffic of 279 miles in 1920 as compared with 261 miles in 1919 and 271 miles in 1918.

There is little question but that one of the best indications of efficiency in operation is revenue train loading, not only as compared with the records secured by other roads handling a like traffic, but more particularly as compared with the road's own records for previous years. One of the features of the Illinois Central's operations has been the marked and steady increase in its train load over a period of years. In 1920 its average revenue train load was 660 tons and the increase since 1916 has been no less than 110 tons. The figures for the various years are as follows: 1916, 550 tons; 1917, 623 tons; 1918, 639 tons; 1919, 649 tons. A similar progressive increase in car loading is also evidenced. The average number of tons of all freight in each loaded car in 1920 was 30 tons. In 1916, it was 24 tons; in 1917, 27 tons; in 1918, 29 tons; in 1919, 27 tons. Another leading figure is that of net ton-miles per car day, which was in 1920, 805, an average exceeded by but few roads in the country. The car miles per day in 1920 were 40.9.

It is quite to be expected that the road will not be able to continue the increase in the various averages into 1921 with the sharp falling off in traffic which has taken place. However, 1921 will not be without its progress. During 1920 the road placed orders for 150 locomotives, some of which will be used presumably on the Yazoo & Mississippi Valley. These orders included 100 heavy 2-10-2 or Santa Fe type locomotives. With them the road should be able to make further marked progress in its efforts to secure increased train loading and increased operating efficiency. To take care of the new locomotives, roundhouse stalls were extended and 100 ft. turntables were put in at the engine terminals at Centralia, Ill., Clinton and Freeport and stalls were extended at Amboy and Paducah.

The Illinois Central was allocated 3,500 coal cars by the Railroad Administration. During 1920 it also placed orders for 1,000 refrigerator, 300 stock and 200 flat cars and for 55 passenger train cars. It should hardly be necessary to bring in any more facts to show in what excellent shape from the standpoint of equipment the Illinois Central should be in to handle efficiently the business which will be offered to it when the much hoped for revival in business takes place.

In conclusion, the Illinois Central during the period of federal control and during the guaranty period did not earn its standard return or its guaranty, respectively; in fact, came far from so doing. Its efficiency of operation was not enough to enable it to overcome the handicaps of high wage scales, the national agreements and other elements characteristic of the uncertain period which all railroad men hope is now nearing its close. However, the period has been characterized by no inconsiderable amount of progress, which remark is particularly true as applied to 1920. Like the Burlington, the Lackawanna and certain other roads which might be mentioned, the Illinois Central is prepared for the future. It is in a particularly good situation to take advantage of any revival of business that may develop and it will naturally be materially assisted by any improvements that take place in the railway situation as a whole.

The operating results in 1920 as compared with 1919 are as follows:

	1920	1919
Mileage operated .....	4,799	4,793
Freight revenue .....	\$101,360,641	\$71,477,112
Passenger revenue .....	26,630,148	23,936,298
Total operating revenue .....	145,547,858	107,886,835
Maintenance of way expenses .....	29,034,954	19,595,657
Maintenance of equipment .....	42,028,103	29,897,946
Traffic expenses .....	1,377,250	947,439
Transportation expenses .....	66,301,718	45,384,834
General expenses .....	3,469,692	3,044,555
Total operating expenses .....	143,208,180	99,262,712
Net revenue from operation .....	2,339,678	8,624,123
Taxes .....	7,613,102	6,057,868
Operating income .....	Def. 5,304,235	2,532,407
Net railway operating income .....	Def. 1,321,720	2,986,964

The corporate income account is as follows:

	1920	1919
United States Government—guaranty period claim .....	\$19,499,887	.....
Rental from United States Railroad Administration .....	3,399,635	\$17,896,467
Net from railway operations .....	18,522,085	16,691,635
Total non-operating income .....	7,219,882	7,634,005
Gross income .....	25,741,967	24,325,639
Total deductions from gross income .....	12,170,845	12,156,720
Net income .....	13,571,122	12,168,919
Income balance transferred to credit of profit and loss .....	13,434,841	11,880,619
Dividends (7 per cent) .....	7,650,720	7,650,720

## Southern Pacific

THE SOUTHERN PACIFIC system operates, exclusive of the lines in Mexico, 11,152 miles of railroad. The distinguishing feature of the Southern Pacific, however, is not so much its size—there are a number of railway systems in North America which rank with it—as it is what may aptly be termed its versatility. The company's lines extend from Portland, Ore., and from Ogden, Utah, to San Francisco, Calif., thence to Los Angeles, and from there eastward to El Paso, Tex., and New Orleans, La., combined with which the company operates steamship lines from Galveston, Tex., and New Orleans to New York.

The system traverses eight states and over half the width of the country. On the line from Ogden to San Francisco, at Summit, Calif., where it crosses the Sierra Nevada range, it reaches a height above sea level of 7,018 feet. At Salton, on the edge of the Salton Sea in southern California, the line is 264 feet below sea level. In eastern Texas and southern Louisiana the region is characterized by its heavy rainfall; in the Imperial Valley of southern California, there is no rainfall at all; in the one place the problem in bringing land under cultivation is most likely to be drainage, the other's extraordinary fertility can only be utilized by irrigation. Northeast of San Francisco the road maintains with greatest difficulty a line across the Suisun marshes; in other parts of California the difficulty confronting operation is moving sand hills.

There are extremely heavy grades on some parts of the system; no grades at all on others. In one place snow sheds are a necessity; in another the heat is so intense the year round that the station buildings and other structures require an additional roof for purposes of insulation. The system traverses at some places areas where there is practically no population; on the other hand, it operates out of San Francisco and Oakland, Calif., a ferry and multiple-unit electric suburban service which ranks with the busiest in the country. The system operates steamship lines, ordinary ferry boats and car ferries. Besides its through railway service, it operates out of Oakland, Calif., and Portland, Ore., extensive multiple-unit electric suburban services; it also has some street railway lines.

These various factors have more value than in that they are interesting. Not only do they indicate how extensive and varied are the operations of the Southern Pacific system, but they also give an idea as to the multitude of problems which have been offered for solution and an idea as to the manner in which the solution was brought about. Considering the conditions mentioned and bearing in mind the character of the territory served by its lines, it is natural that the Southern Pacific should have been characterized by continual growth and expansion. In the areas adjacent to Portland, Ore., San Francisco and Los Angeles, Calif., as likewise Houston and Galveston, Tex., and New Orleans, La., the company is serving regions of progress and prosperity. Because of its position and its extensive network of branch lines in these centers the traffic and traffic density of the company have increased in marked manner in recent years.

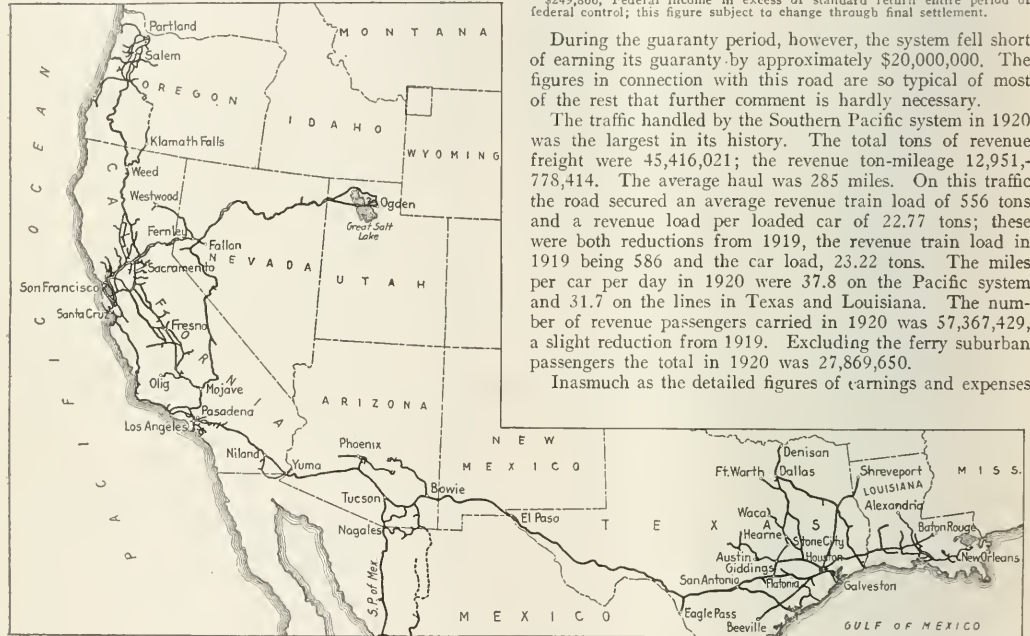

The Southern Pacific is still one of the carriers that is

deriving advantage from the law of increasing return. There is no indication that this expansion will not continue. Every portion of the country served by the lines of the Southern Pacific still has its future before it. This is evidenced in a number of ways, such as: (a) our increased ocean-going business across the Pacific; (b) the continued expansion of the deciduous fruit industry as assisted by the continuing progress in irrigation, of which the Imperial Valley project is an outstanding example; (c) the introduction and expansion of the growing of long staple cotton in the irrigated districts of Arizona and New Mexico, (d) the gradual expansion of manufacturing on the Pacific coast, of which the extensive plant of the Goodyear Company at Los Angeles is a leading project.

There is also the expectation that eventually trade relations may again be restored with Mexico. This will, natu-

ally, help the trade centers along the Mexican border, especially El Paso and likely Houston, and the carriers which serve them. As far as the eastern lines of the Southern Pacific are concerned, mention should also be made of the continued progress agriculturally of eastern Texas and Louisiana. Extensive fertile areas are gradually being added in this region by drainage and other methods.

The Southern Pacific

ally, help the trade centers along the Mexican border, especially El Paso and likely Houston, and the carriers which serve them. As far as the eastern lines of the Southern Pacific are concerned, mention should also be made of the continued progress agriculturally of eastern Texas and Louisiana. Extensive fertile areas are gradually being added in this region by drainage and other methods.

The Southern Pacific's traffic is as diversified as its operations are what we have termed versatile. In 1920, products of agriculture constituted 17.23 per cent of the total tonnage carried on the rail lines of the entire Southern Pacific system, exclusive of the lines in Mexico; products of animals furnished 2.49 per cent; products of mines, 31.35 per cent; products of forests, 20.31 per cent, and manufactures and miscellaneous 28.62 per cent. The tonnage of bituminous coal carried in 1920 was but 3.03 per cent, the reason for this small amount, being, of course, that the fuel used in Southern Pacific territory is oil.

The Southern Pacific, despite the great expansion in business which has taken place in the territory served by

Year	Federal income in excess of standard return	Standard return in excess of federal income
1918.....	\$7,757,935	
1919.....		\$4,334,355
January and February, 1920....		3,173,714

\$249,866, Federal income in excess of standard return entire period of federal control; this figure subject to change through final settlement.

During the guaranty period, however, the system fell short of earning its guaranty by approximately \$20,000,000. The figures in connection with this road are so typical of most of the rest that further comment is hardly necessary.

The traffic handled by the Southern Pacific system in 1920 was the largest in its history. The total tons of revenue freight were 45,416,021; the revenue ton-mileage 12,951,778,414. The average haul was 285 miles. On this traffic the road secured an average revenue train load of 556 tons and a revenue load per loaded car of 22.77 tons; these were both reductions from 1919, the revenue train load in 1919 being 586 and the car load, 23.22 tons. The miles per car per day in 1920 were 37.8 on the Pacific system and 31.7 on the lines in Texas and Louisiana. The number of revenue passengers carried in 1920 was 57,367,429, a slight reduction from 1919. Excluding the ferry suburban passengers the total in 1920 was 27,869,650.

Inasmuch as the detailed figures of earnings and expenses

for 1920 and 1919 are given below and more particularly inasmuch as they follow what we have come to consider the usual trend, reference to them may be omitted. Attention should be drawn to the fact, however, that the Southern Pacific will this year be required to spend an unusual amount for maintenance of equipment. At the return of the railroads to private control on March 1, 1920, no less than 87.5 per cent of the company's box cars were away from home.

These cars have been returned to the Southern Pacific lines in bad condition, a typical factor which has already received considerable attention in these columns. On June 1, 1921, the company had 80 per cent of its cars on home lines, of which 16 per cent were in bad order. When the road went under federal control at the end of 1917, the percentage of bad order cars was 4.6 per cent.

It would take considerable space to detail the various projects looking to the improvement of the Southern Pacific's properties which were under way during 1920. They included additions to the shops at Sacramento, Calif.; im-

provements at various engine terminals, notably the installation of 100-ft. turntables at various points; increased capacity at various water stations; new docks and wharves at Oakland, Calif., Wheeler, Ore., Algiers, La., etc.; replacing and strengthening of a considerable number of bridges, trestles and culverts; tunnel improvements at Tillamook Branch, Ore., Tunnel, Calif., Cisco to Lakeview, Calif.; Bakersfield, Calif., to Mojave, etc., and various other work of a miscellaneous character.

During the year there were put in track 524 track miles of 90-lb. rail. The total mileage of main line trackage (as distinguished from branches) of the Southern Pacific on December 31, 1920, was 6,472; of this total 4,343 was laid with 90-lb. rail. Of the total track mileage of 11,610,

Freight Service and Traffic on the Southern Pacific, Showing Per Cent of Increase Over 1885

(including branches) 4,786 had 90-lb. rail. Of the total of main line trackage of 6,472 a total of 3,885 or 62 per cent was automatic block signaled.

During the year the company placed large orders for new cars and locomotives both with its own shops and outside builders. These orders included 10 Mikado, 21 Pacific, 24 six-wheel switching, 15, 2-10-2 type and 2 electric locomotives.

A description of the Pacific and 2-10-2 type locomotives, with some details as to the service for which they are intended, was given in last week's issue of the *Railway Age*.

Freight car orders included 2,500 box, 500 automobile, 1,000 stock, 1,000 flat, 250 ballast and 65 caboose cars. Orders were also placed for a total of 100 passenger train cars. Reference should also be made to the 4,000 refrigerator cars received during 1920 by the Pacific Fruit Express, in which company the Southern Pacific has a half interest. It is rather evident that the Southern Pacific should be in a good position from the standpoint of equipment when deliveries on these several orders have taken place.

A noteworthy feature in connection with this equipment is that the system applied for a loan from the revolving fund to assist in financing its purchase. This application covering an amount of \$7,500,000 was denied by the Interstate Commerce Commission on the ground that the showing made in respect to the inability of the company to secure the funds from other sources was unconvincing. Whether that was the intention or not, the commission's decision may properly be regarded as a bit of a tribute to the system's financial standing.

The operating results in 1920 as compared with 1919 are as follows:

	1920	1919
Mileage operated .....	11,152	11,043
Freight revenue .....	\$183,116,323	\$163,011,669
Passenger revenue .....	71,701,637	59,371,140
Total operating revenue .....	283,269,504	239,657,272
Maintenance of way expenses .....	48,465,465	34,894,157
Maintenance of equipment .....	59,548,392	48,011,453
Traffic .....	4,900,707	2,256,661
Transportation .....	117,227,798	93,280,331
General .....	8,112,652	6,101,740
Total operating expenses .....	242,113,790	188,385,172
Net revenue from operation .....	40,155,714	51,272,100
Taxes .....	14,792,064	11,911,995
Railway operating income .....	25,363,650	39,360,105
Net railway operating income .....	21,312,344	39,677,168

The corporate income account is as follows:

	1920	1919
Total operating income .....	\$17,718,104	\$2,352,809
Income from lease of road—standard return (January and February, 1920) .....	8,043,288	48,244,660
U. S. Government guaranty (March 1 to August 31) .....	20,490,428	
Total non-operating income .....	39,892,613	55,105,210
Gross income .....	57,610,716	57,458,023
Total deductions from gross income .....	25,540,441	25,909,413
Net income .....	32,070,275	31,548,610
*Dividend appropriations of income .....	17,478,459	17,478,459
Income balance to credit of profit and loss .....	31,016,329	13,047,284

\*The dividends paid during 1920, amounting to \$18,309,597, were appropriated from the profit and loss surplus, and therefore do not appear in the income account.

## Atlantic Coast Line

THE DISTINGUISHING FEATURE of the operations of the Atlantic Coast Line is probably indicated in no better way than by reference to the fact that of the 22,000 odd box cars owned by that road, no less than about 95 per cent are felt-lined ventilator cars. These cars are, of course, used for other purposes than for carrying commodities which require ventilator cars, but so important is the perishable freight traffic that cars for it must be available on short

The Atlantic Coast Line

notice and in sufficient quantity. The Atlantic Coast Line is one of the largest, if not the largest, originators of perishable freight in the country. Its tonnage of fruits and vegetables in 1920 constituted but 5.66 per cent of the total tonnage; the revenue from perishable freight, however, made up 19 per cent of the total freight revenues, being exceeded only by products of forests which made up 20 per cent of the revenues. The Atlantic Coast Line originates no coal—bituminous coal in 1920 made up less than 7 per cent of the total revenue tonnage.

The Atlantic Coast Line is the most easterly of the important north to south lines in the southeast. It serves the

coastal plain which extends along the Atlantic seaboard and which includes Florida and the eastern portions of Georgia, the Carolinas and Virginia. This extended area is characterized by having some of the most fertile soil in the world. Its place in the agricultural development of the country bids fair to become of greater and greater importance as its potentialities are better realized and as the various existing low areas are gradually drained and brought into use. Because of the character of the region which the Atlantic Coast Line serves and more particularly because of the fact that it lies in a north and south direction, the road's traffic in perishables extends with fair regularity throughout the year. From November to May it handles the peak of the Florida traffic, notably in citrus fruits, celery, lettuce, tomatoes, etc. As the season advances, the road begins to receive traffic from the regions further north, the various vegetables being brought into the market in such a way as to fill out the year round.

This perishable traffic is difficult to handle; it requires fast schedules which must be adhered to so as to prevent undue damage claims. The problem of car supply is of special importance and the predominance of ventilator equipment shows how the road has succeeded in meeting it. Much of the traffic moves in refrigerator cars and there is a growing tendency in that direction. Some 60 per cent of the traffic in perishables moves to points in and east of the Buffalo-Pittsburgh zone; the remainder going to the west and southeast. It should not be understood that fruit and vegetables constitute all of the agricultural products carried. Cotton supplies a considerable tonnage. North Carolina in 1920 for the first time exceeded Kentucky from the standpoint of value of its tobacco sales; a large portion of this tobacco moves over the Coast Line.

The Atlantic Coast Line's standard return for the period of federal control was \$10,180,915. In 1918 it was one of the few carriers which earned more than its standard return, its net railway operating income for that year being \$11,626,128. In 1919 its net railway operating income was \$7,144,330; in 1920, \$3,908,649. So far this year, the road has not been doing as well as in the same period of last year. The net railway operating income for the first four months of 1921 was \$2,821,048; in the first four months of 1920 it was \$3,592,540.

In 1920 the road carried 17,324,916 tons of freight for a total of 3,290,282,723 ton-miles, increases of 8.62 and 4.86 per cent respectively, over the 1919 figures. The total freight revenues in 1920 were \$48,193,387 as compared with \$40,842,275 in 1919, an increase of 18 per cent. Total operating revenues were \$74,121,956, an increase of 16.62 per cent over 1919. As against this increase of 16.62 per cent in operating revenues, there was an increase of 28.87 per cent in operating expenses; or, in other words, the Atlantic Coast Line is another road typical of all the rest that have found too great the burden of high wage scales and the handicaps in general corollary to the aftermath of federal control. The Atlantic Coast Line's report gives in rather better detail than the reports of most roads the information which the student needs to analyze the year's results. The following figures, introduced to show the reason for the decreased net even with increased freight rates, will be of interest:

In 1916 the company had a total operating payroll of 19,170 employees, it moved 2,514,243,295 tons of freight one mile and had a total operating payroll cost of \$13,381,874.

In 1920 it moved 3,290,282,723 tons of freight one mile, it had a total operating payroll cost of \$40,199,926, and in August of that year had 25,252 employees.

From December, 1916, to December, 1920, freight rates were advanced approximately 60 per cent.

The above figures reduced to per cents show:

An increase in the number of employees of.....	31.5 per cent
An increase in the number of tons one mile of.....	30.9 per cent
An increase in the operating payroll cost of.....	200.4 per cent
An increase in freight rates of.....	60.0 per cent

From December, 1920, to February, 1921, or in two months, the tons moved one mile show a decrease of 10 per cent (based on daily movement), or at the rate of 60 per cent per annum, bringing the amount of freight moved below the normal amount due to move, had pre-war conditions not been interrupted by the world war. It is hoped that by agreements to be negotiated direct with your company's employees and by reductions in wages in conformity with the decrease in the cost of living, reasonable reductions in payrolls will be effected without any measure of injustice or unfairness to your employees. Your officers are making every effort to secure proper economies in expenditures for fuel, crossties and other materials, and in this connection there will be noted a decrease in the number of employees from 25,215 in August, 1920, to 21,980 in March, 1921.

The Atlantic Coast Line is one of the more prosperous and strongly financed American railroads. Its growth to its present size and importance, particularly because of the manner in which it was brought about, forms one of the most interesting developments of American railroad history. This story has been put in book form, a book entitled "A History of the Atlantic Coast Line Railroad," written by Howard Douglas Dozier, Professor of Economics at Dartmouth College, having been published a few months ago.

The Atlantic Coast Line itself operates 4,890 miles of railroad. It is nucleus, however, of a system of no less than 13,334 miles. It owns a majority stock interest in the Louisville & Nashville, operating 5,044 miles, which in turn controls the Nashville, Chattanooga & St. Louis, 993 miles, and has, jointly with the Southern, a majority stock interest in the Chicago, Indianapolis & Louisville, 658 miles. The Atlantic Coast Line and the Louisville & Nashville together lease the Georgia Railroad, and other carriers in which the Coast Line has an appreciable interest include the Charleston & Western Carolina, the Atlanta & West Point, the Winston-Salem Southbound, etc. The general balance sheet of the company as of December 31, 1920, shows investments in affiliated companies amounting to \$68,085,882 and other investments of \$3,110,181. Of the gross corporate income of \$15,252,783, non-operating income, including dividends amounting to \$2,890,383, interest on investments, etc., was \$4,633,544. The net corporate income in 1920 was \$7,890,562 as compared with \$7,187,537 in 1919. Dividends on the common stock amounting to 7 per cent were paid in both years.

During 1920 the Atlantic Coast Line ordered and received five switching and 25 Pacific locomotives and also ten of the Russian Decapod locomotives. It received also 100 phosphate cars ordered in 1919 and had on order on December 31, 500 box and 400 coal cars. This new equipment has been financed without assistance from the revolving fund administered by the Interstate Commerce Commission.

The operating results for 1920 as compared with 1919 are as follows:

	1920	1919
Mileage operated.....	4,890	4,868
Freight revenue.....	\$48,193,387	\$40,842,112
Passenger revenue.....	19,138,399	18,448,229
Total operating revenue.....	74,121,956	63,559,015
Maintenance of way expenses.....	13,306,513	9,488,092
Maintenance of equipment.....	17,025,590	13,851,670
Traffic expenses.....	1,018,168	775,813
Transportation expenses.....	36,366,143	27,702,731
General expenses.....	1,763,373	1,334,789
Total operating expenses.....	68,943,732	53,499,911
Taxes.....	3,225,000	2,510,000
Operating income.....	1,953,224	7,549,104

The corporate income account is as follows:

Standard return (January and February, 1920):		
year 1919.....	\$1,684,187	\$10,180,915
Additional compensation, January and February, 1920.....	5,317	.....
Railway operating income, March 1 to Aug. 31.....	5,478,458	.....
Operating income, Sept. 1 to Dec. 31.....	2,886,334	.....
Dividend income.....	2,890,384	2,689,619
Gross income, inc. other.....	15,252,783	14,116,304

# Remedies for Wastes in Railway Operation

## More Thorough and Intelligent Cost Keeping Methods Necessary —Where Are the Greatest Leaks?

By F. J. Lisman  
F. J. Lisman & Co., New York

THE TRANSPORTATION ACT of 1920, Section 222, provides that the Interstate Commerce Commission shall establish rates so that carriers as a whole in each rate group will "under honest, efficient and economical management and reasonable expenditures for maintenance of way, structures and equipment, earn an aggregate annual net operating income equal as nearly as may be to a fair return upon the aggregate value of the property of such carriers held for and used in the service of transportation." Section 223 provides "that during the two years, beginning March 21, 1920, the commission shall take as such fair return a sum equal to 5½ per cent of such aggregate value."

Sooner or later the commission must take up the question of exactly what constitutes "honest, efficient and economical management," etc., and this question is brought to the forefront in the New England rate case, because some of the lines concerned charge each other with inefficiency. Before exact justice, therefore, can be done in this New England division case, the question of economical management will have to be adjudicated. The Interstate Commerce Commission has had a number of knotty problems put before it but none more difficult than this particular one.

The commission can, of course, send its own experts or recognized railroad experts to investigate these properties, but no matter whom they may employ the findings will, as usual, be disputed not only by the particular management which may happen to be criticized, but also probably by other experts considered equally competent.

I have suggested as a temporary solution\* of the New England problem that the earnings on business interchanged between other roads in trunk line territory and the New England railroads, for the time being, be divided so that the New England railroads as a whole will earn on their fair value, a sum approximately equal to that earned by the trunk line group as a whole. This method of settling the New England rate case, however, is akin to communism, because if all the properties were operated in common such an arrangement would take away the incentive for each road to cut down its operating expenses to a minimum.

The only method of arriving at an adjudication of any subject is to have the parties in interest get together as closely as possible and then clearly define the points on which they cannot agree. I have, therefore, suggested that the Interstate Commerce Commission suggest or recommend to the carriers that they keep separate accounts not only of earnings accruing from the business interchanged with New England lines, but also as nearly as possible of the expenses incurred in connection with said traffic; that the carriers west of the Hudson river file with the New England carriers, and the New England carriers file with their western connections, not more than 90 days after the close of each month, a detailed report of the earnings and expenses incurred in connection with this interchange traffic. If any carrier should feel that these accounts are not properly kept they shall endeavor to arrive with each other upon an understanding as to the proper method of keeping such accounts, and if they fail to come to an agreement within 45 days after the question of improper accounting has been raised, they shall appeal to

the commission with a request for a decision on the subject.

For instance, if the Erie Railroad should assert that the New Haven system is charging an undue proportion of its terminal and yard expenses to through traffic, or that it is not operating its terminals economically, and is prepared to point out how money can be saved, then it would be up to the officials of the two lines to thrash out the matter and if they cannot agree as to what is fair, the subject should be referred to the commission for adjudication.

### Cost of Handling Any Given Commodity

The New England rate case which pushes this cost problem to the front, also presents in a more aggravated way the problem of what expenses can be reduced. Railroad officials have generally asserted that exact cost accounting in railroad operation is impossible; that they cannot state how much it will cost to haul a carload of silk as against a carload of coal, etc. This to an analytical mind seems like begging the question. The exact cost of hauling a carload of silk as against a carload of coal can be exactly defined, because the cost of hauling one ton per mile over any particular division is known. If a carload of silk contains 15 tons of paying freight and the car weighs 20 tons, then the cost of hauling these 35 tons of weight is in the same proportion as the cost of hauling a coal car weighing 20 tons and carrying 50 tons of coal. To be precise, the gross weight of the carload of silk would be 35 tons and the carload of coal 70 tons. If the locomotive is capable of hauling 3,500 gross tons over any given division, then the cost of hauling this carload of silk would be 1 per cent of the total operating cost of that train, while the cost of hauling the carload of coal would be 2 per cent. In order to further adjust the cost of handling these commodities, the empty car movement in the reverse direction must be taken into consideration and if this particular road should move 80 per cent of its coal cars light in the opposite direction and only 30 per cent of its box cars, then the cost of the empty return movement must be added to the cost of the loaded movement.

The actual cost of hauling freight over the road, or what might be called the "rolling charge" forms, however, only about 15 per cent to 18 per cent of the total operating expenses, or about half of the cost of conducting transportation. This particular and important part of conducting transportation is probably the easiest to define.

### Maintenance of Way

The Interstate Commerce Commission has finally decided on how the companies are to distribute the relative cost of passenger and freight business. It has always been said this could not be done and quite possibly the theory on which rules prescribing how this should be done may not be exactly correct; however, the rules are in force and should remain so until somebody can definitely prove that they are wrong in some particular respect, when undoubtedly they should, and can be changed.

When it comes to a question of how much it costs for maintenance of way to haul a carload of silk or a carload of coal, then undoubtedly experts will agree that the upkeep of roadway, while it may be partially influenced by weather,

\*See *Railway Age*, April 29, 1921, page 1028.

is really based on the amount of tonnage hauled over the track and on the speed with which it is hauled. If a company happens to have a traffic density of 1,000,000 net tons, which is probably not far from 2,000,000 gross tons per mile per annum, then the expense of maintenance appertaining to freight business can be divided on a gross tonnage basis, with a proper adjustment for fast freight as against drag or local freight trains.

Engineers have figured out, more or less, the hammer blow of a locomotive moving at 40 miles per hour as against one moving at 20 miles per hour. Fast freights should be debited with a somewhat heavier proportion of the cost of maintaining the track than the slower trains. Experienced engineers may not have been able to agree entirely on just what would be a fair arbitrary, but the opinion they would give would probably coincide fairly closely and an average of these opinions would not be far from correct. One 150-ton locomotive may, on account of more scientific construction, have a lighter hammer blow on the rail than another locomotive of the same weight, and a heavily loaded coal car may be harder on the track than a locomotive of the same weight.

Maintenance of buildings, such as freight stations, should not be charged for on a tonnage basis, but on a basis of usage to the different commodities. For example, mineral traffic does not pass through the freight houses and the only reason why it should be debited with a part of freight house expenses would be on account of the office force handling the clerical part of the work in these buildings.

### Maintenance of Equipment

Maintenance of equipment might probably be accounted for entirely on a basis of gross tonnage because it costs as much for repairs per locomotive for 1,000 ton-miles whether the locomotive is hauling empty cars or paying freight. The proper method of charging up the maintenance of freight cars is open to considerable discussion. Naturally the cost of maintaining flat, gondola, box, tank or stock cars, etc., should be charged up to the respective classes of commodities carried in same. Furthermore, certain commodities are harder on the equipment than others: for instance, lime carried in bulk, chemicals, etc. Naturally, such special appliances as grain-doors must be charged to the grain traffic.

Maintenance of equipment officials might agree that the cost of maintaining any given type of cars should be loaded by certain percentage according to the commodity carried.

The cost of maintaining shops, machinery, etc., should be based on the same theory as that of maintaining locomotives and cars, while the cost of maintenance of engine terminals should probably be charged on a straight mileage basis.

### General Expenses and Traffic Expenses

General expenses and traffic expenses should also be based on the amount of work done by the railroads; that is, on the gross tonnage handled. Railroad men and others talk of railroads handling net tons when they are all the while handling gross tons. Advertising, salaries of traffic men, cost of traffic associations, etc., are incurred for the purpose of handling net tons, but in order to get net tons, it is first necessary to produce gross tons, just the same as it is necessary for a mining company to extract large quantities or many tons of ore in order to get a comparatively small amount of metal. A mining company generally bases all its overhead and most other expenses on the tonnage of ore produced. Substantially the same remarks apply to all general expenses.

### Conducting Transportation

Coming back to the cost of transportation, the cost of superintendence is largely based on the amount of paying business handled and should be based on the gross tonnage. The cost of dispatching trains is based on the cost of cars handled and should likewise be based on the amount of gross tonnage

handled. The same remarks apply to weighing, inspection and demurrage. The cost of coal and ore wharfs should naturally be charged up to the commodities passing over these wharfs.

The cost of loss and damage should in all cases be ascertained and be debited to each particular commodity as nearly as possible.

The cost of injuries to persons, damage to property, clearing wrecks, etc., is so difficult to allocate, that undoubtedly the fairest way is to base it all on gross tonnage.

### Yard and Station Service

The allocation of the cost of yard and station service has been the item which has shown the greatest increase in the last eight years and is more difficult to define than any other. I have searched diligently for information on this subject, but have generally met with the response that these expenses cannot be allocated. Where there is a will there is a way, and by analytical thinking some way must be found to analyze these costs, not only for the purpose of knowing whether the business is handled economically but also whether certain traffic is worth having.

Yard switching is for the purpose of making and breaking up of trains, and should be clearly allocated on the same basis as that of the rolling charge; that is, on a gross ton basis. Yard service, if performed for the purpose of switching cars to and from freight houses, to and from team tracks or to and from industrial tracks, is in a different position. Nearly every engine in the course of each day performs all three of these latter services, and the time spent in each kind of service is probably not alike in any two given cases. It depends on the promptness of clearances which the engine with a cut of cars may get over busy tracks; on the number of switches which have to be thrown; distance traveled and also, to a considerable extent, on the diligence and intelligence of the crew in trying to do its work promptly. Nevertheless, it is up to the yard officials to keep track of the number of cars handled by each switching engine in each service, and to consider the cost of the various movements with a view to working out a standard of cost, etc.

### Freight House Expenses

It probably costs a trifle more to handle outbound freight than inbound freight. While the expenses per ton handled through modern freight houses do not differ greatly, those familiar with this particular kind of work say it is utterly impossible to state whether it costs more to handle a piece of machinery weighing 1,000 lb. as against 20 boxes of groceries weighing 50 lb. each. Study can, and should be made of this subject, and expenses in station buildings in many cases can be greatly reduced by more efficient handling and by piece-work. It has been found that when gangs have been handling goods moving through freight houses on a piece-work basis, they do the work much quicker and at a substantially lower cost than employees who are paid by the hour. Close comparison of such costs as between companies would undoubtedly lead to considerable saving.

It is precisely the costs of freight houses and yard expenses which will finally have to be thrashed out in the New England rate division case. Possibly the trunk lines are right when they claim that the yard and freight house expenses of the New England roads are unduly heavy, but it is up to them to prove this assertion, and if they can do it, a great leap ahead in railroad cost accounting will be accomplished.

These statistics will also demonstrate, more or less, what kind of traffic is paying and what kind of traffic is handled at a loss.

### Losses in Railway Operation and Their Remedies

This leads to the important question: Where are the greatest leaks or losses in the railroad business? I believe

that on the "less than carload business" the railroads are losing not less than \$50,000,000 a year.

It is impossible to get at the gross earnings from l.c.l. business, but they are probably about 8 per cent of the total freight earnings, or about \$350,000,000 per annum against which must be debited the bulk of the loss and damage expense, which has been steadily creeping up and now averages over 2 per cent of the freight earnings. If these costs of loss and damage were properly allocated to the l.c.l. traffic, it would probably consume from 15 per cent to 20 per cent of the gross earnings from this source.

The bulk of the freight house expenses and the large investments for terminals are made in connection with and for the purpose of handling l.c.l. traffic, and further investment for this particular purpose is called for from time to time. The loading of merchandise cars averages about 16,000 lb. and, therefore, the proportion of paying freight carried in these cars is only approximately 30 per cent of the gross weight hauled by the locomotive.

A close cost study of l.c.l. traffic will disclose that most railroad companies, many of which are now bitterly complaining about automobile truck competition, had better let the trucks have this business. This applies especially to the short haul less than carload business originating or terminating in the larger cities, where there are long delays in connection with switching to and from freight houses through large yards, and where the capital investment is very great.

Another way of saving on this business, besides the obvious attempts in reduction of loss and damage, consists of what was known during the war as "sailing days." Many companies should decline to handle the usual daily number of package cars and let competing railroads get the business or force concentration into much greater loads and do the loading more carefully.

### Raise the Minimum of Loading

The second greatest source of waste, running into many millions, is light loading. While the capacity of freight cars in the last 20 years has increased by fully 50 per cent, the minimum carloads of the various commodities have probably not increased more than about 20 per cent. Many state commissions have prescribed a low minimum carload on many commodities in order to help the small producers or dealers. This is short-sighted local regulation at the expense of the nation at large. There have been long investigations of this subject and barrels of ink have been spilled over it, but very little has been accomplished in the interest of economy. A small committee should be appointed composed of representatives of the different groups of railroads throughout the country which should make definite proposals to raise the minimum weight of carload freight to a reasonable and economical level.

There is no reason why a small shipper should be allowed to load a car at less than its reasonable capacity just for the purpose of helping him, and let the public at large in effect pay him a bonus. The most economical and intelligent ruling for a minimum carload is the tonnage capacity, or cubic capacity of the car. If a shipper prefers a 40-ton car when only a 50-ton car might be available in his vicinity, then he should, in the interest of national efficiency, be compelled to take whatever car may be at hand.

Assuming that mineral traffic, which amounts to roughly 50 per cent of the tonnage, is now all handled in full carloads, then the raising of the minimum weight per carload by 10 per cent on other commodities would not only be equivalent to the construction of 125,000 additional freight cars which, at present prices of about \$1,800 per car, would represent an investment of \$225,000,000, but it will mean a reduction of substantially 5 per cent in operating expenses all-around, because it will cause a reduction of 5 per cent in freight train miles on the main lines; also in switching miles,

cost of repairs and, theoretically, a similar decrease in maintenance of way and in the bookkeeping; that is, general expenses connected with the handling of traffic, etc.

### Wasteful Accounting Methods

The additional expense of accounting put upon the railroads by the Interstate Commerce Commission in asking for all kinds of statistics, is surely not less than \$25,000,000 and probably exceeds \$50,000,000. There is no reason why the Interstate Commerce Commission should not have all the information which is of service to it, but methods could be found to consolidate these various reports and abolish a great many. If, for instance, someone in a certain section of Texas complains to the commission that he is not getting as many livestock cars as another section of the same state, or of Oklahoma, the railroad companies will be required to regularly file a report as to the number of livestock cars dispatched in each particular section and these reports are required to be filed continuously and long after the necessity or use for them has ceased.

I recently congratulated a president of a railroad on the fact that he had just crossed the \$1,000,000 mark in gross earnings, and that, therefore, his road has become a Class 1 carrier. He replied that this was a subject for condolence rather than congratulations, because it would require much additional accounting on the part of his organization. He figured this additional cost would run anywhere from \$10,000 to \$25,000 and that the additional net which he might derive from the first \$100,000 gross earnings above \$1,000,000 would all go for additional cost of accounting as required by the commission. Surely this is absurd!

I would suggest that a conference be called between the railroad accountants and the statisticians of the Interstate Commerce Commission with a view to reducing the number of reports required to a minimum, and to consolidate them as much as possible.

There are, of course, many other savings possible in various ways by the various companies. Unquestionably, all railroad shops are not run efficiently, no more than all private machine or government shops. Right here, one difficulty arises. While railroad officials have not been compelled during the last three and a half years to spend as much time with the various state commissions as they formerly did, far too much time is being given by them to the various governmental requirements and to discussing matters of accounting, physical valuation, etc., with the numerous kinds of government officials. Railway officials cannot give the required time to thoroughly supervise their own affairs because they are too much involved in problems which too much regulation has thrust upon them.

### Increased Percentage of Paying

#### Load Most Important

Some one has well said that the objects of a railroad are:

- (1) To transport as large an amount of freight and passengers as possible;
- (2) To handle this traffic with the smallest number of train-miles;
- (3) To operate each train-mile at the lowest possible cost.

The public at large certainly would be startled if it could be made to visualize the fact that the actual cost of transportation of trains over the road constitutes less than one-fifth of the total costs connected with the operation of railroads, and it is equally difficult for the public to visualize the fact that the expenditure of most of the remaining four-fifths is absolutely essential. All railroad statistics as shown to the public and stockholders, and for that matter most of those as shown to the operating officials themselves, are based on net tons. Managers of sugar mills base their reports on the number of tons of cane or beets which are ground and

they take much pride when they can show in any one year that the amount of sugar extracted by them is a fraction of one per cent greater than it was during the year before.

Similarly, the attention of everyone interested in railroads must be concentrated on extracting a greater amount of paying ton-miles in proportion to gross tons handled. If everybody will concentrate and the operating officials of the various lines will emulate each other towards producing less gross and more net tons the possible achievements in this direction would probably be quite surprising.

### Labor Costs

All the above savings are trifling compared with possible savings connected with the cost of labor.

Out of every dollar earned by the railroad companies

In 1912, 43.1 per cent went for wages

In 1916, 40.8 per cent went for wages

In 1920, 59.9 per cent went for wages

Similarly, out of each dollar of railroad gross earnings, net earnings applicable to interest on capital were—

In 1912, 25.2 per cent

In 1916, 29.10 per cent

In 1920, 1.00 per cent

The amount of public service rendered for each dollar of interest and dividends paid to owners of railroad securities was—

In 1913, 459 ton-miles and 47 passenger miles

In 1917, 582 ton-miles and 53 passenger-miles

In 1920, 611 ton-miles and 64 passenger-miles

In other words, in spite of the decreased value of the dollar, capital during this eight-year period rendered an increased service of about 33 per cent for each dollar paid to capital. Inasmuch as the additional capital invested in railroads during this period has received no income, or has transplanted other capital which had to do without income, the result achieved by capital in the way of public service is shown in another way: that is to say, the increased service per dollar of capital invested in railroads during the same eight-year period was about 12 per cent. On the other hand, for each dollar of wages paid out, the railroads rendered—

In 1913, 245 miles of freight service

25 miles of passenger service

In 1920, 121 miles of freight service

13 miles of passenger service

or just a trifle less than half.

One might write volumes, but they could not more strongly prove the fact that the present high cost of transportation and lack of return on railroad capital has been due to abnormally high wages and inefficiency of labor. If railroad rates are to be reduced and the railroads are to be really managed in the most economical and efficient way, the only way is to repeal all special pro-labor legislation and let the railroads deal direct with their employees, practically in the manner in which the Pennsylvania Railroad is now proposing to handle its business.

We had very few railroad strikes before the war and the enactment of the Adamson bill, and we probably would have less strikes in the future because railroad officials would have to conform to public opinion on the subject of wages: public opinion is much more wide-awake on this subject than it used to be.

### Permanent Remedy for Labor Trouble

Congress could in the interest of the public, in the interest of capital invested in the railroads, and in the interest of the bulk of labor, pass constructive legislation which will forever settle the wage question in a peaceful manner. The remedy for the present situation is as follows:

The provisions concerning the Labor Board in the Esch-Cummins bill should be repealed and in lieu thereof, there should be authorized a Labor Bureau under the supervision of the Interstate Commerce Commission. Labor employed by railroad and utility companies is just as much charged with the public interest as the management and, therefore, its joint activities should be under the same authority as the management. The function of the Interstate Commerce Commission Labor Bureau should be as follows:

1. To lay down rules for the election of the labor union officials, which shall be by secret ballot, and to supervise such elections.

2. If there appears to be any dissatisfaction or disagreement between a railroad corporation and its employees, the points of difference shall be submitted to the Labor Bureau, which shall clearly define them. In case 5 per cent of the employees or members of any union shall sign a petition favoring a strike, then the Labor Bureau shall order a secret strike vote which shall be supervised by it.

3. To prescribe a form of accounting, in accordance with which, all books of such labor unions are to be kept.

4. The accounts of the labor unions shall be audited by a certified accountant employed by the bureau; said reports to be printed and open to inspection by the public.

Everyone knows that strikes are generally declared by a small minority of more or less irresponsible and restless young men who want excitement, while the majority of the loyal, steady employees are passive in these matters and merely go on strike because they fear that they or their families will be molested. The union leaders will vociferously object to such legislation, but I am convinced that if this proposed legislation were to be voted on, not only most working people but also a majority of union labor would favor it by a large majority.

### Competition

Just as it was the fashion a generation ago to encourage competition, and just as it was the fashion up to recently to regulate everything, the present slogan seems to be to avoid the alleged waste incidental to competition. Before Congress and the country go too far in this, a very close study should be made of the amount of operating expenses actually due to competition. While some railroad mileage might be abandoned here and there if competition were eliminated, this probably would not amount to very much—certainly not more than 5,000 miles, or 2 per cent of the entire mileage, and probably not half that.

While freight stations in many communities might be consolidated, the total savings in the expenses of maintenance of way would certainly be less than 2 per cent. There would be no savings in the maintenance of equipment at all, except, possibly, by the consolidation of shops here and there, but as all the good railroad shops are now generally worked to their full capacity, the savings of maintenance of equipment would not be very much.

The traffic department involves an expense of not over 3 per cent of the gross earnings of the railroad. This probably could be largely eliminated, although the shippers will greatly miss the accommodation and information now given out by this department.

Advertising could undoubtedly be reduced considerably, but whether this would be a real saving is another question because advertising of special excursions, reduced round-trip fares, etc., stimulates traffic, and the advertising of train schedules is a great service to the public.

In the conducting transportation department the only possible savings would be by increasing train loads on branch lines; which is equal to saying that people served by branch lines would get poorer service.

Quite true, other savings might be instituted, such as the

slowing down of competition, time freights, etc., all of which would mean reduction of service to the public.

Consolidation of service in the yard and terminals might here and there save considerable money, but these savings would probably be considerably less than 3 per cent of the total amount expended for conducting transportation.

General expenses could, theoretically, probably be reduced by consolidation, but as the size of the companies would be greatly enlarged, the work assigned to clerks would probably be increased so much that the theoretical savings would disappear. While the number of presidents might be decreased, the number of general, or supervising officers could not be decreased at all because as it is, there are not enough of them. Therefore, the amount disbursed for that purpose could not be reduced.

While anyone who has not studied this situation may glibly talk about the waste of competition, upon close examination it will be found that, with the exception of the operation of wasteful competitive passenger service, it does not exist on a great scale. If competitive expenses amount to 3 per cent of the total gross earnings of the railroads, they would run up to the very tidy sum of \$180,000,000 a year, or a little over one-half of what the government is now collecting in taxes from passenger and freight service.

Wasteful passenger service could easily be regulated by pooling of the business, and competition in freight service is probably worth to the public all it costs. Stratification of service and bureaucracy is certain to creep into every management which has no competition. The incentive to get ahead of the other fellow by giving better service is probably worth, not only what it actually costs, but several times that.

Before Congress legislates against competition, a close analysis of the cost and value of competition should be made.

Many old problems are dealt with in a new way in this article and many new points are raised on which there will unquestionably be much difference of opinion. As progress can only be achieved through discussion, I hope that your readers will freely and frankly criticize the suggestions which are made.

## Grand Central Busiest

### New York Station

THE GRAND CENTRAL TERMINAL carried off the honors in 1921 for handling the largest number of railroad passengers into and out of New York City with a total of 36,937,129 passengers, according to figures compiled by the New York Transit Commission and made public last week. The Pennsylvania Station was second with a total of 35,947,570 while the Long Island's station at Flatbush Avenue, Brooklyn, was third with 33,968,090. The Long Island, which brings passengers into three stations, including Flatbush Avenue, Pennsylvania Station and Long Island City, handled the largest number of passengers during the year, its total being 59,133,876, while the Pennsylvania was second with 42,260,425 passengers. The Long Island's traffic at Flatbush Avenue represents what may be called the most intensive movement shown in the record, as the whole of the traffic to and from Flatbush Avenue is carried on two tracks. The Flatbush Avenue total for 1920 was almost 6,000,000 (23 per cent) greater than in 1919.

These figures omit from consideration the Hudson & Manhattan, which operates tubes under the river and a line to Newark, N. J. That road handled to and from its Cortlandt street terminal 52,389,914 passengers and a total of 85,685,868 passengers, a large portion of whom used also trains of the Pennsylvania, Baltimore & Ohio or Lehigh Valley (to or from Manhattan Transfer) or of the Erie or Lackawanna.

The figures compiled by the transit commission show the

total number of passengers handled in and out of New York City in 1920, including those using the Hudson & Manhattan, as 252,763,523, an increase of seven per cent over 1919.

The details as compiled by the commission are tabulated as follows:

PASSENGER TRAVEL ON ALL STEAM ROADS IN AND OUT OF NEW YORK CITY, 1920				
Baltimore & Ohio (Pennsylvania Station).....				330,000
Central of New Jersey—

\*Estimated.

In addition to the traffic shown in the table, the Pennsylvania also received from and delivered to the Hudson & Manhattan at Manhattan Transfer 23,891,389 passengers (commuters 15,529,403; all others, 8,361,986), making the grand total of all Pennsylvania Railroad passengers arriving at and leaving New York City during the year 42,260,425. This company also carried to and from its Jersey City Terminal (Jersey City passengers) 3,900,000 (commuters 2,535,000, all others 1,365,000).

Lehigh Valley Railroad passengers arriving at and departing from Jersey City numbered 162,000, this figure being included in the total number of Pennsylvania Railroad passengers carried on its two ferries.

The Staten Island Rapid Transit Company carried on its lines in Staten Island (all within New York City) 15,011,958 passengers.

## Railroads in the Post-War Readjustment\*

By Atlee Pomerene  
United States Senator from Ohio

I AM MINDFUL of the many criticisms of our transportation system, and many of them are well founded, but notwithstanding these facts we have the best transportation system in the world, at the cheapest rates per train mile in the world, and with the best paid labor in the world.

I have no defense to make for the executive management of our railroads as it existed 20 or 30 years ago, but the management has been greatly improved, and the class of men who are now the active executives of the great systems of the country are far in advance of the executives of 30 years or more ago. Most of them appreciate the fact that railroad property is not for their private manipulation, but that it is quasi-public property for the benefit of the entire public.

The war reduced the morale not only in private industry, but in the railroad world as well. Part of the shortcomings of every industrial activity is attributable to the war, and we must be very patient with one another when we attempt to criticize too severely. The object of criticism should not be for the purpose of maligning those who have made mistakes, but rather for the purpose of calling attention to them, with the view of curing them. It is in this spirit that I shall discuss briefly the transportation problem.

Theorists suggest government ownership. It is only charitable to say of them that while their intentions may be the best, they never have studied their way through the problems involved. Agitators speak of it, but as a rule they are bent only on destruction of things that are, and care nothing for the future of the country, except as they themselves may profit by the change. The government did many things which it was required to do during the period of the war just as manufacturers and business men, and in fact all other citizens, were compelled to do, which they would not think of doing during a time of peace.

And one of the things which it was necessary for the government to do during the period of the war was to take over and operate the railroads for the purpose of hurrying the manufacture and transportation of our war supplies for the boys who went to the front to fight the battles of democracy and world-freedom.

As a result of government management during these trying times, notwithstanding the great increase in all traffic rates, the government so far has sustained a known and conceded loss of somewhat over \$1,200,000,000. When the government took over the railroads, it agreed to return them at the end of government control in as good a condition as they were at the time the government received them. Under this provision of the statute some of the railroads have filed large claims. If the claims of the railroads which are not yet filed shall be proportionately as large as those which have been filed, the total of unliquidated claims will amount to between \$1,500,000,000 and \$2,000,000,000. Of course, it would be but a wild guess to state what part of this amount must ultimately be paid. Enough is known, however, to make us realize that it will be no inconsiderable amount.

The total railway investment, according to the best estimates that can be made by the Interstate Commerce Commission after they have been trying for six years and more to ascertain the value of these railroads, is about 19,200,000,000 of dollars. The finally ascertained value may be somewhat below or somewhat above these figures. There was a time when there was a great deal of water in these railroad stocks and bonds, but that is not so now, at least to no very great extent. The actual value of the railroads will not be very

far from the combined stock and bond issue. I am speaking of the railroads as a whole.

And now what is the situation? Labor has its rights which must be protected. The investors have their rights which must be guarded, and the public has rights which are paramount to all of them. The public has the right to have the best, the quickest, the cheapest transportation obtainable. And while present traffic rates per ton mile are lower in this country than they are in Europe, the public feels that present freight and passenger rates are higher than they ought to be, and I share this view. At the same time we must remember that the total revenues of the railroads cannot be reduced, generally speaking, unless there is a material reduction in the expenses of operation. I do not overlook the fact when I make this statement that high rates in some instances have resulted, as I believe, in the reduction of transportation to the extent that there has been an actual loss instead of an increase in revenues.

That it has been necessary to increase traffic rates I think all must concede. It is impossible to increase expenditures unless you increase the revenue to meet them, and instead of the railroads earning during the last year the 5½ per cent on their investment, the net earnings for the railroads of the whole country during the calendar year 1920 were only \$61,928,626 available for interest and dividends, or less than three-tenths of one per cent.

If we take the year March 1, 1920, to March 1, 1921, the net earnings are less than \$3,000,000 for the entire railroad systems of the United States.

A few weeks ago a manufacturer of engines came into my office. His company's plant had been operating only part capacity for some time. He had just returned from the south where he went to sell some engines. He met with only fair success. In talking about conditions in his own plant he told me that wages in his shop had increased from time to time during the war until the total wage average increase amounted to 115 per cent over and above the average wage prior to the war. Some weeks ago his company called its men together and advised them that the management in order to get work would be obliged to reduce the price of the product, and that this could not be done unless there could be a reasonable cut in the wage. The company proposed a cut of 15 per cent. All the men in the shop eagerly accepted this proposition except those in one department. They wanted to accept it, but advised the company that their international officers would not allow them to do so. What a fine spirit it showed to have employers and employees getting together in their common interest. How gladly, I imagine, the men accepted this reduction in order that they might have work, and the company might continue to do business. And when all their fellows were accepting, what must have been the feeling of the men in the one department who were not permitted to go to work by their international officers? My judgment is that officers of an organization should do what their men want, and the men should not be dictated to by the few arbitrary leaders.

In this particular instance let me add that before the war the standard engine of this company required 7,000 hours to build it. At the time of which I speak this same engine required 13,000 hours to build it, at an increase of wages of 115 per cent. In other words, as compared with pre-war times the cost of the engine was almost quadrupled.

I am not referring to these conditions in a fault-finding way. I know that during the period of the war the morale of the country was so interrupted that not one man nor one class of men was responsible for the conditions. All must accept their responsibility. It is one of the misfortunes that must be charged to war. I am referring to these conditions with the hope I may help all classes to see conditions as they are, and in order that we all may determine what should be done under present conditions.

\*From an address before the Chamber of Commerce, Hamilton, Ohio, on June 14, 1921.

## New Freight Terminal Nearing Completion in Chicago

Multiple Story Construction and Elevators are Prominent Features  
of Chicago & Alton Project

THE MULTIPLE STORY principle of freight house operation and the idea of elevator communication between floors find their most recent application in the terminal project which the Chicago & Alton is pushing to completion in the city of Chicago. This involves the replacing of an old freight house with a new one and the extensive revision of a restricted track layout. The new building is a combined freight house, warehouse and office structure, built over the tracks, in which outgoing and incoming freight will be handled separately and all freight, regardless of kind, will be

century old, while the general offices of the company have been confined to rented quarters for several years. With these basic needs present, an inducement for commencing the undertaking was supplied in the necessity which arose for the Alton to abandon its older facilities to make room for the construction of the new Union Passenger Station. Aside from the special engineering and operating features embodied, the project is of interest because of its having been undertaken at a time when the tendency on railroads has been to postpone improvements of this character. Also, associated as

The Track Layout of the Chicago & Alton Terminal

handled between different floor levels by elevators. The building is six stories high, and about three acres in extent. It provides approximately 140,000 sq. ft. of area in track platforms and freight house floors and 50,000 sq. ft. of warehouse space, has about 1,400 lin. ft. and 3,000 lin. ft. respectively of doorways and car platforms, and is located advantageously with respect to the Chicago river, along which the road has about 1,000 lin. ft. of dockage on a level with its tracks.

The project had its origin in the need for more adequate freight handling facilities and quarters for its enlarged office organization, the existing facilities being more than half a

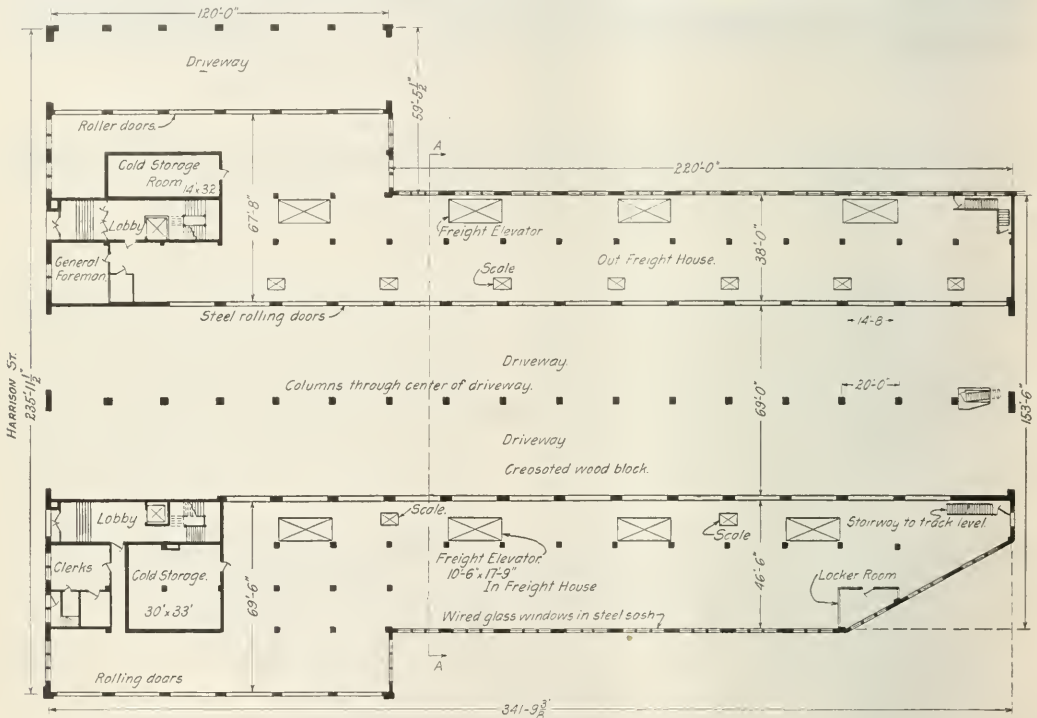

century old, while the general offices of the company have been confined to rented quarters for several years. With these basic needs present, an inducement for commencing the undertaking was supplied in the necessity which arose for the Alton to abandon its older facilities to make room for the construction of the new Union Passenger Station. Aside from the special engineering and operating features embodied, the project is of interest because of its having been undertaken at a time when the tendency on railroads has been to postpone improvements of this character. Also, associated as

it is with the union depot construction, it occupies a place of general interest as a part of a still larger terminal development program, the latter anticipating the remodeling of the entire terminal district in the vicinity of the present union depot through the construction of the new union station (now under way), the Alton layout, the Pennsylvania freight terminal building (already completed) and the proposed freight terminal of the Chicago, Burlington & Quincy.

In determining the design of the layout and the character of the construction several exacting conditions presented themselves for consideration as governing factors. The available ground space was a narrow strip extending from Van

Buren street on the north to Polk street on the south, a distance of about 1,300 ft., between the Chicago river on the east and the Union Station property on the west. This strip, comprising about ten acres, is situated some 20 ft. below the street level and is crossed by three elevated streets, Van Buren on the north, Harrison at the center and Polk street on the south. Furthermore, it is made irregular by the bank of the river and the existence at the Polk street end of two commercial warehouses. It will be bounded along the west side by an elevated street extending from Van Buren to Polk streets as called for by the plans of the Union depot. Added to these conditions and confinements with respect to location were considerations regarding the present and future business requirements, the limitations on funds for construction and the high value of the property, all of which created a problem

forms, one on the west for outgoing freight, a second on the east for incoming freight and a third midway between for effecting transfers directly from one car into another. These platforms accommodate elevators at intervals of about 50 ft., which provide the means of communication with the upper floors and also give access to 12 house tracks, seven of which extend through the house and are covered by it for a distance of about 800 ft. and four of which extend along the west side, the remaining track being a short spur at the south end of one of the platforms. These tracks are arranged in groups of four, three, two and two from west to east with respect to the platforms and provide capacity for about 270 cars. Excepting for the two tracks to the east which terminate at the north end of the structure, they may be entered both from the south and the north from the joint main line tracks of

Floor Plan of the South Unit Showing Elevator Shafts and Scales

necessitating close arrangement to detail. In the existence of such factors, the project was begun only after extended studies had been made to the end of minimizing cost and building most advantageously.

### The General Layout

The general layout comprises a building occupying a rectangular area along the west side of the Alton property on both sides of Harrison street. This building, about 900 ft. in its longest dimension and 236 ft. in its widest, is a continuous structure at track level, but at the street level is separated by Harrison street into north and south units, each of which faces on Harrison street. With respect to freight handling it is divided lengthwise into outgoing and incoming houses whereby all incoming freight is handled on one side of the building, while the outgoing is handled on the other. Below the street level the building accommodates three plat-

forms the Alton and Pennsylvania, there being one lead at the north and two at the south end of the yard.

The remaining 20 tracks of the total of 32 in the yard are team tracks. These tracks are arranged in groups separated by concrete pavements and provide capacity for about 165 cars. Access to them will be had by two inclines, one already in existence extending from Polk street and the other to extend south from Van Buren street. The inclines will rise to the street levels on a grade of about 3.5 deg.

### The North Unit

Of the two units formed by the intersection of Harrison street, the north unit is the largest. This building, not including the 70 ft. by 30 ft. extension on the rear for power plant and heating purposes, is 340 ft. long, has a street frontage of 235 ft., extends five stories above the street level and, aside from the local freight handling facilities, provides warehouse

space and quarters for the company's local freight and general office organizations. The local freight business is confined to the first or street floor, all communication with street vehicles being effected at this level while access is had to the car platforms by means of the elevators. The area of the first floor is divided lengthwise into two sections, one intended

tions of the house and also affords ready accessibility to the street from all parts of the building. In addition to a stairway, a passenger elevator and four freight elevators (one of the latter being omitted for the present), the platform of each section accommodates a cold storage room and platform scales for weighing, there being eight scales for the outgoing and

Section of the South Unit Through A-A, Showing Arrangement of House Tracks and Platforms

for incoming and the other for outgoing freight, the sections being separated by a driveway 67 ft. wide. This driveway extends through the house from and on a level with Harrison street and terminates at the north end in a 24-ft. viaduct which, when completed, will provide a connection with Van Buren street. In addition to this central driveway, the plan

two for the incoming section. The floor is lighted by closely-spaced windows along each side of the building and by the large open entrances at each end of the driveway.

The second floor of the building is designed for warehouse and storage use and allows for that purpose the entire area of the building except for the elevator shafts. The space

Looking North from Polk Street. South End of Freight House in Foreground

provides for two side entrances to the building from Harrison street, each to be 30 ft. wide and 120 ft. long. When constructed one will extend along the east side of the building for ingoing freight and the other under the west side of the building for outgoing freight.

This arrangement of the first floor provides about 19,000 sq. ft. of floor space each for the inbound and outbound por-

approximates 61,000 sq. ft., communication to it being effected by the several freight elevators which are located on the car platforms and the first floor. This floor is well lighted by windows on the sides and ends of the building and by large and high monitors above the center.

The third, fourth and fifth floors of the building will be devoted to the needs of the local freight and general offices.

of the company. These floors extend only above the front end of the building and provide about 20,000 sq. ft. of office area. According to the plan the third floor will be occupied by the offices of the local freight agent, telegraph and telephone department, superintendent of car service and a lunch room; the fourth floor, by the controller's and auditor's forces and the fifth floor by the executive offices and the engineering, transportation, purchasing and freight and passenger departments. Two elevator and stairway units, one unit on each side of the building, will furnish access to the street and to the roof, the latter to be surrounded by a four foot parapet and prepared for recreation purposes.

### The South Unit

The south unit of the terminal structure is confined to one story above the street level and appears as two separate buildings, an inbound and an outbound house separated by a common driveway. This building is 460 ft. long and 154 ft. wide and is devoted entirely to freight handling. As such it differs from the north unit in three particulars. The car platform of the outbound house extends beyond the south end of the building sufficiently to accommodate a crane by means of which heavy objects may be transferred directly from street vehicles to the cars. Also the house like other terminals in the business center of the city provides accommodations for the transfer of freight with the Chicago Tunnel Company. By means of elevators tunnel cars can be transferred directly from the tunnel to tracks on the trucking floors. A further feature of this house lies in the relation of the incoming house to the team tracks by reason of which the two tracks extending under the east side of the building can be utilized as team tracks as well as house tracks. Sim-

ilarly to the north unit, the driveway to this unit is an extension from Harrison street and when desired may be prolonged south to intersect with Polk street.

of these caissons, one under each column except in two instances where the presence of a tunnel of the Chicago Tunnel Company required the supporting of the columns on a reinforced concrete beam spanning between adjacent piers. These beams are 5 ft. by 9 ft. in cross section. The caissons vary in diameter from  $4\frac{1}{2}$  ft. to  $6\frac{1}{2}$  ft., extend to an average depth of 60 ft. and rest on hardpan except in one instance, where bedrock was encountered.

The floor construction varies throughout the building. The car platforms are concrete on cinders and the floors above the street level are, in general, of the T-slab type construction patterned after the Branson system of joist molding, whereby the many joists supporting the slabs flare at each end. The car platforms and floors of the south unit are surfaced with asphalt mastic. All other platforms and floors are finished in "Carborundum," a mixture of carborundum dust with cement. The office floor hallways and the stairways are to

Interior View of Second Floor of North Unit. Floor in Process of Curing

Interior View of Outbound House of South Unit

be laid with "terrazza." The roadways will be paved with creosoted wood block and the roof covered with asphalt mastic.

All windows in the first and second floors and the skylights are of wire glass in hollow steel sash and the 84 doors between the driveways and the freight handling floors are of the steel rolling type, each door protecting an opening 16 ft. wide and 10 ft. high, separated only by the wall pilasters. The storage space on the second floor of the north unit is subdivided by a brick fire wall provided with four automatic tin-clad fire doors. In the third, fourth and fifth floors, expanded metal on the floors and floor joists provide the surfacing for plaster and on the fifth floor a false ceiling will be hung several feet below the roof. Partitions between the offices in general will be wood and glass while hollow tile will comprise the walls of all vaults and elevator shafts. The direct system of electric lighting is to be used throughout the building.

### Elevators

With the knowledge that in the final analysis the efficiency of the house will depend upon the elevators, this subject received particularly careful attention with the result that provision has been made for 17 automatic elevators, each of 5 tons' capacity. These elevators are electrically operated by means of push buttons. The buttons are located on the outside of the shaft as well as in the cage, by which arrangement the operator may or may not follow the elevator and the operation of the elevator is such that regardless of weight carried the platform automatically will come to a stop at the exact floor level. The elevator system also provides steel doors in the shafts, which are counterbalanced to effect easy operation and which both prevent their being opened from

### Structural Details

The building is of concrete-encased steel frame construction with brick walls and terra cotta coping and floors of reinforced concrete. It presents a number of interesting features in design, chief among which are the close attention given to lighting and the supporting of that portion of the four story section which extends over the four tracks on the west side by 60-ft. trusses. Two types of foundations support the structure, that under the south unit consisting of concrete pedestals carried on piles, while that under the north building consists of concrete piers carried down to hard pan or rock by the open caisson or Chicago method. There are 125

the outside and make impossible the rising of the elevator in the shaft until they are closed. By means of these elevators the system of operating the house is such that outgoing material received from street vehicles on the first floor is transferred to the scales, thence to the elevator and from there lowered to the track level platform and loaded into the cars. It is the intention of the Chicago & Alton in operating the house to require the men handling the material on the first floor to follow the freight entirely through the process of handling. Should occasion make it desirable, however, the system is one which will enable the work to be accomplished by separate gangs, each confined to a single floor.

This structure has been designed and erected under the direction of W. T. Bierd, president, H. T. Douglas, Jr., chief engineer, and W. F. Rech, bridge engineer of the Chicago & Alton, and is being built by the Dwight P. Robinson Company, New York. The south unit of the terminal is completed and has been in operation for several weeks while the construction of the north unit is expected to be far enough along to permit of its opening for operation by July.

## Labor Leaders Meet at Chicago to Determine Policy on Wage Reductions

**T**HE GENERAL CHAIRMEN and chief executives of the labor organizations affected by the recent wage cut order of the Railroad Labor Board met at Chicago on July 1 to consider and pass upon the wage reductions which went into effect on that date. Prior to July 1 strike talk was rife but as the meeting continued the conservative element in the ranks of the various organizations led by the "big four" brotherhoods obtained control of the situation and on July 5 several spokesmen of the labor organizations stated that anything in the nature of a strike in protest against wage reductions was "more than remote."

Soon after the various organizations convened a committee of five representatives of the 16 larger railway unions was appointed. This committee, which is headed by B. M. Jewell, president of the Railway Employees' Department of the American Federation of Labor, and composed of F. H. Fitzgerald, president of the Brotherhood of Railway and Steamship Clerks, Freight Handlers, Express and Station Employees; L. E. Shepard, president of the Order of Railway Conductors; E. J. Manion, president of the Order of Railway Telegraphers, and Timothy Shea, vice-president of the Brotherhood of Locomotive Firemen and Enginemen, will formulate the policy of the railway employees toward the wage decrease order of the Labor Board. The committee subsequently received daily reports from the various group meetings in progress and will prepare general recommendations for submission to the union's membership.

After the meetings had been in session it developed that the maintenance of way employees, clerks and shop men, together with the firemen and oilers, as a group are strongly opposed to accepting the decreases ordered for these employees by the Labor Board, whereas the train service organizations are seriously considering an "informal acceptance" of the Labor Board's decision. Later developments indicated that the conservatism of the "big four" brotherhoods was acting as a check upon the more radical representatives of the maintenance of way, clerks' and other organizations.

The great differences of opinion held by the representatives of the workers at the various group meetings led on July 2 to the appointment of a committee of ten in each of the organizations to draw up a program. When these various programs have been completed and approved by the representatives they will be submitted to the committee of five which, in turn, will consolidate them into one program which will then be submitted to the organizations for approval or rejection.

On July 3 it became apparent that the abrogation of rules and working conditions ordered by the Labor Board to be effective on July 1 and later indefinitely postponed, accounted to a large extent for the dissatisfaction of the employees as expressed in referendums on the wage reductions. When the more radical representatives became thoroughly informed as to the present status of the national agreements and of the various interpretations of Decision 119 which have been issued by the Labor Board, peace sentiment gained rapidly.

Factional differences within the organizations rendered a final decision as to labor's attitude at the present time impossible on July 4 and it became necessary to continue the meetings on July 5.

The train service organizations finally decided upon a plan of action late July 5 with the adoption of a resolution providing for a referendum vote of the membership of the train service brotherhoods as to whether the wage cuts recently ordered by the Labor Board will be accepted or rejected.

This referendum is to be taken not later than September 1 and in the meantime an effort will be made to arrange a conference between the Union chiefs and the railroad executives. The resolution adopted by the brotherhoods said in part:

*Whereas*, The general chairmen are required not only to consider wage reduction but in many instances railroad officers have served notice of their intention to abolish time and one-half for overtime in road freight and yard service and in addition thereto to revise schedules for the benefit of the railroad by abolishing many rules and conditions which in the aggregate mean loss of much money and creation of less favorable conditions for various classes of employees and

*Whereas*, Much unrest and uneasiness exist which cause deep concern, add to seriousness of the situation and establish a condition of affairs which makes it practically impossible for this body of general chairmen to take responsibility of deciding these important questions for the reason that we hold that no reduction in wages of various classes is justifiable and

*Whereas*, It is the earnest desire of the representatives assembled to do everything possible compatible with their duty to those whom they represent to avoid any inconvenience or loss to the public, and

*Whereas*, In keeping with this thought we hereby authorize and direct our executive officers to acquaint those in authority with these resolutions; further that they call attention to the fact that certain carriers, namely the Missouri & North Arkansas and the Atlanta, Birmingham & Atlantic have disregarded decisions and flouted authority of the Railroad Labor Board, and

*Whereas*, Despite all these provocative circumstances coupled with a common desire to refrain from taking any action that might precipitate a deplorable situation we

*Resolve*, That the general chairmen cannot assume the responsibility of accepting wage reductions and that not later than September 1, 1921, the entire subject matter be referred to the membership through the various general chairmen for acceptance or rejection.

*Be it further Resolved*, That we authorize our chief executive to make arrangements if possible to meet a committee of railway executives to be selected to meet the subcommittee representing the organizations named herein to consider and if possible adjust all matters in controversy and that our chief executives and committees handling these questions be directed clearly to place the representatives of the railway corporations on record as to whether or not they will request further decreases in rates or compensation, abolition of schedule rules or regulations or elimination of time and one-half time.

The ballot when submitted to the men shall contain an impartial and unbiased recital of all that is involved and the wishes of men as expressed by ballot shall determine the matter in accordance with the laws of the representative organizations.

It is believed that the other labor organizations will follow the lead of the brotherhoods and accept the wage reductions under protest, taking at the same time a decided stand on the abrogation of the National agreements.

### Pullman Shop Employees' Wages To Be Reduced

The shop employees of the Pullman Company will receive the same wage decreases as were ordered for the shop employees of the carriers in the Board's Decision No. 147, according to a ruling announced on July 5.

# Hearings Before Senate Committee Adjourned

## Committee Members Show but Small Interest—Prospects for Little Railroad Legislation at This Session

WASHINGTON, D. C.

THE HEARING before the Senate Committee on Interstate Commerce, which has been inquiring into the railroad situation for several weeks, was adjourned on July 1 to a date to be fixed later by Chairman Cummins in the latter part of August or about the first of September. Chairman Cummins' announcement merely stated that it was felt advisable to adjourn the hearings during the hot weather. It has also been proposed in the Senate to take a series of recesses during July and August. Very little interest has been displayed in the railroad hearing during the past two or three weeks by members of the committee. Seldom have more than three or four members been present and on several days Senator Cummins was the only member of the committee present. He has now been ordered by a physician to take a rest and the committee will hold no hearing of any kind during the next month. Testimony on behalf of the National Association of Owners of Railroad Securities was completed on July 1, although S. Davies Warfield, president of the association, may appear again when the hearings are resumed. The committee had had comparatively few requests from representatives of the shippers for opportunity to be heard and, while it had been arranged with representatives of the labor organizations to appear on July 5, they had asked for a later date. They had originally asked to be heard after the other testimony had been presented.

### Prospects for Little Railroad

#### Legislation at This Session

Now that the Frelinghuysen seasonal coal rate bill has been practically killed by vote to recommit it to the committee, there are prospects for very little, if any, railroad legislation at this session. A large number of bills introduced to amend the Transportation Act, practically all of which were originated by those who are unfriendly to that law and opposed it at the time of its passage, have been referred to committees, where no action has been taken on them.

While the hearing before the Senate committee has indicated no prospect of any definite results, it has afforded an opportunity to the railroads to give a public explanation of the situation. The investigation was started at a time when a good many people were making charges that the large increase in railroad expenses in 1920 after the railroads were returned was due to extravagance and that the decrease in railroad traffic was mainly due to the latest advance in freight rates. The railroads were able to show conclusively that the largest part of the increase in expenses was due to the wage award and other increases in payroll which resulted from the national agreements and wage orders issued by the Railroad Administration during the last few weeks of its existence, while there were also large increases in the cost of fuel and other expenses, over which the railroads had very little control. The hearings have also served to convince at least a majority of the committee, apparently, that the diminution of traffic was due to general business depression in no way related to freight rates and that even if freight rates were too high a repeal of the 6 per cent rate-making rule of the Transportation Act would not in any way affect the situation since the advance in rates has at no time been sufficient to pay a 6 per cent return even during the months of the heaviest traffic last fall.

### Director Colston Submits

#### Written Statement Outlining Views

At the request of Senator Cummins, W. A. Colston, director of finance of the Interstate Commerce Commission, submitted a written statement on June 30 outlining his views regarding the organization proposed by the National Association of Owners of Railroad Securities and the bills for the federal incorporation of the National Railway Service Corporation and to promote further economies and efficiency in railway transportation.

He said there was no doubt in his opinion that the corporation under a federal charter would continue to accomplish in part at least the benefits realized under its state charter, namely, the extension of credit to carriers which otherwise could not obtain credit and the reduction of interest rates, discounts and commissions on moneys required by railroads.

Without provision for adequate capital, however, he said, these benefits would be limited by amounts available under section 210 of the Transportation Act, or by similar provisions under future laws, and the work of the corporation would be handicapped, as the State corporation has been, by the unwieldy forms of equipment trust agreements, etc.

"I think that the proposed corporation could be made a much more virile and helpful institution if the bill were amended in the following respects," said Mr. Colston.

"First. In order that there may be no fear or suspicion of private profit or benefit growing out of the activities of the federal corporation, the act of incorporation should distinctly provide that the assets and profits of the corporation shall be the assets and profits of the United States, to be administered by the managers of the corporation, as trustees or fiduciaries, solely in the interest of commerce and of the people of the United States. Instead of providing, as is now done by section 10 of the bill, that the corporation shall issue no shares of stock, it might be well to provide that all of the capital stock of the corporation shall be issued to and held by the United States. The loans, leases, underwritings and other major operations of the corporation should be under the control or subject to the supervision of the Interstate Commerce Commission just as loans are now made under section 210 of the Transportation Act under the direction of the commission. But transactions incidental to carrying out the general enterprises authorized by the commission should be performed by the corporation's officers and trustees just as business of a private corporation is carried on by its officers and an executive committee under the general authority of the directors or stockholders.

"Secondly. The business of the corporation should be simplified by providing that the corporation itself shall make the loans, underwrite the securities, or exercise the other activities contemplated, upon direction or approval of the Interstate Commerce Commission, without the necessity for multiplying transactions between the commission and the Treasury, between the Treasury and the corporation, and between the Treasury and the carriers. And to the extent of its assets or capital stock the corporation should be permitted to underwrite, as well as buy, sell and loan upon, the securities of carriers, but should, of course, not be permitted to bind the United States by its underwritings or agreements, except to the extent of the assets turned over to the corporation and the profits therefrom, or to such

further extent as may be specifically authorized by law.

"Thirdly. There should be turned over to the corporation, as the basis of its operations and to be held, administered and dealt in as trustee, for the uses and purposes for which it is created, all railroad securities of any kind now held directly or indirectly by the United States government, all balances in the revolving fund created by section 210 of the Transportation Act, 1920, and all the accretions of the general railroad contingent fund provided for by section 15a of the Interstate Commerce Act. A rough estimate of the assets now or prospectively dormant and available for such purposes, in addition to the accretions which may be expected for the general railroad contingent fund, may be obtained from a consideration of the following:

In June of last year the War Finance Corporation held securities of railroads amounting to \$64,658,210. It is probable that the greater part of this sum is still unpaid.

On April 30, 1921, the Treasury held obligations of carriers acquired under section 7 of the Federal Control Act, approved March 21, 1918, as amended, amounting to \$66,047,250, and equipment trust 6 per cent gold notes acquired by the Director General of Railroads pursuant to the Federal Control Act of March 21, 1918, as amended, and the act approved November 19, 1919, to provide for the reimbursement of the United States for motive power, cars and other equipment ordered for carriers under federal control, amounting to \$310,098,300, and obligations of carriers acquired pursuant to section 207 of the Transportation Act, approved February 28, 1920, amounting to \$89,506,500.

The revolving fund of \$300,000,000 created by section 210 of the Transportation Act has been increased by accrued interest, and if other provision is made for payment of judgments against the Director General now required to be paid out of this fund we may set down the assets and balances in the fund as amounting to something over \$300,000,000.

The carriers are now seeking the funding of additions and betterments during federal control amounting to approximately \$750,000,000.

The obligations held for advances to carriers under the Federal Control Act are subject to some changes growing out of the final settlement of the carriers' accounts with the Director General, but we may say in round figures that if the request of the carriers to fund additions and betterments during federal control is granted we shall have in sight dormant or frozen assets amounting to about \$1,500,000,000, which, if turned over to the proposed corporation, could probably be made the foundation of a financial power of \$4,500,000,000, an amount sufficient, apparently, to finance the needs of all of the railroads of the United States for many years.

"Incidentally to the amendments suggested there should be provisions to permit the making indefinitely of loans by the corporation, on order or approval of the Interstate Commerce Commission, out of its funds or assets, including the balances and assets arising from the operations of the revolving fund under section 210 of the Transportation Act, 1920, and there should be either no limitation of the time for which loans may be made or the time should be considerably extended beyond the period of 15 years now permitted by section 210 of the Transportation Act. The average life of equipment is considerably more than 15 years, and under the restrictions of section 210 of the Transportation Act it was impossible to arrange for the purchase by the National Railway Service Corporation (or any other organization effected for the purpose) of equipment to be held by the corporation and leased to carriers generally. As will appear from the table submitted in my testimony of today, and showing the amortization at 6 per cent of equipment on basis of  $4\frac{1}{2}$  per cent return on original investment, and with depreciation rates of 4 per cent and 5 per cent, respectively, the National Railway Service Corporation could buy equipment in quantity and lease such equipment to carriers indefinitely on basis of  $4\frac{1}{2}$  per cent return on original cost of equipment plus depreciation, the carrier, of course, making the repairs. With such central ownership, benefits of a standardization of cars and of use of cars where needed to meet seasonal requirements, etc., could be largely realized."

Relative to the bill providing for the promotion of fur-

ther economies and efficiency in railroad operation, Mr. Colston said in his opinion the creation of formal organizations on the part of the railways and men of financial experience as proposed by the Warfield organization would be of great benefit in furthering economies and efficiency, particularly in the matters of standardization of equipment, common use of terminals and universal interline billing. He said it was his belief that the greatest difficulty in the way of accomplishing those results in the past has been through the lack of power or failure to exercise power to make mandatory the conclusions of those who have studied the several subjects. He said the proposed bill should confer on the commission the power to act upon recommendations made by the proposed service board or of any of the group boards, because if the recommendations could not be made mandatory the act would be of no effect.

Director Colston said he wished it understood he had prepared his statement hastily and that it represented his personal views and not in any way those of the commission.

### Views of American Manufacturers' Association

H. A. Holmes, representing the American Manufacturers' Association, told the committee that members of his association stand ready to provide \$100,000,000 a month for a year to enable the government to pay its debts to the railroads, which he estimated at about that amount, receiving in return  $5\frac{1}{2}$  per cent tax-free Treasury certificates. Senator Cummins said that the Railroad Administration owes the roads about \$700,000,000 and has on hand about \$235,000,000, whereas the roads owe the government for capital expenditures about \$750,000,000. If the President decides to fund the indebtedness of the railroads, he said, a situation might arise in which Mr. Holmes' proposition would be very interesting.

### Walter L. Fisher Urges Legislation in Favor of Co-ordinating Facilities

Walter L. Fisher, counsel of the Chicago Railway Terminal Commission, urged upon the committee the importance of legislation which will compel the better co-ordination of railroad facilities by grouping or consolidation and by unification of terminals along the lines suggested by Chairman Clark of the Interstate Commerce Commission in his testimony before the House Committee on Interstate and Foreign Commerce in 1919, in which he advocated that a beginning be made by consolidation of terminals under terminal associations or companies under a single management. Mr. Fisher said that the fundamental difficulty of the whole railroad situation is the failure of the public, the government agencies and the railroads to keep in mind the inherent character of the railroad business. He said he is not an advocate of immediate government ownership and would be reluctant to state the date for government ownership, but every time we fail to have definitely in mind the fact that a railroad is a government agency we get the wrong point of view. The railroads are performing a function of government, he said, yet the railroad executives are constantly disposed to ignore that fact except when they want help from the government on the ground that they are performing a public service. There is an unsound and uneconomic duplication of terminal facilities which are only superficially used, he said, yet many railroad executives claim that the advantages of competition overbalance the advantages to be derived from unification. Yet, he said, this spirit of competition amounts to very little from the public standpoint and is little more than a talking point for a railroad that has better facilities than another in selling freight.

In the matter of service, he said, the railroads find that if they compete too much they get into destructive competition and so they agree to limit it. The unification carried

out under the Railroad Administration, he said, was so successful that many railroad officers who were concerned with it boasted of it, although they had previously opposed unification, while it is difficult now to get them to admit the advantage of unification because of the attitude of their superiors, and unless there is some strong authority to compel unification, the movement will not get very far.

The Interstate Commerce Commission, he said, has no greater opportunity for usefulness than to make a real study of the possibilities of unification to determine the facts, and if it does not have the power should have the power to put its recommendations into effect. People who regard government ownership with apprehension should realize that the danger of government ownership is increased by their failure to recognize the necessity for co-operation and co-ordination and their insistence on the competitive theory. This, he said, is doing more to force premature government ownership than anything else. In some respects, he said, the railroad executives are doing remarkably well, but they are so reluctant to give up advantages which one road may possess over another that some compelling power is required. Senator Cummins pointed out that the Interstate Commerce Commission now has power to compel the common use of terminals and facilities. Mr. Fisher assented, but said that power is tied up by the necessity for fixing the value of the property to determine the proper compensation. He believed the Supreme Court would sustain the theory that back of all the titles to property lies the obligation to perform the public service and, while he would be the last to say that a railroad ought not to receive a fair return, it should only receive a fair return, but, he said, the railroads want to capitalize the disadvantage of a competitor. He said that the railroads are appealing to congress for help, but before Congress responds they should be compelled to adopt measures that will promote a more economical use of the facilities.

Mr. Fisher said it was gratifying to observe the efforts of the bondholders, as represented by Mr. Warfield's organization, to take a more active part in railroad affairs. The railroad executives, he said, resent it and are inclined to treat the bondholder as a mere creditor, but they fail to recognize the inevitable tendency of railroad financing in the future. Because the railroads have not been able to sell stock at par they have been driven to issue bonds and the real owners of the railroads have come to be the bondholders. The real problem is how to raise additional money for the railroads and to do so it is necessary to stabilize railroad securities. That means that the bondholders have got to come to the front and they ought to be invited to do so.

Mr. Fisher said he did not believe the existing Interstate Commerce Act reaches the difficulty in the way of a greater co-ordination of railroad facilities and that the permissive provisions as to consolidation certainly are insufficient, particularly as very little sympathy has been manifested on the part of railroad officers toward a grouping of the roads. Senator Cummins said that he agreed that the act does not go far enough and that the Senate had favored a compulsory consolidation law. Senator Cummins asked if this would not have to be done by some public agency because of the difficulty of raising capital enough for it to be accomplished by a private company. Mr. Fisher said that if the Interstate Commerce Commission would revise the rate divisions so that the rates would provide on terminal properties the same rate of return that is allowed on railroad investments generally there would be no difficulty in getting capital. He said it would not be necessary to condemn the terminal properties or pay for them, but the title can be left where it is, but the Interstate Commerce Commission could be empowered to compel the properties to be turned over to a company that would operate them in the common interest.

## Deraiment of Passenger Train Ascribed to a Split-Head Rail Failure

THE CHIEF of the Bureau of Safety of the Interstate Commerce Commission calls attention to the dangerous character of split-head rail failures in a report on a derailment occurring on the Chicago Great Western near Wyeth, Mo., on January 3, 1920. This is based on an investigation by the engineer-physicist, James E. Howard, which has led to the conclusion that the derailment was caused by rail failure of this type. The report goes into considerable detail as to the nature of these rail failures, carefully differentiating them from piped rails. Considerable data are also presented, designed to indicate the influences leading to this type of rail failure. Excerpts from this report follow.

In rails with split heads a longitudinal, vertical plane of rupture is developed, located along the middle of the width of the head. The origin of the plane of rupture is an interior one, located about  $\frac{1}{4}$  in., more or less, below the running surface of the head. The shallow zone above the origin of the rupture remains unbroken until the last stages of failure are reached. In the development of the split head the plane of rupture extends downward until abreast the junction of the head and the web. Here it commonly bifurcates, the branches extending right and left toward the fillets under the head. Final rupture occurs by the complete separation of the halves of the head and their detachment from the web.

Split-head rails are often erroneously reported as piped rails. The primary causes which lead to the failure of these two types are distinctly different, and their origins are located in different parts of the cross section of the rail. A split-head fracture has its origin in the upper part of the head. A piped rail has a plane of separation in the web and lower part of the head. Split-head rails are of frequent occurrence, while piped rails are not. A split-head fracture may occur in conjunction with a piped rail as the present rail shows—a matter not affecting their separate origins.

It will be inferred from the present exhibit and the remarks which are submitted that relatively there is a greater tendency, under the influence of track conditions, for a rail to fail by the development of a split head than by reason of the presence of a pipe.

Mr. Howard also presented a report on micrographic studies showing evidence of flow of the metal in the upper portion of the rail head as a result of which he presents the following statement concerning probable cause of the failure:

In summation, the failure of the rail which caused the present derailment was due to the presence of a split-head fracture. Wheel loads cause distortion of the grain of the steel and induce lateral flow of the metal at the running surface of the rail, the tendency of such loads being to spread the railheads. The successful resistance of such lateral forces depends upon the structural soundness of the metal in the railhead. Longitudinal streaks are lines of weakness which influence the formation of split-head fractures and locate their incipient points of origin. Longitudinal streaks are due to casting and mill conditions. Their elimination, or reduction in numbers and gravity of development, are matters for the steel makers to consider. The ages at which split-head rails manifest themselves indicate such fractures are of slow and progressive development. It is a matter of conjecture, although having the appearance of probability, that split-head rails would be unknown if strictly seamless steel was available for rails. The rail problem is intensified by reason of the employment of high wheel pressures. Soft rails display mashed heads. Hard rails furnish a large number of transverse fissures.

There is a popular fallacy entertained that split-head rails do not constitute a dangerous type of fracture, since at certain stages in their progress of rupture they may be detected in the track. This evidence, however, is presented at a late stage, after the necessary margin in strength in the rail has been practically exhausted, and not prior thereto. An element of danger has arisen when split-head rails are detectable in the track. An economic question is involved in the elimination of the causes of split-head failures, since many rails are removed for this cause which are not otherwise unserviceable. Finally, split-head failures should not be reported as piped rails.

A ROUGH GAME. "What has become of the tin locomotive and the train of cars I gave you on your birthday?"

"All smashed up," replied the small boy. "We've been playing government ownership."—*Exchange*.

# The Delaware and Hudson's New Car Service Rules

## Revised Rules for Promoting Prompt Car Movement Simplified for the Benefit of Yardmasters

A VERY successful wording of the rules for the guidance of station agents and yardmasters in the prompt and economical movement of foreign freight cars is that of the Delaware & Hudson Company and a reprint of these rules is given herewith. This code has been in use for over a year, but it has now been revised to conform to the changes, going into effect July 1, which have just been adopted by the American Railway Association and it will be found of interest as an example of a concise arrangement of the matter in concrete form, most suitable for the agents and clerks, who will use it, free from some of the technical

it will be seen, is well adapted to be a powerful aid to the yard clerk in the attempt (which he must never relax) to keep in mind the railroad geography of the whole country and the bold-type subheads in the instructions enable him, in each instance, to avoid wasting time on paragraphs which do not apply to the question in hand. For example, if he is dealing with a private-line car, he reads only the short section devoted to those cars.

It will be noted that these only do not include the new portion of Rule 2 under which two roads, connecting, may agree on exceptions to one of the requirements of that rule.

Delaware & Hudson Mileage Table for Car Service Department

details which are necessarily included in the American Railway Association circular, but which are not required in everyday use.

These rules are printed in large type, on the two inside pages of a four-page leaflet 9 inches by 11 inches, and are embraced under eight heads as shown. When the leaflet is opened out the two inside pages form a convenient poster to put up on the wall of a yard office; and the two outside pages are used to show: (1) the map (reproduced in the illustration reduced one half in width and height) designed to aid the agent in selecting the most suitable cars for use in loading freight to points on other roads and (2) the mileage chart (reproduced full size) for use in short-routing foreign cars which are to be sent home empty.

The rules, with the map and the mileage chart, have proved their adaptability to their purpose by reducing to a minimum the volume of messages from yardmasters to headquarters asking for instructions about routing. The map,

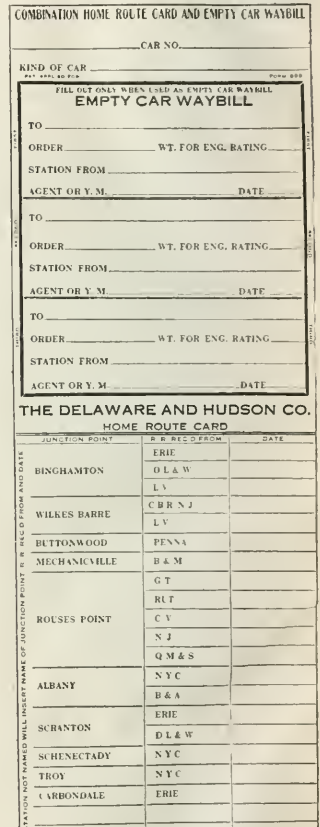

This is covered by separate instructions to each junction agent and, of course, is of no interest to other stations.

### Combined Home Route Card and Empty-Car Waybill

The adoption by the American Railway Association (June 23) of the revised rules re-establishes the home route card, the use of which was suspended during the period of quai-pooling which prevailed under war conditions; and the Delaware & Hudson is introducing a form (size 4 in. by 11 in., reduced in the illustration one-half in width and height) which contains both this and three empty-car waybills. The form is self-explanatory. Every foreign car received must be accompanied on its travels by a home route card as long as it is retained; and, as such a car may make a number of journeys, loaded or empty, before it is surrendered to the road whence it came (or to some other road) the three waybill forms printed on the single large card may often obviate the use of three separate cards. In the worst case

The home route card is Form 889. Agents and yard-

Delaware & Hudson Combined Card  
(4 in. x 11 in.)

Circular No. 14 follows:

## Delaware and Hudson Circular No. 14

## D. &amp; H. CARS

**RULE 1.** D. & H. cars must not be used for the loading of traffic beyond the limits of The Delaware & Hudson Company when the use of other suitable cars under these rules is practicable.

D. & H. coal cars may be loaded off line only to destinations in New Jersey, New York, New England, and Canada via Rouses Point, and with iron ore and pig iron to destinations in State of Pennsylvania via Wilkes-Barre and Buttonwood. Unless otherwise instructed surplus empty D. & H. coal cars will be billed to Carbondale.

## FOREIGN CARS

Foreign cars received under load may be forwarded to destination; when original lading is removed or when received empty they must be handled as provided in Rules 2 and 3.

## FOREIGN CARS AT HOME ON DIRECT CONNECTIONS OF D. &amp; H.

- RULE 2.** (a) May be loaded in local service in the direction of the home road, or  
 (b) Loaded (via any route) so that the home road will participate in the freight rate, or moved  
 (c) Loaded or empty in any direction to a local point, or delivered to a short line or switching railroad, if to be loaded for delivery on or via the home road, or  
 (d) Delivered empty to road from which originally received under load, if such road is also a direct connection of the home road, or  
 (e) Returned empty to the delivering road when handled in switching service and owner is not a direct connection in that switching territory, or  
 (f) Delivered empty to home road at any junction point.

## FOREIGN CARS AT HOME ON OTHER THAN DIRECT CONNECTIONS OF D. &amp; H.

- RULE 3.** (a) May be loaded locally in the direction of the home road, or  
 (b) Loaded (via any route) to any road in the direction of the home road, or  
 (c) Loaded (via any route) so that the home road will participate in the freight rate, or moved  
 (d) Loaded or empty in any direction to a local point, or delivered to a short line or a switching railroad, if to be loaded for delivery on or movement via the home road, or to a point in the direction of home road beyond Delaware & Hudson Rails, or moved  
 (e) Empty to road from which originally received at junction where received, if impracticable to load in accordance with this rule.

## DISPOSAL OF SURPLUS EMPTY CARS

**RULE 4.** The use of the home route card is re-established and the information shown thereon will be used as the basis for disposing of empty cars under sections (d) and (e) of Rule 2, and section (e) of Rule 3.

Special care must be taken to dispose of cars owned by our direct connections via shortest route. In disposing of such cars, it is permissible to deliver to road from which received at the junction point where received, or at a junction nearer home road, when empty mileage can be saved for both roads.

Example: D. L. & W. car at Saratoga originally received from N. Y. C. at Saranac Lake may be delivered N. Y. C. at Schenectady.

Cars owned by our direct connections when received from other than owners may be returned to the road from which received only when such road is also a direct connection of car owner.

Yardmasters after filling daily billing orders will dispose of surplus empty foreign cars in accordance with these rules, reporting surplus empty D. & H. (except coal cars) for disposition.

Local Agents will report on daily telegraph report, all surplus empty cars for disposition (except D. & H. and foreign coal cars) which should be disposed of in accordance with these rules.

## PRIVATE LINE CARS

**RULE 5.** Unless otherwise instructed the return movement of empty private line cars will be over the same road and

through the same junction points as the outbound loaded movement as indicated by the information shown on the home route card.

## TANK CARS

**RULE 6.** When tank cars are unloaded the owners or party to whom consigned will issue instructions for empty movement to the Agent at point of unloading. The Agent will bill each car to final destination, without revenue, but using standard form of revenue way-bill showing name of consignee and full route.

## GENERAL INSTRUCTIONS

Agent will require shippers to furnish destination and routing of shipments when ordering cars for loading. If proper car is not available for loading offered, same will be ordered in usual manner. When ordering cars, Agents must give commodity to be loaded, destination and full routing. Agent must immediately notify shippers of change in Car Service Rules, furnishing them copies if desired, and notifying them that no cars may be loaded except as authorized herein. Cars loaded by shippers without authority and in violation of these rules must be transferred into proper cars by shippers at their expense, and demurrage charges assessed against cars improperly loaded, until release, as per published demurrage tariff. See chart for the principal connections of the D. & H. Co. and the roads with which each connects.

[The following appears on the front page in red ink.]

THE RATE FOR THE USE OF FOREIGN FREIGHT CARS IS NOW ONE DOLLAR PER DAY.

## Illinois Central Makes Claim Prevention Appeal to Shippers

ON JULY 1, the Illinois Central, through its president, C. H. Markham, issued an appeal to shippers and consignees through advertisements in the press, to aid the road in its "claim prevention" campaign. The advertisement read in part:

During May, 1921, 68 per cent of the amount paid out for loss and damage to freight on the Illinois Central System was on carload shipments. We request carload shippers to insist upon being provided with cars suitable for the particular kind of freight they desire to ship and to see that shipments are properly braced and stowed in cars to prevent damage by shifting.

We request shippers of less-than-carload freight to comply with the rules and specifications of the Consolidated Classification Committee appointed by the Interstate Commerce Commission by selecting substantial containers in which to pack their goods for shipment, so that packages may not be crushed and contents damaged when loaded into cars with other freight. We request them to mark their packages plainly as to name of consignee and destination, removing all old marks that may appear on packages, and to furnish legible billing orders, so that billing may indicate clearly the name of consignee and destination. We also request them to deliver their goods at freight depots early in the day to avoid hurried loading and billing.

We request receivers of freight to observe the character of containers used by shippers and the manner in which goods are packed, crated and marked, particularly when goods are not received in good order, and to make those facts known to the shippers, appealing to them to use good containers, on the ground that defective goods and delayed transportation service cause them loss of trade. We also request receivers of freight to notify our representatives promptly of any concealed loss or damage to their shipments, in order that immediate investigation may be made. Some receivers of freight neglect to do this for days, and even weeks, after shipments have been received, rendering it difficult for the proper inspection and investigation to be made. This militates against good service.

Our purpose in presenting this problem to our patrons is to enable us to render a better service by eliminating delay in the delivery of freight in good condition and to assist in reducing the cost of transportation. By no means do we claim that all of the trouble is due to lack of care on the part of shippers and consignees. We are doing everything within our power to correct abuses for which we are responsible. We are working with our best efforts to render a service of satisfaction. By working closely with shippers and receivers of freight we believe it possible to bring the troublesome question of loss and damage under control, to the great advantage of shippers and receivers of freight as well as to this railroad.

## Freight Car Loading

WASHINGTON, D. C.

**A** REDUCTION of 5,680 cars, compared with the previous week, in the number of cars loaded with revenue freight during the week ended on June 25 is shown by the weekly report of the Car Service Division of the American Railway Association. The total for the week was 775,061 cars which was a decrease of 136,442 as compared with the corresponding week in 1920 and 70,623 below the total for the corresponding week in 1919. Comparisons with the previous week show reductions in the loading of all commodities with the exception of ore.

The largest increase compared with the week which ended on June 18, was in the loading of grain and grain products, the total for the week being 38,821 cars or 2,173 cars less than the preceding week. Loading of merchandise and miscellaneous freight, which includes manufactured products, amounted to 468,107 cars, which was 1,416 cars under that for the week before. A decrease of 1,045 cars was reported

for forest products, bringing the total for the week to 49,427 cars. Only a slight increase was reported in the number of cars loaded with coal, the total for the week being 156,999 or 244 more than the week before. This was, however, 38,500 cars less than were loaded during the corresponding week in 1920 and 30,159 under the total for the corresponding week in 1919. Loading of livestock totaled 28,229 or a decrease of 312 cars compared with the preceding week and coke 4,557 or a decrease of 545 cars compared with the same period. Reports showed 28,921 cars loaded with ore which was an increase of 55 cars over the previous week. With the exception of grain and grain products, reductions in the loading of all commodities compared with the corresponding week last year were shown.

Compared by districts, the Pocahontas, Southern and Central Western were the only districts to report increases in the number of cars loaded with revenue freight over the week. With the exception of grain and grain products, reductions were under the corresponding week last year.

The loading report for the week of July 18 is as follows:

### REVENUE FREIGHT LOADED AND RECEIVED FROM CONNECTIONS.

Summary—All Districts, Comparison of Totals This Year, Last Year, Two Years Ago. For Week Ended Saturday, June 18, 1921.

Districts	Year	Grain and grain products	Live stock	Coal	Coke	Forest products	Ore	Misc. L.C.L.	Miscellaneous	Total revenue—Freight loaded						Received from connections		
										This year 1921	Corresponding year 1920	Corresponding year 1919	This year 1921	Corresponding year 1920	Corresponding year 1919

Curve of Revenue Car Loading

Week ending June 25 not plotted, 775,061.  
Week ending June 18, 1921, 780,747.

Week ending June 18, 1920, 916,736.  
Week ending June 18, 1919, 807,907.

The number of surplus freight cars continued to decline during the period from June 15 to June 23. The average was 377,850 cars in excess of current freight requirements or a reduction of 3,896 cars as compared with the total on June 15. Surplus box cars totaled 140,627 or a decrease of 3,308 in approximately a week while surplus coal cars numbered 163,982. The latter figure is an increase of approxi-

mately 4,500 over that reported for June 15 but this is due principally to a correction that had to be made in the earlier figures resulting from a mistake made by one of the large carriers in its report. Reports also showed an increased demand for other classes of freight cars. From June 15 to June 23, surplus automobile and furniture cars declined approximately 460, flat cars 388 and stock cars 1,140.

## Impact and Its Relation to Damage Claims\*

### Two Miles an Hour the Maximum Speed for Coupling if Evils of Rough Handling Are to Be Avoided

By J. A. Pilcher

Mechanical Engineer, Norfolk & Western

THE REDUCTION of operating expenses, necessary to the very existence of railroads in this country, is the greatest problem confronting operating officers at the present time. Among the many items which make up the volume of operating expenses is damage to freight equipment and lading in transit.

Damage claims chargeable to rough handling and unlocated damage arising from movement of freight traffic present a serious financial drain. Campaigns to educate employees through picture lectures and periodic meetings have been instituted on many roads to illustrate more forcibly the de-

when the fast moving train strikes a standing train or some other obstruction.

A package dropped from a high building is not hurt in starting, though the package and every part of it increases its speed at the rate of 32.2 ft. per second and has a force constantly pressing against it equal to the weight of the package. This is nearly 22 miles an hour. Inversely, it is also true that if the package or a car or train moving at a speed of about 22 miles an hour, had a constant force applied to it to stop it equal to its own weight, it would come to a standstill in one second and in a distance of 16.1 ft. and with no more damage to it than to the package in starting the fall, provided it were possible to apply the force uniformly to every particle of the package, car or train, and its contents at the same time.

If the package weighs only one pound and is packed in any kind of shape, a force of one pound on any part of it is not likely to do harm. If the package weighs 1,000 lb. and we desire to set it in motion, we must be more particular where we apply the force and be sure it is not concentrated on some weak spot or some very limited area of the surface. Exactly the same law applies to stopping the movement of the package after it has been set in motion. If a package made of strawboard or other light material for holding light or fragile commodities, be stored between the end of a car and heavier goods in a strong box, or between two such boxes, it will suffer if the car receives even reasonable service. If it is stored under such heavy boxes it is, of course, crushed by their weight. Such packages, therefore, should be stored on top of the heavy freight when not stored in cars by themselves.

If we start or stop cars weighing 130,000 lb. to 300,000 lb. it is necessary to take hold of them at some point of the structure designed to resist a force of 130,000 lb. to 300,000 lb. if they are not to break or crush. Likewise, the package or the car must be strong enough to transfer the force from the point at which it is applied to every other particle of itself and its contents. It would not be wrong at all to stop one car weighing as much as 300,000 lb. traveling at a speed of 22 miles per hour in one second and in a distance of 16.1 ft., by applying a retarding force of 300,000 lb., on the end of the coupler in a proper contact, but it would be out of all question to apply to this one coupler a sufficient force to bring to a stop a train of such cars under the same conditions.

In the stopping of trains with the brakes, the necessity for any such attempt is done away with by the application of the retarding force to many points along the whole train, thus distributing the great total force. The brakes on the freight cars are proportioned in such a way that under no

Relation Between the Speed at Which Cars Are Coupled and the Force of Impact

struction of freight equipment and lading caused by careless shifting and handling of trains, improper warehouse trucking of freight and indifferent stowing of merchandise in cars.

The term rough handling does not always convey the same meaning to everyone and a definition may not be out of place. In the first place, it does not mean the rapid moving of either car or package, after it has once been set in motion. But it does mean a rapid rate of change in the speed of movement, as when a package, dropped from a high building, strikes the pavement and comes to a sudden stop, or

\*Prepared for the Freight Claim Prevention Committee of the Freight Claim Division, American Railway Association.

condition can the retarding force exceed about one-quarter of the weight of the light car. Under this condition, if traveling at a speed of 22 miles per hour it could not be stopped by the brake in less than four seconds or in a distance less than 64.4 ft. In the case of trains of loaded cars the retarding force from the brake, compared to the weight of the car and contents, is very much less, in many cases not as much as one-twentieth of the weight of the car. If the force is one-twentieth the weight of the car it will come to a standstill from a speed of 22 miles per hour in 20 seconds or in a distance of 322 ft. Such forces as have just been discussed, even up to the weight of the package, if uniformly and evenly applied, do no damage.

Rough handling, therefore, is either too rapidly starting or stopping the movement of the package, car, or train, or applying the necessary forces for stopping or starting on much too small a portion of the package, car or train. Ramming a truck into a box of goods to slightly alter its position does local damage to the package and contents, and, so far as the results to this particular package are concerned, it is just as much rough handling as running a switch engine into a train of box cars standing at a freight station.

The general rule for moving cars in all cases is "do not start or stop too quickly" and for moving packages in the freight house the same rule applies, with the additional caution to "be careful where and on what amount of surface the force is applied."

In moving packages there is little danger from local application of the force unless the package is rammed with the truck to produce a small movement, but the warning against stopping too quickly is very necessary, as packages of all kinds stop very quickly when dropped on the floor or on each other. Personal experience with package handling soon teaches the conscientious man, as he so often sees the results of ramming and dropping, and no further reference will be made to them. But car handling, probably the most prolific cause of unlocated damage, will be considered further for the reason that the damage is largely hidden and thus leaves the party causing the damage without the much needed experience, be he ever so conscientious.

### Impact Between Cars

No car should strike another at a speed greater than two miles an hour. This speed brings a force of about 125,000 lb. between the couplings of cars weighing about 130,000 lb. and brings the twin spring draft gear solid. Any striking speed above this rapidly increases the forces of reaction.

No locomotive weighing with tender as much as 130,000 lb. should have the tender end with the draft gear connection rammed into a car at a speed greater than two miles an hour. When the front end of the locomotive is used the speed should be brought down to about one and one-third miles an hour, as only the car draft gear comes into action. When a larger locomotive is used, the striking speed should be still further reduced in proportion to the weight of the locomotive.

In starting a train, if the locomotive is traveling at a speed greater than two miles an hour when the rear end is jerked into motion, the condition is the same as far as the results are concerned as if one of the cars had been rammed into the other at that speed. While the train is in motion all conditions that will bring about a difference in speed of two adjacent parts of over two miles an hour should be avoided. If there were no unrestricted slack in the train when the train is passing through dips and over humps the variations in speeds of adjacent cars could not become of any serious importance. If the brakes could be applied to each car simultaneously and in equal proportions no marked difference in speed could be developed. Unrestricted slack between cars cannot be entirely eliminated. Up to the present time no brake is in use that does not have a time element

between the application of the brakes on the adjacent cars. Owing to changes in loading and variations in piston travel the brakes are not always proportionately the same. Care must be exercised in bringing the train through dips and over humps. Maintaining a constant speed of the engine is a great help in this respect. In the application of the brakes a heavy application at slow speeds is the one most liable to give trouble. This may bring the front part of the train to a dead stop before the brakes have applied on the rear portion. This is the same as running into a standing car.

A series of impact tests were made at Rochester, N. Y., using cars fitted with various kinds of draft gears and with no draft gears. Recording instruments were used which showed the instantaneous speeds and recorded the time down to one-thousandth of a second. From this accurate record of the speed of movement of the struck and striking cars, the forces of reaction between the parts of the cars in contact were determined during each moment of contact. The diagram *A* is a record of the impact between two loaded cars, weighing 132,000 lb. each, without any draft gears, and shows the striking speed in miles per hour, plotted against the forces in pounds. It will be noted on this diagram that striking at a little more than one-half mile an hour brings the forces of reaction at the points of contact up to the weight of the car. Striking at one mile an hour brings the forces up to about 270,000 lb.; one and one-half miles an hour, up to about 455,000 lb., and if the striking is done at two miles an hour the forces will be 730,000 lb., provided the car is not already over-strained and giving way under the forces thus developed.

Diagram *B* shows the forces when two loaded 40-ton cars weighing 132,000 lb. each and fitted with tandem spring draft gears, are run together. This type of car with the tandem spring draft gear is selected because so many box cars of this capacity and so equipped are in use and in them is hauled the larger portion of the box freight of the country. If striking speeds are reduced to take care of these cars, more modern cars with better draft gears will be properly protected.

It will be noted on diagram *B* that the draft gear goes solid at 1.93 miles an hour and at this point the force of reaction between the cars is only about one-half the weight of the car, or 62,000 lb., a very small force for the car to stand. After the draft gear goes solid the forces between the cars rise very rapidly with the increase in the striking speed. Even at as low a striking speed as two miles an hour, an increase of only 0.7 miles an hour, the forces of reaction have increased to 125,000 lb. At a striking speed of 2.25 miles an hour the forces of reaction have increased to about 375,000 lb. Another 0.25 mile an hour speed increase brings the forces of reaction up to about 635,000 lb.

If these forces acted on the units in the car the same as the force of gravity acts in the case of a falling body, viz., if every particle received just the force necessary to retard it, results would not be so serious as the records show. The fact is that speeding up or slowing down of movement in a horizontal plane has to be brought about by some external force, applied against some particular portion of the car, viz., between the wheels and rails with brake application and at the coupler when the cars come together. Each package or unit of freight in the car has also to be acted on from without itself either to be accelerated or retarded in its motion. Some of the packages are in contact with the ends of the car. If they are heavy and the friction on the bottom of the car or of the parts on one another is not great enough, the ends of the car are knocked out, as when lumber comes through the end of a car. If one package has to take the force of the one next to it, it is simply a question of the relative values of the strength and force as to whether or not it will be crushed.

The character of the package also has much to do with the liability to damage under the forces of the impact. A crate of eggs with proper strips between the eggs does not need the care in handling that would be necessary with a box full of eggs with no strips between them; neither does a basket of eggs require as careful handling as a box of eggs. The basket, being less rigid and the parts of the basket itself being readily subject to changes in shape from small forces, allows the eggs some movement after the basket has reached the floor and so does not bring them to so sudden a stop as would the box. The crate with the resilient or spongy pasteboard partitions between the eggs allows a comparatively large amount of movement of the eggs and so does not need the care in handling of either the basket or the box.

This illustrates the necessity for holding striking speeds down to the point where no draft gear in common use goes solid if rough handling damage to freight is to be held down to a reasonable minimum. It also illustrates the fact that the reaction forces of impact increase very rapidly after the draft gears go solid and, further, that a very small increase in striking speed above that necessary to bring the draft gears solid brings into action a force that will damage any reasonable structure.

The question can very naturally be asked, "If such a statement is true, why do we not see more damage?" Reported rough handling damage added to the hidden and unaccounted damage to freight, called "unlocated damage" is now certainly more than enough. The cost of freight car repairs is another item that shows more than enough. Furthermore, the damage to equipment, by absorbing the force of the impact, often protects the lading.

### Damage to Equipment

The damage to equipment is not always immediately apparent to the eye. A car, unlike a glass tumbler or an egg, does not fall to pieces as soon as it is struck too hard. It is a structure that has more or less resilience in itself and the parts will go through a very considerable amount of deformation before they break. This deformation of parts is not apparent to the brakeman who allows the cars to go together or to the engineman who allows the engine to go against the cars too hard. The damage has been done nevertheless and shows up at some future time when there is seemingly no reason. A stone mason breaking a rock with his hammer does not accomplish his purpose with a single blow. He strikes a large number of blows and finally the rock cracks open. Can you say which blow broke the rock? Did the last blow have any more to do with it than the first? The last blow was probably not as hard as the first, since the striking arm grows tired. Just in this way does every over speed coupling of cars do its damage, which finally shows up in the car repairs.

### Prevention

The great question is how are we going to bring the damage from rough handling down to a reasonable minimum? The answer is to educate the men doing the handling as to the significance of impact at over-speeds and further educate them so they can judge the slow speeds at which the equipment should be brought together. Two miles an hour is a rail length in about 11 seconds, a very slow walking speed for a man. Three miles an hour is an ordinary walking speed for a man, and four miles an hour is a very fast walking speed for a man. Remember that no striking or contact speed should be above two miles an hour.

Would it pay to have trained observers constantly on the alert that they might keep the car handlers trained in the matter of speeds and the effect of over-speed impact? There are certainly great possibilities for saving by employing such a supervisory force.

Such training would also put an end to the constant call

for stronger cars from year to year. The energy of moving masses is as the square of the speed, so the strength has to be increased much faster than the speed or the damage will be much greater in proportion than the increase in speed.

The increased cost of car repairs is just as much or more a question of the method and care of handling as it is a question of design of equipment and efficiency of the repair department. Comparison can be made of the cost of repairs per car mile as between one road and another, but if a comparison is not also made of the method and care of handling, it has little real value. The man having responsibility for the repairs has nothing to do with the handling and no chance to reduce the over-speed impact. The man who is responsible for the handling is also responsible for the cost of handling and has constantly before him the incentive to handling cost reduction. He should remember that the men who repair the bad order cars do not put the cars in bad order and that the cost of repairs to bad order cars on the mileage basis depends much more on the number of cars damaged and the amount of the damage, than on any possible difference in the methods of handling the repair department.

Those responsible for the cost of handling the equipment very naturally say they cannot handle at a speed of not over two miles an hour and keep handling expense at a reasonably low point. They must not forget that the handling speed and the over-speed at the instant of impact are entirely separate matters. The question is, how much extra will the railway company have to pay for the reduction of over-speed impact and will this extra payment save as much or ten times more in freight claims and cost of repairs to equipment? It must not be forgotten here that only a small portion of the over-speed impact damage is apparent at the time of impact, only those cases that are very flagrant digressions from proper methods showing up immediately.

Over-speed impact can only be gotten rid of by the conscientious painstaking effort of those handling the equipment. They must learn how they can give quick handling with low impact speeds of not over two miles an hour. They must inform themselves of the consequences of over-speed impact and train themselves to estimate the slow speeds correctly. Those who supervise in this work must give particular study to the consequences of over-speed impact and give themselves particular training in judging slow speeds so they can intelligently instruct and correct those who actually handle the cars and locomotives.

The supervising forces will have to be at this instructing and correcting day in and day out, year after year, even more strenuously than they are after the speeding up of the movement and keeping down of the handling cost. They must remember that the direct handling cost is easily shown on paper, but the indirect handling costs can be much greater, and that while these indirect costs are accounted for by another department, their influence on the net earnings of the railroads is no less marked for that reason.

They must remember also that while it may save the car, the designing of stronger cars does not save the lading. Furthermore, stronger cars mean heavier cars. Heavier cars cost more in the first place, their earning capacity for a given axle loading is reduced, and hauling around the extra dead load causes a direct increase in operating expenses.

THE MERCHANTS' ASSOCIATION of New York City, through its traffic bureau, is agitating the plea, said to be in the minds of many thousands of traveling salesmen, for a resumption of the general sale of mileage books—3,000 miles or 5,000 miles—for travel on all railroads at a rate lower than the regular one-way fare. The statement of the Merchants' Association says that the National Council of Traveling Salesmen's Association has appointed a committee to present this matter to the railroads and to the Interstate Commerce Commission.

# Electrification of the Paulista Railway of Brazil

## Fuel Scarcity Forces the Adoption of Electric Motive Power on Brazilian Wide Gage Line

By W. D. Bearce

Railway and Traction Engineering Dept. General Electric Co.

THE concluding shipments are being made on the \$2,000,000 contract with the International General Electric Company for the electrification of a section of the Paulista Railway in Brazil. This project includes a double track section 28 miles in length between Jundiáhy and Campinas.

The motive power equipment consists of eight freight locomotives weighing 100 tons each and four passenger locomotives weighing 120 tons each. Work has been

The road bed is rock ballasted and the construction throughout is equal to any of the main line roads in the United States. The track gage is 5 ft. 3 in. on the section to be electrified, but some of the connecting lines are narrow gage and facilities are provided for transferring the car bodies complete with merchandise to narrow gage trucks and vice versa. The passenger service includes high speed passenger trains with full Pullman accommodations. The present locomotive equipment consists of heavy type locomotives for freight service with high speed engines for passenger service. All are equipped for burning wood as fuel instead of coal. On account of the high price of coal and the great difficulty in securing it, wood is burned almost exclusively in this part of South America. The variety most used is known as quebracho, which gives satisfactory results except that, of course, the quantity required for a 100-mile run is very bulky. Recently there has been difficulty in procuring even wood that is suitable for this work. Electrification, therefore, was decided upon as the remedy.

The section selected for electrification presents a rather difficult profile including maximum grades of 1.5 to 1.8 per cent. While the immediate plans of the Paulista company contemplate electrification for only a distance of 73 miles, the design and capacity of all apparatus and equipment is suitable for operating on an extension to Sao Carlos a total distance of 129 miles. The approximate tonnage handled over this line during the year 1918 from Jundiáhy to Cordeiro was about 275,000,000 ton-miles, including freight, passenger and non-revenue service. The electrical equip-

Freight Locomotive for the Paulista Railway

progressing on these locomotives for about a year at the Erie works and the first locomotive was put on the test track about the middle of March. Complete running tests were made and two freight locomotives were shipped before the middle of May. One of the passenger locomotives was also put on the test track and shipment was made, according to schedule, during May.

In addition to the locomotives, the contract included the equipment of a complete 3,000-volt direct current substation of 4,500 kw. capacity consisting of three 1,500 kw. 3 unit motor generator sets, transformers, switches and high tension equipment. Overhead line material has also been furnished for 76 miles of track and material for 10 miles of 88,000 volt, 3 phase, 60 cycle high tension transmission in duplicate from the lines of the Sao Paulo Light & Power Company.

The line from Campinas to Jundiáhy is a main line section connecting at the southern terminus with the Sao Paulo Railway and the Central Railway of Brazil. The Central Railway is government owned and electrification of this line has also been authorized. At Campinas and other points north connection is made by the Paulista Railway with a number of feeder lines, which bring large quantities of coffee and other raw material from the interior.

120-Ton 3,000-Volt Passenger Locomotive

ment is designed for handling approximately double this amount and the sub-station and line equipment is also capable of handling approximately double the 1918 revenue tonnage. As a basis for estimates it was assumed that the number of trains per day over the initial electric zone will be 6 passenger and 21 freight in each direction, making a total of 54 trains per day.

### Locomotives

The initial order for locomotives included eight freight and four passenger all of the twin geared type. These are similar to those in successful use in United States on the Chicago, Milwaukee & St. Paul, the Butte, Anaconda & Pacific, the Detroit River Tunnel and other roads, and

include the well tried features of the best types of locomotives now in service.

**Freight Locomotives.**—The freight locomotives weigh 100 tons, all weight on driving axles. They are designed for handling a trailing train of 770 tons on the maximum 1.8 per cent grade at speeds of from 12 to 16 miles per hour. The maximum allowable speed on tangent level track is 30 to 35 miles per hour. It is expected that because of the greater capacity and higher speed characteristics the electric locomotives will provide an appreciable improvement in the existing steam service, both as regards schedule speed and weight of trains handled.

As shown in the photograph the freight locomotive has a running gear consisting of two 2-axle trucks coupled to-

or bulk heads so placed as to form two end compartments about 5 ft. in length for the operator's cabs and the remainder for housing the control equipment, compressor-exhauster set and other auxiliary apparatus. Two pantograph trolleys are of the double pan sliding type similar to that used on other heavy electrification projects and are mounted on the cab roof. These are insulated for 3,000 volts and are designed to operate through a range of from 15 to 22 ft. above the rail.

To conform to the equipment on this road it is necessary to provide control for the vacuum type brakes used on the cars. Two entirely different systems of brakes are therefore provided for; a straight air brake system for the locomotive, and vacuum type brakes on the train. The two systems are manipulated in the same manner as the usual all compressed air type, the locomotive brakes being applied automatically at the same time as the train brakes under normal running. Brakes can be applied on the locomotive alone or on the train alone if desired. When regenerating, however, there is a magnet valve so arranged that straight air cannot be applied while returning power to the trolley. However, should an emergency application be made, regeneration is discontinued and the brakes are applied on the locomotive.

**Passenger Locomotives.**—The passenger locomotives are similar in design to the freight units except that a two

Paulista Railway System and Connections

gether by an articulated joint, and a single cab of the box type. The draft gear is mounted on the trucks and, all hauling and buffing stresses are transmitted through the truck frames and articulated joint, thus eliminating any possibility of damage to the cab and platform structure. Each truck is equipped with two GE-267 motors of the box frame type geared to the driving axle by two sets of gearing, one at each end of the motor. One of the trucks is side equalized and the other cross equalized, thus providing the equivalent of a three point support for the superstructure. The diameter of the driving wheels is 42 inches and of the cast wheel center 36 in. allowing for a steel tire 3 in. in thickness. The overall length of the locomotive is 39 ft. 2 in. and the rigid wheel base 8 ft. 8 in. The interior of the cab is divided into three compartments by partitions

Three Unit Four Bearing 1,500 Kw. 3,000-volt D. C. Motor Generator Set for the Paulista Railway

axle guiding truck is provided at each end to comply with the railway company's specifications for high speed service. The motors used are identical to those on the freight locomotive except for the change in gear ratio to provide for maximum speeds of from 56 to 62 miles per hour. The running gear consists of two 2-axle driving trucks the inner ends of which are connected by an articulated joint. The outer ends are extended and supported on the guiding trucks by roller centering devices over the front axle and an articulate joint over the rear axle which also connects the guiding and motor trucks. The general arrangement of motors and control is the same as that on the freight locomotives, and a similar system of regenerative braking is also provided. This locomotive is designed for hauling a train of 440 tons trailing up a one per cent grade at a speed of 38.8 miles per hour. The gear ratio on the passenger locomotive is 70 to 30 or 2.33.

Regenerative braking is accomplished by connecting one motor in such a way that it excites the field of three other motors and also its own field. This scheme is in general similar to that used on the Chicago, Milwaukee & St. Paul gearless passenger locomotives and eliminates the necessity for a separate motor generator set for excitation. A balancing resistance is connected in the circuit to protect the motors against sudden surges of the line voltage and to give effective protection against line voltage changes. In order to

begin regeneration, the main controller handle is turned to the first notch series position and the selective handle to the braking position. The main handle is then notched up until the desired braking effect is obtained.

A high speed circuit breaker is placed between the 3,000 volt trolley and the locomotive apparatus. The duty of this breaker is to protect the motors and equipment from any injury due to short circuits or overloads. In case of a short circuit this breaker cuts in a protective resistance and then opens the line contactor. The action is very rapid so that in case of heavy overload, or short circuit, the possibility of damage is reduced to minimum. Breakers of a similar type

3,000-volt D. C. Generator and Feeder Railway Switchboard

are in operation in many parts of the United States both on locomotives and in sub-stations.

The following table gives the dimension, capacity and weights of the two locomotives:

DATA ON ELECTRIC LOCOMOTIVES FOR PAULISTA RAILWAY

	Freight	Passenger
Length overall .....	39 ft. 2 in.	55 ft.
Width .....	10 ft. 1 1/4 in.	10 ft. 1 1/4 in.
Height over trolley down .....	14 ft. 3 in.	14 ft. 3 in.
Total wheel base .....	26 ft. 8 in.	46 ft. 0 in.
Rigid wheel base .....	8 ft. 8 in.	7 ft. 9 in.
Total weight .....	200,000 lb.	240,000 lb.
Weight on drivers .....	200,000 lb.	160,000 lb.
Weight per driving axle .....	50,000 lb.	40,000 lb.
Weight per guiding axle .....	None	20,000 lb.
Weight of mechanical equipment .....	115,400 lb.	155,400 lb.
Weight of electrical equipment .....	84,600 lb.	84,600 lb.
Diameter of drivers .....	42 in.	42 in.
Diameter of guiding wheel .....	42 in.	36 in.
Number motors .....	4	4
Gear ratio .....	82/18	70/30
Total continuous rating hp. ....	1,600	1,600
Total (1 hour rating) hp. ....	1,680	1,680

Speed 1 hour rating m.p.h. ....	20.8 (33.5 km.)	40.5 (65 km.)
Maximum safe speed .....	28 (45 km.)	53 (85 km.)
Tractive effort 30% coef. adh. ....	60,000 lb.	48,000 lb.

## Substations

For the initial electric zone between Jundiacy and Campinas, one substation is being installed located at Louveira, a distance of 9.5 miles from Jundiacy. This station contains three 1,500 kw. 3 unit synchronous motor generator sets each arranged to operate its two generators in series for 3,000 volts. Power is received from an 88,000 volt 60 cycle transmission line and stepped down through three 3 phase, 1,900 kva. transformers to 2,300 volts for the synchronous motor.

The switchboard is similar in design to other 3,000 volt d. c. equipment. The 3,000 volt panels are installed together with the auxiliary station lighting panel. The high voltage panels include one for each of the motor generator sets, and one for each outgoing feeder. The main circuit breakers are located above and to the rear of the switchboard panels so as to be well out of reach to prevent accidental contact. They are remotely controlled from operating levers located on the front of the panels. A 3,000 volt line switch is also included with each circuit breaker. These switches are remote controlled from the front of the panel, as a safety measure. The switch handles for the circuit breakers are inverted to distinguish them from the line switches. The alternating current switchboard is electrically controlled throughout. For lightning protection a 96,000 volt aluminum cell arrester is installed in the high tension room of the station.

As a protection from short circuits and excessive overloads a high speed circuit breaker is installed with each motor generator set. This is connected to the negative terminal of the machine and arranged to connect a limiting resistance into the circuit upon opening. At the same time the station circuit breakers are opened, completely cutting off the power supply. The speed of these circuit breakers is such that resistance is inserted in the circuit before the short circuit current reaches sufficient value to injure the apparatus.

Other auxiliary equipment supplied to the station includes a 15 ton hand operated crane, a portable oil filter press and oil testing equipment, and a stationary compressor set. For control current a 4 3/4 kw. battery charging motor generator set is used with a 170-volt storage battery.

## Power Lines

The railway company's high tension transmission line has been constructed with duplicate circuits mounted on separate wood poles between Jundiacy and Louveira, a total distance of 10 miles. At Jundiacy this line is permanently tied in with a new line constructed by the Sao Paulo Light & Power Co., extending a distance of about 17 miles to the hydro-electric station at Parnahyba. The power company's line is constructed with an H type pole line carrying the duplicate circuits. This transmission line from the water power plant to the substation will thus be operated over a distance of 43 km. as a single system at 88,000 volts 3 phase 60 cycle. The line is designed for ultimately supplying three substations and the conductors are of 1/0 B&S stranded copper which will insure a very low line loss under ordinary operating conditions. On the railway company's line two cross arms are used with large pin type insulators. A ground wire is also carried on each transmission line for lightning protection.

**Secondary Distribution.**—The overhead line construction is of the same general design as that used on the Chicago, Milwaukee & St. Paul. This is known as the twin catenary construction, having two 4/0 trolley wires supported from the same steel messenger by loop hangers. Wood poles suitably guyed are used for supporting the catenary. The hangers for the two contact wires are attached at alternate points, giving a most flexible type of construction and insuring the elimination of all "hard spots." Bracket supports are

used on single track construction and cross span for multiple track work. The normal height of the contact wire is 15 ft. above the rail. For all sidings and yard tracks a single wire is used over each track. The material furnished by the General Electric Company includes hangers, pull offs, copper and steel wire, miscellaneous hardware, etc., for 76 miles of track. The use of the twin catenary construction is particularly successful for lines operating heavy trains requiring the collection of large amounts of current through pantograph trolleys. In addition to the advantage of the two contact wires for handling the current required, this construction also insures practically sparkless commutation at the point of contact, both for heavy freight and high speed passenger operation.

### Bonding

The weight of rails on this line is 91 lb. and these are bonded with the pin terminal type bond 42 inches in length and 211,600 circular mills cross section. Cross bonds are also used for interconnecting the rails of the same track and for bonding between tracks on the multiple track sections.

### Locomotive Testing and Shipment

In the preparation of the electric locomotives for testing and for export shipment there are a number of unusual features which may be of interest. The gage of track on the Paulista Railway being 5 ft. 3 in. special arrangements were necessary to provide for removing the locomotives from the shop to the test track. To provide the necessary test track about one mile of extra rail was laid on the East Erie Commercial Railroad with 5 ft. 3 in. gage. In order to transport the locomotives from the shops to the test track, a distance of about three-quarters of a mile, special transfer trucks were used; one for each truck of the locomotive. By means of these trucks, which operate on their own wheels of standard gage, the locomotives were moved out over the usual transfer table and standard gage track to the special gage section provided for testing. Upon reaching this section they were moved off the transfer trucks over a ramp, the end of which was elevated to the same height as the special trucks.

A complete set of tests was run on all locomotives including regenerative braking and high speed running. After test the locomotives were transferred to the shipping department where they were disassembled and prepared for export shipment. The cab complete was removed from the truck and the pantograph, bells, etc., removed from the cab roof. Each truck was shipped separately without removing the motors from the truck frame. In the case of the passenger locomotive, each bogie truck was shipped with the adjacent motor truck without disassembling. On account of the large vessels available for making this shipment it was not necessary to reduce the locomotive to small packages.

Progress on the construction is shown by the fact that the first freight locomotive was ready for test March 15; during the month of May three freight and one passenger locomotives were shipped and progress on the balance of the order indicates that similar shipments will be made the following two months in accordance with the terms of the contract.

GEORGE W. LEE, chairman of the Temiskaming & Northern Ontario Railway Commission, announces that the Ontario Government has been recommended by this commission to place on sale through the municipalities of the North, the entire number of lots, between six and seven thousand, which the commission holds, outside of the railroad's right of way. As Government property these are not assessable, and the commission's decision is the result of a long series of protests from the municipalities where they are located.

## New Rules Replace National Agreement at Altoona Works

PIECE work has been re-established, punitive overtime abolished and new classifications and rates of pay inaugurated in the Altoona works of the Pennsylvania System under an agreement between the management and the employees, which became effective on July 1, 1921. Details of the rules were made public in an announcement by P. F. Smith, Jr., works manager.

The new rules, which take the place of the Shop Crafts' National Agreement covering working conditions, were formulated by a committee representing the employees at Altoona works. These representatives, a committee of 75 employees, elected by secret Australian ballot, supervised jointly by the management and the employees, to represent the employees at the four shops comprising the Altoona Works, have also formed themselves into a permanent organization known as the Altoona Works Employees Association. The preamble of the constitution and by-laws adopted by the organization at its first meeting reads:

We, the employees of the Altoona Works, Pennsylvania System, in order to form an organization to establish satisfactory working conditions in our shops, provide means for fair dealing between the management and the employees, and to promote the general welfare of our community, do establish this constitution for the Altoona Works Employees Association.

The organization of the plan of employees representation, established at Altoona, provides as follows:

A local committee of three members to represent the employees in each class in each of the shop units; a shop committee, consisting of a local committee chairman of each craft to represent the employees in each of the shop units; an Altoona Works general committee, consisting of a shop chairman to represent all the employees in the shop crafts at Altoona, and a Works Council composed of all the local committeemen. The committeemen will serve for three years, one-third of the entire representation being elected every year.

In general, the most important of the new rules agreed to by the men and the management provide:

1. Re-establishment of piece work under the principles previously announced by the railroad, namely, under rates set so that piece workers can earn a rate which is higher than the day-work rate which may from time to time be established for day-workers.

2. A 48-hour basic week, with not more than nine hours on any one day, or less than eight hours on any day except Saturday. This permits the men to decide for themselves whether they shall work eight hours per day or more than eight hours on some days during the week, in order to get a half holiday on Saturday.

3. Where reduction in expenses becomes necessary, it may be accomplished either by reduction in force or reduction in hours of work, as the employees themselves decide.

4. Overtime to be paid *pro rata* for the ninth and tenth hours and time and one-half after the tenth hour.

5. Seniority based on length of service with the company, rather than length of membership in a particular craft.

6. Classification of work under a wide spread of rates, which permits the establishment of rates of pay based on skill required, rather than a flat rate, and gives a man doing more important work a higher rate of pay.

FOUR TRACKMEN WERE KILLED and three seriously injured on the Cumberland Valley division of the Pennsylvania Railroad near Milnor, Pa., on July 2, while riding on their work on a motor car. They met a freight train and their car was wrecked. There was a dense fog at the time.

# General News Department

The American Association of Railroad Ticket Agents will hold its third annual convention at St. Paul, Minn., on August 19 and 20.

The Chicago, Burlington & Quincy on July 1, put on 1,500 workmen to repair grain and coal cars, according to E. P. Bracken, vice-president in charge of operation, to make ready for the expected heavy movement of these commodities.

An erroneous statement occurs in the sixth sentence of an article describing the Minich safety hand brake published on page 1464 of the June 24 *Railway Age*. The sentence should read "The usual brake chain is eliminated, being replaced by a connecting bar attached to the brake rod (or air brake lever on hopper cars)."

The Southern Pacific in connection with its fuel economy campaign will reward the engineer and fireman on each division having the best fuel efficiency and economy record for the year with a trip to Chicago as representatives of the company at the next International Railway Fuel Association's annual convention with all expenses paid including time lost.

A fire in the yards of the Chicago Junction at West Forty-third street, Chicago, on July 4, the origin of which has not been determined, destroyed a yard office and 20 empty freight cars and damaged 40 others, with an estimated loss of \$35,000. The fire started in some loose rubbish in the yard near an oil house and spread when a barrel of oil exploded and scattered the flames.

The running of freight trains on Sunday in the State of Georgia normally forbidden by law, but allowed since August 20, 1917, because of war conditions, is now the subject of an inquiry by the State Railroad Commission, which has called upon the carriers to report on the matter by July 25. The suspension of the law was made through an order of the Commission, and the Commission now proposes to revoke that order under authority provided in the statute. Forty-five railroads have been called upon to report.

The Pennsylvania Railroad has once more been contending with the Bigelow Boulevard slide at Pittsburgh, Pa., which, due to recent rains has become somewhat troublesome. About 10 days ago small quantities of earth started to work out over the tracks adjacent to the hillside and while steam shovels had been brought up to the site in anticipation of a movement the slide encroached upon the two inside tracks. These have since been cleared. The movement, on last report, had ceased and will, apparently, give no further trouble unless some heavy rains occur.

## Northern Pacific Signal Department

In the signal department of the Northern Pacific a general reorganization, which has just gone into effect, provides for an increase in supervising forces to provide closer supervision and more assistance to their workmen. Under the new arrangement there is one supervising officer to approximately every five men, while formerly the ratio was as one to eight. Prior to July 1 the men were on a monthly rate of pay, but will now work under hourly rates; this at the request of the Brotherhood of Railroad Signalmen of America.

## Express Messenger Shot

The express messenger on train No. 44, eastbound, on the Cleveland, Cincinnati, Chicago & St. Louis, was shot twice when he resisted two robbers who boarded the express car at Covington, Ind., early on the morning of July 1 and made away with loot estimated at \$9,000 in cash and securities which they took from the safe in the car. The robbery was

discovered at Veedersburg, Ind., 12 miles east of Covington, when the express messenger was found beneath a pile of express bags which had been stacked upon him. It is believed the robbers dropped from the train as it slowed down at Veedersburg.

## Railway Earnings for May

The net operating income of the railroads for May made a somewhat better showing than in the preceding months of this year. For 200 Class I roads it was \$37,160,000, as compared with a deficit of \$4,882,000 last May. The operating revenues were \$441,000,000, a decrease of 2.7 per cent, and the expenses were \$376,000,000, a reduction of 13.1 per cent.

## Operating Statistics

The average mileage per freight car per day for the month of April, according to the Interstate Commerce Commission's monthly operating statistics was 20.6 as compared with 19.5 in April, 1920. This average, however, is less than that established during April in 1917, 1918 or 1919. The average net tons per loaded car was 26.9 as compared with 28.6 and the net tons per train averaged 637 as compared with 647. The percentage of unserviceable cars was 12.3 as compared with 6.5.

## Tentative Valuations Served

The Interstate Commerce Commission during the past week has served a number of additional tentative valuations of the smaller roads. The commission's figures for the final valuation of the property used as of the valuation date are as follows:

Gainesville Midland.....	1915	\$1,174,665
St. Johns River Terminal Co.....	1915	1,880,705
Spokane International Railway Co.....	1917	5,330,039
Coeur d'Alene & Pend d'Oreille.....	1917	400,000
Toponah & Goldfield.....	1915	1,856,150
Washington, Potomac & Chesapeake.....	1915	216,656
Delaware & Northern.....	1916	1,417,210
Caddo & Choctaw.....	1916	238,161
Great Southern.....	1916	764,401
Bridgeton & Saco River.....	1916	360,563
Wiscasset, Waterville & Farmington.....	1916	500,168
Colorado-Kansas.....	1916	365,778
Pacific & Idaho Northern.....	1916	2,100,176
Fourche River Valley & Indian Territory.....	1916	257,000
Intermountain.....	1916	991,127

## Chairman Clark Receives Replies

### to Coal Supply Letter

Chairman Clark of the Interstate Commerce Commission has received replies to his letters which, as noted in last week's issue, were sent to the associations representing the railroads and public utilities urging the importance of accumulating a reasonable reserve supply of coal in advance of the period of heaviest demand this fall and winter. Thomas De Witt Cuyler, chairman of the Association of Railway Executives, said the letter would be submitted to a meeting of the standing committee of the association and that he would urge that prompt action be taken. G. W. Elliott, of the National Committee on Gas and Electric Service, said he would endeavor to have the suggestions conveyed to the public utilities through channels that would be the most effective and that the commission's thoughtfulness regarding the coal requirements would be appreciated. M. H. Aylesworth, executive general manager of the Electric Light Association, said that some definite action on the subject would be taken at once.

### Honorary Degrees

At the recent commencement exercises in the universities and colleges honorary degrees were conferred upon a number of men in or closely associated with the railroad business. Harvard University conferred the degree of Master of Arts upon William J. Cunningham, its James J. Hill Professor of Transportation. Benjamin B. Greer, vice-president of the Chicago, Milwaukee & St. Paul, was given the degree of Master of Arts by Dartmouth College, of which he is an alumnus. E. G. Buckland, vice-president and general counsel of the New York, New Haven & Hartford, was given the degree of Doctor of Laws by Washburn College, of which he is an alumnus.

### Changes in Car Service Rules

The car service rules of the American Association have been amended by numerous changes in Rules 1, 2, 3, 4 and 5; and by letter ballot, closed on June 23, these changes, unanimously approved by the general committee and also by the committee on car service, were ordered to go into effect on July 1.

The important changes are: In Rule 2, the provision for the return to the owner of empty cars located at junction points with the home road; in Rule 3, for a more favorable operation with respect to empty car mileage, by the elimination of paragraphs d and e of the present rule and the substitution thereof of a provision under which a road, unable to dispose of empty cars belonging to indirect connections by loading them to or in the direction of home, may return them to the road from which received, on the basis of record rights.

The use of the home route card is re-established.

At the same time the per diem rules were amended by the addition of more detailed provisions in Rules 1, 7, 13, 14 and 15, increasing the strictness of the regulations for correcting errors in settlements. By Rule 15 a road failing to receive promptly from a connection empty cars, at home on its road, moving home under car service rules, shall be responsible to the connection for double the per diem on such cars.

### Valuation Field Work, Eastern District, Completed

The engineering field work of the eastern district, Bureau of Valuation, Interstate Commerce Commission, has been completed. The eastern district includes the states of Maine, New Hampshire, Vermont, Massachusetts, Rhode Island, Connecticut, New York, New Jersey, Pennsylvania, Delaware, Maryland, District of Columbia, West Virginia, Virginia, and North Carolina.

The field party work was begun on February 26, 1914, and completed on June 30, 1921. The district field organization included 12 roadway parties, but this force was not maintained during the war years of 1917 and 1918, due to the fact that the bureau released over 600 engineers for military and naval service, of which the eastern district contributed a due proportion. The record shows that the work was in progress about seven years, but after making due allowance for vacancies which existed during the war, and the lesser number of parties in use during the organization and demobilization periods, it appears that the field party work in the eastern district was completed in five years. This estimate is based upon an average of 12 full roadway field parties. The eastern district includes 43,000 miles of steam railroads whose all-track mileage is 82,500, and 50,000 miles of telegraph lines.

The field work having been completed, the eastern district is now concentrating all of its engineering force on the preparation of the reports showing the cost of reproduction new and the cost of reproduction less depreciation.

W. H. BARR, president of the National Founders' Association, has sent out a letter calling on members of the association to work for the complete abolition of national railroad labor agreements; restoration to the carriers of individual jurisdiction over wages, classifications and working conditions; repeal of the Adamson law and funding of the indebtedness of the railroads of the country. Mr. Barr points out that this is one of the few times where the association has recommended intensive action by its members, but that restoration of railroad prosperity on sound lines is now a recognized necessity. He says that business men generally must arouse themselves to the serious condition confronting the railroads.

## Traffic News

Six thousand tons of rails for the Alaskan Railroad are to be sent by water direct from Mobile, Ala., to Seward, Alaska, by way of the Panama Canal.

T. L. Wolfe, for the last five years vice-president and traffic manager for the A. E. Staley Manufacturing Company of Decatur, Ill., has resigned. He is succeeded as traffic manager by Thornton Burwell, formerly assistant traffic manager.

The Traffic Club of Wheeling, W. Va., has elected the following officers: President, H. H. Marsh; vice-president, H. J. Hofmann; treasurer, C. W. Henry, and secretary, P. M. Neigh. Members of the board of governors are C. W. Henry, W. H. Higgins, P. M. Neigh, H. H. Marsh, J. A. Fleming, R. J. Miegel, E. C. Jepson, H. J. Hofmann, A. T. Oxtoby, S. C. Williams, G. W. Koonee and Douglas Vass.

The establishment of a government line of ships between the United States and Alaska to connect with the government railroad is proposed in a bill introduced in the Senate by Senator Cummins and referred to the Committee on Territories. Under the bill the Shipping Board would be required to transfer to the Secretary of the Interior ships of sufficient number and tonnage to operate between the United States and Alaska ports and the President would be given authority to co-ordinate all government agencies having to do with Alaskan affairs.

The principal coal carrying roads serving West Virginia and Pennsylvania mines in carrying cargo coal to the lower lake ports have filed with the Interstate Commerce Commission application for special permission to make the 28 cent reduction on lake cargo coal apply only on coal going beyond the upper lake ports. A complaint against this reduction on the ground of discrimination has been filed with the commission by the Morton Salt Company, which alleges that as its plants are located at Port Huron and Ludington, Mich., it is damaged by reason of the preference given to west bank Lake Michigan ports.

### Coal Production

Production of soft coal increased slightly during the week ending June 25, but was still short of the 8,000,000-ton mark. The output is estimated at 7,769,000 net tons, which is about 350,000 tons below the rate maintained from May 14 to June 11. The Geological Survey says the present recession in output is now seen to be due to a marked decrease in shipments from the mines to the lake front and a slight decrease in the movement to tidewater.

### Interstate Commerce Commission

#### Opposes Reduced Mileage Fares

Both the Senate and the House committees on interstate commerce, to which have been referred various bills introduced in Congress to require the railroads to issue interchangeable mileage books at reduced rates, have called upon the Interstate Commerce Commission for an opinion as to the advisability of such legislation. Chairman Clark of the commission has written a letter to the House committee opposing a reduction of passenger fares at this time on the ground that it would reduce railroad revenues, which are already insufficient to pay their return on the investment. A hearing on the subject of reduced mileage rates was held before a sub-committee of the Senate committee on interstate commerce on June 27, at which reduced mileage rates were advocated by representatives of the commercial travellers' organization and opposed by representatives of the railroads. The letter said that approximately one-third of the passenger travel represents commercial travel and that a reduction would reduce the revenues which the railroads are now receiving from this traffic, while it would not stimulate additional travel sufficiently to make up for the loss.

## Operating Statistics of Large Steam Roads—Selected Items for the Month of April, 1921,

Region, road and year	Average miles of road operated	Train-miles	Locomotive-miles		Car-miles		Ton-miles (thousands)		Locomotives on line daily		Stored	
			Principal and helper	Light	Loaded (thous. ands)	Empty (thous. ands)	Gross, Excluding local motive and tender	Net, Revenue and local motive	Service-able	Un-serviceable		Per cent un-serviceable

## Equipment and Supplies

### Car Deliveries—First Five Months of 1921

Freight car production is again returning to the low level which characterized the first half of 1920. Reports of the leading car building companies to the Railway Car Manufacturers Association show that in May there were produced for domestic service 3,610 freight cars. This compared with 4,455 in April and represents a progressive decline from the figure of 7,298 reached in December, 1920. The production for the first six months of 1920 averaged about 3,000 cars monthly.

The following table shows the production of freight and passenger cars by months from January 1, 1920, to May 31, 1921, by the car building companies which report their production to the Railway Car Manufacturers' Association.

TABLE I—CAR DELIVERIES

1920	Freight cars		Passenger cars	
	Domestic	Foreign	Domestic	Foreign
January .....	4,482	1,904	1	9
February .....	3,771	1,039	4	..
March .....	2,796	1,994	11	28
April .....	2,127	1,912	15	..
May .....	2,630	1,387	..	21
June .....	2,608	708	..	21
July .....	2,583	380	18	27
August .....	3,056	1,184	21	13
September .....	3,529	1,088	38	..
October .....	5,999	668	21	13
November .....	5,902	976	48	..
December .....	7,298	1,362	96	17
Total for 1920.....	46,784	14,602	273	135
1921	Freight cars		Passenger cars	
	Domestic	Foreign	Domestic	Foreign
January .....	7,008	819	43	..
February .....	6,276	500	50	14
March .....	5,753	700	69	..
April .....	4,455	871	116	6
May .....	3,610	429	138	..
5 mos. 1921 .....	27,102	3,319	416	20

Other figures supplied by the Association show that in the greater part of the period under consideration the builders have been working on back orders. In other words, as small as the production was, it has been considerably ahead of the orders taken for new business. Thus at the end of August, 1920, there were on order and undelivered 50,275 freight cars for domestic service; at the end of May, 1921, the total had been decreased to but 13,890. The detailed figures follow:

TABLE II—CARS ON ORDER AND UNDELIVERED

	(Figures for end of month)					
	Freight Cars			Passenger Cars		
	Domestic	Foreign	Total	Domestic	Foreign	Total
December, 1919.....	24,816	10,720	35,536	407	110	517
January, 1920.....	282	9,381	36,663	311	103	414
February .....	29,706	8,389	38,095	282	103	385
March .....	33,061	7,854	41,455	522	80	602
April .....	42,869	7,180	50,449	886	88	674
May .....	47,761	6,338	54,099	732	110	842
June .....	48,171	7,792	55,963	796	97	893
July .....	50,275	8,212	58,487	811	88	899
August .....	49,442	7,574	57,016	775	861	936
September .....	47,114	6,793	54,907	903	75	978
October .....	46,051	7,026	53,077	851	66	917
November .....	41,290	6,234	47,524	925	59	984
December .....	35,268	4,856	40,124	829	42	871
January, 1921.....	32,874	2,903	35,777	786	42	828
February .....	26,685	3,225	29,910	750	28	778
March .....	21,808	4,029	25,837	681	28	709
April .....	17,513	3,312	20,825	565	24	589
May .....	13,890	3,359	17,449	450	18	468

Car repair work has been an important feature of the work of the car building companies for the past several months. The figures follow:

TABLE III—FREIGHT CAR REPAIRS

	Delivered during month	On order and undelivered at end of month
May, 1920 .....	2,396	20,130
June .....	2,541	24,092
July .....	2,491	23,541
August .....	2,818	27,021
September .....	3,140	26,710
October .....	3,945	27,779
November .....	4,345	25,663
December .....	4,648	22,951
Total, Jan. 1, 1920, to Dec. 31, 1920.....	34,198	

January, 1921.....	4,229	21,469
February .....	4,499	18,303
March .....	4,824	14,348
April .....	3,898	11,884
May .....	3,250	12,308
5 mos. ....	20,700	

(Note. In using the above tables attention should be drawn to the fact that from March, 1921, on, one additional car building company is included. The figures now represent the production of all the important builders and, therefore, the larger part of the car building capacity of the country, with the exception of the railroad shops, the production of cars in which relatively to the total is not great.)

## Locomotives

THE UNITED STATES OF COLOMBIA has ordered 4 locomotives from the Baldwin Locomotive Works.

THE ILLINOIS CENTRAL is asking for prices on the repairs of from 100 to 130 Mikado type locomotives.

THE SOROCABANA RAILWAY (Brazil) has ordered 2 Mikado type locomotives from the Baldwin Locomotive Works.

THE PITTSBURGH & WEST VIRGINIA has ordered 2 Pacific type locomotives from the American Locomotive Company.

THE NATIONAL RAILWAYS OF MEXICO have ordered 10 Pacific type locomotives from the Baldwin Locomotive Works.

THE HUNTINGDON & BROAD TOP MOUNTAIN RAILROAD has ordered 4 locomotives from the Baldwin Locomotive Works.

THE LEHIGH & HUDSON RIVER is having repairs made to 2 locomotives at the shop of the Baldwin Locomotive Works.

THE MONTEREY IRON & STEEL COMPANY, Mexico, has ordered from the American Locomotive Company, 4 Consolidation type locomotives, with a total weight in working order of 294,000 lb.

THE PEKIN-KALGAN (China) has ordered from the American Locomotive Company, 3 Pacific type locomotives with a total weight in working order of 292,000 lb. and 2 Mikado type locomotives, with a total weight in working order of 296,000 lb.

THE NATIONAL RAILWAYS OF MEXICO have ordered from the American Locomotive Company, 20 Consolidation type locomotives with a total weight in working order of 314,000 lb. and 7 Mikado type locomotives, with a total weight in working order of 440,000 lb.

## Freight Cars

THE NORTHERN PACIFIC is inquiring for prices on 1,000 steel center constructions for freight car repairs.

THE WABASH has given an order to the Western Steel Car & Foundry Company for making repairs to 300 steel hopper cars of 40 tons' capacity.

THE AMERICAN REFRIGERATOR TRANSIT COMPANY, St. Louis, Mo., has ordered 100 steel underframes from the General American Tank Car Corporation.

## Passenger Cars

THE HUNTINGDON & BROAD TOP MOUNTAIN RAILROAD has ordered 10 passenger cars from the Harlan plant of the Bethlehem Shipbuilding Corporation, Ltd

## Iron and Steel

THE KANAWHA & MICHIGAN is inquiring for bids on 700 to 800 tons of structural steel for bridge work.

THE WHEELING & LAKE ERIE is inquiring for 150 tons of steel for car repairs and 200 kegs of spikes.

THE CHESAPEAKE & OHIO has ordered 1,700 tons of bridge material from the Mount Vernon Bridge Company.

## Signaling

THE MISSOURI, KANSAS & TEXAS has ordered from the Union Switch & Signal Company 63 semaphore signals to be installed between La Bette, Kan., and Vinita, Okla.

## Supply Trade News

Charles Copeland, assistant treasurer of E. I. du Pont de Nemours & Co., Inc., Wilmington, Del., has been elected secretary, to succeed Alexis I. du Pont, deceased.

The Jeffrey Manufacturing Company, Columbus, Ohio, on June 1, removed its New York City office, from 50 Dey street to 30 Church street, with Harold B. Wood as district manager.

N. C. Catabish, general sales manager of the National Carbon Company, Inc., Cleveland, Ohio, has been assigned to other duties and J. R. Crawford, general sales manager of the Union Carbide Sales Company, has been appointed to succeed Mr. Catabish.

### American Car & Foundry Company

The annual report of the American Car & Foundry Company for the fiscal year ended April 30, 1921, shows earnings from all sources, after provision for taxes, of \$13,212,816, as compared with \$14,382,565 in the year ended April 30, 1920. A total of \$4,661,961 was expended for renewals, replacements, etc., leaving net earnings of \$8,550,856, as compared with \$10,401,192 in 1920. Dividends were paid amounting to \$2,100,000, or 7 per cent on the preferred stock, and \$3,600,000, or 12 per cent on the common stock. The surplus for the year was \$2,850,856, as compared with \$1,101,192 for 1920. The profits for the year equal \$21.50 a share on the common stock, as compared with \$27.67 a share in the previous fiscal year.

President W. H. Woodin in his report to the stockholders says in part:

The present condition and future prospects of the railroads continue as causes of grave anxiety. It is unnecessary to dwell on the effects of governmental control and operation upon their financial and physical conditions. The question pressing for solution is their rehabilitation so that they may perform efficiently their proper functions in serving the industries of the country and that the vast amount of the people's money invested in their securities may be properly safeguarded. Because of lack of traffic, the increase in freight rates granted during the year just past has not as yet had any appreciable effect towards restoring a condition of prosperity. Undoubtedly a crying need is a reduction in the costs of operation, and some progress has been made in this direction by the recent ruling of the Railroad Labor Board. More than this, however, is required for their complete rehabilitation and relief. Particularly a backward step will be taken if the roads now shall be deprived of the benefit of the increase in freight rates recently granted them. This certainly should not be attempted until after a fair trial has been given the conditions brought about by the increase in rates and the reduction in operating costs.

During the year there has been but little buying of new equipment. This has been due in part to inability to finance purchases. Some relief has been given by the operation of the law of last year by which the government has been able to assist the roads in their buying—but compared to their requirements the measure of this relief has been almost negligible. The financing by the roads of the large amount of new equipment purchases that will be needed in the near future and without which the country's progress and prosperity will be greatly retarded, presents a problem. That from time to time a greater or less number of cars stand idle does not argue that the roads have all the equipment needed. It happens at the present time and due to general business depression, that there is a dearth of traffic to be moved. Notwithstanding this, the ratio of cars now idle to the total available for service is inconsiderable—and as soon as conditions once more approximate the normal the lack of equipment will be very much in evidence. While, therefore, this company in common with like industries confronts the likelihood of a lessening of its activities for some time to come, nevertheless this can be faced with equanimity in the certainty that the needs of the country will make imperative in the near future the resumption of equipment buying on a large scale.

During the year there have been brought to complete adjustment and in entire harmony all of the company's manufacturing accounts with the government, including those relating to the purchase by the director general of railroads of the 31,000 freight cars referred to in prior reports.

Due to the bad condition into which the equipment of many of the roads was allowed to fall while under government control, it was expected that there would be a very large amount of car repairing to be done. The result, however, has fallen far short of the expectation—such work accounting for approximately only one-fifth of the company's business and profits for the year. The manufacture and sale of its miscellaneous products has yielded a greater volume of business than has the work of car repairing.

The company enters upon its new year with a thoroughly liquidated inventory and a comfortable volume of business booked—approximately \$30,000,000. In all respects its affairs are in satisfactory shape.

The balance sheet follows:

## Obituary

Edward J. Ronan, representative of the Gold Car Heating & Lighting Company, Brooklyn, N. Y., died at his home in Brooklyn on July 3. Mr. Ronan had been connected with the company for 21 years.

Alexander H. Handlan, president of the Handlan-Buck Manufacturing Company, St. Louis, who died at Oconomowoc, Wis., on May 28 after more than a year of ill-health,

had spent his entire business career of 52 years in the service of that firm. In January, 1869, he was employed as a bookkeeper by M. M. Buck, a dealer in railroad lanterns at St. Louis, and shortly after bought an interest in the firm. In 1901 Mr. Handlan acquired the entire ownership of the company by purchase and changed the name of the concern to its present form. The business of the company was also expanded to permit the manufacturing of a line of railroad supplies. Mr. Handlan, at the time of his

death, was not actively engaged in the management of his company, having retired from business about 20 years ago.

A. H. Handlan

## Railway Construction

**ALABAMA, FLORIDA & GULF.**—The Interstate Commerce Commission has issued a certificate authorizing the construction of lines between Dothan and Wilson, Ala., four miles, and between Greenwood and Marianna, Fla., nine miles.

**CHICAGO UNION STATION.**—This company has let a contract to the Brennan Construction Company, Chicago, for the construction of a 12-duct conduit line between Harrison and Van Buren streets, noted in the *Railway Age* of July 2 (page 42); also a contract to the W. J. Newman Company for a temporary office building to be used in connection with the wrecking of the old Chicago & Alton freight house at Van Buren street.

**ILLINOIS CENTRAL.**—This company is accepting bids for the construction of the substructure of a bridge south of Johnston, Miss., to cost about \$30,000.

**ILLINOIS CENTRAL.**—This company, which was noted in the *Railway Age* of June 17 (page 1422) as contemplating the construction of a pumping station at Ramsey, Ill., has closed bids for this work. This company is also receiving bids for the construction of a new water-treating plant at Amboy, Ill., to cost about \$30,000.

**MISSISSIPPI WARRIOR BARGE LINE.**—This company has commenced construction of the new floating freight terminal at Cairo, Ill., to provide for the direct transfer of freight in the Illinois Central and the Mississippi Warrior Line.

**PENNSYLVANIA SYSTEM.**—This company has awarded a contract for the dismantling of its train shed at Jersey City, N. J., to Henry A. Hittner's Sons Company, Philadelphia, Pa. It is intended to replace this old structure with three low shelter sheds to take care of the passenger business which has been of a local character since the construction of the Pennsylvania terminal in New York City.

**SOUTHERN PACIFIC.**—This company has awarded a contract for the construction of a tunnel, 1,420 ft. long, eliminating the trestle on the west bank of the Willamette river, about 7 miles from Portland, Ore., to the Hauser Construction Company, Portland.

**TEXAS & PACIFIC.**—This company is accepting bids for the construction of a new brick and tile passenger station at Ranger, Tex., with dimensions of 42 ft. by 263 ft., to cost about \$75,000.

**THE PITTSBURGH & WEST VIRGINIA.**—This company has let a contract to the John F. Casey Company, Pittsburgh, Pa., for the grading of 3½ miles of track into the coal fields owned by John A. Bell, of Pittsburgh. The work includes one 70-ft. steel bridge.

**TOLEDO, PEORIA & WESTERN.**—This company has awarded a contract to the Ogle Construction Company, Chicago, for the construction of a 100-ton frame coaling station at Cuba, Ill.

**VIRGINIAN.**—This company is receiving bids for the construction of additions to its shops at Elmore, W. Va.

**WOOD CONSTRUCTION INFORMATION SERVICE.**—The National Lumber Manufacturers Association, Chicago, has recently issued some additional data dealing with mill construction. The subjects treated in these sheets deal with basement floors, roof and roof coverings and include a set of floor beam charts to facilitate the determination of the most economical system of floor construction to carry a given load. Another subject presented is a progress report of tests made by the Forest Products Laboratory, Madison, Wis., in co-operation with the association on built-up beams under various loads in comparison with solid timbers.

**ABOUT 2,000 SHOPMEN** of the Delaware & Hudson resumed work on July 5, after a general suspension of work lasting six weeks. Certain shops on the Baltimore & Ohio on the same day took back about 3,600 shopmen who had been furloughed for three weeks or more. It is said that at the Mount Claire shops of the Baltimore & Ohio, in Baltimore, the forces now aggregate about two-thirds the normal number.

## Railway Financial News

**ANN ARBOR.**—*Authorized to Issue Bonds.*—The Interstate Commerce Commission has authorized an issue of \$2,000,000 of 6 per cent bonds under the company's improvement and extension mortgage, \$1,925,000 of the bonds to be pledged as collateral security for certain promissory notes and \$75,000 to be issued in exchange for 5 per cent bonds now held in the treasury.

**ATLANTIC COAST LINE.**—*Annual Report.*—A review of this company's annual report for 1920 appears on another page of this issue.

**CHICAGO & ALTON.**—*Annual Report.*—The income account for the year ended December 31, 1920, compares with the previous year as follows:

	1920	1919
Operating revenues (March 1-December 31)....	\$25,785,052	.....
Operating expenses (March 1-December 31)....	24,403,890	.....
Revenues over expenses (March 1-December 31)...	\$1,381,162	.....
Rental from United States Railroad Administration	529,719	\$3,178,315
United States Government guaranty period claim	3,105,524	.....
Railway operating income .....	\$5,016,405	\$3,178,315
Operating expenses, corporate, not assumed by the United States Railroad Administration.....	\$9,573	\$64,192
Taxes .....	657,144	4,787
Railway operating income over corporate expenses and taxes .....	\$4,349,688	\$3,109,336
Total income from railroad properties.....	\$4,412,748	\$3,101,409
Deductions:		
Hire of equipment, etc. ....	\$1,056,888	\$271,053
Net income from railroad properties.....	3,355,860	2,830,356
Total other income .....	\$119,256	\$105,825
Total income from all sources .....	\$3,475,116	\$2,936,181
Deductions:		
Interest on funded debt, etc.....	\$4,109,763	\$3,933,650
Net deficit .....	634,647	997,469

The annual report of the Chicago & Alton will be reviewed editorially in an early issue.

**GREAT NORTHERN.**—*Asks Loan for New Equipment.*—Application has been filed with the Interstate Commerce Commission for a loan of \$606,000 from the revolving fund to aid in the purchase of 500 refrigerator cars, and authority was also asked for the issuance of \$606,000 of equipment gold notes at 6½ per cent which it is proposed to sell at 97½ to the First National Bank of New York.

**ILLINOIS CENTRAL.**—*Annual Report.*—A review of this company's annual report for 1920 appears on another page of this issue.

**INTERSTATE RAILROAD.**—*Authorized to Issue Stock.*—This company has been authorized by the Interstate Commerce Commission to issue \$3,000,000 of additional stock, the proceeds to be used for the purchase of property for and the construction of an extension of its railway from the present terminus at Norton, Va., to a connection with the Carolina, Clinchfield & Ohio, a distance of about 25 miles. The right of way of the Norton & Northern to be purchased will constitute a portion of the completed extension.

**MINNEAPOLIS, ST. PAUL & SAULT STE. MARIE.**—*Authorized to Purchase Road.*—This company has been authorized by the Interstate Commerce Commission to acquire the railroad property of the Wisconsin & Northern and to issue \$2,671,000 of its first consolidated 5 per cent mortgage bonds to be used in part payment.

**MINNEAPOLIS & ST. LOUIS.**—*Authorized to Issue Bonds.*—The Interstate Commerce Commission has authorized an issue of \$714,000 of refunding and extension mortgage 5 per cent bonds to be placed in the company's treasury in respect of expenditures for additions and betterments amounting to \$398,000 and for retirement of equipment obligations amounting to \$316,000.

**MINNEAPOLIS & ST. LOUIS.**—*Annual Report.*—The corporate

income account for the year ended December 31, 1920, compares with the previous year as follows:

	1920	1919
Operating revenues	\$14,352,998	.....
Operating expenses	14,923,309	.....
Taxes (other than U. S. Government)	568,623	.....
Total	\$15,491,932	.....
Operating revenues over expenses and taxes, Def.	\$1,138,934	.....
Standard return	\$451,438	\$2,773,857
Amount by which M. & St. L. R. R. failed to earn Govt. Guaranty (March to August) estimated	3,362,819	.....
Total income, including other	\$4,055,806	\$3,058,508
Surplus	\$2,916,872	\$3,058,508
Interest on outstanding funded debt	\$2,079,218	\$2,040,479
Taxes—U. S. Government	53,257	17,416
Total fixed and other charges	\$2,316,696	\$2,627,815
Balance—Surplus	\$600,176	\$430,693

The annual report of the Minneapolis & St. Louis will be reviewed editorially in an early issue.

**MISSOURI, KANSAS & TEXAS.—Application for Loan Approved.**—The Interstate Commerce Commission has approved a loan of \$450,000 to the receiver to assist in the acquisition of 300 50-ton steel tank cars of 10,000 gal. capacity, to cost \$3,007 each.

**SEABOARD AIR LINE.—Defers Interest on Bonds.**—The directors on July 1 voted to defer the semi-annual interest payment due August 1 on the \$25,000,000 5 per cent adjustment mortgage bonds, the principal of which is due October 1, 1949. The bonds were issued on October 1, 1909.

Robert L. Nutt, treasurer of the Seaboard Air Line, made the following statement after the meeting:

The directors under ordinary conditions might have considered an advancement of the necessary amount, although not carried, but since the interest is cumulative and because of general depressed business conditions throughout the country, in the opinion of the board, the company would not be justified in advancing interest on the income bonds, which would take from the property money considered essential to its proper maintenance. A further consideration was the fact that the reduction of wages does not take effect until after July 1.

The policy of the company during the succeeding six months will be to put the motive power in first class condition to meet the winter business of the corporation. This policy will, it is believed by the board, prove to the material benefit of the adjustment bondholders in that their property will be better conserved.

The amount earned during the period under consideration, viz., November 1 last to April 30, 1921, available for interest on the adjustment bonds was approximately \$30,000. This will be carried over into the next interest period, the amount being insufficient to justify its distribution.

**SOUTHERN PACIFIC.—Annual Report.**—A review of this company's annual report for 1920 appears on another page of this issue.

**SUGAR PINE.—Asks Permission to Abandon Line.**—This company has applied to the Interstate Commerce Commission for a certificate authorizing the abandonment of its line of 14.15 miles in Tuolumne County, Cal.

**TENNESSEE CENTRAL.—Sale Postponed.**—The sale of this road, scheduled for June 30, has been postponed to October 1, at the request of the Mississippi Valley Trust Company, trustee for the first mortgage bondholders.

**TEXAS CITY TERMINAL.—Certificate Held Not Necessary.**—The Interstate Commerce Commission has issued a decision that the proposed acquisition and operation by this company of the railroad formerly owned by the Texas City Transportation Company and operated by the Terminal Company as lessee, is not within the scope of Paragraph 18, Section 1, of the interstate commerce act, and the proceeding was dismissed.

**TOLEDO, ST. LOUIS & WESTERN.—Annual Report.**—The corporate income account for the year ended December 31, 1920, compares with the previous year as follows:

	1920	1919
Operating revenues:		
Freight	\$9,307,538	.....
Passenger	400,925	.....
Total	\$10,118,447	.....
Operating expenses:		
Maintenance of way and structures	\$2,124,597	.....
Maintenance of equipment	2,019,174	.....
Traffic	164,459	.....
Transportation	3,657,763	.....
General	179,450	.....
Total	\$8,144,957	.....

Net revenue from operations	\$1,973,490	.....
Tax accruals	288,150	.....
Railway operating income	\$1,685,172	.....
Total other income	279,795	\$1,273,316
Gross income	2,464,967	1,273,316
*Deductions from total gross income including interest on funded debt	1,146,228	1,087,653
Total	\$2,103,491	\$1,368,749
Net income	361,476	Def. \$5,433

\*Includes interest on A and B Gold Bonds of 1917, amounting to \$461,080 defaulted.

The operating revenues and expenses in detail and the principal traffic statistics for 1920 compare as follows:

	1920	1919
<b>OPERATING REVENUES</b>		
Freight	\$10,766,900	\$7,419,636
Passenger	461,017	452,377
Total operating revenues	\$11,758,721	\$8,267,878
<b>OPERATING EXPENSES</b>		
Maintenance of way and structures	\$2,317,092	\$1,475,281
Maintenance of equipment	2,371,601	1,821,103
Traffic expense	178,056	72,625
Transportation	4,425,344	3,440,980
General expenses	201,312	137,569
Total operating expenses	\$9,492,917	\$6,944,945
Net revenue from railway operations	2,265,804	1,322,932
Railway tax accruals	350,150	315,000
Railway operating income	\$1,915,192	\$1,007,801

	1920	1919
<b>FREIGHT TRAFFIC</b>		
Number of tons carried	5,082,141	4,123,391
Number of tons carried one mile	1,261,496,000	896,804,000
Average distance hauled per ton (miles)	248.23	217.43
Average revenue per ton mile	\$0.0854	\$0.0527

	1920	1919
<b>PASSENGER TRAFFIC</b>		
Number of passengers carried	319,619	295,166
Number of passengers carried one mile	15,347,648	18,447,764
Average distance hauled per passenger (mile)	48.02	62.50
Average revenue per passenger mile	\$0.03004	\$0.02455

W. L. Ross, receiver, in his remarks, says that the results of the operation of the property for the year show the largest operating revenues in the history of the road, there being an increase of \$3,400,843, or 42.22 per cent over the preceding year, regardless of the disturbed business and financial condition of the country.

**WHEELING & LAKE ERIE.—Authorized to Issue Equipment Obligations.**—This company has been authorized by the Interstate Commerce Commission to issue short term notes to the amount of \$13,629,000 for the acquisition of equipment through the National Railway Service Corporation's equipment trust agreement; to assume obligation as endorser and guarantor in respect of obligations of the service corporation to the United States, to the amount of \$3,304,000, and to pledge with the Secretary of the Treasury \$779,000 of refunding mortgage 5 per cent bonds to secure the repayment of a loan of \$3,304,000.

## Guaranty Certificates Issued

The Interstate Commerce Commission has issued certificates for partial guaranty payments, as follows:

Eric	\$10,000.00
Fernwood, Columbia & Gulf	18,000.00
Middletown & Unionville	35,000.00
New Orleans Great Northern	1,240,000.00
St. Johnsbury & Lake Champlain	70,000.00
Winston-Salem Southbound	10,000.00
Trinity Valley	1,500.00
Susquehanna & New York	50,000.00
Manistique & Lake Superior	33,000.00
Flint River & Northwest	4,000.00
Chicago Great Western	150,000.00

## Dividends Declared

Ashland Coal & Iron Ry.—1 per cent, quarterly, payable June 25 to holders of record June 25.  
 Atlanta & West Point—3 per cent, payable June 29, to holders of record June 21.  
 Belt Railroad & Stock Yards (Indianapolis) Common—3 per cent quarterly; preferred, 7½ per cent; both payable July 1.  
 Delaware, Lackawanna & Western—5 per cent, quarterly, payable July 20 to holders of record July 11.  
 Georgia Railroad & Banking—3 per cent, quarterly, payable July 12 to holders of record July 1.  
 Manhattan Railway—1¼ per cent quarterly, payable July 1 to holders of record June 30.  
 Pittsburgh & West Virginia—Preferred, 1½ per cent, quarterly, payable August 31 to holders of record August 1.  
 Richmond, Fredericksburg & Potomac—Common and dividend obligations, 4½ per cent, payable June 30 to holders of record June 24.  
 Western Ry. of Alabama—3 per cent, payable June 30 to holders of record June 30.

# Annual Report

## Illinois Central Railroad Company—Seventy-First Annual Report

TO THE STOCKHOLDERS OF THE ILLINOIS CENTRAL RAILROAD COMPANY:

There is submitted herewith the report of the Board of Directors covering the affairs of your company for the year ended December 31, 1920.

The number of miles operated on December 31, 1920, was, 4,799.40

Added for year, 1920—Tracks of New Orleans Great Northern

R. R. at Monticello, Miss., not reported in previous years .36

December 1, 1920—Reclaiming at Tara, Ia. .... .02

4,800.15

Less:

February 1, 1920—Reduction due to construction of cut-off

at Scottsbluff, Ky. .... .62

February 1, 1920—Shortening line at Carbondale, Ill. .... .10

March 1, 1920—Shortening line due to construction of cut-off

at Camp Knox, Ky. .... .03

.75

The number of miles operated on December 31, 1920, was, 4,799.40

The average number of miles of road operated during the

year was 4,799.44

### INCOME

A summary of the Corporate Income for the year ended December 31, 1920, compared with the Corporate Income for the year 1919, is stated below.

1920 1919

Average Miles Operated 4,799.44 4,793.22 + 6.22

Operating Revenues \$121,804,579.25 + \$121,804,579.25

Operating Expenses 121,874,327.47 + 121,874,327.47

Expenses over Revenues 69,748.22 + 69,748.22

United States Government—Guaranty Period Claim 19,499,886.56 + 19,499,886.56

Rental from United States Railroad Administration 3,399,634.99 + 17,896,467.48

Railway Operating Income 22,829,773.33 + 17,896,467.48

Operating Expenses, Corporate, not assumed by United States Railroad Administration 117,657.90 + 351,632.62

Federal War Income and Other Taxes 7,172,261.96 + 853,200.00

Uncollectible Railway Revenues 23,319.80 + 23,319.80

Railway Operating Income over Corporate Expenses, Taxes and Uncollectible Railway Revenues 15,516,533.67 + 16,691,634.86

Equipment Rents—Net 3,196,849.02 + 3,196,849.02

Joint Facility Rents—Net Debit 191,297.36 + 191,297.36

Net Railway Operating Income 18,522,085.33 + 16,691,634.86

Income from Investments and Other Corporate Income 7,219,881.91 + 7,634,404.57

Gross Income 25,741,967.24 + 24,326,039.43

Interest on Funded Debt and Other Miscellaneous Corporate Charges 12,170,844.96 + 12,156,719.96

Net Income 13,571,122.28 + 12,169,319.47

Disposition of Net Income: Income Applied to Sinking and Other Reserve Funds 118,200.00 + 118,200.00

Income Appropriated for Investment in Physical Property 18,080.85 + 170,100.07

Total Appropriations of Income 136,280.85 + 288,300.07

Income Balance Transferred to Credit for Profit and Loss 13,434,841.43 + 11,880,619.40

The income account for the current year 1920 consists of the Federal contract compensation for January and February, less Corporate expenses and war taxes; and the income resulting from operation for the ten months beginning March 1, 1920. To these sums is added an amount which represents the difference between the amount earned and the amount guaranteed under Section 209 of the Transportation Act, 1920, during the six months' guaranty period, from March 1 to August 31, 1920, inclusive, which amount stands as a claim against the Government. For the year 1919 the income account was made up of compensation accrued to your Company under the contract with the Government entered into pursuant to the Federal Control Act, from which were deducted Corporate expenses and Federal war taxes. To the income for the respective years was added income from securities and other Corporate income and there was deducted interest on funded debt and other Corporate charges.

In the current year's income the items "Operating Revenues," amounting to \$121,804,579.25, and "Operating Expenses," amounting to \$121,874,327.47, represent operating results for the months from March to December, 1920, inclusive. There were no corresponding figures for the previous year because in that year all operating revenues accrued to and all operating expenses were borne by the Government and in lieu thereof there accrued to your Company rental payable by the Government under the terms of the Federal Control Act and the standard form of contract entered into by your Company with the Director General of Railroads.

The item "United States Government—Guaranty Period Claim" of \$19,499,886.56 is the sum by which the Railway Operating Income, as defined in Section 209 of the Transportation Act, 1920, for the six months from March 1 to August 31, 1920, was insufficient to meet the guaranty under this section of the Act.

The decrease of \$14,496,832.49 in "Rental from United States Railroad Administration" for the year 1920, compared with the year 1919, is due to the fact that rental payable under the Federal Control Act and the Standard Contract accrued for January and February of the current year only, while in the year 1919, the rent for the entire year accrued to your Company.

There was a decrease of \$233,974.72 in "Operating Expenses, Corporate, not assumed by United States Railroad Administration" for the reason that Federal contract terminal charges from March 1, 1920, to December 31, 1920, the remaining ten months were included in "Operating Expenses." In the previous year the expenses for the entire twelve months were included in this account. These expenses were for salaries and expenses of officers and clerks necessary to maintain the Corporate organization.

The increase of \$6,319,061.96 in "Federal War Income and Other Taxes" is principally due to the inclusion in the current year of ten months of State and other taxes accruing from March to December, 1920, in addition to Federal contract terminal charges for the year. The state and other taxes for the first two months of the year 1920 were chargeable to the Director General of Railroads. In the previous year the Company assumed the Federal war income taxes and the State and other taxes for the entire year were borne by the Director General of Railroads.

The increase of \$23,319.80 for the calendar year 1920 in the item "Uncollectible Railway Revenues" was for transportation charges earned by your Company determined to be uncollectible and therefore charged off. Uncollectible railway revenues in the previous year were included in the accounts of the Director General of Railroads and any portion thereof antedating the Federal control period was charged back to your Company by the Director General and in the report of the previous year included in "Expenses Prior to January 1, 1918."

The increase of \$3,196,849.02 for "Equipment Rents—Net Credit" is the excess of income over cost for hire of railway equipment for the last ten months of the current year. In the previous year, as also in the months of January and February, 1920, this income accrued to the Director General of Railroads under the terms of the Federal Control Act and the Standard Contract.

The increase of \$191,297.36 in "Joint Facility Rents—Net Debit" is for the excess of rentals paid over rentals received for tracks and terminal facilities used in common with other carriers for the last ten months of the year. The corresponding rentals for the first two months of the current year and for the previous year accrued to or were assumed by the Director General of Railroads.

"Income from Investments and Other Corporate Income" decreased \$414,122.66. There was a decrease of \$1,005,858.53 in the amount of interest receivable on Louisville, New Orleans & Texas Railway Company Second Mortgage Income Bonds and a decrease of \$126,382.06 compared with the previous year, caused by a reduction in the amount of revenues accrued prior to January 1, 1918, being reported by the Director General of Railroads. These decreases were offset in part by an increase of \$150,006.38 in dividends from securities owned, representing an increase of \$400,000.00 in dividends on Madison Coal Corporation stock, less decrease of \$249,993.62 on account of dividends received in Dubuque & Sioux City Railroad Company capital stock last year and on which no dividends were paid during the current year. There was also an increase of \$564,219.03 in "Income from Unfunded Securities and Accounts," the major portion of which was for interest receivable from The Yazoo and Mississippi Valley Railroad Company on its outstanding indebtedness to your Company. The balance of the increase \$3,892.52 consisted of minor items of nonoperating income received this year as compared with the previous year.

The increase of \$14,125.00 in "Interest on Funded Debt and Other Miscellaneous Corporate Charges" is largely due to an increase in interest on funded debt, less a substantial decrease in rents for leased roads. The increase in interest on funded debt was on account of additional securities issued during the year for new equipment. The decrease in rents for leased roads represents the deficit in net operating results of the Dubuque & Sioux City Railroad by your Company during the last four months of the current year and is payable by the Dubuque & Sioux City Railroad Company.

### ASSETS AND LIABILITIES

The following is an explanation of the important changes in "Investments" and "Funded Debt" during the year:

#### Investments:

Expenditures for additions and betterments amounted to \$17,295,942.82, as shown in detail on page 8. Of this sum \$15,191,381.07 was for improvements to lines of railroad owned by your company and to its equipment and is included in General Balance Sheet Account "Road and Equipment since June 30, 1907." The balance of \$2,104,661.75 covered improvements to the railroads of subsidiary companies and is included in General Balance Sheet Account "Investments in Affiliated Companies—Advances."

The increase of \$196,500.00 in "Investments in Affiliated Companies—Bonds" was as follows:

Purchase of Ocean Steamship Company of Savannah Seven

Per Cent Gold Bonds of 1925, at par. .... . \$209,000.00

Less: Florida & Seaboard Union Railway Company Five Per Cent

Debenture Bonds matured August 1, 1920, redeemed, par

value 12,500.00

Increase 196,500.00

There was an increase of \$2,044,172.66 in investments in Affiliated Companies—Advances, as shown in Table 6, representing expenditures for additions to subsidiary companies.

Advances for additions and betterments to the lines of railroad and equipment of subsidiary companies. .... . \$2,104,661.75

Less: Reduction in advances to non-transportation subsidiary companies 60,489.05

Increase 2,044,172.66

There was an increase of \$2,088,900.00 in "Other Investments—Bonds" explained as follows:

The Yazoo and Mississippi Valley Railroad Company Registered

Five Per Cent Gold Improvement Bonds. .... . \$2,614,000.00

These bonds were transferred from the Insurance and Fidelity

Fund closed during the current year.

Less: Sale of United States Fourth Liberty Loan Four and

One-Quarter Per Cent Bonds sold to Central of Georgia

Railway Company. .... . \$255,000.00

Income of Kentucky Club First Mortgage Five Per Cent

Bonds, redeemed. .... . 100.00

Increase 2,088,900.00

**Funded Debt:**

There was an increase in "Funded Debt" of \$18,911,085.00, as follows:	
Illinois Central Railroad Company Six Per Cent Equipment Gold Notes issued under Government Equipment Trust No. 3	\$9,117,000.00
Illinois Central Equipment Trust, Series "E," Seven Per Cent Certificates issued	8,107,000.00
Illinois Central Railroad Company One to Fifteen Year Secured Six Per Cent Notes issued	4,440,000.00
Illinois Central Railroad Company and Chicago, St. Louis & New Orleans Railroad Company Joint First Refunding Mortgage Five Per Cent Bonds, Series "A," issued for conversion of Sterling Bonds in Dollar Bonds	5,085.00
Total	\$21,669,085.00

**Less:**

Equipment trust obligations retired and cancelled:	
Illinois Central Railroad Company Equipment Trusts:	
Series "A"	\$800,000.00
Series "B"	350,000.00
Series "C"	190,000.00
Series "D"	190,000.00
Series "E"	550,000.00
Chicago, St. Louis & New Orleans Railroad Company Equipment Trust, Series "A"	570,000.00
Total	\$2,658,000.00
Real Estate Mortgage matured and paid	100,000.00
Total	\$2,758,000.00

Net Increase ..... \$18,911,085.00

"Funded Debt Held in Treasury" decreased \$70,000.00 due to the retirement of a like amount of matured Chicago, St. Louis & New Orleans Railroad Company Equipment Trust, Series "A" Bonds.

**Additions and Betterments—Expenditures:**

There was expended during the year for Additions and Betterments (including improvements on subsidiary properties), \$17,295,942.82.

	ADDITIONS AND BETTERMENTS ON OWNED LINES	ADVANCES FOR ADDITIONS AND BETTERMENTS TO LINES OF SUBSIDIARY COMPANIES	TOTAL EXPENDED
<b>ROAD</b>			
Total	\$3,671,844.12	\$1,999,235.79	\$5,671,079.91
<b>EQUIPMENT:</b>			
Steam locomotives	\$1,801,316.47	.....	\$1,801,316.47
Freight train cars	9,656,447.03	.....	9,656,447.03
Passenger train cars	Cr. 9,721.18	..... Cr.	9,721.18
Floating equipment	Cr. 2,000.00	..... Cr.	2,000.00
Work equipment	49,353.74	.....	49,353.74
Miscellaneous equipment	1,894.63	.....	1,894.63
Total	\$11,497,290.69	.....	\$11,497,290.69
<b>GENERAL:</b>			
Organization expenses	.....	\$15.66	\$15.66
General officers and clerks	.....	2,361.52	2,361.52
Law	.....	4,263.49	4,263.49
Taxes	\$336.63	41.73	378.36
Interest during construction	21,809.63	98,743.56	120,553.19
Total	\$22,146.26	\$105,425.96	\$127,572.22
<b>Grand Total</b>	<b>\$15,191,281.07</b>	<b>\$2,104,661.75</b>	<b>\$17,295,942.82</b>

The following shows the amount advanced during the year to each of the subsidiary companies, these amounts being included in total advances shown in Table No. 6 of this report:

Benton Southern R. R. Co.	\$82.36
Bloomington Southern R. R. Co.	Cr. 612.00
Big Island R. R. Co.	1,708.57
Central, Aberdeen & Nashville R. R. Co.	23,321.09
Chicago, St. Louis & New Orleans R. R. Co.	1,340,047.05
Dubuque & Sioux City R. R. Co.	467,600.66
Fredonia & Reeds R. R. Co.	6,228.61
Goldsboro Northern R. R. Co.	213,718.71
Kensington & Eastern R. R. Co.	55,574.16
Memphis R. R. Terminal Co.	Cr. 6,000.00
South Chicago R. R. Co.	3,192.54
Total	\$2,104,661.75

**ROAD AND EQUIPMENT**

The following is a summary of the more important improvements during the year, the cost of which was charged wholly or in part to Road and Equipment.

**Additions and Betterments—Road:**

136 new industrial sidings were built or extended.  
137 new company sidings were built or extended, a net addition of 18.33 miles. Included therein were additions to yard facilities of 5.03 miles at Freeport, Ill., 2 miles at Centralia, Ill., and 1.70 miles at Yonconah, Tenn.  
The grading for the Markham Yard, located between Harvey, Ill., and Homewood, Ill., referred to in the report of the previous year, was continued.

Second main track was constructed from Ambly, Ill., to Sublette, Ill., 5.70 miles, and from Heyward, Ill., to Clinton, Ill., 8.66 miles. There were constructed during the year 12.53 miles of third main track between Peotone, Ill., and Tucker, Ill.

That portion of the line change and grade reduction work between Dawson Springs, Ky., and Scottsburg, Ky., known as the Scottsburg Grade Reduction, was completed.

The 56th St. subway, Chicago, Ill., was finished. This completed the renewal of bridges over streets between 51st St. and 67th St., Chicago, Ill. The construction of the new St. Charles Air Line bridge over the south branch of the Chicago river was completed and the old structure retired. The bridge over the Rock river at Dixon, Ill., was replaced with a new structure during the year in order to permit the operation of new Central type locomotives on the Ambly Division.

The construction of subway at Washington Street, Bloomington, Ill., and two subways at Lepp and 14th Streets, El Dorado, Iowa, was completed.

The interlocking plant at Bemis, Tenn., referred to in the previous report, was completed.

The suburban platforms with waiting rooms at track level, at Chicago, Ill., between 51st and 53rd Streets, 56th and 57th Streets, and 59th and 60th Streets; suburban stations at street level at 51st, 53rd, 56th, 57th, 59th and 60th Streets; also, interchange facilities for the Chicago, Lake Shore and South Bend Railway at Kensington, Chicago, Ill., referred to in the previous report, were completed. A suburban station was constructed at 175th Street, south of Chicago, Ill., to serve the Calumet Country Club. A new passenger station and a new freight station with power house and track facilities were constructed at Centralia, Ill. A new freight and passenger station was constructed at Newbern, Tenn.

New icing facilities were constructed at Jackson, Miss., and improvements made to the ice house, Watertown, Iowa.

Improvements were made in water facilities at Kankakee, Ill., Hart, Ill., Centralia, Ill., Peotone, Ill., and New Orleans, La. A new 100,000 gallon capacity crescented frame water tank was erected at Peotone, Ill.

Roundhouse stalls at Centralia, Ill., Clinton, Ill., and Freeport, Ill., and Paducah, Ky., were extended to accommodate the new Central type freight locomotives. New 100-ft. turntables, replacing 85-ft. turntables, were installed at Centralia, Ill., Clinton, Ill., and Freeport, Ill.

Work of constructing block signals between Isley, Ky., and Princeton, Ky., a distance of 20.5 miles, was commenced. There were 2,408 miles of block signals in operation at the close of the year.

2,335 lineal feet of permanent bridges and trestles were constructed replacing pile and timber bridges and trestles; 1,032 feet of permanent bridges and trestles were filled and 11,893 lineal feet of pile and timber bridges and trestles were replaced or replaced with embankment. 2.5 miles of track were ballasted or rebalasted and brought up to the present standard. Additions and Betterments—Equipment:

Twenty-five Pacific type locomotives were added and eighteen locomotives of various types were disposed of, resulting in an increase of seven locomotives. Three Consolidation type freight locomotives were converted into Mikado type freight locomotives and three Pacific type passenger locomotives and nine freight locomotives of various classes were superheated. The increase in tractive power of locomotives for the year was 744,910 pounds.

Seventy passenger trains were destroyed and one sold. One thousand six hundred and twenty-seven freight train cars were added and four hundred and eighty were destroyed, sold or transferred to other classes, resulting in a net increase for the year of one thousand one hundred and forty-seven cars.

**GENERAL REMARKS**

Federal control having terminated on March 1, 1920, your Company accepted the provisions of Section 209 of the Transportation Act, 1920, and was thereby guaranteed by the Government an income for the six months beginning March 1, 1920, of not less than one-half of your compensation as fixed in the Federal Control contract, subject to increases due to adjustments as provided for in Section 4 of the Federal Control Act.

Approximately twenty per cent was added to your Company's payrolls by the decision of the Railroad Labor Board, which, though rendered on July 29, 1920, was effective from May 1, 1920.

To meet increases in labor costs due in part to this decision, increases in costs of fuel and supplies, as well as to provide the six per cent return upon property values as provided in the Transportation Act, the Interstate Commerce Commission, by its decision in the case of your Company, Ex Parte 74, rendered July 29, 1920, but effective August 26, 1920, permitted increases of forty per cent in interstate freight rates in the territory North of the Ohio River and East of the Mississippi; of thirty-five per cent in territory West of the Mississippi; and twenty-five per cent in Southern territory.

Interstate rates applying to passenger trains were increased thirty per cent and one-third per cent. Interstate passenger fares other than suburban, and rates on milk and cream carried on passenger trains were increased everywhere twenty per cent, and the railroads were granted a surcharge for transporting passengers in sleeping cars equal to one-half of the regular sleeping car fare. Intrastate rates and fares were not increased at the same time or to the same extent as the interstate. State commissions, to whom applications were promptly made for increases in state rates, were in several states without authority to allow increases in passenger fares, and in some states the increase was granted in freight rates but not in passenger rates. By action of the Interstate Commerce Commission, protected in many instances by Federal injunctions, most of these rates were finally advanced to the interstate basis. In only two states, however, were the full advances effective before the end of the year, and in one of the two the increase was not effective until October 1, 1920. Generally speaking, intrastate passenger fare increases in the important states of Illinois, Iowa, Indiana and Louisiana were not effective until the end of the year, and advances in freight rates in these and other states were only partially effective.

The marked decline in traffic during the final months of the year prevented your road from earning the sums hoped for from the rate increases. To meet this situation expenses were promptly reduced to correspond with the decline in traffic so far as this could be done consistently with safe and efficient operation.

Prior to September 1, 1920, through freight traffic was moved over the Yazoo and Mississippi Valley Railroad between Asylum, Miss., and West Junction, Tenn., under a trackage agreement covering that part of the line between Asylum, Miss., and Lewis, Miss. A verbal agreement was made extending this arrangement to the line between Owen, Miss., and West Junction, Tenn., in lieu of the traffic arrangement previously existing between the two Companies.

An equipment trust agreement known as "Government Equipment Trust No. 321" was executed during the year to cover the minimum purchase price of three thousand five hundred coal cars allocated to your Company by the Director General of Railroads, and \$9,117,000.00 of notes of your Company bearing interest at six per cent per annum were delivered to the Government under this agreement. Advances were made by the Government to cover the purchase price of one hundred fifty coal cars received subsequent to the execution of the trust agreement and to provide for the balance of the purchase price on the original three thousand five hundred cars.

Your Company contracted for the purchase of seventy-five locomotives, fifty passenger train cars and one thousand five hundred fifty freight train cars to cost approximately \$13,515,000.00. To provide funds for the purchase of this equipment there was issued during the year "Illinois Central Equipment Trust, Series F," amounting to \$8,107,000.00 and there was advanced by the United States Government under the provisions of Section 210 of the Transportation Act, of 1920, to your Company \$8,107,000.00 of its notes maturing in equal amounts annually between 1921 and 1935, bearing interest at the rate of six per cent per annum, to secure the loan. The balance of the purchase price of the equipment was paid in cash as your Company.

The number of stockholders as shown by the books of your Company at the close of the year was 13,645, as compared with 11,960 last year.

The Board desires to express its appreciation to the officers and employees for their loyal and efficient services during the last year.

By order of the Board of Directors,

C. H. MARKHAM,  
PRESIDENT.

## Railway Officers

### Financial, Legal and Accounting

**E. R. Belt** has been appointed auditor of disbursements of the St. Louis-San Francisco, with headquarters at St. Louis, Mo., effective June 6.

### Operating

**A. A. Sims** has been appointed assistant to the superintendent of transportation of the Southern Pacific with headquarters at Houston, Tex., effective July 1, succeeding C. L. McManus, deceased.

**G. H. Minchin**, assistant superintendent of the Illinois division of the Atchison, Topeka & Santa Fe, with headquarters at Chillicothe, Ill., has been appointed trainmaster on the Missouri division, with headquarters at Marceline, Mo.

**B. S. Tobias**, trainmaster on the Panhandle division of the Atchison, Topeka & Santa Fe, with headquarters at Wellington, Kan., has been appointed chief dispatcher, with the same headquarters, succeeding C. J. Wells, who has been assigned to other duties. The position of trainmaster has been abolished.

### Traffic

**T. D. Geoghegan**, traffic manager of the Gulf, Mobile & Northern, with headquarters at Mobile, Ala., has resigned, effective July 1.

**W. M. Organ** has been appointed general live stock agent of the Chicago Great Western with headquarters at Chicago, Ill., effective June 15.

**Golder Shumate**, freight traffic manager of the Baltimore & Ohio, with headquarters at Baltimore, has been appointed general freight traffic manager for the system with the same headquarters. **O. S. Lewis**, general freight agent at Pittsburgh, succeeds Mr. Shumate. **W. W. Blakely**, assistant general freight agent at Pittsburgh, has been promoted to general freight agent with the same headquarters, and **A. L. Doggett**, division freight agent at Youngstown, Ohio, takes Mr. Blakely's place. **C. H. Pumphrey**, district freight agent at Philadelphia, succeeds Mr. Doggett at Youngstown. **Samuel House**, assistant general freight agent at Baltimore, has been appointed general freight agent with office at the same place. **George Harlan** has been appointed assistant general freight agent, and **J. L. Hayes** division freight agent at Baltimore. **P. S. Phenix**, industrial survey agent at Baltimore, has been appointed division freight agent at Cumberland, Md. **E. Jordan** and **J. R. Brown** have been made division freight agents at Charleston, W. Va. **Samuel Strachan** has been appointed assistant to the general freight traffic manager at Baltimore, Md.

### Mechanical

**J. McDonough**, master mechanic of the Atchison, Topeka & Santa Fe, with headquarters at Fort Madison, Iowa, has been transferred to the Illinois division, with headquarters at Chicago, succeeding A. L. Beardsley, who has resigned on account of ill-health.

### Engineering, Maintenance of Way and Signaling

**J. N. Olson**, assistant engineer of the Gulf lines of the Atchison, Topeka & Santa Fe, with headquarters at Galveston, Tex., has been transferred to the office of the chief engineer, with headquarters at Chicago.

## Obituary

**Frank E. Teetshorn**, chief train dispatcher of the Green Bay & Western, died at Green Bay, Wis., on June 27.

**W. A. Ballard**, president of the New Jersey, Indiana & Illinois, died at his home in South Bend, Ind., on June 30, after a long illness.

### JOHN F. WALLACE

**John Findley Wallace**, of New York City, consulting engineer, and chairman of the Chicago Railway Terminal Commission, died suddenly at a hotel in Washington, D. C., on July 3. He had been in Washington to testify before the Senate Committee on Interstate Commerce in connection with its railroad investigation. Mr. Wallace was one of the most prominent engineers in the United States, having had an extensive experience not only on railroads in various parts of the country and abroad, but in other lines of engineering activity. He was born at Fall River, Mass., on September 10, 1852. He entered railway service in 1869 as a rodman on the Carthage & Quincy. He was engaged in engineering work on the Rockford, Rock Island & St. Louis, the Peoria & Farmington, the Iowa Central, the Atchison, Topeka & Santa Fe, the Chicago, Madison & Northern and the Illinois Central. This service covered most of the period to June 1, 1904, although he was for a time engaged in private practice. On the Illinois Central he was successively engineer of construction, chief engineer (for five years), assistant second vice-president, assistant general manager and general manager.

On June 1, 1904, he was appointed chief engineer of the Isthmian Canal Commission and he also became vice-president and general manager of the Panama Railroad & Steamship Line and a member of the Isthmian Canal Commission. From October, 1905, to May, 1906, he was confidential adviser of the president of the Chicago & North Western. In June, 1906, he became president of the Electric Properties Company and also president and chairman of the board of directors of Westinghouse, Church, Kerr & Co. He left the Westinghouse companies in 1914 and has since been engaged in consulting work on numerous large enterprises. He was vice-president of the Kansas City, Mexico & Orient and of the Northern Colorado Power Company. Since 1914, he has been chairman of the Chicago Railway Terminal Commission and has acted for the City of Chicago in negotiations in contract ordinances involving relations with the railway companies serving the city.

Among the notable works with which Mr. Wallace's name is connected are the terminals of the Illinois Central built for the Chicago World's Fair of 1893, and the present Chicago & North Western passenger terminal in that city. At the age of 24 he made for himself a reputation by his work in rock excavation in the upper Mississippi river, where he was assistant United States engineer. He prepared the construction organization for the building of the Panama Canal. He was the first president of the American Railway Engineering Association. He was for years prominent in the American Society of Engineers and was president of that body in 1900.

FORTY CENTS A PLATE is the cost of a good noon-day meal at a lunch room which seventeen shop foremen of the New York, New Haven & Hartford have established for themselves at Van Nest, New York City; and at that price they have accumulated in two and a half years a reserve fund of about \$500. Van Nest is not well provided with restaurants and so these men got the company to give them an old passenger car and they fixed it up as a dining car (without trucks). The company furnishes hot water and gas. They have a woman cook, and, with a present membership of 40 (foremen and clerks) and an average daily company of eaters of 26, they are maintaining the establishment without difficulty. The woman reporter of the *New York Evening Post*, who gives these facts, says that this unpretentious "dining car" is beautiful with rosebushes, and that the odor from the kitchen is "savory."

The Ryerson-Conradson Motor Drive eliminates all belts, tension idlers and chain drives with their consequent trouble and inefficiency

## Lathes for Progressive Railroads

*"A large amount of machinery used in railroad shops is obsolete to the extent that it has gone out of date and can no longer be efficiently operated."*

RAILWAY MECHANICAL ENGINEER

In twenty-five years locomotive weight has increased 265.9%—modernize your shops to keep pace.

Ryerson-Conradson Railroad Lathes embody many improvements that speed up shop output and reduce costs.

Direct motor drive; headstock cast integral with the bed; gears constantly in mesh; and centralized apron control are features of these modern machines.

They are built for increased production in the repair of heavy modern motive power.

For some weeks railway and railway supply men have looked to July 1 as marking a change from the period of inactivity

July 1  
Is  
Here

to that of increased action in the rehabilitation and improvement of the railway properties. That date has now arrived and passed. The wage reductions estimated to exceed one million dollars a day are now in effect and this saving is accruing to the roads. Traffic continues to increase and is far above that of last spring, although still slightly below that of two years ago and much below that of a year ago. That these conditions are having their effect is indicated by the announcement during the last week by a number of roads that they have put on considerable numbers of maintenance of way men, and on other roads that the car repair forces have been increased. The need for increased activity in both the mechanical and maintenance of way departments is pressing. The situation is especially acute with reference to cars, for the roads, particularly in the western grain producing areas, are facing the movement of an unusually heavy crop, harvesting of which is already under way. Likewise, maintenance of way work is seasonal in character and there is much of it which if not started now should not be undertaken at all this year.

Elsewhere in this issue will be found an article describing the construction of a large bridge on the Government Railway in Alaska. As one of several formidable structures which are important features of this project it exemplifies the magnitude of the venture better than it can be expressed by a statement

A Large Bridge  
on the  
Alaskan Railway

that the railroad is estimated to cost 50 million dollars. In view of the meager traffic which it must expect through a long period of development, the question naturally arises as to the possibility of using a pile trestle or other short span structure to cross the Susitna river, a stream with relatively shallow water, but the annual recurrence of terrific ice floes positively precluded the consideration of anything other than a clear span over the entire main river channel. Hence the expenditure of over one million dollars for this one crossing. To the engineer this project is of interest because of the problem introduced by the extreme low temperature at which it was necessary to prosecute the work. The slow setting and curing of concrete under these conditions introduced one element of anxiety, and with a view to the elimination of all other sources of uncertainty in the quality of the concrete, more than the usual pains were taken to obtain the quality of workmanship and material which under normal conditions would insure a very high quality of concrete. As an illustration it was necessary to haul the sand and gravel a distance of 200 miles to obtain the quality desired. While this work was carried on under what are obviously abnormal conditions, the precautions taken may well be carefully considered inasmuch as they serve as an object lesson in the practical

application of the results of recent scientific studies of the quality of concrete.

As the retailer in the merchandising field has been the last to reduce his prices, so has the restaurant proprietor generally

Make Reduced  
Living Costs  
Real

been even slower in lowering the prices of the food he serves to conform with the decreased cost to him of groceries, meat and vegetables. Such a condition is particularly noticeable in eating houses and lunch rooms at outlying railroad yards where there is no competition. It is difficult to persuade a man who is forced to eat most of his meals at such places that there has been any appreciable reduction in the cost of living. The only restaurants accessible to railroad employees at many yards and terminals have often provided food of indifferent quality and now some of them are overcharging. Many of these restaurants occupy railroad premises and are otherwise obligated to the railways for special concessions. Where such conditions exist direct pressure might well be brought to bear to prevent further violation of the railways' hospitality by the restaurant proprietors in dealing unfairly with its employees. Some of these houses, of course, are not in any way obligated to the railways but even in such cases a hint that the company might open its own restaurant or assist a competitor in doing so by leasing space or an old building to him at a nominal rental might prove effective. Other remedies may suggest themselves in various localities, but in any event some effort should be put forth to end this unfair dealing which is undeniably a source of considerable discontent.

It has been well said that "the heart of the roundhouse is the turn-table" and there is room for improvement in the heart action of many present day terminals. Strength is the first essential in turn-tables and advantage should be taken of the present opportunity to reinforce them, making sure that they are amply strong to support modern, heavy locomotives. Second only in importance to strength is the need for adequate, reliable power for turning the tables. In many cases replacing a small, inefficient turn-table tractor by a new unit, large enough to carry the load, will save subsequent expense in calling out inspectors, repairmen and hostlers to push the turn-table around by hand. Careful attention to proper balancing, lubrication, sanding and means for the removal of snow in localities subject to severe winter weather, will also prove time well spent and reduce future delays. There is a possibility of improvement in many roundhouses, so arranged that the opposite tracks do not line up. This condition reduces the flexibility of locomotive movement and necessitates uncoupling tenders with resultant expense and loss of time. The design of a new terminal development

Turn-tables  
and Track  
Lay-outs

offers a fine opportunity for the study and proper location of coaling stations, ash-pits and water cranes in order that locomotives may be handled through the terminal in a direct line and with the least possible delay and back movement. Many present terminals, however, can be improved by minor alterations in track lay-outs. For example, the busiest terminal of an important railroad was greatly benefited by moving 75 ft. of track, thus making the turn-table accessible from both ends of the ash-pit. This obviated making all movements on and off the same end of the ash-pit and resulted in saving a large number of locomotive hours. In this particular case the replacing of an obsolete turn-table tractor and the later installation of a 100-ft. turntable was responsible for an important increase in terminal efficiency. Another condition to be guarded against occurs in track layouts where movements to and from the yard are made over a single switch point. The derailment of equipment at or near this point may cause serious delay and an emergency outlet should be provided. This can be accomplished at a comparatively small expense and may prevent tying up the entire terminal for several hours when its services are most needed.

The need for a generally higher standard of freight car maintenance has frequently been commented on in these columns. Not only would the ultimate

#### Loss and Damage from Defective Cars

cost of maintenance be reduced, but better and more economical service would be rendered if cars were maintained at the highest instead of at the lowest practicable standard. The effects of bad car condition on the character of the service rendered is clearly evident in the classified summary of freight loss and damage expenditures issued by the Freight Claim Division of the American Railway Association. For the month of March, 1921, the latest report available, 223 carriers report a total expenditure for loss and damage of \$9,580,536 of which \$946,290, or 9.9 per cent, is directly attributable to defective or unfit equipment. Next to rough handling and delays, this is the cause of the largest expenditure of any of the other directly assignable causes. But the most striking evidence of the effect of poor car condition will be seen in the carload shipments of grain, flour and other mill products, and of coal and coke. Of a total expenditure for loss and damage to grain shipments of \$549,488, \$287,940 is directly attributable to defective or unfit equipment. Of a total expenditure of \$326,767 for loss and damage to flour and other mill products, \$147,800 is attributable to the same cause. Combined, the loss and damage payments for these two groups of commodities, both of which require box cars, amount to over \$874,000 for the month of March, of which practically \$436,000, or slightly less than 50 per cent, is chargeable to the condition of the equipment. Expenditures amounting to \$403,488 were made in payment of loss and damage claims to carload shipments of coal and coke. Of this amount \$187,508, or over 46 per cent, was attributable to the condition of the equipment, largely open top cars. A total expenditure for loss and damage to all commodities caused by defective or unfit equipment running at an annual rate of nearly \$5 a car for all freight cars of railroad ownership is indicative of an average equipment condition which ought to be improved without delay. When it is taken into consideration that a large part of this loss and damage may be attributed to a comparatively small number of cars the saving in reduced loss and damage alone would go far toward completely justifying the retirement or rehabilitation of these cars, without considering any of the other important factors entering into the problem.

## Danger of Coal Shortage Increases

WISE PEOPLE who know they must buy coal between now and next winter will buy it as soon as practicable. Foolish people who know they will have to buy coal will postpone buying it and probably pay dearly for doing so. There may be no substantial revival of business activity within the next six months. If there is not, possibly there will be no serious coal shortage. If there is any considerable increase of manufacturing and other forms of industrial activity, there will be a coal shortage, and a serious one, unless buying for business and domestic purposes soon increases very largely.

The normal increase in consumption of coal in the United States for a long time has been from 10,000,000 to 20,000,000 tons a year. The year 1914, like the year 1921, was a year of depression. Both being years of depression, the amount of coal required by the country in 1921 should be from 70,000,000 to 140,000,000 tons more than in 1914. Nevertheless, in the first six months of 1921 the amount of coal produced and shipped actually was 9,000,000 tons less than in the same months of 1914, and, in fact, less than in the first six months of any of the last eight years except 1915. It was 30,000,000 tons less in the first six months of 1921 than in 1913, 50,000,000 tons less than in 1916, 77,000,000 tons less than in 1917, 86,000,000 tons less than in 1918 and 62,000,000 tons less than in 1920. At the present rate of output the total production of 1921 would be less than 400,000,000 tons. The last year in which less than this amount of coal was consumed was 1909—twelve years ago.

There is nothing in present conditions to justify the belief that unless the production and transportation of coal speedily increase the country can avoid a coal shortage this fall and winter. As already indicated, if there should be a revival of business activity the shortage would be serious. The Interstate Commerce Commission has become so alarmed regarding the situation that Chairman Clark has made a special appeal to the railways and public utilities to increase their purchase and storage of coal. Many of the railways and public utilities are doing so, but there is a limit to the beneficial effect this will produce. Unless other business concerns and domestic consumers speedily and largely increase their purchases the country will have serious coal troubles this winter.

There is every reason why consumers that can buy and store coal to provide for future needs should do so now. The railways today have a surplus of 163,000 coal cars. In addition, they have over 130,000 coal cars in bad order, many of which could soon be put into service if there was a demand for them. This makes a total of almost 300,000 coal cars for which there is no demand now; but past experience shows that a large increase of coal traffic in the fall and winter would soon wipe out this car surplusage and create a shortage.

It is as certain as any future thing can be that there will be no substantial reductions in freight rates on coal this year. The railroads themselves are paying for coal prices per ton which, according to the latest statistics available, average \$4.40 per ton, or about 180 per cent higher than in 1916. The advances in rates on coal have averaged nowhere near this much, and the railways cannot afford to reduce the rates on coal when they are having to pay such high prices for it. Furthermore, there seems no prospect of any considerable reductions in prices of coal, because the mine operators are still paying the mine workers the highest wages in history and, under their contracts will have to continue to do so until April 1, 1922.

With the prospect of a serious coal shortage looming up, and with no apparent prospect of reductions in prices, it is plain that in their own self-interest business concerns and domestic consumers should begin buying at once the supplies that they will need later. If they do not do so, and later

find that they cannot get the coal they need, they will have nobody to blame but themselves.

All past warnings regarding the increasing danger of coal troubles next fall and winter have been disregarded by the public. It is to be hoped that the warnings now being given will receive more attention.

## Will the Labor Board Enforce the Closed Shop?

THE HEARINGS before the Railroad Labor Board last week regarding the differences which have arisen between the management of the Pennsylvania and the shop crafts' unions involve principles of the utmost importance. One great question involved was whether the individual railway management may negotiate regarding rules and working conditions with its employees, both union and non-union, or must deal with the labor unions exclusively. Another great question involved was whether rules and working conditions are to be so formulated as to reward individual employees regardless of the work they do, and thereby promote inefficiency, or so as to reward individual employees in proportion to the work that they do and thereby stimulate efficiency, in the interest of the employees, the railroad and the public. Another great question involved was whether the Labor Board is to usurp the functions of the management of each individual railroad and its employees in determining rules and working conditions, or to allow this function to be exercised by the individual railroad and its employees.

The provisions of the Transportation Act regarding the settlement of labor controversies are so plain in their letter as to make it very difficult to understand how any serious doubt can be raised as to their spirit and intention. They specifically require all disputes between carriers and their employees "to be considered and, if possible, decided in conference between representatives designated and authorized so to confer by the carriers or the employees, or subordinate officials thereof, directly interested in the dispute." There is not a word to indicate that the carriers must deal exclusively with representatives of the unions.

The labor leaders are trying to get the Board to so interpret the law as to compel each railway management to deal solely with officers of the unions if the unions include a majority of the members of any particular class of employees on the individual railway. Suppose, however, that a union includes 60 per cent of the employees of any particular class, and that the remaining 40 per cent of the employees and one-third of the union employees, making 60 per cent of all, elect representatives to deal with the management. In such a case these representatives will not represent the unions, but they will represent a majority of the employees. Obviously, to try in such a case to force the management to deal solely with representatives of the unions would be to deny it the right to deal with representatives chosen by a majority of its employees, which would be directly contrary to the spirit of the law. The practical effect of forcing each railway to deal only with representatives of the union, if the union happens to include in its membership a majority of the employees of any particular class, would be to force upon the railroads the closed shop for that particular class of employees—a thing plainly not contemplated by the Transportation Act.

Negotiation by a railway solely with the representatives of the unions means, as long as the unions persist in their present policies, either the exclusive application of union principles in fixing rules and working conditions, or the making of all rules and working conditions by the Labor Board.

The application exclusively of union principles means the continuance of the abolition of piece work, of the

payment of large amounts of so-called "wages" for work not done, and, in many cases, excessive payments for work that is done. The shop crafts' unions especially have stood throughout for continuance on every railroad, practically unchanged, of the rules and working conditions provided in the national agreements. That means continuance of the gross waste and inefficiency which have prevailed ever since the national agreement with the shops crafts was made.

Since it is obvious that the railroads never will voluntarily agree to the principles and methods for which the shop crafts' unions stand, recognition by the Labor Board of the principle that the railways must deal solely with the unions, would mean that rules and working conditions on practically every railway must be made by the Labor Board itself. This, however, would mean that the Labor Board would become the manager of all the railways of the United States, in so far as management relates to labor matters; and they are the most important matters to which it does relate. The railways were returned to private operation under the provisions of the Transportation Act for the express purpose of abolishing nationalized and centralized management in all its forms. Therefore, for the Labor Board to constitute itself the manager of all the railroads with respect to labor matters would be to defeat the very intent and purpose of the law which created it.

The untenable position in which the Labor Board now finds itself with respect to the subject of rules and working conditions is due to an almost unbroken series of mistakes it has made in dealing with that subject. The law plainly contemplated that it should not take jurisdiction of any matter whatever until there had been conferences between the carriers and their employees regarding it which had resulted in a controversy that threatened to interrupt transportation. The national agreements made by the Railroad Administration with the employees expressly provided for their own termination when government control should terminate. The railways continued them in effect until September 1, 1920, because the law required that until that date no changes should be made in wages or working conditions which would reduce the compensation of any employee. Both prior and subsequent to that date rules and working conditions were a proper subject for conference and negotiation between the railways and their employees. They were not, properly or legally, a subject for consideration by the Labor Board until after such conferences had been held and controversies had arisen which might result in a substantial interruption of transportation. The Labor Board, however, disregarding the plain language and intent of the law, assumed jurisdiction of rules and working conditions in its decision in the wage case of last summer, and ordered the national agreements continued in effect until it could hold hearings regarding them and reach a decision. Having issued an order in April that they should be abrogated, effective July 1, it issued another order late in June ordering them continued indefinitely.

Meantime, the Pennsylvania and its employees had reached an agreement regarding rules and working conditions for its large Altoona shops, this agreement, however, being reached with the elected representatives of its employees there, and not with representatives of the labor unions. If this agreement had been reached before the Labor Board took jurisdiction of the subject of rules and working conditions it would have been difficult to raise any serious question as to its conformity to the letter and spirit of the law. The Labor Board having, however, taken jurisdiction of the subject of rules and working conditions and made certain rulings, and interpretations of rulings, regarding it, the labor unions now come in and demand that the Labor Board should require the agreement between the Pennsylvania and its employees to be set aside on the ground that it is contrary to the rulings of the Board. But if the Board's rulings in

not in conformity with the law there is no good reason why the railroad should regard them.

Up to the present time the Labor Board has pursued a policy which has seemed to be dictated mainly not by the provisions of the law which created it, but by fear of what the labor unions would do if it rendered any decision which displeased them. The result is that almost a year and a half after the return of the railways to private operation they and the public are still bearing the burden of the iniquitous standardized wages and rules and working conditions which were imposed under government control. The railroads were returned to private operation for the purpose, among others, of relieving them and the public of these things, not of perpetuating them. The Labor Board was created to carry out the purposes of the law, and not to defeat them, but its policy, or want of policy, in dealing with the subject of national agreements has thus far defeated those purposes.

## Government Versus Private Management

WE PUBLISH ELSEWHERE in this issue an article by J. L. Payne analyzing in some detail the operating results of the Canadian government lines and the privately owned and operated Canadian Pacific in the year 1919. We leave the reader to draw his own conclusion from the statistics presented by Mr. Payne, and his comments on them. We call attention to the fact, however, that if from the data presented by Mr. Payne the reader draws the conclusion that the government lines are less efficiently operated than the Canadian Pacific, this does not necessarily reflect upon the energy or ability of the official personnel of the government lines.

The railways of the United States were operated under government control mainly by the same men who operated them under private management in 1917, and who are operating them under private management now. The results obtained by these men under private and government control have been, however, widely different. This difference in results has been due almost entirely to differences in the principles that had to be applied, and the methods that had to be used, under government management, on the one hand, and private management, on the other.

There are many things the officers of a railway system which is privately owned and managed can and will do, that the officers of a railway system that is government owned and managed cannot and will not do, because government and private management necessarily are subjected to different influences.

For example, the officers of a government railway system cannot, as a practical matter, meet a reduction of traffic with the same large reductions in the number of men employed, and in other expenditures, as the officers of a private railway system can. The business of the railways of the United States declined under government operation following the armistice almost as much as it did under private operation in the latter part of 1920 and early part of 1921. Under government operation, however, the reduction made in the number of employees was comparatively small, while under private operation, between August, 1920, and March, 1921, the number of employees of the railways of the United States was reduced 605,000, or almost 30 per cent.

The successful operation of a railway system demands the application of the same principles and methods that are used in the successful management of any other kind of business, and neither in Canada, the United States, nor any other country—especially in one having a democratic government—can accepted business methods be used to the fullest extent in the operation of a government railway. They may be used

to a greater or less degree, depending on circumstances, and the present management of the government railways of Canada undoubtedly has used them to as great an extent as the conditions would permit. But government operation by its very nature necessarily is subjected to influences and motives which do not originate with the management, and which necessarily have an important effect on the operating results.

## Labor Cannot Eat Its Cake and Have It

THE DRASTIC MEASURES the railroads have been forced to adopt to avoid financial disaster are illustrated by the fact that 604,756 railway employees were contributed to the army of unemployed between August, 1920, and March, 1921. The establishment of new records in August, 1920, for the amount of transportation service rendered entailed the employment of 2,197,824 persons, according to the statistics of the Interstate Commerce Commission. Decreased traffic and excessive operating expenses, with a consequent low net return, despite higher freight and passenger rates, compelled the railroads to reduce the total number of their employees during the succeeding seven months to 1,593,068, a decrease of 27.5 per cent. Despite these drastic reductions, receivership was still "just around the corner" for many carriers.

Comparisons of the number of employees of various classes in August, 1920, and in March, 1921, bring to light interesting facts and indicate to some extent the causes and effects of this curtailment. The heaviest cuts were made in the maintenance of way and maintenance of equipment departments. Almost half—49.1 per cent—of the 456,179 foremen, masons, bricklayers, structural iron workers, section men and employees in construction gangs and on work trains were laid off in this seven-month period. Approximately 191,900 section men, or 52.5 per cent of the number in service in August, 1920, were not included in the March, 1921, pay roll. Almost 71 per cent of the men in construction gangs and on work trains were cut from the pay roll. Of the 1,274 masons and bricklayers employed in August, 1920, only 45.3 per cent, or 577, were employed in March, 1921. Similarly, the number of structural iron workers decreased from 900 in August, 1920, to 556 in March, 1921, a reduction of 38.3 per cent.

In the maintenance of equipment department the August, 1920, pay roll included 347,628 machinists, boilermakers, blacksmiths, carpenters, painters, upholsterers, electricians, air brake men, car inspectors, car repairers and other skilled laborers. The March, 1921, pay roll included but 239,446 employees of these various classes, a decrease of approximately 31.1 per cent.

Comparable reductions, of course, could not be made in freight, passenger, yard, terminal and station service because of the necessity for continuous operation regardless of financial difficulties. In freight train service, the number of engineers, firemen, conductors, brakemen and flagmen was reduced from 169,983 in August, 1920, to 135,534 in March, 1921, or 20.3 per cent. Employees in similar capacities in passenger service were reduced from a total of 59,965 in August to 57,159 in March, or 4.7 per cent. Employees in station, yard and terminal services, such as those classed as yardmasters, yardmasters' assistants, engineers, firemen, conductors, brakemen, switch tenders, other yard employees, hostlers, enginehouse men and station service employees, numbered 364,093 in August. In March they numbered 281,884, a decrease of 82,173, or 22.6 per cent.

The reduction in clerks during this period was comparatively small because of the great amount of necessary accounting and statistical work. Of the 261,211 clerks

employed in August, 33,830, or 13 per cent, had been laid off by March.

While this large reduction of employees undoubtedly was partly due to seasonal causes and much more largely to the slump in traffic, it is unquestionably true that many of the railway employees who are not now in service owe their unemployment to the policy followed by their union leaders. These leaders must have known that the carriers' excessive operating expenses would have to be reduced. They knew, too, that the cost of living was declining and that labor in outside industries was contributing towards necessary business readjustment by accepting lower wages. They knew that readjustment of the railway pay roll was inevitable. Nevertheless, they resisted every effort to bring operating expenses, of which the pay roll constitutes about 65 per cent, into a proper relation with operating revenues through reductions in basic wages and reform of rules and working conditions. The result was that the carriers were compelled to make reductions in forces so large that they were not good for either the railroads, the employees, or the public.

For example, in August, 1920, the percentage of un-serviceable freight cars was 7.1 per cent; in March it was 11.1 per cent; the increase being mainly due to the fact that railroad shop forces had to be reduced 31.1 per cent to save many railroads from ruin. Railroad labor's representatives blocked every other avenue of relief. Again, there is still a large amount of deferred maintenance of way work which was left over from federal control. The exceptionally mild winter and spring would have enabled the railroads to

## Northern Pacific

THE FACT that the directors of the Northern Pacific voted two weeks ago to declare the regular quarterly dividend of 1 3/4 per cent, despite the business depression and the low earnings of the railways, is a clear indication of the essential financial strength of the company. Its financial standing was also emphasized by the success of the Hill lines in floating the recent issue of bonds to refund the Burlington joint 4's.

The Northern Pacific was very hard hit by the increase of operating expenses which characterized the period of the war. Up to the present it has not been able to reduce this level of expenses materially, combined with which it is suffering severely from the depression which has been especially acute in the Pacific Northwest. The road's standard return was set at \$30,057,760. In 1918, despite the fact that it handled the largest business in its history, it did not earn its standard return, the net railway operating income for the year being \$28,209,373. In 1919, the net railway operating income was \$18,379,363; in 1920 but \$8,636,686. In the first four months of 1921, which is as far as the figures are at present available, the operations of the road resulted in a deficit of \$818,315 as compared with a net railway operating income in the first four months of 1920 of \$5,159,326.

Referring now to the corporate income, including the standard return while the railroad was under federal control and the guaranty for the six months from March 1 to August 31, 1920, it will be noted that the income available for

The Northern Pacific

accomplish much towards putting the physical properties in shape, but the refusal of the labor leaders to act in the best interests of all their clientele made it necessary to reduce the maintenance of way forces by almost one-half.

There should be a lesson in these unfortunate developments for both labor leader and employee. Some of the men who were laid off during this seven months' period are again in service; many more will be, as operating revenues and expenses approach a proper relationship. Then it will be interesting to find how many have learned by experience that they "cannot eat their cake and have it"—that they cannot force the railways to pay excessive amounts to individual employees without at the same time forcing them unduly to reduce the number of men employed. The surest and shortest road to extensive unemployment in the railroad and in every other industry is successful insistence by the labor unions upon wages and working conditions which impose upon the industry a burden greater than it is able to carry.

dividends in 1920 was \$19,094,183. In 1919 it was \$22,836,737. The dividend appropriations in both years totaled \$17,360,000.

The story of the Northern Pacific's operating results over the past few years is the same story that has been referred to so many times in these columns; namely, that there was a considerable increase in total operating revenues, a still greater increase in total operating expenses and the resulting decline in net. The annual report of the road brings out these facts clearly and they are also shown in the form of tables in this review. Table I is a resumé of the earnings, expenses, traffic handled, etc. It will be noted that in 1916 the total freight revenue was \$59,543,090, the total operating revenue \$80,281,343, and the net operating revenue \$37,049,065. In 1920 the freight revenue had increased to \$81,090,390 and the total operating revenues to \$113,084,408. The operating expenses, however, had increased to \$100,983,874 and the net had decreased to one-third of what it was in 1916 and was \$12,100,534. The progressive

crease in the operating ratio from 53.85 in 1916 to 89.30 in 1920 is especially noticeable.

The Northern Pacific's busiest year was in 1918, when it carried 24,150,782 revenue tons of freight. The total ton-miles were 9,589,272,892. Further than that, in 1918 the railroad secured an average haul of 397 miles. The amount of freight presented for transportation enabled it to haul an average train load of 737 tons and to secure an average car load of 25.4. In 1920 its average haul was but 334.9 miles; its average train load was 659.66 and the average car load but 24.2. The increase in operating expenses was due mainly to increased wages and the figures are given in such striking fashion that it would not be proper to omit them. They are as follows:

Total payroll for year ending June 30, 1915.....	\$24,486,852
Total payroll for year ending December 31, 1916.....	28,204,669
Total payroll for year ending December 31, 1917.....	35,877,879
Total payroll for year ending December 31, 1918.....	49,632,127
Total payroll for year ending December 31, 1919.....	52,605,396
Total payroll for year ending December 31, 1920.....	66,503,794

From 1916 to 1920 there was an increase of nearly 50 per cent in the cost of locomotive fuel. The average cost per ton in 1916 was \$2.57. In 1920 it was \$4.67. The fact is further developed that during 1920 the road was unable to secure sufficient quantities of eastern coal. Eastern coal brought the highest prices ever paid, ranging from \$8 to \$39 per ton delivered on the docks at the head of the lakes. During the year locomotives were supplied with a considerable quantity of Illinois coal. The figures relating to fuel are given as follows:

Year ended December 31	Coal used by locomotives tons	Average cost per ton	Total cost
1916	2,520,215	\$2.566	\$6,466,872
1917	2,745,034	3.030	8,317,453
1918	2,718,558	3.884	10,570,841
1919	2,604,428	4.1008	10,689,223
1920	2,625,493	4.6740	12,271,554

Another noteworthy handicap with which the Northern Pacific has to contend is that of increasing taxes. The taxes paid in 1920 totaled \$10,108,868 as compared with \$6,910,728 in 1917, an increase of 46 per cent. The increase was made up entirely of state taxes.

The foregoing does not have quite that optimistic sound which might be wished. It merely shows, however, that the Northern Pacific, while a fine property, has been subjected more severely than most roads to the unfavorable influences from which all have suffered within recent years. The Northern Pacific is fortunate in being able, because of its efficient management, to have put itself in a financial position so that it can continue its dividends in a time of stress such as the present.

Furthermore, the year 1920 for the Northern Pacific did show marked progress. During that year the road placed

the total tractive effort 49,094,650, and the average tractive effort 34,918. Of the locomotives in service at the end of 1919, 509, or 36 per cent, had superheaters; at the end of 1920, 600, or 41.49 per cent, had superheaters.

The Northern Pacific is at present confronted with the lack of traffic resulting from the depression, which, as above noted, has been particularly severe in the Northwest. The Northern Pacific is a large carrier of lumber. A story is told of a prominent Pacific coast lumber man who recently came east for the purpose, he said, "of getting out of the gloom." His remark is a bit facetious, it is true, but it emphasizes the nature of the conditions on the Pacific Coast. This and other factors which are corollary to a depression in a territory so widely extended as that served by the Northern Pacific, are further indicated by the fact that in the first four months of 1920 the road's freight revenues were but \$17,867,644 as compared with \$24,540,702 in the first four months of 1920. Like most railways, its great needs are an increase of its traffic, and a reduction of its labor, material and fuel costs.

The figures for operation in 1920 as compared with 1919 are as follows:

	1920	1919
Mileage operated.....	\$6,653	\$6,592
Freight revenue.....	81,090,390	72,934,723
Passenger revenue.....	21,143,708	20,331,317
Total operating revenue.....	113,084,408	100,739,354
Maintenance of way expenses.....	21,012,798	16,223,655
Maintenance of equipment.....	25,593,923	19,809,119
Traffic expenses.....	1,142,318	765,310
Transportation expenses.....	48,439,001	38,274,463
General.....	3,148,012	2,537,657
Total operating expenses.....	100,983,874	78,672,509
Net from railway operations.....	12,100,534	22,066,845
Taxes.....	10,108,686	9,000,737
Operating income.....	1,973,378	13,042,167

The corporate income account is as follows:

Gross income.....	32,390,893	35,644,402
Interest on funded debt.....	12,134,442	12,117,483
Net deductions from gross income.....	13,996,709	12,807,665
Net income.....	19,094,183	22,836,737
Dividends.....	17,360,000	17,360,000
Income balance.....	1,734,183	5,476,737

## New York Central

AMONG THE MULTITUDE of questions that received more than ordinary attention during the war, one that resulted in no inconsiderable discussion among transportation men was the importance of the port of New York. That port, being the country's largest port, and with one exception the port nearest the scene of the conflict in Europe, was the key to the export and supply situation. As a result it was congested and even with its enormous facilities proved at times unable to handle to best advantage the great stores of war supplies which were loaded on ships at its many miles of docks. For a time there was an agitation, if such it might

TABLE 1—NORTHERN PACIFIC OPERATING RESULTS

Year	Freight revenue	Total operating revenues	Operating expenses	Net operating revenue	Operating ratio	Revenue tons	Revenue ton miles	Average haul	Revenue train load	Rev. car load
1920	\$81,090,390	\$113,084,408	\$100,983,874	\$12,100,534	89.30	23,444,182	7,832,847,753	334.90	659.66	24.2
1919	72,934,723	100,739,354	78,672,509	22,066,845	78.10	21,389,131	7,589,036,420	354.81	660.85	24
1918	78,534,344	102,908,259	71,516,302	31,391,957	69.62	24,150,782	9,589,272,892	397.06	737.14	25.40
1917	65,258,995	88,225,726	53,297,861	34,927,865	60.41	22,842,151	8,812,675,163	385.81	662.42	23.17
1916	59,543,090	80,281,343	43,232,278	37,049,065	53.85	21,892,980	7,731,585,793	352.63	636.72	21.21
1912-13	52,270,686	72,676,139	44,673,298	28,002,841	...	21,285,527	6,232,168,637	292.8	541.62	19.74

orders for 20 Pacific, 25 Mikado, 20 Eight-wheel switching and six heavy Mallet locomotives, the purchase of which, together with that of certain freight cars and various expenditures for additions and betterments to way and structures was financed with the assistance of a loan of \$6,000,000 from the government's revolving fund. The six Mallet and four switching locomotives had not been delivered up to the end of the year. On December 31, the road owned 1,446 locomotives, the total tractive effort being 52,136,870 and the average tractive effort per locomotive, 36,056 lb. At the end of 1919 the number of locomotives was 1,406,

be called, which aimed to convince shippers that New York was not the only port on the Atlantic seaboard. The port of New York, nevertheless, finally managed to solve its several problems; it continues to be America's leading seaport and is expanding its facilities at present in greater degree than is the case at most of its competitor ports. The agitation to induce shippers to use other ports has in a large measure ceased. The other export centers have their functions and will continue to derive compensating advantages therefrom. New York will continue to be the real Atlantic seaboard shipping center and will continue to retain the advantages

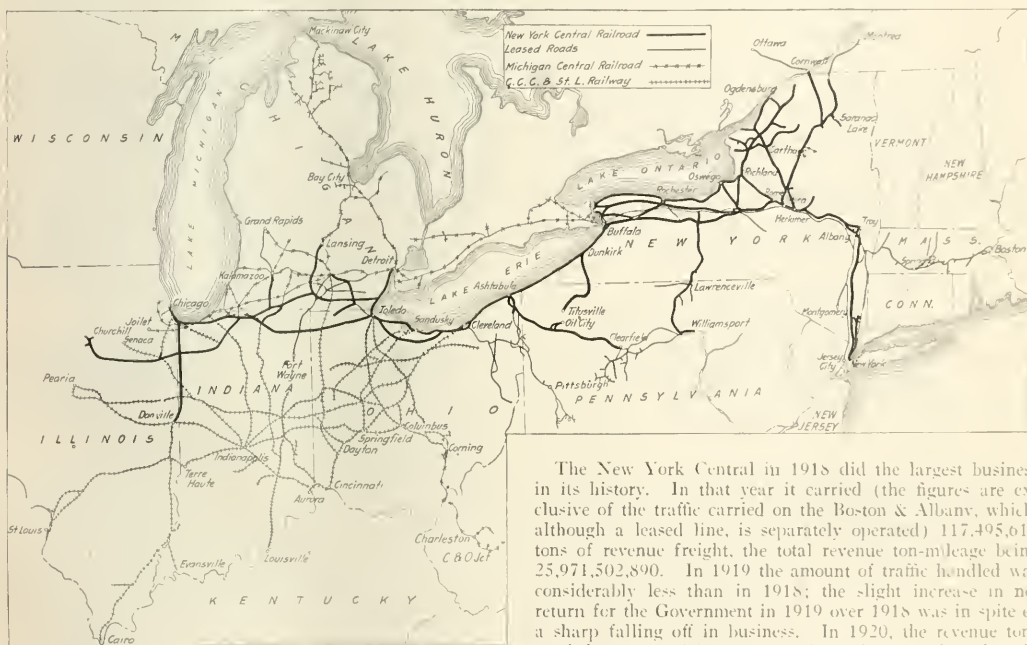

due to its great facilities and to the fact that as predominantly the largest port, it has the greatest number of ships and therefore the greatest amount of available cargo space.

Because of its being one of the more important of the lines serving New York and because of its strategic position and operating capacity in general, the New York Central was called upon during the war and the federal control period to serve in a measure as the backbone of the transportation lines in the eastern district. This statement is made with all due respect to the other lines serving the Atlantic seaboard, some of which, notably the Lackawanna, rendered a service, differing from that rendered by the New York Central in amount rather than in character. The New York Central was, because of the situation, called upon to do almost the impossible. The development of its plant and more especially the progressive policy evidenced in its large purchases of equipment just prior to the federal control period, enabled it to come through the difficult period in quite creditable shape.

The impression should not be secured, however, that the New York Central has not suffered from the handicaps resulting from the high wage scales, the national agreements

a net railway operating income, as reported in the December monthly statement to the Interstate Commerce Commission, of but \$3,557,579. The road, in short, was able to meet in fair measure the high costs of operation characteristic of the federal control period; it was not able to meet similarly the high wage scales embodied in Decision No. 2 of the Railroad Labor Board, nor the other conditions of the railway situation evidenced in general in 1920.

As far as the present is concerned, the New York Central is not now doing as much business as it did in the early part of 1920. Even with this smaller traffic it is, however, because of the increased rates, succeeding in keeping its gross ahead of last year's. In the first four months of 1920 its gross earnings have been \$63,321,465 as compared with \$60,978,831 in the first four months of 1920. Its net railway operating income for the first four months of 1921 was \$7,087,063 as compared with \$5,928,833 in the same period of 1920. The New York Central should succeed in coming through 1921 in much better shape from the standpoint of net earnings than it did in 1920, but it is not yet apparent that it will succeed in reaching for the year the net which it earned for the Government during the federal control period.

The New York Central System

and in general the high costs of operation characteristic of the federal control period and of the year 1920. The New York Central had a standard return for the period of federal control of \$55,802,631, although in 1918 this was increased to \$56,324,508 and in 1919 to \$57,690,588 through additional compensation on account of completed additions and betterments. In 1918 the net railway operating income was \$48,410,217; in 1919, it was \$49,704,631, which figures, although they did not equal the standard return, were not so unfavorable as compared with those of the majority of the roads.

In 1920, however, including the two months of federal control, the six months of the guaranty period and four months of operation on its own, the New York Central had

The New York Central in 1918 did the largest business in its history. In that year it carried (the figures are exclusive of the traffic carried on the Boston & Albany, which, although a leased line, is separately operated) 117,495,612 tons of revenue freight, the total revenue ton-mileage being 25,971,502,890. In 1919 the amount of traffic handled was considerably less than in 1918; the slight increase in net return for the Government in 1919 over 1918 was in spite of a sharp falling off in business. In 1920, the revenue tons carried were 110,753,433, some 7,000,000 tons less than in 1918. The revenue ton-mileage was 24,548,839,472. The average haul in 1920 was 200 miles.

The New York Central has creditable statistics of operating efficiency. In 1920 it had an average revenue trainload of no less than 895. Its average carload was 28.45 tons. Its daily car movement was 23 and its net ton-miles duty per car were 432. The New York Central carries a considerable tonnage of coal, bituminous coal in 1920 making up 36,616,030 tons and anthracite 8,583,211 tons of a total revenue tonnage of 110,753,433. This should assist it in securing a heavy trainload, but in view of the great amount of fast freight and merchandise traffic, the average of 895 mentioned above seems especially noteworthy.

It is hardly necessary to show the reasons for the sharp decline in net earnings in 1920 which took place in spite of the heavy traffic carried in that year. However, the following

ing facts quoted from the annual report for 1920 may be of interest:

The abolition of piece work in the shops of the company has cost millions of dollars. Under the piece work system and other shop conditions existing in 1915, 2,799 men turned out 73,072,000 effective miles of equipment. In 1920, piece work having been abolished and classification and working conditions of employees having been changed and employees being restricted to one kind of work for each class of employment, practically the same effective miles of equipment were turned out, namely 74,655,000, but 4,521 men were required. The cost of the work in 1915 was \$2,903,700 and \$8,352,000 in 1920, an increase of \$5,448,300. This is to say, there was an increase in men of 61.5 per cent, an increase in money of 187 per cent and an increase in effective mileage output of but 2 per cent.

The increase in payrolls since 1917 for the New York Central, excluding those of the Boston & Albany Railroad, is indicated by the following:

Date	Number	Monthly payroll	Average monthly pay per employee
December 31, 1917.....	94,386	\$8,409,722	\$89.10
February 29, 1920.....	103,572	13,511,978	130.45
December 31, 1920.....	96,418	15,892,121	164.83

The total amount of payroll charged to operating expense in 1917 was \$83,053,280, while for 1920 it was \$177,289,640. The entire operating expenses in 1917 were \$153,597,903, or \$23,691,734 less than the 1920 payroll included in operating expense.

Mention was made above of the progressive policy which the New York Central has followed in recent years in the matter of purchase of equipment. The large purchases made prior to federal control were one of the most important features in enabling the New York Central to meet the great demands upon it late in 1917, in 1918 and again in 1920. The company apparently intends to be similarly prepared for future eventualities. In 1920 it placed orders for no less than 196 locomotives, 265 passenger cars and 9,244 freight cars, of which about one-third was received before the close of the year. The total cost of this equipment was about \$48,318,300, one-quarter of which was financed through a loan from the government's revolving fund. The New York Central itself took 95 locomotives, 160 passenger cars and 4,194 freight cars, the remainder being sublet to the following affiliated companies: Michigan Central, Big Four, Pittsburgh & Lake Erie and Toledo & Ohio Central. Notes were given by these companies to cover the equipment assigned to them.

The New York Central's total borrowings from the revolving fund were \$26,775,000 in two loans, one of which, totaling \$14,850,000, covered equipment and the other, \$11,925,000, covered additions and betterments to way and structures. Of the former loan, the New York Central itself received \$6,976,000 and of the latter \$5,500,000; the remainder going to various of the other companies in the New York Central system, each of which gave notes to the parent company covering the amounts which they received.

The New York Central is also carrying out various other improvements to its properties other than those represented in the acquirement of new equipment. These projects include engine terminal improvements; extension of the car repair shops at East Buffalo, N. Y.; work in connection with the New York State Barge Canal, notably in 1920 at Tonawanda, N. Y.; a new line and traffic connection with the Toronto, Hamilton & Buffalo and Canadian Pacific at the Niagara frontier; the new proposed passenger terminal at Cleveland, etc. Another project that should prove of special importance to the road is now being carried out by the Cunard Line on land leased from the New York Central at Weehawken, N. J. The project calls for eight large steamship piers and accompanying facilities and represents one of the largest port developments now under way in the country. The net increase in property investments in 1920, which is another indication of the amount of work done, was \$11,422,-

340, of which \$3,349,574 represented equipment received less that retired during the year.

The New York Central's corporate income account for 1920 showed a surplus after the payment of the 5 per cent dividends amounting to \$1,250,256 as compared with \$7,433,063 in 1919. This reduction was due primarily to a decrease of \$8,246,181 in return from railroad operations and to an increase of \$1,509,689 in interest on funded debt. Rent for leased roads showed an increase of \$1,077,449 and interest on unfunded debt, \$788,603. This matter of increase in interest on funded debt is of rather serious importance to the New York Central, particularly inasmuch as it represents interest on expenditures which must be made if the property is to continue to be able to meet the heavy demands upon it for the efficient movement of traffic.

The funded debt as of December 31, 1919, was \$671,654,782; on December 31, 1920, this had been increased to \$748,354,477. The increases during the year included the \$25,000,000 ten-year collateral trust bonds sold about a year ago; equipment trust notes totaling \$13,674,000, covering the standard equipment allocated by the Railroad Administration; \$17,297,510 equipment trust notes covering that part of the 1920 equipment purchases not delivered to affiliated lines; and two items of notes, \$11,925,000 and \$14,850,000, given the secretary of the treasury and covering the two loans from the revolving fund (something over half the value of these notes is balanced by notes given the New York Central by the affiliated companies, covering the advances made to them). The interest charges on this increased indebtedness will no doubt prove something of a burden in the future. How much of a burden will depend upon the amount of progress that is made in working out the solution of the railroad problem.

The New York Central is an efficiently operated property; it would appear to be fully able to realize on any improvement in the general situation, and that such improvement is to occur now seems quite certain.

The operating results in 1920 as compared with 1919 follow:

	1920	1919
Mileage operated.....		
Freight revenue.....	\$209,792,208	\$173,926,744
Passenger revenue.....	84,601,640	75,652,262
Total operating revenue.....	338,624,456	283,659,331
Maintenance of way expenses.....	47,865,568	34,591,703
Maintenance of equipment.....	93,287,339	62,196,767
Traffic expenses.....	3,464,274	2,510,703
Transportation expenses.....	159,203,006	114,767,234
General expenses.....	8,928,625	7,516,781
Total operating expenses.....	317,553,242	225,675,360
Net revenue from operation.....	21,071,214	57,983,971

The corporate income account is as follows:

	1920	1919
Compensation—January and February.....	\$9,300,435	.....
Additional compensation account completed additions and betterments.....	237,569	.....
U. S. Government guaranty—March 1 to August 31	28,699,177	.....
Net railway operating income—September 1 to December 31.....	11,537,943	.....
Total (compared with compensation accrued in 1919).....	49,444,407	\$57,690,588
Total other income.....	13,459,803	13,619,366
Gross income.....	65,109,739	71,308,955
Interest on funded debt.....	30,736,911	29,227,222
Total deductions from gross income.....	50,263,819	48,194,885
Net corporate income.....	13,734,688	19,917,251
Dividends (5 per cent each year).....	12,479,613	12,479,611
Surplus for the year.....	1,250,256	7,433,063

LIVE-STOCK DEALERS of western Canada, contending that the live-stock industry is almost completely ruined through high freight rates, have asked the Board of Railway Commissioners for a 50 per cent reduction in rates on cattle. Scarcely any cattle are now moving in Canada, and the dealers fear that cattle will remain in the country instead of being placed on the railways unless rates are made cheaper.

The Susitna Bridge on May 14, One Day Before an Ice Run.

# Great Alaskan Bridge Built During Coldest Weather

Government Railway Structure Over Susitna River Provided  
With 504-ft. Span to Clear Ice Jams

THE largest railroad bridge in Alaska, in point of size of main span, was built last winter by the Alaskan Engineering Commission, where the government railroad crosses the Susitna river near Gold Creek. This bridge, which was completed in February, 1921, is on the main line 264 miles north of Seward, the southern terminus of the new railroad, and 150 miles north of Anchorage, the ocean port at the head of Cook Inlet. It consists of a south approach of twenty-eight 14-ft. trestle spans, one 70-ft. pony span and one 121-ft. through Howe truss spans; a 504-ft. steel through

breaks the dams. The accumulated water and ice then rush out at a high velocity and the force of this run would no doubt take out any timber piers in its way, while a concrete pier would not only be exposed to the tremendous pressure of the ice jam but also to under-mining created by the underwater scour that would result from the creation of an ice dam against the pier. A comparative estimate for the structure over the main channel to consist of two 250 ft. steel spans on three concrete piers, including a pier near the center of the channel, against a 504 ft. steel span on two concrete shore

Diagram of Susitna Bridge and Stream Profile

truss span of the Pennsylvania type over the main channel; and a north approach of one 121-ft. through Howe truss span, one 70-ft. pony truss span and two 14-ft. trestle spans, giving a total length end to end of timber stringers of 1,322 ft.

## Ice Jams Call for Clear Span Over Main Channel

The design of this structure first involved a study of the action of the river under summer and winter conditions. Observations of high water marks and ice scars on trees along the shore supplied the required information as to the highest elevation reached by the ice while in movement. The spring break-up usually occurs before the ice has become soft and in passing down stream massive pieces jam against islands and bars and against the shore at points where the river takes a sharp turn, back of which the water rises until the pressure

piers slightly favored the long span. The latter alternative was therefore adopted.

The combination of timber and steel trusses in the same bridge may appear peculiar, but it is believed that this design was justified by the following conditions: Due to the high price of bridge steel and concrete work at the time of construction, it was much cheaper to build all approach spans out of timber, making provision for possible renewal with steel and concrete at some later date after the life of the timber had been exhausted. The main piers were designed to support adjacent 200 ft. spans at some future time, each to replace one 70 ft. pony truss and one 121 ft. Howe truss as now built.

The trestle was designed for Cooper's E-44 loading, the timber spans for E-50 loading and the 504 ft. steel span for

E-60 loading. American Railway Engineering Association specifications of 1910 were followed in the design of the 504-ft. steel span except in the matter of wind loads. Trusses and bottom laterals were designed for 40 lb. per sq. ft., considered as being applied on the surfaces presented by the train and floor as seen in elevation and by  $1\frac{1}{2}$  times the area of the members of the windward truss together with 500 lb. per lin. ft. of span for the floor and top laterals.

#### Pier Construction Begun 22 Miles Ahead of Track

Pier construction was begun in May, 1920, when the end of track was 22 miles south of the bridge site, supplies being freighted by sleds until the river broke and thereafter by boats and wagons. The transportation difficulties were overcome to a large extent in the middle of September, 1920, when track was laid up to the site. At this time excavation for the south pier was complete and that for the north pier begun. A temporary trestle had been driven across the river 100 ft. downstream and parallel to the axis of the bridge to permit track-laying to proceed and to facilitate the erection of the bridge without interference with traffic and other construction work along the line extending to the north. The piling for the south approach, consisting of trestle bents, pile-piers and an abutment for the timber spans had been driven and the falsework for the steel span had been started from the north end, before the arrival of the track. To determine the character of the foundation for the concrete piers, test holes had been bored the previous winter to a depth of 60 to 75 ft. below the surface of the ground. The material encountered was compact sand, gravel and large boulders in layers of varying thicknesses, suitable for carrying pier loading without foundation piling.

For the south shore pier excavation Wakefield sheet piling was used and for the north shore pier an open caisson. Excavation was started in the wet with orange-peel buckets operated by two stiff leg derricks until hard compact material was struck, when the holes were pumped out and the work continued with pick and shovel, the laborers filling dump boxes operated by derricks. Excavation extended to an average depth of 25 ft. below the ground surface in each pier foundation. Drain ditches were maintained about one

pits in the vicinity of the bridge was not satisfactory, as samples were found to contain humus. The field test for humus, recommended by the Portland Cement Association, was applied to several deposits available along the railway line and all showed the presence of this element in various amounts except samples from a pit in a glacial moraine in front of Spencer glacier, located 56 miles north of Seward,

The Main Span on November 29, 1920, with the Bottom Chord and Web Members Partially Erected

which tested clear. As the natural aggregate from this pit was deficient in sand, 7 per cent of sand was added. This provided a satisfactory mixture and was used in the substructure.

#### Extraordinary Measures Required in Placing Concrete

When the coffer dam, forming the pier enclosure, was unwatered, the bottom of the enclosure was under a 22-ft. head

To Avoid Ice Jams Was an Important Factor in the Design. This Ice Run Came on May 15 and Was Gone the Next Day

foot deep around the edges and sloped to carry seepage water to a sump at the downstream end of the excavation where one 5-in. and two 8-in. pulsometer pumps operated continuously in the lower levels of the work.

Considerable difficulty was encountered in finding sand and gravel suitable for the concrete piers. The importance of doing so, however, was forcibly brought out by a partial failure in one of the piers during September. It was concluded that this had resulted from inferior aggregate as well as poor cement and inadequate provision to meet the effects of the low air and water temperatures. Aggregate taken from

of water from the Susitna river which, due to the porous nature of the boulder and gravel formation, forced considerable water through the floor of the pit. The enclosure was 33 ft. by 69 ft. and it was found impracticable to partition off, place and hold concrete "in-the-dry" on this floor, the flow of water being too strong to permit of this being done. The temperature of the water, 35 deg. in November, and the large area, 2,277 sq. ft., made it impracticable to place concrete under water by bucket or pipe methods.

The following plan was devised to place the concrete under the circumstances of cold running water and low air tem-

perature: A large sheet of canvas was prepared in one piece, sufficient to cover the bottom area entirely and to extend about six feet up the sides of the enclosure. This canvas was "formed-in" by wooden forms along the sides and ends, to provide a run-way for water around the edges. Steam coils were placed around the sides of the pier enclosure and the entire space was housed in and made warm. Sand and gravel delivered on cars for the concrete work were heated by being dumped on a platform holding perforated steam pipe coils. The aggregate went into the mixture hot and hot water was used in the mixing operations.

The south pier, containing 1,456 cu. yd. of concrete, was poured between October 24 and November 11, 1920, during which time temperature readings at the bridge site ranged from 2 deg. below zero to 48 deg. above. The north pier, containing 1,520 cu. yd., was poured between December 1 and December 18, 1920, when temperatures ranged from 12 deg. below zero to 34 deg. F. above zero. The pier pit was kept unwatered during concreting operations and the concrete

The Main Span on February 6, 1921. Erection Nearly Completed and the Span Still Supported on Falsework

placed from chutes and pipes leading from the mixer to the pier. Concrete was given sufficient time to set before allowing cold water to come in contact with it.

#### Erection of Steel Begun Before Completion of Piers

To hasten the erection of the 504 ft. span it was necessary to proceed without waiting for the completion of the piers. Falsework for this span, as mentioned, had been driven from the north and southward. The north approach trestle, piers and falsework for the timber spans were driven and a temporary deck laid. One of the 70 ft. pony spans was used temporarily to span the excavation for the north pier, thus permitting the construction of this foundation. Erection of steel started on November 8, 1920, from the north end at the second panel point, a yard having been constructed on the north side of the river which was reached by means of the temporary trestle. Erection of steel was continued to the south end and all steel except for two north panels was assembled by December 15, 1920. All steel in these two panels which could be erected without interfering with the temporary 70 ft. pony span over the north pier, was placed after December 25, 1920, and as soon as this temporary span was removed the balance of the steel was placed, completing the erection on January 8, 1921. The American Bridge Company, which did the erecting, used a 100 ton locomotive

crane with a boom extended to a total length of 85 ft. This was supplemented in the yard by a 35 ton locomotive crane with a 50 ft. boom. The total weight of steel in the span is 1,803 tons.

But little riveting was done until after December 20, 1920, when over 90 per cent of the span was in place. Riveting was pushed from then until completion on February 9, 1921, during which time temperatures ranged from minus 42 deg. to plus 34 deg. F. On some cold and windy days the riveters usually did not work but on one occasion rivets were driven when it was minus 42 deg. in the morning and minus 12 deg. at quitting time. Rivets driven during very cold temperatures were retested several times in warmer weather and found to be in first class condition. The total number of field rivets was about 42,200.

The span was swung on February 2, 1921, and the first train passed over on February 6. The work of erecting the timber spans and finishing the trestle progressed simultaneously with the steel work, so that the bridge was entirely completed and ready to be put into service on February 16, 1921.

General supervision of the work was under Col. Frederick Mears, chairman and chief engineer of the Alaskan Engineering Commission, to whom we are indebted for the description presented above. The preliminary design of the 504 ft. steel span as well as design and details of the timber and foundation work were made by W. J. H. Fogelstrom, former bridge engineer, for the Commission, assisted by F. H. Chapin, assistant bridge engineer. The final design and details of the 504 ft. steel span were made by the American Bridge Company, which also fabricated and erected the steel. Modjeski and Angier, consulting engineers, Chicago, were retained to check and approve all designs and detail plans of steel work. Hildreth & Co., Chicago, performed the inspection of steel at the mill and shop.

## Freight Car Loading

WASHINGTON, D. C.

THE NUMBER of cars loading with revenue freight showed another slight decrease during the week ending July 2, according to the weekly report of the Car Service Division of the American Railway Association. The total was 774,808, as compared with 891,621 in the corresponding week of 1920 and 745,226 in 1919.

Comparisons with the report for the preceding week show increases in the number of cars loaded during the week of July 2 with grain and grain products, coal, ore and merchandise and miscellaneous freight, which includes manufactured products, but decreases in livestock, coke and forest products.

Loadings of merchandise and miscellaneous freight totaled 469,842 cars, an increase of 1,735 cars over the preceding week. Grain and grain products increased 1,726 cars over the previous week to a total of 40,547 while 30,335 cars were loaded with ore or 1,414 more than during the week before. There were 157,265 cars loaded with coal during the week. This was an increase of 266 cars over the previous week but, on the other hand, was 35,769 less than were loaded during the corresponding week in 1920. It was, however, 2,331 cars more than were loaded during the corresponding week in 1919.

The greatest decrease was in the number of cars loaded with livestock, the total for the week being 24,932 or 1,000 less than during the week before. Forest products dropped off 1,885 cars to 47,542 while coke totaled 4,334 cars or 100 less than during the week before. Forest products showed a decrease of 203 cars compared with the loadings of the week before.

Except for grain and grain products, decreases were in

ported in the loading of all commodities as compared with the corresponding week last year.

Compared by districts, increases over the week before were reported in the number of cars loaded with revenue freight in the Southern, Northwestern, Central Western and Southwestern, but decreases in the Eastern, Allegheny and Poca-

the total on June 30 being 162,537 compared with 163,982 on June 23. Surplus stock cars numbered 18,170 compared with 20,029 one week before or a reduction of 1,859. These reductions, however, were in part counteracted by an increase of more than 6,200 in the number of surplus cars of miscellaneous classes, due principally to a big increase in the num-

### REVENUE FREIGHT LOADED AND RECEIVED FROM CONNECTIONS

Summary—All Districts, Comparison of Totals This Year, Last Year, Two Years Ago. For Week Ended Saturday, June 23, 1921

June 4	1921	41,394	24,039	142,674	4,642	48,227	28,311	195,246	221,975	706,508	828,907	776,610	480,162	657,709	524,731
May 28	1921	46,337	27,518	165,870	5,605	50,277	28,673	217,707	248,862	790,849	898,169	763,761	519,191	670,536	550,858

hontas regions. All, however, were below the corresponding week in 1920.

The summary for the week of June 25 is given in the table above.

The demand for freight cars continues to increase according to reports received by the Car Service Division of the American Railway Association. For the week ending June

ber of ore cars now being stored on sidings in the northwest. There was also an increase of approximately 200 in the number of surplus coke cars.

THE AVERAGE COST OF FREIGHT TRAIN OPERATION (selected accounts) for April was \$1.876 per freight train mile, according to the monthly bulletin published by the Interstate Commerce Com-

Curve of Net Car Surpluses and Shortages

30 there was an average of 373,791 surplus freight cars or a decrease of 4,059 as compared with the previous week.

The total number of box cars, including ventilated, automobile and furniture cars, in excess of current freight requirements was 146,298, which was a decrease within a week of 6,335. A decrease of 1,445 coal cars was also reported,

mission. This is slightly greater than the average for these selected accounts for April, 1920, \$1.874, but it represents a considerable saving as compared with the average for March, which was \$1.974. The average cost per passenger mile, selected accounts, was \$1.043 as compared with \$.991 in April, 1920, but was also less than the average for March, 1921, which was \$1.077.

# Government and Private Operation in Canada

## An Analysis of Results Obtained on the Two Large Railway Systems in That Country Under State and Company Control

By J. L. Payne

Formerly Comptroller of Statistics, Department of Railways and Canals of Canada

SINCE THE SPECIAL announcement of a deficit of \$70,000,000 on the Canadian National Railways for the fiscal year 1920 there has naturally been a great deal of speculation and inquiry as to the underlying causes. That deficit was, of course, much larger than the figures given out. It omitted a very large volume of fixed charges. The only excuse for this omission was that some of these charges, on the basis of standard accounting, are not definitely known. They are readily ascertainable; but they have not been made up. That was the loose way in which state railway accounting was begun more than half a century ago, and it has never been thought worth while to make a change. There was no demand for the information anyway. Absolute indifference prevailed with respect to the whole matter.

A reversal of public sentiment has taken place within the past three months. The craving for authentic data is general and insistent. Thinking men all over the country are expressing deep concern in the volume of actual loss and the causes which have brought it about. Since the facts with regard to the deficit were presented in recent issues of *Railway Age* there is no intention of repeating them now. It will be sufficient to bear in mind that the fixed charges attaching to \$2,300,000,000 of capital liability, added to the operating shortage, will probably produce a deficit of not less than \$140,000,000 for the current year. It need not be said that, inasmuch as this loss falls wholly on the Dominion treasury, it is a serious matter to a country like Canada, with a population of 9,000,000 and a gross revenue of less than \$500,000,000.

### Judgment by Comparison

If a glance is taken at the map of Canada, it will be seen that three lines of railway run closely parallel to each other from Winnipeg to the Pacific coast. One of these is the Canadian Pacific, the other two form parts of the Canadian National group. As units, the latter are the Canadian Northern and the Grand Trunk Pacific. The eye is scarcely able to follow the parallel through Ontario, Quebec, and the Eastern Provinces; but it nevertheless exists. That will be obvious when a statement of operating mileage by provinces is brought under the eye. The facts from West to East are as follows:

	Canadian National	Canadian Pacific
British Columbia	1,201	1,816
Alberta	1,816	1,901
Saskatchewan	3,371	2,777
Manitoba	2,294	1,728
Ontario	3,120	3,286
Quebec	1,935	1,076
New Brunswick	765	524
Nova Scotia	375	576
	14,877	13,694

One or two explanations are necessary in relation to the foregoing table. It does not include the mileage of the Grand Trunk nor of a number of branch and subsidiary roads. The Prince Edward Island Railway is also omitted. If these were all brought in the mileage of the Canadian National would rise to 22,500. But the Grand Trunk had not been officially taken over by June 30, 1919, which happens, for reasons not creditable to the new Dominion Bureau of Statistics, to be the last year for which information is available on a basis permitting of direct comparisons. The units which will be com-

pared with the Canadian Pacific are the Canadian Northern, the Grand Trunk Pacific, the National Transcontinental and the Intercolonial. They contribute the mileage in the statement. If the omitted mileage and the operating results therefrom were brought in they would merely serve to make matters worse.

It will be observed that these roads have closely corresponding mileages in the various provinces. They tap in about the same measure the great wheat growing areas of the west, and meet on an equal footing in the industrial centres of Ontario and Quebec. They run through the maritime provinces practically side by side. Therefore it would be difficult to find any good ground for objection to the comparisons which will be made. Yet these two systems had operating results far apart in 1919. The Canadian Pacific had a net corporate income of \$36,977,263 and the Canadian National units had a deficit of \$40,650,222. This deficit, in accordance with the reprehensible practice of many years, left out of the reckoning an immense amount of fixed charges.

The object immediately in view is to look carefully at the various aspects of operating results and to see if any reasons for this adverse showing by the Canadian National group can be identified. If, for example, it were proposed to subject the system to searching examination, what tests would be applied by a skilled railway accountant, or a train railway operator, to locate the weak spots? Either of these investigators would certainly probe beneath the surface in a perfectly proper effort to ascertain why in the case of two great railways, operating side by side, one should be strong and prosperous and the other weak and insolvent. Having located the trouble centres, he would next seek to know whether or not the adverse results arising therefrom might have been modified if not wholly prevented.

### Where the Losses Came In

The four units of the Canadian National Railways here under review, and the Canadian Pacific, had the following operating results in 1919:

	Canadian National	Canadian Pacific
Gross earnings	\$93,173,827	\$162,846,470
Operating expenses	104,032,753	130,416,995
Tons hauled	5,754,622	25,894,741
Passengers carried	10,551,151	14,542,882
Earnings per mile	6,263	11,900
Expenses per mile	6,993	9,554
Earnings per train mile	3,010	4,104
Expenses per train mile	3,361	3,907
Operating ratio	111.6	89.1

Certain points of similarity will here be observed in contrast with other points of great dissimilarity. The tonnage of freight was almost identical; yet gross earnings and earnings per mile of line, as well as per train mile, were far apart. In this relation three facts should be candidly stated because they are advantageous to the Canadian Pacific: First, the Canadian Pacific had average ton mile receipts of .963 as compared with .892 by the Canadian National. This was due to the higher proportion of first class freight. Second, the Canadian Pacific had a larger average haul; and third, the Canadian Pacific had a higher traffic density.

With these more or less basic facts in mind, it is now important to apply analytical methods to some of the details which spring therefrom. In the operating ratio we have at

once a strong clue to the field in which weakness or faulty administration is likely to be found, and let it be said at once we shall be rewarded by several rather startling discoveries as we proceed. For this inquiry the years 1917 and 1919 are selected, for good and definite reasons. In the former year the Canadian Northern and Grand Trunk Pacific, representing the great western section of the Canadian National, were in corporate hands. In the latter they had been for a full year and more under government control. That fact at once suggests the pertinent question as to what were the general results of the change. Were betterments brought about? Was administration strengthened or weakened? Let the facts give the answers.

### Excessive Transportation Expenses

Since all the operations of a railway find their focus in the running of trains, the cost of transportation becomes fundamental. In this instance we shall be just to the Canadian National units in comparing them with the Canadian Pacific. We must first, however, find a satisfactory gage. For that purpose ton miles and passenger miles are combined and taken as a standard which will not be questioned. Ton and passenger miles represent not only the full service of railways, but the lowest unit of measurement obtainable. They place the roads in comparison on an absolutely common footing. The cost of transportation per ton mile and passenger mile will get us at once to the very core of operating conditions and, by comparison with a strong road, tell us whether or not there is weakness in that vital center. Here are the facts as to transportation expenses per ton and passenger mile:

	1917	1919
Canadian Northern.....	.321 cent	.634 cent
G. T. Pacific .....	.391 cent	.673 cent
Transcontinental .....	.294 cent	.439 cent
Intercolonial .....	.442 cent	.708 cent

The average for the four units in 1917 was .355, as against .288 for the Canadian Pacific. In 1919 the average was .626 for the Canadian National and .503 for the Canadian Pacific.

The difference between transportation cost per ton and passenger mile on the Intercolonial and Canadian Pacific is very striking. In the case of the Canadian Northern, which is responsible for 52 per cent of the freight tonnage and 60 per cent of gross earnings, there was a distinct worsening of operating conditions. From being 11.5 per cent higher than the Canadian Pacific in 1917 the cost rose to 26.0 per cent higher in 1919.

We get a little nearer to our final answer when our inquiry discloses the fact that while these four units of the Canadian National increased gross earnings in 1919 over 1917 by 24.6 per cent, the Canadian Pacific scored a betterment of but 10.9 per cent during the same period. Thus the Government system had a distinct advantage in respect of income. The trouble was not in that field. While, however, the Canadian Pacific was adding to operating expenses by 34.9 per cent, the Canadian National was swelling outgo by 69.7 per cent. The result in dollars and cents was that a net operating surplus of \$13,510,116 in 1917 was turned into an operating deficit of \$10,858,926 in 1919. The Canadian Pacific, on the other hand, came out with net operating earnings of \$32,429,475.

Extending the analysis, by measuring both earnings and operating expenses by combined ton and passenger miles, it is found that while the Canadian National increased gross earnings from .831 in 1917 to 1.122 cents in 1919 the Canadian Pacific advanced from .897 to 1.282. This was equal to a gain of 35.0 per cent in one case and 42.9 in the other. With respect to operating expenses, however, the Government group rose from .681 to 1.252 while the Canadian Pacific went up from .591 to 1.027. The difference in one instance was 83.9 per cent and in the other 73.8. Putting it in another and suggestive way, while the difference between the

two systems was 15.2 per cent in 1917 adverse to the Canadian National, in 1919 it was 21.9. That difference tells us rather plainly how much better the Canadian Pacific was able to meet the rising tide of operating cost than was the management of the Government system.

### Trainload and Carload Tests

A very strong sidelight is thrown on the operating results as expressed in terms of dollars and cents, and we begin to catch a clear glimpse of weakness in fundamentals, when we look into the trainload and carload situation on the Canadian National as contrasted with that on the Canadian Pacific. The facts will spare me from any comment whatever.

In carload the Canadian National is not open to serious criticism. It was only one ton below the average of the Canadian Pacific in 1917 and it picked that up in 1919. That is the single sign of betterment in operating conditions. By all other tests, without exception, the system gave a poorer performance in 1919 than in 1917.

The trainload of the various units was as follows:

	1917	1919
Canadian Northern.....	378.4	337.9
G. T. Pacific .....	368.8	302.1
Transcontinental .....	446.6	502.0
Intercolonial .....	362.9	402.1
Average.....	382.5	370.1

This result was 38.5 per cent below the average trainload of the Canadian Pacific in 1917 and 41.1 per cent in 1919. It might be assumed that this striking difference was due to unfavorable grades on the Government roads, but that would be a mistake. The Canadian Pacific is at a marked disadvantage in that regard. It has always been the boast of the Canadian Northern that its .4 per cent controlling grade was the best of any road of similar length in North America; yet the Canadian Northern had an average trainload of 378.4 tons in 1917 and fell to 337.9 in 1919. That must be compared with 529.8 and 522.1 on the Canadian Pacific.

The lighter trainload of the Canadian National is due to fewer cars hauled. In 1917 the number was 17.2; but in 1919 this had decreased to 15.6. On the other hand, the Canadian Pacific had an average of 22.6 cars in 1917 and 22.2 in 1919.

### Wages and Employees Compared

It was during the year ended June 30, 1919, that the McAdoo award began to make its pernicious influence felt among the railways of North America, and it would seem to be perfectly fair to compare the way in which this difficulty was met by the Canadian National and the Canadian Pacific. Two tests have been applied, and the results are rather significant. The first deals with the volume of wages per ton and passenger mile combined. The showing is as follows:

	1917, cent	1919, cent	Increase, per cent
Canadian Northern.....	.389	.819	110.5
G. T. Pacific .....	.543	1.100	102.6
Transcontinental .....	.418	.622	48.8
Intercolonial .....	.445	.782	75.7
Average ..	.415	.798	94.7

These figures must be contrasted with averages of .344 and .625 by the Canadian Pacific. Incidentally, this test reveals the extent to which the swollen payroll affected operating cost of all railways in Canada up to 1919. But while the Canadian Pacific was able to keep the increase down to 78.8 per cent the Canadian National, dealing with precisely the same conditions as to scale and classification, had an addition of 94.7 per cent.

The second test related to the combined ton and passenger miles per employee. As to number of employees, the Canadian Pacific between 1917 and 1919 met a decline of 21.8 per cent in ton and passenger miles by cutting down the operating staff by 2.1 per cent. The Canadian National, on the other hand, had a drop of 9.1 per cent in the same mileage, yet added to the number of employees by 21.8 per cent.

The result, measuring ton and passenger miles by employees, was the following performances:

	1917	1919
Canadian Northern.....	235,908	154,399
G. T. Pacific.....	185,786	133,563
Transcontinental.....	217,938	181,940
Intercolonial.....	178,649	167,831
Average.....	212,547	159,962

The Canadian Pacific had, per employee, an average of 261,713 ton and passenger miles in 1917 and 208,331 in 1919. The decrease in the case of the Government roads was equal to 24.8 per cent, and in the case of the Canadian Pacific 20.3. The contrast in administrative skill in respect of both wages and performance by employees is obvious. The broad question of operating policy, as well as the further consideration of morale, are involved in the tests.

It should not be necessary to repeat that the standard of appraisal here employed is absolutely just. Ton and passenger miles express quite directly the service which each railway is called upon to give, and it is therefore fair to measure both financial and operating results by that comprehensive gage. We have seen how the two systems here contrasted stand up under the analysis made, and while many other deductions are plainly and pertinently suggested I have no disposition to deal with them. My purpose has been to present the facts and allow them to tell their own story as to how the various units composing the Canadian National performed in 1917 and 1919.

### The Results in 1920

The facts for the fiscal year 1920 cannot be presented in comparative form for two reasons in chief: First, the essential factor of loaded car mileage is lacking; second, the year to which the figures recently presented to Parliament relate ended December 31 instead of June 30. Some general comparisons, however, can be made, subject to the qualifications as to the difference in years.

The operating ratio rose in 1920 to 124.01, and the operating deficit to \$36,842,970. This should be compared with a ratio of 81.39 by the Canadian Pacific and a net operating revenue of \$33,153,045.

Operating expenses per ton and passenger mile combined were equal to 1.567 cents on the Canadian National and 1.179 on the Canadian Pacific. Without making allowance for the difference in the years, it may be said that these results showed a worsening by 25.2 per cent over 1919 on the Government system, as compared with an increase of 14.8 per cent on the corporate road. An important, but quite unavoidable, qualification in these and succeeding results is that they do not include figures from the Grand Trunk Pacific. Data as to mileage for that road are lacking, which prevents their being brought in. The effect would, however, quite definitely be to aggravate the situation as disclosed by the other units, for the Grand Trunk Pacific in 1920 made much the worst showing in its history.

Measuring transportation expenses by ton and passenger miles in 1920 the result gives .774 cent for the Canadian National and .556 for the Canadian Pacific. In this particular test the showing of the Government roads was worse by 23.6 per cent in 1920 over 1919, as compared with an increase of 10.5 per cent by the Canadian Pacific.

In short, if a full and accurate comparison could be made as between operating results on the Canadian National lines in 1917 and in 1920 it would unquestionably show not only a serious aggravation of all the conditions, but a much greater increase in the adverse showings than was experienced by the Canadian Pacific. The point which should be given proper emphasis is that, while the Canadian National system is fundamentally weak, operating results have been made worse year after year by unskillful, wasteful and incompetent administration. There cannot possibly be any doubt of that, and it has a vital bearing on the exceedingly perplexing Canadian railway problem at this moment.

## Tentative Valuations Issued

WASHINGTON, D. C.

THE INTERSTATE COMMERCE COMMISSION, Division 1, has issued a tentative valuation of the property of the Western Pacific as of June 30, 1914, stating the final value of the property used for common carrier purposes as \$66,730,011, which is less than the amount of bonds outstanding at that time, which amounted to \$75,000,000, to say nothing of \$75,000,000 of capital stock and other obligations which increased the total capitalization as of the valuation date to \$172,720,912. The final value stated is also less than the original cost, which the report says cannot be ascertained exactly but which it states "as closely as it is possible to determine from the carriers' records with certain limitations" described, as \$72,616,081. The report covers 925 miles of main line and 1,118 miles of track, much of which was very expensive to construct. The report says the cost of building the section from Chilcoot to Oroville, Cal., is probably not exceeded by the cost of the same length of any other railroad in the United States. The final value of the property owned is given as \$66,075,947.

The company constructed all of its mileage except about 31 miles of completed road, together with about 6 miles of other tracks bought from one of the predecessor companies, but most of the capital stock was exchanged, together with \$1,518,063 in cash for the unappraised property of seven predecessor companies and certain traffic agreements. The investment in road and equipment, including line, is stated in the books of the company to be \$156,318,136. This the commission has readjusted to \$147,552,091 and, the report says, if the \$74,837,000 of capital stock exchanged be subtracted the investment account would stand at \$72,715,091. It could not be determined from the carrier's accounts whether the cash given for the property of the predecessor companies was equal to or greater or less than the value of these properties; hence, the report says, it cannot be determined how much stock was issued without consideration. But the \$72,715,091 is said to represent the nearest approximation to the actual investment of the carrier in existing road and equipment that can be made from obtainable records. Under the recent reorganization the capitalization of the Western Pacific has been reduced to a figure more consistent with what the commission has stated as the value of the property.

The cost of reproduction new of the common carrier property used other than land is stated as \$61,577,074 and the cost of reproduction less depreciation as \$55,751,732. The report describes some of the factors taken into consideration in reaching this figure, as well as the details of the various accounts. The present value of the carrier lands owned and used is stated as \$6,048,133 and the present cost of condemnation and damages or of purchase of the lands used for carrier purposes in excess of the present value is stated as \$4,355,287. In addition, the present value of non-carrier lands held by the carriers is given as \$3,752,680. From the beginning the results of the operations of the carrier have been unprofitable and insufficient to meet the interest on the funded debt, hire of equipment charges, rents and other miscellaneous items. The results of the corporate operations for the period from July 1, 1910, to June 30, 1914, were a net deficit of \$15,537,356.

### Figures for Other Carriers

The commission has issued tentative valuations giving the final value as of the valuation dates as follows:

Wood River Branch.....	1914	\$1,100,000
Riverside, Rio Grande & Pacific.....	1914	1,100,000
San Joaquin & Eastern.....	1914	1,100,000
Central of Oregon.....	1914	1,100,000
Grand Canyon.....	1914	1,100,000
San Juan Valley.....	1914	1,100,000
Woodstock.....	1914	1,100,000
Minneapolis & Rainy River.....	1914	1,100,000
Delta Southern.....	1914	1,100,000

## Charles Azro Prouty

CHARLES AZRO PROUTY, director of valuation of the Interstate Commerce Commission, and for over 17 years a member of the commission, died at his home at Newport, Vt., on July 8 after having been ill for nearly a year. He had not been at his office since about the first of the year, but for several months had continued to keep in touch with his work and to handle his correspondence from his apartment. About two months ago he was taken from Washington to Newport in a special car provided by Thomas W. Hulme, vice-chairman of the Presidents' Conference Committee on Valuation.

Mr. Prouty was appointed a member of the Interstate Commerce Commission in December, 1896, and upon the expiration of his term he was successively reappointed until he resigned as a commissioner in February, 1914, to organize the valuation work provided for by the law passed in 1913.

He has thus been a prominent figure in the field of federal railroad regulation for a quarter of a century and because of his ability and strong personality he exerted an important influence upon the course of the development of public regulation of the carriers. He had a habit of speaking his mind freely, the courage of his convictions and as he possessed an unusual ability to write and speak good clear English in a forceful way, his many public addresses and written articles on the subject represent a most important contribution to the literature of the railroads in their public relations. Becoming a member of the commission at a time when conditions in the railroad world were such that the need of the curb of governmental authority was more strongly manifested than it has been of recent years, as well as at a time when the commission had comparatively little power and felt called upon to emphasize the necessity for strengthening its authority, Mr. Prouty for a number of years quite naturally came to be looked upon as representing what railroad men would term the punitive side of regulation. In later years, however, as the process of subjugating the railroads became more complete, his attention was devoted more toward what a railroad officer might regard as constructive regulation and his influence was exerted on several occasions to assist the swing of the pendulum in the other direction.

In the early days of commission regulation Mr. Prouty was a caustic critic of many railroad practices and by newspaper interviews as well as by the language used in his official opinions did much to call the attention of the public to the need for various reforms. At this period he was very prominently quoted in the newspapers as saying that the railroads only refrained from buying the commission because it was not worth buying. He was the author of several opinions of the commission which ordered drastic reductions in freight rates as well as of the opinion in the Eastern rate advance case of

1911, which denied one of the first of the applications of the roads for a general rate advance, but he was also one of the first public men to point out that a failure of regulation of railroads as private companies might come as the result of the discouragement of investors. While chairman of the commission in 1912 he made the statement in a public address that "while we can provide by legislation the sort of cars which a railroad shall use and the rates which it shall impose, we cannot by legislation force one single dollar of private capital into railway investment against its will." He also took occasion to emphasize on several occasions the conviction that while the government must regulate the railroads, it ought to leave the private capital invested as free as it can be left consistent with the public interest.

After he resigned as a member of the commission and felt more free to express his individual ideas he did much to assist in the removal of some of the prejudices against the railroads that had existed in the public mind as the result of

former conditions and while the legislation for a return of the railroads to private management was under consideration in 1919 his influence was exerted in support of the efforts to provide some assurance to railroad investors by a statutory rule prescribing 6 per cent as a fair return. He was an outspoken man of strong opinions which were usually stated with considerable vigor and in expressive language. He was also able to back up his opinion with strong arguments, in which he frequently preferred to rely on what he called common sense than upon legal technicalities.

Mr. Prouty did not live to see accomplished the results he had anticipated would follow from the valuation work and he was always careful to refrain from predicting how soon the effects would be felt, but he lived to see carried out the bulk of the preliminary work of gathering the facts which was organized under his direction and leaves to others the task of putting

them into practical effect. The commission has issued an announcement that his death will not interfere with the completion of the valuation work, which during his illness has been and will henceforth continue to be carried on under the direction of the associate director of valuation and Division I.

Mr. Prouty was born October 9, 1853, at Newport, Vt. He was graduated from Dartmouth College in 1875. He was assistant to Prof. S. P. Langley at Allegheny Observatory in 1875 and 1876 and then taught school for several years. He was admitted to the bar in 1882 and practiced law at Newport, Vt., from that year to 1896. He was a member of the lower branch of the Vermont Legislature in 1888 and was reporter of decisions of the Supreme Court of Vermont from 1888 to 1896, when he was appointed a member of the Interstate Commerce Commission. Mr. Prouty served as chairman of the Interstate Commerce Commission during the year 1912.

Charles A. Prouty

# Will Investigate Relations of Western Pacific

## I. C. C. Institutes Inquiry of Dealings with D. & R. G.—Denver & Rio Grande Western Stock Issue Approved

WASHINGTON, D. C.

THE INTERSTATE COMMERCE COMMISSION on July 12 announced the institution of a proceeding of inquiry and investigation into the history, financial operations, accounts, and the practices of the Western Pacific Railway, the Denver & Rio Grande Railroad, the Western Pacific Railroad and the Denver & Rio Grande Western Railroad, their respective relations with one another, and "any and all other matters pertaining thereto, to determine the manner and method in which the business of said companies and each of them is or has been conducted, with a view to the making of a report and to the making of such order or orders as may be proper in connection with the issue of securities by and the accounts and practices of said companies or any of them." The order was dated July 11.

### Denver & Rio Grande Stock Issue Approved

At the same time the commission granted authority to the Denver & Rio Grande Western to issue 300,000 shares of common stock without nominal or par value, but held that the proposed acquisition of all the outstanding stock of the applicant by the Western Pacific Railroad Corporation is not within the scope of paragraph (2) or paragraph (6) of section 5 of the act, relating to the acquisition of control of a carrier, and that the proposed acquisition and operation by applicant of the Denver & Rio Grande Railroad is not within the scope of paragraph (18) of section 1 of the act. The commission report on this matter said:

A joint hearing was held on April 25 upon this application and upon the application of the Western Pacific Railroad for authority to issue certain bonds. No objection to the granting of the application was offered by any authority of any state in which the applicant proposes to operate.

The protective committee of the stockholders of the Denver & Rio Grande appeared at the hearing for the purpose of noting on the record the facts with respect to litigation pending in the district court for the district of Colorado between certain of the stockholders, as parties plaintiff, and the applicant and others, as parties defendant; and also for the purpose of objecting to the commission entertaining jurisdiction of the application unless and until applicant complies with the provisions of paragraph (18) of section 1, and paragraph (6) of section 5 of the interstate commerce act.

The old Denver company is a consolidated corporation which succeeded a former company of the same name and the Rio Grande Western, which companies, by contract dated June 23, 1905, in practical effect guaranteed payment of principal and interest of the first mortgage, 5 per cent, 30-year gold bonds of the Western Pacific Railway. The last mentioned company defaulted in the payment of interest due March 1, 1915, whereupon the first mortgage was foreclosed and the property was sold for \$18,000,000 to representatives of the holders of a large amount of the bonds. The Western Pacific Railroad Company was then organized by such bondholders to take over and operate the property purchased. The Western Pacific Railroad Corporation was also organized by the same bondholders, and all of the capital stock of the operating company, except a few qualifying shares held by its directors, was acquired by the holding company.

After the application of the \$18,000,000 received from the sale of the property of the old Western Pacific company there still remained unpaid upon the bonds \$38,270,343. The Equitable Trust Company of New York, the trustee under the first mortgage, obtained a judgment for this amount on

June 14, 1917, against the old Denver company based upon the guaranty contained in the contract of June 23, 1905, and thereafter a receiver was appointed for such company. As a result of various proceedings considerable amounts were realized from the sale of certain free assets of the old Denver company which were applied upon the judgment debt and interest. The balance remaining unpaid amounted on September 25, 1920, to \$36,192,655.78. The district court on that date directed the sale of the remaining property of the old Denver company for the purpose of satisfying the last-mentioned amount. Such sale took place at Denver on November 20, 1920, and the property was purchased for approximately \$5,000,000 by John F. Bowie, John B. Marsh and Ralph M. Arkush, on behalf of the holding company, which in turn represented the interest of approximately 95 per cent of the bondholders of the old Western Pacific company. The sale was confirmed on March 28, 1921, and is to be consummated as soon as possible after the commission has authorized the proposed issue of securities.

The Denver & Rio Grande Western has been organized by the holding company to take over practically all of the property of the old Denver company. The purchasers of the property have agreed with applicant by contract dated April 4, 1921, to cause title to be vested in the applicant, and as the principal consideration therefor, applicant will issue the 300,000 shares of its stock without nominal or par value, authority for the issuance of which was asked. Such stock will be acquired by the holding company, which has been represented in the transaction by the purchasers, and will be retained by it for the purpose of maintaining control of the applicant.

The property has been sold subject to the lien of all existing mortgages thereon, but as a result of the sale the property will be relieved of liability for the balance remaining unpaid on the judgment of the Equitable Trust Company of New York, amounting to \$35,224,493. The outstanding capital stock of the old Denver company is \$49,775,670, par value, preferred, and \$38,000,000, par value, common. The applicant for the present will have outstanding only the proposed issue of 300,000 shares of its common stock without nominal or par value. The total authorized capital stock of the applicant, however, is 500,000 shares of the par value of \$100 of preferred stock and 1,000,000 shares of common stock without nominal or par value. The property will be acquired by the applicant subject to outstanding funded debt amounting to \$121,175,500.

The \$32,063,500 of first and refunding mortgage bonds and the \$10,000,000 of adjustment mortgage bonds are now in default by reason of the fact that part of the collateral pledged to secure them consisted of \$25,000,000 of second mortgage bonds of the old Western Pacific company, the value of which was destroyed by the foreclosure of the first mortgage above mentioned.

Negotiations are now in progress between the holding company and the holders of the refunding bonds and the adjustment bonds, which contemplate their retirement through foreclosure and the substitution, if all of the bondholders consent, of \$25,750,000 of 7 per cent preferred stock of the applicant and \$15,750,000 of 5 per cent bonds secured by a junior lien on the applicant's property. If the proposed substitution is effected, the fixed charges upon the property will be reduced approximately \$1,500,000 per annum. The testimony shows that it is desirable to terminate the present mortgage

although the future of the applicant will remain uncertain until some agreement has been reached with the holders of the bonds.

It appears that the applicant is in need of new equipment and of betterments to its way and structures. The holding company proposes to finance these requirements to the extent of \$12,000,000, for which it is proposed ultimately to issue to the holding company an additional 120,000 shares of applicant's common stock without nominal or par value. Pending an agreement with the holders of the refunding bonds and adjustment bonds, however, the holding company will make advances only where they can be adequately secured.

Applicant stated in the application that it is unable to assign a cash value at this time to the property to be acquired by it.

### Holding Company Not a Carrier Subject to the Act

After outlining the foregoing the commission said:

The holding company is neither a carrier subject to the act nor organized to engage in transportation subject to the act.

Referring to the objections made by the stockholders' committee of the old Denver company we are of the opinion that the proposed acquisition and operation by the applicant of the properties of the old Denver company are not within the scope of paragraph 18 of section 1 of the act because such property was in existence and was operated in interstate commerce prior to the effective date of that paragraph. We are further of the opinion that the proposed acquisition of applicant's stock by the holding company does not constitute a consolidation of the property of two or more carriers by railroad subject to the act into one corporation for the ownership, management, and operation of properties theretofore in separate ownership, management, and operation within the meaning of paragraph 6 of section 5 of the act. The testimony shows that although the holding company will by stock ownership control both the applicant and the Western Pacific Railroad Company, the properties of the operating companies will be separately owned, managed and operated.

Inasmuch as the holding company is not a carrier engaged in the transportation of passengers or property subject to the act, the acquisition of the control of the applicant by the holding company is not within the scope of paragraph 2 of section 5.

We find that the proposed issue and sale of common capital stock without nominal or par value (a) are for lawful objects within the corporate purposes of the applicant, and compatible with the public interest, which are necessary and appropriate for and consistent with the proper performance by it of service to the public as a common carrier, and which will not impair its ability to perform that service, and (h) are reasonably necessary and appropriate for such purposes.

Commissioner McChord, in a concurring opinion, said he concurred in the majority report, except that he was of opinion that the holding company is subject to the provisions of paragraph 2 of section 5 of the Interstate Commerce Act.

Commissioner Eastman, dissenting, said he was not disposed to question the desirability of an investigation, but that if one is justified, it is better that the Denver property should remain in the hands of a receiver appointed by the court, pending the results of the investigation, rather than pass into the possession of a company organized in behalf of the bondholders who have been so intimately associated with the matters under inquiry.

He also took the position that the acquisition by the holding company of the stock of applicant is subject to the provisions of paragraph (2) of section 5 of the Interstate Commerce Act. That paragraph authorizes the commission to approve the acquisition by one carrier of the control of any other carrier "either under a lease or by the purchase of stock or in any other manner not involving the consolidation of such carriers into a single system for ownership and operation."

Commissioner Campbell concurred in the views expressed by Commissioner Eastman.

THE GOVERNOR OF WISCONSIN signed a bill on July 6, making railroad tickets in Wisconsin good for 30 days from date of sale.

## Derails; Are They Good or Bad?

By A. H. Rudd

Chief Signal Engineer, Pennsylvania Railroad System

THE PROPOSITION to eliminate derails in main tracks, especially at grade crossings, may at first glance appear radical, revolutionary and retrogressive; and yet many signal engineers and other operating officers who have studied results now feel that safer and, therefore, better and more economical operation and maintenance would be attained by such elimination, and that the introduction of a device which may cause an accident to prevent an accident appears, to put it mildly, somewhat illogical.

The subject is at least a fruitful one for discussion, although, as the installation of these devices is largely a matter of state regulation, results in the near future in the direction indicated are more or less problematical.

The frequent derailments at derails might be cited as arguments for their retention, and as proofs of the danger resulting from their removal; and yet some roads which do not have derails in their main tracks not only escape these accidents but do not have the collisions which derails are supposed to prevent.

It would appear that the sentiment is quite general that "our men are so careful we do not need derails, but we are afraid of what the *other fellow* may do"; and the other fellow feels the same way. Those who admit that they need derails to enforce their own discipline are few and far between—it is the "other fellow." Put yourself in the other fellow's place and what becomes of the derail? It stays in, because the third party in the case, the arbiters, as represented by the public service commissions, feel "We might not be able to rely on either or any of you."

On the one hand we have the actual derailments, on the other, occasional collisions. Unquestionably there are many more derailments than collisions, but the answers to the questions "Did the derail prevent a collision?" or "Would a derail have prevented the collision?" must be, in a very large number of cases, more or less conjectural. For this reason, comprehensive comparative statistics have never, as far as the writer knows, been compiled; and obviously they are inherently difficult of compilation.

Does the derail tend to better observance of signals? Is it a "moral agent" as some claim, or an immoral one? Its theoretical utility is to protect the careful from the negligent, and, in some cases, the innocent from the guilty. Does it always work out that way?

At a crossing or junction on a double-track or a four-track road, where a derailed train may foul other tracks, is it a safeguard or a menace?

It is not used or required to be used to protect crossovers in double track and four-track roads; why? Largely because of this danger of wrecking trains other than the one intended. Does experience show that its omission has resulted disastrously? Is it better to put a train down the bank if it overruns a stop signal fifty or sixty feet, or to give it 500 ft. more in which to have a chance to stop before it reaches an open draw, or a crossing?

Which signals are more frequently overrun, stop signals or stop-and-proceed signals—due allowance being made for the number of each in service? Which signals are most frequently disregarded—interlocking or block (manual, controlled manual or automatic)? Why? Are they in most cases actually disregarded and ignored, or are they, when overrun, passed only a few feet?

How many derailments at derails have occurred in the past 10 years? Count not only those which have resulted in fatalities or injuries but also those classed as minor accidents but which, nevertheless, blocked traffic and required the services of the wrecking crew. How many serious collisions

have resulted in the same period at interlocked crossovers, crossings and junctions not "protected" by derails? What is the percentage of each?

The facts noted early in this contribution—frequent derailments and the absence of accident on some roads—have led some of us to think that the derail is perhaps an *unnecessary* rather than a "necessary evil"; that at least its value is open to question, and that an unprejudiced examination may disclose some interesting facts. What are these facts?

Are reliable statistics available? If not, perhaps the *Railway Age* will attempt to collate them; not only for the information of railroad officers but also for the public authorities, so that all doubt may be removed, and we may know definitely whether the derails should be retained or removed.

## A Proposed Bridge Across the Hudson River at New York City

A PROJECT FOR THE construction of a bridge to span the Hudson river and to connect the city of New York with the mainland on the west has been receiving considerable attention recently partly because of the need of some practical means to relieve congestion around New York and partly because of the size of the contemplated structure. As the plans now stand, the bridge, if built, will be one of the largest single structures yet constructed. Originally the undertaking embraced a structure in the neighborhood of Twenty-third street and a permit was issued by the War department for a bridge at that point. Of recent years civil growth and other factors have resulted in a change in location. The plans now advanced cover a structure crossing the Hudson river from a line south of Fifty-ninth street in Manhattan to Weehawken, N. J., with terminal and classification yards in New Jersey and a union passenger station and other facilities on the New York side.

The design of the proposed bridge, which is being changed

of high tensile strength steel, each 60 ft. to 70 ft. long and pin-connected. In order to prevent corrosion the chords will be enclosed in a continuous gallery formed by a casing of sheet copper which will protect the chains from the weather, and at the same time permit of their inspection.

The towers supporting the suspension members will be of extraordinary size, extending about 800 to 840 ft. above water level, and 165 ft. below with foundation dimensions of approximately 400 ft. by 200 ft. The construction will be of

Cross Section Through the Main Span

steel and each tower will be enclosed in masonry in order to protect it from corrosion. This factor of corrosion has been carefully considered in the design of all parts of the structure and precautions have been taken in the design to render it practically negligible.

The traffic, in so far as it concerns the railroads in their problem at the Port of New York, will be handled somewhat as follows: In New Jersey a large classification yard or perhaps a series of contiguous yards will be constructed in the Hackensack meadows as well as connecting tracks to all the railroads affected, both to the yards and to the bridge direct.

The Design Is Pleasing to the Eye

from time to time as regards some of its details, follows the general lines of typical suspension bridges. It has a river span of 3,240 ft. with approach spans of 1,710 ft. The roadway is double decked, 235 ft. wide and so arranged that the upper deck carries all highway, trolley, bus and pedestrian traffic while the lower is solely for the accommodation of railway freight and passenger traffic. On the upper deck there will be space available for 16 lines of vehicles, two bus and two trolley lines and two promenades 15 ft. wide. The lower will have 12 railway tracks in sets of two each. The clearance above mean high water will be 155 ft. at the center and 140 ft. at the towers.

This roadway will be carried by two suspension arches spaced 160 ft. apart. In place of the usual cables, the suspension members will each consist of two parallel chords of chains, one spaced 60 ft. above the other with structural steel bracing between them. The arches will be divided longitudinally into 60-ft. panels by the suspenders from chords to deck. Each chord will be built up of three chains formed of eyebars, making a total of 12 chains for the bridge. The individual chains will be composed of from 20 to 30 eyebars

In New York the railroad tracks will be looped to the south, probably in the vicinity of Ninth avenue to a union station in the vicinity of Forty-second street. Freight tracks will continue along near the waterfront into the lower part of Manhattan Island and will be served by a comprehensive warehouse system.

Both the freight and passenger traffic will be on the basis of one-way operation. The maximum rail grade on the New Jersey approach is 1.0 per cent and on the New York approach it is  $2\frac{1}{2}$  per cent. The maximum grade for vehicles on approaches is  $3\frac{3}{4}$  per cent while the maximum grade on the bridge itself, both rail and highway, is  $2\frac{1}{2}$  per cent. The estimated cost of the bridge is \$100,000,000. The present estimated cost of the terminal facilities on both sides of the river is \$115,000,000, making a total of \$215,000,000.

The project is being developed by the Hudson River Bridge and Terminal Association, Inc., New York, of which George A. Post is president. The designs for the structure were made by Gustav Lindenthal, consulting engineer, New York, and chief engineer of the association.

## I. C. C. Commodity Statistics

WASHINGTON, D. C.

THE tonnage of freight originating on the railroads of the United States during the first three months of 1921 was 217,967,619, as compared with 275,931,603 in the first quarter of 1920, according to the quarterly summary of freight commodity statistics of Class I roads issued by the Interstate Commerce Commission. This is a decrease of 21 per cent. The total revenue freight carried was 401,818,363 tons, as compared with 511,699,501 in 1920, a decrease of 27 per cent. Decreases are shown in all of the main groups of commodities but large increases are shown in the tonnage originating of some of the commodities, including several as to which there has been the most complaint that high freight rates were retarding traffic.

For the calendar year 1920 the tonnage of products of agriculture was 110,881,685, as compared with 115,033,319 in 1919. The tonnage of products of animals was 26,545,844, as compared with 35,493,662. The tonnage of mine products amounted to 712,512,968, as compared with 589,950,958, and of forest products to 101,613,209, as compared with 94,075,639. Manufactures and miscellaneous showed large increase, 251,166,994, as against 201,256,077. Carload traffic for the year was 1,202,720,700, as against 1,044,809,655. The l. c. l. merchandise was 52,984,273, as against 51,301,616, and the total tons originating were 1,255,704,973, as against 1,096,111,271.

For the first quarter of 1921 the total tonnage of products of agriculture was 26,023,087, as compared with 28,109,847 in the first quarter of 1920, but the tonnage of wheat was 4,968,196, as compared with 4,459,922. The tonnage of corn was 5,544,760, as compared with 4,325,425. The tonnage of citrus fruits was 474,947, as compared with 451,790; other fresh fruits 608,463, as against 467,580; and potatoes 1,001,832, as against 923,020.

The tonnage of products of animals was 5,900,684, as compared with 6,960,967 in 1920. Decreases are shown in all items except eggs, which amounted to 120,665 tons, as compared with 74,413, and wool, which amounted to 66,736 tons, as compared with 66,280 in 1920.

The tonnage of products of mines was 115,836,502, as compared with 143,323,954. There were decreases in all items except anthracite coal, of which the tonnage was 19,337,873, as compared with 17,304,993. The tonnage of bituminous coal was only 73,023,364, as against 90,622,687.

Products of forests amounted to 20,634,584, as compared with 25,575,364. Ties amounted to 1,950,149, as against 894,290, and pulpwood amounted to 3,182,513, as compared with 1,345,813. Manufactures and miscellaneous show a total of 39,726,611, as compared with 58,399,996.

The grand total of carload traffic for the quarter was 208,121,448, as against 262,370,128. The l. c. l. merchandise was 9,846,171, as against 13,561,475, and the grand total was 217,967,619, as against 275,931,603. The total number of carloads for the quarter was 6,224,990, as compared with 8,007,435.

## Over 600,000 Employees Laid Off Between August and March

WHAT IS PROBABLY the greatest "layoff" which ever occurred in the transportation industry took place between August, 1920, and March, 1921, when, according to the statistics of the Interstate Commerce Commission, the total number of employees on the Class I railroads decreased from 2,197,824 in August, 1920, to 1,593,068 in March, 1921, representing a decrease of 604,756, or 27.5 per cent.

The accompanying table shows by classes the reductions which were made in this seven month period and the per-

centages of decrease. It will be noted that reductions were made in all classes of employees except general officers receiving \$3,000 per annum and upward, division officers receiving \$3,000 per annum and upward, traveling agents and solicitors and employees in outside agencies. The largest cuts were made in the maintenance of way departments, the figures indicating that among the employees in construction gangs and work trains, almost 71 per cent were laid off. The average cut in the number of employees directly engaged in maintenance of way work was 49.1 per cent. The significance of these figures is pointed out in an editorial elsewhere in this issue.

NUMBER OF EMPLOYEES BY CLASSES—CLASS I ROADS  
August, 1920, Compared with March, 1921

Class of employee	August, 1920*	March, 1921*	Decrease	Per cent of decrease
1 General officers, \$3,000 per annum and upward	7,254	7,774	502†	6.9†
2 General officers below \$3,000 per annum	1,800	1,299	501	27.8
3 Division officers, \$3,000 per annum and upward	8,115	9,099	1,794†	22.1†
4 Division officers below \$3,000 per annum	5,724	3,776	1,948	34.
5 Clerks, \$900 per annum and upward	247,119	215,755	31,364	12.7
6 Clerks below \$900 per annum	2,304	1,447	857	37.2
7 Messengers and attendants	11,788	10,174	1,609	13.7
8 Assistant engineers and draftsmen	11,020	8,979	2,041	18.5
9 M. W. & S. foremen	8,838	6,312	2,526	28.6
10 Section foremen	42,834	39,837	2,997	6.9
11 General foremen, M. E. department	1,904	1,817	87	.5
12 Gang and other foremen, M. E. department	26,009	22,245	3,764	14.4
13 Machinists	63,478	50,609	12,869	22.7
14 Boiler makers	21,020	16,184	4,836	23.0
15 Blacksmiths	11,274	7,941	3,333	29.5
16 Masons and bricklayers	1,274	577	697	54.7
17 Structural iron workers	800	556	244	30.8
18 Carpenters	56,240	33,847	22,393	39.3
19 Painters and upholsterers	16,045	6,999	9,054	56.4
20 Electricians	15,678	12,702	2,976	19.0
21 Air-brakemen	8,173	6,162	2,011	24.6
22 Car inspectors	27,070	22,585	4,485	16.6
23 Car repairers	94,185	54,537	39,648	42.0
24 Other skilled laborers	62,272	45,819	16,453	26.4
25 Mechanics' helpers and apprentices	138,709	99,702	39,007	28.1
26 Section men	365,818	173,917	191,901	52.5
27 Other unskilled laborers	132,651	85,317	47,334	35.7
28 Foremen of const. gangs and work trains	1,966	942	1,001	50.9
29 Other men in const. gangs and work trains	34,549	10,058	24,491	70.9
30 Traveling agents and solicitors	3,865	4,475	614†	16.0†
31 Employees in outside agencies	1,200	1,340	140	4.7†
32 Other traffic employees	426	395	31	7.3
33 Train dispatchers and directors	6,289	5,561	728	11.6
34 Telegraphers, telephoners and block operators	22,374	19,704	2,670	11.9
35 Telegraphers and telephoners operating interlockers	8,230	8,105	125	1.6
36 Levermen (non-telegraphers)	4,014	3,678	336	8.4
37 Telegrapher-clerks	12,690	11,506	1,184	9.3
38 Agent-telegraphers	19,811	19,593	218	1.1
39 Station agents (non-telegraphers)	13,885	13,511	374	2.7
40 Station masters and assistants	642	553	89	1.4
41 Station service employees	127,942	94,079	33,863	26.5
42 Yardmasters	4,506	3,532	974	22.7
43 Yardmasters' assistants	3,893	2,981	904	23.3
44 Yard engineers and motormen	23,317	17,808	5,509	23.6
45 Yard firemen and watchmen	23,888	18,068	5,820	24.4
46 Yard conductors (or foremen)	22,901	17,383	5,518	24.1
47 Yard brakemen (switchmen or helpers)	57,143	43,576	13,567	23.7
48 Yard switch tenders	6,540	5,998	506	7.7
49 Other yard employees	5,609	4,217	792	15.8
50 Hostlers	12,375	10,626	1,749	14.1
51 Enginehouse men	76,587	63,216	13,371	17.5
52 Road freight engineers and motormen	34,499	27,682	6,817	19.8
53 Road freight firemen and helpers	36,951	29,564	7,387	20.0
54 Road freight conductors	28,437	22,125	6,312	22.2
55 Road freight brakemen and flagmen	70,096	56,163	13,933	19.9
56 Road passenger engineers and motormen	13,458	12,843	615	4.6
57 Road passenger firemen and helpers	12,942	12,738	214	1.6
58 Road passenger conductors	11,162	10,522	640	5.7
59 Road passenger baggage men	5,896	5,735	161	2.7
60 Road passenger brakemen and flagmen	16,507	15,331	1,176	7.1

# Pennsylvania Defends Employee Representation Plan

## Labor Board Confronted with Problem of Ascertaining Authority Over National Agreements

REPRESENTATIVES of the Pennsylvania, appearing before the Railroad Labor Board on July 14 and 15 in defense of its procedure in conducting negotiations with its shop employees and clerks threw new light on the authority of the Board as outlined in the Transportation Act and upon the legality of the Board's various rulings regarding national agreements. The shop men on the Pennsylvania, through System Federation No. 90 of the American Federation of Labor, and the clerks through the Brotherhood of Railroad and Steamship Clerks, had protested against the plan of the Pennsylvania to negotiate new agreements as to rules and working conditions with a committee selected by a majority of the individual workers in the various classes involved.

Representatives of the employees, in opening the hearing, requested the Board to render an interpretation on:

"(a) The right under principle 15 (of Decision No. 119, abrogating national agreements) of the majority of the employees of any craft to determine what organization shall represent them.

"(b) The right of such organization to negotiate agreements for all members of such crafts through designated representatives of their own choosing without regard to whether they are in the employ of the carrier with which negotiations are to be conducted.

"(c) The right of the organization under principle 5 (of Decision 119) to select such representatives in accordance with its own laws, and without interference by the officers of the carriers."

The basis for the employees' case was that the Pennsylvania, in attempting to carry out its plan of employee representation which has been described in previous issues of the *Railway Age* and which contemplates the negotiations of agreements between the management and the employees through the agency of a committee composed of employees who have been elected by vote of the majority of the individual members from each craft, violates various of the Board's rulings and interpretations and is intended to limit and eventually destroy the existing organizations.

N. P. Good, president of Pennsylvania System Federation No. 90, and B. M. Jewell, president of the Railway Employees' Department of the American Federation of Labor, specifically charged that the Pennsylvania plan violated several of the principles which the Labor Board ruled should govern in the negotiation of new agreements as to rules and working conditions. For instance, principle No. 15, provides that "the majority of any craft or class of employees shall have the right to determine what organization shall represent such craft or class" and "such organization shall have the right to make an agreement which shall apply to all employees in such craft or class." Both contended that the Pennsylvania plan was directly contrary to this principle. The ballot which the Pennsylvania took for the election of representatives to confer on rules and working conditions was objected to on the grounds that it provides, first, for the election of individual representatives, and not organizations; second, that it ignores the organizations of employees now in existence, and, third, it provides for the division of the Pennsylvania into several regions, and the negotiations of different agreements in the several regions.

After representatives of System Federation No. 90 and of the Pennsylvania had failed to reach an agreement as to the method which should be pursued in electing representatives to confer on the question of rules and working condi-

tions, two ballots were taken, one by the organization requesting the men to name the organization which they desired to represent them in the negotiations, and the other by the carrier requesting the men to elect representatives with whom it could confer in forming new agreements. Mr. Good stated that of a total of 37,845 votes cast in the organization ballot, 37,238 voted in favor of representation by System Federation No. 90. The employees' representatives also charged that the Pennsylvania was violating the ruling of the Board continuing national agreements indefinitely by seeking to place new rules and working conditions into effect.

### E. T. Whiter Defends Pennsylvania Plan

E. T. Whiter, assistant to the vice-president in charge of personnel of the Pennsylvania, opening the carriers' case, outlined the Pennsylvania's position substantially as follows:

First, the Board has exceeded the authority given to it by the Transportation Act when it continued National Agreements in effect by Decision No. 2. The Board in Decision No. 119 admitted this contention by saying, "these agreements, by their terms, expired with Federal control." Again, in the same decision, the Board said, "Although Section 301 has not been complied with by the parties, the Board has jurisdiction of this dispute as it is and has been one likely substantially to interrupt commerce." The Board, however, cannot take jurisdiction until the provisions of Section 301 have been exhausted. Decision No. 119 was thought to recognize the unfairness and undue restrictiveness of many of the rules and working conditions and the right of the individual roads to deal directly with its own employees. However, later decisions have continued National Agreements indefinitely and taken away the right of individual negotiations.

Second. If carried out as apparently now intended, these decisions will have the effect of perpetuating the National Agreements in spite of the evident opinion of the public that these pacts be abolished and in spite of the Board's own ruling to that effect. This will mean nothing more or less than the closed shop.

Third. The Pennsylvania has endeavored to carry out its understanding of the Board's purpose, expressed in Decision No. 119, to encourage the railroads to re-establish relationships with their own employees on the basis of direct dealing, fair play and mutual understanding. The results accomplished with other classes of employees demonstrate the practicability and success of the plan offered by the Pennsylvania. However, the recent rulings of the Board tend to defeat the efforts of the carrier to reach a mutually satisfactory understanding with its employees, under which the railroad may be operated in the interest of the public as well as in the interest of the employees.

Mr. Whiter then said in part: "It must be evident to this board that while the Pennsylvania is anxious and willing to assist the Board in carrying out the Transportation Act, it cannot consistently comply with Section 301 of that Act, which requires that disputes shall be considered and, if possible, be decided in conference between the representatives designated and authorized to confer by the carriers and the employees or subordinate officials directly interested in the dispute, and at the same time carry out rulings of this board which are so diametrically opposed to this section and to the best interests of the railroads, the public and the employees."

We share the Board's desire to avoid any interruption of traffic and to live up in letter and spirit to the mandates of the Transportation Act; that every means be taken to settle controversies that may endanger the continuous operation of the carriers. As far as the Pennsylvania is concerned, however, there is no danger of any substantial interruption of transportation. Railroad employees who prior to federal control lived harmoniously with their employers over a long period of years on the basis of just such relationship as we are re-establishing with our men, do not strike without just cause. The Pennsylvania has always treated its men fairly. There will be no interruption of traffic under such circumstances and harmonious relations will be re-established if this Board in its desire to avoid misunderstanding does not interfere with honest efforts of the railroads to get together and continue to live together with their own men."

#### E. H. Seneff Testifies on Authority of Labor Board Over National Agreements

E. H. Seneff, general solicitor of the Pennsylvania, followed with an argument in regard to the jurisdiction of the Labor Board over the question of National Agreements. Mr. Seneff's arguments were in general similar to those outlined in Mr. Whiter's remarks with a more extended analysis of the authority given to the Labor Board by the Transportation Act and the manner in which that authority has been used in the controversy over National Agreements. Mr. Seneff pointed out that the Labor Board, in the first place, had no power to continue National Agreements in its Decision No. 2, and that inasmuch as a bona-fide dispute over National Agreements has never been created, none of the subsequent orders of the Labor Board in regard to the abrogation or continuation of these agreements is legally rendered. Furthermore, Mr. Seneff pointed out, even had the Labor Board acquired jurisdiction over the question of National Agreements, its action in retaining jurisdiction indefinitely, deciding, first, on April 14 that National Agreements would terminate on July 1, and then deciding without a hearing on June 27 that they would not terminate, would still be beyond the power given to the Board under the terms of the Transportation Act. Assuming again that the Board had complete jurisdiction over the question of National Agreements, Mr. Seneff challenged its right or power to lay down principles to be observed by employer and employee in the making of contracts, as the Board did in Decision No. 119. Regarding these principles, Mr. Seneff said, "I am unable to find a word or syllable in the Transportation Act conferring any such power upon the Board. The Board in prescribing these 16 principles has undertaken to legislate respecting property rights and obligations of the carrier and employee, and no such power has been delegated to the Board by Congress. Even though such power had been delegated by Congress, it would not be constitutional, as the exercise of any power compelling the carrier and the employee to observe substantive principles in the adjustment of differences between them in the making of contracts amounts to an appropriation of property rights which cannot be taken away from either in this manner without infringement upon their constitutional rights. Congress never intended that the Labor Board should usurp the rights and obligations of the contracting parties in this way, but on the other hand, it was the obvious intention of Congress that the parties directly interested in the matter be free and untrammelled to deal with each other in any way they see fit, regardless of locality or territory and likewise regardless of majority or minority representation, until a dispute which cannot be settled in conference arises, and then the Board has a right to function."

In closing, Mr. Seneff said, "There is one thing more to which I desire to direct the Board's attention, and that is the apparent growing tendency on the part of the Board, as

I view it, to group the carriers as a whole and subject them to the same treatment regardless of different or varying conditions. It is apparent to me that Congress had in mind in the enactment of the Transportation Act controversies between individual carriers and their employees, and if that is so it is the legal duty of the Board to carry out that direction to the fullest extent."

#### Officers and Employees Testify

##### In Behalf of the Pennsylvania

J. T. Wallis, chief of motive power of the Pennsylvania, then outlined the development of the closed shop during and after federal control, and pointed out the probable effect of the Board's position, as expressed in its orders, on the extension of this principle, saying: "We believe that it is but a step from the closed shop and union domination in Interpretation No. 5 (of Decision No. 119—the recent ruling in the Pullman case), to union domination for the railroads as a whole and to uniform national agreements, national boards of adjustment and those things denied labor organizations when the Anderson amendment was rejected. We believe it because we have all seen what happened during government control, and we think that your action and recent decisions are so nearly in conformity with what happened during federal control that they cannot but produce a like result."

Mr. Wallis was followed by H. A. Enoch, superintendent of the wage bureau, eastern region of the Pennsylvania, who outlined in detail the steps which that carrier has taken to carry out the provisions of Decision No. 119. Mr. Enoch, in turn, was followed by E. Peterman, a blacksmith in the Altoona shop. Mr. Peterman outlined the conditions existing at Altoona, the detrimental effect of the attempt of labor leaders to establish a closed shop and the manner in which the company had conducted its balloting for representatives with whom it could negotiate new agreements.

In reply to inquiries by members of the Board, Mr. Whiter later stated that of the 185,000 employees on the Pennsylvania, 167,100 were involved in this controversy. Of the 167,100, Mr. Whiter said, 108,254 have either agreed to working conditions or are negotiating through their duly elected representatives at the present time. In discussing the agreement which has been reached at the Altoona shops, Mr. Whiter later informed the Board that the total number of employees eligible to vote at that point was 2,198, and that 1,320 employees participated in the election of committees with whom the carrier had negotiated a new agreement.

Mr. Whiter closed the Pennsylvania's case with the following remarks:

"You have heard our case. You have been told freely of our aims and our methods of procedure and what we hope to accomplish. You have been told of our success in negotiating with those of our employees who were willing and did meet us half way. You have been told of our success at Altoona works where a majority of the shop crafts voted for their representatives who in turn completed their schedule in conferences with the Company's representatives and put it into full force and effect July 1, 1921.

"We propose to continue negotiations with those representatives who were duly elected by those who exercised the right to vote and will put into effect the schedules as soon as they are completed, and agreed to, and of which you will be currently advised."

Representatives of the Brotherhood of Railway and Steamship Clerks, Freight Handlers and Station Employees, presented similar arguments on behalf of the clerks on the Pennsylvania, B. R. Briceland declaring that the carrier had refused to negotiate with the brotherhood and to recognize the brotherhood as representing the majority of the workers of this class.

As a sequel to the meeting of the various labor leaders and general chairman at Chicago last week, the developments at

which were described in last week's *Railway Age*, the Railway Employees Department of the American Federation of Labor issued a warning in the form of a circular to the members of the shop craft union to "so conduct yourselves that you will not become involved in a stoppage of work." The letter stated that no action should be taken without authority of the Railway Employees Department "pending the time when the standard recognized railroad labor organizations can arrive at a point of handling this question, where concerted action by all may be taken." A "constitutional majority" for the rejection of the recent wage cut was also announced in the circular.

Several orders have been announced during the past week by the Labor Board, among them three interpretations to Decision No. 2. One of them increases the daily guarantee for engineers and firemen from \$6.00 and \$4.25 respectively to

\$6.80 for engineers and \$5.05 for firemen. Another interpretation applies the increase of 13 cents per hour specified in Article 12 of Decision No. 2, to labor foremen in shops and engine houses whose duties consist of supervising engine wipers, laborers, tool checkers, headlight men, fire tenders, turntable operators and similar positions. These men will receive a monthly increase of not less than \$26.52 per month.

The wages of the employees of the American Railway Express Company, except those employed in shop work, will be reduced six cents an hour on August 1, according to an order of the Labor Board, announced on July 12. It is estimated that the saving to the company will approximate \$8,000,000 annually. Last July the wages of employees of the American Railway Express Company were increased 16 cents per hour, and their present rates will therefore be 10 cents per hour larger than they were prior to that time.

## How the New York Central Inspects Perishables

Loss and Damage Guarded Against by Inspection Service  
at Points of Origin and Terminals

By F. S. Welsh

Manager Stock Yards and Agriculture, New York Central Lines

THE INSPECTION service which the New York Central Lines conducts in handling perishable commodities has a two-fold purpose. Its immediate object is to determine the exact condition of the perishables transported, while its ultimate end is the collection and dissemination of information concerning causes and means of correcting damage to these perishable shipments.

To accomplish the purpose of the work, as it has been outlined it is necessary to know the condition of the various commodities when they are offered for shipment. Our first procedure, consequently, is to maintain a detailed inspection service at the various shipping points. This inspection includes a thorough examination of the mechanical condition and equipment of the car. The arrangement of the load in the car must be carefully looked over with an eye for such physical defects as salty floors, collapsed bunkers, improperly fitted doors and any other conditions which might damage the commodity to be transported. The descriptions which our inspectors turn in as to the condition of the load include notations concerning the stripping and stowing, as well as descriptions of the containers being used. Other facts noted, pertain to the presence or absence of false floors, the size and construction of the car, together with mention of whatever additional protection is afforded, as for instance, when paper is used on the floor, sides and ends to guard against freezing. The type of the load is also sized up and mentioned in the report; that is to say, the inspector determines whether it is a vertical or an offset load and whether it is spaced or not. Mention is also made of the number and approximate dimensions of the channels left in the car for the circulation of air, together with their comparative regularity.

In describing the contents of the car, our men note the variety of the commodity, its quality, color, size, pack and general condition. To illustrate, we base the condition of the pack on the height of the cover of the container above the contents, and this is described as high, medium, flat or slack. When the commodity in question is fruit, its degree of ripeness is classified either as hard green, green, hard ripe, ripe, soft ripe, over-ripe, or decay. When the degree of ripeness is noted as past ripe, bruising occurs rapidly and the tendency toward this condition is also reported.

### Qualifications for an Inspector

From the nature of the information required by this sort of inspection, a conclusion can be drawn as to the qualifications necessary for a competent inspector. We prefer men who have had actual experience in growing and shipping perishable produce, supplemented by a four year course in an agricultural college where opportunity has been given for studying plant pathology.

In conducting inspections at points of origin, we take into consideration the amount of territory which can be covered profitably by the individual inspector. We also determine the percentage of the total number of shipments which must be inspected in order to give us a comprehensive knowledge of the condition in which commodities are offered for shipment at any particular station or in any particular region. It is desirable, of course, that the cost of inspection per car be kept as low as possible. To accomplish this end and to increase the scope of each inspector's activities, we have divided our territory with reference to convenient highways and other transportation facilities, and in addition we have provided our inspectors with automobiles to enable them to cover the maximum number of shipping points. Our inspectors keep in close touch with the agent at each station, and are instructed to pay particular attention to those points at which commodities are frequently offered for transportation in bad condition. They also co-operate with shippers who are experiencing difficulty in loading their products. It is found that the moral effect of the presence of the inspector or the possibility of his appearance at any point without advance information as to his arrival, is very good.

### Number of Shipments Inspected Varies

The percentage of the total number of shipments which can be thus inspected at points of origin varies greatly with the territory and the variety of the commodity. Inspections made at the time of the peach movement in western New York last fall amounted to about 3,500 cars, or approximately 85 per cent of the total shipments. Given this detailed knowledge of the condition of the various commodities offered for shipment, the carrier's liability and the factors affecting the commodity while en route can be determined with a fair

definite limit, provided the exact condition of the commodity is also reported upon its arrival at destination. The inspectors stationed at the principal receiving terminals have the same general qualifications as our inspectors at points of origin. Their duty is to make a complete record of each carload of perishables received. These reports generally are of two kinds: (1) The line-a-car report, which secures data as to the general condition of the car, and which is made after a more or less cursory examination, usually from the car doorway, (2) The detailed report which is made after a thorough inspection of the car. In addition to this close examination, the inspector notes all factors mentioned in the report from the point of origin, and the amount of damage to the load, if there is any, together with its location and probable causes. To illustrate, take the case of injury to potatoes caused by freezing. If potatoes thus injured are distributed throughout the load and are interspersed with unfrozen specimens, it is a clear indication that the injury occurred before the shipment was loaded. On the other hand, if most of the damaged potatoes are along the floor, the side walls or at one end of the bunkers, we know that the injury has been received in transit. Terminal inspectors make these detailed reports only upon request of the consignee or in the event that the line-a-car examination reveals extensive damage to the contents. The consignees of damaged shipments request these inspections at all of our terminals since notations concerning the damage existing are not made on paid freight bills unless the detailed examination has been called for. Without a damage notation on his paid freight bill, the consignee has no acknowledgment from the carrier of the existence of damage in the event that he presents a claim. We frequently make joint inspections with consignees, and the information thus obtained is not only reported and recorded in a track book, but is supplemented by photographs.

#### Full Use Made of Information

Once having collected this information as to the condition of commodities offered for shipment and received at destination, it becomes necessary for us to centralize the data and classify it in order to determine the causes for damage and the means of remedying them. To accomplish this end each inspector reviews his reports weekly and sends a written summary to the central office. This summary, stating the number of inspections and the variety of the commodities, makes clear the principal causes and the extent of all damage, and any unusual features which may have been noticed. From these weekly statements, supplemented by copies of the inspection reports themselves which are called for from time to time, we find it possible to classify causes for damage to perishables into three general groups as follows: (a) Bad

practices in the preparation of commodities for shipment. (b) Improper loading practices. (c) Faulty refrigeration.

In attempting to correct cases of faulty individual practices, we find it advisable to take the matter up with the shipper or consignee responsible, either by mail or through a personal call from one of our inspectors. If the trouble is occasioned by improper methods of loading, we try to persuade the shipper to adopt methods that have been proved efficient by experience. This we accomplish by means of blueprints and actual demonstrations by our inspectors of the best means for preparing shipments for loading. On the other hand, if the damage is due to faulty containers, we take it up not only with the shippers but also with the package manufacturers. In some instances it has been found possible to devise an entirely new container where the old one has been found unsatisfactory. This is true in the case of the New York celery crate which we found too large to afford proper refrigeration of the celery in storage, and too weak to hold together during transportation with the large amount of celery which it contained. A smaller size package has been designed and is proving so popular with a large majority of New York shippers that it is rapidly replacing the old crate. In this instance, too, we found the package manufacturers anxious to co-operate in every way.

When damage is caused by general field conditions, such as the prevalence of brown rot in peaches, we issue circulars and instruct all our inspectors to make organized efforts, urging that particular attention be paid to removing this trouble in the packing houses. In other instances if a change in the entire method of loading is necessary, we prepare blueprints and illustrations in circular form for distribution throughout a given region. Where damage is caused by improper refrigeration, the matter is reported to the supervisor of refrigeration who in turn issues orders to the particular icing station or officer responsible.

#### Satisfactory Results Obtained

The results of this inspection service on the New York Central Lines have been very satisfactory from our standpoint, and there is every indication that the service is meeting with approval from shippers and consignees. In the first place, there has been an actual increase in the receipts of perishable freight at our terminals under this system. Secondly, the reliable consignees and shippers are co-operating heartily with our inspectors in making inspections at destination. As an evidence of their attitude, one of the principal receivers at a large terminal, in filing claims for damage, has simply presented these to our claim agent with the request that he be allowed whatever damage was shown by the inspector's report.

New Eight-Wheel Switcher for the Illinois Central

Twenty-five of these engines have recently been delivered by the Baldwin Locomotive Works. They resemble closely the N. I. R. A. design but have increased grate area and firebox heating surface. The total weight in working order is 221,700 lb., tractive effort 51,000 lb., evaporative heating surface 2,782 sq. ft., and superheating surface 658 sq. ft.

# Locomotives for Federated Malay States Railways

Prompt Delivery and Success of Previous Shipment Secures  
Additional Order for American Builders

THE FEDERATED Malay States Railways during the four years of the war, deferred placing even the most essential orders for locomotives and rolling stock because of the enormous demand for such equipment by the allied governments for military transportation purposes. However, at the termination of the war, these railways had so expanded and passenger and freight traffic had so increased that it was

weighed 177,600 lb., including the tender fully loaded, and were equipped with American superheaters.

These, first American locomotives placed in service in the Malay States, gave such satisfaction that in September, 1920, the railways supplemented their previous order by 20 more engines of two distinct types. This order consisted of 10 Mogul (2-6-0) type locomotives for freight service and 10 six-coupled side tank locomotives (0-6-0) for switching and general freight service.

After being inspected by a representative of Messrs. Rendel,

Mogul Freight Locomotive

necessary to secure as much additional motive power as possible with a minimum delay.

The Federated Malay States Railways own and operate over 1,000 miles of meter gage track. The main line runs practically the length of the Malay peninsula, connecting Bangkok and Singapore. From this main line are various branch lines for local passenger and freight service. The motive power consists of 202 steam locomotives of various types. For the accommodation of passengers, 560 coaches are used and for the handling of freight, 4,154 cars. In addition

Tank Locomotive for Switching

Palmer and Tritton, London, the locomotives, which were built in 58 working days, were shipped on April 23, 1921.

The contract for the 20 engines mentioned was placed in this country on account of the rapid delivery which could be obtained and also because of the excellent service rendered

Pacific Type Locomotive for Federated Malay State Railways

a marine service is operated consisting of steamboats, tugs and ferries, supplemented by the railways' own harbors, docks and wharves.

As the traffic on these railways was so materially augmented during and after the war, an order was placed with the Baldwin Locomotive Works for 12 Pacific (4-6-2) type locomotives for combined passenger and freight service. These locomotives, which were built and delivered in 1919, had 17 in. cylinders with 24 in. stroke, operated by 8 in. piston valves actuated by Walschaert valve gear. They

by the previous order of 12 Pacific (4-6-2) type engines. Due to existing conditions in England and based on statistics obtained from recent deliveries made by British locomotive manufacturers, it would appear that the delay between the receipt of an order and the actual date of delivery is of considerable length.

The locomotives are of the most up-to-date type and have open bar steel frames. American outside equalized steam brakes are applied to all the driving wheels and automatic vacuum brakes to all the tender wheels, with train connections

at the front of the engine and at the back of the tender. These vacuum brakes are designed to interchange and operate with the railways' standard Gresham and Craven system. Hand brakes are applied on the driving wheels of the tank locomotives and the tender wheels of the Pacifics and Moguls.

These locomotives were designed to operate on rails of 3 ft. 3 $\frac{3}{8}$  in. gage, 2 $\frac{1}{2}$  per cent grade, and over curves of a radius of 16 deg. The weights and principal dimensions are shown in the accompanying tabulation.

	Pacific Type 4-6-2	Mogul Type 2-6-0	Tank Type 0-6-0

## Negotiations for Settlement of Government Accounts

WASHINGTON, D. C.

**N**EGOTIATIONS are still in progress between the railroad executives and government officials in an effort to work out a plan for funding for 10 years at 6 per cent the balance of the \$750,000,000 expended by the Railroad Administration for additions and betterments and for expediting the payment to the railroads of the government's indebtedness to them for the federal control period. The figure of approximately \$500,000,000 to be paid to the roads in settlement is frequently used by the government officers and apparently it is their desire to induce the railroads to abate their claims, particularly those for undermaintenance, to some such amount, which probably represents something like the Railroad Administration's own estimate of what it owes the

railroads, using its own theory of its maintenance obligation. Apparently the government is exerting considerable pressure upon the roads to induce them to accept a much lower figure than they claim in return for an agreement to fund their debt by accepting 6 per cent securities for it.

Secretaries Hoover and Mellon are taking an active part in conferences with the committee representing the Association of Railway Executives in an effort to reach a compromise on the claims and numerous other conferences have been held between the two cabinet officers, J. E. Davis, director general of the Railroad Administration; E. E. Clark, chairman of the Interstate Commerce Commission, and Eugene Meyer, Jr., managing director of the War Finance Corporation, to discuss the entire subject and particularly ways and means for raising the necessary cash if a plan of prompt settlement is agreed upon. Messrs. Mellon, Hoover, Davis and Clark made a brief report of the progress of the negotiations to the President on Saturday, July 9, following a meeting of the steering committee of the Association of Railway Executives in Washington the day before, but it was stated that no definite conclusion had yet been reached and that another conference would be held with the executives. There was such a conference on Monday and on Tuesday the steering committee held another meeting on the subject in New York.

A press association dispatch last week which represented the Secretary of the Treasury as having announced that a plan for a settlement for approximately \$500,000,000 had been practically completed seems to have had no more foundation than a statement that negotiations were in progress. The administration is willing to accept railroad securities for the indebtedness of the roads on account of capital expenditures, but as that would increase the amounts which must be paid to effect a cash settlement of the accounts on the other side, it is desirous of an assurance that the claims of the roads will be reduced to a figure which the government considers reasonable and which it feels it can pay under present conditions. Approximately \$200,000,000 is available to the credit of the Railroad Administration and the balance to be paid would require an appropriation by Congress unless it is found possible to carry out a plan that has been discussed for having the War Finance Corporation furnish it by taking over railroad securities now held by the Railroad Administration or the new ones to be given in connection with the funding operation. The administration is particularly interested in bringing about a settlement because of the belief that it would have an important effect on general business conditions to enable the railroads, which normally represent so large a proportion of the purchasing and employing power of the country, to pay their bills and undertake maintenance and other work that would put money into circulation. The railroads are anxious to effect a settlement, but they are confronted with a demand that they sacrifice a large proportion of their undermaintenance claims in order to obtain their money without litigation.

# How Sincerely Do Railroads Want College Men?

## Roads Should "Establish a 'Look to the Future' Policy of Recruiting and Training"

By F. E. Hanson

IN MARION B. RICHARDSON'S LETTER appearing in the *Railway Age* of June 17, it is stated:

(1) That letters received from railway officials on the subject of whether or not the railroads want college men state "that the college man does not come up to expectations in most cases and that railroad work requires men of certain temperament and qualifications."

(2) That one letter in particular stated, "that the railroads wanted students who had received good grades in their studies and had also taken an active part in athletics and campus activities."

From these letters Mr. Richardson states, "It appears that the railroads must have the highest grade of material available," and he suggests a means of establishing relations between the railroads and college students whereby the students will know what the railroads want and the railroads will be able to get the material which they desire or need.

### Poor Recruiting Methods

In regard to the statement that "the college man does not come up to expectations in most cases." Just consider the method followed by most railroads in recruiting for their technical or engineering departments. It is done very much as the recruiting for the other and non-technical departments is done; namely, consideration is given, except in isolated cases, only to the qualifications necessary for the particular vacancy to be filled. For the lower grades of railway engineering departments a technical education is not essential to the satisfactory performance of the duties required; consequently these grades are for the most part recruited from such bright appearing young men as happen to apply when there are vacancies for rodmen or chainmen. If a college man happens along at the time and is willing to accept the pay offered, he is likely to be given preference over the non-college man but there is no definite effort on the part of the railroads, as a whole, to get the technically trained man who will be able intelligently, as well as satisfactorily, to perform the work, nor are there any special inducements held out to him if he accepts a position under the system.

To this recruiting system, and to the fact that until very recently the railroads have paid less for the lower grades of technical workers than have other employers, can, I believe, be accredited the fact, if it is a fact, "that the college man does not come up to expectations in most cases and that railroad work requires men of certain temperament and qualifications." Under the system only those men with the temperament and qualification enabling them to forget that they have spent considerable time, at some cost, in obtaining a technical education, to "stick around" in the same grades with the non-college men who are obtaining their education at the expense of the railroad and through the helpfulness of their college brothers with no special opportunity offered them for using the education, will stay in railroad work. Those not having this temperament and qualification seek employment elsewhere where the fact that their technical knowledge is an asset is recognized from the beginning.

Of those college recruits who are left, after their number is depleted by the above process, there is required, in the face of an apparent lack of any regular system of promotion in grade or advancement in pay, a "certain (super) temperament and qualification" to keep from "going

stale" and taking the attitude of "Let George do it." Those men having this super temperament and qualification are probably the ones that would be recognized in the letters referred to as outside the classification of "Most cases."

### A "Looking to the Future" Policy

In regard to that part of the letter stating that "the railroad wanted students who had received good grades in their studies and had also taken an active part in athletics and campus activities." The letter must have been written by an official of some one of the few railroads which employs a recruiting system looking to the future rather than one which functions only to fill present vacancies. There are some railroads employing such a system as a corporation policy and there are others where the system is temporarily in force through the foresight of the head of the department or sub-department using it. At the present scale of pay there is no reason, from the standpoint of available supply, why all railroads should not adopt this "looking to the future policy" of recruiting to the lower grades of their technical departments. If this policy should be adopted, I think it safe to say that any foundation of fact for the statement that "the college man does not come up to expectations in most cases" would be removed and that the morale of the engineering departments of these railroads would be greatly improved, would be far more efficient and would consequently be operated at less expense to the railroads.

I do not wish to imply that there is no place in railway engineering departments for the non-college man. Deserving men or boys who desire to obtain a technical education and follow a chosen vocation by practical training, together with personal application and study, should be given every opportunity, but they should not be employed at the start at the same scale of pay as the college man nor should they be advanced in pay or grade until they have completely passed both mental and practical tests indicating that they are qualified in the fundamental principles on which engineering work is based and are, therefore, equally capable from a fundamental standpoint with the college man. Moreover, any non-college man employed in this way who does not qualify within fixed time limits in different grades of fundamentals should be dismissed from service as not showing the proper initiative and desire to master the technical principles of the profession or calling which he seeks to follow. By this means only could the morale and quality of an organization employing a "look to the future" policy of recruiting be kept to the standard which such a policy implies.

### Training the College Man

As to Mr. Richardson's suggested solutions whereby the conditions complained of could be remedied and the railroads could get properly qualified men: There can be no criticism of the first two suggestions, but in regard to his third and last one there is some doubt. Any man who can successfully complete the courses in a technical institution of high standing cannot help but assimilate all of the theoretical knowledge which is essential to railway engineering work. There may be isolated positions for which the railroads require men of exceptionally high theoretical ability, but they are so few in number and require such specialized

practical training that they cannot be properly considered in a general discussion of Mr. Richardson's question.

Some years ago one of our large middle western systems adopted a policy of annually employing a limited number of college men for its engineering departments. These men were first assigned to section crews where they were called upon to do regular section-hand work for a period of two to three months. The section foreman was under instructions to teach them the practical principles of track work and the roadmaster to watch them and observe their progress. Could any better method be devised whereby the railroads might be assured of getting men of the required calibre; could any better method be adopted to teach the recruit what constitutes track maintenance, or could there be any doubt concerning a man who successfully completed this part of the training, at section-hand pay, as to whether he knew what constitutes a day's work for a day's pay?

When this period was completed the men were assigned to various minor positions with a view to giving them an opportunity to learn something of the work in the different departments and sub-departments of railway engineering; they served an apprenticeship in practical work, not becoming experts in all branches to be sure, but becoming sufficiently well acquainted with the work of different sub-departments to make them more valuable to the department or sub-department to which they were finally assigned than they could otherwise have been. If such a system is consistently pursued, there can be no doubt that there would result an organization in which there could seldom occur a vacancy concerning the filling of which the head of a department or sub-department need lose any sleep at night. This, it seems to me, is a system or policy which might profitably be adopted by many railroads and whereby they would be assured of the selection of men best fitted for railroad work.

### How to Get College Men

As for the matter of obtaining college men for carrying out such a policy: A frank, open and honest statement of the policy would do it. Let the railroads designate an officer or employee to go before the student bodies of the colleges located in the territory traversed by their road and state their policy and method; tell the students that while they may be potential railroad presidents it will take some time and a good deal of hard work to shed the potential garb; let them know the pay that may be expected in the various grades and how slowly promotions are likely to come, particularly in the first few years;—here it would be well to have some of the professors listening in; gather a few statistics to give them an idea of the pay which they may expect in railroad work compared with that in other industries; inform them that, if they take up railroad work, their day's work will be done as to hours when it is done as to work and then tell them of some of the interesting features of railroad work.

Do this, establish a "look to the future" policy of recruiting and training, live up to the policy, and then let the college men come to the railroads. They will come, and those who stay through the test period will be such that any indictment to the effect that "the college man does not come up to expectations in most cases" will be a false indictment; railway engineering departments will be organized, and railway coaches will ride the rails just as smoothly as they have in the past and at less cost so far as engineering work is concerned.

I believe that the railroads want college men; but how sincerely do they want them? Unless the desire is sufficiently sincere to be felt by those officials who direct corporation policies which department and sub-department heads must follow, it is not sufficiently sincere to alter or correct the conditions of which Mr. Richardson writes.

## Making Screws Hold in Any Material

THERE HAS RECENTLY been placed on the market a device known as the Rawlplug which permits fixing an ordinary screw into any kind of material so that it will hold permanently. By its use screws may be made to hold in metal, plaster, brick, concrete, slate, glass, or in fact any rigid substance.

The Rawlplug is especially advantageous in railroad work in connection with maintenance, signal and interlocking systems and for the original installation of interior trimming and fixtures for both steel and wooden coaches. Its use solves the problem of replacing screws in repair work on the interior of cars, as an old screw can be removed and again put in place permanently in the same hole by simply inserting a Rawlplug before placing the screw. The use of Rawlplugs in metal eliminates the need for tapping and does away with tapping costs.

Rawlplugs are hollow tubes of stiffened, longitudinal strands of jute fibre, so cemented that once in place they never crumble or pulp and are unaffected by moisture or temperature changes. They are installed by first making a hole with any common drilling tool or with the Rawlplug tool in the material into which the screw is to be fixed, this hole being the proper size to receive the Rawlplug with a sliding fit. The plug is inserted into the hole and as the screw is turned home in the plug, the fibre strands expand

A Rawlplug; Several Sizes in Place, with and without Screws; Cross-section Showing Plug Expanded and Threads Cut by Screw

and enter every minute pore of the material, practically becoming an integral part of it. The screw forms a perfect thread in the fibre plug. The threads cannot be stripped but they do permit withdrawing and reinserting the screw in the usual manner whenever desired.

Tests conducted under actual working conditions showed that Rawlplugs withstood a direct pull, expressed in pounds, varying from 150 in plaster up to 600 in iron, or 1,250 in common brick for a number 14, 2 in. screw. These results were obtained by a direct pull and the plugs withstood a correspondingly greater stress in every case for an indirect pull.

Rawlplugs are made in sizes to receive all screws from number 1 to number 32 and are furnished in  $\frac{1}{2}$  in.,  $\frac{5}{8}$  in.,  $\frac{3}{4}$  in., 1 in.,  $1\frac{1}{2}$  in. and 2 in. lengths. For convenience, tools for forming holes for Rawlplugs are made in sizes to correspond with plug and screw sizes. For example, a number 8 tool makes a hole of the proper size to receive a number 8 plug and a number 8 screw. Any type of drill may be used, however, for making the holes to receive Rawlplugs.

Rawlplugs are packed in boxes of 100 plugs of any one or assorted sizes. There are also various complete kits which include plugs, screws and tools. This product is manufactured by the Rawlplug Company, New York, which is represented in the railroad field by the Universal Packing & Service Company, Chicago.

# General News Department

The Railway Equipment Manufacturers' Association has decided on account of present business conditions not to hold a convention this September.

The Railway Claim Agents Association of Texas, embracing membership from the states of Louisiana, Arkansas, Oklahoma and Texas, will hold its ninth annual convention at El Paso, Tex., from July 14 to 16, inclusive.

Express Messenger Frank Beckman was shot and his safe was rifled, when two robbers attacked him in his car on Big Four passenger train No. 44 near Covington, Ind., on July 1, about 2 a. m. The robbers jumped off when the train slackened speed in passing through Veversburg. Reports say the only valuables stolen were non-negotiable securities.

## N.R.A.A.-A.R.E.A. Meetings Moved

### Ahead One Week

Owing to inability to make the necessary arrangements for accommodations at the Coliseum, the National Railway Appliances Association has changed the date for its annual exhibition of railway engineering and maintenance of way equipment from March 20-23, 1922, inclusive to March 13-16, 1922, inclusive. The American Railway Engineering Association is contemplating a similar change in the date of its convention so that they will meet on March 14-16, inclusive.

## Traveling Engineers' Convention Postponed

The Executive Committee of the Traveling Engineers' Association has announced that the annual convention, scheduled to be held at the Hotel Sherman, Chicago, on September 6-9, 1921, has been deferred. There will be a business meeting instead at the same hotel, commencing Tuesday, September 6, at which reports on the following subjects will be considered: Distribution of Power and Its Effect on Operating Costs; Recommended Practice for Conservation of Locomotive Appurtenances and Supplies; What Are the Advantages of Self-Adjusting Wedges, the Feed-water Heater and Devices for Increasing the Tractive Power of the Locomotive in Starting and at Slow Speed? The Best Method of Operating Stoker-fired Locomotives To Obtain the Greatest Efficiency at the Least Expense; A Comprehensive Standard Method of Employing, Educating and Examining Engineers and Firemen; Operation and Maintenance of Oil-burning Engines; Revision of Progressive Examination for Firemen for Promotion and New Men for Employment; Committees on Subjects, Constitution and By-laws and Arrangements. All other committees are asked to attend and be ready to submit their reports.

## Passenger Traffic to Elk Convention

The Elk convention at Los Angeles, Cal., which began on July 11, furnished the Atchison, Topock & Santa Fe and the Chicago & North Western with considerable additional passenger traffic and both of these roads figured in the special train movements both to and from the convention. The Santa Fe ran 14 special trains westbound and has to date 2 special eastbound trains scheduled. Some 2,000 passengers were carried to the convention on the special trains. The largest special train movement on this road was from Philadelphia, three trains coming from the eastern city which continued westward over the Santa Fe lines some ten minutes apart and maintaining an on-time schedule throughout the journey without mishap. Other specials handled by this road came from New York, Brooklyn, Baltimore, Pittsburgh, Washington and other points in the east and south.

The North Western had special trains from Chicago, Detroit,

Mich., Indiana and Madison, Wis., with a total passenger carry of some 500, while approximately 300 passengers were carried in special cars on the regular trains. An outstanding feature of this road's business during the convention month is the number of eastbound specials which have been scheduled. The New York delegation, St. Paul, Philadelphia, Omaha, Newark-New Jersey, and the "Purple" and "White" contingents of Brooklyn will return over this road, or a total of 7 special trains, which is unique in that the return passenger travel from a convention is generally scattered and spasmodic.

## Roads Urged to Purchase Coal

Chairman Cuyler of the Association of Railway Executives has written to Chairman Clark of the Interstate Commerce Commission saying that his letter urging the railroads to purchase reserve supplies of coal as early as possible was read at a meeting of the member roads of the association in New York on July 1, and the chairman was instructed to transmit it to all roads with the request that they comply with the request of the Commission in so far as it may be practicable. Mr. Cuyler said it was also ascertained that a very considerable number of roads had already made liberal purchases of coal during the present period.

## Locomotive Equipment Hearings at Chicago

Hearings on the construction and repair of the locomotive equipment of the Chicago & North Western, the Chicago, Milwaukee & St. Paul, and the Chicago, Burlington & Quincy, began at Chicago before Examiner Barclay of the Interstate Commerce Commission on July 6, when the case of the North Western was taken up by the examiner. George W. Hand, assistant to the president of the North Western, when called to the stand, stated that locomotives were sent to outside shops for repair because there were nearly 375 engines out of service and the road was being offered more business than it could handle. "There was never any suspicion, intention or suggestion," said Mr. Hand, "that engines be sent out to punish employees. We tried to keep our own shop forces at par." This was the substance of the testimony of F. H. Hammill, assistant general manager of the road; Robert Quayle, general superintendent of motive power and machinery; R. M. Blackburn, general storekeeper, and F. J. Berck, general purchasing agent.

The chief witnesses introduced by M. C. List, attorney for the Interstate Commerce Commission, were John L. Rogers, mechanical engineer of the Interstate Commerce Commission, and John R. Hale, of the Bureau of Analysis of the commission, who submitted detailed charts on repair costs compiled from the records of the commission. According to Mr. Rogers' testimony, the percentage of defective locomotives of those inspected rose from 53 per cent in 1917 to 65 per cent in 1920, and that of the 83 locomotives sent to outside shops, for repair, most of the units were rated in good or fair condition. Mr. Hale's charts showed a total increased cost charged to the corporation accounts on the 83 locomotives of \$857,282, which showed a large difference both as compared to the cost of repair work in other railroad shops and as compared with cost in the company's own shop. J. B. Sheehan, counsel for the railroad, sought to show that this was due to difference in materials, labor and overhead costs. In closing the case for the railroad, he stated that these alleged excessive cost charges were made of tentative bills and estimates, which had not been accepted by the railroad and were, in fact, a subject of litigation.

On July 8, the Chicago, Milwaukee & St. Paul's case was called. B. B. Greer, vice-president of this road, testified that the St. Paul was obliged to send out the work because of the shortage of boiler makers and refusal of those employed to work between October, 1919, and September, 1920, the St. Paul.

TABLE OF MAY AND FIVE MONTHS OF CALENDAR YEAR

50 compound locomotives to the Baldwin Locomotive Works to be repaired and converted to simple locomotives. It was stated on the witness stand that the repair work was such as to very greatly increase the tractive effort of the engines, the difference being equivalent to 10 additional locomotives at 35,000 tractive effort each. J. N. Anderson, superintendent of shops at Milwaukee, Wis., and R. W. Anderson, superintendent of motive power, also testified. John R. Hale brought in cost charts to show that the 50 locomotives cost \$731,196.84 more to repair in the Baldwin Works than if the work had been done in the St. Paul's own shops. He declared that the St. Paul could do such heavy repairs and that his cost figures had been properly weighed for the difference in wage scales, etc. The allocation of overhead cost on the work in the company's own shops, he said, was negligible. His figures showed that the average cost of 20 locomotives of the first lot sent to the Baldwin Works, December, 1919, was \$27,527.59, compared with \$16,978.37 in the company's own shop, or an average increase of \$10,549.22 per locomotive and a total increase for the 20 of \$210,984.40. L. Olds, director, and M. B. Gregg, member of the research bureau, Railway Employees' Department of the American Federation of Labor, putting in their intervening evidence, called attention to extensive charts and exhibits to prove the concentration of railroad, equipment and banking control in the hands of a few leaders. They also brought in material seeking to show that the high prices of steel maintained during the year, when other commodity prices had been steadily declining, "had been held up with the deliberate purpose of creating a winter of unemployment." Quoting the *Railway Age*, Mr. Olds undertook to show that the failure of the railroads to buy in normal amounts had been one of the principal causes of industrial depression. The carriers, he said, buy about 20 per cent of all commodities and "it is not stating the case too strongly to say that in the past the railroads have been among the worst disturbers of general business conditions." The influence of railroad purchases of raw materials and unemployment was also introduced in detail.

Hearings closed on July 12 with the case of the Chicago, Burlington & Quincy, when Kenneth F. Burgess, attorney for the Burlington, asked that the commission grant new oral hearings at Washington, before the entire commission. New evidence was presented on the last day to show a different, and, it was believed, fairer basis of figuring repair cost other than that indicated by the commission. The new method shows cost in terms of tractive effort ton miles restored instead of comparing locomotive with locomotive.

### Railway Returns for May

The railroads of the United States had a net operating income in May of \$37,246,000, which was approximately \$7,997,000 more than that for April. This is the largest amount earned by the railroads since last November, when their net operating income was \$54,343,793. Eighty railroads—28 in the Eastern, 19 in the Southern and 33 in the Western districts—had operating deficits in May while in April the total was 91.

On the basis of the tentative valuation fixed by the Interstate Commerce Commission for rate making purposes under the Transportation Act, the amount earned in May would be at the annual rate of return of 2.41 per cent compared with 2.2 per cent the previous month, and the carriers fell short by \$55,490,000 or 59.8 per cent of earning the amount contemplated by the Act.

The ratio of operating expenses to revenues during the month fell to 85.4 per cent as compared with 86.69 per cent in April and 87.19 per cent in March. Total operating revenues in May were \$444,566,000 or 2.8 per cent less than they were during the same month in 1920, while operating expenses totaled \$379,715,000 or a reduction of 13.2 per cent. The net operating income was \$37,246,000 compared with an operating deficit of \$5,519,000 in May one year ago.

During the nine months since September 1, 1920, when the guaranty period expired, the net operating income of the carriers has been \$316,302,000, which on the basis of their tentative valuation, would be at the annual rate of return of 2.41 per cent. This sum is \$469,696,000 below the amount contemplated to be earned under the rates established by the commission.

## Traffic News

The Pere Marquette has inaugurated a new local freight service schedule coordinated with the present symbol train system and the plan is expected to provide a more prompt delivery of freight.

The Southern Pacific has placed three new steamships in service since last November and a tank steamer is to be delivered the latter part of 1921. The new steamships are the El Estero, El Isleo and the El Lago, while the tank steamer has been named Tamiahua.

The Baltimore & Ohio reports that, with the week ending June 4, 1,194 carloads of freight had been secured as a result of a campaign on that road by veterans' and other employees' for the solicitation of traffic. The road also reports that a substantial passenger business has been derived through the same agency.

Representative Christopherson, of South Dakota, introduced a resolution in the House of Representatives on July 6 requesting the Interstate Commerce Commission to take up for consideration forthwith the matter of freight rates, giving especial attention to the rates on agricultural products including livestock, with a view of promulgating new and lower schedules.

Shipments of fruits and vegetables throughout the United States this season are greater than last, according to reports received by the Bureau of Markets of the Department of Agriculture. Carload shipments for the season up to June 4, 1921, the report shows, total 367,741 compared with 309,181 during the corresponding period in 1920, or an increase of 58,460 cars.

Notice of a 5 per cent reduction in freight rates on all lines in the state of Michigan, operating south of the main line of the Michigan Central, was filed with the Michigan Public Utilities Commission on July 5. Representatives of the Michigan Traffic League appeared before the commission, following notice of the decrease, to protest against the new rates. They argued that with the present system of zone rates the reduction would simply add another zone to the state and further complicate present conditions.

The output of soft coal during the week ended July 2, according to the weekly bulletin of the Geological Survey, was 7,591,000 net tons, or 125,000 tons less than that of the week preceding. The bulletin says the decline was probably due in part to the approach of the Fourth of July holiday. The cumulative production for the first half of the year was 196,000,000 tons, which is 41,000,000 tons behind the average for the eight preceding years. But, the bulletin says, before concluding that this subnormal production indicates a future shortage, the greatly decreased consumption of coal caused by the depressed condition of industry in general should be considered. Cumulative production is but little less than that in 1914, which was also a year of general business depression. In that year no shortage of soft coal occurred.

The annual convention of the American Association of Traveling Passenger Agents, will be held at the Hotel Utah, in Salt Lake City, Utah, from September 12 to 14, inclusive. C. H. Cutting, assistant general passenger agent for the Los Angeles & Salt Lake, and chairman of the executive committee of the association, announces that the program will begin the morning of September 12 with an address of welcome by Governor Mabey of Utah, while the afternoon will be devoted to a sight-seeing trip about Salt Lake and vicinity, as will the afternoons of September 13 and 14, with business sessions to be held in the morning. Harry M. Cushing is chairman of the local entertainment committee, while H. W. Stoutenborough heads the local reception committee. Gordan G. Noble of Philadelphia, Pa., president of the association, will deliver an address at the opening session.

The board of governors of the Southern Traffic League has requested that the Interstate Commerce Commission make a formal inquiry into railroad freight rates to determine whether their reduction would aid business at this time. The board took the position that the commission should not consider the problem on the basis of mere letters of protest from shippers and carriers, but should institute formal proceedings of investigation, at which the facts can be developed from the sworn testimony and thus bring about a more orderly consideration of the question. In a letter to the commission the board said that whereas the President, Cabinet officers and members of Congress are urging that reduced rates be established as soon as possible, the commission has put itself in a position where it is being criticized for its failure to assist the administration and because of its handling of the problem on a purely informal basis. The letter asserts that if the commission should institute a formal investigation, much futile clamor for reduced rates would cease and, on the other hand, those whose claims are based upon merit would be able to present their arguments in an orderly way and receive a decision that would be controlling.

### Traffic Statistics for April

The number of tons of revenue freight carried one mile by 174 Class I roads in April, not including switching and terminal companies, was 22,783,939,000 as compared with 27,323,760,000 in April, 1920, according to the monthly bulletin of traffic statistics published by the Interstate Commerce Commission. The average haul per road was 190 miles as compared with 185 miles last April. The average revenue per ton mile was 1.334 cents. The revenue passengers carried one mile were 2,832,811,000 as compared with 3,552,683,000. The average miles per passenger per road was 33.98 as compared with 36.09. The average revenue per passenger mile was 3.19 cents.

### Anthracite Shipments—June, 1921

The shipments of anthracite for June as reported to the Anthracite Bureau of Information at Philadelphia, amounted to 6,031,937 gross tons, as compared with 5,793,895 tons in May, an increase of 238,042 tons. Cumulative shipments for the first three months of the present coal year beginning April 1, have amounted to 17,793,297 gross tons, as compared with 17,290,046 tons for the corresponding period in 1920, an increase of a little over 500,000 tons. The average monthly shipments for the present coal year have been 5,931,000 tons, against 5,780,560 tons for the coal year 1920-21, and 5,923,557 tons in the coal year 1919-20, and have exceeded the averages for any preceding years with the exception of the two war years 1917 and 1918, when washery coal recovered from the culm banks furnished a temporary excess supply.

Shipments by originating carriers were as follows:

	June, 1921	May, 1921
P. & R. R. W.....	1,157,738	1,108,478
L. V. R. R.....	1,069,521	1,027,688
C. R. R. of N. J.....	571,213	544,716
D. L. & W. R. R.....	1,009,119	915,191
D. & H. Co.....	763,893	753,039
Penna. R. R.....	441,693	409,027
Erle R. R.....	555,882	630,574
N. Y., O. & W. R. R.....	163,742	153,809
L. & N. E. R. R.....	299,136	291,375
Total .....	6,031,937	5,793,895

The bureau estimates that domestic consumers have in their cellars one and a quarter millions more coal than they had a year ago.

THE CHEAPNESS OF FREIGHT TRANSPORTATION in the New York State Barge Canal was discussed at length in the meeting of the Great Lakes, Hudson & Atlantic Waterways Association at Buffalo, N. Y., on June 29; and representatives of the Standard Oil Company and the General Electric Company told of the advantages they had derived from using the canal for certain classes of traffic. The Standard Oil Company runs barges between Rochester and New York City. The General Electric Company was able to use boats for cargoes in both directions between Schenectady and New York City.

## Commission and Court News

### Interstate Commerce Commission

The commission, upon its own motion has ordered an investigation into the question of the transportation of strawberries by express in carload lots in passenger trains from Florida to northern markets, and of requiring the express companies or the railroads to provide themselves with and furnish refrigerator cars for use in that transportation.

The commission has further suspended until August 29, the operation of an item published in Agent E. B. Boyd's tariff which proposes to reduce from 60,000 lb. to 33,000 lb., the carload minimum weight of sugar, from points in Colorado, Idaho, Kansas, Nebraska and Utah to destinations in Arkansas, Colorado, Iowa, Kansas, Louisiana, Missouri, Nebraska, New Mexico and Oklahoma.

The commission has rendered a decision finding that the charges for the transportation of passengers in sleeping and parlor cars required by state authority to be maintained by railroads within the state of Alabama are discriminatory against interstate commerce and the railroads were ordered to increase these charges by the amount of the increase authorized by the commission in the general rate advance case. The Alabama state commission had ordered a discontinuance of the surcharge for intrastate traffic after December 23, 1920.

The Public Utilities Commission of Kansas has filed a petition with the Interstate Commerce Commission asking a reduction in the interstate freight rates on grain, grain products and hay between all points in the Western group. The petition states that the latest advance in rates of 35 per cent in the Western group "vitiate all attempts at a readjustment toward economic normalcy" and is under present conditions unjust, unreasonable and discriminatory. It is stated that owing to a reduction in the market price of grain and hay unaccompanied by a reduction in the freight rate, the producers of Kansas are financially in a precarious position and that the result is destroying business throughout the West. The members of the Kansas commission, accompanied by members of the Kansas delegation in Congress, were to call on Chairman Clark of the commission on Thursday of this week to present the petition and ask for early action.

The Interstate Commerce Commission has made public a tentative report of an examiner representing the first formal case before the commission involving the reasonableness of rates for the transportation of oil through pipe lines. The examiner finds that the rates for the transportation of crude oil by pipe line from the mid-continent field of Oklahoma and Texas to Franklin and Lacy Station, Pa., are not unreasonable, but that the rule of the Prairie Pipe Line Company requiring shipments to be tendered in quantities of not less than 100,000 barrels is unreasonable to the extent that it requires tenders in excess of 10,000 barrels. The commission was asked to reduce the rates by the amount of the so-called gathering charge covering the transportation from producer's tanks to the trunk line of the pipe line system, which rate when the complaint was filed was 12 cents, but in September, 1920, was increased to 20 cents. The commission was also asked to reduce the minimum to 2,000 barrels. The report says the only evidence offered as to the reasonableness of the rates was certain statistical tables pertaining to the earnings of the pipe line companies. The present minimum was held by the examiner to be unreasonable on the ground that it required an investment on the part of the shipper of approximately \$450,000 for tankage and oil in order to obtain service.

Western state commissions are being asked to join the Kansas Public Utilities Commission in a petition to the Interstate Commerce Commission for a general investigation of rates on grain, grain products and hay on the western railroads. At a conference with the chairman of the Kansas commission and the Kansas

delegation in Congress on July 7, at which the Kansas commission presented a petition asking the Interstate Commerce Commission to reduce the rates. Chairman Clark of the Interstate Commerce Commission asked whether it would be agreeable, if an investigation should be ordered, for the representatives of the grain producing states to appear before the commission in Washington and thus eliminate the necessity for holding various hearings in the different states. After the meeting J. E. Benton, solicitor for the state commissioners' association, telegraphed to the western state commission to get their views, in the hope that the plan of holding a single hearing would expedite the case. Chairman Clark said the commission realized the serious situation in the agricultural states and that it would approach the matter sympathetically. Chairman Reed, of the Kansas commission, predicted a shortage of box cars in Kansas within the next few days. He said the railroads have not furnished as many cars as they have promised and complained because some of the stronger western roads do not make more progress in repairing bad order cars.

### Regulations for Transportation of Explosives

The Bureau of Traffic of the Interstate Commerce Commission has issued the following notice to carriers:

"By amendment to the penal laws of the United States, approved March 4, 1921, the commission is required to formulate regulations for the safe transportation of explosives and various other classes of dangerous articles which shall be binding upon all common carriers that transport such articles by land or by water. Such regulations are law to the carriers as well as to the shippers and they cannot be changed except by act of Congress or by this commission.

"In the interest of safety and in view of the requirements of the statute, it is important that the regulations should be given the widest publicity. For convenience of tariff reference and in the interest of accuracy and authoritative publication such publicity may and should take the form of a separate tariff duly filed with the commission by all carriers affected and regularly posted under the provisions of section 6 of the interstate commerce act. Such a tariff circular may be most economically prepared and filed by a joint agent acting under powers of attorney granted by the respective lines. The Bureau of Explosives, 30 Vesey street, New York, N. Y., has expressed willingness to undertake publication and filing upon due execution of appropriate powers of attorney, and classification committees have endorsed that plan of publication. The bureau is in constant touch with shippers and carriers and seems peculiarly fitted to act as joint agent in this matter. The commission has no especial preference but makes free to express the thought that publication and filing by the bureau will be found more economical and satisfactory. It will expect publication and filing in tariff form within a reasonable time. It will afford the carriers a reasonable opportunity to formulate their plan of publication but some plan must be decided upon and put into effect promptly."

### Personnel of Commissions

Charles F. Staples, who has been associate director of valuation of the Interstate Commerce Commission, has been appointed acting director of valuation. Mr. Staples was formerly chairman of the Minnesota Railroad and Warehouse Commission.

J. A. Little, of the traffic department of the Railroad Administration, who has been in charge of short line adjustments, has been appointed to take charge of rate analyses and the supervision of accounting regulations for the Nebraska Railway Commission. Mr. Little was formerly connected with the North Dakota Commission and during the period of federal control was with the Railroad Administration handling car service matters in the short line section.

### Court News

The State of Texas' temporary injunction withholding the scrapping of the Southwestern railway, extending 27 miles from Henrietta to Archer City, has been set aside by the Federal Court. It is expected that as a result of the decision, the road will shortly be junked.

## Foreign Railway News

### German Interests to Build Railways in Bulgaria

LONDON

Hugo Stinnes, the German industrial leader, has formed a German-Bulgarian company for the construction of railways in Bulgaria. The new work involves some 170 miles of line.

### New Zealand Railway Orders

New Zealand has placed orders with British firms amounting to some \$8,000,000 for 12,000 tons of rails, 2,500 freight cars and 45 locomotives. The New Zealand government has also allocated about \$25,000,000 for the development of hydro-electric works in that country.

### Belgium Makes Lowest Bid on Rails for Argentina

According to Commercial Attaché Feely at Buenos Aires the lowest bids on 7,000 tons of steel rails for the Argentine Government Railways which were opened on May 20 were \$42 (at the current rate of exchange) per metric ton (2,205 lb.) by a Belgian concern and \$44 by a German concern. The lowest American bid was \$58.

### Great Western of Brazil to Extend Lines

The Great Western of Brazil has made arrangements with the federal government for a number of extensions in the states of Parahyba, Pernambuco and Alagoas, the work to be inaugurated within 60 days after specifications are approved. To cover the expense of the work the government will issue some \$24,000,000 of securities (milreis to dollars at par).

### Railway Commission Appointed in Peru

The government of Peru has, according to Commerce Reports, recently appointed a commission to "study the needs of the railways and to formulate changes in the general railway ordinance." The occurrence of several serious accidents lately, it is said, which have been attributed to faulty rolling stock, gave rise to the discussion which brought the matter to the attention of the government. The Minister of Public Works will head the new commission.

### Second Hand Railway Material for Mexico

Second-hand railroad construction material to the value of several million dollars may be purchased by the Mexican government for use upon extensions of the National Railways of Mexico which are now being built, according to advices received here from the City of Mexico. It is stated that former Governor W. P. Hobby of Texas is now in the capital and that he has submitted a proposition to President Alvaro Obregón for the sale of this material. Most of the rails which are offered come from abandoned logging roads in East Texas. Mr. Hobby is also negotiating for the sale of many thousand railroad cross-ties.

### English Coal Strike and the Railways

LONDON

Statistical reports have just been published showing how the first month (April) of the English coal strike affected the railways. The number of passenger journeys, excluding commutation travel, was 16.48 per cent less than in the preceding month and passenger train miles were reduced by 20.38 per cent. The total freight tonnage decreased 67 per cent as compared with April, 1920, and there was a decrease of 62 per cent in ton-miles. The average car load was 3.70 tons as against 5.45 tons in April, 1920, and the average train load was 94 tons as against 133 tons, or a decrease of 32.1 per cent and 29.3 per cent, respectively. The number of freight cars under and awaiting repair on April 30, 1921, was 3.1 per cent as compared with 5.4 per cent at the end of April last year.

## Proposed Extensions of a Mexican Railway

Financial interests which are said to be identified with Wells, Fargo & Company have purchased the Pachuca, Zimapan & Tampico Railroad, according to advices received from Pachuca. It is stated that the owners have taken preliminary steps to extend the line to Tampico, a distance of about 300 miles. Engineers have been in the field for some time making surveys of the route of the proposed extension. At Pachuca direct rail connection with the City of Mexico will be obtained. The project involves difficult engineering and construction work, on account of the almost precipitous decline of the mountains to sea level which the track will have to negotiate. This projected short line between Tampico and the capital has been talked of for many years and several different attempts to build the road have been made. The National Railways of Mexico had the line under construction at the time the Madero revolution was started ten years ago, but the project had to be abandoned on account of the upheaval.

## New General Manager for Great

### Western Railway (England)

LONDON

Felix J. C. Pole has been appointed general manager of the Great Western Railway (England), superseding Charles Aldington, C. B. E., who has been compelled to resign owing to ill-health.

Mr. Pole entered the service of the Great Western Railway in the telegraph department at Swindon in 1891. He passed through the electrical engineer's and civil engineer's departments and in 1904 received an appointment on the general manager's staff, becoming assistant general manager in 1919. Mr. Pole was editor of the Great Western Railway Company's official magazine, and was the first to advocate the "Safety First" movement in Great Britain. He is an authority on labor questions, having been secretary to the company on the staff conciliation boards. He is a member of the Central Wages Board, and a strong supporter of the recent agreement between the railway companies and the trade unions.

## American Concern to Build

### Important Bolivian Railroad

The Ulen Contracting Corporation of New York and Chicago has been awarded a contract by the Bolivian government for the construction of a railway from Atocha, Bolivia, to Villazon on the Argentine frontier. This line will connect the Bolivian system with that of Argentina and will shorten considerably the time necessary to make the trip from this country to Buenos Aires. This connecting line will be 128 miles in length and of meter gauge, the Bolivian standard. The company will not only build the road but also all necessary buildings and will equip its shops and purchase motive power and rolling stock. In financing the work the company has assisted by purchasing \$7,000,000 of bonds from the Bolivian government. Surveys are being made now and work will begin by January 1. The country which the road must negotiate is quite difficult and five years are allowed for the completion of the line.

The Ulen Corporation is at present working on sanitation plants at La Paz and Cochabamba, Bolivia, involving some \$2,250,000. This work is about 50 per cent completed. The company is also building the 18-mile Shandaken water tunnel for the New York Board of Water Supply.

## Spanish Railway Bill Proposes

### Government Ownership

Senor La Cierva, Minister of Public Works of Spain, has presented in the Spanish congress a bill providing for the gradual Nationalization of the railways of Spain, according to the Railway Gazette (London). The concessions to private lines were for 99 years and most of them have 40 years to run. This time has been reduced to 30 years in the new bill, giving the government the right, however, to foreclose at any time by the purchase of the outstanding capital stock at the rate of the average dividend for the past 10 years based on a 25 years' purchase.

Meanwhile the government is to enter into a partnership

with each company, each company to contribute its present capital stock and the government to contribute the funds it has already advanced and advances hereafter for increased wages and improvements. The capital thus contributed by the railways will receive a guaranteed dividend equal to the average for the past 10 years, but not more than 3 per cent. The first distribution of profit is to be 5 per cent to the government on its contribution. After the payment of the guarantee to the owners and the 5 per cent to the government there is to be paid a preference dividend to the owners and the government (that of the government to be 2 per cent on its investment) out of the remaining funds. There is to be a further dividend of 1 per cent to the companies and a bonus of 1 per cent to the personnel, if the funds are available, and further profits are to be distributed pro rata between the companies and the government.

Rates are to be fixed to pay all expenses, but the state may fix an unremunerative tariff on guaranteeing to cover the resulting deficit. Foreigners may not number more than one-third the board of directors of any company and no equipment or supplies to be had in Spain are to be purchased abroad. The operation of the roads is to be managed by a "Supreme Railway Council," on which representatives of the government, the owners, the employees and the public are to sit. Provision is made for the issue of loans for additions and improvements.

## John Fritz Medal Awarded to

### Prominent English Metallurgist

As the seventeenth recipient of the John Fritz Medal, Sir Robert A. Hadfield, Bt., D.S., D.Met., F.R.S., was honored at the engineering conference of the Institution of Civil Engineers,

England, on June 29. Sir

Robert was unanimously

chosen metallist for the

year 1920, by the John

Fritz Medal Board of

Award for his invention

of manganese steel. The

presentation was made

by a committee made up

of Ambrose Swasey,

president, Warner &

Swasey Company, Cleve-

land, and chairman of

the John Fritz Medal

Board of Award, who

delivered the presenta-

tion address; Dr. Ira N.

Hollis, president,

Worcester Polytechnic

Institute, who presented

a memorial address on

behalf of the United En-

gineering Societies;

R. A. Hadfield

Charles T. Main, representing the American Society of Civil Engineers; Dr. F. B. Jewett, representing the American Institute of Electrical Engineers; Christopher R. Corning, delegate from the American Institute of Mining and Metallurgical Engineers; Colonel Arthur S. Dwight, representing the American Institute of Mining and Metallurgical Engineers; John R. Freeman, past president of the American Society of Mechanical Engineers, and Charles F. Rand, member and secretary of the John Fritz Medal Board of Award. The presentation was attended by George Harvey, the American Ambassador to Great Britain, Lord Bryce and by high officials of the British government.

Sir Robert was born at Sheffield, England, November 2, 1859. He was educated at the Sheffield collegiate school and entered his father's works in 1876, becoming chairman and managing director of Hadfields, Ltd., in 1888. His discovery of manganese steel dates from the year 1882. Sir Robert is a past president of the British Iron and Steel Institute, a past president of the Faraday Society and is an honorary member of many American scientific societies. He was made a baronet in 1917.

Advantage was taken of this occasion by the technical societies of America for officially expressing the obligation which the United States and the world generally owes to the engineers in Great Britain for the part they played in winning the war.

## Equipment and Supplies

### Locomotives

The PEKIN-MUKDEN RAILWAY (China) has ordered 5 Pacific type locomotives, from the Baldwin Locomotive Works.

The CHINESE GOVERNMENT RAILWAYS, reported in the *Railway Age* of April 15, as inquiring for 35 locomotives, have placed an order with builders in Belgium, for 30 Prairie type locomotives, and 6 English type locomotives.

The NATIONAL RAILWAYS OF MEXICO have ordered 8 Mikado type locomotives from the Baldwin Locomotive Works. These are in addition to the 10 Pacific type locomotives ordered from the same builders as reported in our issue of July 9.

### Freight Cars

The TOLEDO & OHIO CENTRAL is asking for prices on the re-paring of 250 steel coal cars of 50 ton capacity.

The TENNESSEE, ALABAMA & GEORGIA has renewed its inquiry for 100 50-ton gondola cars and 150 50-ton box cars.

The WESTERN PACIFIC has ordered 25 30-yard extension side dump cars, of 50 tons capacity, from the Clark Car Company, Pittsburgh, Pa.

The CHICAGO, INDIANAPOLIS & LOUISVILLE has let 100 underframes and 100 gondola superstructures to the Haskell & Barker Car Company. This road is also in the market for repairs on 1,000 gondola cars.

The CHINESE GOVERNMENT RAILWAYS, reported in the *Railway Age* of January 28, as inquiring for from 500 to 1,500 freight cars have placed orders for 300 cars with the American Car & Foundry Company, 600 with the General American Car Company and 240 cars with builders in Belgium.

### Iron and Steel

The GREAT NORTHERN is inquiring for 200 tons rolled steel wheels.

The ILLINOIS CENTRAL is inquiring for 50 tons of locomotive forgings.

The CHICAGO, INDIANAPOLIS & LOUISVILLE is inquiring for 100 tons rolled steel wheels.

The LEHIGH VALLEY has ordered 2,700 tons of steel, for a transfer table at its Claremont, Jersey City, N. J., terminal.

MITSUBI & COMPANY, New York, has ordered from the U. S. Steel Products Company, 1,850 tons of steel bridge material, for the Hanshin Electric Railway, Japan.

### Track Specialties

The CHICAGO, BURLINGTON & QUINCY is inquiring for 200 tons universal plates and angles.

The SOUTHERN PACIFIC is in the market for 4,800 kegs of spikes and 3,300 kegs of track bolts.

The PEORIA & EASTERN is inquiring for 7,000 A. S. C. E. rail wrought iron tie plates f. o. b. its own tracks.

The CINCINNATI NORTHERN is inquiring for 29,900 tie plates for 80 lb. A. S. C. E. rail, f. o. b. its own tracks.

The CLEVELAND, CINCINNATI & ST. LOUIS is inquiring for 155,000 Dudley rail and A. S. C. E. rail tie plates f. o. b. its own tracks.

MITSUBI & COMPANY, New York, has ordered from the U. S. Steel Products Company, 63 sets of railroad switches for the Tokio Municipal Railway.

## Miscellaneous

The GREAT NORTHERN is inquiring for 100 tons of wire products—fencing, etc.

The BALDWIN LOCOMOTIVE COMPANY has been given a large order for locomotive forgings, for export to India.

THE SHANTO RAILWAY has ordered, through Mitsui & Co., New York, from the Consolidated Steel Corporation, 900 steel tires for freight car wheels.

THE NORFOLK & WESTERN will receive bids at Roanoke, Va., until 12 o'clock noon, July 20, for: 18 steel coil engine truck springs; 200 D-bevel soft steel bars; 120 rods of wire fencing; 2,500 pairs 85-lb. steel angle bars; 100,000 tie dating nails; parts for electrical apparatus, and electrical material.

### Signaling

THE CLEVELAND, CINCINNATI, CHICAGO & ST. LOUIS has placed orders with the Hall Switch & Signal Company, Garwood, N. J., for 153 style "LN" upper quadrant, three-position semaphore signals, which will be installed by the railroad company's forces.

### Trade Publications

**WATERPROOFING.**—Bulletin No. 101 issued by the Minwax Company, Inc., New York, describes the structures built by that company in connection with the track elevation project at Tonawanda, N. Y., with particular reference to the manner in which they were waterproofed. Various details of the expansion joints, culverts, gutters, down-spouts, etc., are described and illustrated with sketches. The particular object in mind in the preparation of the matter in this bulletin has been to point out the practical methods of handling the various details involved in the typical waterproofing project.

**BREAKDOWN INSTRUCTIONS, THE YOUNG LOCOMOTIVE VALVE GEAR.**—An eight-page pamphlet, bound in stiff paper cover, has been issued by the Pyle National Company, Chicago, describing the proper methods of procedure in case of the failure of various parts of the valve motion, in order that the locomotive may proceed on one side. Introductory to the breakdown instructions is a clear and concise illustrated description of the operation of the Young valve gear, which in the case of a number of the failures enumerated will continue to provide lap and lead motion on the affected side in addition to complete operation of the valve on the unaffected side.

**LACKAWANNA STEEL SHEET PILING.**—The Lackawanna Steel Company, Lackawanna, N. Y., has issued bulletin No. 109, 172 pages, illustrated, which is descriptive of the various types of sheet piling manufactured by this company and its application to construction work. The bulletin in reality is a text book on the application of sheet steel piling in construction work, wherein water, earth or other material is to be retained as in cofferdams, open caissons, foundations of bridges and buildings, etc. The application of sheet piling to all of these various classes of work is not only described in the written matter but is also illustrated by a large number of photographs showing the actual installations. Other photographs and drawings show all of the various types manufactured by this company as well as the different combinations for which they are adapted. Other sections of the bulletin describe and illustrate various methods for handling the piling under unusual or difficult conditions.

THREE UNIDENTIFIED TRESPASSERS were killed on June 30, when nineteen cars of a Missouri, Kansas & Texas freight train went into a ditch one mile north of Troy, Tex., and were destroyed by fire, originating in an oil car of the train. Two of the cars destroyed carried live stock.

## Supply Trade News

A. F. Zacher has resigned as district manager of the Buffalo office of the Economy Fuse & Manufacturing Co., Chicago.

The Walworth Manufacturing Company has removed its general offices from its Boston factory, First and O streets, to Pearl and High streets, Boston, Mass.

John Hyland has been appointed representative of the Globe Seamless Steel Tube Company, with headquarters in the Fourth National Bank building, at Atlanta, Ga.

The National Machinery Company, Tiffin, Ohio, has opened an eastern sales office in room 637, Knickerbocker building, Broadway and Forty-second street, New York City, in charge of F. J. Mawby.

G. A. Nelson, special representative of the Waterbury Battery Company, of Waterbury, Conn., has been elected vice-president and general sales manager, with headquarters at New York. Mr. Nelson was born in Chicago, and started his business career in that city with E. W. Gillett. In 1896 he was in Toronto, Ontario, in temporary charge of the Canadian business of E. W. Gillett, of Chicago. The following year he came to New York to open up and become manager of a branch factory of the Champion Chemical Works, Chicago, grinders and packers of caustic soda and similar chemicals. In 1901 he was elected secretary and treasurer of the Gordon Primary Battery Company, and continued his connection with that company until January 1, 1916, at which time he accepted the agencies for several lines of railway tools and supplies. In March, 1917, he was appointed special representative of the Waterbury Battery Company, and he now becomes vice-president and general sales manager of the same company, as noted above. Mr. Nelson has been an active member at the various railroad conventions. Since 1914 he has been secretary-treasurer of the Railway Telegraph & Telephone Appliance Association.

Victor M. Summa has opened an office as general consulting engineer at 415 Merchants-Lafayette building, St. Louis, Mo. Mr. Summa was formerly in the service of the American Brake Company, St. Louis.

The Dominion Oxygen Company, Ltd., will begin work in July on a new oxygen plant at Montreal, Que., to cost \$250,000. The building will be 100 ft. by 100 ft., and will be a duplicate of the company's Toronto plant.

Barbour, Love & Woodward, Inc., machine tool dealers, formerly at 149 Broadway, has moved its temporary office and warehouse from 131 Washington street to its new offices and show rooms at 45 West Eighteenth street, New York City.

The Badger Concrete Mixer Company of Milwaukee and Watertown, Wis., has purchased a 27½ acre tract of land at Winthrop Harbor, Ill., north of Chicago, where it will erect a factory unit, 80 ft. by 260 ft. One-half of the tract is to be used for the erection of dwellings for its workmen and officers. In addition to its own line the company will manufacture at this plant the McVicker tie plate for the Railway

Safety Tie Company. It is expected that the factory will be completed for occupancy early in the Fall.

The Goddard & Goddard Company, Inc., Detroit, Mich., has opened an eastern sales office and permanent exhibition of milling cutters in the rooms of the Manufacturers Exhibit, Inc., 45 West Eighteenth street, New York. James W. Sederquist, eastern sales manager, is in charge of the sales office and exhibit.

The Dressel Manufacturing Corporation, New York, which is a reorganization of the Dressel Railway Lamp Works, has increased its capital to \$1,150,000 and has plans nearing completion for building a new and larger plant at Buffalo, N. Y. William Smith, who is president of the new corporation, is well known in the railroad field, having been in the railroad and railway supply business for over 30 years. He resigned as vice-president and general manager of the Montana Southern Railway to assume his new duties. F. W. Dressel is vice-president of the new corporation and F. H. Gregory is secretary and treasurer.

The Western Electric Company has opened a new warehouse at 395 Hudson street, New York City. The building occupies the entire square block bounded by Hudson, West Houston, Greenwich and Clarkson streets, an area of 338 ft. by 200 ft., with a total floor space of 706,000 sq. ft. Several departments of the Western Electric have already moved into the new quarters, but the New York shops and the supply divisions of the Eastern district territory, which includes New York, New Jersey, Pennsylvania and the New England states, and the International Western Electric Company will not remove to the same building at the present time.

Crerar, Adams & Company, Chicago, Ill., western sales agent for B. M. Jones & Co., Inc., New York, will in future carry a complete stock of Double Mushet high speed steel, also Titanic carbon tool steels, and can supply Taylors' Best Yorkshire Iron, in Chicago. F. W. Clifford, associated for a number of years with Crerar, Adams & Co., as a tool steel expert, will in future specialize on Mushet and Titanic tool steels. The Connelly & Kendal Company, 115 St. Clair avenue, N. W., Cleveland, Ohio, is now managing the Jones company's Cleveland branch, and R. G. White, who was manager of the Cleveland branch, has been appointed special western representative, with headquarters in Chicago.

## Obituary

Henry S. Manning, who retired in 1905, as senior partner of Manning, Maxwell & Moore, New York, died on July 9, in New York City, at the age of 76. Mr. Manning established the firm of H. S. Manning & Co., New York, in 1880, its name was changed to Manning, Maxwell & Moore, and in 1905, the present corporation was organized. After leaving Manning, Maxwell & Moore, Mr. Manning became interested in the firm of Milliken Brothers, New York. He was a member of the executive committee of the Kansas City, Mexico & Orient Railroad.

Albert Taylor, manager of the North Atlantic district, of the Electric Storage Battery Company, Philadelphia, Pa., died suddenly on July 6. He was taken ill in his office in New York City and died a few hours later in a hospital. Mr. Taylor was born in Liverpool, England, on February 6, 1864, and in 1884, he was graduated from Princeton University. He served an apprenticeship with the Edison General Electric Company and in 1885, joined the United States Electric Company. This company was absorbed by the Westinghouse Company in 1889, and in the Spring of 1890, Mr. Taylor became associated with the Stanley Electric Manufacturing Company, Pittsfield, Mass., remaining in its employ for eight years. In 1898, he entered the service of the Electric Storage Battery Company, as a salesman in its New York office. In January, 1900, he was made assistant manager; in March of the same year he was appointed manager of the New York office, and since February, 1920, he was manager of the North Atlantic district.

G. A. Nelson

## Railway Financial News

**ARKANSAS & LOUISIANA MISSOURI.—Authorized to Issue Stock.**—The Interstate Commerce Commission has authorized this company to issue at par for cash \$1,000,000 of capital stock, the proceeds to be used in acquiring and rebuilding a line from Monroe, La., to Crossett, Ark., formerly owned by the Arkansas & Louisiana Midland.

**ATLANTIC COAST LINE.—Not to Absorb L. & N.**—There has been no consideration of a consolidation of the Atlantic Coast Line and the Louisville & Nashville, according to a statement issued by Henry Walters, chairman of the boards of both companies.

**ATLANTIC COAST LINE.—To Lease California Southern.** This road will take over the properties of the California Southern, under a one-year lease, with an option to buy, effective on August 1. The railroad is 50 miles long and extends from Rice to Ripley and is reached from Barstow via the Santa Fe-Phoenix cutoff.

**BALTIMORE & OHIO.—Authorized to Issue Bonds.**—The Interstate Commerce Commission has authorized an issue of \$1,624,000 of refunding and general mortgage 6 per cent bonds for pledge and repledge from time to time as collateral security for short-term notes. The subsidiaries of the Baltimore & Ohio were also authorized to issue various bonds upon its order to the trustees under certain mortgages.

**CALIFORNIA SOUTHERN.—Leased to A. T. & S. F.**—See Atchison, Topeka & Santa Fe.

**CANADIAN NORTHERN.—Bond Sale.**—A banking syndicate, composed of the National City Company, Guaranty Trust Company of New York, Blair & Co., Inc., Lee, Higginson & Co., Bankers Trust Company and the Continental and Commercial Trust and Savings Bank of Chicago, have sold \$25,000,000 25-year 6½ per cent sinking fund gold debenture bonds at 96½ and interest to yield about 6.80 per cent.

The bonds are non-callable, dated July 1 and due July 1, 1946. A sinking fund of \$500,000 per annum is to be made available in equal installments during each six months for the purchase of bonds in the market, if obtainable at or below par. The bonds are the direct obligation of the Canadian Northern Railway Company which is owned by the government of the Dominion of Canada and forms part of the Canadian National Railways System, which will consist of over 22,000 miles, extending from the Pacific Ocean and reaching every important traffic center in Canada.

**CHARLES CITY WESTERN.—Authorized to Issue Bonds.**—The Interstate Commerce Commission has authorized an issue of \$373,600 of 10-year 6 per cent first mortgage notes, \$200,000 of the amount to be pledged and the remainder to be sold at not less than par.

**CHICAGO, ROCK ISLAND & PACIFIC.—Authorized to Issue Equipment Notes.**—This company has been authorized by the Interstate Commerce Commission to issue \$6,470,230 of rent notes for the purchase of equipment through the National Railway Service Corporation, to guarantee the obligations of the service corporation to the United States for a loan of \$1,568,540 and to pledge securities with the Secretary of the Treasury to secure the loan.

**DENVER & RIO GRANDE.—J. C. C. to Investigate Relations with W. P.**—See article on another page of this issue entitled, "Will Investigate Relations of Western Pacific."

**DENVER & RIO GRANDE WESTERN.—Authorized to Issue Stock.**—See article on another page of this issue entitled, "Will Investigate Relations of Western Pacific."

**EL PASO & SOUTHWESTERN.—Annual Report.**—The corporate income account for the year ended December 31, 1920, compares with the previous year as follows:

	1920	1919
Operating revenues (March 1-Dec. 31).....	\$11,865,369	
Operating expenses (March 1-Dec. 31).....	8,826,313	
Net from railway operation.....	3,039,057	
Taxes.....	1,109,872	
Railway operating income.....	1,928,900	
Miscellaneous operating income (credit).....	4,301	
Total operating income.....	1,924,599	

Income from lease of road.....	689,186	\$4,135,114
Gross income.....	3,524,814	5,599,094
Deduct—Rent for leased roads.....	1,948,859	1,927,032
Total deductions from gross income.....	2,474,500	2,470,384
Net income.....	1,047,314	3,128,710
Dividend appropriations.....	1,097,314	2,000,140

The annual report of the El Paso & Southwestern will be reviewed editorially in an early issue.

**FLINT BELT.—Perc Marquette Applies for Control.**—See Perc Marquette.

**GRAND TRUNK.—Arbitration Proceedings Ended.**—The arbitration proceedings which are eventually to decide the value to be allowed to the English holders of first, second and third preferred and the common stock of the Grand Trunk Railway, now taken over by the Dominion Government, together with actual ownership and control of the whole Grand Trunk system, came to an end in Montreal on July 8. The board has been in session, with one break of eight weeks, since February 1.

**GREAT NORTHERN.—Bond Syndicate Ends.**—The banking syndicate which sold \$230,000,000 Northern Pacific-Great Northern joint 15-year 6½ per cent bonds was dissolved July 5.

**ILLINOIS CENTRAL.—Asks Authority to Issue Bonds.**—This company has applied to the Interstate Commerce Commission for authority to issue and sell \$8,000,000 of 15-year 6½ per cent secured gold bonds and to pledge as collateral security therefor \$8,225,000 of Illinois Central refunding mortgage 4 per cent gold bonds and \$3,820,000 of Illinois Central and Chicago, St. Louis & New Orleans joint first and refunding mortgage 5 per cent bonds. The new bonds are to be dated July 1, 1921, and the company has tentatively accepted an offer from Kuhn, Loeb & Co. to take them at 93¼. The proceeds are to be used to retire maturing obligations. The Illinois Central and the Chicago, St. Louis & New Orleans have also asked authority to issue \$136,700 of their joint 5 per cent bonds to reimburse the treasury for advances for expenditures on the Chicago, St. Louis & New Orleans.

**KANSAS CITY SOUTHERN.—Annual Report.**—The income account for the year ended December 31, 1920, compares with the previous year as follows:

	1920	1919
Operating revenues.....	\$18,668,388	
Operating expenses.....	15,051,665	\$90,477
Net from railway operation.....	3,616,723	
Taxes.....	833,750	100,970
Income from lease of road.....	485,919	3,536,228
Federal guaranty of income.....	1,340,332	
Gross income.....	4,807,939	3,636,425
Interest on funded debt.....	1,883,277	1,835,392
Total deductions from gross income.....	2,883,885	2,102,330
Net income.....	1,924,054	1,534,079
Dividends.....	840,000	840,000
Income balance.....	1,084,054	502,679

The annual report of the Kansas City Southern will be reviewed editorially in an early issue.

**KANSAS, OKLAHOMA & GULF.—Authorized to Issue Bonds.**—The Interstate Commerce Commission has authorized an issue of \$203,478 of 6 per cent cumulative income bonds for the purpose of satisfying claims against the Missouri, Oklahoma & Gulf railway and railroad companies which existed prior to the receivership.

**LIBERTY WHITE.—Asks Authority to Abandon Line.**—This company has applied to the Interstate Commerce Commission for a certificate authorizing the abandonment of 24.2 miles from Liberty to South McComb, Miss.

**LOUISVILLE & NASHVILLE.—Merger with A. C. L. Denied.**—See Atlantic Coast Line.

**MINNEAPOLIS & ST. LOUIS.—Authorized to Issue Equipment Notes.**—This company has been authorized by the Interstate Commerce Commission to issue \$1,593,033 of rent notes under the terms of the contract with the National Railway Service Corporation, to assume obligation as guarantor in respect of obligations of the service corporation to the United States for a loan of \$386,190, and to pledge with the Secretary of the Treasury securities to secure the repayment of the loan.

**MISSOURI, KANSAS & TEXAS.—Authorized to Extend Receivers' Certificates.**—The Interstate Commerce Commission has author-

ized the receiver to extend the maturing of \$3,000,000 of receivers' certificates from February 15, 1921, to February 15, 1922.

**NEW YORK CENTRAL.**—A review of this company's annual report for 1920 appears on another page of this issue.

**NORTHERN PACIFIC.**—*Annual Report.*—A review of this company's annual report for 1920 appears on another page of this issue.

**OREGON-WASHINGTON RAILROAD & NAVIGATION COMPANY.**—*Authorized to Assume Additional Liability.*—This company has been authorized by the Interstate Commerce Commission to assume additional liability upon \$14,755,500 of its outstanding first and refunding mortgage 4 per cent bonds by the modification of the tax covenant therein, and the Union Pacific has been authorized to guarantee the payment of principal and interest thereon. The bonds are to be delivered to W. A. Clark as part payment for his interest in the Los Angeles & Salt Lake.

**PERE MARQUETTE.**—*Asks Authority to Acquire Control.*—This company has applied to the Interstate Commerce Commission for approval and authority for its acquisition of control of the Flint Belt by purchase of its capital stock. The Flint Belt has just been organized to construct a belt line at Flint, Mich.

**PHILADELPHIA & READING.**—*Annual Report.*—The corporate income account for the year ended December 31, 1920, compares with the previous year as follows:

	1920	1919
Compensation accrued under federal control.....	\$2,656,513	\$16,009,826
U. S. Government guaranty.....	7,969,539	.....
Operating revenues (Sept. 1 to Dec. 31).....	38,547,921	.....
Operating expenses (Sept. 1 to Dec. 31).....	31,587,469	.....
Net revenue from operations.....	\$6,960,452	.....
Taxes.....	981,454	.....
Gross income.....	15,514,922	16,351,892
Deductions:		
Rent for leased roads.....	3,488,833	3,480,759
Interest on funded debt.....	1,956,195	1,961,582
Total, including other.....	\$5,874,863	\$6,640,353
Less corporate charges not included above:		
U. S. income taxes Jan. 1 to Aug. 31, 1920, and for year ended Dec. 31, 1919.....	596,000	1,089,515
Corporate expenses, January and February, 1920, and for year ended Dec. 31, 1919.....	33,269	629,269
Net income.....	\$9,010,790	\$8,460,763
Appropriated for investment in physical property.....	2,538,571	4,500,100
Dividends.....	6,372,253	4,248,170
Uneven balance.....	6,430,825	3,960,663

The annual report of the Philadelphia & Reading will be reviewed editorially in an early issue.

**ROCK ISLAND, ARKANSAS & LOUISIANA.**—*Authorized to Issue Bonds.*—The Interstate Commerce Commission has authorized the issue of \$227,000 of first mortgage 4½ per cent gold bonds to the Chicago, Rock Island & Pacific for money advanced for certain additions and betterments.

**TENNESSEE & NORTH CAROLINA.**—*Authorized to Issue Stock.*—This company has been authorized by the Interstate Commerce Commission to issue \$250,000 of common stock in payment for the property formerly operated by the Tennessee & North Carolina Railroad, which has been reorganized as the Tennessee & North Carolina Railway.

**TENNESSEE, ALABAMA & GEORGIA.**—*To Be Sold.*—This road will be sold by Special Master Grayson on August 6, under orders issued by the Federal Court at Chattanooga, Tenn. The minimum bid has been fixed at \$400,000. The road, operating 90 miles of lines, has been in the hands of receivers since December, 1920.

**WESTERN PACIFIC.**—*I. C. C. to Investigate Relations with D. & R. G.*—See article on another page of this issue entitled, "Will Investigate Relations of Western Pacific."

**WICHITA NORTHWESTERN.**—*Authorized to Issue Bonds.*—This company has been authorized by the Interstate Commerce Commission to issue \$600,000 of first consolidated mortgage bonds and to pledge them with the Secretary of the Treasury as collateral security for a loan.

**WILLIAMSPORT & NORTH BRANCH.**—*Authorized to Issue Securities.*—This company has been authorized by the Interstate Commerce Commission to issue at par \$200,000 of first mortgage 6

per cent gold bonds, \$200,000 of non-cumulative 6 per cent preferred stock and \$500,000 of common stock, in full payment for its railroad property, rights and franchises, acquired at a foreclosure sale.

**WISCONSIN NORTH WESTERN.**—*Authorized to Abandon Line.*—The Interstate Commerce Commission has issued a certificate authorizing this company to abandon its line from Girard Junction to Taylor Rapids, 18.3 miles, in the county of Marinette, Wis.

### Guaranty Certificates Issued

The Interstate Commerce Commission has issued certificates for partial payments of the railroad guaranty for six months of 1920 as follows:

Georgia & Florida, \$150,000.  
Chicago & Alton, \$200,000.

Total payments by the Treasury Department under the provisions of the Transportation act, and exclusive of payments made by the Railroad Administration to July 11 were as follows:

(a) Under Section 204, for reimbursement of deficits during federal control.....	\$1,354,339.74
(b) Under Section 209:	
(1) To carriers to which final payment of the guaranty has been made under paragraph (g) including previous advances under paragraphs (h) and (i).....	1,690,114.71
(2) For advances under paragraphs (h) and (i) to carriers as to which a certificate for final payment has not been received by the Treasury from the Interstate Commerce Commission.....	262,950,874.00
(c) Under Section 212:	
(1) For partial payments in respect to the guaranty provided in Section 209.....	159,372,690.05
(2) For partial payments in respect to the reimbursement for deficits during the period of federal control provided in Section 204.....	588,853.02
(d) Under Section 210, for loans from the revolving fund of \$300,000,000 therein provided.....	218,211,667.96
Total.....	\$644,168,538.52

### Dividends Declared

Central of Georgia.—Common, 2½ per cent; preferred, 3 per cent; both payable June 30 to holders of record June 30.

Huntingdon & Broad Top Mountain.—Preferred, 1 per cent, payable August 1 to holders of record July 15.

Pere Marquette.—Prior preferred, 1½ per cent, quarterly, payable August 1 to holders of record July 14.

Baltimore & Ohio.—Preferred, 2 per cent, semi-annually, payable September 1 to holders of record July 30.

Nashville, Chattanooga & St. Louis.—3½ per cent, semi-annually, payable August 1 to holders of record July 23.

THE SALT LAKE CITY PASSENGER ASSOCIATION held its first dinner session at Salt Lake City, Utah, on June 27, and a constitution and by-laws were adopted and a general plan outlined to furnish tourists in Salt Lake with suitable information.

Income balance for year—transferred to profit and loss	\$5,476,736.74	\$1,734,183.31	D \$3,742,553.43

"In arriving at "Total operating income" and "Total nonoperating income" Federal items for 1919 amounting to \$18,353,506.64 and for 1920 to \$4,002,909.68 have been added to corporate items. In arriving at "Total deductions from gross income" Federal items for 1919 amounting to \$1,072,843.99, and for 1920 to \$261,924.42, have been added to corporate items. In order to arrive at the correct "Income balance" for each year it is necessary to deduct the amounts shown above.

### MILEAGE OPERATED

Changes have taken place in the mileage operated as follows:

	Miles
There were added:	
March 1, 1920, Fort Sherman Branch, Idaho, operation reinstated	13.61
Dec. 31, 1920, Crest Northern Ry., Helena to Hyndman, Montana, operation reinstated	2.66
Dec. 31, 1920, Lake Superior Terminal and Transfer Ry. tracks in Superior transferred from side tracks	1.13
Sundry minor changes and corrections	.41
Total additions	17.81
Deductions:	
Dec. 31, 1920, Cuyuna Northern Branch, South, Minnesota, operation discontinued	3.56
Dec. 31, 1920, O.W. R. and N. Co. joint tracks, Gray's Harbor District, Washington, transferred to second track	1.22
Net addition	13.03

Mileage operated December 31, 1919..... 6,642.26

Mileage operated December 31, 1920..... 6,655.29

Average mileage operated during the year..... 6,653.36

### REVENUE TRAIN MILEAGE.

Revenue passenger train miles during the year were 9,977,960, an increase of 306,599 miles compared with the previous year.

Revenue freight and mixed train miles during the year were 11,904,455, an increase of 420,650 miles.

Revenue special train miles during the year were 12,820, a decrease of 5,666 miles.

All revenue train miles during the year were 21,895,235, an increase of 721,587 train miles.

### EARNINGS.

#### FREIGHT BUSINESS.

Freight revenue was \$81,090,389.63, an increase of \$8,155,667.04 or 11.18 per cent compared with the previous year. Freight revenue for 1917 was \$65,258,994.76.

\$85,847,753 tons of revenue freight were moved one mile, an increase of 263,811,353 tons one mile, or 3.48 per cent compared with the previous year.

The average earnings per ton mile increased from .00961 to .01033.

The revenue train load decreased from 660.85 to 659.66 tons. The total train load, including company freight, increased from 752.33 tons to 761.21.

The number of miles run by revenue freight trains was 11,209,167, an increase of 401,421, or 3.71 per cent.

#### PASSENGER BUSINESS.

Passenger revenue was \$22,143,707.94, an increase of \$812,390.48, or 4.00 per cent compared with the previous year.

Mail revenue was \$2,891,069.40, an increase of \$1,938,107.25 or 20.38 per cent; making allowance for hack mail pay received in 1920, there was an increase of \$178,081.03 or 11.87 per cent.

Express revenue was \$2,326,076.90, an increase of \$304,817.35, or 15.08 per cent.

Sleeping car, parlor and chair car, excess baggage and miscellaneous passenger revenue was \$801,527.22, an increase of \$658,486.50, or 460.35 per cent. This increase was caused by The Pullman Company not paying any portion of earnings to railroads in 1919.

Total revenue from persons and property carried on passenger trains was \$27,162,381.46, an increase of \$3,713,801.58, or 15.84 per cent compared with the previous year. Total revenue from passenger trains in 1917 was \$18,874,197.67.

The number of passengers carried was 8,447,966, a decrease of 185,620 over the previous year, and the number of passengers carried one mile was 719,445,961, a decrease of 20,189,636, or 3.50 per cent.

The number of miles run by revenue passenger trains was 9,977,960, an increase of 306,599, or 3.17 per cent.

The average rate per passenger mile was 2.939 cents against 2.716 cents last year.

### EARNINGS AND EXPENSES PER MILE OPERATED.

	1917	1918	1919	1920
Operating revenues per mile	\$13,526.37	\$15,594.28	\$15,282.27	\$16,406.59
*Operating expenses per mile	8,171.39	10,857.13	11,934.71	15,177.88
Net operating revenue per mile	5,354.98	4,737.15	3,347.56	1,181.71
*Taxes per mile	1,059.52	1,236.01	1,365.42	1,519.34
Net	\$4,295.46	\$3,501.14	\$1,982.14	\$299.37

### RATIOS.

Operating expenses to operating revenue 60.41% 69.62% 78.10% 89.30%

Taxes to operating revenue..... 7.83% 7.93% 8.93% 8.94%

\*The corporate expenditures for expenses and taxes are included in order to make proper comparison between the four years, 1917, 1918, 1919 and 1920, and for the same reason are also included in the ratios.

### OPERATING EXPENSES.

#### CONDUCTING TRANSPORTATION.

The charges for transportation expenses were \$48,439,001.28, an increase of \$10,164,538.53 or 26.56 per cent, as against an increase in total operating revenue of 12.25 per cent. The charges for 1917 were \$28,531,412.99.

#### MAINTENANCE OF EQUIPMENT.

The charges for maintenance of equipment were \$25,593,923.34, an increase of \$5,784,804.48 or 29.20 per cent. The charges for 1917 were \$11,245,120.34.

#### LOCOMOTIVES.

Total number of locomotives on active list December 31, 1919, the date of the last annual report.....	1,406
Additions:	
Locomotives purchased.....	61
Locomotives remodeled.....	4
	65
Deductions:	
Locomotives sold during the year, from active list.....	1
Locomotives dismantled and withdrawn from service.....	24
	25
Total locomotives on active list December 31, 1920.....	1,446
In addition to the locomotives on active list there were:	
Withdrawn from service and on hand December 31, 1919.....	39
Withdrawn from service during the year.....	23
	62
Less—Dismantled during year.....	22
Rebuilt and reinstated on active list.....	4
	26
Leaving on hand locomotives withdrawn from service which may be sold.....	36
Of the 71 locomotives, the purchase of which was authorized during the year, 6 Mallet and 4 Switching, have not been delivered.	

#### PASSENGER EQUIPMENT.

On December 31, 1920, the Company owned 1,041 passenger train cars, a decrease of 23 cars, destroyed or transferred to other classes during the year.

Of the 1,041 cars owned, 710 were not due in shops for two months or more.

No additional passenger equipment is under contract for construction or is building at company shops.

## FREIGHT EQUIPMENT.

Of the total number of freight train cars on the road on December 31, 1920, 3,322, or 7.04% were in need of repairs requiring one hour's labor or more per car; and 2,419, or 5.13%, required heavy repairs or in excess of twenty hours' labor on each car.

## MISCELLANEOUS EQUIPMENT

The purchase of 90 cacheous cars has been authorized, none of which have been delivered.

## MAINTENANCE OF WAY AND STRUCTURES.

The charges for maintenance of way and structures were \$2,012,798.18, an increase of \$4,789,142.79, or 29.52 per cent. The charges for 1917 were \$1,072,178.23.

## GENERAL.

## FINANCIAL RESULTS OF OPERATION.

During the first two months of 1920 your property remained under Federal control. The compensation under contract with the United States Government for this period was \$5,301,309.04, out of which your company was obliged to assume operating expenses and war taxes amounting to \$696,097.69, leaving net compensation of \$4,605,211.35. The net railway operating income accruing to the Government from the use of your property was \$3,741,045.26.

As a result of the Government guaranty to your company for the succeeding six months there was included in the income account \$14,760,606.14. In actual operation there was a deficit for this six months' period of \$1,238,010.96.

For the last four months of the year the net railway operating income was \$6,142,521.61.

It is thus apparent that while the amount actually accruing to your company for the first two months from the use and operation of its property was \$2,470,328.14, its actual net railway operating income was only \$7,949,458.22.

The operating revenues, \$113,084,407.78, were the largest in the company's history and the decrease in total operating income was due entirely to the great increase in operating expenses (due largely to higher wages and prices of fuel and materials), and to increase in taxes.

## CLAIMS FOR BALANCES DUE FROM GOVERNMENT.

Your management has reached an agreement with the Director General of Railroads as to the balance due to your company in connection with the use of its property during the period of Federal control ending February 29, 1920. Under this agreement your company will receive at once \$9,000,000.00.

The check of the quantities of material and supplies turned over to the Director General at the commencement of Federal control, and of the quantities returned to your company at the end of Federal control, has not been completed. Your company will receive, in addition to the amount above stated, the balance found due to it for the value of material and supplies delivered to the Director General for which he has not made settlement.

Your company has also presented to the Interstate Commerce Commission, under the provisions of the Transportation Act, its claim for an amount which, when added to its net railway operating income for the six months' period ending August 31, 1920, will equal the amount guaranteed by the Government for that period. On this claim payments amounting to \$12,000,000.00 have been made pending final consideration and settlement.

## VALUATION WORK.

The Bureau of Valuation of the Interstate Commerce Commission has continued the work of valuing your property. The field work in connection with the compilation of the inventory of all of the property owned has been completed and it is understood that under the present program of the Commission preliminary Engineering and Land Reports will be served on the company some time late in 1921.

The number of company employees engaged in this work at the present time is 118 and the compensation for the company's portion of the work up to December 31, 1920, was \$1,399,745.64.

## STOCKHOLDERS AND EMPLOYEES.

On December 31, 1920, there were approximately 36,000 holders of the stock of your company, an increase during the year of 5,235. This makes an average holding of about 69 shares for each stockholder, compared with an average holding on December 31, 1919, of 80½ shares. Average number of employees in 1920 was 35,244 and on March 31, 1921, there were about 27,000.

## LAND DEPARTMENT.

The operations of the Land Department for the year 1920 are shown on pages 36 and 37. New sales were less by 2,968.90 acres than the acreage included in cancelled contracts. Payments of principal and interest by contract holders were much less than in the previous year. These results reflect the difficult situation which the farming and stock growing industries in territory occupied by your lines have had to confront. The Company's policy has been to treat contract holders leniently, and contracts have been cancelled only when no adjustments could be made.

## OIL DEVELOPMENT.

The year 1920 has shown marked progress in oil exploration in Montana. During the year work was under way on ninety-seven wells in twenty-eight areas throughout the state. Omitting the Elk Basin oil district, which is largely in Wyoming, oil in commercial quantities has been produced in only one distinctively Montana field, the Cat Creek District in eastern Fergus County. On December 31, ten wells were producing oil and fourteen wells were being drilled in which a few barrels of oil have since been brought in. The first oil was shipped out of the district in August and to the end of the year 948 carloads had been shipped, all consigned to Wyoming points. The territory so far proved is quite limited, none of it being within the grant of lands to the Northern Pacific. A small commercial well was brought in on Northern Pacific land in the Devil's Basin District in Musselshell County, north of Roundup, but so far no oil has been shipped. Drilling is being carried on actively at numerous points in Central and Eastern Montana.

Although the oil thus far produced from Northern Pacific lands has been inconsiderable, there are within these lands a number of so-called "structures" of which the geology suggests that oil may be found under them. Your management has considered it unwise to give drilling rights in these lands to third parties, but has been unable to make to their oil bearing possibilities. With that end in view the Absaroka Oil Development Company was formed with an authorized capital of \$1,000,000.00. Control of this company will be retained by your subsidiary, the Northwestern Investment Company; the organization of the company has been completed and the work of examining the lands will be pushed forward energetically.

## SUBSIDIARY COMPANIES.

The Spokane, Portland and Seattle Railway Company, owned jointly by your company and the Great Northern, has settled with the Government for the balance due for the use of its property. No settlement has as yet been reached by the Oregon Trunk, the Oregon Electric, or the Minnesota and International Companies.

## CHANGES IN BALANCE SHEET ACCOUNTS.

The analysis of the accounts reflecting sales of lands granted in aid of construction by the United States and the State of Minnesota, to which reference was made in the last annual report, has been completed and the results are embodied in the general balance sheet statement below.

The entries covering the adjustments of these land grant transactions have been reviewed by the Interstate Commerce Commission and found correct in principle.

Further analysis of the "Investment in road and equipment" account developed that the cost of stocks and bonds of The Manitoba Railway Company to the amount of \$8,199,044.69 had been included in that account, and that a part of the cost of the Great Northern Railway Company to the amount of \$1,389,234.33 had not been included in that account. In accordance with the requirements of the Interstate Commerce Commission proper adjustments have been made.

As a result of these entries "Investment in road and equipment" account has been increased \$17,505,454.36, "Corporate surplus" has been increased \$15,484,873.04, "Funded debt" has been increased \$827,000.00 and other accounts have been changed \$1,193,581.32.

## REFUNDING OF NORTHERN PACIFIC GREAT NORTHERN, C. B. AND Q.

## COLLATERAL, JOINT 4% BONDS.

The joint bonds issued in 1901, when your company together with the Great Northern Railway Company, acquired approximately 97% of the stock of the Chicago, Burlington & Quincy Railway Company, will mature July 1, 1921. The amount outstanding is \$215,227,000.00. For the payment of these bonds your company and the Great Northern Railway Company are jointly and severally obligated.

It was necessary for the two obligor companies to make some provision for refunding this indebtedness, and application was made to the Interstate Commerce Commission for authority to issue the Joint Collateral Bonds of the two companies to the amount of \$230,000,000, payable in 15 years, bearing interest at 6½% per annum. This authority was granted and the new issue has been sold to the public at 90%.

The new joint 6½% bonds are convertible to the extent of \$115,000,000.00 into 6½% bonds of your company, subject under its Refunding and Improvement Mortgage, and to an equal amount into the 7½% General Mortgage Bonds of the Great Northern Railway Company.

The funds derived from the sale of the new issue of joint bonds will be used for the payment at maturity of the joint 4% bonds now outstanding.

## INCREASE IN FREIGHT RATES AND PASSENGER FARES.

In July, 1920, the Interstate Commerce Commission authorized increases in freight rates and passenger fares throughout the United States. The increased rates and fares became effective August 26, 1920, on traffic moving in interstate commerce. Similar increases have since been authorized in all states served by your lines except the State of North Dakota. Proceedings begun to secure such increases in that state are now pending before the Interstate Commerce Commission, and it is believed that they will shortly be brought to a conclusion.

## COMPARATIVE STATEMENT OF PAYROLLS.

On July 20, 1920, the United States Labor Board rendered its Wage Decision No. 2, effective as of May 1, 1920, under which wages for all employees covered by working agreements and properly before the Board, were granted substantial increases in rates of pay. It was necessary to grant similar increases to employees not before the Board. These increases amounted in all to nearly \$11,200,000.00 per annum.

Comparison of your company's payroll for a period of years shows the cumulative effect of the wage increases since the beginning of the war:

Year ended	Total payroll for year ending
Dec. 31 1915	\$24,486,852.00
1916	28,204,609.00
1917	35,877,879.00
1918	49,632,127.00
1919	52,605,396.00
1920	66,503,794.00

## MATERIALS AND SUPPLIES.

There has been a marked advance, within the past five years, in the prices of all materials used in the operation and maintenance of railroads. The following statement shows the extent of this advance in the single item of coal for locomotives:

Year ended	Coal used by Locomotives	Average Cost per Ton	Total Cost
Dec. 31 1915	2,520,215	\$2.566	\$6,466,872.00
1916	2,745,035	3.030	8,317,453.00
1917	2,718,558	3.888	10,548,110.00
1918	2,460,428	4.108	10,089,729.00
1920	2,625,493	4.670	12,271,554.00

Because of difficulties in the eastern coal fields the companies operating coal docks at the head of Lake Superior were unable in 1919 to bring up an adequate supply of railroad fuel from those fields, and it became necessary in 1920 to purchase and use a considerable amount of Illinois coal. Eastern coal brought the highest price ever paid, ranging from eight to nine dollars per ton delivered on docks at the Head of the Lakes.

## TAXES.

Taxes are constantly increasing and become more burdensome from year to year. The following statement shows the amounts charged to Railway tax accruals in each of the four years ending with 1920. It will be noted that the total amount charged in 1920 was more than 46% greater than the amount charged in 1917.

	1917	1918	1919	1920
State taxes	\$5,109,742.57	\$5,865,600.69	\$6,913,707.44	\$8,453,990.33
Federal taxes	\$7,127,242.85	2,264,767.40	2,055,483.31	1,606,591.91
Canadian and miscellaneous taxes	13,742.77	26,654.17	31,546.76	34,104.14
Totals	\$6,510,728.19	\$8,157,083.26	\$8,900,737.47	\$10,108,686.38

\*\$89,657.00 refunded by Government and credited to Profit and Loss.  
 \$89,657.00 refunded by Government and \$181,434.00 abated and credited to Profit and Loss.  
 \$181,434.00 refunded by Government and not charged to Income.

## ST. PAUL TRUST IN DISBURSEMENT MORTGAGE BONDS.

Since the last report your management, exercising the discretion vested in it by Article III of the Agreement of November 15, 1900, between your company and the Guaranty Trust Company, has acquired up to December 31, 1920, \$5,261,000 par value of the outstanding bonds secured by mortgage

on the St. Paul-Duluth Division of your railroad. These bonds were acquired by the use of funds derived from the sale of the St. Paul and Duluth lands. These funds had been invested in Liberty Bonds and a direct exchange was made for the sale of Liberty Bonds for the St. Paul-Duluth Division Bonds of your company. There are still outstanding \$2,819,000 of these St. Paul-Duluth Division Bonds, and the company now has on hand funds derived from the sale of St. Paul and Duluth lands, available for their retirement.

#### EXPRESS CONTRACT.

Effective September 1, 1920, a contract was entered into between your company and the American Railway Express Company, giving to the latter the exclusive right to move express business over your railroad. The contract is terminable at the end of two and one-half years; if not then terminated it runs until September 1, 1925. It provides that your company shall receive all of the net earnings from express transportation over its railroad less a commission of 2½% to be paid to the Express Company.

#### EQUIPMENT TRUST.

It was considered necessary to acquire some additional heavy locomotives and other equipment during the past year, largely to replace units already retired or approaching retirement. To finance this purchase an Equipment Trust was created and \$4,500,000 of Equipment Trust certificates, bearing interest at the rate of 7% per annum were sold. The following equipment was acquired under this trust:

60 Air dump cars.	20 Pacific type locomotives.
300 Hart convertible cars.	20 Switching locomotives.
25 Mikado type locomotives.	6 Mallet locomotives.

#### LOAN FROM GOVERNMENT.

For the purpose of providing additional equipment and additions and betterments to existing equipment and to way and structures, your company filed application with the Interstate Commerce Commission under the provisions of Section 210 of the Transportation Act, 1920, for a loan of \$6,000,000. The application was approved and on November 23, 1920, your company issued note for \$6,000,000 payable in five years with interest at 6% and secured by \$6,000,000 United States Liberty bonds as collateral.

#### CHANGES IN OFFICIAL ORGANIZATION.

On the termination of Federal control Mr. J. M. Hannaford was re-elected President of your company. He held that office until December 1, 1920, when he resigned because of his desire to be relieved from its active duties and responsibilities. Mr. Charles Donnelly was elected to succeed him.

Since the last report, two of the company's most faithful and efficient officers have died. Mr. Thomas Couper, who held the office of Vice President and Land Commissioner at the time of his retirement on October 1, 1919, died at his home in Long Beach, California, on October 20, 1920. Mr. C. A. Clark, Treasurer of the company, and who had been in its service continuously since 1882, died at his home in St. Paul on August 1, 1920. Mr. H. A. Clifford, for many years the company's Cashier, was elected as his successor.

By Order of the Board of Directors.

HOWARD ELLIOTT, Chairman.  
CHARLES DONNELLY, President.

### NORTHERN PACIFIC RAILWAY COMPANY.

GENERAL BALANCE SHEET, DECEMBER 31, 1920.

ASSETS.		LIABILITIES.	
<b>INVESTMENTS.</b>		<b>STOCK</b>

This company received from the Cleveland, Cincinnati, Chicago & St. Louis Railway Company and from the Michigan Central Railroad Company, respectively, their 6 per cent notes dated December 23, 1911, for the

amounts lent to them as above stated, divided into fifteen notes of each company, maturing in equal installments December 23, 1921-35.

For this \$4,850,000 this company gave to the Government its fifteen notes dated December 23, 1920, for \$994,000 each, maturing serially December 23, 1921-35, secured by the pledge of the notes of the Cleveland, Cincinnati, Chicago & St. Louis Railway Company and the Michigan Central Railroad Company, equal in amount to \$994,000 of this company's 6 per cent refunding and improvement mortgage bonds, series B, issued for the purpose of such pledge; \$6,420,000 of 6 per cent deferred equipment trust certificates dated December 23, 1920, maturing in equal installments December 23, 1921-35 issued under agreement dated December 23, 1920, supplementary to the original 1920 equipment trust agreement heretofore mentioned; \$1,000,000 of 4 per cent general mortgage bonds of the Cleveland, Cincinnati, Chicago & St. Louis Railway Company and the 7 per cent demand note of the Lake Erie & Western Railroad Company, guaranteed by this company, which note is in turn secured by the pledge of \$4,189,000 of that company's 6 per cent refunding and improvement mortgage bonds, series A.

The \$11,925,000 loan:

This company is using the proceeds of this loan for the following purposes:

1. For additions and betterments to its way and structures.....	\$5,500,000
2. Loan to the Cleveland, Cincinnati, Chicago & St. Louis Railway Company for additions and betterments to way and structures.....	\$4,560,000
3. Loan to the Cleveland, Cincinnati, Chicago & St. Louis Railway Company, which, in turn, made a loan in the same amount to the Cincinnati Northern Railroad Company to provide for additions and betterments to way and structures and equipment of that company.....	113,000 4,673,000
4. Loan to the Michigan Central Railroad Company for additions and betterments to way and structures.....	613,000
5. Loan to the Toledo & Ohio Central Railroad Company for additions and betterments to way and structures.....	214,000
6. Loan to the Zanesville & Western Railway Company for additions and betterments to way and structures.....	60,000
7. Loan to the Kanawha & Michigan Railway Company for additions and betterments to way and structures and equipment.....	256,000
8. Loan to the Lake Erie & Western Railroad Company for additions and betterments to way and structures and equipment.....	609,000
	\$11,925,000

This company received from the Cleveland, Cincinnati, Chicago & St. Louis Railway Company, the Michigan Central Railroad Company, the Toledo & Ohio Central Railroad Company, the Zanesville & Western Railway Company, the Kanawha & Michigan Railway Company, respectively, their 6 per cent ten-year notes dated December 23, 1920, for the amounts lent to them as above stated, the note of the Cleveland, Cincinnati, Chicago & St. Louis Railway Company for \$4,560,000 being secured by the pledge of the like amount of that company's 6 per cent refunding and improvement mortgage bonds, series B, the note of that company for \$113,000 being secured by the pledge of the 6 per cent ten-year note, dated December 23, 1920, of the Cincinnati Northern Railroad Company, the note of the Lake Erie & Western Railroad Company, the note of the Michigan Central Railroad Company being secured by the pledge of \$507,000, principal amount, of that company's 6 per cent refunding and improvement mortgage bonds, series B, the note of that company for \$613,000 being secured by the pledge of the 6 per cent ten-year note dated December 23, 1920, secured by pledge of (1) the above notes of the Cleveland, Cincinnati, Chicago & St. Louis Railway Company, the Michigan Central Railroad Company, the Toledo & Ohio Central Railroad Company, Zanesville & Western Railway Company, the Kanawha & Michigan Railway Company and the Lake Erie & Western Railroad Company, guaranteed by this company, several of the said pledged notes being, in turn, secured by the pledge of bonds or other collaterals as above shown; and (2) by \$5,500,000 of this company's 6 per cent refunding and improvement mortgage bonds, series B, issued for the purpose of such pledge.

In addition to the funded debt outstanding, there were nominally issued during the year and pledged as collateral, as more fully set forth elsewhere, \$31,494,000 of New York Central Railroad Company refunding and improvement mortgage 6 per cent bonds, series B, and \$6,420,000 of New York Central Railroad Company Supplemental Equipment Trust of 1920 deferred 6 per cent equipment trust gold certificates.

On the payment of the full maturity of \$15,000,000 one-year notes, the \$20,000,000 of New York Central Railroad Company refunding and improvement 4½ per cent bonds, series A, which were pledged in 1919 as pass security for said notes, were returned to the treasury of the company and, upon resolution of the Board of Directors, cancelled.

The changes in the funded debt of the company are shown in the following statement:

Amount as reported on December 31, 1919, which has been increased as follows:	\$671,654,782.46
N. Y. C. R. R. Co., ten-year 7% Collateral trust gold bonds.....	\$25,000,000
N. Y. C. R. R. Co., Equipment Trust 6% notes of January 15, 1920, given to the Director General of Railroads.....	13,674,000.00
N. Y. C. R. R. Co., Equipment Trust of April 15, 1920, 7½% certificates.....	\$36,225,000.00
Proportion allocated to other N. Y. C. Lines.....	18,927,490.05
17,297,509.95	
Ten-year 6% promissory note given to the Secretary of the Treasury of the United States, dated December 23, 1920.....	11,925,000.00
Fifteen 6% promissory notes maturing serially at yearly intervals given to the Secretary of the Treasury of the United States, dated December 23, 1920.....	14,850,000.00 82,746,509.95
	\$754,401,292.41

and has been reduced as follows:

Three-year mortgage favor East Cambridge Land Company, matured and paid off.....	\$100,000.00
Payments falling due during the year and on January 1, 1921, on the company's liability	

for certificates issued under equipment trust agreements as follows:

N. Y. C. Lines Trust of 1907, installment due November, 1920.....	1,492,884.74
N. Y. C. Lines Trust of 1910, installment due January, 1921.....	1,406,413.74
N. Y. C. Lines Trust of 1912, installment due January, 1921.....	688,398.90
Boston & Albany Trust of 1912, installment due October, 1920.....	500,000.00
N. Y. C. Lines Trust of 1913, installment due January, 1921.....	742,117.61
N. Y. C. R. R. Co. Trust of 1917, installment due January, 1921.....	1,117,000.00
leaving the funded debt on December 31, 1920	\$748,354,477.42

In addition to the funded debt outstanding on December 31, 1920, the following loans and bills payable appear on the balance sheet:

War Finance Corporation.....	\$17,500,000.00
Secretary of the Treasury.....	6,500,000.00
Director General of Railroads.....	7,000,000.00
Banks, trust companies and miscellaneous.....	2,432,866.68
Total.....	\$33,432,866.68

On October 25, 1920, the company gave its 6 per cent demand note for \$7,000,000 to the Director General of Railroads to be applied upon the company's indebtedness to the United States for additions and betterments made during federal control. It was agreed that the note should be secured by the pledge of \$7,000,000, principal amount, of the company's refunding and improvement mortgage bonds, series B, to be issued, when authorized by the Interstate Commerce Commission, against additions and betterments made during federal control. Amount of the above the loans and bills payable are renewals or extensions of those shown in the stockholders' report for 1919.

During the year the company acquired 193 shares, par value \$9,650, of the common stock of the Pittsburgh McKeesport & Voughnghien Railroad Company. In this stock the year 1920 were 31,337 shares, par value \$1,566,850, or 39 per cent of the amount outstanding. The Pittsburgh & Lake Erie Railroad Company owns a like amount of this stock.

The capital stock of the Detroit, Toledo & Milwaukee Railroad Company is owned jointly and equally by the New York Central Railroad Company and the Michigan Central Railroad Company. The road of the Detroit Toledo & Milwaukee Railroad Company originally extended from Dundee, Michigan, to Allegheny, a distance of 108 miles. By an agreement dated January 1, 1905, provision was made for the operation of the section between Homer and Allegheny by the Michigan Central Railroad Company and between Homer and Dundee by the Lake Shore & Michigan Southern Railway Company. In 1913, a section of this line between Dundee and Battle Creek, a distance of 49 miles, was sold to traction company, and the remaining mileage of the road was redivided for operation between the Lake Shore & Michigan Southern Railway Company and the Michigan Central Railroad Company, so that the portion assigned to the Lake Shore & Michigan Southern Railway Company was 46.98 miles between Dundee and Moscow and the portion assigned to the Michigan Central Railroad Company was the line between Moscow and Battle Creek, a distance of 47.15 miles. As the original agreement of January 1, 1905, had not been modified, the New York Central Railroad Company and the Michigan Central Railroad Company executed during the year an agreement with the Detroit, Toledo & Milwaukee Railroad Company, effective September 1, 1913, for the operation of the road based on the new division of mileage.

A controversy of long standing with the Western Union Telegraph Company in connection with wire mileage allowances was satisfactorily settled during the year.

In the operation of the Pension Department 255 employees were retired and placed upon the pension rolls. Of these retirements, 161 were retired because of the attainment of seventy years of age and 94 because of permanent physical disability. The number of pensioners who died during 1920 was 187. The number of retired employees upon the pension rolls at the close of the year 1920 was 1,606. The average pension in dollars of these is \$39.61. The total amount paid in pensions during the year was \$615,020.52.

On July 28, 1920, the Board of Directors authorized the execution of a uniform contract for express operations over rail lines with the American Railway Express Company subject to the approval and authorization pursuant to law by order of the Interstate Commerce Commission. The contract was duly executed in behalf of this company, and the approval of the Interstate Commerce Commission having been given, it became effective on September 1, 1920. The contract is in the nature of an experiment, being the outgrowth of the merger of the express companies and other conditions created during federal control. It is for a term of five years and thereafter until the expiration of four months' notice by either party, but may be terminated by this company, on six months' notice, on February 28, 1923, or, under certain conditions, on that date by the express company.

In order to preserve continuity of comparisons, operating revenues, operating expenses and other statistics have for 1919 been shown in detail elsewhere in this report for the full calendar year 1920 regardless of federal control, guaranty period or corporate operation.

The income to the corporation, arrived at by the addition of compensation received under federal control, the guarantee net railway operating income under Section 209 of the Transportation Act of 1920, and the net railway operating income for the four months September to December, 1920, inclusive, was less by \$8,246,181.33 than that received as compensation from the United States Government during the federal control year 1919. The results for the four months of the year 1920 since August 31 have been indicated pro rata the return provided for under the Transportation Act and contemplated in the rate increases granted by the Interstate Commerce Commission.

During 1920 the results of operation of the stockyards at East Buffalo were included in miscellaneous operating accounts while in 1919 they were included in the operating revenue and expense accounts. This is the principal cause of the increase shown in miscellaneous operations.

The decrease in income from lease of road, the increase in income from separately operated properties-profit, the increase in miscellaneous rent deductions, and the decrease in miscellaneous tax accruals are chiefly due to adjustments of accruals, etc., in the accounts and not to greater or smaller income.

Miscellaneous rent income shows an increase of \$263,785.13, mainly due to additional amount accrued during the year on land leased.

Revenue from miscellaneous non-operating physical property decreased \$81,809.33. This is a net account and the decrease is mainly due to the inclusion in 1920 of accumulated charges for expense of operating and maintaining corporate office in the Mail Service and Office Building for the years 1918 and 1919 as well as those for 1920.

The increase in dividend income of \$636,548.38 is principally accounted for by extra dividends declared during the year by the Mahoning Coal Railroad Company and by the Merchants Despatch Transportation Company.

## SUMMARY OF FINANCIAL OPERATIONS AFFECTING INCOME

	Year ended Dec. 31, 1920	Year ended Dec. 31, 1919	Increase or decrease
Compensation accrued for the possession, use and control of the property of this company and its leased lines, as stated in contract with the Director General of Railroads—January 1 to February 29, inclusive....	\$9,300,438.41	.....	.....
Additional compensation accrued additional completed additions and betterments—January 1 to February 29, inclusive.....	237,569.11	.....	.....
Guaranteed net railway operating income under section 209 of Transportation Act of 1920—March 1 to August 31, inclusive.....	\$28,699,177.36	.....	.....

## Profit and Loss Account

BALANCE TO CREDIT OF PROFIT AND LOSS, DECEMBER 31, 1919.	\$87,623,144.87
<b>ADDITIONS:</b>	
Surplus for the year 1920.....	\$1,250,256.33
From United States Government adjustment of mail pay for years 1916-1917.....	1,646,161.61
Profit on road and equipment sold.....	21,899.69
	2,918,317.63
	\$90,541,462.50
<b>DEDUCTIONS:</b>	
Surplus appropriated for investment in physical property.....	\$23,096.20
Depreciation prior to July 1, 1907, on equipment retired during year.....	502,362.54
Loss on retired road and equipment.....	29,121.99
Sundry adjustments (net) and uncollectible accounts.....	53,326.52
	607,907.16
BALANCE TO CREDIT OF PROFIT AND LOSS, DECEMBER 31, 1920....	\$89,933,555.34

Income from funded securities increased \$149,179.14, this being attributable to interest received on old first mortgage bonds of the Kanawha & Hocking Coal and Coke Company, and accrued interest on first mortgage sinking fund bonds of that company received during the year in exchange for the old bonds in connection with a general settlement with the coal and coke company.

The increase of \$694,494.50 in the income from unfunded securities and accounts is largely due to interest received from temporary investment in United States Treasury certificates and other securities, of cash from the sale of equipment trust certificates of April 15, 1920, until such time as the funds were required to pay for new equipment.

The increase of \$22,021.46 in miscellaneous income largely represents profit resulting from the purchase of foreign exchange for payment of dividends.

Rent for leased roads increased \$1,077,449.29. This is almost entirely caused by larger payments to the Mahoning Coal Railroad Company since February 29, 1920. During federal control the company paid, under agreement with the Mahoning Coal Railroad Company, a rental based on 40 per cent of the average annual earnings during the test period, while, since the termination of federal control, the payments have been on the basis of 49 per cent of the actual gross earnings.

The decrease of \$656,801.04 in war taxes is the result of a change in method of accounting since August 31, 1920, war taxes for the last four months of the year having been included in railway tax accruals.

Largely contributing to the increase of \$67,258.47 in charges for loss in connection with separately operated properties is this company's proportion of an increased deficit in operation of the Indiana Harbor Belt Railroad.

The increase of \$1,509,689.16 in interest in funded debt is due to the increase of such debt as noted elsewhere, while the increase in interest on unfunded debt is mainly in that accrued on deferred payments on additions and settlements of road and equipment and on other accounts due the United States Government, this more than offsetting the saving in interest due to the reduction in the short term debt of the company.

The corporate general expenses shown for 1920 represent only those for the months of January and February during which the property was under federal control, expenditures of this character for the remainder of the year being included in operating expenses. This accounts for the decrease of \$639,212.95 as shown.

The net corporate income for the year was \$13,734,687.96, a decrease of \$6,182,562.69 as compared with 1919. After payment of the dividends of 5 per cent and sinking fund deductions of \$16,887, there remained for the year a surplus to be carried to profit and loss of \$1,250,256.33.

Expenditures during the year for improvements on property were as follows:

Improvements on owned property used in operation.....	\$3,776,663.77
Equipment purchased and acquired less equipment retired and transferred.....	3,349,574.02
Improvements on leased property.....	2,137,424.07
Improvements on miscellaneous physical property.....	2,136,678.33

The net increase in property investments during the year 1920 was..... \$11,422,340.19

The cost of the equipment allotted to the New York Central Railroad Company during federal control by the Director General of Railroads and covered by equipment trust agreement dated January 15, 1920, was included in the detailed lists of expenditures for improvements to property contained in the annual reports for the years 1918 and 1919. About one-third of the equipment covered by the New York Central Railroad Company's Equipment Trust established by agreement dated April 15, 1920, was delivered in 1920 and its cost appears in the detailed tabulations in this report. The cost of the remainder of this equipment, which it is expected will be delivered in 1921, will appear in the report for that year.

This company owns 67 per cent of the capital stock of the New York and Harlem Railroad Company and operates its steam lines under lease. The traction lines of the New York and Harlem Railroad Company were operated by the Metropolitan Street Railway Company under a 999 year lease dated June 11, 1896, and following reorganization of the lessee, were operated by the New York Railways Company, as successor, subsequent to January 1, 1912, and by Job E. Heders, Receiver, of the New York Railways Company, after March 20, 1919, until midnight of January 31, 1920, when, by order of the United States District Court, the lines were returned to the New York and Harlem Railroad Company and have since been operated by that company.

On July 22, 1920, in Paris, France, occurred the death of William K. Vanderbilt, concerning whose character and service with this company an appropriate minute will be found on another page of this report.

The Board also records with deep regret the death of Dwight W. Parlee, Secretary of this company, at his home in the Island of New York on February 21, 1920, after forty-four years of service with the New York Central Lines. Edward F. Stephenson was appointed Secretary, effective February 4, 1920.

On January 28, 1920, Messrs. Albert H. Harris and Bertram Cutler were elected directors of this company.

Appreciative acknowledgment is made to all officers and employees of their loyal and efficient co-operation and service.

For the Board of Directors.

AT FRED H. SMITH,  
President.

## Railway Officers

### Executive

**D. M. Swobe** has been elected president and traffic manager of the McClellan River with headquarters at San Francisco, succeeding J. H. Queal, deceased.

**Charles S. Lake** has been appointed assistant to the president of the Chesapeake & Ohio and the Hocking Valley, with headquarters at Richmond, Va., effective June 1. Mr. Lake was born on May 27, 1871, at Front Royal, Va., and received his education at private schools and at the Front Royal Academy. He entered railway service in May, 1885, as a telegraph operator with the Richmond & Allegheny (now a part of the Chesapeake & Ohio) and subsequently served that road and the Norfolk & Western in yard and train service. In September, 1888, he became a dispatcher for the Norfolk & Western and from 1890 to 1897 served in the same capacity on the Chesapeake & Ohio. In January, 1897, he returned to the Norfolk & Western and until 1902 served in turn as night chief dispatcher, general yardmaster and assistant trainmaster at Roanoke, Va., and Bluefield, W. Va. For five years he served as trainmaster and superintendent of the Danville and Washington division of the Southern. He then became superintendent of the New York, New Haven & Hartford, first at Hartford and then at Waterbury, Conn., and served in that capacity until 1912, when he was appointed general superintendent of the Minneapolis & St. Louis. From May, 1914, to June, 1917, he served as general manager of the Seaboard Air Line and left to perform special service for the president of the Erie, where he remained until the period of federal control, during which he served as assistant director, division of operation, and assistant to the director general of railroads. At the expiration of federal control he remained until August, 1920, with the United States Railroad Administration, when he became general manager of the Norfolk-Southern, in which capacity he was serving at the time of his recent appointment.

### Operating

**J. A. Davis**, district superintendent of the Pullman Company, with headquarters at San Antonio, Tex., has been transferred to Louisville, Ky., and has been succeeded by **T. J. Eddings**, who has been district superintendent at Mexico City, Mex.

**R. G. Fagan** has been appointed superintendent of freight protection of the Southern Pacific with headquarters at San Francisco, effective July 1. The work of preventing loss of and damage to freight shipments has been assumed by the operating department.

**J. H. Walsh**, assistant superintendent of the Southern Pacific, with headquarters at San Antonio, Tex., has been promoted to superintendent of the Austin division, with headquarters at Austin, Tex., succeeding **T. T. Player**, who resigned recently. **C. H. Maguire**, trainmaster of the Austin division, with headquarters at Austin, Tex., has been promoted to assistant superintendent, with headquarters at Houston, Tex., succeeding **A. L. Kuykendall**, who was killed recently

in a motor car accident at Houston. **H. F. Kelly**, chief clerk to the division superintendent, with headquarters at San Antonio, Tex., succeeds Mr. Maguire.

**W. J. Edwards**, whose appointment as general superintendent of the Southern with headquarters at Chattanooga, Tenn., was announced in the *Railway Age* of June 10 (page 1378), was born at De Kalb, Kemper county, Miss., in 1866. He entered railway service at the age of 16 as a track laborer with the Mobile & Ohio and was later promoted to track foreman. Mr. Edwards then entered train service as a brakeman and subsequently served as freight and passenger conductor, and roadmaster. In 1914, he was appointed division superintendent at Birmingham, Ala., which position he held at the time of his recent appointment. Mr. Edwards has served continuously with the Mobile & Ohio and the Southern for 39 years, with the exception of one year, when he was in the service of the St. Louis Iron Mountain & Southern as division engineer.

**James H. Aydelott**, whose promotion to superintendent of transportation of the Chicago, Burlington & Quincy, with headquarters at Chicago, was announced in the *Railway Age* of July 2 (page 50), was born in Jersey County, Ill., in 1883. Mr. Aydelott entered railway service as a stenographer and clerk in the mechanical department of the Chicago, Burlington & Quincy at St. Joseph, Mo., in September, 1902. Six years later he was promoted to chief clerk to the division superintendent at St. Joseph. After three years' service in that position, he became chief clerk to the general superintendent, with headquarters at St. Louis, Mo., and one year later was transferred to Chicago as chief clerk to the assistant general manager. In 1916 he was promoted to trainmaster, with headquarters at La Crosse, Wis., and after one year's service at that location he was promoted to superintendent, with headquarters at Hannibal, Mo. During the next three years, Mr. Aydelott served as superintendent at Hannibal, at Omaha, Neb., and at Casper, Wyo., and in August, 1920, was advanced to assistant superintendent of transportation, with headquarters at Chicago, the position he occupied at the time of his recent promotion.

### Traffic

**L. R. Capron** has been appointed assistant freight traffic manager of the Northern Pacific, with headquarters at St. Paul, Minn., effective July 1.

**F. C. Jerome** has been appointed general eastern freight agent of the New York Central with headquarters at New York, succeeding **L. M. Souders**, resigned.

**A. C. Irons**, general passenger agent of the Chicago Great Western, with headquarters at Chicago, has resigned to become associated with the D. H. Howland Sugar Company of Detroit, Mich.

**F. M. Hicks**, comptroller of the Gulf, Mobile & Northern, with headquarters at Mobile, Ala., has been appointed traffic manager, succeeding **T. D. Geohagan**, whose resignation was noted in the *Railway Age* of July 8 (page 941). **L. C. Hollingsworth**, auditor of receipts, with headquarters at Mobile, Ala., has been appointed assistant general freight and passenger agent, with the same headquarters, effective July 2. **J. S. Gibson**, succeeds Mr. Hollingsworth.

### Mechanical

**D. D. Briggs** has been appointed master mechanic in full charge of the mechanical department of the Alabama, Tennessee & Northern with headquarters at Mobile, Ala., effective July 1.

### Obituary

**Dr. Norman H. Morrison**, for 30 years chief surgeon of the Atchison, Topeka & Santa Fe Coast lines, died at his home in Los Angeles, Cal., on July 3, after an operation. Mr. Morrison was 68 years old.

WE GUARANTEE, that of this issue, 9,050 copies were printed; that of these 9,050 copies, 8,150 were mailed to regular paid subscribers, 69 were provided for counter and news company sales, 374 were mailed to advertisers, 82 were mailed to employers and correspondents, and 375 were provided for new subscriptions, samples, copies lost in the mail and office use: that the total copies printed this year to date were 284,250, an average of 9,802 copies a week.

Modern big locomotives have added to the shop's burden.

Ryerson-Conradson Railroad Radial will help lift it.

## A Growing Problem

To perform efficiently, modern locomotives with their numerous improvements and increased number of parts must be properly maintained.

Their maintenance involves work of great variety.

Ryerson-Conradson Railroad Radials are designed for just this kind of work.

Twin motor drive, elimination of bevel gears, reduction by one-half of the number of gears used in the ordinary radial and convenient control—all speed up repair production, and reduce maintenance cost.

The condition of freight cars is steadily growing worse. The total number of cars reported in bad order on July 1 was 354,611, or 15.4 per cent of the total number, as compared with 15.1 per cent on June 15. The number of box cars in bad order was 180,544, and the number of gondolas, 136,144.

### The Condition of Cars Grows Worse

The number of cars of each of these classes reported in bad order showed an increase. These figures are the worst ever reported in the history of American railroads so far as this paper knows. The wage reduction granted by the Railroad Labor Board went into effect on the date on which these figures were reported. The statistics given in the next report will be interesting and significant. Undoubtedly many railroads postponed repairs on all the cars they could until July 1 in order to get the benefit of the reduced labor costs. It would be a healthy sign if the next report should show a reduction in the number of bad order cars. Just how long it will be before a substantial revival of traffic will occur cannot be safely predicted. It does seem, however, that there soon should be a rapid increase in the demand for box cars to move grain, and gondolas to move coal. Both railroad earnings and public sentiment would be adversely affected if the railways should find themselves unable this fall and winter to handle all the traffic of any kind offered because of too much delay in beginning to improve the condition of cars.

In securing the greatest economy in the purchase and use of cross-ties, there are numerous factors to be considered just as in the purchase and utilization of any other material on a railroad. A low first price is by no means the determining factor in all cases and at all times, for there are often many other

### Cross-Tie Purchases and Economy

points which must be taken into consideration in arriving at true economy. It would seem that this should be so well known by this time as not to need repetition, yet from time to time instances come to notice which tend to show that it is not as well known as one might think. Just where the fault lies it is difficult to say. It would seem, however, to rest with the purchasing methods pursued by the roads involved. In the past few years a large amount of information relative to the economical selection of ties has been made available through the research work and the studies of the various committees of such organizations as the American Railway Engineering Association, the American Wood Preservers Association and others. Thus it has become possible for maintenance men and others sufficiently interested to determine the classes of ties that would be most economical for any particular road. In general maintenance officers have availed themselves of this information with varying success, though on some roads little of this accumulated knowledge has been put to effective use. In some cases this may be due perhaps to the fact that the finances of the road are in such a shape that the cheapest tie in first cost is the only tie it can afford to buy. There are other roads, though, that are able to look beyond first cost and yet do not always do so. There is a tendency on some such roads where the specification of ties is largely out of the control or guidance of the tie men of the maintenance department to think in

terms of branch line ties—cheap ties. And on such roads it will be found that usually there are far too many branch line and siding ties for such tracks and far too few good ties available for main line service. The result is obvious—the uneconomical use of ties. The remedy is equally obvious.

The critical period through which the railroads have passed during the last ten months has put a damper on the activities of several sections of the American Railway Association as well as on some of the independent associations of railway men. In some cases the meetings have been abandoned; in others the

### Encourage the Associations

work has been greatly curtailed. While this may not be a serious matter in the case of a technical group subjected to direction by the A. R. A., in the case of an independent association, the failure to hold an annual meeting may readily jeopardize its very existence. This is the case at present with one of the smaller associations composed of men of the foreman and general foreman class, who, because of reductions in compensation and the drastic curtailments of their work by the various roads, have suffered a heavy loss in esprit de corps. As a consequence the officers of this association despair of instilling the necessary enthusiasm in the membership to insure a successful program at this year's meeting. The value of these technical associations of railway men is generally recognized. They constitute a most wholesome influence for loyalty and interest in the welfare of the properties. The railways can ill afford to allow the work of these organizations to lapse because of any lack of encouragement or guidance on the part of the managements.

In examining a list of the officers of the railways of Great Britain a striking characteristic is at once apparent to one

### Recognition of Faithful Service

who ordinarily refers only to such lists of American railroad officers. Directly under the name of every important officer is found the name of his chief clerk, before the subordinate officers are listed. This practice is in strong contrast to the procedure in this country, where in the usual list available to the public not even the names of chief clerks to the highest executive officers are given. The duties of a chief clerk are admittedly of great importance. Upon him depends to a great extent the proper functioning of the property under the supervision of the officer for whom he works. Often the chief clerk's duties take on the characteristics of those of an officer and not infrequently he is called upon to assume the responsibilities of his absent superior. In view of the importance of the position and the recognition accorded it in other countries the question as to whether or not American railroads as a whole are giving adequate recognition or compensation to the chief clerks of our railroads is a natural one. Many of these men naturally take the position that they are not receiving the recognition their service merits and this view is ably expressed in an article written by a chief clerk which appears elsewhere in this issue. At all

events the subject is one of greatest importance and merits the fullest discussion as does any suggestion of injustice in any quarter—and all the more in the case of these men who number so largely among the loyal servants of our railroads.

The Class I railroads of the United States in May, 1921, had a net railway operating income of \$37,080,654, as compared with a deficit in May, 1920, of \$5,429,769. For the first four months of this year the net was \$90,332,121 as against but \$26,400,110 in the first five months of 1920. Even though the

**The May  
Net of  
\$37,080,654**

May, 1921, net represented but 2.41 per cent instead of 6 per cent on the aggregate value of the property used in the service of transportation, the situation has certain favorable aspects, for it indicates that some progress is being made. The difficulty is, however, that too much of this progress has had to be brought about through economies of the most drastic order and represents the severe methods adopted to meet a most difficult problem rather than improvement in the traffic and general situation. The business handled in the first five months of 1921, as is only too well known, has been much less than that carried in the first five months of 1920. The higher freight rates even with the smaller traffic have kept the freight earnings on a par with the 1920 period; the freight earnings in the first five months of 1921 being \$1,547,860,564 and in the same period of 1920, \$1,518,840,239. The total operating revenues, however, have been less. Now, it is well known that with the decreasing traffic, operation cannot be handled as efficiently. The train load cannot be maintained and in general economies in transportation cannot keep pace with the falling off in business. In the first five months of 1921 total operating expenses were \$1,984,693,193, or \$106,209,104 less than the same period of last year. Transportation expenses were \$33,288,859 less. Expenses for maintenance of way and structures, however, were \$51,556,966 less and for maintenance of equipment \$37,689,558 less. It is, therefore, evident that the improvement in net has been too largely due to savings in maintenance rather than to a real improvement in the situation. The stock exchange has a somewhat uncanny way of reflecting improvement or the lack of it in the properties behind the securities in which it trades. The absolute lack of interest in railroad securities at present is probably due to various reasons, but, no doubt, one of them is a recognition of the facts of the case that are here noted.

Analysis of the net earnings for May and the first five months of 1921 taking into consideration some of the major factors which affect them, shows that

**Inadequate Main-  
tenance Affects  
Net**—the emphasis that has been placed on the improvement over the showing in the corresponding month of 1920, is hardly justified. As has been pointed out in a

preceding note, the larger part of the increase in net as compared with last year has resulted from reduction in expenses for maintenance of way and structures of \$51,556,966 and for maintenance of equipment, \$37,689,558. These great reductions would indicate that road bed and equipment were not being kept up. If confirmation were needed, it is to be found in the statistics of the number of employees. The latest figures are for March and in that month less than one-half as many section men were employed as in August, 1920, while the various classes of shop employees show reductions averaging about 25 per cent. It would be interesting to see what the net earnings in May or the five months would have been had the proper amount of work been done on the track and rolling stock. No ready measure of the deficiency in maintenance of way work is available, but the

statistics of bad order cars furnish a rough indication of the deferred expenses in the equipment department. From April 1 to May 1, to take one month, the number of heavy bad order cars increased 36,568. The average cost of properly repairing heavy bad order cars is placed at \$1,000 to \$1,200 each. Assuming that the roads had repaired these 36,000 cars instead of applying bad order tags, taking \$1,100 as the average cost of repairs, the expenses for maintenance of equipment in the month of April would have been increased \$40,000,000 and the net operating income would have been changed into a deficit. Of course many of these cars may be retired, but even so there will be a considerable charge to operating expenses. The results for April are typical of the first six months of this year. In that period the heavy bad order cars increased 139,193 for which the estimated cost of repairs is \$153,000,000. Railway officers realize that the properties have not been kept up to the proper standard in recent months and now that wages have been reduced, the amount of maintenance work is being increased. This will affect the financial results and net earnings may show little increase, despite the reduction in wages. At any rate, it will be extremely difficult to judge whether the roads are on a sound basis financially until maintenance reaches a normal volume.

What apparently is the most valid criticism of the British railway bill which is now in committee is the fact that super-

**British Bill  
Has No  
Guaranty**

vision practically as thorough as outright government control is contemplated under its provisions without the compensating feature, even for the period of transition, of financial responsibility on the part of the government. The justice of this criticism becomes apparent when recent income figures are examined. In April of this year the roads incurred an operating deficit of \$28,472,116, calling for a payment of \$46,386,076 by the government to bring receipts up to the guaranteed return on the basis of the year 1913. In May the deficit was \$25,475,945 and the government's liability \$44,196,665. The situation in which the roads will find themselves next month when government control, and consequently the government guaranty, ceases can scarcely be considered an enviable one. It is doubtful if the most optimistic advocates of the bill could expect the economies hoped for under the consolidations provided by the bill to be great enough to compensate for the cessation of the government guaranty. At any rate the contemplated savings can not be expected to make themselves felt immediately and, until they do, Britain's transportation system will be in jeopardy. Meanwhile the time remaining for the consideration of the bill is becoming shorter and the hope that ample opportunity would be provided for the fullest discussion in committee and on the floor of the House of Commons has all but disappeared.

One of the striking features of the May revenues and expenses of the individual Class I roads—published in last week's issue of the *Railway Age*—was the somewhat remarkable improvement

**The  
Pennsylvania's  
Come Back**

in net shown by the Pennsylvania Railroad. The Pennsylvania, considering it as a road of 7,323 miles, rather than as a system of over 10,000 miles, had a gross income in May, 1921, of \$40,773,400 as compared with a gross in May, 1920, of \$40,408,665 or about the same amount. Its net railway operating income, however, for the month of May was, in 1921, \$3,848,609 as compared with a deficit in May, 1920, of \$5,727,323; in other words there was a difference, or an increase in net of no less than \$9,575,933.

For the first five months of 1921, the net railway operating income was \$6,370,846; in the first five months of 1920, operations resulted in a deficit of \$30,944,101, an increase in 1921 over 1920 of \$37,314,949. The Pennsylvania today is carrying only about 75 per cent of the amount of traffic handled in the early part of 1920. It is, however, apparently keeping the situation well in hand. For one thing, its average train load in May, 1921, was 877 as compared with 887 in May, 1920, and an average for the year 1920 of 880. The per cent of locomotives in bad order in May was 22.8 as compared with 31.1 in May, 1920, or with 28.9 in January. Bad order freight cars were 10.3 per cent in May an increase from 3.9 per cent in January; this indicates a trend in the wrong direction and shows that part of the savings in costs of operation have come in maintenance of equipment but attention may be drawn to the fact that the average percentage of bad order cars in May for the country as a whole was approximately 14 per cent. The Pennsylvania is far from being back where it ought to be, but its progress towards recovery is quite decisive.

It is a well-known fact that, regardless of the conscientiousness of the efforts made, familiarity with a job or problem frequently acts as a deterrent in attempts made towards improved methods of carrying on work. In other words it is possible to get so close to one's own work as to secure a distorted perspective. Probably no class of men suffer more from this handicap than railway division officers. The work carried on under their direction is at all times urgent, leaving little time for the minor officials or foremen charged with its actual prosecution to visit and learn how their neighbors are meeting similar problems. The handicap is general, existing in all departments—mechanical, maintenance of way, engineering, traffic, etc. Various schemes for broadening the vision of the men engaged in a particular line of work have, at different times, been tried out on the roads of this country with the same success that attended a recent experiment made in England where, as reported in the Railway Gazette for May 6, 1921, the London & North Western invited the personnel of the permanent way department to submit suggestions for improving methods generally. The response was generous and several devices for saving both labor and time were received and thus made available for general adoption. Usually such schemes have been somewhat departmental in character, the efforts of a particular road being confined to a single department and often to a single department of a particular division, thus localizing the benefits and leaving the general situation little improved. However, the better methods which have been developed more or less locally seem to indicate that much good might result from making the experiments more comprehensive and to include all divisional work and all divisions of a road.

### Give Your Men the Chance

One of the greatest farces in the history of American railroads was enacted last month. The officers of two hundred railroads met with dummy representatives of the employees and went through the motions of negotiating rules. At the end they were no nearer agreement than at the beginning, for progress was blocked by the instructions which the American Federation of Labor gave to the local labor committees. In the decision on the national agreements the Labor Board said, "Naked presentation as irreducible demands of voluminous forms of contracts regulating working conditions with instructions to sign on the dotted line is not a per-

formance of the obligation to decide disputes in conference if possible." The unions absolutely disregarded this decision. The local committees of employees were governed entirely by instructions from a sub-committee of the National Agreement Committee of the Railway Employees' Department of the American Federation of Labor, which, before the conferences were opened, laid down the procedure that all committees were to follow. It will be recalled that at this time the president of the machinists' union was trying to get into Soviet Russia. Perhaps the sub-committee was not authorized to deviate from the policies laid down before he departed. After trying to arrange conferences with groups of carriers covering certain territories, the local committees on the individual railroads presented to the managements as the proposed new agreement the national agreement, with the exception of those rules dealing with wages. When this was rejected by the railroads, the program outlined by the sub-committee was followed. Almost without exception, the employees refused to accept rules proposed by the railroads and the only portions of the agreement accepted by both parties were those rules in the national agreement which were acceptable to the roads. It is clear that throughout the controversy the roads did not negotiate with their employees, but negotiated through them with the officers of the Railway Employees Department of the American Federation of Labor, who alone were authorized to give a decision on the acceptance of the rules. Will future conferences be a repetition of this nonsensical procedure and will the department heads of all the railroads be obliged to take several weeks from constructive work and spend it in fruitless argument with committees who can take no action without the sanction of union officers? If so, the sixteen points, and in fact the whole machinery established by the Transportation Act for the settlement of labor disputes, will be a mockery.

Two things greatly needed at the present time in both railroad shops and roundhouses are an improved quality of material used for repairs and a higher grade of workmanship in applying that material. It costs just as much to apply poor, as good material and when the former fails consistently in service, more reliable, higher priced material must be purchased, the labor cost of one removal and application being a total loss. During the war, it may have been necessary for the railroads to accept poor material in order to obtain output, but this practice should be discontinued. It results in excessive failures, high maintenance costs and delayed equipment. All railroad materials should be purchased with a view to the use for which intended, price not being the only factor considered. It is becoming more and more the practice for progressive railroads to purchase materials on practical and conservative specifications. Every assistance should be afforded the American Railroad Association committees in writing and passing on specifications and good results will follow if these specifications, once accepted, are rigidly adhered to. The way any material is standing up in service can be determined by checking periodically the amounts ordered against that on hand and what has been used. If certain articles are being ordered in unusually large quantities, this will indicate excessive failures and, therefore, defective design or poor material. It always pays in the end to purchase durable material, owing to reduced maintenance and operating costs, and no matter how cheap the first cost, any material requiring frequent repair, patching or renewal, is expensive. Good workmanship also is essential. If output regardless of quality was ex-usable during the period of the war, that emergency has finally passed and railroad repair shop and roundhouse work should be brought back once

### Good Material and Workmanship Needed

One of the greatest farces in the history of American railroads was enacted last month. The officers of two hundred railroads met with dummy representatives of the employees and went through the motions of negotiating rules. At the end they were no nearer agreement than at the beginning, for progress was blocked by the instructions which the American Federation of Labor gave to the local labor committees. In the decision on the national agreements the Labor Board said, "Naked presentation as irreducible demands of voluminous forms of contracts regulating working conditions with instructions to sign on the dotted line is not a per-

### The Futility of the Labor Conferences

One of the greatest farces in the history of American railroads was enacted last month. The officers of two hundred railroads met with dummy representatives of the employees and went through the motions of negotiating rules. At the end they were no nearer agreement than at the beginning, for progress was blocked by the instructions which the American Federation of Labor gave to the local labor committees. In the decision on the national agreements the Labor Board said, "Naked presentation as irreducible demands of voluminous forms of contracts regulating working conditions with instructions to sign on the dotted line is not a per-

more to a consistently high standard. This can be accomplished only by educating the shop men and developing able, conscientious inspection forces. One railroad official recently said, "It would pay us, I believe, to get better work with less output, than to get high output with low quality workmanship as the latter only adds to the difficulty of maintaining locomotives at enginehouses. Engine failures increase, trains are delayed and operating costs mount."

## The Contracting of Maintenance of Way Work

ONE OF THE DEVELOPMENTS of the last few years in the conduct of maintenance of way work which has received a great impetus during the last few weeks is the performance of certain work of this department by contract. The railways have very generally followed the practice of contracting the construction of new lines or facilities for many years. They have, however, almost universally opposed the contracting of maintenance of way work which in any way affected the operation of trains, preferring to do work of this character with their own forces, over which they had undivided control. Conditions in recent years have caused a number of roads to forego their scruples in this direction.

During the acute labor shortage in 1917 and 1918 several roads contracted with outside parties for the performance of certain work, particularly in the vicinity of the large industrial centers, on the basis of actual cost plus a fixed percentage, thereby allowing the contractor to pay whatever price was necessary to secure the required number of men at the particular location without disturbing the railway's wage rate elsewhere on its system.

In these instances this plan was adopted as a means of increasing the wage rates locally. More recently this plan has again been resorted to for the opposite reason. With the standardization of railway wages throughout the country and the fixing of the wages for common labor at figures considerably above those prevailing in most localities, contractors, who are free to take advantage of the lower wages denied the roads, are able to do work for the railways at marked savings in cost.

This has led to the development of at least three general forms of contract. A number of roads are turning certain work over to contractors with a cost-plus-fixed-percentage arrangement. Other roads are contracting on a force account basis, whereby the contractor is paid on the basis of an agreed price per hour for all men employed. With both of these arrangements the roads secure the benefit of the lower wages at which a contractor can secure labor, while the work is commonly done under the supervision of the same railway officers who would handle it with company forces. A third form of contract which has been adopted by a few roads for several years involves the performance of certain fixed tasks at unit prices. While this last kind of contracting is limited necessarily to those classes of work which can be measured readily, it has the advantages of contracting in general to commend it without the possibility of the abuses which may creep into work that cannot be readily measured. It is a significant commentary on the wage decision of the Labor Board that it has produced conditions resulting in so much contracting of work which heretofore has been done by the railways themselves. The facts show that the Labor Board, like other governmental agencies, cannot set aside the law of supply and demand by arbitrary decisions which disregard obvious economic acts. The fact is, labor can be obtained for section work at lower wages than those fixed by the Labor Board; and it is unfortunate that the Labor Board makes it necessary for the railways to obtain it indirectly rather than directly.

## Reduce the Accumulation of Bad Order Cars

ON MAY 1, Car Service Division reports showed approximately 310,000 freight cars in bad order, or 13.2 per cent of the cars reported on the lines of the Class I railroads. Of these 310,000 cars, 228,200, or 74 per cent, were in need of heavy repairs. On June 1, 341,300 cars, or 14.8 per cent of the cars on the lines of the Class I railroads, were reported in bad order, of which 74 per cent, or 252,682 cars, were in need of heavy repairs. From the middle of April to the middle of June the net surplus of freight cars declined from a high point of over 500,000 to slightly less than 382,000 at an average rate of about 13,000 cars a week. This marked decline in surplus freight cars has been the result of an increase in traffic which, although definite enough, is still materially behind the average seasonal movement for certain commodities, the most important of which are coal and the merchandise and miscellaneous loadings which make up the great bulk of finished products of the country. Another factor which must be taken into account is the probability that as compared with last year's movement, the demand for grain cars will be materially heavier owing to a general desire to market this year's crop promptly.

There is reason to believe, therefore, that even though the general business activity of the country does not completely revive, there is likely to be an accelerating increase in the demand for cars during the next few weeks, particularly for coal cars, which at its climax may be as great as that reached last fall. If such a demand is to be met satisfactorily, large numbers of bad order cars in need of heavy repairs will have to be placed in service. Unless these cars are to be placed in service without the much needed and long deferred heavy repairs, their number cannot long continue to increase, and vigorous measures will have to be taken by all railroads.

The present equipment conditions are in no small part the result of drastic curtailments of expenditures which the roads were compelled to make during the last winter and spring in a struggle for solvency. For most roads interest payments become due on July 1 and January 1, and it is evident that, whatever the results of the struggle during the past six months, they cannot now be changed. It is now time to look ahead and appraise the situation likely to confront the railroads during the next six months. It is evident that whatever the change in general business conditions may be, there must be a material increase in the traffic movement during the coming six months as compared with that during the first half of the year, and that the longer this increase is delayed, the greater and more insistent will be the demand for cars when the increase finally takes place. If the railroads fail to meet this demand because of an abnormally large accumulation of bad order cars, they will deserve and will receive little public sympathy. The carriers cannot now afford to overtax the public's patience.

The greatest need of the railroads from the standpoint of their own interest is a heavy traffic. Should a car shortage accumulate with several hundred thousand freight cars still in bad order, how can any railroad management justify to its stockholders a policy which did not prepare to take full advantage of a heavy traffic when offered?

It should be stated in passing that equipment conditions are no worse on those roads of comparatively weak financial standing than on those that are comparatively strong. But can any management, irrespective of its financial condition, now justify itself in continuing a policy of curtailing maintenance expenditures likely to jeopardize the service which the public has a right to expect as well as the ability of the road to best serve its own interests? An immediate and extensive campaign of freight car rehabilitation should be inaugurated.

## The Farmer and the Railroad Employee

**S**AMUEL GOMPERS and other labor leaders, including leaders of the railway labor unions, are trying to bring about some kind of organized co-operation between the labor unions and the farmers. The purpose would be joint offensive action by the farmers and the labor unions against the railroads and large industrial and commercial concerns. The labor unions would especially like to get the assistance of the farmers in keeping up railway wages and forcing down railway rates. The result would be to bankrupt the railroads and force government ownership and management, or the Plumb plan of employees' management, on the country; and this is what the railway labor unions want.

Organized co-operation between the farmers and the labor unions regarding railroad matters would, under existing conditions, be extremely anomalous. The reasons why it would be so can be made clear by the presentation of a few facts showing the wide differences between the situations in which the farmers, on the one hand, and railway employees, on the other, now find themselves. The farmer usually is both a capitalist and a working man. The investment he has in his land, buildings, machinery, etc., makes him a capitalist. From this point of view he is just as truly a capitalist as the man who has money invested in a railroad or factory. Most farmers themselves perform a large part of the manual work on their farms. From this point of view they are working men. Both the farmer's return on his investment, and the wages for his work, are derived from the money he receives from the sale of his products.

The farmer is working as many hours a day and as many days a year as he was eight years ago. The latest report of the Bureau of Statistics of the United States Department of Labor shows that in June, 1921, the average wholesale price of farm products was only 13 per cent more than in 1913, before the world war began in Europe. From his investment and his manual labor the farmer is getting only 13 per cent more than before the war. The same statistics show that the average wholesale prices of all commodities were 48 per cent higher in June, 1921, than in 1913, and the average retail prices 44 per cent higher. In other words, while the farmer is receiving 13 per cent more for his labor, he is paying approximately 44 per cent more for what he buys.

Contrast these facts regarding the farmer's situation with the following regarding that of the railway employee: In 1913 the average wage of a railway employee was \$761. Since the 12 per cent reduction made by the Railroad Labor Board, effective on July 1, the average wage of a railway employee is approximately \$1,695, or 123 per cent more than in 1913. Nor is this all. Railway employees, since before the war, have been granted substantial reductions in their hours of work. About ninety per cent of them are paid on an hourly basis. The average wage per hour of these employees, because of the increases in their wages and the reductions in their hours, is now, even since the recent reduction of wages, at least 140 per cent more than in 1913. In other words, with the retail prices which the railway employee, like the farmer, pays, about 44 per cent more than in 1913, the railway employees who work on an hourly basis are receiving approximately 140 per cent more for each hour they work than in 1913.

There is much agitation among the farmers regarding railway rates. They wonder why, since the prices of their products have declined so much recently, the railway rates cannot, and should not, be substantially reduced. Most of the explanation can be derived from the foregoing figures. In 1913 the total wages paid by the Class I railroads amounted to \$1,338,612,385. As a result of numerous advances, including that granted by the Railroad Labor Board in July, 1920, this was raised to an annual basis of \$3,900,000,000, or almost 200 per cent. The 12 per cent reduction

granted by the Railroad Labor Board, effective on July 1, would make it, if the railroads were handling a normal traffic and employing the same number of men as they did last year, \$3,432,000,000, or 156 per cent more than it was in 1913. The railroads are not handling a normal business, however. Because of the decline in business they reduced the number of their employees from 1,993,524 in the first quarter of 1920, to 1,691,471 in the first quarter of 1921, or 15 per cent. This was a smaller number than they had in 1913, when the average number was 1,759,020. They could not long continue to maintain and operate their properties with this greatly reduced number of men, with the reductions in hours of work which have occurred since 1913. Even, however, on the basis of a 15 per cent reduction in employees, the annual pay roll on the basis of present wages would be \$3,000,000,000, or 120 per cent more than in 1913.

On the basis of the same number of employees as last year, the total wages of the railways at the present time would be running at the rate of about \$3,400,000,000, which is more than the total amount of money that they ever earned from all the service they rendered—freight, passenger, mail and express—in any year before the calendar year 1916. The principal explanation of the fact that the farmer is having to pay higher rates than for years is that the railways are still required by the Railroad Labor Board to pay so much more for labor than in past years.

Just how Mr. Gompers and the leaders of the railway labor unions expect to succeed, in the light of such facts as these, in persuading the farmers that they should co-operate with the labor unions in keeping the railway pay roll up and getting freight and passenger rates reduced is somewhat difficult to surmise. The rates have to be kept up mainly to meet the pay roll. The question of railway wages has been settled for the present. The question of the rules and working conditions of employees established under the national agreements has not, however, been settled at all. The national agreements are still in effect, and the rules and working conditions established by them are continuing to inflate the pay rolls and the operating expenses, thus contributing toward making necessary the rates of which the farmers complain. If the farmers' own leaders would present to them the real reasons why the present rates of the railways are necessary, Mr. Gompers and the leaders of the railway labor unions would meet with insuperable difficulties in enlisting the co-operation of the farmers in an attack upon the owners of the railroads, who, at the present time, are getting only one-half as large returns on their investment as they did eight years ago, while railway employees are receiving wages more than twice as large.

## Virginian Railway

**S**O MUCH HAS BEEN SAID in the columns of the *Railway Age* recently, notably in the issue of May 27, pages 1203 to 1208, regarding the operation of this road that the review of the annual report of the company can be made brief.

The year 1920 was a good year for the Virginian Railway. It was marked by large net earnings and by the carrying out of several progressive developments. In 1920 the Virginian Railway had a net railway operating income, as reported in the monthly statement for December to the Interstate Commerce Commission, of \$4,944,243. This compared with the net railway operating income for 1919 of \$2,541,603. So far this year the Virginian has kept ahead of its 1920 figures. The net railway operating income for the first four months of this year has been \$1,288,717, compared with \$1,020,025 in 1920. In the article which appeared in the *Railway Age* of May 27 considerable stress was placed on the importance of export trade and coal in the Virginian's operations. The

figures which are given above show how this new business has been reflected in net earnings.

Referring now to the corporate income account, which takes into consideration the standard return for January and February and the guaranty for the six months of the guaranty period, it will be noted that the net income for the year ended December 31, 1920, which figure is subject to settlement with the United States government, was \$3,287,462, as compared with a corporate income to 1919 of \$1,845,632.

Inasmuch as so much information concerning the operations of the Virginian was given in the article previously referred to, it is hardly necessary to say much concerning them here. However, in 1920 the Virginian carried 7,784,517 tons of revenue freight, its traffic aggregating 2,848,422,083 ton-miles, as compared with 5,985,824 tons and 2,114,771,380 ton-miles in 1919. Of the total tonnage carried in 1920, 7,145,731 tons were bituminous coal. In carrying this tonnage the railroad secured an average number of freight cars per train of 65.22, an average load per car of 53.32 tons and an average revenue train load of 1,718 tons.

The progress that was made by the Virginian in 1920 was of a character which should permit the road to make a considerable increase in its capacity as a bituminous coal road. During the year the road acquired the first part of an order of 1,000 of the new 120-ton coal cars. With this acquisition the number of freight cars was increased from 8,875 at the end of 1919 to 9,425 at the end of 1920 and the total capacity of 451,148 tons to 512,330 tons. In view of the fact that this increase was secured with only a portion of the total order, it is apparent that the 1921 report will show a similar increase.

Considerable attention has been given at various times in the columns of the *Railway Age* to the double-tracking of the 2.07 per cent grade between Elmore, W. Va., and Clark's Gap. This improvement will add considerably to the capacity of the railroad and will solve one of its most serious operating problems. To assist in carrying out the work, the road has secured a loan of \$2,000,000 from the revolving fund.

The railroad has also been making some extensive as well as intensive development. The extensive development includes the lease of the Virginia & Wyoming Railway, which had in process of construction, or about to be constructed, about 14½ miles of line extending from a point on the Virginian near Mabon to a point on Laurel Fork of the Guyandot. The new line is now in process of construction and it is hoped to have it completed during the present year. It will open up an entirely new territory west of the territory at present served by the Virginian's lines and should have an appreciable bearing on the future business of the company.

The following gives the figures for operation in 1920 as compared with 1919:

	1920	1919
Mileage operated:		
Freight revenue .....	\$15,737,818	\$10,268,428
Passenger revenue .....	909,686	742,508
Total operating revenue .....	18,158,253	12,075,313
Maintenance of way expenses .....	2,229,597	1,838,773
Maintenance of equipment .....	3,710,211	2,662,387
Traffic expenses .....	100,168	56,343
Transportation expenses .....	6,513,536	4,421,506
General expenses .....	379,634	300,748
Total operating expenses .....	12,908,982	9,274,535
Net from railway operation .....	5,249,871	2,800,770
Income from operation .....	4,133,169	2,536,937

The corporate income account is as follows:

Tentative net railway operating income for the ten months ended December 31, 1920 .....	\$4,510,729	
Compensation due from U. S. Government (January and February, 1920; full year 1919) .....	513,365	\$3,247,603
Tentative railway operating income for the year subject to settlement with the United States Government .....	5,024,095	
Total non-operating income .....	\$284,209	
Gross income .....	\$5,308,304	\$3,548,577
Total deductions from gross income .....	2,020,842	1,767,012
Net income (tentative for year 1920, subject to settlement with U. S. Government) .....	\$3,287,462	\$1,845,632

## Union Pacific

IN ANALYZING the operations of the Union Pacific System, it must be borne in mind that in addition to being made up of a group of well operated properties, the system is characterized by being somewhat of an unusual investment organization. The Union Pacific System properly speaking consists of the Union Pacific Railroad, 3,614 miles; the Oregon Short Line, 2,359 miles, and the Oregon-Washington Railroad & Navigation Company, 2,224 miles. The Los Angeles & Salt Lake, the St. Joseph & Grand Island, etc., are controlled by the Union Pacific System, but they may better be spoken of as affiliated rather than as constituent companies. In this review, the facts stated and the figures given will relate, unless otherwise stated, to the system as made up of the three constituent companies and excluding all offsetting accounts.

The best way to show that the properties are well operated is to indicate that the constituent companies of the Union Pacific System were very much in the way of exceptions in that they were among the very few carriers who earned during the period of federal control more than their standard return. Operating ratios are not supposed to be given too much importance; however, the operating ratio of the system in 1920, despite all the handicaps for which that year is justly noted, was but 75.07 per cent.

Similarly, the best way to indicate the importance of the system as an investment organization is to point out that on December 31, 1920, the Union Pacific owned \$70,932,147 par value of stocks and \$115,282,300 face value of equipment trusts, short term notes and mortgage bonds of companies not affiliated with the Union Pacific System, and, in addition \$15,232,300 of Liberty and Victory loan bonds. The ownership of securities of companies affiliated with the system, such as the Los Angeles & Salt Lake, the St. Joseph & Grand Island, the Pacific Fruit Express (in which the Union Pacific has a half interest), etc., but excluding the Oregon Short Line and the Oregon-Washington, totaled on December 31, 1920, \$38,846,503 par value of stocks and \$41,449,198 face value of bonds and notes. On this total enormous investment, the company received in dividends in 1920 the sum of \$4,172,396 and in interest \$7,331,211, or including some \$800,000 interest on loans and open accounts, etc., a total of \$12,298,957. The size of this figure is indicated by comparing it with the total fixed charges in 1920, which were \$15,419,279.

The Union Pacific pays dividends of 10 per cent. This rate was established in October, 1906, reduced to 8 per cent in July, 1914, shortly after the distribution of the Baltimore & Ohio stock and restored to 10 per cent in December, 1916. When the rate was established it was announced that 6 per cent was paid out of the return from railroad operations and 4 per cent from the return on investments. The story of the Union Pacific's investments is interesting; it is one of the brilliant spots in the history of American railroad finance and inasmuch as it has been treated in complete detail by numerous writers of the highest standing it is not necessary to enlarge upon it here except insofar as affects present conditions.

The Union Pacific, as above noted, owns \$70,000,000 in stocks and \$115,000,000 of equipment trusts, short term notes and mortgage bonds of companies not affiliated with the system. It is interesting to see what may have been the effect on this investment of the present decline of stock and bond prices, the lowering of dividend rates or the passing of dividends. The \$70,000,000 of stocks of unaffiliated companies consists principally of \$22,500,000 Illinois Central stock; \$21,000,000 of New York Central; \$10,343,100 of Chicago & Alton preferred; \$4,420,600 of Chicago & North Western common; \$3,594,035 Baltimore & Ohio common and \$1,805,992 preferred; \$1,845,000 of Chicago, Milwaukee & St. Paul, preferred, etc. The holdings in some of these

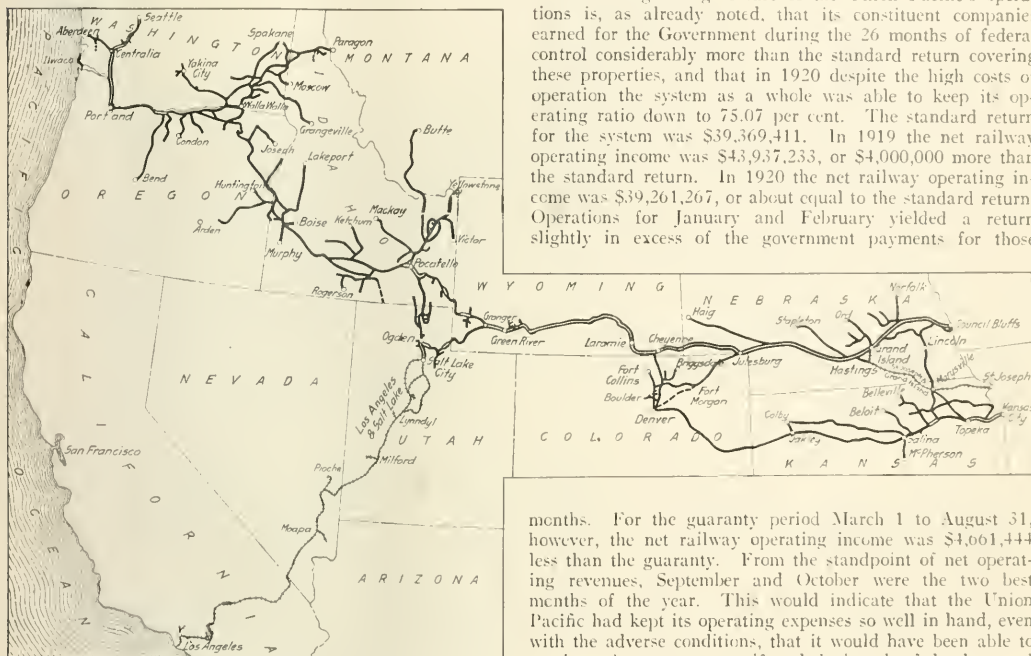

companies have presumably been of value to the Union Pacific because of traffic relationships; the Union Pacific's operating strength lies largely in its favorable connections.

However, it happens that some of these stocks were bought at very high figures. The Illinois Central stock, which is now selling at 91½, cost about \$163 a share; the North Western common, now selling at 65, was secured at 168; the New York Central, now selling at about 70, was secured at from par to 136; the Alton, preferred, now quoted at 8 bid and 12 asked, cost about 161; B. & O. preferred, now selling at 51, cost about 93; the B. & O. common, now selling at 39, cost about 120. Because of the present low state of the bond market, depreciation from the \$115,282,300 face value of the bonds, notes, etc., has also taken place, but, of

is indeed unlikely that any of these four companies will be unable to maintain the present dividends on the respective stocks mentioned. In concluding this portion of our review, the point can be made that the Union Pacific has suffered severely from the decline in railroad securities, particularly in the case of stocks which were purchased at high prices, but on which dividend payments have since ceased. The depreciation in values it has been able to compensate for out of its surplus, but it has nevertheless lost considerable additional income. There is, however, the compensating factor that its ownership of stocks in these other companies has helped its traffic relations with these roads and has presumably assisted it in getting business which it otherwise might not have had.

The distinguishing feature of the Union Pacific's operations is, as already noted, that its constituent companies earned for the Government during the 26 months of federal control considerably more than the standard return covering these properties, and that in 1920 despite the high costs of operation the system as a whole was able to keep its operating ratio down to 75.07 per cent. The standard return for the system was \$39,369,411. In 1919 the net railway operating income was \$43,937,233, or \$4,000,000 more than the standard return. In 1920 the net railway operating income was \$39,261,267, or about equal to the standard return. Operations for January and February yielded a return slightly in excess of the government payments for those

The Union Pacific System

course, because of the different factors involved to a considerably lesser extent. A drop in the value of securities owned such as has been here indicated would have proved a staggering blow to almost any company—that is, except one of the financial strength of the Union Pacific. The company some years ago was able to compensate for it by the establishment of a reserve for depreciation of securities. This is now carried on the balance sheet at \$50,000,000; in view of the conditions the matter does not seem to present particular difficulty for the company's future.

Another factor that is worthy of consideration is the matter of future return on this investment in stocks and bonds of unaffiliated companies. The bonds which are owned are high grade; the railway situation would have to get very bad, indeed, to jeopardize the return on the equipment trusts, notes and bonds owned. Insofar as concerns the stocks, little reduction in dividends in stocks of companies not affiliated with the system other than that which has already taken place may be expected. The stocks that are at present paying dividends include the B. & O. preferred; the North Western common, the Illinois Central and the New York Central. It

months. For the guaranty period March 1 to August 31, however, the net railway operating income was \$4,661,444 less than the guaranty. From the standpoint of net operating revenues, September and October were the two best months of the year. This would indicate that the Union Pacific had kept its operating expenses so well in hand, even with the adverse conditions, that it would have been able to continue the progress manifested during the federal control period. It happens, however, that the decline in business beginning in November has been especially sharp.

The total operating revenues in 1920 were \$209,049,510, or 17.8 per cent more than in 1919; the operating expenses, \$156,939,935, or 27.9 per cent more than in the preceding year, and the operating ratio 75.07 in 1920 and 69.64 in 1919. The total tons of revenue freight carried in 1920 were 28,320,410, the revenue ton-mileage being 12,882,042,232, or 9 per cent in excess of 1919. On this freight the Union Pacific secured a haul of 455 miles. The net tons per train in 1920 were 659; in 1919, 645; the average car load, 26 in 1920 and 24.54 in 1919.

The Union Pacific, however, makes its chief claim for attention in so far as its operating statistics are concerned in its remarkable daily freight car mileage, particularly on the Union Pacific Railroad itself as distinguished from the O. W. R. & N., or the O. S. L. For the year 1920 this averaged no less than 69.8 miles, as compared with a daily car movement in 1919 of 58.4. In October, 1920, a figure was reached of 84 miles. The net ton miles daily per car in 1920 averaged 1,229 as compared with 977 in 1919. In October, 1920, the average was 1,414. The Oregon Short Line in 1920 had a daily car movement of 43.5; the Oregon-

Washington 29.3; a combined figure for the system is not given.

The Union Pacific, referring to it again as a system, has been especially hard hit by the present slump in business. The total freight revenues in the first five months of 1921 were \$45,469,077, a considerable reduction from the \$53,934,226 of the first five months of 1920. The net railway operating income for the period in question this year has been \$7,750,671. In the first five months of 1920 it was \$18,510,956. One of the results of this decrease in business has been an end to the record-breaking figures of miles per car per day. In May, 1921, the daily car movement on the Union Pacific Railroad was but 33.3 and the ton-miles daily per car but 595.

The Union Pacific is noted as being a rather keen buyer of equipment. In 1920 there was spent for extensions and branches \$74,351; for additions and betterments to roadway and structures \$6,450,765 and for equipment \$10,335,658. The additions to equipment during the year included 155 locomotives, 355 freight cars and 2 passenger cars. The company during 1920 placed orders for 100 locomotives, 2,069 freight cars and 81 passenger train cars. The additions in 1920 included such deliveries as were made on these orders and 55 locomotives allocated by the Railroad Administration.

The corporate income account of the Union Pacific shows for 1920 a surplus after the payment of dividends amounting to \$6,452,454 as compared with \$8,196,937 in 1919. The 1920 figures, however, do not include any amount covering the payment due from the government for operations during the guaranty period. The net railway operating income, as noted above, was \$4,661,444 less than the guaranty. As in the case of the claim for undermaintenance during the guaranty period, the amount will be credited to income after the final settlement is made.

The operating results in 1920 compared with 1919 are as follows:

	1920	1919
Mileage operated .....	8,192	8,183
Freight revenue .....	\$150,160,928	\$128,914,431
Passenger revenue .....	38,170,277	35,738,572
Total operating revenue .....	209,049,510	177,447,698
Maintenance of way expenses .....	34,770,779	25,753,722
Maintenance of equipment .....	38,869,167	31,469,737
Traffic expenses .....	2,162,518	1,119,860
Transportation expenses .....	69,055,557	54,663,519
General expenses .....	7,318,804	5,989,549
Total operating expenses .....	156,939,935	122,682,049
Net revenue from operation .....	52,109,575	54,765,649
Taxes .....	12,086,046	8,908,937
Railway operating income .....	39,261,267	43,937,233

The corporate income account is as follows:

	1920	1919
Revenues over expenses (March 1 to Dec. 31) .....	\$40,148,812	.....
Rental .....	7,009,453	\$39,369,411
Railway operating income .....	47,248,264	39,369,411
Federal income and other taxes .....	10,754,015	2,293,226
Net income from railroad properties .....	35,962,262	36,549,100
Income from investments and other corporate income .....	12,298,957	13,026,687
Total income from all sources .....	48,261,218	49,575,786
Interest on funded debt and miscellaneous corporate charges .....	15,586,987	15,565,573
Net income from all sources .....	32,674,231	34,419,214
Dividends on stock of Union Pacific Railroad Co.: .....		
Preferred stock at 4 per cent .....	3,981,740	3,981,740
Common stock at 10 per cent .....	22,229,160	22,229,160
Surplus, transferred to profit and loss .....	6,452,454	8,196,937

COMMERCIAL TRAVELERS renewed their battle for a reduction in passenger fares on July 11, when a petition signed by more than 1,000 business men of the middle west was presented to the Western Passenger Association at Chicago, asking that the railroads west of Chicago and east of the Rockies put on sale an interchangeable mileage book at a 20 per cent discount from regular tariffs. It is stated by Franklin H. Dietz, representing the Interstate Commercial Travelers, that the organization would present the traveling men's argument at the next general meeting of the association.

## Letters to the Editor

### Statistical Reports to the Interstate Commerce Commission

WASHINGTON, D. C.

TO THE EDITOR:

In an article by F. J. Lisman on remedies for wastes in railway operation, in your issue of July 9, it is stated that methods could be found to consolidate the various reports to the Interstate Commerce Commission and abolish a great many of these reports. There is mentioned a report on the number of livestock cars. It suffices to state that the Interstate Commerce Commission requires and receives no such report.

Mr. Lisman, moreover, suggests, in other parts of his article, the desirability of additional information that would involve more detailed reports than are now required. He suggests that the commission ascertain the usage of freight stations by various commodities, the segregation of car repairs by classes of cars, the distribution of loss and damage by commodity classes, and the further subdivision of yard expenses. I think that careful study of the matter in detail will show that the commission is in reality very modest in its statistical requirements. A great deal of desirable information has not been called for simply because of the expense involved. Before any important statistical innovation is introduced, the cost and method of compilation is discussed with the representatives of carriers. Is it not incumbent upon Mr. Lisman to show where saving could be effected by abolishing reports to the Interstate Commerce Commission and to specify the particular reports now made which can properly be termed useless?

Some persons might perhaps mention the separation of expenses between freight and passenger services as useless, but Mr. Lisman appears to be among those who think it should be continued. It will not be denied that salaries of clerks are a considerable element in operating expenses, and it is possible that economies in clerical work can be effected. But it is important to distinguish the cost of furnishing statements to the Interstate Commerce Commission from the cost of compiling the data which are necessary to the management for proper supervision, and which would be compiled anyhow in a similar form even though the commission should not require such information.

M. O. LORENZ,

Director of Statistics, Interstate Commerce Commission.

### The Dining Car Department An Advertising Asset

SEATTLE, Wash.

TO THE EDITOR:

The value of the dining car department as a traffic producer is in general underestimated by the higher railroad officers today, and as a result the management and present standing of this department are woefully in need of improvement. One of the most objectionable examples of mismanagement, in my estimation, is the getting together of dining car superintendents to arrange portions, prices, etc., a system inaugurated by the United States Railroad Administration, which has been continued. We can all understand that agreement must exist among the railroads insofar as freight and passenger rates, schedules and so on, are concerned, but I fail to see the advisability of agreements on prices in dining cars if we really want competition.

With equipment practically standardized and running

time between terminal points practically the same, competition on the various roads today is left to the dining car departments. If we want competition it does not appear reasonable that the various dining car superintendents should meet to establish a practical uniformity in prices and portions on the different roads.

I do not believe that a non-competitive policy is wanted by the railroads or at least by some of them, because as long as the dining car department has to lose money, it will be much better for it to render the service that will advertise the road. It has been proved that the dining car can be the biggest, cheapest and most effective advertising medium a road can have.

In the past the dining cars were operated principally for the convenience of a very few passengers. It is my belief that we should get away from that exclusive atmosphere that still pervades our dining cars and the aloofness of the majority of the dining car crews, which is felt by what we might call the common everyday passenger. Let us run our cars as popular priced restaurants, where good food, cleanliness and willing service are given to the public at reasonable prices.

It is an absolute impossibility to continue the present a-la-carte service and expect to be able to furnish meals to dining car patrons at prices within the reach of the majority. I have frequently seen lunch baskets carried nowadays on standard Pullman cars, something that was unknown in years gone by and there is no question in my mind but that this is caused by the high prices prevailing in dining cars. There is only one solution and that is to go back to the old table d'hôte system wherever this is possible. This does not mean in any way a step backward for the table d'hôte service has been in evolution as has anything else. Experiment has shown that the table d'hôte plan has conserved more food than the a-la-carte system and also effected a considerable saving in man-power.

The average railroad officer will probably discredit this, adding that we had table d'hôte service years ago and that it was done away with on account of the great waste. Two of the principal objections to the system were the size of the menu, the privilege of the patron to order anything or everything that was on the menu and the easy way for dishonest dining car crews to make money. These objections do not now exist.

First, there is no waste in the present manner of giving table d'hôte service because the menu is limited; second, in addition to an up-to-date system of checking table d'hôte meals, the working conditions on dining cars are so much better than they used to be, that it is now worth while for an employee to keep his position.

Another important point is the system of buying and the interference with the dining car department by other departments. A dining car department cannot be run successfully unless it is made a department by itself. By this I mean that the superintendent of dining cars should report direct to the president or maybe to one of the vice-presidents, certainly not to any traffic manager or general passenger agent who as a rule knows less about dining cars than the dining car man knows about running an engine. The dining car department should be in charge of an officer called a "Manager of Dining Cars" who will have all the authority that this title implies.

I do not think we shall ever be able to make any money in the dining car department, but if we can run the dining cars at a limited loss, if we can give service and make them an efficient advertising medium, that is all we can expect to do.

It would only be justice that when a dining car department is a real business getter, it should be given credit for its proportional amount and have it entered up to either operating or advertising.

H. FERRY.

## A Train of 201 Cars

NEW YORK CITY.

TO THE EDITOR:

The report which you have printed of a trial run on the Virginian Railway with a train of 100 coal cars, making a train about one and one-tenth miles long, calls to mind the fact that long freight trains are getting to be somewhat common. This train on the Virginian evidently will make a record for length, as well as for weight and for the other elements which you mention.

While the matter is fresh in mind I want to call your attention to the movement of a train, in the year 1914, which was about 1½ miles long. I think perhaps that run was not much advertised, but it is well authenticated, and you ought to make a note of it, in your scrap book, alongside the Virginian record.

This train was run from New Haven, Conn., to Harlem River, N. Y., on the 15th of November. It was made up largely of empty cars; but even with empties a train over 8,000 ft. long is something of an event—(201 cars, estimated average length 40 ft.). This train was made up at New Haven and it consisted of 197 empties and four loads, with a caboose. It weighed 3,962 tons and was drawn by three large locomotives. From Bridgeport to Rye, 32 miles, it was run without a stop. There are on this section some up-grade sections of about 30 ft. per mile, but none of these is over about one mile long.

Just beyond Rye the coupling parted behind the 155th car and the train was stopped, with the locomotives west of Mamaroneck. The hind end was back near Harrison, making an unusual spectacle for the natives. It was deemed best not to risk the delay of coupling up, and so the engines, with the 135 cars, went on to Harlem River. The 66 cars constituting the rear part of the train were taken through to Harlem River by another locomotive.

This division of the New York, New Haven & Hartford is, as everyone knows, a busy passenger line, four-track, and in ordinary practice trains are limited, not by reason of the grades or curves or the power of the locomotive, but by the exigencies of the passenger service; the passenger trains must not be delayed. Therefore, the ordinary limit is 80 cars to a train. This long train was experimental. R. W. H.

## Do Railroads Want College Men?

STATE COLLEGE, Pa.

TO THE EDITOR:

Of course the railroads need college men, but do they want them? The question raised by Mr. Richardson under the above title in your issue of June 17, goes further and asks if the railroads want the *pick* of college men. Mr. Richardson, who graduated in June, speaks for the undergraduate, but he also has had practical railroad experience.

If the American Railway Association will adopt the suggestion for some form of working relation, forming a link between the association and railway students, it will give an additional incentive to develop railroad courses and should form the basis for a more general student response similar to results in other national societies. It may also assist the railroads in obtaining more picked men.

I do not infer that Mr. Richardson intends to criticize present college courses, or all of the railroads, for lack of interest in the railroad student, for he knows full well the co-operation between our railroad mechanical course and the Pennsylvania system and other railroads. I have found the railroads, when requested, willing to do their part in assisting us in our work, and believe that further advancement will be made if such co-operation becomes more general. It is, however, a well-known fact that the railroads as a whole and the railroad associations have led some of the

best college men to feel that the railroads are indifferent. This impression can be corrected, but only in one way.

There is a good reason, known to railroad men, why no representative from railroads came to this college the past year, but there has been one or more in previous years, and the graduates in railroad mechanical engineering could be placed many times over. During the last year, five lectures were given to seniors by men from outside representing the railroads and allied interests, and this is more than was delivered in any other single branch of engineering in the same period of time.

A. J. WOOD,  
Professor, Railroad Mechanical Engineering.

## A New Plan for the Settlement of Per Diem Accounts

CHICAGO.

### TO THE EDITOR:

Much has been said recently regarding the necessity for reducing expenses and I feel that a brief outline of one step which might advantageously be taken in that direction is not now amiss. Therefore, I am presenting the following plan, which contemplates the compiling of per diem accounts direct from interchange reports on a car balance basis, which can be used for the settlement of per diem balances through a clearing house or with direct connections, for the consideration of those interested in advancing the efficiency of accounting:

#### DEFINITIONS:

**CARS**—All cars owned by roads subscribers to the per diem agreement.

**CAR BALANCE**—The difference between the total number of owner's cars on foreign lines and the total number of foreign cars on that line.

**POTENTIAL (OR UNUSED) DAYS**—A car away from home has a potential earning power in days, in any month, equal to the number of days in that month.

**LAST DAY**—The last day of the month preceding the installation of the plan.

All cars have a potential earning power in days, counting the date interchanged as unused, equal to the number of days remaining in the month. Therefore, the delivering road would charge its connections the total number of cars shown on the interchange report each day of their total value in unused days for that date.

Thus—On September 1, 30 cars at 30 days each = 900 days,  
September 2, 20 cars at 29 days each = 580 days.

Assuming that the roads had 100 per cent ownership on line on the first of the month, the difference between the total potential days on cars delivered and the total potential days on cars received for the month would be the actual per diem balance for that month.

The difference between the total number of cars delivered and the total number of cars received for the month would constitute the car balance and would be charged to the owing road, or the clearing house, on the first day of the following month at their total potential value in days for that month.

Car balance would be carried forward from month to month with the result that a carrier receiving a car and signing the interchange report therefore would pay per diem on that car perpetually unless it, in turn, delivered it, and secured a receipt for it, from the same or some other carrier. This would automatically force each carrier to complete deliveries, either by proper interchange report at the time the car was delivered, by supplementary report or pay the penalty.

The usual way of arriving at a car balance is to take the car ownership as a basis, inventory all cars on line and the difference between cars owned and cars on line constitutes the car balance. It is plain that figures arrived at in this way could hardly be used as a basis for clearing house settlements. A basis for a clearing house settlement can be arrived at, however, by having each carrier make a per diem report in triplicate, one to the clearing house, one for the owner of the car or cars remaining on its line on the last day of the month prior to the installation of the new plan, and one for its record.

Theoretically, we would then have the location showing the initial and number of all cars away from home on a certain day, in a permanent form and separated as to ownership. There would probably be cars not reported. These the owners would be required to trace. When a car was located and per diem report rendered to the owner for the one day due, the clearing house would adjust the car balance and per diem as explained later.

The total number of cars reported by all roads would constitute the debit to the clearing house. A commercial bookkeeper would term it a control account. The several items in this debit control account would be distributed to the debit of each carrier, in one item, covering all cars reported by it. The total of the distribution would balance the control account. Likewise, all cars reported must be credited to the different owners. The total number of cars reported would now be the credit control account to the clearing house, and the items would be distributed to the different roads according to ownership. The distribution would balance the credit control account. The clearing house would now be in a position to begin doing business without a deficit.

The difference between the total number of foreign cars reported as being on its line by a carrier and the total number of its cars reported by all other carriers would be the existing car balance, as reported, for that carrier. This balance should agree with the balance as carried on the clearing house books and it would be the basis for settlements.

An error in car number or initial on an interchange report would not impair the correctness of the per diem accounts.

A car omitted from an interchange report would be added to that report if the error was discovered in time to include in the current month. Where an error is discovered in the following or any subsequent month, the car would be reported to the clearing house on a supplementary report signed by the proper officer of both carriers. The car would carry a charge in days equal to its potential value on the date interchanged, plus all days in each of the following months, including the month it is taken into account.

A car entered on an interchange report in error would be deducted from the report if the error was discovered in time for correction in the current month. Otherwise it would be handled in the same manner and would carry the same value in days as an omitted car in the reverse direction.

When a car, not reported to its owner for the last day, was located, the erring road would be charged the sum of the days in each month, including the month in which the adjustment was made, for all time elapsed since the date the plan went into effect. The movements of the car since the plan went into effect would have no bearing on the claim. As all cars would finally be located by their owners, a carrier would gain nothing by a failure to report a car.

Switching and other reclaims to be handled as at present, with settlement through the clearing house.

Some of the advantages of the plan are as follows:

Does not require a large force of train employees.

The effective data could be made retroactive to any month that the drafts are not yet drawn against per diem reports.

Its benefits could be extended to cover non-subscriber roads by local agreements between the roads interested.

It would not require any change in present car records.

A force of examiners would not be needed.

Reports could be balanced with those of immediate connections, as each road would be working from the same reports. Settlements could be made the following month without fear of making overpayments, which would result from the same procedure under the present plan.

Relieve the banks throughout the country of the burden of to them for collection every month.

Finally, it would make possible a saving in labor and ex-clearing the hundreds of thousands of drafts now turned over to the banks, which each car accountant can figure for himself.

H. E. SANDERS.

# France Undertakes Huge Electrification Program

Utilization of Water Power and High Price of Fuel Are Most Important Considerations

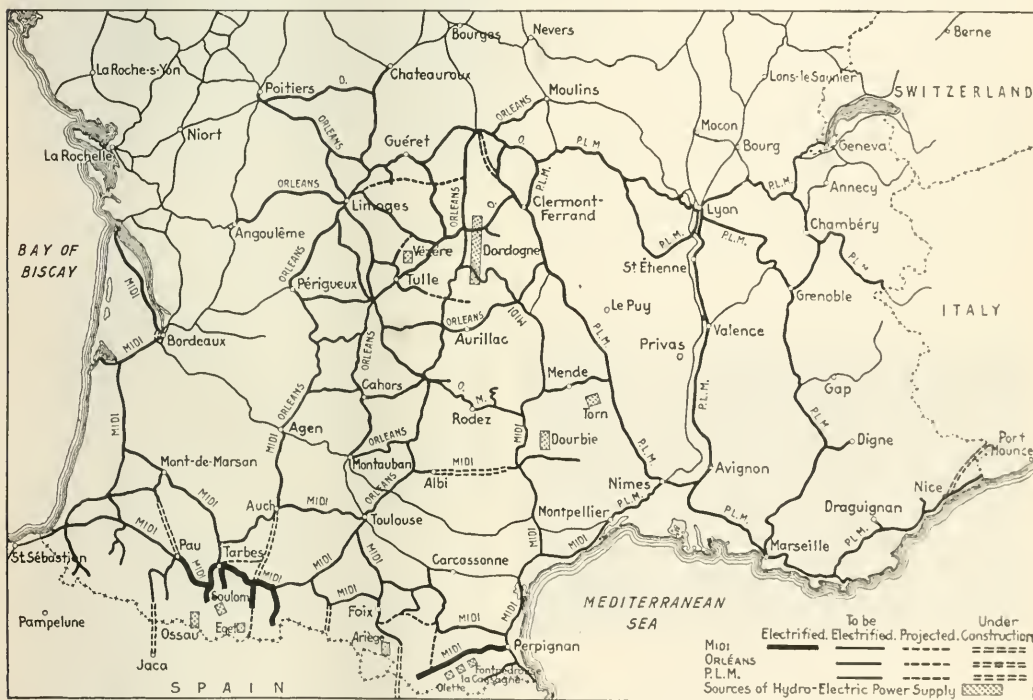

By Oliver F. Allen

Formerly Major of Engineers, American Expeditionary Forces

THE ELECTRIFICATION of French steam railway lines, as distinguished from street car or interurban service as those terms are understood in America, began by the equipment about 1900, and almost simultaneously, of the tunnel and connecting tracks between Quai d'Orsay station and the Austerlitz station of the Paris-Orleans Railway in Paris with an extension for suburban service as far as Juvisy and the suburban line from the Invalides station in Paris to Versailles on the old Western Railway, now known as the State Railways. A division from Fayet to Chamnoix on the

electrifications, in the French Alps and in the Pyrenees, were made to meet the requirements of mountain grades and to take advantage of water power. These first installations are all still in service, and the further extension of three of them are the first steps in the present program.

The successful operation of these early installations, the facility with which they took care of increased traffic with a moderate increase in investment, combined with the successful development of electric traction in America and elsewhere, led the French railway engineers to study, before the

Southern France, Showing Lines to Be Electrified

Paris-Lyons-Mediterranean line was electrified about 1902, and one on the Southern Railway, in the Pyrenees, from Villefranche to Vernet-les-Bains by 1910. The two electrifications at Paris radiating out from the centers of the city, were made for the purpose of increasing terminal facilities, improving suburban service and removing the smoke nuisance. They were of the same general order as the early electrifications in America at the New York City terminals and the Baltimore & Ohio tunnel at Baltimore. Current for both of these early Paris electrifications has always been supplied by steam plants burning coal. The other two early

war, the problem of reducing their coal bill by the electrification of their main lines.

The electrification of the lines from Limoges to Gannat and from Clermont-Ferrand to Tulle and the development of steam power stations in the central plateau, the Massif Central, where coal is to be found, was studied by the engineers of the Paris-Orleans before the war. The electrification of the mountain divisions of the Paris, Lyons & Mediterranean Railway northeast from the French terminal of the Mt. Cenis tunnel at Modane and of more Southern Railway lines in the Pyrenees was all carefully studied before 1913,

During the two years preceding the war, the Southern Railway had completed preliminary negotiations for electric locomotives and had placed firm orders for samples.

It is apparent that irrespective of the great economic changes resulting from the war, especially in the matter of cost of coal and labor, the electrification of the French railways would have gone ahead under pre-war conditions and it is possible that had France not been set back five years by the war, a considerable portion of the present program would be an accomplished fact today.

As soon as mobilization began in the last days of July, 1914, the entire resources of the French railways were placed at the disposal of the government, and from then until after the armistice all the railways were operated as a unified command under the fourth section of the general staff of the French army. Under war conditions no attention was paid to the matter of electrification.

### The Reconstruction Program

The undreamed of increases in the cost of coal and the diminution of personnel, combined with the eight-hour day movement, forced the study of reconstruction and after-the-war railway economic problems while we were all still fighting the Boches. This study was so far advanced that three days after the armistice, that is, on November 14, 1918, a committee was formed by a decree of the Ministry of Public Works for the study of the electrification of the standard gage steam railways. Within two weeks, November 23, 1918, this committee was organized and a program adopted for the study of the electrical operation of railroads all over the world, particular attention to be paid to what had been accomplished in America, France, Switzerland, Italy, England, Sweden and Germany. The visit of representatives of this committee to the United States in 1919, and their exhaustive reports on electrification in this country as well as in Europe have been published and are so well known to railway engi-

the same characteristics. That decision has been made by the railways and approved by the Ministry of Public Works and the Ministry of War. It standardizes 1,500 volts continuous current for all French railways. Incidentally it is interesting to note that this French action has been followed by the adoption of the same standard for Belgium and for England.

### Both Overhead Wire and Third-Rail

#### Current Collection Will Be Used

The voltage selected permits the use of either overhead trolley wires or third-rail for delivering the current to the

St. Lazare Station of the State Railways, Paris

locomotive and it is probable that both will be used according to local conditions and the relative cost. Irrespective of the exact method of suspension of overhead wire or of support or type of third-rail which may be used by any particular railway, standardization will be carried to such a point that the pantographs and contact shoes of all the locomotives will be so designed and located that they can collect current on any electrified line in the whole country.

The investigations showed so plainly the restrictions on the development of electric traction resulting from lack of standardization in other countries, especially in America, that the French railways and government very soon realized the necessity for an organization to study and make effective standardization work begun by the decision to use only one kind of current. Something over a year ago the State Railways, the Southern Railway, the Paris, Lyons & Mediterranean Railway, the Paris-Orleans Railway and the railways of Alsace and Lorraine, with the co-operation of the Ministry of Public Works, created an organization for the study of railway material known as l'Office Central d'Etudes de Material de Chemins de Fer. It will be noted that the Northern and Eastern Railway systems are not included in this group. It was felt that their problems of reconstruction were so difficult that they should be left entirely free to restore service by any means available. In articles which have appeared recently in the *Railway Age* the terrible destruction of the Northern Railway has been referred to. Certain parts of the Eastern Railway suffered in exactly the same manner and the parts of their lines which were not destroyed were subjected to the most intensive traffic possible by the requirements of the French and American armies.

### Frontier Development Must

#### Provide for Military Factors

Another aspect of the matter is the military situation and the realization that along the frontier it must always be possible not only to mobilize an army quickly but to move it and its supplies across the frontier rapidly and efficiently. If the railway lines near the frontier were equipped for electric traction, it might be possible to mobilize as rapidly

First Electrification in France

Low building facing park is Invalides Station, Paris, whence suburban line to Versailles was electrified in 1900

neers that further reference will not be made to this committee's work except to point out a few important results which might be advantageously considered by American railways.

### Equipment for All Lines to Be Standardized

Realizing that successful electric traction must be as flexible and as universal in its application as steam traction, the French concluded that all their main line electrifications must be standardized to such an extent that the electric locomotives of any company can circulate on all the lines in France just as easily as steam locomotives can. This involves agreement by all of the railways to use electric current of

as with steam locomotives, but getting an army across the frontier would be another matter. There is some doubt about the relative reliability of the necessary interconnected generating stations, distributing stations, transmission lines, etc., for electric locomotives and the supply of water and fuel for steam locomotives, when subjected to the hazards of long range shelling and airplane bombing. This question is still so far from being decided that the electrification of the railways of the north and east of France is not contemplated now.

### Immediate Development Will Be Limited to Terminals and Suburban Lines

While the State Railways are in the group which created this standardization committee their electrification for many

Northern Railway Station at Paris

years to come will probably be confined to terminals and extension of suburban service in the immediate vicinity of Paris. The major portion of their lines as well as the lines of the Northern and Eastern Railways cover territory in which there are not only no large water powers available but in much of which the amount of condensing water to be had is so limited as to curtail seriously the construction of very large power plants. It is probable that in those parts of France north of a line running southwest from Paris to the Atlantic Ocean at St. Nazaire, and those between Paris and the Belgium and Luxembourg frontiers, the railways will not be equipped for electric traction until electric power may be available either from the Rhine or the Alps, nor until the electrification of the other parts is largely completed. In view of the demands for power in the neighborhood of Paris and between Paris and the German and Swiss frontiers, all electric energy which may be available within the next twenty years will probably be utilized before it gets to the north and northwest, or for the metallurgical and other industrial plants in the north and east where needs for electric power are economically more urgent than those of the railways.

### Effects of High Cost of Fuel and Labor

This standardization committee of the principal railways outside of the north and east is working for general standardization and in many aspects of its work, through the Ministry of Public Works and the close affiliation of all the railway executives and engineers, it will affect all of the railways, including the north and east. So far as its practical application to electrification is concerned its work will be confined for a long time to the railways which made their first electrification twenty years ago and the railways in the recovered provinces of Alsace and Lorraine. In fact, the men who are most active today in carrying on the French railway electrification program are the very men who personally had to do with the four original installations referred to above.

The electrification of the French steam railways is not a

new proposition resulting from the war, but is the natural and logical evolution of those first applications at terminals and in mountains almost a generation ago. It is true that the war has brought about certain economic changes, particularly in the cost of fuel and labor, which will tend to expedite the change from steam to electric power. For instance, the cost of coal before the war was from 20 to 30 francs per metric ton and since the war reached the maximum in 1920 of 300 francs per ton with a peak of 500 francs, which is the price actually paid by one railway for part of its coal. It is now descending to between 100 and 150 francs per ton. There is little likelihood, however, of coal going to less than about 75 francs per metric ton, that is, three to four times pre-war price, for many years to come. On the other hand, the tremendous increase of the public debt in France and the general economic losses resulting from five years of war tend to retard the expenditure of the vast sums of money required for extensive electrification and it is doubtful if the urgency of the high fuel cost and the labor situation is not so far offset by the financial situation as to make the carrying out of the program move slower rather than faster than it would have had there been no war. Our French friends seem to have taken the lead in the world in standardizing and adopting electric traction for steam railways, and in spite of the delays and embarrassments resulting from the war they may still go ahead faster than we will in this country, particularly in the matter of high speed passenger service.

### Reasons for Electrification

Their reasons for electrification are substantially the same as influenced similar decisions elsewhere and are too well known by railroad men to be discussed in detail here. The determining factors are: first, utilization of water power to reduce the amount of coal imported into France each year and to reduce operating expenses; second, the ability to increase terminal facilities and improve terminal service by substitution of motor cars for suburban service and electric

Eastern Railway Station at Nancy

locomotives for main line passenger trains and freight service; third, the ability to handle heavier freight trains and move greater tonnage on mountain divisions than is possible with steam locomotives without great expense for enlarging tunnels, strengthening bridges, and other items of increasing the number of tracks. There are many other reasons which have affected the decision to start a comprehensive program of electrification, but they are more or less subsidiary to these main considerations.

### Program Calls for 1,200 Miles of Main Line Each Year

The program, the execution of which is being seriously undertaken, involves electrification within the next fifteen years of approximately 6,000 miles of main lines mostly

already double track and the building of hydro-electric plants and high tension transmission lines of the first magnitude. French engineers have gone so far as to promulgate a tentative program involving electrification of over 1,200 miles of main line per year and putting into service of not less than 400 new electric locomotives every year. Financial considerations will probably greatly curtail such a program, but the more conservative one of the electrification of 6,000 miles within fifteen years will involve buying between 200 and 300 new electric locomotives per year, which is a bigger project than has yet been undertaken in any other country.

### Power Supply

The hydro-electric developments to furnish the necessary power will be carried on simultaneously in the Pyrenees for the lines of the Southern Railway; on the central plateau for the Paris-Orleans Railway and in the French Alps for the Paris, Lyons & Mediterranean Railway. These are being studied in connection with the development of a great network of power transmission for industrial requirements. Under the leadership of the Ministry of Public Works a program has been prepared for a transmission network at 220,000 volts for the main lines and 100,000 to 150,000 volts for the secondary lines which will cover all the northern, eastern, central, southern and southwestern part of the country with great trunk lines from the upper Rhone valley and from the Rhine valley in Alsace in long loops across the country to Paris.

The first plants and transmission lines will be built partly by private organizations, including some of the railways, and partly by the government. Some of the 100,000 and 150,000 volts lines are now under construction and the first additional hydraulic plants with a total capacity of the order of 300,000 h.p. may be under construction within a year.

### Belgium

In Belgium the program covers several of the lines which converge at Brussels. The first step will be to take care of the intensive passenger traffic between Brussels and Antwerp. The next, the freight traffic in the metallurgical district where there are steep grades and great tonnage. The rapid fall in the price of coal (that mined locally plus that shipped in from Germany has already accumulated until Belgian stocks on hand present a serious problem) combined with the delay in getting any reparation payments from the always delaying Germans has set back the Belgian electrification program indefinitely.

## Railroad Settlement Plan Tentatively Agreed Upon

WASHINGTON, D. C.

**D**EFINITE announcement is expected before the end of the week of the plan for funding for 10 years at 6 per cent the indebtedness of the railroads to the Railroad Administration for additions and betterments made during the federal control period, and a compromise plan for expediting the settlement of the railroad claims against the Railroad Administration for the balance of their rental due and other items. This will make possible some early payments to the roads of cash which they can use to pay their outstanding bills and increase their maintenance work.

A plan under which the railroads would surrender a large part of their claims for undermaintenance in return for the funding and for a more expeditious settlement of their claims was tentatively agreed upon, after many conferences with the government officials, at a meeting of the steering committee of the Association of Railway Executives in Washington on Monday and was submitted to the member roads of the asso-

ciation at a meeting in New York on Wednesday afternoon. President Harding also discussed the matter on Monday with Chairman Clark of the Interstate Commerce Commission and Director General Davis of the Railroad Administration and on Tuesday he held another conference on it with Secretary Mellon of the Treasury, Secretary Hoover of the Department of Commerce, and Chairman Cummins of the Senate Committee on Interstate Commerce. While the details have not been made public at this writing the plan contemplates that the government shall accept 6 per cent securities of the railroads for the capital expenditures and that the War Finance Corporation shall advance the cash which the Railroad Administration will need, in addition to some \$200,000,000 which it still has available, to pay its obligations to the railroads. It is to furnish the cash by taking over railroad securities from the Railroad Administration which it is not desired to place on the market at this time but which can be readily marketed under more normal conditions, in accordance with a suggestion made by Director General Davis in his letter to the House committee on appropriations some time ago as an alternative to an additional appropriation for the Railroad Administration. The War Finance Corporation has a book credit with the Treasury which it would require legislation to make available for this purpose, and it would be necessary for the Treasury to sell certificates of indebtedness to obtain the funds, but it would not require a Congressional appropriation.

The plan does not contemplate an immediate payment to the roads of any definite sum but the funding of the capital expenditures will make it possible for the Railroad Administration to pay the railroads some large sums on account of the undisputed items of their claims in advance of a final settlement, and the railroads, under the tentative plan, would agree to give up certain principles on which their undermaintenance claims have been based. It is understood that the principal concession required of the roads was that they waive that part of their claims for undermaintenance based on the inefficiency of labor and that they accept in general the interpretation placed on the standard contracts by the Railroad Administration, which would measure its obligation to maintain the properties on the expenditures during the test period plus an allowance for the increase in wages and prices of materials. The roads had taken the position that this was insufficient without an allowance for the fact that more man-hours were required to perform a given unit of work during the control period than in the test period.

The Interstate Commerce Commission has had the same question before it in connection with the claims for the six months guaranty and it is understood that its ruling on the maintenance interpretation has been withheld pending the negotiations covering the federal control period in which Chairman Clark has participated.

Agreement by the executives to the plan for the funding of the roads' obligations to the government was indicated in a statement given out by T. DeWitt Cuyler, chairman of the Association of Railway Executives, at the close of the meeting of the member roads of the association at New York on Wednesday. The statement follows:

"Today's meeting was for the purpose of receiving a report from the steering committee—now known as the executive committee—on the efforts to reach a final settlement with the government of all matters pending from the period of federal control. Any further statement on the situation must come from the President of the United States."

THE PENNSYLVANIA has completed preliminary arrangements for the use of the Belt Line terminals of the Muskegon Railway & Navigation Company, Muskegon, Mich., and will develop a car ferry service across Lake Michigan connecting with railroad at Milwaukee.

# Inadequate Recognition of Chief Clerks' Position

Salaries Smaller Than Those of Many Organized Employees,  
While Duties Are Those of Officers

By a Chief Clerk

THE PLIGHT of the American railroads and the questions concerning their rehabilitation are matters that interest everybody. The question of the responsibility for the desperate situation in which the railroads now find themselves is rather interesting and has provoked much fruitless argument. Labor is shouting at the top of its voice that capital is solely to blame, but this assertion is not corroborated by the facts. It is true enough that labor fared badly in that nonc-too-distant era when the word of capital was like the laws of the Medes and Persians. It is also true that the labor unions were natural products of that era and those conditions, organized as means of self-defense. But no sooner did they grow strong enough to stand on their own legs than they began to use the very tactics they had been organized to combat. They schemed to get maximum pay for minimum work, to protect their lazy and incompetent members and to harass the representatives of capital needlessly and often without hope of reward.

The first big mistake of the labor unions was in contending for uniform rates of pay. No well-informed person believes that all workers of any given occupation are worth exactly the same amount per hour or per month. If the best mechanic in an average railroad shop is worth just 85 cents an hour, the poorest mechanic in that shop is probably worth not more than 10 cents an hour. If the poorest mechanic is worth 87 cents, the best is worth something like six to seven dollars an hour. Men are not created equal nor can they be equalized. The uniform scale is a source of perennial discouragement to the ambitious workman and a misguided solace to the drone.

The fatal mistake of some of the railroad labor unions was made during the World War. When the Railroad Administration signed agreements with the various unions awarding large increases in rates of pay and outlining working conditions that labor might well have regarded as almost ideal, the labor leaders had a golden opportunity to strengthen and fortify their organizations by urging the men to deliver what the administration had agreed to pay for, but instead of doing this some of the organizations were apparently foolish enough to curtail production systematically by working more slowly and by such other methods as were available. This policy was suicidal. Disaster was certain to result and is now resulting. Nothing can be enjoyed that is not first produced.

## Loyal Service Penalized

On the other hand, some of the policies of the average railroad management have been for many years and still are, as I see it, surprisingly short-sighted. Consider the case of the railroad clerk. This has probably been the most loyal, the hardest-working and the least appreciated of all classes of railroad workers. For years prior to government control, the roads used all means in their power to prevent the clerks from organizing; and they succeeded on a majority of the roads. At the beginning of government control, the average railroad clerk's rate per hour worked was disgracefully small, but the organized classes had been granted, from time to time, increases of rates and other concessions affecting their working conditions and had gradually reached a state which, compared with the situation of the clerks, resembled affluence. It seems obvious that the wise policy would have been for the railroads to have given the unorganized clerks everything

that was given to the organized classes. In this manner the railroads could have proven what they claimed: that there was nothing tangible to be gained by organization. Moreover, there is never any legitimate excuse for penalizing fidelity and loyalty.

There is only one class of workers on the railroads now, I believe, that is not organized and not classed as official. This class is the chief clerks. When the readjustments of rates were worked out in 1918, the average shop foreman was given an increase about double that given the average chief clerk. The only apparent reason for this was that the foremen had formed a national organization early in 1918, whereas the chief clerks belonged to no organization and were therefore not in position to demand the same consideration that everybody else on the railroads received. Prior to that time, the foremen and the chief clerks in division offices had received approximately the same rates but the new rates of the chief clerks mentioned were generally far below the new rates of the cheapest foremen.

A chief clerk who is successful must have education, intelligence, experience, energy, enthusiasm, executive ability and numerous other attributes and qualifications that are thought to be valuable. When the office organization breaks down, the officer in charge is in a serious predicament. The details of the business revolve around the chief clerks in the division and higher offices. When an officer is off his territory, for any reason, the chief clerk usually runs the railroad; and the chief clerk attends to the details of the business at all times. If the chief clerk is competent to do this, he should be paid what the service is worth, and if he is not competent, he should be replaced.

## Inadequate Recognition

Not only is the pay of chief clerks comparatively poor, as I see it, but the recognition accorded them otherwise is much less than they are entitled to by reason of the service required. They are certainly assistants to the officers in charge and I maintain that they should be so classified. There may be sound objections to this proposal but I cannot think of any. Possibly the railroads fear that such action might be made the basis of argument for increases in rates of pay. But the salary should be based on the character of the service required and delivered and should be forthcoming regardless of the classification. There may be some railroad officers so narrow as to oppose official titles for chief clerks on the theory that this might detract from the prestige of the officers themselves but I do not believe that such officers are numerous. The average railroad officer is a man of considerable breadth of mind, has a proper amount of confidence in his own ability and does not consider it necessary to suppress his subordinates in order that he may be more conspicuous. The subordinates constitute the organization and the organization makes or breaks the officer at its head—therefore the wise and prudent officer encourages the ambitions of his subordinates and recognizes honest merit wherever he finds it. "A chain is no stronger than its weakest link." The strength of any organization depends on the strength of its individual members.

A few years ago a certain young man whom we will call Harvey Hammond was chosen as chief clerk in the office of a general officer of the operating department of a main railroad. Young Hammond was well educated and had ex-

perience in all lines of operating department office work, having started as a stenographer and mounted, round by round, the short ladder reaching to the position of chief clerk. He was energetic, loyal, resourceful; had plenty of initiative and executive ability. He also had that rarest of combinations, brains and balance.

The officer in question did not enjoy the best of health and eventually his health broke down completely. His physician forbade his talking business with anybody for months. He had no assistant and the management did not appoint another officer pro tem. Harvey Hammond suddenly found himself charged with all the duties and responsibilities of a general officer—without the title—or the salary. He did not hesitate but welcomed the opportunity to show his calibre. Committees of the labor unions appeared before him with grievances, real and fancied, and he fought them single-handed when they were wrong or agreed to their demands when they were right. He was an expert in the various agreements between the railroad and the labor unions. If he made mistakes they were so slight that they passed unnoticed. His work in this unique situation naturally attracted a good deal of attention. All who had an opportunity to watch his performance during this period agreed that he made good as a general officer—without the title—or the salary.

At a later date, the rivalry between two railroads for the services of Harvey Hammond was decidedly keen. Each wanted him as a chief clerk and he went with one of them in that capacity, at a salary much smaller than the average shop foreman draws. His name does not appear in the Pocket List nor on any correspondence. His present salary is considerably below that of any shop foreman in the metal trades but every shop foreman, even the most unimportant, is regarded as an officer of the railroad he serves.

An unusual case? Certainly. But it illustrates my point: that a chief clerk is expected to measure up to any emergency. Every chief clerk meets emergencies at times and his competency is judged largely by the manner in which he meets them. If he is incompetent, any little emergency will unhorse him, but if he understands his business and is conscientious, the percentage of his mistakes will be gratifyingly small.

I do not claim that the average chief clerk could or would have duplicated the performance of Harvey Hammond but I do maintain that the average chief clerk would cheerfully have tackled the problems and done his best; and he would have done much better in this emergency than the average foreman who is designated as an officer of the railroad and whose salary is much higher. The plan of organization on the railroads shows that this fact is clearly recognized. In every case where the officer in charge is absent from his post for any reason, the chief clerk takes charge in the name of the absent officer. If any of the foremen were supposed to

be better equipped to cope with a situation of this kind, such foreman would naturally be called upon to act in place of the absent officer.

It is sometimes argued that a chief clerk is not entitled to as much consideration as a shop foreman because he has not served an apprenticeship of any kind. This fallacy is conspicuous. The shop foreman has served an apprenticeship of four years whereas the chief clerk, if he is properly equipped for his job, has spent no less than seven to fifteen years in acquiring an education, after which he has spent perhaps three to fifteen years in learning the details of the various office jobs over which he has supervision. This comparison is not intended to disparage the shop foreman. His importance on a railroad is obvious and is universally conceded. For many years his slender salary was a very good example of what may be termed wasteful economy. Now that the wrongs of the foremen have been righted, the wrongs of the chief clerks should have attention, for the latter hold positions every whit as important as those of the foremen. A good man in any capacity who does not get proper recognition will eventually become discouraged, and discouragement impairs efficiency.

### Commendation Not Adequate Remuneration

No railroad officer of marked ability fails to appreciate the value of a good chief clerk but this appreciation, for some mysterious reason, appears to be purely personal. The officer may say to the chief clerk: "Your excellent handling of the office relieves me of endless details and I appreciate it." Not every officer will commend a subordinate to his face but many of the best of them will. The normal man is susceptible to flattery and the abnormal man is abnormally susceptible to it. Remarks of this kind are gratifying but the fact remains that all the recognition accorded even the exceptional chief clerk is some private commendation.

In offering these sentiments, let me disclaim any malice or any desire to place the blame on any man or group of men. The conditions to which I call attention are a part of the system under which the railroads are operated. The railroads, like people, are slaves of custom. The policy of the big roads and of some of the smaller ones is and has ever been to concede nothing that could not be taken by force or the withholding of which would not endanger their own welfare. This policy has proven unwise. The organization that is rewarded for using dynamite will certainly return next week or next month or next year with more dynamite; and the patient, loyal, dependable employee who received only a two per cent increase when the dynamiters got ten per cent will just naturally ask himself what he has gained by his patience and loyalty. It pays to be fair. The most stupendous mistake of all history was Germany's recent attempt to prove that might makes right.

Consolidation Built by Baldwin Locomotive Works for Mexican Fuel Company

# Unit Cost Data Reduce Freight Train Expense

Prompt Distribution of Information Aids in Cutting Wage  
Charges Per Hundred Ton Miles

By J. E. Hutchison

General Manager, St. Louis-San Francisco

HAVING REALIZED for many years that the successful operation of any manufacturing establishment is dependent to a very large degree upon the possession of unit cost data, it has been constantly in my mind that there should be a method of measuring accurately the cost of freight train operation, reduced to the item of each train moved, and available immediately after each movement is completed, if the full measure of economy is to be secured.

For illustration, some years ago I went through a furniture factory with the manager of the plant, who was conducting the business in a manner that was showing a nice net profit each year. They were manufacturing many articles of furniture. In going through the plant, I asked the cost of producing quite a number of different articles. In each instance

tation—there are a great many units of this article. In fact, every train run is a unit, and the cost of the train, expressed in ton-miles, should be definitely known when the trip is completed. It has doubtless been in the mind of every railroad operating officer for many years that the most difficult thing to determine was where to fix his train load. Railroads have conducted experiments along this line and the general theory has been that economical operation followed the train load absolutely; the greater the train load the greater the economy. Some, and possibly all, railroad operating officers have realized that this theory was not entirely correct, and that there was a possibility of producing a train load in excess of what could be justified by economical results. Most roads have had means of determining what their train load was

### Form Used in Reporting Wage Cost of Handling Trains

I was told that he did not know. I asked what they sold it for and was given the price; then I asked if they were making any money on that particular article, to which the reply was made that they did not know, but that the business as a whole was showing a profit. I suggested the advisability of working up unit cost data showing the cost to manufacture each one of these different articles. The idea appealed to the manager and, at considerable expense and with a great deal of effort, very accurate cost data were collected with the result that the company abandoned more than half of the items that it was manufacturing because the cost data revealed that it was incurring an actual loss in some instances and a very meagre profit in others, the plant being concentrated on the manufacturing of such articles as the cost data revealed were yielding a reasonable profit. The result was that without increasing the production the plant showed a net profit of more than double what it had shown before.

While a railroad manufactures but one article—transportation—there are a great many units of this article. In fact, every train run is a unit, and the cost of the train, expressed in ton-miles, should be definitely known when the trip is completed. It has doubtless been in the mind of every railroad operating officer for many years that the most difficult thing to determine was where to fix his train load. Railroads have conducted experiments along this line and the general theory has been that economical operation followed the train load absolutely; the greater the train load the greater the economy. Some, and possibly all, railroad operating officers have realized that this theory was not entirely correct, and that there was a possibility of producing a train load in excess of what could be justified by economical results. Most roads have had means of determining what their train load was

with reasonable accuracy up to the time the trains move and a few have cost data but railroad officers have generally felt that when they were producing a satisfactory train load, that is, when their train load was approaching closely to 100 per cent of the potential rating of the engine, they were getting all of the economy out of their train operation that it was possible to produce.

Two or three weeks after the close of the month many operating officers have been greatly astonished to find that while they made magnificent train load performances their operating ratio had increased instead of decreasing, as they had expected. It is true that the operating ratio follows the train load for the most part; that an increased train load has the effect of reducing the operating ratio, and a decreased train load the effect of increasing it. But every operating officer has had experiences that show him that this is not always true.

With this thought in mind, I have tried for years to work

out a unit cost data of freight train operation that would give me a measure in money of the cost of operation immediately after the movement of the trains were completed.

In May, 1920, arrangements were completed to start compiling this data. It was realized it was going to take a great deal of effort to get the data sufficiently accurate that it would be dependable and also to get the division superintendent and his staff sufficiently interested in the data to make it valuable. With this end in view a very competent man was assigned to the work of installing these reports, following them up, checking them for accuracy and going over the performance with the superintendents picking out the bad units of operation and devising ways and means to correct them. It was found necessary to make some changes in the forms then in use in order to get the information in proper shape and from May until August was consumed in revising the forms and getting the reports nearly enough correct to be relied upon. By the first of August the reports were so nearly accurate that we began to apply them with some degree of assurance.

These reports are now prepared each day as soon as the train sheet for the day before is completed, and the superintendent has placed on his desk every day a full report for the day before by freight train districts, showing the performance of each freight or mixed train, including the cost per 100 gross ton miles and this data consolidated to show the average train load and cost per 100 gross ton miles, for each class of service by directions; also this information further consolidated for all classes and directions, as well as the amount of deadheading, penalty, called and not used, etc., for the freight district or sub-division. This is all consolidated in the car accountant's office into 7, 14 and 21 day and whole month reports, showing freight districts or sub-divisions separately, as well as a division and system report. The unit of 100 gross tons per mile has been used in order to differentiate more closely between the performance of individual trains on the same district, in the same service and with the same power, carrying the cost to two decimal points. If it is desired to compare with a cost based on 1,000 gross ton miles it is of course only necessary to move the decimal point over one figure.

In August we had a peak load of business, with every train on the road handling its maximum tonnage. There was a minimum of light movements—practically none at all. In September and October business remained heavy. In November the business commenced to fall off considerably and it was more difficult to get a maximum train load. This condition became more marked steadily through November, December, January, February, and continuing into March; yet in spite of this fact we were able to reduce our cost for moving 100 gross tons one mile about one cent. The accompanying form is the only form we use for the daily report (except three small forms for gathering the information), and from which it will be seen that the wage cost for 100 gross ton miles is shown for every train run. For the last two or three months the accumulated figures from these daily reports have been so accurate that the variation from the operating sheet and the income account has only been about one per cent. On some divisions the variation has been less than half of one per cent, so that the report can be said to be absolutely accurate.

Its value lies in the fact that the report shows in a very condensed form the cost of operating each freight train, divided into classes, through freight, local freight and branch lines, so that the superintendent can compare the operation of the cost of the various trains at a glance and incidentally pick out the trains on which the cost is excessive and can determine the cause of the excess cost. These causes, of course, may be numerous, such as the overloading of the engine, bad train dispatching, bad performance of the engine, or any other of a number of causes, an analysis of which causes the superintendent to take steps to overcome these

conditions and prevent a similar occurrence in the future.

Each superintendent very soon has fixed in his mind a certain figure of cost and when these reports come to his desk covering the previous day's operation, if the cost is higher than this figure he immediately starts looking for the reason and is able to locate instantly the train or trains that produced the higher cost.

When we first began to make real use of this report in August, a conference was held with the superintendents and they were told that they should reach a certain cost per hundred gross ton miles. This result was accomplished the first week in March, at which time they were commended for the result produced and a new figure set for them to strive to reach. The cost varies somewhat, of course, on different divisions, on account of different conditions, and a mark has been set for each division to work to. The superintendents are fully alive to the importance of this data and are using it more than they ever used any report of any kind that we have ever seen.

As stated, the reduced cost has been produced in the face of a condition that made the building up of a maximum train load absolutely impossible. Business was light and fluctuated and light miles were necessarily made, and, as a matter of fact, the train load showed a very marked falling off.

We have been able to determine almost definitely the exact point at which to fix the train load on different operating districts and a good many previous figures and ideas have been shown to be entirely inaccurate. In many cases we have produced a decreased cost by decreasing our train load. As an illustration, in a detail check made on one of our sub-divisions, a period of four days was taken, as they were running. Then a reduction in tonnage of not to exceed 200 tons was authorized and the same check was made for second period of four days after the reduction was made effective, which resulted in a reduction in the average train haul of 46 tons, a decrease in cost of 0.5 cents per 100 gross ton miles, a saving based on the business handled during the second period of \$472, an increase of 1,498 gross ton miles per crew hour, and an increase of 533 gross ton miles per engine hour (including time on roundhouse tracks). In other places we have produced the same result by increasing our train load.

As a further illustration, the average train load for the entire railroad for December, 1920, was 19 tons less than November, yet the cost per 100 gross ton miles was 0.12 cents less in December than November—a saving of \$10,526.

The valuable part of the : rangement is that the superintendent knows immediately following the day's performance just what he did. He does not have to wait until the month is completed and then wait three or four weeks for the operating sheet and the income account to determine whether or not his operation was economical, but he knows each day what his operation was the day before, and can put his finger on the train or trains that caused any excess cost and can also figure out almost at a glance the trains that could have been operated more cheaply or economically.

With this report we are able to analyze the operation in a way that we never could prior to its installation. It had been the opinion of everyone that in order to get a report of this kind an enormous amount of detail work and accounting would be necessary and that the expense of it would make it prohibitive. The accuracy was seriously questioned. These theories have all been exploded. We are able to discontinue enough reports and data of one kind and another that we had been assembling before in an effort to analyze our train operation so that we did not have to add any cost at all in our division offices to prepare these reports. The only thing the report has cost us to date is the paper it has been printed on and the one man employed as an expert to work the system out and make it effective.

The difference in cost of moving 100 gross ton miles now and prior to using this report means a saving of more than

\$75,000 per month on this railroad in wage costs for freight train operation. I believe that this result is due entirely to this cost data immediately at hand, and I am thoroughly convinced that we have not yet worked out all of the economy that can be secured by careful study and application.

But the most valuable part of it, as I see it, is that we have a cost item definitely worked out that will be of the greatest possible value in preventing an increase in unit costs, because we can so quickly detect any increase and locate it accurately and correctly, and that, of course, means that we can take steps immediately to overcome it.

## Freight Car Loading

WASHINGTON, D. C.

OWING to the observance of the Fourth of July holiday there was a falling off of 135,110 in the number of cars loaded with revenue freight during the week ended on July 9 as compared with the previous week, according to reports compiled by the Car Service Division of the American Railway Association. The total for the week was 639,698

cars, a decrease of 156,493 cars as compared with the corresponding week last year and of 170,147 cars as compared with the corresponding week in 1919.

Reductions, compared with the week before, were reported in the loading of all commodities, the greatest being in merchandise and miscellaneous freight which includes manufactured products; coal and forest products. Because of the holiday in the week of July 9, however, comparisons with the preceding week in which there were six full working days are out of line.

The summary for the week of July 2 is tabulated below:

### Decrease of Surplus Cars Continues

The gradual decrease in the number of surplus freight cars continued during the first eight days in July. The average was 369,525, a decrease of 4,266 cars as compared with the previous week. Surplus box cars totaled 145,112, a decrease of 1,186, due largely to a brisk demand for grain cars in the west where shortages have developed on several roads. There was also considerable demand for ventilated box cars owing to heavy loading of perishable products in the south. A further reduction of 931 in the number of surplus coal cars

### REVENUE FREIGHT LOADED AND RECEIVED FROM CONNECTIONS

Summary—All Districts, Comparison of Totals This Year, Last Year, Two Years Ago. For Week Ended Saturday, July 2d, 1921

Curve of Revenue Car Loading

Week ending July 9, 1921	639,698	Week ending July 9, 1920	796,191
Week ending July 2, 1921	774,808	Week ending July 9, 1919	845

was also reported, the total on June 8 being 161,606 compared with 162,537 on June 30. Coke cars in excess of current requirements increased nearly 120 during that period to a total of 11,643. Greater demand for stock cars reduced the total for that class of equipment to 17,221, or about 950 cars below what it was at the end of last month. Small reductions in a number of other classes of cars were also reported.

### Bad Order Cars July 1, Total 15.4 Per Cent

The number of bad order freight cars, however, continues to increase. The report for July 1 shows a total of 354,611, or 15.4 per cent, as compared with 15.1 per cent on June 15, while the percentage of bad order box cars was 17.4 as compared with 17.1 and of gondola cars 14.1 as compared with 13.7. Of all freight cars, 88,224 or 3.8 per cent, required light repairs and 266,387, or 11.6 per cent, required heavy repairs, while of the box cars 4 per cent required light repairs and 13.4 per cent heavy repairs. Not only is the percentage of bad order cars much greater than a year ago, but the proportion requiring heavy repairs is larger.

### Tentative Valuations Issued

**T**HE Interstate Commerce Commission has issued a number of additional tentative valuations.

#### Toledo, St. Louis & Western

In the case of the Toledo, St. Louis & Western the commission finds a final value as of June 30, 1916, of \$17,282,997 for the property owned and \$17,326,253 for the property used, which includes a small amount leased from other companies. The total track mileage covered is 625 miles. The final value found is very much less than the total capitalization or investment account. The outstanding capitalization on the date of valuation was \$48,412,413 and the investment in road and equipment as readjusted is stated as \$39,339,257, which includes \$35,500,000 face value of securities issued by the carrier in accordance with the reorganization plan of the Toledo, St. Louis & Kansas City less net cash receipts from the reorganization committee and plus expenditures for improvements and additions. The original cost, the report says, cannot be ascertained and figures are given for only a small part of the property. The cost of reproduction new and the cost of reproduction less depreciation of common carrier property other than land are given as \$16,742,614 and \$12,980,050, respectively.

#### Ann Arbor

In the case of the Ann Arbor, the commission places the final value as of June 30, 1915, as \$11,127,277 for the property used, a total of 420 miles of track. The total capitalization outstanding at the valuation date was \$17,271,538. The

cost of reproduction new of the common carrier property other than land is given as \$4,056,034, the cost of reproduction less depreciation as \$3,038,625.

#### Chicago, Milwaukee & Gary

The Chicago, Milwaukee & Gary is given a final value as of June 30, 1915, of \$2,889,974, which covered 99 miles owned. The report says that the funds provided for the initial construction amounted to something less than \$3,380,000, while the total capitalization outstanding on the valuation date was \$13,093,187. No dividends have ever been paid on the stock and no interest has ever been paid or even accrued in the accounts on the first mortgage bonds. The original cost to date is found to be an indeterminate amount in cash within a maximum of \$3,694,357. The cost of reproduction new other than land is given as \$2,609,678 and the cost of reproduction less depreciation as \$2,086,718.

#### Trinity & Brazos Valley

For the Trinity & Brazos Valley the commission states the final value as of 1916 as \$9,064,566; the capitalization was \$17,531,645, the book investment \$11,467,726 and the original cost approximately \$9,889,581 in money and \$1,518,338 in securities. The cost of reproduction new is given as \$10,528,526 and the cost of reproduction less depreciation as \$8,043,452.

#### St. Louis Southwestern of Texas

In the case of the St. Louis Southwestern of Texas, which on June 30, 1915, owned 897 miles of tracks and used 1,019 miles, the commission found a final value of \$23,831,840 for the property owned and \$26,029,939 for the property used. The capitalization as of the valuation date was \$27,590,936. The report says the original cost cannot be ascertained but the maximum expenditure of the company and its predecessors in creating and improving the property was \$21,685,529. The cost of reproduction new of the carrier property other than land was given as \$28,156,973 and the cost less depreciation as \$21,352,005, while the present value of the carrier land was reported as \$2,458,778.

The commission has also reported tentative values of a number of smaller roads in which the final value of the property used is given as follows:

Lithonia & Arabia.....	1916	\$51,858
Milstead .....	1916	31,924
Blaney & Southern.....	1916	56,000
Sunset .....	1916	1,468,226
Timpson & Henderson .....	1917	392,643
Gulf Texas & Western.....	1917	1,667,771
White River .....	1917	392,223
South Manchester .....	1916	184,425
Montana Western .....	1915	186,500
Peoria Railway Terminal .....	1916	1,126,355
Mount Hood .....	1916	507,463
Gideon & North Island.....	1917	130,906
Garden City Western .....	1916	192,099
Washington & Choctaw .....	1915	147,685
Sardis & Delta.....	1916	116,000

Ten-Wheeled Locomotive Built by the H. K. Porter Co. for the Manila Railroad

A duplicate order for 10 locomotives of this type was shipped recently. The equipment includes vacuum brakes and electric headlights.

# Reduction of Live Stock Rates Proposed

## Interstate Commerce Commission Examiner in Report Recommends Readjustment to Aid Farmer

WASHINGTON, D. C.

**O**RAL ARGUMENTS were heard by the Interstate Commerce Commission at Washington on July 15 on the first important complaint asking a reduction of rates increased by the commission's order in Ex Parte 74 that was filed with the commission following that advance. The case is that of the National Live Stock Shippers' League and other live stock interests against the western railroads and the proceeding was expedited by the commission so that the argument was held on the day following the issuance of a proposed report in the case by Attorney Examiner Disque, who recommended to the commission a finding that the rates for the interstate transportation of ordinary live stock in carloads in the Western and Mountain-Pacific groups in the aggregate are not excessive from a strictly transportation standpoint, but are unreasonable from an economic standpoint and that the carriers should favorably consider the making of substantial reductions in those rates for the benefit of the live stock industry and business generally. Mr. Disque found that, judged by the usually recognized standards employed in rate cases, the live stock rates are relatively low for the service performed, but he recommended a reduction of the rates in the two western groups by the amount of the increase put in effect last August, which was 25 per cent in the Mountain-Pacific group, 35 per cent in the Western group and 33⅓ per cent on inter-territorial traffic. This was strenuously opposed at the argument by the attorneys for the roads.

The complaint asked for a blanket reduction in the live stock rates on the ground that it was impossible for the live stock industry to thrive under the present rates and that they injure business generally. The rate making authorities of several states intervened as complainants and the commission was asked to eliminate both the increase of 25 per cent with a maximum of 7 cents per 100 pounds or \$15 per car, made by the Railroad Administration under General Order 28, and the increase ordered by the commission in Ex Parte 74. For the most part the important live stock rates in the West had been fixed by the commission before these advances were applied.

### Live Stock Industry in Serious Condition

The report discusses in detail the situation of the live stock industry, pointing out that the market prices are determined largely by the law of supply and demand and that the proceeds of the farmer are based on the price at the market less transportation and marketing charges. "The record establishes," Mr. Disque said, "that the live stock industry is in a very serious condition. Millions of dollars have been lost within the past year or so because of the rapid and severe decline in market prices of live stock. When the live stock industry is in a depressed state the whole section of the country is depressed." For hauls up to 400 or 500 miles, he said, the increases under General Order 28 and Ex Parte 74 resulted in rates about 68 per cent higher than those in effect before the war. For greater hauls the increase was less severe, but in general exceeds 50 per cent.

"The market prices of live stock are near the pre-war levels and the indications are that as a general rule the live stock grower at best is not receiving and will not receive," the report said, "if present producing and marketing costs and selling prices continue, anything more than a nominal

return over and above the out of pocket costs, to say nothing of interest on investment and an allowance representing a salary for the farm or ranch owner-manager. The present relatively low price may be due largely to a possible oversupply on the market.

"The present rates discourage and to an extent actually prevent the free interchange of cattle among ranchmen, thus reducing railroad traffic. Future traffic is also threatened. Many have discontinued the raising of live stock and many more are expecting to do so. Freight charges are the only item aside from commission charges which is at its peak."

The complainants pointed out, the report says, that the value of live stock is far below what it was when Ex Parte 74 was heard and that the value of the commodity is one of the important considerations in rate making. The reduction in rates is not sought on the ground that it would substantially increase the present movement but on the theory that it would stimulate the industry, help save it from ruin and preserve it as a future and continuing source of traffic for the carriers. The desired benefit to the industry might be accomplished if substantially increased prices for live stock could wisely be fixed by law, the examiner said. Possibly when the present period of liquidation has spent itself and production is reduced higher prices will come about naturally.

### The Railroad Point of View

"The railroad situation is a matter of common knowledge," the report continued, "and need not be considered here. Suffice it to say that the evidence is calculated to establish that the carriers, like the live stock industry, are in a bad way and that they are in no position to make extensive reductions in rates. The defendants roughly estimate that on the basis of 1919 traffic the reduction sought would cost them about \$34,000,000. Complainants perhaps would have us regard this amount as defendants' just contribution toward an early return to normal conditions. If only the Ex Parte 74 increases were taken off the loss would be about \$22,500,000. The carriers say that if there is any commodity which should be excepted from a reduction, it is live stock. They have offered what they regard as the most comprehensive and convincing evidence ever submitted in a live stock case. That the rates in the aggregate are not excessive from a strictly transportation standpoint is so abundantly shown that it is not deemed necessary to do more than state the ultimate facts. The evidence establishes beyond and question of doubt that the present rates contribute to the revenues of the carriers in less proportion than do most other commodities of importance. In other words, judging them by the usually recognized standards employed in rate cases, they are relatively low for the service performed. Live stock rates have not been increased as much in the last 10 years as most other rates. On account of the light loading the car milk earnings are far below what they are on most other important commodities. We have no hesitation in saying that our judgment is that they should be substantially reduced to assist in tiding the live stock industry over its present period of adversity and to hasten the return of normal conditions. In other words, it is our view that the rates are unreasonable from an economic standpoint.

"It is not every line of business that would be materially helped by a reduction in freight rates but here is one which would be. It is our view that in the long run a substantial reduction would redound to their (the carriers') advantage.

"The defendants fear that if they make reductions on one commodity the same thing will be demanded on many others and that if they yield most of them will be shortly found in bankruptcy. We cannot believe, however, that the country will allow such a thing to come to pass as a general condition of receivership. We think the carriers in the public interest should favorably consider the matter of eliminating for the most part, temporarily at least and especially for longer hauls, the increases in live stock rates made following Ex Parte 74. This exception is not to be taken as any indication of what course we may pursue as to some other commodity. A reduction in rates on traffic in general seems unwarranted at this time and in our view no adequately compensating benefit would be thus achieved. However, the rates on certain commodities are stifling industry and should be reduced. If the carriers cannot live on rates that will permit industry to thrive, special measures may have to be adopted to maintain and preserve the efficiency of our transportation system."

#### Argument on Behalf of Railroads

Kenneth W. Burgess, arguing in behalf of the railroads, said that the present condition of the livestock industry is due entirely to economic factors other than freight rates and that a reduction in freight rates will not relieve the situation. To illustrate this he showed that while the deflation in the farm values of live stock in the western district in 1920 was \$819,660,288 the freight rate increase made last year was only \$7,488,336 or less than 1 per cent of the decrease in values, the advance having been in effect for four months. The present value of the western live stock at the market is \$2,419,200,000 and the entire reduction in freight rates asked, \$34,000,000, is only 1.2 per cent of the value, while the reduction proposed by Examiner Disque is less than 1 per cent. He also showed that the value of a car of live stock at the market is \$1,800 to \$2,000 a car, while the average freight rate in the western district is \$66 a car. These figures illustrate in a general way, he said, the fallacy of charging the commission with causing the deflation in the value of live stock or Congress with dereliction of duty in passing the transportation act.

No general rate reduction is possible at this time in the western district, he continued, and live stock cannot be singled out for a rate reduction at this time in the light of the circumstances and conditions of transportation which are attendant upon it. Under the law as defined by the courts and the commission rates on one class of traffic cannot be decreased so as to throw a burden on other classes of traffic. Upon the facts of record it appears, Mr. Burgess argued, that this result would follow if live stock rates are reduced. The courts have frequently held, Mr. Burgess said, that the reasonableness of a freight rate does not depend upon whether the customers of the railroads are making money in their business and the examiner in his report has undertaken to set up a new test of the reasonableness of a rate, the economic reasonableness, unknown to the law, without giving any measure to tell what would be reasonable.

Commissioner Campbell asked if he contended that the commission should keep on raising rates in an effort to make them produce 6 per cent. Mr. Burgess said that he would not make any such contention but that in this case it is not claimed that the reduction of the rates would even stimulate traffic. It is claimed that live stock has been moving merely because it was necessary for the producers to realize cash. The western railroads have been earning only at the rate of 2.87 per cent.

Mr. Burgess went into a detailed discussion of the causes for the deflation in live stock prices to show that a reduction in freight rates would not result in any material or permanent benefit to the industry and concluded by saying that if the commission should find, as the examiner has found, that

the rates are reasonable from a transportation standpoint, he challenged its jurisdiction to reduce the rates.

#### Argument of Shippers

S. H. Cowan and Clifford Thorne, representing the live stock shippers, and J. E. Benton, representing the state commissions that have intervened in the case, emphasized the argument that the commission can reduce rates on a single class of traffic on the ground of their inherent unreasonableness regardless of whether the rates as a whole are producing the return prescribed in the law and upon the superiority of the rights of the public to ship on reasonable terms from the standpoint of the shipper, to the rights of the stockholders. Mr. Thorne and Mr. Cowan also objected strenuously to the finding of the examiner that the live stock rates are reasonable from the transportation standpoint and that rates generally can not be reduced, saying that such findings are unnecessary in this case and may cause trouble in the future. They also referred at length to exhibits used in previous live stock rate cases which they claimed demonstrated that live stock rates are remunerative as compared with the rates on other commodities when compared on the basis of net ton miles rather than on car mile earnings.

Mr. Cowan said that the reduction is asked so that the live stock industry may prosper so that the railroads may prosper because the prosperity of the railroads depends in great measure on that of the live stock industry. The business now is paralyzed, he said, and the shippers did not even have the money to prepare an abstract of testimony in this case. It is not contended that the railroads are wholly responsible for the condition, he said, or that the western roads are earning the return prescribed by the law, but that the commission is empowered to make rates which are fair and reasonable in the circumstances, which means rates that will enable the industry to live. He denied that the live stock traffic costs more per net ton mile than other traffic, saying it is the most desirable traffic in the west that moves in volume.

Senator Kendrick of Wyoming, who is president of the American National Live Stock Association, also made a statement to the commission, describing the serious condition of the live stock industry and arguing that a reasonable freight rate must be one that is reasonable to the shippers. He said the last increase in rates had more to do with discouraging those who were financing the live stock producers than any other factor and seemed to have brought them to the conclusions that the business could not be made successful. He said that reduction is asked on traffic which must be moved whether the rates are reduced or not because the cash must be realized from it and he urged expedition in deciding the case because the heaviest movement will be early in August. Senator Kendrick declared that the freight rate represents 25 per cent of the net return from live stock and that the reduction asked would not enable the producer to realize the cost of production but would merely reduce his losses.

Clifford Thorne answered Mr. Burgess' figures by saying that the condition of the industry is the result of many factors which collectively are of large importance and that one of the largest factors in the list is the freight rate burden. Chairman Clark asked whether there is anything in the record to show whether the producer of live stock would get the benefit of a reduction in rates. Mr. Cowan interjected that the farmer gets the price at the market less the freight rate and Mr. Thorne added that anything that reduces the cost of shipping is important and it is up to the shipper to see that he gets the advantage of it.

THE RULE REQUIRING all engineers and conductors on the Atchison, Topeka & Santa Fe to have standard watches, has been extended so that it includes all firemen, brakemen, switchmen and train porters of the system.

# Locomotives of American Design for Use in Spain

## Pacific Type Handles Heavy Express Trains on Madrid, Zaragoza & Alicante with High Efficiency

THE Madrid, Zaragoza & Alicante is one of the two large railroad systems in Spain. Having 2,267 miles of line, it constitutes about 25 per cent of the total railroad mileage in the kingdom, which is 9,610. The road is of 5 ft. 6 in. gage, this being the standard used on 75 per cent of the mileage in the country, the balance being meter gage. The road operates three main lines out of Madrid, the first running easterly through Zaragoza to Barcelona and along the coast to the French border, the second southeasterly to Alicante with a branch to Cartagena, and the third southerly and westerly to Cordoba and Seville. The rolling stock consists of 879 locomotives, 1,643 passenger coaches and 20,964 freight cars.

American built locomotives of the balanced compound 12-wheel type have been in operation on the Madrid, Zaragoza & Alicante for several years, but they were constructed from drawings furnished by the railroad and were duplicates of previous locomotives used on the road which were built in Germany. A full description of these engines was given in the *Railway Age*, April 13, 1917.

In May, 1920, the Madrid, Zaragoza & Alicante placed

These Pacific type locomotives conform as closely as possible to American practice. They are, however, equipped with copper fireboxes and staybolts and screw reverse gear. Automatic vacuum brakes are used for the driving wheels and on the tender, with auxiliary hand brakes on the tender.

The superheater is designed to raise the temperature of the steam to 725 deg. F., or 350 deg. above that of saturated steam. This extremely high temperature requires the use of special oil and a great amount of care on the part of the enginemen. Due to lack of experience with steam of such high temperature, several of the valves were scratched during the first two months of service, but no trouble has been experienced recently.

Despite the fact that so many details of construction conformed to American practice and were therefore new on the road, the men soon became familiar with these engines and now handle them as perfectly as the older types of locomotives. Although the Pacific type locomotives are of smaller power than the older 12-wheel type, they are satisfactorily handling the same loads, run easily at the fastest speeds allowed and if delayed are usually able to make up lost time.

American Design of Locomotive Giving Good Service in Spain

an order with the American Locomotive Company for 15 passenger locomotives of the Pacific, or 4-6-2 type, to be built in accordance with American designs. They were completed in 100 days after the signing of the contract, but shipment was delayed on account of the protracted strike of the longshoremen. They were finally received at Alicante early in September, erected at the roundhouse at that point and placed in service on express passenger and mail runs from Madrid to Barcelona, Santa Cruz, Alicante and Cordoba. As these new locomotives, numbers 901 to 915, are used in the same service as the earlier 12-wheel locomotives of the 1,300 class, the following information which has just been received from E. Maristany, superintendent of motive power, relating to their performance after they have been in service for several months, is of particular interest.

The service requirements specified were the handling of 280 tons back of the tender at a speed of 31 miles an hour on 1.5 per cent grades and curves of 1,312 ft. radius, 310 tons at a speed of 37.3 miles an hour on 1 per cent grades and curves of 1,312 ft. radius and 400 tons at a speed of 62.1 miles an hour on level track and curves of 2,297 ft. radius.

The arrangement of the trucks and the disposition of the suspension permits running at high speed without trouble from journal heating.

The workmanship on these locomotives has received very favorable comments and refutes the opinion frequently held in Europe that American workmanship is of a low grade. Due to the results thus far obtained, the impression made by these locomotives is a very favorable one. In two or three years when they are taken in for heavy repairs, it is hoped that a comparative report can be obtained between the cost of repairs on these locomotives and other locomotives of European design.

At the present time economy of operation is of vital importance in Spain as well as in other parts of the world as the coal now available on the Spanish roads is not only of a lower grade than that formerly obtained, but the cost is two or three times as much per ton as it was before the war. During the month of April, 1921, the average total mileage made by the fifteen engines was 3,510 with an average coal consumption of 71.5 lb. per train mile, while the amount of oil used per mile was 0.12 pint, or 8.3 miles per pint of oil. In coal and oil consumption the results obtained with these

engines compare very favorably with that of the most economical locomotives on the road.

The general dimensions and the weights of the locomotives are given in the accompanying tabulation.

Tractive effort (85 per cent of working steam pressure).....	28,830 lb.
Gage.....	5 ft. 6 in.
Cylinders.....	23 in. by 26 in.
Boiler.....	
Diameter.....	65 in.
Length between sheets.....	19 ft.
Working pressure.....	170 lb.
Grate area.....	45.3 sq. ft.
Tubes.....	28-5 3/4 in.
Plues.....	14-2 in.
Heating surface, firebox.....	143 sq. ft.
Heating surface, arch tubes.....	13 sq. ft.
Heating surface, tubes.....	1,305 sq. ft.
Heating surface, total.....	1,461 sq. ft.
Heating surface, superheating.....	705 sq. ft.
Wheels:	
Driving.....	69 in.
Truck, front.....	38 3/4 in.
Truck, trailing.....	45 3/8 in.
Weights:	
On driving wheels.....	105,800 lb.
Engine light.....	169,000 lb.
Engine in working order.....	188,500 lb.
Engine and tender in working order.....	293,500 lb.
Tender:	
Water capacity.....	717 cu. ft., 9,600 U. S. Gals.
Fuel capacity.....	5 1/2 tons

## Labor's Bill of Rights and the Seniority Rule

By L. E. Gardner

MR. JEWELL in setting forth labor's "Bill of Rights," said the reason for so doing was to show to the Labor Board "how easy" it would have been for employees and the railroads to get together on the National Agreement had the railroads shown a "sincere desire" to meet those selected and instructed by the railroad employees to adjust the matter of national agreements. Even the most casual consideration of the "eleven points" of the "irreducible minimum" on which labor would have an agreement, shows the labor leaders to be begging the question. It is difficult to say which of these "eleven points" is the most objectionable. The purpose of this article is to discuss only one of them, namely, the tenth, which demands: "Craft, point seniority, limiting seniority to the local shops or points, and not permitting interchange of seniority with other shops, crafts, or departments of railroads."

It does not seem that "those selected" by railroad employees to adjust this matter are acting in the best interests of railroad employees in asking for any such disastrous rule, or that in doing so, they really voice the wishes of the employees as a whole. Under present working conditions, many employees do not have an opportunity, or at least do not see fit to exercise the opportunity of expressing their real convictions. A closed shop is closed in more ways than one.

This rule not only places the emphasis on seniority instead of on ability, but does not even make mention of the ability or fitness of the employee. Seniority alone is to be considered. Such a rule might benefit the incompetent workman who had no qualification other than seniority by which to win promotion, but would have a very discouraging effect on the success of any worthy or ambitious workman. No matter what the workman's natural talent, or his special fitness for the job in question, or the training he had received in preparation for just such work, he could not hope for the job so long as anyone else wanted it who happened to have more seniority than he. And just what is this talisman of "seniority," this "open sesame" to all job preferment? It isn't a question of the man's fitness or faithfulness, or even of his length of service. But one of "craft, point, departmental seniority." Let us consider each of these three phases of this rule.

First craft seniority: nothing that the workman ever did before becoming a member of the craft is to be considered.

If he spent four years in an apprenticeship preparing for service in that craft he may have less seniority than the so-called McAdoo mechanic, who was made a mechanic over night, by a stroke of a pen, and happened to become a member of the craft the day before the young apprentice completed his four year course, even though the date the latter completed his course may have been delayed by two years or more spent overseas in his nation's service. The handyman's seniority dates from the day he began doing mechanic's work, but not so with the apprentice. He has absolutely no seniority until he begins drawing full mechanic's pay, and even then he has no more seniority with the employer for whom he has worked these several years than in a shop in which he had never entered. So much for "craft" seniority.

But even after becoming a member of the craft, and having craft seniority his chances of success and advancement are further limited by "point seniority," which in brief stipulates that nothing the workman ever did at any other locality is to be of any avail to him. He may have been broadened and developed by experience in some of the best shops in the country, or may have given a lifetime of efficient and faithful service to this same employer, but possibly his own health or the health of some member of his family, may have made it necessary to move to some other section of the country and to seek employment in another shop of this same company. Should this be necessary, he finds to his sorrow that in the choice of work and in times of reduction, he has less "point seniority" than the most incompetent boomer who happened to light in that shop a day ahead of him. Though he has given his former employer good and faithful service, this rule would tie the company's hands and make the management powerless to reward him for his service. Truly this seniority rule is a great protection to the workman.

But it is not sufficient that the workman should be handicapped by craft seniority and point seniority, he must be still further restricted by "departmental seniority." His ability is not to be considered. His seniority in the craft is not sufficient, his years of service with the company is worth nothing, not even his service with the company at that particular point, unless he also has "departmental seniority." Any fellow workman, who happened to start in that particular department ahead of him, no matter how inefficient or unworthy, would have seniority rights over him as to choice of jobs and as to being retained in service in times of reduction. If the man accepts work in a small department he limits his chance for advancement. The man in a large department finds that once he loses a desirable position, he must start again at the very bottom in a class of work not only very distasteful to him, but work for which he is really not fitted. For instance, if a skilled cabinet maker or inside finisher suffers a break in his service, for any reason whatever, voluntary or otherwise, he cannot ask for similar employment with his former employer, nor even on any other railroad in the country, but can only ask for the least desirable job in the freight car department. In this as in other cases, nothing is of any value but the "technical seniority," the conditions of which he cannot always foresee, as many workmen have recently learned to their sorrow.

During these recent reductions in forces, the management would have gladly rewarded many of these men for their faithful service, and would have found some way in which to take care of them, but no, they must follow a rule the conditions of which are such that not only is no guarantee made for merit of any kind, but the employer is even denied the opportunity of giving any consideration to a worthy employee not given to the most worthless and unworthy of those able to get by. And yet labor leaders include such a rule in the "irreducible minimum" on which they would make an agreement, and in doing so claim they are acting in the best interests of the men they are supposed to represent.

But the frequent injustice to the workman himself is not

the worst of it. Railroad men are human beings, endowed with the desire for self betterment and service to others. Like all normal individuals, as a whole, they at heart believe in reward of merit; they know that some men are more capable than others, that some men are adapted to the work they are doing while others are industrial misfits; that some make the most of their opportunities while others fail to do so. While they and their employers feel that old and faithful employees should be rewarded for the service rendered, they realize, too, that the quality and quantity of work done by the individual employee should receive its own reward. Imagine the effect, if you please, on a competent, energetic workman seeing an ignorant, incompetent, slow and lazy fellow-workman given preference over him in choice of work or other favors in the shop. If this happens not once, not twice, but scores and scores of times, what effect is it bound to have on his efficiency and ambition, his feeling toward his employer and toward his fellow-workmen. If such a condition should continue day in and day out, year after year, what would be the result in a decade or a generation? What would be the quality and quantity of work turned out by a body of workmen from whom all incentive to individual effort had been removed? What would be the earning power and consequent income of this same body of workmen, what their feeling toward each other, what their respect for themselves?

Let us view this obnoxious seniority rule from a different angle, from the viewpoint of the output of the shop, in case the management has nothing to say as to the placement of the men. If all jobs must be bulletined, if from the foreman is taken the right to place his men in work for which they are fitted, and where they will work as a whole to the best advantage, if his men know that he had nothing to say as to their present assignment of work and will have nothing to say about such assignments in the future, what will be the effect on shop discipline, what the effect on the immediate and the ultimate output of the shop? Where is teamwork going to come in? How is the work of the various jobs going to be co-ordinated and the whole body of workmen formulated into an efficient working unit? What would have been our chance of defeating the Germans had our army been organized in such a manner, and the various positions filled, and men detailed for special duty merely on the basis of seniority alone?

If the shop management is to have nothing to say as to placement of men, and to have no opportunity for rewarding merit, but must bulletin each job, shut its eyes and take what comes, what will be the inevitable result, either in present output or future progress and efficiency? If this arrangement is to be continued in the assignment of work to the definite craft, would it also be extended to foremanship and other leaders? In short, would the oldest man in the shop be made superintendent, the oldest man in the state be made governor, and the oldest man in the nation be made president? These illustrations sound ridiculous, but they serve to show the ridiculousness of the seniority demands.

Under the individual effort system, by which is meant any system which recognizes effort and ability, men are not promoted, they promote themselves. It is just as natural for some men to rise to the top and others to go to the bottom, as it is for material objects to obey the laws of gravitation. There may occasionally be a few instances where men of ability are temporarily passed over by favors shown men with a pull, but such cases are rare and are daily becoming more so. Even from a purely selfish point of view, a foreman or other official is not going to injure his own success and chance of advancement by tying about his neck a lot of dead weight in poor subordinate assistants. Even if a sense of fairness and justice would not influence him, his own interests in the matter would result in his rewarding those of his men who show most ability and fitness.

As the individual workman increases his efficiency and usefulness, so will the usefulness and prosperity of the workmen as a whole increase. As output is increased and the company's earnings increase, the cost of transportation will be lowered and the public correspondingly benefited. This question is a most serious one and is of direct concern not only to the railway employees and railway managements but to the public as well. In brief we might as well expect the race to be won by the oldest horse on the track as to expect to win out in the present industrial struggle with a system recognizing length of service alone, with no regard for merit or fitness.

## Chesapeake & Ohio Wants to Unify Properties

WASHINGTON, D. C.

THE CHESAPEAKE & OHIO has filed an application with the Interstate Commerce Commission (noted briefly in the Railway Financial News Column) for authority for the conveyance to it of the property of the Chesapeake & Ohio Northern, which indicates that the provisions of the Transportation Act interpose numerous technicalities in the way of a consolidation of the properties of a railroad system in advance of the publication by the commission of its tentative plan for a general consolidation of the railroads into a limited number of systems.

It has been the policy of the Chesapeake & Ohio to unite the properties of its various subsidiaries with its own property by deeds of conveyance from time to time, but in order to carry out this policy in the case of the Chesapeake & Ohio Northern, which in part connects its line with that of the Hocking Valley, it has asked for authority under three separate provisions of the act.

In the first place it applies for a certificate that public convenience and necessity require the operation by the Chesapeake & Ohio of the Chesapeake & Ohio Northern and permitting the abandonment by the Northern of its line coincident with the assumption of operation by the Chesapeake & Ohio. Application is also made for an order approving and authorizing the acquisition of control through conveyance to the Chesapeake & Ohio of the rights, properties and franchises of the Northern company, or for authority to assume direct liability for the bonds of the latter. The Chesapeake & Ohio built the Northern line under the name of a separate company of which it owns the stocks and bonds and the application states that the properties are now and always have been operated as parts of a single system under one management and are in substance commonly owned. The application is made under the provisions of section 1, paragraphs 18 to 22 and section 5 paragraph 2, either or both, and under section 20a of the interstate commerce act, but not under section 5, paragraph 6, which provides for the consolidation in one corporation of properties in separate ownership.

The paragraphs referred to in section 1 are those which provide for the issuance of certificates authorizing the construction or acquisition of extensions or the abandonment of existing lines, but the commission has held in several recent finance cases that paragraph 18 does not apply in the case of a railroad which was in operation in interstate commerce prior to its effective date last year. Section 5, paragraph 2, under which application is also made, authorizes the commission to approve the acquisition by one carrier of the control of another carrier either under a lease or by the purchase of stock "or in any other manner not involving the consolidation of such carriers into a single system for ownership and operation," while Section 5, paragraphs 4 to 6, provide for consolidations but only in case they are in harmony with and in furtherance of the complete plan of consolidation mentioned in paragraph 3 on which the commission is now work-

ing with the assistance of Professor W. Z. Ripley of Harvard University.

The application of the Chesapeake & Ohio says the object is to acquire by purchase and operate the property of the Northern company. Applicant is advised that Section 10 of the Clayton law is susceptible of a construction which may have a serious effect on the heretofore efficient and economical operation of these properties as a single railroad system because of the restrictions thrown around dealings between companies having common officers and directors, and it is stated that the steps taken by the applicant to meet the technical difficulties arising from this construction of the act are proving very expensive and otherwise embarrassing. The effect of granting the application, it says, will be to change an equitable into a legal title to the property and a guaranty into a principal and in addition to effecting accounting and other economies will result in the restoration of efficient operation impaired by Section 10 of the Clayton Act.

## "No Exception Month" on the Illinois Central

**D**URING THE PERIOD of federal control very satisfactory results were obtained in reducing the number of casualties to employees by means of "no accident" or "safety first" campaigns. With this past experience in mind, officers of the Illinois Central were of the opinion that a similar campaign, to be known as "No Exception Month," might obtain worthwhile reductions in the number of loss and damage claims on their road. The plan seemed so feasible that the month of April, 1921, was set aside for the campaign, which was to be known as "No Exception Month," and which had for its immediate purpose the reduction of exception reports, with their subsequent claims. The general method chosen for accomplishing this end was to enlist the cooperation of employees in a general effort to handle more carefully all freight delivered to the road for transportation, so as to insure its reaching its destination in the same good condition in which it had been received, thereby obviating the necessity for exceptions of any kind.

It was decided that the territory to be included in this "no exception campaign" should embrace all lines of the Illinois Central south of the Ohio river, consisting of the two so-called grand divisions, the Illinois Central Southern lines and the Yazoo & Mississippi Valley, a total of seven divisions.

### Campaign Well Advertised

General superintendents and superintendents were notified two weeks in advance of the campaign in order that they, in turn, could issue preliminary instructions to all supervising officers and agents. To further insure the success of "No Exception Month," supervising agents from each division were called together at Memphis, Tenn., where a uniform program was discussed and adopted for the use of all agents and their forces. An outline of this plan which, it is believed, was largely responsible for the extraordinary success of the campaign, follows:

1. Notices, fully outlining the campaign, were sent out to all agents, trainmasters, master mechanics, roadmasters, yardmasters and local freight conductors.
2. Supervisory forces conducted a personal campaign among the employees of every department.
3. Meetings were held at all the larger stations at which the agents could instruct both their office and platform organizations.
4. Platform foremen held ten minute meetings daily with their forces.
5. Agents and foremen at the principal stations were required to ride local freight trains frequently during the campaign to check up any bad practices in the handling of freight which might come under their observation.
6. All foremen in charge of transferring and repairing carload shipments were made familiar with the details of the campaign

and were impressed with the importance not only of transferring all lading carefully, but also of using the utmost care in selecting the cars to be used.

7. Agents at the larger stations were urged to inform shippers of the campaign and to solicit their co-operation.

8. Inspectors from the department of the superintendent of stations and transfers were assigned to each division one week before the inauguration of the campaign. They were to co-operate with the superintendents, supervising agents and other division officers in making the campaign a success, and were free to handle any details which might be assigned them after conference with the division staffs.

9. On the last day of March, 1921, superintendents sent notices to all heads of departments on their division, calling their attention to the fact that the campaign was to become effective on the following day, and issuing instructions that the employees should be called together before going to work to be impressed with the importance of giving close attention to the proper handling of all carload and l. c. l. shipments, and otherwise making every effort toward success in the campaign.

### Excellent Results Obtained

The exception reports received as the result of improper handling of freight during this period were tabulated daily, being charged to the station and division responsible for them. Report was made by telegraph daily to the general superintendents of the number of exceptions received against each division and larger station, together with the total to date.

In addition to the general "no exception campaign" a special effort was made to reduce exceptions resulting from bad order equipment. As a result of this effort, these exceptions, which had totaled 1269 on the two grand divisions in March, were reduced to 364 in April, a reduction of 905 or 71 per cent. This was accomplished largely by interesting the stowmen in the proper loading of freight, by instructing yard and train officers in methods of careful handling, and by bulkheading "through destination cars." As an example of this latter remedy, there were 105 bad order exceptions reported on outbound freight from Louisville, Ky., during March, and this number was reduced to 20 in April, solely by bulkheading merchandise cars. A test showed that of 127 cars bulkheaded only 8 were damaged.

The general campaign itself resulted in a reduction of more than 70 per cent in the number of exceptions received on the grand divisions in the handling of less than carload freight in April, as compared with March. The reduction as compared with October, 1920, was more than 80 per cent. It must be borne in mind, however, that while the tonnage in March and April was approximately the same, that in April was 50 per cent less than in October, 1920. The table which follows illustrates in detail the exceptions which were received against the two grand divisions during the month of April, in comparison with the totals for March, 1921, and October, 1920:

	Southern Lines	Y. & M. V.	Total April 1921	Total March 1921	Decrease of	Per cent
Shorts	46	108	154	666	512	76.8
Bad orders	146	218	364	1,269	905	71
Filferences	10	32	42	118	76	64
Overs	102	98	200	537	337	62
Astrays	46	73	119	430	311	72
Total, April, 1921...	350	529	879	3,020	2,141	70
Total March, 1921...	1,426	1,594	3,020	.....	.....	.....
Total October, 1920...	2,311	2,796	5,107	.....	.....	.....

Decrease in April as compared with October, 4,280, or 82 per cent

### Interest of Employees Continues

The entire campaign, according to the officers of the Illinois Central immediately in charge, was marked by the co-operation of every officer and employee. Intense interest and rivalry were created between the larger loading stations and between the various divisions, with the result that interest among the employees in preventing loss and damage to freight has been permanently increased. An especially gratifying result of the campaign has been the increased activity of the employees on the grand divisions during the month of May. Reports received up to and including May 16 indicated that a better showing was made during that month than was made even in April, while the campaign was on.

## Water Softening as a Factor in Fuel Conservation

By C. R. Knowles

Superintendent of Water Service, Illinois Central, Chicago

FUEL SAVING is only one of the many benefits to be derived from water softening, others including the longer life of flues and firebox sheets, a reduction in the cost of labor for cleaning and repairing boilers, fewer boiler failures due to leaking, greater locomotive mileage between stoppings, fewer locomotives required to do the same work and a material saving in overtime and delays. Space will not permit of discussing the many advantages of water softening in detail; this article, therefore, will be confined as closely as possible to a discussion of fuel economy through the use of properly softened water.

The cost of fuel to the Class 1 railroads of the United States in 1920 was \$765,870,663, according to the report of the Interstate Commerce Commission to the Senate, the quantity and cost of various fuels being as follows:

Bituminous coal .....	155,343,635 tons	\$641,234,469
Anthracite coal .....	5,779,819 tons	24,268,764
Oil .....	55,990,783 bls.	97,874,094
Coke .....	91,642 tons	1,027,336
Wood, etc. ....		1,476,000

The fact that some of this fuel is wasted or consumed unnecessarily is generally recognized and railroads have waged extensive campaigns in the interest of conservation of fuel. These campaigns, however, have been directed largely toward effecting economies in the handling and use of fuel, neglecting to a certain extent at least the quality of the water furnished and its possible effect upon the fuel consumption. If we stop to consider that practically all of the fuel used on railroads is for the purpose of converting water into steam and that much of the steam is used for heating or handling water it will be realized that a campaign against fuel waste is not complete unless a careful study is made of the water supply as well as the coal pile.

Chief among the many fuel wastes is that caused by boiler scale. No locomotive or other boiler is absolutely free from scale after it has been in service for a short time, the extent of the scale depending entirely upon the character of water used. The calcium and magnesium sulphates and bicarbonates are the most important scale-forming elements commonly found in boiler waters. Sulphate scale usually has a higher heat-insulating value than carbonate scale, due to the greater density in structure, although this may vary to some extent under different conditions and with water differing in character. Scale is objectionable in boilers for more than one reason, but the principal objection is due to its great heat-insulating value and the resultant loss in fuel necessary to drive the heat through the accumulated scale.

It is, of course, preferable to develop a natural water supply of satisfactory quality rather than to install a treating plant, but unfortunately this is not always possible, except at a prohibitive cost. Therefore, if a natural water supply of good quality cannot be developed the proper treatment of the available supply is necessary.

For convenience water treatment may be roughly divided into two general methods, namely, "Interior" and "Exterior" treatment, the first covering the use of chemicals and boiler compounds introduced directly in the boiler, the second covering the treatment and removal of the scale-forming materials before the water enters the boiler. Where facilities are not provided for fully treating the water outside the boiler, the use of a good compound is often advisable and is followed by good results when properly applied. The existing objections to the use of boiler compounds are due largely to their improper application rather than to the failure of the compounds themselves, and they have often been condemned as unsatisfactory when the fault lay in the failure

to apply them as instructed. However a properly designed treating plant offers the most satisfactory and economical method of treating boiler waters, and the use of compounds should be confined to those points where the results to be obtained will not justify the expense of maintaining and operating a treating plant.

The lime-soda process in general use on American railroads is so well known that a detailed description is hardly necessary. It is sufficient to describe briefly the principal actions of the chemicals as applied to the water during treatment. Calcium and magnesium carbonates are soluble only in water containing carbonic acid gas; when the carbonic acid is removed the carbonates become insoluble and are precipitated. This is accomplished by adding enough lime to take up the carbonic acid.

The sulphate hardness is removed by adding soda ash which combines with the sulphates of lime, and forms carbonates of lime and sulphate of soda. Additional lime is then necessary to neutralize any carbonic acid present, the carbonate of lime is then precipitated leaving the sulphate of soda dissolved in the water.

The sulphate of magnesium and the nitrates and chloride of lime and magnesium, when present, are treated in a similar manner. The sodium salts left in the water after treatment will, if present in considerable quantity, cause trouble from foaming, particularly in the presence of suspended matter. This condition may be corrected by blowing down boilers, or the use of anti-foaming compounds, or both.

Water softeners are built in two general types, the intermittent and continuous. In the intermittent treating plant two or more tanks are always required, as it is necessary to allow the water to stand after treatment until reaction and precipitation have taken place. In the continuous treating plant the process of reaction and precipitation takes place as the water is passing through the softener.

Professor Schmidt, of the University of Illinois determined that boiler scale only 0.02 in. thick caused a loss of boiler efficiency of 5.4 per cent. The following table shows the heat losses through the formation of scale of different thickness:

Character of scale	Thickness	Composition	Per cent loss
Hard .....	1/50 in.	Mostly carbonate	5.4
Soft .....	1/32 in.	Mostly carbonate	7.2
Hard .....	1/32 in.	Mostly carbonate	8.5
Soft .....	1/25 in.	Mostly carbonate	8.0
Hard .....	1/25 in.	Mostly sulphate	9.3
Hard .....	1/20 in.	Mostly sulphate	11.1
Soft .....	1/16 in.	Mostly sulphate	10.8
Soft .....	1/16 in.	Mostly carbonate	11.0
Soft .....	1/16 in.	Mostly carbonate	12.4
Hard .....	1/16 in.	Mostly carbonate	12.6
Soft .....	1/11 in.	Mostly carbonate	15.0
Hard .....	1/9 in.	Mostly sulphate	15.9

It may perhaps be considered unusual to find an accumulation of scale of the maximum thickness given in above table, but as a matter of fact this amount of scale is less than the thickness usually found in a locomotive at the shopping period in most sections of the country. In a report on the results of water treatment on a middle western railroad in the June 30, 1916, issue of the *Railway Age Gazette*, photographs were presented of samples of boiler scale, one of which was 1 1/2 in. thick, taken from a front flue sheet brace after 10 months' service; another showed a sample of sulphate scale 1/4 in. thick which put a boiler out of commission after three months' service; another specimen completely clogged up the space between the tubes after eight months' service.

In another case on a railroad operating through Iowa, scale 3/4 in. thick was removed from the sheets of a locomotive after 56,000 miles. This represented the maximum thickness of scale in the boiler and was present only on the outer sheets. The scale was, of course, much lighter on the firebox and flue sheets.

These examples represent extreme conditions of scale formation and are, of course, not representative of average

conditions, as a scale  $\frac{1}{4}$  in. thick will in many cases probably cause the sheet to burn or the boiler to leak to such an extent that it must be taken out of service.

A middle western railroad, in a report covering the operation of treating plants for 1920, estimates that a saving of at least 60,000 tons of coal was accomplished by the removal of 4,517,883 lb. of scale-forming material; 750 engines were operated in the treated water territory, therefore, the scale-forming solids removed from the water averaged over 6,000 lb. per engine. Assuming that only 25 per cent would have adhered to the tubes and sheets, the average thickness of scale formed in these boilers would have been  $\frac{3}{16}$  in. As the heat loss through  $\frac{3}{16}$  in. of scale is from 20 to 30 per cent the estimated saving of 60,000 tons of coal would appear to be very conservative.

A saving of the entire cost of a water softening plant in less than two months' time through the resultant economy in the fuel used in locomotives constitutes an unusual demonstration of the value of water treatment. This, in short, is the nature of the results secured by a contractor on railroad construction in the boilers of two steam shovels, six locomotives and two hoisting engines. The demonstration is especially conclusive because the isolation of the equipment limited its supply of water to a single source and because the record of performance gives a check not only on the total quantity of fuel but also on the relative amount of fuel used per unit of equipment performance.

The Walsh Construction Company, Davenport, Ia., contractor for the grading for the new Markham Yard of the Illinois Central at Homewood, Ill. (near Chicago), found the water upon which it was dependent for its boiler supply so unsatisfactory as to cause serious difficulty in the operation of equipment. As a result, a water softening plant was installed which treated all the water used in the boilers after October 27, 1918, and records of the fuel used before and after the installation of the softener constitute the basis for the conclusions reached with regard to the fuel economy.

This treating plant was placed in service October 27. In the period from September 6 to October 27 there were a total of 650 boiler shifts in the course of which an average of 4.2 tons of coal per boiler shift was used. Considering this with the quantity of earth moved by the contractor during this period the cost of the coal used per cubic yard of earth handled amounted to \$.0306 per cu. yd. For a period of not quite two months following the installation of the water softener the coal consumed decreased to 3.1 tons per boiler shift, resulting in a cost of only \$.0204 per cu. yd. of material graded. In this case 25 per cent of the coal per boiler shift was saved through the treatment of water and operating conditions were improved to such an extent that the cost of fuel per cu. yd. of material graded was reduced 33 per cent.

The following data are taken from Bulletin No. 11 of the Engineering Experiment Station, University of Illinois. An Illinois Central Engine having run 21 months and accumulated a scale deposit averaging  $\frac{3}{64}$  in. in thickness, was given a two days' test according to the test code of the American Society of Mechanical Engineers. It was then cleaned and after two days, the following shows the water evaporated from and at 212 deg. F. per pound of combustible before and after cleaning:

EVAPORATION PER POUND OF COMBUSTIBLE	
Before cleaning .....	7.53 lb.
After cleaning .....	8.48 lb.
Increase after cleaning .....	6.93 lb.

In the above case 485 lb. of scale was removed from the boiler, resulting in the saving of over  $10\frac{1}{4}$  per cent in fuel.

From the best information available the locomotives and power plants on the railroads of the United States consume annually 720,000,000 gal. of water. While there is no complete record of the number of water treating plants in service on the railroads of the country a fairly accurate

estimate would be in the neighborhood of 600 plants and from the known capacity of some 200 plants the average amount of water treated by each plant is 36,000,000 gal. per year, making approximately 21,600,000,000 gal. of treated water used annually on our railroads. Assuming that 50 per cent of the water used is of such quality that treatment would be economical, it means that we have less than six per cent of the treating plants that are needed. As previously stated in this article, in some instances the existing bad water conditions may be relieved by the development of a good water supply within a reasonable distance, but the proper treatment of the existing supply is the only remedy in the majority of cases.

The fuel Director for the United States Railroad Administration stated in 1918 that "all locomotives have  $\frac{1}{16}$  in. of scale 40 per cent of the time and many have scale from  $\frac{1}{8}$  to  $\frac{1}{4}$  in. in thickness." He further states "that in some districts it is not unusual to find  $\frac{1}{2}$  in. of scale on the boiler sheets." His estimate of the loss of fuel on account of scale on boiler sheets for the year 1918 was \$50,000,000. If we use the same ratio of loss on the cost of fuel for 1920 we have an annual loss of \$60,000,000 on the railroads of the country which represents 6 per cent on an investment of one billion dollars. When we consider that the fuel saved represents only a portion of the saving to be effected through improving the quality of boiler water it is apparent that there are few investments that can be made on a railroad that will show quicker or greater returns than a properly designed water treating plant.

## Modern Refinement in Coaling Station Design

THE COALING STATION and sanding plant recently completed for the Philadelphia & Reading at the Tulip street engine terminal in Philadelphia is unique in the degree of refinement that has been carried out in the perfection of both structural details and operating facilities.

View Above the Bin Showing the All-Concrete Roof and the Partitions Between the Three 200-Ton Coal Pockets

The building is of reinforced concrete throughout, including the superstructure over the bins and the housing for the elevating bucket and the stairway which is entirely en-

closed. The facilities also include a steam heated wash and locker room for employees.

The plant has a storage capacity of 600 tons of coal and, for the purpose of providing separate storage for an-

General Elevation of the Station, with the Wash Room on the Left

thracite coal, lump coal and stoker coal, the bin is divided into three pockets, each holding 200 tons. The bins are equipped with gates in such a way that the coal in each one is available to three tracks. The stoker coal is passed

The Plant from the Receiving Track Side Showing the Concrete Cover Over the Track Hopper

through screens in the discharge chute 12 ft. long by 6 ft. wide of the lip design and offset. The perforations are 2 in. wide by 6 in. long.

The coal is received from cars in an all-concrete receiving

hopper which is 24 ft. long in the clear and has a slope of 50 deg. to make it suitable to handle green sand also. The coal or sand, whichever may be handled, is discharged by gravity into a three-ton capacity measuring feeder which is actuated by the ascent and descent of the elevating bucket. This feeder automatically loads the three-ton, ball-bearing coal bucket which is connected with a 7/8-in. hoisting cable to a direct-connected electric hoist which is equipped with a 22-hp. alternating current electric motor with solenoid brake.

Working in connection with the electric motor is an automatic controller enclosed in steel cabinet. The controller is equipped with a push button starting and stopping station which permits the continuous and automatic operation of the elevating bucket as desired. By pushing one button the machinery is started and the bucket operates up and down without attention, and when it is desired to stop, the second push button brings the motor to rest by setting the

"Safety-First" Undercut Coaling Gates with Hooded Aprons, All Operated from Platform Between the Coaling Plant Columns

brake. The hoist and controller are located in a separate reinforced concrete machinery house.

An unusual feature of this plant is a wash house which has been provided for the convenience of the workmen about the terminal. This room is equipped with 20 all-steel lockers, 8 wash bowls with hot and cold water, 2 toilets, 4 urinals and 1 shower with hot and cold water. The wash-house is heated by steam radiators equipped with standard central apparatus. The plant is also thoroughly wired for electric lights.

The facilities for handling the sand are also very complete. After being elevated in the bucket, the green sand is by-passed to a reinforced concrete pocket having a storage capacity of 100 tons of green sand. This bin is equipped with three special control gates through which the sand gravitates to three Banner rectangular steam sand dryers. As the sand dries it escapes through the coils and is gathered on a large steel hopper, where foreign matter, pebbles, etc., are screened out by gravity.

The dry sand passing through the screen falls into a hopper on a Tyrone automatic sand drum and, by the con-

trol of two air valves, is blown in a straight line, four-inch, extra-heavy pipe to an all-concrete dry sand bin located over the pocket. This dry sand bin is lined with hollow tile to prevent condensation and keep it thoroughly dry. From this bin the dry sand gravitates through discharge pipes to three moisture-proof undercut sand valves for supplying dry sand to locomotives on three coaling tracks. The receiving hopper is covered with an all-reinforced concrete canopy to protect the men from the elements when unloading coal.

This plant was designed and built throughout, including the foundation, by the Roberts & Schaefer Company, Chicago, under the direction of Charles Corwin, acting superintendent, the work being subject to the general direction of Samuel T. Wagner, chief engineer of the Philadelphia & Reading. The contract price for the plant was \$115,000.

## A Many Purpose Locomotive Crane

**I**N THE HANDLING of materials in railway terminals, shops, store yards, etc., as well as in construction and maintenance work, there is an increasing necessity for employing better and quicker methods of carrying on the work. In meeting this necessity light, portable, high speed locomotive cranes are becoming more and more important factors. These machines are being used economically for many purposes such as the loading and unloading of rail, ties, spikes, angle bars, tie plates, frogs, switches and numerous other heavy materials in store yards, tie treating plants, and out on the line. Such cranes are also useful in bridge work for handling material which is not heavy enough to require a wrecking crane.

The Truck Body Can Be Shifted on the Axles, Reducing the Clearance to 6 ft. 6 in.

Equipped with a grab bucket the cranes economically move dirt, coal, cinders, etc., and when fitted with a magnet may be used for handling scrap in reclamation plants or other places.

For work of this character, the Universal Crane Company, Elyria, O., has developed a portable locomotive crane of three to four tons capacity, which can be handled by one man. It is operated by its own 4-cylinder gasoline engine or electric motor and handles a clam shell bucket, magnet or hoist block. Various other equipments such as a dragline bucket, an exciter generator for furnishing current to an electric magnet, a capstan head for snaking loads or shifting cars, etc., can be added as desired.

This crane can be mounted to suit the work it has to do. It may be mounted on a motor truck, a rubber tired trailer, a continuous tread, or a wide tired steel wheel industrial truck that will operate on the ground or standard gage track. To suit the railroad field, the mounting illustrated has been

developed after extensive investigations to determine a convenient form. This mounting consists of a low wheel truck built to travel under crane power over a pair of rails which are laced together and laid on standard railroad flat cars. Two or more of the rail sections may be used and moved ahead by the crane as desired, or the rails may be laid from car to car over a train for the crane to operate over. The flat cars need not be permanently tied up, as, when it is not in

The Crane Travels Under Its Own Power Over Rails Laid on the Flat Car

use, the crane can be run off onto a platform, this relieving the cars for other service.

One of the most important features of this crane is its compactness. The rear swinging clearance is 7 ft. 6 in. This clearance from the center of the car can be decreased to 6 ft. 6 in. (half of 13 ft. track centers) by mechanically shifting the truck body on the axles one foot in either direction where it locks. This allows the crane to be used without fouling traffic on an adjacent track.

THE CHICAGO, ROCK ISLAND & PACIFIC has created a new department of personnel and public relations under the supervision of H. S. Ray, assistant to the president. Mr. Ray will be especially concerned with the maintenance of cordial relations between the employees themselves, and between the management and the employees.

AN ATTEMPT TO WRECK an American Express Company's train of fourteen cars was made 2 miles west of Willoughby, Ohio, on the New York Central, early on the morning of July 14. Officers of the road reported that spikes had been pulled and tie plates removed from the rails with tools stolen from the Willoughby tool house. Although the train jumped the track when it struck the spot where the spikes had been removed, no cars were overturned.

Compo and Pacific, Equipped with Superheater, on the Paris, Lyons & Mediterranean

# General News Department

The Union Pacific, on July 17, re-employed 1,500 men on its Mountain division who had been laid off with the slump in business.

The request to suspend the 5 per cent freight rate reduction made by the railroads operating south of the Michigan Central in Michigan, was filed by the Traffic Department of the Michigan State Farm Bureau, and the Grand Rapids Association of Commerce, and not by the Michigan Traffic League, as reported. According to T. H. Wallace, of Lansing, Mich., president of the League, that body, however, will soon file joint complaints with the Michigan Public Utilities Commission and the Interstate Commerce Commission, asking for hearings on the adjustment of the entire Michigan class rate situation.

According to an article appearing in the "Illinois Central Magazine," the freight on a \$1.25 meal, served in Springfield, Ill., consisting of beef from Iowa, salmon from Oregon, and other foods from as far away as Louisiana and New York, is approximately 1 cent and 2 mills. In this computation, the cost of transportation is based on carload rates from the producers and manufacturers to the wholesalers, and the less-than-carload rates from the wholesalers to the retailers. The products figured in on the meal were coffee, pepper, salt, beef, wheat, butter, salmon, strawberries and sugar.

## Work of C., B. & Q. Homeseekers' Bureau

Through the efforts of the Homeseekers' Bureau of the Chicago, Burlington & Quincy, the co-operation of the State Immigration Bureau and the several government land offices, 2,222,380 acres of land were homesteaded in the Buffalo, Douglas, Newcastle and Cheyenne, Wyoming, land districts, during 1920. In addition about 10,000 acres of irrigated homestead land were taken up in the Shoshone, Wyo., and North Platte, Neb., projects. It was estimated that the number of families received at western stations along the Burlington and recognized as new settlers and so reported by agents, totaled 5,692.

## P. R. R. Insurance Department

### Increases Death Benefits

The Voluntary Relief Department, the company insurance plan of the Pennsylvania System, has announced amendments in the regulations pertaining to death benefits. Under the new rules, which went into effect June 1, the maximum death benefit has been increased and now ranges from \$1,000 in the first class to \$5,000 in the fifth class. The premium rates are very low, ranging from \$14.40 annually per \$1,000 of insurance for employees not over 45 years of age, to double that amount for employees over 60 years of age. These low rates are made possible by the fact that all operating expenses are paid by the railroad company.

## M. K. & T. Locomotive Makes Record Run

Missouri, Kansas & Texas locomotive No. 392, a coal burning Pacific type of 41,000 lb. tractive effort, recently made a continuous run of 1,024 miles, so far as is known the longest on record. The occasion was the movement of a special train of Shriners from Waco, Texas, to Kansas City on the way to the Shriners convention at Des Moines. The locomotive was suitably decorated at Denison, Tex., and ran light to Waco where it was immediately turned and started on its trip on the Shriners' special. The average speed on the trip was 40 miles an hour. The engine was in perfect condition upon arrival at Kansas City

and because of its elaborate decorations it was desired to run it to Des Moines but it was too heavy for the connecting line to handle.

## "Management Engineering"

"Management Engineering" is the title of a new monthly publication issued by the Ronald Press, New York. Its contents are devoted to a discussion of problems of management and production, the object, as stated in the first issue, being "to help executives better to discharge their duties in preparing, organizing and directing industry to secure maximum production."

L. P. Alford is editor of Management Engineering and E. W. Tree, associate editor. Mr. Alford was formerly editor of the American Machinist and later of Industrial Management. He is a vice-president of the American Society of Mechanical Engineers and chairman of the Management Division of that society.

## Salary Reductions on the Baltimore & Ohio

Coincident with the wage reductions for employees which went into effect on July 1, the Baltimore & Ohio also reduced "in like manner the compensation of those general, division and other officers and monthly employees who in the light of the higher cost of living were granted increases in their compensation at or since May 1, 1920," according to an announcement made on July 18. The announcement continued: "While the wages of such officers and employees do not come under the decision of the Labor Board, it was deemed necessary, because of the general conditions which so adversely affect the revenues of transportation companies, that such action be taken, notwithstanding it is recognized that during the period of inflation the officers did not receive increases in their salaries at the time or of the extent generally granted to many classes of officers and employees of industrial organizations nor in proportion to the increases granted from time to time to other classes of railroad employees generally."

## Unique Position of the Texas-Mexican

No railroad in the United States, perhaps, occupies a more unique position so far as ownership and management is concerned than the Texas-Mexican, which runs between Laredo, Tex., and Corpus Christi, 160 miles. It is a part of the National Railways of Mexico, a little less than 51 per cent of the stock of which is owned by the Mexican government, notwithstanding the fact that the Texas-Mexican division is situated wholly in the United States. Naturally, when the Mexican government took charge of the operation of the National Railways several years ago as a revolutionary war measure, it did not extend this control to the Texas-Mexican. The latter line has continued to be operated by a separate corporation, as required by the laws of Texas. The Texas-Mexican was built as an independent line, but it passed into the hands of the old Mexican National Railroad Company many years ago. When the merger of the latter into the National Railways of Mexico was put into effect the Texas part of the system went in along with the rest.

At the recent annual meeting of the board of directors of the Texas Mexican Railway Company, held here, the following officers were elected to serve during the ensuing year: Miles T. Cogley, president; S. DeWolf, vice-president and general manager; M. M. Leyendecker, general superintendent; R. W. Wolf, auditor; C. M. Fish, traffic manager; Alden B. Miller, secretary-treasurer.

## Operating Statistics of Large Steam Roads — Selected Items for the Month of May, 1921,

## Heavy Holiday Traffic at New York

The movement of passengers in and out of New York at the time of the Fourth of July holidays is believed to have been the greatest on record. At least the figures of passengers who passed through Grand Central Station and the passenger traffic figures of the Long Island Railroad point in that direction. During the week ending July 7 a total of 717,089 passengers arrived and departed through the Grand Central Station. The largest business was handled on Friday, July 1, when 136,561 passengers arrived and departed. The exceptionally heavy business in addition to the crowds leaving the city for the holiday has been ascribed to the movement of passengers who attended the Carpentier-Dempsey fight. The greatest number of trains was handled on July 2, when 5,098 cars, in 679 trains, entered and left the station. This figure shows that 257 more cars were used than on the similar day in 1920.

The Long Island handled a total of 1,633,900 passengers in the five-day period including the holidays. The largest business was on July 4, when 370,400 passengers were carried. Some of the Long Island's traffic statistics given in the following table for previous years give some measure of the increased business.

Figures for five days—	1918	1919	1920	1921
Passenger train movements.....	4,857	5,179	5,470	5,705
Passenger car movements.....	26,519	30,674	31,054	32,835
Baggage car movements.....	1,342	1,481	1,353	1,264
Passengers carried.....	1,121,560	1,433,600	1,569,800	1,633,900

## Railway Returns for May

The Interstate Commerce Commission's summary of revenues and expenses for 203 class I roads, for May and five months, is as follows:

Item No.	Item	May		Five Months	
		1921	1920	1921	1920
1	Average number of miles operated.....	235,592.68	235,175.88	235,592.75	234,723.57
2	Revenue:				
3	Freight.....	\$313,057,371	\$314,147,944	\$1,547,860,564	\$1,518,840,239

17	Miscellaneous operations.....	3,892,733	4,973,361	20,717,886	22,898,674
18	General.....	14,169,471	13,020,652	73,345,106	63,992,218
19	Transportation for investment—Cr.....	56,232	253,816	2,653,591	1,307,342
20	Railway operating expenses.....	380,041,234	437,829,758	1,984,693,193	2,090,902,297
21	Net revenue from railway operations.....	64,833,855	19,729,307	230,260,403	155,511,824
22	Railway tax accruals.....	22,415,730	23,032,592	112,959,526	110,216,113
23	Uncollectible railway revenues.....	102,469	87,506	424,083	444,821
24	Railway operating income.....	42,315,656	3,390,791	116,876,794	44,850,890
25	Equipment—Dr. balance.....	3,977,689	562,036	19,230,452	10,705,190
26	Joint facility rent—Dr. balance.....	1,257,313	1,476,942	7,314,221	7,745,590
27	Net of items 22, 23 and 24.....	37,080,654	5,429,769	90,332,121	26,400,110
28	Ratio of expenses to revenues (per cent).....	85.43	95.69	89.60	93.08

<sup>1</sup>Includes \$2,744,334, sleeping and parlor car surcharge.

<sup>2</sup>Includes \$13,128,190, sleeping and parlor car surcharge.

## Meeting of Protective Section of the A. R. A.

The Protective Section of the American Railway Association met at the Hotel Pennsylvania, New York, on July 14 and 15. Among the principal speakers were R. H. Ashton, president of the American Railway Association; General W. W. Atterbury, vice-president of the Pennsylvania, and E. J. Pearson, president of the New York, New Haven & Hartford. The general theme of all was the recognition by the railroads of the necessity for closer co-operation between

the police departments of the railroads and state and federal authorities.

The heavy losses chargeable to robberies was emphasized. From September of last year to March of this year the loss from this source was in excess of \$3,000,000. It was said that the shipment of liquor was causing trouble to the railroads, and that the losses through these shipments were soaring each month. It was said it took more police to guard those trains than to handle any other kind of shipment of like value.

The advisability of having the railway police commissioned by the states or by the federal government was discussed. A terminal police association in all large cities, to work with the Protective Section, and a more uniform method of handling witnesses and the expenses of getting evidence were advocated.

More prompt reports on loss when noted and a strict surveillance of auction rooms where stolen material is sometimes placed for sale were also advocated as methods of reducing this loss. A more uniform method of handling witnesses with expenses for obtaining evidence and other kindred matters were discussed. It was contended that an educational campaign should be instituted to teach shippers the importance of crating their goods in a more serviceable manner and in stronger containers to avoid their being broken into. It was urged by some of the members that robberies of freight be first reported to the local police by the railroad agents or other employees instead of to railroad officials.

## Commission to Investigate Grain Rates

The Interstate Commerce Commission, on petition of the Kansas Public Utilities Commission, which was joined by a number of other western state commissions, has ordered, upon its own motion, a proceeding of investigation into the reasonableness and propriety of the level of interstate rates on grain, grain products and hay, in carloads, in the western territory, with a view to prescribing such reasonable rates as the facts and circumstances may appear to warrant. No testimony will be admitted with respect to the relationship between particular points under the existing rates. A hearing has been set for August 15 at Washington before Commissioner Lewis. The Kansas commission asked for a reduction of the increase put in effect last summer on the ground that it is ruining business in the west and a number of western commissions have combined to prosecute the case. A similar investigation was undertaken by the commission on formal complaint of the western livestock interests and expedited so that the oral argument was heard on July 15. The two proceedings thus bring into question the matter of proposed reductions of the advances on two of the most important classes of traffic for the western lines.

Scrapped Because of Excessive Size When Seven-foot Gage Was Abolished. Great Western, England, 1892.

## Traffic News

The Detroit, Toledo & Ironton filed a freight schedule with the public utilities commission of Ohio on July 18, providing for a 20 per cent reduction in rates between all points on its line but not affecting connecting line rates.

Members of the Southern Hardwood Traffic Association voted unanimously in favor of filing an immediate complaint with the Interstate Commerce Commission against the present excessive freight rates on logs, lumber, cooperage and other forest products at Memphis, Tenn., on July 12.

The Railroad Commission of the state of California on July 13, on its own volition, directed an order to river transportation companies to show cause why increases granted last year should not be cancelled and the old rates restored. The order applies to all river lines operating on the Sacramento and San Joaquin rivers and their tributaries and on San Francisco Bay. The hearing is set for July 20.

The decision of the State Railroad Commission of California, making a substantial reduction in charges and rates for switching in the South San Francisco industrial zone, has been extended to include the Oakland-Alameda, Oakland-Berkeley and Berkeley-Emerlyville switching territories, making a total of six large industrial zones now on an equality as to distances and rates, with the same substantial reductions in charges.

Executive officers of the Eastern roads leading into Chicago, on July 14, finally approved an agreement to allow the Erie, Wabash and the New York, Chicago & St. Louis a differential passenger rate east of the Mississippi river. While the new agreement will not authorize differentials between many points that enjoyed the lower rates before the war, nearly all of the main points will be restored to the lower level. Before the war there were no differentials rates from St. Louis to the east, but according to the new arrangement they will prevail out of that city on the Wabash and any road that operates through cars in connection with the Erie, Wabash and Nickel Plate. The agreement will go to the Interstate Commerce Commission in a few days, and if promptly approved, the tariff should be ready by September 1.

The Interstate Commerce Commission has rendered its decision in the Kansas intrastate rate case, ordering an increase of the state rates by the percentages applied last year to interstate traffic except on petroleum products. The Kansas commission had allowed increases somewhat less than the interstate increases on the ground that many of the Kansas intrastate rates were already on a higher basis than the interstate rates. Commissioners Eastman, Campbell and Lewis dissented, the two former on the ground that the commission's jurisdiction had not been sufficiently increased under the transportation act to authorize it to step in and order increases in state rates in the circumstances, and the latter on the ground that the majority opinion in this case carries the doctrine of federal authority to unjustified extremes.

### Utilities Urged to Buy Coal

Secretary Hoover of the Department of Commerce has written a letter advising public utility companies to buy their winter coal supply as early as possible instead of waiting for lower prices, saying that he is convinced that, due to the general depression, the prices of bituminous coal at the mines are not too high at the present time. "If there should be a recovery of business activities in the Autumn," he said, "taken in connection with the large increase in the percentage of disabled cars and the inability of the railways to finance their maintenance, there are possibilities of developments of a most serious situation as regards coal movement. I cannot but feel that the Interstate Commerce Commission, in the face of warnings they have sent out in this connection, would not be disposed to give any priority in such an event."

## Commission and Court News

### Interstate Commerce Commission

The commission has reopened for further hearing part of an application filed by R. H. Countiss, as agent, for authority to continue rates on wool in sacks and in bales from Pacific Coast terminals to Atlantic Seaboard territory and points intermediate lower than from intermediate points of origin.

The Interstate Commerce Commission has authorized F. A. Leland, as agent for the southwestern lines, to file on five days' notice tariffs reducing the rates on lumber from the southwest to points in Kansas, Nebraska, Iowa and border points in Minnesota, but not the principal gateway points, to meet the recent reduction in rates on lumber from the northwest.

### State Commissions

The Railroad Commission of the state of California, on June 30, denied the petition of the Southern Pacific for a re-hearing in the South San Francisco switching cases, and the decision of May 13 stands. By this decision the three big industrial centers of the state—San Francisco, Oakland and Los Angeles—were placed on an equal footing as to switching charges. The charges are uniform, being 37½ and 50 cents a ton depending on the distances cars are moved. The rate from South San Francisco to San Francisco was reduced from 80 to 50 cents. The railroad had proposed a rate of 70 cents.

### Regulation of Wire Crossings

The general assembly of the state of Ohio has enacted a law which will go into effect on September 6, authorizing the public utilities commission of the state to determine the "standard of maintenance and operation, and also the nature, location and character of the construction to be used where telegraph, telephone, electric light, power or other electric wires of any kind cross, or more or less parallel, the line of a railroad, interurban railway or other public utility." The bill further gives power to the commission to act upon complaints by the carriers and interurban railways when their properties are injured by these lines.

### Illinois Commerce Commission Bill

The law regulating public utilities in the state of Illinois, which was known as the State Public Utilities Commission Act, was superseded on July 1, 1921, by a new law, known as the Illinois Commerce Commission Bill under which the name of the commission is changed to the "Illinois Commerce Commission." This law provides that the number of commissioners be increased from 5 to 7; assistant commissioners are created not to exceed 8 in number and each is to receive a salary of \$5,000; other employees, such as assistant commissioners, accountants, engineers, experts and one private secretary to each commissioner and assistant commissioner, are exempted from the civil service, while branch offices of the commission may be established at places other than the seat of government. Any railroad or transportation company may, by the terms of the new law, grant reduced rates for the transportation of any materials to be used in the construction, maintenance or repair of public highways. The act provides that any party to a proceeding before the commission, may inspect the records of all hearings or inquiries and submit suggestions as to other matters to be investigated, whereupon if the commission sees fit, it may require questions propounded to be answered and if the utility to whom the inquiries are directed shall refuse to comply, the commission shall refuse relief if that utility is the one seeking it, or may grant the relief prayed for by the opposing party if such utility is defeated. It is further provided that a re-hearing may be applied for within 30 days after the service of an order. The commission must grant or deny the application for a re-hearing within 20

days, while no appeal lies from an order of the commission, unless and until an application for a re-hearing thereof shall first have been filed and acted upon by the commission; cities are given the right by the new law to appear as complainants in any investigation relating to rates or services of utilities operating within their limits; appeals from orders and decisions of the commission shall be taken to the circuit or superior court of the county in which the subject matter of the hearing is situated rather than to the Circuit Court of Sangamon County; Article VI (Local Utilities) is entirely new and provides that any city may, with respect to any utility (except trunk line railroads), furnishing service within its limits, exercise power and jurisdiction over the rates, service and extensions of such utility, in substantially the same manner, and to the same extent, that the powers of the Illinois Commerce Commission are exercised. The matters of accounts and the issuance of securities, however, are left under the jurisdiction of the commission. This question of so-called home-rule is to be submitted to the electors of any city at certain general elections upon the petition of 25 per cent of the legal voters thereof, and requires a majority vote for adoption. The article further provides that any utility dissatisfied with any action of the city may appeal to the Illinois Commerce Commission for a review of the city's order.

## Personnel of Commissions

Charles F. Staples, who has been appointed acting director of the Bureau of Valuation of the Interstate Commerce Commission, succeeding C. A. Prouty, deceased, has been associate director of the valuation bureau and has been connected with it since the Division of Valuation was organized in 1914, when he resigned as a member of the Minnesota Railroad and Warehouse Commission to become a member of the advisory board of the division. Mr. Staples was born August 4, 1856, at St. Paul, Minn. He was educated in common and private schools and later taught school for three years. He was a practical farmer and dairyman for 15 years and for 10 years was engaged in banking. He was a member of the school board of St. Paul for 26 years, chairman of the town board for 10 years and chairman of the board of county commissioners for four years. He was elected a member of the lower branch of the Minnesota legislature in 1892 and re-elected for three successive terms. He was elected a member of the railroad and warehouse commission in 1900 and was several times re-elected.

## Court News

### Need Not Inspect Car Used by

#### Consignee in Intraplant Service

While a carrier's duty of inspection of cars includes, in some instances, a duty to an employee of the consignee, it would seem that it does so only when a duty of the consignee to exercise like care for its employee has not arisen. When a duty of inspection by another than the carrier arises after unloading—as where a consignee takes over a car for its own purpose, a purpose entirely dissociated from that for which it had been delivered by the terminal carrier in the discharge of its business—and the one owing that duty fails to perform it, that breach of duty, intervening between an injury to an employee of the consignee and a previous breach of a like duty at one time owed by the carrier, is the proximate cause of the injury. When a consignee assumed full control over a car, put it in its intra-mill transportation service, and there used it for 48 days between the day it was unloaded and the day of injury to an employee, the Circuit Court of Appeals, Third District, holds that the consignee assumed the duty of inspection for the protection of its employees, and the railroad's responsibility for its failure previously to inspect and discover a defect not 'ecret ceased. The railroad's liability to the employee also ceased, unless it assumed a duty of inspection after delivery. Collection of demurrage on the car was not proof that the railroad knew the car was being used in intra-mill traffic, so as to make it liable for its unfitness for such traffic.—*West Jersey & Seashore v. Cochran*, 266 Fed. 609.

## Foreign Railway News

### Consulting Engineer Appointed

#### for Bolivian Construction

Fred Lavis, consulting engineer, with offices at New York, has been appointed consulting engineer to the Bolivian government and the Ulen Contracting Corporation in connection with the construction of the Atocha-Villazon railway line, some details of which were published in the *Railway Age* of July 16 (page 133). Mr. Lavis expects to sail for Bolivia early in August.

### American Loan for Brazilian Railways

According to Commerce Reports, the Brazilian press reports that the state of Rio Grande do Sul has entered into negotiations with New York bankers for a state loan of between \$10,000,000 and \$30,000,000. The funds thus acquired will be spent in improving the railway systems of the state and in completing the port works of Porto Alegre, both of which are state property.

### Great Reduction in Traffic on British Railways

In March of this year the railways of Great Britain hauled 22,783,195 tons of freight, a decrease of 8,614,037, or 27.44 per cent, when compared with the same month last year. Ton miles handled were 1,272,873,399, or a decrease of 29.72 per cent from the total of March of last year. The average receipts per ton mile, exclusive of collection and delivery charges, were 4.186 cents. The heavy decline in traffic affected the operating results adversely—the average tonnage per car was 5.23, as compared with 5.49 tons for March last year, and the average train load was 123.52 tons, as compared with 136.06 for March, 1920.

### New Zealand Railways Make Good Showing

The returns of the New Zealand Government Railways for the fiscal year ended March 31, 1921, have just been announced, and show that the railways experienced another good year, according to Consul General Wilber at Auckland. The revenue amounted to \$33,620,361 (normal exchange), as compared with \$27,994,478 for the fiscal year 1920, with expenditures at \$27,430,514 against \$19,977,308, leaving a net revenue of \$6,189,847, as compared with \$8,017,170. The number of passengers carried during the year was 15,315,614, as compared with 12,760,814 for the preceding year, a gain of 2,554,800. Freight carried totaled 6,085,360 tons, being an increase of 488,128 tons.

### An Important African Project

During the war the South African—Rhodesian—Congo trunk line was pushed northward to Bakuma, in the Belgian Congo, on the navigable Congo river, providing through-rail connections with South African ports. To link the Atlantic coast to the west with Bakuma a line from Lobito bay, in Angola, westward to Bakuma, was projected. Before the war this railway was completed to Chinguar, a distance of 322 miles, and the roadbed was completed to Bié, 66 miles farther. Recently track laying has commenced on this section, which will soon be ready for service. Financial arrangements for the completion of the line from Bié to Bakuma are now under discussion, according to the *Times* (London) Engineering Supplement. The Benguela Railway, as this line is called, will be 1,155 miles in length from the Atlantic coast to its junction with the trunk line from Capetown, just south of Bakuma. The railway when completed will provide the shortest route from the interior to the coast.

A great part of the mileage of this line will be through mountainous country which will necessitate some sharp curves and heavy grades. On the existing line there is a short section of rack rail which it is proposed to eliminate. The road is of 3 ft. 6 in. gage—the same as that of the South African Railways.

## Operating Results of the French Railways In 1920 as Compared With 1913

The Minister of Public Works of France has recently published some very interesting statistics on railway operations in that country. The operating results of the six large railways are shown in Table I for 1920, and compared with those for the year 1913, the last normal pre-war year.

The 486 per cent increase in the railway expense account in 1920 as compared with 1913 is attributed to the increased cost of labor, materials and fuel. In Table II is shown the number of

TABLE I—OPERATING RESULTS

Items	(In thousands)						Total All Roads	
	Northern	Eastern	Paris, Lyons & Mediterranean	Paris-Orleans	Modi	State	1920	1913

employees and their compensation for the year 1913 as compared with 1920.

The total increase in the number of employees in 1920 as compared with 1913 is 40.6 per cent, while the total compensation paid employees during the same period increased 319.2. This increase in compensation does not include the cost of living and family indemnities, nor does it allow for certain conditions brought about by the installation of the eight-hour day. In addition, the average price per ton paid for coal by the railways in 1913 was \$4.63, as compared with \$46.51 in 1920, which represents an in-

## New Officers for South Manchuria Railway

The president of the South Manchuria Railway, Dr. R. Nomura, and the vice-president, S. Nakanishi, some time ago presented their resignations and S. Hayakawa, a Japanese business man and banker, has been elected to the presidency, according to the Trans-Pacific (Tokyo). The former officers resigned, it would seem, while under suspicion of certain irregularities in the management and it is said that Mr. Nakanishi is being prosecuted under the charge of breach of trust in connection with the purchase by the

TABLE II—EMPLOYEES AND COMPENSATION

Road	Number of employees	Per cent increase 1920 over	Compensation		Per cent increase 1920 over 1913	
			1913	1920		
			(In thousands)			
Northern	51,053	76,909	45.0	\$23,372	\$101,325	335.7
Eastern	54,259	75,326	38.8	22,002	90,710	312.3
Paris, Lyons & Mediterranean	81,000	118,577	46.4	40,337	154,400	282.8
Paris & Orleans	50,338	72,179	43.4	18,335	94,570	415.8

State	78,815	106,586	35.3	31,459	115,993	268.7
Totals	344,944	484,908	40.6	143,862	603,125	319.2

crease of over 900 per cent. Rails in 1913 were \$34.74 per ton, ties \$0.98 apiece, while in 1920 the roads were obliged to pay \$161.15 per ton for rails and \$4.05 apiece for ties.

The true measure of traffic is not the number of cars moved, but the ton-miles, and the operations of some of the individual French roads indicate that there has been an increase in the ton-miles in 1920 as compared with 1913, even though the number of cars moved per day have decreased. This condition is a result of greater carloads and longer hauls during the year 1920. The French roads are now exerting every effort to care for the increased traffic, in spite of the increased prices they are compelled to pay for material and fuel.

The *Railway Age* is indebted to the Bureau of Railway Economics for supplying the above information, which was obtained from the *Revue Politique et Parlementaire*.

## Locomotive Exports in May

May showed some improvement in the number and value of locomotives exported, largely due apparently to a movement of 62 to Mexico. The month's total was 109, valued at \$2,647,441. The detailed figures by countries, as compiled by the Bureau of Foreign and Domestic Commerce, follow:

Countries	Number	Dollars
Canada	1	5,115
Mexico	62	1,433,380
Cuba	7	193,891
Argentina	6	226,500
Peru	1	26,837
Chosen	2	27,060
Straits Settlements	20	496,000
Dutch East Indies	3	30,850
Japan	1	12,875
New Zealand	1	14,958
Philippine Islands	5	180,075
Total	109	2,647,441

company of a large colliery at what would appear to be an exorbitant price. It is expected that the new president will make many changes in the executive personnel of the road. The South Manchuria Railway Company was organized in 1906 to take over the railways ceded to Japan at the end of the Russo-Japanese War, and the Japanese government owns a large block of its capital stock. The road has an improvement program before it involving the expenditure of some \$210,000,000 in the next four years.

## Prospective Construction in Mexico

The British capitalists interested financially in the Kansas City, Mexico & Orient, in Mexico, who spent some time in Chihuahua recently going over the road, expressed themselves as well pleased with the prospects, and they returned to London with the avowed intention of arranging for the immediate expenditure of many millions of dollars in the completion of the road, according to the information published in *Commercial Mexico*. A careful study has been made of the entire situation in Mexico, and the visitors left with an optimistic belief that stable conditions have returned to that part of the country which for nearly ten years has been scourged by civil war, and that now is the time to undertake work on railroads and those other public utilities so badly needed for the development of the immense resources of the State of Chihuahua.

The original concession of the K. C. M. & O. calls for the building of the line to connect Kansas City, by way of Chihuahua, with the Pacific coast port of Topolobampo in the state of Sinaloa. The completion of this line would bring Chihuahua into prominence as a railroad center, as the road would cross the lines of the Mexico Central, which runs from Juarez, on the Mexican

border, to the City of Mexico, and would also cross the line of the Southern Pacific of Mexico as it passes through the state of Sinaloa. It would place Chihuahua in direct touch with Kansas City, Chicago and the Middle West, and would make it the marketing center for a large and fertile portion of Northwestern Mexico.

The completion of the line to the Pacific Coast involves many engineering difficulties. The building will be expensive, as there are gorges and passes in the rough slope of the Sierra Madre which will have to be bridged before the gentle Pacific slope is reached, and it is believed that the work, if undertaken now, will not be completed within three years. The road will open up rich lumber and mining country, with immense possibilities for development. Western Chihuahua and the highly mineralized valleys of Sierra Madre have been neglected in the past because of the lack of transportation facilities.

The representatives of the British stockholders of the Orient were enthusiastic as to the future of the line, and while it was stated that nothing definite could be said at present as to the prospects of commencing work of building to Topolobampo in the immediate future, it seems reasonably certain that the work of linking up the line between Falomir and Alpine will be begun as soon as the necessary financing can be arranged in London.

### Exports of Car Wheels and Axles

Each month shows a further decline in the exports of railway equipment. May exports of car wheels and axles were valued at \$207,966, as against \$304,659 in April. The detailed figures by countries as compiled by the Bureau of Foreign and Domestic Commerce, follow:

Countries	Dollars
Norway	7,690
England	196
Canada	38,639
Costa Rica	565
Honduras	915
Mexico	8,724
Cuba	7,700
Virgin Islands of United States	87
Argentina	123,162
Brazil	7,013
Chile	1,346
Colombia	334
Ecuador	1,011
Venezuela	277
British India	1,088
Straits Settlements	282
Dutch East Indies	400
Japan	1,765
Australia	697
Philippine Islands	4,000
Portuguese Africa	2,070
Total	207,966

### May Car Exports

Further declines in the exports of cars are shown by the May figures. No passenger cars were shipped and only 465 freight cars, valued at \$639,454. The detailed report by countries, as compiled by the Bureau of Foreign and Domestic Commerce, follows:

Countries	Freight and other		Parts of cars.

## Equipment and Supplies

### Locomotives

THE MIDLAND TERMINAL is inquiring for 1, 2-8-2 Mallet type locomotive.

### Freight Cars

THE MAINE CENTRAL is asking for prices on 200 steel center constructions.

THE CHICAGO GREAT WESTERN is in the market for repairs on 175 to 200 box cars.

THE NORTHERN PACIFIC is asking for figures on 1,000 steel center sills and 1,000 underframes.

THE CHICAGO & NORTH WESTERN is asking for prices on the repair of from 1,000 to 5,000 freight cars.

THE BUFFALO, ROCHESTER & PITTSBURGH is asking for prices on the repair of from 500 to 1,000 freight cars.

THE ILLINOIS CENTRAL has contracted for the repair of 400 gondola cars with the Haskell & Barker Car Company.

### Track Specialties

THE NEW YORK CENTRAL will receive bids until 12 o'clock noon, August 1, for its present requirements of track bolts, track spikes, angle bars, tie plates, frogs, switch points and switches, switch plates, crossing frogs, terminal stud track bonds, guard rails, knuckle rails and movable points for crossings.

### Machinery and Tools

DWIGHT P. ROBINSON & COMPANY, INC., New York, is inquiring for lathes, planers, shapers, rail drills, and blacksmith shop machinery for export to Brazil.

### Miscellaneous

THE GREAT NORTHERN is inquiring for 136,000 bolts.

THE CHICAGO, ROCK ISLAND & PACIFIC is inquiring for 200,000 bolts.

THE LONG ISLAND will receive bids until 2 p. m., July 25, for 750,000 to 800,000 gallons fuel oil of a density from 14 deg. to 16 deg. Baume.

THE CHICAGO & NORTH WESTERN will accept bids until 12 o'clock, noon, July 29, for 34,000 gallons of burner oil in barrels; 6,000 gallons of burner oil in tank cars, and 15,000 gallons of mineral seal oil in barrels.

THE NEW YORK CENTRAL will receive bids until 12 o'clock, noon, August 2, for a minimum of 600,000 gal. and maximum of 800,000 gal. of Asphaltum base fuel oil with gravity of 18-20 deg. Baume, cold test 10 degrees.

THE NORFOLK & WESTERN will receive bids on July 27, at Roanoke, Va., for 116,711 lbs. steel plates; 75,000 lbs. steel bars; requirements of the railroad of Mazda incandescent electric lamps for one year from August 1, 1921; parts for electrical apparatus and electrical material.

THE NEW YORK CENTRAL will receive bids until 12 o'clock noon, August 3, for its shop requirements until September 1, 1921, on black galvanized and blue annealed sheets, driving and truck tires for freight and passenger service, seamless steel tubes, car and tender axles, car axles for axlelight system, driving and trailer truck axles, front engine truck axles, standard wire nails, galvanized and polished fence staples, steel bars, steel shapes and steel plates, galvanized tie dating nails, bridge warning poles and woven wire fence.

## Supply Trade News

**Theodore L. Dodd & Co.**, Chicago, have been appointed district sales agents of the middle west for the **Foster-Songer Company**, Pittsburgh, Pa.

The **Miller Train Control Corporation**, Danville, Ill., has opened offices in the Riggs building, corner Fifteenth and G streets, N. W., Washington, D. C.

**E. J. Brennan**, formerly superintendent of motive power, Lines East, of the Chicago, Milwaukee & St. Paul, is now sales manager for **The Rogotchoff Company**, Baltimore, Md.

**Edgar L. Keithley** has established an office at 1323 Alaska building, Seattle, Wash., as a representative of **The Central Foundry Company**, New York, makers of universal cast iron pipe, soil pipe and general castings.

The **Canadian Chicago Bridge & Iron Company, Limited**, of Bridgeburg, Ont., and Montreal, Que., has changed its corporate name to **Horton Steel Works, Limited**. The new name has been selected in honor of the late Horace E. Horton, who founded the Chicago Bridge and Iron Works in the United States in 1865.

The **Universal Packing & Service Company**, Chicago, in addition to handling spring journal box packing, has enlarged its organization to take care of the railroad field and mid-western commercial field for the development and sale of Rawplugs, a device which enables an ordinary screw to hold in any material. **The Rawplug Company** has its offices at 461-475 Eighth avenue, New York City.

The **Du Pont Company**, Wilmington, Del., has developed a formula for the manufacture of straight dynamite which results in that explosive being proof against freezing even in zero temperatures. The new explosive has been fully tested and proved and the formula for making it has been made standard in all the plants of the company producing dynamite. As a consequence of this development the company has determined to discontinue the manufacture of its former straight dynamite and hereafter all this kind of explosive will be made by the new low-freezing method.

**E. C. Richardson**, manager of the **Western Electric Company Italiana**, at Rome and Milan, since 1910, and who also saw foreign trade service at Antwerp, has been transferred to Peking, China, as general manager of the **China Electric Company**, the Far Eastern subsidiary of the **International Western Electric Company**, New York. He succeeds **C. H. Minor**, who has supervised the operations of the China Electric Company ever since it started business early in 1918. Mr. Minor is returning to the European organization of the international company, with headquarters at London.

**Alfred L. Kuehn**, vice-president in charge of operation of the **American Creosoting Company**, of Louisville, Ky., has been elected president of the company, succeeding the late **Alvin T. Hert**, effective June 21. Mr. Kuehn was born on August 16, 1877, at Chicago, and was educated at the University of Illinois, from which institution he graduated in 1900. In 1892 he entered railway service as a clerk and operator on the Illinois Central and was later a clerk in the machinery department. On June 1, 1898, he was appointed assistant engineer on the Wheeling & Lake Erie, a position he held until December, 1898. From June 1 to October 1, 1899, he was assistant engineer on the Chicago Drainage Canal. During the next year he was appointed assistant engineer on the Chicago & Alton and thereafter served as assistant engineer on the Cincinnati, Richmond & Muncie. In 1902 he was appointed engineer maintenance of way on the Chicago, Cincinnati & Louisville. Two years later he was appointed engineer maintenance of way of the Michigan division of the Cleveland, Cincinnati, Chicago & St. Louis, and in 1905 was transferred to the Chicago division, with

headquarters at Indianapolis, Ind. Four years later Mr. Kuehn was appointed general superintendent of the **American Creosoting Company**, a position he held until 1918, when he was promoted to vice-president in charge of operation, the position he held at the time of his recent appointment.

### Waterbury Battery Company

The **Waterbury Battery Company**, Waterbury, Conn., has completed a reorganization of its officers and directors, which has been occasioned by the deaths of **Charles B. Schoenmehl** and **E. E. Hudson**. The officers of the company are now **Martin L. Martus**, of Waterbury, Conn., president; **G. A. Nelson**, vice-president and general sales manager at New York; **Francis T. Reeves**, treasurer, and **Harold B. Schoenmehl**, secretary, both at Waterbury. The directors are: **Francis T. Reeves**, **Martin L. Martus** and **Darragh De Lancey**.

**Martin L. Martus**, who has been elected president, has been associated with the company since April, 1911; for the past nine years as secretary and factory manager. He was born in New Haven, Conn., and became associated with the Scovill Manufacturing Company in 1901. In 1906 he was chief engineer for one of the subsidiary plants of The American Brass Company, and in 1911 became associated with The Waterbury Battery Company as factory manager, which position he has held until the present time.

Judge **Francis T. Reeves**, treasurer, was born in Thomaston, Conn., and has been a director of The Waterbury Battery Company since October, 1916, and its general counsel since 1914. He is director and trust officer of The Manufacturers National Bank, of Waterbury, Conn., and is a practicing attorney in Waterbury.

**Harold B. Schoenmehl**, the newly elected secretary, is the eldest son of the late **Charles B. Schoenmehl**. He has been associated with the Waterbury Battery Company for the last six years, engaged in laboratorial and experimental work.

**Darragh De Lancey**, the newly elected director, was formerly president of the Waterbury Chamber of Commerce and during the late war served with the War Department and the United States Shipping Board.

### Obituary

**Alvin T. Hert**, president of the **American Creosoting Company** of Louisville, Kentucky, and chairman of the board of directors of the **American Tar Products Company**, who died

A. T. Hert

on June 7, was born at Owensburg, Ind., on April 8, 1865. Mr. Hert started his business career in his father's store at Owensburg and thereafter was engaged in the general merchandising business until 1894, when he was appointed general superintendent of the Indiana reformatory, a position he held until 1903. In 1904 Mr. Hert was a principal in the organization of the **American Creosoting Company**, which at that time started its first plant at Shirley, Ind. Shortly thereafter Mr. Hert was elected president of the company, which today, with its affiliated companies, operates 17 plants in various parts of the country. From 1916 to 1920 inclusive, he was a member of the republican national committee and of the executive committee of this body from Kentucky, and in 1916 he was western manager of the republican presidential campaign. Mr. Hert had his home at Hurstbourne Farms, Jefferson County, Kentucky.

## Railway Construction

**ATCHISON, TOPEKA & SANTA FE.**—This company contemplates the construction of a new passenger station, hotel, and Harvey house at Newton, Kan.

**ATCHISON, TOPEKA & SANTA FE.**—This company, which was noted in the *Railway Age* of June 10 as contemplating the construction of an addition to its power house at Albuquerque, N. M., to cost about \$150,000, has authorized this work and will shortly accept bids.

**ATCHISON, TOPEKA & SANTA FE.**—This company has authorized and will shortly accept bids for the construction of a viaduct over Merlin street, Dallas, Tex., to cost approximately \$107,000. The company will also soon accept bids for the construction of a new passenger and freight station at Longview, Tex., to cost about \$28,000.

**CHICAGO, INDIANAPOLIS & LOUISVILLE.**—This company, which was noted in the *Railway Age* of July 2 (page 42) as contemplating the construction of a new freight station at French Lick, Ind., closed bids on July 16 for the structure, which will be of brick construction with dimensions of 26 ft. by 52 ft., and will cost about \$10,000.

**CHICAGO, ROCK ISLAND & PACIFIC.**—This company contemplates the construction of a freight house at Omaha, Nebr., and a new roundhouse at Memphis, Tenn.

**CHICAGO, ROCK ISLAND & PACIFIC.**—This company is accepting bids for the construction of a 50-ton frame coaling station at Pipestone, Minn., and a 100-ton frame coaling station at Livermore, Ia.

**ILLINOIS CENTRAL.**—This company is accepting bids for the construction of a one-story brick express building at Mattoon, Ill. The company is also accepting bids for the construction of a frame engine house, with dimensions of 60 ft. by 200 ft., at Herrin, Ill. The new facilities at Herrin will also include concrete cinder pits, a sanding plant, and water and sewer improvements. The Illinois Central is also accepting bids for the construction of a new frame passenger and freight station at Duck Hill, Miss.

**MISSOURI PACIFIC.**—This company is accepting bids for the construction of an employees' hospital at Grand and Shaw avenues, St. Louis, Mo. The building will be a seven-story structure with a two-story annex, and will be of concrete, brick and stone construction.

**OKLAHOMA & ARKANSAS.**—This company has applied to the Interstate Commerce Commission for certificate authorizing the construction of 20 miles of line from Salina, Okla., to Kansas, Okla.

**STATE OF NEW YORK.**—The superintendent of public works of New York announced on July 1 the opening of the bids which were submitted for the construction of the barge canal terminal building at Rochester, N. Y. All the bids were under the engineer's estimate, which was \$233,310. At the same time bids for the construction of a bridge across the Hudson river from Troy, N. Y., to Cohoes were opened. Three of the six bids were lower than the estimate of \$572,180. No contracts have been awarded as yet.

**SUSQUEHANNA & WESTERN.**—This company has applied to the Interstate Commerce Commission for a certificate authorizing the construction of a branch from Bloomfield to Blain, Pa.

**WABASH.**—This road has purchased 65 acres of land west of Oakwood, at Detroit, Mich., as a site for railroad yards and general development of its property. It is reported that the average price of \$4,000 an acre was paid. The strip is approximately 500 feet wide and a mile long, extending from Raupp road to Allen road and north of this railroad's present right-of-way. It is just north of the land bought in 1916 by the Pennsylvania-Detroit.

## Railway Financial News

**ATCHISON, TOPEKA & SANTA FE.**—*Asks Authority to Acquire Control.*—This company has applied to the Interstate Commerce Commission for authority to acquire the control by lease of the California Southern and for the operation of its railroad and property.

**CHESAPEAKE & OHIO.**—*Asks Authority for Conveyance of Property of Subsidiary.*—This company has filed with the Interstate Commerce Commission an application for a certificate that public convenience and necessity require the operation by the Chesapeake company of the Chesapeake & Ohio Northern, which forms part of the connection between its lines and those of the Hocking Valley, and also for permission for the abandonment by the Northern company of the operation of its line coincident with the assumption of operation by the Chesapeake & Ohio; or, an order approving and authorizing the acquisition by the Chesapeake & Ohio of control of the Northern through conveyance to it of its rights, properties and franchises; or, authority to assume direct liability for the bonds of the Northern company. The application states that it is made under the provisions of section 1, paragraphs 18 to 22, and section 5, paragraph 2, either or both, and under section 20a of the Interstate Commerce Act, but not under section 5, paragraph 6, which provides for the consolidation into one corporation of properties under separate ownership. The Chesapeake & Ohio owns the stock and bonds of the Northern company.

See also article on another page of this issue, entitled "Chesapeake & Ohio Wants to Unify Properties."

**CHICAGO UNION STATION COMPANY.**—*Authorized to Issue Bonds.*—The Interstate Commerce Commission has authorized the issue of \$6,000,000 of first mortgage 6½ per cent bonds, the proceeds to be used in the construction of the union passenger station and facilities at Chicago, and has authorized the owning companies to guarantee the principal and interest of the bonds.

**DENVER & RIO GRANDE.**—*Stockholders Welcome I. C. C. Investigation.*—The decision of the Interstate Commerce Commission to investigate the financial operations, accounts and practices of the Western Pacific and Denver & Rio Grande Railroad companies, as noted in last week's issue of the *Railway Age*, page 111, is called a great victory for the stockholders of the Denver & Rio Grande by Arthur M. Wickwire and Daniel W. Blumenthal, counsel to the protective committee. In a joint statement they said:

It is now certain that the entire history of the proceedings and financial operations of both the Denver & Rio Grande and Western Pacific companies will be laid bare and the country will learn how the wrecking of the Denver & Rio Grande was accomplished and the stockholders placed in their present plight.

The committee, through its counsel, intends to participate in the hearings and investigation at Washington before the Interstate Commerce Commission. While this investigation will doubtless be of great benefit to the stockholders as well as to the whole country, the protective committee will relentlessly continue the legal proceedings already instituted, and others to be instituted for the purpose of vindicating the rights of the stockholders and compelling full restitution from those who are responsible.

**DULUTH & NORTHERN MINNESOTA.**—*Authorized to Abandon Line.*—The Interstate Commerce Commission has issued a certificate authorizing the abandonment of its entire line of railroad extending from Knife River to Cascade, Minn., 99.25 miles. The Minnesota commission had authorized the abandonment after April 1, 1921, but the district court had reversed the order on the ground that the commission had exceeded its jurisdiction and the case was appealed to a higher court. The attorney general of Minnesota had objected to the jurisdiction of the Interstate Commerce Commission on the ground that the railroad is intrastate, but the commission expresses the opinion that it has jurisdiction. The company claimed that the road has not been and cannot be operated except at a loss. It was built by a lumber company to reach timber which has now been cut down to such an extent that the lumber operations were discontinued. The commission says that apparently certain elimination of most of its traffic in forest products will diminish its present insufficient revenues by at least 90 per cent.

**FLORIDA & EAST COAST.**—*Annual Report.*—The corporate income account for the year ended December 31, 1920, is given as follows:

	1920	1919
Operating revenues	\$10,868,520	
Operating expenses	8,950,204	
Net operating revenues	\$1,918,316	
Taxes	502,472	
Railway operating income	1,395,792	
Compensation from U. S. Government (January and February, 1920)	394,782	\$2,408,171
Balance on guaranty	621,930	
Gross income	2,523,793	2,418,423
Interest on funded debt	592,333	1,790,000
Total deductions from gross income	1,136,084	2,014,265
Surplus	1,387,708	404,158

**GREAT NORTHERN.**—*Asks Authority to Abandon Line.*—This company has applied to the Interstate Commerce Commission for authority to abandon a branch line in Stevens County, Wash., 7.49 miles.

**MISSOURI, KANSAS & TEXAS.**—*Bondholders' Committee Opposes Reorganization Plan.*—The committee representing the second mortgage bonds claims that the reorganization plan discriminates in favor of liens junior to the second mortgage, and holders of that issue are asked to deposit their bonds in an effort to defeat or modify the plan under consideration. The reorganization plan of the company has not yet been published, but has been submitted to the committee representing the second mortgage bonds, which is headed by Edwin G. Merrill, president of the New York Life Insurance and Trust Company. The American committee representing these bonds already has on deposit about half the bonds outstanding in this country, or more than \$6,000,000. The total issue is \$20,000,000.

**NEW ORLEANS, TEXAS & MEXICO.**—*Authorized to Issue Equipment Notes.*—This company has been authorized by the Interstate Commerce Commission to issue \$3,499,122.50 of conditional sale purchase notes for the acquisition of equipment through the National Railway Service Corporation, to guarantee a note for \$926,000, to be given by the service corporation to the United States for a loan, and to issue and pledge bonds as collateral security.

**NEW YORK CENTRAL.**—*Asks Authority to Issue Bonds.*—This company has applied to the Interstate Commerce Commission for authority to issue \$4,425,000 of 4 per cent consolidated mortgage bonds from time to time to be exchanged for New York Central & Hudson River 3½ per cent bonds under the terms of the agreement of April 27, 1914, in connection with the consolidation of the Lake Shore.

**NORFOLK SOUTHERN.**—*Asks Authority to Abandon Line.*—This company has applied to the Interstate Commerce Commission for a certificate authorizing the abandonment of the Carthage & Pinchurst, 12.2 miles.

**OKLAHOMA & ARKANSAS.**—*Asks Authority to Issue Stock.*—This company has applied to the Interstate Commerce Commission for authority to issue \$307,500 of stock for the construction of 20 miles of line from Salina to Kansas, Okla., and for the purchase of a locomotive.

**UNION PACIFIC.**—*Annual Report.*—A review of this company's annual report for 1920 appears on another page of this issue.

**WHEELING & LAKE ERIE.**—*Asks Authority to Issue Bonds.*—This company has applied to the Interstate Commerce Commission for authority to issue \$451,000 of 6 per cent refunding mortgage bonds to reimburse the treasury on account of expenditures for additions and betterments and to be pledged as collateral.

### Guaranty Certificates Issued

The Interstate Commerce Commission has issued partial payment certificates on account of the six months' guaranty, as follows:

Buffalo, Rochester & Pittsburgh	\$135,000
Chicago, St. Paul, Minneapolis & Omaha	115,000
Minneapolis Eastern	17,000
St. Joseph Belt	62,500
Trans-Mississippi Terminal	55,000

### Railroad Administration Settlements

The United States Railroad Administration has made a final settlement with the West Side Belt for \$1,080,000 and with the Pittsburgh & West Virginia for \$720,000.

## Railway Officers

### Executive

**J. C. Murray**, traffic manager of the Missouri & North Arkansas, with headquarters at Harrison, Ark., has been elected receiver, with the same headquarters, succeeding C. A. Phelan, who has resigned.

**Carl L. Gray**, president of the Union Pacific, has been elected president of the Los Angeles & Salt Lake, in addition to his other duties. **H. M. Adams**, vice-president in charge of traffic of the Union Pacific, has also been elected vice-president.

### Operating

**G. R. Mabie** has been appointed superintendent of the Louisville Railway & Navigation Company with headquarters at Shreveport, La., succeeding H. L. Graham, transferred, effective July 1.

**A. L. Hayden**, contract agent of the Southern Pacific with headquarters at San Francisco, having resigned, the position has been abolished and the duties assumed by Wm. M. Singer, contract attorney.

**J. J. Sexton**, trainmaster of the Northern Pacific with headquarters at Livingston, Mont., has been transferred to Seattle, Wash., in a similar capacity, succeeding J. F. Fitzsimmons, resigned. **R. T. Taylor**, trainmaster with headquarters at Forsyth, Mont., succeeds Mr. Sexton at Livingston. **W. D. Pearce**, supervisor of bridges and buildings with headquarters at Glendive, Mont., has been appointed trainmaster at Forsyth, succeeding Mr. Taylor. These changes were effective June 15.

**W. L. Barnes** having resigned as executive manager of the Car Service Division of the American Railway Association, with office at Washington, D. C., to return to his position of general superintendent of transportation of the Chicago, Burlington & Quincy, with headquarters at Chicago, the position of executive manager has been abolished, effective as of August 1, and **M. J. Gormley**, director of the transportation division of the American Petroleum Institute, has been appointed chairman of the Car Service Division, reporting to the president of the American Railway Association. **C. A. Buch**, who has been assistant to Mr. Barnes, has been appointed secretary of the Car Service Division. A photograph and sketch of Mr. Barnes were published in the *Railway Age* of October 8, 1920 (page 637), and a photograph and sketch of Mr. Gormley were published in the issue of February 27, 1920 (page 647).

### Traffic

**W. W. Baker** has been appointed industrial survey agent of the Baltimore & Ohio with headquarters at Baltimore, effective July 1.

**W. W. Blakely** has been appointed general freight agent of the Sharpsville, with headquarters at Pittsburgh, Pa., succeeding O. S. Lewis. Mr. Blakely will also serve as general freight agent of the Baltimore & Ohio, which company controls the Sharpsville.

**W. R. McFarland**, assistant general passenger agent of the Pennsylvania, with headquarters at Chicago, has been appointed general passenger agent of the Chicago Great Western, with the same headquarters, succeeding A. C. Irons, whose resignation was announced in the *Railway Age* of July 16 (page 144).

**A. S. Gimble**, general agent of the Gulf Coast Lines, with headquarters at Brownsville, Tex., has been appointed general agent, with headquarters at Monterey, Mex., in addition

tion to his other duties. **L. R. Jones** has been appointed general agent, with headquarters at Mexico City, Mex. The appointments were effective July 11.

**Golder Shumate**, whose appointment as general freight traffic manager of the Baltimore & Ohio was announced in the *Railway Age* of July 9 (page 94), was born February 1, 1877. He began railway work in July, 1897, as a clerk in the general freight office of the Baltimore & Ohio at Washington, D. C., resigning from that position in October of the following year. He returned to the service of the Baltimore & Ohio in April, 1899, and the following September became a correspondent in the general freight department. In 1903 he became a rate clerk; two years later he was promoted to chief rate clerk, and, in April, 1912, to chief clerk in the general freight department at Baltimore, Md. On May 1, 1916, he was promoted to division freight agent at Youngstown, O., and the following December was transferred in a similar capacity to Baltimore. In March, 1917, he was promoted to assistant general freight agent and in November of the same year to general freight agent. In January, 1920, he was appointed acting freight traffic manager of the Baltimore & Ohio under the Railroad Administration. On the return of the roads to their owners he was appointed freight traffic manager with headquarters at Baltimore, which position he was holding at the time of his recent promotion.

**O. S. Lewis**, whose appointment as freight traffic manager of the Baltimore & Ohio, with headquarters at Baltimore, was announced in the *Railway Age* of July 9 (page 94), was born on March 8, 1873, at Lawrenceburg, Ind. He was educated in the public and high schools and began railroad work as a clerk in the accounting department of the Kentucky Central (now a part of the Louisville & Nashville) at Covington, Ky. From January, 1892, to the following November he was in the accounting department of the Chesapeake & Ohio at Richmond, Va., and in the office of the agent of the same road at Cincinnati, O. Then until 1896 he was in the accounting department of the Ohio & Mississippi (now a part of the Baltimore & Ohio). He next served, successively until 1906, as agent of the Baltimore & Ohio Southwestern at Lawrenceburg, Ind., and as chief clerk to the division freight agent at Vincennes, Ind. From 1906 to 1912 he was in the general freight office of the same road at Cincinnati and then, for a year, he served as division freight agent of the Cincinnati, Hamilton & Dayton, at Dayton, Ohio. He then went to the Baltimore & Ohio Southwestern at Cincinnati in the same capacity and, in 1915, was appointed assistant general freight agent of the Baltimore & Ohio Southwestern and the Cincinnati, Hamilton & Dayton. The following year he was promoted to general freight agent of the Baltimore & Ohio.

Golder Shumate

O. S. Lewis

**G. M. Schleyer** has been appointed executive general agent of the St. Louis-San Francisco with headquarters at Birmingham, Ala. Mr. Schleyer will report directly to the president except on rate matters when he will report to the vice-president in charge of traffic. His jurisdiction will include Birmingham and the coal mines in the immediate vicinity of that city.

### Mechanical

**J. I. Mailer**, master mechanic of the Fort Smith & Western with headquarters at Fort Smith, Ark., has been appointed superintendent of motive power with the same headquarters, effective July 1. The office of master mechanic has been abolished.

### Engineering, Maintenance of Way and Signaling

**C. M. Staples**, assistant to the corporate engineer of the Southern Pacific, with headquarters at San Francisco, Cal., has been appointed division engineer of the Houston division, with headquarters at San Antonio, Tex., succeeding **R. W. Meek**, who has been assigned to other duties. These changes were effective July 15.

**H. M. Righter** has been appointed division engineer on the Erie with headquarters at Susquehanna, Pa., succeeding **Charles M. Lewis**, transferred to Jersey City, N. J. Mr. Lewis takes over a part of the territory formerly under the jurisdiction of **S. J. Malloy**, division engineer with headquarters at Jersey City. In company with the above changes, the headquarters of **J. C. Patterson**, regional engineer, has been changed from New York City to Jersey City.

### Purchasing and Stores

**G. H. Pinion**, assistant purchasing agent of the Texas & Pacific, has been appointed general storekeeper with headquarters at Marshall, Texas, succeeding **A. D. Walther**, resigned to accept service in another department. The position of assistant purchasing agent has been abolished.

### Obituary

**William A. Henderson**, formerly general solicitor of the Southern, died at Washington, D. C., on July 16.

**James Hughes**, chief horticulturist of the Denver & Rio Grande with headquarters at Denver, was drowned in the Columbia river in Washington on July 19.

Ryerson-Conradson Railroad Radials satisfactorily handle any work the railroad shop offers.

## A 5 ft. Radial on 8 ft. Work

In a rush—two heavy gruelling jobs just alike—jobs for a heavy duty 8 ft. radial drill.

They had tried before—nothing smaller would pull it.

Time was vital—a recently installed 5 ft. Ryerson-Conradson Radial was tried—it pulled the work with ease.

With the Ryerson-Conradson Railroad Radial you are ready for any drilling job.

The Table of Contents Will Be Found on Page 5 of the Advertising Section

The two articles entitled respectively, "Expenditures of the Railways for Labor and Material" and "Operating Revenue and How It Was Expended," which

### Interesting Statistical Material

appear in this issue will be read with more than ordinary interest. To be sure, they point out facts and results which are already known, but it is to

be doubted if the available data as to the developments in recent years in railway earnings, expenses and net have ever been put together in a more striking and useful manner than is done in these two articles. As pointed out in the second article in question, the difficulty in analyzing the figures relating to railway operation is that of visualization. The data which are presented and the manner in which the colored charts in particular are gotten together will permit the visualization in a way that will not be readily forgotten. The Bureau of Railway Economics, to which the *Railway Age* is indebted for the data which are used and for the colored charts which are reproduced, has, in working up this material, performed a service for which it is indeed entitled to congratulation.

Unconfirmed press reports from Chile indicate that a large American electrical concern has been awarded the contract for the electrification of the State Railway's main line from Valparaiso to Santiago, a distance of 125 miles. The press reports state further that the contract has been awarded with some stipulations which have not as yet been accepted by the American concern in question. The cost of the installation is said to be in the neighborhood of \$10,000,000. Obviously this is a contract of no small importance and is one which those interested in our foreign trade will be glad to see come to one of our own concerns, but the monetary consideration involved gives no adequate measure of the real importance of the work. Chile is a mountainous country and the consequent heavy grades naturally suggest the advisability of electrification. An installation like this will undoubtedly, if satisfactory, result in more and more electrification. In such a case the natural tendency would be, matters of price and finance being equal, to turn to the country which makes the first installation. The situation is one of vast opportunities and the confirmation of these press reports will be awaited with considerable interest.

### The Chilean Electrification

When profits in manufactures, agriculture and other lines of business were large before the war, and railway traffic would easily have borne higher rates, the railways were not allowed to advance the rates. They were told by regulating bodies that the railways had no moral or legal right to advance the rates being paid by a particular class of industry because that industry was prosperous and easily could afford to pay higher rates. Consequently, railway rates constantly declined in proportion to the prices of the commodities on which they were

applied, and railway profits stood still or declined, while profits in other lines of business increased. Under government control when other industries were making enormous profits, the railways were rigorously restricted to the same return they had made in the three years before the war. At present neither the railway nor any other important branch of industry is prospering. Prices recently have declined until the freight rates charged for transporting many commodities are much higher in proportion to their prices than before the war. And now the railways are told by numerous persons and publications that they should reduce their rates to enable certain kinds of business to be done at a profit, even though the operating costs of the railways themselves are so high that reductions of rates would make it impossible for an indefinite time for the railways to earn a reasonable return. In other words, the railways were not allowed to advance their rates in order to share in the profits of industry when large profits were being made, and now it is demanded that they shall reduce their rates so that they will share to a disproportionate degree in the losses of industry when the losses of industry are large. Could any surer way to ruin an industry be conceived than to deny it opportunity to share in the increased profits of business when profits are increasing and compel it to participate fully in the losses of business when losses are being taken? When railways are regulated with business sense—if they ever are—they will be allowed to make large profits when large profits are the rule, and thereby be enabled to take losses when losses are the rule. Unless they get their share of the profits, with what are they to pay their share of the losses?

If the railways may be justly criticized for one thing more than another, it is for their lack of knowledge of many of their operating costs. Their activities are so complex and are performed under such a variety of conditions that the collection of this information is difficult. At the same time, these very conditions make information of this character all the more valuable. No manufacturer can succeed today without a knowledge of the cost of production of each of his products, for it is only with data of this character that he can determine which of his several products to push. Likewise, while the railways must handle all of the business offered to them, they can still select that for which they shall compete most actively and that road prospers most which exercises the best judgment in the selection of the traffic it goes after. It is equally true that the success attending any plan for conducting railway operations must be measured by its effect upon the net revenues, as was pointed out by J. E. Hutchison, general manager of the St. Louis-San Francisco, in his article describing the development of unit cost data on the operation of freight trains in the *Railway Age* of July 23, page 161. The system which has been devised on the Frisco enables each operating officer to know at the beginning of each day the cost of operating the freight trains on the road for the day before. He is thus enabled to detect any unfavorable influences affecting operating costs adversely and to adopt such measures as may be necessary to correct them.

### Knowing What It Costs

### When Do Railways Get Their Profits?

What has been done with reference to these items can be done elsewhere in railway service. When such data are available and only then will railway officers be able to reduce their operating costs to the lowest limit for so long as they are in the dark as to the nature of any of these costs they are unable to know where to look for opportunities to make further reductions.

A British contemporary recently reviewed English practice in the use of concrete by the railroads, pointing out that whereas this material is applied extensively for

### A Contrast in Practices

overhead bridges, posts, poles, etc., only limited use is being made of it for bridges carrying railway trains. Reluctance to apply this material to railway structures is ascribed primarily to a doubt in the minds of English railway engineers concerning the ability of concrete to resist the vibration set up by the rapidly moving loads. A question is also raised as to the permanence of the bond between concrete and steel under these conditions. A discussion in another issue of the same journal with respect to the relative merits of concrete and stone arches which clearly favors the latter places further emphasis on this seeming lack of confidence in the use of the newer construction material. This attitude of the English engineers is in sharp contrast to that of the officers in charge of structures on American roads where stone is now used for bridges only in cases of special architectural treatment, for salt water construction or bridges of unusual magnitude. Reinforced concrete has been used for so many years in railway bridges in this country that it has come to be accepted almost universally as a standard material of construction. Such instances of failure or unsatisfactory service life as have been brought to light are ascribed in most cases to the use of improper materials or poor workmanship. Consequently, scientific investigation in this country with respect to concrete is directed almost entirely to the elimination of these causes of failure and a higher degree of refinement in workmanship.

Under the circumstances prevailing during the last year or so it has been necessary for railway officers to deviate at times from their customary methods.

### Make Use of What Others Have Done

Further than that there has been a tendency toward the speedier adoption of the newer methods as already tried out successfully by other roads. Even with more normal conditions and more nearly normal traffic, the railways will find themselves working under circumstances that will often call for the use of what would have been unorthodox methods a few years ago. This condition may be hastened and thus the roads benefited sooner by the realization of railway officers in general that they can no longer work entirely by rule and that in the future they must be even more broadminded than they are today. An instance indicative of this realization was shown recently by an advertisement in a metropolitan paper in which a large industrial firm stated frankly that while it wanted a high calibre man already holding an important position, it did not want a man who worked by rule but rather one who was open minded enough to do the unconventional. The railroads have many men of this calibre but too often their hands are tied. A condition which should not exist is well illustrated by the remarks of an engineer maintenance of way who said in effect that it often took him months and even years to secure a small authorization for something new to his superior officers, even though it was of proved resultant economy on other roads and readily adaptable to his. On

the other hand and at the same time he could easily secure an authorization for from two to five times the amount in money for something well known to his officers but not particularly needed.

An important characteristic of railroad transportation in recent months which those who are clamoring for reductions

### The Equivalent of Rate Reduction

in freight rates have apparently ignored is the greatly improved service which many of the roads are offering. An example of what is being done in this direction is the speeding up of the fast freight schedules. Commodities moving in refrigerator cars and other perishable goods are now being delivered in New York on the fourth day after leaving Kansas City, the third day after leaving Chicago and St. Louis and the second after leaving Toledo or Detroit. Similar improved schedules are in effect between other cities. In other words, while the charge to the shipper is the same, the service rendered him is much greater and consequently what is, in effect, a reduction in charges has been brought about. And in addition, with these improved services shippers can now in many cases avail themselves of freight transportation instead of the more costly express service. Where this is possible the actual cost to the shipper has, of course, been reduced. In any event the shipper of these commodities is getting more for his money than he formerly did and this fact should be given the consideration it merits by those who are attacking the prevailing scales of rates.

Few persons realize the extent to which specialization is necessary in the efficient operation of a large railroad. Not

### An Age of Specialization

only is the organization divided into a number of primary branches such as the operating, accounting, engineering, mechanical and traffic departments, each with its specific duties, but these are again subdivided. Take the engineering department, for example. In the early days of American railways, all engineers in railway and other private employ were known as civil engineers to distinguish them from the military engineers. Later engineers dealing with motive power and machinery came to be known as mechanical engineers, while, with the development of electricity as a source of power, mechanical engineers specializing in the construction and operation of electrical machinery came to be known as electrical engineers. Even those remaining in the classification of civil engineers have been further divided until today the staffs of the chief engineers of large railways include men with titles such as engineer maintenance of way, engineer of construction, bridge engineer, engineer of buildings, engineer of water service and more recently such titles as engineer of grade separation, terminal engineer, engineer of track, landscape engineer, etc. As their titles indicate, each of these men concentrates his attention on the handling of a particular class of engineering problems, to the solution of which he brings highly specialized knowledge. Obviously, such a highly diversified organization is warranted only on the larger roads where specialized problems are of sufficient frequency to justify the employment of men to concentrate their attention on these various branches of engineering work. To meet the need for such services on the smaller roads where the creation of a specialized staff is not justified, numerous consulting engineers have established themselves, each specializing on a particular class of problems. More recently large engineering organizations have been created which are prepared to design and also to erect engineering structures. These organizations likewise specialize

in certain limited fields and thereby bring to the assistance of the railways, large and small, the best practices of all of the roads, assembled through their specialized organizations. This is, indeed, the day of specialization on the railways as well as in other industries. That management will profit which realizes the value of such service either regularly or occasionally as conditions warrant.

The approval by the stockholders a week ago Thursday of the plan of the Delaware, Lackawanna & Western to issue

**One of  
the Few  
Exceptions**

a one hundred per cent stock dividend again brings into the lime light this interesting and unusual carrier. The occurrence seems to have come at a rather opportune time, for the Lackawanna, judging by its record so far this year, is out to prove itself a marked exception from its fellow railroads in this time of stress. The Lackawanna was one of the three or four roads shown in the operating statistics in last week's *Railway Age* as having carried more net ton miles in May this year than it did last year, in fact the net ton miles in the first five months this year have equaled those of the first five months of 1920. This is due to the manner in which anthracite coal traffic has held up and insofar as other traffic is concerned, it is largely the result of the work of an able traffic department and of a service on which the traffic department can count at all times. It, in turn, has resulted in a gross so far this year of \$42,279,985 as compared with a gross in the first six months of 1920 of \$34,767,373 and in a net railway operating income up to June 30, 1921, of \$4,662,496 as compared with a net of but \$612,543 in the same period last year. The net in June, 1921, was \$1,395,173; in June, 1920, there was a net of \$520,552. Most of the roads of the country which are showing increases in net this year as compared with last year have produced that result through savings in maintenance charges. This is not the case with the Lackawanna; its maintenance charges in June this year and in the first six months of 1921 as a whole have actually been considerably greater than in June or the first six months of 1920, respectively.

History does not record when the book agent first made his appearance on this planet. Possibly it was in the days of

**Use the  
Service  
Representatives**

ancient Rome, for the Latin proverb "Let the buyer beware" proves that at that time people looked with suspicion upon the man who had something to sell. The relations between buyer and

seller have improved in recent years. The vast majority of companies selling to railroads realize that the only satisfactory basis for a permanent business is to give service and keep costs down. The best example of the results obtained by co-operation between railroads and manufacturers are the service contracts which certain makers of supplies have with the roads. These companies are able to guarantee low costs because their experts observe practices on the road and see that materials are properly used. Some companies making appliances have tried to introduce a similar practice by having representatives check up the performance of their products and instruct the men in the proper methods of operation and maintenance, but in many cases the purpose of these men has been misunderstood and their work hampered by the in-born prejudice against the man who has something to sell. There is no reason for looking askance at the service representative. He is not an order taker; his sole function is to see that the railroad gets the most for its money, which should also be the object of every railroad officer and employee. If, because of a mistaken viewpoint, the local

officers do not co-operate with the representatives of the supply companies, the railroad is the principal loser. Probably the best way to get the full benefit from service organizations is that adopted by the superintendent of motive power of a prominent road who has given these men a definite standing by issuing instructions to his subordinates pointing out that their experience with their particular specialty gives them an opportunity to offer valuable suggestions which should receive proper consideration.

## "What the Traffic Will Bear"

**WE** HAVE RECENTLY BEGUN to hear much of the good old principle of basing railway rates on "what the traffic will bear."

Basing rates on "what the traffic will bear" formerly was advocated by railway officials as the soundest and fairest principle of rate making. The critics of railway management, and those who were seeking to prevent advances or secure reductions of rates, loudly decried this principle. Rates, they said, should be based not on what the traffic will bear—not on what the shipper could afford to pay—but on the expense incurred by the railroad in handling the traffic—on what the railroad could afford to take. If the traffic could bear certain rates, but the railroad by charging these rates could make more than a so-called "fair return," then the rates must not be charged. Railway officials contended that if the traffic could easily bear particular rates, or schedules of rates, this was proof of their reasonableness and fairness regardless of the profit the railroad made by charging them. This theory was made so odious to the public by attacks on it that railway officials almost ceased to advocate it.

Times have changed. Professional railway attackers, like Clifford Thorne and S. H. Cowan, after having for years denounced charging "what the traffic will bear" and contending that rates should be based on the "cost of the service," are now appearing before the Interstate Commerce Commission to contend that certain rates are too high solely because they are "more than the traffic will bear."

The question of the correct principles on which to make rates is presented with striking clearness and directness in the case before the Interstate Commerce Commission for reductions in the rates on live stock. Those who are seeking reductions in these rates are doing so entirely on the ground that if they are maintained the farmer cannot raise and ship live stock at a profit, and that therefore the rates should be reduced practically regardless of what it costs the railroads to transport live stock. This argument, unfortunately, is not entirely without foundation. The only reason why the railroads do not voluntarily reduce rates on live stock is that railway costs of operation are now so high. What makes them so high? Two-thirds of the present operating expenses consist of an excessive payroll; and the working conditions and wages which produce this payroll were first established by the Railroad Administration, one government body, and have since been continued by the Railroad Labor Board, another government body.

In other words, when the "cost of service" was mainly determined by railway officers and was low, Mr. Thorne, Mr. Cowan and other professional attackers of the railways contended rates should be based on the "cost of the service"—on what the railways could afford to haul the traffic for—and not on what the traffic would bear—on what the shipper could afford to pay. Now, however, when most of the cost of railway operation is fixed by government bodies and is high, Thorne, Cowan, et al., come in and contend that the rates should be based, not on the cost of the service—on what the railways can afford to handle traffic for—but on what the traffic will bear—on what the shipper can afford to pay.

When it was to the advantage of the railways to base rates on what the traffic would bear, Thorne, Cowan, et al., got the Interstate Commerce Commission and other regulating bodies to recognize and act on the principle that rates should be based mainly on the cost of the service. Now, when the cost of the service is high and the railways need to have rates based on this high cost, these same men appear before the regulating bodies and demand that rates shall be based not on the cost of the service but on what the traffic will bear!

The principle of basing rates mainly on what the traffic will bear always was the correct principle, and is the correct principle now. To refuse, however, to apply it when its application would increase the profits of the railways and then apply it when the railways are making practically no profits and its application would further reduce their already ruinously small net return, would be the height of imbecility and injustice. Besides, how could any government body base rates, as the Interstate Commerce Commission has in the past, mainly on the cost of rendering railway service when that cost was low owing to the good management of the railway companies themselves, and then refuse to recognize the cost of service when it was high mainly owing to the policies of government bodies deriving their authority from exactly the same source as the Interstate Commerce Commission?

It is exceedingly refreshing to hear people who in every rate hearing for years have denounced the railway managements as brigands because they advocated the principle of basing rates on "what the traffic will bear," now asking the Interstate Commerce Commission to ignore and forget all they have said upon the same point in the past and denouncing rates made by the Commission itself because they are not based on "what the traffic will bear." Meantime, we call the attention of these people and the Interstate Commerce Commission to two pertinent points. First, the Transportation Act directs the Interstate Commerce Commission to so fix rates as to yield the railways an average of  $5\frac{1}{2}$  per cent and the rates have not yet yielded this return—the law has not been carried out. Second, the Constitution of the United States is interpreted to prohibit confiscatory regulation, and the confiscatoriness of any general reduction of rates at present would be as palpable as the Washington Monument.

## Locomotive Resistance Formulas

**L**OCOMOTIVE RESISTANCE is an important factor influencing the performance of motive power. It is necessary to determine the amount of this resistance in designing locomotives to haul a definite tonnage, in determining the maximum allowable grades, or in calculating the performance that can be expected from existing engines. Both mechanical engineers and civil engineers have given the matter attention and many formulas have been evolved to express the amount of resistance under varying conditions. The values for the resistance given by the several formulas vary widely, which is not altogether surprising, because the resistance is influenced by several variable factors. A graphic chart of the resistance as determined in numerous locomotive tests shows that there is a considerable variation in the resistance when expressed in terms of the weight on drivers which should, of course, be considered in evolving a general formula. On the other hand, a chart of the numerous formulas shows that some give values which are consistently lower than the experimental results, while others are much higher. As the maximum resistance is several times as great as the minimum, a mean value is not satisfactory.

The problem of determining the resistance of a locomotive with a fair degree of accuracy under all conditions is discussed in an article by Kiichi Asakura, mechanical engineer of the Japanese Government Railways, published else-

where in this issue. By plotting a large number of experimental results, Mr. Asakura shows that the resistance apparently is not a function of either speed, cut-off, or mean effective pressure in the cylinders. It is only when the resistance is expressed in terms of mechanical efficiency at various speeds and at various cut-offs that consistent results are secured.

When the resistance is expressed in terms of mechanical efficiency, the available tractive effort can not be obtained as readily as when the resistance is given in pounds per ton of weight on drivers. To apply the mechanical efficiency, it is necessary to compute the output on a horsepower basis by using charts showing the steam consumption per drawbar horsepower hour. This method, however, has certain advantages because it brings out the fundamental relations between steam consumption, power and locomotive resistance under the condition being investigated. For instance, it is interesting to note that the lowest steam consumption per indicated horsepower hour occurs at the shortest cut-off of 20 per cent and the highest speed, 320 r.p.m., but on the basis of drawbar horsepower hour, the maximum economy occurs at 35, 40 or 45 per cent cut-off and at 160 to 200 r.p.m. In making an analysis of locomotive tractive effort, it is useful to have these factors brought out as a step in the final process.

The method suggested by Mr. Asakura complicates the calculations involved in finding the tractive effort and also introduces variables due to differing degrees of superheat and variations in boiler pressure. Basing the tractive effort on horsepower output and mechanical efficiency is more logical in the light of the data presented. Its advantages in actual practice over the method in common use can only be determined by a careful comparison of the results obtained by the two methods under varying conditions.

## El Paso & Southwestern

**T**HE EL PASO & SOUTHWESTERN is a comparatively small road, but withal a rather important one. It is controlled by the Phelps-Dodge interests, the products of whose mines it carries. It has strong financial backing, has a position of great strategic value as the connection between the lines of the Southern Pacific and those of the Chicago, Rock Island & Pacific and is noted for its efficiency of operation. The lines of the El Paso & Southwestern total 1,028 miles. They extend from Tucson, Ariz., eastward above the Mexican border south of and parallel to the line of the Southern Pacific as far as El Paso, Tex., and thence north into New Mexico as far as Dawson, connection being made with the Rock Island at Tucumcari.

The traffic of the El Paso & Southwestern is predominantly ores. Of the total tonnage of 4,692,401 carried in 1920, 1,477,145 tons were ores; 698,989 tons, bituminous coal and 614,693 tons, products of agriculture.

The El Paso & Southwestern is more properly regarded as a system rather than as a single railroad. The parent company is known as the El Paso & Southwestern Company. The lines east of El Paso are known as the eastern division. They are composed of a number of railroads, all the stock of which is in the hands of the El Paso & North-eastern Company, a holding company only, control of which is held by the El Paso & Southwestern Company through entire stock ownership. The lines of the several railroads are also leased by the El Paso & Southwestern Company. The lines west of El Paso, comprising the western division, are owned by still another company, the El Paso & Southwestern Railroad Company. This company controls two smaller companies through stock ownership and all of its own stock is held by the El Paso & Southwestern Company. In addition

to this somewhat complex organization, the El Paso & Southwestern Company also owns all the stock of the Morenci Southern and the Nacozari Railroad and 50 per cent of the stock of the Tucson, Cornelia & Gila Bend. None of these three companies, however, is included in the El Paso & Southwestern System.

The El Paso & Southwestern in 1920 did an extremely heavy business. Its net railway operating income, however, for the year was \$2,910,006 as compared with \$2,993,415 in 1919. The figure for both years was about \$1,000,000 under the average earnings for the test period. In 1918, the system earned over \$1,000,000 more than its government rental. The corporate income for 1920, taking into consideration the standard return for January and February and the guaranty for the guaranty period showed a net income available for dividends of \$1,097,314 as compared with \$3,128,710 in 1919 or \$3,551,700 in 1918. Dividends are paid at the rate of 8 per cent annually and total \$2,000,000. To pay these dividends in 1920 the company had to call upon its surplus account.

The extreme dullness in the metal markets at the present time has been sharply reflected in the El Paso & Southwestern traffic and earnings, at least up to April or May,

7,056. Bad order cars in April were but 5.0 per cent, or considerably below the average.

The El Paso & Southwestern will likely show improvement in its earnings in the June and July figures. It has been carrying a large portion of the cantaloupe traffic from southern California to Chicago and eastern points, profiting thereby from its being the connection between the Southern Pacific and Rock Island.

The operating results for 1920 as compared with 1919 are as follows:

	1920	1919
Mileage operated	1,028	1,028
Freight revenue	\$11,212,405	\$9,983,206
Passenger revenue	2,705,268	2,196,839
Total operating revenue	14,917,674	12,180,045
Maintenance of way expenses	2,835,948	2,290,443
Maintenance of equipment	2,843,758	2,528,666
Traffic expenses	241,017	120,726
Transportation expenses	4,219,057	3,542,638
General expenses	543,957	309,643
Total operating expenses	10,806,319	8,886,443
Net revenue from operation	4,066,295	3,874,948
Taxes	1,252,954	724,181
Railway operating income	2,812,601	3,149,389
Net railway operating income	2,910,006	2,993,415

The corporate income account is as follows:

Compensation for lease of road	\$689,186	\$4,135,114
Gross income	3,524,814	5,599,094
Deduct—Rent for leased roads	1,948,859	1,927,032
Total deductions from gross income	2,474,550	2,470,384
Net income	1,097,314	3,128,710
Dividend appropriations of income	1,097,314	2,000,000

The El Paso & Southwestern

1921, the figures for which months are the latest at present available. The gross earnings for the first five months of 1921 were \$4,977,296 as compared with \$5,801,581 in the first five months of 1920. The net railway operating income of \$178,948 in the first five months of 1921 compares with \$1,218,809 in the same period of 1920. The traffic has been running at about 75 or 80 per cent of the 1920 average. With this falling off in traffic, the company has naturally not been able to keep up its train loading, car loading, etc., at the 1920 average. The average net tons per train in the first four months of 1921 were 528; in the first four months of 1920, 555; in 1920 as a whole, 585. The net ton miles per car day, which figure takes into consideration, car load, car miles per day and per cent of loaded to total car movement, were in the first four months of 1921, 555; in the first four months of 1920, 706; in 1920 as a whole, 740. A new figure in the operating statistics which is being given increasing importance is that of net ton miles per train hour, which takes into consideration not only train load but train speed. In the first four months of 1921 the El Paso & Southwestern's average of net ton miles per train hour has been 7,969 as against an average for the central western region of 7,011 or an average for the entire country of

## St. Louis-San Francisco

THE ST. LOUIS-SAN FRANCISCO is at present handling about 25 per cent less traffic than it handled over its lines in the early part of 1920. In no month up to and including May this year have the net ton miles even equaled the total for April, 1920, in which month the road had to contend with the outlaw strike. The gross revenues of the St. Louis-San Francisco itself (4,760 miles of the system's total of 5,253) in the first five months of 1921 were \$33,544,308 as compared with \$34,974,331 in the same months of 1920. Through reductions in operating expenses, chiefly in decreased expenses for maintenance of way and structures and for equipment, the company has been able to increase its net nearly 50 per cent over the net in the first part of last year. The net railway operating income for the first five months of 1921 was \$6,514,797; for the same period in 1920, it was \$4,350,552.

The St. Louis-San Francisco is being looked upon with increasing favor in financial circles, for which various reasons may be assigned. Probably the most interesting feature is the outlook for the cumulative adjustment mortgage bonds due in 1935 and the income bonds due in 1960. The former issue totals \$39,219,643; the latter \$35,192,000; both pay interest of 6 per cent if earned, the total interest charges for the two issues being \$4,464,699. This interest has been paid regularly since the reorganization in November, 1915. The total funded debt of the St. Louis-San Francisco is \$282,940,676, on which interest charges total \$13,999,286. It appears that even with the decline in traffic with which the system is at present confronted, it should be able in 1921 to meet these charges.

Except as concerns the present depression in business and the falling off in railway traffic resulting therefrom, the St. Louis-San Francisco has been characterized in recent years by a steady growth in traffic and by increased operating efficiency which this larger business has permitted. The increase in traffic has been reflected in progressively higher figures of revenue tons carried as well as of revenue ton mileage. The road has been able to secure a longer haul, an increasing car load and an increasing train load. Its passenger business has similarly improved, with a larger number of passengers carried, a greater passenger mileage, a larger average journey, a greater number of passengers per car and

per train. The year 1920 was the busiest in the company's history. It carried 24,718,345 revenue tons of freight; the ton mileage was 4,621,380,827. The average haul was 187 miles; the revenue car load 23.44 tons and the revenue train load 398 tons. For purposes of comparison it might be noted that the average car load in 1916 was but 19.24 tons and the average train load, but 337 tons.

Naturally the revenues have shown an increase in greater ratio than that of increase in traffic handled. The St. Louis-San Francisco did fairly well for the government during the period of federal control although it was unable to keep up this record during the guaranty period. It earned close to its standard return in 1918; in 1919 its net railway operating income exceeded the government's rental. In 1920, however, the net railway operating income ran nearer one-half the average for the test period. As far as 1920 was concerned, the St. Louis-San Francisco, despite its record traffic, higher rates and increased gross, was no exception from most of the railroads of the country. Except as far as 1920 is concerned, therefore, the road seems to have been making good in a rather decent manner. The way in which so far this year it is earning its fixed charges despite the small amount

products, which made up 12.44 per cent of the total traffic carried by the system. As compared with the 1919 totals, the increase in coal and petroleum products is especially noteworthy.

The decreased traffic so far this year has prevented the St. Louis-San Francisco from realizing the operating efficiency which characterized it during 1920. The savings which have permitted a greater net in the first five months of 1921 than in the first five months of 1920 have been in maintenance rather than in transportation expenses, which is, of course, the normal condition to be expected in the early part of a period of decreasing traffic. In May, the road—we refer to the St. Louis-San Francisco as a road of 4,761 miles rather than as the system of 5,253—secured a figure of net tons per train of 425 as compared with 448 in 1920 as a whole. It is to be noted that this figure is increasing each month; in January, the net tons per train were 387. The car load in May, 1921, averaging 24.5, compared with an average for all of 1920 of 26.1; the net ton miles per car day in May was 314; in 1920, 371. Despite the savings in maintenance of equipment, the Frisco has kept its hands on the bad order car situation in good shape. The percentage of bad order cars in May was 6.3, a decrease from preceding months. This average of 6.3 per cent compares quite favorably with the bad order car situation on the country's railroads as an average.

The St. Louis-San Francisco received from the government 33 of the standard light Mikado and 7 light switching locomotives and 3,500 double-sheathed, 40-ton box and 1,000 50-ton gondola cars. During 1920, the company also purchased from the War Department at a price of \$25,000 each, 10 of the Decapod locomotives originally built for the Russian government, making a total of 20 such locomotives in service at the end of the year. On the whole it would appear that the system has improved its situation as to equipment rather materially through these acquisitions.

The operating results in 1920 as compared with 1919 are as follows:

	1920	1919
Mileage operated .....	5,253	5,252
Freight revenue .....	\$66,338,922	\$53,558,494
Passenger revenue .....	26,341,511	23,599,251
Total operating revenue .....	98,723,040	82,202,919
Maintenance of way expenses .....	18,389,537	13,051,814
Maintenance of equipment .....	23,501,539	16,085,236
Traffic expenses .....	995,110	709,440
Transportation expenses .....	44,116,333	31,852,973
General expenses .....	3,148,968	2,524,107
Total operating expenses .....	89,886,545	64,069,624
Net operating revenue .....	8,836,495	18,133,295
Taxes .....	3,533,514	2,789,445
Operating income .....	2,899,565	14,176,271

The corporate income account which follows shows that the company was able in 1920 to meet the interest charges on its cumulative adjustment bonds and on its income bonds and still have a balance of \$1,743,231 to be credited to profit and loss account:

	1920	1919
Standard return, January and February, 1920; full year 1919 .....	\$2,270,838	\$13,415,510
Guaranty period, March 1 to Aug. 31 .....	6,812,514	
Increased compensation on account of additions and betterments .....	705,685	
Difference between tentative standard return taking into account and standard return as finally certified January 1, 1918-December 31, 1919 .....	419,034

Interest on income bonds .....	2,111,520	2,111,520
Balance .....	1,743,231	152,052

The St. Louis-San Francisco

of traffic handled, seems to augur well for the future when business conditions are restored to a more normal level.

The St. Louis-San Francisco is a system of 5,253 miles, of which the St. Louis-San Francisco itself constitutes 3,545 miles; the Kansas City, Fort Scott & Memphis, 926; the Kansas City, Memphis & Birmingham, 290; the Fort Worth & Rio Grande, 235; the St. Louis-San Francisco & Texas, 134, etc. In the monthly operating statistics referred to above, the first three roads are regarded as one line; in the annual report the figures given are for the entire system. This total mileage of 5,253 miles, as will be seen from the map, is contained in eight states, the two having predominantly the greater part of the mileage being Missouri and Oklahoma. Considering the extent of the area traversed by the Frisco lines, it is natural that its traffic should be greatly diversified. In 1920, products of agriculture made up 13.44 per cent of the total tonnage; products of animals, 2.12 per cent; products of mines, 39.42 per cent; products of forests, 12.39 per cent and manufactures, 28.47 per cent. Of the products of mines, considerably over half was bituminous coal which constituted 24.24 per cent of the road's total tonnage. Of manufactures nearly half was refined petroleum and its

# Railroad Settlement Plan Announced by President

Railroad Indebtedness to Government to Be Funded and Roads  
Surrender Part of Claims to Expedite Adjustment of  
Some \$500,000,000 Due to Them

WASHINGTON, D. C.

THE PLAN FOR FUNDING the indebtedness of the railroads to the Railroad Administration for additions and betterments, and for expediting the settlement of the Railroad Administration's indebtedness to the railroads on a compromise basis by which the roads waive their claims on account of the inefficiency of labor, as outlined briefly in last week's issue of the *Railway Age*, was informally announced by President Harding on July 22 and on July 26 he sent a message to Congress proposing a method for providing the funds needed to pay the railroads without an additional appropriation for the Railroad Administration. Congress was asked to extend the authority of the War

Finance Corporation so that it may purchase the 10-year secured and negotiable promissory notes to be given by the railroads to the Railroad Administration and use them as the basis of credit by which to raise the additional funds which the Railroad Administration will need in order to settle its obligations to the roads, estimated at some \$500,000,000. Part of that amount it has available from its former appropriations.

President Harding in his message also suggested "the very promising possibilities of broadening the powers of the War Finance Corporation for the further relief of agriculture and live stock production."

## The President's Message to Congress

The President's message, in which he described the agreement reached with the railroad executives, was as follows: To the Senate and House of Representatives:

It is necessary to call the attention of Congress to the obligations of the government to the railroads, and ask your co-operation in order to enable the government to discharge these obligations. There is nothing new about them, but only recently has there come an understanding which seems well to justify a sincere endeavor to effect an early settlement. These obligations already have been recognized by the Congress, in the passage of the Transportation Act restoring the railroads to their owners, but previous recognition was made in the contract under which the railroads were operated by the government for the period of the World War.

The contract covering operation provided that the railways should be returned to their owners in as good condition as when taken over by the government, and the Transportation Act, recognizing that betterments and additions belong to capital account, provided that such sums as the railway companies owed the government for betterments and new equipment, added during the period of government operation, might be funded. There has been, at no time, any question about the justice of funding such indebtedness to the government. Indeed, it has been in progress to a measurable degree ever since the return of the railroads to their owners. It has been limited, however, to such cases as those in which final settlements with the railway administration have been effected. The process is admittedly too slow to meet the difficult situation which the owners of the railroads have been facing, and I believe it essential to restore railway activities and essential to the country's good fortune to hasten both funding and settlement.

Quite apart from the large sums owing to the government, which we are morally and legally bound to fund, the government admittedly owes the railway companies large sums on various accounts such as compensation, depreciation and maintenance. There has been a wide difference of opinion relating to the amount the government owes, due in the main to the claim of the owners that in spite of materials and hours of labor being estimated in proper relations to similar expenditure in the pre-war test period, the "inefficiency of labor" still left a wide difference between actual up-keep and the expenditure made during the government operation.

### A Moral and Contractual Obligation

In order to expedite settlement and funding an informal understanding, which is all that is possible or practical, has been reached, under which the railway claims based on the "inefficiency of labor" are to be waived to hasten complete and final settlements, without surrender of any rights in court in case there is failure to settle. I have no doubt that early, final and satisfactory settlements will be reached, since the policy of the railway administration already has been effective in finally settling the accounts of roads filing claims amounting to \$225,568,764, resulting in the payment to them of \$68,141,222.

The way now would seem to be clear to very early adjustment and relief, except for the fact that the railway administration, though possessing assets, does not command the funds necessary to meet what will be its admitted obligations.

There is no thought to ask Congress for additional funds. Perhaps \$500,000,000 will be necessary. The Railroad Administration has, or will have in the progress of funding, ample securities to meet all requirements if Congress only will grant the authority to negotiate these securities and provide the agency for their negotiation.

### Congress Asked to Extend Authority

#### of War Finance Corporation

With this end in view you are asked to extend the authority of the War Finance Corporation so that it may purchase these railway funding securities accepted by the director general of railroads. No added expense, no added investment is required on the part of the government, there is no added liability, no added tax burden. It is merely the grant of authority necessary to enable a most useful and efficient government agency to use its available funds to purchase securities for which Congress already has authorized the issue, and turn them into the channels of finance ready to float them.

I can readily believe that so simple a remedy will have your prompt sanction. The question of our obligation can not be raised, the wisdom affording early relief is not to be doubted, and the avoidance of added appropriation or liability will appeal to Congress and the public alike.

The after-war distresses of two great and fundamental activities have been riveting the anxious attention of the country. One is the readjustment and restoration of agriculture, the other is the distress of our railway transportation system.

Pending proposals for relief and their discussion have already brought to the attention of Congress the very promising possibilities of broadening the powers of the War Finance Corporation for the further relief of agriculture and live stock production. This corporation has proven itself so helpful in the relief thus far undertaken, that I can not help but believe that its broadened powers, as have been proposed, to meet agricultural needs, will enable it wholly to meet the nation-wide emergency. This is an impelling moral obligation to American farming in all its larger aspects, and it will be most gratifying to have your early sanction.

### A Moral and Contractual Obligation

In the case of the railroads there is a moral and a contractual obligation, and your favorable action is no less urgent, and will no less appeal to public approval. Railway solvency and efficiency are essential to our healthful industrial, commercial and agricultural life. Everything hinges on transportation.

After necessary and drastic curtailments, after harrowing straits in meeting their financial difficulties, the railways need only this financial aid which the fulfillment of our obligations will bestow, to inaugurate their far-reaching revival. Its effects will be

felt in varied industries, and will banish to a large degree the depression which, though inevitable in war's aftermath, we are all so anxious to see ended.

I am appending herewith memoranda concerning the progress

### Plan Accepted by Railroads Last Week

The compromise proposed by the President, who was represented in the negotiations principally by Secretary Hoover, was accepted at a meeting of the member roads of the Association of Railway Executives in New York on July 20 by the adoption of a short resolution. The result was not announced by the executives but was reported to Mr. Hoover on the following day by Alfred P. Thom, general counsel for the association, and then communicated to the President.

Before undertaking to fund the indebtedness of the roads to the government on capital account, which the President was authorized to do in his discretion under the Transportation Act, he thought the railroads ought to facilitate the final settlement of the other accounts by removing the principal cause of controversy. In the settlements which the Railroad Administration has been making so far it has steadfastly refused, with the full approval of the President, to allow anything on account of inefficiency, but the controversy has delayed the negotiations and many roads have not yet filed their claims because of the length of time required to make up their case on that basis. The administration is anxious to close up the Railroad Administration, which is a rather expensive organization, at the earliest possible date, and it has also been anxious to pay to the railroads as promptly as possible the sums which it considers fairly due them, partly for the influence which it is believed such payments will have on the general business situation. In asking the roads to waive this feature of their claims the President

of railroad liquidation and revealing existing conditions which Congress will be interested to note, while considering the simple remedy proposed for the relief of the situation. The information is submitted by the director general of the railroads.

promised on his part to do everything possible to expedite the settlements. The President is convinced that there is some ground for the contention of the railroads that it was not sufficient to measure the government's maintenance obligation on the expenditures made without reference to the fact that even an equation for the increased rate of wages did not cover the same amount of work that was performed for the wage in the test period, but he has also taken the position that the government cannot go into a fine analysis of a question that is so difficult to prove quantitatively. He also recognizes that the railroads have not been fairly treated as a result of federal control in that the government drew very heavily on the service life of their rolling stock and other property, although he has been convinced as a result of his conferences on the subject in the last few weeks that the railroads have filed some rather extravagant claims. The President is now rather pleased with the whole situation.

Any railroad that is not willing to negotiate on the compromise basis will not receive the benefit of having its capital expenditures funded, but it is understood that the roads that have already settled will receive the same treatment that the others receive as to funding. Although it will require time to negotiate the individual settlements the funding operation will make it possible for the Railroad Administration to pay out undisputed items on account which will release some ready cash to some of the roads very soon.

The memorandum from Director General Davis regarding the progress of railway liquidation, which also describes the reasons for the adoption of the new plan, was as follows:

## Director General Outlines Progress of Railway Liquidation

The total number of federal controlled carriers, including subsidiary companies, was 425. The mileage of the federal controlled roads was 239,009.

The number of claims on final settlement filed with the director general up to July 15, 1921, was 184, the aggregate amount claimed being \$758,032,235. The mileage of the roads that have filed their claims aggregates 167,070.

The amount of claims settled by the director general up to and including July 15, 1921, aggregated \$225,568,764. These settlements represent some 43 per cent in number of the claims actually filed. The total amount paid in settlement was \$68,141,227.

The largest single disputed item in final settlement is the claim for undermaintenance of way and structures and equipment. The undermaintenance claims represent more than 50 per cent of the total amount of claims filed. Included in these claims for undermaintenance is the much discussed claim variously described as "inefficiency of labor," "ineffectiveness of labor," or "the difference in the cost of applied material as between the test and federal control periods," this item representing some 70 per cent or 75 per cent of the total undermaintenance claims.

Claims for inefficiency of labor have not been allowed by the Railroad Administration, not only, as contended by the Railroad Administration, because such claims are not contemplated by the standard contract, but they are of a too highly indefinite, speculative and contingent character to warrant consideration.

In addition to the claims on final settlement, covering the various items of dispute between the carriers and the administration, there are innumerable claims for loss and damage in the transportation of freight, fire and personal injury cases, and reparation claims growing out of freight rate controversies. These claims are being rapidly disposed of, and within a reasonable time the adjustment of same should be completed.

During the period of federal control there was expended by the Railroad Administration, on behalf of the carriers, some \$1,144,000,000 in additions and betterments, properly chargeable to capital account. Of this sum in excess of \$381,000,000 was used in the purchase of additional equipment, consisting of 100,000 box cars and 2,000 locomotives, and the expenditure for this equipment has been taken care of in equipment trust certificates now held by the Railroad Administration. This leaves about \$763,000,000 of additions and betterments which, if not funded, must be deducted from the amount due from the Railroad

Administration to the carriers in final settlement. An extension of the time in which these addition and betterment obligations could be paid, to such carriers as could give reasonable and satisfactory security, would enable the carriers recovering this extension to expend this amount of money in the much needed rehabilitation of their cars and locomotives, and apply the usual and necessary maintenance upon their way and structures, so that the national system of transportation could be equipped during the coming fall and winter to promptly and effectively perform its duty to the public in the way of prompt and efficient transportation.

### Bad Order Freight Cars and Locomotives

The percentage of bad order freight cars has not been below 5 per cent at any time during the past five years. During the year 1917, it ranged between 5.2 and 6 per cent. While there is no general agreement as to what the normal percentage should be, it seems to be generally accepted at from 5 to 6 per cent. The percentage of bad-order cars on July 1, 1921, was 15.6 per cent, or about 10 per cent above normal. The total number of freight cars in service at the present time is about 2,400,000, and 10 per cent of that number would be 240,000, which represents the excess or abnormal, bad-order condition of freight cars today.

The normal percentage of bad-order locomotives is understood to be 10 per cent. The percentage of bad-order locomotives on July 1 was 23.9 per cent, or 14 per cent above normal. The total number of freight and passenger locomotives (exclusive of switching) is about 50,000, and 14 per cent of this would be 7,000 locomotives, which represents the abnormal bad-order condition of locomotives at the present time.

### Deferred Maintenance

The amount of deferred maintenance at the present time has been conservatively estimated at \$400,000,000, of which \$200,000,000 represents maintenance of way and \$200,000,000 maintenance of equipment. That is, these are the amounts which should be expended on the railway properties to bring them up from their present physical condition to normal.

### Shortage in Number of Railway Employees

The total number of railway employees in the first quarter of 1921 was 1,691,471. This was less by 340,456 than the average

number in 1920, and less by 302,053 than in the first quarter of 1920.

This manifestly means an enormous increase of unemployment. If the railroads were in a position to resume their normal maintenance of ways and structures and equipment it is conservatively estimated that it would mean immediate employment of at least 200,000 workmen.

### Delayed Payments of Vouchers

Delayed payments of the current liabilities of the railroads, representing principally payments due for fuel and materials used in operation, have been conservatively estimated at not less than \$300,000,000.

The failure to pay these has involved great industrial distress and depression. It has meant the shutting down of many industries. If the railroads are paid what is due them by the government, they in turn can pay these debts, and the starting up of industry will be enormously assisted and promoted.

It is evident, if the products of our farms, of our forests, of our mines and of our other industries are to find a way to market, that our railroads must be adequately equipped to move them. Manifestly, from the foregoing statistics, they are not now so equipped. If there is to be a return, as we devoutly hope there soon will be, of normal business activity and prosperity, it must not be halted and obstructed by insufficient transportation, which is a fundamental condition of all commerce.

### Funding

By the terms of Section 6 of the Federal Control Act, the President was authorized to incur, on behalf of the carriers, indebtedness for additions and betterments. To create an indebtedness to be paid by others without limit in amount is, it must be admitted, a most unusual power and was justified only by the exigencies of war.

As a result of the exercise of this power, a large amount of indebtedness was created by the director general, and imposed upon these carriers, for additions and betterments, some of it assented to by them, and some of it not concurred in. This class of indebtedness, although on capital account, was made by the government immediately payable, instead of being arranged as long-time obligations.

If the carriers had been dealing with their own affairs in respect to additions and betterments, it is reasonable to suppose that they would not have undertaken to provide for these large capital requirements out of their current income, but would have followed their usual course, which would have been not to incur indebtedness, as to a large part of this amount, until they had succeeded in financing the capital required on long-term obligations. They could not do this under the conditions of federal control and of the war, for the two reasons: First, because

### Plan Is a Compromise

The plan as adopted is a victory for the Railroad Administration in that it practically recognizes its position on the interpretation of the provisions of the standard contract governing the government's obligation to maintain the railroad properties, but it does not foreclose any legal rights of the railroads if they desire to or can afford to delay a settlement while seeking to enforce their contentions in the courts. As a practical matter, however, the concession that they are making represents the surrender merely of a claim on which they have been given full notice that they would have the greatest difficulty in collecting. It is said in some quarters that the railroads have been led to prepare claims on what the administration terms an extravagant basis by the fact that Director General Hines publicly insisted on several occasions that any undermaintenance on some roads would be, if anything, more than offset by overmaintenance on other roads and there was a general impression that the administration intended to make some heavy counter-claims against the roads for overmaintenance. In view of such a position on the part of the Railroad Administration it would not be surprising if many of the railroads had prepared their claims on a "fighting basis."

All sorts of figures have been given as estimates of the amounts of money involved in the various phases of the proposed settlement but they cannot be stated exactly for several reasons. The Railroad Administration has made no

the matter was not legally within their control, and, second, because the entire investment market was necessarily absorbed by the government in securing war loans.

The question, therefore, arises what it is equitable and just to do now in regard to the adjustment of this indebtedness? The carriers insist that it should be funded by the government for a term of at least ten years.

This, they claim, is just, not only because of the circumstances above narrated under which the indebtedness was created, but for an additional reason in which the public, as well as the carriers themselves, have an interest. The carriers at the end of federal control had been out of the possession of their properties for more than two years. They were called upon at that time to resume the responsibility of furnishing transportation adequate to the needs of commerce. It must be admitted that they undertook the performance of this duty under adverse conditions. Their organizations had been broken up; much of the normal traffic of the various lines had been diverted to others; their rolling stock had been widely scattered by government management throughout the country, and their labor expenses had been enormously increased during federal control. This situation, they claim, put upon them the necessity of providing for abnormal expenses of operation at the very outset.

It is in the public interest that they should be able to perform successfully the duty of transportation. This will necessitate not only an adequate supply of cash for their abnormal expenses, due to the special conditions which have surrounded their properties, and for their current purposes, but also will necessitate the borrowing of large amounts of new capital, so as to keep their roads up to the requirements of the public, and for other capital purposes, such as the payment of maturing obligations. This they will have to do in a market disturbed by war conditions, and where there is a tremendous competition, as between themselves and with other industries, for the funds available for investment.

It is even more vital to the public than to the carriers, that the carriers should succeed in securing the money necessary to the successful performance of their transportation duties.

If the government refuses to fund this indebtedness which it created for the carriers, and for which the Transportation Act expressly provided, and if, in addition to their large capital requirements for other purposes, it is necessary for them to borrow also the amount they owe the government for additions and betterments, their problem and the public's problem in respect to transportation will be enormously embarrassed.

The indebtedness of the carriers to the government for additions and betterments incurred under the circumstances above mentioned, ought not to be allowed to constitute an additional complication and embarrassment in this situation. To avoid this, the government ought not to hesitate to carry this indebtedness for ten years, as provided in the Transportation Act, in view of the fact that the reason it was made immediately due grew out of the war and the public needs.

formal report since the expiration of federal control and the accounts between it and the roads are greatly complicated by many items as to which there are claims on both sides and as to which the conflicting figures cannot be checked in a short time. A large percentage of the claims have not been filed and those which have not been made will probably now be made on a more conservative basis than those filed heretofore, while presumably some roads have already been more conservative than others. Claims to the amount of \$758,000,000 have already been presented and on the basis of these Director General Davis has estimated that the aggregate would be about \$1,250,000,000, of which approximately \$700,000,000 to \$800,000,000 would be for undermaintenance and a large percentage of which would be based on the inefficiency of labor, although the claims do not state any definite item of that kind. If this factor is eliminated the claims might be reduced by \$400,000,000 to \$600,000,000, which would still leave a considerable margin of difference between the Railroad Administration's idea of what it fairly owes the roads and their idea of what they should receive. The amount which the government expects to pay has been variously stated at \$300,000,000 to \$500,000,000. Up to date it has settled with about 75 roads, on a basis which includes in some cases an allowance on account of undermaintenance. The administration is not adhering to Mr. Hines' contention that the government does not owe anything for undermaintenance. As a large proportion of the roads that have settled are the smaller roads perhaps the settlements already made

are not exactly typical but they include half a dozen or so of the larger systems.

### Amount Involved in Funding Arrangement

The amount to be involved in the funding operation is somewhat more definite but is by no means exact. The Railroad Administration expended for capital improvements on the railroads about \$1,144,000,000, of which nearly \$400,000,000 was for the standard equipment, of which some has been paid for in cash and \$310,000,000 was funded by car trust certificates during Mr. Hines' administration. That left approximately \$763,000,000 for additions and betterment, part of which have been paid for in cash or offset against other accounts, and part of which has already been funded. A part will not be funded because some roads will prefer to pay up and some roads will not be able to furnish adequate security. It is estimated therefore that the government will accept the railroads' negotiable 10-year promissory notes, secured by mortgage bonds, for about \$500,000,000 to \$600,000,000.

### Great Northern as Concrete Example

A concrete example of how the funding operation is expected to work in the case of a road that has already settled with the Railroad Administration is described in an application filed with the Interstate Commerce Commission by the Great Northern for a loan of \$15,000,000 to repay a loan of like amount maturing on September 1. The company states that it has made a settlement with the Railroad Administration in which the director general set off against the amount due the company \$16,997,642 due the government for additions and betterments. The company asked to have this amount funded but its request was denied on the ground of the general policy of the Railroad Administration and the limitation of its funds. The company had hoped to use this money to repay the loan. It has now been assured by the director general, the application states, that in the event the general policy shall be changed and funds are put at the disposal of the director general to enable him to fund the additions and betterments for the roads generally the director general will refund in whole or in part the \$16,997,642 which was withheld at the time of the settlement and the company was informed that plans were under consideration whereby funds were to be placed at the disposal of the Railroad Administration for the purpose of refunding for the railway companies whose properties were under federal control the amounts due to the United States on account of additions and betterments. The company therefore proposed that the loan of \$15,000,000 be made for five years with a provision that not to exceed \$10,000,000 of it should become due and payable when funds are received from the director general.

### Requests Short Line Claims Be Expedited

President Robinson of the American Short Line Railroad Association called on the President last week and urged that the settlement of the short line claims for some \$25,000,000 also be expedited.

How soon action may be had in Congress on the President's recommendation appears somewhat uncertain. It bumped into politics at the start. A bill had been drafted by Secretaries Mellon and Hoover and Managing Director Meyer of the War Finance Corporation to extend the powers of the corporation with reference to railroads, agriculture and exports all at the same time but opposition developed promptly in the so-called "agricultural bloc" in the Senate and Senator Curtis of Kansas called at the White House on Monday to protest vigorously against coupling the relief for the farmers with the plan for financing the railroad settlements. Apparently the agricultural interests that have been complaining bitterly about high freight rates would rather have the railroad matter treated in a separate bill where they

could point to the railroads as attempting to "raid the Treasury." Probably the plan for combining the three plans in one bill was inspired in part by a desire to conciliate the various interests, but at any rate when the bill was introduced in the Senate on Tuesday by Senator Kellogg, as a substitute for the Norris bill to create a separate \$100,000,000 corporation to finance agricultural exports, the railroad part of it was left out, and it was stated that it would be put into a separate bill. The President's message was then referred to the Senate committee on interstate commerce which is expected to formulate a bill. Chairman Cummins of the Senate committee is out of the city. The Kellogg bill would authorize the War Finance Corporation to extend credits to promote agricultural exports. The War Finance Corporation has announced that it has on hand a cash credit with the Treasurer of the United States of \$403,827,771.

## Missouri & North Arkansas

### Discontinues Operation

OPERATION of the Missouri & North Arkansas will be discontinued on July 31, following a long series of difficulties which culminated recently in a strike of the employees. The company has been operating 364 miles of line between Joplin, Mo., and Helena, Ark., of which it owned 335 miles, and leased 29 miles. In addition, the company has an equal joint ownership in the Joplin Union Depot Company. The Missouri & North Arkansas was chartered in August, 1906, for 50 years, and was a reorganization of the St. Louis & North Arkansas, a line which had been constructed originally to tap a lumber region in southern Missouri and northern Arkansas. The reorganized company, however, was forced into a receivership in April, 1912, and has not been out of the jurisdiction of the courts since that time. Up to December 31, 1919, the property had incurred a deficit of \$956,482.

In March, 1920, C. A. Phelan, general manager of the road, was appointed receiver. Recognizing the need for drastic economy, the receiver ordered wage reductions effective February 1, 1921. The reductions were immediately contested by the employees of the company, who took the controversy before the Labor Board, and when the board remanded the dispute to conference between the management and representatives of the men the latter immediately notified officers of the road that the employees would walk out unless the wage reduction order was rescinded. This threat materialized on February 27, when the enginemen, trainmen, telegraphers and station agents left their work. The strike has been attended with considerable violence and has never been settled, although traffic was resumed on March 24, after a tieup due to destruction of the road's property by strikers. C. A. Phelan resigned as receiver on July 14 and J. G. Murray, traffic manager, was appointed in his place. The new receiver immediately encountered difficulty in raising the July payroll of \$28,000, and announced on July 22 that operation of the road would be discontinued. The abandonment of the Missouri & North Arkansas will leave five counties in northern Arkansas entirely without railroad facilities.

While the plan of the receiver for discontinuing operation has been definitely approved by the federal court for the eastern district of Arkansas, business men in the region served by the road are making a final effort to prevent suspension. A meeting was held at Harrison, Ark., on July 26, to launch a campaign to raise \$150,000 in order to guarantee the road's expenses for three months after July 31 in the belief that the crops and other products which will be moving at that time will enable the road to meet future expenses it will incur.

# New Cornwall Railroad Shop Has Walls of Glass

Small Line Gives Unusual Attention to Light and to  
Layout of Unusually Complete Plant

By J. C. Childs

The Austin Company, Cleveland, Ohio

THE CORNWALL RAILROAD recently placed in operation a new locomotive repair and machine shop at Lebanon, Pa., which is of special interest as indicating the tendency of small industrial railroads to reduce their labor costs of locomotive repair or do away with the expensive methods of contracting for repairs. The Cornwall Railroad operates 13 miles of line out of Lebanon, Pa. Its chief business is the transportation of iron ore from the Cornwall ore banks to the furnaces of the Bethlehem Steel Company at Lebanon. The very nature of its business makes this line practically an industrial road and it is in fact a subsidiary of the Bethlehem Steel Company's local Lebanon interests.

The road's motive power consists of 13 locomotives vary-

ing in weight and size from the old 50-ton locomotive now used in passenger service to the modern 2-8-0 type locomotive weighing 165 tons. In addition to maintaining its own motive power the Cornwall Railroad also repairs all of the industrial locomotives used at the furnaces around Lebanon.

The road's engine terminal consists of a 10-stall square engine house and the locomotive repairs were formerly handled in a small back shop of frame construction, adjoining two stalls of the engine house. All of the work was done by hand with the use of small jacks so that a de-wheeling operation loomed up formidably as a day's job for the entire crew. Repairs to the road's heavy steel ore cars of 50 tons capacity are also made at the terminal so that in selecting the site for the new locomotive repair shop consideration was also given to improved conditions for the repair of cars.

The Walls of the Shop Building Are Almost Entirely of Glass

ing in weight and size from the old 50-ton locomotive now used in passenger service to the modern 2-8-0 type locomotive weighing 165 tons. In addition to maintaining its own motive power the Cornwall Railroad also repairs all of the industrial locomotives used at the furnaces around Lebanon.

The road's engine terminal consists of a 10-stall square engine house and the locomotive repairs were formerly handled in a small back shop of frame construction, adjoining two stalls of the engine house. All of the work was done by hand with the use of small jacks so that a de-wheeling operation loomed up formidably as a day's job for the entire crew. Repairs to the road's heavy steel ore cars of 50 tons capacity are also made at the terminal so that in selecting the site for the new locomotive repair shop consideration was also given to improved conditions for the repair of cars.

The site finally selected is just back of and to one side of the present engine house so that when a two-stall addition

is made to the engine house the outside stall track will become a through track leading into the new locomotive repair shop. The old locomotive repair shop becomes the car repair shop, and, with the blacksmith and forge shop located midway between the two departments, the whole becomes a compact and efficient arrangement for the work to be done.

The repair shop is 110 ft. wide by 162 ft. long and consists of a 60-ft. erecting aisle and a 50-ft. machine shop aisle. Owing to the many classes and the number of locomotives handled a longitudinal shop seemed the only logical one. The erecting aisle has two tracks on 25 ft. center, each with a pit and gives a track capacity for four of the largest locomotives at one time. The present tendency is for in-

creasingly heavy locomotives, so that instead of the old style burdensome and expensive drop pits one track is fitted with a four jack, 200-ton, Whiting hoist, which, with the use of shop tracks, allows the full use of pit capacity. The erecting aisle is also served by a 35-ton crane operating the full length of the building.

Due to the limited amount of money available it was decided to use one end of the erecting aisle for the heavy machine work so that it could all be handled by the crane, which accounts for stubbing the two pit tracks instead of running them clear through the shop. The wheel press, drill and lathe are all located in this end, leaving the machine aisle free for lighter operations not necessitating the use of a crane.

The present tendency in the design of large locomotive erection shops, where complete rebuilding operations will be done, is to allow approximately 4,000 sq. ft. of machine shop space per pit. The late Walter Berg in his book on Amer-

ican Railway Shop Systems recommended about 2,500 sq. ft. per pit. The Cornwall shop was not designed for complete rebuilding operations so the area of machine shop space of 3,000 sq. ft. per working pit seems unusually ample for the work contemplated, and in fact the railway officers have found that the unobstructed floor greatly facilitates the work.

shop of the Pennsylvania recently built at Logansport, Ind. The heating is with a hot blast system conducted by conduits from a central boiler plant adjoining the shop and is so arranged that recirculating air can be used if desired.

The plant has now been in operation about three months but has already proved its fitness for the work of reducing

Plan of the Cornwall Shop

The Cornwall shop contains 13,000 sq. ft. of sash area, or nearly one sq. ft. of sash to every sq. ft. of floor area. This gives practically daylight working conditions in all parts of the building.

The shop is lighted artificially by high power nitrogen lamps, following in general the layout used in the erecting

de-wheeling operations from five to six hours to less than a quarter of that time. It was designed, built and equipped by The Austin Company, Cleveland, Ohio, under the direct supervision of its Philadelphia office, and under the general supervision of John Wintersteen, master mechanic of the Cornwall Railroad.

The Interior of the Shop Is Almost as Light as Outdoors

# Expenditures of the Railways for Labor and Material

Over a Billion Dollars' Worth of Material Used to Maintain  
and Operate Class I Roads in 1920

THE FIRST COMPLETE segregation of all expenditures for labor, fuel and other materials, irrespective of the primary accounts, has recently been prepared by the Bureau of Railway Economics from information in the files of the Interstate Commerce Commission for the fiscal years from 1912 to 1920, inclusive.

These data show that from less than \$40,000,000 in 1912 and less than \$500,000,000 in 1917, the expenditures of the Class I railroads of the United States for materials required for the maintenance and operation of the properties increased until they exceeded \$1,000,000,000 in 1920. In addition to these expenditures, the railroads normally have spent about \$500,000,000 annually at pre-war prices on additions and betterments chargeable to capital account, of which probably considerably more than half was accounted for by material purchases.

From a low point in 1915 the total expenditure for labor by the Class I railroads has increased from \$1,190,000,000 to \$3,698,000,000 in 1920 and the locomotive fuel bill has increased from a low point of approximately \$209,000,000 in 1915 to \$673,000,000 in 1920.

The total amounts of these three major classes of operating expenses of the Class I roads are given for each fiscal year during the period in Table I, which also shows the operating expenses incurred through loss and damage, injuries to persons, and insurance, as well as the deductions from net operating revenues for taxes, hire of equipment and joint facility rentals.

The table also shows the proportion of total operating

revenues which went to meet each class of expenditure during each of the fiscal years in the period. This information is shown graphically in Fig. 1, which presents a striking picture of the rapid decline in the proportion of operating revenues available for interest and dividends since 1916, due largely to the correspondingly rapid increase in the proportion of revenues required to meet the payroll. From 20.8 per cent in the fiscal year ending December 31, 1916, the total cost of labor has increased until 59.9 per cent of the operation revenues were required to meet the payroll in 1920. Of only less importance than the increased payrolls are the increases in the expenditures for material and supplies and locomotive fuel. From 12.5 per cent in 1916, the expenditures for materials and supplies increased until they amounted to 17.3 per cent of the total operating revenues in 1920, while expenditures for locomotive fuel increased from 7 per cent to 10.9 per cent of the total operating revenues during the same period. The result of these large proportionate increases in the principal items of operating expense, together with a similar though relatively less important increase in loss and damage, is that the return on the investment, which was 28.9 per cent of total operating revenues in 1916 has steadily declined until but one per cent of the total operating revenue was available for interest and dividends in 1920.

While the increase in loss and damage has not played a leading part in wiping out the proportion of total operating revenues available for interest and dividends, an inspection of the table shows that there has been an exceedingly large increase in the amount paid out on this account. Rising

NOTE.—The proportion of labor and material shown for maintenance of way and structures and maintenance of equipment are approximately but not strictly correct.

\*Includes uncollectible railway revenues.

from about \$33,600,000 in 1912 to \$42,000,000 in 1914, and then decreasing to less than \$31,000,000 in 1916, the cost of loss and damage increased to over \$122,000,000 in 1920, an amount almost four times as great as that in 1916. Proportionately this is by far the largest increase shown in any of the classes under which railway expenditures are grouped in the table.

### Maintenance of Way and Structures

A similar classification of the expenditures for maintenance of way and structures and maintenance of equipment will be found in Tables II and III. In Table II it will be noted that from an average annual expenditure of over \$209,900,000 for the test period, the expenditure for labor employed on maintenance of way and structures has increased to practically \$577,700,000 and that whereas the cost of labor accounted for 54.71 per cent of the total charges to maintenance of way and structures during the test period, last year it amounted to 60.09 per cent.

As might be expected, this proportionate increase in the

22 Total train miles (excl. work trains) .....	1,111,318,695	1,093,777,083	1,043,965,272
			1,123,589,412

expenditure for labor has been accompanied by a proportionate decrease in the expenditure for material. While the actual expenditure for material has increased from an average of \$133,500,000 annually during the test period to \$285,193,000 in 1920, this increase has been considerably less rapid than that in the payroll and the proportion of the amount paid out for material to the total charges to maintenance of way and structures has decreased from 34.79 per cent during the test period to 29.67 per cent in 1920. The notable fact in this connection is the high proportion of labor and the low proportion of materials during 1918, when labor accounted for 65.07 per cent of all charges for maintenance of way and structures and material for 25.25 per cent, al-

though the actual expenditures for material during this year was considerably larger than the average for the test period.

It will be noted that the expenditure for rail, ties and ballast, which amounted to \$202,038,000 in 1920, was 71 per cent of the total expenditures for materials used in the maintenance of way department and that during the test period the average yearly expenditure for these materials

### Maintenance of Equipment

The outstanding feature of Table III is the large increase in the total expenditures for maintenance of equipment during 1918, 1919 and 1920 as compared with the average annual expenditure during the test period. From an average of creased to over \$1,000,000,000 in 1918. In 1919 there was a further increase to \$1,145,000,000, or about 11 per cent over

46 Passenger car-miles	3,156,414,488	3,032,100,087	3,246,067,026	3,414,352,123	.....	.....	.....	.....

amounted to over 77 per cent of the total material expenditures.

In this connection the fact should not be overlooked that these figures deal only with maintenance expenditures, and that normally the amount spent on additions and betterments

\$530,370,000 during the test period these expenditures increased to over \$1,000,000,000 in 1918. In 1919 there was a further increase to \$1,145,000,000, or about 11 per cent over 1918, while in 1920 the total cost of equipment maintenance amounted to \$1,487,000,000 or practically 30 per cent more than in the preceding year.

A similar comparison of the cost of maintaining locomotives, freight cars and passenger cars, each considered separately, shows that the total increase in the expenditure for

TABLE IV.—PROPORTIONATE EXPENDITURES FOR LABOR AND MATERIALS ON MAINTENANCE OF EQUIPMENT

<b>Locomotives</b>				
	Average per annum, test period	1918	1919	1920
Labor	67.2	74.9	71.2	72.5
Material	32.8	25.1	28.8	27.5
<b>Freight Cars</b>				
Labor	56.7	65.6	62.8	63.1
Material	43.3	34.4	37.2	36.9
<b>Passenger Cars</b>				
Labor	61.6	68.8	66.2	66.4
Material	38.4	31.2	33.8	33.6
<b>All Equipment</b>				
Labor	62.7	70.6	67.4	68.4
Material	37.3	29.4	32.6	31.6

to permanent way and structures, chargeable to capital account, is equal to if not greater than the expenditures chargeable to operating expenses. Approximately the same division between labor and material as exists in the case of the maintenance accounts also applies in the case of the capital expenditures; hence it is evident that the amount of materials shown in Table II represents only about one-half of the average annual purchases for use in track and other permanent railway structures.

TABLE V.—AVERAGE UNIT COST OF EQUIPMENT MAINTENANCE

Locomotives									
		Average per annum, test period		1918		1919		1920	
		Per loco.	Per loco. mile	Per loco.	Per loco. mile	Per loco.	Per loco. mile	Per loco.	Per loco. mile
Labor and material ..		\$2,964	\$0.101	\$6,707	\$0.249	\$6,951	\$0.284	\$8,935	\$0.336
Total .....		3,494	.129	7,401	.274	7,794	.318	9,968	.375
Freight Cars									
		Per frt. car.	Per car. mile	Per frt. car.	Per car. mile	Per frt. car.	Per car. mile	Per frt. car.	Per car. mile
Labor and material ..		\$76.50	\$0.008	\$159.80	\$0.016	\$180.00	\$0.020	\$246.00	\$0.033
Total ....		\$107.80	.011	191.70	.020	217.90	.024	282.40	.029
Passenger Cars									
		Per pass. car.	Per car. mile	Per pass. car.	Per car. mile	Per pass. car.	Per car. mile	Per pass. car.	Per car. mile
Labor and material ..		\$691	\$0.011	\$1,113	\$0.019	\$1,389	\$0.032	\$1,711	\$0.026
Total ....		943	.015	1,991	.023	1,798	.027	2,008	.031

locomotive maintenance has been proportionately considerably greater than that for either freight or passenger cars and that the increase in the expenditure for the maintenance of freight cars has been proportionately much greater than that for pas-

senger cars. Comparing these expenditures in 1920 with the average during the test period, the increase in locomotive maintenance has been 200 per cent while the increases in freight and passenger car maintenance have been 172 per cent and 127 per cent, respectively.

Table III also shows the ratios of the expenditures for labor, material, depreciation, retirements and miscellaneous expenditures, to the total maintenance expenditures for locomotives, freight cars and passenger cars and for all classes of equipment combined. A study of these ratios discloses the fact that in 1918 there was a large proportionate increase in the amount paid out for labor by the mechanical department, which was accompanied by a considerable reduction in the proportionate expenditure for material. It will be seen that the proportion of labor to total expenditures still remains considerably higher than during the test period, while the proportion of material is still low.

A clearer conception of the changes in the relationship of these two great classes of direct expenditures may be obtained by considering them separately from the other items,

which have little direct relation to the actual condition of the equipment in service. These relationships for each class of equipment and for the department as a whole are shown in Table IV.

The direct and total annual expenditures per unit of equipment and per locomotive and car mile are shown in Table V. The direct cost of maintenance (labor and material) has increased from an average of \$2,964 per locomotive per year during the test period to \$8,935 per locomotive in 1920, while the total cost of maintenance increased from an average of \$3,494 per locomotive per year during the test period to \$9,968 in 1920. For the same period the direct cost of maintenance per locomotive mile has increased from 10.1 cents to 33.6 cents and the total cost from 12.9 cents to 37.5 cents. Freight car maintenance has increased from an average of \$76.50 per car per year to \$226.00 for labor and material and from \$107.80 total charges to \$282.40, while the average expenditure per passenger car has increased from \$691 for material and labor to \$1,719 and from \$948 total charge to \$2,098 during the same period.

### Bad Order Cars

Considerable space has been given in the columns of the *Railway Age* recently to the bad order car situation. The figures which follow give the details as to bad order box,

gondola and all cars from January 1 to July 1, the latest figure reported. On the chart the number and per cent of bad order cars are plotted from January 1, 1920, to date.

Date	BAD ORDER CARS					
	Box Cars		Gondola Cars		All Cars	
	Bad Order	Per Cent	Bad Order	Per Cent	Total On Line	Bad Order Per Cent
January 1.....	91,450	8.9	78,273	8.3	2,231,173	191,234 8.5
January 15.....	94,325	9.2	78,635	8.3	2,252,432	194,113 8.6

Bad Order Cars as Reported Semi-Monthly, January 1, 1920 to July 1, 1921

# Operating Revenue and How It Was Expended

A Review in Colored Charts of the Figures and Changed  
Conditions from 1912 to 1920

**I**N 1912, of each dollar of operating revenue of the Class I railroads, those earning over \$1,000,000 gross annually, 43.1 cents went to labor; 8 cents for fuel; 13.8 cents for material, supplies, etc., and 25.2 cents for return on the investment. In 1920, under the new order of things, labor received 59.9 cents of each dollar of operating revenue; there was 10.9 cents spent for fuel; 17.3 cents for materials, supplies, etc., and but one cent for return on investment. The gross revenues in 1912 were \$2,805,006,544; in 1920, \$6,171,493,301. The payments to labor in 1912 were \$1,209,716,686; in 1920, \$3,698,216,351. On the other hand the return on investment which in 1912 was \$708,484,383; in 1920 was but \$61,928,626. Interest charges in 1920 approximated \$450,000, to which must also be added a sum, not yet determined, representing dividend payments. The difference between the return on the investment, as previously noted, \$61,928,626, and the amount paid in interest and dividends, represents what the government had to make up in the form of standard return or guaranty or else was paid from surplus earned by the railroads in former years.

## Shown in Colored Charts

These facts and considerable additional data of like importance are presented on the two following pages in the form of colored charts which have been reproduced from similar charts issued by the Bureau of Railway Economics. The difficulty of analyzing the railway situation and in arriving at proper conclusions in the matter lies in no small measure in the inability to visualize the many imposing figures which have been compiled and presented. It is sufficiently difficult to visualize the relationships as between the various classes

of expenditures in a single year; it is still more difficult to see the relationships as between a series of years. These charts will assist in permitting that visualization not only for 1920 but for the period from 1912 to 1920.

## Railway Operating Revenue and How It Was Expended

There are two charts given. One is entitled, Railway Operating Revenue and How It Was Expended, 1912-1920. This chart shows in dollars the gross revenues for each year; the operating expenses, taxes and rents; and the amounts spent respectively for: Labor; fuel; materials, supplies, etc.; loss and damage, injuries to persons and insurance; depreciation and retirements; taxes; hire of equipment and joint facility rents, and finally the diminishing figure representing return on investment.

## Distribution of Each Dollar of Railway Operating Revenues

The other chart shows the same relationships in terms of the distribution of the dollar. It is entitled, Distribution of Each Dollar of Railway Operating Revenues, 1912-1920.

To assist the reader to follow the situation as between the several years there are also shown the actual figures covering each class of expenditures in addition to which the essential traffic statistics are shown, such as: Net tons carried; net ton miles; passengers carried and passenger miles.

These charts should be of great assistance to all those interested in the welfare of the American railroads, not only because of the figures which they give in convenient and readily available form, but because of the striking manner in which the data is used to point out the essential facts of the situation.

**Railway Age**

July 30, 1921.

## Railway Operating Revenue and How It Was Expended. Class I Railroads, 1912-1920

Chart and Figures from Bureau of Railway Economics

Distribution of Each Dollar of Railway Operating Revenue, Class I Railroads, 1912-1920

## Revenue Car Loading

The business world is beginning to realize in greater degree the duties which the railways perform in assisting the industry of the country. The result has been an entirely new interest in the figures of railway operation and a closer observation of transportation conditions. This is shown by the manner in which such figures as those relating to revenue, car loading, car surpluses and shortages, bad order cars, etc., are being watched in business circles.

Outside of the figures of railway earnings and expenses, there is probably no information relative to railway operation which is being watched at present with greater interest than that of revenue car loading.

The following table is a compilation of the weekly car loading reports covering a period of three years and to assist in making the data

of greater use, a chart is given. It will be noted that for the years 1919 and 1920 there are two columns, one headed "As originally reported" and one "As revised." The revised figures are those issued with the 1921 figures for purposes of comparison. The figures "as originally reported" cover the week ending Saturday. The revised figures cover the week ending not necessarily Saturday but instead on the same date. Thus the figure of 774,808 for July 2, 1921, when issued a week or so ago was compared not with the figure originally issued last year, 839,629, representing the loadings for the week ending Saturday, July 3, 1920, but with a revised figure of 891,621, representing the loading for the week ending July 2, 1920. In addition the revised figures also include some corrections of the previously reported figures.

Revenue Car Loading, 1918 to 1921

# A Striking Diagram for Railroad Stockholders

Statement Prepared for Southern Pacific Shareholders—  
Fallacious Views About Freight Rates

By Julius Kruttschnitt  
Chairman of the Executive Committee, Southern Pacific Company

THE EXECUTIVE COMMITTEE of the board of directors submits this brief of important facts developed in the inquiry conducted by the Senate Committee of Interstate Commerce, and requests your careful attention. *The main trouble with the railroads is that their revenues have not kept up with their expenses.*

About 1905 wholesale prices of commodities and the rates of railway wages began climbing. A summit never before dreamed of was reached in May, 1920. In the same year, 1905, railway freight rates began falling, and, continuing un-

less on the owners after the return of their properties on March 1, 1920.

## Wages Increased Much More Than Freight Rates

The Federal Labor Board, by a decision made effective in May, 1920, increased wages an average of 21 per cent, raising them to a level 240 per cent above those of 1900; wholesale prices were also 240 per cent higher than in 1900, while freight rates were but 30 per cent higher.

The rate increase finally authorized by the Interstate Com-

interruptedly, reached the lowest level in seventeen years in 1916 and 1917.

Decisions rendered in 1914, 1915 and 1917, in three appeals to Interstate Commerce Commission for better rates, afforded but slight relief, so that at the beginning of Federal control in 1918 freight rates were slightly less than in 1900; while wholesale prices were 120 per cent higher than those in 1900.

The Federal Railroad Administration made a substantial rate increase in June, 1918, which, however, fell far short of establishing any proper relation between freight rates and costs of commodities; and notwithstanding the continued and rapid rise of prices and insistent demands of labor for higher pay the Railroad Administration refused to act either as to rates or wages, and forced the solution of these difficult prob-

merce Commission about the first of September, 1920, raised freight rates to a level only 59 per cent higher than in 1900; wholesale prices then had fallen, but were still 203 per cent higher than in 1900, while railway wages remained 240 per cent higher.

All industries except railroads (which under strict regulation were restrained from doing so), raised prices currently as costs went up, so that when at last the 1920 rate increase was granted, further increased expenses and the cost of disorganization under Federal control more than wiped out the amount of the increase.

Publication by the Interstate Commerce Commission in February, 1921, of revenues, expenses and net railway operating income of large (or Class 1) roads for the years 1920 and 1919, coming as it did at a time of great industrial dis-

turbance and readjustment, when prices were falling and the purchasing power or the purchasing inclination of the consuming public was substantially reduced, caused great anxiety, and a thorough study of the situation was instituted to determine what bearing, if any, the present level of transportation charges has upon the existing business depression.

These data showed:

Operating revenues were for—	
1920 .....	\$6,225,402,762
1919 .....	5,184,064,221
Increase 1920 over 1919 .....	\$1,041,338,541
Railway Operating Expenses, Taxes and Rents—	
1920 .....	\$6,163,138,341
1919 .....	4,667,774,131
Increase 1920 over 1919 .....	\$1,495,364,210
Net Railway Operating Income was in—	
1920 .....	\$ 62,264,421
1919 .....	516,290,090
Decrease 1920 from 1919 .....	\$454,025,669
And this notwithstanding the gross revenues were larger in 1920 than in 1919.	\$1,041,338,541

### Costs Over Which Railroads Had No Control

To properly allocate responsibility for this difference, which was caused by the disproportion of operating expenses, it must be understood that except as either year is affected by bad management, the operating revenues and more than 64 per cent of the operating expenses—being labor costs—and in 1920, in addition, a very substantial part of the cost of materials and supplies which were purchased by the Federal Railroad Administration, but used by the railroads at the prices paid, or contracted by the Government to be paid—are fixed by the Government.

In other words, that the Government prescribed the rates from which the operating revenues of the carriers are derived and likewise fixed the wages, which constituted more than 64 per cent of the operating expenses; and that the prices of the materials and supplies which the carriers must have, are fixed either by Government, as above stated, or by economic forces beyond the control of the carriers.

Out of every dollar of operating expenses 64 cents were paid for labor at prices fixed by the Government, 15 cents for materials and supplies at prices fixed by the Government, and 3½ cents were paid for other expenses incurred by the Government in the first two months of 1920, or a total of 82½ cents out of every dollar of expenses for the year 1920 was paid out at prices directly fixed by the Government itself.

The remaining materials and supplies used during 1920 were purchased by the carriers at prices fixed by general market conditions beyond their power to control, costing 15 cents out of every dollar. In other words, prices fixed by the Government or by market conditions cover 97½ cents out of every dollar of operating expenses.

The labor costs to the carriers of Class I were 115 per cent higher in 1920 than in 1917, and if the increased wage scale had been in effect during twelve instead of eight months in 1920 the increase would have been about 128 per cent. During the same period the gross revenues of the carriers (fixed by Government) increased less than 54 per cent.

Since the Government under the Adamson law in 1916 took charge of labor costs, these have increased from \$1,468,576,000 to \$3,698,216,000, the total amount paid to labor during 1920 being very nearly sixty times the \$62,264,000 of income yielded by the railroads to their owners for the purpose of meeting fixed charges and dividends.

### The Record of Railroad Efficiency in 1921

As to efficiency, the best evidence is that in 1920 the railroads performed the greatest transportation task in their history. They moved more freight and passengers, loaded their cars more heavily and moved them farther per day. That

it cost too much to do this was due, as shown beyond all doubt, almost entirely to causes beyond the railroad managers' control.

A widespread propaganda is being carried on in favor of a general reduction of freight rates; whereas the fact is that even since the rates have been advanced the cost of transporting a great many commodities which it is asserted cannot move at the increased rates is far less than the toll taken by commission merchants and retailers for buying and selling them. People are misled into believing that high rates have stopped the movement of a large amount of freight, and that the railroads would make more money if they would reduce rates and thereby revive traffic.

There is the strongest reason to believe that the great stagnation in business is due almost entirely to world-wide conditions which must inevitably have come if there had been no advance in freight rates.

With the decline in ocean freight rates some commodities can reach the markets of Europe for a less transportation charge—water and rail combined—than before rail rates were raised in September, 1920. Moreover, attention might well be called to the fact that the volume of freight traffic increased substantially for some time after the increased rates became effective (August 26).

### The Demand for a Reduction of Freight Rates

We have shown that the policy of the Government for many years was not to raise rates in normal or good times sufficiently to yield adequate revenues, and if rates are now to be lowered on account of bad times, where will this leave the railroads? As seen on the diagram, other industries in good times, as shown by the rise in wholesale prices, reaped large profits out of which surpluses could be accumulated for use in bad times; it is shown just as clearly how the railroads were denied the enjoyment of this right; yet there is a country-wide demand before they have enjoyed the too long delayed relief contemplated by the Transportation Act, 1920, that there should be a general reduction of rates.

The Transportation Act imposes on the Interstate Commerce Commission the duty of providing revenues and on the Federal Labor Board the duty of fixing wages, which is by far the largest single item of operating expenses. If wages are reduced to the general level of peace-time wages in other pursuits, such reduction, in connection with the constantly increasing efficiency of operation, to which we have already called attention, should control one factor determining net income; while the operations of the Transportation Act, if allowed to function without interference, will control the other.

Irresponsible statements as to fabulous sums that can be saved by common use of train and terminal facilities, unification of management and by the expenditure of still more fabulous sums in capital—that could not be obtained at all—to make wholesale improvements, must not be accepted without most careful investigation.

It must be remembered that during two years, 1918-1919, the Federal Railroad Administration, with autocratic control of revenues, expenses and character of service, accomplished little in these directions, although the public, from patriotic motives, cheerfully submitted to many inconveniences and inferior service. Economies in the indicated directions have long been the subject of study by the carriers; some of them have for many years been in use by all of the roads, and all of them by some of the roads.

Railroad executives have established agencies to give all questions of economic and efficient management thorough study by the highest talent obtainable, and they may be trusted in every respect to furnish the "honest, efficient and economic management" required by the Transportation Act, 1920.

## Car Surpluses and Shortages

THE DATA which are given on preceding pages relative to revenue freight car loading and bad order freight cars would not be complete without the figures of car surpluses and shortages. There are given herewith, therefore, the figures from the beginning of 1917 to date. It will be seen that the peak of net car surplus was reached in April but that since that time the surplus has been gradually decreasing.

SUMMARY OF NET SHORTAGES AND SURPLUSES OF FREIGHT EQUIPMENT\*

Net Freight Car Surpluses and Shortages, January 1, 1917, to Date. Plotted by Months to July, 1919. Since Then by Weeks

## Freight Car Loading

WASHINGTON, D. C.

LOADING of revenue freight totaled 776,252 cars during the week ended July 16, according to the reports of the Car Service Division of the American Railway Association. This was an increase of 136,554 cars over the preceding week when, however, the observance of Fourth of July resulted in a drop in the total.

The total for the week of July 16 was 166,599 cars less than were loaded during the corresponding week in 1920 and 126,044 less than were loaded during the corresponding week in 1919, but it was approximately 1,400 cars more than were loaded during the week which ended on July 2 last and which consisted of six full working days.

With the exception of coke, increases were reported in the loading of all commodities during the week of July 16,

compared with the previous week. The largest increase was in the loading of merchandise and miscellaneous freight which includes manufactured products. This totaled 463,085 cars or an increase of 73,298 cars over the week before but 65,000 less than during the corresponding week last year.

Coal loadings totaled 152,116, which was an increase of 25,785 cars over the previous week. It was, however, approximately 55,000 cars under the total for the corresponding week in 1920 and 36,600 cars below the total for the corresponding week in 1919.

A gain of 18,976 cars in the number loaded with grain and grain products over the previous week was shown by reports, bringing the total for the week to 56,991 cars.

Loading of forest products during the week reached 44,037 cars, or an increase of 9,681 cars over the preceding week, while there was a gain of 5,172 in the number of cars loaded with ore, thus bringing the total for the week to 31,484. Re-

ports showed 24,802 cars loaded with live stock, which was an increase of 3,735 cars over the week before, while coke loadings totaled 3,737 cars or a decrease of 93 cars compared with the week of July 9.

With the exception of grain and grain products the total loading for each class of commodities during the week of July 16 was less than during the corresponding week in 1920.

Increases were reported in all districts over the week before.

Due principally to a reduction in the demand for coal cars in the Eastern district, an increase of 2,525 in the number of surplus cars during the week ended on July 15 was shown by reports received by the Car Service Division of the American Railway Association. The average for the week was 372,050 as compared with 369,525 for the preceding week. Surplus coal cars numbered 173,617, an increase of 12,011, while surplus box cars totaled 135,633, a decrease of 9,479. This increase was due largely to the increased demand for grain cars in the wheat sections.

In addition to the 372,050 surplus cars, reports just received by the Car Service Division show that on July 1 there were also 354,611 freight cars out of repair or 15.4 per cent of the cars on line. On June 15, there were 346,861 bad order cars or 15.1 per cent of the cars on line.

Movement of grain and grain products has recently been

heavier than for the corresponding period of the past three years. From June 4 to July 16 inclusive, 297,881 cars were loaded with grain and grain products. This was 67,403 cars more than were loaded during the corresponding period in 1920 and 70,043 cars in excess of the total for the corresponding period in 1919. During the week which ended on July 16, according to reports received by the Car Service Division, 56,991 cars were loaded with grain and grain products which was an increase of approximately 19,000 over the preceding week. During the corresponding week in 1920, the total was only 33,967, and in 1919, 45,466 cars.

The big increase in the movement of grain over the preceding years has resulted in some difficulty being experienced at such points as Galveston and Chicago in the handling by the elevators of the increased volume but through the co-operation of the grain concerns and the railroads, which were represented by the Car Service Division, the situation is being cleared. At Galveston, it was necessary to place embargoes against certain elevators but these have since been lifted except by one road. Reports on Monday showed 3,061 cars of grain standing at Galveston and 8,000 cars at Chicago. Reports received by the Car Service Division show that 75 per cent of the Texas crop, which will move through Galveston for export, has already been loaded.

#### REVENUE FREIGHT LOADED AND RECEIVED FROM CONNECTIONS

L. C. L. Merchandise loading figures for 1921 and 1920 are not comparable, as some roads are not able to separate their L. C. L. freight and miscellaneous of 1920. Add merchandise and miscellaneous columns to get a fair comparison.

# Locomotive Resistance and Mechanical Efficiency

## Investigation Shows Resistance Can Best Be Expressed in Terms of Mechanical Efficiency

By Kiichi Asakura

Mechanical Engineer, Japanese Government Railways, Tokyo, Japan

WHEN A LOCOMOTIVE runs with a uniform speed on a level tangent track, it requires some force to maintain its motion. This force is used to overcome the locomotive resistance which is the sum of the following resistances:

(a) Resistance of the driving gear, i.e., that of the piston, piston rod, valve gear, crosshead, crank pin, etc., and re-

only in the locomotive, while the others exist both in the locomotive and in the cars, and for this reason the locomotive resistance is greater than the car resistance (for a given weight). The fact that the locomotive resistance is greater to a considerable extent than the car resistance shows that the resistance (a) constitutes an important part of the locomotive resistance, and therefore the locomotive resistance becomes the greater as the driving gear becomes more complicated and bigger. In the resistance formulae recently published by several authors, the above idea was taken into consideration and the formulae include generally the three following terms:

1. Resistance caused by the weight on truck wheels and tender.
2. Resistance caused by the adhesive weight.
3. Air resistance.

The old resistance formulae do not differentiate the above terms.

Resistance caused by the weight on truck wheels and tender is independent of the driving gear and therefore this resistance may be treated as that of a car of the same weight per axle. Air resistance is independent of the locomotive weight and may be considered separately from other parts of the locomotive resistance.

Resistance caused by the adhesive weight is the resistance

Fig. 1.—Several Locomotive Resistance Formulae Plotted for Comparison

sistance caused by the impact of the reciprocating parts. This resistance combined with that of (b), explained below, corresponds to the machine friction of the usual steam engine.

- (b) Resistance at the journal of the axle due to friction.
- (c) Resistance between the wheel and the rail, i.e., rolling friction of the wheel upon the rail, that caused by the slipping of the wheel tread and flange on the rail, and that due to the deformation of the rail.
- (d) Air resistance.
- (e) Miscellaneous resistances, i.e., resistances at buffers couplings, those due to vibration, etc.

Among the above mentioned resistances that of (a) exists

Fig. 2.—Locomotive Resistance Plotted with Speed as a Base

mentioned under items (b), (c), (e), and the resistance of the total driving gear (a). This resistance is very complicated and is calculated by several empirical formulae. But the results of the calculation by several formulae differ from each other in very great amounts and often do not coincide with the experimental data. The object of this work is to determine how to calculate the resistance caused by the ad-

hesive weight, to make the calculated results coincide with experimental results closer than the usual formulae.

### Experimental Data

If the locomotive resistance is measured by a test on an actual road, it is almost impossible to separate therefrom the resistance caused by the adhesive weight alone. Moreover, the experimental data usually contain several irregular factors resulting from lack of such long straight track, of level or uniform gradient, as to enable the running conditions to be kept uniform. If, on the contrary, the locomotive resistance is measured in the testing plant, the resistance caused by the adhesive weight alone is measured and moreover in such a test the tractive force, speed, throttle opening, cut off duration of test, etc., may be regulated as is demanded. For this reason, the experimental data obtained in the testing plant are more exact and reliable and should be taken as the basis for the investigation of the locomotive resistance caused by the adhesive weight. The experimental data obtained in Purdue University, at the St. Louis Exposition, at the Altoona Testing Plant of the Pennsylvania Railroad, in Illinois University, at our Oi Testing Plant, etc., are applicable for that purpose.

The resistance measured in the testing plant will be different from that obtained by road test in the amount of the resistances between wheels and rails and miscellaneous re-

tion of the steam consumption, the experimental data of the superheater locomotives at Altoona Testing Plant alone are adopted.

### Formulae Usually Used

The resistance formula usually used expresses the resistance in the form of so many pounds per ton of the adhesive

Fig. 3.—Locomotive Resistance Plotted on the Basis of Cut-off

sistances. But since these resistances constitute only a small part of the total resistance, excepting the case of a very bad road, this difference has no great effect upon the determination of the locomotive resistance. Moreover, since the resistances of several locomotives differ from each other to a considerable extent and it is almost impossible to establish a formula exactly applicable to every locomotive, as will be shown hereafter, the experimental data in the testing plants may be adopted, without a serious error, as the basis of the determination of the locomotive resistance. Thus in this investigation the data of the following simple locomotives in the above mentioned tests are adopted and for the estima-

Fig. 4.—Resistance Expressed as Mean Effective Pressure and Plotted with Cut-off as a Base

weight; that is to say, the resistance is considered to be proportional to the weight. As the internal friction of the engine constitutes the essential part of the resistance, several authors made their formulae in such form that the construction of the locomotive and the number of revolutions of the driving wheels have some effect upon the amount of the resistance. But other authorities considered the resistance to be independent of such factors. The following are well known formulae usually used.

(1) Formula of the American Locomotive Company.

The resistance is stated to be 22.2 lb. per short ton (25 lb. per long ton or 11 kg. per 1,000 kg.) or the resistance is independent of locomotive construction and speed (for the Mallet type, greater resistance is adopted). This formula is very simple, but it is not certain whether the resistance may be expressed so simply.

(2) Strahl's formula.

Type of locomotive	Resistance in lb. per ton	Resistance in kgs. per 1,000 kgs.
4-Wheel-coupled, 2 cyls.....	13.0	5.8
6-Wheel-coupled, 2 cyls.....	16.4	7.3
8-Wheel-coupled, 2 cyls.....	18.8	8.4
10-Wheel-coupled, 2 cyls.....	20.8	9.3

The resistance is considered to be independent of the speed but to increase as the number of coupled axles increases.

As the number of coupled axles increases the construction becomes so much more complicated and therefore the total resistance will increase. But as the adhesive weight increases at the same time, it is not certain that the specific resistance increases as the number of coupled axles. In our Oi Testing Plant, we have found that the specific resistance increased to a considerable amount when we made a test of a 4-wheel-coupled locomotive which was made temporarily a 4-wheel-coupled by taking off a pair of coupling rods of the 6-wheel-coupled engine. The resistance of such a 4-wheel-coupled locomotive may differ from that of a well proportioned

Fig. 5.—Mechanical Efficiency Bears a Definite Relation to Speed and Cut-off

4-wheel-coupled locomotive, but this test may serve to indicate the fact that the specific resistance does not increase as the number of axles.

(3) Sanzin's formula:

Resistance in lb., per ton	Resistance in kg. per 1,000 kg.
$a' + \frac{b' v'}{D' 10}$	$a + \frac{b v}{D 10}$
D' = dia. of the driving wheel in feet.	D = dia. of the driving wheels in meters.
v' = speed in miles per hour.	v = speed in km. per hour.
a', b', a, b, = constants as follows:	
4 Wheel coupled.....	12.3 9.5 5.5 0.8
6 Wheel coupled.....	15.7 11.8 7.6 1.0
8 Wheel coupled.....	18.0 33.1 8.0 2.3
10 Wheel coupled.....	19.8 42.5 8.8 3.6

This formula indicates that the greater the number of coupled axles the greater is the resistance, and therefore may not represent a true resistance as was shown in the case of Strahl's formula. In fact several resistance formulae were made as the results of experiments on German and Austrian railways. The run off test, the throttle being shut, was usually applied for the determination of the frictional loss. However, since, as is shown hereafter, the frictional loss is much dependent upon the power developed, the run off test result ought not to be as well suited for the determination of the frictional loss as the results obtained in a testing plant.

The second term of this formula contains  $\frac{v}{D}$  which represents the number of revolutions of the driving wheel. Sanzin assumes simply that the resistance will be increased if the number of revolutions increases. This assumption seems to be right as is shown hereafter.

(4) Kiesel's formula:

$22 + 0.15 (n-1) v'$ , lb. per short ton.  
 $24.6 + 0.168 (n-1) v'$ , lb. per long ton.  
 $10.9 + 0.0467 (n-1) v$ , kg. per 1,000 kg.  
 $v'$  = speed in miles per hour.  
 $v$  = speed in km. per hour.  
 $n$  = number of coupled axles.

This formula also shows that the resistance increases with the number of coupled axles but the rate of increase is small. When the axles are coupled together each is dependent upon the motion of the other, and so resistance due to slip between wheels and rails may increase. This formula also shows that the resistance increases with the speed. Since, however, only the second term of the formula is dependent upon speed, the increase of specific resistance with the speed is only little. That the second term, which is comparatively a small part of the resistance, is dependent upon the speed and the number of coupled axles, may prove that the second term represents essentially the resistance between wheels and rails. Then this formula shows that the essential part of the resistance is constant and is nearly equal to that given by the formula of the American Locomotive Co.

(5) Formula of the American Railway Engineering Association:

$18.7 + \frac{80n}{W'}$  lb. per short ton  
 $21. + \frac{80n}{W''}$  lb. per long ton  
 $9.4 + \frac{36n}{W}$  kg. per 1,000 kg.

W' = Adhesive weight in short tons  
W'' = Adhesive weight in long tons  
W = Adhesive weight in metric tons  
n = No. of coupled axles

This formula shows that the greater part of the resistance is constant and the remaining part increases in inverse pro-

Fig. 6.—Mechanical Efficiency at Various Speeds on the Basis of Cut-off

portion to the axle load. In America the resistance of 22.2 lb. per short ton is adopted very often and it is usually said that about 80 per cent of the above value corresponds to the internal resistance. Then the first term of the formula may represent the internal resistance, and the second term may represent the resistance between wheels and rails. That the

resistance decreases when the axle load increases is coincident with the experimental results of cars in America.

(6) Dalby's formula:

$$\frac{120}{D'} + 0.05 n v', \text{ lb./ton} \quad \frac{16.3}{D} + 0.0138 n v, \text{ kg. per 1,000 kg.}$$

D' — dia. of driving wheel in feet  
D — dia. of driving wheel in meters  
v' — speed in miles per hour  
v — speed in kilometers per hour  
n — number of coupled axles

In Dalby's formula the resistance is given in the form of so many pounds per ton of the total weight. But when we consider only the part of the resistance caused by the adhesive weight the formula takes the above form.

The first term of this formula shows the internal resistance and was determined from some special case of Prof. Goss's experiments. The second term represents the resistance be-

Table II shows the mean resistance by the adhesive weight obtained by experiments of locomotives given in Table I and also of other locomotives tested at the St. Louis Exposition:

Name of railway	Locomotive type	Adhesive weight	Resistance by adhesive weight	
			lb. per ton	Kg. per 1,000 kg.
Pennsylvania	4-4-2 Sup.	63.0	43.3	19.3
Pennsylvania	4-4-2 Sup.	59.5	31.7	14.1
Pennsylvania	4-4-2 He. Glenn Comp.	39.2	26.3	11.7

Pennsylvania	4-4-2 Cle. Comp.	49.2	30.4	13.6
Pennsylvania	4-6-2 Sup.	80.3	31.0	13.8
Pennsylvania	2-8-2 Sup.	105.0	36.7	16.4
Illinois Central	2-8-0	89.7	28.3	12.6
Pennsylvania	2-8-0	77.4	45.5	20.3
Pennsylvania	2-8-0	72.6	23.5	10.5
Michigan Central	2-8-0	73.5	24.8	11.1
	2-10-6 Tandem Comp.	104.0	36.0	16.1

As is observed from the table the resistance of the locomotive with more coupled axles is not greater than that of the

Fig. 7.—Steam Consumption Per Indicated Horsepower Hour at Various Speeds and Cut-offs

tween wheels and rails and was estimated from the experimental data of a 4-4-0 type locomotive.

Beside the formulae above mentioned there are still many other formulae. Since, however, these formulae usually express the resistance per ton of total weight, and it is impossible to separate the resistance only due to the adhesive weight, neither comparison nor discussion was made about these formulae.

As was explained already, all the above formulae have some defect in their forms, when we consider them theoretically. The above formulae are plotted in a diagram, Fig. 1, which shows how great a deviation exists among them. In fact each formula may represent the experimental result of one locomotive, but it is not applicable to another locomotive and perhaps to any other case.

locomotive with less coupled axles. Moreover, the resistance of locomotives with the same number of coupled axles differs to a very great extent. Thus the above experimental results do not justify the correctness of expressing the resistance in terms of the number of coupled axles.

To find out if there is some relation between the resistance per ton weight and the number of revolutions of the driving wheels or cut off in the cylinders, the experimental results of the locomotives in Table I are plotted in Figs. 2 and 3. From these diagrams we cannot observe any regular relation, except that the resistance may be dependent upon the number of revolutions. The spots representing the resistance are distributed irregularly between 13 lb. and 63 lb. Even if we eliminate the specially high and low values, they are scattered between 20 and 50 lb. These figures may serve to

prove that the resistance ought not to be expressed in the form of so many pounds per ton weight, although such form is usually adopted.

### Resistance and Mean Effective

#### Pressure in the Cylinder

Since the internal resistance is to be dependent upon the size of the driving gear, and the steam pressure in the cylinder ought to have some effect upon the resistance, there is some hope that the resistance may be expressed as a func-

whether the locomotive resistance may be expressed in the form of the efficiency. The mechanical efficiency of the locomotives of Table I is plotted in connection with the number of revolutions of the driving wheel and the cut off in the cylinder, as shown in Figs. 5 and 6. Though we find from these figures that the relation between these factors is not regular enough, it is still by far more regular than the case in which the resistance is expressed in terms of unit weight or of mean effective pressure. As the design, workmanship, lubrication, etc., differ in each locomotive, it will be impos-

Fig. 8.—Steam Consumption of Superheated Locomotives Per Indicated Horsepower Hour at Various Cut-offs and Speeds

tion of the mean effective pressure in the cylinder. Prof. Goss gives in his work the following values of the mean effective pressure, which corresponds to the resistance, stating that it is almost independent of the speed, and decreases with the later cut off.

Cut off, per cent.....	25	35	45	80
M. E. P. corresponding to the resistance.....	5.29	4.18	3.57	1.69
	lb. per sq. in.	kg. per sq. c.m.	0.294	0.251
			0.119	

sible to expect the experimental results of several locomotives to coincide and to give sufficiently regular relations between the mechanical efficiency and number of revolutions or mean effective pressure. We can acknowledge from Fig. 5 that the efficiency increases slightly as the number of revolutions of the driving wheel increases, so long as the number of revolutions is small, and then the efficiency decreases as the number of revolutions increases. The loss due to im-

Fig. 9.—Steam Consumption Per Drawbar Horsepower Hour with Varying Speed and Cut-off

If this statement may be applicable to any locomotive, the resistance will be calculated from the above data. When, however, the mean effective pressure corresponding to the resistance of the locomotives of the Pennsylvania Railroad before mentioned, is plotted in connection with the cut off, as is shown in Fig. 4, it is found that the resistance is not expressed as a function of the mean effective pressure.

### Resistance and Mechanical Efficiency

As the internal friction loss of steam engines is expressed in the form of the efficiency, it is quite natural to investigate

part of the reciprocating parts will be greater at a high number of revolutions, and this may be the cause of the decline in the efficiency at high speed. Fig. 6 shows that the efficiency increases with the later cut off. The rate of change of force acting in every part of the driving gear decreases with the later cut off and this may be the cause of rise in the efficiency at the later cut off. Figs. 5 and 6 each represent the relation of the efficiency, number of revolutions and cut off. Though in each figure the points are distributed in a rather too irregular order to trace curves representing the relation, the other figure serves to aid in the curve tracing,

because the relation given by the two figures must be the same. Thus the curves in Figs. 5 and 6 were drawn and are represented by the following equations:

$$e = \left( 100 - \frac{440}{c} \right) - (0.0055 - 0.00004 c) \left( n - \frac{6500}{100 - c} \right) 1.5$$

$e$  = mechanical efficiency.

$c$  = cut off in per cent.

$n$  = number of revolutions of driving wheels per min.

The maximum efficiency is given by the following equations:

$$e \text{ max} = 100 - \frac{440}{c}$$

The number of revolutions with which the efficiency should be maximum is given by the following equation:

$$n' = \frac{6500}{100 - c}$$

### Application of the Efficiency Formula for the

#### Determination of the Tractive Force

The most usual application of the resistance formula is to find out the effective tractive force from the indicated tractive force. The efficiency formula may also be applied for the same purpose, though the calculation in this case is not so simple, as the case in which resistance is expressed in terms of unit weight. In such calculation the steam evaporation of the boiler and the steam consumption per indicated horse power hour are estimated and thus the indicated horse power developed by the locomotive is calculated, from which the indicated tractive force is calculated. By deducting the locomotive resistance from the indicated tractive force, the available tractive force is calculated.

Now, by using the above efficiency formula, we can calculate the steam consumption per drawbar horsepower hour corresponding to several numbers of revolutions and cut offs. Then the drawbar horsepower which can be developed by the locomotive, can be calculated. Thus the effective drawbar pull can be obtained if the proper care be taken in determining the resistance due to the weight on truck wheels and tender and the air resistance. The calculation of the drawbar pull as above explained is to be applied to the case in which the drawbar pull is limited by the boiler capacity or the speed is not very low. If the speed is low the drawbar pull is limited either by the adhesive weight or by the cylinder effort. The drawbar pull calculated from the adhesive weight is the effective drawbar pull, so that there is no need of considering the internal resistance.

Now to consider the cylinder tractive effort, we take the mechanical efficiency from Fig. 5 at 90 per cent, since the speed is low. The steam pressure drop from the boiler up to the cylinder may be taken from the experimental data of the locomotives previously mentioned being at most 5 per cent, at low speeds. Then the total loss is 15 per cent, or, as is usually adopted in America, the tractive effort can be expressed as follows:

$$T = \frac{0.85 P d^2 l}{D}$$

$T$  = Tractive effort.

$P$  = Boiler pressure.

$d, l$  = Dia. and stroke of cylinder.

$D$  = Dia. of driving wheel.

When the locomotive runs without steam the resistance will be different, but this case is not treated here.

### Steam Consumption

Steam consumption is considered only in the case of the superheater locomotive. The steam consumption depends upon the number of revolutions, cut off and steam tempera-

ture. Thus the steam consumption per indicated horse power hour is plotted in connection with the cut off, for 120, 160, 200, 260, 280 and 320 r. p. m., as shown in Fig. 7. There is some tendency for the steam consumption to decrease when the steam temperature increases. Since, however, the difference is small, when the superheat is more than 160 deg. F. (89 deg. C.) the steam consumption is assumed to be independent of the superheat, provided that the superheat is considerably high. Then the steam consumption per indicated horse power hour is represented in connection with the number of revolutions and cut off as shown in Fig. 8. By dividing the steam consumption thus obtained by the corresponding mechanical efficiency, we get the steam consumption per draw bar horse power as shown in Fig. 9. The value of this figure is to be applied to the calculation of the tractive force.

### Conclusion

It was explained that it was more rational to consider the locomotive resistance in terms of mechanical efficiency than in terms of unit weight as was usually done. The formula for the mechanical efficiency was established. Also the steam consumption was investigated in connection with the number of the revolutions and cut off, and thus the more rational method of calculation of draw bar pull was introduced.

Since for the experimental data for the steam consumption, those of the superheater locomotives of Pennsylvania Railroad were adopted, the result obtained should be applied strictly speaking only to superheater locomotives having a boiler pressure of 205 lb. per sq. in. But the result will be applicable to all the superheater locomotives commonly used without serious error.

## Canadian Pacific Uses

### Heavy Slabs for Bridge Spans

WHILE NOT THE FIRST to use reinforced concrete slabs for bridge or trestle spans, the Canadian Pacific has probably carried this development as far as any railroad in North America as regards the use of long spans. Thus, in 1918 slabs in 36 ft. and 34 ft. lengths were used for the decks of an unusual reinforced concrete trestle carry-

Street Subway in Montreal Involving the Use of 36 Ft. Slabs for the Roadway Spans

ing a double-track main line over a gorge 100 ft. deep and nearly 400 ft. wide just east of North Toronto. This structure was described in the *Railway Age* of August 16, 1918, page 289. Another application is illustrated in the photograph showing the use of 36-ft. slabs for a grade separation subway in Montreal. Slabs of this kind have now been standardized in various lengths up to 35 ft. 4 in. and feature in the renewal of pile trestles and steel girder spans. In this connection they are sometimes hauled distances of as much

as 300 miles from the casting yard to the bridge site. The 34-ft. 4-in. slabs weigh 101,000 lb. each.

The design of the slab follows the generally accepted practice. Rectangular section slabs are used for lengths under 20 ft. while the slabs 20 ft. long and over are of the T-section illustrated in the drawing. All slabs are made 6 ft. 6 in. wide, thus requiring two for each track and as the parapet is cast separately all the slabs are alike except those having ends carried on abutments without backwalls which must be

the top of the slabs, a special sling is used which is carried by lifting rods passing through four 2¼-in. diameter holes (two near each end of slab) placed at such distance from the end as to be well clear of the bearing in order that tackle may be released when the slab is landed.

We are indebted for the above information to J. M. R. Fairbairn, chief engineer, Canadian Pacific, Montreal, Que. P. B. Motley, engineer of bridges, was responsible for design.

## Shall the Crossing Alarm Whistle Be Modified?

By E. H. Hemus

Assistant Claim Agent, Atchison, Topeka & Santa Fe

TO MEET the increased danger incident to the enormous number of high-speed automobiles now in use on our highways, it has been proposed to improve the whistle signal, to be given from the locomotive, with a view to more effectively safeguarding traffic at highway crossings. It has been suggested that it might be well to sound the whistle continuously from the whistling post to the crossing; but no practical operating officer sees any merit in that proposal. One thing certainly ought to be done and that is to comply strictly with the laws in every state; and engineers should be required to familiarize themselves with the statutes in each state in which they may have to run. Sounding the crossing signal twice, instead of once—that is to say, eight blasts instead of four—also would be but a partial remedy for the difficulty. The most direct and rational course would be to enforce with greater care the rules now in effect.

The claim department should show the management just how many crossing accidents have occurred in each state traversed by the company's lines, and this should be followed by checking up the engineers to see how careful they are. Probably there are engineers who are satisfied to do the minimum of duty; having blown the whistle to relax their vigilance. A fireman always tells you that he was putting in a fire at the time the accident occurred, so that he did not see anything; but firemen can be educated to take a more

View Underneath, Showing the T-Beam Construction

provided with diaphragms to fill in the open space under the flanges of the T-slabs.

The concrete is composed of 1-1½-3 mixture, using sand and broken stone for the aggregate. About 300 lb. of reinforcing material is required per cubic yard of concrete and this is of medium open-hearth steel. The bars are usually ordered of the manufacturer to be delivered cut to required lengths and bent according to a detailed bending diagram, the bars being tagged with an identifying mark.

Longitudinal Elevation and Cross Section of the Standard 35 ft. 4 in. Slabs Showing the Reinforcement

Special attention is given to the bearings of the slabs on the substructures, these bearings being provided with steel bearing plates held in place on the cap or bridge seat by means of dowels. No connection is provided between the slabs and the bearing plates.

For waterproofing, the top surface, ends, inside of the flanges and the underside and inside of coping blocks are covered with two coats of hot asphalt. The joints between slabs are caulked with oakum or other suitable fabric saturated with the asphalt. The usual practice is to erect the slabs by means of wrecking cranes. For all except the lighter slabs, which are fitted with lifting stirrups projecting from

lively and human interest. Are your whistles properly tuned to give the best signal; and are you sure that the engineers do not re-tune them, for reasons of their own? Locomotives might be equipped so that the fireman would have a whistle cord on his side of the cab; and then, in case of emergency, he could sound the whistle instantly.

Finally, the claim department, knowing the causes of accidents at crossings should take care to see that all the lessons from such knowledge are thoroughly impressed on the minds of the officers who are in authority.

\*Abstract of a paper read before the Association of Railway Claim Agents at St. Louis, on May 19, 1921

## Edgar E. Clark Resigns from Interstate Commerce Commission

WASHINGTON, D. C.

PRESIDENT HARDING announced on July 22 that he had received the resignation of Chairman Edgar E. Clark as a member of the Interstate Commerce Commission and had appointed to succeed him, Frederick I. Cox, of New Jersey, as a representative of the interests of the commercial travellers. Mr. Clark's letter of resignation was dated July 14 and seems to have been entirely unexpected. It gave as his reason that he had devoted as many years of his life to public service as he felt he could afford. Mr. Clark is to be associated with Wilbur La Roe, Jr., formerly chief examiner of the commission, in practice before the commission, and courts in interstate commerce matters, with office in Washington.

Mr. Clark was the senior member of the commission, having been appointed by President Roosevelt in 1906, had served as chairman during the past year and had recently been re-elected chairman for the new fiscal year ending June 30, 1922, on the motion of Commissioner McChord, who stood next in seniority. Mr. Clark has not been in the best of health for a long time and the duty of representing the commission as chairman has placed upon him an unusual strain during a period when the commission has had before it a task of tremendous magnitude and has been under great pressure of many kinds.

Mr. Clark enjoys the distinction of being the only man, in recent years, at least, to resign from the work of the commission to engage in private enterprise. Usually the commissioners have been reappointed upon the expiration of their terms, but some have not been reappointed. Commissioner Lane resigned to become Secretary of the Interior, Commissioner Knapp left it to become a judge of the Commerce Court and Commissioner Prouty resigned to become director of the commission's valuation work. Commissioner Clark's term would not have expired until December 31, 1926.

In the five months since his inauguration, President Harding has now appointed five of the eleven members of the Interstate Commerce Commission. At the end of this year the terms of Commissioners Aitchison and Hall expire so that by that time he will have appointed a majority of the commission. The terms of Commissioners McChord and Eastman expire in 1922.

Mr. Clark was originally appointed as a representative of the labor interests on the commission. He was then president of the Order of Railway Conductors and during the first few years of his connection with the commission he was on several occasions chosen as the representative of labor organizations in wage arbitration proceedings. During recent years, however, he has not been regarded as in any sense a representative of labor and in fact the organizations have made several efforts to obtain direct representation upon

the commission. As a practical railroad man and the most experienced in the work of the commission Mr. Clark has been identified with practically all sides of the commission's work and because of his fairness and ability has been generally recognized as its strongest member.

For the past two or three years particularly he has been the chief spokesman of the commission in public. As chairman of its legislative committee Mr. Clark represented the commission in the various hearings before congressional committees while the work of formulating the Transportation Act was in progress and his influence in favor of some of the principal provisions of that act had much to do with commanding an adequate support for them in both houses of Congress.

As chairman of the commission since it was charged with the administration of the new law he has had a tremendous task in trying to translate into a working program the principles laid down in the law, in the face both of wide differences of opinion among some of the commissioners and of

the most persistent sort of pressure from interests that were violently opposed to the principle of the act that gave the commission responsibility for the adequacy of the revenues of the carriers as well as for their reasonableness from the point of view of the shipper. He has stood out strongly against a policy of general rate reductions at a time when the President and several members of his cabinet as well as many influential members of Congress were openly urging such a policy. Remembering that the shippers generally a year ago told the commission that they wanted better railroad service and were willing to pay for it he apparently has tried to take them at their word and he has been writing numerous letters to shippers, congressmen and others pointing out that the causes for the business depression lay far deeper than any question of freight rates. His strong stand that rate reductions generally, as distinguished from readjustments

in special cases, could not be considered until the railroads had had an opportunity to reduce their cost of operation, has undoubtedly had a potent effect in preventing the administration from being influenced more than it has by the clamor of several large groups of shippers for an immediate reduction of rates.

Chairman Clark has taken an active part in the recent conferences of the government officials on the plan for expediting a settlement of the accounts between the railroads and the government for the period of federal control.

His resignation is to become effective on August 31, or as soon as the appointment of his successor is confirmed.

Mr. Clark was born February 18, 1856, at Lima, New York, and was in railroad service from 1874 to 1889 as a brakeman and conductor. From 1889 to 1890 he was vice-president of the Order of Railway Conductors and from 1890 to 1906 he was president of the order. While in this position he was appointed by President Roosevelt as a member of the Anthracite Coal Strike Commission in 1902. He was ap-

E. E. Clark

pointed to the Commission, July 7, 1906, to fill one of the two new vacancies created by the Hepburn Act, which increased the membership from five to seven. He was reappointed at the expiration of his term on December 31, 1912, by President Taft, but his confirmation was delayed by the Senate along with other appointments, until after March 4, when he was reappointed by President Wilson. He was then elected chairman of the commission. He was again reappointed in 1919 by President Wilson and on March 8, 1920, he was elected chairman again for the term ending June 30, 1921.

## The "DeWitt Clinton" Moves Under Its Own Power

THE LOCOMOTIVE DeWitt Clinton, and its three coaches, the historic New York Central passenger train, which for the past year has been on exhibition in the Grand Central Terminal, New York City, has been taken to Chicago to be exhibited at the "Pageant of Progress" on the Municipal Pier, from July 30 to August 14.

For a short section of this journey the old locomotive was

years. It made a maximum speed of 30 miles an hour on its first trip; but as fired up for the present exhibition it has been moved at only about eight miles an hour.

COLONEL B. W. DUNN, chief inspector of the Bureau of Explosives, in commenting on the suggestions for stopping leaks in tank cars, recently made by the Committee on Freight Claim Prevention, Freight Claim Division, A. R. A., stated:

"The proper action in the case of any leakage of inflammable liquid from a tank car is to transfer the contents, unless the leakage can be stopped by manipulation of the outlet valve or tightening of the outlet valve cap. When leaks cannot be stopped in this manner, plugging with oatmeal or other material may be advisable to undertake a short movement of the car, but such measures should not be adopted as a permanent repair, and any approval of the same should be handled in such a way as not to encourage this action except when absolutely necessary.

"The use of oatmeal might be effective where there is a leakage of gasoline through a narrow crack or around the valve seat. Oatmeal may be considered a reasonably good substance, due to the fact that the material is rolled or crushed and not ground into a fine powder. The effectiveness of the method will depend upon the size and shape of the opening. It has also been sug-

The "999" with the "DeWitt Clinton" at Erie, Pennsylvania

moved under its own power. For the rest of the trip the ancient train was carried on platform cars in a special train drawn by locomotive No. 999, which was one of the notable engines built for the New York Central by William Buchanan, 20 years ago, when the Empire State Express and the Twentieth Century Limited express were first making their reputations. The illustration of this special train on this page is from a photograph taken at Erie, Pa. The 999 has been remodeled, since it was in service on the main line, and during recent years it has hauled passenger trains on the Pennsylvania division. For this special trip the tender was again painted and decorated in the style which was familiar to passengers in 1893.

The first trip made by the DeWitt Clinton with a passenger train was from Albany to Schenectady on August 9, 1831, so that the exhibition at Chicago will mark the ninety-ninth anniversary of the life of the locomotive. In its present condition the locomotive weighs 9,420 lb. and the tender 5,340 lb. A standard New York Central Pacific type passenger locomotive, now in use, such as that shown in the illustration, weighs 276,000 lb., or about 11 times the weight of the entire train of 1831; though the gage of the track is the same now that it was then.

The DeWitt Clinton continued in active service for 14

gested that plaster of Paris, mixed to a plastic mass, with water, might be rammed down over the point of leakage from inside or outside as may be most convenient. This will set hard in a few minutes."

A Baldwin Decapod Leaving Manchuria, China, for Chita, Siberia

# General News Department

An average on-time record of 92 per cent was made by the fast freight service of the Chicago, Indianapolis & Louisville, between Indianapolis, Louisville and Chicago, during the months of May and June.

The number of applications for employment has permitted the Chicago & Alton to restore its age restriction for new employees. No one over 45 years of age or under 21 will be employed hereafter, although during the labor shortage occasioned by the war this rule was waived.

The Railroad Division of the American Society of Mechanical Engineers has elected the following Nominating Committee to present nominations for next year: G. M. Basford, G. M. Basford Company, chairman; W. L. Bean, N. Y., N. H. & H., and Kenneth Rushton, Baldwin Locomotive Works

The Texas Association of Claim Agents held a three-day session at El Paso, Tex., from July 14 to 17. Approximately 200 members of the association were in attendance at the session, which concentrated on means of relieving heavy claims resulting from live stock losses on railroad right of ways in Texas, Oklahoma, Louisiana and Arkansas.

## I. C. C. Decision in New England Divisions Case

The Interstate Commerce Commission in a decision made public Thursday says that it can find no basis afforded for a valid prescription of divisions by it. It decides, however, that fair divisions cannot in many instances flow from the existing arrangements. It expects the roads to work out readjustments and report.

## A Correction

In the *Railway Age* of July 2 (page 40), it was incorrectly reported that on the Illinois Central during the month of May, 92.2 per cent of the trains operated were on time, but as shown by the figures given, the percentage of trains on time should have been 99.2 per cent, or 13,451 trains maintaining a scheduled time out of 13,567 operated.

## Train Robbery on the Missouri Pacific

Train No. 205 on the Missouri Pacific, running between Memphis, Tenn., and St. Louis, Mo., was held up near Van Dale, Ark., on the night of July 23, and the mail and express cars were looted but it is reported that the robbers made away with but little money. The robbers are said to have been six in number and all armed with rifles. The loot was loaded into an automobile in which the robbers made their escape.

## Employers' Associations Ask

### Permission to Testify Before Labor Board

Telegrams were received by the Railroad Labor Board from the National Association of Manufacturers, the National Erectors' Association and the National Founders' Association on July 26, and the Employers Association of Chicago put in its request on July 27, petitioning the body and seeking to intervene in the Pennsylvania controversy with the shop craft labor union now before the Board. The associations seek to appear for a hearing on behalf of the public and in support of the open shop policy.

## Good Work in Freight Offices

J. J. Hooper, general claim agent of the Southern Railway, publishes in the Southern News Bulletin for July, a list of the names of agents who have 100 per cent records in revising inbound freight billing for some period of time which is not given. Mr. Hooper says that the agents, whose names appear—two columns of small type—have made such progress in the work of

revising all inbound way bills that they now require only general supervision. Great progress is being made in reducing the number of costly overcharges and undercharges by correct billing and proper care of tariff files.

## Unauthorized Strike on the Cincinnati,

### Indianapolis & Western

Three hundred and two employees of the federated shop crafts of the Cincinnati, Indianapolis & Western shops at Indianapolis walked out on an unauthorized strike on Friday night, July 22. The shop laborers refused to join the strikers and all the foremen remained in service, taking the places of the mechanics. The road began hiring new men Saturday and on the following Wednesday morning had 320 men at work, with applications more than ample to fill all vacancies. A traffic of over 25 per cent above normal has been handled without delay during the strike.

## New Grade Crossing Law in Michigan

Representatives of all steam and electric railroads and of county road commissions of the state of Michigan will meet in Lansing, Mich., this week, with the State Public Utilities Commission, to work out the application of the new law, which gives the utilities commission jurisdiction over grade crossings. The new law requires that signs at least 24 in. in diameter be placed 500 to 600 ft. from every crossing, the highway department furnishing the posts and the railroads the signs. This work must be completed by May 18, 1922. The law further requires that all crossings shall be smooth and even and 16 ft. wide for 25 ft. on each side of the crossing.

## District Court Issues Decision in Stoker Suit

The suit brought by the Mechanical Construction Company against the Locomotive Stoker Company for infringement of Patent No. 979,849 to William T. Hanna, was tried before Judge Thomson in the District Court of the United States for the Western District of Pennsylvania in February and March, 1921. The defendant denied infringement, alleged the invalidity of the patent, and by way of counterclaim alleged infringement by the plaintiff of Patent No. 1,130,443. The plaintiff in reply denied the validity of this patent or infringement thereof and asked that the counterclaim be dismissed.

The claims of the Hanna patent covered the use of diverging channels in the distributor plates for the distribution of coal in the firebox. In this suit the decision states, "The claims in suit I find valid and infringed." The counterclaim was based on a fuel receptacle below the firing floor, in regard to which the decision states, "I find that for the reason set forth in this opinion, defendant's counter-claim should be dismissed."

The case has been appealed by the Locomotive Stoker Company and it is expected that it will be heard by the Upper Court early in the October term.

## Wood Preservers' Association Has

### Established Service Bureau

The American Wood Preservers' Association is establishing a service bureau to promote the use of treated timber and thereby conserve the forest resources of the country. This bureau will be prepared to furnish information concerning the uses to which treated timber may be applied economically, to answer inquiries regarding the relative durability of treated and untreated woods, and to supply other data concerning the use of timber treated with the standard preservatives, such as zinc chloride and creosote. Headquarters have been established at 10 S. La Salle street, Chicago, and P. R. Hicks, engineer in forest products of the United States Forest Products Laboratory at Madison, Wis., has been appointed secretary-manager.

### Tentative Valuations Issued

The Interstate Commerce Commission has issued tentative valuations giving the following figures for the final value:

Kentwood, Greensburg & Southwestern, 1916.....	\$138,834
Gulf Terminal, 1915.....	565,148
Pine Bluff & Northern, 1916.....	39,758
Fordyce & Princeton, 1916.....	174,071
Shreveport Bridge & Terminal, 1915.....	424,067
Dallas Terminal Railway & Union Depot Co., 1915.....	1,187,810
Grafton & Upton, 1916.....	436,785
Conway Electric Street Railway, 1914.....	151,163
Hoosac Tunnel & Wilmington, 1916.....	641,864
Pine Bluff & Arkansas River, 1915.....	153,840
Green Bay & Western, 1916.....	5,298,582
Kewaunee, Green Bay & Western, 1916.....	1,289,193
Ahnapee & Western, 1916.....	676,408
St. Joseph & Lake Champlain, 1916.....	1,924,120
Thornton & Alexandria, 1916.....	243,542

### Wage Reductions in Canada

By a tentative agreement between the Railway Association of Canada and Division 4, Railway Employees Department, American Federation of Labor, the railway employees in the locomotive and car departments, as specified in wage agreement No. 4, will receive a decrease of 8 cents per hour, effective on July 16, 1921. It has also been agreed that promptly upon notice from either the Railway Association of Canada or Division No. 4, Railway Employees Department, American Federation of Labor, to the other, representatives of both will confer further and that except as may be otherwise mutually arranged, any rates and conditions finally agreed upon will be effective as of July 16, 1921. At that time any necessary adjustments will be made accordingly, provided, however, that any such adjustments will not operate to bring about any reclaim from employees of any amount which may have been paid to them pursuant to the terms of the above tentative agreement.

A similar agreement with United Brotherhood of Maintenance of Way Employees and Railway Shop Laborers has resulted in tentative reductions, effective the same date, as follows: all maintenance of way foremen and signal construction foremen, 80 cents per day; carpenters and other skilled workmen, 10 cents per hour; track laborers, crossing watchmen, bridge tenders and other laborers, 8½ cents; signal maintainers, 8 cents; signal helpers and helpers of maintenance mechanics, 7 cents; roundhouse laborers and ash pit men, 10 cents; pumpmen, \$17.34 per month; signal men at interlocked crossings, \$12.24.

### Program for the Roadmasters' Convention

The tentative program for the convention of the Roadmasters' and Maintenance of Way Association, which will be held at the Auditorium Hotel in Chicago on September 20-22 inclusive, has been definitely arranged as follows:

#### TUESDAY MORNING, SEPTEMBER 20

- 10:00 a. m. Convention called to order.
- Opening business, president's address, etc.
- 11:00 a. m. Committee report: "The Construction and Maintenance of Railroad Crossings"; D. O. Hearn, roadmaster, Elgin, Joliet & Eastern, Joliet, Ill., chairman.

#### TUESDAY AFTERNOON

- 2:00 p. m. Paper: "Results Obtained from the Use of Treated Ties"; J. H. Waterman, superintendent, timber preservation, Chicago, Burlington & Quincy, Galesburg, Ill.
- 3:00 p. m. Committee report: "The Most Economical Method of Handling and Renewing Cross and Switch Ties"; E. P. Hawkins, division engineer, Missouri Pacific, Wichita, Kan., chairman.

#### WEDNESDAY MORNING, SEPTEMBER 21

- 9:30 a. m. Committee report: "Methods of Stimulating Rivalry Among Track Forces"; George T. Koonz, roadmaster, Delaware & Hudson, Carbondale, Pa., chairman.
- 11:00 a. m. Paper: "The Budget System as Applied to Track Work"; C. A. Morse, chief engineer, Chicago, Rock Island & Pacific, Chicago.

#### WEDNESDAY AFTERNOON

- 2:00 p. m. Committee report: "The Classification and Distribution of Second Hand Rail"; L. E. Dale, supervisor, Pennsylvania, Philadelphia, Pa., chairman.
- 3:00 p. m. Committee report: "The Records and Accounts of a Roadmaster's Office"; F. J. Meyer, assistant engineer, New York, Ontario & Western, Middletown, N. Y., chairman.
- 6:30 p. m. Annual dinner of the Roadmasters' & Maintenance of Way Association and the Track Supply Association.

#### THURSDAY MORNING, SEPTEMBER 22

- 9:30 a. m. Paper: "The String Lining of Curves—Methods and Results"; H. L. Pierce, supervisor, Pennsylvania, Cresson, Pa.
- 10:15 a. m. Business session, including election of officers, etc.

#### THURSDAY AFTERNOON

Arrangements are being made for a visit to some interesting operations of value to maintenance men.

### Chamber of Commerce Appoints Transportation Committees

The Chamber of Commerce of the United States has appointed two committees to deal with transportation questions during the ensuing year. One is a committee to act for the Chamber's department of transportation and commerce and the other is a special railroad committee.

The members of the regular departmental committee are: Howard Elliott, chairman of the board of directors of the Northern Pacific, chairman; L. B. Stillwell, consulting engineer, New York; E. O. Edgerton, San Francisco; George A. Post, president of the Hudson River Bridge Corporation, New York; W. W. Salmon, president of the General Railway Signal Company, Rochester, New York; H. H. Raymond, New York; J. M. Whitsitt, Charleston, S. C.; A. J. Brosseau, New York; P. H. Gadsen, Philadelphia; D. Fiske, Minneapolis; B. F. Cresson, Jr., New York; J. J. Carty, vice-president of the American Telephone & Telegraph Company, New York; and L. Teter, Chicago.

The members of the special railroad committee are: George A. Post, chairman; T. C. Powell, vice-president of the Erie; H. A. Wheeler, vice-president of the Union Trust Company, Chicago; G. W. Simmons, St. Louis; W. W. Salmon, Rochester; A. W. Smith, general counsel of the Railroad Administration; Emory R. Johnson, Dean of the Wharton School, University of Pennsylvania, Philadelphia; C. E. Lee, East Orange, N. J.; F. C. Dillard, Sherman, Tex.; W. S. Dickey, president of the Kansas City & Missouri River Navigation Company.

The Chamber's transportation department was organized recently with J. R. Bibbins as its manager. The committee will deal with transportation in all its forms and will take up the following subjects:

1. Railroads—Further study of financial resources, consolidation and efficiency, with the object of making them self-sustaining, with adequate service to the public.
2. Marine Transportation, both lake and ocean—The problems of the American merchant marine and proper relation to foreign competition.
3. Terminals and Ports—Intensive study of operating unification to secure a more efficient trans-shipment machine.
4. Electric Railways—The fare situation and ways and means for securing a self-supporting agency of essential public service.
5. Highways—Economic analysis of the problem of highway transport in relation to other agencies, and the proper public subsidy therefor.
6. Waterways—Economic analysis showing the true position of waterways as a natural resource, as yet largely undeveloped.
7. Communications—Encouragement of adequate development for needs of business, especially in connection with foreign countries.
8. Postal and Express—The problem of transportation of the mails upon an economic basis.
9. Air Transport—The codification of laws and regulations to promote safety and encourage aeronautical development with the maximum rapidity.

## Traffic News

Freight rates on export grain from points in Illinois to New Orleans, La., were reduced 3 cents per 100 lb. by the Illinois Central on August 11.

New facilities that will permit the icing of two 55-car trains at one time have just been placed in operation at Sparks, Nev., by the Pacific Fruit Express Company. Similar improvements have been made recently at Carlin, Nev., and Ogden, Utah.

The Mississippi section of the government barge line has carried or booked for delivery on downstream barges, this month, 50,000 tons of freight, more than three times the tonnage handled in July, 1920. Over half of the total is grain, which is principally wheat.

The Interstate Commerce Commission has authorized the roads carrying lake coal to extend the 28 cent reduction in the rates on coal transhipped from lower to upper lake ports to apply to Chicago and certain other points not covered in the original tariff.

The Baltimore & Ohio has restored the stop-over privileges on through tickets which were discontinued when the government took control of the railroads in 1919. The list of 31 points at which the stop-over is allowed (ten days) includes the principal cities and summer resorts on the company's lines.

The Chicago, Rock Island & Pacific, the Missouri Pacific, the St. Louis-San Francisco and the Kansas City Southern have agreed to give American Legionnaires attending the third annual convention at Kansas City, Mo., from October 31 to November 2, a special rate of 1 cent a mile.

Representatives of the utilities commissions of 14 states west of the Mississippi river met in Chicago on July 20, to perfect a petition to the Interstate Commerce Commission to reduce rates on hay, grain and grain products 35 per cent, or to the basis in effect prior to August 26, 1920. The commission has set August 15 as the date for hearing arguments for rate readjustments and this case will come up at that time.

### Farm Bureau Asks Lower Freight Rates

The American Farm Bureau Federation has prepared a memorial to be sent to the President, members of Congress and the Interstate Commerce Commission asking for a reduction of freight rates on the "basic necessities of life." The memorial criticizes Section 15-a of the Transportation act as the cause for the high rates and urges its repeal, apparently on the theory that such a step would in some way affect the rate situation.

### Georgia Peaches and Melons

Shipments of peaches and watermelons from Georgia this season have surpassed all previous records, disproving the predictions that the crops would rot in the fields because of high freight rates. The Fruit Growers' Express reports that up to July 23, 10,264 cars of peaches had been shipped from Georgia. The total movement for 1920, according to the United States Department of Agriculture, was 5,663 cars. Up to July 17, 10,110 cars of watermelons had been shipped from Georgia, as compared with 5,258 for the same period last year, and 11,103 for the total 1920 movement. Prices received for both peaches and watermelons have yielded the growers good returns.

Favorable weather conditions, improved transportation and icing facilities, and better marketing methods have all contributed to the satisfactory results obtained. The yields of both peaches and watermelons went far ahead of the railways' estimates, but there was an ample supply of refrigerator cars for the peaches and of ventilators for the watermelons. The Atlantic Coal and Ice Corporation was called on to furnish 100,000 tons of ice for the peaches.

The Georgia peach growers, for years, and now the watermelon growers, have co-operative marketing associations which have had a great part in securing the good prices which have been received.

## Commission and Court News

### Interstate Commerce Commission

The Interstate Commerce Commission, on petition of the Illinois railroads, has ordered an investigation to determine whether the intrastate rates on railroad cross ties in Illinois are discriminatory against interstate commerce.

The commission has issued a decision holding that proposed class rates between points in Kansas and points in Oklahoma; between points in Kansas and Oklahoma and points in Texas; between points in Texas, on the one hand and points in Arkansas and in Louisiana, and Memphis, Vicksburg and Natchez, on the other; and between points in Oklahoma on interstate traffic, filed by the railroads in extension of the Memphis-Southwestern scale, are not justified. The tariffs under suspension were ordered cancelled without prejudice to the filing of tariffs in conformity with the findings of the report.

The Interstate Commerce Commission has rendered a decision on a complaint filed by the Railroad Commissioners of Florida, attacking the line-haul rates and refrigeration charges on citrus fruits and vegetables from Florida producing points to various interstate destinations, in which it is held that the aggregate charges are not unreasonable, except (1) that the line-haul charges on vegetables, except celery, under refrigeration, are unreasonable in that they do not provide in those instances where a lower minimum and higher rate apply than under ventilation for the alternative application of the same rate and minimum as under ventilation, and (2) that the refrigeration charges on fruits and vegetables are unreasonable in that they are based on an excessive quantity of ice. Carriers are directed to revise their tariffs in accordance with the conclusions of the Commission. The rates considered were those in effect prior to the general advance last year.

The Interstate Commerce Commission has rendered its decision on the complaints filed by the National Wholesale Grocers' Association and the Southern Wholesale Grocers' Association in which it finds that the practice of the railroads in permitting the meat packers to load certain articles of groceries in their peddler and branch-house cars is not shown to result in undue prejudice to complainants or unduly to prefer the packers. The various peddler car rates and rules are not shown to be unreasonable or unduly prejudicial, except that the mileage scale of rates applicable on packing house products in peddler cars in southwestern territory are found to be unduly prejudicial to complainants and unduly preferential of the meat packers insofar as it applies on lard substitutes, cottonseed cooking oil, peanut cooking oil, corn cooking oil, soya-bean cooking oil, canned meats, canned soups, chicken tamale, chili con carne, spaghetti-meat chili, and canned meats with vegetable ingredients. Various rules applicable on mixed carloads of fresh meats and packing-house products are found unjust, unreasonable and unduly prejudicial, and reasonable, and uniform mixing rules are prescribed for the future.

### Mail Pay Petition Denied

The commission has denied a petition of the railroads for an interpretation of Section 9 of the mail pay order so as to make application of separate compensation for side, terminal and transfer service retroactively to the period November 1, 1916, to March 1, 1920, and for a ruling making application of the minimum annual payment provided in the proviso to Paragraph 2 of Section 3 of the order to the routes as shown in the statement and comprehensive plan of the postmaster general submitted to the commission.

The commission orders, however, that the 25 per cent increase in rates from January 1, 1918, specified in Section 3 of the order be made applicable to the minimum payment of \$50 per mile per annum named in the proviso to Section 3 of the order.

## State Commissions

### The Louisiana Public Service Commission

By the adoption of a new constitution the state of Louisiana has abolished the state railroad commission; and the commissioners, Shelby Taylor, John T. Michel and H. P. Long now constitute the Public Service Commission; and they have authority over all common carriers, street railroads, public utilities, boats and canals, except irrigation canals.

The new commission has issued an order continuing in effect all of the rates and regulations of the former commission until further orders. Street railroads and other concerns now being brought under commission regulation for the first time are ordered to publish tariffs and file copies by July 31. The same order gives in brief form the requirements of the law in relation to rates, undue discrimination, etc. The provision allowing free transportation of property for state or municipal governments indicates that this applies only where the said government is "the direct beneficiary" of the reduced rate. No authority for reductions in transportation rates will be granted on account of merely potential water competition.

## Personnel of Commissions

Frederick I. Cox, of New Jersey, was on July 22 nominated by the President as a member of the Interstate Commerce Commission in place of Edgar E. Clark, whose resignation takes effect on August 31. Mr. Cox is a silk salesman, for many years connected with Belding Brothers and Company, manufacturers, of New York City, and his appointment is made on the recommendation of the National Council of Traveling Men's Association, endorsed by Senator Frelinghuysen, of New Jersey. This association conducted a campaign in behalf of Mr. Cox last April, when the President made the appointments called for under the law enlarging the Commission. Mr. Cox was born on May 25, 1870, at Rockaway, N. J., and now resides at East Orange, N. J. He has been in mercantile pursuits throughout his business life. His appointment is for a term expiring on December 31, 1926.

F. I. Cox

## Court News

### Court Approves Reduction of Wages Below

#### Scale Fixed by Labor Board

The federal district court for the Eastern District of Arkansas holds that, in view of the Fifth Amendment to the federal Constitution, a receiver of a railroad, operated before and after his appointment at a continuous loss, the gross earnings being insufficient to pay operating expenses, and where money can no longer be borrowed on the receiver's certificates, may be authorized to reduce the wages of the employees below the scale fixed by the United States Railroad Labor Board in its decision No. 2, which became effective May 1, 1920, without being subject to punishment under section 312 of the Transportation Act. The court holds that to require the railroads to continue in business at a loss is beyond the power of Congress or a state, citing *Brooks-Scanlon Co. v. Railroad Commission of Louisiana*, 251 U. S. 396, 40 Sup. Ct. 183, 64 L. Ed. 323, reaffirmed in *Bullock v. State of Florida*, 254 U. S.—*St. Louis Union Trust Co. v. Missouri & N. A.*, 270 Fed. 796.

## Foreign Railway News

### New Line to Connect French and Italian Railways

The French parliament has just voted \$12,400,000, according to the Times (London) Engineering Supplement, to unite the railways of France and Italy by a line from Nice to Cuneo. The Italian part of the line has been in operation for a number of years but of the 36 miles of line in France little has been done but the construction of two important tunnels, one 3¾ miles in length and the other 2½ miles. It is not expected that the line will be completed until some time in 1925.

### Tientsin-Pukow Railway Developments

The increase in traffic at the Pukow terminal of the Tientsin-Pukow Railway necessitates the addition of further floating wharves (on the Yangtze river across from Nanking) and the repair of those put in use 10 years ago. About \$50,114 will be spent for the entire work, according to Consul John K. Davis. A new power plant is to be erected at Pukow, to be completed in two years. It will supply the city and port with light and power for the Puchen shops, the current to be transmitted to Puchen at 6,600 volts. The maximum power of the plant is stated at 3,000 kilowatts. The cost is estimated to be \$237,384.

### Belgian Operating and Construction

#### Company Changes Name

The General Light Railway Company of Belgium (Compagnie Générale de Chemins de Fer Secondaires) has announced that henceforth it will be known as the Belgian Railway and Enterprise Company (Compagnie Belge de Chemins de Fer et d'Enterprises). The reason given for the change is that the company in departing more and more from the construction of narrow gage lines and tramways and is devoting itself to standard gage lines and to various construction projects. The old name it was felt was misleading and prejudicial to the best interests of the company.

### Spectacular Train Robbery in France

A night express train from Paris bound for Marseilles was, according to a Paris dispatch to the New York *Herald*, held up by bandits on the night of June 24 and the passengers robbed of money and goods valued at approximately \$20,000. The robbers, all heavily armed, who boarded the train at a regular stop, began relieving the passengers of their valuables while the train was in motion in the neighborhood of Dijon. When they had finished their work they pulled the bell cord and when the train slowed down left the train for a waiting automobile and made their escape. One passenger was killed and another wounded when they made a show of resistance.

### Contract for Chilean Electrification

A newspaper report dated July 20 stated that the directors of the Chilean State Railways had decided to accept the bid of the Westinghouse Electric & Manufacturing Company for the electrification of a section of the state railways.

A later report, issued by the Wall Street Journal, states that the contract which was awarded to the Westinghouse Electric & Manufacturing Company is contingent upon certain financial reservations which have not yet been accepted by that company. The report further states it is understood that the Chilean government has not yet found a means of financing the project, and the inference is that it is a condition of the contract that the company shall assist the government in arranging the financing, or shall accept bonds in payment and thereby be obliged to find a syndicate here or elsewhere to buy those bonds.

The contract involves the electrification of the line between Santiago and Valparaíso and the connection with the Trans-Andine line, from the junction with the Santiago-Valparaíso line, to Los Andes. The work will involve 200 route miles and the contract will amount to between \$10,000,000 and \$12,000,000.

## Equipment and Supplies

### Car Orders and Deliveries in June

In presenting in these columns the figures of deliveries of freight cars for domestic service in May, attention was called to the fact that deliveries were "returning to the low level which characterized the first half of 1920." The deliveries in June declined to 2,245—a figure lower than that of any month in 1920 excepting April (when the total was 2,127) and lower than that of any previous month in the current year.

The deliveries of freight cars for foreign service totaled 413, lower than any such total for any month of 1920 or thus far in 1921. Passenger car deliveries for domestic service, on the other hand, increased to 159 for June over the May figure of 138. Indeed the June total is greater than that of any month in 1920 or thus far in 1921.

Freight cars on order and undelivered at the end of June totaled 12,149 for domestic and 3,711 for foreign service—comparing with similar figures of 13,890 and 3,559 for May. Domestic freight cars repaired during June totaled 2,939 as against 3,250 in May. The cars for repair on order and undelivered, however, rose from 12,308 at the end of May to 13,752 at the end of June.

The summary for June, as prepared by the Railway Car Manufacturers Association from the reports of 26 car building companies, follows:

New Cars Delivered			
	Domestic	Foreign	
Freight .....	2,245	413	
Passenger .....	159	4	
On Order and Undelivered			
Freight .....	12,149	3,711	Total 15,860
Passenger .....	291	52	343
Car Repairs			
Delivered—June .....			2,939
On order and undelivered June 30.....			13,752

### Locomotives

THE NEW YORK CENTRAL and subsidiary lines will receive bids on August 2, for the general repairs of 50 locomotives.

### Freight Cars

THE KATANGA RAILWAY (Africa) has placed orders with Belgium car builders for 60 gondola cars.

THE LEHIGH & NEW ENGLAND is having repairs made to 300 box cars at the shops of the Middletown Car Company, Middletown, Pa.

THE RUSSIAN SOVIET GOVERNMENT, according to a dispatch from Montreal, Que., July 19, has given the Canadian Car & Foundry Company, Ltd., a \$2,000,000 order for 500, 50-ton tank cars.

THE DELAWARE, LACKAWANNA & WESTERN has given contracts for the repair of box cars to the Magor Car Company 500, and the Buffalo Steel Car Company 500, and the American Car & Foundry Company 500.

BUFFALO, ROCHESTER & PITTSBURGH reported in the *Railway Age* of July 23, as asking for prices on the repair of from 500 to 1,000 freight cars, will make repairs to a total of 2,000 30-ton wooden box cars. The company has given a contract to the Buffalo Steel Car Company for repairs to 500, 50-ton hopper cars.

THE NEW YORK CENTRAL, reported in the *Railway Age* of July 1, as asking for prices on the repair of 1,000 steel hopper, or gondola cars of 50 tons capacity has given contracts for the repair of freight cars as follows: For the New York Central, 500 box cars to the Ryan Car Company; 500 box cars to Streator Car Company; 500 box cars to Standard Steel Car Company; 500 hopper cars to American Car & Foundry Company, and 500 hopper cars to Buffalo Steel Car Company. For the Pittsburgh & Lake Erie, 500 box cars to Pressed Steel Car Company and 1,000 hopper cars to Standard Steel Car Company. For

the Cleveland, Cincinnati, Chicago & St. Louis, 500 general service cars and 500 hopper cars to American Car & Foundry Company. For the Michigan Central, 500 box cars to the Illinois Car & Manufacturing Company, and for the Lake Erie & Western, 500 box cars to Haskell & Barker Car Company.

### Iron and Steel

THE MISSOURI PACIFIC is inquiring for two 100-ft. deck turntables weighing 175 tons each.

THE MISSOURI PACIFIC has placed an order with the Lincoln Steel & Forge Company, St. Louis, Mo., for 500 steel underframes.

THE MISSISSIPPI CENTRAL is in the market for two 100 ft. second-hand steel bridge spans, designed for Cooper E-40 loading.

THE U. S. GOVERNMENT RIVER TERMINAL at St. Louis, Mo., has let 150 tons of structural material to the St. Louis Structural Steel Company.

MITSUI & COMPANY, New York, has ordered from the United States Steel Products Company, 700 tons of 80-lb. rail and accessories for use on the South Manchuria Railway.

THE CHICAGO & NORTH WESTERN has ordered 1,225 tons of steel from the Morava Construction Company, for use in the reconstruction of the elevator at Irondale, Ill., recently injured in an explosion.

### Machinery and Tools

THE CENTRAL OF GEORGIA has ordered a driving wheel lathe and some smaller lathes from the Niles-Bement-Pond Company. The company has also placed an order for car wheel lathes and boring mills.

THE CHICAGO, BURLINGTON & QUINCY will receive bids until 12 o'clock noon, August 5, for machinery for the electrical operation, including the end lift reduction gearing, for the Burlington, Ia., drawbridge.

### Miscellaneous

THE CENTRAL OF NEW JERSEY will receive bids until 12 o'clock noon, August 2, for the work of repairing, rebuilding, etc., of its marine equipment, for the period of one year from August 2, 1921, to August 2, 1922.

THE CHICAGO, BURLINGTON & QUINCY will receive bids until 12 o'clock noon, August 5, for 400,000 standard, double punched steel tie plates. The company received bids July 29, for 800 spools of galvanized barbed wire fencing, 350 kegs 7-D, 100 kegs 8-D, 49 kegs 16-D, and 85 kegs 20-D cement-coated heavy barbed car nails.

THE NORFOLK & WESTERN will receive bids until 12 o'clock noon, August 10, at Roanoke, Va., for: Parts for electrical apparatus; repairs to electrical apparatus; 75 billets of welding steel; 12,000 lb. spring steel; 110,000 lb. soft steel bars; 80,000 lb. steel shapes and for its requirements of locomotive driving wheel and truck tires for the months of July to September, 1921, both inclusive.

### Signaling

THE CHICAGO, BURLINGTON & QUINCY will receive bids until 12 o'clock noon, August 1, at Chicago, Ill., for two 3-track signal bridges.

### Trade Publications

STEAM JET ASH CONVEYORS.—The Conveyors Corporation of America, Chicago, has recently issued a booklet entitled "The Proof of the Pudding," which contains reproductions of 70 letters regarding the service obtained with American steam ash conveyors. The list of users who commend this device includes several prominent railroads.

## Supply Trade News

M. J. O'Connor has been appointed general sales manager of the Gary Industrial Paint Company, with headquarters at 20 East Jackson Boulevard, Chicago.

The Oxweld Acetylene Company, Newark, N. J., has removed the offices of its foreign sales department from Newark to 30 East Forty-second street, New York City.

The Webster & Perks Tool Company, Springfield, Ohio, has sold the grinding and polishing stand and accessory department, of its business, to the Hill-Curtis Co., Kalamazoo, Mich.

The Schaffer Engineering & Equipment Company announces the combining of its administrative, sales and manufacturing departments in its new general offices at 2828 Smallman street, Pittsburgh, Pa.

The Sullivan Machinery Company has moved its Cleveland, Ohio, offices from the Park building to Room 824, Kirby building. The company has also established a new supply depot and service station at Seventh avenue and Thirteenth street, Terre Haute, Ind.

The Allied Machinery Company of America, 51 Chambers street, New York City, with offices in all the large countries of the world has been appointed foreign representative in all countries except the United States and Canada for the Universal Crane Company, Cleveland, O.

A. M. Castle & Co., Chicago, has started work on the construction of a new steel warehouse at Blackhawk and North Branch streets, Chicago. The building will be 211 ft. by 232 ft. of fireproof construction. The west end of the building for 75 feet is to be two stories in height and the second floor will provide office space 75 ft. by 211 ft. for the general offices of the company.

Charles S. Pflasterer has resigned as assistant manager, railroad sales department of the National Carbon Company, Inc., Cleveland, Ohio, to become railroad sales manager of the Twin Dry Cell Battery Company, with office at Cleveland. Mr. Pflasterer was born in Allegheny, Pa., in 1875. After spending two years in the steel mills at Braddock, Pa., he became connected with the Union Switch & Signal Company, Swissvale, Pa., in 1891 as a laborer. In 1893 he entered the employ of the Johnson Railroad Signal Company, Chicago, and from 1894 to 1901 was connected successively with various signal companies, the Chicago & Eastern Illinois, the Cleveland, Cincinnati, Chicago &

St. Louis, the Chicago Elevated Railways and the Chicago Great Western. In 1901, he was appointed interlocking foreman on the Union Pacific at Omaha, Neb. From 1901 to 1908, he was successively signal foreman, general signal foreman, superintendent of construction, general signal inspector and assistant signal engineer, and in 1909, was appointed assistant signal engineer of the Oregon Short Line, with headquarters at Ogden, Utah. In 1911, he became connected with the National Carbon Company, Inc., in charge of the caustic soda primary battery department. In October, 1919,

he was appointed eastern manager of the railroad sales department at Cleveland and now resigns as assistant manager of the railroad sales department of the National Carbon Company, Inc., to become railroad sales manager of the Twin Dry Cell Battery Company, as above noted.

A slack adjuster constructed along new lines applicable to both freight and passenger cars has recently been developed by a Swedish inventor, A. R. Djurson. The Djurson adjuster, which is built for the European market by Actiebolaget Bromsregulator, Stockholm, Sweden, has found extended use on the continent. It is now being introduced in this country and will be handled by the firm of Hamilton & Hansell, Inc., Park Row building, New York.

Sidney G. Johnson, formerly vice-president and director of the General Railway Signal Company, has been made assistant to president of the Chicago Railway Signal & Supply Company, Chicago.

S. G. Johnson

Mr. Johnson's headquarters are at 30 Church Street, New York City, and he will continue also as sales representative of the Signal Accessories Corporation, Utica, N. Y., and for the Hazard Manufacturing Company, Wilkesbarre, Pa. Mr. Johnson was born in 1874, in Eccles, Lancashire, England. At the age of 12 he came to America and went to Swissvale, where his father, Henry Johnson, was works manager of the Union Switch & Signal Company. About a year later he went to Rahway, N. J., where

the Johnson Railroad Signal Company had been established, and during vacations he worked in the shops and drawing office. He attended a preparatory school and for two years after leaving school he worked in the construction gang of the Johnson Railroad Signal Company. He later served with the construction forces of the Union Switch & Signal Company for a year. In 1896, when the Standard Railway Signal Company was organized, with his father as president, he was made signal engineer and had charge of the locking and dog sheets, making estimates, etc. When the company went to Troy he went with it; but, after the Trojan Car Coupler Company's interests took hold, his father left the Standard and he followed him after a few months and went with the Union Switch & Signal Company in 1899, in the New York office. Shortly afterward he was appointed engineer of construction for the eastern district and later was for two years at Swissvale as signal engineer in charge of the estimating department. He then went to New York and had charge of installing the signal system on the Interborough and of other large installations put in at that time. When the Interborough work was finished he was made eastern manager, in charge of sales and construction. About 1910 he was appointed general sales manager, and in March, 1914, became vice-president in charge of sales and engineering. The following July he left the service of the Union Switch & Signal Company to go to the General Railway Signal Company as assistant to the president, and in August, 1914, became a vice-president and director of the latter company, from which position he resigned in July, 1920.

E. W. Crellin, president of the Pittsburgh-Des Moines Steel Company, Pittsburgh, Pa., has retired, effective July 15, and W. H. Jackson, secretary and treasurer, has been elected to succeed him at the same time; P. E. Guibert and W. W. Hendrix have been elected vice-presidents, and George A. Smith, secretary and treasurer. A. C. Pearsall has been appointed general manager of the Des Moines, Ia., branch, succeeding Mr. Smith, who has gone to Pittsburgh, Pa.

C. S. Pflasterer

## Railway Construction

**AMERICAN RAILWAY EXPRESS.**—This company has awarded a contract to the St. John Company, Miami, Fla., for the erection of a concrete block express office at Miami, Fla., to cost approximately \$15,000. The building will be 50 ft. by 150 ft. and one story in height.

**AHUKINI TERMINAL & RAILWAY COMPANY.**—The Interstate Commerce Commission has issued a certificate authorizing this company to construct a line in the district of Puna, Island of Kauai, Territory of Hawaii, extending from a point near Anahola Bay to Ahukini Landing on Hanamaulu Bay, approximately 16 miles.

**ATCHISON, TOPEKA & SANTA FE.**—This company is receiving bids for the construction of an addition to its power plant at Albuquerque, N. M., to cost about \$150,000.

**CHICAGO, BURLINGTON & QUINCY.**—This company has awarded a contract to B. J. Martin, Billings, Mont., for the construction of an addition to its power plant at Sheridan, Wyo.

**CHICAGO & NORTH WESTERN.**—This company contemplates the construction of a new icing plant at Clinton, Ia., to cost about \$50,000.

**CHICAGO UNION STATION.**—This company, which was noted in the *Railway Age* of July 2 (page 42), as accepting bids for grading the new station site between Madison and Adams streets, has awarded the contract for this work to W. J. Newman & Company, Chicago.

**CHICAGO UNION STATION.**—This company will shortly accept bids for the construction of the substructure of the Madison street viaduct, Chicago. The company will also shortly accept bids for widening the second link of Canal street, between Jackson and Van Buren streets.

**ILLINOIS CENTRAL.**—This company has awarded the contract for a new brick passenger station at Speedway, Ill., with dimensions of 22 ft. by 60 ft., to Ellington-Miller, Chicago.

**ILLINOIS CENTRAL.**—This company has awarded a contract to Joseph E. Nelson & Sons, Chicago, for the construction of a switchmen's office and general yard office at Clinton, Ill., to cost about \$25,000.

**MISSOURI PACIFIC.**—This company has awarded a contract to Joseph E. Nelson & Sons, Chicago, for improvements to the terminal facilities at Hoisington, Kan., including the installation of a new 100 ft. turntable and an extension to its yards.

**SEABOARD AIR LINE.**—This company has awarded a contract to the Elliott Building Company, Hickory, N. C., for the erection of a brick station with necessary sheds, platforms, etc., at Chester, S. C.

**ST. LOUIS-SAN FRANCISCO.**—This company contemplates the construction of a new freight and passenger station at Fayetteville, Ark., to cost about \$70,000.

### A Paid Technical Course Offered To High School Graduates

**TECHNICAL TRAINING**, six hours a week, is offered by the Western Electric Company, in a special free course, to a limited number of its employees who are this year's high school graduates. These young men will be developed for positions of responsibility in the laboratories and drafting divisions of the company's engineering department. The new course is divided into three units, each requiring a year for completion. It covers the fundamental principles of physics and mathematics and their use in the field of telephony. The instruction will be given on company time within the regular hours of employment, but the students will be required to do considerable study and preparation at home. The salaries of the young men will be readjusted twice a year and will be based upon their records in the classroom and their proficiency in their duties. The only expense will be that for the purchase of standard textbooks.

## Railway Financial News

**AMERICUS & ATLANTIC.**—*Asks Authority to Issue Securities.*—This company has applied to the Interstate Commerce Commission for authority to issue \$150,000 of capital stock and \$120,000 or 50-year 6 per cent bonds. It is proposed to use \$115,750 of the proceeds of the stock to purchase a railroad, extending for 15 miles from Mata, Ga., which it is proposed later to extend to Americus, Ga.

**BOSTON & MAINE.**—*Authorized to Abandon Branch Line.*—The Interstate Commerce Commission has issued certificates authorizing the abandonment of a branch line from Bethlehem Junction to Profile House, Grafton county, New Hampshire, about 9 miles, and another branch from Cherry Mountain to Jefferson, N. H., 3.5 miles. The certificate was asked on the ground that the competition of automobiles had reduced the traffic to practically nothing.

**CHESAPEAKE & OHIO.**—*Authorized to Issue Bonds.*—This company has been authorized by the Interstate Commerce Commission to nominally issue \$8,539,238 of first lien and improvement 20-year bonds in respect of expenditures made for refunding and construction and to pledge \$6,674,000 of the bonds as collateral for a loan from the United States.

**CHICAGO, ROCK ISLAND & PACIFIC.**—*Asks Authority to Pledge Bonds.*—Application has been filed with the Interstate Commerce Commission for authority to pledge \$8,364,000 of first and refunding mortgage gold bonds as security for short term loans.

**DELAWARE, LACKAWANNA & WESTERN.**—*Stock Increase and Segregation of Coal Properties Approved.*—The stockholders on July 21 approved the increase of \$45,000,000 in the company's capital stock, as was authorized by the Interstate Commerce Commission in its decision outlined in the *Railway Age*, issue of April 22, 1921, page 995. Approval was also given to the plan for segregating the coal properties by their sale to the Glen Alden Company, for \$60,000,000 of the latter's 4 per cent bonds and notes. See *Railway Age*, issue of May 20, 1921, page 1192.

The contract for the sale of the coal properties calls on the Glen Alden Company to establish a sinking fund of \$1,500,000 annually, beginning September 1, 1926, to be continued until the \$60,000,000 shall have been paid. It is provided further that should the Glen Alden Company mine more than 12,000,000 tons of coal in any year, the sinking fund must be increased to \$2,000,000.

The Glen Alden stock will be offered to the Lackawanna shareholders at \$5 per share, on a share for share basis. This privilege goes to stockholders on record June 15. Payment of the shares must be made on or before August 20.

The Delaware, Lackawanna & Western Coal Sales Company will not be disposed of, but will act as the sales agent for the Glen Alden, which will confine its work to mining.

**DENVER & RIO GRANDE.**—*Formal Transfer Authorized.*—The formal transfer of this road, sold at foreclosure November 20 to the Western Pacific, was authorized by Federal Judges Lewis and Sanborn on July 27 in an order approving and affirming the final report of William A. Jackson, special master. An appeal from the decision of Judge Lewis against the stockholders in their fraud suit is still pending, but Judge Lewis has announced that this will not interfere with the transfer.

F. C. Schramm, president of the Salt Lake Commercial Club, has sent a letter to Senator Reed Smoot of Utah, urging him to see the Interstate Commerce Commission in an effort to get an immediate decision on the Denver & Rio Grande situation. The letter states that the delay is having an adverse effect on business interests in Utah and other western states.

**EL PASO & SOUTHWESTERN.**—*Authorized to Issue Stock of No Par Value.*—This company has been authorized by the Interstate Commerce Commission to issue 750,000 shares of capital stock without par value in exchange for and in retirement of all its capital stock now outstanding, which consists of 250,000 shares of an aggregate par value of \$25,000,000. Commissioner Eastman dissented.

**GREAT NORTHERN.**—*Asks Loan from Revolving Fund.*—This company has applied to the Interstate Commerce Commission for a loan of \$15,000,000 for five years from the revolving fund with which to repay a loan for a like amount which matures on

September 1. The application explains that the company has made a final settlement with the director general of railroads and has received partial payments on account of its six months' guaranty, amounting to \$12,500,000. In making its settlement the director general set off \$16,997,642, due to the government for additions and betterments, against the amounts due the company for the period of federal control, and denied the request that the additions and betterments be funded, but the company has been assured that if the policy be changed as proposed and funds are put at the disposal of the director general, he will refund, in whole or part, the amount of the additions and betterments, which would enable the company to repay the loan from the revolving fund. The loan is asked for five years, but it is proposed that not exceeding \$10,000,000 of the amount shall become due and payable when funds are received from the director general. The company offers to deposit as collateral security for this loan, and \$2,910,000 of other loans, \$22,500,000 of general mortgage 7 per cent bonds.

**HUNTINGDON & BROAD TOP MOUNTAIN.**—*Authorized to Assume Liability.*—The Interstate Commerce Commission has authorized this company to assume liability in respect of \$300,000 of equipment trust 6 per cent certificates in connection with the procurement of four locomotives and 10 passenger cars.

**KENTWOOD, GREENSBURG & SOUTHWESTERN.**—*Authorized to Abandon Line.*—The Interstate Commerce Commission has issued a certificate authorizing this company to abandon its line, extending from Kent's Mill to Freiler, La., 13.21 miles.

**KINDER & NORTHWESTERN.**—*Authorized to Abandon Line.*—The Interstate Commerce Commission has issued a certificate authorizing the abandonment of a portion of its line from Kinder to Bullard, La., 16 miles.

**LEHIGH VALLEY.**—*Another Extension Granted.*—Judge Learned Hand in the United States District Court at New York has granted this company another extension of time for 30 days, or until August 23, to present a plan for segregating its properties.

**LITTLE ROCK, MAUMELLE & WESTERN.**—*Dismantled.*—The right-of-way, ties, rails and equipment of this company, which runs between Becker, Ark., and Cold Springs, 25 miles, and was originally planned to be extended to Hot Springs, will be sold and junked.

**LONG FORK.**—*Asks Authority to Issue Securities.*—This company has applied to the Interstate Commerce Commission for authority to issue \$485,000 of capital stock and \$1,347,500 first mortgage 6 per cent bonds to be disposed of to the Baltimore & Ohio in settlement of advances.

**LOUISVILLE & NASHVILLE.**—*To Increase Capital Stock.*—The stockholders at a special meeting in Louisville, Ky., on July 23, authorized an increase of \$53,000,000 in the company's capital stock and authorized the board to apply to the Interstate Commerce Commission for permission to distribute proceeds of the new issue as a stock dividend. See *Railway Age*, issue of June 24, 1921, page 1472.

Steps also were taken to execute a blanket mortgage upon the company's property as security for first mortgage and refunding gold bonds to fund as much as may be deemed necessary of the debt of the road, which on December 31 last was \$166,300,825.

**MISSOURI & NORTH ARKANSAS.**—*New Receiver.—Road to Discontinue Operation.*—J. C. Murray, who has been appointed receiver and general manager to succeed C. A. Phelan, resigned, has announced that passenger service will be stopped July 31. Mr. Murray says that interference by strikers is the main cause. The citizens of Eureka Springs, Ark., are organizing a company to lease the track and equipment of the Missouri & North Arkansas and have applied to the court for permission to operate the line.

The Missouri & North Arkansas operates between Joplin, Mo., and Helena, Ark., 368 miles. The road has stocks and bonds outstanding of \$16,680,000, all of which are pledged under \$6,000,000 notes of the Allegheny Improvement Company. There are also approximately \$2,000,000 receivers' certificates outstanding.

See also article on another page of this issue entitled "Missouri & North Arkansas Discontinues Operation."

**MISSOURI PACIFIC.**—*Authorized to Issue Bonds.*—This company has been authorized by the Interstate Commerce Commission to

issue from time to time \$5,501,500 of first and refunding mortgage bonds to be sold at not less than 90 or pledged as collateral for short term notes.

**READING COMPANY.**—*Supersedes Bond Filed.*—The \$750,000 supersedeas bond of the Continental Insurance Company and the Fidelity-Phoenix Fire Insurance Company of New York, required for an appeal to the United States Supreme Court from the decision of the United States District Court in the Reading segregation plan, that common and preferred stockholders shall share equally in the distribution of the stock of the new company, was filed in the District Court at Philadelphia on July 21. The bond was required to protect the preferred stockholders and others from any financial loss through the appeal.

**ST. LOUIS-SAN FRANCISCO.**—*Annual Report.*—A review of this company's annual report for 1920 appears on another page of this issue.

**ST. LOUIS SOUTHWESTERN.**—*Annual Report.*—The corporate income account for the year ended December 31, 1920, compares with the previous year, as follows:

	1920	1919
Tentative standard return* (January 1 to February 29, 1920; full year 1919)	\$651,819	\$3,910,914
Ten months, March 1 to December 31*		
Railway operating revenues	25,994,911	
Railway operating expenses	20,974,095	
Net revenue from railway operations	5,020,816	
Railway tax accruals	1,041,355	
Railway operating income	3,979,467	
Total non-operating income	1,534,298	659,740
Gross income	6,105,478	4,570,653
Interest on funded debt	2,236,888	2,259,490
Total deductions from gross income	3,145,642	3,223,744
Net income	2,959,837	1,345,909
Income appropriated for investment in physical property	2,959,837	
Income balance transferred to profit and loss		1,345,909

\*The St. Louis Southwestern did not accept the U. S. Government guaranty.

The annual report of the St. Louis Southwestern will be reviewed editorially in an early issue.

**SOUTHERN.**—*Question of Eligibility to Guaranty to Be Considered.*—The Interstate Commerce Commission has announced a hearing at Washington on August 3 before Director Colston of the Bureau of Finance on a question as to the construction of section 209 of the Transportation act, providing for the six months guaranty, in its application to carriers under common control and management, and particularly regarding the right of subsidiary or controlled companies of the Southern Railway to claim benefits under the guaranty section. The Southern did not file with the commission a written statement accepting the provisions of the guaranty section but its various subsidiaries did. The commission's notice says that evidence may be presented bearing upon the corporate, financial and operating relationships between the Southern and the various subsidiaries.

### Guaranty Certificates Issued

The Interstate Commerce Commission has issued certificates for partial payments on account of the six months' guaranty to the following roads: Terminal Railroad Association of St. Louis, \$30,000; Arizona & New Mexico, \$150,000.

### Railroad Administration Settlements

The United States Railroad Administration reports the following final settlements, and has paid out to the several roads the following amounts: Missouri Pacific, \$9,000,000; Alton & Southern, \$385,000; Trans-Mississippi Terminal, \$55,000; Chattanooga Station Company, \$19,623.81; Gulf Terminal, \$9,426.33. The payment of these claims on final settlement is largely made up of balance of compensation due, but includes all other disputed items as between the railroad companies and the Administration during the 26 months of federal control.

### Dividends Declared

Delaware & Hudson.—2½ per cent, quarterly, payable September 2 to holders of record August 27.  
 Pennsylvania.—\$0.50, quarterly, payable August 31 to holders of record August 1.  
 Pullman Company.—\$2, quarterly, payable August 15 to holders of record July 30.

# Annual Report

## Report of St. Louis-San Francisco Railway Company

### TO THE STOCKHOLDERS:

Your Directors submit report for the year ended December 31, 1920. During the two months ended February 29, 1920, the property of the Company was within the control of and operated by the United States Railroad Administration. At midnight, February 29, 1920, corporate operation of the property was resumed and in due season the Company accepted the guaranty provisions of Section 209 of the Transportation Act.

The primary basis of the guaranty provided by the Transportation Act is one-half of the average annual railway operating income (Standard Return) of the Company's lines (including affiliated companies) for the three years ended June 30, 1917, as finally certified by the Interstate Commerce Commission or compensation to be paid the Company for the use of its property during Federal Control.

In your Directors' report for the year ended December 31, 1919, you were advised of the amount of such compensation which at that time had been tentatively certified by the Commission and that final certification was being deferred pending the decision of certain questions of accounting. These questions have since been decided with the result that the Commission has finally certified as due the Company and its affiliated companies, annual compensation in the amount of \$13,632,917.19, in lieu of the amount of \$13,423,409.27, allowed in its tentative certificates, an increase of \$209,516.92 in the annual basis of compensation for both the Federal Control and Guaranty periods.

The Company's gross income for the year ended December 31, 1920, as set forth in the statement of Income Account submitted herewith, includes, for the months of January and February, 1920, a proper proportion of the annual Standard Return as finally certified by the Interstate Commerce Commission; a six-months' proportion of similar annual Standard Return guaranteed under the Transportation Act for the six months ended January 31, 1920; the difference covering the period from January 1, 1918, to December 31, 1919, between the tentatively certified Standard Return previously taken into account and the Standard Return as finally certified; increased compensation on account of equipment acquired and addition and betterments made to the Company's properties during Federal Control and the Guaranty period; and the net operating income from corporate operation of the properties for the four months ended December 31, 1920.

No settlement has as yet been made with the Director General of Railroads for maintenance of the property during Federal Control, nor for any other matters growing out of the operation of the property by the United States Railroad Administration. Settlement has not yet been effected with the Interstate Commerce Commission under the terms of the guaranty provisions of the Transportation Act. On January 13, 1921, an advance of \$1,000,000 was received from the United States Railroad Administration, and on March 24, 1921, an advance of \$1,353,000 was received on account of the guaranty period on certificates issued by the Interstate Commerce Commission. The President is actively engaged in negotiating a final settlement and cash reimbursement from the United States Government on account of the claims filed by the Company, including its affiliated and subsidiary companies for both the Federal Control and Guaranty periods. Negotiations to that end are proceeding currently.

### SECURITIES ISSUED, SOLD OR PLEDGED

During the year, the Company issued to the Director General, as stated in its last annual report, \$14,029,500, principal amount, equipment notes, dated January 15, 1920, bearing interest at the rate of six per cent per annum, payable semi-annually, and maturing serially from January 15, 1921, to January 15, 1935, inclusive. These notes were issued at par in payment

of the cost, as tentatively certified at the time of such issue, of the following equipment purchased from the United States Railroad Administration:

33 Light Mikado locomotives,  
7 Light Switcher locomotives,  
3500 Double Sheathed 40 ton box cars,  
1000 Composite 50 ton gondola cars.

No stocks, bonds or other securities of the Company or of any controlled or subsidiary company of the system have, during the period covered by the report, been sold or pledged by the Company or by any of its respective controlled or subsidiary companies.

### EQUIPMENT

In addition to the purchase of equipment set forth in the last Annual Report, the Company has also purchased from the War Department ten (10) additional decapod type locomotives (originally built for the Russian Government) at a total cost of \$250,000—\$25,000 payable in cash and the balance in nine annual installments of \$25,000 each, beginning November 1, 1921; the deferred payments to bear interest at the rate of six per cent per annum.

### DOUBLE TRACK

During the year the Company has had under construction a considerable amount of additional main track in order to provide stretches of double track for more economical operation in heavy traffic territory, having completed and placed in service during the period covered by this report 6.67 miles, and had under construction 24.2 miles additional, of which 16.5 miles were completed and placed in service during the early part of 1921 and the remaining 7.7 miles it is expected will be completed and placed in service shortly. When all of the new construction has been placed in service the Company will have 89.72 miles of double track in main line service.

At the time of Reorganization, and the preparation of the Adjustment Mortgage, and the Income Mortgage of the Company, the fiscal year for the making of the Annual reports to the Interstate Commerce Commission ended June 30. The same fiscal year was adopted in both the Adjustment Mortgage and the Income Mortgage.

This has since been changed by the Interstate Commerce Commission so that the period for making the Annual Reports is now the calendar year instead of the year ending June 30, and as a consequence the Annual Report filed with the Commission does not show income for the fiscal year ending June 30.

### INCOME ACCOUNT FOR YEAR ENDED JUNE 30, 1920

The following statement shows the corporate income for the fiscal year ended June 30, 1920, as certified by Messrs. Deloitte, Plender, Griffiths & Company, Certified Public Accountants.

Eight Months' proportion of Tentative Annual Standard Return, as certified by the Interstate Commerce Commission .....	\$8,993,143.16	
Increased Compensation on account of allocated Equipment, January 15 to March 1, 1920....	109,391.60	\$9,102,534.76
Four months' proportion of Guaranty under Transportation Act 1920, based on Tentative Standard Return .....	\$4,471,836.77	
Increased Compensation on account of Equipment allocated and purchased and Additions and Betterments (net) completed at March 1, 1920 .....	367,188.50	4,839,025.27
		<b>\$13,941,560.03</b>

### STATEMENT OF INCOME ACCOUNT

	SIX MONTHS ENDED JUNE 30, 1920	SIX MONTHS ENDED DEC. 30, 1920	TWELVE MONTHS ENDED DECEMBER 31, 1920
Two months (Jan. 1st—Feb. 29th), proportion of Annual Standard Return as finally certified by the Interstate Commerce Commission .....	\$2,235,918.44	\$34,919.45	\$2,270,837.89
Six months (March 1st—Aug. 31st), Guaranty under the Transportation Act, 1920, based on Standard Return as finally certified by the Interstate Commerce Commission .....	4,471,836.77	2,340,676.90	6,812,513.67
Increased Compensation on account of equipment allocated and purchased and additions and betterments (Net) completed at March 1st, 1920, and during Guaranty Period .....	476,586.10	229,104.61	705,684.71
Difference between Tentative Standard Return taken into account and Standard Return as finally certified January 1st, 1918—December 31st, 1919 .....		419,033.84	419,033.84
Net Operating Income September 1st—December 31st, 1920. (Less corporate expenses for months of January and February, 1920, Column 1.) For detail see page 15 .....	51,719.14	5,588,236.57	5,536,517.43
Other Income:	\$7,132,616.17	\$8,611,971.37	\$15,744,587.54
Rentals .....	558,371.75	\$183,463.91	\$241,835.66

## Railway Officers

### Executive

**Robert J. Marony**, assistant secretary and assistant treasurer of the Chicago, Milwaukee & St. Paul, with headquarters at New York, has been elected vice-president, succeeding G. G. Mason, who has resigned. Mr. Marony was born in 1881, at Philadelphia, Pa. He was educated at the public schools of New York City and the College of the City of New York, which institution he attended two years. In 1905 he entered the employ of the Chicago, Milwaukee & St. Paul, as a clerk in the company's financial offices at New York and subsequently served in various positions in the company's financial and executive offices in New York. In 1912, he was elected assistant secretary and assistant treasurer, in which position he was serving at the time of his recent election. Mr. Marony will continue to serve as assistant secretary and assistant treasurer in addition to his new duties.

R. J. Marony

### Financial, Legal and Accounting

**C. Leber** has been elected secretary of the Peoria & Pekin Union, succeeding R. H. Hardin, resigned, effective July 15. Mr. Leber has also been appointed auditor succeeding Mr. Hardin.

### Operating

**L. R. Taylor**, superintendent of telegraph and signals of the Virginian having resigned, effective July 1, the position has been abolished and employees formerly reporting to Mr. Taylor will henceforth report to the general manager.

**W. A. Gore**, superintendent of the New River division of the Virginian with headquarters at Princeton, W. Va., has been appointed general manager, with jurisdiction over the transportation and maintenance of way departments, with headquarters at Norfolk, Va., effective July 1. **J. W. White** succeeds Mr. Gore as superintendent at Princeton.

### General

#### Appointments on the Los Angeles & Salt Lake

Coincident with the purchase of the Los Angeles & Salt Lake by the Union Pacific the officers of the latter company will also serve the Los Angeles & Salt Lake as follows:

Name	Position	Headquarters
Robert S. Lovett.....	Chairman executive committee.....	New York.
Carl R. Gray.....	President.....	Omaha.
E. E. Adams.....	First vice-president.....	Omaha.
H. M. Adams.....	Second vice-president.....	Omaha.
Thomas Price.....	Secretary.....	New York.
E. M. Kindler.....	Assistant secretary.....	New York.
C. B. Matthai.....	Assistant secretary.....	Omaha.
E. G. Smith.....	Treasurer.....	New York.
T. C. Richards.....	Assistant treasurer.....	New York.
H. W. Clark.....	General counsel.....	New York.
F. W. Charke.....	Comptroller.....	New York.
H. S. Bradt.....	Assistant Comptroller.....	New York.
E. B. Bissonnet.....	General auditor.....	Omaha.
H. A. Scandrett.....	Valuation and commerce counsel.....	Omaha.

F. W. Robinson.....	Freight traffic manager.....	Omaha.
W. S. Bassinger.....	Passenger traffic manager.....	Omaha.
R. R. Mitchell.....	Assistant freight traffic manager.....	Omaha.
J. W. McLymmonds.....	General agent ref'r service.....	Omaha.
R. L. Huntley.....	Chief engineer.....	Omaha.
N. D. Ballantine.....	Superintendent of transportation.....	Omaha.
F. E. Lewis.....	Manager dining cars and hotels.....	Ogden.

The following officers of the Los Angeles & Salt Lake will serve in the positions indicated below:

Name	Former position	New position	Headquarters
C. P. Smith.....	Secretary.....	Asst. secretary.....	Los Angeles
W. H. Leete.....	Treasurer.....	Asst. treasurer.....	Los Angeles
W. H. Comstock.....	General manager.....	General manager.....	Los Angeles
A. S. Halstead.....	General counsel.....	General solicitor.....	Los Angeles
S. S. Edmonds.....	Gen'l traf. mgr.....	Traffic manager.....	Los Angeles
M. D. Brabant.....	Asst. gen'l traf. mgr.....	Asst. traffic mgr.....	Los Angeles
T. M. Scan.....	Gen'l frt. agt.....	Gen'l frt. agt.....	Los Angeles
T. C. Peck.....	Gen'l pass. agt.....	Gen'l pass. agt.....	Los Angeles
C. C. Barry.....	Auditor.....	Auditor.....	Los Angeles
A. Maguire.....	Chief engineer.....	Asst. chief engineer.....	Los Angeles
G. W. Thompson.....	Supt. dining cars and hotels.....	Supt. dining cars and hotels.....	Los Angeles

These changes were effective July 14.

### Traffic

**H. C. Dinkins** has been appointed general agent of the Missouri Pacific, with headquarters at Mexico City, Mex.

### Mechanical

**J. S. Allen** has been appointed master mechanic of the Brownville division of the Canadian Pacific, with headquarters at Brownville Junction, Me., succeeding E. Bowie, transferred, effective July 16.

### Obituary

**John F. Morris**, commercial agent of the Michigan Central, died at Buffalo, N. Y., on July 14.

**C. M. Agnew**, commercial agent of the Southern, with headquarters at Dallas, Tex., died at his home in Oak Cliff, Tex., on July 20.

**Edwin N. Armstrong**, president of the Toledo, Peoria & Western, died at Peoria, Ill., on July 26. Mr. Armstrong was born at Nashua, N. H., September 19, 1845, and entered railway service as a warehouseman for the Illinois Central in 1867. He then became a telegraph operator for the same company, and in 1869 became a train dispatcher for the Indianapolis, Bloomington & Western (now a part of the Cleveland, Cincinnati, Chicago & St. Louis). In 1872 he went with the Toledo, Peoria & Warsaw (now the Toledo, Peoria & Western) in a similar capacity. In 1880 he became superintendent of the Iowa division of the Wabash and subsequently served in a similar capacity on the Chicago, Middle and Northern divisions of the same road. In 1885 he was appointed general superintendent of the Toledo, Peoria & Western and in 1904 was elected to the presidency and continued in that position until the time of his death.

**Marcus A. Low**, formerly general attorney of the Chicago, Rock Island & Pacific, died at his home in Topeka, Kan., on July 19. He was born at Guilford, Me., on August 1, 1842, and was educated at the law school of the University of Michigan. After engaging in the private practice of law, Mr. Low entered railroad service in 1886, as president of the St. Joseph & Iowa railroad. From 1887 to 1892, he served as general solicitor of that road and of the Chicago, Kansas & Nebraska. In the latter year he was appointed general attorney of the Rock Island and at the same time was made general solicitor of the Chicago, Rock Island & Texas. In 1902 and 1903 he served as general solicitor of the Chicago, Rock Island & Gulf and the Chicago, Rock Island & Mexico, in addition to his other duties. Mr. Low, who retired from railroad service in 1912, was for a number of years prominent in national republican politics.

THE MISSOURI, KANSAS & TEXAS has reported that of 19,213 merchandise cars run on its lines during the period between January 1 and June 12, 17,793 or 92.6 per cent arrived on time. Only 118 cars, or 0.6 per cent, were 48 hours late.

## For Railroads— Strength

Simplified—Strengthened by twin, reversible motors.

*Locomotive maintenance costs yield to new and improved machine tools, such as are provided by the Ryerson-Conradson line.*

Rugged reliability is essential in a tool for railroad shops, particularly in the Radial drill.

Take the tapping operation. Most drills have special tapping attachments. They are not made to stand the gaff of quick reversals that speedy work demands.

In the Ryerson-Conradson Railroad Radial the motor itself is reversible. Tapping is as simple as drilling.

Another difficulty overcome by modern design.

The shop man knows what this means—ask him.

## Railway Age

The Table of Contents Will Be Found on Page 5 of the Advertising Section

The general curtailment of maintenance expenditures during the past six months has in a large measure forced the breaking up and re-arranging of locomotive and car shop forces. Many of the railroads are now restoring these forces preparatory to catching up with deferred equipment maintenance and others will soon be doing so. In many cases this means a complete rebuilding of the organizations, the re-employment of men who have been away from the shops for several months and of new men to replace those who have found other employment or otherwise have drifted away from the service. Until these men have completely acquired their old personal habits of safety and have learned to work well together, the possibilities for personal injuries are greatly increased. Extraordinary precautions should be taken to prevent these possibilities from being realized.

### Safety Campaign Needed in the Shops

Approximately one-eighth of all railway expenses or about one-fourth of all transportation expenditures are incurred in the operation of yards. Therefore, it is necessary that it be scrutinized most carefully. One of the most extensive studies of the subject which have ever been made was that which led to the complete systematization of switching work on the Baltimore & Ohio which is described on another page in this issue. This investigation, which extended over the entire system and was designed to co-ordinate this work on all of its lines, had for its objects the reduction of switching to the minimum consistent with the prompt movement of traffic to destination; the performance of this switching at points where it can be done to the best advantage, traffic conditions and physical facilities considered, and the distribution of this work so as to secure the maximum use from the existing facilities and thereby postpone or eliminate the necessity for additional expenditures. The results of this study were crystallized into a detailed plan for the conduct of all switching work over the system so that the forces at each local terminal can work in harmony with the system plan and contribute to its savings. This plan and the study which preceded it should be very helpful to operating officers on other roads who are confronted with similar problems.

### A System Study of Yard Operation

The derailing switch, one of the time-honored institutions of American railroad practice, not only averts dangers, but sometimes is the cause of danger, and that of a costly character. The automatic block signal not only facilitates train movement, reducing delays, but in some circumstances may introduce a new and troublesome source of delays; delays which are so costly that the fact has been used as an argument for not installing automatics. These somewhat anomalous facts are brought out by A. H. Rudd, chief signal engineer of the Pennsylvania system, in his two articles printed in the *Railway Age* of July 16 (page 112) and in this issue. These articles are well worth the attention of all operating officers—including signal engineers and other engineers who realize the importance of their functions as counselors of the general

### Some Inconsistencies in Our Signaling

manager in operating questions—for Mr. Rudd is an idealist as well as a practical engineer, and his writings are calculated to induce readers to agitate his proposals in their own minds. The *Railway Age* will be only too glad to compile the facts of experience bearing on Mr. Rudd's questions, as suggested by him in the earlier article, so far as such facts can be made available; every reader is invited to send them; but in view of the elusive character of the great bulk of these data, it seems quite reasonable at this time to suggest that each officer who is interested in these problems shall begin at once to formulate his conclusions, on the basis of what he already knows. In what particular can you, Mr. Manager, dispute Mr. Rudd's assertions? If you do not accept his proposals, what are your reasons for your conservatism?

The important part played by the chief clerks in railroad offices is practically pretty generally realized. Whether or not the salary and official recognition accorded the position are adequate is another question and one which merits careful consideration. In the *Railway Age* of July 23 a chief clerk discussed the question from what presumably is the point of view of a great number of men filling that position. He contended that the chief clerk who was called upon to act for his superior belonged really in the "assistant to" officer category and should be so classified and paid. On another page of this issue will be found a letter to the editor by an operating officer in answer to the chief clerk's contentions. This officer, while suggesting that chief clerks are, perhaps, not adequately paid, takes the view that business of an official nature cannot in the interest of the property be entrusted to them to too great an extent because, he says, of their lack of outdoor experience. He calls attention to the practice of referring the recommendations of responsible subordinate officers to the chief clerks of superior officers for their decision and he urges that no recommendations should be vetoed or letters of criticism written except by the officer himself. In short, his remedy for the problem would be the curtailment of the chief clerk's authority. An impartial observer can see merit in the points of view of both our correspondents. Their views are, however, widely divergent. More discussion will be needed to harmonize them—and the subject merits discussion, for the chief clerks by and large are a loyal band of men and the suggestion that they are being dealt with unjustly deserves the fullest investigation.

### Curtailment of Authority

The adoption of store door delivery is now being urged vigorously for the cities of New York and Baltimore, Md., with a fair prospect of success in one or both places. Store door delivery is quite familiar to Baltimore since that city had nearly 45 years' experience with it up to 1911, when it was withdrawn because of certain features held to be discriminatory by the Interstate Commerce Commission. New York has had no direct experience with store door delivery, although as a result of the terminal congestion during the war period such a service might have been inaugurated under government control had not the signing of the armistice intervened. As

### The Adoption of Store Door Delivery

231

a means purely to lessen or relieve congestion at terminals, store door delivery has proved itself both in this country and others. Its practicability under the exceedingly complex terminal and business conditions now prevailing is not, however, entirely clear to a large number of railway and business men nor is it, as yet, recognized as being altogether desirable. The more advanced forms of this service have eliminated many of the features heretofore objectionable to the railroads, the trucking companies and the shippers. In their place newer methods are being advocated which apparently give the method a greater degree of flexibility. Baltimore, with its experience to look back to, is, in general, favorably inclined toward the adoption of a modified form of store door delivery and the results of the many meetings between representatives of railway companies, trucking concerns and shippers point toward an increasing possibility of its early adoption. New York is not so favorably inclined but the idea is being pushed strongly as a relief measure for the port of New York. While the interest manifested in store door delivery is, as yet, more or less local to the two cities involved, the developments at these two places should be watched closely. There is present the possibility that, should it be adopted at one or both places, public opinion would demand its inauguration at other important terminals.

It is significant to note that, out of a considerable number of prominent railroad men recently approached for suggestions as to how the mechanical department could function more effectively, several stressed the importance of maintaining separate motive power and car departments. The consensus of opinion seemed to be that for all large roads there should be one officer in charge of the entire mechanical department with two assistants in charge of locomotive and car maintenance work respectively. In this way there would be undivided responsibility and a more direct supervision of the work, thus saving time and eliminating a large amount of red tape. It is by no means true that all motive power men are incapable of assuming charge of car departments, but in far too many cases their experience has been confined to the locomotive side and they are unfamiliar with methods of handling car repair work. In these cases, there is a tendency to adopt the suggestions of minor car department officers regarding serious problems which have not been worked out with sufficient care. Another argument in favor of separating the motive power and car departments on the larger railroads is that the burden of responsibility for both departments is more than one man ought to bear. There is altogether too little appreciation of the importance of the car department by railroad men in general. True, the locomotive usually comes first in a train, and there is something almost of fascination about the word "motive-power," but the fact remains that more than twice as much money is tied up in freight cars alone as in locomotives. Responsibility for the maintenance of equipment representing this immense investment should not be placed on motive power officers who already have as much as they can do to keep locomotives in proper operating condition. The most experienced, high caliber men available should be secured to direct the policies of car departments and then made fully responsible for results. Experience has amply demonstrated that material economies can be effected on large railroads by maintaining separate locomotive and car departments under a joint mechanical department head. The claim that such an organization is top-heavy has never been established. In fact the tendency is to fix responsibility, get direct action, eliminate a large amount of red tape and increase car department efficiency.

#### Separate the Car Department

tions as to how the mechanical department could function more effectively, several stressed the importance of maintaining separate motive power and car departments. The consensus of opinion seemed to be that for all large roads there should be one officer in charge of the entire mechanical department with two assistants in charge of locomotive and car maintenance work respectively. In this way there would be undivided responsibility and a more direct supervision of the work, thus saving time and eliminating a large amount of red tape.

It is by no means true that all motive power men are incapable of assuming charge of car departments, but in far too many cases their experience has been confined to the locomotive side and they are unfamiliar with methods of handling car repair work. In these cases, there is a tendency to adopt the suggestions of minor car department officers regarding serious problems which have not been worked out with sufficient care. Another argument in favor of separating the motive power and car departments on the larger railroads is that the burden of responsibility for both departments is more than one man ought to bear. There is altogether too little appreciation of the importance of the car department by railroad men in general. True, the locomotive usually comes first in a train, and there is something almost of fascination about the word "motive-power," but the fact remains that more than twice as much money is tied up in freight cars alone as in locomotives. Responsibility for the maintenance of equipment representing this immense investment should not be placed on motive power officers who already have as much as they can do to keep locomotives in proper operating condition. The most experienced, high caliber men available should be secured to direct the policies of car departments and then made fully responsible for results. Experience has amply demonstrated that material economies can be effected on large railroads by maintaining separate locomotive and car departments under a joint mechanical department head. The claim that such an organization is top-heavy has never been established. In fact the tendency is to fix responsibility, get direct action, eliminate a large amount of red tape and increase car department efficiency.

While there is some difference of opinion among railway supply men regarding purchases of equipment in the immediate future the general impression prevails that the railway companies will during the next few months carry out an extensive program of repairs.

#### The Equipment Situation

If the government refunding plan as outlined by President Harding is carried out it will make it possible for the railways to place orders for equipment, although large orders will likely be delayed until the number of idle cars and bad order cars is less than at the present time. The *Railway Age* showed in its equipment record for July that 6 locomotives were ordered for domestic roads and 61 for foreign account and that inquiries were made for prices on repairs to 130 locomotives. In July orders were placed for repairs to 9,500 cars and inquiries made for prices on repairs to 11,450 cars. Other contracts pending or about to be closed will greatly increase these figures. Orders were reported in July for but 775 freight and 10 passenger cars for domestic use and 960 freight cars for foreign account. The predominance of business in repair work as compared with new orders is too striking to pass without comment. It is further shown by the production figures reported by the Railway Car Manufacturers Association. In the first six months of 1921 the companies reporting to that organization delivered 29,347 new freight cars on domestic orders. In the same period there were delivered 23,639 repaired cars. The new cars delivered in June totaled 2,245; the repaired cars, 2,939.

#### Why Limit the Joint Committee Specifications to Buildings?

THE SPECIFICATIONS for concrete and reinforced concrete recently submitted in tentative form by the Joint Committee, which are reviewed elsewhere in this issue, are probably a source of disappointment to railway bridge engineers and others engaged in the design of railway structures.

Concrete and reinforced concrete are used by the railways primarily for the construction of bridge piers and abutments, arches, reinforced concrete trestles, retaining walls and culverts, whereas only a very limited number of railway buildings lend themselves to the use of these materials. The specifications prepared by the Joint Committee on the other hand are admittedly and clearly intended primarily for building construction.

This limitation applies only in minor degree to that portion of the specifications relating to workmanship and materials. This in a large measure constitutes an elaboration and improvement over the specifications adopted by the American Railway Engineering Association in 1920. The real shortcoming, insofar as railway structures are concerned, relates to the specifications for design. The Joint Committee's specifications present detailed requirements for the framing of columns, beams and slabs and for flat slab construction as used in multiple story reinforced concrete buildings. Retaining walls, it is true, receive some attention, but presumably this is because they form an important part in building basement construction. On the other hand, the requirements of such structural items as reinforced concrete trestle slabs, which must be adequate to carry heavy and rapidly moving trains, are covered only by the most general statements concerning simple reinforced concrete slabs. Arches also receive no attention in the specifications.

This tendency of the committee to favor building work to the exclusion of bridge work may be explained largely by the influence of the American Concrete Institute, an association which has been very active in developing concrete practice and with which few railway men have been prominently

identified. Whether or not it is the intention of the Joint Committee to supplement the work it has already done by a greater measure of detail concerning structures other than buildings, the fact remains that there is a very real need for standardization in the design of concrete bridges, arches, culverts, etc., such as would be accomplished by specifications dealing directly with these structures. If the Joint Committee cannot consistently fulfill this need then it must be met by some other organization, presumably the American Railway Engineering Association. That body has done excellent work during the past 20 years in the development of specifications for steel railway bridges which, during the course of gradual development in succeeding editions, have gradually come to cover a multitude of detail not considered in the original scope. Efforts to the same end with respect to concrete structures would ultimately lead to the same result and thereby be of great value in the promulgation of the best practices in the use of a most valuable structural material.

## The Retirement of Chairman Clark

THE RETIREMENT of Chairman E. E. Clark from the Interstate Commerce Commission at this time is a serious loss to the nation. Before Mr. Clark went upon the Commission fifteen years ago he was head of one of the railway labor organizations. Neither railway officers nor shippers highly approved of his appointment. However, while some members of the Commission may have commanded more respect and confidence from the shippers, and some more respect and confidence from the railways, it can be said with confidence that no member of the Commission ever commanded the respect and confidence of both shippers and railway officers at the same time to a greater degree than Mr. Clark did in the years immediately preceding his retirement.

By years of study and experience he acquired an almost unequalled knowledge of the general railroad situation. He manifested a desire and determination to be fair which won the regard even of those who differed from him. He proved himself the possessor in a very unusual measure of that common sense and good judgment which are the very foundation of all ability for handling practical affairs of large moment.

One way in which Mr. Clark showed to an increasing extent, as the years went by, his common sense and good judgment was by trying more and more to get shippers and railways to settle their differences regarding rates and service by conference and agreement with each other. Long experience taught him that protracted hearings and decisions by the Interstate Commerce Commission, or any other body, were not the best way to settle the highly practical business questions arising from time to time between the railways and their customers.

His course in this respect was statesmanlike. Small men in important positions like to show their power by deciding things themselves. He saw that too many of the relations between the railways and those from whom they buy labor and supplies, and to whom they sell transportation, are being settled by regulating bodies. More and more this tendency toward excessive regulation is destroying initiative and flexibility, and hindering progress in the railroad business—tending to make both railway costs and railway rates high, and to impair and curtail service. Mr. Clark evidently saw this. It is impossible to say to just what extent he expressed the views of his fellow members. It is to be hoped future developments will show that he expressed the views of a majority of them.

We understand Mr. Clark has retired because he can make a larger income by practicing before the Commission than he could by drawing a salary of \$12,000 a year as a member of

it. Thus we see illustrated in a striking way the effects of the government's policy of paying men in such important positions such inadequate compensation.

Nobody can justly criticize Mr. Clark for retiring. He served the public faithfully and capably at a personal sacrifice for years. The public had no moral right to claim any further sacrifices from him. What the public should have done was to have paid him what he was worth and kept him in its service.

Not infrequently men get into Congress who know much more about how to make a noise that their constituents will hear than about how much it costs to buy real brains. Recently one such member introduced a bill to fix \$15,000 as the maximum salary that could be paid to any railway officer. Many railway officers would then do what Chairman Clark has done. They would quit positions where they could never hope to get large incomes, and go into business or professional work where they could get them.

The welfare of the country demands that the railways shall be ably regulated and ably managed. Chairman Clark's retirement illustrates the fact that the government, like the railroads, must pay the market price for brains if it is to get and keep them.

## The Agitation for Reductions in Rates

THE AGITATION for reductions in railway rates is nationwide and relates to almost every important class of commodities. In a single day the *Railway Age* received literature advocating general reductions in rates on grain, live stock, petroleum, iron and steel, coal, ore and lumber. In each case those sending out the literature gave reasons why reductions were especially needed in the rates on the particular class of commodities in which they were most interested. It is easy to understand why shippers of all classes desire reductions of their rates. It is hard to understand why they do not realize that general reductions of rates under present conditions in the railroad business would be unjust and, in the long run, harmful to business of all kinds.

Most of the arguments set forth merely why producers and shippers of particular classes need lower rates, and say little about why the railways under present conditions need the present rates. None of them makes any reference to the fact that while rates are now high compared with the general level of prices, for many years rates did not increase while the general level of prices was advancing, and that the producers and shippers who were now complaining about the present rates were, during this long period of years, profiting by the fact that prices were advancing while railway rates were not.

The average railway freight rates was the same in 1917 as in 1913. Meantime the average wholesale prices of commodities had advanced 76 per cent. In 1920 the average railway freight rate was 46 per cent higher than in 1913, while the average wholesale prices of commodities were 143 per cent higher than in 1913. Since the present freight rates were fixed the average railway rate has been 70 per cent higher than in 1913. As recently as January, 1921, average wholesale prices of commodities were 77 per cent higher than in 1913. Only since then have freight rates been relatively lower as compared with 1913 than wholesale prices.

In other words, during the entire six years from 1915 to 1920, inclusive, average wholesale prices were from 1 to 143 per cent higher than in 1913, while railway rates during this time were never more than 46 per cent higher than in 1913. Yet now, when for less than six months railway rates have been relatively higher as compared with 1913 than wholesale prices, we have a loud and general demand for reductions in rates on the ground that producers and shippers "cannot stand" the present rates.

Do any of these producers and shippers remember what

spokesmen of the railways were constantly saying between 1913 and 1917, when railway rates were standing still and average prices were advancing 76 per cent? We shall refresh their memories by recalling that at that time every spokesman for the railways was saying that with wages and prices of all kinds advancing the railways "could not stand" the then existing railway rates and were entitled to advances in them, both because the cost of railway operation was rapidly increasing and because the increasing prices of commodities would enable the traffic to stand higher rates. Nevertheless, almost every class of the shippers who are now demanding reductions of rates then opposed, and successfully opposed, advances in rates.

Upon what principle of consistency, equity or sound business can these people, who opposed advances in rates when their own prices were advancing and the railways needed advances in rates and the traffic could stand it, now demand reductions in rates because prices have declined and they need reductions of rates which the railways cannot stand? They profited for six years by keeping railway rates relatively much lower than their own prices. Is it unfair to suggest that they should now be willing to take for a time such losses as may be caused them by the fact that railway rates are relatively higher than their prices?

It should be added, in this connection, that the present disparity between railway rates and average prices is small compared with what it was when prices were at their peak. When average wholesale prices were 143 per cent higher than in 1913, railway rates were only 46 per cent higher. Now, when the average railway freight rate is 70 per cent higher than in 1913, the average wholesale price of commodities is still 48 per cent higher than in 1913.

Furthermore, while railway rates are at present relatively higher than the prices of most commodities, they are not relatively higher than the things which the railways themselves have to buy, and which determine their costs of operation and the rates at which they can afford to sell their transportation. Without going back so far as 1913, let us compare the average increases since 1916 in the rates which the railways are receiving, and in the average costs they are obliged to meet. The average advance in passenger rates (including the surtax on sleeping car tickets) has been 53 per cent. The average increase in the rate per ton per mile in this five years has been 74 per cent. The average increase in both passenger and freight rates has been less than 65 per cent.

Now take a look at the operating costs. Over 94 per cent of all railway expenses are wages, cost of fuel and cost of materials and supplies. About 90 per cent of all railway employees are paid by the hour, and even since the recent reduction in wages the average cost per hour of railway labor is 123 per cent more than in 1916. There have been substantial reductions since last year in the prices of materials and supplies, but the prices at which the railways are now buying materials and supplies average 65 per cent higher than in 1916. The average price paid for coal in 1916 was \$1.76 per ton. Coal prices have been slowly declining since last December but the average price paid by the railways in May, the latest month for which figures are available, was \$4.29, or almost 144 per cent more than in 1916.

In the first five months of 1921 the total earnings of the railways were 58½ per cent more than in the same months of 1916. Their total operating expenses, in spite of the vast retrenchments made, were 109 per cent more than in the same months of 1916. Their taxes were 80½ per cent more than in the same months of 1916. Result: In the first five months of 1916 the railways earned \$286,400,000 net operating income, while in the same months of 1921 they earned only \$117,000,000 net operating income, a decline in net operating income for these months of over 66 per cent.

From the standpoint of the producer and shipper the

present railway rates are too high. From the standpoint of the railways they have not thus far been high enough. The reason why they are too high from the standpoint of the producer and shipper, and not high enough from the standpoint of the railways, is that the present operating costs of the railways are excessive. Who made these costs excessive? Not the managements of the railways. They did not fix the wages they are paying to labor, or the prices they are paying for materials and supplies, or the prices they are paying for coal. They did not increase their own taxes over 80 per cent. The managements are striving mightily to reduce their costs. Undoubtedly the rates should be reduced—when the costs of labor, materials and supplies and fuel have been reduced enough to enable the railways to pay their operating expenses and make a reasonable net return on lower rates.

We can draw only one of two conclusions from the widespread propaganda that is being carried on for general reductions in rates. One of these is that those who are carrying it on are ignorant of present railway conditions, which reflects no credit on any man who sets himself up as qualified to discuss railway rates. The other is that those who are carrying on this propaganda are willing to help complete the financial and physical ruin of the railways of the United States if, by carrying on agitation regarding rates, they can win the temporary approval and applause of the classes of producers and shippers on whose applause and approval they rely for the furtherance of their own selfish interest.

There is but one wise course for the managements of the railways, under the existing conditions, to follow. That is to fight to the last ditch, first, for reasonable reductions of their operating costs, and, secondly, against all general reductions in rates until operating costs have been reduced and traffic has increased enough to enable the railroads to earn a reasonable net return. Doubtless they will antagonize many classes of persons by doing this. They may arouse public sentiment against them. But such premature and unwarranted reductions in rates as are being advocated would wreck the railroads of the United States, financially and physically, and do the public far more harm than good. The present extremely bad railroad situation is largely due to the fact that the managers and owners of the railways have not in the past resisted vigorously enough unreasonable demands which have been made on them, and unreasonable regulation which has been forced on them. If public sentiment is antagonized, private ownership and management may fail, but it is sure to fail if the railways under private management cannot get fair and reasonable treatment.

## Kansas City Southern

THE TRAFFIC HANDLED by the Kansas City Southern in the first four months of 1921—April being the latest month for which figures are at present available—was approximately equal to that handled in the first four months of 1920. This comparison, it is true, is not an entirely fair one, inasmuch as the figures for 1920 include the month of April, in which month the road's operations were severely handicapped by the outlaw strikes. Nevertheless, the fact that the traffic up to April 30 this year was on a par with that in the same period last year makes the Kansas City Southern an exception from most of the other roads of the country. It further means that the road has been able to secure, because of the higher rates now in effect, considerably better gross earnings than were secured in the early part of last year. The figures as to earnings are available to the end of May. In the period from January 1 to May 31 the gross earnings of the Kansas City Southern, including the Texarkana & Fort Smith were \$9,305,726 as compared with \$8,057,053 in the first five months of 1920. The operating expenses to May 31 were slightly in excess of those in the same period last

year. The net railway operating income of \$1,903,828 in the first five months of this year compared with a figure for the first five months of 1920 of \$985,555. This would indicate that the Kansas City Southern apparently has the present situation well in hand. The fact that the increased net is not the result of savings in maintenance of equipment and way and structures is especially noteworthy.

The Kansas City Southern operates a total mileage of 842, its lines extending from Kansas City south to the Gulf of Mexico at Port Arthur. The traffic carried by the road is indicated by the following figures showing the percentage of the total tonnage carried in 1920: Grain, 8 per cent; bituminous coal, 14.1 per cent; lumber, 21.7 per cent and petroleum and other oils, 19.8 per cent. The road has but a small branch line mileage, a factor which has permitted its progressive management to carry out a somewhat more intensive development of the property than might otherwise have been possible. The revenue tons carried one mile per mile of road

The Kansas City Southern

in 1920 were 1,989,826. The intensive development which is referred to is indicated chiefly by the average revenue train load in 1920 of 674 tons and by various other figures which are given below.

The Kansas City Southern did not earn its standard return in either of the two years of federal control. Its standard return was \$3,535,427; in 1918, it earned \$3,128,053; in 1919, \$2,189,359. In 1920 the net railway operating income was \$2,766,306. The improvement in net in 1920 as compared with 1919 was largely the result of operations during the last four months of the year. Operations during the guaranty period resulted in a deficiency under the guaranty of \$1,120,332. The corporate income account for the year, in which consideration is taken of the standard return for January and February and of the guaranty for the guaranty period showed a total net income of \$1,924,054. This compared with a net corporate income in 1919 of \$1,342,679.

The traffic carried by the Kansas City Southern in 1920,

totalled 6,135,187 tons of revenue freight as compared with 4,884,555 tons in 1919 or 5,632,481 tons in 1918. The revenue ton mileage in 1920 was 1,674,717,315. Although the total tons carried in 1920 were in excess of 1918, the revenue ton mileage was less, the reason being that the average haul in 1920 was but 273 miles as compared with 298 in the second year preceding. On this traffic the road secured an average revenue train load of 674 tons and an average revenue car load of 25.77 tons. These figures were considerably in excess of those for 1919, but they were below the figures of 677 revenue tons per train and 26.89 revenue tons per loaded car in 1918.

The interesting feature of the road's operations at present is the manner in which the figures relating to operating efficiency have held up so far this year. We have already noted that the traffic carried in the first four months of 1921 was about equal to that carried in the first four months of 1920 and that the gross and net earnings were considerably higher. For the first four months the road secured an average net tons per train, revenue and non-revenue freight combined, of 728 as compared with a figure of 716 in the first four months of 1920 or with a figure of 734 for all of 1920. The net tons per train so far this year, incidentally, have been over 100 tons higher than the figure for any other road in the southwestern region and nearly 200 tons more than the average for that region. The net ton miles per train hour—the figure which takes into consideration train speed as well as train load—was, in the first four months of this year, 7,613 as compared with an average for the region of 6,442. The Kansas City Southern's net tons per loaded car to April 30, 1921, were 28.8 and its miles per car per day 35.4. The net ton miles per car per day were 726. This latter figure compared with 648 in the first four months of 1920 and with an average for the whole of 1920 of 759. Another interesting figure is that of bad order cars. The latest figures reported—those for July 15—show that the percentage of bad order cars in the country on that date was 15.9. The Kansas City Southern is shown as having 7.8 per cent of its cars in bad order. Looking at these figures as a whole indicates that the Kansas City Southern is in an enviable position at present. It will be interesting to watch its operating figures in future months when its traffic increases with better business conditions.

The operating results in 1920 as compared with 1919 were as follows:

	1920	1919
Mileage operated .....		
Freight revenue .....	\$17,361,235	\$12,576,430
Passenger revenue .....	3,225,909	2,723,353
Total operating revenue .....	22,587,144	16,607,011
Maintenance of way expenses .....	3,004,632	2,527,250
Maintenance of equipment .....	4,332,926	3,608,203
Traffic expenses .....	469,949	229,545
Transportation expenses .....	9,231,599	6,477,872
General expenses .....	901,874	508,989
Total operating expenses .....	17,911,665	13,359,087
Net operating revenue .....	4,443,562	3,277,923
Taxes .....	957,905	846,439
Operating income .....	3,480,542	2,425,679

The corporate income account is as follows:

Total operating income .....	2,780,448	
Standard return (January and February, 1920, full year 1919) .....	485,919	3,536,28
Federal guaranty of income .....	1,120,332	
Gross income .....	4,807,916	3,636,25
Interest on funded debt .....	1,884,277	1,835,392
Net income .....	1,924,054	1,342,678
Dividends:		
Preferred stock, 4 per cent .....	840,000	840,000
Balance .....	1,084,054	502,679

AN ARTICLE printed in the Illinois Central Magazine for July describes the gardening activities of the department devoted to this work on that road. This department has been in operation for 20 years and there are 13 division gardeners in addition to the chief gardener, H. S. Moulder, who is stationed at Champaign, Ill. It is the aim to work not only to beautify the property of the company, but also the territory served by the railroad, the gardeners co-operating with town and city officials along the route.

## Letters to the Editor

### Duties Should Not Be Delegated

Boston, Mass.

TO THE EDITOR:

I have read with considerable interest the article by a Chief Clerk in the *Railway Age* of July 23. Granting the situation as it exists today I think his position is well founded. I do not wish to detract in any way from the efficiency and loyalty of the average chief clerk and I agree fully that, considering the work he is called upon to do, he is in most cases neither properly compensated nor recognized.

I believe, however, the wrong remedy is proposed. Do not give the chief clerk greater recognition (more compensation perhaps), but insist that the officers do more of their own work and not delegate authority which they should exercise. One of the chief causes of lower operating efficiency is the delegation of this authority to men who, regardless of their intelligence, efficiency and loyalty, are not, as a result of their limited outdoor experience, competent to pass upon subjects which are now left to their judgment.

We all know of numerous cases, starting in division superintendents' offices and going to the top of the railroad, where the chief clerk overrules the recommendations of responsible officers of lower grade when, in most cases, if the same facts were laid before his chief, the decision would be reversed. This tends to discouragement and lack of initiative on the part of the lower officers and decreases morale.

No recommendation over the personal signature of a responsible officer should be acted upon adversely by a chief clerk, and no letter of criticism written except after consideration by, and over the personal signature of, his superior officer.

To give the chief clerk greater recognition and a definite position in the organization would simply tend to perpetuate and increase what is already one of our greatest weaknesses.

OPERATING OFFICER.

### Track Tanks for Freight Trains

Heath, Mass.

TO THE EDITOR:

The cost of train stops brings up the utility of track pans for freight trains. The track pan is usually considered as an adjunct to high speed passenger service but in view of modern conditions, would not the installation of track pans pay in certain cases purely for the purpose of eliminating freight train stops for water?

A few of the advantages may be cited. A water plug may often by necessity be located at the bottom of a grade or in a hollow. This may cause engines to cut off a mile or two from the plug to avoid stalling on the grade. Useful momentum is lost whichever way the train is bound. A track pan in this location obviates these inconveniences.

A water stop involves, besides the time lost for taking water, as much more for pumping up the train line on account of the rule on so many roads requiring engines to cut off from the trains. More air is lost than would be the case if the engine had remained coupled to the train for the reason that the brakes usually leak on so that auxiliary air is lost. As the stop is of considerable duration, the flagman probably goes back some distance. All these things make the cost of a water stop in excess of that for a stop for other purposes.

W. G. LANDON.

## Assignment of Motive Power

Taunton, Mass.

TO THE EDITOR:

The recent depression in business, with a prospect of resumption of traffic in the fall, should cause motive power officers to consider carefully the assignment of their power. The question might well be asked, "Is the power assigned where it will produce the best results?"

There are at least two methods used to assign the motive power on our railroads. With one method the authority rests in the office of the superintendent of motive power. He is the man who says what engine or class of engines shall be placed on the trains. With the other method, the authority rests with the division superintendent. Certain locomotives are assigned by the mechanical department to each division and the division superintendent then selects and assigns the power while the master mechanic keeps them going.

Of the two methods, the latter is much to be preferred on a large system, as it is logical that a man who devotes all his time to the operation of a particular section of a railroad is vastly more familiar with certain conditions that exist thereon than an officer whose time cannot be burdened with many of the minor details. On a small road, however, where the number of locomotive designs is not large and where uniform operating conditions exist, it is possible that the former method may have some advantages.

Having assigned the power, the next step is to keep it on its assignment. A few years ago the writer was greatly pleased to notice on a certain road that traverses New York state the regularity with which the locomotives appeared on the various trains. A remark made to the master mechanic on this subject brought forth the reply, "Well, why not? They are given to us to run, why not give them a job and keep them on it!"

On another road when inquiring about the performance of a certain type of locomotive, one of the inspectors replied, "They double the division every 24 hours and we seldom find anything the matter with them. Yes, we try to keep them on the same service as much as possible."

On a third road that during the year frequently issues an assignment of power bulletin, before that bulletin can be received by the proper officers, it is out of date.

One road has taken its locomotives by classes and assigned them to divisions closely related in order that the storekeeper can reduce the number of spare parts necessary to carry in stock. It is no unfrequent sight for a large locomotive in passenger service to be handling three or four coaches, with the result that the cost of hauling that train over the road is certainly greater per car than had the engine been given her maximum load.

In these days when roads are applying devices which will result in economy and increase tractive effort, considerably more economy can be gained by the proper assignment of the power and the man closest to the existing conditions is certainly the ablest officer to direct the matter. Some officers think that the moment a locomotive is received from the shops she is in condition to go out on her regular run, but a wise master mechanic will warm up a freshly shipped engine gradually by placing it in local service. The old saying that oil is cheaper than crank pins and brasses still holds true.

Place as much individuality as possible in the service! A master mechanic will take more pride in his own engines and give them better care than he will a visitor, and if the number of visitors is large, the results won't be the best. It is human nature and you can't change it.

Now is the time to consider this matter before the predicted fall increase of traffic. Certainly this question is of enough importance to give it more than a passing thought.

# I. C. C. Declines to Fix New England Rate Divisions

## Defendants and Complainants Expected to Appoint Committees to Work Out Readjustments

WASHINGTON, D. C.

THE INTERSTATE COMMERCE COMMISSION on July 28 made public its decision in the New England rate division case, holding that the voluminous record in the case affords no basis for a valid prescription of divisions by the commission; but that it is shown that just, fair and equitable divisions cannot, in many instances, flow from existing arrangements. Because of these conditions the commission expects the defendant carriers outside of New England and the complainant New England lines to propose promptly adjustments that will remove the inconsistencies shown, and bring into conformity with the principles of law and equity expressed in the act the divisional arrangements, individually and as a whole, between complainants and defendants. The commission recommends the appointment of committees for this purpose, to report in 90 days, and thereafter each 60 days, until the issues shall have been disposed of.

Commissioners Eastman, Potter, Campbell and McChord dissented from the majority opinion on the ground that the commission should have taken definite action for the immediate relief of the New England roads, but the majority opinion by Chairman Clark says that the financial condition of the New England roads is not measurably worse than that of some of the defendants and that the record fails to show clearly that relatively the New England lines have had exceptional handicaps which their competitors have not encountered. The opinion contains a comprehensive review of the evidence introduced regarding the condition of the New England lines. The decision is based not only upon the insufficiency of the record as a basis for fixing divisions but also on the idea that the law does not contemplate taking revenue from one road for the primary purpose of equalizing the condition of a less prosperous road.

## Abstract of the Commission's Decision

On behalf of the Bangor & Aroostook, Boston & Maine, Central New England, Central Vermont, Maine Central, New York, New Haven & Hartford, Rutland, and their subsidiaries and operated lines, operating almost entirely within New England, it was alleged, in effect, that divisions accruing to them out of the joint freight rates increased pursuant to Ex Parte 74, between points in New England on their lines and all other points in the United States and adjacent foreign countries, particularly the Dominion of Canada, were and are in violation of paragraph (4), section 1, and paragraph (6), section 15, of the interstate commerce act.

The commission was asked (a) to prescribe just, reasonable, and equitable divisions for the future; (b) to require the cancellation of all joint rates and charges on traffic not moving entirely within the United States, or to authorize such other action as shall assure just, reasonable, and equitable compensation to the parties for their services in connection with such traffic; (c) to determine what would have been the just, reasonable, and equitable divisions of all joint rates and charges participated in by any of the parties hereto since the filing of the complaint; (d) to require adjustment to be made in accordance therewith; and (e) to determine a just and proper allocation among the complainants of such increased revenue as may be awarded to them.

### Complainants Urged Blanket Increases

Complainants urged that the divisions be treated "as a whole," not individually; that is, that blanket increases be applied to the divisions without regard to the specific divisions of individual joint rates. They suggested, among others, the following methods by which this might be done:

(1) Graded percentages that will reflect in the various divisions a definite additional amount which the complainants should receive in excess of what they now receive, apportioned in inverse ratio to the present divisions; in other words, the highest divisions to be increased the least percentage, and vice versa.

(2) Fifteen per cent of the total amount accruing to the lines west of the Hudson river from divisions on traffic interchanged with complainants to be transferred to the latter to afford them an additional annual amount of revenue approximating \$25,000,000. This plan, it was urged, has the advantages of simplicity, flexibility, and definiteness; would permit the pooling and redistribution of the total amount among the various complainants; the amounts paid to the complainants would be in absolute proportion to the amounts received by all the defendants jointly and severally; and while the plan remained in effect, divisions of particular rates could be examined and revised until all of the divisions were properly apportioned, when the plan could be discontinued.

(3) By the use of road-to-road per cents, combined into a road-to-New England per cent, a resumption of the method of dividing rates in vogue during the period of federal control, now applicable on some traffic to New England as to which divisions have not been re-established since the termination of federal

control, and on inter-line New England traffic between the Boston & Maine and the New Haven. Under this plan such road-to-New England per cents would be worked out for each defendant on the basis of normal traffic conditions, and then appropriate changes would be made in these per cents to increase the revenue received by complainants.

It was urged for defendants that the complainants were not in reality asking the fixation of just, reasonable, and equitable divisions of joint rates, but that they sought, in substance, the transfer to them of a fixed amount to be arbitrarily deducted solely from the revenues of the carriers operating in eastern trunk line and central territories, to be "allocated" among the complainants, not in relation to the traffic which they interchange with the carriers outside of New England, but according to their failure to receive, out of the joint rates established pursuant to Ex Parte 74, a return upon the value of their property held for and used in the service of transportation as large relatively as the return received in the aggregate by defendants. In other words, that the allegation of unjust divisions is only a means by which to secure the adjustment of an alleged claim flowing from the fact that the complainants were included with certain of the defendants in a group designated by us in accordance with the provisions of the interstate commerce act. It was insisted that the commission may not erect a subgroup in a divisional case, especially one composed of these complainants alone, and consider divisions "as a whole"; that the statute limits its power to prescribing divisions "as between the carriers" parties to the joint rates and that after considering, "among other things," all of the elements specified in the act, none of which is dominating, it must determine how much each carrier shall receive of each joint rate; that the application of a general principle would obviously produce divisions which would be unjust, unreasonable, and inequitable as between the individual carriers, and that the general principles governing the prescribing of divisions differ from those observed in authorizing rates under section 15a of the interstate commerce act, principally because the latter are made to produce a fair return for the carriers "as a whole," individual rates being subject to review in separate proceedings.

The divisions exhibited by complainants were of first and sixth class rates and of some few commodity rates on so-called merchandise traffic, the arrangements applying to class rates and to commodities which are classified. Coal and coke are not classified in the official classification, and as there was no evidence with respect to the divisions of the rates on these commodities, no finding is made with reference thereto. Nor is it understood that the division arrangements exhibited were applicable to fluid milk and the edible products thereof, high explosives, fresh meat in carloads, or to short-haul transportation of low-class commodities.

With respect to commodities moving in foreign commerce, we are not asked to determine whether or not the divisions of the

rates are just, reasonable, and equitable, but to require the cancellation of all joint rates and charges on such traffic or to authorize such other action as shall assure just, reasonable, and equitable compensation to the parties for their services in connection therewith. Nothing of record bears on the cancellation of the joint rates. With respect to the divisions which now accrue to the complainants out of the joint rates with their Canadian connections, it should be observed that our jurisdiction inheres only in so far as the transportation takes place within the United States.

The "importance to the public of the transportation services of" the complainants is conceded, and of it we take judicial notice, as well as of that of the principal defendants.

"The efficiency with which the carriers concerned are operated" is impossible of determination on the record, comprehending, as it does, all common carriers in the United States that are subject to our jurisdiction. Some general evidence was offered by complainants indicating that in the units of operating efficiency the degree of improvement in New England during the last few years has been as great as or greater than in the remainder of the eastern group. The specific evidence relates mainly to the operations of the New Haven.

### Special Conditions in New England

The elements which the complainants contend should or must be considered by us in determining whether their divisions accord with the provisions of the act are, their financial needs; their operating handicaps, some of the more important of which are said to flow from the terminal character of complainants' operations; the alleged disproportionate effect of recent wage increases upon their operating expenses; the increased cost of locomotive fuel and other railroad materials and supplies; per diem or freight-car hire; and the peculiar character of their traffic. It is said that complainants have very little traffic in the carriage of which they are intermediate carriers having no terminal expense; that their operations embrace large percentages of less-than-carload and passenger traffic; that they receive a larger percentage of raw materials than they forward of manufactured products; that they have little tonnage of low-grade commodities moving in volume; and that it is impossible for them to obtain as large a transportation product from a given amount of labor as is possible in other parts of the eastern group. The density of complainants' traffic is relatively low and the diversity of their routes, the diffusion of their traffic over New England, their numerous junction points, stations, branch lines, and switching yards permit only comparatively short hauls. In general, complainants endeavor to demonstrate that since the present divisions were established their costs of operation have increased relatively much more than have those of carriers in eastern trunk line and central territories.

It is asserted for complainants that they have demonstrated that the divisions they receive are inadequate "as a whole," even when tested by the standard of mileage. They urge, however, that "the amount of service rendered by the several carriers participating in a joint rate is no longer controlling," and that "mileage is no longer the yardstick by which divisions are to be measured." They urge that paragraph (6), section 15, of the interstate commerce act is revolutionary in that it subordinates the mileage haul and stresses certain other specified considerations which have no relation thereto, and that the provision that those factors shall be considered by us "without regard to the mileage haul" is, in a sense, the most important change in the law in respect of our power over divisions.

Locally, the needs of the New England carriers have had our consideration before. We have recognized the peculiar local transportation difficulties encountered by the New England lines.

It is insisted for defendants that if special difficulties exist in New England it must be that they flow, not from the traffic interchanged with the connections of complainants, but from local conditions. Complainants' principal statistical witness states that the high proportion of traffic local to New England may have an adverse effect on operating costs. Obviously, all interchange carload traffic originated by the complainants in New England destined to points throughout the remainder of the United States and in the Dominion of Canada must be distributed by the defendants; all interchange traffic from points outside of New England delivered by the complainants must have originated at some point on defendants' lines, and the expense of furnishing cars and other expenses incident to its origination must have been borne by one or more of them. Inasmuch as the volume of interchange tonnage into New England considerably exceeds the outbound movement, the defendants must have the expense incident to originating and furnishing cars for a larger proportion of the interchanged traffic, and it must follow that it is usually less difficult for the shippers on the complainants' lines to be supplied with empty cars. It also follows that complainants have the expense of returning many cars without load to defendants.

There is no break of bulk of carload shipments during the transportation, and therefore the type of the car, the commodity, the weight of the load, and many other incidents of the through joint haul must be the same within and without New England. Defendants assert that the only conditions peculiar to New England are (a) a high proportion of passenger-train mileage to total train mileage, which prevails only in the densely populated section of southern New England; (b) the high proportion of less-than-carload freight as compared with the total tonnage, which must be transferred and handled en route by the defendants with a constantly decreasing load as the haul increases; (c) the substantial volume of traffic moving by water from and to New England owing to the concentration of about 73 per cent of the population within 50 miles of the coast line, the remainder of the territory being more sparsely settled; (d) the fact that New England is contiguous only on the west to eastern trunk line territory; and (e) the character of the products of New England manufacturers. These peculiarities, in the view of the defendants, afford no warrant for increasing divisions of joint rates, and for them it is asserted that the conditions in New England are in other respects essentially like those in other territories.

The distinctive transportation characteristics of New England, complainants contend, should here be given controlling weight. However, it is their view that we must consider as the dominant factor "the amount of revenue required to pay their respective operating expenses, taxes, and a fair return on their railway property held for and used in the service of transportation."

### New England Roads and Other

#### Eastern Carriers Compared

Based on a property investment of \$838,274,769 of the seven complainant roads as of October 31, 1919, it is estimated that they obtained a net railway operating income for the year ended June 30, 1920, adjusted, of \$8,696,666, a return of approximately 1.04 per cent on the property investment. Their fixed charges, based on the same adjusted year, were \$34,783,380; their non-operating income, \$7,170,256; and their "net" fixed charges \$27,613,124. Thus, the complainants show that they failed to meet their fixed charges for the year ended June 30, 1920, by \$18,916,458. Taking the actual results of the first four months of a year ending August 31, 1921, and estimating the remainder of the year therefrom, complainants forecast that they may fail to meet their fixed charges for the year 1921 by \$27,386,975. This estimate attempts to make allowance for diminution in traffic. The results of operation for the months of September and October, 1920, indicate that traffic fell off and that the net income for those two months, after the payment of fixed charges, was a deficit of \$3,591,183.

The property investment shown by the complainants includes \$40,213,406, alleged to represent the value of the contract rights of the New Haven in the New York terminals of the New York Central, and about \$8,500,000 for the investment in the Portland Terminal Company, which is controlled by the Maine Central through ownership of the entire capital stock. The preliminary reports of our bureau of valuation indicate that the cost of reproduction new of the lines of complainants was \$760,195,671, and the present value of land \$161,229,938, a total of \$921,425,609.

The ratios of net railway operating income to property investment of five of the complainants and of the principal lines in the eastern group other than such New England lines for the years ended June 30, 1913, to 1917, inclusive, and the calendar year 1919, and the ratios of deficit to property investment for 10 months of 1920, are shown in the following statement:

	1913	1914	1915	1916	1917	1919	10 months 1920
New England .....	4.88	3.82	4.75	6.01	5.68	1.02	33.10
Eastern group less New England .....	5.10	3.79	4.20	6.43	5.63	1.84	1.92

\* Ratio of deficit.

The property investment upon which the ratios are based excludes materials and supplies. On the surface the statement does not indicate that in periods prior to the recent large increases in wages and rates these complainants were weak roads as compared with the defendants in the eastern group. Comparing individual roads, it may be observed that the Central of New Jersey, the Erie, including the Chicago & Erie, the Pennsylvania, lines east as well as lines west, the New York, Ontario & Western, the Delaware & Hudson, and many others outside of New England earned a less per cent of their standard return during the period of federal control than did the New Haven, and that in several instances the percentage of operating income to property investment for the first 10 months of 1920 for some of the direct connections of the complainants showed a deficit greater than the average for all the New England roads.

During the pendency of Ex Parte 74 our attention was directed to this contention of the lines in New England and to the fact that an average percentage increase for official classification territory as a whole would not meet the needs of the New England car-

riers. We found, however, with certain exceptions, that general percentage increases made to fit the needs of the groups of lines serving each of the four groups designated by us must be considered for the then present purposes the most practicable, without prejudice to any subsequent finding in individual situations, stating that—

While the New England carriers are included in the eastern group and are subject to the percentage for that group, the evidence as to the disproportionate needs of the New England lines makes it desirable that the carriers give careful consideration to the divisions of joint rates accruing to these lines.

A brief and necessarily general outline of the basis for the allegation of paragraph VIII of the complaint follows: New England, located in official classification territory, was included in the eastern group, the boundaries of which are practically coterminous with those of official classification territory. The complainants do not contend that New England was included therein without their consent, nor do they ask that it be separated therefrom. For rate-making purposes, official classification territory had been subdivided into New England, eastern trunk line, and central territories. The financial needs of the carriers, estimated in part, were based upon statistical data derived from questionnaires sent to the individual carriers, their original proposals not having made allowance for the wage award made by the United States Railroad Labor Board July 20, 1920, after the close of the hearings. Data for 51 Class I systems, 39 Class II, 30 Class III, and 24 switching and terminal companies were considered in the proposals for the eastern group.

After our decision in Ex Parte 74, the assertion of the New England carriers that they had lost and the other carriers in the eastern group had gained by the inclusion of New England in that group was considered by a conference of the executives of the eastern roads. For informal discussion data taken from the questionnaires for a constructive year ended October 31, 1919, were assembled separately for the complainants and the Boston & Albany; for Class I roads in eastern trunk line territory; and for Class I roads in central territory, the other classes of roads being excluded. From these data it was computed by an expert of one of the defendants that the eight New England carriers, the eastern trunk line carriers, and the central territory carriers, prior to the wage award of the labor board, required to produce a net return of 6 per cent on their property investment, increases in their freight and switching revenues amounting to 47,407, 29,767, and 24,431 per cent, respectively. All of the carriers in the eastern group, considered "as a whole," required an increase of 29,461 per cent, but if the carriers in eastern trunk line and central territories had been embraced in a separate group, they would have needed only 27,981 per cent increase. Accordingly, complainants contend that, due to their inclusion in the eastern group, they lost, and the other carriers in the group gained, 1.48 per cent of the total freight and switching revenues prospectively derivable from the increases allowed in Ex Parte 74. Stated more specifically, the freight and switching revenues of the eight New England carriers for the constructive year were \$136,298,531, and they needed 47,407 per cent of that amount in addition, or \$64,615,799. Mathematically they received, or will receive, only the average per cent for the group as a whole, 29,461 per cent, or \$40,150,939, a difference of \$24,464,860, or 17.946 per cent.

Of the above amount defendants' expert computed that about two-thirds was gained by the eastern trunk lines and about one-third by the central territory carriers. On this statistical basis the eastern trunk lines, considered as a separate group, also suffered by their inclusion in the eastern group to the extent of the difference between the per cent their freight and switching revenues needed to be increased, 29,767 per cent, and the per cent of the group as a whole, 29,461 per cent, and the central territory carriers benefited to the extent of the difference in the per cent of their needs, 24,434, and the per cent of the group as a whole. In other words, theoretically the eastern trunk lines, by their inclusion in the eastern group, lost \$3,374,276 and the central territory carriers gained \$27,811,393.

However, the so-called Pocahontas lines are also within the eastern group. Had these lines been excluded, the eastern group lines as a whole would have needed to have their freight and switching revenue increased 30,586 per cent to produce a net return of 6 per cent on their property investment and, statistically, as the Pocahontas lines needed their freight and switching revenues increased by 15,729 per cent, they gained \$18,598,904 by being in the eastern group. On the adjustment proposed by the complainants the Virginian Railway would contribute \$152,398, although, by its inclusion in the eastern group, it theoretically lost \$1,981,168. The statistics of the so-called Allegheny region lines, so presented in Ex Parte 74 indicated a need for increases in their freight and switching revenues of 36,126 per cent. The application to them of the common percentage of the eastern group resulted in a theoretical loss to the Allegheny region lines of \$36,244,058.

The data upon which the complainants contend they lost and

the defendant eastern trunk line and central territory carriers gained 1.48 per cent of the total freight and switching revenues were incomplete. The complete figures presented to us in Ex Parte 74 indicate that the revenue needs, excluding amounts to be raised from passenger-train service, passenger revenue, excess baggage, Pullman surcharge, and milk, were for all roads in the eastern group 39.75 per cent of the total freight and switching revenue, while the revenue needs, including the revenues from passenger-train service, for the defendants was then 38.55 per cent of their freight and switching revenue, a difference of 1.2 per cent of the total freight and switching revenues, or \$20,377,678, approximately \$4,000,000 less than the amount claimed by the complainants. If the Pocahontas lines had been excluded from the eastern group the remainder of the lines in the group would have needed their freight and switching revenues increased 40.95 per cent, or 1.2 per cent more than the group as a whole required. In other words, what the complainants lost theoretically the Pocahontas roads gained. The complainants are located in the north-eastern part of the eastern group and the Pocahontas lines in the western part. They do not directly connect, and the amount of tonnage participated in under joint rates to or from New England is negligible. This fact is significant only in that it suggests that there is not necessarily a relation between the prayer of the complainants for increased divisions and their claim for adjustment of earnings due to their inclusion in the eastern group. The amounts by which the lines west of the Hudson river are alleged to have benefited by the inclusion of the New England lines in the eastern group bear no relation to the traffic which they interchange with the complainants.

It is contended for defendants, however, even assuming that the theory of complainants has merit, that the total of \$24,464,860 should not be assigned to the interchange traffic alone, but should be apportioned among the various classes of traffic, as follows: Local, \$3,701,533, or 15.13 per cent; interline New England, \$2,358,413, or 9.64 per cent; interline Canadian, \$1,091,133, or 4.46 per cent; New England passenger, \$8,335,178, or 34.07 per cent; and interline trunk line, \$6,329,059, or 25.87 per cent; Boston & Albany, \$2,649,544, or 10.83 per cent. It is defendants' view that, if there is any merit in complainants' contention that their inclusion in the eastern group benefited the other carriers in that group, the extent of alleged benefit should be measured by the total per cent of the deficiency to total operating revenues and not by the per cent of the deficiency to freight revenues. Thus measured the inclusion of the complainants' lines increased the needs of the carriers in the eastern group from 32.71 per cent to 33.28 per cent of the total operating revenues, a difference of 0.57 per cent. The total operating revenues of the carriers in the eastern group for the constructive year ended October 31, 1919, were \$2,585,316,615, of which 0.57 per cent is \$13,488,748, and defendants assert that this amount represents the theoretical benefit rather than 1.48 per cent of the freight and switching revenues, or \$24,484,860, as stated by the complainants.

Based on their needs when application was made in Ex Parte 74, and disregarding the downward trend of traffic and revenues since that time, 21 carriers in the eastern group may earn more than 6 per cent on their property investment because the required percentage increases of their freight and switching revenues were less than the required percentage of the eastern group as a whole. The amount of their contribution to the 1.48 per cent would be \$11,337,717. However, under the provisions of paragraph (6) of section 15a of the interstate commerce act, if any carrier receives for any year a net railway operating income in excess of 6 per cent of the value of the railway property held for and used by in the service of transportation, one-half of such excess is recoverable by the commission for the purpose of establishing and maintaining a general railroad contingent fund. Hence 50 per cent of the return in excess of 6 per cent, if earned, would not be available in any adjustment with the complainants covering the past, although it would be available for the future.

### Rate Increases Did Not Bring Estimated Return

In their original applications in Ex Parte 74 the carriers proposed general percentage increases in freight rates in the eastern group of 30 per cent. After the wage award they filed an amended application. We estimated, based on data furnished by the labor board, that the wage award would be equivalent to 12.2 per cent of the total railway operating revenues of the eastern group carriers. We approved increases in the eastern group of 40 per cent for freight service, including switching and special services; 20 per cent in passenger fares, excess baggage charges, and rates on milk and cream; and authorized a surcharge upon passengers in sleeping and parlor cars of 50 per cent of the charge for space in such cars, such charge to accrue to the rail carriers. Joint or single line through rates between points in one group and points in other groups were permitted to be increased 33 1/3 per cent.

The increases on freight traffic for the roads in the eastern

group did not average 40 per cent. Complainants estimate that they actually received or will receive 37 per cent increase instead of 40 per cent. Principally because of the interterritorial percentage increase having been made 33 1/3 per cent, the refusal of certain states to permit increases in intrastate rates equal to those we authorized for interstate traffic, and the continuance of fixed differentials, it is estimated that the increases for roads in the eastern group other than the complainants will be freight, 36.06, and passenger, 18.08 per cent. The acquiescence of the New England lines in being treated as a part of the eastern group and in receiving no more than the uniform percentage increases for the group as a whole was undoubtedly due to the fear on their part and on the part of the shippers in New England that a larger increase of rates, corresponding to financial needs, in New England than in the remainder of the eastern group would injure industry and traffic. The complainants and the defendants may be said to have been joint participants in a common undertaking i. e., to have their rates increased uniformly. Prescribing rates as a whole in rate groups necessarily means that the return will not be the same for each carrier. Complainants admit that the eastern trunk line and central territory carriers can not be legally required to transfer directly to them an equalizing amount, but claim that this may be accomplished indirectly through a change in the divisions of joint rates.

### New England Roads Originate or Deliver

#### Large Percentage of Traffic

Complainants particularly emphasize another of the statutory considerations for the determination of just, reasonable, and equitable divisions: They are either originating or delivering carriers in respect of the largest percentage of their traffic. For example, it is stated that 93 per cent of the traffic of the New Haven begins or ends on its line. Advance in transportation has been more marked in train service than in terminal services, or the latter has not kept pace with the former. Complainants contend that New England, particularly the dense manufacturing sections of Connecticut, Rhode Island, Massachusetts, and southern New Hampshire, containing 3,400,000 people, or 3.25 per cent of the population of the United States, is in effect a large terminal or railroad yard, and much of their evidence is directed to demonstrate the relatively high costs inherent in that condition.

Based on property investment figures submitted in Ex Parte 74 of \$833,583,558 for New England lines, other than the Canadian Pacific lines in Maine and the Boston & Albany, and of \$8,327,377,457 for the eastern trunk and central territory lines, it is shown that those investments are, respectively, \$109,480 and \$145,026 per mile of road. The investment per mile of road for the New England lines is 75.5 per cent of that for the eastern trunk and central territory lines. Based on a separation of operating expenses between freight and passenger train service, however, it is shown that the freight proportion of operating expenses was 63.03 per cent for these New England roads and 76.27 per cent for those in eastern trunk line and central territories, making the freight service proportion of the property investment, based on operating expenses per mile of road, \$69,006 for these New England roads and \$110,611 for the eastern trunk line and central territory roads. The revenue ton-miles of these New England carriers for the calendar year 1919 were 37.6 per cent per mile of road of the revenue ton-miles of the eastern trunk line and central territory carriers, and the property investment per 1,000,000 revenue ton-miles per year was, per mile of road: New England, \$58,005; eastern trunk line and central territory, \$34,958; the former being 165.9 per cent of the latter, the result, it is said, of the lower density of traffic, the greater density of terminals, and the shorter haul. On this basis, the net operating income must assume a 66 per cent greater carrying charge per ton-mile for these New England roads than for eastern trunk line and central territory carriers. This is a rough average and admittedly an indicative approximation only.

The major operating handicaps, interrelated and overlapping each other, of the complainants in comparison with operations in eastern trunk line and central territories, each of which is said to embrace factors largely beyond the control of complainants, may be summarized under four general headings: (a) diversity of routes and diffusion of traffic, (b) low freight traffic density, (c) terminal characteristics, and (d) short hauls.

### The Commission's Conclusions

After a discussion of these and other points the conclusions of the majority are stated as follows:

We think that there is merit in the allegations of defendants that the proceeding is, in substance, an effort on the part of complainants to augment their revenues from traffic which they interchange with their connections without regard to the question of whether the present divisions of the various joint rates are fair and reasonable or considerate of the probable effects upon the

revenues of the respective defendants. The proceeding is essentially an outgrowth of Ex Parte 74. It is contended for complainants that our decision in that proceeding operated to the relative disadvantage of the New England lines because their inclusion in the eastern group gave them less additional revenue and defendants more than might otherwise have been received and because of the difference in the percentage increases authorized for freight and passenger traffic, respectively, the lower percentage of increase having been authorized for passenger traffic, which is, generally speaking, relatively greater on complainants' lines than on the lines of defendants.

At the close of complainants' case defendants moved to dismiss the prayer for relief under paragraph VIII on the ground that we are without power to grant such relief. They moved also to dismiss other portions of the complaint, alleging that complainants had failed to make out a *prima facie* case and had not offered proof that would entitle them to the relief prayed. We shall, however, deal with the issues upon the record made.

In no proceeding heretofore brought under the provisions of the interstate commerce act have we been called upon to exercise powers so broad as those upon which complainants here rely. We may, therefore, fittingly advert to the controlling principles of law, illumined in the event of possible doubt by cardinal rules of statutory construction.

Under the substantive provision of section 1, paragraph 4, of the interstate commerce act, there rests upon every common carrier subject to the act the duty, in the case of joint rates, fares, or charges, to establish just, reasonable, and equitable divisions thereof as between the carriers participating therein which shall not unduly prefer or prejudice any of such participating carriers. A reasonable construction of the statute makes clear the intent of Congress that paragraph 4 of section 1 and paragraph 6 of section 15, taken together, should supersede former provisions of the statute and constructions placed thereon with respect to divisions of joint rates, whether established voluntarily or pursuant to our finding or order. It follows as a necessary corollary that we must be guided by the intent of Congress as expressed in the provisions of the present statute.

Under the provisions of paragraph 6, section 15, of the act we are authorized in appropriate cases, after full hearing, to prescribe by order the just, reasonable, and equitable divisions of joint rates, fares or charges to be received by the several carriers. Our jurisdiction attaches irrespective of the manner in which divisions theretofore prevailing were established. And our duty to prescribe divisions arises when, after full hearing, we are of opinion that the divisions brought in issue "are or will be unjust, unreasonable, inequitable, or unduly preferential or prejudicial as between the carriers parties thereto." In so prescribing and determining divisions of joint rates we are required to give due consideration, among other things, to the efficiency with which the carriers concerned are operated, the amount of revenue required to pay their respective operating expenses, taxes, and a fair return on their railway property held for and used in the service of transportation, and the importance to the public of the transportation services of such carriers and also whether any particular participating carrier is an originating intermediate, or delivering line, and "any other fact or circumstance which would ordinarily without regard to the mileage haul, entitle one carrier to a greater or less proportion than another carrier of the joint rate, fare, or charge." Under the provisions of the section no one of the elements which we are required to consider is predominant; all are to be considered *per se* and relatively in the determination of just, reasonable, and equitable divisions "to be received by the several carriers." The words "without regard to the mileage haul" do not forbid consideration of the element of distance. They serve rather to emphasize the fact that other specified elements may outweigh the element of distance in which event we may properly disregard the mileage haul. The clause is inclusive rather than exclusive, and the general words "among other things" constitute a clear exposition of the intent of Congress that we should consider all the facts and circumstances. We are bound under the statute to determine whether divisions properly in issue justly, reasonably, and equitably compensate each carrier, relatively and *per se*, for the service it performs in the joint haul under joint rates, fares, and charges. Our determination must be predicated upon a consideration of all the various pertinent factors including the ability or disability of the several carriers to adequately, economically, and efficiently meet their common-carrier obligations. In the final analysis the just measure of divisions is the reasonable and equitable share of the revenue earned under the rates to be divided which each carrier should receive.

By evidence of costs reflected largely in units of miles, ton-miles, locomotive-miles, and switching-miles, complainants endeavor to show that the cost of transportation over their lines is relatively greater than that incurred by defendants. The voluminous record upon which the case is submitted is replete with evidence of peculiar local conditions in New England and the

consequent relatively higher cost of conducting services for which complainants allege they are not justly, reasonably, and equitably compensated, with the result that their financial needs are not met.

## Complainants as Strong

### Financially as Some Defendants

It may well be that complainants are operated as efficiently as are other carriers; the importance of their service to the public in the highly developed territory which they serve can not easily be exaggerated; but their financial condition is not measurably worse than that of some of the defendants. The public interest does not demand nor does the statute either expressly or by reasonable implication provide that we may prescribe increased divisions of joint rates, fares, and charges to be received by certain carriers merely because other carriers participating in the joint rates, fares, or charges considered as a whole, have not failed in so great a degree to earn a fair return upon the value of their property devoted to the public service, although this is one factor which may be taken into consideration. Nor are we vested with discretion by virtue of which the mandate of section 1, paragraph 4, that divisions of joint rates, fares, and charges as "between the carriers" participating in joint hauls shall be just, reasonable, and equitable might be made ineffective by administrative or judicial action. The remedial provisions of paragraph 6, section 15, of the act offer to the carrier a source of relief to which it may resort in the event of a failure to observe the substantive provision of section 1, paragraph 4, or in the event of a failure to agree upon divisions and indicate the facts and circumstances which the Congress intended should be considered in determining what is "just, reasonable, and equitable."

### No Equitable Measure of Division Offered

In the view of complainants, we have "ample power to readjust these divisions by adding to the divisions of the New England lines without in this proceeding attempting to readjust the division between lines west of the gateways." It is submitted for complainants that "the New England lines are entitled to divisions 33 1/3 per cent in excess of what they now receive" notwithstanding admissions that divisions of certain joint rates now received by complainants are reasonable and equitable and that the present blocking of divisions in New England is a "mess of inconsistencies" and must be almost entirely rebuilt. No evidence of the reasonable and equitable measure of divisions other than "as a whole" has been offered. No method by which the apparently incongruous plan of divisions now in force might be readjusted has been submitted and we are thus left to deal with the situation in the light of generalizations which can lead only to speculative ventures upon an unknown field. The various methods which have been suggested to alleviate the financial condition of the New England lines and to insure to them just, reasonable, and equitable divisions indicate in themselves the uncertainty of their application and it is apparent that if adopted they would not only perpetuate the inconsistencies to which complainants refer but would create new preferences and prejudices.

For defendants it is contended that the failure of complainants to submit any evidence of the divisions on coal traffic, irrespective of those on other commodities which have been heretofore enumerated, is fatal to complainants' request for blanket relief since we can not know whether the divisions on coal and the other traffic are more or less than those to which the complainants are entitled and if it might be assumed that the divisions on the merchandise traffic are "as a whole" unjust and unreasonable, we have no evidence upon which to base an opinion as to whether the deficiency is or is not met from the revenues on coal.

### Unfair to Treat Complainants as a Whole

To treat the complainants "as a whole" or as a group would disregard the differences which obtain between the complainants individually. Much of the evidence adduced was solely in behalf of the New Haven and manifestly has no application to conditions on the Bangor & Aroostook, the Central Vermont, or the Rutland. The conditions obtaining on the lines of complainants are so essentially dissimilar that general relief would not afford each of them reasonable and equitable divisions.

The terminal characteristics of the New England lines have long been recognized, and complainants show that constructive mileage and arbitraries have been allowed them in partial recognition of their terminal character. A witness for complainants testified that during the last 15 years there has been no substantial change in the characteristics of the New England roads, and, as has been seen, we permitted material increases in the class rates in New England which reflected the terminal characteristics of their roads. To what extent the constructive mileage and arbitraries recognize in the joint rates the terminal characteristics of the New England lines is not capable of accurate ascertainment from this record; whether or not they are reflected in such rates

is doubtful, since for many years, for example, transcontinental rates have been blanketed over wide areas, and, despite the additional haul to New York, westbound rates from Boston and points north thereof are on the same basis as those from New York. Eastbound, the rates to Boston and numerous points grouped therewith are differentially from 7 to 2 cents per 100 lbs., first and sixth classes, higher than to New York. None can question but that these rate adjustments among others are to the interest of New England. Whether they are reasonable or unreasonable is not in issue in this proceeding. Our power is limited to dividing the available rates; otherwise the additional costs of a particular carrier not reflected in the rate might leave no division for another carrier.

The age of the divisions affords no presumption that they are unreasonable; it may be that they were too liberal originally. The record fails to show clearly that relatively the New England lines have had exceptional handicaps which their competitors have not encountered. We are told that it cost the New England lines \$17,646,168 a year to have per diem substituted for mileage as the basis for car hire, but no complementary statement is offered with which this amount can be compared. It is shown that New England is remote from the coal fields and that the New England roads must pay for the transportation of coal and other materials and supplies more than their connections pay, but there is nothing in the record to indicate that relatively these costs have increased to a greater extent than have similar costs in other territories. The relatively high proportion of passenger traffic on the principal New England roads has been especially stressed, but how that high proportion should be translated into increased divisions of freight rates for the complainants is only vaguely and indefinitely indicated. The effect of the cost of labor in New England has been stated in gross amounts, and the alleged exceptional effect of such costs has been expressed in percentages for certain roads, but it may be that defendant roads operating in sparsely settled communities were also adversely affected by wage increases.

### Complainants' Evidence Not Complete

If it had been clearly and definitely shown that particular divisions assailed were but fair compensation for the service performed when they were established and that since the establishment complainants have been subjected to relatively exceptional operating expenses of permanent character, some basis for an adjustment by us of the divisions of joint rates as between the several carriers participating therein would have been indicated if those exceptional expenses were reflected in the rates. Mounting operating costs, with which revenues have not kept pace, have been general. The voluminous, but yet limited, character of the divisions submitted; the selection of the points between which the divisions apply; the dividing of the rates only at the gateways; the almost total lack of the reasons which impelled the making of divisions via one gateway lower than via another; the doubt cast upon the reasonableness of the allowances and the arbitraries; the varying amounts of constructive mileage received by the complainants; the extent of the groups; the inconsistency of the division blocking; the failure of the Bangor & Aroostook to show any of its divisions; the fact that the Maine Central receives terminal arbitraries and arbitrary proportionals on much of its traffic; the failure to submit divisions on coal, high explosives, fluid milk and its edible products, fresh meat, in carloads, and other commodities; the absence of concrete final cost figures and indispensable facts, and, generally, the submission of much unrelated data, have resulted in a record that affords no basis upon which we might predicate a valid prescription of divisions. We are authorized to prescribe only just, reasonable, and equitable divisions "to be received by the several carriers." Full hearing and competent and relevant evidence are prerequisite. Any attempt to prescribe a blanket increase of divisions as here sought in the face of admissions and uncontradicted evidence that certain divisions are now just, reasonable, and equitable to complainants would override the plain mandate of law.

### Some New England Roads Among Defendants

While we are urged to adjust the division "as a whole" on the presumption that the facts shown of record as to a part of the complainants are generally true as to all of them, and that they reflect the situation in New England, it is to be noted that some of the roads in New England have been excluded from the list of complainants and included in the list of defendants. To so deal with the situation would not be treating the New England roads as a group. It would be taking from one road and giving to a less prosperous road, thus doing by indirection what the Congress deliberately and specifically refused to authorize us to do. The statutory provision for recapture of excess earnings from individual carriers also clearly negatives the idea that the Congress contemplated or intended that all carriers in a group should

so share in the aggregate earnings of the roads in the group that all would be upon an equality. Such a plan would stifle all incentive to skill, efficiency, economy, and good management.

However, the record lays before us an existing condition of divisional arrangements which is the antithesis of equality, unity, system, or order. A plan of transportation practices so fraught with incongruities and from which, as indicated by one of counsel, anything might be proved by a judicious selection of items, is indefensible. While the record affords no foundation upon which might rest a valid prescription by us of divisions, we can not disregard the conditions portrayed. Our duty would not be fully performed if we did not require a readjustment under which the conditions shall be relieved and demonstrably fair treatment accorded to all parties with respect to individual divisions. We are convinced, upon consideration of all the facts, that just, fair, and equitable divisions can not in many instances flow from the chaotic divisional arrangements to which we have adverted. We shall expect defendants and complainants to promptly submit to us proposed readjustments that will remove the inconsistencies portrayed of record and bring into conformity with the principles of law and equity expressed in the act the divisional arrangements, individually and as a whole, between complainants and defendants. To this end designation by the parties of appropriate committees of qualified personnel is recommended, and we shall expect the appointment of such committees to work jointly in revision of the divisions and to report to us at the end of 90 days after the date hereof the results of their efforts, together with statements of divisions upon which agreement has been reached, as well as those upon which there may not be complete agreement. Such statements may be accompanied by statements of fact and argument upon which the respective committees rely. Thereafter reports should be made to us at the end of each period of 60 days until final and complete disposition of the issues shall have been accomplished. For these purposes the record will be held open.

### Commissioner Eastman Dissents

#### Commissioner Eastman said in part:

Throughout the majority report runs the criticism that complainants ask revision of their divisions "as a whole." If the New England carriers were to obtain relief in this proceeding which would be of avail against impending financial danger, it was necessary for them to move quickly and deal broadly with the situation. They merit no criticism for so doing, and in my opinion they have made out a case justifying temporary relief pending more detailed consideration of specific divisions. In this case I fear that the majority are construing certain vital provisions of the act in a way that will make it a less effective instrument than it was designed to be for the promotion of the general transportation good.

The critical financial condition of the New England roads, in which the United States has an investment of some \$125,000,000, is a matter of common knowledge. For some months they have been failing to earn fixed charges. It is at least possible that only some measure of success in this proceeding will save certain of these carriers from serious financial trouble. If the danger is not averted results will follow of direct and serious concern to the whole country. Not only will it be deemed proof of the failure and futility of the transportation act, 1920, but for years it will discourage investment in railroad securities in a part of the country which has been one of the great markets for such securities.

### Acute Conditions Call for Action

These results will be the more certain and severe because the financial trouble will be due to failure to earn upon legitimate investment. New England railroads have a reputation for financial mismanagement which is only in part well founded. The New Haven was the chief victim of this mismanagement, and it consisted in the waste of many millions of dollars in the purchase of securities of trolley, steamship, and other companies. But the investment of the New Haven in physical railroad property is sound, and if it earns a return on that investment it can at least pay its way. Its present difficulty is in earning even operating costs.

It is, I think, an inevitable conclusion that Congress intended to give us a wider jurisdiction and discretion in determining divisions than would have been proper if such determination were viewed merely as an isolated problem. In other words, divisions were regarded in connection with and as a phase of the larger problem of assuring a national transportation system sound and healthy in all its parts, and it was the definite intent to permit us, in fixing divisions, to take into consideration this larger end. In the hearings which preceded the transportation act, 1920, attention was continually directed to the problem of the weaker roads. It was realized that the rule of rate making in section 15a would produce uneven results and leave this problem unsolved. While Congress was unwilling to go so far as to authorize the

direct diversion of the excess earnings of the strong roads for the benefit of the weak, it did deem it wise and expedient to permit, and indeed require, the relative prosperity of carriers to be taken into consideration in determining the divisions of joint rates. Nor was this a means of doing indirectly what Congress was unwilling to do directly. It was, rather, a means of going part way along the path suggested without traveling the full distance.

### "Financial Needs" Should Be Given Consideration

I find no difficulty, therefore, in reaching the conclusion that in this case we have both the right and the duty to consider, not only the relative importance and cost of the service rendered by the respective carriers, but also the *financial needs* of the New England roads and the consequences to the entire country if they should meet with serious financial trouble.

A second vital question of law is whether we have authority to make a temporary adjustment of divisions pending a further and more detailed consideration of the problem which they present, consuming many months of time. It is good administration to act quickly when the public interest demands, upon the best evidence available, even if we know that readjustments may be necessary before the problem under consideration is finally put to rest.

I think it a logical conclusion, therefore, that we are not without power to prescribe a temporary adjustment of divisions where we know that further inquiry may be necessary before stability and permanence can be attained, if good administration of the national transportation interests calls for "prompt action" and the best measure of relief that can presently be afforded. It should here be noted that while interchange traffic with defendants is a very large factor in the revenue of complainants, the interchange traffic of any one of the defendants with complainants is but a minor factor in its revenue.

### Temporary Adjustment Recommended

My conclusion is that we may and should require a temporary adjustment of the divisions in favor of the New England lines, keep the case open, and direct the parties to reopen negotiations and be prepared to renew the trial of the case at or before the expiration of one year if they are unable to agree among themselves as to a permanent adjustment in the meantime. As I have tried to show, the record will support such temporary relief either upon the theory of financial needs or upon the theory of changed conditions, or upon a combination of the two. The evidence is insufficient to measure the effect of the changed conditions accurately in dollars and cents, but it is not insufficient for a conservative estimate, and partial reliance upon financial needs makes even this unnecessary.

Stated concretely, my judgment is that the least we should do is to require the carriers west of the Hudson for a period of 18 months, unless otherwise ordered, to shrink their divisions by 15 per cent on all interchange traffic, except coal, with complainants, this amount to be added to the divisions of the New England lines. Coal must be excepted for the present, because no evidence has been introduced in regard to the divisions on this traffic, and complainants have themselves asked that we allow the case to remain open for the submission of further evidence on this point.

The plan thus suggested would probably help certain New England carriers more than others, but they would have it within their power to correct such result by adjustment of their own interline divisions, and we could with propriety suggest that this be done.

### Commissioner Potter's Dissenting Opinion

#### Commissioner Potter said in part:

I can not concur in the majority report, which seems to me needlessly to concede the futility of the transportation act and the impotence of the commission to remove injustice. I concur generally in the views expressed by Commissioner Eastman.

The transportation act has settled the carriers upon the high plane of public service. The aspect of private business enterprises, entitled to all they can win from their position and strength, limited only by what the traffic will bear, is no longer dominant. Subject only to supreme decree on constitutional questions their revenues are to be limited to fair compensation for the services which they render. The Congress has expressly applied to them the rule which, in the present day, must be recognized with increasing application to all industries—that enterprises are justified primarily, not for individual gain, but because the public needs them and those who thus serve the public are entitled to receive as profits fair compensation for the service which they render.

As public servants carriers are to have public protection and fair compensation. Having regard to the essential function which they perform, the railways which are honestly, economically, and efficiently managed are entitled to a status and relation to indus-

try and to each other which assures them prosperity. To these ends the transportation act was framed. We have been given the power to work out the detail of rate adjustment to yield the compensation which the Congress has determined shall be provided. We are authorized to act in helpful ways in matters of operation. We are charged with the duty of enforcing correct adjustments between carriers in their joint relation and of requiring the application of the rule of right instead of power. We must see that through rates are fairly divided, and we must find a way to bring this about. We are not a court to dismiss for want of proof. We must ascertain the facts, and we have all necessary means. We must correct injustice when and where we find it and as we can. With one accord we have condemned the existing adjustment. We should now correct it. Commissioner Eastman has pointed a way, and we should follow it.

The effect of including the New England lines in ascertaining the values of the railways in the group and the earnings needed, to make up the deficit below a fair return, as a basis for determining the amount and percentage of rate advance was to increase the percentage which was accorded to the other lines beyond what it would have been if only the values of their own lines had been considered. The other lines are enjoying not merely the increases that their own values entitled them to, but something additional resulting from the value and deficit of the New England lines. Large sums which the public pays, in rates and charges, because of the value and deficit of the New England lines are going, not to them, but to the other lines in the group. The effect of this is to give to the other lines more than they are entitled to under the theory of the transportation act and to give to the New England lines correspondingly less than they should have. This wrongful diversion of earnings is represented by an ascertainable percentage of all earnings on through business, which are being withheld from the New England lines as a whole and given to the other lines in the group as a whole. This percentage should be taken away from the other lines and given to those in New England, and this can be done by a percentage readjustment of divisions within the group as between the lines east and west. The task involved is one of accounting, and if we would announce the principle the carriers could readily apply it. I have complete confidence in their ability and purpose to apply the rule that we announce.

Beyond the direct unmerited contribution which the New England carriers have made and are making to the other lines, as the result of our application of the rate-making provisions of the transportation act (and which the New England lines are entitled to have restored to them) the record shows that the New England lines are entitled to increased divisions.

## Value of New England Roads

### Considered in Making Rates

The value of the New England lines was considered and included by us in Ex Parte 74 in determining the aggregate amount to be paid by shippers for the use of the group transportation machine. The low earnings of the New England lines were considered in determining the amount of additional income to be raised. The effect of this action by us was, because of the difference in traffic density, to transfer to the other lines a part of the compensation which, under the statute, was to be raised, and which we started out to raise, for the New England lines. It is now our duty to correct this unsound result and direct these earnings back to the New England lines, where they belong under the statute and by virtue of our action which created them. To do less is not only to perpetuate gross injustice but to sanction a result which, it seems to me, is not in harmony with the spirit of the law. As I see it we are not asked to give to the New England lines something that belongs to the others, but to end a misappropriation in violation of law, by the other lines, of funds that belong to the New England lines. In fairness and justice the burdens of all carriers participating in through traffic, including a fair return to their owners upon their respective investments, should be considered in making an equitable division of the returns from their joint activities. The transportation act embodies these rules of simple justice. This act, recognizing that in the last analysis all enterprises involve only dealings between individuals and their relations to one another, requires that the rules of common fairness as between man and man shall be applied by railway public service corporations. We are the nation's agency to enforce these rules. Acting in the nation's power, we should not say we can not. I have so valued the transportation act, and have had such high hopes that I can not adopt the majority conception of our power and duty.

If it be true that we can not do complete justice immediately, this is no reason why we should not do partial justice. We can immediately, by a percentage readjustment, see that the New England lines receive what is now being diverted from them to the lines west as a result of their inclusion in determining the value of the properties in the group for rate-making purposes.

We can require that the New England lines be given that part of the increased earnings of the group, which was authorized for them by us in Ex Parte 74, because of the lower earnings of these New England lines. We can correct the carriers' methods so that the scheme of the transportation act to raise moneys to compensate for the use of all parts of the group machine shall not be defeated, after the moneys have been raised, as a result of our action in fixing different percentage increases on freight and passenger traffic and of the different ratios as between freight and passenger traffic on the different lines.

The representatives of the complainants adopted sound procedure in seeking a readjustment of the relations as a whole. Conditions were serious and required a major operation. As efficient men charged with great responsibility they had no other course. Immediate justice, to which the New England lines were entitled, could not be obtained in any other way. A delay of justice in such a case is a denial of justice. The display by the defendants in this case of the traditional and not unnatural attitude of carriers to protect their revenues has been sufficient to justify the complainants in their view that a short-cut course to general directions by us was necessary. Similarly, we should be convinced that little will be accomplished promptly unless we announce the rules that are to guide the carriers.

## New Specifications for Concrete

THE JOINT COMMITTEE on Concrete and Reinforced Concrete, which was organized in February, 1920, has presented its first progress report in the form of tentative specifications for concrete and reinforced concrete. This committee is composed of five representatives each from five national societies, namely, the American Society of Civil Engineers, the American Society for Testing Materials, the American Railway Engineering Association, the American Concrete Institute, and the Portland Cement Association. Richard L. Humphrey, consulting engineer, Philadelphia, Pa., is chairman of the joint committee, and J. J. Yates, bridge engineer of the Central Railroad of New Jersey, is vice-chairman. Besides Mr. Yates, the American Railway Engineering Association is represented by George E. Boyd, until recently division engineer, Delaware, Lackawanna & Western; Frederick E. Schall, bridge engineer, Lehigh Valley; H. T. Welty, engineer of structures, New York Central, and C. C. Westfall, engineer of bridges, Illinois Central.

This committee is the successor of the Joint Committee which made its final report in July, 1916, but the work of the present committee differs from its predecessor's in that whereas the earlier committee formulated general principles of practice for concrete design and construction, the present committee has undertaken to prepare complete specifications for both design and construction. The specifications were submitted before the recent convention of the American Society for Testing Materials, and will subsequently be reviewed by the other associations represented, following which the specifications will be referred back to the committee for a final draft.

Owing to the fact that the work of the present committee is not directly comparable with that of its predecessor, the present specifications are best compared with the specifications for plain and reinforced concrete adopted by the American Railway Engineering Association at its convention in March, 1920. The newer specifications, however, are much broader in their scope in that they cover the general subject of design and stresses, whereas the A. R. E. A. specifications refer only to workmanship. Taken as a whole, the new specifications are primarily building specifications in that where special details and conditions are referred to, they are primarily such details as are encountered in reinforced concrete building construction rather than those met in the design and construction of reinforced concrete railway or highway bridges or culverts. In the case of the design specifications, in particular, large portions are related primarily to the details of columns, slabs, etc., which go to make up the reinforced concrete building.

The specifications for materials and workmanship, which

are the portions of primary interest to railway engineers, may be said to represent a distinct advance as considered in comparison with the A. R. E. A. specifications. There is, however, very little of direct conflict between the two specifications, such differences as occur being primarily due to the inclusion in the new specification of requirements based on the results of more recent investigations in the strength of concrete. Thus a number of the clauses in the specifications imply the making of 28-day field tests of the materials actually to be used on the job, this information to be used on a check of the strength of the concrete in the light of the working stresses used in the design and as a means of obtaining the desired proportions of the various ingredients. The section on proportioning, however, provides for alternate clauses which make such tests unnecessary.

The specifications for the fine and coarse aggregates contain requirements for certain gradings of sizes, and in the case of the coarse aggregate this is contingent upon certain sieve analyses. In the case of the sand also it is provided that "The decantation test shall be made in accordance with the standard method of test for quantity of clay and silt in sand for highway construction of the American Society for Testing Materials." A further clause, however, provides for some modification of this requirement.

The requirements for metal reinforcement differ from those of the A. R. E. A. specifications in that bars rolled from old rails are permitted, whereas the A. R. E. A. specification excludes them. A deformed bar is defined as "one that will develop a bond strength at least 25 per cent greater than that of a plain round bar of equivalent cross-sectional area." The portion of the Joint Committee specifications relating to metal reinforcement under "details of construction" would seem to contain some valuable features not usually covered. This section is as follows:

Metal reinforcement, before being positioned, shall be thoroughly cleaned of mill and rust scale, and of coatings of any character that will destroy or reduce the bond. Reinforcement appreciably reduced in section shall be rejected. Reinforcement shall be reinspected and when necessary cleaned where there is delay in depositing concrete.

Reinforcement shall be carefully formed to the dimensions indicated on the plans or called for in the specifications. The radius of bends shall be four or more times the least diameter of the reinforcement bar.

Metal reinforcement shall not be bent or straightened in a manner that will injure the material. Bars with kinks or sharp bends shall not be used.

Metal reinforcement shall be accurately positioned and secured against displacement by using annealed iron wire of not less than No. 18 gage or suitable clips at intersections, and shall be supported by concrete or metal chairs, or spacers, or by metal hangers. Parallel bars shall not be placed closer in the clear than one and one-half times the diameter of round bars or one and half-times the diagonal of square bars; if the ends of bars are hooked as specified in Section 130 the clear spacing may be made equal to the diameter of round bars or to the diagonal of square bars, but in no case shall the spacing between bars be less than one inch nor less than one and one-fourth times the maximum size of the coarse aggregate.

Splices of tension reinforcement at points of maximum stress shall be avoided. Splices, where required, shall provide sufficient lap to transfer the stress between bars by bond and shear, or by a mechanical connection such as a screw coupling.

Vertical reinforcement shall be offset in a region where lateral support is afforded when changes in column cross-section occur and the vertical reinforcement bars are not sloped for the full length of the column.

Exposed reinforcement bars intended for bonding with future extensions shall be protected from corrosion.

The portion of the specifications relating to mixing and placing concrete is drawn much along the same lines as that of the A. R. E. A. specifications. A mixing period of 1½ min. as given in the A. R. E. A. specifications is amplified by the requirement that the mixer shall travel at a peripheral speed of about 200 ft. per min. No effort is made in these specifications to dodge the question of spouting, which is covered by the following clause.

When concrete is conveyed by spouting, the plant shall be of such size and design as to insure a practically continuous flow in the spout. The angle of the spout with the horizontal shall be such as to allow the concrete to flow without separation of the ingredients. The spout shall be thoroughly flushed with water before and after each run. The delivery from the spout shall be as close as possible to the point of deposit. When operation must be intermittent, the spout shall discharge into a hopper.

The specifications for forms were obviously drawn with the idea of meeting the requirements of building construction. One omission noted is the absence of any reference to steel forms, while the requirement that "wire ties will be permitted only on light and unimportant work" will no doubt seem a rather drastic restriction by those who build railway bridge structures and retaining walls and culverts.

Concrete in sea water is treated along the line of the report presented by the Committee on Masonry of the American Railway Engineering Association at the 1921 convention. A significant admission as to the limitations of concrete in this connection is found in the clause stating "Where unusually severe conditions of abrasion are anticipated, the face of the concrete from 2 ft. below low water to 2 ft. above high water, or from a plane below to a place above wave action, shall be protected by creosoted timber, dense vitrified shale brick, or stone of suitable quality, as designated on the plans."

Finishes are treated in somewhat more abstracted form than they were covered in the A. R. E. A. specifications.

## Tentative Valuations

WASHINGTON, D. C.

THE INTERSTATE COMMERCE COMMISSION has served a tentative valuation report on the property of the St. Louis Southwestern in which it states the final value as of June 30, 1915, as \$29,072,479 for the property used, 988.54 miles of track, and \$26,792,424 for the property owned, 838.15 miles. The valuation includes the Gray's Point Terminal, the Paragould Southeastern and the Central Arkansas & Eastern. The total capitalization of the St. Louis Southwestern as of the valuation date was \$123,327,083 but this includes a considerable amount of bonds and stocks of other companies, some of which form a part of the St. Louis Southwestern system, including the St. Louis Southwestern of Texas. The total par value of these stocks and bonds was \$33,810,757. No dividends have ever been paid on the company's common stock. The investment in road and equipment, including land, is stated in the books of the carrier as \$67,430,327 as of the valuation date and the commission says that if certain readjustments were made and the items in the account taken at their recorded amounts, this figure would be reduced to \$62,853,401, of which \$46,881,248 is the par value of securities issued for the property of the St. Louis, Arkansas & Texas. The total maximum outlay in creating the property of the Arkansas company, the report says, could not have exceeded \$11,301,661. The original cost to date is not reported. The cost of reproduction new of the property used, excluding land, is given as \$31,099,584 and the cost less depreciation as \$23,757,820. The present value of the lands is given as \$2,462,159 and the excess cost as \$1,713,252.

The commission has also issued other tentative valuations which report the final value as follows:

Montpelier & Wells River.....	1914	\$1,925,000
Manistique & Lake Superior.....	1915	686,444
Union Freight Railroad.....	1915	429,833
New Orleans, Natchitoches & Natchez.....	1916	381,619
Uachita & Northwestern.....	1916	354,944
Wichita Union Terminal.....	1916	2,070,911
Chicago & Wabash.....	1915	455,500
Milledgeville.....	1916	70,551
Mehroe.....	1916	119,928
Moshassuck Valley.....	1916	160,404
Sugar Land.....	1916	490,697

## E. P. & S. W. Rebuilds 141-Mile Wood Stave Pipe Line

Conduit Supplying Entire Engine District Rebuilt After 13 Years'  
Life to Provide Enlarged Capacity

By J. L. Campbell

Chief Engineer, El Paso & Southwestern, El Paso, Tex.

**O**RIGINALLY the entire water supply of the El Paso & Southwestern System was from wells. From Carrizozo to Santa Rosa (128 miles) the water carried more than 100 grains of incrusting solids per gallon, could not be made suitable for steam by treatment, and was so bad

level, from which the pipe line runs around the northeast base of the mountains 12 miles to Nogal storage reservoir, also situated on the crest of the divide 7,100 ft. high, from which the line drops into the Rio Grande basin to the railroad at Carrizozo and Coyote to elevations of 5,400 and 5,800 ft., respectively—a total of 46 miles of pipe from source of water to the railroad.

From Coyote to Corona (36 miles along the railroad) the water is pumped up to an elevation of 6,750 ft. (a 950-ft. lift), Corona also being on the crest of the divide between the Rio Grande and the Rio Pecos. From Corona to Pastura (the present terminus of the line), 59 miles along the road, the pipe drops back into the Pecos basin to an elevation of 5,300 ft. Eventually it will be extended 20 miles to Santa Rosa on the Pecos, the water of this stream being unsuitable for steam—a total distance of 150 miles from the source of water supply.

In the original line there were 117 miles of wood, 6 miles of steel and 18 miles of cast iron pipe. Diameters ran from 16 to 4 in. The maximum pressure is 130 lb. for wood and 300 lb. for iron pipe. This line has a capacity of 3½ million gallons daily from source of supply to Nogal reservoir and 1½ million from the reservoir to the railroad. The reservoir is a natural bowl-shaped basin in the summit of the water shed 1,700 ft. above the railroad. It has a capacity of 400,000,000 gal. up to the lowest place in the rim of the bowl. This can be increased to 1,000,000,000 gal. by three small embankments.

The pipe line was built 13 years ago. The annual peak demand on it now equals its original capacity. To provide for future requirements, a renewal and enlargement program to be completed in 1930 has been inaugurated by which the original capacity will be doubled. The lower line on the profile gives the diameters of the proposed enlarged line from the source to the Rio Pecos at Santa Rosa. This will include 137 miles of wood, 6 miles of steel and 36 miles of cast iron pipe. The wood pipe diameter will run from 21 to 5 and the iron from 15 to 12 in. The maximum pressures will be the same as above given for the original line. About 25 miles of the renewal program, including the 21-in. wood pipe, is completed and the capacity from source of supply to Nogal reservoir is now 7,000,000 gal. daily.

Weight and cost of cast iron pipe in isolated and moun-

**Two Views of the Eagle Pipe Line Crossing the Mountains**

that the growing traffic could not be successfully handled on that district.

A better water supply was imperative. This was found in Bonito and Eagle creeks, small streams on the east slope of White mountain situated 30 miles southeast of Carrizozo and fed by springs and snow, the mountain being 12,000 ft. high. This water is good, having less than 10 grains of incrusting solids per gallon. It is conducted to and along the railroad in a pipe line shown by the dotted line on the map on the following page.

White mountain is on the divide between the Rio Grande and the Rio Pecos. The point of water diversion lies in the Rio Pecos drainage on the east slope 7,750 ft. above sea

tainous country led to selection of wood pipe for original construction for all pressures not in excess of 130 lb., and the same considerations still impel adherence to original conclusions. The wood pipe is the kind known as machine-made spirally-wound pipe. In Vol. 70 of the Transactions of the American Society of Civil Engineers there is a full description of the original line.

The wood pipe is now made to E. P. & S. W. specifications. Cast iron collars, when required for the joints, are made in El Paso to the railroad's design and specifications. We believe the iron collar is best, especially for high pressure, but wood collars under 130 lb. are serving satisfactorily. All of this pipe so made is remarkably tight, the average leakage therefrom not being in excess of 25 gal. per mile per inch of diameter per day.

At Coyote and Luna (on the pumping section) the maximum pump pressure is 300 lb. and cast iron pipe is used

pumps are Nordberg, cross-compound, condensing, crank and fly wheel pumping engines having a contract duty of 135 million ft.-lb. per 1,000 lb. of dry steam at 150 lb. pressure. The boilers are Sterling water tube with superheaters. Each plant is lighted by a small electric light unit.

The renewal and enlargement program described was not put under way because of necessity for general renewal of the original line at this time. The original wood pipe could be maintained at reasonable expense for the next 10 years, perhaps longer, but such a program would finally require the renewal of more than 100 miles of pipe in limited time with attendant risk and concentration of expenditure.

About the only material limitation of the life of wood pipe properly designed, made and laid and kept saturated is the corrosion and consequent failure of the steel banding. The banding on the original pipe herein described is an ungalvanized flat steel band protected only by a heavy coat of asphalt. Failure of this band began in the fourth year, but has never been serious. During 1920, the twelfth year, the repair of banding so failing required an average of 15 individual  $\frac{3}{8}$ -in. round bands of the kind used on continuous stave pipe per mile of pipe line. This was a quite nominal expense. A failure of the banding is indicated by a leak which is usually discovered and stopped by application of a few round bands without taking the pressure off the pipe. The round galvanized banding, also covered with asphalt, will last much longer and the pipe so made should be maintained at a reasonable expense for 50 years, other conditions being right.

The investment in this water supply was necessarily large, but within two years the reduction of operating cost due to the better water was greater than the investment. Train tonnage increased  $33\frac{1}{3}$  per cent within 30 days after the use of the new water supply began. One of the marked results was a psychological one. Under the disastrous conditions prevailing with the bad water everyone on the district was discouraged and esprit de corps was gone. In 30 days it was more than recovered, everybody developed a high batting average and the operating district was converted from a liability to an asset.

Map of the El Paso & Southwestern, Showing the Water Supply Line

from each pumping station up the line to the point where the pressure in the pipe is 130 lb., from and beyond which wood pipe is used. Water hammer on these pumping mains is eliminated by large air chambers in the form of a riveted steel cylinder 5 ft. diameter and 15 ft. long, mounted in horizontal position over and connected to the main by a 12-in. tee just outside of the pump house. These cylinders are kept charged with air by small automatic air charging devices attached to the water end of the pumps and actuated by the piston movement.

Each pumping station consists of two duplicate pumping units, one unit being in reserve. The units are operated alternately, usually in three-month periods. Additional units will be added as required by increasing pumpage. The

# "Stop or Proceed" versus "Stop and Proceed"

## Signaling for Economy and Progress, Not for Safety in Its Narrow Sense; Abolish Useless Stops

By A. H. Rudd

THE CAMPAIGN to eliminate the unnecessary stopping of trains is on. The campaign to automatically stop trains is on. The pendulum, as the German said, "Swings fro and to, fro and to." At first glance it would seem that the two movements represent diametrically opposed forces, tending to bring the pendulum to rest. At first glance also it would seem that the vibration of a pendulum does not aptly illustrate rapid progress and advancement—yet this "swinging fro and to" has been frequently cited as the characteristically American method of arriving at its destination and, when it ceases, the works stop. Both campaigns should succeed; the forces back of both should work together: the result should be ideal.

Nothing is so easily overlooked as the obvious. Perhaps the presentation of a few scrambled axioms may lead some card-index mind to arrange them in logical sequence and help the solution of the problems. At all events, a review of the development of signaling and the changing ideas as to its value and its functions may be of interest:

1. Travel by railroad is safer, in spite of its dangers, than almost any other method of locomotion.

2. If no trains moved, no trains could collide; but there would be no travel.

3. The danger element is introduced as soon as a train starts.

4. Having necessarily introduced this danger it is obvious if all trains moved in the same direction at the same speed no collisions would result.

5. With a number of trains moving in the same direction each stop may endanger the movement. Therefore, unnecessary stops should be eliminated.

6. Signals were originally installed to indicate Stop, and for no other purpose.

7. Later, they were erected to give warning of danger ahead, or "Prepare to stop."

8. For years they were regarded as a luxury or a necessary evil.

9. Later they admittedly "safeguarded traffic," but it took years of work to convince "practical" old-school railroad operating officers that signals could be used for *expediting and facilitating traffic*.

10. Even yet education along these lines is apparently necessary, and the publicity departments of the signal companies are advocating the installation of interlockings at grade crossings and junctions, and the shortening of blocks by providing automatic signals for the purpose *not* of safeguarding traffic by *stopping* trains, but of *safeguarding, expediting and facilitating traffic by the elimination of unnecessary stops*.

11. A great many inventors, still clinging to the original conception as to the functions of signals, are attempting to develop devices whose sole function is to stop trains (in at least 50 per cent of their actions unnecessarily), while perhaps one-tenth of one per cent are working to *safeguard, expedite and facilitate traffic*.

Ideal operation is one of speed at termini, infrequent yarding and continuous movement between yards. It is, of course, impossible of attainment, but every stop, every delay, every moment cars or engines are idle, no matter from what cause, increases the cost.

Obviously, therefore, a device which will prevent excessive speed on curves, over crossovers and at other points where speed should be restricted, and which will, as a last resort, stop the train short of the danger point; a device which will only function when the engineman fails, leaving him free control while he does function, and permitting him to cut out the stop, but, in such event, to run only at slow speed, would theoretically at least not only safeguard but expedite traffic, and would supplement rather than nullify a signal system designed to keep trains moving.

Collisions resulting in fatalities rarely occur in terminals or in the congested districts; as a matter of fact, they rarely occur at all, considering the number of trains run; but they most frequently occur in the open where fast running for long distances is the rule.

This is the field for speed control, but not for automatic stops as such, which would not only cause collisions but which would force us to violate the Esch-Cummins law, which requires that railroads be economically and efficiently operated. Every real railroad man wants to so operate, not alone because it is the expressed wish of the Congress, but as a matter of pride in his work and the joy of accomplishing something worth while; and he knows the railroads must be so operated if they are to live.

The progress of signaling has been so rapid that every signal engineer in the country, worthy of the name, knows where he can earn a big percentage on his investment (much of it, unfortunately, intangible earnings and savings) if he could fully equip his busy lines with modern signals and interlockings, and replace a large part of what he has in service, just as manufacturers replace their machinery, with more efficient apparatus. He knows what he wants to do. He knows what he would do if he had unlimited funds, but he also knows the financial condition of the roads, and he is living from hand to mouth, hoping the day may come when he can again create and have others, as well as himself, look upon his work and say "behold it is good." It is doubtful if, under the present conditions, he can do much to hasten the advent of this signal millennium; but, instead of waiting with his hands folded and his white robes on, he may be able to ameliorate existing conditions by assuming the well-known role of the reformer and telling others where to head in.

### Some Improvements Practicable, in Spite of Financial Restrictions

Several signal engineers, and even some "practical operating men," firmly believe better and safer operation could and would be attained if the stop-and-proceed signal were eliminated and the signal provided in the A. R. A. standard code rule No. 501-G, which does not require the stop, substituted. This is an operating matter and the signal engineers have no jurisdiction; but they may express their opinion.

The A. R. A. standard code (automatic block signals) Rule 504, April 15, 1896, read: "When train is stopped by a block signal it may proceed when the signal is cleared or after waiting — minutes, and then running under caution or preceded by a flagman to the next clear signal." This rule, revised April 25, 1920, reads: " \* \* \* it may proceed when the signal is cleared or: A: after waiting — minutes

and then running under caution; B: Preceded by a flagman to the next clear signal"—either being considered good practice; "B" being generally used on single track. Edition of February, 1911, Rule No. 504: "When a train is stopped by a block signal it may proceed when the signal is cleared; if not immediately cleared it may proceed—A: On single track preceded by a flagman to the next clear signal—B: On double track at once with caution."

The standard code, Nov. 17, 1915, differentiates between the stop signal and the stop-and-proceed signal, and Rule 509 provides—"When a train is stopped by a stop-and-proceed signal it may proceed \* \* \* \*: On two or more tracks at once, at slow speed, expecting to find a train in the block, broken rail, obstruction or switch not properly set."

We started out with a time interval. Then we put in the absolute manual block system, spacing trains perhaps four or five miles apart. Then we installed automatic signals with shorter blocks and held trains — minutes (on one road originally, I believe, five minutes, then cut to two, then to one, and finally no time required, simply the stop), and the standard code, as noted above, now provides a signal, Rule 501-G, "Proceed at slow speed prepared to stop short of train or obstruction"—eliminating the stop—Name: Permissive Signal—Requisites of Installation: "Block is occupied, or switch is set to diverge." This indication is used on some roads to govern heavy tonnage trains on up grades, other trains being required to stop and proceed, although this aspect is different from the stop-and-proceed signal, and the anomalous condition exists of two aspects indicating stop-and-proceed for certain trains and one aspect indicating stop-and-proceed for some trains and proceed without stopping for other trains. On other roads, this signal permits all trains to proceed without stopping.

Many roads run freights "permissive with freight" in manual block territory, either by signal indication or by card or order, without stopping, and yet we cling to the antiquated stop-and-proceed signal with the idea that in some way it tends to safer operation.

Recently on a busy line, where all automatic signals are either stop or stop-and-proceed the proposition of an extension of automatic signals was discussed and objected to, because, while it would facilitate passenger traffic, the frequent additional stops required on account of the automatic signals (with shorter blocks) would tie up freight trains on up grades which were being safely moved under the manual permissive without stops. And the objection was good.

"Cutting off his tail an inch at a time doesn't really make it any easier or better for the dog." Why not cut out the stop everywhere?

There are two component parts of Rule 509 (Old rule 504):

1st—The stop.

2nd—The slow speed after stopping.

Advocates of the stop insist that the first part enforces the second and makes for better discipline. This may be the case on heavy up grades with heavy trains, which cannot get up speed for a long distance, if at all, after stopping, but this is just the condition under which, by the use of grade signals, the first requirement is eliminated. On level track a light train, and on descending grades any train, can attain considerable speed after stopping, while passing through blocks 4,000 ft. or 5,000 ft. long or longer. Therefore, the second requirement must for safe operation be enforced independently of the first.

Some of us believe that the automatic block signal governing following movements should give information as to the occupancy or non-occupancy of the block and, when three-position or home and distant signals are used, of the indication displayed by the next signal; the stop-and-proceed signals should be eliminated; and stop signals displayed *only where stops are required*, i. e., when protection is needed

against opposing movements and at grade crossings, junctions and crossovers where side collisions might otherwise occur.

### Argument for Eliminating "Stop and Proceed"

By eliminating stops which are unnecessary and are known by the enginemen to be unnecessary, we should strengthen the significance of the *stop signal as such*.

We now have signals which indicate in effect:

- Proceed at slow speed, prepared to stop short of train or obstruction.
- Stop and then proceed at slow speed, prepared to stop short of train or obstruction.
- Stop and stay till signal clears or specific authority is given to pass.

The first and second of these indications (a and b) are identical in the action required of the engineman after passing the signal but *b* requires a stop before reaching it. The protection afforded a train ahead is in either case the requirement that the following train shall *proceed at slow speed prepared to stop short of train or obstruction*. If this requirement is obeyed the stop is absolutely useless, for the train is not required to stop and *stay* till the block is clear, but may proceed at once at slow speed!

Why, then, the stop? Because it is presupposed that without it the second requirement may be disregarded.

Is it not logical to assert, as some operating officials do, that the men, realizing the stop delays traffic, are more likely to run faster than they would if they had not (as they do in many cases) spent two or three minutes in starting?

Every effective signal system in use is based on the premise that the indications will be obeyed. Any attempt to design or enforce a system predicated on the violation of its indications would be worse than futile; it would be nonsensical.

Any statement that this one particular indication must require the stop, when we know that the indication *a* (Proceed at slow speed prepared to stop short of train or obstruction) is properly obeyed thousands of times a day all over the country, is an assumption of weak discipline and reckless and disobedient enginemen, which is not only humiliating but is not in accord with actual conditions.

It is a curious fact that the devices intended for speed control, as differentiated from the straight stop, eliminate the stop feature, or provide for its elimination if slow speed is maintained.

When we install train control, do we want each train to stop at or considerably before reaching a signal indicating block occupied or that a train is to diverge at slow speed, and have the engineman get off his engine and do some complicated releasing act? Or, do we want to get our trains over the road safely, with a minimum delay, and pull them down to slow speed only when necessary and when the engineman fails to function?

Let us clarify the situation.

Let us give the engineman the best information possible of conditions ahead, consistent with a system of signals whose indications he can instantly grasp. Let us tell him to stop only where necessary and when we say stop let us mean it.

Let us eliminate "b" or else let us add a few more variations, such as "You may stop," "You should stop," "You must stop," and then wind up with that effulgence of splendor, that exuberance of verbiage, so dear to many—"Trains must come to a full stop!"

Eggs, fresh eggs, strictly fresh eggs! Let's have less eggs and all fresh. Less variations in stops and all real stops. *Stop-and-Stay*; this because it is necessary.

A careful, unprejudiced study of the problem, undertaken with an open and active mind, will, we believe, by the unassailable logic of the situation, lead eventually to only one result. The change will be made some time, and it will be interesting to see which management has the "intestinal investiture" to issue the first Declaration of Independence.

# Suggested Remedy for the Freight Car Situation

## Inadequate Per Diem Rates Remove Incentive for Ownership; Holding Company Would Improve Conditions

By W. S. Moseley

Mechanical Engineer, Carolina, Clinchfield & Ohio

**A**N article in the *Railway Age* of June 10 forcibly brings to attention the need for better maintenance that will result in more permanent improvements to freight cars.

Notwithstanding the numerous rules governing the repairing of cars and the honest endeavors of the motive power officers, the problem bristles with complex and involved conditions over which the motive power department has no control. A condition, such as has prevailed in recent years, in which cars are off the owning line 50 per cent of the time and some cars are away four or five years, tends to prevent proper repairs or the carrying out of repair programs. Stringent rules are fine for the other fellow, but when it comes to applying them to ourselves and making repairs of a permanent nature to foreign cars, probably at a loss, and at the same time paying the owner a rental charge for each day the car is on the line, it is somewhat difficult to convince the management that the expense is justified, especially when home cars awaiting repairs are accumulating. We have yet to find a road that is complying with Rule I of the Code of Interchange. The rule is at variance with the primary motive of the railroad officers, whose interest is the welfare of their company.

The car service rules attempt to prevent the misuse of equipment, but in their application they do not prevent a railroad holding a modern car which is in good condition and getting rid of a weak and worn-out car which is likely to cause trouble and damage to both equipment and contents.

The per diem charges are not sufficient to justify owning enough equipment to meet the requirements, when repairs, fixed charges and return on the investment are considered in connection with the fact that probably 20 per cent of the time (during depressions) the car is idle and not earning its upkeep, or when consideration is given also to the investment in plants necessary to keep the cars in service. The present practice of charging a flat per diem rate for all cars and the distribution of cars without regard to condition, capacity or value is not sound and tends to perpetuate the use of equipment that should be taken out of service. This practice also encourages the purchase of cars on a price basis to the extent that a non-coal carrying road will buy light weight coal cars and the coal carrying roads buy light weight box and house cars.

### Present Accounting Rules Discourage

#### Ownership of Cars

The practice of charging all costs of repairs made to home cars on foreign lines to the maintenance of equipment account and not giving this account credit for any of the rentals, tends to discourage the purchase of freight equipment, both by the motive power and operating departments, for the reason that as the equipment rentals are not charged to operating expenses, a better showing can be made with an inadequate car supply than would otherwise be the case. This is illustrated by a case where one road had a debit of \$500,000 per month on account of equipment rental and a smaller adjoining line had a credit of \$200,000. Neither of these amounts affected the operating ratio, but the smaller line had a charge to maintenance of equipment each month on account of repairs to cars on foreign lines equal to the total amount expended on the home line on home cars, in addition to the depreciation

charges which were necessary for the surplus equipment.

Regulating expenditures on the basis of revenue may be necessary but it is uneconomical and results in work not being done at the most opportune time. The present is a good example of this unfortunate practice when the repair tracks are full of equipment needing overhauling with employees laid off on account of funds not being available to do the work.

### Standardizing Cars Through a Holding Company

Freight cars lend themselves to standardization more readily than any other equipment, and standard designs should be adopted, but under present conditions, as outlined above, the proposition seems hopeless until some central body is given the authority and held responsible for results. How can this be done?

One answer is to break away from the time honored, but inefficient methods of today and place all cars used in interchange traffic under central control, which would be held responsible for the repairs, renewals, retirements, depreciation and return on investment in freight cars. This central body should also have control of the Car Service Division. All would necessarily be subject to the Interstate Commerce Commission.

The central body should be a company with its entire stock owned by the railroads in proportion to their equipment requirements. The present equipment should be turned over to the company in payment for stock, and if not sufficient equipment is now owned, the balance should be in cash or approved obligations.

The company would probably subdivide the country into regions and would undertake to make all repairs to freight cars by means of centrally located car shops, the railroads doing only such repairs as may be necessary to make the equipment safe to run and light running repairs in yards. The railroads would bill against the owning company for this service.

The owning company would make a combination charge for the use of the equipment on a basis of car days, plus the total car miles per month. This charge should be sufficient to provide a surplus that would be used to make repairs when cars are not in demand. The charge should also be sufficient to insure a net profit which would be turned back to the railroads in the form of dividends and in this way penalize a company for not providing for its full requirements by stock subscription. A minimum charge per month based on normal requirements should also apply in order to equalize the carrying charges when there is a surplus of equipment.

### Advantages of Unified Control of Cars

The advantages of the above plan would be numerous, and should reduce the cost of maintenance as well as better the condition of the equipment. Cars of obsolete design could be segregated and either permanent improvements applied, or the cars retired. Groups of cars needing heavy repairs could be ordered into shops, systematically overhauled and placed back in service promptly. Repair shops could be segregated from railroad shops and handled on a piece work basis. These shops would be of sufficient size to specialize various operations and utilize complete shop equipment. The sepa-

ration of repairs due to wreck damage from those due to use would facilitate an analysis of the cost of maintenance of various types of cars and devices and lead to adoption of improved designs.

Standards could be promulgated with the knowledge that they would be applied and benefits derived immediately therefrom. The systematic handling of repairs at large shops would reduce the cost as well as keep the number of bad order cars to a minimum.

A company to handle this proposition should have a capital of about \$2,500,000,000, but this would not mean new capital as the present equipment would represent something near this amount.

The following table, compiled from bulletins of the Car Service Division, shows that the larger railroads are in better shape to keep their equipment in serviceable condition.

	Number of Railroads	Cars Owned		Cars Bad Order	
		Number	Per Cent of Total	Number	Per Cent of Total
Group A, over 100,000....	3	506,000	21.5	57,900	17.8
Group B, 50,000 to 100,000...	10	620,000	26.4	83,100	25.6
Group C, 25,000 to 50,000...	16	607,000	25.8	86,100	26.5
Group D, less than 25,000...	108	613,000	26.3	97,900	30.1
Total .....	137	2,346,000	100	325,000	13.9

It will be noticed that 137 roads owning 2,346,000 cars can be divided into groups of those owning over 100,000 cars, those between 50,000 and 100,000, those between 25,000 and 50,000, and those under 25,000 cars. This division shows that each group owns approximately one-fourth of the total number of cars, although the first only consists of three roads, the second 10, the third 16 and the fourth 108 roads. The interesting feature is that the larger the number of cars owned per road, the smaller is the proportion of bad order cars, both to the total number of bad order cars and to the number of cars owned by the groups.

It is appreciated that an arrangement as outlined would include many details that would have to be worked out, but this should not be any more complicated than the present method.

## Railroad Bill Introduced in House

WASHINGTON, D. C.

A BILL TO CARRY OUT President Harding's recommendations for providing the Railroad Administration with funds to enable it to settle its obligations to the railroads was introduced in the House on July 28 by Chairman Winslow of the committee on interstate and foreign commerce. The bill would authorize the War Finance Corporation to purchase from the Railroad Administration railroad securities now held by it, or to be acquired by it, at an aggregate purchase price not exceeding \$500,000,000, at the prices and subject to the discounts, if any, at which they were acquired by the Railroad Administration. The bill also amends section 207 of the transportation act, which provides for the funding of expenditures for capital improvements, to provide that any bond, note or security acquired by the Railroad Administration, as the agent of the President, in connection with the funding, may, at the option of the President, bear interest at the rate of 6 per cent, and in such event shall be received at par less such discount as may, in the opinion of the President, represent the customary and reasonable expenses of marketing such bond, note or other security, or may bear interest at a rate less than 6 per cent, and in such event shall be received at a price to yield an average return, if held to maturity of 6 per cent, such price to be subject to such further discount as may in the opinion of the President represent the reasonable expense of marketing.

It is also provided that in the case of a carrier that has already made a settlement with the Railroad Administration,

the settlement may be readjusted for the purpose of funding any indebtedness of the carrier to the United States arising out of additions and betterments made during federal control.

The part of the bill relating to the War Finance Corporation is made an amendment to the War Finance Corporation Act. It provides that whenever, in the opinion of the board of directors of the corporation, market conditions justify, the securities acquired by the corporation from the Railroad Administration may from time to time be sold at not less than the original cost to the corporation, and it is also authorized to sell at the request of the President railroad securities not purchased by the corporation. The proceeds of all bonds, notes or other securities so sold to the corporation, or sold by it as selling agent, are to be a fund to be used by the President for the purpose described in section 202 of the Transportation Act, which provides for the settlement of the obligations of the government to the roads arising from federal control.

Representative Winslow explained that the purpose of the bill was to put funds into the hands of the railroads so that they may be able to go into the market and purchase supplies, and he said that they apparently are ready to make such a move if their credit can be established so as to warrant them in so doing. The settlement of the accounts, he added, would make it possible to reduce the Railroad Administration force, which now numbers 1,200 and which is costing the government \$4,000,000 a year.

A bill to the same effect but with somewhat different language was introduced in the Senate on July 29 by Senator Townsend, a member of the committee on interstate commerce, and plans are being made for early consideration in the Senate. The Senate committee, after its extensive hearings on the railroad question, is not expected to hold hearings on the new bill, but the House committee will probably consider it necessary to hold hearings. It is expected that there will be a fight against the bill on the part of those who believe, or would like to make it appear, that the railroads are receiving some special favor, but the support of the administration is counted upon to put it through.

A statement was issued from the White House on July 29 outlining "the accomplishment of the past four months by various branches of the government in the direction of relieving financial conditions" which contained the following on the railroad situation:

"The financial necessities of the railroads have long been recognized as of imminent concern to the entire country, not only because efficient transportation is vitally necessary, but also because there is hope for a resumption of industrial activity when the railroads are put in funds and enabled to begin buying the vast quantities of material which they need. In order to make this possible the administration has put forth a program which contemplates the early and rapid settlement of the accounts between the railroads and the government, growing out of the period of federal control and operation. This settlement should enable the roads to become extensive purchasers of materials and thus greatly improve industrial conditions. In this connection the President has recommended to Congress that the War Finance Corporation should be given power to purchase railroad securities from the director general of railroads in order to finance the settlements by the Railroad Administration. This proposal is merely a revival of the war-time powers of the corporation, under which it made advances of about \$205,000,000 to the director general of railroads and the railroad companies. Of this amount, about \$160,000,000 has been repaid. In connection with the advances previously made the War Finance Corporation was able to give effective assistance to the general railroad credit situation by means of its intervention and the co-operation it was able to secure from bankers. It is expected that its intervention at this time will again have a beneficial effect on general railroad credit . . . ."

*Benguella Locomotives Are Equipped with Automatic Vacuum Brakes*

## Recent Designs of Twelve-Wheel Locomotives

Not Extensively Used in America, Common in Other Countries—Baldwin Designs for Export

THE FIRST LOCOMOTIVE in which eight driving wheels were combined with a four-wheel leading truck and which is now known as the 12-wheel or 4-8-0 type was the "Centipede," which was placed in service on the Baltimore & Ohio in 1863. Although 12-wheel locomotives are commonly used for heavy freight mixed traffic on a number of European and Asiatic railways, comparatively few have been built for American railways. Probably the

Driving wheels .....	56 in. diameter
Boiler .....	80 in. diameter
Heating surface .....	4,041 sq. ft.
Grate area .....	44.7 sq. ft.
Boiler pressure .....	200 lb.
Maximum tractive effort .....	52,500 lb.

### Benguella Railway—Portuguese West Africa

The Benguella Railway of Portuguese West Africa extends eastward from Lobita Bay on the Atlantic coast into

Heavy Standard Gage Jamaican Locomotive

most extensive users of this type in the United States are the Norfolk & Western and the Lehigh Valley. During 1906 and 1907 the Norfolk & Western placed in service 100 4-8-0 type locomotives built by the Baldwin Locomotive Works. These were followed in 1910 by 50 heavier engines of the same type. These locomotives, as originally built, used saturated steam and were equipped with Walschaert valve motion and piston valves. They were of the following dimensions:

Weight of engine .....	261,100 lb.
Weight on driving wheels .....	213,200 lb.
Cylinders .....	24 in. by 30 in.

the interior to Colongo, and at present has 390 miles of 3 ft. 6 in. gage line in operation. When completed the road will be 1,155 miles in length, reaching from the coast to a point near Bakuma, where it will connect with the trunk line from Capetown. The rolling stock includes 23 locomotives, 4 rack locomotives, 15 passenger coaches and 198 freight cars and will be added to as the road is extended. Eventually the road will be an important one and furnish the shortest route to the interior of the country.

On May 29, 1920, an order was placed with the Baldwin Locomotive Works for two locomotives of the 12-wheel type,

which were shipped to Lobita Bay and are now used in construction work extending the railway. These locomotives are the first of this class ever purchased by the Benguela Railroad.

### Midland Railway—Western Australia

The Midland Railway runs south from Geraldton along the coast to Denison, then inland and connects with the Government Railways of Western Australia at Midland Junction, about 10 miles north of Perth, and at present operates 17 locomotives, 20 passenger cars, 11 brake vans and 342 freight cars over some 275 miles of 3 ft. 6 in. track. The Baldwin Locomotive Works also received an order from the Midland Railway for two 12-wheel locomotives. These

Inclined Cylinders Are Used on Midland Locomotives

locomotives, as in the case of the two for the Benguela of Portuguese West Africa, were the first of this type to be purchased by the Midland Railway. They were ordered in September, 1919, and shipped in April, 1920, to the port of Fremantle. They are now being used for both passenger and freight service.

### Jamaica Government Railways

The Jamaica Government Railways run west from Kingston, forming two lines at Spanish Town; one runs north to Linstead, Ewarton and Port Antonio, while the other runs in a northwesterly direction to Montego. The railways operate 197 miles of standard gage track and possess 44 locomotives, 38 passenger cars and 589 freight cars. The Baldwin Locomotive Works have built various designs of the 12-wheel type of locomotive for the Jamaica Government Railways since 1907, in which year the first order was placed. In September, 1919, an order was given for two 12-wheel type locomotives, which were completed and shipped in January, 1920. While these locomotives were being built and erected additional orders were placed, one in the latter part of September, 1919; one in December, 1919, and one in January, 1920. These duplicate locomotives were respectively shipped in January and March, 1920, to Kingston, Jamaica. They are now being used for mixed passenger and freight service.

The weights and principal dimensions of the 12-wheel type locomotives supplied to the three railroads referred to are given in the accompanying tabulation:

	Benguela Portuguese West Africa	Midland Western Australia	Jamaica Government
Tractive Effort (85 per cent working pressure)	27,200 lb.	22,520 lb.	32,975 lb.

A Compound Consolidation on the Northern Railway, France

# Reorganization of Car Service Division, A. R. A.

## M. J. Gormley New Chairman—Changed Methods of Reporting Car Surpluses—Freight Car Loading Increases

THE CAR SERVICE DIVISION of the American Railway Association has been reorganized, effective August 1, and M. J. Gormley has been appointed chairman. The chairmanship will be the point of contact between the Car Service Division and the Interstate Commerce Commission on all details relating to car matters. Mr. Gormley will have general supervision over the activities of the division and will report to the president of the American Railway Association.

Car service managers are W. C. Kendall, A. G. Gutheim, W. J. McGarry, and L. M. Betts. J. J. Pelley is manager of the refrigerator department with headquarters at the Manhattan building, Chicago. C. F. Sewart is manager of the troop movement department and C. A. Buch is secretary. The manager of the refrigerator department will also act as district manager at Chicago. It is proposed to appoint district managers at other important centers if necessary.

The car service managers are assigned as follows: W. C. Kendall to the Railroad Relations Section; A. G. Gutheim to the Public Relations Section; L. M. Betts to the Closed Car Section; and W. J. McGarry to the Open Car Section. The Railroad Relations Section will handle all questions relating to car service and per diem rules, analyze statistics not in the field of other departments, supervise the work of local car service committees, district managers and inspection forces and supervise the placement and cancellation of embargoes. The Public Relations Section will co-operate with government and local authorities other than the Interstate Commerce Commission and make special studies of various classes of traffic from time to time. The sections dealing with closed, open and refrigerator cars will supervise the distribution of the classes of cars assigned to their jurisdiction. The secretary is responsible for the organization of the division's general office.

### Roads Expected to Keep Records

#### Showing Violations of Rules

In the interests of reducing unremunerative car mileage to the lowest possible minimum and in order to remedy conditions which permit inefficient handling of cars, the Car Service Division expects all railroads to maintain records which will bring to the attention of executives the extent to which:

1. Home cars are loaded to off line points contrary to car service rule 1.
2. Foreign cars are forwarded contrary to car service rules 2 and 3.
3. There are other violations of car service rules 1 to 5.
4. There is reason or necessity for violations mentioned under items 1, 2 and 3.

The following suggestion is outlined as a simple method of keeping a summarized record of rule violations, and may be augmented as advisable or necessary to suit local conditions. Separation of violations by types of cars is recommended where there is general loading by types. Weekly count of:

- (a) Total foreign cars loaded.
- (b) Foreign cars loaded locally contrary to car service rules.
- (c) Foreign cars loaded to connections contrary to car service rules.
- (d) Per cent violations to total foreign cars loaded.
- (e) Home cars loaded off line separated by types and by roads.

- (f) Foreign cars of similar types delivered empty to connections, separated by roads.

### A New Figure—Cars Out of Service

#### Due to Business Depression

In arriving at a fair total of surplus cars the Car Service Division has adopted a new category, "freight cars temporarily out of service due to business depression." This figure includes the total serviceable cars on hand in excess of current freight requirements and *in addition* includes bad order cars in excess of 7 per cent of the total number of freight cars. It is believed that this figure represents a better standard for present comparisons due to the difficult conditions respecting labor and materials of the past few years and to the fact that in a period of depression cars are allowed to remain in bad order for longer periods.

Freight cars temporarily out of service due to the business depression totaled 555,168 on July 23, according to reports just received from the railroads of the United States by the Car Service Division. This is a reduction of approximately 10,000 since July 15.

Reports show that surplus cars (not including those in bad order) on July 23 numbered 350,772, which was a reduction of 21,278 cars when compared with the total on July 15. This reduction was due principally to the increased demand in the Central Western region for grain cars. Surplus box cars totaled 119,442, which was a decrease of 16,191 compared with the July 15 figure, while surplus coal cars were reduced 5,049 to a total of 168,568. Surplus stock cars fell off 628 during that period, so that on July 23 they numbered 16,297.

Reports from the Central Western region show that the decrease in the number of surplus cars reported in that territory was not offset by any increase in the number of cars needing repairs but that the freight car situation in that part of the country has taken a turn for the better. Due to the demand for grain cars, a shortage of 2,768 freight cars was reported to the Car Service Division, of which 2,500 represented box cars. This was an increase of 1,500 over the total shortage reported on July 15.

Cars in need of repairs on July 15 totaled 365,092 or 15.9 per cent of the cars on line, compared with 354,611 or 15.4 per cent on July 1. Allowing for seven per cent being normal, cars in need of repairs above normal totaled 204,396, which added to the total surplus means 555,168 cars out of service because of business conditions.

### Freight Car Loading

Loading of revenue freight totaled 790,348 cars during the week ended July 23, according to the reports of the Car Service Division of the American Railway Association. This was an increase of 14,096 cars over the preceding week but was, however, a decrease of 138,070 cars when compared with the corresponding week of 1920, and a decrease of 119,334 when compared with the corresponding week in 1919.

The principal increase during the week of July 23 was in the loading of grain and grain products, which totaled 64,919 cars, or 7,928 cars more than during the preceding week. This total was 29,442 cars greater than that for the corresponding week in 1920 and 13,374 cars in excess of that for the corresponding week in 1919. It also was 7,804 cars above the peak loading of any week since January, 1919, which is as far back as the Car Service Division records go.

Tabulations also show that from June 1 to July 28, inclusive, 362,800 cars have been loaded with grain and grain products. This is 100,000 cars more than were loaded with that commodity during the same period last year. It also exceeded the loadings for the same period in 1919 by 83,400 cars. An increase of 4,804 cars in the number loaded during the week of July 23, compared with the week before, with merchandise and miscellaneous freight, which includes manufactured products, was also reported. The total for the week was 467,889 cars, which was, however, 48,796 cars under that for the corresponding week last year.

Coal loadings totaled 152,142 cars, or only 26 cars more than during the preceding week, but 49,448 cars under that for the same week last year. It was also 31,641 cars below the total for the corresponding week in 1919. Tabulations show that the loading of livestock totaled 24,689 cars for the week, which was a decrease of 113 cars compared with the week before, while coke loadings increased 191 cars to a total of 3,928 cars. Forest products fell off 911 cars, the total being 43,126, and ore loadings were 33,655 cars, or an increase of 2,171 cars over the preceding week. Except for grain and grain products, the loading of all commodities was less during the week than during the corresponding week in 1920.

Compared by districts, all reported increases in the number of cars loaded compared with the week before but there were reductions in all except the Southwestern district when compared with the corresponding week of last year.

## A Systematic Plan for the Movement of Freight Traffic

THE DISPATCHING and classifying of freight trains at all terminals on the Baltimore & Ohio is now conducted through the aid of a comprehensive system which constitutes a most excellent example of the manner in which scientific management may be applied to railway operation.

ORIGINATING TO ST. LOUIS - WESTBOUND

F A	Section order		
F Q	Bunch Shops proper with the locale between Shops and Cose	For Shops Yard and Flora Yard to classify and dispatch on head end of through trains except No. 97	
P O	Bunch East St. Louis and beyond	For Shops and Flora to maintain and Cose to classify and dispatch	Dispatched in either way grouped with Symbol R T - solid on hind end
R T	For solid trains empty roof and tank cars for East St. Louis and beyond Bunch all refrigerators, stock, box and tank cars	For Shops and Flora to maintain and Cose to classify and dispatch	

Note 1: Foreign equipment enroute to home road via East St. Louis will be dispatched with Symbol - R T - Such cars at intermediate points east of East St. Louis will be forwarded on way freights and pickups.

Typical Sheet of Instructions for Handling Tonnage Trains and Local Freight

More directly it points to the solution of the perplexing problems of excessive terminal costs and delays to trains consequent on a lack of proper co-ordination in handling the work of the various yards on a given route. Briefly the system comprises an outline showing in minute detail where and how all trains shall be classified so as to move them over the line with a minimum of break-up between origin and destination,

while providing that this work shall be done at those points on the line where the facilities are most adequate for the particular requirements. The system is founded on a minute study of the physical characteristics of the property in the light of a detailed knowledge of the volume, source and nature of the traffic, and the operating limitations of the system, both as to yard and train movements.

The plan was applied to the eastern lines of the Baltimore & Ohio in 1919 and was extended to the entire system about six months ago. It is the natural consequence of a critical study of the traffic and facilities of the Baltimore & Ohio

Note 2: This train enroute between Brunswick and Willard may pick up Symbol Y-17, slow or fast and place in train regardless of standing for Willard Yard to classify and dispatch.			
Note 3: If insufficient tonnage, slow and fast, to run New Castle Division Section, it shall be con- solidated with Chicago Division 97 and be so maintained through to New Castle Junction and backed off.			

### Specimen Page of Instructions for Handling Time Freight

which has been in progress for some time. The initial result of this was to improve the operation of the individual yards; further, it led to perfection in the handling of traffic on particular routes and ultimately the same degree of systematic direction in the movement and classification of trains has been extended to the entire system.

One fundamental idea carried out through all of this work has been to classify the trains completely as near the origin of the traffic as possible in such a way that they may be run through as many terminals as possible without breakup. For instance, Brunswick, Md., is the point where western movements are concentrated into solid trains for Pittsburgh, New Castle, Chicago and the St. Louis-Cincinnati lines. Similarly, Brunswick is the point where eastbound movements are reclassified for destination at the principal terminals on the seaboard. In like manner, Willard, Ohio, is the concentration terminal for freight eastbound from Chicago, the cars for the Atlantic seaboard being made up into trains that are not broken up until they reach Brunswick. The operation of this system as applied to time freight will be better understood by reference to the typical sheet taken from the volume of instructions from this classification. This shows the handling of time freight in the section of train No. 97 destined from New York to Chicago. Here it will be noted that this train is made up at Brunswick, Md., to run without breakup through Cumbo, Md., Cumberland, Connelleville, Pa., and Newcastle to Willard, Ohio, where the train is classified for destination so that it may be handled through Garrett, Ind., without change. As a consequence of this system, therefore, train No. 97 from New York to Chicago, suffers delays for classification only at two terminals in the entire distance.

The same system applies to tonnage trains, not only on through routes but on lines where much of the traffic is of

local origin and destination. The plan is to make up the train to run as great a distance as possible without breakup. This is illustrated in the specimen sheet No. 40 comprising instructions for the makeup of westbound trains at Seymour, Ind., the first engine terminal west of Cincinnati. This sheet shows four classifications. The first is EA, the local freight between Seymour and Shops, the next engine terminal to the west. The second classification, PQ local freight between Shops and Cone (East St. Louis) obviously must be reclassified at the other intermediate terminals. The other two classifications, however, cover freight destined for East St. Louis and beyond and the instructions specifically provide that this freight shall be made up in trains that are not to be broken up between Seymour and East St. Louis.

The responsibility for the observance of this classification rests primarily with the district and division officers of the system, with the assistance afforded by four district supervisors of terminals located at Cumberland, Md., Wheeling, W. Va., Willard, Ohio, and Cincinnati, under the direction of the general supervisor of terminals. The benefits derived from this system now accruing to the Baltimore & Ohio have been found to include: Increased engine miles; increased car miles; decreased per diem; decreased overtime; decreased terminal time and minimum switching in all yards; quick and dependable freight service; lessened liability to claims from delays in transit and lessened opportunity for thefts by delays in yards.

The system was developed and put into practice under the direction of E. T. Horn, general supervisor of terminals, Baltimore, Md.

## The Value of the Tracing Service\*

By P. W. Gates

Tracing and Reconsignment Bureau, Southern Pacific Company

**I**N DISCUSSING the value of tracing service it is well to make some distinction between the value of the service to shippers and consignees on the one hand, and to the railroad companies themselves, on the other. For many years the railroads have maintained a tracing and manifest system for recording the movements of their cars for the benefit of their patrons. In recent years, however, owing to the keen business competition, there has been a growing demand for the extension of this service with the result that today the carriers have perfected an elaborate automatic tracing system at considerable expense which enables them to keep shippers and consignees fully informed daily as to the location of their freight. This service enables merchants to: (1.) Divert, (2.) Re-consign, (3.) Make more favorable arrangements for handling, (4.) Create a better market for their freight, (5.) Carry on their business without being obliged to tie up considerable funds in goods which are in transit, (6.) Protect themselves from the rise and fall of the market. In addition, it enables smaller purchasers to secure passings on shipments contained in pooled or consolidated cars.

This valuable information is given out by the railroads to their patrons without solicitation, and materially assists them in building up undeveloped business. As an example of the extent to which patrons of the Southern Pacific make use of the information disseminated by our tracing system, it has developed that our traffic department sent out approximately 48,000 wire tracers, locating and expediting freight during 1920. This service, it must be borne in mind, was entirely apart from the individual wiring done by our respective superintendents over the system, and indicates the great value of the tracing service to the public.

## Tracing Improves the Carriers' Service

Undoubtedly one of the greatest values the carriers derived from their tracing service is increased tonnage. But in addition to more business, tracing also enables the carrier to improve the service which they are rendering by locating the delays occurring at terminals or junctions and by determining whether or not their schedules are being maintained. It also assists the traffic departments in tracing shortages, and in locating waybills for cars which are held up on account of lost revenue billing, an occurrence which causes delays all too frequently. The service also prevents delays to cars which may have been set out for repairs or to reduce engine rates. In short, it serves as a check by which the road may determine whether or not every link in its freight service is performing its function properly.

The tracing service is not without its evils and abuses, however. Experience has made it clear that many merchants have the impression that any shipment, whether carload or less, should be followed with a tracer immediately after being shipped, to insure its prompt movement. Other shippers make a practice of requesting the services of a tracer when their shipment has been in transit only a few days. This sort of tracing does not produce satisfactory results. On the contrary, it results in congestion of the wires, as well as freight jams at junction and terminal points, thus destroying the efficiency of legitimate tracing. The carriers should make every effort to discourage requests for this sort of tracing and should encourage their patrons to permit sufficient time to elapse for their freight to reach its destination before calling on the tracing service. Articles in various periodicals indicate that a large number of industrial associations are making an organized effort to eliminate this unnecessary tracing. For instance, the National Industrial Traffic League has appealed to its members to confine their requests for tracing to their actual needs. In addition, the American Railway Association, together with the Western Weighing and Inspection Bureau, has suggested to its members that the practice of tracing cars from shipping points to destination immediately after the freight has been offered for shipment be confined to cases of real necessity.

## A New Specification for Rails

By Robert W. Hunt,

Robert W. Hunt & Co., Chicago

**M**Y INTEREST in and connection with the manufacture of steel rails have extended over the entire period of their production; and the establishment of specifications governing their manufacture which, while resulting in the output of good rails should at the same time be of practical commercial application, has received my careful thought. At this time the subject of rail specifications is, as always, of importance, but, unfortunately, is in a somewhat unsatisfactory condition, owing to the difficulty of the rail manufacturers and rail consumers uniting on various phases of a specification aiming toward improved practice.

There is, I think, very little, if any, dissatisfaction with the actual wear of open-hearth steel rails. What the users desire, most of all, is a safe rail; meaning by that rails that, while generally affording good long life under usual traffic and roadbed conditions, are free from sudden failures. This the roads do not feel they are obtaining, and, in addition to the annoyance and expense caused by defective rails which have to be removed from track after comparatively little service, the anxiety and menace to life caused by actual broken rails is at the same time very great. Head failures in rails rolled from metal forming the tops of the ingots are apparently on the increase and internal fissures constitute a most dangerous defect deserving of the fullest study.

\*Abstracted from an address before the Pacific Railway Club, Oakland, Cal., May 12.

It is not my purpose now to go into any long discussion of the merits of various rail specifications, but it seems to me that the time is opportune to present a specification for consideration which I believe offers many advantages not found in others. Those portions of this specification which vary from other specifications in common use appear below.

I have been claiming for many years that each ingot cast on a heat is a unit unto itself and deserving of being tested and treated as such. It is nearly ten years since I recommended the nick and break test on every ingot, and the practicability of the method then proposed has been thoroughly demonstrated by the fact that practically all rails made in Canada for the last six years have been so tested. But, because of the loathness of American manufacturers to permit it, the system has not been given a thorough trial in the States; and I am now proposing that in lieu of this plan of testing, if the manufacturer desires, the top rails of each ingot can be rolled into tie plates to be hot punched, sheared and annealed, which the purchaser agrees to accept in place of the tonnage of "A" or top rails that he would ordinarily obtain under his contract. Tie plates made from such steel have given good satisfaction for several years and, no doubt, those manufacturers whose works are not now properly equipped will be glad to install the machinery for producing them to aid the railroads in obtaining better rails.

I have been convinced for a number of years, and actual experiences have proven that the cold straightening of rails can be minimized very much and in some cases eliminated without detriment to the track conditions, and with such obvious saving to the manufacturers as would more than cover the cost of milling the ends of the rails square and free from burrs. Better attention to the soaking pit practice and restricting the cold straightening, I believe, will ultimately afford relief from the development of internal fissures.

The attached specification is not offered as the best that can be proposed. It is presented with the thought that it may help to compose the difference existing between rail makers and users and to afford the groundwork for a common standard which will insure good safe rails at the base price.

### Specifications for Open-hearth Steel Rails

80 lb. to 110 lb., inclusive, per yard

#### Chemical Requirements

4. Chemical Composition and Analyses. (a) The chemical composition of each heat of steel from which the rails are rolled shall comply with the following:

Carbon, not less than.....	.60 per cent
Manganese, not less than.....	.60 per cent
Phosphorus, not more than.....	.04 per cent
Silicon, not less than.....	.10 per cent

(b) Rails rolled from heats containing more than .75 per cent of carbon shall have the flanges near the ends painted yellow and be shipped separately, provided, however, that such heats do not have either the manganese content over .90 per cent or the phosphorus content over .03 per cent.

(c) A chemical analysis for each element above mentioned, including sulphur, shall be made on each heat of steel cast for rails. The analysis shall be made on approximately equal portions of carefully mixed drillings taken from two ladle test ingots, one representing the steel going into the second regular ingot cast, and the other that going into the next to the last regular ingot. The methods for making the analyses shall be those adopted by the American Society for Testing Materials.

(d) The ladle test ingots shall be of such shape and size as to induce quick sound setting of the steel and, if necessary, a few pellets of aluminum may be added to the dipper to insure soundness. The drilling for analyses shall be taken not less than one-eighth inch beneath the surface.

(e) The complete analyses of each heat cast for rails shall be available for the inspector as promptly as possible and he shall always be furnished with a copy of it before the rails are loaded.

(f) The inspector may witness the manner of obtaining the drillings for analyses and the methods employed for analyzing, and he may take a portion of the original drillings at any time for checking purposes.

10. Drop Tests. (a) If two of these test pieces do not break at the first blow, all of the rails of the heat shall be accepted, subject to the requirements of Section 11.

(b) If two of the test pieces break at the first blow, all of the top rails of that heat shall be rejected.

(c) Second tests shall then be made from three test pieces selected by the inspector from the bottom end of the top rails of the same heat and ingots. If two of these test pieces do not break at the first blow, all of the remainder of the rails of the heat shall be accepted, subject to the requirements of Section 11.

(d) If two of these test pieces break at the first blow, all of the second rails of the heat shall be rejected.

(e) Third tests shall then be made from three test pieces selected by the inspector from the bottom end of the second rails of the same heat and ingots. If two of these test pieces do not break at the first blow, all of the remainder of the rails of the heat shall be accepted.

(f) If two of these test pieces break at the first blow, all of the remainder of the rails of that heat shall be rejected.

11. Destruction Tests. (a) A test piece representing the top end of the top rail from each ingot of each heat rolled, which has passed the drop test requirements of Section 10, shall be nicked and broken to determine whether the interior metal is sound. If an interior defect shows on the fracture, the top rail of the ingot represented shall be rejected and a second test piece cut from its bottom end shall be nicked and broken to determine the character of the metal of the second rail. If an interior defect shows on the fracture, the second rail shall be rejected and a third piece cut from its bottom end for retesting. Thus the rails of each ingot shall be tested progressively from the top downward until the fracture shows sound metal, following which the rails of the ingot represented shall be accepted.

(b) An interior defect is interpreted to mean seams, laminations, cavities or interposed foreign matter, or a distinctly bright or fine grained structure in the center of the section evidencing segregation, made visible by the destruction tests, the saws or the drills.

(c) Rails represented by test pieces found to be segregated shall be accepted as No. 2 rails.

(d) If, under the drop test requirements of Section 10, the "A" and "B" rails of a heat have been rejected, but the "C," "D," "E," etc., rails accepted, the destruction tests herein specified will be waived on the accepted rails of that heat.

12. Optional Conditions. (a) In case the manufacturer elects after due notice, the purchaser agrees to accept hot sheared, punched and annealed tie plates rolled from the steel that would, in the ordinary course of the manufacturer's practice, be rolled into "A" or top rails from the ingots cast under this specification. It is understood that such tie plates shall be in accordance with purchaser's drawings and specifications.

(b) When a top discard of not less than twenty per cent is made on all ingots from which rails are offered for test and inspection, Section 11 shall be waived.

#### Details of Manufacture

15. Quality of Manufacture. (a) The entire process of manufacture shall be in accordance with the best state of the art.

(b) The steel must be well deoxidized in the furnace or ladle before the ingots are teemed, and the use of aluminum in the molds to insure the quiet setting steel desired will not be permitted.

(c) Heats or ingots, the metal for which has been poured over the top of the ladle or cast with a full running stopper not under control of the operator, will not be rolled.

(d) Special care must be taken to insure the casting of good, clean, sound ingots, free from scabs and cracks and with reasonably flat tops. Bled ingots shall not be rolled.

(e) Treatment of the ingots in the soaking pits must be such as to insure thorough soaking with the subsequent increase of temperature necessary. Overheated or burned or white sided ingots shall not be rolled, neither shall ingots that have once been allowed to get cold.

22. Finishing. (a) All rails shall be smooth on the heads, without rough crescent-shaped marks, and the bases shall be free from guide marks and scratches. They shall be milled square on both ends, but a variation of one thirty-second inch in a vertical direction to make head-long rails will be permitted.

(b) All rails shall be free from twists, waves, kinks or short bends, but rails containing a uniform sweep, the middle ordinate of which does not exceed 1 in. in 33 ft., will be accepted without cold straightening.

23. Branding. (b) The number of the heat and of the ingot number in the heat and a letter indicating the portion of the ingot from which the rail was made shall be plainly stamped on the web of each rail where it will not be covered by the joint bars. The top rails shall be lettered "A" and the succeeding ones "B," "C," "D," etc., consecutively; but in case of a top discard of 20 per cent the letter "A" will be omitted, the top rail becoming "B."

# Labor Board Orders New Election on Pennsylvania

## "Middle of the Road" Decision Finds Both Carrier and Employees Guilty of "Unfairness"

THE RAILROAD LABOR BOARD in rendering a decision on August 1 in the controversy between the Pennsylvania and its shop employees, not only finds both the carrier and the employees' organization guilty of "illegal and unfair" action in the selection of representatives to negotiate new rules and working conditions, but definitely overrules the contention of railroad labor organizations that the representatives of a majority of a class have the sole right to negotiate for the entire craft and establishes a method for determining who properly represents both the majority and the minority of the employees. At the same time the decision upholds two positions of the employees, namely, that they shall be allowed to vote for either an organization or individuals as they wish; and, second, that they may vote for representatives who are not employees of the road.

The hearings in this dispute were outlined in the *Railway Age* of July 16 (page 115).

A new election of employees' representatives is ordered under conditions laid down in the decision; and a conference between the carrier and representatives of the employees is required before August 10 to arrange the details for the new election.

The Pennsylvania's contention that the Board has no jurisdiction over the question of National Agreements under the terms of the Transportation Act in that that subject has never been properly before the Board, is not passed upon, the Board stating it is of "secondary importance" since "the questions involved arise directly from the Transportation Act itself and are properly before this Board for disposition."

The Board said: "There is no question of the closed or open shop involved in this dispute and no other real matter of principle. The question involved is merely one of procedure. At a time when the nation is slowly and painfully progressing through the conditions of industrial depression, unemployment and unrest consequent upon the war, it is almost treasonable for any employer or employee to stubbornly haggle over non-essentials at the risk of social chaos."

### The Opinion of the Labor Board

The opinion of the Labor Board reads in part as follows:

It matters not whether the carrier, in its recent efforts to negotiate rules, was proceeding under the order of the Labor Board in Decision No. 119, or whether it was proceeding under the Transportation Act itself, as it claims. The fact remains that both the carrier and its employees were taking steps to hold conferences for the negotiation of rules, that a dispute arose at the very outset in the conference between the carrier and the representatives of the employees who constitute System Federation No. 90, and that this dispute is now before the Board.

The question involved is one necessarily incident to the negotiation of rules and within the unquestioned jurisdiction of the Board. It is quite obvious that no conference could ever be held and no rules ever agreed upon, if either party could block the proceedings by declining to deal with the other upon any ground or pretext.

For the purposes of this case, the arguments of the parties pro and con as to the regularity and validity of Decision No. 119 are of secondary importance. The questions involved arise directly from the Transportation Act itself and are properly before this Board for disposition.

In the case under consideration, the matter in dispute was the adoption of a schedule of rules and working conditions for the shop crafts on the Pennsylvania System. Both the carrier and the employees were taking steps to hold the conference required by the Transportation Act, and directed by Decision No. 119. Naturally, the question arising at the very threshold of the negotiations was: Who are the accredited representatives of this class of employees for the purposes of the proposed conference? The carrier had the right to know this fact, just as the employees had

the right to know that they were dealing with the properly authorized representatives of the carrier.

It is true that the federated shop crafts claim that the carrier knew that their organization constituted a majority of that class of employees, and that the carrier was not in good faith in refusing to deal with their representatives. This Board cannot enter into the motives of the parties. The carrier did not deny that said organization comprised a majority of that class of employees, but merely stated that no evidence of the fact had been furnished to the carrier.

It is evident that since the statute provides that the employees interested in the dispute be represented in such a conference by representatives "designated and authorized" by said employees, it necessarily follows, under our system of government, that a majority of such employees would have the right to designate their representatives.

The Transportation Act does not prescribe any method by which the employees shall elect their representatives for such conference. Both the carrier and the employees in this case correctly concluded that an election by ballot would be necessary. It was at the next step that both parties fell into error.

The carrier had no more right to undertake to assume control of the selection of the representatives of the employees than the employees would have had to supervise the naming of the representatives of the carrier, for the statute plainly provides that the employees shall "designate and authorize" their representatives. It is entirely proper, however, that the carrier should keep in close touch with said election, and should be given every facility for first-hand knowledge of the manner in which it is conducted and the correctness of the result reached and announced.

The carrier was not justified in refusing the request of the employees to place on the ticket the name of the organization. The granting of this one request would have avoided all trouble, and nobody would have suffered any injury, because the name of any other organization or the names of individuals could have appeared on the ticket, and all employees, union and non-union, would have had the right to vote. If a majority of the employees had not wanted to be represented by the organization, they would have had the unobstructed right to say so.

Representation by the organization is only representation by individuals after all. There is nothing in the statute to deny the employees the privilege of belonging to an organization and being represented by that organization through its accredited officers. In fact, this has been the established custom for many years and is recognized in the Transportation Act itself.

The Transportation Act says the "chief executive of any organization of employees" is authorized to submit to the Labor Board any dispute where disagreements have occurred in the conference between the carrier and employees. The existence of the organization of employees is thus recognized as it is elsewhere in the statute.

The Labor Board also holds that the employees may vote for representatives who are not employees of the carrier, if they so desire, just as the carrier may select a representative who is neither a director nor a stockholder. It seems, however, that the employees in this instance were not asking to have the name of any outsider placed on the ballot, but simply the name of their organization, which would have resulted, as the carrier well knew, in the employees being represented by the officers of the organization who are employees of the carrier.

### Carrier Had no Authority

#### To Divide System Into Regions

The carrier had no legal authority to divide its system into regions and require the employees to elect regional representatives. The Transportation Act contemplates that the employees of the class directly interested on an entire system shall select representatives. It is easy to see how an arbitrary regional division of the employees by the carrier might be as unjust as it is unlawful.

After having failed to reach a satisfactory agreement with the carrier as to the ballot, the shop crafts put out a ballot of their own with no provision for any representatives to be elected for, except organizations. This was not authorized by law and ignored the rights of the non-union men.

Neither election, as held, was fair and legal. As a consequence of the failure of the parties to agree upon a method of holding an election, the employees have so far been denied their legal

right to select their representatives for this important conference on rules. As evidence of the fact that no real test of the choice of the employees has been had, the carrier in its own presentation to this Board admits that, exclusive of the Altoona Shops, only 3,480 men voted, out of 33,104 entitled to vote, for the alleged representatives who are now negotiating rules. In other words, only 10.5 per cent of these employees are represented in these negotiations, and 89.5 per cent are virtually disfranchised. This is the big, outstanding, uncontroverted fact presented in this case, and undoubtedly the law provides a remedy for such a wrong.

It is the duty of the Labor Board to settle this dispute by providing a method that will protect the legal rights of every employee, union and non-union, to the end that the carrier and this class of employees may proceed to the orderly negotiation of rules.

Neither of the parties to this dispute can serve the country, or justify themselves in the eyes of the public by any amount of propaganda, if they permit a controversy over small technicalities to interrupt commerce and bring loss and suffering upon themselves and the public.

There is no question of the closed or open shop involved in this dispute and no other real matter of principle. The question involved is merely one of procedure.

At a time when the nation is slowly and painfully progressing through the conditions of industrial depression, unemployment and unrest consequent upon the war, it is almost treasonable for any employer or employee to stubbornly haggle over non-essentials at the risk of social chaos.

### The Board's Decision

The actual decision of the Board in this case is as follows:

Under the authority of the Transportation Act, as hereinbefore cited, the Labor Board hereby declares that both of said elections on the Pennsylvania System were illegal and that rules negotiated by the alleged representatives selected by either ballot will be void and of no effect, and orders that a new election be held.

For the purpose of determining the choice of a majority of each of the respective crafts coming under the provisions of this decision the following shall govern:

- 1-a. All machinists, apprentices, and helpers, as defined in and coming under the provisions of Decision No. 2 (Dockets 1, 2 and 3), issued by the United States Railroad Labor Board under date of July 20, 1920, in the service of the carrier, including Altoona Works, and including all employees coming under the provisions of this decision who have been laid off or furloughed and are entitled to return to the service, under the seniority rules, when the force is restored to what is generally recognized as constituting a normal force, if accessible, shall be furnished a ballot and be permitted to vote.
- 1-b. All boilermakers, apprentices, and helpers, same definition and conditions as set forth in preceding 1-a to apply.
- 1-c. All blacksmiths, apprentices, and helpers, same definition and conditions as set forth in preceding 1-a to apply.
- 1-d. All sheet metal workers, apprentices, and helpers, same definition and conditions as set forth in preceding 1-a to apply.
- 1-e. All electrical workers, apprentices, and helpers, same definition and conditions as set forth in preceding 1-a to apply.
- 1-f. All carmen, apprentices, and helpers, same definition and conditions as set forth in preceding 1-a to apply.

A conference shall be held on or before August 10, 1921, at such place as the carrier may designate (of which due notice shall be given to all parties interested), between the duly authorized representatives of the carrier and the duly authorized representatives of System Federation No. 90; the duly authorized representatives of any other organization (representing the classes of employees set out in preceding 1-a to 1-f inclusive) whose by-laws or constitution establishes the fact that the organization was established for the purpose of performing the functions of a labor organization as contemplated in Title III of the Transportation Act, 1920; and the duly authorized representatives of 100 or more unorganized employees, selected by the respective crafts set out in the preceding 1-a to 1-f inclusive, for the purpose of arriving at a clear understanding as to the distribution, casting, counting and tabulating of the ballots and announcing the results thereof.

NOTE.—Representatives of unorganized employees authorized and desiring to attend this conference must have the individual and personal signature and authorization of not less than 100 employees of a single craft, such authorization shall likewise name the place of employment and craft to which each belongs.

The employees shall, at their own expense, have ballots and envelopes printed in sufficient numbers to provide each employee an opportunity to vote.

Six sets of ballots and envelopes shall be printed, a separate and distinct ballot for each craft as per the following, and only the craft named thereon shall be permitted to use the ballot:

#### PENNSYLVANIA SYSTEM Machinists, Apprentices, and Helpers Official Ballot

A dispute exists between the carrier and System Federation No. 90 of the Railway Employees' Department of the A. F. of L., as to who the employees, in the craft above named, desire to be represented by in the conference to negotiate rules and working conditions.

The machinists, apprentices, and helpers, irrespective of membership or nonmembership in any organization, are therefore to be given an opportunity to designate, by a majority vote, the representation of their choice, as follows:

Those in favor of either of the following will designate their choice by marking an X in the square set out for that purpose.

Those who desire to be represented by System Federation No. 90, Railway Employees' Department of the A. F. of L. mark an X in this square ☐

Those who desire to be represented by the American Federation of Railroad Workers, mark an X in this square. ☐

Those who desire to be represented by individuals or by any other organization, write the name of such individual or organization here:

and mark an X in this square. ☐

Place employed ☐

Craft ☐

Actually working ☐

Laid off or furloughed. ☐

Name of voter. ☐

If, in any craft, no organization or individual receives a majority of the legal votes cast, a second vote shall be taken in the same manner and on the same kind of ballot, but the second ballot will contain only the names of the two organizations or individuals receiving the highest number of votes cast in the first election.

The vote shall be taken by crafts, each craft to include mechanics, apprentices and helpers, a majority of each of the respective crafts shall have the right to determine by whom they desire to be represented; this right shall not be construed to mean that employees shall be denied the right to name an organization as their representative, neither shall it be construed to prevent the employees from naming an individual who is not an employee of the carrier.

A general committee, composed of duly authorized representatives of the carrier, duly authorized representatives of System Federation No. 90, and the duly authorized representatives of any other organization or 100 or more unorganized employees participating in accordance with the provisions of this decision, will be located at designated places for the purpose of distributing, receiving, counting and tabulating the results of the ballot.

A local committee composed of the duly authorized representatives as above outlined will be established at each division point and at Altoona Works for the purpose of receiving, distributing, packing and forwarding the ballots by express or registered mail to the general committee. Local committees will see that each employee is given every opportunity to vote and that his ballot is placed in envelope and sealed; the local committee shall also keep a record of the ballots received.

Only the general committee is authorized to open envelopes and count the ballots. Where the force is limited and the local committee cannot be procured, arrangements shall be made to place ballots in the hands of such employees and they shall be properly instructed as to the manner of getting their ballot to the general committee.

The ballot should be completed at the earliest possible date. No one but the general committee is authorized to open, count and tabulate the returns of the ballot, and all parties to the dispute are entitled to be present when any ballots are opened and counted.

When the ballots have been canvassed, the result shall be reported to the Labor Board and the representatives of the carrier and the employees will proceed with the negotiation of rules.

If either party to this dispute believes that the spirit and intent of this decision is not being complied with, the complaint should be filed with the Board with all supporting data.

THE SUPREME COURT of the state of Minnesota, held on July 22, in affirming the Lake County District Court in the matter of application of the Duluth & Northern Minnesota to abandon this railroad, that the Minnesota Railroad and Warehouse Commission has no power to order the abandonment of a railroad on the plea the railroad can be operated only at a loss. The court held that the order of the State Commission authorizing the abandonment as of April 1, 1921, was made without authority. The Interstate Commerce Commission recently ordered the abandonment of the road.

# Suggestions as to Economies in Railroad Operation

An Amplification of the Article by F. J. Lisman on "Remedies for Wastes in Railway Operation"

By Geo. R. Henderson

AT FIRST SIGHT, many things in railway operation appear to be wastes that are good business propositions. The abandonment of light locomotives, although in fair condition, for modern, powerful engines, while a seeming extravagance, results in decreased hauling costs well worth the additional investment, just as in the case a few years ago, when the Chicago Edison Company stepped out of a plant a few years old, into one where the generators had a much better water rate per kilowatt-hour.

The Pennsylvania Railroad has spent many dollars in reducing grades and curves, which would probably not be allowed as a capital betterment, but the operating results show the wisdom of such improvements. The expensive bridging of the Des Moines River Valley by the Chicago & North Western 20 years ago, eliminated heavy grades and bad curves which had been responsible for more than one accident. An expensive grade reduction on the same line brought about an *increased fuel consumption* per ton-mile, although the costs of operation as a whole were reduced.

At other times there are operating costs which seem to be abnormal, and yet if these were rectified, the public would suffer great inconvenience. A case in point would be the reduction in service as on branch lines, which are generally feeders for the main line. When we consider that it requires three times the power to haul people in sleeping cars that it does in day coaches, the waste is evident, yet sleeping cars will certainly never be abolished on our railroads. There are real wastes, however, that are often the result of competition or a desire to obtain statistical showings. Light engines are sometimes sent over a division ahead of an overloaded drag freight (instead of being double headed) in order to increase the tons per engine mile, the light engine not being considered in the train computations. There are cases of parallel roads where one has much easier grades than the other, and if the loaded trains were sent over the low grade line and the empties returned over the steeper grades, joint economy of operation would result, but this can only be accomplished by government ownership—a much greater evil.

A superintendent who was to receive a lot of new cars from a car building company on a foreign line had the cars loaded with sand consigned to his road, whereby he paid for hauling the sand, but obtained car mileage for the use of his cars from the delivering road, thereby saving a round sum for his road and obtaining speedy advancement for himself, but there was really a waste in hauling the sand, which came out of the operating expenses of both roads, to some extent.

These are just a few suggestions to show how easy it is to be misled, even by the regular statistics, unless all the facts are known in each case, and for all the various occasions of operation, the study would become one of endless complexity.

## Division of Costs

In the *Railway Age* of July 9 in his article entitled "Remedies for Wastes in Railway Operation," F. J. Lisman made a number of valuable suggestions regarding the methods of keeping accounts so that wastes and losses could be located and properly assigned to the various classes of traffic. This would mean the addition of much clerical labor, unless some of the present reports could be discontinued. There is always danger in starting the compilation of new statistics, that they may be continued indefinitely after the need for

them has expired or that they will so flood the officer who should scrutinize them, that they will get to the files without imparting their information to those who could profit by it.

Referring to the many investigations by state and federal commissions, one can sympathize with the manager of a road that, when asked what were his duties, replied "chiefly answering fool questions before commissions." The vice-president of an important line recently made the statement that the time had come when a road needed three sets of officers, one to operate the property, one to appear before commissions, and the other set to go to jail. All of which goes to show that investigations and reports can be, and often are, carried to an extreme. At the same time, rational reports carefully studied, are essential to every business.

In general, expenses may be divided into Hauling Costs and Terminal Costs, and even the general expenses can be prorated, if necessary, between these, but it is the *actual* detail costs that are of the greatest interest. Expenses for maintenance of way and equipment and conducting transportation are mostly hauling charges, while expenses for maintenance of buildings and yards are principally terminal charges referring to the handling of goods and passengers. Expenses relating to the care of cars and locomotives at shops and roundhouses are really hauling charges and should be so considered. If we desire to go into details, we will need very different records from those which show the division costs on a ton-mile basis only. For the same division and same fuel and supply costs per ton or other unit, the cost of transporting various commodities will depend upon the speed, the car loading and the type of cars needed for the goods which are hauled.

## Speed

Speed increases the cost of hauling in a very striking manner, principally as the train load must be greatly reduced if we wish to haul at high speeds (with electric traction the case is different, but we are here considering steam locomotives). As a locomotive has a horsepower limit, depending upon its boiler capacity, it follows that at twice the speed, only one-half the tractive effort will be available; at three times the speed, only one-third the tractive effort, approximately. The coal burned per ton-mile may not vary greatly, but as the crew is paid by the mile (overtime not considered) the costs per ton-mile mount rapidly, being roughly from  $1\frac{1}{2}$  to 2 times as much at 30 miles per hour as at 15 miles. The exact amounts depend on the grade, cost of coal and supplies, car repairs, wages, etc., but they can be definitely determined in any case, as demonstrated in "The Cost of Locomotive Operation" by the author and published by the *Railroad Gazette* a few years ago. This demonstrates the expensive nature of handling livestock, and when to this is added the possible depreciation of the load if the cattle are not delivered in time for the market, we can easily understand the suggestion of an operating officer that his competitors should be allowed to take the stock business.

Passenger traffic is even more expensive. The 15 hour trains between New York and Chicago were so notoriously costly to operate that for several years they have been abandoned.

It has been demonstrated that a speed of about 15 miles per hour is the most economical for ordinary freight trains,

and such commodities as coal, ore, lumber, etc., cost less to haul per ton on account of speed alone than fast freights, such as perishable fruits and live stock. If the speed is arranged to suit the goods, the most economical transportation results—in any case the cost of the speed factor—may be determined by careful study, but it requires time and patience. High speed trains, either passenger or freight, cause delays and therefore expense to other trains which must give them safe clearance.

### Car Loading

Car loading affects the cost very seriously, not only because the paying load may be a small percentage of the gross train load, but also because lightly loaded cars require more tractive effort per ton than heavily loaded cars. All this is too well known to need elaboration here, but it is well to remember the bearing of this upon the cost of hauling, and it is possible to figure the cost of such loads. The question of minimum loading is continually being fought out between shippers and railroad, but there is no question about its costing more to haul light loads. Perhaps a sliding scale would be equitable to all concerned. Then it might be possible to use containers for parcels to one consignee, and fill a car with such containers from several points and deliver them in the same way. This has recently been tried by the express companies, and corresponds somewhat to the small car units in Europe. In any event it seems as if much could be accomplished by co-operation between the shippers and the agents.

### Car Types

The selection of car types means much to a railroad, but is not often duly considered. If we compare the relative costs of flat or gondola cars and box or refrigerator cars, we see at once that one vehicle may cost three or four times that of another, so the repairs and maintenance will vary, as also the obsolescence charges. Of course, different commodities pay different rates for transportation, but these are seldom based upon the actual cost of movement. The more costly cars are certainly entitled to higher rates, which is another reason why roads hauling coal and ore are often considered so much more desirable from a business standpoint.

### Terminal Costs

Terminal costs would properly cover switching, receiving and loading, and unloading, storing and delivering, including sorting, handling, etc. Yards and buildings are a necessary feature and entail much expense, of which the railroads would be glad to rid themselves. Terminal buildings are always doubtful assets as far as returns are concerned. Note the expensive passenger station of the Pennsylvania Railroad in New York City and consider how many passengers have been induced by this structure to use that road in preference to others. The New York Central station will be more profitable on account of the improvements of "air rights," but as a rule little additional traffic is induced by costly terminals. Probably freight facilities are of more value as traffic producers, where electric cranes are available for handling heavy loads, and where storage facilities are ample to protect goods from weather and theft.

When full car loads can be taken from shippers' sidings or yard tracks and delivered in the same way, these are only the switching and accounting costs to be covered, and no doubt this would be an ideal arrangement, if universally practicable, but unfortunately, it is not and never will be. Small and various kinds of packages must be handled in and out at the expense of much unremunerative labor; that is, the labor has added no value to the goods, but rather damage. This costs the railroad companies much more than to shift a car to a siding or independent yard. Many terminals for receiving freight have only manual labor to sort

and handle the goods, whereas electric trucks, conveyors, etc., might save a lot of high priced workmen. Of course, the variety of goods and packages militates against a too elaborate mechanical layout, but there is no doubt that much could be accomplished if carefully considered. As above mentioned, special containers might help in many cases. Then terminal expenses must be considered in connection with short hauls. It costs as much to load a car for a 25 mile journey as for one a hundred times as long, but the carriage returns are inconsiderable in the former as compared with the latter and expensive floor space is occupied regardless of the journey. This leads to the conclusion that many railroads might, with profit to themselves, operate a line of motor trucks, or at least have a working arrangement with trucking companies.

Let us consider the routine of a package to be forwarded 25 or 50 miles. It must be carted from shipper to railroad freight station, removed to platform, sorted and loaded before it really starts on its journey, which may be the next day. The opposite course of events will follow on arrival and two or three days elapse between the time it leaves shipper until it reaches its destination. If now this were taken by motor truck, it would go direct from shipper to consignee in possibly four or five hours and much handling and expense thereby would be saved. With long hauls this would be entirely different, as the terminal delays would be a small proportion of the total time of the journey. Another advantage would accrue, and that is, freight cars would increase their mileage enormously by eliminating the short haul and instead of 25 miles a day they might make considerably more, all of which would mean a much greater return on the investment. These ideas may sound radical, but it is believed that they are worth serious thought, and careful computations would, no doubt, produce astonishing figures. Just what length of haul would be most economical for truck service would have to be determined for each district; probably 100 miles or so would be the limit. The value of terminal space thus gained should be taken into consideration, as in some localities a high price is paid for freight stations.

Co-operation is necessary between all the interests if waste is to be reduced to a minimum, but this should not eliminate a healthy competition, for the public benefits most thereby. This is why we have sleeping and dining cars, even on short runs, as people will travel over the road that offers the most conveniences, even at somewhat greater expense. Roads should compare figures and obtain the benefit of each other's experiences, as they do in the mechanical conventions, and as all intelligent officers approve, but careful analysis and investigation into the detail costs of each section and commodity will probably well repay for the time and expense of such work, and may lead to changes in methods of operation that would be productive of many economies.

### The Cash Register in a Ticket Office

A SPECIALLY DESIGNED cash register is in use in the consolidated ticket office at Dayton, Ohio, which is effecting measurable economies in the accounting of the office. When the offices were consolidated during the war there was a shortage of efficient ticket sellers which made the simplification of operations highly desirable. At the end of each day's business each ticket seller had to make out a report of his day's sales, classifying them by railroads. This work made it necessary for the sellers to remain a long time after the closing hour. Because of the shortage of efficient sellers it was believed that any system which would promote efficiency would make it possible to get along with fewer employees; and by making the work easier the places would be more attractive to those seeking positions. The National Cash Register Company, after studying the problem, designed a cash register to meet the needs of the situa-

A Receipt Printed by the Register and a Section of the Recording Tape

tion and this machine has been in successful service since that time.

When a ticket seller makes a sale he takes the cash, goes

Cash Register in Use in Consolidated Ticket Office, Dayton, Ohio

to the register and records the transaction. This record credits the railroad with the amount collected and also gives it credit for one ticket sold; it adds the amount of the

sale to the ticket seller's total. The amount is also accumulated in a grand total, and a record showing railroad, ticket seller, amount and sale number is printed on a strip of paper inside the register.

The register prints a receipt showing the same information as is printed on the paper in the machine. The ticket seller attaches this receipt to the stub of the ticket and deposits both in a pigeonhole reserved for the railroad for which the sale was made. The filing of ticket stubs in this manner saves the accountant's time in sorting when he collects them to make up his report. All tickets sold at this office are provided with stubs, but in an office where stubs were not provided a memorandum of the ticket number written on the register receipt would serve the same purpose in facilitating the work of the accountant.

The register system has been of material assistance in keeping the kind of records that are necessary in an office of this kind. The information required is compiled mechanically as the transactions are registered during the day. The adding wheels on the register tell at a glance how much money has been taken in to the credit of each railroad. The register has made it unnecessary to have a cashier. This saving alone has more than paid for the installation.

Ticket sellers now get away in less than ten minutes after closing time, having nothing to do but to count their cash and reserve enough for change for the next day's business. It is unnecessary for them to make out a daily seller's report, since the register shows the total amount of sales made by each seller for each road.

The register receipts which are issued by the register each time a sale is made, and which the clerk attaches to the ticket stubs, show the accountant at a glance any error that may be made, and, of course, it identifies the ticket seller who made the error. Each seller has his own cash drawer, which also simplifies the location of errors.

At the close of the day's business, the accountant takes the readings from the adding wheels on the cash register. These figures give him a balance to bring his books to and, having been added mechanically, they are necessarily correct. The grand total on the cash register shows the total amount of business at any hour during the day, facilitating the handling of bank deposits.

Under the old system the accountant was always a day behind the operations of the office. Under normal conditions now he is able to get his books balanced from one to two hours sooner than with the old way, because he does not have to check the ticket sellers' reports. When it is necessary to refund money for a ticket, the amount is registered in the regular way and the register receipt is pinned to

the returned ticket. The register does not add the amount of the refund to the sales, although it prints the amount on the recording tape and shows which ticket seller received the ticket and refunded the money. This gives the office a permanent record of all refund transactions; it interferes in no way with actual sales and enables the accountant to check accurately the money paid out.

Aside from its value as a time saver the register also prevents errors. The ticket seller must press his identification key first and then indicate the road for which the ticket sale is made before he can record any amount. In other words the register can be operated in only one way and that way necessitates making the record as the office wants it.

The *Railway Age* is indebted to the National Cash Register Company for furnishing information and photographs and to C. L. Tipton, ticket agent of the consolidated ticket office, Dayton, for information concerning the working of the device.

## Short-Turn Overhead Trolley Conveyor System

THE SHORT-TURN overhead trolley conveyor system, illustrated in Fig. 1, is comparatively a new departure. Several successful installations have been made. The track consists of two parallel standard rolled channels, spaced  $2\frac{1}{2}$  in. between flanges and held in place by clamps. The track is designed to carry loads with no intermediate supports except at the splices, corners and switch points, and is fabricated to meet the requirements of each condition. One special feature of this system is that spanning a long gap, as

Fig. 1—View of Overhead Trolley System With Universal Switches

from one building to another, can be done without intermediate supports by using a heavier section of channel.

The short-turn trolley system consists of the standard channels, 90-degree right switches, 90-degree left switches, 45-degree right switches, 45-degree left switches, and the universal switches. Each corner and switch connection is interchangeable so that at any time in the future a right corner can be removed and a double switch or universal switch bolted in the same place. The design and exceptional compactness of the short-turn universal switch gives much greater switching facilities and covers much greater space than any other switch.

All of the short-turn corners and switches have a track curvature of 18 in., practically turning the load at right angles. This is especially adaptable in foundries for serving

a row of brass furnaces or machines close to the wall without losing valuable space by long sweeping curves. It is also a good feature in freight houses and terminals. This short-turn system can be extended out of the warehouse and along the receiving platform so as to load goods directly into an open freight car or automobile truck. The system can also be readily wired should an electric hoist be desired in place of chain falls. The track is built and shipped and can be erected in single units, thus greatly reducing the cost of erection.

Special 2-wheel, 4-wheel, or 8-wheel trolleys are provided, the 4-wheel type being illustrated in Fig. 2. There are ball-bearing wheels *W* and guide rollers *R* which run between the toes of the channels, practically eliminating friction and making it difficult for the wheels to bind against the track when rounding the curves. Carbonized steel ball bearings

Fig. 2—Phantom View of Short Turn Trolley

are shown at *B*, pivots at *P* and the hoist connection at *H*. The trolley runs on the level top of the channel tracks and is designed to swing in 18 in. radius curves. The fact that the track is built from standard rolled channels or can be built from I-beam sections where long spans and greater strength are required, makes it easy to obtain from local stocks and easier to erect.

The operation of this system lightens the work and makes it much more easy and favorable for the men handling material, thereby decreasing labor turnover and increasing the efficiency of unskilled labor. The whole system, comprising the tracks, trolleys and switches, is so designed that it is impossible for the trolleys to run off the track or go in directions not predetermined and, therefore, causes no accidents or loss of time. This system is being manufactured and sold by the Whiting Corporation, Harvey, Ill.

THE PROPOSED TUNNEL between Staten Island and Long Island, New York harbor, was the subject, last week, of a conference in City Hall, New York, between Mayor Hylan and the presidents of the principal railroads. The mayor stated that the city desired to co-operate with the railroads. On the suggestion of Ira A. Place, vice-president of the New York Central, it was decided that each railroad company should appoint its chief engineer or some other engineering representative as a committee to confer with the chief engineer of the Board of Estimate and Apportionment, of the city, on the engineering features, and that the presidents of the roads constitute a standing committee, with whom the engineers are to confer.

# General News Department

The Cleveland, Cincinnati, Chicago & St. Louis re-employed men laid off since last February at its shops at Bellefontaine, Ohio, on July 25. The Bellefontaine shops are now running at normal capacity.

The Minneapolis, St. Paul & Sault Ste. Marie will operate the line of the Wisconsin & Northern, which it recently purchased, as a part of its Wisconsin & Peninsular division, beginning August 1.

The New York, New Haven & Hartford announces that the Railway Clerks' Union has agreed to modification of the wage schedule regarding the payment of overtime and other compensatory rates, effective as of July 1, the new schedule to remain in force pending the decision of the United States Railroad Labor Board.

The Joint Congressional Commission on Agricultural Inquiry, Sydney Anderson, of Minnesota, chairman, announces the creation of a Division of Transportation, to be in charge of D. D. Conn, Minneapolis, Minn. This Congressional Commission is to investigate and report to Congress on the cause of the present condition of agriculture and kindred questions and the Division of Transportation is to make a thorough analysis of freight rate and car service problems as they affect prices of commodities.

The Long Island Railroad has received from the United States Railroad Labor Board a decision to the effect that it must negotiate concerning rules with System Federation No. 90, affiliated with the Railway Employees' Department of the American Federation of Labor. The officers of the System Federation are all employees of the Pennsylvania Railroad. The officers of the Long Island declared they would deal only with their own employees, and the union took the case to the Labor Board.

## M. W. Painters—No Convention

The Executive Committee of the Maintenance of Way Master Painters' Association has decided to abandon the 1921 convention of that association which was to have been held at Buffalo, N. Y., on October 4. It is planned to hold the next convention in October, 1922.

## The Reid New Foundland Company

The Legislature of New Foundland, after a debate lasting three days, has adopted a law under which the Reid New Foundland Company is to continue to operate its railroad, the Colony assuming the burden of losses up to \$1,500,000 yearly.

## The "Pageant of Progress"

The advancement in railroad transportation is depicted in a number of exhibits at the Pageant of Progress at Chicago. The New York Central exhibits the locomotives De Witt Clinton and "999," as noted in the *Railway Age* of July 30. The Chicago & North Western is exhibiting the "Pioneer" which drew the first train out of Chicago in 1848. This road also shows its latest type of superheater locomotive. Other equipment shown includes a fishery service car for the stocking of interior lakes and streams and a mine rescue car with complete equipment and personnel.

## Train Robbery Near Altoona

Westbound express train No. 23 of the Pennsylvania Railroad, the Manhattan Limited, was boarded by four robbers a short distance west of Gallitzin, Pa., on the morning of July 30, about 2 o'clock, and the seven clerks in the mail car were intimidated

with pistols, and one of them was wounded. The robbers threw off, or carried off, one or two bags, and escaped. When their job was done, two of them crawled into the locomotive cab and ordered the engineman to stop. It does not appear that the amount of booty obtained was large. It is thought that the robbers boarded the train when it was stopped, after passing through the tunnel, for the helping engine to be detached.

## A Successful Campaign Against Loss and Damage

The Freight Service Committee of the St. Paul Association of Commerce is co-operating with the railroads in an effort to curtail freight loss and damage claims by carrying out an educational campaign under the slogan of "Perfect Package Week." The campaign has been a decided success and the tabulated figures for the week from June 6 to 11 have been brought to the attention of the American Railway Express Company, which, as a result, plans a national campaign. During the campaign all shipments that were received by the freight and express companies not properly packed and marked were rejected and sent back to the shipper with instructions to remedy the shortcoming. A strict account of such rejections was made and results tabulated. Out of a total of 26,041 freight shipments during the week there were 503 rejections or 1.92 per cent, and of 22,248 express shipments only 103 were rejected or 0.46 per cent. Many potential claims were eliminated from the count, however, by the traffic department's instructions, issued to all shippers just prior to the campaign.

## Consolidation of Express Companies

The Canadian National Express Company, operating on the Government railways, and the Canadian Express Company, operating on the Grand Trunk, announce that, beginning on September 1, the operation of the two companies will be consolidated, and the combined business will be continued thereafter under the name of the Canadian National Express Company. John Pullen, heretofore president of the Canadian, will be president of the new company, and W. C. Muir, heretofore general manager of the Canadian National, will be vice-president and general manager. The new company will operate on 22,000 miles of railway and will have an extensive organization in Europe. The two express companies, operating as units, had a combined annual gross revenue of \$12,000,000 and did business at nearly 3,500 established agencies. With the unified service the supply of ventilated cars, refrigerators, horse stable cars and steamheated cars will be more readily available, and the vehicle service in the cities and larger towns, being consolidated, will respond more readily to calls from the public.

## Study of Wood Seasoning

The Forest Products Laboratory, Madison, Wis., in co-operation with saw-mills and wood utilization plants throughout the country, is organizing an extensive field study of the air seasoning of wood. The purpose is to determine the piling practice which will result in the fastest drying rates consistent with the least depreciation of stock, the least amount of yard space required and the least handling costs. All the important commercial woods of the United States will receive consideration. The study of both hard and soft woods will be carried on concurrently. This investigation will furnish a comparison of the effects of such piling variables as the spacings of boards in layers, the height of pile foundations, and the directions of piling with relation to prevailing winds and yard alleyways. It is expected that the study will determine whether lumber should be dried partly at the mill and partly at the plant of utilization or whether it should be dried completely at the mill. Data collected is expected also to show whether air seasoning or kiln drying is more economical.

### Southern Pacific Reduces Rate on Apples

The Southern Pacific announces that on apple shipments from California points to eastern territory, with a minimum carload weight of 30,000 lbs., not subject to storage in transit, the rate is now \$1.50 per cwt., where the old rate was \$1.66½. With storage in transit privileges, shipments of like weight will cost \$1.60, where the old rate was \$1.75½. New rates on beans, canned goods, dried fruit, etc., from California to eastern territory will go into effect on August 22. The company will also place in effect on August 3 a new rate on imported shipments of flax, hemp, jute and other fibres, vegetable oil, nut oil, whale oil, seed oil and other oils, butter and dressed poultry, through Pacific Coast ports to points east of Chicago and north of the Ohio river.

### Grain Rates Reduced in East

Traffic executives of eastern roads have announced a reduction of 5 cents per 100 lb. in export rates on wheat, corn and rye from Buffalo, Erie and Fairport to eastern export points. A reduction of 3 cents in export rates on barley and oats was agreed upon at the same time. The reduction in wheat, corn and rye rates amounts to about 25 per cent. Following are the present export rates from lake points to New York: wheat, 20.17 cents; corn and rye, 19.79 cents; oats, 19.63 cents; barley, 20.08 cents per hundred pounds. The roads will preserve the usual port differentials. An adjustment of rates from central to eastern territory was to be given further consideration at a conference to be held in Chicago this week. It is stated that the heavy reductions now made in grain export rates are not justified on the basis of the cost of transportation service, but in deference to demand from grain shippers for concessions in the rates. This year's export grain movement under existing rates exceeded the export movement of the past three years.

### Safety Section—Operating Division, A. R. A.

A Safety Section, of the Operating Division, was established by the board of directors of the American Railway Association at a meeting in Chicago on July 27. The first annual meeting of the new section has been set for Monday, September 26, at Boston, Mass. This date and place were selected because of the fact that the Tenth Annual Congress of the National Safety Council will convene there on September 27. The temporary officers of the new section are: E. M. Switzer (C. B. & Q.), chairman; John T. Broderick (B. & O.), first vice-chairman, and Isaiah Hale (A. T. & S. F.), second vice-chairman.

The temporary committee of direction consists of the foregoing and R. C. Richards (C. & N. W.); F. M. Metcalfe (N. P.); C. H. Blakemore (N. & W.); A. O. Ridgway (D. & R. G.); H. A. Adams (U. P.); M. A. Dow (N. Y. C.); H. M. Mayo (S. P.); and T. H. Carrow (Penn.). The other committees which have been formed, with the names of the chairmen, are as follows: On publicity and education, Isaiah Hale; on prevention of grade crossing accidents, J. T. Broderick; on nominations, L. F. Shedd; on arrangements, F. W. Mitchell (N. Y., N. H. & H., New Haven, Conn.).

### Food Cost of Living Shows Slight Increase

From figures compiled in 10 cities, the Bureau of Labor Statistics reports slight increases in the retail price of food in all but one of the cities during the month ending July 15. In Detroit there was an increase of 7 per cent; in Peoria and Providence, 5 per cent; in Manchester and New Haven, 4 per cent; in Mobile and Savannah, 3 per cent; and in Atlanta and Richmond, 1 per cent. In Little Rock there was a decrease of one-tenth of 1 per cent.

For the year period, July 15, 1920, to July 15, 1921, there was a decrease of 30 per cent in Providence and Richmond; 31 per cent in Little Rock; 32 per cent in Savannah; 33 per cent in Atlanta and New Haven; 34 per cent in Manchester and Peoria; and 35 per cent in Detroit and Mobile.

As compared with July 15, 1913, the retail cost of food on July 15, 1921, showed an increase of 42 per cent in Little Rock; 45 per cent in Atlanta; 46 per cent in New Haven; 51 per cent in Manchester; 55 per cent in Detroit; 56 per cent in Richmond; and 57 per cent in Providence. Prices were not obtained by

the Bureau of Labor Statistics from Mobile, Peoria or Savannah in 1913, hence no comparison for the 8-year period can be given for these three cities.

### Steel Passenger Cars for the Northern Pacific

Sixty-two passenger cars are being rebuilt by the Pullman Company for the Northern Pacific which will be used on trains Nos. 1 and 2 running between St. Paul and Seattle. A part of the order has been delivered to the railroad company and when completed will consist of 22 coaches, 12 diners, 11 dynamo baggage cars, 12 baggage cars and five mail and express cars. Three business cars are also being rebuilt in similar manner. All of the equipment used on these trains will then be steel. The cars are similar to the latest design of Pullman cars and are built of wood with steel underframes and ends and ½ inch steel sheathing. The trucks were reinforced to carry the added weight. The advantages ascribed to this type of construction over the all-steel construction are that they are less noisy, are warmer in winter and cooler in summer and more resilient in case of impact. The head end system of lighting with power supplied by a steam turbine driven generator, located in the baggage car, is used on these trains. New switch panels were added to the cars, but the lighting fixtures were not changed. Storage batteries will be used on each car, excepting coaches and straight baggage cars.

### Urges Co-operation With American Railway Express

F. C. Fox, general manager of the eastern lines of the Atchison, Topeka & Santa Fe, has recently issued an interesting circular to officers and employees of the road, urging co-operation with the American Railway Express Company. Mr. Fox states, in part: "Since September 1, 1920, the express business on this road has been conducted by the American Express Company under a contract materially different from any heretofore existing. The present agreement, providing, as it does, for the payment to the railway company of a certain proportion of the net express income, gives our line a greater interest than ever before in the efficient and economical operation of the express business. The maximum benefit from this arrangement can be obtained only through the heartiest co-operation between officials and employees of the express and railway companies on all matters of mutual interest, thus holding to our road, through superior service and facilities, the maximum volume of express traffic, and by personal interest in its safe, economic and prompt handling and movement, keeping the expense down to a minimum."

"With the thought clearly in the mind of every one of our people that the express business is not a side issue, but is an important part of the railway company's operations, and that the express company's interests are the railway company's interests, substantial progress will be made toward increasing the express company's net earnings, with consequent benefit to our own company. I therefore want to appeal to all of you to personally interest yourselves in the handling of the express, taking the same interest in this traffic that you would in the case of freight or passenger business to the end that our line will receive the greatest possible net return from the express business."

### Illinois Central Continues Series of Public Statements

The results which the Illinois Central has secured from the series of monthly public statements which have been published during the past year in the newspapers along its lines, have been such as to justify the continuance of the policy, and the advertisements will continue to appear during the next twelve months. In the final statement of the current series, C. H. Markham, president of the company, said in part:

"We believe the railway problems of the United States require the best and most constructive thought of all the public—farmers, business men, professional men and railway men working in harmony. The railroads are ruled by public opinion. If public thought on railway questions is unprogressive, the railroads cannot make progress, which means that they will not be enabled to meet the constantly increasing demands of public service."

"The public is not entirely to blame for such unsatisfactory railway conditions as have obtained in the past. We believe the reticence of railway men themselves, in failing to keep the public

well informed, has been one of the causes of the growth of restrictive legislation, of unprogressive regulation and of an anti-railway spirit, which have worked a hardship upon railway development, and consequently upon the public itself.

"That our discussions have contributed to a better understanding of railway problems on the part of the public served by the Illinois Central System is evidenced to us in many ways. Not only have our patrons helped us in their hearty support of many problems which we have presented to them, giving us their hearty support and co-operation in carrying out our programs for better service, but the better mutual understanding which has been awakened—a better understanding on our part of our patrons' problems and a better understanding on their part of ours—has been reflected in generally improved service. Our discussions have also been a means of perfecting within our organization that spirit of loyalty and service which always has characterized the Illinois Central System."

## U. S. Chamber of Commerce

### Names Transportation Committee

Appointment of two committees to deal with transportation is announced by the Chamber of Commerce of the United States. A departmental committee for the department of transportation and communication will consider problems relating to the general field of transportation and communication, and there is a special railroad committee.

The chairman of the departmental committee is Howard Elliott, chairman of the board of the Northern Pacific Railroad, and member of the chamber's board of directors. Other members are: Vice-chairman—Lewis B. Stillwell, Lakewood, N. J., a consulting engineer and also a chamber director; Utilities—Edwin O. Edgerton, San Francisco, ex-chairman of the California Railroad Commission; Railroads—George A. Post, New York, president of the Hudson River Bridge Corporation, and W. W. Salmon, Rochester, president of the General Railway Signal Company; Marine—H. H. Raymond, New York City, president of the Clyde Line; J. M. Whitsitt, Charleston, S. C., president The Carolina Company; Highways—A. J. Brosseau, New York, president of the International Motor Company; Electric Railways—Philip H. Gadsden, Philadelphia, vice-president United Gas Improvement Company; Waterways—Douglas Fiske, Minneapolis, Lawyer; Port Terminals—B. F. Cresson, Jr., New York City, Chief Engineer, Port of New York; Communications—John J. Carty, New York, vice-president American Telephone and Telegraph Company; Postal—Lucius Teter, Chicago, president Chicago Trust Company.

George A. Post is chairman of the special railroad committee and the other members are: Railroad Executive, T. C. Powell, New York, vice-president Erie R. R. Company; Banker—Harry A. Wheeler, Chicago, vice-president Union Trust Company; Merchant—George W. Simmons, St. Louis, president Simmons Hardware Company; Railway Equipment—Wilmer W. Salmon, Rochester, president General Railway Signal Company; Railroad Administration—A. W. Smith, Washington, General Counsel U. S. Railroad Administration; Transportation Economist, Emory R. Johnson, Philadelphia, Dean, Wharton School, University of Pennsylvania; Transportation Engineer—Charles E. Lee, East Orange, Lawyer—F. C. Dillard, Sherman, Texas; Rail and Water Transport—Walter S. Dickey, Kansas City, president Kansas City and Missouri River Navigation Company.

The chamber's transportation department was organized recently with J. Rowland Bibbins as its manager. The department will deal with transportation in all its forms. In its work it will take up the following:

1. Railroads—Further study of financial resources, consolidation and efficiency, with the object of making them self-sustaining, with adequate service to the public.

2. Marine Transportation, both Lake and Ocean—The problems of the American merchant marine and proper relation to foreign competition.

3. Terminals and Ports—Intensive study of operating unitification to secure a more efficient trans-shipment machine.

4. Electric Railways—The fare situation and ways and means for securing a self-supporting agency of essential public service.

5. Highways—Economic analysis of the problem of highway transport in relation to other agencies, and the proper public subsidy therefor.

6. Waterways—Economic analysis showing the true position of waterways as a natural resource, as yet largely undeveloped.

7. Communications—Encouragement of adequate development for needs of business, especially in connection with foreign countries.

8. Postal and Express—The problem of transportation of the mails upon an economic basis, as affects both shippers and carriers.

9. Air Transport—The codification of laws and regulations to promote safety and encourage aeronautical development with the maximum rapidity.

## Conferences with "Big Four" Brotherhoods

A few weeks ago the heads of the train service brotherhoods joined in a communication to Chairman Cuyler of the Association of Railway Executives making certain demands upon the railways; in substance that the railways should restore the wages of train service employees to the rates which they were receiving prior to July 1; that they should agree to seek no further reductions in wages; and should desist from asking for abolition of time and a half for overtime in freight train service.

The matter was referred to the railways of the various territorial groups. The Southeastern lines have adopted resolutions indicating that they will not comply with the demands, but will appoint a committee of railway officers to meet with the brotherhood officers and discuss matters of mutual concern if the brotherhood leaders desire.

The executives of the Western lines met in Chicago on Tuesday and took similar action.

The Eastern lines, speaking through a committee of four, at a conference in New York on Wednesday of this week, told the labor leaders that the whole question would be referred to the whole Eastern Presidents' Conference, which it is expected will take action next week. After Wednesday's conference, E. E. Loomis, president of the Lehigh Valley, issued a statement on behalf of the railroads, saying:

"The union chiefs in seeking the meeting said it was their desire to ascertain: (1) If the operating officials of the railroads will restore the wage rates in effect on June 30, 1921; (2) if all demands for further decreases will be withdrawn; (3) if all demands for the elimination of time and one-half for overtime and radical schedule revision will be withdrawn and not again pressed for a stated period.

"The railroad executives pointed out that to grant the request of the brotherhood heads would mean an increase in wages of approximately twelve and one-half per cent at a time when all other wages are coming down; would assume that no further decreases are or will be warranted by reductions in the cost of living, and would take the question of time and one-half for overtime out of the hands of the Labor Board, where it is now under discussion, and violate every agreement the men now have with their respective roads, each of which has a terminating or revision clause.

"After hearing the arguments presented by the labor men, the railroad officials said they would make a report to the Eastern Presidents' Conference, which will take final action."

Representing the companies, besides Mr. Loomis, were W. W. Atterbury, vice-president of the Pennsylvania System; E. N. Brown, president of the Pere Marquette, and Percy R. Todd, president of the Bangor & Aroostook.

For the employees there were Warren S. Stone, grand chief of the Brotherhood of Locomotive Engineers; W. S. Carter, president of the Brotherhood of Locomotive Firemen and Engineers, L. E. Sheppard, president of the Order of Railroad Conductors; W. G. Lee, president of the Brotherhood of Railway Trainmen and T. C. Cashen, president of the Switchmen's Union of North America.

## Meetings and Conventions

The following list gives names of secretaries, dates of next or regular meetings and places of meetings:

AIR BRAKE ASSOCIATION—F. M. Nellis, 163 Broadway, New York City. Exhibit by Air Brake Appliance Association.

AIR BRAKE APPLIANCE ASSOCIATION—Fred W. Venton, 836 So. Michigan Ave., Chicago. Meeting with Air Brake Association.

AMERICAN ASSOCIATION OF DEMURRAGE OFFICERS—F. A. Pentious, Supervisor of Demurrage and Storage, C. & N. W. Ry., Chicago.

AMERICAN ASSOCIATION OF DINING CAR SUPERINTENDENTS—S. W. Derr, Philadelphia & Reading, Philadelphia, Pa.

AMERICAN ASSOCIATION OF ENGINEERS—C. E. Drayer, 29 S. La Salle St., E. I. R. R., 332 South Michigan Ave., Chicago.

- AMERICAN ASSOCIATION OF PASSENGER TRAFFIC OFFICERS.—W. C. Hope, C. R. R. 9, N. 13 Liberty St., New York. Annual meeting, November 21 and 22, Cardina Hotel, Pinchurst, N. C.
- AMERICAN ASSOCIATION OF RAILROAD SUPERINTENDENTS.—J. Rothschild, Room 400, Union Station, St. Louis, Mo.
- AMERICAN ELECTRIC RAILWAY ASSOCIATION.—E. B. Burritt, 8 W. 40th St., New York. Next convention, October 3, Atlantic City. Exhibits this year will be omitted.
- AMERICAN RAILROAD MASTER TINNERS', COPPERSMITHS' AND PIPE FITTERS' ASSOCIATION.—C. Borchardt, 202 North Hamlin Ave., Chicago, Ill. Next convention September 12-14, Hotel Sherman, Chicago.
- AMERICAN RAILWAY ASSOCIATION.—J. E. Fairbanks, General Secretary, 75 Church St., New York, N. Y. Next regular meeting, November 16, 1921.
- Division I—Operating.  
Freight Station Section (including former activities of American Association of Freight Agents). R. O. Wells, Freight Agent, Illinois Central Railroad, Chicago, Ill.  
Medical and Surgical Section. J. C. Caviston, 75 Church Street, New York.
- Protective Section (including former activities of the American Railway Chief Special Agents and Chiefs of Police Association), J. C. Caviston, 75 Church St., New York, N. Y.
- Telegraph and Telephone Section (including former activities of the Association of Railway Telegraph Superintendents). W. A. Fairbanks, 75 Church St., New York, N. Y.
- Safety Section.—J. C. Caviston, 75 Church St., New York. First Annual Meeting, Boston, Mass., September 26.
- Division II—Transportation (including former activities of the Association of Transportation and Car Accounting Officers). G. W. Covert, 431 South Dearborn St., Chicago, Ill.
- Division III—Traffic. Gottschalk, 143 Liberty St., New York.
- Division IV—Engineering. E. H. Fritch, 431 South Dearborn St., Chicago, Ill.
- Construction and Maintenance Section. E. H. Fritch.
- Electrical Section. E. H. Fritch.
- Signal Section (including former activities of the Railway Signal Association). H. S. Balliet, 75 Church St., New York, N. Y.
- Division V—Mechanical (including former activities of the Master Car Builders' Association). V. R. Hawthorne, 431 South Dearborn St., Chicago, Ill. Meeting postponed indefinitely.
- Equipment Painting Section (including former activities of the Master Car and Locomotive Painters' Association). V. R. Hawthorne, 431 South Dearborn St., Chicago, Ill.
- Division VI—Purchases and Stores (including former activities of the Railway Storekeepers' Association). J. F. Murphy, General Storekeeper, National Central, Chicago, Ill.
- Division VII—Freight Claims (including former activities of the Freight Claim Association). Lewis Pilcher, 431 South Dearborn St., Chicago, Ill.
- AMERICAN RAILWAY BRIDGE AND BUILDING ASSOCIATION.—C. A. Lichty, C. & N. W. Ry., 319 Valley Ave., Austin Station, Chicago. Next convention, October 18-20, 1921. Next New York City. Exhibit by Bridge and Building Supply Men's Association.
- AMERICAN RAILWAY DEVELOPMENT ASSOCIATION.—J. F. Jackson, Central of Georgia, Savannah, Ga. Next meeting, November, 1921, Chicago.
- AMERICAN RAILWAY ENGINEERING ASSOCIATION.—(Works in co-operation with the American Railway Association, Division IV.) E. H. Fritch, 431 South Dearborn St., Chicago. Next convention, March 14-16, Chicago. Exhibit by National Railway Appliances Association, March 13-16.
- AMERICAN RAILWAY MASTER MECHANICS' ASSOCIATION.—(See American Railway Association, Division 5.)
- AMERICAN RAILWAY TOOL FOREMEN'S ASSOCIATION.—R. D. Fletcher, 1145 East Marquette Road, Chicago. Next convention, which was to have been held August 9-11, Hotel Sherman, Chicago, has been postponed. Exhibit by Supply Association of American Railway Tool Foremen's Association.
- AMERICAN SHORT LINE RAILROAD ASSOCIATION.—T. F. Whittelsey, Union Trust Bldg., Washington, D. C.
- AMERICAN SOCIETY FOR STEEL TREATING.—W. H. Eisenman, 4600 Prospect Ave., Cleveland, Ohio. Next convention, September 19-24, Indianapolis, Ind.
- AMERICAN SOCIETY FOR TESTING MATERIALS.—C. L. Warwick, University of Pennsylvania, Philadelphia, Pa.
- AMERICAN SOCIETY OF CIVIL ENGINEERS.—E. M. Chandler (acting secretary), 33 W. 39th St., New York. Regular meetings, 1st and 3d Wednesdays in month, except July and August, 33 W. 39th St., New York.
- AMERICAN SOCIETY OF MECHANICAL ENGINEERS.—Calvin W. Rice, 29 W. 39th St., New York.
- AMERICAN TRAIN DISPATCHERS' ASSOCIATION.—C. L. Darling, Northern Pacific Ry., Spokane, Wash.
- AMERICAN WOOD PRESERVERS' ASSOCIATION.—George M. Hunt, Chemist, Forest Products Laboratory, Madison, Wis.
- ASSOCIATION OF RAILWAY CLAIM AGENTS.—H. D. Morris, Northern Pacific R. R., St. Paul, Minn. Next annual meeting, May 19, 1922, Montreal.
- ASSOCIATION OF RAILWAY ELECTRICAL ENGINEERS.—Jos. A. Andreuccetti, C. & N. W. Ry., Room 411, C. & N. W. Sta., Chicago. Next convention, October 18-21, 1921, Hotel Metropole, Chicago. Exhibit by Railway Electrical Supply Manufacturers' Association.
- ASSOCIATION OF RAILWAY EXECUTIVES.—Thomas De Witt Cuyler (chairman), 61 Broadway, New York, N. Y.
- ASSOCIATION OF RAILWAY SUPPLY MEN.—A. W. Clieko, 1658 McCormick Bldg., Chicago. Meeting with International Railway General Foremen's Association.
- ASSOCIATION OF RAILWAY TELEGRAPH SUPERINTENDENTS.—(See American Railway Association, Division 1.)
- ASSOCIATION OF TRANSPORTATION AND CAR ACCOUNTING OFFICERS.—(See American Railway Association, Division 2.)
- BRIDGE AND BUILDING SUPPLY MEN'S ASSOCIATION.—A. J. Filkins, Paul Dickinson Company, Chicago. Meeting with convention of American Railway Bridge and Building Association.
- CANADIAN RAILWAY CLUB.—W. A. Booth, 131 Charron St., Montreal, Que.
- CAR FOREMEN'S ASSOCIATION OF CHICAGO.—Aaron Kline, 626 North Pine Ave., Chicago. Regular meetings, 2d Monday in month, except June, July and August, New Morrison Hotel, Chicago.
- CAR FOREMEN'S ASSOCIATION OF ST. LOUIS, MO.—Thomas B. Koneke, St. Louis, Mo. Meetings, first Tuesday in month at the American Hotel Annex, St. Louis.
- CENTRAL RAILWAY CLUB.—Harry D. Vought, 95 Liberty St., New York. Regular meetings, 2d Thursday in November and 2d Friday in January, March, May and September, Hotel Statler, Buffalo, N. Y.
- CHIEF INTERCHANGE CAR INSPECTORS' AND CAR FOREMEN'S ASSOCIATION.—W. P. Elliott, Terminal Railroad Association of St. Louis, East St. Louis, Ill. Convention this year has been postponed.
- CHIEF INTERCHANGE CAR INSPECTORS' AND CAR FOREMEN'S SUPPLY MEN'S ASSOCIATION.—D. B. Wright, 34th St. and Artesian Ave., Chicago, Ill. Meeting with Chief Interchange Car Inspectors' and Car Foremen's Association.
- CINCINNATI RAILWAY CLUB.—W. C. Cooder, Union Central Bldg., Cincinnati, Ohio.
- EASTERN RAILROAD ASSOCIATION.—E. N. Bessling, 614 F St., N. W., Washington, D. C.
- FREIGHT CLAIM ASSOCIATION.—(See American Railway Association, Division 7.)
- GENERAL SUPERINTENDENTS' ASSOCIATION OF CHICAGO.—A. M. Hunter, 321 Grand Central Sta., Chicago. Regular meetings, Wednesday preceding 3d Friday in month, Room 856, Insurance Exchange Bldg., Chicago.
- INTERNATIONAL RAILROAD MASTER BLACKSMITHS' ASSOCIATION.—W. J. Mayer, Michigan Central R. R., Detroit, Mich. Next convention, which was to have been held August 16-18, 1921, Hotel Sherman, Chicago, has been postponed. Exhibit by International Railroad Master Blacksmiths' Supply Men's Association.
- INTERNATIONAL RAILROAD MASTER BLACKSMITHS' SUPPLY MEN'S ASSOCIATION.—(See American Railway Association, Division 5.)
- INTERNATIONAL RAILROAD MASTER BLACKSMITHS' ASSOCIATION.—Meeting with International Railway Fuel Association.
- INTERNATIONAL RAILWAY FUEL ASSOCIATION.—J. G. Crawford, 702 E. 51st St., Chicago.
- INTERNATIONAL RAILWAY GENERAL FOREMEN'S ASSOCIATION.—Wm. Hall, 1061 W. Wabasha Ave., Winona, Minn. Next convention, which was to have been held September 12-15, Hotel Sherman, Chicago, has been postponed.
- MAINTENANCE OF WAY MASTER PAINTERS' ASSOCIATION.—E. E. Martin, Union Pacific R. R., Room No. 19, Union Pacific Bldg., Kansas City, Mo. Next convention, which was to have been held October 4-6, 1921, at Buffalo, N. Y., has been canceled.
- MASTER BOILER MAKERS' ASSOCIATION.—Harry D. Vought, 95 Liberty St., New York.
- MASTER CAR AND LOCOMOTIVE PAINTERS' ASSOCIATION.—(See A. R. A., Division 5.)
- MASTER CAR BUILDERS' ASSOCIATION.—(See A. R. A., Division 5.)
- NATIONAL ASSOCIATION OF RAILWAY TOOL PRODUCERS.—E. E. Pershall, T. J. Moss Tie Company, 720 Security Bldg., St. Louis.
- NATIONAL ASSOCIATION OF RAILWAY AND UTILITIES COMMISSIONERS.—James B. Walker, 49 Lafayette St., New York. Next convention, October 11, Atlanta.
- NATIONAL FOREIGN TRADE COUNCIL.—O. K. Davis, 1 Hanover Square, New York.
- NATIONAL RAILWAY APPLIANCES ASSOCIATION.—C. W. Kelly, Peoples' Gas Bldg., Chicago. Annual exhibition, March 13-16, Chicago, at convention of American Railway Engineering Association.
- NEW ENGLAND RAILROAD CLUB.—W. E. Cade, Jr., Boston, Mass. Regular meetings, 2d Tuesday in month, excepting June, July, August and September.
- NEW YORK RAILROAD CLUB.—Harry D. Vought, 95 Liberty St., New York. Regular meeting, 3d Friday in month, except June, July and August, at 29 W. 39th St., New York.
- PACIFIC RAILWAY CLUB.—W. S. Wollner, 64 Pine St., San Francisco, Cal. Regular meeting, 2d Thursday in month, alternately in San Francisco and Oakland.
- RAILWAY ACCOUNTING OFFICERS' ASSOCIATION.—E. R. Woodson, 1116 Woodward Building, Washington, D. C.
- RAILWAY BUILDING ASSOCIATION.—Frank W. Nixson, 600 Liberty Bldg., Broad and Chestnut Sts., Philadelphia, Pa.
- RAILWAY CLUB OF PITTSBURGH.—J. D. Conway, 515 Grandview Ave., Pittsburgh, Pa. Regular meetings, 4th Thursday in month, except June, July and August, at the Club House, Pittsburgh.
- RAILWAY DEVELOPMENT ASSOCIATION.—(See Am. Ry. Development Assn.)
- RAILWAY ELECTRICAL SUPPLY MANUFACTURERS' ASSOCIATION.—J. Scribner, General Electric Co., Chicago. Annual meeting with Association of Railway Electrical Engineers.
- RAILWAY EQUIPMENT MANUFACTURERS' ASSOCIATION.—R. J. Himmelright, 17 East 42nd St., New York. Meeting with Traveling Engineers' Association.
- RAILWAY FIRE PROTECTION ASSOCIATION.—R. R. Hackett, Baltimore & Ohio R. R., Baltimore, Md. Annual meeting, October 18-20, Hotel Sherman, Chicago.
- RAILWAY REAL ESTATE ASSOCIATION.—R. H. Morrison, C. & O. Ry., Richmond, Va.
- RAILWAY SIGNAL ASSOCIATION.—(See A. R. A., Division 4, Signal Section.)
- RAILWAY STOREKEEPERS' ASSOCIATION.—(See A. R. A., Division 6.)
- RAILWAY SUPPLY MANUFACTURERS' ASSOCIATION.—J. D. Conway, 1841 Oliver Bldg., Pittsburgh, Pa.
- RAILWAY TELEGRAPH AND TELEPHONE APPLIANCE ASSOCIATION.—G. A. Nelson, 30 Church St., New York.
- ROADMASTERS' AND MAINTENANCE OF WAY ASSOCIATION.—P. J. McAndrews, C. & N. W. Ry., Sterling, Ill. Next annual convention, September 20-22, 1921, Auditorium Hotel, Chicago. Exhibit by Track Supply Association.
- ST. LOUIS RAILWAY CLUB.—B. W. Frauenthal, Union Station, St. Louis, Mo. Regular meeting, 2d Friday in month, except June, July and August.
- SIGNAL APPLIANCE ASSOCIATION.—F. W. Edmunds, Sunbeam Electric Manufacturing Company, New York City. Meeting with American Railway Association, Signal Section.
- SOCIETY OF RAILWAY FINANCIAL OFFICERS.—L. W. Cox, Commercial Trust Bldg., Philadelphia, Pa.
- SOUTHERN AND SOUTHWESTERN RAILWAY CLUB.—A. J. Merrill, P. O. Box 1205, Atlanta, Ga. Regular meetings, 3d Thursday in January, March, May, July, September and November, Piedmont Hotel, Atlanta.
- SOUTHERN ASSOCIATION OF CAR SERVICE OFFICERS.—E. W. Sandwich, Western Ry. of Ala., Atlanta, Ga.
- SUPPLY ASSOCIATION OF AMERICAN RAILWAY TOOL FOREMEN'S ASSOCIATION.—C. N. Thulin, 935 Peoples' Gas Bldg., Chicago.
- TRACK SUPPLY ASSOCIATION.—W. C. Kidd, Kemaco Iron Works, Hilburn, N. Y. Meets with Roadmasters' and Maintenance of Way Association.
- TRAVELING ENGINEERS' ASSOCIATION.—W. O. Thompson, 117 East 98th St., Cleveland, Ohio. Business meeting, September 6, Hotel Sherman, Chicago. Exhibit this year by Railway Equipment Manufacturers' Association has been canceled.
- WESTERN RAILWAY CLUB.—Bruce V. Crandall, 14 E. Jackson Boulevard, Chicago. Meeting third Monday each month except June, July and August.

## Traffic News

The Department of Agriculture announces that 598,524 carload shipments of fruits and vegetables have been made this season up to July 2 or nearly twice as great as during the corresponding period of last year when 315,597 such shipments were made.

The Detroit, Toledo & Ironton, owned by the Ford interests, has filed with the Interstate Commerce Commission tariffs providing for a reduction in the rates on coal, coke, grain and grain products amounting to about 20 per cent, similar to the intrastate tariffs already filed with the state authorities.

The Chicago, Rock Island & Pacific to date has moved 9,000 carloads of cantaloupes from California as compared with 7,000 carloads for the corresponding period in 1920. The movement, which schedules 153-hour shipments from Branley in the Imperial Valley to Chicago, goes by way of the Southern Pacific, El Paso & Southwestern and the Rock Island. The season's crops started to the market in the latter part of May.

The Detroit, Toledo, & Ironton has been operating with its commercial agents and freight solicitors working from the central office since July 1. When the road came under the Ford management, about 30 of these officers were stationed about the country. All of these men have been called in and attached to the traffic department headquarters, with a view to giving service to the shipper and to work on special assignments.

More citrus fruit, with the exception of lemons, has been shipped from California and Florida so far this season than during the corresponding season last year, according to official reports received by the Department of Agriculture. Of oranges, 40,700 carloads were shipped in 1920, as compared with 48,732 in 1921; grape fruit, 9,261 cars in 1920, and 10,490 in 1921; lemons, 6,600 cars from California in 1920, as compared with 5,516 in 1921.

The Governor and other officers of the state of Alabama propose to resist with every available resource the execution in Alabama of the recent order of the Interstate Commerce Commission directing the Southern, the Alabama Great Southern and the Mobile & Ohio to increase certain freight rates between points within the state of Alabama to a parity with rates in effect between Meridian, Miss., and points in Alabama.

Southern roads appearing before Examiner John H. McQuilgan at St. Louis, Mo., asked for a revision of certain rates between St. Louis and New Orleans, La., declaring that the fixing of rates with river traffic as a basis was unfair because freight competition on the Mississippi river actually does not exist. The attention of the examiner was called to the serious handicap of roads which parallel the river as compared to those which run from the river to interior points.

At a state marketing conference held at St. Paul, Minn., on July 21, railroad officers told state officials and live stock men that it was impossible for the railroads to undertake to regulate the flow of live stock to market by changing train schedules. They suggested a campaign of education among shippers in order to get them to regulate the movement of stock themselves and declared that the railroads are compelled to handle all classes of merchandise on their lines and that it would be unfair to make special schedules favoring live stock men.

The Public Service Commission of New York has issued an order, to go into effect on August 1, requiring a general and sweeping reduction by the principal railroads of the state in the freight rates on peaches, in carloads, said to be equal to the increase which was made in these rates when the Interstate Commerce Commission authorized general advances last year. Shippers of peaches have declared that their business was in danger of destruction because of the high rates, and this claim appears to have had weight with the commission.

## Commission and Court News

### Interstate Commerce Commission

The commission has reopened the Indiana intrastate rate case, insofar as it applies to rates on water in carloads, for such further hearing as the commission may hereafter direct.

The commission has reopened the Nebraska intrastate rate case, insofar as it applies to rates on sand and gravel in carloads, for such further hearing as the commission may direct.

The commission has suspended, from July 30 until November 27, the proposed advances in rates on woolen yarn from Skowhegan, Me., to Boston, North Andover and Lawrence, Mass., and other points in New England and Trunk Line territory.

The commission has denied the application of R. H. Countiss, agent, for authority to establish rates on dried beans, canned goods, canned salmon, dried fruits and vegetables, condensed milk, rice and other commodities from Pacific coast points to certain points in eastern territory without observing the long-and-short-haul provision of the law.

Commissioner Charles C. McChord is chairman of a joint committee composed of three members of the Interstate Commerce Commission and members of the United States Shipping Board to cooperate in overlapping duties of the board and the commission due to amendments to the Interstate Commerce Act and the passage of the Merchant Marine Act. The two statutes are to be administered with the least possible crossing of paths.

The joint committee is at present considering the question of a uniform through export bill of lading. Members of the committee, in addition to Mr. McChord, are commissioners Hall and Esch, representing the I. C. C., and commissioners Edward C. Plummer, Frederick I. Thompson, and Meyer Lissner, representing the shipping board.

### Court News

#### Connecting Carrier Cannot Recover from Consignor Freight for Shipment Misrouted by Initial Carrier

A consignor and receiving carrier entered into a contract to carry a car of perishable fruit to Syracuse, N. Y., but before the goods started the contract was rescinded and a new bill of lading issued with destination Nashville, Tenn. By mistake the receiving carrier acted on the abrogated contract, sending the fruit to Syracuse. The federal district court for the Southern District of Georgia holds that the connecting carrier which carried the fruit to Syracuse could not recover freight for that service. The receiving carrier having misrouted the shipment, "it was without authority from the shipper to contract with a connecting carrier in aid of a wrongful diversion, and neither it nor its connecting carrier can lawfully charge freight to the shipper for such wrongful diversion. The connecting carrier's remedy for its freight charges is against the initial carrier, and not against the shipper, with whom it had no privity of character."—D. L. & W. Co. v. Johnson-Brown Co., 270 Fed. 679.

#### Bill of Lading. Notify Consignee, Does Not Require Notice of Right to Inspect

The Circuit Court of Appeals, Second Circuit, holds that a bill of lading for a carload shipment to the order of the consignor, notify consignee, does not require the carrier in its notice to advise the consignee of a right of inspection given by the bill of lading, in addition to stating the fact of arrival of the goods. The car having been destroyed by fire on a siding at destination, the point contested was whether under the bill of lading the railroad was liable as insurer or as warehouseman, and that depended on whether notice of arrival was given to the consignee more than 48 hours before the fire. Judgment for the plaintiff shipper was reversed.—Director General v. Lewis E. Sands Co., 271 Fed. 85.

## Foreign Railway News

### Poland Gets Rolling Stock from Soviet Russia

In compliance with the treaty of Riga, the Soviet government has delivered to Poland 155 locomotives, 435 passenger cars and 8,859 freight cars, according to Commerce Reports. The freight cars are said to be in fairly good condition.

### Railway Accidents in France

LONDON.

The following table gives some statistics of accidents in France during the past few years. The table has been compiled by the Temps (Paris) in order to reassure the nervous public of France:

Year	Total number of accidents	Killed	Injured
1912.....	209	50	754
1913.....	142	60	413
1919.....	167	271	1,064
1920.....	142	122	1,184
1921 (up to July 15).....	43	54	238

### French Train Robbers Apprehended

The bandits who robbed a Paris-Marseilles express train on the night of July 24 (*Railway Age*, July 30, page 223) were apprehended in a Paris café on July 30, according to a cable dispatch to the New York Times. Two of the robbers were killed in an attempt to escape their captors and one policeman was mortally wounded in the mêlée. The third bandit who had been captured several hours before had informed the police where the others were to be found. This robbery in which one passenger was killed and two wounded was one of a series of spectacular train robberies which have occurred in France recently.

### French Railway Places Order with Westinghouse

An order for electrical equipment amounting to \$1,200,000 has been received by the Westinghouse Electric International Company from the Midi Railway of France. The order includes transformers, synchronous condensers, lightning arresters and other substation equipment. The Midi Railway operates an extensive system, starting from Bordeaux, running through Toulouse to Certe, with many branches. The section on which the Westinghouse equipment will be used extends from Pau to Toulouse in the Pyrenees mountains, near the Spanish border. The line passes through Tarbes and St. Gaudens, and has a total length of over 100 miles.

### Mexican Northwestern to Reopen Line to Chihuahua

The Mexican Northwestern expects to have through connections established over its line from Ciudad Juarez to Chihuahua City by September 1, 1921, according to Vice Consul Harper at Ciudad Juarez. This will put into operation a portion of their lines between Madera and Temosachic that has not been operated since 1916. The establishing of another connection between Juarez and Chihuahua will open a new trade territory for both cities since the re-establishment of traffic in the Madera territory will have its influence on mining, agricultural, and other enterprises. Some of the mining companies are already planning to open up properties that have not been operated for the past five or six years. One mining corporation has recently completed a new power plant in Madera which is to furnish power for its mines located some 25 miles from that city.

### Merger Adds to Power

#### of German Locomotive Builders

Another great merger in the German metal trades has just taken place, according to the Times (London) Trade Supplement. The Rheinische Metallwaren-und Maschinenfabrik at Duesseldorf has combined with the Allgemeine Elektrizitaets Gesellschaft, the Friedrich Krupp Allgemeine Gesellschaft and the Cologne iron trading firm of Otto Wolff, and has increased its share capital by 95,000,000 marks to 120,000,000 marks (\$30,000,000 par).

By this combination the "Rheinmetall" concern will rank among the leading locomotive plants of the world, its output capacity being 350 engines, and that of the whole group about 1,200 engines. In connection with the Allgemeine Elektrizitaets Gesellschaft, increased attention will be devoted to the manufacture of electrical supplies. Krupp's and Wolff will chiefly supply raw and semi-finished products and place their extensive foreign sales organization at the disposal of the concern. It has already been decided to make a further increase in capital of 50,000,000 marks (\$12,500,000 at par) for reconstruction of plant.

It is said also that there is a movement on foot to establish a syndicate of rail manufacturers to support German interests against foreign competition. A concern at Chemnitz has increased its capital by some \$7,500,000 (par) and will greatly increase its output of locomotives. This concern, it is said, recently secured an order for 500 engines from Japan.

### English Road Facilitates Examinations of Employees

The Lancashire & Yorkshire Railway has issued a book of questions and answers relative to the rules and regulations governing the operating department which is designed to facilitate the work of the examiners and to insure a careful examination of employees seeking appointment or promotion. The book is divided into sections containing questions and answers concerning the following topics:

1. Manual Block System—Double Tracked Lines.
2. Electric Train Tablet System—Single Tracked Lines.
3. Regulations Affecting Signalmen.
4. Regulations Affecting Guards (Trainmen).
5. A Double-Tracked Line Operated as Single Track Because of Obstruction.
6. Safe Operation of Trains in General.
7. Fog Signaling.

### Purchase of Railway Supplies Exclusively in Britain Causes Dissent in India

The most important step taken by the government of India to relieve the acute congestion on the government railways has been the placing of a \$35,000,000 bond issue in England, according to a Calcutta correspondent of the Brooklyn Eagle. The proceeds of this issue, says the dispatch, are to be spent entirely for British goods and this policy is said to have evoked the following letter to the government from the Indian Merchants' Chamber of Bombay:

"We would like to know how long the tragedy of purchasing railway materials for India only in the United Kingdom is to go on. Even English corporations and the governments of self-governing dominions have placed orders in foreign markets on advantageous terms, whereas India alone is fleeced in the interests of English manufacturers. My committee does not see the advantage to this country of borrowing at heavy rates in the United Kingdom, putting the burden of interest and capital charges on India and feeding English manufacturers with orders out of such money. My committee suggests that the materials for India must be purchased in India by competitive tenders, open to every nation of the world, and the lowest price tenders alone should be accepted. According to my committee's belief, a saving of at least 30 to 40 per cent would be effected by adopting this procedure."

### Road Transport and the English Railways

LONDON.

Road transport in England since the war has grown by leaps and bounds, due primarily to the large number of motor trucks which were made available for commercial purposes by the cessation of hostilities. It has cut into the earnings of the railways to such an extent that now, on the eve of the railways being returned to their owners, the railway companies are seeking to have included in the railway bill, now before Parliament, provisions whereby they will be enabled to transport freight and passengers by road as well as by rail. Arthur Watson, joint manager of the London & North Western and the Lancashire & Yorkshire, stated the railways' case quite clearly in an interview appearing in the Evening Standard (London) recently.

"Obviously a railway bill which does not deal with the ques-

tion of road transport for railways is not complete," he declared. "With the advance of mechanical science during the war, road transport agencies came into existence; they diverted the traffic—the best paying traffic—from the railways, and we feel that we ought to be in a position, so far as we can, to deal with that traffic which has been so diverted.

"As things stand at present we can only transport by road for collection and delivery purposes. Now we are seeking powers to carry by road, even though the goods do not travel on the railway at all.

"We are also seeking powers to carry passengers by road, but it is goods we have in our minds chiefly.

"What the railway companies want to make clear is that what they are seeking is not a monopoly of road transport. Their idea would be in practice to set up conferences, as is done in the railway world, with the other road transport haulers and get the rates to be charged by road agreed among them."

### Germans Get Preferential Tariff Rate By Shipping from Belgium

LONDON.

The 20 per cent rebate on customs duties accorded to Belgium by Brazil seems to have given an opening to German exporters, who have quickly seized the opportunity by negotiating with Belgian merchants for the shipment of the goods to Brazil in order to enjoy the preference. According to the Rio representative of the Federation of British Industries, the Brazilian Minister at Brussels has cabled to the government to the effect that German manufacturers have been shipping goods from Antwerp to Brazil. Both Germany and Belgium are dealing largely with Brazil in iron goods, rails, locomotives, and so forth. The Brazilian government has instructed its consuls in Belgian ports that all goods exported to Brazil must be accompanied by a declaration from the burgomaster of the town of manufacture declaring the origin of the goods.

### English Road Uses Attractive Publication to Build Up Suburban Traffic

The Metropolitan Railway, which has extensive suburban lines in and around London, has issued an attractive booklet of some 90 pages descriptive of the various suburban communities served by its lines. The book, which is called "Metro-land," is printed on gloss paper of excellent quality and is profusely illustrated with maps and photographs, a number of which are in color. Each of the communities served by the company's lines is dealt with separately, giving interesting bits of history of the towns and villages, the places of interest in them, the number of their inhabitants, the physical characteristics of the communities, the principal industries and the distance from the company's Baker street terminus in London.

One section of the book is labeled "Country Homes in Metro-land" and in it the various real estate developments in progress along the company's lines are described. Here the prospective home owner can find the cost of land, some idea of building costs and suggestions as to the monthly payments necessary to acquire residential property. The company's service even extends further than that. It will furnish definite information as to plans, cost and monthly payments to those who apply on the following coupon, which can be clipped, filled out and mailed:

Please send me further details of the ..... Estate.  
I require .....  
No. of Bedrooms .....  
No. of Reception Rooms .....  
Extent of Ground .....  
Maximum Price to be Paid .....  
Amount Available as Deposit .....  
Name .....  
Address .....

A supplementary publication deals with house plans and gives the reader an idea of the cost of various types of houses. A number of advertisements appear in the publications—for the most part those of real estate agents and country hotels—a fact which doubtless has materially lessened the cost to the railway and at the same time has permitted the publication of a book of much greater interest and value than would have been otherwise possible.

### European Design of Automatic Coupler

The adoption of automatic car couplers in Europe was retarded by the war, but is now again receiving attention. Since 1914 the Iron & Steel Works, Schaffhausen, Switzerland, has been manufacturing the GF automatic coupler, which couples the cars by impact and also makes connections between the brake pipes. It is now in use in Switzerland on broad gage lines, light railways and street railways and has been applied in other countries.

The GF coupler consists of two similar coupling heads, one of which is attached to each end of the car. The head is in the form of a funnel shaped casting with a coupling eye, in blade

The G F Coupler Head with Brake Pipe Connection

form, protruding from the funnel and provided with a hole near the front of the projection. At the back of the funnel is a bolt which can be set in a raised position. On impact the latch is released by the projecting coupling eye of the opposite head, thus making the coupling. This operation is plainly shown in the drawing. In uncoupling, the handles, shown in the photograph on each side of the head, are raised. In this position the cars can be detached after which the coupling heads resume their normal position, ready for coupling.

As the GF automatic coupler can be fitted to any kind of rail-

Positions of the Mechanism Ready to Couple, Coupled and Set to Uncouple

way vehicle, it is constructed in various ways. Working conditions on all narrow gage railways can be suited so that coupling can take place on any degree of curve. The device is fitted to two-axle cars by cross buffer rods, or scissors. The rods are supplied with springs to meet the forces of traction and impact and are kept in their central position by special centering springs. On four-axle cars the coupler is either attached directly to the truck or attached by a pivot to the underframe of the car and guided from the truck to conform to the curves of the track. A transition coupling rod is used to connect cars provided with the GF coupler with cars still fitted with couplings of the old system.

## Equipment and Supplies

### D. L. & W. Electrification Bids Rejected

All bids for supplying electrical equipment for the Delaware, Lackawanna & Western's proposed electrification of some of its mileage in the Scranton, Pa., district have been rejected. July 29 was the last day upon which bids could be submitted. They were opened immediately and it was found that all were unsatisfactory. Gibbs & Hill, consulting engineers for the Lackawanna, who received the bids, may advertise for new offers soon. The General Electric Company and Westinghouse Electric & Manufacturing Company were the only two companies that submitted bids for furnishing the heavier equipment.

### Locomotives

THE DELAWARE, LACKAWANNA & WESTERN will receive bids until 12 o'clock noon, August 10, through Gibbs & Hill, Consulting Engineers, New York City, for 7 electric freight locomotives. See item above regarding rejection of bids for electrification on part of this road.

MITSUBI & Co., New York, have ordered specialties for 6 Decapod locomotives for the South Manchurian Railway, including headlights from the Pyle-National Company; driver brake rigging from the Westinghouse Air Brake Company, and superheaters from the Superheater Company.

### Freight Cars

THE SOROCABANA RAILWAY (Brazil) is inquiring through the car builders for 50 stock cars.

THE ALABAMA, TENNESSEE & NORTHERN is inquiring for 100, 50-ton flat cars and 100, 50-ton gondola cars.

ILLINOIS CENTRAL is inquiring for prices on the repair of about 900 miscellaneous box and gondola cars.

THE MATHER HORSE & STOCK CAR COMPANY, Chicago, is inquiring for 500 steel underframes for car repairs.

THE VIRGINIAN RAILWAY is having repairs made to 150 hopper cars, of 50-ton capacity, at the shops of the Virginia Bridge & Iron Company.

THE NEW YORK CENTRAL has given a contract for the repair of 500 gondola cars, for the Pittsburgh & Lake Erie, to the Youngstown Steel Car Company. This is in addition to the repairs reported in our last issue.

THE KANSAS, OKLAHOMA & GULF is inquiring for 150, 50-ton steel frame composite gondola cars with tight bottoms; 250 steel frame composite gondola cars with 12 drop doors, and 100, 40-ton steel frame composite, tight bottom car bodies.

### Passenger Cars

THE ATCHISON, TOPEKA & SANTA FE is inquiring for 10 dining cars and 10 buffet cars.

THE FLORIDA EAST COAST, reported in the *Railway Age* of January 7, as asking for prices on 6 passenger cars, has ordered this equipment from the Pullman Company.

THE SAO PAULO-RIO GRANDE (Brazil), reported in the *Railway Age* of May 6, as inquiring for passenger train equipment, is now inquiring through the car builders for 4 sleeping cars, 6 mail cars, 8 baggage cars, and 6 passenger coaches.

### Iron and Steel

THE EAST ST. LOUIS, COLUMBIA & WATERLOO has ordered 121 tons of plate girder spans from the American Bridge Company.

THE LEHIGH & NEW ENGLAND has given a contract to the

Shoemaker-Satterwait Bridge Company, Philadelphia, Pa., for about 275 tons of bridge steel.

MITSUBI & Co., New York, have ordered 135 tons of structural steel from the Consolidated Steel Corporation for export to Japan; also have ordered 4 miles of 60-lb. rail and 9 miles of 70-lb. rail, a total of about 1,500 tons, from the same company for the Osaka Electric Railway, Japan. The order for 700 tons of 80-lb. rail for the South Manchurian Railway was given to the Consolidated Steel Corporation and not to the United States Steel Products Company as was reported in our issue of July 30.

### Miscellaneous

THE CHICAGO & NORTH WESTERN will accept bids until 12 o'clock noon, August 10, for 50 ash pans for locomotives; 50 cast steel pilots for locomotives, and 21 cast steel tender frames.

THE NEW YORK CENTRAL will receive bids until 12 o'clock noon, August 11, for its present requirements on bridge parts, and structural steel for bridges, frogs, repair parts for switches, switch points, switch plates and braces and crossings.

MITSUBI & Co., New York, have given an order to the United States Steel Products Company for 63 sets of tramway switches and frogs, about 100 tons, for the Tokio Municipal Railway, Japan, and have also ordered 4 sets of electric trucks from the J. G. Brill Company, for the Nankai Railway, Japan.

### Railway Construction

ATCHISON, TOPEKA & SANTA FE.—This company, which was noted in the *Railway Age* of July 23 (page 184), as having authorized the construction of an addition to its power house at Albuquerque, N. M., to cost about \$150,000, closed bids for this work on July 30.

CHICAGO GREAT WESTERN.—This company has awarded a contract for the construction of a rectangular enginehouse at Sycamore, Ill., to the T. S. Leake Construction Company, Chicago.

CHICAGO, INDIANAPOLIS & LOUISVILLE.—This company, which was noted in the *Railway Age* of July 23 (page 184) as having closed bids for the construction of a new brick freight station at French Lick, Ind., to cost about \$10,000, has awarded the contract for this work to the T. S. Leake Construction Company, Chicago.

CHICAGO, ROCK ISLAND & PACIFIC.—This company is accepting bids for the construction of a new 8-stall roundhouse at Amarillo, Tex., to cost about \$40,000.

CHICAGO UNION STATION.—This company has let a contract to the Underground Construction Company, Chicago, for the construction of the substructure in connection with the widening of Canal street, between Jackson and Van Buren streets.

IDAHO CENTRAL.—The Interstate Commerce Commission has issued a certificate of convenience and necessity to this company authorizing the construction of a line from Rogerson, Idaho, to Wells, Nevada, a distance of 90 miles.

ILLINOIS CENTRAL.—This company, which was noted in the *Railway Age* of July 23 (page 184), as accepting bids for the construction of a new frame passenger and freight station at Duck Hill, Miss., has awarded a contract for this work to the A. Lund Construction Company, Chicago. This company is accepting bids for the construction of two abutments and a concrete pier near Heyworth, Ill., to cost approximately \$10,000.

INTERSTATE.—This company, which was noted in the *Railway Age* of April 15 (page 958), as about to accept bids for the construction of 18 miles of single track line with passing tracks and an interchange yard near Whitesburg, Ky., has awarded the contract for this work to Brooks, Callaway & Company, Atlanta, Ga.

KANSAS CITY SOUTHERN.—This company closed bids on July 27 for the construction of seven water treating plants to be located on its line between Kansas City, Mo., and Pittsburg, Kan., and costing a total of approximately \$50,000.

## Supply Trade News

The Barrett Company on August 1 removed its offices from 17 Battery Place to 40 Rector street, New York City.

The O. M. Edwards Company, Inc., Syracuse, N. Y., has moved its Chicago, Ill., office to 532 First National Bank building.

A. H. Handlan, Jr., vice-president and manager of the Handlan-Buck Manufacturing Company, St. Louis, Mo., has been elected president of the company, succeeding his father, the late A. H. Handlan; E. W. Handlan, vice-president and treasurer, has been made vice-president; E. R. Handlan, secretary, has also been elected to a vice-presidency, and R. D. Teasdale has been appointed secretary.

The T. H. Symington Company, New York, in order to better serve its customers has created a new Northwestern district for the selling of its products. J. F. Schurch, vice-

president of this company, and also president of the Railway Supply Manufacturers' Association, who has been in charge of the Symington office at Chicago for several years, and who is well known in railroad circles, is in charge of this district with headquarters in St. Paul, Minn. The Chicago office is in charge of Le Roy Kramer who has been elected vice-president and director of the company. He assumed his new duties on August 1. Mr. Kramer spent many years in the operating departments

of the St. Louis-San Francisco and the Rock Island railroads and for six years was vice-president in charge of manufacturing for the Pullman Company. During the war he acted as federal manager of the St. Louis-San Francisco and the Missouri, Kansas & Texas railroads at St. Louis under the United States Railroad Administration. He left there in the Spring of 1919 to become vice-president in charge of production for the Willys-Overland plant at Toledo, and was also for a short time vice-president of the Pierce-Arrow Company at Buffalo.

## Trade Publications

**BELLS AND ALARMS.**—The Holtzer-Cabot Electric Company has issued a 16-page booklet describing and illustrating its fire alarm, watchmen's clock and audible signal systems for use in railway service and elsewhere.

**SIGNALING SYSTEMS.**—Some of the products manufactured by the Holtzer-Cabot Electric Company, Boston, Mass., including fire-alarm systems, calling systems, watchmen's clock systems, etc., are briefly described in a 14-page, illustrated booklet which the company has recently issued.

**MANING, MAXWELL & MOORE, INC.**—A 38-page illustrated booklet has recently been issued by Manning, Maxwell & Moore, Inc., in which is given a brief history of the development of the company and its business, followed by a complete list of the official personnel of the various departments and works operated by the corporation. The book also contains a list of the products manufactured by the corporation, as well as of the machine tools and shop facilities of other manufacturers, the distribution of which is handled by Manning, Maxwell & Moore.

## Railway Financial News

**AKRON, CANTON & YOUNGSTOWN.**—*Loan Approved.*—The Interstate Commerce Commission has approved a loan to this company of \$200,000 to assist it in meeting maturing indebtedness and in the purchase of equipment.

**ALABAMA, FLORIDA & GULF.**—*Authorized to Issue Bonds.*—The Interstate Commerce Commission has authorized this company to issue for cash \$150,000, 7 per cent sinking fund gold bonds, the proceeds to be used in constructing an extension from a point near Wilson, Ala., to Dothan, approximately 4 miles, and from Greenwood, Fla., southward to Marianna, approximately 9 miles, the construction of which has been heretofore authorized. The right of way and \$40,000 in cash will be donated to aid in the construction of these extensions, the estimated cost of which, exclusive of the right of way, is given as \$158,779. The approval is conditional upon the sale of the bonds at not less than 90 per cent of par.

**BALTIMORE & OHIO.**—*Asks Authority to Issue Toledo-Cincinnati Division Bonds.*—The Baltimore & Ohio has asked the Interstate Commerce Commission for authority to issue nominally \$2,447,000 of its Toledo-Cincinnati Division first lien and refunding mortgage 6 per cent bonds in payment of advances made to acquire a like amount of the Toledo & Cincinnati Railroad Company's first and refunding 6 per cent bonds. The latter bonds when acquired will be used to secure the issue of the bonds which the applicant now requests authority to issue. The Baltimore & Ohio has also asked authority to pledge from time to time \$2,447,000 first lien and refunding mortgage bonds as collateral security for short time loans; and for authority to issue and pledge the first and refunding mortgage 6 per cent bonds of the Toledo & Cincinnati Railroad as collateral to the applicant's first lien and refunding mortgage.

**CAMBRIA & INDIANA.**—*Loan Approved.*—The Interstate Commerce Commission has approved a loan of \$250,000 to this company from the revolving fund to assist it in meeting the maturity of short term notes on August 1. The company had applied for \$750,000.

**CENTRAL VERMONT.**—*Asks Loan from Revolving Fund.*—This company has applied to the Interstate Commerce Commission for a loan of \$75,000 for five years to retire equipment notes.

**CHICAGO & ALTON.**—*Annual Report.*—A review of this company's annual report for 1920 appears on another page of this issue.

**CHICAGO GREAT WESTERN.**—*Loan Approved.*—This company has been granted a loan from the government by the Interstate Commerce Commission amounting to \$1,929,373.

**CISCO & NORTHEASTERN.**—*Granted Authority to Issue Stock.*—This company has been granted authority by the Interstate Commerce Commission to issue for sale at par \$264,950 of capital stock and to issue \$882,000 first mortgage 10-year, 6 per cent gold bonds, \$326,500 of which is to be used at par to pay various promissory notes and accrued interest and the remaining \$555,450 of bonds to be sold at not less than 80 per cent of par or to be pledged as collateral securing for short time notes. The proceeds would be applied to the cost of constructing and equipping the applicant's line and of additions, betterments and extensions.

**DELAWARE, LACKAWANNA & WESTERN.**—*Directors Declare Stock Dividend.*—The directors of the Delaware, Lackawanna & Western on July 28 declared a stock dividend of 100 per cent, payable August 20 to stockholders of record August 8. The taking of this action follows the approval of the Interstate Commerce Commission last April and of the stockholders of the company on July 21.

**DENVER & RIO GRANDE.**—*Suits Against Former Directors Dismissed.*—Judge Lewis, of the Federal Court, Denver, has dismissed a suit charging collusion and fraud brought by the

Le Roy Kramer

stockholders' protective committee against directors of the company and others. He has also denied the plaintiff's motion for leave to file an amended and supplemental petition. The Protective Committee has subsequently appealed to the U. S. Circuit Court of Appeals at St. Louis on the right to file an amended and supplemental complaint, and this appeal has been granted by the court at St. Louis.

The Wall Street Journal says:

The suit dismissed by Judge Lewis was the one filed by counsel for the protective committee last December, and which made general charges of interlocking directorates, and which alleged conspiracy and fraud in connection with that part of the Denver's financial history surrounding the company's default of bond interest on Western Pacific bonds which had been guaranteed. Inasmuch as the charges in this suit were only of a general character it was expected that the protective committee would file another complaint naming more specific instances of alleged fraud, but this has not been done. The committee has made no announcement as to whether or not it intends yet to file an entirely new complaint.

The stockholders' hope of saving the property now rests with what success it might have in the Court of Appeals, though counsel for the protective committee has maintained that in the last resort the U. S. Supreme Court will be referred to and the whole matter laid before it.

In the meantime Western Pacific interests who purchased the Denver at court sale price in consequence of a deficiency judgment following foreclosure on the Western Pacific, are in Denver looking after the actual transfer of title to the property to the new Denver & Rio Grande Western.

The formal transfer of the property of the Denver & Rio Grande to the newly organized Denver & Rio Grande Western was sanctioned July 27 by Judges Lewis and Sanborn of the Federal Court of Appeals, and the transfer has taken place.

**ERIE.—New Directors.**—George T. Slade and Frank L. Polk have been elected directors, succeeding Ogden Mills and the late Francis Lynde Stetson.

**GEORGIA & FLORIDA.—New Receiver.**—John Skelton Williams has been appointed sole receiver, succeeding Langborne M. Williams, W. R. Sullivan and John F. Lewis, who have resigned as receivers.

**GREAT NORTHERN.—Annual Report.**—The income account for the year ended December 31, 1920, compares with the previous year as follows:

	1920	1919
Operating revenue (10 months).....	\$106,801,583	.....
Operating expenses .....	94,911,125	.....
Taxes .....	8,617,402	.....
Operating income .....	\$3,273,056	.....
Federal compensation (2 months).....	4,781,162	*\$28,868,973
Other income .....	19,747,501	3,395,294

Comprises tax liability, insurance and casualty reserves, accrued depreciation of road and equipment, and other unadjusted credits.

The annual report of the Great Northern will be reviewed editorially in an early issue.

**GREEN BAY & WESTERN.—Proposed Abandonment of Branch Line Held Not Justified.**—The proposed abandonment by the Green Bay & Western of a branch line between Onalaska, Wis., and La Crosse, 6 miles, has been held by the Interstate Commerce Commission not to be justified and a certificate of public convenience and necessity has been denied. The carrier desired to abandon the branch line because of deficits in the costs of its operation. The commission holds that the results of the operation of the branch as reflected in the accounts of the system as a whole, are not such as to call for a granting of relief in view of the showing made as to the public need for the service. If the carrier, however, can work out other arrangements whereby the public will be given the same service and at similar rates, the proceeding may be reopened. The carrier also proposed to abandon operation under trackage rights on the Chicago & North Western, between Onalaska, Wis., and Marshland, 22 miles, but the commission holds that the cessation of operations under trackage rights is not prohibited by paragraph 18 of section 1 of the act.

**ILLINOIS CENTRAL.—Authorized to Issue Bonds.**—The Illinois Central has been granted authority by the Interstate Commerce Commission to issue and sell \$8,000,000 of 15-year, 6½ per cent

secured gold bonds at not less than 93.75 per cent of par, and to pledge as collateral security for the bonds \$8,225,000 of Illinois Central refunding mortgage 4 per cent gold bonds, and \$3,820,000 of Illinois Central and Chicago, St. Louis & New Orleans joint first refunding mortgage 5 per cent bonds. The purpose of the issue is to secure funds to meet maturing indebtedness. Arrangements have been made by the carrier with Kuhn, Loeb & Co. for the sale of the bonds at 93.75 per cent of par and accrued interest.

The Illinois Central and the Chicago, St. Louis & New Orleans have also been granted authority to issue from time to time \$136,700 of Illinois Central and Chicago, St. Louis & New Orleans joint first refunding mortgage 5 per cent bonds for pledging and replying as collateral security for short time notes. The bonds are now in the applicant's treasury.

**JACKSON & EASTERN.—Asks Authority to Issue Bonds.**—This company has filed an application with the Interstate Commerce Commission for authority to issue \$95,000 of bonds, secured by a first mortgage, now in its treasury. The proceeds of the sale of the bonds will be used to pay current indebtedness and for betterments and extensions.

**LAKE ERIE, FRANKLIN & CLARION.—Authorized to Issue Notes.**—This company has been granted authority by the Interstate Commerce Commission to issue, from time to time, promissory notes for an aggregate face amount outstanding at any one time not to exceed \$25,000, in renewal of a promissory note for a like amount, the issue of which has heretofore been authorized in this proceeding.

**LANCASTER & CHESTER.—Granted Authority to Extend Bonds.**—This company has been granted authority by the Interstate Commerce Commission to enter into an agreement with the holder of \$135,000 first mortgage 5 per cent, gold bonds for the extension of the maturity date thereof from July 1 last to July 1, 1922, and to increase the rate of interest from 5 to 7 per cent per annum.

**LONG ISLAND.—Annual Report.**—The corporate income for the year ended December 31, 1920, compares with the year 1919, as follows:

	1920	1919
Compensation, January and February, 1920; year 1919 .....	\$ 647,200	\$3,221,949
Compensation for guaranty period March 1, to Aug. 31 .....	1,833,689	.....
Operating results, Sept. 1 to Dec. 31, 1920:		
Operating revenues .....	9,172,265	.....
Operating expenses .....	8,825,396	.....
Net from railway operations .....	346,869	.....
Railway tax accruals .....	396,798	.....
Railway operating deficit .....	52,437	.....
Net railway operating deficit .....	165,833	.....
Non operating income .....	760,002	719,276
Gross income .....	3,075,058	3,941,225
Interest on funded debt .....	2,311,618	2,122,786
Total deductions from gross income .....	3,585,280	3,258,719
Net income .....	510,221	682,506
Def. .....	430	.....
Balance transferred to credit of profit and loss .....	510,651	682,076

The annual report of the Long Island will be reviewed editorially in an early issue.

**MIDDLE TENNESSEE.—To Be Sold.**—The Commercial and Financial Chronicle reports the Nashville Trust Company as saying that this road, which runs from Franklin, Tenn., to Mt. Pleasant, a distance of about 44½ miles, and which was reported to have discontinued business last October, will be sold September 10 at Franklin. Officers of the Louisville & Nashville, it is reported, have made an inspection of the road and it is believed intend inquiring about the property. It is said that the Illinois Central may also be a bidder.

**MINNEAPOLIS & ST. LOUIS.—Authorized to Pledge Bonds.**—This company has been authorized by the Interstate Commerce Commission to pledge and repledge from time to time \$714,000 of refunding and extension mortgage 5 per cent gold bonds as collateral security for short term notes. The issue of the bonds was recently authorized by the commission.

**NEW ORLEANS, TEXAS & MEXICO.—Authorized to Issue Bonds.**—This company has been granted authority by the Interstate Commerce Commission to issue \$533,700 of its first mortgage bonds as collateral security for a note of \$500,000, payable to the Columbia Trust Company of New York 24 months after date.

**SPRINGFIELD TERMINAL.**—*Authorized to Issue Capital Stock.*—This company has been authorized by the Interstate Commerce Commission to issue \$62,500 of capital stock at par for cash, the proceeds thereof to pay indebtedness on capital account. The company wished to issue \$100,000 of stock, but the commission limited the amount to the sum that would be used for capital purposes.

**TEXAS CITY TERMINAL.**—*Authorized to Issue Securities.*—This company has been authorized by the Interstate Commerce Commission to issue \$500,000 of common stock and \$1,984,300 of 20-year sinking fund, 6 per cent first mortgage bonds to be used in payment for the property formerly owned by the Texas City Transportation Company, which is to be operated by the new company.

### Final Settlements with Railroad Administration

The United States Railroad Administration reports the following final settlements, and has paid out to the several roads the following amounts:

Delaware, Lackawanna & Western.....	\$5,000,000
Elgin, Joliet & Eastern.....	3,700,000
Gulf Coast Lines.....	800,000
New York Dock Railway.....	64,861
Fairchild & Northeastern.....	10,000

The payment of these claims on final settlement is largely made up of balance of compensation due, but includes all other disputed items as between the railroad companies and the Railroad Administration during the twenty-six months of Federal control.

### Treasury Payments

The Treasury has announced the payment of a loan of \$250,000 to the Cambria & Indiana and partial payments of guaranty, as follows:

Alabama, Tennessee & Northern.....	\$22,500
Boone City, Gaylord & Alpena.....	12,500
Chicago & Erie.....	336,500
Chicago Tunnel.....	14,500
Galveston Wharf.....	39,000
Houston & Brazos Valley receiver.....	15,500
Huntington & Broad Top Mountain.....	122,000
Pittsburgh, Shawmut & Northern receiver.....	200,000
St. Joseph & Grand Island.....	40,000

### Guaranty Certificates Issued

The Interstate Commerce Commission has issued partial payment certificates on account of the six months' guaranty, as follows:

Alabama, Tennessee & Northern.....	\$22,500
Boone City, Gaylord & Alpena.....	12,500
Chicago Tunnel Company.....	14,500
Chicago & Erie.....	336,500
Colorado & Southern.....	340,000
Denison & Pacific Suburban.....	1,800,000
Galveston Wharf Company.....	39,000
Houston & Brazos Valley.....	5,500
Huntington & Broad Top Mountain.....	122,285
Rio Grande Southern.....	15,000
St. Joseph & Grand Island.....	40,000
Tonopah & Goldfield.....	80,000

### Dividends Declared

Buffalo, Rochester & Pittsburgh—preferred, \$3, and common, \$1, payable August 15 to holders of record, August 8.

Delaware, Lackawanna & Western—100 per cent, stock dividend, payable August 20 to stockholders of record August 8.

Illinois Central—1½ per cent quarterly, payable September 1 to stockholders of record August 5.

THE RAILROADS OF TEXAS report a total revenue for the first four months of the present calendar year of \$72,938,538, an increase of \$5,780,190; operating expenses, \$66,694,459, an increase of \$62,390. Net revenue from operation was \$6,244,229, an increase of \$5,717,800.

FRUIT GROWERS of Oceana County, Michigan, 400 of them, have sent to President Harding a request that Henry Ford be appointed director-general of the railroads of the country. The farmers say that high freight rates are destroying their profits, and they think that Mr. Ford could do for the whole country what he has done on the Detroit, Toledo & Ironton—make a general reduction in freight rates.

## Railway Officers

### Executive

John Pullen, president of the Canadian Express Company, has been elected president of the Canadian National Express Company, the two companies having been merged under the name of the latter, effective September 1. W. C. Muir, heretofore general manager of the Canadian National Express Company, will become vice-president and general manager of the reorganized company.

### Financial, Legal and Accounting

R. W. Wynn has been appointed car accountant of the Georgia & Florida with headquarters at Augusta, Ga., effective July 8, succeeding G. B. Matthews, Jr., superintendent of car service, resigned to accept service with another company. The position of superintendent of car service has been abolished.

### Operating

M. McKernan has been appointed superintendent of safety of the Missouri Pacific, with headquarters at St. Louis, Mo., effective August 1, succeeding R. H. Dwyer, who has been assigned to other duties.

E. M. Grobel, assistant trainmaster of the Chicago, Milwaukee & St. Paul, with headquarters at Miles City, Mont., has been promoted to trainmaster, with headquarters at Mobridge, S. D., effective August 1, succeeding D. D. Spade, who has been assigned to other duties. The position of assistant trainmaster at Miles City has been abolished.

W. L. King, superintendent of the Southern with headquarters at Bristol, Va., has been transferred in a similar capacity to Columbia, S. C., succeeding W. D. Post, who has been transferred as superintendent to Knoxville, Tenn. Mr. Post succeeds A. P. Johnson, who has been appointed trainmaster with headquarters at Tooea, Ga., succeeding J. F. Gaffney, transferred as trainmaster to Knoxville, Tenn. C. E. Burchfield, trainmaster at Knoxville, has been promoted to superintendent with headquarters at Bristol, Va.

W. F. Eckert, superintendent of the Wilmington and Columbia division of the Philadelphia & Reading, has been transferred in a similar capacity to the New York division with headquarters at Philadelphia. A. T. Dice, Jr., assistant superintendent of the Reading and Harrisburg divisions, succeeds Mr. Eckert. P. S. Lewis, assistant superintendent of the Atlantic City (a subsidiary of the Philadelphia & Reading), has been appointed superintendent of the same road with headquarters at Camden, N. J., and the position of assistant superintendent has been abolished. A. T. Owen, superintendent of stations and transfers of the Philadelphia & Reading, has been appointed assistant superintendent of transportation in addition to his present duties. C. A. Beach, superintendent of the New York division, has been appointed assistant to the superintendent of stations and transfers. J. E. Turk, superintendent of the Atlantic City and the Delaware River Ferry (both subsidiaries of the Philadelphia & Reading), has been appointed general superintendent of the Delaware River Ferry and the position of superintendent of the Delaware River Ferry has been abolished. W. D. Kinzie, assistant superintendent of the Shamokin division of the Philadelphia & Reading, has assumed the duties of trainmaster in addition to his present duties. D. S. Haldeman has been appointed assistant superintendent of the Reading and Harrisburg divisions with headquarters at Reading, Pa. These changes were effective August 1.

### Traffic

T. J. Shea has been appointed general agent, freight department, of the Chicago & Alton, with headquarters at Chicago, effective July 16.

J. F. Zurn, agent, consolidated ticket office, Fort Worth, Tex., has been appointed district passenger agent of the Texas & Pacific, with the same headquarters.

S. W. Gafner, ticket agent of the Lehigh Valley, with headquarters at Buffalo, N. Y., has been promoted to division passenger agent, with the same headquarters.

Andrew L. Doggett, whose appointment as assistant general freight agent of the Baltimore & Ohio with headquarters at Pittsburgh, Pa., was announced in the *Railway Age* of July 9 (page 94), was born at Paris, Tex., June 17, 1883. He was educated in the public schools of Cincinnati, O., and entered railway service August 27, 1898, as a messenger in the general freight office of the Baltimore & Ohio at Cincinnati. Subsequently he served as claim record clerk, bill clerk, rate clerk and claim clerk in the various freight traffic offices of the company at Cincinnati. In 1907, he was appointed traveling freight agent at Cincinnati and served in that capacity until 1917 when he was appointed commercial freight agent at Akron, O. In 1919 he was promoted to division freight agent at Youngstown, O., which position he was holding at the time of his recent appointment.

A. Kittler, assistant agent, consolidated ticket offices, Newark, N. J., has been appointed division passenger agent of the Lehigh Valley, with headquarters at Ithaca, N. Y.

W. R. MacFarland, whose appointment as general passenger agent of the Chicago Great Western, with headquarters at Chicago, was announced in the *Railway Age* of July 23 (page 185), was born at Columbus, Ohio, in 1876. He entered railroad service on September 1, 1897, on the Hocking Valley, remaining in the service of that company until September 1, 1901, when he became a rate clerk on the Pennsylvania and served in that position until January 1, 1912. He was then promoted to chief rate clerk in the passenger department of the road at Pittsburgh, Pa. Mr. MacFarland served continuously in this position until March 1, 1920, when he was promoted to assistant general passenger agent of the Northwestern region of the Pennsylvania, with headquarters at Chicago. His recent appointment, effective July 16, brought him to the Chicago Great Western, succeeding A. C. Irons, resigned.

W. M. Brooks has been appointed commercial agent of the Atlanta, Birmingham & Atlantic with headquarters at Cincinnati, succeeding J. J. McCarty, resigned, effective July 20.

T. P. Fenelon, assistant agent, consolidated ticket office, Fort Worth, Tex., has been appointed division passenger agent of the Gulf, Colorado & Santa Fe, with the same headquarters.

E. G. Hukill has been appointed traffic manager of the Cleveland, Southwestern & Columbus, with headquarters at Cleveland, Ohio, succeeding C. C. Collins, who has resigned.

S. M. Spears, city freight agent of the Illinois Central, with headquarters at Memphis, Tenn., has been promoted to commercial agent, with headquarters at Louisville, Ky., succeeding C. Klinger, deceased.

L. R. Capron, whose promotion to assistant freight traffic manager of the Northern Pacific, with headquarters at St. Paul, Minn., was announced in the *Railway Age* of July 16 (page 144), entered railway service in April, 1902, as an office boy in the freight traffic department of the Chicago, Burlington & Quincy at St. Paul, Minn. A year later he was employed in a similar capacity by the Northern Pacific and served in various clerical positions in the general freight department of that road until 1914, when he was appointed chief clerk to the vice-president in charge of traffic. He was promoted to assistant general freight agent, with headquarters at St. Paul, on April 1, 1915, and was given jurisdiction over rate litigation before the Interstate Commerce Commission and various state railroad commissions. Mr. Capron was transferred to Seattle, Wash., on March 1, 1920, and was serving in that position at the time of his recent promotion.

A. L. Doggett

### Mechanical

G. L. Ernstrom has been appointed road foreman of engines of the Yellowstone division of the Northern Pacific, effective July 7.

### Special

R. P. Rockefeller has been appointed special assistant in the office of the assistant to the president of the Chicago, Milwaukee & St. Paul, with headquarters at Chicago.

L. J. Benson, district special agent of the Chicago, Milwaukee & St. Paul, with headquarters at Chicago, has been promoted to chief special agent, lines west, with headquarters at Seattle, Wash., succeeding J. Wernick, who has resigned. W. E. Grant, district special agent, with headquarters at Milwaukee, Wis., succeeds Mr. Benson. J. E. Nolan succeeds Mr. Grant. The promotions and appointments were effective July 15.

### Obituary

Le Grand Young, formerly counsel of the Utah Central, the Utah Southern and the Union Pacific, died at his home near Salt Lake City, Utah, on July 25.

W. C. McLaughlin, formerly assistant general freight agent of the Baltimore & Ohio, with headquarters at Cleveland, Ohio, and later a member of the auxiliary committee of the Central Freight Association, died at Chicago on July 24.

WE GUARANTEE, that of this issue, 8,800 copies were printed, that of these 8,800 copies 8,800 were mailed to regular paid subscribers, 56 were provided for counter and news company sales, 34 were mailed to advertisers, 82 were mailed to employees and correspondents and 248 were provided for new subscriptions, samples, copies lost in the mail and office use; that the total copies printed this year to date were 311,100, an average of 9,719 copies a week.

A Ryerson Standardized Spring Shop  
Where springs are repaired at the lowest possible cost.

## Increase Spring Life

A railroad shop repairing over 700 tons of locomotive springs per month replaced hand spring repair methods with Ryerson Standardized Spring Shop Equipment and increased the life of the springs by 300%.

At the same time the number of men employed was reduced one-half.

By uniform shaping and treatment throughout, Ryerson machinery has the advantage over hand work in producing a more uniform, reliable and durable product.

*We are prepared to furnish Spring and Flue Shop layouts to meet individual requirements, together with complete description of each machine.*

Railroad managements are confronted with many and varied problems which will increase in their complexity as traffic gradually approaches normal. In many localities congestion will tend to occur and one of the important subjects to consider at present is how best to prepare to prevent it. Those operating and engineering officers who are not familiar with what signaling has accomplished may naturally consider double track as the logical remedy. Before plans are definitely determined upon it is well to consider the results which may be obtained by the installation of signals in connection with the possible relocation of passing sidings, water and coaling stations, etc. The Signal section of the American Railway Association in its latest report, submitted charts and data concerning the location of automatic block signals with reference to *time spacing*. The proper application of this information will demonstrate to operating and other officers the extent to which a signal system will aid in getting trains over the road in shorter time.

### Increasing Track Capacity at Moderate Costs

There seems to be little hope of immediate action by Congress on the President's recommendation that the railroads' obligations to the government be funded. The Senate has been planning a recess of a month or six weeks and the fear has been expressed that if the railroad funding bill is brought up at this time the consideration of the measure will preclude the possibility of any vacation for the senators. The matter is largely in the hands of the President. If he insists on immediate action undoubtedly his wishes will be respected. Even in that event, however, discussion and conferences would require some time. If the President does not urge immediate consideration of the measure final action on it cannot be expected for a month or two. Favorable action by Congress on the bill is a matter of considerable importance to the railroads and to business generally. Any steps that may be taken, therefore, to expedite its passage without working undue hardship on Congress will naturally meet with general favor on the part of those who have the interests of our transportation system at heart.

### Progress of Funding Legislation

The railroads are so fully occupied at the present time with solving the problems of rail transportation that any suggestion that they enter the motor truck transportation field on a large scale could not be expected to meet with a cordial reception. In this connection, however, it is interesting to note that the railways of England are asking that they be permitted to enter that field. The situation in Great Britain, of course, is considerably different from that in this country. The average length of haul of freight in that country is under the limit within which it is claimed in some quarters that motor trucks can operate economically. Unquestionably there is a certain amount of L.C.L. traffic moving over short distances on railways everywhere which is carried at a loss and would

be well for the motor trucks to get this business. At the same time if motor transportation companies work independently of the railroads there will be some wasteful competition between the two agencies. Some traffic will be hauled by road which could better be moved by rail and vice versa. The same holds true as regards passenger traffic. If the English railways are interested in moving freight and passengers by motor truck they should be granted that privilege. Only by co-ordinating the two systems of transportation under one management can the selection of the most economical method of transport for given shipments be assured. Economies effected in this manner redound to the benefit not only of the transportation companies and shippers but to society as a whole.

The part which poor food and poor sleeping quarters play in making railroad employees dissatisfied with their jobs cannot be overestimated. This factor is especially important in the case of train and engine employees who spend the greater part of their time away from home. Often, especially at outlying terminals, the only hotels and restaurants available are of the lowest order. It is of course neither feasible nor desirable that expensive hostels be provided at such points but plain, wholesome, well cooked food and good, clean beds are necessary and every effort on the part of railway officers to secure these accommodations for their men at reasonable prices will pay many times over in improved morale. Many hotels and restaurants adjacent to railroad yards are under obligation to the railroads for certain concessions. In such cases criticism of the service or the prices by a trainmaster or superintendent would have added weight. If the hotel is in no way connected with the railroad the suggestion that the company was considering the erection of an establishment of its own might be effective. This is a matter which can probably best be handled by division officers. A trainmaster or a division superintendent is in a position to know the kind of treatment his men are getting and, if it is not the best, a few well chosen words from him to the hotel men from time to time should at least serve to improve conditions somewhat. If food and lodging away from home were more attractive, layovers of a few more hours would be less odious and demands for punitive payments less insistent.

### Good Food and Comfortable Quarters

Occasionally operating officers indicate that they regard automatic signals as a liability rather than an asset in the economics of train operation. Such an attitude cannot help but be reflected by the men who operate trains under the automatic block signal system. The employees may be more inclined to take a chance in order to make their running time than they would be if the officers had impressed them with the true function of signals in expediting train movement while at the same time promoting safety. It is an economic necessity for signal indications to be acted on properly, for otherwise the investment in them is ineffective and serious results may

### A Proper Respect for Signals

take a chance in order to make their running time than they would be if the officers had impressed them with the true function of signals in expediting train movement while at the same time promoting safety. It is an economic necessity for signal indications to be acted on properly, for otherwise the investment in them is ineffective and serious results may

### Rail and Motor Transport in England

The railways of England are asking that they be permitted to enter that field. The situation in Great Britain, of course, is considerably different from that in this country. The average length of haul of freight in that country is under the limit within which it is claimed in some quarters that motor trucks can operate economically. Unquestionably there is a certain amount of L.C.L. traffic moving over short distances on railways everywhere which is carried at a loss and would

occur, the alibi then being that "the signals failed to work properly." Recently two opposing trains, a passenger and a freight, very nearly collided in single track automatic signal territory. At the investigation the blame was laid on the signal controlling the entrance to the single track section, the trainmen saying they received a false proceed indication. The signal department could find no evidence of signal trouble. Shortly afterward two freight trains very nearly met in a similar collision and again the signal was blamed, although it was found to be working properly. Naturally, the confidence of the operating officers was lowered; until a quiet investigation disclosed the fact that, to make time, some of the train crews were in the habit of disregarding the stop indication of the particular signal in question. This instance, which is typical of others, shows the importance of proper signal observance and discipline. Operating officers can do much to instill proper respect for signals by their own attitude. In fact, this is the first essential to strict observance by their men.

One of the many factors which have contributed toward past congestions of traffic has been attempts to move supplies and materials for road building when seasonal traffic has been moving in large volume. The railways can well afford to lend their aid to Secretary Hoover in his endeavor to secure increased economy and efficiency in highway construction. In a letter addressed to the governors of the various states he has urged the letting of contracts for road building in the fall instead of in the winter and spring, supporting his position with a report made for him by a committee representing the larger engineering societies, outlining the advantages which would accrue. The railroads are concerned chiefly with the effect which such a procedure will have upon transportation. The first advantage apparent to the railroads will be that the movement of contractors' supplies and materials will be advanced some two months or more, thus bringing the peak of the demand for movement of this traffic earlier in the year. The second advantage would result from the longer working season, which would distribute the demand for freight cars over a longer period and permit a more uniform utilization of railway equipment. In the middle west where letting of contracts in the fall has been practised successfully, an increase of approximately 46 per cent in time for grading and 37 per cent in time for concreting was obtained. Experience in recent years, especially in 1919 when the major portion of the country's hard surface highway projects was carried over, has been such as to bring about increased favor for this plan. The amount of money allotted for highway construction in 1922 is large. The amount of transportation required will be, as a consequence, large in proportion and, if there is any revival of general business by next spring, shippers of road building materials will benefit by shipping them early.

While labor troubles constitute the most difficult problem confronting railroad managers today, there is another ever-present problem in the establishment of satisfactory standards of shop practice. It is essential that these standards be safe and productive of economy, therefore they should be established only after thorough investigation. Each railroad should define its own standards, to be followed on the entire system and continued only as long as economical; not after they are obsolete and have been displaced by up-to-date practices. Good standards will support themselves and, as was recently said, "The surest way to kill a poor standard is to insist on it to the letter." It is not maintained that standards should be so

**Standards of Shop Practice**

rigidly adhered to that all initiative of local officers is destroyed. On the contrary, there should be a continual search for improved methods. The important point to guard against is the adoption of so-called improved methods before a thorough investigation has demonstrated that they are time and labor-savers. When the parts of cars and locomotives fail, shop superintendents, master car builders and master mechanics often arbitrarily change designs in accordance with their personal ideas and without finding out what the real or fundamental cause of the trouble is. The duties of these officers are in reality limited to responsibility for maintenance and production, and the best results are secured when all changes are made by the designing engineer who keeps in close touch with the maintenance men and thus learns how various locomotive and car parts are standing up in service. In addition to the possibility of standardizing both general shop practice and many small locomotive parts, considerable economy can be effected by standardizing small tools. In this case the problem is to determine the forms of tools demonstrated by experience to be most satisfactory, and take steps to insure that these tools are manufactured in quantities and distributed to all points on the system. To be of the greatest benefit, it is essential that shop standards be arranged in substantial, systematic form, so that they can be furnished to all interested and be enlarged and revised when necessary.

It is all too frequently the experience in planning or making property alterations or additions and in meeting situations imposed by operating conditions where the use of a map is at least desirable, to find before or during the performance of the work, that the maps, prints, diagrams or sketches covering the point in question are incorrect or lacking in the necessary detail. This is particularly the case where underground or otherwise not easily accessible, but nevertheless important, layouts such as waterlines, sewer pipes, plumbing or wiring, are the subjects of consideration. A bad leak occurs, which for the lack of a complete map, defies efforts to locate it; a break, a clog, a fire or some other unusual condition arises which involves the finding of a forgotten valve, the location of old pipes for the purpose of either utilizing them or of avoiding them, or the complete study of existing layouts with a view to making important changes. When the maps available are complete and correct the performance of the work involved is greatly facilitated, but when incomplete and incorrect, as they too frequently are at the very point where they are needed most, namely, at terminals, they often not only do not serve the purpose for which they were prepared, but also give rise to expenses which may be justifiably attributed solely to their deficiency. Manifestly they should be complete and should be correct and up to date, and all parties who make use of maps usually will find it to their own ultimate advantage to see that they do conform to these standards. Where maps are in error or incomplete usually it is not difficult to account for the cause. Although an accurate representation of the work at one time, alterations or additions to existing layouts have been made at frequent intervals by operating or other forces about which the engineering department has not been informed or the recording of which it had neglected altogether or postponed until the proper location of the work could only be estimated; or again local conditions governing at the time may have necessitated changes in the original plans which the individual in charge, uninstructed, neglected to record. But whatever the origin of the deficiency, the fact remains that the map should be correct and to that end, whether it requires a closer supervision by the engineering departments of all work of a kind done by operating forces, or the frequent inquiry and inspection of his territory by the local engineer, the maps should be kept revised.

**Revise the Maps**

In recent months a great deal of emphasis has been laid upon the wisdom of directing close attention to the study of all manner of processes and practices and of methods and machinery with respect to their ability to promote economy, better service and a more rapid rehabilitation of the railway properties. At a time when the prosperity of the railroads rests more upon their efficiency of operation than ever before, when their expenses are greater and their income far less than a prosperous condition could justify, who would say that such emphasis was not well placed? If there are practices in use which no longer have anything to recommend them but the years through which they have been perpetuated, now indeed is the time to find them out; likewise, the opportunity for improvement in the machinery or the potential benefit in its replacement. But by all means, in doing this let us not be unmindful of the man. In war times much was heard of the "Esprit de Corps," when it was applied to the army. Now we might well apply it to the railroads. At that time the attitude manifested by the men was a fundamental, all-important consideration, the nature of which was a close index of the probable success of the undertaking. The railroad situation is one different in degree only—not kind. To attain even fair results there must be alive the willingness to work as well as the ability to do so, and along with it fidelity of purpose, enterprise, pride and loyalty. Without forces of this kind active in some degree, little can be accomplished with all the attention given to machinery and methods. There may be some industries where the man need be considered scarcely more than a mechanism, but this cannot be said of the railroads. There is too much diversity of occupation and of conditions and too wide a distribution of the immense and heterogeneous constituency. Here a proper "Esprit de Corps" is essential, and those officers do wisely who recognize it and exert themselves constantly to maintain it.

During recent months the labor situation has completely changed. From a period featured by an acute shortage the country has passed into one marked by a labor surplus. This situation has arisen because of the general let down in industrial activities and presents to employers of labor a problem hardly less important than that facing them during the shortage. Then the problem was to find the men for the jobs. Now it is to carry on the reduction of forces in such a manner as to avoid completely disrupting the organizations. Anyone experienced in labor supervision on the railroads knows well the difficulties that must be overcome in building efficient working forces from the ground up. In the present situation the more fortunate roads will, in all probability, find it feasible in the force reduction to stop short of the danger point and retain in service the more experienced men of all departments. On the other hand the less fortunate roads may find it necessary to reduce forces, in certain departments, to the point where the organization is seriously injured. Such roads, on the revival of business, will find themselves faced with a difficult task; that of recruiting and bringing to a point of efficiency a new organization. At least one industrial concern which has found it necessary to dispense with the services of experienced and valuable men is taking steps which promise to lighten the task of getting back to normal on the resumption of business. Its plan is to first impress on the employees the fact that the lay-off is temporary. Representatives of the company keep in touch with the men personally and by letter during the period of idleness. Blanks are forwarded to the men on which any change in address may be reported. In certain instances temporary work has

been found for the men with other concerns. All of this is done in such a way as to convince a man that he is in fact an essential unit of his company. There is no apparent reason why some similar plan cannot be adopted by roads which temporarily have had to lay off men. Such a course will, in the long run, prove advantageous both to the managements and the employees.

## Railway Traffic Standing Still

IT IS DIFFICULT, if not impossible, to draw from the recent trend of railway traffic any rational conclusion regarding future business. The total number of cars loaded with freight in the four weeks ending on July 23 was 2,981,106. This was slightly less than in the four preceding weeks, but the small decline can be entirely accounted for by the fact that the week ended July 9 included the 4th of July holiday. The car loadings mentioned compare with 3,559,081 for the same weeks in 1920, and 3,365,049 for the same weeks in 1919. The decline in shipments as compared with those of 1920 and 1919 was substantial and negative past indications of a possible revival of traffic such as occurred in the latter half of 1919.

The statistics of car loadings make it easy to locate the cause of the small freight movement. The total volume of agricultural products being shipped is very large. The movement of grain is much heavier than in either 1920 or 1919. Shipments of merchandise, which include mainly the higher grades of manufactured products, also are larger.

On the other hand, shipments of the bulkier raw materials used in manufacture, especially forest products and ore, and also the movement of coal, are almost extraordinarily small.

The coal situation is unprecedented. Never since reliable statistics regarding the production and transportation of coal have been kept have shipments of bituminous coal been relatively so small as thus far this year. The years 1914 and 1915, like 1921, were years of business depression. Since then, however, the population and producing and consuming capacity of the country have largely increased. Nevertheless, in the first seven months of 1921 shipments of bituminous coal were 12,000,000 tons less than in 1914, and 2,000,000 tons less than in 1915. Compared with other years they range from 29,000,000 tons less than in 1919 to 110,000,000 tons less than in 1918. It is a remarkable fact that while there has been such a great reduction in shipments of bituminous coal, the amount of anthracite shipped thus far this year has been slightly larger than last year. Coal ordinarily constitutes about 35 per cent of the tonnage of the railways. There can be no substantial increase in their total traffic while shipments of coal continue so small.

Practically all recognized authorities on business conditions agree that underlying conditions are improving. Bank reserves are increasing, interest rates are lower and prices in general are becoming more stable. The farmers are selling their grain and getting money with which to pay their debts and increase their purchases. While the movement of railway traffic has remained practically unchanged for three months, railway net earnings, as a result of recent reductions in expenses, are bound to show increases. If, in addition to increased net earnings, the railways receive the payments from the government contemplated by the plans of President Harding's administration they will be able substantially to increase their purchases. In fact, they already have begun to do so. Increased purchases by the farmers and the railroads will substantially improve general business conditions.

The prolonged stagnation of railway traffic is disappointing, but it is impossible to believe in view of the general situation that there will not be in future months a slow but steady increase of traffic and earnings.

## The Rail Problem

IT IS NOW TEN YEARS since the rail problem was brought forcibly to the attention of railway officers by the epidemic of failures which occurred during the winter of 1911-12. They have been continuously studying this problem ever since. While many independent investigations have been made, they have centered to a large extent in the work of the Rail Committee of the American Railway Engineering Association. This committee has presented numerous reports of special investigations to determine the influence of various conditions on the quality of the steel. These studies have undoubtedly contributed to the improvement in the character of the rails now being rolled, as far as wear is concerned. However, it is also true that similar improvement has not been evinced in the quality of the rails, as measured by freedom from failures. In fact, rail failures are becoming more numerous on many roads, and this is causing much concern to railway maintenance officers.

In an effort to secure better material, the Rail Committee prepared a specification which was adopted by the American Railway Engineering Association in 1920, and which imposed a number of new restrictions on the manufacturers, which were designed to eliminate defects causing failures. As pointed out by G. J. Ray, chairman of this committee, at the annual convention last March, the manufacturers are unitedly opposed to this specification, either refusing directly to accept orders for rails to be rolled under it or placing such a high premium on them as to accomplish the same purpose, basing their position largely on the contention that the roads have not proved the necessity for these restrictions or the fact that conformity with them will eliminate the present defects.

The result is that there is now a deadlock between the railways and the manufacturers, while the rails continue to fail and to endanger traffic. Such a condition should not be permitted to continue. The relatively large number of rail failures is a reflection on the ability of the manufacturers to produce sound rails and only to a lesser extent on the railway engineers who accept them. The situation demands action, particularly to determine the causes for the various defects contributing to these failures with such conclusiveness that the proper remedies can and will be delayed. Undoubtedly the main things needed are less controversy and more co-operation between the railways and the manufacturers, and closer concentration on the causes and remedies of the more serious kinds of failures.

## More Railway Security Owners Than Employees

THE NUMBER of stockholders the railways have is ascertainable with approximate accuracy, since the names of practically all stockholders are shown on the companies' books. Taking the railways as a whole it has long been believed that the number of owners of their bonds is larger than the number of their stockholders, but it is more difficult to ascertain the exact number of them.

The Northern Pacific, using the best sources of information available, recently had a count made of its bondholders and found that there were approximately 37,000. On March 18, the date on which its stock books closed preceding the annual meeting of stockholders, it had 36,000 stockholders. This makes the total number of owners of its securities 73,000.

The public is prone to show more solicitude for the employees of railways than for the owners of their securities, mainly because it assumes that there are many more employees than owners of securities. The average number of employees of the Northern Pacific in the year 1920 was 35,244, while it now has about 30,000. In other words, the

Northern Pacific has more than two security owners for every employee.

The following table shows the number of employees and the wages paid, the number of bondholders and the interest paid, the number of stockholders and the dividends paid, by the Northern Pacific in 1920:

Number of employees.....	35,244	Total wages.....	\$66,503,794
Number of stockholders.....	36,000	Total dividends.....	17,360,000
Number of bondholders.....	37,000	Total interest.....	12,134,438

It will be seen that while the railroad had twice as many bondholders and stockholders as employees, the wages paid by it were more than twice as large as the total interest and dividends paid.

The ownership of the Northern Pacific's stock and bonds may be more widely diffused than that of the average railway, but it is probably true of the railways as a whole that the number of people who own their securities is not far from twice as large as the number employed by them. The Northern Pacific is not a typical road in one important respect. It is a relatively prosperous railway and the amount of interest and dividends paid by it is larger in proportion to the wages paid than is the case with most railways.

The wages paid by the railways as a whole increased 285 times as much between 1912 and 1920 as the total interest and dividends paid by them to their bondholders and stockholders in spite of the fact that the bondholders and stockholders probably outnumber the employees by two to one. And yet labor leaders constantly cry out that the employees are oppressed for the benefit of a few Wall Street magnates, who, they say, "own" the railroads!

## The Railways' Interest in Highway Construction

THE HIGHWAY CONSTRUCTION program is today assuming vast proportions. Starting more or less locally in the vicinity of the larger cities a few years ago, it has today become national in extent and its contemplated expenditures aggregate vast sums of money. It is estimated that approximately \$390,000,000 was spent for this purpose in 1919, while the amount available for highway construction work in 1921 has been placed at \$1,394,000,000.

Although this program may at first glance appear to be outside the scope of railway activities, it is in reality of concern to the roads from a number of angles. From the traffic standpoint it has been estimated that the railways must transport 100 carloads of equipment and materials for every mile of highway constructed. However, another and even more important angle to the railways is the fact that they are among the heaviest tax-payers and are therefore interested in the proper expenditure of the funds to which they contribute, to secure roads of the proper character of construction. They are interested for the same reason in the proper use and maintenance of these roads after they are built. As transportation agencies they are also concerned with the expenditure of these funds for the development of co-ordinating arteries radiating from their lines rather than paralleling them.

Up to the present time the highway program in general has been unco-ordinated, both as to the location of the roads and as to their character of construction. Each local unit, state or county, has proceeded to improve those roads which best serve its local needs without reference to a comprehensive program. It has likewise selected the type of construction according to its best information (or lack of information). There has been no central agency which has led in the development of standards of construction to determine those most economical. In fact, most of the constructive work which has been done in the development of highway standards

has been done by those who are promoting the use of their materials in this work.

In spite of the large expenditures which have already been made and the far larger ones now being made or in immediate prospect, the feeling prevails in many quarters that we still have much to learn regarding the types of construction most suitable for various local conditions and classes of traffic, and the rapid deterioration of many of these roads of even recent construction supports this contention. The railroads who guard their own expenditures most carefully by trained staffs of specialists have a right to expect that the public authorities to whom they will turn over large sums of money in taxes of one kind or another within the next few months, will exercise similar care. This will involve far more engineering study and design than has been given most highway construction to date.

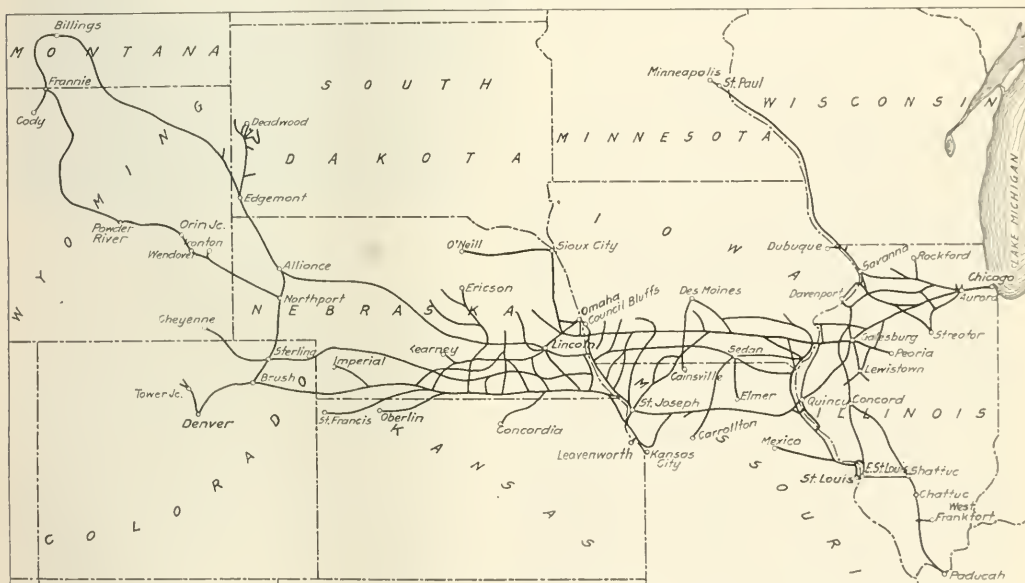

## Chicago, Burlington & Quincy

IF A MEDAL were to be awarded to the railroad that has secured the most publicity during the past several months, there would probably be a unanimous decision in favor of presenting it to the Chicago, Burlington & Quincy. Through the application to the Interstate Commerce Commission

as a property; one would be merely adding to a wealth of material that has already been published.

The question that would be more worthy of discussion might better be the manner in which this high-grade and prosperous carrier has fared under federal control and the progress it is making in meeting the many problems resulting from the aftermath of government operation. Analysis shows that in important respects the experience of the Burlington has not been exceptional. Its operations have shown an increase in gross earnings similar to that of most roads, the usual still greater increase in expenses and the like resulting decrease in net which are typical. The Burlington's standard return for the period of federal operation was \$33,360,683. In 1918 it earned for the government a net railway operating income of \$25,016,100; in 1919, \$25,156,532. In 1920, including two months of federal control, six months of operation under the guaranty provisions of the Transportation Act and four months of private operation, the company's net railway operating income, as reported in the December monthly statement to the Interstate Commerce Commission, was \$8,012,045.

The year 1920 was the busiest in the Burlington's history with the exception of 1918. In 1920 the road carried 47,233,256 tons of freight as compared with 47,264,416 tons in 1918. The revenue ton-miles in 1920 were

The Chicago, Burlington & Quincy

covering the steps proposed by the Hill lines to refund the Burlington joint 4's and as a result of the sale of the new issues, the property and its operations were put in the limelight for an extended period. Searching analyses on the part of financial houses and others were made public, and the final result was that the Burlington came through the tests with a record of 100 per cent. Someone has suggested that the factors to determine whether a railroad property will be successful are chiefly three—its strategic position; its physical characteristics and its management. The Burlington was given a grade of A on all three points and presumably now stands before the public as an example of what an American railroad ought to be. In view of all that has taken place, it is hardly necessary to discuss the Burlington

14,130,364,374 as against 14,162,605,344 in 1918. In 1920 the total freight revenues were \$131,040,733; in 1918, in which year traffic was carried at lower rates, the freight revenues were \$104,492,837. Total revenues in 1920 were \$186,872,918; in 1918, \$144,172,769. The increase in revenues as between the two years was thus about \$42,700,000. The increase in operating expenses as between the two years was \$49,000,000. To carry this comparison further, attention should also be given to 1916, in which year the Burlington did less business than in either 1918 or 1920, but in which it earned the largest net. The increase in total revenues in 1920 over 1916 was \$77,700,000; the increase in operating expenses \$90,000,000.

These facts are brought out in this detail because they

are of special importance as far as the Burlington is concerned. The Burlington is noted for its conservative financing and the practice that has been followed over an extended period of years of putting earnings back into the property for the purposes of bringing it to higher standards and of enabling it to operate more efficiently and economically. The management of the Burlington seemed to have an almost unannounced way of utilizing its funds to the best advantage. As a result it was enabled to derive full advantage from the growing traffic of its increasingly prosperous and expanding territory and, in short, to benefit in an unusual degree from the working out of what the economists call the law of increasing return. It is not advisable to put too much stress on operating ratios. However, it is a fact, nevertheless, that over a period of years the operating ratio of the Burlington showed a steady decrease; in the year ending June 30, 1913, it was 66.59 per cent; in 1916, but 59.74. Since that time, however, the tendency has been the other way; in 1917, it was 64.27 per cent; in 1918, 77.73; in 1919, 78.42 and in 1920, 86.32 per cent.

The increase in operating ratio in these several years can not be attributed to any marked decrease in operating efficiency, although it is to be presumed that the important factor of morale must have suffered on the Burlington during the war just as it did on all other roads. In 1913 the average revenue train load on the Burlington was 484 tons; in 1916 it was 575 tons; in 1918, 669 tons; in 1920, 655 tons. The average revenue load per loaded car in 1913 was 19 tons; in 1916, 20.53 tons; in 1918, 25.78 tons; in 1920, 24.86 tons. The Burlington in 1920 secured a figure of net tons per train, including in this case both

the total material expense (excluding fuel) increased \$9,554,628, or 39.77 per cent and the total fuel expense increased \$5,579,855, or 40.58 per cent. These several comparisons might be carried further, but no doubt enough has been said to show that the Burlington's difficulties, serious as they are, are after all, only those of the railroads as a whole.

The Burlington is in rather a better position than most roads. It should realize rather better than most roads on any improvements that may be brought about in the railway situation. The fact that a road as favorably situated and as efficiently operated as this one should have been so adversely affected as it has been, is, however, rather a clear indication of how serious the railway situation is and has been.

In reviewing the operations of a road like the Burlington, or the Lackawanna, which are noted for their continued physical improvement, one cannot fail to omit reference to the particular projects that may be under way at the time. The Burlington in 1920 had capital expenditures totaling \$14,737,456, including \$8,516,660 for road, \$6,176,945 for equipment and \$43,851, general. "Capital expenditures generally," says President Holden in his report, "have been directed toward the improvement of existing property, particularly locomotive shops and terminals, yards and station facilities and primarily for increasing efficiency and economy of operation."

Among the improvements in hand in 1920 were those related to the Chicago union station project; grade elevation through Aurora, Ill.; new engine terminal facilities at Galesburg, Ill., Pacific Junction and Denver, Colo.; second track

#### CHICAGO, BURLINGTON & QUINCY OPERATING RESULTS

Year	Freight Revenue	Passenger Revenue	Total Revenue	Total Expenses	Net Revenue	Operating Ratio	Revenue Tons	Revenue ton Miles	Average Haul	Average revenue Train load	Car load
1912-13	\$64,063,856	\$21,895,691	\$94,374,485	\$62,842,891	\$31,531,594	66.59	33,389,439	8,791,435,597	263.30	483.83	19.10
1916	77,310,516	21,833,534	109,191,204	65,235,705	43,955,499	59.74	39,278,135	10,923,326,440	278.10	574.69	20.53
1917	87,008,590	24,373,780	122,342,707	78,632,343	43,710,363	64.27	45,364,552	13,143,186,449	289.72	629.39	23.37
1918	104,492,837	28,052,905	144,172,769	112,067,616	32,105,153	77.73	47,264,416	14,162,605,344	299.65	668.81	25.78
1919	107,019,788	35,345,285	154,011,438	120,777,801	33,233,636	78.42	40,235,427	11,952,720,771	297.07	620.97	22.60
1920	131,646,733	36,468,265	186,872,918	161,304,686	25,568,232	86.32	47,233,256	14,130,364,374	299.16	654.85	24.86

revenue and non-revenue freight, of 766. This was the highest train loading of any carrier in the west whose operations are at all comparable with the Burlington's with a single exception—the Great Northern, which had in 1920 net tons per train averaging 777. Further than that the car miles per day on the Burlington in 1920 were 31.8, a high figure. The ton-miles daily per car on the Burlington in 1920 averaged 611; the average for the western district was 503, and for the country, 496. The decrease in net earnings on the Burlington in 1920 came about in spite of efficient operation.

The trouble with the Burlington in 1920 and, at present as well, was the wage scales, the increased costs of fuel and the fact that the traffic to be handled fell off before the benefit of the rate increases in Ex Parte 74 could be realized to counterbalance the increased expenses. In the comparisons which have been given above, comment on the figures for the year 1919 was omitted, because in 1919 the traffic handled was considerably less than in either 1920 or in 1918. However, it may be noted that the ton-miles of revenue freight in 1920 were 18.22 per cent over 1919 and the total operating revenues 21.34 per cent greater than in 1919. As against these increases there was an increase of 33.55 per cent in operating expenses. The increase in revenues as between the two years was \$32,861,480; in expenses, \$40,526,885.

The reason for the increased expenses is plainly evidenced by the following figures: In 1920, as compared with 1919, the total payroll increased \$28,950,520 or 37.83 per cent;

on the Beardstown and St. Joseph divisions, totaling about 11 miles; work on bridges, including notably the Platte river bridge at Northport, Neb., completed in August, 1920; the installation of 300 miles of automatic block signaling on the Aurora and Lincoln divisions of which 97 miles was completed in 1920, etc. A total of 340 miles of 90-lb. and 100-lb. rail were laid in 1920. During 1920 the Burlington placed orders for 15 six-wheel switching, 16 Mikado and 15 2-10-2 type locomotives and 500 stock cars, a substantial portion of which were delivered before the close of the year.

The operating results in 1920 as compared with 1919 follow:

	1920	1919
Mileage operated .....	9,390	9,372
Freight revenue .....	\$131,646,733	\$107,019,788
Passenger revenue .....	36,468,265	35,345,285
Total operating revenue .....	186,872,918	154,011,438
Maintenance of way expenses .....	30,263,101	21,987,643
Maintenance of equipment .....	42,366,974	32,422,401
Traffic expense .....	1,752,317	1,064,457
Transportation expenses .....	79,828,378	60,170,510
General expenses .....	4,191,043	5,115,392
Total operating expenses .....	161,304,686	120,777,801
Net revenue from operation .....	25,568,232	33,233,636
Operating income .....	8,792,978	25,086,660
Net railway operating income .....	16,702,350	22,530,855

Corporate income account is as follows:

	1920	1919
Railway operating income and standard return .....	\$11,230,951	\$30,735,006
Gross income .....	30,706,991	31,881,131
Interest on funded debt .....	6,616,006	6,669,587
Total deductions from gross income .....	7,782,627	8,338,660
Net income .....	22,924,364	23,542,471
Dividends .....	8,867,128	8,867,128
Income balance .....	13,826,158	14,173,088

# Lackawanna Elevates Tracks Through East Orange

## Section Between Newark, N. J., and Orange Forms Closing Link in Suburban Grade Crossing Elimination

THE DELAWARE, LACKAWANNA & WESTERN has recently started work on the elevation of its main line through East Orange, N. J., on the Morristown branch of the Morris & Essex division. This operation involves approximately two miles of track, lying between the city lines of Newark, N. J., on the east and Orange on the west. The work is in reality the completion of the program started a number of years prior to government control, for the elimination of all grade crossings, the addition of a third or express track, and the construction of more modern passenger sta-

city of Newark, because of the necessity of securing sufficient elevation through the major portion of the city of East Orange to permit of the construction of undercrossings without too great a depression of the streets involved. This necessary elevation is obtained by the use of a  $1\frac{1}{2}$  per cent grade from a point 200 ft. east of the Newark-East Orange city line to Greenwood avenue, at the east end of the Grove street station, the first stop in East Orange, changing there to a 0.78 per cent grade for about 1,200 ft. to North Maple avenue, at which point the line will revert to the  $1\frac{1}{2}$  per cent grade, which will be maintained until the East Orange station is reached. From there west, the line will continue to ascend, on grades varying from 0.55 per cent through the East Orange station down to 0.177 per cent through the Brick Church station and finally joining the present elevated line in the city of Orange at a level grade. These grades result in a maximum elevation of the new tracks of approximately 20 ft. above the present track.

The grade crossings to be eliminated will necessitate the construction of six new and independent undercrossings, the rebuilding of an existing structure over the East Orange

Laying the New Temporary Track Alongside of the Old Line

tions in the suburban territory served by it. This work, consisting of a section on the main line to Morristown and one in the vicinity of the Ampere station on the Montclair branch, marks the closing link of the entire program.

The main line section involves the elimination of 11 existing grade crossings, the alteration of numerous street grades incidental thereto, the addition of a third main track, the construction of two new passenger stations and the raising and reconstruction of a third passenger station. The section on the Montclair branch involves the elimination of three existing grade crossings and the alteration of street grades in their vicinity, the provision of a new undercrossing, as well as the raising and reconstruction of one passenger station. With these improvements the grade crossing problem of the Lackawanna will have been virtually disposed of, so far as it concerns the densely populated suburban territory in the vicinity of New York.

### Grades Are Increased to

#### Secure Undercrossing Clearance

The present line through East Orange is double track, connecting with a three-track line through Newark on one side and through Orange on the other, with three stations intervening, Grove street, East Orange and Brick Church. From the point where the line emerges from the Roseville cut there is an ascending grade of 0.78 per cent which continues to the East Orange station, running level through the station as well as through the Brick Church station, otherwise being on an ascending grade until it connects with the elevated line through Orange.

The new line will have a steeper grade where it leaves the

One of the Steel Forms Which Is Being Used Between the Old Line and the Temporary Tracks

Parkway, the provision for six other undercrossings as parts of the elevated station and platform structures at East Orange and Brick Church, together with a subway for pedestrians at North Fifteenth street and an overhead footbridge at North Maple avenue. The independent undercrossings will follow the general design used in the construction of similar crossings on the Orange and South Orange work installed in previous years. The designs developed utilize reinforced concrete slabs for the bridge floor, supported by centrally located concrete piers and abutments and in some instances sup-

ported by the addition of rows of concrete piers or columns along each curb line. The parapets in this type are made integral with the slabs and where the crossing is skewed are reinforced to act also as girders. The design is such that in either case a clear opening of not less than 16 ft. 6 in. is maintained between the center pier and the curb lines.

### Cantilever Flat Slab Type of Viaducts at Stations

The two new stations will be constructed to the north of the tracks, the one at Brick Church remaining in approximately the present location while the East Orange station

At Work in the Vicinity of the Temporary East Orange Station

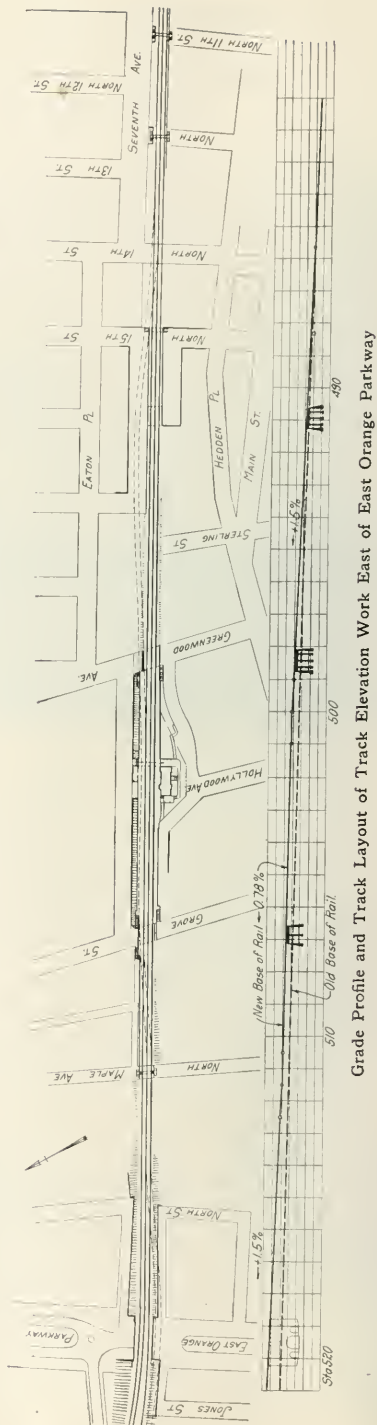

will be located between Main street and Arlington avenue. The tracks at these points will be carried on long reinforced concrete viaducts, with 800 ft. to 1,100 ft. platforms serving the three tracks. The type of construction adopted for these viaducts is the cantilever flat slab type so successfully used at South Orange and Buffalo and will consist of reinforced concrete slabs supported on four longitudinal lines of circular columns at Brick Church and five lines at East Orange. The eastbound main and the express tracks will be served by island platforms, while the westbound main will have separate platforms along the north side of the viaducts. A part of the space under the platforms and tracks will be utilized

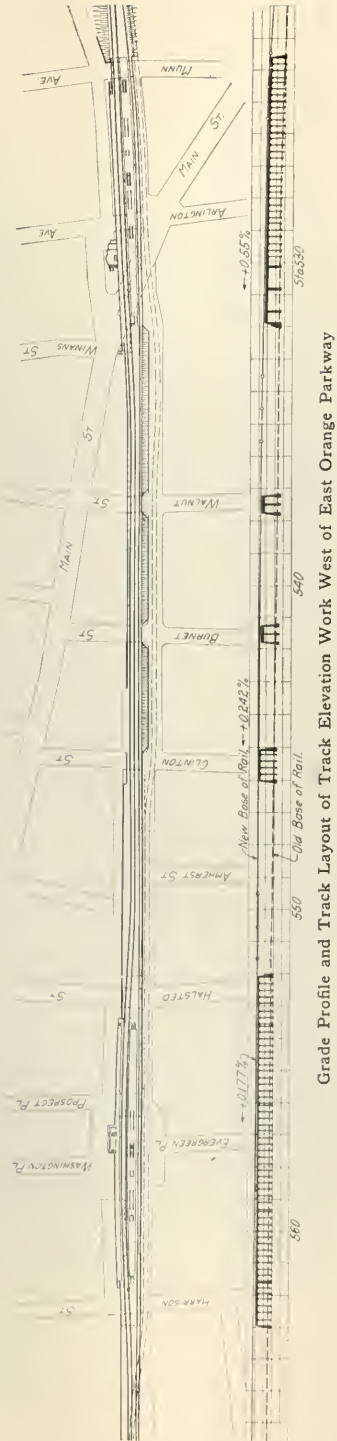

The Start on the Retaining Walls in the East Orange Parkway Section

for additional station facilities, consisting of waiting rooms, ticket booths, etc. The island platforms and the waiting rooms in the stations will be accessible by stairways through the slab structure to the facilities at the lower level, thus obviating the necessity of any crossing of tracks at grade, by incoming or outgoing passengers. The platforms will be covered for a portion of their length and will also have stairs at each end, leading to the streets.

The Grove street station and shelter house will be elevated to conform to the new grade of the tracks, a new street level

floor will be constructed and also a subway connecting the station with the shelter house.

Elevation Necessitates Considerable

Changes in Street Grades

The elevation of the tracks through East Orange will necessitate considerable changes in existing street grades in addition to some construction of entirely new streets. In the majority of cases it will be necessary to depress the streets for depths varying from three feet to ten feet in order to secure the required clearances of 13 ft. to 14 ft. In the vicinity of North Fifteenth, Sixteenth and Seventeenth streets, an entirely new street will be constructed on the north side paralleling the tracks and connecting North Fifteenth and Seventeenth streets. From Eaton Place, one block north of the railway, the two last named cross streets will be given a descending grade of about four per cent to the junction with the new or proposed street. From this point the grade will continue to descend to the center of what would be North Sixteenth street if it were cut through. Passing under the tracks at this point, the traffic will be swung to the east again,

Large Capacity Concrete Mixers on Flat Cars and Locomotive Cranes Facilitate the Work

paralleling the tracks and passing over another new street leading into North Fifteenth street. The total length of street changes involved at this crossing will be approximately 1,200 lineal feet and will entail some fairly heavy grading.

Other extensive street alterations will be made in the vicinity of the Grove street station and at the East Orange station, where Main street as well as Arlington avenue will be slightly depressed. At the Grove street station the changes will be the greatest in lineal feet and will include changes in grade, of Grove street, Eaton Place paralleling the tracks. Greenwood avenue and the approaches to the station between Greenwood and Hollywood avenues, totaling altogether about 2,400 lineal feet of new grades.

Temporary Tracks to Be Laid During Construction

On account of the topographical conditions to be overcome the problem really divides itself into two sections, an east end and a west end with East Orange Parkway practically the dividing line. Temporary tracks will be laid throughout and traffic maintained over the temporary tracks until, with exceptions, the new line is ready for service on the east end.

From East Orange Parkway to the connection with the old work at Orange, the problem has been greatly simplified, so far as the construction facilities are concerned, by the availability of a street paralleling the Lackawanna's line. A temporary double-track line has been laid along this street, with a complete automatic block signal installation. At the Parkway heavy concrete retaining walls will be built to carry the two temporary tracks and afterward used to retain the new embankment at this point. With traffic thus completely detoured around the west end of the work, the necessary retaining walls, viaducts, undercrossings and stations can be constructed, the fill made, the new tracks laid and made ready for use.

The temporary relocation of the main tracks has entailed the construction of a temporary station between South Clinton and Burnett streets, and a temporary waiting room between Burnett and Walnut streets, with driveways leading to both and a platform extending the full length of the two city blocks. This will serve the patrons of the present stations at East Orange and Brick Church.

### East End Will Be Raised Under Traffic

At the other or east end the problem is much more difficult, because of the limiting conditions, which will require that the temporary tracks be kept somewhere near the present alignment. Leaving the Newark depression the temporary tracks will swing out to the north, paralleling the present roadbed until they reach the east end of the Grove street station. Through this section it will be possible to carry the new work practically to completion without interference of traffic, but from the east end of the Grove street station to East Orange Parkway the work of raising to the new grade will have to be carried on chiefly under traffic. From the point mentioned the tracks swing back onto the present roadbed, following the north edge for a short distance and then cross the present alignment, joining the two temporary tracks laid in the street on the south side of the line. With the completion of the work on either side of the part just described the temporary tracks will be cut into the new lines by means of run-offs and the final raise to grade then made. With three tracks available two will be kept in operation while the third is being raised after which the operation is shifted to another set and the method repeated.

The design and construction of this improvement at East Orange is being carried out under the direction of G. J. Ray, chief engineer of the Delaware, Lackawanna & Western; M. H. Doughty, division engineer; F. J. Nies, architect; A. E. Deal, bridge engineer; M. Hirschthal, concrete engineer, and O. H. Kellogg, assistant engineer, in direct charge of the work. The contractors on the work are the F. M. Tallot Co., H. F. Curtis and Hyde & McFarland.

## Coopering Cars for Grain

**E.** F. FORD, freight service inspector of the Chicago, Burlington & Quincy, has prepared some useful suggestions to grain shippers, calling attention to the need for careful inspection and preparation of grain cars, particularly at this time when over \$4,000,000 out of a total of \$6,000,000 paid out in loss and damage claims to grain, represents shortages resulting from causes other than wrecks. Mr. Ford says:

It has been our experience that grain can be moved practically without leakage by the right kind of teamwork on the part of shipper and railroad agent. Our statistics show as many as 100 to 200 cars from a certain station forwarded without a claim, while a nearby station forwarded half as many cars and had several claims, both stations being on the same railroad and the empty cars allotted by the same car distributor and set to elevators by the same train crews.

Investigation of such cases invariably develops that at the station having such good results, there is teamwork on the part of shipper and railroad agent in the inspection and coopering of cars, while at the station having unsatisfactory results we find there is little or no co-operation between shipper and agent. The local will set out an empty car, and if the agent sees a "Fit for Grain" tag on it he has it set for loading, shipper does what he regards a good job of coopering and the car is loaded. Three heads are better than one, and if the shipper would request the railway agent to look the car over after it has been coopered, in many instances defects which escaped the previous inspection would be discovered.

A shipper should not assume that a car is fit for loading simply because a "Fit for Grain" tag is on it. Car inspectors, like the rest of us, are liable to error. The safest course is for the local agent and the shipper to carefully inspect the car before loading regardless of the tag.

Reject any car with weak or broken door or end posts, leaky roof, creosote or oil-soaked floor, or if it is an old car which in your judgment cannot be made grain-tight by a fair amount of coopering.

Look carefully for cracks at side walls caused by short floor boards and cover tightly with paper or burlap, cleating the paper or burlap.

Cover tightly in the same manner all defective places found in car lining, being particular to cover with tight fitting boards end-door openings.

King pins and draft bolts should be covered and cleated.

Grain lining at top and belt rail should be carefully inspected and where not absolutely grain-tight it should be made so by use of paper or burlap calking.

Place paper pads tacked to door post to give smooth surface and tight fit to grain doors, which should be nailed with 12d nails two to each end of each grain door. This is important, since experience proves that 12d nails are the exact size required for safety—this nail gives 1½ inch penetration into the oak door post and will hold the door in its place through any rough handling car might encounter. Smaller nails give trouble and larger nails require chopping out and consequent destruction of grain door at unloading point.

Cover with paper all grain door cracks and where loading heavier than 60,000 lbs., reinforce with an extra door across joints between first, second and third door joints from the bottom.

Go over the outside of car and securely fasten with cement-coated nails any loose sheathing boards you may find.

Prevent any possible leakage where sills have rotted by using burlap padding nailed to bottom of sill and further secure sheathing by nailing a strip of board over it at the rotted sill.

Before a wagon load of the new crop is taken in, the cautious shipper satisfies himself beyond any doubt that his scales are in good shape, having them inspected and overhauled if necessary. He also keeps a complete record of purchases and of cut-off when elevator is made empty during shipping season, of weights loaded, outturn weights, etc., so that when an actual loss in transit has occurred the shipper is able to present satisfactory proof to the railroad of the extent of his loss.

Team work by shipper and railway agent wins for both, and heads off claims.

Photo by Keystone.

Railway Station at Lucerne, Switzerland

THE STATE SUPREME COURT OF MINNESOTA, on July 22, held that the United States Railroad Administration is liable for damages resulting from a fire which started on the Great Northern tracks near Cloquet, Minn., and swept into that city in October, 1918, causing a loss of many hundred thousand dollars.

# Fuel Conservation Plan of the Central of Georgia

Over \$30,000 a Month Saved by Consistent Efforts and  
Co-operation of Employees

ABOUT FIVE MONTHS ago, the Central of Georgia effected a permanent organization of committees for securing the greatest possible economy in the use of fuel. Splendid results have been obtained under this plan and the fuel performance for the months of April and May showed reductions in the unit consumption of approximately 18 per cent compared with April and May, 1920. Based on the average price prevailing during these months, the monetary saving amounted to \$36,967 and \$38,080, respectively.

The June issue of *The Right Way*, the employees' magazine issued by the Central of Georgia, is a special number devoted principally to the subject of fuel economy and contains numerous articles by employees in the various departments, outlining the methods they are using to reduce the coal consumption. One of the principal articles is by W. H. Fetner, superintendent of motive power and chairman of the general fuel committee. This article describes concisely the organization and methods which have been applied with such success in reducing the fuel consumption and is therefore reprinted below:

For a number of years in the past the Central of Georgia has followed the usual plans in conducting fuel economy campaigns. Fuel meetings were held at various points on the system and many practices were introduced by which fuel could be saved.

These campaigns are productive of certain results, but, unless followed continuously from day to day and month to month, do not produce any permanent improvement. With this idea in mind, and in order to bring down the coal bill and get results that will be permanent, the vice-president and general manager conceived the idea of a regular fuel organization of a permanent character.

This organization was effected during the month of February and was carried out according to the plan of the vice-president and general manager. The first step was the appointment of a general fuel committee, of which the superintendent of motive power is chairman. The other members of this committee are the assistant general manager, general superintendent, chief engineer, engineer of maintenance of way, purchasing agent, general road foreman of engines, engineer of tests and the transportation inspector.

This committee handles the following matters: The coal supply, distribution of different grades with the view of getting the best possible results from each grade of coal, method of handling coal at chutes, the storage of coal, regulation of the coaling of locomotives to full capacity at certain points, and to light capacity at others, in order to save expense of hauling, and the settlement of questions submitted by division committees and others pertaining to fuel and its related subjects. The committee meets once a month, or oftener if necessary, at the call of the chairman.

## Purchase of Fuel

In order to get the best results in handling the above questions, sub-committees were appointed from the members of the general committee to specialize on certain matters. To handle the purchase of fuel, the following sub-committee was appointed: The purchasing agent (chairman); the assistant general manager, the general superintendent, and the engineer of tests.

A certain proportion of our fuel supply comes from the Alabama fields. This supply has been obtained for a number of years from the same mines, and therefore the majority

of the company's firemen are very familiar with this fuel.

This contract is renewed from year to year, but close inspection is made of this fuel from time to time, and visits are made to the mines and washers of the operators, furnishing the fuel, by the engineer of tests. Samples of the fuel are sent to the company's laboratory and analysis made. In this manner we keep posted on the physical and chemical condition of our fuel.

It is necessary from time to time to purchase spot coal, sometimes in considerable quantities, due to a falling off of the regular supply. This is brought about from several causes, and very often necessitates going into new fields for a supply. This is handled by the engineer of tests. He visits the mines, investigates conditions and obtains samples. Report is made to the committee, who decide for or against the purchase, as the case might be. If the investigation indicates that the coal in question is worth considering, a car is ordered and the coal is tested on the locomotive under working conditions. By following this method we are assured of getting a good grade of coal. It is then the committee's duty to see that the quality is kept up to standard by the operators.

## Distribution and Storage

The sub-committee on the distribution and storage of coal is as follows: The general superintendent (chairman); the purchasing agent, the chief engineer, the general road foreman of engines, and the engineer of tests.

This committee, as mentioned above, handles the distribution of fuel. It is impossible for the railroad to get all of its fuel supply from one mine, consequently we have the usual conditions resulting from the use of fuels from different districts. Some of the coals which we use will mix with any other, while some will not, and if these latter are mixed the usual troubles arising from this cause will follow. I refer particularly to the forming of clinkers in the firebox, which is always objectionable and very often serious, as it is the cause of low steam and delayed trains, besides the waste of fuel. Our committee, knowing these conditions, arrange the distribution of the different coals with the idea of reducing the mixing to a minimum. They also handle the storage of coal to the end that the proper coal will be stored in the proper place and in the proper manner.

There is a sub-committee on coaling stations, as follows: The chief engineer and engineer of maintenance of way.

This committee has supervision over the maintenance of coal chutes and coaling stations, the selection of new ones, and any change that might be made in order to facilitate the handling of fuel from a standpoint of efficiency and reduction of cost.

The sub-committee on coaling locomotives consists of the general road foreman of engines and the transportation inspector.

## Division Fuel Committees

This committee supervises the coaling of locomotives, with the view of saving as much hauling as possible. In order to do this the fuel stations must be located as near the coal supply as possible. It certainly is just as easy for a locomotive to make a round trip over a certain division, starting from one end with its supply of fuel, as from the other. In this manner considerable expense is saved, which includes fuel burned in the unnecessary hauling of coal.

This covers all the duties of the general committee, as well

as the sub-committees. The next step in the formation of our fuel organization consisted in the appointing of committees on each division and also at certain terminals.

The division committee consists of: The superintendent (chairman); master mechanic, trainmaster, road foreman of engines, roadmasters, supervisor, chief dispatcher, two locomotive engineers, two locomotive firemen, one conductor and one yardmaster.

These division committees meet once a month on regularly scheduled days and handle the following subjects:

First—The holding of special fuel meetings at different points on the division with their employees, in the interest of fuel economy.

Second—Method of coaling locomotives at different chutes. Preventing the overloading of tanks, thereby saving fuel which would otherwise be lost off the tank during the movement of the locomotive about the terminal and on the road.

Third—The separation of different grades of fuel on chutes, where necessary to provide selected grades for passenger service. Also the separation of different grades at chutes which serve two or more divisions using different coals.

Fourth—The daily inspection of the quality of coal unloaded on the chutes.

Fifth—The periodical inspection of chutes to prevent waste of fuel which falls off locomotive tanks from overloading, and which in other ways gets on the ground.

Sixth—The handling of locomotives at terminals and engine houses to prevent them being fired up too far in advance of their leaving time; to prevent them from being held too long at cinder pits awaiting fires to be knocked, or being delayed in getting into the engine house. They also supervise the firing up of locomotives, not only with the view of saving fuel at this point, but to get the fires properly started and in good condition when the locomotive is turned over to its crew.

Seventh—The assignment of regular engines to regular engineers and firemen.

Eighth—The supervision at engine houses of repairs to locomotives, with the view of specializing on repairs to defects which make locomotives wasteful of fuel.

Ninth—Prevention of delays at engine houses and yards.

Tenth—The arrangement of schedules and meet orders so as to avoid excessive delays to freight trains at meeting points. To avoid where possible putting long and heavy freight trains in sidings on grades which are hard to start away from. In other words, it is the idea to give the long, heavy train the advantage at all times possible.

Eleventh—The reduction of slow orders, particularly on grades, and the prompt removal of flags when work is complete.

Twelfth—The flagging of trains by maintenance of way employees.

Thirteenth—The supervision of fuel at all stationary boilers, which includes shop boilers, pumping station boilers, heating plant boilers, etc.

Fourteenth—All other matters of interest, including the constant talking to and keeping the question of fuel economy before all engineers, firemen, trainmen, yardmen, engine-house men, and all others either directly or indirectly concerned with the handling of fuel.

All of the above subjects are of considerable importance, and each one has a direct bearing on the question of fuel economy; so in order to get the most efficient handling, sub-committees were appointed to handle each subject. These committees consist of from two to five members of the division committee, selected according to their experience with and their knowledge of the subject in question.

These sub-committees make their reports to the division committee, either as a special report or at the regular meeting of the committee, as the occasion may require.

At our most important terminals there are terminal committees which handle as many of the aforementioned matters as may apply to them. These committees are composed of the superintendent of terminals, master mechanic, general yardmaster, supervisor, coal chute foreman, one engineer and one fireman.

At some of the more important outlying points we have committees composed of the general foreman, two or more engineers, two or more conductors, two or more firemen and one yardman.

These committees work in conjunction with the division committee, and handle all matters pertaining to fuel economy.

Full reports of all committee meetings are made and copies are sent to each member of the general committee, as well as to the committees of other divisions.

In this way the general committee keeps in close touch with what is being done on all divisions. They can observe the interest that is being displayed by individuals and by committees. It is the policy of the general committee for one or more of its members to attend division meetings whenever possible.

The interest manifested by the various employees, whether committeemen or not, is wonderful. Every member of each committee started out with the avowed intention of doing his very best toward the movement.

Improvement was seen in a short while. The efforts of those directed towards the repairs to locomotives, particularly those which caused excessive waste of fuel, soon began to bear fruit, with the direct result that we have better satisfied engine crews. This improvement in the condition of their engines of course is an incentive to them to put forth their best efforts and get out of the locomotive the best possible results.

### Concerted Efforts Bring Results

As a result of these efforts our fuel performance for the system for the months of February and March, 1921, was quite an improvement over that of February and March, 1920, as shown by the following figures:

	Passenger service, pounds of coal per pass. train car miles	Freight service, pounds of coal per 1,000 gross ton miles	Switching service, pounds of coal per locomotive mile
February, 1920.....	23	240.7	141.8
February, 1921.....	23	216.5	132.5
March, 1920.....	22.4	235.7	137.7
March, 1921.....	18.9	197.1	121.6

The actual saving in dollars, due to a better fuel performance in the three classes of service, was \$15,073.03 for February and \$39,172.89 for March, 1921. This shows conclusively what can be accomplished by the concerted efforts of every one concerned, whether it be the fireman who puts the fuel in the firebox, the engineer who is handling the engine, the men who take care of the train line, the men who attend to the front end, the flue blower and many others. Each one has a direct influence on the performance of the locomotive by doing his part of the work well, and thereby preventing failures on the road.

With the view of creating further interest in the work, it was decided to publish each month, as soon as possible after the data was all in, the individual performance of each locomotive. This was started with the month of March, and is to be continued. This will show some interesting facts from month to month, and our first statement has already brought about considerable rivalry in certain quarters. Some remarkable performances have been made by engine crews in their efforts to lower their fuel record.

### Keeping the Men Interested

We have crews which have made two round trips between two terminals with our large Mountain type locomotives, handling passenger trains of from 6 to 10 cars a total distance of 412 miles on one tank of coal, or on less than 18

tons, for so far each one has gotten into his last terminal with a safe margin left.

Another splendid performance is the covering of 536 miles with a 19 in. by 26 in. 10-wheel locomotive, handling a three car train and consuming 11 tons of coal. Still another one may be mentioned, that of certain crews handling 8 and 9 car steel trains, with a 23 in. by 28 in. Pacific type locomotive, 382 miles on 11 and 12 tons of coal.

It is not necessary for a locomotive to have its fuel supply replenished every time it makes a short run. In the first place, imagine a tank holding 16 to 18 tons of coal; at the end of the first trip approximately four tons has been consumed. The locomotive is taken to the coaling station and enough coal put on to fill the empty space, and in the majority of cases the coal left on the tank is not touched. How long do you suppose this excess coal remains on the tank? If the coal was moved toward the gate and the fresh lot put on in the rear it would be quite different but the coal is not put forward as a general rule unless the locomotive is to turn without getting an additional supply.

The making of such performances as just mentioned shows what can be done when anyone puts his heart into his work. You cannot expect an engineer or fireman to have his heart in his work when he gets on his engine and finds it dirty and ill kept. What would any fireman say, one with any pride at all, if when he looks into the fire door he finds his fire in bad shape, dirty and clinkered; and the engine just from the engine house? Then when they start out they discover that the piston valve packing is blowing or that engine loses one or two exhausts when the lever is pulled up, driving boxes or main rods pounding and various other defects. Could you expect them to put forth their best efforts? All you can expect of them is that they will handle that locomotive over the road just as it has been handled in the engine house.

### Saving Fuel in the Roundhouse

While the engineer and fireman are not the only ones who can waste or save fuel, the engine house is a very good place to start with; so, as mentioned before, we started specializing on those repairs which had to do directly with the efficient performance of the locomotive from a fuel standpoint.

It would surprise anyone who has had experience in these matters, to know just how much fuel can be saved by the

proper supervision over the fire builders. How much fuel is wasted yearly by firing locomotives up too far in advance of their schedule leaving time? A modern locomotive will consume approximately 300 lb. of coal per hour standing under steam with all valves closed. This will vary, of course, with weather conditions and conditions of the locomotive. Don't let your fuel be wasted in this manner, as there is no excuse for it. Have men on the job that understand the building of fires. Don't let the locomotives reach the train with the fires dirty and improperly made. They can be properly prepared and it is the duty of those in charge of this part of the work to see that it is done.

I feel that too much emphasis cannot be placed on the foregoing, as I have always considered that the handling of locomotives at the terminals presented a splendid field for the fuel economist.

I cannot take up the space necessary to go into all the details concerning the many ways in which the locomotive is allowed to waste fuel, but I must mention some of them, such as dirty flues, choked grates, restricted air openings in the ash pan, air leaks in the front end, blowing piston and valve packing, and many others. Soot is a better insulator against heat than asbestos, so keep the flues clean and free from everything that prevents the transfer of the heat to the water in the boiler. Keep the air spaces in the grates open and see that each locomotive has air space in the ash pans, equivalent to at least 14 per cent of the grate area. Keep the front end tight, for you cannot maintain the vacuum in the front end unless you do, and if the vacuum is not maintained the locomotive cannot properly burn the fire, and we have the usual result—waste of fuel. When the pistons and valves are allowed to blow, steam is wasted and in addition the cylinders and steam chests cannot be properly lubricated.

Much has been said and a great deal written on the subject of fuel economy, but until it becomes a fixed principle we cannot expect to accomplish a great deal. The interest manifested in this work by the employees of the company is truly remarkable, and due to this interest our April performance, which has just been published, is a splendid achievement. The pounds of coal per thousand gross-ton miles per passenger car train mile and per switching locomotive mile, is the lowest in the history of the railroad, and as a result the company makes a saving in its fuel account of \$36,967. Co-operation has brought this about.
