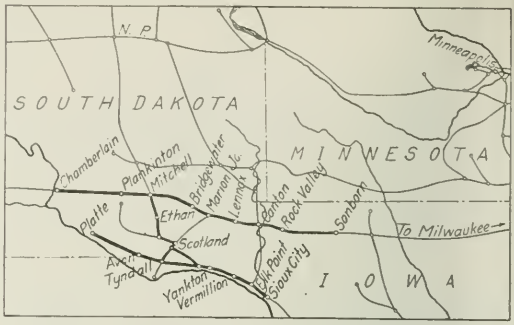
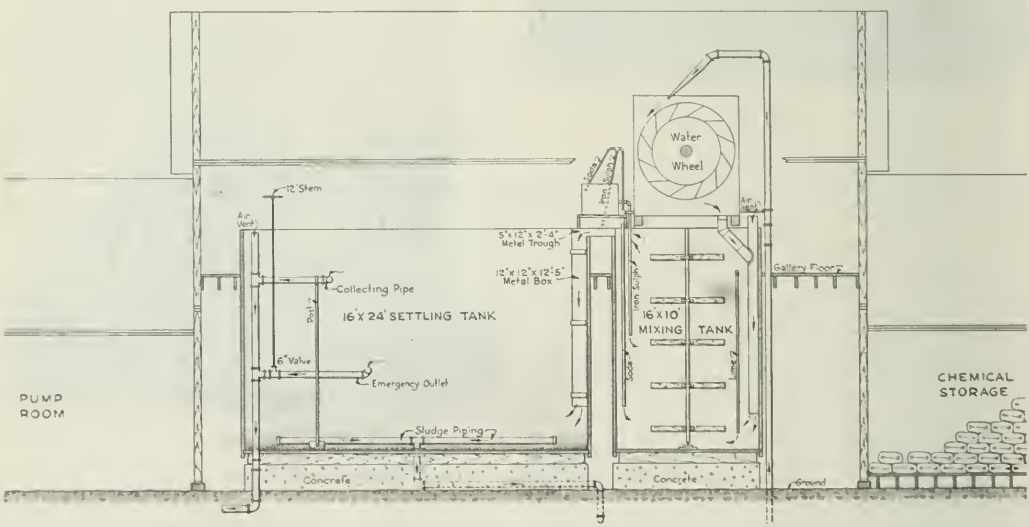
The settling tank is freed of its accumulated sludge once daily by opening for 30 seconds the valves controlling the system of perforated sludge pipes lying in the bottom of the settling tank. The perforations are in the bottom of the sludge pipes, and the branch pipes are connected to the main pipes by street-ells so that they are close to the floor. The pump room and working rooms are heated by hot water pipes along the walls. The chemical storage room is of $2^1/_2$ cars capacity.



Where the Water Treating Plants Were Installed



A Sectional View of the Plant at Scotland, S. D., Showing Arrangement of Piping and Tanks

Roadside Tanks Converted into Treating Plants

The plants at Lennox, Bridgewater, Avon, Tyndall, and Platte differ from the other plants in that, being smaller stations, the existing roadside tanks are utilized as settling tanks as well as storage spaces for water to be drawn off by locomotives. One of the illustrations gives an exterior view of one of these plants. In the plant the mixing tank is built inside the roadside tank and a small engine is installed below the tank to furnish the power to operate three small

pumps which discharge the chemicals each from a separate vat, into the untreated water. This engine also furnishes power to drive the agitator in the mixing tank. Under this arrangement the untreated water enters at the bottom of the mixing tank where it receives the chemicals and is stirred continuously as it rises to the top, flowing thence through an over-flow pipe to the bottom of the settling compartment. Water for filling locomotive tanks is then obtained from the top of the settling space by a pipe, the receiving end of which is buoyed up by a float. The housing around the base of the tank is equipped with a stove for heating purposes and is made large enough to store the requisite supply of chemicals.

Plants Do Effective Work

At Scotland the well water has the general character of all the waters derived from that layer of hard-water sandstone (the upper layer of soft-water sandstone having run out a few miles away). Our laboratory analysis shows its dissolved mineral content as follows:

Calcium Sulphate	64.9	grains	per gallon
Magnesium Carbonate	10.0	"	" "
Magnesium Sulphate	11.8	"	" "
INCRUSTING SOLIDS	95.7	"	" "
Alkali Sulphate	9.7	"	" "
Alkali Chloride	2.6	"	" "
NON-INCRUSTING SOLIDS	12.3	"	" "
TOTAL, DISSOLVED SOLIDS	108.0	"	" "

The treated water analysis follows, it being understood that there are daily variations up to one grain per gallon due to lack of uniformity in the rate of pumping water or feeding chemicals:

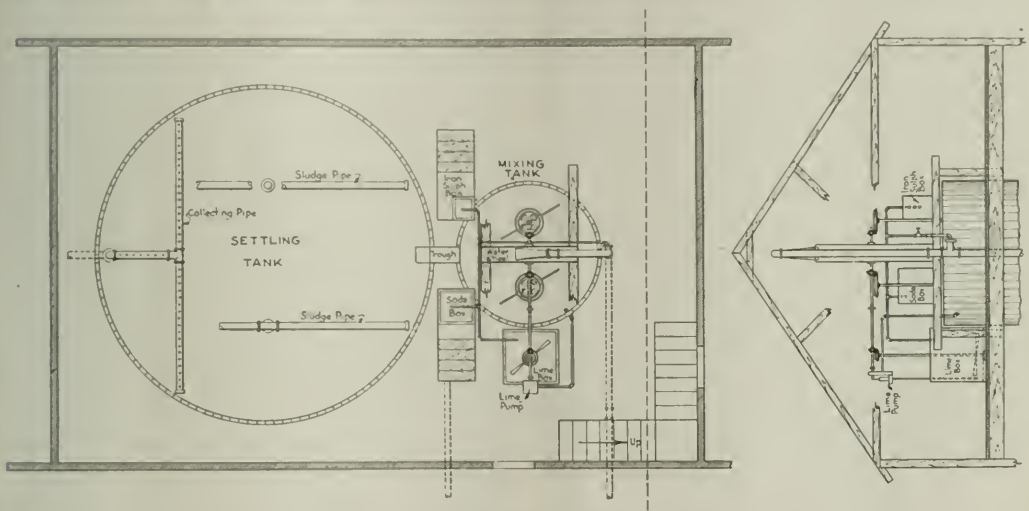
Calcium Carbonate	3.3	grains	per gallon
Sodium Hydroxide	0.8	"	" "
Alkali Sulphate	92.0	"	" "
Alkali Chloride	2.6	"	" "

Mechanical Mixing and Up-Flow Important Features

The chemistry of water softening is simple in both theory and practice when working on a small scale and with a filter, but when working on a large scale, where the resulting water must be settled instead of filtered, certain precautions are necessary. Experience shows that slow and continuous mixing of the hard water with the chemicals for a period varying from 25 min. to 50 min., according to the temperature and cleanness of the water, is necessary to complete chemical action; and experience shows also that unless the softening plant is to be encumbered with filters (a very serious drawback to a railroad plant) other special precautions must be taken to insure the perfection of settling.

In the plants built last year on the Chicago, Milwaukee & St. Paul, the advantage of the 40-min. mixing tank with its continuous but slow stirring is that the precipitate is all formed and ready to settle when the water enters the settling tank, and there is none left to form just below the top of the settling tank when it is too late to settle. Another feature of construction insures a character of precipitate which settles easily. When the chemicals first meet the water the rapidity of chemical action is so great that the particles of precipitate formed are very large and tend to settle quickly; but when the chemical work is nearly done and the few remaining molecules of carbon dioxide meet the few remaining molecules of calcium oxide, the particles of precipitate formed are so small that millions of them make only a bluish cloud which will float for hours and is the bane of water intended for boilers, because precipitate suspended in the water of the boiler is the cause of the foaming attributed to many treated waters.

These small particles, at the moment of coming out of solution (commonly called the nascent state), have great adhesive power and will attach themselves to any solid matter within adhesion distance. In the old way of feeding with a reaction tank at the top so that the flow was downward, the heavy precipitate had gone ahead and there was nothing for these last and very small particles to attach themselves to; but in the plants referred to, the hard water and the chemicals are introduced at the bottom of the reaction tank and flow upward, so that (since the precipitate lags behind the water) the reaction tank soon becomes and remains charged with a mass of precipitate to the full sustaining power of the upward flowing current, and these infinitesimal particles attach themselves to the older and larger particles as fast as they are born. The result is that the water flowing from the top of the reaction tank to the bottom



Plan Drawing of the Treating Facilities and Sectional View of Mixing Floor

of the settling tank carries only comparatively few and large particles which settle rapidly and leave the water free from haze.

The Plants Have Already Paid for Themselves

The treating plants were built by company forces at an expenditure of approximately $18,000 for each of the larger plants and $7,000 for the smaller ones. Since their installation (the last plant built being the one at Scotland, S. D., which was set in operation on January, 1922), our boilers have been free from scale and from leaking, and almost free from foaming. I know that there has been some foaming because sometimes one of those little rivers will change the character of its water 10 grains per gallon over night (from a rainstorm perhaps a hundred miles away, perhaps a week before) and sometimes something may go wrong in the plant and the water be under-treated, but when the treatment is correct there is little foaming.

Of course, we save in boiler repairs and coal, and we have a much superior service. As mentioned, the last plant has been in operation less than a year and the accounts are not yet made up, but the plants have paid for themselves (and will do so every year) in items of saving that can easily be calculated in dollars. Boiler repairs on the district are now almost nothing and during the entire strike period no boiler troubles attributable to water were reported on this district. Of interest in this connection, also, the statement was made at a recent meeting of master mechanics on the road that while previous to the installation of these plants, the boilers were always leaking, cases of buckled side sheets were frequent and three or four boiler failures occurred on the district every week, no leaking has been reported since the installation of the plants, no cases of buckled side sheets have arisen nor any boiler failures, and during the winter season not one engine was sent into the shop for heavy repairs, although it had been a customary practice before to send all power into the shop for this purpose annually.

We have much bad water on other divisions where traffic is more dense than on these, and it is true that the damage to a railroad from a bad water increases with the number of locomotives which use it, but the waters about Mitchell were so very bad and the difficulty of railroading so great that it was decided to utilize our 1920 money in that district.

I. C. C. Issues New Service Orders

WASHINGTON, D. C.

THE Interstate Commerce Commission on September 19 issued its Service Order No. 25, applicable eastward from the west bank of the Mississippi river, which cancels and supersedes Service Order No. 23, effective at midnight September 20, 1922.

By reason of certain embargoes issued by carriers, the commission says, complaints have been made that various commodities, which in the public interest should be handled currently and promptly, have not been so handled. In addition to the commodities specified under Service Order No. 23, this order adds mine supplies, medicines, fertilizers, seeds, news print paper and petroleum and its products in tank cars to the list of commodities to be given preference and priority in movement, when carriers are currently unable promptly to transport all freight traffic offered to them for movement. The words "fuel oil" as used in Service Order No. 23 are changed to read "other fuels."

Service Order No. 23 directed all carriers to discontinue the use of open-top cars suitable for the transportation of coal for the transportation of commodities other than coal, so long as any coal mine remained to be served with such cars. There are extensive road-building projects with uncompleted gaps, which, in the public interest, should be completed before cold weather sets in, and for which appropriations have been made by the States and by the Federal Government. There are large building programs under way which must be completed without undue delay to avoid serious loss. Service Order No. 25, therefore, permits the use of open-top cars suitable for the loading and transportation of coal, after the discharge of the coal lading, for the transportation of road and building construction materials, ore, mine supplies for current operation and fluxing stone for furnaces, when the destination of such commodities is in direction of, but not beyond the mine or mines to which such open-top cars are destined for coal-loading, and when such use will not materially delay or minimize the production and transportation of coal. Carriers are directed to place an embargo against the further placement of open-top cars for loading with such commodities for any shipper who shall fail or refuse to load the open-top cars within 24 hours after placement for such loading and are directed to place an embargo against any consignee who shall fail or refuse to unload such cars within 24 hours after placement.

The order further cancels the priority afforded consumers which was embraced in Class 2 in Paragraph 7 of Service Order No. 23. "The production of bituminous coal has increased to approximately nine and one-half million tons per week, and should," the commission's notice to the public says, "with reasonable use, take care of current needs, if panic, undue storage and waste of fuel and equipment are carefully avoided. The commission, therefore, feels that it can now relax its previous order by omitting general priorities by classes of consumers, reserving, however, the right in special cases of great emergency to direct carriers to furnish any coal mine with such open-top cars as may, in the public interest from time to time, be designated by it or its agent therefor. By virtue of the general priority which is given both to movement and use of open-top cars for coal, the effect of the change now made is to advance all coal into the priority class, instead of only those classes of consumers formerly embraced in the priority designations. While it was necessary during the period of extremely limited production to give priority in use to certain highly essential classes, this necessarily involved deferring others. Under existing circumstances, it is believed that the course now taken will tend to a considerable improvement in the production of coal by facilitating its movement and general distribution. It will be necessary, however, to avoid a return to priority classifications, for continued efforts looking to the avoidance of overstocking, of delay to equipment, and to the curtailment of demand to meet bare daily necessities until the reserve of coal in circulation can once more be built up."

This cancellation of the classified list of preferred consumers was recommended at the conference of railroad and business men called by Secretary Hoover and the Chamber of Commerce of the United States last week.

Service Order No. 24, which required carriers west of the Mississippi river to afford priority in movement to certain commodities, and for the return movement of empty cars for such loading, has also been amended to correspond with Service Order No. 25, applicable in Eastern United States. Service Order No. 22, as to routing of freight to avoid congestion, remains in effect.

Service Order No. 25 reads as follows:

It appearing. In the opinion of the commission, that an emergency which requires immediate action exists upon the lines of each and all the common carriers by railroad subject to the Interstate Commerce Act, east of the Mississippi river, including the west bank crossings thereof, and because of the inability of said common carriers properly and completely to serve the public in the transportation of essential commodities. *It is ordered and directed,* that effective September 21, 1922, and until the further order of the commission:

1. That each such common carrier by railroad, to the extent that it is currently unable promptly to transport all freight traffic offered to it for movement, or to be moved over its line or lines of railway shall give preference and priority to the movement of each of the following commodities: Food for human consumption, feed for live stock, live stock, perishable products, mine supplies, medicines, fertilizers, seeds, news print paper,

coal, coke and other fuel, and petroleum and its products in tank cars.

2. That to the extent any such common carrier by railroad is unable under the existing interchange and car service rules, to return cars to its connections promptly, it shall give preference and priority in the movement, exchange, interchange and return of empty cars intended to be used for the transportation of the commodities specially designed in paragraph numbered 1 hereof.

3. That any and all such common carriers by railroad which serve coal mines whether located upon the line or lines of any such railroad or customarily dependent upon it for car supply, herein termed coal-loading carriers, be, and they are hereby, authorized and directed whenever unable to supply all uses in full, to furnish such coal mines with open-top cars suitable for the loading and transportation of coal, in preference to any other use, supply, or distribution of such cars; provided, that the phrase "open-top cars suitable for the loading and transportation of coal" as used in this order shall not include or embrace flat (fixed) bottom gondola cars with sides 42 inches or less in height, inside measurement, or cars equipped with racks, or cars which, on July 1, 1923, had been definitely retired from service for the transportation of coal and stenciled or tagged for other service.

4. That all such common carriers by railroad other than coal-loading carriers, herein termed non-coal-loading carriers, be, and they are hereby, authorized and directed to deliver daily to a connecting coal-loading carrier or carriers, or to an intermediate non-coal-loading carrier for delivery through the usual channels to a coal-loading carrier, or carriers, empty coal cars up to the maximum ability of each such non-coal-loading carrier to make such deliveries and of each such connecting coal-loading carrier to receive and use the coal cars so delivered for the preferential purposes herein set forth.

5. That all such common carriers by railroad be, and they are hereby, authorized and directed to discontinue the use of open-top cars suitable for the loading and transportation of coal, for the transportation of commodities other than coal, so long as any coal mine remains to be served by it with such cars; and as to each non-coal-loading carrier, so long as deliveries of any such cars to connecting carriers may be due or remain to be performed under the terms of this order; provided, that such open-top cars suitable for the loading and transportation of coal, after the discharge of the coal lading thereof, may be used for the transportation of road and building construction materials, ore, mine supplies for current operation and fluxing stone for furnaces when the destination of such materials is in the direction of the mine or mines to which such open-top cars are destined for coal loading, and when such use will not materially delay or minimize the production and transportation of coal; provided, further that an embargo be placed against the further placement of open-top cars for loading with such commodities for any shipper who shall fail or refuse to load the open-top cars within 24 hours after placement for such loading thereof.

6. That all such common carriers by railroad be, and they are hereby, authorized and directed, to place an embargo against the receipt of coal or other freight transported in open-top cars suitable for coal loading, by any consignee, and against the placement of such open-top cars for consignment to any consignee, who shall fail or refuse to unload such coal or other freight so transported in coal cars and placed for unloading, within 24 hours after such placement, until all coal or other freight so transported in coal cars and so placed has been unloaded by such consignee and shall notify the commission of such action. This authorization and direction as to embargoes shall not interfere with the movement of coal to tidewater or the Great Lakes for transshipment by water, nor shall it apply where the failure of the consignee to unload is due directly to errors or disabilities of the railroad in delivering cars.

7. That in the supply of cars to mines upon the lines of any coal-loading carrier, such carrier is hereby authorized and directed, to place, furnish, and assign such coal mines with open-top cars suitable for the loading and transportation of coal for such special purposes as may from time to time be specially designated by the commission or its agent therefor by special priority direction in writing, in preference and priority to any other use; provided, that the open-top cars so placed, furnished, and assigned, shall after loading be transported for the special purposes designated, and shall not be subject to reconsignment or diversion except by and with the approval of the commission.

For the more prompt and effectual administration during the present emergency of the authorizations, directions and requirements of this paragraph No. 7, the following persons are designated and appointed as agents of the commission, with authority to give directions as to car service and to the matters referred to in paragraphs (15 and 16) of section 1 of the Interstate Commerce Act, and referred to in paragraph No. 7, viz: John C. Roth, director, E. H. DeGroot, Jr., assistant director, Frank C. Smith, chief inspector, and B. S. Robertson, service agent, of the Bureau of Service of the commission, and the directions so given by them shall be regarded as directions of the commission.

8. That all rules, regulations and practices of said common carriers by railroad with respect to car service as that term is defined in said act are hereby suspended so far as they conflict with the direction hereby made.

9. That Service Order No. 23, as amended, be, and the same is hereby, suspended and superseded, effective at midnight September 20, 1922.

10. That copies of this order be served upon the carriers hereinbefore described, and that notice of this order be given to the general public by depositing a copy hereof in the office of the secretary of the commission at Washington, D. C.

By the commission, division 5.

Inquiry Into Erie's Embargo of California Perishables

An inquiry into the embargoes issued last week by the Erie and other anthracite-carrying railroads against the receipt from their connections of certain classes of perishable freight in order that they might give preference to anthracite coal, although food stuffs are also given priority in the Interstate Commerce Commission's service orders, was instituted by Division 5 of the commission at a conference in Washington on September 14. The representatives of the railroads were asked to give an explanation for their action in issuing the embargoes and what the commissioners apparently considered a substitution of the judgment of the railroad for its judgment as expressed in the service orders.

H. A. Taylor, general solicitor, and A. E. Ruffer, transportation manager, of the Erie, explained that the condition of their motive power was such that the Erie was moving only about 75 per cent of a normal traffic and that a large part of the freight shipments which had been embargoed consisted of wine grapes from California which had been shipped in such a condition as to indicate that they were intended to be crushed into grape juice and serve as a substitute for the product of California which formerly was transported in tank cars. Mr. Taylor said that the shipments of grapes have greatly increased and constitute 42 per cent of the fruit and vegetable traffic handled by the Erie. He brought out these facts to show that the embargo was not intended to hold back essential food products, to which the priority order was presumably intended to appiy, and in reply to a question as to what changes the railroad would recommend in the commission's service order, Mr. Taylor suggested that this class of grapes be excluded from the list of perishable freight.

W. E. Jenney, vice-president and general counsel of the Delaware, Lackawanna & Western, said that that road had issued its embargoes to prevent the diversion of fruits, vegetables and live stock to its rails for delivery at New York, because it had no facilities for handling those classes of traffic. Reference was also made to a conference between representatives of the Erie and the Pennsylvania, which was expected to result in the Pennsylvania taking some of the fruit traffic the Erie could not handle. Representatives of the fruit and vegetable shippers who attended the conference were vigorous in their protests against the embargoes. C. M. Shaeffer, chief of transportation of the Pennsylvania, expressed the personal view that to rescind the commission's Service Order No. 23 would do much toward helping the railroads handle their traffic as the observance of priority regulations tends to cause delay.

Erie Removes Embargo

Following the inquiry, the Erie removed its embargo against shipments from California. It retains, however, its embargo against diversions of traffic from other lines—which embargo is similar to that of a number of Eastern roads.

Anthracite Production Increases

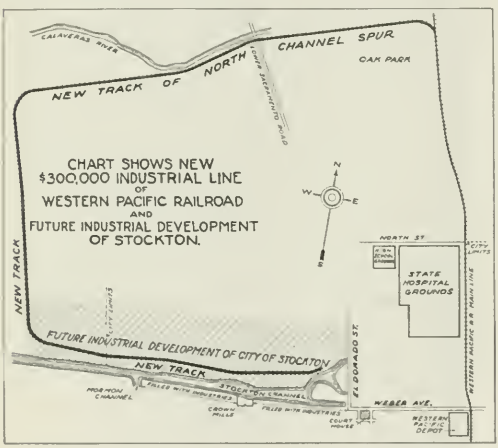
Although more than a week has elapsed since the resumption of anthracite mining, production has not gained full headway as yet. The Lackawanna loaded 713 cars on September 19, but it is hoped that this figure can in a short time be brought up to 1,000 cars a day. On the same day the Lehigh Valley handled 41,248 tons—a total which exceeded that of last year, but the road hopes to increase this loading materially. Loadings of other anthracite carriers show considerable increases during the week, but on none of them has production apparently reached its maximum. The attainment of maximum production in the anthracite fields is watched with interest, because probably not until it is achieved will the traffic on Eastern roads reach its peak.

CATTLE SHIPMENTS from Alberta to the United States are reported as unusually heavy because of the desire to avoid paying the prospective high duties of the United States tariff. During August nearly 10,000 head were shipped from Calgary alone, whereas during July, August and September of last year only 1,136 head were shipped.

Western Pacific Plans New Industrial Section

ACTIVE CONSTRUCTION operations have been begun by the Western Pacific in the development of what is expected to become the leading industrial section of Stockton, Cal. The company has secured all necessary rights and franchises and has complied with all legal requirements for the construction of over six miles of industrial trackage in and adjoining that city. Contracts have been let to the Utah Construction Company, nearly all of the right of way has been bought, and before the seasonal rains of the winter months have set in, the company hopes to have the initial trackage of about six miles, laid and ready for ballasting.

The Western Pacific, in starting this improvement, secures access to the north side of Stockton channel with its navigable water, for a distance of about 10,000 ft. It also gains access to several square miles of level land admirably located for industries. With one operation the Western Pacific is placed in a position to create a great manufactur-



ing district and a freight terminal adequate for a city several times the present size of Stockton.

The heart of the retail section of Stockton is embraced in the district shown on the accompanying chart between the Western Pacific station and the Court House. Stockton is famous on the Pacific Coast for its manufacturing industries. Three large tractor manufacturing companies are located there. It also has a well developed flour milling business, many clay working concerns, glass and paper industries, and others of varying nature. It is served by the Western Pacific, the Southern Pacific and the Santa Fe and by three interurban electric lines.

Its water front activities, at present, are along the south side of Stockton channel, and to a less extent along Mormon channel, the point of intersection of which with Stockton channel is shown on the map. All three of the steam lines have access to the south side of the channel to a greater or less degree. The north side of the channel, to which the Western Pacific gains access, is to all intents and purposes not now in use.

The Western Pacific calls this new project the North channel spur. As planned by Col. J. W. Williams, chief engineer, and Thomas L. Phillips, construction engineer, the new track leaves the main line over two miles north of the present passenger station. The track goes westerly for more than two miles, then turns almost due south for something less than two miles, and then turns almost directly east for, as stated, about 10,000 feet. On this final portion of the spur, the tracks will be laid from 100 to 200 feet from the water line, enabling connection to be made with water facilities wherever desired.

In planning this spur, or industrial track, the Western Pacific followed in principle the theory which was adopted when the road built its belt line around the city of San Jose, Cal. The San Jose belt line comes into that city along its eastern side, then turns around the southern side, and then turns along the western side of the city, the total length being nearly six miles. The North channel spur does not enclose Stockton on three sides, but it does enclose or reach several square miles of virgin territory, and gives the Western Pacific access to a valuable piece of undeveloped water front property.

Coal Production

WASHINGTON, D. C.

THE TOTAL production of all coal, anthracite and bituminous, in the week ended September 16 was estimated by the Geological Survey on Saturday at 10,200,000 to 10,500,000 tons.

Final returns on soft coal production in the week ended September 9 show 8,756,000 tons which, although less in the aggregate than for the week before, was at a higher daily rate, the holiday (Labor Day) considered. For the week of September 11-16 the output of bituminous coal is not expected to exceed 9,500,000 tons. Over the three weeks' period following general resumption of mining under the Cleveland agreement production has been at a rate less than 9,500,000 tons a week.

Mining of anthracite under the Philadelphia agreement began on Monday, September 11, and gained headway rapidly during the week. Production was between 900,000 and 950,000 net tons.

The following statement of cars of bituminous coal loaded shows the trend of output, day by day. Loadings on Monday, September 11, were 35,808 cars, a larger number than reported for any day since March, and gave promise of large production during the week, but the decline which has usually developed during the week was more marked than in preceding weeks. On Tuesday, loadings dropped to 30,786 cars and on Thursday were down to 26,923 cars. These figures indicate a total output for the week of between 9,300,000 and 9,700,000 tons.

	1st week	19th week	20th week	21st week	22nd week	23rd week	24th week
Monday	11,445	16,229	15,703	18,601	30,662	9,753	35,808
Tuesday	11,019	13,729	13,032	17,801	28,197	33,645	30,786
Wednesday	11,437	13,368	12,531	18,524	28,641	31,044	28,565
Thursday	11,090	13,277	13,521	19,388	28,687	28,274	26,923
Friday	11,296	13,539	13,718	22,882	27,040	28,477	.....
Saturday	8,888	11,009	13,524	23,070	25,517	27,476	.....

"Transportation is the dominant and limiting factor in soft coal supply," says the Geological Survey bulletin. "Restricted by transportation difficulties the rate of soft coal production is seemingly fixed temporarily at 1,600,000 tons a day, or 9,600,000 tons a week—this in spite of a strong market and prices sustained at high levels not only by demand for current consumption but also by the need for rebuilding ordinary reserves and by extraordinary call for household sizes."

Total production of bituminous coal for the calendar year to September 9 was 241,676,000 tons, as compared with 269,836,000 last year.

Loadings of anthracite on Monday, September 11, were 928 cars; on Tuesday they were 1,783 cars; on Wednesday, 3,258 cars, and on Thursday, 4,024 cars. When the mines are in full production loadings average about 6,000 cars

a day. In the last week of the anthracite strike only 1,018 cars were loaded, practically all of which was steam sizes dredged from the rivers. The total output was 55,000 tons, against 1,483,000 in the corresponding week a year ago.

At the close of the 23-week strike the cumulative output since the beginning of the calendar year was 22,255,000 tons, against 64,285,000 tons in 1921. The present year is therefore 42,030,000 tons behind last year.

Stocks of anthracite are very low. The reserve on the Lake Superior docks on September 1 was only 23,833 tons against 120,384 tons on the same date of 1921. Stocks of retail coal merchants in Massachusetts on August 15 were the lowest on record in the last three years and equivalent to but three per cent of the year's requirements.

Soft coal shipments from the mines to Lake Erie ports, under stimulus of priority orders increased 55 per cent during the week ended September 10 over the preceding week. The Ore and Coal Exchange reports a total of 717,226 tons dumped as against 463,242 the week before. Of the total 682,724 tons were cargo coal and 34,502 tons were vessel fuel. The rate of dumpings was 58 per cent greater than that in the corresponding week a year ago, but 21 per cent behind the rate in the corresponding week of 1920. The total quantity of cargo coal forwarded during the present lake season now stands at 6,019,999 tons, but of this 908,251 tons have gone to destinations not ordinarily taking lake coal. The quantity sent to regular lake markets was only 5,111,748 tons as against 10,650,153 tons in 1921 and 12,201,266 tons in 1920.

In the following table coal shipments on September 11, 12 and 13 are compared with the average daily shipments for the weeks ended August 26, September 2, and Sept. 9. The total shipments on Monday, September 11, were the largest recorded for any day since March. General increase was shown for all of the coal-producing districts as compared with shipments during the preceding week. On Tuesday and Wednesday, however, shipments from a majority of the districts declined to levels below those of corresponding days during the preceding week.

In Pennsylvania, shipments have decreased slightly and on Wednesday were at the rate of about 400,000 tons daily. In northern West Virginia, output has decreased notably, principally on account of transportation difficulties. The same condition was shown by Wednesday's shipments in Ohio, Indiana and Illinois.

In the non-union fields of the middle and southern Appalachian regions the coal output continues to be greatly reduced by railroad disabilities. This is strikingly shown by the great drop in mid-week shipments as compared with shipments on Monday which were comparatively large because the Sunday holiday enables the roads to make temporary recovery. In the region immediately west of the Mississippi river there was a small increase in shipments.

In Colorado, shipments last week were larger than during preceding weeks but the large gain on Monday was not maintained on Tuesday and Wednesday. Other western states show similar changes.

Coal Prices and Distribution

Belief that the natural processes of increased supply, provided distribution is facilitated, will bring down the price of bituminous coal, and assure complete supplies to the householders and industry, a definite pledge on the part of commercial interests to aid expediting those natural processes, and determination on the part of the government that advantage shall not be taken of the recent strike in an effort to exact high coal prices from the public were evidenced at the conference on the bituminous coal situation on September 15 at the Department of Commerce. Officials of the United States Chamber of Commerce, the American Railway Association, the National Association of Manufacturers, the National Association of Purchasing Agents, and the public utilities associations met with the Secretary of Commerce, H. Foster Bain of the Department of the Interior, and C. B. Aitchison, of the Interstate Commerce Commission.

It was agreed that the mines had ample capacity, even to the point of surplus, to meet the situation, that the problem was wholly one of transportation, and that the price would ameliorate if transportation could be increased and if consumers would purchase only for their immediate needs.

The conferences voted to organize voluntary campaigns for three major purposes:

1. To induce manufacturers, utility corporations, and buyers generally not to purchase coal beyond their day-to-day needs until the flow of coal becomes more normal.

2. To persuade holders of coal contracts not to call for delivery on those contracts past their day-to-day needs. It was considered that about one-half of the coal in the country is under contract at normal prices and that a relaxation in the demand for this coal to the minimum daily requirements would allow an increase in supply to the general public.

3. To expedite the movement of coal in every way.

The co-operation of the responsible coal operators in these matters will be sought.

The question of priorities in coal movement was discussed at great length, it being the consensus of opinion of the meeting that more mobility would be given to movement with less opportunity for speculation if the priorities to special uses, which have been necessary prior to the reopening of the union mines, should be relaxed and priority parallel with agricultural produce should be given to the movement of all coal without discrimination as to consignees. It was also pretty generally the opinion of the meeting that all reconsignment rights upon coal should be abolished in order to prevent speculation in coal.

DAILY SHIPMENTS OF SOFT COAL FROM PRODUCING DISTRICTS

Net tons, assuming 50 tons to the car, based upon records of cars loaded, as reported by the railroads to the American Railway Association

General News Department

The Railway Fire Protection Association will hold its annual meeting at Willard Hotel, Washington, D. C., on October 17, 18 and 19.

The Senate on September 19 agreed to strike out of the rivers and harbors appropriation bill provisions for the purchase of the Cape Cod and Dismal Swamp canals.

Persons Going Up in aeroplanes, from New York City, mostly or wholly for amusement or recreation, are said to have numbered, in the week ending on September 16, no less than 574. It is said that a group of 15 persons may now take a flight over the city, lasting 15 minues, for $3.50 each.

The Michigan Central reports that its automobile loadings from Detroit plants this year have far exceeded all past records, a total of 55,045 carloads in the first eight months this year, as against 25,724 in the same period of 1921, an increase of 114 per cent. August, 1922, was the banner month of history, with loadings of 8,557 carloads.

A Fire at New Orleans, La., on September 16, destroyed extensive wharves and warehouses belonging to the Federal Government and used, under lease, by the Louisiana State Dock Board. The fire is said to have started in a carload of bagging, and 40 loaded freight cars were included in the property destroyed. The total loss was estimated at $5,000,000.

The Railroads of Georgia, by a law recently passed in that State, are allowed to issue annual passes to sheriffs and deputy sheriffs, one of each in each county. According to a statement made by a member of the Public Service Commission, it appears that this law is designed to accommodate the sheriffs when they are engaged in transporting criminals.

Pensions Paid by the New York Central to superannuated employees during the current year will amount to $1,083,000 which is nearly double the total amount thus paid in 1916. This total includes the payments of the constituent companies, and the total prior to 1922 amounted to $7,018,486. The number of pensioners on the roll at the beginning of 1921 was 2,771, a number which is about two per cent of the total forces employed.

A Delegation of Canadian railway officers conferred on September 20 with the Interstate Commerce Commission and officials of the Car Service Division of the American Railway Association in an effort to obtain the return of a large number of Canadian box cars now on American lines to the Canadian roads in order to relieve a severe car shortage in Eastern Canada. It was estimated that approximately 30,000 Canadian cars are held on American roads.

In the Federal Court at Memphis, Tenn., on September 18, Jacob Cohen, editor of the Labor Review, was sentenced to six months' imprisonment and to pay a fine of $1,000 for violation of the injunction against interfering with railroad operation or abusing railroad employees. Cohen had published an article referring to men employed in places of strikers as "loathsome and scurrilous scabs." Another Memphis editor has been arrested on a similar charge.

The Shopmen of the Central of Georgia have organized two unions, one the Central of Georgia carmen's organization and the other the Central of Georgia metal trades' organization. C. O. Voss, of Savannah, is chairman of the carmen and W. J. Bice, also of Savannah, a boilermaker, is chairman of the metal trades. It is said that the new unions have already made contracts with the railroad company, which conform to the rulings of the United States Labor Board.

Radiophones, for transmitting news and other matter to passengers, are to be introduced on one of the fast trains of the Louisville & Nashville running between Cincinnati and New Orleans, successful experiments having been made with apparatus on a train which was run out of Louisville on September 13. The apparatus worked all right while the train was in the tunnel beneath Muldraughs Hill, 300 ft. below the surface of the earth. This hill is said to contain a large percentage of iron.

Hearings before the House judiciary committee on impeachment charges instituted by Representative Keller against Attorney General Daugherty partly on account of his action in obtaining the injunction against the railroad shop unions, were postponed by the committee on Monday until the next session of Congress in December. Chairman Volstead said that this was because Mr. Keller had refused to produce or submit other than general evidence and that time should be allowed for the attorney general to appear in his own behalf.

The Alaska Railroad, since July 1, has been running a through passenger train twice a week between Seward and Nenana, 412 miles, making the trip in less than 24 hours, with a regular connection from Nenana to Fairbanks; but, according to news despatches, the result in tourist travel has been disappointing. General tourist travel to other sections of Alaska has been good throughout the season but it is claimed that the older routes have been very active in their solicitation of business and it appears that they have had much success in retaining their traffic. The new train has sleeping and dining accommodations.

Steel Car Design and Construction

John A. Pilcher, mechanical engineer of the Norfolk & Western, will present a paper entitled, "The Design and Building of Steel Freight Car Equipment" at the meeting of the Railway Club of Pittsburgh, in the English Room of the Fort Pitt Hotel, Pittsburgh, on Thursday, September 28, 1922, at eight o'clock.

Chicago Has Tag Day for Shop Strikers

After two weeks of strenuous effort, which included the calling of a special meeting of the city council, S. W. Govier of the Chicago Board of Aldermen succeeded in having a permit issued for a city-wide tag day on September 20, to benefit the striking railroad shopmen, their wives and children. "I know the city has an ordinance providing for only three tag days a year, but we have given generously for the aid of stricken people in foreign lands, and we can stand one more tag day to take care of our fellow citizens here at home," Mr. Govier declared.

Newspaper Investigates Shipping Conditions

The Chicago Tribune last week conducted a business survey throughout the central western states to determine how the railroads were serving the shippers. In a full page advertisement under the caption: "Here is What Shippers Say About the Railroads" parts of 53 letters were reprinted of which 37 stated the service to be very good and 12 fair, while only four considered the efforts of the carriers a complete failure. The Tribune believes that the business conditions in the central west are generally good and that the railroads are furnishing adequate and satisfactory service.

D. & R. G. W. to Spend Over $23,000,000

A rehabilitation program involving the expenditure of $23,792,511 for improving the Denver & Rio Grande Western was requested of C. E. Herrington, special master recently appointed by the United States District Court at Denver. The attorney for the railroad, who presented the above plan to the Federal Court,

stated that the expenditure is necessary to make up deferred maintenance costs and to bring the road up to the advancing requirements of a rapidly developing territory. The budget includes as its largest item $15,314,376 for additions to the fixed property. This item includes $6,132,000 for new rails and $2,736,900 for new shops. Other main divisions of the budget are $6,226,283 for new rolling stock and $2,251,859 for improvements to existing equipment.

Coroner's Jury Reports on P. R. R. Car Shop Fire

The fire at Pittsburgh, Pa., on September 3, in which seven employees of the Pennsylvania Railroad were burned to death in their lodging room, has been investigated by a coroner's jury and a verdict was rendered on September 13 to the effect that the origin of the fire could not be discovered. The verdict censures the officers and employees of the railroad company for housing 25 men in a building containing a large quantity of inflammable material, including oil-soaked waste and petrolite; for making changes to convert this shop or storehouse into lodgings without securing a permit from the city, and for maintaining an exit stairway too narrow. The verdict also said that the railroad company had fire-fighting equipment in and near the building but had no efficient organization for handling the apparatus.

Great Western Installs Motor Car Service

A two-unit motor train, consisting of a passenger motor car and a trailer, was placed in service on September 18 by the Chicago Great Western on its line between Des Moines, Ia., and Marshalltown. Interest was attached to the inauguration of this

Photo by International

Ready for the Initial Trip

service for the reason that this type of equipment was an innovation in Iowa railroading. A number of Great Western officers and others made the initial trip, leaving Des Moines on Monday morning and reaching Marshalltown by noon that same day.

Adding Insult to Injury

According to the Macon (Ga.) Telegraph more than $600 and some watches and jewelry were stolen from the occupants of the Savannah sleeping car of the Central of Georgia, in Macon, as the car lay on a side track at the Terminal station, on the morning of September 15, the car having arrived about 3:30 a. m., and the passengers being asleep. A screen window at one end of the car had been cut out where the thief had made his entry and another at the other end where he made his escape.

C. H. Findley, chief claim agent of the railroad, a passenger on the car, was relieved of a gold watch and some documents; and the hammock in which his clothing was lying was removed from the berth.

The porter, who claimed to have been awake all the time, was in one end of the car shining shoes and did not hear any noise. When one of the passengers called the porter to locate his trousers a number of pairs of trousers were found crumpled in a heap on the floor of the women's dressing room with the pockets rifled.

A. R. E. A. Building Specifications Ready

The Committee on Buildings of the American Railway Engineering Association has been working for two years on specifications for buildings for railway purposes which specifications have now been completed and have been issued by the association in Bulletin No. 247, a publication of 100 pages. These specifications have been published at this time in order that an opportunity may be afforded for criticism prior to their presentation before the association at its annual meeting next March. It is the intention of the committee that these specifications shall be prepared in loose leaf form with the idea that specifications for any particular building may be built up by combining the necessary sheets into one specification. The committee solicits suggestions and comments and requests that they be sent to J. W. Orrock, principal assistant engineer, Canadian Pacific, Montreal, Que., who is chairman of the sub-committee in charge of their preparation.

Railway Revenues and Expenses

The Interstate Commerce Commission's monthly summary of revenues and expenses for 198 Class I roads for July and for seven months is as follows:

	July		Seven Months	
Item	1922	1921	1922	1921

[2]Includes $2,823,339, sleeping and parlor car surcharge.
[3]Includes $17,879,407, sleeping and parlor car surcharge.
[4]Includes $18,846,480, sleeping and parlor car surcharge.

Former C. & E. I. Coal Road Sold

Purchase has been concluded of that portion of the former Brazil branch of the Chicago & Eastern Illinois between West Melcher, Ind., La Crosse and Goodland, and the Illinois-Indiana state line. This road, which was known, until the first part of this year, as the Brazil branch and the Indiana Coal division of the C. & E. I., will hereafter be known as the Chicago, Attica & Southern. Much of the stock in the new company has been sold to farmers, mine owners and grain elevator operators who are located along the line. These people have exerted every effort to prevent the junking of this road which proved so unprofitable to the C. & E. I., this company averaging a loss of about $500,000 or more annually.

The purchase price was said to be $250,000. Among those interested in the purchase of the road are J. S. Nave of Attica, Ind.; C. W. Zeigler, Attica, chairman of the Indiana highway commission; F. Lyons of Brook, Ind.; L. Shipman of Fowler, and E. S. Booe of Kingman, Ind. That part of the coal division between West Welcher and Brazil was recently saved from abandonment when the Cincinnati, Indianapolis & Western purchased it. This is considered the most profitable section of the branch line.

Fire Risk in Northern Minnesota Forests

The railroads in Northern Minnesota, having suffered serious losses in damages paid on account of forest fires, particularly in 1918, have been taking special precautions to guard against the recurrence of these disasters. William Byrne, supervisor of the railway fire patrol, under the State forestry service, says that during the recent drought, the railroads have given a good account of themselves. He cites, particularly, the Duluth, Missabe & Northern, operating many trains daily through a section of woods which by the protracted drought, has become a mass of tinder. This road uses a small fleet of speeders, and one follows every train. Every fire caused by sparks is quickly reported and where necessary a special fire train is dispatched to extinguish it. Scores of small fires have thus been kept within the right-of-way. This fire train consists of a locomotive and four tank cars with a high-pressure steam pump on the locomotive.

Railway Books Selected by Executives

The Hotel McAlpin, New York, asked a number of railway executives to recommend books on transportation subjects for the hotel's business library. A number of executives gave their selections and the hotel has made public the titles chosen by Messrs. Kruttschnitt, Holden, Willard, Gorman and Parmelee. These lists varied from eleven to seventeen books each and the titles chosen by three or more of the five whose selections have been made public are:

Principles of Railroad Transportation, by E. R. Johnson and T. W. Van Metre,
The American Transportation Question, by Samuel O. Dunn,
Railroads: Rates and Regulation, by W. Z. Ripley.
Railroad Traffic and Rates, by E. R. Johnson and G. C. Huebner.
Regulation of Railways, by Samuel O. Dunn,
Railroads and Government, by F. H. Dixon,
Waterways versus Railways, by H. G. Moulton,
Where and Why Public Ownership Has Failed, by Yves Guyot,
Government Ownership of Railways, by Samuel O. Dunn,
Railroad Administration, by Ray Morris.

Titles mentioned on two of the five lists which were submitted are:

The Railways and the Traders, by Sir W. M. Acworth,
Railroads: Finance and Organization, by W. Z. Ripley,
Elements of Railway Economics, by Sir W. M. Acworth,
The Rise of Rail Power in War and Conquest, by E. A. Pratt,
Economic Theory of the Location of Railways, by A. M. Wellington.

Report on Winslow Junction Derailment

The Interstate Commerce Commission has issued a report, dated July 26, and signed by W. P. Borland, Chief of the Bureau of Safety, on the cause of the derailment at Winslow Junction, N. J., on the Atlantic City Railroad, July 2, when three passengers and four trainmen were killed and 84 passengers and five employees were injured. This derailment was reported in the *Railway Age* of July 8, page 77 (with editorial comment in the issues of July 8 and July 15). The present report gives few additional details. It contains excellent photographic engravings showing the line of the road and the signals. The summary at the end of the report says that the evidence is conclusive that the route was lined for the branch at least five minutes prior to the approach of train No. 33 The approach locking would not have prevented the signalman from changing the route after the train had passed the distant signal, but there is no evidence that this was done and the inspector accepted the signalman's statement that he had not moved any of the levers after setting up this route. Engineman Wescott was employed as a fireman in 1906 and was promoted to engineman in 1909; and his record was clear. He had been on duty about one hour and 40 minutes, and before that was off duty 13 hours or more. The report says, further: "The investigation disclosed that Engineman Wescott apparently failed to shut off steam, did not acknowledge proceed signals given by brakemen at the rear end and head end of freight train No. 491 (standing on the side track), did not whistle for the crossing near the distant signal, and did not sound one long blast on the whistle required to be sounded when approaching junctions, and customarily sounded at this particular point to call for the high-speed route to Atlantic City." The report contains the usual recommendation for the introduction of automatic train control apparatus.

Commission and Court News

State Commissions

Final Effort to Prevent Junking Part of M. D. & G.

Roused in final effort to prevent junking of that portion of the Memphis, Dallas & Gulf between Hot Springs, Ark., and Glenwood, and seeking immediate restoration of freight and passenger service as vital to the interests of over 1,500 square miles tributary to the line, more than a dozen petitions were presented to the Arkansas Railroad Commission on September 18. The petitions, many of which were in bulk form, containing the names of many farmers, mill operators, fruit and truck organizations, laborers, schoolteachers and other producers and shippers, set forth that following the annulment of service on the railroad: "Mills have shut down, immigration and land settlement has stopped, bank deposits have shrunk, trade has dwindled, lands have depreciated in value, many businesses have gone into bankruptcy and permanent junking of the said railroad or longer annulment of service means financial ruin to hundreds of farmers and scores of business enterprises. . . ." The petitions represented a territory from Hot Springs west to New Hope, about 70 miles.

United States Supreme Court

Court Will Construe Tariffs, Regardless of I. C. C.

In an action by an elevator company against the Great Northern and the Director General to recover $80 alleged to have been exacted in violation of the carrier's tariff, as a reconsignment charge for corn shipped from points in Iowa and Nebraska to Willmar, Minnesota, and after inspection rebilled to Anoka, it appeared that the tariff rate from points of origin to both places was the same. Willmar is the place where grain by this route is inspected and graded under the state and federal laws. The shipper claimed that the case was within the exception, Paragraph A, to Rule 10 of the tariff. Whether the charge was payable depended solely upon a question of construction; that is, whether the body of the rule or the exception to it applied. On this question there was room for reasonable difference of opinion. The railroad, relying particularly upon Texas & Pacific vs. American Tie & Lumber Co., 234 U. S. 138, and Loomis vs. L. V. 240 U. S. 43, claimed seasonably that until the true construction of the tariff had been determined by the Interstate Commerce Commission the trial court was without jurisdiction. The court overruled this objection, construed the exception, and entered judgment for the shipper, which was affirmed by the Minnesota Supreme Court. The case was brought to the United States Supreme Court on writ of certiorari, 255 U. S. 567.

The railroad contended that, to insure uniformity, the true construction must, in case of dispute, be determined by the Commission. The Supreme Court says, in part: "This argument is unsound. It is true that uniformity is the paramount purpose of the commerce act. But it is not true that uniformity in construction of a tariff can be attained only through a preliminary resort to the Commission to settle the construction in dispute. Every question of the construction of a tariff is deemed a question of law; and where the question concerns an interstate tariff it is one of federal law. If the parties properly preserve their rights, a construction given by any court, whether it be federal or state, may ultimately be reviewed by this court either on writ of error or on writ of certiorari; and thereby uniformity in construction may be secured. What construction shall be given to a tariff presents ordinarily a question of law which does not differ in character from those presented when the construction of any other document is in dispute. . . . In this case no fact, evidential or ultimate, is in controversy; and there is no occasion for the exercise of administrative discretion.

Judgment of the State Supreme Court was affirmed. Great Northern vs. Merchants' Elevator Co. Opinion by Mr. Justice Brandeis. Decided May 29, 1922.

Foreign Railway News

A Swiss to Direct Electrification in Japan

Press dispatches from Geneva are authority for the statement that a Swiss engineer named Durler has been appointed director of works for the electrification undertakings planned by the Japanese State Railways.

120 Miles of Color-Light Signals for New Zealand Railways

The New Zealand Government Railways are to instal automatic block signals on 120 miles of line, single track, color-light signals to be used, and the electric apparatus to be alternating current. The material has been ordered from the Westinghouse Brake & Saxby Signal Company, London.

Technical Details of Portuguese Railway Equipment

Consul General Hollis at Lisbon has prepared a report called "Equipment on Portuguese Railways" which can be obtained by any interested manufacturer by applying to the Bureau of Foreign & Domestic Commerce, Washington, D. C., and asking for exhibit No. 64991. This report shows the various standard types of locomotives and freight and passenger cars in use on Portuguese railways, giving complete technical details.

Wages in Ireland to Stay Up Temporarily

LONDON

A year ago, on the termination of government control, the Irish railway companies proposed to reduce their employes' wages, but this proposal was resisted and eventually an agreement was arrived at, which was later extended and was finally to expire on August 15, 1922, the anniversary of decontrol. The railway companies have now intimated to the provisional government that in view of the present disturbed state of the country, and in the national interest they will carry on to the best of their ability until the end of the year under the present conditions, it being understood that the government will see that the interests of the shareholders are not prejudiced.

Automatic Train Control Tests in Ireland

LONDON.

On September 4 tests were conducted of an automatic train control and fog signaling apparatus invented by Andrew Kerr, of Belfast. A 4-4-0 locomotive belonging to the Northern Counties section of the Midland Railway had been fitted with Mr. Kerr's apparatus, which is designed to give an audible warning and partial brake application at distant signals, to bring a train compulsorily to a stop at home signals and to give also a definite clear indication when passing a signal which is "off." The apparatus is entirely mechanical. The tests were carried out under the direction of Bowman Malcolm, chief engineer; F. G. Hopkirk, assistant engineer, and F. Cochrane, general foreman of the locomotive works.

Hungary Builds Locomotives With Water Tube Fireboxes

LONDON.

The Hungarian State Railways with a view to testing the relative merits of the 4-6-0 type of passenger engine arranged for simple and compound operation, in both cases with superheated steam, have built one of each type at the shops at Budapest, and some extensive tests have been made. These tests favored the single-expansion type of locomotive and large orders for this class of locomotive are now in course of execution. The engines are fitted with water tube fireboxes, feed water heaters with purifiers and other special features. For freight traffic locomotives of the 2-8-2 and Mallet types have been introduced and both these are similarly equipped with water tube fireboxes and the other devices mentioned. The locomotives are of large proportions and designed for the highest tractive effort that circumstances permit. The difficulty in Hungary is that maximum axle loads of 14 tons cannot be exceeded in the Eastern zone and 16 tons per axle in most of the other districts. These moderate loadings have naturally had their effect upon locomotive design, the weight having to be distributed over a greater number of wheels than would otherwise have been necessary.

Color Light Signals on the Great Western

LONDON

At Paddington station, London, of the Great Western Railway, color light signals have been installed, suspended from the passenger footbridge across the station, in place of mechanically operated repeating signals and some of the backing signals. These color light signals have orange and green indications and can be seen in both directions. They are designed so that a failure of the operating current will cause the orange light to be given in all cases.

London & North Western Ticket Limits

The London & North Western announces in New York that passenger tickets for journeys in Great Britain, bought in America, are now valid for 40 days from date of issue; and the return halves of round trip tickets are good for 3 months. The requirement for further stamping or dating at stations in Great Britain is discontinued. The free allowance for baggage, subject to a few exceptions, is, in Scotland, on one first-class ticket, 120 lb., and on one third-class ticket, 60 lb. Between all stations in England and Wales and to or from Scotland, on one first-class ticket, 150 lb.; on one third-class ticket, 100 lb.

The Riga Railway Conference

At the railway conference held in Riga during the last two weeks of June, three agreements were adopted regarding direct traffic between the Baltic states (including Finland) and Germany and Russia, according to Commerce Reports.

The first agreement concerned traffic between Russia and the Baltic states (Latvia, Esthonia, Lithuania) and Finland, and represented the so-called Baltic states and Russian Direct Traffic Union. According to this convention, the states in question retain freedom of action in stipulating the rates for direct communication until the drafting of mutual tariff scales. A mutual settlement of accounts is to be offered on the fifteenth of each month.

The second agreement concerned direct traffic between Germany and Soviet Russia, by way of Latvia, Lithuania, and Esthonia. According to this agreement, Russia will exact payment in Russian currency for the conveyance of passengers, goods, and luggage between the Russian border and the Russian interior; Germany receives that part of the remuneration which covers the conveyance of such traffic between Germany and the Russian borders via Latvia and Lithuania. Both Latvia and Lithuania settle their accounts with Germany, each in its respective currency.

The third agreement relates to direct traffic between Germany and the States of Latvia, Lithuania, and Esthonia. These several agreements are subject to confirmation by the respective governments, whereupon they come into force.

Electrification of the South Eastern & Chatham Railway, England

Plans and negotiations are being made for the purpose of obtaining a supply of electric power for the electrification of the South Eastern & Chatham. The railroad company has applied to the Electricity Commissioners for consent to the establishment of a 60,000-k.w. generating plant at Angerstein's Wharf, Charlton. The West Kent Electric Company Limited also applied for consent to build a 150,000-k.w. generating station at Belvedere in the urban district of Erith. During the course of the inquiry, offers to supply the railroad company were made by the West Kent Company and by the County of London Electric Supply Company.

An important factor in this case is the forthcoming grouping into one railway system of the London & South Western, the London, Brighton & South Coast and the South Eastern & Chatham Railways. The London & South Western Railway Company is supplied with electric power from its 25 cycle generating station at Wimbledon. The London, Brighton & South Coast purchases

energy from the London Electric Supply Corporation. The further electrification of that railway's suburban lines will entail a supply which will be many times in excess of that now furnished by the London Electric Supply Corporation and this additional supply must be supplied at a frequency of 25 cycles, for the reason that the equipment of the company's rolling stock is designed for that frequency. The South Eastern & Chatham Railway Company also desire a supply at 25 cycles, but as their system of electrification will be direct current, a supply at a frequency of 50 cycles is also practicable.

It is expected that the first stages of the electrification of the South Eastern & Chatham will be completed by June 30, 1925, and arrangements have been made with the Treasury for a guaranteed loan of £6,500,000, five millions of which are to be expended on the electrification of the lines. This financial assistance is dependent upon making arrangements for an adequate power supply. If the railway company purchases its power supply from an outside source, it will be relieved from a capital outlay of something more than £1,000,000.

What Great Britain's Railways Have Accomplished Since Returned to Private Control

London, Eng.

It is now practically one year since the railways of Great Britain were handed over by the British government to their owners. The coal strike and trade depression at that period had caused a serious diminution in railway revenues and it was well known that the railways were working at a loss. With the return to private ownership the railway companies were confronted with the necessity of making expenditures and revenue balance. They had at the same time to meet the persistent demands of the British public for a reduction in rates and fares, the public absolutely ignoring the financial embarrassment of the railways. It was under such conditions that the companies were faced with the necessity of restoring their financial equilibrium. The problem of giving improved facilities to those which had been possible during the period of government control was rendered more difficult by the fact that the chief item of railway expenditure, namely wages, was outside the control of the companies, being regulated by a sliding scale based on the cost of living, and that no direct action could be taken to reduce the cost of fuel and other materials required by the railways. There was also the fear that in the then depressed condition of trade the attempt to provide better facilities for passenger and merchandise traffic at lower rates would easily result in actual loss. It is, however, to the credit of the British railways that no sooner were they placed on their own resources than they instituted quite an elaborate program of holiday excursions. These concessions included day and half-day excursions at a single fare for the double journey, period excursions at a fare and a third for the double journey, guaranteed day and period excursions by special trains, daily tickets for local journeys to and from holiday resorts under certain circumstances at a single fare for the double journey, cheap fares to passengers attending local events, such as flower shows, agricultural shows, and so forth, from stations within a radius of 60 miles, week end tickets and commercial travellers tickets at a fare and a third for the double journey, tourist and pleasure party, walking tour, shopping and other cheap tickets. These facilities, however, lack the generosity of those prevailing before the war. It is also interesting to note that as passenger fares are still 75 per cent above prewar level, cheap tickets are also 75 per cent above those prevailing in 1913.

With reference to freight traffic, the 100 per cent increase brought into operation on September 1, 1920, has been reduced to 75 per cent, while the flat rate increases have been lowered by one-half.

Much progress has also been made in the speeding up of passenger services and the provision of through travelling facilities and the restoration of old and the introduction of new cross-country trains. This last feature has been made possible owing to the union of interests arising out of the railway grouping scheme. With regard to the speeding up of freight traffic the revival of express services for perishable freight and the improved timing of many long-distance services following the exclusion of vacuum brake fitted cars from the car pooling scheme, is of interest. Runs of trips of 500 to 600 miles are now made by freight trains in 48 hours.

Equipment and Supplies

Locomotives

The Lehigh Valley is inquiring for 25 Mikado type locomotives.

The Maine Central is inquiring for twelve 4-6-0 type locomotives.

The Seaboard Air Line contemplates buying 15 Pacific type locomotives.

The Great Northern contemplates purchasing a number of locomotives.

The Atlantic Coast Line has ordered 25 Pacific type locomotives from the Baldwin Locomotive Works.

The Chicago, Rock Island & Pacific is inquiring for 30 Mikado type and 10 Mountain type locomotives.

The Erie will have repairs made to about 100 locomotives at the shops of the Crucible Steel Company, Harrison, N. J.

The Nashville, Chattanooga & St. Louis has ordered 7 Mikado type locomotives from the Baldwin Locomotive Works.

The Baltimore & Ohio has placed an additional order for 50 Mikado type locomotives with the Baldwin Locomotive Works.

The Northern Pacific is expected to issue inquiries within the next few weeks for from 50 to 80 miscellaneous type locomotives.

The Delaware, Lackawanna & Western has ordered 15 Mikado type locomotives from the American Locomotive Company. These locomotives will have 28 by 32 in. cylinders and a total weight in working order of 355,000 lb.

The Chesapeake & Ohio, reported in the *Railway Age* of September 16 as negotiating for the purchase of 50 Mallet type locomotives, has ordered this equipment from the American Locomotive Company to be built at its Schenectady, N. Y., works.

The New York Central's order for 100 locomotives reported in the *Railway Age* of September 16 has been changed to 90 locomotives—50 Pacific type and 40 Mikado type. The Pacific locomotives will have 23½ x 26 in. cylinders and a total weight in working order of 288,000 lb., and the Mikado locomotives will have 28 x 30 in. cylinders and a total weight in working order of 340,000 lb.

The Texas & Pacific, reported in the *Railway Age* of September 16 as inquiring for 8 Pacific type and 8 switching locomotives, has ordered this equipment from the American Locomotive Company. The Pacific type will have 26 by 28 in. cylinders and a total weight in working order of 281,000 lb. The six-wheel switching locomotives will have 21 by 28 in. cylinders and a total weight in working order of 164,000 lb.

The Norfolk & Western, reported in the *Railway Age* of September 16 as inquiring for from 20 to 40 Mallet type locomotives and 12 Mountain type locomotives, has ordered 30 Mallet type locomotives from the American Locomotive Company and 12 Mountain type locomotives from the Baldwin Locomotive Works. The Mallet type will have 25 and 39 by 32 in. cylinders and a total weight in working order of 531,000 lb.

Freight Cars

The Grand Trunk is inquiring for 250 refrigerator cars.

The Atchison, Topeka & Santa Fe is inquiring for 50 caboose cars.

The Fruit Growers Express is inquiring for 1,000 steel underframes.

THE ELGIN, JOLIET & EASTERN [illegible] having repairs made to 200 side dump cars.

THE NEW YORK, CHICAGO & ST. LOUIS is inquiring for 200 steel center constructions for freight cars.

THE CHICAGO & ALTON is asking for prices on repairs to 300 gondola cars. This company however, may repair its own cars.

THE WESTERN PACIFIC reported in the *Railway Age* of September 16 as inquiring for 100 gondola cars is inquiring for 100 automobile cars instead

THE ROXANNA PETROLEUM COMPANY, St. Louis, Mo., has ordered 50 insulated tank cars of 8,000 gal. capacity from the Standard Tank Car Company.

THE CHAMBLIN REFINING COMPANY, Enid, Okla., has ordered 500 tank cars of 8,000 gal. capacity with 40-ton trucks, from the Pennsylvania Tank Car Company.

THE WABASH, reported in the *Railway Age* of September 16 as inquiring for repairs to 500 box cars, 300 stock cars and 250 automobile cars, has decided to do its own repair work

THE CHICAGO, ROCK ISLAND & PACIFIC will soon issue inquiries for 500 box cars, 500 coal cars, 500 automobile cars, 250 flat cars, 250 ballast cars, 250 refrigerator cars, and 250 stock cars

THE BALTIMORE & OHIO, reported in the *Railway Age* of September 2 as inquiring for 1,000 steel hopper cars of 55 tons' capacity, has ordered this equipment from the American Car & Foundry Company.

THE CINCINNATI, INDIANAPOLIS & WESTERN was erroneously reported in the *Railway Age* of September 16 as having placed an order with the Pullman Company for 300 gondola cars. No contract for this equipment has been closed to date.

THE PITTSBURGH, SHAWMUT & NORTHERN, reported in the *Railway Age* of September 16 as inquiring for 200 stock cars of 30 tons' capacity and 50 box cars of 40 tons' capacity, is also inquiring for 200 stock cars of 40 tons' capacity, 50 box cars of 50 tons' capacity and from 150 to 200 stock car bodies.

THE INDIAN STATE RAILWAYS are inquiring through the car builders for a total of about 3,100 cars to include 1,875 covered goods wagons, 500 open goods wagons, 100 bogie wagons, 35 bogie rail and timber, all of broad gage, 585 four-wheel covered goods wagons and 25 bogie rail and timber of meter gage.

ST. LOUIS-SAN FRANCISCO, reported in the *Railway Age* of September 9 as inquiring for 1,500 steel frame, double hopper cars of 55 tons' capacity, 1,500 single sheathed box cars of 40 tons' capacity and 300 stock cars of 40 tons' capacity, has ordered 1,000 hopper cars from the Chickasaw Ship Building Company and 500 hopper cars from the Pullman Company; the 1,200 box cars from the American Car & Foundry Company and 300 stock cars from the Mount Vernon Car Manufacturing Company.

Passenger Cars

THE CHICAGO, ROCK ISLAND & PACIFIC will soon issue inquiries for 50 all-steel suburban passenger cars.

THE CHICAGO & EASTERN ILLINOIS, reported in the *Railway Age* of September 9 as inquiring for 17 steel baggage cars, 70 ft. long, has ordered this equipment from the Pullman Company.

Iron and Steel

THE ST. LOUIS-SAN FRANCISCO is inquiring for 600 tons of structural steel.

THE MISSOURI PACIFIC has ordered 275 tons of structural steel from the American Bridge Company

THE LONG ISLAND will receive bids until 10 a. m. September 30 for 8,000 gross tons of open-hearth steel rail.

THE UNION PACIFIC has placed an order with the American Bridge Company for 2,735 tons of structural steel.

THE MISSOURI PACIFIC has asked prices on its 1923 requirements for steel rails, the tonnage not being specified.

THE CHICAGO & EASTERN ILLINOIS is expected to place contract with the Illinois Steel Company for 5,000 tons of new rail.

THE CHICAGO, BURLINGTON & QUINCY has placed an order with the American Bridge Company for 1,056 tons of structural steel for miscellaneous bridge work.

A MAJORITY OF THE WESTERN RAILROADS are negotiating direct with the steel companies for new rail to place contracts before the price increase becomes effective

THE PENNSYLVANIA RAILROAD has ordered from the Phoenix Bridge Company 1,000 tons of bridge steel for five bridges to be built over street crossings at Elizabeth, N. J

THE NEW YORK CENTRAL will receive bids until 12 o'clock noon September 25, for the requirements of the New York Central and subsidiary lines of not to exceed 200,000 tons of open-hearth steel rail, ranging from 120 lb. to 80 lb. sections with the necessary angle bars for delivery not later than July 1, 1923

Track Specialties

THE WABASH is inquiring for 370 kegs of track bolts.

THE MOBILE & OHIO is inquiring for 900 kegs of track spikes.

THE ST. LOUIS SOUTHWESTERN is inquiring for 500 kegs of track bolts and 300 kegs of track spikes.

Machinery and Tools

THE CENTRAL OF GEORGIA is inquiring for 15 miscellaneous type machines.

THE CHICAGO & NORTH WESTERN has ordered a coal handling gantry crane with a 1½ yd. bucket from the Milwaukee Electric Crane & Manufacturing Company. The crane will be leased to the Armour Grain Company for use at its grain elevator in South Chicago.

THE MISSOURI, KANSAS & TEXAS is inquiring for 37 miscellaneous type lathes, six planers, six radial drills, six crank shapers, five milling machines, three grinders and two boring mills, besides shears, bulldozers, boxlathes, bolt cutters, pipe threaders and other miscellaneous equipment. The machines are to be motor driven with push button control.

Miscellaneous

THE BROWN HOISTING MACHINERY COMPANY, Cleveland, Ohio, is inquiring for 107 trucks.

THE NEW YORK CENTRAL LINES WEST will receive bids until October 2 for its requirements until January 1, 1923, for fuel oil, gasoline, kerosene, lubricating oil, grease and tallow candles.

THE GOVERNMENT OF THE NETHERLANDS, Colonial Branch, New York, is asking for bids on 2,000 axles and 400 wheels for service on passenger and freight cars of the State Railways in the Dutch East Indies.

THE GOVERNMENT OF THE NETHERLANDS, Colonial Branch, New York City, has bought from the American Copper Products Company, New York, 900,000 lb. of copper cable for a 70,000-volt transmission line to be erected in Java in connection with the electrification of the Java State Railways. An order has also been given for high tension insulators of the link type Hewlitt insulator to R. Thomas & Son, East Liverpool, Iowa.

Signaling

THE GOVERNMENT OF JAPAN, through the Takata Exporting Company has ordered from the General Railway Signal Company 200 Model 2 A semaphore signals and 70 light signals. The order includes all auxiliary equipment such as relays, transformers, etc., required for installation. Seventy color light signals are to be shipped to Kobe and 200 upper left-hand quadrants to Yokohama. This order follows one placed last year for 370 automatic signals

Supply Trade News

H. C. Thomas, general superintendent of the **United Alloy Steel Corporation**, Canton, Ohio, has been promoted to assistant general manager.

The **Chicago Flexible Shaft Company**, Chicago, Ill., has opened a new district sales office at 305 Merchants Bank building, Indianapolis, Ind., in charge of **F. W. Odemar**.

The merger of the **Bethlehem Steel Corporation** and the **Lackawanna Steel Company** was ratified at recent meetings of the stockholders of these companies. Announcement of this merger was made in the *Railway Age* of May 20, page 1196.

C. T. Pratt, treasurer of the **Brown Hoisting Machinery Company**, Cleveland, Ohio, has resigned and **A. C. Brown**, president of that company, has assumed the additional duties of treasurer. **J. F. Pierce** has resigned as auditor and director of the same company. This latter vacancy probably will not be filled for the present.

The **Walworth Realty Company**, a subsidiary of the **Walworth Manufacturing Company**, Boston, Mass., manufacturers of pipe fittings, piping tools, etc., has awarded to **Dwight P. Robinson & Co., Inc.**, New York, a contract for the design and construction of a warehouse, pipe shop and garage to be located at Jackson avenue, Long Island City, N. Y.

H. C. Mull, in charge of railway sales for both the Reliance Manufacturing Company, Chicago, and the Warren Tool & Forge Company, Warren, Ohio, with headquarters at Chicago, has resigned from the former and will hereafter represent only the latter, with headquarters at Warren, Ohio.

Russell, Holbrook & Henderson, 30 Church street, New York, has been appointed sales representatives for the territory in and near New York City of the **Oilgear Company**, Milwaukee, Wis. The **Cadillac Machinery Company**, Detroit, Mich., will handle Oilgear products in the state of Michigan and the **R. E. Ellis Engineering Company**, 621 Washington boulevard, Chicago, will represent the Oilgear Company in Chicago and the surrounding territory.

John S. Ruble, who recently resigned as vice-president of the Austin Company, has been elected vice-president in charge of all construction of the **H. K. Ferguson Company**, engineers and builders, Cleveland, Ohio. Mr. Ruble was graduated in mechanical engineering from Pennsylvania State College in 1901. He was then engaged for four years in dock, ore storage and unloading equipment design and construction with Hoover & Mason, contracting engineers. He subsequently served for eight years as an engineer with the U. S. Steel Corporation at various places, then as construction engineer for the Tennessee Coal, Iron & Railroad Company, at Birmingham, Ala.

The stockholders of the **New York Air Brake Company**, New York City, at a recent meeting voted to amend the certificate of incorporation so as to provide that the authorized and outstanding 100,000 shares of common capital stock of the par value of $100 each be changed into 200,000 shares of common stock without par value, so that each stockholder in the company will hold two shares of common stock without par value for every share of capital stock of par value of $100 heretofore held. The certificate of incorporation was further amended so as to create an issue of class A stock of an authorized number of shares of 100,000 and the board of directors unanimously resolved that this class A stock be offered to the stockholders of record September 28, 1922 pro rata for subscription at $50 per share.

Obituary

J. M. Potter, president of the Northwestern Malleable Iron Company, Milwaukee, Wis., died on September 6, at the age of 64 years. Mr. Potter had been connected with the above company for 22 years.

Frederick W. Cooke, formerly general manager of the Cooke Locomotive Works whose death on August 30 at his summer home at Quogue, Long Island, was noted in the *Railway Age* of September 9, was born on July 10, 1860, at Paterson, N. J., and graduated from Stevens Institute in 1882. He served as vice-president and general manager of the Cooke Works from 1883 until the plant was sold in 1901 to the American Locomotive Company and then was general manager until his resignation in 1912. The Cooke Works originated as the Charles Danforth Company, manufacturer of cotton machinery at Paterson, N. J. In 1852 John Cooke became associated with these interests and a new company was organized in July of that year under the name of Danforth, Cooke & Company, Paterson, N. J., to build machinery and locomotives; and it continued under this name until 1865 when the name was changed to the Danforth Locomotive & Machine Company, of which John Cooke was the head and active manager of the locomotive branch. The business soon outgrew the machine interest and the latter was given up entirely some years later. John Cooke died in February, 1882, and was succeeded by his brother, James Cooke, formerly superintendent. The latter died on August 2, 1883, shortly after which date the stock control passed into the hands of the Cookes and the corporate name was changed to the Cooke Locomotive & Machine Company with John S. Cooke, president, and Frederick W. Cooke, vice-president and general manager. The business increased and work was started in 1888 on new works on the present site. In 1901 the works were sold to the American Locomotive Company and became the Cooke Works of that company. Mr. Cooke continued as general manager until his retirement in 1912. During the late war Frederick W. Cooke took an active part in the raising of funds for the various war reliefs.

Frederick W. Cooke

Trade Publications

BEARING METALS.—The A. W. Cadman Manufacturing Company, Pittsburgh, Pa., has recently issued engineering bulletins M-1 and M-2. The first bulletin deals with the properties of bearing metals, especially those alloys known as Cadman metals. The second contains miscellaneous technical information pertaining to bearings and bearing metals, discussing such questions as the theory of bearing metals, friction in bearings and permissible bearing pressures.

THE PENNSYLVANIA proposes during the next nine weeks to put forth a "giant effort" to do more than its share in moving bituminous coal from mines to Cleveland, Ashtabula, and Erie, for the upper lake territory. The Northwest has been taking an average of 22,000,000 tons of lake cargo bituminous coal annually. The season for the lake boats ends about November 15. The Northwest is estimated to be short more than 10,000,000 tons in lake coal. It is calculated that the total lake cargo coal that the railroads can move to lake ports will run about 1,000,000 tons a week. This amount is not yet in sight for a weekly haul. The Pennsylvania has ordinarily hauled 21 per cent of this freight. The Bedford yard, 12 miles out of Cleveland, used exclusively for bituminous coal and ore trains, has been reopened. The Pennsylvania has coal-loading machines at Cleveland (3), at Ashtabula (2) and at Erie (2), seven in all. The record for speed at the Cleveland docks is 40 cars in an hour. Under an arrangement just put into effect bituminous coal reaching lake ports will be pooled, assuring faster boat loadings and saving in time probably 20 per cent.

Railway Construction

ATCHISON, TOPEKA & SANTA FE.—The Interstate Commerce Commission has issued a certificate authorizing the construction of two branch lines in Osage County, Okla., one beginning at a point 17 miles north of Burbank and extending in a northeasterly direction through De Noya, 6.24 miles, and the second beginning at De Noya Junction on the above branch and extending in an easterly direction 2.97 miles. Construction of the two lines was begun on February 4, 1922, but at the time it was intended to operate them as spur tracks.

ATCHISON, TOPEKA & SANTA FE.—This company has awarded a contract for a machine shop at Waynoka, Okla., to E. Ware, El Paso, Tex., and a contract for sash work to the Truscon Steel Company, Detroit, Mich.

CHICAGO & WESTERN INDIANA.—This road is working on plans for a new passenger terminal on its present location at Chicago for use by the roads using the present terminal with facilities sufficient to accommodate also the roads using the LaSalle and Grand Central stations.

CHICAGO, BURLINGTON & QUINCY.—This company will close bids on September 25 for the construction of a passenger station 24 ft. by 100 ft. at Clarence, Mo., and will close bids on September 29 for a 50-ton coaling station at Clarinda, Iowa.

CHICAGO UNION STATION.—This company will receive bids for the widening of Canal street, Chicago, from Harrison street 225 feet north.

FLORIDA EAST COAST.—This company has applied to the Interstate Commerce Commission for a certificate authorizing an extension from Okeechobee to Miami, Fla., 125 miles. The line is to develop the Everglades south and east of Lake Okeechobee and open a territory practically devoid of any means of transportation. The extension would also afford a separate through line inland from Miami to Smyrna, 240 miles, which would serve as a second main line.

ILLINOIS CENTRAL.—This company will construct additional storage tracks at Manchester, Iowa, and passing tracks at Gilman, Ill., Weedman and Guthrie, and at one other place.

ILLINOIS CENTRAL.—This company will improve its water facilities at Peosta, Ia., at a cost of $15,000; at Kinmundy, Ill., $20,000; at Pana, $9,000; at Ramsey, $21,000; at Memphis, Tenn., $27,000, and at Champaign, Ill., $18,000. This company will also improve its coal handling facilities at McComb, Miss., at a cost of $69,000, and its air testing facilities at Dubuque, Ia., at a cost of $10,000. Passing tracks will be constructed at Dowell, Ill., at a cost of $20,000; Lenzberg, $11,000, and Marion, $13,000. This company will also extend its passing and yard tracks at Marissa, Ill., at a cost of $76,000, and passing and storage tracks will be constructed at Cambria, Ill., at a cost of $25,000.

MISSOURI PACIFIC.—This company is receiving bids for the construction of a car repair shop 120 ft. by 510 ft. at Kansas City, Mo.

OREGON, CALIFORNIA & EASTERN.—This company, which operates a railroad between Klamath Falls, Ore., and Hildebrand, a distance of 24 miles, will within the next few months, extend its line from the latter point northward to Squaw Flat, a distance of eight miles, while during the first part of 1923 it is proposed to extend the line six miles further to Sprague river. This same company is also doing some work on what is known as the Bonanza branch, a line extending eastward from Dairy to Bonanza, a distance of seven miles. Part of the grading has been finished and a small amount of track laid and it is expected to complete this line early in 1923. The construction of another branch line known as the Swan Valley branch has also been undertaken. This will extend from a point 15 miles northeast of Klamath Falls into the Swan Valley region. Two miles of this branch is already completed and it is intended to extend it several miles further. The O. C. & E. Company contemplates eventually extending northward to Bend, Ore., where it will connect with the Oregon-Washington Railroad & Navigation Company and the Oregon Trunk Line. The Klamath Falls-Bend line will be 175 miles in length. From a point 20 miles south of Bend a branch of the O. C. & E. will extend eastward to Crane, a terminus of a branch line of the Union Pacific. The line from Silver Lake to Lakeview, a distance of 80 miles, will connect at the latter point with the Nevada-California-Oregon, while at Klamath Falls a direct connection is made with the Southern Pacific. All the surveys for this system, which in total, will comprise 423 miles of line, have been completed and a large part of the right-of-way obtained. The cost of the entire project will be $10,000,000, much of which has been raised locally. In anticipation of this construction, numerous lumbering, irrigation and other enterprises have been inaugurated, some of them 75 miles ahead of the track.

LAKE SUPERIOR & ISHPEMING.—This company will construct a steel repair shop, 69 ft. by 301 ft., a paint and coach shop, 48 ft. by 100 ft., and a woodmill, 47 ft. by 100 ft., at Marquette, Mich., the total cost of which is estimated at $250,000.

SOUTHERN PACIFIC.—This company will construct a new five span steel girder bridge approximately 929 ft. long across the Rio Grande river at Eagle Pass, to cost about $225,000. The bridge will be owned jointly by the Mexican National and the Southern Pacific.

UNION PACIFIC.—This company is receiving bids for the extension and repairing of its passenger station at Kearney, Neb.

UNION PACIFIC.—This company, in conjunction with the city of Denver, Colo., has awarded contracts for the Broadway viaduct of steel truss and girder spans having a total length, including embankment and reinforced concrete approaches of 2,257 ft. To C. S. Lambie & Company, Denver, was awarded the contract for the concrete substructure of the viaduct proper and to D. Munro, of Kansas City, Kan., for the reinforced concrete work in the approaches. The steel superstructure will be furnished by the American Bridge Company and erected by the Kansas City Bridge Company. This company has also awarded a contract for an addition to its passenger station at Cheyenne, Wyo., to H. W. Baum Company, Salt Lake City, Utah.

THE ST. LOUIS-SAN FRANCISCO moved 730 cars of peaches from southeast Missouri and northeast Arkansas orchards during the season which recently closed. Of the total, 476 cars were from the Fort Smith district; 222 cars from the Koshkonong, and Brandsville districts; 24 from the Springfield district, and eight from Oklahoma. This is considered one of the best seasons experienced by the growers of southeast Missouri.

LABOR UNION DISCIPLINE.—Too little public attention has been paid to certain acts of discipline worthy of praise for organized labor. There was lately published a list of a dozen trainmen who were punished by their union for the abandonment of passenger trains in Arizona and California. All of them lost their union cards, although a majority of them were union officials. This action does credit alike to the character and the intelligence of the train-service brotherhoods. It is in line with their previous refusal to break their service contracts for the purpose of striking in sympathy with the shopmen, and with the threat to revoke the charter of the unions whose strike contributed to the receivership of the Chicago & Alton Railroad. The train-service brotherhoods are entitled to recognition of the fact that their conduct in these cases supports their character as a superior sort of union. The brotherhoods abide both by their own laws and by the laws of the country, and within the past few days their highest officials have rebuked members who have rashly broken contracts of employment for the purpose of striking in a manner "unlawful," according to brotherhood rules. These facts gain significance in contrast with the course of the unions affiliated with the American Federation of Labor. The difference in the conduct of the two sorts of unions shows why the train services have resisted all overtures from the Federation to join forces, and gives value to the independent action of the train services. The mechanics employed by the railways are in industrial competition with workers in private employ. Either can exchange their duties at will, and their pay should be approximately equal, all conditions considered. The train-service brotherhoods are real railway workers, and the country is fortunate that they are so conservative in their policies.—*New York Times.*

Railway Financial News

BANGOR & AROOSTOOK.—*Preferred Stock Offered.*—An issue of $3,480,000 7 per cent cumulative preferred stock offered by Brown Brothers & Co. and Hayden, Stone & Co., at 95 and accrued dividend, to yield 7.36 per cent, has been over-subscribed.

CHICAGO, INDIANAPOLIS & LOUISVILLE.—*Equipment Trust Authorized.*—This company has been authorized by the Interstate Commerce Commission to assume obligation and liability in respect of $725,000 of equipment trust certificates.

CLEVELAND, CINCINNATI, CHICAGO & ST. LOUIS.—*Stock Exchange Offer Extended.*—See New York Central.

DELAWARE, LACKAWANNA & WESTERN.—*Annual Report.*—The annual report issued this week shows the following income account for the year ended December 31, 1921, compared with the combined corporate and federal account for the previous year:

	1921	1920
Total revenues	$85,977,815	$83,340,062
Total expenses	67,872,058	73,898,430
Net revenue from operation	18,105,757	9,441,632
Tax accruals	5,312,066	4,539,785
Operating income	12,781,395	4,899,037
Add additional income	13,478,144	19,382,212
Gross income	26,259,539	24,281,249
Deductions from income	7,101,136	9,622,805
Net income for year	19,158,403	*14,658,444
Less dividends declared	13,510,576	8,444,110
Balance, surplus	5,647,827	6,214,334

*To afford, as far as possible, a correct basis for comparison, the operating results of the U. S. R. A. for the months of January and February, 1920, together with overlapping items relating thereto, are included with the operating results of the company for the ten months of 1920, resulting in an increase in this item of $983,334.81 over the actual net income of the company, as shown on page 6 of the annual report for the year 1920.

DENVER & RIO GRANDE WESTERN.—*Expenditures for Improvements.*—A correspondent at Denver, Colo., states that the receiver of this road is asking permission to spend $23,000,000 for improvements during the next three years.

CINCINNATI, NEW ORLEANS & TEXAS PACIFIC.—*Annual Report.*—The annual report issued this week shows the following income account for the year ended December 31, 1921:

	1921	*1920
Operating revenues	$17,170,446	
Operating expenses	14,789,237	
Net revenue from operations	2,381,209	
Taxes	643,547	
Operating income	1,942,444	$4,026,759
Total non-operating income	276,869	134,359
Gross income	2,219,314	4,161,117
Rent for leased roads	1,324,205	1,218,954
Interest on equipment obligations	153,645	175,040
Total deductions	1,515,778	1,432,482
Total available income	703,535	2,728,635
Dividends of 5 per cent on preferred stock	122,670	122,670
Dividends of 12 per cent in 1921 and 13 per cent in 1920 on common stock	358,800	388,700
Additions and betterments charged to income		950,000
Balance carried to profit and loss	222,065	1,267,265

*Operating revenues and expenses are not comparable, the property having been operated by the U. S. R. A. during January and February, 1920.

CHICAGO, ROCK ISLAND & PACIFIC.—*Bonds Sold.*—Speyer & Co. and Harris, Forbes & Co. subject to the approval of the Interstate Commerce Commission, have sold an issue of $5,000,000 first and refunding mortgage 4 per cent gold bonds, due April 1, 1934.

GEORGIA SOUTHERN & FLORIDA.—*Annual Report.*—The income account for the year ended December 31, 1921, follows:

	1921	*1920
Operating revenues	$4,586,770	
Operating expenses	4,669,211	
Net revenue from operations	†82,141	
Taxes	206,313	
Operating income	†552,561	†$277,852
Total non-operating income	393,002	216,912
Gross income	†159,559	†60,940
Interest on funded debt	280,000	280,000
Total deductions from gross income	716,343	309,785
Deficit charged to profit and loss	†425,784	†370,725

*Operating revenues and expenses are not comparable, the property having been operated by the U. S. R. A. during January and February, 1920. †Deficit.

ILLINOIS CENTRAL.—*Asks Authority for a New Line.*—This company, the Chicago, St. Louis & New Orleans and the Kentucky Midland have filed a joint application with the Interstate Commerce Commission for orders authorizing the purchase of the Kentucky Midland by the Chicago, St. Louis & New Orleans for $255,000 and for the construction of a new line connecting with it and to be operated in connection with it by the Illinois Central under lease. The line of the Kentucky Midland extends from Central City to a point near Earles, Ky., 11 miles, and it is proposed to build an extension from Earles to a point 5 miles north of Dawson Springs, Ky.

Equipment Trust Notes.—Kuhn, Loeb & Co. have placed privately an issue of $6,645,000 Illinois Central 1-15-year 4½ per cent equipment trust notes, at price to yield about 4.95 per cent. These are the first equipment trust notes issued since the war to bear 4½ per cent interest.

LACKAWANNA OF NEW JERSEY.—*Stock Offered.*—Joseph Walker & Sons, of New York, are offering $200,000 4 per cent capital stock of this company at a price to yield nearly 5 per cent. The total authorized capital stock amounts to $11,000,000, of which $10,750,000 is outstanding. The road is leased in perpetuity to the Delaware, Lackawanna & Western at a rental of 4 per cent per annum on capital stock.

NEW YORK, CHICAGO & ST. LOUIS.—*Equipment Trusts Sold.*—The Guaranty Company of New York, the Union Trust Company and Hayden, Miller & Co. of Cleveland, have sold at 100 and accrued dividend, $3,150,000 equipment trust 5 per cent certificates. They are dated September 1, 1922, and mature $225,000 each September 1, 1924 to 1937, inclusive.

NEW YORK CENTRAL.—*Exchange Offer Extended.*—The offer made to Cleveland, Cincinnati, Chicago & St. Louis stockholders to exchange New York Central stock for Big Four preferred and common on the basis of par for par for the preferred and 80 shares of New York Central for 100 shares of Big Four common has been extended until November 1. This extension offer was on condition, however, that holders surrendering Big Four common for exchange after September 28 should pay $1 for each share of common stock thus exchanged in order to equalize the position of the common stockholders exchanging before and after that date.

NORTHERN PACIFIC.—*Dividend Declared.*—The directors have declared the regular quarterly dividend of $1.25 a share, payable November 1 to holders of record October 2. This is the same dividend as was declared last March when the rate was reduced from $1.75 to $1.25 a share quarterly.

READING COMPANY.—*Listing.*—The New York Stock Exchange has authorized the listing of certificates of deposit of J. P. Morgan & Co. and Drexel & Co. for the general mortgage 4 per cent gold bonds, due 1997, of the Reading Company, and the Philadelphia & Reading Coal & Iron Company.

SEABOARD AIR LINE.—*Equipment Trusts Offered.*—Ladenburg, Thalman & Co., Redmond & Co., Kissel, Kinnicutt & Co., and Freeman & Co. are offering a new issue of $2,560,000 5½ per cent equipment trust certificates, series U due semi-annually from 1923 to 1932 inclusive, at prices to yield from 5 to 5.75 per cent, according to maturity. The certificates are to be issued in part payment for standard equipment.

TERMINAL RAILROAD ASSOCIATION OF ST. LOUIS.—*Authentication of Bonds Authorized.*—The Interstate Commerce Commission has authorized this company to procure authentication and delivery of $2,499,000 of general mortgage 4 per cent gold bonds to be held in the treasury.

Dividends Declared

Cleveland, Cincinnati, Chicago & St. Louis.—Common, 2 per cent, payable November 1 to holders of record September 29; preferred, 1¼ per cent, payable October 20 to holders of record September 29.

Kansas City Southern.—Preferred, 1 per cent, quarterly, payable October 16 to holders of record September 30.

Minneapolis, St. Paul & Sault Ste. Marie (Leased Lines).—$2.00, semi-annually, payable October 1 to holders of record September 20.

New York Central.—1¼ per cent, quarterly, payable November 1 to holders of record September 29.

Trend of Railway Stock and Bond Prices

	Sept. 19	Last Week	Last Year
Average price of 20 representative railway stocks	73.45	74.16	56.24
Average price of 20 representative railway bonds	80.80	90.37	76.47

Railway Officers

Executive

W. H. Finley, president of the Chicago & North Western with headquarters at Chicago, has been elected also president of the Chicago, St. Paul, Minneapolis & Omaha.

J. M. Schweizer has been appointed assistant to the vice-president of the Cuba Railroad with headquarters at Camaguey, Cuba, succeeding H. W. Lillengren, resigned.

J. Fred Townsend, of Pittsburgh, has been elected vice-president of the Lake Terminal Railroad, the McKeesport Connecting Railroad and the Benwood & Wheeling Connecting Railway.

A. B. Atwater, assistant to the president of the Grand Trunk, lines west of the Detroit and St. Clair rivers, with headquarters at Detroit, Mich., has retired from active service. Mr. Atwater was born in November, 1845, at Sheffield, O. He entered railway service in 1864, as a telegraph operator of the Cleveland & Erie. From October, 1865, to June, 1885, he was consecutively: in engineering service on the Jamestown division of the Cleveland & Erie; resident engineer on construction of the Canadian Southern; assistant engineer of the Port Dover & Lake Huron; general superintendent of the Georgian Bay & Lake Huron division of the Grand Trunk and chief engineer of the Chicago & Grand Trunk. In June, 1885, he was promoted to superintendent of the Grand Trunk lines west of the Detroit river, which position he held until July 12, 1898, when he became assistant general superintendent of the Michigan Central. He held this position until July, 1902, when he was made assistant to the president of the Grand Trunk, lines west of the Detroit and St. Clair rivers, the position he was holding at his retirement.

Financial, Legal and Accounting

H. A. Toland has been appointed auditor of the Union Pacific at Omaha, Neb., succeeding H. J. Stirling.

E. L. Parker has been appointed auditor of freight accounts of the Seaboard Air Line succeeding B. B. McCaa, deceased.

J. R. Turney, assistant general solicitor of the St. Louis Southwestern, with headquarters at St. Louis, Mo., has been appointed acting general solicitor, with the same headquarters, succeeding D. Upthegrove, deceased.

C. H. Bender, assistant treasurer and paymaster of the Minneapolis, St. Paul & Sault Ste. Marie, with headquarters at Minneapolis, Minn., has been promoted to treasurer, with the same headquarters, and **W. R. Harley,** assistant secretary, with headquarters at Minneapolis, Minn., has been promoted to secretary, with the same headquarters. **J. E. Olson** has been appointed assistant treasurer and assistant secretary, with headquarters at Minneapolis, Minn.

Operating

T. F. Conklin has been appointed general trainmaster of the Michigan Central, with headquarters at Detroit, Mich.

P. L. Randall, assistant to the superintendent of car service of the Pullman Company, has been appointed acting superintendent of car service succeeding D. J. Hinchey, resigned.

J. P. Johnson, assistant superintendent of the Canadian National, with headquarters at Prince Albert, Sask., has been promoted to superintendent of the Prince Albert division, with the same headquarters.

F. C. Fox, general manager of the Atchison, Topeka & Santa Fe, Eastern Lines, with headquarters at Topeka, Kan., who has been on a six months' leave of absence, resumes his duties October 1, succeeding **W. K. Etter,** acting general manager who resumes his duties as assistant to the vice-president at Chicago, succeeding **G. W. Lupton,** who resumes his duties as superintendent of terminals at San Francisco, Cal.

C. H. Gaffeney, whose appointment as superintendent of telegraph of the Central of New Jersey, with headquarters at Jersey City, was announced in the *Railway Age* of September 2, page 450, was born on July 27, 1867, at Lawrenceville, Mercer county, N. J. He was educated in the public schools at Lawrenceville and studied also with the International Correspondence School, Scranton, Pa., and Cooper Institute, New York City and was graduated from the Trenton (N. J.) Normal School. Mr. Gaffeney entered railway service in 1883 with the Pennsylvania as a telegraph operator and served with that company in various capacities, including that of train dispatcher. After leaving that company, he entered the service of John Hoey, president of the Adams Express Company, as private telegraph operator. After Mr. Hoey's death, he worked in various clerical capacities with this company and thereafter entered the employ of the National Service Docks Railway as assistant dispatcher and operator, which position he resigned in 1900 to become chief clerk to the supervisor of signals of the Central of New Jersey. Two years later he was appointed chief clerk to the superintendent of telegraph and remained continuously in that position until the time of his recent promotion.

C. H. Gaffeney

Traffic

G. W. Neudling has been appointed general agent of the Kansas, Oklahoma & Gulf, with headquarters at St. Louis, Mo.

F. G. Brown has been appointed commercial freight agent of the Western Maryland, with headquarters at Kansas City, Mo.

D. R. Peck has been appointed district freight agent of the New Orleans Great Northern, with headquarters at Chicago, Ill.

L. S. Wickes has been appointed assistant general freight agent of the Oklahoma Southwestern, with headquarters at Oklahoma City, Okla.

F. D. Wilson, traveling freight and passenger agent of the Union Pacific, with headquarters at Reno, Nev., has been appointed general agent, with the same headquarters.

H. W. Brodie, general passenger agent of the Canadian Pacific with headquarters at Vancouver, has been appointed assistant passenger traffic manager with headquarters at Montreal. **W. H. Snell,** general passenger agent at Montreal, succeeds Mr. Brodie at Vancouver. **George A. Walton,** general passenger agent at Winnipeg, has been transferred in a similar capacity to Montreal. **R. C. McNellie,** assistant passenger agent at Winnipeg, has been promoted to general passenger agent with the same headquarters. **N. R. DesBrisay,** district passenger agent with headquarters at St. John, N. B., has been appointed assistant general passenger agent with headquarters at Winnipeg. **G. P. Burpee,** general agent at Cleveland, Ohio, has been appointed district passenger agent at St. John, N. B. **Walter Maughan,** assistant general passenger agent with headquarters at Montreal, has been appointed assistant to the general passenger traffic manager

with the same headquarters. **W. B. Howard**, district passenger agent at Toronto, has been appointed assistant general passenger agent with headquarters at Montreal. **W. Fulton**, assistant district passenger agent at Toronto, has been promoted to district passenger agent. **W. Horder**, chief clerk in the general passenger department at Montreal, has been promoted to assistant district passenger agent at Toronto.

Louis R. Jones, whose appointment as assistant general freight agent of the Philadelphia & Reading was announced in the *Railway Age* of September 9, page 491, was born on February 22, 1882, at Haddonfield, N. J., and attended public school in that city from 1888 to 1901. On July 29, 1901, he entered the service of the Philadelphia & Reading as a clerk in the comptroller's office, Reading Terminal, Philadelphia. In connection with this position he also served in the offices of the auditor of freight traffic, auditor of traffic receipts and auditor of disbursements. On May 1, 1907, he was transferred to the freight traffic department as tariff and rate clerk, holding that position until February 28, 1920. He was then promoted to chief clerk of the freight traffic department, which position he held until the time of his recent promotion.

Mechanical

J. J. Hanlin has been appointed assistant superintendent of motive power of the Seaboard Air Line, with headquarters at Portsmouth, Va., effective September 19.

Robert Collett has been appointed superintendent of fuel and locomotive performance of the New York Central with headquarters at New York, effective September 1.

B. F. Bardo has been appointed superintendent of electric transmission on the New Haven in charge of operation and maintenance of the wire plant between New York and Cedar Hill with headquarters at Cos Cob, Conn., reporting to H. A. Shepard, general superintendent of electric transmission and communication. Mr. Bardo was born in Wilkes Barre, Pa., December 16, 1889. He was educated in the Morris High School, New York City, and Cornell University, being graduated from the latter institution with a degree of mechanical engineer in 1913. After graduation he served for a little more than a year in the testing department of the General Electric Company at Schenectady, N. Y., and at Pittsfield, Mass. In August, 1914, he entered the services of the New York, New Haven & Hartford in the office of the superintendent of power. In October, 1915, Mr. Bardo was appointed inspector of power plants and in November, 1917, was promoted to engineer of power plants, serving in that capacity until his present appointment.

B. F. Bardo

Engineering, Maintenance of Way and Signaling

S. J. Stinson, signal maintainer of the Canadian National, with headquarters at Saskatoon, Sask., has been appointed acting signal supervisor of the Saskatchewan district, with the same headquarters, succeeding R. G. Gardiner, transferred.

T. L. Doyle, assistant division engineer of the Mackinaw division of the Pennsylvania, with headquarters at Grand Rapids, Mich., has been promoted to assistant to the chief engineer of the Pennsylvania-Detroit Railroad, with headquarters at Detroit, Mich. **R. Stephens**, an assistant in the engineering department of the Mackinaw division, with headquarters at Grand Rapids, Mich., has been appointed acting assistant division engineer of that division, with the same headquarters, succeeding Mr. Doyle.

Obituary

C. A. Benscoter, assistant general passenger agent of the Southern with headquarters at Knoxville, Tenn., died September 19.

J. R. Dickinson, assistant general solicitor of the Chicago, Milwaukee & St. Paul, with headquarters at Chicago, Ill., died in that city on September 17, after an extended illness.

W. H. Richardson, general passenger agent of the Chicago & Eastern Illinois, with headquarters at Chicago, whose death on September 4 was reported in the *Railway Age* of September 9 was born on January 25, 1862, at Bloomington, Illinois. He entered railway service in 1880 as a stenographer to the division superintendent of the Chicago & North Western at Baraboo, Wisconsin. In 1882, he left this company to enter the employment of the Chicago & Eastern Illinois as a stenographer. Six years later he was promoted to rate clerk and remained in this capacity until 1895, when he was promoted to chief clerk in the passenger traffic department. In 1900 he was promoted to general passenger agent which position he held at the time of his death.

W. H. Richardson

Charles M. Carter, assistant treasurer of the Chicago, Burlington & Quincy, with headquarters at St. Joseph, Mo., died on September 1. Mr. Carter was born on September 22, 1852, at Cambridge, Mass. He entered railway service on August 1, 1876, as a clerk in the assistant treasurer's office of the Burlington & Missouri River, at Omaha, Neb. From March 1, 1877, to August 1, 1880, he was assistant treasurer of the Chicago, Clinton, Dubuque & Minnesota at Dubuque, Ia. From August 1, 1880, to January 1, 1885, he was assistant treasurer and auditor of the Kansas City, St. Joseph & Council Bluffs at St. Joseph, Mo., and on August 1, 1884, he was also acting auditor of the Hannibal & St. Joseph. He was appointed assistant auditor of these roads on January 1, 1885, which position he held until May 1, 1885, when he was promoted to auditor. He was also auditor of the St. Louis, Keokuk & Northwestern and the Chicago, Burlington & Kansas City from July 1, 1891, to February 1, 1903. He was appointed assistant treasurer of the Chicago, Burlington & Quincy, lines east of the Missouri river on February 1, 1903, his jurisdiction later being extended over the system, which position he held to the time of his death.

Railway Age

The Table of Contents Will Be Found on Page 5 of the Advertising Section

As an average for every 100 cars that are moving, loaded or empty, there are 119 being loaded, 119 being unloaded, 164 on repair tracks, and 680 standing in yards. The last figure deserves the careful attention of railway operating officers. Millions will be spent to get cars in condition during the next few months, but if the time in yards could be reduced one-fourth, it would be equivalent to putting all the bad-order cars back in service. Is there any reason why the average time cars spend in yards on each trip cannot be reduced from 11 days to 8 days?

An Opportunity for Saving Cars

Telegraph and telephone facilities have not kept pace with increases in track capacity and improvements in motive power on not a few railroads. Too often train delays due to lack of wires or modern telephone equipment are considered inevitable. As an illustration, on one important small road which is considered to be in good financial condition, as evidenced by extensive improvements in track and power, the communication system is inadequate. The superintendent of telegraph of this road has long desired to discard considerable of the old equipment, install a new telephone system and make many improvements in the telegraph but he has instructions to spend no money as long as the business can possibly be handled without extensive improvements or replacements. As a result of this policy this road will suffer serious delays from its obsolete communication system during the heavy business now coming. The regrettable feature is that the road may struggle through the traffic congestion blind to the small defect that is causing trouble. With the existing pole lines, new instruments, combined circuits, or new wires can be installed in a short period and at a small cost compared with the benefits. Considering this condition it might be well for other roads to check up the capacity of their communication facilities while there is yet time to correct conditions.

Antique Communication Facilities

The railroads have for some time been supplementing the activities of their own repair shops by sending to the car and locomotive builders large numbers of cars and locomotives for repair. The shopmen's strike has proved sufficiently serious to increase the volume of this outside repair work by the regular equipment builders. In addition it has also brought out a new development in the form of contracts for repair work which have been given by various railroads to concerns not previously experienced in car or locomotive repair work. Car repairs by concerns familiar with similar activity do not seem to present a difficult problem outside of that of so organizing the work as to keep down costs. Locomotive repairs, however, represent a problem not quite so simple of solution. The companies which are taking on this work are familiar in only a general way with locomotive repairs and it is naturally to be supposed that they may lack various kinds of equipment. They are presumably, on the other hand, being asked to repair only the smaller locomotives and it is very likely that in each of the shops which has taken a contract there is a fair proportion of the forces familiar with railway work. One industrial plant offered a locomotive repair contract found that it had 80 former railroad employees, including an ex-master mechanic. If these companies show that they can come through with results, however, the new development will be one of great importance. It will help those railways taking advantage of it out of a rather difficult situation and not the least element in its importance is that it means that a large number of concerns will have been enlisted in helping the railways fight the railway shopmen's strike. Apparently about as far as one can go at this time, however, is to say that the new development will be watched with interest.

Equipment Repair Work

It is characteristic of native merchants in the Far East always to set the first price of an article high above the anticipated selling price. Tourists and traders are compelled, therefore, either to haggle with the natives and drive hard bargains, or else pay more than goods are worth. In cases where both buyer and seller understand that the first price is unduly high, this haggling represents a needless waste of time and energy, the final selling price being beaten down to what will give the seller a reasonable profit and what he could just as well have stated in the first place. Continual efforts of a buyer to obtain unjust price concessions are equally ineffective, as this characteristic becomes known and first quotations are made correspondingly high. Haggling over material prices has little place in modern business and it is to be regretted that certain railroads follow this method in purchasing supplies and equipment, of which machine tools may be taken as an example. Of two powerful roads in the same general territory, one requests bids and absolutely holds the machine tool manufacturers to whatever prices are first quoted. The other road requests bids, plays the manufacturers against each other and exerts undue pressure to obtain price reductions. Knowing this fact from past experience, the manufacturers in self-defense quote a higher price to the second road than that at which they expect to sell and realize a reasonable profit. The repetition of bids and negotiations for price reduction represents a total loss of time and energy which fails in its purpose of getting the machinery for the second road at a reduced price.

Haggling Over Material Prices Does Not Pay

The article by A. S. Baldwin, which appeared in the *Railway Age* of September 2, affords an object lesson in the scientific study that should be given to the design of a large passenger station by those responsible for the development of plans for such projects. The intensive thought given this subject has resulted in the formulation of certain fundamental principles which, if we are to judge from the arrangement of some of the older stations, were not brought to light in the

Design of Large Passenger Stations

development of the earlier designs. One fundamental principle that now seems axiomatic is that the route of the passengers through the station must be so obvious and direct that an individual of average intelligence should have no occasion to ask directions from the time that he enters the street door until he shows his ticket to the attendant at the track gate. All the facilities which must serve him should come to his attention through visual indication in his movement from the street to the train or in reverse order. This condition is best fulfilled if the train gates can be placed on the same level as all the other station facilities, a requirement that is not always easily met. For this reason the plan of the headhouse for the new Chicago Union station, which is described on another page of this issue, will be found of interest to students of station design, where the requirement has been fulfilled in spite of adverse street levels. The ultimate solution is exceedingly favorable, since it has been found possible to place even the tracks on the same level with the rest of the station.

Make Hay While the Sun Shines

The shop strike cost the railroads a lot of money. This will be reflected in the monthly balance sheets by increases in operating expenses. Although the shop forces have now been restored almost to normal on most roads, through the agency of settlements or the perfection of new organizations, the strike will continue to exert an influence on operating expenses because of the large forces which must be employed to restore cars and locomotives to a normal condition of maintenance. This state of affairs will have an unfortunate influence on the operating ratio unless the expenses are curtailed in some other way and, as is usually the case under such circumstances, the maintenance of way department becomes the victim. This tendency is now being reflected on more than one road in the form of instructions to reduce the track forces and carry over bridge and building repair work. In the face of a capacity traffic that bids fair to continue well into the winter months and with the memory of the "holiday" seasons of 1917 and 1918 still well impressed on the minds of all railway officers, curtailment of maintenance of way at this time does not bear the stamp of good judgment. A stretch of soft track may tie up traffic just as effectively as a car with defective brake rigging, while the repair of a snow fence in a cut, some new switch ties on a ladder track or a better frost box on a water tank may exert as much influence on the car mileage as new flues in a locomotive boiler. This is no time to talk of retrenchment which affects operating facilities.

False Economy

A western railway has been considering the elimination of a limiting grade on one of its heavy traffic lines for more than fifteen years. Survey after survey has been made without locating an entirely satisfactory line. Finally, after many of the officers had given up the search and the project had been dormant for three or four years, one of the engineers, who was not willing to admit that no satisfactory line existed, secured authority to undertake a new study, as a result of which he found an entirely new line which was such a marked improvement over any other line that had been located in first cost and in operating characteristics that its construction has been authorized. This illustrates the economy of liberality in engineering investigations. In general, the railways make more detailed investigations of proposed improvements than other industries, but there are numerous instances where roads have spent unnecessarily large sums for work the cost of which a more detailed investigation would have reduced materially. The proportion which the cost of engineering investigation and design bears to the total expenditure is so small and the possibilities for economies in construction and in operation are so large that the fullest opportunity should be given to the engineering department to make adequate investigations before undertaking work of any magnitude. In fact, it would be economy for the management to insist that such investigations be made before approving plans and authorizing work and the efficiency of an engineering department should be determined by the character of its construction rather than by the size of its payroll.

Increase the Car Loading

It is trite to say that the number of cars required to move a given volume of traffic varies inversely with the amount loaded in each car. It is equally evident that a car shortage can be relieved or averted as directly by increasing the average load per car as by adding to the number of cars. The roads have ordered a large amount of new equipment in recent months, some of which is now being delivered. This new equipment will not, however, be sufficient to enable the roads to cope successfully with the traffic now confronting them and they must of necessity resort to the heavier loading of cars if a serious shortage is to be avoided. The loading of cars is controlled by the shipper, subject only to certain minimum restrictions, but the roads can do much to increase the loading by enlisting the co-operation of their patrons, as was evidenced during the fall of 1920 when the average car load rose to 31.2 tons in December, as compared with 27.7 tons in the same month of the previous year. This improvement effected an increase in the carrying capacity of the railroads equivalent to the addition of more than a quarter of a million cars, with no added investment and with an increase in operating expenses far less than that in revenues. The roads are now facing a serious shortage of cars, particularly those designed for the transportation of coal, grain and fruit. It is therefore important that the measures which were instrumental in bringing about the increase in loading in 1920 be again restored. Much can be done in this direction through campaigns directed and co-ordinated by system officers. The real work, however, devolves upon the local traffic and operating men who come in contact with the patrons and who can appeal to them for their support in using the equipment which is available in a way which will enable it to serve the largest possible number of shippers. These local officers can do no more effective work for their roads under the present conditions than by bringing the necessity for car conservation to the attention of their patrons and showing them how they can co-operate.

Finding and Using the Best Shop Methods

A railroad system with considerable mileage is obliged to operate engine terminals and repair shops for maintaining locomotives and cars at widely separated points. Under such circumstances there is a strong tendency for each shop, large or small, to be conducted as an independent unit. Master mechanics and foremen are so busy with routine work and matters that must receive prompt attention that they often have far too little time even to sit down and think out plans for improved methods of doing work in their own shops, to say nothing of familiarizing themselves with the methods used at other shops. On how many systems are the foremen familiar with the practices followed at other points on the same road which are only a few hundred miles

apart? At practically every shop there are foremen who, being not only good mechanics but possessed of considerable ingenuity, have devised excellent methods and devices for doing certain jobs. These may be simpler and more economical than the usual methods followed at other points, but the railroad does not obtain the full benefit of the improvement as long as it is used at one point only. Much benefit could be obtained by the inauguration of a well-planned and systematic arrangement for foremen periodically visiting other shops, supplemented by an occasional meeting of all foremen holding similar positions on the system. Another method which also has been productive of considerable good and is followed frequently by many industrial concerns operating a number of plants at different points, is to employ some one, frequently in the capacity of a general superintendent, whose duty it is to divide his time between the various plants, investigating the methods followed, harmonizing practices and advising changes in layout and equipment to reduce operating costs and increase output. Such a person, freed from the details of routine administration, has an opportunity to familiarize himself with machine tools and ways of doing work which is not possible to a man directly responsible for shop operation.

The Transportation Situation—Cause and Effect

THE FARMERS, business men and other people of the United States who have been responsible for the policy of government regulation and government operation of railroads which has prevailed during the last fifteen years are now beginning to have an experience which should be as instructive to them as it is to be feared it will be expensive. The railways in the week ended September 16, the last date for which we have the figures, moved 945,919 carloads of freight. The largest business ever handled by them in their history was in 1920. The number of carloads of freight moved in the week mentioned was only 3½ per cent less than in the corresponding week of 1920, and only 6 per cent less than the largest number of carloads ever moved in any week in history.

In spite of the remarkable transportation results being obtained under adverse conditions, the railroads for the week ended September 8 reported for the first time since 1920 a net shortage of cars. The orders for cars in some parts of the country which could not be filled exceeded by 15,000 the surplus cars in other parts of the country for which there were no orders. The net shortage was small. But on April 8, 1921, the railways had a car surplus of 507,427 cars, and even six months ago there was a car surplus of 260,000 cars.

It has taken only this short time for the increase in business activity to wipe out the large car surplus. The so-called "car shortage" is a symptom, not a disease itself. The disease is inadequacy of railway facilities of all kinds, and we have not yet felt its worst effects.

Business activity and production are increasing throughout the country. Every class of producers and shippers is clamoring for more transportation. Although the amount of coal transported has increased over 125 per cent since the coal strike was settled, the United States Geological Survey in its report for the week ended September 16 says: "Transportation is the dominant and limiting factor in soft coal supply."

One of the associations of manufacturers of lumber in a circular letter calls attention to the fact that the production of lumber has for some time been exceeding the amount that could be shipped, and that finally lack of transportation is forcing a curtailment of production. The National Association of Sand and Gravel Producers has been before the Interstate Commerce Commission to secure modification of its priority orders in favor of coal because these priority orders are seriously interfering with road building and other construction work. There are wide-spread complaints in the west because the railroads cannot move the grain as fast as the farmers desire to ship it. Governor Kendall of Iowa issued a statement on September 1 in which he said: "The car shortage in the state is a serious embarrassment to all industry and enterprise and it is one most difficult to remedy." He stated that the elevators are overflowing everywhere, and heavy losses will be sustained unless provision can be made for the immediate marketing of the grain. He advocates a transportation priority order in favor of cereals for two weeks. This condition exists in spite of the fact that thus far in 1922 the railways have moved more grain than ever before. The number of cars of grain moved this year to September 9 was 1,636,230. The previous high record was that of 1921, when up to the same date shipments of grain had been 1,571,538 cars.

Governor Kendall said the prolonged strike left the railways without adequate equipment. The situation would be somewhat better if the railways did not have an abnormal amount of equipment in bad order. But the shop employees' strike is by no means the principal cause of the present transportation situation. The principal cause of the present situation is that the general development of the railroads has very greatly declined within recent years while all the other industries of the country have continued to expand at a normal or more than normal rate. Consider the significance of the following figures some of which already have been published in these columns: The number of locomotives in service increased 17,725 in the seven years ending with 1907, only 10,579 in the next seven years, and only 1,912 in the seven years ending with 1921. The number of freight cars in service increased 626,000 in the seven years ending with 1907, only 349,000 in the seven years ending with 1914, and only 41,000 in the seven years ending with 1921. The increase in the number of locomotives for the seven years ending with 1907 was more than *nine times* as great as in the last seven years, and the increase in the number of freight cars was over *fifteen times* as great. If these reductions of the increase in the number of cars and locomotives had been the only reduction in railway development, the situation would not be so bad. But there has been a corresponding reduction of the increase in all railway facilities.

When the restrictive policy of government regulation began to be applied about 15 years ago those who opposed it predicted that this very reduction of railway expansion would be the result. They said the policy of reducing and limiting the net returns the railways could earn would drive new capital away from them, and that, of course, without sufficient new capital railroad expansion would decline. The advocates of the policy which has been followed ridiculed these predictions. The predictions have come true, and the nation is now entering on a new period of business revival with a transportation system utterly inadequate to the demands which will be made upon it if the demands increase as much in proportion as they have in every past period of business revival.

What is to be done, if anything, to remedy this situation? The natural way to stop an effect is to remove its cause. Since restrictive regulation has arrested the development of the railroads, it would seem that the logical thing to do would be to make regulation less restrictive. The net return earned by the railroads on their valuation in July, the first month after the recent reductions of wages and rates went into effect, was only four per cent. Business is increasing and the net return earned will increase if the railways are fairly regulated. If they earn an adequate net return they

will raise the needed new capital and provide the needed facilities.

In a large part of the country, however, there is being carried on a powerful agitation for legislation which would repeal all the constructive provisions of the Transportation Act and make the government's policy of regulation worse than it was before government control was adopted. In Governor Kendall's own state of Iowa the republicans have nominated for United States Senator a man who is making his campaign largely upon the ground that the valuation of the railways made by the Interstate Commerce Commission is from five to seven billion dollars too large and should be correspondingly reduced. In Wisconsin the republicans have renominated by a large majority Senator LaFollette, who has for years been the most persistent advocate of the very policy of regulation which is chiefly responsible for the fact that at the present time the farmers of Wisconsin, Iowa and other western states cannot get enough transportation to move their crops to market.

In other words, many of the farmers of those states are complaining bitterly of the losses they are suffering and the greater losses they fear because they cannot get enough transportation, and at the same time are supporting for election to Congress and to the Senate men who advocate policies which would cause railroad development to be even less in the next seven years than it has been in the last seven years.

The present transportation situation and the still worse situation which seems to be coming are due to policies the adoption of which has been caused by the very people who are now complaining most about the lack of transportation. The railways are doing, and will do their best to move all the traffic with the facilities available because, other things being equal, the more traffic they handle the more money they make. It is evident, however, that no matter how well they do, the country is going to suffer severely from lack of transportation. Perhaps the experience will teach the public that it has much to lose and nothing to gain by supporting a policy of regulation, the direct and necessary effect of which is to render the railways unable to handle the country's commerce.

What Will Be Done With the Victory?

THE RESULT of the shop employees' strike has been a victory for the railways. In strikes, as in wars, it is often easier to win a victory than to use it wisely. Germany won a great victory in the Franco-Prussian war but did not use it wisely. Fifty years later Germany is much worse off than she probably would be if she had not triumphed so completely.

The outcome of the shop employees' strike is that on a large majority of railways the shop crafts' unions affiliated with the American Federation of Labor no longer exist. For some years the worst labor conditions on the railroads have prevailed in their shops. The rules and working conditions which the labor unions got adopted partly before and partly during government control had become an almost insuperable obstacle to efficiency and economy. The shop employees as a class had become, under bad leadership, the most radical and insubordinate class of employees. It seemed impossible to remedy this condition as long as the shop employees all belonged to national unions which successfully insisted upon only national negotiations of differences with the railway managements and upon nationally uniform wages and working conditions.

The result of the strike is to enable all the railways which have not settled with the unions to deal separately with their own men. This means with representatives of their own men, since in no other practical way can large numbers of men deal with employers regarding matters of importance. The shop crafts' unions are quite certain to try to extend their organizations over these railways again. The managements will naturally try to prevent this. The most effective means of preventing it will be for the managements to convince the employees that it is contrary to their own interest to allow themselves to be drawn back into these unions. In order to do this it will be necessary for the managements, in concert with representatives of the employees, to establish means of co-operation between them which will work to the benefit of the employees as well as the railroads. The railways will naturally try to establish working conditions which will promote efficiency and economy of operation—which, in other words, will increase the output obtained per man and per machine. If, however, they are to attain this result without alienating their employees and causing the growth among them of a sentiment in favor of a renewed affiliation with the shop crafts' unions, it will be necessary, first, to bring about the establishment of relations which will give the employees a real opportunity to present their views and wishes to the management and participate in determining the conditions under which they shall work, and which, secondly, will convince the employees that they have more to gain by dealing directly with the management of their own railway than by dealing with it through the national unions.

The means adopted to bring about co-operation between the managements and the men and to secure increased efficiency will naturally differ on different railroads. It is to be hoped that many new means will be tried—local adjustment boards, shop committees, piece-work, and so on. If many new and varying methods are tried opportunity will be afforded to compare the results obtained for both the railways and the men. The outcome on most roads should be that controversies which may arise will be settled without going to the Labor Board, that the more hard-working and efficient men will be enabled to earn higher wages than the minimums fixed by the Labor Board, and that the railways at the same time will be enabled to get a given amount of work done at a lower total cost than they would have been able to if the strike had not occurred.

As paradoxical as the statement may sound, the outcome of the strike has also opened some new opportunities to the shop crafts' unions. They are still in existence as before on the railways which have made settlements with the strikers. The greatest fault of the shop crafts' unions, like so many other unions, has been that in efforts to further what they have regarded as the interest of their members they have pursued policies which directly militated against efficiency. They have proceeded on the false economic theory that there is only a limited amount of work to be done and that the more they restrict the amount done by each man the more they will increase the number of men that can and will be employed. The leaders of these unions can persist in following the old policies if they choose to. On the other hand, if they choose to, they can adopt a new policy of encouraging their members to do the most and best work they are capable of and to co-operate with the managements of the railways in increasing the efficiency and economy of operation.

The conditions will be such that, it would seem, the leaders of the unions would find it expedient to do this. With the shop crafts' unions representing the employees on some railways and not representing them on others, there will be opportunity to compare the results obtained for both the men and the railways where the unions are recognized and dealt with and where they are not recognized or dealt with. Persistence by the labor leaders in the policies for which they have stood in the past is almost certain to make the conclusions drawn from these comparisons unfavorable to labor unionism and its methods.

The outcome of the strike should have good effects on both the managements of the railways and the labor unions. It should stimulate the managements of the railways which have refused to settle with the unions to use every reasonable means to so promote the welfare of their employees as to make them satisfied and loyal to the companies. It should at the same time stimulate the shop crafts' unions to so deal with the railways which have made settlements with them as to convince their managements and the public that these railways did not make a mistake in so doing instead of fighting the strike to a finish. The strike has cost a great deal and the employees, the railways and the public will not cease to feel its effects for a long time to come. But if it results in causing both the railways and the labor unions to follow more enlightened policies in future it will be worth far more than it has or will cost.

Does It Pay?

WHAT IS THE VALUE of a well-balanced athletic program for employees on a railroad system? Can it be measured in terms of increased output or in other practical ways? These questions are suggested by the fact that at a time when various railway associations and railway clubs are cancelling and discontinuing meetings because of unrest and the congestion of traffic, the Pennsylvania Railroad has gone forward with its athletic or recreation program, which culminated in the great system field meet at Altoona last Saturday. Not only did this mean relieving many workers over the system to take part in the events—including the shutting down for the day of the great Altoona shops—but many special trains were required to carry the employees to Altoona from all parts of the system.

The crowd—possibly 35,000 were in the grandstands on Saturday afternoon—included the workers and their families, from the president and some of the directors down to office girls and boys, apprentices and laborers; and they were apparently welded together in a complete and happy unit. Nowhere was this better evidenced than in the way in which President Rea, backed up by many of his official family, left the grandstand for the field and personally gave out the medals and trophies to the fortunate contestants in the many events.

What did the day not mean also to thousands of workers all over the system who were not fortunate enough to be able to go to Altoona for the day, but who followed the reports which were wired direct from the top of one of the grandstands? Two minutes after one of the young ladies had won a close race the telegraph operator called to her from the top of the stand, "Betty, they already know all about it in Philadelphia and are proud of you." This, of course, is an extreme case, but surely the enthusiasm and comradeship of the day must mean something in the development of a better family spirit throughout the great system, as well as in increased loyalty.

After all, the great field meet, with its hundreds of contestants and thousands of spectators, was a small thing compared with the other thousands of employees and more tens of thousands spectators who took part in the preliminary training and events all over the system during the preceding months. This, measured in terms of improved health alone, means much to the railroad aside from other aspects. Intangible, you say. Possibly so. But it will be interesting to watch the Pennsylvania in the coming weeks and months and see if it is reflected in better performance under the trying conditions which lie before it. Obviously, an athletic program in itself may not mean much in inspiring loyalty and co-operation. To be really fruitful for good, it will ordinarily be linked up with other things that were mentioned in the editorial entitled "Our Road" in the *Railway Age* of last week; in the last analysis it will depend for its effect, good or bad, directly upon the spirit back of the whole thing and by which it is dominated.

Speeding Up Train Movement

THE SUGGESTION has been made that in some cases freight train performance might be improved by decreasing the tonnage and thus increasing the speed. But this method could not be adopted with good results in most cases. For one thing, it would add to the number of locomotives turned at roundhouses and would not be practicable where the locomotive terminals are congested. Another method of increasing the ton-miles per locomotive would be to increase the speed without decreasing the tonnage. There are probably many cases where this could be done. Operating officers usually consider that the speed is fixed by the tonnage, but this is true only if the locomotive is worked at a definite rate.

The power that is developed depends on the amount of coal supplied to the fire. A higher rate of firing means more power and, therefore, higher speed. The maximum rate for hand firing is about 7,500 lb. per hour. Few firemen can equal this, but it would not be unreasonable to expect them to fire 5,000 lb. an hour while running. The actual rate will often be found as low as 3,000 lb. One of the principal reasons why some crews do not get over the road is because they do not develop the proper amount of power from the locomotive. Road foremen of engines by checking the rate of firing should be able to speed up the movement of trains appreciably. A method that is still more effective is to provide some additional incentive for increasing speed, either by giving the slow-freight crews an opportunity to exceed the basic 12½ miles an hour, or by establishing turn-around service. It is hard to give road crews continual supervision to keep them up to a high standard if the only object is to improve the company's operating performance, but the engineer and fireman can be depended upon to work hard to get over the road if it is to their personal advantage to do so. Still another method of increasing ton-miles per locomotive is that of maintaining the speed while increasing the tonnage per train. This also imposes heavier work on the locomotive, and makes necessary better firing. The importance of maintaining or even increasing speeds is greater now than it was a few years ago because of the necessity of paying train crews punitive overtime after eight hours. From the standpoint of locomotive efficiency the main object to be attained is an increase of ton-miles per locomotive hour, or per train hour, which is almost the same thing, and usually the way in which this has been attained has been by increasing the train load even when this had the effect of reducing the average speed.

For example, on one of the best operated railways in the entire country the average speed of the freight trains declined from 12.05 miles an hour in April to 10.7 miles in August. Because of the large increase in the average train load, however, the average ton-miles per train hour—practically the same thing as per locomotive hour—increased from 7,967 to 8,651. The result was that this railway was able to handle in August the largest freight business in its history—undoubtedly a larger business than it could have handled at higher train speeds—with maximum economy. Determination of the speeds and loads with which freight trains can be operated with the greatest efficiency and economy depends on local conditions, and therefore these conditions must always be given the most careful consideration if the best results are to be attained.

Letters to the Editor

Labor's Opportunity

El Paso, Texas

To the Editor:

The idea outlined herein has been evolved as the result of disputed points between the railroad employer and employee since the writer can remember, and he is now 54 years of age. It has been strengthened by the fact that a local brick manufacturing plant, of most modern construction and equipment, was built, put in operation, and is operated by a labor organization.

Contention has always existed: First, by the employee that wages are kept down to a point out of proportion to railroad earnings. Second, that abnormal earnings thus made possible for the operating companys are accumulated to the enrichment of large stockholders and the over-payment of executives. Third, that repairs contracted for outside of the carriers' own shops represent waste of money for the main purpose of discrediting organized labor.

The employer claims that the wage scales demanded, compared with freight tariffs, permit of inadequate earnings to create legitimate and fair interest on investment, and sufficient surplus with which to care for repairs, operating expenses, maintenance of way, overhead, etc. (That this claim is valid, of record, and accounted for by various corps of most skilled men, selected by the government for their fitness, means nothing to those who contradict these facts).

Why would it not be possible to select some road which has been a profitable property, but is now in the hands of a receiver, or a previously profitable road about to be sold for indebtedness, and with our government as referee, permit allied trades unions to take such property over for operation.

Some of our best and most profitable roads have gotten into financial difficulties at times, and men like Mr. Loree have been given the hard task of rehabilitating them and putting them on their feet again.

Such a plan would open to the unions an investment for their treasury funds and men like Samuel Gompers, who have accumulated some means, should jump at the opportunity to invest some of their money in such property, where it would be safeguarded by the individuals for whom they have fought and whom they have championed. There would also be the great value of such a departure as an object lesson, highly valuable to the contestants as well as to our government.

Some capable, worthy man, identified with labor, having executive ability, but whose light has been hidden under a bushel, would be given the opportunity to accept the service for which several railroad executives receive $100,000 and $150,000 per year, at a salary of $10,000 to $15,000. In addition to this, the road under this new plan of management could immediately, with special governmental permission, reduce the freight tariffs, raise the wage scale, and put all work of repairs through their own shops, to the end that the public would at once begin to profit in saving of freight charges. All tonnage possible in tributary territory would be routed over the lines of this road; the increased revenue would go to the unions, and no element would have any reason to be dissatisfied, for the public, the patrons, would not begrudge the investors and operators the increased earnings when receiving better service at lower cost.

All new ideas are scouted as radical when the departure suggested is at such variance with custom, and yet were it possible to carry this roughly outlined plan into operation, the result it would accomplish within twelve months would be definite and mean that which has not been attained in many years of heated argument, dispute, and struggle at cross purposes.

E. E. Morrow.

Need for Courts of Last Resort

Boston.

To the Editor:

In one of your recent interesting editorials on improving the personnel of the railroad service, you mention, as an essential in promoting friendly co-operation, the settlement of disagreements by having them taken before one or more referees. (Page 319, August 19.) Disputes arise in all important human affairs and provision for settling them is of the first importance; yet we go on neglecting the duty. President F. D. Underwood, of the Erie, in an interview, has proposed local arbitration of disagreements between employer and employee; which means that our present ponderous machinery for settling grievances is very inadequate. This everybody knows. It is a kind of machinery which is likely at any time (if you try to accomplish useful results with it), to come to a full stop from its own internal friction.

Failure to recognize this need of a final arbiter *who can act promptly* is the cause of half our troubles. We recognize this need in various vital matters every day, and yet in other vital matters we are oblivious to it. The Supreme Court of the United States has been called the sheet anchor of our liberties. It is more than that; its influence steadies our feet every day. Yet, what is it but a board of arbitrators? Nine men whose word we agree to heed and obey, whether they be right or whether they be wrong. All of our recent labor and wages troubles have been due to the lack of this spirit; lack of a man or men whom we can agree to obey. All efforts should be directed to finding some way to select and appoint suitable arbitrators. The futility of trying to compose our differences in any other way is illustrated by the action of the baseball men in appointing Judge Landis to boss them. The motion picture people have done the same thing, employing Mr. Hays; and a similar course is proposed in the theatrical business.

Note my italics. In the complicated affairs of the modern industrial world, there can be no satisfactory progress unless we can get rid of tedious delays. The legal profession does many things for us; but, on the other hand, too many of our lawyers make their living by manufacturing delays—or calling them down from the heavens. It is the lawyers who have taught us how to accomplish all sorts of ends, good and bad, by delay, delay and more delay. Most grievance committees spend a good deal of their time in making sure that their business shall not go on too rapidly.

There are two halves to the arbitrator problem. It is hard enough to find a man who can comprehend our controversies and who will have the courage to decide them with absolute freedom from fear or favor; but the second half is harder yet; to get ourselves into the state of mind—and heart—where we are willing to accept the arbitrators' decisions when they are rendered. (It is yet to be demonstrated whether or not this exalted mental and ethical state has been reached and can be maintained by the baseball and movie people.) The first qualification of an arbitrator is impartiality; this is more important than education or than knowledge of the railroad field; but the latter can be acquired; an impartial mind cannot. Equally important with impartiality is the arbitrator's reputation for impartiality. This quality is valueless unless people recognize it. Mr. Underwood's idea is a good one; but we need a lot of committees, right away, to hunt for the individuals whom we can trust to tell us what to do, or what to submit to, when, left to ourselves, we should sulk, or strike or fight. Every large road needs a score of men.

E. Moseman.

Work Under Way on Union Station Headhouse

Architects Solve Difficult Problem in Combining Office Building with Terminal Structure

While work is in progress on the excavation and basement of the great headhouse and five of the new station tracks already in use, the completion of the new union station at Chicago is now definitely in sight. Progress on the plans for the headhouse also has now reached the point that permits of a more tangible conception of the principal features of this important terminal than has been possible heretofore.

The general character of this station is now a matter of rather common knowledge among railway men; it will comprise a double stub terminal with two grids of station tracks extending to the north and south respectively from a train concourse lying between the Chicago river and Canal street, with the headhouse occupying an entire block west of that street. The station tracks and the main floor of the station are depressed below the streets, permitting the latter to pass over the tracks and over the connection between the headhouse and the train concourse.

The original plan for the headhouse contemplated a structure of monumental type housing only the main waiting room and the auxiliary station facilities, and foundations were designed and constructed on the basis of the loads imposed by such a structure with an allowable foundation bearing of 6.5 tons per square foot, transmitted to concrete caissons carried to hardpan about 60 ft. below city datum (lake level). The subsequent decision to provide a structure to serve the dual purpose of a station headhouse and a high office building necessarily imposing loads much greater than those originally contemplated, introduced a serious foundation problem and naturally raised a question as to the application of greater loads to the caissons already in place. As a means of affording a possible answer to this, two test caissons were sunk on adjacent ground and subjected to test loads, as a result of which authority was granted by the city building department for an increase in the allowable bearing pressure to 10 tons per square foot subject to certain restrictions.

Further complications attending the decision to construct the office building type of headhouse arose from the fact that a redesign of the building superstructure resulted in some marked changes in the location of building columns, so that the existing caissons would not in all cases fit the new column locations, and although the use of reinforced concrete distributing girders made it possible to utilize nearly all of the caissons already in place, the general result of the change in plans has been a considerable increase in the number of caissons. This additional foundation work is now well under way.

General Plan Not Changed

The earlier plan for the headhouse provided for a great waiting room in the center of the block, and by designing the office building as a hollow square with a central court the principal feature of this plan has been retained without involving the support of any column loads over the 100-ft. span of the waiting room ceiling. This not only insures adequate skylighting of this waiting room, but also permits of an application of the originally contemplated architectural treatment, that of the Roman baths.

The base of the building will occupy practically the entire block bounded by Canal, Jackson, Clinton and Adams streets, and will have a length of 372 ft. north and south by 319 ft. 10 in. east and west. However, the mass of the building above the base, that is, the outline of the office building portion, is to be set back 50 ft. 4 in. on the Canal street side, 59 ft. on the Clinton street face and similar amounts on Jackson boulevard and Adams street, giving the effect of a terraced base, extending practically to the fourth floor level. On Canal street, this is to be treated as a portico comprising a colonnade of Roman Doric columns, 39 ft. high, and will serve to emphasize the two main entrances to the station. A similar treatment is to be used on Clinton street except that the building wall will be flush with the backs of the columns. On the Jackson boulevard and Adams street sides, the base projections of the building will be occupied by two cab and baggage driveways entering at the two west corners of the building with ramps descending toward the east, the outside walls being pierced by large openings for the sake of ventilation and lighting. Architectural emphasis will be given to the two entrances to the driveways by ornamental pavilions at the two corners of the building, and for the sake of symmetry, similar construction will prevail at the two east corners.

The underlying thought in developing the design of the station was to evolve a plan of the utmost simplicity in which all facilities of direct service to the passenger in arriving or departing on trains are assembled on a single level. Special pains were taken to insure that the routing of the passengers through the station would not only be obvious but would also afford direct access to the various facilities with practically no opportunity for confusion on the part of even the most inexperienced traveler. It is the opinion of the officers of the station company that the plan is unique among stations placed either above or below the street level and that the efforts and expense incurred in developing the plan will be entirely warranted by the operating results to be obtained.

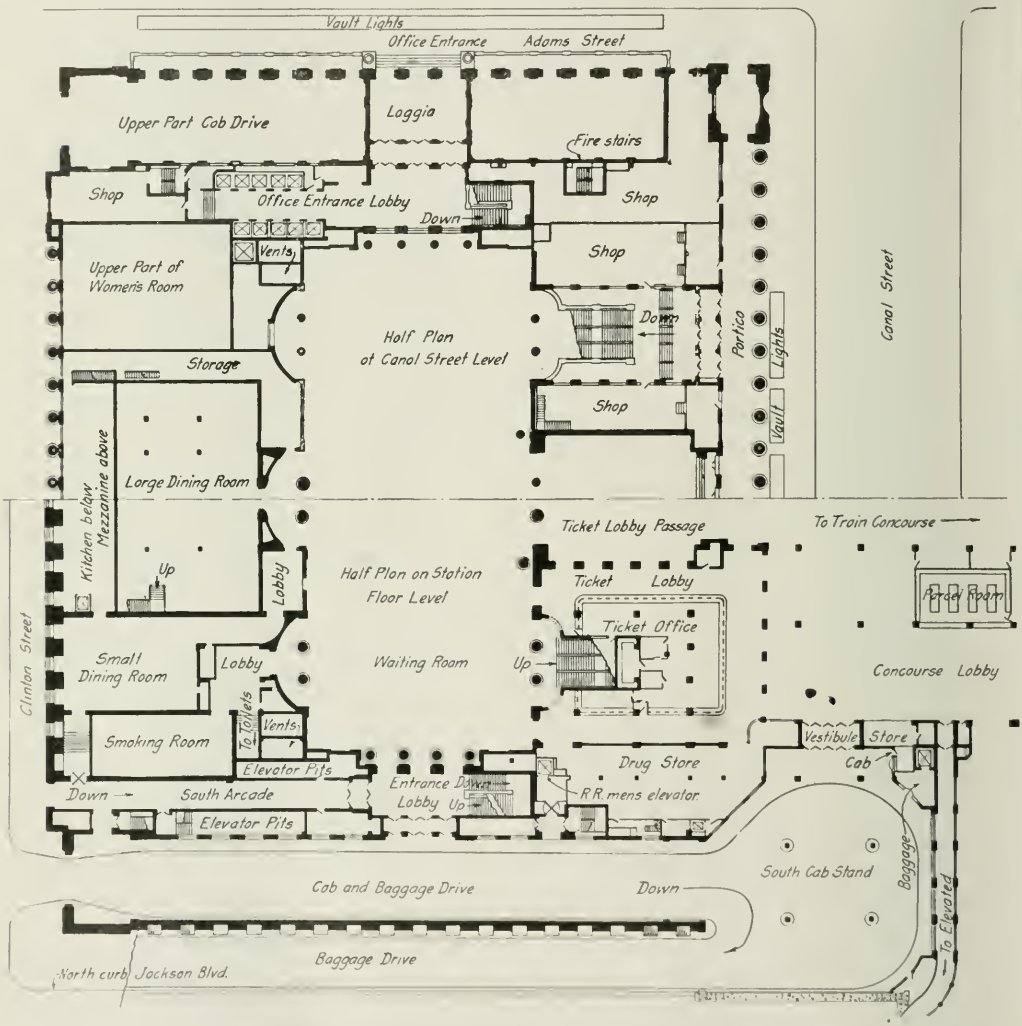
An understanding of the station arrangement implies a thorough conception of the arrangement of the street grades. To provide adequately for a separation of the track grades from those of the streets, it was necessary to raise Canal street to elevation + 26, which is approximately the same elevation as the bridges over the tracks and the river, whereas the elevation of Clinton street, which is on a level with the other streets to the west of the station is + 15, necessitating descending grades from Canal street to Clinton street on the two streets flanking the headhouse on the north and south. Therefore, by placing the level of the main waiting room floor at + 10, it was readily possible to provide a concourse leading to the east under Canal street, while the fact that Clinton street is 11 ft. lower than Canal street was also of advantage in providing ramps for the descending driveways entering from the two Clinton street corners.

The main waiting room will be an enormous hall, 100 ft. wide by 217 ft. long and having a ceiling 114 ft. from the floor. The interior treatment will consist primarily of paneled walls, with recesses marking large openings at each end and at three equally spaced intervals on each side, these openings being emphasized by marble columns surmounted by a classic entablature that extends around the room at a height of 47 ft. above the floor. Above this level will be a clerestory covered by a flat barrel vault ceiling, the walls being pierced by windows at each end and at three places on each side. Although this room will have no outside walls, these openings will be afforded natural light because the walls of this clerestory are to clear the interior walls of the office building by a distance of 16 ft. The ceiling of the waiting room will consist entirely of skylights with

the exception of one tier of coffers around the sides and ends.

The main entrance to this waiting room from the street will comprise duplicate entrance lobbies 40 ft. wide by 85 ft. long, fronting on Canal street 70 ft. 10 in. to either side of the east and west axis of the building. These lobbies will enclose stairways leading down to the waiting room level, but will function also as arcades giving access to shops bordering on either side. In addition, a large part of the trian arcades 11 ft. 10 in. wide by 134 ft. long communicating with Clinton street.

The passengers entering the waiting room will find the space to the west of it devoted to restaurants and separate accommodations for men and women, one each of the three large doorways mentioned above marking entrance to each of these three facilities. The south doorway will communicate with the smoking room and with a stairway leading to



Composite Plan of the Headhouse on the Station Floor and Canal Street Levels

Canal street front of the building not occupied by the entrance lobbies will be devoted to shops.

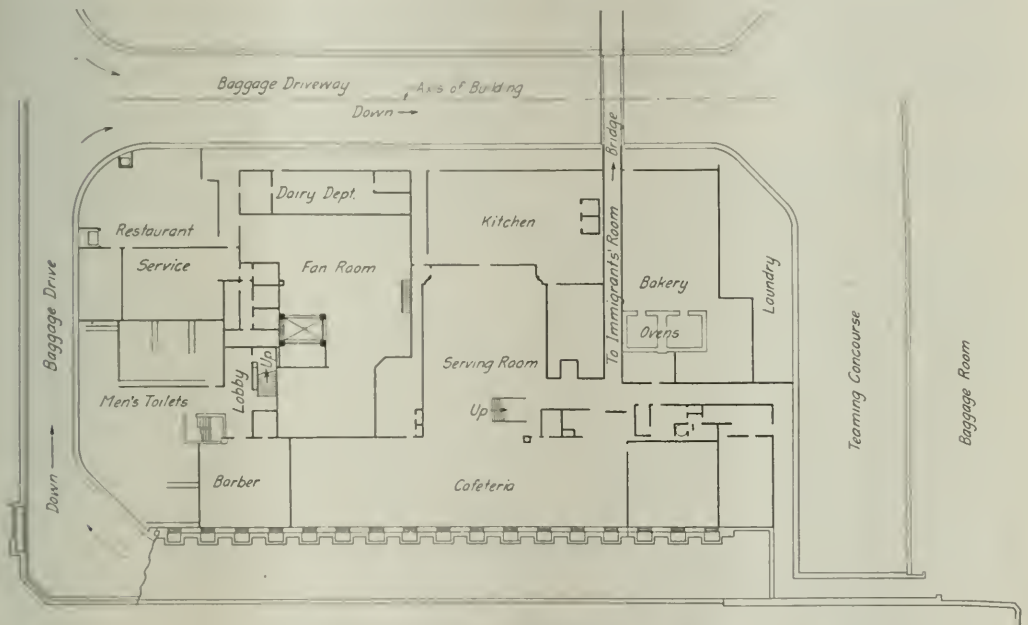
There will be two other entrances into the waiting room, namely, at the north and south ends where three doors will lead to entrance lobbies 18 ft. by 43 ft., communicating directly with the cab and baggage driveways and will serve as the cab entrances to the waiting room. To the west of these entrance lobbies a connection will be had with pedes- a toilet room in the basement. The central doorway will lead to a large restaurant and, by means of a lobby and corridor, to a smaller restaurant affording greater seclusion from the activities of the station. The north doorway in the west wall will lead to the women's waiting room and by a stairway to a toilet room in the basement.

The main restaurant will be a room 48 ft. by 110 ft. with a ceiling 40 ft. above the floor. It will have a walnut

wainscot 12 ft. high above which the walls will be treated with paneled caenstone. The ceiling will have an over-all pattern of coffer treatment in color. The smaller dining room, 40 ft. by 60 ft. with a 30 ft. ceiling, will have somewhat similar architectural treatment.

On the main axis of the building in the east wall between the two main stairways will be a large doorway leading to the ticket concourse from which direct access is had further east to the concourse lobby under Canal street, and beyond that to the train concourse. However, this central passageway will be supplemented by smaller doors on each side of the two stairways so that, with the exception of the space occupied by these stairways, one will be able to pass from the waiting room into the concourse space to the east at almost any point in the entire length of the east wall. In other words, there will be an open passageway from the waiting room in the general direction of the train concourse, having a total width of 192 ft. Immediately under the south stairway an enclosed grill or cage 64 ft. by 49 ft. will be provided for a ticket office, affording service windows on all four sides. Under the north stairway a similar enclosure will be provided for the baggage service with an elevator, chute and stairway communicating with the baggage room on the floor below.

Direct entrance to the concourse lobby will also be afforded by vestibules to the north and south connecting with the two cab stands under the two Canal street corners of the building at the lower end of the driveways descending from Clinton street. In addition to suitable landing platforms, adjacent space will be devoted to a taxicab office, baggage service counter for checking hand baggage, and a toilet room for cab men.



Plan of the South Half of the Basement

Separate Entrances for the Office Building

Since the headhouse will encompass an office building of large size it is essential to provide adequate entrances to the office building in such locations and under such an arrangement as to isolate them from the station facilities. Accordingly, entrances have been provided in the center of the Jackson boulevard and the Adams street sides of the building at a considerable distance from any of the entrances to the station proper. By provision for a flight of six steps from the sidewalk level access will be had to a loggia with a floor at an elevation +23.5, or sufficiently above the level of the inclined driveway from Clinton street so that this loggia may bridge across the driveway with a sufficient clearance for the vehicle traffic. This loggia leads to an entrance lobby abutting on the end of the waiting room, but at an elevation 13 ft. 9 in. above the station floor level so that it gives the general effect of a balcony overlooking the waiting room. To the west of this loggia is a corridor leading to two banks of five elevators each. These elevators will not run below the office entrance level so that they cannot be used for direct communication between the offices and the station. This arrangement was deemed necessary to separate the offices from the station, but for the benefit of office employees who have occasion to go into the station a stairway has been provided to the south of the office building lobby which leads to the station floor level in the entrance lobby at the end of the waiting room. As a further facility for railway officers or for trainmen reporting to division offices on the upper floors a special elevator connection to the upper floors will be provided with entrance on the station level, opening out onto the cab drive from which it is but a short walk to the concourse. Further means of communicating between the office floors and the ground level will be afforded by four stair wells enclosed in fire walls in the four corners of the building.

Baggage Room in the Basement

The driveways leading from Clinton street to the cab stands are also used for access to the baggage room in the basement. From the cab stands a continuation of the ramp is to be carried westward outside of the first run of the drive

to the corner of Clinton street, thence to the middle of the block on Clinton street and thence eastwardly on the center line of the building to a teaming concourse under Canal street. This concourse will be 47 ft. wide and will have tailboard space for a length of 382 ft. along its east side beyond which all of the space under the train concourse is to be occupied by the baggage room. The remaining portion of the basement, that is, the part directly below the headhouse will be devoted to a variety of purposes. One interesting innovation is provision for a large cafeteria near the south wall of the building, with communication from the main waiting room by means of a stairway leading down from the south vestibule, which will have a table room 38 ft. by 144 ft. to be supplemented by a service room 50 ft. by 55 ft. and a kitchen 40 ft. by 76 ft. In the north half of the building a room 54 ft. by 90 ft. will be assigned to immigrants and connected by a corridor to a stairway that gives direct access to the train concourse. Other portions of the basement are to be used for the main toilet rooms, storage space for the concessions, employees' rooms, etc.

The design and construction of the union station is under the direction of J. D'Esposito, chief engineer, Chicago Union Station Company. Graham, Anderson, Probst & White of Chicago are the architects.

Long Island to Improve and Extend Electric Service

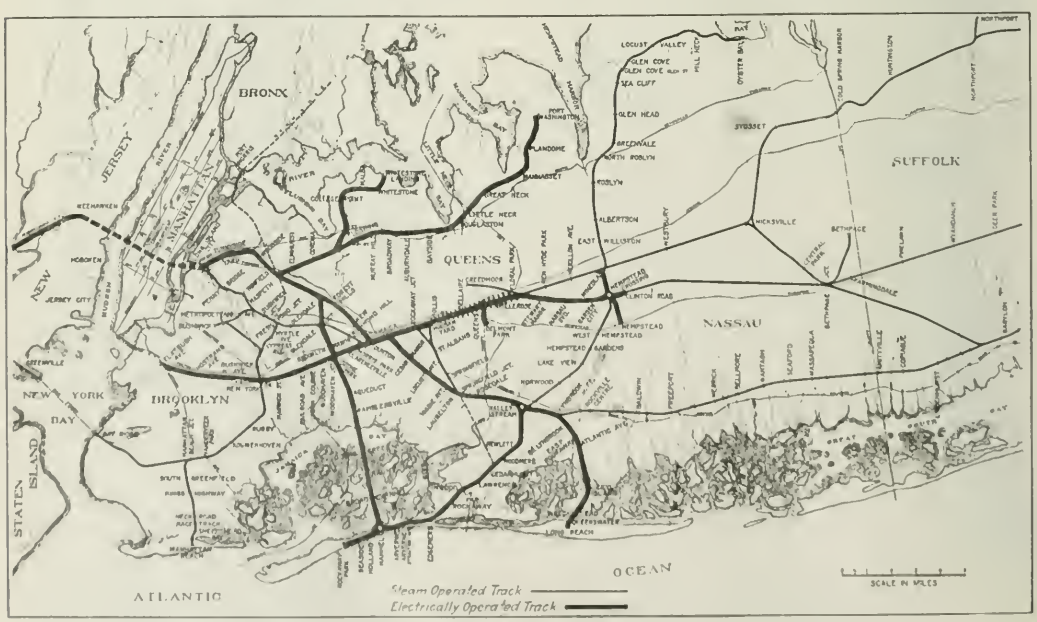
To care for present requirements and to prepare for the carrying out of a plan for improving and extending the electric service on the Long Island, a 25,000-kilowatt generator is now being installed in the Long Island City power plant and additional feeders are being run in conduit along the right of way to Forest Hills.

This fall the company will begin the extension of the elevated structure through Hollis, eastward through Queens to the Nassau County boundary line, a distance of about two miles. This section will be elevated and four-tracked at the same time and the four-track section will be continued to Floral Park, two miles farther east. It is estimated that the work will require about a year and a half for completion at a cost of approximately $2,000,000. Building of many new homes in Hollis, Queens, Bellrose and Floral Park has caused a large increase in traffic with resultant congestion. The new four-track elevated structure will make it possible for express trains to pass locals between Hollis and Queens and thus speed up operation over the entire line.

Tentative plans for future building include extending the electrification of the Montauk division from Lynbrook to Babylon, a distance of 19 miles, the entire Oyster Bay branch and the Wading river branch to Northport. It is also planned to connect the old unused Central Railroad line with the main line to divert express service from the entire Montauk division east of Babylon through Hicksville and Mineola to Jamaica.

The Long Island is properly a standard railroad and it is the contention of its president, Ralph Peters, that New York City should not depend on the Long Island to furnish rapid transit, as this transportation line is needed to serve all other parts of Long Island for passenger and freight transportation. In explaining the situation President Peters said: "I have tried to impress upon the transit commissioners of this city that they ought to build a four-track rapid transit line from Jamaica over the Queens Boulevard route to Long Island City, thence under the river and across the city to 10th Ave., intersecting all the north and south lines on Manhattan Island and giving the Borough of Queens real rapid transit."

According to a report presented to the Italian parliament, the Italian railways at present possess 6,436 steam and electric locomotives and they have under construction 475 steam and 82 electric locomotives. Grants have been made for the construction of 120 locomotives and another 75 will shortly be ordered. Within the next five years 600 steam locomotives will be scrapped.



Western Lines of the Long Island

New Shop Agreements Have Novel Features

Union Pacific and Burlington Wage Rates Recognize Varying Degrees of Skill Within the Crafts

Among the railroads which have recently negotiated agreements with newly organized associations of their shop employees, the agreements of the Union Pacific System, effective September 1, and the Chicago, Burlington & Quincy, effective September 15, are of particular interest because of the extent to which they depart from the practice established by Labor Board decisions, both as to working conditions and rates of pay. The new wage rates established by both of these agreements are similar in that the various craft classifications have been subjected to a considerable subdivision based on the degree of skill required in the performance of the work, and each subdivision carries its own wage rate. Generally speaking, these wage rates range from 15 cents above to from 7 to 15 cents below the mechanics' rates established by the last wage reduction of the Labor Board.

In both agreements the minimum rate for work ordinarily assigned to fully qualified mechanics is two cents an hour above that established by the Labor Board. The work of specialists or handy men, requiring more skill than the class of work ordinarily assigned to helpers but not the skill of a fully qualified mechanic, is paid for at rates lower than the mechanics' rates established by the Labor Board but above the rates for helpers.

Wage Rates for the Locomotive Crafts

In the special craft rules of the Union Pacific agreement the mechanics in each craft are divided into two groups: (1) those doing work requiring fully qualified mechanics, and (2) those doing work not requiring the skill of fully qualified mechanics.

In the machinists' rules there are 28 classifications of fully qualified mechanics. The first eight classes each receive a rate of 85 cents an hour and include specialists (who determine the time and methods required for the performance of all operations), layers out, tool makers, die makers, valve setters, large vertical turret lathe operators, special milling machine operators and axle and crank pin lathe men. The next five classes receive a rate of 80 cents an hour. These classes include operators of frame and cylinder planers and frame slotters, air brake specialists, valve gear repair men and inspectors required to sign affidavits under the Federal locomotive inspection rules. The next four classes receive a rate of 76 cents an hour and include air brake repairmen, machinists assigned to such work as power plant machinery and roadway equipment, autogenous welders and operators of horizontal boring and milling machines. The last 11 classes receive a rate of 72 cents an hour. The work in these classes includes that of first-class machinists, locomotive inspectors not required to make affidavits, machine operators not specified in other groups and steam pipe and superheater men.

In the second or less skilled group of mechanics there are 26 classifications. The highest rate in this group is 68 cents an hour and applies to the first 10 classifications. These include operators of semi-automatic machines, operators of lathes and shapers on work not specified under any of the superior classifications and operators of driving wheel lathes, radial drills and ordinary drill presses. Boiler stud men and men assigned to laying out and squaring up engine trucks and trailer frames and fitting up truck brasses are also included in this group. The next nine classes receive a rate of 64 cents an hour. These include engine and trailer truck men who are assigned to repairing trucks and putting up shoes and wedges, car wheel lathe operators, tire setters, men on valve and cock work, spring and brake rigging men, second-class boring mill operators and operators of engine and tender truck axle lathes. The next two classes include operators of rough grinders and tool grinders, and receive a rate of 60 cents an hour. Men repairing tender trucks, and applying and removing couplers, metal bumpers, metal pilots and engine and tender drawbars, are rated at 60 cents an hour if of over one year's experience and 57 cents an hour if of less than one year's experience. Gas and electric cutters and men doing machinists' work on metal cabs, running boards, stack saddles, brackets, etc., receive a rate of 57 cents an hour.

Helpers with over one year's experience are rated at 49 cents an hour and those with less than one year's experience receive 47 cents an hour.

Each of the other locomotive shop crafts is subdivided in a similar manner, although the number of classes from the nature of the work is not as large as in the case of the machinists. But throughout the agreement each classification is so specific as to leave little opportunity for misunderstanding of the jobs to which it applies.

With the exception of the blacksmiths, the first classification under each craft is that of the specialist competent to determine the time and the methods to be used in the performance of all operations in the craft, and rates for the various groups are 85 cents, 80 cents, 76 cents, and 72 cents an hour for men who are fully qualified mechanics. In the case of the blacksmiths, the heavy hammersmith working on material six inches or over receives a rate of 95 cents an hour.

For work not requiring the skill of fully qualified mechanics the rate groups in each of the locomotive shop crafts are 68 cents, 64 cents, 60 cents and 57 cents an hour respectively. The rates for ordinary helpers are the same in all of the crafts, but a rate of 54 cents an hour is applied to certain special jobs such as helpers on hand flanging work and boiler washers in the boilermakers' craft, and first furnace heater helpers, hammersmith helpers, first and second fire helpers, and hammer operators in the blacksmith shop.

Carmen's Rates

Car repairmen are divided into two separate crafts: passenger car men and freight car men. Fully qualified passenger car mechanics receive the same rates as the locomotive crafts. The 85-cent rate applies to specialists, layers out and decorators. Letterers and stripers, pattern makers and first-class cabinet makers receive 80 cents an hour; mill wrights, electro-platers, and autogenous welders, 76 cents an hour; burnishers, first-class painters, paint mixers, upholsterers, wood machine operators, second-class cabinet makers, first-class locomotive carpenters, and carmen working on passenger car bodies, 72 cents an hour.

Of the less skilled mechanics, truck and platform men, second-class locomotive carpenters and air brake men receive 68 cents an hour; passenger car inspectors, 65 cents; hand car carpenters and rough painters, 64 cents; seamsters and seamstresses, 60 cents; gas and electric cutters, 57 cents, and paint removers, oilers and brassers, 54 cents an hour. The same helpers' rates apply as in the locomotive shop crafts.

Starting at 38 cents an hour, coach cleaners receive up to 42 cents an hour depending on the length of service.

Freight car repair men are classified as fully qualified

mechanics and helpers. There are six rate groups among the mechanics, the highest of which receives 75 cents an hour and the lowest 54 cents an hour. The first group includes specialists, layers out, wrecking derricks engineers and autogenous welders. The second group, which receives a rate of 71 cents an hour, includes air brake rack men and triple valve repairers. The third group receives a rate of 67 cents an hour and covers car carpenters and flask makers. Car inspectors and car men on all ordinary car repair work, starting at 54 cents an hour for less than one year's experience, and adding three cents an hour for each additional year's experience, receive a maximum of 63 cents an hour. Stencilers, painters and gas and electric cutters receive a rate of 57 cents an hour, while oilers and brassers are rated at 54 cents. The rates for helpers are the same as in the other crafts.

The wage rates established in the Chicago, Burlington & Quincy agreement are practically the same as those of the Union Pacific, although the classifications are somewhat less specific and less jobs are included in the higher rate groups than in the latter agreement. Like the Union Pacific agreement the Burlington agreement groups passenger and freight car repair men in separate crafts.

Both agreements provide differentials above the standard rates for men employed at certain specified points on the system, and in the case of coach cleaners on the Union Pacific System, those employed at Los Angeles receive a rate from four to six cents below the standard for the system, depending on the length of service.

More Seniority Groups

In general, the working rules of the Chicago, Burlington & Quincy do not differ widely from those established by Decision No. 222 of the United States Railroad Labor Board. In some respects, however, they are more specific. Both the Union Pacific and the Burlington agreement provides considerably more sub-divisions in the seniority group, particularly those for the car men, and both provide that where the requirements of the service justify such assignments, employees may be assigned to work within a spread of twelve hours with one interval of relief of not less than two hours' duration. Both also specify that a mechanic may be required to perform the work of more than one craft when a literal application of the craft classification would require the use of more men than are actually necessary to perform the work.

The Union Pacific agreement provides for 11 seniority groups of mechanics. These are machinists, boiler makers, blacksmiths, sheet metal workers, electricians, pattern makers, upholsterers, painters, mill men, car men (including locomotive carpenters) and coach cleaners.

In this matter the Burlington agreement has gone even farther. Separate seniority lists are maintained for machinists in the machine and erecting shops and wherever forces are under separate supervision separate seniority lists are to be maintained. Sheet metal workers are arranged in two lists, divided between the tinners and copper smiths, and plumbers and pipe fitters. Electrical workers are sub-divided as electricians, power plant electricians, and electric crane operators (two classes). For the car men, separate seniority lists are maintained for pattern and cabinet makers, wood working machinists, upholsterers, silver platers, coach builders, trimmers and repairers and locomotive carpenters; painters (letterers, etc.); painters (plain painting); car inspectors, and freight car builders and repairers. Wood and steel car repairers are carried on separate seniority lists.

Union Pacific Stabilizes Employment

One of the most significant features of the Union Pacific agreement is the article providing for the increase or reduction of expenses with as little disturbance as possible to regularity of employment. Under this article both the managements and the local employees' representatives are charged with the responsibility to so regulate the bulletined hours of assignment as to reduce to the minimum the necessity for increasing or decreasing the number of men employed. For this purpose variations in the bulletined hours may be made by agreement from a minimum of seven hours a day for five days a week, or 35 hours a week, to a maximum of 58 hours a week. The assignments are to be so regulated as to provide as nearly as possible an average of 8 hours a day for the total number of working days in the year.

The overtime rules conform to the requirements of this article and instead of applying to time after eight hours, are made to apply after the normal bulletined hours, whatever they may be.

Stationary Engineers and Shop Laborers

The Union Pacific System has also negotiated a separate agreement with other shop, engine house and power plant workers, who are included in the Shop Employees' Association. This agreement, which is essentially the same as that applying to the mechanic, takes in the employees formerly associated with the International Brotherhood of Stationary Firemen and Oilers and the United Brotherhood of Maintenance of Way Employees and Railway Shop Laborers. The same system of detailed classification and varying rates of pay has been worked out for the employees within this group as that which applies to the mechanical trades.

Settling Grievances

By the terms of the agreement an adjustment board is created consisting of an equal number of representatives from the Association and the Union Pacific System lines. All differences of opinion as to the meaning or application of the rule, or as to the innocence or guilt of any employees disciplined, which are not satisfactorily adjusted between the general manager or lower officers and the representatives of the employees are to be referred to the adjustment board, the decision of which is to be final and binding on both parties. Should a dispute arise involving the revision of the rules or rates of pay, the agreement provides that such disputes be referred to the United States Railroad Labor Board for settlement, the decision of the Labor Board to be final and binding on both parties.

The Union Pacific agreement provides for the application of the so-called check off system to the collection of association dues. Provision is made, however, that upon giving 90 days written notice to the other, either party may withdraw from this arrangement.

Strike Situation Continues to Improve

Conditions in the shops of carriers that have adopted the so-called "Willard-Jewell" peace plan and of those that have met the strike issue by forming company associations or by continuing to recruit new forces are rapidly approaching normal. Strikers who returned to work under the settlement terms have done so with less signs of disorder than occurred last week when returning union men demanded the dismissal of non-union workers and the restoration of "bosses," jobs to former union men. Most of the returned men have resumed work in good spirits and there has been comparatively little interference with strike breakers employed by the roads during the course of the controversy.

The use of dynamite and bombs and outbreaks in the form of rioting and slugging continue to decrease as shown by the small number of such cases that have been reported. Among these were a bomb explosion in the Chicago, Burlington & Quincy roundhouse at Kansas City, Mo.; the

destruction of a car by a bomb in the Missouri, Kansas & Texas yards at St. Louis, Mo.; a fight which marked the return of strikers at Knoxville, Tenn., where 14 men received minor injuries and non-union men were driven from the shops before armed guards quelled the disturbance; a clash between guards and alleged strike sympathizers at Gretna, La., in which four were wounded; the bombing of a Central of Georgia trestle near Macon, Ga.; the bombing of the home of a Louisville & Nashville employee at Birmingham, Ala., and the bombing of an Illinois Central bunkhouse at Mattoon, Ill.

Nineteen roads, according to a statement made by John Scott, secretary of the shop crafts organization, have settled with the striking shopmen on the basis of the "Willard-Jewell" agreement. The following are the roads named by Mr Scott: the New York Central lines with subsidiaries, except the Indiana Harbor Belt; the Baltimore & Ohio; the Chicago, Milwaukee & St. Paul; the Chicago & North Western; the Seaboard Air Line; the Chicago, St. Paul, Minneapolis & Omaha; the Southern; the Mobile & Ohio; the Minnesota & International; the Minneapolis, Dakota & Western; the Monon; the Green Bay & Western; the Elgin, Joliet & Eastern; the St. Paul Bridge & Terminal; the Duluth, Winnipeg & Pacific; the Louisville Railroad & Navigation Company; the Macon, Dublin & Savannah; the Buffalo & Susquehanna, and the Western Pacific. Of the 19 roads which have reached a settlement, only 10 are Class I roads and the 19 represent a mileage of but 54,050 miles, or 23 per cent of the total mileage of the country.

In the East

The strike situation in the east changed little during the week. At the time of going to press representatives of the striking shopmen were in conference with officers of the Erie at Youngstown, Ohio, and it was stated that an early agreement was expected. On the other hand, several roads, including the New Haven, the Lehigh Valley and the Norfolk & Western, have definitely rejected the overtures of strike leaders looking toward conferences with them. E. J. Pearson on Monday gave out the following statement telling of his road's rejection of the shopmen's peace move:

Through the source from which the inquiry was received, definite reply has been made that the New Haven would not consider any such settlement. This last statement on behalf of the management of the New Haven should set finally at rest any expectation that the New Haven will depart from the position maintained throughout the strike, that no man who has left its service on strike will be re-employed except as a new man, if re-employed at all, and that no qualified man now or hereafter employed who desires to remain in the service will be displaced to make room for returning strikers.

Settlement of the shopmen's strike under the Willard-Jewell plan was effected last week by the Chesapeake & Ohio; the railroad refused, however, to make any adjustment with striking clerks.

The Association of Railway Executives announced on Tuesday that 372,000 men, approximately 88 per cent of normal forces, were now at work in the railway shops of the country.

Due to the great increase in anthracite production and the importance attached to its movement, the Lackawanna and the Lehigh Valley have extended their embargoes to prohibit the acceptance of all classes of traffic for movement anywhere except priority commodities.

Southern Tells of Terms Made With Striking Shopmen

Fairfax Harrison, president of the Southern Railway, in a statement given out to public officials of the territory served by his company, gave in full the terms of the settlement his road made with strikers. This settlement involved the acceptance of the Willard-Jewell agreement verbatim. Mr. Harrison said, in part:

In accordance with our announced intention, we began on August 15 to recruit forces, and from day to day added to the men in the shops until we had at work 7,599 men, equivalent to 65.7 per cent of a normal shop force. None of the craftsmen we enlisted sought or was promised a permanent job. They were mercenary troops and took service specifically as "strike-breakers." It is significant that many of them were striking shopmen from other railroads.

On September 14 the chairman of the strikers' committee asked us for a conference, advising that he was authorized to negotiate a separate peace. As the result of the ensuing discussion, a treaty was made, adopting verbatim the so-called Chicago agreement. This treaty is quoted in full on the next page.

The agreement speaks for itself. There is no understanding, express or implied, varying the terms of it.

The men return to work upon the reduced wages fixed by the Labor Board.

Willard Addresses B. & O. Employees

Daniel Willard, president of the Baltimore & Ohio, has issued an appeal to officers and employees of the company asking for a genuine spirit of co-operation in handling the heavy traffic which the road is called upon to move. The statement reads in part as follows:

During the past ten weeks, owing to the fact that a large number of the men employed in the shops were on strike, the Baltimore & Ohio Company has been obliged to curtail its service to a considerable extent. Much through freight, which customarily would move over the Baltimore & Ohio rails, has been diverted to other lines. The pressure for coal since the end of the strike of the bituminous coal miners has also added to our difficulties and made it impossible to fully serve shippers located on the lines of the Baltimore & Ohio and at some places dependent wholly upon this company for transportation. Nevertheless, the shippers have shown great patience under trying circumstances.

Now that the Baltimore & Ohio men have returned to work, the public will expect an immediate resumption of normal operations. This will, of course, be impossible, no matter how hard we may try to meet the requirements of the situation. We cannot in a few days recover what was lost in a period of more than two months. However, by a united effort and with a determination on the part of everybody connected with the Baltimore & Ohio System to restore normal conditions at the earliest possible moment, in order that we may give to the public the service it has a right to expect, a remarkably quick recovery can, without doubt, be made.

The officers and men, upon whom an unusual burden has fallen during the strike, have undergone a great strain. The management realizes this and appreciates the efforts and sacrifices they have made. The men who have been idle have experienced a loss in wages equal relatively, perhaps, to the severe loss which the company has sustained in consequence of the strike. To regain the business which naturally and normally belongs to the Baltimore & Ohio, to handle the business which has been held back, but will now move, together with the increase which we must look for, due to a lessened coal production during the past summer, is a task which we must now unitedly attempt to perform. It is a big task, but one which I believe we can accomplish, and accomplish quickly, if there is a genuine spirit of co-operation among all connected with the Baltimore & Ohio service.

Sand and Gravel Producers Want More Cars

WASHINGTON, D. C.

REPRESENTATIVES of the National Association of Sand and Gravel Producers at a hearing before Commissioners Aitchison and Cox of the Interstate Commerce Commission at Washington on September 21 asked that the commission modify its priority orders in favor of coal so as to remove all preference in the use of open top cars except in favor of the most essential users of coal. They expressed appreciation of the modification made in Service Order No. 25 allowing the use of open top cars for other commodities in the direction of the mine, but maintained their objection to any "rules" restricting their use of open top cars.

Most of the witnesses asserted that there was no serious emergency in the coal situation and generally said that there was plenty of coal to be had in their communities, although

at a high price, and they thought that an unreasonable number of cars of coal were held under load. This they were inclined to attribute to speculative holding, although it developed that the principal points they had in mind were those where large numbers of cars are required to keep up a steady movement. It was stated that from 14,000 to 20,000 cars were being held at Cleveland and Commissioner Aitchison said that experience had demonstrated that about that number were needed to avoid delay in dumping at the docks for lake shipment. Whenever a witness referred to the holding of cars under load for higher prices, Commissioner Aitchison asked for specific information, saying that the commission desired to watch that kind of cars because they could be used for other purposes, but in general the testimony along this line was rather vague.

Commissioner Aitchison asked various witnesses if they had not been warned well in advance of the probability of coal shortage and car shortage, to which the reply was that while they had expected these things they had not been warned of a priority order and that in any event it was generally impracticable to ship and store roadbuilding materials in advance. To those who insisted that there was no fuel emergency because they had observed no shortage of coal, Mr. Aitchison pointed out that the exercise of the priority orders had relieved the emergency to a considerable extent and that that was the purpose of the orders.

Commissioner Aitchison also displayed great interest when many of the sand and gravel men stated that they had been told by railroad operating officials that they could meet the requirements both for coal and for roadbuilding and construction materials, if given a free hand. One witness stated that L. W. Baldwin, vice-president of the Illinois Central, had made such a statement, but after Mr. Aitchison had apparently taken a note of the name no more names were forthcoming. Mr. Aitchison said that the commission was interested in finding out which railroad men were talking to shippers in one way while their executives were talking to the commission in another, and said that the Illinois Central had recently come to the commission and stated its inability to get enough fuel for its own purposes and had been given a Class I priority order for coal from the West Kentucky fields. He said that during the many years of his experience as a state and federal commissioner, he had been told thousands of times by shippers of railroad officers who had said they could do various things if the commission would only let them.

A representative of the state highway officials urged that the commission remove all restrictions on the use of cars except for coal necessary for the comfort of the people, saying that no industry should be shut down and that all should be given an opportunity to earn enough to pay their coal bills. Mr. Aitchison pointed out that if the commission should grant the request 100 per cent there was no assurance that the sand and gravel producers would get all the cars they desired, because of the keen competition of other industries for the cars. When the witness said that the shippers expected to take their chances with the general car shortage, but that the commission's conscience would be more clear if it removed all "rules" which created the shortage of cars for any industry, Mr. Aitchison said that his conscience would be clear if he were certain that people would not freeze this winter. He also pointed out that while many governors and other branches of the state governments are flooding the commission with demands for coal, the highway officials representing other branches are presenting a totally inconsistent position and that it would be helpful if the state authorities would get together and help in pointing out to the commission where the public interest lies.

To the repeated statements that there is plenty of coal, Mr. Aitchison said that as soon as the commission is convinced that every one has all the coal they need, it will be very glad to relax its orders. He pointed out that the sand and gravel industry is not the only one that is complaining of car shortage and asked if the witnesses had any figures to demonstrate they were not getting their fair share of the cars, but none were forthcoming. When reference was made to an accumulation of 600 unbilled cars of coal at Chicago, he said the commission had carefully investigated this report and had ascertained that the number was no more than was customary and necessary to handle the business in a community as large as Chicago.

Cab Signals In France

The Paris, Lyons & Mediterranean now has about one-third of its passenger locomotives fitted with audible cab signals for repeating the indications of distant signals; and the management plans to increase this number steadily. This company began its first test with audible cab signals 20 years ago, on four distant signals fitted with contact bars, and in 1908 five new types of audible cab signals were put on 12 engines, and apparatus was fixed at 16 distant signals. From these tests the present type was evolved, which was applied in 1912 on 140 express engines and at the 268 distant signals of a main double track line, 255 miles long.

These experiments came to a standstill during the great war, but they were resumed in 1920; and installations are now being made extensively.

An officer of the road has sent in the following data:

Locomotives in Service

Passenger	1,556
Passenger & freight	831
Freight	2,101
Switching	402
	4,890

Locomotives Fitted and to be Fitted with Cab Signals: Totals to Date

	August, 1922	Dec. 31, 1922	Dec. 31, 1924
Passenger	634	735	1,335
P. & F.	10	346	822
Freight	...	...	1,276
Switching	...	...	...
All classes	644	1,081	3,433

The contact bars (crocodiles) on the roadway are placed at distant signals only; and the number of distant signals equipped with bars at the end of August, 1922, was 1,077. This total will rise to 1,479 at the end of the present year, and up to more than 2,600 at the end of 1924, including every distant signal on all main lines and on the most important branch lines (about 3,000 miles).

When passing over the contact bar of a distant signal which is set against the train, an electro-pneumatic relay on the engine is energized; a pneumatic valve liberates steam so as to sound a larger whistle on the top of the cab, and, at the same time, a special tap is registered on the speed recorder. If the engineman, before passing over the contact bar, sees the visual set against him he must pull a small lever to register another type of special tap on the speed recorder, to show that he has seen the signal and has read it correctly. This arrangement is designed to keep the engineman watchful all the time; he must not depend upon the cab signal.

One of the Six New superheated locomotives which have been put into operation on the Glasgow & South Western Railway (Scotland) during a trial run between Glasgow and Carlisle, attained a speed of 69 miles an hour with a load of 325 tons. The normal maximum load for a single engine on the section at which this speed was attained is 240 tons. The locomotives are of the Baltic type with six coupled driving wheels and a two-wheeled bogie at each end, and are 47-ft. 7-in. in length, with a weight of 99 tons.

President Rea (sixth from left) and a Group of the Associates on the Field Just Before the Awarding of the Prizes

Pennsylvania System Holds Third Annual Field Meet

The Breaking of Nine System Records Was Witnessed by Employees from Thirteen States

THREE LARGE RAILROADS had developed system athletic programs in pre-war years, which culminated each year in system field meets—the Pennsylvania Railroad (Lines East), the Erie and the Missouri, Kansas & Texas. Naturally these were discontinued after our entry into the World War. The Pennsylvania System, after its reorganization following the period of federal control, inaugurated a system athletic program similar to that which had formerly existed on the Lines East; on Saturday, September 23, it held its third annual system field meet at Altoona, Pa. It was a tremendous affair; more than 700 athletes took part in the 35 events; 16 special trains, requiring about 180 passenger cars, brought visitors to Altoona from 13 states; in the afternoon the cricket field, surrounded by grand stands and forming a huge bowl, must have held at least 30,000 spectators; 12 employees' bands, distributed throughout the stands, added to the interest and excitement.

While this represented the climax of the season's efforts, it must be remembered that thousands of athletes had been in training during the season and had taken part in the preliminary events in the various localities, divisions and regions.

The really remarkable thing about the affair was that with the great influx of visitors and the complicated program with many events, there was little if any confusion. The meet was so thoroughly organized and was so capably administered by those in charge of the actual carrying out of the program, that the schedules were closely adhered to. With all of the noise and excitement the best of order was maintained, both among the contestants on the field and the spectators in the stands. The crowd seemed to be particularly good-natured and the 150 uniformed Pennsylvania Railroad police gathered from all over the system, were mainly concerned in helping to make the visitors feel at home by courteously directing or otherwise helping them. Pickpockets and rowdies were notable for their absence and not an intoxicated man was seen during the day. The contestants and their backers showed the best of sportsmanship in spite of close decisions. The weather was perfect and the conditions ideal for making records.

It was necessary to carry on some of the events at a distance from the cricket field, which was the central point of the activities and only a comparatively short distance from the station and the business section of the city. For instance, the swimming events were held at the athletic field at Tyrone, Pa., a special train being required to take the contestants and spectators to and from Altoona. The men's tennis matches were held at the Altoona golf club, golf on the Blairmont Country Club course at Hollidaysburg, trap shooting at South Altoona, and rifle shooting at the East

A Close Finish

Altoona range. This rather widespread distribution of the events might have caused some inconvenience, had it not been that hundreds of the citizens of Altoona generously loaned their automobiles for the day. Prominently displayed signs in the vicinity of the railroad station indicated where automobiles could be found to take the visitors to the particular events in which they were interested.

The large number of special trains which were necessary required special provisions to relieve congestion at the Altoona station. Relief was afforded by having the visitors take their trains several blocks east and west of the station, depending upon the direction in which they desired to travel.

Plentiful traffic signs on buildings and street corners were posted for the direction of visitors. Moreover, special regulations for automobile traffic were put in force for the day and the local police were assisted by Pennsylvania employees in seeing that this traffic was properly directed on the important thoroughfares. The problem of feeding the visitors was relieved by the cordial co-operation of the various

Other events—circling bases, running high jump, running broad jump, shot put, quoits, horseshoes and tug-of-war.

Records Smashed

Nine system records were smashed, as follows:

100-yard dash (open), held by Garland of Harrisburg, :10⅗; won by Eberts, Philadelphia, in :10, flat.

50-yard dash (girls), held by Pauline Kennedy, Pittsburgh, :07, flat, won by Schenkel, Philadelphia, in :06⅘.

220-yard dash (open), held by Garland of Harrisburg, :23⅘; won by Eberts, Philadelphia, :23⅗.

50-yard dash (girls' novice), record was :07; won by Zelda Murphy, Newport, in :06⅘.

Circling bases, held by Plate, Baltimore, :15, flat; won by E. L. Maurer, Pittsburgh, in :14⅘.

880-yard run (open), held by Poor, Harrisburg, 2:05⅕; won by Kelly, Philadelphia, in 2:03⅕.

440-yard dash, held by F. Trout, General Offices, :56, flat; won by Trout, Altoona Middle Division, in :52⅘.

Mile run, held by Poor, Harrisburg, 5:00, flat; won by Siegmund, Harrisburg, in 4:46⅘.

The Middle Division Band

churches and other organizations in providing lunches in the churches or other buildings, or in vacant lots near the cricket grounds.

Several emergency hospitals were provided near the athletic grounds and the railroad station. Comparatively few cases had to be taken care of, except at the athletic field, several of the athletes being overcome because of overexertion and the fact that the weather was more than ordinarily dry and bright.

The various events included the following:

Swimming—100-yd. (novice), 100-yd. (open), 220-yd. (novice), 440-yd. (open), plunge for distance.

Trap shooting, rifle shooting and golf.

Tennis—girls' singles, men's singles, women's doubles, men's doubles.

Track events—100 yd. dash (open), 100-yd. dash (novice), 220-yd. dash (open), 440-yd. dash (novice), 440-yd. dash (open), 880-yd. run (open), 880-yd run (novice), mile run, mile relay. For boys: 50-yd. dash and 100-yd. dash. For girls: 50 yd. dash (novice), 50-yd. dash (open), 75-yd. dash, and quarter-mile relay.

Broad jump held by R. Juday, Ft. Wayne, 20 ft. 10¾ in.; won by R. Juday, 21 ft. 5 in.

Shot-put, held by P. Nesser, Columbus, 43 ft. 5½ in.; won by Thurman, Baltimore, 46 ft. 6 in.

There has been considerable rivalry between the various regions; the Eastern Region, however, won over its competitors by a wide margin. The standing in points at the close of the meet was as follows:

	Points
Eastern Region	181
General Office (Philadelphia)	55⅝
Central Region	55⅓
Southwestern Region	31½
Altoona Works	19⅝
Northwestern Region	18½

After the field events and before the baseball game President Rea personally handed the medals and trophies to the winners of the various events.

Base Ball Game

The final event of the day was the ball game between Altoona works and Fort Wayne; this was the first of a series

of three games to determine the system championship. The Altoona works had a good lead during the first eight innings. Fort Wayne rallied in the last half of the ninth and tied the score, 4-4. No runs were made in the tenth inning, after which the game was called because of darkness.

A progressive story of the field meet was wired direct from the top of one of the grand stands on the field to the important

Winning Team, Girls Quarter-Mile Relay Race. Represents Philadelphia General Office. Miss Betty Schenkle, Left, Also Won the 50 and 75-Yard Dashes for Girls

parts of the system. The newspapers generally in cities with many Pennsylvania System employees gave a generous amount of space to the event. The Pittsburgh Post, in particular, had several representatives at the meet and its profusely illustrated story in the Sunday edition covered several pages.

Coal Production

NORMAL PRODUCTION at the anthracite mines during the week of September 18-23 brought the total output of all coal, anthracite and bituminous, up to about 11,650,000 net tons, according to the weekly bulletin of the Geological Survey. This is still somewhat below the amount required to meet current consumption and lake shipments and at the same time to rebuild consumers' stocks.

The total output of anthracite during the first week after the strike was 1,064,000 net tons and during last week (the second following the strike) it was about 1,850,000 net tons.

Production of bituminous coal last week was estimated at from 9,600,000 to 9,900,000 tons, a slight increase over the week preceding. Loadings on Monday, September 18, were 37,330 cars, the highest since the close of the strike. On Tuesday, however, they dropped to 29,496, on Wednesday to 28,746, on Thursday to 29,483; on Friday to 27,396.

The present output is above that of the corresponding period of the year of depression, 1921, but is below that of the other years shown. The following statement gives production in the second week of September of the last five years:

1918	12,542,000	1921	8,187,000
1919	11,046,000	1922	9,661,000
1920	10,685,000		

The present condition of the coal market resembles the three years 1918 to 1920, more than 1921. In those three years, as now, demand for soft coal was active enough to absorb all the coal that could be transported.

Preliminary returns on daily car loadings at anthracite mines show remarkable speed in resumption of mining. During the first week loadings increased rapidly from less than 1,000 cars on the first day to a total of approximately 20,000 cars for the week. During the second week beginning with 5,179 cars on Monday, loadings increased to 6,767 on Wednesday, but dropped off to 5,912 according to preliminary returns for Thursday. The indicated total for the second week is about 35,000 cars, which compares favorably with the weeks immediately following the "miners' vacation" in the fall of 1920. The average weekly rate before and after the vacation was approximately 36,000 cars with a maximum in the week of October 23, 1920, of 37,300 cars.

The cumulative production to September 16 this year is 23,325,000 tons; with an estimated production of 1,850,000 tons last week the total output to date is approximately 25,175,000 tons as against 67,759,000 tons in 1921. The present year is about 42,589,000 tons behind last year.

The all-rail movement of soft coal to New England through the six principal Hudson gateways increased to 3,009 cars, and of anthracite to 438 cars, in the week ended September 16. In addition there were also shipped through Rouses Point 21 cars of bituminous coal in the week ended September 9, and 69 cars of bituminous and two of anthracite in the week ended September 16.

Statistics collected by the Massachusetts Fuel Administration give the quantity of anthracite received in New England in the present calendar year to August 31 as 3,345,000 net tons, against an average of 7,700,000 in corresponding periods of the six years preceding.

Receipts of bituminous coal from January to August, inclusive, this year were 10,805,000 net tons as compared with 11,020,000 tons in the same period of 1921, and with an average of 14,880,000 tons for the corresponding periods in the six years preceding. The bituminous coal trade this year is notably different from other years in that a larger part of the supply came from tidewater instead of by rail.

Shipments of bituminous coal through Hampton Roads in the week ended September 16 increased slightly over the previous week, but remained as for several weeks past, at about 300,000 net tons. Dumpings for the week totaled 307,426 tons as against 298,697 tons in the week before. Cargo coal for export and for New England decreased whereas coal for other coastwise destinations and bunker coal increased.

The movement of soft coal up the lakes from ports on Lake Erie finally touched the million-ton mark in the week ended September 17. Final returns have not yet been received, but preliminary daily reports on cars dumped indicate an increase of 71 per cent over the week preceding, when the piers handled 683,000 tons of cargo coal and 35,000 tons of vessel fuel, a total of 718,000 tons.

A further increase marked dumpings of lake coal during last week. The total handled at the piers on the three days September 18 to 20 showed an increase of 59 per cent over the corresponding days of the previous week. This indicates that lake coal is now going forward at a rate close to the maximum of any time in the past.

The total cargo dumped from the beginning of the season to September 17 was in round numbers, 7,000,000 tons. This was 10,100,000 tons behind 1921, and even 6,170,000 tons behind 1920, when, as now, priority was given to coal shipped to the lakes.

Final statistics of production as reported to the Geological Survey by the bituminous operators show 415,921,000 net

tons in 1921. The Survey's preliminary estimate, published January 7, 1922, was 407,000,000 tons. The error in the estimate was thus 2.2 per cent. These figures are exclusive of the output of country banks and of some wagon mines. They include, however, many small operations that fall within the definition of wagon mines but that operate steadily year after year. The tonnage not included would amount to little in a year of acute depression such as 1921. Were statistics available for the small mines not included, the total output would be raised by not much over 1,000,000 tons.

Contrary to what might have been expected, the number of employees increased in 1921. There was less work but more men to share it. The total employed at bituminous mines was 663,754—an increase of 24,000 men. This figure is not the average number of men at work at any one time, including the weeks or months when the mine may have been shut down; it is rather the number of men on the working force of the mine when it was in operation. Since the effect of the business depression upon the demand for coal did not become acute until February or March, the great majority of commercial mines got at least a few weeks' operation during the year, and their working forces were thus counted in the total number of employees. By August, 1921, so many mines had closed down that the total number of men drawing wages in one week had fallen to somewhere between 500,000 and 520,000. Examination of the individual returns shows that in many districts the men laid off at small mines found employment at the larger mines. In fact, in some districts, such as Illinois and Pittsburgh, the coal mines absorbed men discharged by the factories or railroads.

The increase in number of employed was confined to the tonnage workers. The number of day-men decreased in almost every state. The total number of surface employees dropped from 110,000 to 96,000, and of underground daymen from 174,000 to 168,000. This shift in occupations reflected, no doubt, the intense competition of a depressed market, as operators sought to eliminate all expenditures not contributing immediately to the mining of coal.

The later revised figures based on complete reports for the week from the railroads indicate a total production of 11,500,000 tons of coal, of which about 10,000,000 tons was bituminous and 1,840,000 was anthracite. The total coal loading for the week was 212,110 cars, or 16,968 cars over the preceding week. Loading on Saturday was 24,756 cars of bituminous and 5,588 cars of anthracite. However, the loading during the last two days of the week was less than it had been during the corresponding days of the week before.

More coal was transported to Lake Erie ports for transshipment up the lakes during the four days ending with Sunday than in any corresponding previous period. An average of 4,081 cars was received and dumped daily. The railroads are now transporting to Lake Erie points considerably in excess of 1,000,000 tons of coal a week, the average fixed by the federal fuel distributor as the amount that should be received at the lake ports to insure an adequate supply in the Northwest this winter. For the week ended Saturday 27,959 cars carrying 1,400,000 tons were received During the week before the receipts were 21,431 cars and during the first nine days of September 16,688 cars. As a result of the increased movement last week the railroads have not only made up for lighter shipments earlier in the month, but have brought the weekly average to more than 1,100,000 tons. Reports received by the Car Service Division on Tuesday indicated that by the close of Wednesday this week 1,-074,000 tons of coal would be received at Lake Erie ports.

It was announced at the White House on Tuesday that reports received by the President indicate that coal is being dumped at the lakes in excess of the ability of the lake carriers to transport it and that while there will be some shortage of coal this winter the situation is being relieved beyond expectations

The Pennsylvania Women's Aid

The Women's Aid of the Pennsylvania Railroad System was described in the *Railway Age* of April 15 last, and in the issue of June 24 there was a notice of its extension to the Northwestern region. The membership has been increased so that now the New Jersey Chapter alone has 10,236 members, and the eastern and central regions together more than 50,000. The New Jersey Chapter will have its second annual entertainment and dance at the Seventy-first Regiment Armory, New York City, on Thursday evening, October 12. The number of employees on the New Jersey Division of the road is more than 26,000 and among these men several thousand tickets for the entertainment have already been sold.

The "Women's Aid" is composed of the wives and daughters of Pennsylvania railroad officers and employees. It is an organization "to organize the women of the families connected with the Pennsylvania Railroad, so that they may know each other, and when occasion may require, to render aid and sympathy in such a manner as may be most helpful."

The Women's Aid succeeded what was formerly known as "The Pennsylvania Railroad Women's Division for War Relief," which was created during the World War as a preparedness society. In July, 1920, a final meeting was held in the Railroad Y.M.C.A. at West Philadelphia, at which time a memorial tribute in honor of the Pennsylvania Railroad hero dead was unveiled. This meeting marked the end of the Women's War Relief.

During the year 1921 over 2,200 families were aided financially and otherwise, and personal calls were made by members upon no less than 11,547 families of employees.

The New Jersey Division Chapter is headed by Mrs. C. I. Leiper, wife of the general superintendent of that grand division. The workrooms at the Pennsylvania Station, New York, constitute the center of activities for New Jersey. Here the members meet each Wednesday and make garments for babies, small children and others left in temporary need through illness or death. Funds for this work are raised primarily from entertainments and by voluntary contributions, as the dues of members are only 25 cents a year. Monthly meetings are held the first Wednesday of each month in the Y.M.C.A. auditorium at the Pennsylvania Station in Manhattan. These meetings have been very enjoyable, promoting the "family feeling" to a marked degree.

A report of ten cases of assistance recently rendered by the New Jersey Division Chapter contains the following:

Case No. 1.—The wife of a freight trainman was sent to the hospital. Her board, nurse and all expenses were paid, including those incident to a serious operation. Visits were continually made to the family, and donations of money extended until the patient was released from the hospital. This woman has now fully recovered.

Case No. 2.—An employee of the master mechanics department was given financial assistance when his child was killed by an automobile, in addition to which suggestions were offered from a legal standpoint.

Case No. 3.—Monthly milk bill is being paid for the widow of a former employee.

Case No. 4.—Flowers were sent to a sick employee of the ticket office.

Case No. 5.—Rent is being paid and monthly allowance given to the family of a ferry employee who was seriously injured.

Case No. 6.—Three months' rent and an allowance extended to a pensioned employee.

Case No. 7.—Six months' rent paid for an employee who is hopelessly ill.

Case No. 8.—A committee has been formed to assure proper recreation being extended to the paralyzed wife of a machinist

Case No. 9.—An employee of the master mechanics department was extended financial assistance, also large box of provisions and groceries sent to his family, in addition to which arrangements were made to send the entire family—father, mother and daughter—to the country in an endeavor to have them regain their health

Case No. 10.—An employee who died recently, left a wife and a three-days' old baby, without adequate means of sustenance. His wife is receiving a weekly allowance, which will be continued for at least one year.

Mrs. W. W. Atterbury, wife of the vice-president (in charge of operation) of the Pennsylvania Railroad System is director of the "Aid" for the entire system.

Federal Court Sustains Daugherty Injunction

Judge James H. Wilkerson's Ruling Upholds Government's Charges—Employees to Appeal Case

IN AN EXHAUSTIVE opinion, buttressed with many Supreme Court decisions, Federal Judge James H Wilkerson on September 23 sustained all of the provisions of the Daugherty injunction restraining striking railroad shopmen throughout the country from committing any acts which might be interpreted as interfering with interstate commerce At the same time the court denied the motion entered by Attorney Donald H Richberg, counsel for B. M. Jewell and John Scott, president and secretary, respectively, of the Railway Employees' Department of the American Federation of Labor, for dismissal of the temporary injunction granted September 1 on the petition of Attorney-General H M Daugherty.

Not one scintilla of evidence, the court held, had been presented by the defendants to refute or deny the abundant proof produced by the government of a nation-wide sabotage plot to destroy commerce. In ruling that any acts committed in furtherance of this alleged conspiracy, whether lawful or unlawful in themselves, might be restrained, the court upheld those provisions of the temporary injunction declared by the strikers to be an abridgment of their constitutional rights of free speech, writing, and assemblage.

In regard to the provisions of the injunction which the defendants complained of as curtailing constitutional rights, Judge Wilkerson said:

"It is asserted by the defendants to permit some of the acts against which the complainant seeks an injunction is to deprive them of fundamental rights guaranteed by the constitution. This contention has been answered by what has been said with reference to the unlawful purpose of the conspiracy.

"'A cardinal error of defendants' position,' to use the language of the Supreme Court, lies in the assumption that 'the right is so absolute that it may be exercised under any circumstances and without any qualification; whereas, in truth, like all other rights that exist in civilized society, it must be exercised with reasonable regard for the conflicting rights of others.'

"The record in this case shows that the so-called peaceable and lawful acts are so interwoven with the whole plan of intimidation and obstruction that to go through the formality of enjoining the commission of assaults and other acts of violence and leave the defendants free to pursue the open and ostensibly peaceful part of their program would be an idle ceremony."

In the preamble of his opinion, Judge Wilkerson reviewed the bill of complaint filed by the government and the vast amount of documentary evidence introduced in support of Attorney-General Daugherty's contention that a nation-wide plot existed to wreck trains, intimidate workmen and cripple rolling stock.

"In disposing of this motion," the opinion reads, "it may be well at the outset to emphasize what this case is not. It is not a case between an employer and employees, or between employers and employees, or between persons employed and persons seeking employment, involving or growing out of a dispute concerning terms or conditions of employment. It is not a private bill to enjoin indirect injury, as one caused by a secondary boycott, to the property of the complainant.

"It is, to use the language of Circuit Judge Baker, 'in the public interest by the government as *parans patric* to enjoin an unlawful conspiracy or combination in restraint of trade.' It is the conspiracy which is inflicting the public injury for which redress is sought.

"The right of the United States to maintain a bill like this under its general equity jurisdiction is no longer open to debate. In the Debs case the court held that the national government is charged with the duty of keeping the highways of interstate commerce, including railroads, free from obstruction."

The Application of the Clayton Act in This Case

Judge Wilkerson quoted various authorities to refute the contention of the defense that the power of the courts to deal with combinations such as Attorney-General Daugherty charges exist has been curtailed by certain provisions of the Clayton act.

"The law is clear," the court continued, "that if the dominating primary purpose of the combination is to restrain trade, or to do things unlawful in themselves and which by reason of their inherent nature operate to restrain trade, the purpose of the combination is unlawful, and that purpose may not be carried out, even by means that otherwise would be legal.

"In cases of this kind the proof is of necessity largely circumstantial. Acts must be taken in their relation to each other. Men must be presumed to intend the natural consequences of their acts. Proclamations of non-participation and exhortations to keep the peace cannot relieve from responsibility for a series of acts so interrelated and interwoven that they bear on their face proof of design and plan."

Judge Wilkerson referred to the fact that not one of the defendants in testifying answered the government's bill of complaint.

"Two have filed motions to dismiss," he said, "and have presented affidavits which leave a large number of averments of the bill unchallenged on the record. The fact that the defendants have been acting in combination is not denied.

"On the contrary, the defendants themselves have produced evidence of the closest association and co-operation on the part of the defendant organizations. That the officers of the unions gave directions concerning the strike from the outset is likewise admitted. The only material question really in dispute on the record is the responsibility in law of the defendants for the large number of unlawful acts shown to have been committed, the most of them by unknown parties.

Judge Cites "Reign of Terror"

"Notwithstanding the warnings against acts of violence set out in the instructions of June 27, 1922, there began throughout the country a series of depredations which rapidly developed, on some portions, into a veritable reign of terror. Railroad bridges were dynamited, spikes were removed from rails, obstructions were placed upon railroad tracks, bombs were exploded on tracks and in railroad yards and hurled at moving trains.

"Regardless of the instructions that no injury must be inflicted upon property, there was sabotage on a large scale. Engines, cars and equipment were tampered with, and innumerable acts of malicious mischief committed which endangered the lives of both passengers and those operating trains.

"These unlawful acts are shown to have been on such a large scale and in point of time and place so connected with the admitted conduct of the strike, that it is impossible on the record here to view them in any other light than as done

in furtherance of a common purpose and as part of a common plan.

"This record does not permit the conclusion that those who are at the head of this combination did not actually know that these things were being done, and that they were the direct result of the methods by which the strike was being conducted. And if they did not actually know, they were charged with such knowledge."

Judge Wilkerson quoted two communications sent out by the strike leaders on Aug. 28, urging the men to continue to fight this "industrial war" with other methods than "kid gloves" and "soft talk."

"These defendants will not be permitted, upon the record here, to deny responsibility for these unlawful acts," the court continued. "They will not be permitted to continue acts which, even though they may be peaceable and lawful in themselves, it has been demonstrated, are only a part of a program of unlawful conduct and are done for the accomplishment of an unlawful purpose.

"Defendants assert," the court continued, "as a ground against the granting of the relief sought by the complainant, that the strike was a defensive measure against a plot of the railway companies to destroy the unions. The argument seems to be that the defendants are justified in inflicting upon the public any injury which it may be proper for them to inflict upon their adversaries in this conflict.

"It must be remembered, however, that this is a suit brought for the benefit of the public. Restraint of trade may not be adopted as a weapon in industrial warfare. The court must act upon the case now before it and give its aid to the removal of the obstructions to commerce which are found to exist."

Judge Wilkerson then referred to the motion presented by Attorney Richberg to dismiss the bill on three grounds, the first two attacking the sufficiency of the bill and the third charging that the relief sought "was obtained for ulterior and unlawful purposes upon misrepresentation and suppression of matters of fact and law, the disclosure of which was required by good faith."

"During the hearing, which has lasted almost two weeks," the court resumed, "the defendants have neither offered nor suggested a scintilla of proof tending to establish this averment in the motion to dismiss. The restraining order was entered after a hearing at which both the averments of the bill and the questions of law involved were fully and fairly presented. It follows, therefore, that the motion to dismiss the bill must be denied."

Federal Judge Enters Formal Injunction Order

Judge Wilkerson on September 25 formally entered the temporary injunction sought by Attorney-General Daugherty. Except for a few minor changes the judge put into effect without modification the draft submitted by the attorney-general.

Immediately following the court's action, attorneys for the shopmen suggested the hearing on the final restraining order be held before three judges of the Circuit Court of Appeals because of the importance of the case as a legal precedent. This plan calls for the filing of a certificate by the attorney-general stating that the case is of supreme public importance and is based on a precedent established in 1903. This certificate then gives the case precedence over all other business before the court. Judge Wilkerson said he had no power to expedite the hearing as suggested, but Blackburn Esterline, assistant solicitor-general, promised to submit the proposal to Attorney-General Daugherty at once.

Respecting the form of the final order, Mr. Richberg refused to make any suggestions. He left a statement with Judge Wilkerson in which he contended that he could make no suggestions as to the form or wording of the order, a move which in his opinion would lend sanction to what he regarded as an unlawful ruling.

The final appeal for the granting of the temporary injunction was made by Attorney-General Daugherty himself, who, appearing before the court unexpectedly on September 21, said:

This order does not question the right of a man or any number of men to strike, but it restrains from the unlawful right to strike back. The enforcement of this decree will not deprive any man of any lawful right. On the other hand, it will afford protection to every man and to all men equally who come within its operation in each and every lawful right.

The law of this country, as applicable to cases of this kind, where transportation and the carriage of the mails are involved, is somewhat different from the law where so-called industrial disputes and strikes are involved. It is the duty of the Government to compel railroads to furnish transportation. If the railroads for any reason are not able to do so because of interference, it is the obligation of the Government to step in and prevent any and all interference.

The life of industry, human life, the life of the Government itself, depends upon industrial peace, and industrial peace depends upon uninterrupted interstate commerce and the transportation of the mails. In case of aggravated and unlawful interference with transportation, when the railroads on account of circumstances conclusively proven to have existed in this case are interfered with, what can the Government do?

First, the Government can, as in this case it did, call on all persons responsible for the interference to cease and desist from interference. That failing, as it did fail, the Government must decide promptly whether it will resort, as it did in this case, to civil proceedings for an injunction to restrain those who persisted in the interference.

Secondly, the Government can step aside supinely in disregard of its duty, thereby contributing to the continuation of the interference and inviting every criminal act destructive of human rights, of property, of life, and of transportation, and let those who bear the torch and hold the dagger proceed in the commission of such crimes against life, property, liberty and government.

That would have involved years of prosecution, and encouraged men to violate the law. It would have encouraged depredations which no civilized country and no Christian people will tolerate.

Third, the Government could call for troops and legally mow down and kill—how many? Nobody knows, how many American citizens!

Fourth, the Government could have adopted a policy of innocuous complacence and let anarchy reign and the mob rule.

Attorney-General Calls Court Decision Victory for Government

In commenting on the ruling Mr Daugherty said:

The decision was a complete and clear cut victory for the Government. It settles the law with respect to strikes which affect the transportation of passengers and property in interstate commerce and the mails. The Government will see to it that any decree entered in pursuance of the decision shall be adhered to. It will also see to it that, as quickly as possible, the railway companies shall comply with the acts to regulate commerce, and any decision or orders of the Interstate Commerce Commission with respect to service or equipment, as well as all decisions of the Railroad Labor Board relating to wages or working conditions.

Erie Piers 20 and 21, New York—Where Practically All Pacific Coast Perishables on the New York Market Are Auctioned Off Each Day

Railroads Oppose Reduced Rate Mileage Book

Would Reduce Revenues and Unduly Discriminate Against Ordinary Traveler

WASHINGTON, D. C.

THE ISSUANCE of interchangeable mileage tickets or scrip coupon books at rates below the prevailing rate of passenger fare was opposed by representatives of the railroads at a hearing before Commissioner Meyer of the Interstate Commerce Commission at Washington on September 26 and 27. Commissioners Cox and Lewis, Chief Examiner R. E. Quirk and M. O. Lorenz, chief statistician of the commission, also sat with Commissioner Meyer. The law recently passed by Congress directs the commission to require the issuance of interchangeable mileage or scrip coupon books "at just and reasonable rates" and to prescribe rules and regulations therefor, but authorizes it to exempt any carrier in whole or in part where particular circumstances justify it. The commission has instituted a proceeding of investigation with a view to the issuance of such order or orders or other requirements as may be proper and necessary to carry the act into effect. At the outset H. W. Bikle, who appeared as counsel for the railroads, stated that the carriers desire to reserve the right to contest the constitutionality of the law or of any order the commission may issue.

C. A. Fox, chairman of the Central Passenger Association, presented a general statement on behalf of 168 roads, operating 225,000 miles of line, and including 149 Class I roads and 19 Class II roads, in the form of answers to seven questions propounded by the commission in announcing the hearing. He was followed by W. P. Rose, auditor of passenger accounts of the Southern Railway, who described in detail the additional accounting that would be required if a reduced rate mileage or scrip book were placed in effect. He estimated this additional accounting expense at $1,680,000 per annum. A large number of roads, principally short lines, also presented testimony in behalf of their applications which have been filed with the commission for exemption from the provisions of the act.

An abstract of Mr. Fox's statement follows:

No Advantage in Sale of Both Mileage and Scrip

"There is no public advantage in the sale of both mileage and scrip tickets. The present forms of scrip coupon tickets, now issued generally in $15, $30, and $90 denominations, fully meet the requirements of the new law, although such forms of tickets have never been satisfactory to the carriers.

"These scrip books are equivalent to currency, coupons being detached to cover the value of transportation furnished at normal one-way fares. The coupons are accepted by conductors on trains; but, if holder desires to travel between two competitive points, by a carrier or carriers whose distance is longer than the direct or short line, coupons of value equivalent to the through fare via the direct or short line are detached by the ticket agent, and a passage ticket of ordinary one-way form is issued in exchange therefor. The coupons are also accepted for baggage charges (excess weight, excess size, excess valuation, storage and transfer).

"There is not a convenience or advantage accruing from the use of mileage tickets that will not be more completely and satisfactorily taken care of, both from the view point of passengers and of the carriers, in the existing forms of scrip books. On the contrary, there are complications and additional expense inseparable from mileage tickets avoided by the use of scrip books. Where rate levels vary, as they do over considerable mileage in different sections of the United States, it would be necessary, if mileage tickets were used, to detach sufficient additional coupons to properly compensate those carriers honoring the ticket, having fares in excess of the basic fare of 3.6 cents per mile, which applies more generally throughout the country.

"The detachment of additional coupons, which represent miles, as applied to a book intended for general interchange between substantially all carriers would make the compilation of covering tariffs involved and expensive. Formerly, where mileage tickets were in use, they were accepted only for passage over individual carrier systems, or, in districts of comparatively small area; or, where the mileage tickets were of joint interchangeable character, good over a number of roads, they were generally restricted in use to the individual systems, with only limited provision for interline application. While it was feasible thus to utilize a mileage ticket good over a single system or a small territorial region, and to compile distance tables, which frequently required computations by both agents and conductors to add two or more distances together to arrive at the total through detachment, it would be impracticable to so apply a mileage ticket for nation wide use. A mileage ticket available for local, interdivision and interline use generally throughout the country, to the same extent as the present scrip books are honored, would have to be supported by underlying distance tables practically equivalent in number of tariffs and in number of pages in such tariffs, to the present system of conductors' and ticket agents' local, inter-division and inter-line tariffs applicable to one-way tickets at normal fares. While the individual carriers now have abbreviated tables of distances, at least between the more important points on their systems, such tables would not meet the requirements of a nation-wide interchangeable mileage ticket.

"As users of scrip books could in no conceivable way derive a greater benefit from a mileage ticket, as distinguished from a scrip ticket of like scope, it is believed that the few foregoing principal objections to mileage tickets should be convincing that a mileage ticket of any type is an unsatisfactory form of ticket, and should not be re-introduced.

"Furthermore, as scrip represents currency, it automatically adjusts itself to any revisions in the basic fare for ordinary tickets that may occur, upward or downward, with no advantage or disadvantage to the holder of the scrip or the carrier."

Should Be No Reduction in Fares

The carriers contend there should be no reduction in fares. The present interchangeable scrip ticket meets all requirements as far as the varying rate levels are concerned.

The present bases of freight rates and passenger fares and charges were fixed by the Interstate Commerce Commission after extended hearings and investigations to determine the revenue which should be realized from the freight and passenger transportation respectively to enable the carriers to perform the service to which the public is entitled, and to yield the net return to the carriers as provided in the Transportation Act. It must, therefore, be assumed that such fares are just and reasonable, as there have been no developments since the date of the commission's order justifying a change, as indicated by the Commission's recent review of the general rate situation.

At no time since the passage of the Transportation Act have the carriers as a whole earned the net return contemplated by that act. Any form of reduced rate mileage or scrip ticket good for nation-wide use on all the railroads of the country will inevitably result in a substantial reduction in passenger revenues, the extent of which will vary accord-

ing to the percentage of reduction from the one-way fare, and the denomination of the ticket. It is practically impossible to accurately estimate the amount of this reduction, because there has never been a reduced rate ticket which was good for use on all roads throughout the entire country. If such a ticket be introduced, a great proportion of the one-way travel between large commercial centers such as Chicago and New York, New York and New Orleans, Chicago and Denver, San Francisco, etc., and theatrical, Chautauqua and other similar traffic will be quick to take advantage of such a ticket. In other words, the larger the scope of territory in which the ticket can be used, the greater will be the inroads upon the passenger revenue of the carriers.

The gross passenger revenues for the year 1921 were $1,152,635,016. The estimated passenger revenues for the year 1922, based on I. C. C. reports for the first six months, will be $1,070,167,869, or a prospective decrease of $82,467,147. These passenger revenues include commutation and surcharge, but exclude mail and express for both years. This showing results in the face of the wiping out of the war tax January 1, 1922.

Some years ago, when mileage tickets were in effect and reductions in various degrees from the basic rate per mile were accorded in different parts of the country, even though such mileage tickets were restricted to smaller territorial limits and were not interchangeable as between all lines in the same territory, an average of not less than 20 per cent of the total passenger revenue in certain sections of the country was derived from mileage tickets; in fact, on some lines as high as 60 per cent of the total passenger traffic was moved.

Confirming these statements, the record shows that for the fiscal year ending June 30, 1917, in Southeastern territory a major portion of the traffic moving between principal commercial centers traveled on mileage tickets.

It is apparent that any reduced rate mileage or scrip ticket will practically supersede the normal one-way fares between all commercial centers of the country, materially reducing the present aggregate revenues which do not now meet the necessity of the carriers, nor the expectation of the commission from a revenue standpoint in their recent general rate investigation.

Another inequitable and discriminating feature of a reduced rate scrip or mileage ticket would be that in view of the long distance covered by journeys in this country, under almost any priced book so far suggested, it would be possible by the use of a scrip book, and with practically the same initial investment, to accomplish a one-way journey between two given points at a less cost than by purchase of a regular one-way ticket, thus producing either a discrimination or a reduction in the one-way fare. The lower the price of the book, the more cases of this kind would be produced.

The cost of handling passengers on reduced mileage or scrip tickets will exceed considerably the cost of performing service for a passenger paying the normal fare and using the ordinary form of one-way ticket, and it is not clear how it can be justifiably concluded that, when the present normal basic fare has failed to produce the results anticipated by previous decisions of the commission, a mileage or scrip ticket sold at a fare below such normal basic fare per mile can be construed as either just or reasonable.

Answer to Arguments Advanced by Commercial Travelers

It has been contended that the purchase of a mileage or scrip coupon ticket involves the wholesale principle, the denominations commonly mentioned being not less than 1,000 nor more than 5,000 miles. In support of this, reference has been made to the fact that a lower freight rate is made for carload shipments than for less than carloads. This comparison is faulty, the difference is not confined to a difference in pay for the service; the cases are not analogous. The rate per hundred pounds is less to move freight in carload lots than to move it in less than carload lots for the obvious reason that the L. C. L. load is composed of a number of shipments involving greater expense in handling and accounting than shipments by carload; for example, carload shipments are loaded and unloaded by the consignor and consignee. Therefore, it is fair and reasonable to fix the carload rate at less than the L. C. L. rate, but there is no reduction in the carload rate on account of the number of carloads shipped, and the commission has opposed every effort to have the principle of a lower rate for a number of carloads than for a single carload.

With mileage or scrip books performance of service is clearly a retail process. A ticket contemplated to cover 5,000 miles would be used for numerous trips. While payment for these trips would be made in advance, the trips would be spread out over the lifetime of the ticket. Each such trip is a separate, complicated transaction involving ticket agents, conductors and ticket accounting departments in a very large amount of additional detail and labor compared with single tickets sold at normal fares. This extra expense for additional employees in auditing and ticket offices and on trains would amount approximately to $1,680,000 annually, which will be explained by the accounting witness who will testify later.

To sum up briefly, the effect of the proposition would be to accord a lower rate to a class of passengers more expensive to handle.

A mileage or scrip ticket sold at a reduced fare would be used between a multiplicity of points within a given period at a preferential fare as against the passenger who travels between the same points, on the same train, in the same car, and in the same seat. Such reduced rate mileage or scrip ticket would impose on the carriers an expense greater than in the case of the passenger holding one-way ticket at normal fare, and to this extent is a discrimination rather than an observance of the principle involved in the construction of carload and L. C. L. freight rates. In fact it would be a direct reversal of the principle applied to freight.

It has been alleged that carriers would derive substantial benefit from the use of the money paid in advance for mileage or scrip books, on which service would not be performed for a considerable time after purchase. A fund created in this manner would be divided into comparatively small totals among the large number of selling carriers. These sums would be constantly changing balances, subject to innumerable withdrawals on account of claims for partially used tickets returned by purchasers for redemption, and subject to hundreds of monthly settlements between roads for coupons of books honored by foreign roads. Of the total mileage revenue only a comparatively small per cent would remain constantly in the possession of the carriers as a daily average balance.

Mileage Tickets "Pernicious and Unbusinesslike"

It has been uniformly recognized by the railroad managements since the inception of mileage tickets that they were the most pernicious and unbusinesslike form of transportation in use, because of their discriminatory character and susceptibility to all kinds of irregularities and manipulations. It was impossible for various reasons for the carriers as a whole to abolish the use of mileage tickets, nevertheless there was a constantly growing restriction in their use to the extent that it was within the power of the carriers to so limit them. Conditions changed when the carriers were operated as a unit by the United States Railroad Administration, and recognizing the discrimination and irregular manipulation of mileage tickets, the carriers were ordered to discontinue them.

The United States Railroad Administration, having ac-

complished during the period of federal control what the carriers themselves were unable to accomplish prior thereto, the carriers did not, upon the return of the properties to private operation, reestablish the mileage ticket at a reduced fare and are strongly opposed to it at the present time.

Any reduction in the basic fare which may be imposed upon the carriers through the installation of a mileage or scrip ticket below the normal fare will deplete the present passenger revenues, and it is the consensus of views that a reduced rate mileage or scrip ticket will not increase the traffic to an extent offsetting the reduction in revenue. The carriers apprehend that a reduced rate mileage or scrip ticket would have a material effect upon the normal basic fare, and desire to call attention to the fact that the reduced mileage fare previously in effect was one of the chief arguments and reasons why the several states forced upon the carriers a reduction in the intrastate one-way fares.

In 1907 the legislatures of a number of western states passed what are commonly known as "two-cent fare acts," reducing passenger fares from three cents to two cents per mile. In the case of one large western railroad (which was the common experience of other roads), passenger fares were reduced in 1907 from three cents to two cents per mile on 75.79 per cent of its total mileage. Notwithstanding the reduced fare, the total number of passengers carried during the fiscal year ended June 30, 1908, increased only 2.16 per cent over the number carried in the preceding fiscal year when the basic rate for passenger fare was three cents per mile.

In April, 1914, the passenger fares on the same lines in South Dakota were reduced from three cents per mile to two and a half cents per mile, a reduction of 16.66 per cent. Notwithstanding that substantial reduction, the number of passengers carried one mile intrastate in South Dakota for the three months immediately following the reduction decreased 5.42 per cent, as compared with the corresponding months in the previous year in which the rate of three cents per mile was in effect.

Further substantiation is furnished by the experience of one of the Southeastern carriers, which also operates in a portion of the territory north of the Ohio river. In Illinois passenger fares were reduced from three cents to two cents per mile, effective July 1, 1907, but the operations of the carrier in question for the last six months of the calendar year 1907 (the first six months after the reduced rate became effective), compared with the last six months of 1906 (when the rate was three cents), showed that while the number of passengers carried in Illinois increased 7.13 per cent, there was likewise an increase in the number of passengers carried by that same carrier in other states where the passenger fare had not been reduced, i. e., in Tennessee, an increase of 19.71 per cent, in Alabama 9.82 per cent, in Georgia 25.67 per cent, and in Florida 14.21 per cent.

Using the experience of this same carrier for further illustration, passenger fares on its lines in Alabama were reduced from three cents to two and a half cents per mile, effective June 1, 1909, but its fare in Georgia remained at three cents per mile. Comparing the nine months' period ended February 28, 1910, with the nine months' period ended February 28, 1909, the number of passengers carried by it in Alabama showed an increase of 12.52 per cent, while in Georgia, with no reduction in the basic rate, the number of passengers carried by it increased 13.45 per cent, and the revenue results for these same periods showed a decrease of 1.35 per cent in Alabama, and an increase of 12.24 per cent in Georgia.

If mileage tickets at a special reduction are sold to the general public, past experience demonstrates that theatrical companies, circuses, concert companies, bands and other public entertainments, and other organized traffic, will demand like special class legislation for their transportation. Wherever a reduced mileage rate prevailed, the traveling public to a considerable extent could not be convinced that the same basis should not prevail for all regular passenger travel. The pressure was always for a downward revision.

The carriers have repeatedly asserted that a reduction in the basic fare through the sale of reduced rate mileage or scrip tickets, or otherwise, would not appreciably stimulate traffic. An outstanding proof of this is furnished by the withdrawal of the war tax of 8 per cent of the transportation charges, effective January 1, 1922. The cancellation of this charge was equivalent to making a horizontal reduction in passenger fares on all carriers in the United States, but, instead of stimulating traffic, the passenger revenues for 1922 will show a decrease of approximately $82,500,000, based upon the decrease already shown for the first six months of 1922.

The Canadian Lines have a form of certificate which they issue to members of the Commercial Travelers' Association of Canada, Dominion Commercial Travelers' Association, Maritime Commercial Travelers' Association, Northwest Commercial Travelers' Association, Ontario Commercial Travelers' Association, etc.

Upon presentation of these certificates, ticket agents issue transportation sold at a reduction from normal tariff fare. To obtain the benefit of these certificates, members of the organization must travel at least three months of the year in Canada, and must have a residence or business connection, or, at least, an office in Canada. Baggage owner's release must be signed by the holder of the certificate. It will be recognized that this is a preferential form of transportation, confined to an exclusive and favored class, which is not permissible under the laws of the United States.

The present interchangeable scrip ticket meets all requirements so far as the varying rate levels are concerned, for the reason it is issued in the nature of currency, in coupon form, the coupons being accepted for transportation upon the basis of normal tariff fares applicable to the line over which the transportation is furnished, and it makes no difference whether the normal fare be 3.6 cents per mile or 8 cents per mile.

The carriers urge that there be no reduction in the present basis of fares, and that there should be no change in present rules and regulations.

The new law requires "All carriers by railroad subject to this act to sell interchangeable mileage or scrip coupon tickets at just and reasonable rates."

The point is raised that there are certain small steam rail lines and electric lines whose responsibility may be in doubt, or with whom the Class 1 roads do not now interchange traffic, and if an interchangeable mileage ticket is issued, then difficulty might be encountered in making collections. It is hoped the commission will give recognition to this condition in their deliberations.

Effect of Scalping

The mileage and scrip forms of tickets, especially those honored on trains, are more susceptible to profitable manipulation by scalpers than any other forms. Mileage tickets have formed the chief stock in trade of scalpers in years past, and their greatest profits have been derived from such tickets. Municipal ordinances, injunctions and state statutes have been disregarded by scalpers, who work through a special clientele, and while a national law against ticket scalping would be of great assistance and protection to the carriers and the public against the manipulations of these malefactors, the greatest protection lies in a system of sale, accounting and espionage, which the carriers themselves must be permitted to follow in handling a form of ticket so susceptible to manipulations. But, surrounded by every safeguard known to the carriers, an important percentage of the revenues will be lost to professional and itinerant scalpers

if a scrip or mileage ticket is ordered on sale at any reduction below the present regular fares.

Discrimination

The testimony of the carriers would be incomplete if they failed to call particular attention to what they consider one of the most important phases of this whole question, namely, discrimination. Any form of mileage or scrip ticket at a reduced fare will discriminate against, and unduly prejudice the interests of 80 per cent of the traveling public, assuming that only 20 per cent will travel on mileage or scrip tickets. Such tickets, sold at a discount, would be used by those best able to pay the normal fares. The farmer, artisan, school teacher, clerk, laboring man and other casual traveler would not, on account of their infrequent trips and the price involved, buy mileage or scrip tickets. The commercial man, who is out on business, earning his living in that way, and the business man and others making frequent trips between commercial centers can afford and would purchase mileage or scrip tickets, thus saving a substantial difference in fare, while the casual traveler would pay the full one-way fare when traveling between the same points, on the same train and in the same car.

Commissioner Meyer asked the witness what he would consider a wholesale transaction in passenger traffic, to which Mr. Fox replied that he knew of no wholesale principle in the passenger business. He said the average commercial traveler travels about 50 miles a day, which at the rate of 3.6 cents a mile would be $1.80 a day. He pointed out that a reduced rate mileage book differs in principle from a reduced rate excursion ticket because it would draw away from the normal one-way business, while excursion tickets create new business and add to revenues rather than detract from them. He also said that a mileage book would be sold to a preferred class and in general a well-to-do class, as indicated by the fact that books in dimensions ranging from 1,000 to 5,000 miles are urged.

J. E. Benton, general solicitor of the National Association of Railway and Utilities Commissioners, brought out that some roads in the West that charge passenger rates higher than the prevailing rate, when mileage books were formerly used, did not require the detachment of an additional number of coupons to represent the higher rate, but Mr. Fox said that a nationwide mileage book would create a different situation and the same reasons that make the basic fares of these roads higher than the regular rate would call for an exemption from the uniform mileage rate. Mr. Fox also said that any mileage book issued should be non-transferable because the use of a transferable book would be substantially equivalent to changing the basic fares. They would be so commonly used that the carriers would sell but few ordinary one-way tickets. He said that if mileage books were sold at reduced rates a burden would be cast on other traffic, either freight or passenger.

Additional Accounting Complications

Mr. Rose said in part:

It has been the endeavor of the carriers for a great many years to equip their agencies with such simple forms of passage tickets as would enable ticket sellers to handle the public with the utmost dispatch to avoid inconvenience and delay to the passenger at the ticket window, and to facilitate the collection of transportation on trains. In carrying out this policy, agents generally are provided with card tickets with printed destinations to all points where the sales justify. Today 90 per cent of the traffic is handled on this form of transportation, which affords the greatest measure of protection against possible loss of revenue, accomplishes the object as set forth above, and produces the utmost simplicity in accounting from every standpoint. Scrip or mileage for general use on trains without exchange at the ticket windows is equivalent to collecting a volume of cash fares with the added confusion of making the computation, and if the scrip became popular, the carriers would find themselves back 50 years, when there were no ticket offices to speak of, and conductors collected the passenger revenue for the carriers.

These facts should be borne in mind in giving consideration to the advisability of adopting a reduced rate scrip book which might, in some directions, suit the convenience of a limited number of travelers, and, on the other hand, place an absolute burden on the carriers, with much added expense.

Exemptions Asked

Ben B. Cain, vice-president of the American Short Line Railroad Association, spoke on behalf of short lines that have filed applications for exemption and expressed the opinion that there should be some classification which would exempt certain roads. J. W. Carmalt, on behalf of the Ulster & Delaware, said that this company's passenger traffic consists mainly of summer vacation travel or local travel and that the use of mileage books at reduced rates would greatly diminish its revenue. J. D. Rahner, general passenger agent of the Florida East Coast, asked exemption on the ground that 65 per cent of the passenger traffic is seasonal winter tourist travel and includes very little commercial travel. When a representative of the commercial travelers asked if lower rates were not made to encourage the winter tourists, Mr. Rahner said that reduced rates are made, but that his road does not participate, but receives its full local rates south of Jacksonville. He also pointed out that the Florida Railroad Commission had approved a higher rate on its oversea line, which is now 4.8 cents a mile. W. J. Craig, passenger traffic manager of the Atlantic Coast Line, and C. B. Ryan, passenger traffic manager of the Seaboard Air Line, also asked exemption of a number of branch subsidiary lines on the ground that they were built to accommodate particular classes of freight traffic and that the additional accounting expense incident to the use of mileage books would in many cases absorb nearly all of the passenger revenue. It was also shown that many of these lines are unprofitable.

Mr. Fox was cross-examined at length by counsel for the commercial travelers' associations regarding the former practices of the railroads in issuing mileage books and as to why the railroads drew a distinction in principle between reduced rates on mileage tickets and special and excursion rates. Mr. Fox said that the use of mileage books had their origin about 1868 as one of the concessions offered by the freight department to large shippers. After giving an annual pass to the head of a company they would often give a mileage book or sell one at a reduced rate to his traveling men. Later the revenue from this source was transferred to the passenger department, but passenger officials always regarded mileage tickets as an unbusinesslike and pernicious form of ticket and constant efforts were made to get rid of them. By 1918 very few were sold, but it was not until the Railroad Administration took control of the roads that they were abolished entirely. In explaining the difference between reduced rates for mileage and other reduced rates, he pointed out that those special rates are restricted either as to dates, trains or destinations and were, therefore, less valuable than the ordinary ticket and that they stimulated traffic which otherwise would not move, whereas reduced rate mileage books would be sold to passengers who would otherwise pay regular fare and whose transactions in no way represented the wholesale principle. He insisted that a reduction of a few cents a day in the railroad fare of a traveling salesman was not of sufficient importance to decide the question how many traveling men would be sent out.

John E. Benton, general solicitor of the National Association of Railway and Utilities Commissioners, presented let-

ters he had received from the railroad commissions of Nevada, New Mexico and Arizona, asking that whatever mileage or coupon rate the commission may require should be honored in the states where the prevailing passenger rate is 4.8 cents a mile. He also read a letter from the North Carolina commission expressing the opinion that the universal rate should be 3 cents a mile, but opposing any plan by which the general public would pay a higher rate than any class.

Commercial Travelers Ask Discount of 33-1/3 Per Cent

D. K. Clink, chairman of the transportation committee of the National Association of Traveling Men, who said he represented 676,000 commercial travelers, urged that the commission order the use of a universal interchangeable scrip coupon ticket in the amount of $100, to be sold at a discount of 33⅓ per cent, good for one year, the unused portion to be redeemable. He asked that these coupons be accepted for all baggage charges and proposed that they be exchanged for tickets at the regular rates, thus automatically adjusting themselves to varying rates of fare in different parts of the country. He said that a discount of 33⅓ per cent appeared just and reasonable in view of the fact that railroads formerly voluntarily sold mileage books at such a discount and because they now make a discount of that amount for excursions and other forms of special travel. Mr. Clink said that excessive passenger rates are driving thousands of commercial travelers out of business, particularly those working on a commission basis, and that commercial travelers are a great national asset and should be encouraged. Mr. Bikle pointed out that prior to federal control the Pennsylvania sold a mileage ticket at 2¼ cents, while its standard passenger rate since 1907 had been 2½ cents, so that the discount was only 10 per cent. He asked if the witness had not proposed a discount representing about the widest spread he could find. Mr. Clink said the railroads sell some tickets at a discount of 50 per cent. He expressed the opinion that such a reduction would so stimulate travel as to more than make up for the loss in revenue, but admitted that he had no idea what the loss in revenue would amount to.

John F. Shea, chairman of the travel bureau of the American Hotel Association, recommended a scrip coupon book to be sold at a discount of one-third in denominations of $50, $100 and $150, with coupons ranging from one cent to $5. He proposed that they should be non-transferable and that identification by photograph and signature should be required at the time of issue. He insisted that any reduction in rates would stimulate travel and cited his own experience in traveling on nine months' tourist tickets to show the reductions in rates which the railroads make voluntarily.

French Records for Weight Per Locomotive Horsepower

By a Foreign Correspondent

RECENT EXAMPLES of locomotive construction in the United States represent very careful study in regard to the design, and to the refinement of details, and to the combination of devices that have proved their worth, into one locomotive, in the endeavor to produce the greatest possible sustained power with the minimum weight of locomotive, and with the minimum consumption of fuel and water.

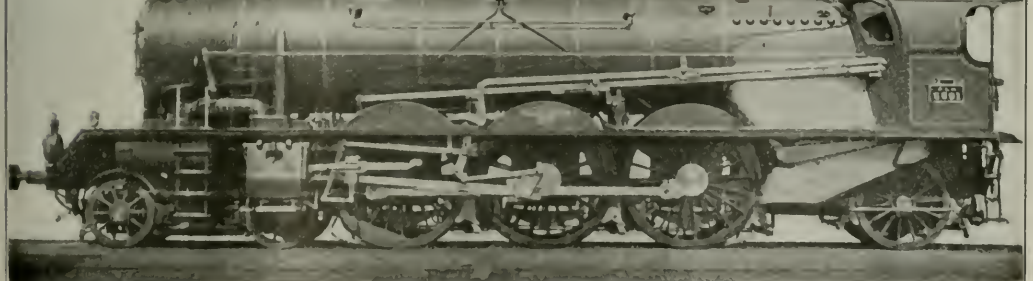
Too much, however, must not be taken for granted, and engineers must not yet be too well satisfied with the results that have been obtained. American locomotives operate in a country where practically there seems to be no limit to the permissible weight allowed on each driving axle, and where the price of fuel has been such that its economy of consumption has not been given its proper consideration.

Turn to Europe, and to France in particular, where the maximum permissible weight on one driving axle *is limited to* 18½ *metric tons* (40,700 lb.) and in very special cases to 20 metric tons, and where the price of fuel is prohibitive in comparison with the price in the United States. It will not be surprising if, from this country, we shall find the locomotive that produces the most power per pound of metal and per pound of fuel consumed.

The Paris, Lyons & Mediterranean has in operation a large number of Pacific type four-cylinder, balanced-compound, superheater locomotives, which handle its heaviest and fastest passenger trains. The locomotive is clearly shown in the illustration and has the following dimensions:

Diameter, h. p. cylinder	17.32 in.
Diameter, l. p. cylinder	25.59 in.
Stroke	25.59 in.
Diameter of drivers	78.74 in.
Working pressure	227 lb. per sq. in.
Loaded weight on driver	122,100 lb.
Loaded weight on one driving axle	40,700 lb.
Loaded weight of locomotive	204,600 lb.
Maximum indicated horsepower on road test	2,405
Weight per indicated horsepower	85 lb.

A sample locomotive of this type was constructed in 1913 and put through the severest kind of tests on the road before duplicates were built. As a matter of fact this locomotive was put in competition against some four-cylinder simple



A French Pacific Type Locomotive Which Developed One Indicated Horsepower for Each 85 lb. of Weight

superheater Pacifics. The locomotive was tested out on the section from Laroche to Dijon, a distance of 98 miles, of which 81 miles are continuously uphill. This is the most difficult section of the P. L. M. Railway in the run between Paris and Marseilles. Road tests were conducted and carried out and complete data obtained with an accuracy to the *nth* degree. On the final trials this locomotive hauled 709 tons of cars on the regular passenger schedule.

Let us consider just what was accomplished. This Pacific type locomotive with a total weight of *only* 204,600 lb. and with *only* 40,700 lb. on each driving axle, produced continuously 2,000 indicated horsepower, and as a maximum over a sustained period of time produced 2,405 indicated horsepower. This represents producing one indicated horsepower for each 85 *lb. weight of locomotive*, a most truly remarkable performance. At the same time this locomotive operated on the average around 14½ lb. of superheated steam per indicated horsepower per hour, and made the low figure of 13½ *lb. of superheated steam per indicated horsepower per hour.*

If this locomotive had been equipped with a feedwater heater, with a booster, with highly superheated steam, its performance would undoubtedly have been still more remarkable.

Although the above figures represent those obtained from a particular set of tests, it is not saying too much to state that the Pacific type locomotives of the other French railways, such as those on the Paris Orleans, on the Midi, or on the French State could, and do, duplicate the same results every day. The figures here quoted may be considered as modern French practice.

In talking about world's records, it is necessary to be very well posted on exactly what results the world has produced.

Endeavors in certain isolated cases, in America, have produced very interesting and very truly creditable results, but until there is produced, over a sustained period of time and on the road one indicated horsepower *per each* 85 *lb. weight of locomotive*, and on a consumption of 13½ *lb. of steam* per indicated horsepower per hour, it is believed that it is more correct to state that the Paris, Lyons & Mediterranean Pacific locomotive, 6201 class, produces the most power per pound of metal and per pound of fuel consumed.

The automobile and the aeroplane have shown what concentration in design can accomplish. The same endeavor is now being made with the steam locomotive, but America has not yet equalled by a good margin, let alone surpassed, what has become an accomplished and every day result on the French railroads. Let us remember that the mere bulk or the size of a locomotive only makes a world's record in brute weight.

Tentative Report Finds Pullman Rates Reasonable

The Interstate Commerce Commission on September 22 made public a tentative report prepared by Robert E. Quirk, chief examiner of the commission, recommending a finding that the sleeping and parlor car rates of the Pullman Company, as increased by approximately 20 per cent on May 1, 1920, are not unreasonable and a dismissal of the complaint filed by the Order of United Commercial Travelers of America, in which other organizations of commercial travelers joined. The report states that the complainants relied to a large extent on the provision of the law requiring carriers to assume the burden of showing that any rate increased since January 1, 1910, is just and reasonable and upon the contention that conditions do not justify the increases, and introduced very little evidence. It says that while statements made by their counsel at the hearings indicated that they were more concerned with the surcharge received by the railroads than with the rates assailed, this point is not in issue in the case up for hearing at the present time.

The report says that the 20 per cent rate advance increased the gross revenues of the Pullman Company by approximately $13,000,000 a year and that the rate reduction sought would, if granted, reduce the revenues by corresponding amount. Any such reduction without reductions in operating expenses more substantial than can now be foreseen would not only unduly impair the defendant's operating income, but would create a deficit. The claim that the rate reduction sought, if made, would stimulate travel in Pullman cars to such an extent as to increase rather than diminish revenues, is dismissed as "too speculative to be accepted as a basis for condemning the rates."

The record does not show, the report says, that the operating department of the Pullman Company has been charged exorbitant prices for the cars constructed by the manufacturing department. The property and facilities set aside for manufacturing are not devoted to public use and may not be considered in this proceeding. Should the manufacturing department incur deficits in its operation, the public could not on that account be expected to pay higher rates for the operation of sleeping or parlor cars. The converse is also true.

No physical valuation of the company's property was on record in the proceeding. The company's estimate of the aggregate value of its property used in common carrier service stated the recorded investment new as $157,878,314 and less depreciation $89,611,407; the reproduction cost new $277,031,929; less depreciation $172,807,185. The reproduction cost new, based on the price levels of the 1910-1914 period, was stated as $194,010,346 and less depreciation, $128,584,858. The report says that whether the defendant's estimate of the value is accurate cannot be determined on the record, but that the record affords no basis for concluding that its estimate of value is excessive.

Of the increase in gross revenue derived from the increased rates, it is stated that approximately four and one-half million dollars accrued to the railroads during the year ended April 30, 1921, as a part of their compensation under their contracts with the Pullman Company. The total amount which accrued to the railroads that year under the contracts was $12,872,650. During the succeeding 12 months the amount which accrued to the railroads was $7,627,375, the decrease being due chiefly to a decrease of more than $15,000,000 in gross revenue and partly to revised contracts with some roads under which the Pullman Company retained a greater share of the gross revenue. The examiner says the existing contracts between defendant and the railroads suggest a question not unlike the one dealt with in the increased express rate case, in which the commission pointed out that for the purpose of obtaining some $12,000,000 needed additional express revenue the increase proposed would yield an additional total revenue of a figure somewhere in the neighborhood of $24,000,000.

In 1920 up to September there was an increase in the number of paying passengers carried in the company's cars in each month as compared with the same month of 1919, but in September the number decreased 5.95 per cent as compared with the preceding month and there was a greater decrease in each succeeding month to May, 1921. The decrease was ascribed in part to the general business depression and in part to the surcharge effective August 26, 1920, which, while collected by the Pullman Company, accrues to the railroads. From November, 1920, to April, 1921, inclusive, there was a deficit in net revenue for each month except that of March, 1921, and for the first whole year under the increased rates ended April 30, 1921, the total net revenue was $4,365,531.

C. E. Spens Appointed Federal Fuel Distributor

Burlington's Traffic Vice-President Takes Over Duties of H. B. Spencer Under 60-Day Furlough

WASHINGTON, D. C.

A CONCENTRATED DRIVE on the part of the railroads for 30 days on the movement of coal and the return of empty coal cars to the mines was suggested by President Harding on September 2 in connection with his appointment of Conrad E. Spens, vice-president in charge of traffic of the Chicago, Burlington & Quincy, as federal fuel distributor, in accordance with the coal priority act passed by Congress, which the President also signed on the same day. Mr. Spens, who was assistant director of traffic of the Railroad Administration and chief of the transportation division of the Food Administration during the war, has been given a 60-day furlough from the Burlington to undertake this work. In a statement to the press following his appointment he indicated that the 30-day drive would be undertaken and he expressed the opinion that with the co-operation of all concerned, particularly the consumers, the result would serve to ameliorate the present apprehension, regarding the country's fuel supply for this winter.

In announcing the appointment it was stated at the White House that the Administration feels that the coal problem is now a problem of transportation rather than production and for this reason especially requires transportation experience in its solution. Henry B. Spencer, who has been acting as voluntary fuel distributor in co-operation with the various departments of the government, had consented to act only until a definite organization could be erected following legislation for the purpose. He requested that he be relieved in order that he might reassume his work as president of the Fruit Growers' Express. The President wrote a letter expressing regret that he was not able longer to continue as federal fuel distributor and to express appreciation for the service performed in tiding over a critical situation. The President said in his letter that the fact that on a small fraction of our normal coal production he had secured its distribution so as to maintain the performance of all of the railways and public utilities is in itself evidence of great service. Mr. Spens took charge of the work at once and announced that F. R. Wadleigh, chief of the coal division of the Department of Commerce, would be his assistant. It is proposed also to make use of the skeleton organization left by Mr. Spencer.

The President also on September 22 signed the bill providing for the creation of a fact-finding coal commission, to consist of seven members to be appointed by the President. It was announced that he would probably not make any appointments for about ten days. In response to the strong demand that representatives of the coal industry and of the miners be appointed on this commission, the President permitted both interests to submit to him a panel of names from which he may, in his discretion, make some selections.

The President's Statement

In a letter to Mr. Spens, the President said:

"I am appointing you to the responsible position of federal fuel distributor under the act just passed by Congress, and I earnestly express the hope that you will direct your first attention to the further extension of the co-operative arrangements with the railways, the coal producing and coal consuming communities and the state authorities which have been initiated by the Secretary of Commerce and Mr. Spencer, the temporary fuel distributor. These arrangements, of voluntary origin, are already having a large effect in mitigating the situation.

"The arrangements set up for the distribution and control of price at last year's levels in the anthracite industry have not been satisfactorily established in co-operation with the state authorities and the coal operators.

"The producing capacity of our bituminous mines is far beyond the public need, but the limiting factor in the supply is solely transportation. The Interstate Commerce Commission has given complete priority on the movement of coal, equal only with agricultural produce and some other necessities. But beyond these provisions I have the feeling that if we could stimulate the enthusiastic and organized personal attention not only of our railway executives, but of the entire operating personnel of the railways, to a concentrated drive for a period of 30 days, on the movement of coal and the handling of 'empties,' we could solve the coal situation not only as to ample supply, but prices would be quickly readjusted.

"The authority of the federal government under the act is limited to coal moving in interstate commerce, and, therefore, can only be effective in control of distribution and prevention of extortion as a supplement to the activities of the state authorities. The governors of the various states already have, at the request of the federal administration, created state coal commissions, and I trust, therefore, you will take up definitely with them plans for co-operating under the new act.

"The federal government is loath to undertake to fix definite prices for coal, because of the objectionable character of such intervention in peace times, because of the difficulty in arriving at fair prices without giving undue favor to some and loss to others, and also because of the incompleteness of an authority which is only supplementary to state action. On the other hand, I wish you to set up such agencies as will vigorously follow up individuals using facilities of Interstate Commerce who are exacting extortion, as defined in the act, in order that we may have relief from such practices, at the earliest moment.

"I trust that the measures initiated to secure co-operation of the responsible coal operators and dealers can be made effective in prevention of such profiteering. Likewise the organization started among the consuming community to co-operate by delayed purchasing of reserves until transportation increases will aid in restoration of normal prices and distribution.

"It would be far more agreeable to our national sense to solve these matters by co-operation rather than by regulation, and I trust you will find that all elements in the community will join with you in this purpose."

Statement by Mr. Spens

Mr. Spens also issued a public statement saying that he was not yet prepared to announce definite plans for execution of the provisions of the recent act of Congress, but inviting the co-operation of the entire public in the solution of the coal situation.

"The coal production capacity of the country is ample to meet all demands. The immediate problem is transportation, and this demand on the railroads for abnormal transportation of coal due to the miners' strike comes at a time when for well-known reasons the physical capacity of the railroads is subnormal, and at a time when the offerings of tonnage of all character are great. We understand, however, that the railroad situation is daily improving, and feel confident that the carriers are exerting and will continue to exert extraordinary efforts so that what otherwise might become a serious situation will be avoided. The result of concerted action during the next 30 days on part of all carriers,—not only the carriers that originate the coal, but also carriers that participate in the haul of loads and empties,—will, we feel sure, serve to ameliorate the present apprehension of the administration as well as of the public.

"The co-operation of the consumer is practically as important as that of the carrier. At the request of the administration, Julius H. Barnes, president of the Chamber of Commerce of the United States, has addressed American industries, commercial and trade organizations urging that purchases of coal under present conditions be confined closely to current needs and that there be no accumulation of stocks of coal moving under contract or otherwise. I would like to add my appeal to that of Mr. Barnes', but will direct my appeal not only to the 'industrial' consumer, but also to the 'domestic' consumer.

"Sufficient coal can be moved for current consumption, but sufficient coal cannot be moved within the immediate future to equalize the deficit that obtains and provide a surplus above immediate needs. The inconvenience of frequent purchases is small compared

with the distress that might be suffered by an unequal distribution due to exaggerated anxiety or lack of neighborly consideration.

"If all consumers of coal,—whether domestic or industrial,—will calmly consider this appeal and will co-operate as suggested, not only will their current needs be taken care of, but the result will be reflected quickly in the price of coal, which, today, in many sections of the country manifestly exceeds a fair profit-basis.

"The administration is not suggesting that the operator in coal shall sell his coal at cost. Nor is it suggested that he shall sell his coal at less than cost. The administration is, however, indicating, and the present act of Congress contemplates that he shall sell his coal on a basis that will not yield an abnormal profit; in other words, that he shall not take an undue advantage of the present unfortunate economic situation.

"Many coal operators are co-operating in a splendid manner. Regretfully I must add that there are some who are not. Is it asking too much that, during these critical times, untoward speculation in an important necessity to comfort,—to life itself,—must cease, and that there be only legitimate merchandising, based on American standards of fair play?"

On September 23 Mr. Spens addressed a telegram to the governors and fuel administrators of the various states pointing out that the federal act provides that it shall be the duty of the federal fuel distributor, among other things, to ascertain in which parts of the United States there shall be a shortage of coal and the extent of such shortage; the fields of production and principal markets to which such production is to be transported and distributed; the prices normally and usually charged for such coal and whether current prices considering the costs of production and distribution are just and reasonable; the nature and location of consumers, and what persons, regions, or community should receive priority in transportation and distribution, and the degree thereof.

He also pointed out that the federal government can exert its influence on distribution and restrain extortion only so far as concerns coal that may be transported from one state to another. It has no jurisdiction as to coal produced and sold within the state of its production or retail or wholesale margins or handling coal within the states. Responsibility as to these features must rest with the state authorities and if profiteering in coal is to be prevented, except as to coal that may be moved across state lines at extortionate prices, the proper remedy in each case must be applied by state authorities.

"Coal production capacity exceeds transportation capacity," he said. "The problem of adequate supplies and diminished prices is therefore primarily a problem of transportation. The federal authorities in co-operation with the carriers, are making every possible effort to expedite movements. Coal today enjoys the same priority in transportation as food and feed. Transportation of coal is ample to meet current necessities, but is not sufficient to permit stocking either by household or commercial consumers and possibly will not be ample for that purpose for another 60 to 90 days. It appears necessary that state organizations or agencies be created in states where they do not now exist that will invite co-operation, that will prevent stocking of coal beyond current necessities and that will establish reasonable margin for retailers and wholesalers.

"As above stated, the constitutional authority of the federal government is limited, but it will gladly co-operate with these state governments as far as it can properly do so. The major responsibility, however, for the price at which the coal is sold to the consumers by the wholesalers or retailers within the state must rest with the state authorities.

"The federal act is, of course, nationwide in its scope and I am, therefore, addressing this communication to the governors of all states and to the State Fuel Administrations, where such agencies now exist, although I understand there is considerable territory in the United States where there is no imminent coal shortage, nor complaint as to the cost of this commodity. We shall depend upon the judgment of the state authorities in each state as to whether or not the aid of the federal government is desired or necessary as to interstate coal. I would appreciate early advices from you as to the situation in your state and the measures taken or contemplated to meet the emergency."

Donald D. Conn, of Minneapolis, has been named as assistant federal fuel distributor. Mr. Conn has been stationed in Washington for some time as chairman of a special committee appointed by the governors of seven northwestern states to represent them in connection with the coal-supply situation.

C. P. White, of St. Paul, Minn., has been designated as assistant to the fuel distributor in handling the fuel situation in the northwest. Mr. White acted in a similar capacity in the later days of the President's fuel committee.

C. J. Hepburn, of Philadelphia, has been retained as general counsel to the federal fuel distributor.

F. R. Wadleigh, chief of the coal division of the Department of Commerce, will act as an assistant to Mr. Spens.

E. M. Durham, of the American Railway Association, went to Philadelphia Monday to represent Fuel Distributor Spens at the sessions of the committee of anthracite operators and Pennsylvania state officials who are considering the problem of the distribution of anthracite.

H. M. Griggs, of the Cleveland Ore and Coal Exchange, who has been handling the movement of lake coal, will continue in this capacity.

It is planned by Fuel Distributor Spens to name special advisory committees, representing the general business and transportation interests of the country.

Federal Fuel Distributor Spens has asked the following named railway executives to serve as an advisory committee on transportation: Daniel Willard, president, Baltimore & Ohio; W. W. Atterbury, vice-president, Pennsylvania; H. L. Byram, president, Chicago, Milwaukee & St. Paul; B. F. Bush, president, Missouri Pacific; Hale Holden, president, Chicago, Burlington & Quincy; C. H. Markham, president, Illinois Central; A. H. Smith, president, New York Central Lines; Carl R. Gray, president, Union Pacific System. Mr. Willard has been invited to act as chairman of the committee, which is expected to consider ways and means for accelerating the expedition of coal traffic.

He also appointed an advisory committee for industry, which will keep in close touch with the distribution of fuel supplies among industrial interests in their respective territories with S. M. Vauclain, president of the Baldwin Locomotive Works, as chairman. Members of the industrial advisory committee will be asked to assist especially in the endeavor to have large industrial consumers confine purchases of coal under present conditions as closely to current needs as safety permits; to suspend accumulation of advance stocks of coal until the present emergency pressure on production is relieved; to unload coal cars immediately and return them to service and to promptly furnish material required for new railroad equipment or repairs.

A committee of the National Coal Association conferred with federal officials in Washington on Wednesday with a view to arranging a plan of co-operation between the bituminous coal producers of the country and the fuel administration.

On Wednesday Mr. Spens issued a set of regulations relative to the designation of 17 bituminous coal producing districts which will be observed as units in the work of the federal fuel distributor and outlining certain data required to be furnished daily by all soft coal producers.

A number of naval officers have been detailed to act as field representatives of the fuel distributor.

Each producer of bituminous coal engaged in the mining and production thereof at any place in any of the designated producing districts is directed to mail daily to the district representative of the federal fuel distributor a written statement or report, signed, setting forth fully and specifically

the following information as to all shipments of bituminous coal made during the previous day

(a) The total number of car loads of each class or grade and size.

(b) Names and addresses of consignees, with car numbers and initials, destinations and amount of each class or grade and size of coal shipped to each consignee

(c) As to each shipment, the prices or prices f. o. b. mine as contracted for, charged and or received for each grade of coal shipped. In the case of coal sold at a delivered price at destination, the destination price less transportation cost shall be used as the mine basis.

(d) A designation of such of said shipments as shall have been made under time (or period) contracts for periods of more than one month's duration.

The Interstate Commerce Commission is considering requiring a modification of the reconsignment practices on shipments in open top cars.

Freight Car Loading

WASHINGTON, D. C.

REVENUE FREIGHT car loading showed another considerable increase during the week ended September 16, but was still below the record figures set in 1920. The total was 945,919, an increase of 103,000 cars as compared with the week before, which included a holiday, and of over 14,000 as compared with the week before the holiday. In the corresponding week of last year the loading was 852,552 and in 1920 it was 991,166. Coal loading amounted to 172,241 cars, an increase of 6,730 over the corresponding week last year and of 22,000 as compared with the week before the Labor Day holiday. Increases as compared with last year were shown in all districts except the Pocahontas and Southern, which showed decreases, and in all classes of commodities except grain and grain products. The largest increase was in miscellaneous freight, which showed a gain of over 40,000 cars. There was also an increase of 24,945 cars in ore, 10,872 in forest products, and 4,831 in livestock. The decrease in the loading of grain and grain products was 3,080 but as compared with 1920 there was an increase of 5,810. Livestock and merchandise, l.c.l., also showed increases as compared with 1920. The summary as compiled by the Car Service Division is given in the accompanying table.

The percentage of open-top cars furnished by the railways to the requirements for such cars continues to show a gradual reduction. During the week ended September 9 the railroads furnished 77 per cent of the requirements as compared with 82 per cent the week before. The number required was 452,355, the number furnished was 346,076, and the number loaded 294,216. For coal loading they furnished 73 per cent of the requirements, for limestone, 83 per cent; ore, 98 per cent; iron and steel, 92 per cent; sand, stone and gravel, 69 per cent; coke, 100 per cent, and miscellaneous, 81 per cent. In the Southern district for that week only 44 per cent of the cars required were furnished, while in the Alleghany district 97 per cent were furnished.

The freight car shortage exceeded the surplus during the period from September 1 to 8 for the first time since 1920, according to the semi-monthly bulletin issued by the Car Service Division of the American Railway Association. For that period the average shortage was 67,899, including 39,032 box cars and 18,555 coal cars, while from other points there were reported surpluses amounting to 43,162, which included 2,187 box cars and 34,685 coal cars. The largest shortage in any district was in the Southern district, 19,333 cars.

More bituminous coal was loaded on Monday, September 25, than on any one day so far this year, or in the year 1921. Monday's loading was only exceeded on six days in the year 1920, during which time there was the heaviest loading ever known in the history of the railroads. The total was 38,804 cars. While loading on that day is always heavy, last Monday exceeded by 1,474 cars the total for Monday, September 18, which had marked the peak up to that time for the period since the miners' strike began on April 1.

For the past two months the Car Service Division of the American Railway Association has been keeping statistics showing the principal freight accumulations, that is, the cars held in greater numbers than can be handled or disposed of currently. By September 8 these accumulations had reached a total of 72,302 for the United States. For the week of September 15 there was a slight reduction to 71,258. Of these, 4,160 were held on account of inability of connections to accept, 1,430 on account of inability of consignees to accept, 57,948 on account of disability of the reporting road, 2,957 for reconsignment, 350 for billing, 1,161 on account of embargoes and 2,847 for export and coastwise shipment. The greatest number of accumulations was in the Southern district, 16,221, while in the Eastern district there were 15,389 and in the Alleghany district 13,941.

REVENUE FREIGHT LOADED

SUMMARY—ALL DISTRICTS, COMPARISON OF TOTALS THIS YEAR, LAST YEAR, TWO YEARS AGO. WEEK ENDED SATURDAY, SEPTEMBER 16, 1922

Districts	Year	Grain and grain products	Live stock	Coal	Coke	Forest products	Ore	Merchandise L.C.L.	Miscellaneous	Total revenue freight loaded: This year 1922	Corresponding year 1921	Corresponding year 1920
Eastern	1922	8,118	3,201	48,024	1,490	5,550	5,945	65,750	96,269	234,347	.....	.....

Australian Gasoline Rail Motor Car

THE STATE RAILWAYS of Victoria, according to information from Harold W. Clapp, chief commissioner of railways, have placed in service recently a gasoline engine motor-driven rail car with the expectation of materially reducing the cost of operation on branch lines where the traffic is light. At present the car is being run between Merbein, Mildura and Redcliffs, in the irrigated citrus fruit section, and serves a population of 14,000 people, the traffic being in the nature of semi-suburban.

The chassis purchased had an engine developing 45 b.h.p. at 1,000 r.p.m. The frame, which was 14 ft. 9 in. long from the driver's seat to the rear, was cut and spliced out by a 4 ft. addition in the center and an addition of 2 ft 10 in. at the rear and the driving shaft was lengthened between the universal joint and the gear box to suit the extended wheelbase of 18 ft. 2⅜ in.

No change was required in the rear axle to adapt it to use on 5 ft. 3 in. gage railway tracks. A new straight front axle was applied together with 30 in. diameter wheels, having standard steel tires and waste-lubricated journal boxes.

The standard chassis when received had a worm drive, giving a speed of 17 m.p.h. with an engine speed of 1,200 r.p.m. and a gear ratio of 8.25 to 1. In order to provide for speeds of 30 to 35 m.p.h. the gear ratio was changed to 4½ to 1 by introducing a new worm and wheel.

No special alteration was made to the brakes, which are all on the rear axle, but the following items were added: pilot, horn and exhaust whistle, speedometer, electric lighting generator and battery, and a spring on the throttle control to shut off the gasoline in the event of the driver, for any reason, letting go.

The car body, which is 22 ft. 7 in. long, 9 ft. wide overall and 6 ft. 7 in. high inside, is provided with seats for 45 passengers. Two 4 in. by 4 in. stringers are carried directly on the chassis frame channels, and into these are checked transverse bearers at 1 ft. 1⅞ in. centers. The body is of lightest construction and is suitable for use in hot climates. The sides are open above the level of the seat backs and instead of windows, canvas roll curtains are provided in case of bad weather. The seats are of maple battens carried on angle iron frames. There are four electric lights in the body and one in the driver's compartment. Electric headlights are also included in the equipment.

No provision was made on the car for the carriage of heavy baggage or freight. For this purpose and for the accommodation of extra passengers, a trailer has been built. This consists of a body, 16 ft. 2½ in. long over-all, of similar construction to the motor body and divided into two compartments, one of which seats 12 passengers, while the other is simply a parcels compartment. When the trailer is employed, it is in charge of a guard, who is then responsible for the sale and collection of tickets, which is attended to by the driver when a trailer is not in use. The guard is competent to relieve the driver in case of emergency. The trailer is electrically lighted by means of a jumper coupling and bell circuits are installed for exchange of signals between driver and guard.

As the car may be required to pick up and set down passengers at level crossings, hinged steps are provided on each side, operated by a lever in the driver's compartment. This mechanism is interlocked so that the clutch can be thrown in only when the steps are clear of the structure gage. In order to prevent passengers from attempting to alight before the steps are in position, the doors are placed under the control of the driver.

Motor Car for Victoria State Railways—Trailer Attached When Required

The light weight of the motor is 13,900 lb. and the trailer, 8,960 lb., a total of 22,860 lb. The total weight with all 55 seats occupied and allowing 5,150 lb. for baggage, is 30,500 lb. When handling a heavy traffic there is space for 15 standing passengers in the motor car and 6 in the trailer, making a total of 76 passengers, bringing the loaded weight of the two units to 39,380 lb. The speed on the level with a load of 4,480 lb. is 35 m.p.h. and on a two per cent grade, 14 m.p.h.

A MOTION PICTURE to illustrate the manufacture of wrought iron pipe has been prepared by the A. M. Byers Company, of Pittsburgh, Pa., and will be lent to colleges, societies and institutions interested without cost. This film fills three reels and shows the processes from the smelting of the ore to the final inspection of the finished pipe. The Byers Company also furnishes lantern slides of this same process.

General News Department

The Interstate Commerce Commission has announced a resumption of hearings on the subject of railroad consolidations affecting the Southeastern district, before Examiner Healy at Mobile, Ala., on October 16, Jacksonville, Fla., October 18, Atlanta, Ga., October 19 and 20, and Columbia, S. C., on October 21.

The "Rochester-Minnesota Special" of the Chicago & North Western, operating daily between Chicago and Rochester, Minn., has been newly equipped from locomotive to observation car. The new equipment consists of seven steel cars, painted yellow and stamped with the "North Western" trade-mark, including a mail car, a baggage car, two coaches, two Pullmans and an observation buffet lounge car.

W. H. Cundey, assistant general passenger agent of the Denver & Rio Grande Western, was elected president of the American Association of Traveling Passenger Agents at its recent convention held at Calgary, Alta. F. D. Rush, division passenger agent of the Louisville & Nashville, at Cincinnati, Ohio, was elected vice-president and P. C. Benedict, division passenger agent of the Baltimore & Ohio, at Chicago, was re-elected secretary-treasurer. The annual convention will be held next year at St. Petersburg, Fla.

The deficiency appropriation bill, passed by the Senate on September 21, provides an additional appropriation of $100,000 for the car service work of the Interstate Commerce Commission and $66,000 for 15 additional safety appliance inspectors but an amendment proposed by Senator Cummins providing $170,100 for the employment of 35 additional locomotive inspectors for nine months was not accepted by the House conferees and their report without this provision was adopted by both houses on September 22.

Railway Business Association Annual Meeting and Dinner on November 9

The annual meeting and dinner of the Railway Business Association will be held at the Hotel Commodore, New York, on November 9. The subject for discussion will be "Railways as a Factor in General Prosperity and Wise Limits Upon Government Regulation." The list of speakers will be announced later.

Handbook of United States Safety Appliances

In response to demand from the members, another edition of the small Safety Appliance Handbook, covering all classes of cars and locomotives, for use of inspectors and others, similar to that issued in 1915 by the Master Car Builders' Association, revised to date, has been issued by the Mechanical Division of the American Railway Association. These books will be supplied on requisition to members or others by the secretary.

Twenty Passengers Killed at Gonzales, Mexico

By a train wreck, due to a flood, on the National Railways of Mexico, four kilometers south of Gonzales Junction, on September 19, twenty passengers were killed or drowned, as were also all members of the crew except the flagman. About 40 passengers were injured.

The wreck occurred at about 11 p. m. and the train was through passenger No. 2 from Laredo to Mexico City. The track had been washed out by a sudden flood caused by the bursting of a dam some distance up stream, from the railroad. But little rain had fallen in the vicinity of the track.

One account says that two trains were wrecked, a second one colliding with the one first derailed.

Proposed New Highway Crossing Rules in Illinois

Last week the Illinois Commerce Commission and a number of safety representatives of interested railroads met in Springfield, Ill., to discuss nine new grade crossing rulings recently drawn up by that commission. The commission invited suggestions for modifications before the rules are put into effect, and Chairman Smith stated that others interested who did not attend the meeting would have an opportunity of making suggestions in writing. The commission has designated crossings as hazardous and nonhazardous and has formulated rules for the erection of suitable signals. M. A. Dow, of the New York Central lines, advocated placing warning signs at least 200 ft. from every crossing. Of the 207 crossing accidents on his lines last year, 146 occurred at open [unattended] crossings, where the view was unobstructed; and 156 of them were in broad daylight. The commission proposes rules for removing obstructions, leveling approaches and the elimination of growing crops on the right of way which may obstruct the view of crossing. In general the new rules were approved by the railroad representatives.

Suspension of Hydrostatic Tests of Tanks of Tank Cars and Safety Valve Tests

The Mechanical Division of the American Railway Association has announced that upon recommendation from the Committee on Tank Cars, that part of Sections 23 and 24 of the Standard Specifications for Tank Cars, Classes I, II, III and IV, covering the requirements of testing of tanks hydraulically and testing of safety valves, has been suspended as to tanks for which such tests shall become due prior to January 1, 1923, except when such cars are shopped for repairs.

The requirements of Section 23 of each of the specifications named, that new tanks shall be tested before being put into service, and that tanks damaged to the extent of requiring patching or renewal of one or more sheets, or extensive re-riveting or re-calking of seams, shall be re-tested before being returned to service, are not suspended.

The requirements of Section 24 of each of the specifications named, that safety valves on new cars shall be tested and adjusted before cars are placed in service, are not suspended.

Fire Prevention Week

Fire Prevention Week for the railroads of the country has been fixed to begin on October 2, and the Railroad Insurance Association, 80 Maiden Lane, New York City, has issued a bulletin emphasizing some of the nuggets of wisdom which have been evolved in its discussions. We quote:

An Ounce of Prevention Is Worth a Pound of Cure. Do you realize what this means as applied to your own particular work? It means a little thought. A little carefulness each day will prevent destruction by fire of property requiring much labor and great cost to replace. Practicing good housekeeping where your own daily work is done will prevent a fire loss that might take away your present job.

What to Do in Fire Prevention Week.—1. Check up on all property which you are in charge of or which you come in contact with daily to see what fire hazards or dangers may be safeguarded better than at present. 2. Study the fire protection equipment that comes under your daily observation. Is it in order? Is it sufficient? Can you or anyone else use it? 3. Report to the authorities higher up defects, dangers and hazards which you cannot remedy yourself. * * * 4. clean up—Clean Up—CLEAN UP—*Clean Up.* * * *

W. F. Hickey, superintendent of insurance of the New York, New Haven & Hartford, in a circular, calls attention to the fact that "every day is fire prevention day on railroads." He sets forth in particular the special duties of all concerned in connec-

tion with water barrels, heating appliances, electric installations, water lines and hose, and chemical extinguishers. Where liable to freeze (except Pyrenes), chemical extinguishers should be removed to heated buildings and all extinguishers must have been recharged within a year. Clean out record rooms, lockers, attics, basements, under platforms, house tracks, behind radiators and cabinets, locomotive cabs, around wooden bridges and piles of cross ties.

Great Western to Increase Number of Motor Car Trains

The Chicago Great Western considers its recent experiment in gasoline motor driven cars for passenger service on branch lines such a success that it is planning to purchase several additional motor trains mainly for service in the more thickly settled sections of Iowa. The trains consist of a specially constructed motor car, equipped with a high-power gasoline engine and a trailer which resembles an ordinary interurban electric coach, although more heavily built. The motor car has room for freight and baggage just back of the compartment occupied by the engineer.

"My theory is," S. M. Felton, president, is quoted as saying, "that with the low overhead on the gasoline-driven train, we can afford to stop at every crossing, farmhouse or small station, if necessary. In this way we expect to give the kind of service which will be appreciated by the Iowa farmers and build up a good interurban traffic. The interurban trolley systems can do this and make it pay and so should the railroads. We have the tracks, the stations, and all the other equipment of a right-of-way. All that is necessary is to add the trains."

The four trains now in use in Iowa, Mr. Felton added, are running from 100 to 150 miles a day without difficulty. The Russell Company, Kenosha, Wis., supplied the equipment recently placed into service by this company between Des Moines, Ia., and Marshalltown.

The Boardwalk Flyer

The Philadelphia & Reading took the first prize in the parade of decorated rolling chairs and floats in the Atlantic City Pageant of September 7, the main feature of its display being a mode of the "Boardwalk Flyer." This model, a locomotive and two cars, was preceded by the Reading shops' band and the Reading shops' double quartette. The Reading float was in the eighth division of the parade. It won not only the first prize in the entire parade, a handsome gold cup, but also the first prize in the division, a beautiful silver cup.

The model of the "Boardwalk Flyer" was built by Jack Daly, foreman of boiler makers at Reading. The wheels of the train were made to revolve by steam generated in the engine, which gave to the model a realistic appearance of a train in motion. The model is about 30 ft. long and 3 ft. high.

The Boardwalk Flyer, leaving Camden at 4 10 p. m., runs to Atlantic City, 55½ miles, in 55 minutes.

On Thursday evening, September 7, the Reading shops' band in a contest with the Philadelphia band and the Altoona shops' band of the Pennsylvania Railroad on the steel pier, won first prize, a silver cup.

Bridge and Building Convention

The American Railway Bridge & Building Association will hold its thirty-second annual convention at the Hotel Gibson, Cincinnati, on October 17-19. The program for this meeting is as follows:

TUESDAY

Convention called to order 10 a. m.
Reports of officers and appointment of special committees.
Report of Committee on Pile Driving Records.
Report of Committee on Labor Saving Devices in Routine Bridge and Building Work.
Report of Committee on Building Inspection and Records
Report of Committee on Relative Merits of Wooden, Steel and Concrete Tanks.

WEDNESDAY

Address by H. A. Worcester, vice-president, Cleveland, Cincinnati, Chicago & St. Louis.
Report of Committee on the Painting of Structural Steel.
Report of Committee on the Framing of Bridge Timbers Before Treatment.
Paper on the Reconstruction of the Cincinnati Bridge of the Cincinnati Southern by F. W. Henrici, assistant engineer of construction, American Bridge Company.
Report of Committee on the Handling and Driving of Concrete Piles.
Inspection of new bridge of the Cincinnati Southern over the Ohio river.

THURSDAY

Report of Committee on the Construction and Maintenance of Sewers and Drains.
Closing business, including election of officers and selection of meeting place.

On Tuesday evening C. E. Paul, chief engineer of the Miami Conservancy District, will present an illustrated paper on the flood protection work in the vicinity of Dayton, Ohio. The annual dinner of the Bridge and Building Association and the Bridge and Building Supply Men's Association will be held on Wednesday evening. Thursday afternoon will be spent in an inspection of the Cincinnati terminals. On Friday a trip will be made to Dayton where the flood protection work of the Miami Conservancy District will be inspected.

Coal Analyses by Bureau of Mines

The results of analyses of hundreds of coals from 25 states and the territory of Alaska are given in Bulletin 193, "Analyses of mine and car samples of coal collected in the fiscal years 1916 to 1919," by Arno C. Fieldner, Walter A. Selvig, and J. W. Paul, just issued by the United States Bureau of Mines. Information as to the heating values of all coals tested is also given in the bulletin, which should be of interest to all extensive users of coal fuel.

Many mine samples of coal are analyzed each year in the laboratories of the Bureau of Mines. Descriptions of the coal samples collected between the beginning of this work, July 1, 1904, were compiled and published in Bureau of Mines Bulletins 22, 85 and 123.

In order that the material in this bulletin may be used to supplement that presented in earlier bulletins, the same plan of geological classification has been followed, the analyses and descriptions of the samples being grouped in alphabetical order according to the states, county and town near which the mines or prospects sampled are situated.

Model of "The Boardwalk Flyer," Exhibited at Atlantic City, N. J., on September 7

Information regarding coal samples and analytical methods employed by the Bureau of Mines and a bibliography on the coal resources of the world are contained in the bulletin.

The entire distribution of Bulletin 123 will be through the superintendent of documents, Government Printing Office, Washington, D. C., from whom the report may be obtained at a price of 35 cents. Bulletins 22, 85 and 123 are sold by the superintendent of documents at prices of 85, 45 and 50 cents respectively.

California Saved Ten Million by Reduced Freight Rates

According to the Railroad Commission of California, the people of that state have been saved $10,450,000 by railroad rate reductions effected during the past fiscal year. The commission states that on behalf of California shippers it supported the reduction in hay and grain rates before the Interstate Commerce Commission, resulting in a cut of 10 per cent and, in addition, obtained a like reduction on products of the field, orchard and range. As this reduction applied to citrus and dried fruit, it was even more beneficial to California than that affecting the hay and grain movement. When the Interstate Commerce Commission ordered a general reduction amounting to approximately 10 per cent in interstate freight rates in the Western division, effective July 1, the California commission notified the carriers that a like reduction would be expected on shipments entirely within the state, and the roads responded favorably. This saving alone to California shippers on interstate and state freight movement is said to amount to about $10,000,000 a year. Only recently the commission made a reduction in freight rates between Los Angeles and Imperial County points which will result in a saving of more than $200,000 a year. This decision, the commissioners expect, will not only save money to shippers, but more important, will contribute materially to the development of the Imperial valley. The California Railroad Commission also claims to have saved express shippers several million dollars by resisting a proposed increase in rates and to have been the direct means of bringing about a national investigation of express charges, which is expected to result in reductions throughout the country.

Signalmen Ask for Higher Wages

Requests for increases in pay affecting members of the Brotherhood of Railroad Signalmen of America on 42 railroads and their subsidiaries were brought before the Railroad Labor Board on September 25 by D. W. Helt, president of that organization. Mr Helt asked practically for the scale of wages in effect under the Board's Decision No. 2 and for certain rules and working conditions which would result in virtually restoring the old signalmen's national agreement.

In opening his case, Mr. Helt said the signalmen based their action on four premises: (1) The general upward trend of the living wage; (2) that the Board in computing reductions in 1921 and 1922 had not used facts of "sound validity"; (3) that the first reduction was made in error, and (4) that government figures place the living cost of the average family at $2,400 a year.

Mr. Helt also asked for the restoration of punitive overtime after the eighth consecutive hour of work instead of after the ninth hour as is the case under the present rules, and for Sunday and holiday work.

The carriers' side in the controversy was presented by J. W. Higgins, Dr. C. P. Neill, and J. G. Welber, representing respectively the western, southeastern and eastern carriers. The general trend of their testimony was to the effect that the downward trends in industrial wage levels and living costs since Decision No. 2 was placed in effect prohibit the restoration of the rates of pay provided for in that decision and that the present rates of pay of these employees are "just and reasonable" in light of the decreases which have taken place in the cost of living during the past year. Regarding the request of the employees for punitive overtime after the eighth hour the carriers' representative pointed out that the Board had already recognized the peculiar conditions connected with the work of signal and maintenance of way employees and that the application of the provision asked for by Mr. Helt would result in penalizing the railroads for conditions over which they were in a position to exert no control.

Traffic News

The Union Pacific has closed its district freight and passenger agent's office at Santa Barbara, Cal., and this territory will be covered by the general agents at Los Angeles.

Black Hills, South Dakota, is the title of a booklet recently issued by the association of Black Hills Commercial Clubs in collaboration with the immigration department of South Dakota. The book gives historical data concerning the settlement of that country and many descriptions of cities and towns.

The Ocean Traffic Bureau of the Port of Philadelphia has appointed W. H. Reed as manager. Mr. Reed was in the railroad service for years, having begun with the Illinois Central in 1899 and subsequently serving on the Mobile & Ohio and the Missouri Pacific. He was engaged in the foreign freight section of the traffic department most of the time.

The Chicago, Burlington & Quincy, now offers homeseekers' excursion rates from stations on its lines in Illinois, Iowa, Missouri, Wisconsin and Minnesota; Atchison and Leavenworth, Kan., and Omaha, Neb., to many destinations in Minnesota, Montana and North and South Dakota. Tickets are on sale every Tuesday up to and including October 31. Generally speaking the round trip fares will equal the one-way rate plus $2 and tickets will be good for 21 days with some stopover privileges.

There is much concern on the Pacific coast over the present shortage of refrigerator cars to handle the ripening crops. The Pacific Fruit Express which is owned jointly by the Southern Pacific and the Union Pacific has at present less than 1,000 of its total 20,000 refrigerator cars in service located at points west of Ogden, Utah, Portland, Ore., and El Paso, Tex. Urgent calls have been made upon the Eastern roads for the return of the refrigerators, and also upon the car service division of the American Railway Association, supplemented by representations to the director of service of the Interstate Commerce Commission. These appeals have been reinforced by representations to the Interstate Commerce Commission by the California state director of agriculture. In addition to efforts of the roads, everything that state and federal authorities can do is being done to bring about the restoration of normal fruit car service.

Mr. Alfred Pleads for Auto Industry

F. H. Alfred, president of the Pere Marquette, has appealed to the Interstate Commerce Commission "to come and save the automobile industry and its workers." The message was in the form of a suggestion for general effort on the part of all carriers "to utilize to the fullest extent standard box cars for the handling of priorities, so that any surplus will be in the shape of automobile box cars that can be used by that industry." There are at this time, says Mr. Alfred, practically no cars for loading automobiles at plants in Michigan, and unless cars can be provided it will be necessary for these plants to curtail production. He further suggested that the railroads be instructed so far as possible to use automobile cars for shipments destined for Michigan, so that these cars will be available for automobiles.

Central Control of automotive traffic has now become imperative, in the view of J. M. Glenn, secretary of the Illinois Manufacturers' Association. So much business has been diverted from the railroads to the automobile, and transportation by gasoline has become such an important factor, coupled with the inability of the public highway to meet the demands, that it is imperative that the Interstate Commerce Commission and the various state utility commissions assume control of motor truck and auto passenger traffic, says Mr. Glenn. The railroads are trying to meet the competition by introducing gasoline cars, but experts doubt if they will be successful. The state furnishes the automobile carrier a road maintained at public expense, and yet it is plainly inadequate.

Commission and Court News

Interstate Commerce Commission

The commission has changed from September 15 to October 2 the effective date of its order increasing the divisions received by the Kansas City, Mexico & Orient out of through rates with its connections.

State Commissions

The Interstate Commerce Commission, at the request of the Railroad Commission of California, has sent a representative to that state to investigate conditions relative to the shortage of refrigerator cars needed immediately to move a very heavy grape crop. The state commission claims that the grape growers are threatened with financial ruin owing to inability to obtain refrigerator cars.

California Commission Checks Construction of New Crossings

In passing upon a recent application of the Southern Pacific for permission to construct a spur track, the Railroad Commission of California warned industries against the expenditure of large sums of money on plants in anticipation of the granting of spur track permits. In the present case the road was authorized to construct a track at grade across Santa Fe avenue and the tracks of the Los Angeles Railway Company in the city of Vernon, to serve the California Dressed Beef Company, which had expended $250,000 on its plant and $12,000 on the proposed track before the commission had passed on the application.

"We draw particular attention to this circumstance," the commission said, "for in many applications filed with us our reports of inspection on the ground reveal that a large amount of money is expended on buildings which are located to fit in with a particular location of the track in which a grade crossing of a public highway is involved, and this expenditure is used as an argument toward granting the application. It would be better for the carriers to see that proposed industries fully understand the situation and refuse to do any construction work until the proper application has been filed and granted and we wish to announce that expenditures so made will not be considered in connection with applications to construct crossings at grade."

Personnel of Commissions

Ray W. Clarke, attorney-examiner of the Interstate Commerce Commission, in charge of matters relating to certificates of public convenience and necessity and acquisition of control of one railroad by another, has resigned effective on October 31 and will engage in the practice of law in Washington.

Court News

Shipper Limited to Grounds of Negligence Alleged

A shipper suing for damages to goods and setting forth specific grounds of negligence, as unreasonable delay and failure to ventilate car cannot recover on another ground of negligence, such as negligence as to icing the car, which is not specified.—New England Fruit & Produce Co. v. Hines (Conn.) 116 Atl. 243.

No Liability from Clogging of Culvert Without Negligence

The Alabama Supreme Court holds that if a railroad culvert was sufficient to take care of a stream, and became obstructed without the railroad's knowledge or fault, the railroad was not liable to a landowner for damage by overflow, unless it was negligent in not knowing of or in failing to remove the obstruction.—Alabama Great Southern v. Killian (Ala.) 90 So. 906.

Foreign Railway News

Russian Railways in Deplorable Condition

LONDON.

The Russian commissar for education, Dzerjinsky, at a recent conference of the communist party, submitted a report stating that 90 per cent of the railway lines were now dangerous for traffic. He further stated that during the last four years practically no repairs to the lines have been done at all. In pre-war years 40,000,000 ties had been renewed annually. In 1920, the commissar for communications had drafted a scheme for the annual replacement of 18,000,000, a quantity which he stated would be adequate. In fact, however, he was only able to renew 6,500,000 ties. Though orders have been given to reduce the speed of trains and the load limit, unless 44,000,000 ties are renewed during the present year, the Russian railway system will, stated the commissar, become practically useless. The only lines on which no immediate repairs were needed were the Nicolaievsky line, the Alexandrovsky line and the Moscow-Winday-Rybinsk line.

Dzerjinsky, replying to a statement in the Soviet press alleging the concealment of profits, declared that the commissariat had a big deficit and owed an enormous debt to its underpaid staff, and was faced with the danger that the workers would give up in disgust.

China Notes

PEKING.

The Peking-Suiyuan Railway management announces that work upon the Paotou extension has proceeded to such an extent that passengers can now be carried on construction trains three stations beyond Suiyuan.

The Shanghai-Nanking Railway is installing a "train control" system, which is a combination of the "staff" and the "dispatcher" system. Movements of trains will be authorized by delivery of the staff as heretofore, but the arrival and departure of trains at stations will be telephoned to the "train controller" as under the dispatcher system, and records will be kept of train movements similarly. The train controller will also issue orders for the delivery of the staff to trains which are to be given preference, much as train orders are given under the dispatcher system. This is an innovation in China and is an attempt to postpone double-tracking of a portion of the Shanghai-Nanking line. This line has experienced an increase in passenger kilometres of nearly 60 per cent since 1915 and an increase in ton kilometres of nearly 80 per cent during the same period. The busiest section of the line carries about forty trains a day as an average.

Reports have it that the British & Chinese Corporation is offering to advance to the Chinese government sums sufficient to pay supply bills, wage arrears, and forthcoming interest charges of the Canton-Hankow Railway on the condition that the government will yield to the corporation the right to appoint the traffic manager and three traffic inspectors of the line. The finances of this line are further jeopardized by the uncertain future of the Hanyang Iron & Steel Works. Because of business depression and the curtailment in naval expenditures, Japanese firms which have had long term contracts with the Hanyang works are cancelling orders and refusing shipment. Very recently one order for some 6,000,000 taels of billets was refused and this firm has been so short of funds as to be constantly in arrears to the railway on its freight charges for coal. As this coal traffic constitutes the bulk of the freight traffic on the railway, the prosperity of the iron works, for the time being at least, is of profound importance to the railway. Incidentally, many "old China Hands" see a close connection between the fading of Japanese demand for the output of the Hanyang Works and the withdrawal of the Japanese troops from Hankow which lies just across the river.

As predicted in these notes some time ago, the defeat of Chang Tso-lin in the neighborhood of Peking did not mean a final conclusion of hostilities. A battle of several days' duration took place early in the month in the region of the Great Wall at Shanhaikuan. But some influence has deterred Wu Pei-fu from fighting it out to a conclusion as he seemed inclined to do at first. A truce has

been arranged whereby troops of both sides will be withdrawn, and it appears likely that the mandate depriving Chang of his command and his honors will be modified so as to leave him in control of Manchuria. It is stated, however, that he will soon return the rolling stock of the Peking-Mukden Railway, nearly all of which he took with him into Manchuria. The line in the meantime has been operating a very limited train service largely with engines borrowed from the Peking-Hankow line.

It is announced that Wu Pei-fu will cease to collect the revenue of the Peking-Hankow at an early date, thus permitting the Peking-Hankow to begin rehabilitating itself financially. Foreign supply firms have been in despair for several months on bills owed by that line.

The ad interim administration of the ministry of communications which succeeded the flight of Yeh Kung Cho has now been succeeded by definite appointees selected by Wu Pei-fu. For the first time in history, the minister, the vice minister and the director of the railway department are all able to speak English. The minister, Kao Fu-hung, is a man of more than usual directness. When coming to Peking to assume office he refused to have a private car put on to the already heavy train, and finding all the seats occupied stood all the way from Tientsin to Peking. He immediately put into effect further retrenchment orders, and fixed the summer office hours at from seven to one. A few bureau chiefs who came late a day or two later, were summarily discharged. A clean-up order went out. Windows were washed, walls were whitewashed, desks were cleared of accumulated trash, and the appearances of the ministry of communications are very much improved. S. W. Lao, who is acting vice-minister, pending the return of Dr. C. C. Wang from the Chinese Eastern, was formerly assistant director of the Tientsin-Pukow line. S. T. Chao, the director of the railway department, for several years was maintenance engineer of the same line, and more lately has been in charge of the construction of the Chefoo-Weihsien railway line.

The finances of the ministry of communications as well as of the government generally are in such a condition that Kao Fu-hung, as well as the minister of finance, have been giving considerable consideration to the subject of a foreign reorganization loan. In view of the anti-foreign feeling in the country, their enemies have sought to discredit them in this connection. An appeal to Wu Pei-fu brought forth a telegram in which Wu stated that he was not in favor of a foreign loan "until the country was re-united." Wu evidently possesses more of the finesse of a politician than has been credited to him, for this reply has satisfied the "inter-meral" Chinese, and has in no way interfered with or changed the plans of his ministers of finance and communications. Their loan plans have been formulated, insofar as they may have taken shape, only on the assumption of a general re-association of the provinces and an attempt to disband a portion of the present armed forces.

One of the first steps toward meeting the obligations toward foreign creditors has just been taken by the Peking-Suiyuan towards the General American Car Company. The latter has sold some 600 freight cars to the railway which have not been erected because first payments could not be made. By the agreement which has been approved recently by the ministry of communication, the car company will nominate and the railway will appoint a car accountant who will keep a record of the earnings of each of these 600 cars, 50 per cent of which revenue shall be paid by the railway weekly to a depository named by the car company. Penalties by way of increased interest rates are named in case the railway is in default of a specified minimum per month. This is the first approach toward the equipment trust method of financing purchases of rolling stock in China.

The American advisory committee has recently made a grant of $200,000 gold toward the building of a highway in Hunan from Siangtan to Paoking. The road is to be built by famine refugees, and upkeep for ten years has been guaranteed by the deposit of $50,000 gold in a special account to be administered by an engineering committee on which foreigners have an equal representation. This road will traverse one of the Siems Carey routes, and will connect one of the most active iron regions with the Canton-Hankow Railway. In North China, highway projects aggregating nearly 1,000 miles are under various stages of progress—mostly under the direction of forces seeking to rehabilitate famine or flood sufferers. A very considerable popular interest in this particular form of communication has been aroused.

Equipment and Supplies

Locomotives

The Montour Railroad is inquiring for 4 locomotives.

The Green Bay & Western is inquiring for two locomotives.

The Chesapeake & Ohio is inquiring for 2 Mountain type and 6 Pacific type locomotives.

The Chicago & North Western may purchase locomotives in addition to the 50 recently ordered.

The Korean Central has ordered two 2-6-2 type locomotives from the Baldwin Locomotive Works.

The Pacific State Lumber Company has ordered for the Coos Bay Lumber Company, Oregon, one Mikado type locomotive from the Baldwin Locomotive Works.

Freight Cars

The Detroit, Toledo & Ironton is inquiring for 500 coal cars.

The City of Grand Rapids, Mich., is inquiring for 3 flat bottom gondola cars.

Chicago & North Western is inquiring for 800 gondola cars and 200 flat cars.

The Grand Trunk is inquiring for 2,000 automobile cars, 4,000 box cars and 700 refrigerators.

The New York, Ontario & Western is inquiring for 100 steel underframes for 40-ton freight cars.

The New York Central is having general repairs made to 200 stock cars at the shops of the Streator Car Company.

The Seaboard Air Line has ordered repairs to 500 composite gondola cars at the shops of the Virginia Bridge & Iron Works.

The Grey Steel Products Company, New York, has ordered 2 steel hopper cars of 55 tons capacity from the Pressed Steel Car Company.

The West Penn Power Company, Pittsburgh, Pa., has ordered 60 hopper cars of 55 tons capacity from the American Car & Foundry Company.

The General Petroleum Corpotation, Los Angeles Cal., has ordered three insulated tank cars of 10,000 gal. capacity from the Pennsylvania Tank Car Company.

The Grand Trunk, reported in the *Railway Age* of September 23 as inquiring for 250 refrigerator cars, has ordered this equipment from the American Car & Foundry Company.

The New Orleans Great Northern is reported to have ordered 200 flat cars from the Southern Car Company and repairs to 197 gondola cars from the same company.

The Maine Central is inquiring for 350 single sheathed box cars, 150 rack cars and 10 produce cars, all to be of 40 tons' capacity. The company is also inquiring for 50 general service cars of 30 tons' capacity.

The Chicago & Alton has placed orders for repairing 200 steel gondola cars with the Illinois Car Company and 200 steel gondolas with the Mount Vernon Car Manufacturing Company.

The Union Pacific, reported in the *Railway Age* of September 16 as inquiring for 50 caboose cars, has ordered this equipment from the Mount Vernon Car Manufacturing Company.

Passenger Cars

THE MAINE CENTRAL is inquiring for 7 steel combination baggage and mail cars.

THE CENTRAL SUPPLY COMPANY, Philadelphia, Pa., has ordered one private car from the Bethlehem Shipbuilding Corporation, Ltd., Harlan Plant.

THE RICHMOND, FREDERICKSBURG & POTOMAC, reported in the *Railway Age* of September 2 as asking for prices on six cars for passenger service, has ordered four steel passenger coaches and six steel express cars from the Bethlehem Shipbuilding Corporation, Ltd., Harlan Plant.

Iron and Steel

THE VIRGINIAN is inquiring for 300 tons of steel for bridges.

THE MISSOURI, KANSAS & TEXAS is inquiring for 10,000 tons of 90-lb. steel rails.

THE CHICAGO & ALTON is inquiring for approximately 10,000 tons of steel rail.

THE NEW YORK CENTRAL is in the market for 600 tons of steel for bridges at various places.

THE TEXAS & PACIFIC has ordered 15,000 tons of rail from the Tennessee Coal, Iron & Railroad Company.

THE PENNSYLVANIA RAILROAD is in the market for 3,000 tons of fabricated steel for new shops at Juniata.

THE ATLANTIC COAST LINE has ordered 30,000 tons of rail from the Tennessee Coal, Iron & Railroad Company.

THE NASHVILLE, CHATTANOOGA & ST. LOUIS has ordered 13,000 tons of rail from the Tennessee Coal, Iron & Railroad Company.

THE ATCHISON, TOPEKA & SANTA FE has ordered from the American Bridge Company 246 tons of structural steel for a powerhouse at San Bernardino, Cal.

THE CLEVELAND, CINCINNATI, CHICAGO & ST. LOUIS will receive bids until October 5, for bolts, screws, nuts, iron bars, steel billets, firebox and boiler plates, tank and car plates, steel sheets, nails, fence wire, cable wire, axles, boiler tubes and safe ends.

Machinery and Tools

THE GRAND TRUNK is inquiring for a lathe, radial drill, crank planing machine and valve grinding machine.

THE DELAWARE & HUDSON has ordered a 500-ton double end wheel press from the Niles-Bement-Pond Company.

THE LONG ISLAND will install a number of new machine tools in its Morris Park shop. See item under Railway Construction.

THE NEW YORK CENTRAL has ordered one 23-in. lathe from the Niles-Bement-Pond Company. This company is also inquiring for one 27-in. by 18-ft. lathe.

THE PENNSYLVANIA is inquiring for one combination journal truing and axle lathe to accommodate wheels up to 36 in. in diameter and to be motor driven, 3-phase, 60-cycle, 220-volt current. Necessary electrical equipment also to be included.

THE BALDWIN LOCOMOTIVE WORKS, Philadelphia, Pa., is inquiring for machine tools including 2 rod milling machines, 2 plain milling machines, 2 vertical milling machines, 1 frame drilling machine, 2 frame slotters, 4 frame planers, 14 standard planers, 2 turret lathes and 3, 60-in. horizontal boring and drilling machines.

LIMA LOCOMOTIVE WORKS, Lima, Ohio, has ordered 12, 6-ft. Right line radial drills, 6 Pond planers (5 of 60-in., one of 90-in.); and a 50-ft. triple-head Bement locomotive frame slotting machine. The company divided an order for additional tools among three other builders, including three planers, a vertical rod milling machine, axle turret lathe vertical rod boring machine, four 20-in engine lathes, two tool makers' lathes, a 60 in. wheel press, two 18-in. slotting machines, a horizontal boring and milling machine, cylinder boring machine and two turret lathes.

Supply Trade News

J. W. Floto has been appointed sales manager of the **Globe Steel Tubes Company** with headquarters at Chicago.

The Brown Instrument Company, Philadelphia, Pa., has opened a New England branch at 185 Devonshire street, Boston, Mass., with **George Goodman** in charge.

A. W. Donop, formerly Pacific Coast district manager of the **U. S. Light & Heat Corporation**, with headquarters at San Francisco, has been appointed district manager in the railway department of that company, with headquarters in Chicago, to succeed **E. C. Wilson**. Mr. Donop has been identified with electric car lighting since its inception, having operated and maintained some of the original headend equipment on Pullman cars. He entered the service of the Pennsylvania at the time when that road established a carlighting maintenance department. He later was in the employment of the Gould Storage Battery Company, and the Lehigh Valley, respectively. In 1907, he entered the service of the U. S. Light & Heat Corporation, with which organization he has been chief inspector, traveling engineer, and a district sales representative.

A. W. Donop

Pell W. Foster, Jr., in the sales office of the Power Specialty Company, New York City, has been appointed New England district manager, with office at 50 Congress street, Boston, Mass.

The Consolidated Machine Tool Corporation of America, New York City, has let a contract to the Shoemaker-Satterthwait Bridge Company, Philadelphia, Pa., for building a two-story foundry, 98 ft. by 240 ft. of steel and concrete construction, at its Hilles & Jones plant, Wilmington, Del.

The Prest-O-Lite Company, Inc., New York, announces a complete new line of storage batteries for railway signaling and interlocking, conforming to the specifications of the Signal Section, A. R. A. The railroad sales division of the **National Carbon Company, Inc.**, Cleveland, O., has been appointed to handle the sales and field service of this new line of equipment.

J. G. Carruthers, manager of sales in the Chicago district for the **Illinois Steel Company**, and special sales agent of the **Carnegie Steel Company**, with headquarters at Chicago, has resigned to become general sales manager of the **Otis Steel Company**, Cleveland, O. He will be succeeded by **D. T. Buffington** of the structural and plate bureau, general sales department, Illinois Steel Company.

The Davis Boring Tool Company, St. Louis, Mo., has bought land for a new factory site fronting on Forest Park boulevard at the corner of Spring avenue. Preliminary work is now under way for putting up a modern three-story daylight factory in the near future. This company manufactures expansion boring tools and expansion reamers for all classes of metal boring in railroad shops. The company during the past 18 years has found it necessary to seek larger quarters on account of increased business and during that time outgrew four different factory buildings.

W. Newton Jeffress has severed his connections with the Carnegie Steel Company and other United States Steel Corporation interests with which he has been identified for a number of years, and is now engaged in the railway specialties and supply business, with offices in the International Building, 1319 F street, N. W., Washington, D. C. Mr. Jeffress represents the following companies: Ideal Nut Company, Chicago; Pittsburgh Knife & Forge Company, Pittsburgh, Pa.; Standard Seamless Tube Company, Pittsburgh, Pa.; Union Draft Gear Company, Chicago; Universal Draft Gear Attachment Company, Chicago, and Verona Tool Works, Pittsburgh, Pa.

The Consolidated Steel Corporation, New York, which was formed in 1918 and began business in January, 1919, under the Webb Export Act is liquidating its affairs and it is probable that the Bethlehem-Lackawanna combination will now go after export trade on its own account. The same thing is true of the Midvale-Republic Inland merger. All of these companies with the exception of the Inland have been members of the Consolidated Steel Corporation. The remaining companies according to some reports may form an export company under the Webb law. The liquidation of the Consolidated Steel Corporation may extend over a period of several months. E. A. S. Clarke, president of the Consolidated, recently gave out the following statement: "The company has ceased selling, and will liquidate its affairs as rapidly as consistent with conditions. The member companies are now quoting directly for their own account for export. Liquidation, naturally, involves drastic reduction of personnel. The directors may later consider a modified plan which will enable them to avail of the provisions of the Webb law."

W. S. Rugg, assistant to the vice-president, has been appointed general manager of sales of the **Westinghouse Electric & Manufacturing Company**, East Pittsburgh, Pa. The position of general sales manager is a new one in the Westinghouse Company and Mr. Rugg was appointed to the position because of his long experience in the electrical industry and in sales work. Mr. Rugg was born in Broadhead, Wis., and was graduated from Cornell University. He entered the service of the Westinghouse Electric & Manufacturing Company in 1892 and three years later was transferred from Pittsburgh to the Chicago office as district office engineer. In 1901 he was transferred to the New York office as special sales engineer, and in 1909 was made manager of that office. He was again transferred in 1917 to the East Pittsburgh works and was appointed manager of the railway department and shortly after he became manager of the marine department also. In 1920 he was promoted to assistant to vice-president in charge of sales, and now becomes general manager of sales as above noted.

W. S. Rugg

Trade Publications

ELECTRIC HOISTS.—Sprague electric type WX worm drive hoists are described in a two-page folder issued by the Sprague Electric Works of the General Electric Company, New York, N. Y. The folder includes a sectional drawing of the hoist and furnishes a brief description of each part.

CINDER PLANTS.—The Roberts & Schaefer Company, Chicago, has issued a four-page folder illustrating and describing its N. & W. type cinder plant. The text matter contains a list of 11 advantages of this type of plant while the illustrations show the construction and method of operation.

Railway Construction

CANADIAN NATIONAL.—This company has awarded contracts as follows: To William A. Dutton, Winnipeg, Man., for the construction of dams and the excavation of reservoirs at Pope, Man., Raymore, Sask., Conquest, Maryfield and Mecheche, Alta.; to the Northern Construction Company, Winnipeg, for the construction of a dam and the excavation of a reservoir at Wiseton, Sask.; to C. G. Anderson, Norwood Man., for the construction of a dam and the excavation of a reservoir at Rama, Sask.; to Green & Elsasser, Winnipeg, for the construction of pipe lines at Wiseton, Sask., Rama, Raymore and Maryfield, Alta.; to G. M. Irwin, Stonewall, Man., for the construction of a pipe line at Pope, Man.; to the Jamieson Construction Company, Edmonton, Alta., for the construction of a pipe line at Mecheche, Alta.; to Riley & Reed, Patience, Alta., for the construction of a dam and the excavation of a reservoir at Tilney, Sask.; to Simpson & Shillington, Winnipeg, for the construction of 10,000 ft. of pipe line at Lloydminster, Sask.; and to the Ideal Fence & Spring Company, of Canada, Winnipeg, for the erection of approximately 50 miles of fencing on the Oakland subdivision in Manitoba.

CHICAGO, BURLINGTON & QUINCY.—This company will accept bids until September 29 for a one-story brick reclamation plant 50 ft. by 301 ft. at Eola, Ill.

CHICAGO, MILWAUKEE & ST. PAUL.—This company has been ordered by the Board of Railroad Commissioners of South Dakota to build a freight and passenger station at Beardsley, S. D.

CHICAGO, ROCK ISLAND & PACIFIC.—This company, reported in the *Railway Age* of July 1 as contemplating the construction of a freight station at Omaha, Neb., has awarded the contract for the grading work to Roberts Brothers, Peterson, Shirley & Gunther of Omaha, Neb.

GRAND TRUNK.—This company will accept bids until October 4 for a two-story brick freight house 20 ft. by 32 ft. at Harvey, Ill.

GREEN BAY & WESTERN.—This company has awarded a contract to the Ogle Construction Company, Chicago, for coal handling machinery to be used in a 200-ton frame coaling station at Whitehall, Wis., which the company will erect with its own forces.

HOUSTON & BRAZOS VALLEY.—The Interstate Commerce Commission has issued a certificate authorizing the construction of an extension from a point near Clute to Hoskins Mound in Brazoria County, Texas, 13 miles.

LONG ISLAND.—This company is making some improvements at their repair shops at Morris Park, L. I., to include a new office building and a new storehouse, both to be of reinforced concrete; the installation of new machinery and two new overhead cranes in the locomotive shop; the remodelling of the old office building into a wheel shop with new machinery. The new office building will be 40 ft. by 80 ft. and will have three floors and basement, the basement to accommodate a modern restaurant for supervisory and office forces, rooms for records, and lavatory for men. The first floor will accommodate the superintendent of motive power's general office force and an information and employment bureau. The second and third floors to have offices of the superintendent of motive power and engineering forces. The new storehouse will be 40 ft. by 100 ft. and will have three floors and a basement, to be equipped with electric elevators for freight and an electric dumb-waiter to speed up delivery for light material to the delivery counter located on first floor. The entire building will be equipped with modern type of adjustable steel shelving. On the third floor will be located the office of the storekeeper and his office force. The old office building and present storehouse will be remodeled into a wheel shop and will have installed a complete monorail system for unloading wheels and axles and for handling this material in shop. New axle lathes, boring mills, wheel press and grinding machines will be installed. The locomotive shop will have a number of new machines, among which are a side head boring mill, a slotter, a bushing press, a radial drill, and a 20 ft. by 10 ft. bed engine lathe. To speed up the handling

of locomotives for repairs, the present slow method of unwheeling locomotives by a drop pit will be done away with and the two present 25-ton cranes will be replaced with a new 150-ton crane, running on a new steel runway the entire length of the locomotive shop. The light work will be handled by a new 10-ton crane, running on this same runway. The entire plant will be equipped with automatic telephones.

MINNEAPOLIS, ST PAUL & SAULT STE. MARIE.—This company, reported in the *Railway Age* of August 26 as accepting bids for a 20-stall roundhouse at Gladstone, Mich., has awarded the contract to Smith & Vandanaker, St. Paul, Minn.

MISSOURI PACIFIC.—This company, which was reported in the *Railway Age* of September 9, as closing bids on September 13, for a passenger station 24 ft. by 100 ft. at Lake Village, Ark., has awarded the contract for this building to the Herman & McCain Construction Company.

PENNSYLVANIA.—This company has awarded a contract to W. E. Wood, Detroit, Mich., for the construction of the foundation of a freight house 60 ft. by 700 ft. at Third and Larned streets, Detroit, and for the construction of a frame engine house 60 by 120 ft. at Lincoln Park, in the same city. This company has also awarded a contract to Meredith & McVaugh, Detroit, for the paving of the driveways of the Summit street yard. The principal engine house, which will serve both passenger and freight locomotives, will be built by the Pere Marquette for the Pennsylvania at Nineteenth street and will cost approximately $1,000,000, including a turntable, water tank, coaling station and other buildings.

PENNSYLVANIA.—This company is receiving bids for all the work necessary to complete the Baltimore, Md. (Canton), No. 3 yard. The work will consist of laying additional tracks and rearranging existing ones. The approximate quantities are as follows: 10,000 cu. yd. excavation; 4.2 miles track material unloaded, piled, distributed and laid; 12,000 cu. yd. unloading and surfacing with cinder ballast; 43 turnouts, labor laying; 5 crossovers, labor laying; 2 sets crossing frogs, labor laying; 6,300 lin. ft. track shifted; 6,100 lin. ft. track removed; 11 turnouts removed; 3 crossovers removed. The work will be in charge of J. W. Craig, assistant engineer, Union Station, Baltimore, Md.

THE SAN ANTONIO & ARANSAS PASS.—This company has awarded a contract to the Truscon Steel Company, Youngstown, O., for the construction of a one-story steel freight house, 40 by 130 ft., with a second story at one end for offices, to cost $15,000, at Waco, Tex.

THE REPUBLIC OF POLAND has purchased 7,504 European type freight cars from the United States War Department, according to an announcement made in Washington on Wednesday. These cars were ordered during the war for use by the American army.

British Troops Leaving for Turkey

Railway Financial News

ALGOMA EASTERN.—*To Pay Interest.*—This company announces that interest on the 5 per cent 50-year first mortgage gold bonds, which fell due on March 1 last, and which was deferred, will be discharged in full on October 1 through the Bank of Montreal.

BALTIMORE & OHIO.—*Authorized to Acquire Control.*—The Interstate Commerce Commission has authorized the acquisition by this company of control of the Indian Creek & Northern by purchase of its capital stock.

BARNEGAT RAILROAD.—*Application to Discontinue Operation.*—This company has made application to the Interstate Commerce Commission for permission to discontinue the operation of its railroad, which is one of the smaller subsidiaries of the Pennsylvania Railroad System. The line runs through the upper end of Long Beach from Barnegat City Junction, New Jersey, to Barnegat City, a distance of a little over eight miles, and is used chiefly for Summer travel.

The line has never been a paying proposition since the original incorporation in 1883. The Pennsylvania Railroad has been called upon to make up the resulting deficits, in addition to advancing sums, from time to time, for betterments. During this long period the local interests also tried to make the Barnegat Railroad profitable and formed the Manahawken & Long Beach Transportation Company to operate the road, but that was a failure and the road was surrendered. Later the Tuckerton Railroad Company operated the line for the Barnegat Railroad Company, but it could not make it self-sustaining, and was obliged to terminate the arrangement. The Barnegat Railroad Company, therefore, is obliged to abandon its railroad as a total loss.

The immediate cause of the application for abandonment is that not only is the road unprofitable, but there has not been any notable development of the territory sufficient to offer any hope of future net revenue, and this railroad and territory it serves have suffered heavily from tidal washouts. The transportation necessities of this section of Long Beach have been provided for by the construction of a State highway paralleling the Barnegat Railroad, and connecting, near Barnegat City Junction, with the highway bridge across Barnegat Bay to the main shore road at Manahawken.

Further, there has been a very rapid growth of the automobile traffic for commercial and recreational purposes to and from the portion of the New Jersey coast served by the line, and there is also jitney service which runs the entire length of Long Beach. While this commercial and private motor car serves the convenience of the population, the result has been to reduce traffic on the Barnegat Railroad to negligible proportions so that the line is practically a total loss.

CHESAPEAKE & OHIO.—*Increases Capital Stock.*—The stockholders at a special meeting in Richmond, Va., on September 26 approved the plan of the directors to increase the capital stock by $30,000,000, making a total of $185,000,000. Of the 300,000 shares increase, stockholders of record September 1 have been given the right to subscribe at par, on or before October 2, to the extent of 20 per cent of their holdings for new 6½ per cent cumulative preferred stock, series A.

CHICAGO, ST. PAUL, MINNEAPOLIS & OMAHA.—*Guaranty Certified.*—The Interstate Commerce Commission has certified the amount of this company's guaranty for the six months period of 1920 as $2,460,096, of which $368,096 remained to be paid.

DENVER & RIO GRANDE WESTERN.—*Interest Payments.*—Judge Robert Lewis of the Federal Court at Denver, Colo., has ordered Joseph H. Young, receiver for this company, to pay interest due in October on the Rio Grande Western consolidated mortgage four per cent bonds of 1949.

HOCKING VALLEY.—*Equipment Trusts Offered.*—Hambleton & Co. and E. Lowber Stokes & Co. are making a new offering of $819,000 stamped equipment trust 6 per cent gold notes, dated January 15, 1920, and maturing $63,000 each January 15, 1923 to 1935, inclusive. The notes are offered at prices ranging from 100.49 to 102.19, and yield from 4.50 to 5.75 per cent according to maturity. They are secured, together with $1,638,000 unstamped notes, by 20 Mallet type freight locomotives and 50 composite gondola cars.

ILLINOIS CENTRAL.—*New Director.*—Vincent Astor has been elected a director to succeed R. E. Connelly, resigned.

INDIAN CREEK & NORTHERN.—*Acquisition.*—See Baltimore & Ohio.

MANILA RAILWAY.—*Bonds Offered.*—Hallgarten & Co. and the Chase Securities Company are offering, at 112¼ and interest, to yield about 5.75 per cent, $1,485,000 Manila Railroad Company 7 per cent sinking fund bonds, guaranteed principal and interest by the government of the Philippine Islands.

MINNEAPOLIS, ST. PAUL & SAULT STE. MARIE.—*Defers Dividends.*—The directors have decided that no further dividends payable in 1922 will be declared out of surplus until the appeal of two preferred stockholders in the suit over the question of rights of preferred and common stockholders is decided. The appeal will be heard in St. Louis in the next term beginning December 4.

The company has declared dividends of $2 a share on both the preferred and common stocks, payable April 15, 1922, out of surplus accumulated during 1920 and prior years. The payment of these dividends was enjoined by the United States District Court of Minnesota until the decision on the appeal.

MISSOURI, KANSAS & TEXAS.—*Sale Postponed.*—The sale of this railway, which was set for September 21, has been postponed.

Extension of time until October 16 has been granted for the deposit of bonds with reorganization managers, J. & W. Seligman & Co. and Hallgarten & Co.

MOBILE & OHIO.—*Guaranty Certified.*—The Interstate Commerce Commission has certified the amount of this company's guaranty for the six months period of 1920 as $1,930,735, of which $605,735 remained to be paid.

NEW YORK, NEW HAVEN & HARTFORD.—*Operating Ratio for Seven Months.*—Owing to a typographical error the operating ratio for the seven months' period was shown in the *Railway Age* of September 16, 1922, page 531, as 89.80. This figure should have read 79.80.

NORFOLK & WESTERN.—*To Redeem Notes.*—The directors at Philadelphia on September 26 authorized the calling for redemption at 103 its 6 per cent equipment trust certificates on January 15 1923. Funds for this purpose will be provided from the company's treasury. No new financing will be necessary.

These certificates, originally amounting to $6,885,000, were issued to the United States Railroad Administration in 1920. There are at present $5,524,500 outstanding.

PENNSYLVANIA.—*Subsidiary Company Asks Authority to Discontinue Operation.*—See Barnegat Railroad.

READING COMPANY.—*Time for Depositing Bonds Extended.*—The protective committee of the Reading Company and the Philadelphia & Reading Coal & Iron Company general mortgage 4 per cent bonds has extended the time for depositing bonds to December 1.

Railroad Administration Settlements

The United States Railroad Administration reports the following final settlements, and has paid out to or received from the several roads the following amounts:

Illinois Terminal	$50,000
Pacific Coast	40,000
Direct Navigation Company	40,000
St. Johnsbury & Lake Champlain Company paid Director General	80,000
Short Lines	
Liberty-White	9,000
Indian Creek Valley paid Director General	7,800

Dividends Declared

Norfolk & Western.—Adjustment preferred, $1.00, quarterly, payable November 15, to holders of record October 31.

Northern Pacific.—$1.25, quarterly, payable November 1 to holders of record October 2.

Reading Company.—Common, 2 per cent, payable November 9 to holders of record October 17; 2nd preferred, 1 per cent, quarterly, payable October 12 to holders of record September 26.

Trend of Railway Stock and Bond Prices

	Sept. 26	Last Week	Last Year
Average price of 20 representative railway stocks	72.01	73.45	57.23
Average price of 20 representative railway bonds	89.34	89.80	77.17

Railway Officers

Executive

A. L. Grandy, chief engineer of the Pere Marquette with headquarters at Detroit, Mich., has been promoted to assistant to the president and general manager with the same headquarters.

R. S. Logan, vice-president of the land, tax and claims division of the Grand Trunk, has at his own request after 27 years of service, been relieved from active duty and retired under the pension rules of the company. Mr. Logan was born at St. Louis, Mo., in 1864 and he began his railroad career in 1885 as clerk in the office of the St. Louis & Pacific. In 1890 he became secretary to the general manager of the Wabash. In 1896 he entered the service of the Grand Trunk as secretary to the general manager and five years later was promoted to assistant to the general manager. In 1901 he was appointed vice-president and general manager of the Central Vermont and in 1902 to assistant to the vice-president and general manager of the Grand Trunk. In January, 1910, he was appointed assistant to the president of the Grand Trunk and the Grand Trunk Pacific. In 1911 he was promoted to vice-president, which position he held at the time of his retirement.

A. B. Atwater, assistant to the president of the Grand Trunk with headquarters at Detroit has, at his own request after 48 years of service, been relieved from active duty and retired under the pension rules of the company. Mr. Atwater was born at Sheffield, Ohio, in 1845, and entered railway service as a telegraph operator on the Cleveland & Erie, being transferred shortly thereafter to the engineering department of that road. He was later advanced to engineer of construction for the Canada Southern; assistant engineer for the Port Dover & Lake Huron; chief engineer of the Stratford & Huron; general superintendent of the Georgian Bay & Lake Huron division of the Grand Trunk; chief engineer of the Chicago & Grand Trunk. From June, 1885, to July, 1898, he was superintendent of the Grand Trunk, Western Lines, and from the latter date until July, 1902, he was assistant general superintendent of the Michigan Central. From July, 1902, until the time of his retirement Mr. Atwater has served as assistant to the president of the Grand Trunk, Western Lines.

Financial, Legal and Accounting

J. P. Pratt has been appointed assistant general solicitor of the Grand Trunk. **E. McDonald** has been appointed solicitor of the land and tax division.

H. A. Palmer, assistant land and tax commissioner of the Grand Trunk, has been appointed property commissioner to deal with all matters connected with the purchase, sale and lease of the company's lands, reporting directly to the vice-president and general manager.

In announcing the appointment of **J. R. Turney,** assistant general solicitor of the St. Louis Southwestern, as acting general solicitor, in the issue of September 23 (page 591), the statement was made that Mr. Turney succeeded **D. Upthegrove,** deceased. This statement was in error insofar as the death of Mr. Upthegrove is concerned, Mr. Turney's appointment having been brought about by the promotion of Mr. Upthegrove to the position of acting president to succeed J. M. Herbert, deceased.

Operating

B. J. Roberts has been appointed trainmaster of the East Carolina division of the Seaboard Air Line, with headquarters at Charleston, S. C., succeeding **A. L. Pritchett,** who has been transferred to the North Carolina division, with headquarters at Hamlet, N. C.

S. H. Osborne, division engineer of the Nebraska division of the Union Pacific with headquarters at Omaha, Neb., has been appointed acting assistant superintendent of the Nebraska division with the same headquarters.

C. H. Brown, superintendent of transportation of the Alberta district of the Canadian National, with headquarters at Edmonton, Alta., has been appointed assistant superintendent of the Biggar division, with headquarters at Biggar, Sask., succeeding M. H. Stuart, and has been succeeded temporarily by **J. T. Armstrong,** chief dispatcher, with headquarters at Edmonton, Alta., who in turn has been succeeded by **T. S. Sullivan** who has been transferred from Biggar. Mr. Sullivan will be succeeded by **F. H. Keefe.**

J. E. Mulick, whose promotion to superintendent of the Wyoming division of the Union Pacific, with headquarters at Cheyenne, Wyo., was reported in the *Railway Age* of September 16, was born on April 3, 1872, at Davenport, Ia. He was graduated from Creighton University in 1888 and entered railway service in December of that year as a train caller for the Union Pacific in which capacity he was engaged until September, 1889, when he became a brakeman on the Wyoming division, which position he held until May, 1890. On the later date he was employed as a switchman at the Omaha terminal and in June, 1892, he became a freight brakeman on the Nebraska division, which position he held until October, 1900, when he was promoted to freight conductor which position he held until July, 1910, when he was promoted to passenger conductor. In October, 1916, he was promoted to train master and in November, 1919, he was again promoted to assistant superintendent of the Wyoming division with headquarters at Cheyenne, Wyo., which position he was holding at the time of his recent promotion.

Traffic

C. P. McGhee, traveling freight agent of the Minneapolis, St. Paul & Sault Ste. Marie, with headquarters at Los Angeles, Cal., has been appointed district freight agent, with the same headquarters.

E. H. Batchelder, assistant general passenger agent of the Chicago & Eastern Illinois, with headquarters at Chicago, has been promoted to general passenger agent, succeeding W. H. Richardson, deceased. Mr. Batchelder was born on September 30, 1870, at Chicago, Ill. He entered railway service in September, 1883, as an office boy of the Chicago & North Western. In 1896, he was employed by the Chicago, Burlington & Quincy as division clerk in the passenger department at Chicago, which position he held until July 1, 1897, when he left to enter the service of the Atchison, Topeka & Santa Fe in the same capacity at Topeka, Kan. Two years later he entered the employment of the Chicago, Rock Island & Pacific as chief clerk to the auditor in the passenger department at Chicago, which position he held until July 1, 1903, when he left to become chief rate clerk in the passenger department of the Chicago & Eastern Illinois. On May 1, 1904, he was promoted to chief clerk and, on April 1, 1920, to assistant general passenger agent, which latter position he was holding at the time of his recent promotion

E. H. Batchelder

J. F. Brady has been appointed foreign freight agent of the New York Central Lines East, with headquarters at New York city, succeeding T. Y. Newman, who has resigned to engage in other business. **W. P. Kohler** has been appointed export agent with the same headquarters.

F. R. Newman, assistant general freight agent of the Michigan Central with headquarters at Detroit, Michigan, has been appointed general traffic manager of the Minneapolis, St. Paul & Sault Ste. Marie with headquarters at Minneapolis, Minn.

R. G. McNeillie, whose appointment as general passenger agent of the Canadian Pacific with headquarters at Winnipeg was announced in the *Railway Age* of September 23, page 591, was born at Lindsay, Ontario, on July 1, 1883, and entered the service of the Canadian Pacific in October, 1901, as a stenographer in the general passenger department at Winnipeg. He was promoted to district passenger agent at Nelson, British Columbia, in October, 1909, and remained there until April, 1910, when he was transferred in a similar capacity to Calgary, Alberta. On July 1, 1913, he was advanced to the position of assistant general passenger agent at Winnipeg and remained in this position until the time of his recent promotion. In his new capacity Mr. McNeillie's jurisdiction will cover the Field lines, Kootenay Landing and East.

R. G. McNeillie

H. W. Brodie, whose appointment as assistant passenger traffic manager of the Canadian Pacific, Eastern Lines, with headquarters at Montreal, was announced in the *Railway Age* of September 23, page 591, was born at Fredericton, New Brunswick, on June 8, 1874, and was educated in the public school at St. John. He entered railway service with the Manchester, Robertson & Allison in St. John in 1899 as an office boy and went with the Canadian Pacific in 1895 as a clerk. Shortly thereafter he was transferred to Boston and then to Toronto, where after a few months he was advanced to the position of chief clerk. In 1899 he was transferred to Winnipeg in the same capacity and in 1903 he was promoted to assistant general passenger agent at that place. In 1910 he was appointed general passenger agent at Vancouver and remained in that position until the time of his recent promotion.

H. W. Brodie

J. C. Hext, commercial agent of the Southern, with headquarters at Charleston, S. C., has been promoted to foreign freight agent, with headquarters at New Orleans, La., succeeding L. E. Wetterau and will be succeeded by E. L. Brown. **W. B. Graham** has been appointed commercial agent, with headquarters at Hattiesburg, Mo., succeeding T. W. Brahan.

C. H. Ryan, Jr., division freight agent of the Louisville & Nashville with headquarters at Memphis, Tenn., has been

promoted to assistant general agent with headquarters at Louisville, Ky., succeeding C. R. Brett, assigned to other duties. Mr. Ryan will be succeeded by **W. C. Dillars**, division freight agent of the Pensacola division, with headquarters at Pensacola, Fla.

W. H. Howard, whose appointment as assistant general passenger agent, Eastern Lines, of the Canadian Pacific with headquarters at Montreal, was announced in the *Railway Age* of September 23, page 592, was born at Chatham, Ontario, on September 15, 1877. He entered the service of the Canadian Pacific as a junior clerk in the district passenger department at St. John, New Brunswick, in August, 1897. Two years later he was appointed traveling passenger agent and in February, 1902, he was appointed chief clerk to the district passenger agent at St. John. In June, 1906, he was promoted to acting district passenger agent with headquarters at St. John, and in the following January became district passenger agent at the same place. In February, 1916, he was transferred in a similar capacity to Toronto and held this position until the time of his recent promotion.

W. H. Howard

L. S. Wickes, whose promotion to assistant general freight agent of the Oklahoma Southwestern was reported in the *Railway Age* of September 23, was born in 1890, at St. Louis, Mo. He entered railway service on February 1, 1909, in the freight traffic department of the St. Louis-San Francisco. Prior to his service with the Oklahoma-Southwestern he was employed by the Pere Marquette.

Walter Maughan, whose appointment as assistant to the general passenger traffic manager of the Canadian Pacific was announced in the *Railway Age* of September 23, page 591, was born at Toronto on September 4, 1876, and entered the service of the Canadian Pacific as a clerk in the passenger traffic department at Toronto in 1892. In September of the same year he was transferred in a similar capacity to Hamilton, Ont., and remained there until July, 1895, when he was transferred again to Toronto. In March, 1897, he was promoted to assistant passenger agent at Toronto and in November, 1912, was appointed assistant district passenger agent with the same headquarters. In December of the following year he was promoted to assistant general passenger agent with headquarters at Montreal and remained in this capacity until the time of his recent promotion.

Walter Maughan

F. P. Cruice, manager of the agricultural and industrial departments of the Atchison, Topeka & Santa Fe, with headquarters at Topeka, Kan., has been promoted to assistant general freight agent, with headquarters at Los Angeles, Cal., taking over the duties of W. G. Barnwell, deceased. He will be succeeded by **F. Jarrell**, who was in charge of publicity matters and editor of the company's magazine, "The Earth."

W. R. Des Brisay, whose appointment as assistant general passenger agent of the Canadian Pacific with headquarters at Winnipeg, Man., was announced in the *Railway Age* of September 23, page 591, was born in Minneapolis in 1888 and entered the service of the Canadian Pacific as a stenographer at St. John, N. B., in 1904. Shortly thereafter he was appointed ticket agent on the C. P. R. steamer "Empress of Ireland." He then served for a time in a similar capacity at Halifax, N. S., and in May, 1910, was promoted to cashier at Quebec. In February, 1913, he was advanced to traveling passenger agent with headquarters at St. John, and in July of the following year he was transferred in a similar capacity to Montreal. In January, 1916, he was appointed traveling passenger agent at New York and in October, 1916, was promoted to district passenger agent at St. John, which position he held at the time of his recent promotion.

W. R. Des Brisay

Mechanical

N. B. Garrett has been appointed master mechanic of the Montgomery district of the Mobile & Ohio with jurisdiction extending from Montgomery, Ala., to Artesia, Miss., inclusive, with headquarters at Tuscaloosa, Ala.

T. C. Raycroft has been appointed master mechanic of the Seaboard Air Line, with headquarters at Hamlet, N. C., succeeding **G. W. Gilleland**, who has been transferred in a similar capacity to Howells, Ga., succeeding J. J. Hamlin, promoted.

Engineering, Maintenance of Way and Signaling

F. D. Lakin, division engineer of the Meadville division of the Erie with headquarters at Youngstown, Ohio, has been appointed acting regional engineer with the same headquarters, succeeding H. Knight.

H. A. Cassill, engineer maintenance of way of the Pere Marquette, with headquarters at Detroit, Mich., has been promoted to chief engineer with the same headquarters, succeeding A. L. Grandy, promoted.

T. J. Bivens, assistant engineer of the Colorado division of the Union Pacific with headquarters at Denver, Colo., has been appointed acting division engineer of the Nebraska division with headquarters at Omaha, Neb., succeeding S. H. Osborne, promoted.

C. E. Dare, whose promotion to engineer maintenance of way of the Richmond, Fredericksburg & Potomac with headquarters at Alexandria, Va., was announced in a recent issue, was born at Rising Sun, Md., on September 2, 1870. Mr. Dare was graduated from Lafayette College in 1892, entering railroad service as a rodman in the construction department of the Pennsylvania Railroad in February, 1893, remaining in that department until 1901 when, as an assistant to the assistant engineer, he was transferred to the Philadelphia division with headquarters at Philadelphia. In 1903 he was promoted to chief draughtsman of the Philadelphia Terminal division, remaining in this position for a year when he was promoted to assistant supervisor with the same headquarters.

In 1906 he entered the service of the Richmond, Fredericksburg & Potomac as a supervisor with headquarters at Alexandria. In 1919 he was promoted to resident engineer with the same headquarters, remaining in this position until his recent promotion to engineer maintenance of way.

Special

Walter S. Thompson, whose appointment as publicity agent of the Grand Trunk was announced in the *Railway Age* of September 9, page 492, was born at Newcastle-on-Tyne, England, on October 22, 1886, and was educated at Rutherford College, Newcastle-on-Tyne. He began newspaper work as a reporter on the St. James Gazette, London, and later served as sub-editor on the Evening Star, the Daily Express and the Observer—all London newspapers. During the years 1909 and 1911 he was engaged in newspaper work in Australia and New Zealand and in 1912 became city editor of the Daily Witness, Montreal, and later of the Daily Telegraph, published in the same city. In 1913 he entered the service of the Montreal Herald as city editor and left that position in March, 1914, to become chief of the press bureau of the Grand Trunk, a position which he held until his recent appointment as publicity agent.

W. S. Thompson

Obituary

C. T. Ames, superintendent of the Des Moines Valley division of the Chicago, Rock Island & Pacific, with headquarters at Des Moines, Iowa, was killed in an accident on September 25.

J. R. Dickinson, assistant general solicitor of the Chicago, Milwaukee & St. Paul, with headquarters at Chicago, whose death at his home in Winnetka, Illinois, on September 17, was reported in the *Railway Age* of September 23, was born on July 17, 1866, at Pittsburgh, Pennsylvania. He entered railway service in September, 1890, as a court reporter and attorney for the Chicago, Milwaukee & St. Paul, with headquarters at Chicago, and held this position until 1900, when he was promoted to assistant general solicitor, with the same headquarters, in which capacity he was employed up to the time of his death. Prior to his connection with the railway company, he was employed in the office of Edwin Walker, Illinois solicitor of the Chicago, Milwaukee & St. Paul.

J. R. Dickinson

R. B. Angus, who was one of the organizers of the Canadian Pacific Railway, died in Montreal on September 17. Mr. Angus was born at Bathgate, Linlithgoshire, Scotland, in 1831, and emigrated to Canada in 1857, where he entered the employ of the Bank of Montreal. In 1879 he entered the railway field as a representative of several Canadians who had bought out the Dutch interests in the St. Paul, Minneapolis & Manitoba Railway (a forerunner of the Northern). He was a member of the original syndicate which was formed to construct the Canadian Pacific, and to his ability as a financier the success of the enterprise in its early stages was largely due. He remained a director of the company until the time of his death.

A. D. Lightner, formerly general executive agent of the St. Louis-San Francisco, died on August 18, at Birmingham, Ala. Mr. Lightner was born on February 2, 1866, at Vincennes, Iowa, and entered railway service as an agent and operator of the Atchison, Topeka & Santa Fe in Kansas, which position he held until 1890. In the latter year he became joint traveling freight agent of the Atchison, Topeka & Santa Fe and the St. Louis-San Francisco, with headquarters at Chanute, Kan., and Carthage, Mo., and remained in this capacity until 1896. Then until 1899, he was general agent of the St. Louis-San Francisco, with headquarters at Dallas, Tex., and from 1899 to 1904, he was general agent of the St. Louis-San Francisco and the Chicago & Eastern Illinois, with headquarters at St. Louis, Mo. He was then general agent of the St. Louis-San Francisco and general manager of the Birmingham Belt, with headquarters at Birmingham, Ala., for eight years. From 1912 to 1914, he was general agent of the St. Louis-San Francisco and the Gulf, Mobile & Northern, also vice-president of the New Orleans, Texas & Mexico and president of the New Orleans Terminal Company, with headquarters at New Orleans, La. He was then general manager and chief traffic officer of the New Orleans, Texas & Mexico, with headquarters at New Orleans, La., until 1916 following which he was in the operating and executive department of the St. Louis-San Francisco at Enid and Tulsa, Okla. From 1917 to 1920, he was engaged in war work as superintendent of terminals, railway construction and operation with the Willys-Overland Company at Toledo, Ohio. From 1920 to 1922, he was general agent of the Southeastern Express Company at Birmingham, Ala.

Burns D. Caldwell, president of Wells, Fargo & Company since October, 1911, and chairman of the board of the American Railway Express Company since July 1, 1918, died on the night of September 24 in a Pullman stateroom just before his train reached Burlington, Vt., while he was on his way home to Orange, N. J., from a fishing trip in Canada. Mr. Caldwell was born at Placerville, Calif., on April 27, 1858. He was graduated from high school at Chambersburg, Pa., in 1873 at the age of 15 and in the same year began railway work as a clerk in the auditor's office of the Vandalia at Terre Haute, Ind. In 1881 he was promoted to chief clerk in the general passenger and ticket department of the Vandalia at St. Louis, Mo., and remained in that position for about four years. In 1885 he was appointed chief clerk in the general passenger and ticket department of the Missouri Pacific in the same city and, in 1888, was appointed assistant general passenger agent of this company. In June, 1892, he was appointed chairman of the Western Passenger Association, with headquarters at Chicago. This position he held until July, 1899, when he went to the Delaware, Lackawanna & Western as traffic manager and later he became vice-president of the same road. In 1911 he resigned to become president of Wells Fargo & Company. Mr. Caldwell has been a director of a number of railroad companies and is a member of the Sub-Committee on Transportation of the International Committee of the Y. M. C. A.

Increase in Railroad Stockholders

The total number of stockholders of Class I railroads for the calendar year 1921 was 752,967, according to the Preliminary Abstract of Statistics of Common Carriers just issued by the Interstate Commerce Commission. This was an increase of 43,172 over the number reported by the commission for the year 1920. It included 342,258 in the Eastern district, 73,187 in the Southern district and 337,522 in the Western district. While at first glance an increase in the number of stockholders in a business might seem to indicate an increase in its popularity as an investment, it is probable that a different explanation would prove truer to fact in this instance. The number of railroad stockholders has been increasing for several years, as it was somewhat over 600,000 before the war, but since there has been very little new stock issued in that time the changes in the stockholders' lists must mean that former owners have sold part of their holdings and they have been taken—generally at lower prices—by a larger number of new purchasers whose average holdings are less. The wide distribution of railroad securities is a good thing from many points of view, but the 1921 statistics represent conditions in a year of depression and great uncertainty and it is very likely that a different condition is being substituted as the financial condition of the railroads has improved during 1922. Recent statements of the number of stockholders of the Pennsylvania have shown a decrease.

New Agreements with Shop Employes

The Union Pacific and Burlington have been the first railways to make public the agreements they have negotiated with their shop employees following their defeat of the striking shop crafts' unions. The managements and the employees' associations on both these railways have agreed to reclassifications of shop employees which recognize much more clearly than those previously in effect the differences in the skill required to do the different kinds of work for which the men are paid. The wage scales fixed give the most skilled men higher pay than the wages fixed by the Railroad Labor Board, while in some cases relatively unskilled labor is to receive wages lower than those awarded by the Labor Board. It seems not improbable the result will be that on both railways the shop employees as a whole will receive as high, or even higher, average wages than those awarded to shop employees by the Labor Board. On the other hand, the new scales of wages place such a premium upon the acquisition and use of superior skill that it seems certain they will have a stimulating effect upon the work of all the employees and in consequence will increase the efficiency of all the work done. The ultimate result probably will be that the employees as a whole will receive higher average wages and that at the same time the railways will secure a larger amount of good work at a reduced total cost. The Burlington and Union Pacific seem to have made good use of their victory in the strike—a use that will be beneficial both to their employees and to the railways. It will be interesting to see what plans for dealing with labor matters are adopted on other railways.

Equalizing Traffic and Facilities

It is in periods of heavy traffic such as this that the inadequacy of facilities becomes most apparent. This condition is, of course, more pronounced at some points than at others. In general the terminals are the first points of congestion, although in many cases line capacity is the limiting factor. In either case facilities which may handle a normal traffic without delay are becoming blocked with the overload, the effects of which may extend far beyond the limits of the division affected if not remedied quickly. The problem of the operating officer now is to distribute the work to be done among the facilities available so that each may be used to the best advantage and an excessive load at any one point may be avoided. This involves closer supervision than is normally exercised. It may call for the rearrangement of switching operations between terminals and other expedients to reduce the danger of congestion in order that traffic may be kept moving.

Manufacturers' Engineering Service

With definite prospects of the railroads being able, and indeed compelled, to fill some of their machine tool needs in the immediate future, it is in order to urge a more general use of the engineering service offered by progressive machine and tool manufacturers. This is a valuable service, never fully utilized in the past. It is offered gratis by the manufacturers who naturally know best what can be accomplished with their respective machines and are anxious that these machines shall prove of maximum value. Few railroad shops are operated on as efficient a production basis as is possible or desirable, and industrial engineers with their extensive and intensive knowledge of modern machine methods, can be of great assistance in an advisory capacity. It is advisable where new machines are being bought to send blueprints, or work details, to the manufacturer who can then make a study of the requirements and recommend the tooling arrangement, or method which will give the most satisfactory results. Not only should advice be sought in the case of new tools, but every progressive machine manufacturer will be glad of a chance to speed up the work on his older machines already installed, retooling them so that they can earn more. Recently a prominent manufacturer of turret lathes sent a practical man to eight or ten different railroad shops and found that many of his machines were running on too small work to be efficient. In practically none of the shops were these machines producing more than 50 or 60 per cent of what they should. The railroad master mechanic or machine shop foreman at each shop had so many irons in the fire that he could not specialize on machinery and, as a result, the operators ran the machines and tooled them in any way they saw fit with no check on the performance. Admitting that certain machine shop operations are too simple to require special tooling arrangements, the fact remains that a considerable proportion of the machinery, especially in large shops, is capable of operation on a highly productive, efficient basis and in these cases it will pay the railroads to utilize the engineering service of machine tool manufacturers to the fullest possible extent.

Checking Signaling with Traffic

Railroads equipped with automatic block signaling should be able to check the efficiency of their signal systems under the heavy traffic conditions which will prevail for some time. Not all automatic block signals are located to the best advantage and some are not maintained efficiently. A signal protecting a busy passing track switch may be so far out as to cause repeated stops and delays to following trains that could be eliminated by the installation of another signal or the relocation of some of them. At certain stations the relocation of a signal or the installation of a starting signal will save considerable delay in getting trains moving. On one road the introduction of three additional signals for upgrade traffic on a long hill increased the capacity of that section of track sufficiently to remove a limitation to the operation of the entire division. Operating officers and signal engineers may now well co-operate in studying the causes of numerous train stops and delays, especially around water tanks, coal chutes, passing tracks and on grades. Slight changes in signal controls or locations may produce economies.

Yardmasters and the B. of R. T.

Reports from various sources show that the Brotherhood of Railroad Trainmen is trying hard to get all the yardmasters and assistant yardmasters of the railways to become members solely of the trainmen's union. W. G. Lee, head of the Brotherhood of Railroad Trainmen, is one of the ablest and fairest labor leaders in the United States. He has insisted always upon the members of his union faithfully carrying out their agreements with the railroads. But the yardmasters ought not to belong to the Brotherhood of Railroad Trainmen. If they are to belong to any organization it should be one of their own. The yardmaster is a supervisory officer who directs the work of trainmen. Neither he nor any other officer can issue and enforce orders without the way in which he exercises his authority sometimes being questioned and resented by his subordinates. A yardmaster who belongs to the Brotherhood of Railroad Trainmen is subject to discipline by that organization. This means that he is subject to discipline by the very men whose work he directs. He is their superior in the yard and they are his superiors in the lodge room. This creates a condition of affairs that is bad for all concerned. It can hardly fail to interfere with the yardmaster performing his duties with fairness and firmness and an officer who cannot thus perform his duties cannot perform them efficiently. An officer who cannot perform his duties efficiently cannot serve his railway well and will imperil his chances of promotion. The railways should treat their supervisory officers so that they will have no incentive to belong to unions composed of their subordinates; and supervisory officers who desire to serve their companies well and at the same time further their own interests will keep out of unions composed of their subordinates.

Bridges Over Navigable Streams

In a letter to the editor, General Lansing H Beach, chief of engineers, United States War Department, presents some specific criticisms of an editorial appearing in the *Railway Age* of May 27, 1922, entitled "The Needs of Water Transportation," which called attention to the large expenditures being made by the railroads in fulfilling the requirements imposed in bridges crossing navigable streams. The specific case cited in the editorial was a 365 ft. lift span provided in the new superstructure of the Cincinnati Southern bridge, which, according to the evidence available, will probably never serve any useful purpose. General Beach calls attention to the fact that the provision for a movable span is one imposed by law and that it is unjust to criticize the War Department or any of its officers for insisting upon the fulfillment of requirements which they have no authority to modify. The facts presented in General Beach's letter have been confirmed in full in a letter received from T. C. Powell, vice-president of the Erie, who was vice-president of the Cincinnati, New Orleans & Texas Pacific at the time that the negotiations concerning this bridge were under way. Mr. Powell testifies also to the spirit of fairness manifested by General Beach and his assistants in all their dealings with respect to this structure. It is, therefore, clear that the editorial in question was in error insofar as it directed any criticism at the War Department. However, the fact remains that the railroad was required to make a large expenditure for no useful purpose. There are many other places in the United States where railways have provided movable spans over streams that have been declared navigable, but where no navigation exists and while, no doubt, the War Department in these cases places an interpretation on the law, such that only the very minimum requirements are imposed, it is extremely difficult for the railroads to obtain the necessary federal legislation to relieve them of the needless expenditure. However, relief is now in sight from a rather unexpected source. The great expansion of highway construction and improvement is causing the shoe to pinch on another foot and because public pressure is being brought to bear a number of streams which have long borne the stamp of navigable waters, because of mythical transportation in the dim past, have been removed from the list.

Highway Crossing Protection

With the steady increase in the number of licensed motor vehicles operating on the highways from 4,983,340 in 1917 to 10,608,128 on July 1, 1922, the railroads have an increasingly difficult problem to protect the occupants of the automobiles as well as their own passengers and employees at the more than 250,000 highway grade crossings in the United States. In 1920 1,201 occupants of automobiles were killed in collisions with trains at grade crossings, while during the first nine months of 1921 873 occupants of automobiles met death in grade crossing accidents as compared with only 99 in all other classes of vehicles in such accidents. In Canada approximately 58 persons were killed and 142 injured in the 85 automobile accidents at railroad crossings involving fatalities during 1921. Another serious phase of this problem was emphasized recently by the derailment of a passenger train on the Minneapolis, St. Paul & Sault Ste Marie at Annandale, Minn., by a motor truck, resulting in the death of the two men on the truck and six passengers and two railroad employees.

With the continued expansion of manufacturing facilities, especially for cheap cars, a glance five or ten years into the future will indicate a dense highway traffic, those interested in which, if organized, can influence legislation on the grade crossing question that may be very detrimental to the interests of the railroads. There is already a tendency among state legislators to introduce bills requiring the roads to install devices for the protection of the highway traffic. The majority of the automobile traffic may be considered more of a luxury than a necessity and should pay its share of the new protection demanded. It is time that the railroads of the country should co-ordinate their efforts to counteract this tendency to require the railroads to stand the expense of all such proposed protection. Some of the problems involved in the location, installation and maintenance of automatic highway grade crossing protection are explained in an article elsewhere in this issue which serves to emphasize the importance of the railroads organizing to combat the demands of the millions of automobile drivers

The Changing Problem of Railway Accidents

COMPLETE STATISTICS regarding railway accidents in 1921 which have just been issued by the Interstate Commerce Commission confirm the conclusion drawn by the *Railway Age* from preliminary statistics issued some months ago. They show that on the whole the accident record made by the railways in 1921 was the best in their entire history. The Commission in its report says: "The number of fatalities resulting from railway accidents of all kinds, industrial included, in 1921 was less than for any other year since 1889. This is a remarkable showing when it is considered that the annual transportation service, measured in ton-miles, was about five times as large at the end of this period as at the beginning."

The total number of persons killed in 1921 owing to railway accidents of every kind was 5,996. The corresponding figure for 1920 was 6,928, and for 1919, 6,997.

Of this number 116 were passengers and persons carried under contract. This compares with 169 in 1920. The total number of employees killed in train and train service accidents in 1921 was 1,032. This includes not only employees at work, but those who were not on duty and even those who were trespassing. The corresponding figure for 1920 was 1,855. The total for employees and passengers declined from 2,024 to 1,048. In proportion to the total business handled, the accident record of 1920 was the best up to that time, and yet it will be seen that the fatalities to passengers and employees due to train operation in 1921 were only 57 per cent as great as in 1920. This fact helps to give an adequate idea of the increase in the safety of railway operation which has occurred.

But the problem of preventing or at least reducing accidents on railroads is far from solved. While the railways have been so greatly increasing the safety of their own operations, other developments over which they have little or no control have been tending to nullify their efforts to reduce the sum total of accidents. Within recent years the great increase in the number of automobiles crossing the railways on highways has been causing a formidable increase in highway crossing accidents. The number of people killed at highway crossings in 1921 was 1,702, or 554 more than the total fatalities to passengers and employees due to train operation. The Interstate Commerce Commission in its annual accident report says: "It will be noted that of all casualties sustained at grade crossings in 1917, 59 per cent involved occupants of automobiles and motor trucks, as compared with 80 per cent in 1921."

The railways of the United States in the months of June, July, August and September, 1922, carried on throughout the country a "National Careful Crossing Campaign" to try to reduce accidents at highway crossings. They placarded the entire country, especially at highway crossings, with warnings to automobilists to be careful when crossing railway tracks. The total results of this campaign are not yet known. Such information as is now available indicates, however, that the number of automobile accidents at highway crossings did not decline, and may actually have increased while this campaign was being carried on. The Pennsylvania Railroad System reports that in June, July and August, the first three months of the campaign, the number of casualties at its highway crossings increased 30 per cent. There were 85 automobile accidents at Pennsylvania System highway crossings in the three months in question. They caused the deaths of 56 persons, which was almost one-half as many as the total number of passengers killed on all the railroads of the United States in 1921.

There was an increase in 1921 in still another class of accidents. The total number of trespassers on railway property killed was 2,106 in 1920 and 2,481 in 1921. Prior to the war the number of trespassers killed annually averaged about 5,000. During and immediately following the war the number was greatly reduced, apparently owing to the fact that there was almost no unemployment in the country. The increase in the number of trespassers killed in 1921 is attributed by the Commission mainly to increase in unemployment due to business depression. The number of men who "beat" their way on the railways from place to place in periods of depression always is greater than at other times.

The facts about railway accidents indicate that the actual operation of the railroads themselves has been made so much more safe that the great problems with respect to accidents have become those of educating or compelling people not to trespass upon their properties and to cross them on highways with reasonable care. In the solution of these problems the railways must have the co-operation of public authorities and the organizations of automobile manufacturers and users.

Britain Succeeds Where America Fails

THERE IS PEACE and good feeling between labor unions and railway managements in Great Britain. This condition obtains in spite of the readjustments in wages which have been brought about in Great Britain as well as in the United States. Why should England have succeeded where we have failed?

One of the most obvious reasons is the sliding scale of wages. This plan is a product of the war period and provides, first, a basic wage which is not subject to change and, second, a substantial bonus which is increased or decreased at a predetermined rate with every increase or decrease in the official index number of the cost of living. The advantage which this method has over ours is plain. As the cost of living fluctuates continually, with our lack of provision for automatic adjustments of wages, we may expect either the railroads to be asking for wage reductions or the unions to be demanding increases most of the time. Consequently, we may look forward to more or less constant friction between the railroads and at least some of their employees. The British are to be congratulated that they have practically done away with controversies of this character.

Another institution on British railways which, although of recent adoption, has already proved its value in promoting cordial relationships, is the railway council. Under the provisions of the Railways Act of 1921 there is at least one of these councils, comprised equally of representatives of employees and managements, on each railway. Subsidiary to these councils are district councils and local committees, the personnel of which is similarly made up. The primary function of the council is the adjudication of disputes between employees and the railway companies, and it has already proved its value as a point of contact between the officers of the railways and their men. Moreover, the councils and committees seem to have awakened the interest of employees in the efficient operation of the railways and deliberations have not been confined solely to matters of wages and working conditions, but have included methods for increasing efficiency and building up traffic as well.

The provision for local committees, district councils and railway councils was not forced upon the railways or the unions from any outside agency, although their establishment has been required by law. On the contrary, the railways and the three operating and traffic department unions, viz., the National Union of Railwaymen, the Association of Locomotive Engineers and Firemen and the Railway Clerks' Association, agreed among themselves upon the formation of these bodies and their agreement was incorporated into the law of the realm.

The points which have been mentioned here about the

British method for dealing with the railway labor problem are only the most obvious and outstanding, yet they should be sufficient to awaken the interest of any railway officer who is not satisfied with labor conditions in this country and who is casting about for methods of dealing with the problem which have proved successful elsewhere.

Reduced Rates for Commercial Travelers

It would be difficult to characterize with moderation the request made of the Interstate Commerce Commission last week by the organizations of commercial travelers for a discount of 33⅓ per cent in passenger fares, were it not for an appreciation of that fairly common aspect of human nature, particularly associated with the calling of the salesman, which so frequently leads men to ask for more than they expect to get in order that they may be better satisfied if the request is granted only in part.

We are inclined to believe, however, that very clever salesmanship would be required to sell to the commission or to the public the idea advanced by the witnesses before the commission who, on behalf of 676,000 commercial travelers, asked that the railroads be ordered to sell to any one willing to advance $66.67 at one time a book of coupons good for $100 worth, of passenger or baggage transportation during the next year.

Less opposition will undoubtedly be expressed on the ground of discrimination to the proposal of the representative of the American Hotel Association that the potential customers of its members be accorded the 33⅓ per cent discount for buying as little as $50 worth of coupons at one time and submitting to the formality of being identified by photograph and signature, because more people would naturally see its possible advantages to themselves, although it would have an even greater effect in railroad revenues.

A good many laws have been placed on the state and federal statute books because in the old days railroads used to pay rebates to large shippers to keep them from sending their freight by some other road that would rather haul the freight for less than the regular rate than not haul it at all, and it is easy to imagine the howls of protest that would be incited by a proposal to allow a rebate of 33⅓ per cent today to all shippers who paid a freight bill of say $1,000 at one time. It would be strange logic that would expect an order that the same thing be done on a smaller scale from the regulating body created to administer the same laws that were directed against the former kind of discrimination under authority of an act of Congress.

It is, of course, perfectly true that railroads formerly issued mileage books at reduced rates for the benefit of the commercial travelers and it was done more or less voluntarily. That fact, however, constitutes no more valid an argument for their being required to resume the practice on a nation-wide scale than would be a contention by the Standard Oil Company that railroads should be required by law to pay it rebates. Chairman Fox of the Central Passenger Association testified before the commission that mileage books had their origin as far back as 1868 in a concession offered by the freight departments of the railroads to shippers in the same way that they used to give annual passes to favored shippers. After concessions in freight rates were made illegal the railroads also sought to get rid of the concessions still made to a limited extent to a class of travelers and they were only freed of the practice when the Railroad Administration had put an end to competition during the war.

It is also true, as contended by the commercial travelers, that railroads make lower rates for carload freight than for smaller shipments and that they make special fares at a discount from the regular rates for conventions, excursions, tourists and commuters, but there is a difference in the character of service rendered for such rates which does not exist between the service rendered to a commercial traveler or any other purchaser of a mileage or discount rate coupon book and that furnished the purchaser of an ordinary one-way ticket. The reduced rates accorded for carload freight and for special classes of travel may be justified on the basis of both the cost of the service and the value of the service. It costs the railroad less to handle shipments in carload lots than it does to handle a multitude of small shipments; it costs less to handle passengers in special suburban trains, often crowded, in the way that commutation traffic is handled, than it does to handle ordinary traffic on through or branch line trains, and it costs less to carry crowds of people to a convention or on an excursion that is planned for in advance than it does to run trains for the ordinary day to day travel for which schedules are maintained. Similarly, the purchaser of a special reduced rate ticket receives a less valuable or less desirable service than does the passenger who pays the standard rate, because the service for which he pays a reduced rate is usually restricted to certain dates, trains or destinations, but they tend to stimulate travel by offering a somewhat less desirable service as a by-product to those who could perhaps not afford or who would not care to pay standard rates for the regular service.

That they represent less of a concession than is desired by the commercial travelers is indicated by the fact that these "discount" rates which the commercial man points to are not satisfactory to him. The excursion ticket or the convention fare good on certain days is available to him and he sometimes takes advantage of it, but *he wants something more.* He wants to travel when he will and where he will at a reduced rate. While he contends that the reduction he seeks is justified on the wholesale principle, he is not asking for a wholesale service. His purchase of a mileage or coupon book ticket to cover exactly the same service that is given the ordinary passenger would not represent a wholesale transaction. It would represent merely payment in advance for a number of retail transactions yet to be completed and the interest on his advanced money would be easily eaten up by the additional cost of printing, collecting and accounting for his coupons.

Averaging approximately 50 miles a day, for which at the regular fare of 3.6 cents a mile the cost would be $1.80, the commercial traveler is no more entitled to wholesale rates for his transportation than are his customers entitled to wholesale prices or freight rates based on the aggregate of the goods sold by the traveler on his entire trip.

It is very easy to claim and somewhat difficult definitely to disprove, that a 33⅓ per cent or any other reduction in passenger fares would stimulate travel. It cannot be denied that any reduction would have at least some *tendency* in that direction, but the fact remains that there must be some point below which a reduction could not possibly pay. The question is whether a given reduction would cause enough more people to travel to make up for the loss in revenue from those who are now traveling. If the railroads believed it would, it would not be necessary to ask them to reduce rates. Those who say that they would travel on railroads more if rates were lower frequently forget that the first effect of a rate reduction would be to cut down the revenues now being collected. In fact, the chief witnesses for the commercial travelers at the hearing were sure that the railroads would more than get back any loss in revenues while admitting they had no figure in mind as to the amount of that loss.

The contention that business houses would send out more traveling men if the fares were lower attaches a rather magnified importance to the amount of money involved in the passenger fare as compared with the much larger other

factors. It is not to be presumed that a house would pay a large number of additional salaries, together with hotel bills and other expense accounts, to send out men at a time when for various reasons merchants are curtailing their buying, merely because the passenger fare is reduced 60 cents a day. Yet it requires no stretch of the imagination to foresee that most people who make even a single round-trip as far as Chicago to New York and return would buy a coupon book if it were available on the terms proposed at a rate 33⅓ per cent less than they now pay.

The commercial travelers often claim to perform an important service as indirect freight solicitors for the railroads, but if allowed to have their way they would prove to be rather expensive as passenger solicitors.

Heavy Electric Traction

THE HEAVY ELECTRIC traction committee of the American Electric Railway Association presented a report this week at the annual convention of that association. The report was of particular value to everyone concerned because it carried one step farther the work of compiling the available data on the subject of heavy electric traction. The report consists of a chart showing the growth of electrified track and of electric locomotive tonnage in the United States and Canada, a list of foreign electrified railroads with data covering the kind of equipment used, and a bibliography on heavy electric traction. The bibliography was orginated by the Association of Railway Electrical Engineers and has twice been revised and brought up to date by the A. E. R. A. In fact these two organizations should have the credit for doing more than their share of the association work on this subject during the past few years and for being the only ones to effect any sort of co-operation. The following statement included in the A. E. R. A. report is particularly noteworthy:

"The question of general co-operation in the study of heavy electric traction has been taken up with the various technical organizations which are actively interested in the several aspects of electrification. Your committee did not have in mind any premature attempt at standardization or discussion of questions which might embarrass the managements of electrified railroads or of railroads contemplating electrification, but did suggest a central organization to co-ordinate the work of studying electrification problems and of collecting information, in order to avoid duplication of effort.

"While many of the organizations with whom the matter was taken up expressed interest in the proposal, and while all agreed in the value of co-operation, it now seems evident that if such a movement is to be successful it should be under the leadership of the steam railroads."

All of the following associations are interested in the subject of heavy electric traction: The American Institute of Electrical Engineers; the American Society of Mechanical Engineers; the Mechanical Division of the American Railway Association; the American Railway Engineering Association; the American Electric Railway Association; the International Railway Congress; the Association of Railway Electric Engineers and the National Electric Light Association. Practically all of these organizations are dealing with the subject independently and in some cases there has been much duplication of effort. As a whole, these organizations include a wide variety of interest and afford an unusual opportunity for compiling complete information on heavy electric traction. What is needed is leadership. Petty jealousies must be forgotten.

The A. E. R. A committee in its statement has made an excellent suggestion with a generous spirit and has put the matter directly up to the steam railroad men. Is there any better way than for A. R. A., Division V, Mechanical, and the A. R. E. A. to get together and arrange a plan by which the various societies can co-operate. It is entirely possible that all of the associations would not agree to such affiliation, but if only a few collaborate, much duplication of effort will be eliminated and all phases of the work can be studied intensively.

Letters to the Editor

A Bonus System for Train Service Employees

CENTRAL STATES

TO THE EDITOR:

To promote efficiency in train service the following plan for a bonus system was suggested some time ago:

Pay to engine and train crews in productive service, a bonus on a minute basis at a pro rata rate for all time less than the established zero time (the maximum time before overtime commenced, based on a speed of 12½ miles per hour) for each class of service. Dead-heading and light sections are not to be governed by this plan. In computing, the total time on duty will be considered, and if less than the established minimum, payment will be made at pro rata rate on a minute basis for the time on duty less than the minimum.

To establish the time from which to figure, it will be necessary to classify the service as between fast freight, slow freight and local trains. For fast freight the time limit will be the minimum schedule from the time a train is due out of the initial terminal to the time of arrival at the final terminal, directions to be separated if necessary on account of differences in schedules of fast freights because of loadings. In slow freight service, use the time after which overtime is paid. In local service, the time limit will have to be determined from a study of the conditions peculiar to the division adopting the plan.

This plan will (1) expedite the movement of locomotives out of the roundhouse, and to and from trains at initial and terminal yards; (2) reduce materially the delays on account of engine and car failures; (3) speed up the movement of trains on the division, and increase the gross ton-miles per train hour; (4) reduce the number of crews and engines in service, making possible a greater service by more experienced men; (5) reduce the overtime expense and increase the earning capacity of men in this service; (6) increase train tonnage; (7) maintain fast freight schedules.

To illustrate, on a certain division of 134 miles the fastest schedule of fast freight is 6 hr. 29 min. eastbound. With this plan a train crew handling a fast freight and on duty six hours would be paid a bonus of 29 min. In slow freight, overtime is paid after 10 hr. 40 min., so that a crew on duty 10 hr. would be paid 40 min. bonus. The same would apply in local service after the time limit was established.

To show just how this should work out in slow freight service, note the following: A crew going on duty at 7 a. m. and off duty at 5:40 p. m. would not be paid a bonus. If off duty at 7:40 p. m. there would be two hours' overtime at penalty rate, which in the case of an engine crew would be $4.70. If the crew went off duty at 3:40 p. m. a bonus of two hours pro rata would be paid which would be $3.14. The difference between the two would be a saving of $1.56 to the road while it would also be an inducement for the men as they would have to work four hours to get $1.56, or about 39 cents per hour. On a basis of 20 trips per month, this would reduce the working time of a crew about 40 hr. per month, giving them a chance to make two or three more trips and increase their earnings accordingly, and also more time at home while reducing the time away from home.

On a basis of 250 trains per month, each saving two hours and a charge of $15 per engine hour, the saving on account of engine hours would be about $7,500, not including that due to decreased yard delays and improved time in freight movement, increased car miles per day or the advantage of

a more nearly maximum train loading, with a corresponding decrease in the aggregate number of trains run.

On a basis of a saving of 30 min. per train for 500 trains per month, the bonus for engine crews would cost about $392 and on the same basis the saving in engine hours, based on engine rental per hour, would be about $3,750 per month, or a net saving for engines and crews of $3,358. The bonus to the train crews on the basis of 30 min. to the engine crews would be about $461, which would leave a net saving of $2,897 per month. OPERATION.

The Needs of Water Transportation

WASHINGTON, D. C.

TO THE EDITOR:

I noted your editorial, "The Needs of Water Transportation," on page 1209 of your issue of May 27, 1922, at the time the paper appeared, but have, however, been prevented from writing to you earlier in regard to the matter. I have no reason to believe that you intended to do an injustice to myself or to the department which I represent, but it is nevertheless a fact that you have done so when you charge us with requiring other people to spend their money unnecessarily. I note your particular expression, "this attitude is frequently manifested by the War Department in its control over railway crossings of navigable streams. The building of new bridges, or the reconstruction of old ones, usually calls for extravagant requirements as to the clear width and height of channel openings, with apparently no effort to balance the pecuniary advantage to be derived by the existing or potential river transportation, with the enormous burden placed upon actual and thoroughly established rail transportation."

The case of the Southern Railroad bridge over the Ohio river at Cincinnati which serves as the text of your editorial, is one where it would have been better, in justice to those concerned and for your paper's reputation for accuracy, if you had ascertained the facts before issuing the statement which you have made. You say that the requirement in regard to the drawbridge "was made in spite of the fact that there is no record of the swing span ever having been turned following the test made at the time of its completion 45 years ago." It happens that I am personally acquainted with all features of this case, as I was the division engineer at Cincinnati, having supervision over the Ohio and its tributaries at the time the Cincinnati Southern Railroad first took up the question of remodeling its bridge.

The requirement to which you object concerning the drawbridge is one imposed by law, under the Act of Congress approved December 17, 1872. When the officials of the Cincinnati Southern presented their plans they were told that the requirement for the swing span was obsolete and in our opinion no longer necessary in the interests of navigation, and that we would do what we could to assist them to secure legislation repealing it or at least waiving it in their case. Their reply was to the effect that the bridge in its then present condition was a great hindrance to the traffic of the road and that it was more important to them to make their plans immediately and proceed with their work at the earliest possible date rather than to wait for legislation before making their plans even if they should save some money on the bridge, as the saving on the bridge would not compensate them for the loss due to the delay in the time.

You will notice that the law requires a swing bridge giving two clear openings 160 ft. each, the swing bridge being practically the only type of opening in a large bridge which was in existence at the time the Act was passed. When the engineer of the railroad company stated that another type of bridge would be more economical than the swing span, owing to the difficulty of enlarging the top of the turntable pier, or entirely rebuilding the pier, we told him that we believed the War Department would consent to another form of construction and permit the bridge to be built in any way that was more economical to them, provided the clearance called for by the law was maintained. After this statement to that effect the company modified its plans for this portion of the bridge and adopted the lift span as more economical and practical. No difficulty was experienced in obtaining the consent of the War Department to this change. I might add that at the hearing certain prominent vessel interests asked that the piers be changed when the bridge was rebuilt to which request we declined to accede on the ground that the expense to the railroad would be greater than the existing or prospective commerce justified.

I feel that your editorial has done not only the engineer department of which I am at the head, but myself, personally, a great injustice. I feel, however, that it was written on superficial knowledge without taking the pains to ascertain the facts. I am sure that the whole truth of the case completely absolves both myself and the department which I represent, from "the spending of other people's money . . . . all too lightly." LANSING H. BEACH,
Chief of Engineers, United States War Department.

The Santa Fe Reading Rooms

ON SANTA FE LINES

TO THE EDITOR:

In the *Railway Age* of September 9, page 455, I find these words: "There is unquestionably something wrong seriously in the industrial and transportation world today. No one will deny this." Following this you say: "We have suggested that conditions on the railways might be improved substantially through the development of something corresponding to the personnel departments that have given such an excellent account of themselves in certain of the larger and more progressive industrial organizations."

This conception has been carried out on the Santa Fe system, as originating in the active brain and warm heart of the late E. P. Ripley and most cordially supported by his successor and all his staff, in the widest and broadest and largest method of operation.

As you know, but seem at present to have overlooked, we have 30 buildings on the Santa Fe, where every comfort is provided for the employee, and where he is surrounded by educational influences.

We have invested close to a million dollars in this enterprise, which has for its object the closing of the gap between the official and the employee, and awakening aspirations towards the true, the beautiful, and the good. The librarians or caretakers of these reading rooms are taken from the ranks of the company, and have an intimate understanding of a railroad man's life and work.

The employee has the privilege of ordering books for his own private library which are delivered to him free at publisher's rates, or which may be added at once to the shelves of the reading room for his use and that of his family.

During the season entertainments of all kinds—musical literary and educational—are held in these reading rooms, for which no charge is made, and which bring the employees and their families into familiar association with many of the leading scholars and scientists. Each year for 20 years the Santa Fe has been appropriating from $10,000 to $20,000 for these entertainments. The Santa Fe has been carrying out the conception of the statements at the head of this letter for 24 years.

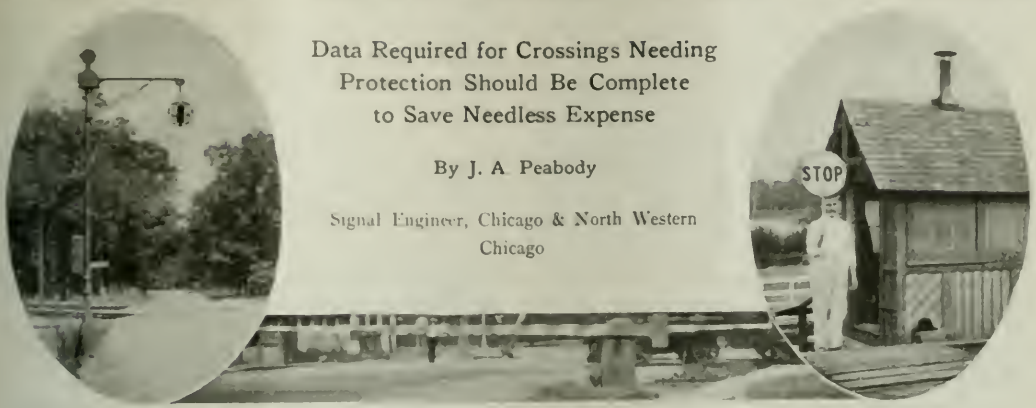
The object is to give the employees an uplift educationally and morally, to bring them into closer and more friendly relations with the executive and operating officials, and to develop a personal interest in the welfare of the company and make them proud to be on its payroll. S. E. BUSSER.

Highway Crossing Protection, Theory and Practice

Data Required for Crossings Needing Protection Should Be Complete to Save Needless Expense

By J. A. Peabody

Signal Engineer, Chicago & North Western
Chicago



A Movable Visible Audible Signal; Crossing Gates and a Flagman with Hand Target

A NUMBER of investigations have recently been made to ascertain the care used by travelers in passing over railroad crossings. One made in St. Louis for a period of 48 hr. showed that of 1,216 pedestrians, only one stopped and looked in both directions before proceeding over the crossing, two persons looked in both directions but did not stop; 9 per cent looked in one direction only, while 88 per cent did not stop or look to the right or to the left; also 91 per cent of the drivers of 2,931 automobiles

Highway Protected by Signs and Movable Visible Audible Signals

failed to stop or look in either direction. Tests made on crossings in other parts of the country have shown similar results. These conditions may account for the numerous highway crossing accidents. Information from the National Safety Council shows that one person has been killed and three people injured for every two accidents. Because of the numerous accidents the problem of protecting highway grade crossings is one of first importance.

The ideal method of eliminating the danger of two objects coming in contact with each other, is to provide paths which do not conflict. This means separation of grades. However, a recent estimate made for one state indicated that the average cost of separating grades would be $50,000 and the cost thereafter for maintenance, depreciation, interest on investment, etc., $4,000 a year. If applied to all crossings in the one state in question this would involve an expense of $170,000,000 which would more than double the investment in those railroads.

In recommending other protection, people forget that they are building up a cost which in some cases may approximate that of grade separation in the way of operating expense. In comparing the costs of different types of protection we find that a crossing sign approximates $20 expense and practically nothing for maintenance; a crossing bell, $1,050 for installation and $200 for maintenance and operation; an automatic flagman and bell, $1,200 for installation and $250 for maintenance and operation; an eight-hour flagman costs an average of $1,070 per year, chargeable to operating expense, while 24 hr. flagman service costs $3,170. At this point the cost of grade separation is being approached rapidly.

Crossing gates with flagmen, at an annual cost of $3,315, may be compared with $4,000 for the average annual cost of grade separation. The public has no compunctions at all about requiring a railroad to put on flagman service, but it feels no obligation whatever towards paying a portion of that expense. It is becoming educated to a certain extent to the fact that grade separation is a joint benefit to the public and to the railroad and in some instances is willing to pay a portion of the expense. New York and some of the New England states for some years have had laws requiring the railroad to pay one-half the expense of grade separation, the municipality or township one-quarter and the state one-quarter. Under those circumstances, the cost to the railroad would be considerably less on an average for grade separation than it would be to put in a 24 hr. service flagman or gate protection.

Preliminary Study of Each Crossing Necessary

The question of how best to protect a crossing is a problem. I was given charge of that work about two years ago and found no uniformity in making reports and as a result I had great difficulty in convincing my superior officers of the necessity for the protection recommended. Therefore

*Abstracted from paper given at Kansas City Sectional Committee meeting, Signal Section, A. R. A.

some data was outlined which I insisted should be obtained.

The railroad data should show all of the tracks and indicate whether they are main, passing, house, yard or industrial. The alignment of the main tracks, right of way lines, width of crossings, planking, the nearby buildings and any obstructions to the view should also be shown.

The highway data should include the alignment and width of the highway, width of traveled way, sidewalks, street car or interburban tracks, surface material, fences, and signs with their location and kind including crossing, approach warnings, advertising and other signs between the approach warning signs and crossing signs. There should also be an approximate profile of the roadway on each approach to the crossing for at least 300 ft. and the obstructions to view within 300 ft. of the crossing along the traveled way.

Where railroad cars are customarily left on the tracks so as to obscure the view from the highway, these should be indicated in their usual location. The lines of the maximum vision to the tracks from the street or highway at critical points within 300 ft. from the crossing should be shown. Information regarding the existing protection, giving data as to apparatus now in place, men employed, rates of pay, etc., should be supplied.

A count of traffic on the highway and on the railroad should be given by hours for a three-day period. The count for the first day should be for the full 24 hours unless there is known to be either no railway or no highway traffic during a part of this period, in which case the reason should be given. The count of the remaining days should cover the number of hours necessary to corroborate the count of the heavy traffic periods on various days as, particularly in the country, there are differences because of market days, Sundays, etc.

It is often necessary to go back and make complete additional 24-hr. period checks in order to know that such variations are covered. For this reason days should be selected carefully and should not necessarily be consecutive. If there is a greater or less traffic on the railway or highways at any season of the year or during some particular period, as when country fairs are being held or when adjacent highways are undergoing repairs, such information, if available, should be given.

Points for Consideration in Making Recommendations

When making the plans and recommendations the following points may well be kept in mind: The clearing away of shrubbery on the right of way, on the highway or on private property; the moving of poles, fences or buildings; the relocation of signs; the installation of additional signs and the removal of advertising signs; widening the approaches; reducing grades to avoid stalling of automobiles, and cutting away knolls and widening cuts to improve the view. Some states have taken the stand that the property owners have a certain responsibility in clearing away shrubs, trees, etc. It is unfortunate that other states do not take the same view. In Wisconsin the railroad and adjacent property owners, if called on to do so, must clear away shrubs and trees to leave a clear view for 325 ft., along the track from the same distance along the highway. In Illinois, if there is not a clear view for 550 ft along the railroad for 200 ft. on the highway, the crossing is considered hazardous and this space must be cleared out or protection may be required. Either one of these requirements will allow an automobile running at 30 mi. an hr. to stop if the train is in sight or to clear the track if the train is out of sight, even if the train is running 60 miles an hour.

The railroad companies have been very careless in the past in leasing their properties for industries with the result that buildings are often erected close to the highways, which require cars to be set near them. This is a point the railroads must consider in the future, not only when making new leases, but in re-leasing their property, because those industries, particularly coal sheds, and even elevators, can often be moved to other points where they do not create a dangerous condition. In some cases we are being penalized to the extent of being required to put on flagmen because industries which do not come anywhere near paying for the expense, are located so close to the crossings that standing cars create conditions which require protection.

Possible Methods of Protection

When it is decided that some protection is required, the question arises as to the advisability of installing (1) one or two automatic flagmen with a bell or without a bell (if

Audible Warning, Crossing Signs and Gates Protect This Crossing

more than one automatic flagman is desirable the number needed and the reasons should be given). (2) Human flagmen with the number needed and between what working hours. (3) Crossing gates, number and between what hours they should be operated. In considering the possibility of installing gates it is often cheaper to give first-class protection with gates than with a flagman, where protection for two or more streets close together is required or when two railroads are close together and one man can operate the gates for both.

A detail which may be somewhat aside from the point is the location of gates for the protection of streets in the vicinity of depots or team yards to give the proper protection and at the same time not unduly delay vehicles. There should also be included a statement of the accidents that have occurred at the particular crossing being investigated and the manner in which they happen. Other conditions should also be reported which occur to the observer and which may influence the decision.

The above outline will not be found to be such a burden as it appears when it is considered that an improper installation may cost the company unnecessary money. When a report is made complete but little difficulty is experienced in securing approval of the recommendations.

All of the possible methods of protecting a crossing have not been mentioned above and additional ways will unquestionably be developed in the future. The use of signs is perhaps the least expensive protection that can be given. The joint committee of the American Railway Association and the state railroad commissioners has decided on certain signs which are coming into quite general use. Unfortunately, however, some authorities oppose them.

It seems very desirable that the forms and the use of certain signs and signals should be uniform throughout the

country so that the driver of an automobile may know just what each means as he approaches it. On a railroad it is feasible to have two or more types of signals controlling the engineman on his run and to use them with perfect safety, but the engineman is thoroughly acquainted with the physical characteristics of the line over which he operates and knows and recognizes these differences at once. This is not true with people driving over highway crossings which are strange to many of them.

A short time since I noticed a book describing the "International Road Signs." These signs are so clear in their meaning that they can be understood on first observation. It is unfortunate, inasmuch as such signs have been adopted, that they are not in use in the United States as there are signs, not only for approach and warning, but also for sharp turns, grades, etc., for which there are now none in general use in this country.

With the proper location of signs, some crossings may be given sufficient protection at a very small expenditure; however, more attention should be paid to their uniform location to the right of the driver for whose information they are installed. The barber pole effect on gates came from an accident that happened on the Long Island Railroad. There is a shale road parallel with the track (which is electrified) running six miles out of Long Beach. It was a general practice of automobile drivers to start from Long Beach and race electric trains to that particular crossing. One night seven of them tried it. The fourth one was hit but,

Three-Position Wig-wag and Audible Warning Signal Located in Center of Street

even with the proof of the drivers before and behind this car, the railroad was blamed by the jury because the crossing was not properly protected. The railroad then protected the crossing by placing across it telegraph poles 8 in. in diameter at the top and about 12 in. at the butt, counterweighted and painted barber pole effect. The railroad advertised what it had done and there were no more accidents.

It is necessary to put the fear of God in the automobile driver's heart. I know of no other way to cure some of them. The hump has that idea in view. It can be built so that a man running at moderate speed will hardly feel it, but if he is speeding it will throw him through the top of his automobile—as did actually occur in one place.

Other Forms of Protection

In one state before the wig-wag was developed we were asked to install illuminated signs and there are a good many in service yet as they have proved to be fairly effective devices. A number of reflecting signs have been used in Ohio and elsewhere; it seems that they have their place, particularly in giving approach information for a crossing. The crossing sign itself should not be moved out for it belongs where it is; it is similar to the stop signal used in railroad signaling. However, automobile drivers in many instances have not been furnished with signs serving the same function as a distant signal on the railroad. Various railroads are developing signs; for example, one railroad uses a two-light signal which it claims is distinguishable.

The automatic flagman, the waving light and the flashing light are designed to attract attention by motion, but varying uses are made of them on railroads and on highways in different parts of the country; for instance, flashing lights not connected to track circuits are in service on some railroads at certain places to indicate dangerous points without reference to the approach of a train. Flashing lights are also being placed at dangerous highway road crossings, or at curves where there are no railroads. Therefore, their effect is lost in indicating a railroad crossing specifically.

Two types of automatic flagmen are installed. (1) The two-position flagman with the banner hanging down when no train is near and waving when a train is approaching, and (2) the three-position flagman with the banner hid from view when no train is close, waving when a train is approaching and hanging straight down when the mechanism is out of order.

Automatic flagmen installed on the C. & N. W. have a small box locked with a switch lock and containing a test switch attached to the relay case. Section foremen at outlying points are required to use the test switch daily to test the bell or wig-wag. The maintainer tests the apparatus in automatic signal territory.

Sometimes it is necessary to install more than one automatic flagman. At heavy traffic crossings automobiles often follow so closely that the attention of a driver is taken up in watching the car ahead of him and he may overlook warning signs. When a road angles at or close to the railroad it may not be possible to locate one automatic flagman so that it can be seen readily at all times from both directions. The red light on the device should never be placed so that it can confuse enginemen; to avoid this on sharp angle crossings it may be necessary to use long hoods or to locate the automatic flagman a considerable distance from the track.

A peculiar condition exists on double track where only one flagman is used as it may be located across the track from an approaching automobile driver. Should a train pass on the track nearest him, he is likely to start across immediately behind it when there may be another train approaching from the opposite direction. Therefore, on angle crossings particularly, it is advisable to use two wig-wags so that one will be waving directly in front of the driver and at least give him food for thought before he starts across.

The Human Flagman

The human flagman is placed on many crossings during hours when traffic is heaviest. A great improvement was made in this protection when the "stop" sign, in place of the flag, was put into the hands of the watchman. Under the old conditions with the flag, it was hard to determine just what the watchman meant by his signal, whereas now it is almost impossible for it to be misjudged.

When the "stop" sign was first adopted I felt that it should be used with a very short handle but we have now adopted the long handle because of the careless manner in which some flagmen held up the "stop" sign and because

it was practically impossible to compel a man to hold up his sign for any great length of time even though he was not careless.

Automatic Gates

Automatic gates have been advocated and two different types have been designed, viz. (1) the high type, with an arm so high above the level of the road that it will not be struck by a passing vehicle even when in the horizontal position, this type having whips attached to it to indicate that it is down, and, (2) the low type, which is practically the ordinary gate but operated with track circuit control on the approach of trains. Neither of these types has apparently proved successful, and I believe the reasons may be briefly stated as follows: The high type does not attract sufficient attention nor does it prevent the driver from going across the tracks even though it is in the "stop" position; with the low type, there is nothing to prevent it from coming down on top of a vehicle or in such a way as to hold the vehicle on the track between the gates.

Manually operated gates perhaps give the best protection at crossings where there is sufficient traffic to warrant their use. Sometimes it is economical to install gates where the traffic is comparatively light when two or three sets can be operated by one man rather than to put in flagmen at each crossing.

When called as a witness once in a crossing protection case I was asked the relative efficiency of a manual flagman (human flagman) as compared with an automatic flagman and after due consideration, stated that perhaps the human flagman was the better at that particular place. After the case was settled I happened to meet the judge and he took me to task for my testimony on the basis that a human being was never as reliable as a piece of machinery and that in view of the conditions at the crossing which was under consideration, the automatic flagman would be much more reliable because there was nobody except perhaps an officer on an occasional train to see whether the flagman was performing his duty properly. The judge's criticism should be taken into consideration when studying crossing protection.

No one type of crossing protection is best adapted for all crossings nor is any one type the most efficient for all; machinery is often more reliable than a man and is on duty 24 hours a day, whereas the man may be on duty but a few hours. Therefore, from a signalman's viewpoint, each crossing must be studied separately and only after considering fully all of the conditions surrounding it can a decision be reached as to proper protection needed or whether that already in is sufficient.

The uniforming of flagmen is a point that should be considered, particularly in protecting crossings in cities, because the average automobile driver will recognize a man who wears a policeman's uniform when he will not recognize others. Very often it is possible to get the watchmen sworn in as special policemen.

A point which has not been touched on is the confusion of drivers when they are in danger. Their brains seem to get scrambled whenever they get in a machine. I was told of an incident by one of our flagmen, who said that he never attempted to push an automobile off of a crossing any more but instead went down the track to flag the train. In two or three instances he could have pushed automobiles off as they stood on a down slope but the drivers had applied their emergency brakes.

Education

The railroads are spending considerable on education. For some years the North Western has had a car traveling over the road with a man in it educating its enginemen and trainmen not only in obedience of signals but regarding the information they can obtain from them. It takes this man a year to cover the road. He is not allowed to report any man, no matter how ignorant he may find him. As a consequence he has obtained their confidence and they come to him with questions relative to signaling which they should know from the book of rules. After the lectures are over they ask for additional explanations and the instructor has found the greatest ignorance in some cases among enginemen who have long been running locomotives. When this is a fact it is seen how much more necessary it is to educate the automobile drivers, and at present it is impossible for automobile drivers to tell what some of the signals put up at crossings for crossing protection mean.

Automobile Disasters Unchecked—Need of a More Extensive Campaign

The Pennsylvania Railroad reports that in spite of the most extensive educational campaign against crossing accidents ever carried on, its records show that in June, July and August, such casualties increased 30 per cent, as compared with 1921. The railroads of the United States have joined in efforts to make plain the deplorable results of carelessness, yet during three months, on the Pennsylvania System alone, there were 107 crossing accidents, in which 71 persons were killed and 115 injured. That this large increase is chargeable almost entirely to growth in the reckless and inexperienced driving of automobiles, is shown by the fact that casualties at crossings from all other causes decreased. Eighty-five automobile accidents caused the death of 56 persons, and injury to 107 others; and 12 of the accidents resulted in 39 deaths; four caused the death of 20 persons, or an average of five for each car involved. In two of the accidents, entire families were wiped out; though in both instances the drivers lived close to the scenes of the accidents and were familiar with the layout of the railroad tracks and roads.

The company has issued a circular, from which we quote:

"As against these lives lost in three months there were no passengers killed in train accidents anywhere on the Pennsylvania Railroad System during the entire year ended May 31, last; 152,000,000 passengers were carried safely. The chief reason for this striking contrast is that locomotive enginemen are thoroughly trained in every detail of their work, and are required to demonstrate knowledge and ability to operate trains safely before being entrusted with their handling. On the other hand, the vast majority of motor car casualties are attributable to a comparatively small percentage of inexperienced and irresponsible drivers who have neither the knowledge, training or judgment required for the safe operation of such machines.

"Moreover, reckless driving of automobiles is not confined to highway crossings. Every day the newspapers report accidents caused by driving automobiles into telegraph poles, or stone walls, and by skidding, sideswiping, turning over and colliding. From this running chronicle of death and injury, the conclusion would seem warranted that what is needed at the present time is not merely a Careful Crossing Campaign, but a national campaign, carefully planned and directed against all forms of careless automobile driving. In this way possibly some impression may be made on the automobile accident record which shows 12,500 persons killed and 300,000 injured, in the United States for the year 1921."

The Accounting Department Offices of the Lake Erie & Western at Indianapolis, Ind., have been closed and the work has been combined with that of the New York, Chicago & St. Louis at Cleveland, Ohio.

The Design of Steel Freight Car Equipment*

Various Viewpoints That Must Be Considered—Importance of Limiting Speed at Impact in Switching

By John A. Pilcher
Mechanical Engineer, Norfolk & Western

THE IMPORTANCE of the proper design of modern freight car equipment to the car owners, as well as the economic interests of the country at large, cannot be overestimated. It is only within a little over 20 years that steel cars have come into general use. This development has been hastened by the increase in the price of lumber, the decrease in the price of steel and the demand for cars of greatly increased capacity. The use of steel makes it possible to build a car of any desired capacity, so far as the structure itself is concerned, the limitations upon size being only such as are placed by the clearances and strength of the roadway and other physical conditions surrounding operation.

The car constructed of wood, with the draft timber attached to the bottom of the center sills, equipped with the single-spring draft gears and the cast-iron link-and-pin drawbar, is a very resilient structure. This resilience was demonstrated by the fact that it was possible for so many years successfully to use the cast-iron drawhead. We cannot imagine the use of a cast-iron drawhead in a modern steel freight car with any expectation of having it moved any distance. This resilience of the old car was, in a measure, a protection to the lading in the car.

Steel Equipment Introduces New Condition

The introduction of steel into car construction, while it allowed of any capacity and any strength necessary, developed a rigidity in the car construction which reflected itself in local damage to the car itself, as well as the lading, and made necessary the development of the modern shock absorbers, known as friction draft gears, so that one of the greatest problems we now have in car design and upkeep is to get and maintain sufficient and proper shock absorbers and coupler attachments.

When we look about us and see the large variety of steel car designs that have been developed we can appreciate that there are many points from which the important features of the design can be viewed. The primary feature to every design is, of course, the production of a vehicle to haul the freight and produce revenue for the owner and user, but there are also various other features that have to be considered, and they present themselves in as many different phases as there are different minds working on the problem. It is my desire to point out some of the many important features that need be given consideration in the design of a steel car.

Stresses Due to Impact Complicate Problem of Design

If a railway car were subject to no other stresses than those of carrying the load the problem would be a simple one, and could be worked out on the same basis as bridges where the conditions are more or less fixed. There would then be no reasons for not reaching a proper strength of construction for the definite loading. The fact, however, is that the car has to be started, moved and stopped without there being any definite speeds of acceleration and retardation or without there being any certainty as to the character of the roadway over which it is to pass.

The design of the car needs to be studied from many points of view. Among these I will mention the following:

The Owner and User.—This involves the weight of the car itself, cost, maintenance and the possible earning capacity, based upon the cost of the investment and the cost of repairs.

The Transportation or Operating Department.—Its idea is a strong car so as to relieve it of all the burden of the supervision of yard switching crews. In this way it can cut down to a minimum the cost of switching service, which is a very large item in the cost of transportation.

The Claim Department.—It desires a car built in such a way that it will protect the lading from all possible weather conditions and be so resilient of itself that whatever is put in the car will never be damaged by any hurry-up movement in the yards.

The Car Builders.—The car builder desires a car that is very easy to build, one that can be put through the shop with the least amount of supervision; one that will allow the maximum of output in shop production. He is willing to sacrifice a great deal to these considerations.

The Manufacturers and Sellers of Specialties.—These look upon the car as a structure upon which they can hang something that they have to sell. A large duplication of cars of the same type offers a wonderful field for exploitation for the specialty man.

Car Design from the Standpoint of the Owner and User

For the owner and user the car must be constructed primarily to carry the most freight with the least deadweight, so as to bring up the revenue load and enable the car to earn the largest amount of revenue during its life. This feature can hardly be given too much prominence. Of course, like all good things, it is possible to carry it too far.

Lightness of structure does not necessarily mean weakness of structure. The car should, of course, be designed so that it will last through a reasonable period of years, or so it will not be everlastingly on the repair tracks, as a car on the repair tracks is a charge against interest and depreciation during that period without any corresponding income.

So far as the load-carrying capacity of the car is concerned, it is not a difficult matter to fix definite limits of stresses for its proper design. If the designer were given fixed definite limits of speed of acceleration and retardation of the car in its movement and definite conditions of the track over which it is to be moved, it would not be a hard matter to fix the definite requisite strength of the car in every other way. It is at this point where different interests in railroad operation clash. It is the man in charge of moving the cars who is responsible for the speeds at which the cars are brought in contact in the classification yards. His idea is that he can save in the cost of classification by rushing the car movement. He should not fail to remember that every car he damages in this way costs him money in switching charges in that he has to take the car to the repair tracks and bring it back. In addition it also costs the company the loss of the time of the car and the cost of repairs, all charges coming from the same treasury.

It is possible to construct a car and make it strong enough to stand any kind of service to which it is liable, even without having the limits fixed for this service, but if a car

*From a paper presented before the Railway Club of Pittsburgh, September 28, 1922.

should be made strong enough to stand any possible yard service it would be so heavy and so costly as to be of little value to the owner.

Impact Speeds in Switching Should Be Limited

You will readily agree that every car should be made strong enough to stand any accelerating and retarding force that can happen to it while in train service or any type of brake application, but we do not believe it should be made strong enough to stand any kind of service that can be given to it in classification yards. Certain definite limits should be placed upon the rate of acceleration and retardation in the classification yards, or rather a definite maximum speed limit at the time of contact should be set and a large amount of supervision given in the education of the men to see that these provisions are carried out.

A great many of the car details have already been standardized. Through the instrumentality of the Master Car Builder's Association and the Mechanical Section of the American Railway Association, such items as wheels, axles, brasses, boxes, brake beams, brakes, couplers and parts, etc., have been definitely agreed upon. Certain other fundamental features of the car construction affected by impact have also been agreed upon, such as the standard cross-section of center sills, the minimum size and quality of draft yokes, and other features in connection with the draft gear, as well as definite dimensions affecting the fundamentals of the design. Studies are now being made as to the standard method of assuming the loading on the car and of the maximum allowable fibre stresses under such assumptions which will be allowed in the car framing itself, as well as the truck side frames, bolsters and other parts. This will be a wonderful step forward in unifying the art of car construction. It cannot, however, result in any permanent good unless there are some limitations put upon the usage of the car in the classification yard service. We can hardly conceive of anything that cannot be damaged or destroyed if handled sufficiently roughly.

The strength of the cars has been gradually built up in its power to resist end shocks, due to over-speed impact, from the old resilient wooden car through a series of modifications of the composite cars with various strengths of metal center and draft sills until we have reached the full steel car with a minimum of 24 sq. in. cross-section of center sills, which until the recent increase to 30 sq. in. was the maximum.

Center Sills Now Stronger Than Couplers

A recent examination shows that cars constructed with the old limit of 24 sq. in. of center sills (which had been in use for several years) are sufficiently strong between the back stops to furnish reaction against which the shanks of the most modern 6 in. by 8 in. coupler can be upset. It is interesting to note that an examination of a group of such cars, 16 cars being taken just as they were reached, showed three coupler shanks upset 1 in.; two 7/8 in.; three 3/4 in.; four 1/2 in. and the rest of the group from 1/4 in. to 1/2 in. A later examination checking up these same cars indicated that one of these coupler shanks was upset as much as 1 1/4 in. From this we draw the deduction that no cars should be brought together at a speed exceeding that which will bring the draft gear solid, as any excess of such speed is nearly always liable to damage the cars, draft gears and couplers.

The old wooden cars with the wooden draft sills were all fitted up with dead-blocks of some form. Through these the final shock on the car came directly on the end of the wooden end sills to the center sills and they were resilient enough to sustain these shocks for a long time. Doing away with the dead-blocks brings the final shocks on the couplers, and with a clearance between the coupler horn and the striking face of the end sills these forces act directly upon the couplers, upsetting the shanks and driving the coupler heads back into the car and damaging the draft gears.

The damaging of the draft gears and the upsetting of the couplers, which allows the coupler head to be driven back into the car body, has made heavy repairs around the ends of the cars necessary, even though the sills are not damaged between the back stops. The general development of trouble at the end of the car has of late brought into evidence many efforts to overcome this damage by building on to the end of the sills very heavy steel striking castings against which the coupler horn and head will land without going back into the car. If these castings are made sufficiently strong they will, of course, protect the shank of the coupler and, in a measure, the draft gear, at least to the extent of not allowing them to be compressed more than the slack between the horn of the coupler and the striking plate, but it will necessarily be at the expense of the coupler head containing the movable parts.

If there is no limitation placed upon the speed of the cars at the time of impact, these heavy striking plates will simply be anvils against which the coupler heads will, in a short while, be destroyed. Already the coupler horns have been suffering.

Suggested Change in Coupler Design

If the dead-block, which was used in the days of the link-and-pin coupler and for a long time afterwards, is to be considered entirely a thing of the past, even though the danger from its use is also largely passed, because no one is allowed to go between the cars in making the coupling, would it not be a good thing if the coupler head were made with a rim all around to come against the heavy cast-wheel striking faces on the ends of the sills, rather than depending upon the horn of the coupler alone?

I am offering in this a method of distributing these heavy loads to all parts of the coupler head rather than to concentrating them on the striking horn of the present couplers, which never was originally intended to be a striking part, but simply a projection through which the lift-hook lever protrudes.

Even if we should replace the dead-blocks which, with resilient material behind them, would, in their shock absorbing capacity for heavy shocks, be equivalent to an additional draft gear, would we not still have to place some limitation on the speed at the time of impact? Protecting the cars from destruction would not protect the lading enclosed within a rigid car from serious damage.

The continual adding of material to the car adds to both the cost and weight. These very seriously reflect in the dividend of the owning and operating corporation.

Comparative Costs of Heavy and Light Cars.

I wish to illustrate just what this means by making a comparison of three groups of cars, built at the same time, coming under our observation not many years back. One group of these cars was built with the idea of increasing the revenue load to the maximum which, of course, meant keeping the deadweight to the minimum and correspondingly decreasing the cost. In connection with the design of these cars, a reasonable strength was not neglected, as they were made sufficiently strong to upset the couplers previously mentioned, and up to the present time have not developed any defects that call for extensive repairs that would in any way attract attention. The other two groups of cars are very much heavier, due to the character of the design and to the additional equipment with which they were loaded.

Considering a train of different groups of cars of 5,500 tons gross, including the cars and lading, the lighter cars have $759.10 more revenue in the train in the case of one group and $516.49 more revenue in the train in the case of the other group. Taking the cost of the train into consid-

eration, the lighter cars cost $[illegible] less than the one group and $74,212.50 less than the other group. If we allow interest and depreciation on the additional cost of 10 per cent and allow 20 round trips per year with the equipment, it means that the lighter cars had an interest and depreciation charge of $479.17 less, per trip, than one group and $371.56 less, per trip, than the other group. If we add together the difference due to the interest and depreciation and the difference in revenue per train we have a difference in one group of $1,238.77, which is 12.32 per cent of the gross revenue of the train, and in the other a difference of $888.03, or 8.62 per cent of the gross revenue of the train.

These figures are startling and show clearly that great saving to the railroads can be made by so regulating the handling of cars in classification yards that the adding on of extra material in the hope of preventing break-downs, due to over-speed impact, will not be needed. The fact that the lighter car in question was sufficiently strong between back stops to upset the shank of the latest A.R.A. coupler and strong enough to furnish the anvil against which the draft gears are being damaged, shows that the car is sufficiently strong in its present state, unless the couplers and draft gears are to be further strengthened.

Damage in Yards Responsible for Failures on Road

Is it not a fact that this over-speed impact in yards, which is upsetting the shanks of couplers and damaging the draft gears and creating in the trains a large amount of unresisted slack is the primary cause of the damage to trains in transit from the emergency brake application and the passage of long trains over humps and through dips?

It is my belief that trains of heavy cars properly equipped with modern draft gears, that have not been damaged and put out of commission or partially put out of commission by improper handling in classification yards, cannot be handled in ordinary train service in such a way as to bring about a sufficient differential in speed between the parts of the train at the time of impact to do any damage to either the equipment or the lading. I have recently been on very long, heavy special trains of new equipment, when the draft gears and attachments are in good condition, and have been impressed with the absence of these internal collisions. While these trains were equipped with special brake appliances which were being tested, I personally give credit for this admirable feature of operation to the condition of the couplers and draft gears and the absence of any great amount of unresisted slack.

This statement may lead to some difference of opinion and may open a way for considerable discussion, but I believe that practically all of the break-in-twos of trains in service when the cars are equipped with modern draft gears and connections is entirely due to damage previously done in classification yards, either to the couplers, knuckles and pins themselves, or else in the fact that the compression of the coupler shanks and damage to draft gears has developed sufficient unresisted slack so there is opportunity for a considerable internal collision in the trains during movement.

Little Gained by Further Increasing Strength of Cars

To show how little can be gained by increasing the strength of cars, we have considered the impact test made by the United States Railroad Administration on the cars on the test track at Rochester, N. Y. At this time they not only tested various types of friction draft gears, but also made impact tests of cars without any draft gears. Drawing an analogy from these to show how little can be gained by increasing the strength of the cars, I call your attention to the following:

1—Assuming a 40-ton car weighing gross 132,000 lb., with a center sill of 24 sq. in. cross-section, fitted with a draft gear that will go solid at an impact speed of four miles per hour, we find the reaction between the cars just as they go solid will be 1.6 times the weight of the car, or 211,000 lb.

2—If we consider the cars going together at 4.4 miles per hour, the force will be 3½ times the weight of the car, or 462,000 lb. With 24 sq. in. cross-section, considering only direct stresses, this will give us 19,250 lb. per sq. in. If the sill of this car were increased to 30 sq. in., and using the same fibre stress, the force of reaction would have to be 580,000 lb., which is 4.4 times the weight of the car and lading. This will represent an impact speed of 4.55 miles per hour for the same car. We could, therefore, by increasing the sill of this car from 24 to 30 sq. in., or 25 per cent, increase the impact speed of the two cars from 4.4 to 4.55 miles per hour, or .15 miles per hour, which is 3.4 per cent. These figures are given that you may see how little increased speed at time of impact is gained by a very large increase in the cross-section of sills. This gives a proportionate increase in strength and unfortunately a proportionate increase in weight. It also gives an increase in interest and depreciation charge, and a proportionate decrease in earning capacity, and nothing like a proportionate increase in impact speed. It has only a very minor effect in the decrease in the cost of car repairs.

In recent years great efforts have been made to reduce the cost of transportation by large increases in the tonnage of the trains, primarily to increase the revenue per train. To do this very large locomotives have been built. This has been largely brought about by those in charge of transportation, who also have control over the equipment in the classification yards where, according to my belief, 97 per cent of the damage to both equipment and lading is done. With more care in the handling of cars in the classification yards the expense and upkeep of equipment can be very materially decreased and the expense of the claim department materially reduced.

How far do you suppose the transportation officer would be willing to go in his efforts in the reduction of the cost of hauling freight if he could bring about a saving equivalent to as much as 10 per cent of the gross revenue of the railway company he is serving? I should think he would be willing to undertake most anything. I have shown in a previous statement as between two groups of cars—one heavy and expensive and the other lighter and correspondingly less expensive, that there is a difference amounting to as much as 12.32 per cent of the gross revenue of the train.

Protecting Against Corrosion

One of the serious features in connection with steel cars, and particularly open top steel freight cars, is corrosion. While the outside of the car can, in a measure, be protected by the use of coatings, the inside portion of the open top car is subject to the corrosive influence of the contents of the car. The dumping and handling of the loads prevent the use of protective coatings on the inside. After the car has been designed so as to carry the load and withstand the shocks of impact, it would last indefinitely, but for this corrosion.

Its final destruction can only be retarded by adding thickness to the material at certain points where corrosion is liable to be excessive, and at certain points where corrosion will weaken the structure, particularly as for instance, in the framing. It is very hard to determine just how much the designer is justified in adding at these points, because any amount added decreases the hauling capacity of the car.

It is very desirable in the construction of large open top cars for use on dumpers to use inside stakes. When the stakes are placed inside they are subject to the extra corrosion which must be allowed for in fixing their size. Shapes should be used offering the least surface for corrosion.

During recent years there has been considerable experiment

made as to the value of copper-bearing steel for the purpose of retarding corrosion, using steel of approximately .20 per cent copper. The special tests that have been conducted and observations that have been made of former steel structures built of copper-bearing metal indicate that we may have a very considerable lengthening of the life of the car by the use of copper-bearing steel.

Every car must be looked upon as a package in which merchandise is being shipped. Any increase in the cost of the package, whether it is a car or a separate package going into the car, is a charge against the transportation of that particular article. Every additional expense to the cost of these packages is an additional burden on the transportation of the article and may, in some cases, prevent its being moved at all by the railways. It is just on account of such additional charges in order to protect freight that the automobiles on highways are cutting so deeply into the revenue of the railways, alongside of which they operate. The high cost of cars and the high cost of packages can kill transportation just as easily as high freight rates, because all three go together to make up the cost of transportation.

The designer, above all things, wishes to produce a car that has a large margin over its light weight for lading and for earning revenue, but to get this there must be some limitation put on the speed at which cars are brought together, and this should not be in excess of that which will bring the draft gears solid.

The Transportation Point of View

I have already touched upon this point of view in the preceding paragraphs. The transportation man always wishes a car designed so strong that it does not have to be repaired and one that can be handled without undue care. The transportation people are responsible for keeping down the cost of handling, but it is also their method of handling that, to a large extent, brings about the necessity for repairs. If any compromise is to be arrived at as between the cost of handling and the cost incident to indifferent handling, and the cost of interest and depreciation and loss of revenue in the train due to heavy construction, some definite limitation of speed at the time of impact will have to be fixed, otherwise the designer has nothing definite to which to work and will continue to build cars, making each one stronger than the other. This tendency to make the parts that break a little bit stronger has resulted in each new design being built coming out a little stronger and having power to inflict damage upon the older cars. Such new cars only await their turn to be smashed up by cars of a still heavier design and less carrying capacity coming out later. It is to be hoped that a campaign of education will be brought about to prevent any cars being put together at a greater speed than that which will bring the draft gears solid. Unfortunately there are a great many cars equipped only with twin-spring draft gears, which on the 40-ton loaded car would go solid with an impact speed just a little less than two miles an hour. There are a large number of such cars in use which must be considered in any study of this important phase of the problem.

It would be a good study for the transportation man to find out what percentage of switching movement he would save in his yards if he did not have to set aside damaged cars. Would he not be very much like the telephone operator who is in such a hurry that she gives the wrong number two out of five times, and as a consequence, gets so many calls that she cannot reduce her speed and so continues to make errors that are not only a source of annoyance to her but more so to her patrons? I cannot help thinking that if more time is taken in the handling of cars in switching there will be so much less time given to cutting out damaged cars that there would be little or no increase in the cost of the service.

Point of View of the Claim Department

The stronger and stiffer the car is designed and the heavier, the more liable it is to go solid on the draft gears, and the more liable it is to bring about damage claims due to the rigidity of the car itself. Damage claims, while very small in proportion to the cost of the car repairs, bring about a great deal of friction with outside patrons and develop dissatisfaction which is often of greater moment than the actual cost. The real cure for this is the educational campaign against over-speed impact.

The Car Builder's Point of View

The car builder, of course, desires a car so designed that it is easy to build. This is a consideration every designer should have in mind, since the simplicity in construction reflects itself in the price of the car to the owner and user, and in the cost of transportation, in that it reduces the interest and depreciation charge against the equipment. Too much study cannot be put in the design in order to increase the facilities for building along with decreased weight.

I recently had my attention called to two cars of the same weights and approximately the same number of rivets to drive, and was told by one builder that with the same working force, 25 cars of one design could be delivered from the shop a day as against 20 of the other design. This is mentioned to show the value of giving attention to this feature of the design. Particularly should attention be given to the possibilities of using machine as against hand-driven rivets, not only to save in the cost of rivet driving, but in getting better driven rivets.

The Specialty Man's Point of View

These men who have felt themselves called upon to develop and sell specialties for railway cars have taken a great part in the constructive development of the car-building industry of the country. They are to be highly commended for their efforts. The car building industry, on account of the large duplication of the same design, is a wonderful field for the efforts of such men. There are a great number of these specialties which are exceedingly useful and they should be used, because they are helps in reducing the weight, reducing the cost and reducing the maintenance of the cars. Great care, however, must be taken in selecting them, to be sure that the designer is not being muddled by having the advantages of the specialty overstressed to the neglect of its final value as an economic device, in comparison with others, when the cost is taken into consideration. It requires a large amount of careful analysis not to fool one's self as to the real value of these devices when they are presented, as they often are, in such a pleasing and convincing manner.

In general I do not believe it is possible to go to too much expense in the preparation of the design for steel freight equipment where there is such a large duplication from the same design. This is true for an individual company purchasing any large number of cars for their own use. It is true in a much larger proportion for the railways of this country, as a whole, when they can standardize cars for use on all railways. I have always felt that the American Railway Association, Mechanical Section, could not do better than to organize an engineering department for this purpose.

Every car for which a design is to be prepared should not have simply one design furnished and passed upon, but a dozen or more qualified designers should each work up a design following his own bent or views of construction, each along different lines, each bringing his design to completion, making all of the necessary diagrams, showing methods of loading, weights, details of construction, estimated costs, and then these designers should themselves

select either the best two or three to be finally passed upon, or the best types of construction that can be put together, considering weight, cost of construction, relative strength, ease of construction and other pertinent features, and in this way get the advantage of the very best that it is possible to produce to be presented to the country at large. The engineering cost of such a method would be insignificant compared to the advantages to be gained.

The final results will be that the car builders themselves will not find it necessary to maintain such large engineering forces, the cost of which enters into their overhead, which naturally has finally to be passed on to the purchaser and user of the cars.

Strike Situation Clears

That the shopmen's strike is practically over is demonstrated by the number of roads with which agreements have been reached, the success of the other roads in restoring normal shop operation, the marked decline in the number of cases of violence reported and the fact that the Car Service division of the American Railway Association has notified the railroad companies that they no longer need honor the commission's request for daily information as to the number of new employees taken on in place of strikers. The latest reports indicate that about 376,417 employees have been engaged by the railroads, which is approximately 90 per cent of the normal force. The majority of the old shopmen are back and the resumption of normal operations is beginning to be seen in the decline in bad order equipment.

Eighty-two railroads, it is claimed by Mr. Jewell, have signed the so-called "Willard-Jewell" agreement. These include the 19 roads which, with their subsidiaries, were among the earliest of the roads to reach a peace settlement. The following is a list of the roads, furnished by the Railway Employees' Department of the American Federation of Labor:

The Ann Arbor; the Alabama Great Southern; the Baltimore & Ohio, the Baltimore & Ohio-Chicago Terminal; the Bellingham & Northern; the Belt Railway of Chicago; the Boston & Albany; the Buffalo, Rochester & Pittsburgh; the Buffalo & Susquehanna; the Buffalo Creek; the Chicago, Milwaukee & St. Paul; the Chicago & North Western; the Chicago, St. Paul, Minneapolis & Omaha; the Chicago, Indianapolis & Louisville; the Chicago, Kalamazoo & Saginaw; the Chicago, Peoria & St. Louis; the Cincinnati Northern; the Coal & Coke; the Chesapeake & Ohio; the Chesterfield & Lancaster; the Cleveland, Cincinnati, Chicago & St. Louis; the Cincinnati, New Orleans & Texas Pacific; the Cincinnati, Burnside & Cumberland; the Dayton Union; the Davenport, Rock Island and North Western; the Duluth, Winnipeg & Pacific; the Des Moines Union; the Elgin, Joliet & Eastern; the Erie, Evansville & Indianapolis; the Fort Smith & Western; the Georgia, Southern & Florida; the Green Bay & Western; the Gallatin Valley; the Harriman & Northwestern; the Kanawha & Michigan; the Kanawha & West Virginia; the Kankakee & Seneca; the Lake Erie & Western; the Lake Superior & Ishpeming; the Louisiana Railroad & Navigation Co.; the Michigan Central; the Mobile & Ohio; the Missouri Valley & Blair Ry & Bridge Co.; the Macon, Dublin & Savannah; the Milwaukee Terminal Co.; the Muncie Belt; the Minnesota & International; the New York Central; the New Orleans & North Eastern; the Northern Alabama; the New Jersey & New York; the New Orleans Public Belt; the New York, Susquehanna & Western; the Pacific Railroad; the Pittsburgh & Lake Erie; the Pierre & Fort Pierre Bridge; the Pierre, Rapid City & North Western; the Pittsburgh & West Virginia; the Puget Sound & Willapa Harbor; the Seaboard Air Line; the Seattle, Port Angeles & Western; the Sandy Valley & Elkhorn; the Sharpsville; the Staten Island Rapid Transit Co.; the St. Paul Bridge & Terminal Co.; the San Antonio & Aransas Pass; the Texas Midland, the Tacoma Eastern; the Toledo & Ohio Central; the Tennessee Central; the Toledo Terminal; the Uintah; the Western Pacific; the Wyoming & North Western; the Wilkes-Barre & Eastern; the Zanesville & Western, and the Chicago & Western Indiana.

Readjustments both of forces and wages have occurred during the past week. The Chicago, Burlington & Quincy decided to reduce its shop forces at Plattsmouth, Neb., by 40 per cent, discontinuing the brass foundry and the freight car department, with the exception of the steel car shops and cutting down its planing mill and lumber yard forces. Increased wages have been granted the Great Northern shop workers through negotiations between the management and delegates who perfected a new system organization of shop workers. The scale of wages is higher than that established by the Railroad Labor Board and the new working rules, it is declared by the delegates, are more favorable than those prevailing previously. An increase in pay has also been granted to all signalmen including foremen, by the Chicago & Alton. The increases range from one to five cents an hour with the proviso that the men will purchase their own motor cars.

Violence was reported at Belle Plaine, Iowa, where several striking shopmen were arrested by federal authorities for violating the Daugherty injunction and at St. Louis, Mo., where a bomb was thrown at the residence of a mechanical superintendent of the Missouri Pacific.

The Erie last week reached an agreement with representatives of the striking shopmen which brought the strike to an end on that road. The details of the agreement were not made public, but it is rumored that they differ considerably from the Willard-Jewell plan of settlement. Strikers have been returning to work, under this agreement, all during the week.

Reports from the anthracite mining region of Pennsylvania indicate that the striking shopmen on some of the anthracite roads are endeavoring to interest the miners and municipal officials in their cause. Indeed, some of the reports stated that mayors of some of the large anthracite cities proposed calling upon officers of the anthracite carriers to urge them to reinstate the strikers. The facts of the case are, however, that miners and public officials have taken little interest in this move. It has been a shop crafts' proposition from start to finish and there seems little likelihood that there is any considerable sentiment on the part of anthracite miners to take any vigorous steps to aid the cause of striking shopmen. There is, of course, considerable congestion of traffic in the anthracite region but little of this can be charged definitely to the shopmen's strike. The roads are moving a heavy traffic of anthracite out of this region every day and some congestion may under such circumstances reasonably be expected.

The shopmen's strike is now so nearly over that the railroad companies were notified on September 27 by the Car Service Division of the American Railway Association that they need no longer honor its request for daily information as to the number of new employees taken on in place of the strikers. On Tuesday, September 26, the figures filed with the Car Service Division showed that the railroads reporting had approximately 363,417 employees engaged in the maintenance of cars and locomotives. Adding to this approximately 13,000 employees for some 50 non-reporting roads, gives a total of approximately 376,417 employees or approximately 90 per cent of a normal force. Starting on July 10 with 155,685 employees, the railroads up to September 26 had added 220,732 employees. Of these, approximately 71,417 have been added since September 1.

Tentative Valuation of Big Four

WASHINGTON, D. C.

THE INTERSTATE COMMERCE COMMISSION on September 28 made public its tentative report on the valuation of the properties of the Cleveland, Cincinnati, Chicago & St. Louis, including also its subsidiaries, the Vernon, Greensburg & Rushville; the Columbus, Hope & Greensburg; the Cincinnati, Lafayette & Chicago; the Peoria & Eastern; Saline Valley; the Cincinnati, Sandusky & Cleveland; the Findlay Belt, and Mount Gilead Short Line, as of June 30, 1915. The commission reports the final value of the property owned as $139,620,322 and of the property used, included leased lines and joint facilities, as $164,163,042.

The total outstanding capitalization of the Cleveland, Cincinnati, Chicago & St. Louis as of the valuation date is reported as $158,947,021. While this is in excess of the final value found for the owned property, it is less than that for the property used. The leased lines which are included in the property used have a total capitalization of about $41,000,000, of which approximately $18,000,000 is owned by the carrier. The owned property, which is given a final value of $139,620,322, includes 1,687 miles of first main track and 3,184 miles of all tracks, while the used property includes 2,221 miles of first main track and 3,946 miles of all tracks. The investment in road and equipment, including land, was stated on the books of the carrier to be $144,375,812. If certain readjustments were made, as detailed in an appendix, the report says, this would be increased to $149,170,011. Entering into this is an amount of $60,333,426 which represents the par value of securities issued or assumed by the carrier, the money value of which at the time of entry is not known and cannot be determined. The report says that the original cost to date of all the common carrier property cannot be ascertained as the necessary details are not shown in the accounting records.

The cost of reproduction new of common carrier property other than land owned is given as $142,369,120 and that for the property used as $165,578,068. The cost of reproduction less depreciation is given as $112,516,329 for the property owned, and $130,580,201 for the property used. The carrier also owned 24,136 acres of land, which is given a present value of $15,486,414. The land used, amounting to 30,378 acres, is given a present value of $20,851,832. Non-carrier lands of a present value of $3,502,837 are also reported and the carrier had investments in other companies and notes of individuals and miscellaneous investments having an aggregate par value of $42,758,486 and a record book value stated as the net investment of the carrier of $19,564,875. The final value stated includes $5,000,969 on account of working capital, including materials and supplies.

The commission has also issued tentative valuations of a number of smaller roads giving the final value as follows:

	Owned	Used
Augusta Southern, 1916	$919,976	$922,190
Barnegat, 1916	86,282	91,782
Durham Union Station, 1916	101,644	160,259
Amador Central, 1916	361,456	361,584
Hillsboro & Northeastern, 1917	96,395	.....
Due West, 1916	28,500	37,000
Bingham & Garfield, 1916	5,894,183	5,830,443
Beaver, Meade & Englewood, 1918	75,000	.....

Graphic Presentation of Railway Earnings and Expenditures

THE Bureau of Railway Economics has prepared bar diagrams showing railway operating revenue and how it was expended and distribution of each dollar of operating revenues during 1921. Similar bar diagrams for years back to and including 1916 are given for the purpose of comparison. These bar diagrams are reproduced on the opposite page and the data from which they were drawn are given in the table below. In spite of the unfavorable traffic conditions of 1921 it is to be noted that return on investment, the measure of the success of the railways from a business point of view was much greater in 1921 than in 1920 which was a banner year as far as traffic is concerned. The diagrams make this and similar comparisons easy.

STATISTICS UPON WHICH CHARTS ON OPPOSITE PAGE ARE BASED

Item	1916	1917	1918	1919	1920	1921
Total operating revenues	$3,596,865,766	$4,014,142,747	$4,880,953,480	$5,144,795,154	$6,178,438,459	$6,516,556,462
Labor (salaries and wages) *a*	1,365,776,046	1,617,718,392	2,430,846,416	2,644,109,442	3,424,075,109	2,585,329,497
Fuel (locomotive)	250,544,862	393,929,538	560,225,205	474,174,792	674,836,361	523,724,146
Loss and damage, injuries to persons, and insurance	71,175,856	91,396,709	110,688,906	154,408,092	219,405,759	161,199,699

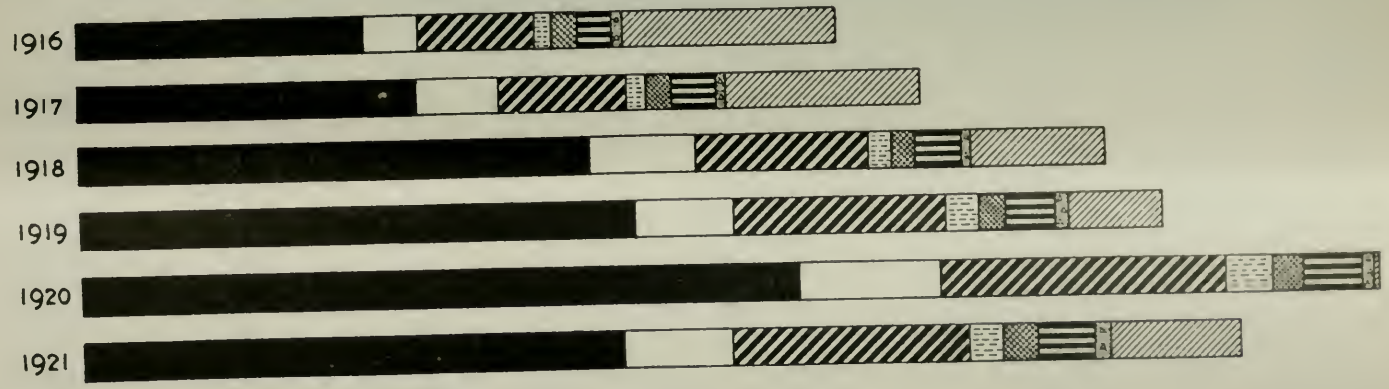
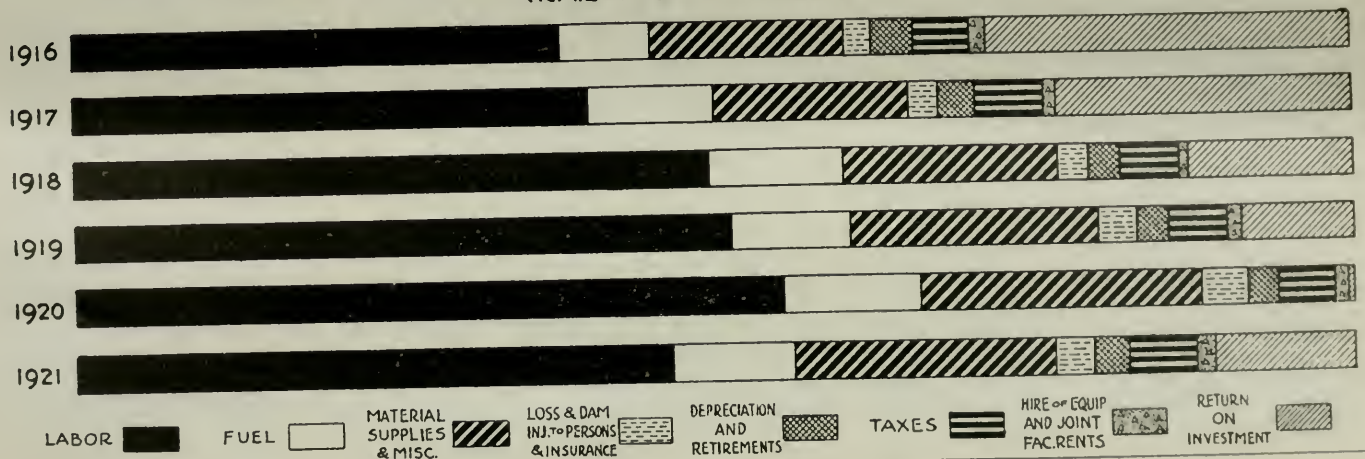
RAILWAY OPERATING REVENUE AND HOW IT WAS EXPENDED, 1916-1921
(RAILWAYS OF CLASS I)



DISTRIBUTION OF EACH DOLLAR OF RAILWAY OPERATING REVENUE, 1916-1921
(RAILWAYS OF CLASS I)



Accident Bulletin No. 82—Annual Report, 1921

THE INTERSTATE Commerce Commission has issued Accident Bulletin No. 82, containing the record of collisions, derailments and other accidents on the railroads of the United States for the last quarter of 1921 and also for the 12 months ending with December. The total number of casualties shown in the annual tables is 126,681; made up of 5,996 killed and 120,685 injured. The principal totals making up this aggregate are shown in our double column table, with comparisons for the preceding three years. In the first line of this table, the most important from a passenger standpoint, there is no marked change as compared with the preceding two years except that in 1921 the number of passengers injured was about 44 per cent less than in 1920. The number of employees killed in train accidents and train service accidents shows a diminution of 48 per cent, due, in large measure, no doubt, to the smaller volume of business done in 1921 and secondly, to the fact that with a smaller volume of business, the competency and efficiency of the individual employees is higher.

The total number of train accidents in 1921 was 21,251, or about 41 per cent less than the total in 1920. The principal items in these tables for the two years are as follows:

TOTAL NUMBER OF TRAIN ACCIDENTS—TWO YEARS

	1921				1920			
	No.	Damage	Killed	Injured	No.	Damage	Killed	Injured
Collisions	5,102	$4,657,290	130	1,839	10,110	$9,078,110	253	3,840
Derailments	13,615	16,51[illegible],440	132	1,854	22,477	[illegible],987,790	194	3,549
Other train accidents	2,534	1,577,520	47	231	3,726	2,063,960	89	743
	21,251	$[illegible],753,350	309	3,924	36,313	$34,129,860	536	8,132

The bulletin contains the usual full and detailed analyses of all the tables in the record, with some of the comparisons carried back 30 years and more. About 20 pages are occupied with tables showing totals of casualties on individual roads. Of the persons killed or injured at highway grade crossings (1,705 killed and 4,868 injured) 80 per cent were occupants of automobiles. This figure has gradually increased from the year 1917, when it was 59 per cent.

The number of passenger train enginemen killed in train and train-service accidents, 37, is equal to 2.86 per thousand in service, the lowest ratio in five years. This is only half as bad a ratio as that recorded for 1920 (69 killed; 5.27 per 1,000) but now, as in the earlier year, it is more than twice as bad as the average for freight enginemen (32 killed; 1.13 per 1,000). Evidently the speed of trains is an important element in the degree of safety enjoyed by locomotive enginemen. The ratios for firemen are about the same as those for enginemen.

In the year now covered, the number of train accidents is smaller than it would have been under former regulations, a rule having been adopted that when a person is killed or injured in a train accident which damages railroad property not more than $150 the casualty will be classed as caused in a train-service accident. A collision, for example, is not a reportable collision if the damage to cars, engine and roadway amounts to less than $150.01.

CASUALTIES TO PERSONS IN RAILROAD ACCIDENTS—FOUR YEARS

	1921		1920		1919		1918	
Passengers—	Killed	Injured	Killed	Injured	Killed	Injured	Killed	Injured
In train accidents	110	2,601	95	4,631	110	4,549	286	4,655
In train service accidents	116	3,543	169	3,825	191	3,598	233	3,427

Total	1,096	28,524	2,107	46,920	1,693	36,280	2,759	46,961
Total passengers and employees on duty	1,322	34,668	2,371	55,376	1,994	44,427	3,278	55,043
Employees not on duty	41	223	91	314	66	321	169	595
Other Persons, not Trespassing—								
In train accidents	3	16	11	86	9	61	117	433
In train service accidents*	1,740	5,346	1,856	5,642	1,873	5,134	1,878	5,268
Total	1,743	5,362	1,867	5,728	1,882	5,195	1,995	5,701
Trespassers†—								
In train accidents	49	141	48	77	32	63	39	67
In train service accidents	2,432	2,930	2,118	2,291	2,521	2,595	3,216	2,738
Total	2,481	3,071	2,166	2,368	2,553	2,658	3,255	2,805
Total of the above	5,587	43,324	6,495	63,786	6,495	52,601	8,697	64,144
Non-train accidents	409	77,361	463	104,522	483	96,452	589	110,431
Grand total	5,996	120,685	6,958	168,308	6,978	149,053	9,286	174,575

*Includes persons struck by trains at highway crossings, of whom, in 1921, there were 1,702 killed, including 106 classed as trespassers. The injured numbered 4,818. The total killed in the year preceding was 1,790.
†A small percentage of the persons classed as trespassers represents employees.

Railroads Urged to Concentrate Efforts on Coal Traffic

WASHINGTON, D. C.

AN URGENT APPEAL to concentrate on a drive for the expedition of coal movements, especially during the month of October, has been addressed by Fuel Distributor Spens to the executives of the various coal-carrying railroads.

"I appreciate fully the current conditions on the railroads; the ravages of the strike, and the fact that today the offerings of tonnage of all character are large, and the further fact that, in spite of these circumstances the carriers, in the aggregate, are making a splendid showing in the transportation of coal," says Mr. Spens. "In these circumstances I am somewhat loath to suggest the possibility of even better performance.

"Due to the dual strikes there is, of course, a dearth of coal. Consumers, domestic as well as industrial, have been urged only to purchase coal for immediate requirements. Current transportation is adequate for current needs, but not sufficient to permit of reserves. An early cold snap would play havoc with consumers, as well as with the power of the railroads. There might be actual distress. It has been suggested that, perhaps, there should be a temporary cessation in transportation of certain other classes of traffic, that more equipment and power might be applied to coal. In my judg-

ment, it would be regrettable if any action in that direction should become necessary.

"Are you willing to see if something can possibly be done to increase the coal movement over your lines?

"As suggested by the President, we are extremely anxious to make October the banner month. A personal word directly from you to each member of your operating staff, down, if you will, at least to the division superintendent that coal shall, so far as practicable, be moved through to destination or junctions with connecting lines, without set-outs, and that empties shall not be delayed at terminals or junctions, but shall be promptly returned to mines will, I am confident, accomplish all that could be reasonably expected. Your traffic department could undoubtedly also be of great assistance by urging prompt unloading by consignees.

"Extraordinary movement of coal, loads and empties, during the next few weeks, in view of the heavy traffic in all commodities, will probably tend to increase the cost of handling, but I believe this additional cost might prove to be a good investment as compared with a much greater cost that might be incurred in the event it should become necessary to adopt more drastic measures to care for the situation.

"Very possibly to accomplish increased handlings of coal, delays to other traffic may occur, but this is contemplated, or at least should be expected, under the existing orders of the Interstate Commerce Commission which provides priority in transportation on coal, equal only with food and feed and some minor public necessities."

The first meeting of the Advisory Committee on Transportation, recently appointed by the American Railway Association at the request of Federal Fuel Distributor Spens, was to be held in Washington on Thursday. At this meeting the committee, which is headed by Daniel Willard, president of the Baltimore & Ohio, was expected to formulate the practical details for accomplishing the heaviest movement of coal possible during the month of October.

In response to an inquiry from the Interstate Commerce Commission regarding the advisability of modification of the reconsignment practices on shipments of coal in open-top cars, Fuel Distributor Spens has declared that, unless there should be an unfavorable change in the present situation as to reconsigning, the existing rules should, in his opinion, be permitted to stand without revision. "It is true," he said, "that at about the time the coal strike was ended there was at certain terminals quite a quantity of coal on hand awaiting disposition, but this was due largely, I think, to the fact that this coal had been purchased at high prices, with the result that the breaking of the strike made it difficult for the operators or jobbers to find customers. Today there appears to be an exceedingly small percentage of the total loading of cars held for reconsignment, approximately one-third of one per cent, and I am inclined to the opinion that, with the big demand for coal that now exists and with the instructions that you have extant that consignees must unload within 24 hours or be embargoed, that we need not, just at this time, have much apprehension that the privilege will be dangerously abused. As a matter of fact, in many instances it perhaps works toward a reduction in prices, and likewise in many instances, actually makes for a more prompt disposition of the coal and release of the equipment than might otherwise be the case. In the event the views of the Interstate Commerce Commission should coincide with my own, this department can, perhaps, be of some assistance by cautioning handlers of coal that unless cars are promptly released it might become necessary for us to recommend to the Interstate Commerce Commission the cancellation of the present privileges, or drastic restrictions."

The 15 naval officers who will act as field representatives of the federal fuel distributor in as many districts into which the territory east of the Mississippi river has been divided for administrative purposes connected with coal distribution, have left Washington and began their duties at their new stations on October 2. The points to which these officers have been assigned are as follows: St Louis, Mo.; Cincinnati, Ohio; Knoxville, Tenn.; Pittsburgh, Pa.; Columbus, Ohio; Louisville, Ky.; Evansville, Ind.; Birmingham, Ala.; Springfield, Ill.; Charleston, W. Va.; Fairmont, W. Va.; Norton, Va.; Bluefield, W. Va.; Altoona, Pa.; and Greensburg, Pa. These officers have been instructed to keep Federal Fuel Distributor Spens informed daily relative to local conditions as to the production and distribution of coal and the prices obtained for coal and other fuels in their respective districts. They are expected to watch closely for acute fuel shortages that may develop, to keep posted as to markets to which coal is moving, to note carefully the transportation conditions prevailing, and to collect information as to whether prices obtained for fuel are justified.

In the south and middle west, bituminous lump coal is the principal domestic fuel, and the field representatives have been instructed to watch carefully the prices and distribution of this grade or size of coal. The principal factor in the coal situation, outside of the distribution, or domestic consumption, existing at the present time is the charge being made by the operators and the delivered price to the consumers. In order that an accurate check may be kept on this situation, the district representatives of the federal fuel distributor have been instructed to make an analysis of the prices being received on contract and spot coal and the general markets in which coal from each of the producing districts is flowing.

Field representatives are expected to keep in close touch with the various trade associations, the officials of coal-carrying railroads, and the chambers of commerce in their representative territories. Periodical visits are to be made to various points in the coal producing districts to ascertain the local conditions. As the car supply situation at coal mines is of particular importance, field representatives will watch particularly the effect of reduced car supply upon the cost of producing coal.

Data regarding the distribution and marketing of coal consumed within the state in which it is mined are desired by the federal fuel distributor as being essential to the proper distribution of coal moving across state lines. Information is needed as to the prices obtained for the first-named class of coal because of the possibility of its being reconsigned to points outside of the state and being resold.

In cases where the coal produced by a mine is sold exclusively through a marketing agency located in an entirely different territory, the price data desired will be arrived at through sales reports made to the mine operator by the selling agent, the cost of transportation being deducted from the sales price in order to determine an approximate price at mine.

A statement of the stocks of coal on hand on the docks of Lake Superior ports on September 15, illustrates vividly the difference in conditions prevailing in that region this year and last. On the Duluth-Superior docks there were on hand 6,786 tons of anthracite and 269,951 tons of bituminous coal compared with stocks of 826,436 tons of anthracite and 5,618,948 tons of bituminous on these docks in September, 1921. On the Ashland-Washburn (Wisconsin) docks 877 tons of anthracite and 44,177 tons of bituminous coal were on hand September 15 of this year as against 22,619 tons of anthracite and 238,923 tons of bituminous on hand a year ago. From these docks, coal is supplied to the states of Minnesota, Wisconsin, North and South Dakota and Iowa. On upper Lake Michigan docks, there were on hand September 1 of this year 49,102 tons of anthracite and 158,978 tons of bituminous compared with stocks of 502,921 tons of anthracite and 2,162,149 tons of bituminous on these docks on October 1 of last year.

Since these figures were compiled heavy shipments of coal

have been received at these docks. The estimated dumping of coal at lower Lake Erie ports Saturday and Sunday for trans-shipment to upper lake ports is 6,555 cars, which would make a total of 1,200,000 tons for the week. On Saturday, September 30, a total of 22,788 cars of coal were on hand at Lake Erie ports or in transit within 48 hours.

Priority orders for the movement of coal are being employed only rarely. The federal fuel distributor is asking the Interstate Commerce Commission to issue such orders only in cases of real distress where it is impossible to relieve an acute fuel situation by any other means.

Assurances of cordial co-operation in the execution of measures deemed necessary to insure an equitable distribution of coal in the present emergency are being received from the governors and fuel administrators of the various states.

Mr. Spens has received inquiries from the diplomatic agents of certain foreign countries relative to the policy to be pursued in providing bunker coal in American ports for vessels sailing under foreign flags. Mr. Spens has informed these inquirers that, while it is expected to make the best provision possible for bunker coal supplies it is strongly urged, in view of the fuel emergency prevailing in the United States, that foreign-owned vessels take on all coal supplies possible to obtain at foreign ports. For the present, such vessels will be expected to stow in American ports coal supplies sufficient only to provide for reaching the next port.

Freight Car Loading

WASHINGTON, D. C.

THE NUMBER OF CARS loaded with revenue freight showed another large increase during the week ending September 23 and the figures are rapidly approaching the high record set in 1920. The total for the week was 973,291 as compared with 873,641 in the corresponding week of last year and 1,008,109 in the corresponding week of 1920. This was an increase of 27,372 over the week before, in and merchandise, l.c.l., showed increases as compared with the preceding week, while increases as compared with the corresponding week of 1920 were shown in grain and grain products, livestock, merchandise and miscellaneous. The summary as compiled by the Car Service Division of the American Railway Association given in the table.

The car shortage for the period September 15 to 23 was 107,666, which included 55,827 box cars and 32,148 coal cars. The surplus was reduced to 11,292, including 1,338 box cars and 7,018 coal cars. During the corresponding week of 1920 the car shortage was only 89,947 but in that year the shortage came earlier and reached its high point during the week ended August 31, when it was 147,309.

The car shortage for the period September 8 to 15 averaged 85,906 cars, including 26,000 coal cars and 46,128 box cars. For the same period the surplus was reduced to 22,969, including only 1,831 box cars and 17,614 coal cars.

The percentage of locomotives out of service for repairs requiring over 24 hours increased from 22.6 on August 1 and 23.8 on August 15 to 25.3 on September 1, according to reports just issued by the Car Service Division of the American Railway Association. The percentage out of service for repairs requiring less than 24 hours was the same on September 1 as on August 1, 5.6 per cent, but less than on August 15, when it was 5.7. The number of serviceable locomotives was 44,501 on September 1 as compared with 46,195 on August 1 and the number of serviceable locomotives stored was 2,842 as compared with 4,939. The number requiring over 24 hours repairs was 14,505 and the number requiring less than 24 hours was 3,573.

Fewer freight cars were in need of repairs on September 15 than on either July 1 this year, when the shopmen's strike began, or on September 15 last year, when there was no strike, according to reports compiled by the Car Service Division. Freight cars in need of repairs on September 15 this year totaled 304,548, or 13.4 per cent of the cars on line. This was a decrease of 20,035 cars compared with July 1, when the total was 324,583 cars or 14.3 per cent of

REVENUE FREIGHT LOADED. SUMMARY—ALL DISTRICTS, COMPARISON OF TOTALS THIS YEAR, LAST YEAR, TWO YEARS AGO. WEEK ENDED SATURDAY, SEPTEMBER 23, 1922

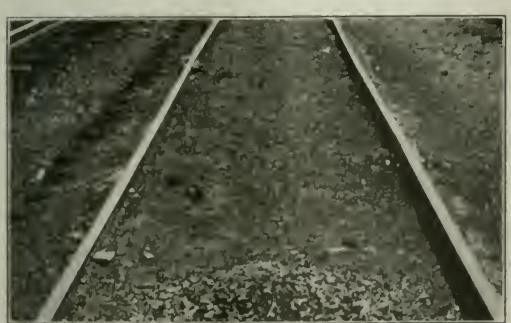
spite of the fact that the car shortage also showed an increase and was greater than it was in the corresponding week of 1920. In that year the peak shortage was reached earlier in the year, during the last week in August. Coal loading was larger than during any previous week since the strike—187,896—and all classes of commodities except ore the cars on line. On September 15 last year, 374,431 or 16.3 per cent of the cars on line were in need of repairs, 69,883 more than on the same date this year. A reduction of 17,126 was reported in the number of cars in need of repairs on September 15, compared with September 1. Comparisons showed a decrease in every district

The Arrangement of the Equipment

Cleaning Track With a Power Driven Sweeper

Pennsylvania Railroad Develops a Labor Saving Unit to Lower Maintenance Costs on Mountain Sections

ONE OF THE LATEST forms of mechanical labor saving equipment for maintenance of way work is a power-driven track sweeper now in use on the Central region of the Pennsylvania Railroad. This unit sweeps up and loads into cars the dirt, chiefly ashes, cinders and coal dust, which fouls the track and ballast with extreme rapidity in the heavy traffic, mountain sections of the road where pusher



A Stretch of Track Before Sweeping

locomotives are used regularly. An average speed of about four miles an hour is maintained and the track is well cleaned. Tests indicate that the cost is approximately one-half of what it normally would be with hand labor.

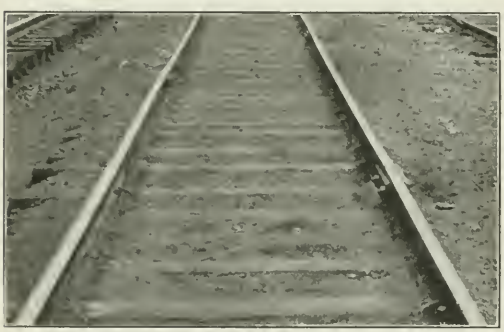
The sweeper unit is used chiefly on the pusher grades of the Pennsylvania main line through the Allegheny mountains, i.e., on the westbound tracks from Altoona, Pa., to Gallitzin and on the eastbound tracks from Johnstown, Pa., to Gallitzin. In some instances, sidings and yard sections are also cleaned by this equipment. The dirt accumulates very quickly on this part of the line, there being about 102 miles of track which require cleaning from four to six times annually. This is necessary primarily to keep the signals working properly as well as to keep the track in such condition that a proper inspection of the rail fastenings can be made periodically and that the ballast does not become badly fouled with consequent interference with good drainage.

The sweeper consists fundamentally of a rotary steel broom 3 ft. in diameter and 7 ft. long built up from steel splints measuring 1/32 in. by 3/16 in. in cross-section. This broom is suspended beneath the frame of an old flat car by special hangers which permit it to be raised or lowered at will. This is accomplished through the use of an air brake cylinder connected with the train air line. The broom turns at about 100 r.p.m., and is chain driven from a gasoline engine mounted on the car deck. A steel pan hinged and shaped to fall over the two rails is attached slightly ahead of the rotary broom which sweeps the accumulations up this pan onto a conveyor belt 7 ft. wide. This belt operates over two rollers spaced 8 ft. 9 in. center to center and is chain driven. The dirt and ashes are retained on it by 2-in. angles riveted to the belt across the full width of the belt and spaced 1 ft. 8 in. apart.

The debris which has been elevated by this belt is discharged into a hopper which in turn discharges it upon another conveyor belt mounted in an extension boom and running over rollers 24 ft. 2 in. center to center. This permits the final discharge of the accumulations at a convenient distance from one end of a hopper gondola or other type of open top car which is coupled next to the sweeper. The entire arrangement is housed over for protection from the weather and to secure maximum results in operation. The sweeper unit and car is handled by a locomotive, which can be one of the lightest engines in service as little power is

required. The work is generally carried on under traffic and the best results are obtained with the device after a light rain has fallen.

When the unit was constructed an obsolete flat car was procured which was somewhat narrower than the more modern cars. This limited the length of the broom to seven feet. The unit is thus able to sweep out towards the end of the tie for only about 6 to 8 in. from the rail. It does, however, do good work, removing deep accumulations easily and thoroughly. This can be seen in the photographs, where an accumulation of about three inches or more was removed down to or slightly below the top of the ties. All rail fastenings were uncovered and freed from contact with the dirt. The experience to date after about 50 miles of sweeping has shown that the broom wears but little, there having been only about $1\frac{1}{2}$ in. wear for that amount of sweeping. Heavier splints are being considered, however, not only with the idea of decreasing the wear but to secure a greater depth of cleaning between the ties. Another change contemplated involves the use of shallow buckets in a staggered arrangement on the main conveyor belt instead of the present angles. The broom itself picks up practically everything which may be on the track. Ordinarily about one car of dirt is secured per mile of track swept and this is picked up at a compara-



The Same Section of Track After Sweeping

tively low cost. A recent test made on a badly fouled section of track where the dirt was mixed with engine sand and well compacted, to determine the costs involved produced the following results:

Cost When Using Sweeper

Engine service (including engine and train crews' time, fuel, oil, enginehouse expense and water) 8 hours @ $5.79	$46.32
Sweeper operator—8 hours @ $0.535	4.28
Laborers, three—8 hours 24 hours @ $0.40	9.60
Gasoline—9 gal. @ $0.29	2.61
Motor oil—1 gal. @ $0.72	.72
Total	$63.53

3,828 ft. of track cleaned and dirt disposed of.
Cost per lin. ft. $0.0167

Cost for Manual Labor

One foreman—9 hours @ $6.28	$ 5.62
14 laborers—9 hours, 126 hours @ $0.40	50.40
Total	$56.05

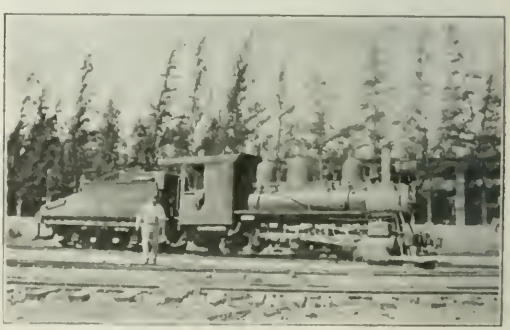
1,650 ft. of track cleaned and dirt disposed of.
Cost per lin. ft. $0.034

The new sweeper has been developed in the maintenance of way department of the Central region; W. D. Wiggins, chief engineer maintenance of way, and R. Faries, division engineer. The sweeper was designed and constructed by George Ehrenfeld, supervisor of track

Conductors' and Trainmen's Wages to Stand in West

An agreement was signed in Chicago on October 3 between the Conference Committee of Managers, representing 34 western railroads, and the chief executive officers of the order of Railway Conductors and the Brotherhood of Railroad Trainmen. The present schedule of rules governing rates of pay and working conditions for trainmen and conductors will, under the agreement, continue until October 31, 1923, and thereafter subject to 30 days' written notice by either party. The eight-hour day basis will be maintained; time and a half will be paid for all work performed after eight hours. The managements and the unions' committees will consider eliminating or modifying local rules that have an important bearing on the efficiency and economy of operation but have little effect on compensation or that result in inequitable compensation, either high or low, to the end that such adjustments as may be mutually agreed for will be made. All questions as to wages and working conditions now before the United States Railroad Labor Board submitted by either party for decision will be withdrawn. This does not include disputes which have arisen over the interpretation of present rules on rates. The railways were represented by W. M. Jeffers, general manager, Union Pacific; the Brotherhood of Railway Trainmen by W. G. Lee, grand president; and the Order of Railway Conductors by L. E. Sheppard, grand president. The roads, including subsidiaries, represented by Mr. Jeffers were:

Atchison, Topeka & Santa Fe, including the Gulf Colorado & Santa Fe; Baltimore and Ohio Chicago Terminal; Belt Railway of Chicago; Big Fork & International Falls; Chicago & North Western; Chicago & Eastern Illinois; Chicago, Burlington & Quincy; Chicago, Milwaukee & St. Paul, including the Chicago, Milwaukee & Gary, Chicago & Western Indiana; Chicago, Rock Island & Pacific; Colorado & Southern; Chicago St. Paul, Minneapolis & Omaha; Davenport, Rock Island & North Western; Des Moines Union; Denver & Rio Grande Western; Duluth, South Shore & Atlantic; El Paso & South Western; Fort Worth & Denver City; Great Northern; Illinois Central and the Yazoo & Mississippi Valley; Minneapolis, St. Paul and Sault Ste. Marie; Minneapolis & International; Missouri Pacific; Spokane, Portland & Seattle; St. Joseph Belt; St. Paul Bridge & Terminal; Terminal Railroad Association of St. Louis; Texas Midland; Trinity & Brazos Valley; Union Pacific; Union Stockyards Company of Omaha; Western Pacific.



A Switch Engine in the Honolulu Yard of the Oahu Railway, Hawaii

Commission Concludes Mileage Book Hearing

Merchants and Jobbers Join Commercial Travelers in Urging Discount of 33 1/3 Per Cent

WASHINGTON, D. C.

THE MERCHANTS ASSOCIATION of New York, the Chicago Association of Commerce, the National Wholesale Grocers' Association and the American Wholesale Grocers' Association joined with representatives of the commercial travelers' organizations in urging the Interstate Commerce Commission to require the railroads to issue scrip coupon books at a discount of 33⅓ per cent, at the concluding session of the hearing on mileage and scrip tickets before Commissioner Meyer at Washington on September 28. The railroads, while opposing any reduction in the present rates, urged that if any such request were complied with by the commission, the tickets should be restricted to six months from the date of issue and be issued in denominations no lower than $200.

A. M. Loeb, president of the National Council of Traveling Men's Associations, was the concluding witness for the commercial travelers. He said the consensus of opinion of his associations is that scrip coupon books are preferable to mileage tickets and that they avoid the confusion incident to varying rates of fare in certain sections of the country. He expressed the opinion that a sale of such tickets at a discount of 33⅓ per cent would stimulate both freight and passenger traffic of the railroads, but said that if he felt it would result in a loss of revenue, as claimed by the railroads, he would not favor it. He insisted that a large share of the business depression and unemployment of 1921 was due to the increased cost of transportation rather than that the falling off of passenger travel was due to the business depression and insisted that lower fares would be an inducement to business houses to send out more traveling salesmen, who would increase the volume of business and reduce unemployment. He said that firms had been very reluctant to send men into new territory and had also greatly reduced the number of smaller towns covered by their salesmen.

On cross-examination by H. W. Bikle, counsel for the railroads, he admitted that the average life of a coupon book such as he proposed would be only about 60 days and that the interest on the average amount of money advanced to the railroads by the sale of such a book would be only about 27 cents. He said that from 25 to 33⅓ per cent of a traveling man's expenses consist of railroad transportation, amounting to $300 to $400 a year, and that the average travel per day would range from 50 to 100 miles after a man reaches his territory; but he said the average would be increased by the fact that his first jump and his return trip home would range as high as 3,000 miles in some instances. He said that the cost of travel is borne largely by the salesman himself because he works on a commission basis, but that business houses were also influenced because they could not ask their salesmen to make trips on a losing basis. He read letters from a number of firms, in reply to a questionnaire he had sent out, in which the majority stated that they had reduced the number of their salesmen in 1921 and that they would increase both the number and the mileage traveled if the passenger rates were lower.

Commissioner Lewis asked the witness if he had made any calculations to show whether 2.4 cents a mile would be a remunerative rate for the railroads, saying that in freight rate cases the shippers generally attempted to justify the rates proposed. Mr. Loeb said he had not done so, but that in proposing the 33⅓ per cent reduction he had in mind the rates formerly made by the railroads and those still made for special fares. Commissioner Lewis said it is necessary that the commission have some basis for making the calculation so that the rate will not be placed below actual production cost.

Business Houses Want Reduction in Travel Expense

J. C. Lincoln, traffic manager of the Merchants' Association of New York, said that the association has been cooperating with the commercial travelers' organizations because the merchants and jobbers feel that the high cost of transportation has reduced the number and the travel of their salesmen and that a lower rate would result in a more extensive use of commercial travelers, which would mean renewed business activity. He thought that a scrip form of ticket would be preferable to a mileage book, but suggested that they be issued in denominations equivalent to 2,000, 3,000 and 5,000 miles. He suggested that a 2,000 mile book could be confined to intra-territorial travel and that 3,000 or 5,000 books be used for inter-territorial travel. He said he had been asked by the Chicago Association of Commerce to express its sentiment in favor of an interchangeable mileage book, on the ground that the present cost of keeping salesmen on the road is almost prohibitive and only necessary travel is being done.

Mr. Lincoln also presented a letter from the National Wholesale Grocers' Association, which favored the adoption of interchangeable mileage books for salesmen, asserting that any saving in the cost of doing business would naturally be reflected in the cost to the consumer and an increase in the volume of business. It would be satisfied, however, with either an interchangeable mileage book or a scrip coupon ticket at a flat reduction of about 33⅓ per cent and had suggested a denomination representing 3,000 miles or from $100 to $150. It was also suggested that the tickets be made transferable among the employees of the company that purchased the books, but Mr. Lincoln said that personally he thought the books should be non-transferable. Former Senator Hoke Smith filed a letter setting forth the views of the American Wholesale Grocers' Association, which he said were along the same lines as the testimony that had been presented.

Railroads Propose Regulations.

C. A. Fox, chairman of the Central Passenger Association, was recalled to the stand to give some estimates as to the loss in revenues that would result from the use of various forms of tickets and to offer some suggestions as to the form of regulations that should be issued if the commission orders a reduced rate. In reply to the assertions of representatives of commercial travelers that the railroads had formerly made a reduction of 33⅓ per cent mileage books, Mr. Fox said that before federal control the reductions in normal fares and increases in the mileage ticket rates had reduced the discount to approximately 10 per cent in New England territory, 10 per cent in Central and Trunk Line territory, 20 per cent in Southeastern territory and 16⅔ per cent in the majority of the Western territory and that there was no reduction below the intrastate basis where the State fares were two cents a mile.

Counsel for the traveling men's organizations and the representative of the American Hotel Association protested against the proposal to restrict the proposed coupon book to six months and $200, outlined by Mr. Fox, on the ground that this would defeat the purpose of the book. Mr. Fox said

that these figures were based on the testimony of representatives of the commercial travelers that traveling men spend nine months of the year on the road, averaging 50 miles per day, or 13,500 miles per year. A $200 book would be equivalent to 5,555 miles and would, therefore, more than fulfill the average time requirements. Mr. Bikle also pointed out that any less amount of travel than this could hardly be called intensive travel sufficient to justify a reduced rate. Mr. Fox said the carriers desire to make it entirely clear that in complying with the request of the commission for a statement of the rules and regulations which they would deem reasonable if the commission should decide to require the issuance of a reduced rate scrip, the submission of these suggestions is not to be construed as in any way an indication on their part that such reduced rate scrip was justified. Mr. Fox also proposed that a photograph signature form of ticket shall be used.

Mr. Fox said that the coupons should be good only when exchanged for one-way tickets, issued at face value, representing full normal one-way fares, and not be good for any other services or charges. Where passenger boards train at a non-agency station, or at a station not open for the sale of tickets, it should be honored by conductor on trains within the run of the initial conductor only. Exchange train tickets issued by agents in exchange for scrip coupons should be accepted by conductors only when presented in connection with the scrip ticket.

The requirement that coupons be exchanged at ticket offices for train exchange tickets is considered an item of paramount importance to the carriers, he said, as the only means by which they may be assured in an accounting way of securing the revenues to which they are entitled in the use of any form of an interchangeable scrip ticket. It would be primarily a dangerous procedure to interfere with a conductor's safe operation of his train by compelling him to assume the complicated detail and burden of handling a large number of passengers holding mileage tickets, the percentage of which, while fluctuating constantly, might reasonably range from 20 per cent to 50 per cent or even more of his total passengers. A system of honoring tickets directly on trains would be equivalent to establishing a traveling ticket office. It ordinarily requires about two years to educate a ticket seller to render that character and degree of service that the railroads endeavor to afford at their ticket counters, so it will be seen what a task will be put on a conductor who is not skilled in the sale of interline tickets. Even if the acceptance on trains were confined to the line of a single system or to through car runs there would be many serious complications, difficult and expensive to overcome. Moreover, hundreds of thousands of short trips are made where the detachments would be represented by minute slips of paper. Conductors have not the facilities for carrying and safeguarding these detachments which have a direct money value to the honoring railroads. Ticket offices are equipped with safes and the employees are bonded, which is another reason why the business should be conducted at the ticket offices instead of on trains, if any form of reduced rate scrip is to be introduced.

The question of the regulations to be adopted in connection with a scrip ticket is a complicated matter of serious difficulty, Mr. Fox said. This difficulty is enhanced by the fact that the carriers do not know whether the commission will require any reduction in the present basis of fares, and if a reduction should happen, they do not know what the measure of the reduction would be.

For this reason they have felt seriously handicapped in making the suggestions and, accordingly, express the belief that they could deal with the matter more adequately and satisfactorily at a later stage of the proceeding after they have been apprised of the commission's conclusion as to the primary question, whether there is to be any reduction in the scrip ticket fare.

In the formulation of the precise regulations it will be necessary to go into greater details and to give more careful consideration to phraseology than has been possible in the time available at the present hearing; and while the carriers think that their suggestions cover the matters of greatest moment they are fearful that they have overlooked other matters which are of importance to them as well as to the traveling public.

Estimated Reduction in Revenues

As to the request made by the commission that the carriers submit approximations of the percentage of travel that would be handled on mileage and scrip books, and as to the amount of the reduction from the sales of such books in the several denominations of 5,000, 3,000, 2,500 and 1,000 miles as to mileage books, and $180, $108, $90 and $36 as to scrip books, Mr. Fox said that, except as to facts which had already been presented and as previously alluded to in the hearing, the carriers have at command no data of a statistical character as a result of experiences of the past in the sales of books over individual carriers and those of a joint character good in a restricted region that would afford foundation for definite, accurate conclusions as to what would happen if the commission should, contrary to the earnest representations of the carriers, urge the sale of a reduced rate scrip ticket. They have avoided mentioning specifically the extent of the possible losses because of this lack of dependable data. In deference, however, to the request of the commission a tabulation had been made in the form requested by the commission, and for the purpose of making the statement plainer, in addition to showing the percentage of travel that would likely avail of the use of a mileage book, there is also shown the total revenue that would be realized from such books. To simplify the computations, the carriers have assumed roughly that in round figures the total average revenue derivable from ordinary one-way tickets sold at full normal fares to be about one billion dollars annually; this omits revenues from commutation, surcharge, and all forms of reduced rate tickets.

While detailed statistics are not available, it is known that prior to federal control, when mileage was actively on sale in the several regions of the country, about 18 per cent of the total revenue was obtained from holders of mileage tickets of limited scope; about 20 per cent in Trunk Line territory, 20 per cent in Southeastern territory, 15 per cent in Southwestern territory. In Central Passenger and Western Passenger Association territories, where the 2-cent fare laws existed intrastate during the past 15 years, sales were practically negligible because of the fact such books as were on sale were only available for interstate transportation, the reduction in Central Passenger Association territory at the time being only 10 per cent; therefore the recent experiences in those regions would be of no value as contributing light on this question.

Prior to the 2-cent fare laws, however, mileage tickets were sold very extensively throughout Central Passenger and Western Passenger Association territories, and their utilization was constantly increasing from year to year. "In the extreme Western part of the United States percentages as a territorial proposition are not available, but it is known that in certain instances in those regions the use of mileage was not so extensive as in the other sections referred to.

"While the carriers have never had effective a nation-wide interchangeable mileage or scrip book of any character, except the present scrip book sold at full normal fare," Mr. Fox said, "it is the universal view of the carriers that the sale of such a book would be far in excess of any experiences of the past, and therefore the percentages which are submitted in the statement take cognizance of this fact and are increased with due consideration therefor. The approximations are the very best judgment of and represent the consensus of views of the carriers. In making these submissions, however, it was

desired to reiterate that they are purely speculative. The commercial travelers themselves, by reason of their experience and knowledge of the extent of travel of the traveling men, have made some speculations which the commission will no doubt deem worthy of careful consideration in this relation, and without the thought of making comment one way or the other concerning their accuracy, it is desired to point out that it was testified in one of the hearings by one of their representatives that the traveling men spend nine months of the year on the road, averaging 50 miles per day, or 13,500 miles per year. It was also stated that the number of commercial travelers identified with the affiliated organizations represented number 676,000. The total distance they would travel, based on these figures, would amount to 9,126,000,000 passenger miles, which, computed at the normal tariff of 3.6 cents per mile, would in round figures amount to about $325,000,000. As this does not take cognizance of the considerable additional travel that would move on mileage tickets, it is obvious that the traveling men themselves consider that the railroads would receive a very large percentage of their total revenue from passengers holding such a form of transportation. It is also manifest that any per cent whatever that might be applied to these figures would result in a material reduction in revenues."

The tabulation estimating the amount of reduction, on the basis of a book identified by photograph and autograph, use limited to purchaser, time limit, one year, was as follows:

Reduction	Mileage Book	Scrip Book	Estimated per cent of all travel using Mileage Book %	Scrip Book	Total Amount of Reduction (Estimated) Mileage Book $	Scrip Book $
30%	5,000 M	$180	24% $240,000,000	do	$72,000,000	do
25%	"	"	21% $210,000,000	do	$52,500,000	do
20%	"	"	18% $180,000,000	do	$36,000,000	do
15%	"	"	15% $150,000,000	do	$22,500,000	do
25%	3,000 M	$108	30% $300,000,000	do	$75,000,000	do
20%	"	"	25% $250,000,000	do	$50,000,000	do
15%	"	"	20% $200,000,000	do	$30,000,000	do
25%	2,500 M	$90	35% $350,000,000	do	$87,500,000	do
20%	"	"	30% $300,000,000	do	$60,000,000	do
20%	1,400 M.	$36	40% $400,000,000	do	$80,000,000	do

When asked whether it was the purpose of the carriers to retard or accelerate the sale of such tickets, Mr. Fox said that the carriers only desire reasonable protection, and if such a ticket were adopted it was his thought that there should be conferences among the representatives of the railroads and of the travelers for the purpose of working out regulations that would be satisfactory and make the use of the book as convenient as possible. Asked why the railroads desire to throw further restrictions around the use of the books than they did in the past, Mr. Fox said that possibly the carriers consider that they made some mistakes in the past which should not be expected to govern them for the future.

Briefs are to be submitted by November 1 and it is expected that oral arguments will be held before the full commission some time in November.

DAN HEALY, one of the best known dining car conductors in the United States, died at his home in Chicago on September 25. Mr. Healy has been steward in charge of the dining car on the Pioneer Limited of the Chicago, Milwaukee & St. Paul, between Chicago and Milwaukee, Wis., for about 20 years and has been in the service of that company since 1898.

Progress In Valuation Work

WASHINGTON, D. C.

THE RAILROAD valuation work, on which the Interstate Commerce Commission has been engaged during the past eight years, is now rapidly coming to a head and it is expected that considerable time of the commission during the next 12 months will be devoted to various phases of the work. Tentative valuation reports have been issued by the Bureau of Valuation in greatly increased numbers since the centralization of the forces of the commission at Washington and its reorganization, which was effected about January 1 of this year.

Up to August 31 there had been served 504 accounting section reports, covering 134,272 miles, or 54.14 per cent of the inventoried main line mileage; 584 land section reports, covering 132,067 miles, or 53.25 per cent of the total; and 593 engineering section reports covering 168,750 miles, or 68.03 per cent of the total. In February the three sections began synchronized work on definite six-month programs. Each section is now bringing forward its work on selected carriers. From now on the work will primarily be focused on the roads having annual revenues of $25,000,000 or over, work on the less important roads being carried on at the same time. The present six-month program calls for the completion of underlying reports by the three sections on practically 190,000 miles by the end of 1922. It is the expectation that by the end of the fiscal year (June 30, 1923) underlying reports will have been issued on all except six of the so-called $25,000,000 roads, and that these six will be included in the program for the succeeding fiscal year 1923-24. It is the hope of those directly in charge of the work to carry it to a stage of completion which will be marked by the service of all underlying reports before the expiration of the next succeeding fiscal year.

The commission has now issued 258 tentative valuation reports. They cover a total of only 37,008 miles, or 14.92 per cent of the total mileage. Thus far, tentative valuation reports, as a rule, have been on the smaller carriers, though the tentative reports are out for the Chicago, Rock Island & Pacific, the Kansas City Southern, and several other large carriers. The next few months will see the issuance of tentative valuation reports covering some of the larger companies. According to the plans, the tentative valuations will be rapidly advanced so that the mileage covered by them will be brought up more nearly to that of the underlying reports. To facilitate the production of tentative valuation reports, a new standardized form of report was put into effect on September 15.

The valuation law gives to the carrier or other interested party 30 days after the service of the tentative report in which to file protest, and provides that in case of no protest the tentative valuation becomes final. Ordinarily none but the smaller and less important carriers have failed to file protest. In 99 cases, however, neither the carrier nor any one in interest has protested.

The commission has actively begun hearings on these protests. Fourteen hearings were set for the spring and summer and the fall dockets will carry an impressive list of such hearings. The underlying work is thus being moved to that stage where it can reasonably be expected that final valuation reports will begin to appear. Among the important cases which now stand submitted on final argument are the Kansas City Southern, the San Pedro, Los Angeles & Salt Lake, the Atlanta, Birmingham & Atlantic and the Winston-Salem.

Great interest will attach to the final reports of the Kansas City Southern and Atlanta, Birmingham & Atlantic because of the nature of the arguments made by S. W. Moore in the Kansas City Southern case, laying insistence on the element of earning power as a most important, if not determining, factor in railroad valuation. On the other hand the Atlanta, Birmingham & Atlantic has been notorious as a deficit road.

It is expected that the commission will devote a considerable part of its time this fall or early winter to these and other final valuation considerations. The final determinations in the first few cases will, of course, be accepted by the public as indicating the policy of the commission and as precedents. On the other hand, they will be accepted by the staff of the commission as indicating its policy.

There has been a growing disposition in the last two or three years, and especially in recent months, both around the Capitol and at the commission offices to push the valuation to a definite stage of completion, though necessarily the valuation of the railroads can never be called completed. This is recognized by the law, which charges the commission with the duty of keeping the valuation, once determined, up to date. Even after the final values have been placed on every railroad there will remain the considerable work of keeping valuations current for utilization in the diverse regulatory activities of the commission. The commission in reaching its decision both in Ex Parte 74 and Reduced Rates, 1922, under the Transportation Act of 1920, brought impressively before the country the needs of valuation. The larger the percentage of railroad property covered by reports the greater is the assurance imparted to the commission in the adoption of values for general rate cases. It is the expectation that by the time another rate investigation occurs the commission will have available for guidance not only the underlying reports covering most of the mileage of the country but also a considerable number of final reports. The commission also realizes the value of reports carrying what is termed "a large diversity factor." It will obtain this by having a large number of reports covering large as well as small roads located in all parts of the country and constructed and operated under all conditions.

Certain divisions of the commission, particularly Division 4, which deals with financial matters, abandonments, etc., are constantly finding an increasing need of valuation reports. For these reasons as well as others, the commission is now insistent on pushing along the valuation work at the greatest speed consistent with thoroughness.

The valuation work falls under the jurisdiction of Division 1, composed of Chairman McChord and Commissioners Meyer, Aitchison and Lewis. It is thought that after the full commission has disposed of a few representative leading cases in which the controlling principles will be enunciated, this division will decide practically all valuation cases.

The Bureau of Valuation has, since January 1 of this year, been under the administrative control of Commissioner E. I. Lewis. Charles F. Staples is acting director, having succeeded the late Director Prouty. T. P. Artaud is executive assistant, and is also supervisor of land appraisals; H. M. Jones, supervising engineer; J. M. Willey, supervisor of accounts; and C. W. Needham, solicitor. The force of the bureau numbers 548. The concentration of the employees in Washington is regarded by the commission as having been attended with very gratifying results.

Mr. Artaud recently gave to the House Committee on Appropriations, when the bureau's appropriation for 1922-23 was under consideration, an estimate that all underlying reports and tentative valuations would be completed by June 30, 1924. Obviously, it would be hazardous to attempt an estimate of the length of time which will be consumed by the hearings and rehearings on the protests which the commission must hold before arriving at its conclusion as to final values. It is a very difficult matter to foretell the length of time any litigation will consume. No one expects the carriers to leave any stone unturned to secure a recognition of all the elements of value claimed by them to inhere in their properties.

Up to the end of June, 1922, the working cost to the government of the valuation work was $23,266,000. According to the Presidents' Conference Committee, the organization looking after the carriers' side of the valuation work, the railroads had expended up to June 30, 1921, $54,120,957 in protecting their interest. It is understood that the estimate to date is in excess of $60,000,000.

The field work was practically completed in the fall of 1921. The district offices in Chattanooga, Chicago, Kansas City and San Francisco were moved to Washington in the plan of centralization for the second step in the work, which consists of collating the data obtained by the field parties which first reaches the carriers and the public in the underlying reports of the land, engineering and accounting sections, after which follow the tentative valuation reports.

Pennsylvania to Make Extensive Additions to Altoona Works

THE PENNSYLVANIA SYSTEM has announced the program for extensive improvements to be made at Altoona, Pa., including the construction of two extremely large repair shops and the electrification of the heavy grades west of Altoona. The first of the improvements will be made at Juniata shops and includes the building of a new erecting and machine shop, 340 ft. by 670 ft., including a midway crane runway with a 105 ft. span and 715 ft. long. This large shop will be devoted to repairing and building locomotives, and will accommodate 49 locomotives at one time. The framework will be of steel and the walls of brick. The locomotives erecting bays will have two 250-ton capacity electric traveling cranes for lifting locomotives, and six 15-ton capacity cranes for lighter work. The machine bays will have two 25-ton capacity cranes, together with jib cranes of from 1 to 8 tons capacity.

There will also be erected a reinforced concrete storehouse, three stories high, with basement, which building is to be 60 ft. by 400 ft. A crane runway for handling material will also be erected with a 95-ft. span and about 600 ft. long.

The building of the shop and storehouse will necessitate changes in the existing buildings as follows: the scale shop will be moved to a new location and will be changed to a flue shop, the machinery now in the scale shop being transferred to the present paint shop. The present storehouse building will be moved to a new location and will be used as a cab shop. The present erecting shop will be changed to a paint shop, while machinery will be installed in the present paint shop and the name changed to Machine Shop No. 2.

At the Altoona car shops will be located facilities for preparing repaired locomotives for service. The present circular building, known as the freight car shop, will be remodelled and 15 stalls will be used as a finishing shop. East of this shop will be located the necessary ash pits and coal handling facilities.

Further additions to the shops at Altoona will be made following the electrification of the heavy grade west of the city. After the electrification is completed, the roundhouse at Sixteenth street, Altoona, will be abandoned. On the site of the roundhouse a duplicate of the erecting and machine shop at Juniata will be built and the present erecting shop at the Altoona machine shop will be fitted up for the use of other departments.

FREIGHT CLAIM PAYMENTS of the Illinois Central were reduced by more than $1,000,000 during the first seven months of 1922, as compared with the first seven months of 1921, and there was also a decrease of 23,524 in the total number of claims presented for this same period. In the first seven months of this year the Illinois Central paid out in freight claims an average of $2.27 per minute, as compared with $5.64 per minute in the corresponding period of last year.

Railroad Employment Bureau Functions in Strike

The Advantages of Such a Bureau Were Strikingly Demonstrated in the Emergency

By An Employment Officer

BECAUSE ITS VALUE is not well understood, comparatively few railroads maintain employment bureaus charged with the responsibility of recruiting personnel. The practice of most roads is for the various departments and divisions to receive applications for employment and to hire men as needed, there being little co-ordination of effort between the departments.

A western railroad, as a part of its experiment in personnel activities, about four years ago established an employment bureau which, together with its complementary activities, was placed in charge of a general officer. At the request of the chief engineer this bureau has employed all maintenance of way forces and in addition has been active in securing clerical, mechanical and train service employees.

As the entire matter was being treated experimentally, no effort was made to force the services of the bureau upon the heads of departments or division superintendents, but they were from time to time kept advised that the services of the bureau were at their disposal at any time they cared to avail themselves of them. The way this worked out was that whenever an employing officer needed men and did not have desirable applicants, he called upon the employment bureau for assistance. This has resulted in the bureaus gaining experience in the employment of men of all occupations.

Pre-Strike Forcast

Realizing that a strike of shopmen was imminent, the officer in charge of the employment bureau planned his campaign for recruiting a new corps of mechanical workers upon its occurrence. The preparatory work consisted of a survey of the local field and adjacent territory to determine the possibility of recruiting a new force quickly and of maintaining this force after it had been recruited. A similar survey was made of outlying territory and the employment bureau force of four people was so organized as to function efficiently during the strike period.

During the latter days of June the employment bureau had kept the road's management advised of the possibility of recruiting mechanical workers, but on June 30 it was decided not to depend upon the employment bureau in the emergency of the strike, but to use an outside organization for that purpose. Therefore, when the strike came on July 1 this organization of professional strike-breakers was placed in charge of recruiting, but on the morning of July 5, the failure of this method having become apparent, the entire responsibility for recruiting was placed upon the road's own employment bureau.

Recruiting During First Days of Strike

Upon assuming this responsibility, the employment bureau took over from the strike-breaking organization such men as it was thought could function efficiently in its pre-determined plan and these men were used as special agents to locate men in the city in which the road's headquarters is located. Men were also sent to towns served by the railroad to, if possible, recruit men there.

Although it was found impracticable to employ men in the towns along the road, 18 men were employed in the headquarters city July 5; 29, July 6; 22, July 7; 21, July 8; and 38, July 9. This was an unexpectedly good showing but an increase in the daily average was necessary to build up an efficient working force.

While men were being recruited in the headquarters city a survey was being made in large off-line cities within a radius of 500 miles from the headquarters city to determine whether conditions warranted sending agents to prospect these places. The survey was made through the aid of blind advertisements carried in newspapers in these cities. These advertisements read, "Experienced Railroad Shop Mechanics Required for Small Railroad in the Northwest. Apply to Box —— Times Office." Arrangements were made with the newspapers to forward replies as received and if and when it was found there were sufficient applicants to justify it, a special agent was sent to the city to interview these applicants. At the same time instructions were wired to the newspapers to insert display advertising reading thus, "Special Agent of North and South Railroad will be in Salt Lake Thursday to Interview Applicants for Employment. Apply Smith Hotel."

Where an applicant's reply seemed to warrant it, a telegram was sent advising him to call upon the special agent and in all cases letters were written to what appeared to be desirable applicants to call upon the special agent upon his arrival. In prospecting one city early in the strike, the special agent employed an automobile and called upon all persons from whom applications had been received. The results in two cities warranted maintaining headquarters and special agents, one for a period of several weeks and the other throughout the strike. Special agents were sent to other cities for short periods of time.

Unusual Methods of Recruiting

During the period of these out-of-town activities the employment bureau staff at headquarters was engaged in prospecting various possibilities for the securing of mechanics. The officer in charge was fortunate in securing the co-operation of the personnel officers of street railway companies, other public utilities and large corporations who permitted members of his staff to go through their application files and to copy therefrom data as to what appeared to be desirable employees. Wherever a telephone number was given, the applicant was phoned to and asked if he cared to consider employment under strike conditions. Where no telephone number was given individual letters were addressed to the applicants. During this same period the names of all mechanics appearing in the city directory were abstracted and a circular letter individually addressed was mailed to each of them. This letter read:

> "You have been recommended to us as a skilled (appropriate craft filled in). We are in need of skilled mechanics for our shops at various points.
>
> "Our road is being operated under rates of pay fixed by the United States Railroad Labor Board under the protection of an injunction of the United States Court and all workers are fully protected from any danger or interference. While strike conditions exist, board and lodging are furnished free of charge. All positions are permanent.
>
> "We should be glad to have you call at our office, 2 North street, in the morning to talk it over."

This was on the company's official letterhead, bore the facsimile signature of the general officer in charge and the

postscript, "All applications treated confidentially." While a great many of these letters were mailed, not very many were responded to, but as the expense involved was small, the effort was worth while.

Several shipyards and industrial plants were about to reduce forces because of the general business depression and especially selected mechanics were placed in these plants by the employment bureau to inform mechanics of the possibility and desirability of securing employment with this particular railroad. Prospective applicants were supplied with the address of the employment bureau by these representatives and quite a few mechanics were secured by this means.

Many other "kinks" were used by the employment bureau, the staff of which held itself receptive to any suggestion as to possible means of obtaining men. On July 31 the working force was nearly 60 per cent of the normal force and on August 31 over 80 per cent.

Selection of Employees

During the early part of the strike no effort was made to separate desirable from undesirable employees, the whole effort being to build numerical strength rather than an efficient working force. This was done for strategic reasons and in the hope which afterwards proved true that in striving for quantity rather than quality at least some good mechanics would be secured. As numerical strength was gained greater emphasis was placed upon the selection of desirable employees and the mechanical department was called upon for a series of questions and answers applicable to each craft which were used in determining whether men applying for work were actually the kind of men they represented themselves to be.

The use of the examination system produced excellent results and permitted of the weeding out of the men who had misrepresented themselves during the early part of the strike and their replacement with experienced mechanics. It probably would have been better if mechanics or mechanical department officials could have been assigned to the employment bureau from the very commencement of the strike, but the services of every man in the mechanical department were required to maintain the road's motive power and rolling stock and this was therefore impossible. As a matter of fact, probably the greatest value of using the organized employment service for recruiting purposes was that it relieved the mechanical department of all responsibility for securing men. The men were recruited by the employment bureau and turned over to the mechanical department at its principal shops so that the motive power department officers could give their entire time to shop and road affairs.

The strike-breaking organization that had been originally engaged to recruit working forces was also to take charge of the employment of guards and the supervision of property protection. It was able to supply but a few guards from its own organization and the some hundreds of guards that it was necessary to employ were also engaged through the railroad company's employment bureau. The delegating of this duty to the employment bureau had the same effect upon the guard service as the employment of mechanics had upon the mechanical service. The chief special agent and his lieutenants were relieved of the necessity of recruiting men and were able to give their entire time to the supervision of protection to company property and employees.

Maintenance of Records

In connection with the employment of maintenance of way men, the employment bureau some years ago adopted to its own use the card system described by William S. Wollner in an article entitled, "Maintenance Labor Turn-over Statistics" in the June, 1921, issue of the Railway Maintenance Engineer, and as the bureau's activities widened into the employment of other classes of men, this same system was used. The purpose of this card system is, as is fully described in the article mentioned, to furnish an office record of all men employed, a notification to the foreman that the man has been employed, acknowledgment to the employment bureau that the man has arrived on the job and a record when he leaves the service.

Upon taking over the recruiting work at the commencement of the strike, the employment bureau merely continued the use of this system, applying it to the new condition. This gave an office record of the men employed and a notification to the foreman of his employment. It was realized that the mechanical department force was far too busily engaged otherwise to return the card notifying the bureau of the employee's arrival, or the card notifying it of his leaving the service. However, as all men were delivered to the shops under escort this was of no importance. This system of employment records has proven itself extremely easy of execution while working under pressure of time, the four cards being filled out at one impression on the typewriter, the office record portion being available for reference in the employment bureau and the notification portion proving of great value in the mechanical department in making up pay rolls, handling mail for employees, and work of a kindred nature.

In addition to the card system just mentioned, the only other record maintained was a form hastily prepared at the commencement of the strike and which each new employee signed, stating that he knew that he was employed under strike conditions. This was done to comply with the state law. Regular passengers' tickets were used for the moving of strike-breakers in order to lessen the possibility of their identification and friction with trainmen and other employees who were not involved in the strike.

Value of Employment Bureau Demonstrated

As stated earlier in this article, this employment bureau was maintained upon an experimental basis insofar as others than the maintenance of way department was concerned. While the justification of the expense of conducting the bureau and the associated personnel activities has never been questioned by the road's management, it is possible that this value would have been questioned by other railroad officials who were not familiar with the objective and the results obtained. In view of the part taken by this organization in breaking the strike, there can now be no question but that the money spent in its maintenance was not only fully justified but that it has proved an excellent investment.

New Development in Traveling Cranes for Shops

One of the most formidable problems imposed in the design of a locomotive shop concerns the means provided for moving the locomotives in and out of the building, or for shifting them from one position to another. This not only involves the character of the crane provided but also the arrangement of the track and the shape and size of the building. These considerations lend interest to a recent development in shop cranes embodying an added feature, namely: a facility for turning the locomotive through a horizontal angle of any desired amount. A crane of this type was recently installed in the River Rouge repair shop of the Detroit, Toledo & Ironton, and is illustrated in the photographs. A shop designed to take full advantage of a crane of this type is said to embody many of the advantages of shops of both the longitudinal and transverse type without introducing some of the disadvantages peculiar to each.

The transverse shop, having the locomotives arranged

crosswise to the longitudinal axis of the building, offers more economical use of the floor space, is convenient to work benches along the building walls and facilitates the floor traffic for handling material. The locomotives are placed on the transverse tracks either by means of an outside transfer table, which requires almost as much ground space as the shop

Fig. 1. The Locomotive in the Position That It Was Received on Longitudinal Track

itself, or with the assistance of overhead traveling cranes of the double trolley type, which in turn necessitate a building high enough so that one locomotive can be carried above the others.

In the longitudinal shop the construction tracks run parallel with the axis of the building and the locomotives are placed on these tracks one behind the other. They are handled by two single trolley cranes and to economize space the buildings should preferably be wide enough to keep one or more tracks clear for carrying the engines to and from their different locations. The selection of either type of shop, is, of course, dependent upon many local conditions as well.

If, instead of providing either the strictly longitudinal or transverse type of shop, one could be designed with a grid of transverse tracks supplemented by one longitudinal track, upon which the locomotives would be brought into the building, and with facilities for turning each engine 90 deg as it is brought in so as to place it on any one of the transverse tracks, it would be possible to realize the working advantages of the transverse shop without being confronted with the expenses and awkward means required to bring in or take out the locomotive. This is accomplished with the aid of the new crane by incorporating a turntable in the crane trolley so that the crane has four different movements, namely: hoisting, cross travel, longitudinal travel and horizontal rotation. Thus it is practical to lift the locomotive off the longitudinal track, carry it down the shop and swing it into transverse position wherever there is a vacant repair pit. At no times is it necessary to lift one locomotive above another, in fact it is sufficient simply to raise it high enough to clear the track.

By reference to illustrations it will be noted that the crane trolley consists essentially of two parts; one upper revolving frame and one lower or trolley frame proper. The upper frame carries the hoisting machinery only. Two sets of ropes, spread well apart, carry a lifting beam which is provided with adjustable slings to accommodate different sizes and shapes of locomotives or boilers. On the underside of this frame is attached a combination ring gear track or "roller path," which in turn rests on conical rollers set in the lower frame. This lower frame also is provided with horizontal guide wheels to keep the roller path central. Motor-driven turning machinery is mounted on the lower frame, having a large pinion meshing into the rack of the roller path. The lower trolley frame also is equipped with customary motor-driven machinery for cross travel. The crane bridge is practically standard.

The speed of rotation of the turntable is one and one-half revolutions per minute. The crane in the D. T. & I. shop has a span of 56 ft. and the two falls or hoisting tackles each have a capacity of 50 tons. No auxiliary hoist is provided in this crane but it could be readily added to a crane of this type if desired. The distance between the two hoist connections to the lifting beam is seven feet, provision being made to insure that the center of gravity of the locomotive lies between these limits by facilities for eight different positions of the front end sling and two alternate positions of the yoke on the lifting beam. This lifting beam can easily be detached and replaced by a short beam with a simple hook for use in ordinary crane service. This new crane is built by the Shaw Crane Works of Manning, Maxwell & Moore, New York.

Lehigh Valley Reaches Agreement with Employees' Association

THE LEHIGH VALLEY has made public the text of its agreement with the newly formed Association of Maintenance of Equipment Employees of the Lehigh Valley Railroad. In general, this agreement provides for three separate classifications viz., craftsmen, promoted helpers and helpers. The rates of craftsmen vary from 72 cents to 80 cents per hour; of promoted helpers from 53 cents to 63 cents an hour; helpers receive 47 cents the first year and 49 cents thereafter. Passenger carmen, gang leaders on freight car repairs, etc., receive regular craftsmen's wages, but freight carmen and inspectors are rated from 63 cents to 65 cents per hour. Promoted helpers in the car department are rated at from 53 cents to 60 cents and car cleaners at 37 cents an hour. Regular apprentices begin at 27 cents an hour and helper apprentices at 47 cents.

The eight hour day is recognized as standard for all employees whose work requires continuous application. Normal working hours for all employees, however, are bulletined and overtime rates apply only for work done in excess of normal bulletined hours. Overtime rates are paid for Sunday and holiday work except for employees who are regularly assigned for work on these days. Employees called to work in emergency before or after bulletined hours are allowed a minimum of three hours pay for two hours work or less. Employees called upon to do road work are paid straight time for traveling and waiting and for the first eight hours of work and time worked in excess of eight hours is paid for at overtime rates.

It is provided that seniority will govern only when ability, loyalty and fitness are equal, the employer to be the judge. Employees transferred from one point to another, except when reductions in forces are made, will carry their seniority with them.

Grievances, if they cannot be satisfactorily settled by the employees and officers concerned, are entrusted to the employees' association for adjustment. The starting point of this adjustment is the local committee. There is one local committee representing each craft on every operating division of the road and at the general shops at Packerton and Sayre. The members of these committees are elected on the basis of one representative for each 100 employees or a major portion thereof. If on any division or in either of the shops there should be less than 100 employees in any craft, the committee representing these employees will consist of two members elected from their number. The committeemen must be in the employ of the company and adult American citizens. Nominations are by petition which must be signed by 25 voters in each craft or by 25 per cent of the voters in that craft. Above the local committees is the general committee, which is comprised of a general chairman together with a general craft chairman from each respective craft. The general chairman is elected by the local committee chairman of all crafts. The general craft chairman of each craft is elected by the local committee chairman of that craft.

For purposes of meeting with the management the general committee, acting with an equal number of representatives appointed by the management, constitutes what is known as the joint board. The officers of this board are chairman and vice-chairman. The office of chairman is to be filled alternately by a representative of the employees and a representative of the management. The employees and the management have equal voting power on the joint board and a two-thirds vote is necessary for a decision. The joint board has a secretary whose pay is assumed by the management.

When a dispute has been referred to the local committee which it cannot settle satisfactorily with the master mechanic or shop superintendent, a joint submission is made by the local committee to the general committee and by the master mechanic or shop superintendent to the superintendent of motive power, covering the following points:

(1) Question at issue.
(2) Statement of agreed upon facts.
(3) Position of local committee.
(4) Position of master mechanic or shop superintendent.

In the event that the general committee and superintendent of motive power are not able to reach an agreement, the point at issue is placed before the joint board.

The agreement contains no provisions against piece work or bonus payments, which leaves the company free to establish this system of payment wherever it sees fit.

New Electric Locomotives for the Norfolk & Western

AS NOTED in the September 9, 1922, issue of the *Railway Age*, the Norfolk & Western has placed an order for four electric locomotives for use on its mountain division known as the Elkhorn grade. The new locomotives will be of the same general type as those which have been in use since the commencement of electric operation, namely the "split-phase," which operate from a high tension single-phase a.c. trolley and are provided with a static transformer and rotary phase-converter for supplying low voltage three-phase power to the induction type traction motors. Each locomotive will consist of two units coupled together by a short rigid bar or link. The wheel arrangement is 2-8-2 + 2-8-2. The pony trucks on each unit will be equalized with the drivers, the whole arrangement of wheels and spring suspension being similar to a Mikado type steam locomotive. There will be four motors geared to jackshafts, connected in turn to driving wheels by side rods, two single-motors being provided per unit (one per jackshaft). This arrangement is different from the present locomotives which are 2-4-4-2 + 2-4-4-2 and have two twin motors for each cab.

Preliminary Drawing of Double-Unit Locomotive, Showing Wheel Arrangement and Location of Traction Motors

The motors and jackshafts will be located between the pony truck wheels and the driving wheels, the main motor

rods being connected to the second pair of drivers, the first and second pair of drivers being coupled.

The cab of each unit will be rigidly secured to the main engine frames, and the main apparatus, such as motors, phase-converter, transformer, etc., will be supported directly on the engine frames and cross-tie castings.

The motors are rated at 1,000 hp. each, and have a pinion at each end of the rotor shaft with collectors outside of the pinions. The locomotives will have about 30 per cent greater capacity than the present locomotives.

Principal Characteristics

Weight on drivers	560,000 lbs.
Total weight, approximately	380 tons
Tractive effort, continuous at 14 M. P. H.	90,000 lbs.
Tractive effort, one hour at 14 M. P. H.	108,000 lbs.
Tractive effort, starting	168,000 lbs.
Horse power, continuous at 14 M. P. H.	3 330 h. p.
Horse power, one hour at 14 M. P. H.	4,000 h. p.
Speeds—14 and 28 M. P. H.	

The order for the electrical equipment has been placed with the Westinghouse Electric & Manufacturing Company and for the mechanical parts with the American Locomotive Company.

Illinois Central Adopts Electrification System

THE COMMISSION appointed by C. H. Markham, president of the Illinois Central, in December, 1920, to consider and report upon the electrification of the Chicago terminals of the Illinois Central in accordance with the requirements contained in the Lake Front ordinance of the city of Chicago of July 21, 1919, has recommended the adoption of the 1,500-volt direct current system with an overhead contact system of current collection. The Lake Front ordinance, to which the city of Chicago, the Illinois Central and the South Park Commission were parties, settled the common boundary lines so long under discussion, provided for additional subways and viaducts across the railroad north of Fiftieth street, and bound the railroad company to extensive improvements, including a new station at East Roosevelt Road and the electrification of certain services.

The electrification requirements are as follows: (a) The entire suburban passenger service to be operated electrically on or before 1927; (b) the entire freight service north of East Roosevelt Road on or before 1930; (c) the entire freight service within the city limits on or before 1935; the through passenger service within the city limits may with certain provisions be electrified by 1940.

Since the electrification of steam roads has been undertaken to any great extent, that is, within the last 15 years, there has been a great deal of honest difference of opinion among the engineers and manufacturers both in this country and abroad as to the best system to be used for each particular installation. The Illinois Central problem, involving as it does a heavy suburban passenger service, freight transfers between yards, switching in congested yards and eventually through passenger movements, all within terminal limits only, is quite different from any electrification so far undertaken either in this country or abroad.

The suburban passenger service will cover the main line from Chicago to Matteson, 28 route-miles; the South Chicago branch, 4.5 route-miles, and the Blue Island branch, 4.4 route-miles. The track miles involved are 125. In a short time after electrification is completed it is estimated that 240 cars, electrically equipped, will be required. These cars as equipped will cost in the neighborhood of $35,000 each. The number of trains per day will be about 350, making about 5,000 train-miles daily. The freight service north of East Roosevelt road, next on the program, will cover more than 40 miles of track, and as this is mainly yard trackage, involves difficult problems to properly electrify it.

The commission considered three possible schemes which were early eliminated from discussion. These were the three-phase alternating current system which requires a double overhead contact and which was eliminated on account of complications in construction without any advantages over the single-phase alternating current system; the storage battery locomotive, which had to be eliminated on account of prohibitive operating charges; the Diesel engine locomotive or some other form of self-contained unit to meet the ordinance requirements as to noxious gases and noises. Some form of the latter type of unit may be developed for freight and through passenger movements, but the development is in such a stage that it could not be depended upon for the Illinois Central.

This investigation left four systems for consideration: (1) 750-volt direct current with third rail; (2) 1,500-volt direct current with overhead contact; (3) 3,000-volt direct current with overhead contact; and (4) 11,000-volt alternating current with overhead contact.

First cost estimates and maintenance and operation estimates covering these four systems were made.

Although the 750-volt system did not differ materially in first cost and annual cost from some of the other systems considered, it was eliminated because of the large mileage of freight yard tracks involved where the third rail was considered undesirable, and also on account of the track location where Chicago climate conditions would seriously hamper operation with the third rail.

Of the three systems using an overhead contact, the 1,500-volt system seemed best to the commission for this particular problem, the electrification of the Chicago terminal, no main line divisions being involved.

Before actual electrification construction work can be started a large amount of preliminary track work must be done. At the present time work totaling about $1,000,000 is under contract and in progress. This consists of track depression work between Twenty-fifth and Forty-fourth streets which involves the moving of over 600,000 cu. yd. of earth; elevation work between Forty-fourth and Fifty-first streets; and the construction of sewers at Rhodes avenue and Woodland Park, a dam at Twenty-third street to allow the filling of the property north of the dam, and a new breakwater between Twenty-ninth and Thirty-first streets. This will be followed by the rearrangement of tracks as the suburban tracks will be consolidated on the west part of the right-of-way; the erection of the new through passenger terminal at East Roosevelt Road; a new suburban passenger terminal at Randolph street; changes and additions to present suburban stations and platforms with entrance and exit subways where needed; and the elimination of grade crossings with other railroads.

In the meantime the design of the new electrification work covering a power-house, with a proposed location on the Calumet river near Riverdale, the sub-stations to be located at various points on the terminal, and the extensive overhead construction work for contact and transmission wires will be prosecuted. At the same time the selection of the electrical equipment for the multiple unit cars will be made. These cars will be similar in design to the 20 new all-steel suburban cars purchased in 1921 and now in use in steam service, which cars were built with the plans for the electrification in mind.

The changes in tracks and electrification of tracks will require several new interlocking plants and a complete new signal system, as the present one is not adapted to tracks where electric propulsion is used. Furthermore, extensive improvements must be made in the telephone and telegraph system involving several miles of underground conduit construction, to suit the new physical and operating conditions.

Changing a Road From a Liability to an Asset

Receiver of Louisiana & North West Has Converted Property from Bankruptcy to a Dividend Basis

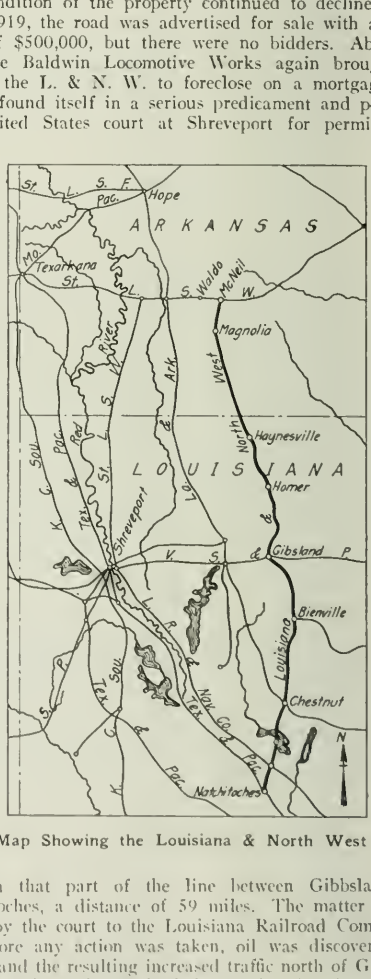
The Louisiana & North West, a railroad extending from McNeil, Ark., to Chestnut, La., a distance of approximately 100 miles, has been converted from a financial failure to a solvent condition within a period of two years. An attempted sale of the property at public auction in 1919 did not bring out a single bid at even the set minimum purchase price of $500,000, while its value is now estimated at $5,000,000. This change has been effected under the direction of E. R. Bernstein, formerly mayor of Shreveport, La., and vice-president of the Commercial National Bank of that city, who was appointed receiver of the road in October, 1920, after it had been out of operation for four days due to its inability to pay its employees.

The troubles of this road had reached a climax in 1919, when suit was brought by the Baldwin Locomotive Works to foreclose on a mortgage. This precipitated litigation in the course of which application was made to junk the entire line. This action was strongly opposed by the railroad commission of Louisiana, which eventually succeeded in its efforts to prevent this step being taken. In May of this year the receivership was terminated and the road was acquired by a syndicate headed by former Governor N. C. Haskell of Oklahoma. Since his acquisition of the road there has been some talk of extending the line from Magnolia, Ark., through Waldo to a connection with the Missouri Pacific at Hope, although no announcement to this effect has been made as yet. Some consideration is also being given to the extension of the line from Haynesville, La., to Eldorado, where Mr. Haskell is interested in timber as well as oil lands, but this is likewise still in abeyance. While it is said that the present liberal policy of additions and betterments to the line will be continued, the L. & N. W. is now in good operating condition and earning a substantial profit. It has not been hindered by the recent general strikes and the relations with its employees are harmonious.

History of the Road

In 1885, Maj. J. D. Beardsley petitioned the state of Louisiana for a charter to construct a railroad from Gibbsland, La., a station on the Vicksburg, Shreveport & Pacific, to Homer, to give rail facilities to the latter town; also to provide an outlet for lumber originating in the territory which this line would traverse. Work was begun in August, 1887, and track laying was completed in the latter part of that year. The road was opened for traffic early in 1888 under the name of the Louisiana North & South railway. The line was projected from Alexandria, La., to a connection with the St. Louis, Iron Mountain & Southern in Arkansas, a total distance of 225 miles, but the year 1890 found the line completed only between Homer and Bienville, 35 miles. At about the same time it was found that the charter of the old company was defective, and the road was reorganized under a new name, the Louisiana & North West, which was leased to J. D. Beardsley, its constructor, for a period of 50 years. In the course of a few years thereafter the road was extended north from Homer, to Magnolia, Ark., through the towns of Haynesville, La., and Emerson, Ark., and arrangements were made with the St. Louis Southwestern to lease its Magnolia branch between Magnolia and McNeil, a distance of 6.4 miles. This part of the line was opened for traffic in 1898. Within a few years another extension was completed which gave the road a through line from McNeil, Ark., to Natchitoches, La., a distance of about 121 miles, this last extension traversing a sparsely settled country and reaching the towns of Chestnut and Grand Ecore.

In August, 1913, upon the application of the Baldwin Locomotive Works and other creditors, the United States District Court at New Orleans, La., placed the road in receivership under G. W. Hunter of St. Louis, Mo., who had been president of the corporation for a few years preceding. The condition of the property continued to decline and in July, 1919, the road was advertised for sale with an upset price of $500,000, but there were no bidders. About this time the Baldwin Locomotive Works again brought suit against the L. & N. W. to foreclose on a mortgage. The carrier found itself in a serious predicament and petitioned the United States court at Shreveport for permission to



Map Showing the Louisiana & North West

abandon that part of the line between Gibbsland and Natchitoches, a distance of 59 miles. The matter was referred by the court to the Louisiana Railroad Commission, but before any action was taken, oil was discovered near Homer and the resulting increased traffic north of Gibbsland warranted the withdrawal of the petition for abandonment.

Mr. Bernstein Appointed Receiver

On October 1, 1920, E. R. Bernstein was appointed receiver to succeed G. W. Hunter, who had resigned. The road had ceased to operate for the four days prior to the new receivership on account of its inability to pay employees and to meet its current obligations. The roadbed and equip-

ment were in a serious condition and wrecks occurred at frequent intervals. The equipment at that time included nine locomotives, several of which had been purchased second hand in 1898, and through lack of proper care, were unfit for service. The freight and passenger cars were in a similar condition. It is said that the service of the carrier was so poor that when oil companies were preparing to drill large oil wells in the vicinity of Homer they shipped their equipment from Shreveport, La., to Minden on the Louisiana & Arkansas, and then transported it by motor truck to Homer. When the highways became impassable between Minden and Homer, fleets of caterpillar tractors were employed, and later when the oil was found, two companies constructed pipe lines, tank forms and loading racks to connect with railroads whose tracks were located 20 to 30 miles distant.

The first official action taken by the new receiver was to borrow $8,000 from the Homer National Bank with which he paid the employees and purchased fuel. On the day following, the employees returned to work and operation was resumed on the entire line. The new receiver also set about to reestablish the road's credit and to obtain the confidence of the public and shippers in the territory which the L. & N. W. served. To carry out his plan of rehabilitation, he directed his activities in two separate fields of endeavor.

First, he saw the necessity of practically reconstructing the property. Therefore, during the few months following his appointment, 100,000 ties, principally of white oak, were inserted and much rail was relaid. The entire right-of-way was cleared and ditched and the bridges and trestles were reconstructed. In addition to improving the roadway, the road's equipment was given attention. Seven new locomotives were purchased, one of the old engines acquired in 1898 was sold for $5,000, and the remaining eight locomotives were thoroughly overhauled. Six additional passenger coaches were bought and other coaches placed in good condition. The carrier's shops at Homer were reconstructed, additions built, and new machinery installed. The freight equipment was repaired in these shops and, in addition, some new equipment was purchased. Water tanks were erected, freight warehouses constructed and passing tracks laid.

The receiver's second method of procedure in the reconditioning of this road was to build a list of satisfied patrons. He appealed to his employees for the necessary co-operation and to date he has not had to contend with a single strike on that line. Prior to his administration there was no regular passenger service with the exception of a shuttle train which ran between Magnolia and McNeil, a distance of 6.4 miles. There were only two mixed trains, one running south from Gibbsland, and the other north, and two local freight trains. In addition to the above, six exclusive passenger trains are now operated as well as two regular freight trains and an average of eight extra freight trains daily. While the L. & N. W. had formerly failed to provide adequate facilities to serve the oil developments near Homer, when oil was discovered recently in the vicinity of Haynesville, industrial spurs were constructed, pipe yards, tank forms, loading racks, etc., were installed. Since October, 1920, train service has been uninterrupted and notwithstanding a large increase in business due to the oil traffic, at no time has the railroad resorted to a freight embargo.

That part of the line between Chestnut and Natchitoches, a distance of about 22 miles, having been unprofitable from the beginning, the receiver secured permission from the Interstate Commerce Commission to abandon it. From almost the start of his service, he also gained the co-operation of the railroad commissions of Louisiana and Arkansas in the settlement of taxation matters and other claims against the company. Having secured the support of federal and state commissions, and regained the confidence of the public, the problem was then to earn enough net revenue to make it worth keeping the L. & N. W. in operation.

From Deficits to Profits

During most of this road's life deficits have accumulated annually. The road had never paid dividends in its 35 years of existence. In 1907 there was a deficit of $39,000; in 1909, $85,752; in 1911, $109,250; in 1915, $168,223; in 1918, $114,717, and for the year ending December 31, 1919, $35,654. In contrast with this record, the only money borrowed under the 1920-22 receivership was the $8,000 loaned on the first day, which amount was repaid within a few months. The sum expended for maintenance of way during the receiver's tenure has exceeded $700,000, which was several times any sum that had ever been applied to maintenance of way during any equal previous period.

The gross revenues for the month of March, 1922, were $215,022.12, whereas for September, 1920, one month prior to the appointment of the receiver in question, they were only $61,404.33. The total operating expenses for March, 1922, were $105,177.86, while for September, 1920, they were $84,276.50. Thus, while the gross revenues for the month of March, 1922, amounted to $153,617.79 more than for the month of September, 1920, the increase in operating expenses was only $20,896.30. The number of passengers carried increased from 12,071 in September, 1920, to 35,521 in March, 1922, while the freight traffic increased from 18,916 tons in the earlier month to 81,828 tons in March of this year.

The operating revenues per mile in March of this year amounted to $2,148 as compared with $505 in September, 1920, while the operating expenses per mile increased from $525 in September, 1920, to $861 in March, 1922. The net operating revenues in March, 1922, amounted to $1,287 per mile, whereas the loss in operating revenues in September, 1920, was $17.80 per mile. At the time of Mr. Bernstein's appointment the cash on hand amounted to $5,841 while an audit completed on May 15, 1922, showed a cash balance of $311,767. While a large part of this increased revenue is, of course, due to the development of the Haynesville oil field much is the result of the improved relations with the shipping and traveling public. That the public is well satisfied with the results of the recent receivership is evidenced by resolutions adopted by the Louisiana Public Service Commission and the Arkansas Railroad Commission, expressing their approval of the improvement of both the physical and the financial condition of the property.

A London & North Western Locomotive Derailed at King's Langley, Hertfordshire

General News Department

The New England Railroad Club announces that its October meeting is postponed owing to the conditions in the transportation field, and that the next meeting will be held on November 14.

The Car Foremen's Association of Chicago will hold a smoker meeting in the Great Northern hotel in that city on October 11, at which time officers will be elected and other business transacted.

A representative from every railroad in the country is the expectation of the officers of the Railway Fire Protection Association in connection with their plans for their annual meeting which is to be held at the New Willard Hotel, Washington, D. C., beginning on Tuesday, October 17. Programs are to be sent to members this week.

The Chicago, Rock Island & Pacific has issued for October a special seventieth anniversary number of its monthly "Rock Island Magazine." This number contains 225 pages, of which 100 are devoted to reading matter. The material consists largely of reminiscences and historical data surrounding the life of that railroad since the date of its founding.

The American Association of Passenger Traffic Officers will hold its annual meeting in Louisville, Ky., on October 10. The meeting of the association will be devoted largely to receiving the reports of the committee on ticket paper, the joint committee of the association and the Railway Accounting Officers' Association, the committees on standing forms of tickets, digest of fares and divisions, and adjustments and disputes relative to passenger fares and kindred subjects.

Donald R. Richberg, of Chicago, counsel for the striking unions, received assurance of readiness to co-operate with counsel for the railway shop craft organizations in any endeavor to expedite further judicial proceedings in connection with the government's strike injunction when he conferred with officers of the Department of Justice on October 2. Attorney General Daugherty said the government would not oppose or seek to delay an effort to bring the Chicago injunction or any of its collateral issues before a higher tribunal.

The riding characteristics of one of the Baldwin-Westinghouse electric locomotives used on the Chicago, Milwaukee & St. Paul have been improved by dividing the cab in two parts, according to a report called the "Log of the Manhattan" issued by the Baldwin Locomotive Company which describes a trip made through the west by President Vauclain and party. The report states: "Engines 10306 and 10307 took the curves easily and rode well. It is only in comparison with engine 10301 that they suffer, because engine 10301 seems to leave nothing to be desired." The last mentioned locomotive has a divided cab, while the other two have not.

New Members on Executive Committee of Railroad Division, A. S. M. E.

The balloting for members of the Executive Committee of the Railroad Division of the American Society of Mechanical Engineers recently held resulted in the election of the following members, re-elected for one-year term, W. H. Winterrowd, chief mechanical engineer, Canadian Pacific; James Partington, estimating engineer, American Locomotive Company; new members elected for a two-year term, William Elmer, division superintendent Pennsylvania System, and B. P. Flory, superintendent of motive power, New York, Ontario & Western. E. B. Katte, the present chairman of the Railroad Division, serves another year on the Executive Committee, according to the rules of the society.

Maintenance of Way Brotherhood Meets in Detroit

The United Brotherhood of Maintenance of Way Employees met in Detroit, Mich., on October 2, in its triennial convention. Approximately 1,200 delegates, representing 300,000 brotherhood members in all parts of the United States and Canada, are in attendance. One of the important questions to come before the convention relates to the removal of the union's headquarters to a more central location.

Freight Claims Continue to Decrease

According to the recently issued classified summary of freight claim expenditures for the first six months of 1922, as prepared by the Freight Claim Division of the American Railway Association, a decrease of 50.7 per cent has been shown as compared with a like statement for the same period in 1921. The total sum expended in the payment of freight claims for the first six months of this year was $27,380,061.

A. R. A. Washington Committee

The Board of Directors of the American Railway Association has appointed a conference committee of eight of its members for consultation and conference, as a necessity may arise, in Washington, consisting of the following: Daniel Willard, chairman, (B. & O.); W. W. Atterbury, (Penn.); B. F. Bush, (M. P.); H. E. Byram, (C. M. & St. P.); C. R. Gray, (U. P.); Hale Holden, (C. B. & Q.); C. H. Markham, (I. C.); A. H. Smith, (N. Y. C.).

A Train Control Program

The Western Society of Engineers, Chicago, will present a symposium on Automatic Train Control on Monday evening, October 23. Among the speakers will be C. F. Giles, superintendent of machinery of the Louisville & Nashville, Louisville, Ky., who will discuss the subject from the mechanical standpoint and Thomas S. Stevens, signal engineer of the Atchison, Topeka & Santa Fe System, Topeka, Kan., who will speak from the standpoint of the signal engineer. Other speakers will trace the history of train control and will discuss it from the standpoint of the operating department.

Missouri Pacific to Terminate Van Noy Contracts

The Missouri Pacific will not renew its contract with the Van Noy Interstate Company for the operation of its restaurants and hotels following its expiration on February 26, 1923. President Bush of the Missouri Pacific states that no plans for the future have been decided upon. It is said that, although relations with the Van-Noy organization have been cordial, the carrier is making the change to insure a more uniform service for its patrons. The Van-Noy Company has had a contract with the Missouri Pacific for 15 years.

Labor Board Considers Wages of Maintenance of Way Employees in Executive Sessions

On October 2 the Railroad Labor Board, in executive session, began the consideration of the demands of the United Brotherhood of Maintenance of Way Employees and Railroad Shop Laborers for increases in the rates of pay of all classes of maintenance of way employees and for a minimum basic wage of 48 cents an hour. Present indications are that this decision will be handed down about October 15 and that the living wage principle so strenuously advocated by the representatives of the maintenance of way employees will not be recognized at this time by the Board, but that the workers involved will be given an increase.

Thornton to Head Canadian National

Word came as we were going to press that Sir Henry W. Thornton, at present general manager of the Great Eastern of England and formerly general manager of the Long Island, had been appointed head of the Canadian National Railways System, with which the Grand Trunk is now consolidated, at a salary of $50,000 a year. Sir Henry is at present in Canada but is leaving at once for England and hopes to return in 30 days to take up his duties.

The following directors will be associated with him: J. H. Sinclair, New Glasgow, N. S.; Richard P. Gough, Toronto; James Stewart, Winnipeg; Ernest R. Decary, Montreal; Frederick G. Dawson, Prince Rupert; Tom Moore, President Canadian Trades and Labor Congress, Ottawa; G. A. Bell, Deputy Minister of Railways; G. G. Ruel, general counsel, Toronto.

Three of these directors are business men, one is a representative of the wheat interests of the west; one represents labor; one is a member of Parliament and one is the present deputy minister of railways. The inclusion of a representative of labor on the board of directors is of special interest and significance.

Net Operating Income in August

Preliminary compilations show that 139 out of the 197 Class I railroads had a net operating income in August of $39,104,000, compared with $70,028,000 for the same roads for August, 1921. The 139 roads represent 176,953 miles. Complete reports for all Class I roads are expected to be available in about a week.

Operating revenues for the 139 roads totaled $382,711,000, a decrease of 6.22 per cent under those for the same roads in August last year, while operating expenses for those roads totaled $316,356,000, an increase of 2.2 per cent over one year ago.

The Burlington Pension Badge

In the shape of a shield, three-quarters of an inch in height, bearing the words "Burlington Service" in the familiar oblong shape of the company's trade mark in the upper part, and a number indicating the years of service just beneath it, the Chicago, Burlington & Quincy has provided an unusual and unique badge of honor for its retired employees who are on the pension roll. The first shield goes to J. R. Wood, a passenger conductor who has just completed 65 years of continuous service, and who was the oldest employee in length of service. Mr. Wood began in 1857 as a waterboy. W. L. Hippert, another passenger conductor, has completed 56 years of continuous service for the road, having begun as a brakeman in 1866.

Only Four Wooden Mail Cars

The wooden railroad car is almost gone, says a statement issued by the Post Office Department. "It is about ready to fade into the past, joining the passenger pigeons, the wild west, the horse drawn carriage and ginger-bread houses." According to the figures of the Post Office Department there are only four wood mail cars now in use out of about 5,000 cars formerly employed to transport United States mail. In 1913 a law was passed by Congress, later reenforced by a law passed in 1916 requiring that no more mail cars be admitted for postal service unless they were all steel or steel under-frame. Those wooden cars which were in use were allowed to remain in service. With the gradual replacement of wooden cars with steel, injuries and deaths of post office employees are said to have greatly decreased. During the last year only two clerks were killed in accidents and 26 seriously hurt. Almost 20,000 railway postal clerks now are employed in the railway mail service.

Later, in order to correct any false impression which might be gained from the statement to the effect that there were only "four wood mail cars now in use," the department issued a statement giving the following statistics on the kinds of cars used in the service. Of the 1,087 Railway Post Office cars 862 are all steel, 154 are steel underframe, 67 are wood steel reinforced, and four are all wood construction. Of the 4,074 apartment cars in use 1,104 are all steel, 641 are steel underframe, 1,947 are wood, steel reinforced, and 382 are all wood construction.

Cab Signals on the Orleans Railway

The Orleans Railway of France, operating 2,969 locomotives, now has 547 of these equipped with apparatus for giving an audible signal in the cab. This system is of the ramp type and "crocodiles" (ramps) have been installed at 987 distant signals. By the end of this year the total number of locomotives equipped will be increased to 802. The Orleans is the railroad which for years has had torpedo machines in service at home signals—apparently throughout the whole of its more important lines—and concerning which an officer of the company has said that not for 50 years have trains been in serious collision because of an engineman overrunning a fixed stop signal.

California Blames East for Lack of Much Needed Cars

With the shippers receiving less than a third of refrigerator cars that they deem necessary to save the California grape crop, the Railroad Commission of that state last week again wired the Interstate Commerce Commission urging action to facilitate the westbound movement of empty cars, as follows:

"Refrigerator car situation in California not improving. Demands for 900 cars daily, with average of 250 to 275 received. Grape crop harvest now at peak and unless equipment furnished, losses will be tremendous. Our information and investigation indicate cars delayed in East account embargo and local loading. Can you advise situation of westbound empty refrigerator cars?"

Priority orders in favor of coal movement are declared to be largely responsible for this situation. Diversion of cars by brokers and delay in loading are also contributing factors. The state commission has strongly urged upon the federal commission an order against circuitous diversion and that demurrage rates be increased.

Accident Report for Second Quarter, 1922

The Interstate Commerce Commission has issued a summary of railroad accident statistics for the months of April, May and June of this year, from which we take the following figures, *those in parentheses being, in each case, the totals for the same quarter in* 1921.

In train accidents 7 (21) passengers, 63 (42) employees and 24 (25) other persons were killed, and 552 (569) passengers, 286 (285) employees and 83 (88) other persons were injured. Adding to these the train service accidents we have totals of 1,279 (1,180) persons killed and 9,015 (8,569) injured. These last include 402 (336) persons killed at highway crossings and 1,201 (1,015) injured. These grade crossing statistics, including also some casualties reported under the head of derailments of trains, show an increase over the same months of 1921 of 20.8 per cent in fatalities, and of 24.2 per cent in injuries not fatal.

I. C. Calls for Co-operation in Movement of Coal

The Illinois Central, through a recent advertisement published in a large number of daily newspapers, urges public co-operation in the speedy movement of coal. If the mine operators, coal dealers and coal consumers work together the pressure on the railroads will be lightened. The advertisement reads, in part:

"The Illinois Central is facing the problem of providing coal cars for fall and winter bituminous coal supplies. During this strike the side tracks of the railroads were crowded with many thousands of idle coal cars. Every informed person will appreciate that no railway system could keep itself adequately equipped to meet such a situation as the present. By the prompt loading and unloading of cars and by direct billing of cars to avoid delays occasioned by reconsignment operators, dealers and consumers can aid materially in accelerating the coal movement. We believe that,

if we receive 100 per cent co-operation from operators, dealers and consumers, no one dependent upon the Illinois Central for transportation will suffer from cold this winter. The Illinois Central System owns 30,667 open top cars suitable for coal and 5,000 new coal cars are being delivered."

Labor Board Holds Hearings on Train Dispatchers' Rules

On September 28 and 29 the Railroad Labor Board held hearings in disputes regarding certain rules and working conditions at the instance of the American Train Dispatchers' Association, the two most important questions in dispute on practically all of the railroad involved being, (1) should chief despatchers, night chief despatchers and assistant chief despatchers be included in the agreement with that organization and (2), should despatchers be allowed vacations and sick leaves with pay. In addition, there were some miscellaneous disputes involving the questions of relief days, calls, overtime, etc., but these were subsequently remanded to one of the Labor Boards' bureaus for a later hearing. After testimony bearing on the two important disputes had been given to the Board by J. G. Luhrsen, president of the train dispatchers' organization, and J. W. Higgins, Dr. C. P. Neill and J. G. Walber, representing respectively the western, southeastern and eastern carriers, the Labor Board took the case under advisement.

Master's Report Favors I. & G. N. in Big Suit

The International & Great Northern will be awarded $2,000,000 in a judgment against the Pierce Oil Corporation, New York, if a master's report to Judge Hutcheson is upheld. The road originally sued for $2,555,625 for failure to fulfill contracts for delivery of 750,000 barrels of oil at 83 cents a barrel at Fort Worth, Tex., and 750,000 barrels at 70 cents at Texas City Junction. The road asserted that it had been forced to purchase oil in the open market at $3.50 a barrel, and it sued for the difference between the two prices. The receiver for the railway sustained damages aggregating $771,350 on Mexican oil and $1,026,462 on domestic oil, a total of $1,797,812; and interest of more than $200,000 was added. A counter judgment for $28,219, with interest at 6 per cent from April 1, 1920, was recommended by the master in favor of the Pierce Oil Corporation for oil furnished during March of that year which would reduce the main judgment to that extent. The judgment will be reviewed by Federal Judge Hutcheson, Jr.

Prevents Orient's Increased Divisions Becoming Effective

A restraining order preventing the carrying out of a recent decision of the Interstate Commerce Commission granting the Kansas City, Mexico & Orient an increase in the division of joint through freight rates, was issued on October 2, as a result of a special hearing in the United States District court, at Denver, Colo. Action brought by 13 carriers whose lines connect with the Orient, on the grounds that the order was confiscatory of their revenues, arbitrary and without evidence to support it, led to the restraining order. The plaintiffs contended that the commission misconceived its powers under the interstate commerce law and that it sought to take arbitrarily the revenues of strong lines and use them for the aid of a carrier unable to earn operating expenses, instead of prescribing a fair and equitable division of the revenue from joint rates. This is said to be the first case under the Transportation Act of 1920 in which the order of the Interstate Commerce Commission making divisions in rates has been enjoined. In New England recently a similar order of the commission was upheld.

Cab Signals on the Northern of France

The Northern Railway of France, as is well known, has used an audible cab signal for 40 years or more, the simple contact apparatus known as the "crocodile." From an inquiry which has been made in connection with the action of the French Government in calling upon all the railroads of the Republic to adopt some kind of cab signal it appears that the Northern now has in service 2,906 locomotives of which all but 43 have the cab signals. These 43 are at present in the shops. Of the engines fitted, 752 are in the passenger service, 1,726 in freight service and 385 are switching locomotives.

The other railroads of France are now making this improvement, and a statement of the conditions on the Paris, Lyons & Mediterranean was given in the *Railway Age* of September 30, page 606. These other roads are not in all cases using the same design as that of the Northern but it appears that there is a general understanding that the principle of operation and the location of apparatus on the roadways are to be sufficiently in conformity to the practice of the Northern to make it practicable to interchange locomotives, if necessary, throughout France.

Mr. Loree on Labor Unions

State supervision of all voting which may result in a strike or lockout was advocated by L. F. Loree, president of the Delaware & Hudson in an address on "Labor Unions" before the clearing house section of the American Bankers Association convention in New York this week. He proposed that laws be enacted to this effect. Such control, to insure a secret ballot free from intimidation or misrepresentation, and its honest count was declared necessary to rescue the American worker from what he termed the tyranny of labor professionally organized. Mr. Loree urged his hearers to devote time and thought to ways and means of helping the laborer "in his safety and comfort * * * intellectually and spiritually." He would have laws enacted—

1. To provide that voluntary associations of seven or more members may sue or be sued.

2. To make the records and accounts of such associations subject to public authority, and to make political use of union funds a criminal offense.

3. To give State authorities better facilities for labor dispute investigation through the power to subpœna witnesses; also to make available to the public full reports of such investigations, then to compel fourteen days' notice of intention to strike or lockout.

Railway Real Estate Association to Meet

The fourth annual meeting of the Railway Real Estate Association will be held at La Salle Hotel, Chicago, on Tuesday, Wednesday and Thursday, October 10, 11 and 12. By the resignation of President F. C. Irvine, James T. Maher (Great Northern) has become president of the association, and Chicago has been fixed upon as the place of meeting instead of Pittsburgh. Mr. Maher will deliver the presidential address on Wednesday morning.

The principal papers on the program are the following: Railroad insurance, by K. T. Krausch (C. B. & Q.); How to buy right of way, by O. F. Scudder (C. B. & Q.); Purposes for which railroad land should be leased, by J. L. Watson (Nor. Pac.); Crossings, and use of railroad land by telephone companies, etc., by W. L. Mattoon (Hocking Valley); The relation of federal valuation to taxation, by A. J. Rooney (C. & O.); Methods of assessing railroad property, by Hon. N. P. Haugen, formerly chairman of the Wisconsin Tax Commission; Can government valuation of railroad lands be made an influencing factor in condemnation proceedings? by W. R. Tarbet (Ill. Cent.); Can the multiple studies made in connection with federal valuation be used as a basis of determining cost of acquiring lands? by W. B. Thomson (W. & L. E.)

Our Duty to Home and Industry

The foregoing is the title of a circular which the Buffalo, Rochester & Pittsburgh has addressed to its employees, calling attention to the crisis in coal transportation. It says, in part:

The Buffalo, Rochester & Pittsburgh is favorably spoken of in every community it serves, and will stay in favor just so long as it continues to serve. We as railroad men have never had an opportunity to show our ability for real railroading such as confronts us today. The jobs of those in many industries depend on us to move coal. The lives of children, babies and the infirm depending on fuel for warmth demand that we do our utmost to move coal. That the public may be adequately served there must be the utmost harmony, co-operation and endeavor all along the

line. The *Railway Age* says: "Coal cars should be unloaded promptly regardless of the free time allowance. For a consignee under present conditions to delay the unloading of cars merely because he has the legal right to do so, would be a crime against the public welfare * * *" This company now calls on every employee to give patrons transportation facilities never before equalled. We have the men who can do it, and with enthusiasm and team work we are out to set a record for every other railroad to try and equal. We must make a record for brilliant railroading. We must move the coal and with the co-operation of mines and consignees we are going to do it.

Effect of Strike on the Mails

Statistics issued by the Post Office Department show that during the period of the railroad strike upheaval 1,269 mail trains were annulled by the railroads, representing a mileage of 112,540. Transferring mail pouches to other trains, re-routing mail and apartment cars, substituting automobile trucks for railroads and other emergency measures were adopted so that there was no serious congestion of the mails at any point for any length of time. Except for slight interruptions at isolated points and a slowing up in the operation of the postal system in certain sections regular delivery of the mails continued as if no serious strike was in existence, according to a statement issued by the department. In only extreme cases was it found necessary to substitute motor trucks to carry the mails, and in these emergencies automobiles were immediately placed in commission, making regular runs both daily and tri-weekly to points cut off from railroad transportation.

Postmaster General Work early completed plans for the mobilization of the Army and Navy air service to carry the mails, and also inaugurated a complete survey of the motor vehicles, both publicly and privately owned, that might be available to secure the safe and complete delivery of mails in case of thorough break-down of railroad service. Scores of messages from every part of the country were received offering the use of airplanes, motor trucks and other vehicles.

The Careful Crossing Campaign in Chicago

At a recent meeting of the Steam Transportation Committee of the Chicago Association of Commerce, a report was made of the work of the Safety Council in connection with the "Careful Crossing Campaign." It was stated that approximately 6,000 large posters, 1,500 small posters and 100,100 "stickers" have been used, this material being distributed to, and by the aid of motor clubs, the Cartage Exchange of Chicago, public and parochial schools, Boy Scouts of America, Association of Commerce, members of the National Safety Council and the Motor Truck Owners' Association and otherwise. Many industries in Chicago were supplied with this material, including the International Harvester Company, which distributed it to its branch agencies and drivers throughout the United States. Also a radio address was made preceding the campaign by E. M. Switzer, superintendent of safety, Chicago, Burlington & Quincy, and during the campaign by J. E. Gorman, president of the Chicago, Rock Island & Pacific, these addresses reaching about 50,000 people (in each instance) in a territory extending 800 miles from Chicago, besides being accorded wide press publicity.

Extensive publicity was accorded the campaign by "Chicago Commerce," the official publication of the Chicago Association of Commerce; in the magazines of the motor clubs and in trade journals and house organs. Approximately 200 reports of carelessness exhibited by motorists at railway crossings have been acted upon individually by the Highway Safety Committee of the council. The Chicago Motor Club and the Illinois Automobile Club carried notice of the campaign in their several electric signs about the city and three large billboard advertisements were located at prominent locations in the city. The plan was explained by A. W. Smallen before the Motor Drivers' School; by E. M. Switzer at C. A. C.'s Foremen's Instructions Course, and M. A. Dow at the Safety Supervisors' School, in addition to which co-operation was solicited on the part of the several hundred companies in Chicago directly interested in the Safety Council's operation.

A special pamphlet, prepared under the direction of the committee, was distributed to all school teachers and by them read to the children to explain the plan and urge their co-operation, thus directly instructing about 550,000 school children. (Several roads also distributed this pamphlet or a revision of it to the schools along their lines.) Publicity was accorded the subject in the newspapers of the city and the subject was presented at sundry public meetings by members of the Speakers' Bureau of the Safety Council. The slogan "Cross Crossings Cautiously" has been made a part of the safety textbook about to be placed in use in Chicago public schools.

During June and July, 1922, there were only four fatalities in automobile-railway crossing accidents in Chicago and Cook county, as compared with five in the same period of 1921. Attention was called to an editorial on the results of the campaign published in the *Railway Age* of September 9, wherein it is shown that on 66 class I roads in June and July, 35 more persons were killed in grade crossing accidents than in the same period of 1921; that the campaign, nevertheless, is counted as a success, and that enthusiasm so developed should be maintained. The committee appeared before the Illinois Commerce Commission on September 20, and urged that body to undertake a campaign for the education of motorists, with particular regard to railway crossing accidents.

R. B. A. Asks President to Let Rate Provisions Stand

The Railway Business Association has addressed a letter to President Harding asking him to preserve intact the income provisions of the Transportation Act. These provisions, the letter says, are in a position different from the labor provisions. The letter, which is signed by Alba B. Johnson, president of the association, follows in part:

"Your attention is invited to the importance of so restricting railway legislation that for some time to come changes may be avoided in the sections which assure the roads an opportunity to earn an adequate income. As we view it, the labor provisions and the provisions embodying the rule of rate making are in two distinct positions.

"Those who urge amendments to the labor clauses state that the object of those sections was to prevent interruptions in railway service through strikes and there have been strikes. Such advocates assert their conviction that a sufficient consensus of public approval for strike remedies has crystallized to warrant serious consideration of amendments. The purpose of the clauses affecting the regulation of rates, on the other hand, was to find a level which would yield the average road sufficient income for it to finance adequate additions and betterments. Nobody can yet say advisedly that these sections have failed. Proof requires trial over a period longer and more fully representative of average normal conditions than has thus far been possible. No observer has asserted that there is a consensus of public opinion as to the sufficiency of these clauses or as to desirable modifications.

"We respectfully suggest that before Congress reconvenes you emphasize to that body and to the country the vital stake of all concerned in the stability of these vast railway purchases and how essential for the continuance of prosperity it is to postpone amendments of the clauses affecting railway revenue and thus preserve confidence in adequacy of railway income as a permanent aim of government regulation."

Meetings and Conventions

The following list gives names of secretaries, dates of next or regular meetings and places of meetings:

AIR BRAKE ASSOCIATION.—F. M. Nellis, 165 Broadway, New York City. Next convention, May 1-4, 1923, Denver, Colo. Exhibit by Air Brake Appliance Association.

AIR BRAKE APPLIANCE ASSOCIATION.—J. F. Gettrust, The Ashton Valve Company, 318 W. Washington St., Chicago. Meeting with Air Brake Association.

AMERICAN ASSOCIATION OF DEMURRAGE OFFICERS.—E. A. Pontious, Supervisor of Demurrage and Storage, C. & N. W. Ry., Chicago.

AMERICAN ASSOCIATION OF DINING CAR SUPERINTENDENTS.—L. A. Stone, C. & E. I. Ry., Chicago. Annual meeting, Oct. 17-20, San Francisco, Cal.

AMERICAN ASSOCIATION OF ENGINEERS.—C. E. Drayer, 63 E. Adams St., Chicago.

AMERICAN ASSOCIATION OF GENERAL BAGGAGE AGENTS.—E. L. Duncan, 332 So. Michigan Ave., Chicago.

AMERICAN ASSOCIATION OF PASSENGER TRAFFIC OFFICERS.—W. C. Hope, C. R. R. of N. J., 143 Liberty St., New York. Annual meeting, October 10 and 11, Seelbach Hotel, Louisville, Ky.

AMERICAN ASSOCIATION OF RAILROAD SUPERINTENDENTS.—J. Rothschild, Room 400 Union Station, St. Louis, Mo.

AMERICAN ELECTRIC RAILWAY ASSOCIATION.—J. W. Welsh, 8 W. 40th St., New York.

AMERICAN RAILROAD MASTER TINNERS, COPPERSMITHS AND PIPE FITTERS' ASSOCIATION.—C. Borcherdt, 202 North Hamlin Ave., Chicago, Ill.

AMERICAN RAILWAY ASSOCIATION.—J. E. Fairbanks, General Secretary, 75 Church St., New York, N. Y. Annual meeting, November, 1922.

Division I.—Operating. J. C. Caviston, 30 Vesey St., New York, N. Y.

Freight Station Section (including former activities of American Association of Freight Agents). R. O. Wells, Freight Agent, Illinois Central Railroad, Chicago, Ill.

Medical and Surgical Section. J. C. Caviston, 30 Vesey St., New York, N. Y.

Protective Section (including former activities of the American Railway Chief Special Agents and Chiefs of Police Association). J. C. Caviston, 30 Vesey St., New York, N. Y.

Safety Section. J. C. Caviston, 30 Vesey St., New York.

Telegraph and Telephone Section (including former activities of the Association of Railway Telegraph Superintendents). W. A. Fairbanks, 30 Vesey St., New York, N. Y. Annual meeting has been indefinitely postponed.

Division II—Transportation (including former activities of the Association of Transportation and Car Accounting Officers). G. W. Covert, 431 South Dearborn St., Chicago, Ill.

Division III.—Traffic, J. Gottschalk, 143 Liberty St., New York.

Division IV—Engineering, E. H. Fritch, 431 South Dearborn St., Chicago, Ill. Exhibit by National Railway Appliances Association.

Construction and Maintenance Section. E. H. Fritch.

Electrical Section. E. H. Fritch.

Signal Section (including former activities of the Railway Signal Association). H. S. Balliet, 30 Vesey St., New York, N. Y. Next meeting, November 21 and 22, Hotel McAlpin, New York.

Division V—Mechanical (including former activities of the Master Car Builders' Association and the American Railway Master Mechanics' Association). V. R. Hawthorne, 431 South Dearborn St., Chicago, Ill. Exhibit by Railway Supply Manufacturers' Association.

Equipment Painting Section (including former activities of the Master Car and Locomotive Painters' Association). V. R. Hawthorne, 431 South Dearborn St., Chicago, Ill.

Division VI—Purchases and Stores (including former activities of the Railway Storekeepers' Association). W. J. Farrell, 30 Vesey St., New York, N. Y.

Division VII—Freight Claims (including former activities of the Freight Claim Association). Lewis Pilcher, 431 South Dearborn St., Chicago, Ill.

Car Service Division—C. A. Buch, 718 18th St., N. W., Washington, D. C.

AMERICAN RAILWAY BRIDGE AND BUILDING ASSOCIATION.—C. A. Lichty, C. & N. W. Ry., 319 N. Waller Ave., Chicago. Next convention, October 17-19, 1922, Hotel Gibson, Cincinnati, Ohio. Exhibit by Bridge and Building Supply Men's Association.

AMERICAN RAILWAY DEVELOPMENT ASSOCIATION.—A. Leckie, Industrial Agent, Kansas City Southern Ry., Kansas City, Mo.

AMERICAN RAILWAY ENGINEERING ASSOCIATION.—(Works in co-operation with the American Railway Association, Division IV.) E. H. Fritch, 431 South Dearborn St., Chicago. Exhibit by National Railway Appliance Association.

AMERICAN RAILWAY MASTER MECHANICS' ASSOCIATION.—(See American Railway Association, Division V.)

AMERICAN RAILWAY TOOL FOREMEN'S ASSOCIATION.—R. D. Fletcher, 1145 East Marquette Road, Chicago. Exhibit by Supply Association of the American Railway Tool Foremen's Association.

AMERICAN SHORT LINE RAILWAY ASSOCIATION.—T. F. Whittelsey, Union Trust Bldg., Washington, D. C.

AMERICAN SOCIETY FOR STEEL TREATING.—W. H. Eiseman, 1600 Prospect Ave., Cleveland, Ohio. Annual convention, Oct. 2-7, 1922, General Motors Building, Detroit, Mich.

AMERICAN SOCIETY FOR TESTING MATERIALS.—C. L. Warwick, University of Pennsylvania, Philadelphia, Pa.

AMERICAN SOCIETY OF CIVIL ENGINEERS.—Prof. J. H. Dunlap, University of Iowa, Iowa City, Ia. Regular meeting 1st and 3d Wednesdays in month, except July and August, 33 W. 39th St., New York. Fall meeting, October 4-9, Palace Hotel, San Francisco, Cal.

AMERICAN SOCIETY OF MECHANICAL ENGINEERS.—Calvin W. Rice, 29 W. 39th St., New York.

Railroad Division—A. F. Stuebing, Manager Editor, Railway Mechanical Engineer, Woolworth Bldg., New York.

AMERICAN TRAIN DISPATCHERS' ASSOCIATION.—C. L. Darling, 1310-1311 Mallers Bldg., Chicago, Ill. Next convention, June 18, 1923, Chicago.

AMERICAN WOOD PRESERVERS' ASSOCIATION.—S. D. Cooper, A. T. & S. Fe R. R., Topeka, Kan. Next meeting, January 23, 1923, New Orleans, La.

ASSOCIATION OF RAILWAY CLAIM AGENTS.—H. D. Morris, Northern Pacific R. R., St. Paul, Minn.

ASSOCIATION OF RAILWAY ELECTRICAL ENGINEERS.—Jos. A. Andreucetti, C. & N. W., Room 411, C. & N. W. Sta., Chicago. Annual convention, October 30-November 3, Hotel La Salle, Chicago. Exhibit by Railway Electrical Supply Manufacturers' Association.

ASSOCIATION OF RAILWAY EXECUTIVES.—Thomas De Witt Cuyler (chairman), 61 Broadway, New York, N. Y.

ASSOCIATION OF RAILWAY SUPPLY MEN.—A. W. Clokey, 1658 McCormick Bldg., Chicago. Meeting with International Railway General Foremen's Association.

ASSOCIATION OF RAILWAY TELEGRAPH SUPERINTENDENTS.—(See American Railway Association, Division I.)

ASSOCIATION OF TRANSPORTATION AND CAR ACCOUNTING OFFICERS.—(See American Railway Association, Division II.)

BRIDGE AND BUILDING SUPPLY MEN'S ASSOCIATION.—D. J. Higgins, American Valve & Meter Company, 332 S. Michigan Ave., Chicago. Meeting with convention of American Railway Bridge and Building Ass'n.

CANADIAN RAILWAY CLUB.—W. A. Booth, 53 Rushbrook St., Montreal, Que.

CAR FOREMEN'S ASSOCIATION OF CHICAGO.—Aaron Kline, 676 North Pine Ave., Chicago. Regular meetings, 2d Monday in month, except June, July and August, Great Northern Hotel, Chicago.

CAR FOREMEN'S ASSOCIATION OF ST. LOUIS, MO.—Thomas B. Koeneke, 604 Federal Reserve Bank Bldg., St. Louis, Mo. Meetings, first Tuesday in month at the American Hotel Annex, St. Louis.

CENTRAL RAILWAY CLUB.—Harry D. Vought, 26 Cortlandt St., New York. Regular meetings, 2d Tuesday in January, March, May, September and November, Hotel Iroquois, Buffalo, N. Y.

CHIEF INTERCHANGE CAR INSPECTORS' AND CAR FOREMEN'S ASSOCIATION.—W. F. Elliott, Terminal Railroad Association of St. Louis, East St. Louis, Ill. Annual convention, November 6-8, Hotel Sherman, Chicago.

CHIEF INTERCHANGE CAR INSPECTORS' AND CAR FOREMEN'S SUPPLY MEN'S ASSOCIATION.—D. B. Wright, 34th St. and Artesian Ave., Chicago, Ill. Meeting with Chief Interchange Car Inspectors' and Car Foremen's Association.

CINCINNATI RAILROAD CLUB.—W. C. Cooder, Union Central Bldg., Cincinnati, Ohio. Meetings, 2d Tuesday in February, May, September and November.

EASTERN RAILROAD ASSOCIATION.—E. N. Bessling, 614 F St., N. W., Washington, D. C.

FREIGHT CLAIM ASSOCIATION.—(See American Railway Associations, Division VII.)

GENERAL SUPERINTENDENTS' ASSOCIATION OF CHICAGO.—C. H. Treichel, Grand Central Station, Chicago. Regular meetings, Wednesday, preceding 3d Friday in month, Room 1414, Manhattan Bldg., Chicago.

INTERNATIONAL RAILROAD MASTER BLACKSMITHS' ASSOCIATION.—W. J. Mayer, Michigan Central R. R., Detroit, Mich. Exhibit by International Railroad Master Blacksmiths' Supply Men's Association.

INTERNATIONAL RAILROAD MASTER BLACKSMITHS' SUPPLY MEN'S ASSOCIATION.—George P. White, 747 Railway Exchange, Chicago. Meeting with International Railroad Master Blacksmiths' Association.

INTERNATIONAL RAILWAY FUEL ASSOCIATION.—J. G. Crawford, 702 E. 51st St., Chicago. Exhibit by International Railway Supply Men's Association.

INTERNATIONAL RAILWAY GENERAL FOREMEN'S ASSOCIATION.—Wm. Hall, 1061 W. Wabash Ave., Winona, Minn.

INTERNATIONAL RAILWAY SUPPLY MEN'S ASSOCIATION.—C. W. Sullivan, Garlock Packing Co., 326 W. Madison St., Chicago. Meeting with International Railway Fuel Association.

MASTER BOILER MAKERS' ASSOCIATION.—Harry D. Vought, 26 Cortlandt St., New York.

MASTER CAR AND LOCOMOTIVE PAINTERS' ASSOCIATION.—(See A. R. A., Division V.)

MASTER CAR BUILDERS ASSOCIATION.—(See A. R. A., Division V.)

NATIONAL ASSOCIATION OF RAILWAY TIE PRODUCERS.—Warren C. Nixon, Western Tie & Timber Co., 905 Syndicate Trust Bldg., St. Louis, Mo.

NATIONAL ASSOCIATION OF RAILWAY AND UTILITIES COMMISSIONERS.—James B. Walker, 49 Lafayette St., New York. Annual convention, November 14, Hotel Tuller, Detroit, Mich.

NATIONAL FOREIGN TRADE COUNCIL.—O. K. Davis, 1 Hanover Square, New York.

NATIONAL RAILWAY APPLIANCE ASSOCIATION.—C. W. Kelly, People's Gas Bldg., Chicago. Annual exhibition at convention of American Railway Engineering Association.

NEW ENGLAND RAILROAD CLUB.—W. E. Cade, Jr., 683 Atlantic Ave., Boston, Mass. Next meeting, November 14.

NEW YORK RAILROAD CLUB.—Harry D. Vought, 26 Cortlandt St., New York. Regular meetings, 3d Friday in month, except June, July and August, at 29 W. 39th St., New York.

PACIFIC RAILWAY CLUB.—W. S. Wollner, 64 Pine St., San Francisco, Cal. Regular meetings, 2d Thursday in month, alternately in San Francisco and Oakland.

RAILWAY ACCOUNTING OFFICERS' ASSOCIATION.—E. R. Woodson, 1116 Woodward Building, Washington, D. C.

RAILWAY BUSINESS ASSOCIATION.—Frank W. Noxon, 600 Liberty Bldg., Broad and Chestnut Sts., Philadelphia, Pa. Annual meeting and dinner, November 9, Hotel Commodore, New York.

RAILWAY CLUB OF PITTSBURGH.—J. D. Conway, 515 Grandview Ave., Pittsburgh, Pa. Regular meetings, 4th Thursday in month, except June, July and August, Fort Pitt Hotel, Pittsburgh, Pa.

RAILWAY DEVELOPMENT ASSOCIATION.—(See Am. Ry. Development Assn.)

RAILWAY ELECTRICAL SUPPLY MANUFACTURERS' ASSOCIATION.—J. Scribner, General Electrical Co., Chicago. Annual meeting with Association of Railway Electrical Engineers.

RAILWAY EQUIPMENT MANUFACTURERS' ASSOCIATION.—R. J. Himmelright, 17 East 42nd St., New York. Meeting with Traveling Engineers' Association.

RAILWAY FIRE PROTECTION ASSOCIATION.—R. R. Hackett, Baltimore & Ohio R. R., Baltimore, Md. Annual meeting, October 17-19, Willard Hotel, Washington, D. C.

RAILWAY REAL ESTATE ASSOCIATION.—R. H. Morrison, C. & O. Ry., Richmond, Va. Next meeting October 10-13, 1922, Pittsburgh, Pa.

RAILWAY SIGNAL ASSOCIATION.—(See A. R. A. Division IV, Signal Section.)

RAILWAY STOREKEEPERS' ASSOCIATION.—(See A. R. A., Division VI.)

RAILWAY SUPPLY MANUFACTURERS' ASSOCIATION.—J. D. Conway, 1841 Oliver Bldg., Pittsburgh, Pa. Meeting with A. R. A., Division V.

RAILWAY TELEGRAPH AND TELEPHONE APPLIANCE ASSOCIATION.—G. A. Nelson, 30 Church St., New York.

RAILWAY TREASURY OFFICERS' ASSOCIATION.—L. W. Cox, Commercial Trust Bldg., Philadelphia, Pa. Annual meeting, October 19 and 20, Battery Park Hotel, Asheville, N. C.

ROADMASTERS' AND MAINTENANCE OF WAY ASSOCIATION.—P. J. McAndrews, C. & N. W. Ry., Sterling, Ill. Annual convention, November 21-23, 1922, Hotel Statler, Cleveland, Ohio. Exhibit by Track Supply Association.

ST. LOUIS RAILWAY CLUB.—P. W. Frauenthal, Union Station, St. Louis, Mo. Regular meetings, 2d Friday in month, except June, July and August.

SIGNAL APPLIANCE ASSOCIATION.—F. W. Edmunds, Sunbeam Electric Manufacturing Company, New York City. Meeting with American Railway Association, Signal Section.

SOUTHERN AND SOUTHWESTERN RAILWAY CLUB.—A. I. Merrill, P. O. Box 1205, Atlanta, Ga. Regular meetings, 3d Thursday in January, March, May, July, September and November, Piedmont Hotel, Atlanta.

SOUTHERN ASSOCIATION OF CAR SERVICE OFFICERS.—L. L. Carrier, Car Serv. Agt., Tenn. Cent. Ry., 319 Seventh Ave., North Nashville, Tenn. Next meeting, October 19, St. Augustine, Fla.

SUPPLY ASSOCIATION OF AMERICAN RAILWAY TOOL FOREMEN'S ASSOCIATION.—H. S. White, 9 N. Jefferson St., Chicago.

TRACK SUPPLY ASSOCIATION.—W. C. Kidd, Ramapo Iron Works, Hillburn, N. Y. Meets with Roadmasters' and Maintenance of Way Association.

TRAVELING ENGINEERS' ASSOCIATION.—W. O. Thompson, 1177 East 98th St., Cleveland, Ohio. Annual convention, October 31-November 3, Hotel Sherman, Chicago. Exhibit by Railway Equipment Manufacturers' Association.

WESTERN RAILWAY CLUB.—Bruce V. Crandall, 14 E. Jackson Boulevard, Chicago. Regular meetings, 3d Monday each month except June, July and August.

Traffic News

The Buffalo, Rochester & Pittsburgh has opened a city ticket office in Pittsburgh, Pa., 529 Smithfield Street. The city passenger agent is H. B. Herrick.

The Northern Pacific has restored 58 passenger trains to service, the operation of which was discontinued during the first part of the summer due to the shop crafts' strike and the fuel shortage.

A committee of freight traffic officers of the trunk line railroads will begin a meeting in New York on October 23 for the purpose of hearing shippers on a plan for a uniform scale of class rates for trunk line territory which has been under consideration for some time.

Freight Commodity Statistics to June 30

The Bureau of Statistics of the Interstate Commerce Commission has compiled a statement showing by districts the freight tonnage transported by Class I steam railways for the quarter ended June 30, 1922, with comparisons between 1921 and 1922:

	Number of tons originated		
Class of commodities	Quarter ended June 30, 1921	Quarter ended June 30, 1922	Per cent of increase 1922 over 1921
Products of agriculture	21,373,939	19,965,391	*6.59
Animals and products	5,775,453	6,150,416	6.49
Products of mines	124,036,608	101,404,725	*18.25
Products of forests	19,746,413	22,779,953	15.36
Manufactures and miscellaneous	41,894,693	57,258,094	36.67
Merchandise—all l.c.l. traffic	10,628,424	11,036,921	3.84
Total	223,455,530	218,595,500	*2.17

	Total tons carried.		
Class of commodities	Quarter ended June 30, 1921	Quarter ended June 30, 1922	Per cent of increase 1922 over 1921
Products of agriculture	44,639,283	43,583,656	*2.36
Animals and products	10,146,292	10,846,813	6.90
Products of mines	208,779,616	180,471,075	*13.56
Products of forests	36,858,931	45,913,216	24.56
Manufactures and miscellaneous	81,054,733	112,557,162	38.87
Merchandise—all l.c.l. traffic	16,770,520	18,057,427	7.67
Total	398,249,375	411,429,349	3.31

* Decrease.

Coal Production

Production of both bituminous coal and anthracite appears to have found a temporary level, bituminous at around 9,750,000 net tons, and anthracite at 1,850,000 tons a week, said the Geological Survey in its bulletin on coal production for the week ended September 30. The total of all coal raised is therefore about 11,600,000 net tons, still somewhat less than the amount required to meet current consumption and the heavy movement up the Lakes, and at the same time to rebuild consumers' stocks.

The total production of anthracite during the week was estimated at from 1,800,000 to 1,900,000 net tons as against 1,856,000 tons in the week preceding.

The output of bituminous coal for the week was estimated at from 9,600,000 to 9,900,000 tons. The returns indicated a slight increase over the week preceding. The following statement shows the number of cars loaded daily during the past three weeks:

	Sept. 11 to	Sept. 18-23	Sept. 25-30
Monday	35,919	37,986	38,804
Tuesday	30,737	29,926	33,396
Wednesday	29,478	28,403	27,404
Thursday	26,571	29,036	26,862
Friday	28,468	27,139	27,177
Saturday	25,418	25,300	26,848

Under the stimulus of active demand soft coal is now being offered for shipment up to the ability of the rail and water carriers to transport it. The present weekly rate of production is nearly a million tons above that of the year of depression, 1921, but is from one and one-half to three million tons below the other preceding three years.

Preliminary returns on daily car loadings at anthracite mines during the week September 16-23 increased from 5,449 cars on Monday to 5,900 on Thursday but fell off on Friday and on Saturday to 5,506 cars. Loadings on Monday of last week increased to 5,952 cars, and on Tuesday were about the same. On Wednesday there was a slight decrease but on Thursday loadings reached 5,983 cars, the largest number since the end of the strike. On Friday 5,854 cars were loaded and on Saturday 6,144. Shipments for the week will be about 30,000 cars which compares favorably with weeks of normal production in recent years.

The mine reports for the week ended September 16 show a gradual but widespread increase in losses ascribed to transportation disability. In only five districts—Tug River, Logan, Virginia, Iowa, and Wyoming was there any marked improvement in car supply. In the strongly organized fields where the Cleveland agreement has been accepted or made the basis of subsidiary agreements production has reached the limit of transportation facilities. Even in the Pittsburgh and Central Pennsylvania districts transportation is now the chief factor limiting production. No agreement has yet been reached in the former non-union fields in Pennsylvania, nor in the Chesapeake & Ohio section of Kanawha and a part of the Georges Creek—Upper Potomac region. When compared with losses through transportation all other factors limiting production in the week of September 11-16 were of small importance.

The all-rail movement of coal to New England through the six principal Hudson gateways increased to 3,255 cars of bituminous and 1,507 cars of anthracite in the week ended September 23. In addition there were also forwarded through Rouses Point 76 cars of bituminous coal and 2 cars of anthracite.

Shipments of bituminous coal through Hampton Roads increased slightly during the week ended September 23. Dumpings for the week totaled 312,003 net tons as against 307,426 tons on the week before. The tonnage of cargo coal for export and for New England increased whereas tonnage for other coastwise destinations decreased.

Soft coal shipments from the mines to Lake Erie ports, under stimulus of priority orders increased 52 per cent during the week ended September 17 over the preceding week and 34 per cent in the week ended September 24 over the week before that. The Ore and Coal Exchange reports a total of 1,453,684 tons dumped during the week of September 24 as against 1,095,919 the week before. Of the total, 1,409,648 tons were cargo coal and 44,036 tons were vessel fuel. The rate of dumpings last week was 137 per cent greater than that in the corresponding week a year ago, and 60 per cent above the rate in the corresponding week of 1920. The total quantity of cargo coal forwarded during the present Lake season now stands at 8,487,318 tons, but of this 962,198 tons has gone to destinations not ordinarily taking Lake coal. The quantity sent to regular Lake markets was only 7,525,120 tons as against 17,690,177 tons in 1921 and 14,025,734 tons in 1920.

Dumpings of coal at Lake Erie ports continued at high rates during last week. The tonnage handled at the piers in the three days, September 25-27, showed a slight increase over the corresponding days of the week before. Lake coal is now going forward at the maximum rate in the history of the traffic.

More cars were loaded with coal during the week ended September 30, than during any week since that of April 1, this year, according to reports issued by the American Railway Association. The total for the week was 216,212 cars. This exceeded by 4,102 cars the preceding week which had been the high mark. Coal production for the week, on the basis of this loading, approximated 11,713,000 tons, including about 9,927,000 tons of bituminous and 1,786,000 of anthracite. Production for the previous week was approximately 11,500,000 tons for both kinds of coal.

Loading of bituminous coal totaled 180,491 cars and 35,721 cars were loaded with anthracite. Loading of anthracite on Saturday, September 30, amounted to 6,144 cars.

For the third successive week more than a million tons of coal were dumped during the past week at Lake Erie ports for shipment to upper lake points. The total dumped during the past week amounted to 24,380 cars or 1,219,000 tons. On Saturday and Sunday 7,083 cars were dumped, the largest unloading in the history of the docks, except on the preceding Saturday and Sunday one week ago, when the total was 8,052 cars. According to advices received by the Car Service Division, the strike on lake carriers up to date has not interfered to any noticeable extent with coal shipments on the lakes.

Commission and Court News

Interstate Commerce Commission

The Commission has suspended until February 2, 1923, the operation of certain schedules published in supplements to F. A. Leland's tariffs which propose to increase the rates on fresh fruits, melons and vegetables, from points in Arkansas, Louisiana, Missouri, Oklahoma and Texas to points in C. F. A. and Trunk Line territories.

Court News

Defective Running Board

The Oklahoma Supreme Court holds that where a defective running board on a car contributed to cause a brakeman to fall from the car, receiving injuries, the railroad is liable under the Supplementary Safety Appliance Act of April 14, 1910.—New v. Saunders (Okla.), 206 Pac. 600.

Live Stock Shipper Overloading Cars Cannot Recover for Loss

The New Mexico Supreme Court holds that a shipper who agrees to load live stock at his own risk, and who overloads the cars, cannot recover against the carrier for losses which would not have occurred but for the overloading.—Spence v. El Paso & Southwestern (N. Mex.), 207 Pac. 579.

Contract Periods of Limitation Not Affected by Transportation Act

The Circuit Court of Appeals, Second Circuit, holds that the provision in the Transportation Act that the period of federal control shall not be computed as part of the periods of limitations applies only to limitations fixed by statute and not to limitations fixed by the bill of lading.—New York Central v. Lazarus, 278 Fed. 900.

Shipper by Acquiescence Held to Assume Risk of Inadequate Unloading Facilities

Where it is shown that alleged inadequate facilities for unloading stock were known to the shipper, but he nevertheless undertook through his own special agent to unload the animals himself, the Georgia Court of Appeals holds that the risk of their being injured must be taken to be assumed by the shipper.—Payne v. Duncan & Nelms (Ga. App.) 111 S. E. 209.

Inconsistent Provisions in Tariff

The Texas Court of Civil Appeals holds that a general provision in a freight tariff item established by the Interstate Commerce Commission, giving the railroad right to carry cotton to any other compress if that designated is not available, must yield to an inconsistent provision in the immediately following item as to shipments on designated routes.—King v. Chicago, R. I. & G. (Tex.), 241 S. W. 180.

Carrier's Negligent Failure to Collect Freight Bill Does Not Prevent Recovery from Consignor

The Georgia Court of Appeals holds that where a railroad transports goods and negligently fails to collect or even to attempt to collect freight charges from the consignee, although it could have collected if it had acted promptly, the consignee then becoming insolvent, the carrier can nevertheless recover the charges from the consignor. It is immaterial that at the time of delivery of the goods there existed an agreement between consignee and the carrier that consignee should have one week in which to pay freight bills.—S. A. L. v. Montgomery (Ga. App.) 112 S. E. 652.

Foreign Railway News

Bolivia Invites Tenders on Big Railway Project

The Bolivian government is calling for tenders for the construction of a railway from Cochabamba to Santa Cruz de la Sierra, according to the Wall Street Journal. The new line will be 388 miles long with a 37-mile branch line and will cost from $40,000,000 to $50,000,000. Gage will be one meter, maximum gradient 3 per cent and 60 lb. rail will be used. Santa Cruz is at the headwaters of the Amazon and Cochabamba is connected with the Pacific and the rest of Bolivia by rail.

Construction must begin 60 days after contract is signed and must be completed within six years. Contractors are guaranteed an 8 per cent return on the investment for 25 years, secured by duties on imports into certain sections of Bolivia. Contractors will be given a concession to operate the property for a period of 99 years.

Sealed tenders will be received by the ministry of public works, La Paz, until June 30, 1923.

China Notes

PEKING.

In these notes published in the *Railway Age* of September 30, report was made of a contract between the representatives of the General American Tank Car Company and the Peking-Suiyuan Railway for the gradual amortization of the indebtedness of the railway to the supplier for a large consignment of rolling stock and sleepers out of the earnings of the rolling stock. This contract bears some resemblance to the familiar equipment trust in America. It provides that an accountant acceptable to the supply company be appointed to keep a record of the car movements and the revenue therefrom,—the latter being the basis of the payments to be made on the indebtedness. The accountant appointed is a Chinese recently returned from Columbia University. The employees of the railway, however, have represented that the contract contemplates the appointment of a foreign accountant, thus permitting of the beginning of foreign control of the Peking-Suiyuan, which up to the present has been the pride of the Chinese people as being Chinese built and Chinese owned. An appeal has been made to the president and to parliament which began its sittings on the first of the month.

A strike was accordingly organized among the trainmen which was extended to the clerks in the head office. The strikers drove off the chief accountant, he being one of the signers of the contract. Following this the managing director took fifteen days' "sick leave" and the employees of the line declared independence of the ministry of communications. A few days later a squad of cavalry surrounded the offices of the railway and attempted to arrest the ring-leaders of the disturbance, but these had been warned and fled. The director of the railway department of the ministry of communications, however, took possession of the offices and installed an acting managing director. An effort is now being made to persuade the American firm to modify its contract.

This incident is significant in several directions. This contract is the first which any American interest has been able to obtain which would place any officer of an operating road under any sort of American influence since the China American Development Company was bought out from its position on the Canton-Hankow line. Every American attempt to build railways in China has been thwarted by some kind of opposition, either native or foreign. But this is the first time any native opposition has developed toward the payment of mere debts due to an American firm. There are many who profess to see in it the usual intrigue which has always attempted to make difficult American trade in a large way with the Chinese government. Those who believe that the education of large numbers of Chinese in America—to be made possible by the remission of the remaining installments of the Boxer indemnity—will promote favorable trade relations will need to explain why it is that these affairs always defeat

Americans, but do not thwart other [illegible]. However, the probable explanation of this [illegible] is to be found along entirely different lines.

Ever since the present cabinet was [illegible], there has been a [illegible] drive on the part of the old Peking political [illegible], principally the Chihli [illegible], the [illegible] of Wu Pei-fu. Tang Kang, the minister of [illegible], [illegible] had [illegible] his report that [illegible] minister [illegible] department had "[illegible]" [illegible] as they had turned over to the [illegible] [illegible] was [illegible] to such an attack as to [illegible], and he has [illegible] the [illegible]. The minister of [illegible] has been [illegible] to a similar [illegible], but being [illegible] for a Chinese, was not [illegible] by it. However, on August 17 a body of teachers from the government schools, whose salaries are long in arrears, [illegible] the ministry of communications, surrounded the minister and forced him to sign an undertaking to pay over to them the sum of a million [illegible] before the end of the month. It would be as easy to [illegible] the moon as a million dollars in the present condition of the ministry, so the minister took a night train for the summer colony at Peitaiho. The following day the bureau chiefs of the railway department went on strike as a protest against the behavior of a contemporary department. The minister of war, at the instigation of the president, immediately tendered apologies, a delegation was dispatched to persuade the minister of communications to return, and to the surprise of those who sent the persuaders the minister returned to Peking on August 22. However, he has not reopened office at this writing, evidently waiting word from Wu Pei-fu.

This word has now arrived, so it is reported, and is to the effect that Wu will support his minister with force if necessary. This incident must be coupled with the Peking-Suiyuan affair if either is to be interpreted correctly.

The rolling stock in the hands of Chang Tso-lin has not been returned as yet. The British interests tried the bluff of recalling all of the British employees of the line stationed in Manchuria, but Chang would not and these men were finally sent back to their posts. But Chang will not allow them to resume duty now, and has put them on his own pay roll in different capacities. Chang now offers to return the rolling stock if the Peking-Mukden line is made neutral for its entire length, neither party to be allowed to carry more than one train load of troops per day. In case of violation, the foreign garrisons along the line would be empowered to remove rails, or otherwise put the line out of commission. The effect of such an agreement would be to make safe the frontiers of Manchuria and confirm Chang's position of independence. This, Peking is hesitating to do. In the meantime some careful feelers have been put out to ascertain if the present financial extremities of the Peking government are sufficient to influence them to accept a bit of assistance. Chang appears to be ready to furnish the cash to redeem the whole British loan on the Peking-Mukden line. This amounts to only a little over a million and a quarter sterling. A premium of twenty per cent must be paid if the loan is retired ahead of maturity. But allowing for this, at the present rate of exchange the total cost would be only a little over 15,000,000 Mexican dollars. Allow 20,000,000 to cover "commissions, etc.," and a line worth between seventy and a hundred millions would be freed entirely from British interference. A half of this line would then fall to Chang,—or between thirty five and fifty millions of property for twenty millions of cash. This half could then be easily disposed of by consolidating it with the South Manchurian, thus putting under one management all of the railway in Manchuria, except the Chinese Eastern with which favorable traffic arrangements have been made,—as previously reported in these columns.

In spite of all these political disturbances, construction continues. Three more stations have been opened during the month on the Paotou extension of the Peking-Suiynan line. The earthwork on the double tracking of the Peking-Mukden line is completed and the bridgework is under way. Tenders are being advertised for by the Taokow-Chinghua Railway Administration for supplies preparatory to the beginning of construction of a westward extension. A loan from the Peking Syndicate (British) has been arranged in this connection.

Equipment and Supplies

Locomotives

The Green Bay & Western, reported in the *Railway Age* of September 30 as inquiring for two locomotives, has ordered this equipment from the American Locomotive Company.

The Erie has ordered 10 Mikado type and 20 Pacific type locomotives from the Baldwin Locomotive Works. This is in addition to the 30 Mikado type ordered from the same builder as reported in the *Railway Age* of August 19.

The Atchison, Topeka & Santa Fe, reported in the *Railway Age* of September 16 as contemplating the purchase of 100 locomotives, has ordered 26 Santa Fe type, 8 Mountain type, 15 Mikado type, and 10 Pacific type locomotives from the Baldwin Locomotive Works.

The New York, New Haven & Hartford has ordered five 181-ton electric locomotives from the Westinghouse Electric & Manufacturing Company. These locomotives will practically duplicate the ones now in use for high speed passenger service. They will be equipped for operation on either alternating or direct current, the direct current equipment being used to permit operation into the Grand Central Station, New York.

Freight Cars

The Erie is inquiring for 1,000 gondola cars.

The Chesapeake & Ohio is inquiring for 50 cabooses.

The Delaware & Hudson is inquiring for 1,000 gondola cars.

The Pere Marquette is inquiring for repairs to 1,000 wooden box cars.

The Lehigh & New England is inquiring for 100, 55-ton hopper cars.

The Buffalo, Rochester & Pittsburgh is inquiring for 1,000 gondola cars.

The Cudahy Packing Company, Chicago, is inquiring for 200 40-ton refrigerator cars.

The Cincinnati, Indianapolis & Western has placed an order for 209 composite gondola cars with the American Car & Foundry Co.

The Pennsylvania has bought trucks of 70 tons' capacity for 10,000 freight cars. These trucks are to be placed under 50-ton cars at the Altoona shops.

The Hocking Valley has equally divided an order for repairs to 500 composite gondola cars between the shops of the Pressed Car Company and the Greenville Steel Car Company.

The Atchison, Topeka & Santa Fe, reported in the *Railway Age* of September 23 as inquiring for 50 caboose cars, has ordered this equipment from the American Car & Foundry Company.

The Chicago, Rock Island & Pacific has awarded a contract to the Western Steel Car & Foundry Company for repairs to 100 furniture cars, 100 wooden box cars and 200 steel frame box cars.

The Chicago & North Western, reported in the *Railway Age* of September 30 as inquiring for 800 gondola cars and 200 flat cars has ordered this equipment from the General American Car Company.

The Atlantic Coast Line reported in the *Railway Age* of September 16 as inquiring for 2,000 box cars of 40 tons' capacity has ordered this equipment from the Standard Tank Car Company.

The Atchison, Topeka & Santa Fe is expected to soon place orders for 2,000 refrigerator cars of 40 tons' capacity, 1,000 auto-

mobile cars of 40 tons' capacity, 500 double-deck stock cars of 40 tons' capacity, 1,000 box cars of 40 tons' capacity, and 500 coal cars of 50 tons' capacity.

Passenger Cars

THE BALTIMORE & OHIO is inquiring for 30 baggage cars.

THE CENTRAL OF GEORGIA is inquiring for 50 coaches, 10 baggage-express cars and 5 combination passenger and baggage cars.

Iron and Steel

THE ERIE has placed orders for 37,500 tons of 100-lb. rail.

THE LEHIGH VALLEY has ordered 20,000 tons of 136-lb. rail from the Bethlehem Steel Company.

THE CHICAGO, BURLINGTON & QUINCY has ordered 15,000 tons of rails from the Illinois Steel Company.

THE ILLINOIS CENTRAL has made reservations divided with various steel companies for 60,000 tons of rail.

THE UNION PACIFIC is inquiring for 135 tons of structural steel for a storage tank at Council Bluffs, Iowa.

THE NEW YORK, ONTARIO & WESTERN has ordered 4,000 tons of 90-lb. rail from the Bethlehem Steel Company.

THE DELAWARE & HUDSON has ordered 10,000 tons of 90-lb. rail from the Bethlehem Steel Company for 1923 delivery.

THE CHICAGO, INDIANAPOLIS & LOUISVILLE has placed an order with the Illinois Steel Company for 3,000 tons of steel rails.

THE NEW YORK, CHICAGO & ST. LOUIS has issued an inquiry for its requirements in axles and steel bars for the next six months.

THE DELAWARE, LACKAWANNA & WESTERN has ordered 15,000 tons of rail from the Bethlehem Steel Company, including 101-lb. and 105-lb. sections.

THE NEW YORK, NEW HAVEN & HARTFORD has reserved space with the Bethlehem Steel Company for 25,000 tons of 107-lb. rail, for delivery in the early part of 1923.

THE VIRGINIAN RAILWAY, reported in the *Railway Age* of September 30 as inquiring for 300 tons of steel for bridges, has ordered this tonnage from the Virginia Bridge & Iron Co.

THE PERE MARQUETTE has divided an order for 15,000 tons of rails equally between the Bethlehem Steel Company, the Illinois Steel Company and the Inland Steel Company.

THE UNION PACIFIC has placed orders for 60,000 tons of rails of which the Colorado Fuel & Iron Company received a contract for 20,000 tons and the Illinois Steel Company, 40,000 tons.

THE CHICAGO & EASTERN ILLINOIS, reported in the *Railway Age* of September 23, as about to place an order with the Illinois Steel Company for 5,000 tons of rails, has placed this order.

THE GREAT NORTHERN has placed an order for 10,000 tons of steel rails with the Illinois Steel Company and 5,000 tons each with the Inland Steel Company and the Bethlehem Steel Company.

THE SOUTHERN RAILWAY has ordered 40,000 tons of rail from the Tennessee Coal, Iron & Railroad Company. Most of the rail will be 100-lb. sections for delivery during the first six months of 1923.

THE CHESAPEAKE & OHIO has placed orders for 24,500 tons of rail for 1923 delivery as follows: Inland Steel Company, 7,500; Illinois Steel Company, 7,500; Carnegie Steel Company, 4,500; and Bethlehem Steel Company, 5,000 tons.

THE ATCHISON, TOPEKA & SANTA FE has ordered 64,000 tons of rails, divided as follows: 25,000 tons, Illinois Steel Company; 25,000 tons, Colorado Fuel & Iron Company; 11,000 tons, Inland Steel Company; and 3,000 tons, Bethlehem Steel Company.

THE ILLINOIS CENTRAL has placed an order with the American Bridge Company for 177 tons of structural steel for its bridge over the Tradeover river, Sturgis, Ky. This same company has been inquiring for 178 tons of structural steel for deck plate girder spans to be used at Paducah, Ky.

THE BALTIMORE & OHIO has placed orders for 52,000 tons of steel rail for delivery during 1923, as follows: Carnegie Steel Company, 23,000 tons; Illinois Steel Company, 7,000; (2,000 tons included for Baltimore & Ohio Chicago Terminal Railroad) Cambria Steel Company, 12,000, and Bethlehem Steel Company, 10,000.

THE NEW YORK CENTRAL reported in the *Railway Age* of September 23, as inquiring for 200,000 tons of rail has placed orders for 194,300 tons for New York Central lines as follows: Illinois Steel Company 74,500 tons, Carnegie Steel Company 16,464, Bethlehem Steel Company 85,036, Inland Steel Company 15,800 and Cambria Steel Company 2,500 tons.

THE PENNSYLVANIA RAILROAD has ordered 170,000 tons of rail for 1923 delivery as follows: U. S. Steel Corporation 78,000 tons, Cambria Steel Company 37,000, Bethlehem Steel Company 37,000, Lackawanna Steel Company 9,000, and Inland Steel Company 9,000. Most of the above will be 130 lb. sections and 8,000 tons are for use on the Long Island Railroad and the balance are for use on the Pennsylvania Lines.

Machinery and Tools

THE CHICAGO, MILWAUKEE & ST. PAUL has ordered two 3-ton hoists from the Shepard Electric Crane & Hoist Co.

THE CHICAGO, ROCK ISLAND & PACIFIC has ordered a 36-in. planer and a 36-in. lathe from the Niles-Bement-Pond Company.

THE CRUCIBLE STEEL COMPANY has ordered a 90-in. driving wheel lathe, also a 96-in. 600-ton wheel press from the Niles-Bement-Pond Company.

THE ILLINOIS CENTRAL has placed orders for about $70,000 worth of machine tool equipment in addition to that reported in the *Railway Age* of September 16.

THE ILLINOIS CENTRAL'S orders for machine tools placed recently include a car wheel lathe and two combination turning and axle lathes from the Niles-Bement-Pond Company.

THE ATCHISON, TOPEKA & SANTA FE has ordered a 150-ton overhead electric traveling crane for its Albuquerque, N. M., shop from the Morgan Engineering Company, Alliance, Ohio.

Track Specialties

THE SOUTHERN PACIFIC is inquiring for approximately 15,000 tons of tie plates.

THE BALTIMORE & OHIO is inquiring for 7,000 tons of tie plates and 15,000 kegs of track spikes.

Signaling

THE BROOKLYN RAPID TRANSIT COMPANY has placed an order with the General Railway Signal Company for a 36-lever interlocking machine to be installed at Queensborough Plaza, Brooklyn, N. Y. This order also includes motor train stops, color light signals, relays, transformers, etc.

THE PHILADELPHIA & READING has awarded a contract to the Union Switch & Signal Company for the complete installation of an electro-pneumatic interlocking plant at Harrisburg, Pa. The plant will ultimately control all of the switches and signals governing movement approaching and passing through the terminal area, and the interlocking machine has 32 working levers, but is of sufficient capacity to take care of both the present trackage arrangement and the future layout.

THE CHICAGO, BURLINGTON & QUINCY has awarded a contract to the Federal Signal Company for the complete installation of two sections of automatic semaphore signaling and two sections of color light signaling, the first consisting of 48 semaphore signals between Arapahoe, Neb., and Indianola, 28 miles, and 32 semaphore signals between Bluff Siding, Wis., and Lytle, 17 miles; and the latter, consisting of 64 color light signals between Hannibal, Mo., and Louisiana, 27 miles, and 17 color light signals between Quincy, Ill., and Eubanks, 7 miles.

Supply Trade News

The Bridgeport Brass Company, Bridgeport, Conn., has opened an office in the General Motors building, Detroit, Mich., with Frank H. Longyear as district manager.

The F. S. Pearson Engineering Corporation, New York City, has reestablished its department for industrial management and technical auditing of industries and public utilities.

The Brown Hoisting Machinery Co., Cleveland, Ohio, has placed its conveyor sales in charge of **E. P. Sawhill**, who has had nearly 30 years' engineering and selling experience on this type of equipment.

The Pan-American Equipment Company, New Orleans, La., has been organized by **R. L. Wilson**, formerly of the Mid-Continent Equipment & Machinery Company, St. Louis, Mo., to engage in the sale of general equipment including cars, locomotives and track accessories.

John J. Kehoe, until recently in the railway sales department of the Texas Company, New York, has been appointed New York representative of **Warren Corning & Co.**, Chicago. Mr. Kehoe's headquarters are in the company's office which was recently opened at 1 Madison avenue, New York City.

The Pawling & Harnischfeger Co., Milwaukee, Wis., has appointed new agents for its machine tool line as follows: The Cadillac Machinery Co., Detroit, Mich.; the Cleveland Duplex Machinery Co., Cleveland, Ohio., and the Seifreat-Woodruff Company with offices at Dayton and Cincinnati, Ohio.

Herbert C. Follinger, manager of the Chicago office of the Chain Belt Company, Milwaukee, Wis., died of pneumonia at his home in Chicago, on September 27, at the age of 38. Mr. Follinger became associated with the Chain Belt Company in 1914, and in 1916 was appointed district manager for the Chicago territory.

The Johns-Manville, Inc., New York City, has been appointed joint selling agents by the H. H. Robertson Company, Pittsburgh, Pa., and in future all asbestos protected metal roofing, siding accessories and ventilators will be manufactured and shipped from the plant of H. H. Robertson Company at Ambridge near Pittsburgh. Hereafter, in the manufacture of asbestos protected metal products by H. H. Robertson Co., Johns-Manville asbestos saturated felts will be used. Asbestos protected metal is largely used by all industry for conditions where an unprotected metal or other equally perishable roofing would quickly disintegrate.

Trade Publications

ELECTRIC FURNACES.—Baily electric furnaces for melting nonferrous metals are described in a six-page folder issued by the Electric Furnace Company, Salem, Ohio. The folder also lists and illustrates a large number of products, for the manufacture of which the electric furnace is most suitable.

MULTI-SPEED MOTORS.—Applications of Watson multi-speed motors for adjustable speed control on alternating current polyphase circuits are described in a two-color, illustrated, 12-page bulletin issued by the Mechanical Applicance Company, Milwaukee, Wis. These motors are designed to run at any one of four different speeds namely, 600, 720, 900 or 1,200 r.p.m.

DAYLIGHT THE NATURAL ILLUMINANT.—The principles of natural illumination are presented in an attractive manner in a 48-page booklet published by the Skybryte Company, Cleveland, Ohio. This treatise also combines the discussion of methods of illumination with its influence on the efficiency of workmen. The book is well illustrated and carefully written.

Railway Construction

ATCHISON, TOPEKA & SANTA FE.—This company has awarded a contract to Joseph E. Nelson & Sons for the construction of a lavatory building at San Bernardino, Cal., at an estimated cost of about $60,000.

ATCHISON, TOPEKA & SANTA FE.—This company will construct a 20,000-ton storage ice plant at Bakersfield, Cal., which works will include the purchase of some additional property and rearranging of tracks to extend the yard facilities. The work is estimated to cost $466,837. This company is also contemplating rebuilding its ice plant at Needles, Cal.

ERIE.—The Interstate Commerce Commisssion has issued a certificate authorizing the construction of a line from a point on the main line near Sparrowbush, N. Y., to a connection with the main line near Lackawaxen, Pa., 20.8 miles.

GULF, COLORADO & SANTA FE.—This company will construct a two-story fireproof freight house 60 ft. by 301 ft. with structural steel frame, fireproofed with concrete, concrete floors, brick wall and steel doors and sash at Dallas, Tex., to cost $200,000.

ILLINOIS CENTRAL.—This company has awarded contract to Joseph E. Nelson & Sons, Chicago, for the laying of pipe lines and the construction of a tank for water service facilities at Ramsey, Ill.

ILLINOIS CENTRAL.—This company, which was reported in the *Railway Age* of September 23 as contemplating improvements to its water facilities, has awarded contracts as follows: At Peosta, Iowa, to Miller Artesian Well Company, Chicago; at Kinmunday, Ill., and Pana, to Fairbanks, Morse & Co.; at Ramsey, to Joseph E. Nelson & Sons; at Memphis, Tenn., and Champaign, Ill., to Layne & Bowler. A contract for the extension of passing tracks at Marissa, Ill., has been awarded to M. L. Windham, Centralia, Ill. A contract for passing tracks at Dowell, Ill., has been let to Blythe Brothers, and at Lenzberg, to Windt. The company will construct passing tracks at Marion, Ill., and Cambria with its own forces. A contract for additional storage tracks at Manchester, Iowa, has been let to P. E. Schugart, Freeport, Ill. This company has also awarded contracts for the extension of passing tracks as follows: At Baton Rouge, La., $50,000, to Colley-Allelo; at Gardere, $12,000, and at Burnside, $18,000, to J. W. Garig; at Gramercy, La., $20,000, to Fred Gardner; and at Harriston, Miss., $30,000, to J. W. Noble. A contract has been let to F. Gardner for the construction of passing tracks at Reserve, La., to cost $46,000, and to W. L. Hicks for the construction of yard tracks and engine tracks at Natchez, Miss., to cost $12,000. This company has also awarded a contract to Woods Brothers Construction Company of Lincoln, Neb., for the construction of six standard current retards and 27 Bignell anchor piles to protect embankment and bridge abutments across the Mississippi river at Council Bluffs, Ia.

ILLINOIS CENTRAL.—This company has awarded a contract to B. F. Davis, Memphis, Tenn., for the alteration and addition to the frame passenger and freight station at Ponchatoula, La.

LOUISIANA SOUTHERN.—This company has been ordered by the Louisiana Public Service Commission to reconstruct and rehabilitate approximately two miles of its line which was destroyed in April by a break in the Mississipper river levee near Poydras Junction, La.

MISSOURI, KANSAS & TEXAS.—This company has awarded a contract to the Sumner Sollitt Company, San Antonio, Tex., for the extension of the freight station at Fort Worth, Tex.

MISSOURI PACIFIC.—This company, reported in the *Railway Age* of September 23 as receiving bids for the construction of a car repair shop at Kansas City, Mo., has awarded the contract to Jerome Moss & Co., Chicago.

PENNSYLVANIA.—See article on another page entitled "Pennsylvania System to Make Extensive Additions to Altoona Works."

Railway Financial News

CHICAGO & ALTON.—*Call for Deposit of Bonds.*—F. H. Ecker, chairman of the protective committee representing the 3½ per cent first lien 50-year bonds, has issued a statement calling attention to the announcement of the receivers of the road that an application will be made to the court for the issuance of receiver's certificates and that payment of the October 1 interest instalment on the 3 per cent bonds will be deferred temporarily. The committee requests the immediate co-operation of the holders of the 3½ per cent bonds and the deposit of these bonds with the Farmers Loan & Trust Company under the deposit agreement which has been prepared.

CHICAGO, ROCK ISLAND & PACIFIC.—*Equipment Trusts Offered.* Hambleton & Co. are offering $1,279,000 6 per cent equipment trust certificates, due 1925-35, at prices to yield from 5.50 per cent to 5.75 per cent.

DELAWARE, LACKAWANNA & WESTERN.—*30,000 Shares Sold Privately.*—A syndicate headed by Charles D. Barney & Co., New York has bought and resold privately a block of slightly over 30,000 shares of stock. The purchase involved more than $5,000,000. The disposition of this stock is believed to have been a major factor in the seven-point rise to 142 in Lackawanna stock in Tuesday's market.

GREEN BAY & WESTERN.—*Authorized to Abandon Branch.*—The Interstate Commerce Commission has issued a certificate authorizing the abandonment of operation of a branch line between Marshland and La Crosse, Wis.

NASHVILLE, CHATTANOOGA & ST. LOUIS.—*Authorized to Issue Bonds.*—The Interstate Commerce Commission has authorized an issue of $747,000 of first consolidated mortgage 5 per cent gold bonds to be sold at not less than 98, to provide for the payment of a like amount of bonds maturing January 1.

NEW YORK, CHICAGO & ST. LOUIS.—*Equipment Trust Authorized.*—The Interstate Commerce Commission has authorized the issuance of $3,150,000 of 5 per cent equipment trust certificates to be sold at not less than 98.

NEW YORK, NEW HAVEN & HARTFORD.—*Interest on Debentures.*—The Listing Committee of the New York Curb Exchange has been notified by the Equitable Trust Company that accrued interest, due October 1, 1922, on the New Haven extended 7 per cent debentures of 1925 (European franc issue) will be paid on and after that date at the office of the Bankers' Trust Company.

PERE MARQUETTE.—*Dividends Declared.*—This company has declared an extra dividend of 1 per cent on the 5 per cent preferred stock and the regular quarterly dividend of 1¼ per cent on the 5 per cent prior preference and the 5 per cent preferred stocks all payable November 1 to stock of record October 14.

The declaration of 1 per cent extra by the Pere Marquette on the 5 per cent preferred stock is made on account of the arrears of the cumulative dividend on said preferred stock. This reduces the amount of such arrears to 2 per cent.

SEABOARD AIR LINE.—*Asks Authority for Equipment Trust.*—This company has applied to the Interstate Commerce Commission for authority for the issuance of $2,500,000 of 5½ per cent equipment trust certificates which have been sold to Freeman & Co., New York, at 96.63.

ST. LOUIS-SAN FRANCISCO.—*Asks Authority for Equipment Trust.*—This company has applied to the Interstate Commerce Commission for authority to issue $6,000,000 of 5 per cent equipment trust certificates to be sold to a number of banks at 96.

TENNESSEE.—*Authorized to Issue Securities.*—The Interstate Commerce Commission has authorized an issue of $600,000 of first mortgage 6 per cent 15-year gold bonds, part to be pledged as security for certain promissory notes and the remainder exchanged for outstanding first mortgage bonds and matured interest coupons. The company was also authorized to issue $100,000 of general mortgage bonds and three promissory notes amounting to $142,249.

TENNESSEE CENTRAL.—*Authorized to Issue Securities.*—The Interstate Commerce Commission has authorized this company to issue $937,000 of first mortgage 6 per cent gold bonds to be pledged with the Secretary of the Treasury as part collateral for a loan from the government and to assume obligation and liability in respect of $636,866 of equipment trust certificates also to be pledged with the Secretary of the Treasury.

Treasury Payments to Railroads

Since last announcement, dated August 31, 1922, payments under Sections 204, 209, and 210 of the Transportation Act, 1920, as amended, have been made by the Treasury as follows:

Section 204:	
Bridgton & Saco River Railroad Company	$15,359.93
Cazenovia Southern Railroad Company	7,187.52
Illinois Northern Railway	202,509.43
Intermountain Railway Company	20,[illegible]
Lime Rock Railroad Company	10,441.[illegible]
Moscow, Camden & San Augustine Railroad Company	7,168.[illegible]
New Castle & Ohio River Railway Company	1,128.[illegible]
Sandy River & Rangeley Lakes Railroad Company	52,585.11
Statesville Railway Company	7,178.[illegible]
Susquehanna & New York Railroad Company	20,271.48
Wabash, Chester & Western Railroad Co.	[illegible]
Section 209:	
Central West Virginia & Southern Railroad Company	8,574.[illegible]
Central Vermont Railway Company	[illegible]
Chicago, St. Paul, Minneapolis & Omaha Railway Company	368,[illegible]
Detroit & Mackinac Railway Company	61,[illegible]
Ft. Smith, Subiaco & Rock Island Railroad Company	5,[illegible]
Georgia, Southern & Florida Railway Company	[illegible]
Minneapolis Eastern Railway Company	[illegible]
Mobile & Ohio Railroad Company	[illegible]
New York, Ontario & Western Railway Company	[illegible]
Osage River Railway	[illegible]
Susquehanna & New York Railroad Company	[illegible]
Tennessee, Alabama & Georgia Railroad Company, Receiver	[illegible]
Trans-Mississippi Terminal Railroad Company	[illegible]
Section 210:	
The S[illegible] Company	1,[illegible]
Total	$3,133,151.62

Total payments to September 30, 1922:		
(a) Under Section 204, as amended by Section [illegible] for reimbursement of deficits during Federal Control:		
(1) Final payments, including partial payments previously made	$[illegible],185.18	
(2) Partial payments to carriers as to which a certificate for final payment has not been received by the Treasury from the Interstate Commerce Commission	[illegible].34	
Total payments as reimbursement of deficits		34,727,[illegible].52
(b) Under Section 209, as amended by Section 212 for guaranty in respect to railway operating income for first six months after Federal Control:		
(1) Final payments including advances and partial payments previously made	[illegible]	
(2) Advances to carriers as to which a certificate for final payment has not been received by the Treasury from the Interstate Commerce Commission	[illegible]	
(3) Partial payments to carriers as to which a certificate for final payment has not been received, as stated above	127,[illegible]	
Total payments account of said guaranty		448,055,813.23
(c) Under Section 210 for loans from the revolving fund of [illegible] therein provided		315,821,[illegible]
Total		$768,[illegible]

Repayments of loans have been made to the amount of $83,945,336.

Dividends Declared

Delaware, Lackawanna & Western.—[illegible] per cent, quarterly, payable October [illegible] to holders of record October 7.

El Paso & Southwestern.—1½ per cent, quarterly, payable October [illegible] to holders of record September [illegible].

Meadville, Conneaut Lake & Linesville.—[illegible] per cent, payable October 1 to holders of record September 20.

New London Northern.—2¼ per cent, quarterly, payable October 2 to holders of record September 16.

Pittsburgh & West Virginia.—Preferred, 1½ per cent, quarterly, payable February [illegible] to holders of record February 21.

Trend of Railway Stock and Bond Prices

	Oct 3	Last Week	Last Year
Average price of 20 representative railway stocks	72.58	72.01	57.16
Average price of 20 representative railway bonds	88.70	89.34	76.58

Railway Officers

Executive

Edgar P. Earle has been elected president of the East Tennessee & Western North Carolina with headquarters at Johnson City, Tenn. **J. E. Vance** has been elected vice-president and treasurer.

D. Upthegrove, whose promotion to acting president of the St. Louis Southwestern with headquarters at St. Louis, Mo., was reported in the *Railway Age* of August 19, has been elected president to succeed J. M. Hurst, deceased.

G. C. Jones, assistant to the president of the Grand Trunk, with headquarters at Toronto, has been assigned to perform such work as may be designated by the vice-president and general manager and the position of assistant to the president has been abolished.

E. L. Whitney, assistant general freight agent of the New York Central, with headquarters at Chicago, has been appointed assistant to the vice president in charge of industrial developments of the Indiana Harbor Belt, the Chicago Junction and the Chicago River & Indiana, with the same headquarters.

E. E. Nash, formerly vice-president and general manager of the Minneapolis & St. Louis, with headquarters at Minneapolis, Minn., who resigned on June 15, 1922, to become western representative of the American Locomotive Company with headquarters at Chicago, and whose photograph and sketch appeared in the *Railway Age* of June 17, has returned to the Minneapolis & St. Louis as vice-president in charge of operation and maintenance.

Financial, Legal and Accounting

H. R. Martin, whose promotion to general attorney of the Grand Trunk Western lines, with headquarters at Detroit, Mich., was reported in the *Railway Age* of September 16, was born February 15, 1881, in Attica township, Lapeer county, Mich. He was graduated from the Detroit College of Law in 1901 and was admitted to the Bar by the Michigan Supreme Court in June of the same year. He practiced law with H. Geer and became a member of the law firm of Geer, Williams, Martin & Butler in 1905 which company later became Geer, Martin & Neudorfer. He will now devote his time exclusively to the Grand Trunk's legal work, having jurisdiction over the Grand Trunk lines West of Detroit and the St. Clair River, including Michigan, Indiana, Illinois and Wisconsin.

H. L. Lehmkuhle has been appointed general accountant of the New York, Chicago & St. Louis and the Lake Erie & Western, with headquarters at Cleveland, O. **C. L. Peckham** and **A. W. Latham**, assistant auditors of the New York, Chicago & St. Louis, with headquarters at Cleveland, have been appointed assistant controllers of the combined roads, with the same headquarters. **W. H. Elmendorf**, auditor of the Lake Erie & Western, with headquarters at Indianapolis, Ind., has been appointed auditor of disbursements, and **W. W. Cumberworth**, auditor of freight accounts of the Lake Erie & Western, with headquarters at Indianapolis, Ind., has been appointed assistant auditor of freight accounts of the two roads, both with headquarters at Cleveland. The above appointments are the result of the consolidation of the accounting departments of the New York, Chicago & St. Louis and the Lake Erie & Western.

Operating

D. H. Miller, general yardmaster of the Illinois Central at Herrin, Ill., has been promoted to trainmaster, with the same headquarters.

F. M. Allison, superintendent of the East Tennessee & Western North Carolina, has been promoted to general superintendent.

W. W. Shoemaker, road foreman of engines of the Seaboard Air Line, with headquarters at Jacksonville, Fla., has been promoted to trainmaster, with headquarters at Hamlet, N. C., with jurisdiction over Andrews, S. C., and territory north thereof.

E. J. Devans, superintendent of the Buffalo, Rochester & Pittsburgh, with jurisdiction over the entire line, has been reappointed general superintendent. This position, along with several others, was abolished on September 1, 1921, and is now re-established, effective October 1. Other appointments occasioned by the re-establishment of the positions are **A. B. White**, superintendent, with headquarters at Punxsutawney, Pa.; **M. G. McInerney**, superintendent, with headquarters at Rochester, N. Y.; **F. H. Post**, superintendent, with headquarters at DuBois, Pa.; **T. C. McCarthy**, assistant superintendent, East Salamanca, N. Y.; **J. J. Garin**, chief dispatcher, East Salamanca; **P. N. Boylan**, chief dispatcher, Rochester; headquarters of **H. E. Patterson**, assistant superintendent, East Salamanca, transferred to Rochester.

N. A. Williams, whose promotion to general superintendent of the Los Angeles & Salt Lake, with headquarters at Los Angeles, Cal., was reported in the *Railway Age* of September 16 (page 544), has been promoted to acting general manager, succeeding W. H. Comstock, temporarily assigned to other duties. Mr. Williams was born May 29, 1778, at Laclede, Mo., and entered railway service July 22, 1898 as a brakeman on the Chicago, Burlington & Quincy at Brookfield, Mo. On January 28, 1902, he left to become a brakeman on the Denver & Rio Grande and on April 3, 1903, was promoted to conductor. On August 10, 1909, he was promoted to assistant superintendent, which position he held until July 1, 1910, when he was promoted to superintendent. He resigned on May 1, 1914, to engage in private business and re-entered railway service September 1, 1916, as a trainmaster on the Union Pacific at Grand Island, Neb., which position he held until June 1, 1917, when he was promoted to assistant superintendent. On February 22, 1918, he was promoted to superintendent and on December 10, 1921, to acting general superintendent. He was promoted to general superintendent of the Los Angeles & Salt Lake, with headquarters at Los Angeles, Cal., on August 6, 1922, and on October 1 was appointed acting general manager.

Traffic

C. L. Brown has been appointed general agent of the Pere Marquette, with headquarters at San Francisco, Cal., succeeding E. S. Andrews, deceased.

L. L. Lapp, chief clerk to the vice-president and general manager of the Gulf, Mobile & Northern, with headquarters at Mobile, Ala., has been promoted to division freight agent, with headquarters at Meridian, Miss.

B. J. Lawless has been appointed commercial freight agent of the Buffalo, Rochester & Pittsburgh, with headquarters at Newark, N. J. **J. C. Gross** has been appointed to a similar position, with headquarters at Pittsburgh, Pa.

J. O. Gill, district freight agent of the Gulf, Mobile & Northern, with headquarters at Mobile, Ala., has been promoted to general freight and passenger agent, with the same headquarters, succeeding **E. W. Ritchie**, resigned to enter the executive department of the Louisville & Nashville, with headquarters at Louisville, Ky.

W. F. Lincoln, whose promotion to general freight agent of the Union Pacific, with headquarters at Los Angeles, Cal., was reported in the *Railway Age* of September 9 (page 491), was born on November 12, 1870, at Baltimore, Md. He entered railway service in May, 1887, in the general freight office of the Southern Pacific at San Francisco, and remained with this company until January 1, 1905. On this date he entered the employment of the San Pedro, Los Angeles & Salt Lake, as a rate clerk, which position he held until No-

vember 15, 1911, when he was promoted to assistant general freight agent. He was holding this latter position at the time of his recent promotion.

Mechanical

B. F. Kuhn, district superintendent of motive power of the New York Central, Lines West, with headquarters at Collinwood, O., has been promoted to assistant superintendent of motive power, Lines West, with headquarters at Cleveland, Ohio.

W. W. Payne has been appointed road foreman of engines of the Seaboard Air Line, with headquarters at Jacksonville, Fla., succeeding W. W. Shoemaker, appointed trainmaster of the East Carolina division. **H. M. Agin** has been appointed assistant road foreman of engines, with headquarters at Waldo, Fla.

Engineering, Maintenance of Way and Signaling

A. J. Hammond, assistant chief engineer of the Chicago Union Station Company, with headquarters at Chicago, resigned September 30 to become associated with James O. Heyworth, engineer and contractor, Chicago, Ill.

Special

J. G. Hughes, whose promotion to assistant commissioner of taxes of the Atchison, Topeka & Santa Fe, with headquarters at Topeka, Kan., was reported in the *Railway Age* of September 9 (page 492), was born in 1878, at Oakland, Cal. He entered railway service in 1917 in the valuation department of the Gulf, Colorado & Santa Fe and remained with this company until the latter part of 1918, when he entered the employ of the St. Louis-San Francisco as land appraiser and served in this capacity until the fall of 1919 when he was placed in charge of joint land appraisals, with headquarters at St. Louis, Mo., which position he held until July, 1921. He became land assistant in the valuation department of the Atchison, Topeka & Santa Fe on the latter date and held this position until his promotion to assistant commissioner of taxes.

Donald D. Conn, of Minneapolis, Minn., has been appointed manager of the public relations section of the Car Service Division of the American Railway Association, at Washington, effective on October 1. He takes the place made vacant by the resignation of **A. G. Gutheim,** who left to practice law. Among Mr. Conn's duties will be those of making special studies, from time to time, of such subjects as may require special attention on the part of the Car Service Division, such as the movement of coal, grain, or other important and seasonal commodities. Mr. Conn was formerly head of the traffic department of the Shevlin, Carpenter & Clarke Company of Minneapolis, and later was head of the Transportation Division of the Joint Congressional Commission of Agricultural Inquiry. More recently, Mr. Conn was appointed assistant to Conrad E. Spens, federal fuel distributor. Mr. Conn was born at Boston, Mass., but most of his life has been spent in the Middle West. He was educated at the University of Michigan and at Cornell University and after some early training in the railroad business he became general traffic manager of the Shevlin, Carpenter & Clarke Company at Minneapolis in 1916. He has also been chairman of the transportation committees of the Western Pine Manufacturers Association, the Northern Pine Manufacturing Association and a member of the transportation committee of the National Lumber Manufacturers Association. In May, 1921, he was appointed chief of the transportation division of the Joint Congressional Commission of Agricultural Inquiry.

Donald Conn

Obituary

H. G. Sparks, vice-president and general manager of the Gulf, Mobile & Northern, with headquarters at Mobile, Ala., whose death from gangrene of the throat occurred on August 17, was born December 23, 1880, at Muncie, Ind. He graduated from Washington and Jefferson University in 1903, and entered railway service in May, 1905, as a rodman of the Chicago & Eastern Illinois with which company he was consecutively assistant engineer, office engineer, division engineer, assistant superintendent and superintendent until March, 1920. On October 1, 1920, he entered the employ of the Gulf, Mobile & Northern as operating assistant to the president, with headquarters at Mobile, Ala., and on November 1 of the same year he was promoted to general manager, with the same headquarters. Early in 1922 he was elected vice-president and general manager, with the same headquarters, which position he was holding at the time of his death.

H. Visscher, treasurer and paymaster of the Kansas City Southern, with headquarters at Kansas City, Mo., and consul for the Netherlands, died on September 21 after a lingering illness due to a complication of diseases. Mr. Visscher was born on April 18, 1871, in Deventer, Holland, and came to the United States in 1893 as a representative of the Dutch interests that financed the Missouri, Kansas & Texas Trust Company and the Kansas City, Pittsburgh & Gulf, which was reorganized after the receivership under the name of the Kansas City Southern on April 2, 1900. He was assistant treasurer of this company from its reorganization until May 9, 1906, on which date he was promoted to treasurer, the position he was holding at the time of his death. Mr. Visscher was appointed consul for the Netherlands in Kansas City in 1915, and was the first consul for that country to be located permanently in Kansas City.

H. Visscher

C. T. Ames, superintendent of the Des Moines Valley division of the Chicago, Rock Island & Pacific, with headquarters at Des Moines, Iowa, whose death from the collision of a track motor car, on which he was riding, and an automobile truck, was reported in the *Railway Age* of September 30 (page 634), was born November 5, 1875, at Boston, Mass. Mr. Ames entered railway service in October, 1892, as secretary to the general freight agent of the Fitchburg (Boston & Maine) at Boston. On January 13, 1903, he entered the service of the Chicago, Rock Island & Pacific as secretary to the superintendent of the Illinois division at Rock Island, Ill., since which he has been chief clerk to the superintendent of the Illinois division, service inspector in the general manager's office, with headquarters at Chicago, assigned to special work in the general superintendent's office, with headquarters at Des Moines, Iowa, transportation clerk in the general manager's office at Chicago, chief clerk to the vice-president in charge of operation, superintendent of the Chicago Terminal division, with headquarters at Chicago, trainmaster of the Des Moines Valley division, with headquarters at Des Moines, due to the consolidation of the division, and superintendent of the Des Moines Valley division, with the same headquarters.

Brighter Prospects for the C. N. R.

The outlook for the future of the Canadian National Railways has brightened with the consolidation of all the properties under one management and the appointment of Sir Henry Thornton to the chairmanship of the board of directors. Only two of the new directors have had railway experience; the rest of them represent various interests, economic and political, including that of organized labor. Presumably, then, the task of operating the properties will devolve almost entirely upon Sir Henry Thornton. Sir Henry has had experience at several widely different types of railroading in this country and abroad and he has succeeded at all of them. He has the confidence and respect of all with whom he has had dealings. His relations with labor have been particularly pleasant during his period with the Great Eastern in England. Concerning the widely different interests represented on the new board of directors, particularly that of organized labor, he has no fears. To use his own words, "A man is either straight and competent or crooked and incompetent. If he is crooked and incompetent we can easily rid ourselves of him. If, on the other hand, he is straight and competent, we have no need for fear simply because he is a labor man or the representative of any other economic interest." On another page in this issue is an article giving the details of the reorganization of the Canadian National. We feel that our readers will join with President Rea of the Pennsylvania in welcoming the appointment of Sir Henry because "he brings to his great task that full knowledge and experience of the transportation situation" which will be advantageous both to Canada and the United States.

Take Advantage of the Natural Tendencies

Analyses of railway operating statistics, unless made with extreme caution, may easily lead to erroneous conclusions. Unless all the prime factors exerting an influence on a given set of figures are taken into consideration, one may easily be led astray. As a case in point, an increase in the net tons per loaded car during succeeding months is no criterion of the amount of effort being exerted by the railroad to increase the average car loading, because the load per car increases automatically during periods of industrial expansion. The character of traffic also has an important influence. For example, variations in the amount of ore and coal movement will always be reflected in changes in the load per car. Thus, in the case of one western railroad handling considerable coal traffic, the net tons per loaded car decreased from 28.9 in March to 20.7 in April, as a consequence of the coal strike. Probably, the most vital factor influencing the car loading is the change in the attitude of the shipper which takes place during a period of improving business. Naturally, during times when the volume of his sales depends almost wholly on his success in effecting shipments, he will take full advantage of every car placed at his disposal. Therefore, even though a railroad makes no organized effort whatever to secure heavier loadings per car, an increase in the average loading is almost certain to take place. But this automatic improvement will by no means equal that which may be obtained if the management directs its efforts to this end. The greatest improvement in the car loading may perhaps be effected by showing full appreciation of the efforts made by shippers who show the greatest willingness to co-operate.

Training Railway Employees

This country is far behind Great Britain in its facilities for educating railway employees. It is true, of course, that certain roads provide courses of training for apprentices and that instruction in the operation of air brakes and other mechanical devices is given to other employees from time to time. Moreover, a number of universities offer courses in transportation subjects for regularly enrolled students, but practically no provision at all has been made for the education of men in active railroad service in such fundamental subjects as railway economics, principles of train operation and the like. As a contrast to what has *not* been done in this country, we have the statement from our British contemporary, Modern Transport, that a total of 557 railway employees attended the classes on transportation offered during the academic year 1921-1922 by the London School of Economics. Such a large attendance, of course, could not have been secured without the whole-hearted co-operation of the railways entering London. These courses were given for the most part in the evening and at other times so arranged as not to conflict with the hours of duty of the employees. In all eleven courses of lectures were offered, including such subjects as Organization of Transport, Economics of Transport, Commercial Railway Economics, Operating Railway Economics, Railway Statistics, Factors in Train Operation and Control, the Railway in Relation to the State, the Law of Carriage by Railway, etc. Such educational advantages serve the dual purpose of interesting employees in their daily activities and in providing well trained men for promotion to positions of higher responsibility. In practically every large American city there is a university or similar institution which conducts evening classes in various lines of study for the benefit of persons employed during the day. If the railways would interest themselves in the matter, these institutions would doubtless be glad of the opportunity to increase their curricula to include railway subjects.

The Smaller Mechanical Associations

The last two years have been unusually difficult ones for all of the railway mechanical associations and this has been particularly true of the smaller associations which are composed of foremen of the various departments, such as the general foremen; master blacksmiths; master boilermakers; tool foremen; chief interchange and car foremen; master tinners, coppersmiths and pipefitters; air brake men; and traveling engineers. The need for strict economy has either made necessary the abondonment of conventions, or has materially restricted the attendance. Several of these associations, which regularly meet in the fall, have been forced recently to cancel convention plans or to postpone them until later in the year because of the shopmen's strike, which made it impossible for

foremen who had to do with the maintenance of equipment to leave their posts for even a few days. These associations have accomplished much in the past and are responsible for the introduction of many improved practices and methods of doing work which have saved the railroads many times over the small expense involved in maintaining the associations and in holding their annual conventions. Printed committee reports are valuable and helpful to a member who is obliged to stay at home, but the only way in which he can obtain the greatest help is by talking over his problems with others who are working in the same field. Much of the benefit of a convention which is taken home, never gets into the printed proceedings, but is developed through informal conversation. The present time is a critical one for some, if not all, of these associations. The demands upon the supervisory mechanical officers are bound to be heavy in the next few years and many new men will be needed. Everyone will require all the assistance and helpful inspiration that can be obtained from the work of the various associations. There never was a time when such work was of greater importance or more lasting good could be accomplished. It is to be hoped that such associations will receive the needed and whole-hearted support of the higher executives of the railways.

Water Supply and Traffic Movement

In the every day work of a railroad, occasions seldom arise where it becomes necessary to the functioning of their departments that officers charged respectively, with the responsibility of supplying water and with the moving of cars should "lose any sleep" over each other's trials and tribulations. So well established is the understanding that to supply water is one thing and to handle tonnage another that it is rare for either branch to manifest more than a casual interest in the affairs of the other. In keeping with this, those entrusted with the water supply ordinarily concern themselves little with what transpires on the locomotive side of the water tank other than to prevent a reckless waste of water where it is none too plentiful. But the situation, for a time, is now changed. The business of moving traffic is the immediate concern of all; a circumstance which means several things in water service. In general, it means, first, that present practices in water service must for the time be justified unequivocally by their contribution to the moving of business or be suspended until the emergency is passed. Specifically, it means that the department, above all else, should so study the trend of consumption and adapt its equipment to the consumption as effectively to guard against shortage. This may lead to a new pumping schedule, or to the repairing of a pump which might otherwise be left untouched until a breakdown occurs. Or, as in the case of one railroad, it may lead to the temporary installation of emergency pumping units. Next to preventing shortage, it means that efforts shall be directed to the elimination of all causes of delay to trains, however slight, that may result in one way or another from a shortcoming in water service. An investigation to this end may disclose the advisability of again cleaning all roadside tanks as well as the more frequent sludging of settling tanks to protect locomotives from delays resulting from roily water. Again, it may disclose the advisability of making a radical alteration in the prevailing method of treating the water in order to eliminate road troubles, even if at the expense of a little more shop work. It may warrant slight changes around the standpipes that will enable engines to take water more quickly, or even such a modification in the method of receiving chemicals or other supplies as will release cars more quickly for revenue service.

Employee Representation on the Pennsylvania

The shopmen's strike and the way in which the Pennsylvania Railroad came through it has served to focus attention on the scheme of employee representation which has been developed on that system during the past year and a half. Less than 30 per cent of the Pennsylvania shopmen left the service when the strike was called, and two months after the strike started the shop force had been restored to more than 95 per cent of the normal working force. The first comprehensive and authoritative account of the development of the employee representation plan and its workings has just been given out—an article in this issue covers it fully. The plan marks a distinct step forward in drawing the men and the management closer together and making a larger degree of real team work possible—a thing which is quite necessary if American railroads are to serve the public acceptably. Briefly the plan provides for the employees having a voice in matters affecting their welfare. The machinery which has been set up makes possible a prompt consideration of all grievances, criticisms and suggestions; these are freely and openly discussed around the table by representatives of the men and the management. The plan itself seems to be mechanically correct. The real factor, however, is the spirit which must vitalize it—a spirit of co-operation and fairness. That this is not lacking is indicated by the results that have been obtained thus far. It is important to understand, in installing and developing a scheme of this sort, that it must be dominated by the right sort of spirit and this must extend from the very top—the board of directors—all the way down to the least important foreman. Even one man in the chain who may be out of harmony will do much to endanger its success. The operation of the plan should incidentally locate inefficient foremen or officers, at least from the standpoint of understanding men and controlling them, and thus make it possible to develop them by proper coaching and training, or to eliminate them if they fail to improve. Handling grievances promptly at the point where they develop prevents their spreading and becoming aggravated; it adds dignity to the local supervision and makes for closer and more cordial relation between the men and the local officers.

Do Railroads Suffer From Inbreeding?

"NINETY PER CENT of the success of a railroad depends upon the human element." This is one man's estimate of the value of personnel in railroading. The same idea has often been expressed by others and is, beyond question, the dominant thought underlying all management. Transportation means movement, consequently dynamic energy is the important quality in those who direct it. But it is not alone in the transportation department that the human element is a vital factor. The effectiveness of the various special branches of the railway organization is even more dependent on good leadership. If a division superintendent, a general superintendent, or a master mechanic, proves unworthy, the results of his shortcomings become apparent to his superiors almost immediately and he is quickly brought to account or dismissed. But there is no such check on the bridge engineer, the engineer of tests, the signal engineer, the superintendent of timber preservation, the general safety agent, the superintendent of water treatment and the director of fuel conservation. So long as the work assigned to them moves smoothly and they keep out of trouble they are comparatively safe in their positions. The real success of the special department, as measured by the extent to which it becomes a vital factor in the efficient operation of the property, depends on the extent to which the man in charge is able to convince the management of the merits of the various measures which he wishes to initiate.

The success of a specialist not only implies a profound knowledge of his subject, but demands also personality and force that can drive home the ideas which his special knowledge gives him. Obviously, this calls for the exceptional individual. The man must be willing to devote his time to the minute technology of his own specialty and this as a rule unfits him for promotion to other branches of the service. The direct result is that his tenure of service in a given position is usually much longer than in the case of the operating officer, who, if he is successful, is frequently transferred from one point to another and rapidly advanced to positions of greater responsibility.

Because of the limited opportunities for promotion and because of the predominating characteristic of the department head, it is usually found that these special departments are of the one-man type. His individuality dominates the work. He alone is held responsible for the results. The situation is one not specially conducive to the development of competent assistants or understudies.

While the one-man organization places a subordinate in an unfortunate position and tends to drive out the more ambitious members of the staff, it does no particular harm to the property as a whole, so long as the head of the department retains his position. The difficulty arises when he resigns or dies. Usually no strong man is available to take his place, but notwithstanding this fact someone from his organization, or, someone from another department of the road, is selected to take his place. The result in either case is much the same. The new incumbent must be educated either in the technology of his position or in the art of management and several years will elapse before the department can recover from the period of ineffective leadership.

Much better results would be obtained if the railroads pursued the policy of canvassing the entire special field for a fitting successor, something which could be done through the channels of the various national associations. A man secured in this way would often be more familiar with the work of his predecessor than anyone actually having previous service on the railroad, but the greatest gain would accrue from the healthy turn-over in the field as a whole. Promotions would be more frequent and the special knowledge would be more thoroughly disseminated among the various roads. It would overcome the effects of the inbreeding from which the special departments on some of the roads of the country are suffering.

Settlements with Train Service Employees

MANY OF THE RAILWAYS recently have made agreements with the conductors' and trainmen's organizations under which the present wages and working conditions of these employees will be maintained for a year. Some railways have made similar agreements with the engineers' and firemen's organizations. These developments mean that existing controversies between the railways and organizations signing the agreements will be withdrawn from the Railroad Labor Board for the period mentioned. Indications are that in a comparatively short time practically all the railways will make similar settlements with the engine and train service employees.

The reasons why these settlements are being made are fairly obvious to those familiar with the pertinent facts. The engineers and conductors are the highest paid railway employees. The firemen and trainmen are among the highest paid. When the railways about a year ago applied the second time within a year to the Railroad Labor Board for general reductions in wages, they asked that the wages of train service employees should be reduced ten per cent, and that time and one-half for overtime in freight service should be abolished.

It was evident even then, however, that serious difficulties would be encountered in trying to secure reductions of the wages of these employees. The RAILWAY AGE mentioned these at that time. The work done by employees in train service is different from that done by any class of workers in any other industry, and therefore it was impracticable to base petitions for reductions in their wages upon the ground that they were being paid more than men doing similar work in other industries. Furthermore, measured by the increase in the cost of living since before the war, the pay of engineers and conductors generally did not show increases in purchasing power. Measured by the same standard, the wages of firemen and trainmen had increased, but not anywhere near as much as those of most other classes of employees. Since then there have been no substantial changes in the cost of living. It was, therefore, plain that the railways would find it difficult to make a case before the Labor Board under the provisions of the Transportation Act for reductions of the basic wages of train service employees.

The situation was different with respect to time and one-half for overtime in freight service. It is based upon an unsound principle and by giving employees a positive incentive to delay the movement of trains it tends to interfere with efficiency of operation. We have not heard the last of it yet. But the railways have just gone through a strike of shop employees which has more or less crippled many of them. They are confronted with a demand for the movement of the largest traffic in history. For them to have got into a serious controversy with the train service employees under present conditions would have been most undesirable from their standpoint, and especially from the standpoint of the public.

There was another reason why the railways were disposed to deal even generously with employees in train service. With a few exceptions they have stayed at work and faithfully performed their duties during the shop employees' strike when such performance of their duties was almost vital to the interests of the railways and the welfare of the country. This undoubtedly influenced many railway managers to be disposed to postpone any attack upon their wages. If a serious effort was not to be made in the near future to secure reductions of their wages it was expedient to take action that would show this was the case. The railways under present conditions need the most efficient service that the train service employees can render, and they would have found it impossible to get such service from them if the employees had been in constant fear that proceedings speedily would be pushed for reductions in their pay.

The railway industry needs a truce to labor controversies in present circumstances above almost everything else. The shop employees' strike is now on most railways a matter of history, although the effects of it are still felt and long will be felt. Peace between the railways and the train service employees now seems certain for at least a year. No other class of employees can by strikes or other means seriously interfere with the movement of traffic. So far as the labor situation is concerned, it would seem that the railways are now going to be given an opportunity to operate their properties for a time with maximum efficiency.

While the wages of train service employees were reduced by a small percentage in 1921, the agreements made leave them among very highest paid of any class of working men in American industry. The average monthly earnings of railways general officers, including all the so-called "fancy" salaries, are $532, and of division officers, $320, the average for all general and division officers being $418. The

average monthly earnings of passenger engineers in July were $254, or an annual rate of $3,048, and the average earnings of passenger conductors were $233, or at an annual rate of $2,796. The average earnings of engineers in freight service were $237, and of conductors in similar service, $212. The average earnings of passenger firemen and helpers were $187, and of passenger brakemen and flagman, $155, the average earnings of firemen in freight service were $165, and of freight brakemen, $154. The highest wage of all, that of freight engineers in local and way freight service—$275 a month, or at an annual rate of $3,300—is not much below the average earnings of division officers, and is more than half as large as the average earnings of general officers. The lowest, that of brakemen, exceeds $1,800.

Certainly none of these classes of employees can justly complain about their compensation in comparison with that received by their officers, or that received by men in any other industry. Once having agreed to continue to pay them these relatively high wages, the railways will have the right to ask in return the most loyal and efficient service that they are capable of rendering.

Keep the Individual Car Moving

WITH A SHORTAGE of more than 100,000 cars at the last report (September 23) it is evident that the limited car supply is now an important factor in the ability of the railways to meet the transportation demands of the country. Every effort that is made, therefore, to use more intensively the cars that are available tends to increase their capacity. Heavier loading of cars is one alternative with vast possibilities; the reduction of delays to cars is another. Both now require increased supervision, particularly the latter

To keep *all* cars moving, attention must be given to *each* car. The big problem now is to bring to light the individual car, loaded or empty, which is being delayed, for when discovered the remedy is obvious in most cases. Nothing will contribute more to this than the personal checking of "on hand" reports by local operating officers at short intervals. The detection by each operating officer of at least one car every day that would otherwise have remained idle will do much to stimulate activity in this direction.

The problem of keeping cars moving has many ramifications. It involves the constant checking of yards to detect cars delayed by "no bill" or other causes, the supervision of company material shipments, the regular inspection of outlying sidings and spur tracks, the prompt and frequent switching of repair tracks, etc. It also involves enlisting the co-operation of shippers in releasing cars as quickly as possible, even when this involves overtime and extra expense for them. At a time such as the present when the co-operation of each shipper will contribute to the common good of all by increasing the number of cars available for their traffic, it is possible to induce many of them to employ extra forces or to work forces longer hours to load and to unload cars more quickly. Many car days can also be saved by the co-operation of the shipper in keeping the railway advised regarding the unloading of cars so that it can move them promptly when released and also in unloading them quickly when placed.

The greatest improvement in the use of cars will not be secured by new or novel means, but by the universal application of those measures with which every railway operating officer and shipper is familiar, but the importance of which they may fail to realize as an aid in the present period of heavy traffic. If those measures are adopted which will keep each individual car moving, as far as practical, the question of car mileage will be answered and a long step will be taken toward meeting the present unusually heavy transportation demands.

Getting the Most Out of Locomotives

NEVER IN HISTORY did conditions so imperatively demand that the railways should get the most possible service out of their locomotives as they do now. The RAILWAY AGE showed in an editorial published two weeks ago how greatly the increase in the number of locomotives in service has declined within the last twenty years.

It is sometimes said by persons who do not study the facts that this decline of the increase in the number of locomotives in service has been largely or wholly offset by the increase in their average tractive power. Unfortunately, this is far from true. The Interstate Commerce Commission has published statistics regarding the tractive power of locomotives since 1902. In the five years ending with 1907 the average increase per year in the total tractive power of locomotives in service was 128,000,000 pounds. In the seven years ending with 1914 the average increase per year was less than 75,000,000 pounds. In the seven years ending with 1921 it was only 63,500,000 pounds. In the year 1921 it was less than 39,000,000 pounds.

Indications are that the increase in the demands of traffic will be as great in the present period of business revival as it has been in past periods of business revival. These figures demonstrate that the total increase in the tractive power of the locomotives in service has been nowhere near in proportion to the probable increase in the demands of traffic. It is probable that the amount of traffic handled cannot possibly be increased as much as it has been in past periods of active business.

The effects of the great decline in the amount of new locomotive power provided can be largely offset only by greatly increasing the number of tons carried one mile per locomotive and per pound of tractive power. The first thing needed to increase the amount of traffic handled with each unit of power is to secure the maximum practicable loading per freight car. Every unnecessary ton of the dead weight of cars which is pulled is a waste of power. The second most essential thing to do in order to secure the maximum utilization of available power is to increase the number of cars per train as much as is consistent with getting the trains over the road in reasonable time. Every time an engine is pulling less cars than it can reasonably pull there is a waste of power.

But the maximum utilization of power cannot be obtained unless every possible expedient is adopted to secure not only the heaviest practicable train loads, but to get the trains over the road with the least possible delay, and to keep locomotives out of shops and out on the line pulling trains as much of the time as practicable. The places where the worst congestions develop and delays occur on railroads are in yards and terminals and in roundhouses and shops. Usually the main tracks are not congested. Therefore, the more trains there are which are so made up and operated as to move long distances without breaking up and making up in intermediate yards, the greater will be the service obtained from power.

Likewise, the longer distances locomotives are run without being taken off trains and turned the greater will be the service obtained from the power. Of course, however, if locomotives are to be run longer distances without attention they must be sent out in the best practicable condition. Furthermore, if trains are to be moved with the maximum average speed practicable in proportion to the size of train loads, they must be despatched in such a manner as to permit the fewest and the shortest possible delays to them. Despatchers can do much to increase the service obtained from locomotives by using their utmost resources to prevent trains from accumulating at points where congestions of trains tend to develop, such as at coaling stations.

All such suggestions as the foregoing point to one sugges-

tion which, under such conditions as now exist, is of the most vital importance. That is, that the most intensive supervision should be exercised by yardmasters, roundhouse foremen, despatchers, trainmasters, road foremen of engines and other supervisory officers over the handling of locomotives and trains. The vital problem which must be solved if the railways are to move the maximum possible traffic with existing facilities is that of keeping not merely every car moving, but also every locomotive moving as much as possible with the maximum practicable load. Statistics upon the subject show not only that there has been a decline over a period of years of the increase in the total tractive power available, but that there has not been, even in times of heavy traffic, an increase in the number of ton-miles per locomotive proportionate to the increase in the average tractive power of locomotives. In other words, even the relatively small increase in tractive power has not been fully utilized. Further analysis of the statistics has shown that this has been due to the fact that the number of miles run per locomotive per month or per day has not been increased or even maintained.

The railways should be making every effort to increase the number of ton-miles per day of cars, but they should be making even greater efforts to increase the number of ton-miles per locomotive per day. Unless the statistics upon the subject are very misleading, there is a great opportunity to increase the amount of business handled with existing facilities by more intensive supervision to increase the mileage of service obtained from locomotives.

Organized Labor's Sense of Responsibility

THE REPORTS of the annual meeting of the National Union of Railwaymen, Great Britain, as published in the union's official magazine, would make surprising reading for anyone who knows labor unionism only from observing conditions in America. Most of the time of the convention, as could be expected, was taken up in the discussion of matters of union policy directly affecting the economic status of its members, but the duty of unionized employees to their employers and the public was not neglected. Witness the opinion of J. H. Thomas, parliamentary general secretary of the union, on the subject of railway employees who are found guilty of pilfering:

> They will get no sympathy or support from our organization in this matter, and I warn them that we will be as anxious as the railway companies to stop this kind of thing. We shall show no mercy to them. The union has respect throughout the length and breadth of the land, and has established the confidence of the railway management, which finds its reflex in many ways. We believe we can contribute to the efficiency of railway service, and we can do much to help the undertaking. We must let the traveling public know and feel in sending goods on the railway they are entrusting them to men who are jealous and proud to maintain their trust.

Local committees of employees and officers are the foundations upon which rest the peaceful adjudication of disputes on Great Britain's railways. Above the local committees are the district councils, above them the railway councils and above the railway councils the two national bodies, the Central Wages Board and the National Wages Board. This method of organization is important because it does away with the professional grievance man and distributes his functions over a larger number of men. The larger the number of employees who come together with their local officers, the larger the group which is going to be informed of the viewpoint of the officers; also, conversely, the officers will get the point of view of larger numbers of employees.

Because of the closer contact between officers and men, there is a considerable improvement in the interest of the union in the successful operation of the railways. C. T. Cramp, industrial general secretary of the union, at the annual convention outlined, as some of the accomplishments which the local committees should strive for, the prevention of claims for loss and damage, heavier and better car loading and improved efficiency generally. Mr. Cramp said further that, while he believed capitalism to be an evil thing, nevertheless that there were among those in high positions within the capitalist class men who were as fair and as honorable as anyone in his own class.

These favorable conditions obtain in Great Britain in spite of the fact that organized railway employees are committed to a policy of government ownership and operation with union participation the same as in America. The British unionists are evidently proceeding on the hypothesis that if the railroads are to be turned over to the government with union participation in management it will be better if they are turned over as going concerns rather than as bankrupts. They also appear to be working with the idea that if they are ever going to be allowed to participate in management under a policy of nationalization that it is up to them to prove themselves capable of performing such a trust.

If there is any lesson to be learned from the railway labor situation in Great Britain—and there should be many—it is that organized labor will find it to its advantage to develop a sense of responsibility in the performance of its duty to its employers and the public. As a corollary to this it might be added that employers should foster and encourage the development of this sense of responsibility by every means in their power—the outspoken recognition of the disciplinary action taken by the trainmen against leaders of certain outlaw strikers, for instance. Another method is the appointment of union leaders on technical commissions and calling for their advice and assistance in outlining the broader phases of railway policy. J. H. Thomas of the National Union of Railwaymen was one of the members of the commission which prepared the able report on automatic train control, a resumé of which was published in the *Railway Age* of July 22, page 149.

It is a question, of course, whether union leaders in this country would co-operate in any such arrangement or whether they would permit their members to meet with the managements in committees formed not only to adjudicate disputes but to promote efficiency of operation. That, however, is for the unions themselves to decide. They, more than anyone else, stand to benefit from the development of a sense of responsibility to their employers and the public. The railways and the public should, however, foster this development as much as they can—especially on the part of unions which by their age and the high ratio of their members to total eligible employees have given proof of their strength and permanence.

New Books

Railroads and Business Prosperity, a Series of Addresses and Papers Presented at the Annual Meeting of the Academy of Political Science in the City of New York, April 28, 1922 Edited by T. W. Van Metre and Parker Thomas Moon. 130 pages. 6 in. by 8½ in. Bound in Paper or Cloth. Published by the Academy of Political Science, Columbia University, New York. Price $1.50 Bound in Paper.

This book contains thirteen addresses on the subject of railway transportation which were delivered before the meeting of the Academy of Political Science on April 28. The speakers were well chosen and this report of their addresses gives in compact, readable form the best survey obtainable of expert opinion on current problems in railway economics.

As such it merits the attention of every railroad man who is concerned with the questions of railroad policy. No railway publicity man should be without it, as indeed should no one who is in any way interested in solving the problems confronting the railroads today.

The addresses reproduced in this book were on three general subjects, viz: the Labor Provisions of the Transportation Act; Railway Policies and the General Welfare; and Freight Rates and Business Revival. Some of the speakers were: Professor Henry R. Seager of Columbia University; Professor Frank H. Dixon of Princeton University; C. B. Heiserman, general counsel of the Pennsylvania; W. N. Doak, vice-president of the Brotherhood of Railroad Trainmen; Henry T. Hunt, formerly of the Labor Board; Henry C. Wallace, Secretary of Agriculture; Daniel Willard, president of the Baltimore & Ohio; Walker D. Hines, formerly director general of railroads; Professor W. J. Cunningham of Harvard University and R. H. Aishton, president of the American Railway Association.

The Academy of Political Science has shown its appreciation of the importance of the railroad problem by having scheduled it for discussion at two of its meetings during the past few years. The value of open forums such as these in bringing railroad problems to the attention of the intelligent public needs no extended elucidation. Railroad men can show their appreciation of the Academy's work in no better way than by following these meetings, if not in person, at least by a study of the proceedings.

The Eastern Railroad. By F. B. C. Bradlee. 118 *pages, 6 in. by 9¼ in. Cloth. Published by The Essex Institute, Salem, Mass.*

This is a book of a single chapter—of 118 pages; a "Historical account of early railroading in Eastern New England, second edition." The lack of chapter headings and of an index will detract from its usefulness, and the reader unacquainted with eastern Massachusetts and southern Maine needs a map if he is to read intelligently; but the book is very interesting in spite of these deficiencies.

The work is about the same as a journal, the only classification of material being chronological, but the author has selected his matter with excellent judgment, and there are no dull pages. He has given us, evidently, a faithful abstract of the railroad news (of that region) to be found in the files of the newspapers of Salem and Boston for the 60 years covered by his story. Yet it is not a mere abstract, as the author must have had a considerable personal acquaintance with the men and things with which he deals. He is a lover of accuracy.

The substance of the book is essentially "popular." The business and financial affairs of the railroad are not neglected, but the personalities of the officers, conductors and station agents, the time-tables, the pictures of locomotives and old station buildings and other features with "local color" constitute the most salient features. The consolidation of the Eastern and the Boston & Maine in 1884 is well covered.

New England was a field of anti-slavery discussion as far back as 1841 and it appears that the term "Jim Crow car" was in use at that time. Controversies about negro passengers led the Eastern Railroad to abolish second-class passenger cars, in which the fare had been about a third less than the first-class rates. The difference of view as to the use of the words "depot" and "station" seems also to have arisen back in those early days. "Depot" is used in officers' orders and quite generally, yet the pictures of early buildings show them lettered with the word "station." George Peabody, afterward eminent as a philanthropist, was president of the Eastern from 1836 to 1842.

The Eastern began using coal in its locomotives in 1858, but it neglected the use of the telegraph (except possibly in very unusual circumstances) until 1871, after the Revere collision, which killed 29 passengers. In 1872 Charles F. Hatch was brought from the Lake Shore & Michigan Southern and made general manager, and Hall automatic block signals (wire-circuit) were installed on 16 miles of the road. Although the Eastern was the main railroad from Boston to Maine and New Brunswick it had at that date only 20 miles of double track.

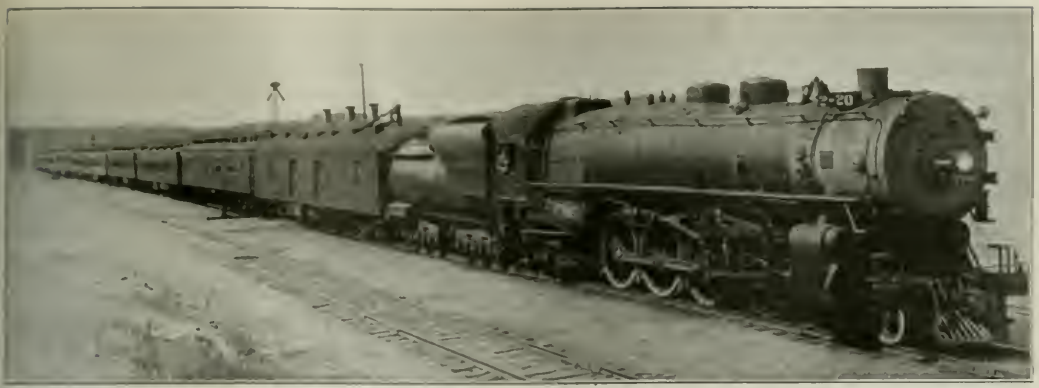
Proceedings of the American Wood Preservers' Association, 1922. *534 pages of text, 6 in. by 9 in. Illustrated. Bound in cloth or paper. Published by the American Wood Preservers' Association, S. D. Cooper, secretary, c/o Atchison, Topeka & Santa Fe, Topeka, Kan. Price, cloth* $6, *paper* $5.

As indicated by the title this is a report of the eighteenth annual convention of an association organized in 1905 for the development and improvement of the science of timber preservation, and the conservation of forests through the increased use of treated timber. One of the most valuable features of the volume is an annual report of statistical data on the use and consumption of treated timber, the volume of preservatives used, and other related data prepared by the United States Forest Service in co-operation with the American Wood Preservers' Association. The list of members in the back of the book, amplified by a classification of the membership according to railroads, industries, educational institutions, etc., also comprises a valuable "Who's Who" in the timber preserving industry. From the standpoint of the railway reader the volume this year is of greatest value because of the amount of space devoted to the economics of timber preservation as applied to railway crossties. Committee reports and individual papers presented and discussed at the convention in Chicago on January 24, 25 and 26, as reported in the proceedings include such topics as the Economics of Crosstie Renewal; Factors Affecting the Cost of Treated Crossties; the Feasibility of Introducing Tropical Ties in the United States; the Experience with Treated Wood on the Santa Fe; Should the Cost of Treating Ties Be Charged to Maintenance or Capital Account?, etc. Mention should also be made of the voluminous progress report made by the San Francisco Bay Marine Piling committee, which has developed valuable information concerning the marine borer problem. Other papers presented relate to the more technical problems of timber preservation and to efforts being made to promote the wider use of treated timber in the United States.

Universal Directory of Railway Officials, 1922. 5½ in. by 8½ in. 644 Pages. Bound in Cloth. Compiled by the Editor of the Railway Engineer (London) and Published by the Directory Publishing Company, Ltd., 33, Tothill Street, Westminster, London, S. W. 1, England.

This is the twenty-eighth annual edition of this work, which gives the names and addresses of principal officers of all the railways of the world. As such it is a valuable reference book for manufacturers of railway equipment and supplies and others who wish to keep in touch with railway officers in various parts of the world. Classification is by countries and under each country the names of the railways with a list of their officers are given in alphabetical order, together with a few details about each railway such as length of line, gage and number of locomotives and cars. Names of foreign railways are given in the language of the country together with their English equivalent. Reference is further facilitated by an alphabetical index of all railway officers. The book is as up-to-date as is possible under the circumstances.

The "Pullman News," October issue, contains an announcement of the establishment of free industrial insurance by the Pullman Company in connection with its system of employee representation.



Locomotive 7000 Hauls 11 Steel Cars Over a Heavy Grade Division

Service Records of U.P. Mountain Type Locomotives

Performance Indicates that No. 7000 Exceeds Both Theoretical Starting and Horsepower Capacity

THE LIGHTEST Mountain type locomotive in proportion to maximum horsepower capacity which has yet been built, was delivered to the Union Pacific by the American Locomotive Company late in May, 1922. From the date of breaking in during the last week in May to July 3, this locomotive made 10,000 miles, at the rate of 500 miles a day, and up to the end of August had made a total of 28,000 miles. Much of the service during this time has been made on runs of approximately 500 miles in length, some of which have been made without cleaning either the fire or the ash pan.

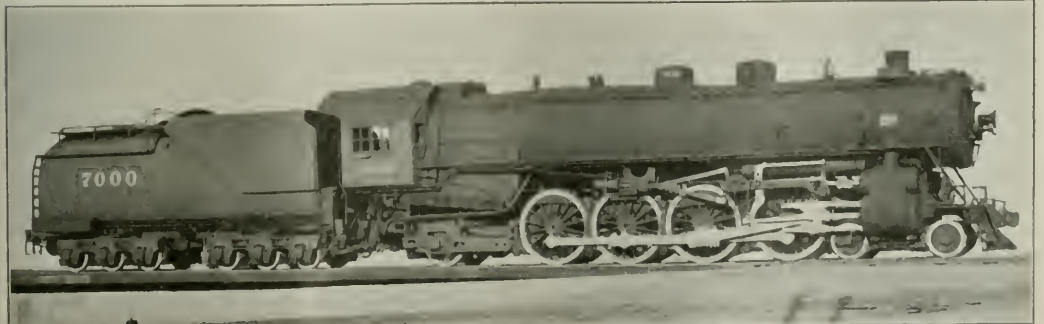
This locomotive, a description of which has already appeared in these columns,* has a total weight of 345,000 lb., of which 230,000 lb. is on the drivers, and a rated tractive effort of 54,800 lb. It has 73-in. driving wheels, 29-in. by 28-in. cylinders and a boiler pressure of 200 lb. per sq. in.

Engine No. 7000 and the 54 additional locomotives of the same type which have since been ordered, were built for use in passenger service between Cheyenne, Wyo., and Ogden, Utah, a distance of 484 miles in which are encountered numerous long grades. The character of the line, which is shown in the accompanying profile, is such that passenger trains have been handled by Mikado type locomotives. With these engines it has been necessary to maintain high running speeds on the down grades in order to maintain the passenger train schedules with the comparatively low speeds which can be made on the up grades. The high sustained capacity of the Mountain type locomotive was expected to maintain the schedules with less extreme variations from the average speed.

Locomotive 7000 made its first trip in passenger service on June 1. Following a trip from North Platte, Nebr., to Omaha, a distance of 281 miles, with a train of refrigerator cars weighing 2,460 tons, which took seven hours and fifty minutes, earlier in the day, the engine left Omaha at 4:30 P. M. with train No. 3 which it took through to Cheyenne, Wyo., a distance of 507 miles, arriving at 10:30 A. M. on June 2. On the same afternoon the locomotive left Cheyenne for Ogden, Utah, a run of 484 miles, with a train of 10 sleepers and two diners, a run requiring 15 hrs. 15 min. of continuous service from the locomotive, which was made with no trouble whatever from journals or bearings running hot.

One of the best runs indicative of the high sustained

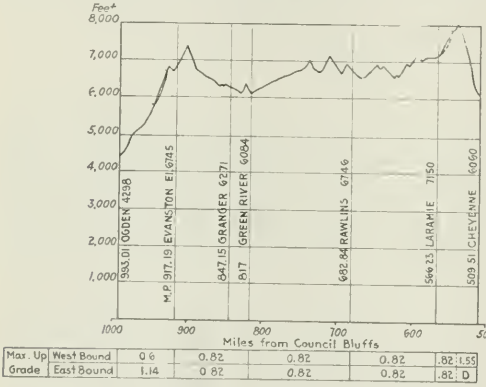
* See the June 10 issue of the *Railway Age*, page 1325.



This Locomotive Established New Records by Developing 3,500 Indicated Horsepower

capacity of the locomotive was made on June 9, when it took second No. 19 from Cheyenne to Rawlins, Wyo. The train, made up of 11 cars, left Cheyenne one hour late. Over the 57-mile district from Cheyenne to Laramie the train made a little better than running time. For the first 31 miles out of Cheyenne is encountered a steady up grade with a total change of elevation of slightly less than 2,000 ft. and about 10 miles of 1.55 per cent ruling grade. The schedule calls for an average speed of 28.4 miles an hour with no stops over this district. From Laramie to Rawlins the grade is broken, with the difference in elevation slightly favorable to westbound movement. Several grades, however, one of considerable length, are encountered. Over this district, 116 miles in length, the running time is three hours and twenty minutes, including four stops. Engine 7000 made this run in two hours and twenty-six minutes. Deducting the time for the stops, this required an average running speed of 60 miles an hour. The highest speed attained was 75 miles an hour, at which the locomotive operated with remarkable smoothness.

On June 15, Engine 7000 took eastbound train second No. 20, consisting of 13 cars, from Ogden to Cheyenne. This train left Ogden 40 min. late, 25 min. of which was made up on the long heavy climb between Ogden and Evanston,



Profile of Union Pacific Between Ogden and Cheyenne

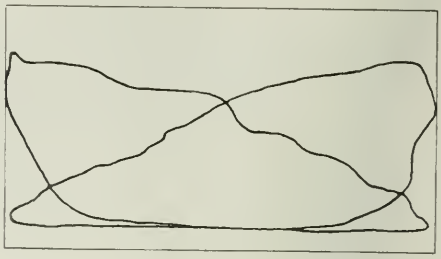
Wyo. In the first 65 miles of this 76-mile district there is a change of elevation against eastbound movement of 2,500 ft. with a 16-mile ruling grade of 1.14 per cent. The schedule of No. 20 calls for an average speed of 27.6 miles an hour with no stops. On this run engine No. 7000 maintained an average of 32.7 miles an hour over the district.

This 484-mile run was made without cleaning either the fire or the ash pan.

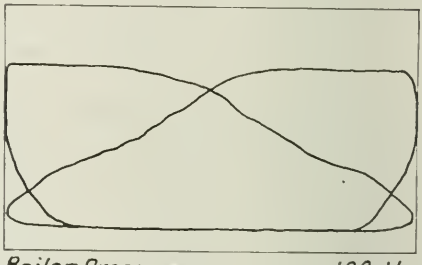
The locomotive has made a number of runs both on the Oregon Short line and the Oregon, Washington Railroad & Navigation Company. On a number of these runs its performance over 2.2 per cent grades has been observed. Although the locomotive is not primarily designed for service on long mountain grades of this character, but rather for its ability to maintain comparatively high speeds on grades requiring considerably less than the maximum starting tractive effort, it is interesting to note that the locomotive maintained 28 miles an hour with a train of 12 cars over a 2.2 per cent grade, and with 10 cars was able to start and rapidly accelerate to a speed of 10 miles an hour, at which it was working at less than half cutoff.

On another occasion this locomotive took a passenger train from Pocatello, Idaho, to Portland, Ore., a distance of 729 miles, including four engine divisions, without cleaning the fire

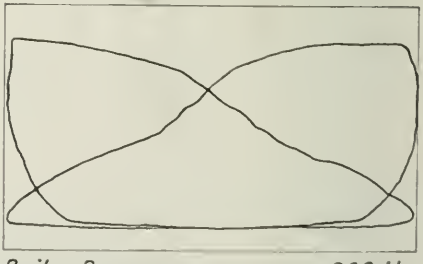
In recent tests this locomotive established a new record of power output for simple locomotives and also set a figure for weight per horsepower which is believed to be substantially lower than has ever been attained previously in road service in this country. On October 1 locomotive 7,000



Boiler Pressure 198 Lb.
Mean Effective Pressure 81.42 Lb.
Miles Per Hour 50
Indicated Horsepower 3500



Boiler Pressure 198 Lb.
Mean Effective Pressure 91.57 Lb.
Miles Per Hour 44
Indicated Horsepower 3464



Boiler Pressure 200 Lb.
Mean Effective Pressure 99 Lb.
Miles Per Hour 40
Indicated Horsepower 3404

Typical Indicator Cards Taken on Road Tests

hauling train No. 4, consisting of 11 cars weighing 816 tons, at a speed of 50 miles an hour on an ascending grade of 0.82 per cent developed 3,500 indicated horsepower. This is at the rate of one horsepower for each 98.6 lb. weight of the locomotive; moreover the power developed is 15.5 per cent greater than the rated cylinder horsepower and 17.2 per

cent greater than the rated boiler horsepower according to Cole's method.

This performance has been nearly equalled on other occasions. On September 26, hauling 11 cars weighing 823 tons, 3,404 indicated horsepower was developed at 40 miles an hour, and 3,464 indicated horsepower at 44 miles an hour. The indicator cards taken at these three speeds are reproduced in one of the illustrations.

Although accurate test data are not available, it is evident from the operating results obtained that the locomotive is rendering a highly satisfactory performance both from the standpoint of fuel economy and starting as well as speed capacity.

On 19 regular trips on the Wyoming, Western and Colorado divisions this locomotive made 62,592 passenger car miles on a fuel consumption of 338 tons, or at the rate of 10.8 lb. of coal per passenger-car mile. Comparing this with the April average for the main line division of the Union Pacific, this shows a decrease of 26 per cent.

Based on train resistance calculations the performance of the locomotive on the 2.2 per cent grade of the Oregon Short Line between Pocatello, Idaho and Butte, Mont., indicates that the locomotive developed a starting tractive effort of 58,000 lb. as compared with the theoretical rating of 54,800 lb. on the usual basis of calculation. A steam gage on the throttle pipe indicates that when working full stroke at low speed the pressure drop between the boiler and the steam chest does not exceed five to ten pounds. This, together with the 90 per cent cut off of the Young valve gear is responsible for the high starting tractive effort.

Although open to some question as to accuracy, calculations based on theoretical train resistance on the 1.55 per cent ruling grade west of Cheyenne indicates that the locomotive developed something over 2,000 hp. at 25 miles an hour, or approximately 12 per cent more than called for by the American Locomotive Company's tractive effort curve.

The engine has made a splendid impression among the crews who have operated it. This is undoubtedly partially due to its smooth riding qualities, particularly around curves, as well as its steaming qualities and ability easily to maintain schedules. The well balanced proportions of the machinery is attested to by the ability of the locomotive to operate continuously on runs varying from 500 to 700 miles in length.

Some of the Physical Properties of Paints*

New Method Used to Obtain Reproducible Films—Effects of Composition—Causes of Spotting

By P. H. Walker and J. G. Thompson
United States Bureau of Standards

THE LIFE of any paint may be divided into three periods: (1), the period of storage between manufacture and application; (2), the period of application when the paint is spread out in a thin, wet film, and (3), the period of exposure covering the life of the dry paint film. Each period is characterized by certain physical properties which indicate the value of the paint. During the first period little information of value is obtainable, but certain defects in manufacture or material may be indicated by such phenomena as flocculation, caking, or excessive settling. It is during the second period that the really valuable physical properties, such as the wetting power or adherence to the surface, ease of application, hiding power, color, uniformity, gloss, spreading rate, and rate of drying appear.

In the final stage of the life of the paint the only factors considered are those which affect the permanence or stability of the film established as a result of the properties which appear and function during the second period. All of these properties are important, but few if any can be measured with any degree of accuracy, and most of the properties are tested by methods in which the personal equation is so large that reproducible results can not be obtained. Any study of the physical properties of paints necessarily must begin with a standardization of tests.

Preparation of Paint Films

In view of the number and importance of the properties which first become evident at the time of application, it is obvious that this forms the logical starting point for any investigation. The physical properties which combine to determine the consistency or behavior of a paint at the time of application are of fundamental importance, but before any comparative study could be undertaken it was necessary to devise some reproducible method of preparing paint films. Flowing produces satisfactory results but unfortunately is limited to a few of the thinnest paints. The ordinary methods of brushing and spraying are unsatisfactory since the resulting films are never uniform and can be duplicated only by accident. Some mechanical means therefore must be employed and as a result of some promising preliminary experiments centrifugal force was adopted.

A number of circular glass plates furnished the standard surfaces to be covered with paint. These plates were each 25 cm. in diameter and approximately 1 cm. thick. The surfaces were ground flat and finished by fine grinding but were left unpolished, to furnish a surface to which the paints would adhere readily. In the earlier work steel plates were used but were later discarded, as the glass proved to be much easier to handle and to keep clean.

The apparatus employed consists of a vertical spindle rotated by a belt connected with a variable speed motor. To the upper end of the spindle is fastened a circular wooden block to support the glass plate. The plate is brought up to constant speed and an excess of paint, previously screened through a 200-mesh sieve to insure uniformity and freedom from skins, is poured on at the center of the plate. The paint flows out, covers the surface, and the excess is thrown off. The motor is then stopped and the plate removed and allowed to dry. After the paint is dry the film thickness is determined by means of an Ames dial gage, reading direct to 0.01 mm. and estimating to 0.001 mm.

At any given speed, the centrifugal force increases directly with the distance from the center of rotation. One would expect, therefore, that the resulting film would be thinnest at the circumference of the plate and would reach a maximum at the center. This is what usually occurs and the resulting film is generally pyramidal, although the pyramid does

*Abstract of a paper presented before the American Society for Testing Materials, Atlantic City, N. J., June 29, 1922.

not extend uniformly over the entire surface. The film usually presents the appearance of a large, flat plane with a small, sharply defined pyramid at the center. The pyramidal film which is characteristic of most paint is not produced by varnishes nor by liquids such as linseed oil. These give flat films of uniform thickness across the entire surface, in spite of the fact that the centrifugal force varies widely at different points on the plate. A table accompanying the paper gave the film thickness measured at varying distances from the center. Raw linseed oil gave a film about 0.016 mm. thick, varnishes 0.024 mm. to 0.040 mm., enamels and oil paints 0.030 mm. to 0.085 mm.

Numerous experiments with varying amounts of paint led to the conclusion that the film thickness is independent of the amount of paint applied. An insufficient amount will cover only a portion of the surface, while an excess will cover the entire surface and the excess be thrown off. The resulting films in both cases are of equal thickness at corresponding points, but for the sake of convenience it is advisable to use a slight excess to insure covering the entire surface.

At speeds of 200 r.p.m. or less many paints produce films too thick to dry properly. Too high speeds cause segregation of the pigment particles and in some extreme cases a tendency to disrupt this film has appeared. A speed of 300 r.p.m. seems to be the most generally satisfactory.

The film thickness is practically independent of the time of whirling after the first short interval of time has elapsed. Working with ordinary paints at a speed of 300 r.p.m., it was found that three minutes' whirling invariably provided a comfortable margin of safety beyond the time necessary to reach equilibrium.

The most satisfactory features of this method are the uniformity of the films produced and the ease and certainty with which they can be duplicated.

Effect of Composition on Paint Films

The next investigation was a study of the effect produced upon the life and behavior of a paint film by varying the proportions of pigment and oil in the film. For comparative purposes the films should be of equal thickness and the use of centrifugal force as previously described furnishes a convenient means for determining the film thickness which will result when any paint is spread under certain selected conditions. If several paints produce films of equal thickness when whirled at the same speed, it may be assumed that those paints will produce comparable films when brushed out on test panels. The object sought was to produce a series of paints of varying oil-pigment ratios thinned with turpentine until they would spread or brush out to produce dry films of equal thickness.

Four pigments were selected for study:

(a) Basic carbonate white lead.

(b) Zinc oxide.

(c) Sixty per cent basic carbonate white lead, 40 per cent zinc oxide.

(d) Sixty per cent basic carbonate white lead, 30 per cent zinc oxide, 10 per cent asbestine.

Each pigment was ground to a paste with a normal amount of raw linseed oil. Each paste was divided into several weighed portions and varying amounts of oil were added to the different portions until the resulting series of semi-pastes or semi-paints represented a range of pigment content varying from 15 to 50 per cent by volume. The corresponding limits for the oil being 85 and 50 per cent by volume. Liquid drier was added to each semi-paint in the proportion of 5 cc. of drier to 95 cc. of oil.

Some one mixture had to be chosen as an arbitrary standard and that consisting of 25 per cent basic white lead and 75 per cent oil was adopted, since this mixture behaved well under the brush and produced a film of satisfactory appearance and properties. The other mixtures were thinned with turpentine until they produced the same film thickness when whirled at the same speed. The turpentine being volatile serves merely to increase temporarily the mobility of the paints and later evaporates.

The preparation of the paints resulted in some interesting observations. As expected, it was found that the thinning power of turpentine varies with the different pigments, but it was rather surprising to find a variable thinning power for any one pigment depending upon the composition of the vehicle already present, as appeared in the cases of the zinc oxide and mixed pigments. It is difficult to draw conclusions regarding the consistency of the paints from the data, since the thickness of the wet films will vary widely although the dry films are all of equal thickness. Nevertheless, there is unmistakable evidence that the thinning power of turpentine not only varies with different pigments, but also varies for any one pigment with the composition of the mixture being thinned.

Causes of Spotting in White Lead Paints

It is generally believed that a paint resulting from the thinning or breaking up of a basic carbonate white lead paste should be allowed to stand for a day or two before being used. The probable reason for the origin of this belief was found when a white lead-oil-turpentine paint was used immediately after mixing, flowing the paint on a clean glass plate to form a smooth wet film. In the course of a few minutes small pits appeared on the surface of the film and gradually increased in depth and diameter. The phenomenon appeared over and over and could not be ascribed to any fault in the preparation of the surfaces painted. The same result was obtained no matter whether the paint was applied to glass, steel, or to a previously dried coat of paint.

Summarizing the results of many experiments, it appears that the spotting tendency:

(a) Is common to all mixtures of basic carbonate white lead and raw linseed oil.

(b) Does not appear when other pigments are substituted for the basic carbonate white lead.

(c) Does not appear when other oils are substituted for raw linseed oil.

(d) Is not due to too much stirring or to lack of stirring; presence or absence of liquid driers and volatile thinners; order of mixing; presence of free fatty acids, mineral acids, or water, although any or all of the foregoing factors may at times exert a modifying influence.

(e) May be explained upon the assumption of a reaction between the basic carbonate white lead and some unidentified portion of the oil.

(f) May be eliminated by boiling the oil in the presence of driers which may convert the troublesome component to an inactive form; by treating the raw oil with basic carbonate white lead during storage prior to its use; or by aging the paint to allow the reaction to reach completion before the paint is applied.

Two and a Half Billions is the total number of passengers carried by rail in local New York City traffic, in the year ending with last June, as reported by the State Transit Commission, an increase of 98½ millions over the preceding year; or from 2,491,909,178 to 2,590,313,728. These totals represent the business of the surface, subway and elevated lines. About 60 per cent was handled by the rapid transit routes—subway and elevated lines—while 40 per cent was carried by the surface lines. More than three-fourths of the increase appears in the reports of the surface lines, which handled 75,316,859 more paying passengers than in 1921. On the Manhattan elevated lines of the Interborough system, the loss was 25,776,235 as compared with 1921. The Sixth avenue elevated has suffered from the opening of the new Broadway subway, operated by the Brooklyn Rapid Transit Company.

Employee Representation on the Pennsylvania

Employees Have a Voice in the Management in Matters in Which They Are Directly Concerned

THE SHOPMEN'S STRIKE has tended to focus attention upon the efforts which have been made by the Pennsylvania System to bring about "a spirit of mutual understanding and cordial co-operation between management and employees." The road, because of the widespread interest in its methods and the many requests for information about them, has issued a statement telling of the origin, development and achievements of the plan.

The introduction to the statement contains these words:

"No illusions are entertained by the management that is has found a panacea for all the ills that afflict present day relationships between employers and employees. It is believed, however, that the employees and officers of the Pennsylvania System have adopted a policy and practice in their own dealings with each other, which, if lived up to by both in a spirit of sympathetic understanding, mutual co-operation and fair play, will materially benefit all who are connected with the railroad, and will be reflected in a higher standard and a larger measure of service to the public. The performance of the Pennsylvania System during the period of the shopmen's strike and the demonstration of loyalty on the part of its employees under most trying circumstances offer a practical and substantial foundation for that belief."

The article which follows is made up of liberal extracts from the statement. We have omitted, however, material concerning certain details relating to the extensions of the plan to other classes of employees than those engaged in train service; also the reproduction of notices informing the employees of the elections, typical ballots, and graphic charts showing the structure of the committees and the steps to be taken in handling controversial questions with the management. The appendix of the booklet contains also a typical set of by-laws jointly formulated by employees and management governing procedure under the plan of employee representation; it also contains the constitution of the Altoona Works Employes' Association.

Purpose and Origin

The policy and practice of the Pennsylvania System in its relations with employees may be summarized in one sentence: To give all employees an opportunity to have a voice in the management in all matters affecting their wages, working conditions and welfare, and in other matters of mutual concern affecting the welfare of the company and of the public which the company serves.

"What we want," said General Atterbury, early in the negotiations with the employees, "is committees of employees, whose orders come from the bottom, from the men at work on this railroad, and are not handed down from the top by some people we know nothing about. We shall be better off by far if we have our agreements and negotiations between ourselves—then we understand them." This policy is based on the belief that the interests of the employees, the company and the public can best be served by bringing about mutual confidence, sympathetic understanding and real co-operation between employees and management. It is essential to these conditions that the relationship between employees and management be direct, frank and friendly, without interference on the part of persons or organizations having interests to serve other than those of the railroad, its employees and the public.

It is recognized, of course, that an employee has a right

Shop Craft Representatives at White House Where They Appealed to President Harding in Behalf of Loyal Pennsylvania Employees

Snyder, General Chairman, Carmen.

to join or not to join any organization as he sees fit, but membership or non-membership in any organization does not concern the management in the practice of the policy on which the officers and the employees have mutually agreed. The primary requisite is that the employees and the management deal directly with each other; that spokesmen for the employees be employees themselves, chosen by the employees, speaking and acting for the employees, and not taking orders from or acting for persons or organizations outside the Pennsylvania System.

Such a basis is fundamentally sound. It is of paramount importance in the interest of the public, which requires adequate, efficient, economical and uninterrupted transportation service, by reason of the fact that the sympathetic strike, the closed shop and restriction of output are countenanced and practiced by certain organizations which during the period of federal control very largely extended their membership among railroad employees.

Prior to federal control the Pennsylvania had an enviable reputation of always treating its men fairly, and the esprit de corps among Pennsylvania men was one of the distinguishing characteristics of the railroad's service. For a period of many years prior to the Railroad Administration there was no serious strike or disagreement between the officers and the men. Every employee understood that he had the right to appeal to the general manager. Substantial justice was done to all, and the employees as a body were satisfied, and worked in close co-operation with the officers of the company.

The management had, many years ago, satisfied itself that the committees with which it dealt on behalf of engine and train service employees did actually represent Pennsylvania Railroad employees in this service. Furthermore, at the termination of federal control, their same committees continued practically intact, and nothing has since transpired to affect the relationship already established between them and the management.

On the other hand, although it had been understood that the status quo, as far as labor organizations were concerned prior to federal control, would be maintained during federal control, the fact is that organization of railroad employees into national and international unions was promoted under the Railroad Administration, and railroad officers were ordered to keep their hands off. The result was inevitable. At the end of federal control, the management found national and international organizations of the character already referred to, superimposed on our employees, regardless of their desires, and representatives of these organizations presuming to speak and act for our employees.

During the so-called "guarantee period" lasting six months after federal control, it was impossible to alter this situation. The Transportation Act, however, required employees and management to get together and adopt every reasonable means of settling amicably all controversial matters liable to interrupt transportation. It was the belief of the management that this was impossible under existing conditions, which constantly jeopardized amicable relations with its employees. The best interest of the public, as well as the company and its employees, themselves, it was felt, demanded closer relationship between employees and officers, and every endeavor should therefore be made to bring about co-operative effort in serving passengers and shippers.

In order to re-establish the harmonious relationships existing between employees and officers prior to federal control, the Pennsylvania System adopted a policy of giving employees a voice in the management and announced a plan of employee representation. Steps toward the development of the plan were taken soon after the return of the railroad to its owners. Informal discussions were held with representatives of various groups of employees looking to a more representative and more satisfactory means of disposing of controversial matters than had been in effect up to that time.

First Steps in Developing Plan

The first definite step was taken at a joint meeting of officers from all parts of the system and representatives of the employees in engine and train service—the engineers, firemen, conductors and brakemen. All the local divisional chairman representing these employees attended. The meeting was held in Philadelphia on December 21, 1920. This meeting was the forerunner of many similar meetings with these and other groups of employees, and it laid the foundations of the present plan. General Atterbury, who addressed the officers and employee representatives in joint session, sounded the keynote of the company's policy when he said: "The successful solution of the problems that are before you, if carried to a logical conclusion, means that not only will there never be a strike, but that it will never be necessary to take a strike vote on the Pennsylvania System. It should mean the setting up of proper machinery for the prompt consideration of changed working conditions and of grievances, and, finally, that failing to agree between yourselves on a settlement of any of these questions, there shall have been provided beforehand the machinery of a tribunal to which the question can be submitted for final decision."

Outline of Policy

Outlining the purposes of the plan that he proposed, General Atterbury said: "This occasion is unique. Never before, so far as I know, have the officers ever invited the representatives of the employees to a conference. Heretofore request has come from the employees, and then only when they had something to ask in the way of increased wages, or improved working conditions, or adjustment of grievances. As representatives of the employees, you are vitally interested in a pleased patronage and an aggressive, business-getting organization. To you it means *greater earnings, more regular employment,* and *earlier promotion.*

"We have heard a great deal the last few years of collective bargaining. One hardly knows what the theorist means by collective bargaining. But if by collective bargaining you mean the employees and the management sitting down to seriously discuss working conditions, and a schedule results which is mutually satisfactory, then we have had collective bargaining in force for at least 17 years.

"This meeting today is in continuance of that policy. Some 310 men are here representing approximately 51,000 men, or nearly 30 per cent of all of our employees. You are the men in the train service—the most responsible; the most highly organized; and, generally, the most highly paid. In all these 17 years years, although occasionally strikes have been threatened, never once has a strike been called. We have always been able to compose our difficulties. You represent the conservative in labor organizations. You neither practice nor advocate the closed shop, nor the sympathetic strike; nor can a strike of your organizations be called without its being properly submitted to your membership by ballot. You do not intentionally through your schedule limit production, as the combination of 'Day' and 'Mileage' is piece work, pure and simple.

"The railroad officers who are present represent the management of a property in which about two billion dollars is represented, approximately half of which is in bonds, and the other half in stocks. The bonds are largely owned by life insurance companies, savings banks, and other financial institutions, and in the stability of these bonds a very large majority of the people of the country are directly or indirectly interested, through their life insurance policies, or their deposits in the savings banks.

"The other half of this great investment—that is the stock

—is owned by some 140,000 stockholders, of whom about one-half are women. Bear in mind that the policy of the Pennsylvania management has never been to pay large returns to its stockholders. The aim has been to assure to stockholders a reasonable return, upon which they could depend. Furthermore, the Pennsylvania Railroad has no watered stock, and the records will show that over a period of nearly 75 years it has paid regular dividends to its stockholders averaging approximately six per cent.

Three-fold Duty of Management

"The duty of the management is three-fold. They have a direct duty to see that the capital already invested shall be given a fair return. Surely that duty is owed to those who have entrusted their money to our care. Further, if a fair return is not paid, new capital for improvements, extensions and betterments cannot be obtained. The management also have a duty to the public. If the railroad is granted reasonable and fair rates, the public, in return, is entitled to efficient and satisfactory service. Last, but not least, is the duty of the management to the employees—that is, good wages, good working conditions, and discipline fairly and impartially maintained. Kindness, courtesy and consideration are not incompatible with good discipline. Lax discipline is not kindness, for in your occupation lax discipline spells death, and disaster.

"The employees equally with the management have their responsibilities. Given fair wages and fair working conditions, the management has the right to expect and exact from the employees an honest day's work; prompt, willing and cheerful observance of orders; and economical use and care of the property entrusted to them. The management has the right to ask the same kindness, courtesy and consideration to the officers and to the public on the part of the employees which the employees have the right to expect from their officers.

"I have tried to lay down a simple platform of principles on which you, as officers and employees, can meet. I have given you jointly certain questions to solve. The spirit in which you approach these questions will determine the success with which they are settled. I have no doubt that there are many petty grievances on both sides. Forget them for the time being. Each put himself in the place of the other, and see if he cannot understand the other fellow's side."

The result of this meeting was the joint formulation of a plan and procedure whereby all questions of a controversial character arising between the employees in engine and train service and officers of the company would be handled in an amicable way, and settled if possible without intervention by outside parties. A "memorandum of understanding" was formulated and signed covering the method to be followed in the adjustment of all disputed matters. Because this memorandum, in its purpose and effect as well as in the spirit in which it was negotiated, became the basis of similar negotiations and understandings affecting employees in other branches of the service, its provisions are given somewhat in detail. The preamble reads: "The outline of the method in which controversial matters are to be handled as given below is for the purpose of expeditious adjustment of matters presented, to the end that there may be a satisfied spirit among the officers and employees and it is important, therefore, that so far as is possible, decisions will be reached at the time of meeting, such decisions to be confirmed in writing as promptly thereafter as is possible. This plan for handling schedule and other matters can be successful only by full and conscientious co-operation on the part of both the management and employees, and it is expected that when questions are presented for disposition that the spirit of absolute fairness will be the factor in adjusting these matters."

The memorandum is a complete exposition of the procedure to be taken in every step of the way from the division superintendent and the local chairman representing the employees in his territory on up to the Joint Reviewing Committee which is the final arbiter in the disposition of any matter referred to it.

Shop Crafts' Southwestern Regional Reviewing Committee

Back row—left to right: Arthur Fischman, Secretary; L. S. Osmer; W. C. Higginbottom; W. C. A. Henry; F. S. Owen; J. L. Deem, G. B. Fravel; Taber Hamilton; J. F. McEvoy; C. R. Perin; J. E. Mechling. Front row seated—left to right: R. K. Rochester; J. E. Cavey, Vice Chairman; E. B. Dithridge, Chairman; H. W. Daringer.

Essential Features of Method Adopted

In general, the essential features of the method adopted are these:

First Step.—Monthly meetings between each division superintendent and the local chairmen representing the engine and train service employees, at which all controversial matters arising on the division may be taken up with five days' advance notice by either party of the subject to be discussed.

In questions relating to schedule matters, when there is agreement between the superintendent and local chairmen, it is put into effect at once and the interpretation agreed upon is referred to the Joint Reviewing Committee for review. When there is a disagreement on the division, and no interpretation of the question has been made by the Joint Reviewing Committee, the matter is referred to the Joint Reviewing Committee for decision.

In each case, however, copy of the interpretation agreed

upon or the joint statement of facts, where there is disagreement, is forwarded to the general superintendent and general manager for their information.

In discipline and other matters when appeal is taken from the decision of the division superintendent, the question goes next to the general superintendent in charge of a general division (which includes several divisions).

Second Step.—Monthly meetings between each general superintendent and the general chairmen representing the engine and train service employees, at which controversial matters on which the local chairmen and division superintendent have been unable to agree are discussed with five days' advance notice by either party of the subject to be discussed. In questions relating to schedule matters, the same procedure is followed as with the division superintendent. In other than schedule matters, in case of disagreement, the question is referred next to the general manager in charge of the region.

Third Step.—Monthly meetings between each general manager and the general chairmen representing the engine and train service employees, at which controversial matters on which there has been a disagreement with the general superintendents are discussed with five days' advance notice by either party. In questions relating to schedule matters the same procedure is followed as with the division and general superintendents. In other than schedule matters, where there is disagreement, the question is referred to the Joint Reviewing Committee for decision.

Fourth Step.—Monthly meetings of the Joint Reviewing Committee, at which all matters in which there has been a disagreement and an appeal taken from the division or general superintendent or general manager, are discussed. The whole schedule of monthly meetings is so arranged that the general chairmen are enabled to cover the meetings with general superintendents and general managers throughout the system and carry matters through to the Joint Reviewing Committee without delay.

Keystone of Plan Is Joint Committee

The Joint Reviewing Committee for the engine and train service employees and similar bodies for employees in other classes of the service, constitute the keystone of the arch of satisfactory industrial relations on the Pennsylvania System. It is the highest authority on the railroad in the settlement of matters in dispute between employees and management. Its decisions are final and it is the final arbiter in the determination as to how any matters on which it is unable to reach a decision shall be decided. Executive officers of the company cannot interfere with its prerogatives.

The text of the "Memorandum of Understanding" in this particular is therefore quoted verbatim:

MAKE-UP OF JOINT REVIEWING COMMITTEE

20. The Joint Reviewing Committee shall consist, for the management, of two representatives from each region of the system; for the employees, the general chairmen of the engine and train service employees, which, as at present constituted, consists of nine members.

METHOD TO BE FOLLOWED BY JOINT REVIEWING COMMITTEE

21. In all matters other than discipline the entire committee will sit.
22. In cases of discipline the representatives of the management in the region where the case arises, together with the representatives of the employee involved in that region where the case arises will not sit on the committee but will present the case to the remaining members of the committee, who will hear and determine the matter at issue.
23. The management and the employees will have equal voting power and not less than a two-thirds vote will be necessary to reach a decision.
24. In case a decision is not reached by the Joint Reviewing Committee not later than subsequent monthly meeting at which the case was first brought up, further procedure will be had as determined upon at the time of such disagreement.
25. Meeting place of the Joint Reviewing Committee will be fixed from time to time by the committee.

The chairmanship of the Joint Reviewing Committee alternates every six months between the management representatives and the employes.

New Schedule of Rules Negotiated

One of the first tasks undertaken by the representatives of these employees and the representatives of the management was the formulation of a new schedule of working conditions. Prior to the formation of the Joint Reviewing Committee the men in engine and train service had been working under six different schedules, one for the former Lines East and one for the former Lines West, and one each for the Vandalia, Grand Rapids and Indiana Railroads, C. L. & N., and N. Y. P. & N. Due to the fact that prior to the end of federal control the Pennsylvania System had not been operated as a unit, there were many points of difference between the schedules and many disputed questions involved in each of the schedules themselves.

When the Pennsylvania Railroad resumed the management of its property on March 1, 1920, however, the system was reorganized as a unit with four operating regions and Altoona Works. When employees in engine and train service requested that a system schedule be established which would harmonize the difference between the existing schedules and settle points of controversy within the schedules themselves, the members of the Joint Reviewing Committee assumed the task and constituted themselves a schedule committee to work out the new arrangement.

In addition to this work, which was under negotiation for several months, the members of the Joint Reviewing Committee held their regular monthly meetings at which all other questions arising between the management and the employees in this service were taken up and decided to the satisfaction of all concerned. The Joint Reviewing Committee has since acted upon any questions arising in the application of the new schedule.

Extension of Plan to Other Classes of Employees

Obviously the working out of the plan already adopted by the employees in engine and train service for local self-government had been watched with considerable interest by other groups of employees and its practical workability was beginning to be demonstrated. To an appreciable degree, therefore, the proposal to extend this policy to other classes of employees met with at least an interested response.

Owing to conditions largely brought about under the Railroad Administration there was a great deal of skepticism as to the sincerity of the management, but it was felt by the more constructive leaders of the employees that the experiment might be worth trying. On the part of the officers the utmost frankness was observed and the employees' spokesmen were invited to participate and assist in working out the details of the proposed election.

When the Labor Board issued its Decision No. 119, respecting the negotiation of new schedules of regulations, and the company announced its policy of instituting a plan of employee representation, the employees generally were in a receptive mood to consider the actual details and to participate in making it effective. The then spokesmen of the signalmen and maintenance of way men actually participated in the preparation of the election machinery.

Accordingly arrangements were made to call into conference with the officers the general chairman and committee of the United Brotherhood of Maintenance of Way Employees and Railway Shop Laborers and later on the general chairman and committee of the Brotherhood of Railway Signalmen of American.

It was pointed out to these men and their committees some of the undoubted good that would result both to the employees and the management if jointly a plan could be devised for them which would provide home rule, popular elections of employee representatives, participated in by all employees coming within their respective groups, a voice in the management in determining their wages and working condi-

tions, and as part of the necessary machinery, a tribunal consisting of an equal number of representatives of the employees and the management, who would sit as a high court and decide all controversial questions properly brought before them.

A complete election procedure was worked out and fully explained to the employees in notices posted on the bulletin boards. The ballots themselves also contained a complete and definite explanation of the machinery provided for them to exercise their right of franchise in the choice of representatives to deal with the management on behalf of the employees in the various classes.

Steps were also taken to meet spokesmen for the other classes of employees with a view to explaining the plan to them in detail. These groups included: shop crafts; telegraphers; clerks; miscellaneous forces (office, station, warehouse, storehouse and elevator forces, and engine and train crew callers, excluding the strictly clerical and supervisory forces); stationery engineers (steam), and firemen and oilers; marine department employees; dining car and restaurant service employees and the employees in the various administrative departments of the general offices.

Essential Features of Election Plan

The essential features of the election procedure were these: All employees were given an opportunity to elect employee representatives by secret ballot; all employees in the respective classes were eligible to vote; no candidates were named or suggested by the management or printed on the ballots; any employee, whether union or non-union member, was eligible for election; employees wrote on the ballot the names of their choice; the ballots, in sealed envelopes, were opened and counted in the presence of representatives of the employees and the management; employees receiving the largest number of votes were recognized by the management as empowered to speak and act for the employees participating or entitled to participate in the election.

How Secrecy of Ballot Was Insured

The ballot itself, contained in a sealed envelope, was enclosed in another sealed envelope by the voter. On the outside of the latter envelope appeared the voter's name, occupation, location and division for the sole purpose of checking the names of the voters against the payrolls to see that only employees had voted. These outer envelopes, however, were destroyed in the presence of representatives of the employees and the management before the sealed envelopes containing the ballots themselves were opened. This procedure insured absolute secrecy of a man's vote.

The ballots themselves were opened and counted in the presence of and by representatives of the men and the management. There was absolutely no way in which the name of a man voting could be identified with his ballot.

No better evidence of fairness and impartiality upon the part of the company could be offered than the fact that some classes of employees elected all union men to represent them, and the management is now dealing with these elected representatives.

In the case of the signalmen, maintenance of way employees and telegraphers, solid union committees were elected. The employees who were members of the union received the highest number of votes and the management recognized them and immediately entered into negotiation with them with a view to formulating rules covering working conditions which would be mutually satisfactory. In the case of some of the other classes, some union and some non-union men were elected and the same procedure was adopted.

The first business before these elected representatives was of course the question of new schedules of working conditions and the employee representatives and representatives of the management immediately took this matter in hand. When it had been satisfactorily concluded, however, request was made by the employees that permanent machinery, similar to the Joint Reviewing Committee for engine and train service employees be jointly established for other groups. In general, therefore, the plan of employee representation ultimately worked out for all classes of employees was based largely upon the memorandum of understanding already entered into by the management and the general chairmen of the engineers, firemen, hostlers, conductors, trainmen and switchtenders.

Regional Joint Committee of Clerical Employees, Eastern Region

Left to right—H. M. Carson, General Superintendent, Central Pennsylvania Division; J. R. Rudolph, General Chairman, Philadelphia Terminal Division; H. E. Enochs, Superintendent, Wage Bureau; R. V. Massey, Assistant General Manager; M. T. Miller, Regional Chairman; J. A. McLaughlin, General Chairman, Southern Division; F. W. Smith, Jr., Special Agent, Eastern Pennsylvania Division; E. S. Werntz, Secretary; Oscar Howe, General Chairman, Eastern Pennsylvania Division; A. B. Clark, Superintendent, Trenton Division; F. J. Garren, General Chairman, New Jersey Division; F. W. B. Humes, Superintendent, Stations and Transfers; E. A. Kidney, General Chairman, General Superintendents' Departments.

Plan of Procedure for Handling Disputes

That is, the plan included:

1. Local committees for the division and general divisions. Regional and system committees for the handling of matters appealed from the divisions and general divisions.

2. Joint committees, similar to the Joint Reviewing Committee already described, composed of equal representation of management and employees, all members having equal voting power with two-thirds vote necessary to decide any issue.

3. By-laws governing procedure of these committees, schedules of meetings with division, general division superin-

tendents and general managers and future election machinery for the election of successive employee representatives at regular periods.

Naturally there are variations from this general plan to meet special conditions such as exist at Altoona Works, but the policy and practice throughout are the same in principle.

Controversy With Labor Board

Of all the groups of employees, System Federation No. 90, Railway Employees Department, American Federation of Labor, and a minority of the clerks, members of the clerks' union, objected to any plan of voting by the employees which did not place the name of their organizations on the ballot as a candidate. System Federation No. 90 was largely imposed upon the employees in the shop crafts during the period of federal control and the management was not satisfied that it actually represented the wishes of the majority of the shop employees on this railroad.

The officers of this organization insisted that they had the right to represent Pennsylvania employees and in a conference similar to the meetings with other groups when the details of the plan were being worked out, they declined to participate in the election machinery which had been agreed upon with the spokesmen for the other groups unless the name of their organization was placed on the ballot. They maintained that they as an organization be recognized as representing all the shop craft employees.

Nevertheless the elections were held. Officers of System Federation No. 90, however, persuaded employees not to vote in the elections and many of the shopmen refused or failed to exercise this right. As a matter of fact, if they had so desired, and as was clearly explained to them, the union officers who were employees could have nominated themselves as candidates, just as the union officers in the signal, maintenance of way and telegraph departments did, and if elected would have been so recognized by the management. Furthermore there was no objection to a voter's placing organization initials or symbols after the name of the candidate for whom he voted. In the case of every one of the signal committeemen elected, the initials B. R. S. of A. appeared after the candidate's name on the ballots voted by signal department employees.

In the case of the shop crafts, employee representatives were elected by those employees who did vote and the management recognized them and negotiated new schedules of working conditions with them. These schedules have been in effect since and have worked with mutual satisfaction to the great majority of the shop employees and of the management.

The United States Railroad Labor Board, without, as it is believed, any authority under the Transportation Act, declared said elections illegal and the contracts entered into between the management and the elected employees representatives null and void and ordered a new election in the shop crafts. (Decision No. 218.)

Not only that but the board declared that the organization itself must have a place on the ballot and must be recognized as entitled, if selected by the majority of the employees, to represent them, that other than employees could represent Pennsylvania employees and that men who had ceased to be employees were eligible to vote.

The management stood by the elections already held and when the Labor Board was about to publish an opinion that the company had violated its decision, the company adopted the only method open to it to test the power of the Labor Board to make the order which it had made and instituted a proceeding in the United States Courts to restrain the board from publishing such an opinion. The United States District Court upheld the Pennsylvania System and granted an injunction. The Labor Board appealed and the Circuit Court of Appeals reversed the District Court and the Pennsylvania has taken the case to the United States Supreme Court.

The Pennsylvania Railroad Company raised two main points:

1. That the order of the Labor Board in this case was beyond its authority under the Transportation Act; that the company therefore had not violated any lawful decision of the board and that the board should be restrained from publishing an opinion to that effect.

2. That if the Labor Board did have authority for its order, then the sections of the Transportation Act giving it such power were unconstitutional.

Summary of Company's Position in Controversy With Labor Board

The railroad position throughout the course of the argument before the Labor Board and before the court may be summarized as follows:

1. The company has not denied and does not now deny the jurisdiction of the Labor Board to hear and decide such disputes as fall within the purview of Title II of the Transportation Act.

2. The company does deny the right of the Labor Board to invade the domain of management and insists that in declaring said election illegal and said contracts null and void, and in ordering that a new election be held as it did in its Decision No. 218, the board exceeded its powers and without warrant of law exercised the functions of an administrative or regulatory body, and asserted jurisdiction over matters solely referable to the functions of railway management.

3. In its relations with its employees, the company seeks one object and one alone namely, the right to deal directly with its own employees without interference by those having interests to serve other than the interest of the employees, the railroad and the public. To that end it has offered classes of employees a voice in matters affecting their welfare through employee representatives of their own selection, whether union or non-union men.

4. Sixty-six and one-half per cent of the employees who are interested in and affected by rules covering working conditions have by vote or otherwise expressed a desire to negotiate rules and working conditions through employee representatives, and contracts have been entered into between the management and representatives of approximately 150,000 employees.

5. Representatives of the various classes of employees with whom contracts have been made have expressed their satisfaction not only with the manner in which representatives were elected, but also with the rules and working conditions agreed upon.

6. If the company complied with the Labor Board's decision No. 218, it would be obliged to repudiate these contracts to the great and irreparable injury of the company and its employees.

How the Plan Has Worked Thus Far

It would seem that there could scarcely be a more severe test of the Pennsylvania plan of employee representation than that afforded by the national strike of railroad shopmen which began on July 1, 1922. Not only has it afforded a successful demonstration of the co-operative policy adopted by the company and its employees in general, but also it has furnished practical proof that System Federation No. 90 does not actually represent the majority of the shop craft employees on the Pennsylvania System.

The strike vote on which the shop craft employees on the Pennsylvania System were called upon to strike was taken when the company refused to hold a new election as ordered

by the Labor Board in 1921. The company was not a party to the issues which precipitated the general strike. The issues on which the strike was called did not apply to this railroad. Wages had been fixed by mutual agreement, rules had likewise been determined and had been in effect for almost a year; and no outside contract work of the kind complained of by the strike leaders had been let by this railroad.

Bearing in mind that System Federation No. 90 had claimed the right to represent the shop crafts and had been sustained by the Labor Board to the extent that a new election was ordered, the strike call on the Pennsylvania really amounted to a protest against the Pennsylvania plan of employee representation.

Employees Repudiate Fancied Grievances

Certainly if the majority of the shop crafts were dissatisfied either with their wages and working conditions or with the methods of election followed by the company, or the procedure adopted for the settlement of matters in dispute, no more propitious occasion for indicating such dissatisfaction could be presented than a strike by shopmen all over the country.

But what happened was this: Less than 30 per cent of the Pennsylvania shopman left the service when the strike was called. Within two months after the strike started the shop forces of the system had been restored to more than 95 per cent of the normal working force. The great majority of the employees who remained loyal were working under regulations that had been agreed upon between the management and the employee representatives elected the year before—the election which the Labor Board had declared illegal. They were working under wages agreed upon between the management and the same employee representatives.

Practical Demonstration of Success of Plan

It would be difficult to imagine stronger proof of the fact that the great majority of even the shop craft employees are satisfied with the Pennsylvania plan.

Ever since the plan has been in effect, however, it has furnished practical demonstrations of its workability and the confidence of the employees. A study of the disposition of grievances and controversial questions arising between employees and the management in the first six months of this year affords interesting evidence as to how the Pennsylvania System plan of employee representation is actually working.

This is the second year in which it has been in effect.

Disposition of Grievances and Controversial Questions
(First Six Months of 1922)

MONTH	No. of Cases Taken Up	Adjusted or Compromised in Favor of Employes	Percent	Withdrawn No Merit, etc.	Percent	Decision Appealed	Percent	Received By Reviewing Committees	Decision in Favor of Management	Percent	Decision in Favor of Employes	Percent	Withdrawn No Merit, etc.	Percent
January	896	415	46.3	256	28.6	225	22.9	18	11	61.1	6	33.3	1	5.6
February	987	441	47.1	279	29.8	217	23.1	10	8	80.	1	10.	1	10.
March	808	412	47.5	221	25.8	232	26.7	6	5	83.3	1	16.7	—	—
April	734	341	46.5	209	28.5	184	25.0	—	—	—	—	—	—	—

Total	5,201	2,553	49.1	1,456	27.1	1,239	23.8	98	49	50.0	20	20.4	29	29.6

Note: This statement is designed to show the disposition made of grievance cases and controversial questions by the various officers with whom such cases were taken up, and represents the procedure followed in handling these matters from origin to final disposition.

It does not, however, show the final disposition of all cases originating or taken up with higher officers, for the reason that in cases where the decision of an officer below the superintendent or of a superintendent is appealed successively to the general superintendent, the general manager and the reviewing committees, such cases would not ordinarily be finally disposed of during the period of one month.

The number of cases shown as having been taken up with and disposed of by higher officers and the reviewing committees may or may not be included in the number of cases reported as having been taken up with and disposed of by the officer next lower in rank, depending upon whether the case was handled during the month by the officer next lower in rank.

Voting Booths at Planing Mill for Shop Employees' Election at Indianapolis, Ind.

The analysis of the records of the first half of this year covers not only engineers, firemen, conductors and trainmen, but also shop craft employees, signal department, maintenance of way, clerical employees, telegraphers, marine employees and miscellaneous forces. It includes such questions as seniority, discipline, time allowances and other matters that arise in dispute in the ordinary operation of the railroad and in its relations with employees.

The accompanying table gives the disposition of these matters and shows the number of cases taken up with officers below superintendents, with superintendents, general superintendents and general managers; the number of cases adjusted or compromised in favor of the employees with these various officers; the number of cases withdrawn as having no merit, etc.; the number of cases in which decisions were appealed to the next higher officers; and the number of cases received and disposed of by the reviewing committees.

The reviewing committees in the case of each class of employees concerned are composed of an equal number of representatives of the employees and the management. All members of these committees have equal voting power, the employee members being selected by the employees themselves. Two-thirds vote of the committee is necessary to decide any question submitted to the committee and the chairmanship alternates between an employee member and a management member.

Summary of Cases Handled Under Plan of Employee Representation

The total number of cases taken up with individual officers, from those below the grade of superintendent on up through the general managers, was 5,201.

Of this number, 2,553, or a little more than 49 per cent of the total number of cases, were adjusted or compromised in favor of the employees in conference between the employee representatives and the respective officers, without appeal and therefore without the necessity of being referred to the reviewing committees.

Appeals from the decisions reached in conference between the officers and employee representatives were taken in 1,239 cases, or about 24 per cent of the cases handled. In 1,409 cases, or about 27 per cent of the total, the matter was withdrawn as having no merit or for other reasons. In less than two per cent of the cases taken up on behalf of the employees was it necessary to take an appeal to the reviewing committees, a mutually satisfactory settlement having been reached with the local officials or next higher authorities in all other cases.

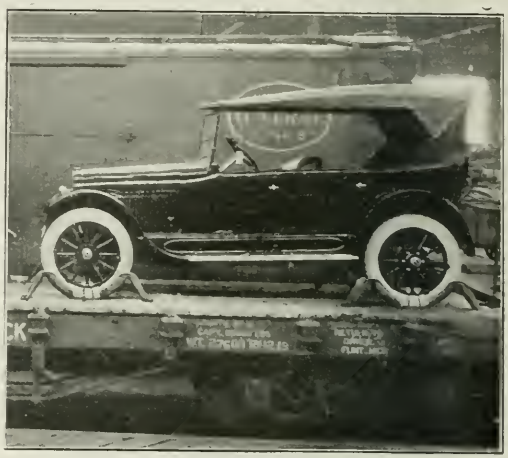
The actual number of cases received by the reviewing committees in the first six months of the year and disposed of, according to records covering this period, was 98. Of this number, 49 were decided in favor of the management, 20 in favor of the employees, and 29 were withdrawn after reaching the committees.

The record of cases handled to conclusion in conferences between the various officers and the employee representatives down the line, is regarded by the management as a tribute to both the employees and the officers. It shows conclusively a manifest spirit of fair play and a willingness on the part of employees and officers to co-operate in reaching an amicable settlement of matters in dispute.

THE NEW JERSEY ASSOCIATION, said to represent 4,000 New Jersey students attending New York University, has petitioned the Interstate Commerce Commission for a lower railroad fare for New Jersey students attending school in New York. The petition says that there are 10,000 such students—men and women, and that the preferential rate would save them $500,000 a year.

Gier's Blocks for Fastening Automobiles on Cars

A NUMBER OF manufacturers of automobiles have reduced loading and unloading costs, and at the same time have made their cars even more secure from possible damage while in transit by using Gier blocks, which are returned by the consignee and used over again. In a severe test made in the Buick Company's yards, the draft timber and the whole end of one box car were broken by the terrific impact, but the Gier blocks held the automobiles securely. These blocks are 10½ in. high and stamped to fit the tread



Gier's Automobile Loading Blocks

of the wheel, from No. 10 steel. They weigh 10 lb. each and can be nested and returned to the factory in bundles.

One shipper reports that the blocks average three trips in two months at a return cost of 40 cents a set of eight. Each is stamped with the owner's name. It is estimated that the blocks earn their cost in five trips. They cause the minimum damage to freight car floors, as an easily removable double-head nail is used.

Sir Henry Thornton to Head Canadian National

American Trained General Manager of English Road Chosen for Important and Difficult Post

By J. L. Payne

All suspense with respect to the appointment of a new board to take charge of the Canadian National Railways has been ended by positive action on the part of the government. No one may say that impulsiveness had been shown. It was in 1918 that the system was erected, following the collapse of the Canadian Northern and Grand Trunk Pacific, and early in the following year legislation was passed providing for a board of directors. Nothing was done in 1919, however, nor in 1920 and 1921.

Matters were about at their worst when the King government came into power in December last. Popular alarm was then acute. There was a general and urgent demand, on the part of press and people, that steps should be taken to put in a strong, capable and courageous board. The taking over of the Grand Trunk in 1921, adding nearly 5,000 miles to the 17,000 odd which had composed the national group, made immediate action imperative. But it was not until 10 months later that this highly necessary step was taken. In this, depending on the angle of view, some will see the looseness and irresponsibility which usually attach to public ownership, while others will identify proper prudence and deliberation in the discharge of an important duty. It is sufficient to say that, in the meantime, growing impatience had been shown on the part of the press of the country, voicing public sentiment.

(*Photo from Co-operative Press*)

Sir Henry W. Thornton

Let no one, however, from whatever point of view the matter may be scanned, fancy that the government was confronted by a light task. Without the slightest prejudice, let it be said that the results of public ownership had positively appalled the Canadian people. As has been said, the operating deficits jumped by many millions annually. Worse still, advances from the public treasury, to cover losses and put the new system into proper working shape, went up by hundreds of millions. Reference to that aspect will be made further along. There was genuine and universal fear that if these losses were not stopped the country would find its credit impaired—would, indeed, be confronted by staggering conditions.

There was unquestionably one cause in particular for this long delay. A man of outstanding capacity was required to head the new board—a man whose record and qualifications would command public confidence—and it was found that such a man was hard to get. The United States was combed to find him. The question of compensation was not an impediment; for the government could fix the salary of the man who measured up to the specifications at any amount. There was no limit. One after another men who had earned a name in the American railway world were called to Ottawa in this grand quest. Those who would have been acceptable backed away when they looked at the task before them and took cognizance of the conditions under which they would be expected to work. Some wanted a freer hand than could be assured. Others who would have accepted the post were found lacking in qualifications regarded as vital. Thus the months went by. The right man could not be found, or when found, shrank from the great responsibilities involved.

At last a choice has been made, and a name hitherto unmentioned in the canvass has been introduced to the Canadian people—the name of Sir Henry Worth Thornton. He is an American by way of England. The new general manager and chairman of the board was born at Logansport, Ind., in November, 1871. He is therefore 51 years of age. He was graduated from the University of Pennsylvania in 1894 as a civil engineer, with the degree of bachelor of science. His first job was as draftsman in the offices of the Pennsylvania Railroad, where he seems to have gained recognition; for, after rising from one position to another in the engineering department, he was in 1911 made general superintendent of the Long Island Railroad, a subsidiary of the road with which he had been engaged for 17 years. Here he found scope for executive judgment, chiefly in connection with the terminal problems of the Pennsylvania in New York City and the organization of the electrical train service of the Long Island Railroad. At one time he was chosen by L. F. Loree, then general manager of the Pennsylvania, to develop a students' course in transportation, because of his experience in nearly all departments of the Pennsylvania System, and he appears to have made good.

While it does not appropriately form any part of this hasty sketch of facts and events, it may be worth while, in passing, to observe what happened in the rise and progress of this distinguished railroader, and why. He had a sound grounding. He started at the bottom of the ladder. He no doubt had great natural gifts; for in this rugged and practical world a pint measure can never be made to hold a quart. He had the capacity for big things; but that would not have carried him to high place if he had not got into his proper orbit. He found the orbit in the Pennsylvania system and quite obviously made the best of it That gives us a clue to the character of the man. His was not a pyrotechnic advancement. He came to his full stature by successive steps, appropriating knowledge as his experience

widened. The point which needs to be emphasized is that he was qualified for a large orbit and he found it.

Achievements in England

In April, 1914, he was offered and accepted the post of general manager of the Great Eastern Railway in England. He got it on his merits. A few months later the world war broke out, and strenuous times came to the heads of the large British railways. The Great Eastern, one of the most important of the English roads, with strong steamship connections, became one of the leading lines of military communication. Mr. Thornton was made a member of the executive committee of general managers which, under the control of government, administered all the railways of the United Kingdom. In 1916 he was appointed director of inland water communication, with functions extending to France, Egypt and Mesopotamia. Early in 1917 he was sent to Paris as assistant director general of railways, and became further identified with military operations. From the rank of colonel he passed up to be brigadier general. Finally, he had charge of army transportation on the continent with the rank of major general.

While all this was happening, Henry Thornton remained an American citizen. Having regard to the more or less rigid rules of English life in such matters, this would seem anomalous. It was. But great events were transpiring and big men were needed to cope with them. His nationality was subordinate to the service he was prepared to give. That alone counted. It was not until March, 1919, that he was naturalized as a British subject. In May of that year he was, for high services to the state, gazetted Knight Commander of the Order of the British Empire, and became Sir Henry Thorton. He is also Commander of the Legion of Honor of France, an officer of the Order of Leopold of the Belgians, and holder of the Distinguished Service Medal conferred by the American government.

New Task One of Greatest in Railway World

These brilliant titles and honors grow rather dim when brought into contrast with the glaring fact that Sir Henry Thornton has now been chosen for one of the most gigantic tasks ever assigned to a man in the history of transportation by rail. Canada's venture into public ownership has created a problem graver than that which has confronted any country. It is no mere figure of speech, or play on words, to say that if he solves it he will save a nation. It is a solemn truth, although it is only clearly recognized by those who have studied the facts and grasped their real significance. He has to turn an annual loss of more than $100,000,000 into at least a balancing of accounts. His pathway is at this moment beset by obstacles. One of them is fundamental and relates to the act under which he must operate. Let us look at its main features—for Americans will be deeply interested in what may happen with respect to Canada's national railways as Sir Henry proceeds with his administration.

The governor in council may nominate such persons as may be deemed expedient, not less than five, nor more than fifteen, to be directors of the company hereby incorporated, and upon such nomination being made the persons so nominated, and their successors, and such other persons as may from time to time be nominated by the governor in council as directors, shall be and are hereby incorporated as a Company, under the name of "Canadian National Railway Company," hereinafter called "the Company." No stock ownership shall be necessary to qualify a director.

The directors shall hold office from one annual meeting to another or until their successors are appointed, unless removed by the governor in council for cause. Upon any vacancy occurring the governor in council may fill the vacancy by the appointment of a successor. The continuance of a vacancy or vacancies shall not impair the powers of the board of directors. The annual meeting shall be held upon the second Thursday in April in each year, or on such other date as the directors may from time to time determine

It will be seen that these clauses place absolute power as respects the board in the hands of the government, and government control of course means political control. "Unless removed by the governor in council for cause" has enormous significance. It is clear that at any time the official life of a director may be brought to an end. It is not for a moment suggested that this power of life or death over every member of the board would be used arbitrarily or contrary to public interests. Popular judgment, always active and articulate in Canada, would not permit the assertion of reckless political control; but we must all see that the power is there, and, while it is there, partisan expediency may compel—as it has so often done in the past—action which could not be defended on higher grounds.

Government Earnestly Striving to Solve Railway Problem

The King government inherited this railway problem, and, the writer believes, is sincerely trying to solve it. The announcement of the personnel of the new board, with such a commanding personality as Sir Henry Thornton at its head, has been received by the Canadian people with unqualified approval. The general judgment is that a strong board has been chosen. There is a universal disposition to give the management every possible latitude in the tremendous task which it has assumed; but no one who is familiar with the main features of that task would feel like minimizing it. One of these features is the great length of parallel mileage, both in the East and the West, but particularly in the West. This grew out of two political roads being built through the same territory at the same time, which must always be regarded as a folly that could not have been carried out under other conditions.

Everything would now seem to depend on whether or not Sir Henry Thornton and his associates are given a free hand. While the power to control is still vested in the government under the Act of 1919, there is nothing whatever to prevent the substitution of another measure giving as complete independence to the new board as the Railway Commission of Australia and the Railway Commission of Canada enjoy. Political considerations alone would interpose an obstacle. Public sentiment would probably approve; but it happens that the Progressives, chiefly from the Western provinces, hold the balance of power in Parliament, and they are strongly in favor of public ownership. It is in their territory, moreover, that the parallel mileage, to which allusion has just been made, is situated. The question of vested rights comes in on the part of small communities located along this double right of way, and to that sort of feeling politicians are invariably sensitive. These people would resist being changed from their present main line status to branch line rank. They like to see the express trains go by, notwithstanding the fact that they contribute very little traffic to them, which is another way of saying that the human factor here holds a large place.

Various Interests—Including Organized Labor—Represented on Board

Sir Henry Thornton will have around him a group of admittedly strong men. They have apparently been chosen on their merits, and for that reason are acceptable to the Canadian people—or appear to be at this moment. They are:

John H. Sinclair, of New Glasgow, Nova Scotia. Mr. Sinclair was for many years a member of Parliament, and is the only man on the new board who could be suspected of holding place for political reasons; but he is really a good choice. He is conservative, cautious and competent. He brings no railway experience to his task; but his strong and slow-moving judgment will be valuable. His integrity is unimpeachable.

Richard P. Gough, of Montreal. Mr. Gough is a man

of large business experience, and in that regard is neither stronger nor weaker than scores of others who might have been chosen. He is what the country will regard as a fair representative of Canada's men of commerce.

James Stewart, of Winnipeg. He is probably the choice of the Progressives. He was for some time the head of the Canada Wheat Board, and is at the present time general manager of a large milling company. He is held in universal esteem as a man of capacity.

Ernest R. Decary, of Montreal. He was for some time head of the Montreal Civic Commission, and made good. In a large sense he might be regarded as the representative of French Canadian interests on the board.

Frederick G. Dawson, of Prince Rupert, British Columbia. Mr. Dawson is spoken of very highly by those who know him; but he starts as a stranger to the people of central and eastern Canada. He is a wholesale merchant.

Tom Moore, nominally of Ottawa. Mr. Moore is head of the labor unions in Canada, an Englishman by birth, who has made a very favorable impression for his moderation and breadth of view. He will not be a cipher at the meetings of the board; but he must be clearly identified as the special representative of labor.

Graham A. Bell, C. M. G., of Ottawa. From a clerkship Mr. Bell has risen in the Department of Railways and Canals to be deputy minister. Of all the members of the board, Mr. Bell is the only man, save the general manager and Mr. Ruel, who has had any railway experience whatever. He was never connected with any of the operating departments, but he is a master of all the financial details relating to the Canadian National system. He was very closely associated with the old Canadian Northern management, and he bears an untarnished name. For the present he will continue also to serve as deputy minister, although it is generally believed that it would be in the public interest if he gave his whole time to the railway proposition.

Gerard G. Ruel, of Toronto. Mr. Ruel, as a lawyer, has had long experience in the capacity of railway solicitor, chiefly for the old Canadian Northern; but his work heretofore has been somewhat in the background. For that reason his being given a place on the new board has occasioned some surprise. He will, however, be a useful member in matters of detail and law.

That then, is the composition of the board, for which the country has waited so long with rising impatience and discouragement. Before it lies a task of stupendous proportions. At the bottom of the broad problem, as has been said, lies the fact of a very large surplus mileage, consisting of trackage running almost side by side over thousands of miles of territory. Can political interests stand the strain of dealing with that situation in a businesslike spirit? That is the supreme question which the course of events alone will answer.

Road's Financial Condition Has Improved, But Is Still Grave

It would be quite impossible for any uninformed reader to gage the real magnitude of the problem awaiting solution in Canada. During the current year drooping hopes have been revived by the monthly announcements of operating results on the government lines. If all continues to go well until the end of the current year, the deficit on operating account may be cut down to about $10,000,000; but, while some of that betterment is on a bookkeeping basis, the fixed charges have grown at such a rate as to practically absorb all the gain on operating account. These fixed charges present one of the most difficult problems with which Sir Henry will have to deal. They were large when the Canadian Northern and Grand Trunk Pacific were taken over. They were increased when the Grand Trunk was absorbed into the public railway system. The swelling has come chiefly, however, from the fact that since public ownership was set up hundreds of millions have been taken out of the Dominion treasury to meet the needs of the system. The actual deficit as revealed by standard railway accounting amounts now to about $100,000,000 per annum, quite apart from operating loss.

The advances made from the public treasury totaled $112,632,154 for the fiscal year ended March 31 last, without taking any account whatever of interest and other charges attaching to five thousand miles of line being operated at a loss, but which are taken care of under the head of the public debt and are therefore not identifiable.

Advances from Public Treasury

The facts in that regard are so enlightening that it is distinctly worth while to give them in detail. They are as follows:

Canadian Northern	$45,688,142
Grand Trunk	56,442,020
Grand Trunk Pacific	10,501,992
Total	$112,632,154

That was the amount of the direct call on the public treasury for these three roads. A very large amount, certainly not less than $30,000,000, would have to be added for the National Transcontinental, the Intercolonial, the Prince Edward Island and 500 miles of branch lines. The facts are not available at the moment. But that is not all. During the year, securities were issued on account of the Grand Trunk for $25,000,000 and an equal amount for the Canadian Northern, both bearing government guarantees; so that the final total would be close up to $200,000,000, if not well beyond that figure. One of the difficulties in the way of getting precise and accurate information is an archaic system of accounting, which covers up an enormous amount of capital charges under the rather indefinite head of the public debt.

Capital outlay, without reference to the $100,000,000 required annually to cover the ordinary deficit, will unavoidably be large as time proceeds. The government, for example, must provide for a high proportion of the transportation needs of the West as the area of settlement is extended. Equipment requirements will be heavy and constant. In short, the money for all purposes must come out of the public treasury, with a corresponding addition to fixed charges. Yet there is the chance that earnings may exceed operating cost, and that as traffic develops a growing credit balance may help to meet the burden arising out of capital liability. That chance will be improved if efficiency and sound administration succeed to the inefficiency and waste which have protruded from every angle of public ownership in Canada. As the retiring general manager said recently, "the Canadian National can be made an asset if politics are excluded."

Notwithstanding the grave burden which rests on the people of Canada as the result of railway nationalization, there is a general feeling that public ownership should be given a fair chance. Let it be clearly understood, however, that this disposition to adopt a passive attitude does not rest on definite popular approval of the underlying principle. It rests solely on the conviction that the situation is so bad nothing else whatever can be done. The people of Canada, neither directly nor indirectly, ever approved of the principle of public ownership. The position of matters in Canada will be quite misunderstood unless that fact is clearly recognized. The people were not consulted, and no one may say how they feel about the abstract proposition. What they realize is that these costly properties are on their hands, and that all they can do is to make the best of them. They are therefore disposed to give the new board their loyal support and on their own part spend much time in fasting and prayer. Their taxes will not permit them to forget their obligations.

Suggestions for Greater Efficiency and Economy

By Franklin Snow

The Limited, running 45 minutes late, was nearing New York. On the next track, a short distance back, was the local suburban train. Ten minutes further delay for the express would mean a refund of extra fare amounting to $1.20 each to over 100 passengers. The trains approached the point where one or the other must take the only remaining inbound track. The recognized principles of dispatching, that a delayed train shall be given every opportunity to make up lost time, and that a through train shall ordinarily be given precedence over a local, even though they may both be of the same actual class, would indicate that the Limited should be given the track. Nevertheless, on No. 2 track appeared a home signal, while on No. 4 track the local received a proceed signal to take the cross-over and precede the Limited into the terminal, thus jeopardizing the chances of the express to arrive less than 55 minutes late (after which the refund for one hour's extra fare must be paid).

That this inefficient dispatching occurred with frequency can be attested to by the writer, who observed this trick as often as once a week over a period of several months. It is obvious that the dispatcher, and indirectly the officers who later reviewed his train-sheet, made a direct error in judgment, or else were inexcusably ignorant of the fact that a chance was being taken in holding a train running so closely on the time when a refund of extra fare would be necessary. The $150 or so, in this case, is a trivial sum, when considered as a portion of a trunk line's monthly revenue, but the indifference with which its loss is evidently regarded indicates a certain laxity in supervision which may be considered a fair criterion of much greater extravagances elsewhere.

In direct contrast to this incident may be cited another similar case which happened several years ago, when railroad operating ratios were below 70 per cent and when there was less absolute necessity of watching every penny. The Knickerbocker Limited, from Boston to New York, left New Haven 40 minutes behind schedule. Considerable "joshing" ensued in the observation smoker between passengers and conductor, the former inquiring as to whether or not refund receipts were ready for distribution. The conductor, with some pride, assured the passengers that they would not need them *that* trip, and such proved to be the case, a particularly fast run being made which enabled the train to pull into the Grand Central just 29 minutes late, or a minute under the time after which refunds of extra fare were necessitated.

Innumerable instances coming to the attention of observant passengers or shippers make it apparent that, despite the much greater necessity for economy in every direction, there is much room for increase in efficiency. Reliable statistics point out the fact that little lasting improvement has been made over 1919 operating standards, despite the temporary spurt in 1920.

The following table, showing comparative statistics of the most interesting and valuable features for the month of July, indicate a discouraging gain in efficiency effected by private management. In 1919 the Railroad Administration was operating the roads under normal conditions, the war traffic having ceased, but being replaced by heavy commercial traffic. In 1920 the railroads were endeavoring to reach the highest possible point of efficiency, with a 30-30 record on car-loading and car-mileage (which was never attained), against the time when the government guarantee would expire, while in 1921 the figures reflect, to an extent, the cessation of activities in shops, to which is attributable the increase in percentage of bad-order cars.

	1919	1920	1921
Per cent of cars loaded	67.9	71.1	63.6
Average number tons per car mile	27.9	28.2	27.8
Average car-miles per car-day	24.1	24.4	21.3
Net ton-miles per car-day	455	490	375
Average speed per freight-train-mile	10.8	10.8	11.9
Gross train miles per freight-train-mile	1,571	1,470	1,472
Net ton-miles per freight-train-mile	757	725	674
Per cent of net to gross-ton-miles	48	49	46
Cost per freight-train-mile	$1.54	$1 87	$1.88
Average per cent locomotives unserviceable	27.2	24.2	23.3
Average per cent freight cars unserviceable	8.7	6.6	15.9

The above statistics, picked at random, represent those given greatest consideration by operating officials, out of the mass of reports which the railroads compile (either voluntarily or by order of the I. C. C.). No extended analysis is offered, nor is one necessary. The 1921 figures show no appreciable improvement over those in 1919, while in some instances they show a decided falling off in efficiency. The spurt of 1920 was short-lived. Car miles are now averaging 21 miles per day, while loading remains fixed at approximately 28 tons per car. Despite the present great surplusage of freight cars, it is indeed a poor policy to permit car-mileage to fall off as it has. When traffic again revives it will take months to get an organization keyed up to the point where it was when the high pinnacle of 28 miles was touched.

This record, once attained, should have been used as a spur to even greater accomplishment in this direction. When there is an ample supply of cars for all requirements, there is, of course, no great incentive to expedite movement of cars on line in order to make them available for another load. Nevertheless, while it is impossible to prepare figures to verify the contention, it is obvious that a car moving only 20 miles per day is costing more to handle than one which is sliding along at a 30-mile per day average, even if only in additional per diem charges. However, some justification of decreased car-mileage may be found in the increased average train speed.

Gross tonnage per train decreased 100 tons to 1,472, but this is really an economy, as too high a tonnage record has frequently meant enormously increased transportation expenses in overtime wages, etc. As the per cent of net gross decreased from 48 to 46, we must, however, consider this as a failure to maintain the highest efficiency of transportation.

Increased cost per train-mile is, of course, directly attributable to wages, while high percentage of unserviceable cars, is, as previously pointed out, due to the fact that the roads have permitted repair work to wait until it could be performed under the lowered wage-scale.

Many concrete examples of extravagance and needless expense are at hand. The sight of a business car, trailing an already over-loaded passenger train is a familiar one to travelers. Transportation experts tell us that it costs 30 cents a mile to haul a heavy steel car. Therefore, let us assume that an official going from New York to Chicago, something under 1,000 miles, taking his car with him, is costing his company approximately $600 for the round trip. As a large part of the run is made at night, "inspection" is a poor excuse for the necessity of a business car. While many officials take such opportunities to get rid of accumulated correspondence, we might remark that even a railroad president could dictate for one evening in a Pullman drawing-room, in view of the economy thus effected. However, the height of the ridiculous is reached when, as happened recently on a great western line, two cars were added to a heavy transcontinental train (necessitating an extra locomotive) to carry certain economically-inclined officials to a fuel-conservation meeting.

In justice to railroad officials though, be it said that the use of official cars has been greatly curtailed recently, and the sight of such a car on a foreign line today is unusual, a tacit understanding having been reached, doubtless, that cars shall not be used off the home roads except in necessity.

Another matter, which is frequently censured editorially by certain periodicals as costing the railroads many thousands of dollars annually is that of free transportation, to which officials, employees, and their families are entitled. Too much has already been said and written on this subject to warrant any further comment on the right or wrong of the question, although the writer is inclined to the belief that passes, judiciously granted, are a direct benefit to the railroads, insofar as the employees take pleasure and pride in obtaining such passes. The system of granting free transportation differs on every road, although the basic principle is length of service, or meritorious service with the company.

Thus, to obtain an annual pass represents something of an achievement and increases the prestige of the recipient among his fellows, thereby increasing his loyalty to the company which rewards his faithful service. Further, an official can obtain a pretty good line on the interest his men take in their road by the pass requests they make; *i.e.*, an employee whose idea of free transportation is that it gives him an opportunity to see what his road looks like and with this knowledge become of greater value to the company, is the man worth developing, while the man who constantly requests passes to a nearby pleasure resort or city thereby indicates his indifference to the opportunity of making his holiday trips of benefit either to the company, or himself.

However, looking at the entire question of free transportation in a broad spirit, there is no reason why railroad men should not receive gratis, or at half-rate (as is the case of some foreign employees' passes), the product of their business, namely transportation, just as freely as those in other industries benefit by gifts, discounts, and wholesale prices in their own line. For instance, it is the custom for hotel men to decline payment of bills incurred by other hotel managers who happen to stop at their hostelry.

Unfortunately, though, an extravagance has crept into the distribution of annual passes by the use of the "complimentary list." This burdensome practice has become so fastened on the railroads, that toward the close of each year all departments of the larger roads prepare, and submit to their pass bureaus, a list of officials and their families, who, in the opinion of the pass-requesting officer, should receive annual transportation over his line. The original idea was to include primarily those officials of foreign roads who might be in a position to divert considerable traffic to a road presenting them with passes. The lists have now assumed such proportions, however, that personal friends of officials, past and present, comprise a large part of the list, together with widows of former officers of various roads, some living, some dead; children of officials, many of whom have long-since become self-supporting, or married, and other similar incongruities.

When the amount of money spent both in stationery and clerical labor in this annual procedure is considered in its entirety, no imagination is necessary to point out one huge and useless extravagance. How much better it would be if an agreement could be made whereby passes would only be issued upon request of an official of a foreign road, who, presumably, would only request such transportation for himself and family as he might reasonably expect to use during the ensuing year. This would also, to some extent, preclude the possibility of passes falling into improper hands.

With the present great number of outstanding annual passes, many conductors glance at them only in a cursory manner, especially on the suburban trains, which many employees use for commuting to and from their places of employment. So lax have conductors become that recently it was discovered that a former employee of a railroad was travelling to work on a Railroad Y. M. C. A. card, which bore a distant resemblance to the annual pass of the company. The conductor on whose train the man rode had doubtless become so familiar with this person's face as being a pass-holder, that he ceased to even glance at the pass-case which was shown daily, the man covering a certain part of it with his hand, and in this way the company was hood-winked for several months, before the fraud was discovered.

However, these occasional instances of mis-use of passes should not be considered as being arguments against the privilege itself, which is a thoroughly and properly appreciated one by the great mass of railroad men. The only condemnation of it is in the extravagances which have crept into the system of distribution.

When Headlight Meets Headlight

READERS INTERESTED in the train accident record will recall the account of a collision of passenger trains at Plains, Kansas, on April 19, 1922, about 2 a. m. (reported in the *Railway Age* of June 10) in which each of the two enginemen, running at full speed toward each other on single track, remained oblivious to his danger until within a very short distance of the other train; though both trains carried bright electric headlights and the line of road was straight and level and the weather clear. Both enginemen were killed.

Since the publication of that report there has been a considerable amount of discussion of the question how such a disastrous error could be made; and we have made inquiry of a number of operating officers and locomotive runners with a view to comparing representative opinions. The government's investigation has afforded no light on the two enginemen's probable mental processes; and, the enginemen themselves being silent in death, all that can now be said is in a measure speculative; nevertheless an examination of the general headlight question may be instructive. Can the engineman of a moving passenger train be so dazzled, as he faces an electric headlight a half-mile away, that he will think it is several miles away? And is there no remedy for such a risky condition? A collision similar to that at Plains occurred at Seneca, Mich., on November 27, 1901, causing the death of 20 or more passengers.

Were the Enginemen Asleep?

A decided majority of careful men who have examined the record of this case hold that with competent and experienced enginemen, awake, the collision would not have occurred. Two superintendents and one engineman conclude, from the record, that unquestionably both of these men must have been asleep.

A trainmaster (formerly an engineman) and two superintendents feel sure that each engineman, having assumed, when he started out on that seven-mile run, that the opposing train was on the siding at the remote station, and having been assured that he himself had the undoubted right of road to that station, continued to rest in that assumption, giving little or no thought to the headlight. This line of thought implies either that (1) the near approach of the opposing headlight was not perceptible or (2) that its presence on the main track (instead of, as assumed, on the station side track) did not present so different an aspect as to remind the observer that it was not on the siding, or (3) that the engineman was not keeping a good lookout.

In all this both enginemen are to be considered, each by himself, each having encountered conditions which presumably were exactly like those encountered by the other.

This view, that both enginemen had full confidence that their right to the road was absolute, is strongly emphasized by a committee which was convened by Road Foreman of Engines E. W. Elleman, of the Hocking Valley, to consider this case. It enforces the grave truth that a mistake of dispatcher or operator in giving right to road, which was

the primary cause of this collision, must always be considered as irreparable.

Explicit Rules Needed

Considering the single question, what to do about the headlight, the first thought of most officers is that the rules ought to cover the point very explicitly. A rule which has been approved by the A. R. A. committee on operation (on January 9, 1922), requires electric lights to be dimmed "when standing." An officer of the Baltimore & Ohio states that substantially this requirement is included in the rule of his road; and a rule of this general character is in effect practically everywhere; but to what degree uniformity of wording and of practice have been agreed upon, in any territory, is a point on which further light is needed.

A traveling engineer of the Illinois Central suggests that the proper rule should read:

(a) When trains are standing on siding, clear of main track, to meet an opposing train, the headlight is to be concealed.

(b) When trains are standing on main track, clear of siding to be entered by opposing train, the headlight is to be dimmed.

(c) When trains are standing on main line, or on siding not clear of opposing train, or when running, the headlight is to be kept burning brightly.

An officer of the Southern Railway sends the substance of a letter, concerning this collision, which was received by him from an engineman of 30 years' experience (on a line with tangents many miles long). The following paragraphs from this letter are intended, evidently, by the writer, as a summary of his views as to both cause and remedy:

1. Brain fag. Loss of memory. A man sees with his brain, his eyes are only a medium for transmitting.

2. Did not err as to distance; they had no knowledge of their surroundings; caused by temporary mental aberration.

3. The difference between a strong electric headlight a half mile away and one three to six miles away is so marked, in clear weather, that no man in possession of his mental faculties could fail to note the difference.

4. To decide distances in a case like this is not difficult, assuming the engineman knows the road.

5. See that enginemen are thoroughly familiar with the physical characteristics of the road.

6. Try to see that the morals of enginemen are of the highest type and that they have ample rest before reporting for duty.

7. A lack of concentration, failure to keep one's mind on the job, is responsible for most accidents.

8. Preach Precaution, Prudence and Morality; this results in safety of operation.

Lights Should Be Focused Downward

Those correspondents who emphasize the difficulty of estimating the distance of an approaching electric headlight —some of them declaring that no one can trust himself to do it with certainty—make prominent the importance of correct focusing of every light. The light should be focused downward, so as to illuminate the rails several hundred yards ahead, but not farther. A lamp improperly focused may light up the rails for many miles ahead. On an undulating grade this difficulty is, of course, inescapable; but runners well acquainted with the road can, of course, make due allowance in such situations. It is suggested that roundhouse foremen should be very particular in requiring proper focusing, and that individual enginemen should be forbidden to make any change in the adjustment. An officer of the Great Northern advises that some of the enginemen on his road propose the dimming of headlights about two-thirds, when opposing trains are nearing each other. This would aid both trains in locating themselves, and each other, while yet affording a light strong enough to drive with safety.

The two following interesting paragraphs are from an officer of the Florida East Coast:

"Shut off your own headlight and when the rails show a glint of light the approaching train is approximately one mile away. We have observed headlights on our road, over the Keys, one-half hour before the train would reach you. It was customary to drive motor cars until the rails showed a glint of light, and then, without hurrying, the motor car could be removed with safety. However, this required a certain knowledge of conditions, and strict attention to the business in hand.

"All enginemen are not alike in this respect. It may or may not be a matter of record, but collisions have in fact been averted a number of times by the headlights burning, when lap-orders were given or orders overlooked. We have had one case of two trains colliding on straight track with headlights burning. The negro fireman, who was experienced, called the engineman's attention to the opposing headlight, and then turned his own headlight out to determine the distance; but the engineer paid no attention to the warning. One train had a meet order, the other had nothing The fact that the headlight showed up called for action."

A Succinct Summary

An operating officer in Louisiana interviewed some of his older enginemen and gives the following comprehensive comment and review:

"Without exception all of the locomotive engineers that I have talked with on the subject insist that this collision should not and would not have occurred under the conditions as stated, had the engineers of both of the trains been awake and alert and fully masters of themselves at the time.

"Almost without exception our engineers called attention to similar experiences of their own. They say that when an electric headlight gets within a range of something like a mile it is very easy to locate it, one of the ways being that the line of rails will show up very plainly; while at a distance of two miles or more, about all that can be seen is a light similar to a ball of fire. After the light gets closer, and particularly when within about a mile, there is a heavy glare which increases and is so strong that it shows up the line of rails brightly. In short, the verdict which I obtained from interviewing these men, at least a dozen in number, is that under the conditions named the engineers, one or both of them, must be held finally responsible.

"I have ridden engines at night a good deal during my years as a transportation officer and the replies given me by these engineers as above are in line with my experience.

"It would hardly seem that both of these engineers could have been asleep at the same time; yet that could be possible. It could be possible also that one of them was asleep and the other carelessly allowed himself to take his eye off the rail for a minute or two at the very time he should have been keeping the sharpest lookout; and, as we all know, enginemen will sometimes do that very thing.

"What can be done to educate or regulate enginemen in connection with such a situation? The solution of the problem lies in selecting for the position of engineman only those who have been proved to be safe and sane men. Enginemen are not all alike. It has been my experience on the three different roads that I have served that we have enginemen who are known by the rank and file to be essentially safe men, while there are others who are generally recognized to be, if not unsafe, not as safe as they should be. And there is what we may call the middle class.

"I think we may safely conclude that this collision could not have occurred under the circumstances, had the enginemen in charge of both trains been what railroad men term essentially safe men."

The Gilmore Arch—An Overhead Highway Bridge

Development of Concrete in Railway Construction*

A Review of the Steps in the Adoption of This Material on the Delaware, Lackawanna & Western

By M. Hirschthal
Concrete Engineer, Delaware, Lackawanna & Western

SOMEWHAT MORE than twenty years ago, the Delaware, Lackawanna & Western embarked on a departure from the then current railroad construction practice in the east, by adopting concrete as the material for bridge abutments, retaining walls, etc., for the Newark, N. J., grade

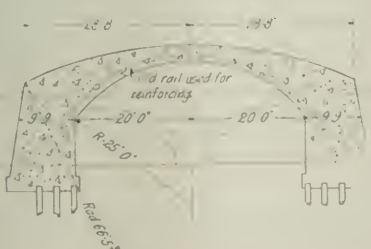

Fig. 1—Forty-foot Arch Over Beaver Brook, Bridgeville

crossing elimination work. Railroad engineers then, as now, enjoyed the reputation of being the most conservative of any in the practice of engineering and this adoption of concrete was considered a bold step forward. Contrary to the normal direction of the progress of civilization, which has been from the east toward the west, the progress in the use of concrete was from the west toward the east as concrete appeared in the construction work of the western railroads several years before it was employed by the eastern lines.

Prior to the advent of W. K. McFarlin as chief engineer of the Lackawanna just before 1900, concrete was not used along the line of the railroad for any purpose other than back-filling or other equally unimportant work not subject to stresses. The remarkable growth of the use of this "new" construction material, both plain and reinforced, in the 20 succeeding years, is evidenced by the monumental structures of concrete all along the line from the lowly drain pipe to the majestic Tunkhannock viaduct. The evolution of the design and construction of concrete structures from the humble beginning became a very interesting process,—at first slow and laborious,—increasing in its momentum and finally becoming almost all-embracing in its scope.

Evolution is defined by Herbert Spencer as a development from the simple to the complex, and the evolution of the use of concrete as a structural material is no exception,—it is the development from the simple gravity sections with pressure lines limited to the middle third of the plane of section, resulting in simple compression throughout, to the highly complex four-way type of reinforcement, and rigid frame structures designed to take stresses of all types and in all directions, complicated by all manner of combinations and conditions of loading pertaining to any particular case.

The following description is an attempt to outline this growth and illustrates the wide usage that concrete enjoys in the construction work of the Lackawanna. The description necessarily partakes somewhat of the nature of a historical sketch due to the fact that each new structure has represented a step forward in the development of the use of concrete for purposes requiring more complicated design.

The Early Uses of Concrete

As already mentioned above, the first use of concrete along the line, and the only use of it for some years, was in the

* This is the first of three articles. The other two will appear in early issues.

construction of retaining walls and bridge abutments of the mass type with the standard section then obtaining in general practice in the design of masonry retaining walls particularly for retaining railroad embankments, keeping the pressure within the middle third to avoid tension at any part of the section. The cry in railroad practice has always been "make them heavy enough," it being assumed that under this condition the soil pressure would take care of itself.

The next use of concrete was in the construction of "rail-

of stone masonry. The new arch is segmental, of 40-ft. span length, with 10 ft. rise and a 3-ft. crown thickness to carry a fill of over 40 ft., necessitating a length of barrel of 123½ ft., supported on pile foundations. The section is what might be termed a "Trautwine" section, having very heavy haunches and but slightly battering abutments. The ring was reinforced by rails to conform to the intrados of the arch, (Fig. 1).

It was also in 1903 that the Keyser Valley and Kingsland

top" and "I-beam top" culverts. These were the earliest structures of concrete but were so designed that the rails or I-beams carried the railroad loading while the concrete filled in to form a solid floor as a protection for the steel. There were also a few concrete arch culverts of smaller spans.

The first structure of any size or importance to be built of concrete on the line, was the arch at Bridgeville, N. J., erected in 1903 to replace a double-barreled arch culvert

shops were built and concrete used in the construction of all of the foundations and floors and subways, and in some instances for the roofs of the various buildings.

Isolated structures of the minor type continued to be constructed of concrete, but the first *reinforced* concrete structure was a coal trestle built at Hoboken, N. J., in 1906-1907. Here, the track stringers were designed as reinforced concrete beams, supplanting the use of steel rails or I-beams.

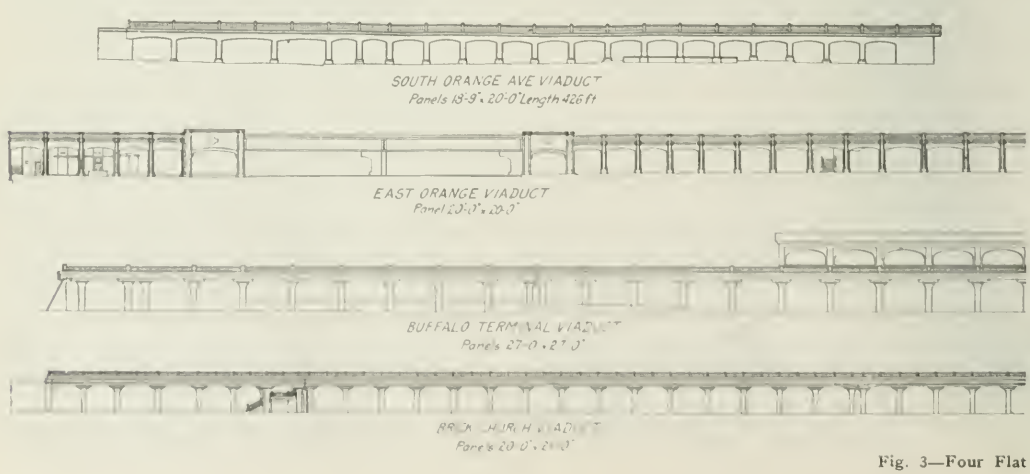

Fig. 3—Four Flat

This trestle of 112 ft. of mass wall aproaches, 226 ft. of reinforced concrete stringers on piers, with temperature reinforcement in each face, and 150 ft. of coal storage bins, entailing the use of reinforced concrete stringers supported on reinforced concrete girders, which in turn are supported by reinforced concrete walls, retaining the coal carried on a reinforced concrete floor, which spans between concrete retaining walls.

At each pier along the open trestle a rail is imbedded transversely, overhanging both sides sufficiently to support a concrete walk. This is evidently a substitute for a reinforced concrete bracket or cantilever, confidence in reinforced concrete not having advanced sufficiently at that time to permit of reinforced concrete cantilevers.

Somewhat later a skew arch bridge was designed and built

Fig. 4—Showing Flat Slab Construction at Buffalo

over Washington Avenue, Washington, N. J. The right span of this bridge is 44 ft. clear, and as the central angle is 42½ deg. there is a skew angle of 47½ deg. This excessive skew was modified by forming the faces of the bridge to a skew of 25 deg. with the center line of the avenue. This arch is segmental in form with a 10-ft. rise and a 3-ft. crown thickness without any reinforcement, while the elevation of the top of parapet is that of the top of rails. The abutments are supported on pile foundation. One-half of the roadway is carried by the roof of a two-span box culvert, reinforced with rails forming a then typical double rail-top culvert.

At about this time the design and construction of the various shops at Scranton, Pa., was begun and it was decided to use reinforced concrete as the material of construction. This project included a vast program of buildings for many purposes and various conditions of loadings from light office loads to locomotive loading and entailed several years of continuous construction.

Late in 1907, the preparation of plans was begun for the Hopatcong to Slateford cut-off, now known as the Lackawanna Railroad of New Jersey. The character and object of this improvement have been described so often and thoroughly that no detailed repetition is needed here. However, it was on this improvement that concrete and reinforced concrete were employed by the Lackawanna for the first time on so large a scale and for so many types of construction. There were the two important viaducts, the Delaware River structure of elliptical arches, and Paulin's Kill with semi-circular arches, and while the majority of the bridges, both over and undercrossings were of the arch type, there were a number of flat construction, both of the "T" beam and simple slab type.

Altogether there were 73 concrete bridges and culverts of which about 50 were major structures, concrete construction having attained to sufficient magnitude to justify the organization of a special concrete department to handle the design of all concrete structures. The successful completion of this cut-off, entailing the placing of 260,000 cu. yd. of concrete and 5,000,000 lb. of reinforcing steel, marked an epoch in railroad construction and put concrete in the foreground as the material for consideration in subsequent important construction work. Therefore in the planning of the Pennsylvania cut-off from Clark's Summit to Hallstead and in connection therewith, the projection of the Tunkhannock viaduct, concrete construction occupied a strategic position and had a strong line of defence against the proposed steel structure, despite the advantage of first cost and of established usage which the latter type enjoyed. It is interesting to note that an effective argument for concrete in consideration of the type of structure to be used for the Tunkhannock viaduct, was the striking effect produced by a wooden model of the proposed viaduct so perfect as to all its architectural details, and color as to simulate the completed structure. This model made so favorable an impression that it was shipped to the Leipzig Exposition.

The Pennsylvania cut-off was by far the largest improvement, both in mileage and cost, undertaken by the railroad, and is described in an interesting article by G. J. Ray, chief engineer, appearing on page 1243 of the *Railway Age* of December 24, 1921. With few exceptions all the structures are of concrete, of which; of course, the Tunkhannock and Martin's Creek viaducts are the outstanding features. The total number of structures on this improvement, exclusive of these two viaducts, is 86, of which seven are of structural steel, and 79 are of concrete, 42 of them being major structures. Like the New Jersey cut-off, there have been many articles descriptive of the general scope and details of construction and of the two viaducts, that it is only necessary to summarize by stating that 345,000 cu. yd. of concrete and 6,250,000 lb. of reinforcing steel were placed in the bridges and culverts of this cut-off.

Between the projection of the two "cut-offs" there was begun an ambitious program for the elimination of all

Length 1085 ft.

Slab Viaducts

grade crossings in the thickly populated districts along the main line and also on the Montclair branch. The part of this program first to be carried into execution was the elimination of the crossings on the branch from the East Orange city line to the terminal at Montclair and incident thereto the construction of new passenger stations. Embraced in this work are arch construction both overhead and undercrossings, flat construction and, for the larger spans, structural steel encased in concrete. In connection with this improvement, reinforced concrete coal pockets were constructed at Montclair.

After the completion of this first portion of the program of elimination, there were executed at various times the improvements along the main line to Morristown, eliminating successively the grade crossings at Chatham, Madison, South Orange, Morris Plains and Orange, culminating in the East Orange improvements now in progress with the completion of which all grade crossings from Mount Taber, N. J. and Montclair to Hoboken will have been eliminated. In all of these improvements, concrete, both plain and reinforced, is the principal medium of construction, particularly in the East Orange improvement where the only structural steel work occurs at the Main street crossing where the excessive skew of the angle of crossing precluded the use of reinforced concrete as an undercrossing. This street crossing is part of a viaduct, the remainder of which is of concrete.

There were important improvements at other points on the line, notably at the west end at Buffalo where a new terminal was designed and constructed. The tracks there are carried on an elevated structure and the portion under the train shed is utilized as a warehouse and provided with tracks for drilling purposes. There again because of the magnitude and importance of the structure, the question of the type and material of construction had to be considered seriously before a final decision was made. Concrete was selected because of the uniformity afforded by the flat slab construction and the reduction in maintenance costs over those for structural steel.

During all this time and since, isolated grade crossing eliminations and bridge renewals have been executed in concrete at many points along the line, except where clearance requirements and excessive spans made its use prohibitive. Among other structures to be designed and built of reinforced concrete are buildings, cinder pits, sand storage bins, transmission poles, etc.

In all of the concrete work along the Lackawanna the distinctive feature is the attention paid to architectural details to produce artistic effects in harmony with the use and environment of the structure under consideration. It is the writer's opinion that this railroad is one of the few, if not the only one in the country that does not submerge all architectural and individual effects by the use of standards throughout, with the result that the structures on this line stand out as individual bridges, stations, etc.

The structures herein described have been selected for the purpose of illustrating certain types and to point out particularly interesting examples as indicating divergence from the ordinary.

Several Large Arch Viaducts Have Been Built

Of all the structures, perhaps the best known are the four arch viaducts, because of the interest attaching to their magnitude and because they perhaps best illustrate the individuality of treatment above mentioned. While the Paulin's Kill and Tunkhannock viaducts are similar to each other in so far as they both have sufficient head-room to permit of the use of semi-circular arch spans and spandrel arches, their treatment both architecturally and structurally is absolutely dissimilar.

The difference architecturally is apparent to the eye in the difference of the piers, pilasters and railings. The structural difference is chiefly in the use of the buried abutment arch spans of the Tunkhannock (employed as well in connection with the Martin's Creek), eliminating the otherwise high walls used at the abutments of the Paulin's Kill viaduct, the selection of the rib instead of the barrel type and the provision of a ledge to support centering later ornamentally treated, to obviate the necessity of erecting falsework for arches from the ground.

A comparison of the Delaware River and Martin's Creek viaducts, in both of which the rise is considerably less than

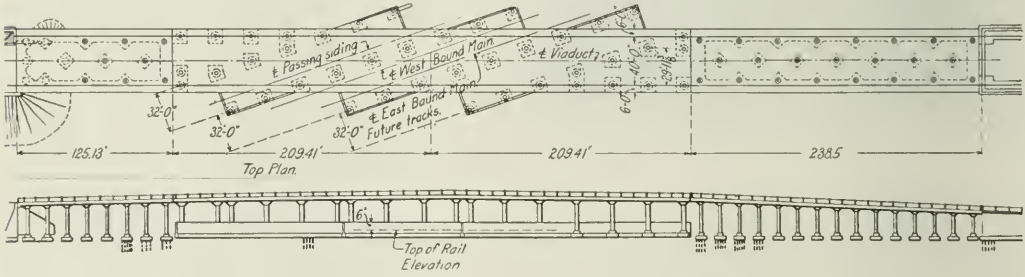

Fig. 5—Flat Slab Viaduct Over the Track at Sanford's Crossing

half the span, discloses the use of a segmental form of arch in the design of the Martin's Creek as contrasted with the elliptical form in the earlier Delaware river viaduct which is of the barrel type with "U" abutments while the later structure is of the rib type with centering ledges, and submerged arch abutments. Architecturally there is a marked difference in the treatment of the pilasters and railing. Figure 2 shows these four viaducts and the data concerning them.

Flat Slab Viaducts

There are also four long viaducts of flat-slab type, viz: The Buffalo terminal, the South Orange avenue viaduct, and the Brick Church and East Orange viaducts now in the course of construction in connection with the East Orange improvements. Here, as in the case of the arched viaducts, it may be noted that each is treated, so far as architectural details are concerned, absolutely independently of the others, and while two of the structures have cantilever fascias and the other two columns and pilaster fascias, they also differ from each other in architectural details. The structures of the cantilever fascia type are the Buffalo terminal and the Brick Church viaduct, while the South Orange avenue and the East Orange viaducts are of the fascia column type.

The viaduct at the Buffalo terminal is by far the largest, both as regards area and cost, having an extreme width of 154 ft. to accommodate seven tracks at its wide end and

narrowing down to a 46 ft width for three tracks with a total length of somewhat over 1,100 ft.

The columns supporting the structure are cylindrical, reinforced by both longitudinal bars and spirals and are spaced 27 ft. center to center in both directions, the transverse section being completed by 9 ft. 6 in. cantilever spans at each side. The slab, two feet thick, is increased in thickness at the supports to form drop panels and is reinforced with four bands of steel reinforcement, running respectively longitudinally, transversely and in each of the diagonal lines, with bars from each band bent up at the supports to take shearing stresses and those due to negative moment. This slab, beside carrying the tracks and platforms, supports the column concentrations of the train shed roof for the major portion of its length. The train shed columns surmounting this slab are spaced 27 ft. on centers longitudinally to correspond to the spacing of the columns below; transversely, however, the spans are increased sufficiently to permit of spanning over two tracks and center to center of 20-ft. platforms so that some of these columns transfer concentrated loads to the slab which distributes them to the lower columns. The foundations throughout this improvement are on piles surmounted by heavy concrete footings, all connected by reinforced concrete struts in both directions.

The three other viaducts provide facilities for three tracks throughout with station platforms between two of the tracks and on one side of the third, having a width of about 80 ft. in the vicinity of the stations and narrowing down to 46 ft. at the ends.

The East Orange viaduct is complicated by the fact that the crossing at Main street is on a considerable skew and requires long spans, precluding the use of this type of construction and necessitating the use of I-beams encased in concrete with fascia girders supporting the skew ends. This problem was solved architecturally by the use of concrete portals over the sidewalk spans adjacent to the two road spans. This treatment is very effective.

The shortest of the viaducts is the South Orange avenue viaduct, which is 426 ft. long and was built without expansion joints. The others are of very nearly equal length, but while the Buffalo viaduct has but one expansion joint which occurs at the change of section, the Brick Church and East Orange viaducts have joints at intervals of 250 to 300 ft. The columns are spaced 20 ft. center to center longitudinally for the three viaducts, except at the street crossings, of which that at South Orange avenue has the longest spans, these being 33 ft. center to center. The transverse column spacing varies in the three viaducts. At Brick Church the transverse spacing is 21 ft. with two cantilevers of approximately 7½ ft. each while at East Orange and South Orange, where fascia columns are used, the column centers transversely are 20 ft. and 18 ft. 9 in., respectively. Figure 3 shows the four viaducts for comparison with the information concerning each of them.

Overhead Highway Flat Slab Viaduct

While the above mentioned are the only viaducts of this flat slab type to carry railroad loadings, there is also a viaduct over the railroad tracks carrying the highway loads of Newark Turnpike, at Kearney, N. J., known as Sanford's Crossing (Fig. 5). This was an unusually difficult grade crossing elimination, due to the character of the soil, the proximity of the trolley line and the Pennsylvania railroad shops crowding the work. It was further complicated by the extreme skew of the angle of crossing (70 deg. 48 min.) as well as by the inordinately large spans made necessary by the requirement of spanning two tracks with the necessary side clearances, resulting in spans of 32 ft. center to center in both directions. The columns for these spans are supported on four rows of continuous piers acting as guard walls, carried to a height of 6 ft. above the top of rail as a protection against derailment. The approaches are smaller spans of 22 ft. 6 in. center to center with diagonal spacing of columns and sidewalks overhanging on either side. Expansion joints are placed at both ends of the main spans. All the foundations on this viaduct, the length of which is 782 ft. exclusive of retaining walls, are supported on piles, the columns of the approach spans being supported on clusters with individual footings, while those of the main spans are continuous. A peculiarity of the columns on this structure is their octagonal shape which, though attractive in appearance, was found to be excessive in cost of forming and their use was not repeated.

Freight Car Loading

WASHINGTON, D. C.

FREIGHT CAR LOADING during the week ended September 30 was the largest for any week since October, 1920. The total showed another increase of 15,000 cars as compared with the week before, to 988,381, which was within 3,902 of the loading during the corresponding week of 1920, when the total was 992,283, and was 83,550 in excess of the loading for the corresponding week of last year. As compared with the week before coal loading increased from 187,896 to 189,349, and there were also increases in the loading of all classes of commodities except grain and grain products and forest products, but the principal increase was in miscellaneous freight which increased nearly 10,000 cars. Increases as compared with 1920 were shown in grain and grain products, livestock, merchandise and miscellaneous. In the Alleghany, Southern, Central Western and Southwestern districts also increases were shown as compared with 1920. While grain loading was less than that for last year the total loading to date in 1922 is in excess, not only of 1921, but also every other year. The summary as compiled by the Car Service Division of the American Railway Association is shown in the accompanying table.

The freight car shortage showed another increase during the last week of September to 130,325, which included 66,529 box cars and 38,954 coal cars, while the surpluses amounted only to 6,593.

The railroads have been furnishing a steadily decreasing percentage of the cars required for coal loading, according to the weekly reports of the Car Service Division of the American Railway Association. For the week of September 23 the percentage of cars placed to cars required was 58, as compared with 63, 73, 78 and 82 in the four preceding weeks, respectively. For the week of September 23 the cars required were 367,616, as compared with only 193,660 in the corresponding week of last year; the cars placed were 212,685 and the cars loaded 181,346, an increase of 21,580 or 13.5 per cent over last year.

The number of locomotives out of service for repairs showed an increase during the first half of September as compared with the last half of August. On September 15 the number requiring over 24 hours for repairs was 16,572 or 25.8 per cent, as compared with 25.3 per cent on September 1, and the number out of service for repairs requiring less than 24 hours was 3,585 or 5.6 per cent, as compared with 3,573 on September 1. The number of serviceable locomotives stored was also reduced from 2,842 to 1,982.

In a circular addressed to the shipping public, asking co-operation to bring about the most economical use of cars, M. J. Gormley, chairman of the Car Service Division, says:

"Prior to the strike of the shop crafts on July 1 the Car Service Division prepared an estimate of car loading for the remainder of 1922 together with probable transportation conditions coincident with the peak of railroad traffic generally reached in October.

"The chart then prepared is attached. It outlines load-

ing for 1920 and 1921, and for 1922 up to July 1 of, (1) Coal, (2) All commodities except coal, (3) Total all commodities. The estimated figures subsequent to July 1, 1922, are shown by the light dotted line. The actual loading July 1 to date is shown in heavy line marked 1922. This estimate was prepared without knowledge of the shopmen's strike and was withheld account conditions incident to the strike.

It was estimated—

1. That coal mining, suspended in union fields since April 1, would generally be resumed not later than August 1, 1922.

2. That the loading subsequent to July 1 would reasonably be expected to increase at a ratio corresponding to the average of years 1919, 1920 and 1921.

3. That while there would be a decided increase in coal loading subsequent to August 1 the production would not reach the record of 1920 for the reason that it was generally conceded there was a production considerably beyond the actual demand in the fall months of that year.

"Records indicate that the railroads handled at one period it would be and which estimate was made prior to the strike of the shop crafts.

"It is extremely important from the standpoint of shippers as well as the railroads that extraordinary methods of co-operation be adopted along the following lines in order to measurably meet the transportation needs, particularly of the next few months.

1. Load cars to their full carrying capacity.

Figures show that 2,250,000 less cars would have been used during the year 1921 to handle the same amount of tonnage provided the cars had been as heavily loaded during the entire year of 1921 as they were during the last quarter of 1920. The light loading of equipment constitutes a very great waste in transportation, including the addition of empty mileage for the return of excess cars in service for handling the same tonnage.

2. Unload cars promptly.

Save car delays. At least 150,000 cars are unloaded every week day. If 24 hours can be saved in more promptly unloading one out of every ten cars placed for unloading there will be 15,000 additional cars available for shippers. The railroads do not want demurrage.

3. Order cars in advance, and on a basis of what will

REVENUE FREIGHT LOADED

in 1921 within 5 per cent of the previous peak car loading of the country, which occurred in 1920, and this was done without car shortage and without transportation difficulties, but during that period there was pronounced efficiency in the handling of cars on the part of shippers and the railroads. It was the conclusion prior to July 1, 1922, that with the continuation of this efficiency in transportation a peak loading of 1,100,000 cars would be reached in October, 1922, which figure is 10 per cent in excess of anything of record heretofore and that this would be accomplished without appreciable car shortage or transportation difficulty.

"It, of course, is impossible to forecast the cumulative effect of the transportation difficulties of the past three months, but the actual loading of traffic, other than coal, since July 1 as shown by the chart, closely approximates the estimates made. The coal loading since the resumption of general mining is only slightly less than it was estimated be loaded within a 24 hour period. Do not hold cars for prospective loading.

This will be helpful in having requirements met, and will conserve equipment available for general distribution. It helps no one to pyramid orders and disrupts efforts of car distributors to meet demands uniformly.

4. Place orders requesting reconsignment with promptness.

It is easily possible to avoid at least two days' delay in car movement by this means.

5. Issue bills of lading promptly.

"Freight cars are built to haul goods, not to store them. They should be loaded to the limit of their capacity. They should be loaded and released with the utmost promptness.

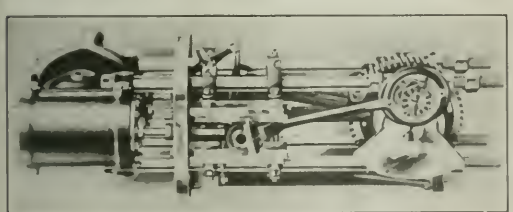
"By co-operating in carrying out these suggestions all will be contributing in large measure to the meeting of current transportation requirements."

Unit Steam Motor Car Built for the Canadian National Railways

Steam-Propelled Unit Railway Motor Car

Improved Power Plant with Water-Tube Boiler and Oil Burner Characterize Canadian National Car

MANY RAILROADS within the past year have turned to the self-propelled passenger car as a device which would aid materially in reducing operating costs on branch lines, or in sections where the traffic is light. Much of such equipment tried has followed closely the lines of development of the gasoline-engine motor bus used on highways



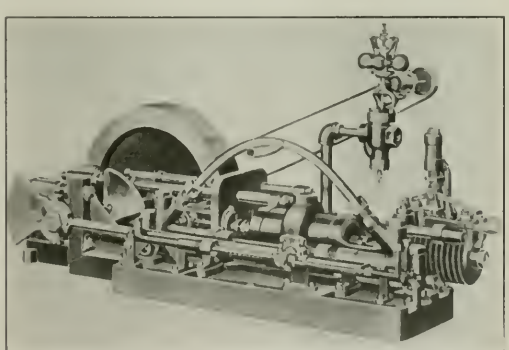
The Main Engine is of the Two-Cylinder Simple Type

with more or less modifications to adapt it for use on railroad tracks.

A distinctly different car of the self-propelled type is the oil-burning, steam-driven car built by the Unit Railway Car Company, Boston, Mass. One of the early cars of this style was shown at the Atlantic City convention in 1919, a description of it being given in the *Railway Age*, June 18, 1919. From experience gained through observation of the cars which have been in service since that time, the builders have been able to make a number of improvements in details of design. These have been incorporated in the cars recently delivered to the Canadian National, the Boston & Maine and the Uruguayan Government.

The power plant in the Unit railway steam cars embodies the principles used in the Stanley steam automobiles and is built under the same patents. Ease and flexibility of control with large reserve capacity for quick acceleration, or for use on grades is a characteristic of these cars. They are usually operated as a single car unit, but have sufficient power for pulling a trailer, or can be used for switching purposes when necessary. Maintenance can be attended to easily by ordinary railroad mechanics and the costs should be low.

The delivery of the car to the Canadian National was hurried in order that it might be shown at the annual exposition in Toronto. Without waiting for a preliminary trial, it was started from Boston under its own power and ran to Toronto, a distance of 660 miles, without interruption, except for delays incidental to orders from the operating



Auxiliary Steam Engine with Air Compressor, Feed Water and Oil Pumps

departments. The running speed for much of the distance was between 45 and 55 miles per hour.

Car Body and Truck

In appearance, as will be noted from the photograph, the car bears a closer resemblance to the usual steam railroad passenger, or to an interurban electric car than is the case with many of the gasoline engine cars. The body is of steel construction and the car is equipped with standard

couplers. The Canadian National car is 50 ft. 7 in. long over end sills and is divided into four compartments. Next to the driver's compartment, in which is located the boiler and auxiliaries, is a baggage compartment. There is also a smoking compartment separated by a partition from the main part of the car. There are seats for 38 passengers and, in addition, two folding seats are provided in the baggage compartment, which furnish room for eight additional passengers if desired. The rear platform is enclosed and provided with doors. A small toilet room occupies one of the rear corners of the passenger compartment. Current for electric lights is supplied by a small generator driven by the auxiliary engine.

The trucks are of a modified arch bar pedestal type of light construction. The wheels are 34 in. in diameter and ball bearings are used in the journal boxes. The distance between truck center pins is 28 ft. The forward truck has a wheel base of 6 ft. 1 in. and is so arranged that the distance from the center bearing to the front axle is 2 ft. 1 in., and from the center bearing to the trailing axle the distance is 4 ft., this being done in order to increase the percentage of weight on the front pair of wheels, which are the drivers. The rear truck has a wheel base of 5 ft. 6 in.

The car is designed for single-end operation, but may be driven at equal speed in either direction. The weight disposition is as follows:

Light weight of car complete	59,000 lb.
Weight on front driving axle	25,500 lb.
Weight on front trailing axle	12,400 lb.
Weight on rear truck	21,100 lb.

As the weight of the power plant complete with all auxiliaries is 13,000 lb., the weight of the body and trucks is but 46,000 lb.

The Water-Tube Boiler

The boiler is of the water-tube type and is made in 12 sections, being constructed throughout of Shelby seamless boiler tubes. Each section consists of a front and back vertical header, the two being joined by 22 water tubes inclined at about 11 deg. to the front header and a single connecting steam tube at the top inclined at about 1 deg. to the back header. All tubes are straight, in which respect they differ from the earlier design. The tubes are electrically welded to the headers and opposite each end of every tube an opening is provided in the headers through which the tube can be inspected, cleaned or in case of a rupture, can be temporarily plugged until a new tube can be welded in place.

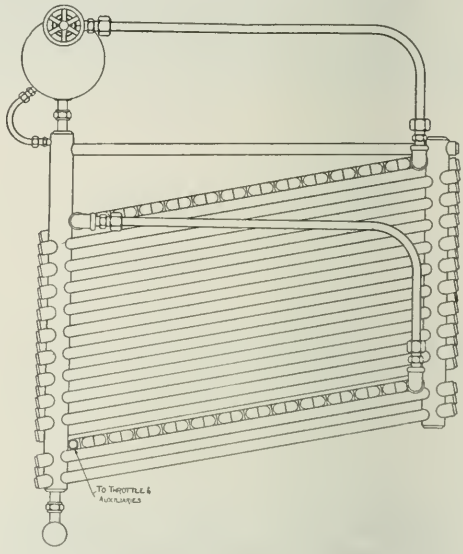
Each boiler section when ready for assembly is subjected to a hydrostatic test of 3,500 lb. per sq. in., and while under this pressure is given a babbitt hammer test for leakage or defective tubing.

The front headers are connected by parabolic shaped tubing to a steam drum. The construction of the drum and connections is such that they act as a desaturator, and any moisture separated from the steam is returned automatically to the boiler. The lower ends of the front headers are connected to a mud drum.

From the steam drum the dry steam passes through the superheater in series, an arrangement which has been found materially to increase the life of the superheater units. As will be noted from the drawing, the superheater pipes are in two banks, one near the top and the other near the bottom. Unions are provided which permit of their easy removal. All unions and connections are of special construction and made of monel metal to resist the high temperatures. All the steam is superheated, no saturated steam being used for auxiliaries or for other purposes. By using superheated steam for all purposes, there is always some flow through the superheater for operating the auxiliary engine, atomizer, blower and ejector.

The steam pressure ordinarily carried is about 800 lb. per sq. in., while the ultimate temperature after passing through the superheater is from 650 to 800 deg. F. The steam from the engine is condensed as explained later, and fed back to the boiler. A gravity-feed oil separator is used together with a boiler compound to eliminate the effect of oil in the feedwater as oil tends to decrease the efficiency of the boiler and endangers the heating surfaces when exposed to high temperatures.

The boiler proper is placed on top of a fire-brick lined combustion chamber, shown in the photograph taken when partly assembled. Any crude or refined oil that can be pumped may be used for fuel, but the grades most generally used are kerosene or distillate. The oil is atomized by high pressure superheated steam. The supply of fuel oil is carried in a tank underneath the car, from which it is pumped as explained later.



Water-Tube Boiler with Superheater

Main Engine and Condenser

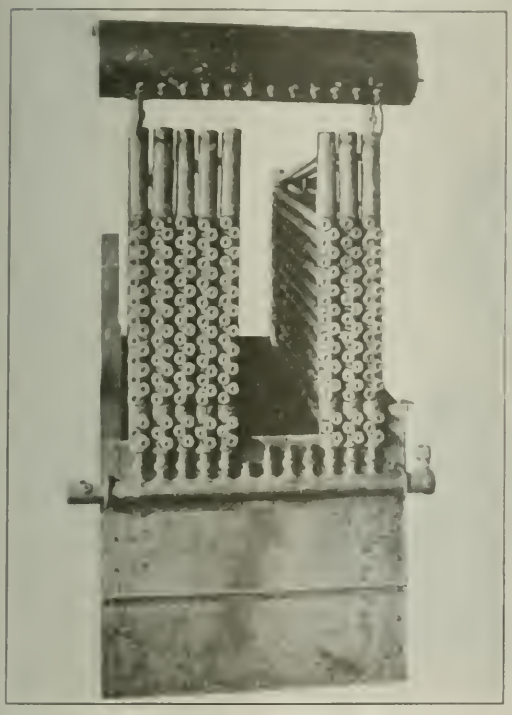
The car is propelled by a simple two-cylinder engine mounted on the front side of the forward truck, power being transmitted to the axle by a single spur gear pressed onto the center of the axle. The gear ratio ordinarily employed is approximately 1½ to 1. When the car is traveling at a speed of 30 m.p.h. the engine, which has an 8-in. stroke makes about 433 r.p.m., and has a piston speed of 577.5 ft. per min. The engine is entirely enclosed and thoroughly insulated. The gears run in a bath of oil.

The high pressure superheated steam is carried from the throttle to the engine by a flexible pipe having four special steam packed joints. The exhaust steam from the main engine and also from the auxiliary engine is conducted to an air cooled condenser located on the roof of the car at the forward end. The condensed water flows back to the tank underneath the car. There are two water tanks, one holding 175 gal. and the other 90 gal. In winter the exhaust steam may be passed through heating coils in the car. The supply is sufficient to keep the car comfortable in the most severe weather.

The auxiliary steam engine, which is located in the driver's compartment, needs little explanation. It drives the two feedwater pumps, the fuel-oil pump, the duplex cylinder

lubricating oil pump, the air compressor and the 2 kw. D.C. generator. The engine is run at a constant speed and governed by a ball type governor.

Boiler feed is accomplished as follows: The two pumps running at constant speed deliver the hot feedwater through the automatic by-pass to the condensate tank. When the water level in the boiler falls below the automatic by-pass tube, expansion of the tube closes the valve and the water is pumped into the boiler until the tube is submerged, or enough of it to establish and maintain a nearly constant water level irrespective of the load on the boiler. When the throttle is open under heavy load, there will be a slight drop of water level as indicated on the water column. This is absolutely reliable for when the throttle is again closed



Partly Assembled Boiler on Combustion Chamber

the water level will rise to the normal or light load level. Due to the high pressure, a water gage is not used, but an indicator mounted on top of the water column and operated by the expansion of that portion of the water column above the water level has been substituted. The water column is equipped with trycocks which permit the water level to be checked for accuracy.

The fuel oil is pumped from the 175-gal. storage tank underneath the car, located in front of the rear truck, to a 20-gal. auxiliary atomizer tank bolted to the partition near the roof in the baggage compartment, which gives a constant head to the atomizer. From the tank the oil flows by gravity to the dual automatic control mechanism, which is actuated hydrostatically by the throttle operation, in that the slightest throttle opening causes a fluid pressure drop in the superheaters, thereby releasing the hydrostatic head on the dual automatic diaphragm permitting a simultaneous opening of the fuel oil and high pressure superheated steam passages to the atomizer. The atomized fuel is ignited by the pilot burner. The fire control is such that a light fire will be maintained for light loads and correspondingly increased for heavy loads. When operated at full loads, the temperature in the chamber is from 2,800 to 3,100 deg. F. and every brick and joint of fire clay is glowing with incandescense and radiates heat to assist in the combustion which is complete before the gases come in contact with the boiler-heating surfaces.

The air compressor, as will be noted from the illustration, is in tandem with the auxiliary steam engine cylinder, the air piston being mounted on an extension of the steam piston rod. The compressor is lubricated by an adjustable oiler in the air intake. A governor is located over the inlet valves, and when the desired pressure has been attained both inlet valves are held open, permitting cold air to circulate in the cylinder until the next pressure drop occurs. The compressor cylinder is air cooled. The capacity of the air compressor is 11½ cu. ft. of free air per minute, which is more than sufficient for the operation of the air brakes with which the car is equipped.

Lubrication of both main and auxiliary engines is by splash, thereby lubricating the housing or the driving axle as well as every portion of the engine with a flood of oil. The cylinders are lubricated through blinkers on the instrument board, thence to the steam lines to either engine.

The low water automatic control is a device by which the flow of fuel oil to the atomizer is shut off before the water in the boiler gets dangerously low. The water connection to the low water automatic control is in series with the automatic by-pass in order to utilize the same temperature that operates the automatic by-pass. Therefore, should the automatic by-pass fail for any reason, or if the pumps should not supply the boiler with water to meet boiler evaporation requirements, the expansion tube of the low water automatic control is filled with steam at a high temperature, closing the valve in the head which at once cuts off the fuel oil supply to the atomizer. The value remains closed until the water level is restored, after which the atomizing burner will again function to restore and maintain the steam pressure.

Tests and Efficiency

Records taken from cars in service show an average consumption of approximately 0.7 gal. of distillate, or 0.65 gal. of kerosene per car mile. At the low price at which distillates can be obtained in many places, this represents a fuel cost of about four cents per car mile. For lubricating purposes two gallons of a special cylinder oil has been found to be sufficient for a 400-mile run and one gallon of engine oil for the same mileage.

The mechanical efficiency in the main engine and drive is high. The boiler efficiency when using superheated steam at 700 to 800 deg. F. at the atomizer is said to be about 77 per cent. The time required to generate steam with storage air for the atomizer is from 20 to 25 min. and with steam at 200 lb. pressure, approximately 18 min. An evaporation of about 14 lb. of water from and at 212 deg. F. may be obtained per square foot of wetted heating surface. The main engine uses from 14 lb. to 19 lb. of water, depending upon load and grade conditions, to develop one horsepower hour.

The Eastern Railway of France now has more than one-quarter of its locomotives fitted with audible cab signals. The total number of locomotives in service at the present time is, for passenger trains, 1220; for freight trains, 798; total 2,018. Of these, 428 passenger engines and 144 freight engines are fitted with the signal apparatus. Ramps have been installed at 390 distant signals and at 130 home signals. The company plans to fit up 1,278 more locomotives before the end of 1923, and to install 1,560 additional ramps.

Daniel Upthegrove

DANIEL UPTHEGROVE, general solicitor of the St. Louis Southwestern, who has been acting president of that company since the death of James M. Herbert on August 5 of this year, was elected president at the annual meeting of the board of directors in St. Louis, Mo., on October 3. He also succeeds Mr. Herbert as president of the St. Louis Southwestern of Texas; as president of the Dallas Terminal Railway & Union Depot Company, and as vice-president of the Arkansas & Memphis Railway, Bridge & Terminal Company.

In the choice of Mr. Upthegrove, the directors of the "Cotton Belt" have named a man who has been connected with the property for 25 years. Although he has always been in the law department he has become well known among the employees and his popularity extends from the lowest rank to the highest officers.

His greatest asset is his unusually clear grasp of the essentials of every problem with which he is confronted. He attributes his steady rise from a local "Cotton Belt" attorney at Greenville, Tex., to the highest position that company can offer, to his "early determination to make himself so useful in his job that it would be a necessary part of the road. My theory of handling any matter," he states, "is to pick out the essential things and to do them to the best of my ability." There will be no change in the present policy of operating the 1,776 miles of line, the new president has declared, and his chief occupation, he states, will be to give effect to a sentiment expressed by the late President Herbert, in the words, "The biggest man on this road is 'Old Man Service,' and service comes first."

Daniel Upthegrove

Mr. Upthegrove was born at Greenville, Tex., on May 26, 1871, in which city his father was a prominent attorney. He was sent to the Battleground Academy, Franklin, Tenn., to take his pre-legal studies. He later continued his education at Vanderbilt University, Nashville, Tenn., and at the University of Texas 1895-96. Early in 1897 he passed the bar examinations and began the practice of law at Greenville under direction of E. B. Perkins, then regarded as one of the ablest lawyers of that state. He obtained his first legal position in 1897, and at the same time first entered railroad service, when he began to represent the St. Louis Southwestern of Texas in the local justice courts in his home town. Soon thereafter his friend and counselor, Judge Perkins, moved to Dallas, Tex., to become general attorney of the Cotton Belt of Texas, and in November, 1901, he summoned Mr. Upthegrove to become his assistant.

In December, 1916, President Herbert, recognizing the marked ability of the assistant general attorney at Dallas, offered him the position of general solicitor of the St. Louis Southwestern, with headquarters at St. Louis, Mo., which he accepted. This advancement was unexpected and made a radical change in his life plans for he had intended to develop a law practice at Dallas that would give him a remunerative income in the event that he later determined to forsake his work as a railroad counsel for general practice. While he has not come up from the ranks of "practical" railroad men, the new executive is said to have an extensive knowledge of railroad operation, gained through study and association with Mr. Herbert, whom he usually accompanied on his inspection trips over the system.

President's View on Strike Settlements

WASHINGTON, D. C.

PRESIDENT HARDING is represented as feeling that at least one of his policies for settling the railroad strike has been vindicated by the adoption on many roads of the so-called Willard-Jewell plan of settlement. Newspaper correspondents were told at the White House on Friday that it was worth their notice that the settlement of the railroad strike is continuing and that it is being made "on the basis of the original proposal of the President to the railroad executives." This proposal was the one in which he suggested that the strikers be returned to work with seniority rights unimpaired, by way of restoring the status quo as of June 30, before he made his later proposal that the question be referred to the Labor Board which had already decided it the other way. The plan of settlement which has been signed upon some 82 roads does not promise the restoration of former seniority rights but the President has been told that the practical effect amounts to about the same thing. He was told by a railroad manager, it was said at the White House, that when his road settled with the shop crafts it had 2,400 new employees to whom it had promised permanent jobs and whose services it needed to make up for the work lost during the strike. It had offered them a chance to stay but in 24 hours 2,200 of them had quit. The President considers this an illustration going to show that the seniority problem was not such a serious one as many of the railroad officers attempted to make it appear, and that 95 per cent of the serious transportation embarrassment now being experienced in many lines is due to the impaired condition of equipment due to the strike and which was represented by the railroads as less serious than it was. Apparently the President regards the illustration afforded by one railroad manager as of more importance than that of the larger proportion of roads on which the seniority question was of such import that they went ahead and beat the strike without settling. It has also been suggested that the President may have overlooked the possibility that if a large number of roads had not stood pat, the strikers on the other roads would not have flocked as new recruits to the "die-hard" roads in sufficient numbers to have aroused the interest of Mr. Jewell in seeking and making settlements with the roads which chose to deal with him.

Railroad Executives Plan to Expedite Coal

WASHINGTON, D. C.

A PROGRAM of recommendations for accelerating the transportation and distribution of coal throughout the country was unanimously decided upon by the advisory committee on transportation, recently appointed by Federal Fuel Distributor C. E. Spens, at a conference held with Mr Spens in Washington on October 5. The details of the committee's recommendations are given in the following letter addressed to the executive heads of all the railroads by Chairman Daniel Willard:

"At a meeting held in Washington this date between C. E. Spens, federal fuel distributor, and an advisory committee on transportation, appointed by him, the situation as to fuel supply throughout the country was fully explained by the fuel distributor and the necessity for increased efforts by the carriers was emphasized. After full consideration the following recommendations were unanimously adopted as definite requirements necessary to meet the situation:

1. Unload promptly all railroad material including railroad fuel.
2. Discontinue as far as possible all maintenance and construction work requiring use of power and cars so as to turn this equipment into commercial service.
3. Use all available forces to check yards and stations for delayed cars with a view to securing not only prompt unloading but prompt movement.
4. Continue a vigorous campaign to reduce to the minimum locomotives and cars awaiting repairs.
5. Return foreign coal cars to owners or connections in home route with the greatest possible dispatch.
6. Loading of foreign coal cars in the direction of the mines, as permitted under I. C. C. Service Order No. 25, should be confined so far as possible to through movement to points on the owner's rails.
7. Conduct an active campaign to have all cars loaded to their safe carrying capacity.
8. Point out to coal operators that available coal equipment can be increased by the avoidance of sales that require abnormally long distance movement.

"All railway executives are urged to make every practicable effort to accomplish these results."

The members of the advisory committee also constitute the conference committee appointed by the American Railway Association on September 29.

An appeal to coal producers to assist in expediting the movement of coal by loading cars to carrying capacity and by refraining from the loading of coal into cars for which they have no billing, was made on October 9 by Federal Fuel Distributor C. E. Spens. Receivers of coal are asked to unload cars immediately upon arrival. Coal shippers are requested to confine their operations as far as practicable to their normal spheres of distribution, in order to reduce the amount of transportation service required. Consumers are asked, if the coal is available, to confine their purchases to the grades of fuel to which they have been accustomed.

"We have already received responses from a number of the railroads to the effect that they will co-operate to the limit along the lines recommended by this advisory committee," Mr. Spens said. "The public, however, should appreciate that there are unusually heavy offerings of traffic of all character to the railroads, and aside from the general priority orders of the Interstate Commerce Commission that now obtain, we are hoping it may not become necessary to recommend any action that might interrupt the transportation of other commodities. The priority orders now governing the handling of coal equipment are, of course, already interfering to some extent with the movement of commodities that are usually loaded in this class of equipment, but it is our great desire that there should be no greater interference with general transportation than appears to be absolutely necessary to care for the coal emergency.

"An analysis of the present coal transportation, production and present reserves clearly indicates that for some weeks the commodities covered by priority orders, particularly coal, must be given extraordinary attention. We are confident the matter has been placed before the carriers in such a way that they are fully alive to the situation, and, in spite of the existing handicaps, will do their utmost to accomplish their proportion of the burden.

"Coal producers and coal receivers can assist to a very large extent. Producers should load cars to carrying capacity, and should not load coal except to fill orders on hand; in other words, they should not have unbilled cars on hand at mines, which practice is common under normal conditions, nor should coal be billed excepting to bona fide consignees. Existing conditions will not permit of making coal warehouses out of coal equipment. Receivers of coal should arrange to unload cars immediately upon arrival."

Fuel Distributor Spens on October 4 issued a modification of his order of September 27 waiving the requirement that coal operators furnish a detailed report of the names and addresses of all consignees with car numbers and initials as to all producers who shall themselves keep and preserve full and detailed records showing such facts in such form as to enable them promptly to furnish such information as to any shipment, if and when required in any particular case. The request for the detailed report of shipments resulted in such a flood of papers being forwarded to Mr. Spens' office that it was difficult to find a force to handle them, and the order says the modification is "to facilitate reporting and assure the earliest possible receipt of the more essential information immediately required."

A slight decrease marked production of soft coal during the first week of October, according to the weekly bulletin of the Geological Survey. For three weeks in succession the output had been slowly increasing, reaching 9,776,000 net tons in the week of September 30. During the week of October 2-7 the returns so far received indicate a total of about 9,600,000 tons. The current rate of output exceeds 1921, but is far below that of other recent years. Production of bituminous coal in the first week of October of the past six years has been as follows:

	Tons		Tons
1917	10,962,000	1920	11,350,000
1918	12,398,000	1921	9,134,000
1919	11,518,000	1922	about 9,600,000

Production of anthracite continues at around 1,900,000 net tons a week. The total of all coal raised is therefore about 11,500,000 tons, considerably below the amount needed to meet current consumption and the heavy movement up the lakes, and at the same time to rebuild consumers' stocks.

Production of anthracite continues to increase and the total output in the third week after the strike was estimated at 1,947,000 net tons. Preliminary returns for last week indicate that production will again be in the neighborhood of 1,900,000 tons. The table below summarizes the preliminary returns on anthracite loadings day by day since the strike was called off.

DAILY CAR LOADINGS ON ANTHRACITE CARRYING ROADS.

	Mon.	Tues.	Wed.	Thurs.	Fri.	Sat.
First week after strike	928	1,783	3,272	4,046	4,704	5,088
Second week after strike	5,449	5,725	5,857	5,900	5,730	5,506
Third week after strike	5,952	5,959	5,862	5,953	6,012	6,144
Fourth week after strike	5,838	6,056	5,839	6,046	.....	.....

The all-rail movement of coal to New England through the six principal Hudson gateways increased to 3,541 cars of bituminous coal and 2,206 cars of anthracite in the week ended September 30. In addition there were also forwarded through Rouses Point in that week 75 cars of bituminous coal and two cars of anthracite. Bituminous coal is now moving into New England by rail in larger volume than at the same season last year, but the anthracite shipments have not yet attained last year's rate.

Shipments of bituminous coal through Hampton Roads decreased during the week ended September 30. Dumpings for the week totaled 283,987 net tons as against 312,003 tons in the week before.

General News Department

The Interstate Commerce Commission has announced that oral arguments will be held at Washington on November 1 in valuation cases involving about a dozen roads, including the Texas Midland, Winston-Salem Southbound, Elgin, Joliet & Eastern, Norfolk Southern, Central of Georgia and Ann Arbor.

The American Association of Railroad Ticket Agents will hold its annual convention at Savannah, Ga., on November 13, 14 and 15. Following the meeting the ticket agents will leave for a trip through Florida, stopping at the larger cities in that state, and reaching Key West on November 20, when they will embark for Havana, at which place they will remain two days.

The Railway & Locomotive Historical Society has issued Bulletin No. 3, a pamphlet of 54 pages, filled with reminiscences of old locomotives mostly those of New England roads, though space is given to the full story of the "General" of the Western & Atlantic, and the tragedy of the Andrews raiders of 1862. The illustrations include the "Uncle Tom," a 4-2-2 locomotive (with tender on the same frame) of about 18 or 20 tons, which flourished on the Fitchburg & Worcester Railroad about 1850-1860, and a number of others equally interesting. It is said that about 1843 Hinkley & Drury built a good many of this type. Charles E. Fisher, president of the society, 152 Harvard street, Brookline, Mass., desires information for a history of the early locomotives of the New York, New Haven & Hartford and of its predecessor companies in Connecticut.

Metropolitan Track Supervisors' Club

R. S. Parsons, vice-president, Erie Railroad, and Earl Stimson chief engineer maintenance of way, Baltimore & Ohio, will each give a short talk on railroad maintenance problems before the Metropolitan Track Supervisors' Club at its next meeting at the Martinique Hotel, New York City, on Saturday afternoon, October 14. Other subjects before the meeting are discussions of previous papers on laying rail and highway crossings and the presentation of a paper on rail creeping by R. L. Haring, supervisor, Long Island.

New York Railroad Club Meeting

"Speeding Up Operation" will be the subject of the meeting of the New York Railroad Club which will be held in the Engineering Societies Building, New York, on Friday evening, October 20, at 8:00 p. m. A symposium has been arranged which will cover the consideration of better operating methods and practices and ways in which the present plant and facilities may be utilized to greater advantage. This will include the use of signals to facilitate operation, how to get more work out of locomotives and better service from the cars.

Labor Board Deadlocked on M. of W. Wage Increase

Disagreement among the three groups on the Railroad Labor Board has delayed a decision on the requests of maintenance of way employees for a wage increase. On October 4 it became known that the three public members on the board favored an advance of two cents an hour in the pay of common laborers, whereas the labor group and the railway group declined to vote favorably on this increase the former because the increase was deemed inadequate and the latter because they did not believe that such an increase was justified on the testimony presented to the board. This deadlock has continued up to the present time and the present indications are that the board's decision in the maintenance of way case will not be handed down until after the convention of the United Brotherhood of Maintenance of Way Employes and Railroad Shop Laborers at Detroit closes on October 15.

N. Y. C. Meets with Enginemen and Switchmen

Representatives of the Brotherhood of Locomotive Engineers the Brotherhood of Locomotive Firemen and Enginemen and the Switchmen's Union of North America met with officers of the New York Central on October 9 for the purpose of negotiating a new agreement covering wages and working conditions. At the time of going to press these conferences were still on and it was reported that certain new working rules sought by the enginemen were delaying the settlement. The proposal for bonus payments to train and engine crews in freight service is one of the points scheduled for discussion at this meeting.

Strike Settlements in the West

The Chicago Great Western has settled with its employees with the provision that employees who took the places of strikers will head the seniority list. The shopmen's strike on the Gulf Coast Lines and the Houston Belt & Terminal has been ended by an agreement which gives the men seniority and other rights as of June 3. The seniority rights of present workmen not being disturbed. The Louisville & Nashville and delegates from all of the shops of the road have perfected a new organization of shopmen.

The Chicago, Rock Island & Pacific has renewed for one year its agreement with the Brotherhood of Locomotive Engineers covering working rules and conditions.

Conductors and Brakemen Agree with Southeastern Road

An agreement covering wages and working regulations until October 31, 1923, was signed at Washington on October 5 by representatives of the Southeastern railroads and the Order of Railway Conductors and the Brotherhood of Railroad Trainmen. In addition to maintaining the present rates of pay and rules, the agreement provides that all disputes over wages and working conditions now pending before the Railroad Labor Board shall be withdrawn. Committees of representatives of the labor organizations and the managements were given authority to take up and consider elimination or modification of local rules during the tenure of the general agreement.

Would Abandon C. P. & St. L.

A plea for the abandonment of the Chicago, Peoria & St. Louis was made to Judge E. S. Smith in the Circuit court at Springfield, Ill., last week by Attorney A. P. Cook of New York, who represents a majority of the bondholders of that road. Mr. Cook pointed out that the road could neither pay operating expenses nor interest on its obligations. Judge Smith, who named receivers for the road in 1914, directed the attorney to file petition with the State and Interstate Commerce commissions. The road includes 245 miles of line, extending from Peoria, Ill., to St. Louis, Mo., 200 miles; with branch lines from Havana, Ill., to Jacksonville, 42 miles and Alton to Grafton 15 miles. There are shops at Springfield and Jacksonville. It has been in the hands of receivers since 1914, and there is a constantly growing deficit.

Railway Fire Protection Association

This association will meet at Willard Hotel, Washington, D. C. on Tuesday, Wednesday and Thursday, October 17, 18 and 19. The principal committee reports to be presented are the following: On statistics—Geo. R. Hurd, chairman; on handbook—E. H. Berry, chairman; on fire prevention in shop plants—J. R. Peters, chairman; on locomotive fire hazards—Earl N. Floyd, chairman; on forms—W. C. Neely, chairman; on storage and handling of gasoline and electric motor trucks in freight depots and ter-

minals—E. J. Reilly, chairman, [illegible] handling of oxy acetylene apparatus in shops—Gilbert A. Hays, chairman, on docks, piers and wharves and fuel oil on water—W. J. Stevens, chairman; on development and use of national standard couplings—F. H. Elmore, chairman; on coaling plants—W. E. Cathcart, chairman; and on protection of tie and timber treating plants—L. F. Shedd, chairman.

Papers will be read by James L. Madden, manager of the insurance department of the United States Chamber of Commerce, L. P. Kimball (B. & O.), W. T. Krausch (C. B. & Q.) and A. R. Small. There will be a general discussion on Tuesday afternoon on the I. C. C. rules for transportation of explosives, etc., and on gasoline dangers at wrecks and in loading and unloading.

The chairman of the committee on arrangements is E. B. Berry, Southern Railway, Washington.

Speakers for R. B. A. Dinner Announced

The speakers for the fourteenth annual dinner of the Railway Business Association to be held at the Hotel Commodore, New York, on November 9, have been announced as follows: Charles H. Markham, president of the Illinois Central; James A. Emery, counsel of the National Association of Manufacturers, and George Wharton Pepper, senator from Pennsylvania.

The official statement of the Railway Business Association describes the speakers as follows:

President Markham of the Illinois Central has risen from the foot of the ladder on the operating side, was for many years a railroad traffic officer, long an executive in commercial industry, during federal control of railways a regional director, identified with company autonomy in railway labor relations, embodies in his leadership the experience of the railway employee, the railway manager as an employer and in contact with the public, the industrial shipper, the government officer and the public spirited citizen.

James A. Emery, counsel of the National Association of Manufacturers, profound student of the social aspects of government regulation, courageous critic of employers and employees in their policies affecting the public, gifted speaker, voices the needs and views of a very large body of business men whom transportation affects on the one hand as shippers and on the other as employers competing with the railways for labor.

George Wharton Pepper, United States senator from Pennsylvania, appointment of whom to that office brought Pennsylvania national congratulations and who in the subsequent primaries against opposition of organized labor and advocates of the veterans' bonus was nominated by more than 200,000 majority, many years a leader in civic, philosophic and athletic activities, eminent orator, brings to our rostrum the impressions of a trained student of government free from the atmosphere which involves senators who participated in the railway legislation of 1920.

"Big Four" No Longer Exists, Says Lee

According to W. G. Lee, of the Brotherhood of Railroad Trainmen, methods of settling wage and working agreements between the "Big Four" transportation brotherhoods and the railroads have entered a new era, and if the present course of negotiations is continued the country for several years at least will not be threatened with a complete tie-up of railroad transportation through a concerted strike of these brotherhoods on all lines of the nation. Decentralization of all wage and working rules negotiations and a return to the system prevailing for twenty years prior to the time when the four train service brotherhoods pooled their strength into what has since become known as the "Big Four" railroad brotherhoods, has already set in, in the view of Mr. Lee, speaking at Cleveland.

The new alinement of the transportation brotherhoods probably will find the Brotherhood of Railroad Trainmen and Order of Railway Conductors in one group, and the Brotherhoods of Locomotive Engineers, Brotherhood of Locomotive Firemen and Enginemen and the Switchmen's Union of North America in another.

"I feel that I am able to handle my organization to better advantage, to get more for my men and to work more effectively all around if the trainmen and conductors go it alone, so far as wages and working rules are concerned," Mr. Lee said.

"This whole business, with all railroad unions on one side and all railroads on the other, with the Railroad Labor Board in between, got too big for any one man or a few men to handle. It was loaded with dynamite for the country as well as for ourselves and the executives. No sane government would permit any fraction or class to paralyze the transportation business of the country and thereby punish the innocent, who are always in the majority. The only way out was to separate." So far as strikes, wages and working rules negotiations are concerned, the "Big Four" no longer exists. The brotherhoods will continue to work together on legislative, non partisan, political and purely organization matters.

Wage Statistics for July

According to the monthly bulletin of wage statistics issued by the Interstate Commerce Commission, for the month of July, the shopmen's strike was badly broken on July 15, two weeks after it was called. At that date it was only 52 per cent effective from the standpoint both of the number of men employed and the straight time actually worked. Whereas statements by the shopcraft leaders usually referred to the number of men on strike as 400,000, the commission's report says: "Based on the count at middle of month, the number of employees in the maintenance of equipment and stores group as a result of the strike conditions decreased 255,266, or 52 per cent from the number in June, while the total number of hours was 45.4 per cent less. On the other hand, the overtime paid for in this group was more than three times as great in July as in June. The straight time actually worked was 52 per cent less in July than in June."

The report shows a total of 234,837 employees in this group in service at the middle of the month, including 14,088 employed on a daily basis and 220,749 on an hourly basis. The average earnings per employee for the month ranged from $80 for common laborers to $207 for boiler makers. Blacksmiths averaged $155, car men from $141 to $172, electrical workers from $144 to $203, machinists $197, molders $131, sheet metal workers $196. Regular apprentices averaged, however, only $69 and foremen and inspectors in general averaged higher than the classes of employees named. Another change due to the strike is shown in the statement that the police forces were 37,929 greater in July than in June, 1922.

The total number of employees reported by Class I railroads for the month of July shows a net decrease from the previous month of 217,590, or 13 per cent. The increase or decrease (D), by groups, was as follows:

Executives, officials, and staff assistants	372
Professional, clerical, and general	39,526
Maintenance of way and structures	D5,583
Maintenance of equipment and stores	D255,266
Transportation (other than train, engine, and yard)	5,157
Transportation (yardmasters, switch tenders, and hostlers)	1,315
Transportation (train and engine service)	D3,111
Net decrease	D217,590

A comparison of the number of employees and their compensation for the month of July, 1922, with the same month last year follows:

	Number of employees	Total compensation
July, 1921	1,634,872	$214,339,385
July, 1922	1,467,824	193,571,244

The Rock Island Celebration

The celebration of the 70th anniversary of the founding of the Chicago, Rock Island & Pacific Railway was carried out at Chicago, Joliet and other places on Tuesday, October 10, in accordance with the previous announcements. A large number of officers of the road, old-timers and friends of the Rock Island gathered at the LaSalle Station, Chicago, in the morning and an hour was spent in greetings, posing for pictures and other holiday activities. The train shed was jammed with the crowd. A holiday spirit permeated the entire Rock Island System. Among the other features at Chicago was a group of girls dressed in gowns similar to those worn by the women who were passengers on the first train which was run on the opening of the first section of the line from Chicago to Joliet, 40 miles.

At ten o'clock, a special train in charge of Charles Hayden,

chairman of the board of directors, was started for Joliet. It was stopped for two minutes at the shops at 47th street, where the shopmen turned out in full force. This train was in charge of five employees whose aggregate service on the road equals 200 years. Among the passengers was a woman who rode on the first train 70 years ago.

At Joliet, the party proceeded to the Court House lawn, where a monument has been erected to Samuel Benedict Reed, the civil engineer who surveyed the route between Chicago and Joilet. The monument was unveiled by Anne Reed Bates, great granddaughter of the surveyor. A dedication speech was delivered by J. E. Gorman, president of the road. Mr. Gorman took occasion to call attention to the danger of super-regulation of the railroads. The anniversary day was brought to a close with the broadcasting of the story by radio from station KYW. This story was again spread throughout the western country, from other stations farther west, and employees and others at various points all over the system were able to listen to the music of the orchestra and parts of the addresses.

Shop Craft Leaders Continue Fight on "Daugherty Injunction"

Two motions, made before Judge James H. Wilkerson of the Federal District Court at Chicago by Donald R. Richberg, attorney for the railroad shopmen in the "Daugherty injunction case," were defeated on October 6, when the court denied Mr. Richberg's motion that the government file a bill of particulars giving details of the charge made against the strikers in affidavits presented to the court, and also refused to issue an order granting Mr. Richberg's request that the case be pronounced one of "extraordinary public interest" so that three judges of the Circuit Court might be assigned to hear it immediately. At the same time Blackburn Esterline, assistant solicitor general, stated on behalf of the government that the court would be asked to refer the hearings in support of the government's plea for a permanent injunction to a master in chancery. Attorney Richberg also filed, on behalf of the defendants in the case, formal denials of the charges made against them in the government's bill. He again declared that the actions of railroad executives were responsible for the strike and that the men had merely walked out to defend their rights.

When Attorney Richberg appeared before the court on October 5 he declared that he had been unable to see Attorney General Daugherty in Washington to present his plea for an early final hearing or a review of the interlocutory injunction handed down by Judge Wilkerson on September 25. In connection with his statement to the court, Mr. Richberg delivered a copy of a letter to Solicitor-General Beck severely criticizing the position of the government attorneys.

After stating delays and disappointments over an appointment with the government attorneys, Mr. Richberg said he had received a letter from the solicitor general asserting the position of the Department of Justice to be as follows:

"1. If it were practicable to have three circuit judges hear the case, that proceeding would not expedite, but delay it.

"2 That the department invites counsel for the defendants to consider agreeing on a statement of facts and asks counsel for the defendants to submit such a statement of facts.

"3. If an agreed statement of facts is not practicable, then two courses are open:

"(a) A stipulation to submit the case on the affidavits with leave to either party to offer additional testimony.

"(b) A trial of the case largely on depositions taken 'throughout the United States' except where a stipulation of facts may dispense with formal proof."

In the letter in reply to Solicitor-General Beck, Mr. Richberg said:

"There are two matters which the defendants desire to have expedited. First, a review of the interlocutory injunction, and, second, a final hearing of the case. Your suggestions affect only the second matter and practically ignore the matter of probably greater importance to the defendants."

The shop crafts' attorney said he would "seek to obtain protection of the rights of the defendants through orders which the court may enter and through procedure which the court may adopt, despite the manifest opposition of the attorney-general to the entry of any order or the adoption of any procedure which will protect the defendants from the abuse of official power."

"The use of the summary equity procedure to obtain a tentative conviction of 400,000 men of criminal conspiracy upon evidence found solely in an undigested mass of ex parte affidavits reeking with hearsay and perjury has been made the means of depriving these men of liberty and property so long as the interlocutory injunction remains in force," his letter said.

"The department threatens to take depositions throughout the United States' and make the burden of defending as oppressive and expensive as possible to the already deeply wronged defendants. As an alternative the department offers that counsel for the defendants may stipulate that the unknown and unexplored 'Mount Everest of evidence' in the form of affidavits, be submitted as though formally taken, or in other words, that we allow the defendants to be found guilty of a criminal conspiracy without opportunity to cross-examine hundreds of witnesses."

Solicitor-General James M. Beck, on behalf of the attorney-general, in a letter to the counsel for the shop unions, suggested that the best method of expediting the case is to follow the course which would permit of a direct appeal to the Supreme Court. This method, he said, would be "to agree upon a statement of facts for submission to the district court, which would eliminate the necessity of proof as to many matters which as matters of fact are indisputable. If you would care to submit to the department, without prejudice, a statement of such facts as you would agree were the facts of the case, the department could then indicate to what extent it was prepared to accept such statement of facts, as the full evidence in the case, or as part thereof. This course might eliminate thousands of pages of testimony which would be for the convenience, not merely of the court, but also of counsel for both parties."

Labor Board Again Rules Against Contracting

On October 7 the Labor Board handed down twelve decisions, all of which involved principles of contracting. Nine of the decisions condemned this practice, while one favored it. In all of the cases decided unfavorably to the railroad contentions, the Board referred to its decision in a similar case involving the Indiana Harbor Belt and published in the *Railway Age* of May 13, page 1111. The disputes so decided in this latest group of decisions involved the following carriers, contracting companies and facilities:

The Erie and the Meadville Machinery Company for the operation of shops at Dayton, Sharon, Meadville, Hammond, Huntington, Marion, Rochester, Avon, Elmira, Cleveland, Binghamton, Galion, Dunmore, Avoca and Stroudsburg.

The Cincinnati, Indianapolis & Western and the Kellogg-Grego Railway Service Company.

The Cincinnati, Indianapolis & Western for the contracting of certain clerical and station work.

The Pere Marquette and the Fort Street Union Depot for the contracting of the power plant and facilities at Baldwin, Mich.

The Cleveland, Cincinnati, Chicago & St. Louis and the Railway Service & Supply Corporation for the contracting of freight car repair shops at Brightwood and Beach Grove, Ind., and the locomotive repair shops at the latter point.

The Bangor & Aroostook for the contracting of its shops at Houlton, Maine.

The Chicago, Rock Island & Pacific for contracting of coal chutes at Cortland, Kan., Fairbury, Neb., and Lincoln, and a pumping station at South Bend, Neb.

The Michigan Central and the Illinois Car & Manufacturing Company for the contracting of the car shops at West Detroit, Mich.

The Chicago & Alton and Joseph Colianni & Bros. for the handling of coal, sand and cinders and for the pumping of water along its lines.

A dispute involving the New York Central and the Railways Employees Department of the American Federation of Labor, the hearings in which were described in the *Railway Age* of September 17, 1921, page 541, was decided by the board in favor of the New York Central. Contracts entered into by that carrier with the Western Union for the purpose of constructing and maintaining telegraph lines along the New York Central right of way were declared legal by the board inasmuch as they were made in the public interest and the practice had been in effect prior to the passage of the Transportation Act.

Several alleged disputes over the practice of contracting were

at the same time dismissed by the Board. Among the cases of this character being two involving the Ann Arbor and one involving the Southern Pacific, Texas & Louisiana lines.

Railway Returns for August Show Effect of Strikes and Rate Reduction

The net operating income of the Class I railroads totaled $2,579,789 in August, according to reports filed with the Interstate Commerce Commission. This represented a return on an annual basis of only 2.65 per cent of their tentative valuation, the lowest since May, 1921. In August last year the net operating income totaled $90,160,200, which was at the annual rate of return of 4.54 per cent, while in July this year it was $69,239,000, or 4.04 per cent.

The railroads fell short $61,689,500 of a return of 5½ per cent.

Operating revenues were $473,877,000, a decrease of 6.3 per cent compared with the same month last year, while the operating expenses amounted to $387,150,000, an increase of 1.3 per cent. Factors affecting this decrease in revenues and the increase in expenses were the coal miners' and railroad shopmen's strikes and the decrease of approximately 10 per cent in freight rates made effective on July 1.

During the first eight months this year the net operating income was $471,183,600, compared with $300,003,000 during the corresponding period last year. This is at the annual rate of return of 4.07 per cent on the tentative valuation, compared with 2.64 per cent during the first eight months in 1921. Operating revenues for the eight months totaled $3,528,502,000, a decrease of 3.2 per cent, while the operating expenses totaled $2,800,501,000, a decrease of 9.7 per cent.

The carriers in the Eastern district had a net operating income in August of $14,929,990, compared with $35,402,300 during the same month last year. The operating revenues were $227,016,000, a decrease of 4.9 per cent, while the operating expenses amounted to $196,821,900, or an increase of 4.3 per cent.

The railroads in the Southern district had a net operating income in August of $4,618,000, compared with $4,422,000 during the same month last year. The operating revenues totaled $54,321,300, or a decrease of 2.4 per cent, while the operating expenses totaled $46,083,000, or 4.6 per cent under those of August last year.

Carriers in the Western district had a net operating income in August of $33,031,700 compared with $50,335,500 in August last year. The operating revenues for those roads totaled $192,539,300, a reduction of 8.9 per cent, while their operating expenses amounted to $144,245,000, a reduction of ½ of 1 per cent under August one year ago.

Forty-nine roads in August had operating deficits. Of this number 28 were in the Eastern district, 8 in the Southern and 13 in the Western district. In July, 47 had operating deficits.

Traffic News

The Interstate Commerce Commission has assigned the interchangeable mileage book case for oral argument before the full commission at Washington on November 15.

A total of 98,223 travelers visited Yellowstone National Park this year as compared with 81,656 in 1921. Of this number 33,588 persons traveled by railroad to the park's entrance.

F. H. Baer, traffic commissioner of the Cleveland, Ohio, Chamber of Commerce, has been temporarily appointed director of transportation of the Ohio State Fuel Administration, with headquarters at Columbus, Ohio.

The steel mills in Pittsburgh and vicinity report serious congestion because of lack of cars, and at the end of last week, according to newspaper reports, the Carnegie Steel Company had 100,000 tons of finished and semi-finished steel piled up.

The Boston Chamber of Commerce is complaining to the Interstate Commerce Commission alleging lack of cars for the movement of flour and grain eastward, and the Commission is requested to see that export trade in these products is not favored to the detriment of domestic consignees.

The coal situation at New York City has been complicated by the presence in the yards on the New Jersey side of the River of large quantities of anthracite, of small sizes, which cannot be disposed of. At the end of last week, it was said that the total number of these cars loaded in all of the yards was 3,500. It appears that the owners expected to sell this coal largely to owners of apartment houses and to manufacturers; but some of these parties have bought bituminous coal from England and others are apparently waiting for a fall in the price.

The Illinois Central's "Hotel On Wheels," which was so popular at the Knights Templar Conclave held in New Orleans, last April, will be re-established for the American Legion convention to be held in the same city on October 16-20, inclusive. At the time of the Knights Templar Conclave, 2,500 persons were housed in parked Pullman cars, 3,211 meals were served in the Illinois Central dining cars, 1,185 shower baths were provided for and a club house, laundry facilities, barber shop and other comforts were placed at the disposal of the patrons. Present indications are that there will be a demand for a great many more cars for the American Legion than the 125 sleeping cars used in April.

Coal Supplies in Hands of Consumers

As a part of its campaign to stabilize the fuel situation through co-operative effort between the government and business, the Chamber of Commerce of the United States has made a survey of coal supplies in the states east of the Mississippi and north of the Ohio rivers. This part of the country has been regarded as the critical territory in the event of a coal shortage this winter. The information gathered by the Chamber which was obtained through local chambers of commerce, was summarized as follows:

"There are practically no supplies in the hands of local dealers.

"Public utilities, about 45 days.

"By-product coke plants fairly well supplied.

"Steel works fairly well supplied.

"General industries about 45 days.

"The bituminous situation is becoming easier.

"There seems to be no general complaint as to price.

"The critical situation is that of securing sufficient domestic supply in advance of cold weather, especially for the Great Lake states and the populous areas of New York State, New England and the central Atlantic states.

"There is much interest being taken in the use of oil.

"There is a general increase in the use of coke for domestic fuel.

"Certain cities have very effective systems of gathering information and distributing their coal, while others have nothing."

Commission and Court News

Interstate Commerce Commission

The commission has suspended from October 10 until February 7, 1923, the operation of schedules published in supplements to B. T. Jones' tariffs, which propose to either cancel or increase proportional rates on petroleum and petroleum products between Chicago, Ill., and Mississippi and Ohio river crossings on the one hand and points in Central Freight Association, Trunk Line and New England Freight Association territories on the other.

The commission has suspended until February 5, the operation of certain schedules published in supplements to Agent F. A. Leland's tariff which propose to establish reduced proportional rates from Beaumont-Port Arthur-Houston groups, applicable on petroleum and its products (except crude and fuel oil) of 14 cents per 100 lb., and on crude and fuel oil 12½ cents to New Orleans, when final destination is in states other than Alabama, Florida, Georgia, Mississippi, North Carolina and South Carolina, also to establish joint rates from the same groups to points in Western Trunk Line and Central Freight Association Territories.

Court News

Damages to Live Stock Attributed to Inherent Nature

Where it is shown that no injury could have occurred to live stock, received by the carrier in good condition, and properly loaded, from negligence in transportation, but some of the stock are dead on arrival at destination, the West Virginia Supreme Court holds that such result will be attributed to the inherent nature or propensities of the animals, and not to the negligence of the carrier.—Talbott v. Payne (W. Va.) 111 S. E. 328.

Right to Require Change in Railroad Bridges

The Circuit Court of Appeals, Seventh Circuit, holds that the fact that land owners constructed an artificial channel under a bridge built by a railroad company and maintained the channel for more than 20 years gave them no right to require the bridge to be altered and nothing more than a prescriptive right to the use of the channel in its existing condition.—Hines v. Woodson, 280 Fed. 966.

Right to Use Other Railroad's Right of Way Held to Include Right to Install Siding

Where a railroad had the right under its charter to maintain an independent track over another railroad's right of way under proper regulations of such other railroad, the Vermont Supreme Court holds that it could install a siding provided that would not give it an unreasonable advantage over the other railroad and was necessary for the proper use of its own rights.—D. & H. v. Rutland (Vt.) 116 Atl. 211.

Injury to Passenger's Fingers in Door Jamb

The Kansas Supreme Court holds that a railroad is not liable for injuries to a passenger of mature years who in the act of leaving the car places her fingers in the door jamb and the door is blown shut by a gust of wind, when she knew that the door was not fastened, and knew it had been swinging freely "all the time" during her journey of 65 miles.—Brehm v. Atchison, T. & S. F. (Kan.), 206 Pac. 868.

Discontinuance of Branch Line Justified

The Mississippi Supreme Court holds that where it is clear from the evidence that there is no public need to be served by the reconstruction of an abandoned branch line, and no reasonable expectation of present or prospective traffic which would justify the expenditure for its construction, equipment and operation, denial of mandamus to keep the track in operation is proper.—State ex rel. Collins v. Leland Southwestern (Miss.) 91 So. 7.

Not Liable for Delay in Delivery Caused by Strikes

The Maine Supreme Court holds that a carrier is not liable for delay in delivery due to strikes where it has exercised reasonable diligence to prevent them and minimize their consequences. While a master is responsible for the acts of its employee within the scope of his employment, an employee ceases to be such when he strikes. The court points out that some authorities distinguish between peaceable strikes and strikes accompanied by violence.—Warren v. Portland Terminal Co. (Me.) 116 Atl. 411.

"Interstate Shipment" Within Federal Larceny Statute

The Circuit Court of Appeals, Second Circuit, holds that a shipment originating in one state and consigned to a point in the same state, but moving in its course through another state is interstate commerce within the meaning of Act of Congress, Feb. 13, 1913, providing for punishment for larceny of goods in interstate commerce. Such a shipment has become subject to different jurisdictions in the course of transportation, and this makes federal control practically necessary, as well as legally possible.—Yohn v. U. S., 280 Fed. 511.

Not Liable if Passenger Negligently Misuses Step Box

The Louisiana Supreme Court holds that where a carrier of passengers furnishes a step box, it is bound to see that it is safe as to strength, so constructed as not to be easily overturned, is kept in proper condition, and when set out for use by passengers is placed on a level and stable surface; but the carrier is not the insurer of the passenger against the consequences of his own negligence, and where the passenger is injured in attempting to use such appliance without looking at it, and stumbles over or against it when he should have stepped on it, his injuries are attributable to his misuse of the appliance and not to its inadequacy, and the carrier is not liable for the injuries.—Scott v. V. S. & P. (La.) 90 So. 840.

Time Limit on Complaints of Overcharge

The Supreme Court of the State of Washington holds that the provision of the Federal Transportation Act that the period of Federal control shall not be computed as part of the periods of limitation in actions against a carrier or claims for reparation to the commission for causes of action arising prior to Federal control, applies only to the Federal rate regulating statutes, and has no effect on a state statute requiring complaints of overcharges to be filed with the state Public Service Commission within two years from the accrual of the cause of action, and failure to file within that time will bar recovery.—Northern Pacific v. Department of Public Works (Wash.), 207 Pac. 686.

Decisions Under Federal Employers' Liability Act

The New Hampshire Supreme Court holds that an employee engaged in repairing the track of an interstate railroad was within the act.—McLean v. Boston & Maine (N. H.) 116 Atl. 435.

The Mississippi Supreme Court holds that an employee injured while repairing an interstate locomotive dismantled and undergoing general repairs, and out of service several weeks before and after the injury, was not within the act.—New Orleans & Northeastern v. Beard (Miss.) 90 So. 727.

The Minnesota Supreme Court holds that persons engaged in emptying a cinder pit used for cinders from engines engaged both in interstate and intrastate commerce should be held to be employed in interstate commerce.—Stavros v. Chicago, M. & St. P. (Minn.) 186 N. W. 942.

The New York Appellate Division holds that a laborer in a repair and construction gang, about to commence work on an uncompleted facility which would not engage in interstate commerce until completed, i. e., a crossover track, was not engaged in interstate commerce.—Otterstedt v. Lehigh & Hudson, 193 N. Y. Supp. 104.

Foreign Railway News

Mexican National Railways to be Returned to Owners

The Mexican National Railways will be returned to their owners not later than November 15 according to a Mexico City dispatch to the Wall Street Journal. The announcement is reported to have been made by the Mexican treasury department.

New Station at Tampico, Mexico

It has been announced at Tampico that government approval has been given the plans and specifications for the proposed new passenger station of the National Railways of Mexico at Tampico, which plans were drawn by J. Montanez, terminal engineer. The building will cost approximately $500,000 United States currency. It is stated, however, that on account of the financial stringency it is probable that the erection of the station will not be started until the early part of next year.

Prospective Large Equipment Inquiry from Argentina

The La Plata Meridiano Railway, owned and operated by the Province of Buenos Aires, Argentina, has been authorized to construct and equip 650 kilometers of new lines provided proper financial arrangements can be made, according to a cablegram received by the Bureau of Foreign and Domestic Commerce. Originally bids were to be opened October 31, but the date has been put off to December 31. Some of the equipment includes 44,300 tons of 31 kg. rails; 470, 30-ton covered-goods wagons; 30, 30-ton open-goods wagons; 50, 30-ton flat cars; 130, 30-ton cattle cars; 27 Pacific type locomotives; 10 first class, American type passenger cars; 10 second class, American type passenger cars; 39 baggage cars; machinery to equip the shops and numerous miscellaneous items.

Southern Pacific Improves Line in Mexico

Permanent bridges are being built on the line of the Southern Pacific Railroad of Mexico to replace the temporary structures that were erected to meet emergencies during the destructive revolutionary period. It is stated that the Southern Pacific has made a formal offer to the Mexican Government to accept bonds to cover the $12,000,000, United States currency, claim which it holds against the government for losses and damages to its property at the hands of revolutionists. The line all the way from Nogales, Ariz., to Tepic is being placed in first class condition and a gratifying increase of traffic has taken place during the last few months. It is authoritatively announced that the Southern Pacific has not abandoned its original plans for the construction of an extension of its line from Tepic to a connection with the National Railways of Mexico at Orendain, near Guadalajara. It is not known, however, just how soon work will be resumed on this project. It involves the construction of several tunnels and much other heavy work.

South Manchuria Railway Plans Improvement

For the fiscal year ending March 31, 1923, the South Manchuria Railway has appropriated $4,061,910 to be devoted to railway improvements and construction, according to recent information from the company, according to Consul J. W. Ballantine at Dairen.

The double-tracking of the line with 100-pound rails between Tiehsing and Chungku, between Chuantu and Shwangmiaotze, and between Wuchiatun and Suchiatun will be continued, and the type of rails used in the Dairen wharf inclosure will be changed.

At Mukden station a roofed-in passenger platform will be constructed and additional sheeting will be purchased to protect against moisture in connection with the equipment for mixed storage of beans. On the line between Mukden and Suchiatun, an automatic signal system will be installed. The building of additional freight locomotives, reconstruction of rolling stock of all types, and the finishing of 9 freight locomotives and 20 freight cars begun during the previous fiscal year complete the program.

To Electrify Portion of Mexican Railway

Information has been received that at the recent annual meeting of the shareholders of the Mexican (Vera Cruz) Railway Company, held in London, England, provision was made for electrifying the thirty miles of mountain division of the road between Orizaba and Esperanza. The announcement of the proposed improvement came from Vincent W. Yorke, of London, chairman of the board of directors. The electric power for operating trains on this portion of the line will be obtained either from the hydroelectric plant of Lord Cowdray and associates situated near Orizaba or an entirely separate plant will be built by the railroad, it is stated. Mr. Yorke further said that at the shareholders meeting the action of the Mexican (Vera Cruz) Railway Company is obtaining a concession for a proposed railroad to run from a point on its Mexico City-Vera Cruz main line to Tampico was ratified and that financial provision for the early construction of this new line has been made. He announced that the cost of its construction would be approximately $8,000,000 United States currency.

New Philadelphia & Reading Consolidation Type Locomotive

These locomotives have driving wheels 55½ in. in diameter, carry 210 lb. steam pressure and exert a maximum tractive force of 64,300 lb. The total weight of engine and tender is 467,000 lb. Twenty-five locomotives of this design are being built by the Baldwin Locomotives Works.

Equipment and Supplies

Locomotives

THE PERE MARQUETTE is inquiring for 22, 8-wheel switching locomotives.

THE PENNSYLVANIA will build 3 electric locomotives in its Altoona shops.

THE SOUTHERN PACIFIC, TEXAS LINES, is inquiring for 9 Pacific type locomotives.

THE CENTRAL OF NEW JERSEY is inquiring for from 5 to 10 Mikado type locomotives and expects to order additional motive power later.

THE UNITED FRUIT COMPANY has ordered one Mikado type and one 6-wheel switching locomotive from the Baldwin Locomotive Works.

THE TIMISKAMING & NORTHERN ONTARIO has placed an order with the Canadian Locomotive Company for rebuilding and repairing 6 locomotives.

THE LEHIGH VALLEY, reported in the *Railway Age* of September 23 as inquiring for 25 Mikado type locomotives, has ordered 15 Mikado type from the American Locomotive Company and 15 Mikado type from the Baldwin Locomotive Works

Freight Cars

THE PENNSYLVANIA will build 100 steel caboose cars in its Altoona shops.

THE CENTRAL OF GEORGIA is inquiring for 10 steel underframes for caboose cars.

THE PERE MARQUETTE expects to come in the market soon for 2,000 cars, including 1,500 box cars.

THE CHICAGO GREAT WESTERN has awarded a contract to the Pullman Company for 500 box cars.

THE NORFOLK SOUTHERN has ordered 240 steel underframes from the Virginia Bridge & Iron Company.

THE UNITED FRUIT COMPANY has ordered from the Magor Car Corporation 25 cane cars for the Tela Railroad.

THE INTERSTATE RAILROAD has ordered 1,000 box cars of 55 tons' capacity from the Pressed Steel Car Company.

F. M. PEASE, Chicago, Ill., has ordered 100 tank cars of 8,000 gal. capacity from the Pennsylvania Tank Car Company.

THE CHICAGO & NORTH WESTERN will receive sealed proposals until October 20 for 800 steel ore cars of 50 tons' capacity.

THE GRAND TRUNK is having repairs made to 1,000 box cars at the shops of the National Steel Car Corporation, Hamilton, Ont.

JOHN A. ROEBLING'S SONS, Trenton, N. J., have ordered 2 hopper cars of 55 tons' capacity from the Pressed Steel Car Company.

THE OLD TIME MOLASSES COMPANY, INC., has placed an order with the American Car & Foundry Company for 72 tank cars of 10,000 gal. capacity.

THE EAST JERSEY RAILROAD & TERMINAL COMPANY has placed an order with the American Car & Foundry Company for 25 tank cars of 10,000 gal. capacity.

THE UNION PACIFIC was erroneously reported in the *Railway Age* of September 30 as having placed an order with the Mount Vernon Car Manufacturing Company for 50 caboose cars. The inquiry for this equipment has been postponed indefinitely.

THE SINCLAIR REFINING COMPANY, Chicago, has ordered 5 tank cars of 6,000 gal. capacity and 5 of 8,000 gal. capacity from the American Car & Foundry Company.

THE TRANSCONTINENTAL OIL COMPANY has placed an order with the American Car & Foundry Company for 75 tank cars of 8,000 gal. capacity and 75 of 10,000 gal. capacity.

THE FRUIT GROWERS' EXPRESS, reported in the *Railway Age* of August 5 as inquiring for 1,000 refrigerator cars, will build these cars in its own shows at Indiana Harbor, Ind.

THE FRUIT GROWERS EXPRESS, reported in the *Railway Age* of September 23 as inquiring for 1,000 steel underframes, has ordered this equipment from the American Car & Foundry Company.

THE NEW YORK, CHICAGO & ST. LOUIS, reported in the *Railway Age* of September 23 as inquiring for steel underframes has ordered 300 steel underframes for stock cars from the Illinois Car Manufacturing Company.

THE BETHLEHEM-CHILE IRON MINES COMPANY, reported in the *Railway Age* of September 16 as inquiring for 20 ore cars has ordered 25 hopper bottom ore cars of 50 tons' capacity from the Magor Car Corporation.

THE CHICAGO, ROCK ISLAND & PACIFIC, reported in the *Railway Age* of September 23 as contemplating the purchase of 500 box cars, 500 coal cars, 500 automobile cars, 250 flat cars, 250 ballast cars, 250 refrigerator cars and 250 stock cars, has now issued inquiries for these cars.

THE DETROIT TOLEDO & IRONTON reported in the *Railway Age* of September 30 as inquiring for 500 to 1,000 coal cars has ordered this equipment from some company who will lease it a number of such cars until the new cars are constructed. It is reported that the Cambria Steel Company received this contract.

THE ATCHISON, TOPEKA & SANTA FE, reported in the *Railway Age* of October 7 as about to place orders for 2,000 refrigerator cars of 40 tons' capacity, 1,000 automobile cars of 40 tons' capacity, 500 double deck stock cars of 40 tons' capacity, 1,000 box cars of 40 tons' capacity and 500 cars of 50 tons' capacity, has ordered this equipment as follows: 1,000 refrigerator cars, 1,000 automobile cars, and 500 stock cars to the Pullman Company; 1,000 refrigerator cars, 500 gondola cars and 500 box cars to the American Car & Foundry Company and 500 box cars to the Standard Steel Car Company. This company reported in the same issue as having placed an order for 50 caboose cars to the American Car & Foundry Company has increased this order to 150 caboose cars from the same company.

Passenger Cars

THE CHICAGO & NORTH WESTERN is inquiring for 36 coaches, 10 baggage cars, 2 dining cars and 2 cafe parlor cars.

THE BALTIMORE & OHIO, reported in the *Railway Age* of October 7 as inquiring for 30 baggage cars, has ordered this equipment from the American Car & Foundry Company.

THE CENTRAL OF NEW JERSEY will buy new passenger equipment, to include 50 coaches, 5 steel combination passenger and baggage cars and 10 steel combination baggage and express cars.

THE CHICAGO, ROCK ISLAND & PACIFIC, reported in the *Railway Age* of September 23 as contemplating issuing inquiries soon for 50 all steel suburban passenger cars, is now inquiring for 50, 70 ft. steel suburban cars.

Iron and Steel

THE WABASH has ordered 15 000 tons of rail.

THE MISSOURI PACIFIC has ordered 15,000 tons of rail.

THE ANN ARBOR RAILROAD has ordered 3,000 tons of rail from the Midvale Steel & Ordnance Company.

THE TOLEDO ST. LOUIS & WESTERN has placed an order for 8,000 tons of rail with the Carnegie Steel Company.

The Chicago, Rock Island & Pacific has ordered 35,000 tons of rail from the Illinois Steel Company and 5,000 tons from the Inland Steel Company.

The Philadelphia & Reading has placed orders for 25,000 tons of 100 and 130-lb. rail with the Bethlehem Steel Company, Carnegie Steel Company and the Cambria Steel Company.

The Missouri, Kansas & Texas, reported in the *Railway Age* of September 30 as inquiring for 10,000 tons of steel rail, has ordered this tonnage from the Illinois Steel Company.

The Chicago, Milwaukee & St. Paul is reported to have purchased 40,000 tons of steel rail from the Illinois Steel Company and 10,000 tons from the Inland Steel Company.

The New York, Chicago & St. Louis has placed an order for 19,000 tons of rail, divided between Carnegie Steel Company, the Lackawanna Steel Company and the Inland Steel Company.

The Chicago, Burlington & Quincy, reported in the *Railway Age* of October 7 to have ordered 15,000 tons of steel from the Illinois Steel Company, is reported also to have ordered 15,000 tons from the Colorado Fuel and Iron Company and 4,000 tons from Inland Steel Company.

Track Specialties

The Missouri Pacific is inquiring for 3,000 tons of tie plates.

The Norfolk & Western is inquiring for 17,000 kegs of track spikes and 12,000 kegs of track bolts.

The Union Pacific is inquiring for 7,000 tons of tie plates, 10,000 kegs of track spikes and 8,000 kegs of track bolts.

The Missouri, Kansas & Texas is inquiring for 3,000 tons of tie plates, 2,000 kegs of track bolts and 4,500 kegs of spikes.

The Cleveland, Cincinnati, Chicago & St. Louis is expected to place an order this week for 2,500 tons of tie plates and 5,000 kegs of track spikes. The company is also inquiring for 1,250,000 bolts.

Machinery and Tools

The Virginian Railway is inquiring for some shop tools including a gap lathe and an engine lathe.

Miscellaneous

The Imperial Japanese Government Railways have ordered 33,000 car couplers from the American Steel Foundries.

The Erie has awarded a contract to the Truscon Steel Company, Youngstown, Ohio, for the sash required in the construction of its new machine shop at Hornell, New York.

The Chicago, Burlington & Quincy, reported in the *Railway Age* of September 16 as inquiring for 7 overhead electric cranes for its new shops at Denver, Colo., and for 2 gantry cranes for its scrap yard near Aurora, Ill., has ordered this equipment from the Pawling & Harnischfeger Company, Milwaukee, Wis.

Signaling

The New York Central has ordered from the Hall Switch & Signal Company 88 semaphore signals, style L; 542 relays; 401 switch boxes and other signal apparatus.

The Illinois Central has ordered from the Hall Switch & Signal Company 15 color-light signals. These with a previous order, will make a total of 69 light signals furnished by the Hall Company to the Illinois Central.

The Government of Japan has ordered for the Imperial Government Railways from the Union Switch & Signal Company, 275 automatic block signals, of which about half are semaphore and half color-light. The order includes 860 relays, 450 track transformers and other apparatus.

Supply Trade News

The Par-Kar Coach Company, St. Louis, Mich., has been incorporated recently to manufacture motor parlor equipment.

E. S. Berry, until recently with the New York Central and formerly with the **Hall Switch & Signal Company**, Garwood, N. J., has re-entered the service of the latter company as sales engineer.

W. S. Murrian & Co., Knoxville, Tenn., is the southern district representative of the **Flannery Bolt Company**, Pittsburg, Pa. In the *Railway Age* of September 9 it was incorrectly reported that W. S. Murrian & Co. was the representative of the American Flexible Bolt Company.

The Federal Trade Commission has announced the dismissal of its complaint against the Midvale Steel & Ordnance Company, Republic Iron & Steel Company, and Inland Steel Company, in which it was alleged that the proposed merger of the companies was an unfair method of competition. The complaint was dismissed upon the filing with the commission of a formal statement by attorneys of record for the three companies, that the merger had been abandoned.

Charles E. Fisher, assistant engineer, test department, New York, New Haven & Hartford R. R., has been appointed service engineer of the **Franklin Railway Supply Company**, New York, in charge of New England territory, with headquarters at Boston, Mass. After graduation from the University of Michigan, Mr. Fisher served the Pennsylvania Railroad in various capacities for three and one-half years. He then joined the Midvale Steel & Ordnance Company in its material department. While in that position, he was called to Rochester by the Signal Corps and later assigned to the Bureau of Aircraft of the U. S. Government, in which branch of the service he had charge of inspection of all material supplied to the government in that district. Upon completion of the government work, Mr. Fisher entered the service of the New York, New Haven & Hartford in its department of tests and from there went to the Franklin Railway Supply Company.

E. deH. Caldwell on September 1, joined the staff of the **Franklin Railway Supply Company**, New York, as special engineer in its service department. Mr. Caldwell began his railroad service with the Aurora, Elgin & Chicago Electric Railway Company, and from there entered the service of the White Company as superintendent of repairs, in which position he had an active part in the design of steam operated automobiles. After five years in that work, he devoted the next five years as chief engineer of the Webb Jay Motor Company in the design of steam automobile engines. For the next seven years he was vice-president and chief engineer of the Empire Axle Company, following which he served for one year as chief engineer of the Hammond Steel Company, with which organization he was connected at the time of entering the service of the Franklin Railway Supply Company.

E. G. Grace, president of the **Bethlehem Steel Corporation**, stated that the meeting of the board of directors held September 10 was for the purpose of taking final action on formal matters with respect to the Lackawanna purchase. The transaction was completed by delivery on the part of the Lackawanna Company of all instruments for passing title to all its properties and the delivery on the part of Bethlehem to the Lackawanna Company of the Bethlehem stock and cash agreed to be paid therefor. The Lackawanna Company is arranging for the delivery to its stockholders of their pro rata part of the Bethlehem stock and cash upon surrender of the stock of Lackawanna Steel Company held by such stockholders. The exchange is to be made at the office of Kean, Taylor & Company, 5 Nassau street, New York City, and it is expected that it will begin about October 27. All corporate proceedings for the dissolution of the Lackawanna Company have been taken and the dissolution papers are being filed.

President Grace emphatically denies recent rumors to the effect that the Bethlehem Company is considering the purchase of the Midvale Steel Company.

The Atlas Steel Corporation, Dunkirk, N. Y., was organized on October 2, as the result of a merger between the Youngstown Electric Alloy Steel Company, Youngstown, Ohio, and the Atlas Crucible Steel Company, Dunkirk, N. Y. Louis J. Campbell, a former vice-president of the Youngstown Sheet & Tube Company, was elected chairman of the board of directors and will be the active directing head of the corporation. On the board of trustees will be James A. Campbell and H. G. Dalton of Cleveland, Ohio, a vice-president of the Youngstown Sheet & Tube Company; John L. O'Brien of Buffalo, N. Y., and H. F. Van Der Voort of Dunkirk. Of the 20 directors of the new corporation, 12 are well-known Youngstown industrial and financial men, or men connected with the steel industry of the Mahoning Valley, who were members of the board of directors of the Electric Alloy Steel Company. They are: J. A. Campbell, L. J. Campbell, T. J. Bray, W. A. Thomas, Charles S. Thomas, Jonathan Warner, L. A. Manchester, Maurice Joseph, S. Livingston Mather, A. E. Adams, S. P. Ker and W. D. Myers. The other directors include Arthur H. Hunter, R. L. O'Brien, and J. F. Carter of Buffalo; H. F. Van Der Voort, R. J. Gross and H. G. Nichols of Dunkirk, and G. A. Colton and E. B. Green of Cleveland. These men were members of the directorate of the Atlas Crucible Steel Company. The officers of the corporation are: Arthur H. Hunter, president; J. H. Roberts, vice-president; W. D. Myers, secretary and assistant treasurer, and H. G. Nichols, treasurer and assistant secretary. Mr. Roberts was assistant to Mr. Campbell in the Electric Alloy Steel organization, while Mr. Myers was secretary and treasurer of the same company. Both these officers moved with Mr. Campbell to Dunkirk. Reorganization of the entire operating and sales force of the two concerns is now in process.

Pullman Company Issues Annual Statement

The net surplus of the Pullman Company for the fiscal year ending July 31, 1922, was $1,171,294. There was a deficit from the year's operations of $6,228,073, but the balance of the amount received from the government in settlement of claims for the period of federal control ($7,399,367) resulted in a net surplus for the year. President E. F. Carry, in his remarks to the stockholders, states:

> Travel, due to various causes, was at a minimum and it was not until the last few months of our fiscal year that it showed signs of improvement in response to seasonal reductions in railroad passenger rates. This improvement, however, has been halted by the discouragement of travel incident to the shopmen's strike commencing July 1. Acting under authority granted by stockholders at a meeting held on December 20, 1921, your company took over the assets and business of the Haskell & Barker Car Company, Incorporated, as of January 16, 1922, and the position of your company has been strengthened by the acquisition of the malleable foundry, wheel foundry, brass foundry and other manufacturing facilities of the Haskell & Barker plant. To complete this purchase, the capital stock of The Pullman Company was increased by $15,000,000, bringing the present capitalization of the company up to $135,000,000. At the close of the year, July 31, 1922, your company owned 7,674 cars, 202 old cars having been scrapped or sold and 126 new cars having been added to the equipment during the year.
>
> While the purchase of equipment by the railroads during the year far exceeded buying during the last few years, it did not approach normal. Scarcity of labor and materials made manufacturing conditions very unsatisfactory. The coal strike seriously interfered with procurement of materials, and on the whole the year from a manufacturing point of view has been a most aggravating one. Your company has orders for freight and passenger cars sufficient to keep it busy until the development of the new buying movement which is expected to follow the removal of uncertainties produced by the coal strike and railroad strike. There is still a great deficit in railroad equipment which must be supplied before the normal business requirements of the country can be met.
>
> Notwithstanding your company had a definite agreement with its employees in repair shops and cleaning yards, providing for arbitration of all disputes on working conditions, on July 1, a considerable number of employees in these departments, without warning and in violation of their agreement with the company, quit their positions in accordance with the general strike call of the shop craft unions. This walkout occurred in spite of the fact that your company did not cut wages, nor did the company in any way change the conditions under which these employees were working. Your company quickly recruited its forces and has been able to operate efficiently and without interruption.
>
> It is believed that with a settlement of the present labor disturbances and a return to more normal conditions in this country, there will be a large increase in passenger travel and a revival of car-building, which will result in a satisfactory improvement in the business of your company.

The income account for the fiscal year ending July 31, 1922, follows:

Revenue		
Earnings from cars	$62,548,406	
Returns from manufacturing, interest, etc.	3,944,631	
		$66,493,037
Expenses		
Operating expenses, repairs of cars, taxes, insurance, etc.	$55,182,022	
Depreciation on cars, etc.	7,039,248	
		$62,221,270
Net income		$4,271,767
Dividends declared		10,499,840
Deficit from this year's operations after payment of dividends		$6,228,073
Balance of amount received from the United States Railroad Administration in settlement of claim for period of Federal control		7,399,367
Net surplus for the year		$1,171,294

Obituary

Allen Sheldon, one of the Chicago representatives of the Gold Car Heating & Lighting Company, Brooklyn, N. Y., died at his home in Chicago on September 27.

E. B. Tyler, vice-president of the Mississippi Valley Structural Steel Company, and one of the founders of the Decatur Bridge Company, died suddenly of heart trouble in St. Louis on September 27.

Marcellus Lester Bailey, treasurer of the Union Manufacturing Company, New Britain, Conn., died on September 26. He had been connected with the company for more than 45 years, and a director and treasurer for 35 years.

John Francis Harrigan, vice-president of the Magnus Company, Inc., New York, died on October 1 at his home in Detroit, Mich. Mr. Harrigan was 54 years old and had been connected with the Magnus Company in Detroit continuously since 1885.

Trade Publications

Lighting System Maintenance.—A 12-page pamphlet under the title of "Lamp Maintenance Equipment" has been issued by the Thompson Electric Company, Cleveland, Ohio. The booklet illustrates and describes the safety disconnecting hangers manufactured by this company, including methods of wiring and the application of various types of reflectors. The reasons for cleaning reflectors and the risks which may be involved in doing so are described and particular stress is laid to the suitability of the hanger where the lighting units are placed close to moving belts or above traveling cranes.

Control, Signaling and Alarm Instruments.—The Brown Instrument Company, Philadelphia, Pa., has issued a 24-page booklet describing and illustrating the automatic control, signaling and alarm instruments manufactured by that company. The catalogue covers a control pyrometer as applied to electric, gas and oil furnaces, indicating control thermometers, a recording control thermometer, a recording pyrometer, a signaling pyrometer which shows by means of lights when the temperature is within certain prescribed limits, an alarm thermometer, control relays and a motor operated control valve.

There's a Lot of Freight to Move—Let's Move It. This is the title of a leaflet which has been issued by W. D. Beck, superintendent of car service of the Chicago & North Western, for both shippers and employees. Attention is called to the fact that the railroads want cars, not demurrage. Superintendents are urged not to "leave it all to the train dispatcher, the agent, or the conductor; try to dig up at least one car every day that otherwise would have remained idle.

"They are also urged to check on hand reports personally, once a week; also to see that all cars are being loaded full. All employees are urged to watch the cross haul of empties. "Don't pass up these cases, when you see them; but consider that it is your business, and then direct the attention of the proper officer to the condition. * * *."

Railway Construction

CANADIAN PACIFIC.—This company is preparing plans for improvements of its ferry docks at Victoria, B. C., to cost about $150,000.

CANADIAN PACIFIC.—This company has awarded a contract to A. E. Hamilton, Moose Jaw, Saskatchewan for a 100-ton standard mechanical coaling plant at Secretan, Saskatchewan. The company has also awarded a contract to W. A. Dutton, Winnipeg, for grading the final section of the Weyburn-Lethbridge line from Bain, Alberta, to Manyberries.

CHICAGO, BURLINGTON & QUINCY.—This company, reported in the *Railway Age* of September 30 as accepting bids for a one-story reclamation plant, 50 by 301 ft., at Eola, Ill., has awarded the contract to the Great Lakes Construction Company, Chicago. This company, reported in the *Railway Age* of September 23 as closing bids on September 25 for the construction of a passenger station, 24 by 100 ft., at Clarence, Mo., has awarded the contract to G. A. Johnson & Sons, Chicago.

CHICAGO GREAT WESTERN.—This company has awarded a contract to T. S. Leake & Company, Chicago, for the construction of a 20,000-ton capacity car icing plant 82 by 254 ft., at Oelwein, Iowa.

CHICAGO, ROCK ISLAND & PACIFIC.—This company has awarded a contract to the International Filter Company, Chicago, for the construction of a water treating plant at Peoria, Ill., to cost approximately $25,000. The company has also awarded a contract to T. S. Leake & Company for the construction of a passenger station at Graham, Tex.

CHICAGO UNION STATION.—This company closed bids October 12 for the granite and stone work of the main building of the Union Station and for the construction of a signal tower.

ILLINOIS CENTRAL.—This company will construct a passing track of 110 cars capacity at Ramsey, Ill., at a cost of approximately $19,000. This company will also construct an additional connection with the Wabash, Chester & Western at Tamaroa, Ill., at a cost of $15,000.

ILLINOIS CENTRAL.—This company will construct a passenger and freight station at Glenwild, Miss., to cost approximately $9,000. The company will also construct extensions to its passenger station at Webster City, Iowa.

MISSOURI PACIFIC.—This company has awarded a contract to the List & Gifford Construction Company for the construction of a 2½ mile detour line between Corning, Ark., and Knobel involving the construction of 228 panels of trestle and the placing of approximately 60,000 cu. yd. of earth embankment. This company has also awarded contracts to the National Boiler Washing Company for the erection of new water treating plants at Ford, Ill., Knobel, Ark., Jefferson City, Mo., Waverly and Nevada, and for the remodeling of existing plants at Kansas City, Mo., Herington, Kan., Marquette, Concordia and Eads, Col., and Haswell, Union, Neb.

NASHVILLE & ATLANTIC.—The Interstate Commerce Commission has issued a certificate authorizing the construction of a line from Campaign, Tenn., 12 miles, in a southeasterly direction to a point on Rocky River.

NASHVILLE & ATLANTIC.—This company, which was reported in the *Railway Age* of August 19 as applying to the Interstate Commerce Commission for permission to construct an extension from Campaign, Tenn., to Rocky River, a distance of about 12 miles, has completed about four-fifths of the construction which includes a trestle 336 ft. long and 54 ft. high. The Rocky River Coal & Lumber Company, Nashville, Tenn., is the contractor.

NEW YORK, NEW HAVEN & HARTFORD.—This company has awarded a contract to the Roberts & Schaefer Company, Chicago, for a 600-ton reinforced concrete, three-track, Rands shallow pit, automatic electric locomotive coaling plant for installation at Boston, Mass.

NEW YORK, NEW HAVEN & HARTFORD.—This company has awarded a contract to the Roberts & Schaefer Company, Chicago, for the installation of a 300-ton reinforced concrete automatic electric locomotive coaling plant at South Worcester, Mass.

NORTHERN PACIFIC.—This company has awarded a contract to the Winston-Grant Company for the construction of a 50-ft. by 153-ft. two-story brick storehouse with platforms; also the construction of a 45-ft. by 95-ft. concrete and brick boiler and engine room, including a coal trestle, at Glendive, Mont., to cost approximately $70,000.

PENNSYLVANIA.—This company is asking for bids on the work necessary to complete the east bound main track and siding, West Morrisville yard. The approximate quantities are as follows: 15,000 cu. yds. excavation; 0.6 mile unloading, piling, distributing and laying track material; 1,600 cu. yds. unloading and distributing cinder ballast, and 3 No. 8 turnouts unloaded and laid. The work will be in charge of D. P. Pugh, assistant engineer, Norristown, Pa.

STALEY SYSTEM.—W. L. Staley of Grants, N. M., as president of the Staley System of Electrical Railway, has filed an application with the Interstate Commerce Commission for a certificate authorizing the construction of a system of railway extending from a point on the boundary line between Arizona and New Mexico in Pima County, Ariz., to a point on the Colorado-Utah line in Dolores County, Colo., making a total of 950 miles with 222 miles of branches.

UNION PACIFIC.—This company, reported in the *Railway Age* of September 23 as receiving bids for the extension and repairing of its passenger station at Kearney, Neb., has awarded the contract to P. J. Sullivan, Denver, Col.

WENATCHEE SOUTHERN.—The Interstate Commerce Commission has made public a tentative report of an examiner recommending a denial of this company's application for a certificate authorizing the construction of three lines in Washington extending from Wenatchee to Beverly Junction, 53 miles; Hanford to a point near Kennewick, 29 miles, and from a point 13 miles south of Wenatchee to Orondo, 30 miles.

THE IMPERIAL JAPANESE GOVERNMENT RAILWAYS, reported in the *Railway Age* of September 16 as inquiring for 32,900 couplers for freight cars, has ordered these couplers from the National Malleable Castings Company.

THE CHILEAN STATE RAILWAYS, 141 Broadway, New York City, are asking for tenders on October 20 for spare parts for locomotives, cars and coaches to include: 22 sets of superheaters; 265 locomotive axles; 139 tender axles; 1,100 axles for freight cars and passenger coaches; 3,861 tires for locomotive, freight and passenger car wheels; 2,713 steel boiler plates of various sizes, some plain and some flanged for locomotives; 1,290 springs for freight and passenger cars; miscellaneous supplies including 782 superheater flues and accessories for locomotives, coaches and freight cars.

Railway Financial News

BALLARD & THOMPSON.—*Application for Certificate Denied.*—The Interstate Commerce Commission has denied this company's application for a certificate for the operation in interstate commerce of a line from Thompson to Sego, Utah, 5.25 miles, heretofore operated as a plant facility.

BOSTON & MAINE.—*Asks Authority to Merge Subsidiaries.*—This company has applied to the Interstate Commerce Commission for authority to acquire by merger the property and franchises of the York Harbor & Beach, Sullivan County, Vermont Valley, Barre & Chelsea, Montpelier & Wells River, and the Portsmouth Bridge, which it has controlled for years through stock ownership. The application states that this will tend to reduce operating expenses by the elimination of accounting, fiscal and other expenses.

CANADIAN NATIONAL RAILWAYS.—*Reorganization.*—See article on another page of this issue entitled "Sir Henry Thornton to Head Canadian National."

CHESAPEAKE & OHIO.—*Authorized to Issue Stock.*—The Interstate Commerce Commission has authorized an issue of $12,558,500 of convertible preferred stock in temporary or definitive form to be sold at not less than par for cash, and the proceeds to be used for additions, betterments and improvements. Authority was also granted for the issue of $12,558,500 of common stock from time to time in conversion of preferred stock of the company.

CHICAGO RIVER & INDIANA.—*Equipment Notes Authorized.*—The Interstate Commerce Commission has authorized this company to assume obligation and liability in respect of $414,700 of equipment notes of the Chicago Junction. The New York Central was also authorized to guarantee the notes.

CHICAGO, ROCK ISLAND & PACIFIC.—*Authorized to Sell Bonds.*—The Interstate Commerce Commission has authorized this company to sell $2,000,000 of 4½ per cent first mortgage bonds of the St. Paul & Kansas City Short Line now held in its treasury, at not less than 83½, to reimburse its treasury for expenditures for additions and betterments to the property of the Short Line company.

CHICAGO, ROCK ISLAND & PACIFIC.—*Authorized to Issue Bonds.*—The Interstate Commerce Commission has authorized an issue of $5,000,000 of first and refunding mortgage 4 per cent gold bonds to be sold at not less than 85, the proceeds to be used for additions and betterments, instalments of equipment trust notes and to pay indebtedness of the applicant to the War Finance Corporation.

CRYSTAL RIVER & SAN JUAN.—*Authorized to Operate Railroad.*—The Interstate Commerce Commission has issued a certificate authorizing this company to operate its railroad extending from a connection with the Denver & Rio Grande Western at Carbondale, Colo., in a general southerly direction to Placita, Colo., 20.66 miles, and also the railroad of the Crystal River Railroad Company extending from Placita to Marble, 7.32 miles. The former railroad was built by an industrial company for the transportation of quarried marble and the latter is controlled by the Colorado Fuel & Iron Company.

DAYTON, TOLEDO & CHICAGO.—*Asks Authority to Abandon Line.*—The receiver has applied to the Interstate Commerce Commission for authority to abandon its line from Delphos to Stillwater Junction, Ohio, 90 miles.

DENVER & RIO GRANDE.—*Sutro Committee Re-opens Contest.*—A committee, of which Richard Sutro is chairman, and the other members are Lewis L. Clarke, president of the American Exchange National Bank, and William Loeb, Jr., has asked holders of the Denver & Rio Grande first and refunding mortgage five per cent bonds and the seven per cent cumulative adjustment mortgage bonds to deposit their securities with the American Exchange National Bank, the depository of the Sutro committee. In its statement to the security holders the Sutro committee says:

> An exigency has arisen affecting the security of your investment and requiring prompt and aggressive action for its protection. This has prompted the undersigned committee to urge you to deposit with it such of your refunding bonds as have not yet been deposited with any of the committees, and to withdraw from the Hammond committee (which is charged to be acting for or under the domination of the Western Pacific Corporation) and from the Perkins committee (which is charged with being a Missouri Pacific committee), as well as from the Equitable Trust Company, which is admittedly acting in the interest of the Western Pacific Corporation, by depositing with the undersigned committee all certificates of deposit in respect of such bonds as are held by you.

The Sutro committee has made public a long letter from its counsel, Samuel Untermyer, narrating his application to the Federal Court in Denver for an order to the receiver to default interest payment on Rio Grande Western consolidated 4 per cent bonds. Mr. Untermyer points out that such default is the only method by which holders of the Denver refunding and adjustment bonds may recover an equity to which they are entitled in the stock of the Utah Fuel Company, which is pledged under the Rio Grande Western consolidated 4s. He advises that the refunding mortgage bondholders should insist to the court that default be made in interest on the Rio Grande Western bonds as a means of forcing the trustee of that mortgage into court, that they appeal in event of an adverse ruling and that they apply to the Interstate Commerce Commission for an open investigation of the history of the Denver & Rio Grande and the Western Pacific and their relations with the Missouri Pacific.

DETROIT, BAY CITY & WESTERN.—*Receivership.*—H. L. Stanton, vice-president of the Detroit Trust Company, has been appointed receiver of this road by the United States District Court for the eastern district of Michigan. The Detroit, Bay City & Western operates between Bay City, Mich., and Marine City, 120 miles.

ILLINOIS CENTRAL.—*Equipment Trust Authorized.*—The Interstate Commerce Commission has authorized this company to assume obligation and liability in respect of $6,645,000 of equipment trust certificates to be issued by the Commercial Trust Company of Philadelphia and sold at not less than 95.

INTERNATIONAL & GREAT NORTHERN.—*Reorganization—New Officers.*—According to J. & W. Seligman & Co. and Speyer & Co., reorganization managers, J. W. Kendrick and T. A. Hamilton, now vice-president of the St. Louis-San Francisco, will be president and general manager of the newly reorganized International & Great Northern. The details in connection with the reorganization are progressing to the satisfaction of the reorganization managers and it is expected that the reorganization will be completed and the new securities ready for delivery before the end of the present year.

MISSISSIPPI & ALABAMA.—*Authorized to Operate Line.*—The Interstate Commerce Commission has issued a certificate authorizing this company to operate under lease 17 miles of railroad from Vinegar Bend, Ala., to Leakesville, Miss., a part of the line formerly operated by the Alabama & Mississippi which the commission had permitted that company to abandon.

MORGANTOWN & WHEELING RAILROAD.—*Asks Certificate for Acquisition and Operation.*—This company has applied to the Interstate Commerce Commission for a certificate authorizing the acquisition and operation of the property of the Morgantown & Wheeling Railway between Blacksville and Morgantown, W. Va., 25 miles, and that of the Monongahela & Ohio, 3¼ miles, in connection with its own line of 14 miles from Waynesburg, Pa., to Blacksville, which will make a through line from Morgantown to Waynesburg, Pa.

OREGON TRUNK.—*Authorized to Abandon Deschutes Canyon Line.*—The Interstate Commerce Commission has issued a certificate authorizing the abandonment of this company's line from South Junction to Metolius, Ore., 28.92 miles, part of its main line up the Deschutes Canyon, which for the greater part of its distance is paralleled by the Central Oregon branch of the Oregon-Washington Railroad & Navigation Company. The two lines were built by the Hill and Harriman interests at a time of keen competition after which an agreement was made for partial joint construction and operation and but one line was built from

Annual Report

Twenty-Eighth Annual Report of Southern Railway Company — Year Ended Dec. 31, 1921.

R[illegible] V[illegible], October 1[illegible], 19[illegible].

To the Stockholders of

SOUTHERN RAILWAY COMPANY

The Board of Directors submits the following report of the affairs of the Company.

The income account for the year ended December 31, [illegible], which was published in March last and showed a balance of $[illegible] over fixed charges is here reproduced as the first of the [illegible] tables of financial data and statistics. It should be stated, [illegible] a comparative study, that some of the non-operating income figures include items, made available through settlements between the Federal Government and affiliated companies, which are not [illegible] operations during that year.

This report will be devoted to a discussion of matters of current interest.

OPERATIONS

The financial results from operation for the first half of the current year present a gratifying comparison with the year 1921. During the six months from January first to June 30, 1922, the operating income remaining after the payment of expenses, taxes, hire of equipment and joint facility rents amounted to $8,877,425, an increase of $6,733,478 over the $2,143,947 of operating income for the first six months of the preceding year. The gross was approximately the same, being $421,331, or little more than one half of one per cent., less in 1922 than in 1921. The revenue from freight traffic was $[illegible],3[illegible] or 5.68%, larger in 1922, but there was a falling off of about the same amount in revenue from the operation of passenger trains. Notwithstanding the fact that approximately the same passenger train service had to be maintained for a substantially smaller volume of traffic, operating expenses in the first six months of 1922 were reduced $7,538,785, or 13.51%, below the level for the same period of 1921, and of this reduction more than five millions were saved in conducting transportation, less than one-half of that amount being cut from the maintenance appropriations. The operating and transportation ratios in the first six months of 1922 were 77.87 and 39.39, respectively, compared with 89.43 and 47.14 in the preceding year. A surplus of $2,003,737 of income remaining after the payment of fixed charges for the first six months of 1922, compared with a deficit of $4,757,515 for the same period of 1921, an improvement of no less than $6,761,252.

These results augured well for a prosperous year, but the realization has been deferred by the consequences of what must now be recognized to have been a futile, if well intentioned, effort by governmental regulating bodies to reduce the cost to the public of freight transportation. First the Interstate Commerce Commission directed that effective July 1, 1922, freight rates should be lowered ten per cent. below the level which obtained on August 26, 1920. Then the Railroad Labor Law decided that wages of certain employees should be reduced from the same date. A nation wide strike of members of the several organizations of railroad shop crafts followed the application of that decision. The strike was a failure and is now history, but it may well have had the economic effect of postponing indefinitely any further diminution of freight rates. Uncertainty will continue to obscure hope in these respects so long as one governmental agency fixes income and another fixes outgo without economic relation the one to the other. If governmental agencies are to continue to determine the destiny of the railroads in these vital respects, there must be such coordination between those agencies as will relate their policies and at the same time establish their power to carry the whole purpose into effect. The time seems to have come for a single responsible regulating commission.

Despite these handicaps for lower freight rates and disorganization of labor, the results for the full year 1922 should be satisfactory, given during the remainder of the year the volume of traffic which now appears reasonably assured.

INDUSTRIAL AND AGRICULTURAL DEVELOPMENT IN THE TERRITORY SERVED.

Business in the South is again on the upgrade.

The output of the mills and factories has been steadily increasing during the last few months.

An outstanding feature has been the operations of the cotton mills, a happy contrast with the strike-ridden cotton manufacturing centers of the East. In July, 1922, according to figures compiled by the United States Census Bureau, 96.97 per cent. of the spindles in mills in the cotton producing states were active, while in other states the percentage of active spindles was only 78.53. During that month the average active spindle hours in the South was 250 compared with 145 in other states. In the twelve months ended July 31, 1922, the mills in the cotton producing states consumed 3,733,147 bales, which compares with a consumption of 2,178,767 bales by mills in the other states. The more favorable conditions for the cotton manufacturing industry in the South are reflected not only in operating statistics, but also in the record of new mill construction. During the same twelve months, according to the Census Bureau reports, there was a net increase of 245,831 spindles in Southern mills, and a net increase of only 79,627 spindles in mills in states outside of the South. A survey of new mills under construction or in prospect, indicates a continuation of the tendency shown by these figures.

There has been unusual activity in the provision of new business and residential structures, as well as in the construction of improved highways.

The mineral exhibit by Southern Railway System at the National Exposition of Chemical Industries held annually in New York City, has been productive of good results. It has afforded a convenient opportunity for those looking for new supplies of raw materials actually to see specimens of the materials available in the South, and to learn the location, character and extent of the deposits. The latest exhibit in September, 1922, called forth a large number of interested inquiries which should result in the establishment of new enterprises, as well as the enlargement of existing operations, with resultant increases in the Company's traffic.

While the farmers of the South have not recovered from the fall in the prices of staple farm products which occurred in 1920, a large part of the indebtedness which they were compelled to incur in 1920 and 1921 has been discharged, thanks to the practice of economy and the diversification of farm operations.

The Southern farmer is making hopeful progress in his journey from dependence upon a single money crop, with its one pay-day per year at market time for cotton or tobacco, toward the independence to be obtained by the operation of his farm to yield cash returns throughout the year from the sale of truck crops, cattle, hogs, poultry and dairy products. One proof of this progress is found in a report by the United States Bureau of Markets that from January 1, 1922, to August 19, 1922, there were shipped from the states of North Carolina, South Carolina, Georgia, Florida, Alabama, Mississippi, Louisiana and Tennessee, 107,2[illegible]8 carloads of cabbage, canteloupes, lettuce, onions, strawberries, sweet potatoes, tomatoes, water

Table 1.—INCOME STATEMENT

	1921	1920
Operating Revenues		
Freight	$85,185,0[illegible]1.64	Operating Revenues and Expenses are not comparable, the property having been operated by the United States Railroad Administration during January and February, 1920.
Passenger	32,1[illegible]4,922.[illegible]

carloads, Irish potatoes, peaches and mixed vegetables, compared with 83,629 carloads for the same period of last year, an increase of 23,669 carloads, or 28.30 per cent., and this showing was made in spite of the fact that there was a substantial decrease in production of watermelons and peaches because of unfavorable weather conditions. Other bits of evidence of the same character are the establishment of twenty-six new creameries in the territory served by Southern Railway System, a large increase in the production of butter, the raising in south Georgia of milk fed poultry along the lines for many years profitably practiced in east Tennessee, the placing on farms throughout the territory of more pure bred poultry than in any previous year, and the growing of high grade tobacco in South Carolina and Georgia.

The higher price for cotton accompanying last year's small crop, led to larger plantings this year throughout the entire cotton belt. Adverse weather conditions and boll weevil ravages have cut down the yield in some localities, but latest condition reports appear to indicate that this year's crop will be larger than last. Production costs have been relatively low, and the crop should be sold at profitable prices.

The movement of farm settlers into the South, comparatively light for several years past, shows signs of increasing. Sound and conservative colonization projects are being launched in several localities served by Southern Railway System. Lands will be prepared for farming and offered on terms which should attract a desirable class of farmers from parts of the United States where land prices, measured by productive value, relatively are much higher than in the South.

It is fair to say that the farmers of the South now are in a more cheerful state of mind than they have been at any time for the past two years.

IMPROVEMENTS AND BETTERMENTS IN THE CAPITAL ACCOUNT.

No additions of importance were made to the property during the year 1921, but in May last arrangements were made to acquire 6,445 box cars, 700 passenger-train cars and 250 caboose cars. The cost of this equipment is $11,736,000, and the money was provided partly from current treasury funds, and the remainder from the sale of $9,300,000 Series "W" 5½% equipment trust certificates dated May 15, 1922, payable in thirty equal semi-annual installments. The substantial addition to the freight car supply thus provided should go far toward remedying the hire of equipment balances against the Company which have been conspicuous in recent income statements.

A start has been made in relaying with 100-lb. rail the existing 85 lb. rail in the heavy traffic main lines.

FINANCING CAPITAL REQUIREMENTS.

Confronted with the necessity of enlarging its facilities to handle a growing traffic, and unable to obtain a satisfactory price for four per cent. bonds secured by the Development and General Mortgage, the Company has for many years past been forced to resort to short term note issues to provide money for essential additions and improvements. The latest issue of $25,000,000 of such notes, made in 1919, to refund a previous issue, matured on March 1, 1922, and presented again the constantly recurring financial problem. A solution was found in the sale of thirty million dollars of bonds issued under the Development and General Mortgage carrying coupons calling for the payment of interest at the rate of six and one-half per cent. per annum. While only four per cent. of this annual interest rate could be secured by the mortgage, because of an express limitation in that respect, the remaining two and one-half per cent. interest is represented by the Company's unconditional promise to pay and is further protected by a covenant to secure such payment in any new mortgage which hereafter may be placed upon the railways subject to the Development and General Mortgage. An immediate and wide distribution of these new bonds was convincing evidence of hearty approval of the issue by the investment community. From the proceeds of this financing the short term notes were paid off, as also was a loan owed to the War Finance Corporation.

RELATIONS WITH EMPLOYEES.

To all officers and employees who have faithfully and efficiently performed their duties, the thanks of the Board of Directors again are tendered. Especially does the Board desire to record its appreciation and admiration of the service rendered by those loyal and courageous officers and employees who operated the railroad during the strike.

The Directors, with deep regret, record the death on August 11, 19.., of their esteemed associate Bishop John Carlisle Kilgo.

Respectfully submitted, by order of the Board,

FAIRFAX HARRISON,
President

(*Continued from page 726*)

Metolius to Bend. The companies have now agreed upon the joint use of the line of the Oregon-Washington between South Junction and Metolius and the Oregon Trunk desires to remove its tracks.

PENNSYLVANIA.—*Authorized to Lease Subsidiaries.*—The Interstate Commerce Commission has issued a certificate authorizing the acquisition by lease for 999 years of the Wheeling Terminal; Englewood Connecting; South Chicago & Southern; Toledo, Columbus & Ohio River; Cleveland, Akron & Cincinnati; Cincinnati, Lebanon & Northern; Pittsburgh, Ohio Valley & Cincinnati; Ohio Connecting; Indianapolis & Frankfort, and the Louisville Bridge & Terminal.

SABINE & NECHES VALLEY.—*Acquisition of Line Authorized.*—The Interstate Commerce Commission has issued a certificate authorizing this company to acquire and operate 11½ miles of railroad from Deweyville to Gist, Texas, and to issue $100,000 of stock, $82,000 of which, together with $24,000 of promissory notes, are to be used in payment for the railroad.

SOUTHERN PACIFIC—*Petition for Rehearing of Dissolution Case Denied.*—The United States Supreme Court on October 9 denied this company's petition for a rehearing of the case in which the court ordered a separation of the Central Pacific from the Southern Pacific.

TERMINAL RAILROAD ASSOCIATION OF ST. LOUIS.—The stockholders on October 9 voted to increase the capital stock from $50,000,000 to $100,000,000. President Henry Miller said:

> The Terminal Railroad Association of St. Louis has outgrown the original financial structure of $50,000,000 made in 1902. At that time it could not be foreseen that the rail tonnage of this region would treble in 20 years. In the light of this experience, the plan and scope must be broadened. It is of vital importance to this community and the railroads that transportation facilities be provided through which traffic may flow freely in increasing volume, and every impediment should be removed as early as possible. Hence, the stockholders and directors at today's meeting voted to increase the authorized capital stock and bonded indebtedness from $50,000,000 to $100,000,000, to provide the financial means for improvements and future growth of the properties and to meet maturing obligations.

VIRGINIAN.—*Ford Not Seeking Road.*—President Clarence W. Huntington denies reports that Henry Ford has attempted to buy the Virginian or that any change in control or management of the road may be expected.

According to dispatches from Norfolk, Ford has long sought a deep-water terminal for a steamship line which could handle his automobile export business.

WESTERN PACIFIC.—*Asks Authority to Issue Bonds.*—This company has applied to the Interstate Commerce Commission for authority to issue $5,500,000 of first mortgage 6 per cent bonds, the proceeds to be applied to the acquisition of 2,000 refrigerator cars and 100 automobile cars. It is proposed to sell the bonds at 94.

Dividends Declared

Morris & Essex Extension.—2 per cent, payable November 1 to holders of record October 24.

Passaic & Delaware Extension.—2 per cent, payable November 1 to holders of record October 24.

Pere Marquette.—Preferred, 1¼ per cent, quarterly; preferred (account accumulated dividends) 1 per cent; prior preferred, 1¼ per cent, quarterly; all payable November 1 to holders of record October 14.

Syracuse, Binghamton & New York.—3 per cent, quarterly, payable November 1 to holders of record October 24.

Utica, Chenango & Susquehanna.—3 per cent, payable November 1 to holders of record October 14.

Trend of Railway Stock and Bond Prices

	Oct. 10	Last Week	Last Year
Average price of 20 representative railway stocks	72.35	72.58	56.48
Average price of 20 representative railway bonds	88.65	88.70	76.99

THE CHICAGO UNION STATION, reported in the *Railway Age* of August 12 as inquiring for 8 tractors and 200 trailers for use in the mail building, has ordered 6 tractors and the 200 trailers from the Mercury Manufacturing Company, Chicago, and 2 tractors from the Elwell-Parker Electric Company, Cleveland, Ohio.

Railway Officers

Executive

W. R. McGraw, superintendent of the St. Louis Southwestern, with headquarters at Pine Bluff, Ark., has been elected vice-president of the St. Louis Southwestern of Texas, and appointed general superintendent of the St. Louis Southwestern lines, with headquarters at Tyler, Tex.

Financial, Legal and Accounting

Clarence R. Smith has been appointed auditor of the Cambria & Indiana with headquarters at Philadelphia, Pa., effective September 20.

Operating

H. H. Hooper has been appointed superintendent of the Cambria & Indiana with headquarters at Colver, Pa., effective September 20.

H. C. Brock has been appointed trainmaster of the Plains division of the Atchison, Topeka & Santa Fe, with headquarters at Amarillo, Tex.

M. O. Willard, supervisor of wages of the Oregon Short Lines, has been appointed assistant to the general manager, with headquarters at Salt Lake City, Utah.

J. P. Johnson, assistant superintendent of the Canadian National, with headquarters at Prince Albert, Sask., has been promoted to superintendent of the Prince Albert division, with the same headquarters.

D. W. Bowker, assistant superintendent of the St. Louis Southwestern, with headquarters at Illmo, Mo., has been promoted to superintendent, with headquarters at Pine Bluff, Ark., succeeding W. R. McGraw, promoted, and will be succeeded by **H. A. Dickey**.

A. C. McDamnell, general superintendent, purchasing agent and traffic manager of the Detroit, Bay City & Western, with headquarters at Bay City, Mich., has been appointed general manager, acting for the Detroit Trust Company, which has been appointed receiver of this road.

J. W. Riley has been appointed district manager of the Car Service Division with headquarters at St. Louis, Mo. He will have the authority of the Car Service Division in the territory which includes terminals at St. Louis, Kansas City, St. Joseph, Omaha, Council Bluffs, and other outlying points as may be directed.

Traffic

M. R. Scanlon has been appointed general agent of the Green Bay & Western, the Kewaunee, Green Bay & Western and the Ahnapee & Western, with headquarters at Toledo, Ohio.

Mechanical

O. M. Foster has been appointed district superintendent of motive power of the New York Central with headquarters at Collinwood, Ohio. **W. R. Lye** has been appointed district superintendent of motive power with headquarters at Elkhart, Ind.

H. Jefferson has been appointed road foreman of engines of the Second and Third Districts of the Plains division of the Atchison, Topeka & Santa Fe, with headquarters at Amarillo, Texas. **W. C. Sherman** has been appointed road foreman of engines of the First, Shattuck and Buffalo districts, including the Canadian terminal of the Plains division, with headquarters at Canadian, Texas.

Engineering, Maintenance of Way and Signaling

J. H. Baker, whose promotion to assistant engineer of valuation of the Southern Pacific, with headquarters at Los Angeles, Cal., was reported in the *Railway Age* of August 26 (page 403), was born April 30, 1882, at New York. He entered railway service in April, 1905, as a chainman on the Los Angeles & Salt Lake and until November, 1905, was successively rodman and levelman. From November, 1905, to November, 1907, he was engaged in subdivision work at Los Angeles and levelman and transitman on location surveys. In February, 1907, he entered the service of the Western Pacific as a transitman and from February, 1908, to December, 1908, he was in charge of engineering work at Townsite Bay Point, Cal. In January, 1909, he entered the employ of the Southern Pacific of Mexico as an instrumentman and remained with this road until March, 1910, when he was made engineer in charge of an irrigation project, which position he held until November, 1910 when he entered the valuation department of the Southern Pacific in which work he has been engaged until his recent promotion.

H. A. Cassil, whose promotion to chief engineer of the Pere Marquette, with headquarters at Detroit, Mich., was reported in the *Railway Age* of September 30, was born at Mt. Vernon, O. He entered railway service on January 1, 1898, with the Cleveland, Akron & Columbia (Pennsylvania). He entered the employ of the Pere Marquette in 1901 where he held several positions including that of division engineer of the Detroit-Canadian division. He left this road in 1906 to become associated with the Canadian White Construction Company of Montreal, Que. Two years later he reentered railway service in the maintenance of way department of the Cincinnati, Hamilton & Dayton, where he remained until this company was absorbed by the Baltimore & Ohio. He was then in the service of the Baltimore & Ohio Southwestern and the Baltimore & Ohio in various capacities until the reorganization of the Pere Marquette in 1917, at which time he was appointed engineer maintenance of way, which position he has held until his recent promotion to chief engineer.

H. A. Cassil

A. J. Hammond, assistant chief engineer of the Chicago Union Station Company, whose resignation on September 30, to become associated with James O. Heyworth, engineer and contractor, Chicago, was reported in the *Railway Age* of October 7 (page 680), is a graduate of Rose Polytechnic Institute and a post graduate of Massachusetts Institute of Technology. He was engaged in municipal engineering work in Indiana up to 1898, on which date he entered railway service as an assistant engineer on the Vandalia (Pennsylvania), with headquarters at Terre Haute, Ind., in which capacity he remained until 1901, when he engaged in private practice, at the same time being city engineer of South Bend, Ind. From 1909 to 1910, he was consecutively chief engineer of the Southern Michigan and Northern Indiana Electric Railways; bridge engineer of St. Joseph county, Ind., and consulting engineer of hydro-electric plants at South Bend and Elkhart, Ind., and Paw Paw, Mich. In 1910, he was appointed consulting engineer of the city of Chicago for the intake water tunnel at Seventy-third street and in 1911, chief engineer of the Bureau of Public Efficiency of Chicago. From 1912 to 1913, he was engineer of bridges and harbors of the same city during which time he designed the Michigan Boulevard, the Lake street, the Chicago avenue, the Belmont avenue bridges, and a number of fixed bridges. In 1914, he became consulting engineer of the Chicago Union Station Company and in 1915 was promoted to assistant chief engineer in charge of the design and construction of the passenger terminal, which position he held until his resignation on September 30.

Obituary

H. Hall, president and general manager of the New Orleans & Lower Coast, with headquarters at New Orleans, La., died on September 28 from septicemia.

Frank Owen Waldo, retired auditor of the Michigan Central, died in Detroit on October 4. Mr. Waldo was born in Hammond, New York, on December 11, 1854. He entered the service of the Rome, Watertown & Ogdensburg (now New York Central) as a telegraph operator at DeKalb Junction, N. Y., in 1870. He continued in various capacities with that road until August 12, 1876, when he entered the service of the Michigan Central as a clerk in the Auditor's office. He served with that company successively as general bookkeeper and chief clerk and on April 1, 1887, was appointed ticket accountant. He was promoted to assistant auditor on November 1, 1892, and was appointed auditor on October 8, 1908. Mr. Waldo retired from active service on account of ill health on June 1, 1918.

F. O. Waldo

Cecil A. Preston, valuation engineer of the Pennsylvania, died at Philadelphia on October 9. Mr. Preston was born in Philadelphia 70 years ago and was graduated from the Polytechnic College of Philadelphia in 1872 as a civil engineer. He at once entered railroad construction work, but he did not enter the service of the Pennsylvania until 1879. His first service with this company was in connection with surveys for new lines. On March 1, 1880, he was appointed assistant supervisor of the Baltimore section of the Northern Central; but after a few months he resigned and went to Mexico where he was engaged as principal assistant engineer of the Mexican National Construction Company, but returned to the Pennsylvania (Northern Central) in 1882 as assistant supervisor at York, Pa. He then served in various engineering positions until July, 1900, when he was appointed superintendent of the Elmira and Canandaigua divisions of the Northern Central with headquarters at Elmira, New York. In 1902 he was transferred in a similar capacity to Williamsport, and in the following year was appointed superintendent of the Middle division of the Pennsylvania at Altoona. In 1913 he was appointed valuation engineer, in which capacity he was serving at the time of his death.

Will Farmers Favor a Policy Ruinous to Them?

THE TRANSPORTATION situation which now confronts the country is, in most important respects, the most serious in its history. The railways in the week ended September 30 loaded 988,581 cars with freight. This was but three per cent less than the highest record ever made. In spite of this the net car shortage reported in the week ended September 30 was 123,732 cars. Only four weeks before that there was still a small car surplus. Never before was a car surplus turned into a large car shortage so quickly. Seldom has there been a larger car shortage, and judging by the present course of events there is now, or soon will be, a larger car shortage than ever was reported before. The shortage of box cars is relatively as large as the shortage of coal cars. Every class of shippers is complaining that the amount of commodities it can produce and ship is being limited by inadequacy of transportation.

The most striking fact about this situation is that it has developed at the beginning of a period of revival of general business. Never was this the case before. Past shortages of transportation always have been experienced either at the end of a period of expanding industry and commerce or after business revival had been in progress for some time.

It is worse than idle to attribute more than a relatively small part of this transportation situation to the coal strike and the shop employees' strike. It is due almost entirely to the decline in the expansion of the capacity of the railroads which has been going on for 15 years. The annual increase in the number of locomotives in service was almost 90 per cent less and the increase in their tractive power 50 per cent less in the period of seven years ending with 1921 than in the period ending with 1907. The annual increase in the number of freight cars in service was 90 per cent less and in their tonnage capacity 80 per cent less. There was no decline meantime of the increase in the productive capacity of the country's farms, mines and factories. This is the real explanation of the present transportation situation.

While every class of producers and shippers is suffering heavy losses and is threatened with much heavier losses owing to this situation, no class of producers is suffering heavier losses from it or is threatened with heavier losses from it in future than the farmers. The decline in the development of the railroads began with the beginning of the policy of restrictive railway regulation and has been due mainly to it. The business men and farmers of the country advocated this policy and are responsible for it. Most business men, however, have come to a realization of the effects it has had in the past and of the much worse effects that its continuance would have in future. They can be relied on to favor and support a fairer and more constructive policy.

But the business men will not have the controlling voice in determining our future policy of regulation. The farmers will have it, especially the western farmers. And there is the gravest danger that the influence of the farmers will be exerted in favor of making regulation worse instead of better, more destructive of their own and everybody else's interest instead of more constructive.

One of the clearest and most conclusive statements indicating the losses the farmers are suffering, and will in future suffer, from the present transportation situation that ever has been made was made by Julius H. Barnes, president of the Chamber of Commerce of the United States, in an address last week in New York before the National Conference of Business Paper Editors. We publish Mr. Barnes' statement elsewhere in this issue. He is a grain exporter of 30 years' experience, was president of the government's grain corporation during the war, and is, therefore, the highest authority upon the subject he discussed. Consider his statement in the light of the fact that up to the middle of September the railways had moved more grain from the farms than in any previous year. Mr. Barnes showed that owing to inability of the railways to move grain from the agricultural districts to the eastern seaboard in sufficient volume within recent weeks the price being offered for grain in foreign markets and the price being paid for grain on American farms has widened from 10 to 15 cents per bushel more than it otherwise would have. He added: "We have today four billion bushels of grain in the west, the value of which to the farmer in every market in the west is at least 10 cents per bushel below the proper relation with the European consumer markets. You take 10 cents per bushel, assuming this condition continues through the crop year—and it won't, thank goodness—and it would mean a loss in farm revenues of $400,000,000. That train of evil, that train of economic loss to a basic industry of this country follows, I believe, from an over-rigid system of government regulation over our railroads which has extended over 10 or 12 years."

Mr. Barnes may be, and probably is, too optimistic in expressing the belief that this general condition will not prevail throughout the crop year. At any rate, as an expert he has given a mathematical demonstration that the farmers stand to lose hundreds of millions of dollars on their grain within the next year because of inadequate transportation.

There is only one way to stop this and even larger losses to the farmers. This is by enlarging the capacity of the railways so that they can promptly move to market all the crops grown when the market is favorable. The development of the railways has almost stopped because, as Mr. Barnes indicated, many years of drastic regulation have reduced and

limited the net return earned by them and made it impossible for them to raise the new capital required to enlarge the capacity of their tracks and terminals and provide more locomotives and cars.

In the face of this past experience and of these present conditions consider what is going on among the western farmers. While their prices are being kept down, and there is prospect that a large part of their crops may even be left to rot upon their hands because of inadequate transportation, men who pretend to be their friends and leaders are going among them preaching the doctrine that the unquestionably bad plight in which they find themselves is due to high railway rates, and that another great drive must be made by them at once for reductions of freight rates. Conspicuous among those who are preaching this doctrine are Senator Capper of Kansas, the leader of the farm bloc in Congress; Senator LaFollette of Wisconsin and Smith W. Brookhart, Republican candidate for United States Senator in Iowa.

They are telling the farmers that the railways are making large profits, although the average return earned by them this year on their valuation has been only four per cent, and in August, partly as a result of recent reductions in rates, was only 2.65 per cent. They are telling the farmers that the valuation of the railways is grossly excessive, although it was made mainly by the Interstate Commerce Commission, a body which certainly never in the past has shown itself unduly favorable to the railways, under a valuation law of which Senator LaFollette was the author. They are advocating the restoration to state commissions of the rate-making power they had and recklessly abused before the Transportation Act was passed, and the repeal of the rate-making provisions of the Transportation Act whose so-called "guaranty" clause expired by limitation on March 1, 1922, and the only important remaining part of which is a provision directing the Interstate Commerce Commission in regulating rates to take into consideration the need of the country for adequate transportation.

The representatives of the western agricultural states in the National Senate and House of Representatives constitute a powerful group. It would be worse than foolish to ignore the fact that such men as those mentioned are arousing a formidable sentiment among the farmers. The adoption of legislation such as they advocate would tend to prevent any increases in the present wholly inadequate net operating income of the railways as a whole, and to almost stop the increases in the capacity of the railways which are now being made and to prevent indefinitely the much greater increases in their capacity which the welfare of the country absolutely requires. The total losses which would be suffered by the farmers as a result of such legislation would be greater than those suffered by any other industry, or perhaps all other industries. But the danger that, with the farmers in their present mood and such propaganda being spread among them, such legislation will be passed, is very real.

The whole business of the country would be most adversely affected. The present transportation conditions would continue and grow worse. The party in power would find that the drastic limitation of all production and commerce which would be imposed would make impossible the great and long increase of prosperity which it is seeking so earnestly to bring about. And yet men high in the national administration who ought to know better are helping to create the very sentiment and to promote the very movement which would do most to defeat what they are trying to accomplish.

It is high time that the facts about the transportation situation and the real reasons for it, and the effects that its continuance and aggravation would produce, were presented by railway men, business men and public men to the farmers. Never in the history of the United States did any men pretending to be their friends do anything better calculated to bring permanent depression and ruin upon the farmers than men like Capper, LaFollette and Brookhart are doing by their advocacy of the most unsound policy of government regulation of railways that ever was conceived. Men such as they are mainly responsible for the present transportation situation. They are not friends of the farmer, but among the worst enemies he ever had, because they are basely and grossly misrepresenting the facts to him, recklessly disregarding the effects upon him to promote their own selfish ambitions. When will something effective be done to combat their propaganda?

Saving Minutes for Freight Trains

The schedule of a passenger train should be made to suit the capacity of the locomotive. That goes without saying. But it should fit the capacity of the men also. If the train needs 15 minutes at a division terminal to change locomotives and to supply the cars with water and ice, 15 minutes should be allowed. To allow only 10 minutes, because every other train is allowed that length of time, puts the train five minutes off its schedule and very likely wastes five minutes, *or more*, of some freight train's time. Making a schedule under which the train can reach the end of its run on time is not sufficient; the engineman should be encouraged to keep on time at every station, not discouraged by requiring him habitually to make up time lost at a station where the loss ought to have been provided against. A dispatcher on a large road remarked recently that there seemed to be a general custom of allowing all passenger trains 10 minutes for changing locomotives, whether the train had 4 cars or 12, and whether it needed 6 minutes or 16. Ten minutes seems to be a popular period, whether a train has much switching or none; whether the station force is small or is large. That dispatcher could think of no better thing to be done to simplify his work than to correct such schedules so as to enable him to always give freights as much time as possible.

Equipment Orders in September

The leading factor in the equipment market just now seems to be the increasing volume of freight car orders. The orders for cars during August and September were not large; in number they trailed locomotive purchases rather badly. A figure of 11,793 cars for the first two weeks in October seems to indicate, however, that things are beginning to pick up in this respect and that conditions in the remainder of the fall of the year should be somewhat better than they were during the period of the shopmen's strike. The month of September proved to be something of a star performer from the standpoint of locomotive purchases. The total for the month

—617—was twice that of any preceding month this year with the single exception of July, the total for that month being 353. To the end of September the orders in 1922 totaled 1,672 locomotives, 111,160 freight cars and 1,437 passenger cars. These are not exactly record breaking figures but they are not at all bad considering the number of idle serviceable or bad-order cars earlier in the year. The details follow:

CAR AND LOCOMOTIVE ORDERS

	Locomotives	Freight cars	Passenger cars
January	8	7,400	235
February	8	14,731	100
March	76	5,580	25
April	272	30,507	540
May	99	18,317	235
June	22	11,097	37
July	353	15,675	120
August	220	576	22
September	617	6,737	63
Total nine months	1,672	111,160	1,437

October, first two weeks: Locomotives, 120, freight cars, 11,793; passenger cars, 30.

Cultivating a Family Spirit

It would be difficult to over-estimate the practical returns, if the employees on the railroads generally could get back into the attitude which was predominant on most American railroads a few generations ago, when they referred to their roads with a feeling of real pride as "our road." Because of the consolidation and enlargement of properties and more intensive operation, capped by certain developments under federal control, this spirit has been lost on most roads, at least to a large degree. It is significant, however, that railroad executives generally realize the necessity of taking steps to bring it back and to have all of their employees feel as if they were members of a great family, of which they could well afford to be proud. As one way in which to develop and cultivate this family spirit, a considerable number of roads have maintained employees' magazines, some of them for a long time. The Pennsylvania Railroad, however, has recently gone one step further and is publishing regional bi-weeklies, in which at least 90 per cent of the space is devoted to news about the employees and their families. Its purpose is to get the employees better acquainted with one another, with the officers and with the property, and to weld them into one great, contented family. An article elsewhere in this issue, by Logan B. Sisson, briefly touches upon the aims and advantages of these regional newspapers and tells how large numbers of the employees co-operate in gathering the news and preparing material for publication. The experiment is still in an early stage, but it would seem to contain great possibilities. It differs so greatly from the average employees' magazine, as now published, as to indicate the desirability of studying the new development closely and critically to determine whether the employees' magazines can be benefited by a change or modification in their present policies.

A Shipper's Tribute

Interested observers who have had the opportunity of seeing newspapers from different parts of the country may have noticed that railroad problems seem to be the subject of somewhat unusual attention at present in two widely separated sections—California and New England. The discussion in California concerns the Southern Pacific-Central Pacific segregation. In New England the matter of railroad consolidations has been given particular attention and in general there has become evident a feeling which has as its basic thought the welfare of the New England railroads. This results partly because the executives of the railroads serving New England have inspired confidence in the favorable and improved results which the rail lines have secured. Another reason is the realization on the part of shippers and others interested that the welfare of the railways is a most important factor in the welfare of industry generally. At any rate, shippers, bankers and others in New England are showing an unusual interest in the railways which serve that section and the sort of interest which cannot but be helpful. A practical incident of the new attitude appeared as an advertisement in Boston papers a few days ago. It was headed "The Boston & Maine's Constructive Policies" and said:

"We desire to call the attention of New England business men, particularly those in the cotton trade, to an illustration of the broad-visioned policy of the Boston & Maine Railroad in co-operating with New England industry. We refer to the granting by the railroad of the storage-in-transit privilege on cotton at Lowell, by which cotton may be shipped from southern points to Lowell, stored there pending sale, and later reshipped to other mill centers, on the payment of the through freight rate from the South to the ultimate destination.

"In suggesting to the Boston & Maine that they grant this privilege, we found that the officials were willing to consider it from only one standpoint—whether or not it would help New England industry. When we pointed out that it would be of great advantage to New England cotton merchants and manufacturers, effecting economies that would help mills to meet the constantly growing Southern competition, the railroad management quickly acceded to our request. We believe New England business men will join with us in our appreciation of this constructive co-operation on the part of the Boston & Maine Railroad in upbuilding New England industry.

"LOWELL PUBLIC WAREHOUSE COMPANY, INC.,
"Lowell, Mass."

For a shipper to advertise a railroad is new and of more than common interest. Looked upon as an expression of a somewhat new and more favorable attitude, it is one of the best indications we have seen concerning the manner in which railway conditions in New England are shaping themselves.

Three-Machine Option Criticized

One railroad purchasing policy which has come in for considerable criticism recently is the practice of requiring the mechanical department, or tool committee, to specify at least three makes of each type of machine tool desired. Objections to this practice cannot be more briefly or fairly stated than in the following quotation from a manufacturer's letter: "Many of the railroads have adopted the policy of insisting that the mechanical department specify at least three makes of tools, any one of which the purchasing department is free to buy, although preference may be expressed for one of the three. While at first blush this appears a perfectly fair plan, it works a decided hardship on the leader in the field as well as on the railroad itself for, naturally, if any one tool has outstanding features, or is superior in quality, the price is apt to be somewhat higher. Although the difference in performance may pay many times over for the comparatively slight difference in first cost, the purchasing department has no means of gaging the value of such differences and so places the order for the cheapest of the three tools pronounced as acceptable. The mechanical department should have the privilege of specifying a particular make of tool provided the difference in price is no more than a fair differential over the next best machine in the class. Unless some such policy is adopted, the railroads will rarely get the most efficient tools but will receive only the second or third best. Furthermore, they are apt to pay more than the inferior tools are really worth for the third grade manufacturer will keep his price just low enough to get under the two leaders in his field, knowing that by so doing he is practically certain of securing the business." The arguments presented above are sound and hold particularly in the case of machine equipment for large shops and enginehouses where high produc-

tion is possible and desirable. For this work, durability and productive capacity are of the utmost importance, first cost being entirely secondary. The high-duty machine is a paying investment at any price within reason. For relatively small shops and terminals at outlying points, however, it is not maintained that the requirements always call for modern machines of the most improved type. The solution of the problem is to leave the final selection of machines to be ordered in the hands of the mechanical department. Knowing the appropriations available and being responsible for maintenance of equipment costs, the mechanical department should not be debarred from specifying the best machine of a given type on the market if it feels that conditions warrant such action.

The Rock Island's Big Celebration

THE MANAGEMENT of the Chicago, Rock Island & Pacific recently has done one of the best pieces of public relations work that it has been possible to credit to the management of any railroad within recent years.

Its officers some months ago conceived the idea of having a celebration of the seventieth anniversary of the founding of the railroad. The principal part of the celebration took place at Joliet, Illinois, on October 10. A special train was run from Chicago to Joliet, 40 miles, over the first section of the line ever opened to operation. Among its passengers on the special was a venerable woman who rode on the Rock Island's first passenger train 70 years ago. Other passengers included the directors and officers, and the train was in charge of five employees whose aggregate service on the road totaled 200 years. A monument to the engineer who surveyed the route between Chicago and Joliet was unveiled at Joliet by his granddaughter, the dedication speech being made by President J. E. Gorman. An address also was delivered by Chairman Hayden.

The foregoing brief statements of fact give a very inadequate idea of the length, extent and enthusiasm of the Rock Island's celebration. It really began weeks ago and was only finished on October 10. Soon after the plan for it was announced facts and anecdotes about the history of the railroad began to be furnished to the press throughout its large territory. The history of every large railroad is in great part the history of the territory it serves. This is conspicuously true of the Rock Island's history, for years ago it was built far out into sections of the country which were almost unsettled and almost wholly undeveloped. Its construction more than anything else made it possible for them to become settled and developed, and in consequence its history has made it possible for these sections to have any real history.

The newspapers in the Rock Island's territory soon saw how the preparations for the Rock Island's celebration made it possible for them to print many stories about the history of the railroad, and about their own communities and the railroad's relation to them, which were made timely and especially interesting because of the preparations for the celebration. Consequently the Rock Island's celebration became the subject of newspaper stories and of talk by the people in every community where it runs. An account of the services at Joliet were sent out by radio and heard by many thousands of people.

The conception and carrying out of the Rock Island's celebration undoubtedly has done much to make a very large part of its employees and patrons think and speak of it as "our railroad" who had not shown the same interest in it or had the same feeling toward it for years before. Furthermore, it has resulted in many things being told and published about the railroad which have revived memories of the great part it has played in developing the middle west and the southwest, and in converting, from almost a desert into fruitful and happy farming communities and towns and cities, lands which but for the railroad would still be virtually a desert.

The *Railway Age* has said much within the last year about the necessity of the railroads doing more to "sell" themselves to their employees and the public. The Rock Island has hit upon and carried out one of the happiest and most effective methods of selling itself to its employees and the public that could have been adopted. The Rock Island having used it so well, the same means probably could not be used so successfully soon by any other railway in its territory. The same method could, however, be used with corresponding results by railways in other parts of the country. Furthermore, the method the Rock Island adopted is but one of many which could be used to arouse a sympathetic interest on the part of employees and the public in their railways, and to make them better understand and appreciate what the development of the railways in the past has meant to the country and what their adequate development in future will mean to it.

The officers of the Rock Island are to be congratulated not only upon the progress they have made within recent years in increasing the efficiency and the earning capacity of the property, but also upon the good stroke they have made in adopting a very ingenious, pleasing and effective way of causing their employees and the public to appreciate the railroad more.

Engineering and Electrification

THE REPORT of the electrification commission of the Illinois Central recommending 1,500-volts direct current with an overhead contact for the electrification of the Chicago terminals should not be construed as a solution for the problem of deciding the voltage for other projects. Many railroads and manufacturers have, no doubt, watched with interest the work of this electrification commission, composed of some of the best qualified men in the country, for a period of over two years, in hopes that its deliberations would bear fruit in the form of conclusions of wide application to steam railroad electrification.

However, it should be understood that this commission, in the study of various electrifications of America and Europe, and in the preparation of detailed estimates of at least four distinct systems, had no intention of solving electrification problems in general but was concerned solely with the design of a plan of electrification to meet the needs of a particular situation.

In contrast to many other electrification projects, that confronting the Illinois Central is *not* required to meet any special operating necessity but rather represents a concession to the civic development of the city of Chicago. Therefore, the desired benefits of the proposed electrification lie within the city limits. As the Illinois Central lines operate through a comparatively level country and traverse several coal mining districts, reason would indicate that under such conditions steam locomotives will handle the traffic for years to come. Therefore, no consideration was given to the possibility of the electrification being extended to adjacent divisions.

In conclusion it should be emphasized that the decision of the Illinois Central applies only to a short mileage of terminal area handling a heavy suburban business, freight transfers and yard switching. This combination controlled the final decision and any road confronted with circumstances that vary from this by a single factor must engineer its own investigations.

Letters to the Editor

[The RAILWAY AGE *welcomes letters from its readers and especially those containing constructive suggestions for improvements in the railway field. Short letters—about 250 words—are particularly appreciated. The editors do not hold themselves responsible for facts or opinions expressed.]*

A Question for the Signal Engineer

KANSAS CITY

TO THE EDITOR:

Will some studious signal engineer tell us the average number of trains per day which must pass over a given crossing of two railways at grade in order to make it profitable to install a simple mechanical interlocking plant, making "whistle stops" unnecessary?

On a double track section, about 70 miles in length, of one of the most prosperous railways in the Middle West enginemen are required to bring their trains to a full stop at four places for unprotected junctions and grade crossings. This section of road is equipped with automatic signals. We are told that these signals "keep trains moving." Yet does anyone know of an instance where the installation of automatic signals has reduced train stops in such proportion as four simple mechanical interlocking plants would reduce them on this road?

This 70-mile example is rather out of the ordinary for a double track road, it must be admitted, yet there are many—almost countless—unprotected crossings at grade of busy single track railways in this part of the country.

The funds available for capital expenditures are limited. The wise railway officer will spend these funds on those improvements which promise the highest net return. The saving which a simple interlocking plant—or perhaps even better, the automatic installation for railway crossing protection which was described in your issue of May 20, 1921—could bring about, should place investment in such facilities on the list of the wisest which railroads can make.

It is the signal engineer's business to tell his superiors what expenditures in signal facilities will pay the largest returns on the investment. Can any signal engineer, then, conscientiously advocate the installation of any of the plain or fancy types of automatic signals while there yet remain in his territory railway grade crossings and junctions unprotected by any type of signal whatever and where, consequently, all trains have to be brought to a full stop?

QUAESTOR

Cost of Selling Machines to Railroads

NEW YORK.

TO THE EDITOR:

Your editorial in the issue of July 15 with the above title is timely. We are heartily in accord with your findings.

The question—Is it profitable to sell railroads, maintaining the same list price as used for commercial firms—is a live one at this time. You suggest that railroads should be willing to pay more. We find railroads are close buyers and hard to sell.

Let us take a commodity or appliance that has *merit proved beyond question*, that is being largely sold to railroads and commercial firms as well and outline briefly the conditions of sale that maintain in practically every case. The salesman demonstrates his appliance to the official in the commercial house, proves that an economy can be effected and lands the order. The concern, having branches in Chicago, St. Louis, Kansas City, Omaha and Denver, and the same class of work to do in each branch, of its own volition equips these branches with the appliance to its own benefit. There is cream in this transaction.

How with the railroads? The salesman demonstrates his appliance to the station agent, satisfies him of the advantages of his product and starts a requisition on its way first to division superintendent, then to general superintendent and so on up until he and it land in the purchasing department and each has to be sold. It is a long, long trail. Yes, he secures the order for Chicago station, installs his appliance, proves that it effects an economy, *but there it stops.*

The salesman claimed, and truly, that the same economy could be effected in St. Louis, Kansas City, Omaha and Denver and he was told to *"go to it"* and he did and—this picture is painted on facts—eventually landed them all, but there was no cream in this transaction. The time, effort and expense necessary eliminated all profits.

A representative of a reliable appliance house goes to the railroad feeling that he has a product that the railroad *should* be interested in. If he has, then the story is not a one-sided one, but of mutual interest. The purchasing of this commodity is not an expenditure but an investment paying a substantial return, and its use throughout the system should be furthered. Mechanical helps are being sought after today by all commercial concerns. The railroads can well seek for them too.

SUBSCRIBER.

Speeding Up Train Movement

ST. LOUIS.

TO THE EDITOR:

After reading the editorial "Speeding Up Train Movement," appearing in the *Railway Age* of September 30, I was prompted to prepare the following memorandum of certain other features of freight train performance:

The relation between the average speed and the average train load is very pronounced and my opinion is that it is more practical than theoretical. It is held generally by some that the gross train load is the first essential, to which I agree. There should not, however, be an overloading of trains and locomotives. In many instances, operating officers in their zeal to show heavier train loading, have gone beyond the economical limits but this is not equivalent to saying that they should permit locomotives to run over their train districts with less than their full economic rating.

Perhaps the speed per hour should be as near as possible to 12½ miles, to avoid excess expenses resulting from penalty overtime. Nevertheless tonnage should not be sacrificed for speed, nor speed for tonnage; admitting there is a difference between the possibilities on a low-grade line and on a heavy grade line. The economical speed at which certain types of locomotives may be run varies. On some freight districts a tonnage loading that would permit an average of 12½ miles an hour would mean uncertain operation on the up-grade side of the hill and unsafe speed on the down-grade side.

The length of trains handled also is an important item in the matter of time consumption. The speed of a train, however, is more frequently the result of train dispatching, passing and terminal track facilities, than it is, perhaps, of the tractive effort of locomotives used, but the train load is an influencing factor and one cannot be properly considered without the use of the other.

Increase in speed with a proportionate train load will increase the ton-miles per train hour to a point where the operation is most satisfactory and economical. The ton-miles per hour unit is influenced favorably by an increased train load or an increased speed, or in both, or an increase in

one factor proportionately more than a decrease in the other. On the other hand, a small decrease in the running time of a train will in many instances result in the loss of a car day at destination for each car in the train and frequently an aggregate loss of several car days; it also increases the per diem charges at intermediate stations, terminals and junctions.

The general rule is that the amount of fuel consumed per ton-mile is reduced as the engine load is increased to a certain reasonable limit. Solely on a ton-mile per hour basis a gradual gain in locomotive efficiency can be shown as speed increases from 25 to 30 miles an hour, but when the speed of a train averages more than 15 miles an hour, many factors other than ton-miles per hour affect the net economy. It is held that the modern locomotive attains its maximum fuel and thermal efficiency at speeds of not less than 12 miles an hour while working at 25 or 30 per cent cut-off. At lower speeds, high degree superheated steam is not obtained. Superheated steam locomotives are capable of higher sustained speeds than saturated steam locomotives capable of dragging the same train load.

The unit of measure is the "cost per ton per mile." Expenses directly chargeable to train service, aside from fuel and wages, include lubricants and locomotive and train supplies. These latter items are of less importance and the charges per ton-mile decrease as the utilized tractive effort increases.

The expenses of yard operation are seldom considered as being influenced by the character of train and/or the average running time between terminals. In hump yards the cost of switching is probably independent of the length of the train but in "flat" switching, the hauling of long cuts of cars reduces the speed of terminal switching and increases the cost. Enginehouse expenses likewise are affected. A reduction in the number of units handled will cause a decrease in the transportation cost per ton-mile. The subject is one which undoubtedly receives the attention of the officers of the individual railroads and what may be good practice on one road is not necessarily good practice on another.

My own thought is continually to force tonnage to the potential rating of the class of power in service, particularly in the direction of heavy traffic, increasing the average speed per hour by improved handling. This is the manner in which the most economical results are obtained, since the function is to move a given quantity of freight within a given number of hours and to produce the best results the happy medium must be found.

C. D. Hicks.

Side Lights Upon the Shop Strike Situation

Chicago, Ill.

To the Editor:

Those railway supply manufacturers who maintain staffs of experts in specialized work on the trunk lines have had quite as interesting a time, during the shop crafts' strike, as have some of the railway executives themselves. These experts are usually recruited from the ranks of railway supervisory forces and frequently belong or have belonged to one of the striking craft unions. Normally they merely instruct in the work concerned but just now there frequently is nobody to instruct and the work is there to be done just the same. In most cases the work is done, and better than ever before, to the credit of these experts and their employing companies. Those systems which heretofore have discouraged the use of experts on their lines have had to contend with embarrassments without this type of efficient assistance.

* * * * *

It is interesting to note what surprising results a few loyal master mechanics have obtained in getting terminal work done on the power. Job after job has been tackled, with only the master mechanic and possibly a foreman to help, with satisfactory results in a half or a quarter of the time usually allowed in normal operation.

One illustration is in mind: In replacing certain spring hangers on a certain class of engines, it has been customary for the machinists' gang to have other craftsmen called upon to drop the ashpan before the job was started and then to replace it after the job was completed. It was found perfectly possible to do the job without these several hours of additional work.

Another illustration: The matter of hydrostatic tests required by the Interstate Commerce Boiler Inspection Law has always been considered quite a formal proceeding. When, after these jobs had been allowed to accumulate, owing to inevitable disorganization, due to the strike, in the press of work of greater emergency, attention was given this detail, it was amazing to note the rapidity with which numbers of such tests were run, without sacrificing thoroughness to any degree whatever.

* * * * *

Several railways called in ticket clerks and other traffic employees for engine house assistance. Some of these men have come from "off-line" offices, and some of them had never even seen those parts of their own lines to which they were sent. They are receiving an education in practical operation, the like of which they could have obtained in no other manner.

Incidentally, these traffic men, clerks, solicitors, etc., become the best kind of terminal labor in a surprisingly short time. Of course, they are instructed in one specialized job after another as occasion arises and rapidly become proficient in each. With uncomplaining willingness they turn their hands and brains to any job which arises as fast as they receive instruction, and this spirit results in large amounts of work being done with a minimum of forces.

Loyal foremen, at outlying shop and engine terminal points, have quite the most unenviable positions imaginable. While they are, by the rules of their own crafts, exempted from strike call, the fact that their loyalty calls for actual work in maintaining operation subjects them to all manner of personal embarrassment and insult. These men deserve any reward it is possible to accord them. They seek no reward, however.

The position of the honest shopmen of long service is pitiable. They may not have wished to strike but their circumstance compelled it. It was not in the cards that they should win anything and many of them realized it, yet they had to go with the majority, their actions being controlled by those of radical tendencies. Whether they know it, their greatest gain is in the loss of the strike. By losing in a sense they win. They will be removed from the influence of discredited and radical leaders.

Greatest prosperity for the shopmen, notwithstanding the slight wage reductions, comes with greatest prosperity for the railways. By elimination of disturbers, non-conformists, and radicals as a result of the strike, the efficiency of the shop forces will mount and the position of the efficient workers taken back will be correspondingly improved.

Lumping the work of the poorest with that of the best, as has been the practice for several years, tends to discourage all but the most inherently loyal. The weakening of such a yoke cannot but have beneficial effect upon the individual.

L. F. W.

J. W. Kroell of Chicago was appointed president of the International Order of Railway Yardmasters on October 10, to fill the vacancy caused by the recent death of President F. W. Whelan. The appointment was made by the board of directors of the above organization.

Rock Island Celebrates Seventieth Anniversary

Display of Enthusiasm Shown as Featured Program is Presented at Both Chicago and Joliet

ON TUESDAY, October 10, the Chicago, Rock Island & Pacific celebrated the seventieth anniversary of its founding, the day being observed over the entire system. The most elaborate ceremonies, however, were held in Chicago and Joliet, Ill., the first terminals of that carrier between which the first Rock Island train's inauguration run occurred on that date in 1852. The LaSalle Street Station, Chicago, was decorated for the occasion with American flags and numerous posters were displayed describing various features of the slogan "Seventy Years of Service." The first sleeping car used by that road was placed on exhibition in the station next to a modern Pullman in order that the public might compare the new with the old type.

Rock Island Special Enroute Chicago to Joliet

The opening incident of the day in Chicago was the presentation of a "half century of service" medal to Engineer J. R. McGann by Charles Hayden, chairman of the board of directors. Adding color to the occasion were a number of young women dressed in the costume of 1852. The presentation was made on the platform of the station near the rear of a special train which was to carry the officers and guests of the road to Joliet for the ensuing anniversary ceremonies. When Engineer McGann had received his medal, Chairman Hayden, clad in the blue overalls of an engineer, took the throttle and guided the special train toward Joliet reenacting

The Unveiling of the Reed Monument by Miss Anna Reed Bates, Great-Granddaughter of Samuel Benedict Reed

the first run. The engine and observation platform were both decorated with small American flags and red, white and blue bunting, and the train crew was made up of a number of the oldest employees. The conductor, J. Arzener, had seen 40 years of service; the brakeman, J. J. Conlon, 34 years; E. Faust, engineer, 39 years; and E. Wirthmiller, fireman, 41 years. At Blue Island, 49th street, Englewood, Hamilton Park, 124th street, and other districts and towns the employees were on hand to greet the train with cheers and the waving of flags and hats.

On arrival at Joliet, city officials received the visitors, together with 5,000 school children. Escorted by a band between lines of the R. O. T. C. of the Joliet high school cadet corps, the officers, and guests of the railroad proceeded to the courthouse lawn, where the boulder monument to Samuel Benedict Reed, civil engineer, who surveyed the original "Rock Island Line" in 1850, stands. This monument was erected by the Union Pacific, of which Mr. Reed was later superintendent of construction. A bronze tablet was placed on the boulder by relatives of the engineer, and Anna Reed Bates, his great-grand-daughter, unveiled the monument.

Addresses were delivered by Mayor A. C. Jeffrey of Joliet, Col. Fred Bennett, son-in-law of Mr. Reed; Charles Hayden, chairman of the board of directors, and James E. Gorman, president of the Rock Island.

Copyright by Underwood & Underwood, Chicago

President J. E. Gorman and Guest of Honor, Mrs. W. W. Stevens, Who Was Passenger on First Train in 1852

Following the ceremonies at the monument a tree was planted in the courthouse lawn, on the former right-of-way of the Rock Island road. The Joliet Association of Commerce then played host to part of the visitors and at a luncheon given by this body, an address was delivered by L. M. Allen, vice-president. The main portion of the party returned to Chicago for a luncheon at the Drake hotel, at which addresses were made by Mr. Gorman, Mr. Hayden, M. L. Bell, vice-president and general counsel; Carl Nyquist, vice-president, and Judge Jacob M. Dickinson. T. H. Beacom, vice-president, was the master of ceremonies. At the close of the speaking program, Chairman Hayden presented, in behalf of the board of directors, a bronze medal to each of the pensioned employees who had or have been with the road for 50 years or more. The response in behalf of the pensioned employees was made by T. Knight of Forth Worth, Tex., a pensioned locomotive engineer.

In the evening the celebration closed with a radio program, broadcasted from the Westinghouse K. Y. W. station, Chicago. Employees' clubs in other localities "listened in" on the program as did commercial clubs in many "Rock Island" cities. The radio program consisted of music by the Rock Island orchestra, a greeting by C. Nyquist, songs, an address by C. Hayden, more songs, and orchestrations. The guest of honor for the entire day was Mrs. W. W. Stevens of Hubbard Woods, Ill., a passenger of the "first train" in 1852.

Copyright by Underwood & Underwood, Chicago

Rock Island Officers and Guests at Joliet Being Escorted to Court House

In addresses during the day of celebration both Mr. Hayden and Mr. Gorman made pleas for public co-operation. Mr. Hayden said in part:

"You can not expect to be served by the perfection of transportation, unless you are willing to co-operate. If the war has taught us anything with reference to the internal affairs of this country, it is that the railroads must be built up, aided and encouraged by legislation, rather than harassed and beaten down. I insist that you and I as citizens of this great country must take an active part in seeing that future lawmaking and future regulations of our railroads shall be constructive and not destructive."

While Mr. Gorman said:

"We realize and face our responsibilities, but they are not ours alone. We need each other's help and friendly consideration. Any other relationship is to our common detriment. It is our ambition to establish and maintain such a relationship. We seek a release from super-regulation which stifles initiative and hampers prompt adjustments necessary to business emergencies. We welcome supervision and constructive criticism. We want you to come to us with your problems and seriously consider ours and aid in their solution."

Railway Real Estate Association Meets in Chicago

Discusses I. C. C. Valuation, Taxation, Land Purchase, Leases and Other Important Related Subjects

THE FOURTH ANNUAL meeting of the Railway Real Estate Association was held in Chicago October 10-12, inclusive. The program consisted of a series of individual papers on subjects related to land, taxation and other matters naturally coming under the direction of the real estate offices. The sessions were presided over by President J. T. Maher, right-of-way, land and tax commissioner, Great Northern. Mr. Maher also took part in the program, with a paper describing the activities of his department on the Great Northern.

J. T. Maher was re-elected president for the coming year. He had served in that capacity during only a part of the past year, succeeding to the office due to the resignation of his predecesor. Other officers elected were: First vice-president, O. F. Scudder, land and industrial commissioner, Chicago, Burlington & Quincy; second vice-president, P. McPherson, right-of-way and tax agent, Canadian Pacific; and secretary and treasurer, R. H. Morrison, assistant engineer, Chesapeake & Ohio. The next meeting will also be held in Chicago, beginning the second Tuesday of October, 1923. Abstracts of the reports follow:

How to Buy Right-of-Way

By O. F. Scudder,
Land and Industrial Commissioner, Chicago, Burlington & Quincy.

In the case of any extensive purchase in the larger towns or cities, it is always an advantage to make these under cover as far as possible, and it very frequently happens that the broker can get his commission from the owner of the property, which works a considerable saving, also. Unless the property to be obtained is too great in extent, the project generally can be carried through to the end without the purpose for which it is being assembled becoming known outside. At any event, results can be secured in the way of establishing a price basis, which is a great advantage if it becomes necessary to condemn. In working through outside agencies, I have always found it a good plan, in the first instance, to get the broker committed to an estimated cost or value of any property you desire him to secure, and have it understood that he is to work practically to that basis and not exceed such estimate without first getting approval. This will tend to hold your man at a conservative figure and he will not, in his eagerness to earn commissions, close on too liberal figures.

It is always an advantage to the right-of-way agent, before approaching the land owners to negotiate purchase, to inform himself as fully as possible of the plans of construction and use to which the property is to be put, especially in the case of any extensive right-of-way purchase for strictly new development, covering particularly the provisions for drainage and crossings, both public and private. If you are informed that at a certain point a very expensive crossing or other facility has been planned for the use of the land owner, it very frequently happens that a great saving in construction cost can be obtained by judicious purchase of land, or in making a cash settlement for waiver of crossings, etc., at considerably less than the engineering estimates.

Our investigation in connection with compiling returns to the Interstate Commerce Commission under the several valuation orders pertaining to Lands Held and Used for the Purposes of a Common Carrier, and for Lands Held and Used for Other Purposes Than Those of a Common Carrier, has developed that numerous transactions in the past, containing elements of severance damages, and damages to property taken, have been erroneously handled in our accounting. In order to obviate this and make sure that the full cost of all land purchased for transportation purposes is written into our capital account, we are now requiring the right-of-way agent to itemize all elements of damage entering into the settlement for every parcel purchased.

Railroad Insurance and Fire Prevention

By C. N. Rambo,
Manager of the Railroad Insurance Association.

Railroads vary in their methods of procuring indemnity against various kinds of loss. Some few railroads carry their own risks in part. In the main, however, they place their risks and liabilities with insurance companies, in some cases not insuring as generally as in others. When we speak of railroad insurance we cannot necessarily confine it to fire insurance. The general indemnities secured are those against loss by fire, general marine perils and disasters, damage and liability due to boiler explosions, and bonding of employees.

The insurance has to be handled on a wholesale basis. A general schedule of properties is prepared, with each property listed and valued, with its contents. These items may be located in many states, but instead of each unit of risk being written under an individual policy, requiring thousands of policies, a policy is issued covering the property in each state, and issued under the insurance requirements of that state.

It must be observed that in insuring the contents of cars, stations, freight terminals, etc., the cover is on the common carriers' liability as prescribed by the standard or uniform bill of lading, for property of others being transported and in the custody of the railroad. It covers also any warehousemen's liability. Aside from the cars and locomotives owned by the railroad insured, insurance is issued on the liability of the railroad for cars of other railroads passing over its lines in the necessary interchange of traffic.

Individual values are insured under railroad property schedules, i.e., a specific amount of insurance is placed upon each building, as well as on its contents, and a specific amount of insurance is placed upon each unit of rolling stock and a specific limit of liability is placed on the contents of each car, under common carriers' liability, as well as a limit of liability thereon in any one fire. Depreciated values of rolling equipment are usually insured. The process of insuring structures varies—but a satisfactory rule and average has been to insure 70 per cent or 80 per cent of value.

We cannot consider the matter of fire insurance without bringing in the collateral feature of fire prevention. If any proof of the necessity for giving fire prevention the consideration it deserves is required, we need only look to the contribution made last year to the national ash heap—$485,000,000. This large annual loss has only been exceeded once, in 1906, the year of the San Francisco conflagration. The present burning rate of $923 a minute constitutes one of the heaviest drags on our economic progress. During the year, 1918, 419 roads reported 20,628 fires, with a property loss of $12,263,220. This represented about four per cent of the total estimated loss of the country on all

properties for that year and it meant to the railroads an average loss of approximately $594.50 for each fire, or about $50 per mile of railroad. Certain of these fires damaged property outside the right-of-way resulting in a source of large claims against the railroads, but one to a very small extent insured. Of the total number of fires mentioned, 9,923 or 62.7 per cent were assumed to have been caused by sparks from locomotives.

Methods of Assessing Railroad Property for Taxation

By N. P. Haugen,
Formerly Chairman of the Wisconsin Tax Commission.

With the constant increase in public expenditures—federal, state and local—taxation has become the subject of much discussion, contention and dispute. The popular demand has increased for better roads, more efficient schools and more of them, better sanitary conditions, police protection, pension funds, bonuses, etc., and taxes are likely to keep on increasing for a time at least. In this increased public burden, railroads have no doubt in most of the states borne at least their full share, nor have they been reluctant or unwilling to take their part, if properly apportioned and equalized. Railroad property is so obviously in sight that it cannot escape the attention of the assessing officials.

Two general methods have prevailed for the taxation of railroads: one the gross earnings or license tax; the other, the advalorem tax. The tendency during the last 20 years has been to replace the former with the latter. The gross earnings tax has the merit of being simple in administration but it does not readily respond to the varying rates of taxation on other property and is therefore likely to violate the rule of uniformity generally prescribed in state constitutions. It is also likely to become the shuttlecock of politics as a change in rate can as a rule be authorized only by the legislative body.

The basis of assessment of railway property within a state is its "value," and many cases dealing with the subject of taxation show how the courts have defined "value" and the methods for ascertaining it. The result may be summarized by saying that "value" depends upon the extent and profitableness of the use of the property; that is, upon its net earnings. The courts have also repeatedly held that cost of reproduction is not "value" for taxation purposes. It is properly used for rate-making purposes but does not necessarily represent "value" as that term is used by the courts.

In assessing railway property it is, of course, the operated property only which is considered, and this presents a difficulty in using the stocks and bonds as the basis of value. Where proper elimination of outside holdings can be made, the stock and bond values of railroads averaged over a period of five years seems to correspond most closely to that full and true value which the assessment laws generally prescribe. It is well, however, to consider other methods for comparison purposes as they serve the assessor in verifying his approach at true value, and in this respect net earnings undoubtedly afford the best test.

Having arrived at the value of the system, the next step is to allocate such value to the different states into which the property extends. No absolutely precise method can be prescribed. One of the most important and also the most difficult of the problems presented in the assessment of railroads is to reach a fair adjustment for taxation purposes between railroads and other property of the state. Assessments can never be absolutely perfect. Judgments will differ, and valuation is largely a matter of judgment, but the public does have a right to insist that the officials exercise their best judgment in arriving at true value for public purposes.

Government Valuation as a Factor in Condemnations

By W. R. Tarbet,
Real Estate Agent, Illinois Central.

Intelligent and honest officials advised as to how and when and for what purpose the government's appraisals were made would not, in my opinion, give them any weight. When the case is on trial before a jury the court should not permit the introduction of the government's figures as evidence, because the government has not promulgated any plan for keeping land valuation up to date, although the act requires it to do so and to report to each Congress figures revised to date. Only an "informal" report on land value has as yet been made to us. Sometime in the future we may get a "tentative" report and eventually perhaps a "final" report. By that time the figures will probably be so out of date as to be utterly worthless for any purpose whatever.

Railroad value cannot be found by trying to fix a "value" on the land, the right-of-way, shop, yard and station ground, and adding to that a "value" of ties, rails, fills, cuts, bridges, buildings and rolling stock. Nobody can determine separate values of the component parts of a railroad, and then add them to get at the value of the carrier. There is no such thing as a "physical valuation" of a railroad until it is defunct; then it is a junk value. The taxable value of that part of a railroad system lying within any state cannot generally be found by capitalizing the net earnings in that state, or the average net for a period of years, because it is impossible to determine the net in most states, due to the prevailing practice of not distributing gross revenue and operating expense consistently with each other. Especially is this true as to the heavy terminal expenses.

The best way to get at the taxable value of a railroad system that generally has a fair net income is to combine the current stock and bond market value (less the value of all non-operative assets) with the value found by capitalizing the average net income for any five years last past. This system value can best be apportioned to the several states on a composite basis found from factors reflecting relative railroad activities, revenue, and investment.

Rental on Leased Railroad Lands

By J. L. Watson,
Right-of-Way Commissioner, Northern Pacific.

The purpose for which railroad lands should be leased, and by railroad lands I mean right-of-way and station grounds available for leasing purposes and the land acquired and held for railroad and industrial purposes, is to furnish sites for the convenient transaction of business to industries requiring trackage, and to create and control traffic for the railway company. The granting of leases on the right-of-way and station grounds will, in many cases, permit the prompt loading and unloading of cars and avoid delay which might otherwise ensue. In the grain growing sections it is more economical to have the grain warehouses and elevators located on the right-of-way, where switching can be done more conveniently and more economically than would be the case if such industries were located some distance off the right-of-way and served by a spur track.

Long term leases should contain a provision for rental adjustment at stated intervals. A good plan is to make such adjustment at intervals of five years with a provision for arbitration if the railway company and the lessee cannot agree upon the rental. In purchasing right-of-way sometimes it is necessary to acquire surplus property which is not needed for railroad purposes and which cannot be served to advantage with trackage and is perhaps of little value for indus-

trial purposes. In such cases it is best to sell the property if possible, but if it cannot be sold, or if the carrier is not anxious to sell it and can lease it for any legitimate purpose, I think it is justified in doing so for whatever rental can be obtained

Discussion

The discussion on this paper was led by J. C. Williams, assistant real estate agent of the Chicago, Milwaukee & St. Paul, who stated: "Land, or railroad right-of-way and station grounds, represents approximately 20 per cent of the total investment. Approximately 80 per cent of this is in towns and cities, as rural right-of-way is negligible so far as leasing is concerned; 65 per cent of this 80 per cent is taken up by tracks, depots, etc., and approximately 25 per cent of the remainder is necessary for future expansion, but due to location cannot ordinarily be leased. Approximately ten per cent of the remainder is neither necessary for future use nor can be leased to advantage and should be sold. The rest can and should be leased, and the guide to follow is 'Lease to the industry which gives rental plus transportation revenue a maximum.' Considering the present value of money and the usual rates of interest, six per cent of the value of the property, basing the value on the use to be made of it by the industry, is not excessive."

Relation of Federal Valuation of Railroads to Taxation of Railroad Property

By A. J. Rooney,
Tax Commissioner, Chesapeake & Ohio.

Taxation for federal government purposes must be indirect, as Congress has not the authority to levy a tax directly on the property of anyone. The most efficient form of indirect taxation was and probably still is that provided by the tariff laws, but in more recent years Congress provided, primarily, for a levy of one per cent upon the income of business corporations, followed by the capital stock tax law and the general income tax law, which latter, in turn, was superseded and augmented by the "War Revenue Act of 1917," later modified. The ad valorem basis of taxation, as applied under authority of the general property tax law, requires a complete valuation of all property at stated intervals. Under the ad valorem system, the total valuation and the total amount of revenue needed determines the tax rate. The valuation of this property and the tax rate, determine the amount of taxes the taxpayer must pay. When all property is listed for taxation at full value, the tax rate, all other conditions remaining unchanged, will be as low as it can be made. The just ad valorem taxation of railroads requires the just ad valorem taxation of all property.

The valuation to be placed on the property of a railroad, or any other "going concern," for the purpose of taxation, depends upon the "profitableness of its use." Such a concern might be entitled to earn a reasonable return upon a valuation of five million dollars, but, if, by reason of the rates prescribed, or the stress of untoward circumstances, it actually earns a reasonable return on only half that amount, then its valuation for the purpose of taxation would be correspondingly reduced—the low earnings being at once reflected in the "price value" or "market value" of its securities. In many of the states, the statutes prescribe that, in assessing the railroads, the earnings shall be "considered" and even in those states which provide for the valuation of physical property separately from the franchise, the earning power of the lines is given more consideration, for without such consideration no intelligent assessment can be made.

Public opinion is a large factor in determining how the railways shall be treated. Developments of the last few years have done much towards causing the public to look upon the railways with a different perspective. They recognize the importance of the railways to their own very existence. The history of the railways is linked with the history of the nation.

The public is interested more in rapid and safe transportation—ample and good railway service—than in cheap transportation or high taxation. There are large areas of land in the United States yet awaiting the coming of the railways for their development, but if the railways already existing are stultified, the capital necessary for their extension will not be forthcoming.

Other Papers

A paper, "Can the Multiple Studies Made in Connection with Federal Valuation Be Used as a Basis of Determining Cost of Acquiring Lands for Railroad Purposes," was read by W. R. Van Campen, land attorney, Presidents Conference Committee. He was inclined to discount the multiple studies as being of service in estimating individual land purchases or a limited number of such purchases. He said that past experiences will be of assistance in estimating new extensive land purchases and would be somewhat of a guide to the less experienced right-of-way agents. The multiple studies can be used, however, he said, in estimating present cost of acquisition for valuation purposes.

E. D. Anthony, assistant real estate and tax agent, Delaware & Hudson, presented the paper, "Crossings and Use of Railroad Land by Telephone, Telegraph and Other Public Service Companies." He said that the prime factors of the case are: first, the protection of the right-of-way and interest of the carriers in their property; second, the safeguarding of the lives of their employees and third, a regard for the welfare of the general public. His discussion concerned each factor individually. Judge R. V. Fletcher, general solicitor of the Illinois Central, representing the Association of Railway Executives, addressed the convention on the general railway situation.

Labor Board Gives Maintenance Men an Increase of Two Cents an Hour

An increase of two cents an hour for approximately 452,000 members of the United Brotherhood of Maintenance of Way Employees and Railway Shop Laborers was ordered by the Railroad Labor Board in a decision handed down on October 14. Increases were given to four of the nine classes of maintenance-of-way employees enumerated in the board's last wage decision affecting these workers. Section, track and maintenance foremen and assistant foremen, track laborers, and other common laborers in the maintenance-of-way department and in and around shops and roundhouses, drawbridge tenders and assistants, pile driver, ditching and hoisting firemen, pumper engineers and pumpers, crossing watchmen or flagmen, and lamp lighters and tenders, received the two-cent an hour increase. At the same time the board decided that the present conditions did not justify an increase for the following classes of employees: Bridge, building, painter, construction, mason and concrete, water-supply and plumber foremen, and assistant foremen, coal wharf, coal chute and fence-gang foremen, pile driver, ditching and hoisting engineers, bridge inspectors, and mechanics in the maintenance-of-way and bridge-and-building departments, and their helpers.

According to the board the increase applies to 451,911 maintenance-of-way employees and will add approximately $22,125,000 to the railroads' annual payroll. The board's latest ruling will place the minimum rate of pay for maintenance-of-way workers at from 25 to 37 cents an hour, the board estimating that 45 per cent of the men will receive

37 cents an hour or more, that 40 per cent will receive more than 30 cents an hour and that only about 5 per cent will receive less than 30 cents an hour.

Ben W. Hooper, chairman of the board, declared that the decision was made because of the definite upward trend of wages in other lines of industry, particularly the wages of common labor. There was no pronounced increase in the cost of living, he said.

"The board does not feel that it is receding from its decision of last spring as at that time the wage increase ordered was just and reasonable," he said. "The reason and issues leading to the present increase will be fully set out when the official decision is handed down."

The board's decision has been held up for more than 10 days because of the failure of the board members to reach an agreement, as pointed out in last week's *Railway Age*. The labor members of the board were holding out for an increase of more than two cents; the public representatives were urging the two-cent an hour advance, and the railroad representatives were demanding that no increases be granted. The deadlock was finally broken when the proposition of an advance of two cents an hour was approved by the three public members, Samuel Higgins, a member of the railroad group, and W. L. McMenimen, a member of the labor group. A. O. Wharton, another member of the labor group, and one railroad representative voted against the increase and the third railroad representative was not present.

The board's ruling follows closely on the defeat of E. F. Grable, candidate for re-election as grand president of the United Brotherhood of Maintenance of Way Employees and Railway Shop Laborers, and the announcement by his successor, F. H. Fljozdal, that a new demand "for improved working conditions and a living wage" would be made upon the board. Mr. Grable was defeated by more than 3,000 votes out of a total of approximately 86,000. The election was held the day previous to the announcement of the board's decision.

Prior to his defeat, Mr. Grable telegraphed a protest to Mr. McMenimen against the proposed two cent an hour increase. Mr. Grable requested a quick decision on the requests of the maintenance men and stated that unless a larger increase than two cents an hour was granted "loyal members may adopt extreme tactics fostered by questionable leaders to remedy their grievance." Following the board's announcement Mr. Grable is quoted as stating that the increase undoubtedly would be accepted by the organization as "temporary relief."

Association of Passenger Traffic Officers Meets

The sixty-sixth annual convention of the American Association of Passenger Traffic Officers met in Louisville, Ky., on October 10-11. While a large part of the meeting was concerned with routine business and the presentation of reports of regular standing committees, considerable time was given to the discussion of subjects of timely interest. Among these may be mentioned the problems now confronting the railroads as a consequence of the motor truck competition, and the recent development of gasoline motor rail cars. The following is a resume of the principal subjects discussed at the meeting. (1) Summer tourist fares: Is a uniform basis throughout the United States desirable and practicable? (2) Motor buses: Effect on passenger traffic. Should motor bus companies and individuals operating motor buses be subject to the same regulations and taxes as railroads? (3) Economies in construction of joint passenger tariffs. (4) Inter-territorial clergy arrangements. (5) Anti-scalping bill. (6) Uniform rules and practices for refund on tickets at stations. (7) Gasoline motor cars. (8) Construction of new hard roads paralleling steam lines.

It was suggested during the course of the reports and discussions that tickets sold prior to date of use be endorsed with both date of sale and date good for passage; that an earnest effort should be made to devise some means by which the ticket agents may clearly indicate on the coupon of each interline ticket sold for advance use, the date on which such ticket was sold and the date on which it will be valid for passage, such information saving an extraordinary amount of correspondence between accounting departments; that transfer charges be published in the Official Guide for information of ticket agents and be shown in tariffs regularly published and filed with the Interstate Commerce Commission, and that there be earlier promulgation of bases for division of tourist and other special fares.

It was also contended that the multi-route ticket is simple and so practical that it can be correctly issued by agents and with a saving of time over the single route ticket, but that the multi-junction ticket is somewhat complicated and likely to cause trouble and annoyance to holders; that whereas the present digest includes only divisions, mileages and transfers, that until some different action is taken by this association, the digest continue to be so restricted that at the earliest convenient date it may be republished in standard tariff size of 8½ in. by 11 in; that a rate expert from each territory be directed to arrange for the preparation and publication in suitable form of a digest of passenger fares for such lines as indicate their desire to participate in such a publication. It was further suggested that it was desirable to publish schedules of mixed freight and passenger trains, especially in view of automobile competition; discussion developed that there is no objection to the publication of such service in the Official Guide; that earlier consideration should be given summer tourist fares than has been the practice heretofore, thus affording needed time in which to determine the construction bases and carefully to prepare and check tariffs and file them on statutory notice and also enable the issuance of advertising matter in the winter and early spring months when many people are planning their summer vacations.

There was some discussion of the desirability of economy in the compilation of passenger tariffs through the elimination of unimportant headline points and destinations, the elimination of inactive and circuitous routes, etc., and the desirability of uniformity and standardization in tariff regulations. While it was felt it would be desirable to have uniform regulations to govern redemption of tickets at stations, for example, as to the period of time within which a wholly unused ticket may be redeemed by the ticket agent, it was concluded that the establishment of uniform rules is impracticable owing to different laws effective in the various states. The influence of the gasoline propelled motor car on passenger traffic and its adaptability to certain traffic conditions were discussed at some length.

The officers elected for the ensuing year are as follows: President, A. B. Smith, passenger traffic manager, Northern Pacific; vice-president, C. B. Ryan, passenger traffic manager, Seaboard Air Line; secretary, W. C. Hope, passenger traffic manager, Central Railroad of New Jersey. The executive committee consists of W. B. Calloway, chairman; M. L. Harris, E. P. Cockrell, W. H. Black, the president, vice-president and secretary. The convention was followed by a short business session of the Fraternal Society.

For Attempting to Wreck Lackawanna and Delaware & Hudson trains three youths at Scranton, Pa., were recently sentenced to eight to ten years' solitary confinement. The motive for their action was said to be revenge against the Delaware & Hudson for alleged injuries sustained by one of them.

I. C. Adapts Electrification to Terminal Traffic

Extended Investigation Leads to Selection of 1,500-Volts Direct Current with Overhead Contact

THE PROPOSED electrification of the Chicago terminals of the Illinois Central, involving heavy suburban traffic, freight transfers and interchanges, yard switching, and later the operation of through passenger trains, wholly within a terminal area, is a combination that has not been met heretofore in electrification problems. Considering the wide variation in the fundamental features of various important electrifications the final decision of the Illinois Central to use 1,500-volts direct current with the overhead contact system, as announced in the *Railway Age* of October 7, after an extended investigation which has been characterized by its thoroughness, is highly important.

Territory Involved in Electrification

In addition to its own trains the Illinois Central handles with its locomotives all of the passenger and freight traffic of the Cleveland, Cincinnati, Chicago & St. Louis from Kankakee, Ill., to Chicago, a distance of 54 miles. The Michigan Central also has trackage rights over the Illinois Central from Kensington into the city by means of which it handles its trains into Chicago with its own power although its freight house is located on the Illinois Central tracks and other facilities including the main passenger terminal at Roosevelt Road are owned by the Illinois Central. In addition to these trains the Illinois Central also handles five northbound and six southbound passenger trains of the Chicago, Lake Shore & South Bend between Kensington and Randolph street terminal. The St. Charles Air Line, running west from a connection with the Illinois Central at Sixteenth street, over which the Illinois Central operates west to Omaha, is not included in the electrification program.

According to the city ordinance covering this project, all suburban trains on lines to the south are to be operated electrically by 1927, the freight service north of East Roosevelt Road must be electrified by 1930 and the entire freight service within the city limits by 1935. The through passenger service within the city limits may, with certain provisions, be operated electrically by 1940.

The electrification for suburban service will include all suburban tracks between the suburban terminal at Randolph street and Sixteenth street; six tracks from Sixteenth street to Forty-seventh street; four tracks from Forty-seventh street to Sixty-seventh; three tracks from Sixty-seventh street to Kensington; and two tracks from Kensington to Harvey; the branch from Kensington to Blue Island; two tracks from Harvey to Matteson, which may also be used for steam passenger service; and two tracks from Sixty-seventh street to South Chicago. The route mileage involved is: Chicago to Matteson, 28 miles; South Chicago branch, 4.5 miles, and the Blue Island branch 4.4 miles, with a total of approximately 125 track miles.

Traffic Study Foundation of Terminal Development

As early as 1881 the Illinois Central operated 44 trains daily in suburban service between the old Central Station, then located at Randolph street, and Grand Crossing, near Seventy-eighth street, a distance of 8.5 miles, while 15 of these trains were run on to Kensington, 6.5 miles farther, which was then the limit of the suburban zone. During the World's Fair in 1893, extensive suburban service was installed to handle the heavy traffic to and from the fair grounds, which were located adjacent to the Illinois Central tracks between Fifty-sixth and Sixty-seventh streets. With the rapid growth of population in the area served, the Illinois Central has continued to show a steady increase in business, the approximate number of revenue passengers handled each year since 1905 being given in the following table:

1905	13,100,000	1915	13,150,000
1906	13,800,000	1916	14,100,000
1907	13,600,000	1917	13,700,000
1908	11,950,000	1918	12,850,000
1909	12,150,000	1919	15,250,000
1910	13,750,000	1920	19,000,000
1911	13,338,000	1921	19,800,000
1912	13,750,000	1922	21,000,000 —or more.
1913	13,550,000		
1914	12,750,000		

It is important to note that these figures do not include the non-revenue employee traffic amounting to over 3,000,000 passengers for 1921, or an average of something like 8,900 a day.

Of the some 73,000 passengers carried on ordinary week days, about 42,000 are carried between 6 and 9 o'clock in the morning and between 3 p. m. and 5:30 p. m. A count on a certain day showed 10,714 passengers departing from Randolph street between 3 p. m. and 5:30 p. m., which together with 7,808 from Van Buren street made a total of 18,522 or 124 passengers a minute. During 15 min. of the peak rush from 4:30 p. m. to 4:45 p. m., there were 3,800 passengers or 253 a minute. During this evening rush trains are operated out of Van Buren street and through the yards

Map of the Chicago Terminal District of the Illinois Central, Showing Lines to Be Electrified

on less than two-minute headway, the average for the full period of service from 3:30 a. m. to 12:45 a. m., being a train every 7.5 min. The Illinois Central made a special effort to serve the public during the strike on the Chicago surface lines from September 1 to 6, 1922, during which period a record traffic of 157,517 passengers was handled in a single day. So many of these people have continued to use the Illinois Central that it has been necessary to add 10 trains to handle the business to the best advantage. The schedule at this time calls for 370 trains each week-day with six or seven coaches in a train during the rush hours, and shorter trains at other times throughout the day. The loading and unloading of passengers is expedited considerably by elevating the station platforms at all suburban tracks level with the car platforms.

One factor that has contributed to the success of the Illinois Central suburban service is the separation of the express and local runs between Van Buren street and Hyde Park (Fifty-third street). The express trains make this run of 5.5 miles in 11 minutes while the local trains, making more intermediate stops, require from 18 to 23 min. The express trains to South Chicago make eight stops, covering the run of 13 miles in a minimum of 35 min. The minimum running time to Matteson, a distance of 29 miles, including eight stops is 59 min.; and to Blue Island, 18.5 miles, including eight stops, the minimum running time is 45 min.

These schedules can be shortened by a higher acceleration rate, with the same running speed. A detailed study of the speeds of over 800 trains showed that 50 m.p.h. was the approximate maximum speed of the present steam equipment. While higher speeds were contemplated at first on the new work, estimates showed that added investment in equipment and the greater operating cost that would be required were out of proportion to the benefits derived. It was decided, therefore, to fix the balanced speed of the new electric equipment at 50 m.p.h. and provide an acceleration under load of 1.5 m.p.h. per sec. and a braking rate of 1.75 m.p.h. per sec. In other words, while the new equipment may not have a greater maximum speed than some of the present steam trains, it will start so much quicker that the trains will make the runs in considerably less time.

Switching Area Important Consideration

The electrification will include the extensive freight house and track layout just south of the Chicago river and extending south to East Roosevelt Road, which, including the additional electrified tracks just south of East Roosevelt Road, aggregates 40 miles of tracks, most of which are yard tracks. The switching service on all of the industry tracks in the terminal within the city limits will also be handled electrically.

Part of the Fordham yard at Burnside and part of the Wildwood yard south of Kensington are to be included in the electrification. At Markham yard (the general classification yard which is not yet completed) all of the southbound receiving yard as well as enough of the northbound departure yard will be electrified to permit the picking up of northbound trains. Inspection facilities for electric locomotives will be located at Markham yard and also at a point in the neighborhood of Twenty-sixth street.

Freight Yard North of Randolph Street

The ordinance concerning the project provides that nothing in the terms shall prevent other roads not electrically operated from entering the tracks of the Illinois Central south of East Roosevelt Road with steam locomotives for the purpose of interchange, or to prevent the Illinois Central from using steam locomotives for the similar interchange of business to and from other lines not electrified until such time as these roads are required to electrify.

The extensive track layout between Randolph street and the Chicago river is located close to the great loop district of Chicago. Freight houses of the Illinois Central, the Michigan Central and the Cleveland, Cincinnati, Chicago & St. Louis are located in this area. Large coal yards and warehouses of private concerns are also served in this yard. The short haul of coal, fruit, and general merchandise from this yard to the main wholesale and retail districts offers a decided advantage. Ground in this territory is very valuable and as the present tracks and freight houses cover almost all of the Illinois Central property there is not much room for further development under steam operation. However, with the introduction of electric propulsion it will be possible to house over many of these tracks with vast freight houses, cold storage warehouses for fruit, etc.

Freight Train Movements

As soon as the Markham yard is completed the main line steam freight service will terminate at this point. Therefore, there will be many through transfer trains to be handled electrically between Markham yard and the Randolph street freight houses. Berry trains, banana specials, etc., will be handled through to Randolph street intact. As high as 500 cars for the Illinois Central and 200 cars for the Michigan Central have been handled into and out of Randolph street in one day.

Transfer trains will also be made up in Markham yard for delivery to other roads. In addition to the traffic of the Illinois Central that of the Michigan Central and the Big Four must be handled electrically over the terminal territory.

A large amount of track changes, depression and elevation are to be carried out before the actual construction of the electrification can be started. These consist principally of the depression of the tracks between Twenty-fifth street and Forty-fifth street and their elevation between Forty-fourth street and Fifty-first street. In the rearrangement of tracks some industry tracks will be located on the extreme west side of the right of way next to which all of the suburban tracks will be consolidated. The through passenger tracks will be just east of the suburban tracks and the freight tracks on the east side of the right of way. At certain places industry tracks will be served from the east side also.

Electrification to Meet Traffic Requirements

A commission was appointed in December, 1920, to make a thorough investigation of the different systems of electrification available. Practically all of the installations in the United States to date have been made to meet special operating problems in tunnels or on grades. The New York Central tracks in New York were electrified primarily to eliminate the smoke in the Park Avenue tunnel and the electrification covers through and suburban passenger service. This is a low-voltage direct current system with a third rail. The Norfolk & Western 11,000-volt single-phase alternating current electrification is principally for heavy freight service over mountain grades; it uses overhead contact wire. The New York, New Haven & Hartford uses an 11,000-volt single-phase alternating current system and is the only example of an electrification which handles through freight, switching, through passenger and heavy suburban passenger service. However, this installation extends to New Haven, a distance of 72 miles. An overhead contact wire is used in this installation. The Chicago, Milwaukee & St. Paul installation is a 3,000-volt direct current system with an overhead contact and handles through passenger and freight, but does not have a dense traffic or suburban services.

Three possible schemes were eliminated early in the study. On account of the extensive yards involved, a search was made for some sort of a self-contained power unit. The storage battery locomotive had to be eliminated on account of the seemingly prohibitive operating charges. A locomo-

tive embodying some form of the Diesel engine may be developed for freight and through passenger service but a unit of this sort has not yet been built to meet the requirements of the present project. The three-phase alternating current system, which requires a double overhead contact system, was eliminated from consideration on account of the complications in construction of the overhead system without any advantages over the single phase.

Complete estimates of first cost, maintenance and operation were then compiled for the four remaining systems (i.e.) (1) 750-volt direct current with third rail; (2) 1,500-volt direct current with overhead contact; (3) 3,000-volt direct current with overhead contact; and (4) 11,000-volt alternating direct current with overhead contact.

The 750-d.c. system was eliminated because of the extensive freight yard trackage involved where a third-rail was undesirable from a safety standpoint and also on account of the fact that this system would require a heavy and extensive overhead layout to provide continuous contact for switching locomotives on ladder tracks and in complicated yards. Considering the climatic conditions along the lake front it was also feared that snow would drift on the tracks in the depression to such an extent as to interfere with the operation of the third-rail. Moreover, the cost of the 750-volt system did not differ materially from that of some of the other systems considered.

The 3,000-volt d.c. system has not been thoroughly developed for multiple unit operation and its use on the multiple unit system required additional complications not met with in the other systems considered. In converting the high voltage alternating current from the generating station into direct current for a 3,000-volt d.c. system it would be necessary to use motor generators which are more expensive and less efficient than synchronous converters which may be used on a 1,500-volt system. Due also to other causes the first cost and annual cost estimates were higher on the 3,000-volt d.c. system.

The investigation, therefore, narrowed down to the 1,500-volt d.c. and the 11,000-volt single phase a.c. systems. Although satisfactory means of eliminating the inductive interference of an a.c. system with the telegraph and telephone circuits have been devised it was the opinion of the majority of the commission that the experimentation and the expense involved would be appreciable. At this point consideration was given to the fact that a growth of traffic in the terminal would require more rolling equipment rather than more track mileage and that there was no immediate prospect of the system being extended to adjacent main line divisions. With this idea in mind it was considered that 1,500-volt d.c. equipment, with its lower first cost, was better adapted to the future development of this particular project. In the final analysis between the 11,000-volt a.c. single phase and the 1,500-d.c. systems it was decided to adopt the latter.

Suburban Equipment

The electrified suburban trains are to be made up of new all-steel coaches equipped with motors and connections for multiple unit control. Controllers will be located at each end of every car, thus eliminating the switching or turning of any equipment at terminals. None of the old coaches now in service are to be used.

In October, 1921, the Illinois Central placed in service 20 new all-steel suburban coaches which are now operated with steam but in which provisions were made for the electrical equipment to be installed later. These new cars have a seating capacity of 84 persons. Therefore, better service can be given with fewer cars than are now used as the old coaches seat only 56 to 65 persons. These new cars were described in detail in the *Railway Age* for December 12, 1921. The 220 additional suburban coaches required for the new project will be designed along similar lines.

Eighty to 100-ton switching locomotives will be used in the various yards. On the through transfer between Randolph street and Markham yard it is the intention to use two locomotive units coupled. In this service under rated capacity the locomotives will operate at approximately 20 m.p.h.

The Illinois Central, as the owner of its own coal field and an advantageous power house site on the Calumet river near Riverdale, is peculiarly well fitted to build and operate its own power generation station. However, no decision has yet been reached on this point and the power may be purchased from a public utility company.

With the electrification the automatic signaling will be entirely rebuilt as a complete alternating current system. The existing direct current track circuits will be replaced with alternating current apparatus. Impedance bonds will be required at the ends of all circuits to isolate the track sections for the a.c. signaling current and to provide a continuation of the return propulsion circuit. The enclosed disc type of signals now used will be replaced with three-color type light signals. Although some of these signals have already been replaced, the new program calls for an entirely new relocation of the greater part of the signals.

Engineering Organization

In conducting the investigation the late A. S. Baldwin, vice-president of the company, was chairman of the commission. With him was associated D. J. Brumley, chief engineer of the Chicago terminal. In the course of their investigations Mr. Baldwin and Hugh Pattison, electrical engineer for the commission, toured Italy, Switzerland, France and England to investigate electrification. It was upon his return to this country that Mr. Baldwin died. Mr. Brumley succeeded him as chairman of the commission, which included Bion J. Arnold of Chicago, George Gibbs and Cary T. Hutchinson, New York, consulting engineers, and W. M. Vandersluis, engineer-secretary. Having rendered the report covering the decision on the fundamental features of the electrification the function of the commission is now terminated.

Railway Fire Protection Association

The Railway Fire Protection Association held its ninth annual meeting at the New Willard Hotel, Washington, D. C., this week, beginning on Tuesday, October 17, with an attendance of about 100. G. L. Ball (St. L.-S. F.), president of the association, occupied the chair.

President Ball in his opening address recited briefly the activities of the executive committee during the past 12 months and referred to the prosperous condition of the association. A periodical news-letter has been issued to members, keeping them advised of current developments. Regional meetings have been started in the east, and it is proposed to hold similar gatherings in the middle west and the west, perhaps once or twice a year. The United States Chamber of Commerce proposes to start a nation-wide fire prevention campaign and this association plans to co-operate in the movement.

The executive committee, E. A. Ryder (B. & M.) chairman, reported a total membership of 235 (157 active, 75 associate and three honorary), 36 members having joined during the year.

The Committee on Resolutions, B. S. Mace (B. & O.) chairman, reported a set of resolutions which were in the nature of a platform of principles for the guidance of members. In these the association appeals to all railroad executives not only to support their own fire prevention departments, particularly in the direction of educating all employees, high and low, but to proclaim with emphasis their own

purpose to support this association. Every road is urged to put all of its fire prevention activities under a single central authority and to see that there is effective co-operation between all other departments and the fire department. It was resolved to send a copy of these resolutions to the chief executive of every railroad in the country.

Fire Causes of 1921 in Detail

The Committee on Statistics, G. R. Hurd (I. C.) chairman, gave totals of fire losses for 1921, as reported by 75 railroads representing about 80 per cent of the Class I roads of the country. The total miles of road represented in these reports is 207,634. The number of fires reported is 7,963, only 12 less than in 1920, but the total of the losses, $7,589,611 is almost $3,000,000 less than in 1920. This difference is accounted for partly by the general fall in values of some classes of property, and partly by a lessened volume of freight business on the railroads. Losses due to fires on adjacent property increased, indicating the need of keeping in touch with neighbors. The committee suggested that a railroad should keep itself fully informed concerning fire hazards in all buildings within 150 feet of its right-of-way. Suggestions of the lessons of fires were given in connection with numerous classes: Exposure to forest fires, friction, hot journals, etc., incendiary and others. Smoking should be prohibited not only in shops, freight houses, etc., but in offices as well.

In the discussion on this report, E. N. Floyd (C. C. C. & St. L.), proposed that statistical averages by the month or day are not so valuable as those per train-mile—for some causes rise and fall with changes in volume of business. The importance of getting reports of all fires, no matter how trifling from a cost standpoint, was emphasized by several members. Some roads do not report all fires even where the loss is as much as $100. When responsible for a small fire, they often try to keep it out of the records.

The uselessness of reports which say "cause unknown" was pointed out by several members. The efficient superintendent does not accept such a report without full investigation. W. F. Steffens (N. Y. C.) said that on his road in 1921, by thorough investigation, a large number of fires were forced out of the "unexplained" column. "Spontaneous ignition" is another which oftentimes is suspicious.

E. W. Osborne (Nor. Pac.) believes he finds at least the probable cause in 99 per cent of his fires, and positive evidence in 75 per cent. Electricity is wrongfully blamed in many cases where the person reporting does not make thorough investigation or has a selfish purpose in concealing the true cause. "Electric fire" has taken the place of the former popular explanation, "caused by rats and matches."

This report was accepted and referred to the executive committee with recommendation to make the improvements in form and classification that had been suggested.

Locomotive fire hazards were reported on by a committee of which Earl N. Floyd (C.C.C. & St. L.) is chairman. The committee expects to have a conference with a committee of the International Railway Fuel Association, but beyond that had nothing to report.

What Progress Can Be Measured?

Tuesday afternoon was devoted largely to a "symposium" on "Are Fire Protection Efforts Producing Results?"

C. C. Rambo, manager of the Railroad Fire Insurance Association, the first speaker, reported his observations while visiting different roads in behalf of his association. Results were noted as "splendid" in 1918 and they are more certainly so now. Losses on fixed structures afford a good index of efficiency, as they are not affected much by fluctuations in volume of traffic and these show greatly reduced losses in 1921. Mr. Rambo emphasized the duty of concentration on preventable fires, which continue to occur year after year. Losses due to smoking and matches have increased seriously. In three years the total of railroad losses in these classes was $763,042, an increase, while the total losses, including all causes, decreased; and doubtless many "unexplained" cases ought to go in this class.

B. S. Mace (B. & O.) confirmed Mr. Rambo's views and statements. Mr. Mace is chairman of a committee appointed by the governor of Maryland, which has reformed much bad practice in that state and he recommends railroad fire protection officers to take part in state, municipal and community fire prevention activities. He has found speaking to pupils of public schools productive of excellent results. Teaching on this subject has been put into the curriculum in some Maryland schools. He hopes to get some advanced legislation in that state. Mr. Mace and E. B. Berry (So. Ry.) represent the Railway Fire Protection Association in the National Fire Waste Council. The Baltimore & Ohio offers to co-operate in fire prevention with all industries located on its lines.

W. S. Topping (Bureau of Explosives) gave interesting observations made in connection with the work of his bureau, confirming what had been said about progress during the past 15 years. The Bureau has induced manufacturers of explosives to make numerous improvements in packing which have lessened the number of fires in transportation. Among these are a rule not to ship in the same package two substances which, if mixed, will evolve heat, and not to ship oily waste or paper, and other such risky substances, in box cars. Gasoline fires have been reduced by encouraging the use of electric hand lanterns. All wrecking outfits should have portable electric lights. The number of train wrecks followed by fire has been markedly reduced.

Robert Scott (A.C.L.) and L. F. Shedd (C.R.I. & P.) reported interesting experiences lecturing to pupils in schools. The suggestion was made that gatherings of boy scouts and of girl scouts constitute a field which ought to be cultivated as much as the schools.

Committee on Forms

This committee, W. C. Neely (N. & W.) chairman, has begun its work but the roads have been slow in furnishing samples and information. The committee proposes to standardize the following: Preliminary notice of fire; full report of same with all needed detail; report of fires on non-railroad premises; form for collection of insurance; for proof of loss; placards; for an original fire survey; for re-inspection; regulations for fire drills, and others.

Transportation of Explosives

W. S. Topping, of the Bureau of Explosives, aided by the chief chemist of the Bureau, C. P. Beistle, and Inspectors Baldwin, O'Donnell, Cook and Campbell, answered a large number of questions presented by members about the proper interpretation and application of the I.C.C. rules covering the transportation of dangerous articles.

On January 1, next, revised rules are to be issued embodying additional features made possible by the increased power granted to the Interstate Commerce Commission in the last revision of the federal law. Shippers can be more effectively held to their responsibility. In this discussion W. F. Hickey (N.Y. N.H. & H.) called attention to the fire risk from stray electric current when cars of gasoline stand on side tracks not properly bonded and insulated to provide against that danger.

The difficulties incident to enforcing the rule that tanks to receive gasoline from cars shall not be placed within 30 feet of a passenger track were enlarged upon by a number of members. Oil men always object to the cost of a special track and if refused the use of a track near the main line, appeal to the traffic department with the threat to go to another road. To preserve this safety rule the railroads must act together.

Bridge and Building Meeting in Cincinnati

Thirty-Second Meeting Characterized by Good Reports, Active Discussion and Interest in the Exhibits

The American Railway Bridge and Building Association, in common with other railway organizations scheduled to hold meetings this fall, was confronted with the prospect of postponing its convention because of the serious difficulties with which the railroads contended during the past summer. The officers of this association were thoroughly determined to hold their convention, with the result that the meeting held in Cincinnati on Tuesday, Wednesday and Thursday of this week was one of the most successful which this association has ever held. That the officers of the association had the courage of their convictions and never laid aside their plans for holding the meeting is attested by the evidence of thorough preparations which characterized the sessions. The preparation of a bulletin containing the reports of all committees in advance of the meeting served to expedite the conduct of the sessions since it obviated the necessity for a detailed reading of the reports on the floor and thus afforded more time for thorough discussion.

The selection of a place of meeting as centrally located as Cincinnati was, no doubt, an important factor in encouraging a large attendance. The selection was also a happy one because it afforded the members of this association an opportunity to inspect the reconstructed Cincinnati Southern bridge over the Ohio river, which is in many ways one of the most interesting pieces of bridge engineering which has been completed in recent years. The session on Wednesday morning included a paper on the reconstruction of this bridge by F. W. Henrici, assistant engineer of construction, American Bridge Company, who was directly connected with the work, and this was supplemented on Tuesday afternoon by an excursion to the bridge site.

The convention was called to order at 10 o'clock Tuesday by C. R. Knowles (superintendent of water service, Illinois Central), president. After invocation by C. A. Lichty (inspector, purchasing department, Chicago and North Western) secretary, the association was welcomed to Cincinnati by Froome Morris, vice-mayor of the city and by Jas. A. Reilly, president of the Chamber of Commerce. A. O. Ridgway (assistant chief engineer, Denver & Rio Grande Western), vice-president, responded in behalf of the association. Following a review of the year's work by President Knowles, the report of the secretary-treasurer showed a membership of 830.

Over 250 members were present. R. N. Begien, general manager, Western Lines, Baltimore & Ohio, addressed the meeting on Wednesday morning, emphasizing the essentials of successful organization in the conduct of bridge and building work.

The papers and reports presented before the convention may be divided into two general classes, those dealing with the special problems arising through the advance in the science of structural engineering and those relating to the routine administration of railway bridge and building maintenance which comprises the principal responsibility of the bridge and building officer. As coming within the limits of the first class may be mentioned a report on labor-saving devices; a comparison of the relative merits of wood, steel and concrete tanks; the framing of bridge timbers before subjecting them to preservative treatment and a review of more recent studies of the bearing power of piles.

A large part of the active discussion at the various sessions related to the reports on the routine problems of bridge and building maintenance. Among these was a report on the painting of structural steel, reviewing common practice as to workmanship, and devoting considerable space to the material. This portion of the report included abstracts from papers presented before other technical societies from which a number of conclusions were drawn with regard to paints most suitable for various purposes.

The inspection of buildings was the subject of a report divided under two heads: Inspection of new buildings during construction and the periodic inspection of existing buildings. This took the form of detailed instructions to the inspector, together with some comments on the necessity for keeping an accurate record of such inspections.

The report of the Committee on the Construction and Maintenance of Sewers and Drains presented a concise summary of the properties and characteristics of the more common types of sewer pipe; namely, vitrified pipe, common drain tile, concrete sewers, brick sewers, cast iron sewers and wooden pipe. It also gave a summary of the hydraulics of conduits and a statement of principles of practice in construction.

Recognition was given to the growing use of the reinforced concrete trestles supported on bents of concrete piles in a committee report covering the handling and driving of concrete piles. This consisted primarily of a review of practices developed on roads that have had the greatest experience with the concrete pile trestle. An interesting feature of the report was the presentation of figures indicating the extent to which concrete piles have been used on some railroads. Thus, the Illinois Central has used 11,000 piles in a total of 22,072 lin. ft. of single-track concrete pile trestle, 3,747 lin. ft. of double-track trestle and 248 lin. ft. of three-track trestle. The Chicago, Milwaukee & St. Paul was reported as having driven a total of 18,088 concrete piles or 48,668 lin. ft. of piling.

Pile Driving and Pile Driving Records

The committee presented the definitions, specifications and recommended practice of the American Railway Engineering Association covering piles, pile driving and the construction and driving of pre-moulded concrete piles. The report also gave an extended review of current literature on the formulas for determining the bearing power of piles with the following comments on the consideration of foundation conditions and the recording of pile driving data.

The soil should be explored to a sufficient depth to determine if the ground alone will support the structure. If the investigation discloses that it will not sustain the structure alone it must then be determined what kind of piles should be used, their length and number. An exploration of the earth to determine the length of piles to be used may be made by driving test piles or by making borings. If test piles are used they should be driven to a greater depth than it is intended to drive the regular piles. The driving should be observed and the safe load at various depths computed by a suitable formula.

If the earth is homogeneous it is only necessary that the piles be driven to such depths that the frictional resistance of the ground is greater than any load which will be placed

upon the pile. It should be noted, however, that in most cases the ground to be penetrated is not homogeneous. In the case of a structure of great weight and extent the engineer should carefully consider the danger of stopping the piles in a hard stratum overlying a soft one for the simultaneous loading of the great number of piles may cause the soft stratum to squeeze out and the structure to settle.

A test load may determine if individual piles or even small groups of piles will sustain a given weight over a given area, but it does not necessarily determine that when the piles receive their permanent load the stratum in which they stopped will not settle or break through into a softer one and cause it to be forced out in a horizontal direction. It appears that an exploration of the earth by borings is safer and more satisfactory than the driving of test piles although a combination of the two methods is ideal and to be recommended. The advantage of borings over the driving of test piles is that they can be carried to much greater depths and the exact soils encountered known. It also obviates the danger of stopping the piles in a hard stratum overlying a softer one as mentioned previously.

Very careful notes should be made of all earth explorations and the driving of test piles. It is well to keep samples of the soils obtained at the various depths of borings. These should be kept at least until the structure has been in use for some time and any danger of its settling past. The engineer will be repaid many times for the trouble and cost of making explorations, one of which is ability to order an economical bill of piles or one calling for lengths that will not call for excessive cutoffs and waste.

The importance of making and filing complete and dependable notes of piles, piledriving, and soil explorations cannot be over-estimated. This has been brought home to the railroads in the work of preparing valuations of their properties for the Interstate Commerce Commission. These data will be found valuable in estimating and ordering material for emergency replacements as in the case of bridges destroyed by fire, washouts and wrecks. Other occasions for their use arise when structures are to be enlarged in extent or increased in height and when it must be determined whether additional piles will be needed and if so the number and lengths required. The results of soil explorations should be not only entered in the field books but also placed upon the piling plan for the information of the inspector and pile driver foreman.

There is considerable opportunity for standardizing the important items in pile driving records. The heading should contain reference to the location of the work on line or branch, date, contractor, pile driver number, and kind and weight of hammer. In case of the gravity drop steam hammer the make and number should be given, together with the number of strokes per minute, the height of fall and weight of entire hammer and striking part separately. If a double-acting steam hammer is used, it is necessary also to record the diameter of the piston.

In the body of the report some put in a date column so as to provide a continuous pile record and to give the opportunity to record the date each pile is driven. The best practice is to number the bents in the direction of the mile posts and the piles from left to right. For piers and other foundations a sketch or pile plan will indicate the system of numbering. The kind of timber or concrete in the pile should be noted. In the case of timber piles the diameter of tip and butt should be given, and in the case of concrete, the date of manufacture and the name of the manufacturer. Next should be recorded the length of pile in the leads, the length below cut-off, and the distance from base of rail, top of pier or other reference to the cut-off. The next group of data to be recorded is that regarding the penetration. It is well to record the total penetration and the amount of penetration in the soft and hard materials separately.

A column for remarks should be provided into which can be placed notes regarding the batter of piles, broken piles, whether rings or shoes were placed on piles and other information that may be desirable. Many roads record the total number of blows for driving the pile. It is also desirable to give the original length of the pile used, where a pile is cut off before being put in the leads, provided the part cut off is wasted and not driven as another pile.

For the record of test piles it is necessary to give the rate of penetration for each foot of the driving and as much information as is possible regarding the kind of soil, along with the data of ordinary driving as given above. It is especially important to get an accurate record on the driving of test piles. The record of soil exploration by borings should show the location of the test and the distance from base of rail or other definite reference point to each kind of soil. A note should be made of the compactness and moisture content of the soils encountered.

It is well within the province of this report to urge the making of clear and definite specifications for pile driving contracts and reasonable inspection during the progress of the work. Some engineers have subjected themselves to no little criticism in the past for loosely drawn pile driving specifications.

The common requirement that the piles be driven to "practical refusal" is deplored. The use of this term has been responsible for the partial or complete destroying of many piles by over-driving. When a pile has encountered sufficient resistance to support the load to be placed upon it, and the soil explorations indicate that it has reached or penetrated into a stratum capable of receiving the load, the driving should be stopped. This condition should be clearly defined in the specifications and the formula for determining the resistance of the pile given.

It is hoped that it will be possible for the railroads of the country to keep track of the results of driving piles under various conditions so that all may make use of the information obtained. The loads put on our bridges and other structures are steadily becoming heavier, and pile material, especially timber, is becoming scarcer and more costly. It is therefore essential that our materials be used with the greatest economy consistent with future safety.

[F. C. Baluss, engineer of bridges and buildings Duluth, Missabe & Northern, Duluth, Minn., chairman.]

Discussion

The discussion of this report hinged largely about the detail with which foremen and inspectors should be required to keep field records. Some advocated complete records of every pile driven to insure that data will be available in the event of a failure, while others deprecated this practice as favored the universal use of a short form, covering every pile unduly burdening a foreman. The consensus of opinion favored by the universal use of a short form, covering every pile.

Labor Saving Devices

The committee reporting on this subject presented detailed examples of a large number of types and classes of equipment which had been found of convenience and economy on various railroads, in many cases reporting on the actual saving obtained. The introduction to the report called attention to some of the difficulties involved in the application of labor saving equipment and suggested a number of principles which must apply.

The chief difficulty in the way of providing and using labor saving devices where considerable investment is involved, is that economies are not always secured unless the device is kept in constant use. It is also important to decide

whether theoretical or actual economies are realized, and whether such equipment should be supplied for each gang, or for alternate gangs or be kept at division headquarters. The distribution of equipment and labor saving devices should be under the direction of the division officers.

The motor car, as usual, came in for considerable commendation from the committee. There is no doubt, the committee stated, as to the advantage in the use of motor cars by bridge and building gangs. Until recently, the motor cars in use did not have sufficient power and capacity and had too much speed. At present the designs measure more accurately to what is required under actual working conditions. With the exercise of good judgment in the question of speed, the motor car is a valuable asset. The proper care and upkeep of a motor depends largely on the personal equation. The more complicated the construction of the car, the greater the cost of maintenance and upkeep and the less the value of the labor saved.

The following are a few brief references to comments appearing in the report concerning various pieces of equipment used in bridge and building work:

More attention should be given to the use of pneumatic and electric motors for boring holes incident to the construction of docks, cribs and protection piers at draw bridges. Electric drills are probably the most convenient and economical to operate where power is at hand. The Michigan Central recently constructed a crib at Mackinaw City where all the boring was done by compressed air furnished from a locomotive air pump. It was found by actual tests of hand and power boring that compressed air saved the equivalent of one man working 192 days in the drilling of 3,600 holes. The Northern Pacific uses electric motors to good advantage in boring for dowels in timber cribs. Holes 7/8 in. in diameter were drilled through 24-in. timbers in 40 sec.

Only limited data are available regarding the efficiency of tie dapping machines. A recent test on the Michigan Central showed that three men dapped 85 ties in eight hours, which is about 50 per cent more than the same number of men could have dapped by hand. The New York, New Haven & Hartford estimates that this class of machinery effects a saving of 50 per cent in labor costs.

To test scales at large freight houses where there are a great number to inspect, the New York, New Haven & Hartford uses a small four-wheel truck which will hold twenty 50-lb. weights. The loaded truck is used as the test weight and is moved to various points in the freight house instead of shifting individual weights.

Paint spraying machines were recently tested on the Pennsylvania at the East Altoona engine house. Inclined panels in the ventilators were painted by spraying at a cost of $0.029 per sq. yd. If this work had been done by hand it would have cost $0.059 per sq. yd. The grandstand and bleachers at Altoona were spray-painted at a cost of $0.036 per sq. yd.

A compressed air whitewashing machine is used by the Illinois Central for the whitewashing of fences and roundhouses, and disinfecting stock yards. The operation requires a crew of eight men. It is claimed that the machine will do the work 50 per cent cheaper than hand labor.

Bridge and building supervisors on the Missouri Pacific and the Union Pacific highly recommend a small stiff legged derrick mounted on a push car, equipped with hand winches and with the necessary clamps for clamping the push car to the track. This is an exceedingly valuable piece of equipment and one which should be placed with all gangs having to take care of pile trestle maintenance.

The self-propelled derrick car is strongly favored by all roads reporting on this machine. It saves a great deal of labor by eliminating train crews and work trains, which at best constitute a very large item in the cost of road work. This machine, being slow, is not recommended for main line work at a distance from sidings. For yard work it is ideal while for other work its usefulness depends on the number of trains to be avoided and the nearness of a siding. The average capacity should be 8 to 12 tons and the speed from 5 to 15 miles per hour. The greater speed is of advantage.

Locomotive cranes follow very closely the advantages claimed for the self-propelled derrick. Their scope is, however, broader and the average work which can be handled runs from 15 to 30 tons. The wrecking cranes are usually made use of where exceptionally heavy loads have to be handled. The value of the locomotive crane lies in its adaptability to many uses. For loading and unloading material out on the road locomotive cranes or self-propelled derricks are recommended by all for heavy work. For yard work, stiff legged derricks, carefully placed, are favored although special self-propelled derricks are frequently used.

Acetylene cutting and welding outfits for bridge gangs have been reported as almost indispensable for those roads having to remove or repair old structures. They may be used for cutting up or repairing girders in the field or dismantling old trusses which must be taken out of the way quickly. They may also be used for cutting I-beams, plates and angles in the field where a close fit is not required.

Portable telephones have proven very efficient for bridge jobs at a distance from a station and where it is necessary to get advice from the dispatcher as to time that track can best be out of service. They do not relieve the foreman of any precaution against accident but help to keep the work running smoothly.

For air tools the light portable compressors used for the tie tampers seem to meet with the approval of several roads. For heavier work the 9½-in. pump and cross-compound pump with three standard reservoirs was found to be a good combination. Air tools have been used for boring, grinding and drilling and for reaming, riveting and concrete drilling, all proving great labor savers.

Electrically-operated tools are of great value where power is available. They have about the same range of use as air tools with perhaps a greater advantage where large power is needed. Electric welders are very useful and particularly economical in welding broken castings on pile drivers, derricks, draw bridges, and bridge pedestals. This device not only saves time in getting damaged equipment back in service but also reclaims considerable material.

The most important field for improvement lies in an improvement of the esprit de corps whereby the men will be encouraged to think for themselves, to suggest methods of increased efficiency and to develop a feeling of loyalty to their employers. Without these, any mechanical device is doomed to failure.

The Michigan Central furnishes its bridge gangs with such technical magazines as the *Railway Age*, one copy to each gang, and other publications that can be picked up around the general offices. The men in most cases have shown considerable interest in these publications and spend their spare time in discussing different methods of handling the work instead of discussing topics which have a tendency to cause trouble and undermine the morale of the organization.

[J. S. Huntoon, assistant bridge engineer Michigan Central, Detroit, chairman.]

Discussion

The discussion of this report was largely in the form of statements pointing to other illustrations of devices developed to effect economies of various kinds. In connection with motor cars, attention was called to the wide variations in the cost of operation and the consumption of gasoline, one explanation offered being the possible diversion of the fuel to other uses, which has been overcome in some cases by mixing oil with the gasoline, thereby making it unsuitable for use in automobiles, stoves, etc. Considerable time was given to testimony on the many uses of pneumatic tools.

Relative Merits of Wooden, Steel and Concrete Tanks

The first railway water tanks were built of wood and, while other materials are now being used, it is safe to say that the wooden tank will never be discarded entirely. The advantages of the wooden tank are manifold. In the first place, it is the cheapest form of construction. A wooden tank is easily constructed and a carpenter crew assigned to this work soon becomes skilled in its erection. As wood is a poor conductor of heat and cold, it is a desirable material for tanks in cold climates as the water can be kept from freezing more easily. It is not considered practicable to build a wooden tank of larger capacity than 100,000 gal. The wooden tank carries a certain fire risk and is likely to be damaged or destroyed by fire in the frost-proofing or by the burning of adjacent buildings.

Creosoted Tanks

The increasing scarcity of durable timber for the construction of tanks, together with the increased cost, has resulted in a number of railroads constructing creosoted tanks, this type of tank now being standard on at least four railroads. Creosoted tanks are now being built in sizes up to 100,000 gal. capacity. The Illinois Central has 31 creosoted tanks in service and seven more now under construction. The advantage of the creosoted tank over the untreated wooden tank is that any timber that will take treatment can be used, thus making the cheaper timbers available for tank construction. Where the entire structure is creosoted there should be considerable reduction in maintenance as the life of the structure will undoubtedly be much greater and there is no necessity for painting other than the hoops.

The need of larger reservoirs than could be made safely with wooden staves led to the construction of the sheet iron and steel tanks, beginning about 30 years ago. The steel tank can be made of almost any desired capacity and has the advantage that it can be built quickly and is not excessively expensive. It is subject to corrosion and for that reason must be kept well painted both outside and inside. If there should be any neglect in this respect much harm may result. Reports indicate that steel tanks pass through severe freezing winter weather successfully and only the usual precautions for keeping the water from freezing need be taken.

Reinforced Concrete

The first reinforced concrete tank was built in this country in 1899, but only 53 had been built in this country and abroad by 1910. Since then many more have been constructed but not as many as the general use of concrete in other lines of construction would lead one to believe. Concrete tanks for railroad purposes are not being given general consideration for various reasons. Very few railroad water stations can be considered permanent because experience has shown that operating conditions are constantly changing, requiring frequent and unexpected changes in yards and tracks. A concrete tank cannot be moved and therefore if the permanency of the location is at all doubtful, it ought not to be built. It is also the most expensive type of tank and as the item of initial cost is often the governing factor in a decision, other types are used instead.

The Problem of the Concrete Tank

The great problem of the concrete tank is to secure a perfectly water tight reservoir. The first tanks built, as a rule, developed cracks after the tank had been filled with water. While the cracks gradually filled up, especially where the water contained limestone in solution, many of the early tanks had to be coated on the inside with some water-proofing composition. As far as is known, no tanks built recently have been waterproofed by coating the inside.

Much speculation has always existed as to the effect of severe winter weather on concrete tanks. Many such tanks are in service in northern climates and seem to give no more trouble than tanks of other types. In fact, some claim that the concrete tank stands up better than the wooden tank.

The construction of the concrete tank requires good workmanship. Most difficulties with concrete tanks can be traced almost directly to faults in the construction and it is therefore necessary that the work must be watched carefully.

Conclusions

A concrete tank will invariably represent a greater first cost than either a steel or wooden tank, yet this first cost is offset to a large extent by a far lower maintenance cost as it is a permanent structure with a life of perhaps 100 years as compared with other tanks having a maximum life not to exceed 50 years. One great disadvantage of the concrete tank is that it cannot be moved after erection.

While the concrete tank is admittedly more expensive than the steel and wooden tank and its greater life and lower maintenance cost are firmly established the relative cost and durability of steel and wooden tanks is still a matter of controversy. An average life of 30 years may be expected of tanks constructed of white pine, cypress and redwood while the other untreated timbers used in the construction of tanks will have a life not to exceed 15 years. Properly treated timber will have a life of at least 30 years and probably more. Steel tanks for railway water service have only been constructed during the past 30 years and as some of the first steel tanks constructed are still in service the minimum life of a steel tank properly painted can be based upon this figure with a minimum life of 40 to 50 years, always dependent on proper painting and maintenance. Many of the old style flat bottom steel tanks have failed through the bottom rusting away, and the figures on the life of the steel tank are based upon the modern type of conical bottom steel tank.

A feature of primary importance in the selection and construction of a water tank, and one that cannot be emphasized too strongly, is material and workmanship. As previously stated most of the difficulties experienced with concrete tanks can be traced directly to faulty construction. The manufacture of steel tanks has been developed to such an extent that one is reasonably sure of good material and workmanship as the material furnished by most manufacturers is uniformly up to standard specifications and the construction is usually done by workmen skilled in that particular line of work. The construction of concrete and wooden tanks is sometimes performed by workmen who are no doubt skilled in ordinary concrete work and general carpentry and building but perhaps do not fully understand the requirements of tank construction. Conditions encountered on the average railroad vary to such an extent that it would be unwise to establish any particular type or kind of tank as standard without regard to local conditions.

[F. A. Eskridge, assistant engineer Chicago & Eastern Illinois, Chicago, chairman.]

Discussion

The discussion following this report was not directed so much at the contents of the report as to the measures which must be taken to obtain good construction and satisfactory maintenance of the several classes of tanks. The greatest interest was manifested in the creosoted wood tanks, particularly as to methods of construction, framing before treatment and the kind of wood used. Favorable reports were given on a concrete tank in which the space underneath the tub is used as a pump house, this type having been found very successful in cold territory.

Framing Bridge Timbers Before Treatment

One of the developments that will come about with the general use of treated timber, is the framing of the timber before treatment. This is logical because it eliminates the cutting in the field that has caused many failures in the past. It is also desirable because it permits the use of machinery in place of hand work in framing the timber. It is an important development because it means that the bridge carpenter will no longer take an assortment of lumber to the job, remove decayed material and replace it by new material cut to fit, but that the lumber will be cut and framed at the mill and sent to the job ready to be placed. The field men will be erectors rather than carpenters. The structures will be built with more care and with an expected life of 30 to 40 years rather than 6 to 15 years. It will no longer be necessary for the railroads to carry large stocks of lumber for repairs due to decay, but only small stocks to take care of emergencies, such as burnouts, washouts and wrecks. It will no longer be necessary to adhere so rigidly to standard types, but structures can be designed more nearly to fit their individual location. In other words, our treated timber structures will soon be fabricated, like metal structures, at the mill ready for erection in the field.

Few railroads have so far adopted treated lumber for general use, but it is to be expected that before many years it will come into general use on all railroads: (1) because lumber is the most important material used in the bridge and building department, and will probably not be displaced to any great extent by other materials in the future; (2) on account of the rising cost of lumber the railroads cannot afford to use it untreated, and allow it to decay in the structure as at present; and (3) on account of the increasing scarcity of the better grades needed for use when untreated, it will be necessary to use the poorer grades which become suitable only after treatment.

Causes of Decay

We treat lumber to protect against decay. It is expensive and the results must warrant the expense. Experience teaches that we cannot get the results we want unless we observe certain precautions in preparing timber for treatment, in treating and in handling and working it afterwards. Treating processes have received a great deal of study and are fairly well standardized, but there is room for more study and care in the preparation of lumber for treatment. In handling lumber after treatment, experience has shown what to do, and we should now get this information to the inexperienced workmen, and make them appreciate that when working treated lumber they are no longer using plain lumber, but an entirely different material.

Decay starts from the outside. It is not necessary for the preservative to penetrate completely and to poison all of the wood; in fact it is not usually practicable to obtain complete penetration, but if there is an impervious armor of treated wood on the outside, surrounding the untreated wood, there will be no decay. If, however, there is a hole in this armor, caused by a crack, an injury, or by cutting or boring, that exposes the untreated wood, decay will take place if the other conditions are favorable, and they generally will be.

The ideal way to build with creosoted lumber would be to make complete detail drawings of each structure to fit the individual location. This would permit the framing of each member before treating. It would not be practicable to do this with pile structures since it is necessary to cut off piles to proper elevation after they are driven, and also because the piles cannot always be driven exactly in the desired location. For pile structures then, the ideal way is to drive the piles and cap them, and measure locations, then frame the balance of the structures to fit these locations and then treat the framed lumber. This idea is being carried out on some railroads in building small structures such as highway bridges, water tanks and coaling plants, but it has not been applied generally to bridges and trestles, where the bulk of the lumber is being consumed. In these structures it is the general practice to provide treated lumber in stock sizes and cut and bore in the field as may be necessary.

While most of the failures of treated lumber seem to be attributable to careless handling or cutting in the field, it is practicable to protect these exposed surfaces of pine lumber efficiently by coating them in the field. The replies to the questionnaire indicate a fairly uniform practice for protecting creosoted pine lumber in the field which consists in coating the surfaces with two or three coats of hot creosote oil and then with hot coal tar pitch. This is sometimes followed on ends of piles by a covering of tarred paper or galvanized iron. No instance is reported where treated pine timber cut in the field and protected in this manner has decayed afterwards. For Douglas fir this field treatment should be avoided wherever possible.

The chief objection to cutting treated lumber in the field is not that the cut surface cannot be protected, but the possibility that it will not be. Until workmen have been trained to work treated lumber, they fail to appreciate the necessity for, and have little patience with the extra care in handling and precaution in working that they are required to observe.

Conclusions

1. In the replies to the committee's questionnaire, all roads advocate the framing and boring before treatment as far as practicable.

2. It is practicable to frame and bore before treatment the timber in all classes of railroad structures, but it may be necessary in badly driven pile trestles, if cutting after treatment is to be avoided, to frame certain members in accordance with measurements taken after the piles have been driven.

3. All treated lumber should be handled carefully. Piles and other heavy sticks are likely to suffer more from rough handling than lighter sticks. They should be handled with chains and not with timber dogs or cant hooks. They should not be dropped from cars as they are likely to be bruised or cracked.

4. All holes for bolts bored before treatment should be 1/16 in. larger than the bolts. Those bored after treatment should be the same size as the bolt and should be protected thoroughly by pouring hot creosote oil into them. Oil can be poured into horizontal holes by using a bent funnel.

5. Ties are likely to suffer considerable wear, particularly if proper track fixtures are not used. Tie plates should be of adequate size and without claws to cut into the wood. Spike holes should be bored and filled with creosote oil before driving the spikes. All unfilled holes should be filled with creosoted plugs. Rails should be well anchored on approaches to prevent running as much as possible.

6. The committee recommends ballast deck trestles as against the general use of open deck trestles of treated timber. While the fire risk with open deck trestles of treated lumber is probably no greater than with untreated timber, when the structure is destroyed the loss is greater. With ballast deck timber trestles experience shows there is comparatively little risk from fire.

7. The committee recommends against the use of treated lumber with plain lumber in the same structure, in situations where it would be necessary to rehandle and refit the treated lumber when the untreated lumber is renewed.

This does not apply to the use of treated piles used in trestles along with untreated lumber.

[A. B. Ilsley, bridge engineer Southern Railway, Lines East, Charlotte, N. C., chairman.]

Election of Officers

At the annual election of officers on Thursday morning, the following were selected: President, Arthur Ridgway, assistant chief engineer, Denver & Rio Grande Western, Denver, Colo.; first vice-president, J. S. Robinson, division engineer, Chicago & North Western, Chicago; second vice-president, J. P. Woods, supervisor of bridges, Pere Marquette, Saginaw, Mich.; third vice-president, C. W. Wright, master carpenter, Long Island Railroad, Jamaica, N. Y.; fourth vice-president, E. T. Howson, western editor, *Railway Age*, Chicago; secretary-treasurer, C. A. Lichty, purchasing department, Chicago & North Western, Chicago; assistant secretary, F. E. Weise, engineering department, Chicago, Milwaukee & St. Paul, Chicago; directors, S. T. Corey, assistant bridge engineer, Chicago, Rock Island & Pacific, Chicago; W. B. Hotson, superintendent bridges and buildings, Elgin, Joliet & Eastern, Joliet, Ill., and P. N. Nelson, supervisor bridges and buildings, Southern Pacific, San Francisco, Cal. In addition to the inspection of the new bridge of the Southern Railway and the Motor Terminals Company's local freight handling facilities on Wednesday afternoon, the members made an inspection of the Chesapeake & Ohio terminal at Stevens, Ky., on Thursday afternoon. On Friday the flood control work of the Miami Conservancy District near Dayton, Ohio, was visited.

The Bridge and Building Supply Men's Association

An interesting and attractive exhibit relating to materials and devices applicable to bridge and building work was presented under the auspices of the Bridge and Building Supply Men's Association and attracted a great deal of interest and attention from those attending the convention.

The officers of the Supply Association for the past year were: President, M. J. Trees, Chicago Bridge & Iron Works, Chicago; vice-president, G. R. McVay, The Barrett Company, Chicago; treasurer, A. J. Filkins, Paul Dickinson Company, Chicago; secretary, D. J. Higgins, American Valve & Meter Company, Chicago; honorary director, C. E. Ward, U. S. Wind Engine & Pump Company, Batavia, Ill. The members of the executive committee were: F. M. Condit, Fairbanks Morse & Co., Chicago; W. H. Lawrence, Johns-Manville, Inc., New York; T. W. Snow, T. W. Snow Construction Company, Chicago; J. E. Nelson, Joseph E. Nelson & Sons, Chicago; William Volkhart, William Volkhart, Inc., New York, and B. J. Wilson, *Railway Age*, Chicago.

A list of the exhibitors, giving the nature of the displays and the names of representatives in attendance follows:

American Tar Products Company, Chicago; S. H. Fields and J. D. Treadway.

American Valve & Meter Co., Cincinnati, Ohio; model of drop spout; J. T. McGarry, D. J. Higgins, and C. F. Bastian.

American Hoist & Derrick Company, St. Paul, Minn.; literature; B. W. Maurer.

Asphalt Block Pavement Company, Toledo, Ohio; asphalt flooring blocks and literature; E. J. Snyder.

Barrett Company, The, New York; roofing, shingles, specifications, and literature; G. R. McVay and R. B. Gunter

Chain Belt Company, Milwaukee, Wis.; literature on concrete mixers; C. H. Marsh.

Chicago Bridge & Iron Works, Chicago; photographs and literature; Merle J. Trees and Ced B. Smith.

Chicago Pneumatic Tool Company, Chicago; H. G. Barbee and T. G. Smallwood.

A. D. Cook, Inc., Lawrenceburg, Ind.; deep well pumps, screens and literature; Charles Taylor.

Detroit Graphite Company, Detroit, Mich.; samples of paint and literature; A. B. Edge.

Duff Manufacturing Company, Pittsburgh, Pa.; jacks; E. A. Johnson.

De Vilbiss Manufacturing Company, Toledo, Ohio; paint sprayers; F. Craig.

Fairbanks, Morse & Company; literature; F. M. Condit, J. L. Jones, C. B. O'Neil and F. J. Lee.

Harker Manufacturing Company, Cincinnati, Ohio; fire prevention devices; C. E. Schultz.

Highgrade Manufacturing Company, Cleveland, Ohio; literature and samples of roofing cement; S. A. Baber.

Johns-Manville Company, Inc., New York; samples of roofing, pipe and boiler insulations, packing, waterproofing, industrial flooring and shingles; P. C. Jacobs, C. E. Murphy, Harry Newman and W. H. Lawrence.

Joseph Dixon Crucible Company, Jersey City, N. J.; literature; H. A. Neally.

Lehon Company, The Chicago; samples of roofing and shingles; Tom Lehon, John E. Eipper and F. T. Carpenter.

E. M. Long & Son, Cadiz, Ohio; model O. G. fire gutters; A. C. Long and H. D. Roby.

Minwax Company, The, New York; model of water proofing flashing for a bridge deck and literature; A. S. Harrison.

Mudge & Co., Chicago, literature; J. Mulholand and K. J. Eklund.

Murdock Manufacturing & Supply Company, The, Cincinnati, Ohio; hydrants, drinking fountains and railway water service boxes; J. C. Endebrock and Kelso Murdock.

Massey Concrete Products Corporation, Chicago; literature; C. H. Hunsaker and A. Hultgren.

National Lead Company, New York; literature; F. M. Hartley, Jr., T. Mangan and S. V. Van Riper.

Norton, A. O., Inc., Boston, Mass.; literature on jacks and jack covers; G. R. Law.

Nelson, Jos. E., & Sons, Chicago; literature; I. B. Tanner.

Nichols, Geo. P., & Bro., Chicago; literature; Geo. P. Nichols.

Patterson, W. W., & Co., Pittsburgh, Pa.; tackle blocks; W. W. Patterson, Jr.

Patterson & Sargent Company, Cleveland, Ohio; G. W. Anderson and W. H. McBride.

Paul Dickinson, Inc., Chicago; model of cast-iron camp car jack, chimney for small buildings and ventilators; A. J. Filkins.

Railway Review, Chicago; copies of paper; W. M. Camp and L. E. Kohler.

Rivet Cutting Gun Company, Cincinnati, Ohio; pneumatic rivet cutter and concrete digger; L. K. De Bus and Joseph Desalvo.

Robertson & Company, Wm., Chicago; model of culvert; R. F. Repasz.

Simmons-Boardman Publishing Company, New York; copies of paper; E. T. Howson, W. S. Lacher, F. C. Koch and B. J. Wilson.

Snow Construction Company, T. W., Chicago; literature; T. W. Snow.

Stover Manufacturing & Engine Company, Freeport, Ill.; literature on engines and samples of steel fence posts; W. V. Heckman.

U. S. Wind Engine & Pump Company, Batavia, Ill.; literature; C. E. Ward.

Volkhardt Company, Inc., The, New York; model of hydrants and parts; Wm. Volkhardt.

International

A Three-Cylinder Pacific on the Great Northern (England)

Engine No. 1471 Recently Hauled a 20-Car, 610 Long Ton Passenger Train Over a 105.5-Mile Division of Uneven Gradient in 2 Hours 2 Min. Locomotive Has Three 20 in. by 26 in. Cylinders, Working Pressure of 180 lb., Adhesion Weight of 60 Long Tons and a Tractive Effort of 29,835 lb. at 85 per cent Boiler Pressure

Freight Car Loading

WASHINGTON, D. C.

FREIGHT CAR LOADING, after having reached during the week ending September 30 within 3 per cent of the peak loading of 1920 dropped back during the first week of October to 968,169 cars, an increase as compared with the corresponding week of last year of 68,488 cars, but a decrease as compared with 1920 of 43,487 cars. There were decreases as compared with the week before in all classes of commodities except coke, although the decrease in coal loading was only 37 cars, but the principal reductions were in merchandise and miscellaneous freight, which decreased about 15,000 cars. It is thought that this may be partly explained by heavier loading on account of the car shortage. In the Southern, Central Western and Southwestern districts, however, the loading was in excess of that for the corresponding week of 1920. In the Pocahontas district it was below that of last year. The summary as compiled by the Car Service Division of the American Railway Association follows:

Citrus fruit movement from Florida, and other perishable fruit, is increasing, and is much earlier than usual. Owing to limited refrigerator car supply, it is necessary to use ventilated box cars to the fullest extent where such cars are available.

The following new instructions are given:

(1) Ventilated box cars must not be used for loading except with perishable freight or with dead freight directly to home roads or from one local station to another on the home road.

(2) When no immediate loading should be moved empty to owners.

(3) Give special supervision to the handling of ventilated cars to see that instructions are fully understood and proper distinction made in the handling of these cars as distinguished from ordinary box cars.

Division 5 of the Interstate Commerce Commission has ruled that empty coal cars should not be used for the movement of coke but that special cases which might warrant an exception to that rule should be brought to its attention for appropriate action.

REVENUE FREIGHT LOADED

Reports received by the Car Service Division show that 32,929 fewer freight cars were in need of repairs on October 1 than on July 1 last when the strike of railway shopmen began. The total was 291,654, or 12.8 per cent of the cars on line. This was a decrease of 12,894 cars as compared with the number on September 15, at which time the total was 304,548 or 13.4 per cent. On October 1 last year, 364,372 or 15.8 per cent were in need of repairs. Of the total 230,565 required heavy repairs, while 61,089 required only light repairs. This is a decrease compared with September 15 last of 11,114 in the number requiring heavy repairs, and a decrease of 1,750 in the number needing light repairs. Every district reported a decrease as compared with September 15.

The Car Service Division has cancelled instructions contained in CSD 111 for the diversion of ventilated box cars to Western territory.

Effective at once all roads were directed to give ventilated box cars expedited movement to their owners, except that cars on roads in territory west of Chicago and the Mississippi river en-route to Western roads on previous instructions will be moved through to destination.

Division 5 of the Interstate Commerce Commission has ruled that no objection will be interposed to the movement of mill cinder and mill scale for furnace use when moving in open top cars under the same conditions as fluxing stone for furnaces.

The percentage of cars placed to cars required for coal loading was reduced during the last week of September to 55 as compared with 58 the week before. There has been a steady decrease for several weeks. The number of cars required was 381,878, the number of cars placed was 211,061, while the number of cars loaded was 182,158. This, however, was an increase of 9½ per cent as compared with the corresponding week of 1921.

The summary of principal freight car accumulations compiled by the Car Service Division of the American Railway Association shows 68,663 cars held in greater numbers than can be handled or disposed of currently, as compared with 72,656 cars for the week of September 29 and 80,320 for the week of September 22. The latter figure represented the peak for the year. Of the total as of October 6, 52,812 cars were held on account of the disability of the reporting road to move them.

The Pennsylvania System Newspapers *

By Logan B. Sisson

THE PENNSYLVANIA NEWS was founded as an employees' newspaper and makes no claim to being an employees' magazine. It is rather an approximation of a country weekly in railroad overalls. It is printed on news print, comes out every two weeks, and at least 90 per cent of the space is devoted to news about the employees themselves and the activities of members of their families. The remaining space is used for new developments in the railroad property in which the employees are interested, humor, cartoons, poems and a short editorial. A considerable portion of the news is presented through pictures and drawings. Company or management propaganda has no place in the paper. It is a newspaper or as near a railroad family newspaper as the employees, with the guidance of the editorial staff, can make it. Its editorial masthead carries this sentence: "Published every two weeks by the Pennsylvania System for all employees in the ——— Region in the interest of getting us all better acquainted with one another and with the property."

Purposes of Regional Newspapers

What the Pennsylvania System hopes to accomplish with these newspapers is briefly summarized in the editorial announcing the first issue published in Pittsburgh last January:

"The Central Region celebrates the advent of 1922 with a newspaper for employees. It's coming around every two weeks—right into roundhouses, shops, yards, signal towers, freight and passenger stations and offices, and thence into the homes of 50,000 P. R. R. families—to repeat the friendly handshake which the first number extends. 'The Pennsylvania News' expects to get personal about the Central Region; to get all of us better acquainted with one another, with our officers, and with the property. Many who wear the Veteran Association button remember that several decades ago the boss knew all the men who worked with him, well enough to ask, occasionally, after the health of the Mrs. and youngsters. 'The Pennsylvania News' comes in, therefore, to supply some of the personal interest and understanding that is otherwise well nigh impossible in a region with 3,600 miles of track running from Altoona to Buffalo to Columbus to Wheeling, with Pittsburgh at the hub.

"It will endeavor to be just as human, just as informal, and just as interesting and helpful as you make it. A magazine interviewer recently asked Lord Northcliffe, the famous English publisher, what people are interested in. 'Themselves,' he replied without a moment's hesitation. That is just how 'Pennsylvania News' feels about its job in the Central Region. It places itself in your hands confident that you will co-operate in making it the influence you want it to be."

These newspapers are intended, therefore, to develop company spirit among the employees and pride in their work. They seek to interest the employee and entertain him. They make no attempt to "uplift" or preach.

The Central Region edition, which began with a circulation of 50,000, is now printing approximately 63,000 copies—one for each employee. The Northwestern Region edition, which began publication July 1, distributes 21,000 copies from the editorial office in Chicago. The third edition, soon to be inaugurated in Philadelphia for the Eastern Region, will require between 90,000 and 100,000 copies. With the fourth edition ultimately to be published in St. Louis for the Southwestern Region, the combined circulation of The Pennsylvania News will be 200,000. It will ultimately be possible to syndicate to the four editions general information of interest to all employees throughout the system.

Reporting News Events

In general the plan for gathering news is as follows: A chief correspondent is selected for each superintendent's division. He has reporters stationed at the shops, yards, roundhouses, freight stations and terminals. The number of reporters varies from six on a small division to 50 or more on a large division. The editor and his assistant at regional headquarters depend on the chief correspondents just as the city editor of a metropolitan newspaper depends on his reporters.

The chief correspondent, therefore, is a most important factor in the development of the newspapers. He is usually an employee who has been with Pennsylvania some time and one who enjoys a wide acquaintance among employees on his own division. He is the clearing house for all information concerning the employees in his territory. He gets out over the road with his camera on his back and develops news stories. He "covers" meetings, outings, athletic events, etc. He is in constant touch with the editor by telephone and telegraph as well as by mail. Once a month he attends a staff meeting at which the last issue of the paper is criticized and plans for the next issue are announced.

In the course of a few months employees who up to January 1 had given no thought to news gathering have developed into extremely capable reporters. They not only handle news when it comes in—they go out and get it. Keen rivalry between divisions for space in the paper keeps each correspondent on his toes. An example of how the division correspondents function was afforded at the annual Pennsylvania System outdoor championships at Altoona on September 23. The staffs of the two regional editions were present to cover the different events on the program. Each man reported to the press booth and wrote a brief account of the sport he had watched. In this way copy which later appeared in The Pennsylvania News was made available to the representative of outside newspapers. The correspondents also wrote news about employees from their divisions who were noticed at the games.

As many as 2,000 names of employees and their families have appeared in a single issue of the Central Region edition. It is safe to say that 25,000 names have appeared in the first 18 issues to date. Some of the most interesting news is obtained by following the employees away from their railroad jobs into their outside interests—their lodges, their hobbies, their pride in their children, the books they read, etc. A freight engineer on the Panhandle division proved to be one of the most talented amateur astronomers in the country. A crossing watchman in Indiana was found to be the author of a historical book which he had typed with the two fingers on his one remaining hand. Certain employees delight in hunting, in raising fancy chickens, in exhibiting prize bulldogs, in building their own homes, in serving as justices of the peace, etc. All this sort of information The Pennsylvania News endeavors to secure together with photographs to illustrate the stories. Last June it published 200 photographs of sons and daughters of Pennsylvania employees who were graduated from schools.

Advantages of Newspapers Over Magazines

In conclusion it might be of interest to enumerate the advantages which the regional newspaper seems to offer over the system magazine:

First—It comes out twice as often as the monthly magazine.

Second—Without any advertising revenue its approximate cost is only two cents a copy.

Third—Because the edition can be printed and distributed via railroad mail service in 24 hours, it has a timeliness which cannot be achieved in a magazine.

Fourth—It comes to its readers on plain news print stock, which suggests economy and democracy.

Fifth—By making over page plates it is possible to increase the volume of news published without increasing the actual size of the newspaper.

*From a paper presented at the meeting of the Railway Employes Magazines Association at Richmond, Va., October 6, 1922. Mr. Sisson is editor of the Central Region edition of the Pennsylvania News.

An Analysis of the Present Box Car Situation

Car Service Division Sends Roads Analysis of Box Car Situation in the Various Regions

WASHINGTON, D. C.

THE CAR SERVICE DIVISION of the American Railway Association, has sent to the various roads an analysis of the box car situation, as of October 1, which indicates:

(a) That combined, the Eastern and Allegheny regions, in other words, the territory east of the Mississippi and north of the Ohio rivers, had on July 1, 106.8 per cent of their box car ownership as compared with 119.9 per cent in 1920; August 1, 106.2 per cent compared with 119.4 per cent in 1920; September 1, 110.5 per cent 1920, compared with 108.4 per cent in 1922; October 1, 109.7 per cent, 1920, compared with 113.7 per cent in 1922, showing that up until the first day of October there were less box cars in this territory than in 1920.

(b) Combining the territory east of the Mississippi and south of the Ohio rivers, there was an increase in cars on line compared with 1920 and beginning with July 1 gradually increasing until October 1. The roads and the lines in this district were handling the heaviest coal production ever handled during their history during the months of April, May and June and beginning with the strike of the shop crafts on July 1 there was a gradual accumulation of traffic on all of these lines that made it impossible to secure prompt movement of the loaded or empty equipment. This is said to be without doubt responsible entirely for the increase in box cars on line as compared with 1920. The embargoes against receipts of traffic from connections and loading on a great many of the lines in this territory which were in effect for July and August have gradually been taken off and traffic that has been held out of those territories has been moving in there more freely since the first of September. There has been a very considerable reduction in the cars on line in the Southern District ever since September 15 due to improved transportation conditions.

(c) Combining the Northwestern, Central Western and Southwestern regions it shows that on July 1, 1920 there was 87.7 per cent box cars of ownership on line as compared with 94.2 per cent July, 1922; August 1, 1920, 90.1 per cent compared with 94.5 per cent 1922; September 1, 1920, 91.9 per cent compared with 94 per cent 1922; 94.3 per cent October 1, 1920 compared with 92.0 per cent 1922.

Divided by regions the situation is about as follows:

Eastern Region

2.6 per cent less box cars on line than ownership Oct. 1, 1922.

2.1 per cent less box cars on line than on Oct. 1, 1920.

0.1 per cent increase in ratio of loading to total loading in all regions as compared with 1920.

This shows that for the region as a total there were comparatively less cars on line than in 1920 at a time when the loading was on a parity with the present and that these roads loaded practically no greater proportion of the loading of the country as a whole than they did in 1920 or 1921.

Group "A" of the Eastern region is the only territory showing an excess over ownership and that is in New England. These roads have approximately 90 per cent in excess of the cars on line that they normally had during a period of car surplus. Under orders from the Car Service Division cars are now moving out of New England empty to make up a deficit of the United States roads to the Canadian roads. In addition to that they are moving out of New England to the anthracite loading roads for loading to the west. In view of the transportation conditions it is not practical to attempt the movement of empty box cars out of New England to the west and furthermore the demand for westbound loaded movement will absorb all cars available for movement in that direction.

Allegheny Region

30 per cent more box cars on line than ownership Oct. 1, 1922.

10.1 per cent more box cars on line than on October 1, 1920.

0.3 per cent increase in ratio of loading to total loading in all regions as compared with 1920.

This is a territory that normally has box cars on line in excess of ownership even during a period of car surplus due to the fact that inbound business in box cars is received in excess of outbound business. It is a heavy coal producing territory and since August 1 the necessities of coal production have absorbed facilities which have increased transportation demands in certain districts and made the equalization of box car traffic more difficult. However, box cars are being delivered to western connections in excess of the number of box cars received, thereby reversing the normal flow; also box cars are being delivered empty to western connections in volume and to some extent to southeastern lines who have a deficit compared to ownership.

Pocahontas Region

48.1 per cent more box cars on line than ownership Oct. 1, 1922.

26.5 per cent more box cars on line than on October 1, 1920.

1.0 per cent decrease in ratio of loading to total loading in all regions as compared with 1920.

The percentage of box cars on line in excess of ownership appears heavy, but in actual figures is only a comparatively small number due to the region constituting only three roads with an ownership of less than 15,000 box cars. These conditions are the after effects of the coal and shopmens' strikes and other labor difficulties which were somewhat more acute in this territory than elsewhere. Specific instructions are in effect on the lines in this district to expedite the return home of cars belonging to the roads in the three western regions which will have a material effect in restoring the proper car balance.

Southern Region

5.9 per cent more box cars on line than ownership Oct. 1, 1922.

9.2 per cent more box cars on line than on October 1, 1920.

0.4 per cent decrease in ratio of loading to total loading in all regions as compared with 1920.

Increase in box cars on line October 1 due almost entirely to result of conditions of operation already cited, due to the coal and shopmens' strikes. Decrease in their relative loading also due to this same cause. With operating conditions rapidly being restored to normal the number of box cars on line is also being brought down to a satisfactory figure. Furthermore definite arrangements applying to the return of cars belonging to western lines are in effect and are expediting the movement of equipment to the west.

Northwestern Region

9.1 per cent less box cars on line than ownership Oct. 1, 1922.

2.0 per cent more box cars on line than on October 1, 1920.

0.6 per cent decrease in ratio of loading to total loading in all regions as compared with 1920.

Roads in this territory had on August 1 a supply of cars practically equal to their ownership, thus putting them in good position for handling the seasonal movement of crops starting at that time. Decrease since that date has been due entirely to heavy off line traffic. It will be noted that with a considerably better car supply than in 1920 the ratio of loading in the region to the total was less than in that year. There are two or three roads in this district to which assistance is being given by arbitrary delivery of empty box cars due to the unusual volume of off line traffic and lack of compensating return loaded movement and to meet an emergency potato movement.

Central Western Region

16.5 per cent less box cars on line than ownership Oct. 1, 1922.

7.4 per cent less box cars on line than on October 1, 1920.

1.3 per cent increase in ratio of loading to total loading in all regions as compared with 1920.

In spite of a slightly less car supply than in 1920 the ratio of loading to the total in all regions increased perceptibly. During the three months July 1st to October 1st Central Western region has handled an extremely heavy volume of off line traffic, including lumber, grain and other agricultural products. It is believed that the increasing westbound movement of cars from the eastern territory will balance this movement and increase the cars on line.

Southwestern Region

9.9 per cent more box cars on line than ownership Oct. 1, 1922.

1.3 per cent less box cars on line than on October 1, 1920.

0.3 per cent increase in ratio of loading to total loading in all regions as compared with 1920.

This territory shows an excess of cars on line to ownership and a consistent increase in cars since July 1. This has been due to normal movement of grain and agricultural products from Central Western region to consuming territory and to ports for export; also due to operating conditions as result of the shopmens' strike which has interfered in some degree with free circulation of cars. However, the increase in cars on line during this period occurred in each of the three years for which figures are shown. Heavy demands for northbound loading, particularly forest products, will reduce the supply in this territory somewhat more rapidly, now that the cotton movement is practically over.

Yardmasters Get New Working Rules

NEW RULES governing the working conditions of yardmasters, members of the Railroad Yardmasters of America, were announced by the Railroad Labor Board on October 16, and are applicable to 12 roads which are parties to the dispute. The new rules include:

ARTICLE I—SCOPE

The term "yardmaster" as herein used shall be understood to include general yardmaster, assistant general yardmaster, yardmaster, assistant yardmaster, except general yardmasters referred to in Ex parte No. 72, Interstate Commerce Commission.

ARTICLE II—HOURS OF SERVICE AND OVERTIME

(a) Eight hours, exclusive of the agreed meal period, shall constitute a day's work.

(b) All time in excess of eight hours shall be paid for at prorata rate. Time consumed in making transfer shall not be counted as overtime.

(c) Where three shifts are worked covering the 24-hr. period, the starting time of the first shift shall not be earlier than 6 A. M., nor later than 8 A. M.

ARTICLE III—REST DAYS

(a) Yardmasters regularly assigned seven days per week will be granted two rest days per month without loss of pay.

ARTICLE IV—MISCELLANEOUS

(a) When a regularly assigned yardmaster is required to perform service other than regular duties, the rate of pay will be not less than the regular pay for days so used. When an assistant yardmaster is required to substitute for yardmaster, or when a yardmaster or assistant yardmaster is required to substitute for a general yardmaster or assistant general yardmaster, the yardmaster or assistant yardmaster will assume the rate of pay and the hours applicable to the position to which assigned.

(b) No change in the title of yardmasters of any grade shall be made for the purpose of reducing the rate of pay of position unless there is a change in their duties and responsibilities.

Referring to seniority, discipline and vacation rules, disputes over which were remanded to the parties involved by the board, the decision said:

The evidence indicates that a majority of the carriers before the Board in this case and their employees have agreed upon seniority and discipline rules, and these subjects are remanded in their entirety. The Labor Board believes that certain other subject matters may not be covered in all localities by rules of general application, and require further consideration by the parties directly concerned. All such rules which involve a dispute between a particular carrier and its employees are hereby remanded to said carrier and its employees for the purpose of adjustment under the provisions of section 301 of the Transportation Act, 1920.

In further negotiations attention is again directed to the principles announced in Exhibit "B" of Decision No. 119.

The action of the Labor Board in declining to adopt a rule requiring carriers to grant annual vacations with pay to this class of employees must not be construed to mean that the Board disapproves the granting of such vacations by the carriers. The Board is expressing neither approval nor disapproval, but is of the opinion that this question should be disposed of by mutual agreement of the interested parties.

The following roads are parties to the dispute ending in this decision:

Baltimore & Ohio Chicago Terminal, Central Vermont, Denver Union Terminal, Ft. Worth & Denver City, Gulf Coast Lines, Jacksonville Terminal Company, Michigan Central, New York Central (West of Buffalo), New York Central (Buffalo and East), Seaboard Air Line, Union Railway, and Wabash.

This decision of the board is particularly interesting in that for the first time official recognition is given to the eight-hour day for yardmasters as a general practice, and also because a specific time is set for the starting time of the first of the three daily shifts.

ORAL ARGUMENT on the valuation of the Western Pacific will be heard by the Interstate Commerce Commission at Washington on November 1. The Boston & Maine case has been assigned for hearing before Examiner Marchand at Washington on November 20.

The Transportation Situation and the Farmer*

Farmers Stand to Lose Millions by Railroad Traffic Congestion —Over-Regulation the Cause

By Julius H. Barnes
President Chamber of Commerce of the United States

I WANT to mention the railroad situation at this point. No man today can claim that a public facility such as the railroads, vested as it is with the public interest, touching every man's business and home, can be left entirely devoid of some public regulation. It is inconceivable that there should not be some public control of a facility in whose hands rests the power to make or unmake entire communities by a rate structure resting in its officials. That goes too far, but we can create an informed and fair public opinion which will recognize not only the justice of allowing a field of return for privately owned and operated facilities, and the wisdom, from the public's own standpoint, of allowing such adequate return if there is to be a constant improvement and expansion of their facilities.

You know that today the transportation facilities of this country are inadequate for the business now tendered them. I want to use as an illustration the grain trade of this country and show you how far-reaching this is in its effect. I speak of grain, not because I am provincial enough to believe that it is the major industry of this country, but because out of 30 years' experience in grain exporting I can qualify somewhat as a competent witness on that subject, and because you will lift the similarity out of grain into the lines of industry with which you are more familiar.

You will agree with me that if there is one single menace to the onward march of business activity and prosperity in this country it rests in the dissimilarity between the prices paid for farm products and the prices of those commodities which the farmers must buy.

I do not follow the full way with those who say that the farm is in a state of collapse. It is no such thing. Twenty cent cotton and ten dollar hogs will take care of a large part of our farmers with a measure of prosperity, but the grain-raising country has suffered and the grain-raising country has today the sunrise of hope before it.

Yet this is the situation: From the first of September until the first of October, in the very height of the crop-moving period of this country, the main channel of export outlet for grain in America, from Buffalo to New York, was practically closed. For thirty days the four great trunk lines that serve that channel of movement contracted no grain for movement. The grain moved from the West until it had congested and exhausted the elevator facilities of Buffalo—18,000,000 bushels. As soon as the unloading facilities were thus exhausted, the lake carriers, reflecting the apprehension of their owners that the boats would be tied up with undischarged cargoes instead of being returned, made an advance in the lake rates, in 30 days, from 2 cents per bushel for the carrying of grain from Chicago and Duluth to Buffalo, to 6 cents.

The rail rate from Buffalo to New York, on the published tariff, is nine cents, but as I explained to you practically no grain was moving. The route that was open—the Erie Canal—with totally inadequate facilities, advanced the rate to 13 cents per bushel, paralleling the railroad, which was supposed to carry it for 9.

From Buffalo to Montreal is a water route. It is equipped with the facilities of forty years ago. It can handle a vessel of 250 feet in length, when the lake carrier of today west of Buffalo is 600 feet in length. That means that the carriers that operate on this 40-year-old route are limited in number, and limited more in carrying capacity. Thirty days ago those carriers were operating on a tariff from Buffalo to Montreal of 6 to 7 cents per bushel. Last Saturday 15½ cents was paid for the carriage from Buffalo to Montreal. That is the pressure of grain west of Buffalo seeking an outlet to foreign markets.

The effect of the market rise in prices has been this. In 30 days the foreign price of wheat has advanced 25 cents per bushel, the foreign price of corn has advanced 20 cents per bushel, because those markets are inadequately supplied. The market price in America of wheat has advanced 10 cents per bushel, and of corn 10 cents per bushel. That is, the spread between the ultimate foreign price which should be reflected back to our farms, has widened from 10 to 15 cents per bushel because of the lack of adequate facilities to move the crop pressing on the market in the west.

I make this statement out of 30 years' experience as a grain exporter, watching the diversion of grain from route to route for a half cent per bushel economy of one route against another. As a member of a trade that has been content for years to lift grain from the western primary markets, like Duluth, Port William and Chicago, and deliver it to Hamburg and Rotterdam and Liverpool and London for a charge of one cent per bushel, I make this statement, that we have today four billion bushels of grain in the west, the value of which to the farmer in every market in the west is at least ten cents per bushel below a proper relation with the European consumer markets. You take 10 cents per bushel, assuming this continues through the crop year—and it won't, thank goodness—and it would mean a loss in farm revenues of $400,000,000.

I don't need to tell you businessmen, familiar with business, what the loss of $400,000,000 of enlarged spending power to the grain farmers alone would mean to other industries in this country.

That train of evil, that train of economic loss to a basic industry of this country, follows, I believe from an over-rigid system of government regulation over our railroads, which has extended over ten or twelve years. By a process of control of revenues without any responsibility for operating costs we have destroyed the earning power of our railroads. We have thereby undermined their credit, and from neither source, of earnings nor of credit, have they been able to maintain their equipment in a proper expansion with the growth of this country.

I said that the Chamber of Commerce of the United States claimed some credit for having lightened this hand around the throat of industry in this country and particularly the railroad industry, from over-regulation. Today, with this situation, it is proposed by farm senators in Congress that at this coming session they are going to restore the authority of state commissions to control railroad rates. Just follow that a moment, gentlemen—48 individual state commissions with no responsibility for the operating results of systems which must operate as a whole (many of them national in character) are going to assume a control in the interest of their own states of the revenues from the evil effects of which

*From an address made before the National Conference of Business Papers at New York, October 12, 1922.

we have just escaped. You can depend upon it that the Chamber of Commerce of the United States will stand against that, and I hope with the unanimity of business support behind it.

Southern Pacific Asks Authority to Keep Central Pacific

WASHINGTON, D. C.

THE SOUTHERN PACIFIC COMPANY on October 17 filed an application with the Interstate Commerce Commission for authority to acquire control of the Central Pacific by lease until December 31, 1984, and stock ownership pending the determination of the proceedings now going on before the commission for the consolidation of the railroads of the country into a limited number of enlarged systems. The control applied for is temporary in character, in that it is subject to be terminated by order of the commission when and if found to be inconsistent with the plan of consolidation, which Congress has directed the commission to make. The application is based on provisions of the Transportation Act, 1920, paragraph (2), section 5, which give the commission power to authorize one carrier to acquire control of another by lease or stock ownership, whenever it finds that such control is in the public interest, and which expressly exempt a control, so authorized, from the provisions of the Sherman Act. Its object is to prevent, by resort to this later act of Congress, immediate dismemberment of the Southern Pacific System, which would otherwise result from the recent decision of the Supreme Court, and to preserve the status quo pending an orderly determination and promulgation by the commission of its final plan of consolidation. The Supreme Court recently denied the Southern Pacific's petition for a rehearing.

The relief sought from the commission, the Southern Pacific counsel assert, is not antagonistic to the mandate of the Supreme Court or in conflict with anything decided by that court. The ultimate object of the mandate is to create a situation in harmony with law. The only remedy the Sherman law, considered alone, provides is to tear the properties apart. But the Transportation Act empowers the Interstate Commerce Commission to legalize the control of the Central Pacific by the Southern Pacific, if it finds that to be in the public interest. Hence the purpose of the petition to the commission is to prevent a separation of the properties until the commission can determine whether it is in the public interest for it to bring about a condition in harmony with the law by authorizing for the present a reacquisition by the Southern Pacific of control of the Central Pacific and afterwards by authorizing the consolidation of the two companies.

The application first calls attention to the recent decision of the Supreme Court based on the Sherman Act. It shows further that the suit under the Sherman law was begun, tried, and the record closed before the passage of the Transportation Act, and that the later law was not mentioned in the decision of the Supreme Court. It cites the provisions of the Transportation Act that empower the commission to authorize a control by one carrier over another or a consolidation of one carrier with another in cases where, without the commission's authority, such control or consolidation would fall within the condemnation of the Sherman law. It is shown that such provisions of the later law manifest a radical change in the legislative policy of Congress in respect of the application of the Sherman law to the railroads of the country and "a belief on the part of Congress that there may be combinations of railroads that are in the public interest but are not legally possible under existing anti-trust legislation, and an intention to afford a means of permitting or rendering lawful a control or combination of railroads which in the opinion of this commission is in the public interest but whose creation or continuance is prevented by the operation of the Sherman or other similar laws. Congress has made this commission the sole judge of all questions of public interest which may arise under its administration of the above referred to provisions of the Transportation Act."

The application then proceeds to state that the decision of the Supreme Court "leaves this commission free to exercise the powers and to perform the duties conferred or imposed by the Transportation Act. And it is without prejudice to the right of applicant to acquire lawful control of the Central under the later law, to the extent deemed by this commission to be in the public interest, to the end that the relations between applicant and the Central may be brought into harmony with the existing policy of the law."

The application sets forth at length the reasons why it is in the public interest that the acquisition of the control applied for should be authorized and the consequence of an attempt forthwith to tear apart the interlaced and interdependent properties of the Central and the Southern Pacific avoided, pending the orderly determination and consummation of the commission's plan of consolidation.

In this connection the history of the origin and growth of the Southern Pacific System, with the Central Pacific always as a part thereof, is set forth from its beginning in 1870. It is alleged that in the course of this 50 years of system development railroads have been constructed, terminal facilities located and provided, equipment for the whole supplied, operating divisions and methods established, routes and channels of traffic created, all for a single united railway system, without regard to corporate ownership of the different parts, the result being the creation of a transportation service of "unexcelled efficiency and economy of operation with which the communities thereby served are well satified."

The physical consequences of a separation of the properties at the present time are thus set forth in the application:

> Independent operation of these lines would result in the creation of approximately 20 new junction points between two independent carriers; the breaking up of train service, freight and passenger; the dislocation of division terminals, shops and other facilities; the duplication of facilities involving expenditures running into many millions of dollars; the disruption of an operating organization and a system all parts of which are now working as an harmonious unit, and the substitution of two fragmentary railroad systems to perform the service which for more than 50 years has been efficiently performed by a single system. There would be created in place of the present unified system, each part designed to operate with every other part, two systems neither of which was constructed as a separate system and neither of which could give the public the satisfactory and efficient service which is being rendered by the existing single system.
>
> By reason of the foregoing, applicant alleges that the public service now rendered by these lines will be greatly impaired and the cost thereof will be greatly enhanced unless the applicant is permitted to acquire lawful control of the lines of the carrier to the extent and by the means proposed herein.

It is alleged that the financial inter-relations of the Central and Southern Pacific are no less extensive and involved than their physical inter-relations. The financial complications and the difficult financial problems necessarily attendant upon the separation of the properties are set up as an additional reason why it is in the public interest that such separation should be postponed, by the exercise of the invoked powers of the commission, until the issue in the pending consolidation proceedings determines whether the Central Pacific is to be grouped with the Southern Pacific or with some other system. In this connection it is shown that the Southern Pacific is the guarantor of the four outstanding bond issues of the Central Pacific, aggregating over $150,000,000, and that to secure the inter-related obligations of the two companies the Southern Pacific had pledged and deposited with trustees not less than $150,000,000 of stocks and bonds owned by it.

Referring again to the pending consolidation proceedings it is stated that in the commission's tentative plan the lines of the Central Pacific are grouped with the Southern Pacific, while in the alternative Ripley plan a part of the Central Pacific lines are grouped with the Union Pacific, but that in no rational plan of consolidation is it likely that the operation of Central Pacific as a separate, independent unit will be provided for. If, however, the commission does not grant the Southern Pacific authority to acquire lawful control of the Central Pacific, of the provisional character prayed for, the necessary result, it is said, will be the enforced tearing apart of lines operated for 50 years as interdependent and complementary parts of a single system, and the inauguration of a temporary independent separate operation of the Central Pacific lines, pending the promulgation of the commission's final plan of consolidation. There would thus be brought about the evil effects of a separation, described in the foregoing parts of the application, intensified and rendered more unjustifiable by the temporary character of such independent operation. The petition therefore asks for a temporary continuance of the present unified service, with which in preceding part of the petition it is alleged that the communities served are well satisfied, until the commission shall have opportunity to determine the proper placement of the Central Pacific in its final consolidation plan.

The permanent separation of the Central Pacific and Southern Pacific railroads would restore to California economic railroad independence, according to a statement by Fred G. Athearn, western counsel of the Union Pacific, given out by the Washington office of the California Producers' and Shippers' Association.

"It is claimed," said Mr. Athearn, "that the carrying out of the Supreme Court decision which decreed the separation of the two roads will result in disruption of service and inconvenience to the traveling and shipping public. That such disruption should occur was specifically guarded against by the court mandate which states that the separation shall take place 'in such manner that each line will be able to freely compete with the other to serve the public efficiently.' Inasmuch as the Southern Pacific now owns all of the stock of the Central Pacific it is manifest that the application asked for would not be in furtherance of the plan for dividing the railroads of the country into groups which shall be competitive with each other as commanded in Paragraph 4 of Section 5 of the Transportation Act of 1920, wherein the duty imposed on the Interstate Commerce Commission is set forth in these words, 'in the division of such railroads into such systems under such plans competition shall be preserved as fully as possible.'

"The Supreme Court of the United States has found and decided that the Southern Pacific Sunset Route is competitive with the Central Pacific. That such competition should exist and that such competition has been heretofore suppressed and throttled by the Southern Pacific the Supreme Court has definitely decided, and I submit that this decision of the Supreme Court was made in the public interest.

"The United States District Court of Utah, which will proceed with separation of the Central and Southern Pacific Lines under the mandate of the Supreme Court, has very broad powers over the two roads, and in the exercise of such powers must compel such joint and common use of rails and terminal facilities as will result in no disruption of service at all or inconvenience to the traveling or shipping public; to the contrary, it will re-establish competition between the Central and Southern Pacific as intended by Congress, which competition will insure a quicker and more efficient movement of California products and will give to producers and shippers of the state two strings to their bow in the matter of rail transportation. It will insure to the producers and shippers now in non-competitive territory the same advantages enjoyed by those in competitive territory as to the prompt supplying of cars and equipment for handling their products."

Commenting on the company's application, J. P. Blair, general counsel of the Southern Pacific Company, said that he wished to emphasize the fact that the application "involves no conflict with the decision of the Supreme Court and no attempt to have that decision reviewed or over-ruled."

"The want of antagonism," he continued, "between the application to the commission and the decision of the court becomes clear when it is understood that under the Transportation Act the commission can authorize a control by one carrier of another or a consolidation of two or more carriers whose union, without such authority, would be prohibited by the Sherman law.

"It is self-evident that the consolidation of all existing railway properties into approximately twenty systems could not be accomplished if the commission were to be controlled by the prohibitions of the Sherman act. The wide departure between the policy of the old law and that of the new is shown by the fact that the commission's tentative plan of consolidation, promulgated August 3, 1921, provides for the continued common control of the Reading Railway and the Central of Jersey, which had been declared by the Supreme Court on April 26, 1920, to be in violation of the Sherman law, for the common control of the Burlington and Northern Pacific, two of the companies whose common control was declared by the Supreme Court in the Northern Securities Case to be in violation of the Sherman law, and for the consolidation of the Chicago, Milwaukee & St. Paul and the Great Northern Railroad, although those two great systems are parallel and competing throughout."

Sir Henry Thornton, New Chairman of the Canadian National, Lady Thornton and Their Daughter, Anna, Sailing on the Olympic for England Where Sir Henry Will Terminate His Connection with the Great Eastern Railway.

Laying Dust for Passenger Trains

In the operation of passenger trains on those portions of its southern line crossing the desert east of Colton, Cal., the Southern Pacific has constantly been confronted with the presence on its right-of-way of fine sand which blows over the tracks and rises in clouds during the passage of trains, to the great annoyance of passengers. The occasional application of oil to the track has not remedied this difficulty owing to the constant blowing of fresh sand upon the oil. To overcome this condition an apparatus has been devised by W. H. Whalen, division superintendent at Los Angeles, whereby water is sprinkled over this sand during the passage of the train, laying the dust temporarily. This is accomplished by means of a perforated pipe beneath the locomotive tender, connected with the interior of the tank by a riser pipe and controlled by a gate valve operated from the engine cab.

The sprinkler pipe is 8 ft. long and is hung about 10

Laying the Dust Under a Train

in. above the rails to give adequate clearance. The pipe is 4 in. in diameter to secure a plentiful distribution of water when traveling at high speeds, but the precaution is taken in the design to establish the inlet end of the riser pipe some distance above the bottom of the tank to prevent the draining of all of the water supply through inadvertence or accident to the sprinkler system. The valve regulating the sprinkler supply is controlled by a pull rod extending from the front of the tender to a bell crank, one leg of which is connected to the stem of the valve.

This device was first placed in service on the Los Angeles division between Indio, Cal., and Palm Springs, since which time it has been installed on a number of locomotives on three different divisions. It has demonstrated its ability to settle the dust and cool the air during the passage of the train so that it is planned eventually to equip all passenger trains operating through these sandy sections with these sprinklers.

In a collision on the Boston & Maine near Dover, N. H., on October 8, an engineman was killed and six other persons injured. The accident occurred during a heavy fog when an eastbound passenger train collided with a westbound freight train which was occupying the eastbound track in crossing over to a branch line.

The Highway Problem*

The legitimate function of a highway is, first, the accommodation of private owners of vehicles for their individual pleasure and business. It is not designed or intended as a permanent roadbed for transportation business and can never be depended upon to fulfill that function. We have not yet developed a roadbed which will stand the everlasting pounding of this traffic for which highways were never intended. Roads that were designed and built honestly for 95 per cent of the traffic have been hammered to pieces by five per cent of the traffic.

The early destruction of many of our highways has called for rebuilding on a far more expensive scale and for all new highways to be designed for the heaviest traffic, which is only five per cent of the total. Are we to continue this expensive construction and maintenance to provide a practically free right of way roadbed and maintain it for a traffic which pays nothing for its use except a simple license, the same as any ordinary vehicle which is operated solely for purposes of pleasure?

It is generally conceded that a highway capable of standing the legitimate 95 per cent of travel can be built for $30,000 per mile (16-ft. road). If this abnormal traffic is to be perpetuated, we must pay at least $50,000 per mile, an extra $20,000 per mile for five per cent of the travel. Are we going to stand for this—to make, and maintain such roads for traffic never contemplated, which cannot take the place of railroads and only serves to bankrupt them in the long run?

Electric and steam railroads are the only safe, sane and permanent means of commercial traffic; and no country can prosper without them. Their rights of way must be bought, tunnels and cuts made, bridges and culverts built, tracks laid, engines and cars bought, and all kinds of buildings erected at an enormous cost to operate this essential means of transportation. The same railroads must pay their share of cost and maintenance of the highways which are giving practically free rights to their competitors. Can we do without railroads? If not, we should see that they have the right to a fair return on their investment.

*From an address before the twenty-third annual convention of the Washington State Good Roads Association at Ellensburg, Wash., in September, by Frank Terrace, president.

When a Passenger Train Sidewiped a Freight on the Electrified Division of the New Haven, Near Cos Cob, Conn.

General News Department

The Interstate Commerce Commission has announced a further hearing on the proposed revision of rules for the distribution of coal cars at Washington on November 15 before Commissioner Aitchison.

Dr. Charles P. Neil, manager of the Bureau of Information of the Southeastern Railways, has been appointed by President Harding as one of the members of the federal commission to investigate the coal industry.

Pension and seniority rights of trainmen and yardmen of the Grand Trunk who struck during 1910 have been restored by order of W. D. Robb, vice-president and general manager, according to press dispatches from Montreal. The order is said to affect about 1200 men.

Pennsylvania Plans Electrification at Altoona

The Pennsylvania is making plans for the electrification of its line between Altoona and Conemaugh, a distance of 35 miles. This work has not as yet, however, been authorized by the board of directors.

Rob Crack Santa Fe Passenger Train

As the California Limited of the Atchison, Topeka & Santa Fe was leaving the Kansas City, Mo., union station at 10 p. m. on October 11, enroute for Chicago, a negro boarded the observation car and proceeded by point of gun to rob six men and one woman who passed him in the corridor of the car. After he had gathered about $200 from his victims, he made a hurried exit from the train.

New Directors of Canadian National on Tour of Inspection

The new directors of the Canadian National left Montreal on a tour of inspection of the western lines of the system on October 15. It is stated that all the directors with the exception of President Sir Henry Thornton and Tom Moore, labor member of the board, are making the trip.

The future headquarters of the Canadian National has not as yet been determined and it is stated the selection will be left entirely in the hands of the new board of directors.

Railroad Seeks to Quit "Grave-Yard Town"

Asserting that Searchlight, Nev., has changed from a wide open mining town to "a grave-yard of tumble down buildings," the California, Arizona & Santa Fe (Atchison, Topeka & Santa Fe) has applied to the California Railroad Commission for permission to abandon its line which extends from Goffs, Cal., to Searchlight, a distance of 53 miles. The road began operation in 1908 to serve what was then considered to be a very promising mining territory. Since the decline in the mining industry, however, the road has been operated at a heavy loss.

A Correction

It was incorrectly stated in the *Railway Age* of October 14 that the shopmen's strike on the Gulf Coast Lines and the Houston Belt & Terminal had been settled with a restoration of seniority rights as of June 30. The strike has been settled but seniority rights have *not* been restored. On the contrary these companies agreed only to re-employ sufficient strikers to bring forces up to normal, the strikers coming back as new employees, relinquishing all seniority and other rights which they enjoyed when the walkout occurred. Under this settlement about one-third of the striking mechanical craftsmen of these companies have been re-employed.

Enginemen Urge More Rigid Locomotive Inspection

More rigid enforcement of the safety appliance and locomotive inspection laws was urged by counsel for the Brotherhood of Locomotive Engineers and Brotherhood of Locomotive Firemen and Enginemen at a conference with President Harding on October 11. The President was told that the condition of railroad power and equipment is such as to constitute "a menace to the traveling public" and that many railroads are disregarding the safety laws. They asked the President to compel the railroads to observe the requirements of the laws. The President pointed out that he had recently recommended to Congress an appropriation for additional inspectors for the Interstate Commerce Commission, but that this item was omitted from the bill as it was passed.

President Has Not Definitely Decided Railway Labor Legislation

Although various statements have been published regarding the attitude of the administration as to proposed railroad labor legislation at the forthcoming session of Congress, and Secretary of Labor Davis has proposed the abolition of the Railroad Labor Board, it was stated at the White House on Tuesday that the President has not yet definitely determined his position on this subject. Many phases of it are still under consideration and it is probable that the President will make his views known in an address before Congress at the opening of the session. He has, however, indicated his desire for some form of anti-strike legislation.

Railroad Surgeons Meet

The Association of Railroad Chief Surgeons, of which S. C. Plummer, of the Chicago, Rock Island & Pacific, is president, held a semi-annual meeting on October 17 in the Hotel Sherman, Chicago, where it was followed, beginning October 18, by a joint three-day session of the American Association of Railway Surgeons and the Association of Chicago, Milwaukee & St. Paul Surgeons. The sessions were almost entirely devoted to papers on the technic of handling various forms of injuries as well as the proper practices in claim cases. In the chief surgeons' meeting both the subjects of drinking water for trains and the report of the American Railway Association Committee on Hernia were discussed, the discussion on drinking water revolving around charges made by health departments concerning faulty handling of ice and water, in which discussion it was brought out that a report on drinking water would soon be made by the American Railway Association.

Hearing on Conditions Relating to Issue of Securities

Division 4 of the Interstate Commerce Commission has announced a hearing at Washington on October 26 for the consideration of the following:

1. Whether and to what extent the commission should, by its order in granting or withholding authorization and approval for the issuance of securities, determine, limit or restrict the price at which or the manner in which securities are to be sold and the cost to the carriers of the marketing of securities issued under the provisions of section 20a of the Interstate Commerce Act.

2. Whether it is within the province of the commission to require competitive bidding in the sale of securities and whether competitive bidding should be required.

3. If competitive bidding is required, to what class or classes of securities should it be applicable and under what regulations?

Any person who may be unable to appear on that date may file a memorandum on or before the date mentioned.

Shop Strike Leaders Ask for Jury Trial in Injunction Case

Leaders of the recent strike of railroad shopmen, named in the temporary injunction obtained by Attorney General H. M. Daugherty, will seek a trial by jury in an effort to balk the government's move for a permanent restraining order. This announcement, which was hinted at in recent Federal Court proceedings at Chicago, was definitely made on October 13 by Donald R. Richberg, attorney for B. M. Jewell and the other strike leaders. Mr. Richberg formally presented his motion for this procedure to the court on October 16.

At the same time it became known that a motion by Blackburn Esterline, assistant solicitor general, that hearings on the government's request for a permanent injunction be referred to a master in chancery, was granted by Judge James H. Wilkerson.

J. M. Dickinson, secretary of war under President Taft and formerly counsel for the Illinois Central, has been appointed special assistant to Attorney General Daugherty and placed in charge of the government's case against the strike leaders. The appointment of Mr. Dickinson is part of the announced plan to prosecute vigorously the injunction suit now pending before Judge Wilkerson.

Sixteen Roads Sign Agreements With New Shop Organizations

Railroads representing a total mileage of approximately 55,910 miles have signed agreements with "company unions," according to information recently given out by the Railroad Labor Board. This mileage does not include the Pennsylvania System, which was conducting negotiations with its employees through "company unions" before the shop crafts strike began. The new agreements provide, in effect, that the men waive their right to strike and the companies pledge themselves not to carry their controversies into the court, both parties agreeing to abide by the decisions of the Labor Board.

The 16 roads which have signed agreements with new organizations of their employees and which are included in the Labor Board's announcement are: The Southern Pacific (Pacific System); the Missouri, Kansas & Texas; the Southern Pacific, Texas and Louisiana Lines; the Nashville, Chattanooga & St. Louis; the Central of Georgia; the New York, New Haven & Hartford; the Chicago, Burlington & Quincy; the Colorado & Southern; the Great Northern; the Lehigh Valley; the International Great Northern; the Union Pacific; the Illinois Central; the Florida East Coast; the Trinity & Brazos Valley, and the San Antonio, Uvalde & Gulf.

Consolidation Hearings to be Resumed

The Interstate Commerce Commission has announced that hearings on its tentative consolidation plan will be resumed before Commissioner Hall and Examiner Healy at Washington, November 17. Evidence will be received with respect to carriers which, under the tentative plan, should be considered in connection with the following proposed systems as there outlined, or in connection with such alternative systems as may be proposed:

System No. 14—Burlington—Northern Pacific.
Chicago, Burlington & Quincy—Northern Pacific.
Chicago Great Western—Minneapolis & St. Louis.
*Spokane, Portland & Seattle.

System No. 15—Milwaukee—Great Northern.
Chicago, Milwaukee & St. Paul—Great Northern.
Chicago, Terre Haute & Southeastern—*Duluth & Iron Range.
*Duluth, Missabe & Northern—*Green Bay & Western.
*Spokane, Portland & Seattle—*Butte, Anaconda & Pacific.

It is expected that the main affirmative case in respect of each carrier, particularly the documentary evidence, will be presented at the hearing in Washington. In proper case opportunity will be afforded at the western hearings for completing the record as to such carrier. *Carriers starred in the above list, and other carriers not listed, may introduce all their evidence at the western hearings if that course proves more convenient and the commission is so advised in advance. The western hearings will be held primarily to afford state commissions, communities and the public an opportunity to present such evidence as they may desire, and, also, to cross-examine witnesses heard at the Washington hearing, provided the commission is so advised in season to enable it to arrange in proper case for the recall of witnesses for such subsequent cross-examination. The dates and places of the western hearings will be announced before the close of the Washington hearing.

War Finance Corporation Loans to Railroads Repaid, All but Five Per Cent

The War Finance Corporation announced on October 10 that it had received from the Chicago, Rock Island & Pacific $2,930,000, which represents repayment in full of the loans, aggregating $10,430,000, made by the corporation to the railroad in December, 1918, and January, 1919, and reduced to the above amount by several partial payments. Under its war powers, the corporation advanced to steam railroads, either direct or through the director general of railroads, $204,794,520. The repayments to date total $194,794,520 and represent 95 per cent of the amount originally advanced. The $10,000,000 still outstanding represents the extension of a portion of an advance of $12,497,940 made to the Erie on April 1, 1919, and is covered by a note, payable upon demand on or after April 1, 1923, bearing interest at 6 per cent and secured by collateral having a market value of approximately $15,000,000. The agreement with the Erie contains provisions under which the company may be required to substitute for the present note collateral trust notes in marketable form which the corporation may then sell at its option. The new notes would be secured by the same collateral listed above and would mature in not less than three years nor more than ten years from their date, as the War Finance Corporation may determine. They would be secured also by suitable provisions for redemption and would bear interest at not to exceed 7 per cent.

P. R. R. Women's Dance

The Women's Aid of the Pennsylvania Railroad held its grand ball at the Seventy-first Regiment Armory, Thirty-fourth street, New York City, on October 12, in accordance with announcement made some weeks ago, and the affair is pronounced a great success. About 17,000 tickets had been sold—far more than the number of persons who could get into the hall—and a good sum is realized for the uses of the "Aid." The gathering was said to be one of the largest of Pennsylvania Railroad officers, employees and members of their families that was ever assembled at a similar social gathering in the history of the Pennsylvania Railroad. Special trains brought large delegations from Atlantic City, Camden, Philadelphia, Trenton and other points on the New Jersey Division. In the entertainment there were many professional artists as well as talented employees of the road. The Car Service Department Glee Club from Philadelphia, numbering about 50 men, rendered many delightful vocal selections. At the conclusion of the entertainment a 1922 Sport Model automobile, given by the Haynes Motor Car Company of New York, was given to the person holding the admission ticket containing a certain lucky number, J. Weinberger, of New York City. The Women's Aid now has a membership of about 75,000. Among the officers of the railroad who came to New York from Philadelphia to attend the function, accompanied by their wives, were: General W. W. Atterbury, Elisha Lee, C. S. Krick and R. V. Massey. R. J. Sauer, secretary to General Superintendent C. I. Leiper, was chairman of the Committee of Arrangements.

I. C. C. Denies Permission to Inspect Valuation Records and Data

The Interstate Commerce Commission has denied the request of certain carriers to be permitted to examine and make copies, written and photographic, of the original field notes, cost data, copies of contracts, records of construction costs, opinions, sales, assessments and other data reports, records and compilations of the land, accounting and engineering sections of the bureau of valuation. After having considered fully the representations of the carriers and a brief submitted, the commission issued an order saying:

"That the opening of certain records and data of the bureau of valuation to inspection and examination by other than employees of the commission unless and until they shall have been offered in evidence in hearings before the commission upon pro-

tests against the tentative valuations of carriers' properties, or before a court of competent jurisdiction, would be detrimental to the public interest; would make it impossible for the commission to secure as reliable and uninfluenced opinions as to land values and price and cost information as it can otherwise secure; would unnecessarily prolong the work, and greatly increase the expense thereof; and would seriously interfere with due performance of the regular duties of the commission's employees."

It was ordered, "That, until the further order of the commission, office or field notations and memoranda in the bureau of valuation, and opinions or correspondence from or to any branch or employee thereof; land field notes, land computation sheets; cost information secured from manufacturers, dealers, contractors, private parties or carriers other than the carrier making the application for permission to inspect, cost studies and cost analyses prepared by the employees of the bureau of valuation, shall not be open for inspection by other than employees of the commission unless and until offered in evidence either in a valuation hearing under the provisions of section 19a of the interstate commerce act or in a court of competent jurisdiction."

Portable Receiving Set with Loop Antenna Used Inside Steel Coach

Wireless radio messages were received successfully inside a moving steel coach without the aid of an outside aerial on the Pennsylvania train No. 29, the Broadway Limited leaving New York on the run to Chicago, on October 13. On leaving the tubes under the Hudson river, the afternoon program of the W.O.R. broadcasting station at Newark, N. J., was picked up and the remainder of the concert received satisfactorily during the run towards Philadelphia. It is significant that while passing over the electrified section of the road from North Philadelphia

Photo by International

Receiving with a Loop Antenna Within a Steel Car

to Paoli the concerts and organ solo from a broadcasting station in Philadelphia were received without any interference or crackling due to the propulsion circuits. After passing Pittsburgh about midnight when all broadcasting was shut down, code messages from boats on Lake Superior and from the Great Lakes Naval Station were received.

The receiving equipment consists of a tuned 18 in. loop antenna, three steps of amplification, audion detector and two steps of audio frequency amplification. No connections or alterations were made to the steel car, the set being entirely self-contained and compact enough to be packed in a small trunk. The apparatus was furnished by the E-D Manufacturing Company of Philadelphia, Pa., and was set up and operated by Arno Zillger, chief engineer of the company; J. D. Jones, superintendent of telegraph and signals on the Eastern region of the Pennsylvania being the official observer representing the railroad. The E-D Manufacturing Company is now developing a transmitting and receiving set for duplex conversation on long freight trains between the engineman in the cab and the conductor in the caboose. It is claimed that a special equipment has been invented by which the conductor can call and automatically put in operation the receiving apparatus on the locomotive.

Valuation Hearings

The following valuation cases are set for oral argument before the Interstate Commission on November 1:

Valuation Docket No.	Carrier.
2	Texas Midland Railroad Company.
5	Winston-Salem Southbound Railway Company.
6	Elgin, Joliet & Eastern Railroad Company.
15	Tonopah & Tidewater Railroad Company.
21	Carolina Railroad Company.
31	Norfolk Southern Railroad Company.
37	Kinston-Carolina Railroad Company.
60	Central of Georgia Railway Company.
102	Riverside, Rialto & Pacific Railroad Company.
127	Ann Arbor Railroad Company.
159	New York, Philadelphia & Norfolk Railroad Company.

The following valuation cases have been set for hearing at Washington, upon protests to tentative valuations, before the examiners and on the dates named:

Valuation Docket No.	Carrier.	Examiner.	Date.
149	Mobile & Ohio Railroad Co.	Marchand	Oct. 20, 1922
150	Bangor & Aroostook R. R. Co.	Sweet	Oct. 20, 1922
192	New York, Ontario & West'n R. R. Co.	Sweet	Oct. 23, 1922
22	Hampton & Branchville R. R. Co.	Kelley	Oct. 25, 1922
24	New Mexico Midland Ry. Co.	Kelley	Oct. 26, 1922
49	Savannah & Northwestern Ry.	Kelley	Oct. 27, 1922
18	Georgia Northern R. R. Co.	Marchand	Nov. 6, 1922
36	Flint River & Northwestern Ry.	Marchand	Nov. 6, 1922

152	Chicago, Rock Island & Pacific Ry. Co.	Kelley	Dec. 7, 1922
195	Central Union Depot Company	Pattison	Dec. 8, 1922
192	Toledo, St. Louis & Western Ry.	Pattison	Dec. 11, 1922
201	Minneapolis Western Railway	Pattison	Dec. 18, 1922

The Bureau of Valuation has filed its brief in support of the supplemental tentative valuation of the properties of the Winston-Salem Southbound Railway Company, Valuation Docket No. 5.

Rate of Return for Two Years 3.47 Per Cent

The Association of Railway Executives has issued a statement calling attention to the fact that during the first two years since the general rate increase became effective on August 26, 1920, the railroads of the United States have failed by a wide margin to earn a return of 6 per cent on their tentative valuation. For the 24 months period ended on August 31, the net operating income of the railroads was only at the annual rate of return of 3.47 per cent.

"The Transportation Act when passed by Congress proposed that rates be so fixed as to yield the carriers a return of 6 per cent on their tentative valuation," says the statement. "This provision was to stand for two years ending on March 1, 1922. After that date the Interstate Commerce Commission was authorized to fix the rate. This the commission did recently, prescribing that the rate be 5¾ per cent, which is now in effect. Since the general rate increase went into effect on August 26,

1920, thousands of reductions have been made both voluntarily by the carriers and also by order of the Interstate Commerce Commission. There was a guarantee provided for in the Transportation Act to cover the first six months after the government relinquished federal control on March 1, 1920, but this terminated automatically on September 1 that year. Under this guarantee the railways were assured of earning the same net income as during the period of federal control. If their earnings proved insufficient to provide the net income so guaranteed, the deficiency was made up by the government out of the public treasury. This six months' guarantee was provided for the purpose of enabling the railroads to get on their feet after 26 months of federal control. Since September 1, 1920, however, there has been no guarantee to the railroads and even though the Transportation Act provides for the fixing of a certain rate level, there is nothing whatever in the act to assure the roads that such a level will enable them to realize any fixed return. If the railways fail to earn the rate of return so fixed, the deficiency is not made up by the government, but is borne by the carriers themselves.

"In computing the rate of return no consideration is given by the commission, whatever, to the capitalization of the roads, but the compilation is based solely on the valuation of the railroads of the country as tentatively fixed by the Interstate Commerce Commission for rate making purposes.

"During the first 12 months which ended on August 31 last year, the railroads had a net operating income of $523,598,172, which was at the annual rate of return of 2.81 per cent on their tentative valuation. During the second year the net operating income amounted to $781,673,377, or at the annual rate of 4.10 per cent. The net operating income for the two years totaled $1,305,271,549.

"The railroads in the Eastern district during the two year period had a net operating income of $590,006,537, which was at the annual rate of return of 3.46 per cent. Those in the Southern district had a net operating income of $135,630,903 or 3.09 per cent. For the railroads in the Western district the rate of return amounted to 3.57 per cent, net operating income having totaled during the 24 months period $579,634,109."

Revenues and Expenses for August

The Interstate Commerce Commission's summary of railway returns for August is as follows:

Item	August		Eight months	
	1922	1921	1922	1921
Average number of miles operated	235,095.59	234,955.69	235,229.32	234,818.00
Revenues:				
Freight	$326,485,814	$353,814,886	$2,491,204,487	$2,539,370,491
Passenger	[1]101,501,635	[2]109,192,034	[3]705,065,952	[4]793,089,978
Mail	7,292,532	7,449,539	54,166,744	63,876,543
Express	12,201,354	14,309,299	81,043,828	60,117,921
All other transportation	14,935,858	14,378,241	113,630,618	105,495,540
Incidental	10,900,732	9,844,240	73,145,610	79,255,919
Joint facility—Cr.	747,119	610,405	6,644,780	5,123,647
Joint facility—Dr.	187,974	133,617	1,399,821	1,092,438
Railway operating revenues	473,877,080	505,732,265	3,558,582,198	3,645,237,601
Expenses:				
Maintenance of way and structures	68,706,324	71,941,028	480,206,020	507,460,950
Maintenance of equipment	104,056,949	105,403,201	773,792,749	842,335,999
Traffic	7,236,029	6,833,954	57,710,675	56,770,158
Transportation	150,861,031	180,858,319	1,163,964,112	1,556,598,510
Miscel operations	4,356,178	4,163,779	31,327,930	33,532,856
General	13,636,746	13,466,110	104,471,306	114,451,672
Transportation for investment—Cr.	692,139	521,490	4,121,123	3,925,284
Railway operating expenses	347,160,178	382,105,901	2,806,451,659	3,107,215,661
Net revenue from railway operations	126,776,902	123,626,364	722,050,539	537,991,940
Railway tax accruals	67,871,000	26,251,763	290,327,272	183,584,799
Uncollectible railway revenues	133,776	125,206	905,274	784,313
Railway operating income	59,769,776	97,249,395	500,817,993	353,622,828
Equipment rents				
Dr. balance	5,460,480	5,653,323	37,537,031	34,963,965
Joint facility rents				
Dr. balance	1,709,349	1,435,870	12,697,303	12,595,264
Net railway operating income	52,579,797	90,160,202	471,183,599	306,063,599
Ratio of expenses to revenues (per cent)	73.29	75.55	79.51	85.24

[1] Does not include Boston & Albany the revenues and expenses of which are included in New York Central report.
[2] Includes $1,276,019, sleeping and parlor car surcharge.
[3] Includes $ 9,713,484, sleeping and parlor car surcharge.
[4] Includes $1,140,661, sleeping and parlor car surcharge.
[5] Includes $11,771,791, sleeping and parlor car surcharge.

Traffic News

The Northern Pacific restored observation cars on ten of its fast passenger trains on October 7.

M. A. Keith has been appointed traffic manager of the International Derrick & Equipment Company, Columbus, Ohio.

The Kansas City, Mexico & Orient of Texas has been given an increase in freight rates by the railroad commission of that state to the amount of 10 cents per 100 lb. to accrue locally and in the divisions.

The Southern Pacific, on October 17, reduced its freight rates on a number of commodities including automobiles, automobile parts, cotton and cotton linters, when for export from the East to Pacific Coast ports. The reductions range as high as 20 per cent.

The officers and directors of the Associated Traffic Clubs of America met in Cleveland, Ohio, on October 17 and 18, to plan a definite constructive policy for that organization. During the summer a number of new clubs were enrolled. Twenty-eight clubs from as many cities are now members of the association.

The Traffic Club of Des Moines, Iowa, has recently elected the following officers: President, S. W. Leigh, manager, Des Moines Hosiery Mills; vice-president, C. M. Cheney, general manager, Des Moines & Central Iowa; secretary and treasurer, C. A. Moore, general agent, Atchison, Topeka & Santa Fe Railway.

Shippers opposed to the Southern Pacific's efforts to retain the Central Pacific are threatening to organize committees in every county of southern California to take an active part in the campaign being waged by the California Producers' and Shippers' Association to endorse the decision of the Supreme Court, separating the Central Pacific from the Southern Pacific. E. G. Judah, chairman of the southern California committee, says that the membership drive is under way and that civic and commercial bodies of every section of the State are joining the campaign.

Commission Amends Coal Order

The Interstate Commerce Commission on October 18 issued Amendment No. 1 to Service Order No. 25 providing that from and after October 23 the supply and distribution of open top cars suitable for the loading and transportation of coal to wagon mines shall be subject to the following rule:

> Upon any day when any such common carrier by railroad is unable to supply mines upon its line with the required number of open top cars, such cars shall not be furnished or supplied by it to any mine which customarily does not load or is unable to load such cars with coal within 24 hours from and after the time of placement until all mines upon the line of any such carriers have been fully supplied with such cars.

It also adds foundry sand and materials for car and locomotive construction or repair to the list of commodities which may be loaded in open top cars in the direction of but not beyond the mine or mines to which such open top cars are destined for coal loading.

Coal Production

Complete returns on soft coal production for the week ended October 14 will show about 9,900,000 tons, according to the estimate of the Geological Survey. During the five weeks just closed the output has been at an almost uniform rate varying little from an average of about 9,780,000 tons.

The number of cars loaded on Monday, October 9, as reported by the railroads, was 40,596, the largest reported this year; but on Tuesday loadings fell off to 29,239 cars, a figure exceeded on several Tuesdays since the close of the strike. The total cars loaded on the first four days of the week shows an increase of 3.9 per cent as compared with the same days of the week before. Full returns on loadings for the week are expected to show an output of 9,800,000 to 10,000,000 tons.

Since the first of September coal has been offered for shipment up to the ability of the carriers to handle it. Production of bituminous coal in the second week of October of the past six years has been as follows:

	Tons		Tons
1917	10,924,000	1920	12,183,000
1918	12,190,000	1921	9,711,000
1919	11,888,000	1922	9,900,000

Production of anthracite has increased slightly and may reach a total of 2,000,000 net tons for the week. According to present indications the total of all coal raised is therefore about 11,900,000 tons, which is too low to meet current consumption and the heavy movement up the Lakes, and at the same time to rebuild consumers' stocks.

The aggregate of tidewater shipments from Atlantic ports increased to 2,224,000 net tons in the month of September. In comparison with August this was an increase of 404,000 tons or 18 per cent, which was distributed between all ports except Hampton Roads. The total shipments from Hampton Roads decreased although the shipments to New England points increased.

The effects of the strike are reflected in a table which shows that the total of 21,213,000 net tons dumped during the first nine months of this year is 11,000,000 tons, or more than one-third less than the average for the corresponding periods of the three years preceding. The principal decline was in tonnage for export —a drop from an average of nearly 10,000,000 to 1,357,000 tons. Bunker coal decreased nearly one-half. On the other hand, shipments to New England were increased markedly in the effort to offset the decline in all-rail shipments brought about by the strike.

In the opening weeks of the present navigation season only a very small tonnage of anthracite was shipped up the lakes. Following that practically none was moved during the summer. About the middle of September shipments were resumed. The cumulative tonnage moved now stands at less than 5 per cent of the tonnage moved in the corresponding period of 1921.

Although dumpings of soft coal into vessels at Lake Erie piers continued at a high rate, there was a slight decrease in the tonnage handled during the week ended October 8 as compared with the preceding week. The Ore and Coal Exchange reports the total handled during the week ended October 8 as 1,179,298 net tons, as against 1,245,373 tons in the week before. In comparison with the corresponding week a year ago, this was an increase of 56 per cent. Of the total dumpings 1,142,332 tons were cargo coal and 36,966 tons were vessel fuel. During the present season to October 8, inclusive, 10,836,083 tons of cargo coal have been dumped into vessels at Lake Erie piers. Of this quantity 9,829,091 tons were forwarded to regular lake markets and 1,006,992 tons were forwarded to Lake Erie destinations not ordinarily taking lake coal. Preliminary reports of dumpings during the first 2 days of the week show a decrease of about 15 per cent as compared with dumpings on corresponding days of the week before.

Complete reports received later by the Car Service Division of the American Railway Association show that more cars were loaded with coal during the week ended October 14 than on any previous week since the coal strike began on April 1. The total for the week was 220,751 cars. This exceeded the week before by 8,773 cars, and exceeded by 4,539 cars the week preceding that.

On the basis of the loading, coal production during the week approximated 11,950,000 tons, the greatest amount produced during any one week since the strike began. Of this amount, 10,037,000 tons were bituminous and 1,913,000, anthracite coal. Production for the previous week was approximately 11,478,000 tons, and for the week before 11,713,000 tons.

Loading of bituminous coal last week amounted to 182,489 cars, 6,589 above the week before. Anthracite loading amounted to 38,262 cars, which represents an increase of 2,184 over the week before.

A total of 41,201 cars were loaded with bituminous coal on Monday, October 16. This was the largest number loaded on any one day with bituminous coal since December 20, 1920, when the total was 42,004 cars. Loadings on Monday exceeded by 605 cars the preceding Monday, which up to that time had been the high point. It also exceeded the daily average for October last year by more than 10,000 cars, and the daily average for September this year by more than 12,600 cars.

Commission and Court News

Interstate Commerce Commission

The commission has suspended from October 15, until February 12, 1923, the operation of schedules which propose increases in the rates on building and roofing paper, and prepared roofing, carloads, from Cincinnati, Lockland, Carthage, Ohio and other points in Ohio and Indiana to St. Paul and Duluth, Minn.

The commission has suspended from October 17 until February 14, 1923, the operation of schedules published in Agent R. H. Countiss' tariff which propose to reduce the rates on imported shipments of vegetable oils from Pacific Coast points to certain points in Central Freight Association Territory, from 105 to 75 cents per 100 pounds.

The commission has suspended from October 15 until February 12, 1923, the operation of schedules which propose to revise the class rates from Southeastern Freight Association territory to all destinations in Mississippi Valley Freight territory. The proposed changes would result in both increases and reductions in existing rates from and to the points mentioned.

The commission has suspended from October 16, and later dates, until February 13, 1923, the operation of schedules contained in tariffs of various carriers and E. B. Boyd, B. T. Jones and F. L. Speiden, agents. The suspended schedules which are principally published by lines in Official Classification territory, propose to cancel the rule and reference to the rule for constructing combination rates on brick and articles taking brick rates and related articles.

Emergency Fourth Section Order for Cotton

By fourth section order and by special permissions dated October 12, the commission has granted applications of the Illinois Central and Yazoo & Mississippi Valley and other carriers parties to Agent J. H. Glenn's eastern cotton tariff to establish on five days' notice rates on cotton, cotton linters or regins from stations on the Illinois Central, Yazoo & Mississippi Valley and Chicago, Memphis & Gulf to Baltimore, Philadelphia, New York, Boston and other destinations in eastern territory named in the tariff via New Orleans, and the Southern Pacific Atlantic Steamship Lines (Morgan Line) the same as the rates currently in effect via all-rail and rail-and-water routes through Atlantic ports, without observing the long-and-short-haul provision of the fourth section, combinations on New Orleans or other points which may make lower rates to be observed as maximum in all cases.

An emergency is alleged to exist in that the all-rail and rail-and-water routes through Ohio river crossings and Virginia cities over which cotton produced in the Mississippi Valley is ordinarily transported to trunk line and New England territory mill points are either closed by embargoes or so congested as to prevent prompt movement and the establishment of the proposed rates is intended to relieve this emergency and permit shipment of cotton from the Mississippi Valley via New Orleans through which port no joint through rates have heretofore been in effect. The relief as granted is limited to January 1, 1923, and is intended by the commission strictly as an emergency measure to relieve existing conditions and not as a permanent adjustment.

United States Supreme Court

The United States Supreme Court on October 16 dismissed three suits brought by Minnesota state officials to contest the right of the Interstate Commerce Commission to order increased passenger and baggage rates for intrastate transportation. The cases grew out of the state rate orders issued by the Interstate Commerce Commission following its increase of interstate rates in 1920. No opinion was written by the court, but the suits were dismissed on the authority of cases cited, including principally the Wisconsin case.

Equipment and Supplies

Locomotives

THE TOLEDO TERMINAL contemplates buying 3 switching locomotives.

THE DENVER & RIO GRANDE is inquiring for 10 Mountain type locomotives.

THE WESTERN PACIFIC contemplates buying 5 Mikado type locomotives.

CHICAGO, ST. PAUL, MINNEAPOLIS & OMAHA contemplates buying 15 locomotives.

THE CHICAGO, MILWAUKEE & ST. PAUL is inquiring for 50 Mikado type locomotives.

THE RICHMOND, FREDERICKSBURG & POTOMAC is inquiring for 2, 8-wheel switching locomotives.

THE GRAND TRUNK is inquiring for 10, 6-wheel switching locomotives and 10, 8-wheel switching locomotives.

THE NORTHERN PACIFIC, reported in the *Railway Age* of September 23 as contemplating issuing inquiries for from 50 to 80 miscellaneous type locomotives, is inquiring for 20 Mikado type, 20 Pacific type, 15 switching locomotives and 4 Mallet type locomotives.

THE BALTIMORE & OHIO has ordered from the General Electric Company 2, 120-ton, 600 volt, direct current electric locomotives to be delivered in March, 1923. The locomotives will be practically duplicates of those now in use in the Detroit tunnel on the Michigan Central.

THE MINARETS & WESTERN has ordered 5 Mikado type locomotives from the American Locomotive Company, of these 3 locomotives will have 24½ by 28 in. cylinders and a total weight in working order of 250,000 lb. and 2 locomotives will have 20 by 24 in. cylinders and a total weight in working order of 190,000 lb.

THE CHICAGO, ROCK ISLAND & PACIFIC, reported in the *Railway Age* of September 23 as inquiring for 30 Mikado type and 10 Mountain type locomotives, has ordered this equipment from the American Locomotive Company. The Mikado type engines will have 28 by 30 in. cylinders and a total weight in working order of 332,000 lb.; the Mountain type will have 28 by 28 in. cylinders and a total weight in working order of 369,000 lb.

Freight Cars

THE TEXAS COMPANY is inquiring for 100 tank cars.

THE NEW YORK, NEW HAVEN & HARTFORD is inquiring for 2 transformer cars.

THE NEW YORK CENTRAL will have 500 box cars repaired at the shops of the Streator Car Company.

THE ATLANTIC COAST LINE has ordered 500 steel underframes for box cars from the Standard Tank Car Company.

THE ERIE RAILROAD has given a contract to the Magor Car Company for making repairs to 500 cars; most of these are gondola cars.

THE TENNESSEE COAL, IRON & RAILROAD COMPANY has ordered 195 miscellaneous cars from the Chickasaw Ship Building Company.

THE PENNSYLVANIA COAL & COKE CORPORATION has ordered 1,000 hopper cars, of 50 tons' capacity, from the American Car & Foundry Co.

THE CUDAHY PACKING COMPANY, Chicago, will build 200 refrigerator cars in its shops at East Chicago. The cars are to be built in lots of 50.

THE VIRGINIAN RAILWAY is inquiring for from 500 to 1,000 flat bottom gondola cars of 100 tons' capacity, also for from 500 to 1,000 steel gondola cars of 120 tons' capacity.

THE NATIONAL REFINING CORPORATION, Hoboken, N. J., is inquiring for from 5 to 25 tank cars of 40 tons' capacity; also for the same number of cars of 50 tons' capacity.

THE PERE MARQUETTE reported in the *Railway Age* of October 14 as expected to come in the market for 2,000 cars, is now inquiring for 1,500 box cars and 500 hopper cars.

THE WESTERN PACIFIC, reported in the *Railway Age* of September 23 as inquiring for 100 automobile cars, has ordered this equipment from the Mount Vernon Car Manufacturing Company.

THE DETROIT, TOLEDO & IRONTON, reported in the *Railway Age* of October 14 as about to place an order for 500 to 1,000 coal cars, has ordered 500 cars from the Cambria Steel Company and 500 from the Standard Steel Car Company.

Passenger Cars

THE CUBA RAILROAD is building one business car in its shops at Camaguey, Cuba.

THE ARMS YAEGER COMPANY has placed an order with the Pullman Company for 14 horse cars.

NEW YORK CENTRAL.—Car builders are asking for prices on specialties for 20, 70-ft. steel coaches and 80, 60-ft. steel baggage cars, for the New York Central Lines.

THE LONG ISLAND, reported in the *Railway Age* of September 16 as contemplating inquiring for 90 cars for passenger service, is now asking for 40 motor cars, 20 electric trailer cars, 20 trailer coaches for steam suburban service, 10 coaches for steam service and 2 combination baggage and mail cars for steam service.

THE CENTRAL OF NEW JERSEY, reported in the *Railway Age* of October 14 as inquiring for 65 cars for passenger service, has ordered 30 all-steel coaches from the Standard Steel Car Company, 20 all-steel coaches, 10 steel baggage cars and 5 steel combination passenger and baggage cars from the American Car & Foundry Company.

Iron and Steel

THE SAN ANTONIO & ARANSAS PASS has issued an inquiry for 5,500 tons of rails.

THE MISSOURI, KANSAS & TEXAS has purchased five boilers, to be installed in the shops at Bellmead, Tex., from the Babcock & Wilcox Company, and the super-heaters for the boilers from the Superheater Company.

Miscellaneous

THE NORFOLK & WESTERN is asking for bids until 12 o'clock noon November 1, at Roanoke, Va., for about 1,450,000 tie dating nails, 300 steel car axles, 400, 33-in. steel wheels and 500 ft. of wire rope.

Signaling

THE IMPERIAL GOVERNMENT RAILWAYS OF JAPAN have ordered from the Union Switch & Signal Company 275 automatic signals for installation on main line tracks. Of the total number of signals, 135 are "T-2" a.c. semaphores and 140 are color light signals. The order embraces complete track circuit equipment, including a total of 230 Model 15, vane relays, 630 SLV-13 a.c. relays, 450 track transformers, and complete track circuit accessories such as impedances, reactors, etc. This is the same class of material as used in the initial installation of automatic block signaling made by the Imperial Government Railways, now in service on the main line, consisting of 310 complete sets of similar material furnished by the Union Switch & Signal Company.

Supply Trade News

F. N. Bard, president of the Barco Manufacturing Company, Chicago, has also been elected president of the **Argyle Railway Supply Company**, Chicago.

The Geo. W. Fife Engineering Company, 1403 Merchants Bank building, Indianapolis, Ind., has been appointed representative in Indiana for the Conveyors Corporation of America, Chicago.

Walter S. McKee has resigned as vice-president and director of the American Manganese Steel Company and in future will develop the business of the Inland Engineering Company, Chicago, of which he is president.

A. F. O'Connor, mechanical engineer of the **Union Railway Equipment Company**, Chicago, has been elected vice-president, with headquarters at Chicago, **R. C. O'Connor** has been appointed mechanical engineer, and **B. Smith**, purchasing agent, with the same headquarters.

The Krantz Works of the **Westinghouse Electric & Manufacturing Company** have been moved to Mansfield, Ohio, from Brooklyn, N. Y., where they have been situated for a number of years. The transfer to Mansfield offers better facilities for increased production, gives the works location in the central part of the country with easy access to a large number of railroads and to both middle west and eastern offices of the Westinghouse Company.

Railway Construction

ATLANTIC COAST LINE.—This company has awarded contracts for the laying of second main track as follows: Ashley River to Bennetts, S. C., 3 miles, to W. W. Boxley & Co., Roanoke, Va.; Ridgland, S. C., to Savannah River, 21 miles to E. W. Parket, Tampa, Fla.; Savannah River to Central Junction, Ga., 12 miles, to F. M. Jones, Savannah; Southover to Burroughs, Ga., 7 miles, to Williams Bros. Construction Company, Roanoke, Va.; Doctortown to Jesup, Ga., 4 miles, to the C. G. Kershaw Contracting Company, Birmingham, Ala.

CANADIAN PACIFIC.—This company has awarded contracts to T. Jamieson and Mr. Kenzie, Ltd., Calgary, Alta., for the extension of 12 stalls of the locomotive house at Calgary, Alta.; to A. C. Creelman & Company, Calgary, Alta., for the building of stations, section houses, grain loading platforms, stockyards and water tanks and for the fencing on 50 miles of the branch from Lanigan, Sask., to Naicam; to the Northern Construction Company, Winnipeg, for the completion of the grading on the extension from Cracknell, Man., to Inglis, a distance of 6.2 miles; and to the Hamilton Bridge Company, Hamilton, Ont., for the construction of two 90.-ft turntables, for installation at Brandon, Man., and at North Bend, B. C.

GRAND TRUNK.—This company, which was reported in the *Railway Age* of September 30 as accepting bids until October 4 for a two-story brick freight house 20 by 32 ft. at Harvey, Ill., has awarded the contract to T. S. Leake & Co., Chicago.

MICHIGAN CENTRAL.—This company closed bids October 14 for a car repair shop 30 by 200 ft. at Niles, Mich., to cost approximately $15,000.

PENNSYLVANIA.—See elsewhere in this issue item concerning electrification between Altoona and Conemaugh.

PENNSYLVANIA.—This company has awarded a contract to the McClintic-Marshall Company for extensive additions to its Juniata shops.

A Tourist Train in Australia

Railway Financial News

BUFFALO, ROCHESTER & PITTSBURGH.—*Bonds Offered.*—Lee, Higginson & Co. are offering at 96¼ and accrued interest an issue of $4,500,000 consolidated mortgage 4½ per cent gold bonds due 1957, and non-callable. The proceeds from the sale will be used to retire at maturity on December 1, 1922, $3,655,000 6 per cent bonds, to provide additional working capital and to reimburse the company in part for the purchase of equipment paid for out of earnings. This issue has been authorized by the Interstate Commerce Commission.

CHICAGO, ATTICA & SOUTHERN.—*Asks Authority for Operation.*—This company has applied to the Interstate Commerce Commission for a certificate authorizing the acquisition and operation of that part of the Chicago & Indiana Coal Railroad extending from La Crosse to a point 25.76 miles north of Brazil, Ind., with a branch from Percy Junction to the Indiana-Illinois State Line. The commission recently had authorized the Chicago & Indiana Company to abandon the line and the part mentioned has been purchased by the new company for $250,000.

ELECTRIC SHORT LINE.—*Asks Authority to Issue Bonds.*—This company has applied to the Interstate Commerce Commission for authority to issue $600,000 of 15-year 5 per cent gold bonds to enable it to finance an extension of 44 miles westerly from Hutchinson, Minn., in the direction of Clare City.

LOUISIANA & ARKANSAS.—*Authorized to Issue Bonds.*—The Interstate Commerce Commission has authorized an issue of $470,000 of first mortgage 5 per cent gold bonds to be pledged as collateral security for short term notes.

MACON & BIRMINGHAM.—*Passenger Service Discontinued.*—Judge H. A. Mathews in the Superior Court at Macon, Ga., has ordered all passenger service discontinued on this road, effective October 11. The order followed the recommendation of R. B. Pegram, receiver, who reported that the road was in bad physical condition. Freight service will be continued between Macon and La Grange, 97 miles.

MISSOURI, KANSAS & TEXAS.—*Sale Again Postponed.*—The sale of this road, scheduled for October 16, has again been postponed. The action was taken pending the approval by the Interstate Commerce Commission of the reorganization plan of the company.

NASHVILLE, CHATTANOOGA & ST. LOUIS.—*New Director.*—Walter O. Parmer, of Nashville, Tenn., has been elected a director to succeed W. W. Berry, deceased.

NASHVILLE, CHATTANOOGA & ST. LOUIS.—*Equipment Trust Authorized.*—The Interstate Commerce Commission has authorized this company to assume obligation and liability in respect of $1,800,000 of equipment trust certificates to be issued by the United States Trust Company and sold at not less than 94.89.

PACIFIC SOUTHWESTERN.—*Asks Authority to Sell Stock.*—This company, which was incorporated for the purpose of building a standard gage railroad between Lompoc, Cal., and White Hills, a distance of 4 miles, has applied to the California Railroad Commission for authority to issue and sell its common stock at par, and to use the proceeds for the purchase of right-of-way and the construction of the road. The company is incorporated for $100,000, divided into a thousand shares of a par value of $100 each.

SEABOARD AIR LINE.—*Partial Guaranty Payment Certified.*—The Interstate Commerce Commission has certified to the Secretary of the Treasury a partial payment of $300,000 on account of this company's guaranty for the six months period of 1920.

SOUTHERN RAILWAY.—*Freer Hand Is Asked for Railway Officers.*—The stockholders at their annual meeting in Richmond on October 10 unanimously adopted the following resolution which was introduced by Arthur C. Graves, of New Haven, Conn.:

Resolved, That we, the stockholders of Southern Railway Company, in annual meeting assembled, do hereby take this occasion to express our complete confidence in the corporate management and control of the railway lines of this system, and of the ability of this railway company to furnish to the communities and the territory traversed by its lines, a proper, efficient and economical transportation system at the lowest possible rates consistent with the proper maintenance and sound credit, when operated under the management of its president, the board of directors and its officers; and that to this end we believe a larger degree of managerial responsibility and discretion should be returned to and vested in the president, board of directors and officers of this company free from the artificial restrictions of commission control; and further, that it is to the best interest, not only of the investing owners of these properties and the security holders, but also of the public and shippers in the way of reasonable rates, and of the operatives in respect of a proper standard of wage, and for a just settlement of industrial disputes, that the initiative in all matters of operation and management should be left to the sound judgment and business experience of the operating officers of this company.

Resumes Preferred Dividend.—The company has declared a semi-annual dividend of 2½ per cent on the preferred stock, payable November 15 to stock of record October 31. This is the first distribution on the issue since December, 1920, when the regular semi-annual distribution of 2½ per cent was made.

TEXAS & PACIFIC.—*Asks Authority for Equipment Trust.*—The receivers have applied to the Interstate Commerce Commission for authority to incur obligation and liability for $810,000 of 5 per cent equipment trust certificates.

WESTERN PACIFIC.—*Argument on Application for Authority to Acquire Control of Sacramento Northern.*—The Interstate Commerce Commission has announced that oral arguments will be heard in this case at Washington on December 6 on the question involved in the interpretation of paragraph 1 of section 20a of the Interstate Commerce Act as to the meaning of the words "a street, suburban, interurban electric railway which is not operated as a part of a general steam railroad system of transportation." The request for argument was made by the American Short Line Railroad Association and others.

Railroad Administration Settlements

The United States Railroad Administration reports the following final settlements, and has paid out to be received from the several roads the following amounts:

Atchison, Topeka & Santa Fe, including following subsidiaries: Gulf, Colorado & Santa Fe, Panhandle & Santa Fe, Rio Grande, El Paso & Santa Fe, Kansas Southwestern, Grand Canyon Railway	$21,500,000
Ashland Coal & Iron Railway	65,000
St. Joseph Union Depot Company	7,300
Port St. Joe Dock & Terminal Railway	4,500
Harlem Transfer Company paid Director General	20,000
Middletown & Unionville Railway paid Director General	45,000

Dividends Declared

Southern Railway.—Preferred, 2½ per cent, payable November 15 to holders of record October 31.

Trend of Railway Stock and Bond Prices

	Oct. 17	Last Week	Last Year
Average price of 20 representative railway stocks	73.63	72.35	54.58
Average price of 20 representative railway bonds	87.85	88.65	76.34

THE LONG ISLAND will receive bids until 12 o'clock noon November 1 for 108 rigid hard frogs, 109 alloy tipped switches and 1,000 twin tie plates. All the above is for use with 100-lb. rail.

THE MISSOURI, KANSAS & TEXAS, reported in the *Railway Age* of October 14, as inquiring for 4,500 kegs of spikes and 2,000 kegs of bolts, has ordered this material from the Illinois Steel Company.

THE MISSOURI, KANSAS & TEXAS has placed an order with the Shaw Electric Crane Works of Manning, Maxwell & Moore, Inc., for an electric traveling crane of 180 tons' capacity, one of 40 tons' capacity and two of 15 tons' capacity.

MONTANA WILL DEDICATE the new engineering building of the Greater University of Montana to William Milnor Roberts, pioneer location engineer of the Northern Pacific. The suggestion of the university faculty that the memory of Mr. Roberts be thus honored has been approved by the State Board of Education. The new building is now under construction on the college campus at Bozeman.

Railway Officers

Executive

S. J. Hungerford has been appointed vice-president with the title of vice-president and general manager of the Canadian National until Sir Henry Thornton, president, takes up the duties of his office. Mr. Hungerford will exercise the authority and perform the duties hereto exercised by the retiring president, D. W. Hanna.

D. E. Galloway, assistant to the president of the Grand Trunk, has been appointed assistant vice-president of the system. Mr. Galloway was born at Crieff, Ontario, in 1882 and entered the service of the Grand Trunk at Hamilton, Ontario, on February 1, 1901. In 1904, Mr. Galloway was appointed secretary to Charles M. Hays, then president of the Grand Trunk Pacific and the Grand Trunk Western. After occupying this position for seven years he was appointed in October, 1911, assistant to the president of the Grand Trunk and served in this capacity until the time of his appointment as assistant vice-president.

D. E. Galloway

T. A. Hamilton, vice-president and assistant to the president of the St. Louis-San Francisco, with headquarters at St. Louis, Mo., has been elected president of the International-Great Northern, with headquarters at Houston, Tex. **J. W. Kendrick**, consulting engineer, Chicago, and formerly vice-president of the Atchison, Topeka & Santa Fe, has been elected chairman of the board.

Financial, Legal and Accounting

L. L. Atwood, has been appointed contract attorney of the Missouri Pacific with headquarters at St. Louis, Mo.

C. H. Moses has been appointed secretary of the Graysonia, Nashville & Ashdown with headquarters at Little Rock, Ark. **G. H. Bell** has been appointed treasurer; **W. E. Collins** has been appointed auditor and car accountant and **J. D. Sain** has been appointed attorney with headquarters at Nashville, Ark.

Operating

E. G. DeLong has been appointed assistant trainmaster of the Pennsylvania, with headquarters at Toledo, Ohio.

C. C. Hill, has been appointed superintendent of the Graysonia, Nashville & Ashdown with headquarters at Nashville, Ark.

A. N. Williams has been appointed general manager of the Midland Valley with headquarters at Muskogee, Okla., effective October 14.

J. H. Fraser, executive general agent of the St. Louis-San Francisco, with headquarters at Memphis, Tenn., has been promoted to assistant general manager, with headquarters at Springfield, Mo.

G. H. Munchin, assistant superintendent of the Atchison, Topeka & Santa Fe with headquarters at Marceline, Mo., has been appointed superintendent of the Illinois division with headquarters at Chillicothe, Ill. He has been succeeded at Marceline by **W. A. Guild**, engineer, East district, with headquarters at Topeka, Kan.

Charles Manning, assistant to the vice-president of the Grand Trunk, has been appointed assistant operating manager, Eastern lines. Mr. Manning began his railroad career with the Great Western at Bristol, England. In 1883 he entered the office of the mechanical superintendent of the Grand Trunk at Montreal and, in 1898, was advanced to chief clerk in the motive power department. He was appointed assistant to the vice-president in charge of the mechanical department on January 1, 1917, and assistant to vice-president in charge of operation in May, 1920, which latter position he held at the time of his recent promotion.

W. D. Dilley, whose promotion to superintendent of the Louisville, Cincinnati & Lexington division of the Louisville & Nashville was reported in the *Railway Age* of August 26, was born on December 7, 1869, at Macksburg, Ohio. He entered railway service in June, 1887, as an operator on the Baltimore & Ohio where he remained until 1890. From that time until 1892 he was consecutively an operator on the Missouri, Kansas & Texas and on the Pittsburgh division of the Pittsburgh, Cincinnati, Chicago & St. Louis (Pennsylvania). He returned to the Baltimore & Ohio as an operator in 1892, and entered the service of the Louisville & Nashville as an operator in August, 1894, since which he has been copy operator in the dispatcher's office, agent, and agent-yardmaster. On June 1, 1907, he was promoted to trainmaster of the Lebanon branch and in 1917, to inspector of transportation, which position he held until August, 1918. He was appointed superintendent of terminals at Louisville, Ky., on the latter date and when the former superintendent of terminals returned from government service on March 1, 1920, he was transferred to the Louisville, Cincinnati & Lexington division as assistant superintendent, which position he held until his recent promotion.

C. J. Bowker, general superintendent of the Ontario Lines of the Grand Trunk, has been appointed operating manager of the Lines East of the Detroit and St. Clair rivers. Mr. Bowker entered the service of the Grand Trunk in 1900 as a train dispatcher at London, Ontario, and shortly thereafter was appointed chief train dispatcher and subsequently to train master, serving at various points on the system until 1909, when he was appointed assistant superintendent of the Stratford division. A year later he was advanced to superintendent of the St. Thomas division and in 1913 was appointed to general superintendent of the Eastern Lines. In that capacity, he handled during the period of the war the heavy war traffic which was carried by the railway to the ports of Montreal, Quebec and Portland. In 1918 he was transferred to the Ontario lines as general superintendent, which position he held until the time of his recent promotion.

C. J. Bowker

D. W. Bowker, whose promotion to division superintendent of the St. Louis Southwestern with headquarters at Pine Bluff, Ark., was reported in the *Railway Age* of October 14, was born on October 9, 1883, at Collinsville, Ill. He entered railway service in 1903, with the Vandalia (Pennsylvania) and was in the employ of the Missouri Pacific from 1909 to 1916. On November 17, 1916, he entered the service of the St. Louis Southwestern as yardmaster and was later pro-

moted to general yardmaster. He held this position until April 1, 1920, when he was promoted to assistant superintendent, which position he held until his recent promotion.

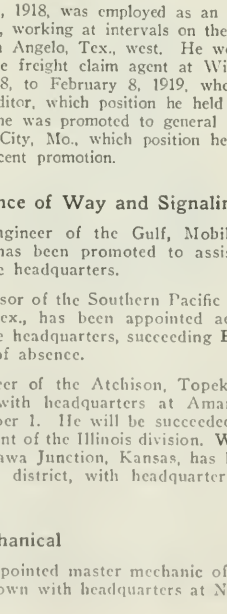
Traffic

A. W. May has been appointed commercial agent of the Illinois Central with headquarters at San Francisco, Cal.

G. W. Wood, has been appointed general agent of the Chesapeake & Ohio with headquarters at Cincinnati, O.

B. Wagner, division freight agent of the New York Central with headquarters at Toledo, Ohio, has been appointed assistant general freight agent with headquarters at Chicago, succeeding E. L. Whitney, promoted. Mr. Wagner will be succeeded by **W. J. Keller**, division freight agent with headquarters at Kankakee, Ill., who in turn will be succeeded by **L. Blue**, general agent, with headquarters at Buffalo, N. Y.

G. Thompson, general agent of the Kansas City, Mexico & Orient, with headquarters at Kansas City, Mo., has been promoted to general freight agent in charge of solicitation with the same headquarters. He was born on February 18, 1888, at Larned, Kan., and entered railway service on August 16, 1906, as a station helper on the Atchison, Topeka & Santa Fe, at Halstead, Kan. From November 20, 1906, to September 17, 1908, he was employed as a baggage and freight checker at Dodge City, Kan., and from the latter date to July 19, 1910, he was a telegraph operator and agent at various points in Kansas. On July 19, 1910, he entered the service of the Kansas City, Mexico & Orient and until December 11, 1918, was employed as an agent and operator at various points, working at intervals on the construction of the line from San Angelo, Tex., west. He worked as a clerk in the office of the freight claim agent at Wichita, Kan., from December 11, 1918, to February 8, 1919, when he was promoted to traveling auditor, which position he held until April 1, 1920. On this date he was promoted to general agent with headquarters at Kansas City, Mo., which position he was holding at the time of his recent promotion.



G. Thompson

Engineering, Maintenance of Way and Signaling

L. P. O. Exley, office engineer of the Gulf, Mobile & Northern, at Mobile, Ala., has been promoted to assistant chief engineer, with the same headquarters.

R. W. Meek, signal supervisor of the Southern Pacific with headquarters at Houston, Tex., has been appointed acting signal engineer with the same headquarters, succeeding **E. E. Worthing**, who is on leave of absence.

F. M. Bisbee, chief engineer of the Atchison, Topeka & Santa Fe, Western Lines, with headquarters at Amarillo, Texas, will retire on November 1. He will be succeeded by **M. C. Blanchard**, superintendent of the Illinois division. **W. C. Baisinger**, roadmaster at Ottawa Junction, Kansas, has been promoted to Engineer, East district, with headquarters at Topeka, Kan.

Mechanical

A. McCormick has been appointed master mechanic of the Graysonia, Nashville & Ashdown with headquarters at Nashville, Ark.

C. Peterson has been appointed acting master mechanic of the Denver & Salt Lake with headquarters at Denver, Colo.

J. D. Young, has been appointed assistant master mechanic of the Central of New Jersey, with headquarters at Ashley, Pa. **David Evans** has been appointed road foreman of engines with the same headquarters.

John J. Hanlin, whose appointment as assistant superintendent of motive power of the Seaboard Air Line was announced in the *Railway Age* of September 23, page 592, was born on June 1, 1871, in Texas county, Mo. He was educated in the high schools of Birmingham, Ala., and left school in 1888 to enter the employ of the Savannah, Americus & Montgomery (now Seaboard Air Line). A short time thereafter he left this road for a private machine shop where he completed his apprenticeship as a machinist and in July, 1891, re-entered the service of the Savannah, Americus & Montgomery as a machinist. From 1891 to 1898 he served the same company as a hostler, fireman and yard engineman at Americus, Ga. From 1898 to 1900 he was in the employ of the Louisville & Nashville at Birmingham as a machinist and gang foreman. From 1900 to 1903 he was general foreman and locomotive engineman for the Birmingham Southern at Pratt City, Ala. During the latter year he entered the service of the Southern as a machinist and roundhouse foreman at Birmingham and, the following year, entered the employ of the Seaboard Air Line in the same capacity at Birmingham; in 1906 he was promoted to general foreman at the same place and, in 1907, to master mechanic of the Georgia division. In this latter capacity he was serving at the time of his recent promotion.

J. J. Hanlin

E. W. Smith, engineer of transportation of the Pennsylvania with headquarters at Philadelphia, has been appointed general superintendent of motive power of the Southwestern region with headquarters at St. Louis, Mo. **W. C. A. Henry**, general superintendent of motive power at St. Louis, has succeeded Mr. Smith as engineer of transportation.

Purchasing and Stores

C. F. Leatherman has been appointed acting purchasing agent of the Kansas, Oklahoma & Gulf with headquarters at Muskogee, Okla.

Special

W. G. Slaughter has been appointed acting chief special agent of the Seaboard Air Line with headquarters at Norfolk, Va., succeeding M. Welsh, resigned to accept service with another company.

Obituary

J. A. Stewart, former minister of railways of Canada died at Halifax, N. S., on October 7.

T. W. Place, who was master mechanic of the Illinois Central with headquarters at Waterloo, Ia., until he retired on a pension on November 1, 1901, died on October 9 at Waterloo after a few months of ill health. He was born on January 2, 1833, at Acworth, Sullivan county, N. H., and entered railway service in 1853 as a locomotive fireman on the Boston & Maine. In 1854 he became a locomotive engineer on the Illinois Central, and on September 1, 1861, he was promoted to master mechanic at Dubuque and later at Waterloo.

Proper Punctuation of Train Orders

This paper for many years has advocated the abolition of complicated train orders (often, perhaps usually, made more complicated by very poor penmanship); that is to say, it has advocated the use of the complete block system, which makes written train orders unnecessary, except in emergencies. In spite of this thousands of 19 and 31 orders are issued every day, and the long-standing veneration in which the American train-dispatching system is held continues unabated in a multitude of offices. This being so, we once more call attention to the fact that each subject in a train order ought to be put into a separate paragraph. A recent collision at Toltec, New Mexico, is reported in another column. The misreading of that train order was, no doubt, due to the lack of a suitable separation after the twelfth word, "Osier." That will be the excuse of the men who blundered in reading. Mistakes of this nature *are not rare*. To write orders properly would in many cases require larger blanks. That, perhaps, is one reason why this improvement remains neglected. If beginning each item of an order on a new line would be too much of a jar to settled habits, perhaps a useful lesson might be learned from the innovation which the machine telegraphers have recently adopted—the insertion of the word "stop" wherever a period ought to appear. It is too bad to go on killing people for lack of so simple a precaution.

Monthly Earnings Reports

The monthly figures of railway revenues and expenses which the Class I railroads render to the Interstate Commerce Commission are made public through their being made available to the press by the commission. A considerable number of the carriers also furnish the press direct with copies of the statements filed with the commission or with statements compiled in a similar manner. Presumably there remains but little doubt as to the value of the monthly statements. There is some criticism of the requirement which calls for the filing of the monthly figures, but it would appear that this is minority and not majority opinion. The value which is admitted to exist in the reports is that the figures in total for all the roads enable the commission, the railway men and the public to check up promptly on railway progress. Monthly figures of railway gross and net serve a variety of useful purposes and are of sufficient use that they are regarded as a very necessary part of business statistical information. The primary value of the figures for the individual roads—as distinguished from the figures of all the roads in total—would seem to lie in the necessity for one railroad to compare its own results with those of its neighbors, and in the necessity for the investor in railway securities to keep himself informed as adequately as he can concerning the property in which he is is interested. The reports, therefore, should be adequate, and should be given a fairly wide circulation. A question that arises is: Are they adequate? Unfortunately they seem to lack that quality to a certain extent. The figures in the reports to the commission show their final results in item 24—"Net railway operating income" or "Net after rentals." The lack of adequacy exists because there does not seem as yet to be a complete understanding of the meaning of these expressions. The monthly reports of the carriers will attain a much greater usefulness when people—railway men, investors and others interested—secure a better understanding of what the commission means when it uses these expressions, when the carriers come to a more universal use of the figure embodied in them, and when, in general, there is a more consistent use of the expressions than there is at present. There is room for much improvement in this regard.

Everybody's Business Is Nobody's

Whenever shortage of equipment imposes on the railroads the necessity for a maximum utilization of the available cars, various measures are called to mind which would encourage, if not actually require, the shippers to load cars to capacity. Among the suggestions offered are increases in the minimum carload, a sliding scale of tariffs favorable to loadings in excess of the minimums and provision for a larger diversity of mixed carloads. But any efforts to obtain relief from this source in a time of stress are much like attempting to repair the roof during a shower—by the time one can borrow a ladder the storm will be over. In short, this is no time to look for outside help; the roads must work with the tools at hand and the most effective tool in this case is the station agent. But unless he takes a sincere interest in the subject, unless he is made to feel that it is a real part of his job, little will be accomplished. Some form of organization must be set up, not only to bring the necessity of increased car loadings to the agent's attention, but to point out to him how he *can* help and institute a follow-up system to see that he *does* help. The form of this organization, the character of its personnel, is in large measure immaterial. It will vary necessarily with the individual roads and the particular divisions. The important thing is to see that it is somebody's business to follow the thing through.

Rate Reductions in Britain

The British public is clamoring for reductions in passenger fares and it appears likely that the railways will soon grant some concessions in this direction. Passenger fares now stand at 75 per cent above the pre-war level and it is proposed that 25 per cent of this increase be removed, leaving the rates 50 per cent above the pre-war level. This proposed reduction is a serious matter for the British railways, because passenger traffic is relatively of much greater importance in that country than in the United States. In 1921, for example, 49 per cent of the operating revenues of British railways were derived from passenger train services, whereas passenger traffic contributes only about 25 per cent of the operating revenues of American railways. The railways of the United Kingdom paid 4.35 per cent on invested capital in 1921, but this was possible only because of compensation by the government; otherwise the railways would have faced a deficit. It is difficult to see just how they are going to meet the falling off in their revenues which reduced passenger fares will occasion. The traveling public in England is not apparently any more

concerned with this side of the question than are the shippers in this country who are continually seeking rate reductions on their products. When the national productive process is out of adjustment and groups of producers, powerful politically or economically, find that they are not making their customary profits, they always find the railways conveniently situated to assume their losses for them. In England, as in this country, these groups shift their burdens to the railways, giving no thought to the plain fact that such action must, in the long run, deprive them of the normal expansion of transportation facilities which the growth of industry and population demands.

It Depends Upon Whose Ox Is Being Gored

Starting with the co-operation of the railways as an aid to the farmer in bringing his produce to the rails for shipment, the construction of hard surface roads has developed until they are today making serious inroads on the earnings of many railway lines. Apparently oblivious and indifferent to this effect on the railways, many communities and individuals are fostering truck competition in every possible way. In doing so few have considered the possibility of the curtailing of railway service made necessary by these inroads on earnings and the effect of such curtailment on their individual interests. Not long ago a highway was built parallel to the main line of a road across a western state. Upon its completion the motor truck and the motor bus appeared in numbers to compete for freight and passenger traffic. This development was encouraged by a leading newspaper in that state with a large rural circulation. This competition soon made such inroads on the local passenger business of the railway that it was forced to withdraw an afternoon local train which had long carried this newspaper to the northern counties. Confronted with the loss of this circulation, which had been developed at large expense, the publisher at once appealed to the railway management for the restoration of this train on the ground that it would mean large financial loss to him. The road replied that it would be willing to restore this train if the publisher would make good the deficit in its operation occasioned by the competition of the motor trucks. This he could not afford to do. Confronted as he was in this way with the results of the campaign he had fostered, he was not slow to see the ultimate interest of the public in a new light, and his paper is now as staunch an advocate of the regulation of motor traffic to restrict it to its legitimate channels as it was formerly for unrestricted competition at the expense of the railways and the tax payers!

Lump Buying of Machine Tools

Does a true sportsman buy his guns, fishing tackle and golf clubs from a mail order house simply because he can get the whole outfit at a relatively low price? Undoubtedly he does not. He is looking for service, and is willing to pay a little more for the privilege of selecting the gun, casting rod, or club which best suits his individual needs. A railroad shop machine tool is also an investment, and first cost is entirely secondary to the amount and kind of service rendered. With the present keen competition in the machine tool industry, price is a pretty accurate measure of serviceability and when it is considered that machine tools and shop equipment are used 15 or 20 years, or more, the productive capacity of a tool is far more important than its first cost. The present more or less common practice of placing big shop equipment orders with one large manufacturer or dealer is objectionable on the grounds indicated above. No one dealer represents all the best lines in the country and in order to quote a lump sum lower than the total aggregate bids, it is evident that he must include some machines not of the first quality. At the risk of being tiresome, the statement is repeated that the sooner railroad shops are operated on a strict business basis, the better it will be for railroad stockholders. No big manufacturer, for example, would consider ordering all his equipment through one dealer, but would require his mechanical men to study each individual job and recommend the specific machines needed to reduce production costs. Those machines would be purchased of the individual manufacturers or dealers as soon as possible and the mechanical men held responsible for reduced shop costs.

The American Railroads and a Centennial

SHALL THE RAILROADS of the United States observe a centennial?

In the issue of the *Railway Age* immediately preceding this, mention was made of an anniversary celebration recently conducted by the Rock Island. As told in that issue, this road, on the 10th of October, three-score-and-ten years to a day since the first train made its trip from Chicago to Joliet, Ill., launched a program of activities, the proportions of which have not been exceeded on railroads in recent years. In commenting on this, the *Railway Age* took occasion to allude to the views it has held and earnestly advanced during the year concerning the importance of ever striving to build up and maintain the good-will of employees, together with the necessity of railroads doing more to "sell" themselves to the public. It referred to this celebration of the Rock Island's seventieth anniversary as a splendid piece of work along these lines. It advanced the thought that a method which had worked so effectively on one road might well be made the subject of consideration on others, and by inference expressed the hope that the railroads would view it in the same light. Passing from the general to the specific, then, consider the question of a railway centennial.

Less than six years remain until the hundredth anniversary of July 4, 1828, when singularly enough, Charles Carroll, better known as Charles Carroll of Carrollton, only living signer of the Declaration of Independence, little catching the full significance of his act, drove home the spike that marked not only the beginning of the Baltimore & Ohio but of American railroads. Only six short years remain to complete a hundred years of American railroad history, a hundred years within which the mileage of the greatest of transportation systems has grown from nothing to 265,000, or more than in all Europe, more than four times that in all Asia, more than ten times that in all Great Britain and which, double-tracked, triple-tracked and more than eight-tracked in places, forms the principal bond between the hundred millions of people with whose prosperity it is inseparably connected. Less than six years remain, in fact, until the rounding out of a period within which, under the impetus of its railroads more than all other agencies combined, this country, initially inconspicuous, has become the most flourishing and prosperous of nations.

A centennial of American railroads then; a celebration of national scope and perhaps even of international interest, representing the combined energies of every American railroad—such, in substance, is the specific question relating to anniversary activities which the *Railway Age* urges all railroads now to consider.

Reviewing the past, when has another topic of railway interest arisen which admits of so universal an appeal? When will so opportune an occasion again present itself for the railroads to engage the attention of the public. Carefully planned, it should accomplish much in renewing that

pride in nearly 2,000,000 co-workers which contributes so much to their contentment; properly supported, it should augment the harmony between railroads which simplifies the working out of mutual problems, and conducted on a sufficiently large scale, it should establish a contact with a great mass of American citizenry which, though but temporary, will mean much to railroads in the future. "There is a tide in the affairs of men," it has been said, "which taken at the flood leads on to fortune." A centennial celebration of American railroads, it cannot be gainsaid, would be an event in a hundred, an opportunity which should not be missed.

Equipment Orders and Freight Business

THE ORDERS the railways have placed thus far this year for locomotives and freight cars show that they are using all available resources to increase their facilities. The number of locomotives which had been ordered to October 15 was 1,792. The average number ordered annually in the 10 years ending with 1921 was 2,118. Thus, orders placed in the first 41 weeks of this year do not equal the annual average orders of the last decade. They do, however, exceed the average number ordered annually in the five years ending with 1921, which was only 1,483.

The number of freight cars ordered to October 15 was 122,953. In only three entire years of the decade ending with 1921 were larger orders placed, namely, in 1912, 1913 and 1916. The average number of freight cars ordered annually in the 10 years ending with 1916 was 100,469, and in the five years ending with 1921 it was 64,619. It will be seen the number ordered already this year exceeds the average annual records of both the last five and the last 10 years.

The new equipment bought will not, of course, result in an equivalent net increase in the amount of equipment in service. The average number of locomotives retired from service annually in the 10 years ending with 1921 was 1,615. This is only 177 less than the total number ordered thus far this year. The average number of freight cars scrapped and retired from service annually in the 10 years ending with 1921 was 76,760. This is only 46,193 less than the total freight cars ordered thus far this year. Because of inability of the railways within recent years to buy a normal amount of new equipment the number of locomotives and cars that ought to be retired is now unusually large.

But two and one-half months of the year 1922 still remained when these statistics regarding the orders placed this year were compiled. Substantial orders are still being placed and probably will continue to be until the end of the year. The total orders placed in 1922 will hardly approach those placed in such years as 1916 and 1912, but they promise substantially to exceed the averages of the last 10 years. They will provide for a normal year's net increase in equipment, but will hardly make up for any of the large deficiency in equipment which has accrued within recent years.

The comparatively large orders for locomotives and cars being placed evidently are predicted on the belief of railway managers that traffic will continue to move in increasing volume. Statistics regarding the amounts of various classes of commodities being shipped seem to support this view.

In the fall of 1920 the railways handled the largest business that they ever did in their history. The total number of cars loaded with freight in the four weeks ending with October 14, 1922, was only 2.9 per cent less than the number loaded in the corresponding weeks of 1920, but there are wide differences in the tonnages of the various classes of commodities handled in the two periods. Study of these differences may suggest what future tendencies are likely to be.

Many people believe that the reason why the railways are now handling such a large volume of freight is that the coal strike has forced upon them an abnormal tonnage of coal and that therefore the present excess in the demand for transportation over the supply will be temporary. The fact is that in the four weeks of 1922 mentioned the number of carloads of coal moved was 13 per cent *less* than in the same weeks of 1920. Furthermore, shipments of ore were 39 per cent *less*, of forest products 5 per cent *less*, and of coke 39 per cent *less*. How, then, was it that the total shipments were only three per cent less?

Shipments of grain and grain products were 21½ per cent larger than in 1920; of livestock 15½ per cent larger and of less-than-carload merchandise 11 per cent larger.

The farmer is sending his crops to market and getting his money for them as fast as he can. He was holding his crops back in 1920 and not getting his money for them. In view of these facts, is he not likely to be a larger purchaser in 1923 than he was in 1921?

Shipments of L.C.L. merchandise thus far this year have been much greater than ever before. They consist chiefly of finished products. Retail merchants must have been buying them from wholesale merchants, and they from manufacturers, in large amounts or they would not have been shipped in record-breaking volume. Since this has been the case, does it not seem probable that there will be activity in general manufacturing for months to come. When there is acitvity in manufacturing there is a large demand for fuel and raw materials. Those engaged in the construction business say there is prospect of a great deal of construction work. Do these things not indicate the prospect of increase in shipments of the classes of commodities which are not now moving in as large volume as two years ago?

Apparently it can be assumed that there will not be a demand for transportation which will equal or exceed all past records only upon the theory that the demand for the transportation of grain and grain products, livestock and merchandise is going to decline as much as the demand for the transportation of coal and coke, forest products, ore and miscellaneous commodities is going to increase. But is there anything in the situation to indicate that the demand for the transportation of commodities now moving in record-breaking volume is going substantially to decline?

The United States is a growing country. There never was a business depression that was not followed by a business revival which made the demands upon the railways greater than ever before. Unless past experience is misleading, the demands upon the railways in months and years immediately ahead are going to increase, and they will have use for more additional facilities than they will be able to provide.

Consideration of Consolidation Plans

THE CONSOLIDATION provisions of the Transportation Act have as yet secured by no means the amount of attention and discussion which their importance will eventually unquestionably bring forth. This statement is made with due regard to the amount of material which has been written or spoken about the subject but nevertheless the fact holds true that the amount of interest which has been taken in the matter still remains relatively small in proportion to the importance of the question. New England and California, however, are exceptions. In the former, as is aptly pointed out in an article by W. J. Cunningham, James J. Hill, professor of transportation at Harvard University, which appears in the first issue of the new Harvard Business Review, the underlying reason is a realization of the importance of the subject as concerns the future welfare of New England industry. In

California the situation is involved in the Southern Pacific-Central Pacific segregation.

The New England discussion represents presumably the more ordinary manner in which the discussions of the various consolidation plans will be carried on. The California situation has its chief measure of interest in the conflict which has arisen between an old and a new idea in railway regulation—the old idea being that represented in the anti-trust acts and the recent decision of the Supreme Court and the new idea that embodied in the consolidation provisions of the Transportation Act. In addition, of course, there is also involved the corporate relationships between Southern Pacific and Central Pacific; it must be remembered that to separate these two companies would not only take away from the Southern Pacific System its line to Ogden but also remove the connecting link between the lines in Oregon and those in southern California.

The California situation should prove of particular value because of the emphasis it will place on the new theory of railway regulation that consolidations may be of value as distinguished from the former theory that they were essentially bad. The expression of this new theory is the best feature of the entire consolidation idea and it deserves considerably more importance than it has thus far received. In truth, the time seems to be approaching for the formulating of a more practical attitude towards the consolidation plans than the railways thus far seem to have felt it necessary to adopt. They are the ones primarily interested and it seems as if they should evidence that they have a keener appreciation of that fact than they have so far shown.

Union Leadership in America and Britain

IT HAS BEEN SAID that trade unionism in the United States is from 25 to 50 years behind that of Great Britain. This is generally taken to refer to the strength of the trade union movement, i.e., that the unions in this country are no stronger, comparatively speaking—numerically, politically or economically—than the British unions were several decades ago. Without arguing this point pro or con, we should like to suggest another phase of the trade union movement wherein Great Britain is certainly many years ahead of us. This is in its intelligent leadership.

One looks in vain among union leaders in this country for men of the calibre, vision and knowledge of economics which are the characteristics of such leaders of the British railway labor unions as J. H. Thomas, J. Bromley, J. Marchbank and C. T. Cramp. The reason for this condition in all probability lies deep below the surface and it is not necessarily a reflection on leaders of labor in this country to say that, generally speaking, they are not as able and as learned as their British contemporaries. Some American labor leaders, potentially as capable, may be restrained from an exercise of their abilities by a narrow-minded membership. Whatever the cause, however, the statement stands—the leadership of the railway unions in this country, generally speaking, suffers by comparison with that of Great Britain.

The outstanding characteristic of most union struggles in this country has been their predatory nature. Most of them have been designed to gain a greater share in the product of industry at present without any effort at all at increasing that product. Anyone with the most elementary knowledge of economic law should be able to see that a continuing increase in the return which any group can receive for its services can come only by an increase in production. Some increases may be obtained, it is true, by wresting a larger share of present production from other economic groups but there is a limit beyond which this sort of thing cannot go. When this limit has been reached the only method of securing increased returns is by an increase in efficiency.

The leaders of labor on the British railways quite evidently recognize this fact and they are exerting their best efforts to interest their membership in improving the efficiency of the railways. By pursuing this policy they are not only doing the very best service possible for their own members, but they are making their unions useful to society as a whole.

How much longer will American labor leaders allow it to be truthfully said that unionism in this country is many years behind the movement in Britain?

New Books

The Alaskan Engineering Commission. 124 pages, 6 in. by 9 in., with map of Alaska. Bound in cloth. Published by D. Appleton & Co., New York.

This is No. 4 of a series of service monographs of the United States Government prepared by the Institute for Government Research and is devoted to the development of railroads in Alaska from the first privately-owned road built in 1898 to the government operations through the year 1920. The monographs are prepared according to a uniform plan and this one is no exception. They give the history of the establishment and development of the service; its functions in detail by specific activities; its organization; the character of the plant; a compilation or reference to the laws and regulations governing its operations; financial statements showing its appropriations, expenditures and other data for a period of years; and lastly, a full bibliography of the sources of information, official and private, bearing on the service and its operations.

The Constitution of the United States: Its Sources and Its Application. By Thomas James Norton, assistant general solicitor, the Atchison, Topeka & Santa Fe Railway Company. 298 pages, 5 in. by 7½ in. Bound in cloth. Published by Little, Brown and Company, Boston.

This is not a railway book, of course, but every American citizen should know what it tells. The Constitution of the United States is the most interesting and important document that ever was produced in this country, if not in the entire history of mankind. It is not only the framework of our federal government, but nobody without knowing its provisions can understand our state governments, since the federal Constitution puts limits upon what the state governments can do.

The federal Constitution was long the object of almost unanimous praise, and even adulation, by American public men and writers on political subjects. Within recent years it has been the object of much criticism. Many young and old persons of radical tendencies have learned to depreciate and denounce it on the ground that it is an instrument of tyranny over the "masses." Nine-tenths of those who think and talk thus know almost nothing about the real provisions of the Constitution and even less about what the author of this book calls "its resources and its application."

Mr. Norton's purpose was "to put within the reach of the American citizen and the young people in school a brief but full and live explanation of the sources of the great clauses of the Constitution and also the applications of these clauses in the great cases which have arisen." There has been great need for such a book. There are numerous ponderous volumes about the Constitution. Most of them have been written for lawyers on the assumption that their readers know the provisions of the Constitution. Only students of jurisprudence would read or could understand them. What was

needed was a book which would tell exactly what the Constitution says and which would set forth exactly what its provisions mean and how they apply in language which anybody could understand.

Mr Norton was admirably equipped to write such a book. He is a successful lawyer of long experience. The study of the Constitution has been almost a life work with him. He was formerly, however, a daily newspaper reporter and writer. In that school he learned how to tell things so that young people and the average man in the street would be interested and would understand. With his unusual experience and great knowledge he has written a book about the Constitution which might well be put in every college and even in every high school. Why should our young people be taught dead languages, history and economics and be allowed to graduate with honors knowing little or nothing about the actual provisions and meaning of the Constitution which is the foundation of our entire government? The book is also one which might well be read by every citizen, for every citizen ought to know what the Constitution of our country really is.

One fault of every book that has heretofore been written on the Constitution is that the Constitution itself has been published either at the front or back and that the history and interpretation and application of its provisions have been given separately in the text. In Mr. Norton's book the various provisions of the Constitution are published in bold face type and run through the entire book, and under each clause quoted from them is given the history, the interpretation and application of this clause. Thus the reader does not have to turn to one part of the book to find what the Constitution says and then to the text to find what is said about it. All through the book references are made to the constitutions of other nations which have copied ours, and to quotations from what great jurists of other countries have said about it.

Mr. Norton has kept out of the book both opinion and propaganda, leaving it to the reader to make his own deductions from the historic facts given. He has, however, written a book which no one who approaches the subject for the first time can read without realizing that much of the criticism of the Constitution and of its interpretation and application by the courts is without justification. The federal Constitution is the bulwark of American liberty and of American institutions. Mr. Norton's book should receive wide reading and use and do great good.

The Canadian Railway Act, 1919, Third Edition. By Angus MacMurchy, K. C., and John D. Spence, barristers-at-law. Toronto, 1922, Canada Law Book Company, Limited.

The second edition of the above work, which was published in 1911, had 80 pages more text and over 400 more decisions than the first edition, which appeared in 1905. About 3,000 cases are cited in the third edition. The first 57 pages of the book are taken up with a comparative statement of the section numbers of The Railway Act, 1919, and amending Acts and the preceding Act as well as with citations of cases. There are 754 pages of text. Readiness of reference is provided for by an index of 43 pages. The present edition has about 100 pages more of text and annotations than the second edition. At the same time, there has been a cutting down in bulk by omitting the Lord's Day Act, the schedule of forms and requirements respecting plans, the regulations of the board, etc., and by adoption of abbreviations in citations wherever possible.

The setting out of the decisions in black faced type in the present edition is an aid to the eye in running down the authorities cited. The text is copiously annotated. Of the total printed text approximately 60 per cent of the space is taken up with annotations. Without attempting to enumerate in detail and simply by way of illustration, it may be noted that of 135 pages of text covering sections 312 to 359 of the Railway Act—the portion peculiarly concerned with freight and passenger tolls—117 are taken up with annotations. The information, especially in the section dealing with tariffs and tolls is rich in citations from decisions of the United States courts and regulative tribunals. The editors in this connection acknowledge their indebtedness to the chief counsel and the assistant counsel of the Interstate Commerce Commission. While these decisions are informative and in various instances indicate the road, at the same time it is recognized that only when the circumstances in Canada are on all fours with those in the United States can the decisions based on the latter be regarded as applicable in their entirety in Canada. Manitoba Dairymen's Assn. vs. Dominion and Canadian Express Cos. 14 C.R.C. 142 at p. 148.

The Canadian Railway Act has developed by accretion and has in form a lack of logic which appertains to such a method of development. It is a code setting out the conditions which, in the absence of express legislation, are to be read with the terms of the Special Act. It sets out the powers of the railway, not only as to the fundamental matter of compulsory taking of land, but also as to the powers in connection with construction and operation. Then, in addition, there is superimposed an extensive regulative jurisdiction extending from the approval of a route map to the sections dealing with tolls. The regulative portions, so far as tolls are concerned, deal primarily with railway tolls. There has not, however, been a development on any rigid logical method. By successive enactments, regulative jurisdiction has been conferred in regard to express, telegraph and telephone tolls. While in respect of railway services there is jurisdiction not only over facilities but also over tolls, the jurisdiction in respect of services set out in the preceding section is a toll jurisdiction alone.

The same lack of thoroughgoing logical organization is apparent when the terms of particular sections are considered. Section 375, sub-section 12, dealing with telephones provides that "The jurisdiction and powers of the Board, and in so far as reasonably applicable and not inconsistent with this section of the Special Act, the provisions of this Act respecting such jurisdiction and powers . . . shall extend and apply to all companies as in this section defined." Such a delegation of law-making power to a tribunal with mingled judicial and administrative functions would give pause to a United States commentator. In dealing with this situation, Parliament has shown that the same laws do not apply to it as those which apply to nature—Natura non facit saltum.

Not only those who desire to deal with the railway law of Canada from a technical standpoint but also those who desire from an informational standpoint to obtain an acquaintance with the evolution of Canadian law in regard to railways will find in the text a clear and compendious treatment applying wherever possible the scientific canons of the comparative method. In sum, it is an excellent and convenient work of reference.

S. J. McLean,
Assistant Chief Commissioner, Board of Railway Commissioners of Canada, Ottawa.

Railroad Freight Transportation. By Leonor Fresnel Loree, president of the Delaware & Hudson and chairman of the board of the Kansas City Southern. 734 pages, 6 in. by 9 in. Bound in Cloth. Published by D. Appleton & Co., New York.

The question sometimes arises as to whether railway men spend much time reading books. If more railway books like Mr. Loree's new volume were available the amount of book reading by railway men would be increased accordingly.

Whether railway men read many books or not, they do not write very many of them; at least, not nearly as many of them as might be desired. It is not often—at any rate not often enough—that readers of railway literature have the opportunity of reading a book by a railway operating officer and still less one written by a leading railway execu-

tive who at the time he writes is playing a leading role in the subjects with which he deals. As concerns Mr. Loree's book, one might wish that it would serve as a precedent. It is interesting and informative enough to serve as a good precedent.

The "jacket," as the publishers term the paper cover which they put on new books to protect the cloth binding and gold lettering, contains this statement: "This book discusses all that enters into freight transportation. It is the detailed and practical work of a railroad officer who draws upon ripe experience in presenting a thorough analysis of every phase of the subject." Careful perusal of the book leads one to remark that this statement is correct but modest, the latter being a characteristic unusual incidentally for book descriptions written by publishers. First of all, the book discusses many more things than freight transportation; it deals rather with railway activity in all its branches, although it is true that operation of the railway freight service is the feature that is given greatest emphasis. Secondly, the publisher, it would seem in all seriousness, might well have said a word or two more about the qualifications of his author. Mr. Loree is remarkably well fitted to write a book of this kind and his fitness is evidenced well in what he has written. There must be a strong tendency on the part of an author who has attained some standing in public life to say a great deal about himself in whatever he writes. Mr. Loree's place in the railway industry could be considered sufficient cause for him to do this very thing. The temptation, however, has not proved too strong for Mr. Loree to combat. The book, therefore, is in no sense whatever autobiographical. It is about railway operation and the author has used his own wide experience only as a source from which to draw some valuable suggestions about railway operating problems and for some extremely interesting examples to illustrate important points in his text.

In 734 pages an author can deal with many subjects and discuss many things, and that is exactly what Mr. Loree has done. Construction, maintenance-of-way and mechanical matters are all given extensive attention. History—notably the history of the locomotive—comes in for considerable space, as also do accounting, statistics and the various other related subjects. The book, however, deals primarily with operation. There are some extremely interesting analyses of the duties and responsibilities of the various workers in the railway service. One section—Part V, Movement of Cars—deals with such subjects as the distribution of time in a typical car journey, car loading, reconsignment, yard and road handling, per diem, the matter of car repairs, car ownership and the responsibilities of the carrier from the standpoint of car supply. The value of the section, as also the value of the other sections of the book, lies not only in the amount of data given but is perhaps primarily embodied in the practical suggestions made to secure improved results in operation and in consideration of what might be done to induce shippers to use cars as transportation facilities rather than as warehouses.

Part VI, dealing with the Movement of Engines and Trains, discusses such subjects as engine ratings, yard work, operation under the standard code of train rules, etc. Some few pages are devoted to signals, although possibly less than the importance of that subject might well deserve. The last 200 pages of the book are devoted to labor. There are discussed the duties and responsibilities of the train and engine crews, after which there follows a long array of details about relations with labor covering such matters as rates of wages, the labor movement as embodied in the long series of wage demands and arbitrations; there is also an interesting section dealing with some of the large strikes which form an important and interesting part of American railway labor history.

The book attracts because of the amount of interesting data which is included; it will have a real value as a book of reference, because some of the information given is not readily available anywhere else. If one were to suggest, however, the book's greatest value, it would be the interesting manner in which it is written. It certainly is characterized by its readibility, and that is an asset which no one in these days can pass without notice. Nor can one read on without thinking when one comes to such clauses as these:

"In a big terminal the difference in value between a good yardmaster and a poor one may amount to a president's salary. The yardmaster who is competent to handle a difficult situation is not always estimated at his full value."

"I have served in a great variety of positions in the railway service from rodman to president. I have always felt that the most desirable of them all, certainly in the vigor of life, is that of division superintendent. Here one knows personally his subordinate officers and men, their character, disposition and conditions, their ambitions, hopes and fears; he knows the customers of the road, their strength and weakness, prosperity or decline; here he can originate projects and follow them through to completion. Under the divisional organization especially he is more nearly master of the situation and of his own fate than in any other office in the service."

And speaking of station agents:

"I am afraid that employees generally have not sufficiently absorbed the fact that it is the use of the car that is wanted, and not the money involved in the collection of demurrage, so that the effects of their efforts with patrons along this line have been somewhat negligible."

"It used to be said that to educate a locomotive engineman cost the company $5,000 and Addison Hills, the vice-president of the Lake Shore, told me in 1886, he thought it cost one million dollars to educate a general manager."

A good example, surely, to illustrate the value of the subject under discussion, in this instance, continuity of employment.

It is not necessary nor is it desirable, however, to be laudatory concerning Mr. Loree's book. One cannot suggest that the book is a perfect production. For one thing, it might, one would suggest, have a better arrangement; subjects sometimes appear under what is patently the wrong heading. In a few places they appear to be dropped and later taken up again. There is considerable extraneous matter and in instances digression from the subject in hand. Other subjects seem to be slighted. Electrification of steam railways, notably, is given scant treatment; the matter of the improvement in locomotive and car design in recent years is given rather less attention than the subject may be believed to deserve. Presumably because the book deals with railway operation, Mr. Loree omits discussing such subjects as railway regulation, valuation, etc., in which he must hold a special interest. He would be expected to be at his best in such subjects as these. On second thought this statement may be a bit too strong. He would have to be pretty good, after all, to be better in them than in the subject around which the present book is written—name, operation.

Taking the book by and large, one has no hesitation in recommending it highly. It is a very informative book by an expert in the subject and it is most interesting.

The review would not be complete did it not acknowledge certain statements concerning the *Railway Age* which Mr. Loree has included in a section dealing with the sources of information which are available to the railway man. On page 194 he says:

"In 1917, it was seen that government operation of our railways as a war measure was contemplated by the administration. From that moment the whole force of the paper was trained against the possible added calamity of government ownership; and not until the railways were actually turned back again to their owners to be operated was there any let-up. The publisher does not claim that the Railway Age fought the battle alone, but he does claim that it was the greatest single factor in bringing order out of chaos and in preventing government ownership."

And on page 195:

"It is probably true that no other technical journal in the world is quoted as frequently and fully by the daily newspapers as is the Railway Age—a great tribute to its strength and a considerable factor in molding public opinion."

Letters to the Editor

[The Railway Age welcomes letters from its readers and especially those containing constructive suggestions for improvements in the railway field. Short letters—about 250 words—are particularly appreciated. The editors do not hold themselves responsible for facts or opinions expressed.]

When and How to Eliminate "Whistle Stops" at Crossings

Baltimore, Md.

To the Editor:

Referring to the letter written by "Quaestor" which appeared in your issue of October 21, 1922; the problem is simple.

(a) Capitalize the stops at $1.00 a stop; that will define just what expenditure may be justified to obviate the stops.

(b) Capitalize a crossing collision.

(c) Separate the grades and thus provide permanent relief and prevention against accident; such cannot be obtained either by automatic signals or interlocking.

F. P. Patenall,
Signal Engineer, Baltimore & Ohio.

Get the Employees to Boost

Portland, Me.

To the Editor:

During the life of the ordinary man, combinations of trade and industry have grown to large proportions. The day of production on a small scale is becoming more and more circumscribed. The personal touch between employer and employee has practically disappeared and has been superseded by the impersonal relation between corporation and servant. The duties and responsibilities of the ordinary captain of industry afford him little, if any, time to devote to the human side of his business, even if by temperament and inclination he was prone to cultivate the friendship and good-will of his subordinates. It is gradually becoming more and more apparent that transportation must be concentrated in large capitalized groups. Large competing aggregations of transportation agencies make for efficiency and economy of operation. All workers, from the high executive to the day laborer, depend upon the successful operation of each individual property, the property serving the community and nation in proportion to the loyalty, efficiency, and enthusiasm of the individual worker. Co-operation is the keynote of success in such enterprises. Unfortunately, all do not agree in the definition of the word "co-operation."

All the animal kingdom and mankind work or perform in the hope of reward. To the animals we offer dainties; to the child at school, a good report card, or the approval of his teacher, is an incentive; the executive is compensated for his strain and anxieties by the success of his efforts and the remuneration that comes therefrom; the worker in all ranks is looking for the same reward as the executive, but in a lesser degree. To the worker, success means the commendation of his superior and associates, and the hope of material reward. Alas! deserved commendation is too often withheld; so much so that the worker often believes it is designedly withheld so as to stifle the hope of material reward. How can industry expect full efficiency if conscientious effort is not encouraged?

Co-operation, real co-operation, must be established between the impersonal corporation through its delegated executive and directors, and the rank and file if our railroads are to continue under private control and operation. Many of us have a sure panacea for the troubles of our railroads. Many are sure real co-operation can not come without government ownership. Security owners and substantial business interests are strongly opposed to government ownership. All agree that efficient and dependable service is contingent upon comity between owners and officers of the corporations and the employees. The ordinary workers, that is, those outside the official personnel, must be taught to take a personal interest in the property from which they derive their living. The morale must be built up so that each employee will defend, and know why he defends, his railroad, when it is assailed either within or without the ranks.

There are many and divers theories for bringing about co-operation within the service and co-operation between officials and the other employees. The rank and file must feel that accomplishment will bring definite reward. Many officials contend that agreements hold them from such action, but this is surely a mistaken notion. Man must have an incentive to put forth intensive effort. Some years ago the steel trust evolved a scheme to interest its employees in the securities of the industry. Some railroad systems are following along similar lines. Care should be exercised that the securities are fully as represented or the cure may turn out to be a disease. Employees should be encouraged to own their homes. The floater is never more than a temporary asset to any stable industry. Governments the world over encourage their citizenry to own land, for landowners, great and small, are always patriots, ready to fight for their countries. The bidding system in the train service operates against this principle, but it would seem that some way might be found to reconcile runs with home stations. To the trainman, seniority in service, with its rights and privileges, is a great stabilizer, and an incentive for efficiency in service.

The employee should be educated so as to be able conscientiously to refute false propaganda. In all walks of life we hear false statements as to policy and resources of the railroads, and alleged malfeasance of the directing powers. Too many employees actually believe their own railroads are concealing assets in order to influence a low wage rate. The effort made to refute this false propaganda is not fully effective, being too direct and radical. The lay mind is not impressed with a mass of figures followed by statements to which his mind and reasoning are opposed. The effort should be simple and direct, gradually unfolding the principles to be developed. Monthly magazines in which employees share in shaping the policy, bulletins in stations, and schools of instruction, are all helpful agencies in molding the minds of the employees. In the last analysis, the employee is the medium to turn the mind of the people to right thinking regarding our railroads.

For several years the Interborough Rapid Transit Company of New York has posted helpful bulletins in its car windows, bulletins helpful to both company and patrons. For four years, the writer lived at Fort Washington Heights and was prone to complain of the service rendered. About five years ago, one of these bulletins informed the public that during the rush hours, a car passed over the 96th street crossover switch every so many seconds. Any reasoning mind could realize that the subway service on that line at that time was at the peak. No doubt many were helped and pacified by the simple statements of facts so gracefully put forth.

If the railroads would issue monthly magazines, as before stated, setting forth truths in an interesting, readable style, readily comprehendable by the average lay mind, something would be accomplished in solving the problem of bringing back morale to the rank and file, as well as helping to mold public opinion through the employees. Dry statistics distributed to the ordinary person are a waste of paper and energy.

Let everyone "hoost" co-operation.

William W. Tirrell,
Former Examiner, Interstate Commerce Commission.

When Headlight Meets Headlight

BUFFALO, N. Y.

TO THE EDITOR:

The very interesting article in your issue of October 14, page 703, throws light on a question that has been somewhat dark. This light, however, is so dazzling that the reader is not at first convinced that the darkness really has been dissipated.

In trying to compose the differing and sometimes opposing views of the different observers who are quoted by you, it has occured to me that there are two simple points which did not happen to be mentioned by anybody. A headlight three miles away you can look at; but if it comes close up, you cannot; the glare is overpowering. This may not be a scientific way of looking at the question, but surely it indicates a very practical, if not a very precise, way of measuring the difference between seven miles and one-fourth of a mile.

Then, again, your various correspondents will, no doubt, agree with me that usually the vibration of the locomotive is sufficiently pronounced, when it is moving at ordinary speed, to enable an observer of its headlight to see and note the motion, sidewise or up and down; to tell quite readily whether or not the locomotive is stationary.

R. W. M.

DETROIT, MICH.

TO THE EDITOR:

In the symposium on electric headlights published in your issue of October 14, I notice that those of your informants who lay stress on the difficulty of estimating distances do not give their reasons in much detail. It is obvious that the condition of the headlight and the atmospheric conditions may vary greatly. If we analyze our difficulties, we shall find that in these features will be found, in many cases, the causes of our perplexity.

On the Grand Trunk, dimmers are made use of, intelligently; and in single-track territory an undimmed headlight is always to be taken as a danger signal. Seeing such a light ahead, an engineman must assume either that the engine whose light he sees is foul of the main line or that this is true of some part of the train attached to the engine. When a train goes into a side-track and the switch has been closed, the headlight is either dimmed or is entirely extinguished.

H. E. W.

Mr. Truesdale's Formula—and Hope

BOSTON.

TO THE EDITOR:

I wrote you the other day appealing for more serious attention to the problem of quickly settling disagreements about wages, working conditions and other things (*Railway Age*, September 30, page 508). Since then Mr. Truesdale, president of the Delaware, Lackawanna & Western has made a statement which powerfully reinforces the argument which I tried to present. It was in the annual report of the business of his company. He set forth the need of finding, for the task of solving the whole complex railroad problem, *broad-minded* men who can *inspire the confidence* of the public. The entire pregnant paragraph is worth quoting:

> "It certainly would seem possible that in the not distant future some clear headed, broad-minded, patriotic men who can inspire the confidence of a large majority of the best elements of our citizenship will study this problem and formulate a permanent policy that will fully meet the requirements of our people without the everlasting enactment of new laws, many of which are contrary to those already in effect."

I should like to emphasize a number of Mr. Truesdale's points. I cannot put the words in italics, for the numerous italicized clauses would tumble over each other. Look at the adjectives in the middle of the paragraph. How plentiful are the public men who are patriotic but neither broad-minded nor clear-headed! Those qualifying words must have been put there because of their weight, not for mere rhetoric.

"Inspire confidence!" How utterly impossible, except as a man who has established his reputation by self-sccrificing public service. Conservative people will not have confidence in any man of unknown antecedents; yet half our lawmakers (who should be the originators of what we call public opinion) are essentially unknown; not perhaps because of their own fault, wholly; we citizens, in carelessly ignoring our aldermen and legislators, are neglecting a duty. These public servants ought to be praised for their good deeds and criticised for their errors; but we do this, if at all, in the most haphazard manner.

Confidence of "a *large* majority of the *best* citizens:" what a huge problem! Yet that is our task. It is necessary to convince a large majority of the wise and prudent to overcome the great number of short-sighted or selfish citizens who cannot be reached.

Mr. Truesdale wants competent and exemplary citizens who will *study* the railway problem and formulate a *permanent* policy. Here we come to the nub of the question. Congress has tried hard enough to fix up something permanent, but with what success, nobody at present can tell. Study is the thing; but where is our guide? One could imagine an autocratic president who would compel the 21 members of the House Committee on Interstate and Foreign Commerce to study history and philosophy and become real experts in at least the domestic side of their duties; but, alas! the study would have to begin back a year or two before these gentlemen were elected to Congress. If we desire to accomplish anything toward reform in the immediate future, we must do something besides pray for such a miracle as putting strong and courageous statesmen in these 21 seats of the Lower House of Congress.

In essence, Mr. Truesdale hopes that it is "possible that some clear-headed men will formulate a policy" to obviate the "everlasting enactment of new laws." How can this be brought about? What can a railroad president do besides keeping up a hope?

I am not a president and make no pretensions to being a prophet; and I do not offer a solution. I think I have done a good thing if I have got you to reprint Mr. Truesdale's deliverance and to call the attention of other presidents to the fact that here is a succinct statement of the chief issue of the day; a brief paragraph which ought to be committed to memory by every one of them, so that the duty of keeping the question uppermost shall not be forgotten. As a mere layman I will, however, offer one suggestion, namely, that it is the railroad presidents of the country who ought to take the initiative. Presidents Rea of the Pennsylvania, Markham of the Illinois Central, Loree of the Delaware & Hudson, and others, have made addresses occasionally and have, no doubt, influenced the public in some degree, but they have barely made a beginning; and they can only very slowly convince the man in the street that they speak at all times with truly unselfish public spirit. They must get some other kind of man to make addresses. Chief Justice Taft is no longer available. Of other impartial and wise citizens who might be named, it might be said that their reputations are too local. (It may be, however, that the only way to educate the citizenry of America will be by employing numerous local men; four-minute men, such as promoted Liberty bond buying). I nominate Sir William M. Acworth. Get him to speak and write to the people of this country for a year. It would take months to convince many of our poorly informed and narrow-minded neighbors of Sir William's knowledge, wisdom, integrity and fair-mindedness; but the trial would be well worth while. He knows American railroad life as well as Lord Bryce knew our political and social life.

E. MOSEMAN.

Looking Westward with Both Reversible Track Signals Showing Green (White in Illustration)

Modern Signals Expedite Heavy Suburban Traffic

Color-Light Signals and Traffic Levers Increase Capacity of Available Tracks on Lackawanna

OPERATION of the Lackawanna's suburban trains in the New York district has been facilitated by the adoption on the section of line most difficult to operate of advanced operating methods, made possible by the installation of a highly developed signal plant using color-light indications throughout.

The section where the measures for improvement were taken lies between the Hackensack and Passaic rivers on the

Looking Eastward with Hackensack Bridge in the Distance

The Three Eastbound and Two Westbound Signals Show the Two Reversible Tracks and the One Non-Reversible Eastbound Track. Train Is Westbound on No. 1 Track (Reversible)

road's Morristown branch, its heavy suburban line. Operating troubles, aside from those normally encountered in handling heavy traffic with a limited number of trucks, arise principally from the drawbridges over the Hackensack and Passaic rivers. Traffic in these rivers, particularly the former, is heavy and is increasing. With trains during the rush periods following each other at intervals of from one to five minutes, the opening of either drawbridge for a few minutes results in holding up perhaps as many as a dozen trains. The problem was to secure the greatest possible utilization of available running tracks as soon as the drawbridges were closed. Formerly trains so held up had to follow each other on one track, assuming again the space interval maintained by automatic block signals. Thus the opening of a drawbridge during the rush hour would cause delays to some trains much greater than the period of time when the draw was open.

The seriousness of the open drawbridge as a source of delay to trains can readily be understood when the company's figures of trains thus delayed are examined. In June, 1922, a typical month, a total of 4,491 suburban trains were run. Of these 179 met with delays and the delay to 104 (58 per cent) of these was chargeable to open drawbridges. On at least two occasions in the past the road has joined with others in the attempt to secure a ruling to the effect that drawbridges need not be opened during rush hours. On both occasions, however, river shipping interests with powerful political influence were able to defeat the railroads' proposals. The result is that during almost any rush suburban hour may be seen the ludicrous spectacle of a tugboat towing a sand barge through a drawbridge to the delay and inconvenience of thousands of passengers.

The increase in the Lackawanna's suburban passenger traffic has been very great in recent years. The road is now handling about 21,500,000 passengers a year at its Hoboken terminal and all but about 800,000 of these travel on suburban trains, by far the greater number of which move over the Morristown branch through Newark. Westbound through trains likewise move over this line, while eastbound through trains, a few suburban trains and practically all the road's freight trains move over the Boonton branch through Paterson. It is the line through Newark then, which has had to bear the brunt of the heavy increase in suburban traffic. Over this line are scheduled more than 160 passenger trains a day. Most of these trains are of all-steel equipment and during the rush periods they run from eight to twelve cars. Superheated steam eight-wheel, ten-wheel and Pacific type locomotives are used, frequently double-headed. Originally a double track line, it had been increased to three tracks

from Newark to Roseville avenue and from Orange to Millburn. The addition of a third track from Roseville avenue to Orange to connect these two three-track sections is now under way and, when completed will give the road nine miles of unbroken three-track line westward from Newark. From Hoboken terminal to West End tower, 1.9 miles, where the Boonton branch leaves the Morristown branch, there are four main tracks. It is on the line between West End tower and Newark, 5.9 miles, where the improvements described herein have been made.

The drawbridges over the Passaic and Hackensack rivers are double track. The section of line between these two bridges was also double track, and there was in addition a third track of light construction used for freight switching movements but not for passenger traffic. The first step taken to improve operating conditions was to rebuild this track applying heavier rail and rock ballast and making it available for passenger trains. The double track drawbridges were not altered, however, and no other track changes were

Looking Westward Near Sanford's Crossing

Strong Green Lights of Reversible Track Westbound Signals Show White in Illustration. In the Distance Two More Signal Bridges can be Seen, Showing the Close Spacing of Signals.

made, with the exception of providing crossovers where needed. The company then had (1) a four-track line from Hoboken terminal, 1.9 miles, to West End tower (which is just east of the Hackensack river); (2) a short double track line across the Hackensack river; (3) a three-track line from the Hackensack river to the Passaic river; (4) a short double-track line over the Passaic river to Newark and (5) a three-track line from Newark west. The problem was to secure the greatest possible efficiency from the two double-track sections over the rivers and the three-track section between them, in order to clear away as rapidly as possible any congestion of traffic occasioned by the opening of a drawbridge and any normal congestion which might result by reason of the two short double-track sections in a territory where three or four tracks have been found necessary to meet the demands of traffic.

Ordinarily where three running tracks are provided two of them may be used in one direction only and the third is reversible during certain hours of the day. The Lackawanna has improved upon this practice by making only one of its three tracks, i.e., track No. 2, between the rivers usable in one direction only, viz., eastward. The other two tracks, No. 1 and No. 3, are reversible, and not during certain hours

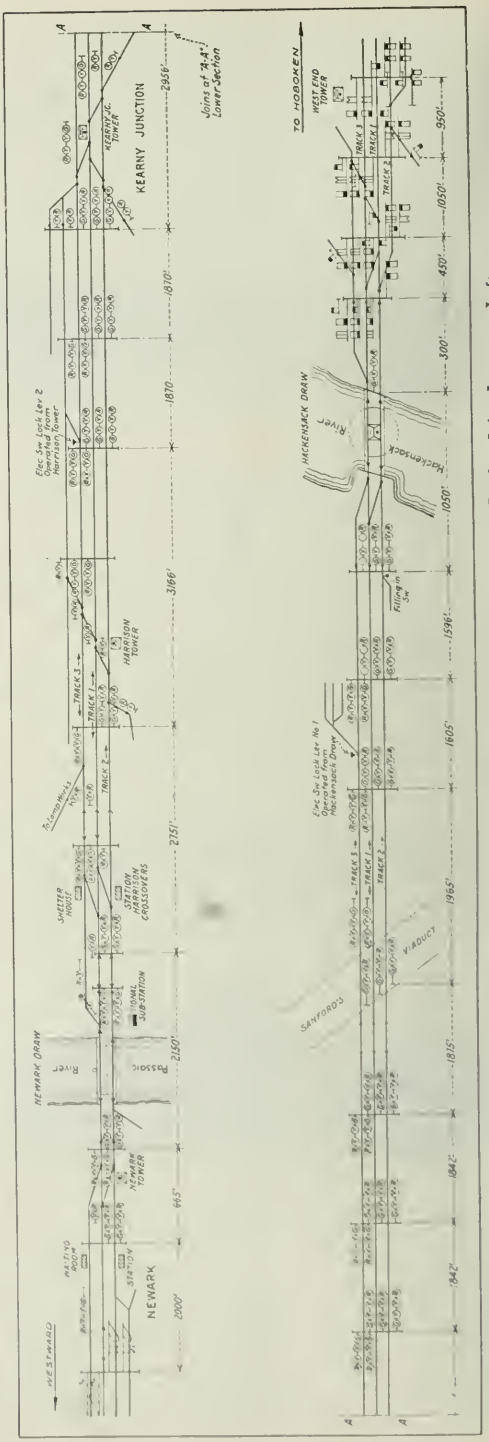

Diagram Showing Color Light Signals Between West End and Newark—Upper Section Joins Lower at Left

of the day only but at all times. Furthermore, both of the two tracks over the rivers are reversible at all times. By the addition of this track the road has doubled the capacity of this section of its line, allowing for ten trains in a given direction where there was room for but five before.

Without the most modern signaling equipment, however, it would not be practicable to reverse the direction of traffic over a given track at any time during the day. Traffic levers, therefore, are provided in all the signal towers between Newark and West End tower to control the operation of the reversible tracks. The traffic lever must be set in proper position before a signalman can display a clear signal to a train on a reversible track and the signalman cannot place his lever in proper position unless the signalman in the next tower places his lever governing that section of track in the same position. This the second signalman cannot do until he has displayed the stop signal against opposing movement.

For example, take the rush period in the morning when the heaviest movement is eastbound. Assume that two eastbound trains arrive at Newark simultaneously, one on track No. 1 and the other on track No. 2. Naturally, during this period one of the two bridge tracks, i.e., No. 2, will have its traffic levers set normally for eastbound movement, so one bound. At the drawbridges one track will normally be lined up for eastbound and the other for westbound movement. Under normal conditions very little changing of traffic levers is necessary, except that governing one of each of the bridge tracks and to allow for freight switching movements over track No. 3. During the evening (westbound) rush both reversible tracks between the rivers are lined up for westbound movement and eastbound traffic moves exclusively over No. 2, the non-reversible track. At the bridges, one track (No. 1) is lined up for west bound and one (No. 2) for eastbound movement and frequent shifting of levers will occur only for one of these tracks on each bridge when they are used, temporarily, for westbound trains.

In spite of the fact, however, that only at the bridges are changes in the direction of traffic sufficiently numerous to bring the levers into frequent use, the provision of them elsewhere makes for a flexibility of operation which in turn reduces to a minimum delays to following trains by derailment or by signal failures. If a reversible track is blocked for any cause, a signalman has only to shift the traffic lever for the remaining reversible track and following trains, crossing over, may proceed without delay.

The automatic signals in this territory are noteworthy.

Looking Eastward at Sanford's Crossing—All Signals Clear—Next Signal Bridge Visible in Distance

of the trains will naturally find the signals in position for its movement. The signalman, however, is aware of the approach of the second train and, let us assume, knows that no westbound trains are due. He will try to move his traffic lever governing track No. 1 to allow the second train to proceed over it. If the signalman at Harrison tower cooperates, sets his signal against opposing westward movement and moves his lever as desired, then the signalman at Newark can allow the second train, as well as the first, to proceed on its journey without delay, using track No. 1 over the bridge. Without the traffic lever, he would have to hold the second train until the first had departed and cleared the block on track No. 2.

Traffic levers are provided similarly to govern the two reversible tracks, Nos. 1 and 3, between Harrison tower and Kearney Junction, Kearney Junction and the Hackensack bridge tower and Hackensack bridge tower and West End tower. In practice there is not much frequency in reversing the direction of traffic except over the two drawbridges. Over the three track section one track, No. 2, is non-reversible eastbound. During the morning rush the traffic levers will be lined up to convert one of the reversible tracks, i.e., No. 1, also to eastbound movement and the other (No. 3) to westbound.

They, as well as the interlocking signals, are exclusively of the color-light type, using high voltage alternating current supplied by the company from its Hoboken power house, with a connection to the power lines of the Public Service Electric Company as an auxiliary source of supply. Fog and smoke often seriously obstruct vision in the Hackensack meadows and the color lights have a higher degree of visibility by either day or night than any other type of signal under these conditions. All interlocking plants in the territory are of the electro-pneumatic type of the latest design. Automatic block signals have four indications, as follows:

	Color given by	Indication
1	Red Light over Yellow Light	Stop and proceed
2	One Yellow Light	Approach Next Signal Prepared to Stop
3	Yellow Light over Green Light	Approach Next Signal at Restricted Speed
4	One Green Light	Proceed

The signals on these tracks are close together, a number of them being only about 1,800 ft. apart. This, of course, makes for high track capacity. Furthermore, with four indications, high speeds when the clear indication is given are safer than where only three indications are provided. The engineman will pass two warning signals, allowing ample time for reducing speed, before he comes to a stop signal.

The Lackawanna has, therefore, not only doubled the capacity of its line across the meadows by the addition of another running track—it has also made safe high rates of speed by the use of four-indication signals.

High interlocking signals have six indications, as follows:

Color given by	Indication
1. One Red Light	Stop
2. Red Light Over Yellow Light	Proceed at Slow Speed Prepared to Stop
3. One Yellow Light	Approach Next Signal Prepared to Stop
4. Yellow Light over Green Light	Approach Next Signal at Restricted Speed
5. Red Light over Green Light	Proceed at Restricted Speed
6. One Green Light	Proceed

Slow speed interlocking signals have two indications: One red light, indicating stop, and one yellow light, indicating proceed at slow speed prepared to stop.

Telephones have been provided at all signal bridges and main line switches have been provided with electric switch locks controlled by towermen.

Officers of the company hold the new signal system and the results they are obtaining from it in high regard. They report, too, that enginemen, although at first rather doubtful about the color-light signal, now are enthusiastic about it. The company is extending this form of signaling westward to Orange in connection with its extensive track elevation work at East Orange. When this work is completed, the company will have 9.4 miles of its line of heaviest traffic equipped exclusively with this type of signal.

Freight Car Loading

WASHINGTON, D. C.

REVENUE FREIGHT loading in the week ended October 14 increased 15,301 cars as compared with the week before, but was still slightly below that for the week of September 30, which was the largest so far this year. The total was 983,470, as compared with 910,529 in the corresponding week of last year and 1,018,539 in the corresponding week of 1920. The loading for that week of 1920 was the heaviest for any one week in the history of American railroads. The loading for the corresponding week this year is 3.4 per cent below that figure.

In the Southern, Central Western and Southwestern districts the loading was in excess of that for the corresponding week of 1920 and in all districts except the Pocahontas it was in excess of that for last year. Increases as compared with the preceding week were shown in grain and grain products, coal, coke, forest products and miscellaneous, but there were decreases in live stock, ore, and merchandise l.c.l. As compared with the corresponding week of last year there were increases in all classes of commodities except merchandise, l.c.l. This is regarded as an excellent indication of the improvement in business conditions as in dull times much freight is shipped in less than carload lots which at other times would be shipped in full carloads. The summary as compiled by the Car Service Division of the American Railway Association is given below.

The car shortage showed a further increase during the first week of October to 141,252, of which 40,499 were coal cars and 71,063 were box cars. At the same time there were surpluses averaging 5,500, including 3,024 coal cars and 97 box cars. During the period October 8-15 there was a further increase in the shortage to 156,309, while the surplus was reduced to 4,275. The shortages included 77,111 box cars, 44,984 coal cars and 7,631 refrigerator cars.

An improvement in the motive power situation is shown by reports filed today by the carriers with the Car Service Division. On October 1, 19,727 locomotives, or 30.6 per cent of the total on line were in need of repairs. On September 15, last, 20,157, or 31.4 per cent were in need of repairs. This was a net decrease during the last half of September of 430 locomotives.

At the same time, the railroads on October 1 had 44,703 serviceable locomotives which was an increase of 538 over the number serviceable on September 15. This increase was due to the larger number being repaired and turned out of the shops, and also to the installation of new locomotives.

Of the total number in need of repairs on October 1 last, 16,313 were in need of repairs requiring more than 24 hours. This was a decrease of 259 under September 15. There were also 3,414 locomotives in need of light repairs which was a decrease of 171 since September 15. From September 1 to September 15, 9,047 locomotives were repaired and turned out of railroad shops, while from September 15 to October 1, the total was 11,213, or an increase of 2,166 over the first half of the month.

The number of serviceable locomotives stored in October 1 was 1,501.

THE PORT HURON & DETROIT is being operated as a separate property, the contract under which it was operated by the Detroit, Bay City & Western having been terminated by mutual consent.

REVENUE FREIGHT LOADED.

SUMMARY—ALL DISTRICTS, COMPARISON OF TOTALS THIS YEAR, LAST YEAR, TWO YEARS AGO. WEEK ENDED SATURDAY, OCTOBER 14, 1922

Districts	Year	Grain and grain products	Live stock	Coal	Coke	Forest products	Ore	Mdse. L.C.L.	Miscellaneous	Total revenue freight loaded: This year, 1922	Corresponding year, 1921	Corresponding year, 1920

Cabinet Officers Discuss Transportation

Various Problems Considered in Campaign Speeches in Different Parts of the Country

Various aspects of the transportation problem are being discussed by members of the President's cabinet in campaign speeches in different parts of the country. While Secretary Davis of the Department of Labor in a speech recently advocated the abolition of the Railroad Labor Board, Secretary Wallace of the Department of Agriculture, in one of his speeches, insisted that quarrels between railroads and their workmen which hang up freight movement must be stopped in some way or other. He also referred to the "burdensome" effect on agriculture of the present freight rates. Secretary Hoover in a speech at Detroit on October 18 laid much of the responsibility for the present inability of the railroads to meet all the transportation demands of the shippers on too much regulation. Attorney General Daugherty also made a speech at Canton, Ohio, on October 21, in which he denounced the radicalism of certain labor leaders and told of the actuating methods which compelled him in the name of the government to institute injunction proceedings at Chicago recently in the railroad strike.

Hoover on Car Shortage

Discussing the rail situation as it now relates to grain and coal shipments, Mr. Hoover said:

"The American roads have been so over-regulated during the last score of years that they find it difficult to finance the cost of acquiring the rolling stock and equipment necessary to keep pace with the ever-increasing industrial and agricultural needs of the country.

"Every year there has developed a serious car shortage and as a result there is today in New York a 5 per cent premium per bushel on wheat for export, due to the inability of the railroads to move grain in sufficient quantity to fill foreign demand. This premium does not add to the wealth of the farmer but is a direct charge against his just profit.

"There also exists a premium on soft coal ranging from 35 to 60 per cent above the normal price because of the car shortage. If there were sufficient cars to transport the coal the mines are capable of producing there would be no such premiums.

"It is safe to estimate that the car shortage levies a direct charge each year on both the producer and consumer of necessities of life, which amounts to no less than the entire annual cost of administering the affairs of the Federal government."

Wallace on the Farmer and Strikes

In an address before the Knife and Fork Club of Kansas City, Missouri, on October 23, Secretary of Agriculture Wallace said:

"There are two things about our transportation system which the farmers want fixed. First, freight rates on agricultural products should be decreased. They are too high with relation to the prices the farmers get. Transportation is a part of production, so far as agriculture is concerned. The farmer pays the freight. He does not want the railroads to reduce freight rates so low that they can not furnish efficient service. Service is important to the farmer. But freight rates are now too high. The farmers want the railroad people to cut down their operating costs, to insist upon a fair day's work for a fair wage, to move their freight cheaper, and thus be able to cut down rates.

"Second, some way must be found to break monopolies of both capital and labor and keep them at work. These quarrels between the railroads and the workmen, which hang up freight movement, must be stopped in some way or other. Farmers are both capitalists and laborers. There is more money invested in agriculture than in any other industry. There are more working people on the farms than in any other sort of work. But farmers get lower returns on their invested capital than the railroads get. They work longer hours and for much less pay than railroad workmen. Being both capitalists and laborers, the farmers can understand and sympathize with the just and lawful aspirations of both capital and labor. More than this, the farmers want both to prosper so they can buy their crops at fair prices. Farmers recognize the right of capital to organize, because only in that way can large business enterprises be carried on. Farmers also recognize the right of labor to organize and be able to bargain effectively with organized capital. But farmers do not recognize the right of labor organizations to conspire and tie up railroad traffic. Farmers have no sympathy with the sort of lawlessness which we had during the railroad strike. There are no words strong enough to condemn murder of men, intimidation of women and children and wanton destruction of property. The right to work is just as sacred as the right to quit work, and must be upheld by all the force of organized society.

"Interference with transportation is a direct attack upon the farmer and his family. Many growers of perishable stuff have gone bankrupt because they could not move their crops. Grain growers and live-stock producers have lost millions upon millions of dollars during the past six months because railroad owners and railroad workmen could not agree. The farmer is sick and tired of this sort of business. He can not stand it any longer.

"There can be no dispute between railroad owners and railroad workmen which can not be settled in an orderly way, with full justice to both, without interference with traffic and without imperiling the business and lives of innocent people. The rejection of lawful means of settlement and the appeal to lawlessness, whether by capital or by labor, must stop. If it does not stop, then in self-defense the farmer will be driven to adopt similar methods. If that should happen people in the cities would starve and we should have anarchy instead of government. The farmer can take care of himself, and he will if he must. He can live on his own farm. But if class is to be arrayed against class, if every group is to organize and fight every other group, our great republic will break down and with it will go the most advanced civilization the world has ever seen. We can not permit that to happen."

Daugherty on the Shopmen's Strike

"The Department of Justice," Attorney General Daugherty said, "had spent a million and a half dollars as economically as possible in a period of seven weeks during the rail strike to preserve 'public interests.' The government and the laws and the courts were being mocked, millions of dollars worth of personal property was being destroyed, and human life, itself, he said, was being sacrificed, as a result of strike conditions.

"The railroads of the country," the Attorney General declared, "are compelled by law to furnish interstate commerce for the country. It is the duty of government to see that this obligation is performed according to the letter of the law. The roads were attempting to keep interstate commerce alive, but conditions had reached a point where this was made impossible through lack of skilled workers, de-

terioration of equipment, and other conditions brought about by the strike of 400,000 members of the federated shop crafts unions.

"When the government acted, it was a duty, not to labor, not to the railroads, but to the American people and to the government itself. More than 17,000 affidavits from every section of the United States concerning anarchy bordering on civil war furnished convincing proof that the people needed the protection of their government as never before.

"Bear in mind that I did not undertake this proceeding as a partisan or as the advocate of the railroads. As between the railroads and those with whom they were in conflict, considering the matters in dispute, I was neutral, and I took no action on behalf of the government until it became apparent to the entire country that interstate commerce and the carrying of the mails were being interfered with to the extent that our people and our industries were being materially affected. The transportation crisis through which we passed came dangerously *near imposing a veto upon the economic readjustment* of our national life."

Mr. Daugherty said that when the railroad workers walked out they were in revolt against organized government. "In practically every other industry in this country and throughout the world," he said, "war-wage scales had been abandoned, but union leaders demanded continuation of wage inflation at the war peak. The government and those chosen to safeguard its integrity and constitutional rights, believe that labor deserves and should enjoy an equitable wage scale. There is no quarrel between labor and government upon this issue.

"Industrial paralysis, human suffering and irretrievable losses confronted the nation as train after train was laid off. Cessation of traffic was destroying the arteries of trade and commerce. Sporadically tales came out of the west, the southwest and the south and from our northern border states of derailments, maiming, sabotage, and even murder.

"Appeals were being made to Washington by countless thousands of American citizens. Scarcely a community in any part of the broad, free land was being spared the iron heel of terrorism. Depredation of property was in full swing, and human life was anything but sacred. All the great trans-continental systems were jeopardized, and the Interstate Commerce Commission, after infinitely painstaking surveys, had found that the rolling stock and equipment of the afflicted roads were so seriously impaired that 50 per cent of the locomotives in use were unfit for service and many were out of commission entirely.

"Then, when all conciliatory efforts on the part of trusted government emissaries had failed, when court proceedings in practically every district in the United States had been instituted by the railroads to safeguard their property and prevent willful and malicious interference with the orderly operation of their lines, when men were willing and anxious to work if permitted to do so, when transportation was impaired 50 per cent or more, the time had arrived when national security no longer made it possible for government to stay its hand.

"Appeal after appeal had come to Washington for troops," Mr Daugherty said, "but they were withheld. Who of you will say that it is not better to lay the hand of government, with its persuasion, its restraint, its admonition and protection, on the shoulder of the citizen, than to call out troops to shoot him down, and, as is always the case, mingle his blood with the blood of innocent bystanders and bruise the hearts of his loved ones?

"It must be remembered," he added, "that the freedom of speech guaranteed under the constitution is *not* that freedom of speech which incites mob violence, destruction of life and property and attacks on government. That is not what our forefathers intended by vouchsafing freedom of speech and liberty of press.

"May I call the attention of the law respecting citizens of this country to the fact that no frenzied voice was lifted by these same pedagogic pawns of profligacy when law-abiding American citizens by the hundreds, all over the land, were dragged into the mire of the woods, stripped of their clothing and there left; when almost as many, according to pre-arranged schedule, well carried out, it seems, by somebody, were tarred and feathered, when others were thrown into streams and their clothing carried off by the vandals.

"Where were those frenzied voices now crying out for freedom of speech, when the loyal engineer and his crew, in the dead of night, faithful to their service and their country, pulled twelve Pullman cars across the continent only to be suddenly switched into eternity without a moment's notice by the vandal and murderer who pulled the spikes and threw the switches that murder might contribute to the cause of anarchy, and anarchy might destroy government.

"The fact of the matter is," Mr. Daugherty said, "that under the circumstances and evidence existing and proved in the case at Chicago, had the attorney general not complied with the provisions of the law by taking the action he did, he could have been impeached, and any attorney general failing or refusing under similar circumstances to do precisely what was done, should be impeached.

"There will be no backward step in the policy of the government as at present organized," the attorney general said, adding that "I think we have reached the day when it may truthfully be said that we have seen in the United States the last extensive strike involving and tying up of transportation."

In a pronouncement to labor the attorney general said: "Your principal trouble lies and your greatest danger is in the radicalism and character of some of your most prominent leaders. Your security lies in the constitution of the United States and in the laws of the United States, and in the good opinion, by you deserved, of all the American people.

"A few irreconcilable railroad executives, who insist upon calling themselves 'hard-boiled,' might also, with considerable benefit to the country, be dispensed with. The fault is not all on one side, but at a time when strife that was almost civil war raged in this country, the government, having the right to do so, insisted upon the railroads performing their necessary functions to serve the people. Those in conflict with the railroads interfered with the performance of this service, and it was to protect the right of all the people that the injunction proceeding was brought."

Railway Construction in Kenya Colony, East Africa

Development of Concrete in Railway Construction*

A Study of the Design of the Minor Structures on the Delaware, Lackawanna & Western

By M. Hirschthal
Concrete Engineer, Delaware, Lackawanna & Western

THE MINOR STRUCTURES may be divided roughly into two groups, one for crossings in the sparsely populated country districts, the other for those in the suburban municipalities with well-defined widths of streets. In the country districts where property along the roads is undeveloped, the problems are more simple, since restrictions as to grade and headroom are generally not severe, therefore the semi-circular arch is more generally used for undercrossings. For overhead bridges an arch is more advantageous in both groups, because it permits of commencing the grades on both approaches with only an intervening vertical curve, whose point of intersection is at the center of span, the only disadvantage of this type being the restriction of vertical clearances over the side tracks.

Arch Undercrossings

The semi-circular arches for undercrossings vary in span from 20 to 55 feet, depending on the requirements, usually governed by the density of traffic along the highway in question. A typical 30-foot semi-circular arch is shown in Fig. 6. Exceptions occurred where clearances necessitated the using of flat construction for single spans, in which case either "I" beams or simple slabs were utilized as in Fig. 7.

In rare instances, where it was necessary to provide an exceptionally wide roadway, segmental arches were designed. This occurred near Hopatcong, where a 40-foot segmental arch bridge was constructed and treated architecturally to produce a pleasing structure as may be noted in Fig. 8. Several segmental arches of larger span were also constructed for the Orange improvements.

Overhead Arches

For overhead bridges the elliptical form of intrados for the arches was generally used because of the additional vertical clearance resulting from the use of that curve as compared with the segmental and because of its pleasing appearance. In addition to the unadorned arch bridge of this type (Fig. 9), there are shown two, one of which is this type architecturally treated (Fig. 10), while the other is segmental in form with ornamental details (Fig. 11), and which show the effectiveness of the treatment in each case.

At Kingsland, N. J., where Ridge Road crosses the track, an arch bridge of this elliptical type had been erected some years prior to the decision to locate a new station at the same site, that is, alongside the existing structure. The parapet and railing were torn down on the side adjacent to the proposed station and the arch foundations for the building were then constructed and connections made with the old arch bridge, as shown by the details, Fig. 12.

At Glen Ridge, N. J., the station, grounds and adjacent topography are delightfully rustic in character. Ridgewood Avenue is the thoroughfare that leads to the station and crosses the creek parallel to the tracks by means of a brownstone arch bridge in keeping with the surrounding coloring. It was necessary to renew the bridge over the tracks and the type of structure selected was an elliptical concrete arch with stone face for both arch ring and parapets, the construction being joined to the existing stonework of the arch bridge over the creek in absolute harmony, Fig. 13. Sneeden's Crossing at Convent, N. J., is shown to illustrate the architectural treatment of a basically unsymmetrical two-span structure of this type, Fig. 14.

Where conditions were such as to provide ample headroom, together without crops of rock in locations available for foundations, long span segmental arches were designed which result in striking structures, as shown in Fig. 15. Another structure of this type that is not ordinarily met with is the overhead arch at New Milford, Summit, Pa., Fig. 16. The intrados of this arch conforms to the parabolic curve, the radii and centers of circles being selected so as to approximate very closely the parabola selected to meet the conditions of rise and span existing for this case. These radii and centers are given to facilitate the laying out of the forms for the arch ribs. The abutments for the arch ribs are continuous. The approach and spandrel spans are of the T-beam and slab type. The end piers of the structures are open to permit of the fill sloping through, and short walls are cantilevered from the piers so that the slope will not encroach on the roadbed of the tracks.

Another striking structure which, however, combines sev-

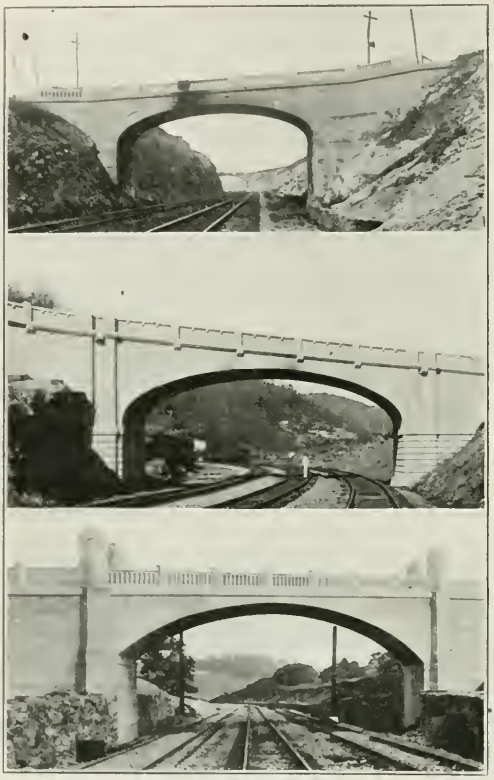
Three Types of Undercrossings

* This is the second of three articles; the first appeared in the *Railway Age* of October 14, page 705. The third will appear in an early issue

eral types of construction into a pleasing combination, is the Roaring Brook viaduct at Park street, Dunmore, Pa., which has a structural steel span over the tracks, a long span arch



Three Overhead Highway Crossings

Fig. 9—Lanterman Cut Arch
Fig. 10—Alford Roadway Arch
Fig. 11—Fuller Roadway Arch

over the brook and T-beam girder and column construction for the remainder of the viaduct, Fig. 17.

While the arch is the prevailing type for overhead bridges, the T-beam type has also been largely used. Fig. 18 is the only example of the three-span type of overhead highway bridge on the Lackawanna where the center span is made large enough to provide for the two main tracks and the necessary side clearances while the spans on either side are made long enough to provide for one side track and to take the slope of the fill to the roadbed.

Milwaukee Road at Clarks Summit, Pa. (the beginning of the Pennsylvania cutoff), crosses both the old tracks and the new at an elevation far beyond the requirements for clearance. Long span T-beam construction was selected as most suitable for this case and the beams were somewhat

Fig. 13—A Stone Faced Concrete Arch at Glen Ridge, N. J.

arched for architectural effect. There are six spans of 50 ft. each, center to center of columns, and two of 45 ft. with two expansion joints for a total length of 395 ft. (See Fig. 19 for illustration.)

A viaduct at Willow Grove, Pa., combines several types of floor construction in one viaduct. The road crosses the tracks at an angle of 45 deg. and as the span for two tracks and side clearances is 30 ft., the T-beam type was selected for this portion of the viaduct, the T-beams being at right angles with the center line of tracks; the skew ends are supported by the reinforced concrete fascia girders. The highway provides for a street car track, separated from the roadway by a curb, so that at the approaches the two-way reinforced slab was selected for the roadway, supported on girders along the face and at the curb line, while a simple slab spanning from the curb girder to the other face was selected to carry the street car loading. There is a curve at

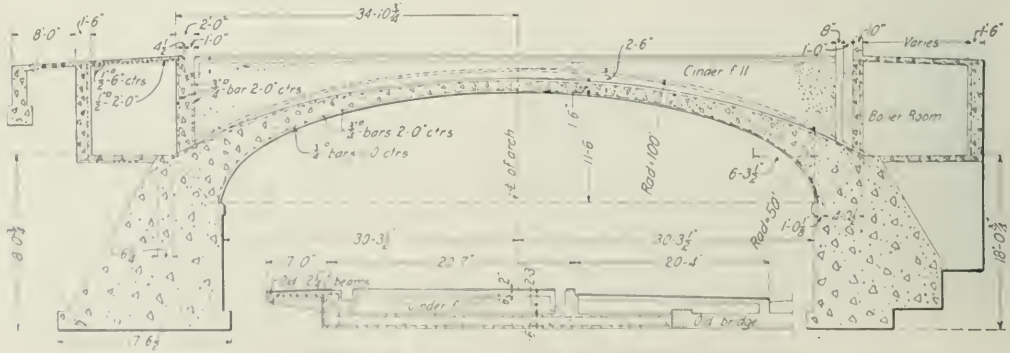


Fig. 12—Sixty-foot Arch Over the Tracks at Kingsland, N. J.

each approach in the opposite direction, the road being on a reverse curve at this point.

Unusual difficulties were presented in the design of the Bloomfield Avenue bridge at Montclair, N. J. Bloomfield Avenue was a busy thoroughfare prior to the improvement, having a double-track suburban car line crossing the railroad at grade at an angle of about 32 deg., resulting in a skew of 58 deg. Under the track was a large culvert, crossing the line of the railroad at an angle of 80 deg. and its bottom at a depth of about 25 ft. below top of rail so that the roadway slab for the new crossing was almost 50 ft. above the brook. Part of the abutment therefore had to be carried on the culvert and its extension, and with rock foundation at one section and soil at another the problem became quite complicated. In addition the approach walls were almost 50 ft. high, which would have resulted in enormous sections if designed as "gravity" sections. The ordinary reinforced sections having been estimated as very expensive, the cellular type of wall was designed, the writer believing this to be the first example (1911), with a thin slab surmounting the walls to carry the sidewalk loads, Fig. 20.

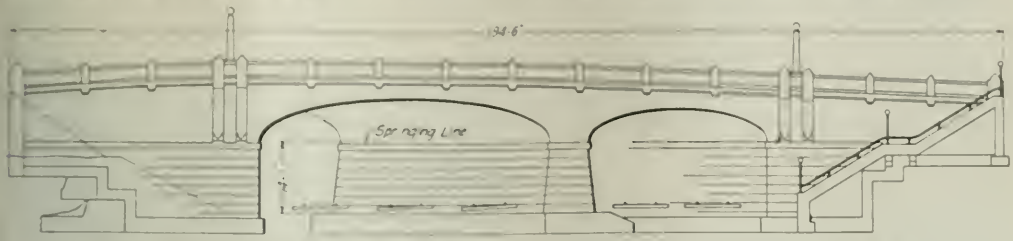

Fig. 14—An Unsymmetrical Two-Span Arch Bridge Over the Tracks at Sneeden's Crossing

Fig. 15—High Arch Span Over a Deep Rock Cut
Fig. 16—Parabolic Rib Arch at Milford Summit, Pa.

A very striking structure is the reinforced concrete footbridge constructed in the suburban district at James Park, Madison, N. J. One similar to this is in course of construction at Maple Avenue, East Orange, N. J. Fig. 21 shows the effective architectural treatment of this type of structure.

There were various farm crossings in the vicinity of Hackettstown that were spanned by bridges that required renewal, whereas the abutments were in good condition. To obviate the necessity of impeding traffic by falsework, the design was of the pre-cast type, the members being molded in Kingsland, transported to the site of the bridge and set in place in the interval between the passage of successive trains, Fig. 22.

Flat Top Undercrossings

Turning to the types used for the thickly populated districts like the cities on the line to Morristown through which the grade crossing elimination projects have been about completed, we find that since the eliminations consist of track elevation, the crossings are with very few exceptions undercrossings, which vary with the width of street. For a 50-ft. street, the bridge consists of two 24-ft. spans with a 2-ft. thickness of pier between. The pier has arched openings to permit of additional light. The bridge floor consists of simple concrete slabs spanning from pier to abutments. Fig. 23 shows a typical bridge of this kind.

An interesting example of this two-span type of bridge, but with smaller spans is the Punch Bowl bridge at Convent, N. J., Fig. 24. The street is 40 ft. wide so that with a 2-ft. 6-in. pier the clear openings are 18 ft. 9 in. each. The slabs were pre-cast and later set in place under traffic. There are really two bridges, one accommodating two railroad tracks and one for two tracks of the Morris County Railroad, which is a suburban street car line, the slabs for which are, therefore, lighter than for the railroad spans.

The architectural and structural features of this bridge

Fig. 17—A beautiful Structure at Dunmore, Pa., Embodying a Pleasing Combination of Construction Types

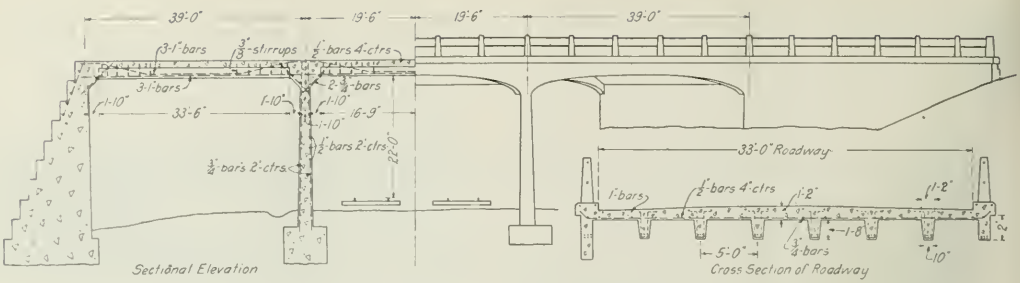

Fig. 18—T-Beam Construction May Be Treated to Give the Effect of a Flat Arch

Fig. 19—An Example of T-Beam Construction in a Concrete Viaduct

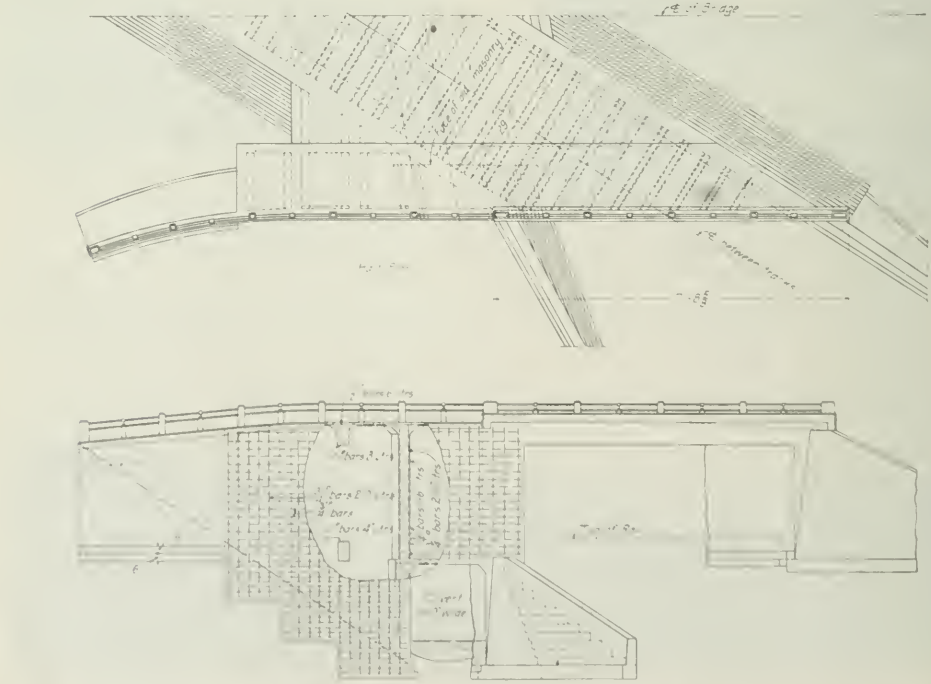

Fig. 20—A Complicated Skew Crossing at Montclair, N. J., Involving Cellular Construction in the Abutments

are the curved reinforced concrete wing walls which beautify the structure materially.

In the case of the 60-ft. streets it was necessary to resort to two types, one where it was permissible to locate a pier along the center line of street as well as along each of the curb lines and the other where it was imperative that the roadway be kept clear from curb to curb. In the first type,

Fig. 21—An Unusual Treatment of a Foot Bridge with Excellent Results

a slab of varying thickness, depending on the relative length of roadway and sidewalk spans, is designed continuous from abutment to abutment over the intervening piers. As a rule the roadway spans are 17 ft. 6 in. clear, leaving 9 ft. 6 in. for clear sidewalk spans, and the reinforcement is carried normal to the pier lines so that where the angle of crossing is skewed the parapets act as fascia girders to carry the loading

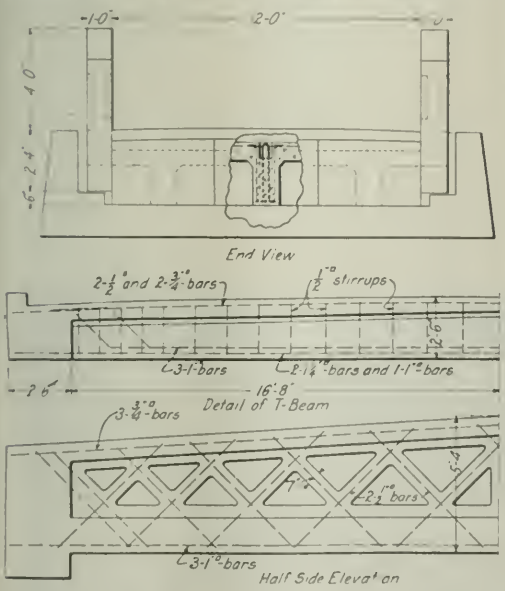

Fig. 22—Precast Unit-Construction Is Well Adapted to Locations Where Traffic Interferes with the Use of Falsework

transferred to them by the slab. The piers, two feet in thickness with arched openings, are carried on continuous footings. In some instances these bridges also carry station platforms which modify the design of the structure somewhat. Figure 25 shows a typical bridge for a 60-ft. street while Fig. 26 shows details of one at Lincoln avenue, Orange, N. J.

Madison Avenue bridge at Madison, N. J., is illustrated in Fig. 27, to show how advantage was taken architecturally of the large skew between the street and the track center lines to produce a structure of exceedingly pleasing appearance.

In the other type, where it was necessary to maintain a clear roadway, a span of 51 ft. clear had until recently been considered too large to permit the use of a reinforced concrete slab to take railroad loading, particularly in view of the limiting thickness of three feet for the depth of the slab. Recently, however, in the case of a bridge at Millburn, by the use of compressive reinforcement, a reinforced concrete slab three feet thick was installed for a 52-ft. clear span and may displace the design heretofore used which consists of I beams imbedded in a solid concrete floor three feet thick, where the structural steel was figured to take the entire load.

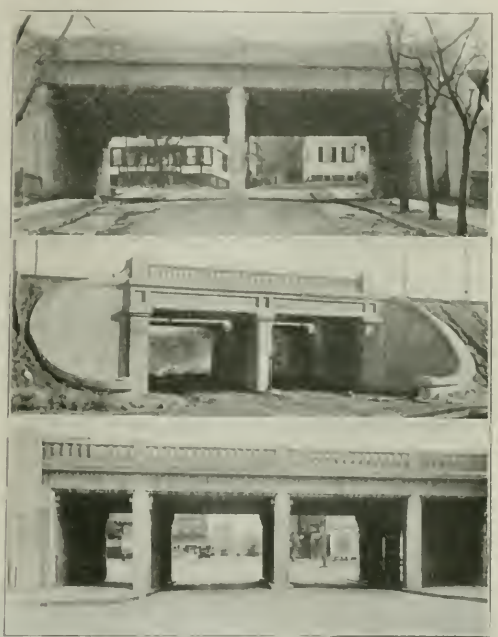

Fig. 23—Two-Span Crossing for a 50-ft. Street
Fig. 24—"Punch Bowl" Bridge with Curved Wingwalls
Fig. 25—A Four-Span Crossing for a 60-ft. Street

This slab is supported by box abutments enclosing the sidewalk spans as shown in Fig. 28.

Streets wider than 60 ft. are rare in suburban cities in the east, but they do occur. Sixteenth street and Fourth avenue, East Orange, are both 66-ft. streets and the side spans are then sufficiently long to permit the use of the four-way slab which was used on both of these bridges. Sixteenth street crosses the tracks at right angles while Fourth avenue crosses the tracks of the Montclair branch at quite a skewed angle, making the design considerably more complicated. The spans on the Fourth avenue bridge are irregular because of the different widths of sidewalks required for the two sides and because of the varying angle of skew of the two parapet faces caused by the location of the stairway from the station platform at one of the abutments.

Bridges for 100-ft. streets begin to partake of the nature of viaducts as expansion becomes a factor to be considered where structures exceed 100 ft. in length. At Madison, N. J., Green avenue is a 100-ft. street with 24-ft. 9-in. clear road-

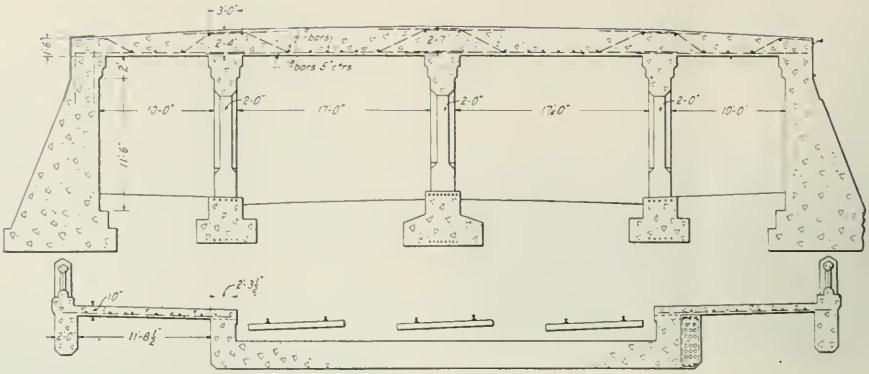

Fig. 26—Typical Details of a Reinforced Concrete Slab Subway Continuous Over Three Supports

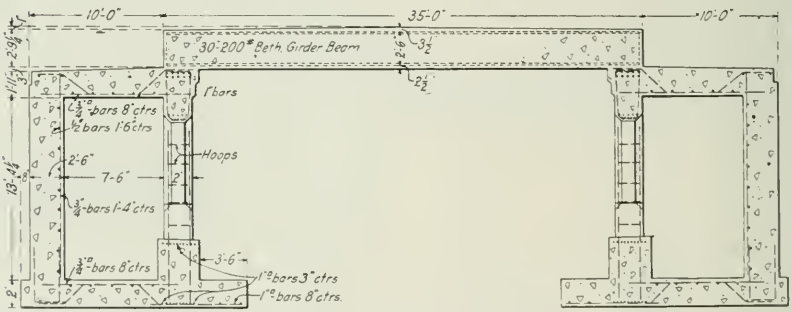

Fig. 28—An Example of Box Abutment Construction Enclosing the Sidewalk Spans

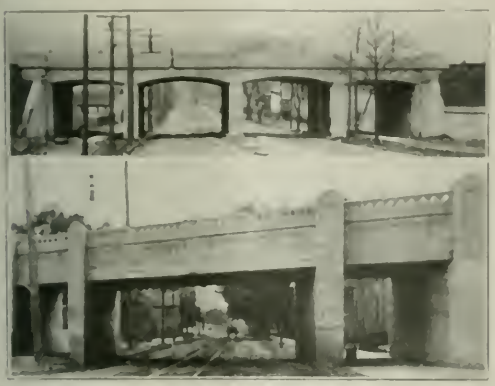
Examples of Two Subways for Wide Streets or Boulevards

Fig. 27—Madison Avenue at Madison, N. J. Fig. 29—Subway for a 100-ft. Street at Green Avenue, Madison, N. J.

way spans, 21-ft. 6-in. clear sidewalk spans and 2-ft. 6-in. arched piers between, bridged over with a 3-ft. thickness of continuous slab from abutment to abutment, the parapets acting as girders to take the load due to the slight skew of the road with the center line of track, Fig. 29.

Another 100-ft. street occurs at Central avenue, Orange, N. J., where the four-way slab was used. While the main spans here are 28 ft. 8 in. center to center of columns the



Two Examples of Slab Construction for Street Subways

Fig. 30—A Four-Span Crossing of 100-ft. Street
Fig. 31—Subway with Center or Roadway Span Consisting of Steel Girders Encased with Concrete. The Side Spans Are of Reinforced Concrete

thickness of floor slab is only two feet, about one foot and a half less than would have been required for a continuous slab of that span with only one line of reinforcement. A feature of this bridge is the use of columns at the abutment lines with the slab cantilevered beyond, to preclude the

Fig. 32—Concrete Coal Pockets at Montclair, N. J.

sliding due to expansion which usually results in spalling at the abutments. The abutments were built around the columns and clear of both the columns and the slab. Figure 30 shows the appearance of the finished structure.

The Springdale avenue bridge on the Montclair branch of the East Orange improvements is another of the four-way slab bridges which is almost long enough to be classed as a viaduct. In fact it is a double crossing, providing two independent roadways requiring a column spacing of 28 ft. center to center each, separated by two smaller spans and having sidewalk spans on either end. The total length of this bridge is 121 ft., end to end of slab.

Glenwood avenue at Bloomfield, N. J., is an example of a bridge with structural steel beams and girders entirely encased in concrete for the roadway spans, while the side spans are of concrete architecturally treated as to give the appearance of a homogeneous structure, Fig. 31.

In connection with various grade crossing elimination improvements, trestles were designed to accommodate sidings for industries adjacent to tracks. Fig. 32 shows the concrete coal pockets at Montclair.

Union Pacific Opposes Southern Pacific Application to Keep Central Pacific

WASHINGTON, D. C.

THE UNION PACIFIC moved promptly this week to meet the application filed with the Interstate Commerce Commission by the Southern Pacific for permission to retain control of the Central Pacific pending a determination by the commission of its disposition in the consolidation plan by filing a petition with the commission for leave to intervene in the proceedings on the Southern Pacific's application. The Union Pacific also filed a motion to dismiss the Southern Pacific application. An interesting feature of the case is that while the Southern Pacific has retained as one of its counsel in the case Max Thelen, former chairman of the California Railroad Commission, the list of Union Pacific counsel includes Edgar E. Clark, former chairman of the Interstate Commerce Commission, as a member of the firm of Clark & La Roe.

The Union Pacific motion to dismiss says that the commission is without jurisdiction to hear and determine the application of the Southern Pacific, that upon the facts and matters already before the commission, or of which it may take judicial notice, the application should be dismissed without the taking of testimony; and that in the exercise of its discretion and in recognition of the comity owed to the federal district court now having jurisdiction of the Southern Pacific-Central Pacific dissolution case, the application should not be entertained. The Union Pacific further moved that its motion be set down for oral argument before the full commission and that, pending the same and the decision of the commission thereon the commission and Division 4 postpone the taking of testimony either in support of or in opposition to the Southern Pacific application. A hearing on the latter had already been set for November 21.

The petition for leave to intervene states that the lines of the Central Pacific and of the Union Pacific together form a through transportation route between the Missouri river and San Francisco and other California points, and with the eastern connections of the Union Pacific constitute a direct transcontinental through route, and that by virtue of such connection and of its participation in such through route, the Union Pacific has an interest in the operation of the lines of the Central Pacific "independently of any control by interests hostile to said through route." It is also set forth that the railroads of intervenor and of the Central Pacific, together with the eastern connections at Council Bluffs and Kansas City, constitute the system of transportation through the Ogden gateway held by the United States Supreme Court in the decision of May 29, 1922, to be normally competitive with the southern routes of the Southern Pacific through the El Paso gateway, "which competition it is the purpose of the said decision of the United States Supreme Court to restore and protect." Some of the contentions made in the petition are:

Throughout the Pacific railroad acts, the lines to be con-

structed by the Union Pacific and the Central Pacific were treated in all respects as parts of a single project and it was specifically provided that the whole line should be operated and used, so far as the public and government are concerned, as one connected, continuous line. This requirement cannot be observed and fulfilled unless the Central Pacific is freed from the domination of the Southern Pacific "because the ownership and/or operation by the Southern Pacific Company of the southern routes through the El Paso gateway creates a primary interest on the part of the Southern Pacific Company in routes highly competitive with and hostile to the direct through transcontinental route formed by the railroads of the Central Pacific Railway Company and intervenor and their eastern connections."

"Upon the faith of the aforesaid requirement of the Pacific railroad acts, and; for the purpose of performing its part of the obligation imposed thereby and of handling efficiently and economically traffic to be routed over said through route and to be interchanged with the Central Pacific Railway Company at Ogden, intervenor has invested many millions of dollars in double-tracking 914 miles of the total 994 miles of its main line between Council Bluffs and Ogden and otherwise improving the same. Unless the statutory obligation shall be fulfilled on the part of the Central Pacific Railway Company or the interests controlling that company, the purpose of said acts will be violated, to the great detriment of interstate and foreign commerce and intervenor will suffer irreparable injury."

By virtue of these matters the Union Pacific said it had an interest in the execution of the mandate of the Supreme Court and in the adoption of a plan for accomplishing a severance of the control of the Central Pacific by the Southern Pacific which would leave the Central Pacific "free from domination by interests hostile to the Central Pacific-Union Pacific through route via Ogden and in all respects able to perform its part of the partnership obligation imposed by the Pacific railroad acts."

In conclusion the petition said that the mandate of the Supreme Court remands the case to the court for the district of Utah for further proceedings.

Car Service Division Orders Cars West

WASHINGTON, D. C.

In order to meet the demands of the farmers, the primary markets and the industries of the West, the Car Service Division of the American Railway Association on October 25 issued orders for a strenuous movement of cars of western line ownership into the western territory. This was done after urgent solicitation on the part of some western roads and representatives of shippers and state commissions. Effective at once and continuing until further notice all box cars except automobile cars belonging to the roads of the North Western, Central Western and South Western districts will be handled, according to the orders, as follows:

First: Eastern lines will discontinue all local loading of these cars and load them only to or beyond Chicago, Peoria, St. Louis or other western points from all territory east of Grand Rapids, Detroit, Pittsburgh and Wheeling, inclusive.

Second. Any cars for which through loading is not immediately available will be moved west empty.

Third: All loading at points west of Grand Rapids, Toledo, Pittsburgh, etc., will be discontinued and cars moved empty west for delivery to owning lines.

Fourth Western line cars will be accepted at junction points from the East regardless of ownership and through route providing home route orders take the cars in the direction opposite from home.

It is believed that these instructions will have the effect of materially improving the car shortage condition in the West.

The Great Northern on October 19 filed a petition with the Interstate Commerce Commission asking it to exercise its emergency car service powers by issuing an order, without notice or hearing, requiring connecting lines to return to the Great Northern at the earliest possible time box, refrigerator and stock cars so as to enable it to haul grain, fruit, vegetables, live stock, lumber and coal that were being offered in greater quantities than could be handled. The commission declined to issue an order as requested, but set the petition for hearing on October 24. Before that date, however, the railroad withdrew the petition.

The Car Service Division has compiled the following report indicating the volume of transportation being handled by the railroads and showing loading for the week of October 14, with various comparisons:

TOTAL CAR LOADING ALL CLASSES OF TRAFFIC

Week ending	1921	1922	Increase	Per cent
Aug. 19	815,147	856,219	41,072	5.0
Aug. 26	828,883	890,838	61,955	7.5

Railway Fire Protection—Ninth Annual Meeting

Details of Varied Fire Risks—The Dangerous Cigarette—Fire Prevention Week—Hose Couplings

THE FIRST DAY'S proceedings of the annual meeting of the Railway Fire Protection Association at Washington last week were reported in the *Railway Age* of October 21, page 745.

The first report on Wednesday, the second day, was that of the committee on the use of gasoline trucks in freight stations, E. J. Reilly (Erie), chairman. Mr. Reilly had no written report, but asked numerous questions. The use of gasoline tractors in freight houses is being tried cautiously in a few places, because of the high cost of electric tractors, but every fire insurance man is, as a matter of course, reluctant to approve them. Gasoline tractors are declared also to be cheaper to operate and maintain. Gasoline (street) trucks have been freely admitted to New York City freight piers for years, on the ground floor, and it was the general feeling of the meeting that the railroads will eventually have to withdraw or modify their objections. It is taken for granted that the underwriters will insist that gasoline trucks used in freight stations be always stored outside the building. The Southern Pacific, at Galveston, Tex., uses some gasoline tractors on its piers, which have concrete floors. The gasoline supply is a mile away. A special muffler is used and inspection is rigid.

The Cleveland, Cincinnati, Chicago & St. Louis is trying these tractors. The Illinois Central uses electric tractors on its long pier at New Orleans and G. R. Hurd, of that road, believed gasoline could not be thought of for that service. Cotton is a principal commodity handled there. Mr. Reilly said that in Erie stations, at New York, barrels of sand for extinguishing gasoline fires had been maintained for a dozen years, but there had never been occasion to use them.

This committee was continued for another year.

The United States Chamber of Commerce and its activities were described to the members by J. L. Madden, manager of its fire prevention activities. His first general survey was finished last August and has shown definite good results. Mayors, governors and even the President of the United States have been exhorted in connection with Fire Prevention Week. Following Mr. Madden's address it was resolved that every member ought to co-operate with the United States Chamber and also with local chambers of commerce and any local power that can do good work in fire prevention.

The Question Box

Miscellaneous questions, brought together since the meeting opened, occupied the members for an hour. One of the most interesting of these was that concerning the rule prohibiting smoking. The labor troubles of the past four months have caused a good deal of disturbance of this rule. Many temporary dormitories have had to be maintained. The self-sustaining cigarette was declared to be one of the worst fire hazards. An appeal was made to members to work for the condemnation of all cigarettes but those in which, as in cigars, the fire goes out when the cigarette is abandoned. Shopmen should be allowed, at noon-time, to smoke; but only in designated places looked after by a caretaker. Fire inspectors should never smoke on railroad premises, even where smoking is not forbidden specifically. To cut down smoking, begin at the top. If a station agent smokes there can be no effective discipline of his subordinates.

Risks of fusees were briefly discussed. Dampness is the principal danger to be guarded against in that direction, though one member said that the best kinds now made do not suffer from dampness.

W. T. Krausch (C. B. & Q.) spoke briefly of the recent burning of the Burlington general office building in Chicago. The vaults, with walls 13 in. thick, functioned perfectly. The Burlington is going to provide portable steel cases for drawings which cannot be kept in vaults. B. S. Mace (B. & O.) called attention to the importance of protecting records at other places than headquarters; for example, at freight junction points. Every division of the road should have one fireproof place for records.

The use of radio telephone receivers was discussed briefly. Some members described damage that had been reported, but the majority seemed to think the fire hazard very small. The United States Steel Corporation found 5,600 radio sets in use in its numerous buildings.

Addresses by Messrs. Kimball and Fleming

L. P. Kimball, engineer of buildings of the Baltimore & Ohio, read a paper on co-operation between his department and the fire protection men. Everyone agrees that such co-operation is desirable, but the speaker's emphasis was on the importance of acting together before, instead of after, the building of any structure. He cited an instance of two similar structures, built about the same time, one of which costs for fire insurance $16,000 yearly more than the other, because the designers did not consult the insurance men.

T. Alfred Fleming, representing the National Board of Fire Underwriters, who had been chairman of a committee to carry on "Fire Prevention Week," gave a glowing account of the success of that enterprise. Messages of wisdom on fire prevention were sent out by 227 radio stations and were advertised by 1,400 Rotary clubs, 1,000 Kiwanis clubs and hundreds of other organizations.

Oxy-Acetylene Apparatus in Shops

The committee on safety in the use of oxy-acetylene welding and cutting presented a printed report of 18 pages, made up of a most elaborate code of rules for the guidance of everybody from the purchaser of apparatus to the last detail of inspection, and four pages of rules for shop workmen. The report was read by the chairman, G. A. Hays (U. S. Steel Corp.), and was discussed at some length. On a number of points differences of opinion proved to be marked and the report was referred to the executive committee, being accepted as in the nature of a progress report. One member proposes to put yellow flags on portable shop apparatus.

Fire Protection Views of an Engineer of Buildings

W. T. Krausch, engineer of buildings of the Chicago, Burlington & Quincy, read a paper on protection as looked at from his department, especially in relation to repaired or altered buildings. He outlined the best methods of renovating a frame station. He gave a condensed pen picture of the policy of the Burlington road in fire protection. Reports received from the insurance companies or brokers are dealt with at officers' meetings, thus avoiding the delays incident to correspondence with various departments. Officers of the road when on inspection trips must keep their eyes open and report to the fire department everything needing that department's attention.

Oil on Water

W. F. Steffens (N. Y. C.) read the brief report of a committee on fuel oil on water. Violations of law by oil-burning boats which waste their oil refuse on the surface of New

York and other harbors have been largely abated. This oil or emulsion is likely to remain in a harbor a long time and the evil demands persistent attention. This committee has conferred with the New York Fire Underwriters' Association and others, and had almost prepared for careful chemical experiments when its work was suspended by reason of the railroad shopmen's strike. The National Fire Protection Association has a committee on docks which also is studying the oil-on-water problem.

A Specialist in Railroad Records

Wednesday's session was closed with a brief address by E. M. Hawes of the Safe Cabinet Company, Marietta, Ohio, advocating the use of fireproof fittings and delineating vividly the annoying and costly experiences of railroad officers whose records have been destroyed in conflagrations. Illustrating by the recent Burlington office fire in Chicago, the speaker showed the inaccurate and often false use of the term "fireproof." Sixty per cent of iron safes fail when tested by a large fire. The Burlington's vaults stood the test; but the walls of many vaults are only two-thirds as thick as these.

Standard Hose Couplings

The first business on Thursday was the reading of a report by a committee, F. H. Elmore, chairman, on the Development and Use of National Standard Couplings for Fire Hydrants and Hose. Compiling data received from eight railroads, the committee finds that 92 per cent of the couplings can be standardized and that only three per cent would have to be replaced in adopting the national standards. The National Board is making some progress in standardization. A set of standardization tools can be had for $200 from the Greenfield Tap & Die Corporation, Greenfield, Mass. Railroads feel a drawback in their attempt to adopt national standards because their apparatus must be uniform with that of the city or town in which it is situated and many of the towns are not progressive. New York City, notably, has a standard different from the national. Some roads have made use of "adapters" for making it possible to use diverse sizes of couplings. Standardization can be facilitated by communicating with the National Board of Fire Underwriters, which will furnish paper strips to put around the threading of a coupler and make an impression with which to report sizes of couplings at the different locations. The paper, however, if used on a badly worn coupling might in some cases give a deceptive result.

This report was intended mainly to promote discussion among members during the ensuing months and was accepted as a progress report.

Dust in Grain Elevators

A. R. Small, vice-president of the Underwriters' Laboratories, Chicago, read an address on The Control of Dust in Grain Elevators. Two courses are always to be considered: (1) Remove the dust from the grain; (2) confine the dust in the grain. Removing it is objected to by farmers and others on the claim that good grain is also removed, some objectors going to the extent of alleging theft of grain. To confine the dust in the grain seems almost impossible; but the flour mills have had success in this line and their experience for 30 years should teach grain elevator men that dust can be controlled. For 40 years there has been no serious explosion in a flour mill. A principal safeguard is to provide that air currents shall flow into the chutes, not out of them.

This paper was followed by a long discussion covering many details of the subject. A large elevator at Chicago has a vacuum cleaning system which has displaced 40 or 50 men who formerly were employed as sweepers, but the discussion seemed to indicate that the superiority of the vacuum system, for general use, has not yet been demonstrated. The high standards set forth by Mr. Small in his paper were generally looked upon as suitable and highly desirable when designing new elevators, but difficult of application to old ones. Mention was made of the fact that with the latest forms of machinery the costly safeguards are needed because these machines operate at perhaps 10 times the speed of older designs. The National Fire Protection Association is working on a standard for machinery used in elevators.

Timber-Treating Plants

L. F. Shedd (C. R. I. & P.), chairman of a special committee on Fire Prevention at Timber Treating Plants, read a report, detailing under 14 heads the principles to be followed and the rules needed for the thorough protection of such treating plants. This paper was not discussed, the aim of the committee having been to prepare a complete and detailed code of rules for the consideration of members between now and the next meeting of the Association.

Mr. Shedd's report ended the list of formal papers and some time was spent in informal discussion of miscellaneous matters. Serious fires started by the ignition of locomotive cab curtains by men using torches were briefly discussed.

A meeting held some weeks ago by eastern members was spoken of as a great success and Robert Scott (A. C. L.), expressed the intention of starting a movement for holding district meetings in the south. A proposal to amend the constitution so that members of the executive committee could not hold office for more than one term at a time was discussed for some time but finally was voted down. In practice the rule of rotation in office has been pretty generally followed, so that any objection to individuals remaining in office too long was looked upon as theoretical only.

The officers chosen for the ensuing year are: President, E. A. Ryder (B. & M.), Boston; vice-president, George R. Hurd (Illinois Central), Chicago; secretary and treasurer, R. R. Hackett (B. & O.), Baltimore. Members of the executive committee: C. J. Parker (N. Y. C.), New York City; J. R. Peters (Penn.), Philadelphia, and W. S. Topping, Bureau of Explosives, New York City. The retiring members are R. H. Newbern and G. R. Hurd.

The Foamite Firefoam Company gave a motion picture exhibition of the use of its suds for extinguishing oil fires, including an actual conflagration at a large oil tank farm in Wyoming. This was the only exhibit in connection with the meeting, although the Pyrene Manufacturing Company had a display in the hotel and the Simplex hydrant was demonstrated for members at a point outside.

Batignolles Tunnel, Paris, Where Many Accidents Have Occurred, Being Converted into an Open Cut

Railway Treasury Officers Meet At Asheville, N. C.

Railroad Financing, Mechanical Devices and Cash Payment of Freight Bills Leading Topics of Discussion

The Railway Treasury Officers' Association held its sixteenth annual meeting at the Battery Park Hotel, Asheville, N. C., October 19 and 20. Besides the regular business of the association, papers were read by F. L. Paetzold, secretary and treasury of the Great Northern, on the subject of "Mechanical Devices in the Treasury Department;" by T. H. B. McKnight, treasurer of the Pennsylvania Railroad, on "Railroad Bonds as an Investment;" by E. L. Copeland, treasurer of the Atchison, Topeka & Santa Fe, on "The Transportation Act and the Treasury Department." A report was also presented on, "How Shall Essential Uniform Observance of the Rules Governing the Collection of Transportation Charges be Attained?" It was prepared by A. T. Bayfield, treasurer of the Lehigh Valley; W. J. Moody, treasurer of the Erie, and F. T. Dickerson, treasurer of the Central of New Jersey.

The president of the Association for the past year was D. K. Kellogg, treasurer of the Richmond, Fredericksburg & Potomac. New officers elected for the ensuing year are: President, W. F. Ingram, treasurer of the Southern Pacific; vice-president, J. F. Fahnestock, treasurer, Pennsylvania Railroad; second vice-president, J. T. Reid, treasurer, Atlantic Coast Line, and secretary and treasurer L. W. Cox, who is assistant secretary of the Norfolk & Western with office at 1217 Commercial Trust Building, Philadelphia, Pa. Members of the executive committee were elected as follows: A. B. Jones, (C. & N. W.); R. N. Harry, (C. C. C. & St. L.); J. A. Yates, (G. T.); A. F. Bayfield, (L. V.); J. P. Reeves, (C. & E. I.); F. T. Dickerson, (C. R. R. N. J.).

Railroad Bonds as Investments

By T. H. B. McKnight
Treasurer, Pennsylvania Railroad, Pittsburgh, Pa.

We railroad men are not in the habit of looking at railroad bonds as investments—at least not nearly so much as might be wished—but rather as the means by which money may be obtained for construction, equipment, improvements and refunding of maturing prior obligations.

When the first railroads were begun their projectors had but slight knowledge of what sums would be required to construct even the small local roads they had in view, and expected the financing to be made entirely from stock sold to the people in the proposed terminals or along the line of the road who naturally hoped to be benefited by the construction of the railway to serve them by carrying their products to the markets and bringing to them such supplies as they had to procure from a distance. The reason for their subscription toward the stock of the new company was hardly to make an investment, but rather to expend money to secure the benefits which would come to them from having cheap and rapid transportation. Owing to ignorance of what it would cost to construct a practical railway ready for operation, the amount required far exceeded expectations and repeated stock issues were necessary and finally failed to bring any additional funds. To attract more money it soon became necessary to make the investment more secure, and preferred shares were issued, giving the new subscribers a preference over the earlier ones, both in dividends and as to division of the assets in the event of liquidation. This increased security, however, failed to procure all the money required and it was necessary to borrow money on the only security generally known in those days—a mortgage on the property—and bonds were issued, but always in sums insufficient to complete the property for operation, so that one issue followed another, each junior in lien to those that preceded it. There were first, second, third and fourth mortgages on the same property; and then came income bonds, when there was nothing else left to mortgage.

It is interesting to note that during these early years when these bonds were going out in successive series, the railroads always seemed to cherish the hope that someway, somehow, they would be able to pay the mortgage debts off, and elaborate sinking funds were provided for out of future earnings to retire enough bonds each year to extinguish the loan at maturity. The earlier railroad builders seemed to have uniformly been of a hopeful and optimistic temperament!

Very few of these early hopes were gratified by fruition and most of the investors in the bonds and practically all of the original projectors of the railroads lost all the money that they put into the enterprise, though some of the owners of the first mortgage bonds may still, in a reduced amount, have an interest in the stock of the present corporations.

Three Periods

Railroad bonds may roughly be divided into those issued in three periods:

I. *Construction*: Practically all of these bonds were extinguished by foreclosures, the first mortgage bonds sometimes receiving stock in the new corporation, only to be wiped out later by a foreclosure of later bond issues. Those that were not foreclosed were paid at maturity or refunded. These bonds generally carried 6 to 8 per cent, for money was not so plentiful in those days and interest rates were higher.

II. *Growth and Prosperity*: Many of the bonds issued by the stronger roads during this period, which lasted up to about 15 to 20 years ago, are still outstanding and are the best of investments, because the railroad people were still entirely unable to realize the expenditure that would be required in the years to come, and hence put out comparatively small issues, so limited that, when the bonds authorized under that mortgage had been sold, future issues had to be made, which were of course junior liens. From force of habit and with the idea that it improved the sale of the bonds many of these issues had sinking fund provisions that are proving very embarrassing to the present corporations, which have to borrow money on junior loans at higher rates for betterments while much of their income must be applied to buying in low-rate prior lien bonds at exorbitant prices.

III. *Government Interference*: With the gradually increasing domination of the Interstate Commerce Commission and its mistaken policy of steadily reducing traffic charges, notwithstanding that growing operating expenses were every year as steadily reducing the margin of profit, it became difficult and finally almost impossible for the railroads to finance necessary but non-productive betterments, such as elevation of crossings, out of net earnings, as had been the proper method for years, or to provide for productive additions and improvements by sale of capital stock, and forced them to provide the money needed for all purposes by sale of bonds, which were necessarily of inferior lien and were known as consolidated, general or refunding bonds. By this time too the railroad officers began to get a vision of the vast expansion of facilities that would be required to perform the service to the public that would be needed in the not very far distant future, so that these mortgages, though limited at first to definite totals, yet permitted so large an issue that they may be called "blanket mortgages" as they cover all the property "now held or hereafter to be acquired."

Comparatively recently mortgages are being put on the property with no limit as to the amount of bonds that may be outstanding thereunder except one based on the amount of capital stock outstanding; for example, in recent mortgages of two of our greatest companies, the provision is that the bonds outstanding under the mortgage and prior ones

must never be more than three times the amount of the capital stock. In such mortgages too the issue of bonds may only be made for betterments or property acquired or for refunding prior liens. These mortgages are the final ones, because they are practically without limit, they will never be exhausted, as when the early series of bonds mature later series will be issued under the same mortgage to refund them and to pay for additional betterments.

Partly because of these blanket mortgages a new form of security has been and is being very largely issued—equipment trust certificates—which are mortgages placed on new equipment before they pass into the ownership of the railroad and under its mortgage, or, as in the Philadelphia plan, where the title to the equipment remains in a trustee until the railroad has paid the cost, over a series of 10 or 15 years.

Value as Investments

To value these various bonds as investments, it is necessary to consider the security of each class and what may happen in the 40 to 100 years which they have to run before the principal comes due. As practically none of the bonds issued during the period of construction remain outstanding now, we can omit any further reference to them.

The bonds of the period of growth and prosperity are outstanding in large amounts at prices based on the prevailing rate of interest. As many of them were issued at 3½ or 4 per cent they have sold very low during this war period of high interest rates but are now coming back to their own again. As these issues are limited in amount and no more can now be issued, they are, when the obligations of standard, well managed, dividend paying roads, very safe investments, and should steadily get better in security as prior liens are paid off and more value added to the property by improvements and betterments placed out of proceeds of stock or bonds of subsequent liens.

It is difficult to imagine anything that could make these prior lien limited issue bonds of a good road unsafe: Even if the radicals ever achieve their fondest hopes and the government takes over the railroads, it is inconceivable that they should not do so by purchase at an appraised value and these earlier bonds must then certainly receive their full par values.

When we come to the blanket or unlimited issues recently made in the period of government interference, it can only be said that the security of the bonds will depend very much on the amount issued, the prosperity of the road and the good or bad judgment displayed by the management in placing additions or extensions on the property. One large road has a blanket mortgage which permits the issue of bonds for the full cost of branches; and as it lies in a coal country the terms of the mortgage would permit the issuance of long term bonds for cost of branches to mines which would be worthless after the coal was exhausted—long before the maturity of the bonds. The purchase or construction out of bonds of a large extension which might prove unprofitable might seriously depreciate the value of the blanket bonds but could not in any way affect the value of the prior lien bonds.

There are now on the market so many good bonds of public service and industrial corporations which are well secured that a prudent investor will be inclined to diversify his investment. These latter bonds generally contain the provision that additional bonds can be issued under the mortgage only to refund prior lien bonds or for betterments at a certain percentage of their cost—generally 80 per cent—and then only when the income for a period of years has averaged three times the interest on all the bonds, including the new issue. Some such provision as this might well be inserted in the blanket mortgages of the railroad companies and would greatly increase the security of the bonds.

As long as railroad bonds of limited issue can be had the careful investor will naturally prefer them for investment of trust funds in his care, and in fact in many states he could not invest such funds in these new unlimited blanket mortgages until the prior lien bonds have been retired.

Equipment trust securities, especially on the Philadelphia plan, issued by a well managed, prosperous road that keeps its equipment in good repair, are about as safe as anything one can imagine, though they are generally of short term. As they start with a margin of safety of 15 to 25 per cent and are retired faster than the equipment deteriorates, and as equipment is always in demand if the certificate holders have to take it over, these certificates ought to be absolutely secure.

The careful investor will probably consider the various conditions surrounding the properties whose bonds are offered to him and the possibilities of future improvement or deterioration, and will naturally diversify his holdings by buying not too many of one kind of security, or of one company or one region, so that his chances of serious losses will be reduced to a minimum. He will of course have in mind the fact that all corporate bonds are subject to government influences, but he will find so few investments to which this does not apply in one way or another that he will have to decide that he cannot entirely avoid this danger but will have to assume it, and can only minimize it by scattering his purchases. He will also probably feel that there are very few corporations more carefully and honestly managed than the railroads, and none as to which such full and accurate information may be obtained, and in the future as in the past, well secured bonds of well managed corporations will be found to form a substantial part of all large funds, such as are carried by insurance companies, colleges, and endowed institutions of all kinds, and of the contents of the strong-boxes of wealthy individuals.

The investor should remember too that the priority of a security does not always make it safe—a general mortgage bond of a prosperous corporation whose property is well located may be much safer than a first mortgage bond of a less prosperous concern.

The tendency of the courts to continue receiverships indefinitely and to permit receivers' certificates to be issued and placed ahead of even the first mortgage does not make toward the security of railroad bonds of prior lien and has resulted sometimes to their great damage, but it really seems as if this practice has about reached its limit—at least we can hope so.

The Transportation Act and the Treasury Department

By E. L. Copeland

Secretary and Treasurer, Atchison, Topeka & Santa Fe

(Mr. Copeland's paper was in the form of a somewhat detailed analysis of the changes in railway regulation embodied in the Transportation Act. Concerning more particularly the treasury department he spoke in part as follows:)

During federal control the services of soliciting agents had been dispensed with. Freight cars for use of all lines had been distributed over the country as business demanded, and it practically made no difference what line secured the business relative to the earnings, as it was all federal. On the return of the railroads to the owners it was fully realized by all that competition for business would be as keen as ever. Under this situation, and with the treasury of the various lines in a cramped condition from lack of funds, it was important that some action should be taken relative to the payment of all transportation charges on a cash basis.

Advantage had been taken of the railroads by many large

shippers prior to federal control in order to secure a concession in the time required for the settlement of transportation charges, and unusual credit had been extended. The tariff charges to be assessed were declared as on a cash basis rather than a time period. In a hearing before the Interstate Commerce Commission some shippers thought that they should be given 15 to 30 days' credit, but Congress realized the injustice of such a plan, and determined that the service performed by the transportation companies should be paid for before the relinquishment of the freight, leaving it to the commission to establish such rules and regulations as would be consistent with good business requirements.

This conclusion was a fortunate one for the treasury departments of the railroads, assuring them that unlimited credit, delays in settlement, etc., would not be permitted under this law. In the general discussion of this subject it was clearly indicated by the members of Congress, that no industrial or mercantile line of trade should be permitted to transact business on railroad money, as that is practically the situation whenever an extended credit is permitted to railroad patrons.

The treasury department controls the collection of revenue and is expected to take care of the varying conditions relative to the delivery of all shipments, perishable or otherwise. The Interstate Commerce Commission has left the detailed requirements to the railroad treasurers, who are in close touch with the situation, and it placed a responsibility on them greater than ever before. Treasurers must know more about the financial responsibility of their patrons at all points on their line; they most avoid discrimination and at the same time recognize the importance of expanding the method of collection as the various lines of business may require. The iron-clad rules must be elastic in various ways. The handling of perishable freight must receive special attention; diversion and delivery of shippers order shipments, without surrender of original bills of lading must be fully protected; congestion of freight must be avoided by arranging for prompt switching and unloading of cars for further service.

I am enumerating a few of the things that the treasury department must handle without fear or favor. After much discussion, the Interstate Commerce Commission decided that exceptions could be made in the collection of transportation charges to well-known, financially responsible patrons, who would agree to pay the bills within 48 hours after presentation, and that where special conditions were such that additional credit should be extended, on the filing of proper bond with the treasury department, a credit of 96 hours could be extended from the time of presentation of the freight bills. This arrangement places the treasury department in close relation with the shipping public, and it is expected to keep posted as to the financial condition and the ability of parties to make settlement within the stipulated time.

These requirements of the commission are well known and have been published for the benefit of all shippers, but there seems to be a feeling that the railroads now being operated by their owners should extend ordinary business courtesies to patrons and permit them to settle the bills at such times as they desire. The treasurers of the railroads should realize that competition is very keen and readily see that the permitting of such delays would soon cause a large uncollected list of bills to report weekly, and at the close of each month. If continued, we would soon be drifting back to old conditions which existed prior to federal control.

I understand that the treasury departments of several lines are quite careless in this respect and refuse to join with other lines in removing delinquent patrons from the credit list. We shall never be able to force obedience to these rules if we permit a continuation of this condition, and I think the treasury department should decide that the rules must be enforced, and parties not making payments promptly should be eliminated from the accommodation list. Without this co-operation there is but one solution of this entire situation, and that is the establishment of railroad clearing house associations. These organizations are now in operation at Kansas City and St. Joseph, Mo., and we have no trouble at these points to make uniform collections from all patrons.

I would suggest that a survey be made by the treasurer of each railroad as to the cost of handling collections in all large cities, and when this has been secured, estimate the expenditure of a clearing house as operated on the Kansas City plan, and determine as far as possible which system would be the more economical. When you consider that under the clearing house plan the traffic officials are not annoyed with complaints against the department handling the collections and there is less friction between the railroads and patrons for the reason that all are treated alike and must pay accordingly, you will then find it much easier to enforce the law and permit the retention of traffic for each line as may have been solicited, according to the service to be rendered. In other words, under this plan you can insist on the collection of transportation charges without driving the business away from any one line.

(The Address of F. L. Paetzold, Secretary and Treasurer of the Great Northern, on the Subject of the Use of Mechanical Devices in the Treasury Department Will Appear in Next Week's Railway Age.)

French Railway Begins Its Electrification Program

By A. H. Candee* and L. E. Lynde†

AFTER A CAREFUL investigation into the subject of electrification, the railroads of France have decided to electrify over 5,000 miles of their tracks. This decision will enable them to increase the capacity of their present trackage, and will at the same time utilize some of France's tremendous waterpower available in the Alps, Pyrenees and other mountainous sections. A large amount of the coal used by the railroads is imported, which not only is costly but proves a serious handicap in time of war.

The following lines have all made definite plans toward electrification; the Paris, Lyons & Mediterranean running to Marseilles-Nice-Monte Carlo and into Italy, as well as into the Alps where heavy grades were encountered; the Midi operating in the southern part of France; and the Paris-Orleans.

The Paris-Orleans is taking the initial step in electrifying approximately 145 route miles, including its main line extending from Paris to Vierzon. The trains of the Paris-Orleans leave Paris from Quai d' Orsay station, travel through one of the most densely populated sections of Paris, after which they head practically southwest for Orleans, a distance of about 75 miles. Enroute to Orleans the road passes through Bretigny from which point a short branch line to Dourdan will be electrified.

Orleans, a city of over 70,000 inhabitants located on the Loire river, is the terminal for a large number of lines. From Orleans the line runs by Nouan and Sabris in passing to Vierzon. Vierzon, which is approximately 125 miles from Paris, is the terminus of the steam locomotive division and it is this division which the Paris-Orleans is electrifying.

200 Locomotives Will Be Purchased

For operation over this zone and a future extension south of Vierzon, 200 locomotives will be purchased. The orders for the first 120 locomotives have already been placed with a group of French manufacturers, namely Compagnie Electro Mecanique, Societe Schneider, Forges et Ateliers de Construc-

*Engineering Department, Westinghouse Electric & Manufacturing Company.
†Railway Department, Westinghouse Electric & Manufacturing Company.

tion Electriques de Jeumont and Compagnie Thompson Houston, each of whom will build a portion of the locomotives or equipment. Each locomotive will rate approximately 1,400 hp. for one hour and approximately 1,200 hp. continuously, both ratings being at 1,350 volts direct current. A single box cab will be mounted on two 0-4-0 swivel trucks, the total weight of locomotive complete being approximately 66 tons. The mechanical parts, however, will be of sufficient strength to permit of ballasting 79.35 tons, without any modification other than a change in springs. The dimensions of each locomotive are given in Table I.

TABLE I
Locomotive Dimensions

Length between buffers	41 ft.	5	in.
Length of cab	36 ft.	3	in.
Width of cab	9 ft.	10	in.
Total wheelbase	28 ft.	11	in.
Rigid wheelbase	8 ft.	10	in.
Distance between truck center pins	10 ft.	0	in.
Diameter of new wheels	—	47¼	in.
Thickness of steel tires	—	3	in.

The specified tractive efforts for these locomotives are given in Table II, these being with a gear ratio of 21 to 62 and wheels of 1.20 meters diameter (47¼ inches). Each axle will be driven by a series type, 1,500-volt four-pole railway motor rated at 300 hp. continuously at 1,350 volts and 350 hp. for one hour at 1,350 volts.

TABLE II
Specified Continuous Tractive Efforts and Speeds

Tractive Effort (lb.)	Speed (m.p.hr.)		
15,600	6.4	Series connections	Full field.
12,200	8.6	Series connections	Min. field.
15,600	13.7	Series-parallel connections	Full field.
12,200	28.8	Series-parallel connections	Min. field.
15,600	28.4	Parallel connections	Full field.
12,200	36.8	Parallel connections	Min. field.

While the mechanical parts and all but a few of the motors for these 120 locomotives are to be manufactured by European concerns, the complete control equipment will be built by the Westinghouse Electric & Manufacturing Company at its plant at East Pittsburgh, Pa. This is practically the only equipment which in its entirety will be manufactured for this electrification outside of Europe.

Locomotive Control Equipment

The locomotives are designed for double-end control, multiple unit operation and are governed through a low voltage battery train line. Westinghouse type HBF electro-pneumatic control will be used. The motors will be connected first in series, then in series-paralled and finally in parallel. Twelve series notches, nine series-parallel notches, and nine parallel points will be provided. The last two notches of each combination are field control notches, the field strength being reduced by means of inductive shunts. Variations in tractive effort from notch to notch must be kept very low on account of the limited strength of the car couplings. The circuits are arranged so that regenerative control and dynamic braking may be provided later with a minimum change by adding the necessary equipment in space left for that purpose. None of the locomotives will be provided with regenerative control at present, but extensions to the south of Vierzon will be over profiles which will warrant the use of this feature.

Third-Rail and Overhead Collectors Will Be Used

Power is to be received either through third-rail shoes or from overhead wire. It was the purpose at first to use a third-rail along the entire length of line except at stations, crossings, yards, and similar points, but the idea has been modified so that the use of the overhead conductor will be considerably extended.

The pantagraph trolleys will be of the air-raised gravity lowered type. A main knife switch will be provided for isolating the locomotive circuits from the trolleys and another will disconnect the circuits from the third-rail shoes.

The main circuit connections will be made by means of unit switches and cam switch groups, each being operated by compressed air at 70 lb. pressure per square inch. Use is made of cam switch groups only where it is found desirable to provide a mechanical interlocking of switches and where the cam shaft can be arranged for two positions only. Where cam groups must have three or more operating positions, the difficulty of stopping the cam shaft on an intermediate position would introduce a complication in the control and reduce its factor of reliability. Unit switches are also preferable for arc-braking service.

Overload protection is provided by the use of an overload relay for each individual motor circuit and also one for the main feeder circuit. A ribbon type fuse is placed in the circuit of each trolley and one fuse is placed on each side of the locomotive connected between the third-rail shoes on that side and the main knife switch. Provision will be made for installing a high speed line switch at a later date, should this be found necessary in order to further protect the motors against flashing.

One master controller will be placed in each end of the locomotive, to the left of the locomotive center line, with the brake valve to the left of the controller. The controller handle extends to the left of the controller for operation with the right hand. This arrangement is to conform to the standard French system of running on the left hand tracks.

Each locomotive will be provided with two blowers for motor ventilation and two compressors. The blowers will be arranged so that the failure of either will not cut off ventilating air from the motors. Expulsion type fuses will be used to protect these circuits. The control battery will be charged in series with the blower and compressor motors by the use of a battery-charging resistor and relay.

Rigid Acceptance Requirements for Locomotives

Very complete and thorough tests will be made of the various items of equipment both before installation in the locomotive and after the locomotive is complete. Preliminary acceptance of each of the first 10 locomotives will be given only after it has operated satisfactorily for a distance of 25,000 kilometers (15,500 miles). The balance of the locomotives will be given preliminary acceptance after operating satisfactorily for a distance of 1,865 miles. Each breakdown of more than four hours will extend the preliminary acceptance run by 621 miles for every two days or less that the locomotive is out of service due to defects. The preliminary acceptance for the first 10 locomotives, however, will be given within three months after their delivery if the necessary mileages have not been covered by that time. Subsequent locomotives will be given preliminary acceptance at the end of one month if the necessary distance has not been covered within that time.

Final acceptance of each locomotive will be given one year from the date of preliminary acceptance providing the locomotive has operated a distance of 31,000 miles. If the distance operated has been reduced on account of defective construction or design this final acceptance will be extended three months if the locomotive has operated more than 21,700 miles and six months if less than this distance. All dates, however, are based on very reasonable allowances, and afford the manufacturers every opportunity to fulfil their part of the contract with the minimum of hardship. It is expected that the first of these locomotives will be in operation by October 1, 1923, and that the order will be completed by January 1, 1925.

While this division extends over a fairly level country and no such tonnages are encountered as are handled in America, the fact that a complete steam division is to be electrified insures a direct comparison between the operation by steam and electricity and many interesting facts are expected to be obtained from this electrification.

Automatic Train Control From Four Viewpoints

Developments to Date—The Effect on the Mechanical, Signal and Transportation Departments

FOLLOWING ITS PRACTICE of setting aside one night each year for the consideration of automatic train control, the Western Society of Engineers, Chicago, presented a program on this subject on October 23, under the auspices of its Railroad Section. Four papers were presented, covering the development of automatic train control and installations made to date with a brief description of the systems at present in service or under test; train control as it affects the mechanical department; its relation to signaling, and the results to be expected from the transportation standpoint. W. J. Eck, signal and electrical superintendent of the Southern Railway, presented a paper on "Developments to Date and Installations." C. F. Giles, superintendent of machinery, Louisville and Nashville, talked on "Train Control from the Mechanical Standpoint." T. S. Stevens, signal engineer, Atchison, Topeka & Santa Fe, discussed "Train Control from the Signal Engineer's Standpoint," and A. W Towsley, assistant to the vice-president and general manager, Chicago, Rock Island & Pacific, treated "Train Control from the Transportation Standpoint." Abstracts of three of these papers follow:

Development of Train Control

By W. J. Eck

Signal and Electrical Superintendent, Southern Railway

The desirability of some form of control of railway trains to bring a train to a stop safely in case of conditions endangering the train, independently of the driver, was recognized in the very beginning of railroading. No feasible method of accomplishing this result seemed possible, however, before the invention and general adoption of the power brake. The knowledge that the opening of the brake pipe line and the escape of the compressed air to the atmosphere, would cause an application of the brakes was recognized immediately as affording a means for stopping a train automatically independently of the action of the engineman. All train control devices have been based on this property of the air brake system.

A majority of the inventors who have worked upon this problem have considered that the opening of a valve in the brake pipe line was all that is necessary for a successful train control system. It involves much more than this, however, particularly in the case of heavy freight trains. Of the hundreds of schemes that have been proposed from time to time—(there are more than 5,000 patents on file in the United States Patent Office on the subject)—only about a score have been considered worthy of service tests and development under actual railroad operating conditions. Many of the inventors had little or no knowledge of these conditions and their devices have little or no value; on the other hand many of the appliances have merit and a vast amount of intelligent and conscientious work has been done during the past 30 years.

The First Permanent Installation

The first permanent installation of automatic stops, so far as known, was made on the Boston Elevated Railway in 1899. It is still in use and consists of a controlled mechanical trip ground contact worked in conjunction with electro-pneumatic block signals. A similar installation was made on the Interborough Rapid Transit, New York, in 1903; also upon the Philadelphia Rapid Transit and the Hudson and Manhattan in 1908. This device consists of a lever arm operated by compressed air in conjunction with the signal system so that the arm is raised above the track when the block in obstructed. This arm engages the handle of a valve in the train pipe if a train should attempt to pass a signal indicating "Stop." The opening of this valve causes the brakes to be applied. A speed control feature devised by J. M. Waldron was added to the Interborough installation in 1912 which has materially increased the capacity of the road over that formerly existing with the plain automatic stop.

In 1910, the Washington Power Co. installed an automatic block signal system with automatic stops on 29 miles of a single-track electric interurban line. The device was similar to that originally used on the Pennsylvania, viz., a glass tube mounted upon the top of the cars and positioned so as to be broken by an arm attached to the block signal in case the signal is passed improperly when in the stop position. As there are no tunnels or overhead structures on this line its use here was not objectionable.

The Pennsylvania Railroad in 1911, in connection with the terminal improvements undertaken by it upon entering the city of New York, installed a system of automatic stops to protect trains using the tunnels under the Hudson river and throughout the electrified zone, extending to Manhattan Transfer, New Jersey. This automatic stop is of the mechanical trip type, electrically controlled. The valve in the brake pipe and the trip upon the ground are of special design and so arranged that ordinary obstructions along the track will not operate the air valve. Ballast, snow, frozen mud, etc., will sometimes operate a valve of the design used in subways and thus interfere with traffic. In this case the

ground grip is provided with a rotating member which raises the valve stem vertically when engaging and thus applying the brakes. It is shielded so that a horizontal blow will not affect the valve as is the case in the ordinary design.

The next installation of importance was one installed during the same year, 1911, by the Key route at Oakland, Calif. This is an electric line and the device protects 54 miles of double track, an important part of this mileage being upon a three-mile pier which extends out in the bay to the terminus of the ferryboats from San Francisco. The automatic stop consists of a mechanical trip overhead contact, in the shape of a metal arm attached to the signal. This arm is operated by a valve handle on top of the cars when the signal is disregarded. The tripping of this valve results in a service application of the brakes and it can only be restored to its normal position by the motorman's brake controller after the automatic brake application has become effective.

In 1912 the Brooklyn Rapid Transit made an extensive installation similar to that in the subway in New York and that on the Boston Elevated.

The next year, 1913, the Miller Train Control Company's intermittent electrical contact type automatic stop system was started on the Chicago & Eastern Illinois. This was not only the first permanent, but up to the present time it is the most extensive installation on a steam railway in the world. It is now in service on a double track division between Danville, Ill., and Dolton, a distance of 107 miles. There are 189 ramps, one of which is located braking distance from the signal governing the entrance to each block. These are controlled by the indication of the signal and the condition of the block in advance. Only one ramp is used per block without preliminary or caution indication.

The Chesapeake & Ohio Railway in 1916 and 1917 undertook the next permanent installation on a steam operated road in the United States by installing the American Train Control on 21 miles of single track between Charlottesville and Gordonsville, Va. An extension of this installation to Staunton, Va., a distance of 39 miles, is now being made and is practically ready for service at the present time.

In 1915 the American System was the subject of an experimental trial upon the Maryland & Pennsylvania Railway. It was then known as the Jones system and as such was tested by the Bureau of Safety of the I. C. C. The installation on the Chesapeake & Ohio, however, has been materially improved from the form originally tested and now consists of an intermittent electric contact system, the indications on the locomotive being picked up by the contact of shoes carried upon the locomotive, with rails located parallel with the main running rails. * * * The control circuits have been specially designed to meet local conditions and are a modification of those used in single-track automatic block signaling. The fixed signals along the roadway are of the light type; the day and the night indication both being given by colored lights.

The next installation in the United States in point of time was one made in 1918 by the United Railway & Electric Co., of Baltimore, Md. This is an electric road operating on the surface with two draw-bridges and 150 trolley cars protected with an overhead mechanical trip device. It consists of a valve with an extended arm mounted upon the top of the cars where it will be struck by an extension from the signal if the stop indication is disregarded.

The Chicago, Rock Island & Pacific, in 1919, started the installation of an automatic train control system, manufactured by the Regan Safety Devices Company, between Blue Island, Ill., and Joliet, a distance of 22 miles. The device is of the intermittent electrical contact type with speed control. Ramps are installed along the right-of-way in connection with the three-position upper-quadrant signals already protecting the tracks in this territory. These ramps are 120 ft. long and located 150 ft. in the rear of the signal. * * *

The system is designed to make an application of the brakes by the automatic control apparatus when any of the following conditions exist:

(a) When a train passes a signal in the caution position at an excessive speed.
(b) Whenever a train exceeds a predetermined speed while running in a caution block.
(c) At a stop signal, or when a block is occupied.

Work of Joint Committee on Train Control

The Interstate Commerce Act of 1920 empowered the Interstate Commerce Commission to order the installation of automatic train stops or train control that would comply with the commission's specifications and requirements upon the lines of any carriers subject to the Act. To assist in carrying out the provisions of this act and the request of the commission a joint committee representing the various sections and divisions of the American Railway Association was appointed and started work in September, 1920. Specifications and requirements of automatic stops and train control were formulated, all existing installations investigated, and arrangements made with the New York Central and the Southern Pacific for the installation of types of train control for test purposes that have not heretofore been fully tried out under service conditions.

Upon the Southern Pacific, the National Safety Appliance Co. has installed a system of intermittent inductive train control between Haywood, Calif., and Halveen, a distance of 4½ miles. This system was tested by the Interstate Commerce Commission on the Western Pacific at Oroville, Calif., in 1919. Material improvements have been made recently and the system is now under observation by representatives of the joint committee.

A permanent magnet of laminated steel, located between the rails, is installed at each indication point. This is neutralized by a situable coil energized by a roadside battery when the block is unobstructed. The locomotive apparatus consists of magnetic valves mounted under the tender in such a position as to come within the field of the track magnets. An air valve controlling the brake application is connected to the magnetic valve by suitable piping. No electric energy is required on the engine.

On the New York Central tests are to be made upon the apparatus of the Sprague Safety Control and Signal Corporation. The installation consists of equipment on one locomotive and about six miles of track in a very busy electrically operated section near New York City. The system is of the intermittent non-contact induction type, with speed control, cab signals and a recording device. Electrical energy from storage batteries is used for neutralizing the normal danger track magnets when the block is clear. This is controlled by the relays of the wayside signal system so that the track magnets are not neutralized when the block is obstructed and by their influence upon the engine receiver cause the display of the proper signal in the cab and the application of the brakes. * * * The installation has been under observation for some months by the joint committee and official tests will probably be started within the next few days.

Order No. 13413

The Interstate Commerce Commission issued its now famous order No. 13413 on June 13, 1922, requiring automatic train stop or train control devices upon 49 carriers in the United States. Installations on one passenger locomotive division on each of the lines to be completed by January 1, 1925. Largely on account of the strike of the railway shopmen, starting of this work has been delayed so that few have been able to announce the type and character of the device to be used in compliance with the order. The matter is being actively handled at the present time and it is expected

that work will be started at an early date on all of the lines specified.

The Pennsylvania and the Chicago & North Western have already announced that they will make experimental installations of a practical nature to determine the characteristics of the system selected by them and its performance under the various operating conditions met in railroad service previous to its installation on the very large scale required by the Interstate Commerce Commission.

The Pennsylvania has under construction at the present time the automatic train control system developed by the Union Switch & Signal Co., and the Westinghouse Air Brake Co. The test installation will extend from about one mile from Lewiston, Pa., over a single-track line for 45 miles to Selinsgrove junction, thence over a double-track line to Sunbury, Pa., the latter portion being now equipped with [illegible] track circuits and automatic position light signals.

Wayside signals will be installed where none are now in service, approximately one-half of which will be controlled by the train dispatcher at Sunbury and the other half of

Automatic Stop and Train Control Systems Tested on American Railroads

the single-track line will be operated by a modified absolute permissive block system controlled by trains. This system is unique in that it provides continuous control, all other installations of any material size being of the intermittent type. * * * Continuous control system, such as this, provide full speed control and transmit the indication to the cab of the locomotive at all times, thus giving immediate indication of any change in conditions in the same block or the block ahead.

The Chicago & North Western has announced that a contract has been signed with the General Railway Signal Company for an extensive test of its intermittent inductive train control with inert roadside elements. This system requires no energy on the roadway or physical contact between engine and roadway parts. The roadside element consists of a "U"-shaped laminated iron core with a coil winding which may be opened and closed by the contacts on a relay in the signal system. The engine equipment includes a pair of coils mounted so as to pass directly over the track element, a storage battery, relays, an electro-pneumatic valve and means for applying a service application of the brakes through the engineman's regular brake valve. * * * It can be arranged, if desired, so that the application will not take place at the caution signal if the engineman acknowledges the signal by operating a lever, thus indicating that he has seen and understands the indication of the signal and will properly control his train. The acknowledgment valve cannot be tied down to permanently cut out the device. * * *

The systems that have been described include only the most prominent of those that have been installed on an extensive scale for regular service. In addition, there have been many experimental trials of various devices made upon railroads of the United States during the past 34 years. For the record, I have compiled a list of some 35 of those that have come to my personal attention. It is no doubt incomplete. Some of the devices are no longer being advocated, while the proprietors of others are quite active in their development. Much, however, still remains to be done, for there are yet many unsolved problems in the art of automatic train control.

Automatic Train Control from a Mechanical Standpoint

By C. F. Giles
Superintendent Machinery, Louisville & Nashville

Aside from the expense of the initial application of an automatic train control device to a locomotive, proper and adequate maintenance will undoubtedly prove the most vital and perhaps the most difficult factor to contend with from a mechanical standpoint. The modern locomotive, representing such a large capital investment, must necessarily be handled and placed in serviceable condition at terminals with all possible dispatch so as to minimize the unproductive period of time during which this investment remains idle. It goes without saying that every additional device applied to a locomotive requires a certain amount of care and attention, more or less proportionate to the intricacy of the mechanism, the intensity of use or the importance of its function. Additional devices tend to retard the prompt completion of the work of inspection and repairs to locomotives at terminals. Therefore, unless such devices effect economies at least commensurate with the time and labor expended for their proper maintenance, they will prove to be a burden and a distinct loss from a financial standpoint.

The only device on a locomotive today to which the maintenance and inspection of the automatic train control may be considered as being comparable is the automatic air brake equipment. In this connection, educational plans and the organization of forces have proved necessary to insure the successful maintenance and operation of the automatic air brake. The methods used for instructing and training the employees must also be carried on regularly and constantly to effect satisfactory results in the operation of the air brake equipment by the engineman, upon whom evolves the making of emergency repairs on the line with the least possible delay, and to insure proper inspection and repairs to the apparatus on the part of the shop and engine house mechanics specially assigned to this work.

It appears only reasonable to predict that somewhat similar methods, more or less extensive in their scope, will have to be inaugurated to care for the inspection and maintenance of the automatic train control apparatus successfully when applied to locomotives. However, the insurance of the successful operation of the latter device will quite probably prove more difficult of attainment than the air brake, for the reason that no occasion may arise for the automatic train control to function during one or many complete trips, and consequently no reports from the enginemen concerning its operative condition can be anticipated; whereas, the condition of the air brake equipment, which is regularly operated on every trip, can and must be reported on intelligently by enginemen after arrival at terminals.

Thus, in the case of a locomotive equipped with an automatic train control device, it is quite apparent that a com-

plete and extensive test of the latter must necessarily be conducted on arrival at, and before departure from, each terminal to determine whether it will perform the important automatic function that may be required of it on the following trip satisfactorily and unfailingly, and to locate and repair any defects that may exist in the equipment. The extent of the maintenance required will, in a measure, depend on the nature of the particular installation, the number of locomotives equipped, the type of device selected and the extent of train control that is desired. Nevertheless, it is obvious that additional forces of expert employees will have to be assigned to maintain this important and intricate mechanism properly, in addition to keeping accurate and infallible records of its conditions so that such records may be produced whenever required for any cause. The additional work of repairs and inspection demanded of this equipment will tend materially to increase the time required for the completion of repairs to locomotives held at engine terminals for that purpose.

Train Control from the Operating Standpoint

By A. W. Towsley
Assistant to Vice-president and General Manager, Chicago, Rock Island & Pacific

The advantages and disadvantages of train control are evident only after an opportunity has been afforded one to study the various devices under test. In my opinion the advantages are: (1) safety, (2) the elimination of long interruptions to traffic, (3) increased productiveness of track, or ability to run an increased number of trains with minimum interruption. If an engineman does not perform this work, this apparatus will perform it for him without taking away from him the initiative for the proper performance of his functions.

Among the disadvantages is the possibility of tying up power at terminals because of interruptions or reported failures of the mechanism to operate. This may result from the engineman neglecting to report the failure of the apparatus because there is no check on its operation. It has been estimated that we are only getting productive service out of freight locomotives 43 per cent of the time. Any measure that will increase the amount of this unproductive time is a disadvantage. The advantages of train control outweigh the disadvantages.

(The Paper on Automatic Train Control from a Signal Engineer's Viewpoint, Presented by Thomas A. Stevens, Signal Engineer of the Atchison, Topeka & Santa Fe, and the Discussion on All the Papers Will Appear in Next Week's Issue of the Railway Age.)

Senator G. W. Pepper, of Pennsylvania, speaking before members of the Philadelphia Chamber of Commerce recently discussed the efficacy of public opinion as a means for solving the problems that hinder industrial peace. "It may well be worth while to provide adequate machinery for making an appeal to the jury of American public opinion. It might be a fine thing in a particular industry or in groups of industries to provide for impaneling the American public. A governmental organization which in an emergency can function by calling into existence a jury or commission composed of those whom the public will trust, may both enlighten the public as to the merits of the controversy and focus public opinion in such a way that the parties to the dispute cannot withstand it. . . . But if our hearts are not right, all we can hope to do is to make the best of a bad situation. If employers and unions not only lack confidence in one another, but if the lack of confidence is deserved and if the stabilizing of industry does not itself minimize the labor problem, then we must inevitably flounder. Let us set up sufficient governmental organization to give us official forecasters who will scan the skies and sense the air currents. Let them be empowered to invoke executive action for the impaneling of emergency juries. . . ."

Interstate Commerce Commission Issues First Final Valuation

Washington, D. C.

The Interstate Commerce Commission on October 21 made public its first order establishing a final value of a railroad in accordance with the valuation act, in the case of the Evansville & Indianapolis Railroad Company as of June 30, 1915. The case, however, which is Valuation Docket No. 51, was decided on July 11. The valuation in this case was made final by default because, although the receiver filed a protest against the tentative valuation, the railroad was later acquired by the Evansville, Indianapolis & Terre Haute, the stock of which was purchased in June, 1921, by the Cleveland, Cincinnati, Chicago & St. Louis, and neither company offered any evidence in support of the protest which had been filed. The commission, therefore, finds and declares that the tentative valuation contained in its order of October 18, 1919, as modified by the supplemental tentative valuation as contained in its order of June 11, 1921, has become and is the final valuation of the property. The tentative valuation and supplemental tentative valuation, as modified because of the repeal of the clause in the valuation act which requires a finding of the present cost of condemnation and damages or of purchase of lands in excess of original cost or present value, have been combined and are set out in the order embodying the final valuation. The final value of the property owned is given as $2,250,000 and that of the property used as $2,250,291.

Commissioners Eastman, Potter and Cox dissented from the finding of the commission and Commissioner Daniels concurred only in part. He said he made no question of the propriety of the figure reached as the final value as the company has not seen fit effectively to prosecute a protest, but that the method of reaching the valuation in this case seems to be in disregard of the express mandate of the statute. He was of the opinion that the report is defective in failing to follow the express mandate of the statute requiring the ascertainment and report separately of other values and elements of value and an analysis of the methods of valuation employed and of the reasons. He stated that his reasons for non-concurrence in certain of the methods of valuation employed had been set out more at length in the Kansas City Southern case and for those reasons he takes similar exceptions to this report.

Commissioner Eastman in his dissenting opinion, in which Commissioners Potter and Cox concurred, said:

"This is the first case in which the commission has fixed the so-called final value of the property of any carrier. The report does not indicate in any way the method or process by which that value was determined, and yet this is the thing of crucial importance in our valuation work. Fundamental questions of law and public policy are involved, many of which have been argued before us in contested cases, no one of which has yet been decided. So far as I know, these questions have not been determined by the commission. Until they are determined and the reasons for the conclusions reached have been made known I believe that we ought not to attempt to fix the 'final value' of any property. The fact that in this case no protests are now outstanding is not conclusive that the value stated is the correct value."

The Committee on Freight Claim Prevention of the American Railway Association will issue a series of prevention suggestions entitled, "Thoughts," for various classes of employees. It is not expected that these thoughts will fit all conditions. They are gathered from various sources and some applying in one instance will not apply in another, but all will serve the purpose indicated in the title as providing thoughts for those particular employees.

The du Pont-Simplex Type Locomotive Stoker

Simplicity and Ruggedness Are Features of New Design Brought Out by Standard Stoker Company

A NEW DESIGN of locomotive stoker, known as the du Pont-Simplex type, has recently been developed by the Standard Stoker Company, New York. The principal features of the machine are clearly shown in the assembled view, Fig. 1. When applied to the locomotive the tender trough, shown at the right, is built into the floor of the tender. The engine is located under the cab deck and the vertical conveyor and housing, shown at the extreme left, are placed against the inside rear wall of the firebox, the housing being just above the level of the grate.

The operation of the stoker is briefly as follows: Coal from the tender drops into the trough below the tender deck by gravity and is moved forward by a screw conveyor which carries the coal through a crusher and into a covered trough extending forward under the engine deck and mud ring. At the front of this trough the coal is delivered into a housing containing a vertical lifting screw, which raises the coal until it overflows onto a horizontal surface, from which it is distributed to the various portions of the grate by continuous steam jets manually controlled. The amount of coal fired is determined by manual control of the speed of the driving engine and its distribution to various parts of the firebox is effected by manipulation of the valves controlling the steam supply to the jets.

The construction of the stoker has been carefully worked out to insure continuous operation with the minimum of maintenance. The tender trough is of steel plates and angles and is so secured that it may be removed when the engine and tender are separated. A cast-steel gear casing at the rear of this trough drives the entire horizontal conveyor screw which delivers the coal into the vertical housing. The coal drops from the tender into the tender trough through a longitudinal slot in the deck. Sliding plates permit closing off the coal entirely from the trough, or allow admission to any section desired. The crusher consists of a heavy steel casting with rearwardly projecting spikes at the front of the tender trough, against which oversize lumps of coal are broken. The portion of the conveying system between the locomotive and tender is made in two parts, one of which slides inside the other. The entire construction is such that the tender may be backed away from the locomotive without disconnecting any portion, or removing any bolts. A section of the locomotive trough is open at the top and provided with a slotted cover through which the movement of the coal may be seen.

The vertical, cylindrical housing into which the coal is discharged from the horizontal conveyor has a vertical screw which makes two revolutions to one revolution of the horizontal screw. This avoids any possibility of choking when the coal changes its direction of movement. The weight of the locomotive trough and the vertical housing is carried directly on the locomotive frame.

To adapt the vertical housing to various designs of locomotives, it is made in two parts, the lower half of standard construction, and the upper of variable length to suit the grate of the locomotive to which it is applied. The lower section contains the gears which transfer the motion of the driving engine shaft to the vertical screw. The construction is such that it is impossible for any of the coal dust to work into the gear housings. Even if moisture is carried over with coal, the water can drain from the trough before it can gain access to the gear casing. The gears are all steel with cut teeth and run flooded in oil.

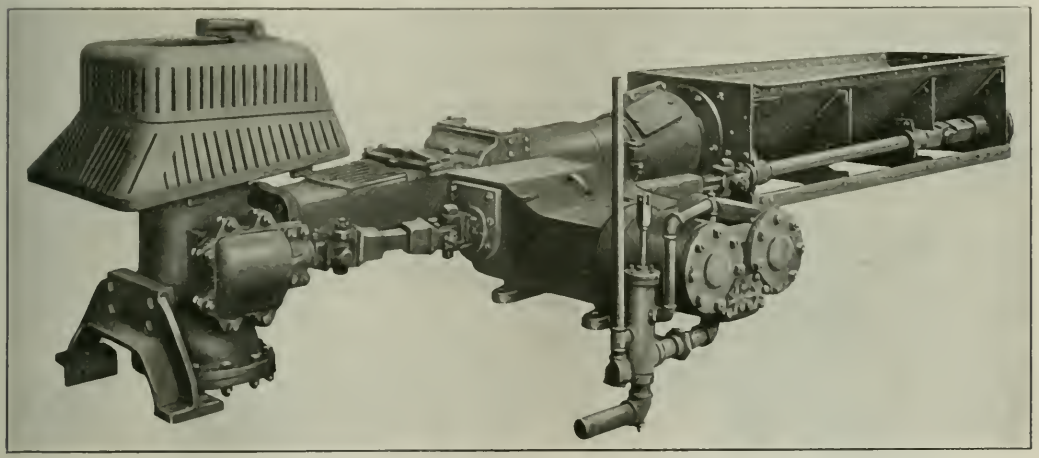

Fig. 1—Assembled View of du Pont-Simplex Stoker

The upper portion of the vertical housing extends above the level of the grates, and would be subject to overheating if provision were not made to protect it. For this reason the vertical section of the housing is enclosed in a cast-iron protecting grate with an air space between. This protecting grate is provided with slots through which air is drawn from the ash pan by the stack draft when the locomotive is running. This air serves a dual purpose, preventing overheating of the protecting grates, and supplying above the fuel bed an amount of air sufficient to furnish the oxygen necessary for the combustion of the volatiles from the coal.

The coal as it rises to the top of the vertical housing overflows on the upper surface of the protecting grate. From this surface it is blown into the firebox and down upon the

surface of the fire by steam jets. These steam jets are divided into five groups, each group being controlled by a separate valve, and by manipulation of these valves varying amounts of coal may be discharged to different portions of the grate so as to maintain an even and uniform depth of fuel bed. The control valves are placed in a convenient position on the boiler front where they may be readily reached by the fireman.

The driving of the stoker is effected by means of a two-cylinder, double-acting, slow moving engine and the amount of coal discharged by the stoker is controlled by varying the speed of the engine. During normal operation and when normal run of mine coal is being fed, this engine runs along with very low cylinder pressure, the throttle valve being only slightly open. If an unusually large or hard lump of coal reaches the crusher plate, the speed of the engine will be checked and the pressure in the cylinders will rapidly rise until the obstruction is crushed, after which the engine will make one or two revolutions at increased speed, dropping back at once to its normal rate. The amount of reserve power is ample to crush the hardest fuel employed and the design is such that all parts have sufficient strength to permit the engine to be abruptly stopped when running at delivery speed without anything giving away.

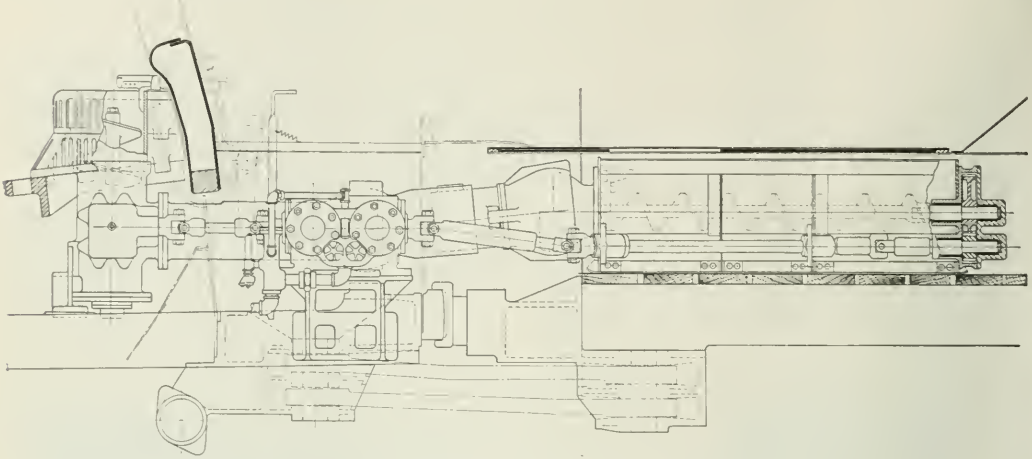

Fig. 2—Side Elevation Drawing Showing Arrangement of Parts on the Locomotive

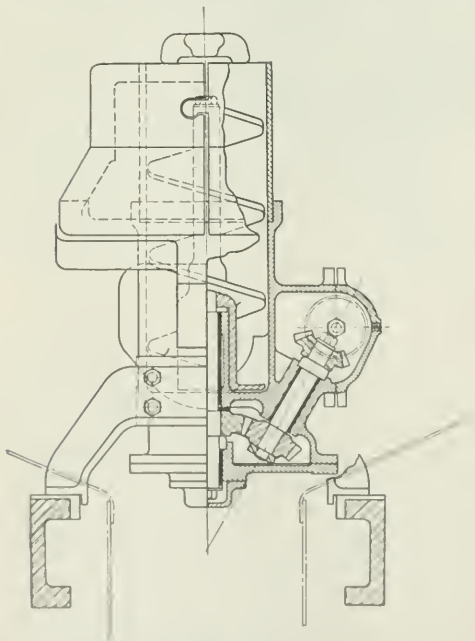

Fig. 3—The Vertical Housing Is Carefully Designed to Prevent Coal Dust or Water from Reaching the Bearings

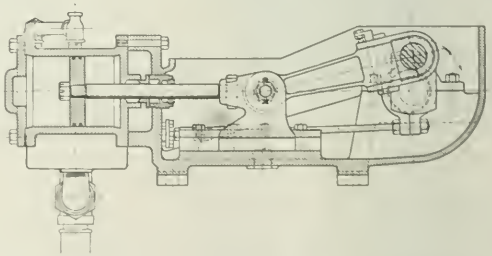

Fig. 4—Section Through Engine, Showing Simplicity of Construction

The design of the engine as will be noted from the illustrations, is extremely simple and rugged. The crank shaft, connecting rods, cross-heads and valve gear are all enclosed in a box casting, the cover of which is made of sheet metal for easy removal to provide accessibility. With the exception of the cylinders, all working parts are lubricated by splash lubrication. The box and the cover are of such a design as to avoid loss of oil and to prevent admission of dust to the enclosed box itself.

The valves of the engine are of the piston type, each driven by a single eccentric. It is necessary in any stoker to be able to reverse the driving engine to loosen a jam, and to effect this a simple outside valve is provided which interchanges the functions between the inlet and exhaust passages.

At each end of the crank shaft of the driving engine is a universal joint, which on the rear side connects to the driving shaft for the horizontal conveying system. A slip joint is provided to allow for the movement between the tender and the locomotive which occurs when rounding curves.

The universal coupling on the forward end of the driving engine crank shaft is connected through universal couplings to a short section of a shaft on the end of which is the first gear of the enclosed train which drives the vertical screw. The details of this drive are clearly indicated in the illustration and have been referred to above.

One of the special features of the stoker is that the coal is delivered into the firebox at a relatively low level. This method of delivery, together with the downwardly directing force of the steam jets, it is stated, avoids fuel losses due to the fine particles being swept above the arch by the action of the draft before being consumed. The continuous introduction of the fuel is also claimed to be a decided advantage.

Extreme care has been used in the design of this stoker to avoid all elements of weakness which have apeared in past practice. The flexibility of the arrangement provided by the universal couplings and slip joints makes it relatively easy to apply the standard design to the many varying types of locomotives.

New Officers for International—Great Northern

J. W. Kendrick and T. A. Hamilton to Take Charge as Chairman of Board and President on December 1

By action of J. & W. Seligman & Co. and Speyer & Co., in charge of the reorganization of the International & Great Northern, J. W. Kendrick, private consultant in matters pertaining to railroad construction, operation and maintenance, Chicago, has been selected as chairman of the board, and T. A. Hamilton, vice-president in charge of operation and assistant to the president of the St. Louis-San Francisco, president of the reorganized company. These officers will assume charge of the property on the termination of the receivership on December 1.

T. A. Hamilton

J. W. Kendrick

This step brings to an end another chapter in the checkered history of this road of 1,160 miles, all of which is located within the state of Texas. Its principal lines extend from Longview to Galveston and to Laredo and from Galveston to Fort Worth.

The International-Great Northern was chartered on September 27, 1873, under the laws of Texas as a consolidation of the International Railway and the Houston & Great Northern. To aid the company in completing the road, the bondholders funded a portion of their coupons—four on the first mortgage and eight on the others—into 7 per cent gold bonds, preferred, and ranking ahead of the original bonds. In April, 1878, upon the suit of the second mortgage bondholders, the road was placed in the hands of a receiver and was sold to a committee of the bondholders, by whom it was reorganized. By the terms of the reorganization, holders of the old H. & G. N. bonds received $1,278.95, and holders of old International bonds, $1,294 for each $1,000 bond, which amounts were paid, one-half in new first mortgage 6 per cent bonds, and one-half in new second mortgage 8 per cent income bonds.

On May 1, 1888, default was made in payment of the interest on the first mortgage bonds and this was followed by default in the payment of the second mortgage interest.

The road was placed in the hands of receivers on February 21, 1889, and in 1892 was reorganized without foreclosure. Under the new plan one-half of the total amount of the defaulted coupons of the first mortgage bonds with interest was paid in cash and the remaining half was deposited with the Central Trust Company, which issued its trust receipts that bore interest at the rate of 5 per cent per annum, payable semi-annually beginning November 1, 1892, and were to be payable in 6 yearly installments. Of the amount of defaulted coupons of the second mortgage, half the coupon interest was paid in cash and the remainder exchanged at their face value for new third mortgage bonds.

The new organization continued until February 26, 1908, when a receiver was appointed upon default in payment of the coupons of the third mortgage bonds and the road was sold under foreclosure on June 13, 1911, to a representative of the third mortgage bondholders, who undertook its reorganization. On August 11, 1914, a receiver was appointed at the instance of the noteholders protective committee as it was impossible to meet either the interest or principal of the notes and in June, 1922, the company was reorganized.

Under the new plan, as outlined in the *Railway Age* of June 3, 1922, page 1312, the International-Great Northern will reduce its fixed charges from $1,597,175 to $1,179,000 and will have a working fund of approximately $4,000,000 that will enable the company to make the necessary improvements outlined in the *Railway Age* of June 10, page 1347, and continue those interrupted by lack of funds.

In recommendations which were included with the reorganization plans, J. W. Kendrick estimated that the property should be able to have a net income available for interest and dividends of $3,031,512 in 1923 and that the operating ratio should not exceed 76. Indicative of the breadth of the measures which are contemplated, special attention will be given to the elimination of the boll weevil and malaria fever which, if successful, will add greatly to the traffic of the road and increase the efficiency of employees respectively.

J. W. Kendrick

In becoming chairman of the board of directors of this property, Mr. Kendrick will bring to it a detailed knowledge of its present condition and its possibilities, based upon his thorough studies of this property during the last five years and supplemented by nearly half a century of active experience in the construction and rebuilding of important western railways. He was born on October 14, 1853, at Worcester, Mass., and graduated from Worcester Polytechnic Institute in 1873. In 1878 he entered railway service as a levelman on a construction party on the Yellowstone division of the Northern Pacific and was engaged in the location of the Yellowstone and Missouri divisions of that road until 1880. In the latter year he was promoted to engineer in charge of constructing the above divisions, 160 miles of line, and remained in this capacity until 1883, when he became chief engineer of the St. Paul & Northern Pacific (Northern Pacific) in charge of the construction of a line connecting Staples, Minn., Brainerd, Minneapolis and St. Paul, with the necessary terminals and shops. At the end of five years he became chief engineer of the Northern Pacific and its leased lines, and in July, 1893, was made general manager for the receivers of the Northern Pacific and later of the reorganized company. His success during the 6 years as general manager is shown by his promotion on February 1, 1899, to vice-president in charge of operation, which position he held until June 5, 1901, when he became vice-president in charge of operation of the Atchison, Topeka & Santa Fe and remained in that capacity until June, 1911, when he established a private practice in Chicago as consultant in matters of railroad construction, operation and maintenance.

During the 11 years in which he has been engaged in private practice, he has made over 50 investigations, large and small, in connection with railroad construction and reorganizations and for the purpose of determining the basis for improvements in operation. Among the more important of these are operating reports on the Wabash and the Chicago & Eastern Illinois; a valuation report on the Canadian Pacific line between Windsor and Montreal in 1912; an operating and financial report on the St. Louis-San Francisco in 1913; a grade reduction study of the Erie and an operating report on the Pere Marquette in 1914; operating reports on the Chicago, Rock Island & Pacific and Minneapolis & St. Louis in 1915; an investigation of accounting methods and proposed changes for the Missouri, Kansas & Texas in 1916; an operating report on the International & Great Northern in 1917; an investigation of traffic tributary to proposed feeder lines and estimates of cost of such lines for the Western Pacific in 1917 and 1918; a valuation of rolling equipment and shops of the Pullman Company in 1919; a report on the cost of construction and operation of a proposed line of the Itabira Railway in Brazil in 1920, 1921 and 1922; and an operating report on the International Railways of Central America in 1921.

T. A. Hamilton

Mr. Kendrick will be ably assisted by T. A. Hamilton, who as vice-president in charge of operation and assistant to the president of the St. Louis-San Francisco, has had an important part in carrying out the plans outlined by Mr. Kendrick for the rehabilitation of that property. Mr. Hamilton is another example of the large number of railway officers who have worked their way up through the ranks to executive positions. He was born on January 21, 1874, at St. Louis, Mo., and was educated in the public schools of Toronto, Ont. In 1887, he entered railway service as a messenger boy in the superintendent's office of the Canadian Pacific and at the end of two years became a clerk in the assistant general manager's office of the Chicago & Grand Trunk (Grand Trunk) at Detroit, Mich., which position he held until 1890, when he was transferred to the general freight agent's office at Chicago. He left the service of the Chicago & Grand Trunk in 1892 to become a car accountant in the local freight office of the Missouri Pacific at St. Louis, Mo., and in the following year he obtained a similar position with the Galveston, Harrisburg & San Antonio (Southern Pacific) at Houston, Tex. In 1894 he returned to the Missouri Pacific as an assistant in the general auditor's office at St. Louis, Mo., in charge of agents' accounts, reconsignments and overcharge claims, and two years later he entered the service of the Illinois Central, where he remained until 1899, holding the positions of rate clerk, chief bill clerk and chief yard clerk at East St. Louis, Ill. On the latter date he again returned to the Missouri Pacific as chief clerk to the superintendent of De Soto, Mo., and from 1901 to 1907 was employed by the Louisville & Nashville, where he was successively chief bill clerk, chief yard clerk, chief clerk to the terminal superintendent and chief clerk in the traffic department.

For the next four years his former experience was utilized and extended by his association with Haskins & Sells, certified public accountants, New York, where he was engaged in railroad cost studies, examinations and miscellaneous accounting work. The period from 1911 to December 1, 1922, was devoted to the St. Louis & San Francisco and its successor, the St. Louis-San Francisco. During the first four years he was a special assistant to the vice-president of operation, part of the time holding the title of supervisor of efficiency and working in all branches of the operating department, and for the next year and one half he was in charge of the reorganization of the accounting department. While the road was under federal control he was vice-president of the corporation, and on March 1, 1920, he was made vice-president of operation and assistant to the president.

General News Department

The Interstate Commerce Commission has set for hearing on November 21, at Washington, the petition of the Southern Pacific for authority to retain the Central Pacific.

Position-light signals, in use extensively on the Pennsylvania Railroad, have been made standard on the Lehigh Valley. Considerable numbers of them have been installed, at various points, in place of semaphores which needed renewal.

Near Williamsport, Ind., on October 19, Wabash eastbound passenger train No. 2 was derailed, resulting in the death of the engineman, an express messenger and a baggageman. Belief has been expressed that spikes were purposely loosened, permitting the rail to spread and derail the train.

The Eastern Railroad Association announces that James T. Wallis, chief of motive power of the Pennsylvania, has been elected president of the Association, in the place of A. W. Gibbs, deceased. John M. Henry, Long Island Railroad, has been elected a member of the executive committee. The office of the Association is at 614 F Street, Washington, D. C.

Friday, October 13, was the 20th anniversary of the first operation of the radio telegraph, using Hertzian waves, from a station to a moving railroad train. It was on the Grand Trunk, between St. Dominique, Que., 30 miles west of Montreal, and a special train carrying members of the general passenger agents' association on the way to their annual meeting at Portland, Me.

The Northern Pacific has asked the Interstate Commerce Commission to modify its automatic train control order so that it may make the required installation on that part of its main line from Mandan to Dickinson, N. D., comprising a full passenger locomotive division of 109.6 miles, instead of between St. Paul and Mandan. The application states that this line has recently been equipped with a thoroughly modern automatic block signal system that would lend itself to the changes.

T. P. Healey, examiner of the Interstate Commerce Commission, last week resumed hearings in the southern states on the tentative plans of the Commission for the consolidation of railroads, as called for by the Transportation Act of 1920. Hearings were conducted in Mobile, Ala., and Jacksonville, Fla., early in the week, and on Thursday there was a hearing at Atlanta. Representatives of numerous small roads gave their views as to how the different companies ought to be combined.

Illinois Central Roundhouse at Council Bluffs Partially Destroyed by Fire

Fire broke out in the roundhouse of the Illinois Central at Council Bluffs, Ia., on October 16, presumably due to defective electric light wiring which ignited the roof of the building and destroyed all of the wooden parts of the structure. Eight engines were in the building at the time of the fire. The total damage to the engines and the roundhouse is estimated at $21,000.

A Love-Feast

The shopmen of the Central of Georgia at Macon, Ga., several hundred of them, on October 18 entertained the Rotary Club of Macon, and other friends, at luncheon in the mammoth machine shop; 92 Rotarians and 60 other guests. The tables were decorated with chrysanthemums and the colors of the Rotary Club. A number of officers of the railroad were present, and one of them, John D. McCartney, assistant to the president, acted as spokesman for the hosts. Following the luncheon, the visitors inspected the shops. This luncheon appears to have been given in recognition of the friendly relations existing between the railroad and the people of the city during the recent disturbances due to the strike.

A. R. A. Convention Postponed

The American Railway Association, through a notice issued by R. H. Aishton, president, announces that in view of the present situation in the railroad world the Board of Directors has decided to postpone the annual session of the Association. Announcement will be made later of a date which will be selected for a session.

Train Control Order Changed

The Interstate Commerce Commission, by an order issued on October 14, in lieu of the requirement in its previous order, has authorized the Southern Pacific to install automatic train control between Oakland, Cal., and Tracy; has authorized the Philadelphia & Reading to install between Camden, N. J., and Atlantic City; and the St. Louis-San Francisco to install between Springfield, Mo., and Sapulpa, Okla. In all other respects, the order of June 13 is to remain in full force and effect.

A. R. A. Asked to Repeat Careful Crossing Campaign

The executive committee of the Steam Railroad Section, of the National Safety Council, at a meeting at Washington last week, unanimously recommended that the American Railway Association be urged to repeat during the summer of 1923 the Careful Crossing Campaign which it conducted this year. Statistics to show the result of the campaign are now being compiled and will be announced as soon as completed. L. G. Bentley (C. & O.) Richmond, Va., is chairman of the Steam Railroad Section.

O. H. & E. Abandoned

The Oberlin, Hampton & Eastern, a railroad extending from Oberlin, La., to Hampton, 10 miles, has been given permission by the Louisiana Public Service Commission to discontinue operations and to dispose of its tracks and equipment. It appears that this line, like many others in that section of Louisiana, was constructed primarily for the transportation of forest products, and its operations as a general carrier have been but incidental. The log and lumber tonnage has disappeared; the mills have discontinued operations and there is now no freight to be handled. Heavy deficits have been incurred for the past several years and with the completion of a gravel highway paralleling the applicant's line these deficits will be increased.

Traffic Records on the Central of Georgia

The Central of Georgia in the month of September established four new efficiency records: (1) Moved the greatest number of tons of freight in its history; (2) Moved freight cars an average of 34.19 miles per car per day; (3) 613 net ton miles per car per day; (4) Per cent of loaded car miles to total car miles, 78.

This is the salient point in one of the railway company's usual advertisements printed in daily and weekly papers throughout the company's territory during the past week or two. The advertisement, signed by President W. A. Winburn, contains a hearty tribute to the loyal and energetic efforts of the officers and men who carried on this traffic. Other statements in the advertisement (to substantiate the road's recent declaration that it had overcome the shopmen's strike) tell of increased efficiency in maintaining train schedules and in keeping cars and locomotives in good repair. During the month, the company had in use only about 7,000 freight cars, which is but 81 per cent of the number of cars owned by the company, an abnormal number of its own cars being in use on other roads.

Operating Statistics of Large Steam Roads — Selected Items for the Month of August, 1922

Region, road and year	Average miles of road operated	Train-miles	Locomotive-miles: Principal and helper	Locomotive-miles: Light	Car-miles: Loaded (thousands)	Car-miles: Per cent loaded	Ton-miles (thousands): Gross, excluding locomotive and tender	Ton-miles (thousands): Net, revenue and non-revenue	Average number of locomotives on line daily: Serviceable	Unserviceable	Per cent unserviceable	Stored

Striking Shopmen Reopen Relations With the Labor Board

The first move to reestablish relations between the Railroad Labor Board and the Railway Employees' Department of the American Federation of Labor was made on October 21 when B. M. Jewell, leader of the shopmen's strike, called upon Chairman B. W. Hooper of the Board and gave notice that the shop crafts would present a petition for the reopening of a case against the New York Central, involving the question of the piece work system in the Elkhart (Ind.) shops. It was unofficially intimated at the board that Mr. Jewell's petition would be granted and that the Labor Board would resume its status as umpire in disputes affecting this organization and those roads on which it still retains a majority of the shop workers.

The Daugherty Injunction

The legal battle over the "Daugherty Injunction," restraining striking railway shopmen from interfering with commerce or with the operation of railway shops, continues at Chicago, despite the fact that the shopmen's strike is now practically a matter of history. Donald R. Richberg, attorney for the shopmen, on October 19, filed a motion before Federal Judge James H. Wilkerson to dissolve the interlocutory injunction obtained by Attorney General Daugherty. The principal plea for the shopmen at that time was that "the conditions described in the bill of complaint, if they ever existed, no longer exist," because a large number of the railroads and the workers involved have settled their differences. Following this plea several continuances were made and at the present time hearings on Mr. Richberg's motion are set for November 6.

Collision at Toltec, New Mexico

On the Denver & Rio Grande Western at Toltec, N. M., on September 29, there occurred a collision which, according to the report of the inspector of the Interstate Commerce Commission, may be classed as due to error in reading a meeting order which was not properly punctuated (though, of course, everybody recognizes that train orders are never punctuated). This collision occurred on a narrow gage line and the trains met on a curve of eight degrees where, on account of rock bluffs, the range of vision is restricted to about 60 ft. The trains were moving at between 15 and 20 miles an hour; engineman and fireman of passenger train killed and 21 passengers and two employees injured. Westbound passenger No. 115 met eastbound locomotive No. 411 (without train). Engineman Smith, of No. 411 had received the following order:

> No 115 Eng 169 run
> one 1 hour late Lava
> to Osier fifty 50 mins
> late Osier to Cumbres

On receiving this order, Smith "glanced at it" and got into his mind the impression that No. 115 was one hour and 50 minutes late. He claims that he thus remarked to the operator and that the operator nodded assent; but the operator claims that this and other orders were read to him by the engineman and that the reading was correct. While the engineman was reading the other orders, the fireman entered, and read this one aloud. He seems also to have got the same impression. Thus they encroached on the time of the passenger train. The report calls attention, as in previous similar cases, to the "inherent deficiency of the time interval system."

First Aid Training on the D. & H.

A tournament of the Delaware & Hudson First Aid Teams was held at Hotel Champlain, Bluff Point, N. Y., on September 7, during the annual meeting of the Delaware & Hudson Company Freight and Ticket Agents' Association. In 1919 the Delaware & Hudson Company created a department for the education of its employes in the matter of personal safety, under the direction of J. E. Long and the work of the department was in 1920 extended to embrace first aid work; and today some 260 certificates of proficiency have been issued. This was the first public demonstration. Contests are to be held annually between teams representing the different divisions of the railroad.

By a process of elimination four teams, consisting of a captain and four men each, met in the finals of the tournament at Bluff Point. The contest consisted in working out eight problems in first aid, with Dr. Larkin, company surgeon, at Plattsburg, acting as judge. Of a possible 800 points, the team from Wilkes-Barre, Pa., representing the Pennsylvania division, scored 781, the Saratoga division 778, the Champlain division 770, and the Susquehanna division 766.

There has been a marked decrease in the number of accidents to employees. In 1921 there were only ten fatalities among all the employees of the entire system.

Work Progressing on P. & R.'s New Camden Terminal

Approximately 150,000 cubic yards of earth have already been filled in on the site of the new terminal of the Philadelphia & Reading seashore lines at Kaighns Point, Camden, N. J. It is expected that the fill-in will have been completed, the tracks laid, and the new terminal ready for service during the 1923 summer season. The entire site of the new terminal was under high tide three years ago. The area which the new terminal and its yards will cover is approximately 1,800 feet long and 700 feet wide. The filling in is being done by the American Dredging Company. The material used is being brought up by hydraulic pressure from the bottom of the Delaware River 30 feet below the surface of the water. The plans for the new terminal call for a modern two-story structure of steel frame and brick with

At Work on New P. & R. Terminal at Camden, N. J.

stone trimmings on a concrete foundation, built on piles. It will house the ferry slips, a large train shed and concourse, waiting rooms for men and women, a restaurant and the offices of the Delaware River Ferry Company, and of the seashore lines of the Philadelphia & Reading Railway. There will be ten platform tracks for use in the company's regular service and four additional tracks for use at times when travel is especially heavy. Each of these tracks will be gated and practically all of them will be long enough to accommodate a train of 14 cars. Extensive driveways leading into the terminal will be laid out, each of them wide enough to accommodate four lines of vehicles. There will be separate driveways for baggage and express. Adjoining the terminal proper will be large storage yard for cars and a Y. M. C. A. building for the use of trainmen.

Improper Billing for Foreign Car Repairs

The American Railway Association has issued a circular calling attention to the lack of compliance with the rules regarding billing for foreign car repairs and determining the responsibility for damage to foreign equipment necessitating repairs. This difficulty, the circular states, is largely due to incomplete supervision, lack of knowledge of the rules on the part of local shop officers and, in some instances, to improper practices. Railroad executives are urged to provide such supervision as will insure the proper observance of the Rules of Interchange with respect to repairs to foreign cars and billing therefor.

The Mechanical Division of the association has a small force of inspectors investigating these conditions. This work will be continued and in addition to calling the attention of the officers of the railroads concerned to the conditions found, similar reports will be made quarterly to the board of directors of the association.

Bridge and Building Association Selects Subjects for Next Year

At the closing session of the thirty-second annual convention of the American Railway Bridge and Building Association at Cincinnati, Ohio, on October 19, the following subjects were selected for investigation and report during the ensuing year:

The repair and renewal of ballast deck trestles.

Water facilities at stock yards—other construction and maintenance.

Methods of installing or replacing sewers and pipe lines under traffic.

The heating of small passenger stations.

Tool equipment for bridge building and water service maintenance gangs.

The relative merits of cast iron, concrete and corrugated metal pipe culverts.

The practibility of a uniform paint program for the entire year.

Specifications of bridge and building forces.

Seattle was the unanimous choice as the location for the next meeting, this point being selected because of the rapidly increasing use of western timber in bridge and building work and the desire of the members to study this timber in the forest and observe its manufacture into lumber for their use.

The Bridge and Building Supply Men's Association elected the following officers for the ensuing year. President, G. R. McVay, the Barrett Company, Chicago; vice-president, A. J. Filkins, the Paul Dickinson Company, Chicago; secretary, John Nelson, Joseph E Nelson & Sons, Chicago; treasurer, D. J. Higgins, the American Valve & Meter Company, Chicago; directors, T. W. Snow, the T. W. Snow Construction Company, Chicago; F. M. Condit, Fairbanks, Morse & Co., Chicago; C. H. Hunsacker, the Massey Company, St. Louis; H. C. Brown, Chicago Bridge & Iron Works, New York City.

Block Signals and Train Speed Control on the C. & N. W.

The Chicago & North Western has awarded a contract to the General Railway Signal Company, Rochester, N. Y., for the installation of automatic block signals, with train speed control, from West Chicago, Ill., north to Elgin, a distance of 12 miles.

The line is double track from West Chicago to Wayne, five miles, and the balance is single track. The double track will be equipped with Model 2A, direct current signals located on bridges and the single track will be equipped with the absolute permissive block system, Model 2A direct current signals being mounted on masts in the usual manner. The system of automatic train control will be the General Railway Signal Company's train speed control, described in the *Railway Age* of March 4, 1922, page 521.

Fixed limited speed is to be imposed at certain locations, as approaching the end of double track and interlocking plants, *i.e.*, there are certain fixed speed limitations that are in effect which will be enforced through the use of pairs of inductors without windings. The speed control scheme generally contemplates the use of three pairs of inductors governing the approach to stop signals which force the deceleration of trains to insure a safe stop. Speed will be so tapered as to handle the trains as they are normally handled now, automatic braking being used only when speed limits are exceeded.

There is an interlocking plant a short distance from the West Chicago station from which it has been customary, under certain traffic conditions, to advance trains to the station on "Call-on" signals. The limited speed indicated by the "Call-on" signals will be enforced by the application of pairs of inductors suitably placed between the interlocking plant and West Chicago station.

The speed control and receiving apparatus will be the same for freight and for passenger locomotives, except for the timing of the time element contactor. Locomotives that may be used in either passenger or freight service will be equipped with time element contactors that may be adjusted for either class of service.

Traffic News

Intrastate passenger fares in Alabama will, from November 15, be calculated at three cents a mile, in compliance with an order of the Public Service Commission of the State issued some months ago. The railroads, by way of protest, asked the Interstate Commerce Commission to investigate the matter with a view to forbidding the reduction proposed by the State Commission, but the Federal body has decided that no hearing will be given on the petition of the railroads, and the State Commission now announces that no further delay will be permitted.

Loading of bituminous coal on Monday was the largest since December 20, 1920, according to reports received by the Car Service Division of the American Railway Association. The total was 43,243 cars, an increase of 2,042 cars over the total for Monday, October 16, which up to that time had marked the high point reached in bituminous coal loading since the miners' strike. The loading on Monday eclipsed the daily average for October last year by approximately 12,200 cars, and also was approximately 13,000 cars in excess of the daily average for the first three weeks in October this year.

Anthracite loading on Monday amounted to 6,398 cars. This exceeded the previous Saturday by 93 cars, and also surpassed the daily average loading for the first three weeks this month by more than 200 cars. It also was approximately 500 cars above the daily average for October, 1920, and 1921.

Chicago Shippers Meet November 7

The annual meeting of the Chicago Shippers' Conference Association will be held at Hotel La Salle in that city on November 7. This association was organized some years ago by the principal industrial concerns of the Chicago district in order to co-operate with the carriers in the handling of freight. The business of the organization is done through committees which deal with similar committees appointed by the railroads.

Want Competing Express Company in Chicago

The Chicago Association of Commerce has issued a circular containing a plea for the entrance of the Southeastern Express Company into Chicago to compete with the American Railway Express Company. The circular says in part:

"At the present time Chicago is served only by the American Railway Express Company. The Southeastern Express Company, is operating over the following lines: Southern; Mobile & Ohio; Tennessee Central; Maryland & Pennsylvania; Washington, Baltimore & Annapolis Electric; Merchants & Miners Transportation Company and Baltimore & Philadelphia Steamboat Company.

"We have received complaints from Chicago shippers of the refusal of the American Railway Express Company to respect routing via the Ohio River gateway over the most direct routes even though a detour of many miles is necessary in order that the American may enjoy the longest possible haul. The final link of the journey is made by the Southeastern, resulting in delays from 24 to 72 hours. The Southeastern has a through line to St. Louis to New York City and to Cincinnati as well as to other cities competing with Chicago for business throughout the Southeast. Please advise by letter if you are interested in having the Southeast enter this market and state the approximate annual tonnage that could move via this route, and if you will support such a service if it is established."

Rate Hearings by Trunk Line Association

The Trunk Line Association began in New York City this week hearings on a proposed general revision of the freight rate structure throughout trunk line territory, invitations having been sent to all interested mercantile organizations. At the first session, the principal speaker was J. C. Lincoln, of the Merchants Association, New York City, who argued that rates on the trunk lines within 500 miles of New York ought to be lower than in New England and in some other territory where advances in

rates had been authorized because of the precarious financial condition of the roads. He thought also that the starting point for the proposed new rates was wrong, the minimum rate of 30 cents per 100 lb. for carload freight for the shortest distance being too high. Arguments of Mr. Lincoln and others protesting against the increase of any rates were replied to by R. N. Collyer, chairman, with the statement that the only purpose of the proposed revision was to clarify the rate structure. Representatives of commercial interests were present from Philadelphia, Rochester, Boston, Buffalo, Brooklyn, Trenton and other places. H. C. Baxter appeared for the Port of New York authority.

George P. Wilson appearing for the Philadelphia Chamber of Commerce expressed the opinion that the carriers and the shippers are getting a little closer together. He said that his constituents were very much interested in knowing how the committee had ascertained the key rate, for upon that answer depends what would be the shippers' views with respect to the application of the rates to particular traffic. Continuing, he said:

"We are much concerned with respect to the accuracy of the distances to be used. We have been informed that some errors have occurred. Another important factor that must be considered in the construction of any rate base, is the relationship between communities; also the action to be taken with reference to industries located on branch lines. In any mileage scale the industry on the branch line is at a serious disadvantage with its competitor on the main line."

Coal Production

Complete returns on coal production in the third week of October show an increase to about 10,200,000 tons of soft coal, according to the weekly bulletin of the Geological Survey. Production of anthracite was at about the same rate as during the preceding week and will be at least 2,000,000 tons. Indications were, therefore, that the total of all coal raised during the week is about 12,200,000 tons.

The number of cars loaded on Monday, October 16, as reported by the railroads was 41,201 cars, establishing a new record for this year. Full returns on loadings for the week are expected to indicate production of 10,200,000 tons.

Transportation remains the limiting factor in the current rate of production.

Production of anthracite passed the 2-million ton mark in the second week of October. Preliminary reports to the American Railway Association show that 24,682 cars were loaded on the first four days of the week of October 16-21.

According to reports from the Northwestern Coal Dock Operators' Association the stocks of soft coal at Duluth, Superior, Ashland and Washburn increased from 120,384 net tons on September 1, to 1,034,520 tons on October 1. Stocks of anthracite declined from 14,475 to 12,370 tons.

The market was able to absorb all the coal that it was possible for the carriers to transport to market, and the only serious losses due to lack of demand were in Iowa and Missouri. In comparison with transportation losses, those due to other cause were negligible.

There has been a gradual decline in tonnage of soft coal dumped into vessels at Lake Erie piers since the week ended September 24 during which was established the high record in Lake traffic. The Ore and Coal Exchange reports the total handled during the week ended October 15 as 1,090,596 net tons as compared with 1,179,288 tons the week before. In comparison with the corresponding week a year ago this was an increase of 37 per cent. Of the total dumpings last week 1,052,043 tons were cargo coal and 38,550 tons were vessel fuel. During the present season to October 15 inclusive, 11,888,126 tons of cargo coal have been dumped into vessels at Lake Erie piers. The quantity sent to receiving Lake markets this season is 38 per cent less than in 1921, 32 per cent less than in 1920, and 40 per cent less than in 1919.

According to reports received by the car service division of the American Railway Association coal loading for the week totaled 223,411 cars. This exceeded by 2,000 cars the week before which had marked the high point in coal loading. Loading of bituminous coal amounted to 186,295 cars. This was an increase of 3,800 cars over the week before. Anthracite loading amounted to 37,116 cars which was a decrease, however, of 1,446 under the week before.

Commission and Court News

Interstate Commerce Commission

The Interstate Commerce Commission has issued a decision finding that a proposed increased rate on iron and steel articles in carloads from Utah common points to certain destinations in California is not justified. The suspended schedules were ordered cancelled.

State Commissions

The Railroad Commission of California has addressed a letter to the Interstate Commerce Commission urging that body to visit California in order to obtain first hand information in connection with the Southern Pacific Company's application to retain control of the Central Pacific. This application was recently made following the unmerger decision and is based on the provisions of the Transportation Act of 1920 authorizing the Interstate Commerce Commission to permit railroad consolidations where they are found to be in the public interest. The letter says, in part: "You are aware, of course, that this matter is of great importance to the State of California. * * * We are the more ready to extend this urgent invitation because we know it is extremely difficult, if not impossible, to come to a correct understanding of the somewhat complicated factors from an oral and written record alone and as far away as Washington. If you should find it possible to make a personal investigation of the territory and property in question, the California Commission will be happy to extend to you, while in California, every facility at its disposal in a spirit of helpful co-operation."

Omnibuses Authorized to Compete With Railroads

The New York State Public Service Commission has issued a certificate of public convenience and necessity to an omnibus line running between Syracuse and Norwich, in spite of vigorous protests from parallel railroad lines, steam and electric. The decision was written by Commissioner Blakeslee. It is on the petition of Walter E. Aldrich for a certificate for the operation of a motor bus line between the cities of Norwich and Syracuse, Norwich is about 45 miles southeast of Syracuse.

The application was opposed by the New York Central, the Delaware, Lackawanna & Western, the New York, Ontario & Western, the Lehigh Valley, the Syracuse & Suburban and the New York State Railways.

The decision says: "The inception and growth of motor transportation is a natural development. Extensions of the improved highway system and betterments of good roads already built will continue for years to come. Consequently competition between motor buses and railroads in the transportation of freight and passengers will continue, and this will be true not only as to short haul traffic but with an increasing tendency to lengthen the distance of haul. This is a period of transition and to require those living at a distance from fixed railroad stations to journey to the stations and there await the arrival of trains, rather than to be allowed to take advantage of buses, stopping at their front doors, merely because this would result in financial loss to the established carrier (the railroad) is not in keeping with ideas of progress. . . . When more convenient and adequate service is offered to the public it would seem that necessity requires such public convenience should be served."

The commission, however, observes the wide discrepancy of taxation between railroads and their contributions toward the support of highways and the taxes paid by bus lines.

The route of the bus line extends from Norwich northerly through the Chenango Valley traversing a populous and prosperous rural community and running through numerous villages and over improved highways for the entire distance. Along the route are about 500 families living outside of villages who are not directly served by any other public carrier. The petitioner has been running over this route for two years but has suspended opera-

tions in the winter, last winter for a few weeks and the year before for three months. He operates three buses carrying 15 passengers each and three cars carrying six passengers each. The large buses are heated in winter. A regular timetable is followed and the chauffeurs have a share in the profits. The proprietor has an accident insurance policy for the benefit of passengers. He has snow ploughs with which he proposes to keep the road open at all times. The present business is 75 to 100 passengers daily. The fare is lower than on the railroads for a comparable journey.

On the New York Central from Syracuse to Earlville the business has fallen off since the buses began to run. The distance from Norwich to Syracuse by this line is 58 miles. The other steam railroads are less affected by the competition. The petitioner promises not to compete with the New York State railways in the city of Syracuse and there are also other sections where he refrains from competing with local carriers.

The difficulties incident to unequal taxation of railroads and omnibus lines are discussed in the report, but are not settled, apparently being left for the legislature; the commission holds that all it has to decide is whether the proposed route is demanded by public convenience and a necessity.

In granting the petition, the commission prohibits competition with the local lines referred to and also with a bus line owned and operated by Nellie E. Bushlev, of Norwich, who has a certificate to run between Oxford and Sherburne, through Norwich.

Court News

Fireman's Primary Duty Is Firing

The Virginia Supreme Court of Appeals holds that it is the duty of a fireman primarily to fire his engine, and the railroad cannot be charged with negligence for his failure to keep a lookout at a time when his duties require him to be firing.—Director-General v. Hubbard's Admr. (Va.) 111 S. E. 446.

Terminal Carrier Not Liable for Initial Carrier's Negligence

The North Carolina Supreme Court holds that under a bill of lading covering shipment from New York to Asheville, providing that no carrier shall be liable for loss or damage not occurring on its own line, unless liability is imposed by law, the initial carrier was not the agent of the connecting roads so as to make the delivering carrier liable for the initial carrier's negligence, in the absence of allegation and proof of partnership or special contract.—M. V. Moore & Co. v. Southern (N. Car.) 111 S. E. 166.

United States Supreme Court

Lessor of Railroad Not Liable for Injuries During Federal Control

An employee of the Southern Railway was killed in March, 1919, while engaged in intrastate commerce on a line in North Carolina held by the Southern under a 99-year lease from the North Carolina Railroad Company. Action was brought in the State court against the lessor company, its liability being asserted under a local rule by which a railroad corporation is liable for injuries resulting from a lessee's negligence in operation. The defendant set up the fact that the Southern system was being operated solely by the Director-General of Railroads under the Federal Control Act. The State court, however, instructed the jury that, if the Government was operating the railroad, it was doing so in the capacity of a lessee and that the defendant "would still be responsible for the acts and conduct of the Government * * * *" Verdict and judgment for plaintiff were affirmed by the State Supreme Court without opinion.

The Supreme Court of the United States holds that the Government operated this railroad not as lessee, but under a right in the nature of eminent domain; it operated through the Director-General and to entertain this suit would be inconsistent with the Federal Control Act.—North Carolina Railroad Co. v. Lee. Decided October 16, 1922. Opinion by Mr. Justice Brandeis.

Foreign Railway News

Second Simplon Tunnel Opened

The second, or parallel, tube of the Simplon Tunnel, the largest in the world, has been completed, according to press dispatches from Geneva, Switzerland. This will make possible the double track operation of the Simplon line, which handles a heavy international passenger traffic. Both tubes of the tunnel are electrified.

Suit Against Mexican National

The Oliver American Trading Company has brought suit against the Mexican government and the National Railways of Mexico in the state supreme court at Rockland County, New York, seeking to recover $1,250,000 which it alleges it lost when the railway "endeavored to repudiate its arrangements" with the company.

The Oliver company at one time operated trains over the lines of the Mexican National and it alleges that the railway violated a contract in stopping this practice and that, furthermore, engines and cars belonging to the company were confiscated.

British Concern to Build Locomotives in India

LONDON.

A group of influential Indian gentlemen, early in the year 1921, invited Kerr, Stuart & Company, Ltd., of Stoke-on-Trent, England, to form a company in India for the purpose of building railway locomotives. In their annual report submitted to the shareholders, the directors of the company state that they have decided to accept this invitation after having fully considered and investigated the position. An undertaking known as the Peninsular Locomotive Company has been formed, the capital having been subscribed privately in India. The production of locomotives on an extensive scale is expected to begin shortly.

To Install Automatic Signals on the New Zealand Railways

The New Zealand Government Railways are planning to equip the new line connecting Otira and Arthur's Pass on the South island with automatic signals and two interlockers. The proposed installation is the result of a connecting line being constructed between the two terminals of the Midland railway division of the Government railways at Arthur's Pass in the Southern Alps. Owing to the mountainous country the railway terminated on each side of the pass and passengers and freight had to be conveyed between the two rail heads by means of stage-coaches and trucks. The construction of a tunnel has been completed between Otira and Arthur's Pass, a distance of 5.25 miles on a grade of 1 in 33, and will be opened for ordinary traffic early next year.

It was decided that a power interlocking frame should be installed at each of these stations and Messrs. McKenzie and Holland, Ltd., Australasian representatives of the Westinghouse Brake & Saxby Signal Co., Ltd., London, were given the contract of supplying two 19-lever electric power interlocking frames and the necessary signaling material for single line operation. The Midland railway connects Christchurch on the East side of the island with Greymouth on the West; between Christchurch and Rolleston, and Greymouth and Singleton there is double track, and between Rolleston and Singleton, a distance of 121 miles, it is single track on 3-ft. 6-in. gage. The government decided to equip the single track with automatic signals and gave a further contract to Messrs. McKenzie and Holland, Ltd., for 166 three-position color-light signals and other necessary material. The absolute permissive block system has been adopted with normal danger starting signals. The "vane" type of relay will also be used, both single and double-element classes to be installed. The transmission will be a.c. single phase, 3,300-volts at 50 cycles and step-down transformers will reduce this pressure to 100-volts for signal operation.

Equipment and Supplies

Locomotives

THE ILLINOIS CENTRAL is inquiring for about 75 locomotives.

THE MINNEAPOLIS & ST. LOUIS contemplates the purchase of from 25 to 30 locomotives.

THE TENNESSEE CENTRAL contemplates buying 4 Mountain type or Pacific type locomotives.

THE INTERNATIONAL & GREAT NORTHERN is said to be considering the purchase of some locomotives.

THE GREAT NORTHERN is said to be preparing to issue an inquiry for 50 or more locomotives of various types.

THE MAINE CENTRAL, reported in the *Railway Age* of September 23 as inquiring for 12 locomotives, has ordered eight 4-6-0 type locomotives from the Lima Locomotive Works.

THE CHICAGO, MILWAUKEE & ST. PAUL, reported in the *Railway Age* of October 21 as inquiring for 50 Mikado type locomotives, has increased this inquiry to 100 Mikado type locomotives.

Freight Cars

THE NORTHERN PACIFIC is inquiring for 3,000 box cars.

THE NORTHERN PACIFIC is inquiring for from 300 to 500 gondola cars.

THE LIVE POULTRY TRANSIT COMPANY, Chicago, will build 100 poultry cars in its own shops.

THE CHICAGO, MILWAUKEE & ST. PAUL is inquiring for 3,000 gondola cars, 1,500 box cars and 500 automobile cars.

THE KINGAN REFRIGERATOR LINE, Indianapolis, Ind., contemplates coming in the market for 100 refrigerator cars.

THE BEAUMONT EXPORT & IMPORT CO., Beaumont, Texas, is inquiring for 40 refrigerator cars for export to Mexico.

THE LOUISVILLE & NASHVILLE is inquiring for 2,000 steel hopper cars of 55 tons' capacity and 1,000 box cars of 40 tons' capacity.

THE WESTERN PACIFIC is inquiring for 800 general service gondola cars of 70 tons' capacity and 500 stock cars of 50 tons' capacity.

THE LEHIGH & NEW ENGLAND, reported in the *Railway Age* of July 29 as inquiring for 100 gondola cars of 50 tons' capacity, has ordered this equipment from the Magor Car Corporation.

THE PERE MARQUETTE is inquiring for 500 composite gondola cars of 50 tons' capacity. As reported in the *Railway Age* of October 21, this road is also inquiring for 1,500 box and 500 hopper cars.

FRUIT GROWERS EXPRESS.—The report in the *Railway Age* of October 14 that this company ordered 1,000 steel underframes from the American Car & Foundry Company is in error, as this equipment was ordered from the General American Car Company.

THE MAINE CENTRAL, reported in the *Railway Age* of September 30 as inquiring for 560 cars of miscellaneous types, has ordered 350 single-sheathed box and 100 open rack cars of 40-tons' capacity, 10 dairy products cars from the Keith Car & Manufacturing Company, and 50 all steel self clearing gondola cars of 50-tons' capacity from the Standard Steel Car Company.

Passenger Cars

THE CHICAGO, ROCK ISLAND & PACIFIC has awarded a contract to the Pullman Company for repairs to 5 dining cars.

THE MAINE CENTRAL, reported in the *Railway Age* of September 30 as inquiring for 7 steel combination baggage and mail cars, has ordered this equipment from the Osgood Bradley Car Company

Iron and Steel

THE BALTIMORE & OHIO has ordered 2,500 tons of bridge steel from the McClintic-Marshall Company.

THE NEW YORK CENTRAL, reported in the *Railway Age* of September 30 as inquiring for 600 tons of steel for bridges at various places, has ordered this tonnage from the McClintic-Marshall Company.

Track Specialties

THE PENNSYLVANIA has issued an inquiry for 100,000 tie plates for its western lines.

Machinery and Tools

THE GRAND TRUNK has ordered two 72-in. spring formers from Joseph T. Ryerson & Son.

THE CHICAGO & NORTH WESTERN is soon expected to issue an extensive machine tool inquiry.

THE SOUTHERN RAILWAY is inquiring for a 32-in. shaper, a 16-in. portable engine lathe and a 36-in. planer.

THE CHICAGO, BURLINGTON & QUINCY has issued a new machine tool inquiry for its reclamation yard near Aurora, Ill.

THE ATLANTIC COAST LINE has ordered a 60-in. planer and a 6-spindle multiple drill from the Niles-Bement-Pond Company.

THE NEW YORK CENTRAL has ordered a car wheel lathe and one or two engine lathes from the Niles-Bement-Pond Company.

THE CRUCIBLE STEEL COMPANY has ordered from Joseph T. Ryerson & Son an equipment for the repairing of locomotive boiler tubes, to be installed at its shops at Harrison, N. J.

THE BALDWIN LOCOMOTIVE WORKS, reported in the *Railway Age* of September 30 as inquiring for a number of machine tools, has ordered two triple-end frame slotters and several frame planers from the Niles-Bement-Pond Company.

THE PENNSYLVANIA, reported in the *Railway Age* of September 30 as inquiring for a number of overhead traveling cranes, has ordered from the Niles-Bement-Pond Company two cranes of 250 tons' capacity, two of 60 tons', two of 25 tons' and 10 of 15 tons' capacity. A list of heavy machine tool requirements has been issued by this company. These include: Three No. 5 knee type milling machines; 17 engine lathes with 16-in. to 48-in. swing; six, 36-in. and three, 42-in. vertical turret lathes; two, 36-in. and two, 48-in. planers; two, 90-in. driving wheel lathes; three, 5-ft. and one, 6-ft. radial drills; four horizontal turret lathes; five, 24-in shapers; two, 15-in. and three, 18-in. slotters; ten, 36 in. by 4 in. wet emery grinders; three turret lathes, an axle lathe; journal-turning lathe; 42-in. coach wheel lathe; 90-in. tire mill; 2-in. pipe machine; crown and staybolt threading and reducing machine, 6 spindles; bolt turning machine, 4 spindles; bolt pointing machine and bolt heading machine.

Miscellaneous

THE NEW YORK CENTRAL will receive bids until 12 o'clock noon November 6, for a number of oil storage barges.

THE NEW YORK CENTRAL is having 25 electric motor trucks built at the shops of the Standard Steel Car Company. These trucks are for use on 600-volt d. c. cars.

THE GREAT NORTHERN is inquiring for one, 65,000 gal. steel oil tank with 30 ft. steel tower for Troy, Mont.; one, 10,000 barrel steel oil tank and one, 65,000 gal. steel oil tank with 30 ft. steel tower for Whitefish, Mont.

THE SOUTHERN PACIFIC, during the past 10 years, has distributed more than 80,000,000 pieces of literature exploiting the agricultural, scenic and industrial resources of the territory served by its lines, at a cost of more than $5,500,000. Leaflets and pamphlets are frequently issued to 14,000 coupon ticket agents of other railroads in the United States and Canada.

Supply Trade News

R. S. Dean has been appointed district sales manager of the machinery and crane departments of **Manning, Maxwell & Moore, Inc.**, Chicago district. His headquarters will be in that city.

S. G. Johnson, president of the Johnson Railway Supply Corporation, New York, has been appointed sales representative of the **Magnetic Signal Company**, Los Angeles, Cal., for the territory east of Pittsburgh, with headquarters at 30 Church street, New York.

Dwight P. Robinson & Company, Incorporated, New York, has been awarded a contract for the construction of a cement mill at Birmingham, Ala., for the Lehigh Portland Cement Company, Allentown, Pa. The mill will have a capacity of 1,000,000 barrels a year.

Trade Publications

War Surplus.—This is the title of a little booklet issued by the Sales Promotion Section of the Office of the Director of Sales. It describes in a general way the methods of sale resorted to by the War Department in the disposal of its vast stocks of surplus property and tells what these stocks contain at the present time.

The Gap Crane.—The H. K. Ferguson Company, Cleveland, Ohio, has issued a four-page leaflet illustrating the adaptation of the gap crane to an erecting shop for the handling of heavy locomotive repairs as worked out for the Hornell (N. Y.) shop of the Erie now under construction. This leaflet shows the manner of handling locomotives with this crane and points out the advantages of this new equipment.

Timber Statement.—The Century Wood Preserving Company, Pittsburgh, Pa., has published timber bulletin No. 24, which is devoted to the consideration of treated timber for flooring and pavements, poles, cross arms, fencing, bins, sheds, platforms, walks, trestles and similar industrial uses. The bulletin is well illustrated and contains data on the proper piling of ties, as well as tables showing the amount of preservatives required for crossties, poles and piling.

Holt Roof Leader and Vent Connections.—This 28-page booklet recently issued by the Barrett Company, New York, is descriptive of the eight types of Holt roof connections manufactured by this company. The different types are discussed in relation to their use in flat roof and saw-tooth construction and in places where vent pipes, leader lines, steam stacks, etc., passing through a roof, require flashings. The illustrations show by photographs and drawings actual installations and the way in which they are made.

International

An Accident at Montalvo, Cal.

Railway Construction

Baltimore & Ohio.—This company has placed a contract with McClintic-Marshall Company for the fabrication of approximately 2,500 tons of structural steel required in connection with its program for bridge renewals during the 1923 working season. The bridges in question are of various types, including "I" beam spans, deck and through plate girders. The contract also includes new steelwork required in connection with the remodelling of second-hand girders in the railroad company's stock for use at new locations. Delivery is to be made March 15, 1923, and it is the intention to prosecute the erection vigorously as soon as the steelwork reaches the respective bridge sites and the weather conditions become favorable.

Chicago & North Western.—This company has been ordered by the Board of Railroad Commissions of the state of South Dakota to construct a station not less than 16 ft. by 24 ft. at Oral, S. D.

Los Angeles & Salt Lake.—The Interstate Commerce Commission has authorized the construction of a branch line from a connection with its main line at Lund, Utah, in a southeasterly direction to Cedar City, 32 miles.

Missouri, Kansas & Texas.—This company has awarded a contract to James Stewart & Company, Chicago, for the construction of a grain elevator of 1,000,000 bushel capacity at Glen Parks Yard, Kansas City, Mo.

Missouri Pacific.—This company has awarded a contract to the Ogle Construction Company, Chicago, for the construction of a 300-ton reinforced concrete coaling station at Bald Knob, Ark.

New York, New Haven & Hartford.—This company will construct a half-through girder bridge carrying six tracks over the proposed Capitol avenue extension, at Hartford, Conn. The bridge will be three spans, giving a clear roadway width of forty feet with two sidewalks, ten feet each, with supports on the curb lines.

Pennsylvania.—This company has awarded a contract to H. F. Curtis, Philadelphia, for an eastbound gravity hump yard at its West Morrisville, N. J., yards.

Texas & Pacific.—This company will construct a 100 ft. turntable and a three stall extension to its roundhouse at El Paso, Tex.

The Louisville & Nashville announces that an agreement on wages and working conditions has been reached in conferences between officers of the road and representatives of the new association of shopmen, which has been formed on that road. This association is said to have about 13,000 members. The agreement provides for a working day of eight hours for skilled labor and one of ten hours for unskilled. No provision is made for an extra rate of pay for work on Sundays or holidays.

Employees of the Long Island Railroad who have been in the service of the road over 20 years are forming a Veteran Employees' Association, and plan to have a dinner in New York City on November 18. About 1200 men are eligible to membership, and large numbers have joined already. President Ralph Peters was one of the first to join. C. D. Baker, general superintendent, will act as chairman at the organization meeting on November 18, when the officers and board of governors will be elected. The temporary committee is made up of F. W. Nichols, auditor of revenue; W. E. Wilkins, chief clerk to superintendent of motive power; H. E. Lewis, train master; J. W. O'Loughlin, supervisor or signalman; Samuel E. Booth, retired engineer; H. L. Merker, baggage trace clerk, baggage department; N. L. Barton, passenger conductor; H. M. Ashmead, engineman, and R. G. Richardson, secretary to the president.

Railway Financial News

CHICAGO & NORTH WESTERN.—*Stock Offered.*—Kidder, Peabody & Co. and Salomon Brothers & Hutzler are offering a limited amount of preferred stock of this company at prices to yield about 5.65 per cent, based upon its present dividend rate of 7 per cent per annum. Dividends are payable semi-annually, January 15 and July 15, and the stock is free from normal federal income tax. The preferred stock is entitled to preference as to dividends to the aggregate amount of 10 per cent out of the net earnings for any one year, in the following manner: First, to a preference of 7 per cent and after dividends of 7 per cent on the common stock, to a further preference of 3 per cent. After a further dividend of 3 per cent on the common stock, both classes of stock shall be entitled to equal rates per share on any further dividends.

CHICAGO, ROCK ISLAND & PACIFIC.—*Partial Payment of Guaranty.*—The Interstate Commerce Commission has certified a partial payment of $1,000,000 on account of this company's guaranty for 1920.

COLORADO SPRINGS & CRIPPLE CREEK DISTRICT.—*Sold.*—This railway, extending from Colorado Springs, Colo., to Cripple Creek, Colo., 71 miles, was sold on October 16 to W. D. Corley, of Colorado Springs, for $375,000, to satisfy a judgment obtained against it by the Guaranty and Union Trust Companies of New York City.

DENVER & RIO GRANDE.—*Holland Bank a Sub-depositary.*—The Sutro committee, headed by Richard Sutro, and including Lewis L. Clarke, President of the American Exchange National Bank, and William Loeb, Jr., which has asked for the deposit of Denver & Rio Grande first and refunding 5 per cent bonds, has appointed the Rotterdamsche Bankcreeniging of Amsterdam as a sub-depositary for these bonds, a large amount of which are held in Holland.

ILLINOIS CENTRAL.—*Asks Authority to Issue Bonds.*—This company has applied to the Interstate Commerce Commission for authority to issue $568,000 of refunding mortgage 4 per cent gold bonds to refund some first mortgage bonds which mature on August 1, 1921.

INTERNATIONAL-GREAT NORTHERN.—*Reorganization Plan Approved.*—The Interstate Commerce Commission has authorized the proposed issuance of securities and other transactions involved in the proposed plan of reorganization of the International & Great Northern by the International-Great Northern Railroad Company. The commission has issued a certificate that public convenience and necessity require the acquisition and operation by the applicant of the lines formerly belonging to the International & Great Northern, and the acquisition of trackage rights over the Galveston, Houston & Henderson between Houston and Galveston, Texas, the acquisition of control of the Austin Dam & Suburban by the acquisition of all of its stock and the acquisition of 50 per cent of the stock of the Galveston, Houston & Henderson. Authority was also granted to issue $20,000,000 of first mortgage, 30-year, 6 per cent gold bonds, of which $2,750,000 was to be pledged with the director general of railroads, $17,000,000 of adjustment mortgage, 30-year, 6 per cent gold bonds and $7,500,000 of common stock. The commission held that its authority was not necessary for the issue of the proposed note or notes to the director general in respect of additions and betterments during the period of federal control. Details of the reorganization plan were given in the *Railway Age* of June 3, page 1312.

The commission's report contains the following additional details:

It appears that the earnings of the International & Great Northern have shown improvement during 1922 as compared with the earnings of the past few years. During the first eight months of 1922, the net railway operating income was little short of eight months' actual fixed charges on basis of the present capitalization, notwithstanding the recent strike. The applicant estimates, on basis of apparently normal increases in traffic and rates, and reduced prices of fuel and other supplies, decreased wages and increased economies in operation, that the net income available for interest for 1922, 1923, 1924 and 1925, will be $2,497,018, $3,031,512, $3,178,135 and $3,326,821, respectively.

It appears further, that as of June 30, 1922, the investment in road and equipment, less accrued depreciation on equipment, was $41,406,847. The applicant will acquire approximately $2,000,000 in materials and supplies and will also acquire $4,000,000 in cash in the reorganization. These amounts added to the net book investment of $41,406,847 will make a total of $47,406,847, which excess will be increased by such amounts as may be determined as representing the value of $500,000 capital stock of the Galveston, Houston & Henderson, and $100,000 capital stock of the Austin Dam & Suburban, to be acquired. The total capitalization proposed, $44,150,000, seems to be reasonable when compared with the book assets of the new company, aggregating over $47,406,847.

We have not yet established the final valuation of the properties involved in the reorganization. It is, therefore, impracticable to compare the proposed capitalization with the underlying value. It appears, however, that the fixed charges will be materially reduced, with a consequent improvement in credit. The evidence also indicates that the new capitalization will not be disproportionate to the prospective earning power of the applicant. Under these circumstances, in view of the manifest desirability of ending the long period of receivership, we think that the proposed capitalization should be approved.

LEHIGH & HUDSON RIVER.—*Guaranty Certified.*—The Interstate Commerce Commission has certified the amount of this company's guaranty for the six-months period following federal control as $384,750, of which $184,750 was still to be paid to the company.

MACON & BIRMINGHAM.—*Service May Be Stopped.*—A hearing will be held in the courthouse at Macon, Ga., on October 28, so that interested persons will have an opportunity to present their views as to a reasonable expectation of continued service on this line. Passenger service on the road was discontinued October 11. J. E. Hall, attorney for the road, said that the entire system had suffered financial losses annually of such magnitude that continuance of regular normal railroad service was out of the question. He added that automobiles and motor trucks have burrowed deeply into the freight and passenger traffic that the short line railroad used to get.

The Transportation Department of the Macon Chamber of Commerce is working on possible ways of keeping the road in operation. It is said that 200,000 peach trees with an estimated average output annually of $3 per tree would show a loss of $600,000 to the farmers along the road, if service were to be stopped. The melon crop would also be practically a total loss. Large timber holdings and about 20 sawmills are dependent on the line for transportation.

MADISON SOUTHERN.—*Asks Authority to Abandon Line.*—This company has applied to the Interstate Commerce Commission for authority to abandon the operation of its line of 6.7 miles, in Madison county, Florida.

MARSHALL & EAST TEXAS.—*Application for Authority to Dismantle.*—The United States Court for the Eastern District of Texas at Texarkana, Tex., will hold a hearing November 11 on the application of Bryan Snyder, receiver of the Marshall & East Texas for authority to dismantle the remaining property of the railway between Gilmer and East Winnsboro for the benefit of its creditors.

MINNEAPOLIS & ST. LOUIS.—*Asks Authority for Equipment Trust.*—This company has applied to the Interstate Commerce Commission for authority to issue $1,500,000 of 10-year, 5½ per cent equipment trust certificates to be sold at 95½.

MISSOURI PACIFIC.—*Bonds Sold.*—Kuhn, Loeb & Co. have sold at par and interest $5,500,000 first and refunding mortgage 6 per cent gold bonds, series "D," due February 1, 1949, similar to bonds of series "D" at present outstanding. The purpose of this issue is to reimburse the company for capital expenditures and to provide funds needed in payment for the purchase of new equipment.

NASHVILLE, CHATTANOOGA & ST. LOUIS.—*Bonds Sold.*—J. P. Morgan & Co. have sold $1,800,000 4½ per cent one to 15-year equipment bonds at prices to yield 4.90 per cent.

NEW YORK CENTRAL.—*Asks Authority for Equipment Trust.*—The New York Central, the Michigan Central and the Cleveland, Cincinnati, Chicago & St. Louis have filed a joint application with the Interstate Commerce Commission for authority for the issuance of $12,660,000 of New York Central Lines 4½ per cent equipment trust certificates to be issued by the Guaranty Trust Company. The application states that the companies are in negotiation with

J. P. Morgan & Co. and it is expected to sell the certificates at 95 or on a net basis of 5.3.

NORFOLK & WESTERN.—*Declares Extra Dividend.*—The directors have declared the regular quarterly dividend of $1.75 on the common stock and an extra dividend of $1 per share. The road has paid 7 per cent annually on the common stock regularly since 1918. The extra dividend on the common is the first since 1917, when the road paid a total of 8 per cent for the year, 1 per cent extra being paid on March 19, 1917.

NORTHERN PACIFIC.—*Vote Director.*—Theodore F. Merseles of Chicago has been elected a director to fill an existing vacancy.

PENNSYLVANIA.—*Restores 6 Per Cent Dividend Rate.*—The directors have declared a quarterly dividend of 1½ per cent, payable November 29 to stock of record November 1. Since May, 1921, the quarterly dividend paid has been 1 per cent, having then been reduced from the long established rate of 6 per cent per annum. Until last year the Pennsylvania had not paid less than 6 per cent since 1900. The stock closed at 49½ on Wednesday.

The declaration of a quarterly dividend of 1½ per cent by the Pennsylvania, restoring the stock to a 6 per cent annual basis, was followed by an advance in the stock to the high price of the year and the highest price since 1918.

ST. LOUIS-SAN FRANCISCO.—*Equipment Trust Authorized.*—The Interstate Commerce Commission has authorized an issue of $6,000,000 of equipment trust certificates by the Guaranty Trust Company of New York to be sold at not less than 96.

SEABOARD AIR LINE.—*Equipment Trust Authorized.*—The Interstate Commerce Commission has authorized this company to assume obligation and liability in respect of $2,560,000 of equipment trust certificates to be issued by the Chase National Bank, at not less than 96.63.

SOUTH GEORGIA.—*Asks Authority to Issue Stock.*—This company has applied to the Interstate Commerce Commission for authority to increase its common stock from $58,000 to $495,500 for the purpose in part of purchasing the West Coast Railway for $205,500. It is also proposed to issue $250,000 of preferred stock to liquidate the company's bonded indebtedness.

SUPERIOR & SOUTHEASTERN.—*Asks Authority to Abandon Line.*—This company has applied to the Interstate Commerce Commission for authority to abandon the operation of that part of its line extending southeast from Grandview, Wisconsin, 11.8 miles.

Railroad Administration Settlements

The United States Railroad Administration reports the following final settlements, and has paid out to the several companies the following amounts:

Chicago Great Western Railroad Company	$1,600,000
Galena Signal Oil Company	150,000
Atlanta, Birmingham & Atlantic Railway Co.	1
Short Lines	
Frankfort & Cincinnati Railway Co.	1

Dividends Declared

Delaware & Hudson.—2¼ per cent, quarterly, payable December 20 to holders of record November 27.

Illinois Central.—Common, 1¾ per cent, quarterly, payable December 1 to holders of record November 3.

Norfolk & Western.—Common, 1¾ per cent, quarterly, and 1 per cent, extra, both payable December 19 to holders of record November 29.

Pennsylvania.—1½ per cent, quarterly, payable November 29 to holders of record November 1.

Pullman Company.—$2.00, payable November 15 to holders of record October 31.

Reading Company.—First preferred, 1 per cent, quarterly, payable December 14, to holders of record November 28.

Trend of Railway Stock and Bond Prices

	Oct. 24	Last Week	Last Year
Average price of 20 representative railway stocks	72.40	73.63	55.23
Average price of 20 representative railway bonds	87.13	87.85	76.43

Railway Officers

Executive

Thomas L. Handy has been elected president of the Port Huron & Detroit with headquarters at Bay City, Mich. **C. W. Handy** has been elected vice-president.

John G. Walber, executive secretary of the Bureau of Information of the Eastern Railways with headquarters at New York, has resigned this position to become vice-president in charge of personnel of the New York Central System, effective November 1.

Financial, Legal and Accounting

O. W. Dynes, general attorney of the Chicago, Milwaukee & St. Paul, with headquarters at Chicago, has been promoted to general solicitor, with the same headquarters, succeeding H. H. Fields, promoted. He was born in Columbus, Wis., and studied law at Cornell University. After being admitted to the bar in 1895, he aided in the first revision of the Starr & Curtis revised statutes of Illinois, and from 1897 to 1908, he was trial attorney with the Fidelity & Casualty Company, and was engaged in general corporation practice. In the latter year he entered railway service as assistant general solicitor of the Chicago, Milwaukee & St. Paul, with headquarters at Chicago, which position he held until 1912, when he was promoted to commerce counsel. In 1918, he was promoted to general attorney and has held this position until his recent promotion to general solicitor.

O. W. Dynes

C. S. Jefferson, assistant general solicitor of the Chicago, Milwaukee & St. Paul, with headquarters at Chicago, has been promoted to general attorney, succeeding O. W. Dynes, promoted. Mr. Jefferson was born on Aug. 31, 1876, at Madison, Wis., and graduated from the University of Wisconsin Law School in 1896. Two years later he entered railway service as a law clerk in the office of the Chicago, Milwaukee & St. Paul at Chicago. He held this position until 1900, when he was promoted to attorney, which position he held until 1910, when he was appointed assistant general solicitor. During the war he served as judge advocate in the United States army, and at the termination of his service he returned to his former position with the Chicago, Milwaukee & St. Paul, which position he held until his recent promotion to general attorney.

C. S. Jefferson

J. N. Davis, solicitor of the Chicago, Milwaukee & St. Paul, with headquarters at Chicago, has been promoted to commerce counsel, with the same headquarters.

Leo. C. Van Laan has been appointed auditor of the Port Huron & Detroit with headquarters at Bay City, Mich. Mr. Van Laan is also assistant secretary of the company. G. W. Handy has been elected treasurer and Helen M. Handy secretary. A. C. McDannel is assistant treasurer.

H. H. Field, general solicitor of the Chicago, Milwaukee & St. Paul, with headquarters at Chicago, has been promoted to general counsel, with the same headquarters. He was born on May 17, 1857, at Leverett, Mass., and entered railway service on September 24, 1880, as an attorney with the Chicago, Milwaukee & St. Paul at Milwaukee, Wis. He was appointed assistant general solicitor in 1887. From November, 1905, to January 1, 1912, he was general counsel of the Chicago, Milwaukee & Puget Sound at Seattle, Wash. On the latter date he was promoted to general solicitor of the Chicago, Milwaukee & St. Paul, with headquarters at Chicago, which position he has held until his recent promotion to general counsel.

Operating

G. C. MacDonald has been appointed trainmaster of the Michigan Central with headquarters at Bay City, Mich.

L. F. Donald, chief clerk to the assistant general manager of the Chicago, Milwaukee & St. Paul at Chicago, has been promoted to trainmaster, with headquarters at Bensenville, Ill.

G. L. Whipple, superintendent of transportation of the Chicago, Milwaukee & St. Paul, with headquarters at Chicago, has been promoted to general superintendent of transportation with the same headquarters.

F. D. Keeler, acting assistant chief clerk to the General Superintendent of the Pere Marquette with headquarters at Detroit, has been promoted to assistant superintendent of car service with the same headquarters.

A. C. McDannel has been appointed general manager of the Port Huron & Detroit, with headquarters at Bay City, Mich. F. E. Pinkerton has been appointed superintendent of car service and G. H. Greenway has been appointed superintendent.

Traffic

H. L. Toland has been appointed general agent of the Graysonia, Nashville & Ashdown with headquarters at Ashdown, Ark.

F. D. Gouldburg has been appointed general freight and passenger agent of the Port Huron & Detroit with headquarters at Bay City, Mich.

F. McD. Quinn has been appointed assistant general passenger agent of the Central region of the Pennsylvania, succeeding Roy L. Stall, deceased.

J. X. Kinberger has been appointed commercial agent of the Chicago & Alton with headquarters at St. Louis, Mo., succeeding C. F. White, resigned.

W. A. Lowe has been appointed district freight agent of the Canadian Pacific with headquarters at Fort William, Ont., succeeding J. J. Weegar, transferred.

F. S. Griffin has been appointed division freight agent of the Louisville & Nashville with headquarters at Pensacola, Fla., succeeding W. C. Dillard, transferred.

J. H. Fox has been appointed district freight agent of the Canadian Pacific with headquarters at Vancouver, B. C., succeeding A. J. Cambie, on leave of absence.

T. O. Jennings, freight traffic manager of the Chicago & Eastern Illinois with headquarters at Chicago, has been promoted to traffic manager with the same headquarters.

E. A. Montgomery, has been appointed general agent of the Mississippi Central and the Louisiana & Arkansas, with headquarters at New Orleans, succeeding J. D. Youman, resigned.

A. E. Enoch has been appointed assistant general freight and passenger agent of the Lehigh & New England with headquarters at Bethlehem, Pa., succeeding Richard Macsherry, resigned.

G. D. Williams, formerly of the Nashville, Chattanooga & St. Louis, has been appointed general agent of the traffic department of the Chicago, North Shore & Milwaukee, with headquarters at Chicago.

G. H. Griffin, city passenger agent of the Canadian Pacific, with headquarters at St. Louis, Mo., has been promoted to general agent, passenger department and steamship lines, with headquarters at Cleveland, Ohio.

J. Webster, assistant traffic manager of the New York Central with headquarters at Chicago, has had his jurisdiction extended over the recently leased Toledo & Ohio, Kanawha & Michigan, Kanawha & West Virginia and Zanesville & Western.

F. E. Jones has been appointed general agent of the Kansas City, Mexico & Orient with headquarters at St. Louis, Mo., succeeding G. W. Neudling, resigned. J. J. Lane has been appointed assistant general freight agent with headquarters at Wichita, Kan.

Mechanical

J. A. Buechler has been appointed master mechanic of the Port Huron & Detroit with headquarters at Bay City, Mich.

F. A. Torrey, general superintendent of motive power of the Chicago, Burlington & Quincy, with headquarters at Chicago, will retire on November 1.

A. W. Novak, district boiler inspector of the Chicago, Milwaukee & St. Paul, with headquarters at Minneapolis, Minn., has been promoted to general boiler inspector succeeding E. W. Young, assigned to other duties.

W. J. O'Brien, master mechanic of the Kanawha & Michigan, with headquarters at Middleport, Ohio, has been appointed master mechanic of the Toledo & Ohio Central, with headquarters at Bucyrus, Ohio, succeeding C. Bowersox, who has resigned to engage in other business.

J. E. Friend, assistant master mechanic of the Fort Worth division of the Texas & Pacific, with headquarters at Marshall, Tex., has been promoted to master mechanic of the Louisiana division, with headquarters at Alexandria, La. He will be succeeded by D. L. Ringer, general foreman at Baird, Tex.

Engineering, Maintenance of Way and Signaling

W. N. Boyd has been appointed chief engineer of the Port Huron & Detroit with headquarters at Bay City, Mich.

Purchasing and Stores

J. D. McCarthy, purchasing agent of the Minneapolis & St. Louis with headquarters at Minneapolis, Minn., has been promoted to general purchasing agent in charge of purchases and stores of the Minneapolis & St. Louis, the Railway Transfer Company of the City of Minneapolis and the Hocking Coal Company.

Special

M. Welch, chief special agent of the Seaboard Air Line, has resigned to accept a similar position on the Chesapeake & Ohio, with headquarters at Richmond, Va.

Obituary

A. F. Vick Roy, superintendent of the Union Pacific with headquarters at Denver, Colo., died on October 17.

Obey the Order of the Car Service Division!

THE CAR SERVICE Division of the American Railway Association has issued an important order requiring a large and immediate movement of box cars from eastern to western lines.

This order should be carried out promptly and literally. The western lines, especially those in northwestern and central western territory, recently have suffered a very serious reduction of the number of box cars on their lines, and they need all of them they can possibly get, and more, to satisfy the demands of their shippers. The order issued may be criticised as drastic. The plain fact is, that the conditions which have caused it to be issued are due to extensive violations of car service rules. If the railways on whose lines the cars have accumulated had obeyed the car service rules in the past, the present condition would not exist and the order issued by the Car Service Division would not have been necessary.

The existing situation presents plainly and directly the question whether, in respect to freight car distribution, the railways are capable of self-government. Having brought about the present situation by extensive violations of rules made by themselves, and which they are pledged to observe, they have now made it necessary to raise the question whether they will or will not promptly, faithfully and completely carry out an order issued by the Car Service Commission, which they themselves created and maintain to deal with just such situations as the present.

The railways are always on trial. They are especially on trial now. Will they show they are capable of self-government by obeying the orders of their own Car Service Division, or will they fail to do so, and thus afford good reason for the exercise by the Interstate Commerce Commission of its legal authority to take control of the distribution of cars when the railways themselves do not handle it efficiently and satisfactorily?

Every railway officer knows what will be said if the Interstate Commerce Commission has to take control of the distribution of cars. It will be said that *the machinery of the railways for handling the distribution of cars under private operation has broken down, and the statement will be true.*

The railways would have to obey an order pertaining to this matter issued by the Commission or take the heavy penalties provided for violations of the Transportation Act. If they could and would obey an order of the Interstate Commerce Commission they can and should obey the order of the Car Service Division.

The Human Versus the Machine Flagman

The State of New Hampshire was the first state to take effective legal action to have warnings set up on the highways, 300 ft. short of each railroad crossing, so that the reckless automobile driver should no longer excuse himself by the plea that he did not know the railroad was there. Its public service commission has now taken another notable step, in setting forth the truth concerning the watching of crossings. Deciding a case at Newfields, on the Boston & Maine, the commission says unequivocally that a good visual and audible signal, on a post, in service 24 hours a day, is a better watchman than the human attendant on duty 12 hours a day. The decision is reported on another page. To thoughtful and well-informed persons, this truth is already well-known, but it is a very good thing to have it formally and officially set forth in this definite fashion. Like many other truths, many people know it, but do not know it well enough. The New Hampshire decision abolishes a practice of *fifty years' standing.* It also voices another economic idea which needs to be kept in mind much more than it is, namely, that a wayfarer who gets in the way of a train and causes damage to the locomotive or other property of the railroad ought to pay a proper penalty in money. This theory is being put to the test occasionally. The Central of New Jersey secured a verdict for $300 the other day against the owner of an automobile truck that was wrongfully on a crossing.

Economics for Railway Men

One of the most important sessions of the coming meeting of the National Personnel Association, the program of which is noted elsewhere, is that on "Economics for Employees." Incidentally, it is, of course, first necessary that the executives and managements have a thorough understanding of economics as applied to their particular industry. Unfortunately much is still to be desired in this direction. The Christian Century in an editorial comparing labor unions in England and in America, in one of its recent numbers, makes this statement: "It is quite likely, too, that British employers, as contrasted with American, read economics rather more than their American cousins. Hence, they do not have the blind reactions in labor disputes that so often characterize American business men." A leading authority on this question—a practical economist of rare talent—in commenting upon editorials on the personnel question which have recently appeared in the *Railway Age*, makes this suggestion: "I feel that until the managers begin to instill some knowledge of economics into their personnel relations, there is not going to be very much progress in solving the labor problem. Bonus plans, profit sharing, welfare work, and all the numberless schemes for industrial democracy will never get far until they are tied up closely with the economic significance of their bearings. I believe if you could get in a few licks on the subject of the necessity of getting the right kind of economic information to the employees that you would be working right at the heart of the question rather than on the

edges." It is hardly necessary to make further comment except possibly to again remind our readers that this is one of the greatest tasks now confronting railway managements and that it demands immediate attention.

Allies End Control of Chinese Eastern

With the withdrawal of allied troops from Siberia the United States, along with Great Britain, France, Italy and Japan, has relinquished all control which it has exercised over the Chinese Eastern—the Chinese section of the Trans-Siberian Railway. The affairs of the Chinese Eastern have, since 1918, been managed by an inter-allied committee at Vladivostok and a technical board at Harbin. In the management of the road the United States has been represented by John F. Stevens. In relinquishing control of the railway to the Chinese government, our government has called to its attention the necessity for increasing the efficiency of the road's operation, making provision for greater safety for employees and passengers and safeguarding the interests of foreign investors and creditors. Attention is called to the important contribution which our government has made toward the maintenance and operation of the property, "both materially and through the services of the distinguished American engineer, John F. Stevens, and his assistants." The future operation of the Chinese Eastern will be watched with interest in this country, not only from a railroad standpoint, but from that of national policy. When order returns to Russia and the Trans-Siberian Railway is made into an avenue of traffic in keeping with its potentialities, the Chinese Eastern will assume a place of increasing importance; keeping it in efficient operation and free to the traffic of all nations will be a task which the Chinese government should exert every effort to carry out.

Pennsylvania Again Pays 6 Per Cent

Over a week has now passed since the Pennsylvania directors voted in favor of restoring the dividend rate to 6 per cent. One writing at this time, therefore, has been given the opportunity of seeing the interesting reaction which has been evidenced in the press and elsewhere. In truth, one hesitates to decide which is the more important (a) the significance of the restoration of the 6 per cent rate as indicating that the Pennsylvania has finally left behind it for good and all the adverse effects of the war and government control period, or (b) the congratulatory manner in which the Pennsylvania's action has been received by the editorial writers. From the point of view of news probably the latter is the more important. The Pennsylvania this year continued with the remarkable come-back which it staged following the end of government control; it came through the shopmen's strike rather better than almost any other road and its earnings statements have been so uniformly good for several months that the declaration of the 1½ per cent dividend was quite according to expectations. The Pennsylvania management has been conducting its operations so as to aim at the 6 per cent for several months past and the stockholders have had a promise that the higher rate would be restored at the earliest opportunity. In speaking of the other angles of the situation it is difficult to refrain from platitudes about such things as the Pennsylvania's reputation for conservative financing, the wide distribution of the stock in small holdings and the favorable public opinion concerning its activities in general. The Pennsylvania has for many years been in that much to be envied position that these attributes have been regarded almost as commonplaces. These things serve to emphasize that the Pennsylvania stockholders were called upon—when their dividend was reduced to 4 per cent—to bear a considerably heavier burden than stockholders in a company of the Pennsylvania's standing should in all fairness have been called upon to bear. The situation will enter railroad history as a standing indictment of the way in which the railroads were treated during the war period. There is a great deal of pleasure in noting the manner in which the press shows its realization of this very patent fact.

September Railway Earnings

It is a bit early to attempt to say what the total earnings of the Class I carriers will show for September when all the monthly reports are in. Those reports that have been made public, however, indicate plainly that the net for the month will probably not prove as good as many expected. The end of the coal strike, which was finally brought about in the latter part of August, was reflected in gradually increasing coal loadings during September. Whereas the coal loadings for the week ended September 2 were reported by the Car Service Division as 149,487, for the week ended September 30 they had reached 189,349. This increased business, however, has not been reflected in any appreciable manner in the September net. The explanation is, of course, simple, for it lies in the expenses due to the railway shopmen's strike. Most of the roads whose September reports we have seen show fairly imposing increases in their maintenance of equipment expenses with corresponding effect on the operating ratio and, of course, on net income. The following gives an abstract of the figures of net railway operating income for a small group of roads for September and for the nine months. It will be noticed that the larger part of them show net for September this year less than that for September last year; in two cases there are actual deficits. The outstanding feature in the figures, however, is of opposite character in the form of the Pennsylvania's report. Its increase in net for the nine months —$32,811,515—is interesting commentary on the recent restoration of the six per cent dividend rate:

NET RAILWAY OPERATING INCOME

Road	Sept., 1922	Inc. or Dec. compared with Sept., 1921	Nine months 1922	Inc. or Dec. compared last year
Atlantic Coast Line	1,024,367	1,011,390	10,839,608	7,866,317
Baltimore & Ohio	def. 2,665,952	—5,721,488	12,491,220	—2,779,977
Chicago, Milwaukee & St. Paul	1,564,107	—817,721	7,981,071	5,410,325
Great Northern	1,836,120	—1,382,636	10,084,242	5,871,607
Lehigh Valley	def. 295,976	—1,867,263	740,832	—1,972,467
Illinois Central	2,677,011	1,072,125	17,971,663	4,150,999
New York Central	3,111,204	—2,317,209	35,657,023	2,839,643
New York, New Haven & Hartford	1,245,279	576,788	9,860,468	12,879,647

St. Louis-San Francisco	731,032	—1,163,513	11,139,414	—1,767,166
Southern Pacific System	5,805,586	604,978	31,304,080	3,967,640
Union Pacific System	3,325,281	—2,261,276	19,879,242	—3,642,265

A Constructive Machine Tool Program—Its Fate

It is self-evident that the small annual net earnings of the railroads in recent years have discouraged investors to such an extent that capital needed to expand the railroad plant in proportion to the normal expansion of business could not be obtained. Necessary new equipment could not be purchased nor repair facilities properly maintained. This is why, in many cases, railroad shops and enginehouses are equipped as at present with so many machines which are antiquated, inefficient and costly to operate. The second reason may be laid to mechanical department men who have taken old machinery too much for granted, either entirely failing to show the managements how much money could be saved by the installation of modern equipment, or else becoming discouraged after once pointing out the needs and getting no action. There are

many progressive mechanical department officers on the other hand who do realize the savings possible by new equipment, but whose hands are completely tied by the physical inability of the railroads to provide the appropriations needed. For example, about two years ago the superintendent of motive power of a road having four repair shops of medium size made an exhaustive survey of all his shop machinery, listing separately the machines which were over 30, 20, 15, 10, 5 and under 5 years old. The exact order in which these machines were to be retired was indicated, together with the types of machines needed to replace them and the savings possible. This constructive program was to be spread over a period of ten years, it being proposed to spend $275,000 for new machinery each year. Owing to financial stringency, the railroad in question was absolutely unable to carry out this program and in the two years since it was initiated, *three* machine tools only have been purchased. It is important that railroad mechanical departments present constructive machine tool programs to the managements as forcefully as possible; in many cases, money thus spent will pay higher returns than if invested in new rolling stock. The greatest need of all, however, is the abolishment of those phases of government regulation which prevent the railroads from operating their own properties with sufficient net earnings to provide for normal growth and expansion. Incidentally, the case mentioned affords a striking example of railroad shop neglect, be it avoidable or otherwise, which is all too common. For years the railroads have not spent enough money for new machinery and shop equipment to replace that which was worn out, let alone take care of new and heavier rolling stock.

Another Personnel Vice-President

The appointment of John G. Walber as vice-president in charge of personnel for the New York Central System is significant, and particularly so at the present time. No definite statement has been given out as to his exact duties and responsibilities, but presumably they will include those ordinarily associated with an executive personnel officer in the industrial field. It was A. H. Smith, president of the New York Central System, who made the statement in testifying before the Senate Committee on Interstate Commerce a year or more ago, that "the efficiency of a railroad depends principally upon its men. It is estimated that 95 per cent of railroading is human." Unfortunately entirely too little attention has been paid to the human element on the railroads, as was noted particularly in the editorial in the *Railway Age* of September 16 on "Developing Machinery and Neglecting Men." On the other hand two of our largest railroad systems, the Pennsylvania and the New York Central, now have vice-presidents who are charged with the responsibility of seeing that the human element is fully understood and developed. Other railroads are taking a keen interest in these developments and many of them are working on similar programs, but of less ambitious nature. Students of industrial progress in Great Britain and America have stated that American industrial managers were many years behind those of Great Britain on this personnel question, because the British industrial leaders had recognized the folly of fighting organized labor and had awakened to the remarkable possibilities of having the unions work with them rather than against them. The events of the past year have apparently made a deep impression upon the minds of many of the leaders of organized labor in this country and upon the more thoughtful element among the employees. Is the time not now ripe for taking advantage of this and developing within each of the individual railroads that spirit of co-operation and teamwork which is so essential to the success of any organization?

Entertaining Guests in Shops

Entertaining business men at luncheon in its shops is one of the recent activities for improving public relations which the Central of Georgia has undertaken. At Macon, Ga., the Rotary and Civitan clubs have thus far been guests of the railroad, and other organizations of business men will be entertained in a like manner. Luncheon is served in the machine shop to employees and guests. There are a few short talks and then the guests are taken for a tour of inspection of the shops. Business men thus have an opportunity to see something of the railroad at first hand and, perhaps, to revise any unfavorable opinions they might have concerning the effects which the strike has had on the efficient operation of the railroad. These luncheons have been a decided success. Not only have they aroused the interest of the guests and tended to make them think favorably of the railroad; they have also aroused the same feelings in the employees, putting them in the position of hosts to leading business men of the community. The Central of Georgia has been unusually successful in its public relations work and one of the reasons for this is that it has not been content with half-measures. Before us is a copy of the menu of the luncheon given to the Civitan club at Macon on October 20 and on it are listed, not sandwiches and coffee and such simple fare as one might expect to be served in a railway machine shop at lunch time, but an elaborate five-course luncheon—a worthy example of the Central of Georgia's thoroughness in its public relations work. The menu was attractively printed for the occasion and, in addition to the bill of fare, gave some facts about the railway of interest to Macon business men, i.e., number of employees in Macon, annual payroll, value of shops, taxes paid to city and state, etc. The cost of the entertainment to the railroad would be well worth while if it did no more than fix firmly in the minds of the guests the few facts printed on the menu card, but it undoubtedly in every case has done more than that. The management of the Central of Georgia evidently agrees with the assertion which has often been made in these columns that "selling" the railroad to the public and to its employees is as important a task as is running trains or maintaining its equipment and track. Having this belief, it is translating its faith into performance.

An Important Step for Transportation

The decision by the University of Michigan to establish a chair of Transportation Engineering and the announcement of the appointment of John S. Worley, formerly a member of the Engineering Board of the Bureau of Valuation of the Interstate Commerce Commission, to that position, means much to the railways and to those dependent upon this industry for service. As expressed by an officer of the university who has been largely instrumental in the development of the plans for this department, it is not the intention of the university to turn out a large number of mediocre men who may ultimately rise to the positions of instrumentman or division engineer, but to help develop a few high-class men who may rise to executive positions in railway service and to give courses which will be taken by many students who will never enter the transportation industry but who through that work will make more intelligent citizens. This action by the University of Michigan, like that which led to the creation of the James J. Hill chair of Transportation at Harvard University, is a recognition on the part of educators and leaders in the transportation industry of the need for trained men for executive service on the railways. Railway operation is rapidly becoming an intricate science which not only requires the highest ability but training in the methods of analysis. The new era of transportation in which we are now entering is requiring greater refinement in methods and

the development of economies not heretofore realized through the more intensive use of facilities of all kinds and the rendering of the maximum transportation service with the minimum expenditure. A recent compilation showed there are one or more men of engineering and maintenance of way training now holding executive positions on roads aggregating more than 50 per cent of the mileage of the United States and Canada. When to this number are added the men who have had collegiate training in other courses the influence of college training in transportation can be realized. The decision of universities of the standing of Michigan and of Harvard to undertake the training of men specifically for transportation service is a development of much importance to this industry which it should foster in every way.

Dealing with the Labor Problem

THE MANAGEMENTS of some of the railways recently have made or are now making important changes in their organizations to deal with the labor problem. The Pennsylvania system has had for some time a department of personnel with a vice-president in charge. The New York Central has just created the office of vice-president in charge of personnel. The Rock Island some time since created the office of assistant to the president in charge of personnel and public relations. A few other examples of the same kind might be cited.

Such changes in railway organizations are being made in recognition of the fact that the labor problem on the railways, as well as in many other industries, has undergone a radical change within recent years.

The conditions of employment in industry have been revolutionized by the great increase in the size of industrial concerns, by popular education and by other important causes. In consequence the attitude of employees to their jobs, especially in large scale industries, has changed greatly within the last quarter century, and especially the last 15 years. Of no other industry has this been more true than of American railroads. The great increase in the size of railroad systems has increased even geographically the distances between most railway employees and the owners and chief executive officers. When a railroad with 3,000 miles of line was a big system, most of the employees were nowhere near as far from the principal executive officers and the owners in merely a geographical sense as they are now when many systems have from 3,000 to 20,000 miles. But in another sense the distance between the employees and the executive officers and owners has been increased much more. It has been increased so much by the results of government control and by radical propaganda that in the minds of many railway employees the ownership of the railways is indicated by two words—"Wall Street," and the executive officers are regarded as agents of Wall Street who are paid high salaries to do its bidding in dealing with employees and the public.

How many reflect upon what these conditions mean to the railroads in relation to efficiency of operation and to their future operation and ownership? There is an old warning regarding the results of trying to put new wine into old bottles. New conditions demand new methods. All change is not progress, but no progress was ever made without change. In spite of the revolution which has taken place in the labor problem no important changes in organizations or methods for dealing with employees have been made on most railways. The view seems to prevail on most of them that if the old methods are used long enough and energetically enough they will finally restore the old labor conditions of efficiency and loyalty. On the other hand, the managements of some railways believe that changes in organization and methods must be made if the labor problem of today is to be solved. They are acting accordingly, and they are right. The plans they are adopting differ, but they have the same purpose. This purpose is to find out what the employees are really thinking, what they really want, and what must be done to bring about new relations between them and the railways which will be beneficial to both.

The first prerequisite to the solution of any new problem is to find out that there really is a new problem and exactly what it is. There always has been a labor problem in industry. There always will be. It always has been a changing problem, and it always will be. It has changed so much on the railroads within recent years that it has become a new problem. Anybody who does not recognize the fact as it presents itself today it is a new problem will struggle with it in vain.

It having been once determined that there is a new problem and what it is, the next thing needed is to work out a new method for solving it, and try it. If it does not work, still another method should be tried.

Neither on the railroads nor in any other industry will the labor problem be solved until the employees are treated fairly and as well as economic conditions will permit. One of the primary duties of a personnel department is to investigate working conditions and provide remedies for all conditions about which employees reasonably complain or might reasonably complain. Another essential to any real solution of the labor problem under modern conditions is that the door of the management shall be kept wide open to receive the complaints and suggestions of employees. But every employee cannot come to headquarters with his complaints and suggestions. Therefore, employees must be given an opportunity to communicate and deal with the management through representatives of their own choosing.

The railways have persistently opposed national negotiations and agreements with labor unions. Those railways which have not made settlements with striking shop crafts unions have a real opportunity to make satisfactory agreements for dealing locally with employees in their own shops. The greatest mistake which these railways could make—and it is a mistake some, if not many of them, seem in danger of making—would be to attempt to dictate the exact kind of organization their shop employees should form, the way that they should choose their representatives to deal with the managements, and the way in which the dealings between these representatives of the employees and the officers of the railway should be carried on. The entire scheme for local dealings between the shop employees and the railway managements should be worked out in conferences between representatives freely chosen by the employees and managements.

In the long run, no plan for local negotiations and settlements which is merely "handed down from the top shelf" by the managements will satisfy the employees and bring about a good understanding and close co-operation. There is a spirit among the working class today which causes intelligent working men, whether conservatives or radicals, to desire a real voice in settling questions the settlement of which will affect their welfare, and no management which does not recognize this spirit as reasonable and laudable will establish relations with its employees which in the long run will inspire loyalty and secure efficient work. The so-called "company unions" must be allowed and encouraged to become real employees' unions, or in the long run it will be found that most of the shop employees have become members of other and larger unions and that these other and larger unions will again have to be dealt with.

One of the most important influences which have made the labor problem on the railways what it is today is the propaganda against private management of railways, and the still more radical propaganda against the entire present industrial system, which has been and still is being so extensively carried on among railway employees. How many railway officers who deal with labor read the weekly and monthly

publications of the labor organizations which are being read by employees? Those officers who do not read them should begin to do so. If they read them they would get light which they much need on one of the principal reasons why the railway labor problem has become what it is today. This propaganda has poisoned and is still poisoning the minds of hundreds of thousands of employees against their officers, against private management of railroads, and against the entire present industrial system. If the railroad labor problem of the present is to be solved, this propaganda must be met and its effects nullified by presenting to employees the real facts about the railroad business, including the part of total railway earnings that go to labor, the part that is spent for materials and supplies, the part that is paid out in salaries and the reasons why some large salaries must be paid, and about the part that goes to capital. Railway employees must be shown why it is to their interest to do efficient work and why it is contrary to their interest to destroy the earning capacity and stop the expansion of the concerns for which they work. They must be shown why it is not practical to give them more favorable working conditions or higher wages, and why their own situation and those of other working men in these respects could not and would not be improved by the adoption of government ownership or the Plumb plan or other revolutionary policies.

The machinery adopted for bringing about a better understanding and close co-operation between the employees and the railways never has been and never will be so important as the spirit in which the problem is attacked by railway officers. The essence of the matter is "Not of the letter, but of the spirit; for the letter killeth but the spirit giveth life." Most men are governed much more by their sentiments and prejudices than by their reason. No amount of presentation of statistics and arguments will ever solve the problem until more employees have their confidence in the fairness and efficiency of their officers and managements built up until they will again speak proudly of "our railroad." As this is done, however, the facts regarding the railroad business in general and about the business of the railroad for which they work in particular which are or should be presented to them, will become more and more effective in nullifying the reckless anti-railroad propaganda which is being carried on.

The Largest Car Shortage in History

THE CAR SERVICE DIVISION of the American Railway Association reported for the week ended October 15 that the railways were unable to furnish 156,309 freight cars for which shippers had made requisition, and that, on the other hand, there were scattering surpluses of cars in different parts of the country amounting to 4,275. This made a net "car shortage" of 152,034. This is the largest car shortage ever reported. The largest net shortages reported in earlier years were as follows:

On February 6, 1907	137,847
On May 1, 1917	145,449
On March 1, 1918	138,102
On September 1, 1920	146,070

There is a prevalent belief that the largest car shortages usually have been reported in the fall or early winter. This is based upon the assumption that the largest amount of freight always is transported in the closing months of the year. The foregoing figures show that the largest car shortages have not always, in the past, developed in the fall or winter. Furthermore, it is not true that within the last five years, at least, the peak of the year's business has always been reached in the fall. In 1917 the largest month's freight business was handled in May; in 1918 in August; in 1919 in October; in 1920 in August, and in 1921 in October.

Unquestionably the general tendency is for the largest freight business to move in the later months of the year, but the time when the largest amount of freight actually has been moved and shortages of cars have come have been determined by whether the tendency of general business has been upward or downward. In 1906 the tendency was one of increasing activity of general business and this tendency caused the freight movement to continue so heavy that the peak of the car shortage in that period was reached in the spring of 1907. Eight months later came the panic of 1907, which caused a heavy decline in freight business. In 1916 the tendency of general business was to increase, and the peak of the car shortage was reached in the spring of 1917. The same tendency of general business prevailed in 1907, while the severe winter of 1917-1918 seriously interfered with the movement of freight. In consequence, the peak of the car shortage was reached in the next spring. The peak of the car shortage in 1919 was reached in October, because late in 1918 and early in 1919 general business activity declined. The largest volume of freight movement and the peak of the car shortage in 1920 were attained in August, because general business activity was at its height and tending to decline, and in the preceding spring the movement of freight had been seriously interfered with by the switchmen's strike. This combination of conditions caused the total freight moved, a large amount of which had accumulated in the spring months, to be the largest in the four months May to August of any four months in history.

Unless most of the present indications are misleading, the tendency of general business is now to increase. There always has occurred in the winter months a decline in the amount of freight moved, even when general business has been extremely active. Undoubtedly this has been mainly due to the fact that the cold and storms of winter have interfered with railway operation and reduced the amount of freight it has been physically possible for the railroads in the northern part of the country to handle, even when general business has been active and growing. The result of this decline in freight movement in the winter months has been, as facts already given show, to increase the car shortage until spring weather has made it possible for the railways to again increase the amount of freight handled.

What do these facts indicate as to the transportation situation which is likely to prevail this winter and next spring? As there is no sign that the activity of general business is going to decline, the conclusion suggested is that the shortage of cars will reach its peak in the spring of 1923, as it did in the springs of 1907, 1917 and 1918. The railways for the last five weeks have been loading an average of over 970,000 freight cars weekly. After they had been making practically the same record for some weeks in the falls of 1918, 1919 and 1920, the demand for cars declined. Some experts on car service advance the theory that after the railways have been moving almost a million carloads of freight weekly for some weeks the supply of commodities received by the purchasers catches up with their demands, and that therefore after some weeks of such heavy traffic there is likely to be a decline in the demand for transportation. But this conclusion is based only on figures for carloadings for the last three years. Now, the decline in the demand for transportation late in 1918 and early in 1919 undoubtedly was largely due to the termination of the war and to resulting industrial readjustments. The decline in the demand for transportation late in 1919 was brief and was followed by a large increase in the demand for it. The decline in the demand for transportation toward the close of 1920 was due to the fact that for months the country had been heading into a period of drastic liquidation and decline of general business.

It would seem that the present conditions are more similar to those which existed late in 1906, 1916 and 1917, and as

has been shown, the conditions existing then resulted in increases of general business activity, of freight movement, and of car shortage. The United States is a growing country. Its periods of depression always have been followed by periods of revival and expansion of business and by consequent increases in the demands for transportation. The country is in the midst of a period of business revival now. Possibly the demands for transportation will not continue to increase, but certainly there seems more in past experience to indicate that they will than that they will not.

At any rate, nothing can be lost and much may be gained by railways, shippers and consignees acting on the assumption that the demand for transportation is going to increase for some time, and that every effort should be made to provide for meeting this increased demand if it comes. The railways, with unfavorable conditions in the shops of most of them, are pushing repairs of locomotives and cars as fast as they can; but while the number of bad order locomotives and cars is being reduced, it is not declining as rapidly as could be wished. The railways are ordering more new locomotives and cars this year than for some time. These are being received and put in service as rapidly as the builders can turn them out.

If, however, the expansion of general business is to continue it is evident that more must be done to secure the maximum utilization of the transportation facilities now available. While the shortage of cars is the best measure of the existing shortage of transportation, it is merely a symptom of the general transportation situation. Even if the railways should immediately put into service hundreds of thousands of new freight cars, the problem presented would not be solved. It would still be necessary to get more service from the tracks, the terminals and the locomotives.

The best immediately available means of partially solving the present problem is to improve the distribution of cars, to increase the average miles traveled daily by each car and to increase the average load per car. There is an acute shortage of cars for the shipment of grain on the central western and northwestern lines. The Car Service Division is trying to remedy this by ordering an extraordinary movement of box cars to these lines. If the railways act wisely they will fully and promptly carry out these orders, which probably would not have been necessary if car service rules had been strictly observed up to this time. The increased average movement and average loading of cars required cannot be secured without the co-operation of shippers and consignees, and the Car Service Division has called upon them for their help. In a recent bulletin it has shown that at least 150,000 cars are unloaded every day, and that if 24 hours were saved in unloading only one car out of every ten, this would increase the number of cars available for shippers by 15,000. The number of cars available could be increased 30,000 by saving 24 hours in unloading one car out of each five. Shippers are also urged to order only cars that will be loaded within a 24-hour period, and to place orders for reconsignment promptly in order to prevent unnecessary delays to cars that are reconsigned. They are also urged to load cars to the limit of their capacity, and to load and release them with the utmost promptness.

It is always obviously to the interest of the railways themselves in periods such as this to accelerate the movement of cars and increase their loading as much as possible. It is not always so plain to the individual shipper and consignee that it is equally to his interest to co-operate with the railways. Nothing could be plainer, however, than that whatever will increase the average movement and loading of cars will have the effect of increasing the available supply, and that, other things being equal, whatever increases the available supply will increase the amount of freight that every shipper can ship and that every consignee can get shipped to him

In the efforts to secure the greatest possible amount of service from the facilities already available, the one most important fact which the existing transportation situation emphasizes should never be overlooked. This is that for the first time in its history the country is confronted, at the beginning of a period of business revival, not only with a shortage of transportation but with the most acute shortage that ever existed. There is only one real remedy for this situation, and this is the expansion of railroad facilities. Whether they will be adequately expanded or not will depend upon future government regulation of railways. The public will determine what regulation will be in future. Therefore, whether the existing shortage of transportation will be remedied or become more acute and serious, will be determined by the public.

Net Railway Operating Income

IN AN EDITORIAL which appeared in last week's issue of the *Railway Age* a suggestion was advanced that the monthly reports of the earnings and expenses of the Class I carriers would perhaps have even a greater usefulness than they now have if there were a better understanding of the terms "Net railway operating income" and "Net after rentals." These two terms are synonymous; the chief difficulty in connection with their use lies in a certain amount of confusion between them and such other terms as "Net revenue from railway operations," "Railway operating income," "Net income," etc. In other words there is a lack of understanding as to what different things these various terms mean and a failure to differentiate them properly.

The best way to define the term "Net railway operating income" is to show what the Interstate Commerce Commission requires on the form on which the monthly reports of the carriers are rendered. That form requires the carriers to fill in six figures for each of a total of 29 items. The form—which measures 9½ in. by 11 in.—thus has seven columns which include the figures for the month (a) this year, (b) last year, (c) increase or decrease. Column (d) contains the items and (e) the figures for the cumulative period this year, (f) last year and (g) increase or decrease. The 29 items in column (d) are as follows:

OPERATING REVENUES:*
1. Freight (Accounts 101 and 121).
2. Passenger (Accounts 102 and 122).
3. Mail (Accounts 106 and 125).
4. Express (Accounts 107 and 126).
5. All other transportation.
6. Incidental (Accounts 131 to 143).
7. Joint facility—Cr. (Account 151).
8. Joint facility—Dr. (Account 152).
9. Railway operating revenues (Account 501).

OPERATING EXPENSES:*
10. Maintenance of way and structures (Accounts 201 to 279)
11. Maintenance of equipment (Accounts 301 to 337).
12. Traffic (Accounts 351 to 359).
13. Transportation (Accounts 371 to 420 and 431 to 433).
14. Miscellaneous operations (Accounts 441 to 446).
15. General (Accounts 451 to 462).
16. Transportation for investment—Cr. (General Account VIII).
17. Railway operating expenses (Account 531).

INCOME ITEMS:
18. Net revenue from railway operations (Item 9, less Item 17).
19. Railway tax accruals (Account 532).
20. Uncollectible railway revenues (Account 533).
21. Railway operating income (Item 18, less Items 19 and 20).
22. Equipment rents (Accounts 503 to 507 and 536 to 540), net.†
23. Joint facility rent (Accounts 508 and 541), net.†
24. Net railway operating income (Items 21, 22, and 23).

MILEAGE:
25. Average number of miles of road operated.

OPERATING RATIOS:
26. Ratio of expenses to revenues (Item 17÷Item 9).
27. Ratio of total maintenance to revenues ([Item 10+Item 11]÷Item 9).
28. Ratio of total maintenance to expenses([Item 10+Item 11]÷Item 17).
29. Sleeping and parlor car surcharge included in Item 2.

* Includes figures for water lines, if any.
†Debit balance should be entered in red.

It will be noted that "Net railway operating income" is item 24 and that what it shows is a "Net after rentals" but before fixed charges. Item 24 is the figure around which the present discussion is based.

Letters to the Editor

[The Railway Age welcomes letters from its readers and especially those containing constructive suggestions for improvements in the railway field. Short letters—about 250 words—are particularly appreciated. The editors do not hold themselves responsible for facts or opinions expressed.]

Statistical Comparisons Should Consider Business Conditions

New Haven, Conn.

To the Editor:

In an article entitled "Suggestions for Greater Efficiency and Economy," on page 702 of the *Railway Age* of October 14, Franklin Snow makes certain suggestions for improving the efficiency and economy of the railroads. His remarks on train dispatching are necessarily read without the information in regard to conditions on the line as a whole which only the dispatcher had at the time. As to the use of official cars and the cost stated—30 cents per car mile—Mr. Snow does not give full consideration of the lesser cost of these movements on trains operating for other purposes, the necessity of traveling offices for officers, the number of which has not increased as rapidly as has transportation. In the matter of passes he neglects the long established considerations of employees, particularly those older in the service. His adverse criticism of 1921 freight operation as compared to 1919, which criticism is apparently based on certain selected unit performance figures, may well be the subject of comment.

His figures for the month of July are quoted below for reference:

	1919	1920	1921
Per cent of cars loaded	67.9	71.1	63.6
*Average number tons per car mile	27.9	28.2	27.8
Average car miles per car day	24.1	24.4	21.3
Net ton-miles per car day	455	490	375
Average speed per freight train mile	10.8	10.8	11.9
†Gross ton-miles per freight train mile	1,571	1,470	1,472
Net ton-miles per freight train mile	757	725	674
Per cent of net to gross ton-miles	48	49	46
Cost per freight train mile	$1.54	$1.87	$1.88
Average per cent locomotives unserviceable	27.2	24.2	23.3
Average per cent freight cars unserviceable	8.7	6.6	15.9

*Some of the titles are not correct, this one obviously refers to the average ton-miles per *loaded* car mile.

†The Bureau of Railway Economics summary shows in 1920, 1,512 tons instead of 1,470, and in 1921, 1,459 tons instead of 1,472.

It is common knowledge that the greatest efficiency of any plant is obtained when it is working to 100 per cent capacity and before it is overworked, which in the case of a railroad is when it becomes congested. When business is light and plants work only to part capacity, the performance units always suffer as compared to those accomplished under 100 per cent operation. This point should be borne in mind when comparing July, 1921, with July, 1919, the latter month, according to Mr. Snow, being a normal one, with war traffic replaced by a heavy commercial traffic.

Therefore as the above factors of car use and train performance are influenced by the volume of business offering, no attempt to judge the relative operating efficiency should be made without knowledge concerning the amount of freight business handled during the different periods. Using as a measure the gross ton-miles handled in July of the three years (and net ton-miles would show 1921 at an even greater disadvantage), we find that 1920 was 12 per cent greater than 1919, but that 1921 was 14 per cent less than 1919.

Without taking any credit from the managers for their successful efforts in 1920, it should be realized that the increases in the percentage of loaded car miles and in the tons per loaded car were due in large part to the heavy freight movement at that time. Following federal operation and the period of heavy traffic, empty car mileage necessarily increased, incidental to the return of cars to owning roads, a movement necessary, moreover, in the interest of car maintenance. When business is heavy every car is required and there is opportunity to load more cars at the point where made empty, except in the cases of specialized equipment, such as coal or stock cars, where but little lading is available for the return movement. These conditions are responsible for the improvement in 1920 and the slump in 1921, rather than any falling off in efficiency.

Car loading is pretty well in the control of the railroads' patrons, so long as they load to the tariff requirements, which is all the railroads can insist upon. Car loading depends somewhat on car supply. When cars are scarce, naturally shippers load the cars they do receive heavier than when there is a car surplusage. Here again, considering the volume of business, 1921 compares favorably with 1919.

What has been said concerning the effect of varying freight movements also applies to the miles per car per day, but there is another important explanation for the decrease in the 1921 figure. That unit, of course, is obtained by dividing the car miles run during the month by the car days of that month. Miles are made only by cars that move, consequently any increases or decreases in the number of cars standing still (bad order and stored cars), affect the average miles per car day. Without entering into a discussion as to the cause of the large number of bad order cars in 1921, whether a result of under maintenance in previous years or, as Mr. Snow suggests, due to a cessation of shop activities in 1921, no criticism can be attached to the managers on that score, bearing in mind the large number of surplus cars available and the slack business of 1921, and the financial situation of the carriers. In 1921 the percentage of bad order freight cars had increased to 15.9 from 8.7 in 1919. If the 1921 percentage had been the same as 1919, the number of bad orders in 1921 would have been 212,000 instead of 375,000, and the average miles per car per day (with the same number of bad orders each year) would have increased from 21.3 to 23.1, or within one mile of the 1919 average. Similar adjustment for surplus cars, 150,000 in July, 1919, and 350,000 in July, 1921, would add another 2.2 miles to the 1921 average or give an adjusted mileage of 25.3 miles per car day, with cars standing (bad orders and surplus) on the same basis as 1919, or a considerably better performance than in 1919. Mr. Snow's remark that "It is indeed poor policy to allow car mileage to fall off as it has," does not appear to be justified.

Nothing need be said of the low figure of 375 net ton-miles per car day. It is simply the product of the three factors previously discussed and when they decrease, it follows.

The statement that the drop in the train load in 1921 is really an economy, because of higher average train speed apparently assumed possible because of the lighter train, and assuming further that the higher speed eliminated a large amount of overtime and other expense, is open to serious doubt. It is by no means an established fact that relatively high freight train speeds mean economy. On the contrary, many railroads have found that their lowest unit costs have resulted when heavy trains were being operated. The average tractive effort of locomotives increases from year to year; it was higher in 1921 than in 1919. Consequently the average locomotive of 1921 should have handled a train of equal tonnage to 1919 at a higher speed or more tonnage at the same speed. Operating men know that the best train loading records are made when there is a strong run of business for the simple reason that when this is true there are ample cars to load locomotives to capacity, while in times of light traffic, such as July, 1921, certain service must be maintained regardless of the train load, consequently many trains leave their terminals with several less cars than they would handle under 100 per cent operation. This argument is somewhat

weakened by the low train load figure shown in Mr. Snow's table for 1920, but as stated the 1,470 tons shown for 1920 is considerably below the figure reported by the Bureau of Railway Economics, while his 1921 figure is higher. While the fact that the gross ton-miles per train hour, which takes into account both load and speed, where higher in 1921, denotes more economical handling—still greater saving would have resulted had the 1,919 train load been handled at the 1921 speed.

The net tons per train were lower in 1921 for reasons previously given, i.e., less loaded cars per train and less tons per loaded car, the same explanation holding for the decreased percentage of net to gross ton-miles.

Everything considered, there seems to be no reason for discouragement so far as freight operation is concerned, and what Mr. Snow terms the temporary spurt of 1920, was really the beginning of improved operation which is continuing, as indicated by the fact that some roads have established new operating records since that time. Of course certain unit figures which necessarily reflect the influence of light business, or at the present time the effects of the coal and shopmen's strikes, will not evidence the improvement. Very likely the railroads will have their troubles during the coming months, but when conditions again become normal, with respect to personnel and business, it is to be expected that our railroads will establish new high marks of operating efficiency.

DON. M. NEISWANGER.

Why Are Dining Cars Unprofitable?

OMAHA, Neb.

TO THE EDITOR:

It is generally known that dining cars are not self-supporting, in fact, in many instances are operated at a loss; that were it not necessary to use them for the purpose of advertising and satisfying patrons, railroads would withdraw most of them.

What is the reason they cannot be made to yield a moderate profit? One view is that some dining car superintendents have fallen into a rut; that is, are too prone to copy menus and methods of some other roads. They cater only to about 15 per cent of their patrons, apparently ignoring the ability to pay and the wants of the other 85 per cent of the 150 passengers on the average train. High prices and small portions are other reasons why the diners are not more liberally patronized; also the tipping abomination, which is more in evidence and seemingly more exacting in dining cars than in any other place.

When a passenger is handed a bill of fare he is at once dismayed and discouraged. True, there is a goodly list of food specialties, but very little offered in the way of real food such as roasts, vegetables and desserts at prices which can be afforded, and which the man who is neither rich nor poor is accustomed to find on his table at home.

A steak costing about 50 cents at home and which is ample for three adults is offered at $1.25. The result of this exorbitant price is that steaks go a-begging. Many are carried on hand until they become unsalable and are a total loss. A passenger traveling alone often finds it necessary to buy enough, in quantity, to feed two or three persons because of ill-adjusted portions.

Why cannot dining cars be made a paying proposition on a basis of 50 per cent profit on the food served?

It is now the custom to serve club breakfasts at from 50 to 90 cents, but an inspection will show that a combination rarely lists the articles of food that you usually eat, or for which you care. If a selection of certain articles could be made from each combination the result would be more pleasing; but this is not allowed.

Why not make some experiments along the following lines:

Distribute menus throughout the train showing in display type "THIS COMPANY PAYS ITS DINING CAR EMPLOYEES A LIVING WAGE. KINDLY REFRAIN FROM OFFERING TIPS IN ANY FORM WHATEVER."

Show only two prices for breakfast—75 cents and $1—specifying in each combination one choice of three or more kinds of fruit, cereals, eggs, bacon, ham, rolls, hot cakes, and drinks.

Serve luncheon at the same prices and list in same manner.

Provide six o'clock dinner at $1.25 and $1.75, permitting passengers to make one selection from, say four kinds of meat, two selections from the same number of vegetables and supply dessert which is appetizing, instead of the usual "cottage pudding," for which about 35 cents is charged. The average American likes baked potatoes and pie, but these are rarely shown on menus now. Soup and bread are inexpensive and should be served as a matter of course. More attention should be given to the quality of the coffee, which on many diners is very poor indeed and is the one thing above all others desired by the traveler. Unquestionably poor coffee has provoked more criticism than anything else.

Since there is delay in changing, why use table cloths at all? They soon become soiled, must be removed while passengers are at table, and are an unnecessary expense. Also, napkins are fully one-third too large. The expense for table cloths at least could be saved by using a dining table having a soft-toned, mottled, cream-colored top, surrounded by a band about 1½ inches wide—cherry, mahogany or walnut—or a pure white composition closely resembling marble, with slightly turned up edges. Such tables may be seen in many first-class public dining rooms and are quite attractive.

A study of the printed part of bills of fare will show that nearly everything offered is canned; therefore, it would cost nothing additional to continue offering these edibles should it be desired to amplify the menus. For the 15 per cent of patrons who desire to be served with something out of the ordinary, the same specials as now appear could be shown; but these articles should not be featured so prominently that the other 85 per cent of the patrons would be stampeded by the prices, the moment they are seated.

One of the inconsistencies of menus is an offering of ham and eggs for 65 cents, while one must pay about $1.25 for a steak that should not cost the railroad more than the ham and eggs. Nearly everyone would prefer the steak.

Following is the cost of an average meal as now shown on many cars:

Meat order (not very much nor very good quality)	$ .80
One vegetable	.30
Bread	.10
Dessert	.35
Pot coffee	.15
Tip	.20
Total	$1.90

A dollar and ninety cents for barely enough to satisfy hunger. Often patrons even forego the dessert in order to pay the tip, as it is felt that both cannot be afforded.

Is it any wonder that dining cars are being operated at a loss? Who will be the first to leave the beaten path and offer passengers food worthy of the name, which they have at home, and upon which at least 50 per cent profit can be made?

H. W. F.

L. F. THOMPSON, of Parkersburg, W. Va., is now 99 years old and the Baltimore & Ohio calls attention to the fact that he is "the oldest employee of the oldest railroad" in the United States. He has been retired on pension for the last 22 years. Mr. Thompson was born in 1823, and until 1857, he was a school teacher and tutor in college. Because of failing health, he then went to work as a brakeman and remained in the railroad service the rest of his active life.

Gondola Cars with Slight Modifications Are Well Adapted for Holding Containers

Recent Developments in Use of Container Cars*

Saving in Manual Handling by Container System—Application to Transportation of Milk in Bulk

By F. S. Gallagher
Engineer of Rolling Stock, New York Central

THE CONTAINER SYSTEM of handling L. C. L. freight is too young to enable any definite or concrete figures in connection with costs to be given, but I will endeavor to draw a word picture that will show the economy and safety effected through the handling of less than car load freight by the container system.

Loading a 600 Gal. Milk Tank Container

The L. C. L. method of handling less than car load freight, permitting the unloading of a car in a few minutes, will be very far reaching, taking into consideration the railroad equipment of the country and the inability of the railroads to control this equipment during the peak load of business, when, in some cases, it is known the shippers use the car as a temporary storage place, tying up equipment that is badly needed. This results in a loss to the railroad company for car revenue which it would have had if the car had been unloaded promptly and returned to service, and an expense to the public at large due to the inability of the railroads to handle promptly shipments because of the lack of equipment.

With the use of the L. C. L. containers, this condition should be greatly reduced, if not altogether eliminated, because the containers can be removed from the car, immediately taken to the shipper's warehouse, and while there might some day be a demurrage charge for holding the containers, it would not keep the rolling stock out of service. In other words, the container methods of handling freight permits the quick unloading, and, of course, the quick unloading permits the quick return to service of the car, and during periods when there is a shortage of cars, which is almost chronic, the quick unloading of the freight car is a benefit to all concerned—the railroads, the shipper and the public.

Thirteen Manual Handlings for Each L. C. L. Shipment

Few people realize the number of times that L. C. L. freight must be handled from the shipper to the consignee. Following one package from start to destination, we will find it is manually handled as follows: (First) From the packing room to the warehouse platform; (second) from the warehouse platform to the wagon by hand truck; (third) from the hand truck into the wagon. The wagon then proceeds to the freight house, and the next manual handling (fourth) is from the wagon to the freight house platform; (fifth) from the freight house platform to the hand truck. The

*Address delivered before the Society of Terminal Engineers, New York, October 10, 1922.

individual package must be weighed and proper record made, and then taken into the car (making the sixth movement). The seventh handling would be the stowing into the car. The car is then sealed and moved to destination.

The next handling (eighth) is the unloader lifting the freight to the floor of the car for the hand trucker; (ninth) the hand trucker carries this freight to a designated place in the freight house. When the consignee calls for the goods the hand trucker takes the shipment to the wagon for loading (tenth handling). When the package is delivered by the hand trucker to the wagon loading platform, it is dumped at the tail gate of the wagon (eleventh handling), and must be handled the twelfth time to place it into the wagon. At the consignee's receiving platform the goods must be unloaded from the wagon, making the thirteenth time that this package has been handled.

Assuming that a car load of L. C. L. freight is 20,000 lb., this means that it must be handled manually lifted 13 times, or man power must be provided to lift 260,000 lb. in order to transfer one car load of 20,000 lb. of freight. This does not include the numerous checkings and records that must be made of this freight, which in itself is a big item of expense. By the container system the container is delivered to the shipper, who will have a light overhead crane or some other means of carrying the container into his warehouse, so that one handling of the original package into the container is all that is necessary. The expense of crating is eliminated. Being loaded with one handling of the freight, the container is lifted by hoist from the floor of the shipper's warehouse to the truck and is lifted by hoist from the truck to the car.

At destination, the operation is just the opposite. The container is lifted from the car onto the truck and then from truck to the consignee's platform, where it is unloaded and is ready for return shipment, or the container is ready to be picked up by the truck for the use of some other shipper. While the container is being unloaded the truck is released.

Instead of having to handle this container shipment of L. C. L. freight thirteen times by man power, it is handled twice, saving on the same basis as before; that is, on a car load of L. C. L. freight weighing 20,000 lb., the man power lifting of 220,000 lb. This is an economy that we cannot lose sight of, and while it would be said, of course, that there will be an expense incident to the installation of equipment for handling these containers at the various shippers' and consignees' plants, when this equipment is once in, the expense ceases.

Saving on Loss and Damage

We are all familiar with the enormous amount of money returned to the shippers by the railroads and by the express companies on account of loss and damage to freight. In L. C. L. freight it amounts to more than 8½ per cent of the revenue. The express companies pay claims to the amount of $25,000,000 a year for loss and damage. A great portion of this can be saved by the container system, because there is no chance of damage if the goods are properly packed in the container unless there is a disastrous smash-up, and no chance of loss en route from the shipper's platform to the consignee's platform, because it is impossible.

Containers for Shipping Liquids

There are other commodities handled by the railroads beside L. C. L. freight, express and mail where the container should play a big part; that is, in the handling of liquids, especially milk, fruit juices, edible oils, acids, etc., where the temperature is an important factor. The New York Central now has containers arranged for the transportation of milk in bulk.

The container and tank for milk or other liquids is shown in Fig. 1. A glass lined tank built by the Pfaudler Company of Rochester, N. Y., is used, but is encased in an insulated container. Time saving and labor saving is accomplished in every operation of handling milk or liquid by the use of the container car tank. The liquid being placed in the tanks at the proper temperature and the container being properly insulated, eliminates the use of ice.

These tanks may be made as large as may be transferred over the highways. In actual service all of the containers from the car will be hoisted and placed on a motor truck regularly in about a minute or a minute and a half per container. To transfer the same amount of milk between truck and railway car in the standard ten-gallon cans would require over two hours in manual labor. The cleaning of one of the large containers could be accomplished within five minutes, while it would require fully an hour to clean 60 cans required to carry 600 gallons of milk. Platforms requiring extensive space for handling the ten-gallon milk can will be done away with.

Any milk station shipping 600 gallons or more, or multiples of any designated size of tank, could utilize the container car tank service and lessen the handling at the shipping point and at the receiving point. The limiting feature of a liquid container would simply mean the capacity of

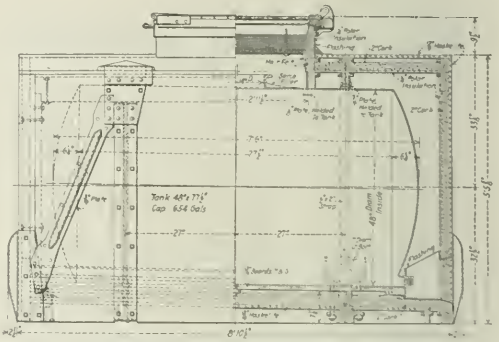

Fig. 1—Container and Tank for Milk

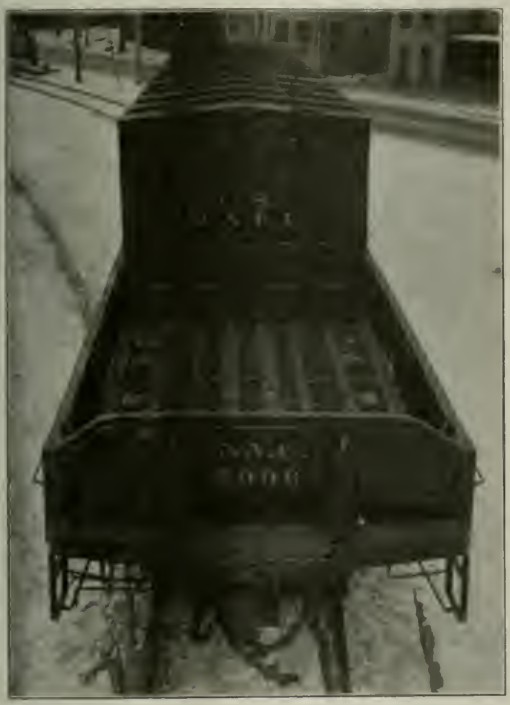
the truck for transferring over the highways. The tank can be made to carry in bulk any amount: 600, 1,000, 1,500 or more gallons of milk.

There is no chance of getting water into the container, because the top of the Pfaudler glass-lined tank is sealed and locked, and in addition a regulation refrigerator car ice hatch plug is used for insulating purposes. This plug is dropped into the opening and then the container cover is fastened down and sealed.

With regard to the actual handling of L. C. L. freight by the container method, a tariff was arranged for between Chicago and Cleveland, and the container system of handling freight put into regular service. The containers were handled as I described, thus making a store door delivery, or in proper words, from store door to store door delivery. This system of handling L. C. L. freight is now in operation between New York and Buffalo and intermediate points, where the "from store door to store door" handling of L. C. L. freight is made possible, and all the equipment that is necessary to put this system in operation is the crane for lifting the container from the car, and at the shipping or consignee's plant the container can be left on the truck and unloaded, but if they have lifting means it would be quicker and cheaper to lift the container from the truck and place it on the shipping or receiving platform, releasing the truck for other work while the container is being loaded or unloaded, as the case may be.

These containers are 7 ft. wide, 9 ft. long and 8 ft. high, and they have a carrying capacity of 7,000 lb. This keeps the gross weight within the carrying capacity of a five-ton truck. They are made of steel throughout, except the floor, which is made of laminated wood. The containers are well braced, and there is very little chance of damage with ordinary handling.

By the container system, when we can arrange for the proper equipment for handling the containers, a car can be



Container Cars for Mail Service Have a Wire-Mesh Floor

unloaded and released for service in a very few minutes; also it will permit the shipper and consignee to transfer or haul their goods from their warehouse or to their warehouse, as the case may be, by auto truck, without waiting at the freight house and without the loss of time necessary to load the truck with individual packages, because it will take only about a minute to load the truck when goods are shipped in an L. C. L. container, thereby saving an hour or two in getting the goods from or to the railroad.

THE LAST WOODEN DINING CAR on the Pennsylvania Railroad has been replaced by a modern steel car. The new cars, when fully equipped, represent an investment of $38,000 each. If all the Pennsylvania dining cars were in operation simultaneously, 4,236 people could be served at one sitting. This company serves 3,575,500 meals annually, requiring a total force of 1,555 employees. The meals are prepared in kitchens having a floor space of 19 ft. 6 in. long and 2 ft. 6 in. wide, where a chef and three assistants prepare and cook 10,000 meals a day. Approximately 2,600,000 eggs are required every year to feed the dining patrons; also 1,500,000 lb. of fresh meat, 1,300,000 lb. of potatoes, 500,000 lb. of sugar, 5,000,000 rolls, 150,000 lb. coffee and 500,000 quarts of milk and cream.

Automatic Highway Crossing Signals Authorized in Place of Gates

AT NEWFIELDS, N. H., on the Boston & Maine, the Public Service Commission of New Hampshire has authorized the railroad company to install, at a crossing 300 ft. south of the station, an "automatic wig-wag flasher and bell warning" signal for the protection of wayfarers at the crossing, in place of gates, which gates, with an attendant 12 hours a day, have been in use 50 years; and this order is issued notwithstanding protests received from the citizens.

When the railroad company announced its intention, the selectmen of the town and, later, 118 citizens, entered a protest, and the commission held a hearing on October 2. Newfields is a town of about 500 inhabitants. It is on the main line between Boston and Portland, where the number of trains is large; but the highway travel is not heavy, consisting mostly of the people who live on the east side of the railroad, on their trips to and from the trading center of the village, which is on the west side.

The commission in its report discusses quite fully the question of reasonable protection, and decides that an audible and visual warning, in service 24 hours a day, properly maintained, is better than the present arrangement, the gates being unattended for 12 hours of the 24. The "automatic flagman" is on duty 24 hours and never forgets. "It has met with universal approval by all regulatory bodies and is fast displacing the gate and human flagman," says the report. The visual apparatus and the audible are each operated by separate batteries and the railroad company reports that, in its experience, there has been no case where both of these warnings at a crossing have failed simultaneously. The

Visual and Audible Signal at Oak Hill, Maine

signal will be inspected daily; and, being near the station, failure to operate will be soon detected. As the view at the crossing is short, the road proposes to install two signals, one on each side of the railroad.

The report of the commissioners, signed by William T. Gunnison, chairman, reminds the public that the duties of the traveler and of the railroad at a crossing are reciprocal; the traveler must exercise due care, the same as must the railroad; and "whichever party fails in the performance of this reciprocal duty is liable for injury done to the innocent party."

The signal to be installed at Newfields is like that shown in the illustration, which is in service on the same railroad at Oak Hill near Portland. As shown, the signal is out of order as indicated by the appearance of the word STOP. Normally, when a train is on the track circuit approaching

the crossing, the stop disk swings back and forth, a bell rings and the six red lights at the top flash, successively, thus making three appeals to the attention of travelers on the highway. When no train is approaching the stop disk is normally hidden behind the case bearing the Look and Listen Sign, the bell is silent and the six red lights are dead.

University of Michigan Establishes Department of Transportation

Announcement was made last week that on October 27, the Board of Regents of the University of Michigan had established in its School of Engineering a new department of transportation intended to cover what may briefly be termed the broader aspects of that subject in its various branches. John S. Worley, a prominent consulting engineer of New York City has been appointed to head the department with the title of Professor of Transportation and Railroad Engineering.

Although the new department is to be identified with the School of Engineering, it is not the university's intention that the courses to be given will emphasize the engineering angle alone. They are intended to be open to students in the academic departments as well as those in the engineering school and through the co-operation of the various engineering departments and others, such, for instance, as that of economics it is expected that the treatment of the subject will be such that the courses will be of value to students interested in public utility and transportation matters generally.

J. S. Worley

The Board of Regents of the University of Michigan have in mind the development of work in transportation beyond anything that has been done in the past through an ordinary professorship in railroad engineering. While it is expected that work will be given in courses in railway engineering and that a number of the best young men may be induced to enter railway service each year, yet it is believed that the university has a much more important office in the creation of a right public sentiment towards the railroads and a more complete recognition on the part of the people of the complete dependence of the United States on the various agencies of transportation. Similarly, the prospective worker in public utility work will be led to see, it is intended, the reciprocal character of this situation, so that he may be able to formulate a proper understanding of the attitude of the public and to realize the utility's obligations in its community.

The relationship that will have to be developed between the railways, the waterways and the growing traffic on the highways is a matter that calls for most intelligent study and for the full co-operation of the railways and the colleges. One of the first elements in the program which is now in more or less tentative stages is, therefore, that of co-ordination. In the School of Engineering, at present, for instance, there are departments dealing with highways, naval architecture or water transport, steam and electric railways and beginnings have been made with a new department dealing with aviation. The department of transportation will have as one of its first aims an analysis and study of the co-ordination of these various modes of transport so that a man specializing in one of these subjects may be able to understand the problems of the others and secure an adequate picture of the existing and possible relationships of the one to the other. Similarly it is intended to cover the subject in such a manner that there may also be encouraged a proper understanding of the various related economic, legal and engineering aspects of the subject so that the student will have a broader understanding of the transportation situation as a whole.

Plans as to the curriculum are as yet not completely formulated. It is the university's idea in the beginning to have as a part of the new work, a course in the history of transportation, as it is believed that this will permit the desired understanding of the relationships of the various modes, as already mentioned, or to put it in other words, it is believed that a course of this kind will enable the student to regard each kind of transportation in its proper economic place. It is later intended to deal with the public utility problem as such, the idea being to give those not necessarily intending to take up that work in later life a better understanding of public utility activities and those actually intending to enter public utility work—such as engineering students trained in the technique of the subject—a better understanding of the broader aspects of the work which they are taking up.

John Stephen Worley, who has been appointed to the new chair of Professor of Transportation and Railroad Engineering is a man of wide experience in railway and public utility work. He was born in Jackson County, Mo., April 19, 1876 and received his education at Odessa (Mo.) College and at the University of Kansas, receiving his M.S. degree from the latter in 1904. In 1900 he entered railway service as an assistant engineer for the Kansas City, Mexico & Orient; was later assistant engineer of construction of the Arkansas & Choctaw, a Frisco subsidiary; from 1901 to 1905, assistant engineer of construction and assistant chief engineer of the St. Louis & North Arkansas and in 1905, engineer in charge of construction of the Toledo, Urban & Interurban. From 1904 to 1908 he was associated with Riggs & Sherman, consulting engineers at Toledo, Ohio, in the capacity of principal assistant engineer of design and construction. In 1908, with H. E. Riggs and M. W. Thompson, he participated in the Central of Georgia income bond case having charge of engineering work which included examination of the accounts and certain valuations. From 1909 to 1914 he was connected with the firm of Worley & Black, consulting engineers at Kansas City, Mo. and engaged in the design and construction of waterworks and water purifications, light and power plants and sewerage and sewerage purification plants in a considerable number of cities in Kansas. At this same time he was also retained in consulting work on various other public utility work such as electric railway construction, preparation of reports on steam railroad properties, etc. On May 1, 1913, he was named a member of the engineering board of the Division of Valuation of the Interstate Commerce Commission and was in direct charge of the Western district. From January 1, 1920, to July, 1921, he was retained as consulting engineer of the Bureau of Valuation. Since January, 1920, Mr. Worley has been the junior partner of the firm of Thompson & Worley, financial accountants and engineers with headquarters in New York. From June, 1921, to November, 1921, he was a director, comptroller and special representative of the creditors of the Habirshaw Electric Cable Company, Inc., New York, and since November, 1921, he has been receiver of the properties of the company.

Labor Board Again Rejects Living Wage Theory

Shopmen's Strike Called "Egregious Blunder" in Formal Decision in M. of W. Wage Dispute

THE THEORY of the "living wage" as advanced by representatives of railroad employees before the Railroad Labor Board "if carried to its legitimate conclusion would wreck every railroad in the United States and, if extended to other industries, would carry them into communistic ruin." This is the manner in which the majority of the members of the Labor Board, including all of the public representatives, present more or less of a final answer to this moot question. The quotation is from a supporting opinion attached to the board's formal decision on the plea of maintenance of way employees for a wage increase. The actual decision of the board in this case was quoted in the *Railway Age* of October 21, page 741. The complete ruling of the board was subsequently held up in order to include a dissenting opinion filed by A. O. Wharton, a member of the labor group on the board; a short statement by W. L. McMenimen, another member of the labor group, and a supporting opinion which, in addition to replying to Mr. Wharton's argument, contains what may be considered more or less of a final word on the part of the majority on the principle of the "living wage" as advanced by the labor organization economists.

The plea of the maintenance of way employees for an increase in wages was based upon (1) a reconsideration of the evidence presented in the hearings which resulted in the wage reduction order for these employees last July and (2) the contention that changes in industrial conditions since March, when this evidence was presented to the board, justify an increase. The board denies in the formal decision the first contention of the employees, "a majority of the board being of the opinion that the previous decision was just and reasonable." Referring to the second contention put forward by the men, the board recognizes a sharp upturn of industrial wages beginning in April of this year and affecting particularly common labor. The board cited that, whereas during the period from February 15 to March 15 there were no increases in other industries and 35 cases of wage reductions reported by the National Industrial Conference Board, during the period from August 15 to September 15 there were 119 increases and only four wage cuts reported.

Referring to the minimum wage of 25 cents an hour, which has been used extensively by labor leaders in the propaganda, the board said:

"The minimum of 25 cents an hour will prevail in very restricted territory and applies comparatively to a very small number of men. As a matter of fact, this 25 cent minimum is a higher wage than the 37 cent mimimum when considered in relation to the living conditions of the respective territories."

In support of this contention, the board cited the fact that whereas the New York, New Haven & Hartford is paying 40 cents an hour to trackmen, several of the larger southern roads are *by agreement* with their men paying between 17½ and 22 cents an hour at the present time.

"Living Wage" Is Primary Consideration; Cost of Living and Competitive Wages Secondary

Mr. Wharton in his dissenting opinion reiterates the argument he made on this same question in the board's previous decision reducing the rates of pay of maintenance of way employees. His arguments at that time were abstracted in the *Railway Age* of June 3, page 1280.

"The specific and fundamental mandate of the law is that wages shall be just and reasonable," Mr. Wharton says in addition. "The relation of rates of pay to those established in private industry, or the relation of rates of pay to the cost of living, is a *secondary* consideration which does not come into play until the *primary* requirement of a 'just and reasonable' or an adequate or living wage has been satisfied."

From this premise Mr. Wharton argues that a "living wage" must be fixed for those at the bottom of the wage structure and "just and reasonable differentials above this basic wage be established for the other classes of railway employees in accordance with the seven relevant circumstances mentioned in section 307 of the Transportation Act."

In support of his contention that the "living wage" is legally sound, Mr. Wharton quotes at length from statements by Senator Albert B. Cummins and from the rulings of several arbitration bodies, including the Kansas Court of Industrial Relations and the National War Labor Board.

Mr. Wharton Again Defends Budgetary Method of Determining "Living Wage"

The use of a family budget is essential to any attempt at ascertaining practically what a "living wage" should be, Mr. Wharton contends, and follows with a lengthy argument, the gist of which is contained in his statement that "a tribunal such as the Railroad Labor Board, in attempting to give practical application to the 'living wage' principle, cannot rely on what is, but must find out what should be."

In this connection Mr. Wharton also analyzes at length the objections which have been raised to the budgetary method of determining what a "living wage" consists of, his contention being that none of the objects raised are insurmountable and "all can be overcome by the exercise of sound judgment and discretion by the board." That the application of the living wage principle by the budgetary method would be financially impossible, or would involve such a financial outlay as would constitute a grievous burden to the shipper and the consumer, is denied by Mr. Wharton on the grounds that "similar arguments and prophecies have been developed in the past against the establishment of the eight-hour day and other measures of industrial equity or amelioration" and that the "dire results which have been predicted have never materialized."

Mr. McMenimen also appended a short statement to the effect that, although he does not feel that the increases awarded in this decision are sufficient, he voted for the proposition "when it appeared that the long delay in reaching a decision was working to the detriment of the men affected." The board's delay in arriving at a decision had already meant a loss to the employees involved of about $1,000,000 in earnings, he says, and justifies his vote on the grounds of expediency.

Labor Board Has Already Granted Railway Employees a "Living Wage"

The supporting opinion attached by the majority of the board says in part:

The fundamental difference between this decision and the dissenting opinion is that the former is based upon the Transportation Act, and the latter upon a fantastic theory, the very essence of which its own proponents expressly characterized in the hearing before the board as a "guess and a makeshift." The theory of the dissenting opinion, if carried to its legitimate conclusion, would

wreck every railroad in the United States and, if extended to other industries, would carry them into communistic ruin.

The contention of the expert economists for the employees was that the board should fix for common labor "the living wage." This is likewise the basis of the dissenting opinion. If the contentions were that the board should establish "a living wage," the majority would readily accede to the proposition, and, as a matter of fact, the board in this instance, as in all others, has granted a living wage. But the abstract, elusive thing called "the living wage," based upon a makeshift and a guess, can not receive the sanction of the board, because it would be utterly impractical and would not be "just and reasonable," as the law commands.

The living wage is defined by its proponents before this board as follows: A wage which will support a family of five in health and reasonable comfort, such family being assumed to consist of a husband and wife and three dependent children under 16 years of age.

This constitutes a bit of mellifluous phraseology, well calculated to deceive the unthinking. It has frequently been demonstrated that a melodious slogan contains more possibilities of danger and destruction than a dynamite bomb.

To ascertain what is reasonable comfort, it is proposed that experts shall prescribe a standard of living for a family of five, setting out in minute detail what the experts think such a family should have in food, clothing, furniture, housing and all the other necessaries of life. The fallacy of this proposal is inherent and fundamental. That it would be wise and practical to undertake to establish an arbitrary standard of living for several millions of people is not apparent. That the desires and requirements of all men are equal and alike is not correct, and that any committee of experts could set up an average living standard upon which a wage scale could be practically based has not been demonstrated anywhere. If theorists should evolve such a standard of living, it would not be possible to obtain any general conformance to it by those for whom it was designed. Standards of living have never been theorized into men. A man cannot be picked up by the scruff of the neck and hoisted into a new standard of living. Such a change in the individual man is a matter of growth and development. When brought about by natural processes, it is socially and economically beneficial, but, if attempted by legislation, it is a wasteful absurdity. To provide a somewhat expensive standard of living for a man who by habits, training and ambition is not prepared for it, wastes money and confers no real benefit on the individual.

It may well be observed that this theory of standardization necessarily fails to take into account many of the economies that are practiced by thrifty peole who desire to get ahead in the game of life.

That standards of living are gradually improving in this country is undoubtedly true, and this is as it should be. There is no member of the board who does not profoundly desire improved living conditions for common labor, but it is our belief that this movement must be continued along the lines indicated by human experience and that it cannot be consummated in the twinkling of an eye by artificial expedients. As a matter of fact, the expert representative of the employees in this case, admitted that the immediate establishment of "the living wage" would, to adopt his language, "throw a monkey wrench into the industrial machinery." He therefore suggested that the board only make a start in that direction at this time. Such a proposition is entirely illogical. If the living wage is the just and reasonable wage authorized by the statute, it is the duty of the board to establish it now. If it is not the just and reasonable wage commanded by the law, then it is not the duty of the board to adopt it now or hereafter, unless the law be changed.

If it would now be equivalent to a monkey wrench thrown into the machinery, as its advocate says, it might amount to the same thing later on, and the board made no mistake in declining to commit itself to this theory.

The adoption of the family of five as the typical family is "arbitrary and questionable," the opinion continues. The facts that the typical family has, according to the 1920 census, 4.4 persons, that there is an average of 1.4 dependent children to a family and not five, and that for each family there are 1.36 male workers instead of one, are cited by the majority.

The opinion further shows the effect of the application of the "living wage" in the railroad industry by pointing out that the establishment of a 72 cent minimum rate with the existing differentials would add $3,112,952,387 to the annual payroll and would result in an annual deficit of $2,241,639,518. Even if the 48 cent minimum rate were to be applied, as the representatives of the employees requested, the result would be an annual deficit of $378,078,125, the majority show, adding:

In either instance, there would not be a cent of returns for stockholders. Of course, for those who desire government ownership this would be a quick method of getting it, for it is a sure thing that the public would not stand for the imposition of higher rates to pay such a deficit.

It must be remembered, in the last analysis of the matter, that the public would have to pay this wage bill, and when we say the public, everybody, rich and poor, is included. A vast percentage of the burden would be passed on to laboring men and women in other lines of industry in the form of increased living expenses. From the effort to meet such increased expenses there would necessarily result a wide extension of the struggle to raise wages in all other lines of industry, and the disturbance and disorganization of business in general.

It is our belief that the people of this country are perfectly willing that railway labor, with its hazard, skill and responsibility, should be well compensated, even to the point of liberality. In view of this friendly public sentiment, it is not wise for labor organizations to seek to impose upon the farmers and producers of the country a crushing burden at a time when the losses of readjustment are so keenly remembered.

The citation by Mr. Wharton of an editorial written by Wm. R. Hearst and containing the statement that "the unjustifiable lowering of the shopmen's wages caused the strike" brings from the majority on the board the following interesting comment on the strike and its justifiableness:

In the judgment of a majority of the board, and, we believe, of a great majority of the people, the shopmen's strike was an egregious blunder without any real justification, and this is said with the kindliest feeling for the employees who have suffered most from its effects. It has wrought harm to all and good to none. It has burdened the railways with an unjust expense, has inflicted great losses upon the public, especially the food producers, and has resulted in approximately $177,535,524 loss to the strikers. For all this, the men on strike have won nothing. They have gained no concession as to any matter upon which they struck. For months the strike has been merely a struggle upon the part of the men to regain their positions.

In vivid contrast stands the course of the maintenance of way employees, whose officials wisely prevented a strike. Since July 1 this class of employees has received in wages approximately $147,656,866, which would have been lost on strike, and now, by orderly and legal processes, they are receiving under the present decision an increase in wages approximating $20,000,000 per year.

Perhaps there is no better time and place to emphasize the belief of a majority of the board that railway strikes are utterly useless and wasteful, and that the employees will always gain better results at the hands of any tribunal fairly constituted and representative of the people than they will by making war on the carriers and the public.

The most disturbing influence prevalent in railway operation today is the continuous preachment that the laboring man can not trust the courts and tribunals of his country and must therefore resort to force for the attainment of justice.

Nothing here said should be construed as an effort to discourage the legitimate activities of organized labor. It serves an essential purpose in the body politic. The conduct of the maintenance of way organization in connection with this wage controversy exemplifies the exalted service that may be rendered to labor and to our Republic by statesmanlike leadership of the railway employees.

The Careful Crossing Campaign, so far as can be judged by the experiences of the four months on the Baltimore & Ohio, was a gratifying success and a statement issued by the road says that if the Baltimore & Ohio's average of reduction of casualties is maintained on all the railroads, the expense of the drive will have been well spent. Actual collisions between trains and automobiles were reduced 13 per cent, as compared with the same four months last year. There was a reduction of 17 per cent in all kinds of accidents at crossings, including those to pedestrians, automobiles, other vehicles, etc. The reduction in persons killed in crossing accidents of all kinds amounted to 41 per cent; 37 fatalities last year, 22 this year. The reduction in injuries amounted to 9 per cent. There were 37 accidents due to the absolute disregard of gates or the fact that a train already was on the crossing. There seems to be little chance at all of saving drivers of this kind.

The Use of Mechanical Devices in the Treasury Department*

By F. L. Paetzold
Secretary and Treasurer, Great Northern.

THIS paper will outline some of the mechanical devices and methods used in the secretary and treasury department of the Great Northern.

Record of Stockholders and Payment of Dividends.—The original stockholders' record, transfers of stock and the payment of dividends are handled from our New York office, but the Great Northern, being a Minnesota corporation, is required under the Minnesota law to keep a record of its stockholders in Minnesota. The New York office sends us at St. Paul at the close of each day transfer sheets showing all transfers of stock which are posted and the stockholders' record is thus kept up to date.

We have about 45,000 stockholders and until recently the St. Paul record of stockholders was kept in approximately 45 large, heavy, clumsy, loose-leaf books, which were moved about on a truck. It took two strong men to wheel the truck into the vault at night, and the books were so large and heavy that it was difficult for the clerks to handle them when posting. The work was becoming so heavy that an additional clerk would have been necessary under the old system, but by discarding the loose-leaf books and installing a Library Bureau card system, using cards 8 in. by 5 in., housed in two small, steel trucks, each made up of a truck base, with three five-tray sections, a top and a truck handle, the need for an additional clerk was eliminated. During the day one truck is kept on each side of a flat top desk so that the operator sitting at a desk has within reach any and all of the 50,000 cards. At night these two small trucks can easily be rolled into the vault. A great saving in time has been made by the new card system as the filing index is exceedingly good.

We use an addressograph machine in connection with the stockholders' record. A stencil is cut of each new stockholder's name and address, and the stencils kept up to date as to changes of address so that when dividend payments are made it is an easy matter to run off a set of envelopes or dividend checks if the window envelope is used. The addressograph is also used in connection with sending out proxies for the annual meeting of stockholders. The name of each stockholder is printed on the proxy so when it is returned signed it is easy to sort and check. Those who have had experience with a large number of stockholders' proxies will appreciate how extremely difficult it is properly to decipher the names from the signatures.

Signograph Machines.—We have two ten-pen signograph machines manufactured by the Signograph Company, New York, one machine at New York, which is used in connection with dividend checks, and one at St. Paul, which is used in signing pay-checks. This permits the signing of 10 checks at a time, two sheets of checks, five checks to the sheet.

Electric Cancelling Machine.—An electric cancelling machine manufactured by the American Perforator Company, Chicago, is installed in the treasurer's office, which is used in cancelling all paid drafts, checks, agents' and conductors' remittance slips, etc., which perforates the date the item passed through the office. The perforation serves two purposes—it cancels the item and shows on its face the date the item was recorded in the treasurer's office.

Perforating Machine Used on Postage Stamps.—All postage stamps for the system are handled by the treasurer on requisitions and all stamps are perforated with the initials "G. N." before being sent out. The machine used is manufactured by the B. F. Cummins Company, Chicago.

Check Writers and Protecting Machines.—In the paymaster's office two electric F. & E. check writing machines are used in the preparation of pay-checks. With the use of these machines the amount of the check is written in and perforated for protection by one operation.

Hand operated check writing machines manufactured by the Todd Protectograph Company of Rochester, N. Y., are used in the treasurer's office for ordinary checks, writing in the amounts and protecting them with one operation.

Adding Machines.—The adding machine is so necessary to the work of the treasurer that it hardly needs mention for no treasurer today could get along without it. All our items, such as drafts, pay-checks, time checks, agents' and conductors' remittance slips, etc., after being proven are listed on statements in duplicate, the original going to the comptroller with the daily cash statement, the duplicate being retained. This saves a great deal of bookkeeping for the cash book merely shows the total paid or received, the details being found on the duplicate statement prepared on the adding machine which is filed in a separate binder. Burroughs machines are used exclusively.

Loose-Leaf Cash Book.—It might be of interest to call attention to the form of loose-leaf cash book used. We have one book for the disbursements and one book for the receipts so that when the work is heavy, one bookkeeper can handle the receipts and the other the payments. As a matter of policy we have banking arrangements in all large cities on the system, and on account of the number of banks, the balancing of the daily work was difficult until our present system was worked out. In our loose-leaf cash receipt form and cash payment form after allowing two columns for the explanation of the item, we have a column for each bank, the name of the bank being placed at the top of the column.

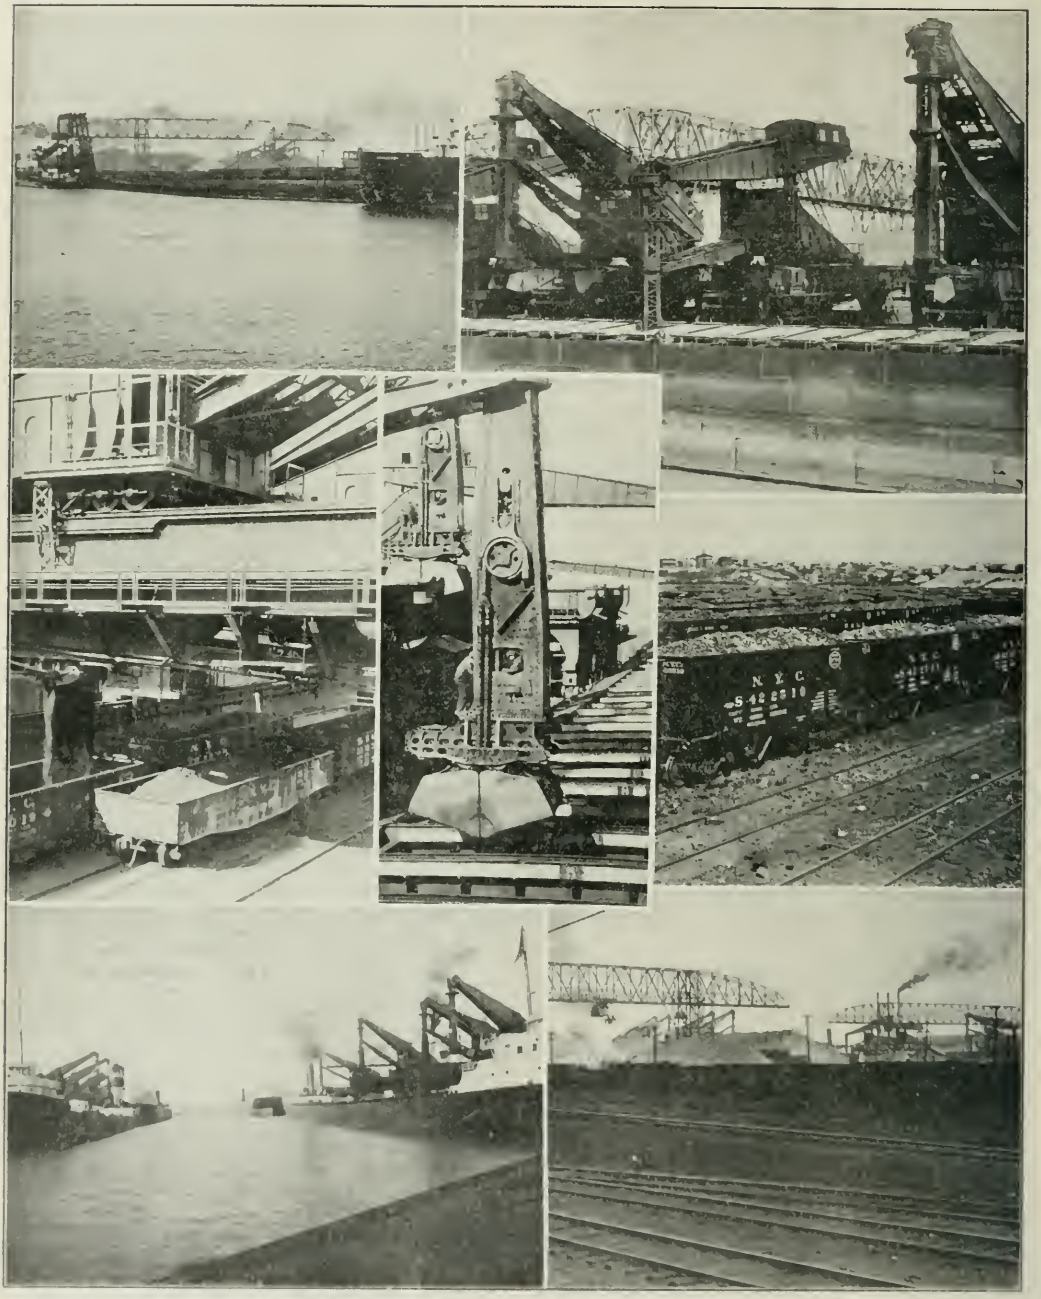
The items credited or charged against each bank each day are entered in the column for the proper bank. At the end of the day after the receipts and disbursements of each bank have been totaled, the total disbursements for each bank are transferred and placed under the total receipts for each bank and the differences brought down to show the balance in each bank at the close of the day. By this method, if the books are not in balance we can quickly locate in which bank the discrepancy is to be found.

The banks report to us daily on a statement which we furnish. When these statements are received each day by express, one clerk proves and checks the items sent in for credit or debit and then distributes the agents' remittance slips, pay-checks, vouchers, drafts, etc., to the various clerks handling those items, showing total and name of bank. He then notes on the face of the statement the net amount to be added or deducted from the bank for that day, after which an entry is made from the cash statement into a loose-leaf running bank balance book which we keep.

In order to show at a glance the total cash on hand and the balance in each individual bank the balance is transferred from the loose-leaf running bank balance book to a daily cash book which has the name of the bank in a column at the left and the balance in a column for each day of the month in succeeding columns. If after balancing the day's work there is any discrepancy, the balances shown at the end of the day on the loose-leaf cash book are checked against the balances shown in the daily bank balance book to ascertain in which bank the difference occurred. Every treasurer realizes the importance of balancing his accounts daily in the shortest possible time in order to settle with the bank and furnish a daily cash statement to the comptroller, and while our method may not be the most practical on other roads, we have found that by this method errors can be quickly detected and the bookkeeping handled most efficiently.

Recording Minutes.—We use an Elliott Fisher machine for writing minutes of meetings into permanent bound minute books, which makes a neat, permanent record.

*A paper read at the Railway Treasury Officers meeting held at Asheville, N. C., October 19 and 20.



A Variety of Views of the Coal and Ore Handling Equipment at the Ashtabula Docks of the New York Central Lines, Where Lake Coal Is Being Transshipped at a Record Rate for That Road. For a Period of 32 Days Coal Has Been Dumped at the Average Rate of a Car Every Three Minutes

A 90-Car Coal Train Headed for Ashtabula

New York Central Handles Coal at Record Rate

End of Five Months of Mining Inactivity Results in Heavy Tonnage Movement at Ashtabula, Ohio

As a result of the coal strike and the mining inactivity, which lasted for about five months, many of the railroads were faced with the problem of getting to destinations in three and two-thirds months "lake" coal in a quantity which they would ordinarily have nearly nine months to handle. This has brought about a very heavy coal movement in the neighborhood of the lake ports, necessitating the use of every facility. It is, therefore, interesting and timely to see what is being accomplished by the New York Central at Ashtabula where new records for this road have been made in the transshipment of lake coal.

Central Handles About 16 Per Cent of Northwest Coal Shipments

Of the 25,000,000 tons of bituminous coal sent annually to the northwest, approximately 4,000,000 tons, or 16 per cent, is hauled to the lake by and transferred to lake steamers at the docks of the New York Central Lines at Ashtabula Harbor and Toledo, Ohio, the facilities at the latter point being on the Toledo & Ohio Central. Between September 10, when coal first began to reach Ashtabula after the resumption of mining, and October 18 this year, that port saw the largest bulk of coal traffic passing through it which the records have ever shown for such a period. During that time 765,405 tons, all bituminous, in 14,559 cars were transshipped. In the 32 working days between the dates mentioned a daily average of 456 cars of coal loaded into vessels was attained. This means that 19 cars were unloaded per hour, or an average of one about every three minutes for a 24-hour day. The actual operation, however, of dumping a car consumes about a minute.

Tonnage for the Current Year Far in Excess of Previous Years

The work of the harbor docks in handling this tonnage since resumption of mining is also brought to mind more clearly by a comparison of business handled in similar periods of previous years. The figure of 765,405 tons for 1922 is many times higher than that of 1921, a slack year, and 67 per cent greater than that of 1920, when 457,338 tons of coal were handled. In 1919 the tonnage for the similar 32 working-day period was 305,126 tons in 6,309 cars, and in 1918, 478,185 tons in 7,913 cars.

The heaviest weekly period of coal-car loadings to vessels occurred during the week ended September 24, when 4,176 cars, or 8,800 tons, were dumped into lake boats at an average of 596 carloads a day. This was during ideal weather, with plenty of boats on hand. This volume was 14.3 per cent, or nearly one-seventh, of the entire shipments of coal dumped into vessels at Lake Erie ports during that week, which approximated 1,453,684 tons. This figure does not include coal dumped by the Toledo & Ohio Central, which, if added in, would bring the New York Central Lines quota on the lake transfer shipments to approximately 25 per cent. The maximum single day's loading at Ashtabula occurred on September 19, when 740 cars were dumped, a total of 37,000 tons.

Record in Loading Established for the Central

Coal handled at Ashtabula, however, is only approximately 10 per cent of the total tonnage handled by the New York Central Lines. A new record in coal loading on the Central's lines was established on October 20, when there was loaded 3,978 cars. The best previous record was made on September 25, when a total of 3,670 cars were loaded. Annually at points on the New York Central system between 500,000 and 800,000 cars are loaded with bituminous coal. Averaging 50 tons to a car, this would show an originating total tonnage of from 25,000,000 to 40,000,000 tons, or about 10 per cent of the nation's annual bituminous coal supply. These figures do not include coal traffic received from connecting carriers, which would bring the total figures much higher. During the same 32 working days (September 10 to October 18) for which figures for Ashtabula dock transfers have been given, 87,686 cars of bituminous coal were loaded on all roads of the New York Central system. This was a tonnage of 4,384,300 tons, an increase of 36.7 per cent over the same period of 1921, the figure for which was 64,122 cars, or 3,206,100 tons. At the Toledo docks of the Toledo & Ohio Central during these 32 days 7,763 carloads, or 388,150 tons, were transferred to lake vessels. New York Central officers on the Franklin division estimate that in the limited operat-

ing period of this year a tonnage far greater than that of the entire season of 1921 will be handled. All indications point to a complete neutralization of the shortage in the northwest by the time navigation closes on the lakes.

Coal and Ore Handling Equipment

Ashtabula harbor is situated north of the main line of the New York Central at Ashtabula and at the northerly end of the Franklin division, the branches of which extend from there into the Oil City and Clearfield districts of Pennsylvania and down to Youngstown, where connection is made with the Pittsburgh & Lake Erie and through it to other coal-carrying roads.

The yard, which is devoted exclusively to coal and ore handling, contains from 60 to 70 miles of track. It is divided into three large sections, *i. e.*, the bridge yard, the East system and the West system. The bridge yard forms a storage space for loaded coal cars which are fed to the car dumpers at the docks. The East system is a switch yard, through which the loaded coal cars are sent to the dumpers and transfer made of the empty cars to the ore docks and to other points. The West system is used for the receipt of empties from the East system and for the loading of ore exclusively. A large part of the yard work in connection with coal transferring consists of grouping the coal cars into the pools. The coal-loading equipment consists of two car dumpers, each of which may care for a vessel at a time.

Ore is unloaded from vessels at what are known as Docks No. 1 and No. 2. These docks can accommodate four of the largest lake vessels at a time and the unloading machinery handles two vessels at the same time. Ore is handled in much larger quantities than coal at Ashtabula, the unloading equipment and storage space being one of the largest in the country. The New York Central handles approximately 25 per cent of all the ore transferred from vessels to railroad at lake ports for rail haul to the furnaces.

Ore Traffic Shows Substantial Increase Over 1921

Traffic in ore declined in the year 1921, due to the business depression which first was felt in the fall of 1920, but the Central has, however, carried this year up to September 30 almost twice as much ore from Ashtabula Harbor docks to the furnaces as was carried last year. This year to September 30, 61,434 carloads, totalling 3,512,345 tons, have been handled, whereas the total figure for 1921 was only 38,693 carloads, or 1,997,514 tons. The record-breaking ore tonnage for the New York Central through the Ashtabula yards occurred during 1918, when 7,945,555 tons, or 158,898 carloads, were sent south from the port. The 1918 tonnage was followed closely by that of 1920, the figures for which show a total ore haul of 143,937 carloads, or 7,473,594 tons.

The most involved part of the task of transferring ore from steamer to cars is the grouping of suitable equipment from which the furnaces may unload. The unloading equipment at the furnaces governs almost entirely the class of equipment which may be loaded at the docks. The ore arriving in steamers is consigned to the furnaces, according to grade then required or to be needed in the near future. There are more than 32 grades of ore received at the docks. On arrival of vessels, yardmasters are given instructions as to the class of equipment wanted for a particular consignment and grade of ore to be loaded. The equipment suitable to the needs of the consignee is then fed into the system for loading.

The ore operation is an all-year around one, inasmuch as a large tonnage of ore is accumulated in the storage space on the docks for the winter supply of the steel furnaces. The storage capacity of the docks is 2,500,000 tons. At the present time there are about 1,500,000 tons on the docks awaiting draft of the furnaces this winter.

Two carloads a minute is the rate at which the ore unloading machinery operates. It consists of two batteries of four each or eight Hulett 15- to 20-ton ore unloaders. Four of these are located on either side of the dock space and are operated independently of one another.

Each battery of unloaders spans four tracks, upon which the cars are spotted for loading.

When furnaces are supplied and all current orders for ore consignments are cared for, the cargoes arriving at Ashtabula are stored. Further handling is carried out by means of two large electric traveling cranes, or ore bridges, one for each dock. Each bridge has a span of 625 ft., is 75 ft. high and handles 15 to 20 tons at a time. The ore bridges can unload 100 cars in ten hours with average capacity of 5,000 tons in ten hours.

Pennsylvania Contemplates Extensive Improvements at Norfolk

The Pennsylvania contemplates the expenditure of approximately $3,000,000 in the development of a rail-water terminal at Little creek, near Norfolk, Va. This information was made public in an address delivered by Elisha Lee, vice-president of the Eastern Region of the Pennsylvania, before a joint meeting of the Chamber of Commerce and the Board of Trade of Norfolk, Va., on October 30.

The Pennsylvania, at the present time, reaches Norfolk by car ferry from Cape Charles, Va., a distance of 36 miles. The development of Little creek, for which the company has already acquired about 1,000 acres of land, will shorten the water haul to 25 miles and will necessitate a new terminal, some new track and the acquisition trackage rights over other lines. Definite arrangements for these trackage rights have not been made as yet, but negotiations are under way and it is thought that they will be carried to a successful conclusion. A new freight warehouse will be built at Norfolk.

Aside from the long water haul, the incentive for the improvement is the congestion of traffic in Elizabeth river, Norfolk, through which all the company's traffic must now pass. In addition, there has been a great increase in traffic between Norfolk and Cape Charles. In 1910 this totaled 125,000 loaded freight cars and 146,000 passengers. During the height of the war activity, freight traffic rose to 190,000 cars and passenger traffic exceeded 500,000. Since that time, there has been some falling off in traffic because of the closing down of many of the war activities in the vicinity of Hampton Roads. Nevertheless, traffic is holding up far above pre-war levels and gives every promise of continuance and a steady growth.

Mr. Lee concluded his address by calling attention to the importance to business men of such improvements as the Pennsylvania is planning for Norfolk and to the fact that these cannot be carried out without money. He urged that business men give their support in helping the roads to maintain their credit in such fashion that extensions and improvements can be made as needed.

Three Hundred Dollars Damages for getting in the way of a moving locomotive, was the verdict won by the Central Railroad of New Jersey at Freehold, N. J., on October 24, in a suit against the Colonial Ice Cream Company of Philadelphia, based on the cost of repairs to one of the railroad's locomotives which, on April 8, last, struck a truck of the ice cream company at Larrabee's Crossing, between Lakeview and Farmingdale. The judgment was recorded by Judge Richard Doherty in the Circuit Court. Two employees of the ice cream company were killed and the truck was virtually demolished, but the evidence showed that the employees were to blame for the collision

Development of Concrete in Railway Construction*

Application of This Material to Other Than Bridges—Discussion of Importance of Waterproofing

By M. Hirschthal
Concrete Engineer, Delaware, Lackawanna & Western

THE DETAILS in connection with the design of reinforced concrete viaducts that are of the utmost importance are those of expansion joints and waterproofing and in connection with the latter, drainage. A concrete viaduct where the waterproofing is defective or where expansion has not been properly provided for, defeats the object of its selection, requiring a considerable expenditure for maintenance

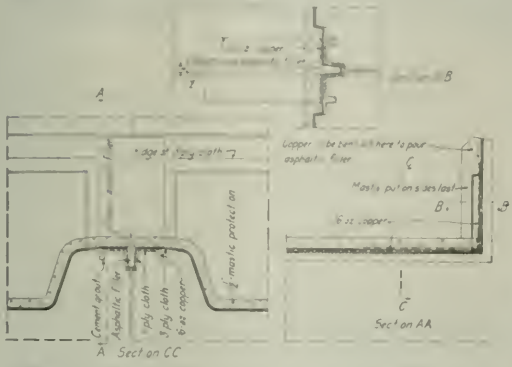


Fig. 33—Waterproofing Details for an Expansion Joint

because of the dangerous conditions resulting from leaks due to failure of either of the above details. It is for these reasons that particular attention was given to the subject of waterproofing and expansion joints and after exhaustive investigation the types described below were selected.

The waterproofing for the Tunkhannock and Martin's Creek viaducts consists of a membrane of 3-ply asphalt

Fig. 34—Pleasing Application of Concrete Construction to the Passenger Station at Far Hills

saturated, cotton fabric laid in asphalt and a protection coat of two ¾ in. thicknesses of asphalt mastic laid completely across the floor system and up the sides of the parapets and expansion joint dykes. To eliminate any possibility of the accumulation of water at any point along the viaduct a system of drainage was devised; cast-iron drain pipes sur-

Fig. 35—Reinforced Concrete in a Large Building, a Coal Breaker

mounted by cast-iron screened drain boxes were placed at the center of each cross wall supporting the floor arches,

Fig. 36—An Admirable Application of Concrete to a Signal Tower at Montclair

*This is the third of three articles, the first of which appeared in the *Railway Age* of October 14, page 705, and the second in the *Railway Age* of October 28, page 791.

except at expansion joints and located at the center between tracks, the bridge floor being pitched toward these drain pipes, forming a hip at the crown of the floor arches.

The expansion joints of the Tunkhannock viaduct are located at approximately the one-quarter points of the main

shop and office and storage building, are entirely of concrete and most of the members of the other buildings are also of concrete.

A splendid example of a concrete station of which there are a number along the line is that at Far Hills, Fig. 34,

THREE DESIGNS OF PLATFORM CANOPIES

Fig. 37—Concrete Canopy with Curved Outline at Watsessing

Fig. 38—Concrete Canopy Conforming to Straight Lines at Bloomfield

Fig. 39—Canopy with Steel Ribs, Giving Much the Same Appearance as Concrete

arch spans and on either side of each pier and consist of a ¼-in. opening starting from the haunch of the floor arches normal to the soffit, running vertically upwards through the center line of the wall with a dyke on each side of the opening extending nine inches or one foot above the floor

and it shows the adaptability of concrete to the architectural treatment required by this type of structure.

A class of buildings offering many different problems in design, are coal breakers, an example of which is shown in Fig. 35. Signal towers, of which Fig. 36 is a typical ex-

Fig. 40—Example of Concrete Construction as Applied to Pier Sheds

to form a dam and the floor adjacent thereto is pitched toward the next walls to shed water. The joints were provided with both sheet copper and saturated cloth as well as mastic protection after the opening had been filled with asphalt compound. The maximum distance between expansion joints is 83 ft. 9 in. Similar provisions have been made for the other viaducts and bridges, both arched and flat. These provisions have proved effective and have dispensed with any maintenance thus far. Fig. 33.

While bridges are the principal and most important structures pertaining to railroad work, there are structures other than bridges and reinforced concrete has been represented in the construction of these as well:

As has already been mentioned, in the erection of the Kingsland and Keyser Valley shops concrete was used for foundations, floors and subways. In the Scranton locomotive shops, however, some of the buildings, notably the pattern

ample, have excited the admiration of many railroad men. An automatic signal sub-station was recently erected of concrete at Harrison, N. J. The building was so designed that

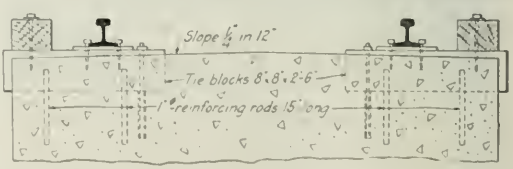

Fig. 41—Track Construction in the Bergen-Hill Tunnel

should it be required to change its location, it can be lifted from its foundations and transported to the new site chosen for it.

While station canopies are in fact facilities in connection with station buildings, they often provide interesting problems which make them independent studies. The Watsessing station is located at the street level while the tracks and

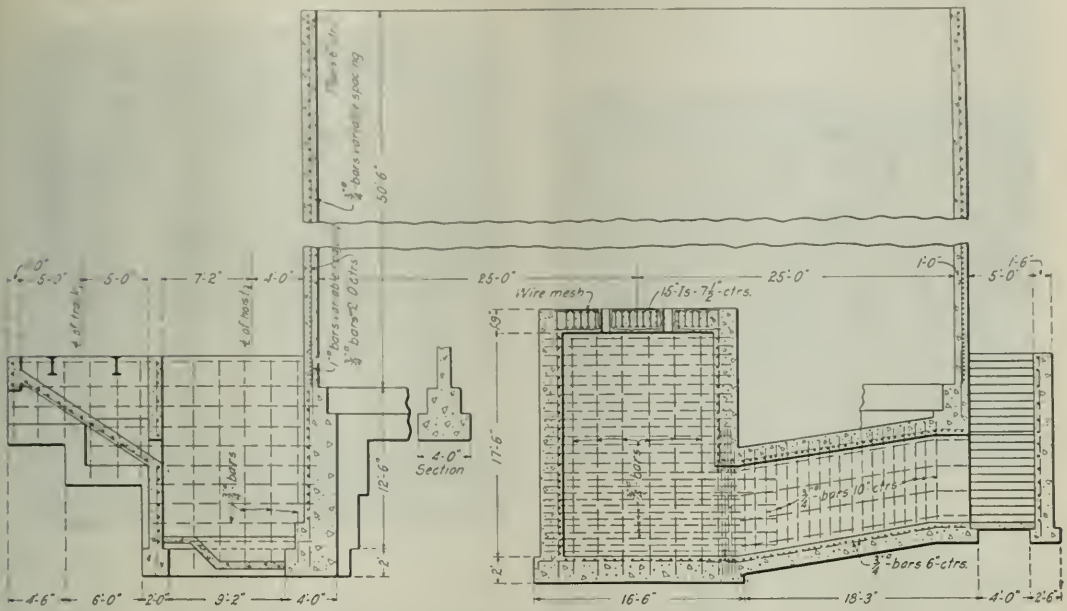

Fig. 42—A Large Concrete Sand Storage Bin

platforms are in a depression. The foundations of the station were formed to an elliptical arch and the underside of the canopy beams conforms to the curve of the intrados of the arch with the results shown in Fig. 37. The Bloomfield station, on the other hand, is on a fill so that the problem is somewhat simplified. The effectiveness of the reinforced con-

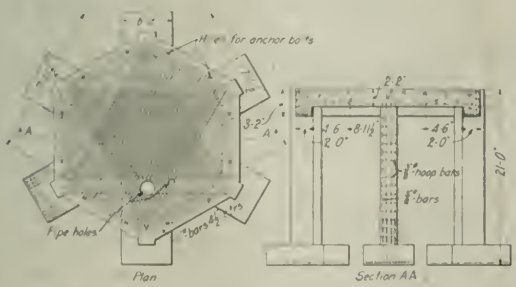

Fig. 43—A Concrete Foundation for a Water Tank

crete canopies is shown by Fig. 38. In the case of the station at Madison, the canopy construction consists of concrete columns and roof slab, while the cantilever beams and purlins are of structural steel, Fig. 39.

To obviate the necessity of frequent repair and renewal incident to timber construction a novel type of construction was resorted to in the design of the Hoboken piers. The piles were cut off at low water and completely decked with timber; a heavy concrete bulkhead wall was constructed, the first of which is a one-story structure, the other two stories in height, Fig. 40.

Concrete has been used for tunnel linings and shafts at various places along the line, notably in both the old and the new Bergen Hill tunnels at Jersey City, N. J. The difficulty in all tunnels is to resist the effects of water on the linings and due to its deleterious effects in the Bergen Hill tunnel, it was decided to substitute vitrified brick for the arches and sidewalls in the latest tunnel work at Factory-

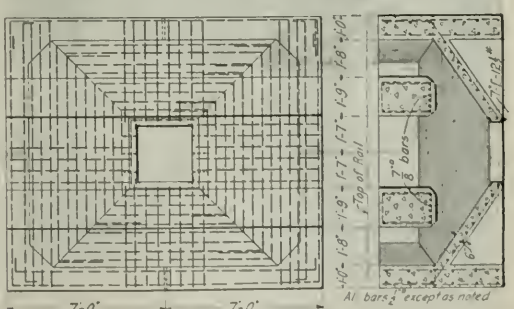

Fig. 44—Example of a Track Hopper for a Coaling Station

ville, Pa., using concrete for the shafts, backing and ditches. In the construction of the Bergen Hill tunnel a concrete roadbed was installed, a feature that has been amply described in detail heretofore in articles and which is shown in Fig. 41.

Among the structures which are classed as miscellaneous

the largest is the sand storage and dryer tank constructed of reinforced concrete at Scranton, Pa., with a capacity of 90 carloads of sand; the details of which are shown in Fig. 42.

Up to recently, water tank foundations, when not of steel or timber were made of solid concrete with a chamber to house the pipes. Figure 43 however, shows one of reinforced concrete at Black Rock, N. Y. to supplant the one of solid concrete heretofore used to support steel tanks. Track hoppers for a coaling station at Buffalo, N. Y., were designed to meet the special case there existing in connection with the coal conveyor, Fig. 44. Cinder pits have been constructed of concrete at various points, but the one for the power house at Hoboken, N. J., presents unusual difficulties because of the conditions surrounding it. The necessity of employing divers in the tidal waters for construction caused modifications in the design to the extent that entirely unusual combinations were required, Fig. 45. Among the minor uses of concrete are in the construction of pipes, piles, box culverts, ducts, manholes, storage battery wells, fence posts, etc.

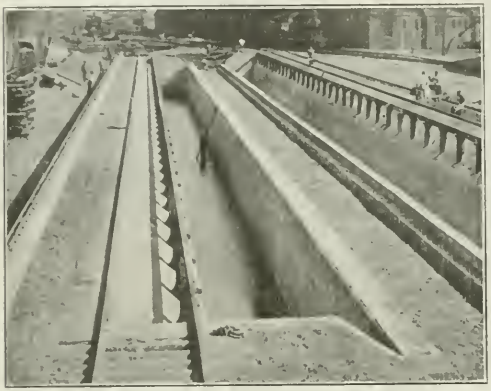

Fig. 45—Reinforced Concrete Cinder Pits at Scranton, Pa.

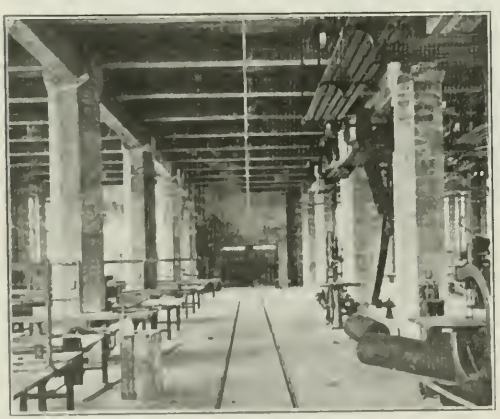

Fig. 46—Reinforced Concrete Building Construction for a Pattern Shop

While it has not been the object of this article to claim that concrete plain or reinforced is a panacea for all structural ills, the writer has attempted to point out the adaptability of this material for a multitude of uses and conditions and its actual adaptation to railroad construction as illustrated by its use on the Lackawanna.

The first chief engineer to countenance the use of concrete for engineering structures on the Delaware, Lackawanna & Western was W. K. McFarlin. Messrs. Lincoln Bush and G. J. Ray who followed him have been instrumental in expanding the uses of concrete to the great development it has now attained. B. H. Davis was the first engineer in charge of concrete design, followed by A. B. Cohen and the writer who is the present incumbent.

Price Fixing and Competitive Bidding on Railroad Securities Opposed

WASHINGTON, D. C.

THE INTERSTATE Commerce Commission was strongly advised at a hearing before Division 4 at Washington on October 26 against embarking upon a plan of fixing the prices at which railroad securities should be sold or requiring competitive bidding in the sale of securities in connection with its orders granting or withholding authorization and approval for the issuance of securities. The hearing was called to give an opportunity for the expression of views on questions which have been considered by Division 4 as to whether and to what extent the commission should determine, limit or restrict the price at which, or the manner in which securities are to be sold; the cost to the carriers of the marketing of securities, and whether it is within the province of the commission to require competitive bidding and whether competitive bidding should be required. Division 4 consists of Commissioners Meyer, Daniels, Eastman and Potter, but Commissioners McChord and Hall also sat with them during the hearing. The commission was told that if the time comes when it considers it necessary to set up its own judgment against that of the railroads and the bankers as to proper prices for railroad securities, it should take the responsibility for the financing of the railroads out of the hands of private management, but that except in cases where there appears a direct conflict with public interest the com-

mission should allow a free hand to those who have the financial responsibility.

Robert S. Lovett, chairman of the Union Pacific, appeared as chairman of a special committee of the railroad executives and expressed the opinion that the commission should not change its present methods of supervision, under which, in giving approval to an issue, it has usually stipulated that the securities should be sold for not less than a given price, but the price has usually been that at which the railroad had stated it expected to be able to sell, if, indeed, it had not made definite arrangements in advance. He said that Kuhn, Loeb & Co. will pay just as much as the securities are worth and just as much as any other banking house could pay for them and that it is of great value for a railroad to have established connections with such an institution. He also referred to the importance of prompt action in placing securities, saying that while the present method of the commission, entailing from four to six weeks before a decision is announced upon a company's application, has not caused a serious delay in the last 18 months, while there was a rising bond market, even that amount of delay might become of more importance should the market condition be reversed so that prices would be liable to fall between the time that applications are filed and authority granted. Judge Lovett said it is not within the power of the commission to require that securities be sold to the highest bidder.

Otto H. Kahn, of Kuhn, Loeb & Co., also expressed opposition to the plan of requiring competitive bidding. He said the services of a banking house are of great value to railroads and that if securities were put up for sale to the highest bidder without the necessary preparatory work, the bankers naturally would pick and choose among issues offered and many railroads would run risks of finding themselves faced with failure to get securities taken. He also described to some extent the competition which exists among banking houses under present conditions.

F. J. Lisman, of F. J. Lisman & Co., said it is frequently easy to say afterward that a certain price was too low, but that some one must have the courage of his conviction to decide what is a fair price at which securities can be marketed. He also pointed out that competition exists even though railroads do not request competitive bids. If the large banking houses were to show an unwillingness to pay fair prices companies would promptly be formed to compete with them and they would lose their hold on the business. A plan of competitive bidding that might work in a rising market, he said, would not be successful in a falling market and in the long run would do much harm to railroad credit by interfering with the free play of human judgment. Bankers are not going to concern themselves with what the price of a security is going to be 60 days hence, because it cannot be determined any more than one can say where the thermometer will be on a given day.

W. A. Colston, vice-president of the New York, Chicago & St. Louis, said he proceeded on the assumption that the commission's power is plenary and exclusive, but that the commission should determine, limit or restrict the price at which, and the manner in which a security shall be sold and the cost to the carrier only when necessary in order to bring the transaction within the public interest as prescribed by the statute. However, it should impose no restriction on the action of the carriers which is not necessary to bring it within the public interest. The government has not undertaken to assume the responsibility for the financial management of the railroads and the authority should go with the responsibility. The commission is not the financial manager of the railroads, he said, just as the Supreme Court has said that the government is not the general manager of the railroads.

Mr. Colston said that in 1920 the commission in effect did limit the prices of railroad securities in connection with the administration of the loan fund. Whereas the carriers had been paying 7½ per cent on equipment trust certificates, the commission made a requirement that in case part of the funds were supplied from the loan fund, the balance should bear no more than seven per cent. It was said that this could not be done, but it was done and was in the public interest, but he said a great southeastern carrier came in and offered to pay over seven per cent for a large issue of securities rather than take a government loan at six per cent, in order to establish its own credit without government aid, and the commission wisely permitted it to do so. The commission should not attempt to issue rigid rules to cover all cases. If it were possible to do so, Congress would have prescribed the rule in the law instead of placing discretion with the commission. Mr. Colston said that there are some cases in which competitive bidding should be required, but it would not be proper for the commission to require competitive bidding if it were also to require that the lowest bid must be accepted because the lowest bid is not always the one most in the public interest.

Dwight W. Morrow, of J. P. Morgan & Co., testified along similar lines. He said that in the eight years of his connection with the company he had never known of any advantage to accrue to a banking house from having a representative on the board of directors of a railroad, from the standpoint of getting business from that railroad. Such representation is rather a responsibility, he said. Commissioner Hall asked Mr. Morrow if there is any reason why a prosperous railroad company should not attempt to sell its own securities through its own offices. Mr. Morrow said he did not see why this could not be brought about, but he pointed out some objections. In many states, he said, the amount of the local investment funds is probably bid for at much higher rates than a railroad could pay as the low rates for money prevail in older regions where there is an accumulating investment fund. He pointed out that the American Telephone & Telegraph Company is selling a large percentage of its stock to its own subscribers and employees all over the United States, but at nine per cent. In reply to a question by Commissioner Potter, he said the Northern Pacific and Great Northern refunding issue of $230,000,000 last year could not possibly have been handled "across the counter"; that the services of a large distributing organization were necessary. Mr. Morrow said it might be desirable for railroads to undertake to sell more of their own securities themselves, but that it is doubtful if any railroad could create an organization to handle its own securities as cheaply as it could be done by an organization whose sole business it is and which handles a large volume of business over which the overhead can be distributed. A. H. Harris, vice-president of the New York Central, said that the New York Central had undertaken a campaign to sell its stock to employees, but that in a year the subscriptions amounted to something less than 5,000 shares. The company thought that it is highly desirable to interest the employees in the ownership of the company, but that such a plan could not be depended upon to furnish capital in any substantial amounts. Mr. Morrow said he had never known bankers to interfere with matters of railroad operation, as such matters were outside their especial sphere, but they frequently give advice regarding financial policies such as matters pertaining to the payment of dividends.

Jackson E. Reynolds, president of the First National Bank of New York, said that it is a matter of indifference to his company whether the commission decides that railroad bonds shall be sold on competitive bids. It would not hurt the bankers, he said. "The only people you would hurt would be the railroads."

John E. Oldham, of Merrill, Oldham & Co., Boston, said that the banker would be taking considerable risk if required to make a bid and wait for some time before knowing whether it is to be acted upon. He said there were no insuperable

obstacles to finding what is a fair price for a security and if the object of competitive bidding is to furnish information, there are better ways of getting at it. Commissioner Potter asked what the commission should do supposing President Rea of the Pennsylvania should sell an issue of bonds at 93 and tell the commission that that was the best he could do, but the commission's Bureau of Finance should report that it thought he ought to have got 93½ or 94. "Shall we kick over the whole transaction?" asked Commissioner Potter.

"I think you had better take Mr. Rea's judgment," replied Mr. Oldham. "When you cannot do that, the government had better take over the railroads."

He said he thought the purpose of Congress was to prevent fraud rather than to substitute the judgment of the commission for that of the railroads and the bankers as to the exact prices at which securities should be marketed. Commissioner Eastman asked what the commission should do in case its own investigation showed that the price for the security mentioned by Mr. Potter should be as high as 102. Mr. Oldham said that in a case of such a wide discrepancy the commission should look into it.

Alfred P. Thom, counsel for the Association of Railway Executives, and Forney Johnston, counsel for the National Association of Owners of Railroad Securities, were given permission to file written memoranda on the subject.

Brief for Association of Railway Executives

Mr. Thom said in part in his brief:

The powers vested in the commission by this Section were conferred for the purpose of enabling the commission to protect the public interests and not for the purpose of making it the guardian of the private interests of the carriers.

At times it may be difficult to determine just where the public interest ends and purely private interest begins; but, when this point is once determined, the difficulty of the problem disappears, it being clear that the power of governmental regulation cannot extend further than the protection of the public interests.

This follows both from the constitutional limitations on the power of government and from the terms of Section 20a of the Transportation Act.

The ownership of property carries with it the right of occupancy and management, and should a statute deprive the owner of the right of management, except as such management may prejudice or affect some right of the public, it would undermine his right of private property and be contrary to the fifth amendment to the Constitution.

Congress had these limitations on its power well in mind when it made Section 20a a part of the Transportation Act, for in that section the power of the commission is to be exercised only if the transaction is "compatible with the public interests," is "necessary or appropriate for or consistent with the proper performance by the carrier of service to the public as a common carrier," "will not impair its ability to perform that service," and "is reasonably necessary or appropriate for such purpose."

No inference can be deduced from these carefully considered provisions of a purpose to go beyond the public interest and invade the field of private management.

If the power to require competitive bidding is conferred by the statute, it would not be wise for the commission to make the requirement. The present method, which is the outgrowth of years of experience, is unquestionably the best and is, in fact, the only practicable method.

There is doubtless a popular misapprehension of what the present method is. It may be popularly supposed that when a railroad deals with its banker in respect to the placing of securities, the banker seeks to drive as hard a bargain as he can and to obtain for himself the maximum possible advantage in the transaction. Nothing can be further from the fact.

The placing of securities through a regular banker is accomplished by one of two methods:

First, by the method of underwriting, in which case the banker undertakes, for a fixed commission or compensation, to ascertain for his railroad client the best terms that can be obtained for the issue and to give the railroad the full benefit of these terms, being interested only in the agreed compensation, and

Second, by the method of purchase. In this case also, where there is a sustained relationship between the railroad and its banker, the banker likewise undertakes to ascertain for the railroad the best terms at which he believes the issue of purchased securities may be placed and makes his price the figure that will give him fair compensation for selling the securities, but, at the same time, will conserve the interests of the railroad company, for which, by reason of his relationship, he feels a moral responsibility, and will likewise be fair to the investing public whose good-will he desires to retain. In this second case also, the fiduciary relationship of the regular banker exists and is enhanced by the moral responsibility he has to the purchasers of previous issues, this responsibility influencing him to regard not merely his own selfish interests in the single transaction but to make terms which will accommodate the present issue to a well conceived financial structure for the railroad.

In both cases, the relationship between the railroad and its regular banker is fiduciary in character and, in a measure, is such as exists between a lawyer and his client, in which the banker becomes a representative of its railroad client's interest and is paid for the service.

The service consists in the study of financial conditions, the forming of an expert judgment as to whether the time is opportune for placing securities, as to what class of securities, and the conditions and terms the market will accept, and a guarantee that the issue will succeed.

To do this successfully, it is necessary in most cases to have a country-wide financial organization, consisting of persons who will help float the issue and a group that will itself take any part of the securities that the investing public fails to absorb.

If an issue is offered which fails, it is a matter of general recognition that the consequences to the credit of the railroads are most disastrous. When the public fails to take an offering, it is an unmistakable announcement that the credit of the railroad is not sufficient to support it. If an issue, necessary for the financial purposes of a strong railroad is offered by it over its own counter or through any other agency, and only a part of it is taken, the part which remains untaken is discredited along with that which has been taken which, owing to the failure of the part, will then be in the hands of discontented holders.

A fundamental principle of sound financing for a railroad is that it shall not make an issue of securities until it is assured that the issue will succeed. No method of giving this assurance has yet been devised except the existing method of having the whole issue underwritten or the whole issue purchased by responsible bankers.

The question is what in any case constitutes fair compensation for the banker's service. There can be no doubt of its value nor that it is essential to successful financing. There may be cases where an issue may be disposed of without it, but these cases are most exceptional and furnish no justification for the abandonment of the orderly and scientific method. The amount of this compensation is, under the existing practice of the commission, subject to its supervision.

Competent bankers know whether the time is ripe for an offering of securities. Railroads and their counsel have no such knowledge, and if, without the aid and enlightenment of competent financial advice, an issue is offered and fails, the effect on the credit of the railroad would, as heretofore stated, be most disastrous. Competent bankers also know the character of securities which the public is ready to take.

Railroads and their counsel do not know, and yet it is of the utmost importance to be competently advised as to what class of security may be most advantageously issued.

They must have some one with scientific knowledge of finance and of markets to advise them and some one pledged to give them advice from the standpoint of the railroads' interest and not from the standpoint of trying to impose on the railroads the harshest terms that independent self-interest may make possible.

Moreover, the financial structure of most of the roads is very intricate and the terms of their mortgages are complex and involved. Whenever a new issue is proposed, there is a substantial value in having a financial adviser fully conversant with the financial structure and history of the company and able to suggest terms and conditions for new securities in harmony with a financial policy deliberately adopted and properly adjusted to the consistent development of the property, and not to have new, variant and perhaps inconsistent conditions imposed on each new issue as compared with those imposed by other bankers and their counsel in existing issues.

This continuity of financial policy cannot be attained without the aid of bankers fully advised in respect to it and actuated by a feeling of responsibility for and committed to its success. The advantage of consistent financial advice and guidance in building up and developing a sound financial structure is equally as great, if not greater, than consistent legal advice given by a single head conversant with the history, purposes and policies of the management, the needs and possibilities of the property, its intricate and interwoven corporate relationships, its charter obligations and the responsibilities it is under to persons, municipalities, state and other governmental authorities; and yet no one engaged in any large industrial enterprise would advocate doing its law business by competitive bidding or calling in a new lawyer every time legal

advice and guidance is needed. The asset of intelligent, informed, consistent and interested—interested from the standpoint of the company in the establishment and development of a sound financial policy—is too great to the public to be abandoned.

It is inseparable from the relationship existing under the present system that the company's bankers feel a special responsibility and a moral obligation to help in times of financial stress and difficulty, which is most valuable and at times essential to the company and which has frequently averted from the public, as well as from the company, financial disaster.

If a system of competitive bidding is resorted to, the rules of the commission would naturally provide either that the best bid should be accepted or, if none of the bids were satisfactory, that all should be rejected and another public offering made.

If the first alternative be adopted, the commission would find itself without power to pass finally on the price and thus would be sacrificing that very important power over the result in the effort to control the method.

If the second alternative is resorted to and all bids rejected, then there would be a manifest difficulty in persuading bidders to make a second bid.

If the system is not competitive in its strictest sense, but consists only of reporting to the commission the outcome of negotiations with more than one or with several responsible bankers, the result would likewise be unsatisfactory and hurtful to the financial interests of the railroads; for the reason that deliberate study and valuable advice cannot be obtained from bankers where the results of it may be enjoyed by others, for if the business is offered to several, there would be no assurance that the banker who studies the problem, devises the plan and assists in perfecting it, will secure the business. The consequence would be that one of the most valuable functions and services of a banker would be lost to the railroad. The railroad would, as a matter of fact, have lost its banker.

It may be that competitive bidding would in an individual instance or a special case produce better financial results for the railroad, but the slight and exceptional advantage thus temporarily obtained would not justify a system which would be injurious and disastrous in its general operation.

The interests of the public are amply protected by the supervision of the terms proposed for the issue of securities before they can be lawfully accepted and made operative.

Traveling Engineers Hold Thirtieth Convention

W. O. Thompson, Secretary, Since the Association Was Organized, Honored at the Opening Session

A REMARKABLE TRIBUTE to his constant service in behalf of the Traveling Engineers' Association throughout the 30 years since the organization had its inception, was paid by the members and friends of the association to W. O. Thompson, the secretary and only living charter member, at the opening session of the 1922 convention, held at the Hotel Sherman, Chicago, October 31 to November 3, inclusive. A three-quarter length portrait of Mr. Thompson, in oil, was presented to the association. In accepting, the association voted to have the portrait hung in the convention hall at all future meetings. The presentation was a complete surprise to Mr. Thompson.

W. O. Thompson

The convention was called to order by the president, J. H. De Salis (N. Y. C.), who, after the invocation addressed the association in part as follows:

President De Salis' Address

"The greater part of our members serve as instructors of locomotive engine crews, and personally observe the performance of the locomotives and the crews operating them. Their responsibilities cover all parts of the locomotive and its proper operation, both from a mechanical and transportation standpoint. The traveling engineer is required to be a specialist on the many devices that go to make up the successful and economical operation of a train.

"Education for the men holding these positions is necessary. Their duties place them in a position where mistakes cannot be corrected; they must act right the first time. If the train is not started in the proper manner the mistake means broken draft rigging or broken cars. If the train is not stopped properly it may mean derailment or collision, and if a train is not properly operated when running it may not make the schedule time or will cause a loss of fuel. At these conventions are brought out the best methods of educating engine crews. In the proceedings is found the best practice for the successful operation of trains, and a book published by this association entitled 'Standard Form of Examination for Firemen' is being used by many railroads for the examination of new men and of candidates for promotion."

Following Mr. De Salis' address, a brief resumé of the early history of the association, prepared at the request of the executive committee, was presented by Mr. Thompson, of which the following is an abstract.

Early History of the Association

A short time after the adjournment of the Master Mechanics' and Master Car Builders' convention in 1892, a road foreman of engines of one of the lines running into Chicago listened to a conversation between his master mechanic and a representative of the Westinghouse Air Brake Company relative to the good work accomplished at the convention and how beneficial it was for a man in railroad business to meet other men in the same business from all parts of the country for the purpose of exchanging views and experiences.

The conversation led the listener to think that if the Master Mechanics' Association was of such inestimable value, why would not an association of traveling engineers be of even more importance, not only to the traveling engineers, but to all departments of the railroad.

Acting on the thought, he started out to find traveling engineers enough to form an association, and, strange as it may seem with our membership of over 1,500 in the United States, Canada and Mexico, he was over three months in getting the names of 14 traveling engineers who were in favor of the idea.

After the 14 traveling engineers had been heard from, a meeting was held at Chicago, November 14, 1892. The result of that meeting was the forming of a temporary organization. During the meeting an invitation was received from Sinclair and Hill, of Railway & Locomotive Engineering, to meet in their office in New York City to perfect a permanent organ-

ization. This meeting was held on January 9, 1893, and 53 members were enrolled.

During the first few years of the association's existence its condition was rather precarious. At that time the newly created position of traveling engineer was not looked upon as an actual necessity by the managements of many railroads. In the panic of 1894 and 1895 approximately 70 per cent of our membership was set back to running engines and had it not been for the hard, painstaking work of a number of our members, the almost immediate popularity of reports and researches of our committees, the loyalty of a few of the higher railroad officials, the press and a few of the railway supply firms, the association would have died in its infancy.

The benefits to the traveling engineer have also been great. Thirty years ago he was considered nothing more than an engine-tamer and trouble-doctor, but today he is considered an indispensable adjunct of any well-organized railroad.

The association has grown from a membership of 53 to 1,536. During its life 575 members have been selected to fill higher positions on railroads or in other businesses. In all of the 30 years there has never been a decrease in membership. Nearly all of the members who have been promoted to higher positions continue their membership, thus giving the association their moral and financial support. Considering these facts, the pride which the traveling engineers feel in their association is pardonable.

Portrait of Secretary Thompson Presented

At the close of the paper, D. L. Eubank (Galena Signal Oil Company) unveiled and presented Mr. Thompson's portrait to the association. In his remarks leading up to the presentation he brought out the fact not mentioned by Mr. Thompson in his paper that the author was in large measure responsible for the organization of the association and for its healthy growth during the early years of its existence.

On behalf of the members, tributes were paid to Mr. Thompson's service to the association by L. D. Gillett (Dominion Railway Commission of Canada) and D. R. McBain. Members of the Traveling Engineers' Association, of the Railway Equipment Manufacturers' Association, and the Hotel Sherman participated in providing the portrait.

A report of the later sessions of the convention will appear in a later issue.

Equipment Manufacturer's Exhibits

The following companies, members of the Railway Equipment Manufacturers' Association, exhibited at the thirtieth annual convention of the Traveling Engineers' Association, held at Hotel Sherman, Chicago, October 31 and November 1, 2 and 3:

American Arch Co., New York.—Literature.—Represented by F. G. Boomer, G. M. Bean, A. W. Clokey, R. J. Himmelright, J. T. Anthony, Major W. L. Allison and W. E. Salisbury.

American Locomotive Co., New York.—Reverse gear, flexible and rigid staybolts.—Represented by G. P. Robinson, W. E. Corrigan, A. Haller and George G. Jones.

Baldwin Locomotive Works, The, Philadelphia, Pa.—Literature and photographs.—Represented by C. R. Riddell, N. E. Baxter, C. H. Gaskill and F. A. Neely.

Barco Manufacturing Co., Chicago.—Power reverse gear; crosshead and shoes; automatic smoke box blower fittings; metallic tender connections for air, steam, oil and water; joints to air reservoir, air pumps, distributing valves, headlight generators, etc., roundhouse blower and blowoff; coach yard and station steam heat and air connections; metal steam heat connections for passenger coaches.—Represented by F. N. Bard, C. L. Mellor, F. A. Stiles, W. J. Behlke and C. O. Jenista.

Bird Archer Co., New York.—Boiler compound, polarized mercury, anti-foaming and anti-leaking compounds.—Represented by L. F. Wilson, J. L. Callahan and G. J. McGurn.

Boss Nut Company, Chicago.—Nuts, bolts and rivets. Represented by J. W. Fogg, A. W. MacLean, W. G. Willcoxon and George A. MacLean.

Bradford Draft Gear Co., New York.—Boltless truck column; twin journal box nut; three spring draft gear; rocker type draft gear, and locomotive throttle.—Represented by Horace Parker, F. K. Mays, E. L. Nusz, J. C. Keene, W. W. Bosser, W. H. McWhorther and E. J. Barnett.

Morris B. Brewster, Inc., Chicago.—Metallic piston rod; valve stem and air pump packing; pressure breaker piston rod packing. Represented by Morris B. Brewster and Frank A. Orland.

Crane Company, Chicago.—Valves and pipe fittings. Represented by Fred Venton.

Dearborn Chemical Company, Chicago.—Represented by Nelson F. Dunn, O. H. Rehmeyer, I. H. Bowen, Ira Beebe, Joseph Arn, L. P. Bowen, George R. Carr and J. D. Purcell.

Detroit Lubricator Company, Detroit, Mich.—Locomotive lubricators; automatic locomotive exhaust nozzle cover; automatic flange oilers. Represented by A. G. Machesney.

The Duff Manufacturing Company, Pittsburgh, Pa.—Jacks for locomotive and car work. Represented by C. N. Thulin and E. E. Thulin.

The Edna Brass Mfg. Co., Cincinnati, O.—Lubricators, injectors, boiler checks, water gages, cold water sprinklers and fire extinguishers.—Represented by H. A. Glenn and F. S. Wilcoxen.

Elvin Mechanical Stoker Co., New York.—Photographs and literature.—Represented by A. G. Elvin and E. W. Englebright.

Flannery Bolt Co., Pittsburgh, Pa.—Grease plugs; flexible stay bolts.—Represented by W. M. Wilson.

Franklin Railway Supply Co., New York.—Radial buffer and unit safety bar; precision power reverse gear; pneumatic fire door; lateral motion driving box; automatic driving wedge; driving box lubricator and spreader; flexible conduit, and reverse gear.—Represented by W. N. Coyle, J. L. Randolph, H. M. Evans, C. W. F. Coffin, J. L. Bacon, T. L. Reed, S. D. Rosenfelt, W. T. Lane, P. Weiler, P. Willis, H. M. Clawson, F. H. Cunningham and C. J. Burkholder.

Galena Signal Oil Co., Franklin, Pa.—Represented by Robert McVicar, W. J. Walsh, P. H. Stack, D. L. Eubank, W. O. Taylor, W. F. Walsh, G. W. Buckpitt, W. L. Trout, L. H. Palmer, J. W. Bunn, B. P. Corey, J. A. Roosevelt, J. F. Ferguson, A. J. Poole, G. E. McVicar, F. B. Smith, J. F. Wilsey, R. J. McQuade, I. T. Birney, J. A. Graham and J. S. Brown.

Garlock Packing Company, Palmyra, N. Y.—General line of locomotive and power house packings. Represented by C. W. Sullivan and Stanley MacDole.

Grip Nut Co., Chicago.—Locomotive and pump piston rod nuts; unit nuts.—Represented by W. R. Richards and R. B. Radcliffe.

Hulson Grate Company, Keokuk, Iowa.—Full size locomotive grate showing rocking dump grate. Represented by A. W. Hulson, J. W. Hulson and A. E. Wentworth.

Hunt Spiller Manufacturing Corp., Boston, Mass.—Cylinder and valve packing rings; valve chamber bushing; piston and valve bull rings; crosshead shoes, side rod knuckle pin bushing.—Represented by J. G. Platt, V. W. Ellet, E. J. Fuller, C. Galloway and Fred Hartman.

International Correspondence Schools, Scranton, Pa.—Literature.—Represented by Ed. M. Sawyer and F. S. Powell.

Jenkins Bros., New York.—Valve and sheet packing.—Represented by George Royal.

The Leslie Company, Lyndhurst, N. J.—Steam heat pressure regulators and reducing valves. Represented by S. I. Leslie and J. J. Cizek.

Locomotive Lubricator Co., Chicago.—System of locomotive force feed lubrication.—Represented by W. J. Schlacks and C. W. Rudolph.

Locomotive Stoker Company, Pittsburgh, Pa.—Mechanical stoker, one-third size working model. Represented by A. C. Deverell, A. N. Wiltse, E. Prouty, V. B. Emerick, J. B. Ball, H. C. Woodbridge and H. C. Kelly.

Madison-Kipp Corp., Madison, Wis.—Force feed locomotive lubricator.—Represented by A. H. Flanagan, J. M. Borrowdale and S. W. Midgley.

Manning, Maxwell & Moore, Inc., New York.—Injectors; consolidated safety valves.—Represented by C. L. Brown, J. S. Smith and C. Corning.

W. H. Miner, Chicago.—Friction draft gears; friction buffers for passenger equipment; spring draft gear; side bearings; coupler centering device for passenger and locomotive equipment; bolster locking center pin for passenger equipment. Represented by Bradley S. Johnson and Charles F. McCuen.

Nathan Manufacturing Co., New York.—Injectors; bulls eye and force feed type lubricators; boiler checks; boiler washer and tester, fire extinguisher; water columns, and whistles.—Represented by F. C. Davern, William Brumble and J. Brandt.

National Boiler Washing Co., Chicago.—Literature.—Represented by F. W. Gale, F. S. Wichman and C. C. Lance.

National Malleable Casting Co., Cleveland, Ohio.—

National Railway Devices Company, Chicago.—Vertical fire door; Radial fire door. Represented by Jay G. Robinson and E. J. Gunnison.

National Tube Company, Pittsburgh, Pa.—Superheater tubes

applied in tube sheet, small 2-in. and 2½-in tubes—Represented by George N. Riley, J. T. Goodwin, J. W. Kelly and P. J. Conrath.

New York Air Brake Co., New York

Ohio Injector Co., Chicago.—Injectors, flange oiler, lubricator; low water alarm, water glass protector, and drifting valve.—Represented by A. C. Beckwith, F. W. Edwards, R. M. Harber and F. B. Farnsworth.

Okadee Co., Chicago.—Blow-off valve; front end hinge; automatic cylinder cock, and tank hose coupler.—Represented by A. G. Hollingshead, G. S. Turner, J. S. Lemley, J. M. Monroe, W. H. Heckman, and F. G. Zimmerman.

Parkesburg Iron Company, Parkesburg, Pa.—Sections of charcoal iron tubes. Represented by L. P. Mercer and J. F. Wiese.

Pilot Packing Co., Sea Cliff, N. Y.—Packing.—Represented by Joseph Sinkler.

Pyle-National Company, Chicago.—Model of Young valve gear; turbo headlight generators; cast metal, cast aluminum and cast iron headlight cases with glass reflector; cast aluminum flood light cases; back-up lamps. Represented by C. P. McGinnis, T. P. McGinnis, W. T. Bretherton, R. L. Kilker, George Haas, J. L. Reese, O. W. Young, William Miller and J. Will Johnson.

Railway Review, Chicago.—Represented by H. A. Smith, A. E. Hooven and J. E. Gougeon.

Sargent Company, Chicago.—Water column; water glass cocks; two seat gauge cock; iron clad protectors; gauges; blower valve and gaskets. Represented by George H. Sargent and L. L. Schultz.

Simmons-Boardman Publishing Co., New York.—*Railway Age*, Railway Mechanical Engineer, Locomotive Cyclopedia and Car Builders' Cyclopedia.—Represented by L. B. Sherman, C. B. Peck, B. J. Wilson, J. M. Rutherford and Homer Beach.

The Smith Automatic Adjustable Hub Plate Company, Chicago.—Locomotive adjustable hub plate. Represented by A. J. Sams.

Standard Steel Works Co., Philadelphia, Pa.—Literature and photographs.—Represented by C. R. Riddell, N. E. Baxter, C. H. Gaskill and F. A. Neely.

Sunbeam Electric Manufacturing Co., Evansville, Ind.—Airtight headlight.—Represented by H. A. Varney, J. Henry Schroeder and W. T. Manogue.

Superheater Co., New York.—Exhaust steam injector; feed water heater, and method of repairing superheater.—Represented by F. A. Schaff, R. M. Ostermann, G. E. Ryder, R. R. Porterfield, Bard Browne, W. A. Buckbee and all district representatives.

Talmage Manufacturing Co., Cleveland, Ohio.—Low water alarm; steam chest lubricating drifting valves; blow-off valves; hammer feed grease cup, and ratchet band brake.—Represented by F. M. Roby, H. B. Thurston and L. Sprague.

The U. S. Metallic Packing Company, Philadelphia, Pa.—Piston, valve stem and air pump packing; sanders and bell ringer; shaker bar and oil cup. Represented by R. A. Light, J. T. Luscombe and H. E. Hyslop.

Vapor Car Heating Co., Chicago.—Steam heat pressure valve; steam heat stop valves.—Represented by E. C. Post and N. F. Burns.

Harry Vissering & Co., Chicago.—Sander; bell ringer; metallic piston rod and valve steam packing.—Represented by Harry Vissering, G. S. Turner, Charles R. Long, Jr., W. H. Heckman, J. S. Lemley, J. M. Monroe and F. G. Zimmerman.

Westinghouse Air Brake Company, Pittsburgh, Pa.—Air cylinder oil cup; brake cylinder packing cup; compressor air strainer; brake cylinder gaskets. Represented by S. G. Downs, J. B. Wright, C. J. Ohmstead, J. S. Y. Fralich, F. H. Parke, L. Wilcox, F. B. Farmer, C. D. Foltze, V. Villette, F. B. Johnson, H. H. Burns, W. M. Sleet, A. G. Houston, A. L. Berghane, L. M. Carlton and E. R. Fitch.

Worthington Pump & Machinery Corp., New York.—Sectional model of locomotive feed water heater.—Represented by D. R. Coleman and J. M. Lammedee.

Over a Million Cars Loaded

WASHINGTON, D. C.

THE NUMBER of cars loaded with revenue freight crossed the million mark in the week ended October 21 for the first time since October, 1920. The total was 1,003,759, as compared with 964,811 in the corresponding week of last year and 1,008,818 in the corresponding week of 1920. The increase as compared with the preceding week was 20,280. The loading was still, however, below the record set in the peak week of October, 1920, when 1,018,539 cars were loaded. Although coal shipments are still being given priority, the large increase in loading as compared with last year is due to the heavy movement of other commodities. All classes of commodities show increases as compared with the corresponding week of 1921 except coal, the loading of which was nearly 19,000 cars less than last year, and merchandise, the loading of which was over 6,000 cars less than last year. Increases as compared with 1920 were shown in

REVENUE FREIGHT LOADED

SUMMARY—ALL DISTRICTS, COMPARISON OF TOTALS THIS YEAR, LAST YEAR, TWO YEARS AGO. WEEK ENDED SATURDAY, OCTOBER 21, 1922

Districts	Year	Grain and grain products	Live stock	Coal	Coke	Forest products	Ore	Mdse. L.C.L.	Miscellaneous	Total revenue freight loaded: This year 1922	Corresponding year 1921	Corresponding year 1920
Eastern	1922	10,407	3,689	60,682	1,947	6,074	5,530	64,739	99,244	252,312	.....	.....

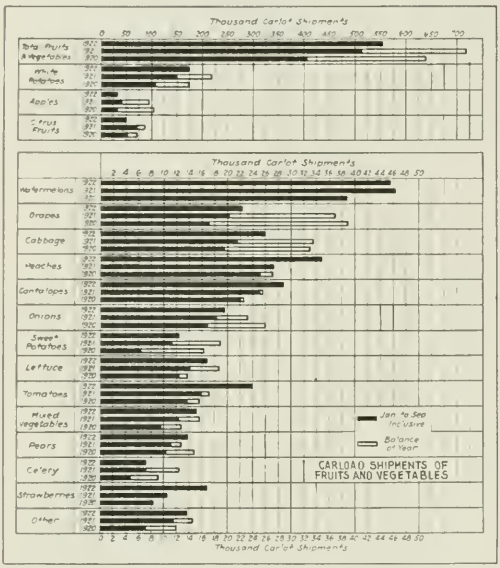
Compiled by Car Service Division, American Railway Association.

all classes of commodities except coal and coke, while there were increases as compared with the previous week in all classes except coal and ore. In the Southern, Central Western and Southwestern districts the loading exceeded that of 1920.

Fewer freight cars are now in need of repair than at any time since March 15, 1921, according to reports compiled by the Car Service Division. On October 15, the latest date available, 270,045 freight cars, or 11.9 per cent of the cars on line, were in need of repairs. This was a decrease of 21,609 cars compared with the total on October 1, at which time there were 291,654, or 12.8 per cent. This also was 54,538 fewer than on July 1, the date on which the strike of railway shopmen began. On October 15, 1921, there were 354,996 freight cars, or 15.5 per cent, in need of repairs.

Freight cars requiring light repairs numbered 55,123 cars on October 15 last, a decrease of 5,966 compared with the total on October 1. Cars in need of heavy repairs totaled 214,922, or a decrease of 15,643 within the same period. Every district on October 15 showed a decrease compared with the total not only on October 1, but also on July 1.

The freight car shortage increased from 156,309 for the week ended October 15 to 166,349 for the period from October 15-23.



Shipments of Fruits and Vegetables; 1922 Compared with Previous Years

Chart compiled by Car Service Division from statistics collected by the Bureau of Agricultural Economics of the Department of Agriculture.

The solid black lines show total loading to date in 1922 compared with the equivalent period for each of the two previous years. Where the 1921 and 1920 lines are extended in outline form, it represents the extent of the subsequent movement of these commodities for the remaining three months of the year. Comparing the length of the black area with that of the outline it can be seen just what proportion of the year's movement was completed by the end of September.

It will be noted that the total movement to date this year has exceeded last year by approximately 40,000 cars, and 1920 by 140,000. Almost without exception individual commodities show a greater movement this year than for the corresponding period of the two previous years.

This chart gives a graphic picture of the extent to which traffic in fruits and vegetables is increasing year by year.

Coal Situation Fairly Satisfactory

WASHINGTON, D. C.

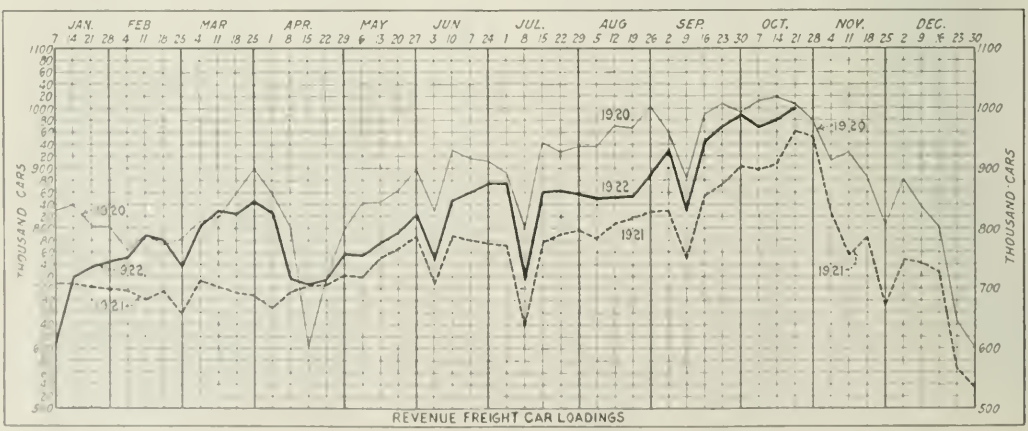
"INDUSTRIAL USERS of coal are beginning to accumulate some reserves, and the general steam coal situation may now be regarded as fairly satisfactory," said Federal Fuel Distributor C. E. Spens in a statement summarizing the present coal outlook. For the past few weeks the average spot price for all grades of bituminous coal has steadily declined, while production figures have mounted. Mr. Spens' statement is, in part, as follows:

A canvass of the situation, now being made by this office, indicates that storage of coal by industry is increasing, although industrial buyers have been urged to purchase only sufficient coal for current requirements, in order that no consumer might be distressed, and particularly that production and transportation of coal for domestic needs might not be jeopardized. The present greatly increased production of bituminous coal is, however, possibly sufficient to permit of some reserves even under the prosperous conditions of industry prevailing today.

The act creating the office of federal fuel distributor became effective September 22. Production of bituminous coal since that time has been as follows:

	Tons
For the week ended September 30	9,822,000
For the week ended October 7	9,736,000
For the week ended October 14	10,021,000
For the week ended October 21	10,350,000
For the week ended October 28	10,500,000

The situation to-day so far as steam, or industrial, coal is concerned, is fairly satisfactory. There are, of course, individual cases where, due to lack of transportation, more or less difficulty is encountered in securing sufficient supplies with regularity and "spot" coal purchases have to some extent been necessary, but,



generally speaking, the present steam [illegible] is not a matter of grave concern.

In the greater part of the country [illegible] as to domestic bituminous coals are quite comfortable though there are still some sections where available supplies would quickly vanish in the event of inclement weather, and with [illegible] curtailment in transportation. The northwest territory, for instance, served largely by lake transportation, will need for all purposes approximately four million additional tons before the close of navigation, in addition to all rail movement from Illinois, Indiana, etc., to care for its requirements until April 1. Barring unexpected difficulties, with dumpings at Lake Erie ports averaging at least one million tons per week, it is anticipated that these requirements will be accomplished.

In Illinois the available supply on hand is low, due largely to the fact that a very considerable proportion of the coal mined within the state and adjoining territories has been, and is, moving all-rail to the northwest to supplement the Lake allotment from eastern fields. It is important that far distant communities be served at this time, nearby communities can, of course, be taken care of with little delay.

In the matter of prices of bituminous coals, the following figures will give an idea of the present trend. For the week ended September 23, the average spot price of all grades of coal was $5.00 per ton.

	Per ton
For the week ended Septe[illegible]	$4.89
For the week ended October 7	4.60
For the week ended October 14	4.45
For the week ended October 21	4.26

During the past few weeks the above average prices have been held up by the comparatively higher prices received for domestic coals, the margin between "run-of-mine" and "lump" coals having in some instances been abnormally large.

The anthracite situation differs from the bituminous. The production today is practically at the peak and due to the strike, the production this season which ends with March 31, 1923, will probably not greatly exceed 60 per cent of that of last season. The plan for distribution of this season's production contemplates a pro rata distribution among last year's trade. This season's production cannot possibly, therefore, equal the demand, and necessarily other fuels must to some extent be substituted.

The most serious territorial situation as to anthracite domestic coal is, like the bituminous, in the northwestern states served by the lakes. The anthracite lake program calls for approximately two million tons, and up to date approximately only five hundred and fifty thousand tons have been shipped, in addition, there has been some movement all-rail, although this amount has not as yet reached an appreciable proportion. If normal lake conditions obtain, it is expected that shipment by lake will continue until at least the first of December, and since it will not be possible during this remaining period to complete the allotted proportion for shipment by lake, operators have been urged to supplement the lake movement by immediate commencement of all-rail shipments with due regard, of course, to necessary distribution to other sections of the country accustomed to the use of anthracite.

The average daily loading of anthracite during the last 18 days of September, 1922, (after the termination of the miners' strike), was 5,007 cars. The average daily loading in October this year up to and including the 26th instant, was 6,254 cars, as compared with 5,853 in October, 1921, and 5,910 in October, 1920. This indicates intense application by all interests.

The necessary distribution of coals is dependent principally upon two factors at the present time: climatic conditions and transportation. The latter factor is to a large extent dependent upon the former, although it should also be remembered in this connection that the transportation lines of this country have not yet fully recovered from the ravages of the recent railway strike, and that in addition, the offerings of tonnage of all character are almost at the peak in the history of the carriers.

Automatic Train Control—a Signal Engineer's View*

Lucid Analysis by a Veteran Signal Engineer—Possibility of Saving Expense of Wayside Signals

By Thomas S. Stevens
Signal Engineer, Atchison, Topeka & Santa Fe System

If wayside signals are to be used and the only purpose of automatic train control is to check the performance of the signals and the actions of the enginemen, those intermittent devices which have only two positive indications, with a speed control which is only local and momentary, may work up into first-class devices. By positive indications I mean those which are not dependent on time element devices or on the speed of the train.

If, however, we propose to make automatic train control pay by developing it into a complete signaling scheme, something more than is provided by these devices will probably be necessary. It would appear that at least three indications or controls are required—stop and proceed, of course, with the addition of a low-speed control of some character which should be continuous in its effect until replaced by a proceed indication.

Whether wayside signals are used or not, it is reasonable to suppose that train control will undoubtedly be the governing factor eventually. Because of the necessities it seems safe to assume that the ultimate development will tend to leave the control of the train in the hands of the enginemen, rather than that the actual brake application for the different indications will be made automatically. The probable function of the automatic train control will be to check the engineman by stopping the train if proper procedure is not taken. If this is finally proved to be true, it seems essential that information should be provided in the cab so that the engineman may be advised of the condition of the automatic train control apparatus and so be able to control the speed of the train properly in order to avoid being checked. This information may be given through the medium of a signal, whistle, or indicator of some kind; but any of these will, in effect, be a repeater of the wayside signal. Except for the fear of failures during the first few days of development, there seems to be no justification for the duplication of indications which will result if wayside signals are used as well as the necessary cab indications which would appear to be necessary in any case whether wayside signals are installed or not.

Developing Train Control

It would seem advisable for a number of railroads to approach this subject with the idea of developing something which would take the place of wayside signals as well as provide an automatic check on the actions of the engineman. This treatment is attractive from many standpoints:

(1) It would, of course, be far cheaper to install without wayside signals than with them.
(2) The cost of operating will be less because the necessity for holding signals clear during 24 hours regardless of whether the protection is needed or not will be eliminated and only the necessary power to protect a train properly which is actually operating over the railroad will be used.
(3) The question of a background for the signal indication will be solved, because the indication will be given in the cab.
(4) Signaling against traffic on double or multiple track rail-

*Paper read before the Society of Engineers at Chicago, October 23. Other papers read at that time were reported in the *Railway Age* of October 28, page 805.

roads can be undertaken with far less cost because the clearance problem is eliminated.

Advantages of Train Control

Railroading generally will not be as flexible with automatic train control because the speed of operation will be prescribed, but this prescription will be of the same extent regardless of whether wayside signals are used or not. Granting that automatic train control is successful, there seem to be many advantages which can be obtained from its use. If proper analysis is made of the effect of signal indications given by automatic signals, it will be found that the only indication which protects the rear end of a train is that which prescribes some form of low speed after stopping at an automatic signal. The stop in itself has never been of any use. Operating officers have been afraid to eliminate the stop because of the fear that a proper low speed would not be maintained without the stop. Probably the fear was justified, but with a controlling device which definitely takes care of the proper rate of speed it would seem that all stops for automatic signals could be eliminated.

In completely signaled territory rear flagging has been retained due to the same fear with reference to the action of the engineman, even after passing an automatic signal at stop in the proper way, and this fear is natural because of accidents which have happened after a train has actually stopped at a signal or picked up a flag. Under automatic train control it would seem possible to eliminate rear flagging or at least to shorten the distance, because the speed of the train will be taken care of definitely and positively by the automatic control.

Problems Involved in Installations

From an engineering standpoint the problems involved are many and varied. Considerable experience has been obtained from some of the installations already made with reference to the possibilities of mounting certain classes of devices properly on engines. The experiments, however, have not covered a sufficient length of time, nor have they been of a sufficiently diversified character to allow of definite suggestions as to the solution of the engineering difficulties involved.

Ramp devices seem to present the least difficulty in connection with the methods necessary to provide the requisite indications and controls. A simple change of polarity is all that is needed to bring about the different speed controls. The electrical problems involved can easily be understood by any signalman who has maintained automatic signals. The problem in connection with this type of device seems to be the integrity of contact during inclement weather and the proper construction and installation of the ramps so that impact shocks will be taken care of properly and the ramps securely protected against possible damage by dragging equipment.

The questions of clearances and interferences with the safety of employees seem to present subjects for study.

With the inductive devices which provide full clearance there is the problem of insulation which has always been a difficult one to take care of with apparatus which is practically underground. Most of the inductive devices involve principles which will require additional education of employees. With all of the ramps and intermittent inductive devices there will be a big problem with reference to the maintenance of track because all of these devices interfere more or less with the present scheme of taking care of the roadway structure.

The installation of this type of device will have to be made very carefully because no really good way seems at present to have been devised to take care of derangement of the apparatus. By somewhat complicated methods the actual removal of a ramp or intermittent inductive device can be protected against, but at the present time it seems possible for sufficient derangement to occur to render the device inoperative without any check being made.

With the continuous control devices which use central energy, the big problem seems to be the integrity of the power supply. This problem exists at the present time in connection with all installations of signals controlled from a central point, but failures of this character where wayside signals are involved can be taken care of by orders and, therefore, business can be moved more readily than will be possible, perhaps, under automatic control. In at least one of the devices an amplifier is necessary, which is a more or less delicate instrument. The installation of such a device on an engine will require careful study to protect it against the shocks which are bound to occur.

Air Brake Control Is the Big Problem

After all is said and done about the transfer of an impulse from the track to the engine, the big problem appears to be the proper control of the air brake apparatus. Whether the air brake control can be actually made automatic or whether it must always be a check on the actions of the enginemen, is the one phase of automatic train control which will require the most study during the period of development. If we endeavor to replace the flexibility of human action by something which is automatic it will necessitate the same brake application regardless of the length of the train, grades, curves, or the condition of the weather and the rail. It would seem probable that the final development would be to provide proper indications as to the allowable speed, with the requirement that the engineman should keep within certain limits under certain conditions to prevent the automatic train control having any actual effect on the air brakes themselves. Another serious problem is the release of the air brakes. Some of the questions on train control about which there is a vast difference of opinion are as follows:

Whether intermittent or continuous control will prove more efficient and flexible.

Whether the control points of intermittent devices should be located at the signal or at braking distance from the signal.

Whether the actual stopping of the train should cause the air brake control to be set to a prescribed low speed and thus a positive proceed indication be required.

Whether an indication should be provided on side tracks which would inform the engineman regarding the occupancy of the main line.

Whether simple apparatus with overlaps is preferable to slightly more complicated devices which would either decrease the overlaps or eliminate their necessity.

Whether it is desirable to introduce the necessary complications to insure that the indications of the signal should be properly checked by the automatic train control, and those of the automatic train control in turn checked by the signals.

Automatic train control will probably be subject to the same extent of mechanical failures as is experienced with other automatic devices. Man failures will be transferred from the human beings operating trains or signals to other human beings who are responsible for its manufacture, installation and maintenance. Whether train control will prove more effective than past schemes will be dependent on the care and study which is accorded its manufacture, installation, maintenance and operation.

Discussion

H. R. Safford (vice-pres., C. B. & Q.): Probably no device relating to safety and operation in railroading has been approached with as much caution as train control. It was hard at first for railroad men to realize that a substitute should be provided to operate when the human mind fails. We don't want to think that a mechanical substitute should be provided to replace human intelligence. The problem is to get a device that is durable and reliable with the organization available for its maintenance. It is my thought that the highest type of construction and highest type of care will be required to obtain a device to operate successfully.

C. A. Durham (sig. engr., G. N.): What is required in train control today is a device to bridge the gap between the automatic block signal system and the air brake device on a moving train. There is a great difference between speed control and the simple automatic stop. Some roads, no doubt, have traffic and speeds which warrant the adoption of a speed control device. However, this does not prove that such conditions prevail on all of the 49 roads listed in the commission's order and that all of these carriers should be required to install a system of this kind.

F. J. Sprague (Sprague Safety Control and Signal Corporation): Train control will offer a greater track capacity on one or two tracks with or without signals, normal clear or normal danger, with steam or electric propulsion. Track capacity will also be increased by operating trains either way on both tracks. The big problem of train control is the maintenance of the apparatus. It is our hope that the train control apparatus will not be required to operate except at infrequent intervals; normally the engineman can control the train with a nicety of manipulation and judgment of train length, air supply, etc., that cannot be duplicated by a mechanical device. Train control, if properly engineered, may tend to increase rather than decrease track capacity. The system should be a friendly mentor and guide for the engineman, aiding, not unnecessarily opposing, him, and a thoroughly reliable but unobtrusive partner in the operation of his engine, which, while interposing an effective shield between him and disaster, will leave, within all proper limits, the handling of the train subject to his judgment.

A. G. Shaver (Regan Safety Device Company): Installations of automatic train control have been in service on railroads under practicable operating conditions sufficiently long to demonstrate their usefulness and reliability. The fact that a train can be safely stopped automatically or can have its speed efficiently controlled automatically is not debatable in view of the records for such performances extending over a period of several years under the variety of operating conditions existing on the usual railroad. That I may not be misunderstood, I would define the essentials of automatic control to be: Means for automatically stopping a train; means to permit it to proceed after being stopped, and means to restrict its speed under certain conditions.

In its application and use automatic train control involves two different engineering departments of the railroad, neither of which usually has any particular interest or part in the business of the other. It has not been necessary for a motive power man to know how to signal a railroad in order to build and maintain a locomotive, nor has it been necessary for a signal man to know much about a locomotive in order to equip a railway line with a signal system. With automatic train control it is different, both the motive power and the signal departments are concerned, and the lack of a full appreciation of this fact, perhaps, has been quite a drawback in train control progress.

Any successful system of automatic train control must be simple in design and well constructed. The use of fragile and delicate apparatus and equipment, the life of which is not accurately known, is to be avoided. The careful railroad will use a system of demonstrated practicability; one comprising equipment which the existing skilled forces of the railroad can readily install and maintain. It should be borne in mind that those systems which will make the engineman unnecessary and which will do everything but talk are a long way from realization.

It has been shown that for systems already installed and in regular operation the locomotive equipment can be looked after by the regular roundhouse forces, and there is nothing about the track appliances which a good maintainer's helper cannot do. To get good service it is, of course, necessary to understand the working of the apparatus and its diseases in operation, but a knowledge of these is soon acquired, since the maintaining forces are already familiar with railroad equipment of a similar sort.

The major part and the important part of the train control system is the equipment on the locomotive. It is essential that it be properly applied and that it be given the same high order of inspection and maintenance as that now given by most railroads to their signal systems.

Although, generally speaking, that part of the train control system located on the track is simple and easily installed and maintained, there is the problem of its proper application to best serve the operating and traffic conditions of the railroad. No matter how good and efficient a train control system may be, it will not best serve a railroad if improperly applied. The important function of a train control system is to keep trains moving safely, and already there are systems which will do this. What railroad would be content to have its trains automatically stopped in such impossible places as on bad curves, steep up-grades, or on important street crossings, or to have them subjected to such interruptions as might occur from the signalman testing his circuits, the trackman trying his switches and the like?

A. J. Brookins (Burdette-Brookins Train Control System): In my opinion the transmission of the controlling impulse from the roadway to the locomotive is far less important than the actual operation of the device used to control the air brake equipment. There should be more latitude in the selection of equipment. Those desiring to use the simple stop should be allowed to do so; if others wish the speed control, let them try it. The audible signal also should be installed for an extensive trial. In this way a varied experience would be offered and a middle ground of development established. By such a program of trials and experiments a multitude of difficulties in the progress of train control would be eliminated.

The Chicago, Milwaukee & St. Paul has named the dining car on its "Pioneer Limited," which is operated between Chicago and Milwaukee, "Dan Healey," in honor of its popular dining car conductor who served on this run for many years and who died last month.

Kadel & Herbert, N. Y.

Hanging Rock at Clifton, Alaska

Thomas DeWitt Cuyler

Death of T. DeWitt Cuyler, Executives' Chairman

Chairman of Association of Railway Executives Found Dead in Business Car on Return from Trip

THOMAS DEWITT CUYLER, chairman of the Association of Railway Executives, was found dead in his stateroom in the business car of President Rea of the Pennsylvania Railroad, at Philadelphia on the morning of Thursday, November 2. Mr Cuyler was 68 years old. He had been chairman of the Association of Railway Executives since May 1, 1918, a director of the Pennsylvania Railroad since May 10, 1869, and was also a director in a number of other railroads and other companies.

Mr Cuyler had just returned from Rochester, N. Y. He was in that city on Wednesday and made an address before the Chamber of Commerce on the subject of "A Constructive Public Policy Toward Our Railroads."

By the death of Mr. Cuyler not only the railways but the entire nation sustains a heavy loss. He succeeded Frank Trumbull as chairman of the Association of Railway Executives at a crisis in the transportation affairs of the country. The railways were under government control and were incurring large deficits. Public sentiment favored their return to private operation. The very difficult problem was presented of formulating and securing the adoption of legislation under which they could be returned to private operation on conditions which would make possible restoration of their earning capacity. It was essential that the railways should secure the support of business interests, public men and the public for a reform of federal railroad laws. The railroads for some years in educating public sentiment and advocating plans for constructive railway legislation had had the statesmanlike leadership of Frank Trumbull, but he was no longer available.

It was a rare piece of good fortune that Mr. Cuyler was available to take up the work that Mr. Trumbull had begun and that he was found willing to do so. He was a man of large fortune. As a director for years of the Pennsylvania and the Atchison, Topeka & Santa Fe he was familiar with the railroad situation in both the East and the West. He had diplomatic gifts of the highest order which enabled him to win a hearing and sympathy for his views from important and influential people in all walks of life. He was not only a man of unusual ability but also a successful lawyer and therefore knew how to present the railways' case on all occasions logically and effectively. He was a natural leader of men, and these qualities of leadership enabled him to hold the railway executives together to get them to harmonize their views and present almost a united front even when there were very wide differences of opinion among them regarding questions of railway management and railway regulation. He was a superb presiding officer and he had to exercise great skill and firmness as a presiding officer at many meetings of the Association of Railway Executives when decisions regarding important matters had to be reached in spite of wide differences between different groups of executives.

While Mr. Cuyler was chairman of the Association of Railway Executives, the Transportation Act was passed; the railways were returned to private operation; the large advance in rates of 1920 was made; the struggle of the railways with the labor unions over the question of national agreements occurred; the railways passed through the historic crisis due to traffic congestion in 1920 and through the more serious financial crisis due to the great decline in their business in 1921 and, finally, they fought out the reduced rates case before the Interstate Commerce Commission and the reduced wage cases before the Railroad Labor Board. The Association of Railway Executives determined the policy of the railways in respect to all these matters and there were times when the differences of opinion between railway executives were so great that it looked as if it would be impossible for them to agree upon policies. That in most cases they finally did agree and that usually the policies adopted were sound were largely due to Mr. Cuyler's qualities of leadership and to the confidence inspired by his unfailing judicial fairness and his statesmanlike presentation of the various problems to be disposed of.

There has been a strong tendency recently among railway executives to believe that the Association of Railway Executives has been playing too large a part in railway affairs and in consequence many functions previously delegated to it have been transferred to other organizations. Before this process had begun, however, Mr. Cuyler had done a great constructive work for the railways for which he will always be held in grateful memory by all the railway executives of the present generation.

No reference to his work would be complete which did not mention the fact that as chairman of the Association of Railway Executives he never received a dollar of compensation. As a man of large business interests and especially as a large owner of railway securities, he was very anxious to help solve the railroad problem, but nobody who knew him will question that in the main his work for the railways was a labor of love performed by him because he believed it to be his duty as an American citizen.

Personally, he was one of the most approachable and charming of gentlemen. He had a powerful will, a dominating mind and tireless energy but in other respects he was the exact opposite of those men having similar qualities who are sometimes called "rough diamonds." He was indeed one of the gentlest and kindest of men as well as a very able lawyer, business man and leader of men.

Samuel Rea, president of the Pennsylvania, said the following Thursday concerning the death of Mr. Cuyler:

"Mr. Cuyler's sudden death is a terrible shock. Knowing him so intimately as I have for many years, I had the warmest affection for him. His legal training, his intimate knowledge of railroad affairs and finance and his keen powers of observation gained through years of service and contact with men of affairs all over the world qualified him as a business man of the ripest experience. His death is a great loss not only to the Pennsylvania Railroad Company, in which he was a director, but to all the railroads in the country, because of his position as chairman of the Association of Railway Executives and his able and impartial supervision of their affairs in the most difficult period in their history.

"No personal sacrifice was ever too great for him to make to advance the interests of the railroads. Among his own friends in the suburbs of Philadelphia, where he lived, his delightful personality and generosity and personal service to the community will be greatly missed."

Thomas DeWitt Cuyler was born in Philadelphia, September 28, 1854. He was the son of Theodore Cuyler, who at the time of his death on April 5, 1876, was general counsel of the Pennsylvania Railroad. He received his preliminary education in the schools of Philadelphia and graduated from Yale in 1874 with the B.A. degree. He was admitted to the bar at Philadelphia in 1876, following which he engaged in the general practice of law, later making corporation law a specialty. He served as counsel for a number of large corporations.

In the earlier years of his business career much of his

work was in the West, taking him to Texas, California, New Mexico and other states. He was counsel for a number of Scottish and English development companies that had brought settlers to the West to open up new territories. This brought him in direct touch with railroad building, and he became acquainted with many of the problems of construction and financing.

From these connections he went directly into railroad work, and was elected a director of the Pennsylvania Railroad on May 10, 1899. He was a director in several railroads embraced in the Pennsylvania System, as well as of the Atchison, Topeka & Santa Fe; the New York, New Haven & Hartford; the Rutland; the New York, Ontario & Western; the Maine Central; the Long Island, and many others.

He was also a director of the Interborough Rapid Transit Company; the Equitable Life Assurance Society; the Bankers Trust Company; the Western Union Telegraph Company; the Guaranty Trust Company; the Metropolitan Trust Company; the United States Mortgage & Trust Company, and others.

He was counsel in the reorganization of the Asphalt Company of America, and engaged in many of the most complicated and important railroad reorganization plans in the last 25 years. He was also a trustee of Yale University.

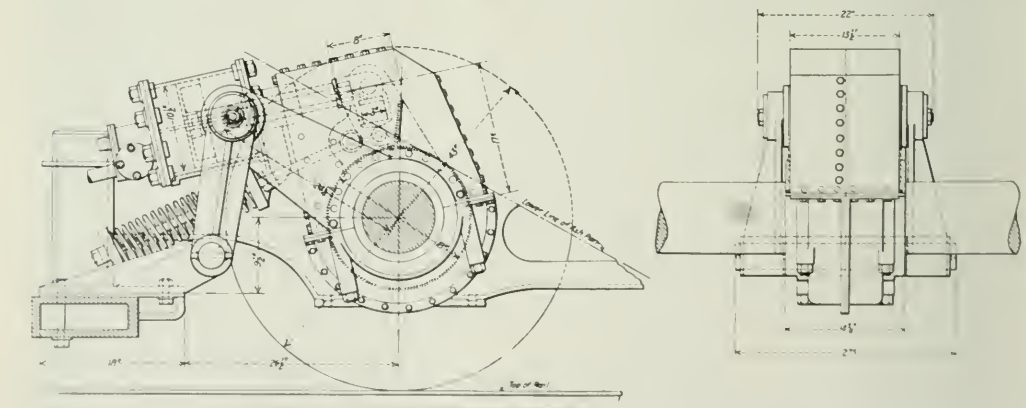
Mr. Cuyler became chairman of the Association of Railway Executives on May 1, 1918, succeeding Frank Trumbull, chairman of the board of the Chesapeake & Ohio.

Mr. Cuyler's home was at Haverford, Pa. His favorite diversion was the raising of blooded cattle at his stock farm at Paoli, Pa., known as the White House Farm, where he had one of the largest pure blooded Jersey dairy herds in the country. Mr. Cuyler was a member of the Rittenhouse Club in Philadelphia, of the Society of the Cincinnati, and of the Century, University, Union, Recess and Bankers clubs of New York.

Construction of the Street Locomotive Starter

Device Designed for Application to Trailer or Tender Trucks to Give Increased Power at Starting

In the past numerous efforts have been made to utilize the auxiliary carrying wheels of the locomotive as well as the driving wheels as a source of tractive force. Recently this practice has become more general with the adoption of boosters acting either on the trailing wheels or on the tender truck. The most recent development in appliances of this type is the Street locomotive starter, originated by Clement F. Street, Greenwich, Conn., which was briefly described in the *Railway Age* of June 22, 1922, page 1710. The function of the starter is somewhat different from that of the booster as it is intended to assist the locomotive only when starting and is designed for use only at very low speeds. The method of application and details of construction of this device are clearly shown in the drawing.



Side and End Views of Starter as Applied to Locomotive Trailing Axle

The starter consists essentially of a heavy cast steel ratchet wheel pressed and keyed on an axle and driven by a steam cylinder. The piston of this cylinder is driven through its working or forward movement by steam pressure and through its return or backward movement by a spring. The piston rod has a crosshead on its outer end which engages a wrist pin carried by a pair of lever arms, which on their lower ends surround and are carried by a pair of collars formed on the ratchet wheel. A ratchet which engages the ratchet wheel is carried by and pivoted in the lever arms.

When the machine is idle and during the return stroke of the piston this ratchet is held out of contact with the ratchet wheel by a pair of springs attached to the lever arms. When steam pressure is admitted to the cylinder it passes through the hollow piston rod and through a hole in the crosshead to a small cylinder formed in the crosshead and forces the ratchet down into contact with the ratchet wheel and holds it there as long as the pressure exerted by the steam is greater than that of the springs which hold the ratchet up. The area of this small piston and the strength of the two small springs as well as that of the main spring are so proportioned as to result in the ratchet being forced down before there is any forward movement of the main piston and lifted before it begins its return movement. This

arrangement eliminates any dragging of the ratchet over the ratchet wheel and the unnecessary wear and noise which would result if this were permitted.

Steam is admitted to and exhausted from the main cylinder through a piston valve embodied in the rear cylinder head and controlled by a small slide pilot valve which is operated by a stop on the piston rod. This construction has been in use for many years in air brake compressors.

The weight of the forward end of the starter is carried by the axle through the lever arms and the weight of the rear end by the truck frame through a pair of cylinder supporting arms. The lower ends of these arms are carried by a pivot pin secured to the truck frame and their upper ends surround a pair of trunnions cast on the cylinder. These trunnions are tied to the axle through a housing which surrounds the entire front end of the machine. This method of supporting and tying eliminates any possibility of a spreading action between the truck frame and the axle and results in all strain transmitted to the truck frame by the starter being in almost a direct downward direction. As the only connection between the truck frame and the starter is pivotal it can move vertically in relation to the axle without hindrance or limit. Lateral movement of the axle is cared for by clearance between the hubs of the ratchet wheel and the lever arms. The casing is water and dust proof and carries lubricant for the bearing between the ratchet wheel and lever arms.

The face or bearing surface of the ratchet and ratchet wheel at the point of contact is four inches in width, the ratchet teeth are ¼ in. in depth and five in number.

The maximum pressure coming on these teeth is 32,000 lb. and while five teeth are provided, any single tooth has ample strength to withstand any strain which must be transmitted through this point.

The control mechanism has been reduced to the most simple form and consists of a one inch steam line leading from the dome of the locomotive to the cylinder of the starter with a throttle at the dome and a flexible joint at the cylinder. The throttle is opened and closed through the medium of a ¼ in. copper pipe leading from the throttle to a push button in the cab. When the push button is held down the machine will run and when it is released it will stop. This button can be operated by either the foot or the hand of the engineer.

A machine of this character must respond instantly when action is demanded and there is no time to wait for water to run out of pipes and cylinders. Therefore the throttle must be placed near the dome or source of steam supply and the cylinder and all steam passage must be free of water when the machine is not working. The Street starter has an automatic drain valve at the lowest point of the cylinder which remains open at all times when there is a pressure of less than about 10 lb. in the cylinder and closes automatically under any greater pressure. There are no pockets in the piping and when the throttle is opened the steam has an unobstructed passage to the piston. The throttle is of the double seated balanced type and is fully opened as soon as the button in the cab is pressed.

The starter exerts its greatest force when standing when it is needed most. It has no dead points and the tractive force exerted at the rim of the wheel is practically constant and the maximum permissible at all times when the machine is working.

The machine shown in the drawing is designed for application to a locomotive trailing truck having wheels 43 in. in diameter and carrying a weight of 52,500 lb. The tractive force exerted at the rim of the wheel with a 10½ in. cylinder and 200 lb. boiler pressure would be 12,900 lb. When making applications to trucks requiring more or less power than this the cylinder and piston are made of different diameter but all other parts of the machine remain the same.

The machine illustrated is called the Type A; another smaller and less powerful, called Type B, is built for application to tender trucks. The starter is intended for moving a locomotive in one direction only, and if it is wanted for backing a second machine can easily be applied.

The device is primarily a locomotive starter and is cut out as soon as the train is well under way. In passenger service it will eliminate starting shocks resulting from taking slack. In freight service it will eliminate the need for taking slack in order to get a train under way and in so doing reduce break-in-twos, and draft gear and coupler failures.

The Problem of Highway Crossing Protection

L. S. Brach, president of the L. S. Brach Manufacturing Company, Newark, N. J., has published a brief essay on this subject, in which he calls for decisive action to do away with the confusion now existing in this feature of railroad operation. He says, in part:

The vast increase in the number of motor vehicles on public highways in all parts of the country has led the general public to become deeply concerned regarding methods of safeguarding grade crossings. One of the great difficulties in arriving at a decision as to what is the best method of protecting crossings by an automatic device is occasioned by the very large number and varied types of devices that are on the market. These different arrangements are so puzzling to the average automobile driver that the need for some standardized form of indication is pressing. To attract attention under all conditions of light and weather, the signal should be different from all other signs or scenery along the highway. It should compel attention in most impressive terms by arresting the eye. It must deliver its message that will be understood in all languages "STOP! A TRAIN IS COMING." It should not merely excite curiosity but it should tell instantly to the subconscious mind of the driver the message that will cause him to bring his car to an instant stop.

It is now possible by taking a trip of not many miles, to pass flashing light signals at road intersections and curves and by traveling further along the highway to meet the same type or similar signal at railroad crossings. Still further along, we find swinging banners, swinging lights, stationary lights and stationary banners, arm type signals, or flashing signs. This condition is further complicated by the use of one of these types of signal for advertising purposes. On close investigation one finds a sign demonstrating the merits of some popular cigarette, or advertising the advantage of a certain bank. At another point the same general scheme may be used for the protection of a railroad crossing.

This condition demands immediate action. It demands unselfish action. It may be necessary for some of us either as manufacturers or as railroad men to abandon our pet ideas.

There is a great opportunity ahead. All signals should be impartially judged by competent engineers without connections or influence, neither having their own or friendly signal interests in view. The writer has been a pioneer in the development of a certain type of crossing signal but he feels that there is more to be gained in a standardization of the best signal by impartial judges whether that signal be manufactured by his company or by another company. Certainly, standardization should not be left to the choice of any individual interested in any type of crossing signals or methods of indication. The general public is entitled to more consideration than any manufacturer or individual and if the apparatus is given the opportunity of impartial choice, the public will be more likely to receive the benefit of a type of signal that will be seen, and when seen will be respected.

General News Department

The Delaware, Lackawanna & Western has reached an agreement as to wages and working conditions with all its mechanical department employees, represented by a new association known as the Lackawanna Association of Mechanics, Helpers and Coach Cleaners.

The Canadian Board of Conciliation in a majority report has ruled against reductions in wages for employees of the Canadian Pacific represented by the International Brotherhood of Railway and Steamship Clerks, Freight Handlers, Express and Station Employees. A minority report, however, supports the position of the company. The company has announced its rejection of the findings of the majority report.

Twenty Million Loaded Cars

More cars were loaded with merchandise and miscellaneous freight during the first 40 weeks this year than ever before in the history of the railroads, according to a statement issued by the American Railway Association. In this period (nine months and seven days) 20,649,237 cars were loaded, an increase of 4.02 per cent over the corresponding period in 1920, and 13.87 per cent over the same period in 1921. Total loading of l. c. l. freight this year was 9,218,484 cars and of other freight 11,430,753 cars.

Freight Claims Adjusted More Promptly

The length of time required to adjust the average freight claim is not as long as some people would have the general public believe. According to the freight claim division of the American Railway Association great progress is being made in expediting the settlement of all claims, with conditions improving steadily. In 1921, about 54 per cent of all claims were adjusted within 30 days, and 77.5 per cent in 90 days, while for the first six months of 1922, records show that 64.7 per cent of all claims were settled within 30 days, 21.2 per cent in 30 to 90 days, and only 14.1 per cent of the total required more than 90 days to be settled.

P. R. R. Improvements at Pitcairn

The Pennsylvania has just completed and placed in service at Pitcairn, Pa., a modern 34-stall enginehouse with turntable at a cost of $1,385,000. This terminal is located on the main line of the Central Region and is one of the key positions of the system in expediting the movement of through trains. Nearly 200 engines are handled daily. In addition to preparing the engines for service the heaviest of running repairs will be made at Pitcairn. Among the important facilities at the new enginehouse is the turntable, 110 ft. long and electrically operated. Each stall is 140 ft. long and so constructed that it can be completely enclosed. The structure is steam heated.

National Personnel Association Convention

The National Personnel Association will hold its annual convention at the William Penn Hotel, Pittsburgh, November 8-10. Several of the sessions will be of interest to railroad officers who are interested in improving the relations between the men and the managements. On Wednesday morning, November 8, there will be sessions on employment and labor turnover, trade apprenticeship progress and psychological tests and rating scales in relation to training; on that afternoon, sessions on economics for employees and health education. On Thursday morning there will be sessions on pension plans, shop training, job analysis and developing men for executive positions. The general session on Thursday afternoon will include a discussion of our immigration policy and its social and economic effects, and also on nation-wide co-operation in personnel work. On Friday morning, November 10, there will be sessions on industrial motion pictures, foreman training methods, personnel problems of small offices and employee publications. Friday afternoon will be given over to the consideration of local personnel groups and activities. On Friday evening there will be sessions on relations with engineering colleges and with industrial and public schools.

The address of the National Personnel Association is 20 Vesey street, New York.

Tennessee Central Shops Destroyed by Fire

The machine, blacksmith, tin and woodworking shops of the Tennessee Central at Nashville, Tenn., were destroyed by fire on October 27, with an estimated loss of $80,000. Six freight cars were also burned and four locomotives damaged. The company intends to replace immediately both the shop buildings and the machinery which was destroyed within.

Iowa Wins Tax Battle

The Iowa state executive council won its tax valuation case against the Chicago Great Western and the Chicago, Rock Island & Pacific, when the United States Circuit Court, at a hearing held in Des Moines, Iowa, on October 30, refused the plea of the railroads for the issuance of an injunction preventing the state from collecting taxes based on the 1922 valuations.

The railroads had protested the per mile valuation set by the state executive council at a meeting in July. At that time the Chicago, Rock Island & Pacific was valued at $30,400 per mile, a reduction of $600 from the 1921 valuation, and the Chicago Great Western, at $29,000 per mile, a reduction of $1,000. The railroads claimed that the valuations were too high in comparison with the tax valuation set by the council upon Iowa farm lands.

Tentative Valuations

The Interstate Commerce Commission has issued tentative valuation reports in which it finds the final value of owned and used property as follows:

	Owned	Used
Sierra, 1916	$2,072,890	$2,077,276
South San Francisco Belt, 1916	69,498	84,425
Denison & Pacific Suburban, 1916	180,000	184,560
Nacogdoches & Southeastern, 1918	210,999	198,999
Cooperstown & Charlotte, 1916	260,000	531,427
Cumberland, 1917	386,203	404,203
Fairchild & Northeastern, 1916	884,746	.....
Birmingham & Northwestern, 1917	722,847	.....
Indiana Northern, 1916	29,310	55,250
Verde Tunnel & Smelter, 1917	571,101	.....
Carrollton & Worthville, 1917	100,000	.....
Eureka Nevada, 1917	35,762	599,762
Yreka, 1917	103,142	.....
Washington, Idaho & Montana, 1917	2,581,294	2,582,836
Keeseville, Ausable Chasm & Lake Champlain, 1916	113,619	.....

Railroad Topics at A. S. M. E. Annual Meeting

L. F. Loree, president of the Delaware & Hudson, will be one of the speakers at the Economic Forum to be held in connection with the annual meeting of the American Society of Mechanical Engineers in New York December 4-7. Other speakers at the forum will include F. M. Herr, president of the Westinghouse Electric & Manufacturing Company, whose topic will be The Human Problem in Industry; Doctor W. C. Mitchell and Professor H. R. Seager of Columbia University, and Dean Dexter S. Kimball of Cornell University, president of the society.

Notable among the reports to be presented will be that by the Committee on Training for the Industries, covering recent advances in correspondence work in extension schools, industrial training schools, and training in the works. Among the professional sessions will be one held by the Railroad Division, which will be presided over by the new chairman of the division, James Partington, of the American Locomotive Company.

Meetings and Conventions

The following list gives names of secretaries, dates of next or regular meetings and places of meetings

AIR BRAKE ASSOCIATION.—F. M. Nellis, 165 Broadway, New York City. Next convention, May 14, 1923, Denver. Exhibits by Air Brake Appliance Association.

AIR BRAKE APPLIANCE ASSOCIATION.—J. F. Cotton, The Ashton Valve Company, 318 Washington St., Chicago. Meeting with Air Brake Association.

AMERICAN ASSOCIATION OF DEMURRAGE OFFICERS.—F. A. Pontius, Supervisor of Demurrage and Storage, C. & N. W. Ry., Chicago.

AMERICAN ASSOCIATION OF DINING CAR SUPERINTENDENTS.—L. A. Stone, C. & E. I. Ry., Chicago.

AMERICAN ASSOCIATION OF ENGINEERS.—C. E. Drayer, 63 E. Adams St., Chicago.

AMERICAN ASSOCIATION OF GENERAL BAGGAGE AGENTS.—E. L. Duncan, 332 S. Michigan Ave., Chicago.

AMERICAN ASSOCIATION OF PASSENGER TRAFFIC OFFICERS.—W. C. Hope, C. R. R. of N. J., 143 Liberty St., New York.

AMERICAN ASSOCIATION OF RAILROAD SUPERINTENDENTS.—J. Rathbun, Room 400 Union Station, St. Louis, Mo.

AMERICAN ELECTRIC RAILWAY ASSOCIATION.—J. W. Welsh, 8 W. 40th St., New York.

AMERICAN RAILROAD MASTER TINNERS', COPPER SMITHS' AND PIPE FITTERS' ASSOCIATION.—C. Borchardt, 202 North Hoyne Ave., Chicago, Ill.

AMERICAN RAILWAY ASSOCIATION.—J. E. Fairbank, General Secretary, 75 Church St., New York, N. Y. Annual convention postponed.

Division I—Operating.—J. C. Caviston, 30 Vesey St., New York, N. Y.

Freight Station Section (including former activities of the American Association of Freight Agents).—R. O. Wells, Freight Agent, Illinois Central Railroad, Chicago, Ill.

Medical and Surgical Section.—J. C. Caviston, 30 Vesey St., New York, N. Y.

Protective Section (including former activities of the American Railway Chief Special Agents and Chief Police Association).—J. C. Caviston, 30 Vesey St., New York, N. Y.

Safety Section.—J. C. Caviston, 30 Vesey St., New York.

Telegraph and Telephone Section (including former activities of the Association of Railway Telegraph Superintendents).—W. A. Fairbanks, 30 Vesey St., New York, N. Y. Annual meeting has been indefinitely postponed.

Division II—Transportation (including former activities of the Association of Transportation and Car Account ng Officers).—G. W. Covert, 431 South Dearborn St., Chicago, Ill.

Division III—Traffic.—J. Gottschalk, 143 Liberty St., New York.

Division IV—Engineering.—E. H. Fritch, 431 South Dearborn St., Chicago, Ill. Exhibit by National Railway Appliances Association.

Construction and Maintenance Section.—E. H. Fritch.

Electrical Section.—E. H. Fritch.

Signal Section (including former activities of the Railway Signal Association).—H. S. Balliet, 30 Vesey St., New York, N. Y. Next meeting November 21 and 22, Hotel McAlpin, New York.

Division V—Mechanical (including former activities of the Master Car Builders' Association and the American Railway Master Mechanics' Association).—V. R. Hawthorne, 431 South Dearborn St., Chicago, Ill. Exhibit by Railway Supply Manufacturers' Association.

Equipment Painting Section (including former activities of the Master Car and Loc motive Painters' Association).—V. R. Hawthorne, 431 South Dearborn St., Chicago, Ill.

Division VI—Purchases and Stores (including former activities of the Railway Storekeepers' Association).—W. J. Farrell, 30 Vesey St., New York, N. Y.

Division VII—Freight Claims (including former activities of the Freight Claim Association).—Lewis Pilcher, 431 South Dearborn St., Chicago, Ill.

Car Service Division.—C. A. Buch, 718 18th St., N. W., Washington, D. C.

AMERICAN RAILWAY BRIDGE AND BUILDING ASSOCIATION.—C. A. Lichty, C. & N. W. Ry., 319 S. Waller Ave., Chicago. Exhibit by Bridge and Building Supply Men's Association.

AMERICAN RAILWAY DEVELOPMENT ASSOCIATION.—A. Leckie, Industrial Agent, Kansas City Southern Ry., Kansas City, Mo.

AMERICAN RAILWAY ENGINEERING ASSOCIATION.—(Works in co-operation with the American Railway Association, Division IV.) E. H. Fritch, 431 South Dearborn St., Chicago. Exhibit by National Railway Appliance Association.

AMERICAN RAILWAY MASTER MECHANICS' ASSOCIATION.—(See American Railway Association, Division V.)

AMERICAN RAILWAY TOOL FOREMEN'S ASSOCIATION.—R. D. Fletcher, 1145 East Marquette Road, Chicago. Exhibit by Supply Association of the American Railway Tool Foremen's Association.

AMERICAN SHORT LINE RAILWAY ASSOCIATION.—T. F. Whittelsey, Union Trust Bldg., Washington, D. C.

AMERICAN SOCIETY FOR STEEL TREATING.—W. H. Eiseman, 1600 Prospect Ave., Cleveland, Ohio.

AMERICAN SOCIETY FOR TESTING MATERIALS.—C. L. Warwick, University of Pennsylvania, Philadelphia, Pa.

AMERICAN SOCIETY OF CIVIL ENGINEERS.—Prof. J. H. Dunlap, University of Iowa, Iowa City, Ia. Regular meeting 1st and 3d Wednesdays in month, except July and August, 33 W. 39th St., New York.

AMERICAN SOCIETY OF MECHANICAL ENGINEERS.—Calvin W. Rice, 29 W. 39th St., New York.

Railroad Division.—V. E. Stuebing, Manager Editor, Railway Mechanical Engineer, Woolworth Bldg., New York.

AMERICAN TRAIN DISPATCHER'S ASSOCIATION.—C. L. Darling, 1310-1311 Mallers Bldg., Chicago, Ill. Next convention, June 18, 1923, Chicago.

AMERICAN WOOD PRESERVERS' ASSOCIATION.—S. D. Cooper, A. T. & S. Fe R. R., Topeka, Kan. Next meeting, January 23, 1923, New Orleans, La.

ASSOCIATION OF RAILWAY CLAIM AGENTS.—H. D. Morris, Northern Pacific R. R., St. Paul, Minn.

ASSOCIATION OF RAILWAY ELECTRICAL ENGINEERS.—Jos. A. Andrenccetti, C. & N. W., Room 411, C. & N. W. Sta., Chicago. Exhibit by Railway Electrical Supply Manufacturers' Association.

ASSOCIATION OF RAILWAY EXECUTIVES.—Thomas De Witt Cuyler (chairman), 61 Broadway, New York, N. Y.

ASSOCIATION OF RAILWAY SUPPLY MEN.—A. W. Clokey, 1658 McCormick Bldg., Chicago. Meeting with International Railway General Foremen's Association.

ASSOCIATION OF RAILWAY TELEGRAPH SUPERINTENDENTS.—(See American Railway Association, Division I.)

ASSOCIATION OF TRANSPORTATION AND CAR ACCOUNTING OFFICERS.—(See American Railway Association, Division II.)

BRIDGE AND BUILDING SUPPLY MEN'S ASSOCIATION.—John Nelson, Joseph E. Nelson & Sons, 1-4 South Michigan Ave., Chicago. Meeting with convention of American Railway Bridge and Building Ass'n.

CANADIAN RAILWAY CLUB.—W. A. Booth, 53 Rushbrook St., Montreal, Que.

CAR FOREMEN'S ASSOCIATION OF CHICAGO.—Aaron Kline, 626 North Pine Ave., Chicago. Regular meetings, 2d Monday in month, except June, July and August, Great Northern Hotel, Chicago.

CAR FOREMEN'S ASSOCIATION OF ST. LOUIS, MO.—Thomas B. Koeneke, 604 Federal Reserve Bank Bldg., St. Louis, Mo. Meetings, first Tuesday in month at the American Hotel Annex, St. Louis.

CENTRAL RAILWAY CLUB.—Harry D. Vought, 126 Cortlandt St., New York. Regular meetings, 2d Tuesday in January, March, May, September and November, Hotel Iroquois, Buffalo, N. Y.

CHIEF INTERCHANGE CAR INSPECTORS' AND CAR FOREMEN'S ASSOCIATION.—W. P. Elliott, Terminal Railroad Association of St. Louis, East St. Louis, Ill. Annual convention, November 6-8, Hotel Sherman, Chicago.

CHIEF INTERCHANGE CAR INSPECTORS' AND CAR FOREMEN'S SUPPLY MEN'S ASSOCIATION.—D. B. Wright, 34th St. and Artesian Ave., Chicago, Ill. Meeting with Chief Interchange Car Inspectors' and Car Foremen's Association.

CINCINNATI RAILROAD CLUB.—W. C. Cooder, Union Central Bldg., Cincinnati, Ohio. Meetings, 2d Tuesday in February, May, September and November.

EASTERN RAILROAD ASSOCIATION.—E. N. Hessling, 614 F St., N. W., Washington, D. C.

FREIGHT CLAIM ASSOCIATION.—(See American Railway Association, Division VII.)

GENERAL SUPERINTENDENTS' ASSOCIATION OF CHICAGO.—C. H. Trencheil, Grand Central Station, Chicago. Regular meetings, Wednesday, preceding 3d Friday in month, Room 1414, Manhattan Bldg., Chicago.

INTERNATIONAL RAILROAD MASTER BLACKSMITHS' ASSOCIATION.—W. J. Mayer, Michigan Central R. R., Detroit, Mich. Exhibit by International Railroad Master Blacksmiths' Supply Men's Association.

INTERNATIONAL RAILROAD MASTER BLACKSMITHS' SUPPLY MEN'S ASSOCIATION.—George P. White, 747 Railway Exchange, Chicago. Meeting with International Railroad Master Blacksmiths' Association.

INTERNATIONAL RAILWAY FUEL ASSOCIATION.—J. G. Crawford, 762 E. 51st St., Chicago. Exhibit by International Railway Supply Men's Association.

INTERNATIONAL RAILWAY GENERAL FOREMEN'S ASSOCIATION.—Wm. Hall, 1061 W. Wabash Ave., Winona, Minn.

INTERNATIONAL RAILWAY SUPPLY MEN'S ASSOCIATION.—C. W. Sullivan, Garlock Packing Co., 326 W. Madison St., Chicago. Meeting with International Railway Fuel Association.

MASTER BOILER MAKERS' ASSOCIATION.—Harry D. Vought, 26 Cortlandt St., New York.

MASTER CAR AND LOCOMOTIVE PAINTERS' ASSOCIATION.—(See A. R. A., Division V.)

MASTER CAR BUILDERS ASSOCIATION.—(See A. R. A., Division V.)

NATIONAL ASSOCIATION OF RAILWAY TIE PRODUCERS.—Warren C. Nixon, Western Tie & Timber Co., 905 Syndicate Trust Bldg., St. Louis, Mo.

NATIONAL ASSOCIATION OF RAILWAY AND UTILITIES COMMISSIONERS.—James B. Walker, 49 Lafayette St., New York. Annual convention, November 14th, Hotel Tuller, Detroit, Mich.

NATIONAL FOREIGN TRADE COUNCIL.—O. K. Davis, 1 Hanover Square, New York.

NATIONAL RAILWAY APPLIANCE ASSOCIATION.—C. W. Kelly, People's Gas Bldg., Chicago. Annual exhibition at convention of American Railway Engineering Association.

NEW ENGLAND RAILROAD CLUB.—W. E. Cade, Jr., 683 Atlantic Ave., Boston, Mass. Next meeting, November 14.

NEW YORK RAILROAD CLUB.—Harry D. Vought, 26 Cortlandt St., New York. Regular meetings, 3d Friday in month, except June, July and August, at 29 W. 39th St., New York.

PACIFIC RAILWAY CLUB.—W. S. Wollner, 64 Pine St., San Francisco, Cal. Regular meetings, 2d Thursday in month, alternately in San Francisco and Oakland.

RAILWAY ACCOUNTING OFFICERS' ASSOCIATION.—E. R. Woodson, 1116 Woodward Building, Washington, D. C.

RAILWAY BUSINESS ASSOCIATION.—Frank W. Noxon, 600 Liberty Bldg., Broad and Chestnut Sts., Philadelphia, Pa. Annual meeting and dinner, November 9, Hotel Commodore, New York.

RAILWAY CLUB OF PITTSBURGH.—J. D. Conway, 515 Grandview Ave., Pittsburgh, Pa. Regular meetings, 4th Thursday in month, except June, July and August, Fort Pitt Hotel, Pittsburgh, Pa.

RAILWAY DEVELOPMENT ASSOCIATION.—(See Am. Ry. Development Assn.)

RAILWAY ELECTRICAL SUPPLY MANUFACTURERS' ASSOCIATION.—J. Scribner, General Electric Co., Chicago. Annual meeting with Association of Railway Electrical Engineers.

RAILWAY EQUIPMENT MANUFACTURERS' ASSOCIATION.—R. J. Himmelright, 17 East 42nd St., New York. Meeting with Traveling Engineers' Association.

RAILWAY FIRE PROTECTION ASSOCIATION.—R. R. Hackett, Baltimore & Ohio R. R., Baltimore, Md.

RAILWAY REAL ESTATE ASSOCIATION.—R. H. Morrison, C. & O. Ry., Richmond, Va.

RAILWAY SIGNAL ASSOCIATION.—(See A. R. A. Division IV, Signal Section.)

RAILWAY STOREKEEPERS' ASSOCIATION.—(See A. R. A., Division VI.)

RAILWAY SUPPLY MANUFACTURERS' ASSOCIATION.—J. D. Conway, 1841 Oliver Bldg., Pittsburgh, Pa. Meeting with A. R. A., Division V.

RAILWAY TELEGRAPH AND TELEPHONE APPLIANCE ASSOCIATION.—G. A. Nelson, 30 Church St., New York.

RAILWAY TREASURY OFFICERS' ASSOCIATION.—L. W. Cox, Commercial Trust Bldg., Philadelphia, Pa.

ROADMASTERS' AND MAINTENANCE OF WAY ASSOCIATION.—P. J. McAndrews, C. & N. W. Ry., Sterling, Ill. Annual convention, November 21-23, 1922, Hotel Statler, Cleveland, Ohio. Exhibit by Track Supply Association.

ST. LOUIS RAILWAY CLUB.—B. W. Frauenthal, Union Station, St. Louis, Mo. Regular meetings, 2d Friday in month, except June, July and August.

SIGNAL APPLIANCE ASSOCIATION.—W. K. Edmunds, Sunbeam Electric Manufacturing Company, New York City. Meeting with American Railway Association, Signal Section.

SOUTHERN AND SOUTHWESTERN RAILWAY CLUB.—V. J. Merrill, P. O. Box 1205, Atlanta, Ga. Regular meetings, 3d Thursday in January, March, May, July, September and November, Piedmont Hotel, Atlanta.

SOUTHERN ASSOCIATION OF CAR SERVICE OFFICERS.—J. L. Carrier, Car Serv. Agt., Tenn. Cent. Ry., 319 Seventh Ave., South Nashville, Tenn.

SUPPLY ASSOCIATION OF AMERICAN RAILWAY TOOL FOREMEN'S ASSOCIATION.—H. S. White, 9 N. Jefferson St., Chicago.

TRACK SUPPLY ASSOCIATION.—W. C. Kidd, Ramapo Iron Works, Hillburn, N. Y. Meets with Roadmasters' and Maintenance of Way Association.

TRAVELING ENGINEERS' ASSOCIATION.—W. O. Thompson, 1177 East 98th St., Cleveland, Ohio. Exhibit by Railway Equipment Manufacturers' Association.

WESTERN RAILWAY CLUB.—Bruce V. Crandall, 14 E. Jackson Boulevard, Chicago. Regular meetings, 3d Monday each month except June, July and August.

Traffic News

The New York Central Lines on Monday, October 23, reported shippers as loading a total of 3,978 cars of coal, 308 more than ever were loaded before on these lines in a single day.

The Southern Railway announces the opening of freight offices at San Francisco and Los Angeles, California. H. S. Knapp is the representative at San Francisco, and H. V. Gardner at Los Angeles.

A bulletin issued by the Superintendent of the Rocky Mountain National Park, Colorado, says that during the 1922 season (July 1 to September 10) there were 108,472 visitors to the park, while during July alone, 51,114 people entered, making an average for that month of 1,648 persons a day.

Grain, to the amount of 150 cars a day, is now going east from Port Arthur, Ont., by rail, this movement having been started because of a blockade at Buffalo making it impossible to send grain forward by vessel. Because of lack of cars at Buffalo, the elevators at that city are full, and at the end of last week it was said that 5,000,000 bushels of grain were afloat waiting to be unloaded.

Eastern Box Cars Ordered Returned

The Car Service Division of the American Railway Association, in orders issued on October 26 instructed railroad companies in the Northwestern, Centralwestern and Southwestern districts to return at once box cars on their lines which belong to Eastern roads. These cars are to be loaded and sent east as rapidly as possible.

The order follows a similar one issued the day before by which railroads east of Chicago, Peoria and St. Louis were instructed to send west immediately all box cars belonging to western roads in order to enable the roads in the western agricultural states to meet the box car shortage that exists in that part of the country, the box cars of western roads being built especially to transport grain.

Under this latest order the western carriers are told to discontinue using locally, in station-to-station service, box cars belonging to eastern roads.

Through this series of orders the railroads in both the eastern and western districts will more nearly be able to supply the class of cars required to meet the demands of shippers in their particular sections.

Increase in Express Rates Asked

The Interstate Commerce Commission on October 26 made public a petition filed with it by the American Railway Express Company on behalf of itself and the railroads over whose lines it operates for authority to make increases in its rates and certain changes in classification and ratings. At the same time the commission issued an amendment to its order calling for a general investigation of interstate express rates, which had been set for hearing at Washington on November 20 to include within the investigation the reasonableness and propriety of the proposed revised rates. In the petition the company mentioned no specific amount of increase, but presented evidence to show that the present rates are inadequate. The company conducted its business without profit from July 1, 1918, to September 1, 1920, the government bearing the loss of approximately $70,000,000. In 1921 there was a deficit in the conduct of the express business by the railroads and the company of $39,171,191 and the deficit for 1922 is estimated at $13,000,000, not allowing anything for a return on the investment of the express company or those of the railroad companies.

Both the express and railroad companies, the petition said, have conducted their business on the most economical basis consistent with good service. While the costs of operation have been declining, due to a gradual return to normal of all operating expenses and general conditions, the petitioner believes that the ratio of operation expense will continue practically the same in the future so that there will be at least the same deficit in 1922 and 1923 and future years unless an increase in express rates is granted. It is also stated that the net operating income of the Class I railroads for the first six months of 1922 was only 4.4 per cent on their total valuation, plus additions and betterments to September 30, 1921. The company says that an increase in rates is necessary to pay operating expenses, taxes and a fair return on the property devoted to that service and it is also desirable that certain changes be made in classification and ratings which will be proposed in detail at the hearing.

Coal Production

Preliminary returns on coal production in the fourth week of October indicate a total of 12,500,000 net tons, of which about 10,400,000 tons is bituminous coal and 2,100,000 is anthracite, according to the weekly bulletin of the Geological Survey. Revised estimates for the third week show 10,365,000 tons of bituminous and 2,003,000 tons of anthracite. The gain in the rate of production during the past two weeks reflects some improvement in the transportation situation which, however, remains the principal factor limiting output. The rate of output is approaching adequacy but does not yet assure sufficient coal to meet current needs.

The outstanding feature of the mine reports for the week of October 14 was the gradual improvement in car supply. Districts in which working time increased because of better railroad service were Illinois, Northern Ohio, Westmoreland, Central Pennsylvania, Pocahontas, Tug River, Kenova-Thacker, Northeastern Kentucky, and the Southwest interstate region. In the Pittsburgh district in Northern West Virginia, Alabama, and the Rocky Mountain States, however, losses of working time ascribed to transportation disability increased.

Even in the Pocahontas field where some improvement was noted operators alleged the loss of 55.8 per cent because of railroad disability. In the Winding Gulf, Logan, Hazard and Harlan fields the loss exceeded 70 per cent.

Labor as a factor limiting mine working time is now important only in the Cumberland-Piedmont, Kanawha, and Connellsville regions. In addition, however, many mines are working shorthanded in the Somerset, Westmoreland and Connellsville district of Pennsylvania.

Reports of declining prices at the mines have yet to be reflected in mine idleness through no market, except in the Trans-Mississippi States. East of that river only two mines reported loss of time through lack of orders. West of the river, however, indications of no market were received from Iowa, Missouri, Kansas, Oklahoma, Texas, Colorado and Washington.

Although the tonnage of soft coal dumped into vessels at Lake Erie ports has declined steadily during the past month, and in the week of Oct. 16-22 was at the rate of about 1,000,000 tons, the tonnage remains much larger than at the same date a year ago. Anthracite shipments from Buffalo during the week ended October 17 were 113,300 net tons and in the week ended October were 119,100 tons.

According to the Ore and Coal Exchange the total soft coal handled at Lake Erie piers during the week ended October 24 was 1,004,094 net tons as compared with 1,090,599 tons in the week preceding. In comparison with the corresponding week a year ago this was an increase of 69 per cent.

During the present season to October 22, inclusive, 12,855,130 tons of cargo coal (bituminous) have been dumped into vessels at Lake Erie piers.

According to reports received by the Car Service Division of the American Railway Association, the total loading of bituminous coal in the week ending October 28 was 190,276 cars. This exceeded the week before by 3,981 cars which up to that time had marked the peak. Loading of anthracite coal totaled 32,927 cars which was a decrease of 4,189 cars compared with the week before. During the first five days last week loading averaged 6,508 cars daily, but on Saturday, because of the holiday (Mitchell Day) only 385 cars were loaded.

More cars were loaded with bituminous coal on Monday than on any day in approximately three years, with the exception of one in 1920, according to reports received by the Car Service Division of the American Railway Association. The total was 45,298 cars. This was only exceeded in the three-year period on November 22, 1920, when the total was 45,457 cars or only 159 cars greater. The records of the Car Service Division do not go back prior to 1920.

Commission and Court News

Interstate Commerce Commission

The commission has issued a decision finding proposed increases in rates on iron and steel articles rated as special iron in Southern classification from Ohio river points, St. Louis and points taking the same rates to points in Carolina territory, Augusta, Ga., and South Atlantic ports and points taking the same rates, to have been justified in part. The suspended schedules were ordered cancelled without prejudice to the establishment of rates in conformity with the commission's findings.

State Commissions

The Railroad Commission of Tennessee has ordered 12 railroads to appear on November 9 and show cause why they should not furnish cars for the transportation of gravel and other material for use in highway construction. The commission believes that the railroads have been furnishing open top cars for use in carrying classes of freight not authorized by orders which require such cars to be used for coal, food and other commodities classed as essentials.

Service on M., D. & G. Ordered Restored

The Arkansas Railroad Commission has ordered that operations on that portion of the defunct Memphis, Dallas & Gulf, between Hot Springs, Ark., and Glenwood, must be resumed within 90 days. At present the new owners are operating the M., D. & G. only between Ashdown, Ark., and Shawmut, under the name of the Graysonia, Nashville & Shawmut. The Commission, however, has held that the entire line between Hot Springs and Ashdown is owned by one interest and must be operated throughout.

Court News

Necessity for Evidence of Value of Damaged Shipment

In a suit for damages to a shipment of celery and cucumbers while delayed in transit, there was evidence that the goods were of some value after being damaged, but no evidence as to this value at the time they were offered by the carrier to the consignee. The Georgia Court of Appeals holds that a verdict for the plaintiff was without evidence to sustain it. Evidence of the selling price on the day following was insufficient, the goods being subject to rapid deterioration.—American Ry. Express Co. v. Dubois Bros. (Ga. App.) 111 S. E. 70.

Violation of Commission's Order as to Use of Ladders on Cars

The federal district court for the Western District of Michigan holds that the Interstate Commerce Commission's order that all cars having sides more than 36 inches high must be equipped with side ladders is final and not subject to review or change by the courts. Where interstate ore cars, no longer required for carrying ore, were reconstructed to carry limestone by adding a superstructure over 36 inches high, which would be so used as long as the limestone traffic continued, the superstructure was held not temporary, and its use without ladders was a violation of the order subjecting the railroad to the penalty therefor.—United States v. Duluth S. S. & Atlantic, 281 Fed. 347.

What Is a Secure Sill Step?

The Circuit Court of Appeals, Fourth Circuit, holds that the requirement of the Safety Appliance Act of "secure sill steps" means "steps which furnish secure footing for employees having to use them," and it was a question for the jury whether slickness of an engine sill step rendered it not a secure one within the act. Knapp, Circuit Judge, dissented, on the ground that thus to hold was to bind the railroad to keep the step continually new, which would be practically impossible, "and is effect to hold that in the matter of safety appliances the railroad company is an insurer, which is not the law." It should be said that the court regarded the case as a close one on the question as to whether it should go to the jury.—Davis v. Reynolds, 280 Fed. 363.

United States Supreme Court

No Reparation to Shippers for Loading Services

The Supreme Court of the United States has reversed the judgment of the Court of Appeals of the District of Columbia (277 Fed. 538) directing the issue of mandamus requiring the Interstate Commerce Commission to take jurisdiction of the claims of the Waste Merchants' Association of New York for allowances, under section 15 of the Act to Regulate Commerce, for loading services in respect of paper stock shipped in carload lots from New York harbor, which services had been imposed upon the shippers, members of the association, by the carriers' failure to perform that duty, and to allow damages and fix the amount thereof. The Supreme Court finds that the commission did not dismiss the complaint for lack of jurisdiction, but heard the case fully, and dismissed the demand for allowances because it held the shippers were not entitled to relief. It found that "the rates charged were not unreasonable or discriminatory (in violation of the Commerce Act) nor unreasonable for the service actually performed (in violation of the Federal Control Act). It found that the conditions complained of were an incident of the World War; that the arrangement for loading was a voluntary one beneficial to shipper; that there was no provision in the tariffs for allowance to shippers who load cars; and that, therefore, such allowance could not legally be made by the carriers."

Petitioners sought in the proceeding to set aside the adverse decision of the Commission on the merits and to compel a decision in their favor. The Court of Appeals granted the writ. This was error. Mandamus cannot be had to compel a particular exercise of judgment or discretion, Riverside Oil Co. v. Hitchcock, 190 U. S. 316; Ness v. Fisher, 223 U. S. 683; Hall v. Payne, 254 U. S. 343; or be used as a writ of error, Commissioner of Patents v. Whitely, 4 Wall. 522.

Whether a judicial review of the Commission's decision could be had by some other form of proceeding the Supreme Court considered it unnecessary to enquire.

The original complaint of the association, filed March 11, 1919, was directed against the Director General of Railroads and 184 transportation companies. Reparation was sought to the extent of "a reasonable allowance per ton or per car for lighterage services performed, and which are presumed to be performed by defendants," and "liquidated damages for violation of said act to regulate commerce and said federal control act." The allegation as to disregard of the tariff provisions in respect to lighterage was abandoned. The proceedings before the Interstate Commerce Commission showed that either the carriers or the shippers suggested that the movement of paper stock would be facilitated if the shippers were willing to load their paper stock into empty cars for outbound movement. The evidence was somewhat conflicting as to the origin of this suggestion. However, from the evidence as whole, there was little doubt that an agreement, tacit or expressed, was arrived at between the carriers and shippers of paper stock by which the latter undertook to do their own loading of the cars, if they were permitted to drive their trucks on to the carriers' piers, having but short periods of waiting. The complainant's members were thus enabled to withdraw their trucks from the long lines of vehicles containing miscellaneous commodities and to form lines consisting exclusively of paper stock, obviating great delays and the consequent additional trucking expense. The Commission held (57 I. C. C. 686) that such a mutual arrangement was unquestionably for the benefit of both parties under war-time conditions. Nothing in the act requires that a shipper must be reimbursed for transportation service that he may elect to perform primarily for his own convenience. Section 15, the Commission held, was intended merely to provide against excessive allowances to owners of shipments for services connected with transportation. The other findings of the Commission are stated in the above quotation from the Supreme Court's opinion. Interstate Commerce Commission v. United States ex rel. Waste Merchants' Association of New York. Decided October 23, 1922. Opinion by Mr. Justice Brandeis.

Foreign Railway News

Performance of British Railways in 1921

The Ministry of Transport of Great Britain has issued a volume of statistics covering the operation of British railways in 1921. The average return to capital for the year's operations was 4.28 per cent. This return was possible only with government compensation, the roads having operated at a deficit amounting to £5,892,000.

1,000 Employees of English Road Are Attending Classes in Transportation

The North Eastern Railway, England, has in operation a very comprehensive program for the training of clerical employees.

Most entrants into the service come in between the ages of 15 and 17. They are required to pass an examination in regard to physical fitness and a written examination in English composition, arithmetic, geography and other elementary subjects. A high standard is maintained and only about 25 per cent of the applicants succeed in gaining employment. The successful ones are then placed on probation for a period of not less than a year. Every clerk is expected to become proficient in shorthand within a reasonable time after entering the service and, after a year's probation, he is called upon to pass an examination in that subject. At the age of 17½, a junior clerk is eligible for a qualifying test in shorthand and typewriting, telegraphy, or some kindred subject and if he passes this examination, he is advanced to the position of fifth class clerk at the age of 18. These tests are compulsory.

In addition to these there are voluntary examinations on the following subjects:

A. Train Signaling; Train Operation by Telegraph Block; General Rules and Regulations.
B. 1. Freight Station Work and Accounts, or
2. Passenger Station Work and Accounts, or
3. Locomotive and Car Accounts and Statistics, or
4. Engineering Accounts and Office Work.
C. Railway Operation.
D. Railway Economics.
E. Railway Law.
F. Railway and Commercial Geography of the United Kingdom.
H. An examination on any other cognate subject.

Preparation for these examinations in subjects A to F, as given above, is offered in classes held during the winter months at various terminals along the railway. Three classes of certificates are issued for passing marks in any of the subjects and a final certificate is granted to any employee who qualifies in five of the subjects, which must include subjects A and B and at least two from C to F inclusive. For success in passing any subject from C to F, money prizes are given as follows:

	£	s.
Class 1 Certificate	5	5
Class 2 Certificate	2	2
Class 3 Certificate	1	1

In addition, a prize of £5 5s. is given to each student who obtains a final certificate within a period of five years.

Instruction in some of the branches in which employees are examined is given in conjunction with the Universities of Durham and Leeds and lectures are given by competent and learned instructors. Each course consists of 20 lectures. The classes are popular and nearly 1,000 students have enrolled for work during the winter months.

Above this program of instruction is the "traffic apprenticeship." The company has about 30 traffic apprentices who are appointed as the result of competitive examinations in the following subjects:

1 Accounts, Block Operation, General Rules and Regulations.
2 Railway Operation.
3 Railway Economics.
4 A General Paper.
5 An Essay.

These examinations are conducted by the University of Leeds and Armstrong College, Newcastle. The company appoints the five candidates who make the highest marks as traffic apprentices and it may also select any other student who has done particularly well. The traffic apprentice goes through a strenuous course of training lasting three years. He serves in many departments and his progress is constantly watched by the officers of the company. A limited number of traffic apprentices have been appointed from outside the service, notably from graduates of colleges and universities.

The *Railway Age* is indebted to the Railway Gazette (London) for the above information.

Control of Chinese Eastern Relinquished

Secretary Hughes of the State Department has addressed a note to the Chinese government announcing that, following the withdrawal of allied troops from Siberia, the United States Government has followed the action of Great Britain, France, Italy and Japan in relinquishing its participation in the inter-allied control of the Chinese Eastern Railway. The control was established by an agreement in connection with the dispatch of American and allied troops to Siberia in 1918. The representatives of the United States on the inter-allied committee at Vladivostok and the technical board at Harbin have been instructed to proceed to the winding up of the affairs of each organization and the termination of further activity as of October 30.

"The government of the United States takes this occasion," Secretary Hughes said, "also to reaffirm its concern in the preservation of the Chinese Eastern Railway with a view to its ultimate return to those in interest without the impairing of any existing rights, as well as its continued interest in the efficient operation of the railway and its maintenance as a free avenue of commerce open to the citizens of all countries without favor or discrimination.

"Having regard to its concern in these matters, and to the important contributions which it has made to the maintenance and operation of the railway during the last four years, both materially and through the services of the distinguished American engineer, Mr. John F. Stevens, and his assistants, the government of the United States will not fail to continue to observe carefully the administration and operation of the railway and the manner in which the government of China discharges the obligations it has assumed.

"At the same time the government of the United States desires to assure the Chinese government of its friendly interest and goodwill and its readiness to assist or co-operate with the government of China and the other powers concerned at any time in any practicable way with a view to conserving the railway and assuring its efficient operation in the interest of all concerned."

Planning for Heavy Passenger Traffic at British Empire Exhibition at Wembley, Near London, in 1924

Railway Officers Inspect Site of Exhibition to Make Preliminary Plans—From Left to Right, Back Row: Col. Stone, in Charge of Exhibition, and Mr. Derry of the London & South Western—Middle Row: Messrs. Hamlin (Great Northern), Oddy (G. N.), Smith (Great Central), Crabtree (Great Western)—Front Row: Messrs. Daniels (G. N.), Dennis (London, Brighton & South Coast), and Milton (L. & S. W.)

Equipment and Supplies

Locomotives

THE PHILADELPHIA & READING is arranging to build 5 Pacific type locomotives in its Reading shops.

THE GREAT NORTHERN denies a current rumor that it expects to come into the market soon for a number of locomotives.

THE TENNESSEE CENTRAL, reported in the *Railway Age* of October 28 as contemplating the purchase of 4 Mountain type locomotives, has deferred buying for the present.

THE SEABOARD AIR LINE has ordered one locomotive from the American Locomotive Company. It has also ordered one locomotive from the Baldwin Locomotive Works and one from the Lima Locomotive Works.

THE SOUTHERN PACIFIC, TEXAS LINES, reported in the *Railway Age* of October 14 as inquiring for 9 Pacific type locomotives, has ordered this equipment from the Baldwin Locomotive Works.

THE CHESAPEAKE & OHIO, reported in the *Railway Age* of September 30 as inquiring for 2 Mountain type and 6 Pacific type locomotives, has ordered this equipment from the American Locomotive Company.

THE CENTRAL OF NEW JERSEY, reported in the *Railway Age* of October 14 as inquiring for 10 Mikado type locomotives, has ordered this equipment from the American Locomotive Company. This company is now asking for 4 Pacific type locomotives.

THE ILLINOIS CENTRAL reported in the *Railway Age* of October 28 as inquiring for about 75 locomotives, has ordered 85 Mikado type locomotives from the Lima Locomotive Works. It is expected that this road will place an order soon for 40 additional locomotives.

THE TOLEDO TERMINAL, reported in the *Railway Age* of October 21 as contemplating the purchase of three switching locomotives, has placed an order with the American Locomotive Company for one six-wheel switching locomotive and two Consolidation type locomotives.

Freight Cars

THE MISSISSIPPI CENTRAL is inquiring for from 100 to 200 flat cars.

THE CORNWALL RAILROAD is inquiring for 40 ore cars of 50 tons' capacity.

THE GENERAL ELECTRIC COMPANY is inquiring for 2 tank cars of 10,000 gal. capacity.

THE CHARLESTON & WESTERN CAROLINA has ordered 100 single sheathed box cars of 40 tons' capacity from the Standard Tank Car Company.

THE BEACON OIL COMPANY, Boston, Mass., has ordered 50 tank cars of 8,000 gal. capacity from the American Car & Foundry Company.

THE PENNSYLVANIA SALT MANUFACTURING COMPANY, Philadelphia, Pa., has placed an order with the General American Car Company for 3 flat cars of 30 tons' capacity.

THE MINNEAPOLIS, ST PAUL & SALT STE. MARIE has ordered 500 box cars and 250 gondola cars from the Pullman Company and 500 box cars from the American Car & Foundry Co.

THE ST. LOUIS SOUTH WESTERN is inquiring for 500 double sheathed box cars of 40 tons' capacity, 500 automobile cars of 40 tons' capacity. The company is also inquiring for 200 ballast cars of 50 tons' capacity.

THE CHICAGO & NORTH WESTERN, reported in the *Railway Age* of October 14 as inquiring for 800 steel ore cars of 50 tons' capacity, has ordered this equipment from the Pullman Company.

THE WESTERN PACIFIC, reported in the *Railway Age* of October 28 as inquiring for 800 general service gondola cars and 500 stock cars, is inquiring for 500 to 1,000 of the latter. Some reports state that this equipment is to be used by the Denver & Rio Grande Western.

Iron and Steel

THE NORTHERN PACIFIC is reported to have divided an order for 35,000 tons of rail.

THE CHICAGO & NORTH WESTERN has ordered 40,000 tons of rail from the Illinois Steel Company.

THE MISSOURI PACIFIC has ordered 118 tons of structural steel from the Virginia Bridge & Iron Company.

THE ILLINOIS CENTRAL is reported to have divided an order for 30,000 tons of rail of which the Inland Steel Company received 10,000 tons.

THE VIRGINIAN RAILWAY has ordered from the Bethlehem Steel Bridge Corporation 5,700 tons of steel for a coal pier at Sewalls Point, Norfolk, Va.

THE GREAT NORTHERN has closed bids for one steel oil tank of 65,000 gal. capacity, including all steel work fabricated for erection.

THE GRAND TRUNK has placed an order with the British Empire Steel Corporation for 25,000 tons of 100-lb. rails. The rails will be rolled at the Sydney, N. S., plant of the Dominion Steel Corporation.

THE SOUTHERN PACIFIC has ordered 43,400 tons of rail from the Tennessee Coal Iron & Railroad Company and 1,600 tons from the Lorain Steel Company. This is in addition to 76,000 tons previously placed by this company for delivery in 1923, as already reported in the *Railway Age*.

Track Specialties

THE MICHIGAN CENTRAL is inquiring for about 11,000 kegs of spikes.

THE NEW YORK CENTRAL is reported to have divided about 25,000 kegs of bolts and 15,000 kegs of spikes between the Oliver Iron & Steel Company, the United States Steel Corporation, the Inland Steel Company and the Buffalo Bolt Company.

Machinery and Tools

THE NEW YORK CENTRAL is inquiring for one crank planer.

THE CHICAGO, ROCK ISLAND & PACIFIC has placed an order with the Whiting Corporation for a 200-ton transfer table.

THE ST. LOUIS SOUTHWESTERN is inquiring for two boring mills, a centering machine, a cutter, a reamer grinder and two emery stands.

THE CANADIAN NATIONAL is inquiring for one 32-in. by 32-in. crank planing machine, one 18-in. by 8-ft. lathe and one close quarter pneumatic drill.

THE CHICAGO & NORTH WESTERN is inquiring for six lathes, three grinding emery wheel stands, three power hack saws, two drill presses, two crank planers, one spot welding machine, one centering machine and one power hammer.

Signaling

THE ANN ARBOR has placed an order with the General Railway Signal Company for a 72-lever electric interlocking machine to be installed at Boulevard (Toledo), Ohio. The order also includes an illuminated track diagram, relays, position-light signals and replacement of storage batteries and charging outfit.

Supply Trade News

John G. Turpie has been appointed assistant to the president and B. W. Lockwood to consulting engineer of the Standard Tank Car Company, Sharon, Pa.

H. P. Hevenor has joined the staff of Dwight P. Robinson & Company, Incorporated, New York, as consulting engineer. He was until recently a member of the firm of Engel & Hevenor, Incorporated, where he specialized in track construction.

Dwight P. Robinson & Company, Incorporated, New York, is now at work on the design and construction of an extension to the plant of the American Rolling Mill Company at Ashland, Ky. The extension will include a jobbing and sheet mill and a galvanizing plant.

J. T. Mullaney, signal supervisor of the Chicago, Milwaukee & St. Paul, with headquarters at Deer Lodge, Mont., has left to enter the service of the Union Signal Construction Company, and will take charge of the installation of an interlocking plant for the new Chicago Union station.

G. P. Atkinson, for several years connected with the sales department of the Weston Electrical Instrument Company, Newark, N. J., has established an office at Atlanta, Ga., to represent that company in Georgia, South Carolina and northern Alabama. In addition to Weston instruments, Mr. Atkinson will represent several other electrical equipment companies.

Joseph T. Ryerson & Son Celebrates Eightieth Anniversary

One of the oldest companies in the railway supply business in this country is Joseph T. Ryerson & Son, which this month celebrates its eightieth anniversary. The history of the company and the earlier connection of the Ryerson family with the iron industry in this country are fascinating chapters in the development of industry and transportation in America.

Shortly after New Jersey was granted to Lord Berkeley,

Old Warehouse on South Water Street, Chicago, Occupied by Joseph T. Ryerson from 1852 to 1872

George Ryerson and a syndicate purchased 6,000 acres of land in the northern part of the state. In 1695 the development of this tract for agricultural purposes was begun. Later ore fields were discovered and developed so that Mr. Ryerson and his associates were among the first to work the iron mines in this region. His son, Marten Ryerson, further developed iron production and quite an amount of pig iron was made as early as 1740. The Ringwood and Wynokie mines in this region supplied the colonial army with great quantities of munitions material and equipment during the Revolutionary War.

About 1790 Marten's son, Thomas Ryerson, moved to Philadelphia and started business as a wholesale dealer in finished iron and steel products. Joseph, the son of Thomas Ryerson, continued in the same business. Hearing the call of the west, he started for Chicago in 1842, as the agent of Wood, Edwards & McKnight of Pittsburgh.

Some idea of the development of the country at this time can be gained from the transportation facilities. On his trip he went by railroad from Philadelphia to Columbia, Pa., then by stage coach to Pittsburgh and Cleveland; by boat to Detroit; by railroad to Jackson, Mich.; by stage to St. Joseph, Mich., and by boat to Chicago. The journey took eight days and he arrived November 1, 1842.

The rent for Mr. Ryerson's first store near Clark and Water streets, was $200 a year. From this small beginning has developed the present company. As business expanded, Mr. Ryerson moved first to Lake street and then to South Water street where the warehouse was located for many years.

Joseph T. Ryerson died in 1883 and his son, Edward L. Ryerson, succeeded him at the head of the business. The company was incorporated as Joseph T. Ryerson & Son in 1888. In 1908 the first buildings of the present Chicago plant were erected. They have been gradually expanded since until they now occupy over 19 acres. Other plants were establishd in St. Louis in 1914; in New York in 1915; in Detroit in 1917, and in Buffalo in 1919. The five plants now cover 40 acres, having a combined floor space of nearly 1,500,000 sq. ft.

Obituary

E. A. Hurlbut, formerly western railway sales representative of the Crouse-Hinds Company, with headquarters at Chicago, died in Evanston, Ill., on October 9.

William Blake Wood, president of Gifford-Wood Co., Hudson, N. Y., died on October 28 at the Albany City Hospital, after a two weeks' illness. Mr. Wood was born in Arlington, Mass., on July 15, 1869. He became a member of the firm of William T. Wood & Co., of Arlington, upon the death of his father, Cyrus, in 1896 and continued as a partner with William E. Wood, and later as a member of Gifford-Wood Co. when it was incorporated in 1905. He moved with his family to Hudson in 1911 and succeeded Malcolm Gifford as president upon the latter's death in 1919.

Trade Publications

Fireproof Construction for Small Coaling Stations.—The Roberts & Schaefer Company, Chicago, has issued a folder illustrating and describing one of the most recent developments in coaling station construction, namely, the application of reinforced concrete, permanent construction to coaling stations of 100 tons storage capacity, serving either one or two tracks. The descriptive matter shows how a permanent and reliable plant can be obtained for a moderate outlay.

Steel Structures.—The McClintic-Marshall Company, Pittsburgh, Pa., has recently issued a leather bound, 70-page book containing illustrations of structures erected by this company. A short introduction states that the pictures is the simplest and most direct method of transferring ideas and that this book is a form of picture writing. Other than this and the titles under the illustrations, there is no printed text. Sixty-four pages are devoted to full-page illustrations of a large number of steel structures covering power houses, enginehouses, erecting shops, warehouses, freight houses, office buildings, pier sheds, and other types.

The Wabash Railroad, by a notice issued by J. E. Taussig, president, has offered a reward of $1,000 for information leading to the arrest and conviction of the person or persons guilty of derailing train No. 2 on October 19, near Williamsport, Ind. The derailment resulted in the deaths of three members of the crew and some injuries to passengers.

Railway Construction

BANGOR & AROOSTOOK.—This company has awarded a contract to the Howlett Construction Company, Moline, Ill., for a coaling station with 50 tons' ground storage and a 25 tons' overhead storage, using automatic machinery, at Squa Pan, Me.

LOUISVILLE & NASHVILLE.—This company has awarded a contract to the H. K. Ferguson Company, Cleveland, Ohio, for the construction of a freight house 60 by 600 ft. with a second story at one end for offices, at Knoxville, Tenn., to cost approximately $150,000.

MISSOURI PACIFIC.—This company has awarded a contract to T. S. Leake & Company, Chicago, for the construction of a frame engine house 90 by 200 ft. with a composition roof at Pueblo, Col.

PENNSYLVANIA.—This company has just completed and placed in service at Pitcairn, Pa., a modern 34-stall enginehouse with turntable at a cost of $1,385,000. The turntable is 110 ft. long and electrically operated. Each stall is 140 ft. long and so constructed that it can be completely enclosed. The building is steam heated.

PENNSYLVANIA.—This company is asking for bids for the completion of the substructure for the Cherry street undergrade bridge, Erie, Pa. The approximate quantities are as follows: 600 cu. yds. foundation excavation; 400 cu. yds. concrete foundation masonry; and 770 cu. yds. concrete abutment masonry. The use of slag concrete will be permitted. The work will be in charge of George Nauman, assistant to the chief engineer, Pittsburgh, Pa.

PENNSYLVANIA.—This company has undertaken improvements and extensions to cost $900,000 at its Enola Yard on its low grade freight line three miles west of Harrisburg, Pa. The purpose of the improvement is to facilitate the movement of through freight and to provide enlarged facilities for the handling of through preference shipments and scheduled freight trains, in all directions and from all points, east, west, north and south. The work includes the erection of a new steel freight car repair shop, 100 ft. by 620 ft., the building of which has already been begun.

PENNSYLVANIA.—This company is asking for bids for all the work necessary to complete the strengthening of the bulkhead of the American Agricultural Chemical Company's warehouse at Baltimore, Canton, Md. The approximate quantities are as follows: 4,300 tons stone (1 and 2 men) furnished and placed; 9,600 sq. ft. four-inch concrete flooring; 300 cu. yd. back fill and excavation; and 25 piles, 40 ft. long, 14 in. butts, in place. The work is in charge of J. W. Craig, assistant engineer, Baltimore, Md.

PENNSYLVANIA.—This company proposes the installation of extensive waterfront facilities at Little Creek, near Norfolk, Va., where it has purchased about 1,000 acres of land together with water rights. At present the road enters Norfolk direct by car ferry from Cape Charles. In the proposed development car ferry service will terminate at Little Creek and entrance to Norfolk will be effected by trackage rights over other roads. The improvement includes the construction of a modern freight warehouse at St. Julian avenue, Norfolk. At Little Creek a complete rail-water terminal will be constructed. This work will involve the expenditure of some $3,000,000.

TENNESSEE CENTRAL.—This company will replace the machine shop, blacksmith shop, tin shop and woodworking plant at Nashville, Tenn., destroyed by fire on October 27.

VIRGINIAN.—This company will build a new steel coal pier at Sewell's Point, Norfolk, Va., to cost approximately $3,000,000. The new pier, it is reported, will be 1,073 ft. long, 86 ft. wide and 74½ ft. high. It will be completely equipped with modern coal dumping machinery and, it is reported, will have a dumping capacity of about 6,000 tons an hour and will double the company's coal dumping capacity at Sewalls Point.

Railway Financial News

ATCHISON, TOPEKA & SANTA FE.—*To Redeem Equipment Notes.*—In addition to the $4,000,000, series C, 6 per cent equipment trust notes maturing on January 15, 1923, this company will retire the remaining $5,884,800 of its 6 per cent equipment notes, at 103, on that date. The total issue of these 6 per cent equipment notes was $7,356,000, and they were issued in 15 series, maturing on the 15th of January from 1921 to 1935.

BOSTON & MAINE.—*Asks Authority to Issue Bonds.*—This company has applied to the Interstate Commerce Commission for authority to issue $4,000,000 of 6 per cent bonds to be issued for refunding purposes. Merrill, Oldham & Co. have offered 87.89 for $3,000,000 of the bonds with an option on $1,000,000 additional at the same figure.

CAROLINA & YADKIN RIVER.—*Asks Authority to Abandon Line.*—This company has applied to the Interstate Commerce Commission for a certificate authorizing the abandonment of its line from High Point to High Rock, N. C., 35 miles.

CENTRAL INDIANA.—*Receivership.*—William P. Herod, of Indianapolis, was appointed receiver for this road on October 31 by Federal Judge A. B. Anderson on the petition of the Union Trust Company, of New York.

The Central Indiana operates between Muncie, Ind., and Brazil, 127 miles.

CENTRAL VERMONT.—*Equipment Notes Offered.*—Plympton, Gardiner & Co. and Paine, Webber & Co. are offering $754,000 6 per cent equipment trust notes, series E, at prices to yield from 5 per cent to 5.75 per cent, according to maturity. The notes are dated May 1, 1922, and mature $49,000 semi-annually from November 1, 1922, to May 1, 1927, and $44,000 semi-annually from November 1, 1927, to May 1, 1930. The first semi-annual instalment of $49,000 was paid on November 1. The notes are issued to provide part payment for 500 30-ton rebuilt box cars and 200 50-ton rebuilt coal cars, purchased at a contract cost of $1,107,571.

CHICAGO & EASTERN ILLINOIS.—*Asks Authority to Issue Bonds.*—This company has applied to the Interstate Commerce Commission for authority to issue $989,000 of 5½ per cent prior lien bonds for the purpose of partially reimbursing the treasury for cash payments for cars and locomotives. It is proposed to sell the bonds to Kuhn, Loeb & Co., at 95.

CHICAGO GREAT WESTERN.—*Asks Authority for Equipment Notes.*—This company has applied to the Interstate Commerce Commission for authority to issue 40 notes aggregating $906,573 at 5½ per cent, maturing quarterly from June 15, 1923, to March 15, 1933 to the Pullman Company in payment of 75 per cent of the cost of 500 box cars at $1,850 each.

CLEVELAND, CINCINNATI, CHICAGO & ST. LOUIS.—*New Directors.*—Albert H. Harris and Warren S. Hayden have been elected directors to succeed A. T. Hardin and William Rockefeller, deceased. Bertram Cutler has also been elected a director.

DENVER & RIO GRANDE.—*Deposit Date Extended.*—The Sutro committee has extended the time for the deposit of bonds with the American Exchange National Bank to December 4, 1922. A statement issued by the committee said in part:
