The Genuine GOLD MEDAL Electric Washing Machine on

## 4 Weeks Trial

Sensational offer—send coupon for free catalog. The world's best machine—the winner of the Gold Medal at the Panama-Pacific Exposition in 1915—sent direct to your home for four weeks of washing *without a penny down!* Convince yourself *first*. No risk to you. Not a penny of cost—not even freight charges—if not satisfied. And:— for a limited time, on a special factory output, only

# \$99.50!

Yes, \$99.50 net—the genuine Gold Medal machine—the best of all machines, washes as well as any make at any price—the very best. The factory price direct to you—less than the price dealers have been paying and are paying right today for this same machine, for this exact, identical 1921 model. And besides—*special easy monthly terms—as low as*

## \$4.00 a Month!

Easy terms depending upon amount of first payment—but no money in advance—four weeks' trial first—then, if satisfied, a year to pay!

# Catalog Free

### 5000 of These

1921 Model Gold Medal Washing Machines were offered to us by the manufacturer (who was overstocked) at the factory cost for quick sale. We guarantee that these machines were formerly priced by the factory, to sell at \$150.00 up. But on this factory output offer, only \$99.50 direct to you—the equal in value of other machines at huge prices—\$150.00 and up. And on 4 weeks free trial and easy terms.

**Straus & Schram, Dept. B406**  
West 35th Street Chicago, Illinois

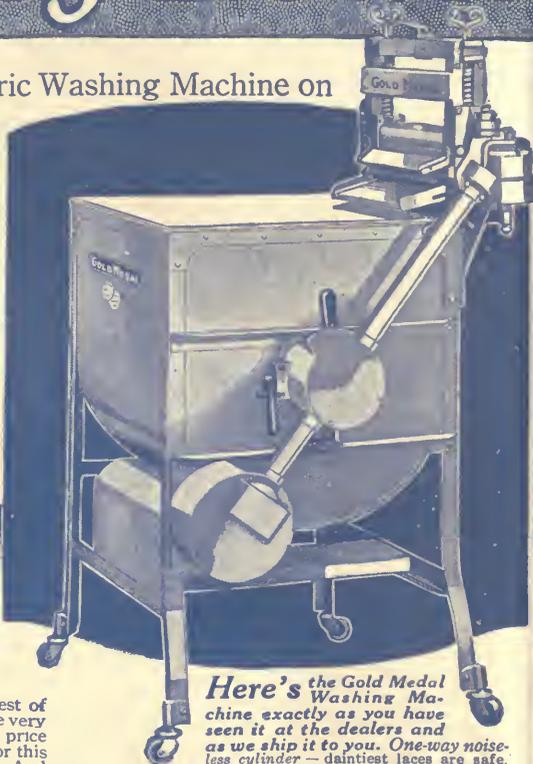

Send coupon—no obligation. Get our completely illustrated catalog, FREE. Learn about our special factory output offer:—5,000 Genuine Gold Medal Electric Washing Machines, 1921 Model, *while they last* \$99.50! First come, first served. Don't wait—send for catalog now!

NUMBER 1

## Public Has a Moral Obligation Toward Property in Its Service

*E. I. Lewis, New Member of Interstate Commerce Commission, Sees a Duty on Both Sides*

THE public has a moral obligation to provide adequate maintenance, replacement and return on property dedicated to the public service, E. I. Lewis, member of the Interstate Commerce Commission, declared in an address which he delivered June 2 before the National Electric Light Association at the Drake Hotel, Chicago. Mr. Lewis' recent appointment to the government commission was preceded by service on the public utilities commission of Indiana. He has had many years of intimate acquaintance with the regulation of public utilities.

Mr. Lewis' subject was "Current Aspects of Utility Regulation." While he did not refer specifically to the railroads in most instances, the points he made can be applied also to them.

After calling attention to the disturbed conditions that have followed the war, culminating in the present downward tendency of prices, Mr. Lewis pointed out why public utility rates have not fallen off appreciably.

### Percentage of Increase Small

"One reason, forgotten by a public that generally will be reasonable when it stops to reason," he said, "lies in the fact that utility rates, as a whole, did not advance comparably to commodity prices. One may truthfully say that utility rates have advanced very little from the pre-war levels. When everyone else—corporation, farmer, laborer, wholesaler, retailer, property owner—sailed away on the wild war-period flight,

E. I. Lewis

the public utility and common carrier alone were anchored to mother earth by regulation at no time over generous and often close to the point of starvation. They were not permitted to enjoy earnings running into the hundreds of per cent of war-period profiteers—no, not even 50 per cent or 25 per cent—and there is not a regulator who has not heard a war-profit-taking community protest, with all the soul that could be mustered, against the public utilities,

which were, and are, their very life, being given an earning of 6 or 7 per cent.

"Time after time I, like other commissioners, heard a demand that the public utility be let go without earning. I have seen some come before me, men making fortunes annually in the fabrication of flour, wares and commodities and in the production of coal, stone and materials, protesting against relief to the seat of their operating energy. The injustice of it seared your very soul. If utility rates did not then double or triple or quadruple, it is of course impossible that they can now contract like the prices of corn, wheat, coal, etc.

### Business Has Not Kept Up

"Another reason for failure of public utility rates to drop is that the utilities were called on to keep up with the abnormal war growth and expansion of cities and industries and with the extravagances of the individual citizen. The plants are there with their financial obligations incurred at a time when the cost of such incurrence was at its height. They are ready to serve the 1917-1920 volume of business. But the business whose demand for the convenience of services was so insistent is temporarily gone or less active. There is a shrinkage in revenues, but no corresponding shrinkage in fixed obligations, overhead, or even in operating expenses.

"Another reason for failure of public utility rates to drop: While public and industrial demand called for expansion of plants, there was generally present a vast amount of physical emaciation. It cannot longer be ignored. When the war was upon us, President Wilson commanded scrupulous husbanding of men, materials and money for the big job of winning the war. Maintenance and rehabilitation suffered. Then followed the most unfavorable financing period utilities have known, with constantly mounting operating costs, accompanied by increasingly unfavorable financial showings. The result is that many utilities emerged from the years 1917-1920 in depleted physical condition, though outwardly having the appearance of financial soundness. Money now has to be used to make good deferred maintenance.

"The drop in operating costs, so far as

public utilities are concerned, has been more apparent than real.

### Taxation Also a Burden

"Then there are taxes. Though public utilities constitute the only business of which I know whose operating sheets do not record payment of excess profit taxes during the war, they are bowed under the steadily accumulating burden of local taxation. It is popular to visit, to a persecuting degree, the full force of assessment and levy, and often special levies, on public utilities and common carriers now have which I have been most familiar, the public utilities and common carriers now have saddled on them approximately one-seventh of all the taxes collected in that state. This probably is typical of the burden in other states.

"If it were not for the gravity of the situation, there would be real humor in the sometimes frantic efforts of designing persons to curry popular favor by taxation reprisals on public utilities. Inasmuch as, of necessity, taxes go above the gross income line, such reprisals result only in higher utility rates to patrons. In many instances, increase in taxation alone is such as to offset all reductions in cost of coal, materials, supplies and operation, and render rate reductions impossible. In some instances taxation is forcing higher rates.

### Greater Interest Shown Now

"When utility rates were weakly trailing far behind ascending commodity prices, the public could easily understand the relation between cause and result. It must also be admitted that the public did not show very great concern about such small items as utility rates. But it is different now. Business served by public utilities has been hit; there is some unemployment; wages are beginning to descend; some commodities have hit pre-war levels. People are beginning to scrutinize the balance sheet, and to count cost. They do not understand these more or less intricate conditions which result in utility rates' failing to respond to the downward readjustment.

"The whole situation has changed.

"Let us first observe that, since 1917, there has been a decided change in the

objective character of public utility regulation. It has become radically different from what it was before that time. Then regulation was enthusiastically sponsored by the public, often against the opposition of the public utilities. The constant tendency was to regulate rates downward. Commissions quite generally found in effect schedules of rates that were over adequate or unjust. Regulation downward was made possible by cutting off unjustifiable demands, by shifting burdens to where they should be, and also by a highly commendable increase in plant efficiency.

### The War Made More Work

"Had there been no war, it is probable that within a few years utility regulation would have found itself with little to do.

"The war changed everything. The currents were reversed. Repeated high tidal waves of operating costs swept rates back, and higher and higher.

"Regulatory commissions, understanding the play of economic currents better than the public, were placed in not only a new but also a most difficult position. Commissions which, five years ago, were reducing rates have been standing, and now stand, between the utilities and an ill-informed and incited public, demanding justice. It is the same justice, but its application, under changed conditions, results in rate increases or refusals to reduce rates in many instances.

"That is the situation now, and it causes me to be apprehensive that both the utilities and the commissions—and, above all, regulation—face a most critical period. I feel that it is so critical that it is essential to the public welfare and to the life of utilities that utility men, such as yourselves, should fully appreciate it; also that, so far as lies within their power, utility operators should properly orient themselves toward these problems.

### Must Be Square With the Public

"There is now a most compelling necessity that public utilities relieve regulatory bodies of some of the tremendous pressures falling upon them by reason of this new state of affairs. This the utilities can do in three ways:

"(1) By educating public opinion to the true condition of the utilities and by taking that public into their confidence by placing all of their cards face up on the table;

"(2) By removing all features of their business which are subject to legitimate criticism by the public, and by going more than half way to conciliate public opinion;

"(3) By stopping some utilities' practice of dodging responsibilities and of 'passing the buck' to the commissions, in matters in which the responsibility lies entirely in the utility.

"It must be remembered that no governmental policy can be maintained for an extended period of time which is not backed by public approval. That is, specifically, to say that any governmental policy which aims to provide utilities with a reasonable return cannot long continue if that public approval is estranged by the beneficiaries of such laws. The only way public utilities can put the public in the frame of mind under which commissions permanently can exercise their functions is by cultivating relations that demand that respect and friendliness which makes the public willing that they receive a square deal.

### Rests on Public Approval

"Let the utilities thoroughly understand that they are public servants; that good will, good public relations are to be acquired not alone by good service but by frankness and an everyday policy of treating even the smallest of their patrons with that consideration that is practiced by successful business in non-regulated fields.

"The public must acquire an inkling of understanding that public utilities, whether they be privately or municipally owned, are not philanthropies; that they operate with costly materials and have heavy wage rolls and heavy investment obligations; that nothing short of real money, and a reliability of it, will satisfy the tax collector, bills for coal and supplies, the laborer and the much-courted investor.

"Let there be a clear understanding on the part of all that the day has passed, under public utility regulation, when the amount of stocks, bonds, and other evidences of indebtedness outstanding, are determinative of the rates to be charged; that

the rate is built on an ascertained fair valuation irrespective of securities; that the public, having rightfully demanded such a basis, has on it a moral obligation of adequate maintenance, replacement and return on that property dedicated to the public use; that repudiation of that obligation brings disaster not alone to the utility but to the community.

"Let there be a full and a frank understanding that on such basic conditions as have been herein enumerated is built the policy, and very best system known up to the present, of public utility regulation

which is primarily designed not for the utilities or those served but for promoting and extending public welfare.

"Finally let there be a clear understanding that the disturbance of a good code of relations between those served and the servants, which code is undergoing unusually severe strains, would—in the absence of substitution of another adequate system—throw the utility situation into chaos and create a condition of affairs that would be highly detrimental to local welfare and demoralizing nationally to a little comprehended extent."

## A New Beauty Added to Our Collection

Herewith is reproduced a photograph of one of the new switch engines. Twenty-five of these engines are being purchased by the Illinois Central from the Baldwin Locomotive Works. They are the largest switch engines in use on the system. Twenty-three of them have been shipped from the locomotive works.

The twenty-five engines will be distributed as follows: Chicago 7, Centralia 2, East St. Louis 2, Clinton 2, Freeport 2, Waterloo 2, Fort Dodge 2, Baton Rouge 4, Paducah 2.

The new engines, which are numbered 3500 to 3524, inclusive, have a tractive effort of 51,041 pounds each. Their cylinders are 25 by 28 inches. The locomotive and tender weigh 376,700 pounds. Each locomotive alone weighs 221,700 pounds. The drivers are 51 inches in diameter. Each tender has a capacity of 12 tons of coal and 8,000 gallons of water. The wheel base of the locomotive is 15 feet and of the locomotive and tender is 53 feet 3½ inches. The diameter

of the boiler is 80 inches, and it is registered for a pressure of 175 pounds. The firebox is 102 by 72 inches. The firebox has an evaporating surface of 216 square feet. The flues and tubes have an evaporating surface of 2,569 square feet. The superheating surface is 637 square feet, and the grate area is 51.06 square feet. There are 230 tubes of 2-inch diameter and 36 flues of 5½-inch diameter.

### TELLS HOW TO TRAVEL

What travelers ought to know and do was the subject of an interview with R. J. Carmichael, assistant general passenger agent of the Illinois Central, which recently appeared in the Memphis (Tenn.) *Commercial Appeal*. His first suggestion was that all possible traveling be done via the Illinois Central, and after that he gave general advice relating to getting the right ticket, getting on the right train, checking baggage properly, and making a trip with the greatest efficiency.

# How 1 Cent and 2 Mills Pays the Freight on an Average Hotel Meal

## *Analysis of Part Played by Rail Transportation in Assembling What We Eat*

**A**MERICANS are great travelers. No doubt about that. Two of them happened to get together the other day for a little dinner in a hotel at Springfield, Ill. As they lingered over their coffee, they drifted into a talk of their wanderings.

"New Orleans is looking about the same as usual," remarked the one. "I was down there a couple of days last week, and the lights on Canal Street are just as bright as ever."

"Haven't been down that way lately," explained the other, "but I spent a week out in the Yellowstone district last month, and then went on to 'Frisco. And here I am, back in the middle of things again. Peculiar, isn't it, that you and I should meet here this evening, after visiting the Gulf and the Pacific? It's a small world, after all."

"Shucks!" remarked the pepper to the salt, as the screen door slammed shut behind the two travelers. "How do they get that way? Where have those two been? They both stopped when they got to the ocean, didn't they? If you want to see a real traveler, look at me. I'm a native of Penang, an island they never heard of, in the Straits Settlements, near Singapore. My one trip from there to here was longer than all their trips put together."

"As for me," sighed the salt, "I am almost one of the home folks. I was mined up in Michigan, less than a day's ride from here."

### **A Hyphenated Traveler**

"True enough," agreed the pepper. "But look at one kind of coffee we have here; he's a stuck-up hyphenated mixture, for a certain. Part of him came from Java, down near my home, and the rest of him from Mocha, over in Arabia, near the Red Sea. Add his travels together, and you get tens of thousands of miles. And proud of it? You ought to hear him rub it in on the brand on this table that came merely from Brazil."

"It certainly is a proud bunch of globe-

trotters we have around here," broke in the strawberry that had slipped from the saucer and saved its existence by hiding under the edge of the plate. "But you mustn't forget that the good old U. S. A. comes pretty near feeding itself at that. I'm from Louisiana, and not a bit ashamed of the fact. How about it, folks?"

"Good for you!" chorused the bread crumbs on the table. "Our wheat came from North Dakota, by way of a Minnesota mill, and if you left out our part of the meal, there wouldn't be any talking about the staff of life. You've got to hand it to the United States on wheat."

"Count us in on that boost for the United States," suggested the flaky cigar ashes on the edge of the plate. "We hail from Havana, and that is only a step beyond Key West."

### **A Roll-Call of the States**

And so the argument went on. It sounded like a roll-call of the states. It developed that the one man's order of beefsteak had come from an Iowa farm and the other man's order of spring lamb from Kentucky, but both by way of a Chicago packing house. The butter had come from Wisconsin, although a country product could have been picked up nearer at hand. The salmon in the salad was from the Columbia River, in the far Northwest, and the peas had been grown and canned in Michigan. The sugar, like the strawberries, came from Louisiana.

The only item in the meal that could not boast of travel by rail was the drinking water, and the power to pump that water five miles to the city was furnished by coal that traveled to the plant by rail.

"Funny how we all got together here, isn't it?" The pepper again had the floor, for he seemed the liveliest talker of them all. "From all I've heard, I don't believe that this gathering could have been possible a hundred years or so ago. Most of you would have been

consumed within sight of the place you were produced, or else you would have been regarded as great delicacies because of the tremendous trouble and expense it would have taken to bring you all together. None of the folks who eat here seem to realize what a wonderful thing this assembly is."

Wherein the speaker paid a compliment, too often unpaid, to the miracle of modern transportation, which has brought together on any one table anywhere in the United States the products of all the world.

**The Price of a Postage Stamp**

That meal cost the consumer \$1.25. A railway man who happened to be at an adjacent table overheard the argument about the distances all these parts of the meal had traveled, and just for his own convenience he took a few minutes off when he got back to the office to figure out what the cost of rail transportation had to do with that charge of \$1.25.

The railway receipts from that meal were almost exactly 1 cent and 2 mills. This was almost exactly 1 per cent of the total cost of the meal. For bringing all these materials together from all over the United States, the railroads had received slightly more than the cost of our cheapest postage stamp.

Would you be interested in his figures? Here they are. He left out the ocean transportation charges on the two importations (coffee and pepper), established routings that seemed most likely to him, and calculated the weights of the various portions of the meal on a basis that would make its total weight

1 pound and 7 11/16 ounces. He figured car-load rates from the producers and manufacturers to the wholesalers, and less-than-car-load rates from the wholesalers to the retailers. The cost of getting this meal together ran like this:

COFFEE—New Orleans to Springfield— \$.60 a hundred pounds—\$.006 a pound— ½ ounce .....	\$ .000187
PEPPER—New York City to Chicago to Springfield—total \$1.52½ a hundred pounds—\$.01525 a pound—⅙ ounce.....	\$ .000059
SALT—Ludington, Mich., to Chicago to Springfield—total \$.52½ a hundred pounds—\$.00525 a pound—¼ ounce.....	\$ .000041
BEEF—Des Moines, Iowa, to Chicago to Springfield—total \$.65½ a hundred pounds—\$.00655 a pound—½ pound.....	\$ .003275
WHEAT—Fargo, N. D., to Minneapolis to Springfield—total \$.41½ a hundred pounds—\$.00415 a pound—2 ounces.....	\$ .000518
BUTTER—Madison, Wis., to Chicago to Springfield—total \$1.12 a hundred pounds—\$.0112 a pound—1 ounce.....	\$ .000700
PEAS—Detroit, Mich., to Chicago to Springfield—total \$.69 a hundred pounds—\$.0069 a pound—4 ounces.....	\$ .001725
SALMON—Portland, Ore., to Chicago to Springfield—total \$1.69½ a hundred pounds—\$.01695 a pound—2 ounces.....	\$ .002118
STRAWBERRIES—Hammond, La., to Springfield—\$1.12 a hundred pounds— \$.0112 a pound—4 ounces .....	\$ .002800
SUGAR—New Orleans to Springfield— \$.60 a hundred pound—\$.006 a pound —2 ounces .....	\$ .000750
<b>TOTAL.....</b>	<b>\$ .012173</b>

And yet we hear talk condemning our railroads—the hands that feed us—and we are always quick to believe anything that is said to their discredit and slow to believe anything that is said to their credit. What in the name of high heaven would we do without them?

## *A Former General Manager Dies*

The older members of the Illinois Central family, who knew the man personally, will learn with deep regret of the passing of John F. Wallace, former general manager of the Illinois Central and later planner of the Panama Canal, who died at Washington, D. C., Sunday, July 3. Mr. Wallace's death was sudden, the cause being arterio-sclerosis, to which the extremely hot weather may have contributed. He was living in a hotel at Washington, where he had been called to testify before the Senate committee on inter-

state commerce, which is conducting a hearing on the railway situation.

Mr. Wallace was chairman of the Chicago Railway Terminal Commission. He was 69 years old. As a civil engineer, beginning in 1869, he served successively as rodman with the Carthage & Quincy Railroad, as assistant engineer on surveys with the Quincy, Alton & St. Louis Railroad, and as assistant engineer with the United States Engineering Corps at Rock Island.

On New Year's Day, 1891, Mr. Wallace

came into the employ of the Illinois Central to assist in handling the World's Fair transportation problems. Seven years later he was appointed second vice-president. Then he was changed to assistant general manager and placed in charge of the operating department. In 1902 he was made general manager.

Chicago was greatly honored in May, 1904, when the United States government offered to Mr. Wallace the position of chief engineer in complete charge of the construction of the Panama Canal. Mr. Wallace accepted and began work there on June 1, 1904, at a salary of \$25,000 a year.

Although the Illinois Central did not wish to part with Mr. Wallace, the decision was made on the recommendation of Stuyvesant Fish that the larger duty was to the government in this work. Mr. Fish said of Mr. Wallace: "There is no professional engineer I know who has in a higher degree than Mr. Wallace the special commercial and diplomatic tact needed on the new job.

He has an excellent and rare capacity for dealing with men, above, beside, or below him, and he will be an honor to the government and to himself."

In 1905 Mr. Wallace became a member of the Isthmian Canal Commission and vice-president and general manager of the Panama Railroad and Steamship Company. From 1906 to 1917 Mr. Wallace served as president of the board of directors of Westinghouse, Church, Kerr & Co. His Chicago work, with the terminal commission, is best known by his designing of the Chicago & Northwestern terminals and his interest in lakefront development. He was also a corporation adviser and consultant.

Mr. Wallace was born September 10, 1852, at Fall River, Mass. He received his education as a civil engineer at Monmouth University, Monmouth, Ill., of which his father, the Rev. David A. Wallace, was founder and first president. Mr. Wallace's wife was Miss Sarah E. Ulmer of Monmouth.

## After the Train Won the Race

## *Employe-Editor Finds Time to Be Loyal to Company and Country*

*Sigmond A. Lee Doubles as Engine Foreman and Writer, and Swats the Radicals, Too*

ALMOST every man has some high ideal—something that he is striving for. Frequently he can devote only his spare time to the attainment of his ideal. An interesting figure of this sort is found on the Kentucky division of the Illinois Central Railroad.

Sigmond A. Lee is an engine foreman in the Louisville yards. He is rounding out the twentieth year with the company, and in those twenty years of service he has not received one demerit mark. This speaks for itself; so let us see what he does during his off hours. Mr. Lee has always been a citizen who has taken a vital interest in the welfare of his community, in the progress of his state and in the development of his country. Having been denied a full school education, he has devoted himself at every opportunity to the cause of education. There has never been an educational campaign, whether it was a bond issue for the schools or an effort to eliminate the management of the schools from politics, that he has not supported with all his heart.

Mr. Lee's wider influence, however, has been through the columns of his newspaper—the *Journal of Labor*, of which he is the owner and editor. This weekly paper is published in Louisville and is devoted to the cause of the working people. After Mr. Lee is through in the railroad yards, he goes to the office of his newspaper and there supervises its management. He realizes that the power of the press is the greatest aid to the cause of the working man. Every good and great movement in the labor world, which rounds to the interest and benefit of the man who toils, finds his hearty support in both the news and the editorial columns of his paper.

### **Served on Council of Defense**

It was during the dark and anxious hours of the war that he was called upon by the governor of Kentucky to serve as a member of the Kentucky Council of Defense. This body consisted of nine men representing the

*Sigmond A. Lee at His Desk*

entire state. The employes of the Illinois Central System already know the patriotic services of these councils of defense. In this position, Mr. Lee represented the workers of Kentucky.

In Louisville a radical had been preaching his doctrines of one big union from the pulpit of a church he had organized. There had developed a public resentment against these sermons, but no one seemed to have the courage publicly to repudiate this man.

A mass meeting was held. Mr. Lee was one of the speakers at this meeting. After the regular program had been concluded and before this meeting had adjourned, pre-arranged calls came for this radical to speak.

The chairman invited this man to come to the platform. Mr. Lee immediately arose and announced that he would not remain on the same platform with a speaker who was against America in the war and who was a pro-German. He immediately left the platform. The Louisville *Courier-Journal*, in commenting upon the instance, published the following editorial:

### Lee's Loyalty and Sanity

"Sigmond A. Lee did himself and the cause of organized labor credit when at a meeting Sunday afternoon he refused to remain on the same platform with a speaker who had made himself notorious for his un-Americanism during our war with Germany.

"The committee which arranged the meeting had voted unanimously not to include this man among its speakers, and when in response to some call from the audience he came forward to address it, Mr. Lee, who, with Mrs. Lee, was to lead in singing 'America,' left, explaining that 'we did not approve of his stand during the war, and we did not see how an audience could consistently sing "America" after listening to him.'

"The *Courier-Journal* feels assured that in this action Mr. Lee, who is one of the local leaders of union labor, is representative of the body and substance of the organization throughout the country. Union labor did its part nobly and proved its patriotism signally when the test came to us all in the ordeal of 1917-18. It had no patience then with nominal Americans who placed any 'issue' above Americanism, and in peace as in war it is not infected with their poisonous heresies. There are radicals and adventurers in the labor organizations, as everywhere else, who are willing to resort to Socialistic and communistic claptrap in order to further their ends, but the conservative mass of union labor is as sound and as much opposed to I. W. W.ism, Socialism and anarchism, as the mass of the American people in general is.

### The War Was a Test

"The truth is that in the crucible of war much of what was labeled 'Socialism' was burnt out. One has but to look among his own acquaintances to note how many there are who called themselves Socialists at the outbreak of the war who have now abandoned that creed; and he will find the result of his personal observations fully confirmed by the

statistics of the strength of the Socialist party today and two years ago. Socialism has not increased among the workingmen, while it has waned in general. As a matter of fact, the most active of what we may loosely call our Socialists today belong to the capitalistic rather than to the labor class, including a few high-browed pedants, a sprinkling of adventurers with money for the indulgence in freak self-advertisement, and all of our coupon-clipping 'milk-fed Bolsheviks.'

"Sigmond Lee does union labor a service when as a union labor man he scorns to flock with any of these birds."

### His Policy a Square Deal

In an interview with a representative of this magazine, Mr. Lee said:

"I find a great deal of pleasure in devoting my spare time to the management of my paper. I consider the editorial department the most important part of my work, as this is the heart and soul of the newspaper. I have

Mr. Lee at Work in the Yards

made it a policy to give every man a square deal when writing editorials, and I have been unrelenting in my fight against the radicals who have not only sought to destroy our movement but to overthrow our government. I believe the cardinal principles of a good newspaper to be these: Tell the truth and have the courage to speak your convictions. An editor of a newspaper who fears to speak courageously and boldly in the defense of the rights of all the people is unworthy of the position he holds. I am running the *Journal of Labor* solely in the interests of my fellow

men, and my one hope and ambition in life is that I may be of service to the man who toils."

From the editorial in the *Courier-Journal* and from the statement of Mr. Lee, it can readily be seen that the Kentucky division of the Illinois Central has in Mr. Lee another of its many valuable employes.

Every man must have some great ideal to work for when he is turned loose from his daily grind, says Mr. Lee. Can a nobler purpose exist than that of service to your fellow-man?

## Our Flag Has Just Had a Birthday

JUNE 14, 1921, was observed as the 144th birthday anniversary of the American flag. June 14 is annually observed as Flag Day all over the United States. The American flag is the oldest of those of the great nations, and only the flags of the small nations of Denmark and Holland are older.

In the accompanying illustration, Figure 1 shows the coat of arms of George Washington, with its stars and stripes, which probably influenced the design of our flag. Its Latin motto means "The event justifies the deed."

Figure 2 shows the first official national flag raised by General Washington at Cambridge, Mass., January 2, 1776. The king's colors are in the canton, and the thirteen stripes represent the thirteen original states. This was used as an ensign in colonial trade as early as 1704.

Figure 3 is the flag which General Washington designed and Mrs. Betsy Ross made at Philadelphia in 1777. Congress adopted this as the American flag on June 14, 1777. It was first raised over Fort Schuyler (at present Rome, N. Y.) on August 2, 1777, during an unsuccessful siege by a British army. The Fort Schuyler flag was "home made" of "a petticoat red, a soldier's shirt and a captain's cloak of blue."

Figure 4 is the flag of fifteen stars and stripes adopted in 1794 after Vermont and Kentucky were admitted to the Union. This is the "Star Spangled Banner" which inspired Key's immortal lines when he saw it "still there" over Fort McHenry, which defended Baltimore from British attack in 1814.

Figure 5 shows "Old Glory"—our present

American flag—the style of which was adopted by Congress in 1818, more than a hundred years ago. It has thirteen stripes for the original thirteen states and one star for each state in the Union—at present a total of forty-eight.

Figure 6 is a sketch of the Betsy Ross house in Philadelphia, where, it is said, Mrs. Ross worked on the design of the flag. This old house is on Arch street, near Third street.

The 144th anniversary of the adoption of the American flag was unusually observed. Thirty-nine governors, hundreds of mayors, and the federal government proclaimed that the flag be displayed on all buildings and that lodges, posts, and patriotic organizations, as well as industrial and business institutions, arrange programs.

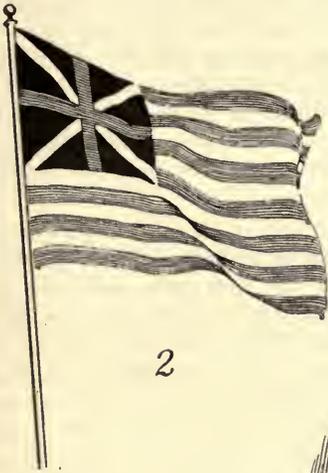

All speakers were urged to remember that Flag Day exercises are free from political or sectarian expressions.

The pledge is as follows: "I pledge allegiance to the American flag and to the republic for which it stands, one nation indivisible, with liberty and justice for all."

"Give the American flag one full and unmolested day, and inculcate lessons of patriotism that this is the only true symbol of American freedom 365 days of the year," urged Dr. B. J. Cigrand, president of the National Flag Day Society, in urging observance of the day.

## Business Is Good if You Make It So

**B**USINESS is very much what you make it, and a cheerful view will aid greatly in restoring normal conditions, according to A. J. Doyle of the Burroughs Adding Machine Company, recently quoted in the Memphis *Commercial Appeal*.

"When I hear a man say that business is 'bad,' 'rotten,' 'dead'—that things are down and no prospect of getting better in sight—I wonder if that man knows how much it costs him in cold cash to make such statements," said Mr. Doyle.

"If a man thinks business conditions are as bad as that and spreads his opinion broadcast, it is bound to react against his own business in particular and to a certain extent on business in general.

"I don't mean that business men should hide their heads in the sand like ostriches or try to juggle the figures on their books to fool themselves, but I mean that in many instances the man does not know whether it is possible to transact more business in his line because he has not tried hard enough.

"We have most of us been so spoiled by the high waves of prosperity in the last two or three years that we have forgotten how we used to work to get orders in the years that we considered normal. We have no right to complain that the public won't buy if we make no real effort to sell, and at the same time discourage the public with talk of hard times.

"Of course, the boom times have passed, and whether they were really good or bad years depends on the net result of business after all the 'boom' has dried up. But looking back over a period of ten to twenty years and comparing the buying power of the average citizen today with the money he had in his pocket or in the bank at any time during that period, who will say that the opportunity to do business today is less than it was five or ten years ago?

"Of course, there are some people out of work, but even some of these are good business prospects today. The fact is that most of the people in this country have more money and more property today than they ever had before, and there are enough of them who want to spend it to make good

business for all of us if we will make it attractive for them to buy what they need.

"Just to illustrate this point: A friend of mine has about made up his mind to buy a new automobile. He knows what he wants and has the money to pay for it, but he is not yet quite willing to walk into that agent's office and lay down his check. Now if a good salesman for that particular car should get hold of my friend and take him into the office and show some interest in putting the sale across, that car would be sold tomorrow.

"Another man says his wife is going to buy a washing machine. He is willing to pay for it, but isn't interested enough to shop around and look into the merits of the different makes himself. If somebody would send one of the things up to his house and show his wife how to run it, the chances are 10 to 1 she would keep it.

"People are eating three meals a day just the same as ever. They are wearing just as many clothes. The movies are crowded, the best hotels are full, the roads on Sundays and holidays are jammed with automobiles all over the country. Many retail stores have so many customers that you can't get waited on promptly if you want to buy anything. Does that look like hard times? I should say not.

"Lots of people have more money than they ever had before. Don't forget that.

"There are just two things we all need to bust this business gloom.

"First, stop talking poor business and talk better business.

"Second, do everything in your power to start the normal flow of money through business channels."

---

### LOCAL ATTORNEY DIES

St. John Waddell, local attorney for the Yazoo & Mississippi Valley for Quitman County, Mississippi, for the past twenty-five years, died at his home at Memphis, Tenn., on June 13, at the age of 66.

Mr. Waddell was born in Ashley County, Arkansas, and was educated at Cumber-

land University, Tennessee. He began the practice of law in Tunica County, Mississippi, afterward removing to Quitman County and later to Memphis. He represented the Y. & M. V. in Quitman County ever since the railroad was constructed in that county. He was more familiar than probably any other lawyer with the land titles in the Yazoo-Mississippi delta, and rendered the company great service in the examination and perfecting of the company's titles to lands in Quitman County. He also had charge of the conduct of all railway litigation in Quitman County and rendered most efficient service.

Mr Waddell also had a large private practice in Western Tennessee, Northern

Mississippi and Eastern Arkansas. He conducted his practice so quietly that few knew the importance and extent of the interests which he represented. He was an exceedingly careful, busy and industrious lawyer. On the day after his death there was a meeting of the bar of Shelby County. Seldom has there been such a large attendance of lawyers at Memphis, and never have there been more sincere tributes paid to any member of the bar.

Mr. Waddell leaves surviving him his wife, two sons, Fred Waddell, American consul at Lima, Peru, and St. John Waddell, Jr., a planter at Marks, Miss., and one daughter, Mrs. W. P. Armstrong of Memphis.

## Illinois Central Boy Makes Good in Oil

The many friends of J. W. Carnes, who a number of years ago was chief clerk to Superintendent J. J. Flynn of the Y. & M. V. at Memphis, will be pleased to learn of his rapid advancement in the oil business.

Superintendent Flynn and Mr. Carnes

were very close friends—in fact, they were almost inseparable. When Mr. Flynn left the Y. & M. V. to go to Texas, he was soon followed there by Mr. Carnes. Mr. Flynn got to be prominent in the affairs of the Texas Oil Company, and Mr. Carnes went with that company under Mr. Flynn. A few years ago Mr. Carnes associated himself with the Sinclair Refining Company.

At a meeting of the Sinclair Refining Company directors held at Chicago, June 13, Mr. Carnes, who had been manager in charge of bulk sales, was made general sales manager and a director of the company. The *Oil News* for June 20, in speaking of Mr. Carnes' elevation, says: "There is no more striking example of the rewards that come to the man who works his way to the front than that shown in the rapid promotion of Mr. Carnes."

Mr. Carnes was born and educated in Ohio. He entered the service of the Pennsylvania Railroad while quite young, serving successfully through the yard, station and operating departments, later going with the Illinois Central. He was superintendent of one of the Texas lines when he decided to throw the railway business overboard and go into the oil business. It is said that Mr. Carnes has developed into one of the best oil salesmen in the United States. His friends in the oil business speak of him as a "human dynamo" in a business way.

J. W. Carnes

## Sunday School Forces Praise Railroads

THE following is quoted from a letter received by President C. H. Markham from Secretary Henry A. Boyd of the Sunday School Congress, dated Nashville, Tenn., May 31:

"Your statement under the caption of 'Illinois Central System Calls Attention to Things the Public Does Not See' is to my way of thinking one of the most far-reaching utterances made by you as head of the great corporation. Our Sunday School Congress forces shall have all of this. I am asking that it be reproduced in several national papers that are working with the Congress forces: the *National Baptist Union-Review*, which has a nation-wide circulation, and the *Nashville Globe*, which covers the southeastern territory."

Another letter from Secretary Boyd to Mr. Markham, dated Nashville, June 14, is given below, together with the resolution passed by the Sunday School Congress June 10:

"Our Sunday School Congress adjourned its sixteenth annual session in Little Rock Monday. During the session the Sunday school forces, representing 21,500 Sunday schools of the Missionary Baptist persuasion, with an enrollment of more than a million and a half constituents, voiced the

sentiment expressed in the following statement, and it becomes a part of their record and will be offered to the papers for publication:

"The Sunday School Congress forces in session here today went on record as being in hearty sympathy with the Herculean task of the railroads of the United States in adjusting themselves from war to pre-war conditions. It is the desire of the Sunday School Congress forces numbering over twenty thousand schools, with more than one and a half million pupils, to have the management of these railroads understand that they appreciate the size of the task that the railroads are called upon to perform, and they would urge all railway employes to properly consider the Christian spirit of the unparalleled services that the railroads have been to the United States in helping to build up the communities and several states through which they pass, refraining from strikes and disorder that would be detrimental to the property and progress of America's greatest industry. The Congress forces believe that the gospel of the Lowly Nazarene properly disseminated among railway employes will hastily bring the desired results of peace on earth and good will toward men."

---

## Mass Meeting Indorses Our System

A mass meeting attended by about 200 citizens was held at Durant, Miss., Tuesday night, June 21, at which resolutions were adopted pledging the support and cooperation of the citizens to the Illinois Central and the Yazoo & Mississippi Valley railroads.

The meeting was arranged for by Mayor John B. Wilkes of Durant and was presided over by John M. Howard, member of the legislature from Holmes County.

A. D. Caulfield, superintendent of the Mississippi division, made a speech in which he described the railroads as agencies of civilization and told of the practical value of the Illinois Central to the people in the

regions which it serves. He said that a cordial good feeling has existed at all times between the personnel of the Illinois Central and patrons, and pointed out that the Illinois Central has paid this year in taxes more than \$650,000 on the Mississippi division, and that \$60,000 of that covered Holmes County.

"The railroads want only a square deal," Mr. Caulfield said, "the same as an individual property owner." Rumors that the railway shops were to be removed from Durant were denied.

Other Illinois Central people who participated in the meeting were Dr. R. E. Howard, division surgeon; W. H. Petty,

trainmaster; M. T. Woods, engineer, and Ira L. Myers, engineer. Doctor Howard, Trainmaster Petty and Engineer Woods were among the speakers.

The resolutions were, in part, as follows:

"We fully realize and appreciate the great and incalculable benefits and conveniences enjoyed by all people living along the lines of this great system of railroads, and by the numerous states, counties, cities and towns traversed by it.

"We are fully mindful of and appreciate the great benefits derived by this community as well as by all our surrounding territory from the railroad shops, roundhouse, terminal, and beau-

tiful station buildings located at this town, and the munificent contributions made and taxes paid by these railroads to the commonwealth.

"We gratefully acknowledge the many courtesies and graceful acts by the ever kind and courteous officers and managers of the Illinois Central Railroad; and we have not forgotten the many acts of ready kindness and cheerful help extended the people of this in common with the people of many other communities in times of epidemic, and other visitations of suffering and distress.

"We desire to express our thanks and appreciation to Superintendent A. D. Caulfield of the Illinois Central Railroad for his attendance at this meeting, and for the interesting and instructive address delivered by him."

## Labor Board Extends Wage Decision

As predicted, the United States Railroad Labor Board on June 27 handed down a decision extending to virtually every railroad in the United States the 12 per cent reduction in pay of employes authorized on some roads by the Labor Board decision of June 1. July 1 was set as the date for the decreases to take effect.

The pay slash ordered by the board June 1 affected 104 roads, although all employes were not affected. The decision of June 27 included 210 roads, many of which were parties to the original decision, but which returned to ask reductions in classes of their employes not covered by the original order.

A list of the decreases authorized was published in the June issue of the *Illinois Central Magazine*.

The new order authorizes reductions identical with those ordered June 1, the only change being the addition of rates of marine workers in certain harbors and a section relating to dining cars and restaurant workers. The wages of that class of employes were ordered reduced 60 per cent of the increases given since February 29, 1920.

Every railroad in the country affected by the decision of the Labor Board in July, 1920, granting a \$600,000,000 increase, is authorized to reduce wages 12 per cent with the exception of a few subsidiary lines, whose parent owners filed petitions for reductions. Most of them have received permission to make the adjustment in the pay of all employes. In addition nearly two score of

roads who voluntarily advanced wages in 1920 were authorized to make reductions.

The estimated annual saving to the roads will be \$400,000,000, or \$200,000,000 less than the increase granted a year ago.

In a later decision, the Labor Board held that pay of time and a half for overtime must be abolished, at the same time announcing the retention of the "national agreements" until such time as conferences between managements and employes have been completed.

### SON OF AGENT DIES

Friends and acquaintances of Agent I. C.

Ira C. Barbee

Barbee at Herrin, Ill., will sympathize with him in the loss of his son, Ira Calvin Barbee, who died on June 8, after an operation for appendicitis the day before. The boy was born May 8, 1913, and thus was 8 years and 1 month old at the time of his death.

### A CONSCIENCE STILLED

St. Louis division offices have received an unsigned letter enclosing a \$5 bill and an explanation that the writer had kept some dynamo belting found along the tracks some years ago.

# Stopping the Waste in Our Production, Theme of Herbert Hoover

## Secretary of Commerce Points Out Cures for Various Ills in Industrial Relations

By HERBERT HOOVER  
Secretary of Commerce

THE waste in our production is measured by the unemployment, the lost time due to labor conflict, the losses in labor turnover, the failure to secure maximum production of the individual due either to misfit or lack of interest. Beyond this again is a wide area of waste in the poor co-ordination of great industries, the failures in transportation, coal and power supplies, which re-echo daily to interrupt the steady operation of industry. There are again such other wastes due to lack of standardization, to speculation, to mismanagement, to inefficient national equipment and a hundred other causes.

There is a certain proof of deficient production by comparisons of our intense results in 1918, when, with 20 per cent of our manpower withdrawn into the army, we yet produced 20 per cent more commodities than we are doing today. We are probably not producing more than 60 or 70 per cent of our capacity; that is, if we could synchronize

all national effort to maximum production, we could produce 30 or 40 per cent more commodities and service. Our national machine is today doing worse than usual, as witness the 3,000,000 idle men walking our streets.

There is no such thing as the nation overproducing, if it produces the right commodities. The commodities or services produced by the whole nation are capable of absorption by the whole nation if they are of the right character. In other words, if we could attune the whole industrial machine to the highest pitch, agriculture as well as manufacture, an increasing production would mean a directly increasing standard of living. When ten men or one hundred million men divide their united output, they can by doubling their output have twice the amount to divide. The problem in doubling output is to direct it to commodities or services that they can use. There is no limit to the increase of living standards, except the limitations of human strain, scientific discovery, mechanical invention and natural resources.

It is true enough that any particular commodity or service

### Man Wanted

Wanted—A man for hard work and rapid promotion; a man who can find things to be done without the help of a manager and three assistants.

A man who gets to work on time in the morning and does not imperil the lives of others in an attempt to be first out of the office at night.

A man who is neat in appearance and does not sulk for an hour's overtime in emergencies.

A man who listens carefully when he is spoken to and asks only enough questions to insure the accurate carrying out of instructions.

A man who moves quickly and makes as little noise as possible about it.

A man who looks you straight in the eye and tells the truth every time.

A man who does not pity himself for having to work.

A man who is cheerful, courteous to everyone and determined to "make good."

A man who, when he does not know, says, "I don't know," and when he is asked to do anything says, "I'll try."

A man who does not make the same mistake twice, who is not a goody-goody, a prig or a cad, but who does the very best he knows how with every task entrusted to him.

This man is wanted everywhere. Age or lack of experience do not count. There isn't any limit, except his own ambition, to the number or the size of the jobs he can get. He is wanted in every big business from Maine to California.

can be overproduced, for each will reach a saturation point in demand when all the members of the community have been supplied.

The absorption of increased productivity lies in the conversion of luxuries of today into necessities of tomorrow, and to spread those through the whole population by stimulation of habit and education. Wheat bread, railways, good roads, electricity, telephones, telegraphs, automobiles and movies were once luxuries. They are still luxuries to some parts of the population.

It is but a corollary that certain commodities can better be produced for exchange for commodities from outside our boundaries of more appropriate character to our needs. Today we have capacities for production of some commodities not only in excess of our home need, but even beyond export demand under present financial conditions. As a matter of practical remedy, we must either reorganize these financial relations or alternately abandon some part of this kind of production and turn our idle men to making things of which we are not yet fully supplied.

#### One Limit to Consumption

To put the matter in another way, there is no limit to consumption, except the total capacity to produce, provided the surplus of productive power is constantly shifted to new articles from those that have reached the saturation point of demand. For instance, we have the productive capacity wasted today that would improve the housing conditions of our entire people to the level that perhaps only fifty per cent of them enjoy—and at the same time not entrench upon our established necessities. I am not suggesting that the forces of production can be shifted by imperial direction. The practical thing that can be done is to eliminate some of the wastes and misfits in our production, and depend upon the normal processes of business and human desires to absorb them.

The largest area of waste lies in the large periods of slack production and unemployment, due to the ebb and flow of economic tides between booms and slumps. The ideal would be steadily increasing production—an ideal of no likelihood of exact realization because of inability to ever gauge the advance in growth consumption or the approach of saturation. On the other hand, there are cer-

tain possibilities of stabilization worth consideration. For instance, we can classify labor into that engaged in production and service from this equipment.

Our studies of industries as a whole show that we usually expand our equipment just at the periods of maximum demand for their products instead of doing our plant expansion during periods of slack consumption. We thus make double demands on labor and we doubly increase unemployment in periods of reduced consumption. This is indeed one of the factors in our great unemployment today.

Every one knows that for our normal productivity, our transportation facilities are today inadequate. We know that we are insufficiently housed, insufficiently equipped in our public roads and our public utilities; that we need an entire revision of our power supply, that we need expansion of our waterways and yet armies of idle men are walking the streets. The reasons why this occurs are not far to seek, in that it is at times of high productivity that capital is most easily obtained. It is then that the necessity of increased equipment most impresses men's minds and it is the high hopes of these periods that lead them into the adventure of expansion. Nor is it possible to expect that all industry could be so stabilized as to do its capital construction in periods of depression in commodity demand. Nevertheless, there are some industries that could, by co-operation of the government and co-operation amongst themselves, be led in this direction. More particularly does this apply to railways, telephones, telegraphs, power supplies and other public utilities, and to the expenditure upon our state, municipal and national public works.

#### Variation in the Coal Industry

Another variety of intermittent employment, and thus great waste, lies in certain industries now operating upon an unnecessarily wide seasonal fluctuation, as for instance the bituminous coal industry. This is today one of our worst functioning industries. These mines operate seasonally and erratically. They proceed from gluts to famines, from profiteering to bankruptcy. As already determined by our engineering bodies, the men who mine our coal find work only seventy per cent of their time. In other words, there are thirty per cent more equipment, thirty per cent more men, attached to this industry than are neces-

sary if it were stabilized to continuous operation. The mining engineers have already pointed out the directions in which remedy lies, through storage, through railway rate differentials and other remedies. Through constructive action an army of men could be released from this industry of necessity to convert some luxury into a necessity of tomorrow. This is no plan to control prices or profits, although through it both the producer and consumer in coal could be placed upon a sounder basis than today. The interest of the consumer and producer is, however, even less important than relief from the intermittent employment and unemployment within this industry that today brings a train of indefinite human misery and some of our lowest standards of living.

The second largest area of waste in productivity is the eternal amount of labor friction, strikes and lockouts. The varied social and economic forces involved in this problem need no repetition here. Fundamentally, this is not alone a struggle for division of the results of production between capital and labor, but there is also a loss greater from strikes and lockouts in the element of purely human friction and loss outside the area of dispute on wages and hours. The growth of industry into large units has destroyed the old mutuality of interest between employe and employer. Our repetitive processes have tended to destroy the creative instinct and interest in employes; at times their efforts sink to low levels, indeed. We will yet have to reorganize the whole employment relationship to find its solution. There is great promise in this field during the past two years, and the progress in this matter is one of the subjects under our inquiry.

#### Distribution of Labor Faulty

Yet another variety of loss lies in the unnecessarily faulty distribution of our labor supply due to seasonal and to shifting demands.

Probably the next largest fraction of waste in productivity lies in a too high degree of individualism in certain basic products and tools. In other words, a standardization of certain national utensils makes for economy in distribution, in operation and in repairs. The necessity of maximum production during the war opened a great vista of possibilities

in this direction. Such standardization as car couplings, or wheels, and cars generally, represented real progress in this direction. These possibilities lie in a hundred directions. There are all sorts of cases from sizes of chains to the size of automobile wheels. Today dozens of different sizes are placed in the market by manufacturers and entail not only special equipment and skill to produce these many varieties, but also great stocks are required in distribution and losses are entailed due to lack of interchangeability.

It is certain that there are a great many articles of everyday use in which the manufacturer would indeed be glad to undertake some co-operation in standardization, from which the saving in national effort would be interpreted not into millions but into billions of dollars. This does not mean that we stamp the individuality out of manufacture or invention or decoration; it means basic sizes to common and everyday things.

#### Need of Better Industrial Equipment

Another type of waste lies in our failure to advance our industrial equipment. The Super-Power Board will demonstrate the saving of 25,000,000 to 50,000,000 tons of coal annually by the electrification of our eastern power supply. The St. Lawrence Waterway Commission will demonstrate the saving of five to ten cents a bushel to the farmers of fifteen states by unlocking the lakes to ocean-going vessels. Nor will this added efficiency to our national transport injure our present systems of canals and waterways, for we have ever found that the prosperity of an industry blesses them all.

Nor do we believe it is necessary to effect those things by the government. The spirit of co-operation that has been growing in our country during the last thirty years has already solved many things; it has standardized some things and is ripe for initiative toward co-operation of a widespread character. The leadership of our federal government in bringing together the forces is needed. No greater field of service exists than the stimulation of such co-operation. The first step is sane analysis of weakness and sober proposal of remedy. If the facts can be established to an intelligent people such as ours, action is certain, even if it be slow.

# Third Month of "No Exception" Campaign Proves Best of All

## June Shows a Reduction of 78.9 Per Cent as Compared With March, Just Before Effort Began

By C. G. RICHMOND,

Superintendent, Stations and Transfers

THE system "No Exception" campaign conducted during June resulted in a reduction of 78.9 per cent in the number of exceptions received as compared with March, 1921.

There were only 1,933 exceptions charged to all stations on the Illinois Central and Y. & M. V. railroads, compared with 9,184 in March, 1921, a reduction of 7,251, or 78.9 per cent, and 14,417 in October, 1920, a reduction of 12,484, or 86.5 per cent.

The following shows the total number of exceptions charged to the four grand divisions in June, tabulated as to the different classes of exceptions compared with totals of March and October.

	Total Northern Lines	Total Western Lines	Total Southern Lines	Total Y. & M. V	Grand Total
Shorts .....	176	16	37	57	286
Bad Orders .....	595	56	104	180	935
Pilferages .....	63	7	4	17	91
Overs .....	229	4	67	89	389
Astrays .....	126	9	47	50	232
Total June, 1921.....	1,189	92	259	393	1,933
Total March, 1921.....	5,085	1,079	1,426	1,594	9,184
Total October, 1920.....	7,481	1,829	2,311	2,796	14,417

Springfield .....	11	46
New Orleans Terminal.....	12	71

Kentucky .....	14	115
St. Louis .....	15	135
E. St. Louis Terminal .....	16	174
Memphis Terminal .....	17	317
Chicago Terminal .....	18	681

The result of the "No Exception" campaigns during the past three months is reflected in a reduced number of claims paid for lost packages, and also in the number of claims presented. The total number of claims paid for lost packages during June, 1921, was 424, compared with 1,166 during June, 1920, a reduction of 742, or 63.6 per cent. The total number of claims presented in June, 1921, was 8,868, as compared with 14,872 during

The rank of grand divisions is as follows:

Grand Division	Rank	Exceptions
Western lines .....	1	92
Southern lines .....	2	259
Y. & M. V. ....	3	393
Northern lines .....	4	1,189

The rank of the various divisions, based on the number of exception reports received, is as follows:

Division	Rank	Exceptions.
Memphis .....	1	15
Louisiana .....	2	17
Tennessee .....	3	22
Minnesota .....	4	23
Wisconsin .....	5	26
Vicksburg .....	6	29
Mississippi .....	7	35
New Orleans .....	8	37
Iowa .....	9	43
Illinois .....	10	44

June, 1920, a reduction of 6,004, or 40.4 per cent.

The intense interest and spirit of co-operation manifested by each and every employe during the "No Exception" campaigns of April and May was continued during June, special attention being given to the causes responsible for the issuance of bad order reports (which represented 45 per cent of the total exceptions received during the past three months), resulting in a decrease of 3,081 reports, compared with March, a reduction of 76.7 per cent.

This reduction was accomplished by more intense supervision of stowing and extending the bulkheading and bracing to all-through destination cars at the larger platforms.

The final result of the system campaign during June was even more remarkable than the showing made during the "No Exception" months of April and May, the record being as follows: June 1,933, May 2,226, April 4,253—June showing a reduction of 293, or 13.1 per cent, compared with May, and 2,320, or 54.5 per cent, compared with April.

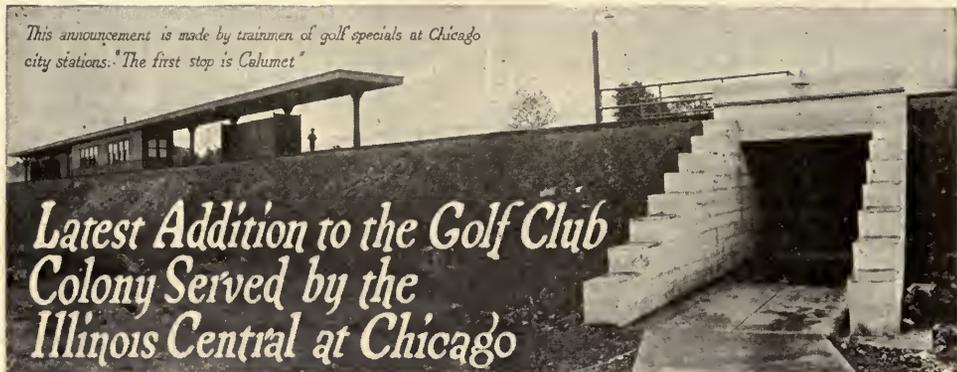

The reduction in number of exception reports received during the past three months

is truly a wonderful achievement and reflects great credit on all supervising officers and employes on the Illinois Central and Y. & M. V. railroads, and it should be the earnest desire of all employes to maintain this high standard of efficiency in the handling of LCL freight.

Following is statement showing the total number of exceptions that were charged to the individual stations and divisions during the campaign:

**T**HE Illinois Central System has encouraged the building of golf courses along its lines out of Chicago. There are now nine golf courses (including the four of the Olympia Fields Country Club) served entirely by the Illinois Central, and the organization of another at Matteson is being discussed.

The latest addition to the colony of golf clubs served by the Illinois Central line is the Calumet Country Club at 175th street and Western avenue. This club has invested in round figures about \$300,000.

The club has been in existence for many years. Its old grounds were on the property of the Pullman Land Association east of the Burnside Shops. It was said that more golf was played on those grounds than on any other private course in the vicinity of Chicago. Encroachment of industries made it necessary for the club to give up these grounds and seek a new location.

After a careful examination of all the available property for sale, accessible to the Illinois Central lines, the beautiful tract of land at 175th street, comprising 160 acres, was selected and purchased.

**Illinois Central Represented.**

Vernon W. Foster, local attorney of the Illinois Central at Chicago, has been one of the moving spirits in the development of the new course and is now the president of the club. Other Illinois Central officials who are members of this club are: L. W. Baldwin, vice-president; D. W. Longstreet, traffic manager; A. L. Davis, principal assistant engineer; W. D. Beymer, comptroller; J. F. Dartt, auditor of disbursements; R. E. Kim-

bell, auditor of miscellaneous accounts; J. F. Porterfield, general superintendent of transportation; F. L. Thompson, chief engineer, and H. B. Hull, general claim agent.

The club has made great strides this year in improving and beautifying the grounds and in furnishing the new club-house. Vice-President James Rose, Secretary Frank E. Bell and Treasurer A. L. Tolin are all "live wires" in the management of the Calumet Country Club and are giving President Foster the strongest kind of support in the administration of the club's affairs during the

Second Green

Fourth Green

current year—the year of the club's greatest achievement. The entire membership is enthusiastic and is pulling together in fine spirit for the advancement of Calumet. This club is on firm footing and its future is assured.

**A Creek on the Course.**

The course is being gradually improved. It is beautifully wooded, and a fascinating creek winds its way through the grounds, providing an interesting hazard for the golfers to shoot over on a number of the fairways.

The new fireproof club-house is said to contain the most commodious locker room of any country club in the vicinity of Chicago. An outstanding feature of the Calumet Country Club is the cafe service, which has become noted for the excellent quality of the food that is served. The cooking is supervised by Charles Kieffer, an efficient French chef, who made the old club at Burnside famous for the meals served. Mrs. Kieffer presides over the dining rooms and sees that the meals prepared under the supervision of her husband are properly served to the members and guests. Mr. and Mrs. Kieffer are entitled to much credit for the popularity of the Calumet Country Club.

The club is also noted for the hospitality

*A. L. Davis, Chairman Sports and Pastimes Committee*

and good-fellowship of its members. This is known far and wide among Chicago golfers as the "Calumet spirit." This spirit is encouraged by scheduling, each season, a

*Views Along the Course*

number of events which tend to mix up the players and form the get-acquainted and keep-acquainted policy of the club, which is being looked after this year under the leadership of A. L. Davis, chairman of the sports and pastimes committee.

The Illinois Central is not overlooking

anything in the way of furnishing the golf patrons of its lines with proper service. Special golf trains are run on fast schedules for the accommodation of golfers, and the growing patronage of these trains has more than met the expectations of the management.

---

## *Our Cliff-Dwellers Who Had to Move*

Cliff-dwellers are all right in their place, which is—or was—in the far, far Southwest of these United States. But when they start making themselves at home on the Chicago lakefront a dozen feet from the many-tracked right-of-way of the Illinois Central Railroad, their picturesqueness is eclipsed by the danger they are to traffic and to themselves. And so, more in sorrow than in anger, the Illinois Central management recently was forced to request the departure of a colony of about one hundred of them from the vicinity of the tracks between Twenty-sixth street and Thirty-first street.

It all came about from the unemployment situation, so the cliff-dwellers, all negroes, declared. Most of the hundred had been soldiers during the war. Finding themselves out of work, and consequently out of homes, they set about to settle down somewhere. The Chicago beach between Twenty-sixth and Thirty-first is patronized almost exclusively by negroes. On the well-protected shore are thousands of blocks of limestone, thrown there to hold back the water of Lake Michigan from the Illinois Central tracks, which parallel the shore line from Sixteenth street to Fifty-third. Living in dug-outs was no new experience to these former soldiers; so they proceeded to make themselves at home.

In the huts which they built from the loose limestone, they were "at home" to all their friends and contributors of clothing. A community kitchen, a commissary and a barber shop were opened. The ice-box was a keg sunk in the wet sand and covered with burlap. Through donations of food from various agencies, including the many curiosity seekers who flocked to see them,

and by fishing continually, the men managed to keep themselves fairly well fed.

A plan of self-government was worked out. One negro was elected captain, and over his headquarters dug-out flew the American flag. Drastic regulations were enforced. The absolutely necessary work was divided. There was none of the pastime known as "African golf," and, except for professional use, razors were forbidden.

All in all, the cliff-dwellers were getting along quite well, and the interest shown in them by the many visitors was flattering. But over them hung the constant menace of the four hundred trains that rushed past their dwellings every twenty-four hours. And eventually, on June 17, despite the system of warning whistles they had established to note the approach of a train, one of the cliff-dwellers was killed. This caused the request for their removal.

---

### **AN EXPLANATION OF "UNCLE SAM"**

"Uncle Sam" is the popular title for the United States. In the year 1812 a large quantity of provisions for the army was purchased at Troy, N. Y., by Elbert Anderson, a government contractor. The goods were inspected by two brothers, Ebenezer and Samuel Wilson. The last named was invariably known among the workmen as "Uncle Sam." The packages were marked EA-U. S. On being asked the meaning of these initials, a workman jokingly replied that he did not know unless they meant Elbert Anderson and Uncle Sam. So the title became current among workmen, soldiers and people, and the United States Government is known now by those who affectionately call it Uncle Sam.

# Why Rates Cannot Be Reduced Is Explained by Samuel O. Dunn\*

*Editor of Railway Age Contributes a Discussion of  
Problem That Perplexes the Country*

By SAMUEL O. DUNN,  
Editor, Railway Age

**M**ANY persons and newspapers in various parts of the country recently have expressed the view that general reductions of railway rates should soon be made. Some even say that in view of the recent reduction of 12 per cent in wages made by the Railroad Labor Board, the entire advance in rates granted by the Interstate Commerce Commission last August should be wiped out. On the other hand, the National Industrial Traffic League, at its recent annual convention, adopted a resolution opposing early general reductions of rates.

This organization for years was the foremost organization of shippers in seeking reductions and opposing advances of rates. The principal reason given for its present stand is that the railroads must have opportunity to rehabilitate and expand their properties if in future they are to give good and adequate service, and that they cannot rehabilitate and expand their properties unless allowed to make larger net returns in future.

On the other hand, there is widespread discontent among the farmers regarding the present rates. The farmers as a class are suffering severely from present conditions. The prices of their products have declined until, according to government reports, they average only about 15 per cent more than before the war. The prices of most of the things they buy have not declined anywhere near as much in proportion. Their present situation is due in only a small measure to the present rates. But the farmers and their organizations, especially those in the West and South, for over forty years have tended to attribute a disproportionate part of their troubles to alleged excessive

*Samuel O. Dunn*

railway rates. Many of them are doing this now.

## Some Reductions Are Favored

It is not the position of the railroads that no reduction of rates should be made. Their spokesmen all concede that, owing to the horizontal percentage advances which were made in 1918 under government control, and again in 1920, there are now many rates which are unfairly discriminatory or too high. They agree that these unfair and harmful adjustments of rates should be rapidly eliminated, and that this should be done chiefly by reductions. They hope and believe that in course of time increases in

\*Written for the Illinois Central Magazine.

traffic and reductions of operating expenses will make practicable and desirable some general reductions. They are opposed to general reductions in the immediate future because they believe that any early general reduction would be not only unfair and harmful to the railroads, but contrary to the public welfare.

One argument which is now very often advanced for general reductions is that the rates are so high they are preventing a revival of general business and of railway traffic, and that therefore the railroads as well as the public would be benefited by reductions of rates which would permit of an increase in traffic. But incontrovertible facts show that the present rates are not preventing a revival of business or an increase of traffic. The freight business of the railroads declined about 40 per cent between October, 1920, and the end of February, 1921. Since then there has been a steady increase in the freight shipped. The number of carloads of freight shipped the last week in February, when the business reached its lowest ebb, was 658,282 cars. Since then the freight shipped has increased steadily, and in the week ended May 28, the latest week for which statistics are available, it was 787,237 carloads, an advance since the end of February of 19 per cent.

#### February Low Month in 1919, Too

The heaviest slump in traffic which ever occurred before was between the signing of the armistice in 1918 and the spring of 1919. In 1919, as in 1921, freight shipments reached their lowest ebb in the last week in February, being in that week only 667,708 carloads. It will be noted that in 1921 the traffic declined to a lower point than in 1919. The recovery of traffic in 1919 was regarded as rapid, but the recovery which has occurred in 1921 thus far has been more rapid than it was in 1919, for in the last two weeks of May the total shipments of freight exceeded those in the last two weeks of May, 1919, being 1,441,084 carloads in 1919 and 1,455,567 carloads in 1921. The traffic moving is still 20 per cent less than last October, but it is increasing faster under the present rates than it did under the lower rates in effect in 1919.

Even more convincing evidence is afforded

by the statistics regarding the shipments of farm products. The prices of these products are relatively lower as compared with pre-war prices than those of any other large class of commodities. The advances in the rates on them were relatively the same as on other commodities. Therefore, comparing with pre-war times, the rates on farm products are higher relatively to present prices than those on almost any other commodities.

#### Shows Small Effect of Rates

Nevertheless, shipments of farm products have increased more relatively within recent months than almost any others. From January 1 to June 11, 1921, the total carloads of grain shipped was 876,581. This was 61,803 carloads more than in the same part of 1919, and 119,628 carloads more than in the same part of 1920. The number of carloads of fruits and vegetables shipped in the present season up to June 20 was 361,471, an increase over last season of 58,670 carloads. A few weeks ago propaganda was started to show that cantaloupes could not be shipped under the present rates from the Imperial Valley of California. Up to June 20 of this year, however, the total shipments were 5,170 carloads, as against 4,497 carloads last year.

Valuable testimony regarding the relationship of freight rates to prices of various products was given recently by W. H. Williams, chairman of the Wabash, in the hearings before the Senate committee on interstate commerce. He showed that on cattle sold in Chicago at \$8.60 per 100 pounds the rate from Sioux City, Iowa, to Chicago was 44 cents per 100 pounds, or only about 5 per cent of the price. On hogs sold at \$9.25 the rate from Des Moines was 40 cents, or about 4 per cent of the price. On a bushel of wheat sold in Chicago for \$1.47 the rate from St. Cloud, Minn., to Chicago was 15.6 cents, or less than 11 per cent of the price. Another example that may be cited is that on a cantaloupe selling at retail in Chicago for 35 cents, the freight rate from California was about 4 cents. The consumer paid enough for it to cover the transportation charge, a reasonable profit to the retailer and the produce merchant, and a fair price to the grower. If the grower did not get

a fair price this was not due to the railway rate.

On most commodities of general consumption the freight rates, although higher than for years, are still low compared with the value of the commodities. Mr. Williams showed the 40 per cent increase granted last August in the rate on a box of apples from the State of Washington to Toledo was only 32 cents; on a crate of 30 dozen eggs from Kansas City to Detroit only 18 cents; on a pair of shoes from New England to Chicago only 1.8 cents; on a barrel of flour from Minneapolis to Toledo only 16.33 cents; on a suit of clothes from New England to St. Louis only 3.1 cents; on 100 pounds of sugar from New York to Kansas City only 20½ cents.

### The Question of Argentine Wheat

The extent of the misunderstanding regarding the present rates is illustrated by a statement which recently was widely published to the effect that the Iowa farmer is paying a rate which approximates 30 cents a bushel on grain from Iowa to New York as against a rate of 10 cents a bushel from Argentine. The Argentine competition, as stated, would constitute a rather serious menace to the Iowa grain grower.

The rate on wheat from Waterloo and nearby points in Iowa to New York City is approximately 34 cents per bushel, and this rate carries the milling-in-transit privilege under which the wheat may be taken off, worked into flour and forwarded as flour to New York without additional charge. The lowest ocean rate we have been able to find from Argentine to New York is 13.6 cents per bushel. However, wheat is not grown at the seaboard in Argentine, and the rail rate from the wheat producing districts of Argentine to the point of export averages 10.1 cents per bushel, and the insurance rate .4 cents per bushel. This makes the total from the wheat-growing parts of Argentine to New York 24.1 cents. This might seem to place the Iowa wheat grower at a disadvantage as compared with the grower in Argentine. But there is practically no wheat consumed in New York. New York is a consumer of flour, and to ship the Argentine wheat from New York to a milling point and return it to New

York as flour would add an additional charge of at least 12.4 cents in each direction. This would give a total rate for Argentine wheat (as flour) delivered at New York of 48.9 cents per bushel as against a rate from Iowa of approximately 34 cents. You will readily perceive the advantage the Iowa grower has. Investigation disclosed that no wheat whatever has moved from Argentine to New York this year. New York is not now and has not been a market for Argentine wheat.

### Expenses Higher Than Estimated

Since it is clear that reductions in rates are not needed to enable the traffic of the

## The Scandal Monger

We have many sculptors today who are different from those of old.

We have those who do not mold in material substances but who impress upon the minds of good American citizens the crude images of uncertainty—disloyalty to country and employer, unfaithfulness and discouragement.

You have met many of these sculptors in the last few years—so many of them that it is hard to tell when or how we will destroy them. They are the greatest menace to our nation today.

The greatest of these is the scandal monger, full of dissatisfaction and criticism, who advances no efforts toward the solution of the problems of the day. He is a poisonous reptile who comes in contact with clean American minds and infects them with his poisonous conversations. He is dissatisfied with the administrative officers of his country and his employers, as well as his fellow workmen. You meet him every day, you work with him, and you read his writings in the newspapers and periodicals. He's on all sides of you. It is necessary to get rid of him.

When he comes in contact with you, attack him as you would a reptile. Realize that he is dangerous. Be self-reliant and draw the poison from him.

Always remember that there is room for only two kinds of isms in this country, and those are Americanism and patriotism.—D. G. BENKERT, *Conductor, Freeport, Ill.*

country to move, it is desirable and necessary to consider the effects which would be produced upon railway earnings and service by premature general reductions. It is well known that when the Interstate Commerce Commission last August fixed the present rates it estimated that the railroads would derive certain earnings from them and have certain operating expenses, and would receive a net operating income of 6 per cent upon the valuation of their properties made by the commission. In the last four months of 1920, when the railroads handled the largest business they ever handled in those months, the net return earned by them was at the rate of only 3.3 per cent. This was because their expenses were higher than had been estimated, and because the rates did not cause as large increases in earnings as had been estimated. The slump in traffic entirely wiped out the net operating income of the railroads in January and February, and the net return earned by them from September, 1920, to June, 1921, averaged only a little over 2 per cent. This is hardly enough to enable the railroads as a whole to pay the interest on their bonds. Furthermore, even the very small net returns obtained within recent months have been gained only by terrific reductions of maintenance expenditures. For example, owing to these retrenchments in maintenance there recently were in the country 325,000 freight cars which were in bad order.

#### **Advance in Rates Inadequate**

The railroads, under government control, were not allowed, like most business concerns, to make large profits and accumulate large surpluses, but were restricted to the same net return they earned in the three years before this country entered the war. Their properties were allowed to deteriorate. The number of freight cars available actually decreased 126,000 under government control. They perhaps have suffered more severely from the recent depression in business than any other class of concerns in the country. They must be allowed to rehabilitate their properties and get upon their feet financially if they are to be able to render the service the country will demand when general business improves and traffic in-

creases. They cannot do this if general reductions in rates are soon made.

It is argued in some quarters that the latest advance in rates was made to offset the advance in wages granted by the Railroad Labor Board last July, and that the rates should be reduced to where they were last August because the Labor Board has ordered two-thirds of the advance in wages eliminated. The facts are that the advance in wages made last July was estimated at the time at \$625,000,000, while the advance in rates was estimated at \$1,500,000,000. The advance in rates had to be made so much greater than the last advance in wages because when the railroads were returned to private operation, before the last advance in wages was granted, they were incurring under government operation a deficit at the rate of almost \$1,000,000,000 a year. Furthermore, the advance in rates when the railroads were handling a heavy business proved to be about \$500,000,000 less than was needed to enable them to earn a return of 6 per cent. Obviously a reduction in wages of only \$400,000,000 a year is not sufficient to justify a demand that the entire advance in rates of \$1,500,000,000 be wiped out, especially in view of the fact that this advance in rates proved to be entirely inadequate.

#### **Revival a Matter of Time**

General reduction of rates, which would result in large reductions of railway earnings, should be postponed until the net earnings of the railroads have become large enough so that general reductions of rates will not completely disable them from restoring their properties to good physical condition.

It is only a matter of time until the production and commerce of the country will completely revive again, and unless the railroads get ready to handle a larger business than ever before the country will suffer enormous losses from the inability of its transportation system to handle its business.

The fact seems to be overlooked by many people that the movement of traffic can be much more seriously hindered by physical inability of the railroads to handle it than by the application of rates which seem high compared with those in 1917 before the

enormous advances in railway operating expenses due to the war and government control occurred.

The advance in rates granted last August was based upon estimates of future operating expenses. These proved so far wrong that even when the railroads were handling a large business they were failing at the rate of \$500,000,000 a year to earn the net return expected. This shows the hazards involved in estimates based upon numerous uncertain factors of great importance. A large part of the recent losses the rail-

roads have incurred have been due to these mistaken estimates. Any general reduction of rates proposed would have to be based on estimates of future traffic and expenses, which might prove to be equally erroneous.

Fairness to the railroads and the welfare of the country demand that future changes in rates shall be based on actual experience, and the only experience on which they can reasonably be based will be experience under the existing general scales of rates and the new scale of expenses which is now in process of being established.

## Y. & M. V. Loses Zachary T. Jolly

Zachary Taylor Jolly, claim agent, Memphis division, died June 21 at St. Joseph's Hospital in Memphis at the age of 42 years. He had been in the Illinois Central

June 17. While the operation was a great shock to him, it was thought after twenty-four hours that he had passed out of danger and his recovery was expected. A few hours before his death he suffered a serious relapse.

Mr. Jolly was born September 14, 1878, at Huntingdon, Tenn., where he lived until 1909, when he removed to Memphis as a deputy United States marshal, a position he held for four years, then entering the service of the Yazoo & Mississippi Valley Railroad. He was married July 6, 1919, to Miss Ola Jordan, and they have lived at 1960 Central avenue, Memphis.

Mr. Jolly was in disposition all that his name implies, a sunny man who made many friends. He leaves a host of warm friends in the Illinois Central family, for he was known to officers and employes throughout the system. His place will be difficult to fill.

Zachary T. Jolly

System service since 1913 as claim agent at Clarksdale, Miss., with his residence in Memphis.

Mr. Jolly was taken suddenly ill at Clarksdale May 30. After spending ten days in the hospital for treatment of inflammation of the gall bladder, he went to his home, but returned to the hospital for an operation

### THIS IS REAL CO-OPERATION

Instances of effective co-operation between departments are cited by W. H. Brill, general passenger agent at New Orleans, who says: "I wish to call attention to the splendid co-operation the passenger department is receiving from employes at New Orleans Union Station, special mention being made of Station Master McDerby, Baggage Agent Cardno and his assistant, Mr. Nugent. There have been instances where these gentlemen and their assistants have really gone beyond the scope of their own departments to solicit competitive business, namely: eight passengers to Eastern Canada and several to New York and Louisville, as well as to various other destinations."

# With the Flyers at Chanute Field, Where Even Dogs Take Wings

## Uncle Sam's School Turns Out Mechanics and Records Along the Illinois Central at Rantoul

TRAVELERS on the Illinois Central Railroad who see the numerous airplanes hopping off or gracefully landing in a field just south of Rantoul, Ill., do not always realize that many interesting things have happened there, and that there is an invaluable store of information in the buildings at the side of the field.

The place is known as Chanute Field. It is the home of the Air Service Mechanics' School of the United States Army, the only institution of its kind in the United States.

A parachute jump from the greatest height ever made was accomplished at this field when Lieutenant A. G. Hamilton leaped from an airplane on March 22 at an altitude of 23,700 feet. Lieutenant Harry Weddington flew the airplane from which the jump was made. It was a De Haviland B 4 type with a Liberty motor and had been specially equipped in order to reach the altitude desired.

When Lieutenant Hamilton jumped, he was not visible to those on the ground, and had probably been floating in the air for

some time before they located him. The landing was perfectly made.

June 17, 18 and 19 were the gayest of days at the field. Airplanes were taking to the air, climbing to a high altitude and then rolling over and over in all sorts of stunts. They were landing on the field just about as fast as they were hopping off, but the landings seemed to be more cautious. In fact, on several instances on the first day, wings were torn off, wheels broken and the noses of airplanes jammed into the ground when a landing was attempted.

### A Reunion of U. S. Aviators

These three days were joy days, because it was a reunion of the aviators who were in service during the war. The government set these days aside and offered airplanes to former soldiers, that they might renew their familiarity with the airplanes and keep in the practice of flying them.

Although some of the men had not been inside an airplane for more than two years, they did not hesitate to start the motor, climb in and take to the air. The first trips of these men were interesting. The ascent seemed to be perfect. At a safe altitude the airplanes would be turned loose. They looked like birds that had been freed after a long life in a small cage. They rolled and tossed, looped and dived. The pilots seemed to be trying out every stunt they had learned. But when it came time to land, that was a different story. It was apparently the most difficult feat of all. Luckily, there were no serious accidents, but a number of the airplanes had to be taken to the hospital for repairs.

Chanute Field had a sad day June 16. On this day Bing, a small dog, supposed to be the only one in existence that has made parachute jumps, was sent away. Lieutenant J. L. Stromme, the owner of the "sky-terrier," was recently transferred to

Bing Ready to Fly

*1<sup>st</sup> Lt. Arthur G. Hamilton, Jumper - Left  
1<sup>st</sup> Lt. Harry Weddington, Pilot - Right  
After breaking world's altitude parachute jump record, 23,700 ft.  
Ship "Jeremiah III" De Haviland 4 B, Chanute Field, Ill., Mar. 22 1921*

*The Field's equipment lined up for  
outdoor class work*

*Air service mechanics learning their trade*

Washington, D. C., and asked that the dog be sent to him.

Lieutenant Stromme straps a parachute on the back of Bing, holds him on the wing of the airplane until they are 500 feet high, then loosens the parachute, and the dog drops safely to the ground. The apparatus has been specially made for the little aviator, and he has made many jumps.

#### Sorry to Lose the Dog

Every man on Chanute Field was sorry when the word came that they were to part with Bing. He was a true friend to everyone, always in the best of spirits and extremely playful. All had learned to love the little creature, and he, in turn, seemed to divide his affections so that each man felt that the dog thought most of him.

Bing could not leave the field like an ordinary dog. He was respected too highly for that. When the day for his departure came, the band was called out, and the entire body of soldiers formed a parade. Bing had a lieutenant as escort and the honor position in the parade, just behind the band. At the station, Bing stood at attention while he was saluted by his army of friends.

But the 1,128 men at Chanute Field do not have all play and no work, although, to the outsider, their work is just as interesting as their play.

There are twenty-six courses of study in the school. The aviators are taught the construction of airplanes in every detail, and they are instructed on domestic and foreign makes of motors. Airplane bodies are taken apart and accurately put together again. Instructors cause motors to function improperly, and the students are told to locate the trouble.

#### Planes Like Those Used in War

All the airplanes at the field are of the type used in the World War. There are twenty now that are in flying condition. These are of the following types: Le Pere, De Haviland, British S. E. 5, Scott, German Fokker and French Spad.

Chanute Field was used as a training field for aviators during the World War. Recently the Air Service Mechanics' School was transferred there from Kelly Field, Texas. Kelly Field is now being used as a training field.

*On the Wing of a Plane*

Plans have been made for permanent improvements at Chanute Field. It is expected to be developed into one of the best aviation fields in the United States.

Government air mail pilots make Chanute Field a landing station on the St. Louis-Chicago route, but they have no connection with the field. They alight there to replenish their supply of oil and gasoline.

Visitors at the field and school are courteously received, and a guide is appointed to take them through all the buildings to view the classes that are under instruction. But the government has issued an order that no visitor is allowed to be taken up in an airplane.

#### EXPLAINS TO EDITOR

A recent issue of the *Calumet Index*, published on the lines of the Illinois Central at the southern edge of Chicago, contained a letter to the editor regarding the Esch-Cummins law. This letter was written by Walter E. DuBois, a clerk in the local treasurer's office at Chicago, and was in reply to an editorial that had previously appeared in that paper attacking the provisions of the law. Mr. DuBois' letter pointed out how unlikely it is that "watered stock" is to be found in railway financing, called attention to the small effect that increased freight rates have had on prices, pointed out that the cost of living is steadily dropping, and prophesied that the provision for turning over to the government all profits in excess of a certain per cent would eventually mean something to the government, citing the case of the charter tax that the Illinois Central pays to Illinois.

# Illinois Central System Makes an Appeal to Shippers and Consignees

The amount paid out by the railroads on account of loss and damage to freight represents an economic waste burdensome alike to the railroads and the public. That this waste is substantial is shown by the following record of the loss and damage payments made by Class I roads:

1916 .....	\$ 23,346,965
1917 .....	35,079,757
1918 .....	55,852,797
1919 .....	104,507,174
1920 .....	104,398,930

The Illinois Central System has borne its share of the economic waste on account of loss and damage to freight, as will be seen by examining these figures:

1916 .....	\$ 655,293
1917 .....	1,077,720
1918 .....	1,653,706
1919 .....	2,298,250
1920 .....	2,745,099

The foregoing figures show how the problem of loss and damage to freight has got out of hand. The Illinois Central System, in common with other railroads, is making a determined effort to reduce this drain upon its revenues. In this we need the painstaking co-operation of shippers and consignees. We, therefore, earnestly request that all shippers and receivers of freight co-operate with us to make this movement a success.

During May, 1921, 68 per cent of the amount paid out for loss and damage to freight on the Illinois Central System was on carload shipments. We request carload shippers to insist upon being provided with cars suitable for the particular kind of freight they desire to ship and to see that shipments are properly braced and stowed in cars to prevent damage by shifting.

We request shippers of less-than-carload freight to comply with the rules and specifications of the Consolidated Classification Committee appointed by the Interstate Commerce Commission by selecting substantial containers in which to pack their goods for shipment, so

that packages may not be crushed and contents damaged when loaded into cars with other freight. We request them to mark their packages plainly as to name of consignee and destination, removing all old marks that may appear on packages, and to furnish legible billing orders, so that billing may indicate clearly the name of consignee and destination. We also request them to deliver their goods at freight depots early in the day to avoid hurried loading and billing.

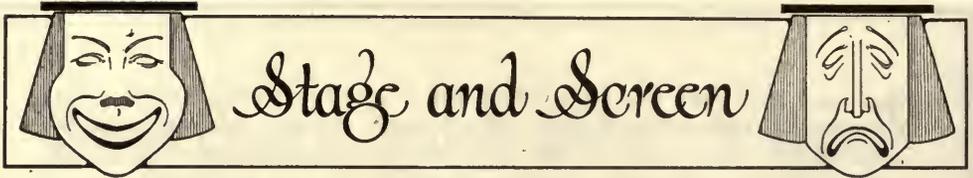

The president of a large wholesale house on the line of the Illinois Central System was told by one of our agents that many packages were being sent back to his house on account of improper packing and addressing. He expressed great surprise and immediately called in his shipping clerk to ask him, in the presence of our agent, how many packages were being returned from the Illinois Central System daily. The shipping clerk replied: "I cannot tell you exactly, but a good many." As a result of this interview, the necessary corrective measures were immediately applied.

We request receivers of freight to observe the character of containers used by shippers and the manner in which goods are packed, crated and marked, particularly when goods are not received in good order, and to make those facts known to the shippers, appealing to them to use good containers on the ground that defective goods and delayed transportation service cause them a loss of trade. We also request receivers of freight to notify our representatives promptly of any concealed loss or damage to their shipments, in order that immediate investigation may be made. Some receivers of freight neglect to do this for days, and even weeks, after shipments have been received, rendering it difficult for the proper inspection and investigation to be made. This militates against good service.

Our purpose in presenting this problem to our patrons is to enable us to render a better service, by eliminating delay in the delivery of freight in good condition, and to assist in reducing the cost of transportation. By no means do we claim that all of the trouble is due to lack of care on the part of shippers and consignees. We are doing everything within our power to correct abuses for which we are responsible. We are putting forth our best efforts to render a service of satisfaction. By working closely with shippers and receivers of freight, we believe it possible to bring the troublesome question of loss and damage under control, to the great advantage of shippers and receivers of freight, as well as to this railroad.

Constructive criticism and suggestions are invited.

**C. H. MARKHAM,**  
President, Illinois Central System.

GEORGE M. COHAN recently said he was "through" with the stage as a producer, and events have borne out the prophecy he made. "The Tavern," in which he has been playing the Vagabond in New York, has closed—it is said, at the height of its popularity. This leaves as his surviving production "The O'Brien Girl," which is running in Boston. All of his various other productions are off the stage, although some of them were booked as far ahead as August.

TO GIVE THE UNDERSTUDIES a workout, the members of the cast of "The Bat" playing in New York are going to take two weeks' vacations this summer, one at a time. Their roles will be played by actors who will tour in the play next season.

AN OLD MAID CLOWN is something to look forward to. Announcement has been made that Doll I. Farlardeau has signed with A. H. Woods as the old maid clown in "Ladies Night" for next season.

H. B. WARNER, long a popular movie star, has accompanied his wife, Rita Stanwood, in a desertion of the films and is now rehearsing a new play in New York.

"MILESTONES" in an actor's life, according to the *Billboard*, are as follows: A few seasons ago—"A Prince There Was"; last season—"The Meanest Man in the World"; now—"The Vagabond."

CHARLOTTE GREENWOOD, the elongated comedienne, is to give us another musical comedy of the "Letty" series next season, it is said. The name of the new one will be "Poor Letty."

THE PHENOMENAL SUCCESS, "Lightnin'," with Frank Bacon, shows no

recent sign of breaking away from New York, where it has passed its twelve hundredth performance. Some hope had been expressed of getting Mr. Bacon and his play to Chicago this year, but the announcement is now made that it will begin its fourth year in the East on August 26.

"PEG O' MY HEART" is to be played by Miss Elsie Janis at the Theatre de Vaudeville in Paris, France, during September and October. The language used will be French, Miss Janis announces.

TRUST SIR JAMES BARRIE to get out something new occasionally. In his new one-act play called "Shall We Join the Ladies?" Sir James introduces his audience to twelve men seated around a table after the women folks have left. The host announces, unexpectedly, that his brother has been murdered in Monte Carlo and that the murderer is present as one of the guests. And then he proceeds to cross-examine the twelve.

MAUDE ADAMS, stage creator of "Peter Pan" and other favorite characters of recent years, received the honorary degree of Master of Arts from Union College at its recent 125th commencement. She is the first woman honored in this manner by Union College.

J. HARTLEY MANNERS, the dramatist, who was recently in Chicago with his wife, Laurette Taylor, during her engagement in "Peg o' My Heart," is putting the finishing touches on a new play for his talented wife, which will be presented at the opening of next season, before they make their production of Fanny Hurst's "Humoresque." Mr. Manners has not disclosed the nature of his new work. For many years he has written on an average

Ula Sharon  
in  
"Broadway Brevities"

Vivian Martin  
in  
"Just Married"

Robert

Celebrities

Laurene Taylor  
in  
"Peg o' My Heart"

Billie Davis,  
Ruth Channing  
Dixie O'Neil  
in  
"Passing  
Show of  
1921"

a play a year. His last was "One Night in Rome," presented last season in New York and London.

ETHEL BARRYMORE is back in vaudeville again with Sir James Barrie's play, "The Twelve-Pound Look," which she has played so often.

"ARMS AND THE MAN," Bernard Shaw's play, has been reported as withdrawn from the stage at Vienna, Austria, because of the opposition of Bulgarian students, who regard it as an insult to their country.

CHAUNCEY OLCOTT will go on tour next season in a revival of "Ragged Robin."

TURNING TO THE MOVIES, one observes that Bert Lytell is working on an adaptation of Franz Mollner's play, "Lilium." Mr. Lytell will have it titled "A Trip to Paradise."

DOROTHY GISH of the movies is trying out a dramatic play in stock in Canada this summer, and if she makes a go of it, she intends to start out in a regular stage play with her husband, James Rennie, as leading man.

MACK SENNETT has been reorganizing, it is reported. Charles Murray is definitely out of the Sennett forces. Others gone are Kalla Pasha, James Finlayson, Louise Fazenda and Polly Moran. Ben Turpin is still on the job, however. Sennett is planning to divide his productions, making half of them comedies of his usual order and half of them serious five-reel stories. In the dramatic productions now working on location are Noah Beery, Mabel Normand, Ben Deely, Lowell Sherman, Jack Mulhall and Jacqueline Logan.

JUDGE PRIEST in "Boys Will Be Boys," the Goldwyn picture starring Will Rogers, is played by Ed. Kimball, father of Clara Kimball Young. He is an old

school actor, with a long legitimate stage career, and is often seen on the screen in support of his daughter.

TOM MIX'S latest picture for Fox has been titled "A Ridin' Romeo."

SPEAKING OF FACE POWDER—even the sun dabs it on in the movies! The other day Victor Schertzinger, directing Tom Moore in "Beating the Game" at the Goldwyn studios, decided to photograph the sun's rays as they came through a group of trees to the scene of action. "Impossible," said the cameramen, "to register the rays unless we put on a little make-up." So they proceeded to throw a handful of cream colored powder into the air and, as it filtered down through the sunlight, they photographed the scene. Old Sol no doubt will be asked to endorse the brand of powder used.

HOW MANY FAMILIES can you name which have three or more of their members in the movies? There are four Moore brothers in films, Tom, Owen, Matt and Joe. The Pickford family is represented by three, Mary, Jack and Lottie. There are three MacDonald sisters, Katherine, Miriam and Mary, the latter being known on the screen as Mary MacLaren. Viola Dana, Shirley Mason and Edna Flugrath are sisters, the family name being Flugrath. Everyone knows of the Talmadges, Constance, Norma and Natalie. There are three Ince brothers in films, Thomas, John and Ralph. The Stewart family has its representatives Anita, Lucille, Lee and George. Then there are Ethel, John and Lionel Barrymore. Three Marsh sisters have shown on the screen at various times, Mae, Marguerite and Mildred.

CHARLES URBAN has recently completed a short length, "Swat the Fly," for the Kineto Review. If that will inform us how to get rid of the pest entirely then the motion pictures have not lived in vain.

### Picnic Sandwiches

I venture to say that the finest sandwiches we ever ate were those which were made of the bread that mother used to bake, with a generous layer of home-boiled ham, corned beef, or tongue between the slices. And she didn't remove the crusts, either. Each wholesome piece had a golden rim which was munched with delight.

In these days of the sanitary bakery, we find that we can purchase bread which is almost as good as mother's. The bakeries make an excellent sandwich loaf, which can be procured for any desired day by placing an order with the baker a day in advance.

To make a sandwich which is at once dainty and appetizing, the bread must be cut so that the slices are neither too thick nor too thin. A crisp lettuce leaf makes an agreeable addition to almost any sandwich. The butter should be softened to spread smoothly. Waxed paper will keep the bread fresh, and if it is necessary to prepare the sandwiches the night before, they may be kept moist by wrapping them in a damp cloth.

It is usually desirable to prepare at least one kind of meat sandwich for the picnic lunch. Thin slices of cold tongue, ham, corned beef, sausage, veal loaf, roast pork, roast beef, or chicken may be used.

For those who crave something different, the following is a list of appetizing sandwiches, easy to prepare:

*Date and nut.* Stone the dates and run the dates and shelled walnuts (equal proportions) through the food chopper. Mix with salad dressing and spread on bread.

*Egg and pickle.* Mix hard boiled egg, finely chopped, with one-half the quantity of piccalilli or finely chopped sweet pickle. Moisten with salad dressing.

*Pork and peanut.* Run through the food chopper an equal quantity of cold roast pork and shelled, unsalted peanuts. Mix with salad dressing.

*Schmierkaese or cottage cheese.* Mix finely chopped nuts with schmierkaese and spread on rye bread.

*Pimento cheese.* There is on the market an excellent brand of pimento cheese, ready to spread, and also cheese with green pepper, both delicious for sandwiches.

### Household Hints for Home Makers

To remove berry stains from table linen, place the stained portion over the top of a pail, and pour boiling water through the cloth until the stain disappears. Apply common salt to tea stains (if possible, while the spot is still wet), let stand for a while, and then wash as usual.

To wash hairbrushes easily and quickly, add a few drops of household ammonia to the water.

Grated cheese is delicious spread over apple pie.

Almost every woman likes to paint—or calcimine. Be sure to strain the calcimine through cheesecloth before applying it to your rooms.

### Tested Recipes

**PEACH SALAD.** Use canned peaches. Place  $\frac{1}{2}$  peach on lettuce leaf for each plate. Chop finely 1 stalk celery, add 2 tablespoonfuls of mustard seed, 1 tablespoonful of vinegar, a dash of salt, and 1 tablespoonful of salad oil, and form little balls to place in the center of each  $\frac{1}{2}$  peach. Just before serving, dress with fruit salad dressing.

**LEMON PIE.** To the juice and grated rind of 1 lemon add  $\frac{3}{4}$  cup of sugar mixed

with 1 tablespoonful of flour; then add beaten yolks of 4 eggs. Stir all together and add  $\frac{1}{2}$  cup of hot water. Cook until thick. When cool, add pinch of soda, and then add the whites of 4 eggs beaten with  $\frac{1}{4}$  cup of sugar until stiff. Stir together and put in crust and brown in oven.

**CARAMEL PUDDING.** 1 pint milk, 2 heaping tablespoonfuls cornstarch, 2 eggs, 1 cup light brown sugar, 1 teaspoonful vanilla. Mix cornstarch and milk, and scald the milk, stirring often. Add the eggs, well beaten. Heat a spider hot. Into it put the brown sugar, stir and allow to caramelize. Add the custard mixture to the caramelized sugar, and cook slowly, stirring constantly, until smooth. Add vanilla last, remove from fire, and put into molds which have been rinsed in cold water. Serve with whipped cream. (This quantity will serve five persons.)

### Every Woman's Duty

Brushing the hair is said to be fatal to the marcel wave. Nevertheless, to keep hair and scalp in good condition, the daily use of the hair brush is indispensable. Fifty strokes of the brush every night or morning will produce that clean, glossy appearance which is one of the ear marks of good grooming. (Any-way, in Paris the popularity of the wave is on the wane.)

"Her neck looked old"—terrible indictment! The neck, like the hands, frequently betrays a woman's age. Massage the lines in your neck with a good skin food. Persevere in this treatment and the results will be gratifying.

If a trim coiffure is your particular style, and you hesitate to go about hatless on that account, try wearing two hair nets instead of one, pinning the second in place over the first, and defy the breezes to disarrange your locks.

Vinegar, applied to the affected parts, will take the sting out of sunburn.

### From the Shops

Of organdie are the newest shades for lamps and candles. Exquisite tones are obtained by combining delicate tints of this lovely material.

For sports and street wear the sleeveless slipover dress has made its bow. Any style blouse may be worn with this dress.

Picturesque for midsummer are Leghorn hats, wide brimmed and laden with flowers of exquisite color.

Eyelet embroidery, excellent for introducing color contrasts, is still in favor on some of the newest gowns.

For sports wear white shoes trimmed with patent and brown leather are modish.

Summer dresses of dotted swiss and voile are a joy to the beholder. A favorite color is the ever-popular blue, with dots of red, or gold, or white.

When packing the vacation bag, one is reminded that almost as indispensable as the toothbrush is a sweater coat. Smart slipover and tuxedo styles of pure wool or heavy fiber silk, all colors, are displayed in the stores.

### The Apartment House

Severe against the pleasant arc of sky

The great stone box is cruelly displayed.

The street becomes more dreary from its shade,

And vagrant breezes touch its walls and die.

Here sullen convicts in their chains might lie,

Or slaves toil dumbly at some dreary trade.

How worse than folly is their labour made

Who cleft the rocks that this might rise on high!

Yet, as I look, I see a woman's face

Gleam from a window far above the street.

This is a house of homes, a sacred place,

By human passion made divinely sweet.

How all the building thrills with sudden grace

Beneath the magic of Love's golden feet!

—JOYCE KILMER.

### Life's Little Lies

"It's a Paris model, Madame, and so very reasonable at \$50."

Moonlight on the lake.

Girl: "Jack, have you ever been in love before?"

Jack: "Dearest, you are the only girl," etc., etc., etc.

Monday in June.

Boss: "Fine cool day to work."

Steno: (with badly sunburned shoulders, temperature 1,000): "Delightful!"

# Uncle Sam Builds a Great Sanatorium at Dawson Springs, Ky.

*Health Resort on Illinois Central Soon to Boast of Care for Our Disabled Soldiers*

**O**UT on a wooded hill-top three miles from Dawson Springs, Ky., the United States government is now engaged in spending approximately \$2,250,000. That sum is the estimated cost of the new Public Health Service Sanatorium now being constructed there. Since Dawson Springs has no rail service except that furnished by the Illinois Central, the sanatorium project is of deep interest to this railroad, and considerable revenue has already come to the company from the freight that has had to be handled to Dawson Springs.

The sanatorium at Dawson Springs is one of several which the Public Health Service is now putting up to care for the soldiers who are yet suffering from the effects of the world war. That the purpose of this sanatorium is to care chiefly for tubercular patients is to be gathered from its plan. Statistics show that many of the men who were gassed in the war have since contracted tuberculosis. Beds for at least 500 of these cases will be ready early next spring at Dawson Springs. The sanatorium personnel will include about 250 skilled specialists, nurses and attendants. The complete plant will almost entirely cover the broad

hill-top selected as a site. Twenty-one buildings of major importance will compose the sanatorium. Eight of these are at present under construction.

### \$680,668 for First Eight Buildings

The contract for the first eight buildings, for which a total of \$680,668 is to be paid, is being executed by the George W. Langford Company of Louisville, Ky., in conjunction with the local agents, the Dawson Springs Construction Company. Willis Kennedy of Louisville is superintendent of construction for the Langford company, while Fremont P. Ward, superintendent of construction of United States public buildings, is on the job in the interest of the government.

Murch Brothers of St. Louis, Mo., have a contract for the building of the power house, in amount \$42,000. S. W. Rittenhouse of Washington, D. C., has a contract for the installation of the mechanical equipment of the buildings, in amount \$62,000, and \$52,000 for the mechanical equipment of the power house. The Wickes Construction Company has the contract for the erection of the 100,000-gallon water tank.

All work is under the charge of Mr. Ward,

*A General View of the Plan for the Sanatorium.*

and is being handled by the supervising architect of the Treasury, Washington, D. C., who has designed the sanatorium for the Public Health Service. Every effort is being made to expedite the work and provide care for the soldier boys who have lost their health in Uncle Sam's service.

The first eight buildings consist of an infirmary, one building for semi-ambulant patients, and six buildings for ambulant patients. These buildings have reached the interior plastering stage, and should be ready for occupancy by the first of October. The remaining thirteen buildings are to consist of a mess hall and kitchen, a recreation building, an administration building, a building for nurses' quarters, one for junior officers' quarters, one for senior officers' quarters, a home for the officer in charge, a non-tubercular hospital, a building for attendants' quarters, a laundry, a power house and a gas house. Bids for the construction and mechanical equipment of the remaining buildings have been asked for July 13, and construction more than probably will begin within the next two months. If it does, the completed sanatorium should be ready for use early next year.

### Has an Ideal Situation

The situation of the sanatorium is almost ideal for its purpose. The hill-top is high and dry—with an elevation of more than 600 feet and a clear exposure to the light so often sung about as "The sun shines bright on my old Kentucky home." Every view is a vista of green wooded hills, as far as the eye can reach, and all of the buildings to house the patients have either southern or eastern exposure. The location is out in the quiet open places, far from the "maddening crowds" that somebody wrote about, and under the hill, feeding the wells, are the mineral springs that have made famous the little city of Dawson Springs.

The hill-top is about two hundred feet above the Tradewater River. The site overlooks the surrounding country for a distance of fifteen miles. It is covered with beautiful woods of pine, dogwood, hickory, white-oak and persimmon. The elevation renders the drainage excellent, and the breezes blow

over the hills when there is any movement of the air. This site was chosen in competition with many other propositions placed before Congress. This land is particularly adapted for fruit growing and pasture. Some of the finest peaches grown in Kentucky have been grown on this property.

Uncle Sam, in his usual thorough manner, is seeing that things are done properly in the construction of the sanatorium, so that none of the advantages of the location will be lost. For the most part, the units are to consist of two-story stuccoed fire-proof buildings, built for permanency. The foundations are to be of concrete and the walls of load-bearing tile. The floors and ceilings are to be of concrete. The cement comes from Kosmosdale, the tile from near Louisville, and the sand and gravel from Paducah; so it can be seen that the Illinois Central has

*Open Bedrooms Shown at the Right*

practically all the traffic to itself. Certain equipment formerly used at Camp Taylor, the army cantonment at Louisville, has been utilized at Dawson Springs, and even this has had to travel over the Illinois Central.

The government is carrying on a large portion of the work under the purchase and hire system—buying the material directly and hiring the labor—and so far, this has been a saving of money for the government and has expedited the work of construction. A large part of the work has been done with the salvage material shipped from other camps. About 1,000,000 feet of lumber

has been sent besides the four tubular boilers, water piping and plumbing materials.

### Patients to Live in the Open

The buildings that are to accommodate most of the patients are the ones that are being built now. For the most part they are long narrow buildings, open to the world on one side so that the patients can have all the light and air there is. They will practically live out of doors. The twenty-eight bedrooms in each building for the ambulant patients will be merely booths built along what is practically a long porch; the only inclosed parts of their buildings will be the day-room in the center, with its fireplace, and the wing back of it for toilet and bath facilities. For the semi-ambulant patients, the building is being made so that their thirty-six bedrooms can be shut off completely from the porch if need be; in other respects the construction is much the same as in the buildings for the ambulant patients.

About two hundred men are steadily employed at the present rate of construction. As there is no community nearer at hand, these men live in Dawson Springs and travel back and forth to and from work every day by truck over those three miles of hard-surfaced road.

### Had to Build a New Road

This calls to mind another piece of work that the government had to do. When the best is said for them, some of the dirt roads in Kentucky cannot be called the finest in the world. When the Public Health

Service selected this site outside of Dawson Springs, the government had to build a rock highway—a brand-new road—over the hills and across the picturesque Tradewater River to connect the Illinois Central's spur track with the site of the construction. That road is an achievement in itself. Its construction spurred on the Dawson Springs boosters, and now there is a hard-surfaced county road running to the sanatorium. The material for building is hauled over these roads from the freight cars to the sanatorium in motor trucks which the construction company has leased from the government.

According to Mr. Kennedy, superintendent for the contractors, the trucks had to struggle over the dirt roads when construction began at the sanatorium in October, 1920, but the work became much easier when the hard road was opened on November 10, 1920.

The mineral water at the sanatorium, while providing the patients with excellent drinking, presents its own problems in construction and maintenance. According to Mr. Kennedy, the water has properties that hasten the setting of the plaster of paris so much that the workmen have to make unusual speed in order to get it in place before it sets. Just what measures will be taken to make the water fit for boiler use have not been explained. There is a chance that ordinary unmineralized water can be found, as the city water supply of Dawson Springs is of this nature. You can get mineral water baths at Dawson Springs if

*The Scene at Present—Infirmary in the Center*

you want them, but the barber shop gives you just the ordinary kind of shave.

### A Western Kentucky Affair

The sanatorium is really not exclusively a Dawson Springs affair. All that part of Kentucky chipped in to win its location there. Contributions from many sources made possible the gift of those 5,000 acres of land to the government. Although Dawson Springs is in Hopkins County, the sanatorium is just over the line in Christian County, and Hopkinsville, to the south, is sharing in the boom that the sanatorium has brought. Great plans have been made for an improved system of roads, and it is predicted that the location of this great government project in that part of the country will be of great and lasting benefit to the whole neighborhood.

Probably the best-known backer of the movement for the sanatorium is Theodore R. Troendle, president of the Dawson Springs Construction Company and for many years a prophet of Dawson Springs' commercial possibilities. The bill providing for the sanatorium was introduced in Congress by Representative David Kincheloe of Madisonville.

### Where Town Pump Is Glorified

Dawson Springs itself is a place where the town pump has reached its ultimate glorification. Without the town pump and the mineral water that bubbles therefrom, Dawson Springs would be just another sleepy little Kentucky station on the Illinois Central lines. As it is, Dawson Springs has become a mecca for health seekers from all over the south; its name is recognized readily anywhere in that broad region, and plans have been made to promote it as a rival for the noted Indiana spas—French Lick and West Baden.

There is something healthy about Dawson Springs that the casual visitor notices without realizing exactly what it is. The altitude is considerable; one cannot help noticing that when he observes the re-grading that has been done by the Illinois Central almost all the way along the line from Paducah. Our friend, the photographer, declared that "Casey Jones" had been written with the Kentucky division in mind, and that the famous wreck took place on the

old grade west of Dulaney Hill; be that as it may, the traveler comes as close to getting mountain scenery on that stretch of the lines as anywhere else on the Illinois Central System.

### Known as Spring Training Camp

At Dawson Springs, too, there is something carefree and hopeful in the attitude of the health seekers who promenade around informally, tin cup in hand, to cluster at the pumps, who take their ease in the shadow of the hotel, or who wander out to the bath houses to get their ailments boiled and perspired out of them. More than twenty hotels are listed in the Dawson Springs directory, in addition to numerous rooming houses, so that Dawson Springs is equipped to handle more than 2,000 visitors at a time—almost exactly as many visitors as there are residents of the town. For many years Dawson Springs has been a spring training camp for the big league baseball teams.

Mr. Troendle's big project—one that has lain almost dormant for some time but which seems more than likely to be revived with the completion of the government sanatorium—is that for the great Karlsbad Hotel, to cost \$3,000,000, to have 1,100 rooms and to bring Dawson Springs to the fore as one of the greatest health resorts in the country. This project was explained in a write-up of Dawson Springs in the *Illinois Central Magazine* for July, 1917. It is again becoming a subject for conversation around Dawson Springs, and many who feared that Mr. Troendle might not be able to "put it over" have had their expectations cheered by the winning of the public health sanatorium—in itself an achievement that will be a great advertisement for the springs.

The prosperity of Dawson Springs is wrapped up in the Illinois Central, as anyone can see by glancing through the advertising matter issued there. Any map showing the location of Dawson Springs is almost sure to be a map of the Illinois Central System, with perhaps a few other lines thrown in to show the central location of the town. G. C. McAuley is agent there, and much of the good feeling toward the Illinois Central can be traced to his courteous and efficient treatment of the shipping and traveling public.

# Does the Carrier Profit in Adjustment of Claims Regarding Coal?

## M. P. Blauvelt Takes Up Question of Scale Variance and an Arbitrary Percentage Deduction

The employment of a percentage deduction from the recorded scale weights in handling claims for alleged loss of coal in transit, taking into account the scale tolerance permitted under government standards and loss due to the inherent vice of the commodity, does not constitute an advantage to the railroad and an injustice to the shipper. This is the attitude taken by Vice-President M. P. Blauvelt in a letter to the editor of *The Retail Coalman* (Chicago), in which Mr. Blauvelt defends the practice from an attack by Ralph Merriam of the Chicago Bar, under whose name a copyrighted article appeared in *The Retail Coalman* for May.

Mr. Blauvelt explains the practice followed by the carriers in handling claims for alleged loss of coal in transit, and it is believed his letter will be of interest to readers of the *Illinois Central Magazine*. The body of it follows:

HERE appeared in *The Retail Coalman* for May, pages 45 to 47, a copyrighted article by Mr. Ralph Merriam dealing with the question of scale variance as applied to claims against carriers in connection with the transportation of coal. Mr. Merriam, assuming an arbitrary percentage of the shipping weight as representative of scale variation, cites sixteen hypothetical cases by which he seeks to show that the employment of a percentage deduction in the handling of claims for alleged loss of coal in transit is unfair to the shipper in that its advantage, where an advantage occurs, is always in favor of the carrier, usually with injustice to the claimant.

Mr. Merriam cites a group of eight hypothetical cases as representative of conditions where there has been an actual leakage or pilferage of coal and eight others as representative of conditions where there has been no actual leakage or pilferage.

The concern of the carrier is, of course, limited to a consideration of the first group, for certainly where there has been no leakage or pilferage the carrier should not be called upon to respond for damages as a result of error in the scales or manipulation of them. In fact, Mr. Merriam recognizes this point when he fails to show that the application of the percentage deduction would work unfairly against the shipper in any of the eight cases of his second group, while he does show that it would prevent an actual injustice against the carrier in three.

In all cases where the evidence as developed by careful investigation indicates leakage or pilferage in transit it is the general practice of the carrier to recognize full liability based on the scale weights without a percentage deduction. This practice exists notwithstanding the fact that the element of scale variance certainly enters into the determination of the weights in such cases just as it does in cases where the only evidence of loss is a discrepancy in weights as recorded by scales at origin and destination. However, let us disregard the advantage to the shipper which accrues under this practice of recognizing, in spite of the scale variance equation, full liability in cases where the carefully developed evidence would indicate leakage or pilferage, and examine Mr. Merriam's cases further.

### What the First Case Shows

In the first case of his first group Mr. Merriam cites a hypothetical instance of an actual loss in transit and an error in the scales at point of origin, as follows:

	Pounds
Actual weight at mines .....	90,000
Scale weight at mines .....	91,800
Actual weight at destination.....	88,500
Scale weight at destination.....	88,500

Mr. Merriam says:

"If the claimant adheres in this instance

to the loss indicated by the difference in scale weights and refuses any allowance for scale variances, he would file his claim for 3,300 pounds, while his actual loss is only 1,500 pounds. If he accedes to the carrier's request, and allows 2 per cent of the mine weight of 91,800 pounds, or 1,836 pounds, for assumed scale variance, he would file his claim for 1,464 pounds, or 36 pounds less than his actual loss."

In this case it is conceded that the 2 per cent deduction would result in substantial justice to all parties. It also is conceded that, if the 2 per cent deduction were not made in this case, the claimant would be paid for 3,300 pounds, resulting in a substantial injustice.

**An Instance of Actual Loss**

In the third case of his first group Mr. Merriam cites a hypothetical instance of an actual loss in transit and an error in the scales at point of destination, as follows:

	Pounds
Actual weight at mines .....	90,000
Scale weight at mines.....	90,000
Actual weight at destination.....	88,500
Scale weight at destination.....	90,270

The conclusion which Mr. Merriam advances with reference to this case is:

"The shipper, relying on the scale weights, would in this instance file no claim, although the actual loss is 1,500 pounds. The 2 per cent deduction rule does nothing to save the shipper in this instance from this injustice."

It is difficult to understand wherein the injustice in this case rests. If the coal had been sold f. o. b. the mines, shipper's weights to govern, the shipper would be paid on the basis of his invoice of 90,000 pounds. If, on the other hand, the coal had been sold with destination weights to govern, the shipper would be paid for 270 pounds more coal than he placed in the car. Wherein does the injustice to the shipper lie?

**A Loss Plus Two Errors**

In the sixth case of his first group Mr. Merriam cites a hypothetical instance of an actual loss in transit and an error in the scales at both the point of origin and the point of destination, as follows:

	Pounds
Actual weight at mines .....	90,000
Scale weight at mines .....	91,800
Actual weight at destination .....	88,500
Scale weight at destination.....	86,730

Mr. Merriam's conclusions in this case are:

"In this instance the actual loss is 1,500 pounds. On the scale weights the claimant would file for 5,070 pounds. By deducting 2 per cent of the billed mine weight of 91,800 pounds, or 1,836 pounds, for scale variance, the claim would still be filed and paid for 3,234 pounds, or 1,734 pounds too much."

It is evident that the percentage deduction rule in this case errs to the benefit of the shipper, as only scale weights can be considered from a claim standpoint.

A chief weakness of Mr. Merriam's conclusions is that they are the sequence of abstract hypotheses and cannot be applied to concrete claims. Where a hypothesis is impossible of application, its worth in the consideration of a question in hand is negligible. Applying the three cases given above to a specific claim filed six months later, when the identity of the shipment has been lost and the condition of the scales probably does not reflect the condition existing at the time of the movement of the coal, let us call upon Mr. Merriam to state definitely under what case the claim shall be considered. It is at once evident that, after the expiration of from three to six months, neither Mr. Merriam nor anyone else is in a position to say definitely under what class a specific claim should be considered.

**What Is an Actual Weight?**

In the adjustment of claims for loss of coal in transit, where the carrier's record of handling the car fails to disclose evidence of such defects as of their nature would permit of leakage, or the condition of the load at destination fails to indicate pilferage, it is customary to require a percentage allowance of the net shipping weight as representative of scale tolerance and loss due to the inherent vice of the commodity.

In each group Mr. Merriam makes reference to the actual weight at point of shipment or destination as opposed to the scale weight. Commercially, actual weight is non-existent save as reflected by scale weights,

and on these the coal is bought and sold and recovery is sought through claims.

Weighing is simply measuring the force of gravity. There is only one never-varying measure of gravity, and that is gravity itself, constant and unchangeable. The United States Bureau of Standards, recognizing the fact that scales even in perfect alignment constitute at best only an approximate measure of gravity, has stated that a scale may be considered as in alignment when the variation under test does not exceed one pound per thousand pounds of test weights. Accepting this, there can be no dispute as to equity of a shrinkage allowance to represent scale variation.

In the adjustment of claims for loss of coal, where the records are clear, an additional percentage allowance is requested to cover loss due to inherent vice of the commodity itself. In dealing with the inherent vice of the commodity one of the principal factors is the loss due to the evaporation of moisture. Moisture in coal consists of (1) extraneous moisture, which comes from external sources, such as underground water trickling over the face of

or through the coal bed, condensation of saturated mine air, etc., and (2) inherent moisture, which is one of the products of the original vegetable matter from which the coal is derived.

From an analysis conducted by the United

*M. P. Blauvelt*

States Department of the Interior we find that the degree of moisture varies considerably with the location of the coal bed. In the case of coal from Illinois mines the moisture content varies from 6 to 18 per cent. The results of the government analysis as to the presence of moisture in coal being unquestioned, it must be conceded from ordinary observation that

the exposure of this coal when taken from the mine to the action of air, light and heat will result in the partial evaporation of the moisture content, with a consequent loss in the weight of the coal. The ordinary observer unquestionably has noted atmospheric effect in the drying out and consequent loss of weight of practically all vegetable matter.

Other factors to be considered are results of the human equation and the variation of scales which do not appear to be within that degree of alignment contemplated by the Bureau of Standards in fixing a variation of one pound per thousand. In considering the reasonableness or unreasonableness of a shrinkage allowance, we must not lose sight of the fact that the human equation enters into the determination of the measurement of the force of gravity at both point of origin and point of destination of the shipment. As long as the human element is called upon to measure the force of gravity it must be conceded that errors will exist. It is true that these errors are not all in one direction, yet their existence is unquestioned.

#### When Loading Weight Is Found

The loading weight of a car of coal is determined prior to the actual delivery of the car into the possession of the carrier. In the process of daily operation there is loss from cars due to coal falling from them; gravity tracks are used at the mines, resulting in shifting of the loads and consequent loss. All this is before the coal has been delivered into the possession of the carrier, but subsequent to the determination of the net loading weight.

In the transportation of this or any other similar commodity, the carrier being charged under the law with the delivery of the same amount as received at point of shipment, with exception of loss due to the inherent vice of the commodity, this question arises:

Where the carrier's record of handling is perfectly clear, failing to indicate pilferage or the existence of defects which might result in leakage, should the carrier be held responsible for the differences indicated between loading and unloading scales, when the Bureau of Standards has definitely fixed the degree of error which may be permitted to creep in without condemnation of the scales, or should the carrier be asked to assume that loss which unquestionably is the result of partial evapor-

ation of moisture content in the commodity?

Eliminating entirely the human equation, there still remains the most potent argument against the absolute guaranteeing of the correctness of loading and unloading scale weights, viz., the loss due to the inherent vice of the commodity by evaporation, and the tolerance permitted under government standards.

### Interest

The savings bank pays you interest on the money you deposit. That money, in most cases, is the consideration paid you for the work you perform; therefore the interest on your money is contingent on the interest in your work; you can't have one without the other. Interest in your work pays another dividend of far greater than monetary value—pays it not quarterly, nor semi-annually, but at the end of each honest day's toil. It is self-satisfaction.

If you're sufficiently interested in the particular line of work you're doing, you'll interest the other fellow who comes in contact with you. It's bound to happen. You may not do it consciously but you'll do it just the same, and he'll pass it along until everyone of us will be full of interest, and the Illinois Central System will continue to enjoy the reputation of being in a class by itself.

Start out today—every day—with the resolve that, for the time you're on duty, Old Man Interest will be working within you just as he is on your money, and that daily dividend of self-satisfaction will roll in until you'll expand your chest to the limit and be proud of yourself and the Illinois Central.

Interest is the foundation of enthusiasm; cultivate one, and you'll acquire the other. Enthusiasm will lighten your work, make that day pass in leaps and bounds instead of just dragging by, and the first thing you know it won't be necessary to stimulate it—you'll be full of it, and it'll bubble over and soak everyone around you like water from a spring.

Buy it! Beg it! Borrow it! Dream it! Think it! But get it and use it.—HARRY K. KIERNAN, Assistant Chief Clerk, Y. & M. V., Memphis, Tenn.

# Chicago's \$5,000,000 Municipal Pier Will House Pageant of Progress

*Industrial Exhibition July 30 to August 14 Planned to  
Be Both Educational and Amusing*

**T**HE prospect of considerable passenger business for the Illinois Central is contained in the extensive advertising now being done for the Pageant of Progress to be held in Chicago from July 30 to August 14 this year. This industrial exhibit and entertainment is expected to be a great drawing card for the city on the lake, as it will appeal particularly to the attention of residents of the Mississippi Valley and will be held at a time when the advantages of Chicago as a summer resort are most apparent.

The Pageant of Progress is expected to be an annual affair in Chicago, beginning with this year. It follows, therefore, that passengers who are pleased with Illinois Central service to Chicago this year may remain patrons in the succeeding years.

Chicago's business men are combining their most serious efforts towards making the Pageant of Progress a complete success. The venture is under the auspices of the Chicago Boosters' Publicity Club, the Chicago Association of Commerce, the Health and Sanitation Exhibition and the Illinois Manufacturers' Association.

### **Pier an Exhibition Building**

The Municipal Pier, where the pageant is to be presented, was built at a cost of \$5,000,000 and is said to be the largest exposition building in the world. It extends almost a mile out into Lake Michigan, and is said to have 382,669 square feet of available floor space for exhibits and recreation.

Mayor William Hale Thompson, who is sponsoring the idea of the Pageant of Prog-

*Auditorium at the End of the Municipal Pier*

*Board Walk on Top of the Pier*

ress, has said that it will be three-fourths education and one-fourth confetti or gayety. Many industrial and manufacturing enterprises will be represented, and all exhibits will be educational.

The automobile and airplane industries of Chicago will occupy two sections, and leading automobile manufacturers are planning exhibits which will show the marvelous progress this industry has made in its brief life of twenty-seven years.

#### **To Show Evolution of Clothing**

There will be industrial exhibits depicting the manufacture of clothing from the wool on the sheep's back to the finished garment on the back of the wearer, the progress step by step from the spinning wheel and the hand loom to the modern mills, and the evolution from the silk worm to the finished dress.

The methods governing the production of food will be displayed by exhibits representing the progress from the farmer to the modern packing plants. Chicago's pre-eminence in the packing industry is to be shown.

Transportation, an essential factor in modern existence, will be exemplified by the evolution from the ox team to the flying machine.

An exhibit of public utilities will show how gas, electricity, water and heat from central plants have replaced tallow candles, the old oaken bucket and the woodpile.

#### **Oil Well to Be Operated**

A miniature oil well in actual operation will be used in depicting the production of petroleum from the time the well is driven into the ground until the refined gasoline is poured into the tank of an automobile.

Progress will be shown in business office appliances, from the old-time bookkeeper with his quill pen and simple ledger to the modern accountant with his bookkeeping machines, card indexes, adding and calculating machines, high-speed typewriters, billing machines, cash registers, automatic coin changers, check writers, addressing machines and hundreds of other time and labor saving devices.

The fur industry, which was one of the first in the Mississippi Valley, will be shown in its every phase from the fur-bearing animal in its natural state to the finished garment in the latest mode.

#### **Logging Demonstration Planned**

Lumber-jacks from the northern woods will demonstrate how logs are rolled and rafted down the rivers.

The Chicago Historical Society will exhibit objects illustrative of the development of the Middle West from a trackless prairie traversed only by Indians to what is almost the center of the population of the United States and one of the world's greatest railroad centers.

One of the most interesting departments of the Pageant of Progress will be that devoted to the development and conservation of public health. Plans have been made for the construction of a glass house, 110 feet long and costing \$5,000, in which the examination, measurements and classification of babies entered in the prize baby contest will be carried out in clear view of the public.

Entertaining features of diversion have been planned to coincide with the general educational nature of the entire pageant. Chief among these will be a daily naval pageant,

*One of the Exhibition Rooms*

*A View Along the Pier, Looking Toward the City*

with 10,000 men from the Great Lakes Naval Training Station.

#### **To Show Baseball's Development**

Ban B. Johnson, president of the American League, has arranged daily baseball games showing the game as first played in America and in its present highly skilled form.

The most modern airplanes will give demonstrations of passenger and freight carrying.

A marine parade of more than a thousand craft, including ocean-going steamers and yachts, will transform the lakefront into a water carnival each night. A boat from Quebec and one from New Orleans will lead the parade, to symbolize the "Wedding of the Waters." Thousands of seats on the roof of the pier will overlook this spectacle. In addition there will be electrical displays on Lake Michigan.

Among the races that will be held will be one among a carrier pigeon, an airplane, an automobile and a motorcycle. They will all leave the Municipal Pier simultaneously for Milwaukee.

Ten thousand voices, one thousand on each of ten gunboats in a semi-circle around the pier, directed by a leader on a barge with an

electrically lighted and operated baton, will sing each night.

From the foregoing it will be seen that the Chicago Pageant of Progress is to be in no sense a local affair but an educational demonstration in which the whole country will undoubtedly be interested.

#### **THE QUIET LIFE ON THE Y. & M. V.**

What an uninteresting month May must have been on local freight trains No. 91 and 92, between Memphis and Clarksdale, Miss., on the Memphis division! In those thirty-one days those two trains had no personal injuries, no exceptions, no derailments, no accidents of any description, no damage or rough handling of equipment, no foreign cars delayed on the Clarksdale district, no bad order cars delayed, no supplies drawn chargeable to caboose, nothing wasted—and last, but not least, no stock struck. What a dreary month! V. R. Byrd was the conductor in charge, and he attributes the quiet existence to strict attention to business, being constantly on the job, and co-operating at all times with his train and engine crew. If any local freight had less excitement in that time, the report of it has not yet reached headquarters.

# Dressing Up the Illinois Central Proves Power of Good Example

*Gardening Department Likewise Exerts an Influence  
Upon Territory Our Lines Pass Through*

*The Illinois Central Greenhouses at Champaign, Ill.*

THE gardening department of the Illinois Central is striving with increasing vigor to beautify not only the property of the company but also every home in the territory that is served by the railroad. At first glance, this appears to be an impossible task—one that is far too great to be considered—but the older members in the employ of the system say they can see a change in the twenty years since this department started its work.

How is the change being accomplished? Through the power of suggestion. The company's properties are beautified, and kept in this condition by a force of men who have studied plant life. When the people of a city see the improvement work that is being done, and a little later see the wonderful results, they become anxious to beautify their own homes in the same manner. Many of them are not familiar with landscape gardening and have no idea as to where to start. They do not know the names of plants that will look best in their lawn nor the names of those that will thrive in that particular part of the country. Consequently they turn to the gardeners of the Illinois Central and ask their advice.

The gardening department, while not taking undue credit, has been the direct cause

of improvements in many cities. The gardeners have given the advice, plans and ideas that have beautified numerous homes. And they do it gladly.

H. S. Moulder, chief gardener, who is stationed at Champaign, Ill., has noticed a two-fold result of his department's co-operation with the public. Besides lending to the beauty of the system, it has added revenue to the company. Formerly, he says, it was a rare thing to see shrubbery and trees shipped from one point to another, but now they are sent in car-load lots. When the department gives the names and species of plants that will be best for the particular needs of the inquirer, companies that are on the Illinois Central Railroad and deal in such material are given preference. This means that the plants are shipped via the Illinois Central.

Mr. Moulder says that the members of his department do not have the time to help their friends in building their gardens, but it gives them great pleasure to study each particular case where advice is desired and to offer suggestions and ideas that will aid materially.

According to the records of Mr. Moulder, the gardening department has been an organization only since 1900. It grew out of

the fact that the local organizations of employes of the Illinois Central Railroad took pride in the company's property in their locality and began beautifying it. At first, it was elementary gardening. Grass was planted in the bare patches and kept mowed. Then a few flower beds were added. The idea grew from year to year, until now there are parks on the system with an area of about five acres and containing more than three thousand shrubs. On all the property of the company, there is a total of 65,000 lineal feet of hedge.

#### A Succession of Gardeners

The first chief gardener of the company was a Mrs. McCray. From 1901 to 1903, J. Porte directed the work, and he was relieved by G. B. Moulder, a brother of the present head of the department, who remained in office until 1913. C. F. Swagyer became the chief gardener that year. In February, 1920, H. S. Moulder began his present work.

Mr. Moulder has had a long training as a gardener. He began working with plants, shrubs and trees at an early age, helping his father. In 1905, he entered the service of the Illinois Central as a helper to the gardener. In 1906, he was made the gardener of the Tennessee division, in which office he remained until he was made the chief gardener, with headquarters at **Champaign**.

Under Mr. Moulder are thirteen division gardeners, each of whom has had from five to twenty years' experience in the work. The entire force of the department numbers

*H. S. Moulder*

sixty-five. This number, however, is increased during the shipping season, November to June, when the department is busiest.

These men constantly study the natural peculiarities and beauties of the property and parks of the company, and plan designs that will bring out the topography and individual features of each park. Unattractive spots are screened from view or gently relieved of their harshness by means of shrubs and trees. Then, to lend an artistic air and to attract attention, flower beds are laid out in geometrical designs.

#### Plan to Follow Natural Lines\*

The gardening departments of other roads lay stress on the geometrical flower beds, according to Mr. Moulder, and do not try to develop the natural beauty as does the Illinois Central. Mr. Moulder believes that the general natural landscape gardening of the Illinois Central is equaled by no other system.

The department is always on the alert for new plants and shrubs that prove their merit and value for adding beauty. To this

*A Box Fit for a Porch*

end, the gardeners constantly watch the experiments of others.

The duties of the department also include the planting of vegetation on cuts, slopes and embankments along the right-of-way to prevent land-slides.

The most recent project of the department is the beautiful Markham Park at Centralia, Ill. This garden, which was formerly the site of the shops in that city, was finished in April. Mr. Moulder said that, in spite of the fact that there are many beautiful parks on the system, he considered the work on the Centralia property the best landscape plan of them all. Each division gardener heralds the gardens in his territory as the most beautiful on the system, he said, and competition is becoming keen. When the Markham Park has had time to develop, Mr. Moulder expects, the jealousy of the overseers of the other gardens of the system will be aroused to such an extent that they will push every effort forward to make their own beauty spots even more attractive.

A glance at the records of the department

gives an idea of the strides it has made since its organization. The greenhouses were constructed at Champaign, Ill., in 1902. Another has been built at Louisville, Ky. In 1901, 15,000 plants were used by the department. In 1910, there were 35,000, and in 1919 this number was increased to 51,000. In 1920 the department placed 82,000 plants. In 1921, a total of 140,500 already have been shipped to the various divisions.

This latter figure does not include 435 plants which were sent to section houses. Much work for beautifying these properties has been carried on in the last two years, and as a result the section houses of the Illinois Central are becoming very comfortable homes. Where conditions have warranted, sufficient fruit trees and plants have been sent to section houses to supply a family of five with fresh and preserved fruits throughout the year. The yards and grounds of these houses have been graded and seeded, new fences have been built, shrubbery and shade trees have been

*A Garden Spot at the Rockford, Ill., Station*

planted, and the places generally beautified. This work is to be carried on with increasing vigor.

Mr. Moulder is making an effort to supply the dining car service with cut flowers, but he says the capacity of the greenhouses is inadequate for this. Last season, the records show, 14,885 cut flowers were supplied. This year he is making an effort to supply double that number. Plans are now being drawn for the extension of greenhouse space.

The most popular shrub for beautifying a lawn, Mr. Moulder says, is the hedge. This serves the double purpose of lending beauty and marking boundary lines.

### How to Start a Hedge

To start a hedge, he advises the following procedure:

Dig a trench 14 inches deep and fill with manure and rich loose soil. Plant the slips 12 inches apart, and pack the soil down thoroughly. The top branches should be trimmed immediately to within 8 inches of the ground. The trimming should be repeated every thirty days during the first season, and the growth at the end should not be more than 4 inches, thus making a total height of 1 foot. The second year the hedge should be trimmed every twenty or thirty days and allowed to grow an additional 6 inches. The trimming should be continued each succeeding year until a height of 18 inches is reached. Then the hedge should be trimmed to fit the local conditions. Eighteen inches is the preferable height.

Hedges for the northern, central and southern parts of the country vary. Those grown in the South are not hardy enough to endure the severe northern winters, but those of the North will grow and thrive in the South as well as in the North.

Mr. Moulder has found the following hedges to be the best for the following localities: Amour River Privet South thrives best south of Tennessee; California Privet will grow as far north as St. Louis, and Amour River Privet North, the most hardy species, will stand the winters as far north as the Wisconsin line.

Other plants, shrubs and ornamental

trees that are best for the different localities he names as follows:

For Memphis, Tenn., and southward, the best shrubs are crepe myrtle, euonymus, pittosporum, pomegranate, cameilias and ligustrum. The best ornamental trees are camphor, magnolia and umbrella china. The best plants for beds are lantana, arbuton, aclypha, calendula and the old favorites, canna and geranium.

For north of Memphis, the best shrubs are spirea, althea, weigelia, buddlia, lilac and hydrangea. The best ornamental trees are maple, elm and poplar. The best plants for beds are petunia, marigold, asters, salvia, vinca and althernanthera.

Very attractive window boxes or flower boxes for porch railings can be easily made as Mr. Moulder describes below:

Build an ordinary wooden box in the size and shape you desire. Then peel the bark from a tree and tack it over the box. Another attractive box can be made by splitting small limbs or young tree trunks and nailing them on with the flat side to the box. If legs are desired, four round posts can be quartered and nailed on.

## Soliciting Business

The best advertisement for the Illinois Central is for its employes to meet the public with a smile, being courteous and polite. Every employe should do his utmost to secure additional business at all times—let it be one package, one box or one carload of freight. We should induce our friends when traveling to go via the Illinois Central. By the co-operation of all employes in one large family, we are bound to rank first among the great railroads of North America. We must give the public first-class service.

If each one will take the interest in his work that he would take if he were in business for himself, we are sure to reach our goal of 100 per cent. So, while working, let's all keep this motto in mind:

Courtesy and politeness to the public and loyalty to the Illinois Central.—J. D. HENDERSON, *Switchman, Evansville, Ind.*

## Starting Them North on Ice a Big Item on T. J. Quigley's Division

*Southern Berry and Vegetable Growers Rely on Illinois Central Service, Superintendent Says*

By T. J. QUIGLEY

Superintendent, Louisiana Division

THE handling of strawberries and vegetables on the Louisiana division ordinarily begins the middle of March, with strawberries, lettuce and early vegetables from the Kenner-Ponchatoula section, and continues about 150 miles up the division, ending the first of July with the final shipments of tomatoes from the Crystal Springs-Jackson territory.

Carload shipments of strawberries and early vegetables begin moving in March from the section of Tangipahoa Parish, Louisiana, between Ponchatoula and Amite, and west as far as Denham Springs. Virtually all strawberries have moved by express the last few years.

### Auction Held Every Day

The berry shipments are made by local associations or brokers. Brokers from all parts of the country, representing fruit dealers, come into this territory, and an auction is held at each station at about 4 p. m. each day during the season, carloads being auctioned on the ground to the highest bidder. If the associations are not satisfied with the prices offered, they frequently start the cars consigned to themselves and sales are made while the cars are enroute.

Ordinarily at the first of the season fancy prices are obtained for the berries, but in the past two or three years prices have remained high for the entire season. The shipping season extends ordinarily for about seven weeks, being closed by the shipments starting from Arkansas and Tennessee towns into the north and northeast territory.

In the cultivation of strawberries the whole family is ordinarily engaged, and the

T. J. Quigley

entire crop is produced by the individual family, being marketed, however, through an association or dealer who undertakes for a certain percentage to sell the output and who also during the off season purchases plants, fertilizer, etc., for the members of the association, giving them the benefit of dealing in large quantities.

### Business Demands Express Cars

The handling of the strawberry business from the railroad's standpoint requires the employment of a trained force of men to inspect and make necessary repairs on the express cars which are used in this service. Express cars owned by the Illinois Central are sent at this season into the strawberry

territory, as well as cars owned by other railroads and by the American Railway Express Company. These cars are placed at McComb, where they are gone over thoroughly as to repairs and are swept and scrubbed out, after which they are iced and ordered for loading.

The ordinary practice is to start a train from McComb at about 4 o'clock in the morning with cars iced for that day's loading, the train spotting cars at each station for loading. All the loading is done by the shippers under inspection as to proper loading by railway and express employes.

Our schedules provide for the express pick-up train to leave Ponchatoula, the southern local loading point, at 5 o'clock. The pick-up trains are moved into McComb in from one to three sections and there consolidated and re-iced, moving from McComb north as sections of passenger train No. 6.

### Beans Follow Strawberries

At the close, or ordinarily just before the close, of the strawberry season the movement of beans from this same territory begins and lasts about three weeks, running ordinarily from three to ten cars a day. At the close of the bean-shipping season green peppers and cucumbers start and, if market conditions remain good, they continue through June and July. Again in the fall, from this same territory there has been developed a fall bean business which lasts for about two weeks, shipping approximately 100 cars. Indications at present are that this business may be increased.

In the latter part of April the vegetable business north of McComb begins to move, the first of this business moving by express and usually consisting of English peas, carrots and radishes. In May the cabbage crop is ready for movement. This constitutes approximately one-third of the total vegetable movement of the division and lasts for about a month. Then the tomato crop continues until practically the first of July, which closes the spring vegetable movement from this territory.

The vegetable crop is financed by a number of large vegetable dealers and brokers. The bulk of the crop is made by tenant farmers, who rent or work their land on

shares. The railroad handles practically the entire vegetable crop, with the exception of the early movement by express.

The cabbage, carrots, beets and beans move under refrigeration. Tomatoes are shipped green, wrapped, and do not require refrigeration unless, because of diversions made by the shippers, they should remain in the cars to exceed one week.

### Trained Force Required

The handling of the cars for the vegetable service requires also the organization of a trained force of men to inspect and make repairs. This work has been done this year at Gwin, Miss., where the cars are inspected, repaired and carefully cleaned, false floors being removed and the vegetables loaded on the strips on the floors of cars. All of the vegetables shipped from this territory are packed in patented crates which provide for proper ventilation through the entire load in the car. In addition to the ventilation provided by the package, in shipping tomatoes a small strip is used to provide additional air space circulation throughout the car.

There has been an increase in the amount of land cultivated in truck in Mississippi within the last two years, and as inland transportation increases there doubtless will be an increase in the amount of truck produced.

It is the history of this business in the past seven or eight years that there has never been a total failure. The average farmer diversifies his crop extensively and does not suffer an entire loss, even if part of his crop is lost.

All of the vegetables are sold in practically the same manner as the strawberries—sold to brokers on the ground immediately upon completion of the loading or forwarded by the shippers' associations to themselves for sale while enroute.

### Government Gives Daily Report

For the past several years the federal government has rendered a good service to both the strawberry and vegetable shippers by giving them about 1 o'clock each day a report on the total number of cars loaded in the territory the day previous, their primary destinations, where known, and a summary of market conditions in the

various large centers throughout the United States. This has enabled the shippers to select their markets and to secure an excellent distribution without glutting.

Vegetable cars are handled from loading points by what are known as pick-up trains, which go to these points, picking up the cars which are ready for movement. This picking up involves a large amount of switching, as it very rarely occurs that all of the cars are ready to be moved. The cars which are not completely loaded and braced are held over and moved the following day. The loading of the cars is done by the shipper under the supervision of the railroad through its agent and representatives of the perishable freight service bureau. The latter at this season of the year devote practically their entire time to the inspection of these cars.

Due to the close co-operation among the various branches of service and the fact that the Illinois Central has handled this business with no delay, claims for loss or damage to vegetables have been practically

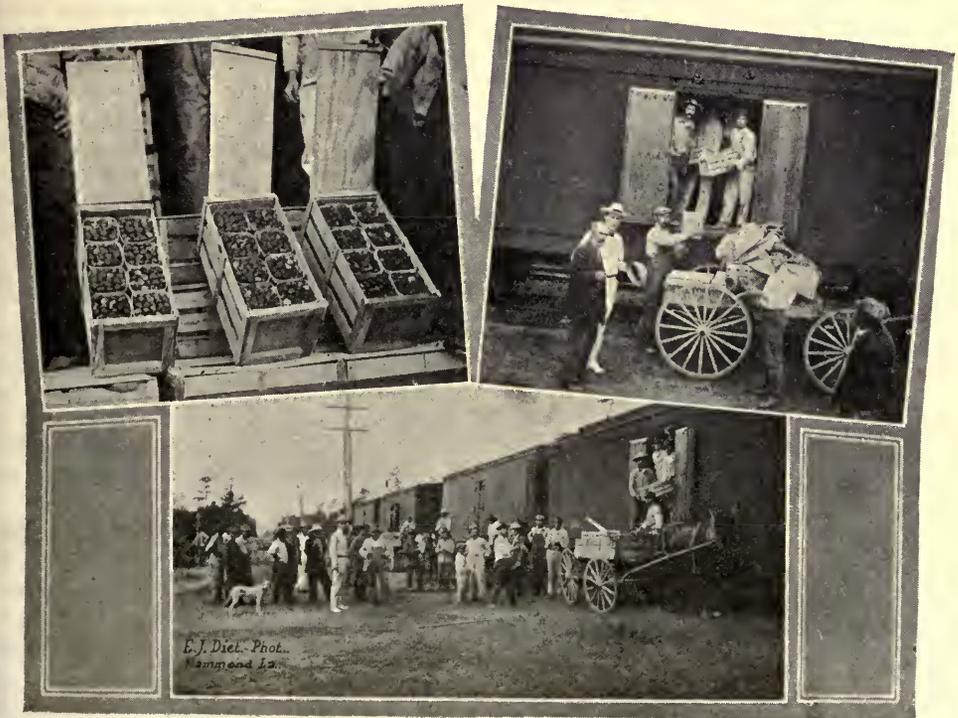

eliminated the past two years. Prior to that time there had been some trouble with ice and some delays which resulted in claims. So far this season, with one exception, vegetable trains have been on schedule every day.

Through the entire strawberry and trucking territory this season the farmers are more prosperous than ever before, having had a long shipping season and having received a higher average price for their product than in previous years, in addition to having had a larger acreage and, in a number of cases, a larger return per acre.

The shipments in this territory from 1915 up to date this year has been as follows:

Car Loads

	By Express	By Freight	Total
1915	749	2,977	3,726
1916	1,111	2,480	3,591
1917	1,293	1,752	3,045
1918	1,005	2,827	3,832
1919	1,043	2,160	3,203
1920	1,264	2,368	3,632
1921	1,649	2,914	4,563

## OUR FAMILY HISTORY

A wealth of information is contained in the pamphlet entitled "What Every Employee Ought to Know About the Illinois Central System," which is being distributed among employees. The pamphlet gives a concise record of the building and development of the Illinois Central System from the granting of its charter in 1851 to date. The story is told in an interesting way, and the management believes employees will find it extremely useful.

The idea of putting the story in this form originated with Mr. Markham, who personally supervised the selection and preparation of the material. There are several histories of the Illinois Central which will be interesting to those who want to make an extended study of the development of the system, but they are too voluminous to assure general reading. Likewise, the statistical records of the system's growth are too extensive for general appreciation. The information which is considered pertinent to an elementary education on the subject has been included in the pamphlet.

Those who fail to receive a copy of the pamphlet and who desire one should apply to their superior officers, who will see that they are supplied.

## WELL SAID

"No great transportation system which is intended to serve the multifarious activities of 105,000,000 people ever can be devised or operated or managed by a few loud-mouthed theorists who destroy and devitalize everything they breathe upon."

These are the words of Senator Atlee Pomerene (Democrat) of Ohio, member of the Senate committee on interstate commerce, which is now conducting the railway

inquiry. They were spoken before the Chamber of Commerce of Hamilton, Ohio, on June 14.

## ALMOST OUR BOUQUET

Speaking before the National Electric Light Association at the Drake Hotel, Chicago, on June 2, E. I. Lewis, recently appointed a member of the Interstate Commerce Commission, made the following suggestions:

"There is now a most compelling necessity that public utilities relieve regulatory bodies of some of the tremendous pressures falling upon them by reason of this new state of affairs. This the utilities can do in three ways:

"(1) By educating public opinion to the true condition of the utilities and by taking that public into their confidence by placing all of their cards face up on the table.

"(2) By removing all features of their business which are subject to legitimate criticism by the public, and by going more than half way to conciliate public opinion.

"(3) By stopping some utilities' practice of dodging responsibility and of 'passing the buck' to the commissions, in matters in which the responsibility lies entirely in the utility."

It is probable that Mr. Lewis did not have the Illinois Central System's policy of public relations in mind at the time he spoke, but he couldn't have expressed it more exactly. The Illinois Central is proud of the fact that it has the friendship of the public it serves.

## SAMUEL GOMPERS' VINDICATION

Nothing done by the delegates at the Denver convention of the American Federation of Labor was of more interest to the public than their refusal to relegate Samuel Gompers to private life.

A study of Mr. Gompers' career as president of the American Federation of Labor

reveals that he has never done anything epochal or spectacular. If, aside from his ability as an organizer, he has any outstanding characteristic, it is his clarity of vision. He has attended the christenings and funerals of more labor organizations than the average man knows of having existed. Many times he could easily have identified himself, or aligned labor's organization, with some popular movement which would have meant disaster for the organization, but he has been able to avoid them.

It is quite probable that more opportunities of this nature have come to Mr. Gompers in the past six years than ever before. At the outbreak of the war certain socialistic elements attempted to place class consciousness above national or patriotic spirit. Samuel Gompers promptly dismissed that idea, and labor may well point with pride to his war record.

The American Federation of Labor was affiliated with similar organizations in Europe, but when the communists proposed to resolve themselves into a political body for the nationalization of industries he severed his connection with them, and the Denver convention has sustained his action. In connection with that idea it is interesting to note that Mr. Gompers has been, and is, opposed to the "nationalization" or government control of railroads. Likewise, it will be remembered that about two years ago what was known as the "Plumb plan" for the operation of railroads was being rather generally discussed. Mr. Gompers refused to be implicated in the matter, and the federation in convention has sustained his action.

In the recent election, the issue was clear cut. John L. Lewis, his opponent, stood for nearly everything that Mr. Gompers has opposed. He charged, according to the press, that Mr. Gompers has outlived his usefulness, and could no longer adjust himself to the rapidly changing conditions.

The overwhelming majority by which Mr. Gompers was re-elected is not only a tribute to the man and a vindication of his policies but also a rebuke to the extremists which augurs well for the future of our country.

We do not always agree with Mr. Gompers, but we do take our hat off to any

man the sphere of whose influence has grown steadily wider and stronger for half a century and who, after twenty-seven years of undisputed leadership, can roll up a majority of two to one over an opponent who represents all that he has been opposed to.

### OUR AIMS

"The magazine should be the official organ of communication of news and matters of interest among the employes, and they should help to make it so," writes Agent L. L. Lamb from Madison, Wis., to the editor of the *Illinois Central Magazine*.

Mr. Lamb is right, and we hasten to endorse his statement. The magazine should be—and will be, if our fellow employes grant us that measure of co-operation—a force in welding the family spirit of officers and employes of the Illinois Central System. Our people in Birmingham are interested in knowing how they do things at Sioux Falls; Chicago employes are interested in Illinois Central events at New Orleans; St. Louis, at Indianapolis, and so on. If an employe in Dodgeville, Wis., is doing something above and beyond his prescribed duties—be it in the service of the company, in the service of the community in which he lives or, more generally, in the public welfare—the tale thereof is interesting to his fellow employes throughout the system, from Omaha and Madison to Jackson and Vicksburg.

It has been said in these columns before that we hold the promotion of better railroading to be one of our chief aims in the conduct of the magazine. We believe that can be done without sacrificing readableness and human interest, by carrying these stories from one employe or group of employes to others. Nothing is more interesting than stories of success, regardless of whether the subject of the story has succeeded in a small way or in a big way.

We hope that employes will grow to look more and more upon the *Illinois Central Magazine* as a family organ, a means of communication of news and matters of interest. They can assist in its usefulness by continually making suggestions and giving information and "tips" on what they consider to be good material. The magazine cannot use all material submitted to it. Often material is held for

several issues. But that fact does not make it unnecessary for our fellow employes to give us all the help they can.

That the situation of the Illinois Central System is as favorable as that of any railroad in the United States speaks volumes for the management and the employes. Each member of the organization is entitled to his full share of credit.

### A THREE-CORNERED SERMON

Although most fiction is carpentered together for amusement only (and frequently misses its aim, at that), the kind that stays with you is the kind that has something to tell you outside of the plot—the kind that offers more between the lines than in them.

In presenting to its readers this month "The Stained-Glass Window," by Earl Derr Biggers, this magazine suggests that the story be read by those who are thinking of putting the boy or the girl through college, by those to whom the sweetheart has become merely a wife, and by those who talk of the insignificant scandal sheet that a newspaper may be and never consider the force for good that can be found in the proper sort of publicity.

Something of the mission of true fiction will be found in this three-cornered sermon.

### COURTESY

In a communication to the *Illinois Central Magazine* Conductor H. L. Nourse of the Tennessee division calls our attention to cases which have come under his observation where discourtesy on the part of certain railway employes was responsible for the passing of ordinances restricting the speed of trains through towns and other objectionable legislation, while the application of courtesy definitely and concretely makes for the smooth operation of trains.

There is scarcely a phase of business life in which courtesy does not play an important part. It is a thing to be cultivated by all us, not only in our relations with patrons but with one another. Courtesy is the oil which lubricates the machinery of life and makes it run smoothly.

It is sometimes the human thing to do otherwise, and yet how we disrespect the fellow who lets down, even for a few minutes!

It is said that a smile travels far and wide. A cheery word spoken with a smile and the right inflection of voice passes from one person to another, and so on and on, like an electric wave through a perfect conductor. The growl and frown are just as far reaching in the opposite effect.

There is no reason why it should be necessary for anyone to preach the practice of courtesy, and yet it is necessary because of the fellow who for any one of a hundred reasons—none of them good, of course, for such reasons never are—lets down in his attitude.

The application of the Golden Rule through the exhibition of a courteous attitude makes other people respect you and want to serve you. It is a measure of the successful man.

In the regular monthly statement by President Markham, a copy of which appears in this issue, the question of the drain upon railway revenues caused by loss and damage to freight is discussed. If the reader of this statement will bear in mind that what has happened in loss and damage to freight during the past five years has been substantially true of each department of every railroad in the United States, he will have an excellent idea of the railway situation today.

### STRAWBERRIES

A \$3,000,000 crop was produced this year in the Louisiana strawberry district, which is served almost exclusively by the lines of the Illinois Central System. The reader will find on page 78 a brief summary of the year's marketing, as taken from "Things to Talk About," the management's monthly bulletin of information.

Tangipahoa Parish, the center of this prosperous industry, on the main line of the Illinois Central north of New Orleans, is indeed a wonderful land of opportunities. Hundreds of farmers and their families have proved what excellent returns can be realized with only a small outlay of capital. There are 5,000,000 unemployed in the country, and Secretary of Labor Davis has been quoted as urging these men to go to the farms. Some of them might well investigate the strawberry country.

The strawberry growers have money in the banks and land prices are actually advancing, almost a phenomenon in this period of readjustment. Building is going on, automobiles are being purchased—even the "blue sky" promoters have not been without victims.

But the most important thing to note in this situation from the railway standpoint is the apparent negligible effect of the present transportation rates. One hears it said frequently that rates are serving as a blight upon business, and yet conditions in the strawberry district prove this untrue, for more berries were shipped this year under the advanced rates than ever before, and the growers never were more prosperous. Those seeking substantiation of their "high rates" charges will have to go elsewhere for evidence.

---

### THE UNBRIDLED TONGUE

If all the injustices which have been caused by ill-considered words could be tabulated as a warning to those who sometimes speak hastily, the evils of an unbridled tongue might be overcome. The tabulation would be imposing.

A word once spoken is gone forever. It cannot be recalled. Whether it be wise or unwise, necessary or unnecessary, it will be charged or credited to the speaker—which ever the future may determine—as long as he lives.

Words travel quite as rapidly on the railroad as any other place, and the rumor whispered behind a door in New Orleans today may be proclaimed from the housetops in Chicago tomorrow as an established fact, leaving pain and ill-feeling in its wake.

If you feel bitter over some matter, write a letter and say all the mean things you want to say, in the meanest way you know. Then tear the letter into bits, or burn it. You thus will have relieved your temper without having harmed anyone—yourself included. Many smart men have found this a splendid practice. The fire of passion passes under more deliberate consideration, but words spoken in heat cannot be recalled with the change of mood. You might as well try to push the sun up, or down, as to recall a word, once it has left the lips.

The man who listens learns. He may not get any definite information about anything except the one to whom he listens, but he is getting a more definite line on that person than would be possible in any other way. Practically every man who has attained greatness has been a listener. By listening, he not only obtained information pertaining to his business, but, in addition, learned the weaknesses and the strength of those who talked. Theodore Roosevelt was a continual questioner, and an excellent listener, and much of his enormous range of information doubtless can be credited to this faculty.

There are conditions which demand expressions of attitude, and the proper employment of speech is not criticised but is to be commended; this is rather meant as a plea for a deliberate weighing of words which might be misinterpreted.

---

### TRANSPORTATION RATES

The American Farm Bureau Federation is conducting a poll in which it is asking the farmers whether they believe lower freight rates would enable them "to move a materially larger amount of agricultural products."

It may seem presumptuous to some of our readers for the editors of this magazine to take issue with the farmers, and yet we believe that the reasoning upon which their questions is based is so false that we cannot permit it to go unchallenged.

It all comes from a widely circulated and glibly repeated phrase, "What the traffic will bear." The vice-president of an Eastern railroad explained what the phrase originally was intended to mean when, in a speech the other day, he defined the economic principle to which it is applied as "the total expenses of railway operation must be apportioned among the articles shipped with due regard to the proportion of the total cost which each is commercially able to bear."

There is a great difference between those two statements, and in an analysis of the difference, we believe, is evidence of the false position of the federation.

Suppose the farmers were correct—although we have plenty of evidence that they are not. Suppose lower freight rates would move the great quantities of farm products—hay, grain, livestock, cotton, etc.—which are not moving now because there is no market for them, and not because the cost of transportation is a material factor. Would that restore prosperous conditions in agriculture and in the country as a whole? Some farmers evidently believe in all sincerity that it would.

But there is an angle of the situation to which some of the farmers evidently have given no consideration: that is, that costs of transportation have risen to such a degree that expenses have been exceeding revenues and the railroads have been unable to meet the actual expense of operation from current funds.

The farmers dislike to claim any responsibility for the costs of railway operation, and yet they make up the great body which, through public opinion, absolutely controls the railroads, dictating the conditions under which they shall operate, the wages they shall pay and the rates they shall charge!

The railroads, to function properly and to expand from time to time to meet the requirements of agriculture and other industry in the territories they serve, must be sound financially. Throw the railroads into bankruptcy, and the whole structure of the country would collapse, for the farmers, as well as every other industrial group, are absolutely dependent upon transportation, and good transportation at that, for their successful operation.

There are always any number of healers on hand with cures for the public ills.

There is a slump in traffic, and it has come about through natural economic conditions: war, an armistice, a flurry to make up for deferred production and distribution, artificial price and wage levels, the reaction—a bump to earth. The way back to normal is simple enough: getting up and rubbing the sore spots, resolving to stay on earth and going ahead.

And yet there are those—as there always are on such occasions—who profess to weave a mysterious spell over the situation, to regard it as something unexplainable,

baffling analysis. They are crying for artificial remedies.

There is no medicine in the world better than sunlight and fresh air. Castor oil, quinine and hypophosphates have their uses, but they cannot cure without the aid of nature's remedies.

And so, in curing the present public ill health, our hope lies in letting nature take its course.

Another of the artificial remedies proposed is the making of seasonal freight rates. As if rates were the element controlling movement of products! As if the making of a rate a few cents cheaper would open up great markets for our products, and making the rate a few cents greater would close them!

However, there is some hope. The following is from a Washington dispatch to the *Chicago Journal of Commerce*, under date of June 15:

"Herbert Hoover, Secretary of Commerce, has announced that he has been forced to abandon the plan advocated by him for the establishment of seasonal rates on coal so far as this year is concerned."

#### LOOKING FORWARD

Optimism regarding the present railway situation is displacing the pessimism so prevalent recently as the developments of the past few weeks are reviewed and weighed.

There are unmistakable signs that the industrial depression which has gripped the nation since last October is nearing an end. This depression, with the consequent falling off of traffic, has been one of the important contributing factors to the present difficulties of the railroads.

In the latter part of March and the opening days of April, the number of cars of freight loaded each week—a barometer of industrial activity—was at low ebb; for the week ending April 2 but 666,642 freight cars were loaded for movement. From that time to the present, however, there has been a slow but consistent increase in the number of cars loaded weekly, reaching a total of 750,158 cars loaded in the week ending May 14.

Again, late in March and early in April the number of idle cars was about as high as it has ever been. In the week ending April 8, 507,427 freight cars, or about 21 per cent

of the roads' total car ownership, were idle. The slow but steady resumption of business, and consequently of traffic offered for movement, has cut this total from week to week until in the week ending May 15 the number of idle cars had been decreased by almost 57,000 cars; only 450,453 cars were idle in the week ending with the latter date.

While it is true that these figures are still far from those prevailing in normal times, nevertheless they do indicate that there is a decided trend toward normal conditions in traffic. This resumption of traffic and a consequent increase in revenues will undoubtedly aid the financial condition of the railroads.

With reduced operating expenses and increased business in sight it is but natural that railway men should see the present situation as T. DeWitt Cuyler saw it when he said in a recent statement to the Senate's interstate commerce committee which is investigating the railroad situation:

"Feeling, as we do, that the world has definitely turned the corner of its most acute depression, so we feel that the railway situation has likewise passed through its darkest hour and has now definitely turned for the better."

### CONTROL OF ACCIDENTS

"The control of accident fatalities and injury is one of the outstanding problems in the movement for longer and healthier lives," says a statement by the statistical service of the American Red Cross, reported in the *Indianapolis News* for May 30. The Red Cross has made a compilation showing that 4.6 per cent of the deaths occurring in 1918, the latest year for which complete statistics are available, were caused by accidents. The toll of accident death in 1918 reached the enormous total of 83,852.

The figures are appalling. To know that more people than live in Sioux City or Rockford—nearly four times as many as live in Baton Rouge—more than three times as many as live in Paducah—nearly five times as many

as live in Vicksburg—nearly four times as many as live in Jackson, Miss.—died in one year as the result of accidents! Cancer is a dreaded scourge, but more persons were killed by accidents than died of cancer.

The Red Cross is right in that the control of accidents is an outstanding problem. One of the chief means at our hands is education—propaganda, if you want to use the word in its true sense, although its use has been generally applied to something foreign to the original meaning. We must let the people know that accidents constitute an enormous toll upon the life of our citizens, not only that, but that the toll may be extended next to you, second person, singular.

The railway service is a good place to emphasize this education. The railroads have been carrying on this sort of thing for years, and the Red Cross recognizes the results obtained by showing that, while loss of life by automobiles has increased tenfold in the last decade, "the safety movement in America," quoting the *Indianapolis News*, "has appreciably reduced the number of deaths on railway and street car tracks."

But our aim should be nothing short of perfection. Railway men, by taking every precaution to safeguard their own lives and by forever preaching safety, can assist in bringing this alarming condition under control.

Readers doubtless will be interested in the compilation made of causes of accidental deaths in 1918, the period covered by the Red Cross survey, and it is given here:

Cause.	Number	Per cent
Poison .....	2,787	3.3
Conflagration .....	1,799	2.1
Burns .....	8,418	10.0
Absorption of deleterious gases.....	4,247	5.1
Drowning .....	6,952	8.3
Firearms .....	2,561	3.1
Falls .....	13,070	15.6
Mining and quarrying.....	3,293	3.9
Machinery .....	3,002	3.6
Railroad and street car.....	13,762	16.4
Automobile .....	9,445	11.3
Other vehicles .....	2,797	3.3
Other accidents .....	11,719	14.0
Total .....	83,852	100.0

## The Wayfarer

Traveling has become such a commonplace thing to railway officers and employes that it is hard for them to realize what an event a railway trip is in the life of the average patron of the lines. In considering this, of course, we must first strike out of mind all traveling salesmen, actors, and major league baseball players; but even with these gone we find enough patrons left to break up all the possible two-chair combinations in every chair car in the country.

The French have lent us a good word, "blase." (Really it has an accent on the final "e," but the American type we are using won't let it in). That word will describe some of the passengers you see in the chair car we just spoke about. The scenery doesn't interest them—they have seen it before, or a lot just like it; the vendor of reading and eating material, with his periodical promenade through the car, doesn't get a rise out of them, unless he has something about half a day early in the newspaper line to offer—they would be mortified beyond measure to be seen eating an orange there or gurgling a bottle of soda-pop; the train suddenly rushing past on the other side doesn't cause them even to start from their seats. They have traveled so much, you can see at a glance, that travel means nothing to them. It merely helps them get from one place to another.

But the rest of the travelers in the car—the great majority of the passengers—have paid their good money for the trip, and they are going to get every last thrill that the railway company and the right-of-way have to offer. The grown-ups, of course, aren't quite so excited about it as the children, and do not crane their necks quite so far out of the window; but nevertheless you will note in each eye a gleam of real interest and in each action the betrayal of some enjoyment in the trip.

It has not been many years since even

the blase traveling salesman asleep over in the corner was a youngster who made for himself a scenic tour of every infrequent 40-mile trip over the branch line to the city. At that time every inviting red barn and windmill on the horizon, every mysterious patch of woods, every thundering and perilous bridge over a gully, every horse galloping in terror across a field held something of interest for him that kept him alert at the window and drew from him a sigh of regret as the train pulled into its final station.

The trouble with him is that he has grown up too far.

But people travel for other things besides the scenery. "I had sold thirty-six tickets on this particular morning," wrote an agent friend of ours the other day, in making some other point. "One man was going to the bedside of a very sick person and cautioned me time and again not to fail to flag that train. Others were just as anxious to have the train stop. The fact was that that train meant to those thirty-six persons the most important part of their day."

The trip, nine times out of ten, is a big thing to the individual, even though the handling of that passenger may be the most commonplace thing in the world to the railway employe who has handled hundreds and thousands of passengers in his time. It is not difficult—indeed, it is the most natural thing in the world—for the employe to try to handle passengers in a wholesale, instead of a retail, way.

But the fact it is easy is no excuse for doing it. The railroad that makes each passenger a guest is a really successful railroad.

### ANOTHER TO HONDURAS

Add to the list of Illinois Central men in Honduras, Central America, the name of O. M. Suter, supervisor of bridges and buildings for the Chicago Terminal division. Mr. Suter is spending a six months' leave of absence as supervisor of bridges and buildings for the railroad owned there by the Vaccaro Brothers & Company, described in the June issue of this magazine by Chief Engineer F. L. Thompson.

# PUBLIC OPINION

What the

World thinks

## A RAILROAD WITH TRADITIONS

Mr. C. H. Markham, president of the Illinois Central Railway, has issued a neat folder under the title "What Every Employee Ought to Know About the Illinois Central System."

Mr. Markham under the map of the country through which the Illinois Central and affiliated lines pass calls it "The Breadbasket of the World."

When one realizes that the Illinois Central touches Sioux Falls, Sioux City, Omaha, Albert Lea, Chicago, St. Louis, Louisville, Indianapolis, Cairo, Memphis, Birmingham, Jackson, Miss., Vicksburg and New Orleans, one sees the truth of the claim. The road runs north and south through Illinois and has many branches in that state. It runs west from Chicago through the great state of Iowa, and touches Minnesota and Dakota. It reaches out into Kentucky, Indiana and into Alabama. It literally covers the western half of Mississippi.

In normal times the city of Memphis is the second loading and unloading point on the Illinois Central System.

As indicative of the progress railroads have made, there are two interesting pictures. There is a Rogers locomotive, made in 1854, with a weight of 56,000 pounds. It has a tractive power of 9,000 pounds.

The latest Illinois Central locomotive is seven times as heavy as that made in '54. It weighs 382,000 pounds and has a tractive power of 73,800 pounds.

The Illinois Central Railroad has 14,225 stockholders. It has been selling stock to its employes since 1893. The road has property \$105,000,000 in excess of its capitalization.

The Illinois Central established a pension

system in 1901. Since that time \$2,106,000 has been paid out in pensions.

The largest terminals the Illinois Central has are in New Orleans, where the yards have a capacity for 9,384 cars.

In 1920 96 per cent of the Illinois Central passenger trains arrived on time. The percentage of the prompt arrivals for all the lines for one year was 83. In 1920 72,137 people were working for the Illinois Central Railway.

Some of the distinguished people who were connected with the Illinois Central Railway as attorneys and as officials were Stephen A. Douglas and Abraham Lincoln. Mr. Lincoln was local attorney for the Illinois Central Line. George B. McClellan was superintendent of transportation.

Among men famous in the Civil War connected with the system were Generals Beauregard, Burnside, Banks, Walthall, Alexander, Brayman, Turchin, Robinson, Neely, Lawton and Sorrell. L. Q. C. Lamar was one time a legal representative of the Illinois Central.

We have a pleasant recollection of some of the former presidents and officials, among whom were J. T. Harahan and Stuyvesant Fish.

The Illinois Central Railway has traditions of which it may well be proud. Traditions create sentiment, and sentiment is a factor in everything that excites the activities of men.—Editorial, Memphis (Tenn.) *Commercial Appeal*, June 25.

## A DEAD LOSS TO INDUSTRY

The Illinois Central railroad appeals to shippers to eliminate an economic waste amounting last year to \$104,398,930 on the railroads of this country through insufficient or improper packing and loading of com-

modities for railroad transportation. That amount of money was paid out by the class I railroads of the country for damages.

That much of this loss is unnecessary and due simply to carelessness or inefficiency is shown by comparison with the figures of 1916, when the total of such damages amounted to \$23,346,965, or more than \$80,000,000 less than last year.

There is in the figures and the appeal a tip not only for manufacturers and shippers but for railroad employes. This sum of more than \$100,000,000 annually is a dead loss to the railroads and to the public through the destruction or damaging of property. It cuts down the net revenue of the carriers and indirectly results in higher freight rates and lower wages. That, in turn, depresses every line of business.

If shipping clerks would remember these facts every time they pack a shipment of goods; if truckers would remember it every time they take such goods to a freight car for shipment; if freight handlers would remember it every time they load a car, and if switchmen, brakemen, and engineers would remember it in the handling of trains, that vast sum might go eventually into their pay envelopes.

It is the inefficiency as well as the wage per hour of workmen which helps to keep up the price of products. In the matter of packing alone, we are told, large consignments of American goods sent to South America have been refused or subject to delay in payment and decrease of orders because the goods were not properly packed and arrived in bad order. That keeps down the expansion of American business, reduces our orders, slows down or closes our factories, and reacts directly upon employer and employe alike.

It is inexcusable waste. Payment of damages by railroads or water carriers cannot compensate a manufacturer or exporter for the loss of a customer. It is a cumulative loss. Care and efficiency will eliminate it. In self-defense they ought to be practiced by every individual having to do with the manufacture, sale, and shipment of goods.—*Chicago Tribune*, July 2.

### SHARING ALIKE

The American Federation of Labor is be-

coming conservative. The convention in Denver Wednesday sustained the action of the resolutions committee in striking out of the resolution a phrase that would have put organized labor on record as declaring for government control and democratic operation of "all industries organized under corporate grants and privileges," and contented itself with reaffirming its stand for government ownership of railroads, with legislation giving the workers equal rights and privileges in the enterprise.

The right to participate with capital in the operation of railroads would give the workers the right to participate in the deficit. It is not assumed that the railroad worker is anxious to see the fruit of his labor diverted to the sink-hole created by Mr. McAdoo, through which so many millions of perfectly good American dollars have passed never to return.

On the other hand, it is probable that the owners of the railroads will be very glad, if it were practicable, to have the employes share alike with them in taking care of the financial problems that burden them and which are obviously destined to annoy them for many years to come.

The Federation of Labor presents a practical solution for the operation of the railroads on a cost basis, if it were not socialistic to take away from one man the thing that he has earned or rightly possesses and give it to another man who has no claim upon it. If the Federation of Labor is consistent in its demand the thing it advocates can be accomplished by the employes accepting a rate of pay commensurate with the returns yielded by the investment.

The railroads are losing millions of dollars annually, and yet, if we remember correctly, the brotherhoods protested vigorously at the hearing before the labor board in Chicago a few weeks ago against a reduction in wages. If labor is to share with capital in the fortunes of railroad operation it can not escape responsibility for sharing in its misfortunes. If labor is to share equally with capital in its enterprise, it would participate in the dividends as well as in the losses. Those who have invested their money in railroad stock must content themselves to receive no return on their investment. We can not conceive of railroad em-

ployees being willing to receive no return from their labor. In some quarters there is a fantastic notion concerning the equal rights of capital and labor. Reasonable persons do not share these views. The individual who invests his capital in an enterprise may profit from it, or he may lose his investment. He understands that he is taking a chance.

The workingman on the other hand, should not be obligated to assume any such risk. He is entitled to a living wage, whether the enterprise he serves is profitable or not. A man may gamble with his money, but he has no right to gamble with his labor. Capital represents a surplus. Labor represents meat and bread.

About all that is left of the sentiment that once prevailed for government ownership of railroads is the well established and accepted policy that the government should exercise supervision over rates and quality of service.

Government operation of railroads had a test under favorable conditions. Traffic was at its peak. There was not an idle car in the country. Rates were increased to a fabulous degree and wages ascended on the same scale. Notwithstanding the condition under which the government operated the railroads, millions of dollars were lost and the public is now paying the deficit and will continue to do so for several years. The government owes it to the railroads to carry out its agreement to return the roads to private ownership in the same condition they were when placed under government control. The roads were returned to the owners with the rolling stock depreciated; with trackage impaired and damage done to the property that years of rehabilitation will scarcely be able to bring back to former condition. The government can not avoid and should not wish to avoid payment of the just claims the railroads have against it. When that is done the government should get as far away from participation in the conduct of the roads as possible without neglecting rights and privileges of the public.

The government found railroad operation unprofitable. The individuals who had their money invested in the roads have found it unprofitable. Employees are the only ones that have profited from the experience. They

profited because they were paid for their labor and because they were not penalized for the misconduct of the roads. Their experience would have been different had they shared equally with capital.

If the Federation of Labor is sincere in its desire for the employees to share alike with capital, it is likely that capital will be very glad to welcome them into the debit side of the ledger.—*Memphis (Tenn.) News Scimitar*, June 24.

### ON TIME

Train schedules have been the butt of many jokes. A favorite one originated, we believe, in the Hippodrome in New York a number of years ago. A comedian appeared on the stage dressed as a station porter. He called out half a dozen trains on as many roads, stating each was a number of minutes or hours late, and giving the cause for each being late—engine trouble, derailment, etc. That last train to be called was reported on time, the comedian stating "the cause for being on time unknown."

It always produced a laugh. None in the audience but had had experience with trains that were late—so much experience had many that it seemed not unreasonable that there should be an explanation when a train was reported on time. Schedules, it seemed, were in the nature of good resolutions, lived up to occasionally, but not as a rule—a sort of goal not frequently attained.

The old order has changed. Railroads still have schedules, but for the most part they are living up to them. On practically all roads during the past few years considerable effort has been put forth to run right on schedule, and splendid results have been attained. On first-class roads it is now the rule for trains to run "on the dot."

As an example of what one of the bigger railway systems is doing in this connection is the record made by the Illinois Central for the month of May. This road operated 13,567 passenger trains on its system during the month, and 13,461, or 99.2 per cent, were run on schedule time. On the Iowa division of the road there were 688 trains operated, and every one maintained schedule time.

This is a record worthy of praise from the public and for which the road has just rea-

son to be proud. The advertised schedules of passenger trains by railroads are promises to the public that such schedules will be maintained. The Illinois Central not only promises but performs.

The May record of the Illinois Central eclipses any former record of the road, and perhaps never has been excelled by any railroad handling as many trains.

Maintaining train schedules is good public service.—Fort Dodge (Iowa) *Messenger and Chronicle*. June 7.

### GOOD FOR THE ILLINOIS CENTRAL

Charles H. Markham, president of the Illinois Central, issued an announcement to all officers and employes a few days ago that carries an important message to the public and all business.

The money realized from lower operating expenses due to railway wage cuts is to be put into the maintenance of the road, purchase of needed equipment and upbuilding of the system.

Mr. Markham, in his announcement, said:

"The decision of the labor board in regard to the reduction of wages, when it becomes effective, will result in a substantial decrease of the operating expenses of the Illinois Central System. You will be interested in learning that we intend to invest that money in maintenance which has been deferred—in the employment of additional men and in the purchase of materials and supplies. We have not waited for the money to come in, but we have already entered upon our program, and we believe that other railways will do likewise.

"The action of the Labor Board, therefore operates as the first signal for the opening up of business which will redound to the benefit of the public at large. The crop prospects are favorable. This railway recognizes its pressing duty to serve them this fall. The Labor Board decision will help to enable it to meet that duty."

The above policy is a direct boost to the commerce of the sections of the country served by the Illinois Central and should be followed by railroads in other sections. It means the purchase of materials of all kinds that enter into railway equipment and maintenance, and the employment of thou-

sands of workmen who have been out of employment.

If every railroad should follow the example of the Illinois Central, and use the money realized from decreased cost of operation for physical improvement, it would go far toward restoration of normal business conditions.

The railways are large buyers of almost every sort, the *Chicago Journal of Commerce* points out. It says: "The railroads have been forced by lack of credit and ready money to postpone improvements and enlargements, to curtail employment, to slow down all possible activities on the road and in shops and offices, to stop the purchase of supplies and to postpone all maintenance or replacement expenditures except those absolutely requisite for safety.

"Now comes one large railway saying through its responsible head that the action of the Railroad Labor Board in reducing wages will be accepted as the first signal for the opening up of business redounding to the benefit of the public at large. We envisage in this announcement the most encouraging sign for business resumption we have seen in months. It constitutes the most authoritative 'Let's Go!' signal that has appeared upon the horizon of business since the present depression set in—the best news item the newspapers have been privileged to print in regard to business."—Editorial, Lincoln (Ill.) *Courier-Journal*, June 21.

### YOUR OVERHEAD

About the middle of the day as you journey, there passes through your car a colored man clad in a white jacket, and distinguished from a Pullman porter by the fact that he also wears a white apron. As he returns he will call out in each car:

"Lunch is now served in the dining car. Meals a la carte. Dining car in the rear. First call for luncheon."

If you make it your rule to go always at the first call, and have washed your hands and brushed your hair a little while before in anticipation of this announcement, you will get a better seat.

You are met at the door by the steward, who shows you to your seat. A colored waiter brings you a glass with a lump of ice

in it, and fills the remaining space within the glass with water. He also spreads out for you a clean linen napkin.

Up to that moment, your meal has cost the company 57 cents.

It cost \$50,000 to build the dining car, and you must pay your part of the interest on that sum, and some more for the repairs, upkeep, and depreciation. The car is fitted with ranges, refrigerators and tanks, and you must pay for your share of the fuel, the ice and the cost of procuring and filtering the water. The laundry bill is enormous, and a part of it is charged to you. The steward must be paid, and so must the four cooks and five waiters. This is what makes up the total of your 57 cents and there are at least 57 varieties of expense to absorb it.

The problem of the company is not how to recover the cost of what it actually feeds you, but to distribute this 57 cents over the prices of the various articles of food you are to order, so as not to make any price prohibitive. For if they charge you too much you will eat your lunch out of a shoe-box. So it is a problem in psychology as well as in political economy.

All in all, you wonder that they do as well as they do.—Jackson (Miss.) *Daily News*.

### MARKHAM SAYS "LET'S GO"

There was a great deal of news value in an announcement which was made to the officers and employes of the Illinois Central System by President Charles H. Markham on June 10 and published in the *Chicago Journal of Commerce* in its issue of June 11.

We quote as follows from what Mr. Markham said in that announcement:

"The decision of the Labor Board in regard to the reduction of wages, when it becomes effective, will result in a substantial decrease of the operating expenses of the Illinois Central System. You will be interested in learning that we intend to invest that money in maintenance which has been deferred—in the employment of additional men and in the purchase of materials and supplies. We have not waited for the money to come in, but we have already entered upon our program, and we believe that other railways will do likewise.

"The action of the Labor Board, therefore, operates as the first signal for the opening up of business which will redound to the benefit of the public at large. The crop prospects are favorable. This railway recognizes its pressing duty to patrons to place its railway and equipment in condition to serve them this fall. The Labor Board decision will help to enable it to meet that duty."

This means that money realized from the decreased cost of operation on the Illinois

Central System brought about by the Railroad Labor Board wage reduction will immediately begin to flow in the channels of commerce; that steel, lumber, ties and all kinds of materials used by the railway will be purchased on a large scale, and that thousands of men out of employment will be re-employed. Mr. Markham says in his announcement that he believes other railways will pursue a similar policy of restoring their properties to their former state of efficiency. That would mean more toward re-establishing normal business relations than any other single factor entering into the present situation.

The railways are large buyers of materials of almost every sort, and they have been forced by lack of credit and ready money to postpone improvements and enlargements, to curtail employment, to slow down all possible activities on the road and in the shops and offices, to stop the purchase of supplies and to postpone all maintenance or replacement expenditures except those absolutely requisite for safety.

Now comes one large railway saying through its responsible head that the action of the Railroad Labor Board in reducing wages will be accepted as the first signal for the opening up of business redounding to the benefit of the public at large. We envisage in this announcement the most encouraging sign for business resumption we have seen in months. It constitutes the most authoritative "Let's Go!" signal that has appeared upon the horizon of business since the present depression set in—the best news item the newspapers have been privileged to print in regard to business.—Editorial, *Chicago Journal of Commerce*, June 14.

### RELIEF, BUT NO CURE

The 12 per cent wage reduction is expected to add \$400,000,000 annually to railway net income. An additional \$300,000,000 is anticipated from the elimination of the waste of the "national agreements." A saving of \$700,000,000 should be enough to keep the railroads going.

But a mistake will be made if the public is drugged into thinking the railway problem is solved. To provide the betterments the demand for which is to grow stronger more is

indispensable. Railway credit must be re-stored.

The public, through a long series of years, has not dealt justly with the owners of railway property, and has suffered the consequences of its injustice. For fifty years the railroads were petted. Bonuses, land grants, all sorts of inducements were offered to secure

their construction. No one dreamed that railway investment, if made in good faith, could become unsafe.

In the '80s a change in public attitude occurred. Speculators gambled in railway securities, sometimes winning and sometimes losing, and these speculators were reckoned owners. It was said that it was necessary to

### Things to Talk About

A few weeks before the marketing season began in the strawberry district of Louisiana this year producers and marketing agents were pessimistic over the outlook. Prospects pointed toward a good crop, but many were worried over the increased cost of transportation. Some declared the close of the season would find producers bankrupt. The outcome was a distinct surprise.

This has been one of the most prosperous years in the history of the strawberry district of Louisiana. The carload movement of berries from the district was greater than ever before, exceeding that of last year by 43 per cent. Good prices were received, berries held up well under long shipments, an excellent distribution was secured, the marketing season was the longest on record, and producers prospered. Business in the strawberry district is thriving, new land is being bought, old land is being improved by buildings and better equipment, and there is money in the banks and in the old family sock.

The June visitor to the strawberry district gets an entirely different impression from the January visitor. Farmers and marketing agents admit, although with some reluctance at departing from their former attitude, that the transportation service they received made possible the best year they have ever known, while the increased scale of rates did not jeopardize their earnings.

The following is a comparison of the number of cars of strawberries loaded on the lines of the Illinois Central System in the Louisiana strawberry district this year and last:

	1921		1920	
	Express	Freight	Express	Freight
Louisiana Division (I. C.).....	1,258	3	871	0
New Orleans Division (Y. & M. V.).....	128	0	96	0
Totals .....	1,386	3	967	0

The cost of transportation by express from Hammond to Chicago was about 43 to 45½ cents a crate this year (including refrigeration charges), as compared with about 34½ to 36 cents a crate last year, the range being due to the variation in the capacity of express cars used, on which there is a refrigeration charge per car. The cost of transportation by freight from Hammond to Chicago was about 31½ cents per crate this year, as compared with about 26 cents last year.

In spite of the fact that the cost of freight transportation this year was less than the cost of express transportation last year, the shippers voluntarily chose the higher rate, because of the more rapid service. The only difference between freight and express service is the time in transit—express taking 36 hours from Hammond to Chicago and freight 60 hours. A few years ago the majority of the berries shipped out of the Louisiana district moved by freight, but there has been a gradual change to express movement, which verifies the contention that service is the more important factor, rather than the scale of rates.

Any number of examples of individual prosperity are to be found in the strawberry district. One farmer made \$2,527.99 from the strawberries which he and his wife raised on 1½ acres, in addition to selling \$327 worth of plants from the same tract. The cost of hauling this entire crop nearly 900 miles to Chicago, the central marketing point, would be about \$376.25, or 14.8 per cent of what the farmer received.

Another farmer made over \$3,000 on 5½ acres; another \$194 on a patch of a dozen 60-foot rows; another over \$5,000 on 10 acres; another over \$2,500 on 8 acres; another over \$1,000 on 3 acres. The demand for berries was so great throughout the season and increased transportation costs were absorbed so readily that the preserving plants which have sprung up throughout the district did not open up at all this year.

establish public control. The railway managers used corrupt methods to avert it. This gave another ground for attack. The result was the Hepburn act. This took away from the railroads control over rates, and then, under the McAdoo regime, control over wages was also taken away. Thus, with practically nothing to say as to either income or outgo, the railroads were rapidly swept toward a Niagara.

Not only was private initiative destroyed by denying to it due reward, but what was tantamount to confiscation was decreed. Hundreds of thousands of savers of the worthiest class found themselves possessed of securities of shrinking price. The tragedy of the average railway investor has never been adequately described. Other property went up. His declined. In ten years land, buildings and plants have doubled in value. The railway owner's possessions have been halved. Is it strange he is averse to sending good money after bad?

In former days, when railway investment was not penalized, the public, decade by decade, saw rates lower and service improve. When a paralyzing hand fell on the business and there was no profit in doing specially well came retrogression. There is the old, old lesson that it does not pay to shackle capacity.

The country may again expect to be satisfactorily served when the best managed railroad makes the most money and this is considered creditable to its managers. To treat symptoms is well enough, but it is wiser to strike at the roots of disease. Liberty of action is the pressing need of the railroads. The greater part of the regulating legislation which Congress and forty-eight legislatures have enacted must be swept from the statute books. As to our most vital industry we have been guilty of violating a natural law.

The chief value of the Labor Board's decision is not in the immediate hope it holds out but in its indication of a basic change of opinion with respect to the railroads. It does not turn the railroads loose to work out their own destiny, but it suggests a weakening in the official habit of assuming that the railroads are always wrong.—New York *Tribune*, June 2.

## GETTING A START

The philosophy of Andrew Carnegie was expressed when he was asked how he got his start in life which led to such wonderful success. He had the vision and self-control.

"How did I get my first thousand? By saving it." This epigram from Mr. Carnegie presents no new idea, but the truism contains more of practical wisdom, from more points of view, than is generally comprehended. The first thousand is saved under exceptional difficulties. The accomplishment of it is of special value in character building. An inexperienced beginner's pay is necessarily limited. To establish the habit of saving demands strong qualities. If not a natural gift it must be acquired. Will power, a prime essential throughout life, is required. Frugality must be proof against self-indulgence. False lures or any form of harmful temptation must be resisted. Backsets may be expected and must be treated as temporary, subject to a firm purpose to "try again." Blue-sky promoters and other sharks must be avoided. They never refer to the fact that high interest means bad security. Saving the first thousand is like the early training of a pilot. He gains then more knowledge of a basic nature than at any other time.

A list of Mr. Carnegie's aphorisms includes this excellent reason why every one should save: "Wealth can only bring happiness in the sense that it brings great opportunities to make others happy." The stored energy of wealth can be used unselfishly, benevolently and fruitfully for the advancement of mankind. Saving the first thousand, a discipline for what follows, may be associated with high altruistic purposes and achievements.

Mr. Carnegie worked for years at small compensation before he could say that he owned a thousand dollars. What followed was easier, though giving away \$350,000,000 was one of the "details."—Indianola (Miss.) *Enterprise*, June 10.

---

## TRAINS RUN BY SPIRITS

The above headline sounds like the report of a dream by Sir Oliver or Sir Conan, but there is nothing supernatural about it. The spirits in the case are those that, not being allowed to drink them, we at least may use for fuel. Of course alcohol as auto fuel is an oft-told tale, and we are coming near

to a solution of the fuel problem for motors in after-gasoline days.

But down in Brazil they have taken a wider view of alcohol's fuel possibilities, probably for the reason that the big republic astride the Amazon River is very short on coal and very long on the many forms of vegetation from which alcohol is easily and cheaply manufactured. And Brazil, as matters stand, is seriously considering the installation of an alcohol-burning system on locomotives serving eight hundred miles of line adjacent to the land's eighty modern cane sugar factories.

We in New Orleans, who have seen the mushroom-like growth of the great industrial alcohol plant on Broadway at Leake avenue, and who recognize that the waste material from sugar manufacture is the raw material for that great plant, will not be surprised at the action of the Brazilian sugar men in proposing to save the big coal bill on their locomotives by making their own alcohol from the stuff that has been refuse on their hands.

In the open market such alcohol is now selling in the Brazil market at 22 cents a gallon, but as that price includes several intermediate profits it is clear that when the manufacturers use the stuff themselves it will show a bookkeeping value far and away less than 22 cents—possibly not half that. At such a price the fuel is expected to make a distinct saving over coal and it, of course, will cause a collateral saving in labor, because all the stoking will be done by a twist of the engineer's wrist.

Recently our United States consul at Pernambuco, Brazil, has become interested in having the United States manufacturers of railroad equipment prepare for the coming demand for alcohol-burning engines and has supplied the Latin American Bureau of the Bureau of Foreign and Domestic Science with all the data needful for those American concerns that deal or contemplate dealing in alcohol-burning mechanism. It would be surprising if, after all, alcohol as a heavy engine fuel should win its way before it comes fully to its own for the lighter forms of motors.—New Orleans (La.) *Times-Picayune*, June 23.

## *Flagged a Train*

*Evans Young*

*Drury Young*

Introducing Evans and Drury Young, 11 and 13 years old, respectively, who on the evening of April 6 saved from a wreck a passenger train on the Chicago, Memphis & Gulf Railroad, of the Illinois Central System, just north of Wrights, Tenn. The C. M. & G. runs from Dyersburg, Tenn., to Hickman, Ky. After finding the broken rail, Evans and Drury walked a mile to Proctor City, notified railway officials there, procured a lantern, returned, and flagged the oncoming train from the south just in time. When the train appeared, the boys swung the lantern frantically and the engineer responded promptly with set brakes, according to the dispatch which appeared in the Louisville (Ky.) *Herald*.

## ACCIDENT AND

## INJURY PREVENTION

*Bulletin No. 9—A Challenge*

**I**F THERE is any employe in any department of the Illinois Central System who can equal or surpass the record in accident and injury prevention of John Morrissey, John Carey and Albert Erickson, whose pictures appear herewith, this magazine would like to hear from them. These men are employed at Burnside Shops, Chicago. In large shops like those at Burnside, many employes receive slight injuries every year; some of the men sustain more than one injury a year; a small percentage sustain severe injuries. On the other hand, many employes work day after day without ever receiving injury. It was

decided to learn from these latter what their secrets of safety were, so that their less fortunate fellow-workers might profit.

Mr. Morrissey, a machinist, says: "I have been in service forty years and have never been hurt. I have had a wife and four children, and so could not afford to be hurt. If I laid off, I wanted to have a good time, and I could not have any good time if I was off because of an injury; so I was always careful.

"I don't have to wear goggles at my work, but I always wear them when I go to an emery wheel or I use the guard on the

*John Morrissey**John Carey**Albert Erickson*

emery to protect my eyes. When I get a chisel of which the head is worn or 'burred,' I have it dressed before using it, so that no piece will chip off and strike my eyes. Many men strike a file against a vise or on something else to clean it, but I never do, because a piece is likely to break off and fly into the eyes. I never wear gloves when operating a machine, because the gloves might catch and draw the hand in. When I am using an air machine, I am careful not to reverse it while the pressure is on, as I have seen men hurt that way.

"That's the reason why I have ten fingers and two good eyes."

Mr. Carey, another machinist, also has some suggestions.

"I have always worn goggles at my work for the last fourteen years," he says, "and I have been in service thirty-three years. I always keep my goggles on when I go to the emery wheel. I never use a tool if it is defective in any way, because there is no use in taking a chance with it. I never work with gloves on, because I can do better work without them, and they are likely to get caught in the machine.

"Whenever a new apprentice is assigned to me, I warn him to be careful, and I show him how to do the work so that he will not get hurt. Years ago the men were more careful. Now we have better machines, with guards on them to prevent injuries, and the men get careless, relying too much on the guards."

Mr. Erickson, who has been in service thirty-three years and who has in that time sustained but one slight injury, has had a family to support and could not afford to be laid off by injury.

Says Mr. Erickson: "I am on the safety committee, and I try to prevent injuries to the other men as well as to myself. If I have to use a scaffold, I first learn, before going on it, whether the planks are in good condition and not likely to break, and also whether they are properly placed so that they will not fall. If I have to move a scaffold, I see to it that the boards will not fall on me, or I take the boards down.

"Before starting work on the side of a boiler, I always take down from the top any tools that might be jarred and fall on me; if another employe is using tools on

top of the boiler, I tell him to place them where they cannot fall.

"I don't wear goggles, but I do wear glasses, which are for protection as well as an aid to my eyes. I always use the guard when grinding; if another man is at an adjacent wheel, I compel him to grind in such a way that the sparks will not fly toward me. When I go through the shop, I watch to see that I do not get struck by the crane or material it may be carrying. When I pass a man who is cutting rivets, I always put up my arm to protect my eyes until I have passed him; if he is not using a broom to prevent the heads from flying, I tell him to get one. These are my suggestions for safety."

### LOSS TO FORDHAM OFFICE

Miss Beatrice Howarth, stenographer in the employ of the Illinois Central at Fordham, Ill., died of pneumonia, at the home of her parents, 106 Dyer boulevard, Ham-

mond, Ind., on June 16 after an illness of two weeks. Miss Howarth entered the service of the Illinois Central on March 16, 1919, as stenographer in the office of E. Husband, general foreman of the car department, at Fordham, and since that time had won a place in the hearts of all the employes at Fordham. The funeral was held from the residence on Monday, June 20, and was attended by a host of her friends. She was laid to rest at Oak Hill Cemetery at Hammond.

*Beatrice Howarth*

### 12 THINGS TO REMEMBER

The value of time—the success of perseverance—the pleasure of working—the dignity of simplicity—the worth of character—the power of kindness—the influence of example—the obligation of duty—the wisdom of economy—the virtue of patience—the improvement of talent—the joy of originating.

# Same Ladders Climbed by Our Executives Available to All Employes

## *Men High in Management Started as Section Hands, Stenographers, Clerks and the Like*

**T**HERE is an inspirational romance wrapped up in the biography of the railway executives of the United States—a romance that should be a spur to every American boy who starts out to make railway service his life work. It should mean to him that he has an opportunity, by schooling himself in the requirements of the service and applying himself diligently, to go to the top of the ladder.

That inspiration is to be found in the lives of the men who stand at the head of the Illinois Central System.

C. H. Markham, president, entered railway service as a section hand.

C. M. Kittle, senior vice-president, was a station clerk.

L. W. Baldwin, vice-president in charge of operation, was a chainman in the engineering department.

F. B. Bowes, vice-president in charge of traffic, was an office boy in a general auditor's office.

M. P. Blauvelt, vice-president in charge of accounting and treasury, was a clerk in a freight office.

A. S. Baldwin, vice-president in charge of the Chicago terminal improvement, was a rodman in the engineering department.

A. C. Mann, vice-president in charge of purchases and supplies, was a stenographer in a commercial agent's office.

That each started at the bottom and worked his way to the top will be seen from an examination of the following records:

### **C. H. Markham**

Mr. Markham was born May 22, 1861, at Clarksville, Tenn. In 1881 he entered the railway service as a section hand for the Atchison, Topeka & Santa Fe. After sev-

eral months he went with the Southern Pacific in the station service at Deming, N. M. Between 1881 and 1897 he rose in the station service until he had charge of the freight and passenger business of a district. In July, 1897, he became general freight and passenger agent of the Oregon lines, and in September, 1901, he was made assistant freight traffic manager. Three months later he was elected vice-president of the Houston & Texas Central Railway. He returned to the Southern Pacific service April 1, 1904, as general manager, and on June 1 of that same year was elected vice-president. He severed his railway connections November 1, 1904, to become identified with the oil industry. December 1, 1910, he was elected president of the Illinois Central. Mr. Markham served during federal control first as regional director at Atlanta, Ga., and later as regional director at Philadelphia.

### **C. M. Kittle**

Mr. Kittle was born October 9, 1878, at Elkins, W. Va. He entered railway service in 1895 as station clerk on the West Virginia Central & Pittsburgh, now a part of the Western Maryland. He later was employed in station and yard work on the Atlantic Coast Line, Queen & Crescent and Baltimore & Ohio. He entered the station service of the Illinois Central October 21, 1900. In 1901 he was assigned to the staff of the roadmaster on the Illinois division and later held various positions in the maintenance of way, mechanical, transportation and accounting departments. October 1, 1910, he was appointed freight claim agent, also in charge of loss, damage and overcharge claims. He was appointed assistant to the president July 1, 1912, and November 29, 1916, was elected vice-president. During federal control Mr. Kittle served as federal manager, and in the reorganization

after the road was returned to its owners he was elected senior vice-president.

#### L. W. Baldwin

Mr. Baldwin was born February 26, 1875, at Waterbury, Md. He entered the engineering department of the Illinois Central in 1896 as a chainman. In 1900 he was appointed track supervisor; in 1901, roadmaster, and in 1904, trainmaster of the Mississippi division. In 1905 he was transferred to the Indianapolis Southern as trainmaster. In 1906 was made superintendent of that road. In 1908 he was appointed superintendent of the Vicksburg division of the Yazoo & Mississippi Valley and May 1, 1910, was made engineer of maintenance of way of the Illinois Central system. Later he became vice-president and general manager of the Central of Georgia. He served during federal control as assistant to Mr. Markham, first at Atlanta and later at Philadelphia, and upon Mr. Markham's resignation was appointed regional director at Philadelphia October 1, 1919. He was elected vice-president in charge of operation March 1, 1920.

#### F. B. Bowes

Mr. Bowes was born January 29, 1862, at Chicago. He entered railway service as office boy in the general auditor's office of the Illinois Central July 1, 1876. A short time later he was transferred to the general freight office as clerk. In 1880 he was made secretary to the general passenger agent. May 1, 1886, he was made general northern passenger agent and in 1894 assistant general passenger agent at New Orleans. He was appointed general freight agent of the southern lines of the Illinois Central and Yazoo & Mississippi Valley May 1, 1895. He was made assistant traffic manager January 1, 1903. July 1, 1905, he was promoted to freight traffic manager. He was appointed general traffic manager September 21, 1909, and was elected vice-president of traffic in 1911.

#### M. P. Blauvelt

Mr. Blauvelt was born February 25, 1865, at Suffern, N. Y. He entered railway service in 1885 as clerk in the freight office of the Delaware, Lackawanna & Western at

Hoboken, N. J. He became a clerk in the office of auditor of traffic of the New York, Lake Erie & Western, now the Erie Railroad, October 6, 1887, and February 1, 1891, became a clerk to the third vice-president and auditor of the same road. In 1896, he was made chief clerk in the accounting department of the Erie; June 1, 1902, assistant auditor; October 1, 1902, auditor; January 1, 1903, general auditor; January 1, 1904, comptroller. On February 8, 1910, he became comptroller of the Illinois Central System. In 1917 he went with the Lehigh Valley as vice-president and in 1918 was made an assistant regional director of the railroad administration at Philadelphia. He was elected vice-president in charge of the accounting and treasury department of the Illinois Central System in November, 1918.

#### A. S. Baldwin

Mr. Baldwin was born September 28, 1861, at Winchester, Va. He entered railway service as rodman for the Richmond & Allegheny Railroad, now the Chesapeake & Ohio Railroad, in 1879. Leaving the railway service, he taught school and later was an industrial engineer. He returned to the railway service in 1884 as a draftsman and assistant engineer of the Baltimore & Ohio, where he was in charge of the construction of bulkheads and docks on the Schuylkill River. He later was employed by the Chicago, Milwaukee & St. Paul as principal assistant engineer on the construction of the bridge crossing the Missouri River at Kansas City. A short time after that he was employed on the construction of the Louisville, St. Louis & Texas Railroad, now the Henderson Route. He entered the service of the Louisville & Nashville in 1887 and for fourteen years served as division engineer, roadmaster and principal assistant in the office of the chief engineer. He entered the Illinois Central service September 1, 1901, as principal assistant engineer. He was made engineer of construction May 1, 1903, and chief engineer March 20, 1905. During federal control he was vice-president in charge of corporate affairs and at the conclusion of federal control was placed in charge of

the plans for electrification of the Chicago terminals.

#### A. C. Mann

Mr. Mann was born September 1, 1881, at Effingham, Ill. He entered railway service January 10, 1900, as stenographer for the commercial agent of the Illinois Central at St. Louis. Later he was bill-of-lading clerk in the same office. He became secretary to the general agent at St. Louis in February, 1902. Four months later he was transferred to Chicago as secretary to the coal traffic manager. He became a price clerk in the purchasing department in June, 1904, and later chief clerk in that department. He was promoted to assistant purchasing agent January 12, 1913, and in May of that year was made purchasing agent of the Central of Georgia. In 1913 he was appointed purchasing agent of the Illinois Central. He served on the purchasing committee under Mr. Markham at Atlanta during federal control and later was elected vice-president of the International Steel Corporation at New York. He was elected vice-president of the Illinois Central in charge of purchases and supplies December 10, 1920.

#### AN APPRECIATION FROM KENTUCKY

Robert W. Bingham, president and publisher of the *Courier-Journal* and the *Times* at Louisville, Ky., recently addressed the following letter to President C. H. Markham:

"The Illinois Central Railroad, through Superintendent Hill, here, was so helpful and obliging and wide-awake in connection with a banker's meeting at Elizabethtown yesterday, that I take the liberty of congratulating you upon your superior organization in this state, due in large measure, I feel certain, to Superintendent Hill.

"I have been engaged in trying to organize the burley tobacco farmers of Kentucky in a co-operative marketing association, and yesterday Mr. Sapiro, who originated the co-operative plan, was to address a most important meeting at Elizabethtown. For various reasons, another company was unable to furnish the accommodations I desired for a distinguished party which assembled to make the trip. But Superintendent Hill not only was able to do it but did it most courteously and luxuriously and made our trip a delightful affair. Since this burley movement, if

successful, will mean much to the economic welfare of this state, the Illinois Central is the first Kentucky railroad to participate in a great reform."

#### It Pays to Boost

A transportation representative must be a booster for his home town. He must be interested in civic affairs, at least to the point of being familiar with every angle of the situation, and, wherever consistent, he should be identified with them. It is not necessary for him to take the initiative, but it is helpful to know when to get in and help pull for the civic good of the community.

To be identified with the local chamber of commerce is of great value, as the important things that come up in the community usually get to the commercial body. Attending meetings of a public nature held to advance civic enterprises is of great value. People will form the representative's acquaintance in a way that will make it easy for them to call upon him when transportation subjects of interest to them arise.

Everything in the community life should interest him. He will find that a large number of business men are deeply interested in things of a public nature, and he will find that mutual interest is a great factor in cultivating their acquaintance and being close enough to them to secure consideration when they are in need of transportation service. This does not mean that a representative is to be a solicitor at all times. In this matter great tact must be used, otherwise a representative may do his cause more harm than good.

A representative should join the clubs, do his part at all times, be ever ready to work on committees, be dependable in attendance and conservative in action.

The railway representative must be a conservative and consistent believer in the city, town or community in which he is stationed. This belief must be whole-hearted and of a nature that will be shown in his daily life.

It pays to be a real, interested booster in your own home town.—  
FRED AUSTIN, *Agent, Sioux City, Iowa.*

## "In the Course of Employment"

Again we mention the nice distinctions which are made by the courts in construing the Workmen's Compensation Acts as between injuries occurring in the course of employment and those growing out of the employment.

The Supreme Judicial Court of Maine has recently referred to the number of decisions construing the words "out of" the employment, and the very few cases that deal with the words "in the course of" the employment. The court points out that no injury can grow out of the employment unless it occurs in the course of the employment. The court seems to think that too little attention has been paid to the question as to what injuries occur in the course of the employment.

The particular case that called for the decision involved a state of facts in which the employe, who was hoisting cotton from a lower to an upper floor, found it necessary to go to the upper floor to see how much cotton of certain grades had been hoisted and how it was disposed of. The cotton was being hoisted by a rope. He took hold of the rope, gave the usual signal and had himself hoisted by that device. He was injured before he reached the upper floor. There was a stairway provided for the employe and instructions had been issued by the employer not to use the rope in this way.

It was obvious that the employe was about his master's business when he was injured. The court held, however, that the injury was one that did not occur in the course of his employment. It gave a definition of an accident which does so arise, that definition being:

"An accident arises in the course of the employment when it occurs within the period of employment, at a place where the employe reasonably may be, in the performance of his duties or engaged in doing something incidental thereto."

The court held that in this case the injury occurred within the period of the employment but not at a place where the employe could reasonably be. The definition furnishes an excellent working rule, and the decision is a

valuable one. The case is reported as Fournier's Case, 113 Atlantic, 270.

## An Honor for E. F. Trabue

Edmund F. Trabue of Louisville, our senior district attorney for Kentucky, recognized wherever he is known as one of the leaders of the American bar, has recently been accorded an unusual honor. Mr. Trabue for more than thirty years has been a prominent figure in the American Bar Association, serving on its most important committees and taking a leading part in all its activities. At the Boston meeting two years ago, he came within a few votes of being elected president of the association. Recently it developed that W. A. Blount of Florida, who was elected president of the association at the St. Louis meeting last year, is in such failing health that he cannot preside at the approaching Cincinnati meeting, nor is he physically able to prepare and deliver the usual president's address. It being necessary to provide a substitute, the executive committee, the governing body of the association, unanimously requested Mr. Trabue to act as president *pro tem* at the Cincinnati meeting. The fact that Mr. Trabue's professional engagements forced him to decline this signal mark of distinction does not make the honor any the less gratifying to his friends.

## The Troubles of a Judge

If any of our readers who belong to the legal profession has ever served a term as trial judge, he will appreciate the following observation made by a Kansas court in a recent case:

"The leader of a symphony orchestra seeks to inspire and synchronize a body of players all intent and harmonious in striving to render the same service, and doubtless even the orchestra leader now and then makes mistakes. The judge who presides over a jury trial is in a different position. His province is to keep the best possible approach to harmony among violently discordant forces fighting every inch of the way through the case, with the witnesses eager to get away and the taxpayers critical of every waste of time. Usually the charge must be written while the trial is going on, in the interim between rulings on evidence or attempts to quiet incipient belligerency among counsel

and the wonder is that so few mistakes are made."

These sage observations were made by Judge West of the Kansas Supreme Court, in *Thirlwell vs. Payne, Director General*, 196 Pacific (Kan.), 1068.

A reference to Judge West's biography shows that for five years he was a district judge, and he therefore knows whereof he speaks.

The case before the court involved the important question of the liability of the railway company for loss by fire sustained by a property owner who had entered into a contract for the construction of a spur track under the terms of which the railway company was not to be responsible for fires. The court, by the way, upheld the contract as being in now way violative of public policy.

#### Recovery Under Released Rates

The somewhat difficult question of the amount of recovery permissible when property lost by a carrier is moving under tariffs providing for released rates was involved in the question of *Lindenburg vs. American Railway Express Company*, 106 S. E. 884. In that case the West Virginia Supreme Court of Appeals required the carrier to pay the full value, although a tariff of the company provided for released rates, and the shipper paid the lower rate.

The difficulty, however, was that the shipper had never declared in writing any released value, nor was there any notation on the bill of lading showing that the shipment was one moving under released rates. In other words, the court ruled the case entirely upon the provisions of the bill of lading, ignoring the tariffs entirely. It justified this decision by the language of the Second Cummins Amendment, which provided for full recovery unless there was a value declared in writing by the shipper or agreed upon as the actual value.

The case emphasizes the importance of having all railway agents make sure that where goods move under released rates there is a written declaration of value shown on the bill of lading.

#### A Problem from Federal Control

If a suit is brought in a state court, after the end of federal control, against the agent of the president, designated under section 206 (A) of the Transportation Act, upon a cause of

action that arose during federal control, can the case be removed to the federal court independent of the question of diverse citizenship?

If the suit was brought before the end of federal control, the Federal Control Act applied, by the terms of which it is provided:

"In any action at law, or suit in equity, against the carrier, no defense shall be made thereto upon the ground that the carrier is an instrumentality or agency of the federal government; nor shall any such carrier be entitled to have transferred to a federal court any action heretofore or hereafter instituted by or against it, which action was not so transferable prior to the federal control of such carrier."

Under this provision, very generally, suits which were not removable prior to federal control were considered not removable thereafter. But with the end of federal control, the Federal Control Act ceased to operate. Thereafter, the Transportation Act, 1920, governed the matter. If this act had been silent on the subject, no suit whatever could have been brought against either the railway company or the government. The act does, however, in section 206 (A), give permission for suits to be brought against the agent of the president. There is nothing in the new law prohibiting removals to the federal court or limiting the character of defense. It does permit suits to be brought in a state court, but says nothing as to removing them therefrom.

In this state of the law, Judge Bourquin of Montana has held (*Stark vs. Payne, Director General*, 271 Fed. 477) that any case brought since the end of federal control can be removed to the federal court as being a suit against the United States, and therefore arising exclusively under federal law.

#### HELD 47TH ANNUAL PICNIC

The forty-seventh annual picnic of the Water Valley, Miss., employes, held at Tarrant, Miss., on June 9, was a complete success, in spite of a shower that came up in the afternoon, according to W. J. King, chairman of the picnic committee, who asks the magazine to express the thanks of the employes to the Illinois Central band, an orchestra from Memphis that assisted at the dancing, Superintendent Caulfield, Master Mechanic Mauldin, General Foreman Chapman, Chief Dispatcher Houston, Traveling Engineer Sieber and Sell Jones, on whose grounds the picnic was held.

# Evidence of Perjury in Big Suit Against Illinois Central

## Previous Verdict for \$35,000 Set Aside in Tossine Personal Injury Case at St. Paul, Minn.

**A**FFIDAVITS showing that perjury had been committed in a case against the Illinois Central and the director general of railroads in which a \$35,000 verdict had been obtained were introduced in the district court of Ramsey County (St. Paul), Minnesota, June 25. Based upon a decision of the United States Supreme Court, Judge J. C. Michael dismissed the verdict as against the Illinois Central and on July 1 granted a new trial in the case involving the government.

In granting the motion for a new trial, Judge Michael announced that his decision was based upon these grounds:

a. Because the verdict of the jury is not justified by the evidence.

b. Because of misconduct of the plaintiff in knowingly adducing perjured testimony of the witnesses Oliver and Baclet as to the manner of the happening of the accident resulting in plaintiff's injuries.

c. Because of newly discovered evidence as set forth in the affidavits submitted by the defendants in support of this motion.

### Picked a Better Site for the Case

The case was that of John Tossine, a Bulgarian coal miner employed by the United States Fuel Company at Benton, Ill. Tossine was injured February 15, 1919, when he fell beneath a miners' train operated by the Illinois Central between Benton and Middle Fork Mine, where he was employed, two and one-half miles east of Benton. He made application to the industrial board and was awarded \$2,600 for the loss of his right arm, which was amputated at the shoulder. The decision was appealed by the United States Fuel Company, and Circuit Judge Torrison at Chicago held that Tossine was not injured in the course of his employment, but while a passenger for hire upon an Illinois Central train.

Suit was instituted shortly after against

the Illinois Central and the director general in Franklin County, Illinois, for \$50,000. Tossine employed as his attorney John H. Kay of Chicago, formerly of the firm of Barton & Kay of St. Paul. Preparations were made for trial of the case, whereupon Kay dismissed the suit in Illinois and Tossine left the state, taking up his residence in St. Paul, where another suit for \$50,000 was instituted against the Illinois Central and the director general by Barton & Kinkead as attorneys. This is the firm of which Kay formerly was a member. It was claimed that the Illinois Central had failed to provide Tossine with proper accommodations in going to and from his work, and that, as a result of a violent jerk of the train, he was thrown from the crowded platform. In addition to the loss of his right arm at the shoulder, it was claimed that he had suffered a scalp wound, that his face had been scarred and bruised and that his left ribs had been bruised and possibly fractured. These injuries, it was claimed, resulted in a partial impairment of his vision.

In the trial of the case in the district court at St. Paul in April, 1921, witnesses were produced who were upon the train and saw the accident. It was the testimony of two witnesses that on two evenings preceding the injury Tossine had attempted to alight from the train while it was in motion and had barely escaped being injured. The place where he attempted to alight was nearer his home than the station. A number of witnesses also testified that the coaches were not crowded on the afternoon of the accident, in fact, that Tossine had been seated in one of the coaches and left his seat to alight from the moving train at the point nearer his home.

### Swore Company Was at Fault

Depositions which had been secured by Attorney Kay from Charles Baclet, Jacob

Oliver and Theodore Zanotto, three laborers of Benton, Ill., were introduced at the trial. Both Baclet and Oliver swore they were standing on the platform of the Illinois Central station in Benton and that they saw Tossine standing on the crowded platform, when the jolt of the train threw him between the cars. It was upon this testimony largely that the verdict of \$35,000 was brought in by the jury.

The testimony given by Tossine's witnesses was so at variance with that given by other witnesses of the accident that the Illinois Central and the government made an investigation. A secret service agent was sent to Benton to form the acquaintance of Baclet and Oliver, and shortly thereafter, he represented to Oliver that he had been injured in an accident at DuQuoin, Ill., when a train backed down upon him without warning, breaking his legs and causing him permanent injury. He suggested to Oliver that he could win his "case," which he said was then pending, if he had a good witness, and offered to split the award if Oliver would testify in his behalf.

Oliver went with the secret agent to DuQuoin and agreed upon the testimony which he should give, returning to Benton and making a deposition before a notary public. When Oliver had given his deposition, holding to his story through the examination and cross-examination, he was confronted with the fact that there had been no injury and that his testimony was false. In the presence of several prominent residents of Benton, some days later, he made a written confession, admitting that his testimony in the Tossine case was false. Baclet was then sent for and he made a similar confession.

#### Confession Explained Frame-up

Oliver stated in his affidavit of confession that he had received a letter from Kay requesting him to be present at a conference at the Hudson Hotel in Benton. He complied with the letter, he said, and met Kay, Tossine and Baclet. He declared that he told Kay at the time that he had not been a witness to the accident and did not know how it had happened. He said that Kay read to him and to Baclet a written state-

ment as to what they should testify to in the Tossine case, and that the testimony they gave in their depositions was substantially in accordance with that outlined by Kay.

A few days later, he said, he again met Kay at the hotel in Benton, and they rode to the station, where he pointed out to the attorney a miners' car similar to that used in the miners' train, which Kay photographed, and the attorney pointed out to him the loading platform at the station and directed him to testify that he was leaning against this platform at the time Tossine was injured.

That morning, according to Oliver's affidavit, the four men met again, together with four others who also were to testify. They sat in the lobby of the hotel for half an hour, Oliver said, while Kay talked to them in low tones. They then left the hotel and went to the attorney's office, where they gave their depositions. Oliver said that while they were waiting for the elevator in the office building Kay told them:

"Now, don't you boys forget to swear just the way I told you this thing happened."

#### Got a Check from the Lawyer

Oliver said that shortly after that time he received a check from Kay for \$20.

Baclet made a similar statement in his affidavit.

An affidavit was obtained from Albert Davini, a restaurant keeper at Benton, who swore that Zanotto, the third material witness in Tossine's behalf, was not standing near his restaurant at the time of the accident, as Zanotto had claimed he was.

Two weeks after Baclet and Oliver had given their affidavits admitting that their testimony in the Tossine case was false, they were interviewed by a representative of the United States Department of Justice, both again admitting that they had given false testimony.

After Tossine's attorneys had been informed of the serious nature of the affidavits which Oliver and Baclet had given, the two men disappeared from Benton and were next heard from in St. Paul. When the case was brought before Judge Michael June 25, counter affidavits were produced from Oliver and

Baclet, in which they confirmed their original stories as set forth in the depositions used in the Tossine case and contended that they were frightened into making the statements admitting perjury. In his counter affidavit, however, Oliver made no effort to explain his action in giving testimony in the faked case. The affidavits of business men and the Department of Justice representative covering admissions that they swore falsely in the Tossine case stood uncontradicted.

The disclosures that the verdict had been obtained on perjured testimony aroused the newspapers of St. Paul, and they gave considerable prominence in their news columns to the developments of the case.

The following is an editorial from the St. Paul *Pioneer Press* of June 30:

#### OUR "FOREIGN" LAW SUITS

St. Paul has no ambition to deserve the reputation industriously spread for sinister purposes, that "heavy verdicts are easy in personal injury cases," and its taxpayers object strenuously to paying the costs of the trials of suits to recover damages for injuries incurred in distant states and in which they have neither interest nor concern.

Under a tortured construction of the Constitution and through the solicitation of a corps of agents scattered throughout the Middle West these personal injury damage suits against railroads are brought into our courts for trial. The accidents from which these injuries resulted may have occurred in Illinois or in Mississippi—usually the farther away the better for the disreputable purpose—yet the damage suits are instituted in St. Paul at the expense of the time of our courts and the cost laid upon our taxpayers. It is pestiferous situation from which there is no escape save in the way of public opinion in protest.

A pending motion for a new trial in the district court of a suit in which a verdict of \$35,000 was recorded, revives interest in the subject and calls for a renewal of the expression of public opinion in opposition to the system. The allegations of conspiracy and subornation of perjury in the case are important as far as the motion is concerned, but do not affect the general question. Whether the suits are clean and honest or whether they seethe with crookedness they ought to be kept out of the courts of Minnesota and tried in the communities where the injuries were incurred and where opportunity is equal for obtaining evidence. Ambulance chasing and the solicitation of personal injury cases are evils of themselves, but they are not in consideration now. We are dealing solely with the importation into Minnesota state courts of these outside cases, which is an annoying and expensive proposition without regard to the merits of the cases or the methods, good, bad or indifferent, of the lawyers associated with them.

Several years ago, when this importing practice was at its height, this newspaper directed

public attention to it as involving an unwarranted reflection upon Minnesota and an exasperating expense to its taxpayers. Remedial legislation was undertaken as the result, but a construction of the Constitution barred the way to closing the doors of our courts. Federal administration of the railroads intervened shortly after this effort and foreign personal injury cases disappeared for the time being, but with the restoration of the railway properties to their owners the censurable practice has reappeared and we are threatened with the old-time deluge.

We have no brief for either side in a case of this character. But we have the liveliest concern in terminating a practice based upon spreading the reputation of St. Paul for easy verdicts in such cases and which is an unwarranted drain on the time of our courts and the pocketbooks of our taxpayers. If a lax public opinion is to blame, we ought to be ashamed of it; and if we are at fault in any way in permitting it to go out and be exploited that it is easy to win damage suits in our courts, we ought to be ashamed of that also.

The case was handled for both the railroad and the government by C. C. LeForgee of Decatur, attorney for the Illinois Central, assisted by Butler, Mitchell & Doherty of St. Paul, also of the Illinois Central law department. The investigation was supervised for both the railroad and the government by P. M. Gatch of Chicago, assistant general claim agent.

## The Coal Situation

By B. J. ROWE,  
Coal Traffic Manager

ONE is frequently asked whether coal is going to be plentiful this fall and whether it will be cheaper.

The answer to the first question is that it will not be plentiful unless consumers start buying right now and keep it up. No one seriously denies the advisability of early buying. The trouble is that Mr. Average Citizen wants the other fellow to do it. While consumers all over the country are debating the question, bituminous production drags along at a weekly average that cannot but be alarming.

The cumulative output of the country as a whole during the first 126 working days of the past five years has been as follows, in net tons:

Years of Activity	
1917.....	220,432,000
1918.....	225,058,000
1920.....	207,749,000
Years of Depression	
1919.....	171,885,000
1921.....	160,513,000

This spells but one thing—coal shortage for this fall. A decrease in production of more than 11,000,000 tons under 1919 makes for a repetition of 1919 conditions (minus the strike).

Three major arguments are advanced for deferred buying. These are the propaganda for a general reduction in freight rates, the hope that mine wages will go down, and general industrial conditions.

Until such time as the railroads of the country are earning the return provided for by the Transportation Act (and this cannot be until operating costs have been reduced), no general reduction in transportation charges can be expected.

Is coal going to be cheaper? All signs point to the contrary. The price at the mine mouth has steadily advanced about 20 cents per month since early spring. So with the

approach of the buying season there is no reason to expect a decline in price. The wage agreement with the miners does not expire until March 31, 1922, and with no modification of these wage agreements in sight, or even remotely considered, it does not require any strain of the imagination to reach the conclusion there can be no great reduction in production costs.

There is no general reduction of transportation charges on coal under consideration at this time by the railroads, although readjustments and restoration of previous relationship are being considered at all times. Suppose some reduction in coal rates should be made? It would not be enough to offset the advancing cost of the coal at the mine, and it could not be made in time to take care of the fall movement.

It took the railroads six months to get their rate schedules in shape to increase the rates last year, and while it would not take quite so long to prepare them for reductions, it would take months, or weeks at best. So it can be seen there is nothing to gain and much to lose by holding off buying in the hope that either the price of the coal or the transportation cost will come down this year.

Railroad facilities are adequate to handle only the necessary annual bituminous output if transported with fair uniformity throughout the year. If the demand is concentrated during a few fall and winter months, there will not be transportation enough to go around, and coal prices will go soaring, as we all know from past experience. *Buy now and save money.*

### BRING ON YOUR LOGS

There seems to be some question about the "banner carload" of logs pictured on page 21 of the April issue of this magazine. The twelve logs loaded at Erot's Spur, Miss., totaled 11,282 feet. According to C. R. Young, superintendent of the Tennessee Division, twenty-six logs loaded on August 26, 1920, car G. R. & I. 897, at Harris, Tenn., totaled 12,451 feet.

# Senate Committee's Hearing on Railroads Enlightens the Public

## *Managements' Side of Presentation Ended With an Explanation of Handicaps Since the War*

**I**N the *Illinois Central Magazine* for June there appeared on pages 74 to 78, inclusive, a summary of the testimony which had been presented during May in the hearing which the interstate commerce committee of the United States Senate is conducting at Washington into the railway situation. At that time eight railway officers had testified.

The hearing has continued through June. The railroads completed the presentation of their case on June 17, and S. Davies Warfield, president of the National Association of Owners of Railroad Securities, took the stand June 17 to explain the so-called Warfield plan of co-ordinating the roads. He was followed by Forney Johnston, Edwin Ludlow, John F. Wallace, L. B. Stillwell and W. A. Colston, also interested in his plan. On July 1 the committee took an adjournment until the middle or latter part of August.

### **Four More Executives Heard**

The railway executives who appeared in June before the committee to testify on behalf of the railroads included: John G. Walber, secretary of the bureau of information of the Eastern lines; E. T. Whiter, chairman of the conference committee of managers, Association of Railway Executives; L. E. Wettling, manager of the bureau of statistics of the Western lines, and W. H. Williams, chairman of the board, Wabash Railway Company.

Mr. Walber in his testimony described the inequalities in the treatment of railway employes as a result of the application of the wage standardization policy of the Railroad Administration to the diversified conditions of employment.

The uniform application, Mr. Walber said, of the 8-hour day to all of these different classes of employes working under different conditions produced very pronounced

distortions in the monthly earnings of these different classes of employes themselves and also in comparison with other classes of employes.

Mr. Walber told the committee that great disparities also resulted from the application of minimum rates to large numbers of employes who had previously received different rates in accordance with different conditions and also from the methods used in converting former monthly rates to new hourly rates.

### **Took Up "National Agreements"**

Mr. Whiter, who followed Mr. Walber on the stand, denied contentions that the railroads are not penalized under the operation of the "national agreements." While one or two of the rules contained in the "national agreements," or rules similar thereto, may have been in the schedules of the individual railroads, "in no case were all of the rules or any material number of them in effect on one railroad," he said.

Mr. Whiter said that the estimate that the "national agreements" cost the railroads approximately \$300,000,000 annually is under rather than over-estimated. He said that the provision in the "national agreements" requiring the railroads to allow employes one hour extra pay each week for punching the clock regardless of the number of hours actually worked cost the railroads \$6,445,658 during the first six months of 1920. He also brought out that the agreements required the railroads to pay for work not performed and to employ from two to six men to do a job that one could have done formerly.

Mr. Wettling's testimony had reference largely to the performance of maintenance work during federal control and after the railroads were restored to their owners.

Chairman Cummins called attention to the

fact that this increase in the cost of maintenance was particularly marked during the six months' guaranty period, and, in reply to this question, the witness explained that it was necessary to make extraordinary expenditures for maintenance immediately after the termination of federal control.

Expenditures for maintenance work in 1919 were subnormal because of restrictions placed by the director general, Mr. Wettling explained.

"Because of urgent necessities the carriers continued their program of restoration of the properties until in October, 1920, when it became apparent that a general business depression was imminent and that the full net revenues anticipated as a result of the advances granted were not being realized. Most of the roads had little hope of further advances from the Railroad Administration and, because of the refusal of the Secretary of the Treasury to honor certificates of partial payment of the guaranty period, the carriers found themselves short of funds and were thus manifestly unable to continue the necessary maintenance expenditures, and expenditures since November, 1920, have suffered a substantial reduction below the necessary requirements by many roads."

**Work Increased in 1920**

Mr. Wettling said the railroads performed more maintenance work during the past year than in either 1918 or 1919, when they were under federal control.

Reports from 93 per cent of the Class I railroads, representing approximately 218,000 miles, show that in 1920 they laid 2,262,033 tons of new and second-hand rails, the total cost of which was \$82,219,999, compared with 2,027,159 tons costing \$69,961,049 in 1919 and 1,615,963 tons costing \$50,836,964 in 1918. During the test period the yearly average was 2,041,676, while the total cost was \$54,166,631.

Figures on the ties placed during those years follow:

	Average per annum
	Test Period
Switch ties (feet).....	172,689,571
Bridge ties (feet).....	55,625,964
Other ties (number).....	83,885,109
Total cost .....	\$58,135,355

Taking up the question of ballast, Mr. Wettling said those roads in 1920 applied 19,118,553 yards at a cost of \$12,045,000, or an average cost of 63 cents per yard. In 1919 those roads applied 17,518,791 yards at a cost of \$9,481,545, or an average cost of 54 cents, while in 1918 they applied only 14,796,252 at a total cost of \$6,472,151, or an average cost of 43<sup>1</sup>/<sub>10</sub> cents per yard.

Of the total cost of maintenance of way and structures, \$577,688,000, or 60.09 per cent, was paid to labor. Cost of material was 29.67 per cent. During the test period \$209,906,000, or 54.71 per cent went to labor; \$401,331,000, or 65 per cent, in 1918, and \$439,140,000, or 60.35 per cent, in 1919.

**Public Misled, Senator Says**

In connection with a table comparing operating accounts from 1912 to 1920, Senator Cummins said that the public is being misled by the repeated publication of figures showing the net operating income earned in 1918 and 1919 during the period of federal control, because people are led to believe that the government's loss from the operation of the railroads was only the difference between the amount actually earned and the guaranty to the railroads. If the government had properly maintained the properties, he said, the net operating income would have been smaller and the loss to the government would have appeared larger, and he estimated that the government's loss after allowing for under-maintenance claims would be at least \$1,500,000,000 instead of \$700,000,000, \$800,000,000 or \$900,000,000.

"The public will never comprehend what government control cost," he said, "until we have to make an appropriation to pay the final bill."

Mr. Wettling described to the committee how increases in railway earnings resulting both from increased traffic and from increases in rates have been more than absorbed by increases in operating expenses, chiefly by increased payroll costs, which in 1920 practically wiped out the net operating income.

From 1912 to 1920, he said, the increase in

	1918	1919	1920
1918	160,024,789	176,079,389	170,345,383
1919	45,400,555	49,644,851	41,533,926
1920	69,327,243	73,398,922	77,015,580
Total	\$62,886,865	\$84,156,035	\$107,772,885

total operating revenues was \$3,366,000,000, or 120 per cent, while the increase in operating expenses was \$3,809,000,000, or 194 per cent, and the increase in compensation of employes was \$2,489,000,000, or 205 per cent. The payroll was 43.13 per cent of the revenues in 1912 and 59.92 per cent in 1920. The average compensation per employe during this period increased from \$736.68 to \$1,820.05, or 147 per cent, and during the latter part of 1920 the average wage was at the rate of \$1,904 per year.

From 1916 to 1920, according to the witness, the revenues increased \$2,575,000,000, or 70 per cent, but operating expenses increased \$3,411,000,000, or 145 per cent, and the payroll increased \$2,230,000,000, or 152 per cent. In 1916 the payroll was 40.83 per cent of the revenues and 62.3 per cent of the expenses.

From 1916 to 1917 the revenues increased \$418,000,000, or 11 per cent, resulting in part

from increased traffic and in part from an increase in rates; but expenses increased \$472,000,000, or 20 per cent, and the payroll increased \$271,000,000, or 18.6 per cent, largely as the result of the passage of the Adamson law in 1916.

**Expenses Increased 100 Per Cent**

From 1917 to 1920, comparing the years before and after the period of federal control, the increase in revenues was \$2,157,000,000, or 53 per cent. The increase in expenses, however, was \$2,839,000,000, or 100 per cent, or \$682,000,000 more than the increase in earnings. The increase in the payroll was \$1,959,000,000, or 113 per cent. In 1917 the payroll was 43.33 per cent of earnings and 61.43 per cent of the expenses. In 1920 it was 59.92 per cent of the earnings and 64.11 per cent of the expenses. The net operating income fell from \$934,000,000 in 1917 to \$62,000,000 in 1920. Besides the increase in ex-

*Things to Talk About*

A remarkable record for passenger train performance was made by the Illinois Central System in May. A total of 13,567 passenger trains were operated, with 13,461, or 99.2 per cent, maintaining schedule time.

The division standing fifth on the list made a record of 100 per cent, and it stood fifth only because four other divisions also established records of 100 per cent and, having run more trains, were entitled to a higher rating. The division standing eleventh on the list had a record of 99 per cent, and the division standing in sixteenth position had a record of 98.4, while the division at the bottom of the list had a record of 97.7.

This brilliant record of passenger train performance for May eclipses any former record of the Illinois Central System and perhaps has never been excelled by any railroad handling as many passenger trains as were handled by the Illinois Central System during May.

The record, by divisions, follows:

Rank	Division	No. Trains Operated	No. Maintaining Schedule	Percentage Maintaining Schedule
1	Memphis .....	1,178	1,178	100
2	Memphis Terminal.....	930	930	100
3	New Orleans Terminal...	744	744	100
4	Iowa .....	688	688	100
5	Indiana .....	414	414	100
6	Vicksburg .....	558	557	99.8
7	Chicago Terminal .....	1,292	1,289	99.7
8	New Orleans .....	548	545	99.4
9	Wisconsin .....	684	679	99.2
10	Mississippi .....	620	614	99.0
11	Springfield .....	808	800	99.0
12	Kentucky .....	848	839	98.9
13	Minnesota .....	632	623	98.5
14	Tennessee .....	806	794	98.5
15	Louisiana .....	589	580	98.4
16	Illinois .....	1,298	1,278	98.4
17	St. Louis .....	930	909	97.7
	SYSTEM .....	13,567	13,461	99.2

penses there was an increase of \$65,000,000 in taxes and there were also some increases in equipment and joint facility rentals.

The testimony offered by Mr. Williams dealt with maintenance work and freight rates. Mr. Williams told the committee that the increase in freight rates had been so small that it cannot be said to account for any appreciable amount of the charges in livestock and grain prices. The wholesale price in Chicago of cattle in 1920 was \$14.50 per hundred pounds and so far this year approximately \$8.60, Mr. Williams said, while to ship cattle from Sioux City, Iowa, it costs only 44 cents per hundred pounds. The wholesale price of hogs, he said, was around \$14.85 in 1920 and \$9.25 this year, while the freight rate from Des Moines, Iowa, to Chicago is only 40 cents a hundred.

**Freight Rate a Small Item**

Last year, according to the witness, the wholesale price of corn in Chicago was \$1.41 a bushel; it is 64 cents this year, while to ship a bushel from Decatur, Ill., to that city costs only 7½ cents. To ship a bushel of wheat from St. Cloud, Minn., to Chicago, Mr. Williams said, the cost is 15½ cents; in 1920 the wholesale price in Chicago was \$2.80, and this year \$1.47.

Mr. Williams submitted the following suggestions as a possible means of providing some relief for the railroads:

State commissions have required the re-establishment of unremunerative passenger service, erection of new passenger stations, and other expenditures which ought to be deferred. The Interstate Commerce Commission, which has authority to regulate the receipts of the carriers, should be the sole agency authorized to require additional service or expenditures for plant facilities.

Freight rates for carlot shipments should be based upon the cars' being loaded to their weight capacity or cubical content capacity. This would make it unnecessary to buy freight cars other than for replacements during the next five years; it would minimize the possibility of car shortage, and would materially add to the revenue tons per train and thereby lessen the cost of operation.

**Would Save Cars for Coal**

Governmental work—particularly road work—should be done at such times and by such

methods as to interfere as little as possible with private enterprise. Materials for such work ought not to be moved by rail when open top cars are needed for the coal trade.

The existing rules with relation to seniority rights when men are promoted or forces are curtailed should be modified so as not to apply when those by whom they are claimed are seriously inferior in qualifications.

"During the past three years," the witness explained, "the railroads have found it necessary to employ men not the most competent or qualified to perform the work for which they were taken into the service. Many of these men are not capable of assuming increased responsibility and should not be retained in their present positions."

**A SLIP IN FIGURES**

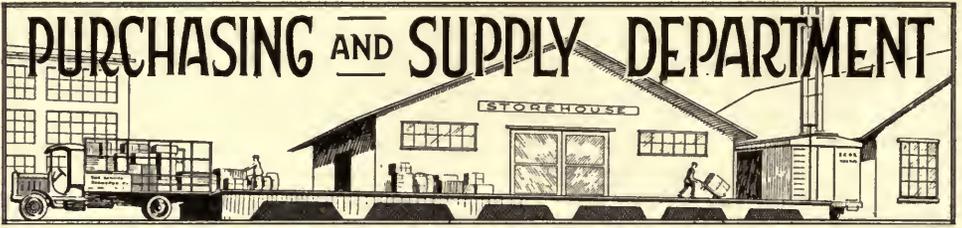

Owing to the fact that the figures and the dates got juggled in making up the June issue of this magazine, the "Things to Talk About" on page 27 failed to make good sense. The figures were exactly reversed from what they should have been. The table showing the percentage of each revenue dollar paid out for expenses and taxes, but not including fixed charges, should have read as follows:

1916.....	65.55
1917.....	70.57
1918.....	81.54
1919.....	85.25
1920.....	93.59

which shows that expenses have encroached on earnings so closely that a considerable reduction in expenses has become necessary.

**ON SUPPLY ORGANIZATION**

Wm. Davidson, general storekeeper of the Illinois Central, is the author of an article on "Results Obtained From Proper Organization," which appears in the June issue of *Railway Purchases and Stores*, a magazine published in Chicago and devoted to the subject which its title indicates. Mr. Davidson points out how much like a smoothly operating machine is a properly formed organization and goes on to explain certain points that he has found of value in his work with the Illinois Central. Mr. Davidson's picture accompanies the article.

## Proper Care of Materials

By G. D. TOMBS,  
Assistant Division Storekeeper,  
Vicksburg, Miss.

**T**HROUGH the medium of the *Illinois Central Magazine* and the *Railway Purchases and Stores Magazine*, we have been taught many lessons in caring for and reclaiming second-hand material that are without a doubt invaluable to the company. Too much has not been said in this regard. In fact, reclamation is one of the most important enterprises engaged in by the various railroads of this country. We must not, however, be over-zealous in this regard to the extent that we overlook the proper care of new material.

On the line of some railroads, at toolhouses, strong bins have been constructed for handling scrap, as well as handy boxes with handles for use in picking up scrap to be stored in these bins, so that at the first opportunity it may be forwarded to the storehouse and sold when a sufficient amount has accumulated. Some persons handling new material, however, do not always use the best judgment in storing it. On the road it is frequently noticed that track bolts, spikes, nails, nutlocks, etc., are stored underneath toolhouses, on the ground and exposed to the weather, or perhaps left at the rear of the toolhouses with no protection whatever.

There has been a continual campaign to instruct all concerned regarding the value of new material and the importance of caring for it. In some cases, in shops, the men are often careless with nails, screws, nuts and carriage bolts by allowing them to lie on the ground and rust, instead of picking them up after the job has been finished and taking them to some central point where they can be re-issued.

Another important item is in lumber used to cooper cars and make scaffolds. New lumber should never be used when serviceable second-hand lumber is available. Of course, where such new material is used, it usually reaches the reclaiming plant, and the better part of it is eventually used again, but no credit is due reclamation for this saving. New material should always be handled in such a manner as not to allow it to reach the scrap dock. The first cost is the highest—therefore we should not allow new material to reach the reclaiming docks and flatter ourselves by claiming a large amount of money saved by the reclamation plant.

The appearance of new material on the scrap dock is always evidence of carelessness or inefficient work. It behooves all of us at this time, when prices of materials and labor are high, to do everything possible to conserve our new material, preventing waste wherever possible. Wherever material can be saved, a corresponding amount of the allotment for labor is made available, and the man who is saving material is largely paying his own salary.

### Things We Should or Should Not Do

Let's keep our passenger trains on time; you can help.

Assist in keeping down personal injuries. Take care of yourself; if you don't, who will?

Call trains so that customers will understand what you say; they don't know the railroad as you do.

Why not clean out the dirty corners and cupboards? It lessens fire risk.

Be interested in leaving your work in good shape when you take your vacation; you should have the same interest in this respect as in planning for your vacation.

Do not lay lighted cigars or cigarettes on window-sills of cars. They burn the varnish. It may not cost you anything, but it is expensive to the company.

When business opens up, everyone should be in first-class condition to handle it. You know at this time how you are in this respect.

Do not ask for transportation the same day it is needed. Anticipate your wants. At this time of the season, requests for transportation are heavy and require considerable work to handle as promptly as you think they should be handled.

Do not put your head or arms out of the windows. Windows are to look out of—not to place half your body out of.

Why not turn off your fans when leaving the office at night? It costs money to allow a fan to run twenty-four hours a day.

Be careful to see that all trucks and baggage are taken off the platforms and set up next to the buildings at night. Why let passengers stumble over these, causing an injury and possibly a law suit?

You should be interested in properly ventilating your office and shops. Good air is necessary.

Let everyone assist in having every coal car available when the coal traffic begins to move.

Do not forget to keep the grass and weeds from around buildings. When grass and weeds dry, a fire is liable to occur.

Wait until the train stops before you get off.

Save all you can of labor and material. This will assist in allowing you to employ more men.

Use your head. It counts in many ways.

## A Week-Day Meeting at Waterloo

A Wednesday noon meeting in the Illinois Central machine shop at Waterloo, Iowa, under the auspices of the Railroad Y. M. C. A. there, whose renaissance was described in the June issue of this magazine. The speaker is Dr. J. R. Macartney, pastor of the First Presbyterian Church of Waterloo. His subject at this meeting was "The Most Popular Sin in the World." This, he decided, was ingratitude.

# Engineer Explains How He Manages to Let the Livestock Live

*James H. Evans, Running on Unfenced Track, Has a Record for Preventing Deaths of Animals*

**T**HE striking of livestock by locomotives on the waylands has long been one of the problems of the railroad. Officers and employes alike are anxious to eliminate this economic waste.

The striking of stock by locomotives has, of course, been more extensive on unfenced track, but it has been learned that it can be prevented even on unfenced track. An example is the case of Engineer James H. Evans, who for years has been running on unfenced track between Baton Rouge and Covington, La. There is a great deal of livestock in this territory, and how Engineer Evans has been able to establish such a good record for not striking stock has been the subject of a good deal of interest.

Mr. Evans was born at Jackson, Miss., February 7, 1854, and has been a locomotive engineer for this company for thirty-eight years. He was asked to explain how he was able to make such a good record in the prevention of the striking of stock on the unfenced track on which he runs. His own story follows:

## Studies Actions of Stock

"I really do not know just how to proceed to tell you how I have prevented striking stock, and I don't remember just when I struck a head of stock, but I do know that it has been a long time. With my long years of service as an engineer, I have grown into the habit of studying the peculiarities and actions of the various kinds of stock. An engineer pursuing this method is able to tell in almost every case just what each head will do when they are seen upon the right-of-way, and, basing his actions on his conclusion, he is able either to proceed or to stop and in this manner succeed in avoiding any damage.

"There are cases, however, where the striking of stock is absolutely unavoidable, and

*James H. Evans*

I would not presume to say that my efficiency along this line is entirely responsible for my success. The grades and curves and embankments have more or less bearing on an engineer's ability to prevent striking stock, and while it is true that for some time past I have been operating through partially unfenced territory the ground is for the most part level and the view is practically unobstructed.

"On the New Orleans division I have observed in recent months a growing spirit of co-operation among supervisors and bridge gang foremen and laborers. We have also succeeded in enlisting the co-operation of stock owners along our territory, and they assist us materially in many ways.

## Cards Notify Section Gangs

"By the system recently inaugurated on the New Orleans division, each engine is equipped with a supply of red cards marked

'STOCK,' and the engineer throws one of these cards to the first bridge or section gang he reaches after having observed stock on the right-of-way. This enables the foreman to send men to drive them off the right-of-way, and I say without hesitancy that this method is enabling us to prevent striking a large number of head of stock. It is surprising to note the interest manifested not only by the classes of employes above mentioned but by all employes in general with a view of decreasing the number of stock struck, and I feel that the pursuance of present methods in keeping this matter on the minds of the other employes, with their real spirit of co-operation, will enable us not only to maintain our present showing but to improve it from month to month.

"I am sure there is no engineer or other employe on this division who would not do everything within his power to avoid damage of this kind which we realize costs money and does no good to any one. You may expect my continued co-operation."

**A Decrease Since 1920**

For the five months ending May 31, 1921,

1,870 head of live-stock were killed or injured on the Illinois Central System, compared with 2,725 head for the same period in 1920, a decrease of 855 head, or 31 per cent.

The following record for this period, by divisions, will be found interesting:

Division	Number of Head Killed	
	1921	1920
Chicago Terminal.....	0	0
Illinois .....	14	11
St. Louis .....	16	29
Springfield .....	14	46
Indiana .....	17	35
Wisconsin .....	27	42
Minnesota .....	16	38

# Billion Dollar Industry Flourishes Along Our Right-of-Way

## Mississippi, in Particular, Shows Good Record in Number of Cows and Production of Butter

By H. J. SCHWIETERT,  
General Development Agent

**T**HE lowly dairy cow has forged her way ahead in the industrial world amid all sorts of adversities until she has become a vital factor in our economic and commercial life.

According to figures furnished by the United States Department of Agriculture, the value of milk produced in 1919 by the dairy cows of the United States was \$2,578,600,000, which was \$354,392,000 greater than the value of our entire wheat crop for the same year. Only one other farm crop had a greater money value than milk, and that was corn. Milk had a greater money value than cotton by \$411,457,000. With these comparisons one gets an idea of the importance of dairying from a monetary standpoint.

There were produced in 1919, in round numbers, 90,000,000,000 pounds of milk. Of this amount 45,430,000,000 pounds were used in the manufacture of various products, some of the more important being as follows:

18,000,000,000 pounds manufactured into creamery butter;

14,000,000,000 pounds manufactured into dairy butter;

4,000,000,000 pounds manufactured into cheese;

5,000,000,000 pounds manufactured into condensed milk;

3,500,000,000 pounds manufactured into ice cream.

According to figures sent out by the U. S. Department of Agriculture there was a decrease in the production of milk for 1920 as compared with 1919 of 400,000,000 pounds, and a decrease in the number of dairy cows of 298,000.

While there was a decrease in milk production in the United States as a whole, Mississippi showed a remarkable increase in the territory traversed by the Illinois Central Railroad, and especially in the following counties, where the Development Bureau has conducted dairy campaigns and lectured to thousands of farmers, urging more and better dairy cows and also more economic production:

Adams, Alcorn, Attala, Benton, Clay, Copiah, Hinds, Holmes, Jefferson, Lafayette, Madison, Marshall, Montgomery, Panola, Tallahatchie, Tate, Yalobusha.

Instead of a decrease in the number of dairy cows in Mississippi, there was an increase of 22,000 head in 1920 over 1919.

### Creameries Show Big Increase

Reports just received from the managers of some of the creameries located on the Illinois Central show a tremendous growth in the production of butter for the first five months of 1921 as compared with the first five months of 1920.

### BUTTER PRODUCED JANUARY 1 TO MAY 31:

	1920	1921	Increase
Lexington .....	15,733.75 lbs.	38,216.5 lbs.	143%
Water Valley .....	18,612.375 lbs.	61,614.625 lbs.	231%
Aberdeen .....	106,812. lbs.	233,766. lbs.	118.8%
Kosciusko .....	53,037.5 lbs.	106,130. lbs.	100%
Jackson .....	61,755. lbs.	101,943. lbs.	65%
Winona .....	38,598.75 lbs.	56,138.5 lbs.	45.4%
Brookhaven .....	97,156. lbs.	125,218. lbs.	28%
West .....	46,854. lbs.	56,177. lbs.	20%

Although we have not yet received a report from the manager of the Canton creamery, we are in receipt of the following from the secretary of the Madison County Chamber of Commerce:

"After eighteen months of struggling in an effort to see the light, the Canton Dairy Products Company, the local creamery, is at this season of the year eclipsing all previous records and its business is growing by leaps and bounds. On Monday, the 27th of June, the creamery churned twice—1,500 pounds aggregate—and one day last week one shipment of cream totaled 55 cans. The quality of butter manufactured results in a big demand all over the South."

The following report showing the increase in number of 5-, 8-, and 10-gallon cans of cream and milk shipped from sta-

tions in Mississippi and Louisiana during May, 1921, as compared with May, 1920, may be of interest:

	1920	1921
5-gal. cans .....	13,214	19,812
8-gal. cans .....	7,278	12,766
10-gal. cans .....	11,522	19,100
<b>Total.....</b>	<b>32,014</b>	<b>51,678</b>

The total increase is 19,664 cans, or 61 3/7 per cent.

We believe the future holds out great opportunities for the dairy farmers in the territory contiguous to our southern lines, and they will become from year to year greater contributors to this billion dollar industry.

## Penny Saved Is Penny Earned Here, Too

The possibility of saving in little things as well as big ones has been proved on the Illinois Central and Yazoo & Mississippi Valley by the success of a campaign to hold down purchases of small tools. The campaign started in February, when Vice-President L. W. Baldwin organized all the roadmasters in the system into a Shovel

Club, whose purpose was to hold to a minimum the investment in all small tools, except shovels. As a result, the small-tool account for the first four months of 1921 shows a decrease of 40.2 per cent from that of the first four months of 1920. The saving in dollars was \$57,457.32, the difference between \$142,850.58 and \$85,393.26. Below is the summary by divisions:

Division	1921	1920	Increase	Per Cent	Decrease	Per Cent
Chicago Terminal .....	\$ 3,310.28	\$ 6,637.34	.....	.....	\$ 3,327.06	50.1
Illinois .....	4,529.72	10,555.37	.....	.....	6,025.65	57.1
St. Louis .....	6,608.83	11,823.54	.....	.....	5,214.71	44.1
Springfield .....	3,161.42	5,568.32	.....	.....	2,406.90	43.2
Indiana .....	2,735.09	5,961.30	.....	.....	3,226.21	54.1
<b>Total Number Lines.....</b>	<b>\$20,345.34</b>	<b>\$40,545.87</b>	.....	.....	<b>\$20,200.53</b>	<b>49.8</b>

# Farm Where Worms Spin Hosiery Found at Our Southern Terminal

*New Orleans Contains One of the Few Silk Establishments in the Country, It Is Said*

THE Illinois Central System, being in what is known as the "bread basket of the world," has in its territory farms of many kinds. Most persons know of our grain farms, our stock farms, our dairy farms, our fruit farms, our truck farms and all the other common varieties, but extremely few know that on the Illinois Central we have one of the few silk farms in the United States. More than that, this farm of Dr. Vartan K. Osigian, adjoining the Illinois Central tracks at New Orleans, is "what may properly be called the largest silk farm in the United States," according to a report made by Daniel Waters, United States trade commissioner, to the Bureau of Foreign and Domestic Commerce at Washington, D. C.

"The silk-growing industry, which before the Civil War attained some prominence in the southern states, is in the process of being revived," Mr. Waters' report declared. "Should the inhabitants of the southern states take up seriously the process of silk raising, it is believed that the United States should then produce the \$200,000,000 worth of silk now imported annually from France, Armenia, China and Japan. The American cocoon is twice the size of the Oriental species, and the silk is of an excellent grade. In fact, before the Civil War, American silk sold for more in the European markets than that of any other country."

## Can Produce Colored Silk

But that is far from all. Doctor Osigian has a secret which he guards zealously, and that is the composition of various pigments which he feeds his silk worms, thereby causing them to produce silk of any desired color. This color, it is claimed, is absolutely fast—an achievement that may threaten the dye industry as applied to the treatment of woven silk.

The Osigian Silk Corporation, of which Doctor Osigian is president, has approximately twelve acres in New Orleans, bounded by Tchoupitoulas street, Nashville avenue, State street and Leake avenue. Past this plot of ground run the Illinois Central tracks. On this farm are approximately 80,000 mulberry trees and 100,000 silk worms. The farm has been in operation about two years and a half. The yield in that period has been estimated by Doctor Osigian as 500 pounds, which he ships raw to a silk manufacturer in Patterson, N. J. The raw silk can be manufactured into thread, hose, cloth and silk goods in general.

Doctor Osigian is proud not only of his achievement in turning out colored silk but also of his achievement in producing a food

*Doctor Osigian and His Trees*

tree for the worms superior to the ordinary run of mulberry trees. This tree, the result of an experiment in grafting, grows with great rapidity and is extremely prolific in leaves. The leaves are many times the size of mulberry leaves and much more succulent. When a leaf is pulled from the tree, a cluster of leaves springs up from the wound in a few days.

#### Likes New Orleans Climate

The climate of New Orleans is acclaimed by Doctor Osigian as being well suited for silk-worm cultivation. His super-worm weaves into its cocoon 1,800 yards of silk, while the foreign worms produce only 400 to 1,000 yards. Foreign countries produce but one crop of silk worms each year. The New Orleans farm produces eight. December and January are the only two months of the year in which the worms do not thrive.

Doctor Osigian himself is an unusual character. He is a native of Harpoot, Armenia, where his ancestors for more than seven hundred years were producers of silk. He is a graduate of the Pasteur Institute in France and of the University at Brusa, in Asia Minor. After losing his relatives and possessions through the activities of the Turks, Doctor Osigian found a haven in this country. Eventually he wandered to New

Orleans, where he succeeded in winning financial backing for his project.

The discovery of silk, as told by Doctor Osigian, is interesting. Its history dates back to Sie Lang Chi, queen of China centuries before the dawn of the Christian era. While walking in the palace gardens one day she found some cocoons of the silk worm, and conceived the idea of having them unwound so that the beautiful thread could be woven into a fabric. The result was so pleasing and the possibilities for the new industry so great that the ancient Chinese lady invested all her personal wealth in developing it.

#### Chinese Guarded the Secret

For thousands of years the Chinese carefully guarded the secret of silk manufacture. Visitors to the country were bewildered and completely charmed by the beauty and pleasing effect of the fabric. Curiosity prompted them to try to learn the process of its manufacture, but they were always unsuccessful. Spies were sent into the heart of China for the purpose of stealing the secret, but they consistently failed to return.

King Lavon of Armenia, about ten centuries ago, sent two ministers into China over the road through Persia. Their mission was to live among the Chinese, preaching,

*A General View of the Silk Farm*

and at the same time endeavor to learn the secret. It was a dangerous undertaking, for at that time the Chinese could exchange a pound of silk for a pound of gold.

The two Armenians were successful in their hazardous journey. By making hollow walking canes, they succeeded in escaping from the country with seeds of the mulberry tree and eggs of the silk worm. On their arrival in Armenia, they established the industry there, and made it successful. It has now spread to several countries where the climate is favorable for the growth of the mulberry tree.

#### How the Cocoon is Unwound

To obtain the valuable silk thread is an easy task. After the worm has eaten heartily for twenty-five days, it spins its cocoon. The worm is then killed by passing bisulphide of carbon through the walls of its silken house. The cocoons are placed in hot water, and stirred with a brush a short time. When the brush is removed, there are a few ends of the silken strands clinging to it. These ends are fastened to a revolving wheel. The cocoons are left free to bob up and down in the water while the thread is being drawn from them. When the silk has dried, it is ready for the weaver.

The eggs of the moth may be kept in cold storage almost indefinitely, it is said. To hatch them it is only necessary to expose them to the ordinary atmosphere of New Orleans. It requires from three to eight days for the worms to hatch out. And then they begin their twenty-five days of eating.

After the cocoons are spun, the lives of some of the moths are spared for breeding. The female will lay about 800 eggs.

"In 1655," according to a writer in the New Orleans *Times-Picayune*, "Edward Diggs brought some Armenians to Virginia and started the silk industry in America. From that time on to the opening of the Civil War the business was quite profitable, especially in the Southwest. In 1759 the state of Georgia exported silk to the value of \$75,000. In 1840 the United States produced \$250,000 worth of silk. Queen Caroline in 1735 wore a silken robe produced in Georgia. After the Civil War the silk industry languished, and was never revived because of the lack of people with expert knowledge of the business.

*The Silk Worm at Work*

Now comes Doctor Osigian, who says Louisiana and the adjacent southern states are the best adapted region for growing silk to be found anywhere in the world."

#### H. M. SIDLER WEDS

Miss Ebba Marie Johnson and Hobart McKinley Sidler were married Saturday evening, June 18, at 8 o'clock, at the residence of the bride's sister, Mrs. H. L. Fox, 4015 Addison street, Chicago. The Rev. Louis J. Vette officiated. The bride's attendants were Miss Ann Johnson as maid of honor and Miss Florence Helsenfinger as bridesmaid. Philip M. Sidler, brother of the groom was the best man. Mr. Sidler has been in the employ of the Illinois Central at Central Station, Chicago, for ten years, and was admitted to the bar in December, 1920. The gift of the law department was a copper percolator set and salad bowl.

#### HELD MEMORIAL SERVICE

One of the most successful memorial services in the history of Division 99, B. of L. E., was held at Water Valley, Miss., on Sunday, June 12. It has been a custom to rotate the services annually among the various denominations, and this year the gathering was held in the First Methodist Church. A program of considerable length was given, in which Judge J. G. McGowen delivered the address of welcome and the Rev. L. P. Wasson delivered the memorial address. The list of deceased members contained forty-three names.

# Co-operation Needed for Success of Fuel Conservation Campaign

*Each Employee Can Find a Way to Help, Trainmaster J. B. Hamilton Points Out; The Committees*

By J. B. HAMILTON

Trainmaster, Chicago Terminals

**T**HE thing of first importance in fuel conservation is securing the co-operation of every employe on the railway system whose work in any way concerns the handling of fuel. Our work is so interwoven, one department with another, that this practically means every employe, regardless of position. When we have the whole-hearted, unstinted co-operation of every employe, we shall have taken our first step. The second step is education, but when we have interest and the desire to co-operate, the task of education will be made comparatively easy.

The employes of the Illinois Central System, I believe, have demonstrated time after time their willingness to support any measure which means greater efficiency and economy in operation. Their loyalty to the welfare of the company is beyond dispute. I think we have only to present the message of conservation to them—to preach the gospel of saving fuel—and their response will be forthcoming. It was for this purpose that the fuel conservation organization was outlined, with one general committee and a local committee on each division, for through this organization the need for fuel saving and practical means for accomplishing it can be brought to the attention of every railway worker on the Illinois Central System.

## Coal a Big Item of Expense

The United States produced 676,000,000 tons of coal in 1920, and 26 per cent of it was consumed by the railroads. The coal used by the railroads cost \$763,158,000. On the locomotives of the Illinois Central System last year 5,000,000 tons of coal were consumed, at a cost of \$16,600,000. During the first five months of this year, 1,730,451 tons of coal costing \$5,928,948 were consumed on our locomotives.

*J. B. Hamilton*

These are staggering figures. Fuel is the most important natural resource with which the country is blessed, and it is being wasted, not alone on the railroads (for through conservation campaigns and constant watchfulness practices have been adopted which have curbed much waste) but by all consumers, the householder who burns six or eight tons in one season as well as the industry which consumes thousands of tons a day. However, the railroads consume 26 per cent of all the coal produced, and it is up to us not to parallel the savings which are made in other industries or by other consumers but to do our utmost.

I believe a point too often lost sight of

in pointing out to the average railway employe the need for coal conservation is the benefit which will accrue to him through economical practices. The wages of employes constitute by far the biggest item of operating expense in the conduct of the railroads of the country. Those wages must be paid out of the earnings of the property. There is no other source of railway revenue. Money to meet the payrolls does not fall out of the sky and is not taken from an inexhaustible mine. And, when coal bills on our own railway system mount into the millions of dollars, it must be self-evident that any saving in this great sum will make more money available for meeting the other expenses of operation, in which wages figure so prominently.

In other words, every dollar's worth of coal saved for the system is that much money put into a fund from which it can be drawn to pay good wages and to employ more men. When employes realize that—that it means more money in their pockets—I think they will be given an incentive which will make them enthusiastic conservationists.

### Must Apply to Each Employe

One point which should be impressed upon employes early in this conservation effort, we are making is that every employe can find a way to help, and that no one else is in as good a position to discover that way as the individual himself. The success we meet depends to a great extent upon the individual initiative of the employe, not in following printed instructions, but in using those instructions for a guide, applying them to himself and figuring out what he can do.

We can accomplish a lot by the elimination of carelessness and indifference, which are great makers of waste. By being careful in our daily work and by taking the cause of fuel conservation to heart, with a firm resolution of "I will," we can win.

Following are the committees which have been named to further the campaign for conservation of fuel:

#### GENERAL COMMITTEE

J. F. Porterfield, general superintendent of transportation, chairman; J. L. Marley, secre-

tary; R. W. Bell, general superintendent of motive power; A. F. Blaess, engineer, maintenance of way; W. A. Summerhays, purchasing agent; J. F. Darrt, auditor of disbursements, and J. W. Dodge, transportation inspector.

#### DIVISION COMMITTEES

**CHICAGO TERMINAL:** A. M. Umshler, terminal superintendent, chairman; A. Bernard, superintendent passenger service, vice-chairman; E. A. Axen, chief clerk to terminal superintendent, secretary; J. E. Carroll, station inspector; J. J. Casey, roundhouse foreman, Burnside; W. B. Davis, traveling engineer; J. J. Desmond, roadmaster; G. L. Dunbar, signal supervisor; A. Frantz, terminal freight agent; J. B. Hamilton, trainmaster; H. J. Iseman, switchman, Fordham; Otto Larson, fireman, Burnside; W. J. Leahy, superintendent freight service; Dan Mallon, engineer, Burnside; M. McCLOUD, track supervisor; V. U. Powell, master mechanic; R. Rogerson, traveling engineer.

**ILLINOIS DIVISION:** J. W. Hevron, superintendent, chairman; J. L. Downs, roadmaster, vice-chairman; J. T. Stanford, trainmaster, secretary; V. U. Powell, master mechanic; W. E. Rosenbaum, traveling engineer; E. R. Fitzgerald, road supervisor; H. W. Weatherford, train dispatcher; A. McIntyre, engineer; H. Conn, fireman; C. E. Schoenberg, conductor.

**ST. LOUIS DIVISION:** W. Atwill, superintendent, chairman; F. E. Hatch, trainmaster, vice-chairman; J. L. Butler, secretary to superintendent, secretary; L. A. Kuhns, master mechanic; J. H. McGulre, traveling engineer; J. W. Kern, roadmaster; T. A. Robertson, road supervisor; Pat Brennan, dispatcher; Lou Wolly, engineer; J. E. Beasley, engineer; Guy Tate, conductor.

**SPRINGFIELD DIVISION:** C. W. Shaw, superintendent, chairman; W. A. Goolze, trainmaster, vice-chairman; J. Stroatt, secretary to superintendent, secretary; H. L. Needham, master mechanic; J. McIntyre, traveling engineer; W. E. Russell, roadmaster; E. Wood, super-

## An Example

The Mississippi division is very much interested in fuel conservation. As an example of co-operation by trainmen and enginemen, Engine 844, manned by Engineman L. C. Hirsch and Fireman W. F. Hobson, employed on a work train driving piling, was furnished with tank of 15 tons of coal on the night of June 19. It worked 6 days—59 hours, 50 minutes—without any additional coal. The engine was tied up at an outside point where it was necessary to use some coal in firing up each morning. The total time between coalings was 144 hours. The number of pounds of coal consumed per hour was 208. Engineman F. R. Williamson has also been commended for economical use of coal while lying over at night and firing up engine in morning.

visor; H. S. Macon, train dispatcher; Frank Gallagher, engineer; Jeff Sweezey, fireman; V. E. Daniels, conductor.

**INDIANA DIVISION:** H. J. Roth, superintendent, chairman; G. H. Danver, traveling engineer, vice-chairman; Florence McShane, secretary to superintendent, secretary; J. A. Bell, master mechanic; G. M. O'Rourke, roadmaster; H. H. Cordier, road supervisor; P. G. Evans, train dispatcher; H. A. Nickerson, engineer; L. Armes, fireman; C. E. Thompson, conductor.

**WISCONSIN DIVISION:** J. F. Dignan, superintendent, chairman; W. J. Ormsley, master mechanic, vice-chairman; R. Barshinger, secretary; M. P. Flanagan, trainmaster; G. F. Rought, trainmaster; W. G. Geddý, traveling engineer; H. G. Bridenbaugh, traveling engineer; E. J. Boland, roadmaster; J. Pierce, road supervisor; A. C. Taylor, dispatcher; F. Hinton, engineer; T. Joice, fireman; T. R. Keilin, conductor.

**MINNESOTA DIVISION:** L. E. McCabe, superintendent, chairman; L. E. Strouse, trainmaster, vice-chairman; R. L. Guensler, secretary; H. Rhoads, roadmaster; N. Bell, master mechanic; G. W. Parker, track supervisor; W. L. Ickes, traveling engineer; E. P. Russell, chief train dispatcher; R. C. Walker, conductor; E. L. Birchard, fireman; W. G. Wise, engineer.

**IOWA DIVISION:** T. H. Sullivan, superintendent, chairman; S. B. Chapman, traveling engineer, vice-chairman; I. J. Bain, secretary; N. C. Mills, trainmaster; N. Bell, master mechanic; E. I. Rogers, roadmaster; H. Huffstutter, track supervisor; J. W. Seip, train dispatcher; A. G. Haines, engineer; J. E. Shouse, fireman; J. S. Pyle, conductor.

**KENTUCKY DIVISION:** T. E. Hill, superintendent, chairman; J. F. Walker, master mechanic, vice-chairman; A. Pritchard, secretary; J. B. Thomas, trainmaster; P. H. Ryan, traveling engineer; P. Glynn, roadmaster; A. Wilson, supervisor; J. W. Taylor, train dispatcher; L. D. Smith, engineer; J. W. Tichener, fireman; J. D. Arnult, conductor.

**TENNESSEE DIVISION:** C. R. Young, superintendent, chairman; L. Grimes, master mechanic, vice-chairman; W. C. Valentine, statistician-secretary, secretary; A. W. Ellington, trainmaster; J. W. Shepherd, traveling engineer; W. H. Cox, road supervisor; R. M. Alford, train dispatcher; C. Schmucl, engineer; W. P. Orr, fireman; E. H. Stockwell, conductor; S. J. Holt, roadmaster.

**MISSISSIPPI DIVISION:** A. D. Caulfield, superintendent, chairman; N. W. Spangler, trainmaster, vice-chairman; G. W. Hadaway, conductor, secretary; W. H. Petty, trainmaster; S. R. Mauldin, master mechanic; C. E. Sieber, traveling engineer; T. M. Pittman, roadmaster; Geo. H. Peacock, road supervisor; J. M. Colson, train dispatcher; W. R. Ruffin, engineer.

**LOUISIANA DIVISION:** T. J. Quigley, superintendent, chairman; H. C. Ruddle, master mechanic, vice-chairman; W. D. Dodds, stenographer, secretary; H. P. Campbell, trainmaster; G. D. Harrell, traveling engineer; C. M. Chumley, roadmaster; T. A. Winborn, road supervisor; C. E. Henley, train dispatcher; Geo. McIntyre, engineer; C. S. Railsback, conductor.

**NEW ORLEANS TERMINAL:** J. W. Cousins, superintendent, chairman; C. T. Beven, trainmaster, vice-chairman; J. N. Chapman, district foreman, secretary; J. D. Harrel, traveling engineer; J. E. Rogan, roadmaster; P. Mumford, engineer; R. J. Lacey, fireman; H. Moore, engine foreman.

**MEMPHIS TERMINAL:** E. Bodamer, terminal superintendent, chairman; B. J. Feeny, traveling engineer, vice-chairman; A. W. Giehler, assistant chief clerk, secretary; J. A. Za-

none, trainmaster; O. A. Garber, master mechanic; C. J. Harrington, roadmaster; C. S. Ward, road supervisor; H. O. Shellman, train dispatcher; T. S. Matlock, yard engineer; R. E. Stokes, Jr., yard fireman; R. P. Scruggs, yard conductor.

**MEMPHIS DIVISION:** J. M. Walsh, superintendent, chairman; O. A. Garber, master mechanic, vice-chairman; W. K. McKay, trainmaster, secretary; E. Von Bergen, traveling engineer; C. A. Maynor, roadmaster; J. W. Fowler, road supervisor; A. T. King, train dispatcher; A. J. Fichetto, engineer; J. L. Presley, fireman; T. M. Rabb, conductor.

**VICKSBURG DIVISION:** T. L. Dubbs, superintendent, chairman; H. I. Fletcher, traveling engineer, vice-chairman; I. F. Loyacono, trainmaster's clerk, secretary; J. M. Chandler, trainmaster; G. C. Christy, master mechanic; J. W. Welling, roadmaster; H. Maynor, supervisor; R. L. Page, train dispatcher; E. R. Jones, engineer; W. N. Gibson, fireman; F. A. Harmon, conductor.

**NEW ORLEANS DIVISION:** F. R. Mays, superintendent, chairman; G. C. Christy, master mechanic, vice-chairman; S. F. Lynch, secretary; F. H. Anderson, trainmaster; J. Cronin, traveling engineer; E. W. Brown, roadmaster; J. M. Harper, road supervisor; W. H. Shields, train dispatcher; J. D. Riggs, engineer; J. D. Coffey, fireman; R. A. Stafford, conductor.

## W. H. SHERMAN DIES

William H. Sherman of Pinckneyville, Ill., was born in 1855 and died June 1, 1921. He entered the service of the Illinois Central as bridgeman June 17, 1893, and was promoted

to assistant foreman in 1903 and to foreman of bridges on November 24, 1914. Aside from his time on the Illinois Central, he worked on railroads in Ohio and California and also on the Eads Bridge at St. Louis, Mo. "Uncle Bill," as he was familiarly known, had scores of friends not only on the St. Louis division but throughout the country. Through his kind words and jovial disposition, all

W. H. Sherman

who knew him will cherish his memory.

He was 66 years old at the time of his death, having been pensioned April 1, 1921, after twenty-eight years of service with an absolutely clear record. Interment was in the Pinckneyville cemetery.

# The Stained-Glass Window

By EARL DERR BIGGERS

A Short Story—Complete in This Issue

MISS PARKINS left her desk, piled high with small town exchanges, and stepping to the window of the Eagle office, stood gazing out on Main street. In the bright light of the August moon, Mapleton looked idyllic; its little brick business blocks exuded a warm glow, as if they were there to give, rather than to receive; its white stone courthouse was suddenly the abode of a kindly justice; its library harbored poets; the citizens who walked its streets were friends and brothers.

The August moon, however, did not deceive Miss Parkins. For thirty years she had translated Mapleton's daily life into news items for her paper, and it was too late now for her to see the town as idyllic. She knew that, like the people who made it up, Mapleton was a mixture of good and bad. Humanly it strove to be virtuous; humanly it often failed. She could forgive it, serve it, even love it whole-heartedly. But she could not be fooled by the August moon.

A few of those who passed in the street looked in at the plump, cheerful-eyed spinster in the window and smiled. "Advanced," Mapleton called her, and said it with a sneer. It mattered little to Mapleton that her vision was the broadest it knew, her sympathies the warmest—that she was, in truth, a great woman among little men. It was enough for Mapleton that, when her old father had died, she had herself assumed control of the Eagle, nor felt it necessary to call men to her aid save in subordinate positions. It was enough that; in her paper, appeared strange talk of a new and wonderful era dawning for women—an era at which Mapleton sniffed.

But Miss Parkins smiled her calm, restful smile, and helped the people of Maple-

ton even while they smiled. Many of those who passed by her office now had come to her at some time or other with stories she had no desire to print, and gone away warmed and comforted by her understanding. She was Mapleton's guide, philosopher, and friend, and though the town might deride her philosophy it accepted her guidance and, deep down in its civic heart, loved her as its friend.

Down the street, a market basket on his arm, his wife by his side, came John Willets. Two years before, the woman had sought out Miss Parkins, in tears, with the news that Willets had found the struggle in Mapleton unbearable, and had run away. In a dark corner at the station, where he was waiting for a train, Miss Parkins had discovered him, and sent him, shamefaced and repentant, back to his family. Out on the asphalt, the new automobile of young Jack Hemphill sped by. Once, in panic times, his business had hovered on the edge of ruin, and it had been Miss Parkins, with her own money and her own courage, who had set him back on the road to prosperity. Fannie Jaynes passed, a good-looking young man at her side. Only a year ago Fannie had tired of the factory, and had looked with willing eyes at the primrose path. It had been Miss Parkins, alone of all those in Mapleton, who had seen and understood; and it had been she who secured for Fannie another position, and drove the bitterness from the girl's soul.

So they came and went, those who had known this little spinster in the crises of their lives. And if Miss Parkins' great heart had done much for them, it had also done much for Miss Parkins herself, for it had kept her from getting angular and querulous and old as the years went by, and it had preserved for her the curves

and the bloom of youth. Her face was wrinkled, but they were the wrinkles of long years of smiling.

Through the plate-glass window she caught a faint echo of melody, and remembered that it was "band concert night." She opened the door; from the direction of the band-stand in the park the lilt of a new tune drifted in. It was the very latest thing in turkey-trots, but Miss Parkins did not know this. She only knew that she liked it for its cheerful swing. Tapping one foot on the floor, she began to hum the tune beneath her breath.

Then she started suddenly, and the giddy song died on her lips. For it seemed to her that crossing the street toward her came Mary Underhill, the friend of her youth long, long ago. Surely that was Mary Underhill's step, alive, eager; her face, fine, fun-loving; her golden hair, gleaming in the moonlight. The long years rolled away, and Miss Parkins was young again, waiting for her friend.

By the time the girl got to the door, however, Miss Parkins was back in the present, and it was Mary Underhill's daughter that she stepped forward to greet. She noted quickly that the girl's eyes were red with weeping, and that her hands moved hysterically despite the library books that weighted them down.

"Come in, Ina," Miss Parkins said, holding open the gate by the counter over which the "classified ads" were received. "I was hoping you'd drop in for a talk before you went away."

The girl turned, and fixed tragic eyes on Miss Parkins' face.

"I'm not going," she said bitterly.

"Not going?" Miss Parkins frowned. "Why. I thought it was all settled."

"That's what I thought. That's what mother thought, when she was—dying. But—he's gone back on his word to her."

Miss Parkins led the way to the rear of her office, lighted only by the green shaded lamp above her desk. The sound of their footsteps on the bare floor echoed through the deserted room. "She'll put down a velvet carpet, and pin tidies on the chairs," male Mapleton had sneered when Miss Parkins took her father's place at the head

of the Eagle. But male Mapleton was wrong, as it very quickly learned.

Miss Parkins pointed to a chair beside her desk.

"Sit down, dear," she said.

The girl flung herself down.

"He told me today," she continued, that same incongruous bitterness in her voice. "He said he'd been to too much expense—and that, anyhow, my place was here at home."

"As his servant," said Miss Parkins, with a sigh.

"In mother's place," he said."

"That means as a servant," remarked Miss Parkins, more to herself than to the girl.

"I never cared so much about going away to college—while she lived," the girl continued. "But her whole heart seemed set on it—I never could understand just why."

"I could," said Miss Parkins, beneath her breath.

"She fairly fought to get father to promise." The girl's eyes widened with the wonder of it. "It was the only time I ever knew her to oppose him."

"Poor Mary," Miss Parkins whispered.

"Yes—I didn't care so much about it—then. But now that she's gone"—the girl's voice broke—"I want to go. It was her great wish. I want to go. And he says—I can't."

Hot anger in her heart for once, Miss

*She threw her arms down on the desk and her head upon them. Her slim shoulders shook.*

Parkins walked the floor of her office. She thought of Henry Bradford, with his hoarded thousands, his oily sanctity, and her fingers itched to shake the meanness from him.

"Did you remind your father of his promise to her?" she asked.

"Yes. And he said he couldn't understand her strange notion—that she must have been a little flighty in her sickness—that he'd promised just to make it easier for her at the end."

"Flighty!" Miss Parkins' tone was hot with scorn. She thought of her last interview with Mary Bradford, of how the defeated, crushed little woman had cried to her: "He sha'n't make a slave of my girl, too. He sha'n't, Ann, he sha'n't!" Poor Mary. It had been her one fight, and, now that she was where she could wage it no longer, the day seemed lost.

"I had to tell someone." The girl was sobbing now. "And I thought mother would have wanted me to tell you."

She threw her arms down on the desk, and her head upon them. Her slim shoulders shook. "Mother!" she moaned. "Oh, mother, mother!" The capable, business-like little woman who edited the Eagle stood at her side looking down at her; and suddenly across that usually business-like, capable face, a shadow passed. It was a shadow of the expression seen on the faces of those women who dream for their sisters, and grow impatient that the day they dream of is so long in coming.

Reaching down, Miss Parkins patted one heavy shoulder.

"That was right—to tell me, dear," she said.

The girl raised her head. The agony of her sobs died out. Something she seemed to see in Miss Parkins' face soothed her.

"What are you going to do?" she asked.

This blind faith touched Miss Parkins, even while it dismayed her. What could she do, indeed? Her heart ached for the daughter of her old friend, but what part could she, an outsider, play in the struggle her friend had forever laid down?

"Oh, Ina dear," she said. "I don't know what I can do!"

She walked away from the girl, toward the corner where the two linotype machines, of which she was so proud, loomed grim

and shadowy in the half-light. Strangely enough, it was not of Mary Bradford or her daughter that Miss Parkins was thinking now, but of a handsome, keen-eyed boy. Perhaps it was the moon that brought him back tonight, for it had shone that other August as it shown now. They had stood together beneath the trees in her father's yard, she and this boy, and his arms were about her, while on her lips she was receiving the only kiss man had ever vouchsafed her. A sharp pain burned its way through her heart. She went back to Ina's side.

"Poor little girl," she said. "What can I do?"

Up in the front of the office, in the semi-darkness, a door banged and a shadowy figure appeared. Miss Parkins moved quickly to greet her visitor. In the light that came in from the street, she recognized Henry Bradford, the hard lines about his mouth twisted into a conciliatory smile, his sly, little eyes alert to greet her. As he took off his hat, his baldness accentuated the shining pallor of his face. It had held that pallor, of late years, as though he had gazed into his own soul, and what he saw there had turned him white.

"Good evening, Ann," he said briskly. "I stopped with a little item of news for you."

"You're out late," she suggested.

"Mid-week prayer-meeting," he responded. "We got to discussing the new church and didn't notice the time. I don't see you at prayer-meeting as often as I used to, Ann."

"My business keeps me here," she told him.

He laid his carefully rolled umbrella on the counter. It was his habit to carry it in all weathers, for he had come to slyly suspect rain even when sun or moon shone brightest.

"There is no business more important than that of the Lord," he said piously. "May I come in?"

Miss Parkins held the gate open and, entering, he became aware for the first time of his daughter's presence.

"Ina," he cried in surprise.

"I was on my way home from the library," she explained, "and saw Miss Parkins' light."

"Well, you'd better run along now," he

said. "I've a little business with Miss Parkins. I reckon I'll catch up with you on the avenue."

The girl seemed relieved as she brushed by him. In another moment the front door closed behind her.

"Sit down, Henry," invited Miss Parkins. He sat.

"I suppose—she's told you," he inquired.

"Told me what?" asked Miss Parkins, though she knew.

"That—things aren't just right for me to see my way clear to sending her off to college this fall. I know people think me a rich man, Ann, but to tell the truth—I haven't much ready money. Collections are slow, and at the bank—"

"Is this your news item, Henry?" asked Miss Parkins.

He tried to smile affably.

"No," he said. "My news item is quite another matter." His white face assumed its usual, doleful look. "Ann, Mary's been dead four months now. And I miss her, Ann. I miss her terribly. When I think of her long years of devotion, of sacrifice—"

He took out his handkerchief and dabbed at his little eyes. Miss Parkins gazed at him, as near to a cynical smile as her kind face could go.

"You're not at prayer-meeting now, Henry," she said. "Don't trouble to weep for me."

He stared at her with the hurt look of an innocent child.

"I know we're not friends, Ann, as we used to be. For some strange reason, you have turned against me. But—whether you believe it or not, Mary is constantly in my thoughts. I have been trying to evolve some plan for paying a public tribute to her—to my dear wife. And it has come to me—the plan has come."

He restored his handkerchief to his pocket.

"Even Ina doesn't know of this yet," he went on. "I shall tell her tonight. Ann, I have made up my mind to donate to the new church building a large, stained-glass window—as a memorial to Mary. The agent was here from Chicago today. I talked with him at the bank. The window will cost me—" he gazed at her as though begging her to be prepared—"twelve hundred dollars."

"Twelve hundred dollars," repeated Miss Parkins, a strange light in her eyes.

"I announced my gift at prayer-meeting tonight. The window will be placed in the front of the building. It will remain there through the years, my tribute to Mary. It will remain there—where all the town can see."

"All the town," Miss Parkins said. That was the most important consideration with Henry Bradford, and she knew it. He drew a great roll of paper from his pocket, leaned over, and spread it out on her desk.

"Here is the Chicago firm's drawing," he said. "You can see the design of the window from this. I don't know whether you can reproduce it in the paper or not. At any rate, it will help you to write the item."

Miss Parkins looked down at the beautifully colored design for her old friend's window. Its great central figure was that of a woman, seated on a dais, her wonderful face smiling and content—the face of a woman set free. About her floated happy cherubim, and on the scroll at her feet Miss Parkins read: "In Memoriam, Mary Underhill Bradford—" Her eyes stole back to that beautiful face—

"Symbolic," Henry Bradford was explaining in his oily voice, "of the peace one may find only in the Lord's house."

Miss Parkins' vision blurred. Then out of the blur emerged the face of another woman—a face that was not smiling, not content—the face of a woman who had only recently been set free.

Mr. Bradford leaned back in his chair, hugely pleased with himself:

"I wish you'd make an item of it, Ann," he said. "You were Mary's best friend, and I'm sure she'd want you to write about her window."

"Yes, perhaps she would," Miss Parkins agreed. Her eyes were fixed again on that symbolic figure; an odd, unhappy smile twisted her lips.

"Well, Ann?" he urged.

She rose suddenly from her desk.

"I'll write it before you go," she said. And, turning on the light above a typewriter, she sat down before it. In a moment the clatter of the machine resounded in the quiet office. Once she looked up.

"I'll mention the price, of course?" she said.

"Of course," he assented.

Finally she whirled the sheet of paper from her typewriter, and read:

"Henry Bradford announces that he will donate to the new church, shortly to be erected on Center street, a large stained-glass window, as a memorial to his beloved wife, Mary Underhill Bradford, recently deceased. The window is to be the work of a Chicago firm. The chief figure of the proposed design is a huge figure, a woman, seated on a dais, on her face the smiling realization of the peace of soul that is to be found only in a house of worship. It is reported that the window will cost not less than twelve hundred dollars."

Mr. Bradford stood up, a pleased smile on his face.

"Well, that's about right, Ann," he said. "I'm very much obliged to you. I'll be going along now."

"Sit down, Henry," said Miss Parkins, suddenly, firmly.

He stared at her, amazed.

"Sit down a little longer. That will do for a news item, but there's something else I want to write. Something for the editorial column. Sit down and wait, Henry!" Her tone was commanding, forceful.

He obeyed, against his own better judgment.

Miss Parkins drew close to her typewriter, and over it stared at Henry Bradford. He stirred restlessly beneath her stare. He did not know that she was looking through him—beyond—into the dead past. For ten minutes she sat like this, and then the noise of her quick fingers on the keys began.

Fifteen minutes passed. Henry Bradford got up and nervously paced the floor. He wandered through the Eagle's small composing room, the odor of ink in his nostrils. The office cat leaped out into the circle of light, but when he stooped to pat it, it scurried away.

"It's getting late, Ann," he complained, at last.

"You wait, Henry," she replied in the voice of one who must not be disturbed.

Twenty minutes later, she rose from the machine and turned toward her desk. Her firm gaze caught Henry Bradford's unsteady one, and held it fascinated.

"A little editorial, Henry," she announced. "I think I shall call it 'A Stained-Glass Window.' I should like to read it to you, if you don't mind."

"Y-yes," he stammered. This thing was getting on his nerves. He glanced timidly out at Main street, the band concert was long since over, the pavements were almost deserted now. He dropped into a chair, and fixed his eyes on a calendar on the wall. "Go on, Ann," he said.

Miss Parkins smiled her twisted little smile, and began:

"Over thirty years ago, the writer of this editorial had a friend, a happy girl whose heart beat fast and whose eyes shone bright with the very joy of living. For live she did—every moment of every day to the full—and she looked forward to the future with eager expectancy.

"And then—she married the man she loved, a man thought fine and noble, to be his companion and his partner. Her face alight with pride and happiness, she followed him off to the home he had waiting for her—a great farmhouse back in the hills. And there suddenly, tragically, she learned that she was to be not his partner, but his unpaid servant. He worked her to the last ounce of her strength; he drove her as effectually as if he had stood over her with a whip.

"Few who have ever lived on a farm realize the drab, terrible monotony of labor that many women on farms endure. Some die; some go mad. This little bride of whom we write did neither. She became a machine. She went to bed at eight o'clock each night, weary of body and soul. She rose at four each morning still weary. She cooked, she swept, she baked, she milked, and churned. She never entered her parlor except to clean it. All the pretty little things of life for which she longed were denied her. All the companionship of books and friends that had formerly been hers was shut off from her now. She was married!

"'Woman's place is in the home.' The tragic meaning of that sentiment to her! In the home, not as wife and companion, but as a prisoner, with the curtains down, the doors barred, and all the joyousness of life passing by on the other side! And all

this that her husband might pile dollar on dollar that, in greed and selfishness, he might grow rich!

"Those who had known and loved her saw the light driven from her eyes and the spirit from her soul. Toward the close of her life the family moved from the farm into a great city house that her savings had paid for. She might have broken her bonds then; but it was too late. She wandered about through the rooms of that house, a dazed look on her face, a broom and dustpan in her hands. She had forgotten how **to live!**

"Not long ago a little, crushed, beaten, humble, forgiving woman was buried out on the hill. It was all that was left of the girl we knew thirty years ago.

"'But surely,' you say, 'the woman is to have her reward. Surely, all those years of faithful sacrifice are not to pass without some acknowledgment!' And you are right. To repay her for all those humdrum, penned-up years when she might have been enjoying the world she lived in as she

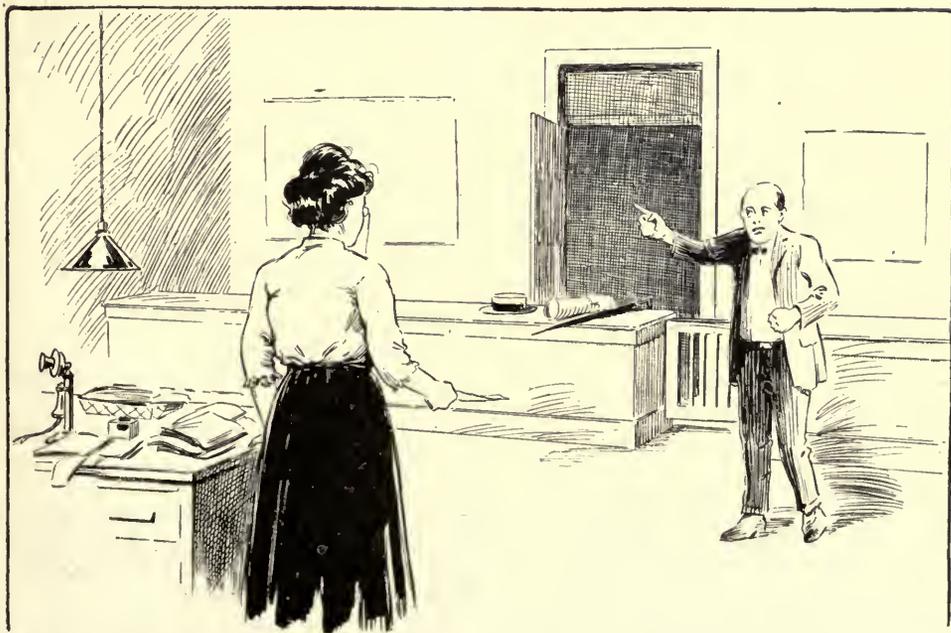

enjoyed it when a girl, she is to have—a stained-glass window in a Mapleton church.

"That is the tribute of a loving husband to the wife he enslaved. That is the proof that she did not live—and die—in vain. A stained-glass window, bought with the money she gave her life to hoard!

"The chief figure in the design of this window is to be that of a woman, sitting on a dais—resting—free—on her face a reflection of the peace that is to be found—we understand—in the Lord's house. The friends of the dead woman will see the irony of this, only when they recall that never once did she sit in church on Sunday morning when her mind was not busy with the dinner she must hasten home to cook, that her man might eat when he had finished worshipping his Maker.

"Sometimes God must look down and smile a sad little smile at a few of the things that are done in his name."

Miss Parkins finished reading, her eyes flashing, her cheeks aflame. What she had written was written from the heart. She

"Print it," he screamed, his little eyes aflame with anger. "Print it; and I'll sue you for libel! I'll close out your cheap, little sheet!"

looked over at Henry Bradford. His face was ashen now, he wet his thin lips with his tongue.

"So that's what you think of me, is it?" he managed at last to say.

"That's exactly what I think, Henry," she replied. "And it seems to me it's time that the town saw you as you really are. You make a great clatter over your religion. You rush around on God's business as wildly as though it were a promissory note that was due you. And you fool many. But you never fooled Mary Underhill, and you never fooled her friends."

"Well?" He stood up. "Are you through with me, Ann?"

"I'll be through with you, Henry when I've printed that editorial in tomorrow's paper."

He started from her, and an odd, dull flush spread over his pale cheeks.

"Good Heavens, Ann! You wouldn't dare!"

"Wouldn't I? Don't you know me any better than that?"

He did know her better than that, and he mopped the perspiration from his sleek, endless forehead.

"It's what I'd expect from you," he cried, "with your fool notions about woman's rights, and all that crank talk in your paper every night!"

Miss Parkins smiled pleasantly.

"Then I haven't disappointed you," she said.

He took a step forward.

"Print it," he screamed, his little eyes aflame with anger. "Print it! And I'll sue you for libel! I'll close out your cheap, little sheet!"

"Maybe," replied Miss Parkins calmly, "but would that put you back in the good graces of the town?"

He sat down and weakly stared at the woman's fine, brave face. In his heart he knew that it was not to his credit that such a woman as this was not on his side.

"Why do you dislike me so, Ann?" he asked, and it was almost a whine.

"Why shouldn't I dislike you?" she inquired, her face very serious now. "You crushed the life out of Mary. That in itself is enough—for I loved her, always. But—there are other reasons." She turned

her face away. "Mary wasn't the only one who believed in you," she added, more gently.

"What do you mean?" he asked.

"Don't you remember, Henry?"

He only stared at her dumbly.

"I see you don't," she went on. "But I do. It was a night in August, Henry—a night like this. You put your arms around me—you kissed me—there under the trees."

He shuddered.

"Why bring that back now?"

"Because I want you to understand. No man had ever kissed me before. No man has kissed me since. I believed in you then—I thought you were wonderful—I—I guess I must have been in love. And then—when Mary came to me and told me that you and she were to be married—I tried to be brave. I told myself it was for the best. I wished her every happiness. I even helped her pick—her wedding dress. She never dreamed."

"No," he said, "she never dreamed."

"I told myself that I must rejoice in her happiness. And I really believe I did. I had the memory of that kiss, that moment under the trees. If you had been what I thought you it would have been a happy memory. But you weren't. The years passed, and the rottenness and meanness that were in you began to show. And I realized that I had been cheated, that you weren't what I thought you, after all. I got to be ashamed of that kiss, horribly ashamed." She turned on him fiercely, accusingly.

"It wasn't only Mary you robbed. You robbed me, too! You robbed me of the only moment of romance I ever had!"

He shrank from her for he had never seen this mild, little woman in such a mood before.

"And in revenge," he cried, "you'll print that editorial?"

She shook her head.

"No. I can't expect you to understand. But it won't be for revenge if I print it. I say if I print it. For I don't believe you're going to let me, after all."

"And how can I stop you?"

"Easily enough. By keeping your last promise to Mary. By sending Ina away to college!"

His little eyes became crafty.

"I won't," he snarled. "Money's tight, I've got too much expense—"

"The stained-glass window, I suppose," she cried.

"Yes—the stained-glass window, for one thing."

Miss Parkins laughed, a wild, mirthless laugh.

"So it's Mary's window, is it," she cried, "that's to keep her daughter at home?"

"At home, where she belongs," he said.

"And you'll break your word to Mary?"

"I'll not send Ina to college, if that's what you mean." He rose to his feet, sullen, bitter. "I'm not going to be blackmailed by you, Ann Parkins. Print that editorial, if you choose—I'll make you pay, and pay dearly."

Calmly Miss Parkins walked over to the nearest linotype machine, and thrust the editorial and the news item on the hook beside it.

"All right, Henry," she said. "It'll be there for John to set up in the morning. I guess that's all. Good night."

He moved slowly to the door, his feet dragging after him. Miss Parkins followed. A party of young people passed in the street, singing in the moonlight. Up above, the courthouse clock boomed ten.

"Where all the town can see," Miss Parkins said. "So that's where Mary's window is to be put up, is it? Well, that's where my editorial will be, too—where all the town can see!"

Out of Henry Bradford's throat came a strange, broken cry. He turned on her, trembling, dazed, beaten.

"Go get it, Ann," he begged. "I—I never could stand it—never. Tear it up—I'll do what you wish!"

Miss Parkins' heart gave a bound. She stepped to the linotype again, then, coming back to the front of the office, swung open the door of a great safe.

"I won't tear it up, Henry," she said. "I'll put it here. No one shall see it but me—unless something should happen—money should be tight—"

He shook his head, and reached out for his ridiculous umbrella.

"Nothing will happen," he replied quite gently. "Ina shall be sent to college, as Mary planned." He turned to the door.

"I'll be going along," he added. "Ina will wonder where I am."

The door closed behind him, and for a moment Miss Parkins stood looking out at the silent street, and the old man plodding up it in the moonlight. Then she stepped back to her safe, and taking out the editorial tore it into shreds.

"I never intended to use it, Mary," she whispered, as though explaining to someone at her elbow. "But it has won your fight, my dear. It has won your fight."

## Keep Scappin'

When you're sick as the deuce, and  
you think, "What's the use?"  
And you're tired out, discouraged,  
afraid;

And you keep asking why they don't  
let you die

And forget the mistakes you have  
made;

When you're chuck full of pain and  
you're tired of the game,

And you want to get out of it all—  
That's the time to begin to stick out  
your chin

And fight with your back to the  
wall!

When you have done all you can to  
scrap like a man,

But you can't keep your head up  
much more;

And the end of the bout leaves you  
all down and out,

Bleeding and reeling and sore;  
When you have prayed all along for  
the sound of the gong

To ring for the fight to stop—  
Just keep on your feet and smile at  
defeat,

That's the real way to come out on  
top.

When you're tired of hard knocks  
and you're right on the rocks,

And nobody lends you a hand;  
When none of your schemes, the best  
of your dreams

Turn out the way you had planned;  
And you've lost all your grit, and  
you're ready to quit

For life's a failure for you.  
Why, start it again and see if all  
men

Don't call you a MAN through an  
through.

—ESTY QUINN, in *Waverly* (Iowa)  
*Democrat*.

## NEWS of the DIVISIONS

### Just a Word

Our best items are those which tell of really important happenings—those which have first names or initials to identify the persons named—those which have pictures with them, if possible—those which will be of as much interest to the folks at the other end of the system as to the folks in the office—and, last but not least, those which get in by the 25th of the month.

#### AROUND CHICAGO Superintendent's Office

J. C. Porter, assistant engineer of the Chicago Terminal division, for more than ten years an employe of the Illinois Central, died on Friday, June 3, at the Illinois Central Hospital, Chicago. Burial was at his old home at Virginia, Ill. C. D. Hurley of the valuation department succeeds Mr. Porter as assistant engineer.

About sixty persons, including members of the Chicago Terminal office and their friends, held a picnic Sunday, June 11, at Hudson Lake, Ind. Fishing and ball playing were the chief amusements. The married men defeated the bachelors in a picnic ball game by a score of 6 to 5.

R. O. Wells, agent at South Water street, and A. Frantz, terminal freight agent, have taken their two weeks of vacation at Ludington, Mich.

#### Passenger Terminal

Superintendent A. Bernard and Traveling Engineer W. B. Davis attended the Smoke Association convention at St. Louis May 31 to June 3.

W. W. O'Keefe, switchman at Randolph street, and Mrs. Hulda Nelson, suburban ticket agent, were married on June 16.

The suburban trainmen's baseball team is meeting all comers. The first game, played at Jackson Park with the towermen, was lost, score 17 to 8. The second game, played at Jackson Park with the mail handlers, was won, score 21 to 2. The third game, played at Washington Park with the Twelfth street office men, was won, score 9 to 5.

The O. R. C. degree team visted St. Joseph, Mo., June 18.

Conductor A. B. Springer has returned to suburban service, effective June 26. He has been in through passenger service for some time.

#### Auditor of Freight Receipts

The A. F. R. baseball team recently defeated the team belonging to the Valuation Engineers by a score of 6 to 2. Games have been scheduled with Princeton, Ky., and Champaign and Effingham, Ill.

Mr. and Mrs. W. J. Lamon are spending their vacation at Wichita Falls, Texas.

A. W. Larsen is spending his vacation at the home of his mother in Denver, Colo., and at Estes Park, Colo.

#### South Water Street Station

Miss Della Dolan, formerly employed in the cashier's department, was married to William Hoffman of Buffalo, N. Y., on June 14, at St. Lawrence's Church, Chicago. Following the ceremony, a wedding breakfast was served to relatives and close friends at the Sisson Hotel. The couple will live in Buffalo.

Sympathy is extended to Miss Anna Ronan of the accounting department, who recently lost her mother. Mrs. Ronan died suddenly on the morning of June 13.

#### Baggage and Mail Traffic Department

The employes of this department held an enjoyable picnic at the Thornton Forest Preserve, near Chicago, on Saturday, June 25. The coffee was left in the office and the fruit on the train, but outside of that the lunch was a success. Games added to the enjoyment of the outing.

Miss Mae J. Nolan left for the East recently. She will spend her vacation at Niagara Falls, Rochester and Watertown, N. Y. Her mother accompanied her.

#### Dining Car Department

Chief Clerk T. S. Robinson was married on June 20 at Rockford, Ill., to Miss Valera Mae McDermid. The happy couple spent their honeymoon of twelve days in the vicinity of Washington, D. C., and also visited Baltimore and Cincinnati.

Martin A. Carroll has returned from Montreal, Canada, after a pleasant vacation of two weeks.

#### ILLINOIS DIVISION Superintendent's Office

Timekeeper G. H. Strauss and family have returned from a vacation at Kankakee and Monee Lake.

Mrs. E. F. Kremer, wife of chief accountant, son Robert and daughter Marie are spending three months at Cedar Rapids, Dyersville, Dubuque and other Iowa points.

Accountant F. L. Hutchins is now enjoying a

fishing trip among the lakes of Minnesota.

Miss Katherine Kelligher, stenographer to Trainmaster J. T. Stanford, has returned to her duties after having her tonsils removed.

Miss Fairy Wand, assistant tonnage clerk, has been granted a three months' leave of absence. Miss Wand will be relieved by Miss Gertrude Greenwood of Kankakee.

Assistant Tonnage Clerk Sidney Watson has returned to work after a four months' leave of absence on account of sickness.

President C. H. Markham visited Champaign Friday, June 1, arriving on No. 5. Mr. Markham visited the division offices and then gave a brief talk before the state convention of county farm advisers at the university, speaking on the relation between transportation and agriculture. Mr. Markham was a guest at a luncheon given at the Inman Hotel, enjoyed a tour of the University farm and stock barns in the afternoon, and then was taken to the Country Club for a round of golf. He departed on No. 2.

A baseball team has been organized in the Illinois division offices, consisting mostly of clerks. Manager J. C. Johnson, assistant chief clerk in the superintendent's office, would be glad to hear from any team wishing to arrange for a game.

A division fuel meeting was held in Trainmaster Stanford's office Monday, June 13.

While we do not wish to brag, nevertheless we want it to be known that the wrecking derrick located at Champaign has not been out on Champaign district this year. Trainmaster Davis says, if we can keep the wrecker off the district for another six months, "we will be able to sell it cheap."

Illinois division employees were shocked to learn of the serious accident which resulted in the death of Guy DeMoss, third trick operator and leverman at Otto. Mr. DeMoss was to have been married to Miss Mildred Parker, stenographer for the New York Central, Monday, June 20. While enroute to Kankakee to have his wedding suit fitted, he attempted to board Extra 175 north, and his foot slipped. The flesh was torn off his left leg from ankle to thigh, and he also had a scalp wound. Mr. DeMoss was taken to the Emergency Hospital, Kankakee, and died at 2 a. m. June 16.

Del Egan, station helper at Kinmundy, age 53, died June 12 of a complication of diseases. Mr. Egan left surviving his wife and one son, Harry, who is a pumper at Galton.

#### Kankakee Freight

Our freight checker, Colonel Coash, and Miss Helen Roth were married May 23 and are spending their honeymoon in New Orleans.

Effective June 25, the freight house forces started on their annual vacation. William Supernant, rate clerk, was the first one to leave June 25. Mr. Supernant went to the east to see the Dempsey-Carpentier fight.

#### Champaign Freight

Miss Kathryn Bridges has returned from a week's vacation in Chicago.

The Girls' Sewing Club met Thursday evening, June 2, with Miss Helen Sullivan.

#### Effingham Freight

Orville Hewkin, first trick yard clerk, and Miss Beulah Kistler, a teacher, were quietly married June 11 at the Methodist parsonage and left immediately for Chicago and other points on a week's honeymoon.

## Ball Bearing Motors

B. J. Utz, cashier, recently returned from Denver and Colorado Springs, where he visited his brother John, former warehouseman, who is in Colorado for his health.

J. R. Billingsly, second trick operator, returned to work June 15 after being off duty three weeks on account of sickness. He was relieved by R. R. McCarthy of Farmer City.

E. Floyd Karr, cashier at Paxton, Ill., was married to Miss Edith Sederlund of Charlotte, Mich., June 7, at the home of the bride. Immediately after the ceremony, the bride and groom left for an extended trip through Kansas and Nebraska.

Lawrence W. Russell of Savoy and Miss Ruby Graham of Mattoon were married at Allerton, Ill., Saturday, June 4. Mr. Russell is agent at Savoy. They departed on the noon train from Pesotum to Chicago, and from there went to New York City and other eastern points on a wedding trip.

#### Maintenance of Way Department

Supervisor of Signals S. C. Hoffman has moved one of the signal gangs to Paxton to install a "wig-wag" crossing at Orleans street.

C. A. Pease, formerly employed in Road Supervisor G. W. Shrider's office, but who has been attending school at Carlinville, has returned to the division and is now working in one of the signal repair gangs.

Roadmaster J. L. Downs spent the week ending June 10 in New York City, attending the A. R. E. A. meeting.

The signal employees' educational meeting was held at Effingham on June 19, with an attendance of forty, including three Pennsylvania railroad signal employees.

#### Kankakee Yard and Roundhouse.

William Mitchell, car repairer, has returned to work after being off two weeks on account of sickness.

E. E. Shapland, fireman, recently was called to Portland, Me., by the death of his wife's sister.

Paul O. LaGessee, car clerk, and Miss Mary Yeates of Kankakee were married June 21. They will spend their honeymoon in Chicago and make their future home in Bradley.

Brakeman Mike Deany, H. Behen, Fireman Leo Deany and Switchman C. Deany have joined the local ball team of the K. C., which made a good showing June 18 by beating the Public Service team by a score of 11 to 8.

G. N. Thompson, engine foreman, has returned to work after being off several months on account of sickness.

Robert Weaver, supplyman, was called to Simpson, Ill., recently by the serious illness of his mother.

Day Yardmaster Damon spent June 14 and 15 in Champaign, taking observations of switching.

Switchman McClarey is off duty on account of an injury to his knee.

Switchman M. T. Croach returned to work June 18.

Brakeman W. J. Rapstock was called to Ohio recently by the death of his father, who was 91 years old.

The bridgemen are finishing the subway at the north end of the yard, leading to Kroehler's plant.

Fireman A. J. Brinkman and family have re-

turned from Pueblo, Colo. They were caught in the great flood and had an exciting time.

## ILLINOIS CENTRAL RAILROAD UNION BAND & ORCHESTRA

*The only R. R. Band and Orchestra in Cook County. Music Furnished for All Occasions*

**Champaign Yard and Roundhouse**

Champaign shop had the pleasure of having the Burnside shop baseball team at Champaign on June 12, Champaign being victorious by a score of 5 to 0. Approximately 350 persons came to Champaign to attend the game.

Miss Margaret Cain, stenographer to General Foreman W. H. Donley, has returned from a week's vacation, spent with friends in Chicago.

Yardmaster Damon of Kankakee, who visited Champaign yard recently, complimented us on the fine appearance of the grounds surrounding the office. Chief Gardener H. S. Moulder has made a great improvement at the yard office by extensive landscape gardening.

Assistant Yardmaster Manifee is spending his vacation in Denver, Colo. Clint Granger is filling the vacancy.

Caller Ray Henderson was seriously injured May 28. While riding his bicycle he was run into by an automobile. At Burnham Hospital, Company Surgeon Kirby found his left leg broken, several ribs fractured and a severe scalp wound.

Conductor E. E. Jolly has recently returned from the hospital and resumed his duties.

Champaign employes are sorry to hear of the death of Mrs. J. G. Saathoff, wife of Car Foreman Saathoff. Mrs. Saathoff died Tuesday, June 14, after a brief illness, leaving her husband and six children, the youngest one week old.

The Clinton shop baseball team was defeated by the Champaign shop team at Champaign June 5 by a score of 13 to 8.

Thomas Inskip, engineer, has resumed his duties after being on leave of absence for the past year, during which he acted as manager of the Co-operative Society Grocery Store.

**SPRINGFIELD DIVISION**

**Superintendent's Office, Clinton**

The property at one time operated as a farm, immediately north of Clinton, has the appearance of a Chautauqua ground, a number of tents having been installed for the care of stock and employes of the grading outfit engaged in building new yards at Clinton. The work is progressing rapidly, and within the next ten days a considerable additional force will be added for the laying of tracks.

A recent visit by President Markham to one of the important stations on the Springfield division, the congenial manner in which he was met by citizens of that city, and the many complimentary remarks made by citizens with whom he came in contact seem to prove conclusively that such visits are worth while.

General Superintendent Patterson made a trip over the Springfield district Wednesday, June 22. He also visited a few hours in Clinton Thursday morning, June 23, inspecting the new yards.

B. W. Tillbury, second trick operator, Clinton yard office, started on his annual vacation June 15. He expects to spend about three weeks visiting friends and relatives in California.

Ticket Agent L. G. Schien submitted to an operation in the Illinois Central hospital at Chicago June 22 for the removal of a tumor on the arm.

H. L. Oates, agent at Shobonier, has been off duty for the past two weeks on account of illness.

J. B. Nowland, agent at Sandoval, is on an

extended leave of absence, visiting the Grand Canyon, Los Angeles and other points in the West.

W. A. Yoder, agent at Litchfield, left June 15 for extended trip through Colorado for the benefit of his health.

A. L. Vallow, dispatcher at Clinton, is taking his annual vacation, visiting friends in Kansas City and other points in the West.

E. R. Evey, refrigeration clerk, who has been seriously ill, has returned to work.

Employees of the Illinois Central Railroad Company, 103 of them—all working on the Springfield division—assembled in Clinton Sunday, June 19, and organized an association to be known as the "Veteran Employees' Association of the Springfield Division of the Illinois Central," according to the Clinton (Ill.) Morning Journal. Employees of the company with seniority of fifteen years or more are eligible to membership.

The organization was formed for the purpose of promoting harmony and good will and social intercourse between fellow employees. Employees of the Rantoul district who were eligible to membership in the organization came to Clinton on a special train under the supervision of M. Sheahan. Interesting talks were made by a few employees prior to organization.

An organization was perfected, and by-laws were drawn up by the executive committee. The organization promises to be one of the most beneficial in the history of the local division of the railroad. Annual social events for members

and their families are being planned.

Officers elected to have charge of the association for the first year follow: President, C. W. Shaw, Clinton; first vice-president, William Brewer, Clinton; second vice-president, M. Sheahan, Rantoul; secretary, Clarence May, Clinton; treasurer, Roy Warrick, Clinton; executive committee, John Burke, fireman, Springfield; G. W. Rollins, agent, Moweaqua; J. E. Phelps, conductor, Rantoul; Joseph Frey, section foreman, Alhambra; Arthur Clause, conductor, Springfield; John Stokes, boiler foreman, Clinton, and Ralph Clemons, yardmaster, Clinton.

**Decatur Station**

Numerous comments have been heard regarding President Markham's visit and talk in Decatur May 31. All comments, to date, have made us, as employees, feel proud to be his business associates.

Only a few of us can remember so far back as June 7, 1881, yet on that date Agent Morgan began working for the Illinois Central Railroad. Forty years of continuous service is a record to be proud of.

A "No Exception" meeting was held in the freight office Tuesday, June 14. Supervisory Agent Plate, Agent Donaldson, Clinton; Agent Baldwin, Springfield; Trainmaster Walker, Clinton, and Agent Simcox, Pana, were out-of-town attendants.

Miss Mary Cecil, bill clerk, has returned to work after several weeks of enforced vacation on account of a broken arm.

# Stifel's Indigo Cloth

Standard for over 75 years

## Did you grow up in Stifel Indigo OVERALLS?

Many are the railroad men who regard Stifel Indigo Overalls as "standard equipment" for railroaders.

It is just as old as the American railroads, and because it serves their needs so well, Stifel's Indigo Cloth has been worn by more than three generations of railroad men.

If you want garments that you can depend upon to give excellent service, be sure to look for this trademark on the back of the cloth inside the Overalls and Jumpers before you buy.

Stifel Indigo Cloth positively will not fade and the dots and patterns positively will not break in the print. Garments sold by dealers everywhere. We are makers of the cloth only.

### J. L. STIFEL & SONS

Indigo Dyers and Printers

Wheeling, W. Va.

260 Church St., New York, N. Y.

**Clinton Shops**

The second annual fish fry and "good fellow-ship" meeting of the officials and supervisory forces of the Illinois Central shops and store department was held at Weldon Springs, June 2. Seventy-five railroad officials attended the affair, which was similar to the one held last year.

A bounteous menu was prepared and served early in the evening by Jake Krehl, Earl Austin, Ed Barlow, Clem Luecke and Scheli Samuel, employes at the local shops, and the men proved to be real cooks and waiters. The menu consisted of fish and all the trimmings, the fish being imported from Havana by M. G. Taylor.

During the "feed" music was furnished by the Illinois Central Shops Jazzapation Society, under the personal direction of Bert Overy. After the tables had been cleared Master Mechanic Needham and Assistant General Boiler Inspector Hunt strove for the undisputed supremacy of the hook and line until dark.

Those who attended were: Officials and supervisory forces of the Springfield division from the master mechanic's office, store department, roadmaster's office, trainmaster's office, and chief dispatcher's office. Out-of-town guests were Engineer Henry Wyman and General Foreman Dick of Freeport, Assistant General Boiler Inspector Hunt of Chicago, Transportation Inspectors Lindrew and Dodge of Chicago, William Larson of the general purchasing agent's office, Chicago, Traveling Engineer Ed King of the Lima Locomotive Works, Lima, Ohio, and Curt Henson of Springfield.

The Illinois Central baseball club of Cham-paign defeated the Clinton club on the former's diamond May 30, score 13 to 7, the latter being unable to get their full team to that city in time for the game on account of experiencing tire trouble. The game started with the pitcher and second baseman missing.

**Springfield Station**

George B. DeFrates, veteran engine foreman at Springfield, was absent from his regular duties from June 1 to 15. His position was filled by William Nellis.

General Superintendent G. E. Patterson, accompanied by Superintendent Shaw, called at this station June 1.

Hiran L. Parkinson, car clerk in the Springfield freight office, returned from Hot Springs, Ark., June 11, very much improved in health.

Charles O. Chandler, baggageman at Springfield, left for Long Beach, Cal., July 1. He will remain there for sixty days. He was accompanied by his wife, daughter and son.

Carl Baccus, former commercial agent at Milwaukee, but now with the Simmons Bedstead Company, Kenosha, Wis., accompanied the Simmons baseball team, which played the Illinois Sangamo baseball team, and greeted some of his old friends at this station.

**ST. LOUIS DIVISION**

R. E. Addington, formerly employed in the engineering department on this division, has gone to McComb, Miss., to accept a similar position there.

Chief Timekeeper P. Hill has been confined to his home by sickness. Timekeeper Carl Bonds acted as chief timekeeper in Mr. Hill's absence.

Lee Wilkey, paint foreman, has a new baby boy at his house.

H. P. Marmaduke, bridge foreman, who has been sick, is now able to be back to work.

The St. Louis division office baseball team recently had a game with a team from the Southern Illinois Normal University, Carbondale, and

won by a score of 6 to 5.

Clarence Miller, who has been working in the superintendent's office, has resigned to accept a position in the Carbondale postoffice.

T. J. Montgomery, carpenter foreman, has returned from a trip to Los Angeles, Cal.

R. A. Trammel resigned his position as file clerk in the roadmaster's office on June 15 to take the position as record clerk in the superintendent's office. Clyde Conatser succeeds him in the roadmaster's office.

Mrs. Louise Bradshaw, who has been a clerk in the car distributor's office, has resigned, as she is moving to Paducah, Ky. Vivian Hopper, formerly record clerk in the superintendent's office, is filling the vacancy.

Miss Eula Clanton, supervisor's clerk, Mounds, has resigned. Miss Lurlene Featherstone has accepted the position.

Charles Johnson, material clerk, who has been attending the national convention of the Modern Woodmen of America at St. Louis, Mo., was selected as a state delegate from Illinois.

Car Distributor Frank Rauch, Carbondale, and Agent H. L. Dye, Brand Tower, Ill., went to Jersey City to see the Dempsey-Carpentier fight.

Agent S. F. Quinn of Logan, Ill., while in Florida succeeded in capturing a large alligator and forwarded it to Carbondale. It is now installed in the fountain in the park just south of the division office.

There are now heavy shipments of tomatoes, cucumbers, melons and mixed vegetables moving from points on the St. Louis division, such as Dongola, Balcom, Anna, Cobden and Makanda.

Operator W. H. Milo at Marissa, Ill., observed a broken beam dragging on I. C. 32913, Extra

1852, the evening of June 18. The train was stopped and rigging removed, which no doubt prevented serious accident.

Conductor E. M. Wilkerson was in charge of 1-271 out of East St. Louis on June 17. On arrival at Belleville his fireman took sick. As there was no fireman at Belleville to relieve the fireman in charge, Conductor Wilkerson volunteered to fire the engine to Coulterville, at which point there was a fireman sent from Carbondale.

#### East St. Louis Local Office

Collector J. T. Quirk of the cashier's department and Miss Felicite Davenroy were married June 15 in St. Phillip's Church. The bride was attended by her sisters, Edna and Veronica, the groom by his brothers, Richard and Paul. Members of the cashier's department were guests at the wedding supper, and during the evening the cashier's department quartet sang.

E. L. Breeding, clerk in the accounting department, has returned, after a short stay at the company hospital in Chicago.

W. J. Thebus, clerk in the inbound department, who has returned from Dallas, Tex., where he spent his vacation, also attended the convention of the Junior Chamber of Commerce held in that city.

Car Record Clerk John Peters is the proud father of a 14-pound baby boy.

The local office baseball team is anxious to schedule several games during July and August and would like to get in touch with such teams as Carbondale, Clinton, Springfield and any others interested. For information as to open dates, etc., kindly address G. E. Dickerson, care Local Freight Office, East St. Louis, Ill.

Demurrage Clerk J. H. Muelken is actively

Bird's-eye View of the Endicott-Johnson Plant.

Endicott-Johnson employ 13,000 people. The output of the six large factories is over 81,000 pairs of shoes daily. The raw hides are bought in the markets of the world and tanned in their own tanneries. 10½ tons of tacks used every day in the making of shoes.

soliciting all of his friends for business via our line. To date he has a record of securing 125 carload shipments of lumber for movement in connection with the Illinois Central.

**Cairo Freight Station**

G. E. Patterson, acting general superintendent, Chicago; W. Atwill, superintendent, Carbondale; Trainmaster Hatch, Carbondale, and others were in Cairo on an inspection trip June 21.

Louis Wettman, uncollected items clerk at this station, is now the proud father of a little daughter, who arrived at his home Tuesday, June 14.

Bernard White, chief clerk, was away the week of June 19 to 25, with other officers of Company K, National Guard, in training for a vacation camp which the company will enjoy in August.

John Cain, chief clerk at Greenville, Miss., recently was called to Cairo by the death of his mother.

John Bentley, local bill clerk, is at home, quite ill.

Guthrie LeRoy, interchange clerk, has resigned his position, the vacancy being filled by Zeno Hook, formerly freight bills clerk. Mr. Hook's position is being filled by Patrick Lawrence.

George Voght, southbound rate and bill clerk, has resigned. Harry Hudson, formerly reconsigning clerk, has been assigned the position. John Hodge, night clerk, is filling the position left by Mr. Hudson.

The work of building and repairing the Illinois Central incline, which has been leased by the Federal Barge Line for the construction of a terminal here, began June 27. The track barges, which are of concrete, are at New Orleans, and reports from that place indicate that the sheds being built on the barges to prevent the merchandise from being damaged by the weather when being transhipped from barge to cars will be complete in another week, and the barges will then be towed to Cairo. With the river falling very fast both below on the Mississippi and the upper Ohio, Cairo will again become the terminal point of the barge line, as it will be impossible for the heavy loaded barges and steamboats drawing eight feet to go to St. Louis. All of the new boats now stop at Cairo and depend on the smaller boats to bring their tows out from St. Louis to Cairo for them.

**INDIANA DIVISION**

A. C. Freigo, chief dispatcher, with Mrs. Freigo, is spending a vacation in Yellowstone National Park.

Miss Helen Hennessey has filled the vacancy in Roadmaster O'Rourke's office as stenographer, Miss Cora Tiffany transferring to the general offices, Chicago.

Miss Lucille Yount is spending her vacation in Kansas City.

**Mattoon Shops**

W. M. Ballard, M. C. B. clerk, spent his vacation with his mother on a farm near Mount Carmel, Ill.

R. E. Downing, division storekeeper, has left to attend the Elks' national convention at Los Angeles, Cal.

J. J. Wallace, stockkeeper, with Mrs. Wallace and their son, James, spent the vacation on a farm near Toledo, Ohio.

S. Anderson, bolt machine operator, who has been off duty on account of sickness, is much improved.

T. O. Paskins, inspector, has been off duty on account of illness.

Galena, Ill.

L. E. McCabe, Superintendent H. Rhoads and B. Jump visited Galena on May 24 in the interest of building a new stock yard at Galena.

H. L. Day, agent, accompanied the officials on an inspection trip over the Minnesota division, leaving May 1, returning May 6.

J. J. Davis, first trick ticket clerk, has returned from the O. R. T. Convention at Savannah, Ga. During his absence his position was filled by Russell Ward.

IOWA DIVISION

E. J. Doll, who has been employed on the Iowa division for the past seven years as operator and relief agent, has been promoted to agent at Onawa.

W. W. Hollingsworth, agent at Wilke, has been absent for some time past on account of ill health. Word has recently been received that he would be unable to return for some time.

I. E. Poulson, agent at Aplington, is absent from service on account of poor health.

C. W. Gardner, pensioner, who is visiting in Fort Dodge, will return soon to his home in California.

Word has been received of the death of K. I. Alexander, Norfolk, Va., August Pherson, Fort Dodge, Iowa, and John Nord, Council Bluffs, Iowa—all Iowa division pensioners, these men having been employed as agent, coalman and section laborer, respectively, prior to their retirement.

In the name of the Iowa division baseball team, a challenge has been issued to the Illinois Central transportation department baseball team, the members of which, it is understood, are employed in Mr. Porterfield's office at Chicago.

"That's where the tall corn grows." No better proof of the truth of these words can be found than in the stock of corn which is being exhibited in the Messenger window this week by W. R. Schaffer of Harrison county. The stock is 9 feet 11 inches high, in full tassel with two embryo ears. The corn was planted May 2 and made a phenomenal growth of over two inches a day. It was grown on Mr. Schaffer's farm in Harrison county. In addition to being the champion corn grower of Harrison county, he is an authority on agricultural subjects and owns one of the best farms along the Illinois Central railway. Mr. Schaffer is also an agent for the Illinois Central at Euclid, Ia., where he is widely known for his geniality and courtesy to the traveling public.—Fort Dodge (Iowa) Messenger and Chronicle.

**MINNESOTA DIVISION**

**Superintendent's Office**

The Transportation Department baseball team from Chicago met defeat at the hands of the local Illinois Central team Sunday, June 26, at Dubuque. It was a tight game until the fifth inning. The final score stood 7 to 2. The Dubuque team will go to Chicago to play there July 10.

R. L. Guensler, chief clerk to the superintendent, spent his vacation around the lakes in Minnesota.

Conductor and Mrs. C. H. McCarthy wish to thank their friends on both the Iowa and Minnesota divisions for the sympathy extended them in their bereavement, and also for the beautiful floral offerings.

Maxine Harrison, 17 years old, died at Finley Hospital, Dubuque, Monday, June 27, after a two days' illness. She was the only daughter of Conductor and Mrs. J. H. Harrison, who, with one brother, survive her. Burial was at Rushville, Wis.

**Maintenance of Way Department**

Leo Rust, section laborer, Menominee, Ill., was married June 21. After a short honeymoon the bride and groom returned to Menominee to reside.

Foreman P. J. Smith, Jr., of Galena was called to Independence May 26 by the death of his mother. Mr. Smith's father is section foreman at Independence.

R. E. Rodeberg has just put the last coat of paint on his canoe, making it ready for his trip to New Orleans.

**Dubuque Freight**

Mr. and Mrs. J. E. Allison attended the first annual meeting of freight agents, Section 1, A. R. A., which convened in Chicago June 21-

**GORDON'S CLOAK HOUSE**  
 "America's Leading Mail Order Women's Specialty House"  
 366 W. Monroe St. Dept. 5201 Chicago, Ill.

23. Two hundred and eighty-seven agents, representing every important railroad from Maine to California, were in attendance.

**KENTUCKY DIVISION**

The first death from heat prostration in Paducah this year occurred June 22, when Thomas P. Curley, 44 years old, a locomotive engineer on the Illinois Central Railroad, died at the railroad hospital. While making his run between Louisville and Paducah on the Illinois Central Railroad June 16, Mr. Curley became overheated and had to be relieved from his engine cab. His general health had been bad for several months and he failed to rally from the heat prostration. —Elizabethtown (Ky.) News, June 23.

The construction of the new yard south of the P. & L. crossing at Paducah is progressing nicely, a good start of the grading and part of the track work being completed. Instrumentman Boes and Chainman Brannon are now at Paducah taking care of the engineering work in connection with the construction of the new yard.

Contractors Ellington and Miller have arrived at Paducah with their forces and have started the extension of six additional roundhouse stalls to take care of the new Central type engines, which are now arriving at Paducah.

Miss Marion Waggener, clerk in the bridge and building department, is now touring in Europe with a party of young people. They will visit France, Belgium, Switzerland, Italy and England, and will return home about September 1.

Traveling Engineers Ryan, Millet and Shepherd are "breaking in" the new Central type engines, which are now arriving at Paducah.

Since the last writing, the Princeton baseball team, composed of Illinois Central employes, has won the following games: Morganfield, one game; Clinton, one game; Central City, two games, and Sturgis, three games.

**TENNESSEE DIVISION**

H. B. Butterworth has been granted a three months' leave of absence on account of ill health.

Everyone is taking an interest in the lovely park that the Illinois Central and the citizens of Martin are building at Martin, Tenn. The park is the pride of the surrounding country, having cost the people \$225,000. A \$15,000 playground for the kiddies is a marked feature of the park.

Ninety days' leave has been granted Conductor D. A. Kenny, on account of his physical condition.

Conductor S. E. Matthews and family of Jackson, Tenn., will leave soon for a visit to Detroit, Buffalo, Niagara Falls, Quebec, Canada, and other points of interest.

R. E. Pickering, Jr., accountant, and Miss Elizabeth Osgood were married at Fulton, Ky., on June 8. Their wedding trip was to Niagara Falls.

J. B. Good, for more than thirty years a locomotive engineer on the Tennessee division, was retired on a pension June 1. Mr. Good plans to move his family to Hardy, Ark., in the Ozark Mountains.

Sam Edwards, engineer at Fulton, is justly wearing a big smile—a 10-pound girl is something to be proud of.

Miss Jennie Pritchard, clerk at Dyersburg, is spending her vacation in California.

Pointing out the profit to be made in cabbage

raising (more than \$350 on one acre), a letter written by W. B. Hunt and published in the Dyersburg (Tenn.) State Gazette June 21 had the following to say for the Illinois Central: "The service I got from the Illinois Central

# Hamilton Watch

"The Railroad Timekeeper of America"

## On Time

You buy a watch to tell you accurate time. Nowhere are watches more carefully checked up for accuracy than in railroad service.

We show here Conductor G. W. Valentine and Engineer W. S. Robinson of the Pennsylvania Eastern Lines comparing their Hamiltons. They run the Manhattan Limited between Harrisburg, Pa., and Manhattan Transfer Station—right outside of New York City—an important run. Engineer Robinson recently received the following letter :

**PENNSYLVANIA RAILROAD**

*Eastern Lines*

*Office of Superintendent Philadelphia Division*

Harrisburg, Pa.

Mr. W. S. Robinson,  
Passenger Engineman

Dear Sir:

I am pleased to note the fact that you have made a perfect record during the month of March, 1920, as all trains you were in charge of made schedule time or better than schedule time, and I desire in this manner to commend you for this excellent performance.

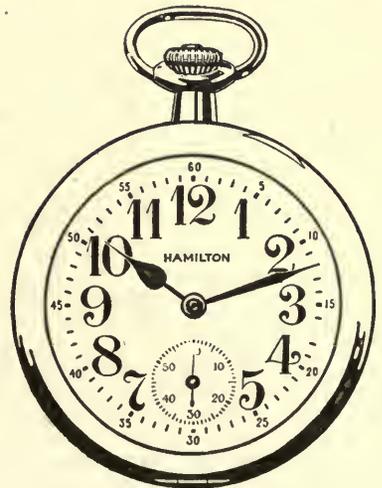

(signed) E. J. Cleave, Superintendent

This splendid record was achieved by men who run their trains by the Hamilton Watches they hold in their hands.

Hamilton Watches are the favorite time-keepers of American railroad men. When you buy, inspect the Hamilton models that railroad men favor, particularly 992 (16 size, 21 jewels). Hamilton Watches range in price from \$40 to \$200; movements alone, \$22 (in Canada, \$25) and up.

Send for "The Timekeeper," an interesting booklet about the manufacture and care of fine watches. The different Hamiltons are illustrated, and prices given.

**HAMILTON WATCH COMPANY**  
*Lancaster, Pa.*

Railroad Company was all that I could have asked. My cabbage left here at 3 o'clock one afternoon and was in St. Louis the next morning at 8 o'clock, and my treatment from the Illinois Central was as courteous as it was efficient."

**MISSISSIPPI DIVISION**

Operator R. J. Hufft of Sardis, Miss., and Miss Helen Carlton, also of Sardis, were married in Memphis, Sunday, June 19.

Trainmaster and Mrs. Spangler have just returned from a two weeks' vacation spent in Kansas City, Mo., visiting relatives.

B. A. Boydston, engineman, is in Chicago for treatment at the Illinois Central Hospital.

Dispatcher W. J. Tipler is receiving congratulations on the arrival at his home of a fine girl.

Dispatcher E. L. Shelton attended the train dispatchers' convention at Kansas City, Mo.

Miss Christine Adams, stenographer to the roadmaster, is spending her vacation visiting Richmond, Washington and other eastern points.

Miss Annie Bell Anderson, stenographer, has returned from her vacation spent with friends and relatives at Fort Dodge, Iowa.

**Water Valley Shops**

The body of Corporal Bernard B. Gooch was laid to rest in the Oak Hill Cemetery on May 16. Corporal Gooch secured a position with the Illinois Central at Water Valley as call boy, afterward as clerk in the master mechanic's office. When war was declared, he volunteered with the Eighteenth Infantry, Company D, and landed in France on June 26, 1917.

When the Americans sneaked the German drive, his regiment was in the thickest of the fight. On the morning of May 22, 1918, his commanding officer was killed, and B. B. took his orders and carried them to another officer, walking a distance of three hundred yards in front of the enemy's guns, delivered the orders and returned to his company. For this act, the French government awarded him the Croix de Guerre. He was made a corporal and fought hard and valiantly until he met his death by a bullet in the forehead from a German machine gun, July 21, 1918.

The funeral was the largest ever held in Water Valley. He was buried with full military honors under the direction of Curtis E. Pass Post of the American Legion, the Illinois Central Railroad band rendering music.

The mechanical department has organized a band of thirty pieces, and several are fine musicians. After two months' practice, they are delighting the town with concerts. The following officers are elected for the year: S. R. Mauldin, J. L. Chapman, W. E. Hoyt, staff officers; W. J. King, manager; J. G. Bennet, director, and Joe Gooch, treasurer. The name of the band is the Water Valley Illinois Central Railroad Concert Band.

The Water Valley baseball team, under the management of our popular storekeeper, W. E. Hoyt, won six games and lost one. Most of the members of the team are Illinois Central boys.

**LOUISIANA DIVISION**

The Louisiana division is alive in everything except magazine notes, which, owing to the

exception campaigns, have been somewhat neglected. In other words, the editor has been busy fighting exceptions. When the campaign is over, we do not expect to draw a breath of relief as if it were just a passing show, but we will continue our efforts in behalf of reducing the number of exceptions and the number and amount of claims paid and presented on the system.

The greatest excitement we have had in McComb in a long time was on the morning of June 1, about 4:30 a. m., when fire was discovered in the shops, which resulted in the destruction of the car shops and about forty cars. Nearly all of McComb was there to assist, if they could, in the quenching of the flames.

**Jackson, Miss.**

Mrs. Homer Hill has applied for and received a leave of absence for sixty days, in which to recuperate from her recent operation.

Freight solicitation is still booming. At the close of June 11 our record for less than three months' work was 830 solid carloads and 91 LCL orders. As we average over 50 cars per week, it will not be long before we are in the "1,000 Class."

L. E. Bonner has been in the Company Hospital at New Orleans for minor operations in the throat and head.

**NEW ORLEANS TERMINAL**

A series of three baseball games between Superintendent Cousins' office and District Foreman Chapman's mechanical department was won by the superintendent's force. The Union Station boys captured every game without a struggle; scores 12-1; 12-9; the last game a forfeit 9-0.

D. E. Moodie is our new joint accountant.

Yard Clerk C. W. Trenchard has been "sub-ing" for Chief Clerk Dalrymple, now convalescing after a minor operation.

Yardmaster Thomas Johnson is having the time of his life keeping cars moving out of Levee Yard since St. Joseph street has been closed to daylight traffic.

L. J. Grady, engine foreman "sub-ing" for Yardmaster Wyman, is receiving praise for the good condition of Poydras Yard.

Germaln T. Nodier, formerly chief clerk to General Yardmaster Mora, is now night assistant general yardmaster at Harahan, La.

**MEMPHIS DIVISION**

Division officers of the Yazoo & Mississippi Valley Railroad on May 30 tendered a dinner to V. V. Boatner, retiring superintendent of the Memphis division of the Yazoo & Mississippi Valley. Among those attending the dinner at Hotel Gayoso at 8 o'clock were: J. W. Rea, trainmaster; C. A. Maynor, roadmaster; A. A. Freiburger, chief dispatcher; P. C. Pettit, assistant chief dispatcher; H. V. Neville, traveling engineer; E. Von Bergen, traveling engineer; A. O. Garber, master mechanic; G. W. Rice, division storekeeper; H. E. Wolf, supervising agent; F. D. Theobald, chief clerk to the superintendent, and W. K. McKay, trainmaster.

**VICKSBURG DIVISION**

F. L. Clark of Cleveland, Miss., general mechanical department foreman, attended a fuel meeting at Greenville Saturday, June 18. Mr.

Clark drove from Cleveland to Greenville in an automobile, bringing with him his wife, his son and a friend of the family. On the return trip, while on the concrete highway between Magenta and Stoneville, with the car running twenty or twenty-five miles an hour, a rubber foot mat resting on the footboard of the car immediately in front of the seat occupied by Mr. and Mrs. Clark, came in contact with the exhaust pipe, which was sufficiently hot to scorch the foot mat, and cause it to smoke. Mrs. Clark became frightened and jumped from the moving car, falling upon the highway and fracturing her skull. Mr. Clark immediately returned to Greenville with Mrs. Clark. She was attended by Company Surgeon Gamble, who found it necessary to operate. Mrs. Clark did not survive the operation and died that night. The body was taken to her home at Roxton, Texas, on June 22 for burial.

#### NEW ORLEANS DIVISION Vicksburg, Miss.

Master Mechanic G. C. Christy has undergone an operation for appendicitis at the Vicksburg Sanatorium, and just a few days ago was able to go home. His condition is daily improving.

The uniforms for the Y. & M. V. baseball team have been received. To celebrate the event, the team proceeded to defeat the crack Max Isaacs team of Vicksburg on June 22 by a score of 9 to 7.

Miss Edna Mahin, head tonnage clerk in the superintendent's office, has been confined to the Sanatorium for two weeks suffering from an attack of pleurisy. Her condition is now much improved.

#### Baton Rouge, La.

Trainmaster Anderson has just returned from his vacation, having visited the far North and East.

The many friends of Joseph McGuire, chief clerk in the yard office, will be sorry to learn that he has been very ill for several weeks. A few days ago he went to Denver, Colo., where he expects to remain about sixty days in the hope of regaining his health.

A new yard office is being constructed at North Baton Rouge and will be ready for occupancy about August 15.

#### Natchez, Miss.

Stenographer John H. Martin recently spent a few days' vacation on the Mississippi Gulf Coast at Biloxi. The Mississippi Coast surely is a fine place, winter or summer, to spend a few days' vacation. In talking up its many delights to your friends outside of the service, be sure and mention that the Illinois Central System can go a mighty long way toward taking them there in comfort.

Accountant E. D. Goza has joined the Natchez baseball club.

The Natchez freight office, having had the distinction of furnishing to the army of the United States during the World War a major, a captain, a regimental supply sergeant, a corporal and five privates, bids fair to have its martial history greatly augmented. Nathaniel Claiborne Hale, one of the young clerks of the office, has been appointed to the United States Military Academy at West Point by United States Senator John Sharp Williams, and has

been ordered by the War Department to report at the Academy early in July. Claiborne has successfully passed both the mental and physical examination.

Engine Foreman F. J. Moore has returned from Chattanooga, Tenn., where he was called by the death of his mother.

We are going to have some movie stars. The Oliver Morosco Company of Los Angeles, Cal., has been here filming a picture, "Slippery McGee," and a few days ago issued some free meal tickets. In consequence, we are going to see Claim Clerk Homer Green and Rate Clerk Thomas Bloodworth prominent in the first scene when "Slippery McGee" is released.

Some of our men spent a most enjoyable day at Rosetta, Miss., on Sunday, June 5, attending a freight service meeting and picnic. In the forenoon Superintendent Mays held a most pleasant and instructive freight service meeting, discussing in detail the campaign against the filing of stock, that of no exceptions, and that of solicitation of freight for the Illinois Central System.

#### "NO CLAIM" CAMPAIGN, TOO

With reference to the "No Exception" campaign, the meaning and intention is "No Claim" campaign, and I believe that it is the greatest movement that has ever been started by any railroad for this purpose. The only bad feature is that it was not started sooner. I have had five claims filed, amounting to \$41.88, on shipments moving in April. We handled 38,764 pieces of freight outbound and about the same number inbound, and all claims for this month have been filed.

For the last five years we have been having at this station from twenty to seventy claims a month, amounting to from \$400 to \$3,000. These figures show what the "No Claim" campaign has done for this station, and I believe that we will have similar results at practically all stations on the system.

The campaign for June is now on, covering the entire system. It should show better results than May, for the men have had one month to experiment in, and as an educational feature there has never been anything started that trained men as quickly to stow, mark, receive, deliver and bill freight correctly.

I would like to see this campaign specialized on at certain months in each year. All that is necessary to get the desired results is to keep each employe who has anything to do with the handling of freight as careful and interested in the work as he is now.

In addition to the claim feature, it has done much toward improving soliciting, made less work for employes handling claims, and provided satisfactory service for our patrons.

—R. SMITH, *Agent, Greenwood, Miss.*

## Our Monthly Roll of Honor

Below is a list of employes who were retired at the meeting of the Board of Pensions held on June 29:

Name	Occupation	Years of Service.	Date of Retirement.

*C. A. Stang*

C. A. Stang was born in New Orleans, April 17, 1883. He began railway service with the Southern Pacific lines at New Orleans in May, 1901, coming to the Illinois Central November 1, 1904, as stenographer in the freight traffic department. He later served as rate clerk, chief rate clerk, executive clerk and chief clerk. May 1, 1921, he was appointed assistant general freight agent at New Orleans.

## September Has Been Designated as "Fuel Economy Month"

**Great Campaign Will Be Waged by Officers and Employees to Reduce Coal Consumption 20 Per Cent**

ILLINOIS Central System officers and employes have set a record for making good on campaigns. They have accomplished much good in the "No Accident," "No Personal Injury" and "No Exception" campaigns, and now September has been set apart for a great campaign having for its object the saving of coal. For this purpose, September has been designated as "Fuel Economy Month."

The campaign will apply to all departments using fuel—transportation, shop and power plants, water stations, depots and office buildings, etc.

The fuel consumption for all departments of the system in September of the five previous years was as follows:

	Total Cost	Avg. Cost Per Ton Including Handling
1916 322,217 tons .....	\$ 419,641.79	\$1.302
1917 376,323 tons .....	705,528.53	1.875
1918 403,664 tons .....	1,084,255.52	2.686
1919 378,099 tons .....	943,766.38	2.496
1920 425,626 tons .....	1,542,046.70	3.623

### Engine Results in Five Years

The September fuel consumption by classes of engine service for the past five years was as follows:

	1000 Ton Miles Freight Service	100 Passenger Car Miles	Switching Locomotive Miles
1916 .....	151 lbs.	*1717 lbs.	127 lbs.
1917 .....	*149 lbs.	1830 lbs.	128 lbs.
1918 .....	158 lbs.	1873 lbs.	*117 lbs.
1919 .....	151 lbs.	1857 lbs.	131 lbs.
1920 .....	*149 lbs.	1785 lbs.	125 lbs.

\* (The stars mark the best records.)

The goal for September, 1921, has been set at 20 per cent less than the best September record in each class shown above.

In transportation freight service the best month's record made was 133 pounds per 1,000 gross ton miles in June, 1918.

In transportation passenger service the best month's record made was 1,637 pounds per 100 passenger car miles in August, 1916.

In transportation switching service, the best month's record made was 117 pounds per switch engine mile in September, 1918.

### All Are on Their Toes

The members of all departments of the Illinois Central System's organization are on their toes to obtain results for the company. It is to their credit that they watch eagerly for the signal from the management to do outstanding things that will redound to the best interest of the company. It is well known that coal is a big item in the company's expenses. It is well known that substantial savings can be made in this item. That has been demonstrated time and again in the past. The purpose of setting aside September as "Fuel Economy Month" is that the greatest effort of all will be made to save coal.

The general fuel conservation committee, division fuel conservation committees, division officers, train dispatchers and oper-

ators, enginemen and trainmen, shop officers and employes, coal chute foremen and employes, power plant and water station employes, maintenance of way employes, agents and all other employes having to do in any respect with fuel consumption, are getting ready to proceed to the task—that of making September, 1921, the outstanding month in the saving of fuel.

Weekly progress reports will be made by divisional fuel committees. These reports will be watched eagerly by all concerned. The Illinois Central System organization knows no such word as failure. It is therefore predicted that "Fuel Economy Month" will result in the usual success.

### A WORD FROM BATON ROUGE

Commenting on the arrival of four of our new switch engines at Baton Rouge, La., the *Baton Rouge State Times* of July 29 had the following to say about the Y. & M. V.:

The assigning of these four big engines to Baton Rouge gives emphasis to the growing importance of Baton Rouge to the Yazoo & Mississippi Valley road, and the growing importance of the road to Baton Rouge.

Next to the Standard Oil, the Y. & M. V. has the largest payroll in Baton Rouge, amounting to nearly three-quarters of a million a month.

Twenty-six trains are made up here every day, and twenty-six crews, comprising five persons to a crew, go out of Baton Rouge every day.

During the busy season there are thirty-two crews and thirty-two trains to go out of and come into Baton Rouge.

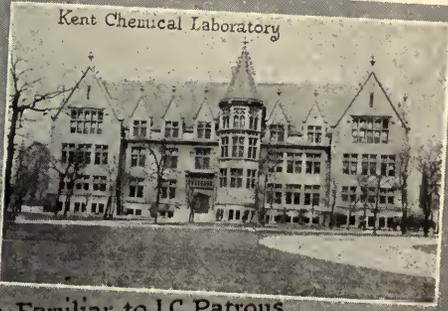

The roundhouse and roundhouse yards contain on an average of twenty-three engines a day. These engines are being overhauled, and minor repairs made. There are ninety-six men employed at the Y. & M. V. shops on locomotives, and sixty-four men employed on car repairs. The total expense of the Y. & M. V. shops is \$650 a day.

Plans are being made to enlarge the shops, the roundhouse and the yards.

# Illinois Central Has Twelve Pensioners of Fifty Years' Service

*Veterans Who Are Older Than the System Relate Incidents of Days When the Road Was New*

**F**IFTY years is a long time in anybody's life. Fifty years of service with one company is a record made by few employes. A check of the list of Illinois Central pensioners, however, discloses the fact that the company at present has a total of twelve living pensioners who have served half a century or more.

All of these men are older than the Illinois Central, for the company was organized in 1851, and the youngest of these veterans was born in 1849. Their combined service totals 615 years and 11 months—an average of approximately 51 years and 4 months apiece.

Needless to say, their experiences have covered a host of things the present-day employe knows little or nothing about. Almost every branch of the service is represented by these twelve.

## Here Are the Record Holders

These pensioners, arranged in order of length of service, are:

John Kief, service 53 years; last employed as tinsmith, Burnside shops; born May 15, 1839; retired May 31, 1909; residence 6512 Ross avenue, Chicago.

John J. Egger, service 52 years and 11 months; last employed as boiler inspector, St. Louis division; born March 21, 1849; retired July 31, 1917; residence 729 South Elm street, Centralia, Ill.

Hugh Gilleas, service 52 years; last employed as roadmaster, Iowa division; born December 28, 1849; retired October 31, 1916; residence 1722 Douglas street, Sioux City, Iowa.

Daniel S. Bailey, service 51 years and 11 months; last employed as supervisor, Springfield division; born November 5, 1846; retired November 30, 1916; residence 208 West Church street, Champaign, Ill.

John W. Carlin, service 51 years and 10 months; last employed as assistant treasurer; born October 31, 1846; retired October 31,

*With years a richer life begins,  
The spirit mellows:  
Ripe age gives tone to violins,  
Wine, and good fellows.*

—TROWBRIDGE

*I have but one lamp by which my  
feet are guided; and that is the lamp  
of experience. I know no way of  
judging of the future but by the past.*

—PATRICK HENRY

1916; residence 93 South Arlington avenue, East Orange, N. J.

Michael English, service 51 years and 8 months; last employed as crossing flagman, Illinois division; born November 15, 1839; retired December 31, 1909; residence Effingham, Ill.

Louis H. Kell, service 51 years and 6 months; last employed as foreman, McComb shops; born February 29, 1844; retired February 28, 1914; residence McComb, Miss.

Daniel W. McMillan, service 50 years and 7 months; last employed as blacksmith, Mississippi division; born December 20, 1845; retired December 31, 1915; residence Water Valley, Miss.

## Two From Wisconsin Division

John Sullivan, service 50 years and 3 months; last employed as supervisor, Wisconsin division; born February 2, 1848; retired December 31, 1915; residence 1030 South Galena avenue, Freeport, Ill.

John S. Lonergan, service 50 years and 3 months; last employed as section foreman, Wisconsin division; born July 14, 1841; retired July 31, 1911; residence Route 1, Polo, Ill.

James T. Tait, service 50 years; last employed as claim agent, general claim department; born June 13, 1848; retired October 31, 1918; residence 297 West Eighth street, Dubuque, Iowa.

John A. Norman, service 50 years; last em-

ployed as crossing flagman, Minnesota division; born August 20, 1845; retired September 30, 1915; residence 434 Almond street, Waterloo, Iowa.

In addition to these twelve men on the records for service of more than fifty years, mention should be made of Locomotive Engineer William Beven of McComb, Miss., father of J. L. Beven, assistant to the senior vice-president. The senior Mr. Beven, who began railway work in 1866, at the age of 17, was retired December 31, 1918, after fifty-two years, with a pension record of 48 years and 6 months of total and last continuous service.

There is almost a coincidence in the records of Mr. Bailey and Mr. Carlin, as there is less than a week's difference in their ages and only a month's difference in length of service. Their dates of retirement, also, were just a month apart. Mr. Kell, it will be noted, is one of those who have a birthday only every four years, as his comes on the twenty-ninth of February. Six of the twelve are named John. There was almost an equal division in number between office

workers and outdoor workers at the time of retirement, but this is not necessarily an argument for longevity one way or the other, as office workers frequently got their start in the open in the earlier days.

#### Old Resident of Chicago, Too

But let them tell their own stories.

"I am now 84 years of age," says Mr. Kief, who heads the list of pensioners. "While I was born in Toronto, Canada, my residence in Chicago dates back to 1846. On June 1, 1856, I started work for the Illinois Central. Now I enjoy the record not only of being one of the oldest living residents of Chicago but also of having been in continuous service for fifty-three years.

"I started to work under Gus D. Clark, the first master mechanic the road ever had. During my service I have seen the company grow from a miniature road to one of the largest in the country.

"My only regret is that I was compelled to get out of the harness in 1909. My principal delight is to relate to my many friends and acquaintances the remembrances of my early days with the Illinois Central. On my retirement from the road I was presented with a handsome new watch and chain, a leather chair and a meerschaum pipe, and also was given a banquet by my co-workers."

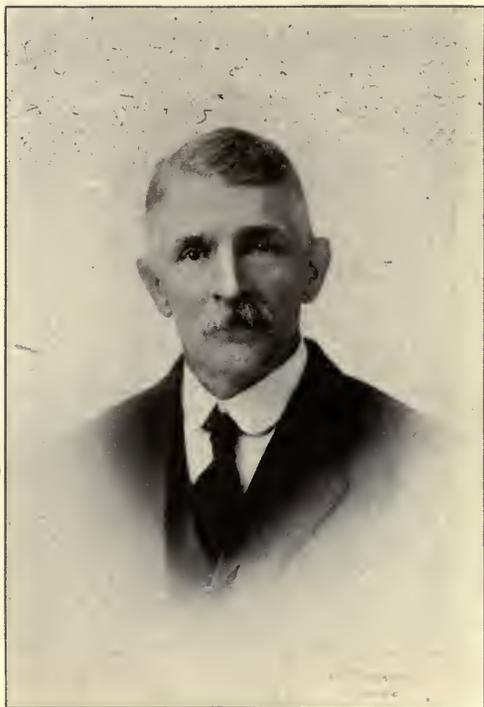

#### Started When 15 Years Old

Mr. Egger, who was born at St. Gallen, Switzerland, was left an orphan at an early age and had his own way to make in the world. "I came to this country in the spring of 1864," he says, "and entered the employ of the Illinois Central in the same year, on September 1, as an apprentice boiler maker at the age of 15 years, under the foremanship of John K. Lape. I served my time and worked as journeyman for a number of years. I held the position of foreman for six or more years, but went back to journeyman work again, as there was more money in it for me.

"In October, 1895, while I was at work, a piece of steel struck me in the eyes and destroyed the sight of one of my eyes. The doctors found it necessary to remove the eye entirely. This was a great blow to me. I was not able to work for some time, and when I did go back to work again I was handicapped in many ways. I was not able to do the same kind of work as before; in

John Kief

*John J. Egger*

consequence, I had to take reduced pay, which was very hard for me at the time, as I had a large family to provide for.

"For eight or ten years previous to my retirement I worked as boiler inspector, a position I held up to the time of being retired. I have seen many changes since the time I first started in as an apprentice boy, and I still feel a great interest in the Illinois Central and its progress.

"As a citizen of Centralia, I feel truly proud of the fine new station the Illinois Central recently built. Although a long time coming, it is all the more appreciated."

#### **From Laborer to Roadmaster**

Mr. Gilleas began work October 27, 1864, at Epworth, on the Dubuque division. For ten years he was a laborer; for thirteen years, a foreman; for eight years, a supervisor; and for more than twenty years, a roadmaster.

"Since I started working for the Illinois Central, conditions have changed greatly," he says. "At the time I began to work, the company was operating only ninety-nine miles of railroad in Iowa, the road being

laid with 42-pound rail. The capacity of all boxcars was ten tons; the tonnage train was thirteen cars; locomotives were forty tons. Today the road is laid with 90-pound rail; the tonnage train is 3,000 to 3,500 tons; locomotives are in the neighborhood of 200 tons.

"At the time I began, the wages of section men were \$1.10 a day; section foremen were paid \$40 to \$45 a month, and we did not know what overtime meant. If we worked twelve hours a day, it meant only a day, and the same was true of trainmen.

"Passenger rates at that time were 5 cents a mile. They ran only a mixed train west one day and back the next when they first began running west of Fort Dodge, as the country was not settled and there was very little business to handle. Most of the settlers were homesteaders and lived in what were called dugouts. I remember of times when the road would be blocked with snow for two weeks at a time, as we had no snow plows or locomotives to handle the snow-drifts.

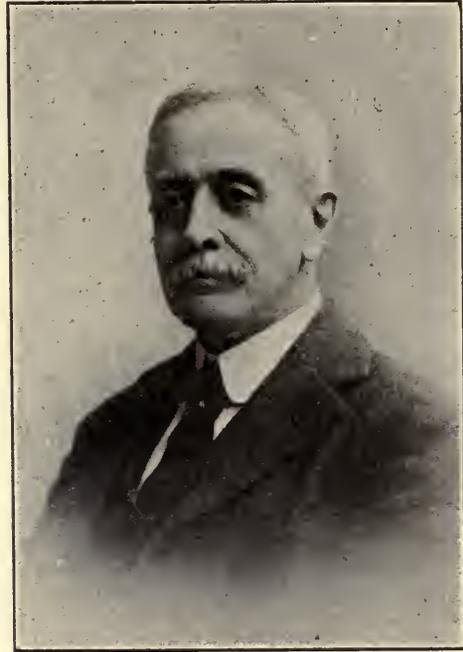

"Sioux City at that time was a very small town. The line now owned and operated by

*Hugh Gilleas*

*Daniel S. Bailey*

*John W. Carlin*

the Illinois Central was the second line built into Sioux City, the first being the Sioux City & Pacific.

"During the early days we had no gasoline cars, while at the present time each section gang is provided with one to carry them back and forth to their work."

#### **Pitched Hay in Chicago**

Mr. Bailey left this father's farm at Kensington, Ill., in November, 1864, to learn telegraphy. Before that he cut and stacked many tons of hay from land now occupied by houses south of 116th street, Chicago, and hunted snipe where the Pullman Works now stand. The house on his father's farm had to be moved when the Blue Island line was built.

He learned telegraphy at Ashley and began work January 1, 1865, as station helper. Mr. Bailey was in the employ of the Illinois Central System as telegraph operator, night ticket agent, train dispatcher, assistant trainmaster, assistant division superintendent and superintendent of division. He was superintendent of trains and track at the time of retiring on pension in November, 1916.

His name was never omitted from the pay-

roll during that fifty-two years' service. He worked on all the divisions in Illinois except the Peoria division. He never asked for promotion or for a position but once, and did not get that one. He says he is glad to call those he worked with, both superior officers and those who worked under his jurisdiction, "friends."

#### **Didn't Fill the Ink Stands**

Mr. Carlin, who retired as assistant treasurer, says:

"When I made my first appearance in the office of the company in the old Bank of Commerce building, at the corner of Liberty and Nassau streets, Chicago, I was the first arrival, but presently came a gentleman with beautiful whiskers, regular Lord Dundreary style (he was an Englishman), and I asked him if I should fill the ink stands. He said, 'No, let the negro do it,' and the negro did.

"This lifted me a peg in my own estimation.

"The man's name was Avery, and he occupied a dark room, lighted by candle. This room was called 'Cudjo's Cave,' as I afterward learned.

"My first duties were with the stock trans-

fer department, and continued so to the time of my retirement. In a vault there were seemingly a million canceled stock certificates, and I was to sort them according to numbers and paste them in the books from which they were taken. So, in a few minutes, I was up to my neck in actual business and forgot to count how many steps were between me and the top of the ladder.

"My friend with the whiskers (we were good friends by this time) gave up his position with the company, and his work of filling in the names on the stock certificates was given to me—my first regular work after pasting. Gradually my work increased, and when the transfer clerk resigned his position was given to me.

#### **Paid Dividends Personally Then**

"The manner of paying dividends was very different from the present method. The number of stockholders was not very large, and they signed a receipt in the dividend book, either individually or through a power of attorney given to some banking or brokerage house or other individual.

"Lynde A. Catlin (now dead) was then secretary of the company, and a very careful gentleman. Everything was done precisely, even if it took all night, and we worked together amicably as late as necessary to get the dividend books ready for dividend day and the customary rush.

"The waiting line extended from the back of the office, down a long hall, down the stairs to the street and some distance along the street. Great times those days!

"Then the manner of collecting the dividends was changed. The stockholders filed a permanent mailing order, and the dividend was sent by mail. The gummed envelope was moistened by mouth or sponge, but now it is moistened and sealed by electricity. Other changes were gradually installed, and the work was specialized with an increasing force of clerks."

#### **Started With Illinois Central in 1857**

Mr. English was born in the southern part of Ireland. When he was 9 years old he was brought to Canada. About four years later he came to the United States.

It was in 1857 that Mr. English perceived the Illinois Central as his opportunity. In that year he entered the service of the com-

pany as a section hand at Pana, Ill. After about six years he was transferred to a section on the line which then ran between Centralia and Cairo. This was the first section on that part of the system. In 1866 his efficient service was in the minds of the officials of the road when he was made foreman of that section. For thirty-three years he served faithfully and to the best interest of the company as foreman of that part of the line. He then was made crossing flagman at Effingham, Ill. He watched over two crossings there from a station halfway between until the time of his retirement from service, December 31, 1909.

In all, Mr. English served the Illinois Central fifty-one years and eight months. And he bristles with pride when he makes the statement that in all that time he was never the cause of an accident on the line, caused the officials a minimum amount of trouble and received not the slightest personal injury.

#### **The Last Survivor of His Family**

Growing close to his eighty-second birthday, Mr. English is the only survivor of his immediate family. He was married twice,

*Michael English*

*Louis H. Kell*

the first time at the age of 28. A daughter, war born to this happy union, but the mother died a short time afterward. The baby was taken to a sister in Chicago, where she could have the benefits of a woman's care and a home. But Mr. English was lonesome.

Two years later, the desire to have his daughter by his side prompted him to marry again, so that he could provide an adequate home for her. They were extremely happy, he said, and the daughter bloomed into womanhood. She married, had a son, who is now in California in successful business, and died only a short time ago. Mr. English's second wife died about eight years ago.

Mr. English is apparently very happy under the care of the St. Anthony Hospital at Effingham, Ill. While in the service of the company in that city, he made many friends. They always have a pleasant passing word for him, and see that he is well supplied with his favorite delicacies, bananas and candy.

#### Worked During Civil War

Mr. Kell was born in Alexandria, Va. He

entered the shops of the M. & O. R. R. at Columbus, Miss., as machinist apprentice in 1859. The shops were moved to Jackson, Tenn., the same year.

"In May, 1862, after the battle of Shiloh, when the Federal troops cut the railroad line between Corinth and Beth, all the fine tools were loaded in a boxcar," he says, "and with Master Mechanic Hugh Boylan, I took an engine over the Mississippi Central, now the Illinois Central, to Grand Junction and over the Memphis & Charleston, now the Southern, to Corinth. I ran this engine in yard service until the evacuation.

"Then I went to Grenada and into the shops of the M. & T. R. R., now the Illinois Central, then on the Mississippi Central in a small wooden shop moved to Water Valley after the war. In 1866, I was sent to Durant and got the engine 'Holmes,' named after that county. This engine and others had been damaged and burned by the Federal troops. I carried this engine to Water Valley, and in February, after the engine was rebuilt, I started running as engineer. I kept this up until 1874, when I was made foreman at Water Valley and transferred to McComb a few months later, where I have since worked. When I came to McComb, the company had a small roundhouse holding thirty-one engines; all the houses and the hotel belonged to the company.

"When I was running as an engineer, there one flag indicating a train following but not giving rights, two red flags displayed, giving following train same rights as preceding section; all engines were wood burners.

"An engineer's salary was \$125 a month. As the road was not making any money, Colonel West requested a loan of \$15 a month from all engineers, which was couced; and after the Mississippi Central was taken over by Colonel McComb, I received \$90, that being the amount I lent for six months out of my salary."

#### Made Repairs After Civil War

Mr. McMillan, according to an account prepared by L. C. Barber, was born near Oxford, Miss., and received his early training on the farm. When he was about 12 years old, the Mississippi Central, now the Illinois

Central, was built through that region, and people came for miles to see the trains.

When 20 years old, Mr. McMillan began his career as a railway man. His first job was on the construction or work train in charge of James Robinson, one of the oldest conductors on the road, beginning work on June 1, 1865, repairing the track and road-bed destroyed by Federal raiders during the war. On September 1, 1865, he came to Water Valley, then a village of less than two hundred and boasting of only four business houses, where he began work as a section hand under Albert Simmons, section foreman. He continued in that capacity about fourteen months.

In 1866 the company began the erection of railway work shops in Water Valley, finishing the plant during 1868. On August 6, 1866, before the shops were completed, Mr. McMillan began work as a car repairer under John E. Becton, master car builder. In 1868 he changed to the blacksmith shop and began as helper to learn the trade. In June, 1869, he was given a forge and fire under Blacksmith Foreman Pat Kehoe, and continued as blacksmith in the same shop for forty-six years.

During this half century of service "Uncle Dan" saw many changes in the shop, its equipment, personnel of the employes, officers, etc. He served under every president of the Illinois Central Railroad and under every master mechanic and foreman of the shops. He began under Master Mechanic John E. Becton, who died in 1878, and served also under Jack White, T. J. Price, J. C. Ramsey, J. W. Lutterell, George Dickey, Mr. Barton, Jake Neudorfer, John Price, Will H. Watkins, Claude Stark and S. R. Mauldin, the present master mechanic.

#### Has Seen Men Come and Go

"Uncle Dan" has had apprentice boys to work with him, and has seen them "grow" in both age and the work until time marked them with silvery hair, and their sons began work at the same anvil their fathers formerly used. It is with pride "Uncle Dan" recalls that Will J. King, the present efficient foreman of the blacksmith shop, began as helper for him. "Uncle Dan's" whole life's interest has been closely associated with the railway company.

On April 28, 1880, he was married to Miss

Elizabeth Turner, who passed to her reward several years ago. To this union were born six children, four sons and two daughters. One daughter became the wife of John W. Tarver, who, at the time of his death some years ago, was chief clerk in the superintendent's office of the Mississippi division and also mayor of Water Valley.

"Like father, like son" is a true axiom applied to "Uncle Dan" and his four sons, Joe, Daniel, Dewitt and Charles. Like their sturdy father, the sons grew into strong muscular men. Charles, the youngest, after a few years' service as clerk, entered other vocations, but Dewitt became an expert machinist and remained with the company until his death a few years ago; the next son, Daniel L., also became an expert machinist and today is a valued employe of the Y. & M. V. at Vicksburg, Miss.; and Joe, the eldest son, became an expert blacksmith and today has a forge and fire in the same shops his honored father served so faithfully and efficiently for half a century.

As a workman "Uncle Dan" has repaired the little old 12-inch cylinder wood burner

Daniel W. McMillan

engines and also the modern type having a cylinder 27 by 30 inches. As a beginner he helped repair the old wooden frame cars of only 30,000-pound capacity, and he finished on the mammoth 55-ton ail-steel cars. In the early days he has many times, unassisted, taken off and put on the track car wheels, but these have been so much increased in size and weight that at the time of his retirement it required the service of several men to handle them. When he worked on the section in the 60's a strong man could easily pick up and walk off with the iron rail used at that period; now rails are made of steel and carry the weight of ninety pounds to the foot.

When you see one of the fine Illinois Central trains pass by today, you would hardly believe that at one time the lowly mule was the only motive power available from Water Valley to Holly Springs, but such was the case at one period of the railway company's existence, according to "Uncle Dan." This was during the turbulent war times between '61 and '65. The Federal forces frequently sent out raiders to destroy tracks and roadbed between Water Valley and Holly Springs. It was to avoid capture of motive power, and also to afford means of necessary transportation for needed supplies, that Henry Armsby, then living at Holly Springs, organized his famous "mule trains."

#### A Mule for Motive Power

The trains consisted of one little old box-car, with a mule attached for motive power. Only food, medicine and possibly war supplies were hauled—no passengers. "Trains" were scheduled so that one each day would arrive at and leave from Holly Springs and Water Valley. In crossing bridges, men pushed the "train" across by hand while the mule engine either forded or swam the stream below. "Uncle Dan" many times made repairs on cars of those famous "trains," but declares he never attempted to put in new cylinders or to monkey with the mule motor.

Mr. McMillan is nearing his 76th birthday and is blessed with good health. He is living in a modest little home on Main street in Water Valley, Miss., with his son Joe and an aged sister, enjoying the evening of a life well spent. He is a member of the I. O. O.

F. and Masonic orders and takes a keen and active interest in both. He is highly esteemed by all in the city and by the "railroad boys" from Chicago to New Orleans. He speaks only in the highest terms of praise for the courtesies extended and excellent treatment afforded him while an employe of the company for half a century, and he deeply appreciates the courtesies and favors so generously extended since his retirement.

#### A Native of Ireland

Mr. Sullivan was born in Ireland in 1848. He came to Massachusetts in 1863 and to Earlville, Iowa, in 1865, where he began work on the section. His service to 1868 was as section laborer at Earlville; 1868 to 1871, section foreman at Floyd; 1871 to 1877, yard foreman at Dubuque; 1877 to 1881, section foreman at Lemars; 1881 to 1887, road supervisor at Dubuque; 1887 to 1895, roadmaster at Cherokee; 1895 to 1898, roadmaster at New Orleans; 1898 to 1902, roadmaster at Clinton, Ill.; 1902 to 1916, road supervisor at Freeport.

"There is a great difference between the railroads of the present time and those of over fifty years ago, as to track and equip-

John Sullivan

ment," he says. "The track on the Earlville section, when I began work, was laid with 50-pound rail, eight feet long; some was laid with 42-pound rail. Quite a contrast between those light iron rails, with what were known as chair points, and the heavy steel rails of the present time!

"I remember having a work train sent to the Earlville station to do some ditching. The train consisted of the engine, seven flat cars and caboose. When the flats were loaded, the engine could not pull them. Imagine the difference between that work train and the number of cars one engine can haul now!

#### Economy in Those Days

"The road west from Dubuque was known then as the Dubuque & Sioux City Railroad. It was acquired by the Illinois Central in the fall of 1867.

"Strict economy in the road department, as to cost of labor and material, was practiced in those days. For instance, in shipping tools to the shop for repairs, we used to make our own tags of the most suitable material available. In making weekly reports, instead of using new envelopes, the supervisor used to cut the ends of old ones which bore his address and send them to his foreman to be used again. In those days money was not so plentiful in Iowa as it is now. People appreciated having steady jobs of any kind. The only work open was on the section and farm.

"I enjoyed my work and always aimed to get the best results for the company—a duty which I think is incumbent upon all. I have always enjoyed and appreciated kindness and favors which I have received from the officers of the Illinois Central Railroad during my time of service and since. I feel proud of the progress the Illinois Central is making and feel for it as if I were still in the harness."

#### Came to United States in 1860

The story of a man who placed the affairs of the Illinois Central Railroad Company foremost at all times is told in the life of Mr. Lonergan. He is now retired and living happily with his daughter on a farm near Polo, Ill.

Mr. Lonergan was born at Waterford, Ireland, in 1841. When 19 years old, the

*John S. Lonergan*

United States loomed as a land of promise to him. He made the voyage in 1860, and traveled west to Eldena, Ill., where he entered the service of the Illinois Central Railroad as a laborer on a section. This was his first work in America. Anxious to make himself of more service to the company, he was constantly going out of his regular routine to do the little things that he was not told to do, but which had to be done by someone.

#### Walked Track in the Storm

Then in 1866 he received an offer of a larger salary with another railroad, and accepted. But by the time he had been with them a year, he considered his move a mistake. In 1867 Mr. Lonergan returned to the Illinois Central as foreman of the section just south of Polo, Ill. He remained in that position until the time of his retirement.

On the night of June 30, 1882, a raging rain storm came up. He was awakened from deep slumber by shrieking winds, deafening blasts of thunder and blinding flashes of lightning. He hurriedly dressed, lighted a lantern and bravely faced the savage storm to see that his and adjoining sections of the

right-of-way were in condition for the passage of the night trains.

It was not long until the most important train on that part of the system was due.

Mr. Lonergan, bent almost double in the effort to resist the great force of the wind and rain, walked the track from Polo to the end of his section. Every joint in the rails was examined, as well as the ties. The water was coming down in torrents, and it was sure, sooner or later, to wash the earth from under the track.

Suddenly there was a sharp whistle behind. At the same moment, just at the extreme limit of his view of the track, Mr. Lonergan saw the rails move. The movement was slight at first, but his eyes caught it. There was a lurch, a sway, and forty rods of the right-of-way was swept away with the water.

Horror stricken, he turned to stop the rapidly approaching train, whose headlight was now plainly seen through the downpour of water. The wind dealt a death blow to the struggling flame of the lantern.

Mr. Lonergan huddled his lantern close to his breast, folded his coat about it and frantically made the effort to give it life. His matches became soaked before he could strike them, and when he was able to light one, the wind quickly put it out. Finally he was successful. The feeble rays of the lantern stretched out into the darkness.

### Signal Saved the Train

Carefully shielding the lantern from the storm, Mr. Lonergan signaled the engineer. A smile of relief spread over his face and his whole body relaxed when the air was split by the shrill whistle that told him the engineer saw the light.

The train was stopped within a few feet of the gaping stretch of track. The engineer alighted, grasped Mr. Lonergan by the hand and greeted him as a true hero should be greeted.

The two then walked back to Polo to wire Amboy of the washout. But the wires were all down. The train remained there until the telegraph line was mended, Amboy was informed and a work train was sent to repair the track.

Mr. Lonergan has been seriously disap-

pointed at the attitude of some employes toward the company in the later years of his service. As new men joined his gang, he says, they showed a lack of interest in it and did not seem to have the company at heart. He says it is more and more that way in the present day, and that many employes do not seem to realize that they are benefiting themselves by giving their best service to the company and by keeping its interests foremost.

Mr. Lonergan was married March 1, 1868, and had seven sons and two daughters. Six of the sons worked for the Illinois Central, and two were killed while serving as brakemen. Two of his boys were in service in France during the World War. Mrs. Lonergan died December 27, 1918, while her two sons were in France.

Today, Mr. Lonergan is the picture of health. Strong, robust and always in the best of humor, he has an army of friends in Polo, and they all have the highest praise for him.

### Tried a Good Many Jobs

Mr. Tait was born in Cold Springs, opposite West Point, on the Hudson River, New York, in 1848. He emigrated to Amboy, Ill., in 1857 and made his home there until 1895, when he moved to Dubuque, Iowa, where he has since resided.

"When scarce fifteen years of age," he says, "I and three or four other 'kids' were graduated with high honors through the back door of the building, and my school boy days were then and there ended. As my father had me lined up for the legal profession, to please him I attended the law office of W. H. Ryan at Amboy. As a starter, two days was spent therein, when I learned the basic principle that law was founded on common sense—and I quit the job never to return to it.

"Later in the season of 1868, another young man and myself made an informal tour of the South, during which time we never lost a meal, had a hand-out, nor 'flipped a train,' and at end of three weeks we returned to Amboy to get a piece of the 'fatted calf' and incidentally tackle the wood-pile.

"A couple of weeks or so after my return,

I formed a co-partnership with a gentleman who was engaged in general merchandise business in Amboy. He was to attend to all inside matters, except such as sweeping, dusting and cleaning lamps, etc., which I had charge of, and in addition I was to see that such articles as needed special delivery were attended to. This place burned to the ground in a month or two, the loss being total, even to my one asset—the wheelbarrow—and I never recovered sufficiently to enter the merchandise line again.

"My next move took me into railroading. On October 2, 1868, I met Superintendent Jacobs on Main street. He and I were scarcely on speaking terms, as I had in mind the diploma he gave me some little time before when he was chairman of the school

*James T. Tait*

board. Much to my surprise, he wanted to know if I could help him out in his office for a month or two. After discussing the matter for a few moments, it was agreed that I was to begin work at noon at a salary of \$36. During the first eight or ten years of my service I never crossed the threshold of the 'old man's' office unless by request, and that was seldom.

#### **Given Charge of the Office**

"In 1876 I was called to his office one morning and was told to close the door be-

hind me. In a few words he advised me that he had made up his mind to have a house-cleaning in the office, and that he had decided to place me in charge of the office. I held the place until he retired April 1, 1892.

"In the meantime, William Head, who was then local claim agent with one assistant, wanted me to take the place of the man he then had. I was called to Chicago, and an arrangement made whereby I was to retain my place at Amboy until July 1, to start as Mr. Jack's successor, and then be transferred to the claim department with an office at Dubuque. I came to Dubuque July 5, 1895, and remained there as claim agent until October 31, 1918, when I retired.

"From October 12, 1868, to October 31, 1918, my name was never off the payroll for a single hour. In those fifty years I never played a game of cards or pool or attended a baseball game, but did take in every horse race in sight.

"When I came to Iowa, more than twenty-five years ago, the country west of Fort Dodge might have been called frontier. There was not a clean or modern hotel in the northwest part of the states. Roads at that time were in such a condition that the only way to make the outside border was to 'foot it.' During three months of the winter season, much of one's time was spent in taking care of frozen members of his body. In March and April, when you had to make a drive, much of the time was spent in getting the horses and vehicle out of the mud. In the winter two scoop shovels to use in a snow blockade were made a part of every equipment sent out of a stable. In June and July a greater part of the time was spent in dodging cyclones and hailstorms and in an effort to keep out of the path of 'hot winds.' The fall season was ideal.

#### **Land Is Worth Much More Now**

"Land was then selling for from \$8 to \$10 an acre. The same land sells at present for from \$200 to \$300 an acre, and in the last ten or fifteen years the country has become almost a Garden of Eden.

"For some years I kept watch of the mileage I covered and found it to be nearly 60,000 a year.

"During these years I had some of the

*(Continued on Page 82)*

# Illinois Central System Betters Service by Co-operating With Public

This is the twelfth in a series of monthly public statements which the Illinois Central System is making through the newspapers on its lines. Each preceding statement has treated of some railway problem of current importance, setting forth information which we believe the public should have and inviting constructive criticism and suggestions. Our aim has been to bring about closer co-operation with the public in such a way as to be reflected in the constant betterment of the service rendered by the Illinois Central System.

Our program was begun September 1, 1920—the day the railroads resumed operations under their own financial responsibilities. The results we have obtained convince us that the plan we have followed has been worth while. We believe that we and our patrons have received, through the better understanding which has been brought about between us, full value for our efforts in newspaper advertising. Consequently we hold it to be our duty to continue to play our part in disseminating information that will give the public a more adequate idea of the problems which railway managements face—which also are the public's problems. We have decided therefore to continue our program another twelve months.

Railway management is the trustee of a vast investment in the railroads, an investment fixed by the Interstate Commerce Commission for rate-making purposes at \$18,900,000,000, but in reality greater than that, for upon the satisfactory administration of railway properties depends the future welfare not only of the railway properties themselves but also of all the manifold activities of our entire national business life.

We believe the railway problems of the United States require the best and most constructive thought of all the people—farmers, business men, professional men and railway men working in harmony. The railroads are ruled by public opinion. If public thought on railway questions is unprogressive, the railroads cannot make progress, which means that they will not be enabled to meet the constantly increasing demands of public service.

The public is not entirely to blame for such unsatisfactory railway conditions as have obtained in the past. We believe the reticence of railway men themselves, in failing to keep the public well informed, has been one of the causes of the growth of restrictive legislation, of unprogressive regulation and of an anti-railway spirit, which have worked a hardship upon railway development, and consequently upon the public itself.

That our discussions have contributed to a better understanding of railway problems on the part of the public served by the Illinois Central System is evidenced to us in many ways. Not only have our patrons helped us in the solution of many problems which we have presented to them, giving us their hearty support and co-operation in carrying out our programs for better service, but the better mutual understanding which has been awakened—a better understanding on our part of our patrons' problems, and a better understanding on their part of ours—has been reflected in generally improved service. Our discussions have also been a means of perfecting within our organization that spirit of loyalty and service which always has characterized the Illinois Central System.

Railway rates are standardized under governmental authority. Service is the basis of competition among the railroads. Service is the measure which determines the worth of a railway system. Service must be unselfish. It must find expression in safety, efficiency and economy. We pledge our best efforts toward serving the patrons of the Illinois Central System.

Constructive criticism and suggestions are invited.

**C. H. MARKHAM,**  
President, Illinois Central System.

## He Finds Contentment, Pride and Profit in Raising Fine Chickens

*E. O. Birchard, Employe at Waterloo, Iowa, Wins Success  
in His Spare-Time Work on Farm*

**W**ASN'T it a Nebraska blacksmith who attracted considerable attention some time ago by proving that he was the richest man in the world because he was the happiest?

The Illinois Central has a man something like that at Waterloo, Iowa. His name is E. O. Birchard, and he is an extra engineer, firing at present on passenger runs between Waterloo and Freeport, Ill. He wouldn't thank you to tell him how well off he is, for maybe he doesn't quite realize it himself; but he has a little farm, a little family, a little motor car, enough work to keep him busy, enough trouble to make life interesting, and enough in the larder to keep the wolf a respectable distance from the door.

Of course, he has his family living in what was built for a chicken house—and what will be a chicken house when he builds his regular home—and he says that the movies would have to close down if they depended on him for their patronage; but outside of that, he and his are getting along as well as anybody could wish. He even finds time to indulge in a hobby—a paying one—and the chicken house above mentioned is the key to that.

### Raises Chickens in Spare Time

Briefly, Mr. Birchard is a chicken fancier—a spare-time chicken fancier. He is one of the growing number of Illinois Central employes who have found better ways of spending their leisure than loafing or sleeping or walking the streets. On his neat little 10-acre farm on the outskirts of Waterloo—on Route No. 3, to be exact, out beyond where the county hospital is likely to stand some day—you will find 250 high-grade White Wyandottes housed in five well-painted wooden buildings, with carefully fenced yards to run in, receiving patient and intelligent attention.

*E. O. Birchard and a Prize Winner*

Mr. Birchard has worked for quality rather than quantity, and in his flock can be found numerous county fair prize winners. Some of his chickens will be shown this year at the Iowa State Fair at Des Moines, August 25 to September 2, and there is a possibility that he may take in some national show. Naturally, as in previous years, he will be represented at the shows in and around Black Hawk County, his home county.

As far as financial results go, Mr. Birchard says he is not getting rich off his chickens, although he always has plenty of eggs and good frying meat and a little something in the way of money. Last year, which was his second season, his expenses for new equipment and up-keep totaled \$261. His income from all sources for the chickens and their products was \$248. This looks like a deficit of \$13, but he points out that his profit was in the fifty head of young

stock he had left over. These fifty chickens were worth about \$3 apiece, which meant a season's profit of about \$140, plus the eggs and other supplies they provided.

### Started Out Three Years Ago

Three years ago Mr. Birchard bought this 10-acre farm, after having lived in Waterloo for several years. At the time his work was so arranged that he was home every third day. He thought that it might be worth while taking up some spare-time occupation; so he talked the matter over with his wife. She agreed, and they decided to try chicken raising, as he had had some experience with them while a boy on the farm.

So they visited the poultry shows, studied the poultry magazines, and eventually picked two varieties to begin with. Mr. Birchard chose the Single Comb Black Minorcas, and Mrs. Birchard chose the White Wyandottes. As frequently happens in many families, the wife was right, and the Black Minorcas were discarded after one season. It is a mistake, anyway, Mr. Birchard says, to try to keep two varieties.

The first year—that was in 1919—they raised fifty chickens. Last year they had about two hundred. This year they have about fifty more than last year.

Right here Mr. Birchard rises to remark that the chicken raiser has to have a lot of stick-to-it-ive-ness. He has to know how to stand discouragements. There's no rosy road to success. You can't get it all from books and magazines; you've got to have practical experience.

### Has Increased His Equipment

Mr. Birchard admits that he has progressed gradually in knowledge of the work. The more he learned, the more equipment he picked up. He now has two small incubators. The first season he had one incubator, and he let the hens assist him with the hatching and brooding. The next season—last season—he got the other incubator, and he got a coal-burning brooder, which he says is the best single piece of equipment the poultry raiser can have. For example, this year, he hatched his first chickens on February 6, and he couldn't possibly have kept them without the brooder.

He goes in for trap-nests, too. In cold weather you have to watch both these and the little chicks constantly, which makes the work a trifle monotonous at times.

Mr. Birchard now has one large brooder house and five small pens for breeders, in addition to a few minor coops. He says he will soon start work on a large laying house to accommodate two hundred layers this winter. It will be constructed so that it can constantly be added to as the flock increases. Then, of course, when he builds the home he intends to build for his family, he will have available for his chickens the house he has been living in. As his farm faces a well-traveled highway, he has everything carefully fenced, as he says it is cheaper to fence that to lose his chickens.

### Ideal Bird a Combination

To start his White Wyandottes, Mr. Birchard imported his settings from Canada. He now has both of John S. Martin's famous lines of White Wyandottes—the Regal for exhibition and the Dorcas for laying. To show the quality of the laying strain, however, he points out that many of his prizes have been won with birds from the Dorcas line. The ideal of the modern poultryman, he says, is to combine both exhibition and utility qualities.

The first season he was in the business he started entering his fowls in the shows but he won only a few minor prizes. The second season, in good competition, he won at several fairs in and about Black Hawk County, and in the local winter show he won several good prizes in competition with old breeders. His chief preparation for the shows is to tame the birds he enters and wash them up—"put 'em in a tub and scrub 'em like a kid," he says. Usually he goes with them to the shows. He will take his vacation to attend the Iowa State Fair this fall and will visit relatives in the neighborhood at the same time. He picks his birds for showing by the standard of perfection published by the American Poultry Association. In order to keep their homes, however, even the layers have to show good qualities on the Birchard farm.

### Gets Eggs in the Winter

Within another year Mr. Birchard plans to have baby chicks for sale, as well as

hatching eggs and breeding birds. At present he markets all his spare eggs to private customers, and he finds they bring good prices, especially in the winter. By having good quality layers, he manages to get eggs in the winter; in fact, his hens average a 50-per-cent production the year around. His main return, however, is from stock and market poultry, which he sells at the local markets.

By culling out the inferior stock all the time, Mr. Birchard manages to avoid much

of the usual trouble poultry raisers have. He culls for disease with the ax. Generally he culls as the chicks come from the incubator. Those with slight ailments then are killed and burned or buried deep in the ground. The mortality is very low in his flock, Mr. Birchard says, and he attributes this to the superiority of the parent stock. He keeps only about a dozen males among his 250 chickens, as the fertile egg is largely a loss on the market.

And he is strong for the White Wyan-

*Above - General View of E.C. Birchard's Farm. Below - Mr. Birchard's Poultry and Their Homes*

*Center - The Birchard Family and Some of Its Pets.*

dottes. Anybody going in the business, even if merely for a backyard pastime, can make no mistake by starting with good quality White Wyandottes, he claims. They make a picture on the lawn or in the field; they are the ideal dual purpose birds; they eat and weigh well; they are of medium size, the standard weight of the males being 8½ pounds and of the females 6½ pounds; they can't be beaten for winter layers, and winter eggs bring the good profit. White Wyandottes are always attractive in the showroom, too, he says, and he claims they are worthy of everything they win.

Mr. Birchard has a hopper feeding system for his flock, with dry mash constantly before both old and young. He gives them grain once a day, just before roosting time. He tries to see that they have plenty of range, plenty of grit and plenty of green food. In fact, he says that one noted poultryman summed success up in five words: Grit, grains, greens, grubs, gump-worms.

#### You Must Know Your Business

Close attention and study are necessary for success, Mr. Birchard adds. It is well

to take poultry magazines. In addition, he and Mrs. Birchard took a course on poultry raising in a correspondence school—that is, they never completed the lessons, but they have the books to refer to. It gives them a chance to follow one man's idea by reading a book, Mr. Birchard says, while in the magazine you find many different ideas, occasionally conflicting. You have to like the work and watch the details, but you can make a neat profit in your spare time and enjoy yourself meanwhile. You have to have some leaning toward it, of course, and a liking to be out-of-doors.

The greatest satisfaction, he claims, is gathering the eggs in the winter time. Another good thrill, he finds, is in standing in the showroom and listening to complimentary remarks on his own fowls.

Mr. Birchard has been with the Illinois Central fourteen years. He started work July 1, 1907, just after he finished high school. He passed the examination to be an engineer in 1912, but has actually worked as one only about a year since then. He and Mrs. Birchard have two children: a boy 6 years old and a girl 4 years old, both of whom are shown with their parents and playmates in the picture.

## Left a Last Word to the Magazine

Chilton R. Pleasants, agent at Bloomington, Indiana, was born November 27, 1875, and died May 9, 1921, at the age of 46 years, 5 months and 12 days. He entered the service of the Illinois Central Railroad Company in November, 1896, and worked twenty-five years as a faithful employe. He started as agent at Poseyville, Ind., coming to Bloomington, Ind., in 1912, as general agent, a position he held until his death. Mr. Pleasants had not been in the best of health for the past year, but his death came as a shock to the entire community.

On May 6 he left Bloomington with a party of friends in an automobile to attend the races at Louisville, Ky. While returning home, he suffered a stroke of paralysis. He was hurried to Paoli, Ind., a distance of about twelve miles, but he was unable to finish the trip home, and died there at 2

p. m., Monday, May 9. He leaves to mourn his death his wife and two daughters, Carol and Eugenia. Mrs. Pleasants and Miss Carol were with him when the end came, but Miss Eugenia, who was attending college at Greensburg, Pa., did not arrive until the following day.

"Chilt," as he was familiarly known, was a member of the Masonic and Elk fraternities and had a large acquaintance covering almost the entire Illinois Central System. His ever-present

C. R. Pleasants

smile (a characteristic of Mr. Pleasants), and his presence in general, will be keenly missed by his host of friends and relatives. He was succeeded by W. T. Pemberton, formerly agent at Linton, Ind.

Just a week before his death Mr. Pleasants wrote the following contribution on "Courtesy" for the *Illinois Central Magazine*:

"Through my twenty-five years' experience as an agent of this company, it has been proved to me beyond all question or doubt that courtesy and kindness in dealing with patrons of this company are the best business getters an agent has.

"No matter how small a patron's business is with us, he is entitled to kind and courteous treatment, and if such is received, he will go away satisfied. As all I have ever come in contact with have some little influence with friends, they will continue not only patrons of our company but advertisers as well.

"I have had hundreds of passengers brought to our line by people I did not even

remember of having seen. My attention was called to the fact that they once took a trip over the Illinois Central Railroad, after buying a ticket from me, and that they got along all right, had no trouble at all changing trains and making connections with the correct and full information given them when they started. They wanted their relatives and friends to go via the Illinois Central because they would have no trouble.

"We all know that about 30 per cent of our passengers are inexperienced travelers and dread a trip of any distance. Disappointments with occasional late passenger trains and fall-downs in freight service can in almost every case be overcome by kindness and sympathy, and hundreds of small claims can be avoided by the same method.

"And so it goes, all the way down through our various departments. A courteous and attentive employe will always get along and is a railroad's best asset. Let's all resolve to practice this virtue even more than at present."

## A Worthy July 4 at Gloster, Miss.

We think that the picnic given by the railway men of the New Orleans division of the Y. & M. V., at Gloster, Miss., on July 4, is well worth more than the casual mention it received in the newspapers, writes a correspondent.

On the day the Y. & M. V. ran special trains from both Baton Rouge and Vicksburg for the accommodation of the railway workers, their families and friends.

At 9:45 a. m. about fifteen hundred of these detrained at the spur north of Gloster and sought the cool shade of a fifty-acre park upon the rolling hills of Amite County with beautifying oaks and rolling lawn. A splendid dancing pavilion in the center afforded ample room for the younger and older couples who delight in these amusements. The music furnished by the Vicksburg Band must have been good to dance by, as we saw an aged minister whose feet involuntarily dropped into the two-step.

But dancing wasn't the only amusement, for every form of amusement that could appeal to the athletic or esthetic sense was provided and indulged in, from foot races

for boys and girls less than 5 years old to the race of the fat men.

It was noted that the prizes furnished by the merchants of Vicksburg were won by those railway people residing at Baton Rouge. Baton Rouge has got so in the habit of growing that she followed her usual course of annexing the prizes, as she does other good things. I must not forget to mention the fact that Judge I. D. Wall of Baton Rouge was the orator of the day. He pointed out the obligation that every 100 per cent American citizen was under to maintain, conserve and hand down the glorious inheritance won for us by those

Men of massive and gigantic mold,  
Whom we must measure as the Grecian sage  
Measured the pyramids of ages past,  
By the long shadows that they cast.

The speech was only twenty-five minutes long, but was packed with good logical reasons for the observance of law as the means of the perpetuation of the rights and privilege of all under the guaranty of the Constitution.

The day passed off without anything to

mar its beauties and its pleasures. Everything had been foreseen and provided for; plenty of ice water distributed in coolers all over the grounds; plenty of cold soft drinks, and one of the most magnificent dinners that it has been the pleasure of anyone to enjoy in a country noted for picnics and barbecues. Truly everything went on merrily as wedding bells; music and laughter and dancing and songs were the constant order of the day, and not a single accident of any kind on the ground or on the train; all arrangements carried out according to schedule.

I have not mentioned what I think was the best feature of the whole entertainment. Men who had read each other's letters, reports, etc., met for the first time and looked into each other's faces, felt the warm clasp of personal contact and realized that they were co-workers in a great enterprise of service, not for themselves alone, but for humanity. The railroad that furnished the transportation and the railway men who gave it and had the observance of the day in charge may safely congratulate themselves that not a soul failed to enjoy the day.

### Things to Talk About

There is every reason to believe that the winter will find the country in the throes of a serious coal shortage, with industry paralyzed and widespread suffering, unless a much greater quantity of coal is mined during the next two months and placed in the hands of retail dealers and consumers.

It is a simple problem in mathematics. The country uses so much coal every year. The mines are able to produce and the railways are able to move this fuel, if the demand is distributed over the year. They are physically unable to mine and move more than a comparatively limited amount during the period of the year when the demand is greatest—the fall and winter. If sufficient coal is not moved, therefore, before this period of heavy demand, there will be suffering next winter.

The demand for coal so far this year has been exceptionally light. During the first four months the production of bituminous coal ran at the rate of more than 12,500,000 tons a month less than during this period last year. We know it was only through giving priority to coal movement that the railways were enabled to keep the country from freezing last winter—and the winter was one of the mildest of recent years. What will be the result of our folly next winter, if the condition which has existed during the first four months of the year is allowed to continue until too late?

Many thousand miners are idle or working only part time. Thousands of railway men who should be moving the coal traffic are out of work. Hundreds of thousands of coal cars and locomotives are standing on the sidetracks, waiting for the coal demand which must come. The miners would be glad to work full time. The railway men are demanding employment. The railways want to turn their equipment to use, to set it to earning.

But the mines can't operate unless they can sell their coal. They can't produce it and store it against the time of heavy demand as other industries can produce and store their merchandise. Individual consumers must buy.

Shortages of materials make for higher prices. If the country is vastly understocked on fuel and the mines and railways are overtaxed to produce and move the coal to supply demands, prices probably will advance. They certainly will not be reduced. Railway freight rates cannot be reduced until operating expenses are lowered and business stabilized; railway men see no hope for a general rate reduction this year.

These factors mean that *now* is the time to buy coal.

It is a big task to make people realize during the summer that they may freeze in winter. We are too prone to drift and throw ourselves into a frantic last-minute effort to save ourselves. But we must wake up on the coal situation. We should make it our duty as railway men to see that the country is apprised of conditions, and realizes their seriousness.

The urgent appeal which President Markham of the Illinois Central recently made for coal-buying has met a great response. His statement has been widely copied, circulated and commented upon. Numerous letters have been received stating that the writers had been moved by his appeal to lay in their winter supplies. The men of the Illinois Central have taken the cue and are laying in their own supplies. This is fine, but it must be continued.

## *Dr. W. W. Leake Resigns to Head Charity Hospital at New Orleans*

*Former Assistant Chief Surgeon, Army Major, Is Succeeded in the Work by Dr. H. W. Kostmayer*

**D**R. W. W. LEAKE, assistant chief surgeon, Illinois Central and Y. & M. V. railroads, in charge of the Illinois Central Hospital at New Orleans since its founding in 1912, has resigned to accept an appointment as superintendent of the Charity Hospital at New Orleans, succeeding Dr. Stephen W. Stafford. Doctor Leake took up his new work August 1, 1921, but will continue as consulting surgeon on the hospital department staff at New Orleans.

To succeed Doctor Leake, Dr. H. W. Kostmayer has been promoted to the position of assistant chief surgeon, effective August 1. Doctor Kostmayer has been on the hospital department staff for ten years, and during his service he has been alternately district surgeon, consulting surgeon and acting assistant chief surgeon. During Doctor Leake's absence from this country while serving in the United States Army, Doctor Kostmayer was appointed acting assistant chief surgeon, and filled the position so satisfactorily that he has been selected as Doctor Leake's successor. Doctor Kostmayer is a graduate of Tulane University, served his hospital service in the Charity Hospital and since that time has been a member of the staff of the Charity Hospital.

### • **Second Largest in Country**

The New Orleans Charity Hospital is the second largest of its kind in the country, the Cook County Hospital, Chicago, holding first place. There are more than 1,200 beds in the New Orleans institution, and the work of superintending such a large institution is a great responsibility. However, the many friends of Doctor Leake among the employes and officials of the Illinois Central and Y. & M. V. railroads are quite sure that he will prove equal to the added responsibilities.

*Dr. W. W. Leake*

Doctor Leake is the son of Hunter C. Leake, district attorney for the System at New Orleans. He was born in West Feliciana Parish in 1884 and has been a resident of New Orleans since 1886. He received his early education in the public schools and T. W. Dyer's University School, graduating there in 1900 and entering the academic department of Tulane University. Upon receiving the degree of B. S., in 1904, he began his study of medicine at the medical department of the university and in 1906 received the degree of M. Ph. In 1907, during his junior year at the medical department, he was selected by competitive examination as an interne for Charity Hospital, remaining there two years,

until he received his degree of M. D. upon completion of his medical service in 1909.

### Headed the Company Hospital

After graduation, Doctor Leake became house physician at the St. Charles Hotel and associate district surgeon of the Illinois Central Railroad Company. A year or two later the hospital department of the Illinois Central and Y. & M. V. Railroad companies was formed, and Doctor Leake was appointed as one of the four district surgeons to look after the hospital department work in New Orleans. On March 3, 1913, when the Illinois Central Hospital was established in New Orleans, Doctor Leake was appointed assistant chief surgeon in charge of this hospital. He remained in this position until entering the military service of this country during the war.

In July, 1918, he volunteered his services and was assigned to Loyola unit, which was organized by Dr. Joseph A. Danna and financed by Mrs. John Dibert. This unit went overseas in August, 1918. Doctor Leake entered with the rank of captain and when the unit became Base Hospital 102 was promoted to major. He was made surgical chief of the hospital at Vincenza, Italy, during the great offensive of the Italians against Austria. After Doctor Leake's return to this country and discharge from the army, he again took up his duties at the Illinois Central Hospital, where he has remained until the present time.

### A Resident of New Orleans

In 1909 Doctor Leake married Miss Virginia deNeveu of Fond du Lac, Wis. With his wife and two children, he resides at 2315 Peniston Street, New Orleans. He is a member of the New Orleans Parish Medical Society, Louisiana State Medical Society, and American Medical Society.

Doctor Leake has been intimately connected with the Charity Hospital for the past twelve years, having received an appointment on the visiting staff of the surgical department in 1909. When the Louisiana Postgraduate School of Medicine was organized a few years later, Doctor Leake was made professor of gynecology and chief of the gynecological division at Char-

*Dr. H. W. Kostmayer*

ity Hospital. At the amalgamation of the Louisiana School with the New Orleans Postgraduate School of Medicine, he remained as professor of gynecology and chief of the gynecological division at the hospital.

---

### GEORGE H. GROCE DIES

George H. Groce, well known on the Illinois Central, which he served for six years, from 1904 to 1910, in general charge of the telegraph, electrical and signal services, died on June 29 at the home of his sister at Fulton, Ky. Burial took place at Fulton. Mr. Groce was born at Tarentum, Pa. His practical railway career began at the age of 16, when he entered the telegraph service, serving successively as operator, agent, dispatcher, chief operator and division superintendent. After leaving the service of the Illinois Central, he devoted his energies to several commercial enterprises in electricity. Paralysis caused his death, although he was active up to five days before his death. He was unmarried.

# 'Tis an Exciting Summer for Baseball Fans on Illinois Central System

## Offices, Shops and Trains—North, West and South—Take Up the National Pastime Seriously

**T**HIS has been an exciting summer in Illinois Central baseball circles. All over the system there has been activity, and local and inter-sectional games have been of frequent occurrence.

The race is now close in the General Office Baseball League at Chicago, two teams being tied for first place on July 16.

There are two, and sometimes three, games played every Tuesday, Thursday and Friday, and some close contests are being staged. At first some of the scores were large, one-sided affairs, but now all the teams are getting down to playing "baseball," there being low scores on each side in every contest. One recent game was a "no hit—no run" game for one team.

The leaders now have to play fast ball to keep from being beaten by the teams in the second division. Since the Burnside players have been using their star battery more frequently, they are mopping up the teams they play.

The league standing on July 16 was as follows:

TEAMS	G.	W.	L.	Pct.
Accounting Department.....	13	10	3	.769
63rd Street.....	13	10	3	.769
Engineering Department.....	13	8	5	.615
Burnside Shops.....	14	7	7	.500
Purchasing Department.....	12	5	7	.417
Operating Department.....	10	3	7	.300
Mechanical Department.....	11	3	8	.273
South Water Street.....	12	3	9	.250

### Active at New Orleans

The Transportation League at New Orleans played its weekly double-header Saturday, July 2, at Holy Cross Park. George Dell, pitching for the Illinois Central Railroad, shut out the Southern Pacific Railroad by the score of 12 to 0, without a hit. The all-around playing of the Illinois Central Club featured, as Dell, pitching for the champion Illinois Central Club, threw the first and only "no hit—no run" game of the season!

Dell sent fourteen back to the cooler via the strike-out route. He passed two men,

the only ones to reach second, and they died there. Not a man reached third base. "Busy" Berckes, the Illinois Central's key-stoner, swinging his timber "a la Babe Ruth," poled one over the right field wall, clearing it by twenty feet. Harry Blackwell crashed out a three-bagger and helped to make it a shut-out by pulling down a long drive to deep center that looked like a home run. Ernie Perrin, playing short for the Illinois Central, accepted six chances without a bobble.

Without a doubt, the Illinois Central team ranks as one of the best semi-pro organizations in the Crescent City. The Illinois Central team leads them all!

Standing of the Transportation League, July 2:

TEAMS	G.	W.	L.	Pct.
Illinois Central.....	6	5	1	.833
Trans-Miss. Terminal.....	6	4	2	.666
Southern Pacific.....	5	3	2	.600
Louisville & Nashville.....	7	2	5	.286
Southern Railroad.....	6	1	5	.166

### Plan Big Game at Champaign

With the assistance of Team Manager Heisler, Manager Said of the Illinois Central All-Stars will place a crack team on Champaign's diamond for a slugfest on Sunday, August 14.

To start with—George H. Culley will do the delivering. Having pitched for Little Rock, Ark., in the Southern Association, the Mississippi State College, and various

other teams throughout the Delta, he came to Chicago to work for the railroad. Culley is connected with the Engineering Department team of the Illinois Central League and just lately with the All-Stars.

Supporting Culley are: "Gene" Heisler, Horton, Shay, King, Ecklund, Bernbach, Stanley and Kiernan. Heisler, King and Bernbach were connected with the Operating team of the Illinois Central League. Stanley is a product of the Engineering Department team, and the fielding of Heisler, Bernbach and Stanley should be one of the big features of the game. The infield will be strongly protected by King on first, Shay at second, Horton at short and Ecklund on third. In all probability Kiernan will be stationed behind the bat.

A strong team represents Champaign,

having a record of winning every game played.

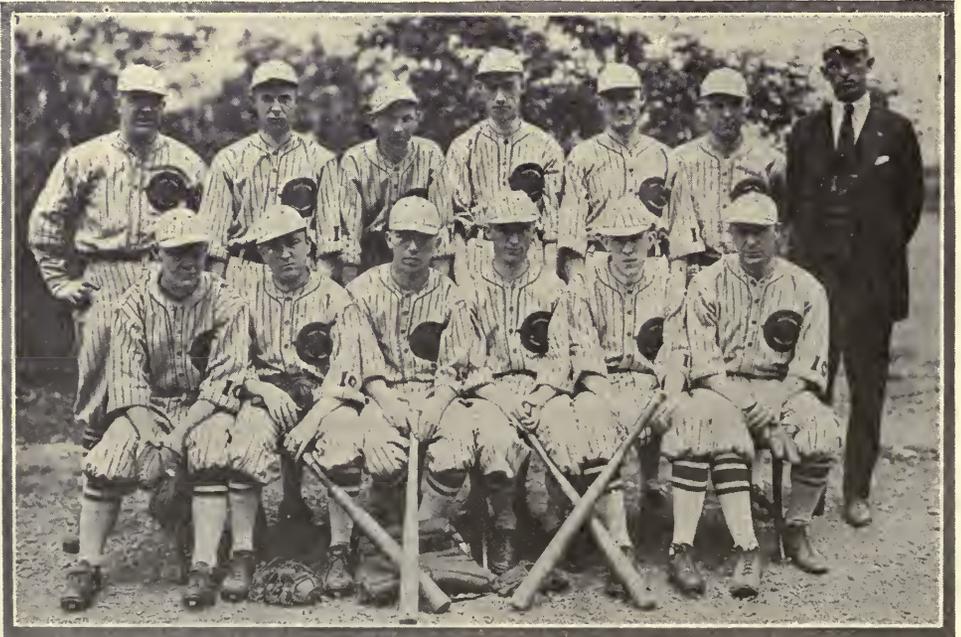

Teams desiring games with the All-Stars may communicate with Manager C. M. Said, E. A. Heisler or E. J. Conway, Room 704, Central Station, Chicago.

#### An Even Break at Princeton

An even break was the best the Illinois Central 63rd Street Accounting Department team could get in a double-header played against the Princeton, Ky., K. I. T. Leagues on July 3 and 4.

The first game—score 4 to 0—was simply a set-up for the crack Illinois Central team. Culley, the star southpaw, was at his best. He struck out seventeen of the first eighteen men that faced him and twenty-two in the entire game. The first hit made by Princeton did not come until the eighth

## Transportation Department, Chicago

Top row, left to right: James A. Henry, pitcher; Robert Stump, first base; Tom Ryan, right field; Charles E. Butler, Jr., center field; Howard Seiselmeyer, utility; Harold Barker, utility; Clyde M. Knodell, manager.

Second row, left to right: Jack A. Southerland, catcher; John F. Henry, third base; Robert Owens, short-stop; James Higgins, second base; Charles W. Giblin, left field; James A. Crotty, pitcher.

inning. The pitching of Culley and the all-around speed and pep of the Chicago boys made the biggest hit so far this year in Princeton.

In some unaccountable manner (our correspondent says) the Princeton team struck their stride in the second game, defeating the Chicago boys by a score of 7 to 4.

Baker attempted to oppose Warner, ex-Southern Leaguer, but the opposition was too great, and Baker was relieved by Casilin in the seventh inning.

The first game consisted mostly of a fusillade of base hits in the first inning which resulted in three runs for the Chicago boys. The firing started after two were out on successive swats made by Nelson, Dowling

and Walker. The next assault was in the third, one more counting at the plate when Reha and Stanley singled after a walk to Bernbach.

### Champaign Wins Another

On Sunday, July 17, a 7-coach special train took the rooters and the baseball team of the Illinois Central trainmen to Champaign to the game between the Chicago team and the team from the Champaign offices. The Champaign team has a private diamond, to which the train was switched for the day. Every one took picnic lunches, which were supplemented by various things on sale on the train. The score of the game was 8 to 6 in favor of Champaign.

---

## Another Honor Voted W. O. Wood

W. O. Wood, a former Illinois Central man, president of the New York & Queens County Railway and vice-president and general manager of the Long Island Electric Railway and the New York & Long Island Traction Company, was elected president of the New York Electric Railway Association at the recent annual meeting held at Lake George. The retiring president is T. C. Cherry, vice-president and general manager of the Rochester & Syracuse Railroad.

Mr. Wood was born in Evansville, Ind., and secured his first railway experience with steam roads. He was for a time with the Louisville & Nashville Railroad, with the Flagler lines in Florida, and also with the Illinois Central Railroad. His service with the Illinois Central began in 1890 and lasted about ten years. He was secretary to the second vice-president at Chicago, chief clerk to the general superintendent at New Orleans and Memphis and trainmaster at Water Valley.

In 1900, he entered the electric railway field as general superintendent of the Rapid Railway, Detroit. Mr. Wood went to Brooklyn in 1903 to become superintendent of the elevated lines of the Brooklyn Rapid Transit Company, and in 1904 was promoted to assistant general superintendent of the company. He resigned in 1907 to engage in special work with the Interborough Rapid

Transit Company, reporting to the late President Shonts. In 1908, he became president of the New York & Queens County Railway and an officer in other companies affiliated with the Interborough Rapid Transit Company.

---

### A BID TO EVANSVILLE

With thirty-five furniture and stove manufacturing plants, Evansville, Ind., on the Indiana division of the Illinois Central, is one of the largest producers of these commodities in the United States, and certainly second to none on our railroad, according to C. C. Kunz, freight agent there. Mr. Kunz, with one eye to advertising Evansville and another eye to freight traffic that is likely to result, is boosting the second semi-annual furniture and stove market of Evansville, scheduled to be held there August 29 to September 3, inclusive. Mr. Kunz would like to see one dealer or more in attendance from every city on the Illinois Central System. The market is being thoroughly advertised in the trade journals throughout the United States, Canada, Mexico and Cuba. All jobbers and retailers are invited to attend. More than 150 firms in fourteen states, Mexico and Cuba were represented at the first market, held in April this year.

## *Busiest Part of Whole System Spreads Along Chicago Lakefront*

*Suburban Passenger Service Runs 348 Trains a Day and  
Handles About 70,000 of City's Workers*

By A. BERNARD,  
Supt., Suburban Passenger Service

**T**HE last article I recall writing for the *Illinois Central Magazine* appeared in the December, 1917, issue. It was an appeal to the employes of the Illinois Central Railroad to be loyal and stick to their jobs. No doubt every reader of this magazine knows of individuals who failed to heed the admonition to "stick" and now are in exactly the predicament then forecast—out of employment and in financial difficulties.

This, however, does not hold true insofar as the Chicago suburban passenger service is concerned. The unrest, lack of interest in work, and dissatisfaction, so apparent among various classes of workers, did not appear to get even a toe-hold among the Illinois Central suburban service employes in Chicago, and the service today, as vouched for by our patrons, is the best in the world because of the experience, loyalty and genuine earnestness of the employes.

### **Handle 70,000 Passengers a Day**

In the 37 miles of territory covered, 348 week-day suburban trains are operated, serving 51 stations and 6 country clubs and handling approximately 70,000 passengers per day.

To handle this traffic at its maximum, there are required 57 locomotives and 227 coaches, and the services of 747 employes, divided as follows: 112 enginemen and firemen, 172 conductors and trainmen, 14 engine foremen and helpers, 51 car department employes, 180 station agents and other station service employes, 30 station cleaners, 83 crossing flagmen, 53 switch tenders, 52 interlocking signalmen.

The efficiency and faithfulness of these 747 men and women is demonstrated by the fact that the 348 trains operated each day are invariably on time, notwithstanding the fact that they are at times scheduled as close as three minutes apart and there are seventeen inter-

locked and non-interlocked railroad crossings and drawbridges with which to contend.

### **Safety First Is Practiced**

These 70,000 passengers are handled daily without friction. Train accidents are of rare occurrence. Such a thing as the death of a passenger is unknown, and the extremely few

*A. Bernard*

personal injuries which do occur are of a minor character, in most instances the result of carelessness on the part of the injured persons.

The more important street and highway grade crossings are protected by crossing flagmen, and although traffic over some of them is extremely heavy, personal injuries and accidents at grade crossings are of no more frequency than they are in outlying territory on divisions where but few trains are run and highway traffic is very much lighter.

The mechanical department employes, although not included in the above mentioned list, play no small part in this highly efficient performance, and are entitled to their full

Illinois Central

Looking south

share of credit for the manner in which the Chicago suburban traffic is being served.

More Than Sixteen Trains an Hour

With 348 passenger trains a day and a rush-hour business of 253 passengers a minute out of two stations, one of the busiest parts of the Illinois Central System is the suburban service of the Chicago terminal division. As the week-day service covers 21 hours and 15 minutes, it can easily be seen that an average of more than 16 trains an hour is maintained for the benefit of the Chicago traveling public. This is one train every 3 3/4 minutes.

Running from Randolph street, on the lakefront downtown, just outside of the well-known "Loop," to the south side of the city and the suburbs beyond, the suburban service carries an exceptionally heavy load of

traffic every day. The week-day begins at 3.30 a. m. and ends at 12:45 a. m. Within those limits, the suburban service handles 216 local trains, 12 39th street expresses, 171 other express trains, 26 specials, and 13 trains for the Chicago, Lake Shore & South Bend railway, an electric line running from Kensington around the lake shore into Indiana.

Territory Totals 37 Miles

The present schedules call for 143,133 train miles in a 30-day month.

The territory covered totals 37 miles, as follows: Randolph street to Matteson, 28 miles; 67th street to South Chicago, 5 miles; and Blue Island Junction to Blue Island, 4 miles.

Of the 70,000 passengers handled each week-day, about 40,000 are handled between 6 and 9

TIME TABLE.—Going North.

TO TAKE EFFECT JUNE 12, 1881.

Table with 44 columns (stations) and 44 rows (times). Includes stations like Riverdale, Wild Wood, Kennington, Pullman, Grand Cross'g, Park Side, Oak Woods, Wood Lawn, South Park, Hyde Park, Madison Park, Kenwood, 43d Street, Oakland, Douglas, 31st Street, 27th Street, 23d Street, 16th Street, 14th Street, Van Buren St., and Central Depot.

Note, opening of 16th Street Station and discontinuance of Weldon.

TIME TABLE.—Going South.

TO TAKE EFFECT JUNE 12, 1881.

Table with 44 columns (stations) and 44 rows (times). Includes stations like Central Depot, Van Buren St., 16th Street, 23d Street, 27th Street, 31st Street, Douglas, Oakland, 43d Street, Kenwood, Madison Park, Hyde Park, South Park, Wood Lawn, Oak Woods, Park Side, Grand Cross'g, Pullman, Kennington, Wild Wood, and Riverdale.

Trains will stop only at Points where Time is given.

a. m. and between 3 and 5:30 p. m. Between 3 p. m. and 5:30 p. m. traffic is the heaviest. A count made recently of passengers leaving from Randolph and Van Buren street stations between these hours showed from Randolph street 10,715 and from Van Buren street 7,807, a total of 18,522 passengers—an average of 124 passengers per minute, the peak being 3,800 in fifteen minutes from 4:30 to 4:45 p. m., or 253 per minute.

#### Add New Equipment and Trains

To improve the already splendid suburban service to the south side of Chicago, we are now adding twenty new all-steel closed vestibule coaches for regular service. These

coaches are 72 feet 7½ inches long and have a seating capacity of 84 passengers, or almost double the seating capacity of our present standard suburban car. The new cars are electric lighted and so arranged that they will be suitable for electric operation when that is installed.

On the west side of Chicago, where we have been operating a limited suburban service between Randolph street and Addison, we doubled, beginning August 1, the service as far west as the Speedway Hospital. This new government hospital, which was opened for the reception of disabled soldiers on August 1, will care for about 1,500 patients.

---

## Had the Jury on the Witness Stand

Colonel Robert N. Miller, one of Mississippi's distinguished attorneys, legal representative of the Illinois Central, at Hazelhurst, Miss., tells the following unusual story of the trial of a case against the company there:

Very many years ago a man who lived near the railroad and who was in the habit of making a pasture of the waylands had the misfortune to have his favorite cow, Sookie, killed. The circumstances were such as to make the company responsible for the killing.

Sookie, unlike the majority of animals killed by the railroads, was not of registered stock, but a plain piney-woods native cow. The owner, however, demanded \$75 for her and scorned a compromise offer of \$25. The lawsuit followed.

The plaintiff's witnesses testified as to color, probable age and size of the animal, and further that in her best state of lactation Sookie yielded only about one pint of milk a day; but nevertheless they stuck to it that she was worth \$75. The railroad had no witnesses, and the outlook for the defendant seemed very gloomy, indeed.

"The only thing in our favor," said Colonel Miller, "was a jury of good farmers, and I at once determined to use them as my witnesses. One after another they were called to the witness stand and promptly qualified. The first juror, when interrogated as to the value of such a cow as Sookie

had been described by the plaintiff's witnesses, hesitated a moment and then replied: 'Well, sir, she was worth not to exceed \$12.50.' The others of the jury were then introduced and concurred in his estimate. Afterward they retired to the jury room and promptly returned a verdict for \$12.50.'

---

#### FRANK J. BECHELY DIES

Frank J. Bechely, at one time superintendent of the old Dubuque division of the Illinois Central, died at his home in Chicago on July 18. Burial was at Bothwell, Ontario, Canada.

Mr. Bechely was connected with the Illinois Central for several years. When the Illinois Central was extended from Chicago to Rockford, he was employed at Rockford as a dispatcher, this being in 1888. When the road was continued to Freeport he went there as a dispatcher and was later sent to Iowa by the company. He was eventually transferred to Dubuque, where he served successively as chief train dispatcher, trainmaster and later as superintendent of what was then known as the Dubuque division.

About eight years ago he retired from railway work and engaged in the real estate business, selling western lands. Later he returned to railway work and organized a company to build a road from Scales Mound, Ill., to Bloomington, Wis

# Coal, Once Burned, Is Gone Forever, and With It Its By-Products, Too.

*Fuel Conservation Is a Personal Matter for Each, and  
Proper Care Is Not Easy to Take*

By G. M. O'ROURKE,  
Roadmaster, Mattoon, Ill.

WE see in the present necessitous condition of mankind that, wherever any benefit is bestowed by nature in an unlimited abundance, we have it always in common among the whole human race, and make no subdivisions of right and property. Water and air, though the most necessary of all objects, are not challenged as the property of individuals, nor can any man commit injustice by the most lavish use and enjoyment of these blessings. In fertile, extensive countries with few inhabitants, land is regarded on the same footing. And no topic is so much insisted on by those who defend the liberty of the seas as the free use of them in navigation. This great country went to war to preserve that liberty, and our flag now sails the seven seas in unrestricted commerce.

The use of air and water without restraint does not exhaust the supply. Economy is made necessary because of the cost of impounding and distributing water and compressing air for commercial purposes, but their nature is not changed. Not so with coal. When it is used for the one purpose required by the railroad—draw bar pull—it is gone forever, and along with it are the by-products. These are certain tarry and watery substances of more or less offensive odor remaining from the transformation of coal into coke and gas. From these substances are secured:

### The Many Gifts of Coal

Creosote, aniline, sodium cyanide, muriate of ammonia, sulphate of ammonia, carbonic acid gas, potassium cyanide, paste blue and blue for enamelers, linoleum stain, wallpaper stain, printing inks, laundry blue, cyanogen green and purple, ammonia, prussiate of potash, cyanogen liquor, carbonate of ammonia, carbozol, crude light oil, copperas, nitrate of ammonia, tar, naphthalene, pyri-

G. M. O'Rourke

dine, pitch, anthracene oil, nitra-benzene, carbolic acid, naphthol, alizarine, anthra-quinone, phenanthrene, gas liquor, prussiate of soda.

### It Is an International Question

There are others, but the foregoing should bring the intelligent person to think seriously. If this paper will but cause the reader to do that, to believe that "I must give the matter of coal saving more thought"—and associate with that one "I" the six "I's" of accomplishment: Industry, Integrity, Intelligence, Initiative, Intensity and Inspiration—it will have been well worth the writing.

The subject is not merely of local or even national interest, but is being seriously considered all over the world. At the last convention of the International Railway Fuel Association, papers were read under the authorship of C. E. Uddenberg, superintendent of motive power of the governmental

railroads of Sweden, and M. deBoysson, chief of the locomotive service, Paris-Orleans Railway, France. In Europe the question of locomotive fuel consumption has always been one of great importance, for the cost of coal, even before the war, has been relatively high, and the yearly fuel bill represents a large proportion of the total operating expenses.

#### A Matter for Each, Personally

Statistics are not considered within the scope of this article. They are presented monthly by the division fuel conservation committees and should be given the close study deserved. Analysis will impress the student with the exigency facing us, but many are not successful analysts, and it is to those the writer would appeal to consider the grave necessity for sincere personal attention to ways and means of conservation and avoiding waste. Let it suffice to say that the fuel bill of the American railroads has increased almost 170 per cent since 1916, and that greater economies in the use of coal must therefore be brought about through greater efficiency in the firing of locomotives and through the thoughtful consideration of all persons interested in the operation of the railroad.

What we must do is all that concerns us—not what our contemporaries think. It is hard, because we will always find those who think they know what our duty is better than we know it. Let us do our work, and we shall reinforce ourselves.

It may be easier, and probably convenient:

To fail to attend meetings of the division fuel conservation committee and take an active part,

To depend upon other committeemen to reach a personal contact with employes,

To let engines out without checking adjustment of valves, running gear, power reverse gears, grate shakers, fire-door openers, etc.,

To fire up an engine some time before needed,

To fill up the fire-box when running and sit down,

To put on a slow order under excuse for safety over track work where possible to maintain higher speed with more work, and

To dispatch trains without regard for conservation of fuel;

*But to do so does not save fuel.*

Our fuel resources are priceless, and the waste of them is a crime. Air we have always with us: rains fall annually in very arid regions, but coal once used is gone forever.

#### Additional Committees

Below is the personnel of the traveling engineers' fuel conservation committees, organized on each grand division to assist the general and division committees, and to promote greater interest and activity among enginemen and firemen:

## For Saving in Locomotive Maintenance

By R. W. BELL,  
 General Superintendent of Motive Power

**L**OCOMOTIVE maintenance is not only related to fuel economy; it is fuel economy in fact.

Next to wages, the fuel bill of the Illinois Central System constitutes the largest single item of expense.

Locomotive maintenance is the only method of conserving fuel that will of itself show a net profit in addition to the fuel saved. Every item of maintenance that makes for fuel economy also promotes operating efficiency and increases the life of the locomotive; therefore the good effects of maintaining locomotives are cumulative.

In 1920 locomotives on this system consumed 4,735,322 tons of coal, costing \$15,681,381.98, divided for use in different classes of service as follows:

Freight .....	3,069,343 tons
Passenger .....	960,727 tons
Yard .....	95,157 tons

The following table shows work performed by engines in each class of service:

Freight..	36,849,449,000 gross ton miles
Passenger	100,450,040 car miles
Yard .....	10,448,844 switch engine miles

### The Performance per Unit of Service

The gross ton miles represent the total scale weight of the car and the lading hauled one mile. The passenger car miles represent the total movement of all of our passenger train cars, while the switch engine miles are computed on a basis of six miles an hour for all yard engines, a summary of which gives us the following performance per unit of service:

Freight ....	167 lbs. per 1,000 gross ton miles
Passenger	1,913 lbs. per hundred car miles
Yard .....	135 lbs. per switch engine mile

We had in service last year the following number of locomotives:

Freight service .....	1,098
-----------------------	-------

Passenger service .....	363
Switching service .....	298

Each one of these locomotives represents a certain definite investment on which a return must be made. This can be done only by maintaining it in a condition to accomplish maximum results in the way of locomotive performance.

A locomotive can only be said to represent 100 per cent value when it is maintained in such a manner to give 100 per cent service. To allow it to deteriorate so that it cannot perform efficient service destroys a proportionate amount of the investment, which would be measured according to its actual physical condition.

### Waste Is Inexcusable

Fuel is potential energy, and the locomotive is the medium through which this energy is transformed into powerful action. The sole object of putting fuel into a locomotive fire-box is to develop power at the draw bar, and waste, due to failure to maintain this medium through which power is developed and applied, is inexcusable.

The locomotive must be in good condition. No other single factor is of so much consequence in promoting the economical use of fuel.

What is meant by a locomotive in good condition? It means a boiler which generates steam freely and economically; proper steam distribution through the cylinders; efficient mechanism for transmitting the power developed in the cylinders to the only place where the power of the locomotive can be measured: namely, the draw bar at the rear of the tender.

For the purpose of considering locomotive maintenance and its relation to fuel economy, the locomotive may be divided into the boiler, the valves and cylinder, and the machinery. The boiler, to promote economy of fuel, must be properly designed, with ample grate and heating surface. It must be clean; the grates

must be level and easily shaken and in good condition; the ash pans and grates must have ample air openings to aid combustion; the fire door should operate easily, and the fire tools should be in good condition; the flues must be clean; the flue and fire-box must be free from leaks; the smoke-box must be airtight; the smoke stack and nozzle must be in line, and the draft appliances must be in good condition and properly adjusted.

## *Selling the Goods*

I called on an old man with my official guide in order to assist him in mapping out a route for his summer vacation, as I knew he had been suffering with rheumatism all winter, and I felt sure that as soon as warm weather arrived he would want to go somewhere to be treated. He had decided to go West.

As he had not had suggestions from anybody as to any other good place to go, I found it very easy to induce him to make the trip to Mount Clements, Mich., via the Illinois Central and another line from Chicago. His reservation was made by me, his tickets obtained, and he left Jackson, Miss., on our Panama Limited for Chicago.

There is some "old man" in every town on the Illinois Central and Yazoo & Mississippi Valley who is going to take a trip this summer. Unless the agent is on the job, he is going West, and the chances are we will not get the "long haul."

A merchant would hardly continue the services of a clerk who could never sell any of his merchandise. Do you, Mr. Agent, expect the Illinois Central to keep you in its service unless you are able to sell some of its merchandise?

As for me, I am going to sell all the goods that I can. It is true that my competitors are many, but my goods are the best; and that is what the public and the "old man" are looking for—the best.

It cost me nothing to make the Illinois Central \$50 in fifty minutes. It cost the Illinois Central 50 cents.  
—B. C. HEIDELBERG, *Agent, Flora, Miss.*

Too much stress cannot be laid on the necessity for keeping boilers clean, because, in addition to effecting a material saving in fuel, this increases the efficiency of the locomotives and materially prolongs the life of the flues and fire-box sheets.

Frequent and thorough boiler washing is the foundation of proper boiler maintenance, and this has been recognized in all standard boiler inspection rules.

A comparison of a number of authoritative tests on the effect of fuel losses due to boiler scale indicates that scale 1-16 inch thick will increase the fuel cost approximately 15 per cent, and scale 1-4 inch thick will increase fuel cost approximately 60 per cent.

Assume that during the past year 50 per cent of our engines contained scale 1-16 inch thick. This means a loss of \$1,176,103.64. While this may not have been the condition, it is quite apparent that there is a possibility of large saving in this one particular item by close attention on the part of all concerned.

### **Must Get Power to Draw Bar**

A boiler that is clean and in the best condition can do no more than generate steam. Proper steam distribution to and from the cylinders must be had; the steam must be made to do efficient work. If the valves are out of square or blowing, if the valve gears are badly worn, if valve chambers or cylinders are badly worn or out of round, if the cylinder packing is worn or broken, if leaky piston rod packing or leaks about the steam chests or cylinders dissipate the steam that should and could be made to work, we can expect no improvement in our fuel performance.

Assuming, however, that the boiler is in good condition, that the steam distribution is good, and that there is no waste of steam through leaks, we can see it remains to deliver this power at the draw bar, and this cannot be efficiently or economically done through the medium of worn-out machinery. Rods in bad condition, boxes or journals loose, wedges which require adjusting and tires badly worn are poor mediums through which to transmit energy.

Some of the repairs which could do the most toward reducing fuel consumption and improving locomotive performance, arranged in what is believed to be the order of

the relative importance, are: setting the valves properly and maintaining valve motion, washing the boilers, keeping the flues clean, eliminating steam leaks about cylinders and steam chests, and maintaining driving boxes and rods, all of which is entirely incumbent upon the master mechanic and his subordinates.

Many fuel tests have been made. As previously stated, the first requirement is that the locomotive must be in good condition, thus implying that the relation of locomotive maintenance to fuel economy is a vital consideration.

### Carelessness Can Spoil All

We have gained nothing by making fuel tests to determine, for instance, the amount of fuel that can be saved by applying a superheater to a locomotive, with everything in good condition, if, when the locomotive properly equipped is placed in regular service, we

operate it with superheater tubes stopped up, clinkers at the end of the superheater units and honeycomb on the flue sheet, thus making, in effect, a condenser out of what should be a superheater. If to this we add 1-8 inch of scale on the interior of the boiler, we have lost more in efficiency than we can possibly hope to gain by the application of the superheater.

If we apply a brick arch to a locomotive to increase the length of the flamework in the fire-box and to promote better combustion, and then continue the locomotive in service with the flues leaking or stopped up, with the grates in poor condition and with the arch tubes coated with scale, we have lost all of the efficiency which should have been gained by the application of the arch; and in addition we have increased the probability of accident and locomotive failure.

The co-operation of all employes concerned is earnestly requested.

## How Others Can Help to Save Coal

By V. R. BYRD,

Conductor, Memphis, Tenn.

**A**S an old employe, twenty years in service of the Illinois Central and Yazoo & Mississippi Valley, I notice with a great deal of pride and pleasure that my old superintendent has been chosen as chairman of the committee. I feel no hesitancy in submitting a few suggestions on a live subject: viz., conserving fuel.

In the first place, I always attend the meetings at the fuel car when it visits our railroad, and from Mr. Dodge and Mr. Lindrew I have learned a great many valuable facts, in addition to what I have observed already in my daily experience in yards and out on the road. While it is true that it is up to the engineer and fireman to a large extent to cut the coal bills, we others can do our bit. I have in the past done, and in the future expect to do, my best to assist them in any way possible. The conductor, brakeman, car repairer, yard crew, bill clerk, agent and dispatcher, all can do their bit and eliminate a great deal of waste if they see fit.

The conductor, who is in charge of the

train, and, next to the engineer, the highest employe, can render a great saving by being on hand and ready to go at the right time; by supervising the switching, picking up cars on line in proper place, thus saving switching at terminal, which costs money; by seeing that his crew release all hand brakes prior to departure of train, that air is O. K. and no leaks, for with hand brakes set and a leaky train line the man on the head has hard sledding to get his train going under such difficulties.

When picking up cars on line, the air should be cut in when the engine is coupled on cut, for if a bad train line is found, if the train crew is unable to repair the defects, they should switch the car to the rear. This may take time, but will save coal and delays in the long run and pay for the move.

The car man can do his part by looking over the train, catching defects and remedying them prior to leaving time. It is a very trying situation to a train crew to find out when all ready to go that the 26th or 77th car in train is bad order. This requires

a bad delay in setting the car out or a worse one in waiting for it to be repaired.

The yard crew can do their part by making up the train in station order, switching out all bad orders, no bills, etc. Couple track, have caboose on and everything set to ride on list. It is very disheartening to a crew to go to the yard and have to wait on a train to be made up.

#### A Chance for the Bill Clerk

The bill clerk can materially assist in the good work by billing cars correctly, both as to initials and numbers. Otherwise, cars will have to be set out. This means delay, and delay means money spent unnecessarily.

The agents at terminals and other junctions and others can assist by seeing that yard clerks have a correct check of the train and bills lined up for pick-up train. Agents at small points can save time and money by making out the switch list properly. We have a number who do not do this.

The dispatcher can save more money than any one else, for he is the main man and master of ceremonies, as it were. He can

eliminate lots of unnecessary stops and detentions by issuing 19 orders. Happily, many of them are doing this with success.

The conductor on a local can save the company a lot of money by keeping himself advised of the movement of all dead freight and manifest trains and block signal territory. He can have his work arranged so he can get into the clear without stopping the superior train.

On one district I ran a local more than a year, and I believe I am safe in saying I never delayed a through manifest or passenger train.

Figures show it costs six hundred pounds of coal to stop a freight train, and if I have the interest of my employer at heart I can at least live up to instructions and get out of the way and let the man go who can. Besides the delay in stopping the train, there is a danger of draw bar trouble, air brakes sticking and having to slack the train away. The easiest way out is the best. A delay of a few minutes to a local may save a through freight an hour's delay somewhere else.

---

## Women Become Railway Workers

Women workers now are flocking to the employ of the nation's railroads. Nearly 100,000 women are helping to build lines and maintain and operate existing systems, a forthcoming report of the Interstate Commerce Commission is expected to show.

Women constituted in 1920 nearly 5 per cent of the nation's 2,000,000 railway employes, according to a census taken by the commission, and the number is increasing daily. The commission now is preparing a new census of female railway workers for 1921.

The 1920 census shows that women are going in for all kinds of rail work, heavy as well as light. They are cleaning engines and headlights in roundhouses, keeping watch night as well as day at dangerous grade crossings, operating telegraph keys, carrying messages of train dispatchers, and even doing carpentry and other heavy work in the railroad shops.

In some jobs, women, the railroads are learning, are more efficient than male.

workers. Some jobs in which numbers of women are at work are:

Attendants, more than 1,000; cleaning, 4,000; shop workers, more than 1,000; station agents and assistants, 1,200; telegraph and telephone signal service, nearly 2,000; car department, 1,500.

More than 400 women are at work in each of these classes of jobs:

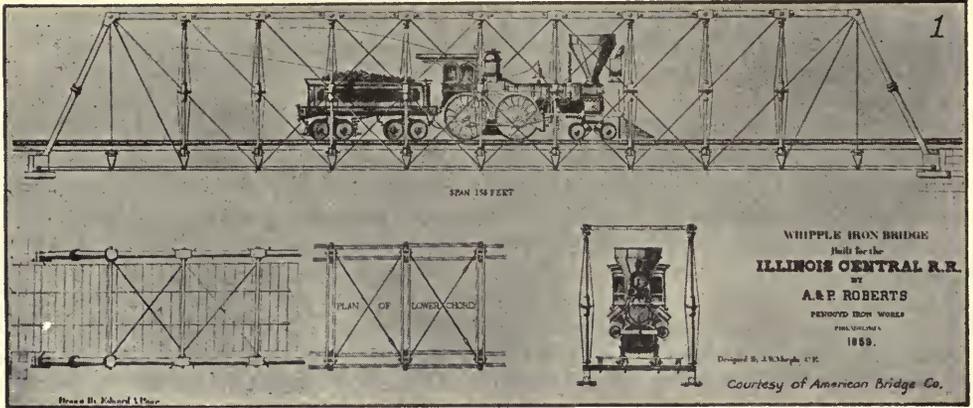

Messenger service, roundhouse general work, watchwomen and warehouses and docks.

Nearly 300 women are listed as common laborers, while 500 were taken on from roundhouse clerical work. More than 100 are at work wiping engines in the dirt and grease of shops and roundhouses, while a few are employed at turntables.

The census shows that more than 50,000 are annually employed in clerical jobs. But the proportion of women workers in other lines of endeavor is increasing at a much faster rate.

# A Pictorial History of Our Bridges

By S. F. GREAR, Chief Draftsman, Bridge Department

No. 1—This photograph of an old drawing, received recently from the American Bridge Company, shows the first metal bridge erected on the Illinois Central Railroad. The truss was fabricated in 1859 at the shops of the Pencoyd Iron Works, and was erected in 1860 over the Cache River at Ullin, Ill. The span was 158 feet long. There is nothing to show the material, but without doubt all of the stiff members and connections were cast iron and the tension members were wrought iron. Some idea of the designing load may be obtained from the picture of the engine which is drawn on the span.

No. 2—The span shown in picture No. 1 was replaced in 1879 by the span pictured above. This was a combination span having timber for all stiff members and wrought-iron rods for tension members. The floor beams were of wrought iron and stringers of wood. A great many of these spans were built about that time, but they have now all been replaced. The last span of this type, at Hodgenville, Ky., was replaced in 1918.

No. 3—The combination span, No. 2, was replaced in 1897, at the time this portion of the line was double-tracked, with the span shown above. This is a steel truss with pin-connected joints and is still in service.

No. 4—This view shows a 150-foot span at Pond River, near Bakersport, Ky. This represents the most modern practice in the construction of truss spans. All of the members of this truss are stiff members, and all joints are riveted, making an extremely rigid span.

# Analysis Shows Most Excellent Results of "No Exception" Campaign

## New Orleans Terminal and Southern Lines First in June, but Others Show Greatest Improvement

By C. G. RICHMOND,

Superintendent, Stations and Transfers

THE final figures of the June system "No Exception" campaign, the ultimate object of which was to reduce freight claim payments on the Illinois Central and Yazoo & Mississippi Valley, show a marked increased efficiency in the handling of L. C. L. freight as compared with March.

The June "No Exception" statement, published in the July number of the *Illinois Central Magazine*, showing a rank of divisions and detail of exceptions charged, was based on the number of exception reports received.

In determining the rank of competing divisions from the standpoint of efficiency in the handling of L. C. L. freight, the tonnage handled compared with the number of exceptions charged is considered a proper efficiency basis.

The New Orleans terminal division ranks first among divisions for June, handling 750 tons per exception; the Illinois Central Southern Lines rank first among the grand divisions, handling 365 tons per exception.

The system as a whole handled 149 tons per exception in June, compared with 34 tons in March, an increase of 115 tons, or 338.2 per cent.

### The Greatest Percentage of Increase

The Louisiana division handled 563 tons per exception in June, compared with 36 tons in March, an increase of 527 tons, or 1,463.8 per cent. This is the largest percentage of increase in tons handled per exception shown by any division.

Illinois Central Western Lines handled 312 tons per exception in June, compared with 33 tons in March, an increase of 279 tons, or 845.4 per cent. This is the largest percentage of increase in tons handled per exception shown by any grand division.

The tonnage handled and exception reports received in June compared with March

show a remarkable increase in efficiency, the tonnage decreasing 26,827 tons, or 8.5 per cent, while the exceptions decreased 7,251, or 78.9 per cent.

As a result of this increased efficiency, the number of claims presented for April, May and June, compared with those for the same period last year, show a decrease of 12,248, or 29.5 per cent; claims paid for lost packages during this same period show a decrease of 1,550, or 53.8 per cent.

### Work Is a Pledge to the Future

The management is very much pleased and has expressed its appreciation of the splendid results which have been obtained during the past three months' "No Exception" campaign, and there is no doubt that the increased efficiency in the handling of L. C. L. freight as shown by all divisions will be reflected in a material decrease in freight claim presentations and payments in future months.

With the closing of the report for June, the special "No Exception" campaign ended, but it is not the intention of the management that the activities of employes in eliminating causes for exceptions be reduced in any way. The same methods which made it possible for these lines to make such a wonderful

### [ The Last Straw

Overlooking things is only a habit, and it ultimately leads to but one end—a Time Ticket. The first oversight leads to a second; the second to two more, from which spring four more, and so on, until the camel's back is broken.

Avoid the habit and you will be ever immune to the consequences. Remember that the straw that broke the camel's back had a lot of assistance.—E. P. O'DONNELL, *Stenographer, President's Office.*

showing should be continued by all departments, and the standard of efficiency shown during June maintained in succeeding months.

The following is a statement showing the tonnage handled and exception reports re-

ceived against each division and grand division for June, also the increased efficiency in the handling of L. C. L. merchandise during June as compared with March, the month preceding the first "No Exception" campaign.

### Things to Talk About

Much of the agitation for lower rates has been coming from the granger section, and rates on grain especially are being subjected to attack. Statistics just compiled by the Bureau of Railway Economics show that the heavy export movement of domestic wheat begun in July, 1920, had, up to May 1 this year, exceeded the export in any twelve months' period for the last six years. It was greater, with one exception, than any like period since 1911.

The export movement of domestic wheat for the first four months of 1920 far exceeded that of any other like period for the last six years.

Exports of all other leading domestic grains, except oats, also were greater in the first four months of 1921 than for any other like period in the last three years. The export of oats during the war exceeded the exports of the last year.

# One Actress All Our Own Is Found for Illinois Central Theater-Goers

*Miss Gladys Coburn, Daughter of Employee, Thanks the  
Road for Her Start in the Profession*

**M**ISS GLADYS COBURN, a noted stage and screen actress, is a member of the Illinois Central family. She attributes the start of her theatrical career to the Illinois Central Railroad. Her father, Frank P. Coburn, of Paducah, Ky., has been in the service of the company since 1895, the last fifteen years in the passenger service, and it was through him that she obtained passage to New York in 1914 to attend dramatic school, and to get her first experience on the stage. If it had not been for this transportation, she says, she might not have gone to New York.

Miss Coburn had no intention of becoming an actress at the time of the trip East, she says. She had attended Central College at Louisville, Ky., and had found there that she was interested in the study of the drama. Then, too, the chance to visit the metropolis appealed to her after many months of conscientious study at school.

After a 6-month course at the dramatic school, Miss Coburn heard of a theatrical producer who was in need of a character for a new play, "Too Many Crooks." Unknown to her parents, she and a friend went to the producer's studio to make inquiry. Not fully realizing what she was doing, but extremely thrilled with the new experience, she says she accepted a position for a minor role in the play. The enthusiasm of the producer over her Southern type—just the type he desired for the vacant part—is what caused her to accept the offer more than anything else, she says.

## Met With Rapid Success

When her mother and father were informed of the step, they protested, but earnest pleading on the part of the daughter won their consent. However, Mrs. Coburn went to New York to be with her daughter. The two went hand in hand, and the mother proudly watched the talent of her daughter

forge its way into prominence. It was not long until her ability attracted other producers, and better offers began to pour in. Then her mother returned to Paducah, Ky., to attend to her home duties.

When there, the fact that her daughter was out in the world alone made more of an impression on her mind than ever, and she decided that it was best to get the family together. By this time, Miss Coburn had become the leading lady in a production with the popular star, Julian Eltinge. But she gave it all up at her mother's request, and returned home.

## And Then Into the Movies

When a year had elapsed, a return to her profession was the first desire in Miss Coburn's mind. She had friends who were in moving picture companies. The screen proved to be her new ambition.

Henry Savage gave her a chance in a production of "Madame X," with Dorothy Donnelly in the leading role. She was fortunate in having friends in the company, she said, for she took a part immediately without going through the usual preliminaries.

Again her unusual talent brought her to the foreground, and she has appeared in the productions of some of the leading motion picture concerns, such as Fox, Metro and Selznick. She was in the Hugo Ballin production of "East Lynne." She also appeared as leading lady with William Farnum in the Fox production of "Heart Strings."

Then the desire to be before the lights of the stage again presented itself. It was too much to resist after she had once been there. So she reported for rehearsals with the "Century Girl" company in New York. She was surprised to find that she was not able to act as well as formerly, she said. It was just like beginning all over again. Her voice failed to obey, she said, because it

had not been employed in the movies. Consequently she was satisfied in the minor roles. But she soon became herself again,

and climbed into the leading roles.

Miss Coburn says that she finds moving picture work much more interesting than

Miss Gladys Coburn

the stage, but that an actress on the stage must be more finished. It requires a longer training and the intention to become a better artist. This does not mean, she said, that the leading motion picture actresses are not artists. In fact, the motion picture concerns are much stricter now in choosing their talent than in former years.

Her advice to ambitious motion picture aspirants is that they should by all means try it if they can get the opportunity. An individual picture is taken of the beginners, she says, to see how the camera records their features. Then a director studies them and advises them as to the best make-up for the individual case. But the person who ultimately makes the decision is the actress herself. That which brings out the features on one person will not suit another at all, she said. Each one must ex-

periment until she is satisfied with the way she appears.

#### Now Playing in Chicago

"Horrors!" Miss Coburn says she exclaimed when she first viewed herself in motion pictures. "Do I look like that?" And Miss Coburn is a beautiful young woman, as the photograph shows. She is of the type that is a feast for the eyes. A camera that could not record her features ought to be thrown in the junk pile.

She is not only beautiful, but interesting. She has a happy disposition which has no trace of the temperament usually attributed to actresses.

Miss Coburn appears alternately on the screen and stage. She finds that one is a help to the other. At present, she is in the role of Mildred Towne in "Up in the Clouds," which is showing in Chicago.

---

## Illinois Farmers Plan a Real Picnic

The Illinois Agricultural Association state picnic, for which preparations are being made to receive as many as 15,000 farmers at Assembly Park, near Dixon, September 3, stands as the modern outgrowth of the picturesque shucking bees, spelling matches and other homely gatherings of bygone days on the farm.

Pitching horseshoes, catching the greased pig, amateur horse races and feats of strength will be featured. The horseshoe tournament will be for the state championship. Each farmer will bring his own lunch basket as of yore.

The modern farmer will come in his automobile. Preparations are being made at Dixon for the parking of hundreds of cars. There will be baseball games and swimming matches.

The "speakin'" will probably be about agricultural economics, marketing and legislation, which take the place with the modern farmer of the problems of clearing and fence building.

The chambers of commerce of Dixon and half-a-dozen nearby towns, in co-operation with the county farm bureaus of the congressional district in which Dixon is located, are organizing themselves as hosts.

County farms bureaus in all parts of the state are holding horseshoe contests at their county picnics to select their champions to compete in the state championship horseshoe tournament on September 3.

Last year's Illinois Agricultural Association state picnic was held in Sangamon County, a few miles out of Springfield. It brought out an attendance of 14,000.

---

#### NAMED FOR COMMISSION

Frederick I. Cox, of East Orange, N. J., has been nominated by President Harding to become a member of the Interstate Commerce Commission, succeeding Edgar E. Clark, chairman, whose resignation takes effect August 31. Mr. Cox, whose appointment was made on the recommendation of the National Council of Traveling Men's Association, indorsed by Senator Frelinghuysen of New Jersey, is a silk salesman, for many years a representative of a New York firm. His name was suggested last April, when the President made the appointments called for under the law enlarging the commission. The present appointment is for a term ending December 31, 1926.

# What an Apprentice Saw and Did Thirty Years Ago in Amboy Shops

*Old Buildings, Dismantled in 1893, Were the Scene of Some Crude but Effective Efforts*

By L. A. NORTH,  
Shop Superintendent, Burnside.

**T**HE Illinois Central shops were built at Amboy in 1855 and dismantled in 1893. The officers in charge just previous to 1892 were: J. B. Adams, master mechanic; B. B. Howard, general foreman; J. Drummond, blacksmith foreman; Dennis Powell, boilermaker foreman; William Hall, tinner foreman; John Gunning, painter foreman; Robert Richards, car department foreman; Charles Tait, day roundhouse foreman; Charles Baunchback, night roundhouse foreman; James Olson and George Edams, gang foremen on the floor side.

The shops consisted of buildings as follows: A complete circle of the roundhouse, consisting of twenty-four pits; the back shop, with two floors; smith-shop, boiler-shop, tin-shop, passenger shop, and sand- and oil-house.

Next to the machine shop was a small building, which served as a storehouse and as the master mechanic's office. The timekeeper, too, had his office there. As the men passed this building to the main entrance to the shops, the timekeeper checked them off morning and noon. No brass checks were used by employes at that time, such as is the present practice.

These shops nominally employed from 250 to 275 men. The back shop was connected to the roundhouse, so that engines which were to be repaired were run through the stall forming this connection. A turntable was in the center of the pit-side. On this table were two separate tracks set out of center, matching up with tracks from the roundhouse stall, so that this arrangement permitted four engines to be placed in the back shop on separate pits.

## Some Jobs for the Apprentice

One of the jobs assigned to the younger apprentices was to crawl under this table and clean off the dirt and refuse that had accu-

L. A. North

mulated on the track since the table was last used, and usually, between keeping from setting himself afire with the old "fist-burner," as the lamp was then called, and dodging rats and other vermin, he had a busy time of it. After an engine had been placed on the table it required all hands to turn it so that the tracks on the table would line up with the pit tracks. Then the engine was pinched off the table by Felix and Andy, old-timers around the pits. These two men also pinched the engine when valves were being set, and the boy who missed catching a center surely received a good calling down from them, as they had performed this class of work so long that all the boys thought they knew as much about valve setting as did the mechanic, which was very likely true.

The method of unwheeling engines at

that time was to jack them up with 50-ton Dudgeon hydraulic jacks. This work was usually assigned to the apprentice boy. The mechanic followed up with the blocking and wedges. After the wheels were removed the engine was lowered to a suitable level by the same method, where the balance of the stripping was performed and the parts distributed to the different places where repairs were to be made.

Boiler work was performed on the engine on the pit where the engine was dismantled. The majority of the engines at that time were of the standard 8-wheel type, and very much easier to handle with the hand labor then in vogue than would be the present locomotive. Fire-boxes were applied in five sheets. After the old sheets were removed, new sheets were drawn up in the box and bolted in place, and all rivets were driven by hand. Staybolt holes were tapped out by hand. Staybolts were made at that time in 24-inch lengths, screwed into the boiler, then nicked with a hand hammer and chisel and broken off, after which the bolt was taken to the bolt-threading machine and repointed, so that it could be again screwed into the fire-box. Why this length was used in place of the present single staybolt length, I am unable to explain. After all this was done the bolts were driven on each end by hand.

#### How the Flues Were Handled

The flues were cut off by hand at the front end with the old-fashioned heel bar, and with the ordinary hammer and chisel at the back. At that time it was necessary to remove the steam pipes, tee-head and dry pipe in order to pass the flues out of the boiler, no large hole having been provided in the front flue sheet for the removal of flues, as is the present practice. After the flues were removed they were tumbled into a rattler, similar to the one still in use for that purpose, then taken to the blacksmith shop, where the rough ends were cut off in a flue-cutter similar to those now used. After this the flues were welded by two flue-welders with hand hammers, one striking right-handed and the other left-handed, the flue being turned all the while by one of the operators to insure an even weld. In re-applying the flues to the boiler, the method was similar to the one now used, except that all labor was performed by hand in place

of pneumatic tools. It usually fell to the lot of the apprentice boys to remove the steam pipes, dry pipe and throttle box, to perform all grinding operations and to replace them.

#### Some Work That Tested Skill.

During the writer's experience as an apprentice there were still in use a few of the old type-V throttle boxes in the smoke-boxes of the engines, as well as a number of the old type-D throttle boxes. The joint on these throttle boxes, which controlled the flow of steam to the cylinders, was a flat joint similar to the present valve seat on a slide-valve engine. The spotting down and grinding of this joint was considered one of the fine-haired jobs of the trade, particularly so with the old style-V throttle box. Sometimes the seat had been cut out, due to a bad steam leak. This required patches to be applied, preferably of brass, and in the close quarters in which the work was required to be done it took exceptional skill to perform a first-class job. This was usually given to the boy well along in his apprenticeship, and the boy who made a first-class job of this joint was considered well on the road to becoming a first-class mechanic.

The driving tires were turned on an old single-head wheel lathe. The time consumed in this operation was from eight to ten days for each pair of tires, working nine and ten hours a day. High-speed tool steel or heavy duty tools were not in existence at that time. Driving boxes were planed one at a time. Driving-box brasses were not fitted in the boxes, as is the present circular shell in the modern engine of today, but were cast in an angular shape similar to the brass now used in the trailer or engine truck box, and were required to be carefully fitted to the sides and top to insure the engine against being turned out of the shop with a pound in the box. This operation was usually performed with a hammer and chisel and file, spotting the brass to the contour of the box with lamp-black. After this operation, the cellar was applied to the box, and the box was bored out to fit the journal on an old quartering machine, as no boring mill suitable for this operation was in use at that shop.

#### When the Master Mechanic Helped

The steam chest, valves, shoes and wedges, binders and spring rigging were handled in

about the same manner as they are handled at present, with the exception that a flat gibb was used in place of the round one in the spring hangers. The eccentrics, motion work and rods were handled by two gangs which were steadily assigned to this class of work. When it became necessary to apply a new crank pin, the old one was first removed either by sledging it out with a 25-pound sledge or with a battering ram, after which, when the new pin has been turned and properly fitted, the hole was heated to expand the wheel as much as possible, while the new pin was applied with the same method as that used in removing the old one. This was rather a particular job, usually requiring the attention and presence of the master mechanic, general foreman, blacksmith foreman and gang foreman. In the removal and application of a driving axle, which was rather an unusual occurrence, the axle was removed by means of large clamps, 3-inch bolts and nuts, pressure being applied to the bolts by means of a large box wrench. This usually required from eight to ten men. After the new axle had been

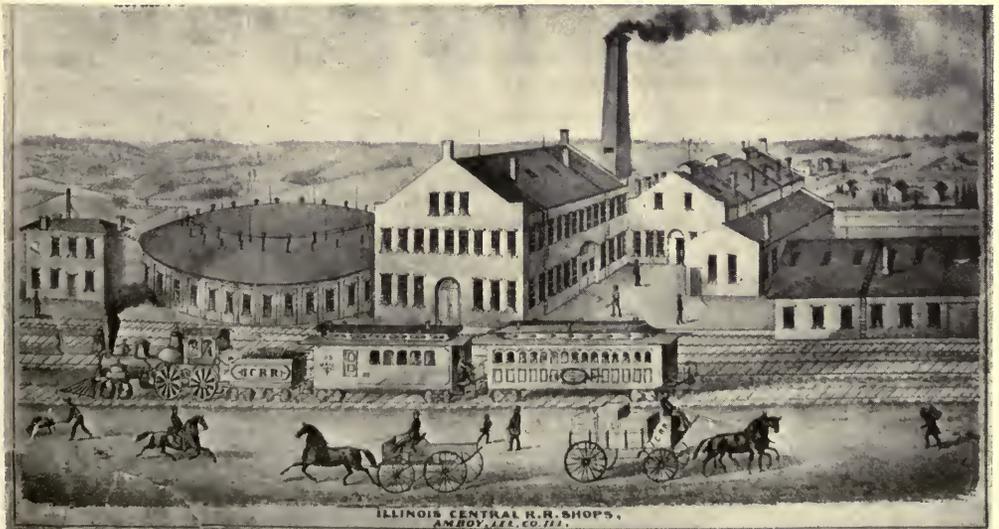

fitted, application was made in the same manner.

Cabs were removed from the locomotive by means of a block and tackle secured to the second floor, after which they were placed in the center of the shop and pulled up with block and tackle through some trap doors on the second floor.

#### "Balloon" and "Diamond" Stacks

Ash-pan work, stack work and all sheet iron work was performed on the second floor and handled to and from the first floor in the same manner. The stack, sheet-iron, ash-pan and front-end work was all taken care of and repairs made by Boilermaker Thomas Huff with several handy men and helpers. Engines at that time were equipped with what was known as the "balloon" stack and the "diamond" stack. Very few engines were running on the division at that time with the straight stack, or what was known as the self-cleaning front end. The sheet-steel or sheet-iron from which these parts were made was usually scattered around on the floor wherever there was room for it.

It happened in the old shop, as it usually

*The Amboy Shops in the 70's—The building to the left of the roundhouse was used as a sandhouse, tank and pumphouse; to the left of that was the coal shed. The roundhouse was a complete circle of twenty-four stalls, including the arch. To the right of the roundhouse was the machine shop, which had the boiler and engine room in the rear. The upper story of this machine shop was used as the wood-work shop. The building adjoining the corner of the machine shop to the right was divided for use of blacksmith shop and boiler shop. The next building was the storehouse and office building. The building to the right of that was used for overhauling freight cars and coaches.*

did in other shops, that one of the employes was given to playing practical jokes whenever the opportunity occurred. He came to the shop one night and caught the shop cat, took some English walnut shells and glued the cat's feet in the shells, then turned the animal loose upstairs. As no night force was employed, the shops were covered or patrolled by a night watchman. After it became dark the cat started to walk over the sheet-steel lying on the floor and naturally made considerable noise. This attracted the attention of the watchman, and he started out to investigate, but when he appeared on the second floor with his lantern the cat remained quiet. After this had occurred several times, the watchman began to believe that the place was afflicted with ghosts. For the rest of the night, whenever he made his rounds on the second floor, he insisted that the night roundhouse foreman or one of his men accompany him. It took some time for this story to leak out, and the watchman was surely the laughing stock of the town when it was explained.

#### **A Job for a Strong Back.**

There was also on the second floor of the machine shop the wood-working machinery for the car department, which made it necessary to handle all the heavy timbers up and down a flight of stairs on the backs and shoulders of the employes engaged in that work. Jackets and pipe work were also handled on the second floor in the tin shop, which was directly over the boiler room. Also, such tinware as was used was manufactured in the same shop.

The blacksmith shop and boiler shop were combined. Some few machines were installed there for punching, sizing and drilling boiler-plates. No forging machines were in use at that place then, all forgings which were required being made over the anvil and under the drop-hammer. All bolts other than rough bolts used by the car-workers were drawn out from billets under this drop-hammer. The blacksmith had become so expert at this class of work that bolts turned out could not be told from one of the bolts made today in one of our present upsetting machines.

Springs were also repaired at that place, and the work of performing that by hand

was much different from the operation today, when practically all of the work is done by machinery.

#### **Depended on Mechanic's Skill**

In the machine shop, on the floor side, were lathes, planers, several shapers, a few drill presses, a car-wheel axle turning lathe and car-wheel boring mill and press for mounting the wheels on axles. Pressure was furnished this machine by means of a screw. I do not recall how the amount of pressure was arrived at, as the screw was turned by means of a pulley driven by a belt. The wheels were pressed on by the straight belt and the screw backed up by a reverse belt. I am of the opinion that it all rested with the skill of the mechanic who made the fit.

Owing to the absence of the present-day autogenous welding methods, it was necessary to apply patches either by rivets or patch bolts, which required a number of bolts to be turned up in order to make repairs. The bolt was first forged in the blacksmith shop in a die under the drop-hammer, then brought to the machine shop and centered on each end, after which it took five complete operations to finish it. By the ordinary apprentice boy this was considered a job to test out his skill, and the boy who could turn out from thirty to thirty-five complete patch bolts in nine hours was considered one who would make a first-class mechanic on machine work.

#### **No Order in Keeping Tools**

The tool-room consisted of a small cubby-hole underneath the stairway leading to the second floor. In this tool-room tools were thrown helter-skelter, no check or record being kept of who used them or whether or not they were returned. No pneumatic tools were in use, and consequently the equipment was not very extensive. All drilling and reaming was done by ratchets. In 1888 instructions were issued to equip all engines with the air-brake. At that time twist drills were a special luxury, and this necessitated a great deal of ingenuity on the part of the officers in charge to provide suitable drills for drilling some of the long holes that were necessary to apply the different parts of the brake rigging, and also to make a drill that would perform a rea-

sonable amount of work in a given length of time.

After the engine had been overhauled, the master mechanic and general foreman broke the engine in—in other words, they ran it up and down the main line for four or five hours. Then the engine was brought back to the shop and the finishing touches put on before it was turned out in regular service.

In the car department, which consisted of one small building and a rip track, repairs were made to all passenger cars, cabooses and freight cars. The building was used mostly for repairs to passenger and caboose cars. The painter foreman surely worked under greater difficulties than does the painter foreman of today, as the shops were not properly heated, ventilated, nor dust-proof, and in applying the finishing touches to a passenger coach close attention was required on the part of the painter foreman.

#### Workers Loyal Then, as Now

Other shops of this plant were heated in a similar manner—that is, with the old style volcano stove, using soft coal for fuel. This did not make so comfortable an arrangement as is now in evidence in practically all of the shops, and work was performed at that time under difficulties, more so than now, although the same spirit existed then as does at the present time. Men employed by the Illinois Central were loyal to the company that employed them and worked for its best interests. Co-operation was much in evidence at that time; otherwise it would have been impossible to have handled the work.

Labor unions were not much in evidence; neither was crafts' demarcation made so distinct as it is at the present time, with the result that an apprentice boy who completed an apprenticeship at that time had a greater knowledge of the crafts than has the apprentice boy of today. It was not an unusual occurrence for the machinist's apprentice to be sent to the tinshop to help lay out or fit a new jacket for the boiler, or to bend, thread, fit and apply pipes to the locomotive, or to do work of a similar nature in the other crafts.

At that time anything unusual in the line of locomotives or cars attracted much atten-

tion and caused a good deal of comment. I recall when "Schlacks' Greyhounds," as they were then called (engines now numbered 1901-2-3-4), first came through Amboy by way of Centralia for the western lines and arrived at the cinder pit. The news quickly spread, and visitors arrived to see the enormous engines that "sat so high on the drivers that one could walk underneath the belly of the boiler."

#### Fire-Box Just One Big Clinker

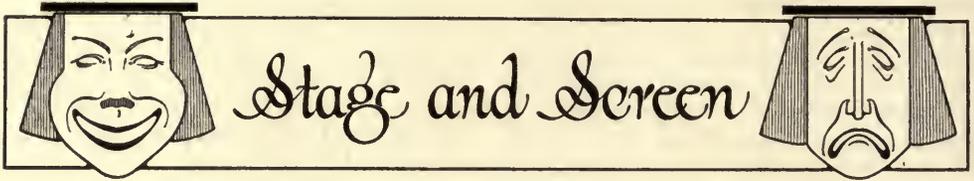

A rather amusing incident happened on the arrival of the 1904, which had handled the train from Clinton to Amboy, fired by Fireman James Connor. The engine had not been steaming very well, and Jimmy had filled up the fire-box from the crown sheet to the door. As the engine arrived at 6 o'clock in the evening, it was necessary for the train crew to go to a hotel for the night, leaving Amboy the following morning. Upon Jimmy's arrival at the cinder pit the next morning, he met the same Felix and Andy previously mentioned in this article and asked Felix if there were any clinkers in her. Felix replied: "Yes, there's wan—the length of her and the breadth of her."

In conclusion, I must explain that the reason for selecting this subject was to give the present-day apprentice boys some idea of the conditions that existed in railway shops some thirty-three years ago, and to call their attention to the advantages they now have in mastering the trade that is to be their future life-work.

---

#### LESSON IN A TRAGEDY

A warning to freight handlers to beware of packages labeled "wine" is contained in the recent death of four Illinois Central freight house employes at Chicago and the serious illness of two others. These six men discovered a paper carton labeled "Wine—34 per cent," part of a shipment from Detroit chemists to New Orleans. Using tin cups from the ice cooler, they drank three of the twelve bottles. What they drank was wine of colchicum seed, which can be obtained at any drug store. An adult dose is a third of a teaspoonful. The six men drank 720 doses.

THE SUMMER WEATHER, to a greater extent even than usual, has cut down the number of plays holding the legitimate stage in the larger cities. A few hardy examples, however, have held on in spite of everything. "The Bat," the Rinehart-Hopwood thriller, has rounded out half a year in Chicago, and soon will complete a year's run in New York, as well. "The First Year," with Frank Craven, has completed its fortieth consecutive week in New York.

THE DADDY of them all, however, with a record of 1,291 consecutive performances and in the 153d week of its world record run, "Lightnin'," with Frank Bacon, must turn its back on the Great White Way at New York, and head for Chicago on Saturday evening, August 27, according to a statement just issued by John Golden, producer. All members of the New York company will come West with the production, Frank Bacon included. "Lightnin'" passed the world's record of Charley Hoyt's "A Trip to Chinatown," which had stood for a quarter of a century, on May 17, 1920. "The Wheel," by Winchell Smith, which John Golden will produce next, is scheduled to open in New York following the departure of "Lightnin'."

GEORGE ARLISS, the English actor, was recently given the honorary degree of M. A. by Columbia University of New York City. Otis Skinner is the only living American actor who has been honored by a similar degree. Tufts College made him a Master of Arts in 1895. Shortly after that time Joseph Jefferson received an M. A. from Harvard, and many years later Sir Johnston Forbes Robertson received a similar degree. He, however, has retired from the stage.

MEANWHILE, in July, "The Passing Show," Taylor Holmes in "Smooth as Silk," and "The Bat," previously referred to, comprise Chicago's remaining regular shows. The vaudeville houses, the movies, the parks

and gardens and some suburban opera draw the rest of the crowds. That is to say, the crowds that remain after the beaches have been properly patronized.

ADD TO THE LIST of warm weather attractions at Chicago "Up in the Clouds," which arrived in the middle of the hot season, but which bids fair to cheer the theatergoers for some time. It has been called a "million-dollar music show."

PROMISED after July are Fred Stone in "Tip-Top," "The Greenwich Village Follies," Eddie Cantor in a new revue, Grant Mitchell in "The Champion," "Spanish Love," Fiske O'Hara in a new Irish comedy, "The Broken Wing," "The Gold Diggers," Mlle. Alice Delysia in "Afgar," and Leo Carrillo in "The Love Chef." A menu worth investigating.

THE CHERRY SISTERS are coming back. They will start on a tour from New York as a feature attraction either in vaudeville or with a revue early next fall. The Cherry Sisters were a sort of national institution about twenty years ago. They have been out on their farm in Iowa milking the cows, feeding the chickens and otherwise keeping themselves busy in healthful occupation.

THERE'S A NEW ROAD to fame by way of the bathing suit, according to a writer in the *Billboard*. The successes of Eva Novak, Gladys Walton and Marie Prevost are founded on the ability to look well in a one-piece bathing suit. Miss Novak, who was a bathing girl four years ago, is now playing the gamut from melodrama to emotional drama with Tom Mix, House Peters and William S. Hart. Miss Walton was a Mack Sennett beauty two years ago. She is now starring with Universal. Miss Prevost, perhaps the most famous of the Mack Sennett bathing beauties, has just signed a contract to play in

dramatic and comedy roles, with a special clause in her contracts which gives her the right to refuse to play a part in which the bathing suit figures.

GUS EDWARDS' "School Days" is to be reproduced on the screen by the Warner Brothers, with William Knight as director.

SOMEONE thought of a new name for Will Rogers the other day—the "poet lariat" of the Goldwyn studios, he's called. And now Rogers is going about, pencil and paper in hand, and a dreamy look in his eyes, trying to live up to the first part of the title.

THE HONOR of being the original comedy cop of the movies is said to belong to Al St. John, whose movie career dates back to the Keystone-Triangle days.

THE NAME of the first motion picture which was longer than one reel was a three-reel play, "Christopher Columbus." It was produced in Chicago by Selig and directed by Marshall Stedman. The motion picture fans were not ready for multiple-reel pictures at that time, and it proved a flat failure, almost bankrupting the producers.

OLGA PETROVA was married at the age of fourteen and was a widow at sixteen. She is now happily married for the second time to an American physician.

JAMES NEILL, character actor, who appears in "A Voice in the Dark," is authority for the statement that all motion pictures are murderous. He explains it this way: "Either we leave the stage dead; shoot the scene; kill the picture; strike the set; cut the film; shoot the juice, or hit the lights."

VICTOR SCHERTZINGER, who used to direct Mabel Normand and is now directing Tom Moore, says that, though his name may be unusual, it never gave him half the trouble it seems to give other people. The latest difficulty was experienced by a member of the Goldwyn scenario department, who reports that when he went into a music shop one day recently to purchase a few of the songs Mr. Schertzinger has composed since the first of the year, he was promptly shown copies of "Abide With Me," "The

Holy City" and "The Palms." After a spirited 5-minute argument that consisted principally of misunderstandings, it finally developed that the clerk thought the patron had asked for songs for a church singer.

PRESIDENT HARDING, like his predecessor, Woodrow Wilson, is fond of the movies, it has been disclosed. The President spent a week-end recently with Senator Knox at the latter's country home, Valley Forge, and witnessed a private showing there of "Wet Gold," the Williamson undersea picture. A projection-machine was rigged up in the Knox mansion for the occasion.

SOMEONE with a mathematical turn of mind has discovered that the average motion picture, in its rough form, is about six miles long—or about thirty-five reels. It would take a generous 8-hour day for a person to view one of the pictures before it is cut and edited. One of the biggest problems a director faces is to eliminate and coordinate scenes until the picture is down to regulation length, which is five, six or seven reels.

AS ALL MOTION PICTURE fans know, screen actors use music to help them "emote." Likewise do they laugh and make merry to the tune of the studio orchestra. Bert Crosland, chief musician at the Goldwyn studios, has compiled this list of selections used by some of the players when they wish to register a joyful mood:

Helene Chadwick....."Do You Think of Me?"  
 Leatrice Joy ..... "Margie."  
 Tom Moore ..... "The Wearin' o' the Green."  
 Will Rogers ..... "Jubilo."  
 Phoebe Hunt ..... "Rose of My Heart."  
 Sylvia Breamer ..... "Bright Eyes."  
 Mary Alden ..... "Moments."  
 Lon Chaney ..... "I Fell in Love."  
 Molly Malone ..... "Rose."  
 Richard Dix ..... "Caresses."  
 Cullen Landis ..... "Some Little Bird Is Calling."  
 John Bowers ..... "Love Bird."  
 Edythe Chapman..... "Dixie."  
 Raymond Hatton ..... "Feather Your Nest."  
 Sydney Ainsworth... "Snap Your Fingers at Care."  
 Richard Tucker ..... "Oh, How I Hate to Get Up in the Morning."  
 Johnny Jones ..... "My Wonder Girl."

# Senior Vice-President Shows That Rates Have Not Been Set Too High

## C. M. Kittle, in Letter, Proves That Reduction Is Not the Thing Needed to Revive Traffic

*The following discussion of the rate question, particularly in reference to the movement of coal, is part of a letter written by C. M. Kittle, senior vice-president, to A. E. Krueger, purchasing agent of the Chicago Screw Company, Homan avenue and Fillmore street, Chicago. Mr. Krueger, who was at one time an Illinois Central employe in the office of the auditor of passenger receipts, declared in his letter that the buying of coal should be postponed in the expectation of a reduction of freight rates before winter. Mr. Kittle wrote:*

I am glad to have your views on the subject of railway rates and their relation to the movement of commodities and their effect upon an early movement of coal, and am also glad of the opportunity to present the situation from our standpoint for your consideration.

You say the railroads know that freight rates are too high. This is not the fact. The price which the people are paying for transportation barely covers the cost of rendering the service, to say nothing of taking care of fixed charges and a reasonable dividend payment. For more than a decade prior to the war the tendency was toward oppressive regulation of the railroads. Little heed was given requests of railway managers for adequate income, and the result was that railway rates were kept down to a point where they did not return sufficient income. This was injurious not alone to the roads themselves but to the business of the country, because the policy of regulation that had been pursued brought about a condition where there was a wide gap between the increase in the commerce of the country and the increase that was possible in the circumstances in railway facilities and equipment.

### No Regulation to Protect Carrier

No one does or can properly complain of regulation on behalf of the shippers and users of the railroad—that is perfectly right. But there was no regulation having for its object the protection of the carriers who furnish the transportation. That was because of the absence of any law requiring the regulat-

ing body to give consideration to the needs of the carriers to enable them to perform efficient service and develop to meet the constantly growing demands of commerce.

The evil effect of the old-time, one-sided regulation was finally recognized. It came to be plain that a change was imperative if the country was to enjoy adequate transportation under the conditions that had made the American railroads the best in the world. The experience during the period of federal control had convinced the great majority of the people that the best interests of the country required the preservation of transportation by private enterprise. These considerations led to the Transportation Act, which in no way lessens the regulations of the carriers in the interests of the public, but does, for the first time, give recognition to the principle that there also must be some protection of the carriers. That protective regulation takes form in the mandate of the Congress to the Interstate Commerce Commission to prescribe just and reasonable rates, so that carriers as a whole (or as a whole in each of such rate groups or territories as the commission may from time to time designate) will, under honest, efficient and economical management and with reasonable expenditures for maintenance of way, structures and equipment, earn an aggregate annual net railway operating income to equal, as near as may be, a fair return upon the aggregate value of the railway property of such carriers held for and used in the service of transportation.

The law provides that during the two years beginning March 1, 1920, the Interstate Commerce Commission shall take as such fair return a sum equal to 5½ per cent of the aggregate value, but may in its discretion add thereto a sum not exceeding one-half of 1 per cent, to make provision in whole or in part for improvements, betterments or equipment. In the administration of the law the Interstate Commerce Commission prescribed the basic rates now in effect.

At the time the railroads were taken over

by the government they had a substantial, although insufficient, earning power. During the period of federal control great increases in operating expenses occurred, due chiefly to advances in wages and changes in rules and working conditions, making it necessary to employ a largely increased number of men. The government made an increase in freight and passenger rates in June, 1918, but nowhere near sufficient to cover the amount which

had been added to expenses.

The difference between the outgo and the income was paid out of the public treasury, the money coming from the people in the form of taxes, and the upshot of it was that that part of the public which received transportation service paid less than the cost of producing the service, and the difference was paid by the balance of the public not directly interested in it.

The result of this governmental policy of taxing the people as a whole for transportation service, instead of making the service support itself and putting the roads on a sound earning

basis, or at least on a basis comparable to that obtaining when they were taken over, was that the roads were returned without any earning power at all and with their

plant and equipment in worse condition than at the commencement of federal control. We do not criticize the government, and are not unmindful of the unusual and difficult conditions of the war period; nevertheless, it is necessary to refer to the period of government operation and the results thereof in order to show the situation of the carriers when they were returned to their owners and to private operation on March 1, 1920.

*C. M. Kittle, Senior Vice-President*

In 1917, under private operation, operating expenses averaged \$7,750,000 a day. On March 1, 1920, operating expenses were averaging \$14,310,000 a day, and earnings were

nearly \$300,000 a day less than required to pay operating expenses and taxes. This explains the six months' guaranty provision of the Transportation Act, which was nothing more than an obligation the government had to meet, because its previous policy had made it impossible for the railroads to support themselves. In July, 1920, the Railroad Labor Board granted employes another advance in wages retroactive to May 1. In the four months of May to August, 1920, inclusive, although the railroads handled a maximum business, operating expenses and taxes exceeded earnings by nearly a million and one-half dollars a day. This explains the increase in rates, effective August 26, 1920.

#### What Senator Cummins Said

While the law contemplates a return of 6 per cent, the actual return is far from that figure. The results have been disappointing, and the railroads are not much better off than they were before rates were increased, but to say they would be better off had the rates not been increased would be directly opposed to the facts in the case. Since, under the old rates, the roads were handling a maximum traffic and were not earning enough to pay their expenses and taxes, it is obvious that, even if a reduction in rates to the old basis would cause a revival of traffic, the reduction of rates, in spite of the revival of traffic, would ruin every railroad in the country.

With a situation where there is no net income, or practically none, it is manifestly impossible to reduce rates, if the railroads are to be kept going. This was aptly stated by Chairman Cummins of the Senate committee on interstate commerce on May 25, 1921, at the hearing in progress in Washington, who remarked to this effect:

Well, whenever the Congress is willing to make an appropriation to help sustain the railroads, or another appropriation, why, I think then we can consider the general reduction of rates, but with a situation in which there is no net income shown for the operation during the last year, it is quite obvious that rates cannot be reduced, so that the income will be reduced, or they must cease functioning.

Our position is that there cannot, or at least there should not, be any general reduction in rates. However, it is appreciated that under the method that had to be pursued in making the increases, some situations were created requiring adjustment. These have been given careful attention; many adjustments

have been made, and many more are in the process of making, through negotiations between carriers and shippers and under direction of the Interstate Commerce Commission.

The theory seems to be, and you give expression to it in your letter, that the increase in rates stopped business, and that a reduction in rates would revive business. The commercial depression is the aftermath of the war—it is the reaction from inflation and is a world-wide condition. The prosperity of business in this country is dependent to a considerable extent upon foreign trade. There has been a tremendous decrease in foreign business. It is well known that ocean rates are now at an unheard-of low level, yet harbors are filled with idle ships. It may be just as well to say that low ocean rates have stopped foreign business as it is to say that high freight rates have stopped the domestic business. There is strong proof that the causes of business depression antedated the rate increase. They manifested themselves as early as May, 1920, in an increase in unemployment, reduction in bank clearings, reduction in building contracts, and a generally lessening demand for goods. In short, that was the commencement of what has generally come to be known as the "buyers' strike," the full force of which was not felt until some months later.

#### Business Good in Last Quarter of 1920

In the last quarter of 1920, the movement of commodities was very heavy, notwithstanding the increase in freight rates, and in respect to some was greater than in any other quarter of the year, notably bituminous coal, fruit and vegetables, cattle, calves, hogs and sheep.

The movement of forest products amounted, roundly, to twenty-three million tons, the largest movement of the year being in the third quarter, twenty-six million tons; movement of sand, stone and gravel was twenty-six million tons, which was less than the largest movement in the third quarter of thirty million tons, but was one million tons greater than in the second quarter; and the movement of cement, lime, brick and plaster was eight million tons, compared with ten million tons in the third quarter, when there was the largest movement of the year. It will be understood, of course, that the move-

ment of commodities entering into building operations declined naturally toward the close of the year. The number of passengers handled in the last four months of 1920 was 399,435,875; in the last four months of 1919 it was 398,576,087.

It does not seem to me that this record affords any justification for the conclusion that increased rates stopped freight and passenger traffic, and since it is true they did not do so, it follows that it is not a reduction in rates which is required to revive traffic. The people will not commence to buy until they come to the mind that things have reached a stable condition. There will not be a complete revival until there is an adjustment of conditions affecting foreign trade. It is necessary that freight rates be stabilized, and therein lies one of the difficulties in the present situation, because the expectation, although unfounded, of a reduction in rates retards the shipment of some goods that are needed now, or will be needed shortly, and should be moving at this time.

#### Heavy Movement After Rate Increase

Reverting to the question of coal, I have pointed out the heavy movement that occurred in the last quarter of the year after the increased rates become effective. The price of coal at that time was high. Neither the measure of the rate nor the price of the coal affected the movement. At this time there has been a greater reduction in many instances than the whole of the freight rate, and certainly in a situation of that sort the freight rate itself cannot be the controlling factor. I have seen some advertisements of Southern Illinois domestic coal prices, quoted \$3.85 and June \$4.05. Had there been a freight reduction of 40 cents a ton in March, whatever effect it might have had in the movement of coal at that time would have been lost in June. The *Black Diamond* of June 4 had this to say: "Frequently, industrial plants refuse during the week even to ask prices, asserting that they could not take the coal at any figure."

The production of bituminous coal in the first quarter of 1921 was less than in any corresponding period since 1912, except 1915. There has been only a slight improvement in May and in June. In the light of this condition and past experience, it would seem that advantage lies in purchasing coal in reason-

able volume earlier in the year rather than putting it off until after mid-summer, because the latter course, with reasonable approach to normal business activity, results in shortage, and it is well known that shortages are accompanied by higher prices. The consumer who persistently puts off buying coal in the hope of a reduction in freight rates may find himself later on facing a loss greatly in excess of his expected gain.

#### Wage Reduction Does Not Mean Profit

It may occur to you that a reduction in rates ought to follow the reduction in wages recently announced by the Labor Board, to become effective July 1. It is not known how much this reduction will amount to, but an estimate of \$400,000,000 a year has been made. Assuming that to be approximately correct, immediately it must be kept in mind that not all of it will be reflected in net income, and indeed, even should that be the case, it must be borne in mind that it would not be enough on the earning basis that has obtained so far this year to meet the fixed charges of the roads. Fixed charges mean, primarily, interest on bonds and equipment trust certificates, and when this is not paid the next step is receivership.

Expenditures for maintenance of way and structures and equipment have necessarily been kept to the lowest possible level in an effort to meet the financial situation brought about by the reduction in traffic, and there is now a necessity of expanding greatly the maintenance work to bring the physical condition to a proper standard. Speaking for the Illinois Central, whatever decrease is realized in operating expenses because of the reduction of wages will be invested in maintenance which has been deferred—in the employment of additional men, and in the purchase of materials and supplies.

---

#### NEW DIRECTOR SERVING

David R. Burbank, secretary of the Illinois Central Railroad Company in New York, was elected a director of the company to succeed Philip Stockton of Boston, who resigned, at the annual meeting of stockholders at Chicago, April 20. The directors re-elected were: Charles A. Peabody, New York; William A. Harriman, New York, and John G. Shedd, Chicago.

## Memphis Division Superintendent Recalls the Achievements of the American Engineers

**M**AJOR J. M. Walsh, recently promoted to succeed V. V. Boatner as superintendent of the Memphis division, has a record of efficient service both in and out of the army. As a member of the Thirteenth Engineers in France, he earned three service stripes, a victory medal with four clasps (Champagne-Marne, St. Mihiel, Meuse-Argonne and defensive sector), a citation from General John J. Pershing for "exceptionally meritorious and conspicuous service," and the decoration of the Order of the Black Star of Benin, bestowed by the French government for colonial service and also upon distinguished officers of foreign armies.

Commendatory letters are also in Major Walsh's possession from Brigadier-General W. W. Atterbury and others, including one from an officer of engineers on improvements he made in camp conditions at Conflans, Audun-le-Roman and Verdun while general superintendent of the twenty-third grand division of the Transportation Corps at Verdun in the spring of 1919.

### Attacked by a Submarine

With Companies A and B of the Thirteenth (Company A being composed of Illinois Central men and Company B of Rock Island men), Major Walsh sailed from New York on July 21, 1917, on the unconvoyed steamship St. Louis. After weathering a submarine attack off the south coast of Ireland and visiting the port of Belfast, they landed in England on July 31.

After training there, this vanguard of the American army paraded in London on August 15 before the king and queen and a vast outpouring of the British people. The next day they landed in France. They took up French railway training at Chalons-sur-Marne and then went into service at Fleury-sur-Aire in the Verdun sector, handling the lines from there to Verdun and later beyond Verdun. All the work was with standard-gauge equipment.

Major J. M. Walsh

Seven months after the signing of the armistice, Major Walsh succeeded in clearing up the affairs left in his charge. In June, 1919, he sailed for home.

In his overseas service of almost two years Major Walsh made the following observations on the engineers of America and the war:

### Some Work in This Country

When diplomatic relations with Germany were severed, steps were at once taken to put together the machinery to handle troop movements upon a large scale, based upon the experience gained in the movement of troops to the Mexican border in 1916.

At the declaration of the war on April 6, 1917, the skeleton of the organization was completed, and it remained to supplement it as occasion arose for its development.

The troop movement section of the Divi-

sion of Operation of the United States Railroad Administration arranged all the details of the movement of troops from local draft boards to mobilization camps, between camps or from mobilization camps to the ports of embarkation for shipment overseas. The troop movement section of the Division of Operation gave figures showing the extent of the troop movement from May 17 to November 10, the day before signing of the armistice, also a supplemental report showing the movement from November 11, 1918, to April 30, 1919, during which time there have been moved a total of 3,389,665 men, of whom 1,583,942 were moved on regular trains and 1,805,723 on special troop trains, an average of 635,959 per month.

From May, 1917, to April 30, 1919, the troop movement section has been responsible for the movement of a total of more than 14,000,000 men, nearly half of whom have been moved on special trains. The maximum for any month of the entire period was 1,147,000 in July, 1918. This entire movement was accomplished with only sixteen accidents involving death or injury.

The number of men killed was 39, and the number of men injured 335. Statistics regarding the movement from May, 1917, to April 30, 1919, follow:

**Figures on Troop Movements**

1. Troops Moved:	
(a) Drafted men from their homes	2,287,926
(b) On regular trains	5,252,432
(c) On special troop trains	6,851,915
<b>Total</b>	<b>14,392,273</b>
(d) Average per month	504,343
(e) Maximum, July, 1918	1,147,013
2. Cars Furnished:	
(a) Pullman, standard and tourist	90,773
(b) Coaches for special troop trains	87,984
Coaches for draft and regular train movements	69,802
<b>Total</b>	<b>248,559</b>
(c) Baggage and express cars for special troop trains	16,084
Baggage and express cars for drafted men	4,576
<b>Total</b>	<b>20,660</b>
(d) Freight cars for special troop trains	24,029
<b>Total</b>	<b>293,248</b>
3. Special Troop Trains:	
(a) Number run	16,393
Number required for drafted men	4,576
<b>Total</b>	<b>20,969</b>
4. Average Special Troop Trains:	
(a) Number cars per train	12
(b) Distance per train	303
(c) Number hours per train	40

(d) Miles per hour	22
(e) Men per train	418
5. Accommodations:	
(a) Number carried in Pullman Cars	3,440,173
(b) Number in coaches	8,664,074
(c) Percentage in Pullman Cars	28.4

**The Start of a Service**

There has never been such a thing as a railway transportation department in the United States army. It had its inception when four or five men went to France in July, 1917. These men made a complete survey of the situation, which resulted in the preparation of what is known as "Requisition Number Six," being a list of materials and supplies that called for an expenditure of something like \$400,000,000. And at the end of a year not a single item was found in that long list which was not needed and didn't have a distinctive part in the machinery of the transportation department.

We didn't build separate railways in France, although many people here have been led to believe that we did. Our contribution was terminals, yards and side-tracks, equal to a new line about 1,000 miles in length, with one important cut-off. With the exception of a few small branches, the French railroads are all double-tracked. There were plenty of French-built railroads, and we found them in pretty good physical condition, but there was a scarcity of men to operate them. The young men were doing their bit on the battlefields, but the men around middle age left in service did excellent work. The women in France also deserve great credit. They fired engines, did braking and performed some of the hardest kind of manual labor in the shops.

By our arrangement with the French, we were to supply trainmen to move a tonnage equivalent to that which the American army would need. For every American serving in France, we had to move an average of fifty pounds a day. This included coal, engineering materials, food, clothing and ammunition. We handled not only our own supplies, but also a great volume for the French as well. They reciprocated, moving American supplies over their lines to different sectors where our troops were fighting. There was magnificent co-operation on both sides.

**A Great Rush of Soldiers**

The plans of the Allies required that by July, 1919, the United States should have three and a half million men in France, fully

equipped and trained to do battle. For every hundred fighting men we had to have between fifteen and twenty service-of-supply troops to do other kinds of work. As many as 18,000 American troops landed at Brest in one day, and it was a gigantic problem to move these hordes of men and their supplies, especially as we were continually handicapped with a comparatively small transportation force.

#### Americans Proved Adaptable

One of the fundamental reasons why the American expeditionary forces did so remarkably well in France was their adaptability to almost any character of work, however difficult. Of the transportation men, few, if any, performed only the work which they came over to do.

There were many French railway practices we did not fancy, but it would have been a tremendous mistake for us to go over there and insist upon introducing American methods. We had to adapt ourselves to conditions as we found them. We had trackage rights over all the French railroads. On no two roads were the signals alike, and we had to prepare a book of rules whereby our men could run the trains. In this country the conductor is in charge of the trains. In France the engineer has charge while the train is in motion, but when the train is not in motion, a so-called conductor is the responsible head.

When the armistice was signed we were moving 40,000 tons of freight daily, and were planning to move a daily tonnage of 100,000. For about a week following the cessation of hostilities, everybody was celebrating the victory, but the transportation department's work could not be interrupted. Our job had only just begun. Our hardest work was done between November 11 and the middle of January, when we had to get the Army of Occupation up to the Rhine. And even then we were not through. The Allied soldiers on the Rhine had to be fed, which meant that several trainloads of food had to be dispatched every day, and hospital trains had to be operated; and there was also the task of feeding the German population.

#### Docks Built in the Mud

It was perfectly clear from the very outset that, to take care of the tonnage the A. E. F. would bring into France, it would be neces-

sary to utilize to the maximum every accommodation not already in use, and that, in addition to all of this, it would be necessary to provide new port facilities; and the splendid dock project at what we called American Bassens, just outside of Bordeaux, was undertaken and carried out to completion. Here was erected out of the mud bank of the Garonne River a modern 10-berth dock, with forty electric gantry cranes. This project constitutes one of the distinctive achievements of the A. E. F. in France.

The condition of the personnel on the French railroads when America entered the war was becoming serious. By reason of the war, there was no source of supply from which could be recruited an adequate number of suitable employes, the strain of three years of work under war conditions was telling on the men, and the caliber of the personnel on an average was not so high as in peace times. The A. E. F. had to provide transportation forces commensurate with the added burden which it placed upon the French railroads, and in addition such supplemental forces in the way of car and locomotive repairmen, track men, etc., as could be brought over from the states consistent with the requirements of the combatant troop program.

#### Sent Locomotives Whole

In equipment, likewise, the French had reached a rather serious stage when the Americans began to arrive in France. A considerable percentage of the cars and engines had been captured by the Germans in the big drive at the beginning of the war, and an excessive number of bad-order cars and locomotives had accumulated.

One of the first steps taken on behalf of the A. E. F. was to send to France experienced car and locomotive repair forces. A car-erecting plant was built at La Rochelle to take care of cars coming in a knocked-down condition from the States, and a locomotive-erecting plant at St. Nazaire to take care of knocked-down locomotives arriving at that port.

In addition, the plan was developed of having locomotives sent to us from the states in a practically completed state on special ships, thus involving but little work in assembling when they reached us, and, what was much more important, relieving the port of St. Nazaire to that extent, as we could take care of

the partly erected locomotives at Brest. Throughout the war, the car and locomotive situation was one of the vital factors entering into the conduct of combatant operations. There never was a time when it was not essential to produce the greatest practicable efficiency out of the equipment available.

To give an idea of what the program to have 4,000,000 men in France by the summer of 1919 meant, it may be stated that we were arranging to have in France by that time 4,000 locomotives and 98,000 cars. To supply an army of that size we were planning for the reception and discharge of 101,000 tons of cargo per day at the ports. The condition of French railroads in September, 1917, was surprisingly good, considering the fact that they had been operating more than three years under war conditions, that no new rail had been laid within that time, and that the force they had been able to keep on maintenance of way was practically negligible.

For the manner in which the French railroads met the requirements of the Allied armies, I have nothing but the highest commendation. At no time was there the semblance of a breakdown in the transportation machinery of the country, despite the great overload placed upon it, and the results achieved are a splendid tribute to the efforts of the French transportation authorities.

#### Expanded French Railroads

To expand adequately the capacity of the French railroads involved the planning and construction of immense storage yards and additional engine houses, the laying of supplemental tracks, the rearranging and extension of existing tracks and, in general, everything that goes into the enlargement and expansion of a railroad to meet the greater needs. Behind each of the main ports we had stupendous storage layouts; then we had what we called our intermediate storage, about midway between the ports and the army zone, and then came our storage developments in the Advance Section.

Several of these yards are the largest in the world, and in general they represent the last word in modern yard construction. The plans for the development at Gievres called for 264 miles of track, 1,152 turnouts, 4,410,000 square feet of covered storage and 10,387,000 square feet of open storage. At the time of the armistice 132 miles of track,

3,552,000 square feet of covered storage and 6,000,000 square feet of open storage had been completed. The project covers an area of 2,600 acres.

It is hardly necessary to say much about the performance of the army transport service in France, which is a branch of the Transportation Corps, because I think the performance of that department has spoken for itself, and that its achievements are per-

### Our Best, Always

The rendition of one's best service is so obligatory that we proclaim in terms glowing with emphasis the acceptance of the affirmative of this subject, not even hesitating to dwell on the negative side, realizing that it is a foregone conclusion that giving our best is worth while.

Admitting one's best efforts are always worth while, and shamefully confessing such an attitude is not always manifested, we find before us the question: Why don't we always exhibit our best?

Trying to camouflage on the "get by" spirit is not a sound method, and frail excuses salved with a self-righteous air don't always adjust satisfactorily.

Both our employer and the public are entitled to our best service, and success is accomplished only by contributing our best for those we serve and to those we serve.

It has been truly said that "hope springs eternal in the human breast." Individually we are led by hopes, piloting us to greater responsibilities and unfolding avenues of possibilities; but the hopes so fondly depended upon will become mere evidences of failure unless we prove our best worth while.

Converting theory into practice enables one to demonstrate the effective results of efficient service, thus creating a mutual interest from which pleasant and profitable relations may develop.

The following lines express the result when our best is manifested:

"Give to the world the best you have  
And the best will come back to you."

—MISS WILLIE CARRICO, *Camp Knox, Ky.*

haps the best known of any of the branches of the Transportation Corps. It may be interesting, however, to state that 340,000 Americans were shipped back to the United States during May, 1919, as compared with the record figure of approximately 312,000 arrivals in September, 1918. The Transportation Corps as authorized provided for 6,000 officers and 200,000 soldiers. This was the force figured would be needed properly to meet the requirements of an American army in France of 4,000,000. At the time of the armistice we had in the corps 1,810 officers and 46,976 soldiers.

The transportation department of the American expeditionary force achieved marvels. Many things which the French and British war chiefs claimed were impossible were accomplished sometimes so easily as to suggest magic.

I do not think that you have a true perspective of what has been done in France—you do not know the size of the job. We all know we had 2,000,000 men in France, and we thought that most of these 2,000,000 men were in the front-line trenches. They were not. There were never more than 435,000 men at the front, out of 2,000,000 men, and that is about the usual percentage in any army; in other words, in the army you have four men back of the lines supporting every man in the line. But do not think that the rest of them, the 1,600,000, were not fighting—they were fighting, by doing work that the men in the front lines could not do.

#### **Doing the Impossible**

At one time we had more than 100,000 men doing engineering work, building railroads, docks, telegraph and telephone systems, building the biggest storage yard the world has ever known, building locomotive round-houses, automobile, refrigerator plants—the latter, the biggest on the face of the earth—and all these things being provided for the maintenance of our 2,000,000 men whom we had in France.

We had the greatest transportation problem the world has ever faced. Our allies did not have any problem such as we had. The British occupied the ports of Le Havre and Calais, and the average haul from England to their front lines was about seventy-five miles. The French had their supplies immediately behind the lines all the time; they had their

shops and all their equipment behind their lines, and their haul was not more than thirty-five or forty miles. We had to haul our stuff half-way across the United States and three thousand miles across the sea, and land it in France; and perhaps you think when it was landed in France all our fellows had to do was to fall on it and eat it. No, it was not so easy as that. We then had six hundred miles to transport it, and we did transport it that distance.

#### **Learned From the Allies**

When we got to France, we were green about the transportation problem. We did not know how much material we had to transport. We sent several to the British and French headquarters to find out what their transportation problem was, and we discovered that the British were hauling 50 pounds per man per day, and the French were hauling 47 pounds per man per day. That means everything, food, munitions, equipment, fodder and everything else that is required by an army. That does not seem much to you, perhaps, but when the armistice was signed we were handling 53,000 tons of freight every day from our own ships. We were unloading every day 20 ocean steamships—literally every day, weekdays, Saturdays, Sundays and holidays.

The great problem when we arrived in France was to find out how we were going to do that. When we got there the British were occupying the two main ports on the Channel. They really had possession of all the available ports.

The first thing we did in August, 1917, when there was no American army in France. That was to select a site for the first port. We picked out the port of Bassens, near Bordeaux, and in August, 1917, it was a slimy mud bank, with a large swamp behind it. We took it as the place to build a port because of deep water up to the very front of the location, and a good piling bottom. We found we had nothing to start with. We asked General Pershing if we could borrow material from the French, and he said: "We came here to help the French, and not have the French help us. You must get your material elsewhere." We cabled to the United States,

## The State of Mind

If you think you are beaten, you are.  
 If you think that you dare not, you  
 don't.  
 If you like to win, but think that you  
 can't  
 It's almost a "cinch" you won't.  
 If you think you'll lose, you've lost,  
 For out in the world, you find,  
 Success begins with a fellow's will—  
 It's all in the state of mind.

Full many a race is lost  
 Ere even a step is run,  
 And many a coward falls  
 Ere even his work's begun.  
 Think big, and your deeds will grow.  
 Think small, and you'll fall behind.  
 Think that you can and you will—  
 It's all in the state of mind.

If you think you are outclassed, you  
 are;  
 You've got to think high to rise;  
 You've got to be sure of yourself, be-  
 fore  
 You can ever win a prize.  
 Life's battles don't always go  
 To the stronger or faster man,  
 But soon or late the man who wins  
 Is the fellow who thinks he can.  
 —Author Unknown.

## A LESSON IN ECONOMICS

Harken to my voice, O my son, and give heed to that which I shall say unto thee. For this day as I passed thee at thy labor, it grieved me sore to hear thee murmur at thy lot. Did I not hear thee wail that a bearer of burdens thou hadst been, and would be, all of thy days? That thou hadst never had that which thou wanted, and hadst no chance to get it?

Verily, verily, I say unto thee; if thou art a bearer of burdens, it is because that is thy greatest desire, for thou wast created to perform that work which thy heart most craved to do, and thou shalt have that which thou dost most want.

Consider now, the man whose servant thou art. So far as thine eye can see, his herds cover the hills, and he is a very rich man. Hath he more members than thou? Or thinkest thou the multitudes stumbled one

over the other in their desire to reach out and to give unto him? I say unto thee that as a youth he had not sandals for his feet. Many times and oft hath his belly cried for meat when he had naught but water wherewith to fill it, and in the morning light I have seen him rouse the cattle from their beds that he might comfort his feet in the warm places where they had lain.

His heart craved riches, and his soul hungered for the fat of the land with a mighty longing, so that he worked without ceasing. He wasted not his substance in riotous living, but saved his shekels and set them at certain tasks that they might beget other shekels. Now, after many days he is rich, and this one sayeth, "He is a conjurer," and that one, "He hath a familiar spirit," but I say unto thee: He hath given that which he wanted least, to get that which he wanted most. He hath that which he wanted, and so mayest thou have.

Seest thou the beggar at the gate of the city? His soul abhorred work, and his body craved rest with a longing mightier than all else beside. Behold, he hath rested. Since the days of his youth hath he begged bread with cold or hunger ever as his companion, but he refrained from toil—which was the thing he most desired.

Thou hast seen mighty hunters come up with much savory meat from the fields where thou hadst found no game, and fishermen come up from the sea with full nets where thou hadst fished in vain. They were skilled with net and spear because they wanted to be, and thou mightst have done likewise, had thy desire been as great.

When thou goest into the market place, thou seest wares that tempt thine eye. If thy desire for the wares is greater than thy desire for thy money, thou wilt buy. If the love of thy money is greater than thy desire for the wares, thou wilt not buy. In either event thou shalt come away with

that which thou most wantest. Men get what they want, albeit not always when they want it, and pay the price for it. It has been so from the beginning, and at the end it will not be changed.

Why then, O my son, shouldst thou expect the multitude to offer thee of their gifts, except thou showest that thou art ready to pay? If thou art not ready to pay, canst thou not understand that thou lovest that which thou hast more than the thing thou seekest? If a man value leisure more than riches, then he will not exchange his leisure for riches, and he will die a poor man, but possessing that which he wanted most. Wings are not given unto asses; neither are great gifts given unto men except they want them enough to earn and use them.

Finally, my son, if thou ledest a horse to water, and he refuse to drink, that is his privilege, and thou shalt not deny it to him. When thou returnest him to his stall, if perchance like Balaam's ass he reproach thee, saying he hath not had a chance, thou shalt in no wise be cast down, for thou knowest he hath had a chance, and hath done the thing he wanted to do.

### THE VALUE OF GOOD WILL

President W. A. Winburn of the Central of Georgia in a recent letter makes a point which we desire to pass along to members of the Illinois Central family—that is, **the** immense value of good will. Mr. Winburn says:

"The Interstate Commerce Commission has tentatively fixed the valuation of the Central of Georgia Railway Company's property devoted to transportation purposes at \$79,083,523. This is the amount upon which the company will be allowed to earn 6 per cent if it can do so. As heretofore stated, this is an opportunity and not a guaranty.

"The valuation of the commission does not include one very important asset of the company—one upon which it would be difficult to place a definite valuation, but which is of just as much consequence as lands, buildings or equipment, that is 'good will.'

"At the recent convention of Advertising Clubs in Atlanta, a speaker pointed out that the Coca-Cola Company, when sold a few years ago, obtained for 'good will' seven

times as much as its actual physical assets listed—and that made its good will stand at more than \$20,000,000. Proctor & Gamble list good will at \$30,000,000 in their inventories, and Marshall Field & Co. compute good will in their annual balance sheets at \$36,000,000.

"The good will of the Central of Georgia Railway Company is just what its employes make it. The opinion of the public which uses its lines for traveling and for shipping depends upon the quality of the service rendered. Public satisfaction with that service will be measured to no small extent by the courtesy and cheerfulness of those who render it."

### WORK AS A LUXURY

"Life without toil, if possible, would be an intolerable existence. Work is the supreme engagement, the sublime luxury, of life."

President Harding has recently published a book, "Our Common Country," setting forth his conceptions of American ideals, and the foregoing is a quotation. It is unfortunately true that the romance of work is too often lost in the humdrum existences which the most of us lead; the burden of making a living weighs down upon us so heavily sometimes that we lose the vision. We grow to regard work as some grim spectre hovering about us, threatening our enjoyment of the artificial things which we in our blindness think of as life itself.

But the chief executive comes along to remind us that we are dead wrong when we thus let go. He assures us that life is work, that life without work would be at least a highly undesirable state.

Perhaps it is a fault of definitions. To many of us, work probably means the doing of unpleasant things, the griming of our faces, the production of perspiration and aches and pains. It is too frequently set in our minds as meaning the opposite of recreation, and thus we come to loathe work and long for play-time. But that isn't the true definition of work. Work means the accomplishment of things, and grime and sweat and aches and unpleasantness are by-products rather than the thing itself. And work is life itself. The President weaves a pretty figure of speech about it in calling it "the sublime luxury of life," but it requires only a

small stretch of the imagination to approve his figure.

What, indeed, is the end of our lives, if not the making of some definite contribution to the progress of the human family through our labors while a part of it? Why struggle on at all, if our struggles lead us nowhere but into the reflection that they are vain? The joy of achievement is the reward life gives us for our strivings. The man who feels no pride in the product of his toil needs to be lifted out of the despair into which he has fallen. The man who digs ditches may well love his work so much that he will aspire to dig better ones; the stenographer may be made to feel the importance of her work so greatly that she will constantly strive for the production of better work; each of us, if we catch the vision, will be ever on the alert to do our daily tasks better.

And thus the ascending scale of progress moves. But first of all must be the love of work for itself.

#### YOURS AND MINE

The family spirit of the Illinois Central folks is a precious thing. It manifests itself in genuine co-operation under the surface as well on the surface; it is apparent in a common pride, a common standard of workmanship, a common initiative.

Outsiders see it, too. In a review of the Illinois Central's recent history, the *Railway Age* said:

"When one's mind turns to the subject of efficiently operated railroads, one of the first carriers that comes to mind is the Illinois Central. This is true not only of students of the railway problem, but of shippers, whose opinion, in these days of restored competitive service, is of equal or greater importance. The Illinois Central today is supplying a service the character of which is bettered by no other carriers and equaled by but few. On the one hand, it furnishes a highly satisfactory fast freight service which delivers traffic in Chicago 62 hours after it leaves New Orleans. On the other, because of efficient management combined with the fact that 45 per cent of its total tonnage is bituminous coal, it secures an average trainload considerably in excess of the averages secured on the roads about it. Its suburban service out of Chicago ranks with the best in the country. There are

few roads in the country so many of whose officers rank with the leaders in their various departments."

Our success is all a matter of pulling together and standing by the home folks. If this magazine can help in any way to cement the allegiance of any Illinois Central employe to his fellow employes and to the company, then its mission is not in vain.

That the family has taken the magazine to its bosom is proved by the constant reference in letters to "our" magazine—not "your" magazine or "their" magazine or "the company's" magazine, just "our" magazine. We couldn't ask for a better description.

#### "OFFICE MEN," TENSUN!

The editor of the *Illinois Central Magazine* has received a letter from a chief clerk in Mississippi, suggesting that a department of special interest to office men be established. The chief clerk suggests that it be an "office man's corner," wherein ideas for the promotion of efficiency in the offices be exchanged. He tells how a suggestion which he received from another office man during a business trip made it possible for him to save at least one hour's time a day in copying freight train performance reports. The editor thinks it a good suggestion. He would be glad to carry it out if he were assured that the office men throughout the system would co-operate in making it a lively, worth-while feature of the magazine.

There is a wealth of material which could be exploited. Labor-, material- and time-saving methods in filing, the handling of correspondence, the making of special reports, the requisitioning and allotment of materials and supplies—all are of general interest. If some clerk has perfected a formula for vitalizing the work in his office he's selfish if he doesn't want to give the others the benefit of his devices.

So the editor is going to "pass the buck" to those who would benefit most from such a department. If the idea appeals to other office men, and they think they have something worth telling,—suppose they sit down and write the editor about it. If sufficient good material is received to give assurance that the department will not languish, it will be started; if not, such good material as is received will be used anyway.

# PUBLIC OPINION

What the

World thinks

## THE UNDERTAKER WINS

It is always well for autoists to remember that no prize is offered for beating a railway train over a crossing.—Toledo (Ohio) *Blade*.

## LOWER RAILWAY RATES

The American Farm Bureau Federation, which claims to represent a million and a quarter American farmers, in its appeal for a lowering of railway rates makes but one definite suggestion.

It asks for the repeal of Section 15-A of the new railway act. This provides that when rates are fixed the railroads shall be allowed, above expenses and taxes, 5½ per cent on their present value. The federation thinks this too generous, but does not recommend a substitute. What would it have?

Nor does it note that the recent railway income has not netted 5½ per cent on value—hovers around 1 per cent. The Interstate Commerce Commission has not met the obligation which rests on it, and hence present criticism of the section is academic. The section now is as if it were not.

Nor does the federation note how carefully the commission has kept away from railway valuations. It has collected some figures, but it has avoided any definite total. What are the railroads worth? On the basis of the present value of their securities, something less than \$20,000,000,000; on the basis of cash cost, probably \$25,000,000,000; on the basis of replacement, probably \$30,000,000,000; with reasonable allowances for increment, such as farmers have gained on their land, probably \$35,000,000,000. But these are all mere estimates. There has been no formal ascertainment of value, and most of the investigation which has been made is already archaic.

But taking the estimate of \$20,000,000,000

as the least the courts would consider non-confiscatory, and assuming that the courts would require an allotment of at least 4½ per cent on this, a little figuring shows how little would be available for rate reduction should 1 per cent be taken from the present theoretical allowance of 5½ per cent. The sum coming to the railway owners would be lessened only \$200,000,000 a year. If this entire amount went to shippers the resultant reduction would be but microscopic.

The federation ignores the condition, as do so many others, that the share of railway incomes now reaching owners is small. Were there now proper maintenance expenditures the expense of railway operation and taxes would be close to 95 per cent of gross income, against 60 to 70 per cent a few years ago. No longer is it possible to extract any considerable fat from railway owners. They have been reduced to leanness. If rates are to be lowered, except as to commodities, where a lowered rate means more net revenue, then it must be by lessening the cost of railway supplies and labor, or by improving the railway plant. Why is the federation unwilling to point out these facts to its membership?

Not only is the federation persuaded, apparently, that the railway owners who get now so little get too much, but it regards it as an economic absurdity to single out the railroads and give them a guaranty. Of course. Yet its aversion to government interference disappears as it asks the government to fix lower rates! It is rather late to find fault with singling out the railroads. The practice began many years ago, and it never has been said that the railroads asked for it.

Not by reviving the doctrine that the railroads are rich and their owners can be safely

and justly plucked is the difficult railway problem to be solved. The interests of farmers and railroads are mutual, not antagonistic. The war cries on which a generation of demagogical politicians did business are out of date. Taking the last twenty years as a whole, those who have put money into land have done better than those who have invested in railroads.

Yet we discover an organization which would be accepted as intelligent and fair seriously saying that because agricultural prices went up from 100 to 150 per cent, while rates and fares advanced only 50 per cent, the one interest should submit to a markdown equal to that of the other. In many instances railway rates need adjustment, and smaller collections, per unit of traffic, doubtless mean larger revenue. But it is manifest that there can be no material reduction of what the railroads collect unless there is first a material reduction of what they pay out. The path of true progress seems to be in furnishing them the capital to make improvements enabling them to do more work at less cost.—New York *Tribune*, July 26.

### THE CHARGE OF EXTORTION

The directors of the Iowa Traveling Men's Association held a meeting at Cedar Rapids last Saturday and went on record in denunciation of prevailing freight, passenger and hotel rates.

This was an expression of impatience and selfishness rather than of sober and responsible judgment. It is easier to denounce freight and passenger rates, whatever they may be, than to tell how the railway companies can hope to induce investment in their properties unless they can show a profit. It is easier to condemn the new rates than to explain how the railways can reasonably be expected to return to the old when confronted by an increase of 150 per cent in the cost to them of a particular quantity of service when compared with the cost of that service before the enactment of the Adamson law in 1916.

So it is with hotel rates. The claim that dining room prices are excessive is made in the face of the fact that dining room service has disappeared from many hotels because it was found after a trial that it could not be conducted at a profit, notwithstanding prices

to the guests were so advanced that many considered them extortionate.

All declarations respecting such matters should be made in a spirit of fairness and with due sense of responsibility. The man of open mind, who does not wish to deceive himself merely to feed his own prejudices, will consider the best evidence always. The best evidence of whether the railways can afford to reduce existing rates at present will be found in their latest financial statements and in the quotations on their securities by the exchanges. The best evidence respecting the charge of extortionate prices for meals at the hotels is supplied by the closed dining room.—Dubuque (Iowa) *Telegraph-Herald*, July 21.

### SUMMER TRAVEL IS GOOD

R. J. Carmichael, assistant general passenger agent of the Illinois Central and the Yazoo & Mississippi Valley railroads, says that tourists, vacation and week-end travel has developed into an excellent volume this summer, but commercial passenger traffic has been and is at a very low ebb. However, this class of travel, he continued, is expected to increase next month, as many wholesale commercial concerns through the country are planning to resume their old-time practice of again placing traveling men on the road.

A number of concerns have been endeavoring to solicit business through correspondence. It is said that the same results have not been obtained as during the period when traveling men made the rounds extending personal solicitation.—Memphis (Tenn.) *Commercial Appeal*, July 22.

### MARKHAM SETS EXAMPLE

The president of the Illinois Central System, Mr. C. H. Markham, is persisting with an innovation which he launched some time ago. This is to keep in touch with the employees and the public, and to let both know everything worth knowing about the railroads, its plans and its affairs.

There is no doubt that this policy will cause the Illinois Central System to be more popular, and that, as the people and employees will understand all of its problems, it will have a minimum of friction and a maximum of co-operation. Adoption of

such a progressive policy by Mr. Markham is a practical sign of executive efficiency. Mr. Markham is ready to try out every new idea which promises better results.

Two examples of his frank methods are of recent date. One is a 25-page booklet, "What Every Employee Ought to Know About the Illinois Central System." The other is a full and candid statement to shippers and consignees regarding the chief problems which the Illinois Central must solve.

Employees of very few concerns know anything about the concern's history, and they take but a casual interest in things. Mr. Markham thought his men would like to know all the facts about the Illinois Central, and so he published this pamphlet which gives the history of the road, its progress, its plans, its service, and all worth knowing. Unquestionably, the employees of the railroad have read the book with the keenest interest.

Shippers and consignees like to be familiar with all of a railroad's affairs. By having this information they find out how to realize better service, and they are able to act with judgment when any question regarding the railroad comes to their attention.

Mr. Markham is taking the public and the road's employees into his confidence, and this will do more than anything else to produce a fair understanding.—East St. Louis (Ill.) *Daily Journal*, July 5.

### MUST OBEY CONDUCTOR

The conductor of a railway passenger train is in absolute control of his train and must be obeyed by passengers if told by him to get off, was the holding of the appellate court at Springfield, Ill., this week in the case of Edward S. Bradbury against John Barton Payne, director general of railroads. W. R. Hunter of Kankakee represented the director general.

The case arose out of the ejection from an Illinois Central passenger train of Bradbury by the train conductor some time ago. Bradbury purchased a ticket at Chicago for Belleflower over the Illinois Central and boarded a train which was not scheduled to stop at Belleflower. The conductor gave him back his ticket and told

him he must get off at Gibson City, the station this side of Belleflower, and go on to the next station on another train. The plaintiff refused, and the conductor called a policeman, who took Bradbury to the police station.

Bradbury told the conductor that the agent who sold him the ticket said the train stopped at Belleflower as did the porter on the train. Both of these men denied making these statements. The porter said that the man had told him he was going to Springfield.

The court held that in all cases the orders of the conductor must be obeyed by the passenger, whether right or wrong, and if requested to leave the train at a railway station he must do so without resistance, and by doing so the passenger does not lose but preserves his right against the company, in any case where the conductor is wrong.—Kankakee (Ill.) *Daily News*, July 23.

### DAMAGE IN TRANSIT

When President Markham of the Illinois Central takes his pen in hand to address his patrons, he usually has something to say that is for their benefit as well as that of the railroads. His most recent appeal to them is to use more care in packing and directing their shipments of freight and to cut down the bills for loss and damage in transit, which are steadily mounting higher.

Mr. Markham is frank enough to say that lack of care on the part of shippers and consignees does not cause all this loss. He states that the railroad is doing all in its power to correct such abuses and to minimize the losses for which it is itself responsible and asks the shippers to do their part also. He requests that carload shippers insist on receiving the cars best adapted to their shipment and to see that shipments are properly braced and stowed to prevent shifting; and that smaller shippers use substantial containers for their goods, mark the destination of packages plainly and remove all old marks. He also asks that shipments received be immediately examined so that any concealed damage may be properly reported.

The loss and damage payments of Class I

railroads have risen from 23 millions in 1916 to 104 millions in 1920—an enormous price to pay for haste and inattention. Those who have presented claims to the railroads are well aware that what they pay rarely covers all of the loss. The incompetency and inefficiency people were obliged to tolerate in the war years, a small fraction of which is represented by this extra annual bill for 80 millions for loss and damage in transit, is not the least alarming relic of that period nor the easiest to eradicate.—New Orleans *Item*, July 8.

### DEATH AT CROSSINGS

Fatal accidents are occurring every day at the railway crossings all over the country. It would seem that everyone who drives an automobile would take warning from the daily reports in the newspapers of parties taking chances at the crossing of the railroad. But it is a lamentable fact that there are those who cannot learn by the experience of others.

There have been several cases recently where auto drivers took the chance of beating the engine across, killing not only themselves, but all the other occupants of the car.

The driver of an auto should bear in mind the fact that he is responsible for the safety of every human life in his car, and should take every precaution to protect them from injury. When he approaches a railway crossing he should slow down to such a speed that he has his car under control to stop at once. He should take no one's word that there is no train coming. It is his duty to look for himself. It only takes a moment of his time to do this. Supposing a train is approaching and there is a fairly good chance of his "getting by" before the train hits him? How much more sensible would it be for him to stop until the train passes? Everyone in his company would feel better, himself included.

"Look at that d—n fool!" That's the answer, if you want to know how people think about you when you "beat the train to it." And if you don't quite make it, of course you don't care much what they think of you. Still someone will feel sorry. But

if you play the game on the "safety first" plan, everybody will be happy.

We oftentimes wonder if the engineer does not, when he observes an autoist stop his car a good distance from the crossing, heave a sigh of relief and wish to God he could depend on every other man driving a car to do likewise. An engineer cannot stop his train at every crossing where an auto is approaching. If he did so there would be no train service. So it is up to the autoist to do the watching and stopping.

Most of the fatal accidents are the direct result of reckless driving and carelessness. All of us have seen autos approach a railway crossing, the driver having one arm around a "friend," each looking into the other's eyes in that "dying duck in a thunder storm" fashion, while the couple in the rear seat were too occupied with their spooning to take any notice, or care, where they were. They may have cleared the crossing. But that was because it so happened that there was no train to bump into them.

On one railroad alone more than 500 crossing gates were broken by motorists in one year. Just think of it.

Don't risk your life to save a minute. "Stop, Look and Listen!"—Editorial, *Winthrop (Iowa) News*, July 14.

### AN APPRECIATION

The Chamber of Commerce has just received a letter from Colonel A. H. Egan, general superintendent of the Y. & M. V. R. R., announcing the through sleeper car service between Greenwood and New Orleans, for which it made urgent request some months since, is finally to be granted, and will be inaugurated on the 24th of this month—Sunday next. The sleeper will leave New Orleans on train No. 24, present schedule 2 a. m., arriving at Jackson at 7:55 a. m. From Jackson to Greenwood it moves on train 324, which now arrives in Greenwood at 10:33 a. m. Leaving Greenwood, the sleeper moves on train 323, which now leaves at 4:10 p. m., and is picked up at Jackson by train No. 5, on the Illinois Central, at 3:15 a. m., reaching New Orleans at 9 a. m.

The Chamber of Commerce feels it nothing more than due Colonel Egan and the Illinois Central Railroad to say that every citizen of

this entire community and section will be profoundly grateful to them for this consideration, particularly at a time when other roads are curtailing service and howling hard time as though they were an exception to the rule. The fact is that the Illinois Central Railroad just about stands at the head of all the railway systems in this country—and so do the men who operate it. They stand in a class by themselves.

It is now up to the traveling public of this section to make a success of this service, financially. Otherwise it will be withdrawn.—Greenwood (Miss.) *Daily Commonwealth*, July 18.

**A CAUSE OF LOSSES**

President Charles H. Markham of the Illinois Central System has issued a statement of the amount paid out by American railroads on account of loss and damage to freight, representing an economic waste burdensome alike to the railroads and the public. That the waste is substantial is shown by the record of loss and damage payments made by Class I roads:

1916 .....	\$ 23,346,965
1917 .....	35,079,757
1918 .....	55,852,797
1919 .....	104,507,174
1920 .....	104,398,930

President Markham does not claim immunity from similar loss. That the Illinois Central System has borne its share of the economic waste on account of loss and damage to freight as will be seen by examining these figures:

1916 .....	\$ 655,293
1917 .....	1,077,720
1918 .....	1,653,706
1919 .....	2,298,250
1920 .....	2,745,099

Without for an instant claiming the Illinois Central employes guiltless of causing loss or damage to freight consigned to their care, President Markham makes a powerful appeal for co-operation by all shippers in looking well to the manner in which they ship their goods. Merchandise hastily and inadequately crated he discovers to be a cause of this appalling economic loss. One effective preventive of this constant and

increasing drain on the railroads and shippers alike would seem to be in the selection of substantial containers in which to pack the goods for shipment so that packages may not be crushed and contents damaged when loaded into cars with other freight.

In an age when nearly every economic loss must usually, in the final analysis, be borne by the consuming public, it is not difficult to trace this loss directly from the first cause to its ultimate effect on the poor chap who lives down in the crowd. Upon the prosperity or adversity of the railways hinges the question of freight rates. Upon the expedition and safety of goods of commerce from the producer to the consumer largely depends the retail cost of every commodity. Assuredly, this business of carelessly handled freight is as much the business of the consuming masses as it is that of the shippers and the railways and the innumerable traffic bureaus which slovenly packed and slovenly handled merchandise have created.—Birmingham (Ala.) *News*, July 11.

**UNJUST RATES**

The roadbuilding campaign in Mississippi deserves all possible encouragement, but it is unreasonable to ask that it be carried on at the expense of the railroads.

This is practically what the railroad commission seeks to do in the new freight rates on sand and gravel promulgated by that body.

The proposed rates are far below those fixed in other states on the same commodities. They are so low, in fact, that their enforcement would mean the hauling of sand and gravel at an actual loss.

The common carriers in Mississippi have borne without complaint their pro rata share of the expense of building better highways. They are heavily assessed in the special road districts throughout the state, and it often happens that boards of supervisors gerrymander a road district for the express purpose of bringing as much railroad mileage as possible within its borders. It is quite a common habit for the surveys of the improved highways to parallel railroad tracks, and the railroad company pays a far larger share of the special assessment than any dozen property owners in the district.

The railroads are entitled to reasonable

rates for hauling sand and gravel. They are not charitable institutions, and it should also be borne in mind that no other form of freight traffic involves a heavier wear and tear on rolling stock than sand and gravel shipments.

Rather than attempt to haul this class of freight business at a loss, one of the common carriers has taken the case to the courts to determine the reasonableness of the new tariff sheet, and others will no doubt do likewise.—Jackson (Miss.) *News*, July 20.

## Appreciates the Railway Employes

*It is nice to be appreciated. Railway employes frequently feel that the railroads' contribution to the life of the communities they serve is not always recognized. But here is an article from the Community Builder, official publication of the Chamber of Commerce of La Salle, Ill., that proves the opposite for La Salle, at least.*

Railway employes and their families are a very important factor in the business and community life of the city of La Salle. Probably but a small portion of our citizenship realize that so many people in this city are employed by the various railway companies, and that the annual payrolls total many thousands of dollars that goes into the business channels of La Salle.

In normal times, when our factories are all running full force, the four steam railroads entering La Salle and the interurban give employment to 390 persons, a large proportion of whom are men, only a few women being employed in the offices. To these 390 persons every month is paid in wages \$55,000, or a total annual payroll to railway employes in La Salle, \$660,000.

Just at this time, owing to the business depression, the normal railway force is reduced to 315, but this is only a temporary matter, and as soon as conditions get back to something like normal the railway force will be increased to 390, the number required to handle railway business in and out of La Salle.

A large number of these employes are married and have families. With an average of five persons to the home, it is safe to say that the railway payrolls support fifteen hundred or more people.

All of this \$660,000 annually goes into the legitimate business channels of La Salle. It is expended for family supplies, rent, fuel, provisions, clothing, etc., invested in homes,

or deposited in banks. It is just \$660,000 of the total that La Salle has to do business with, and it comes as the earnings of 390 railway employes.

Our railway people are all high-class citizens. Most of them earn good salaries, and they are in every way law-abiding, progressive citizens, a very desirable factor in our business and community life. They help to develop and build up La Salle. They are worthy of every consideration. They are supporters of the good things that are necessary to a community.

These facts and figures are given to call the attention of our people to the importance of the railway interests of La Salle in the way of financial and community support to the city. It is well for our people to be advised of all these facts that they may fully realize the importance of La Salle railway employes.

We are very fortunately situated from the standpoint of transportation. With three trunk lines entering the city and adequate connection and good service with another trunk line, we have good freight service touching all parts of the country and practically every commercial center in the United States.

The three trunk lines entering La Salle give us a very satisfactory passenger service, while the interurban puts us in touch with various towns east and west. This transportation service is an important factor in our industrial and community life and makes of La Salle a desirable place in which to do business and gives us many advantages as an industrial community.

The *Community Builder* extends greetings to the railway employes of La Salle. We recognize them as a potent factor in the commercial and social life of this city and wish for them success and prosperity.

Short Story  
Complete  
in This Issue

I'M telling this moral and diverting tale as an innocent bystander. Well, maybe

I wasn't as innocent as I looked, at that, and once or twice I was a little more than a bystander, but all right. It's about two guys in the car and ticket accountant's office. Their names are Bert Brown and Fatty Ferrill. And then there was the boss's new bronze-haired typewriter agitator: name of Nettie Belle Nevins; I say *was* because she isn't his stenographer now, and her name isn't Nevins any more—but that in its place.

The day Nettie Belle came to stenog in our office she started a fad. She was the fad. The minute she arrived, there was a stir. Everybody sat up and breathed hard. For she was sure sweet ointment and soothing lotion for tired eyes. Say about nineteen, cheeks like rose petals dipped in dew, hair like spun copper, eyes the color of a June sky after a shower—cool, calm, peek-a-boo-waisted, coy, and wise—that was Nettie Belle. But of course the gang of slaves around the office didn't know her name so glibly at that particular time.

Bert Brown met her formally right away. He's a kind of Friday for the boss. And the minute he met her he fell in head over heels. I don't hold that against him, poor simp. He might have had good sense and still made the same mistake. Bert's an old schoolmate of mine; both of us hatched and fledged in the same little town; I feel I have a right to make light of his mental caliber, range and velocity.

The boss's stamping ground is in a little railed-off pen up in front. Back of the fence, the rest of us hack along at different desks scattered around the big room. Of course, during that first forenoon—and for some time afterward—whenever the new baby doll happened to glance back of her in a pensive way while cudgeling her marshmallow brain trying to remember how to spell Ypsilanti or Sault Ste. Marie—incidentally overtaking some Hopeful Herbert in the throes of a sly

once-over—she made no sign. At least, not until she chanced to mix her violet gaze with the yearning rubber of Fatty Ferrill—when what does she do but curve a cherry lip and treat him to a glimpse of a row of seed pearls. Zowie! Fatty is gaffed. All this the first day, mind. Two scalps hung up to cure in the sun before the battle had begun.

As a matter of fact, Bert and Fatty sort of elbowed the rest of us off the firing line from the start, anyway. Nobody wants to be on a mere waiting list with the chances about 400 to 1 that the call boy won't ever give 'em a lusty summons. Me? No, I'm not beefing. I don't go bughouse over every bird of paradise I see. I think I'll kind of pussy-foot around and find me a nice, plain-plumaged, oldish chickadee with a safety-deposit vault full of Liberty bonds and Standard Oil shares. I sure could occupy my week-ends pleasantly clipping coupons. Besides, beauty isn't even skin deep a lot of the time, and if it is, it wouldn't do to have two star lookers hitched to the same road wagon; they'd steal each other's thunder. But to resume.

Fatty engineers it so he can cop a knock-down to the charmer. A forward lad is Fatty. Nosey; and a forger to the far front. He fixed it so he'd have to confer with Miss Venus de Miles about something or other, and the sum of his schemes equaled the least common multiple of his high hopes. The boss himself made 'em acquainted.

Fatty isn't tongue-tied, either. He's always steamed up where a girl is concerned and ready to roll out on the main line and pull her wide open. He believes in the old adage which says, "A stitch in time knocks the persimmon, and faint heart never gathers any moss." So while conferring officially he makes a date to take Nettie Belle to the White City Sunday afternoon for to eat candy, popcorn, peanuts and see the works.

Adalbert Brown was mightily peeved when he heard about that. And he heard about it when he tried to get himself elected escort

to Luna Park for the same day and date, as the law sharks say. Being sort of an old acquaintance of mine, he singled me out to serve as a waste basket in which to dump the disgruntled whinings of his disappointed soul, as it were, while we were walking up the street.

"You know Miss Nettie Nevins, the boss's new stenographer," he began.

"Who, me?" I growled. "No, kiddo, I don't know her. I haven't got any friends in the courthouse who think it's worth while to present me. How could I know her?"

He muffed my throw. "Whatty y'think?" he yammers. "That slob of a Fatty Ferrill has had the nerve to make a date to take her to the White City Sunday. She told me so herself. I thought she'd have more judgment than to let a lard head like him get on the good side of her."

"Yeh," I said, refusing to get excited. "I s'pose he must've threatened her life or something to make her go."

"Oh, he's got plenty of nerve, and she's a stranger. But he's gotta cut it out. I can take Miss Nevins around and introduce her into polite society."

Well, I guess you could call the bunch that goes to Luna Park and the White City "society" in a way; I wouldn't go so far as to say they're polite, though, in a rush for the street-cars. But let it go.

"Um," said I, "Well, so long. I'll leave you here. Be good."

Telling Bert Brown to be good was like admonishing a squirrel to eat walnuts. He was the original angel child. Never smoked, drank or played a game of chance in his life. Never even said a naughty word. In school he was teacher's pet, and wouldn't play rough games because it got his velvet suit dirty. Never read a dime thriller. Always home by sundown, that was Bert. He was a kind of boy that plays with girls. You see 'em turning the skip-rope and helping make mud pastry when they're little fellows with long

*The minute she arrived, there was a stir. Everybody sat up and breathed hard. For she was sure sweet ointment and soothing lotion for tired eyes.*

curls, and when they get bigger you'll spot 'em carrying a snap-shot camera, and a striped parasol, with some young thing out the railroad track hunting wildflowers. I wonder sometimes if the spectacled little men you see leading poodle dogs along the sidewalk of evenings aren't the final stage of those mamma boys. But to continue.

Fatty took his charmer to the gay pageant Sunday afternoon, as scheduled. But he overlooked a bet. He ought to have got the young lady committed in writing or something for future engagements. Success must have made him careless. Anyway his wild career as a gay Lochinvar was a thing of the past as soon as Bert Brown got a chance at the birdie's pink ear. Even a rabbit is dangerous when desperate. Bert didn't do a thing but hog all the open dates with Nettie Belle for a month ahead.

Nobody loves a greedy guy. The shoat who grabs two whole seats for himself in a day-coach or gloms on to the best piece of meat on the platter is well-despised, and the lad who tries to monopolize a fair Lizzie who is presumably foot-loose is deliberately aggravating. I almost took it as an insult myself. Not that I was interested or implicated in the least. Sure not! She didn't know me from Noah's son Hamlet, and it would 've been all the same if she had. The world is full of beautiful damosels.

You see 'em hopping off of every train—or else climbing on board—at every station in the land. They're growing both ways out of their clothes on all sides. Me, I don't carry my bleeding heart around like a bangle on my wrist. Cold, critical, cynical and casual, that's me. And yet, Nettie Belle might have done worse. As the thing stood, she prepossessed herself into my disfavor, so to speak, by ignoring me and double-crossing my friend Fatty. Hence my interest.

Fatty mentioned the subject to me.

"Whatty y'think," he said. "You know that Miss Nevins, the boss's steno?"

"Nevins, Nevins," I said blankly, "you said Nevins, didn't you?"

"Oh, fiddle!" he said profanely. "You seen she and I at the White City Sunday"—Fatty's grammar was sadly neglected early in life, I fear.

"Why, so I did," I conceded, "at a distance. My room," I added, "seemed much more desirable than my company on the occasion mentioned."

Fatty overlooked the satirical tang to my tone.

"She's a cute little Jane," he said, like a calf bleating. "She's my idea of a dag-goned pretty girl. Smart, too. But that sis of a Bert Brown has took a lot on himself; he's got her engaged for the rest of the summer. Say, old hoss," he exclaimed, suddenly lit up with a thought. "You and Brown came from the same backwoods village, I hear. I'd hate to think you like him—if you do, I pity your taste. Say, ain't there nothing you know about him? Was he ever arrested for snatching candy from a sick baby or nothing? Don't you think of a thing we could tell her to queer the boob?"

I pretended to rack the old bean. After all, why not frame up something in the way of a little local color for Adalbert? His record was spotless, but I could make up something. Why not? Nothing raw, of course, just something sort of mischievous.

But I mustn't appear too ready and willing.

"Why—why—" I muttered reluctantly—"I don't want to be a knocker—"

"Poof-poof!" said Fatty, interested. "We're

Fatty took his charmer to the gay pageant Sunday afternoon, as scheduled.

good friends. Come on, you can trust me with anything it's safe for you to know yourself."

"Well, the fact is," I said with great earnestness, "Brown's a bad outfit. I know him like a clothbound book. I've known him since he wore rompers. He's a sly dog. A tough proposition. He used to drink, gamble, and raise Cain a good deal—I wouldn't wonder if he does yet—all on the Q. T., you understand—"

"That sounds like a joke," Fatty grumbled. "You would never think it. You ain't kidding me—"

"Kidding you? Not a bit. Bert Brown is the original weasel. Sly as a fox. Old James J. Catfoot. He's got a poker face, and he keeps 'em all guessing. And when it comes to hiding the shells—well, take it from me, he's there, that's all—"

A 10-year-old kid wouldn't have swallowed such cock and bull, but Fatty actually fell for it. "Well, whatty y'think of that!" he gurgled. "I'll sure put Miss Nevins next to the pup," he promised.

"You'll do nothing of the kind!" I forbade. "I didn't tell you this for publication. I'm not running a free information bureau for red-headed stenographers."

So Fatty hot-footed it at the first opportunity and told Nettie Belle everything and more. I fear his imagination ran riot over hill and dale. I fancy he represented that Bert Brown was a thug in dude's clothes and worse, for the girl wound up by flying mad at Fatty himself and enjoining him never to speak to her again, not even on official business. She meant it, too, for from that day to present writing she never did raise the ban as far as Fatty is concerned. But immediately afterwards she began to make all kinds of googly eyes at Bert. All day long you could see them ogling each other like a couple of dying calves. It was plumb sickening.

It looked like she had decided to take Bert in hand and reform him. Fatty had merely scuttled his own barge when he lied about the other fellow. His own petard had turned out a boomerang. But that's generally what happens to an amateur muck-raker. However, after all, what was it to me? None of 'em was any of my folks. So I snapped my fingers and caught a trolley car for Luna Park.

Perhaps half an hour after I arrived, as I stood harmlessly munching an ice-cream cone beside the iron balustrade around the lagoon where the boats full of yelping yokels scoot out from the shoot-the-chutes, I heard somebody say:

"There he is, now, the big roughneck! I'll make him eat what he said."

Then I heard a trembly female voice say: "Oh, please, Bert, don't start any trouble! Please don't, Bert—"

With which I beheld old Belligerent Bert Brown, the beetle-browed brawler, standing before me with Nettie Belle Nevins hanging like a dove of peace festooned with olive branches to his brawnless right arm. Whisht, mavourneen! The lad was angry.

I stared expectantly.

"I understand you've been telling a pack of lies about me!" he said fussily.

"What was it I'm supposed to've said?" I parleyed, after taking a bite of ice-cream to conceal my nervousness.

"Why, you said I was a card shark and a booze-fighter and a—a—I don't know what all. And you know it wasn't so. We lived in the same town, and you know I never gambled or drank like the rest of you fellows did. What did you tell Fatty Ferrill I did for?"

"Oh, Bert, don't get into trouble, now," begged the girl.

"Keep back!" I said, acting like I was mightily alarmed. "You needn't think you can scare me with your fighting record. I'll have you pinched if you jump on to me!"

It must have been on account of my seeming timorousness, I can't think what else. It is well known that a barking pup will chase you furiously if you show fright. Anyhow, all at once, Nellie Belle turned Bert loose, and—whatever got into him at that moment, I couldn't say—the following is what actually happened. Bert went Berkshire or whatever they call it and fell upon me like a raging setting hen, cackling, scratching and pecking with the murderous frenzy of some terrible insect.

His onslaught was so abrupt that I hadn't time to let go of my half-eaten ice cream cone or regain my balance. My next definite impression was that of falling backwards over the iron railing. Then I lit with a tre-

mendous splash in the wet, wet water of the lagoon.

I caught a fleeting glimpse of bad old Adalbert and his red-haired accessory before, during and after the fact, beating it hastily through the gathering mob of sightseers.

I clambered dripping and considerably abashed over the railing to terra firma.

Confounded little man-eating guinea-pig! If I could have found him and his partner and coadjutrix, I'd 've stood treat to the soda pop and pledged them both to a long and adventurous career and many happy returns. But I couldn't find them. They must 've hit the first outgoing car.

I paused beside the boss's corral the following morning. I felt guilty of bald-faced defamation of Bert Brown's character, and I wanted to eat crow, to the best of my ability, before Bert's loyal lady friend. If my words interfered with her lofty plans for reforming bad old Bert, I couldn't help it. I was resolved to confess up.

"I want to tell you something about Bert

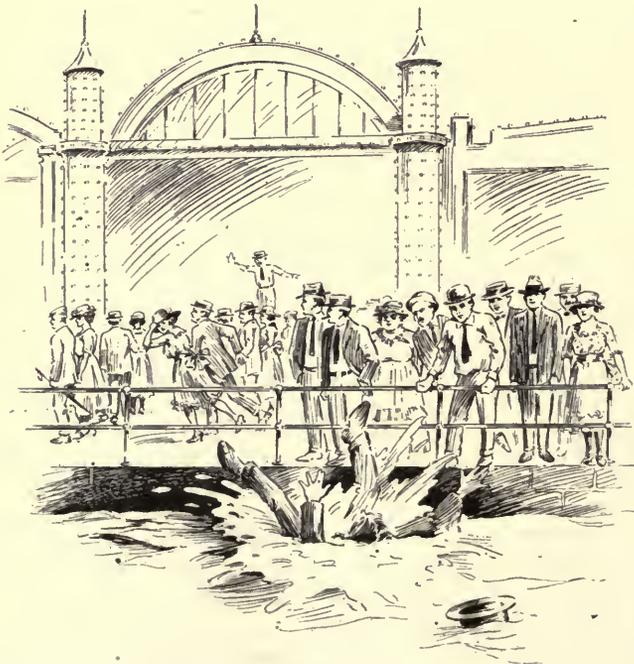

Brown," I said sheepishly. "The truth is you've been deceived in thinking that Bert Brown's a bad oyster, Miss Nevins. I've known him since he was a baby. He's always been a good boy. He couldn't do anything wrong if he tried. At school he held the championship record for sustained cleanliness, godliness, punctuality, punctuation and punctiliousness. He never missed a Sunday school lesson in all the days of his youth. He never even had an argument with anyone, much less a fight. His record for drinking and gambling is as flawless as a white rabbit's. I sincerely hope you won't get the notion because of his assault on me yesterday that he's a bad man from Bitter Creek, for he isn't. He just had a little brainstorm, and my foot slipped, I was so surprised. He probably won't have another spell like that in a hundred and sixty years—"

I thought she looked kind of horrified-like as I stated the heights and depths of the young man's innocence and harmlessness, but I was wound up, and I kept on talking—

that is, I continued to reassure her—until the boss happened to come in. I cut my visit short after that.

"Thanks, awfully," she said rather coolly, it seemed to me. "Your unselfish interest in Mr. Bert Brown's affairs is remarkable, I'm sure. He ought to feel under obligations to you for clearing up all misunderstanding about his past life—"

I zoomed on my way, wondering what she was trying to get at. But then most of these beautiful dolls are shy when it comes to that convoluted gray stuff. So I let it go at that. Bert hung around her right fondly all morning, but later on he had a look on his face as if he'd smelled rubber burning or something. And pretty soon, it was evident that he was slipping. He glowered at me sometimes when he thought I wasn't looking, but he never attacked me with sui-

*Then I lit with a tremendous splash in the wet, wet water of the lagoon. I caught a fleeting glimpse of bad old Adalbert and his red-haired accessory . . . . beating it hastily.*

cidental intent again. But why prolong the suspense and also the expense per word?

Nettie Belle's married now. We made up the price of a silver tea service or some such bagatelle in the office. Did she marry Bert? Not so you could notice it. She married the boss.

And him with an awful police court rec-

ord. Fined twice this summer for speeding in that Mudcat roadster of his. A regular law-breaker. A tough guy. Sometimes I get to wondering—but no matter. It's nothing to me. I'm looking for a nice, plain-featured, oldish-like young woman, with a barrel of boodle and a generous disposition—but I believe I said that before.

## Think—"As a Man Thinks, So Is He"

By HERMAN J. STICH

(Copyright, 1921, by Public Ledger Co.)

James J. Hill, king of railroad organizers, once handed a written order to a young, newly hired bookkeeper.

The bookkeeper glanced at the order, thought for a moment, then said to the railroad czar:

"Sir, this order is all wrong!"

Mr. Hill took back the order, studied it a minute or two, then carefully scrutinized the young fellow before him.

"I believe," he remarked finally, "you'll DO. You THINK!"

The man who can think is the man who can DO, and the man who thinks is the man who DOES; exceptions to this rule simply emphasize it.

"I think, therefore I am," reasoned one of the world's greatest philosophers.

And the man who does not think simply is NOT—he is a dead one—whether he knows it or not.

The final test of a man's value is his ability to think.

Inability to think—which usually means unwillingness to think or mental laziness—makes a man a liability to himself and to everybody with whom he does business.

The man who will not think as he works eventually degenerates into a worshiper of precedent. He prays to the calendar and the time clock. He becomes warped, incapable, prejudiced, dogmatic and ignorant.

If you want to improve, to move up and to enjoy—THINK! THINK as often and as hard as you know how.

A man may have knowledge, faith, initiative, graciousness and all.

But if he will not think, if he does not use

his gray matter while using his muscles, if he refuses to seek eternally a better way to capitalize the day, he is neglecting the one fundamental that alone can win him a place in the sun. And he grows constitutionally inefficient and inferior.

There need be no such thing as purely mechanical work, although much work is done mechanically.

When a man becomes so proficient that he "doesn't have to think about his work" he ought to get some other work, or somebody else's hat will soon hang from his favorite peg.

THINK!

"As a man thinks, so is he," said the wisest of men.

Think as a matter of self-preservation.

For the man who stops thinking starts drifting—always toward the rocks.—*By courtesy of the Ledger Syndicate, Philadelphia, Pa.*

### NEW EQUIPMENT ADDED

July has seen several additions to the passenger service equipment of the Illinois Central. The additions include: twelve 70-foot compartment coaches with two partitions, No. 3150 to No. 3161 inclusive; eighteen 70-foot baggage cars, No. 755 to No. 772 inclusive; five 70-foot dining cars, No. 4000 to No. 4004 inclusive; twenty suburban cars, No. 1301 to No. 1320 inclusive. The suburban cars were expected to be delivered at the rate of three a week beginning July 26; delivery of the others was expected to be completed by the end of July. The new baggage cars, coaches and dining cars will be used on the through trains. The cars come from the Pullman Company.

## Our 12 Veteran Pensioners

(Continued from Page 19)

best legal talent in Iowa as my advisers: J. J. Knight, of Dubuque, J. F. Duncombe, Kelliher & O'Connor, Senator Kenyon, and Thomas D. Healy, all of Fort Dodge. Senator Kenyon and Mr. Kelliher are the only ones surviving."

### Lost His Right Leg

Mr. Norman, who is now 75 years old, started his railway work as a brakeman on the old Dubuque & Sioux City Railroad, September 16, 1865, and continued as brakeman for two years. On September 16, 1867, he was injured, and it caused the loss of his right leg five inches below the hip, which laid him up for a year, which he spent in recuperating and brushing up at a business college at Dubuque.

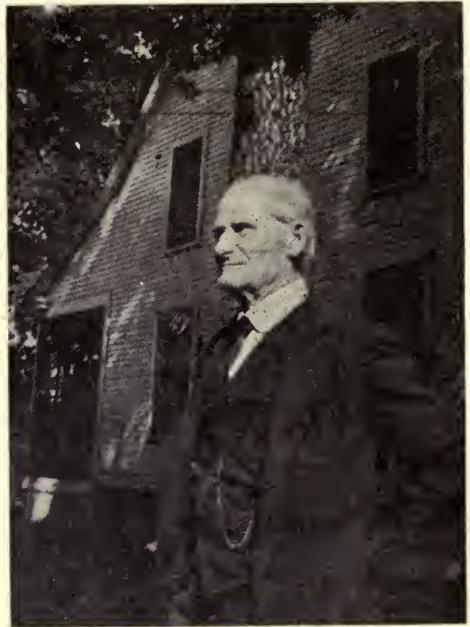

"In September, 1868, I was called to go to Winthrop, where I learned telegraphy in a very short time, about one week," he says. "Then I was given charge of the office and became a full-fledged telegraph operator. I continued at this work until 1902, most of the time nights.

"I have acted as extra agent at Raymond, St. Ansgar and Mona at short intervals. I was train dispatcher at Waterloo, Iowa, for seventeen years. During this time I also sold tickets nights. By 1902 I was pretty badly run down. For the last thirteen years I had an outside job until I was retired. Today I feel younger and stronger than I did forty years ago.

### Dodging Trouble on a Train

"My first trip was over the road from Dubuque to Waverly, Iowa. Al Herron was conductor; Ame Aldrich, head brakeman, and David Chevalier, engineer. There had been a wash-out on Pine Creek, between Winthrop and Independence, which took the bridge away. When we got there men had a temporary bridge across the creek about 100 feet from where the old bridge was washed out, and track was laid on the ground without grading. We went down to the creek and the engine got on the bridge, which sank into the water about a foot.

"Imagine how a green man would feel under the circumstances! When the car I was on approached the creek, I ran to the

John A. Norman

rear of the train. Finally the last car came to the creek, and I made a run for the head end.

"Well, we all got over safely.

"The next day, returning to Dubuque, I was sitting on the brake head on the head end of the car between Independence and Winthrop when I heard a loud report and saw a great deal of steam escaping. Of course I thought the engine had blown up, but it had only blown out a cylinder head. Engineer Chevalier disconnected and took the side rod down, and in putting the rod on the tank I cut the palm of my hand with the sharp corner of the rod. But I lived through it.

"In December, 1921, I will have been married 50 years. I have three daughters, five grandsons and one great grandson, all living and doing well. All members of my family are living."

### And Here Is Our Oldest Pensioner

Although not included in the foregoing list, John Howard, living at 1941 Turner avenue, Chicago, is the oldest pensioner of the Illinois Central System. On October 3, 1920, he celebrated his 94th birthday. He has a record of 31 years of continuous serv-

ice and has been a pensioner since July 1, 1901.

Mr. Howard was born in Ireland and came to the United States in 1864. Fifty-one years ago he went to work at the freight house at South Water street, Chicago, where his duties were to unload and call off freight to the checkers. He held that position for eighteen years and was then a watchman at the local freight house for thirteen years.

Mr. Howard says that he never was reprimanded while in the service and believes that this was the result of temperate habits. He never tasted liquor. At the age of 94 years he is hearty and appears not older than 70.

### *Meeting the Public*

The paying public, which has been shouting distress since 1914, has evidently turned the major portion of its attention to the railroads. As in the case of a man with heart disease, the blame is always placed on the heart and not on what causes or maintains the trouble.

The farmer attributes his financial distress to the present rail rates. He does not study the entire set of conditions that have forced the prices of his commodities down.

At every turn the responsibility seems to be shifted to the railroads. Railway employes therefore find themselves facing the public in a new manner.

A doctor soothes the man with the afflicted heart; so must railway employes soothe the public. We can do it, and we must do it in every way possible.

If we are attentive to the customers and handle their particular business to their satisfaction, they are quick to note the good service. A little explaining as to why rates are high and their comparison with other costs and relationship to final costs will cause the people to do careful thinking on the question of present freight rates.

Railway employes must shoulder the responsibility of curing the public of its many imaginary ills, and an "I thank you" is a wonderful tonic to remove frowns.—L. F. GIFFIN, *Agent, Monticello, Ill.*

*John Howard*

### **TWO RAPID SPECIALS**

On June 28 two special Illinois Central trains were operated from St. Louis to Chicago, carrying nearly 300 members of the Concordia and the Tower Grove gymnastic societies of St. Louis to participate in the American Gymnastic Tournament held in that city June 28 to July 8. The first special, consisting of seven all-steel cars, including a sun-parlor car and chair cars, left St. Louis at 8:03 a. m. with 191 passengers (Concordia Society) and made the run in 6 hours and 20 minutes, arriving at Chicago at 2:23 p. m. The second special, of six all-steel cars, including a sun-parlor car and chair cars, left St. Louis at 8:10 a. m. with 100 passengers (Tower Grove Society) and made the run in 6 hours and 17 minutes, arriving at Chicago at 2:27 p. m. It was a two-stop trip for both trains—at Litchfield for water and at Clinton for change of engines—and the performances of both over the 294.2 miles covered were such as to gratify the passengers exceedingly.

## Neatly Kept Section Home Is an Asset

**Section Foreman  
J. L. Donsbach  
and His Home  
at Rantoul, Ill.**

He keeps 14 hogs  
and 200 chickens.  
He has also 12  
peach trees, 4 cherry  
trees and a good  
garden. . . . .

The growth of the section-house idea from a shelter to a home was not attained in a short period, but has been a gradual development in keeping with the other developments in railroading.

The old section property originally constructed for the housing of construction gangs and the large maintenance gangs which usually follow construction, with its poorly maintained buildings and ill-kept grounds, was a fit companion for the old railroad with antiquated equipment and poorly maintained roadway.

But for a railroad of the standard of the Illinois Central, with its well-kept roadway and trains of the class of the Panama Limited, Daylight Special and Seminole Limited, to be satisfied with such conditions is unreasonable. We, as a corporation, are judged by the traveling public largely by the physical appearances of our equipment and roadway, even as individually we judge other people by their personal appearance or the appearance of their residences.

Every hour spent in beautifying section property brings large returns, not only to the foreman who lives in the section property, but also to the railroad company. The immediate returns are to the foreman and his family: the pleasure of living in the beauti-

fied surroundings, the healthfulness from living in clean conditions, the economy resulting from well-kept gardens and fruit trees; they have real homes, places for rest and recreation with their family; it increases their pride and gives them a larger place in the life of the community.

Well-maintained section property instills confidence in the traveling public, confidence which increases both our passenger and freight traffic, as the shipper's first consideration is safe shipment. Such maintained property speaks of permanency and responsibility, as a large part of the safety of our tracks is dependent upon our foremen. Ill-kept section property is usually accompanied by poorly maintained sections.

We are all interested in the section property. Let us see that the work done by the gardeners in the planting of trees, vines and flowers is not wasted. With only a small amount of effort on our part, the section property can be made a credit.

# *New Giant Dirigible Is Soon to Be Housed Near Illinois Central Line*

## *Scott Field at Belleville, Ill., Selected as Site for Second Great Air Service Hangar*

**B**ELLEVILLE, ILL., on the St. Louis division of the Illinois Central, has prospects of becoming the center of aviation transportation of the United States in future years.

The War Department has approved Scott Field, which is near that city, as an ideal location for the home of its largest dirigible balloons. A total of \$1,250,000 has been appropriated for the erection of a hangar to house one of the huge dirigibles which this country has purchased from foreign nations. Work on the building is expected to begin about September 15 and continue for fourteen months.

Dirigibles of the type that are to be kept there have a carrying capacity of 200 persons, and are capable of making a trip to Europe in eighty hours, or crossing the continent in less than that.

At the close of the World War, Scott Field, which had been a great boon to Belle-

ville and had brought much business to that city, became inactive. The business men there had always realized its value to the city, and they determined to make every effort to revive activities at the field if it was at all possible. When word was sent out from Washington that a desirable location for the large dirigible balloons was needed, the Belleville Board of Trade took upon itself every effort to obtain the project for Scott Field.

### **A Disapproval Feared**

The War Department was immediately informed of the advantages of that field. Nothing definite was done at that time, however, but the Belleville Board of Trade kept its courage and determination at a high tension. When information reached Belleville that Secretary of War Weeks had disapproved Scott Field as the location, E. A. Daley, secretary-manager of the board of

*The Present Scott Field From an Airplane*

trade, made a trip to Washington to persuade him to reconsider the proposition.

On his arrival at the capital, Mr. Daley found that the Secretary of War had not made his disapproval public. Mr. Daley learned that information on the desirability of the field was lacking. The War Department had been given the wrong impression.

Seizing the opportunity, Mr. Daley, with the help of Representative Rodenberg, laid the facts before the head of the War Department and persuaded him to remove his disapproval. Mr. Daley says that if the Secretary of War had made his disapproval public, their efforts would have been unsuccessful.

The new hangar will be 220 feet wide, 910 feet long and 180 feet high, with landing facilities 1,500 by 500 feet at the front. The entire structure will cover an area of eight acres. The doors at both ends of the building will weigh 3,000 tons a pair, and are to be operated by electric power. It has been estimated that it would take 1,500 men to open them in the half hour it requires electric power to accomplish the task.

#### Like Hangar in New Jersey

The only other structure of similar dimensions in the United States is that of the Navy Department at Lakehurst, N. J., which is just nearing completion to house the Z-R-2, the world's largest airship, which was constructed in England for the United States Navy.

The hangar at Scott Field will probably be the home of the Roma, which was purchased from Italy by this government. The giant dirigible has been dismantled and will be sent to America soon.

The Belleville Board of Trade is responsible for the establishment of Scott Field at Belleville. Ever on the alert for progressive steps for the betterment of the city, that body searched the county for desirable land when it heard that the government was to establish a flying field in 1917. The first trip out from the city disclosed a tract of land that appeared perfect for such a purpose. It was as level as a floor, treeless and one mile square. On all sides, there rose a line of hills that immediately suggested breakers for the wind. From a

*E. A. Daley*

height, the place resembled a huge saucer with a perfectly smooth bottom.

Enthusiasm ran high. The board of trade immediately leased the land from the seven farmers who occupied it, and obtained an option to buy. Then Washington was informed. Investigators were sent out, and final plans were made for the establishment of Scott Field on this location.

#### Field Started in June, 1917

Belleville had been far-sighted enough to make preparations for housing the army of workers that would be necessary to do the work on the field. Construction of the various buildings began June 25, 1917, and at present there are sixty-nine structures on the field. All of them were constructed at the expense of the government, except the natatorium. A flying circus was held, admission charged and the proceeds were turned over to the building of this playhouse for the soldiers. The cadets constructed the building.

Some of the details of construction at Scott Field are as follows:

All buildings lighted by electricity; gravel

walks everywhere; 50,000 square yards of roadway; a sewage disposal plant of 75,000-gallon daily capacity; a water tower for emergency, 160 feet high, with a capacity of 30,000 gallons; two miles of water main, with forty-seven plugs for fire protection; most of the buildings heated by steam, forced through 3,200 feet of concrete conduit by a vacuum system; three 10,000-gallon gasoline storage tanks; underground telephone conduit cable serving the field.

In accordance with the usual procedure of naming the aviation fields in honor of American flyers who had distinguished themselves or in honor of early work in the aeronautical field, this field was named in honor of Sergeant Scott.

#### Work Completed in September

The field was completed and accepted by the government September 1, 1917, a little over two months after the work was started. The first airplane left the ground at the field on the morning of September 2. It was a Standard, with William Couch as pilot.

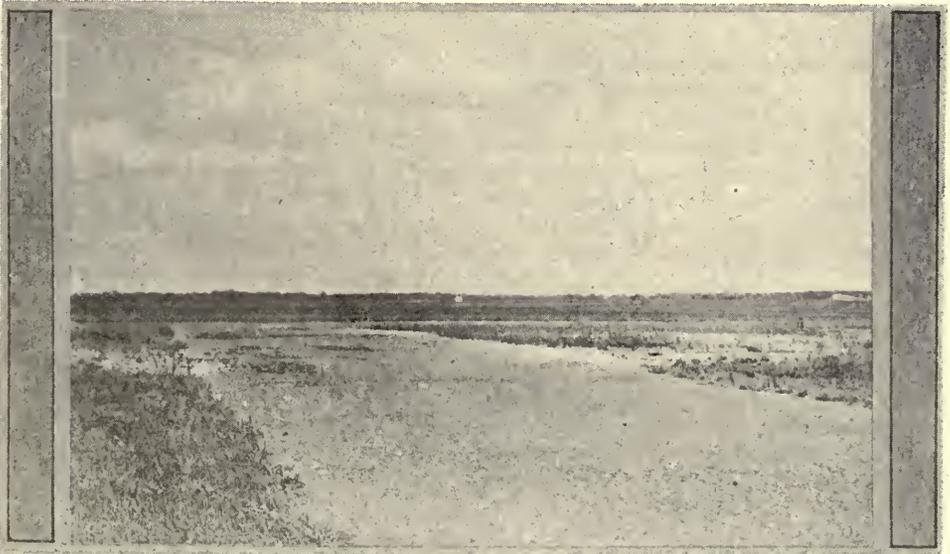

During 1918, 414 cadets reported at the field. Ninety-five of them were discharged at their own requests after the signing of the armistice, sixty-five were transferred to other fields, one was burned to death in an

airplane accident, two died of influenza, two were transferred on account of physical defects, one was transferred to the line at his own request, two were transferred to the hospital for treatment and two were discharged for the good of the service before they completed their training. The remaining 244 completed their course and were commissioned at this field.

rented the land from the owners and in turn rented it to the War Department. Later the board of trade bought the land and sold it to the government.

#### WATER A BIG ITEM

Conservation of water used on the Illinois Central System is one of the big items the management has to contend with, according to C. R. Knowles, superintendent of the water service, who was recently interviewed by the Memphis (Tenn.) *Commercial Appeal*. The Illinois Central System uses about 16,000,000,000 gallons of water annually, says Mr. Knowles. At Memphis the road pays the city between \$700 and \$800 a month for water. Mr. Knowles was making a trip over the southern divisions in the interest of saving water and teaching the men how to save it.

# Workers' View of the Railway Problem Explained by a Machinist

## *Points Out Absolute Necessity for Co-operation of the Employe and Support of the Public*

By W. M. GETZENDANNER,  
Machinist, Kankakee, Ill.

**A**LMOST every one who undertakes to do anything is actuated by some motive, and how well he succeeds in his undertaking depends largely on his qualifications and the thought and study he has given to the object he wishes to accomplish. The great trouble with most of our thinkers is that their thoughts have traveled in one groove too long. It is a known law that everything travels in the course of least resistance unless propelled by some greater force, and one of the greatest propelling powers and the cause of really earnest thinking is necessity.

The average man never stops to do any serious thinking until necessity stares him in the face. He who is out of reach of poverty has his thinking, as a rule, made too easy for him. He takes too many short-cuts to arrive at his solutions.

The railway problem is a problem of four equations, of which the human equation forms the major part. The first three are known to some extent, but the fourth is of such magnitude and its ramifications are of such varied nature that it is hard for the human mind to grasp. First, there is the employe; second, the stockholder; third, the public; and fourth, the power to see in the future with a reasonable amount of accuracy.

### **Employes Reflect Management**

Take the first factor—the employe. It can be said as truly of employes as of any other body of men that the government is no better than the governed. So, on the various railroads, the personnel reflects to a greater or less degree the policy of the management. Many of the roads have discovered this and have acted upon it by undertaking a system of education that will give the employes a better understanding of the management as a whole and its desires and the things it wishes

to accomplish. Man, like any other animal, will respond to good treatment, and there is nothing so conducive to efficiency as satisfied labor. Taken as a whole, the majority of the men on the railroads that have been well managed are loyal to the road for which they work and have the interest of the company at heart; but, as in all problems of human life, the small minority is the power that is seen and makes the most noise when there is any trouble.

The employe has been accused of inefficiency. But if any one who is familiar with railroading today will stop long enough to think what one train crew accomplishes today with the power we now have and to compare it with the performance of the same crew twenty years ago, he will have no doubt in his mind as to efficiency. Whether the employe has obtained these results through his own initiative or had them forced upon him by invention and improvement, the fact stands out that he has produced them, and the accomplishment answers for itself.

One great defect charged against the employe is that he is getting too high a rate of pay. Every man, I believe, should be worth his hire. The man who invests money wants more than a place to sleep and something to eat as his return; so with the man who works—the higher the wages that a railroad company can afford to pay, the better a class of men it will be able to attract to its service. As an employe, I believe low wages, in a majority of cases, are false economy.

### **Who Owns the Railroads?**

Take the second factor—the stockholder, who is represented by the management. Many employes and members of the public have an idea that the managers of the railroads are the owners and that they are working for their own personal gain. But when an analysis is made of the stockholders, the ones who in reality own the roads, we find that the men who manage the railroads own but a very small percentage of the stock, and that

they are nothing more than the servants of the stockholders, the same as any other employe, and that the real owners of the railroads are made up of hundreds of thousands of individuals of all walks and stations of life, and that they are just as human as you and I. If a widow is left a small legacy to support her family, when she invests that small amount in railway stocks, she expects to get her interest in return on it just the same as you and I do when we lend our money to others. As to asking the government to subsidize the railroads by guaranteed fixed revenues, it is merely borrowing from Peter to pay Paul; you are simply paying back your own self, for in the end you will have to pay it back in increased taxes.

Take the third factor—the public. The railroads always have been a target for the public at large. The vast majority of the public used to think—by some peculiar manner of reasoning and the stretching of imagination—that any crime committed against the railroads was justifiable, that the railroad was a monster to be crushed. The average legislature used to think, when elected by the people, that it was part of its sworn duty to take a whack at the railroads by some freakish legislation or some regulatory law, but this order of things is changed greatly. The change was brought on by a more liberal policy of railway managements in taking the public more in their confidence, showing the patrons more consideration and being more solicitous to their wishes and demands.

#### Can't Reduce Rates at Present

The public's present grievance against the railroads is the rates. I am not going to try to justify the present rate, but if the railroads are to run and pay a dividend, wages and taxes, it is hardly conceivable to see how it can be accomplished by any present reduction in the freight rates as a whole. Other corporations can well afford to make reductions in their rates and revenues—and should—but if one will only take the time to familiarize himself with the facts, he will find that the railroads, among all the big corporations, are the only ones that did not share in the large profit of the war and were the only corporations not required to pay an excess profit tax.

As I said in the beginning, the human equation enters largely in this problem. The

public, as we all know, is composed of the employe, the employer, the stockholder, as well as each and every individual citizen, and we all pay our part of the freight rate. This is a republican form of government, not of an invisible character, but some of our laws are invisible in their workings, if not in their effects, such as our indirect taxation.

Few stop to think that a big percentage of the added cost of living is due to high taxation and not chargeable to high freight rates, as a majority of the people try to make you believe, for everybody has to pay taxes—the railroads are no exception—and it is all added to the cost of the article, and the ultimate consumer pays in the end.

There could possibly be some arrangement made so that perishable farm products could be shipped without a loss to the shipper, but as long as competition governs prices the farmer who lives nearer the market can sell cheaper than the ones who have to ship thousands of miles and will have a controlling influence on the price, regardless of the extra freight cost.

#### Trouble Not of Recent Origin

One place where the effects of higher rates are noticeable is in the passenger business. The average man does not notice the freight rates so much, for that is a kind of indirect taxation for the majority of the public, but when he goes to the ticket office and lays down his money in front of him, he has an ocular demonstration of what increased rates are. Most people have to see a thing before they realize what it is.

To start an analysis of the last factor—planning for the future—causes me to hesitate, as it has ramifications which no mind or small group of minds can see. The present difficulty of the railroads is not of any recent origin, but has been a culmination of events and circumstances that have been **some time** in their making and have crystalized themselves in a definite form, superinduced by the war.

If it were possible to go back in the past and get those who were responsible for these conditions and punish them, that would be the wisest plan to pursue, but unfortunately this cannot be done.

Whether government ownership was beneficial or detrimental to the railroads, I will not discuss; but one thing is certain, when

you take and mix the good and bad together, the good is bound to suffer with the bad. Few railroads in the country operate under the same conditions as to physical condition, geographical position, and the commodity which they haul. Therefore, no set rule can apply to all, in operation, employment or management. It is not so much a question whether we have private or government ownership. The problem is of such magnitude that no man or small group of

men can grasp all the details and prepare for eventualities.

But if the problem is to be solved and the railroads are to survive and pay a revenue in the future, they must have the utmost loyalty and co-operation of the employe and the unstinted support of the public, as well as efficient management of them by those upon whom the responsibility rests. It matters not who owns or operates them—the public has to pay the freight.

---

## *Favors Putting Courtesy on the Payroll*

By J. M. HOLLAND,  
Agent, Dunlap, Iowa

The discourteous fellow may have had his day in court, but there is nothing surer under the sun than that he will never have it again. For the clever and obliging employe, his opportunity has arrived, and well may the company rejoice that he is on the payroll, for he is worth his weight in gold. With rates practically the same on all roads, the only margin left is that of emulating the virtues of Chesterfield and being ever ready to go the other fellow just one better in pleasing the trade.

One concrete case where the railroad was enriched considerably by the exercise of a little courtesy stands out vividly in my memory. Two weeks ago a traveling salesman handed two letters to the station men to mail. After telling the salesman his mail would be dispatched without delay, the station men noticed that one of the letters was addressed to a Chicago salt dealer. The representative was hailed and asked if he had sold a carload of salt, and he replied that he had. He was asked to route the car via the Illinois Central and replied that he would be delighted to do so, but, because our station was several blocks farther away than another line, the customer had designated the other line in order to placate the draymen.

"But I have been treated courteously here," he said, "and I am going to return the compliment right now."

He came back to the station and wrote a special letter routing it over our rails.

This works every time. Get out in the

waiting room and solicit the ten or twelve traveling men to whom you have just sold tickets. Note the alacrity with which they take out their order books and write the initials "I. C." at the top. Then go back and listen to them as they discuss the incident in subdued tones. They have been soliciting unwilling buyers all the week, and you, by soliciting them, have reversed their positions, made them feel much better and added materially to the revenue of the road.

It has been said that "virtue is its own reward." The same is true of courtesy.

Nine cars of Chicago stock moved from one of our stations the other day because the courtesy the railroad owes the public was properly observed. This shipper had always been a rock-ribbed, dyed-in-the-wool booster for a competing line. A few weeks ago he was stricken with appendicitis and hurried to a hospital in Omaha. The agent remembered that a hospital is a lonesome place, where time hangs heavily. He wrote the invalid a letter, injecting into it the humorous happenings of the town during his absence, told him how they missed his hearty handshake and pleasant greetings, and expressed the hope that he would be able to return at an early date. The patient's first lines after recovering from the sick bed were written to this agent in a trembling hand on a postal card.

This man was not a particular friend of our representative, certainly not in a business sense—but the agent's thought of writing him when he was sick, while his competitor forgot to do so, was the trick that turned the scale.

# Here Are the Ladders That Have Served Some General Officers

## Additional Thumb-Nail Sketches Show That All Started Their Climb at the Bottom Rung

A railway executive who had come up the ranks of the service from the humblest position the railroad had to offer in his department was telling what had induced him to make railroading his life work.

"I lived in a small town," he said, "and, like every small boy, I was fascinated by the bigness of railway operations. The telegraph operator, the agent, the train crews and engineers—all of them seemed to play such definite parts in the biggest thing that touched my life. Even the section men performed a class of work upon which depended the safety of hundreds and hundreds of human lives.

"As I grew older, I grew to know the romance of railroading. I learned that men who started out in the smaller jobs and proved themselves faithful to their tasks had risen to the highest positions of trust and responsibility. That was the real reason I took it up."

There is a romance in the lives of railway men which is filled with inspiration to every imaginative boy. In the *Illinois Central Magazine* for July we presented sketches of the executive officers of the Illinois Central System, showing the ladders they had climbed in attaining their present positions. Without exception, they started at the bottom.

### Where They Started

With the hope of furnishing inspiration for some youngster who is starting out in railway work—and, it must be admitted, to furnish the same inspiration for our own work—we are presenting herewith the "thumb-nail" sketches of a number of the general officers of this system. It would be incorrect to say that they are at the top. Not one of them would admit that he has stopped climbing. But their biographies are indicative of the opportunities which lie ahead of the beginner in railway work.

The first job J. L. Beven, assistant to the senior vice-president, had was as messenger

boy in the Illinois Central's local freight office at New Orleans.

A. E. Clift, general manager, substituted for a call boy at Champaign while the regular employe was on a leave of absence, and after that he was a brakeman.

When J. F. Porterfield, general superintendent of transportation, started out in the railway service he was a helper in the station at Pulaski, Ill.

D. W. Longstreet, traffic manager, began in the local freight office at Holly Springs, Miss.; billing and handling freight, checking baggage, etc.

R. W. Bell, general superintendent of motive power, was an apprentice in the machinist trade.

The first railway work performed by F. L. Thompson, chief engineer, was as a chainman in the engineering department.

W. B. Beymer, comptroller, was a freight bill clerk for the Baltimore & Ohio at Chicago.

W. A. Summerhays, general purchasing agent, began as a track apprentice.

A. F. Blaess, engineer, maintenance of way, also started out as a track apprentice.

The following are the "thumb-nail" sketches:

### J. L. Beven

Mr. Beven entered railway service with the Illinois Central as a messenger boy in the local freight office at New Orleans. He was subsequently employed as chief clerk to the superintendent and chief clerk to the general superintendent. His first official position was as a trainmaster on the New Orleans terminal division, and in 1916 he was promoted to superintendent of that division. During governmental control he served on the staff of the regional director at Atlanta, Ga., and later held the same position at Philadelphia, Pa. He was made assistant to the senior vice-president April 19, 1918.

### A. E. Clift

Mr. Clift was born on a farm near Urbana,

Ill., October 15, 1869. He entered the railway service as a call boy for the Illinois Central at Champaign, substituting for a regular employe on a leave of absence. He was made a brakeman in the freight service December 5, 1888, and a conductor June 24, 1891. He became a conductor for the Cleveland, Cincinnati, Chicago & St. Louis April 14, 1892. He returned to the Illinois Central service in February, 1893, as engine foreman at Champaign. He was made yardmaster at Champaign March 7, 1893, and September 10, 1894, he again became a conductor. He was made an acting trainmaster of the Chicago district October 14, 1902. On February 3, 1903, he was made trainmaster. He was made superintendent of the Freeport division February 22, 1905. On January 16, 1907, he was made superintendent of the St. Louis division. He was appointed general superintendent of the southern lines June 1, 1910, and May 10, 1912, was made general superintendent of the northern and western lines. He became general manager October 4, 1917.

#### J. F. Porterfield

Mr. Porterfield began his railway service as station helper at Pulaski, Ill., May 27, 1883, when he was 12 years old. He filled this job during the summer for three years and attended school during the winter. During that time he learned telegraphy, and he worked as agent and operator until 1890, when he entered the trainmaster's office. He was chief clerk to the superintendent at New Orleans, Chicago and La Salle, Ill. In 1897 he was made trainmaster at Clinton, Ill., and he subsequently held that position at Fort Dodge and Carbondale. In 1905 he was promoted to superintendent of the New Orleans division at Vicksburg, and he served as superintendent successively at Vicksburg, McComb, Miss., Memphis and Carbondale. He was appointed general superintendent of the southern lines May 10, 1912, with headquarters at New Orleans. He was made general superintendent of transportation in February, 1915.

#### D. W. Longstreet

Mr. Longstreet began his railway work August 1, 1887, in the local freight office at Holly Springs, Miss., billing and checking freight, handling baggage, etc. In November of that year he entered the local freight agent's office in New Orleans, where he

served in various capacities; at the time he left he was the rate man in the waybill department. In June, 1888, he was transferred to the general freight office in New Orleans as rate clerk. When the general freight office was moved to Louisville in December, 1899, Mr. Longstreet went with it and was made chief clerk. In January, 1903, he was appointed assistant general freight agent at Louisville, and just two years later was made general freight agent at that point. In January, 1907, he was appointed general freight agent at Memphis. May 1, 1911, he was appointed freight traffic manager and March 1, 1920, traffic manager.

#### R. W. Bell

Mr. Bell left school to enter railway work as an apprentice in the machinist trade. He worked as a journeyman machinist on the Great Northern and the Northern Pacific. Later he was a fireman on the Great Northern, and he left that job to become an engineer on the Chicago, Burlington & Northern, now a part of the Burlington Route. He entered the Illinois Central service as an engineer at Freeport, Ill., and served in the following capacities, up to his appointment to his present position: Traveling engineer, roundhouse foreman, general foreman, master mechanic, St. Louis division; master mechanic, Iowa and Minnesota divisions, and superintendent of machinery, Chicago. He was promoted to general superintendent of motive power June 1, 1913.

#### F. L. Thompson

Mr. Thompson was born at Grandview, Ill. He attended the public schools and DePauw University and was graduated in civil engineering from the University of Illinois in 1896. Immediately upon leaving school he took a job as chainman on the Illinois Central, working on the project of depressing tracks and grading Grant Park, Chicago. Later he was a rodman in the work of removing an old tunnel near Vicksburg and constructing the freight house at that point. When the line from Fulton, Ky., to Memphis was acquired he was placed on the grade reduction work there. He had charge of the grade reduction and second track construction between Cairo and Fulton and the second track construction between Centralia and Carbondale. He was in the chief engineer's office for a year, then from 1903 to

1907 was roadmaster on the Kentucky and Illinois divisions. In 1907 he was appointed assistant engineer of bridges and in 1910 engineer of bridges and buildings. In 1913 he was made engineer of construction, in 1914 was promoted to assistant chief engineer, and August 20, 1918, was promoted to chief engineer.

#### W. D. Beymer

Mr. Beymer was born at Clyde, Ohio, April 10, 1866. He entered railway service September 1, 1886, as freight bill clerk for the Baltimore & Ohio at Chicago. After one year he went to Topeka, Kan., as clerk in the office of auditor of freight receipts of the Santa Fe. During the following ten years he was chief clerk of agents' accounts, chief clerk of interline accounts and assistant chief clerk of the office. On April 1, 1897, he went to Savannah, Ga., as chief clerk in the accounting department of the Central of Georgia Railway Company and the Ocean Steamship Company of Savannah. July 1, 1902, he was appointed auditor, and later comptroller, of the two companies, and on July 1, 1917, he was appointed comptroller of the Illinois Central.

#### W. A. Summerhays

Mr. Summerhays was born in Chicago and attended the public schools and the University of Illinois. On June 15, 1898, he entered the Illinois Central service as a track apprentice in the engineering department and served on the Illinois division as laborer, assistant foreman of the ballast gang, section foreman and general foreman. He was promoted to assistant storekeeper in charge of track material at the Burnside storehouse in November, 1901, and became general storekeeper in May, 1910. He was made assistant purchasing agent in May, 1917, and general purchasing agent March 1, 1920.

#### A. F. Blaess

Mr. Blaess was born in 1871 at Ann Arbor, Mich. He attended the public schools and the University of Michigan. He was employed in 1895 and 1896 by the Detroit & Mackinac Railroad, and in 1897 he entered the Illinois Central service as a track apprentice at Cherokee, Iowa. After several months he was transferred to the engineering department and served in various capacities from rodman to assistant and resident engineer until 1902, when he was appointed supervisor of the

Cherokee district. In 1905 he was appointed roadmaster of the Springfield division. In 1907 he was transferred to the Kentucky division as roadmaster, and in December, 1912, was appointed assistant engineer, maintenance of way. In August, 1913, he was made district engineer, and on April 1, 1914, he was promoted to engineer, maintenance of way.

### BELIEVED DROWNED

William L. Logan

William L. Logan, employed as an inspector in the bridge department of the Illinois Central at Chicago, is believed to have been drowned in the vicinity of retards under construction on the Iowa side of the Missouri River, near Council Bluffs, July 1. It is thought that Mr. Logan fell from his canoe, as the canoe was found about 10 o'clock that morning floating upside down and resting against the up-stream side of a retard. Mr. Logan was about 36 years old and a graduate of Purdue University. He was soon to have been married. The Illinois Central Railroad Company has offered a reward of \$500 for the recovery of the body.

## Major Walsh on the War

(Continued from Page 66)

and we got big lumber from Oregon and Florida, and we got pile drivers and cranes from the United States, and we got generators to generate electricity, and American operators to operate the trains, and we started in with about 13,000 men. Inside of ten months a swamp was turned into docks for ten ocean-going ships.

### Who the Laborers Were

Then we started on other ports, and after we got these ports we had to take care of the stuff that came in. You may think we had a supply of common labor in France. A colonel made the following statement: "I went across on a ship with two engineering regiments, and on the way over these 5,000 men were constantly talking about the men who were to do the labor on the job they were going to be the brains for. One of the officers said: 'Is there much labor in France?' The reply was: 'Not that I know of, but there are 5,000 good laborers aboard this ship.'"

Across the swamp I saw 2,500 men stretched out in line, hip-deep in mud, shoveling up the mud on the bank. The colonel waved his hand to the long, hard-working set of men and said, "Behold the fate of the college graduates." As we got further down the line he stopped opposite a nice-looking boy, perhaps 20 or 21 years old. He said: "You see that boy with the long-handled shovel—his father is one of the richest men in San Francisco. He wanted a commission and could have had it, but he did not wait for it and joined as a private." He then said to the boy, "Walter, how is it?" The boy wiped the perspiration off his forehead and said, "Colonel, I passed three examinations to get this job."

### Yards on a Large Scale

That was the class of laboring people our railroads had there. After we got through the building of the ports we went to build yards. We had freight coming in at the rate of 50,000 tons a day, and we had to build yards to accommodate that freight. We laid out our first yard in the center of France, 8 miles long and 4 miles wide, and we had 125 miles of ladder tracks, and between the ladder tracks we had warehouses. The General came in August, 1918, and said: "Write a cablegram

to the United States, describing the character of storehouses that you will require." Then we wrote the following: "We want storehouses 50 feet wide, 11 feet high at the eaves, built of wood or iron frame. Length immediately required, 25 miles." That was the cablegram for the first order of warehouses, and we got it. That is the style we went into it. When we took that yard drawing up to the army headquarters, they said: "We never would think of using a yard like that. We don't need it. We are here to fight a war, not to build warehouses." But before the armistice was signed we had six yards like that.

After we got the yards built, we had to begin building roads, to get the stuff up to the front. You might think we could take our stuff up to the front on railroads. We could not. We took it up to within five or six miles of the front, then we took it the rest of the way by motor trucks, and the War Department says we had 16,000 trucks. They were great roads, not roads like the ordinary country roads. They were eighty feet wide and had rock on them three or four feet deep, because we had to get a good bottom in that muddy country; and we resurfaced them all the time, the motor trucks wearing about 3½ inches of rock off every month. We had to employ about 36,000 men in keeping those roads in order.

### Getting Rock by Wholesale

We were told a drive was coming and told to hurry rock; a total of forty or fifty thousand tons was used to build roads. That doesn't seem much to you, because you could go to the telephone any day in our big cities and call up a few quarries, and they would furnish you all you wanted, but you must remember that in France we had nobody to telephone to, and if we needed the rock we had to dig it out and crush it and carry it ourselves.

So we opened two quarries, one on top of a hill upon the Marne. It was 240 feet above the river; it had never been opened. It was good stone, but rather expensive to get it down. And the French did not think we could do it. They stood in open-eyed wonder when we hauled two big 45-ton steam shovels up the hill, for we hauled them with beef, man-power, and blocks and tackles. Then we did not have any ordinary drills; we had only 8-inch well drills; so we drilled holes and

loaded them with TNT and ordered the men off into the next county until we fired, and what rock did not land in the next county we picked up. There was six to eight thousand tons after we fired those shots. Then we tumbled it into the crushers and ran it down to our cars at the bottom of the hill, and within five days after we started that work we were getting five or six hundred tons a day, and there wasn't another quarry in France getting fifty tons out.

Just one thing as to the bridge work. The bridges were generally very simple, but most of the work in the Argonne fight was pontoon work, and we didn't have an American pontoon over there.

### **An Army, but No Equipment**

You people at home did wonders. You sent us all the ammunition and clothing and many other things, but you don't ever want to accept as true the statement that an eminent statesman used to make that a million men could rise to arms over night. A million men could rise to arms, but they are not an army; they are not equipped with lots of the things we need, and could not make in time for use in this war.

To begin with, we did not have any artillery in France. I was taken up by one of the army officers in that statement. He sent me a list of fifty-seven guns we had. Well, what are fifty-seven guns? We did not have any aeroplanes to speak of. We had a lot of things assembled, but they were not on the front. The gas masks and helmets were almost entirely British, and so also were a lot of supplies. We had to get them from our Allies, and they furnished them to us.

Among other things, we did not have any

pontoon boats; we had to cross the rivers, and the chief engineer said: "It is up to us to know where things are and to get them." And we did get them, because we found that the Germans had come to the Marne with the greatest pontoon equipment that the world has ever seen. They had come with 183 boats better than the U. S. army had ever seen.

Somebody said, "How do you know they had 183 boats?" We knew it because, after they had been shelled for three days, they had the experience and we had the boats. We sent men up along the Marne and pulled those boats out of the bottom of the Marne mostly, filled with dead Germans and holes. We did not care about the dead Boche, but we did worry about the holes. And we had some trouble patching up those holes and making timber structures, but we got them fixed up, made them sound, and used them. And when we got one of the bridges up some of the boys were very busy at a certain spot, near the end of the bridge; we looked to see what they were doing, and found they were placing a sign, and it said: "Made in Germany, but erected by the U. S. Engineers."

### **A Great Work Well Done**

I cannot speak too highly of the work of our transportation men in France. No body of men worked harder or more industriously, and no body of men is entitled to greater credit. In the corps we had some of the leading railway and shipping men of America. These men came to France at great personal sacrifice, and in the development of the organization of the corps worked more strenuously than they had ever done before in their lives. I have never seen a more

## *Things to Talk About*

The movement of vegetables from the district served by the Southern lines of the Illinois Central System is further evidence that business is not being hampered by the present scale of rates. Up to and including June 9, 5,420 cars of vegetables were loaded on our Southern lines, as compared with 4,455 during the same period of 1920, an increase of 22 per cent.

This bears out the contention made by the Illinois Central System that service is a greater factor in the problem of transportation than the scale of rates. This has been one of the most profitable years in the history of the vegetable producing section of the South, and the Illinois Central System has handled this business efficiently. Every car of vegetables reached the market on time; during the entire season not a single complaint was registered.

hearty spirit of co-operation than that manifested by these officers in the carrying out of the assignments that fell to their lot in the army life, and there is nothing of which I am more proud than to have been associated with them in the work in France.

**Our relations** with the French and the British were of the most pleasant and harmonious character. They made it perfectly clear right from the start that they were at all times at our service for the benefit of any advice or suggestions they might be able to offer by reason of their longer experience in the war, and we availed ourselves of their assistance to great advantage.

This spirit prevailed not alone in connection with the respective staff organizations, but throughout the entire working of our transportation relationship. In addition, they rendered us valuable service in connection with the loan of facilities at times when, pending the provision of our own, we otherwise should have been greatly handicapped.

#### **Railway Work Distinguished**

So far as concerns the railway men who served in France, I can speak with authority regarding their accomplishments, and my message to you is that you can go the limit in commending them. I rank their work with the most distinguished performed in France.

A large percentage of the railway men who went to France were well beyond the age at which military service might reasonably have been expected; many gave up very remunerative positions, home ties, and all those comforts and conveniences that are so foreign to army life, all to answer to the call of their country, and to serve in such capacity as they could be used with benefit to the cause. I think that if the facts were analyzed, it would be found that, of all agencies that contributed over and above what might be termed the reasonable call of duty, the railway profession stands out pre-eminently. I am proud not only of the sum total of achievement of the railway men in France, but also of every man who had the opportunity of serving there.

The enviable record made by the Thirteenth Engineers (Railway) in France has earned for this regiment the following letter of commendation issued by Brigadier-General Moseley, assistant chief of staff, at the

order of General Pershing, commander-in-chief of the American Expeditionary Forces:

The letter says:

#### **A Letter of Appreciation**

"Official report has just been received at these headquarters of the decorations and citations awarded you with the approval of the French High Command by the Commanders of the French Armies, Army Corps, Divisions, Brigades and Regiments under whom your regiment has served during its tour of duty in France. It is very gratifying to know that the efficient service of your regiment has been so recognized and rewarded.

"At the request of the French government, presented in the spring of 1917, your regiment was organized at an early date and under the most favorable auspices. By reason of the great number of men who presented themselves for service in France and the selection which was thereby made possible, the character and qualifications of the officers and men composing the Thirteenth Engineers were such as to make it a true representative of the very highest type of railway personnel in the United States.

"It was your good fortune to come to France in the formative period of the American expeditionary forces, and you were at once placed on duty with the French armies in the sector of Verdun—a name which is the apotheosis of the glory and honor of France. Here you took up the task of transporting men, material and supplies to our Allies under conditions of service utterly unlike anything in your previous experience.

"Railway equipment and methods of operation were entirely new to you, and the situation was made still more difficult by the lack of common language.

#### **A New Luster to the Service**

"The cheerfulness, the adaptability, the loyalty and the self-sacrificing devotion to duty, uniformly displayed under these trying circumstances by the officers and men from the regimental commander to the most recently arrived private, have added a new luster to the traditions of our railway service.

"I therefore take advantage of this occasion to express to you and through you to the officers and men of your command, our high appreciation not only of the valuable service rendered by them, but for the great

assistance they have been to one of our Allies. As a token of its appreciation for these services, the military authorities of the French Republic have awarded you these decorations. These medals and citations

should be more highly prized by you when you realize that in receiving them you have won at the same time the real appreciation and gratitude of the French military authorities under whom you have served."

## After Six Months of Traffic Solicitation

Traffic solicitation by postcard and personal request is progressing more satisfactorily on some parts of the system than on others, according to the regular report of results issued at the end of June, covering the third 10-day period of the month and summarizing the results to that date. The middle of the year finds the campaign in progress slightly more than six months.

The extreme northern and western parts of the system have a considerable lead in the matter of results, as will be seen by the table below. The Minnesota division stands first,

followed by the Iowa division. Much of the excellent work there can be attributed to the influence of the Illinois Central Employees' Business Association, formed last winter on that part of the system and described in an article in the May issue of this magazine.

The table below shows the results obtained by traffic solicitation cards and personal requests on the various divisions. The first line under each division gives the results for the last ten days of June, and the second line is the record from the beginning of the campaign to June 30.

Division	Cards Mailed	Personal Requests Made	Routing Orders Obtained		Additional Freight Shipments Obtained

# Work to Increase Facilities Is Under Way at Several Places at Once

## *Kentucky, Louisiana, Iowa and Illinois Are to Benefit From the System's Improvements*

IN line with the general policy of increasing facilities to conform with increasing business, and to perform more economically the handling and weighing of cars at Paducah, Ky., an authority to extend the existing yard southward to the Paducah & Illinois Railroad crossing, and to construct an entirely new south-bound departure yard, has been issued by the management. Grading and track laying are now well under way. The grading is being done by R. L. Frazer, a team contractor of LaCenter, Ky., while the tracks are being laid by company forces.

The new yard is on the west side of the main line, south of the Paducah & Illinois Railroad crossing. When completed, it will contain five body tracks, each of 75-car capacity, together with a drill track and scale track, at the north end, in addition to storage tracks for cabooses and bad order cars.

A 150-ton, 60-foot track scale is to be constructed near the north ladder, slightly elevated, to provide for motion weighing. The design is such that the cars, after being weighed, will roll away from the scale, into the body of the yard, without the necessity of car riders.

The new yard will be equipped with an air compressor and pipe lines, to test the air brakes of departing trains before the engine is attached. The estimated cost of this yard is \$225,000, and arrangements are being made to have it completed and in operation not later than October 1.

### **Some Work in Louisiana**

The territory extending from Sellers, La., south, for a distance of about ten miles, is rapidly developing, due principally to the activity of the oil refining business. The section referred to lies about twenty-five miles northwest of New Orleans, adjoining the east bank of the Mississippi River, under levee protection, and is traversed by the

Y. & M. V. and L. R. & N. railroads. Having both river and rail transportation it is not surprising that it has been selected as a site suitable for such industries.

These refineries receive their supply of crude oil from fields in the southern states by tank cars, or through pipe lines, and from foreign fields by tank steamers, which come up the Mississippi River to discharge their cargoes. The majority of the refineries own their own tank cars. Owing to the fact that at times there is such an accumulation of this class of equipment at the plants, it has become necessary to build additional storage tracks to take care of them. In order to avoid delay to through trains, it has also been decided to build an additional track adjoining the main track through this section, to which the spur tracks leading to the different plants may be connected, in order that switching may be done independently of the main track.

### **Construction Now Under Way**

The following additional facilities have been authorized, and construction is now under way:

Sellers, La.—three 50-car storage tracks;

Sellers, La., to Good Hope—additional main track 4,130 feet long;

Good Hope, La.—switching lead 4,050 feet long;

Destrehan, La.—storage tracks 8,250 feet long.

The cost of this work is estimated to be approximately \$140,000. The grading is being done by M. J. Roach of Memphis, Tenn., and the track work by the division forces.

As the property adjoining the right-of-way has been subdivided and improved with buildings, pipe lines, etc., the securing of additional width for borrow-pit purposes is expensive. On account of being unable successfully to drain borrow-pits of any considerable depth, it will be more economical to

haul the greater part of the filling material by train. Brookhaven gravel will be used for ballast, and it is expected that the tracks will be completed and ready for service not later than October 1.

The recent decision of the Illinois Central management to use heavier and more powerful engines to take care of the increasing freight business has necessitated improvements on the districts over which these engines are to be operated. Among the improvements necessary is the enlargement of the mechanical facilities at various points. At Freeport, Ill., Dubuque, Iowa, Waterloo, Iowa, and Paducah, Ky., improvements are now under way.

### Improvements at Freeport, Ill.

At Freeport eight stalls of the present roundhouse are being extended from 100 feet to 120 feet in length. It was also necessary to replace the present 85-foot turntable with a 100-foot turntable to turn these engines. There are also being built two driver drop pits under two tracks each, a front track drop pit under two tracks and a new tool room, and changes are being made to the present boiler washout system. The changes above enumerated have also made necessary various changes in the drainage and water systems. This work is being done by Joseph E. Nelson & Sons of Chicago. The cost of improvements to mechanical facilities at this point will be approximately \$40,000.

At Dubuque the present frame 7-stall roundhouse is being extended from 90 feet to 120 feet in length, and the present 75-foot turntable is being replaced with a new 100-foot turntable with a timber pit. A new double installation Robertson cinder conveyor is being installed. These improvements have necessitated changes and additions to the sewer and the water systems. The work on the sewer and water systems is being done by the Railroad Water and Coal Handling Company of Chicago, and the balance of the work is being handled by division forces. The total cost of these improvements will approximate \$65,000. The improvements at Dubuque are of a somewhat temporary nature, pending decisions as to future development.

### Changes Made at Waterloo, Iowa

At Waterloo the 85-foot turntable is being

replaced by a 100-foot table with a concrete pit, thirteen stalls of the present roundhouse are being extended to 120 feet in length, a driver drop pit and a front truck drop pit, each under two tracks, are being built, and a new toilet room is being constructed. The boiler washout plant is being remodeled, and changes in the sewer and water systems are being made. Some track work is also necessary. The new turntable pit was constructed by the Ellington-Miller Company of Chicago, and the rest of the work is being done by W. J. Zitterell & Company of Webster City, Iowa. These improvements will cost approximately \$70,000.

At Paducah six stalls of the present roundhouse are being extended from 100 feet to 120 feet in length. This extension necessitates certain changes in the water lines, but no other work. Five stalls of this roundhouse were extended a year ago, so that there will now be eleven stalls extended. The approximate cost of this work will be \$30,000. In addition to the work for mechanical facilities, there is also included a new 150-ton track scale and air compressor house.

Improvements at other points on the system are awaiting the decision of the management as to requirements to take care of engines to be assigned.

---

### TO REPUBLISH OUR STORY

The readers of the *Illinois Central Magazine* may be interested to know that the story of Elsie Sprouse, the invalid girl of La Clede, Ill., whom the Illinois Central trainmen made happy last Christmas, will appear in the December number of the *American Magazine*. This unique incident was published at the time all over the country, and the girl has since received letters from almost every state in the Union. Engineer R. J. Stuart got in correspondence with the publishers of the *American Magazine*, and they sent one of their staff writers, Neil M. Clarke, to La Clede, who gathered material for an illustrated story concerning the life of the girl and the part the Illinois Central trainmen played in it. The million and a quarter readers of the *American Magazine* are expected to add their approval to one of the greatest acts of goodfellowship of which they ever read.

# Illinois Central Co-operates in Running First "Dairy Special"

*Development Bureau Reports Success of Farmers' Trip  
to the Mississippi A. & M. College*

By H. J. SCHWIETERT,  
General Development Agent

**I**F YOU want to become thoroughly "sold" to the dairy idea of farming, visit the Kosciusko, Miss., Creamery and talk with its secretary, Mr. Hester, and you will come away fully convinced that the dairy cow has been the salvation of the farmers in that community. You will come away thoroughly infected with the germs of "dairyites."

It was Mr. Hester who conceived the idea of running a "Dairy Special" to Starkville, Miss., so that the farmers and dairymen and their wives and children might have an excellent opportunity to visit that splendid institution of learning, the Agricultural and Mechanical College, on July 19.

The development bureau, in co-operation with Mr. Hester and Mr. Eason, the county agent, and others, gave the "Special" all the publicity possible, and it is said there was not a farmer in Attala County who did not know all the details concerning this train and the object of operating it. It was a farmers' train, run for their special benefit, which the majority appreciated, and they showed their appreciation by making the pilgrimage to this seat of learning.

## A Good Crowd Despite Rain

Many were prevented from making the trip due to heavy rainfall the night before which made the roads in some instances almost impassible, especially for those who lived a long distance from the railroad. But in spite of these conditions, 367 farmers and their families made the trip. It was a day long to be remembered by those who were privileged to go. The majority of these farmers had never visited the college before, and there were some who had never been outside of their own county.

The train was well equipped and handled without a complaint, both going and re-

turning. Everything possible was done by Illinois Central officials and employes who accompanied the train to render the best service and to make the trip both pleasant and profitable.

## The Visitors Showed Interest

Upon the arrival of the train at Starkville, the crowd was conveyed to the college grounds by automobiles provided by the Starkville Chamber of Commerce, who also provided free transportation in bringing the people back to the Illinois Central station in the evening in ample time to catch the "Special" at 6 p. m. for home. Through this co-operation on the part of the Starkville Chamber of Commerce the farmers were able to give considerable time to the study of the dairy herds, poultry, and the various soil plots on which demonstrations are being conducted. The farmers were intensely interested and reluctantly left the various places of interest at the college.

The day was too short. It will be repeated. There will be another "Attala Special." We have no doubt that other counties will follow suit.

The development bureau has conducted two dairy campaigns in Attala County in co-operation with the Kosciusko Creamery, the county agent and the home demonstration agent, and now plans are under way for one of the biggest dairy campaigns ever put over in Mississippi or any other state. We are receiving the heartiest co-operation from every agency interested in the greater development of Attala County. We will report this later in this magazine. That the past two campaigns have brought results is evident from the fact that the Kosciusko Creamery has increased its output for the first five months of this year 100 per cent over that for the first five months of 1920.

That the farmers of Attala County appreciate the efforts of the Illinois Central is

evident from the following, taken from the *Memphis Commercial Appeal*:

### Voted a Resolution

A number of the farmers of Attala County who made the trip to the A. & M. College on the "dairy special" July 19 met and adopted the following resolutions:

"Whereas on the 19th day of July it was the pleasure of the farmers of the county of Attala to have the privilege of visiting the great A. & M. College of Mississippi through the energies of the Kosciusko Creamery, the business men of Kosciusko, the county demonstration agent, the Star-Herald, the Ethel Gazette, all of Attala County, and feeling that we, the farmers, should show our appreciation to them and to the other agencies co-operating in making this trip successful, and having expressed to them personally our appreciation, we, in body assembled, desire to make further and public expression to them. We desire to especially thank the Illinois Central Railroad Company for the efficient manner in which they handled the train, with plenty of room, order and decision. We desire also to thank the Chamber of Commerce of Starkville, Miss., for courtesies extended, the business men laying aside their duties and extending personal service to the crowd, handling the vast crowd of people in their cars and extending every other courtesy possible. We desire to extend our thanks to President Hull, who set in force every agency of that great institution for the benefit of the people on the special, opening the doors of the college to them, and especially do we appreciate the work of Messrs. J. S. Moore, R. S. Wilson and J. R. Ricks and for their thorough explanations of their work and their desire to benefit the farmers. Their lectures on subjects of vital interest to the farmers were especially fine, and we thank them for their useful information and leave at their door an open invitation to come to our county and partake of the best we have.

"We further desire to express our thanks to Mr. Clyde Hester of the Kosciusko Creamery for the splendid manner in which he handled the crowd for us and made the trip such a delight.

"We thank Senator Clarence E. Morgan for his splendid address of thanks to these parties and agencies on our behalf.

"We desire that The Commercial Appeal, the Star-Herald and the Ethel Gazette be each handed a copy of these resolutions for publication and that the Chamber of Commerce of Starkville, the office of the state agent, the railroad officials, the head of the experiment station and President D. C. Hull be handed a copy of these resolutions.

"Respectfully submitted (signed), P. G. Bailey, W. W. Wood, L. J. Jenkins, J. H. Kimbrough, E. A. DuBard, L. D. Kuykendall, J. H. Jamison, W. M. Huffman, W. H. Black."

### Our Work Is Appreciated

The following letter from Secretary Hester shows how much the efforts of the Illinois Central and its development bureau are appreciated, and what results have been accomplished through our efforts:

"We have arranged to try to get your help to put on a dairy campaign in our territory beginning the 12th and running through to the 17th of September. We are anxious to make this the biggest and most enthusiastic dairy campaign that has ever been put over in our county or territory, and any new idea or any plans you will outline will be greatly appreciated. Of course you will expect to use your picture machine.

"The plan we are working on is to get enough

help to make up three good live teams and to send these teams in different directions and cover the whole territory completely in this week.

"We certainly will be glad to have you visit us the first of August. We believe the trip will be worth your coming, and I know it will be worth a great deal to the creamery and dairymen. Sometimes I wonder if the railroad company realizes the real value of their work. I know from personal observation that your development agents for this territory have been the cause of hundreds of folks going into the dairy business, and we have several hundred yet that ought to be in the dairy business. But they are cotton lovers and growers. So keep the good work you are doing up to its present standard, if it is possible.

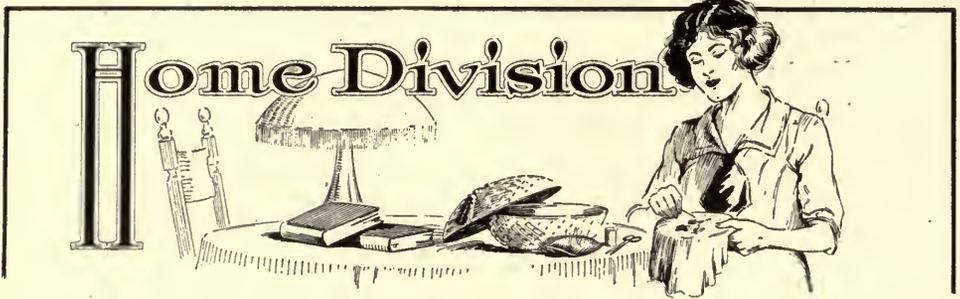

"Now any time you have any suggestions to make, or any plans you would like to carry out in my territory; write me, and you will always find us ready to co-operate with you, and carry out any plans that will result in the upbuilding of our territory."

Efforts of this kind will get results and make any community prosperous and happy. Prosperous people means prosperous railroads.

## READY FOR TROUBLE

Frank Anderson, in the office of the general superintendent of transportation, Chicago, returned July 19 from a two weeks' outing at Camp Logan, where he enjoyed himself immensely with the boys of the First Infantry, Illinois National Guard. "Between swimming, target practice, sham battles and all sorts of athletics, 'chow' never tasted better," he said. Mr. Anderson can be seen at the extreme right of the group.

DEAR WOMEN READERS: You will agree that "civilized man cannot live without cooks." Every woman who can cook has at least one recipe which is her specialty. Will you contribute your favorite recipe for the readers of the Home Division? Write out the directions plainly, being careful to give exact measurements and all necessary ingredients. As there may be duplicates, we cannot print every recipe which is submitted, but we will print those which are of general interest. Address Home Division, care Editor, *Illinois Central Magazine*, Chicago.

### Are You a Beautiful Woman?

No? Then blow upon the ashes of your hopes. That you can become beautiful is demonstrated by the following incident:

We met in the Union Station. I had not seen her for three years.

"Alice Gray," I exclaimed. "I scarcely knew you. What have you done to yourself? You are positively beautiful!"

"Do you really mean that?" she asked, earnestly.

"I most certainly do."

"Well, those words mean so much to me that I am going to tell you about what I call my transformation. Let us sit here near the open door, where it is cool."

"Yes," she continued, after we had settled ourselves for a chat. "You are the third person I have met today who has remarked about the change in my appearance. The two others may or may not have been sincere—but I know you are.

"You remember what a bookish sort of person I have been since childhood. I was

considered the ugly duckling of the three Gray girls. When Lucile, the beauty of the family, was married three years ago, everybody raved over the loveliness of the bride and the bridesmaid, and I felt secretly that I had not been included in the wedding party because of my plainness. At the wedding breakfast I overheard a remark of the kind. Someone said that I didn't seem to belong to the family—but that there was apt to be a weed in every flower garden. That hurt so that I wanted to cry right there. When I could do so, I stole off alone, locked myself in my room, and sat down before the dressing table to think the situation over.

"I began at the top of my head. The mirror revealed a bushel basket of hair, chestnut in color, but dull in tone. I must say that my sisters were constantly trying new beauty aids. I had been blind to my need of treatment, for I had scoffed at such nonsense. I would try a tar soap shampoo and lemon rinse. My eyebrows were straggly, so I had a hairdresser shape them. The result was marvelous. The trim, carefully-shaped brows lent a patrician air. For two weeks I shunned books in order to rest my eyes. Incidentally, I discovered that the least touch of rouge brought out their color. The offending, shiny nose was next subjected to astringent treatment. The Grays all have good teeth, and by persistent practice I succeeded in curving my lips upward at the corners. I noticed a fat bump where my neck and shoulders met, and that melted away after persistent exercises in twisting my neck from side to side and rolling my head around. To reduce the waist measure I again resorted to exercises, this time bending the trunk forward, backward, and to left and right. The manicure was visited three or four times, until I be-

came proficient in caring for my nails. A chiropodist removed a horribly painful corn, so that I could again wear neat shoes. I studied the fashion magazines until I found a style of garment becoming to my slim figure, and I chose colors that matched my hair and eyes.

"But that was by no means all. Saying unkind things of others was tabooed. I weeded out all mean, jealous, envious thoughts. I walked in the open for miles, all the while telling myself fiercely that I *would* be beautiful. It was not an easy task. I became dreadfully tired of keeping everlastingly at the treatment. Then when I was almost ready to give up in despair, a kind man praised my beautiful hands. A girl friend noticed the gloss on my hair, and asked me how it was acquired. I tell you I treasured the tiniest compliment, and threw upon it. Finally Jack came along, and when I found that he loved me and that he called me his beautiful girl, I just naturally turned as the sunflower to the sun, and you see the result. We are to be married in September.

"There's Jack now. We are going to lunch together. Good-bye, dear."

#### Household Hints for Home Makers

Make a cheesecloth bag in which to keep lettuce in the refrigerator. Wash lettuce carefully, dry between towels, place in the bag and put in refrigerator. It will be crackly crisp when ready for use.

For cream pies and others for which the crust is baked before filling, invert the pie tin and place the paste on the outside, shaping it to the pan, prick with a fork, and put, still inverted, in the oven. Crusts baked in this way are perfectly molded and never humpy.

Drop a few grains of rice in the salt shaker, and the salt will shake out freely despite the weather.

Add a few drops of kerosene to the water when washing woodwork. It cuts the dirt and will not injure the finish of the wood.

#### Tested Recipes

**GINGER DROP CAKES.** Mix 1 cup of molasses with  $\frac{1}{2}$  cup of boiling water. Sift  $2\frac{1}{4}$  cups of flour with 1 teaspoon of baking soda, 1 teaspoon of ginger,  $\frac{1}{2}$  teaspoon of salt, and add to the molasses. Stir into this

$\frac{1}{2}$  cup of chopped raisins and 4 tablespoonfuls of melted butter. Bake in muffin pans 20 minutes.

**STUFFED TOMATO SALAD.** Select tomatoes of uniform size. Scald so that skin can be removed easily. Cut a slice from top of each, and with a small spoon remove the seeds and pulp to form cups. Sprinkle inside with salt, invert on a plate, and set in a cool place until ready to use. Peel a cucumber and cut it into dice, season with salt and pepper, and mix with  $\frac{1}{2}$  cup of cream dressing. Fill the tomato cups with this mixture, put another spoon of dressing on top, and sprinkle with a very little finely-chopped parsley. Serve on crisp lettuce heart leaves.

**CREAM DRESSING.** Mix  $\frac{1}{2}$  teaspoon salt, 1 teaspoon flour, 1 teaspoon mustard, and 1 tablespoon sugar with 2 tablespoons butter, add 2 egg yolks, then  $\frac{3}{4}$  cup cream, and lastly  $\frac{1}{4}$  cup vinegar. Cook over hot water until it thickens. Strain if necessary, and chill.

**CHOCOLATE CREAM FILLING.** Mix together in a bowl until smooth 1 cup of pulverized sugar, 1 large tablespoon of butter, 2 tablespoons of hot coffee, 3 teaspoons of cocoa, and 1 teaspoon of vanilla. Use for center and top of cake.

#### Every Woman's Duty

If you are one of those women who sunburn, do not wear a georgette blouse if you expect to be out in the sun for any length of time. The skin needs more protection than this transparent fabric affords.

A teaspoonful of glycerine will relieve hoarseness.

If your new shoes rub at the heel, wear a small square of adhesive plaster over the spot where you feel the friction. This may prevent a blister.

Most of us overlook the importance of uniformity in odor of toilet preparations which we use. Not only is it bad taste to use, say, geranium talcum and rose perfume with lilac powder, but the effect is spoiled. Select an odor that pleases you, and be consistent.

#### From the Shops

Fetching indeed are felt hats trimmed with fruit, flowers or beads.

Pongee, that light and practical silk, is

seen more and more. Not only does it make a charming frock or suit for mother, but it has crept into father's wardrobe, where it finds favor for shirts, handkerchiefs and pajamas.

Quaint ornaments of all sorts are used for trimming.

#### Life's Little Lies

Telling the fond father that his week-old son looks just like him.

Promising you won't tell a soul.

From the weather report: "Unsettled tomorrow and not so warm." And "tomorrow" was the season's hottest!

#### O Mother-My-Love

O Mother-my-love if you'll give me your hand

And go where I ask you to wander,  
I will lead you away to a beautiful land,  
The dream-land that's waiting out yonder.  
We'll walk in a sweet posie-garden out there  
Where moonlight and starlight are  
streaming

And the flowers and the birds are filling  
the air

With the fragrance of music and dreaming.

There'll be no tired-out little boy to undress,

No question or cares to perplex you,  
There'll be no little bruises or bumps to caress,

No patching of stockings to vex you;  
For I'll rock you away on a silver dew-stream

And sing you asleep when you're weary,  
And no one shall know of our beautiful dream,

But you and your own little dearie.

And when I am tired, I'll nestle my head  
In the bosom that's soothed me so often,  
And the wide-awake stars shall sing in my  
stead.

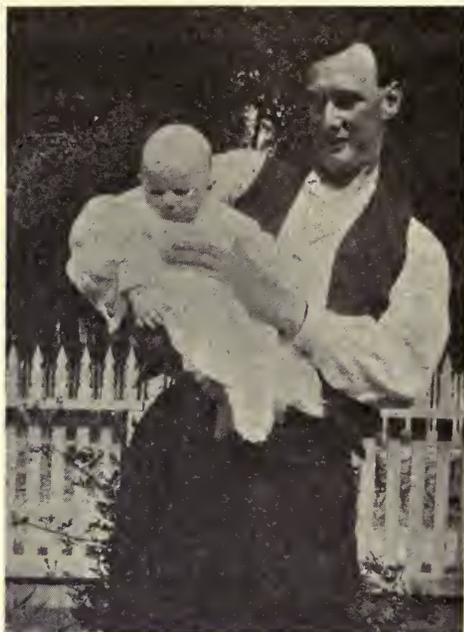

A song which our dreaming shall soften.  
So Mother-my-love, let me take your dear  
hand,

And away through the starlight we'll  
wander,  
Away through the mist to that beautiful  
land,

That dream-land that's waiting out yonder.

—EUGENE FIELD.

## IN THE FAMILY, TOO

This is a picture of John Ira Cronin, locomotive engineer on the New Orleans division, and his baby son, August Jeremiah Cronin. The baby is named for his two grandfathers. He is a husky little fellow for his age. His grandfather on his father's side, Jeremiah Cronin, is the well-known traveling engineer of the New Orleans division. There is no more popular official on the railroad than Grandfather Cronin.

#### AN ACKNOWLEDGMENT

For the photographs of the scenes from the tower of Central Station, Chicago, and the Chicago beach scene appearing in this issue, as well as for the photograph of the Wrigley Building that was reproduced in the July issue, the *Illinois Central Magazine* is indebted to Fred Abrahamson, in the office of the general superintendent of transportation, who snapped the pictures, and to Almer Coe & Co. of Chicago, who furnished the materials and finished the pictures.

# Law Department

## A Claim That Came Too Late

An interesting point, arising under the Louisiana Workmen's Compensation Act, has recently been passed upon by the Supreme Court of that state in the case of Cuna vs. Elton Lumber Company, 88 Sou. 493.

The original act, passed in 1914, provided that a claim could not be maintained under the law unless it was presented to the employer within six months after the date of the injury. In this case, one Cuna was injured, but did not make his claim until after the expiration of six months. In the meantime, however, five months after the injury, the law was amended so that it was no longer necessary to make a claim within six months.

It was contended by the claimant that the repeal of the provision requiring a claim to be filed within the 6-month period saved his case from the operation of the old law. The court held, however, that, under workmen's compensation laws, the statute in effect at the time of the injury has the effect of a contract, and that the subsequent repeal of the law will not affect the rights of the parties, which must be determined by the law as it existed at the time of the injury. A decision of the Connecticut Supreme Court of Errors was cited to support this view.

## A Loss to the Nation

All thoughtful students of the transportation question were pained to learn from a recent announcement in the public press that Chairman Edgar E. Clark of the Interstate Commerce Commission has offered his resignation. Mr. Clark has been so long identified with the railway problem that his retirement from the commission leaves a vacancy which it is hard to fill. It is understood that Mr. Clark is retiring from the commission to engage in business which will yield him a greater compensation than the somewhat meager salary which is paid to an interstate commerce commissioner.

Mr. Clark is now 65 years old. Whether

he has managed in some way to acquire a competence is not known, but it is a fact that he has a young and growing family and doubtless feels the need for more money than the government pays its public servants. Whatever may be the cause of his retirement, it is certain that with his resignation there passes from the scene of public action the most influential figure of the last quarter of a century in the field of railway regulation.

Mr. Clark came to the commission fifteen years ago. He was appointed originally by President Roosevelt and was twice reappointed by President Wilson. Prior to his great constructive work upon the commission he was a prominent labor leader and attracted the attention of President Roosevelt by his admirable work as an arbitrator in the great anthracite coal strike. He was appointed to the commission in 1906, almost simultaneously with the amendments which were made to the law, by which the Interstate Commerce Act, theretofore a rather harmless and flaccid statute, became so vitalized that it represented one of the most important legislative provisions of recent years.

Mr. Clark steadily grew in usefulness, in knowledge, in ripened judgment, and in the confidence of the country. It is more than probable that at the beginning of his career, owing to his training, he approached the solution of railway questions in a somewhat biased frame of mind, but as his experience increased and his knowledge of railway conditions widened, he undoubtedly reached a very high degree of impartiality, so that in the last few years of his career he commanded the unlimited confidence of shippers and railroads alike.

Perhaps his most useful work was in his dealings with the Congress. He has for many years been on the legislative committee of the commission and was the usual medium whereby the commission communicated with the Congress. His work in connection with the Transportation Act of 1920 is well known.

It is commonly believed, with good reason, that the Esch bill, as it was reported from the house committee in 1920, was largely the work of Chairman Clark. Certain it is that every provision of the bill was carefully scrutinized by him before it was introduced into the Congress.

Mr. Clark was perhaps more familiar with tariffs, their construction and their application, than any other man in the United States in or out of the railway service. In addition to his extensive knowledge of this highly technical subject, he was as familiar with the ordinary operation of railroads and with the rate structure of the country as anybody who could be named. So thoroughly did he command the confidence of the country that he had become a great conservative influence, and it will take many years of patient effort for anyone else so to grow into the confidence of the country that he can even approximate the work which Mr. Clark was doing at the time of his resignation.

#### A Friendship Broken

The death on July 18, at Independence, Iowa, of Judge Joseph Ney, formerly judge of the Dubuque district, and for years instructor in law at the University of Iowa, serves to recall his former residence at Dubuque, and his long and intimate acquaintance with W. J. Knight, for so many years the valued district attorney of the Illinois Central for Iowa. We are indebted to James T. Tait, known to the Illinois Central family as "claim agent emeritus," and now justice of the peace in Dubuque, for an interesting account of the friendship once existing between these men, and the manner in which this relation was broken. Mr. Tait was their contemporary. In a recent communication to one of his friends in the general office, he falls into a reminiscent mood.

It appears that when Mr. Knight was married Mr. Ney was his best man. The friendship begun in youth extended into middle age and for years they were almost inseparable companions. But after Judge Ney's useful and honorable career upon the bench, and when he had returned to the bar, these ancient friends found themselves on opposite sides of a law suit which Judge Ney brought against the Illinois Central.

Mr. Tait, with the best of intentions and zealous for the interests of the company, as was his wont, effected a settlement of the case, evidently without the full approval of Judge Ney. However that may have been, Judge Ney filed a motion to set aside the settlement. The motion not being very vigorously pressed, Mr. Knight had it dismissed for want of prosecution. Thereupon Judge Ney asked that his motion be reinstated and sustained.

At the hearing of the motion both these eminent lawyers and Mr. Tait testified, and as a result the motion was overruled. But unfortunately the interchange of comment and repartee between counsel in a case which had taken on a personal aspect, involving questions of veracity and professional conduct, produced a breach which was never healed. It was only at the bier of Mr. Knight that the familiar features of his former associate, now rigid in death, brought to the eyes of Judge Ney the gracious drops that washed away all recollections of past differences and left only the earlier blessed memories of their long friendship.

Doubtless, on the shores of the undiscovered country, where clear vision is never beclouded with passion, these rare spirits are now in happy communion, untinged by any trace of bitterness.

#### Two Questions Settled

The Supreme Court of the United States has recently put to rest two rather troublesome questions which have from time to time led to very considerable differences of opinion, particularly as between the state and federal courts. It has always been somewhat doubtful as to whether a railway company could be sued and recovery had against it for the torts of the director general.

On the one hand it has been insisted that the Federal Control Act could not, consistent with familiar constitutional principles, be so construed as to make the corporation owning the railroad responsible for the acts of the director general, when the corporation did not have control of the property and had no voice in its management. However, the Federal Control Act did provide for suits against the carriers, and this has led many of the state courts to hold that suits could be prose-

cuted against the carriers by name and recovery had, without bringing in the director general as a party defendant. Many of these state decisions ignore General Order No. 50, providing that suits must be brought against the director general for injuries arising during federal control, the holding in such cases being that the director general had no authority under the Federal Control Act to make an order which ran so palpably counter to the language of the law.

The federal courts, however, have very generally recognized the right of the director general to promulgate General Order No. 50, and many of them have pointed out that it was extremely doubtful if the Federal Control Act would be constitutional if it was construed to give a right of action against railway companies for injuries committed by the director general at a time when the properties were entirely out of the hands of the owners.

Now comes the Supreme Court in the case referred to (*Missouri Pacific R. R. Co. v. Ault*, 41 Sup. Ct. Rep. 593) and holds that General Order No. 50 is entirely within the power of the director general to promulgate, and that suits cannot be maintained against railway companies but must be brought against the director general alone. Justice Brandeis in so holding intimates, though he does not find it necessary to decide, that if the Federal Control Act were construed to give a right of action against the companies it would be unconstitutional.

In the same decision there is also settled the interesting question of whether penalties can be recovered against the director general. The case arose in Arkansas, where a state court imposed a penalty of \$390 upon the railroad for failing to pay a \$50 labor claim. There was a state statute which authorized a penalty of this character. The court holds, however, that the government cannot be sued except by its consent, and that it has never given its consent to be sued for anything except compensation. Compensation alone, says the court, is the measure of the liability of the government under the Federal Control Act, and nothing else can be recovered.

It would seem, therefore, to be reasonably clear that there can be no recovery of punitive damages against the director general, since undoubtedly such damages are vindictive

in their nature or imposed not as compensation but as a punishment for wrongdoing, for which the government has, under the cited case, not given its consent to be sued. We say this in all deference to the opinion of the Supreme Court of Mississippi in a very recent case (*Davis, Director General, v. Elzey*, 88 Southern, 630) in which that court held that punitive damages could be recovered against the director general.

### Interstate Commerce Again

The courts are constantly struggling with the question of whether or not a particular shipment is in interstate commerce. It is settled by the Supreme Court of the United States that this question cannot be answered by the mere incidents of the billing. Ordinarily the test is said to be: What is the intention of the parties who start the shipment on its way? But it is difficult to reconcile the decisions of the Supreme Court of the United States on the subject, not to mention the great body of opinion rendered by various state courts and by the inferior federal courts.

If anyone desires to relieve the tedium of routine work by wrestling with a pretty problem, let him read *Gulf, C. & S. F. Railroad Company v. Texas*, 204 U. S. 403; *Railroad Commission v. Worthington*, 225 U. S. 101; *Texas & N. O. Railroad Company v. Sabine Tram Company*, 227 U. S. 111; *Bracht v. San Antonio & Arkansas Pass Railway Company*, 41 Sup. Ct. Rep. 150; *Pere Marquette Railway Company v. French*, 41 Sup. Ct. Rep. 195. If any of our lawyer friends, after reading these opinions, feels like framing a simple and easily understood rule whereby this vexed question can be settled, the editor would appreciate a note to that effect.

Our attention has been directed to this subject by the very recent opinion of the Supreme Court of Idaho in *Rice v. Oregon Short Line Railroad Company*, 198 Pac. 161. In that case it appears that a shipment of sheep was delivered at Linder, a station on a little railroad known as the Boise & Interurban Railway. It appears that this railroad filed no tariffs with the Interstate Commerce Commission and did not hold itself out as an interstate carrier. It received the sheep, transported them to a point on its own line,

and there turned them over to the Oregon Short Line Railroad Company, which company issued its bill of lading calling for the transportation of the stock to an interstate destination.

The court held that the Oregon Short Line Railroad Company was the initial carrier within the meaning of the Carmack Amendment, and therefore responsible for the safety of the shipment to its destination. The court rested its opinion upon the ground that, although the shipper intended to move the sheep beyond the limits of the state, yet the movement over the Boise & Interurban Railway was entirely intrastate, that the transaction was a complete one when the stock reached

the junction point, and that an entirely new contract was made thereafter with the Oregon Short Line Railroad Company.

The court does not seem to have been influenced in its opinion particularly by the fact that the Boise & Interurban Railway was not a carrier subject to the Act to Regulate Commerce. It is of course clear that the Carmack Amendment has no application to a carrier which is not subject to the Interstate Commerce Act. It might, therefore, have been said with show of plausibility that the real initial carrier was the first carrier in the line subject to the Interstate Commerce Act. Obviously the point needs clarification by the highest court in the land.

## Illini—"We Are the Men"

Long years ago a race of people famous for their power as shown in cruel and relentless warfare, victorious over many an enemy through physical prowess alone, prided themselves on their successes and called themselves accordingly, Illini—"We are the men."

After this in the continuing history of our country, when one of the strong powers of the earth undertook to oppress and cripple the forward progress of our forefathers, it was declared by those wronged, that all have an equal right to life, liberty and the pursuit of happiness. And for the establishment of these principles they pledged their lives and property, and while they took no such name to themselves, they also spoke more strongly than ever through the character of their accomplishments—"We are the men."

Still later the great and small of our nation began to have conscientious and pronounced opinions as to the consistency and right; in a world-renowned land of freedom, to hold millions of men in abject slavery. This feeling grew and gathered strength, until as a nation our people arose to determine what should be considered right, with the result that in less than four years not a single slave remained shackled in the land of the free and the home of the brave, nor could such a condition in our country

ever afterward prevail, so well was the work done. Again unconsciously, our fathers were writing in glowing and brighter characters, "We are the men."

Silently, and by few fully appreciated, another movement is on and daily gathering power. Like all these former history making epochs, its purpose includes more and higher ideals than its immediate predecessor; not by force of arms, intrigue or other questionable and improper means is this effort for the betterment of thousands of both rich and poor, laborer and capitalist, being urged. Reason and justice are the great instruments in the present contest. In its present condition in this respect it is vastly ahead of all the history making controversies of our country. More and more all are giving attention to the needs, requirements and viewpoints of the various classes concerned. Men are fast becoming more considerate and looking not alone at one, but at all sides of questions presented, so far as they are capable of seeing and understanding, and are also seeking instruction to guide them righteously in their course.

We are also anxious to be able to say—and hope that ere long in more brilliant and glorious characters than ever before, by any of our foregoers, shall be written—"We are the men!"—Illini!—E. N. VANE, *trainmaster, Indiana division.*

# Hospital Department

## *On Keeping Really Cool*

**M**Y, but it's hot, someone says. As you read the above, you consciously or unconsciously fall into one or the other of two classes—you either agree with the statement or disagree with it. Let us briefly consider the reasons for this and see whether, should you agree, there might not be ways to lessen your discomfort and have you, with a better understanding of its cause, join the other class and be comfortable.

In the first place, heat is a relative term—what seems hot for some people is only comfortable for others. If you live in a climate where there is considerable humidity in the air, as in the river towns or adjoining some considerable body of water, the increased temperature will be more perceptible. The quart of perspiration thrown off by the skin every twenty-four hours does not get a chance to evaporate so quickly and thus cool the skin. If the weather happens to be cold and there is a large amount of moisture in the air, we feel the cold more keenly.

### Watch What You Eat

What we eat has its due influence, because food produces bodily heat, and some classes of food produce more heat than others. Therefore, it is important to eat food which is adapted to the weather and climate.

The clothing has a decided influence. One should dress lightly and in such material as will allow free circulation of air, thus favoring evaporation of perspiration and consequent cooling of the skin.

Exercise produces increased perspiration, which, if one is properly dressed, allows of increased evaporation and resultant cooling of the skin.

In the conditions thus lightly touched upon a general idea of contributory causes for feeling comfortable or uncomfortable has been given. The causes will be considered a little more in detail, so that we may the more fully

understand how they contribute to our comfort and govern ourselves accordingly.

### Humidity Affects Health

Humidity means the amount of moisture in the atmosphere. It is an ever-present factor, for moisture is given off by everything that breathes, including both animal and plant life. Think of it—the adult person gives off four and one-half pounds of watery vapor every twenty-four hours, two and one-half through the skin and one and one-half through breathing. Growing plants and trees also throw off a great amount of moisture. All this moisture in the air has an effect upon health. The proper amount of humidity is about 50 per cent of the amount of moisture which the air can take up at that temperature. An increase of 27 degrees Fahrenheit doubles the capacity of the air to take up moisture. The precipitation of dew is a familiar illustration of the inability of air when cool to retain as much moisture as when warm.

Humidity increases the effect of heat and cold on the body. In other words, we feel the hot weather more when the air contains much moisture, such as on the so-called "muggy days." One can readily understand why people living on or near large bodies of water are made more uncomfortable by very hot or very cold weather, since the larger amount of moisture interferes with the evaporation from the skin and cooling of the surface. This will also explain why a person living in a river town will feel uncomfortable with a temperature of 90, and why a person living in the desert regions can feel comfortable with the thermometer at 110.

### What a "Calorie" Means

The food which we eat has a marked influence on the production of bodily heat, and a consideration of the heat produced by the classes of food-stuffs is instructive. The meaty and starchy foodstuffs produce about four calories of body heat, while the fatty foodstuffs produce nine and one-half calories. The term "calorie" represents the amount of heat necessary to raise the temperature of

one pound of water 4 degrees. This means that in hot weather we should avoid eating any considerable amount of meaty or fatty foodstuffs, knowing, as we now do, that heat production is increased thereby. It is important to remember also that the amount of food must be reduced in hot weather. The bulk of the foodstuffs plays an important part in producing the feeling of satisfaction which follows eating, the appetite being more easily satisfied in hot weather. If bulk is desired to produce satisfaction, make up the difference by consuming more "green stuff" and less meat and fat. There is no subject which presents more diverse views in the handling than that of eating. The truth of the old rhyme concerning one Jack Spratt, who, it will be remembered, would eat no fat while his helpmate would eat no lean, still serves as an example to present-day generations of what an exactly opposite taste in diet may accomplish.

#### How Necessary Water Is!

It would be impossible to close the consideration of foods and diets without taking up the subject of water, the most important constituent of any diet, and without which this body of ours would perish in five days. Water composes between 60 and 70 per cent of the human body, and when we consider that we are getting rid of it at the rate of nearly five and one-half quarts a day, the necessity for replacing this loss immediately becomes apparent. About five and one-half quarts a day is the normal daily excretion for the average person.

While it is true that the food which we eat supplies a certain amount of water, yet the fact remains that entirely too little water is consumed by the great majority of people. Various reasons cause this. In the first place, the use of ice water tends to make one cautious as to drinking any large amount—it is too cold—and the sensation of thirst being in the mouth and throat, a few swallows of ice cold water will have a tendency to blunt the nerves and give the false impression that the thirst is satisfied. Water, to perform its greatest good, should be taken either warm or only fairly cool. Then only can we consume the two or four quarts necessary to the carrying on, with greatest efficiency, of the life process. When you are looking for the greatest aid to good health, good com-

plexion and sufficient elimination to produce these results, do not forget water and its health-producing value.

In this connection the relation of good health to water drinking while eating should be considered briefly. The belief has been handed down to us that it is bad thing to drink more than one glass of fluid at meal time. This is right if the practice of washing down a mouthful of unchewed food is followed. Food should be chewed thoroughly and not swallowed until it has been thoroughly ground up by the teeth and moistened by the saliva. The practice of washing it down with fluid is bad. Experiments have shown that copious but careful water drinking with each meal has even had beneficial results.

#### Use Light Clothing Indoors

The matter of clothing for hot weather is of importance, inasmuch as we have to satisfy both the esthetic and the useful. Much has been said about woolen, which absorbs the perspiration and keeps the wearer from getting chilled. This is good for certain occupations, where the work is arduous and the intervals of rest few, but the wearing of woolen would not be well borne by office workers, who should dress as lightly as possible in loose-fitting linen or cotton clothing, which allows the air to circulate next to the skin and carry on that important function of evaporation and the consequent grateful cooling of the skin. The color of outside clothing should preferably be light, even white, in order to reflect as many of the heat rays as possible and absorb the fewest possible number.

In the matter of exercise during hot weather, the term must be understood to mean the performance of the work which is the means of livelihood and necessarily varies from the heavy out-of-door labor to the work entailed by sitting at a desk and using the brain. Work is not difficult if the mind is attuned to its task. The negro in the field sings while working. He enjoys the work in hand. The brain work performed by one who is in close touch and sympathy with his task is never irksome—it is enjoyable, and he, too, has a song, if not on his lips, at least in his heart.

#### Keep Cool Mentally, Too

This brings us to the consideration of the

greatest factor in keeping cool in hot weather—the condition of the mentality. If one is worried and fretful, the simple task of adding up a column of figures is difficult. All the diverse interruptions so common to office work serve only to make the fretfulness more marked, until at last it seems that the task could not be finished. During all this time the perspiration pours out upon the flushed skin and only serves to increase our irritation. There is no actual increase in bodily temperature; yet the skin feels hot, the mind is disquieted, the attention strays and failure to accomplish the work in hand is the result.

Now is the time to stop work for a moment and recall something of a pleasant nature and other pleasant thoughts. Then, with a smile on the face as well as in the heart, take up the appointed task again—and, lo, the heat has disappeared, the difficulties have flown away, the remainder of the work runs off as speedily and as pleasantly as even you could wish for. Don't get angry, even when the provocation seems great enough—it is surprising how we lose our sense of proportion when angry, the smallest irritation assuming the size of a mountain. A firm determination not to give way to irritation will do much to mitigate the discomfort of hot weather.

## *Explains How to Win Shop Efficiency*

By O. A. GARBER,  
Master Mechanic, Memphis, Tenn.

Now that the fighting days are over and we must return to our old standard both in labor and prices paid for labor, the word "efficiency" stares us in the face.

I know that most of our employes realize that they must give eight hours' work for eight hours' pay; in fact, I am given to understand by the different organizations that this is their motto, and that they are preaching this in their meetings.

I consider a day's work all that one man can do; therefore, we must increase efficiency, which can be done only by improved machinery and by improved practices. When improved machinery is furnished, great study should be given as to placing it. A very careful study must be made as to the location of each machine. The machines must be grouped so as to avoid the backward movement of all parts removed from a locomotive or car, which must be moved forward from the time the car or engine is shopped until it is again assembled.

Our management has given us to understand that it will furnish us any money-saving device if it can be proved that the proper saving can be made.

There is a proper pride among our employes at the individual shops, and if a man-hour record could be established on each machine's operation and the result advertised among the different shops, it would no doubt create a rivalry that would result in an in-

creased output. An individual record of man-hours should be kept of each rebuilt car, so that the foreman will know just exactly what his men are doing. A fair man-hour allotment should be established for the different series of cars, and there is no doubt that there will be a big effort made to finish these cars within the allotted man-hours, which will increase our output.

We should insist on having our foremen of the different departments visit other shops. By doing this they will advance new ideas which will increase efficiency.

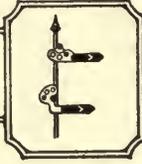

The proper sizes of lumber and material must be furnished at all times, if we expect to increase our output at a normal cost.

The general foreman of the shop should hold a staff meeting with his force at least once a week and go over with them the work that he expects to do the following week, as we must have closer co-operation among the different foremen from the different classes in order that we may increase our output.

### C. A. PROUTY DIES

Charles A. Prouty, 68 years old, former member of the Interstate Commerce Commission, died at his home, in Newport, Vt., on July 8. He had been ill for several weeks. He was on the commission for eighteen years until February, 1914, when he was appointed its director of valuation. In 1918 he was appointed director of the division of public service and accounting of the railroad administration.

## ACCIDENT AND

## INJURY PREVENTION

## Some Personal Work for Safety

AS the summer rolls on, the toll of automobile accidents on the Illinois Central System gets longer and longer. Moreover, the record of accidents exceeds that made in the corresponding period of 1920.

So far, in the first six months of 1921, there were 157 automobile grade crossing accidents on the system—an average of more than 25 a month—almost one a day. This is an increase of 14 per cent as compared with the same period of 1920.

Within this period this year, 7 persons have been killed and 52 injured in automobile accidents in which trains of the Illinois Central System have figured. This is about one death or injury to every three automobiles smashed.

Many, many years ago, safety dictated the use of the "Stop, look and listen" signs at railway crossings. It is safe to say that not one person who has observed this rule in crossing the right-of-way has ever been injured by a train. Until drivers of automobiles pay stricter attention to the observance of these precautions, there will continue to be an increasing number of grade crossing accidents.

Meanwhile, a little personal attention by trainmen in converting their friends and acquaintances to the plan of "Safety First" might not be amiss. Witness the following letter in which Conductor H. L. Nourse of the Tennessee division, temporarily acting as flagman on Extra 1776, a freight train, preached a little sermon on safety to a physician of Martin, Tenn., who took a chance and almost caused some trouble:

"In writing you this letter, I would be pleased to have you consider it in an intelligent way and gather from it a lesson or warning that, I am quite sure, if heeded, will be of great benefit to you in the future.

"You will recall that somewhere near 8

o'clock this morning you were driving south on Lindell street, and found this street

### A Soliloquy

I am the golden key to the temple of success.

I am the ideal of the management of all industries.

I am the difference between the artist on the job and the artisan.

I am the spirit that does the right thing at the right time and right place.

I am not abiding within the careless, the lazy, the indifferent nor the sloven.

I am the best solicitor and retainer of business any railroad possesses.

I am the vital principle in safety first and first-class service.

I am the guiding star of the ambitious, the skilled and the successful.

I am that which pleases by courteous treatment and maintains my employer's prestige.

I am the trained mind, plus experience, plus interest, plus action.

I am that virtue that eliminates claims through prevention.

I am the latent spirit that abides in man, but grows only by exercise.

I am *efficiency*, the greatest up-lifter of mankind, the mark of the 100 per cent employe.

The Illinois Central System has efficiency.

Two Wisconsin exporters of pedigreed Holstein cattle were enroute to New Orleans on my caboose. One was a regular patron; the other, a new one. Both agreed that the Illinois Central was the best route on account of efficient service and courtesy of the trainmen.

A satisfied customer is a railroad's best advertisement.—L. C. GAERIG, *Freight Conductor, Memphis Division.*

crossing blocked by Engine 1776. You were signaled by two members of the train crew not to attempt to cross the track. You disregarded these signals, and by so doing you almost struck the conductor of this train, who failed to see your approach, and at the same time you stood an excellent chance of having your car struck. Your car cleared the rear end of the engine by only a possible 10 inches. For your information, I may say that a signal had been given the engineer to back up. Had it not been for the watchfulness of Fireman Murchison, who saw your approach, you now no doubt would be without the service of your car and possibly would have been injured yourself.

"The Illinois Central Railroad has been for several years, and is at present, conducting a strenuous campaign in the interest of safety, and there exists in my mind an idea that you, dear sir, should exercise more care in driving, and especially when crossing railway tracks.

"Your exhibition of carelessness at any future time may result in an injury to some one dear to you, and may I suggest that you give the matter of safety more thought. By so doing you will assist very materially in the successful conclusion of the above mentioned campaign."

Conductor Nourse closed by wishing the doctor a long and prosperous life.

---

## *What One Safety Council Has Done*

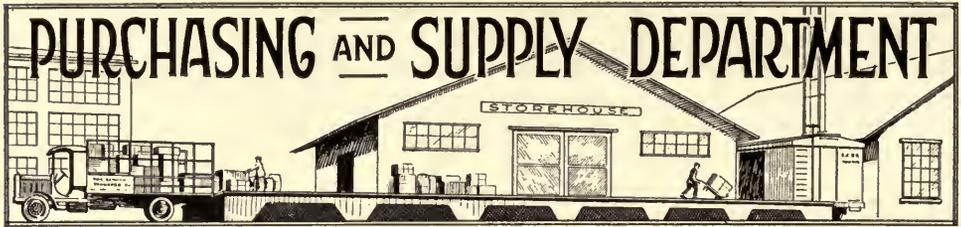

Life, limb and property are well worth saving, according to the Chicago Safety Council, which has just issued a summary of its first year's activities.

The council was organized to work in cooperation with the Chicago Association of Commerce and the National Safety Council. The plan was initiated by Harold F. McCormick, president of the International Harvester Company, and sponsored by E. J. Buffington, president of the Illinois Steel Company, Samuel Insull, president of the Commonwealth Edison Company, Charles H. Wacker, chairman of the Chicago Plan Commission, and Thomas E. Wilson, president of Wilson & Company.

That was in April, 1920. It was authorized to begin work August 16, 1920. Since then it has completed its organization, enrolled 328 men and women as active workers, conducted a school of safety supervisors which graduated 283 men and had an average attendance of 475, started a highway safety committee at work, introduced the study of safety and fire prevention in the Chicago public schools, graduated 310 men from a foremen's safety instruction course with an average attendance of 525 foremen representing approximately 50,000 workmen, obtained much useful publicity for safety, put

at work a police and traffic committee, co-operated with the Red Cross, sent high school and Boy Scout representatives to the Safety Congress, perfected a steam transportation committee to prevent death and injury to children trespassing on right-of-way and to minimize crossing accidents, formed a health and sanitation committee, taught a safety instruction course for 610 chauffeurs and graduated 469 of them, organized a fire prevention committee and a juvenile safety committee, co-operated in Americanization work, held many meetings, perfected an electric transportation committee, and in general aroused public interest in its work.

It points to a reduction of 2.2 per cent in the number of fatalities in Cook County for 1920 as compared with 1919, in spite of a 29-per-cent increase in the number of automobile deaths, as the result of a great increase in the number of automobiles. That the council has a big field to work in is proved by the fact that accidents in Chicago and Cook County in 1920 caused the death of 1,982 persons and the serious injury of 49,550. Children less than 16 years of age made up 497 of these deaths. Automobiles caused 542 deaths. Fires in Chicago in 1920 caused a property loss of \$11,800,000.

## The Monthly Inventory

By J. B. FLANNERY,  
General Foreman, General Storehouse,  
Chicago

ONE of the things essential to good stockkeeping is the accuracy of the monthly inventory. The stockkeeper's slogan should be, "Do it right."

To accomplish this, special attention must be given to the proper storing or placing of the stock, so that the inventory can be taken accurately in the least possible time. In order to do this, stock should be placed so that a simple problem in mental multiplication will give you accurately the amount of each item of stock on hand.

### Shelf Material

Shelf goods, so far as is practical, should be arranged with the same quantity in each tier. Always issue from one tier only, until the entire contents have been removed, before taking from another.

### Racked Goods

Keg stock should be placed on racks made to hold five or ten kegs the long way of the rack, depending upon the quantity of stock required to be carried. Stack them four or five kegs high. In the same manner should be arranged flag bar iron, angles, channels, etc., thus making a neat appearance and at the same time affording an opportunity to check the stock quickly and accurately.

Round iron should be neatly racked with a vertical gauge stencilled on the side of the support to show at a glance the amount of bars on hand. The use of the stencil gauge should be applied to bins containing dry paint, powder, welding rods, and similar articles to avoid the necessity of weighing or estimating each month the quantity on hand.

### Piled Material

Frogs should be arranged beginning with the lowest section of rail and the lowest

number frog. Arrange switches in the same manner according to the section of rail and length of switch. This plan not only facilitates taking the monthly inventory but saves a great deal of time for your shipping force when making shipments.

Only a few items of material have been mentioned in this article. However, the scheme should be carried on throughout the several thousand items of necessary material carried in stock to operate a railroad.

So far as it can be done practically, the following plan should be adhered to: Each section stockkeeper's stock should be stored and his stock book written to conform with the location of the stock. By doing this, the stockkeeper, when taking his monthly inventory, will have a starting point and can go through his entire stock without doubling back and wasting time and steps.

This article is written with the general store stock in mind. The basic idea, however, applies equally to division stores, and its application would assist materially in the reduction of the "cost of handling."

### Things We Should and Should Not Do

Do not leave tools and materials in the weeds.

Be courteous to the passengers—they pay for it.

Get your stoves and stove-pipes in shape this summer for next winter. It may be that you will eliminate a fire.

Be sure you nail the skid that goes from platform to car securely. It may save an injury.

Now is the time to paint the inside of gutters to save deterioration.

Clean up all the old scrap that you can get your hands on and ship it in. It can be turned into money.

Assist your fellow workman when he is

on his vacation. It may be someone will assist in your work when you are taking yours.

Talk about the Illinois Central and its service. When you are talking about the company, you are talking about yourself.

Have you asked your neighbor to consider traveling over the Illinois Central when on his vacation? If not, do so.

Do not drop heavy packages when unloading from cars to the ground. Take a little time and get a skid. It may save a freight claim.

Let everyone encourage the purchasing of coal during the summer. If everyone

waits until winter sets in, transportation as well as coal will not be available.

Why allow that package to sit out on the station platform and get wet? Are you not trying to reduce claims?

Do not walk by a piece of wood with a nail in it sticking up. Pick it up or bend the nail down. The nail may stick in your foot the next time you pass it.

Why use a fine grade of paper when a cheaper grade will do just as well? Paper costs money.

Keep your water barrels filled, especially this time of year, when fire is liable to start from dry grass and weeds.

## To Complete Dawson Springs Hospital

An article in the July issue of the *Illinois Central Magazine* describing the construction of the new government sanatorium at Dawson Springs, Ky., announced that bids were to be opened on July 13 for the thirteen remaining buildings. An announcement from the Treasury Department at Washington on July 16 said:

"Proposals for the construction of thirteen additional buildings at the Dawson Springs Sanatorium, Dawson Springs, Ky., at an approximate cost of \$800,000, have been opened and the Secretary of the Treasury has awarded the contract for the construction work to Algernon Blair of Montgomery, Ala., whose bid was \$596,300, and the contract for the mechanical work to the Forbes Manufacturing Company of Hopkinsville, Ky., whose bid was \$196,255. In each instance the contract has been awarded to the lowest bidder.

"Under the original appropriation of \$1,500,000 of March 4, 1919, a road three miles in length was constructed to the sanatorium site and the contract made for the construction of the eight principal buildings of fireproof construction. These buildings are now nearing completion. Contracts have also been made for the power-house and equipment of same, and good progress is being made.

"Thirteen additional buildings are necessary to make a complete hospital of 500 beds for tubercular patients, but, owing to insufficient funds, these buildings could be built only of wood construction. As fireproof construction was considered essential, these

buildings were held in abeyance until an appropriation of \$750,000 was made (deficiency act of June 16, 1921). Immediately after the passage of this act the work was placed on the market and bids opened on July 13 and contracts let. All work is to be completed within six months."

With the construction of the thirteen additional buildings, the new sanatorium, to be operated by the Public Health Service, will be a complete hospital of 500 beds for tubercular patients. The patients will be ex-service men who have contracted tuberculosis.

### THE EDITOR WEDS

Honeymooning in Northern Wisconsin as these lines are written are Mr. and Mrs. George Maxwell Crowson. Mr. Crowson is editor of the *Illinois Central Magazine*. Mrs. Crowson, until 4 p. m. Saturday, July 23, was Miss Vida Pearl Yeakley, daughter of Mr. and Mrs. C. F. Yeakley of St. Joseph, Mo. Mr. Crowson, who is a son of Dr. and Mrs. E. L. Crowson of Pickering, Mo., received his newspaper training on the Maryville (Mo.) *Tribune* and the St. Joseph (Mo.) *News-Press* before joining the public relations staff of the Illinois Central a year ago. He saw service overseas during the war. The noon hour, July 22, was devoted to an office luncheon in honor of Mr. Crowson by the employes of the general claim office and the public relations and magazine departments, at which Mr. Crowson was the recipient of the offices' gift of the necessary silver tableware.

## *The Birmingham District*

By E. F. STOVALL,

General Agent, Birmingham, Ala.

**I**N the autumn of this year, Birmingham, Ala., will celebrate its fiftieth anniversary, and I feel that it will be interesting to the readers of our magazine, most of whom have not had the opportunity of visiting the "Magic City," to know some of the reasons why it has grown from a small village to a city of 180,000 population within this period.

This semi-centennial will be noteworthy because it will commemorate the most astonishing development and growth achieved by any American city within the space of fifty years.

Many of the pioneer residents remember the Birmingham of fifty years ago—a few scattered huts nestling in Jones Valley in the foothills of the Appalachians, banked by low ranges of forest-clad mountains, secreting a vast treasure chest of virgin wealth. These pioneers were men of broad imagination and envisaged in this fertile valley a great industrial metropolis.

### **A Romance of Coal and Iron**

The story of Birmingham and its district is a romance of coal and iron. Its prosperity rests on this bed-rock foundation of rich mineral deposits, sufficient, it is said, to last the needs of man for centuries to come. Geologists have marveled at the lavish diversity of Nature's gift to the Birmingham mineral district—a combination of iron ore, coal and limestone, all the materials necessary for the manufacture of pig iron, and hence for the manufacture of steel, in such close proximity as to be practically in one locality. No other known region in the world is said to be so endowed, and therefore so peculiarly fitted for commercial success in the iron and steel business.

Alabama, and particularly the Birmingham district, is now generally regarded as

the coming center of the iron and steel industry in North America and as the ultimate rival of the Pittsburgh district. As a matter of fact, since 1890 Alabama has dictated the price of pig iron to the rest of the United States.

In the near vicinity of the Birmingham district there is mined annually approximately 16,000,000 tons of coal, and there is manufactured within this district more than 3,000,000 tons of coke annually. The normal production of pig iron within the district is 2,500,000 tons, while the actual tonnage of steel produced in 1919 was 1,045,000 tons. A great part of the steel produced in the district is fabricated into finished articles, including steel rails, blooms, billets, angles structural material, wire, nails, staples, etc. Steel railway cars are also being manufactured here in increasing numbers.

### **Good Business in Cast-Iron Pipe**

The largest tonnage produced, aside from pig iron and steel, is cast-iron pipe of all kinds and sizes. The average annual output of this is 500,000 tons. This pipe is shipped to all points in the United States. A considerable portion is exported.

There has developed, within the past few years, a large industry from the use of slag, a pig-iron furnace refuse which for many years gave the furnace companies much concern as to its disposal. During the years of the manufacture of pig iron, many millions of tons of slag have been dumped into every available space in the vicinity of the furnaces. It has been proved that this slag is peculiarly adapted for all concreting uses. It has been recognized as one of the best materials for the construction of modern highways, as well as city paving and the like. One company in this district shipped 9,681 carloads during 1920, a great part of which moved to various other states for road building.

While primarily this is an iron and steel district, the influx of capital for the develop-

ment of its abundant resources has in later years so greatly altered this condition that it is rapidly becoming a center for diversified manufacturing. A recent survey made by the Birmingham Chamber of Commerce shows 682 manufacturing plants doing business in this district. The list of manufactured products ranges from small nails to railway cars, and these products are being shipped all over the world. Some of the principal manufactures are sugar mill machinery, cotton gin machinery, cotton seed products, cement, brick and packing house products.

### **Makes Sugar Machinery, Too**

This district is the largest sugar machinery manufacturing point in this country, the major part of the output going to Cuba and other sugar producing sections.

There are two large cotton gin factories which ship to all parts of the world where cotton is grown.

The cement plants have an annual output of 2,250,000 barrels, and there is now under construction a new plant which will largely increase this production.

Sixty per cent of all the paving brick manufactured in the southern states is produced here. In addition to factories with a large production of face and common brick, there are also a number of fire-proofing and hollow-tile and sewer-pipe manufacturing plants.

There are four large cotton seed oil mills, two meat packing plants and a great many other smaller plants, all of which add materially to the great volume of tonnage and to the prosperity of this district. The establishment of these smaller manufacturing plants here has been greatly encouraged during the past few years by the provision of practically unlimited hydro-electric power, which is generated at the Coosa River, fifty miles away, and brought to Birmingham over copper wires one-half inch in diameter, supported by 70-foot steel towers, making available an energy of 110,000 horsepower daily.

With its boundless mineral wealth, abundance of skilled labor, exceptional transportation facilities, hydro-electric power, cheap gas, cheap coal, cheap manufacturing sites, equable climate, beautiful residence environs, and pleasant living conditions, the Birmingham

district offers the manufacturer one of the most attractive locations in America today.

### **Illinois Central There Since 1908**

Many years ago the Illinois Central management, realizing the importance of the Birmingham district, determined to extend its operations thereto. By the construction of a line from Corinth, Miss., to Haleyville, Ala., and by arranging operating contracts with the Mobile & Ohio Railroad, the Northern Alabama Railroad and the 'Frisco Railroad, giving trackage rights over those lines, the Illinois Central on April 19, 1908, moved its first train, carrying a full tonnage of steel and iron, out of Birmingham.

In June, 1909, the capital stock of the Central of Georgia Railroad, the western terminal of which is Birmingham, was acquired by the Illinois Central. Shortly thereafter, the facilities of the two lines were consolidated, thus constituting a through line from Chicago, St. Louis and the Mississippi Valley to the Atlantic seaboard at Savannah and enabling the Illinois Central to enjoy the tonnage of this district moving both east and west. In addition to the trackage rights covering the operation of trains into Birmingham proper, the company acquired practically equal rights with the 'Frisco on what is known as the Bessemer branch of that line, extending from Pratt City to Bessemer, Ala. This branch touches the larger operations of the Tennessee Coal, Iron & Railroad Company at Ensley and Bessemer, the Woodward Iron Company at Woodward, Ala., and various other large industries located at and between Pratt City and Bessemer.

### **Good Facilities at Birmingham**

The Illinois Central also, through contract arrangements, acquired equal rights on the Birmingham Belt Railroad, a line which serves a large industrial territory in North Birmingham and East Birmingham, as well as Birmingham proper.

Splendid facilities have been provided at Birmingham in the way of freight houses, team tracks, train yards, etc. The freight houses and team tracks are within three blocks of the principal wholesale and retail districts. Hence, with the splendid service which is being given the patrons of the

Illinois Central and the Central of Georgia, our merchandise and miscellaneous traffic between Birmingham and Chicago, St. Louis, New York, Boston, and all northern and eastern points is steadily increasing.

The wisdom of the management in extending its operations into the Birmingham district is evidenced by the growth of the tonnage, which on steel and iron alone normally

averages between 5,000 and 6,000 cars annually.

With our splendid facilities, enabling us to reach the whole of the industrial district on equal terms with other lines, and with the continued excellence of the service rendered, the Illinois Central and the Central of Georgia are in position to enjoy their full share of the prosperity of this district.

## *Between Transportation and Traffic*

By E. P. RUSSELL,

Commercial Agent, Hattiesburg, Miss.

**I** WONDER at times whether transportation realizes that its existence depends upon traffic, as well as, on the other hand, whether traffic realizes that its existence depends upon transportation.

Most of my service of twenty-six years with the greatest railroad in the world has been spent in the transportation department, and in writing this article I speak from practical experience. What I say should be construed not as a criticism but as an attempt to emphasize the importance of close cooperation between employes of the transportation and the traffic departments.

It is noticeable that a radical change has taken place in the past few years in this regard—that is to say, harmony and cooperation between the officers and employes of both departments as a whole are showing results in securing more business for our railroad and in rendering more efficient service. I am thoroughly familiar with the policy of the management in this regard.

Every employe should interest himself in a personal way in serving the public. He should realize, as has been thoroughly emphasized by the management, that we have but one commodity for sale—transportation—and he should also realize that there are various ways in which to sell this commodity. Every employe has some friends in business, and he possibly can do more to win their good will and friendship for our railroad than anyone else, if his interest is made manifest and the proper methods pursued.

### **Local Agent Is Important**

I believe everyone realizes the important position held by a local agent and the

importance of the local agent's having a well-drilled and efficient organization. Having been a local agent, fourteen years, I believe I am in position to speak on the subject. I know from experience that the local agent and his force at a station are looked upon by the public in general as "the railroad." The agent and his force have it in their power to create either a feeling of friendship and good will or the reverse. It is necessary that the agent give these matters thorough consideration, and, if he has not already done so, he should put his shoulder to the wheel, line up his organization and get busy with the public.

There is nothing that counts more in creating good will in the people than courtesy, and in my judgment this is the first factor that should be emphasized. It should be studied from every angle. Telephone conversations are an instance. I have had this matter brought to my attention in the past, and I feel the importance of courtesy in telephone conversations. I believe it will be agreed that an abrupt manner in using the telephone is much worse than the same manner in a personal interview. Both, of course, should be avoided.

### **A Matter for Each One of Us**

Another matter which I feel is important and deserving of recognition is the necessity of each employe's so conducting himself in his daily life as to cause favorable comment instead of unfavorable criticism. I feel that if each employe would give this matter consideration it would assist materially in cementing the friendship of the public for the railroad.

Still another matter of importance, in my judgment, is for each employe to interest himself in the matter of complaints and crit-

icisms against the railroad. In other words, at any time he hears of a complaint or criticism, he should not wait until the next day and then depend upon someone else to handle it. It might be well to refer the complainant to the head of the department complained of, but the employe should not stop at this; he should make a report of it himself, so that he may be in a position to assure the person making the complaint or criticism that it will be promptly investigated.

A short while ago I made a visit to a business man who was president of several large concerns. We had been receiving practically none of their traffic. He was quite affable during our conversation. When I got to the matter of actual solicitation, he said he would like to give us his business, but had not done so because he thought we had been negligent in settling a freight claim. I promptly got into the subject and found he did have a just claim, which was filed, however, with another railroad, the papers subsequently coming to our road. I told him I would see that the matter was promptly investigated.

That was on Monday. He submitted a copy of the file to me. I wrote a letter the same day, and on Thursday he received a voucher to cover the loss. On Friday and Saturday he routed six cars of competitive

business our way, and since then he has routed a large per cent of his business over our road. Previous to this we had not obtained a car from his plants in several months.

### Handle Complaints Promptly

This, I believe, emphasizes the necessity for prompt handling of complaints and criticisms. Employes no doubt are thoroughly familiar with the policy of our railroad in regard to suggestions and constructive criticism, but I think it would be well for every person to give this matter more thought and interest himself personally.

An employe may be in possession of facts or have the knowledge of something that may be done to improve service, but unless he imparts to the proper authority such knowledge it is dead. It is the desire of the management that each employe make suggestions which might benefit any phase of railroading. There should be no hesitancy in making these suggestions in the usual manner to a superior officer.

I realize there is no railroad on earth on which more co-operation and loyalty are shown by each employe than are shown on the Illinois Central. I am merely trying to emphasize the importance of the close co-operation and loyalty which I believe exist.

## Things to Talk About

One of the greatest impediments to a return of normal business activity is the agitation for generally lowered freight rates. This agitation seems to have led a considerable number of people to believe that rates can be lowered generally, and business is being deferred because business men believe they will be able to take advantage of lower rates within a short time. It is of the greatest importance that this erroneous impression be corrected, for there is no indication at present that rates can be reduced in time to affect the business which should move during the next several months.

Much of the agitation for lower rates is not based upon a knowledge of railway conditions. Senator Albert B. Cummins, chairman of the Senate committee on interstate commerce, made the following statement during the progress of the railway hearing in Washington recently:

"Whenever the Congress is willing to make an appropriation to help sustain the railroads, I think then we can consider a general reduction in rates. But with a situation in which there is no net income shown for the operation during the last year, it is quite obvious that rates cannot be reduced."

Samuel O. Dunn, editor of the *Railway Age* and student of transportation economics, made the following statement in a recent contribution to *Review of Reviews*:

"Suggestions for reductions of rates which are not predicated on the assumption of previous and relatively much larger reductions of expenses betray an ignorance of the railway situation which is almost inconceivable."

It is obvious that a general reduction of rates will have to be postponed until the net earnings of the railroads get to the point where reductions will not completely disable them from rendering efficient service.

# CLAIMS DEPARTMENT

## Where Sympathy Causes a Waste

Clyde H. McCandless, a young white man living at Vicksburg, Miss., lost one of his legs by falling under a Y. & M. V. passenger train in the yards at Greenville, Miss., on August 10, 1920.

It seems that McCandless had gone from Vicksburg to Greenville to apply for a position as train flagman. He failed to get the position and tried to obtain a pass home, claiming he was short of funds, but was refused because the rules did not permit its issuance. He then inquired about trains, particularly freight trains. This gave the impression he had in mind beating his way.

As passenger train No. 15 was leaving the station at Greenville about 9:50 p. m., McCandless was seen to run out of a restaurant on the east side of the railroad and attempt to catch the tender of the engine, but his body came in contact with the switch-stand, and he lost his hold and fell under the car. Within a day or two after his injury, relatives from Vicksburg, accompanied by a lawyer, visited Greenville, and extensive preparations were at once made for a law suit. Suit filed at Vicksburg for \$40,000 came to trial in January last, resulting in a hung jury, seven being in favor of a verdict for the railroad.

The case was again tried at the May term, with a like result, the jury being divided exactly as before.

It was contended that McCandless was walking down the railroad just east of the main track (the fact being conceded that many persons do travel back and forth from Washington to Main streets that way). It was further contended that it was very dark at the place, that the light on the switch-stand was out, and that he stumbled over the switch-stand and under the train, which was then passing beside him. At the first trial he produced a witness who claimed to have seen him fall over the stand and three witnesses who testified that they noticed the switch

light was out a short time before the accident. These witnesses, as well as McCandless, claimed it was so dark the switch-stand could not be seen until one actually ran into it.

The railroad introduced twenty-seven witnesses to show that the switch light was burning at the time, also that the premises surrounding the switch-stand were sufficiently lighted by the "white way" arc lights, electric signs, etc., in the vicinity to enable one to read the headlines of a newspaper at the switch. Many of the witnesses testified that they had made numerous tests under conditions existing at the time of the accident to determine this.

The proof was so clear and overwhelming that it seemed there could be no doubt as to how the accident occurred; yet in the two trials ten men out of twenty-four refused to return a verdict for the railroad. Each trial lasted more than three days. Of course, the expense to the county is considerable, but so is the expense to the railroad, since to keep twenty-seven witnesses waiting around court three or four days, paying their time and expenses, is not a trivial matter.

The case seems to have resolved itself into an endurance test. The attorneys for McCandless say they are going to try the case again. Of course, they have everything to gain and practically nothing to lose.

A rather sensational feature developed on the second trial. One of the best witnesses for McCandless on the first trial failed to appear for the second. The attorney, on examination of one of the railroad's witnesses, uncovered, very much to his surprise and consternation, the reason. This witness testified that he had heard the missing witness say on one occasion, when confronted with documentary proof showing that the witness could not have been at the place and observed the conditions as they existed, that it was true he was not there. Upon being pressed for an explanation why he had testi-

fied to facts he did not know anything about, he admitted that he had been promised \$400 so to do.

It is but natural that a jury should sympathize with a young man who has lost a leg, but in the face of such clear and positive proof as was twice introduced in this case to the effect that the railroad was in no way at fault, it would seem that at least nine of twelve men on a jury might lay aside their sympathy and agree on a verdict.—E. W. S.

### Another Angle on the Case

In connection with the case above mentioned, the following letter has been received giving another angle on the incident:

"I would like to say a few words to show the inconsistency of some people when it comes to law and justice—and a railroad involved.

"The case in mind is one that has just been tried in this county from Greenville, Miss. It is a case where a man who was trying to beat the railroad out of his fare attempted to get on the train between the engine and mail car and, in doing so, fell off and lost a foot. The case was a mistrial—seven for the company and five against the company, as I understand it, because it was claimed the railroad did not have a certain switch light burning.

"It appears to me that they want to put a premium on this kind of beating the road by any one who might be disposed to do so. Evidently they do not know the danger of this practice—not only to the person who tries to beat the road in this style, but to the lives of the passengers on that train.

"Any person getting on and riding on that part of a train is liable at any time to move the angle cock which supplies the air to the train—and when this happens the engineer loses all control over his train. This has been done a great many times to my knowledge.

"Just think of it, Mr. Juryman: Just suppose this man or any other would get on the fastest train on the road and put it in the condition just mentioned. Can you imagine how many would be killed and the damage that would be done? I will ask—who would be to blame? The engineer has no way of finding out that the air has been cut until it is too late.

"Don't encourage this kind of danger. It is the public and the railroad who suffer when

any person who wants to risk his life and endanger others attempts to board a train in this manner, just for the purpose of beating the railroad.

"Another question I would like to ask you fellow-men: We all own and operate a vehicle of some kind. Do you think it would be right for you to keep a light burning, at any time, for the purpose of permitting any one to jump on and ride at your risk?"—J. D. RIGGS, *Taxpayer, Warren County, Vicksburg, Miss.*

### Climbed Between the Cars

Benjamin Angyal, an Austro-Hungarian, is minus a portion of his right foot, but has profited by a recent experience in trying to obtain money from the United States Railroad Administration through the avenue of a law suit, brought for injuries sustained when he was attempting to climb in between a freight train April 11, 1918. He has found out that it is much easier to lose a foot than to win a law suit.

Mr. Angyal is a coal miner. On the date mentioned, he was going to his home in Divernon, Ill., from the business district of that town. When he arrived at the Kenney street crossing of the Illinois Central tracks, he found the crossing blocked by a freight train. Being unwilling to wait for the train to clear the crossing, he started to climb between two cars. His foot was caught between the couplers when the train moved.

After more than three years, the suit against the railroad administration came up for trial at East St. Louis on May 16. After the testimony had been presented, the court thought that the railroad was not guilty of negligence and therefore directed a verdict in its favor.—S. M. C.

### How the Track Scales Saved Money

Frequently the man on the ground can, by using his head and taking advantage of minor situations which arise, save the railway company considerable money, thereby assisting in making the two blades grow where only one grew before. This is aptly illustrated by a little incident at Cherokee, Iowa, not long ago, and Foreman Ross Johnson (who, by the way, is always on the job) was the man in the case who used his head.

A steer was killed on his section, and Foreman Johnson had a "hunch" that trouble

might be experienced in adjusting the case. The carcass was about a mile from a track scale; so it was loaded on a push car, brought in and weighed. The scales showed it to be a 600-pound animal.

In due time a claim was presented, not for a 600-pound steer, but for one weighing "about" 900 pounds. The owner was insistent on his 900 pounds of flesh and produced the usual number of good neighbors who knew the animals in the herd averaged that. When he was finally confronted with the track scale weights, he admitted that perhaps this was one of the smaller members of the herd, and settlement was made accordingly.

A track scale may not always be readily available in such cases, but there are innumerable circumstances which may be taken advantage of by the man on the ground, with a resulting benefit to the company.—W. J. H.

**Why—Oh Why—Is It Thus?**

Persons in ordinary conversation speaking of a railroad or a train usually say "your darned old railroad" or "your blankety-blank old train." When speaking of the ocean or a steamship, they always say "the magnificent old ocean" and "the good ship Rock and Rye"—or whatever it may be. When persons on board ship dispute the orders and directions of the captain, he places them in irons in the hold and turns them over to the proper authorities when he reaches port, but persons on a railway train may refuse even a request of the conductor, call him all sorts of names (to which he must not retaliate), and then sue him when he delivers them to their destination.—C. D. C.

**Better Be Safe Than Under Sod**

Under the heading, "Engineer's Alertness Prevents Accident to Careless Motorist," the Jackson (Tenn.) *Sun* of May 31 presents the following evidence of Illinois Central carefulness and at the same time an indictment of careless automobile driving, which this season, as usual, is reaping its harvest of death and injuries:

"Careless autoists who love to spit out chatter about the carelessness of railroad men would have learned a mighty good lesson a few nights ago, had they been in the vicinity of Royal street where the Illinois Central tracks cross near the Union station. It would have caused them to have a higher respect

for the alertness of engineers in general, and would also have taught them to be more careful in shooting across dangerous crossings before oncoming trains.

"No. 10, the fast Seminole Limited, was approaching the station in charge of Engineer 'Dixie' Fenner. Behind the giant locomotive there were twelve steel cars. The lightest one would balance railroad scales around the 75-ton mark, and with their loads of human freight they would weigh even more.

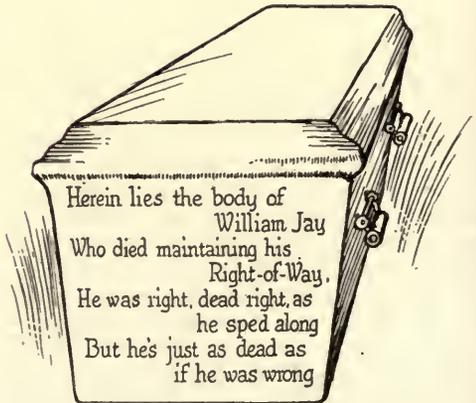

"Behind the long string of Pullmans another engine was 'shoving' in order to get the heavy train over the steep grade that leads into Jackson from the north.

"When the train was less than 100 yards south of the crossing a careless motorist started across in spite of warnings. He 'stepped on the gas,' but he crowded the motor so hard it stopped. His car was directly in the path of the oncoming passenger train, but Engineer Fenner was alert. He shoved on his brakes without unnecessarily shaking up the passengers, but at the same time the application was strong enough to stop the train before the car was reached. Only a few feet—a matter of a second or less—was between the motorist and certain injury—probably death—when the train was brought to a halt.

"Engineer Fenner and his fireman helped the careless motorist shove his car off the tracks and then climbed back on their locomotive and resumed their journey.

"There is a mighty good moral in this story—both for autoists and railroad men. But more so for careless motorists."

S. M. Copp and C. D. Carey herewith present No. 3 in their series of epitaphs:

## NEWS of the DIVISIONS

### AROUND CHICAGO

#### Baggage and Mail Traffic Department

Saturday, July 23, the girls of the baggage and mail traffic department had a surprise shower for Mrs. Lawrence Clark, formerly Ella Berkley, who recently announced her marriage, which took place May 27.

Misses Rose Litka and Leona Scharlau are touring the East on their vacation.

Misses Leta Visel and Elsie Carlson have just returned from a two weeks' trip through Colorado and Utah.

Fred Laenhardt, chief mail clerk, Central Station mail room, who has been on leave of absence on account of ill health, reports he is feeling fine.

#### Valuation Department

In order better to enjoy his annual vacation, which came in July, George Greenfield of the bridge and building valuation engineer's office entered into matrimony on June 29, and took his bride with him for a delightful visit to Montreal and Quebec, Canada. Mrs. Greenfield was formerly a Miss Holbrook of St. Johns, Mich.

#### Chicago Passenger Terminal

Mrs. Mollie Stang, ticket agent, who has been sick at St. Bernard's Hospital, is improving.

On June 26 the Trainmen played the N. Y. C. Trainmen at Washington Park—score 6 to 0 in favor of our boys. D. L. Hall was pitcher and E. Roth catcher. Fielder Milligan made a running catch when the N. Y. C. boys had three men on bases, which made the third out. Pressler, Boeschel and Wheeler figured in double plays.

Mrs. Minnie Galena, ticket agent, reports the arrival of a little girl, born June 18. Both are doing nicely.

On July 10 the Trainmen played the Lake Shore team at Washington Park—score 14 to 13, in favor of Illinois Central Trainmen.

Alfred Graff, Bud Kerr and John Hoffman, suburban trainmen, are the proud fathers of baby girls, born recently.

Conductors Harry Darling and Herman Butcher are spending their vacations fishing in Northern Wisconsin.

Sympathy is extended to Flagman Edward Ferlin, who recently lost his sister.

H. E. Bragg, night chief clerk at Randolph street, and family are spending their vacation visiting his parents in Indiana.

Engineer J. Vrooman has been commended for prompt action in bringing his train to a

stop before striking an automobile, stalled on the track at Harvey, Ill., on July 6.

#### Dining Car Department

The vacation period is still on, and consequently there is more work to be done than usual.

Albert Nankweil, our timekeeper, has been to the Dells of Wisconsin for one week, and has gone to Gilman, Ill., for his second week.

Miss Edna Roswall has returned from Memphis, Tenn., after a pleasant week among friends.

Business is very good with this department. It is surprising to see the large quantities of food supplies that pass through our commissary every day. The best of everything is bought, and if the best is not delivered, it is promptly returned.

"I never knew how important the dining car department was to a railroad until I took a trip from Chicago to Montreal, Canada, on another railroad, about a month ago," writes a correspondent. "A short time after leaving this city I became weary and tired, owing to the intense heat and other causes. In the morning I took my breakfast in the diner, and I was somewhat surprised to find an old Illinois Central steward, Dave Farwell, in charge of the car. The food was so nicely cooked and so well served that it put me in the best of humor. It was such a good meal that it would make a sick man well. At any event, it caused me to forget my troubles. I had a pleasant time and felt fine all the rest of my journey.

"All people are the same when it comes to wanting a good meal. They are tired and weary when they travel, and when they are served with a good meal it gives them strength and good cheer to make the rest of their journey in comfort.

"That is why the Illinois Central dining car department employs only experienced help, and that is why we have three inspectors continually ride our trains in order to see that the patrons of the Illinois Central are properly taken care of.

"A person has to eat to live, and if the patrons don't eat right, there is going to be trouble. That is why we have to be so careful in buying and in cooking and preparing the food. It is also very important that the meals be served properly.

"We have a set of rules which all must follow, and our inspectors are continually on the lookout for any violations of our rules. Any employe who does not live up to our strict set of rules is taken out of the service. This, how-

ever, seldom happens, as the majority of our help are old timers who have spent the greater part of their lives in the service.

"A good cup of tea is a simple thing to make. All you have to do is to take an earthen tea-pot, put your tea in it, and then pour boiling hot water on the tea. Let the tea steep a few minutes, and then you have a good cup of tea. However, if this good cup of tea is served in a tea-cup that has not been washed properly it will give the tea a dish-water taste, and is liable to spoil a good meal. To avoid this, the dishes must be scalded with boiling hot water. To keep the dishes absolutely clean is a very important matter on a diner or in a restaurant."

#### ILLINOIS DIVISION Superintendent's Office

Accountant Vern Johnston, Trainmaster's Clerk Nick Richmond and Report Clerk Gilbert Webster attended the convention of the Rainbow Division at Cleveland, Ohio.

The best passenger train performance record the Illinois division has yet attained was made when we closed June with a percentage of 99.3 in the maintenance of passenger train schedules, ranking in fifth place among road divisions, the System average being 99.1.

Miss Lona Lawson, tonnage clerk, returned July 11 from a two weeks' vacation spent in Detroit, Washington, New York City and other Eastern points. Miss Lawson was accompanied by Miss Margaret Hipelius, a former employe of the Illinois Central, now employed by the Michigan Central.

Assistant Tonnage Clerk Sydney Watson is off duty again on account of illness. Mr. Watson has been removed to his home in La Salle, Ill., to recuperate.

The division signal meeting for June was held at Effingham on June 19; that for July, at Paxton, on July 17. Forty attended in June and twenty-nine in July. The August meeting will be held at Kankakee on August 14.

Superintendent J. W. Hevron, Assistant Chief Dispatcher C. C. Chapman, and Chief Dispatcher P. Mallon of the Springfield division, and their families, are enjoying a two weeks' vacation at Found Lake Resort, Sayner, Wis.

The Fuel Cars, in charge of O. L. Lindrew and J. W. Dodge, were in Kankakee July 19, and Champaign July 20, 21 and 22, meetings being held at 2:30 and 7:30 p. m. being well attended.

#### Champaign Freight

Miss Mayme Woy, abstract clerk, has returned from a two weeks' vacation trip spent at Kent, Ohio, Washington, D. C., and other eastern points.

F. A. Baker, bill clerk, left Friday, July 15, for Denver and Colorado Springs.

#### Kankakee Freight

Baggageman A. C. Show was on committee work in Chicago June 12, 13 and 14. Brakeman Blake relieved him.

Lehigh and Southern tracks should be completed August 1 between Lehigh and Irwin, Ill.

#### Effingham Freight

Miss Amelia Feldhake, clerk in the freight office, has returned from a ten days' camping trip at Woodbury, Ill.

Chris Alt, for many years proprietor of the

Illinois Central lunch room at Effingham, passed away July 12, after a two months' illness. He was well known to many of the Illinois Central employes, and his presence at the lunch room will be greatly missed.

#### Kankakee Yard and Roundhouse

Engineer T. J. Tyrrell has reported to work after being off for two weeks on account of sickness.

Frank L. Coyer, clerk, was called to Burnside on account of the new time book's being put into effect.

Clifford Rutherford, car repairer, has reported to work after being off on account of sickness.

Switchman W. F. Hardgrove is off on account of injuries to his chest, received July 6 while attempting to get on an engine at the viaduct.

#### Champaign Yard and Roundhouse

Charles Thompson, acetylene welder and star third baseman on the Illinois Central baseball club, was very painfully injured Sunday, July 17, when he fractured a bone in his right ankle while playing against the Chicago Terminal Trainmen's team.

Silvyo Massel, machinist, while operating a valve-boring machine, lost the last three fingers on his right hand when he got them caught in the gears of the machine.

Margaret Cain, stenographer in General Foreman Donley's office, spent the week from July 17 to 23 at Quiver Beach, near Havana, Ill., with a party of friends camping.

M. E. Marmion, roundhouse clerk, left August 1 for Breckenridge, Mich., to spend a ten-day vacation.

Karl Cagann, night roundhouse foreman, returned to work on July 18 after spending ten days in Denver, Colorado Springs, Ogden, Utah, and other points in the West.

#### WISCONSIN DIVISION

##### Bloomington, Ill.

C. E. Slonaker, agent, attended a meeting of the Freight Agents' Association in Chicago, June 21, 22 and 23.

The concrete work on the Washington street subway has been completed. Everything now is in line for the paving work, and no doubt this will be rushed rapidly to completion and our East Side residents will realize their wishes. All say that the work is really a greater undertaking than any expected it would be.

Frank B. Major, yard clerk, suffered fatal injury in an accident in the yards here, involving the overturning of a car of cinders. Frank was riding the lead footboard of Switch Engine 586, which was pushing car I. C. X6314 and two empties into the Parker track, when I. C. X6314 overturned for some reason, pinning him between the draw-bar and deadwood on car X6314 and the pilot beam of Engine 586, causing almost instant death. Arrangements were made for thirty employes from here to attend his funeral at Warrensburg, Ill., Sunday, June 26.

#### SPRINGFIELD DIVISION

Earl R. Rice, of South Clinton, employed by the Illinois Central Railroad Company as a section foreman, died on June 30, following an operation for appendicitis. Mr. Rice was 33 years of age at the time of his death. He had resided in Clinton practically all his life, for

some time being employed under his father, who preceded him as foreman of a section on the Champaign-Havana district of the Springfield division. He is survived by his wife, seven children, his father and three sisters.

Through the efforts of Master Mechanic Needham and the co-operation of the employes of the mechanical department and engine men, a fund of \$243 has been raised for the benefit of the widow and family of the late Earl Rice, section foreman, according to the Clinton (Ill.) Journal, of July 12. While Mr. Rice was not in the same department as the foregoing men, this illustrates the spirit of loyalty which is always shown by the employes of the Illinois Central to their fellow workmen, the Journal comments.

#### ST. LOUIS DIVISION

The Illinois Central Division Office baseball team has been playing some good games and is anxious to schedule games with other teams.

Walter Trammel, check clerk in the freight office at Carbondale, has been in Holden Hospital at Carbondale for a number of days, but is now out and is improving rapidly.

Miss Julia Stearns, accountant, is away on

a leave of absence on account of the serious illness of her mother.

Charles Clayton, formerly employed in the superintendent's office, but now employed by an oil concern in Tampico, Mexico, has been visiting relatives and friends at Pinckneyville and Carbondale.

Trainmaster W. R. Givens was in the hospital at Chicago for several days recently.

Miss Lillian Milligan, from the superintendent's office, and Miss Nellie Cresse, from the freight office, spent several days visiting friends and seeing the sights in Denver and other western cities.

There is a lot of building, including hard roads, now going on in Southern Illinois. The hauling of materials makes business good for the railroads. There are lots of tomatoes, melons, and cucumbers now being shipped from the St. Louis division to the South Water Street Market, Chicago.

C. A. Batson, clerk in Roadmaster Kern's office, has a fine baby boy at his house.

The St. Louis division is still actively engaged in the solicitation of business, and we firmly believe that we live in one of the most thriving spots in the country.

Brakeman M. Conder of Tamaroa, Ill., has

## Driving Piles on St. Louis Division

Pile driving gang, with Pile Driver X-2, in charge of Foreman George Smith, on the St. Louis division. There were 180 piles driven in Big Muddy Bridge in seven days; 42 piles driven at Big Bay in 1½ days, and 72 piles driven at Gale in 3 days—or a total of 310 piles driven in 11½ days, an average of approximately 26 piles a day.

been commended for observing and reporting, while off duty, a bent axle on a train of eighty-four refrigerator cars passing through Tamaroa on June 19.

**Trainmaster's Office, Centralia, Ill.**

Yardmaster J. D. Philpps at the passenger station is back on the job after a vacation.

Train Lister W. H. Webster and family recently spent a week's vacation at Riverview clubhouse.

Miss Lena Watts, 722 clerk, and Shum Conner of the mechanical department were married at Chicago on June 29.

Trainmaster F. T. Gibbs and Supervisor of Scales Walter Schlinkert have returned from a ten-day trip inspecting scales at some of the large terminals on Eastern lines.

Miss Ethel Buckner, record clerk, recently entertained the girls from the office with a variety shower in honor of Mrs. Lena Conner, until recently Miss Lena Watts. Mrs. Conner received many useful and pretty gifts, for which she expressed her appreciation.

Train Lister Walter Klosterman took a short leave of absence a few weeks ago and came back to town with a wife, formerly Miss Edna Kraemer.

Brakeman E. D. Horner, who underwent an operation at the Illinois Central Hospital in Chicago a short time ago, is doing very nicely, and expects to be home soon.

W. H. Kiser, who was injured on a motor car some time ago, is able to get around a little and expects to be out of the hospital in a few weeks.

**KENTUCKY DIVISION**

Chris Klinger, commercial agent for the Illinois Central at Louisville, died in that city on July 4, according to a note in the Memphis (Tenn.) Commercial Appeal. Mr. Klinger was well known to almost all railroad men and a number of shippers in Memphis. He had been connected with the Illinois Central a number of years.

**TENNESSEE DIVISION**

**Jackson, Tenn.**

C. B. Thompson, formerly roundhouse foreman at Jackson Shops, has been transferred to Blrmingham, being succeeded by W. Wilcox.

J. H. Turner, car carpenter, is able to be out of the hospital after a serious operation.

Car Foreman Rowley and family have returned from a two weeks' vacation, which they report was pleasantly spent in "Ole Alabam."

Mr. and Mrs. P. L. Witty have returned from a trip to Buffalo, New York City and Niagara Falls.

Mr. and Mrs. L. E. Craig are spending their vacation in Chicago.

F. E. Young, demurrage clerk, is able to be back to work after an operation for appendicitis.

Local Surgeon Jere L. Crook left recently with his family for a visit to his oldest son, Senter, who has been in Denver for some time on account of ill health.

All express themselves as having thoroughly enjoyed the pamphlet, "What Every Employee Ought to Know About the Illinois Central System," having gained much knowledge through this condensation of history and statistics, and being justly proud of "OUR" System.

"Agent Bond Wilkinson, past exalted ruler of the Jackson lodge of Elks, had hardly alighted in Los Angeles, Cal., to attend the annual

B. P. O. E. convention, when he was picked and plucked," says the Jackson Sun.

"A postcard from Mr. Wilkinson, showing the picture of many bathers on the Los Angeles beach, was received just prior to the message that he had lost his wallet.

"Following item from the Los Angeles Times: 'Loss of a wallet containing railway passes, B. P. O. E. membership card, Grand Lodge credentials and a small amount of money has been reported by F. B. Wilkinson, delegate to the Grand Lodge reunion from Jackson, Tenn. The wallet was lost shortly after the arrival of Mr. Wilkinson, whose address is room 774, Alexandria. Suitable reward is offered.'"

**Dyersburg, Tenn.**

Miss Jemmie Pritchard, demurrage clerk, is back on the job after a pleasant vacation trip spent in California.

The entire office force was much pleased to learn of the recent promotion of both A. N. Robinson and T. D. Clark, and wishes them both success in their new undertakings.

**Birmingham, Ala.**

On June 11 Miss Grace Alexander, abstract clerk, was married to Hugh Alford at the First Baptist Church, Miss Klee Sullivan acting as maid of honor and Reilly Hatton as best man. The guests of the evening num-

**ECZEMA**

No matter how long you have suffered with Eczema No matter how severe your case may be. bered around two hundred. The bride and groom left immediately for a reception given by Mrs. Alford, mother of the groom, after which they departed for Hot Springs, Ark.

Miss Alberta Hall, our O. S. & D clerk, had her appendix removed at St. Vincent Hospital on July 7.

J. W. Nall, inbound revlslng clerk, who has been in the service some forty years, has been ill at his home for the last two months.

H. C. Hoot, first trick operator, has been at home ill for the last month or two, but the last word received was that he was doing fine.

#### Haleyville, Ala.

C. C. Burdette, former agent, is spending an indefinite vacation in Asheville, N. C., with his family, being succeeded by C. D. Mitchell.

R. H. Briggs, conductor, is spending the summer months with his family in Jackson, Tenn.

C. W. Hall, who has been on special duty at Birmingham, is expected to return to his former position as conductor in the near future.

#### Fulton, Ky.

Mrs. L. Castleberry reports a delightful vacation in Gulfport, Miss.

Paul P. Pickering, chief clerk to the roadmaster, together with Mrs. Pickering and their son, Paul, Jr., is spending his vacation at Eureka Springs, Ark.

R. D. Benedict Herbert Rankin, D. C. Ligon and Miss Estelle Slaughters have just had their annual vacations.

P. M. Newhouse, timekeeper, left Sunday, July 24, to spend his vacation camping at Fish Lake.

Miss Lois Covington has returned from a visit to Chicago, Washington and Ossco, Wis.

T. H. Chapman, former income tax collector this district, is now employed as trainmen's timekeeper.

Mrs. Bunk Hale has gone to Hardy, Ark., to spend her vacation.

Tralnmaster J. J. Hill and family are spending their vacation in California and Oklahoma.

#### MEMPHIS DIVISION

Joe Gulo, car distributor, has definitely committed himself to matrimony.

E. L. Galloway, accountant in the superintendent's office, is a proud father for the second time.

Supervlsor D. L. Meeks and Mrs. Meeks have returned from Hot Springs, Ark., somewhat benefited in health.

The work of improving section houses and section lots is progressing rapidly under the supervision of Divlsion Gardener H. W. Dorsey.

Miss Clara Milligen, supervisors' clerk at Tutwiler, Miss., will leave shortly for a vacation in the East.

Supervlsor W. H. Wood has made a remarkable record in keeping down personal injuries among his men. For the past six months of this year, he did not have a single injury to report, and he hopes to repeat for the last half of the year.

Section Foreman Boatwright of Clarksdale, Miss., has been off for a week. He and Mrs. Boatwright motored to Tupelo during his leave.

George Digel has succeeded Clyde Ferguson as roadmaster's clerk. Mr. Ferguson succeeded H. H. Kiernan as assistant chief clerk to the superintendent. Mr. Kiernan resigned to accept a position with the Peoria and Pekin Unlon Railway at Peoria, Illinois.

D. T. Overby, rodman accountant, was pro-

motored to instrumentman accountant at Louisville, Ky., effective July 15.

Resident Engineer E. O. Hebert has about completed his final report on the slide work at Greenwood, Miss.

The Memphis division has the best set of dispatchers to be found on any man's railroad, and to prove our contention we can cite you some record runs made on Tallahatchie district. Engineer Forest King took a train of 100 empty refrigerators from Memphis to Gwin, 147 miles, in 8 hours, 15 minutes. If anybody can beat this, we would like to hear from them.

Our old friends and neighbors at Crystal Springs, Miss., are doing business this year. Two solid trains of sixty-two and sixty-four cars of tomatoes were shipped one week recently. This means \$60,000 to \$64,000 for each train.

Our passenger, manifest, banana and vegetable trains are all on the advertised so far this month.

Old H. C. L. has evidently not hit the planters in Mississippi, as the local business is heavy, and in addition to feed stuff and groceries a great deal of gravel is being handled for the public highways. The Tunica oil mill is working overtime and the crops never looked better.

Supervisor J. Crahen has been complimented

## ILLINOIS CENTRAL RAILROAD UNION BAND & ORCHESTRA

*The only R. R. Band and Orchestra in Cook County. Music Furnished for All Occasions*

on the condition of track on his district, Memphis to Lula.

Conductor E. B. Huffman, who has been away on a 30-day vacation pleasantly spent in the East, is back with us, looking much improved by his trip. A. Graves was a member of the party that Mr. Huffman accompanied.

Conductor W. A. Wyley, who was injured at Trotters Point last year, is back on his run.

No exceptions, no derailments, no accidents, no personal injuries, no stock struck—that is what we are expecting to do this month. One of our men made this record in thirty days' service in May. It can be done.

B. F. Edwards, a former Y. & M. V. conductor, now employed as yardmaster for the Union Belt Railroad, was elected, and attended, as delegate from the Memphis Lodge, a meeting of the International Yardmasters' Association at Indianapolis this month.

The sympathy of all who know him goes out to our good friend, R. R. Nethercott, general yardmaster at Memphis, who was injured at Nonconah yard June 17th.

**MEMPHIS TERMINAL DIVISION**

Conductor J. S. Wesson has been commended for taking up a pass issued to a negro former employe and being misused by another negro. His action resulted in bringing to the company \$42.30 for passage from Memphis to Chicago and return. This is the third case reported in which Conductor Wesson has taken up such passes. In one case he caught a brakeman's pass in the hands of a negro wearing glasses and appearing to have defective eyes.

**LOUISIANA DIVISION**

Superintendent T. J. Quigley and family returned on July 17, after spending several weeks with relatives in Kentucky.

Private Secretary Dodds, Ticket Agent Bentley and Stockkeeper Fox are vacationing in California.

We have had a recent addition to our office in the way of 101 force composed of Robert Vest, Reginald Middleton, Thomas Evans, George Little, Forrest Kermeen and C. M. Streibich. Mr. Vest is in charge of the work.

Miss Della Mae Dougall, statistician, and Miss Vivian Johnson, income tax clerk, are enjoying the air at Signal Mountain, Tenn. Mrs. Fitzhugh Lee has just returned from that resort.

The result of the "No Exception" campaign showed how hard the employes of the Louisiana division worked during June. And we haven't stopped yet; we are fighting as much as we did in June.

Miss Frances Otken, stenographer, has been granted a 60-day leave of absence on account of ill health and is spending that time at Asheville, N. C.

**Mechanical Department**

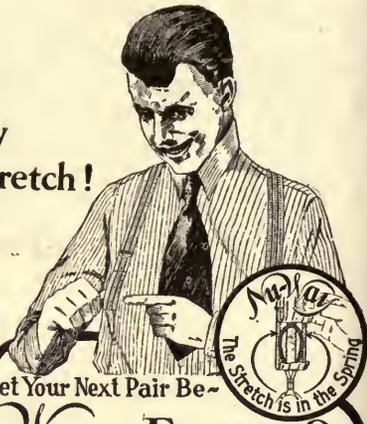

All on the Illinois Central must be wondering why they have not heard from the mechanical department, McComb shops, for some months past, but our silence was caused by the sudden onrush of work in the shops in the handling of engines to be delivered to the National Railways of Mexico. We have all worked, and as we view our completed task, we are proud of the record that we have made.

General Foreman R. R. Royal at this point was appointed general mechanical inspector for all engines delivered. Roundhouse Foreman Martin acted as general foreman in Mr. Royal's absence.

shop, was found to be 100 per cent on inspection.

C. V. Miller and W. L. Catchings, foremen in this department, are taking a much-needed vacation.

W. J. Shea, blacksmith foreman, was a recent visitor to Houston, Texas, where he visited other shops with a view to securing any items of interest that would give greater efficiency at McComb.

The boys have organized a ball team and have made a fine record this season, playing five games, losing only one. They would like to make arrangements to play any team on the system. The team is composed of Vannie May, moulder, catcher; Bill Cullom, welder, second base; Goofie Wilkes, machinist, shortstop; Geo. Galloway, messenger, third base; John Lyons, machinist, pitcher; John Haffey, apprentice, fielder; B. Westbrook, apprentice, fielder; Ernest Smith, stockkeeper, fielder.

R. A. Mason's gang has been working at McComb for the past several weeks on the new cupola for the foundry.

The filing position in the master mechanic's office is keeping its reputation, as our file clerk, Miss Reba Womack, is following in the steps of all her predecessors. She is leaving us on the 15th to take the long journey on the sea of matrimony with Night Gang Foreman W. D. Lyons.

We are glad to have the following of our old 109 force back with us again: Julian Leggett, Earl Winborn, Jack Causey, William Marks, Joe Blair, Miss Anna Belle Craft, and S. M. Schrader in charge.

Freight service on the Memphis division between Memphis and Gwin is pooled, train and engine crews being run, first in and first out. July 1 to 15 an exceptionally good record was made in this service. Engineman P. Brady ran 1,590 train miles without overtime. Engineman Fred Wright ran 888 miles without overtime. Engineman M. G. Dodds ran 448 miles without overtime. Engineman A. H. Addison ran 1,344 miles, making only 7 miles overtime, which was .5 of 1 percent of his train mileage. Of the conductors in the same service, E. Y. Stone ran 1,328 miles, making 13 miles overtime; F. H. Nelson, 942 miles, making 9 miles overtime; J. B. Gordon, 883 miles, making 8 miles overtime.

NUMBER 3

## Management Pleased With Effort to Make September Remembered

*Vice-President L. W. Baldwin, in Interview, Calls Attention to "Fuel Economy" Month, Now in Progress*

**V**ICE-PRESIDENT L. W. BALDWIN is highly pleased with the initiative and interest displayed by the officers and employes of the Illinois Central System in preparing for the "Fuel Economy" month campaign, beginning September 1, as this issue of the *Illinois Central Magazine* goes to press. As for the outcome of the special coal conservation drive, Mr. Baldwin hasn't a doubt in the world. He declares it is going to be a huge success from the word "Go!"

It was Mr. Baldwin who made the plans for "Fuel Economy" month, but he likes to pass the credit on to the officers and employes of the system. He declares that when the records of "Fuel Economy" month are written, the credit for the success he knows it is going to be will go to the officers and men who, in more senses than one, are on "the firing line." As for his part in the generalship, he says:

"How could anyone help putting forth his best efforts as a general when he has the men to work with that we who are the officers and employes of the Illinois Central System have?"

### Talks on Work of All Employes

And that is the tone that runs through all his comment on the coal-saving campaign. When the *Illinois Central Magazine* asked his permission for a coal conservation interview he refused to talk about his own part in the big drive, but dwelt enthusiastically on the part which the officers and employes of the system as a whole are taking.

"It has been wonderfully gratifying to note the interest displayed by officers and

employes preparing for the campaign," he said.

"I have had occasion to read the letters and circulars issued by the general fuel conservation committee, the division fuel conservation committees and the officers, and I was greatly pleased with many letters written by engineers and firemen.

"I was particularly interested in a report made by Engineer S. Baker and Fireman N. A. Marshall on the Champaign district, who made a trip August 18, handling 3,999 tons and consuming only 43 pounds of coal to the 1,000 gross ton miles. These men counted scoops between stations and made a record of them. From the yard office at Mattoon to Champaign their report shows that they used 528 scoops of coal. This was great work, and it shows that the men are interested.

### Report Work Necessary on Engines

"Down on the Louisiana division I noticed a bulletin to engineers attaching a form to be filled in and sent to the superintendent, showing work needed to be done on engines to conserve fuel. This is a fine idea.

"On the Y. & M. V. a placard is entitled 'The Alphabet of Fuel Economy.' It has a good fuel-saving point for each letter in the alphabet. For instance, for 'S' it shows: 'S stands for steam and also for smoke; the more of the latter, the nearer we are broke.' The other placards also are good. One of them calls the attention of extra gang, bridge and section foremen to the fact that every time a train is slowed down or stopped unnecessarily 750 to 1,500 pounds of coal are wasted. Then, too, one addressed to car inspectors, oilers and repairers shows how

they can help. This placard points out that the average leakage in brake pipes and hose on freight trains wastes one ton of coal each eight hours the train is in service.

#### Bulletins on the Western Lines

On the Western Lines bulletins were issued to locomotive firemen, engineers, boilermakers and machinists, showing what they could do to save coal. Boilermakers were

shown how they can help by applying front-end rigging in such a manner as to draft engines properly, by keeping ash-pan in good condition and open, so that the necessary amount of air will reach the firebox unobstructed, by keeping flues open and knowing that flue-borers are properly cleaning them. Machinists were shown how they can save coal by proper setting of valves, by making steam and exhaust pipes tight, by making

Vice-President L. W. Baldwin

tight all steam valves and connections, such as blower valves, injectors, drain cocks to water glasses and blow-off cocks.

"On the Chicago terminal division the firemen have classes of their own for instruction. I am advised that they discuss many questions pertaining to fuel economy, and that recently they invited an officer to make a talk to them on boiler construction.

"In fact, on every division and at every place wonderful suggestions have been made and placed in effect.

"The general fuel conservation committee has issued interesting circulars. All of the formulae put out by the committee, if followed, will produce a fine result.

"The division fuel conservation committees have held meetings to devise and impart to employes having to do with fuel consumption the many ways in which they can economize in using coal.

**How Station Forces Can Help**

"Station and yard clerical forces can be of material assistance in making this campaign a success by having waybills ready for trains at the time the trains are listed and making an extra effort to supply billing for all cars in the train. The billing may happen not to be in the bill box when the list is checked, but may be available by notifying the billing or revising clerks that the car is in the train, permitting them to make a special effort to prepare it and thus avoid the necessity of having a switch engine stop its work to set the car out, thereby wasting an unnecessary amount of fuel.

"This is the first fuel economy campaign

to be attempted on our lines. What has been done to get ready for the campaign and the hearty response made by enginemen and trainmen, shopmen, track, bridge and water service employes—and employes in all other branches—reflect great credit on the ability and loyalty of the entire organization. The campaign is going to result in a great saving in one of the greatest items of our expenses, the coal bill."

**Remember September!**

**BOILER-MAKERS CAN SAVE COAL—**

1. By applying front-end rigging in such a manner as to draft engine properly.
2. By having petticoat pipe in line with stack.
3. By keeping flues tight and firebox sheets free from leaks.
4. By adjusting grate rigging so that the grates are level.
5. By keeping ash-pan in good condition and open so that necessary amount of air will reach firebox unobstructed.
6. By keeping flues open and knowing that the flue borer is properly cleaning them.
7. By keeping smoke-box and connections to smoke-box tight.
8. By repairing all steam leaks in connection with boiler and firebox each trip.
9. By keeping brick arch cleaned off and applying new fire-brick where necessary.

**What an Item Coal Has Become!**

Largely because of the increased cost of coal per ton, the Illinois Central System's coal bill in September, 1920, was 267.4 per cent greater than it was in September, 1916. The number of tons of coal consumed increased only 32.1 per cent in that time, the comparatively small increase in tons consumed being the result of greater efficiency, but the average cost per ton increased 178.3 per cent. Here are the figures:

	Tons Consumed	Average Cost Per Ton	Total Cost
September, 1920.....	425,626	\$3.623	\$1,542,046.70
September, 1916.....	322,217	1.302	419,641.79
Increase.....	103,409	\$2.321	\$1,122,404.91

# On the "Firing Line" for Our September Campaign to Save Coal

## St. Louis Division Fireman Outlines Practical Fuel-Saving Methods for Enginemen and Others

*When any discussion of fuel economy gets down to brass tacks, it addresses itself chiefly to enginemen—to the fireman who scoops the coal into destruction and to the engineer who must make the most efficient application of the power that the coal develops. The following article, by a man on the firing line (literally as well as figuratively), contains many valuable suggestions addressed to these enginemen, as well as a few remarks, at the end, for others who can help.*

By J. E. BEASLEY,  
Fireman, St. Louis Division

**F**IREMEN—don't wait until the last minute to start building your fire before starting on a trip. You know what the result will be: Your fire will be light and low; when you start your train, the fire will be pulled full of holes, and your steam will drop back twenty-five pounds or more; then you will crowd your fire, and by doing so you will get your fire banked, so that it will take you several miles to right your mistake.

Try to be at the roundhouse on time. Be sure your firebox is in good condition. When ready to leave, examine your grates and see that the front end is tight. Don't think that what little coal you save won't help, for it takes the small quantities of things in life to make the big ones. Ask yourself the question: Couldn't I have saved five scoops of coal today? If each of us would save five scoops of coal a day, that would mean seventy-five pounds for each crew a day. The St. Louis division works something like sixty engines every day. On these alone it would mean 4,500 pounds of coal saved on this division in one day, amounting to sixty-seven tons a month. We can do this well, and maybe better. Let's all try—we can't lose anything by making an honest effort.

### How Co-operation Will Help

Engineers—you should not be backward

in calling attention to any fireman you might have who is firing your engine too heavily. A fireman with the right spirit will thank you and try to do better. Keep him informed of all unusual stops and delays that you have in mind; it will save that last fire. Don't get offended if a fireman asks you to put a little water in the boiler when standing around. This will save the pop. In case you have too much water in a boiler to prevent the pop from opening, that is so much the better; then you will use the blow-off cock, which is more to give you better circulation and a cleaner boiler. Don't use the cylinder cocks to blow off a boiler. Let's work in harmony and help each other.

After standing a while, don't try to start a heavy train without first knowing that your fireman is ready. You will save time and coal by doing so.

Don't try to take water at every tank station just because it is there—every unnecessary stop makes it harder on your fireman and harder on your train, besides wasting coal. Try to get water where you think the water is best.

Firemen—don't allow your fire to get too low; this is a damage to your firebox and flues. There is more coal wasted in building up a low fire than in adding small quantities to a light fire.

### Black Smoke to Be Avoided

Don't forget your smoke-stack. When you are out alone on a trip, get the habit of taking care of your black smoke at all times; then it won't be so hard on you when the boss is around. You might as well shovel that fire out the gangway and on the ground as to force it out of the stack in smoke.

In firing the small-type firebox, try to avoid putting in a fire when the engine is being worked hard. Wait until she is hooked up to a shorter stroke, for opening the fire door when the engine is being worked at full stroke will cause your fire to be pulled full

of holes. Then your clinkers start to grow. If this is not your custom, try it once.

Don't blame your engine or coal every time your engine is not steaming fully. Examine your injector; it may be that your water ram is open too wide; maybe you are firing too heavily, or else you have a hole in your fire. Talk it over—the trouble might be in you.

#### Proper Handling of Water Important

Your engine will never steam so freely by heavy firing as it will by the lighter method. This same practice with water will have the same result. Don't use the stack for a gauge cock. One or two gauges of water is far better than three. Working the water through the cylinders and out the stack just a little will spoil your coal record for the whole trip. Now, you fellows who are in the habit of carrying high water—try less, and see what the result will be. Watch the steam gauge just as often as you can; take advantage of all your excess steam. If the pop valve is about to open, blow this excess steam back in the tank; it will help to warm the water in the tank. Warm water is said to help a poorly steaming engine; if so, it will surely help a well steaming engine.

When starting your train, don't wait until the engine has made several exhausts before shutting off your injector. Let that be one of the first moves you make, for, with the injector working when starting the train, you cause the cold water to circulate more rapidly, which will result in reduced steam pressure; then you will have to crowd your fire to gain the required amount of steam.

#### No Use Having the Engine Slip

Don't neglect your sand and let your engine slip—let that be one of your first moves, for you know what will happen to a fire when an engine slips.

Now, after leaving, don't let the pop valve be a reminder to put on the injector. Watch your steam and water. Above all try to avoid having the pop opening while around terminals.

Try the air, for there might be leaks in the train line that would not be heard with the pop valve open. These leaks will cause the brakes to drag, so that the heavy pull will damage your coal record. Then, too, with the pop going the engineer and con-

ductor cannot get a clear understanding as to how the work is going to be done at different places. Knowing just where stops are to be made and what work is to be done will help your coal record.

Now, if you have a bad tank of lumps, don't spite yourself by not breaking the larger ones, for you can't get the best results otherwise. Break what you can; then report the trouble to the master mechanic. Don't just get "sore" on the world and "rare" around in the deck—you can't expect any good from that. Report the trouble. If that doesn't help, take it higher up. The officers want us to save coal; so let's have them help us.

#### Watching the Bell and the Whistle

Engineers—don't expect a fireman to do a clean job of firing when you have him start the bell every time it is rung. Get the habit of using the bell ringer; the bell is just as important as the whistle, and when one is required make a practice of using both. On fast runs, when you see the fireman is busy

### Remember September!

#### MACHINISTS CAN SAVE COAL—

1. By proper setting of valves.
2. By making steam and exhaust pipes tight.
3. By proper application of cylinder packing so that it will not blow, and properly fitting up the valves so that they will be tight and free from blows.
4. By making tight all steam valves and connections, such as blower valves, injectors, drain-cocks to water glasses and blow-off cocks.
5. By having safety valves adjusted to shut off properly and whistle valves free from leaks.
6. By close inspection of engine, so that engine failures or extra stops will not be necessary on our road.
7. By seeing that all reciprocating parts are free and that all oil-holes are open.
8. By seeing that cylinder cock rigging is so adjusted that it will shut off and that valves are tight.
9. By seeing that throttle valves are ground in and kept tight to avoid waste of steam.

in the deck, sound the crossing whistle far enough back to give him a chance to be on the lookout over all public crossings. If he doesn't respond to the whistle, ask him to take a look; he won't mind that.

Firemen—get the old idea out of your head that you are wise and can't be told anything; two heads are sometimes better than one. Remember, the engineer is responsible for what takes place. Help him. As all can't be perfect, call his attention to anything you think might be wrong.

Don't forget the different grades of coal used. Some coal is harder than others and is bad to fill up and clinker. With this be sure to keep your grates free, for plenty of air through the grates is half the battle. Air is much cheaper than coal; use all you can. Watch the color of your fire and keep it bright.

#### Anger Doesn't Help Matters

While taking coal at coaling stations, don't overload the tank. You can't burn the coal that rolls off. Take just a full tank and no more. If you run short, the company will furnish a man to cut it ahead when needed. Report all disadvantages at coaling stations to the proper official. He will help you. Don't fuss to yourself about it—it's hard on your nerves. When you are all angry and everything goes wrong, you can't do your work as you would otherwise.

Keep your deck clean. Be neat. Insist that all steam leaks be repaired in winter months. Insist that all steam-heat appliances on the train be kept in first-class condition. Try to keep the coal record for your engine as low as the rest. Then if you are still high, have that engine tested out; there is something wrong. If you can't get a hearing by reporting the work, start something; you might as well fight for what you think is right.

A good engine in first-class condition gives good results for a fuel test. Get a good engine; then make the rest just as good. When an engine is reported "not steaming," bear in mind that two men have done their best for eight hours or more. Read carefully their report; give them credit for just one brain; anyhow. Don't repair that engine with a pencil O K; get busy and help find the trouble.

Trainmen—don't think that because the

engineer and fireman are away up there in the cab, fifty or seventy-five cars away, they can't tell when something is wrong. They pull the same tonnage every day. Walk a few car lengths; let that hand brake off or bleed the air off that car. You are paid for an honest day's work. Do your best, just as you would at home for yourself, for you really are working for yourself; you are part of the company; if the company loses, you are bound to lose. If you have a broken train line, don't throw that angle cock away because it is a bad order. Pick it up and send it in with the defective car. If you have a burst air hose, don't throw it away; send it in. Get the habit of trying to save; be careful with all supplies; if the other fellow sees you trying to save, maybe he will follow your example.

If you are not familiar with certain jobs you have to do, maybe your engineer was on that same job yesterday. Get an idea from him, and put the two ideas together. Maybe it will save you time and help the coal record for that engine crew. The success we are to get in this drive for economy depends largely on the spirit that each employe is putting in his work.

When you get figures from the superintendent about the amount of coal used and the cost of it, don't throw the report away without reading it. This information is valuable, as well as expensive. Read it. Then wonder what you can do to help to keep that record down.

### Remember September!

STATION FORCES, YARD CLERKS AND OTHERS CAN SAVE COAL—

1. By turning off electric lights when not actually required.
2. By properly billing carload shipments and avoiding unnecessary back-haul of car to destination.
3. By providing billing for all cars listed and lined up in trains or deliveries for connections, thereby avoiding extra switching to throw out "no bills."
4. By listing and carding all cars promptly when billing is furnished to avoid re-handling of cars in switching yards.

# Good Engine Performance Means Getting the Most Out of the Coal

*R. W. Bell Writes on Proper Handling After Locomotive Has Had the Right Kind of Preparation*

By R. W. BELL,

General Superintendent of Motive Power

**T**HE possibility of saving fuel by proper maintenance of locomotives was discussed in a previous article.

We will assume that the roundhouse and shop forces have delivered the locomotive for a trip in first-class condition—the boiler clean and free from scale, the flues and superheat units free from leaks and clear of soot and clinkers, the front end air-tight and netting clear, the firebox and flue sheets and mud-ring free from leaks, the valve and piston rods properly packed, the cylinder and valve packing free from blows, valves properly set, the driving boxes, rods and valve gear free from lost motion, the fire properly started in a reasonable time before call or schedule, and all supplies necessary made ready for the trip.

## Responsibility Is on Engine Crew.

The responsibility for the proper performance and condition of the locomotive is then charged directly to the engineer and fireman, under the supervision of the traveling engineer, until such time as the trip is complete and the locomotive is turned in at the terminal.

The engineer and fireman have, above all, the greatest opportunity to promote fuel economy by studying and taking advantage of every condition that presents itself on the trip, inasmuch as 84 per cent of the coal purchased is consumed on locomotives in service. In order to accomplish this saving, they must thoroughly understand each other and work to each other's advantage. In other words, co-operation should be the watchword. Co-operation in railroading means more than merely obeying orders. It means working together in a whole-hearted manner, avoiding the friction of conspiracy, selfishness, indolence and inattention.

## Locomotive a 2-Man Machine.

The locomotive is not a 1-man ma-

*What We Must Avoid*

chine. Its operation requires two men, the engineer and the fireman. The fireman is occupied in converting water into steam, while the engineer is manipulating the valves and mechanism to make this steam effective at the drawbar. The extent of such efficiency depends altogether on how well the engine crew does its work.

Whenever possible the engineer should give the fireman advance information of the approximate time of closing the throttle, so that he may regulate his fire accordingly. Similar information should also be common knowledge before starting trains, so that the fire will be in shape to handle the movement properly.

When the railway company hires a man to fire a locomotive, he is carried on the payroll as a fireman, which is merely a matter of

form, as his real status is that of a potential engineer. His successful development depends entirely on how studious he is and how willing he is to respond to the instructions of the engineer he is working with.

**Fireman Watches Engineer**

When the engineer intelligently supervises the firing of a locomotive and exercises habitual attention in the prevention of the loss of coal by incomplete combustion and falling off end-sills, decks, and top of tender by overloading at coal chutes, you soon have a fireman who is watching and appreciating the care with which a locomotive is operated and the judgment with which the use of an injector is applied and adjusted.

When the engineer is persistently on the alert to avoid black smoke, you will soon find the fireman doing the necessary things to produce smokeless firing, thereby avoiding a possible loss of the volatile matter, which is equal to approximately 35 per cent of the total heat in coal used on our system.

An average composite analysis of all the coal used on the entire system, on a mine run basis, is as follows:

Moisture .....	11.64	per cent.
Volatile matter .....	36.16	per cent.
Fixed carbon .....	40.31	per cent.
Ash .....	11.89	per cent.
<hr/>		
	100.00	per cent.
<hr/>		
Sulphur .....	3.86	per cent
B. T. U. a pound.....	12,003	

**Coal Is Three-Fourths Energy**

A study of the table reveals the fact that, if moisture and ash content are eliminated, coal produces 76.47 per cent, or 1,529 pounds, of potential energy a ton, in combustible content—fixed carbon and volatile matter.

During the burning process the fixed carbon remains on the grate in the form of coke until consumed, while the volatile matter evolves rapidly from the fired in the form of heat-laden gases and should be consumed before coming in contact with the heating surface of the boiler, or a cloud of black smoke from the stack, such as will be seen in the accompanying picture, will be the result.

This condition can easily be avoided by maintaining a level fire and by adding to it only the quantity of coal from which the gases will be readily consumed in the com-

bustion space of the furnace provided for that purpose, before putting in the next fire.

By using this method of light firing the fireman may be able to save a ton or more of coal on the trip and incidentally conserve his own physical energy by lessening the number of scoops he puts through the fire-door.

**Must Manage Mechanical Stoker**

The mechanical stoker, which is applied to our 2-10-2, or Central type, engines, offers a possibility for fuel saving, inasmuch as the physical labor is eliminated. This gives the fireman ample time to study his fire and the operation of this wonderful labor-saving machine. This machine, however, will give us only the results which are made possible by its proper operation on the part of the engine crew; so it is evident that their closest attention is necessary to make it perform in accordance with its rating.

As a rule, our engineers and firemen are strong advocates of fuel economy and the methods to bring it about, and the management thoroughly appreciates their constant efforts for better results.

In conclusion, the writer earnestly invites all employes to join work in behalf of the management's program for saving coal. Every dollar saved in the purchase of coal is a clear saving, and this money which is saved can be applied to maintaining the property in better condition.

**Where We Stand**

Nobody loves a corporation. Sometimes, to serve their own ends, politicians and newspapers encourage this feeling.

All that we, the employes of a corporation, can do is to show the public we are trying to do right.

We must not resent criticism. If it seems unjust, we must point out the injustice—patiently and in good temper.

If it is deserved, we must readily, cheerfully admit it—and do better. We give up many things when working for a public utility.

One of the biggest is the luxury of personal resentment: the privilege of bearing a grudge.

—BULLETIN OF THE GEORGIA RAILWAY AND POWER COMPANY, ATLANTA, GA.

# A Woman's View on the Coal-Saving Drive Is Appeal to Patriotism

## Miss Mildred Abbott Points Out Duty of Conservation Owed Our Company and Our Country

By MISS MILDRED ABBOTT,  
General Foreman's Office, McComb, Miss.

**D**URING September, the great drive for saving fuel is being staged. What subject that can be mentioned can be of greater interest to each and every one of our employes than that of saving coal?

Each one of you who read these lines, pause for just one moment, and consider what you are doing to help in this great campaign. It is the co-operation of "you and me" that will bring about the desired results.

When the call for volunteers was sent forth in 1917-18, how many of our brave boys answered and how many were ready to give the last drop of their life-blood for the cause? How many of them, the "flower of the nation," lie in Flanders fields? The thought of those who died so willingly, for such a noble cause, should stir the soul of man to its utmost depths. Can't we show that we appreciate their efforts in our behalf by conserving the resources which they died to save?

The railroads were among the greatest factors in the great war. The throbbing, pulsating locomotives carried across the country not only millions of soldiers but food, supplies, ammunition, etc.

### Retrenchment Is Necessary

Our railroad, the Illinois Central, one of the greatest in the world, has proclaimed to us all that retrenchment is necessary. We must work longer and harder and give our best for the cause, in order that the company can withstand the great crisis.

Our coal consumption is enormous. Did you ever stop to consider just how many tons of coal this railroad alone burns each year and the cost of it? How many tons do you suppose the company has to pay for that are wasted? We, the employes, are guilty.

*How many times do:*

Coal crane operators pile the engine tank

with coal so that the surplus falls off the tank and is lost?

Inspectors and repairmen allow engines to be dispatched with air leaks in front end, holes in smokestack, etc.?

Fire kindlers fire up an engine ahead of

## Remember September!

### ENGINEERS CAN SAVE COAL—

1. By working engine in shortest cut-off possible to handle train.
2. By carrying as small an amount of water as consistent with handling train.
3. By advising fireman as to grades and shut-off points.
4. By advising fireman as to stops and when he will take siding meeting or passing train.
5. By instructing fireman if he does not employ best practices.
6. By avoiding waste of steam by safety valves by carefully analyzing blows of cylinder packing and valves and reporting them for repairs.
7. By watching the manner in which engine burns fire, so that the drafting of engine may be regulated to the best advantage.
8. By avoiding unnecessary stops.
9. By watching closely for defects that increase consumption of coal and reporting them.
10. By keeping oil-holes open and oiling all reciprocating parts.
11. By avoiding over-pumping of engine, flooding valve chambers and cylinders and destroying the lubrication.
12. By seeing that fireman does not over-load tenders when taking coal on line of road.
13. By filling boiler with water at completion of trip before turning engine over to hostler.
14. By shutting off electric generator when the sun rises.
15. By close co-operation with all concerned.

listing time, and allow the fire to clinker? How many pounds a day are consumed in this way?

Not only is the waste of fuel made by those handling coal directly but also by those whose position does not bring them into such close contact with the situation.

*Clerks, consider:*

How many times do you use a large-watt light globe when a small one will do just as well?

How many times do you leave lights burning when not necessary?

Now admit, don't you sometimes leave the electric fan running all through the lunch hour, and very likely a stream of water running from the faucet in the wash basin?

It is not only the "big" things that count

but also the little thoughtless acts on the part of every employe of this railroad.

How many dollars will be saved in just one day if every one of us will perform just one act to save fuel?

During September, while this drive is on, it behooves each one of us to do his part to save fuel—not for the railroad, or the government, or any other individual, but for our personal benefit. We should put forth our best efforts to effect a saving such as has never been known before.

The Louisiana division expects to make a reduction in fuel consumption of 20 per cent.

Think of our dead heroes; had they shirked their duty, would the world be safe for democracy today? Will the railroads continue their operations, and present high standard of wages, if we fail in ours?

## *Saves Coal and Scoop, Too*

Herewith we have a photograph of William Stark, fireman on the Champaign district, Illinois division, showing a scoop which he has used since April 28, 1917. After making student trips and being examined on the Book of Rules, he caught a turn out with Engineer Bussman. Mr. Stark, having no scoop, inquired of his engineer where he could obtain one. Mr. Bussman, being an extra engineer, informed him he would give him a scoop, Mr. Bussman having already used it for two months.

In June, 1918, Mr. Stark was taken into military service, but before leaving he locked his scoop in a secure place, where he knew he would be able to obtain it after returning from the army. He was discharged in September, 1919, found the scoop where he had left it, and has used it since that date.

Mr. Stark has been in the service of this company four years and three months, and he has yet to draw his first scoop from the storehouse. He is a willing and ready worker. The fact that he has kept his scoop this length of time shows he has the interest of the company at heart. When called for duty he reports in plenty of time to leave the roundhouse at the time he is listed to leave.

As for saving coal, this scoop speaks for itself; it holds only a small amount and is sparingly used.

## Meet Five of the Veteran Employes of the Minnesota Division

*Old-Timers in Active Service, With Reminiscences Dating to D. & S. C. Line, Include Two Brothers*

**W**HEN the *Illinois Central Magazine* published in its August issue the stories of the twelve pensioners of the company who saw service of fifty years or more, the question naturally arose as to the records of employes still in service. Who's who on the system as regards length of employment?

A check by divisions indicates that the Minnesota division has five veterans who aggregate a greater length of service than any other five employes of any one division. These five men, whose records range from 56 years 1 month to 47 years 4 months, have a total service of 254 years 6 months, or an average of almost 50 years 11 months each.

Undoubtedly the oldest employe in active service on the Illinois Central System is R. O. Pease, watchman at Waterloo, Iowa, who heads the list. His service is one month more than 56 years.

Then comes J. H. Quinlan, conductor, Dubuque, Iowa, 51 years 3 months. Next is William Adrian, boilermaker at Waterloo, with 51 years 2 months; then T. J. Quinlan, conductor, Dubuque, with 48 years 8 months; then Fred H. Spohr, section foreman, Waverly, Iowa, with 47 years 4 months. The Quinlans are brothers.

### Is He Our Oldest Employe?

R. O. Pease, shop watchman at Waterloo, Iowa, has probably been in the service of the Illinois Central System longer than any other employe. His record extends over a period of fifty-six years of unbroken service.

Mr. Pease, who is an American to the core, was born in Sycamore, Ill., October 20, 1848. His boyhood days were spent entirely in Illinois. His home was in Sycamore, Magnolia, Winona and finally El Paso, where he was graduated from high school.

When 16 years old, Mr. Pease went into the railway business as a brakeman on the Toledo, Peoria & Western Railroad. He had worked for that company one year when he

received an offer as bridge carpenter with the Illinois Central Railroad. He was interested in this kind of work, and accepted the position August 1, 1865.

At that time, Mr. Pease says, the Illinois Central System had only 705 miles of track. The bridges were all clumsy wooden structures, except two or three which were made of iron. The wooden ones required constant attention, and Mr. Pease was with a gang of men that inspected and repaired every bridge on the system. They were kept busy all the time, he says.

### Worked Nine Days and Nights

His constant interest and increasing eagerness to accomplish all that he could was rewarded in May, 1879, when he was promoted to bridge foreman.

During the night of July 4, 1876, Mr. Pease recalls, a severe rain storm washed out twenty bridges between Council Hill and Galena, Ill. He and his men worked nine days and nights with very little sleep. Mr. Pease says that he did not have his clothing off during those nine days. Then, in June, 1890, he went through about the same experience again.

The company saw the value of metal bridges and began replacing the wooden ones about 1884. Mr. Pease was made foreman of this work, and for six or seven years he directed the work of building the iron bridges.

### Transferred to Water Department

This task was not completed until March, 1897, and as the new structures did not need the care and attention that the wooden ones required, the work of the bridge workers was greatly lightened. Mr. Pease then was transferred to the Iowa division and was made pile driver engineer.

In December, 1904, he was again transferred, this time to the water department as pump engineer, having charge successively of the pumping stations at Scales Mound,

Ill., Galena, Ill., Manchester, Iowa, and Waterloo, Iowa.

In October, 1916, Mr. Pease was transferred to the mechanical department as shop watchman, and has held that position since.

Although he is nearing his seventy-third birthday, Mr. Pease is hale and hardy, full of energy and seems to be fit for several years of service. He has many friends over the system who say that he has always been ready to do anything that would be of benefit to the company.

#### Starts Fifty-Second Year of Service

J. H. Quinlan, who serves as conductor on various passenger trains between Chicago and Dubuque, rounded out his fifty-first year in the service of the company on June 14 of this year and is now well started on his fifty-second. Outside of the fact that his feet bother him occasionally, he is as fit as when he first began work on the section at Dunleith, now East Dubuque, in 1870, and seems good for several years more. He has been sick enough to need a doctor only once in his life, as he recalls, although he has been laid up with accidents several times.

Mr. Quinlan was born at Sandusky, Ohio, March 22, 1853, which makes him 68 years old at present. When he was only 3 years old his family moved to Illinois, coming over the Lake Shore (now New York Central) to Chicago, crossing the Chicago River in flatboats pulled by ropes (the old Rush street bridge was then the only one in existence), traveling to Freeport over the old Galena Union Railroad (now the Northwestern) and then on the Illinois Central from Freeport to Dunleith. The main line of the Illinois Central at that time was from Cairo to Dunleith, Mr. Quinlan says.

After accumulating a public school education at Dunleith, Mr. Quinlan at the age of 17 tried steamboating on the Mississippi between Dubuque and St. Paul, but gave that up after a few months. He quit one afternoon and began work on the section gang of the Illinois Central at Dunleith the next morning, June 14, 1870. Since then he has never been out of the employ of the Illinois Central, and he has never

worked in any territory except that between Dubuque and Chicago.

#### Helped Lay First Steel Rail

Mr. Quinlan believes that he had the honor of helping lay the first steel rail the Illinois Central ever had. That was in 1872 at Dunleith, and he helped to spike it himself. As he recalls, it was 70-pound steel from Sheffield, England. It replaced the chair iron in use before that. John C. Jacobs was superintendent at Amboy when Mr. Quinlan began work on the section, and his roadmaster was Ed Courtney, who was stationed at Galena.

After three years on the section, Mr. Quinlan began service as a brakeman between Dunleith and Amboy, August 11, 1873. September 29, 1879, he was promoted to freight conductor. June 13, 1891,

### Remember September!

#### FIREMEN CAN SAVE COAL—

1. By having fire prepared and leveled, but not too far in advance of leaving time.
2. By seeing that all equipment necessary is on engine before leaving time.
3. By not trying to put all coal in firebox at one time, nor slugging the fire.
4. By firing with as few scoops of coal at a time as possible to meet existing conditions.
5. By breaking up coal to the proper firing size.
6. By not shaking grates except when absolutely necessary and then only slightly.
7. By not raking fire except to fill a hole or break a bank.
8. By keeping the deck clean.
9. By not permitting coal to waste off the gangway.
10. By studying the problem of firing and talking about it with other firemen.
11. By watching closely movement of engine, particularly at shutting-off points.
12. By not over-loading tenders when taking coal.
13. By stopping firing in time to avoid delivering engine to round-house with green coal in firebox.
14. By close co-operation with all concerned.

T. J. Quinlan

J. H. Quinlan

William Adrian

R. O. Pease

Fred. H. Spohr

he became a passenger conductor between Dubuque and Chicago, and he has served in that capacity for thirty years.

When he started his passenger work, it took 9 hours for the run from Dubuque to Chicago; the run now requires 5 hours and 25 minutes. One crew now can do the work that three were once needed for, he says, largely as a result of improved equipment. In freight, for example, it was hard for one engine to take sixteen loads up Scales Mound, while twenty-five loads required the services of a second engine; now it is nothing for one engine to drag forty-eight cars up the same grade.

#### All His Accidents in December

Mr. Quinlan has had his share of narrow escapes. He was the only member of his train crew left alive in one of the worst wrecks the Illinois Central ever had, that at Perryville, Ill., December 14, 1901, when his passenger train and a freight train met head-on. He was in the hospital until May, and it took nineteen stitches in his head and nine in his left leg to pull him through. The first finger of his right hand is useless as the result of an accident in coupling at Warren, Ill., December 15, 1875, while he was a brakeman. He has had other mishaps, too, and he recalls that they all happened in December, his hoodoo month.

There was much trouble with snow in the earlier days, he says; in March, 1882, there wasn't a wheel turning between Dunleith and Amboy for ten days.

When he started braking, the beginner drew \$45 a month, Mr. Quinlan recalls; a freight conductor started at \$65.50 and at the end of three years was drawing \$83.33, or \$1,000 a year. Passenger conductors started at \$110 and worked into \$120, while now they will average \$288 a month.

Mr. Quinlan has worked under seventeen superintendents at and near Dubuque—Superintendents Jacobs, Russell, Harriman, Baker, Harahan, Wallace, Clift, Gilleas, Downs, Berry, Williams, Atwill, Sullivan, Bailey, Bechely, Dignan and McCabe—and he has been and is loyal to them all. He believes that loyalty to the company should be a man's first thought when on duty, that an employe ought to be where he is wanted when

he is wanted, and that it pays to take a genuine interest in your work.

#### Has Time Table Dated 1870

One of Mr. Quinlan's prized keepsakes is an employe's time table and set of regulations for the running of trains on the Northern division, issued just about the time he began work for the company and signed by Marvin Hughitt, general superintendent, and John C. Jacobs, superintendent.

The schedule called for four passenger trains and five freight trains between Dubuque and Centralia, with certain other stock trains and local freights. All trains were to take five minutes over the Mississippi River bridge at Dubuque and eight minutes from the west end of the bridge to the passenger station.

Another keepsake of his is a train order of June 6, 1887.

Mr. Quinlan is a charter member of the Order of Railway Conductors, organized at Amboy in 1881. He was also one of twenty-one charter members of Camp 894, Modern Woodmen of America, organized at Dubuque in 1882, which now numbers 700 members.

Mr. Quinlan was married on September 10, 1879, to Miss Catherine Kinslow, who had been a schoolmate of his at Dunleith. With them at 25 South Altavista street, Dubuque, are a grandson and a granddaughter, children of their deceased son, Charles. Another son, Norman, is with a steel company at Gary, Ind., and their only daughter, Alice, is now the wife of Judge D. McGuire at Dubuque. The family for several years were residents of Chicago, but Mr. Quinlan believes they will remain in Dubuque from now on.

#### Brother a Conductor, Too

T. J. Quinlan, brother of J. H. Quinlan, is likewise a conductor on the Illinois Central, likewise lives at Dubuque, and likewise is one of the five oldest employes of the Minnesota division. He is now on his forty-ninth year with the company, as his present service began January 6, 1873. T. J. is older than J. H. and has had a train longer than his brother, although his total service record lacks two years and a half of being as long.

T. J. Quinlan takes passenger runs be-

tween Dubuque and Fort Dodge, going west on No. 11 and returning on No. 16. Although more than 70 years old, he is active, efficient and able to hold his own with the younger men.

His earlier experience at Dunleith, where he attended the public schools, was much the same as his brother's. He left school when 15 years old and served as a brakeman on the Illinois Central between Freeport and Dunleith, working under Conductor Theodore Gosney. His employment lasted forty-five days; for the spout of the water tank at Freeport knocked him off the train early one winter morning, and he decided to take up other work.

An uncle at Louisville, Ky., taught him how to be a stone cutter, a trade he followed until after his marriage in 1871. The summer of 1870, while on his way to California, he met some friends at Cheyenne, Wyo., and stopped there to enter the employ of the Union Pacific as a brakeman from Cheyenne to Laramie City. After a few months he went back to stone-cutting, working on the state capitol at Des Moines, Iowa.

#### Worked on the Dubuque Bridge

In his stone-cutting career he worked on the first Louisville bridge across the

Ohio River, the St. Charles, Mo., bridge over the Missouri River and the St. Louis and Dubuque bridges over the Mississippi River.

In December, 1867, the first pile was driven for the foundation of the Dubuque bridge, the pile driver resting on the ice. At the same time the East Dubuque tunnel was begun. Both were completed in December, 1868. Mr. Quinlan rode on one of the first four engines coupled across the bridge. This bridge was the first large contract Andrew Carnegie undertook, and its successful completion brought his company into the limelight. No lives were lost and no person was seriously injured in carrying out this then large contract.

#### Remembers Old Argyle Hotel

January 6, 1873, Mr. Quinlan again entered the service of the Illinois Central at Dubuque as a freight brakeman. In 1876 he was promoted to freight conductor and in 1880 to passenger conductor. That was forty-one years ago. He has had an unbroken service as a passenger conductor since then, with the exception of the winter of 1886-87, when he served as trainmaster between Fort Dodge and Sioux City.

Mr. Quinlan's recollections date back to

---

*(Continued on Page 108)*

### *Things to Talk About*

Some persons seem to think that the administration, in recent legislation, is proposing to donate \$500,000,000 to the railroads. Nothing could be farther from the truth. The administration is not even proposing to lend any money to the railroads.

When the president took over the railroads for war purposes in 1918, it was with the express promise that they should not suffer by his action. They were retained by the government for two years and two months, and during that time enlargements were made by the government, the cost of which was charged to the railway companies. Such enlargements are called "additions to capital." When the railroads are operated by their owners the money for these enlargements is almost invariably obtained from the sale of bonds, which spreads the burden over a term of years. It would be the height of injustice for the government to force the railroads to pay these capital charges down spot cash. The government, on the other hand, owes the roads a large amount for rents and other current items growing out of governmental control.

What the much discussed legislation amounts to is this: The roads shall be allowed to give their notes, amply secured, for the sums they owe for capital advances; then the War Finance Corporation, which is in ample funds, will buy the notes from the government, and the proceeds will be used by the government to pay the rents and other indebtedness due the roads. The securities purchased by the War Finance Corporation will then be placed on the market and sold to investors.

It is no more than an act of simple justice. It merely handles the transaction as it would have been handled if the roads had not been taken over. Furthermore, it puts the railroads in a position where they can contribute their part to the revival of business.

# Illinois Central System Shows How Taxes Have a Bearing on Railway Rates

Notwithstanding that for the past twelve months the railroads as a whole have earned almost no net return on the capital invested in them, many persons insist that freight and passenger rates be reduced, regardless of the costs of producing that transportation service which the public must have. We wish, therefore, to direct attention to the fact that the costs of producing transportation are still relatively much higher than the rates. We think it fair to ask the public to give consideration to what the railroads are having to pay for labor, materials, locomotives, fuel, cars, taxes and interest on borrowed capital before passing final judgment upon the reasonableness of present freight and passenger rates.

It is true that, effective July 1, railway wages were reduced 12 per cent, but they are still 108 per cent higher than they were in 1914—the year of the beginning of the great war which upset everything. Road locomotives cost 123 per cent more, switch engines cost 144 per cent more, gondola cars cost 117 per cent more, refrigerator cars cost 107 per cent more, box cars cost 122 per cent more, steel passenger coaches cost 100 per cent more and locomotive fuel costs 138 per cent more at present than in 1914. The Illinois Central System sold bonds in 1914 on a basis yielding less than 5 per cent to the purchasers. It recently sold \$8,000,000 of bonds running for fifteen years, and the best terms it was able to secure yielded a return of more than 7 per cent to the purchasers.

Take the single item of direct taxes for a ten-year period. The Class I railroads, which include all railroads having gross operating incomes of \$1,000,000 or more annually, paid \$98,626,848 in taxes in 1911. In 1920 the same railroads paid \$278,868,668 in taxes, an increase of \$180,241,820, or 183 per cent.

The Illinois Central System paid \$3,278,107.96 in taxes in 1911, while in 1920 it paid \$9,575,680.87, an increase of \$6,297,572.91, or 192 per cent.

But these are not the only taxes affecting transportation charges. When the shipper pays his freight bill, he should remember that 3 per cent of what the railroad's bill otherwise would be is added and

collected by the railroad as a transportation tax. Likewise, when the passenger pays for his ticket, he should remember that 8 per cent of what he otherwise would pay the railroad is added and collected for the government as a transportation tax. Patrons generally consider only the total cost of freight and passenger transportation, and many think the railroads get the whole amount.

The transportation tax collected by the railroads for the government on freight bills in 1920 totaled \$129,710,329.80, and on passenger fares, \$103,099,633.36—a grand total of \$232,809,963.16! This vast sum is not included in any of the railway accounts. It was collected by the railroads acting as agents for the government and remitted directly to the government.

As the agent of the government the Illinois Central System collected from its patrons in 1920 the sum of \$3,084,072.54 as transportation tax on freight, and \$2,254,256.87 as transportation tax on passenger fares, a total of \$5,338,329.41! This is not included in the above mentioned item of \$9,575,680.87 direct taxes paid, but was collected and remitted directly to the government.

The question of abolishing the transportation tax is having consideration at Washington. The abolition of this tax would reduce railway rates without injury to the railroads.

We do not bring up the question of railway taxation in a spirit of complaint. We realize that all citizens and all businesses must bear their just proportion of the expense of government. We refer to the matter just now to make it clear that railway taxation must be added to the cost of transportation and necessarily has a bearing on freight and passenger rates.

The Illinois Central System has been striving for more than a year to present facts in regard to railway problems for the consideration of the public. The public will be able to decide for itself the advisability of such a course when it considers that the management of the Illinois Central System is the trustee of an investment in roadway and equipment of more than a half billion dollars. We realize that this property, and all railway property, will be dealt with accordingly as public sentiment develops and crystallizes. We feel, therefore, that we must present our case before the court of public opinion, and we are glad to do that, having an abiding faith in the fairness and justice of the people when they have the facts before them.

Constructive criticism and suggestions are invited.

C. H. MARKHAM,  
President, Illinois Central System.

## Former Employee Runs Across Some of Our Old Locomotives in Mexico

*Fred Dean Smith Says Sensation Was Just Like That When You Meet a Friend From Your Home Town*

*Employees who see Illinois Central engines chasing up and down the tracks every day of their lives can scarcely realize "the grand and glorious feeling" described by Fred Dean Smith, formerly instrumentman on the Minnesota and Iowa divisions, in the following letter to the Illinois Central Magazine. Mr. Smith, who is now assistant to the chief engineer, International Petroleum Company, wrote from Tampico, Mexico, on August 1.*

**H**AS the reader ever spent months and months in a strange place, among strange people, without ever meeting with a familiar face, and then, after finally thinking that all his friends were dead and gone, suddenly run across an old-time com-

panion from his old home town? Oh, man! **Sound Brought Back Memories**

You can imagine my feelings, after coming into Tampico from a six months' isolation in the wilderness of interior Mexico, to run right slam into one of the good old Illinois Central locomotives switching in the yards of a foreign city two thousand miles from home. It seemed so real to hear the ringing of the familiar old bell that I imagined for a moment that I was back in the yards of Waterloo again measuring up the rail laid in 1916 under Work Authority 1167!

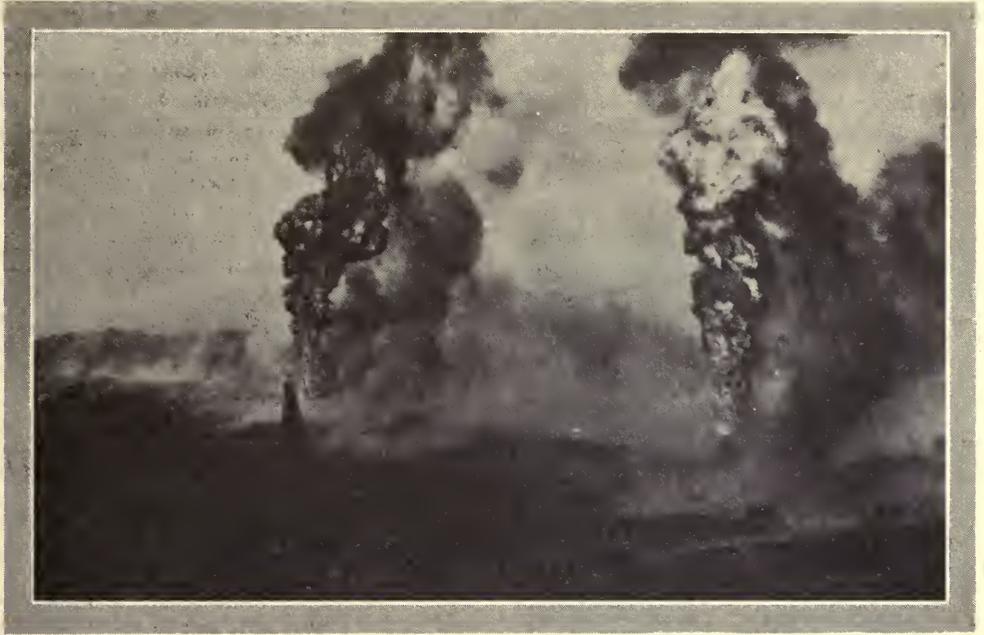

Engine 635, shown in the photograph, is only one of several which have been purchased by this government to help relieve the congestion on the national railways. They are surely making good, notwithstanding the

*Far From Familiar Scenes Former Illinois Central Engines in Mexico. . . .*

*Engine 635 clearing freight congestion at Tampico.*

*The Burning Oil Wells at Amatlan*

*Mexican Oil Wells Coming In*

racking disabuse by the native workmen and the occasional blow-ups by the bandits.

**The Great Oil-Well Fire**

I am inclosing several other views which might be of interest, showing various phases of the oil industry. One picture shows the burning of the now famous wells in Amatlan.

The first well caught fire from a boiler near by, just after oil had been struck, and immediately set fire to the second, which had been brought in a few minutes before and had not yet been controlled. The heat was so intense that no one could approach within five hundred feet without getting scorched.

The smoke column extended more than six miles into the sky, and the flames could be seen for a hundred miles around.

For six days the fire raged, burning more than five thousand barrels of oil an hour. After several unsuccessful attempts, two men finally succeeded in reaching the well under cover of a fireproof shield which was kept continually drenched with water from a battery of hose operated from the rear. The air adjacent to the burning column of oil was comparatively cool, due to the enormous draft, and with very little effort the men succeeded in closing the valves on each well.

*Echoes of the "No Exception" Campaign*

That the good results of the system "No Exception" campaign are going to be permanent is indicated in the report submitted by C. G. Richmond, superintendent of stations and transfers, covering the number of claims paid during July, 1921, for lost packages destined to points on each division. Compared with that of July, 1920, the 1921 record shows a decrease in total number of payments from 663 to 231. This is a reduction of 432, or 65 per cent. Every division on the system showed a substantial reduction. Below is the comparison submitted by Mr. Richmond:

B. A. Talbert, supervising agent of the Mississippi division, has made a comparison of shorts for the first six months of 1920 and of 1921, which shows that a reduction from 1,720 to 443 was made possible by the campaign. This is a decrease of 1,277, or 74 per cent. As there are 62 stations reporting on the Mississippi division, the 1921 record of shorts is an average of about 7 for each station, or slightly more than 1 a month. A comparison of lost packages on the Mississippi division for the first seven months of 1920 and of 1921 shows a gratifying decrease from 428 to 160, which is a reduction of 268, or about 63 per cent.

**FREIGHT INSPECTION PAYS**

An addition of approximately \$125 to the revenue of the railways handling a shipment of emigrant movables from Cooksville, Ill., to Lowefarm, Manitoba, Canada, is reported as the result of an inspection made by a chief clerk at Bloomington. The inspection disclosed that the "emigrant movables" included one motor truck, and a notation to this effect was placed upon the waybill. Charges, therefore, according to Superintendent J. F. Dignan's letter about the matter, should be assessed at the destination, in addition to the regular emigrant movable rates, for one truck at a minimum of 5,000 pounds of first class.

## Loyal Employees Plus Routing Orders Bring Illinois Central the Business

*Superintendent L. E. McCabe of Division Leading in Solicitation Takes Up Points Worth Remembering*

Up to the end of July in the traffic solicitation campaign, employes of the Minnesota division of the Illinois Central had mailed out 2,345 postcards, made 7,472 personal requests, obtained 2,515 carload routing orders and 7,236 less-than-carload routing orders, recorded 2,025 additional carload shipments and 16,851 additional less-than-carload shipments, and attracted 4,694 passengers to use the Illinois Central who might have traveled over other lines. With this record of achievement, the Minnesota division leads the system in employe solicitation of traffic. Who then could be better fitted than its superintendent to discuss the subject?

By **L. E. McCABE**,  
Superintendent, Minnesota Division

**S**OLICITATION of traffic is a subject of importance to any railroad at any time, but it is one of ultra-importance to all railroads today. It is a subject too often regarded by the average employe as only remotely concerning him, but connected chiefly with those individuals of varying position employed by the company for that sole purpose.

The one railroad in which I am principally interested, however, the Illinois Central, feels that in this respect its employes differ widely from those of other companies. Campaigns have placed routing orders in the hands of each person in its employ and instructed him in their use, presenting a means of securing business from friends and acquaintances. Whether the routing order reads "one L. C. L. shipment" or "one hundred carloads," it means just so much added traffic and revenue which the company would not otherwise have enjoyed.

### Routing Orders Do the Work

I have often heard it said that routing orders are worthless sheets of paper and that little or no attention is ever paid to them. These remarks always come from people who

L. E. McCabe

are not in a position to know, and show nothing but complete ignorance of the situation. On the Minnesota division we have sent in thousands of these routing orders obtained by our employes, and we are thoroughly convinced that the method is an efficient one. When someone induces a friend to sign a routing order instructing the shipper to route a car of lumber via the Illinois Central, and later we haul the car and collect the charges, then we know it pays.

Whether the employe receives an order on a large shipment or only a small one, whether he receives any order or none at all, these are not the most important things to be considered. The real question is: Did he ask for the business in a courteous and intelligent manner, and, if refused, did he smile as though a favor had been bestowed? If so,

he created a favorable impression which may be instrumental in securing a large amount of business at some future time.

### The Pleased Passenger Returns

In regard to passenger business, the employes of the freight department can do as much for this branch of the service as the passenger employes can do to obtain freight business. Any wide-awake person will find countless opportunities for putting in a good word for Illinois Central passenger service. Among everyone's friends and acquaintances there is always someone who is taking a trip, and the chance of obtaining a passenger should never be passed up, no matter how brief the journey contemplated. If an employe influences a friend to use our road for only a short trip, and our service pleases him, he will remember the Illinois Central when he and his friends are planning a longer one.

Always bear in mind the fact that a business never stands still. If we do not all cooperate and get together to push, we are bound to go backward, and once started down-hill, it is a difficult matter to reach the top again. Business is here, all around us, and most of it is ours for the asking. All we need is a little enthusiasm and perseverance, coupled with the information which will enable us to answer those questions which are bound to arise. I said perseverance, for everyone is bound to fail sometimes. Robert E. Peary once said: "If you fail once, try again. If you fail twice, try harder. Make each failure a reason for redoubling effort." Even as Peary reached the pole, so we shall reach our goal.

### But Avoid Over-Enthusiasm

However, there is such a thing as over-enthusiasm. By this I mean that occasionally a desire for business stimulates an employe to overestimate our service in one way or another or to misrepresent the facts in the case. This can result in nothing but harm to our cause. While it may lead a man to route one shipment of freight over our line or to use our passenger trains on some one occasion, he will not do it again, for he will have discovered for himself that the truth has not been told. If we are not in a position to handle his business to the best advantage, it is better to say so. He will thank us for it, and

we shall have won a friend. One friend is better than a hundred dissatisfied patrons.

Aside from the active solicitation of business, there is another side to the question—indirect solicitation. By this I mean that while it is the regular duty of a few employes to go forth to get freight and passenger traffic, it is the duty of all to hold this business, for it is of no avail to solicit business if the matter is dropped there. The solicitor has done his part, but it remains for the other employes to do theirs. A courteous answer to a telephone inquiry, promptness in the checking of a rate requested, elimination of delay in the switching of a car—these things may do more

## Remember September!

### ROUNDHOUSE MEN CAN SAVE COAL—

1. Flue-borer can save coal by keeping flues bored out.

2. Fire-knocker can save coal by thoroughly cleaning ash-pan and air space between ash-pan and mud-ring.

3. Fire-kindler can save coal by avoiding over-firing, causing engine to pop off before leaving roundhouse.

4. Boiler washer can save coal (a) by thoroughly washing the barrel and lag of boiler.

(b) By having the blow-off cock and wash-out plugs tight.

(c) By not having more than one gauge of water in boiler when fired up.

5. Coal crane operator can save coal by not overloading tenders.

6. Engine watchman can save coal (a) by seeing that inbound engines have sufficient water and steam in boiler to avoid building up fire.

(b) By seeing that fire is in good condition on outbound engines and avoiding engine popping.

7. Hostlers can save coal by keeping cylinder cocks and drain valves to air-pumps open.

8. Roundhouse men can save coal by seeing that the engine stacks are covered while under steam.

to win and retain business than any amount of solicitation.

#### Each Has a Responsibility

Every person in the employ of the Illinois Central is to some extent responsible for the success or failure of the vast corporation which he represents. It is well to remember that the manner in which he treats a patron reflects to the credit or discredit of the railroad; and, in fact, to that portion of the public with which he comes in daily contact, he is the Illinois Central. From this fact it may be readily seen that everyone on the payroll holds in his hands a great respon-

sibility—that of retaining the good will of those patrons with whom he deals, as well as doing his share to add to the list. He may do his part in a number of different ways, according to his position, but something is expected of each and every one.

After all, the solicitation of traffic is a subject which should deeply interest every employe of the railroad, for only by doing our part in helping to build up business and increase our revenue can we feel that we have had a share in the success of our company. Remember, every person listed on the payroll should be a solicitor!

## The Employe and Our Public Relations

By J. K. JOHNSON,

Claim Agent, Princeton, Ky.

As individual employes of the Illinois Central System, what use are we making of the public relations campaign carried on by the system to enlighten the public regarding railway problems? We should awaken to the fact that, except through our actions as individuals, nothing can be satisfactorily accomplished *en masse*. Concerted movements, uniformity of action, are effected through individual understanding and training.

The principal object of this public relations campaign is to give, candidly and in open-hand fashion, such information as will enable the public to reason with fairness from the facts presented, reach an intelligent conclusion respecting its attitude toward railway affairs, and appreciate the many unfair restrictions and burdens imposed upon the railroads in their efforts to serve the public at a living cost and a fair, legitimate return on the investment involved.

#### Why Profits Are Needed

Railroads could not be constructed and operated except through a collection of wealth. Securities for this investment are held by all classes of individuals, who have a right to expect a reasonable interest on the money so invested. The merchant sells his wares at a profit, else he must go out of business. The railroads are a business, con-

ducted on business principles, like any legitimate enterprise, and when they fail to pay to their stockholders, who are numerous and scattered throughout the nation, a reasonable rate of interest on the investment, they are a failure as a business; hence the public, in the end, pays the price, either in the reduced value of its holdings or failure to receive the kind of service it has a right to expect.

For years persons have had a distorted idea of the net earning power of railroads, and of conditions under which they have so faithfully labored. They could see nothing but the gross receipts; while fair-minded and perfectly honest, they were content to pass judgment on that basis without realizing the expenses and conditions incident to the operation and maintenance of railroads.

It should be unnecessary to comment on the necessity for the railroads. We cannot dispense with our factories, mills, banks, merchants, and many other industries; we deem them necessary to our existence and convenience, and we know that they cannot remain in business unless they are able to earn a legitimate profit. The railroads are no less necessary, and should be accorded similar consideration.

#### How the Public Must Help

Manufacturers and merchants are not controlled by law in fixing the prices of their products. The railroads, on the other

hand, are powerless to make any charge beyond the rate fixed under law. Laws regulate and control practically all the rights of railroads, and it is within these fixed limits and defined rights that railroads are expected to operate, serve and exist. The public has a right to expect of railroads efficiency and the best service they can render, but in expecting such efficiency and first-class service the public, in justice to itself and its servants, the railroads, cannot afford to lose sight of the fact that real service can only be had by providing the means with which to maintain it.

The railroads in August, 1920, were granted increases in rates, in order to avoid an impending collapse. This increase has been so trivial, as it concerns the individual, that the public could ill afford its repeal and a possible endangering of the adequacy of railway service.

Nothing affords railway officers and employes more pleasure than to be in a position to serve the public faithfully and efficiently, and the public generally is realizing that fair concessions on its part must be made in order to enable the railroads to render that character of service.

We should feel proud of the Illinois Central System as a railroad and as our employer. We should recall with pride that the Illinois Central System is a pioneer in the matter of developing public relations, a leader among the great railway systems in its progressive policies. It is gratifying to know that we are employed by a railroad with such a high standard of efficiency, and to know that our officers rank among the highest in their respective positions. It is pleasing to observe their candor and their fair and logical comment on railway affairs, with nothing to conceal.

As individual employes of the Illinois Central System, we can help the public relations effort by following it closely and spreading the information among our acquaintances. As railway employes, we may perhaps have a clearer understanding of some of the details than those not familiar with railway operation, and, by reason of that fact, render a service both to our employer and our hearers by amplifying the information.

It is our duty to join hands with our officers in this work and do what we can to make it effective.

---

## Co-operation—An Oil We Must Use

By A. M. McINTYRE,  
Engineer, Illinois Division

In the present critical stage of economic and industrial readjustment, one of the most serious problems confronting the company is how to reduce operating expense to the minimum, without impairing the efficiency of service. This cannot be done, of course, without the heartiest co-operation of every employe. Obviously, the greatest saving can be made in our department by fuel economy, but this cannot be very effective without even greater co-operation than in other departments.

Following are some of the "leaks" due to lack of co-operation: Between engineer and fireman, resulting in decreased efficiency of engine; between conductor and brakeman, decreased efficiency in movement of train;

between engineer and train crew, with the same result; between engineer and roundhouse foreman, when the former neglects to report necessary repairs to engine or when the foreman neglects to have the work done, resulting in decreased efficiency of engine; between roundhouse and yard, resulting in having the engine fired up an unnecessary length of time before listing, causing excessive consumption of fuel.

But the greatest waste of all is perhaps the lack of co-operation between divisions. Each division is a unit in a collection of units, and, while each unit may be working harmoniously within itself, when it comes to the next unit, the machinery grinds, the cogs don't mesh properly, all for the want of lubrication with the oil of co-operation. While responsibility for the train ends when

it is handed over to each succeeding division, interest should not end; instead, the train should be handed over in a condition to be handled economically and with the least possible delay. This can be done by close and thorough inspection and lubrication of boxes by car men, and proper classification and placing in station order of cars by yardmen.

The answer to a problem usually cannot be foretold until the problem is worked out,

but the answer to our problem can be just one of three: success, incomplete success or failure. It depends upon the degree of interest we take what the answer will be. Indifference on our part means failure; incomplete co-operation means only incomplete success; but close co-operation, individually and collectively, means that the answer will be success—complete success—and I predict this will be the ultimate answer.

## Kept a Score of Their Use of Coal

The saving in coal that care on the part of the engine crew can accomplish is forcibly shown by the unsolicited report submitted by Engineer S. Baker and Fireman N. A. Marshall for a run with Engine 1594 from Mattoon to Champaign, Ill., a distance of 46 miles. For this distance they averaged 43 pounds of coal to each thousand gross ton miles, which compares more than favorably with the Illinois division average of 127 pounds for July, 1921.

In other words, on this run of August 18 this one engine crew fired with 84 pounds a thousand ton miles less than the division average for the previous month. This is a saving of 66 per cent, or almost exactly two-thirds, and the saving sought for September is only 20 per cent less than the best September record for the system, which was 149 pounds.

Engineer Baker and Fireman Marshall kept a diary of their trip, counting the scoops between stations. The score went like this:

Mattoon to Dorans.....	75
Dorans to Humbolt.....	41
Humbolt to Arcola.....	60
Arcola to Galton.....	22
Galton to Tuscola.....	46
Tuscola to Hayes.....	58
Hayes to Pesotum.....	50
Pesotum to Tolono.....	84
Tolono to Savoy.....	49
Savoy to Champaign.....	43
Total .....	528

"The larger numbers used out of Mattoon and Pesotum are the result of starting at

those points," their report remarks. "This only goes to show what it means in fuel to start a large train."

When they got in, they took their pencils and figured it up like this:

Distance .....	46 miles
Cars in train.....	62 loads
Tonnage .....	3,999
Stops .....	One—Pesotum
Time.....	8:40 p. m. to 11:25 p. m.
Shovels of coal used.....	528
Size of scoop.....	No. 3
528×15 lbs. per scoop.....	7,900 pounds
3,999 tons×46 miles.....	183,954 gross ton miles
7,900 lbs. divided by 183,954 gross ton miles.....	43 pounds per thousand gross ton miles

### KEEPS A NEAT MOTOR CAR

If all persons in charge of motor cars, on highway or railway, could have a report like the following made on Foreman John Woodside, Carbondale, Ill., a good many motor mechanics would be going into some other kind of work. E. E. Christoph, motor car repair man at Carbondale, said recently: "I found Mr. Woodside's car was in good condition, all but timer, which I installed. I would like to say that Mr. Woodside has taken good care of his car, and I found in my inspection that the same cotter keys were in the car that were in there when the car was put in service. I will say that Mr. Woodside has not called for a repair man on an average of more than once a year. His motor and car are always clean, and woodwork is in first-class condition."

# Illinois Central Locomotives Make Big Hit as State Fair Exhibits

*Visitors at Springfield Show Much Interest in the Old Mississippi and Our Newest 2-10-2 Acquisition*

THE Illinois Central exhibit of old and new engines at the Illinois State Fair at Springfield, August 20-27, was one of the big hits of the week. The exhibition of the old Mississippi and the new 2-10-2 engine at the fair was arranged by Superintendent C. W. Shaw and Master Mechanic H. L. Needham of the Springfield division. Mr. Needham took special pains in putting the engines in exhibition condition. The 2-10-2 was spotless, and the trimmings were burnished with gold leaf.

Traveling Engineer Charles Zanies of Clinton was at the display during the day, and Fireman Jeff Swezey of Clinton had charge of the evening exhibition. Handbills

giving descriptions of the two engines with their photographs were distributed. Superintendent Shaw estimates that more than 65,000 persons attending the fair viewed the exhibit.

Many business men of Springfield declared that the engine exhibit was the outstanding feature of the fair. This opinion was also expressed by Manager W. W. Lindley of the fair association.

The Illinois Central monogram formerly used in a downtown arch at Springfield was placed on the tender of the 2-10-2 engine, and an electric circuit kept the monogram lighted by night. Lights were also displayed through both engines. The easels describing

the engines were also electrically lighted for night use.

The engines were moved into place the opening day of the fair. The Mississippi was taken from Burnside Shops on a coal car to the roundhouse at Springfield, where it was unloaded and pushed by a switch engine to the fair grounds. The 2-10-2 engine moved under its own steam.

Special tracks had to be built a short distance into the fair grounds. The crowds quit the automobile races which were in progress to watch the engines being moved into place.

Steps were built to the cabin of each engine so that the spectators could pass through and get a close view of the heart of the machines. Throughout the days and nights, there was a constant stream of interested persons passing over the steps.

The bills which were distributed to the visitors described the 2-10-2 engine as follows: Built at Lima, Ohio, in 1921; weight 382,000 pounds; total working weight 586,000 pounds; tractive power 73,800 pounds; length 96 feet; cylinders 30x32 inches; heating surface 5,160 square feet; carries 17

tons of coal and 12,000 gallons of water; equipped with duplex stokers; cost \$88,819. The Mississippi was described as follows: Built in 1834 at a cost of about \$2,000; 9½x 16-inch cylinders; weighs 14,000 pounds; and has a tractive effort of 4,821 pounds. This engine was used in 1836 on a railroad between Natchez and Foster, Miss., now a part of the Illinois Central System.

## Remember September!

### *We're Squelched*

They talk about the women, and the way we do our hair—  
The way we wear our skirts and shoes—our very haughty air;  
They tell us that we're foolish in such little things, but then,  
If they think we are alone, in such—well, how about the men?

They used to wear a pompadour, but nothing like that now;  
A center-part gleams faultlessly above a noble brow;  
And if they don their headgear, they pull it forward so  
That, though they may have eyebrows, you really never know.

And then the little jazz tie—another thing absurd—  
Not bad upon the little ones, but on the big—my word!  
That half-inch kind of collar tells us ever and anon  
That girls are not the only ones with throats like to the swan.

And then they go around with that "Ain't-I-the-peanuts?" air—  
"Think anything you like of me, for really I don't care!"  
Third eyebrows, and galoshes—now, now tell me if you can  
The reason that you talk and laugh about the girls, O Man!

—EXCHANGE.

Wheat

## How Are the Crops? A Survey of the System

*Earth is here so kind, that just tickle her with a hoe and she laughs with a harvest.—DOUGLAS JERROLD, A Land of Plenty.*

**H**OW are the crops? Since we are so largely an agricultural people, even today, any prophecy regarding prosperity must depend upon the answer to this question. Few agencies are better qualified to speak upon this subject than the Illinois Central System, situated as it is in fourteen states of the Mississippi Valley, the "bread basket of the world." Deeming the crop situation one of vital importance, the *Illinois Central Magazine* has quizzed the division superintendents regarding the situations in their respective vicinities, and the answers are given below.

For the most part, crop conditions are favorable. Lack of rain in the earlier part of the season endangered some of the crops, but recent relief has saved the day. Oats however, fared poorly. Corn, the staple crop of most of the Illinois Central states, is in excellent condition and is expected to give a larger yield an acre than in 1920. Wheat acreage has fallen off, but the yield has held its own as regards bushels an acre, and in many cases has exceeded the figures of last year. Other grains, with reduced acreage, will make about the usual yields.

Reduced damage from boll weevil is reported in the cotton raising districts, and a good yield is expected from a reduced acreage. The other crops into which the south-

ern farmers are going are making satisfactory yields. Stock raising is proving increasingly popular. Truck farming has been surprisingly successful.

The reports cover, for the most part, the third week in August, and should be read with that point in mind. The magazine is indebted to the superintendents for their co-operation in this survey.

### Illinois Division

Corn is in fine condition, having received good rains just at the critical time, when there was great danger of firing from the dry, hot weather. Good rains have followed at frequent intervals, assuring at this time a bumper crop, other conditions remaining favorable.

The oats crop was disappointing, both in quantity and quality, due to the extremely hot and dry weather while heading. The production is only about 25 pounds a bushel on the average, instead of 32 pounds, the standard.

The wheat yield exceeded that of last year and was of a fair quality, although the acreage was below normal, due to the low market price at seed time.

Hay production was also below last year, although of a good quality. It is finding a ready market, principally in the South.

Broom corn also suffered from the dry weather, and the acreage was short on account of the low prices offered at planting time.

The following figures will give an idea of

Corn

Cotton

the crop prospects compared with last year:

Crop	Acreage Pct.	Yield per Acre 1920	Yield per Acre 1921
Corn .....	101	40 bu.	45 estimated
Oats .....	105	41	35
Wheat .....	85	18	20
Hay .....	100	1½ ton	1 ton
Broom corn .....	75	1-3 ton	1-3 ton

Fruit of all kinds might be considered as a complete failure this year, due to the late killing frosts last spring while the fruit was in bud. This loss can better be appreciated when it is recalled that we loaded from this division last year nearly 800 cars of pears, peaches and apples, compared with possibly 150 cars of apples this year and no pears or peaches.

**Springfield Division**

Farm production has been cut down to some extent for 1921. Severe drouth during the early part of the season injured the growth of oats and grass. This resulted in a decrease in milk and cream shipments.

The wheat crop is above the average, except in the southern part, where chinch bugs did considerable damage. The wheat crop in the central part of the division was good not only in yield but in quality as well.

The oats yield was only about half a crop, in many instances yielding fewer bushels an acre than the wheat, the grain being of a light and poor quality, in many cases weighing less than 25 pounds a bushel.

The rains which visited this section in the immediate past have materially contributed to the prospects of the largest corn crop in our history, except in the extreme southern portion, where crops adjacent to timber lands have been damaged by white grub worms.

The general expression of the farmers seems to be optimistic, and all indications point to a prosperous year for the farmer by reason of the bountiful corn crop's offsetting losses in wheat and oats.

**St. Louis Division**

The fruit for which southern Illinois is so universally recognized suffered great losses by heavy freezes which followed the early warm days in the spring. There was, however, a light crop of early apples,

and it is estimated that there will be about a 10 per cent crop of late apples.

The early vegetables, such as onions, rhubarb and asparagus, were fair; the crop of berries, tomatoes, cucumbers, melons, etc., was good. The tomatoes and cucumbers suffered to some extent from the dry and hot weather, but the crop of melons was heavy and of fine quality. The returns for all truck garden products have been good.

The acreage of wheat and oats was not heavy, as farmers in this section are turning their attention more to live stock and dairy farming than to grain farming. The wheat ripened in fair shape, but upon being threshed was found to consist of considerable straw. Oats were cut somewhat short on account of the dry weather and smut. The yield and quality of both wheat and oats are about as in former years, with an average of 15 to 18 bushels for wheat and 20 to 30 for oats.

The hay crop, both clover and timothy, is good and is baling up in fine condition, averaging from 1½ to 2 tons an acre. There is a large acreage of stock peas sown for hay and soil building, and the crop is in fine condition. Pastures are good, and the recent rains insure fine fall grazing.

The corn acreage is heavy in both bottom and hill land with prospects very bright for the best corn crop in this section of the state for many years, an estimated yield of from 25 to 30 bushels per acre.

The following shows, approximately, the number of cars (freight and express) shipped so far this season:

Apples .....	30
Mixed vegetables, such as onions, rhubarb, asparagus, berries, etc.....	100
Tomatoes .....	200
Cucumbers .....	110
Melons .....	75
Hay .....	95
Oats .....	50
Wheat .....	165

**Wisconsin Division**

If conditions of crops are an indication of renewal of prosperity, the territory covered by the Wisconsin division is doing its part in the march to normalcy. Crop conditions generally are encouraging.

In the seven months, January to July,

inclusive, 1921, 1,947 cars of grain were loaded on the Wisconsin division, compared with 1,993 handled the same period of 1920. This represents about 40 per cent of the grain raised in this territory; the other 60 per cent is used by farmers and growers for the feeding of stock, with the exception of wheat, of which perhaps 85 per cent is taken to the mills by farmers to be ground into flour for home consumption. About 15 per cent of the wheat raised is being shipped to market.

While it is true a large portion of grain raised in this territory is used for feeding stock, we receive a direct benefit from this, as the stock business on the Wisconsin division is a very important item, after which come the dairy products.

The Madison and Dodgeville districts produce about as much cheese as any other locality in the United States. In addition to this, there is a considerable volume of milk, both fresh and condensed. On the Freeport district considerable acreage is devoted to dairying to produce milk for consumption in Chicago.

The Amboy district, particularly the southern portion of it, is in the corn belt. There should be a normal crop of corn this year.

### Minnesota Division

Weather in eastern Iowa is ideal for the corn crop, and indications are that the corn will be well out of the way of frost within

the next ten days or two weeks, which makes the crop about two weeks advanced in season.

The weather early in the summer was favorable, for rapidly maturing corn mixed with occasional moisture insures us a good crop. Good corn weather, however, makes bad weather for smaller grain. Oats grew too rapidly, with the result that it headed out lightly.

As an indicator of crop conditions, note the following tabulation:

Crop	Condi-		Yield per Acre, 1920	Est. Yield per Acre, '21
	Acreage Pct.	tion Pct.		
Wheat .....	75	95	19 bu.	20 bu.
Corn .....	100	95	35 bu.	40 bu.
Oats .....	100	90	24 bu.	30 bu.
Hay .....	100	93	2 tons	1½ tons
Barley .....	25	90	30 bu.	30 bu.
Rye .....	25	95	23 bu.	.....

With the recent scattered rains, meadows and pasture lands have been revived and are much improved over a month ago. The crop of late potatoes has a better outlook. Farmers along the line have just about completed their threshing, and some have already started to do fall plowing.

Considerable grain in the elevators is being held for shipment and prices.

There seems to be a plentiful supply of farm labor.

In the vicinity of St. Ansgar, Iowa, which is a heavy vegetable producing section, the onion harvest is progressing rapidly. The

Clover

crop is being stored, as there seems to be no market.

### Iowa Division

The growing season drawing to a close has been especially favorable to the corn crop, and, as a consequence, the small grain did not mature so well as in the average season. The outlook was never more promising for a bumper corn crop through Iowa, and especially the territory served by the Illinois Central.

Present indications point to a heavy yield of exceptionally good quality. It is estimated approximately 75 per cent of the crop will be fully matured and out of way of frost by September 1, and the entire crop assured by September 15, or about two weeks in advance of last year.

The yield and acreage of winter wheat just harvested are about up to average. The spring wheat generally is somewhat disappointing in yield and with quality below standard, having been damaged by the extremely hot weather more than was supposed.

Oats are very light, both as to weight and acreage, running from 16 to 28 bushels to the acre and testing in some cases as low as 18 pounds to the bushel.

The yield of timothy is far better than expected. The potato crop is practically a failure, due to the extreme temperature; this is especially true of the late planting. The early planting is somewhat better, but damaged to a large extent. Pastures are in fair condition, due to recent rains.

### Indiana Division

Never in the history of the Illinois Central have the general crop conditions throughout this section been so satisfactory as this season. Although during the latter part of June and throughout July the precipitation was greatly below normal it only added to make the grain harvest and threshing an absolute success, and the bountiful rainfall in August has insured an abundant yield of corn, the recognized king of the crops. Wheat averaged a yield of 25 bushels, compared with only 20 last season, but the cool late spring, with an abnormal precipitation, reduced the yield of oats from 30 last year to 25 bushels an acre this year.

The quality of grain, however, is excellent, and it has moved in a steady, unbroken stream to the markets, with an adequate supply of cars made possible by the concentrated efforts of the railroads to condition and move to the territory the equipment for this important commodity.

A 90 per cent acreage of corn is under cultivation. Its condition is 100 per cent, and the yield an acre is estimated at 45 to 50 bushels, compared with 40 to 45 last season. This abundant yield of corn, coupled with the prevailing low price, which in all probability will continue, is certain to stimulate the live stock industry, and the farmer is already looking about for feeders as a method through which more advantageously to market the crop.

The brush corn is heavy and above the average in both quality and yield; also, the acreage is in excess of that of previous years.

Farm labor is plentiful, and in this respect no difficulty has been experienced in caring for the crops.

### Kentucky Division

Kentucky, mother of the far-famed and justly renowned blue grass, has disappointed us in not coming up to her usual standard of excellence in the production of crops this year. Not within the memory of the oldest farmer has there been such a drouth as that experienced this season. This, of necessity, will affect all the fall crops. The timely rains of the past two weeks, however, have improved the soil to some extent.

Tobacco acreage is smaller this year than in previous years, due to the unfavorable market prices and the large quantity left over from last season. The total tobacco crop for the United States is now estimated at 889,000,000 pounds, compared with 1,508,000,000 pounds last year.

The fruit crop is poor, apples being estimated at only 1,251,000 bushels, and peaches at 153,000 bushels.

The condition of other crops in Kentucky, such as alfalfa, millet, pasture, cowpeas, field beans, tomatoes, cabbage, onions, grapes, watermelons and muskmelons,

broom corn, sorghum for syrup, and clover hay, shows a percentage a little below the average, with the exception of clover hay, which is normal.

Following are some Kentucky figures. The estimates shown are below the usual standard.

	Estimated production
Corn .....	77,059,000 bu.
Wheat .....	5,030,000 bu.
Potatoes .....	3,465,000 bu.
Oats .....	6,375,000 bu.
Tobacco .....	251,790,000 lbs.
Rye .....	380,000 bu.
Barley .....	103,000 bu.
Sweet Potatoes .....	1,629,000 bu.
Hay of all kinds.....	1,051,000 tons

**Tennessee Division**

The Tennessee division is so located in the agricultural world as to enable it to give to the market a certain percentage of almost every food product, merging into the wheat country on the north and into the cotton plantations on the south, with a happy medium of such staple farm products as corn, oats, hay, rye and barley.

During June and July, this year, the indications were that there would not be an abundance of any of the farm products on account of drouth, but since that time the rains have been very generous over the entire district. Indications are that there will be enough of every staple crop grown in the district, and the farmers are enabled to face the future with a light heart.

The corn crop of the current year

promises the largest aggregate yield, as well as the largest yield an acre, of any crop grown during the last several years, according to Ed E. Williams of Newbern, Tenn., one of Dyer County's most successful farmers. There will be a large marketable surplus of corn after providing for home consumption.

The cotton acreage is the smallest—not more than 30 per cent of normal—grown during the last decade.

The area seeded to winter wheat during the fall of 1920 was the smallest for several years, and the yield was reduced by drouth in the spring and early summer months. The amount of wheat produced, however, was probably sufficient to meet the requirements of local millers and allow the shipment of a small surplus to other sections. The average yield an acre of wheat was only around 12 bushels, but the quality is high.

The acreage of oats was larger than for several years, but poor stands were caused by excessive rains during the seeding period and the yield was reduced by drouth during the growing period and harvest. Notwithstanding the conditions named, oats have been shipped and a sufficient quantity retained on the farms to supply seed for the 1922 planting.

Hay (clover, timothy and red top) is about 50 per cent of a normal crop in quantity,

but the quality is high, as dry weather prevailed during the entire haying season.

The berry yield was reduced 50 per cent by late frosts, but those that were marketed were of superior quality and sold at a good price. There was an increase of approximately 70 per cent in the amount of berries loaded for shipment.

#### Mississippi Division

Although the Illinois Central has helped to preach diversification of crops on the Mississippi division, the main agricultural crops are still classified as cotton and corn. While the acreage in cotton has been curtailed somewhat, there is still going to be an average crop harvested. Also there is an abundant crop of corn throughout the entire state.

It is estimated that, if no unforeseen conditions arise, the corn crop will aggregate 95,000,000 bushels. Computing ear corn at 70 pounds a bushel, this is equivalent to 3,325,000 tons. If this amount of corn were loaded into cars for movement, basing the tonnage a car on the cubical capacity of ear corn, it would take approximately 118,000 cars to transport this one commodity alone to market. This amount of corn moving would be equivalent to 2,969 trains of 40 cars, 2,000 tons to the train; if handled at the rate of 10 trains a day, it would consume 297 days in handling.

The present estimate on cotton is 1,000,000 bales. To transport this amount of cotton to concentration points for compressing, double decking and loading 40 bales of flat cotton into a car would require 25,000 cars to handle it. To transport this number of cars, at the rate of 10 trains a day, would require 373 trains, 67 cars, 2,000 tons to the train, consuming 37 days to handle from points of origin to compresses.

It is estimated there will be between 75,000 and 80,000 bushels of sweet potatoes raised and marketed. The handling of sweet potatoes to the curing plants will require but little railway transportation, as the plants are in sections of Mississippi where the climate is adaptable to raising potatoes. After being kiln dried, these will be shipped to various markets.

The sandy soil in North Mississippi, and especially in Yalobusha County, around Coffeeville and Water Valley, is known as the most fertile watermelon section in the state. From the Fourth of July to the first of September, the streets of Water Valley and adjacent towns within a radius of 50 to 75 miles are lined with trucks and other vehicles loaded with melons for local consumption. To date 15 cars of melons have been shipped from Water Valley to other points in Mississippi. One of the cars of which particular note was made contained 1,300 melons, ranging in weight from 25

to 60 pounds each. After paying the freight charges on this car from Water Valley to another station in Mississippi on the Illinois Central, a distance of 150 miles, the farmer raising the melons netted a profit of \$300.

### Louisiana Division

The beginning of the planting season was somewhat unfavorable, due to excessive rains, which retarded preparation of the ground. Late frosts and unusual cold waves after early crops were planted did considerable damage; in fact, very little early corn was made.

Then the tide changed to a hot and dry spell, damaging corn, hay and oats, but at the same time helping the cotton, as the boll weevil cannot thrive in dust.

It is estimated we will have a short corn and hay yield, but the cotton, barring the reduced acreage, should yield a fair crop. The average cotton yield an acre will probably be  $\frac{3}{4}$  to  $\frac{1}{2}$  bale of 500 pounds.

There is considerable activity in this section this year on fall vegetables. This is principally due to the short crops of corn and hay. We expect several carloads of beans and sweet potatoes will move to the northern markets.

### Vicksburg Division

For several years extensive experiments have been made by state and county in-

stitutions, as well as by progressive private individuals. These experiments have proved that the Mississippi Delta can produce as good a quality and as large a yield an acre of feedstuffs, especially corn, hay (including alfalfa), peas, oats, as well as beef, sheep, hogs, poultry, vegetables, etc., as are produced anywhere in the United States.

This year, for the first time on record, the planter has made a sufficient crop of corn, hay, oats and other feedstuffs to enable him to take care of his requirements for the next twelve months, also a considerable quantity of beef, mutton, pork, poultry, vegetables, etc.

The yield and quality were beyond expectations and of a grade as good as or better than that heretofore purchased elsewhere; therefore, the Delta planter will be able to carry on until next season, when it is anticipated that conditions will have improved to such an extent that he will enter upon an era of continued success and prosperity.

The cotton acreage this year has been materially reduced on account of the surplus carry-over, but the general average and condition of the staple is good, with early and clean picking. The quality should insure a fair price and bring the planter a sufficient amount to enable him to discharge his most urgent obligations and prepare for the next season, when an average crop and

Rice

price will put him in a more permanently prosperous condition than he has ever been before.

### New Orleans Division

The lay of the land and the character of the soil here are such as to encourage diversification in the greatest degree.

In Mississippi are thousands of acres of hill land on which the grass grows in ample quantities to furnish sufficient pasturage for many head of stock. From year to year we observe stock raising on a larger scale. Again our line encourages this industry by improving the handling of shipments. Only recently a shipment of fifteen cars from Natchez and Gloster, Miss., were moved to the St. Louis market without stopping for feed and water en route, only thirty-two hours being consumed in covering the entire distance. While this movement is not an exception as far as our line is concerned, it has been given considerable publicity by the stockmen.

In the past few years truck farming has increased to an enormous extent. In 1920 we handled 557 cars of truck, compared with 960 to date this year. In the vicinity of Utica, Miss., a banner crop of tomatoes was grown this year. The favorable weather caused a heavy yield and early maturity, which brought an excellent price. This enabled the majority of the planters to retrieve the greater portion of their losses in cotton during recent years from the depredations of the boll weevil. Reports from the various truck growers' associations indicate that the acreage will be practically doubled in the coming season.

Our line alone in the 1920-1921 season handled 44,094 tons of sugar cane, and in the 1920 season 378 cars, or 121,990 sacks, of rice. This year, however, there is a noticeable decrease in the rice acreage in favor of sugar cane. From the present indications we will have a banner crop of cane this year.

The business depression in commercial lines has resulted beneficially for the planters in at least one respect, by enabling them to obtain ample labor at a nominal wage to work and harvest the crops. The news of the success of our planters in stock

raising, as well as with tomatoes and beans, is spreading rapidly over the entire territory in this vicinity.

## BOOST FOR SAFETY

Above, two coming railway men, live wires of the transportation and mechanical departments of the Louisiana division in the "Safety First" campaign. The shorter one, on the left, is Arthur Sidney Bouysou, son of M. A. Bouysou, general mechanical foreman at the Gwin, Miss., terminal. The other is Walter Wicker, Jr., son of Walter Wicker, general yardmaster at Gwin. The picture was snapped in the park at the Gwin telegraph office, one of the beauty spots of Gwin, which was made possible, according to Mr. Bouysou, by the efforts of J. J. Desmond, former Louisiana division roadmaster, now roadmaster of the Chicago terminal division.

## Springfield Division Veterans Hold First of Their Social Meetings

*General Superintendent W. S. Williams Principal Speaker at Successful Gathering Near Clinton, Ill.*

**T**HE first semi-annual social function of the Veteran Employees' Association of the Springfield division was held Sunday, August 14, as a picnic at Weldon Springs, near Clinton, Ill. All worries were cast to the wind that day, and the veterans gathered with their families and friends for a few hours of friendly talk, entertainment and exchange of ideas. About four hundred persons attended the outing.

The crowd assembled at the Clinton passenger station at 1 o'clock that afternoon, while the Junior Band of that city filled the air with music. When this organization of boy and girl musicians had played for half an hour, enthusiasm reached a high pitch. A special train left the Clinton station at 1:30 o'clock, carrying most of the crowd. Others

went in automobiles. The Junior Band arrived at the grounds before the majority of the assembly, and immediately started another concert.

### A Get-Together Organization

"Inspired by the thought that 'All work and no play makes Jack a dull boy' and that the coming together on a common ground of acquaintance would lead each of us to live a more contented life, the veteran employes of the Springfield division of the Illinois Central Railroad formed this organization," said Superintendent C. W. Shaw, president of the association, at the close of the band concert. He expressed his appreciation for the large attendance, and told everyone to have such a good time that

Clinton Ill..*

the day would be long remembered. E. I. Day, county clerk of De Witt County, acted as chaplain.

Mr. Shaw then introduced W. S. Williams, general superintendent of the Western Lines, as the principal speaker of the day.

"Association of this character is just what has bulit up the wonderful organization of the Illinois Central System today," Mr. Williams said. "The friendship of the officers and employes, the co-operation of the rank and file, enables the Illinois Central Railroad to maintain its place as foremost among the railroads of the country," he continued.

**Praise for the Wives, Too**

Mr. Williams reviewed his own service, from thirty-three years ago, when he was a brakeman on the Springfield division, up to the time of promotion to his present position. He praised the pension system of the

company. In conclusion, he declared that the wives of the employes deserve as much credit for their success as the men themselves do. "They have put in just as many hours as you have, and it has been in the best interest of the company, too. When you men are called to duty early in the morning, your wives get up at the same time to start you on the new day with good wholesome food. Then when you return from work, they have your homes cheerful and inviting," he said.

"It takes all of us for the Illinois Central System to be operated successfully," Mr. Williams concluded.

J. H. Lord, district passenger agent, with offices at Springfield, Ill., was the next speaker on the program. He spoke highly of the possibilities of the organization, and said that he felt that it was an honor to be recognized as a veteran employe of the Illi-

nois Central. Mr. Lord reviewed the public relations work of the company, and told of the great good that was resulting from co-operation with the public. He kept the gathering in laughter with jokes of his own and others' experiences in railroad service.

#### A Wonderful Lot of Food

It was 3:30 o'clock when the speakers finished, and it was announced that the next thing on the program would be "eats." There were hundreds of baskets bulging with food. Tables were set, papers were spread upon the ground, and all started to eat as one large family. The food excelled in quantity, quality and variety. Chicken, fried to a crisp brown, was piled in great heaps. There were home-made rolls, salads, beans, pickles, tomatoes, potatoes, cakes, preserves, coffee and too many other choice dishes to mention.

After the meal, games and contests furnished amusement. There was a tug-of-war, with five sturdy men at each end of the rope. The winning team received a prize of \$5. A wheelbarrow contest for the women proved to be one of the best entertainments of the afternoon. In this, each contestant received a stake with her name written on it. Then she was blindfolded, led to a wheelbarrow and told to go straight to a peg about twenty-five yards directly in front of her and to set her stake where she stopped. The start was usually perfect, but before many steps were taken, there was a slight shift to one side or the other which resulted in a final position far from the goal. Some made complete circles, and others turned around and went back of their starting point. In only two or three instances did the contestant come within a

The executive officers of the Veteran Employees' Association according to the numbers in the picture are: (1) Treasurer, Roy Warrick, chief accountant, Clinton; (2) vice-president, W. J. Brewer, locomotive engineer, Clinton; (3) president, C. W. Shaw, superintendent, Springfield division, Clinton, and (4) secretary, C. H. May, assistant chief clerk to the superintendent, Clinton. These four men, together with (5) George Wilson, locomotive engineer, (6) H. S. Macon, train dispatcher, and (7) E. I. Day, county clerk of De Witt County, constituted the arrangement committee for the picnic.

few feet of the peg. A 12-year-old girl won the \$5 prize.

### Even a Greased Pole Contest

Then there was a greased pole contest. Extending out over the lake was a long, slender and exceedingly smooth pole. It had been thoroughly greased. On the extreme end was a \$5 bill for the boy who could climb out and get it. So thoroughly had the pole been greased, even a start seemed to be impossible. With some experience and practice, however, the boys were able to climb out a little farther each time, and finally one got to the end, reached out his hand for the coveted prize, touched it with his finger-tips and began to slip. With a frantic effort, he lunged at the bill, clinched it with both hands and fell head-first into the water.

Special trains carried the picnickers back to Clinton, Havana and Rantoul.

The next social function of the association will be held during February, 1922.

The Veteran Employees' Association of the Springfield division is the first organization of its kind on the Illinois Central System. The employes on that division discussed the proposition several months before the first meeting was held June 19, 1921.

### Those Eligible to Membership

According to the constitution made on that date, any employe who has been in the service of the Illinois Central System or affiliated lines fifteen years or more may make application for membership. The application must include a record of service and should be made on a blank prescribed by the president and secretary.

Any employe who has had service on the Springfield division and whose qualifications have been recognized by his promotion to the rank of a general officer is entitled to honorary membership. Employes retired from active service may be made members without assessment of fees or dues.

The object of the association, as laid down in its constitution, is to promote social intercourse and foster a fraternal feeling among its members.

The officers elected at the first meeting are: President, C. W. Shaw, Clinton; first vice-president, William Brewer, Clinton;

second vice-president, M. Sheahan, Rantoul; secretary, Clarence May, Clinton; treasurer, Roy Warrick, Clinton; executive committee, John Burke, fireman, Springfield; G. W. Rollins, agent, Moweaqua; J. E. Phelps, conductor, Rantoul; Joseph Frey, section foreman, Alhambra; Arthur Clause, conductor, Springfield; John Stokes, boiler foreman, Clinton, and Ralph Clemens, yardmaster, Clinton. George Wilson, H. S. Macon and E. I. Day assisted these officers in arranging for the first picnic.

Superintendent Shaw said that he was very much encouraged by the first outing of the association, and hoped that the idea would spread to the other divisions of the system. "The organization is not simply for the enjoyment of its members," he said. "The company is sure to get just as much good out of it as the employes."

## ACROSS THE BORDER

Herewith we have Illinois Central engine No. 37, recently purchased by the National Railways of Mexico, drawing a Mexican passenger train across the border at El Paso, Tex., on August 4, 1921. This was the first train to cross in more than eight years, since June 4, 1913, according to the September issue of the *Santa Fe Magazine*, to which we are indebted for the photograph and story. Engineer Jose Maria Munoz had the distinction of being the engineer on this train. Munoz, until four months ago, was a hostler in the Santa Fe shops at El Paso. The engine was gaily decorated. Photo by Cleo.

# Judge Robert S. Lovett Takes Up Problem of Railway Consolidation

## *Illinois Central Director Shows Difficulty of Governmental Action Prescribed by Transportation Act*

The following article by Judge Robert S. Lovett, member of the Board of Directors of the Illinois Central System, is reprinted from the August issue of *The World's Work* by permission of Doubleday, Page & Company, the publishers.

THE Sherman Anti-Trust Law, enacted July 2, 1890, was construed by the supreme court to prohibit absolutely the consolidation or common control of competing railroads, and this was the law of the national government for nearly thirty years. This policy was reversed by the great Transportation Act passed by Congress on February 28, 1920, to the following extent: It provides that the Interstate Commerce Commission shall, as soon as practicable, prepare a plan for the consolidation of the railway properties of the United States into "a limited number of systems," and that in working out such a plan, "competition shall be preserved as fully as possible, and, wherever practicable, the existing routes and channels of trade and commerce shall be maintained."

### Act Makes Conditions Understood

The act then specifically authorizes two or more railway companies to consolidate into one corporation for the ownership, management, and operation of the properties theretofore separate, but only on the following conditions:

1. The consolidation must be in harmony with the complete plan of consolidation previously outlined by the commission, as required by the act.

2. Bonds at par of the corporation which is to become the owner of the consolidated properties, together with the outstanding capital stock at par, shall not exceed the value of the consolidated properties as determined by the commission; and the commission is required to proceed immediately with the ascertainment of the value of the properties in-

volved upon the filing of the application for such consolidation.

3. Application for the consolidation must be presented to the commission which, thereupon, shall notify the governor of each state in which any part of the properties is situated, and also the carriers involved, of the time and place for public hearing of the matter. If, after such hearing, the commission finds that the public interest will be promoted by the consolidation, it may authorize the consolidation with such modifications and upon such terms and conditions as it may prescribe, "the law of any state or the decision or order of any state authority to the contrary notwithstanding."

### No Conflict With Anti-Trust Laws

The act further provides that the carriers affected by any order of the commission authorizing a consolidation and any corporation organized to effect a consolidation approved and authorized by the commission, "shall be, and they are hereby, relieved from the operation of anti-trust laws . . . and of all other restraints or prohibitions by law, state or federal, insofar as may be necessary to enable them to do anything authorized or required by any order made" under and pursuant to the act.

The act also empowers the commission, after hearing, to authorize the acquisition by one carrier of the control of any other carrier or carriers, "either under a lease or by the purchase of stock or in any other manner not involving the consolidation of such carriers into a single system for ownership and operation," whenever the commission is of the opinion that the same will be in the public interest. There is, of course, a well-defined difference in law between control of one railway company by another through ownership of stock by lease, and the "consolidation" of such companies. But it is not necessary to go into that distinction here further than to say that mere stock control, or lease, leaves

the separate corporate entities in existence, whereas consolidation merges all into one. It is undoubtedly the purpose of the Transportation Act to permit consolidations only under the two fundamental conditions specified: (1) They must conform to a plan first to be worked out and adopted by the commission for a consolidation of all the railways of the United States "into a limited number of systems"; and (2) the aggregate of the capitalizations of each system consolidated must not exceed in par value of securities the value of the consolidated properties as the same shall be appraised by the commission.

#### Commission to Work Out Plan

It follows from this that while control of independent lines here and there may be obtained through purchase of stock or by lease, if the commission shall be convinced that the public interest will be thereby promoted, yet no railway consolidations can be effected until the commission works out tentatively, and after many hearings and revisions finally adopts, a plan for dividing all the railroads of the United States into "a limited number of systems." The task imposed upon the commission by Congress is exceedingly difficult. Adequate transportation should be the first, not to say the sole, object. The relative value of the existing properties to the different sets of stockholders who own them is, of course, an essential consideration, and will be made so by the courts if not by the commission; but the act requires the commission also to take into account the future values of the several systems to be created. I fancy that the commission will be particularly embarrassed by that requirement of the act which provides that:

The several systems shall be so arranged that the cost of transportation as between competitive systems and as related to the values of the properties through which the service is rendered shall be the same so far as practicable, so that these systems can employ uniform rates in the movement of competitive traffic and under efficient management earn substantially the same rate of return upon the value of their respective railway properties.

#### To Make Strong Help Weak?

What does this mean? Taken literally, the provision is absurd. But let us read it broadly, and adopt the most helpful construction the language will allow. Line A was well located with reference to grades and traffic, wisely planned and constructed, evenly developed with respect to division terminals, engine facilities, and repair shops, and with

double tracks and other means of economically conducting its business, while line B was less advantageously located, has a longer and more circuitous route, traverses a rougher country, has heavier grades, cost more money than the other, has been unevenly developed, lacks adequate or wisely located division terminals, shops, and other necessary facilities, and cannot possibly be operated as economically as line A. Now the statute quoted seems to require that the "cost of transportation as between" these two systems and "as related to the values of the properties through which the service is rendered" shall be the same, so far as practicable, "so that these systems can employ uniform rates" and "earn substantially the same rate of return" upon their value. To accomplish this would indeed be a

### Displayed the New Cars

Conductor J. A. Maxwell, who runs between Jackson, Tenn., and Fulton, Ky., recently picked up some refrigerator cars at Fulton to be set out at Idlewild and Milan, Tenn., for loading. Three of these refrigerators were new and had just been placed in service. They were very much more attractive than the other freezers in his train.

Having an eye for business and working to the interest of the company, he decided that the new refrigerators would probably attract the attention of shippers at the competitive points. Therefore he set out the old refrigerators at Idlewild and carried the new ones to Milan, notwithstanding the fact that it was more convenient for him to set out the new refrigerators at Idlewild and carry the old ones to Milan. This care resulted in the securing of two cars of competitive business.

The shippers had already begun loading one car on the competitive line, but after noticing the new Illinois Central refrigerators, they directed that the shipment be placed in the Illinois Central car. Another shipper trucked a carload of competitive business several miles to Milan in order to get it in the new Illinois Central car.

This is one instance which illustrates the various means used by employees on the Tennessee division to obtain additional traffic for their system.

miracle. Standing as above described, the lines are obviously unequal in value and efficiency. Line A has more business, can render better service and, therefore, will get more competitive traffic and can handle it at less cost than line B. The only way by which the apparent object of the statute can be accomplished is to handicap and weight line A by merging it with some inferior line and then help line B by merging it with some better line, thus creating two new systems of average value and efficiency; and this, as I understand, is precisely the object of the statute—to burden the strong with the weak lines and support the weak. The natural effect of the object thus sought would seem to be to lower the standard of credit, and therefore of service, of the strong lines and raise the standard of the weak to a common level. But whether the process will merely lower the general average of railway credit and service, or whether it will result in wrecking the strong together with the weak lines, remains to be seen. Our railway history is well strewn with wrecks of strong companies through overloading with unprofitable consolidations and extensions.

#### A Number of Difficulties

At all events, the plan will be very difficult to work out practically. Strong lines and weak lines do not always lie end to end where they may be united into a continuous system. More often they are side by side and interlace so that they compete in service and facilities, which is vital to the public. Then, there are sections where all, or most, of the lines are strong, and other sections where all are weak. And not the least important to railway credit is the problem of relative values. The owners of the successful lines certainly will object to taking on the burden of the failures except at their actual values, and the owners of the unsuccessful lines, finding support in the policy of the government to sell their lines, will be stimulated in the price they ask. And the owners of the successful lines will resist to the last resort the basis of valuation which the commission's bureau of valuation has adopted, namely, the supposed cost of reproduction of the properties, less depreciation. That method tends to value line A at less than line B because a line wisely located with low grades and a shorter route (probably being the older and having the

choice of routes) may cost much less than line B with a circuitous route, constructed through rough country, with heavy grades, etc., and yet line A would be immeasurably more valuable to its owners.

#### Might Reduce Stock and Bonds

Another difficulty, but of a different kind, in the way of consolidations under the statute as it stands, arises from the requirement that "the bonds at par of the corporation which is to become the owner of the consolidated properties, together with the outstanding capital stock at par of such corporation, shall not exceed the value of the consolidated properties as determined by the commission." This means that if the commission should determine that the aggregate value of the several systems to be consolidated is less than the aggregate par value of the stock and bonds outstanding, then consolidation could not be effected unless and until the outstanding stock and bonds were reduced accordingly. With these securities already outstanding in the hands of investors, how would this be accomplished? Would the owners voluntarily scale them? It is not apparent how they could be paid off, because this probably would involve the necessity of issuing more securities for the money with which to pay those to be retired. Moreover, it would necessarily involve acceptance of the valuation placed upon the property by the commission, which might be considerably less than the owners believed it to be worth. It seems unlikely, therefore, that any consolidations will be effected voluntarily where the valuation placed upon the property by the commission is less than the aggregate amount of securities outstanding. The provision, therefore, is worse than useless, for where it is applicable, the parties simply will not consolidate.

#### Occasion for Endless Negotiation

There is nothing in the act making consolidation compulsory. It is left optional with the carriers, although press reports some months ago credited Senator Cummins, the originator of the idea, with a purpose to seek an amendment of the law, making such consolidations obligatory. So long as it is voluntary there is an almost boundless field for negotiations among the carriers respecting the terms upon which they will consolidate. When it is proposed to consolidate roads A, B, and C, each with its separate properties and sep-

arate groups of stockholders, into a single corporation with the properties in a single ownership and with a single body of stockholders, it will first be necessary for the three sets of stockholders to agree upon the relative value of their properties and the relative value of their stock, not only with respect to the theoretical equities, but as to the actual income in the way of dividends. It is evident that here is occasion for almost endless negotiation. Agreement will not be facilitated by the knowledge that the partners are not choosing each other, but that the choice has been made for them by the commission. Nevertheless, it is quite likely that agreements will be reached in some cases and a number of voluntary consolidations may be effected in time.

### Can Consolidation Be Forced?

But if the consolidations laid out by the commission pursuant to the requirements of the act are not effected voluntarily, may the government, by further legislation, compel the carriers to enter into them? Undoubtedly the government may, through eminent domain or other exercise of its sovereign functions, expropriate and acquire the direct ownership of any or all railroads in the United States. If taken free of existing mortgages, that would require a vast sum—perhaps twenty billions. Or the government may, by the exercise of like power, get complete control of the roads—not by taking title to the physical properties—but by acquisition of the stock which gives control of the corporations; and, through the corporations, it could control and manage the physical properties. But if the government should merely acquire the stock, it would obtain control subject to the bonds—whereupon, as a practical matter, all railway bonds—the good and the “near-good”—would, in effect, become government bonds, as the government would have to pay the interest to prevent foreclosure.

### Government Would Have to Pay

But whatever the method, if the government acquires the railroads, it must pay for them, and it must pay in cash where the owner demands it. The government cannot compel the stockholders of company A to accept in exchange for their property the stock of company B, or any other company.

If the government should acquire merely the stock, thus taking the property subject to all existing mortgages and bond issues, however excessive as regards the value of the security, then the amount of cash required would be comparatively small. Having thus acquired control of all the railroads, the government, through appropriate legislation, could erect out of the whole as many separate systems as desired; and, with much or little regard for previously existing systems, it could incorporate a separate company for each system, issue as much stock as deemed proper, and, by selling—if it could—the stock to investors, transfer the railroads back into private hands.

It is not impossible, therefore, for the government to force the policy of consolida-

## The Station Agent

The much-abused railway station agent, whose duties are many and varied, plays an important part in the operation of a railroad. At the smaller stations he is almost all if not quite the railroad. According to his handling of the patrons, the public and fellow employes, the railroad is generally either liked or disliked. Small favors shown citizens are nearly always returned many times, besides establishing a good fellowship and making the agent's duties pleasant.

If an old farmer coming for his freight, driving from five to ten miles in the country, reaching the station and calling for his freight a few minutes after hours, while the agent is still around, is told he is too late and will have to call again, his thoughts will be none of the most pleasant toward railroads and agents in general. If called upon to sit on a jury in a railway case, he will likely be anything but unbiased toward the company.

In our handling of subordinates, we note that their observation of our own loyalty, attention to duty, proper application of rules, right treatment of those under us and courtesy toward our fellow-workers has the proper effect. This makes our duties and those of everyone around us a pleasure.—J. COOPER, *Agent, Wilson, La.*

tion of all the railroads of the United States into a "limited number of systems," as contemplated by the act. This would involve the government in a very large debt to provide the money for carrying out the plan, and it is, to say the least, extremely doubtful whether the government could then resell the stock of the consolidated companies for enough to pay the debt thus incurred. There is no reason to suppose that there would be a readier demand and better prices for the stock of the consolidated companies than the average for the present stocks. Average of values through consolidations would theoretically strengthen the weak lines, but, on the other hand, it undoubtedly would weaken the strong lines. But no one knows the market result of such averaging. There are many large holders of railway stock now who, if once bought out, might prefer to stay out.

#### Competition the Best Plan

Instead of having the commission evolve a plan for forcing all of the railroads of the United States into arbitrarily formed groups, it would be far better for the laws to provide for voluntary consolidations from time to time, subject in each case to approval by the commission after full public hearing. Then the carriers could enter into negotiations with much better prospects of agreeing upon terms unembarrassed by a prior finding of the commission that they must consolidate. I have never faltered in the belief that competition in service and facilities is the best railway policy for the public, and, therefore, I am not in favor of the consolidation of large, competing systems. But there are many short lines and roads of subsidiary importance that might be merged into other systems that would improve their efficiency and extend the field of competition between large systems in the interest of the public. This country owes most of its great railway systems to wise consolidations as well as to construction. None of the great systems as they exist today resulted wholly from construction by a single company. Along with construction of main lines went the policy of extension by purchasing or absorbing connecting lines—sometimes competing lines. This policy, however, as already pointed out, was stopped by the

Sherman Anti-Trust Act in 1890, and the consolidation of competing lines ceased many years ago to be revived, if at all, only under the Transportation Act of 1920. I have no doubt that many consolidations ought to be effected in the public interest, but they ought to be natural and evolutionary. They should be dictated by considerations of transportation alone and the needs of the particular case. They should be a natural growth and development of our transportation systems, just as were the earlier successful consolidations which resulted in the creation of the existing successful systems. They should not be forced arbitrarily, and least of all should the really efficient lines, which handle the great bulk of the nation's traffic, be loaded down with the inefficient. But under the new law no such consolidations are possible until the commission shall have worked out and adopted a plan for the consolidation of all the railroads for the United States into a "limited number of systems" and that probably will require much time.

#### The Best Interest of the Public

And, after all, what is to be gained by the consolidation of all the railroads of the country into a "limited number of systems," as the new law contemplates? There would remain still the question of the present day—whether railway securities with unrestricted government regulation of both rates and wages are a desirable investment. Indeed, my own judgment is that, if all the railroads shall be consolidated into a small number of large systems, as contemplated by the act, to compete with one another, it will be but a few years thereafter until we have "strong" systems and "weak" systems again, just as now, differing only perhaps in the size of the systems, which in case of failure will only add to the magnitude of the disaster. Weak lines and strong lines are an incident to and an inevitable result of private ownership and competition; and we may as well choose first as last between private ownership with strong and weak lines and other incidents of competition, or government ownership with all that attends it. I am for private ownership and competition in service and facilities as being for the best interest of the public. If we are not willing to

take what comes with it—the bad as well as the good, the strong lines and the weak lines, success for some and failure for others—then we should come at once to the other alternative of government ownership. We cannot expect to have all the benefits without any of the burdens of either plan. If we would be rid of the financial disabilities of the weak lines, then we must give up the benefits of competition in service and facilities. If, as some insist, remote and thinly settled sections must have as good and as cheap transportation as the more populous and prosperous, then the government must provide it. But if each locality is to have

just such transportation as its traffic will justify and is to pay for what it gets and get what it pays for; if enterprise, efficiency and ability are to be encouraged in the field of railway development and operation as heretofore; if each investor in railway property is to have the rewards and take the losses that justly appertain to his venture as in all other lines of business; if the public generally is to have the service and facilities and the incentive to progress that competition brings about, then private ownership and operation under national government control and regulation, as at present, should be the policy.

## How the Dollars Can Run Out the Faucet

The following table, compiled in the office of C. R. Knowles, superintendent of the water service, shows how a waste of water can cause a waste of coal. The elimination of water waste co-ordinates with fuel conservation. The vigorous campaign of the

water department in recent years has cut down to a great degree the waste of water, and it is hoped that the interest in fuel conservation this month will do much toward eliminating this waste altogether.

# A Hospital That Is Like a Home Belongs to Company at Paducah, Ky.

*Illinois Central Establishment, a Pioneer in Railway Efforts of This Sort, Dates From January, 1884*

**T**O the old employes of the Illinois Central Railroad, particularly those employed in the territory covered by and adjacent to the Kentucky and Tennessee divisions, the history of the Illinois Central Hospital at Paducah, Ky., is well known. In the early days when this hospital was established, hospitals were rare, and the beneficial results obtained from this institution extended a wide influence.

The original hospital was established in January, 1884, upon the request of the employes of the C. O. & S. W. Railroad, before the latter became a part of the Illinois Central System. Colonel C. P. Huntington purchased this property in 1883 and converted it into a hospital, dedicating it to his son, H. E. Huntington. It consisted of a magnificent colonial residence in the center of three acres of ground in the most beautiful part of Paducah. Under the direction of General John Nichols, third vice-president of the C. O. & S. W. Railroad, this building was transformed into a hospital and properly equipped to be used for the benefit of sick and injured employes. Dr. Joseph W. Thompson, chief surgeon, was placed as surgeon-in-charge upon the request of the majority of employes. It was provided that voluntary contributions should support this

hospital, which was held under the direction of the Illinois Central Hospital Association.

## A Pioneer in Company Hospitals

Additions were made to the original building from time to time, so that adequate and modern hospital facilities were furnished, and long before the inauguration of the hospital department on the entire Illinois Central System, the employes of the Kentucky and Tennessee divisions learned of the benefits to be gained from a hospital association. However, this hospital building, a large frame structure, unfortunately was destroyed by fire on the night of July 10, 1917. It therefore became necessary to provide suitable modern hospital facilities to replace this loss, and the new Illinois Central Hospital at Paducah is the result.

Ninety-pound rail and 190-ton locomotives are easy ways to measure the physical condition of a railroad. Unfortunately, there are no such simple methods of measuring the physical condition of the employes. But as the rails and locomotives need constant inspection and occasional overhauling, so do men. The medical department does its inspection through its medical staff, co-extensive with the system, and occasionally it finds a "Mogul" or a "Mikado" in need of overhauling or repair, and it is necessary to

*Front View of the Paducah Hospital*

*A Rear View of the Hospital*

send him to the "back shop." The medical shops are its hospitals. Here is assembled all of the apparatus for assisting in diagnosis and for treatment and here are the skilled physicians and surgeons, assisted by trained nurses—just as one finds the cranes and lathes in the shops, operated by trained mechanics and directed by skilled foremen.

#### **Making a Hospital Attractive**

Here the comparison ceases. While the human body may be the most nearly perfect machine ever devised, it is something far greater. The old conception of the hospital was that it was a shop where human ailments were chopped out. The old hospitals were too frequently factories in external appearance, ultimately repellent, odorous and forbiddingly white, from which the curtain, the rug, the picture were all austere banished as harborers of the pestilential microbe. Today we yield nothing to the old type of hospital in the demand for the cleanliness which we are told is next to godliness, but we add much "goodliness." The walls have been metamorphosed from their ugly white cocoon into grays, greens, pinks, blues, buffs and yellows, all in the attractive and soft pastel shades; the windows are curtained; the furniture is attractive and comfortable (even the white bed is taboo); the rugs are of a cheerful tone, and flowers lend their gayety and books their solace. The comforts of a club are provided, to which is added the expert and loving care of doctors and nurses.

Such is the atmosphere created by the newest of the Illinois Central hospitals, that at Paducah. When one sees it first in its setting of large ancient elms and oaks, well back from the street, in its ample site, it creates the impression of being the home of ease and comfort. The vari-toned red brick, the white cornices, the two-storied white entrance porch, or gallery, and the easy way in which the building nestles among the magnificent trees, are reminiscent of the Virginia planter's home. It seems to have been there always.

#### **Gives Impression of a Home**

When we enter it is a pleasant surprise to find that we are not ushered into the midst of hurrying nurses and sheeted stretcher carts, but that the lobby carries out the atmosphere of the exterior, as the reception hall of a large home. The simple paneling and cornices decorated in two tones of very delicate gray-green are enhanced by the simple drapes at the windows, the black and white floors, the Windsor chairs and the lamps. The main office and information clerk are directly opposite the main entrance. To the left is the reception room and to the right the out-patients' waiting room, opening directly off of the main waiting room. Each of these has a simple fireplace.

The building is in plan much like a huge turning fork, with the offices in the center and the two prongs facing the south. On the first floor, in the stem of the fork and directly back of the main office, is the

kitchen department; to the left, the negro patients' section; and to the right, the out-patients' examining rooms, the X-ray department, internes' rooms, assistant chief surgeon's office, laboratory, and, in a distant section, the nurses' quarters. The entire second floor is devoted to patients, the east end to private rooms, the west end to twenty bedrooms and wards. The central section of the building continues up an additional story, forming an isolated operating department.

### Operating Rooms Well Equipped

Three large operating rooms—with anesthetic rooms, sterilizing and nurses' work-rooms, doctors' locker and scrub-up rooms—are fitted with every device for scientific surgery. There are powerful eye magnets, tables for the painless setting of broken bones, powerful lights for emergency night operations, cupboards full of sterile bandages

and a room where these dressings are sterilized under high steam pressure to insure that no bacteria are present. In this room, too, we find tanks in which the water used in the wound is carefully sterilized, and others where the basins and instruments are sterilized.

The commodious elevator, operated by a pushbutton, then takes us to the second floor, where we pass through doors which shut out the noise of the elevator from the patients' corridor, and a courteous nurse tells us where we may find our friend. We see a long and wide corridor, terminating at each end in a delightful sun-porch for the convalescent patient. This floor is divided into two parts, each of which is independent of the other except for the main stairs, elevator, serving pantry and linen room, which are common to both. Each section has its own utility room, or more

Attending Staff, Illinois Central Hospital, Paducah, Ky.

Top row, left to right—Miss Mabel Hough, assistant technician; Miss Elizabeth Craig, technician; Dr. Frank Boyd, assistant surgeon; Dr. W. T. Dowdall, assistant surgeon and internist; Miss Sarah E. Dock, superintendent; Mrs. Ethel Iseman, nurse; Miss Ruth Kettler, stenographer; Miss Mabel Moss, bookkeeper and cashier.

Middle row—Miss Sallye Brenton, nurse; Dr. J. Q. Taylor, assistant chief surgeon; Miss Kathryn Skinner, nurse; Dr. V. L. Powell, assistant surgeon and roentgenologist; Miss Lucile Edwards, nurse; Miss Amy Van Horn, operating room nurse.

Bottom row—Miss Amy Longest, operating room nurse; Miss Gladys Collins, dietitian; Miss Anna Darlington, nurse.

properly called nurses' workroom, its own toilets and baths and a fire escape. In the east section is a delightful ward of sixteen beds with exposure to east, west and south. This floor has a few rooms with private baths and a small section devoted to women. The first-floor negro ward section is similar to the portion immediately above it. The nurses' quarters at the extreme east end have their own living room and baths, with the nurses quartered in attractive two-bed rooms, an arrangement that will undoubtedly insure a high quality of nursing service.

#### Even the Kitchen Is a Delight

The laboratory, the X-ray department and the pharmacy are all completely equipped with the necessary devices for the prevention, diagnosis and treatment of disease, providing all facilities not only for patients in the hospital but also for those who may be well enough to receive treatment as out-patients.

The kitchen, at the extreme north end of the stem of our giant turning fork, is a delight. With a ceiling fifteen feet high, with lofty windows on three sides, and of ample dimensions, it offers a startling contrast to the all-too-prevalent basement hospital kitchen, which is unusually dark, dirty and poorly equipped. The equipment at Paducah includes all of the labor-saving devices, besides a dish-washing machine which not only cleanses but sterilizes the dishes in boiling hot water. Adjacent to the kitchen is a receiving room, where all goods are received, a pantry and the dining rooms for help, nurses and staff. The portion under the kitchen wing provides a basement for additional storerooms and for the refrigerating machine, which cools all of the refrigerators and the drinking water, besides making the ice used in the hospital.

#### An Absence of Odors Noted

One notable achievement in this hospital is the absence of the hospital odor. We are not assaulted anywhere by kitchen smells, ether disinfectants, and other noisome offenses to the olfactory nerves. This is due to careful planning, large windows and doors with transoms, and the ventilation of the corridors directly to the outside. At points where many odors may be produced, such as the kitchen, utility rooms

and toilet rooms, natural ventilation has been assisted by ducts leading to electric fans in the attics, which exhaust the air from these places. Careful thought has been given to the rooms on the second floor, which are likely to be hot during the summer, with the result that these are as comfortable as those on the first floor.

While the mental and physical comfort of the patient has always been a primary consideration, it has not been necessary to sacrifice any of those elements which make for perfect cleanliness and sanitation. The floors throughout are of terrazzo, with bases

### Official Relationship

Less than a hundred years ago railroads were just beginning; there were no arguments between capital and labor. Employer and employe knew each other; each knew the other's wife, children, and family history; each understood the other's motive. Loyalty to his employer was often the workman's greatest incentive.

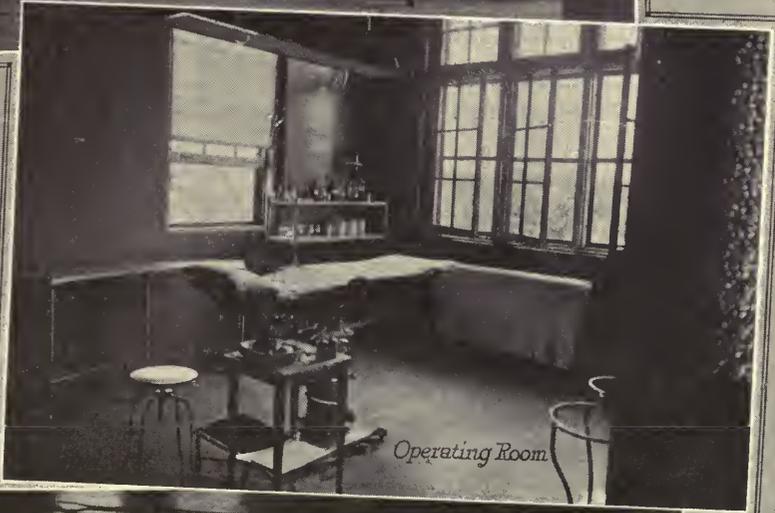

Now the great railway systems of this country represent billions of dollars, and the large army of men and women employed makes it impossible for executives to be personally acquainted with each employe. This I know is a source of annoyance to our executives, and especially to President Markham. He would like to have every employe of the Illinois Central know something of the problems that enter into the business of directing this great railroad to success. He desires to have everybody get the benefit of good suggestions. It is impossible to assemble all the employes. Imparting the problems to those executive officers under him and thence to the rank and file is the best plan we have.

I believe in division get-together meetings and further believe the good influence can be facilitated by local meetings of the heads of departments and foremen under the direction of the agent, where local conditions can be discussed and plans laid for strengthening the organization and increasing efficiency.  
—H. R. AUFENSPRING, Assistant Agent, Rockford, Ill.

Operating Room

Laundry

or mop boards of the same material, with ample coves where they join the floor. The walls are of hard plaster with washable paint. At the ceiling and wall corners the plaster is coved. The window stools are of marble. There is a noticeable absence of wood trim around the doors and windows. The doors are without panels. Everywhere ease of cleaning and the imperviousness of the material have been the primary considerations.

### Everything, Even a Garage

Heat is supplied from an already existing boiler room in a separate building, which

also houses the laundry. A garage completes the buildings on the site.

The new Paducah hospital, thus rising out of the ashes of one of the pioneer railway hospitals of this country, fittingly takes its place with the older Chicago hospital. In the completeness of its appointments and perfection of detail, it will prove a great boon to those who require it as a result of sickness or injury. To those more fortunate, it should prove a substantial comfort to know that they have at their command, if needed, the utmost that medical science affords and the greatest comforts that man can devise.

## The Importance of Proper Containers

By C. W. McKNIGHT  
Agent, Paxton, Illinois

We can never expect to get very far in the matter of eliminating the damage and loss to less-than-carload freight so long as the company is compelled to accept freight in the ways prescribed by the rate-making bodies—that is, in containers in which it is claimed to be safe for handling.

For the past several years the material used for the boxing of less-than-carload freight has been of the poorest lumber, and even at that it became so costly that it added a great expense on the price of the goods. Finally they brought out the pulp board container, which is all right for certain articles, but when it comes to handling canned goods in either tin or glass, vinegar in glass, bluing, paint in cans and even hardware, then I think the shippers are overstepping the purpose for which the containers were intended.

If a carton containing bluing, or in fact liquid of any kind, should get even a short drop—and it is liable to happen with the most careful trucker or handler—by falling from a truck, or a little rough handling, there are chances for a bottle to be broken, especially if such a container should fall on its corner. The result is, all the other articles will be damaged, and the carton will become soaked and go to pieces. Once wet, these cartons cannot be recovered, and consequently there is a greater damage.

My idea of handling less-than-carload pack-

age freight is by the use of containers or trunks, to be furnished by the shippers—that is, the wholesalers—which could be delivered to the freight house under seal, the shipping receipt to show what each carrier contains. The carrier would go through to destination and be delivered to the consignee under the same seal. This could be handled in another way, where one shipper makes a shipment to two or more consignees at one point, by allowing the carrier to be opened at the destination station, the agent making deliveries as per mark. This would in no way change the manner of billing or marking, but would serve to guard against the damage caused by rough handling in trains.

These containers could be made of different sizes and of strength that would safely handle the commodity for which they were intended, each wholesaler to use containers most suited for his business. These containers should then be returned at a low rate, if returned empty, but should any of the receivers of the containers so desire, they could fill them with freight, provided the same was shipped to the original owner, in which case they would travel at the regular rate for the articles which they contained.

It is my honest belief that if this was done, even though goods in such containers were handled at a much reduced rate, the company would be ahead of the game, for I believe 50 per cent or more of the bad orders could be eliminated.

# In Regulating Business, Why Not Figure That Most Men Are Honest?

**Samuel M. Felton, Chicago Great Western President, Asks Question Regarding Governmental Supervision**

(Copyright 1921, by P. F. Collier & Son Company; Reproduced by Permission From Collier's, The National Weekly, Issue of August 13.)

By **SAMUEL M. FELTON**,  
President, Chicago Great Western

**W**HY cannot the government do something to stabilize business, to put the railroads in proper shape, to make prices fair? To make life better?

A little while ago the public was asking for statutes against profiteering. Now a good many industries want to put into effect price agreements under government supervision. Special groups are forming in Congress to guard special interests on economic instead of political lines. It is urged that the government can save, say, the cotton growers or the wheat growers from selling at less than the cost of production; that it can save the cattle men or the exporters. Where once we thought we were through with the government in business, now we begin to find a new and somewhat insidious form of government in business.

The old idea was that the government ought to own transportation and the basic industries. The war pretty well knocked out that idea. Nobody was satisfied with government ownership. It may or it may not have been given a fair trial, which is, in a way, unfortunate; but at the rate at which the railroads were going to the dogs under government ownership the country could scarcely afford the luxury of giving federal management a fair trial—which was fixed by its advocates as a period of five years. Government has made a mess of owning here and everywhere else in the world; it is fairly acknowledged that it has, but the thought persists that somehow the government, even if it cannot manage on its own account, may, by some species

of regulation, save each and all of us, particularly each of us, from the consequences of a big war waste and a big war boom.

## A Little Difference of Opinion

There is a little difference of opinion as to what ought to be saved. The buyer thought prices ought to be regulated downward, and now thinks they ought to be kept down; the wage earner thinks wages ought to be regulated upward, and the manufacturer and the seller think business generally ought to be stabilized—which is only another way of saying that prices ought to be regulated upward. There is no doubt at all that it would be extremely nice to have all of these things done. But who is going to do them? The government? How? And why do we want them done for us? Have we lost faith in our honesty and ability to do for ourselves?

The situation, although many do not know that it exists, is serious. The tendency to pass the buck to the government is not one that makes for progress.

Why not give ordinary common honesty a fair trial? Why look about for outside remedies when we have the only real remedies within ourselves?

## Declaration of Business Independence

I have been in the railway business for nearly fifty years—from the panic year of 1873 to be exact—and in various capacities from rodman to president. I have seen the railroads of the country grow and have been intimately associated with a number of men who made them grow—notably E. H. Harriman, J. J. Hill, J. P. Morgan, and Colonel Thomas A. Scott and A. J. Cassatt of the Pennsylvania—and I have tried to keep my eyes open and to learn something. I have seen both railroads and rates manipulated, but, as was pointed out by Mr. Edward N. Hurley's article in a recent issue of *Collier's*,

I have never seen a railroad attain satisfactory service or pay satisfactory dividends to its stockholders when the major attention of its officers and directors was given to other than honest service. I have seen the growth of innumerable laws and regulations and commissions, state and federal.

These prohibitory and regulatory statutes and commissions have stamped out evil. They have, however, created new evils of their own. Applied to transportation, they have made the management of railroads as much a question of law as of business. They have prevented a great amount of new construction and equipment that was needed, and they have compelled not a little construction and equipment that was not needed, and I think, if all the figures could be collated, we should discover that the costs of regulation have exceeded any supposed savings made to the public by regulation and that the net result of all that has been done to date, as far as the railroads are concerned, has been to put them in a position where they are less able to give good service than they would otherwise have been—where they are less able to pay adequate wages and less able to make a proper return on the capital invested with them.

Our forefathers deemed certain truths to be self-evident; perhaps they were, perhaps they were not. Anyhow, as principles they stand out rather well. And I think we might adopt certain other truths as self-evident. Our experience has made them self-evident. We might think of them as a preamble to a Declaration of Business Independence. I should phrase them something after this fashion:

#### Eight Truths of Business

(1) The foundation of commercial enterprise is honesty. Nothing succeeds but square dealing. Although it may sometimes appear that dishonesty is successful, its success is only fleeting.

(2) Our country is founded on the presumption that all men are honest. We punish the exceptions to the rule. These exceptions, compared with the whole population, are trivial in number.

(3) It is very wrong as well as very foolish to amend this rule and say all men are honest excepting those in business, with

the reservation that if there are any honest men they are not in big business. The theory of regulation proceeds on exactly this unlovely basis.

(4) If we presume that all men are dishonest, there will be no use for regulation because there will also be no honest regulators. And quite aside from honesty, no man or group of men is wise enough fully to order this world. We simply must shut up shop.

(5) Government regulations are almost always made by those who know the least, not the most, about business, and the regulators commonly make more mistakes injuring the public than could the business if left to itself. Honest errors are more disastrous than dishonest ones because they are persisted in to the end.

(6) The government can regulate downward but not upward. It is passive, not active.

(7) We must be active.

(8) Most ideas of government in business, or government regulating business, spring out of the world-old notion that man can manage the laws of nature much better than does the Almighty.

#### The Railroads a Business Matter

Without going into the vast maze of argument, fact, and pseudo fact with which the whole railway situation is surrounded and confused, look at the railroads as a business matter and look at business generally. Perhaps we can discover that the new tendency is not going to do anyone good and is going to do everyone harm.

Whenever a body of business men meets at a public luncheon or dinner in these days, the principal address will be on business conditions, and the speaker will either learnedly go into the cycles of business prosperity and depression and conclude that we are about out of depression, or he will launch into a learned discussion of what the government ought to do for business. Usually he will say, in almost these words:

"Business, for its own good, must prepare itself for government regulation. The individual can no longer dominate—the public must be protected."

I have heard these or assertions of like meaning in some dozens of addresses dur-

ing the last few years, and usually the sentiments are applauded. An average audience, and especially an audience of business men, is curiously idealistic. The regulation of business, presumably to the end that all parties shall receive entire justice, is abstractly idealistic. And, of course, we each of us consider "justice" from our own viewpoint. It seems good to think that a higher power can step down and straighten out our relatively petty affairs. We visualize the government as a higher power, which it is, but unconsciously we take for granted that there is no difference between higher authority and higher wisdom.

If Jack Jones, whom we have known well since boyhood, is appointed or elected to a governmental office and comes before us at a luncheon or a dinner and announces, a little hazily perhaps—as one who holds state secrets should—that the government proposes to do this or to do that, we cheer Jack and say among ourselves that he is a fine fellow and admit that we always knew that he would do well. We take for granted that Jack knows what he is talking about—which may or may not be a fact. He may merely be out to make a good speech.

### Those Statutes "With Teeth"

But the point is that we do admit that the government can help business in a regulatory way and that it can do things for us of a very intimate, personal, helpful nature which we cannot do for ourselves. Do we know what we are talking about? Do we specifically know how, where, or when a government can regulate business for the benefit of the public?

Any regulation which benefits the public in a large sense will benefit business. There is no distinction between them. A regulation which merely restrains business, or which merely restrains or promotes those parts which we term capital, management, and labor, is not usually in the end for the benefit of the public. The railroads, which are the phase of business with which I am most intimate, give a striking example of how regulation, beginning ostensibly for the benefit of the public, ends by hurting everyone, including the public. Special legislation in connection with the railroads (and

there have been barrels of it) has not been a benefit to anyone.

Most of us are entirely willing—no, more than that, anxious—to give the fullest support to any measure of business regulation which will benefit the public. Because the regulation punishes some one, it does not follow that it benefits the public, and, fortunately or unfortunately, most of the adventures of the government in the region of business regulation have for their end only the punishment of a group. These are the statutes "with teeth" in them, and usually their intent is to correct an economic swing by fining or putting into jail a few individuals. This is a very common

### What Is Success?

We all want to be successful, do we not? It is always your first step that counts for your success. For your own sake, take that step now.

When we look at some immense structure and realize what a big part even one brick plays in perfecting it, we begin to understand how important a part the first step plays in every big accomplishment.

The determination, the will power to be successful—these are the chief factors in producing success. When we conquer our own fears in our own consciousness, we can conquer all circumstances without.

The biggest thing offered us in this great United States of ours is opportunity, and if we expect to be successful we must take advantage of it. We Americans are eager for adventure, and many of our adventures have led to success. Let us mention the world war—a successful adventure. That is why the foreigner finds America so successful, perhaps—he is an adventurer.

We are living in the most wonderful part of the whole universe, America, the land of opportunities. The young American must get ahead to win. He is living in a fast age, striving for success. Set your standard, and go after it; whatever it is, let it mean your Success.—MATILDA K. NAGLE, *Secretary to Roadmaster, Memphis, Tennessee.*

delusion because it is a very satisfying one. It may be recalled that the last administration sent somewhat voluble "flying squads" of lawyers and detectives into various sections of the country and that wherever they went they made quite a fuss and took up a good deal of newspaper space, but I have yet to learn that they did anything toward lowering prices. Other forces, generated by no man-made law and put into effect without appropriations, attended rather efficiently to the lowering of prices.

### Danger in Group Regulation

We have seen a great deal of group regulation either by special statute or under the more general authority of the Interstate Commerce Commission and the Federal Trade Commission. We have seen the Federal Trade Commission announce the astounding doctrine in the case of the packers that it is wrong to charge too low a price, that it is wrong to be too efficient in business. They did not phrase their findings in so many words, but that was the sense of them. With the formation in Congress of special groups we are threatened with the possibility of a considerable amount of special legislation, disguised, however, as general legislation. There is a disposition to fool with the economic machinery even to the extent of throwing monkey wrenches into it—and usually because some special interest thinks that its own aims can be promoted.

Usually it is the man or group who cannot produce cheaply who wants to prevent a large competitor from producing too cheaply. Of course the arguments are never put so crudely. They will go to the "protection" of something or somebody. During the era of inflated prices and supposed scarcity the effort was to prevent the harming of the public by charging too high prices. This was a special condition which probably merited specific legal attention—although attention directed to the real point at issue was seldom given.

Under ordinary circumstances the public does not have to be protected from the greed of sellers. The public protects itself—it does not buy. If it wants to buy, it will buy in spite of everything. The Volstead

Act is a good example of this. It is not really enforced by police officers; it is enforced by the sentiment of the community. If the sentiment of the community favors prohibition, there is no difficulty about enforcement; if it does not favor prohibition, then the work of the police officers is all but futile.

### The Landlords in New York

If we protect for the moment a class by a special statute, it may shortly come about that the supposedly protected class has, with its special laws, become an aggressor class. This has happened with the emergency landlord and tenant laws in New York. These were intended to prevent landlords from charging too much rental during the period of acute shortage of apartments and houses. One section provided that a tenant could not be ousted by his landlord before he found another dwelling. While searching for the new place he could hold his lease at the old rental. In consequence those tenants with advantageous leases have been singularly unable to discover new habitations for themselves. As a result of this law, fewer and fewer tenements are offered for rent and more and more are offered for sale. The man with money who can afford to buy is at a great advantage over the man without money who must rent, and it was this latter class that the statute was supposed to protect.

What is it that we want to regulate in business, and what, if any kind of regulation, will inure to the permanent benefit of the public? It is all well enough to approach every form of regulation with enthusiasm, and there is a cult that does exactly that. It is all well enough to shout against "big business" and to indict it generally without specifying on what ground—but that enthusiasm does not get us anywhere.

No phase of business is perfect. It cannot possibly be, so long as it involves the conduct of human beings, and I think, if you analyze most proposals for regulation and supervision, you will discover that they go to the regulation of corporate beings be-

## *E. I. Rogers' Resignation Brings Changes in Engineering Department*

*J. E. Fanning Succeeds Iowa Division Roadmaster Who Joins  
Pekin and Peoria Union as Chief Engineer*

**A**FTER almost exactly five years as roadmaster of the Iowa division of the Illinois Central, E. I. Rogers has left the service to become chief engineer of the Pekin and Peoria Union Railway Company, of which V. V. Boatner, recently superintendent of the Memphis division, is president. J. E. Fanning, until recently assistant engineer in charge of construction work, has been transferred from Chicago to Fort Dodge to succeed Mr. Rogers, effective August 17. W. R. Gillam, who has been assistant engineer, maintenance of way, at Chicago, succeeds Mr. Fanning in the chief engineer's office, and F. W. Armistead of the chief engineer's office is

made assistant engineer, maintenance of way.

Mr. Rogers, who was born August 3, 1876, in St. Joseph, Mo., joined the Illinois Central in 1897 as a track apprentice. He has served in nearly every capacity in the engineering department. He was instrumentman and later assistant engineer in the Delta region and served also on the Kentucky, Tennessee and Mississippi divisions. In 1911-12 he was roadmaster of the New Orleans division.

From 1912 to 1916 he was out of the service, in the employ of the Lorimer & Gallagher Construction Company at East St. Louis and also as chief engineer of the Texas City Terminal Company, Texas City, Tex.

In February, 1916, he returned to the valu-

J. E. Fanning

E. I. Rogers

ation department of the Illinois Central. On August 8, 1916, he was sent to the Iowa division as roadmaster, and he has been there ever since. His headquarters in his new position will be at Peoria, Ill. Just before he left the service Mr. Rogers returned to Fort Dodge to find on his desk a gold watch and chain, with the inscription: "Presented to E. I. Rogers; a token of remembrance from the Iowa Division, Illinois Central Railroad, August 15, 1921."

#### Has Held Several Positions

Mr. Fanning was graduated from the University of Mississippi in 1905. The same year he entered the service of the Gulf & Ship Island Railroad as transitman; in 1907 was promoted to assistant engineer; in 1909 to supervisor of tracks; in 1910 to assistant to chief engineer.

In 1917 he entered service with the Illinois Central as resident engineer at Chicago. In 1918 he was in charge of the construction of the Golconda Railroad at Golconda, now a part of the Illinois Central. In August, 1920, he was transferred by the Railroad Administration to Hattiesburg, Miss., as chief engineer of the Gulf & Ship Island Railroad and Mississippi Central Railroad.

On March 15, at the end of federal control, he returned to Chicago as assistant engineer, handling construction work.

#### With Illinois Central Since 1899

Mr. Gillam has been continuously in the service of the engineering department of the Illinois Central since January, 1899. He followed the usual line of promotion as chainman, rodman and instrumentman, and was appointed assistant engineer, maintenance of way, Wisconsin division, in 1904.

In 1906 he was appointed resident engineer on double track construction, Atoka to Kerrville, Ky., and in 1907 was transferred to a similar position on construction work at Baton Rouge, La. In 1907 he was appointed assistant engineer, maintenance of way, Memphis division, and in September, 1915, was made assistant engineer in the valuation department.

December, 1916, he was made road supervisor, Memphis division, and in February, 1921, was promoted to assistant engineer, maintenance of way, at Chicago.

Mr. Armistead has been with the Illinois Central since May, 1905, practically all of the time in various capacities in the chief engineer's office at Chicago.

## Smallest Reduction Is in Railway Wages

Wage reductions affecting 4,540,000 workers and averaging 15.9 per cent have been made in twenty key industries since the first of the year, according to a survey just completed by J. L. Jacobs & Co., Chicago statisticians and engineers.

The survey included reports covering 693 industrial establishments or groups of establishments characterized as typical of every industry of any consequence in the country. Government statistics show that the cost of living has dropped 16.2-3 per cent since the June, 1920, peak.

Among the last industries to reduce wages were public utility concerns, including many street railways outside of Chicago. Chicago street railway workers still are enjoying the scale which went in force when the cost of living was at the peak.

Steam railway employes received the smallest reduction—approximately 12 per

cent—and with their wage rate eliminated from the table from which the average reduction was obtained the balance of the workers have taken reductions of 18.7 per cent—a little more than the cost of living has dropped.

The greatest reductions, made in the cotton manufacturing plants, averaged 26.5 per cent and affected 205,000 workers. Hosiery and underwear manufacturers came next with 24.3 per cent, while the boot and shoe industry trailed along with a flat cut of 22 per cent. Utilities averaged 16 per cent, while building trades workers in half a dozen big cities accepted cuts averaging 18.1 per cent and affecting 380,000 workers.

**Remember September!**

# U. S. Railroad Labor Board Lays Down New Rules Regarding Overtime

*Revises Definitions and Rates of Pay in Decision Which Has  
Been Characterized as a Compromise*

**R**EAFFIRMING its belief in a basic 8-hour day for railway employes, the United States Railroad Labor Board on August 19 handed down a decision regarding pay for overtime, providing seven new rules to take the place of seven in the abrogated "national agreements" of the federated shop crafts. In general the rules recognize the principle of punitive pay for overtime in railway shop service, at the same time making a distinction between "extra" work and work regularly scheduled.

The decision has been characterized as wholly pleasing neither to the carriers nor to the employes. The board itself describes the decision as a compromise to make rules and working conditions just and reasonable. In the main it eliminates the possibility of recurrence of some of the exaggerated interpretations made under the old agreements. A dissenting opinion was filed by A. O. Wharton, one of the labor members of the board.

The rules are retroactive to August 16 for the eighty-nine carriers named in the decision, and retroactive to July 1 for others who have paid merely "straight time" since then by temporary direction of the board. Roads which have succeeded in making new agreements with their employes prior to the present decision are not affected.

The seven rules, their numbers corresponding to those in the "national agreements," are in substance as follows.

#### Rule No. 6.

All overtime continuous with regular bulletin hours will be paid for at the rate of time and one-half until relieved; except as may be provided in rules hereinafter set out. Work performed on Sundays, New Year's Day, Washington's Birthday, Decoration Day, Fourth of July, Labor Day, Thanksgiving Day and Christmas, shall be paid for at the rate of time and one-half, except that employes necessary to the operation who are regularly assigned by bulletin

to work on Sundays and holidays, will be compensated on the same basis as on week days.

#### Rule No. 7.

For continuous service after regular working hours, employes will be paid time and one-half on the actual minute basis with a minimum of one hour for any such service performed. Employes shall not be required to work more than two hours without being permitted to go to meals. Time taken for meals will not terminate the continuous service period and will be paid for up to thirty minutes. Employes called but not used will be paid a minimum of four hours at straight time rates.

Employes called and reporting will be allowed a minimum of four hours for two hours and forty minutes or less.

Except as otherwise provided all over-time beyond sixteen hours' service in any twenty-four hour period shall be paid for at the rate of double time.

#### Rule No. 9.

Employes required to work during, or any part of, the lunch period, shall receive pay for the length of the lunch period at straight time.

#### Rule No. 10.

An employe regularly assigned to work at a shop, etc., when called for emergency road work away, will be paid from the time ordered to leave home station until his return for all time worked in accordance with the practice at home station and straight-time rate for all time waiting or traveling.

If, during time on road, a man is relieved from duty and permitted to go to bed for five or more hours such relief time will not be paid for, provided that in no case shall he be paid for a total of less than eight hours each calendar day. Where meals and lodging are not provided by railroad, actual necessary expenses will be allowed.

If required to leave home station during over-time hours, they will be allowed one hour preparatory time at straight-time rate.

Wrecking service employes will be paid under this rule, except that all time working, waiting or traveling on Sundays and holidays will be paid for at rate of time and one-half, and all time working, waiting or traveling on week days after the recognized straight-time hours at home station, will also be paid for a rate of time and one-half.

#### Rule No. 12.

Employes sent out temporarily to fill vacancies at an outlying point or shop, or sent out on a temporary transfer to an outlying point or shop, will be paid continuous time from time ordered to leave home point to time of reporting at point to which sent, straight-time rates to be paid for straight-time hours at home station, and for all other time, whether waiting or traveling. They will be guaranteed not less than eight hours for each day. Actual necessary expenses will be allowed.

On the return trip, straight time for waiting or traveling will be allowed.

#### Rule No. 14.

Employes regularly assigned to road work whose tour of duty is regular and who leave

and return to home station daily (a boarding car to be considered a home station), shall be paid continuous time from the time of leaving the home station to the time they return whether working, waiting or traveling (not sleeping), exclusive of the meal period.

**Rule No. 15.**

Employees regularly assigned to perform road work and paid on a monthly basis shall be paid not less than the minimum hourly rate established for the corresponding class of employes coming under the provisions of this schedule

on the basis of 365 eight-hour days a calendar year. The monthly salary is arrived at by dividing the total earnings of 2,920 hours by 12; no overtime is allowed for time worked in excess of eight hours a day; on the other hand, no time is to be deducted unless the employe lays off of his own accord. . . . If it is found that this rule does not produce adequate compensation for certain of these positions by reason of the occupants thereof being required to work excessive hours, the salary of these positions may be taken up for adjustment.

## A Memphis Division Family Affair

*Top row, left to right—Misses Diamond Crow, Lily Mergil, Collie Said, Mary Lynch, Alice Wolf, Ada May Johns, Juawice Tabb.*

*Bottom row—Neal Brien, D. H. Pope, George Digel, C. B. Hall, Elliott Rose, Hope Cannon, Ike Brown, Joe Concklin, John Wiley.*

It is "SAID" the following conversation between two clerks of the Memphis division offices was overheard in the "HALL" of the third floor, Grand Central Station, just prior to the sad news contained in Decision 147:

A—Whassa matter, "JOE"? Why so blue? You look like someone was going to "LYNCH" you. Cheer up—it "MAY" not be so.

B—I sure hope it ain't, but from where I sit it sure looks like they're gonna do us up "BROWN." I've been keeping "TABB" of this decrease dope, and by "GEORGE" that Labor Board is sure a "WILEY" bunch. My hopes have "ROSE" only once since it started,

and it's kinda hard to look as sweet as a "LILLY" when you know you're gonna get socked. I'm having a tuff time keeping the "WOLF" from my door now, and when the cut comes I guess I'll have to take my "DIAMOND" down on Beale Street. I'm not as saintly as a "POPE," but it may help some, and so I'm gonna "NEAL" right down here and pray \_\_\_\_\_.

The sentence was never finished, as "A" fainted from the shock when "B" said he was going to pray.

The actors in this playlet are in the picture above.

# Editorial

## REMEMBER SEPTEMBER!

As this issue of the *Illinois Central Magazine* goes to press, the Illinois Central System is engaged in making history for itself by engaging in the "Fuel Economy Month" announced in the August issue. "Remember September, the Fuel Economy Month" is the slogan that has been adopted. The aim is to reduce the consumption of fuel on the system 10 per cent for this one month, and eventually to make a habit of saving about a million dollars or more a year in this one item.

Nobody is worrying about the ability of Illinois Central employes to accomplish this saving. They have proved so often that they are equal to anything the management asks that the biggest problem is to direct their efforts to the economies most needed.

The "No Exception" campaign was a brilliant success and now stands at the head of the list of all campaigns conducted on this system, but when the record of the "Fuel Economy Month" has been written the management believes that the "No Exception" campaign will have to take second place.

One of the efforts needed, however, is to convince every employe that he or she can do something to help in the success of the campaign. Many who thought they could be of no service in the "No Exception" campaign found later they could do much, and it is hoped that the same experience will apply to the "Fuel Economy Month."

Each employe is requested to make this his or her campaign. Each is expected to do as much as is humanly possible, and at the same time to interest and encourage others.

Fuel economy bulletins will be issued at various periods in the campaign. These will give information regarding the activities manifested on the divisions. In order to make the campaign effective and to give credit where credit is due, the general fuel conservation committee announces that it will appreciate information in regard to

where fuel is saved or where it is wasted. J. F. Porterfield, general superintendent of transportation, is chairman of this committee, and the other members are: R. W. Bell, general superintendent of motive power; A. F. Blaess, engineer, maintenance of way; W. A. Summerhays, purchasing agent; J. F. Dartt, auditor of disbursements, and J. W. Dodge, who is in charge of fuel conservation.

## COURTESY A PART OF LIFE

Nearly every issue of the *Illinois Central Magazine* contains an editorial on courtesy. Perhaps some of our readers will think we are having too much to say on this subject, but we do not believe that too much can be said.

The Illinois Central System is gradually becoming known far and wide as the railway system having the most courteous employes of any railway system in the country. Its employes have given it that reputation; in doing so they have conferred upon the company a priceless asset, and they have also made their own futures more secure.

In these days of slack business and fierce competition of the motor truck for freight transportation and the automobile for passenger transportation, it behooves railway employes to attach a good deal of importance to the question of their striving to make the railway business permanent. Nothing will contribute more to that desirable end than courteous treatment of the public.

Illinois Central System employes have done a great constructive work for the company by specializing on courtesy to the company's patrons. Most of the company's employes are extremely courteous to patrons. There are perhaps a scattering few who are not. That scattering few ought to change their ways, and the courteous employes ought to make it their business to see that they do so.

The officers of the company are always

inaugurating some sort of a campaign having for its purpose the bringing about of reform resulting in economies or improvement in the service. It would be a nice thing if employes would occasionally start a campaign of their own. Suppose all the employes of the Illinois Central System who are courteous to the patrons of the company (and they are vastly in the majority) were to declare war on the scattering few employes who are not courteous to the public! What would be the result? The writer believes that the result would be that the scattering few who do not practice courtesy to the public would soon disappear, and that in a short time it would be possible to comb the Illinois Central System with a fine-tooth comb for employes who are not courteous to patrons, and not to find a single one. That would put the Illinois Central System up high on a pedestal as the most wonderful railroad in the world. It is climbing toward that pedestal rapidly. Let us, the employes, put it there!

What the sunshine is to the poppy, courtesy is to the human heart. Without it life would be colorless. An act of courtesy on the part of a railway employe to a railway patron is a forget-me-not from the garden of good will.

#### WHY DO THEY DO IT?

"People Act as if They Wanted to Be Killed" is the title of an article by Rex Stuart in the *American Magazine* for September which should be widely spread. Mr. Stuart made several trips in the cab of a New York Central locomotive to observe the recklessness with which people face danger at railway tracks. The title sums up his observations. In 240 miles of travel he saw seventy-five persons narrowly escape death or serious injury through their foolhardiness—pedestrians dashing under lowered gates and across the tracks immediately in front of the on-rushing train, automobilists racing their cars with the train and trying to beat it to a crossing, passengers crowding to the edge of station platforms and jumping on and off moving trains. Mr. Stuart declares that he was appalled by the indifference with which people risk their lives.

There is always time to take the safe course.

As a matter of fact, the greatest risks are usually taken by those who are not in a hurry. Mr. Stuart tells of seeing three persons dash under lowered gates and rush across the right-of-way immediately in front of the fast moving train, and then, when they reached the other side, stopping to watch the train pass by!

The action of a chicken upon the highroad at the approach of an automobile is an interesting study in the workings of the animal mind in one of its lower forms. But men, supposed to have inherited a high order of intelligence and to be endowed with the faculty of reason, often make the flustered chicken appear as a sage for wisdom in comparison when it comes to behavior in the face of danger.

Mr. Stuart emphasizes a point which the public often overlooks in considering the subject of which he writes. That is the strain upon the men in the locomotive cab. He was in a position to make some first-hand observations, and he doubtless came out of his experience breathing a thankful sigh of relief that his daily work did not take him through the nerve-racking experience of driving a train before which people fairly throw themselves as if trying to commit suicide.

A world of material has been presented to the public on the question of safety—in pictures, in lectures, in articles, and, most convincingly of all, in the stories which darken the newspaper pages almost daily. The men whose work brings them day by day in contact with the results of the foolish risking of life never cease to wonder at the apparent lack of common animal intelligence displayed by their fellow men.

#### OUR ANCIENT VIRTUES

Great wars stir the emotions, stimulate the sense of devotion to country and intensify the natural inclination of mankind to worship its heroes. But like other intense emotional experiences, they leave in their wake many deplorable and depressing consequences, not the least of which is a certain state of mind that makes for helplessness in the face of the ordinary facts of life. We refer to the tendency to look to the government for aid in solving those economic and industrial problems that of necessity confront every people in the course of the nation's growth

and development. This tendency seems to be present with us now.

Under the stress of war, our people gladly yielded implicit obedience to every mandate of the government, upon the very proper view that to do otherwise would be to fall short of that full allegiance which true patriotism demanded. But this experience undoubtedly weakened the moral stamina of a great many people, and particularly that quality of character which we call self-reliance. For in time of war, the government is everything. It marshals all the forces and resources of the nation to one common end. In this process it must necessarily furnish the directing power—supply the moving energy,

Thus we find, in such a time, the government saying what we shall eat, what we shall drink, and wherewithal we shall be clothed; doling out our supply of fuel and fixing its price; determining what industries are essential and what non-essential; limiting our manufacturing and our commerce to essential industries; operating our railroads and our shipping; closing our places of amusement at will; darkening our streets, and doing a hundred things that offend our sense of personal liberty, but quicken our pulse-beats as they throb to the sounds of war. We come in such a time to depend so largely upon the government for guidance in everything that when peace returns we are too prone to continue the sense of dependence. If someone else does our thinking for a considerable time, we are only too likely to allow that someone to go on doing it after the necessity has passed.

All these general and rather trite observations have been suggested by a recent and inspiring letter written by Governor McKelvie of Nebraska. The governor on the whole writes in an optimistic strain, particularly as to the outlook for the farmer. Among other excellent things, he says:

The country is beginning to realize that a return to normalcy means, not the artificial readjustment of business conditions through legislation, but rather a readjustment that will come only through the application of the sound principles of industry, thrift and economy.

This is another way of echoing President Harding's wise observation that it is time the government was getting out of business. The government has undoubtedly got, measurably at least, out of certain kinds of busi-

ness. The fuel administration is no longer functioning, and the press is free. The shipping board is struggling under its immense load of debt and incompetency in management; the railroad administration is hastening to its end. All these signs of a renewal of individual activity are encouraging.

Still there are restless and discontented spirits who would like to see business go on leaning on the government for support. Without realizing it, perhaps, these individuals are in fact unconscious advocates of a form of state socialism, which, if allowed to prevail, will ultimately destroy our system of government, based as it is upon the broad principle of individual initiative. We have grown great as a nation because we have minimized government and magnified the individual. It is that policy which has made the United States the dominant country of the world—the leader in all the fields of finance and industry. In turn, the growth of our industry has benefited him who toils with his hands, as he has been given steady employment at a living wage. This policy must not be abandoned, unless we are content to take our place with those second-rate powers in the world who have enthroned either despotism or anarchy as their gods.

We need, once in a while, to take stock of ourselves—our habits of thought, our ideals, our aims, and our ambitions. This is a good time to do so. It is a time for calm reflection and for sane thinking. It is a time for each of us, with grim determination, to resolve that each will work out his own salvation.

What is the function of government as an aid to industry? It is to insure to the individual the largest possible freedom of lawful action in the way of exercising his powers of initiative, of enterprise, of endurance. It should do no more than to make certain that a busy, honest, industrious, intelligent person is not interfered with in his efforts by the powers that prey, in whatever guise they come. Government must see to it that the toiler gets the fruit of his labor. It must do no more. It cannot create wealth, nor opportunity. Particularly can it not give the rewards of industry to the weak, the incompetent and the slothful. It cannot re-

vive business by passing laws. There is one great law which government is powerless to repeal or to amend, and that is the law of compensation. In its final analysis, our industrial prosperity depends upon the functioning of that law.

As a people we can learn no more wholesome lesson than the one which is the keynote of Governor McKelvie's letter—namely, that the prosperous man and the happy man is he who in the practice of the ancient virtues holds on his course with serene faith in himself, determined to do or die.

### THE MARCH OF PROGRESS

A Pageant of Progress has recently been conducted by the city of Chicago, presenting to the thousands who visited its scenes a graphic story of development from the muzzle-loading rifles and spinning wheels of the Middle Western prairies to the equipment of our present complex civilization. Public and private collections of industrial curios were explored to produce the relics with which to compare the machinery of the present day. Nearly every line of production which has a history was represented. It was a remarkable pageant.

The march of progress never will cease to be of absorbing interest to the person with an imaginative turn of mind. No more fascinating romance can be read than that found in the pages of America's industrial history, a record of progress from crude to highly finished methods, in which our own fathers, and even the older ones of us, had a definite part. The person is poor indeed who cannot find in such study a wealth of inspiration.

There probably has been no greater single factor in the march of progress than the railroads. The story of the improvements which have been made in railway methods, materials and facilities is an inspiration of itself, but the part which the railroads have played in bringing about, in making possible, the present high order of society is a story which cannot grow old. The railroads and the men who conceived and built and operated them were the empire builders of the early day in the Middle West. Development followed the railroads as they threw out their lines into new territory and laid their plans for empire building. They brought with them the set-

ters for the new country, and the materials of society in the new land were largely supplied by the iron horses of the rails. They carried the mails which kept the new world in touch with the old. As industries were established and the fabric of society added to its complexity, the railroads were called upon for more important work. Down the years, hand in hand with industry and with society in general, the railroads have marched, keeping pace with American achievements, leading the world in the character and economy of their service.

The Pageant of Progress in Chicago gave an important place to the exhibition of the DeWitt Clinton, the pioneer train of the New York Central Railroad, as compared with the present high standard of equipment; and other paraphernalia of railway equipment was likewise displayed. But it was left for the visitor to weave his own picture of the tremendous part railway development and service have played in the pageantry of progress.

In this connection it is interesting to note an item which appeared recently in a Pennsylvania newspaper, which we reprint from *The Express Messenger*:

In the little town of Lancaster, Pa., just ninety years ago the literary society asked the use of the schoolhouse for debating the question: "Are the Railroads Practical?" And here is the answer the school board made in their wisdom:

"If the society wants the use of the schoolhouse to debate some decent, moral question, we would cheerfully give the use of it, but such a thing as a railroad is wicked as well as absurd. If God had wanted human beings to travel at the fearful rate of seven miles an hour, He would have clearly foretold it by His prophets, but since nothing is said about it in Holy Writ, it is plainly an invention of the devil to lead immortal souls to hell. Hence we must refuse the use of the schoolhouse."

The question of the practicality of the railroads is no longer considered by enlightened people as debatable, although some persons seem to have forgotten the lessons of history. Under the present condition of things, the railroads must have public support and confidence to win, and an attitude of heckling and badgering, and trying to embarrass, railway managements scarcely serves that end.

**Remember September!**

# PUBLIC OPINION

What the

World thinks

## THE FARMERS' SHIPPING

The facts about the railway business almost always arise to confuse and embarrass those who base their discussions of railway affairs on mere theories as to what the facts are or ought to be. The present freight rates have been widely attacked by theorists on the ground that they are "higher than the traffic can bear." It has been argued that they have prevented the movement of much traffic and that this has been one of the main causes of the prolonged business depression.

The facts regarding the shipments of farm products utterly refute this theory. Railway rates have been advanced as much in proportion on farm products as on other commodities. The prices of farm products have declined more since the rates were advanced than the prices of any other very large group of commodities. Therefore, on this theory the rates on agricultural products should be especially difficult for the traffic to bear and should sharply curtail its movement. A few months ago an extensive propaganda was being carried on which was predicated on the assumption that if rates were maintained they would greatly restrict the movement of farm products.

The sequel is illuminating. The total traffic on the railroads thus far in 1921 has been abnormally small. Paradoxical as it may seem, while the total traffic moving has been abnormally small the shipments of farm products have been almost unprecedentedly large. Throughout the present year shipments of grain and grain products have been much larger than in 1920 or 1919, before the present freight rates were fixed. In the eight weeks ending July 23

the shipments of grain and grain products were 97,105 cars greater than in the same weeks of 1920, and this is typical of what has been going on throughout the present year.

A very extensive and energetic propaganda was being carried on a few months ago to show that it was and would continue to be impossible for the farmers to ship their fruits and vegetables to market on the present rates. What are the facts?

*During the season of 1920 up to August 6 the total shipments of fruits and vegetables were 145,316 carloads, while in the season of 1921 up to the same date the total shipments were 171,390 carloads.*

These are the statistics of the Bureau of Markets of the United States Department of Agriculture.

There has been a corresponding increase in shipments of other kinds of produce. From January 1 to August 6, 1920, shipments of butter were 314,600,000 pounds, while during the same period of 1921 they were 346,800,000 pounds. Shipments of cheese increased from 105,500,000 pounds to 113,600,000 pounds; shipments of dressed poultry from 86,300,000 pounds to 93,800,000 pounds; shipments of eggs from 10,300,000 cases to 11,500,000 cases.

It was said that cantaloupes could not be shipped from the Imperial Valley of California to the eastern market on the present rates. The number and tonnage of cantaloupes shipped were greater than in 1920. It was said that the large peach crop of Southern Georgia could not move to market under the present rates. The Department of Agriculture reports that "shipments of peaches from Southern Georgia during the season just ended were twice as great as

during the 1920 season, and growers regard the season as fairly successful despite the lower prices this year. A tabulation of carlot shipments to August 1 shows 9,500 cars shipped from Southern Georgia and about 10,500 cars from the entire state. In 1920 the carlot shipments were 5,500 from the entire state up to August 1."

The *Railway Age* does not contend that the present rates on farm products should be indefinitely continued. They and other rates should be reduced when the operating expenses of the railroads have been reduced enough to justify reduction of the rates. But the people who contend that the present rates are protracting the industrial depression by preventing the movement of a large amount of traffic which would move if the rates were reduced are talking nonsense. The present rates are relatively higher, as compared with past years, on farm products than on any other large class of commodities, yet the farm products throughout the year have been moving in larger volume than before the rates were advanced.

It may be said, however, that freight rates are only relatively a small part of the prices of farm products, and that the present rates are restricting the movement of cheaper and more bulky commodities in whose cost to the user the railway rate is a larger factor. There is no class of commodities more bulky or the freight rates on which are relatively higher in proportion to the prices for which they sell than sand, gravel and stone. The shipments of sand, gravel and stone in the seven weeks ending July 16 were 33-1-3 per cent more than they were in the same weeks of 1920.

The facts show beyond any rational question that the traffic of all kinds will bear the present rates and that the present small volume of traffic is due to general business conditions and not to the present freight rates. There ought to be reductions in railway rates in the future, but they should not be based on false ground, and they should not be made until the traffic of the railroads has increased and their operating expenses have been reduced enough to enable the railroads on lower rates to make a reasonable return.—*Railway Age*, August 20.

## HELPS THE PUBLIC, TOO

During the war the government made certain betterments on railroads and charged the amounts to operating expenses. These obligations are still carried by the government.

There is a bill before Congress to give the railroads an extension on these obligations. The practical result of this bill would be that the railroads would have certain funds to go forward with or would be in position to get credit to make improvements and carry on their work. It might result in a general revival in railroading. Certainly the railroads would be in a position to buy material, to repair their cars and to keep their tracks improved. This would be employment for more men. It would

## Don't Be Discouraged

Remember this:

When Abraham Lincoln was a young man he ran for the legislature in Illinois, and was badly swamped.

He next entered business, failed, and spent seventeen years of his life paying off the debts of a worthless partner.

He was in love with a beautiful young woman, to whom he became engaged—then she died.

Later he married a woman who was a constant burden to him.

Entering politics again, he ran for Congress, and was badly defeated.

He then tried to get an appointment to the United States land office, but failed.

He became a candidate for the United States Senate, and was badly defeated.

In 1856 he became a candidate for the vice-presidency, and was again defeated.

In 1858 he was defeated by Douglas.

One failure after another—bad failures—great setbacks. In the face of all this, he eventually became one of the country's greatest men, if not the greatest.

When you think of a series of setbacks like this, doesn't it make you feel small to become discouraged, just because you think you are having a hard time in life?—Ob-long (Ill.) Oracle, August 5.

mean more lumber, steel, more ties, more men and more general supplies.

The railroads are the biggest customers of the people of the United States. The railroads buy more for their own use than any other instrumentality, public or private. The railroads are bigger customers of the people than the government. They cannot buy unless they have credit or money. All the government is asked to do is to extend a line of credit to them.

It is not a government subsidy. It is merely a postponing of immediate payment of certain bills.

The passage of this bill has been recommended by the war finance corporation. We have absolute confidence in the integrity and far-sightedness of the war finance corporation. Mr. Eugene Meyer sees in this a way by which people could be put to work, material could be bought and sold without endangering any debt the government might have. Yet some of our southern members of Congress are fighting the bill.

Activity on the part of the railroads will be of immense benefit to the south. They would buy southern timber, southern ties, coal, iron and a thousand other things that we either create or manufacture.

Certainly our southern representatives as southerners are standing in our own light. But the passage of the bill would be a great thing for the entire country.

There is going to be a revival of traffic in this country. Let the roads get ready for it. Let us not have a revival of freight tonnage with the railroads badly equipped to handle it.

We have got to quit this way of refusing to approve something because a corporation may be benefited. This particular act would be of more benefit to the people than the corporation.

There are certain progressive measures that can be undertaken in Washington that will help legitimate capital, help the farmer, the laborer and the business man, and our members of Congress should look into legislation that is sound and economically logical and give it their earnest consideration.

We are getting sick and tired of Demo-

cratic members of Congress jockeying merely for political advantage to be used in some future election just as we are disgusted at certain Republican leaders answering criticisms by abusing past measures, persons or past legislation.—Memphis (Tenn.) *Commercial Appeal*, August 23.

### IT TAKES LABOR—PLUS CAPITAL

In one of his public addresses, many years ago, Colonel Robert G. Ingersoll laid emphasis upon the fact that raw materials have comparatively little value and that finished products have comparatively large value; and he made it plain that it is labor that contributes to the greatly increased value.

Colonel Ingersoll was an American—with all the good qualities the term connotes; and he was an eloquent and forceful speaker. Furthermore, he was right when he spoke of the value labor adds to all products.

But Colonel Ingersoll didn't tell the whole story, didn't reveal the whole truth, concerning production; or, if he did, I find no account of it in the article to which I have access.

Prices and values have changed considerably since Colonel Ingersoll's day, to be sure; but the relation of raw materials to finished products has changed but little. Labor is still the greatest cost of production; but labor isn't, by any means, all that enters into production.

Colonel Ingersoll went on to show that a ton of iron ore in the ground was worth but a few cents, while made into steel rails it was worth many dollars.

All true, but—

We must not lose sight of the very important fact that it isn't labor alone that works the miracle. No laborer, no group of laborers, with brawn and simple tools, could turn the trick. They simply couldn't take a ton of iron ore from the ground today, and make it into a finished product which could be sold upon the market at the market price.

There was a day when such a state of industrial affairs prevailed; but that day is gone—and gone forever. In that day, processes of production were simple. But few classes of goods were produced; and, necessarily, these goods were produced in small quantities. The world couldn't be housed and fed and clothed

today, under the old means and methods of production.

At every stage of the process of production today, there is a necessary business organization; an accumulation of buildings, machinery, tools and general equipment; research laboratories; means for handling and transporting materials and products, in an extensive way; sales departments; purchasing agencies; office forces.

And all these things must exist that the unit cost of production may be relatively small.

In the iron industry—taking that industry simply as an example—there must be shafts and tunnels, tracks and motor equipment, for moving the ore from the mines; there must be smelters and steel mills—acres on acres of costly buildings, acres on acres of expensive machinery; there must be yards and cars and sheds; and there must be office buildings—with costly equipment, housing the managing, buying and selling and bookkeeping forces.

All these things are not done by labor alone.

All the things cannot be done by labor alone.

All these things are not furnished by labor alone.

All these things cannot be furnished by labor alone.

These things must be done by capital, these things must be furnished by capital.

Thus capital today enters into production.

And capital takes all the risks of success or failure.

Shall capital have a square deal—or not?—Chicago (Ill.) *Journal of Commerce*, July 26.

### BEATING THE TRAIN ACROSS

The terrible accident here on Thursday afternoon, in which four negroes lost their lives in an automobile, was simply a repetition of the danger in trying to "beat the train across."

It is one of the strange things in this world that people who have nowhere especially to go; and nothing particularly to do after they get where they are going, when they set out in an automobile, will risk their own and the lives of others in the car with them, simply for speed without apparent reason, or will take a chance on beating a street car or a railway train over a crossing.

Lives are lost every week in this country

by people who try to beat a train or a street car over a crossing.

It requires only a second to slow down the car, and wait until the train has passed, and the danger of accident over.

And yet, with a train rushing down upon them, the driver of a car will take a chance. If the engine of the automobile should be "killed" by the vibration of the steel rail, as is not infrequent, death to the occupants is certain.

The evidence in Thursday's accident clearly showed the driver of the car took a chance of beating the fast northbound passenger train over the crossing. He underestimated the rate of speed at which the train was traveling, and the instant death of himself and his companions was the tragic result.

Automobile driving at any high rate of speed is serious. And those who pass over dangerous crossings can't be too careful for their own sake and the sake of others.—Baton Rouge (La.) *State Times*, August 6.

### Loyalty and Courtesy

Two of the biggest things in the world—Loyalty and Courtesy.

Loyalty is essential to success; it brings personal freedom of mind and real liberty.

Loyalty to your country, your company and your daily tasks raises you in the esteem of your fellowmen, and that means a bigger, better you.

Loyalty starts with your belief that your country and your employer are dependent on you, and that they are loyal to you.

Loyalty—it's the biggest thing in the world. It makes nations and it makes men.

As for courtesy, we agents sometimes think we have a hard time in dealing with the public. It is just as easy to say, "Thank you," and, with a smile, "Call again," as it is to make no reply at all or to look at the patron with a frown.

We are selling service, and the restaurant man is selling ham and eggs.

Did you ever stop to think how much a cheerful smile, a pleasant word, a "thank you," means to the general public? Try it.—J. S. BERRY, *Agent, Sturgis, Ky.*

# Water, Water Everywhere, but How Does the Illinois Central Get It?

*The Company Uses More of This Than of Anything Else, by Volume, and Its Story Is Well Worth Reading*

By C. R. KNOWLES,

Superintendent, Water Service

**W**ATER is one of the most important items necessary to the operation of every railroad using steam as motive power, yet the average person seldom realizes the enormous quantity of water required on a railway system such as the Illinois Central.

During 1920 the water consumed on the system amounted to 17,199,822,000 gallons. This represents the greatest volume of any single commodity used in the operation of the railroad. As a comparison, the water consumed amounted to approximately one gallon for every ten mile of freight handled during this period.

An analysis of the various uses of this water indicates that 12,039,875,400 gallons were used directly for locomotive purposes. The water used at terminals is estimated at 2,235,976,860 gallons; 1,203,987,540 gallons were required by stationary power plants, etc.; 1,719,982,200 gallons were used for sanitary and domestic purposes. Approximately 13,199,822,000 gallons of this water were pumped by the company's pumping plants, and 4,000,000,000 gallons were purchased from municipal and privately owned pumping plants. This represents an average consumption of more than 47,000,000 gallons a day.

## An Extensive Water System

The question of supplying water for a railroad offers far more serious problems than that faced by an individual plant using many times as much water. For example, on the Illinois Central it is necessary to deliver the 47,000,000 gallons a day at 324 different points on more than 6,000 miles of railroad, while the individual pumping station usually delivers the water supply to one point only.

The water supplied the Illinois Central

C. R. Knowles

System is pumped by 158 steam pumping plants, 31 oil pumping stations, 26 gasoline and kerosene pumping stations, 7 electrical pumping stations, 3 gravity supplies and 3 miscellaneous supplies; at 96 points water is obtained from municipal or privately owned water plants.

## Water Has to Be Treated

A total of 1,149,370,000 gallons of water used for locomotives is treated by the lime and soda process at 20 treating plants, 18 of which are located on the Western Lines. In addition to this, we have one caustic soda treating plant and four filter plants all on the Southern Lines. The water for locomotive use is stored in 27 elevated steel tanks and 329 wooden tanks and is delivered to locomotives through 298 water columns. At 126 of the locomotive water stations

water is obtained from wells. The supply is from streams at 141 stations; from lakes at 14 stations, and from springs at 10 stations, while a reservoir supply is available at 33 stations.

A comparison of the consumption of water at Centralia, Ill., offers a good illustration of the increase in the quantity of water used during the last quarter of a century. The annual consumption of water at Centralia in 1898 was 72,637,000 gallons, while in 1908 the consumption was 144,163,000 gallons, and in 1918 it was 288,454,000 gallons. Thus it will be noted that the consumption at Centralia almost exactly doubled each ten years. The consumption of water in 1918 was 79,000,000 gallons less than the consumption in 1914 because of a vigorous campaign against water waste. Except for the saving made through prevention of waste the amount used in 1918 would have been more than double that of 1908.

#### Total for U. S. Runs Into Figures

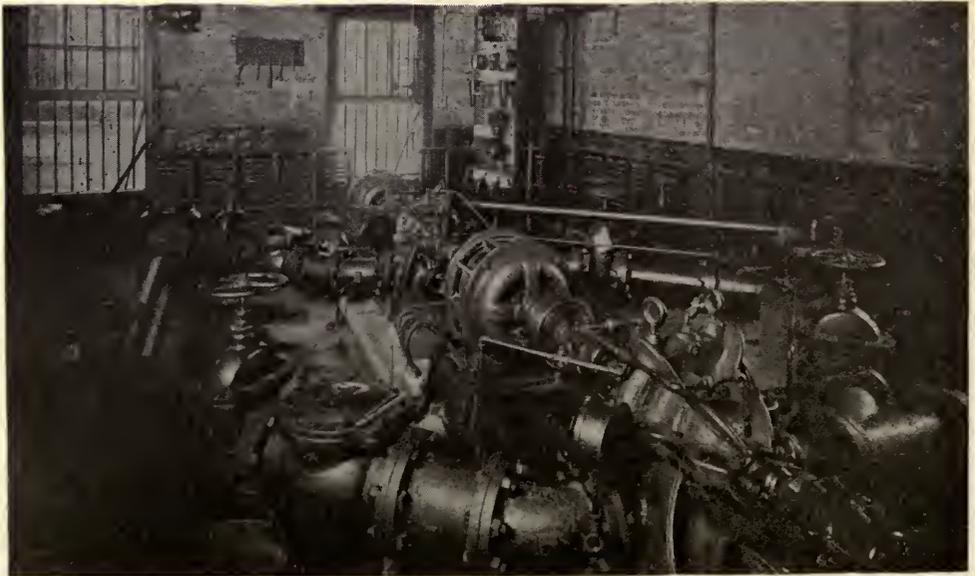

The consumption of water on the Illinois Central is, of course, a comparatively small portion of the total water required by the railroads of the United States, which is

estimated to be—in round numbers—900,000,000,000 gallons a year. To supply the water required in the operation of approximately 65,000 locomotives throughout the country it is necessary to maintain more than 13,000 water stations for locomotive supply alone, in addition to the many required for general service.

The problems common to all railroads in furnishing an adequate supply of good water for railway purposes are present in the Illinois Central System perhaps in a greater degree than on many railroads, due to the fact that climatic conditions vary so greatly over the system. The common belief is that the waterworks man's worst foe is winter and cold weather. On the contrary, with proper precaution, winter offers but few problems, as the available supply of water is generally most abundant during the winter months.

#### Dry Months Cause Most Trouble

The worst condition to contend with is the shortage of water during the dry months of the year, from August to January. As an example, during the past fall and winter we experienced the dryest weather known in the last twenty years, certain portions

*Modern Electric Pumping Station at Kankakee, Ill.; Capacity 1,000,000 Gallons Daily; Automatic in Operation, Pumps Being Controlled by Amount of Water in the Tank.*

*Our Most Modern Equipment: Central Type Locomotive Taking Water at Bloomington, Ill., From 12-inch Telescopic Water Column, Connected With 100,000-Gallon Conical Bottom Steel Water Tank at the Right.*

of the system being without rainfall from May to January.

Fortunately, these conditions were anticipated to a great extent. With the exception of a few points where we depend upon outsiders for water, the Illinois Central suffered but little inconvenience throughout the long drouth, while other railroads operating in the same territory suffered serious delay, inconvenience and

expense through having to haul practically all water required in the territory affected by the drouth. The Illinois Central, on the contrary, was furnishing water to many industries in order to permit their keeping their plants in operation. In November alone, approximately nine hundred cars of water were delivered to various industries in addition to all water required for railway purposes.

---

## *British Put End to Governmental Control*

Direct government control of the railways in Great Britain, which has existed during the past seven years, ended at midnight, August 15.

This action may be said to have been occasioned immediately by the complaints of the shareholders of the various railroads throughout the kingdom on the score that they were at a disadvantage in earning power as compared with other great industrial concerns.

The financial sheets of the British railroads show that, while their net income has been doubled during the past seven years, expenditures have been tripled. The deficit between income and expenditures has,

roughly speaking, been equalized by treasury grants in the form of subsidies. With decontrol the railroads are released from direct government administration and also deprived of government support.

The railways bill (1921) already has passed the House of Commons. In general, the act seeks to place the roads in the position of self-supporting commercial undertakings. It may be said that the bill is a half-way measure between unfettered private operation of the railroads and nationalization of the entire railway system and is an earnest endeavor to obviate the objectionable features of both these forms of operation. Charges are not to be deter-

mined by the operating companies, but by "rate tribunals," and are to be so fixed as to yield an annual revenue equivalent to that of 1913. The rates of pay and conditions of service are to be settled by the central wages board.

Satisfaction over the terms of the new railway bill is expressed throughout the United Kingdom, as it is felt that both the railway companies and the trade unions have got what they asked for and at the same time the general public is protected by the tribunal, which establishes maximum traffic charges. This act, coming immediately after decontrol, substitutes forms of regulation which are more far-reaching than anything known to the experience of the

country, since it takes from the various companies the prerogative to make their own rates and settle differences with their own workmen.

For purposes of administration and to secure greater economies as to personnel, improvement in traffic and general co-ordination in service, the railway systems of the United Kingdom—composed of twenty-seven great constituent and ninety-six subsidiary companies—are to be amalgamated into four main groups. It is reported that the railroads are endeavoring to make revenue more proportionate to expenditure by increasing traffic rather than by pressing for higher rates.

## How Two Employes Saved a Baby's Life

Illinois Central employes have proved faithful to the best traditions of the company, above and beyond the call of duty, so frequently that performances of that sort have come to be regarded more or less as a matter of course. Seldom, however, are employes called upon to risk their lives to save lives; but when such a call comes, there is always someone to respond.

A recent instance of this is reported in the following letter written by Mr. and Mrs. O. E. Jordan of Bogue Chitto, Miss., to Superintendent T. J. Quigley of the Louisiana division. The employes referred to are Engineer Robert Pfrangle of McComb, Miss., and Section Foreman T. J. Waller of Bogue Chitto.

"We are writing you this letter to call your attention to the heroic conduct in the very efficient and difficult discharge of their duty of two employes of your company, the circumstances of which were as follows: Our 18-month-old baby in some way slipped out of the house and on the railway tracks. In a very short time, before his absence from home was noticed, a heavily laden freight train (southbound) approached, in charge of Engineer Pfrangle. In spite of Mr. Pfrangle's most determined efforts to stop his train, the child would have been run over

and killed had it not been for the presence of mind and prompt action of Foreman Waller of this section, who at imminent risk

Oscar Eugene Jordan, Jr.

of his own life dashed in front of the moving train and jerked the child out of danger—the pilot of the engine was in less than three feet of them as he cleared the track.

"In calling your attention to the foregoing, we are doing so without knowledge of these two men. This engineer, Mr. Pfrangle, did his full and entire duty with fidelity and presence of mind, not always found under like circumstances, and by reason of his manner of handling his train made it possible for Mr. Waller to reach the child in time to save him. However, despite Mr. Pfrangle's most determined and heroic efforts to stop his train, the baby would have met a horrible death had it not been for the prompt and self-sacrificing action of Mr. Waller, who, without a moment's hesitation, took his own life in his hands in effecting the rescue. If ever a man deserves a Carnegie medal, this man does.

"Words are a very poor medium through which parents can hope to express their feelings in a case like the foregoing; hence we are writing you and relating to you and, through you, to the company all the circumstances as stated above, so that if there is

*T. J. Waller*

anything we can help the company do to reward these men for their unselfish and fearless fidelity to their duty, we want to do it. We feel that the Illinois Central is fortunate indeed in having such men in its employ and that its welfare will never suffer in the hands of such men."

#### A. P. HUMBURG WEDS

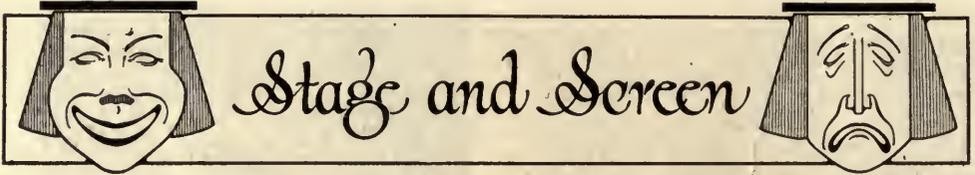

Andrew Phillip Humburg, commerce counsel for the Illinois Central, was married to Miss Dora Ellen Grass, Thursday, August 18, at the home of the bride's parents Mr. and Mrs. Harry White Grass, at La Crosse, Kan. E. A. Smith of the Illinois Central law department acted as best man, and Miss Alma Grass, a sister of the bride was bridesmaid. The couple left after the ceremony for Boulder, Colo., where they are spending their honeymoon.

Mrs. Humburg is a graduate of Ottawa University, and for several years has occupied an important position in the faculty of the State Normal School at Hays City Kan. She has devoted much attention to music.

Mr. Humburg for more than twenty-five years has devoted his talents and energy to the work of the law department of the Illinois Central. For more than ten years he has been commerce counsel of the system.

*Robert Pfrangle*

SEPTEMBER SEES the real opening of the winter theatrical season in the big cities. Playhouses which have been closed and dark all summer again are lively with crowds, and the prospects for good business never were much better, according to many of the managers. New York is seeing the usual number of new pieces, some of which have been imported from overseas.

IN CHICAGO, too, there is an importation, but most of it is from New York. "The Midnight Rounders," a musical show, opened on the matinee of Labor Day—Monday, September 5—with Eddie Cantor, formerly of the Follies, as star of the production. August 27 saw the opening of "3 Live Ghosts," a comedy. Leo Ditrichstein is playing in "Toto," a comedy of French origin. Florence Reed in "The Mirage" opened on September 4, as did Holbrook Blinn in "The Bad Man," a satirical comedy of the Mexican border. "Up in the Clouds" is still running. Frank Bacon has arrived in "Lightnin'."

THE END of September will see the Shuberts launched in their vaudeville venture, which they are going to push on a large scale. Represented in their circuit will be New York, Chicago, Philadelphia, Brooklyn, Boston, Baltimore, Washington, Pittsburgh, Cleveland, Dayton, Louisville, Detroit, Cincinnati, Springfield, Mass., Newark, N. J., Providence, R. I., Montreal and Toronto, Canada, Buffalo, Syracuse, N. Y., St. Louis, Kansas City, Toledo and Indianapolis.

E. H. SOTHERN and Julia Marlowe returned to this country from England recently. They open in Boston September 26 for a tour of the country in Shakespearean repertoire.

HANS BARTSCH, the play broker, arrived in New York recently from a trip

abroad with a batch of foreign plays in his trunk. The musical ones include "The Baroness Lili," with book by Martos and music by Eugene Huszka. It is an operetta from the Hungarian and will be produced by the Shuberts. Other musical pieces are "Offenbach," a play founded on the life of the composer, and "The Divorce Mill."

IN PLACE of the incidental music for "Don Juan," which was to have been arranged for Lou Tellegen by Geraldine Farrar, but has not been forthcoming, Theodore Bendix will select old Spanish music to be played during the course of the play.

FOUR COMPANIES, a total of 1,100 players, are using the Manhattan Opera House, New York, for rehearsals just at present. "Mecca" is being rehearsed on the stage proper, "Aphrodite" is using the foyer, "Chu Chin Chow" is rehearsing on the second floor, and "Afgar" is using the rehearsal room.

HEDDA HOPPER, wife of De Wolf Hopper, has been engaged for a part in "Six Cylinder Love," the comedy by William Anthony McGuire, to be produced by Sam Harris.

CORNELIA SKINNER, the daughter of Otis Skinner, and a graduate of Bryn Mawr, will appear with her father in "Blood and Sand." Miss Skinner has studied dramatic art in Paris for a year.

IMMEDIATELY upon Sir Harry Lauder's arrival from abroad on October 3 he will spend a fortnight at William Morris' summer estate, "Camp Intermission," in the Adirondacks, where he will indulge in his favorite pastime of hunting, fishing and golfing, prior to opening his forthcoming annual tour at New York October 17.

JANE COWL, who has spent the sum-

Rounders"

Charles M. Naughton, Darryl Belmont, and  
Olive Reeves-Smith in "Three Live Ghosts"

mer in England and France, seeing all the new plays and motoring through the battlefields of France, is home. Miss Cowl will continue her appearance in "Smilin' Thru" until around Thanksgiving, when the Selwyns will present her in a new play.

IN THE MOVIES, Harriett Hammond, a one-time Sennett bathing beauty, who was graduated into the ranks of featured players, has been engaged by Maxwell Karger for his new Metro production, "The Golden Gift," in which Alice Lake is starred. Miss Hammond recently completed work as leading woman for Roscoe Arbuckle in "Should a Man Marry?"

RUPERT HUGHES, who has been busily engaged for the past two years turning out photoplays for Goldwyn, does most of his writing between 11 at night and 2 in the morning. His days he spends at the studios.

THEODORE ROBERTS has sufficiently recovered from his attack of illness again to take his place upon the screen.

THE ARBUCKLES certainly seem to run to poundage. There are three of them in the movies, all unrelated. Andrew Arbuckle weighs 235 pounds and appeared with Mary Pickford in "The Hoodlum" and also with Mabel Normand in "Pinto." Maclyn Arbuckle has played on both the stage and screen versions of "The County Chairman." The heaviest and perhaps the most famous of the Arbuckles is Roscoe, otherwise known as "Fatty," who registers 250 pounds on a Fairbanks scale.

IT IS HARD to realize that every time the clock ticks while you are watching a motion picture you have seen 16 separate pictures. Each minute you watch the picture 960 separate pictures are flashed before your eyes. In two hours you will have seen 115,200 individual pictures. The pictures are flashed on the screen so rapidly that the eye is not able to detect the fact that what you are actually seeing is a series of individual pictures with a very short pause between each one when the screen is absolutely blank.

THE AVERAGE five-reel feature film costs from \$100,000 to \$250,000. In an average production costing \$140,000, about 18 per cent, or \$26,000, is paid in salaries to the actors. In such a production the average cost for the scenario would be \$2,795, or 1.99 per cent of the total cost. About 19 per cent of the cost of a picture is paid out in salaries to mechanics, electricians, stage hands, carpenters and laborers.

A NEW TYPE of automobile story is being filmed by Charles Ray. It is called "Gas, Oil and Water," and the cast includes Charlotte Pierce, Otto Hoffman, Robert Grey, William Carroll, Bert Offord and Dick Sutherland. Mr. Ray is slated to essay numerous airplane and motorcycle stunts.

MOST FIRE SCENES are faked by means of smoke pots and flare torches. These smoke pots are very much like fat, short cannon crackers and are lighted much the same way, with a fusc. They pour forth a steady column of thick smoke for a long time. By means of these and flashes of flame from flare torches, a good director can simulate a very creditable fire scene. Occasionally, where some particular effect is needed, and where it can be done safely, a house or building will actually be set on fire.

CHARLIE MURRAY has gone back to his first love, vaudeville. Murray, who is now 49 years old, was on the stage for twenty years before going into pictures. He was a member of the famous old vaudeville team of Murray and Mack and began his screen career with the old Biograph Company. He was a comedian with Keystone in the days of the famous old Keystone cops. Murray is 6 feet tall, weighs 200 pounds and has red hair.

ALTHOUGH Bill Hart "retired" almost a year ago, he is now planning a comeback next February. He said he plans to make four pictures a year, at least half of which will not be Westerns. With the censors so busy in so many states cutting out revolver, holdup and shooting scenes, it is somewhat difficult to put on the old Westerns with their thrills and fights.

# Some Views of Our New Equipment

The Illinois Central is dressing up a little. Herewith we present views of the new equipment mentioned in the August issue. These additions include: Twelve 70-foot compartment coaches with two partitions, No. 3150 to No. 3161 inclusive; eighteen 70-foot baggage cars, No. 755 to No. 772 inclusive; five 70-foot dining cars, No. 4000 to No. 4004 inclusive; twenty suburban cars; No. 1301 to No. 1320 inclusive.

The Chicago newspapers carried stories and pictures regarding the new steel suburban cars when they were put in service. A folder with the following information, signed by President Markham, was distributed to each patron in the new cars:

"We believe you will be interested in learning that these cars introduce the first feature of the plan for the electrification of the Illinois Central Railroad Company's

Suburban

Pullman Co.

Chicago Terminals. The cars were designed for use interchangeably in trains propelled by electricity and steam, so that you may have the use of them immediately.

"Before deciding upon the plans for these cars our engineers studied the latest designs of cars used for suburban traffic in this country and the principal foreign countries, and we believe the best points developed in these studies are combined in these cars. The cars are entirely of steel construction. Every seat is provided with a high-opening window. The aisles and end doors are sufficiently wide to provide for comfort of pass-

engers in entering and leaving the cars. Other features, we believe, will commend themselves to you. On the other hand, you may find objectionable features. It will therefore be most helpful to us if you will let us have the benefit of your criticisms, and we trust that you will express your opinions freely.

"It is our desire to render the kind of service that will satisfy you. You can help us and also help yourselves by co-operating with us to that end. We seek your confidence and support."

## Old-Timer Recalls Railway Club

TO THE EDITOR: I am sending you an "Old-Timer" article for our magazine written by an O. T.

"The Illinois Central Railroad Club?

"Does this title recall anything to you, 'Old-Timer?' Does it bestir any atom of gray matter 'way back in the extraneous portion of your think-tank and awaken that elusive thing called memory?

"The eats, the jokes, the talks and the smokes all were conducive to good-fellowship, which in turn promoted a better understanding and more cordial relations among the various general offices of the company.

"How come? Well, the personnel of the club was composed almost entirely of chief clerks, with a smattering of a few 'higher ups,' and at the meetings, which I recall were held on the second and fourth Mondays of the month, someone read a paper or gave a talk on his own particular line of work.

"A general discussion followed the reading or the speech (prepared carefully beforehand and committed to memory) of the 'extemporaneous' orator, and many a wrinkle was ironed out and kinks straightened in affairs that had been in a state of protracted controversy between departments. Likewise, the co-operative 'I Will' spirit started many a matter that had been placed 'last out' for some convenient tomorrow.

"All appeared to enjoy themselves, and

the combining of business with pleasure seemed a success for a time, but after a while, through lack of interest and support, the meetings were discontinued, and the club dropped out of existence.

"I have always considered this a serious mistake, and I, for one, would like to see this 'get together' idea revived, as one can accomplish so much more with the other fellow if he can call him 'Bill' instead of 'Mister.'"—C. W. T., *Accounting Department, Chicago.*

### HAS FREIGHT-CAR GATE

J. F. Watts, clerk for the Illinois Central at Memphis, Tenn., has patented an adjustable bracing gate and live stock separating partition for use as equipment inside of freight cars. Mr. Watts expects his invention to save the railroads a large sum of money that is now being paid out in loss and damage claims. A recent demonstration in Chicago was made with a small model of an Illinois Central box car.

The adjustable bracing gate slides on a track at the side of the car. It can be brought to any position and fastened with strong pins. This, Mr. Watts claims, will make less-than-carload shipments much safer. The gate can also be used as a live stock partition and a grain door.

He intends to demonstrate his invention to all the large railroads of this country and Canada. The model Illinois Central car is carried as a grip.

# No Easy Matter This, Scoring 100 Per Cent in "No Exception" Campaign

*How Jackson, Tenn., Did It Is a Story of Many Trials and Tribulations and Being Always on the Job*

*Although the "No Exception" campaign on the Illinois Central System has passed to a glorious history, the need for the prevention of exceptions is still with us. It is with the thought of encouraging the prevention of exceptions that the following entertaining and instructive account of how Jackson, Tenn., made a 100 per cent record in June is given the readers of the magazine.*

By **F. B. WILKINSON,**  
Agent, Jackson, Tenn.

**W**E have been asked to tell how we managed to avoid having an exception chargeable to us during June. To tell the tale we must begin at the beginning.

The Tennessee division has always been greatly interested in the safe and proper handling of freight, and we, who were doing the work, felt that we were just as good freight handlers as folks ever got to be. To be honest about it—we were fully satisfied that we knew all there was to be known and that our organization performed with the smoothness of the proverbial sewing machine.

## Held a Preliminary Campaign

Our superintendent and supervising agent evidently did not fully agree with this, for they decided upon a Tennessee division "No Exception" campaign, which was to be held during the period of December 6 to 11, 1920, and they made it plain to us that the station making the poorest record would not be applauded.

We discussed the matter with our force, and as a result of the conference we were strengthened in our assurance that but little improvement could be made at our station. We decided, however, that other stations, particularly those to which we loaded our freight, lacked that high degree of perfection which characterized us, and that the local train crews were sorely in need of our

F. B. Wilkinson

attention and advice. Encased in an armor of self-righteousness and all puffed up with pride, we struck boldly out to preach the gospel of reform to those of our fellows who were blindly groping in freight-handling darkness.

We soon found that the missionary effort which we were so cheerfully and enthusiastically expending upon our neighbors was more needed at home than abroad. It is a hard thing to acknowledge, but we soon found that the train crews and agents at the unloading stations were so busy trying to find our freight that we had failed to load in

proper station order, or that we had otherwise mishandled, that they really did not have the time to give their own freight the care and attention they knew it deserved and that they wanted to give it.

We quit our job of missionary and returned to the heathen at home—chief among whom were we.

#### Properly Received and Chaperoned

At home we began at the beginning. That is—we began with the agent. We gave the incoming freight from the city a personal reception at the warehouse door and stayed with it until the car in which it was loaded had been closed and sealed.

Next, we met the incoming merchandise cars and chaperoned the freight from the time the seal was broken until the freight either had been delivered to the drayman or had been stowed and sealed in the car into which it was transferred or consolidated.

We most heartily recommend this personally conducted freight-house tour to any freight agent who is satisfied that everything is all right at his station, or to the agent who is interested in strange animals and who wishes to see, at first hand, just what queer creatures can thrive and grow fat in the rarefied atmosphere of his most excellent station.

When we had finished our tour we were absolutely sure that no mistake was made when it was commanded that "the gospel should be preached to every nation"—beginning at Jackson.

#### Noticed Substantial Progress

Our intensive supervision finally resulted in our being able to forestall many errors of omission and commission which otherwise might have escaped us, and, the fact that we were taking such an unusual interest in station platform affairs inspired our warehouse forces to greater effort than ever before. By the time the campaign closed on December 11 we could see that we were making substantial progress.

Our division officers were so well pleased with the results of the campaign that another was planned for February 7 to 19, 1921. Forearmed by the experiences of the previous campaign, we were able to make still greater progress during the February contest, and when, at its close, we stood charged with only two exceptions, we began to feel

that we were really not so bad after all, and we entered with confidence into the Southern Lines "No Exception" campaign, which began May 1.

We might more truthfully say that we entered the race with over-confidence and that we ran with the same handicap, for when the month was ended we stood charged with seven errors, consisting of three bad orders, one pilferage and three overs. All these occurred despite the fact that we had honestly tried to make 100 per cent during the campaign.

#### Planned for Even Better Work

We had failed somewhere, but where? It was vital to us to discover just where the trouble lay, for about that time we had received notice that we had been entered in a contest which was to be waged during

### *Remember September!*

CAR REPAIRERS, INSPECTORS AND OILERS CAN SAVE COAL—

1. By stopping all air leaks in train line.
2. By repairing defective triple valves and connections.
3. By close inspection of brake beams and brake connections.
4. By proper oiling of journal boxes, so that train will not have to stop on account of hot-boxes.
5. By close inspection of running gear, so that there may be no cause for an extra stop.
6. By completing inspection of train and having it ready to leave on listing time.
7. By seeing that all car doors are closed when train leaves terminal.
8. By seeing that side bearings on cars have proper clearance, so that trucks will adjust themselves after passing around curves.
9. By seeing that hand and power brakes are released on cars before trains leave terminal.
10. By seeing that defective or suspicious air-hose are removed from cars before train leaves terminal.
11. Foremen can help by seeing that all water and air leaks are repaired immediately.

June between the Northern and Southern Lines to determine who could best handle freight. Not only would our own reputation and that of the Tennessee division be at stake, but our grand division itself would be on trial, and the station which failed would certainly not be applauded by our general superintendent. That is—he would not applaud in such a way that one would enjoy the applause.

A council of war was held, at which every one who had anything to do with the movement of freight at the station was present. Our problem was earnestly discussed from every angle, each man telling of his experiences during the preceding campaigns and offering preventative suggestions which would safeguard us during the coming contest. The feature of the conference was the earnestness and eagerness with which each man entered into the discussion and the spirit of loyalty to the station and to the Tennessee division and the Southern Lines which was displayed.

The errors which had embarrassed us during the Southern Lines' campaign were taken up and analyzed in detail. This analysis proved to us that much of the trouble had originated here at home, but we were also convinced that some of it was likewise with the train crews and the local stations which unload the freight we handle.

### A Reversal of Appomattox

During the previous campaigns we had made trips on local freight trains, and, while we had met with hearty and intelligent cooperation from every one of the agents and trainmen, we felt that it might be well for us to visit and counsel with them again.

The first response received was very encouraging. We explained the situation to a local freight conductor and told him just how difficult we felt that it would be to defeat the Northern Lines, because they had just completed a thirty days' "No Exception" campaign and their men would be well trained and eager for the fray. He listened attentively, and when we had finished he snorted and exclaimed: "Thunderation, man, you needn't worry. We'll beat them Yankees like they did us at Appomattox, and then

some." This was the spirit that made our record possible.

The supervising agent had helped us mightily during the previous campaigns and was with us on the firing line when we went over the top on the morning of June 1 and he was with us until the last shot was fired on June 30.

### Supervising Agent on Firing Line

During the late war an amusing incident occurred. A negro was scurrying toward the rear while a hard-fought battle was in progress, and as he ran he was hailed by an officer.

"Where are you going and who ordered you back of the lines?" the officer called to the frightened negro.

"My captain sent me back an' I'se gwine back, too," the negro yelled without slackening his speed.

"Stop, nigger," the officer shouted, "I am a lieutenant-colonel."

"Good Lawd, is I dat fur back?" the negro exclaimed, and he sat down and mopped his face. "I shore didn't think I had cum dat fast."

What we needed was not a man behind us to direct us, but a man who knew, in front, to lead us. We had this man in our supervising agent. Without his timely assistance and advice it would have been impossible for us to have won out.

Our real estimate of the value and importance to the agency of the supervising agent could not be better illustrated than by the following:

An agent and a conductor were discussing the relative merits of the various inventors of this century. The conductor argued that Thomas A. Edison had done more for humanity than any other inventor and was, therefore, entitled to the honor, while the agent argued strenuously for Charles G. Richmond.

"Heavens, man," the agent exclaimed, "all Edison ever invented was electricity and the phonograph, while Mr. Richmond invented the supervising agent."

### Started With a "Pep" Talk

June 1 arrived, and the fight was on. The opening gun was fired when we called together our warehouse and platform forces

and gave them a short "pep" talk before we started over the top. Each man was a veteran of the three previous campaigns, knew his job and had the will to do.

To get a package safely to a patron at destination you must first get the package. This is fundamental. After you get it, you must know that it is in a strong container; that it is correctly, legibly and durably marked; that it is loaded into the prescribed car; and that it is correctly described and waybilled in the prescribed car. Having started the package right, you may reasonably expect it to reach its destination in safety.

We did all of these things and made our record show the name of each man who participated in the various inspections and movements, so there would be no question as to responsibility in case of error. The same record was kept of freight consolidated or transferred. By it we were able to know positively just who checked and supervised the movement of each shipment, the name of the man who loaded the freight upon

the truck and the name of the man who stowed it. The pickers and stowmen kept such a close watch upon the movements that they could, in the majority of instances, remember the name of the man who trucked a shipment and the position and place the freight occupied in the car. During the campaign an amusing incident occurred which proves this.

#### The Top Was on the Bottom

We received a wire from a local agent who stated that a top was missing from a milk can in a shipment that we had transferred the day previous. We questioned our force and found that the stowman who had handled the shipment remembered the can in question. He said that the missing top could be found on the bottom of the can. This was good news to us.

We immediately wired the complaining agent: "Top is on the bottom of the can."

He evidently thought that we were joking him, for he replied: "Bottom is on bottom, but top is not. Answer."

We tried to be more specific this time and

*The Force That Put It Over: Back Row, Standing, Left to Right—Truckers Bill Simpson, Henry Ware, Horace Theus, Jack White, Frank Houston, Sam Matthews, Charles Luckey and Charles Cranberry.*

*Second Row, Seated—Chief Clerk W. H. Brooks, Check Clerks W. B. Day and E. A. Bell, Foreman F. A. Williams, Warehouseman J. A. Coppedge.*

*First Row, Seated—Break-Out Curtiss Comer, Stowman Andy Stewart, Break-Out Marion Patterson, Stowman P. P. Major, Stowman Alf Bolin.*

wired him: "Look on bottom of can, and you will find the top of the can stuck in the bottom of the can."

He then found the top on the bottom, and the incident was closed. The stowman was vigorously applauded. We think he deserved it.

The agency forces were not the only ones who were interested and who made strenuous efforts to prevent exceptions. During June it seemed that we had an epidemic of leaky cars and an unusual amount of rain. Here we want to pay a tribute to the car and yardmen who played such an important part in preventing exceptions by their careful selection of cars for our loading. The yardmen made an extra switch in order to furnish us waterproof cars, and not a car was roughly switched after it was loaded.

#### Wouldn't Take a Little Chance

Many incidents could be related that would reflect the fine spirit of helpful co-operation which was in evidence throughout the campaign by employes of every kind, but space forbids our mentioning more than a very few. Two are so good that we simply cannot refrain from relating them. They illustrate so well the spirit which made our achievement possible.

One hot, sultry day during the campaign we discovered a conductor busily engaged in re-stowing a shipment of flour in clayed bags. It transpired that he had found the flour stowed against a shipment of agricultural implements. None of the bags had been damaged, and the shipment was scheduled to unload at a station less than fifteen miles distant. The conductor felt, however, that the risk was too great; so he removed every sack of it to a safe location in the car, and from the first telephone station paid his compliments to the loading agent for his carelessness. He was not content to rest when he had removed the danger from that particular shipment. He protected future shipments by his prompt action in reporting to the loading agent. This was real team work, and that the conductor was an extra man adds to its significance.

#### Slow Stop Saved the Goods

The other story that we must tell is that of an engineman whose train was rattling

along down grade at such a fast clip that the engine passed by the water spout. This caused some delay, and a division officer who witnessed it wanted to know why he did not stop sooner.

"I misjudged the speed a little," was the engineman's reply, "and I couldn't make a quick stop because this is 'No Exception' month and I can't take a chance on jazzing up that merchandise on the rear end of the train."

This engineer was not a Tennessee division man, but he has the Tennessee division spirit, which, we are proud to say, is the spirit of the Illinois Central System.

It is this spirit which made our achievement possible, and which makes the Illinois Central System the-peer of all the railroads upon the earth.

#### MEN STUDY HOW TO SAVE

As an example of the spirit which permeates the organization of the Illinois Central System and helps to make it the greatest railway system in the world may be cited the class which twenty-five young men who are employed as engineers and firemen on the Chicago terminal division hold twice weekly at the 63rd street office building. The class studies fuel conservation, locomotive machinery and airbrakes. There are twenty-five regular members and others who drop in from time to time, and the class is growing. The men hope that in time it will include every engineman on the Chicago terminals, and then they would like to see it spread to all the system.

The class is organized and run by and for the men, and it is hardly necessary to add that it has the enthusiastic approval of division and general officers. Meetings are held every Tuesday and Friday night. Two brothers are among the leaders, C. C. Kempf, a fireman, being chairman, and F. A. Kempf, an engineer, vice-chairman. C. E. Hughes is secretary.

The members of the class have been preparing to take part in "Fuel Economy" month. At their meeting Tuesday night, August 30, they invited in General Boiler Inspector J. F. Raps, who made an interesting talk to them on "The Construction and Maintenance of Locomotive Boilers."

# CLAIMS DEPARTMENT

## A Judge on Ambulance Chasing

"That capital is now scared of Mississippi is due largely to the unethical practices of some of our lawyers in flooding the courts with personal damage suit cases, and the verdicts secured on the slightest pretenses," declared Judge R. W. Heidelberg in a recent address to the Rotary Club at Hattiesburg, Miss.

"I have known of many instances where some of these lawyers go to the extent of bringing men into court to swear to lies. And it is strange to me that business men, whose affairs are affected because of these conditions, often employ lawyers of this class to handle their business when they could secure the services of ethical attorneys who would try to do the right thing. Lawyers of the ethical class are thus forced to meet unfair competition, since our ethics forbid advertising.

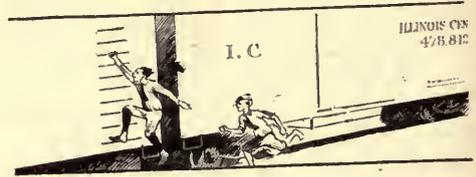

"I say to you that the shyster lawyer who brings perjured witnesses to the witness stand to win a personal damage suit case is no better than a highwayman. In fact, he is not so good, for he lacks the physical courage, and does not encounter the same physical dangers as does a robber. He will go into court to get your property, and thereby runs no chance of physical harm. Such a lawyer in a community is as dangerous as a rattlesnake. And business men who encourage such attorneys by employing them are aiding the very man who is the cut-throat of business in our state."

## Adds to Cost of Transportation

The law forbids the practice of hopping trains, and whenever boys steal away from home for the fun of hopping on the cars there is great danger of injury to them. This is what happened to Timothy Cleary at La Salle, Ill., when he lost a leg back in 1908. He waited ten years before starting a suit, and finally came into court with a story all his own.

Doubtless he hoped that so long after the

accident none would be found who could remember that the unfortunate injury came in hopping a train. But he had misjudged the memory of man, for, although it was years afterward, he was confronted in court by the very boys who were his companions and who now contradicted his story by relating the

true circumstances of his stealing away from home and hopping the train.

The case was tried twice. Twice were employees taken from their work, and other witnesses transported great distances, so as to be present at the trials, which used up days of the time of court and jury. Of course the plaintiff failed in his attempt to get his fingers into the funds which should be used in the furtherance of transportation—few people would have dreamed that he would ever try—but even this expense of trying cases which have no merit is a considerable drain upon the funds of the railroads.

## Damage Suits Again

In anticipation of the approaching term of the Hinds County Circuit Court, our semi-annual damage suit epidemic is making its appearance.

Damage suits are far more deadly than pelagra, for that disease is both preventable and curable.

But there seems to be no hope whatever for the lawyer who has a mania for filing damage suits. His disease is chronic.

A striking illustration of the injustice of these suits is furnished by a declaration filed

here a few days ago. The action is in behalf of a 12-year-old boy named Clark who lost a leg while stealing a ride on a freight train. The evidence shows that the boy went to the South Gallatin street crossing to meet a group of Boy Scouts. A fast freight train, made up of banana cars, was passing, and the youngster jumped aboard. A short distance down the track there was a switch target. The boy's body swung outward, struck the switch target, and he was knocked off the ladder, one leg being crushed by the passing wheels.

It was an unfortunate accident, of course, and everybody sympathizes with the youngster who is forced to go through life minus a leg. But there can be neither reason, justice, nor the slightest measure of common sense in giving him the judgment for \$30,000 sought in the declaration just filed. He was unquestionably a trespasser. He had no business of any kind aboard the freight train. No doubt he had been repeatedly warned by his parents not to clamber aboard trains. And yet, on the shallow pretense that the train was running at "an illegal speed," an effort is to be made to mulct the railroad of \$30,000.

The suit is not unusual. In fact, it is typical of a majority of the damage suit actions filed in our courts. As every well-informed person well knows, when the claim against a railroad is just, and the liability is conclusive, it is never necessary for a claimant to go to court. It is always possible to settle directly with the company. In practically every instance, when these big damage suits are filed, they are utterly devoid of legal or moral ground of action, and the only hope of the attorney is that he may be able to get a rabid anti-corporation jury, or else induce the company to settle for a small sum, rather than incur the expense of a trial in court.—Jackson (Miss.) *Daily News*, July 31.

### A Death of Disappointment?

Some days ago a cow was discovered on the right-of-way near Yazoo City, Miss., by Sec-

tion Foreman T. O. Davis. A freight train was heard in the distance, and Mr. Davis sent one of his laborers to drive the cow off the right-of-way. He succeeded in getting the cow away from the track, but before he got her entirely off the right-of-way, she fell dead. The veterinarian who was called to hold a post mortem stated that the cow died of disease, but there were those among the men who thought that disappointment, because she could not go the same route as so many of her ancestors, hastened her departure from this world.

### Another Settlement Over-Ripe

Fruit won't hang on the tree after it is ripe, and the litigant who is sparring for a settlement must recognize the proper time to pick it.

Six years ago the scene was laid near Newell, Iowa. The setting was a railway crossing, and the cast included, besides the principals, Frank A. McFarline and his wife, May McFarline, their obedient servant who had in his day been a worthy contender among fast race horses but who now played only the minor role of pulling the buggy in which the two were riding. There was a quick lash of the reins, such as the race horse had probably not felt for years, but it was the once familiar touch, and the response was instant, as if the race were on once more. He jumped, but the buggy failed to measure up to the spirit of the occasion and tipped its occupants out on the ground. They were not struck by a train, but they claimed they were crossing over just ahead of one.

As a sequence to the first act, the next was set in the surroundings of the courtroom at Storm Lake in the presence of judge and jury. The bringing of the suit had compelled the railroad to come in and defend.

While the railroad could not appreciate any valid reason why it should be called upon to pay for the little tragedy, yet, in its pursuit of a policy of keeping out of court, a neat sum had been offered to persuade the plaintiff to drop the litigation and thus save the railroad the expense of bringing its witnesses to court and other expenses of the trial. The plaintiff's lawyers had been sparring for a settlement; now their opportunity was ripe. But still they wanted more, and this kept them

from picking the fruit which was within their reach.

The judgment entered by the court at the conclusion of the trial denied the plaintiff any recovery, leaving the plaintiff to pay the costs.

While Mr. McFarline evidently was after the railroad's money, yet we cannot believe that he was anxious for a real law suit. He was always friendly throughout the trial, swapping stories and cigars with the claim agents who were present, and after the trial asked pardon for having put folks to so much trouble. It might be surmised that he would have been better satisfied if his lawyers had accepted the settlement offered by the railroad.

### A Good Ticket, but the Wrong Train

Hark to the story of E. S. Bradbury of Belleflower, Ill., who on June 19, 1919, boarded Train No. 17 out of Chicago for his home, a place where No. 17 was not scheduled to stop. When asked to leave the train at Gibson City, he refused. A policeman came aboard and took him off. Later he sued the company for damages.

While he was in the restaurant of Gibson talking about the matter, a friend offered to take him home, which was but a few miles away, but he preferred to remain and cuss and discuss the subject. He said that he had been greatly humiliated, greatly wronged and injured—that he had a ticket to Belleflower, that the ticket agent at Chicago said this train stopped at Belleflower, that the porter said it would stop at Belleflower, and by jinks that he himself said it would stop at Belleflower, too, that night. But it didn't.

Of course, although he said that he was directed to get on this train by the ticket agent and the porter, the latter said they did not advise him the train would stop at Belleflower. But who would believe a ticket agent or a porter? He had his ticket and was on the train; now it was up to the railroad to deliver him, if he once got on.

The case was tried at Paxton, and the court instructed the jury for the defendant.

It so happened that Bradbury produced the ticket he purchased at Chicago as evidence of his authority to ride, and to ride to Belleflower. There was some reading matter on this little wretch that had escaped the official notice of Bradbury wherein it said: "Good to destina-

tion on trains scheduled to stop there; otherwise passenger must take local train."

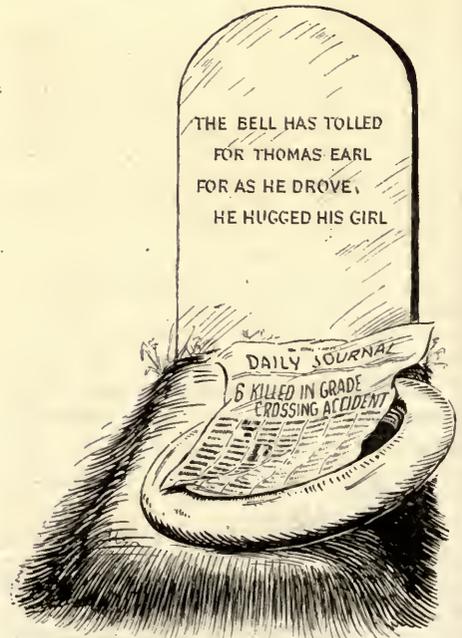

The case was taken to the Appellate Court. An opinion was rendered a few days ago in which the court said:

As between a conductor of a railway train and a person riding thereon, the latter's right to transportation depends upon his ticket. The ticket presented by appellant entitled him to ride on only such trains as were scheduled to stop at Belleflower, the destination named on the ticket. His ticket did not entitle him to ride upon the train in question, and when the conductor informed him of that fact and requested him to leave the train at Gibson City and to take the next train, which would stop at Belleflower, it was his duty to do so. Whatever indignity, humiliation or mental anguish the appellant may have suffered by being compelled to leave the train with the officer was the direct result of his own conduct, and he cannot recover damage from appellee therefor.

Speaking of the ticket agent and the porter as having told this man that he could go to Belleflower on this train the court remarks:

Neither the ticket agent nor the porter could waive the limitations on the ticket without authority to do so, of which there was no proof.

S. M. Copp and C. D. Cary herewith present No. 4 in their series of epitaphs:

### The Penny We Save

The lake was crested with feathery foam, as the waves splashed up on the beach and quickly receded. The sand under the July sun was a stretch of bleaching brightness. Far out in the water the red-and-black-capped heads of the more venturesome bathers bobbed up and down like floating buoys. It was a deliciously lazy afternoon. I lay at full length, and the girl sat close by, still in bathing costume, and dug damp little holes in the sand with her slender toes. She was a blue-eyed, round-faced, smiling sort of girl, and I had been attracted to her instantly.

"Sitting out here makes one think of so many things," she sighed. "I do so want a vacation, but I really can't afford it."

"Have you been out of work?" I inquired, for we had met only that day.

"Gracious, no. But I haven't saved a penny all year. You see, I worked for the government at the shipyards in Philadelphia for eighteen months during the war. Living was higher in the East, and I went about a lot, and I spent all I earned then. I just don't save for vacations, or rainy days, or anything else. My bills and the little old pay check run a race every two weeks, and it seems that the bills are always waiting when the money comes in."

"That's bad business, girl," I said. "We are creatures of habit, and that applies to saving as well as to anything else."

"But I do so love pretty clothes," she persisted.

"What girl doesn't? The trouble is that most of us don't know how to buy clothes. There are three questions which you should ask yourself before making a purchase: First, do I need this thing? Second, will it

fit in with my present wardrobe? Third, is it worth the price?"

"Is it worth the price?" she repeated, measuring the words. "Do you know, I believe you are right. I have said to myself often that a certain blouse or hat wasn't worth what it cost me, and I wished I had my money back. Just look at this bathing suit—twenty dollars! And I really could have made a cheaper one do. I am going to adopt your plan in the future, and start in again to save."

"Good for you. Saving for the right kind of vacation is an investment that will net you 100 per cent in health and happiness. You will find that it pays better than spending the hard-earned dollars for a too-expensive and perhaps unserviceable frock or suit. And now let's join the others and get something to eat. I'll race you to that big tree."

### Household Hints for Home Makers

When boiling sugar and water for cake frosting, add a pinch of cream of tartar, and the frosting will be creamier. Instead of pouring the boiled syrup over the beaten white of egg, one housewife declares that her method of adding the beaten white to the pan containing the syrup makes the frosting smooth and glossy.

Lace curtains which are badly soiled should be soaked over night in cold water, before washing them in the regular way.

Do not try to sweep up bits of glass from the floor with a broom. It is best to use a damp cloth, as the smallest particle will adhere to it.

If you are keeping your furs at home, examine them for moths. Furs should be whipped with a stick and brushed, then put

in a fairly air-tight package or box in which there is some naphthalene.

### Every Woman's Duty

To reduce the waist measure, try bending the trunk forward, at the same time touching the floor with the finger tips. Do not bend the knees.

The finger nails should be trimmed with a nail file. Cutting makes them brittle.

Standing on the sides of the feet rests them. Try it the next time you are required to stand for an hour or more.

### Tested Recipes

**PINEAPPLE SALAD.** Drain slices of canned pineapple and cut them into halves. Arrange on crisp lettuce leaves, cover the fruit with cream cheese pressed through a ricer, garnish with strips of canned pimento and dress with French dressing.

**NUT BREAD.** 1 cup graham flour, 2 teaspoons baking powder,  $\frac{1}{2}$  cup chopped nut meats, 1 cup sweet milk,  $\frac{3}{8}$  cup white flour, 1 tablespoon sugar, 1 level teaspoon salt. Combine the dry ingredients and then add enough milk to make a rather stiff dough. Mold into form of a loaf, let stand for 30 minutes, and bake.

**PINEAPPLE FILLING.** 1 cup sugar, 1 egg white,  $\frac{1}{2}$  cup boiling water, 1 cup grated or crushed pineapple. Boil sugar and water (adding a pinch of cream of tartar) until the syrup threads. Pour gradually on well beaten egg white. Beat until of right consistency to spread on cake. Spread the pineapple on the cake and cover with the boiled frosting.

**COFFEE CAKE.** Mix a sponge of 1 teaspoon of sugar, 2 cups of sifted flour,  $\frac{3}{4}$  cup of milk and  $\frac{1}{2}$  cup of water,  $\frac{1}{2}$  teaspoon of salt, and  $\frac{3}{4}$  cake of compressed yeast dissolved in a little warm water. Cream  $\frac{3}{4}$  cup of sugar with  $\frac{1}{4}$  cup of butter and add 2 well-beaten eggs. Add this to the sponge, beat well, and sift in gradually 2 cups of flour. Set aside to rise to double its bulk. When light, dip a spoon in hot water and divide the dough into two square tins, pressing it with spoon until spread evenly. Let rise one-half hour, brush the top with melted butter, strew with sugar and cinnamon, and

bake. Raisins may be added to the cake if desired.

### From the Shops

Quills poke out jauntily from the newest hats for autumn wear.

Metal cloths, woven of exquisite colors, are used for fashioning fall frocks.

Knickers are increasing in favor. Always the sensible thing for golf, motoring, or hiking, they have actually been worn on a busy thoroughfare. And they make a hit!

Blest be the tie that binds the buttonless tie-on apron dress, for the wringer can't pull off the buttons.

Cape effects in draperies and sleeves are found everywhere.

If any little love of mine

May make a life the sweeter,

If any little care of mine

May make a Friend's the fleetier,

If any lift of mine may ease

The burden of another,

God give me love and care and strength

To help my toiling brother.

—ANON.

### Life's Little Lies

Urging the world's greatest bore to "call again."

What the wild waves hear: "Oh, Jim, don't let go. I'm afraid! I really can't swim a stroke."

### A REVISION

In the story about the Dawson Springs, Ky., sanatorium, which appeared in the July issue of this magazine, proper precedence was not observed in listing the contractors, according to a note from Theodore R. Troendle, president of the Dawson Springs Construction Company. Mr. Troendle interprets our statement as being to the effect that his company and the George W. Langford Company of Louisville are joint contractors, whereas they are merely associated. "The Dawson Springs Construction Company is the general contractor on the work," he writes, "and the George W. Langford Company of Louisville is associated with the Dawson Springs Construction Company in the work."

## Problem: To Find the Reproduction Cost New of Company's Equipment

*Four Methods Are in Use, Mechanical Engineer Explains, but  
Difficulties Are Many; June 30, 1915, Used as Date*

By W. T. KELLY,  
Mechanical Engineer

CONGRESS, in 1913, passed what it known as the Valuation Act. By provisions of this act, the Interstate Commerce Commission is given the duty to investigate, ascertain and report the value of all property owned and used by every common carrier subject to the orders of the commission. The act also provides that the commission shall ascertain and report in detail the original cost to date, the cost of reproduction new and the cost of reproduction new less depreciation of each piece of property owned or used by each common carrier.

In order to do this work the commission was authorized to employ experts and other assistants, and the railroads were required to furnish such information as was necessary to make a valuation.

The present article is intended to describe some of the methods used in valuating the rolling stock of a common carrier, and particularly the methods of determining its cost of reproduction new. In order to value any large property, and especially one similar to the Illinois Central, which is composed of so many different kinds of units, two things are necessary—first, to know the correct number, kind, type, size and capacity of the various units, and second, to make the application of the proper prices.

### June 30, 1915, "Date of Valuation"

In a property of the size of this railroad, the number of units is constantly changing, due to the fact that some become inadequate and have to be retired, some are destroyed in accidents, and new units are constantly added to keep the property up to the required standard. It therefore becomes necessary to designate some particular date when the units are to be counted. The commission has set June 30, 1915, as this

W. T. Kelly

date for the Illinois Central. This date is known as the "date of valuation" for the Illinois Central lines. About November 1, 1914, the commission, through the central district organization at Chicago, began the field inventory of this company's property.

The determining of the correct number of locomotives and passenger cars is a comparatively easy task, as there are not so many of these units and, furthermore, they do not leave the company's lines, except possibly for very short periods. It was found, however, that it was necessary to make an actual inspection of each locomotive and passenger car in order to obtain certain information which was not kept in the records.

The ascertaining of the correct number

of freight cars and work equipment for any particular date is sometimes most difficult. On June 30, 1915, this company owned 67,912 freight cars and 2,810 pieces of work equipment. When one stops to consider that the freight cars are scattered over forty-eight states, Canada, Mexico, and parts of Cuba, it can be seen that the work of tracing each one to find if it is on the "live list" is no small job. Each railroad is supposed to make a report to the owners as soon as a car is destroyed, but sometimes these reports are delayed for months.

#### Cars A. W. O. L. in Mexico

An extreme case may be cited of some cars which moved into Mexico in 1913 and 1914. No reports have been received from these cars since, with one exception, when one of the cars was reported in 1919. In this case the company could not prove the existence of these cars, and therefore they were not included in the valuation. This case is cited merely as an example to show the work involved in tracing each car.

The correct number of units and their complete description having been obtained, the next step is to find what it would cost to reproduce each one new. Before this can be done, it is necessary to know what prices, whether those of this year or some other year, are to be used. The commission has ruled that the average market prices for 1910 to 1914 inclusive should be applied. To determine the average prices for 1910 to 1914 for cars and locomotives exactly like those of the Illinois Central is difficult. This is due to the fact that very few railroads buy the same car or engine year after year, and seldom does one railroad buy equipment exactly like that of another. To many of us one car may look like another, but there are certain differences in the detailed construction which may affect the price materially.

#### Couldn't Use "Bill of Material"

One of the oldest methods of finding the cost of reproduction new of any article composed of different kinds of material is to make what is known as a "bill of material." By this method the number of pieces, their size, weight, etc., are tabulated, after which each item is priced. To this material charge

is added an estimated cost of the labor for making, plus a reasonable overhead and manufacturers' profit. In the case of equipment, this method would be very tedious and would consume a large amount of time. Furthermore, the manufacturers' profits vary to a considerable extent, for in times of business depression they cut their profits in order to obtain business to keep their plants running. It was also found that the manufacturers of equipment were not willing to divulge their profits and overhead charges. For these two reasons, this method is difficult to apply.

A certain modification of this plan, developed by the equipment committee of the presidents' conference committee, is known as the "P. C. C. Method." The method developed for locomotives will apply to cars as well, as the same principles are used. The equipment committee obtained from the builders a complete list of all locomotives built for American roads for 1910 to 1914. This list gave the sale price, light weight and all specialties used in constructing the locomotives. A "specialty" may be defined or properly called an "accessory," a term used in the automobile trade but up to the present time not generally applied to railway equipment. A complete list giving the price and weight of all specialties was also obtained, and these prices were reduced to net prices by deducting from the purchase price of the specialty its weight times 8 cents a pound. Each locomotive was reduced to a base, or plain, locomotive by deducting the net price of all specialties from the total price received by the builder from the railway company. From its weight, the price a pound was figured. The price a pound of a plain locomotive varies according to its weight; the heavier the engine, the less the cost a pound. This information was determined and furnished all carriers. The price a pound as developed is the average for 1910 to 1914 and includes the manufacturers' overhead and profit.

#### How the New Method Is Applied

The application of this method to determine the cost of reproduction new is simple. First, it is necessary to know the light weight of the locomotive. This weight, multiplied by the price a pound corresponding to the weight, gives the price of the loco-

motive stripped of its specialties. After the price of these is added, the cost of reproducing the complete locomotive is obtained.

This committee, in developing the information for additional years to and including 1920, found that the same locomotive would cost 251 per cent more if built in the first half of 1920 than if built in the earlier period mentioned above. Likewise, a steel passenger car would have increased 231 per cent in price, and a composite wood and steel freight car 313 per cent.

Another method of finding the cost of reproduction is by the use of a trend line. By this method the percentage of increase or decrease of average prices is developed by comparing the prices of each year with those of some other year used as a base, or 100 per cent. These percentages, plotted on cross-section paper, give points on a line which show the increase or decrease of prices as compared with any particular year taken as a base. Given the year bought and the original cost of any article, its reproduction cost can be found by applying the percentage of the increase or decrease of prices of that year as compared with the base.

A fourth method is the use of the original

cost as the cost of reproduction. This plan is criticized by some who contend that this is not finding the cost to reproduce new, but merely what the article cost in the first place. Others contend that for some things this is the only plan that can be followed satisfactorily. There were some machines built years ago which are not like those being built today, and it is therefore impossible to obtain any comparative prices to ascertain the cost of reproduction.

The four methods described above, or combinations of them, are the principal ones used by most carriers and the bureau of valuation.

This company is not required to find the cost of reproduction of equipment, but has had this work done in order to check the figures submitted by the commission. A comparison of these figures is as follows:

	Bureau of Valuation	Illinois Central
Locomotives .....	\$24,196,073	\$27,775,784
Cars .....	60,236,260	61,734,147

It must be kept in mind that these figures represent the cost of reproduction new of the locomotives and cars that were in existence on June 30, 1915, and at the average of 1910 to 1914 prices.

## *Big Business at Canton, Miss., in 1857*

A reminder of the days when an agent's accounting was not a difficult matter at the Canton, Miss., station appears in a document recently received at the office of the *Illinois Central Magazine* from L. C. Eschen, auditor of passenger receipts, Chicago. This document is the original report rendered by D. H. Otto, agent of the Mississippi Central and New Orleans, Jackson & Great Northern railroads, now Illinois Central, at Canton, Miss., for the week ending October 31, 1857.

Apparently that was a big week, for the receipts—including \$10.10 cash from Conductor I. R. Hull—totaled \$19.60, almost half of the month's receipts of \$42.75. It is interesting to note, says Mr. Eschen, that

the October, 1920, receipts at Canton were in excess of \$6,000.

Passengers north that last week in October totaled thirteen, with not a one listed in the column for sales south. Ten of these thirteen traveled 80 cents worth apiece, to what appears to be Cypress. One spent half a dollar to get to Ways Bluff, and two spent the same amount apiece to get to I. R. Davis' place.

Ticket earnings for the week ending October 7, figured into the same account, were \$5.75. The next week saw receipts of \$6.80; the next week, \$10.60.

This report was brought to light as a curiosity in 1898 by Captain James Dinkins, who was our southern passenger representative at the time.

# The Busy Bees: How to Choose Them and Set Them at Work for You

## Fear of Being Stung and Lack of Knowledge Keep Many From Making Good Money, Says Expert

In the May issue of the Illinois Central Magazine reference was made to the bee-keeping knowledge of J. R. Wooldridge of Chicago, Pullman conductor on the Illinois Central between Chicago and Carbondale, Ill. Mr. Wooldridge has a statewide reputation among bee-keepers. In the belief that employes of the Illinois Central may be interested in taking up this interesting and profitable work as a sideline, Mr. Wooldridge has set down some of the A B C's of bee-keeping.

**W**HY do so few people keep bees? The fear of being stung and lack of knowledge how to handle bees. The fear can be overcome by the use of wire veil, elbow gloves and smoker. These articles will absolutely protect you from all danger and cost you less than \$5 to procure, a small amount indeed. Then why not keep a few bees as a sideline, when you have recreation, pleasure and financial gain all combined, to say nothing about the beautiful honey for your table, with the balance for market?

Where could you keep them? Almost any place in your back yard. Lattice work or

vines just in front of the entrance to the hive will cause the bees to fly above your head. In the garret of your house, garage, barn, on flat-top buildings—just set them down, look after them three or four times a month, having in the meantime gained some knowledge by reading a bee journal or text-book in order to be able to tell when anything appears to be wrong.

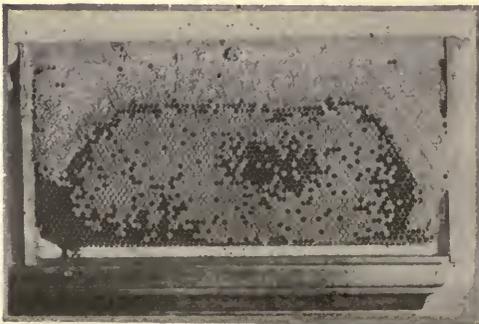

### Work Done in Three Months

Your work almost always is done in three months, except the honey harvest, which can be handled promptly or delayed to suit your convenience. Nature, which so wisely provides our flowers with nectar secretion going to waste by the ton, also provides the bee to gather and reduce it into the purest sweets known, of many flavors adapted to the taste of all. Honey is considered largely a luxury by the masses, when in reality it should be on the table of the poor as well as the rich, and would be if we had the bees to gather the wasted nectar that nature provides but is lost.

Why don't you investigate? A small investment will start you. The profit will surprise you, and you have converted your idle hours into a "bonus" and not interfered in the least with your position. You also have become a producer in place of a consumer, and scarcely know it, the effort has been so small on your part. You know there is no scolding, no driving; the little busy bee works from sun-up until sun-down for you and boards itself.

### Modern Equipment Necessary

After he has decided to make a start in bee culture, many minor questions arise for the beginner, such as what kind of bees to keep, what kind of hives to use, and perhaps where to get them. Nearly all bee supply houses send out a complete catalogue containing cuts of all the different parts and what they are used for. This will give you a general idea

Where the young bees come to life. The bees come out below and find their food supply around the sides and top. Typical brood-frame taken late in October—an ideal frame for that late in the season. Ten of these are in the equipment of an average hive.

of what you need, but don't buy all they offer. Perhaps you have a friend who is a good "bee-keeper" (not just a keeper of bees), who will take pleasure in giving you all the information needed at this time. But remember: For success you must have modern equipment to start with.

The modern hive has its ten removable brood frames, so that you can uncover the hive, take each of the ten frames out one at a time, inspect them thoroughly, return them to the hive in order, and replace the cover. When this examination is over, you have not injured a comb, killed a bee, or even so much as received a sting, and it is all done in fifteen or twenty minutes by the beginner. This examination gives you practical experience, and you soon learn the habits and conduct of the colony.

The Italian bees have proved themselves superior in resistance to bee disease, gentle in

disposition and excellent in honey gathering. You will find both the leather and the golden colored Italians of this character. For myself, I prefer the leather colored Italian, as it seems to stand the severe winter just a little better for me, although both are good. These can be purchased many places at a moderate price.

Often the question is asked by the beginner: "How much honey will I get?" Of course, seasons have considerable to do with this. In Illinois in 1920, the state average per colony was about forty-seven pounds. The general average is materially reduced by the soap-box and nail-keg bee-keeper, while the modern equipment bee-keeper's average will be one hundred pounds or more in a single season surplus, as well as providing the colony with ample stores for the following winter and spring brood-raising.

*How would a scene like this look in your back yard? Part of Mr. Wooldridge's bee-yard at Carbondale, Ill. The landing boards in front of the hives are unusually wide, so that the returning worker need not alight on the ground. The jars are feeders for stimulating brood-raising. At the end, at the right, is a watering vat for the bees.*

# Hitting It Up With the Snoop-Hounds

By HORACE

Short Story Complete in This Issue

*Chronicling Some Experiences of an Amateur at the Great American In- and Out-Door Sport of Suing for Damages. Exciting Adventures While Splitting Prospective Contingent Fees.*

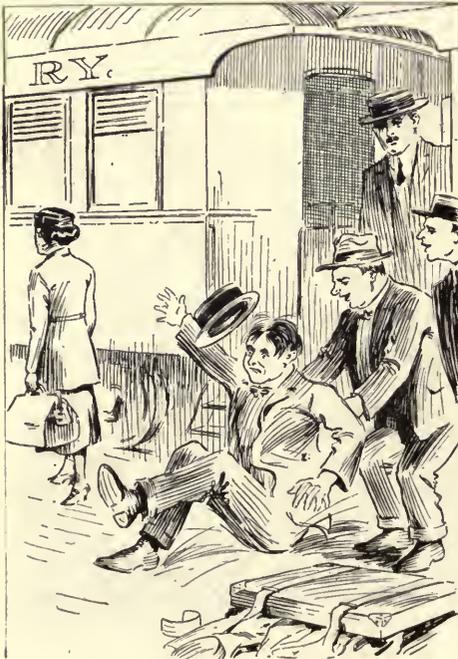

SHE sat just across the aisle of the old-fashioned day coach. It was on a branch line from Hawbush Junction to the city, and the hour was late afternoon, not quite light enough to see very well, yet not dark enough to have the Pintsches burning. She was apparently young and prepossessing, mysteriously veiled, and traveling all alone. A dashing brunette. I have a peculiar *penchant*

for brunettes. They interest me strangely. Not that I flirt—dear me, no! Merely a protective instinct, feeling of chivalry, knightly courtesy and—er—that sort of thing. Especially if it's a young and comely brunette, traveling alone—

But she didn't notice me, more's the pity. Arrived at the whirring city terminal she got up to get off. Me, too. I followed her down the aisle. Her dark blue suit sure fitted her—not too snugly, of course, according to the style, but just enough. Fine figure, what? My word, yes. A pippin. I got jammed with my grip in the doorway. Confound those old-style coach doorways! She nearly got away entirely. In my haste to get down the steps I did an awkward thing. I missed the little stool the brakeman sets for passengers to step on to get down. Down went McGinty—you understand my name isn't McGinty. Speaking poetically. Lost my hat; my grip came open; out tumbled soiled collar, socks, pack of cards for playing patience, toothbrush and whatnot. Awfully friendly little man helped me up. Friendly and solicitous. Meanwhile the brunette was escaping. Had a curiosity to see whether she stopped in the station or went up town; if the latter, whether she took street car, taxi, luxurious private limousine driven by family chauffeur, or simply walked. You know—a fellow gets to wondering and can't rest until he knows for sure.

Friendly little guy recovered hat and brushed me off. Thanked him and made as if to hurry away.

"One moment," he chirped. "May I ask your name? Also address. I'm Mr. Catchem," he says, "of the firm of Catchem, Goings & Cummings, Attorneys. You fell off this train. Cause for action against the company," he says. "We'll take your case—quick, your name—" he pressed a business card into my limp hand. "I'm in an awful hurry," I told him. "I'll

*In my haste to get down the steps I did an awkward thing. I missed the little stool the brakeman sets for passengers to step on.*

look you up tomorrow. Excuse me temporarily," I called over my shoulder.

"I'll get the names of witnesses," he yelled after me. "See you in the morn—"

The brunette was just leaving the waiting room by way of the street door. As I sprinted in pursuit something woolly and soft entangled my feet; there were shrill ki-yis, barking, growls, and the angry tones of a woman's voice. Seems I'd stepped on somebody's poodle. Instantly a crowd of rubberers assembled. Somebody yelled, "Mad dog!" The station was in a turmoil. A sandy-haired man with a face like a sorrel horse hooked me by the buttonhole and led me to one side.

"You were bitten," he hissed. "I saw the whole affair. You've got a cinch. Big damages for harboring a vicious dog. Trust me—I'll secure all the evidence and fight the case for half. My name's Trimm—Shearm & Trimm, Lawyers, Skinner Building, Room 23. Name

and address, please—" he got out his notebook.

I gave a jump and his finger tore out of my buttonhole. "Awful hurry," I squealed. "See you tomorrow—" and ducked. The lady with the toy poodle under her arm issued from one door as I burst out of another. She was conveyed by two red caps to a waiting automobile. The horse-faced man was writing down the license number when—Eureka and oh, joy! There was my nifty brunette just in the act of boarding a street car. I thundered in her wake. But for a trifling untoward incident I would have caught that car by a 6- or 8-inch margin. My right forefoot came in contact with something round and slippery. As slippery as ice; in fact it was ice, as we later established in open court. A piece of ice no bigger than half a dollar (fifty cents, silver, a United States m'nted coin), which very probably had dropped out of a passing ice

*Eureka and oh, joy! There was my nifty brunette just in the act of boarding a street car. I thundered in her wake. . . . My right forefoot came in contact with something round and slippery.*

wagon upon the pavement. I side-swiped the street. My hat went under the wheels of a second street car, my grip under the hoofs of a grocer's cart—er, that is, the hoofs of the horse which was hitched to the cart, don't you know.

Two men helped me to my feet. Both were lawyers. And one other lawyer got there a fraction of a second later. There seemed to be some dispute as to which one actually saw me first. After some bluffing and bluster the disputants effected a sort of compromise by which, I gathered, each was to share on a percentage basis. Meanwhile the street car went on away with my lady fair inside it. The three legal gentlemen proffered their cards: Mr. Getts, of Golightly & Getts; Mr. Diggs, of Diggs & Hunt; Mr. Fox, of Fox, Fox, & Buzzard. I never learned which Mr. Fox he was. We were now joined by Mr. Catchem and Mr. Trimm. The latter assumed a proprietary attitude with his finger in my second buttonhole.

"This is my client, gentlemen," he said a little brusquely. "Our firm represents him in his suit against Mrs. Upton Scadleigh, whose dog bit him a few minutes ago in the waiting room—"

"He! he!" cackled Mr. Catchem. "What part of the person is the waiting room, Trimm? As a matter of record, I am this gentleman's attorney. We are bringing action against the R. F. & D. Railroad and the Union Depot Company for \$500,000 damages by reason of injuries sustained when our client was forcibly ejected from a train and—"

"Shut up, Catchem," interposed a fat man with rat eyes who bustled up. "I'm George W. Quibble, a reputable member of the bar, sir," he said to me. "I have the names of nine witnesses who saw you run down by the automobile whose driver failed to stop; I have telephoned a description of the car to the police—"

"But I wasn't run down," I objected feebly. "I slipped and fell—I think I stepped on some ice—"

"Ha! Good! We'll sue the city for having an icy pavement—your name and address, please!" His assurance rather overpowered me.

"My—my name's Horace," I deposed in a still, small voice.

"Horace what? Speak up, don't mumble."

"Put it down John D. Horace," I told him, summoning my native effrontery. "I'm named after Rockefeller. John Doe is my full given name; only I spell it 'Doe' and he spells it 'Dough.' My address is Mrs. Sniff's boarding house, corner Tomtit street and Bearcat avenue."

All six of them wrote this information down. The man Diggs, as I afterward learned, insinuated himself into juxtaposition with my left ear.

"Tell the rest of these shysters," he whispered, I thought rather excitedly, "to beat it. They're all sharks. You want an honest lawyer, not a pack of ambulance-chasers like these fellows. Where can I see you privately in say half an hour for a heart-to-heart conference?"

"At the east door of the post-office," I whispered back.

In the course of the next ten minutes I privately made appointments with the five others for personal conferences at different times and places. "Don't sign any papers for anybody else without consulting us first," each one admonished me.

I noticed that Messrs. Trimm and Fox were treated with scant, not to say stilted, civility by the rest of my lawyers. I shrewdly surmised that these two weren't affiliated with the Amalgamated Ambulance-Followers' Association, or something. I took it they were outlanders, belonging to that scurrilous and conscienceless tribe which ekes out a precarious livelihood independently, scavenging around the edges and "making nice of no vile hold to stay 'em up." The latent ill-feeling between these rival factions broke out suddenly in loud abuse when Mr. Fox referred to "my client's cause against the street railway company." Mr. Getts strongly objected to such an assumption. "Bunk and balderdash!" exploded Mr. Getts. "It has been clearly understood that Getts & Golightly have been retained to fight Mr. Horatius's \$50,000 suit against the traction people. Our specialty is fighting the traction company—"

"That," retorted Mr. Fox warmly, "is a statement utterly false and misleading, if not actually libelous. It reflects upon the sanity, business acumen and general reputation for

honor and integrity of my client Mr.— ah— Mr. Horatio—”

“Liar and poltroon yourself!” shouted Mr. Getts, losing his temper.

Whereupon Mr. Trimm, deeming no further provocation necessary, gave Mr. George W. Quibble a shove with his shoulder. In a few seconds a deafening, six-mouthed, vocal street brawl was in progress. As the bone of contention, I decided to slip away under cover of the barrage. Somebody had restored to me the handle of my grip, one sock and a pair of soiled collars. My hat was gone—entangled in the diabolical machinery of that street car. Likewise my wondrous charmer, the veiled houri with the sable tresses. One had gone one way and the other the other, obscurely speaking. So I oozed out of the thick of the verbal riot and trickled away in the lee of a passing flivver, or flivvers.

A big placard painted on white cotton cloth, stretched across the front of a store, caught my eye like a newspaper headline. It read:

“MAMMOTH FIRE SALE! UNSPEAKABLE BARGAINS. MARVELOUS AND UNHEARD-OF SACRIFICES OF HIGH-CLASS MERCHANDISE. CLOTHING, SHOES, FURNISHINGS, HATS, CAPS,—

“Hats, caps,” was what did the business. The proprieties demanded that I obtain a hat or cap to cover my immodestly exposed turret of thought. I entered the store.

Twelve smiling, abject, almost groveling clerks leaped to welcome me. They shook my hand, felt the texture of my slightly wilted Palm Beach suit, cuddled me, murmured soft nothings in my ear.

“Mr. Silverlieber! Front! A gentleman wishing a complete outfit, clothings, overcoat, shoes, linen, and a steamer trunk. One moment. Mr. Goldheimer, this way—”

“I would like to buy a hat,” I insisted weakly. “Just a hat, nothing else.”

But I finally compromised by purchasing a hat, a golfing cap, a suit of Alabama all-bull English tweeds with two extra pairs of trousers, tan shoes, shirts, collars, neckties, hole-proof socks, hankerchiefs, celluloid cufflinks, studs and buttons, and an imitation pasteboard suitcase—but what I started out to say was: They short-changed me. My bill came to \$11.68. I tendered two \$10 bills and received back \$3.32 in change instead of \$8.32.

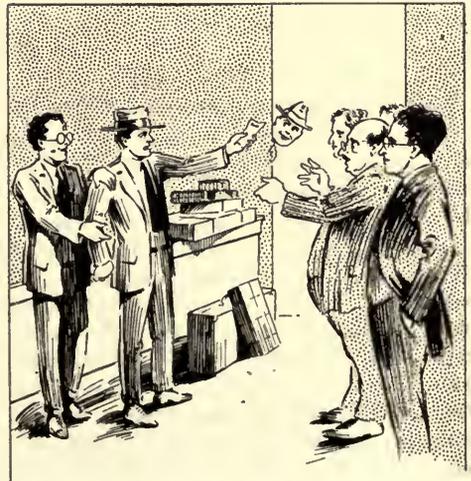

I raised a roar. All hands insisted that it was a ten and a five I'd given them. They wafted me volubly toward the door. There, as we reassured one another with promises of reprisals and threats to summon the police, a dapper person appeared at my side as if by magic. He distributed cards all around reading “Philbert Q. Philpotts, Attorney-at-Law, Claims and Adjustments.”

“I have the honor to represent this gentleman,” he said putting an arm tenderly around my shoulder. “Let us have done with wrangling. We'll let a court of justice pass upon the merits of our contentions—suit will be filed tomorrow for actual and punitive damages.”

The Silverheimers and Goldliebers and Coppersteins displayed visible evidences of being considerably taken back. My lawyer's formidable mien threw a panic into their craven bosoms. There ensued a hurry and a scurry, and in a twinkling somebody pressed certain money or moneys into my unresisting hand. It was paper money—two green-backs, a ten and a five. My legal friend and I passed arm-in-arm out of the store.

He was a genial soul. I liked him from the first.

“What was the controversy about?” he

*They short-changed me. My bill came to \$11.68. I tendered two \$10 bills and received back \$3.32 in change, instead of \$8.32. I raised a roar. All hands insisted that it was a ten and a five I'd given them.*

inquired affably. I recounted the circumstances in minute detail.

"Good!" he said. "We have them where we want them. The restoration of your money, or any part of it, was an admission of attempt to defraud. We'll file suit for \$50,000 actual and \$50,000 punitive damages tomorrow morning. Let me have the money, please. It's important evidence. I'll put it in my office safe. One moment—I'll write you a receipt. What name, did you say?"

Thus I met and instinctively trusted Philbert Q. Philpotts. We had a lemon sour together, and discussed the ins and outs of modern litigation. Before we separated, I entered whole-heartedly into the beginnings of a career of intrigue. I dedicated myself to stratagems and spoils. My friend and adviser, Philpotts, instituted suit against the Gold-Silver Fire and Water Sacrifice Sale Establishment without delay. There was also a piece in the city *Daily Argus* which stated that "an unknown man created a near riot at the Union Station yesterday evening by attempting to steal the prize Pomeranian chow beagle of Mrs. Upton Scadleigh, wife of Upton Scadleigh, millionaire sportsman, clubman, coalman, and iceman, president of the Black Diamond Coal and Cold Spring Ice Company, as Mrs. Scadleigh was on her way from the baggage room to her waiting motor car. The would-be thief escaped in the crowd."

We at once filed suit against the paper for \$100,000 damages because of the libelous character of its published statements—that is, libelous as concerned me.

I then proceeded to engage, with the assistance of my diversified and more or less imposing array of legal talent, in various and sundry suits at law evolving out of my natural and commendable desire to see what became of a certain dimpled and delectable young woman in an attractive blue tailored suit. Catchem; Goings & Cummings represented me in my case against the R. F. & D.'s leased and operated lines; we asked for \$500,000 damages. I wasn't particularly smitten with Trimm, of Shearm & Trimm, but I felt sort of morally obligated to him for getting Mrs. Scadleigh's number—that is to say, her motor car's number—so I let him handle my case against the

Scadleighs for \$100,000 damages due to being attacked by said defendant's dog while affected with rabies—the dog had the rabies, you understand—etc., etc.

Then there were suits brought against the traction company, the city, the ice company—not Scadleigh's ice company this time, but another one—and also the grocery establishment that owned the cart which devastated my suitcase. The suit on account of the suitcase—confound the apparent asininity of English phraseology!—was for \$50,000 only. We thought that sum wouldn't be confiscatory, and yet it would teach them to be more careful of other people's rights and property. I broke with Fox, of Fox, Fox & Buzzard, at the last minute. His firm insisted that I buy a wheeled chair and pretend to be paralyzed from the waist down by reason of the accident wherein I lost my hat. We were to ask \$1,000,000 damages of the traction company for having run over me with one or more of its street cars. I flew the track when they mentioned sticking pins in me and such like.

"Paralyzed from the waist down, eh?" I snorted. "No, you're paralyzed from the neck up—" and so we parted without mutual endearments. George W. Quibble handled the case against the street railway people. It was bitterly contested.

We got our witnesses from many sources when the several cases came to trial. My attorneys were resourceful to an unbelievable degree when it came to obtaining witnesses. I haven't the slightest doubt that they could have conclusively established, without any difficulty at all, if it had seemed necessary or even advisable, that I was a world-famed philanthropist and benefactor of the human race, or a liar and a fool, as the case might require—in fact, they did establish all that. We had unimpeachable testimony to prove that I had been systematically and persistently misused and persecuted by different soulless corporations—that I'd been threatened, browbeaten, intimidated, bribed, blackmailed—that I was a man of deep and fervent religious beliefs, born of ancient and illustrious parents, whose chief bid to fame had been their extreme poverty and sterling honesty. That I had once been a paragon of manly vigor and strength, but now, look at me! Look at me, gentlemen of the jury! A pitiable wreck in mind and body. A

shattered, miserable, repulsive, gibbering shadow of a human being, to be shunned and side-stepped by his fellows. Like some witless, mesmerist's helper, I enacted the role I was supposed to play. I was devout, or doddering, or doped with deadly drugs, or bowed by the weight of my horrible sufferings—I, who had once been a banker and owner of my private racing stable, and also a famous athlete and *bon vivant*. Sometimes I was a blue-blooded scion of a lordly race, and again I was only a poor Hick from the high weeds, who'd been stepped on and squashed flat by Juggernaut.

We surely used up a lot of language.

The cases resulted variously. As my attorneys said, nobody knows what a jury will do. Sometimes we got judgments; sometimes not. Either way there would be an appeal taken. Once we were awarded a verdict of \$10 damages—that was in our suit to recover from the grocery company—but the court set it aside as excessive, and we appealed. I have four or five suits—I forget exactly—now pending in the Supreme Court.

Last Tuesday counsel telegraphed me from Washington that the United States Supreme Court or something had remanded my case against the R. F. & D. Railroad for a new trial. I had already won in the lower courts with a verdict of 1-cent damages, but our opponents took an appeal.

My attorneys are uniformly and universally optimistic.

And yet—one thing saddens me whenever I think of it. I wish to goodness I could have caught that street car and found out where my veiled temptress went. I've never laid eyes on her beautiful unseen face and matchless form since I lost her.

I wonder who the deuce she could have been! I liked the fit of her suit, and if I could find her I don't know but I'd lay suit as a suitor for—but there, there!

## The Locomotive Engine

Into the gloom of the deep, dark night,

With panting breath and a startled scream,

Swift as a bird in sudden flight,

Darts this creature of steel and steam.

Awful dangers are lurking nigh,

Rocks and chasms are near the track;

But straight by the light of its great white eye

It speeds through the shadows dense and black.

Terrible thoughts and fierce desires

Trouble its mad heart many an hour,

Where burn and smolder the hidden fires,

Coupled ever with might and power.

It hates, as the wild horse hates the rein,

The narrow track of vale and hill;  
And shrieks with a cry of startled pain,

And longs to follow its own wild will.

Oh, what am I but an engine shod  
With muscle and flesh by the hand of God,

Speeding on through the dense, dark night,

Guided alone by the soul's white light?

Often and often my mad heart tires,

And hates its way with a bitter hate,

And longs to follow its own desires  
And leave the end in the hands of fate.

Oh! ponderous engine of steel and steam,

Oh! human engine of flesh and bone,

Follow the white light's certain beam—

There lies safety, and there alone.

The narrow track of fearless truth,

Lit by the soul's great eye of light,

O passionate heart of restless youth,  
Alone will carry you through the night.

—ELLA WHEELER WILCOX.

## Five Minnesota Veterans

(Continued from Page 21)

the days when he was a schoolboy at Dunleith, when the old Argyle Hotel there was considered the finest west of Chicago, with its 145-foot front, four stories and basement, and dining room and ballroom that could accommodate twenty sets of a quadrille on the floor at one time. He recalls seeing troop trains leaving over the Illinois Central for Cairo when General Grant was concentrating troops there in the winter of 1862—thirty-five box cars in a train with 2-inch plank seats across the cars, and two days and nights to get to Cairo.

He recalls the beginning of the career of C. A. Beck, made general manager of the company in 1890, who served as operator and agent at Dunleith about 1860.

The Vixen and the Vampire, thought to be the first engines west of the Mississippi River, were brought to Dubuque in 1857 to assist in the construction of the Dubuque & Sioux City Railroad (now the Illinois Central) to Dyersville, Iowa. They were of 12-inch cylinders with one driver and were found able to handle two cars from Dubuque to Farley. The last time Mr. Quinlan saw the Vixen was in 1888, when she was loaded on a flat car for delivery to some lumber company in Minnesota.

### Took Engines Across on Ice

In the winter of 1858 two engines, the Blackhawk and the Platt Smith, arrived at Dunleith for delivery to the Dubuque & Sioux City. These were considered the final thing in engines, as they had four drivers and 15-inch cylinders. To get them across the river, which was frozen, tracks were laid to the edge of the ice and the engines were dragged cross by horses after they had been placed on foot-square timber skids. These engines were in use until many years after the Illinois Central took over the property in 1867.

T. W. Place was the engineer on the first engine reaching Dyersville, and Peter Girard, whom Mr. Quinlan describes as a stout, hardy Frenchman, was his fireman. The engine was off the track several times on the trip, and a day was used to reach

Dyersville. Fireman Girard is now dead, but Engineer Place, who later was master mechanic, is still living at his old home in Waterloo, Iowa.

### Like Your Work, He Advises

Mr. Quinlan recalls shaking hands with General Grant on his first return to Galena after the Civil War, and after the general's trip around the world Mr. Quinlan was called to be conductor of an excursion train from Waverly, Iowa, to Galena on the occasion of the celebration. With excursion trains arriving all morning, it was a great gathering, Mr. Quinlan recalls, and the pickpockets from the cities reaped a harvest, including a gold watch and chain from D. W. Parker, superintendent of the Iowa division. The watch had been a gift from employes, and Mr. Parker eventually succeeded in getting it back.

After almost fifty years of service, Mr. Quinlan's message to the new employe is to conserve his health and to enjoy his work. Don't be discouraged by lack of education or of training, he advises; a man can make himself succeed. "A man should grow happier as he grows older, if he is on right terms with his work," he declares.

Mr. and Mrs. Quinlan live at 100 Langworthy street, Dubuque. They have been happily married fifty years and six months.

### Worked 50 Years in One Place

William Adrian, boilermaker at the shops in Waterloo, Iowa, is on his fifty-second year of service for the Illinois Central Railroad. During all that time he has been employed in the shops at Waterloo.

Mr. Adrian was born January 25, 1854, in Hessen, France. When he was six months old, his parents brought him to America and settled in Napleville, Ill. Ten years later they moved to Waterloo, Iowa, and he has lived here since.

When he was 16 years old, he obtained employment in the Illinois Central shops at Waterloo as helper. He found the work interesting, and at the end of six months bound himself to the company for four years' service under a \$100 bond. During these four years he was an apprentice boilermaker, and was the first apprentice in the shops at Waterloo. His interest and willingness for

work won for him the position of boiler-maker at the end of those four years, and he has held that position since.

#### Never Reported Late but Once

Last year Mr. Adrian was painfully injured when a brick arch in the firebox of an engine he was working on gave way and fell on him. One rib was fractured, and his arm was badly bruised. He was sent to the Illinois Central Hospital in Chicago and received treatment there for three weeks. He underwent an operation, and was kept from his work six months. When he was able to return to the shops, the doctor advised that he be given light work. He is now located in the old roundhouse there, repairing units and testing engines for leaks.

In speaking of his long record of service, Mr. Adrian says with pride that he never reported for duty late but once, and was docked one-half hour for that.

Fifty years of service in one place may seem uninteresting to most people, but Mr. Adrian says that he has never felt the time hanging over him, nor has his work been monotonous at any time. Boilermaking was his chosen trade, and he has found it extremely interesting.

#### Has Been Forty-Seven Years in Service

Fred H. Spohr, section foreman at Waverly, Iowa, has spent the greater part of his life in the service of the Illinois Central Railroad, and he insists that every moment of it has been a pleasant one regardless of the many great hardships he was forced to endure in the early days of his employment. Last March rounded out his forty-seventh year of service.

Mr. Spohr was born June 26, 1852, in Germany. When about 20 years old, he came to America on the advice of a friend from the old country who had made the move and had obtained a position with the Illinois Central on a section at Waverly, Iowa. Mr. Spohr's first place of employment was on a farm in Cook County, Ill. He continued a correspondence with his friend in Iowa, and after one year was persuaded to move there to obtain a position on the same section. To his sorrow, when he arrived in Waverly, there was no opening on the railroad. There were many more men seeking positions on that very section, he said. When the gang

would return after making a tour of inspection of the track, the platform at the station would be lined with men asking if there was an opening for them.

#### Finally Got in the Section Gang

He was greatly discouraged at first, but knew that as soon as there was a vacancy his friend would do all he could to get him the place. He contented himself with odd jobs of anything that would afford him a livelihood.

In March, 1874, his friend's leg was broken when a crossing sign was being put in place.

"This is your chance, Fred," his friend said. "I want you to take my place on this section, and make good."

Mr. Spohr was given the position by P. Bunn, who was the foreman at that time.

The work in those days, Mr. Spohr says, was much harder than today. There were no power cars to take the men to work. The cars had to be pumped by hand. The result was that the men were tired from propelling themselves when they arrived at the location where the real work was to be done. Then there was the final task of pumping back to town after the day's labor was completed.

But the men took much interest in their work in those days, he says. None of them "watched the clock," and each put all his strength into his work and tried to do as much as possible. The men sought to show that they were really of service to the company, for there were others to take their positions if they failed. And their pay was only 50 cents a day, Mr. Spohr says.

#### Much Trouble With Iron Rails

The rails used in his first years of employment were chair iron. They battered quickly at the joints, and had to be replaced often. The iron served well for the first few years, but as the traffic became heavier, the rails required constant attention. The battered ends were broken off and spliced back into place again. Sometimes the rails were turned around so that the battered ends would come at a different place and make the rails last a short time longer.

The first rails weighed only 45 pounds. These soon had to be replaced by 56-pound rails on account of the increasing weight of

the traffic. But these soon wore out, and 60-pound iron rails were put in. The rail problem was proving to be a menace, Mr. Spohr says, and the company made a great step forward by installing 60-pound steel rails. These proved to be a great relief to the section men and a much greater insurance of safety to the trains. The iron rails often broke under the weight of the train, and accidents were numerous, although the section men were constantly on the lookout.

The ballast in those days was heaped up earth, and each shower meant a thorough inspection of the right-of-way. The section men tore down fences to place under the ties to hold them in place, and searched for heavy rocks to make the roadbed more solid.

**Walked Track in Bad Weather**

The men walked the track in all kinds of weather. Snow often drifted in the cuts to a depth of fifteen feet. Mr. Spohr says that the merchants and clerks of Waverly often went out with the section men to clear the track of snow so that the trains might pass. Some trains were snow-bound for weeks. Often it got as cold as 30 and 40 degrees below zero, and Mr. Spohr says he has had to walk the tracks at night with his face and

hands covered with ice. Frost would cover his lantern so completely it was impossible for the light to be seen.

About half-way on his section, there was a farmer who kept a warm fire burning each night so that Mr. Spohr could stop in to warm himself and clear off all the ice. At times, his hands became so numb they were useless to him. If it had not been for the kind-hearted farmer, he says, there were many nights that he would have been unable to proceed.

**Never Injured While in Service**

Mr. Spohr made many friends as his years of service wore on. It was obvious that he had the interest of the company at heart. In 1891 his efforts were rewarded when he was made foreman of that section. Since that time, the company has placed rock and cinder ballast on its right-of-way and has installed 85-pound steel rails. The section men ride to and from their work in power cars, and the laborer receives more pay than the foreman received in former years. Mr. Spohr smiles when he recalls the time when he received 50 cents a night for walking the track in a blinding snow storm.

Neither he nor his men have ever been

*Things to Talk About*

During July, 1921, the number of carloads of grain loaded on the Illinois Central System exceeded the number loaded during July, 1920, by 91.8 per cent. The number of cars loaded during the first seven months of 1921 exceeded the number loaded in the corresponding period of 1920 by 24.2 per cent. For January, February and April, the 1920 loadings exceeded those of this year, but for March, May and the months following there has been an appreciable gain over 1920. The carload grain loading figures follow:

	1921	1920
January .....	5,404	5,747
February .....	4,336	4,630
March .....	3,649	2,972
April .....	2,588	3,209
May .....	6,022	3,357
June .....	4,379	3,491
July .....	7,661	3,995
Total, seven months.....	34,039	27,401

There is some cause for optimism in a study of these figures. In connection with the general signs of a business reawakening, which are visible on every hand, they indicate that commerce is once more struggling back to its feet. The economic structure of the United States is such that the welfare of business is largely dependent upon agricultural prosperity, and the increasing liquidation of the farmers' holdings of grain may be taken as an indication that agriculture especially is building the foundation for the business revival.

Incidentally, and by no means unimportant, is the indication contained in these figures that the present scale of freight rates is not, as some claim, a barrier to better business.

injured while in the service of the company, and no accidents have occurred through lack of duty on the part of this section. Mr. Spohr speaks highly of the Illinois Central System, and says that when his railroad days are at an end it will be hard for him to stay away from the section when the hour for work arrives.

He is in good health now and apparently hardy, but he says that his staying out in all kinds of weather in his earlier days is beginning to tell on him.

Several of the men of his section worked

under his direction for from ten to twenty-five years. One man was retired not long ago on account of old age.

Although German by birth, Mr. Spohr is a good American, and gave his whole support to this country during the war. Before long, he says, he intends to turn in his papers to be placed on the pensioners' list. He is a constant reader of the *Illinois Central Magazine*, and says it interests him greatly to know what is being done on other parts of the system.

## *What Waste in Small Things Can Mean*

By C. W. TITUS,  
Accounting Department

Our company buys and distributes annually more than a ton and a quarter of rubber bands, for which we pay in excess of \$3,000.

Rubber bands are handy little things and serve a great number of purposes, but unfortunately their lives are limited, and therefore their usefulness is curtailed to the extent of their period of resiliency. They were never intended to serve any but a temporary purpose, yet I have found them by the singles, doubles, triples and dozens even, wrapped about permanent and closed files.

Most of them had become entirely disintegrated, unfit for further use, and consequently a dead loss to us. Examination of current files, however, will disclose a large number of "live" ones that may be salvaged and restored to a sphere of usefulness.

The same utter disregard for expense applies to the various kinds of paper fasteners in common use, 4,200,000 of which cost us \$3,500 annually. And last but not least, consider the humble pin, at two tons a year and a cost of \$1,700.

Any of you who read this article and who have access to or handle files, take a look through the files in your own office, vault or storeroom, and I'll warrant you can in a very short time salvage enough such material to last you for a considerable period, *provided* you cut out the extravagance and don't use two paper fasteners where one answers the purpose, and

*never* use a rubber band on a permanent or closed file.

Speaking of waste, I have seen tacks on the side of a box car as thick as flies on a molasses barrel.

• We must realize that the company's property is our property; so if we waste it we shall have skimp or retrench somewhere else, and that "somewhere else" is likely to be our own semi-monthly pay check. Why not? Think it over, you fellows, and run the railroad's business the same as you would the one with your own name over the front door.

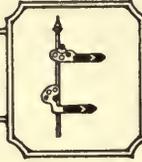

This applies not only to the humblest switch shanty down in the yards and the most obscure agent's office out on the line, but to Central Station, 135 East Eleventh place, Chicago, as well.

These may seem like small matters, but it takes only 100 small round copper discs to make 1 dollar, and the latter doesn't seem small to any of us these days.

If the stationery department would discontinue furnishing such material for a stated period, what would happen? I'll tell you. We'd find a lot of old paper clips and rubber bands in bottom drawers and various other obscure places, (besides in the files), and we'd utilize the used material the same as we did our old clothes during the war.

***Remember September!***

## ACCIDENT AND

## INJURY PREVENTION

## A Challenge Accepted

**B**URNSIDE shops—your challenge is accepted. When you put up John Morrissey, John Carey and Albert Erickson in the July issue of this magazine as examples of long service without accident, little did you reckon with the maintenance of way department of the Springfield division. Superintendent C. W. Shaw decided that he probably had some pretty careful workers on his own part of the system; so he had the records looked up, and now we have the pictures and records of four section foremen of the Springfield division who have been in the service from thirty-four to forty-nine years without an accident.

This means that these four men have avoided accidents themselves and have led

their men in the paths of safety so that their men likewise have escaped accident. When the risks of handling heavy track material are taken into consideration, in connection with the other chances that a workman takes, it will be seen that the maintenance of way department of the Springfield division has been doing its part for safety.

Section Foreman George F. Shimp, Patoka, Ill., has been in the employ of this company for forty-nine years, two years as laborer and forty-seven as foreman. In 1907 he had charge of a large extra gang laying steel between Pana and Branch Junction, a distance of fifty-eight miles, and he has always worked a fair force of men on the track at Patoka. He says that before per

*Thomas Hughes, Martin Hughes, George F. Shimp, John M. Pyatt*

mitting men to handle heavy material he cautions them to be careful and to have the same thoughts toward their fellow employes. Mr. Shimp says he will maintain this record throughout the rest of his term of service with this railroad, so that when retired he can look back over his career and feel proud of the fact that his efforts toward accident prevention were not in vain.

Thomas Hughes, section foreman, Champaign, Ill., has been in the service for forty-one years, five years as laborer and thirty-six as foreman. He attributes his good record to requesting his men always to think before doing any hazardous work and to have the safety of their fellow employes always in mind. He says, "I always live up to the rules and regulations governing the use of hand and motor cars and also to all other safety instructions." Mr. Hughes will soon be retired on a pension. After he is transferred from active to honorary service, it will be gratifying indeed for him to know that during his period of service with this railroad neither he nor anyone under his direction ever lost any time on account of injuries.

Martin Hughes, section foreman, Lincoln, Ill., has been in our employ for forty-one years, three years as laborer and thirty-eight as foreman. He says that accidents are preventable and that they can be eliminated when men avoid placing themselves in dangerous positions. He further says that foremen must keep the "Safety First" ideas before the men at all times and should be especially watchful of new employes. He is certain that he will maintain the good record he has had for the past forty-one years.

John M. Pyatt, section foreman, Vera, Ill., has been employed for thirty-four years, five years as laborer and twenty-nine as foreman. "I have never had occasion to make out a personal injury report in my life," he says. He was associated with Mr. Shimp in laying the heavy steel between Pana and Branch Junction in 1907 and had charge of a large extra gang. Taking into consideration the risks incurred in the handling of rails, etc., he feels it is remarkable indeed to go through without having a personal injury. Mr. Pyatt further says, "I have never asked any of my men to do anything that I would not feel safe in doing myself."

*The Rock Island recently retired an engineer who has worked fifty-two years without an accident. Has the Illinois Central any examples like that? Can any other division or any other department of any other division produce records of safety to compare with those of Burnside shops or the maintenance of way department of the Springfield division?*

## He Laughed

He laughed when they told him the ladder was weak,  
And remarked it would hold half a ton.

It cost him a hundred to settle the bill  
When the doctor and nurses were done.

He laughed when his foreman urged greater care  
As he carelessly cleaned the machine.  
The doctor remarked as he bound up the wound,  
"It's the very worst mangling I've seen."

He laughed when a shopmate dug from his eye  
A speck with a match whittled round.  
They removed the bandage in the course of six weeks;  
He could see with one eye, it was found.

He laughed when they warned him to drive with due care,  
And he struck a 60-mile clip.  
The judge fined him fifty, and gave him three months;  
He had broken only one hip.

He laughed when the doctor ordered him home  
For a couple of days with a cold.  
In a tubercular hospital he thinks of the past,  
It's too late now to help him, he's told.

He laughed when told that infection might come  
From leaving a cut go undressed.  
'Tis said he looked natural as if but asleep;  
His headstone says he's "At Rest."

He laughed when told to go lighter on food,  
He said he would eat what he chose.  
The funeral was large and the music was fine;  
On his grave was planted a rose.

He laughed when advised to insure his life,  
And said he would live forty years.  
His widow does washing to earn her support.  
And he might have saved her the tears.

## ***But Most Men Are Honest!***

*(Continued from Page 62)*

cause the human beings in charge do not happen to be as wise as they might be. We can have a predatory corporation just as we can have a predatory individual, but the corporation is predatory not because it is a corporation but because it is managed by predatory individuals. If a congenital burglar happens to be president of a public-service corporation, he is going to run that corporation on burglarizing lines, and if we pass a general statute designed to stop this particular man's depredations we are not doing anything of a larger social benefit than if we attempted to prescribe by law exactly what tools a burglar should carry in his kit.

### **What Shall We Regulate?**

It is unpleasant to have to examine public statutes dispassionately, even cynically, for a doubt as to the wisdom of regulation is sometimes interpreted as a doubt of democracy.

The only way to be popular is to have faith in the sublime efficacy of law. It does not do to suggest that maybe we have too much law and too many lawyers—that we are law and lawyer-ridden, that perhaps the narrow, detached, legalistic view is distinctly at variance with the public interest. But if we are going to regulate, what is it that we want to regulate?

"Profits" is the usual answer. For some time past most people in business would welcome a regulation of profits, especially a regulation upward. The regulation of profits not many moons ago was, however, a fertile field for the natural-born regulator. How can you regulate profits? Shall we say that not more than a certain percentage of profits shall be earned on the cost of an article? We tried to regulate prices—every country tried that during the war and with uncommonly disastrous results. If we make the maximum percentage of profit low—and there is no reason for a law if other than a low limit be set—then the big, well-equipped manufacturer will earn a great sum because his business is apt to be founded on an ability to make a large annual profit on a small profit per dollar.

The smaller and less efficient manufacturer, or the manufacturer who may have a special trade, cannot earn a living on such a profit basis.

### **Making Efficiency Dishonest**

Or shall we reckon the profit on the capital invested? Good business depends upon getting the largest possible profit out of the smallest possible capital. The man who makes a little capital go a long way would then be penalized for his efficiency. Nobody can or will put more capital into an enterprise than is necessary; and if we limit the amount of profit that may be earned upon capital, we either drive out capital or the efficient concern will be forced to juggle its accounting so that less is charged off for depreciation, and so that repairs, which might by a stretch of the imagination be charged to capital, are so charged. Thus, in order to make efficiency profitable, it would have to be first made dishonest.

We can regulate by forcing trade-unionism upon an industry. That also has been tried. The reply to trade-unionism is the trade association formed to combat or to treat with the union. After a period of negotiation there is always the danger that the two of them will join in a species of guild socialism—as in the building trades—and become united for depredation. This is both a shortsighted and a self-destroying policy, but again it is the individuals concerned who are at fault and not the plan under which they work.

There are dangers in individualism, but they are easily met. They are practically not more than ordinary criminal dangers. They become serious only when groups under individual leadership acquiesce in what amounts to criminality. Whether in such cases it is better to take drastic criminal measures or to pay out enough rope for the organizations to hang themselves is another question.

### **Told All but One Thing**

That, however, is aside from the main topic. The belief seems to be growing that it is possible in some salutary way to regulate business in general without going to the full lengths of state ownership—in

short, to adopt what are said to be the advantages of socialism without adopting what are said to be the disadvantages of socialism. There is rumored to be a pleasant middle course.

Let us take the most complete example of regulation. Take the railroads and the Interstate Commerce Commission. The Interstate Commerce Commission is supposed to be responsible for the management of the railroads. It minutely supervises their every move. It tells me how I should build a car or locomotive. It will soon be telling me how many and what kind of cars I must have. It tells me how I must spend my money. It passes upon any securities that I may want to issue. It does nearly everything about the railroad excepting to tell me how, with the regulations in force, I can make money, and consequently how, if I need more capital, I can get it. The federal commission is supplemented by state commissions.

#### Orders Without Responsibility

In a degree the same condition extends through every detail of public service—through the electric railroads, the gas companies, and the electric-light companies. They are all regulated by commissions, and they are required to keep these commissions informed upon the vast number of details in which the commission, through voluminous blanks and special inquiries, evidences interest. These reports are a serious burden on the railroads; all the information of possible utility could be compiled without great difficulty. The railroads compile a deal of it themselves for their own use. But practical information does not much interest commissions. They want to have complete rather than useful statistics, and the archives of state and federal offices are piled high with masses of documents, costing millions of dollars to prepare, that never will, and probably never could, be used by anyone. That is one phase of government in business.

The railroads, in addition, to all intents and purposes, have had taken away from them the power to fix wages. So in the railroads we have the best of all examples of everything we know up to the present

time about the regulation of corporations. For every angle is covered. The presumption is that this species of regulation prevents individuals associated in railway corporations from preying upon the public. As far as the railroads are concerned, the regulation was in the beginning negative. Without tracing the various stages, it is enough to say that today it is positive. The railroads are told what they shall do as well as what they shall not do. This is a logical progression of authority.

The moment, however, that the state says what a corporation shall do, it takes away from the owners of that corporation the right to direct its policies, excepting within a very narrow sphere. If the state has the needed wisdom to direct the affairs of a corporation better than can its officers, then it would appear proper for the state to take over the property. That wisdom has not been apparent.

There is no reason to believe that any commission, appointed or elected, can, either by virtue of the office or by virtue of the power vested in the office, have superwisdom. Commissions do not have, and so we get the very dangerous situation of practically autocratic bodies being able to issue orders without responsibility. This has happened time and again on the railroads.

#### Try This in a Factory

We have had wages fixed entirely without regard to the ability of the corporation to make ends meet. The railroads have been compelled to employ many, many thousand more men than were necessary for the work in hand. Suppose a manufacturer, an advocate of government regulation, should receive an order commanding him to increase his working force by one-third—to put three men to the doing of every job that two men had been doing. What would happen? How long would that factory stay in business? And what would that manufacturer say if, when he announced that he would quit business, he received another order to go on whether or no and find the money somehow? We have smiled rather indulgently at the tales from Russia of workmen insisting that their

wages be paid whether or not the factory was operated. But we have done almost exactly the same thing here—a little less boldly, perhaps, but not less pointedly.

If we must have regulation—and it is believed that those without experience in an industry are better able to regulate it than those with experience and employed in that industry—another step is inevitable, and that is federal or state guaranty of the profits of an industry. With a guaranty of profits we reduce the management of industry to a mere matter of order taking.

The man does not live who can direct to the fullest of his ability—if he has no discretion in directing. If the president of a railroad or the president of a corporation merely sits at his desk and looks at orders from without as they come to him, he is not going to be much of a president. He cannot be. His corporation, under the guaranty, will earn the same amount whether he be efficient or inefficient, and, being only human, he will at once adopt the governmental formula of office-holding, which is that the only mistakes that count are those of commission.

In ordinary business the mistakes of omission are as important as those of commission, but in government it is otherwise. The way to be happy and secure in a government office is to play safe. The way to ruin a business is to play safe. With government regulation and a guaranty nobody has any responsibility. If a commission makes a mistake, it can cover its tracks. For instance, the Railroad Administration made an immense number of mistakes, but responsibility for them cannot be placed as in private business. The responsible head is so far away as to be irresponsible.

### Few Monopolists Survive

The most prosperous business men know today that profits are not made at the expense of anyone—they are made by fair dealing. The criminal of business is the profiteer, and his season is no longer than any other criminal's. He flourishes only in an emergency when goods or service can be bought from him and from no one else.

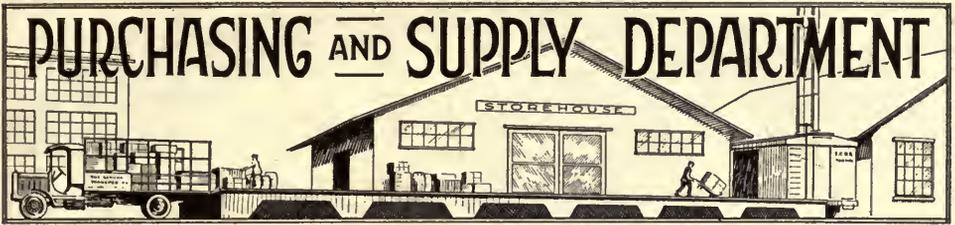

He has loomed large in the last several years, but he does not amount to much now. The only form in which he can now extort profits is through monopoly. Monopoly can exist only by law or because country-wide or world-wide transportation is in such bad shape that a section is cut off from the competition of the world markets. And the idea of monopoly is today fairly well toward death. The monopolist is a creature surviving from a past age. When he tries to be criminal, he can be treated as a criminal. We had adequate laws to cover that. We do not need laws that assume criminality in business, for most men are thoroughly honest. We can create dishonesty by law—but that is hardly the professed intention of legislators.

Would it not be better to assume that the average man in business is honest and wants to be fair—just as we must assume that the average citizen is honest and fair? Then we can go on from that and define what is unfair or dishonest in order that the few criminals may be punished. That is the usual procedure of laws touching individuals. What more is required for business?

Would it not be possible to order our affairs to better advantage if we were to sweep out most of the regulatory statutes and commissions that only make business more difficult and add to the burdens of the public through higher taxes and higher prices, and if we were to ask the government to keep away from business unless it could aid in a constructive way? Otherwise do we not run the danger of having our whole economic life weakened? It has been tinkered with a good deal lately. The railroads are an example of what regulation can do. Do we want more examples?

Why not assume that most men are honest?

*Remember  
September!*

## *A Pensioner's Tribute*

By I. E. MARTIN,  
Pensioner, Supply Department,  
Port Arthur, Tex.

**I**N 1916 I retired on pension, after twenty-five years' service. My home was in McComb, Miss. After I was placed on pension, I moved to Port Arthur, Tex., September 20, 1916.

I had not been in Port Arthur long before I found out that the Illinois Central was not known to the people here out of New Orleans and the cities immediately to the north. I went to work for a real estate man, a former employe of the Illinois Central, N. M. Barris; through his office I became acquainted with the business men here. I ordered a supply of folders, and when I received them I gave them to the people who were going away to cities east of the Mississippi River. After this they came to the office inquiring as to Illinois Central trains out of New Orleans and to the cities north.

Later on through F. L. Jones of Houston, district passenger agent for the Illinois Central, I received two maps and two official guides. One of these I placed in the Mississippi State Bank and the other in Mr. Barris' office. Partly as a result of this a good passenger business has been turned over to the Illinois Central.

Mr. Jones has called on me several times. He is always very busy. I often advise the merchants and the business people, when they go away for their vacations or to some northern market, to take the "only road" out of New Orleans. I am glad to do this for the Illinois Central in return for the good treatment I received and am still receiving.

To all of my fellow employes, I would say: "Stand by the bridge, it will carry you over safely."

**Things We Should or Should Not Do**  
Tomorrow never comes; do it today.

You can help. Will you?

Why not do it now?

Prepare for a rainy day. This applies to railroading.

A satisfied customer makes two satisfied. This applies to an employe.

Use tools for what they are intended. If not, you only break them. They cost money both in labor and material.

Be on time. It can be done.

Get your fuel in early. It will help transportation as well as yourself.

You can assist in reducing claims. Just help a little. Every little helps.

When the public is asking questions and no one of authority is around to answer them, if you have the knowledge, assist.

Let's all help to conserve fuel.

Now is the time to release cars. Talk it and do it!

Be courteous and polite. It won't hurt you, and it will help the company.

Help the *Illinois Central Magazine*. Contribute something.

You work for the best railroad in the world. Why not have your friends ride and ship over it?

Do your part.

### **ACTS AS STOREKEEPER**

J. W. Cockrill has been appointed acting division storekeeper at Water Valley, Miss., succeeding W. E. Hoyt, temporarily assigned to other duties in the supply department. The appointment was effective August 16.

*Remember*

*September!*

**AROUND CHICAGO**

The General Office Baseball League during August played its last series of games. The standing as of August 17 was as follows:

Teams	Games	Won	Lost	Pct.
63rd St. ....	21	17	4	.809
Accounting .....	19	15	4	.789
Engineering .....	19	13	6	.684
Burnside .....	18	8	10	.444
So. Water St.....	17	6	11	.353
Purchasing .....	16	5	11	.312
Mechanical .....	17	4	13	.235
Operating .....	13	3	10	.231

**Dining Car Department**

On August 12 the Pullman Company delivered five new standard up-to-date dining cars to the dining car department. These cars have been put in service on the famous Panama Limited, trains 7 and 8 between Chicago and New Orleans, relieving five other cars which were models of the car-builder's art at the time this train was put into operation, in November, 1916.

The new cars, which are steel and equipped with electric lights and fans, steam heat and improved methods of ventilation, have the same seating capacity (thirty-six) as the other cars, but have a more elaborate complement of silver and china-ware. The silver-ware is the latest pattern devised by Redd & Barton, and is not equaled by any other service in this country, while the china-ware is the latest production of the Bauscher potteries of Germany. The car alone represents an outlay of \$52,000, while the silver service and china-ware on each car totals the tidy sum of \$8,000. Thus it costs about \$60,000 to prepare the car for service, not counting the cost of the pure imported Irish linens which decorate the tables.

It has been computed that, after completely equipping a dining car with all the paraphernalia necessary for road service, it costs the railway company 57 cents to prepare a guest a comfortable chair to sit in, a fine carpet to walk on, an electric light and an electric fan to enjoy, shining silver-ware to handle the food, exquisite china to serve it, spotless snowy-white line to cover the table, and courteous waiters and skilled cooks to prepare and serve—this before the guest has received anything save his sparkling glass of ice-water.

Al Ballard, our teamster, is away on his vacation, visiting friends in New York state.

Vacation time is drawing to a close, and it is a relief, as the work becomes lighter when everybody is on his own job.

**Suburban Passenger Service**

The first train of new all-steel suburban cars was operated out of Van Buren street, train 329, Engine 1448, Conductor J. E. Zimmerman, Engineer P. Larson, August 19, 1921. Conductor Zimmerman, who is the oldest conductor in suburban service (the "daddy" of them all), is proud of the fact that it fell to his lot to be conductor of the first train of steel cars put into service.

Miss May Johnson, after a long illness and operation, is improving.

Miss Jessie Shoemaker is visiting in Ohio.

Miss Julia Stage is taking a vacation.

Miss Minnie Lorel has returned from Montana after three months' absence.

Miss May Van Ness has been absent for five weeks on the sick list.

E. O. Guyton and family made a tour through Wisconsin while on their vacation.

B. O. Brussow and family are on their vacation.

Mrs. Marion Pressler is on her vacation.

Station Master Hovey recently entertained his father from the East.

Cy Kenney is on his vacation.

The ball game between the Suburban Train-

**Trussing Cars**

Very little has been said in the past in regard to trussing cars. This is an important matter and should be given more attention in the future than it has had in the past. We all know that, if cars are permitted to run and be loaded with loose truss-rods and truss-rod saddles missing, it is damaging to the cars. It is much better to keep cars properly trussed at all times than to wait until they have become swagged and all out of shape and then try to straighten them. All of our new cars, as well as the old ones, should be watched closely in regard to this matter. If they are kept properly trussed at all times, we will find that it will prolong the life of our cars several years.—MAURICE WILSON, *Car Foreman, Shops, Paducah, Ky.*

Arthur Donnals, trainmaster's clerk, submitted to an operation for appendicitis at Burnham Hospital, Monday, August 8. He has now been removed to his home and is getting along nicely.

Mr. Dodge and Mr. Lindrew were in Champaign the afternoon of August 24. They held a meeting in Superintendent Hevron's office, in regard to consumption of fuel.

**Champaign Freight**

Owing to ill health, A. C. Bialeschki, delivery clerk, is leaving the latter part of this month for Phoenix, Ariz., to remain indefinitely.

A meeting of Illinois division agents was held in Champaign freight office, Saturday, July 30. The principal subject discussed was car service rules, per Circular 26, July 6.

Dave Wiseheart, warehouse clerk, has returned from a month's vacation spent in Seattle and Tacoma, Wash.

**Kankakee Freight**

Bill Clerk J. F. McCarthy is spending his vacation on a tour of the East.

Agent J. M. Purtil, Yardmaster E. Damon and J. R. Brayton attended a car service educational meeting in Superintendent Hevron's office, August 17.

Yardmaster Damon, after tramping up and down the yards for the last twelve years, concluded that walking while off duty is too tiresome, so he has purchased an automobile.

**Effingham Freight**

Joe Keane, bill clerk, and Express Messenger Ed Ludwig are enjoying their vacations in Denver and Colorado Springs, Colo.

William Laux, freight trucker, has returned from his vacation, which was spent in Evansville and other points in Indiana.

**Kankakee Yard and Roundhouse**

The Kankakee fair ground grandstand burned down the afternoon of July 21, 1921, necessitating the canceling of the fair this year.

A. J. Wakat, car inspector, has gone to Toronto, Canada, to attend the car repairer's convention.

Fireman P. F. Ryan is the proud father of a baby boy, born two weeks ago.

Fireman R. W. Saltsider has reported to work after being off for one week on account of injuries received when riding his motorcycle; he overbalanced and ran against a tree.

Brakeman H. Kirkpatrick is off duty on account of sickness.

**Champaign Yard and Roundhouse**

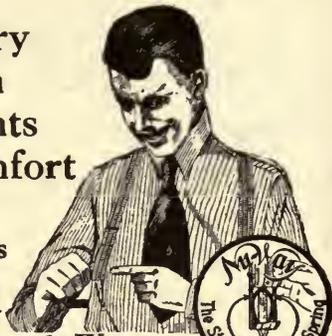

Lawrence Gore, clerk in the car department, and Mrs. Gore left Champaign August 17 for Peace Valley, Mo., to spend a week or ten days visiting Mr. Gore's parents.

Arthur Beam, pipe fitter, was painfully injured on August 20, when he fell about twenty feet from a ladder, striking his head against some large pieces of pipe. Mr. Beam was making repairs to the roundhouse blow-off line when the ladder slipped out from under him. He was taken to Burnham Hospital and placed in the care of District Surgeon Kirby.

Henry W. Geisler, machinist, had his left hand severely cut on August 16 while at work.

The August Illinois division signal employees' educational meeting was held at Kankakee,

Railroad Watches are adjusted to **six positions**. Ask your jeweler about these superior watches. Descriptive folder sent on request.

**Illinois Watch Company  
Springfield**

Sunday, August 21, with an attendance of thirty-six. The subject was relays and style "K" signal mechanisms. The Hall Switch & Signal Company was represented by R. D. Day, sales engineer, of Chicago, and O. B. Frink, chief inspector, Garwood, N. J. Mr. Frink addressed the meeting. In attendance also were Mr. Densmore, manager of the National Refining Company, Chicago, and his sales engineer, G. Hannaway, for at the October meeting the subject will be illuminating oil. The subject for September will be the storage battery, and a representative of the Electric Storage Battery Company will address the meeting.

**SPRINGFIELD DIVISION**

Trains 19 and 20 of July 30 and 31, Engine 1054, in charge of Engineer F. Gallagher and Fireman J. Sweazy, performed a round trip on 17,384 pounds of coal, which equals a rate of 839 pounds of coal per 100 passenger car miles.

Extra 1585, south, Clinton to Springfield, handling 70 cars, used 6,048 pounds of coal, or 76.6 pounds of coal per 1,000 ton miles.

Train 120, July 10, Engineer George Wilson and Fireman F. Wheeler, consumed 5,500 pounds of coal, Centralia to Clinton, or 1,608 pounds of coal per 100 passenger car miles.

Trains 19 and 20, July 10 and 11, Engineer T. B. Scott, Fireman W. H. McAnally, consumed 21,550 pounds of coal, or 916 pounds of coal per 100 passenger car miles.

Trains 19 and 20, July 11 and 12, Engineer W. Hayes and Fireman George Crawford, consumed 17,050 pounds of coal, or 828 pounds of coal per 100 passenger car miles.

Extra 2930, south, in charge of Engineer C. W. Overleese and Fireman C. F. Smith, leaving Clinton with 2 loads and 28 empties, 2,100 tons, took siding for Extra north 102 at Forsyth, 164 at Elwin, first 172 at Oconee, second 172 at Ramsey and 182 at Vera without stopping at any of the chutes for a supply of coal. In other words, they made the entire trip from Clinton to Centralia, including the delays, and handled the tonnage on one tank of coal given out of Clinton.

It should be understood that engines protecting No. 19 and No. 20, trains which consist of 7 cars southbound and 8 cars northbound, do not take any coal at St. Louis, but make the round trip on coal furnished the engines on leaving Clinton.

A letter of commendation has been given Roy Williams, switchman at Decatur, for discovering a broken wheel on C. I. & W. 12190, cha-tauqua outfit, while going through progress of switching at Decatur, Ill. Discovery of the broken wheel doubtless averted an accident.

Engineer Bitterly, Conductor Burns, Fireman Salmon and Brakeman Scott of Extra 2918 on August 19 have been commended for discovering and putting out a fire in M. & St. L. 7152 in Clinton yard. They coupled on this car and took it to the ice house, where a hose was obtained. It is thought tramps set fire to straw in the car.

**ST. LOUIS DIVISION**

Miss Helen Foley, who has been a stenographer in Superintendent Atwill's office, was married August 21 to Winton Walkup, who is employed in the general offices at Chicago. They will reside in Chicago.

Miss Florence Sill, stenographer for Chief Clerk Culley, enjoyed her vacation by camping out at Carbon Lake, near Murphysboro, Ill.

D. C. Moss, tonnage clerk, was absent from

duty a few days on account of the death of a relative.

William Atwill, Jr., and Miss S. E. Patterson, tonnage clerk, have been visiting relatives and friends in the New England states for several days.

Superintendent Atwill held a staff meeting in his office August 23.

Miss Lena Hampton has been appointed to fill the stenographic position made vacant by the marriage of Miss Helen Foley. Charles Clayton has been placed on the position made vacant by Miss Hampton.

C. A. Linn, clerk, has been spending his vacation in Frankfort, Ind., with relatives and friends.

The St. Louis division is going strong on the conservation of fuel. You are economical in the use of fuel at home. Why not for the railroad?

J. L. Butler, stenographer for Superintendent Atwill, spent his vacation with friends in Detroit, Mich.

The coal mines on the St. Louis division are eager to serve your needs for winter coal. Why not get it now before the severe weather sets in?

There is considerable track construction to be performed on this division to serve coal mines. The contractor to construct the tracks to serve the Lake Creek Mines, near Johnston City, Ill., is on the ground, and the work has begun. There is also a track connection to serve Royaltown Mines, near Zeigler, Ill., on which construction will be under way in the near future.

**INDIANA DIVISION**

R. E. Downing, for the past several years division storekeeper at Mattoon, Ill., has been promoted to a similar position at Clinton, Ill.

Miss Lucille Yount of the superintendent's office has returned from a vacation spent in Kansas City, and Miss Florence McShane from a two weeks' vacation in Michigan.

Pete Carlson, supervisor B. & B., has been ill at his home in Mattoon, but is slowly recovering.

Miss Catherine Stephenson is back at work after two weeks at home.

**Mattoon Shops**

Miss Harriett Bledsoe, stenographer in the office of the master mechanic, is spending her vacation in Petosky, Mich.

A. L. Tate, clerk in the office of the master mechanic, is spending his vacation in Chicago and other points of interest.

The employes in the office of Master Mechanic Bell had a picnic at Riverview Park.

Fred Runge is a new employe in the store department at Mattoon Shops.

Irving Walton, stockkeeper at Mattoon Shops, spent a week in Detroit, Mich., recently.

J. M. Misenhimer, night oilhouse man at Mattoon Shops, and Mrs. Misenhimer have returned from a trip to Detroit, Mich.

**TENNESSEE DIVISION  
Fulton, Ky.**

W. C. Valentine has returned from Diamond Springs, Ky., where he spent his vacation.

The Tennessee division fuel committee met at Jackson, Tenn., August 22, for a special meeting, preparatory to launching the big September conservation campaign.

Superintendent C. R. Young is back in the office, after an enjoyable vacation.

R. C. Pickering, assistant chief clerk, left August 21 on his annual vacation.

Miss Hortense Johnson is now enjoying her vacation.

Miss Vernita Tribble, stenographer, has resumed her duties after several days' absence on account of sickness.

Miss Estelle Slaughter, tonnage clerk, spent an enjoyable vacation this year, making a trip to New York and taking a steamer from there to Key West, Fla.

"I have been in the road contracting business

**If Ruptured  
Try This Free**

Apply it to Any Rupture, Old or Recent, Large or Small and You are on the Road That Has Convinced Thousands

**Sent Free to Prove This**

Anyone ruptured, man, woman or child, should write at once to W. S. Rice, 79A Main St., Adams, N. Y., for a free trial of his wonderful stimulating application. Just put it on the rupture and the muscles begin to tighten; they begin to bind together so that the opening closes naturally and the need of a support or truss is then done away with. Don't neglect to send for this free trial. Even if your rupture doesn't bother you what is the use of wearing supports all your life? Why suffer this nuisance? Why run the risk of gangrene and such dangers from a small and innocent little rupture, the kind that has thrown thousands on the operating table? A host of men and women are daily running such risk just because their ruptures do not hurt nor prevent them from getting around. Write at once for this free trial, as it is certainly a wonderful thing and has aided in the cure of ruptures that were as big as a man's two fists. Try and write at once, using the coupon below.

**FREE FOR RUPTURE**

W. S. Rice, Inc.,  
79A Main St., Adams, N. Y.

You may send me entirely free a Sample Treatment of your stimulating application for Rupture.

# Hamilton Watch

"The Railroad Timekeeper of America"

## You Might as Well Own a Watch with a Record

From steam to electricity, from the invention of the first engine to the air-brake, inventors have constantly sought two things—speed and safety.

The speed and safety of modern railroad traffic are made possible through carefully prepared schedules. Back of these schedules is the Hamilton Watch, the favorite timekeeper of American railroad men.

The engineer shown above is S. W. Powers. He has been with the Boston & Albany R. R. for 25 years. He runs his trains by a Hamilton Watch—has for years.

You might as well own a watch that will give you time with day-in-and-day-out accuracy.

When you make your choice, ask to see the Hamilton models most popular with railroad men, particularly No. 992 (16 size, 21 jewels). Hamilton Watches range in price from \$40 to \$200; movements alone, \$22 (in Canada, \$25) and up. Write to us today for "The Timekeeper," an interesting booklet about the manufacture and care of fine watches. The different Hamiltons are illustrated, and prices given.

HAMILTON WATCH COMPANY, Lancaster, Pa.

for several years and have therefore had to deal with a number of agents, good, bad and otherwise, and it is a real pleasure to me to say that your agent, B. Chandler, at Lucy, Tenn., heads the list," writes H. W. Dew of Lucy, Tenn., to Superintendent C. R. Young. "He is always on the job and has his business at his finger tips. He is wide awake, really alive, always looking out for the interest of the company he is serving, but at the same time giving his patrons every care and attention."

**Dyersburg, Tenn.**

Auditor J. M. Peay and E. L. Yontz spent several days in Dyersburg this month.

Supervising Agent T. D. Clark and Agent Waggoner made a trip over the C. M. & G. lines recently.

Accountant Jodie Smith has gone to Alligator, Miss., to spend several days.

**Jackson, Tenn.**

Several of the Jackson shop men spent their vacation at Dawson Springs, Ky., this month, and all report an enjoyable rest and much benefit from the famous Dawson water.

The Jackson Shop force desires to extend its deepest sympathy to the loved ones of Joe Bond, engineer, and Mrs. M. B. Thomas, wife of Conductor M. B. Thomas, in the time of their bereavement.

During the noon hour, August 16, the shop force was highly entertained by a 4-round boxing contest between two local negro fighters. Both put up a stiff fight, but the decision was rendered in favor of Oscar Smith, better known as the "I. C. Backing Hammer."

**Birmingham, Ala.**

C. A. Randall, timekeeper, has returned to work after a week with relatives in Talladega, Ala.

J. J. Foster, former day roundhouse foreman at Birmingham, was a visitor in the city recently.

Clarence Gilbert, day roundhouse clerk, has returned from a two weeks' vacation, enjoyably spent in Florida.

Miss Catherine Colgan, stenographer in Mr. King's office, has returned from her vacation. She reports an interesting trip through the East.

Machinist Apprentice Frank Foster attended the reunion of the Rainbow Division in Cleveland, Ohio, recently.

**MEMPHIS DIVISION**

Foreman J. R. Hamlett of Tutwiler left recently for Chicago, Milwaukee and St. Paul on his vacation.

Miss Clara Milligen, supervisor's clerk at Tutwiler, has left for New York and other eastern points on her vacation.

E. T. Cross has succeeded D. T. Overby as rodman accountant at Memphis. Mr. Overby was promoted to instrumentman accountant at Louisville, Ky.

Jack Maynor, son of Roadmaster C. A. Maynor, died suddenly at Jackson, Miss., Sunday morning, July 31. Mr. Maynor and family have the sympathy of the entire division.

Miss Matilda K. Nagle, secretary to Roadmaster Maynor, has resigned, effective August 13. She will leave Memphis for Chicago the latter part of September.

R. S. Abel, supervisor at Lambert, Miss., recently spent a few days in New Orleans with his parents.

The superintendent's office is recovering from the vacation spirit. Again we have among us

*A Railroad  
in the Making*

Miss Ada M. Johns, Mrs. Collie Said, Miss Julia Gavin, John Digel, Ray Lipsey, Miss Adron Smith, Miss Juawice Tabb.

D. C. Clark of the accounting department is the happy father of a bouncing girl.

Conductor Church Buck, after an illness of several months, died on August 24 at his home on Hayden street, Belzoni, aged 48 years. He leaves a wife and two small children. Mr. Buck entered the service of the Illinois Central before he was 20 years of age. He was a conductor at 20 between New Orleans and Memphis. For twenty-eight years he had been a valued employe of the Illinois Central System, the last two years as conductor on the Belzoni-Vicksburg branch. He was universally popular. Burial was at Rolling Fork.

#### LOUISIANA DIVISION

##### Superintendent's Office, McComb, Miss.

W. E. McCloy, supervising agent, accompanied by Agent Murphy of Yazoo City, left August 23 on an inspection trip over the Western Lines.

Miss Frances Otken has returned from a 60-day leave spent in the mountains of East Tennessee.

Miss May D. McMichael is resting in Alexandria, La. Harry Campbell again visited Kentucky. Beulah Glendenning has been signaling on the mountains in Tennessee. Louise Bridges chose Schenectady for her trip, while Altha Day visited the Plymouth Rock. Annette Wilson spent her allotted time with her sister in Detroit, Mich.

Miss Mary Browne has gone to Texas for ten days.

An addition to our office is Miss Bessie Lane, now employed on the tonnage desk.

Chenet Bourgeois, chief accountant, is on a leave of absence, recuperating.

Joe Stamps has gone back to Central America.

#### Jackson, Miss.

Lowell B. Carter of this office and Miss Clara Rogers of Jackson were married this month and are at present in the West on their wedding trip.

Miss Ola O'Quin and Clarence M. Quin were recently married. Miss O'Quin was the recipient of several "showers." The couple now live in the suburbs of New Orleans.

J. L. Morgan, agent, accompanied by Mrs. Morgan, is in the West for a short vacation.

We welcome back into the service, after several months' absence due to illness, Mrs. Homer Hill.

Charles S. Kramer has accepted the offer of the government to give him vocational training and has left with Mrs. Kramer for Atlanta, Ga.

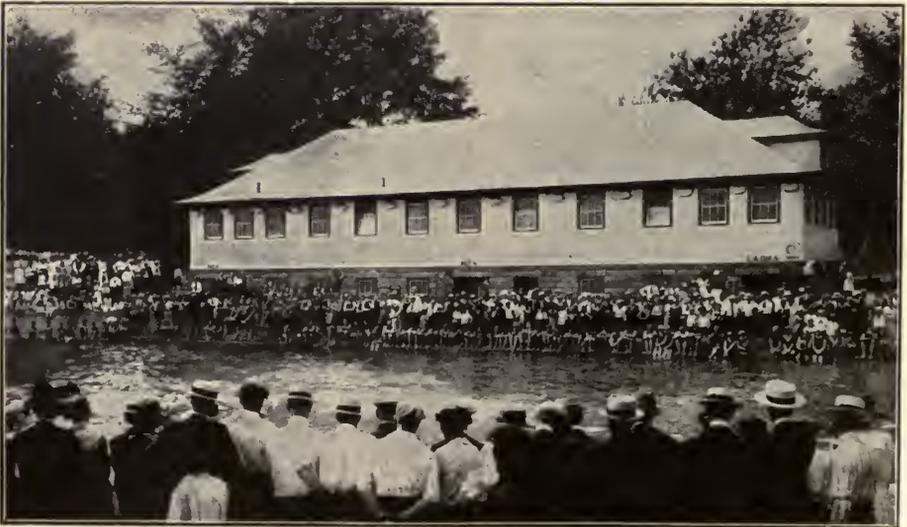

#### Magnolia, Miss.

A. R. Gwinn of the Illinois Central development bureau recently spent several days here giving lectures and moving picture views in the interest of dairying in this vicinity.

Clerk E. C. Wren of the local office has been installed as temporary agent at Gluckstadt, Miss.

Miss Grace Brent, clerk in the freight office, reports a delightful time at Signal Mountain, Tenn.

The construction of the vitrified brick road from McComb to Magnolia is being rapidly pushed, the initial supply of brick already having been received here, in fifty cars, which ma-

President

terially increased the freight receipts at the local freight office.

W. H. Brill, general passenger agent at New Orleans, reports that Harry H. Schroeder, brakeman, McComb, Miss., wrote our city ticket agent at New Orleans that J. W. Twining, 918 Girod street, New Orleans, was contemplating a trip to the East. Our representative called on Mr. Twining, and in the face of strong solicitation from our competitors was successful in selling him three and one-half tickets to Toledo, Ohio, routed Illinois Central to Chicago.

On the night of August 2, F. B. Morris, agent at Chatawa, Miss., went into his office at about 11 o'clock and found that the cash drawer had been pried open. He flashed his pocket light about the room, and found an intruder crouched in a corner. Mr. Morris kept the light in the man's face, and picked up an iron bar. Without hesitating, the stranger surrendered, and was taken to the Magnolia County jail, where he gave his name as George Irvin of Nashville, Tenn. He admitted that he had served a 2-year term in the Louisiana penitentiary. Mr. Morris found \$3.70 missing from the cash-drawer. The alleged robber is being held for trial.

**NEW ORLEANS DIVISION**

S. F. Lynch, chief clerk to the superintendent at Vicksburg, returned Wednesday, August 10, from Chicago, after an operation for appendicitis in the Illinois Central Hospital. His many friends in Vicksburg are delighted at his rapid recovery. Mr. Lynch is enthusiastic about the hospital and the careful attention that is given the patients.

Miss Thelma Welsch, stenographer in the superintendent's office, has returned from a pleasant two weeks' visit to various points in Texas.

Misses Aurélla Curran and Jessie Billet, stenographers in the superintendent's and roadmaster's offices, left August 13 on their vacations, Miss Curran going to Chicago and Evansville, Miss Billet to Colorado.

C. A. Westmorland left recently for a trip to his home in Arkansas. This is his first trip home since he joined the force some two years ago.

The Y. & M. V. team engaged the "Max Isaacs," a local organization, in a fast game of ball Friday, August 12, winning by a score of 8 to 5. Our boys showed up in splendid form. Another game was planned between the same teams for Sunday, August 21.

"The banquet tendered by Jerry Cronin, traveling engineer of the Yazoo & Mississippi Valley Railroad, and the local engineers, complimentary to the visiting engineers of the Illinois Central and Y. & M. V. system, last evening at the National Park hotel, was one of the most successful ever served in this city or at any point along the lines of the two roads," said the Vicksburg (Miss.) Herald of August 19. The banquet followed a business meeting of the traveling engineers of the Southern Lines and the Y. & M. V. Those present at the banquet, several of whom made speeches, were: J. W. Dodge, B. J. Feeney, P. H. Kyan, J. W. Shepherd, C. Seeber, Joseph Harrington, James Millet, Jeff Harrell, of the Illinois Central, south of the Ohio River; Jerry Croin, Ed Van Burgen, H. V. Neville, J. R. Tuson, A. F. Walton, Pat Gallagher, H. A. Covington, A. Smith, P. F. Gallagher, H. Y. Fletcher, of the Yazoo & Mississippi Valley; J. J. Hayes, mayor of Vicksburg; Barney McNamara, of O'Neill, McNamara Hardware Company; J. J. Lum, of Jones' Smoke House, and E. A. Fitzgerald, Sr., of the Herald.

**REMOVE YOUR WRINKLES**

**"Beautiful Eyelashes and Eyebrows, Beautiful Figure Merely a Question of Willingness to Try."**

—HELEN CLARE.

**Superfluous Hair, Pimples and Blackheads Disappear "Like Magic," Say Letters**

This clever woman has perfected a method simple and yet "marvelous" in the opinion of hundreds of sister women, and the result has brought a wonderful change in her facial charm. "In a single night," says Helen Clare, "I have sensed the working of my method, and for removing wrinkles and developing the form, reports from nearly every state in the Union are even more pronounced than my own—and rapid."

In an interview Helen Clare said: "I made myself the woman that I am today. I brought about the wonderful change in my own appearance, and there are hundreds of my friends who know how I did it (in a secret, pleasant, quiet, yet harmless manner). My complexion today is as clear and fair as that of a child. My figure, formerly almost scrawny, I have developed into a beautiful bust and well developed form. Thin, scrawny eyelashes and eyebrows, so poor they could scarcely be seen, have become long, thick and luxuriant; and by my own method." Referring to pimples, blackheads and superfluous hair, Helen Clare continued: "I banished mine in my own way and by my own method, using nothing but my own simple home treatment, which any other woman can now have the personal benefit of and do as well as I have done "if"—"if"—"if"—they will only make the effort and have even a little, teeny bit of faith in themselves as well as in me."

Hundreds of women are so delighted with the results from Helen Clare's methods that they write her personally the most enthusiastic letters. Here are extracts from just two: "Thank you for what your Beauty Treatment has done for me. It has cleared my face of blackheads and pimples. My complexion is as smooth as a child's now. It will do all you claim." "And your treatment for removing wrinkles is wonderful—removed every wrinkle from my face."

The valuable new beauty book which Madame Clare is sending free to thousands of women is certainly a blessing to women. All our readers should write her at once and she will tell you absolutely free, about her various beauty treatments, and will show our readers:

- How to remove wrinkles;
- How to develop the bust;
- How to make long, thick eyelashes and eyebrows;
- How to remove superfluous hair;
- How to remove blackheads, pimples and freckles;
- How to remove dark circles under the eyes;
- How to remove double chin;
- How to build up sunken cheeks;
- How to darken gray hair and stop hair falling;
- How to stop perspiration odor.

Simply address your letter to Helen Clare, Suite A801 8311 S. Michigan Avenue, Chicago, Ill., and don't send any money, because particulars are free, as this charming woman is doing her utmost to benefit girls or women in need of secret information which will add to their beauty and make life sweeter and lovelier in every way.

# Brings this Seamless Wool Face Brussels Rug

Hartman's Newest Pattern—Full Room Size, 9 Feet x 12 Feet

Only \$1 to send now—and we ship this magnificent seamless, wool face, tapestry Brussels rug. Use it 30 days on free trial, then if not satisfied, return it and we refund the \$1 and pay transportation both ways. If you keep it, take nearly a year to pay—a little every month. And note—the price is cut—you save over a third. Even before the war this rug would have been an amazing bargain at this phenomenally low price.

## Superb Coloring—Artistic Floral Medallion Pattern

**Woven from Fine Wool Yarns** A most artistic design. Soft, rich and harmonious colorings. Brown, tan, red, green and light colorings are beautifully blended. An attractive floral pattern with large medallion center, surrounded with harmonizing floral sprays; finished with a pretty border. Made seamless of fine wool yarns. Order by No. 34CCMA16. Price \$26.85. Send \$1.00 now. Balance \$2.50 monthly.

**IMPORTANT!**  
This seamless wool face Brussels rug is a close, firm weave which gives it much greater durability than you get from the ordinary kind. Be sure to examine the texture and weight. Judge by actual quality and see what an amazing bargain you get in this rug.

**Nearly a Year to Pay** When our stock of these rugs is gone we may not have this particular pattern to send at any price. So act quick! You take no risk. Keep it or return it—30 days' free trial!

## FREE BARGAIN CATALOG

392 pages of stunning bargains in furniture, rugs, linoleum, stoves, ranges, silverware, watches, dishes, washing machines, sewing machines, aluminum ware, phonographs, gas engines, cream separators, etc. 30 days' free trial on anything you send for—everything sold on our easy monthly payment plan. *Post card or letter brings it free.*

"Let Hartman Feather Your Nest."

*W. H. Rhedemeyer*

Mr. Rhedemeyer, agent at East St. Louis, Ill., was born September 2, 1874, at East St. Louis. He was educated in the public schools in that city, and attended the night school of the Bryant & Stratton College at St. Louis. His railway service has been entirely in East St. Louis, and the last thirty years of it has been with the Illinois Central System. His record is as follows: 1889, messenger for the C. C. & St. L. R. R.; 1890, clerk for the same railroad; 1891, clerk for the Illinois Central; 1892, chief bill clerk; 1896, cashier; 1902, chief clerk; 1916, local freight agent.

NUMBER 4

## October, Too, Is Fuel Economy Month for Illinois Central System

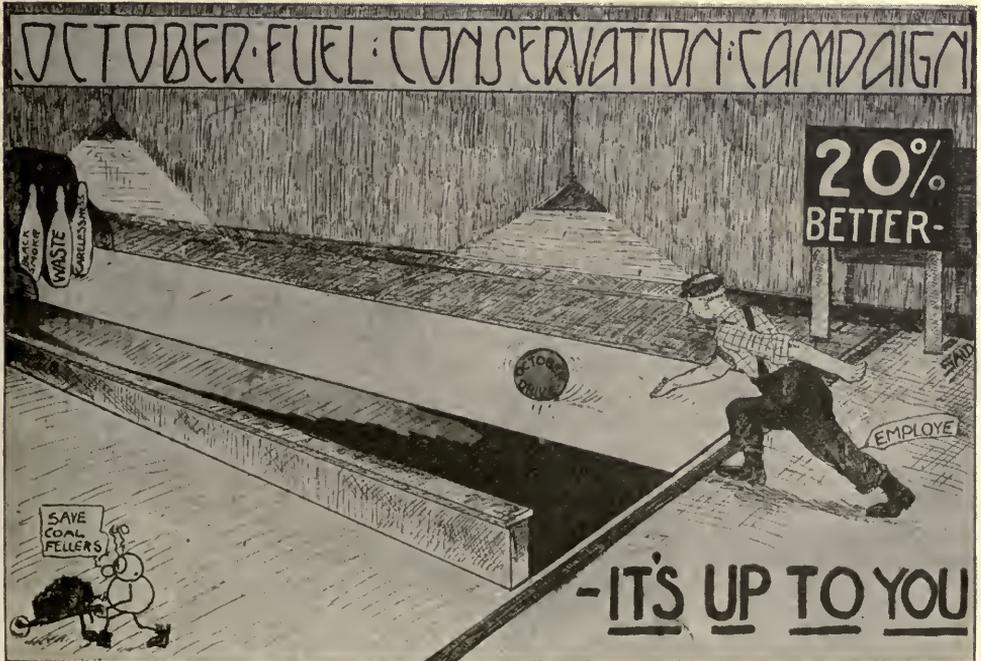

**Goal Set at 20 Per Cent Less Than the Average October Consumption of Last Five Years; New Plans in Effect**

THE intensive drive for greater savings in the use of fuel on the Illinois Central System, which began September 1, has been extended to include the month of October. Complete results on the September effort were not yet available when forms were closed on the October number of the *Illinois Central Magazine*. Information received at that time, however, indicated that the final results would be highly gratifying.

Some fine ideas and plans for saving fuel were worked out late in September by individuals and division committees, and the man-

agement wants to give the officers and employes an opportunity to put them into full effect during an entire month. The methods used in the compilation of former records also did not provide fair comparisons for showing the big things which have been accomplished on a number of divisions, and that will be corrected in the October effort.

During October, the effort will be to make a record 20 per cent better than the average for the Octobers of the last five years. Each division will compile its figures on the amount of coal consumed per 100 passenger car miles,

per 1,000 gross ton miles (freight service) and per switching mile. These figures, by years, for the Illinois Central System are:

	Per 1,000 Gross Ton Miles	Per 100 Passenger Car Miles	Per Switching Locomotive Mile
1916.....	161	1787	132
1917.....	174	1914	139
1918.....	166	1861	126
1919.....	161	1874	126
1920.....	154	1886	133
Average			
5 years.....	163	1864	131
Average less 2%....	130	1491	105

The cost of the coal consumed on the Illinois Central during the October of each of the last five years follows:

	Tons Consumed	Total Cost	Average Cost Per Ton
1916.....	362,501	\$ 509,856.27	\$1.41
1917.....	425,763	777,022.34	1.82
1918.....	414,311	1,099,031.91	2.65
1919.....	414,567	1,096,101.82	2.64
1920.....	470,050	1,858,811.54	3.95

The management is well pleased with the efforts which have been put forth by individual officers and employes and by the various committees. They have taken the spirit of the campaign to heart and have worked faithfully. It is believed that when the final records are written, upon the close of the campaign October 31, the officers and employes may well be proud of what they have accomplished.

## Superintendent Sees Hope in the Delta

By J. M. WALSH,  
Superintendent, Memphis Division

The farmer of the Mississippi Delta is learning the lesson of diversification. This year one views from our tracks and on drives through the country large fields of corn, sorghum, soy beans, velvet beans, cow peas and other forage crops, and around each farm house and most of the negro cabins are patches of garden truck, often as well kept as, and far more productive than, on the farms of the North.

The Delta farmer is learning that it pays to feed his family and his stock from the products of his own land.

The cotton crop, always the main crop in this section, was up until some time ago considered an 85-per-cent crop, and considerably above the 10-year average of 70, but the ravages of the boll weevil, that pest of all native cotton growing regions, has begun to tell until now it is doubtful if more than a 50-per-cent yield will be had.

The corn crop is excellent. Ample rainfall with hot growing weather bids fair to make a record crop, and the prospects are the coming season will see the Delta farmer shipping corn out instead of buying it from distant markets.

Most of the cotton raised in the Mississippi Delta is of the Webber type, long staple and early, and it is the early crop that suffers least from the boll weevil.

Picking and ginning this year started ten days earlier than usual. The first shipping started August 27. The cotton is moved to near-by compress points for compression and storage until it is shipped to the cotton man-

ufacturing mills in the North and East. The seed is shipped in bulk car lots to the various cotton seed oil mills on the division, where it is pressed to extract the oil. The cake (the residue left after the oil is extracted) is shipped in cake form or ground into meal for stock feed and other uses.

Many exaggerated reports circulated through the press in various parts of the country of the bankrupt conditions existing in the Delta country are entirely without foundation.

Despite a bad market the past year and a short crop of cotton this year, the Delta farmer is without doubt in better shape than ever before. His farm is reduced in size, resulting in more intensive cultivation and diversification. Raising feed crops and supplies at home makes the farmer, both white and black, to a great extent independent of outside help.

### ELSIE SPROUSE IS DEAD

Illinois Central employes, particularly those who knew her and who contributed to her Christmas last year, heard with much regret of the death of Elsie May Hogan, invalid foster daughter of Mr. and Mrs. John Sprouse of LaCledde, Ill., which occurred September 3. Illinois Central employes assisted at the funeral, which was held at LaCledde, September 4. Miss Sprouse, who had been an invalid for more than six years, always made it a point to wave to the Illinois Central trainmen and enginemen passing her home, which was near the tracks. Newspapers all over the country told last Christmas Day how the Illinois Central employes played Santa Claus for her, presenting her with a wheel chair and numerous other comforts.

# How Tiny Keys Unlocked Big Doors When C. H. Markham Got His Start

*Illinois Central President Was Station Agent in a Small Town at 36 and Vice-President at 40*

Reprinted from the October issue of the American Magazine by permission of the editor and the Crowell Publishing Company.

By ALFRED PITTMAN

**A**MAN said to me not long ago: "The story of Charles H. Markham's career is, in many respects, the most extraordinary one I know anything about."

That is a pretty strong statement. But, knowing what I did know about Mr. Markham's experiences, I was perfectly ready to agree with it. Here are a few bold facts, for instance, which surely sound almost incredible:

When he was thirty-six years old he was only a railway station agent at a comparatively small town. Four years later, he was vice-president of a railroad. Three years after that, he was vice-president and general manager of a great railway system. And, seven years later, he became president of another great system.

Most men who get almost to the forty-year milestone without achieving anything but a minor position do not begin to climb suddenly and swiftly to the top. It is because Markham did that very thing that his story is so extraordinary.

When he was fourteen, Charles H. Markham left school and went to work at whatever odd jobs he could find in his home town of Addison, New York. Doing odd jobs didn't seem to get him anywhere in particular, so he went West to look for something better.

## Broke Into Railway Work

At Kansas City he ran out of money and had to find work immediately, so he became a laborer in the packing houses. He was nineteen then. The next year he got into what was to be his life work—railroading. His debut was made as a section hand at Dodge City, Kansas. At twenty-one, he was shoveling coal into locomotive tenders at Deming, New Mexico. At twenty-two, he was baggage man and janitor of the station at Deming.

## Aren't You Getting On Fast Enough to Suit You?

Thousands of men who are capable, and even energetic, can't seem to find the stairs! Occasionally they make a step or two upward; but the steps are so few and far between that, even after years of work, these men are not much above the level where they started.

Then, sometimes, they suddenly start going upward by leaps and bounds. It looks like luck, or pull, or mere chance, and the people who are watching them wonder how it all happened, and wish that things would "break" that way for them.

Charles H. Markham, president of the Illinois Central Railroad, is one of these men who, for years, made only an occasional small upward step, then suddenly began to climb with amazing rapidity.

How did he find his way to the big stairs? What was the secret of his rapid advance after he once got started? That was what we wanted to know, and, on the chance that his experience might prove helpful to someone else, Mr. Markham consented to tell his story.—THE EDITOR, *The American Magazine*.

By the time he was twenty-six he had got what seemed a very great promotion—but it was only to the station agency in the little town of Lordsburg, Arizona, with five hundred inhabitants. His salary was one hundred dollars a month. For the next ten years he was merely a station agent at small towns, winding up at Fresno, where he held the same kind of job until he was thirty-six years old!

What kept him so long in the slow-moving phase? And what finally got him out of it? That was what we wanted to know. And, on the chance of its being useful to someone else, Mr. Markham consented to tell what he could about it.

"It seems to me," he said, "that the one

thing that helped me most—not only at thirty-six, but all the way up to that time and since—was a kind of *zest in small tasks*. Every promotion I ever had can be traced back in some way to that. I handled some little job as if it were a big one. That attracted attention; and in a number of instances it also gave me training for a bigger job. The two things together repeatedly did the work for me

#### An Ambition at Twenty-Nine

"In the beginning, this keenness for small tasks was due simply to the near-sighted sort of ambition that I had for many years. All the way along, I was as eager as a young fellow ever was, I think, to better myself. But until I was nearly thirty it somehow never occurred to me to look beyond the next job ahead.

"When I was twenty-nine, I remember very well that the most I hoped for was to get a little station out in one of the California valleys, where I could have grass and raise chickens! I was then agent at Benson, Arizona, in the dry country. Mrs. Markham and I lived up over the station, and we used to talk about the California place as another couple might have talked about the presidency of the road and a limousine car. If we had been sure then that we *would* have it some time, we should have been perfectly satisfied. At any rate, we thought so.

"When I was twenty-two, and hustling baggage at Deming, my goal was some sort of clerical work in the station office. It hadn't entered my head that anything finer could happen to me.

"This short-sighted ambition had its disadvantages, but it accounts for the incident that started me out of the manual-labor class. I was puzzled, for nearly twenty-five years, as to how I had got this start. Finally, the day I was made general manager of the Southern Pacific, I went to the old Pacific Union Club in San Francisco for luncheon. There I happened to meet E. F. Gerald, a former chief traveling auditor for the road, and he told me—or rather told a mutual friend of ours, while I stood listening—the secret of what had puzzled me so long.

#### A Good Job of Sweeping

"Did I ever tell you about the first time I ever saw Markham?" he asked our friend, putting his arm around my shoulders. "I'm not sure that he ever heard himself. It was

down at Deming. I was sitting in a private car in front of the station one morning, when he came out in his blue shirt and overalls and swept off the station platform. Something in the way he went about it caught my eye. For he didn't miss any dirt or waste any licks. He handled it like a brisk piece of engineering.

"Pratt, the assistant general superintendent, was with me, and I called his attention to the way the sweeping was being done, and said I believed that fellow would bear watching. You know all of us from headquarters were more or less scouts for good material. Well, we did watch him. We had him tried out after a while on some work in the station office, and by and by, as a result of it all, he was given his first station agency, the one down at Lordsburg."

"I don't know how I did the sweeping," Mr. Markham went on, "but I do remember how I felt about it. It was so much **better** than the job I had just had—shoveling coal all day—and so manifestly an approach to the brakeman's work—for which I was aiming—that I was proud to be doing it. And that was the essential thing. I handled the job as if it were a big one; because, to me, that was the sort it was.

"This, of course, is far from saying that the short-sighted sort of ambition is the best. A high goal to work toward from the beginning may be of immense value to a man. Nobody can appreciate that better than a man who has gone for a good while without one. It is a distinct advantage—if it doesn't work the wrong way. But very often it does work the wrong way.

#### Careers Spoiled That Way

"Very often it makes the man's immediate task seem futile to him; makes him detest and slight it. I have seen many careers spoiled that way.

"If I were starting over again, and had a chance to pick my equipment, I would choose the lofty goal *and* the zest in all the small steps toward it. But if I could have only one or the other, I would certainly take the zest in the intermediate steps. With enough of that, a man is mighty sure sooner or later to break through into something worth while.

"About the most fortunate thing that ever happened to me came at the time when I was getting a bigger sort of ambition. For just then the special significance of cer-

tain types of these smaller-looking tasks was being very forcefully illustrated to me.

"I had been sent down to Fresno, the shipping point for a district that produced great quantities of wine and raisins, much of which went out for long hauls. I was in a bigger field, and there was stimulus in that.

"But what counted more was that for the first time I had to meet straight-out competition. Always before, I had been selling to people who could buy from no one else. But here people not only could, but were constantly being importuned to buy from someone else. The Santa Fé had connections into Fresno, and was out after the same business we wanted.

"My job included running the station; but it also compelled me to go out among the shippers all over the district and to sell against this competition. The selling was not difficult in the way I had expected. I

had dreaded it beyond measure. Years before, at Lordsburg, a traveling freight agent had tried to talk me into just this kind of work.

"But I wouldn't hear of it. The very thought of the work frightened me. I imagined it would call for some kind of glib talk that I wasn't up to; glib talk, and fancy clothes, and a derby hat!

#### Plain Talk, and Plenty of It

"But nothing fancy in language or clothes was required at Fresno. All that was necessary was good service at the station, and straight talk and plenty of it in the field. During the busy season I had to keep on the job often from early in the morning to early the next morning.

"Very naturally, this matching of wits with other salesmen, and finding that I could get away with it, set me thinking of some better sort of future for myself; and

*C. H. Markham—Then and Now*

Mr. Markham is president of the Illinois Central, one of the great railway systems of the country. Before he took this position, he was vice-president and general manager of the Southern Pacific. And four years before he became its vice president he was station agent at a comparatively small town in California.

The story of his sudden and phenomenal rise is a remarkable one. He was born in Clarksville, Tenn., sixty years ago and began, as a boy of fourteen, doing odd jobs in a little town in New York State. Later he was a laborer in a Kansas City packing house; then a section hand, a coal shoveler, a baggage man and janitor, a station agent in a town of five hundred inhabitants. He was twenty-six years old before that promotion came to him, and ten years later he was still only a station agent. But then he began to climb faster than he had dreamed was possible, and today he is one of our great railway executives.—*American Magazine*.

it brought me evidence of approval from headquarters that gave an appearance of substance to my hopes. But the thing that helped most was neither the farther-looking ambition nor the selling record; it was the special attention I managed even in that busy time to give to the types of small tasks I referred to just now.

"Take the fund of information about Fresno and the surrounding country that I began to build up early in my experience there. Nothing could have been more useful to me than that. It gave me the background necessary for quick and sound decisions in my work. And it made a peculiarly valuable sort of impression at headquarters. The volume of business we were getting might have sold me to the management as a salesman. But this reputation for knowing the valley, and being able to reach my own decisions about it, and even to advise the general offices in regard to things, made me look more like executive material to them, and gave that twist to my future.

#### The Age of a Vineyard

"One of the general officers came down the valley with a party of investment bankers from New York, and from Fresno took them out over a new branch line through the grape country. The division superintendent and myself were annexed to the party at Fresno as sort of 'rubberneck spielers.' Something went wrong with our engine as we were passing a place called Barton's Vineyard, and while it was being fixed everybody got out of the train to enjoy the sunshine.

"One of the bankers turned to me as we walked up and down, and asked, 'How old is this vineyard?'

"'Twelve years,' I said.

"Before I could get any further, the general officer interrupted me.

"'Charley,' he said, 'how the deuce do you get onto such things?'

"'There it is,' I said; and pointed to a sign over a gate. The sign read, 'Barton's Vineyard, 1882.' (It was then 1894.)

"I don't suppose the incident particularly helped my reputation for being well informed. All the same, the reputation was due to just such closeness of observation. From the beginning, as I drove about the valley on my selling trips, I made it a practice to look out for facts which might be useful, and to hold onto them.

"The first work I was given, that reached beyond the jurisdiction of the Fresno station, began with another small task of the significant type: We were in the midst of the wine-moving season, and were having trouble getting the dozen cars we needed for a certain shipment. The wine was ready to be loaded, and only eight of the cars had come. The morning the men started putting the wine into the eight cars, I walked out on the platform to watch them a moment, and was struck for the first time by the wastefulness of the old method of loading the casks. Always up to that time, one layer of them had been put across the bottom of the car; and the remaining upper part, half the total space, left vacant. It had been taken for granted that if another layer of barrels were put on top of the first they would be knocked about and the wine probably spilled.

"I needn't have bothered about it. We were at the height of the shipping season, and there was plenty else to bother about! But the thing manifestly had an importance beyond the immediate emergency.

"A little figuring showed that a second deck of casks would leave plenty of margin under the weight capacity of the car. Having determined this, I called over some carpenters who were repairing the station platform, and put the problem up to them. They laid a shelf over the first layer of casks; and then, as the second layer was put in, built braces about the casks which made them perfectly safe. Before the morning was over we had all the wine loaded securely in six cars, and had two empties to spare. It was an obvious solution. But now see how it worked for me:

#### A Good Piece of Luck

"Julius Kruttschnitt, then general manager of the road, came into Fresno unannounced that afternoon. That was rather like luck. But one of the remarkable things about this attention to significant small tasks is the way it seems to have of dragging in luck.

"The division superintendent dropped off Mr. Kruttschnitt's train in front of the station, told me who was aboard, and asked if I had anything to show him. I mentioned the wine shipment. The superintendent went out and saw it, then took Kruttschnitt to see it. The car shortage that had been

bothering me had been bothering him, too, in a larger way.

"This is a sort of work that needs very much to be done all over the system,' he told me. 'I wish you'd look into some other phases of it. Take wheat, for example. See where we are wasting car space on that.'

"You see how one thing led to another—and in a way prepared me for the other. The wheat problem was almost exactly like the wine problem, only on a larger scale. There again, the trouble was mainly that no one had seriously studied the problem. The wheat was shipped in bags, and a little investigation through the California wheat country enabled me to develop a method of packing that was a good deal better than any commonly in use. I put this into my recommendation, and along with it suggested that prizes be offered to the agents in the various states who made the best packing records for the following year.

#### Better Results Loading Wheat

"The recommendation was adopted, and it got results. The season before the contest was started, the wheat shipped from California had footed up to just 66 per cent of the capacity of the cars it was shipped in. The season of the contest it amounted to 99 per cent! After that I was asked to handle the same problem in relation to other commodities.

"The promotion to the general freight and passenger agency, which I got when I left Fresno, did not grow out of any brilliant piece of work. A few years before, I would have said it would *have to*.

"Looking out for significant small beginnings was, if anything, even more useful to me after I got onto bigger jobs. Take the Willamette Valley problem, for example. I was sent up there to find out why the Southern Pacific's Oregon lines were not paying—and to *make* them pay. It seemed bigger when it was given me than any other job I've ever had. I was still a station agent at Fresno when the appointment came. All the problems I had worked on before had been compact and fairly well defined. But now I had several thousand square miles of territory to consider.

"The valley had held great promise when the Southern Pacific built into it. It had good soil, was abundantly watered, and led down to as important a distributing point as Portland, Oregon. In earlier years large

numbers of settlers had come in. Later the immigration had pretty nearly stopped and a lively emigration had set up.

#### Dairy Cow Solved Problem

"With my large inexperience I could work only one way, but it turned out to be an effective way. I looked for a simple beginning. For two or three months I went about the district, familiarizing myself with it, talking to people, and searching by all possible means for some key task, not too difficult for me to handle, yet promising a solution to the problem.

"The trouble, as I made it out presently, was that the farmers—it was mainly an agricultural region—were still largely following the methods they had used where they came from.

"I finally found my key task through a handful of dairy cows. Farmers all over the valley had told me that dairying was not profitable there. They had tried it, and been unable to succeed. But in a little creamery at Albany, the only one in the valley at the time, I found records to show that among a few farmers about Salem it had been made to pay and pay well. All the farmer needed, apparently, was a creamery in the neighborhood.

"Was that, in fact, all? Could these results be duplicated elsewhere in the valley? The best authorities in the state assured me they could.

"You see the simple beginning of the task? Just selling the dairy and creamery business idea to the people of the valley. That would have been hard if I'd had to do it alone. It was a totally unfamiliar sort of thing to me. But, as is usually possible with a sound and simple idea, I managed to get help. I got the very able co-operation of Doctor Withicomb, then the acting president of the State Agricultural College and afterward governor of the state. He and I gathered the proven facts about the dairy business, and put them out to the farmers and townspeople through the newspapers, the farm journals, even the school-teachers and preachers, and finally through some dozens of special meetings in churches, town halls, and the like. And soon the farmers began buying cows and the townspeople establishing creameries.

#### And a Social Influence, Too

"And the dairy cow turned out to be an even better institution than we had hoped.

She did not pay any better than we had expected. She paid about as well—and that was well enough. But she surprised us in other ways. She turned out to be a tremendous social influence. Besides giving a great many farmers something profitable to do, she actually kept them doing it—twice a day. That itself was wholesome, a factor for optimism if you please. I have seen it work so, not only in the Willamette Valley but in many other places since, for the dairy cow has long been one of our standard remedies for backward communities. But, in addition, she kept the farmers doing some-

thing that made tremendously for sociability. Outside of golf I know of nothing that makes a man so want to talk to his neighbors as a herd of thoroughbred dairy cows making good records.

“Other things were done to help. And many others, important ones, have been done since I left. But the big thing in my time, the thing that marked the turning point for the valley, was just this dairying campaign with its small beginning. And most of the jobs I have had, when I have got down to studying them, have yielded up some such elementary key task or tasks.”

---

## *Some Definite Economies in Use of Fuel*

By J. W. BRANTON,  
Master Mechanic, Centralia, Ill.

One could go on indefinitely giving reasons for saving fuel, but each employe should know his shortcomings and his wasteful practices, as all employes have had opportunities to visit the Fuel Car and to learn the various causes for saving coal. We are earning our livelihood from the Illinois Central System and should take enough interest to repay it by courteous and efficient service. The management has made an appeal to save coal. Let us all be big enough to do our part, for we are working for the best railroad in existence.

Some time ago we instituted a system here of saving coal in the various departments. In the power house each fireman has a form on which he enters the number of scoops of coal put in the firebox at each fire, and he is coached constantly by the engineer in charge to reduce the number. The engineer shows him how to fire properly and economically and to carry the water at a proper level.

Surprising results follow. Where we were using thirty-four tons of coal in twenty-four hours at one of our largest power houses, it has now been reduced to twenty-three tons, a decrease of approximately 32 per cent. Part of this was brought about by suggestions from the engineers in the power plant in regard to steam leaks, high pressure steam traps and other irregularities in the power house, the use of the blower in the roundhouse, air and steam leaks in the

roundhouse and shop. In connection with this, the engineers are required to make a log of their daily performances, which comes to the general foreman personally. These practices were put in effect at all points under my jurisdiction.

In the roundhouse the fire-up men have a form on which they enter the number of scoops of coal required to fire up each engine. They also see that the stacks are covered, in order to bring down the use of coal. These forms are signed by the fire-builders and also by the roundhouse foreman and forwarded to the general foreman and from him to the master mechanic. These men are then given the results of the different fire-up men in order to compare the best performances. By continuous talking to them, we have reduced the number of scoops used in firing up engines by 25 per cent.

The enginemen are giving us the number of scoops of coal consumed on each trip, and each day they endeavor to beat their previous day's records. Everyone seems to be taking a pride in his particular work.

On a recent check, it was found that considerable fine coal sifted through the grates in firing up engines, lodging in the ash pan. This coal was weighed and found to average from 100 to 184 pounds per engine. This coal is now being saved and again put back on the engine. This would be a big item on a large system like the Illinois Central. At one point alone, like Cairo, this amounts to approximately one and one-half tons a day.

# L. W. Baldwin Goes Into Some Problems of Maintenance of Way Work

## *Illinois Central Vice-President Urges Use of "Yardsticks" and More Extensive Employment of Mechanical Aids*

*The following address by Vice-President L. W. Baldwin was delivered to members of the Roadmasters' and Maintenance of Way Association at their annual national convention in session at the Congress Hotel in Chicago, Tuesday, September 20:*

**R**EGARDLESS of the wonderful improvements which have been made in the performance of maintenance and construction work, you know and I know that there are many primitive methods still employed which must be eliminated. In my opinion, we should work especially for these things: (1) The introduction of more practical methods in our work and the establishment of some effective methods for measuring our results, that is, to determine proper units of measure of work (yardsticks), and (2) the more general application of mechanical devices to increase production along these lines. These points, boiled down, mean that we must make sure that we are using the most practical, the most progressive methods we can devise, and, above all, that we know what we are accomplishing.

It is only through the adoption of the most practical methods that we will be able to get our maintenance of way and construction work done at the proper cost. I am sure you appreciate how important it is that this work should be done economically. The public is demanding the most efficient and economical operating methods which railway men can devise.

We have new problems to face every day. Wage, labor and material conditions change rapidly, requiring us to keep ever on the alert to get the maximum result for the railroads which we represent. In these days of high costs we need to use every resource at our command to get the best work done in the most economical way.

### **Must Devise "Yardsticks"**

There is a great need for men in charge of maintenance of way work to devise units (yardsticks) for measuring the work which

men under their supervision perform. The conditions we have to contend with on one division, stretch of track, or even section, vary so greatly from those on other adjacent territories that it becomes difficult to apply a standard of measurement which will be workable in all sections. We all agree the work should be done economically and within the estimates that are carefully prepared; yet we are using nothing but primitive methods in measuring the production. Nothing would be productive of more good than the establishment of units of measure (yardsticks) arrived at by proper studies to know that results obtained are satisfactorily economical.

It has been my experience that few men do their best unless their work, good or bad, is noticed by those who are above them in rank. There is no satisfaction in working unless one knows what he is accomplishing. For illustration, there is no satisfaction to a man moving dirt from one pile to another if the size of neither pile changes, unless he knows he is doing as much as a man should do, and unless he knows the person for whom he is working has some method by which he knows the amount of dirt being moved and that it represents a fair day's work—and, further, that the person for whom he is working is apprising him of this from time to time. Likewise, we cannot expect to get the best results from labor, unless the work is carefully mapped out and systematically outlined, and unless we have a method of informing all the men of the results they accomplish.

### **Can Pick the Right Man Now**

I have been employed in and have had supervision over maintenance of way work for many years. Fifteen years ago practically all of our efforts were the results of direct labor. At that time and until the war, the railroads paid track labor a minimum wage. During the war the wages of railway labor were put on a level with other lines of industry, but now in many parts of the country the railroads pay the very highest wages, which means we should now be able to pick

men for track labor who are intelligent, reliable, efficient and most suitable for their task. To do this should be one of the foremost duties of foremen, supervisors and roadmasters, of course, always being fair in their selection to the faithful men of long service.

Output records per man, per outfit and per machine should be kept, and the men should be apprised of the result. Output should be further stimulated through comparison, rivalry and the commendation of all good records—no man worth while is willing to be continually at the foot of any list reflecting merit. I appreciate this is not now practicable in many kinds of work, but I am sure you will agree that this subject requires much practical study to insure that all conditions and circumstances are taken into consideration and that figures or results obtained are comparable, to the end that no man will be condemned who has done his best. We are entitled to honest work, which can be obtained by proper supervision directed in the manner I have illustrated, but I would again like to impress upon you the urgent necessity for proper units of measure (yardsticks) that you may know and all may know if and when such results are being obtained.

#### **New Machinery Developed**

When I was first connected with maintenance of way work we had few labor-saving devices. In the past few years many such devices have been put into service; yet there are still many opportunities for such equipment to produce more economical results. The high costs impose on the supervisory officer the particular duty of obtaining the utmost output from each machine he may have on his territory, not only in the line of work for which it is especially designed but also in other work to which it may be adapted at a less expense than the present method. The high costs also impose on the railway management the duty of obtaining such equipment as will produce the most economical results. Unfortunately, many of the railway managements have not had the financial ability to purchase such equipment, although it could be shown that, after taking care of the carrying cost, maintenance and operation, the machine or appliance would result in good economies.

There are labor saving devices which may be made use of effectively. It is unnecessary to try to name all of them, but among the most important are:

Ditchers of various kinds and designs; spreaders without and with ditching wings; derrick cars of various kinds and designs, from the large wrecker and pile driver to the small push-car derrick for handling bridge timber and rail-laying machines for small gangs; air compressors with various attachments, for tamping ballast, drilling bond wire holes, tightening or loosening nuts, cleaning steel with sand blast, for repairing, painting and whitewashing, lining tunnels with concrete and oiling joints; narrow gauge dump cars in sliding cuts to haul out material clear of main track; ballast cars to unload in center of track or uniformly across track; device for spreading ballast after unloading and for taking surplus ballast off top of ties; small creeper pile drivers for fence posts of concrete and wood; mechanical and chemical means for destroying weeds; discs and mowing machines on motor cars for work adjacent to track; motor cars; air dump cars for use with ditchers, as well as for moving dirt on large scale; tool grinders; snow-thawing outfits; switch point straighteners.

#### **Might Enlarge Mowing Machines**

Nearly all of these devices are susceptible of improvement, and there are a great many others which should be produced: for instance, mowing machines on motor cars. If these are practicable, is it not practicable to put larger mowing machines on flat cars and thereby eliminate a large portion of hand cutting or farm machine cutting? Even with the present rail-laying machines, methods used are still primitive. More economical methods must be produced. Also, more mechanical devices not requiring locomotives to handle should be produced.

Maintenance and construction men in a supervisory capacity need to study the equipment which they have on their territory with the view of getting the greatest possible amount of work out of it. As one example of the great variety of work which can be accomplished by one machine, take the railway ditcher, which is probably the most versatile. One of our former district engineers, of Irish descent, now unfortunately dead, remarked of the ditching machine: "It can do anything in railway service except talk, and that fortunately isn't required, for there is already too much talk."

In addition to the ditching for which it is designed, this machine can be utilized to load and unload rail, load and unload bridge timbers, load cinders, load and unload storage coal, load ties, take up abandoned track, transfer loads of timber, rail, etc., load gravel

from pit, excavate roadbed or build embankment for new sidings and extensions, excavate for turntable pits, scale pits and building foundations, load and unload heavy scrap, load trucks, perform light wrecking service. Equipped with leads, it can be used as a pile driver. With a bridge derrick car, self-propelled, it can be used for lifting bridge decks, thus effecting a large saving in renewing bridge ties. Therefore, the machines should be studied to see if additional work cannot be obtained from them.

#### **Must Seek Economical Result**

Economies in both material and labor can be effected through the use of materials especially suited for use in particular places. In purchasing material all conditions should be taken into consideration, to the end that material in place will be the most economical and, when placed, will prove the best in total expense over periods of time, taking into consideration the first cost, carrying expense and action on other units, such as equipment, so that the final result will be the economical one.

Special methods may be used effectively in the conservation of materials, such as building up frogs and crossings of ordinary rail, and of the rail itself, either in track or out, by the oxygen-acetylene process, and of manganese by the electric welding process.

Great changes are being made in railway methods. Old ideas are being discarded, and the railway industry is looking for the men and the ideas with which to carry on the work more effectively. I believe the railway service never was more attractive than it is today. There is a vast opportunity for men of ability, resourcefulness and the desire to be of real service. I think it is a rare privilege we have in being permitted to have a part in this age of railroading, and I believe we should be wide awake to our opportunities and responsibilities. We in supervisory positions on railroads must continue to devise proper "yardsticks" by which we may measure maintenance work, as it is not going to be satisfactory to spend money unless we can show that it has been practically and economically spent and can prove that all has been derived from the expenditures that could be expected or anticipated. The successful man in the future will be the man who can show his superiors, and those furnishing the money, that he is getting such a result. This cannot be done without having the "yardstick" established.

The railway situation is improving daily. I think we have every reason to be optimistic over the prospects for future improvement. During January and February the railroads of the country as a whole showed a deficit, but since then, by the reduction of operating expenses and with the increase of revenues which has come through a resumption of business, a small net return has been earned, and this is steadily gaining. For the first six months of 1921 the net return was \$128,912,000. In order to have earned 6 per cent upon their investment, the railroads should have made a net return in those months of \$477,256,000. Their actual earnings were 73 per cent short of what they should have been. There is every evidence that the resumption of business activity is now definitely under way, and I think we can look for a steady improvement in the situation.

That will bring about this danger, however: As railway earnings increase there is going to be an increase in the agitation for lower rates. It is up to railway men to meet this with a counter movement to show the public that rates cannot be reduced at this time—that a reduction must wait until earnings become definitely stabilized at a point which will assure the railroads an income adequate for paying the expenses of operation, their taxes and other fixed charges and a fair return upon the money invested in them, and some surplus, otherwise the railroads cannot expand in order to take care of the growing communities which they serve; and unless the transportation systems are adequate and expand as necessity demands, this country cannot continue to be progressive and maintain the lead in civilization.

#### **Rates Must Not Fluctuate**

Some people seem to believe that railway rates should be made to follow the decline in commodity prices. These same people, however, did not advocate such a policy when commodity prices were soaring far above their pre-war levels. Then they were perfectly willing that railway rates should be based upon the cost of producing service. If rates should be reduced at this time, and some miracle would produce the money which would make it possible for the railroads to continue to operate under such rates, there is nothing to indicate that the railroads would be able to get their rates back to a point which would make adequate earnings possible when commodity prices were increased again.

# Illinois Central System Holds Railroading

---

## Is as Attractive Now as Ever

---

Right now, when optimism in all branches of industry is needed more than ever before, we regret to note an unorganized but none the less effective effort to make railway work appear unattractive to our young men. Non-railway men have expressed discouraging views, and even some railway officers have lent their opinions to this unprogressive effort. For the most part, fortunately, these views are merely opinions without a statistic in support.

We, of the Illinois Central System, do not subscribe to these pessimistic opinions in any single particular. We believe—indeed, we know—that the present-day complexity of railway organization demands men better trained and more resourceful than ever before, and that opportunities for advancement, to the right men, are as good as they ever were.

There is danger, however, that, although unfavorable opinions of railway work are false, constant reiteration may result in their acceptance as fact, and some promising young railway men may be side-tracked into other missions of less benefit to themselves and to the public. Any business is largely what you make it. Railway men should point out how attractive their business really is.

What other present-day businesses have greater romance, better compensation and swifter chances for advancement than railroading? These three factors—opportunity, compensation, adventure—are the lodestones that draw young men today as truly as they did their fathers twenty, thirty or forty years ago. What has railroading lost in these respects that other businesses have gained?

As construction of new lines, with consequent opening of new territory, has almost ceased, perhaps some of the romance has faded out of railroading. The day of the empire builder is past. But have other businesses fared better? What competing industry has more adventure, even today? Only on the frontiers of civilization, which have crept far outside our immediate problem, will you find the great adventures again—and out there, the chances are, you will find the railroader, next to the soldier perhaps, the envied man.

In place of the old frontiers we have something far more productive of opportunities for service—a large population busy in the further devel-

opment of our country. In this development the railroads play a part of tremendous importance, for business of every kind is dependent upon adequate transportation. In providing that transportation at minimum cost and at the same time improving and enlarging the transportation plant, to keep it abreast with the country's growth, the present-day railway man has a problem bigger than his grandfather and his father faced in the days of pioneer railroading, and he is better paid.

But how about advancement? Has a young man in railway work a chance as good as those in other lines? Will merit find its own place at the top? We believe no other business offers better opportunity for advancement to the young man who insists upon advancement. Inertia won't push him to the top any more today than it would forty years ago, but his boss' job is always just in front of him, and the pursuit is still the same old game.

The young men who are now coming along in railway service don't know much about the conditions that prevailed a generation ago, and we doubt that many of them care. All that a young man who has the right kind of stuff in him is concerned about is the problem of tackling the task confronting him today, and he doesn't care a rap about how somebody did the job before. He has his own future to carve—and many young railway men are carving theirs rapidly today.

For example, of the official positions on the Illinois Central System, 85 are held by men less than 30 years of age, 122 are held by men between 30 and 35 years of age, and 213 are held by men between 35 and 40 years of age. This proves that opportunity still exists in the railway business. The best man will seize it, as he always did and always will. The same effort wins in railway work as in other lines, and the final rewards compare favorably with those in most competing industries.

The editor of an important newspaper wrote the other day: "There is no more interesting calling than that of railroading. It is a man's game, and next to our own we esteem it as a vocation of less monotony and more adventure than any other." This is a competent outsider's opinion of the railway business. While we do not agree with the exception he made, we believe it is otherwise a correct opinion.

Moreover, we believe it would be conducive to the good of the railroads if similar opinions were adopted and expressed more frequently. We believe the contrary viewpoint is erroneous, and its adoption by many of our citizens would be detrimental to the railroads as well as to the public welfare.

Constructive criticism and suggestions are invited.

**C. H. MARKHAM,**  
President, Illinois Central System.

## *Five St. Louis Division Veterans Average Almost 49 Years of Service*

*List With Records From 1868 to 1921 Has Probably the Only Negro Telegraph Operator in the Country*

**T**HE St. Louis division of the Illinois Central System has five men in active service whose length of service is surpassed only by the veterans of the Minnesota division. The records of service of the five men on the St. Louis division range from 53 years to 46 years and 6 months. The total number of years of service of these men is 243 years and 6 months, an average of 48 years and 8 months.

J. H. Wooldriege, team track clerk at Cairo, heads the list with a record of 53 years of active service. He is followed by G. A. Hilburn, engine foreman at Cairo, with 49 years to his credit; J. D. Ladd, agent at Cairo, with 48 years; J. H. Kelley, negro telegraph operator in the yard office at Carbondale, with 47 years, and Richard Johnson, negro lamp tender in the yard at Carbondale, with 46½ years.

In Kelley at Carbondale, the Illinois Central Railroad has probably the only negro telegraph operator in the country.

### **Has Service of 53 Years**

J. H. Wooldriege has spent the greatest and happiest part of his life in the service of the Illinois Central. His term of service extends over fifty-three years, and each day has been filled with life and interest for him, he says. J. D. Ladd, agent at Cairo, Ill., is high in his praise of the service Mr. Wooldriege has given the company. They have worked at the same place many years, and Mr. Ladd says Mr. Wooldriege has always been on the job, a good conscientious worker, loyal to the company and 100 per cent efficient.

"Six men of the caliber of Mr. Wooldriege can do the work of twelve other men," Mr. Ladd says.

Mr. Wooldriege was born November 30, 1851, at Van Buren, Ark. His parents died while he was young, and he lived in Van Buren with relatives, obtaining what education was possible. Then he went to Little Rock, Ark., to live. He attended school

there, but it became necessary for him to work for his living, so he began on a job driving a horse at a tannery on the outskirts of Little Rock. He received no pay for this, only his board and lodging. His shoes were in bad condition, and he asked his employer to have them fixed for him. When two weeks passed, and his shoes had not been fixed, Mr. Wooldriege says that he realized that his staying there was a waste of time. He abruptly quit his job, and went into Little Rock, where he made his living by doing odd jobs.

### **Was Bellboy in Chicago**

It was then that Chicago called. His first position in Chicago was that of bellboy in the old City Hotel. He made more money at this than he had ever made before—he was a success in the large city. The most appealing part of his new position was the uniform, he says. There was something about it that made him feel dignified and important.

Later he found a better opportunity in a grocery store. Then his brother-in-law, who was an auctioneer at Cairo, Ill., offered him a good position as helper, and he accepted. They worked together throughout southern Illinois and Kentucky for several years.

Then the railway business took his attention. He went to the old stone station of the Illinois Central at Cairo, Ill., and asked for a position as messenger and office boy. He worked diligently at this for a little more than a year. Then he was promoted to transfer cotton clerk.

In those days, freight cars of one railroad were not sent over another. When they were loaded with material that was billed to a station on another line, the car was sent to the junction with that line, and the material was reloaded in a car of the road that touched the station where the freight was destined.

Mr. Wooldriege worked at this for about

two years, and was then made night check clerk. His eagerness to get the work done prompted him to get right in with the men, and help unload the merchandise. On one occasion, he managed the freight warehouse during the illness of the man in charge.

Later Mr. Wooldriege was placed in charge of the stock yards at Cairo. One morning, after an unusually large amount of stock had passed through the yard there and had been loaded, the master mechanic made the remark in the freight office that the stock had been loaded in less time than ever before at that yard. Mr. Wooldriege was informed of the compliment, and was asked how he accomplished the feat. He explained that he had asked the engineer of the switching engine to take the cars away as fast as they were loaded, and then told the men to keep the stock on the run so that the engine would be kept busy. The plan worked, and the stock was moved in record time.

He was later made team track clerk at Cairo, and holds that position now.

#### Has Handled Much Cotton

Records of some of the freight that has passed through Cairo are indicative of the amount of efficient work Mr. Wooldriege has done. In 1890 157,000 bales of cotton were transferred there. In 1891 194,000 bales and in 1898 354,331 bales were handled by him and his force.

Mr. Wooldriege has threatened to resign from the service of the company on three occasions, but each time was persuaded by the agents to stay. The last time was only a short while ago, when he decided that he would like to get into the retail coal business. Mr. Ladd, the agent, called him into the office when he heard of the proposed venture, and asked him all about it. It did not appear to be a sound business proposition, and he advised Mr. Wooldriege to let the matter drop.

Mr. Wooldriege gave up the idea on Mr. Ladd's advice, and is continuing his good work for the company. He intends to send in his papers in the near future to be placed on the pension list.

#### Started When 17 Years Old

G. A. Hilburn, engine foreman at Cairo, Ill., first started work for the Illinois Central

Railroad when he was 17 years old. He is 66 years old now, and has been in service forty-nine years.

Mr. Hilburn was born December 8, 1855, at Wilmington, Ill., and lived there until 1868. When he was 8 years old, his father died. He lived with relatives there, attended school and then moved to Danville, Ill. He was in Danville two years when he found it necessary to obtain work.

Mr. Hilburn was only 15 years old when he started to work steadily at Kankakee, Ill. His uncle gave him position in a machine shop. The work was hard, and he was young, but he stuck to it for two years.

A. G. French, supervisor of bridges for the Illinois Central Railroad, was a close friend of young Hilburn. He had been watching the young man in his work at the machine shop, and was pleased to such an extent that he determined to help him all that he could.

#### Went Into Bridge Work

In 1872 Mr. French went to Mr. Hilburn and told him of a vacancy in a gang of bridge workers on the Illinois Central System. The pay was better than he was receiving at the machine shop, and the work was much easier. Mr. Hilburn heeded the fatherly advice of Mr. French, and showed his great appreciation for the personal interest taken in him by immediately digging into the bridge work with his best efforts.

His service for the Illinois Central started at La Salle, Ill., where a bridge was being repaired. For seven years he traveled all over the Illinois Central System repairing bridges and building new ones. Some of them were of wood; others, of metal. Many of the wooden structures were being replaced by metal ones.

In 1879 Mr. Hilburn became switchman in the yard at Cairo, Ill. His ability and worth to the company proved themselves, and he was promoted to yardmaster in 1885. He held this position for about ten years, and then gave it up on account of his health. He then became engine foreman there. He continued at this until January 1, 1900, when he became yardmaster again. However, the change was only for three years. He found it best to

become engine foreman again. He has continued in that position at Cairo since.

#### Directs Engine in Cairo Yard

Mr. Hilburn's duties consist in directing the work of an engine in the yard at Cairo. At present, he has engine No. 2880.

He was yardmaster at Cairo when the great bridge was built there. He says his former experience in bridge building made the new structure there very interesting to him, and at times, he says, it was hard for him to keep from pulling off his coat and helping the men.

Mr. Hilburn is hale and hearty, and braves all kinds of weather to attend to his duties as engine foreman.

#### Learned Telegraphy in Six Months

J. D. Ladd, agent at Cairo, Ill., has been in the service of the Illinois Central for forty-eight years. In all of that time, there has not been a day that he has not placed the interest of the company foremost. Through his pleasing personality he has made hundreds of friends for the Illinois Central System.

Mr. Ladd is a native of Illinois. He was born in Grayville, February 11, 1854. His parents soon moved to Kentucky, where he received his elementary education and was later graduated from Mayfield College, at Mayfield, Ky.

When 19 years old, Mr. Ladd decided that he wanted to learn telegraphy. He paid \$50 for instruction that lasted six months.

In those days, the telegraph instruments contained a roll of paper on which the dots and dashes were punched as the messages were received. The operator read the strip of paper after the sender had stopped. It then remained for him to decode the message. Reading the instruments by sound was thought impossible, Mr. Ladd says, and in fact was not given consideration for some time.

#### Learned to Read by Sound

In June, 1873, Mr. Ladd accepted a position as operator for the Paducah & Memphis Railroad (now the Illinois Central) at Paducah, Ky. It was while he was in this position that he learned to read the telegraph instruments by sound.

While he was receiving a message one day, the paper roll of his instrument

jammed, the weights were forced out of place, and the paper connection was rendered useless. To make the repair meant several hours of tedious work and probably failure in the end. He had heard of operators who had experimented with receiving by sound, and he decided to attempt it. He wired the sending station to continue slowly. The experiment was successful, and Mr. Ladd lost no time in perfecting himself in the new method. There were few operators who were able to receive by sound then.

Mr. Ladd successively held the positions of operator, agent, train dispatcher and trainmaster on that railroad at Paducah. In 1878 he became agent at Memphis, but resigned a short time later on account of the yellow fever which was prevalent in that city.

In December of that year, Mr. Ladd accepted a position as agent for the C. St. L. & N. O. Railroad (now the Illinois Central) at Martin, Tenn. He remained in that city until 1884, when the agencies for the N. C. & St. L. and the C. St. L. & N. O. railroads were consolidated. He was offered the joint agency, but refused it. He then went to Cairo, Ill., as the acting assistant agent for the Illinois Central Railroad. In 1890, he was made agent at Cairo, and he has held that position since.

#### Worked in Old Station at Cairo

When Mr. Ladd first took up his duties at Cairo, the station was an old stone building with no ventilation, no heating plant, no electric lights and none of the modern conveniences. These were added one at a time, and finally the new passenger station and freight depot were built. The new freight depot, where his office is, was completed in 1913.

In 1912 and 1913 the Ohio River reached such a height that the entire city of Cairo was endangered. At that time there was no wall to protect the city from the rising waters, and the old stone station was right on the river bank. Most of the residents left the city when the water became so high. The old station was rendered unsafe, for the water had reached a height of twelve inches on its floors.

Luckily, the new freight building was nearing completion at that time. As soon

G. A. Hilburn

J. H. Wooldriege

J. D. Ladd

J. H. Kelley

Richard Johnson

as it was possible to make the move, the employes in the old station carried their office fixtures to the new building.

This was the highest the Ohio River was ever known to get at Cairo. Since that time, a thick wall has been built on the river bank for the protection of the city.

#### **Saw Ohio River Bridge Built**

It was while Mr. Ladd was acting assistant agent at Cairo and just before he was made the agent that the present Illinois Central bridge, the longest metal bridge in the world, except the Tay Bridge in Scotland, was built over the Ohio River at Cairo. It was constructed under the direction of George S. Morrison, and was opened for traffic October 29, 1889. The time of construction was two and one-half years. The total length of the bridge was about  $3\frac{3}{4}$  miles.

In 1894, during the A. R. R. U. strike, Mr. Ladd filled all the positions in Mounds and Cairo. That his judgment was good is proved by the fact that only two changes were made out of his forty appointments.

Reviewing the early days of his railway career, Mr. Ladd says the employes worked from 7 a. m. to 6 p. m. regularly, and often worked overtime without extra pay. To work several days and nights without sleep was a frequent occurrence, he said, and the men never thought of asking for extra pay. Each had the interest of the company at heart.

#### **Telegraph Operator, and a Negro**

J. H. Kelley, employed in the yard office of the Illinois Central at Carbondale, Ill., is probably the only negro telegraph operator in the United States. He has been in the service of the company for forty-seven years. Although he was 71 years old July 31, he is spry and jolly, and does not appear to be older than 50. His father, who died about six months ago, lived to be 100 years old.

Kelley learned to operate when he was employed as a messenger boy in the Western Union office at Alton, Ill. At that time, a Mr. Clow from Mississippi was in charge of the office there. Kelley's monthly pay was \$10, and attention to extra details won him a bonus of \$5.

One day Mr. Clow smiled and patted him on the back, saying, "Henry, you are a mighty good boy, but the company says that you have to learn this business if you

are to stay here." That day, Mr. Clow connected up a set of telegraph instruments in one corner of the room, and told Kelley it was his to practice on. From then on, Kelley says, he was made to practice a part of each day. Mr. Clow taught him the telegraph code for the alphabet, and stood over him until he got it correctly.

#### **Picked Up the Work Slowly**

After months of practice, the beginner was able to distinguish a letter now and then coming over the regular wire. Then he became able to catch a word or two in a message. Later he could receive a message sent slowly by Mr. Clow, and before he realized it, he says, he was able to understand every message that came into the office.

It was a long hard grind, he now reflects, and if it had not been for Mr. Clow's personal interest, he would never have made an operator.

Kelley obtained his first position as a telegraph operator in June, 1874, with the I. & St. L. Railroad at Wann, Ill. He had been there only six months when he took a position with the Illinois Central Railroad as an operator at Pulaski, Ill. After working there two years, he was transferred to Anna, Ill., a town where no negroes had previously been allowed to live. He married, paid strict attention to his duties at the station there and always gave courteous attention to the patrons. His politeness won for him the respect of the residents of Anna, and they made room for him in their village.

#### **Success As a Musician**

Kelley has musical talent. While living in Anna, he played violin in the Greer Brothers' orchestra. Although a negro, he found his ability as a violinist made him desirable in the white orchestra. Later he was chosen to lead the orchestra at the insane asylum there. He remained in Anna for twenty-two and one-half years.

He is the father of twelve children, eight of whom are living. All were born in Anna and were allowed to attend the white schools there.

In 1898, Kelley was transferred to Carbondale, Ill., and served as operator and leverman in the tower there. He continued in this position for ten years. It was while he was at work in the tower one day that a man of his own race came to

him and said: "I've seen you-all some place befo'. Wasn't it at Pulaski?" The speaker was "Dick" Johnson, previously mentioned, who had been transferred from a section in Pulaski to the job of lamp tender in the yard at Carbondale.

Kelley was then made the operator in the yard office at Carbondale, and he has kept that position since.

### Met a Stranger From Texas

He tells the story that a telegraph operator whose home was in Texas came to Carbondale one day seeking a position. He was assigned to the third trick at the yard office, and was told that he would be relieved at 7 o'clock the next morning. At 6:45 o'clock Kelley stepped in the door, took off his coat and, hanging it up, said: "You can go now."

"Go where?" asked the new operator, surprised.

"Go home, of course," Kelley replied. "I have come to relieve you."

"Are you an operator?"

"Yes, sir."

"Well, I'll be dashed," exclaimed the other. "I have heard of you, but I never thought it possible. You know I'm from Texas, and the negroes down there don't learn to be operators."

### Surprised to Find Him There

As time went on, these two operators became friendly, and when the Texan left the office for other employment, he made Kelley a present of a valuable stylus. He prizes this little instrument very highly.

Kelley says that men often come to the window of his little office and ask for the operator, not knowing that he is the one in charge. And when told that he is the operator, they always marvel at the fact that he is a negro with ability enough to manage that office.

Kelley is a competent worker, and gives the company the best of service. He always reports for duty a little before the time he is supposed to, and has never been off on account of illness. He is kind hearted, too. Each day he scatters bits from his lunch upon the ground before the window of his office so that the hungry birds may feed.

"The reason I get along so pleasantly with white people," he says, "is because I know my place, and always act accordingly."

### Born a Slave in Tennessee

Richard Johnson, negro lamp tender in the yards at Carbondale, Ill., who has been

in the service of the Illinois Central Railroad for forty-six and one-half years, was born a slave on Christmas night in 1842, ten miles from Huntington, Tenn.

His master, a Mr. Johnson, he says, was a kind-hearted Southern gentleman. One negro mammy and her four children were all the slaves Mr. Johnson had, and Richard was the one at the bottom of all the pranks that took place on the plantation, according to his own confession. He says now that if he had a nickel for each whipping he received for his boyish tricks, he would be a rich man. He smiles when he refers to them, for they were not brutal beatings, he says. In fact, they were no more severe than the master would have given his own child had it been caught in the same tricks.

When the Civil War began, Richard was a sturdy young man about 20 years old. He did not run away from his master and join the Union army, as many slaves were doing. He was well satisfied with his home, and realized that he was much better off there than elsewhere, he says.

### With His Master to the War

But when the son of Mr. Johnson joined the Confederate army, Richard went into the fighting with him. He determined that his young master should be looked after, his clothes cared for, and his horse kept well groomed. Richard was constantly at the side of his young master until a rifle ball snuffed out the life of the gallant young Southern gentleman. Richard buried his beloved master with greatest care and reverence, carefully marked the grave and carried the sad news back to the Johnson home.

He relates an incident that proved disastrous to a group of Confederate soldiers during the Civil War. A few Union soldiers were encamped behind a pile of small wood cut in 4-foot lengths when a band of Confederates dashed into the open from a thicket. Each of the Union soldiers was taken so by surprise he grabbed a stick of the wood instead of running to the stacked guns. On the other hand, the Confederates were just as greatly surprised, for they did not know the Union soldiers were in hiding there. When the blue-coats darted out with their wooden sticks pointed as guns at the foe, the Confederates surrendered in a body without firing a shot.

### Joined Illinois Central in 1875

When Richard returned to the Johnson home, the desire to earn his own living over-

took him. But it was with much regret that he left the old plantation, he says.

He obtained a position as a water boy on a section of what he calls the North Windy Railroad. During the time of this employment, he was critically ill with brain fever. It left him blind in the left eye.

After a year's service as water boy, he obtained a position as porter on a Mississippi Central train. He continued this work for two years, and in 1875 became a member of a section gang of the Illinois Central Railroad at Pulaski, Ill.

As near as he can remember, he had been on this section two years when he was called to tend to the lamps in the yard at Carbondale.

He has been in that position since. His work includes the cleaning, re-oiling and lighting of about eighty lamps. He has not missed a day, never was injured in service and has never had to lay off on account of illness, he says.

He now has a son in the service of the Illinois Central System as a train porter between Centralia and Cairo.

#### Is an Applicant for Pension

The elder Johnson has sent in papers requesting that he be placed on the pension list after having served the Illinois Central Railroad for more than forty-six years.

There remains in him a great love for his boyhood home, and it was clearly an effort for him to check his emotion long enough to speak when he referred to it. "Yes sah," he was finally able to say, "I wants to go back to de ol' home-place if the company can spah me fo' awhile."

He is a typical old Southern negro, and a conscientious church worker. He is a member of the Free Will Baptist Church, and attends services regularly. The residents of Carbondale call him "Brother Dick." His hat comes off when he is spoken to, and he responds with a low bow.

---

## Moral: Know Thy Neighbor as Thyself

Several years before the war a Louisville manufacturer rode some distance on the same seat of a street car with a pleasant-faced young man, relates a writer in the Louisville (Ky.) *Courier-Journal*, under the heading of "In Louisville's Byways." They conversed with each other.

Just before the manufacturer came to his corner, he said:

"My name is So and So. Come in to see me some day. I've enjoyed talking with you."

The young man smiled.

"Thank you, Mr. So and So," he replied. "I go to your place every day. I have worked for you, in your factory, for nearly ten years."

The manufacturer was greatly embarrassed. He went home and thought about the matter. As a result he made it a practice to go often into his factory and offices. He saw to it that he knew every man and woman in his employ by name. He also made a point of speaking to each at least once in every month.

The beginning of the large success of the manufacturer dates from that time.

Not so very long ago, during a period of

acute depression in the manufacturer's particular line of business, it was rumored that he was in financial straits—that there was danger he would fail.

A delegation of his employes asked permission to talk with him. The spokesman said:

"We hear that you are short of money to run the business until times get better. Nearly all of us have saved money in your employ. You have given us steady work, brotherly treatment and better than the average pay. We will take a cut in wages now and we can raise \$100,000 between us for the business. We have faith in you and in ourselves. We know that we can weather the storm."

For a moment the manufacturer scanned the earnest faces of his employes. Then he covered his own face with his hands, to hide the tears that flooded his eyes. Presently he looked at them again and said:

"I am not going to try to thank you, my dear friends. You must know how I feel. But, thank God, our business is safe—we do not need any help to pull through. Henceforth it will be more than ever our business."

*We Use Ten Tons of Coal a Minute*

## Help Save Coal

*Fuel Economy Reaches  
Every Department  
and  
Every Employe*

*By A. F. Blaess  
Engineer, Maintenance of Way*

Direct Fuel Waste

Indirect Fuel Waste

*September has gone, but we must still save fuel in October. Herewith we have a summary of the situation that every employe ought to clip, at least in part, and paste in his hat:*

**C**OAL is the chief essential of all raw materials or natural resources in the home as well as in industry and commerce. About 27 per cent of the bituminous coal produced in the United States is used by the railroads, and of that used by the railroads during 1920 the Illinois Central System used 5,423,440 tons. This, reduced to consumption per minute, means that for every minute during the entire year an average of 20,600 pounds of coal was consumed. If all the coal used on the Illinois Central System last year were loaded in coal cars averaging fifty tons each, and they were coupled together, they would form a continuous string of cars from Chicago to New Orleans. The cost of fuel for 1920 was \$17,832,958 (including cost of handling). This represented 11.2 per cent of the total operating expenses for the year. Next to wages, fuel is the largest individual item which goes to make up the operating cost. The cost of coal used in 1920 was 158 per cent higher than in 1915. The enormous quantity of coal used and also the enormous increase in cost per ton should impress everyone with the importance of putting forth every effort to avoid the use of coal where it is not necessary, to eliminate all waste, and to get 100 per cent out of every pound of coal consumed.

There are many angles to the question of fuel saving on a railway system. Many employes seem to be under the impression that these economies are wholly up to the man

who shovels the coal. This is far from true, for, while the man who burns the coal can certainly show a saving by producing the energy from the fuel with the least possible waste, he cannot control the use of that energy after it has been produced, and the man or woman who uses steam, water, electricity or air is just as much concerned in the conservation of fuel as the man who shovels the coal into the furnace.

Coal or other fuel enters into the production of almost every commodity used on a railroad. Therefore, a saving of material of any kind, as well as the conservation of energy produced by coal, means a saving in fuel. It follows, therefore, that fuel economy may be practiced in two general forms:

First: A direct saving of fuel through effecting economies in handling and firing.

Second: An indirect saving accomplished through conserving energy and material produced by the consumption of fuel.

Usually the first efforts in fuel conservation on a railroad are directed toward economies in consumption of fuel by locomotives. This is quite natural, as about 85 per cent of the total railway fuel consumption is by locomotives, but at the same time the other 15 per cent should not be neglected, as it is often possible that greater relative results may be obtained through economies effected in the use of this lesser quantity used for miscellaneous purposes than in the 85 per cent.

### Overloading Coal Cars

To get the full efficiency of coal cars, they should be loaded to the maximum limit to which they can be loaded without having the coal fall off while in transit. The loss from improperly loaded cars not only means

the cost of the coal but causes unsightly and dangerous yard conditions, destroys the purpose of the ballast by obstructing drainage and creates an expense to reclaim in excess of the value of the coal. A large part of the coal lost in this manner is rarely if ever salvaged, as it would be too expensive to pick it up separately or separate it from the ballast, cinders, etc., with which it becomes mixed.

**Black Smoke**

Black smoke emitted from a locomotive stack is an indication of imperfect combustion—consequently of a waste of fuel. Bituminous coal is composed of the following substances, in percentages averaging about as shown:

	Per Cent
Carbon .....	43
Volatile matter .....	37
Earthy matter .....	9
Moisture .....	11

When coal is heated to a certain temperature (which is below 1,800 degrees Fahrenheit) the volatile matter is given off in the form of combustible gases. The carbon, when heated to a temperature of about 1,800 degrees Fahrenheit in the presence of oxygen, combines with it and forms either carbon dioxide or carbon monoxide, dependent upon the relative amounts of carbon and oxygen present. Carbon monoxide on combustion produces 4,452 heat units per pound of carbon, whereas carbon dioxide produces 11,600 heat units. From this it is apparent that where the amount of oxygen supplied is not sufficient there is a great loss in the efficiency of the coal; further, where there is insufficient oxygen supplied to produce a proper combination of carbon and oxygen for perfect combustion a part of the carbon escapes through the smoke stack, partly or entirely unconsumed, in the form of black smoke (waste).

This can be overcome by increasing the supply of air to the firebox and by supplying fresh coal more slowly. The supply of air can be regulated by opening and closing the dampers of the fire-box and by increasing or decreasing the draft by the use of the blower, both of which can be controlled by the fireman. The fireman is also the one who shovels the coal into the fire-box, and the proper and economical use of

*A. F. Blaess*

coal is almost entirely dependent upon his skill in feeding the fire.

**Coal Chutes**

A large part of the coal wasted at coal-ing stations is salvaged and either returned to the chute or loaded and delivered to stationary power plants. The value of this coal is decreased, however, by the breakage in handling. The expense of handling the coal is often as much as, or more than, the coal is worth.

This loss may be prevented by keeping the coal-handling equipment in good order and by having coal chute attendants and firemen exercise care in loading tenders and properly trimming the coal so that it will not fall from the tender when the engine is in motion.

**The Safety Valve**

Another avenue for waste is the safety valve. Every time pressure is released by steam escaping through the safety valve there is a waste of coal, and it is conservatively estimated that seventy-five pounds of coal are wasted every time a locomotive "pops off" for five minutes. This waste also can be eliminated by the proper handling of the engine.

While the fireman burns the coal and is responsible for its proper combustion in the fire-box, he is forced to shovel a great

many scoops of coal that could have been saved if all those who have a part in train operation would co-operate in fuel saving:

#### **The Engineer**

can save coal by keeping his fireman advised as to where stops are to be made, where an unusual amount of work is to be done, by exercising good judgment in handling the throttle and reverse lever so as to use as little steam as possible, by seeing that an excessive amount of water is not carried in the boiler, and by giving proper attention to the use of the injector.

#### **The Conductor**

can save coal by keeping the engineer advised of unusual stops or work required to be done at stations and by requiring the least number of moves to be made with the engine in properly handling the work. In handling a local he can materially assist by clearing tonnage trains and not stopping them.

#### **The Brakeman**

can save coal by closely inspecting the train for leaky train lines, sticking brakes and defects in equipment that may cause delay or derailments.

#### **The Dispatcher**

can save coal by closely following train movements so meeting points can be made with the least possible delay, by putting out orders and instructions so far as practicable at stations where trains will not ordinarily

be required to make extra stops, and by the use of "19" train orders to the fullest permissible extent. Every time a tonnage train is stopped, from a quarter of a ton to a ton of coal is burned in excess of what would otherwise have been consumed.

#### **The Yardmaster**

can save coal by working closely with the dispatcher and starting trains, so far as practicable, at times when they can be moved with the least amount of delay from trains of superior class, by having trains ready to go forward at the time listed, by giving the roundhouse forces reliable information as to the time engines will be required, by knowing that all cars in trains are in good order and properly waybilled to avoid delay to road crews in switching and setting out cars when ready to leave, and by knowing that trains are properly made up, placing the short loads so that the least number of cars will have to be handled in setting them out.

#### **The Switchman**

can save coal by avoiding unnecessary moves, careless signals and signals causing excessive use of brakes.

#### **Roundhouse Forces**

can save coal by close co-operation with yardmasters, by seeing that engines are given proper attention and dispatched in good condition, by not having an excessive number of engines fired up and under steam, and by not firing engines to go out on the road any longer than necessary, before they are listed, to get up the required amount of steam.

#### **Car Inspectors and Repairmen**

can save coal by properly inspecting and repairing all cars, leaky air lines, defective brakes and brake rigging.

#### **The Supervisor**

can save coal by planning the work of his gangs as far in advance as practicable to require the least number of slow orders, by being posted at all times of the number of slow orders on his district and handling them in such a manner as to know that they are removed promptly when necessity for them no longer exists, by using work trains only when absolutely necessary and closely watching their performance, by fully advising conductor of the work train before he starts out what and where he is expected to work to make possible doing the work

*Not on Our System Any More*

with the least number of delays and the least number of moves, by not listing work trains any longer in advance of time work will start than necessary, and by releasing them promptly when work is completed.

#### Section and Bridge Foremen

can save coal by keeping the number of slow orders as low as consistent with safe and economical operation, bearing in mind safety must be given the first consideration and, where work is being performed that will prevent the safe handling of trains at scheduled speed, the trains should be protected by proper signals, and where caution signals are used the necessity for them should be removed as quickly as pos-

sible and slow orders taken down. Slowing down or stopping trains not only means increased use of coal in many cases to the trains stopped, but frequently disturbs the movement of other trains with which meeting points have been arranged, consequently causing an increased use of coal to these other delayed trains.

#### The Signalman

can save coal by maintaining signals and interlocking plants in good order, thereby avoiding unnecessary stops to trains.

#### Every Employee

can save coal by remembering that a moving train represents energy and that to

*Two Wastes—At the Chute and Off the Car*

stop the train unnecessarily means that energy is destroyed which can be replaced only by additional fuel and at an added expense to one of the largest items of railway operation.

### Open Fires

Open coal fires are frequently made at cinder pits, in the vicinity of water columns and elsewhere where it is necessary for men to work outdoors during the winter months. Often these fires are maintained day and night for weeks, and may consume a ton or more of coal a day. These fires should be eliminated wherever possible. Where they are absolutely necessary, they should be confined to a salamander, sheet steel stove or similar device that will provide more useful heat with less discomfort to the men and with a great deal less coal.

### Pumping Stations

Boilers should be washed out at regular intervals. Particular attention must be given to the crown sheet and water leg, removing all mud and loose scale. The length of time between washouts will depend upon the character of the water and the hours the boiler is under steam. With the same conditions as to service and quality of water, a boiler under steam twenty hours a day should be washed twice as often as one under steam ten hours a day. Soot and ashes should be cleaned from all heating surfaces. Tubes should be kept clean, either by running a tube cleaner through them or blowing them out with dry steam.

Grates must be kept in good shape; burned out or broken grates permit coal to waste into the ashpit and allow surplus air to enter the fire-box, causing holes in the fire and forming clinkers. A level, bright fire should be maintained; banks and holes in the fire cause clinkers and an excess fuel consumption. Large lumps of coal should be broken up. The coal should be fired in small amounts and at regular intervals, as large amounts cut off the air required for combustion or cause it to enter the fire-box in uneven quantities with a resultant poor combustion and loss of fuel. Screenings as a rule should be fired more lightly than lump or mine run, and if properly handled will give as good results. Injectors should be used to feed the boiler at as nearly a uniform rate as possible and should not be used when cleaning fires or

when the fire is low, if possible to avoid it. Boilers should be blown off as often as necessary to prevent an accumulation of mud. To prevent foaming the blow-off valve should not be opened while the pump is running or while the injector is on. It is preferable to blow off while the pressure on the boiler is low enough to avoid loss of fuel and undue strains on the boiler.

Coal should not be unloaded at pumping stations in excess of a reasonable supply, preferably not to exceed one for sixty days, on account of the excessive loss in storage. Coal should be piled so that it will not become scattered or inaccessible. Waste, pieces of wood or other easily combustible material should not be permitted to remain in coal piles, as they may form a starting point for spontaneous combustion.

### Heating Plants

The remarks on pumping stations apply also to heating plants, particularly as to firing and care of boilers. Most heating plants have bricked-in or insulated boilers, and it is important that air leaks in the brick work or boiler setting be stopped. Leaks in arches or interior brick work should be stopped, as they permit the gases of combustion to short circuit and have a tendency to overheat the outside brick work, causing a further leakage of outside air.

Steam lines should be insulated against loss from condensation. This loss is especially serious on underground lines not properly protected or so located that the lines are covered with water. Traps or a vacuum pump should be provided for all steam-heating systems, and they should be kept in good order to avoid steam losses, as the steam consumption is materially reduced

*Some Coal We Didn't Burn*

through the higher efficiency of a heating plant properly drained. Wherever possible exhaust steam should be used for heating instead of live steam, as it represents a large percentage of the heat delivered by the boiler.

Offices and stations are usually kept warmer than necessary in cold weather, and often the temperature is regulated by opening windows and doors rather than by controlling the heat from radiators and stoves, with a resultant fuel loss. Losses from direct radiation often occur where the radiation is not properly located with respect to exposed walls and windows. Radiators and steam lines should be properly vented of air to secure the greatest efficiency.

**Air, Steam and Water**

The following table, worked up by our superintendent of water service, shows the amount of air, steam and water wasted through openings from 1/32 to 1/2 inch. As a large portion of the expense shown is for fuel, it will be realized that the fuel losses from leaks of this kind are enormous:

amounting to \$167 a month. This represents a fuel loss of at least \$100 a month, or more than a ton of coal a day. The fuel loss from steam leaks represents about the same proportion as air; while the fuel loss from water waste is not so great in proportion as that of steam and air, the aggregate loss is greater, as there are more water lines, and consequently a greater opportunity for waste.

**Electricity**

Fuel and power may be saved by strict attention to waste of electric lights. A five-watt lamp will use about one-half pound of coal an hour. With the thousands of lights on the system, the possibilities of fuel saving through economy in their use are important.

Fuel saving is not confined to any particular class or department of the railroad, but is common to every employe, and if maximum results are to be obtained every employe will have to do his or her part whether it consists of the economical handling and firing of the fuel itself or merely

Size of Opening	AIR		STEAM		WATER	
	Number of Cu. Ft. Wasted Per Month, 100 lbs. Pressure.	Total Cost of Waste Per Month at 15c Per 1,000 Cu. Ft.	Number of Pounds Wasted Per Month 100 lbs. Pressure.	Total Cost of Waste Per Month, at 50c Per 1,000 Pounds.	Number of Gallons Wasted Per Month, 40 Lbs. Pressure.	Total Cost of Waste Per Month at 15c Per 1,000 Gallons.
1/32"	17,798,400	\$2,669.76	805,000	\$402.50	1,231,000	\$184.65
1/16"	9,979,200	1,496.88	460,000	230.00	692,400	103.86
1/8"	4,449,600	667.44	203,000	101.50	307,700	46.15
1/4"	1,114,560	167.19	50,500	25.25	76,900	11.53
3/8"	278,640	41.79	12,750	6.37	19,200	2.98
1/2"	69,552	10.44	3,175	1.58	4,800	0.72

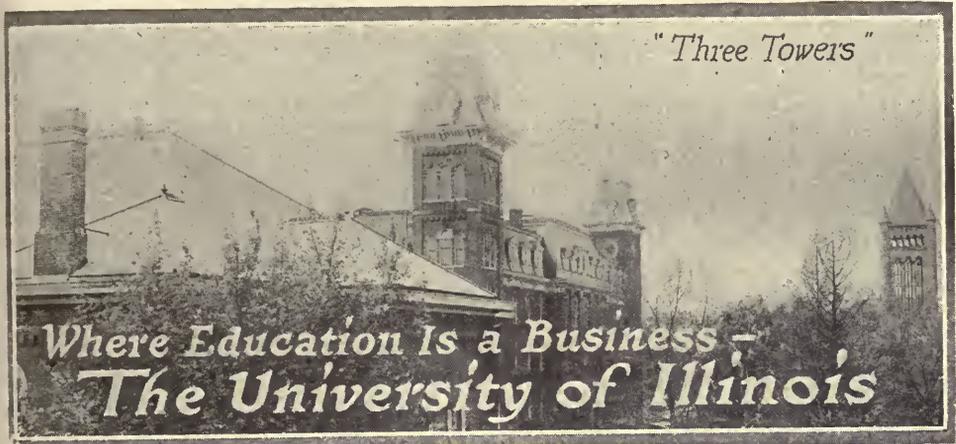

Nearly all railway shop and yards have extensive systems of pipe lines carrying air, water and steam. The fuel loss due to leakage from these lines is one of the most serious conditions we have to contend with. By referring to the table above it will be noted that an 1/8-inch opening will waste air

turning off an electric light or faucet when not in use.

*The co-operation of every employe is solicited to place and keep the Illinois Central System second to none in the conservative and economical use of coal.*

*The Banner of Waste*

IT is a rest and relief from the workaday world to drop off an Illinois Central train at Champaign, Ill., and make a little visit to the home of one of the million dollar industries along the Illinois Central—the University of Illinois.

Strictly speaking, the University of Illinois is not in Champaign. Most of it is on the edge of Urbana nearest Champaign, and Champaign and Urbana are twin cities in a closer sense even than are St. Paul and Minneapolis. There is no way of telling them apart. Most of the students live in Champaign, and when the Illinois Central serves Champaign it is serving the University of Illinois.

Since the Illinois Central is the only north and south line through these twin cities, and the only connection with Chicago, 128 miles distant, the University means a great deal to the Illinois Central in passenger and freight business. At Champaign are located the offices of the Illinois division of the Illinois Central, and the relations between the University and the Illinois Central management have always been close and cordial.

#### Illinois Central Aided Fund

The Illinois Central, which is about sixteen years older than the University, was a contributor to the fund which established the University in its present location. Our recent booklet, "What Every Employee Ought to Know About the Illinois Central System," makes the following statement: "The Illinois Central endorsed the movement to establish the University of Illinois at Champaign and contributed the first \$50,000 toward the University fund. The University of Illinois now

enrolls more than 11,000 students and is conceded to have one of the greatest agricultural colleges in the United States." That gift is still acknowledged in the annual register of the University, which says, in describing its location: "Champaign County offered a large brick building in the suburbs of Urbana, erected for a seminary and nearly completed, about 1,000 acres of land, and \$100,000 in county bonds. To this the Illinois Central Railroad added \$50,000 in freight."

That was in 1867, when the University was incorporated. In 1868 school work began with one regent, two professors and about fifty students. The growth of the University of Illinois has been almost unprecedented in the history of American education. Last spring, only a trifle more than half a century after its founding, the University had 973 teachers and administrative officers and an enrollment of 9,493 students.

The daughters of Illinois are faring well at the University. In 1870, only a few years after the University was established, they were admitted on equal terms with the men. Their enrollment in 1870-71 totaled twenty-four. Since that time they have constituted from one-sixth to one-fifth of the total number of students. Last year they bettered this percentage, as they numbered 2,336 of the total of 9,493. They have an excellent women's building dedicated to their use on the University campus, and the only residence hall, or dormitory, the University has is for its women students.

#### Crowded Again This Year

School has just begun again, and the fall

enrollment of 8,000 has broken records. Unlike most universities, the University of Illinois does not need to encourage enrollment; most of the time it has more students than it can conveniently handle. That condition is true again this fall. The University requested a state appropriation of \$10,500,000 for the present biennial period, but received less than \$9,000,000, which will necessarily restrict to some extent its program of expansion.

It will be seen that, in point of number of persons handled and the amount of money involved, the University of Illinois is one of the biggest industries along the Illinois Central System.

Last year Dr. David Kinley, Ph. D. LL. D., was elected president of the University, succeeding Dr. Edmund Janes James, Ph. D., LL. D., who had served since 1904. On the advisory board of the College of Engineering for the railway industries of Illinois appears the name of C. H. Markham, president of the Illinois Central System. In addition

Railway Engineering and Administration, the College of Medicine, the College of Dentistry, and the School of Pharmacy. The last three are in Chicago; all the others are in Urbana.

#### How Enrollment Was Divided

The College of Liberal Arts and Sciences led in total registration last year with 2,535; Commerce, 1,841; Engineering, 1,662; Agriculture, 1,135; Graduate School, 422; Education, 137; Law, 126; Music, 117; Library School, 30. The registration in the Chicago departments was 766.

The land occupied by the University totals almost 2,000 acres. There are at present more than fifty buildings on the campus, in addition to those required by the University's work in Chicago. In the libraries of the University are 471,183 volumes, 55,036 pamphlets, 2,123 maps and 5,553 pieces of sheet music.

In 1913 the estimated cost of land and land improvements belonging to the University was \$322,447. This has been added to since by purchase and gift. The land valuation today is \$1,079,315.05. The total acreage is

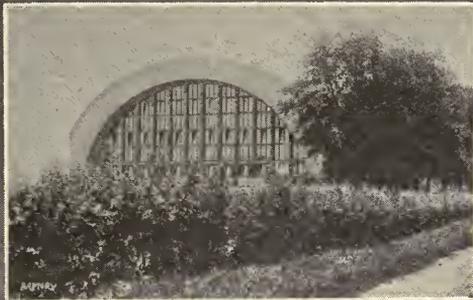

*A Campus Scene*

to the College of Engineering, the University organization includes the College of Liberal Arts and Sciences, the College of Commerce and Business Administration, the College of Agriculture, the College of Law, the Graduate School, the Library School, the College of Education, the School of Music, the School of

1,957.99, divided as follows: Urbana-Champaign campus, 247.50; Chicago campus, 2.02; Champaign County farm, 934.47; agricultural experiment fields, 713.72; timber reservations, 60.14; Chicago outlying property, .14.

The estimated value of buildings in 1913 was \$2,022,175, to which may be added \$179,550.75,

the inventory of furniture. This does not include the new Armory, the Stock Judging Pavilion, the Locomotive Testing Laboratory or Horticultural Greenhouse, which were in process of construction. Inventory of buildings at present, including those of the Chicago departments, is \$4,886,749.53, or an increase of \$2,844,574.53. By adding the inventory of uncompleted buildings, the total valuation is \$5,295,784.10, or more than double the valuation of 1913.

#### Noted for Its Athletics

Among other things, the University of Illinois has become noted in the Middle West for its proficiency in athletics, and in particular for its Department of Athletic Coaching, which has been built up under the direction of George A. Huff. Coaches of athletics from all over the country come to Illinois to be grounded in the fundamentals and enlightened as regards the finer details of their work. The University of Illinois is a member of the Western Conference, or "Big Ten," composed of Michigan, Wisconsin, Minnesota, Indiana, Chicago, Northwestern, Iowa, Ohio State, Purdue and Illinois. In nearly all branches of athletics, representatives of the

University of Illinois can be found fighting for the conference championships.

In football, out of 42 games played, Illinois has won 28, lost 9 and tied 5 since Robert Zuppke has been at the helm. Out of 299 baseball games played, Illinois has won 220, lost 76 and tied 3. In dual meets with other conference schools, Coach Harry Gill's teams have won 67, lost 5 and tied 1.

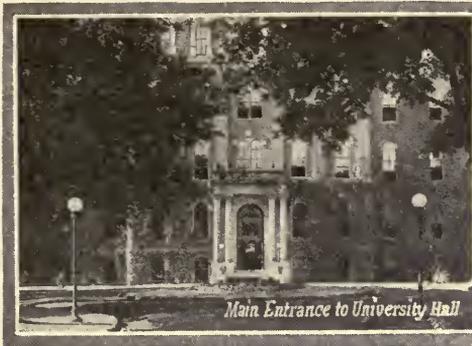

It is only natural, therefore, that the students of the University of Illinois should have athletics in mind when they set out to build a memorial to those members of the tribe of Illini who served in the World War. Just now the big topic of interest is the campaign for the university's new stadium and recreational field, the largest athletic plant of its kind in America, costing more than \$2,000,000 and seating 75,000, which is to be dedicated to soldiers and sailors of the University.

#### To Honor All State Heroes

W. L. Kelley, junior vice-commander of the state American Legion, a member of the stadium executive committee, is fostering a proposal whereby the legion will join with athletic authorities in dedicating the new structure to the 353,000 war veterans of the state,

*A Glimpse of the Agriculture Building*

It is planned to inscribe their names on bronze tablets on the seats and boxes. Memorial columns are to be erected to those who lost their lives.

The stadium will be larger than the Yale Bowl, which was originally built to seat 61,000 persons, larger than the stadiums at Harvard, Princeton, Washington, and even larger than the bowls which are now being built at California, Ohio State, Columbia, Kansas and Cincinnati.

At the entrance of the new Illini athletic field will be a campanile tower, 250 feet high, dedicated to those who died. Within this campanile will be the war memorial room containing the names in gold of those who did not return. On each side of this tower will be two lesser towers, one in honor of the sailors and the marines, the other in honor of the soldiers. These will contain numerous memorial features.

#### A Greek Theater Included

Back of the memorial columns will be the court of honor, containing a Greek theater seating 10,000 persons. It can be used for pageants, plays, commencement and community gatherings of all kinds. Surrounding the honor court will be 183 Doric columns, dedicated to each of the 183 graduates and former students who died in the service.

The stadium will contain a gridiron and quarter-mile running track with a 220-yard straightaway.

The stadium will cover approximately thirteen acres and will be the center of a recreational field of one hundred acres. The recreational field will contain one hundred lawn and clay tennis courts, twenty-five baseball diamonds, eight gridirons, soccer and hockey

fields, handball courts, a polo field, and perhaps an artificial ice skating rink.

With this stadium memorial, Illinois will be the first state in the Union thus to commemorate her war heroes, for as yet no definite state memorials have been started. The University of Kansas is planning a memorial stadium, while Nebraska may erect a gymnasium in honor of her fighting forces.

Construction work on the Illinois stadium will begin immediately after the state and nation wide campaign for \$1,500,000 among the alumni and former students during the football season. It should be completed in 1924.

#### Subscribers Get Seat Options

Donators to the stadium fund will have no difficulty securing seats to the large intersectional football games of the future. That much was decided by a plan announced by stadium authorities whereby seat options are given to every subscriber.

The unit option on seats for students is \$50, entitling a student to one seat for ten years, or two seats for five years. As the donation increases the number of seats increases in the same ratio. For instance, a \$200 donation is four seats for ten years, or eight for five years.

The alumni unit seat option is \$100, giving graduates one seat for ten years or two seats for five years. In this case the ratio between seat options and contributions increases in like proportion with that for students.

#### Pledges Already Total \$700,000

With practically \$700,000 already pledged for the new University of Illinois Stadium from student and faculty subscriptions, stadium authorities are completing plans for the state

and nation wide campaign this fall. It is hoped to raise \$1,500,000 at that time.

A general executive committee, composed of twelve well-known men, of whom Robert Zupke, football coach, is chairman, will supervise the campaign.

Every county in Illinois and every state in the Union will be represented by a chairman who will be in charge of the solicitation work. Under these county and state leaders will be various subcommittees. Each unit will have one solicitor for every ten alumni.

The minimum donation from an alumnus will be \$100, and the honor donation will be \$200, both payable in five installments over a period of two and one-half years. The student minimum of \$50 was doubled in the recent campus drive, and for that reason stadium leaders feel that the alumni individual average will be something more than \$200.

One alumnus has announced an intention of pledging \$20,000, while several \$10,000 donations have been promised.

#### Real Instances of Loyalty

The forthcoming campaign is to be among the 48,000 alumni and former students. About 11,000 of these hold degrees from the University. That the campaign is to be a complete one is proved by the fact that arrangements have been made to canvass the 1,000 graduates and former students who are natives of foreign countries. That these foreign sons and daughters of Illinois have the proper spirit was proved in the student campaign that raised \$700,000 from 6,000 contributors—an average of about \$112 to the student. The first donors of \$1,000 subscriptions among the students were a South American, a Filipino and a Sulu princess.

How's that for loyalty?

## Short Talk With Drummer Got His Trade

By **ARTHUR L. ALDRICH,**  
Agent, Pawnee Junction, Ill.

One hot day the latter part of June a man stepped upon the platform, a traveling bag in his left hand, a handkerchief in the other. He had carried the grip a mile and a half up the track. It was one of those hot, sultry days, about 90 degrees. He was all in. Sweat pouring down his face, his shirt clinging to his back, he made his way to the ticket window and asked for information regarding passenger train service to a point on our connecting line, following with, "Its hotter than H— and d—hard on a fat man"—and he was one of such a build.

I gladly gave him all the information he desired, sympathizing with him. Seeing that he was a traveling salesman whom I had never met, I thought he might be able to give us some good business. I handed him an evening paper, just arrived, and invited him into my office, where a cool breeze from an open west window made him forget all about the hot weather. Right then we became friends.

After looking over the paper a few minutes he remarked: "Well sir, Mr. Agent, I believe that man Carpentier will whip Dempsey. What do you think about it?" Seeing that he was a Carpentier man, I also talked in Carp's favor, and that made us better friends.

Then I asked whom he traveled for and found that he represented a large grocery house in Chicago. I asked him if he made any points on our connecting line, which is a short line road, and he advised me that he made all towns on that line. I asked him how his firm had been routing its shipments to these points. He mentioned another road. I told him of our first-class service out of Chicago and asked him for his business, assuring him that we would greatly appreciate any business he could give us and would take good care of it, giving him the best service possible.

This was his answer: "If I can help you out any, I will be glad to do it. Your proposition sounds good to me. I will write the house tonight."

I thanked him and continued our friendly conversation. The next week we received 10,000 pounds of merchandise in one shipment, from which the Illinois Central received a revenue of \$34.11. We have been getting a nice business from the firm ever since, and they say they are much pleased with the service received.

*October, Too!*

# Mr. Ford's Railway Miracle Can Be Traced Largely to Natural Causes

## Same Improvement Might Have Been Achieved, It Is Pointed Out, If the D. T. & I. Had Bought His Factories

The following story is reprinted by permission from *The Railway Age*, issue of September 10:

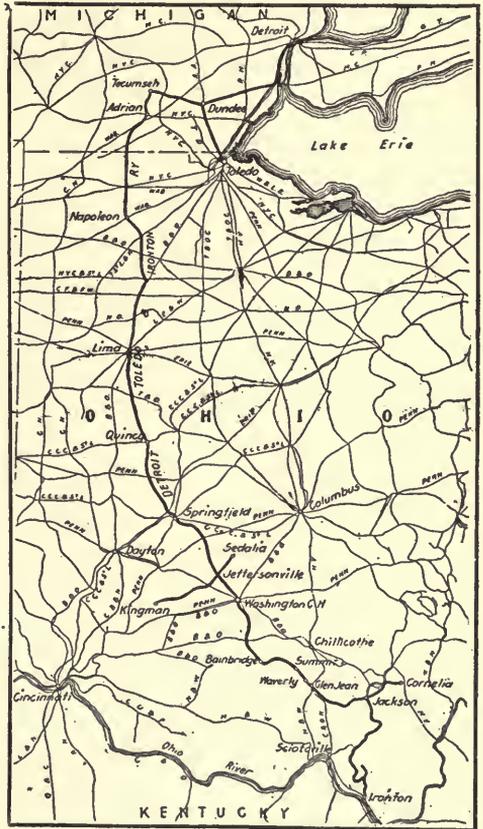

**H**ENRY FORD'S entrance into the field of steam railway transportation, through his acquisition of the Detroit, Toledo & Ironton, has aroused a more intense public interest than any other single event in railway history, not excepting the advent of federal control at the beginning of 1918. His success as a manufacturer in a field in which, through great ability and highly standardized factory methods, he has built up a vast business, has given him an international reputation such that his opinions on any industrial subject are received with great respect by the public.

Mr. Ford has purchased a railroad which never before had demonstrated that its existence as a common carrier was economically justified. He raised the wages of his railway employes when other roads were adopting reduced wage scales. He has made a 20 per cent reduction in local freight rates and has started a movement for a general rate reduction.

In February, 1921, the D. T. & I. produced an operating deficit of \$104,923. Mr. Ford became president on March 4. In April the road produced a net operating revenue of \$301,675, which has increased steadily for the succeeding three months. Hence, when Mr. Ford was asked, "What is the first thing you would do if you were given all the railroads to run?", and he is said to have replied, "Slash rates, boost wages, let a lot of men go," the connection between cause and effect seems to be established, and it is not unnatural that Mr. Ford is credited with having worked a miracle in the transportation world.

### Not a Matter of Cause and Effect

But a chronological statement of the facts does not justify belief in so simple a rela-

Mr. Ford's Railroad

tionship between cause and effect. The most-talked-of Ford policies, such as the new wage scale based on a minimum of \$6 a day, the 8-hour day and 6-day week in train service and the abolition of off-line traffic agencies, did not become effective until July 1, 1921, and the reduced freight rates became effective still later. The latest published returns for revenues and expenses are for the month of June, 1921. It is evident, therefore, that these policies have not been a direct factor in the results on which public opinion has been formed.

These policies and the favorable operating results have been made public by the

daily press at the same time, giving the erroneous impression of cause and effect.

It is not the purpose of this article to speculate on the effect likely to be produced by these policies. Time will make available the facts from which their wisdom may be judged with assurance. With the facts already available, however, it is possible to determine the principal causes for the spectacular improvement in operating results which has so closely followed the assumption of complete control of the railroad by Mr. Ford.

**How Revenues Have Been Increased**

From September to December, 1920, inclusive, the Detroit, Toledo & Ironton handled an average of 49,246,000 net ton-miles of revenue freight per month. During this period the freight revenues averaged about \$493,800 a month, giving an average revenue of 1 cent per revenue ton-mile. During January and February there was a marked falling off in the volume of traffic; the net ton-miles for the latter month scarcely exceeded ten million. In March, following Mr. Ford's accession to the presidency of the road, the traffic movement showed a marked improvement in the face of a pronounced depression on other roads. This increase continued through the months of April and May with a slight falling off in June, which is the latest month for which operating statistics are available. The volume for May, however, is 16.5 per cent below the average for the last four months of 1920.

In April the traffic movement amounted to 31,600,000 revenue ton-miles, and freight revenues were \$674,692. The May movement amounted to 41,090,000 revenue ton-miles, and the freight revenues for the month were \$721,562. In June revenue ton-miles dropped to 38,589,000 with a freight revenue for the month of \$686,355.

It is evident, therefore, that instead of the 1 cent per ton-mile received during the last four months of 1920, the D. T. & I. received 2.13 cents in April, 1.76 cents in May and 1.78 cents in June. For the three months the receipts averaged 1.88 cents per ton-mile. During the same period the average revenue per ton-mile for all Class I roads increased only from 1.1 cents to 1.33 cents.

In December, 1920, the Detroit, Toledo & Ironton handled 44,396,000 net ton-miles, for which it received \$470,350. Total operating

revenues amounted to \$508,666 and operating expenses to \$686,736, or 134.4 per cent of the total operating revenues. To demonstrate the effect of the increase in revenue per ton-mile on operating results, had these 44,396,000 net ton-miles produced revenue at the same rate as the business handled in June, the freight revenue for the month of December would have amounted to \$790,250 and the total revenues to \$828,550. Instead of 134.4, the operating ratio would then have been 82.5, with no change in operating economy.

**The Traffic Situation**

This marked increase in the price received by the railroad for its commodity reflects two conditions. One is a marked increase in the volume of high grade traffic with a simultaneous decrease in the volume of low grade traffic; the other is the strengthened position of the road with respect to through rate divisions.

**Revenue Tons of Freight Handled by the D. T. & I. Classified by Commodities**

	Net tons loaded and received		
	Av. per Mo., Sept., Oct., and Nov. 1920	April 1921	May 1921
Products of agriculture.....	24,271	8,671	7,419

Merchandise and l. c. l....	3,211	4,302	5,813
Other manufactures and miscellaneous .....	59,781	39,030	68,706

The foregoing table presents the salient facts relative to the change in the character of the traffic. The large volume of coal traffic moving during the late months of last year has been replaced by a growing volume of high grade semi-finished products and automobiles, largely but not entirely controlled by the Ford Motor Company. At its Highland Park plant alone this company controls a daily movement, in and out, of about 300 carloads of freight. Of approximately 6,000 cars a month shipped out of Detroit by all of the Ford industries, more than 5,000 are now being routed via the D. T. & I.

The Detroit, Toledo & Ironton, with its poor location and the meager volume of

through traffic originating on its line, had never been in a position to secure what it considered adequate percentages of the through rates in which it participated. The road now has a large and growing volume of high grade traffic at its disposal at a time when traffic is scarce. This complete reversal of conditions undoubtedly is already reflected to some extent in the increased ton-mile revenues, and its complete effect on rate divisions will be a strong factor in maintaining a high average ton-mile revenue when normal business conditions increase the movement of coal and other low grade products.

#### Attitude of the New Management

Another factor having more or less effect on the traffic of the D. T. & I. is the purchasing power of the Ford interests. Instances are said to have occurred where Ford Motor Company purchases, either actual or prospective, have been the controlling influence in routing business, other than that controlled by Mr. Ford, over the rails of the D. T. & I.

While the Ford interests acquired possession of the D. T. & I. in August, 1920, the present management did not assume complete control of the property until March 4, 1921. From that time until July 1, 1921, no marked innovations were inaugurated, although considerable study was given to the operating organization and progress made toward its rearrangement and simplification according to general principles which Mr. Ford believes apply equally as well to railroading as to the conduct of an industry. On July 1 the first real operating innovations, already referred to, went into effect, and on July 18 the road filed a freight schedule with the public utilities commission of Ohio providing for a 20 per cent reduction in rates between all points on its own line. None of these changes has been in effect long enough to supply any data relative to their effect on revenues or expenses.

In taking over the active handling of the property Mr. Ford's management has approached the problem with a full appreciation that it has little knowledge of the details of the railway business, and any intention to "show up" other railway managements is disclaimed by it. It is Mr. Ford's belief, however, that through years of development many practices and details of organization

have been perpetuated in the railway business which a close analysis would show to have little to justify them except precedent. Certain records, for instance, once established possibly for a certain purpose, continue to be compiled long after that purpose has been served and after their usefulness has ceased. In the matter of organization it is his belief that there has been a tendency toward the development of bureaucratic methods with an amount of red tape which tends to stifle the initiative of the man on the ground who is directly responsible for results.

In view of this conception of the situation, a lack of what is commonly termed expert knowledge of the details of the railway business is considered by Mr. Ford an asset rather than a liability on the part of the new management, which approaches the problems involved in operating the property with a firm conviction that, as a business, railroading does not differ essentially from any other industrial venture. The human element is believed to constitute the largest single factor in the operation of a railroad, just as it does in the conduct of an industry, and Mr. Ford believes that the same principles and methods of dealing with men which have led to satisfactory industrial relations in the plants of the Ford Motor Company will produce the same results in dealing with railway employes.

#### The Ford Labor Policies

The purpose of the labor policies established by the Ford Motor Company is the development of a stable force of satisfied employes. The advantages of stability with a minimum turnover are generally well recognized. The stability and efficiency of the force depend upon its loyalty; and loyalty, in the opinion of Mr. Ford, is only rightly to be expected from employes who are satisfied with their wages and working conditions.

The policies adopted by the Ford Motor Company with respect to wages and working conditions are founded on the belief that it is better to pay a minimum number of employes a wage high enough to justify the individual in giving to the management his unqualified support and the utmost effort of which he is capable, rather than to spend the same or a larger amount of money to meet a payroll of larger numbers of less satisfied

men, who feel justified in giving considerably less than their best efforts. In this connection it is pointed out that the purpose of the restrictive working conditions imposed by labor unions is primarily to increase labor earnings—that they are not an end in themselves. Hence, if the men are satisfied with their wages, these waste-breeding restrictions can be abolished.

These reasons have been considered sufficient to justify the extension of the policies in force in the plants of the Ford Motor Company to the Detroit, Toledo & Irónton. Accordingly, on July 1, instead of putting into effect the reduced wage rates established by the United State Railroad Labor Board, Mr. Ford established the \$6-a-day minimum wage scale which had the effect of a general advance in wages. The rates affecting some of the more important classes of employes, compared with those established by the Labor Board, are given in one of the tables. In paying these wages the management has adopted the policy of refusing to hire experienced railway men who are employed by other roads.

#### Adds a Bonus to Wages, Too

In addition to the increased wage scale, a bonus is to be paid periodically, varying with length of service and rate of pay from \$50 to \$150 a year for employes receiving \$6 a day, and from \$170 to \$270 a year for employes with a rate of \$10.80 a day. The bonus also applies to salaried employes whose salaries do not exceed \$250 a month.

The 6-day week with no train movement from 6 o'clock Saturday night till 6 o'clock Monday morning, except as required by live stock or perishable shipments, has been inaugurated in order that as nearly as possible all employes may have one day of rest in seven, and have it on the same day as men in other lines of work. This has been worked out so that as low as forty men on the entire line are required to work on Sunday. These include about ten bill clerks who work a few hours in the morning on shipments received late Saturday, two yard engine crews and the men employed in the operation of joint railway crossings.

Employes are paid on the basis of eight hours' work per day, twenty-six days a month, or 208 hours a month. As far as possible, train service employes and others whose duties subject them to call are laid

off at the completion of 208 hours' service, if completed before the end of the month.

#### Wage Rates on the D. T. & I., Compared With Labor Board Scale

Class of employe	Average daily rates	
	D. T. & I.	S. Labor Board
Clerks .....	\$150—\$225*	\$4.21—\$4.77

\*Monthly basis for eight-hour day and six-day week.

In reorganizing the forces the central idea has been simplification and the elimination of duplication of effort, closer co-ordination of the different departments and the elimination of as many of the intermediate agencies in the control of the forces as possible. At the time Mr. Ford acquired control of the property in August, 1920, there were 2,723 employes on the road. In March, 1921, the number had been reduced to 1,326. In the rearrangement of runs necessary to provide for the 8-hour day and the 6-day week in train service, it was necessary to increase the number of employes. There was also a seasonal increase in the maintenance of way department. There were 1,822 employes in the roll for July.

#### Reduction in Maintenance Forces

A classified list of the employes on the road during these three months is shown in another table. It will be noted that the largest decreases were in the maintenance departments. The August, 1920, roll is said to have been about 500 above a normal average, nearly 300 of this number being accounted for in the maintenance of way department, which averaged about 1,000 employes during federal control. The reduction

in the number of employes in this department has been effected largely by reducing section gangs to a foreman and two men each, the foreman being required to work with the men. These gangs, however, are not expected to take care of all of the routine maintenance work on their territories the year around, while heavier work is performed with floating gangs of fifteen or twenty men which are moved from section to section as conditions require. Considerable work is also accomplished by utilizing the idle time of such men as crossing watchmen and pumpers on minor track maintenance, such as cutting weeds, repairing road crossings, looking after joint bolts, spikes, etc.

Number of Employes on the D. T. & I. in August, 1920, and March and July, 1921

	August, 1920	March, 1921	July, 1921
General and accounting.....	128	105	111
Maintenance of way.....	1,291	377	646
Mechanical .....	623	345	466
Station forces.....	276	210	220
Trainmen .....	229	167	225
Enginemen .....	171	122	154
<b>Total.....</b>	<b>2,723</b>	<b>1,326</b>	<b>1,822</b>

Through the late summer to the end of last year about 3,000 tons of 85-pound rail were laid on the north end of the line. A considerable amount of 56-pound and 60-pound rail farther south was replaced with relaying rail, about 200,000 ties were renewed and some ballast inserted. This work was done with three extra gangs of forty-five to sixty men each. Since the middle of May this year, four gangs of fifteen men each have been renewing ties at the rate of 20,000 a month and putting from twelve to fifteen 50-ton cars of stone ballast a day under the track.

During this same period last year, the Jackson, Ohio, shops averaged a monthly output of four locomotives with heavy repairs. During the past few months with about 60 per cent of last year's force, the output has averaged at the rate of slightly more than four locomotives a month. In comparing the total number of employes in the department during the two periods, however, account must be taken of the fact that an abnormal volume of car repair work was in progress during the earlier period.

**Reorganization of Accounting Department**

The accounting department, organized on the divisional system, formerly maintained

During the four months, September to December, 1920, inclusive, after the present railway freight rates were fixed, the D. T. & I. handled an average of 49,246,000 ton-miles of revenue freight per month and had freight earnings averaging \$493,800 a month. In the months of April, May and June, 1921, the road handled an average freight business of 37,093,000 ton-miles a month and earned from it an average of \$694,203 a month. In other words, its average freight business in these three months was almost 25 per cent less than in the last four months of 1920, while its average monthly freight earnings were over 40 per cent greater.

three offices, one at Jackson, Ohio, the location of the principal repair shops, one at Springfield, Ohio, and one at Detroit, Mich. The work of these three offices has been consolidated successively by moving the Jackson office to Springfield and finally moving the Springfield office to Detroit, where all of the work of the department is now conducted. Centralizing the work of this department has brought to light a number of duplications, the elimination of which has made possible a reduction in the clerical forces from sixty-six to fifty and the dropping of one supervisor.

All original documents, such as time slips and material slips, are sent direct to the auditor's office for distribution. Instead of making out the usual payrolls, pay checks are made out from the distribution sheets in case of time slips, and, where time clock cards are used, from them direct. This has made it possible to pay on the fifth of the month following the close of the payroll period, instead of the fifteenth, as was the former practice. Also, instead of maintaining a rate clerk in the auditor's office to check rates on interline waybills, this work is now done by the rate clerk in the traffic department, to whom all questions of the correctness of rates or divisions must be referred for settlement in any case. This has saved two rate clerks and a mail boy. In all, seventy-three monthly reports between the divisional and general offices or

## *Bre'r Rabbit Means Meat, Fur and Prizes to Illinois Central Employe*

*J. T. Rust, Extra Conductor, Birmingham, Ala., Has Backyard Industry That Beats Chicken-Raising in His Estimation*

**W**HAT Illinois Central employes do in their spare time are many and various things. One keeps bees; another starts an orchard; a third edits a paper; the next raises fine chickens; then one runs a garage, and now we have another who is going into the rabbit business and winning a national reputation at it.

The rabbit-raiser is J. T. Rust of Birmingham, Ala., extra conductor, assigned flagging the Seminole Limited to and from Central of Georgia territory. Mr. Rust is engaged during his spare time in breeding and raising pedigreed and registered rabbits. He has between 150 and 200 head of his stock at present, and he plans to raise about 1,800 next year.

Mr. Rust has the honor of being state governor of the National Breeders' and Fanciers' Association of America, Inc., and in that capacity has charge of all the local associations in Alabama. His growing reputation has made him a favorite as judge, and he already has a list of shows calling for his services this winter. He is so enthusiastic in this work that he is engaged in organizing boys' and girls' Belgian hare clubs in Alabama. He devotes much time to campaigning in an effort to educate the public as to the food value of rabbit meat.

### **Favors the Flemish Giant**

Mr. Rust is raising the rabbits for both profit and pleasure. He raises several different breeds, but the Flemish Giant is his main breed, as these rabbits are more profitable than the others, for they are the largest of all breeds. He has some specimens that weigh as much as seventeen and eighteen pounds. It costs considerable money to get a start with these. He has some that he has refused \$100 for, but they are his registered stock and have made several winnings in big shows. The three on the picture with Mrs. Rust were first prize winners at Cleveland, Ohio, at a show with 1,800 rabbits. The three rabbits cost \$200, but rabbits are not so expensive now, for

*Food, Fur and First Prizes*

people are raising them more for meat purposes than for fancy showing.

The New Zealand hare, Mr. Rust believes, is next to the Flemish, for it is a great commercial rabbit, as it is fine for both food and fur. The meat is well worth eating, and the pelt is valuable, for when it is tanned and dyed you can't tell it is rabbit. Much rabbit fur is used now to imitate Hudson seal, gray squirrel, moleskin and other popular furs used on valuable coats and other garments.

The Rufus Red Belgian, another valuable rabbit, is raised mostly for fancy showing, but is also valuable for its fur. The rabbit business is growing wonderfully in the South now, as the people are beginning to realize the commercial value of the rabbit—food, fur and fancy—but mostly for food and fur.

### **Only a Small Space Required**

The rabbit is easy to raise and takes up little space. You can keep rabbits in small hutches in the back yard or in the out-houses, such as the garage. Out-door hutches are mostly built in tiers. Mr. Rust makes most of his three tiers high to save room, and he usually has six or eight hutches together, with a good roof of roofing paper and closed up tight on three sides, with a wire netting on the front. You can only keep one matured rabbit in a hutch, he says, for they will fight each other. After they are 5 months old, you have to separate them, putting them in separate hutches.

Mr. Rust has now about 150 or 200 head, and he has a regular rabbitry, as he says he

can't begin to raise them fast enough to supply the demand. He has to buy them from other breeders to supply his trade.

"I will sell all I can raise at 50 cents a pound for meat," he says, "and the breeding stock that I raise I get a good price for, all the way from \$5 to \$25 apiece, depending on the specimen, but I think there is more money to be made from the meat than from the fancy stock, as you don't have to be so particular with the meat stock. I have about twenty-five head of registered fancy stock that I will keep; the others are for my commercial trade in meat and fur.

"My rabbitry is 150 feet long and 20 feet wide, all under a roof, so that I can work with the rabbits in bad weather. It is so hot here in summer that I have to make a shade for them,

as the heat is not good for them in the summer.

#### In the Business Six Years

"I began fooling with rabbits about six years ago just as a hobby—something to do at home to keep out of town and off the streets when I am in off the road—and I kept on with them until now I am in the business right. I saw some time ago where I could make something with them and have my pleasure also, for I get the pleasure in showing them and winning the prizes, and I usually win when I show.

"Last year I showed at the New York State Fair at Syracuse, N. Y., winning three first prizes and two second prizes. There were 2,100 rabbits at this show. I also sent six to the Louisiana State Fair at Shreveport, La., and got five firsts and one second. I sent eight

*Mrs. Rust and Three Prize-Winners That Cost \$200*

*The Rust Family and the Rabbit Hutches*

to Jacksonville, Fla., to the Florida State Fair, for which I got eight firsts and two silver cups, one for the best rabbit in the show and one for the heaviest rabbit. I always win several prizes in the shows in Birmingham, for I always put in a lot of rabbits.

"I won't be able to show many this year, for I have been appointed judge for most of the shows in this section—at Shreveport, La., Mobile, Ala., Atlanta, Ga., Knoxville, Tenn., and Birmingham—for which I get a good salary, and I always have a good time with the boys at the show.

#### **Garden Provides Rabbit Feed**

"My son, who is 13 years old, takes care of my stock while I am out on the road, but with the run I have now I am at home a part of every day and can take care of them myself very nicely. It doesn't cost very much to feed rabbits, especially in the summer, for I raise most of their feed in my garden, such as carrots and green feed. They eat very nearly everything that grows in the garden, but their main feed is grain and alfalfa or clover hay. My grain feed is mostly oats and some barley and cracked corn."

Anyone wishing to cut living expenses can do it very nicely, according to Mr. Rust, by getting three or four good breeding does and a buck, so they can have young rabbits to eat the year around. Rabbits are just as good to eat in the summer as in the winter, Mr. Rust says, and you can raise four litters a year from a doe. They will average from six to eight in a litter, and they are good to eat at 3 months of age. Mr. Rust usually sells them for meat when they are 3 to 5 months old.

You can cook them any way you like—bake, fry, stew, roast, make rabbit hash or croquettes—any way you want to cook them is good, Mr. Rust declares. They are nothing like the trouble that a chicken is to raise, and you can raise so many more so much easier than you can chickens. The shop man or the office man cannot always get home in time to feed the chickens in the afternoon, but you can feed the rabbit at 10 o'clock or 6 o'clock or any time, and it will be OK—he will be looking for it. You can feed and water rabbits once a day, and they will do all right; if you fail to feed the chickens once or twice, you don't get any eggs.

You don't have to fight on the rabbit the mite and louse and several other things that you are bothered with when you raise chickens. Chickens are mighty nice if you have time to bother with them, Mr. Rust believes, but a man working days doesn't usually have time to fool with them before dark

#### **Twenty-Three Years With Company**

Mr. Rust has been with the Illinois Central since 1898. He began as call boy at Water Valley, Miss., and went from call boy to yard clerk at the same place in 1899. From Water Valley he went to Canton, Miss., where he worked something more than a year. Then he was used at various points on the Mississippi division as ticket agent and office clerk until 1903, when he went on the road on the Mississippi division as a flagman. In September, 1907, he was transferred to the Birmingham line, which was known then as the Alabama Western Railroad, and has been there ever since. In 1908 he was promoted to conductor.

# Rain Water Proves Best, as a Rule, for General Locomotive Use

*Streams Are Regarded as Next Most Satisfactory Source, and Wells and Springs Rank Third, According to Tests*

By C. R. KNOWLES,  
Superintendent, Water Service

**T**HE relative degrees of purity of water suitable for boiler purposes may be roughly classified as follows:

- (a) Rain water.
- (b) Water from creeks, rivers and lakes.
- (c) Water from wells and springs.

This classification is given in a general sense only and will not hold true in all instances, as there are several points on the Illinois Central System where well waters are lower in dissolved content than some of the streams. This is particularly true when a comparison is made of the waters from some of our wells on the Southern Lines with the waters from the streams of Iowa. It will generally hold good, however, when waters from streams and wells in the same territory are compared.

The Illinois Central serves a considerable portion of the country, and it is necessary to use a variety of waters, the greater part of which must be made use of in locomotives. It follows that the selection of a satisfactory water supply or the treatment of an unsatisfactory supply is of the utmost importance in locomotive operation.

If water were simply what its chemical formula represents, a compound of hydrogen and oxygen, the troubles which arise when it is used in locomotives would not exist. An ideal water for locomotives would be one that would not form scale, corrode or pit flues and sheets and that would not cause foaming. Unfortunately a water entirely free from these objectionable features does not exist in nature.

## Some Causes of Boiler Trouble

All natural waters contain more or less of substance in solution in varying amounts. In addition to the dissolved matter, most surface waters, especially streams, carry a great deal of suspended matter in the form of sand, fine clay, vegetable matter, etc. During rainy seasons, all these substances

foreign to the composition of water itself have their part in causing boiler trouble and are present to a greater or lesser extent in all waters used on the Illinois Central.

Well waters as a rule are pure, clear and colorless, although many are very hard and others contain much iron in solution. Such waters are not particularly objectionable for drinking and domestic purposes, but hard waters are unsatisfactory for use in boilers as well as for other industrial uses.

Water from a reservoir supply is usually the best for boiler purposes because of the physical improvement resulting from storage. Storage causes the subsidence of the fine suspended particles and the reduction of color due to substances held in solution. The second result is produced largely through the bleaching effect of the sun.

River waters are usually of a fairly good quality, except for suspended matter. As previously explained, they show less hardness than ground waters in the same territory, although the condition of the river waters in general use is not improving by any means, as the amount of matter causing pollution of water which practically all rivers and streams of the country carry is increasing year by year.

## Good Water on Southern Lines

The waters on the Southern Lines are, with a few exceptions, among the best boiler waters of the country. The exceptions are where the surface waters carry large quantities of mud and other matter in suspension and where the well waters are low in dissolved content and the elements in the water are not properly balanced. These well waters are commonly classed as "too pure." For example, a condition of this kind exists on the Tennessee division from Jackson, Tenn., to Birmingham, Ala. In order to overcome corrosion and pitting from the use of the water, it is necessary to add certain impurities to the

water in the form of soda ash, caustic soda, etc.

Some few cases also exist where surface water supplies are contaminated by sewage and industrial wastes, although this is a rare occurrence.

The purification of most of the Southern waters is largely a matter of filtration and removal of mud. At Baton Rouge, La., the Mississippi normally carries from 100 to 350 parts per 1,000,000 of suspended matter, but during certain seasons of the year the water from Red River predominates to such an extent that the suspended matter will be as high as 3,300 parts per 1,000,000 at Baton Rouge and 2,500 at Harahan.

### Not So Good on Western Lines

Compared with waters on the Northern and the Southern Lines, all waters on the Western Lines are poor, being highly mineralized, or, as it is commonly expressed, "hard." This is particularly true of the waters of Iowa. The state is deeply covered by drift and soil, composed mostly of finely divided material which is highly

calcareous and contains large amounts of calcium sulphate and other more soluble compounds. The rainfall comes in contact with this material, and that which becomes ground water must pass through it, giving the water opportunity to take up mineral matter. Only small superficial sand areas in the state take up the rainfall and transmit it as soft water to wells or rivers. The deep rich soil contributes indirectly to the mineralization of water. Nearly the whole area is covered with vegetation of some sort, and the soil contains large amounts of decaying vegetable matter.

An unusual amount of carbon dioxide is thus supplied to the water at the surface, which enables it to dissolve large amounts of calcium and magnesium carbonates. Iowa rivers contain very much larger amounts of mineral matter in solution than the rivers of the continent as a whole. The average total solids of the Des Moines, Cedar and Iowa rivers, as determined by analysis made by the United States Geological Survey, is 262 parts per 1,000,000, while the average of the

### Three Sources of our Water Supply

- 1- Raccoon Spring empties into reservoir at Princeton Ky.
- 2- Eddy Creek, near Princeton Ky.
- 3- Flowing Well, Roseland, La., 925 ft. deep, flows 750 gallons per minute

*A Pumping Station Where Oil is Used for Fuel—Millington, Tenn.*

river waters of the continent is given as 150 parts per 1,000,000. The same general agreement is found between the mineral matter of the rivers and that of the best deep wells. The total solids for the rivers include only the dissolved mineral matter. If the suspended matter is added, the total average matter carried by the river waters is 553 parts per 1,000,000. The comments applying to the waters of Iowa will also apply to the whole of the Western Lines, with certain modifications on the eastern and southern portions of the territory. There is no water on the Western Lines that would not be benefited by treatment to remove the hardness.

#### **Quantity Problem on Northern Lines**

The question of quantity has been more serious than that of quality on the Northern Lines, especially on the Illinois, St. Louis and Wisconsin divisions. On the Illinois division, outside of the Chicago terminal, 50 per cent of the water stations are supplied by wells, 25 per cent by streams and 25 per cent by reservoirs. There is a wide variation in the quality of the water from wells, although all are rather high in carbonates. The waters from streams vary according to the seasons, but may be classed as fair boiler waters. The waters from reservoirs are, of course, all good waters.

On the St. Louis division, 60 per cent of the water used is from streams, 25 per cent from reservoirs and 15 per cent from wells.

The well waters on this division are of poor quality, with the single exception of the wells at Mounds. The surface waters are of good quality except where they are contaminated by industrial wastes, especially free acid from the mine wastes which are discharged into the streams. This is particularly true of Big Muddy River, supplying the Carbondale, Texas Junction and Sand Ridge water stations. The water from Big Muddy at Carbondale is probably the most variable water on the system, ranging from a good water at flood stages to a very bad water at low stages of the river. This water is high in sulphates and very corrosive when the river is low. All water used at Carbondale is treated with lime and soda ash.

The Indiana and Springfield divisions are in fairly good shape as to water supply, except at Clinton, where the supply is inadequate during the dry season and of poor quality.

Most of the waters on the Northern Lines are satisfactory for boiler use without treatment, although there are individual cases where water softening plants are necessary, as at Big Muddy.

#### **Variation in Well Waters**

As illustrating the wide variation in waters, as well as certain interesting types found on the system, the following examples of well waters are selected:

Some waters have but from two to three

grains of incrusting solids and total solids not exceeding six or eight grains a gallon. These waters are from Mississippi, Louisiana, Kentucky and Tennessee. At first thought it might be the impression that these are surface waters or waters from very shallow wells where the soil formation would be such as to yield but little to the solvent action of the water. This, however, is only partly true.

For example our well at Covington, Tenn., with a depth of 538 feet, shows only 4.05 grains of incrusting solids a gallon, with a total content of only 5.36 grains per gallon.

A 500-foot well at Mounds, Ill., shows

only 5.9 grains of scaling matter and 8.6 grains of total solids. Some wells through the Mississippi Delta show less than 5 grains of scaling matter and less than 8 grains of total solids, while perhaps the most remarkable of all is the Geyser Well at Hammond, La., 2,100 feet in depth, showing incrusting solids to the extent of only 5.5 grains, with free sodium carbonate (soda ash) amounting to 5.9 grains, the total solids being less than 12 grains a gallon.

The Roseland well, with a depth of 925 feet, has almost the same composition—that is, scaling matter 3.9 grains, free alkali 4.5 grains, with total solids amounting to less than 10 grains.

## Former Employe Gives McComb \$400,000

Announcement has recently been made of the gift of \$400,000 to the city of McComb, Miss., by William McColgan, millionaire and former employe of the Illinois Central shops at that city. This gift, which is to build and endow a trade or vocational high school for the city, is made in the name of McColgan Brothers and Sister. This includes Mr. McColgan's living sister, Mrs. Neville, and his brother Hugh, likewise a former employe of the Illinois Central shops, who died a few years ago.

Many years ago the McColgan brothers began life as mechanics for the Illinois Central in the McComb shops. It is largely in remembrance of this experience that Mr. McColgan will build and endow this modern fire-proof school building. "Our town is an industrial one," said his spokesman, in announcing the gift. "The large majority of our citizens, therefore, must and should be mechanics. In addition to his literary education, a boy can specialize and receive technical training as a machinist, a carpenter, a brick mason, an electrician, a signal man, or a plumber, or one of the other similar important trades."

The announcement was made at a luncheon of the Exchange Club of McComb on September 21. It came as a surprise to most of the members and was hailed with wild enthusiasm, according to the report of the meeting in the *McComb City Journal*.

Xavier A. Kramer, a business associate of Mr. McColgan, who announced the gift, pref-

aced his announcement by pointing out that Mr. McColgan, in his early years, was without influence and without money.

"He had only the average education of his day, but had a good head and a kind heart," Mr. Kramer went on to say. "The story of his success by reason of hard, honest and consistent effort is well known to all here present. Mr. McColgan, as you well know, is a keen observer, but his extreme interest in the education of the youth of the land has been known to only a few of his closest associates. His own experience has taught him that one of the most valuable assets that a young person can have is a good education, and he knows that without it, while success in life is not impossible, it is made much more difficult. Without children of his own, having remained a bachelor, yet he feels a great interest in the children of his community—the children of the present, as well as those yet to come."

The McColgan brothers, after leaving the employ of the Illinois Central, went into the hotel business, and afterward into a number of industries, including the manufacture of ice.

### A NEW ATTORNEY

George W. May and J. O. S. Sanders, comprising the law firm of May & Sanders, district attorneys for the Illinois Central at Jackson, Miss., announce the admission of A. J. McLaurin as a member of their firm under the new style of May, Sanders & McLaurin. Their offices are at 604-608 Merchants Bank Building.

# Former Champion Pedestrian Now Sweeps Station for Illinois Central

*Highways and Byways of the United States Well Known to Fred Miller, Whose Exploits Once Were Famous*

*SIC transit gloria mundi.*

Said a recent item in the Hammond (La.) *Vindicator*, under the heading, "Illinois Central Yards Complimented": "A Chicago traveling man the other day remarked that the railway yards and depot properties were the best kept of any he had observed since leaving the Windy City on his swing through the South. We have always said that Hammond maintained its railway facilities in the very best style, no trash, rubbish and debris being allowed to assemble. Fred Miller of the white wing department certainly is on the job all the time. . . ."

A neat compliment, but little did the Chicago traveling man realize that the station sweeper whose work he saw was once one of the champion long distance walkers of the United States, with a record of 13,316 miles in two years and eighteen days and a medal to prove it, winner (for other persons) of numerous large wagers, a contemporary and friend of John L. Sullivan and Bob Fitzsimmons, whose arrival in a city in the days of his prime was the signal for great crowds to gather in welcome.

## Still Full of Ambition

But even so it is. Mr. Miller, who is now 62 years old, was born in Sandusky, Erie County, Ohio, September 6, 1859. Age, however, has not dimmed his ambition, for he signs himself "An old-time sport, Fred Miller, champion pedestrian" and offers to take on anybody any time in defense of this title, which the *Police Gazette* gave him in 1895. "It is something I earned by the sweat of my brow," he says, "and something I am proud of so many years."

Let any young upstart would take him up too rashly, however, it might be well to mention that he still walks about twelve miles a day around the Illinois Central yards at Hammond and on his way to and from home each day, and to recall that his walks included such little strolls as those from San Francisco to New York, New York to New Orleans and return, Denver, Colo., and return to the *Police*

Fred Miller

*lice Gazette* office in New York, New York to Jacksonville, Fla., and return, New York to El Paso, Tex., and return, and so on.

It was Mr. Miller's custom to make his trips without a cent in his pockets. The leading sporting papers of that time would give him publicity, he says, and every town he arrived in would give him plenty to eat, and the people would be at the station by thousands to meet him. He recalls crossing the plains and the Great Desert, stopping at the railway section houses at night, and all the time keeping in touch with the *Police Gazette* and Richard K. Fox, his backer, whom he calls "one of the greatest sporting men the world ever

knew." One wager he won for Mr. Fox totaled a small fortune.

#### The Ups and Downs of Life

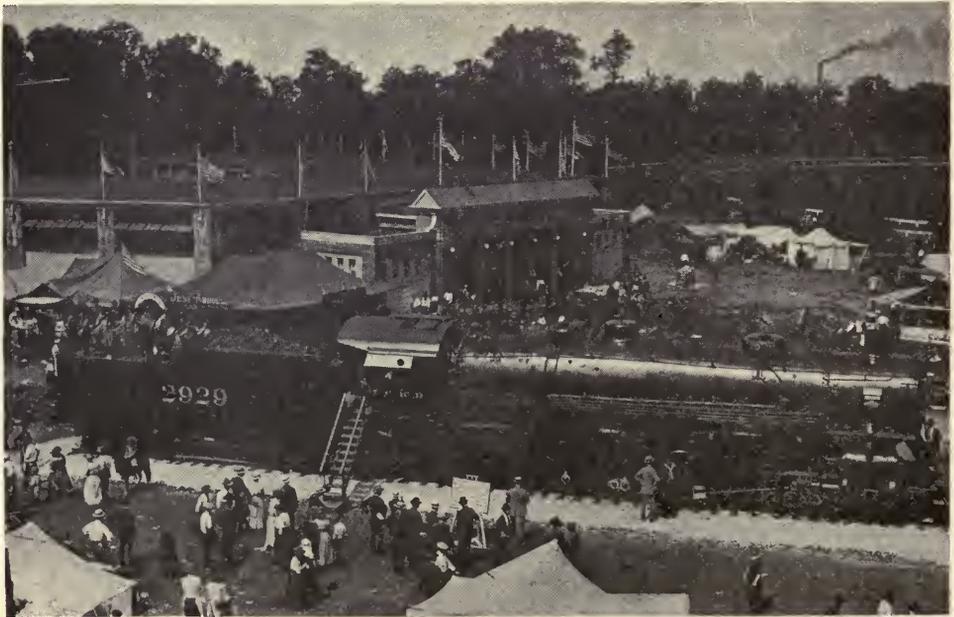

One trip he recalls was from New York City to New Orleans and return in 1894, the year of the Pullman strike, when he saw "some sights" at Cairo, Ill. The ferry was not running at the time, and he had to get a skiff and a man to row him across the river. "But I must say that everybody was kind to me," he adds.

"Life is what a man makes it," he concludes. "At one time I was a boy behind the plow; then I was a sporting man, and now I am a working man again. I knew all the old-time

sports, such as old John L. Sullivan and Lanky Bob Fitzsimmons, followed the same pace that so many did, and went broke. After I got through with my long walks I spent some time with the Cole & Middleton dime museum, and also in New York as a freak before the public."

Mr. Miller has been a resident of Hammond since 1898. Before entering the service of the Illinois Central as station sweeper in October, 1913, he was employed to carry the United States mail between the trains and the postoffice. Occasionally he drops into New Orleans to talk over old times with the sporting men that are left.

## From One Triumph to Another

*Our Exhibit at the Indiana State Fair, Indianapolis, September 5-10*

The Illinois Central's exhibit of old and new engines, whose success at the Illinois State Fair at Springfield, August 20-27, under the management of Superintendent C. W. Shaw, was described in the September issue of this magazine, has gone on and scored additional successes at other fairs. Some of the comments will be found in this issue in the Public Opinion department. The exhibit of the old engine "Mississippi" with Central type

2-10-2 engines has continued as follows: with No. 2929, Superintendent H. J. Roth, Indiana State Fair, Indianapolis, September 5-10; with No. 2956, Superintendent T. E. Hill, Kentucky State Fair, Louisville, September 11-17; with No. 2977, Superintendent T. H. Sullivan, Interstate Fair, Sioux City, Iowa, September 20-24; with No. 2929, Superintendent H. J. Roth, National Implement and Vehicle Show, Peoria, Ill., September 30-October 8.

## Liking for Mechanics Leads One Employee Into Ownership of Garage

*Sideline Occupation Is Development of Boyhood Ambition of  
Clifton B. Funk, Flagman at Lincoln's Birthplace*

**Y**OUTHFUL ambitions and ideals do not always manifest themselves in a man's later life. Almost every boy has ideals, but in the progress of his life there is usually something that comes up to take the place of them. Often they are discarded as impractical, and then forgotten.

But once in a while there is a boy who clings to his ideals like a leech. For instance, take the boy who wants to become a mechanic. You will find him at work during his hours out of school. He will have a hut in which will be found small machines, steam, electrical and otherwise. There will be instruments of all kinds. He knows the workings of every one of them, and is always experimenting to see if he can find some other use to make of them.

Just such a boy was Clifton B. Funk, who is now flagging on the Hodgenville, Ky., branch of the Illinois Central. He had real tools in his playhouse. When he made things, he made them thoroughly. His experiments were carried out in a systematic and practical way. The results were always instruments that could be used.

### Hobby Installing Electric Bells

His greatest hobby was the installation of electric doorbells in the houses of his neighborhood. Electric doorbells were new in those days. People could not understand how the power that rang the bell could

travel through the slender wire. Clifton held the secret, and felt his importance.

He loved to work with all kinds of mechanical devices. At one time he assisted a man who was working on a patent steam engine. They experimented with a new idea of conducting the used steam from the cylinders back into the boiler. However, they were never successful.

Louisville, Ky., was the scene of Clifton's boyhood dreams and realities. He was reared and educated there. He attended a manual training school in that city three years.

In July, 1905, he entered the railway field as night clerk for the C. C. C. & St. L. Railroad. He was with that company only two months when he was offered and accepted a similar position on day duty with the Illinois Central. Soon afterward, he was promoted to night agent.

### Made a Flagman in 1906

June 21, 1906, Mr. Funk accepted a position as flagman in the Louisville district and continued as such until July, 1910, when he was promoted to conductor. In this position he worked extra. He was sent to Central City, Ky., where he was conductor on the coal run for a year. He says that this work was unsatisfactory in that it was not regular.

He then applied for and obtained a posi-

*Mr. Funk Doing Chores for the Illinois Central*

tion as flagman on the line between Cecilia and Hodgenville, both in Kentucky and eighteen miles apart. It was in 1916 that he started his service on this branch. He has retained that position since. It is desirable, he says, because he is able to have his home in Hodgenville, be there for every meal and stay there at night.

Although termed a flagman, he finds his duties on this branch are frequently far more than just that. He is baggage master, express messenger, bulk U. S. mail clerk, company mail clerk, switchman, brakeman, flagman, tower leverman and extra conductor. A trip with him in the baggage car over the line shows that he is a busy man.

#### Busy Time on the Branch Line

He receives the baggage and express in the car at Cecilia, stores the mail bags in one section of the car and assorts the company mail in the boxes. He does the switching when there are freight cars to be taken to Hodgenville, and he is at the end of the train as flagman when it is ready to start on its 18-mile journey. Just a short way out of Cecilia, the branch line crosses the tracks of another railroad. The train stops, and Mr. Funk runs ahead to the tower and throws the levers. When a station stop is made, he discharges and receives baggage, express and mail. If there is switching to be done, he is there to do it.

W. D. Morgan, the conductor on the branch, was off duty at one time, and Mr. Funk collected tickets in his place.

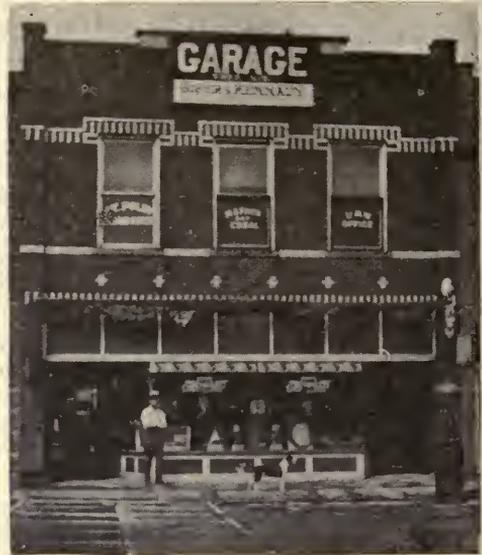

The love for mechanics has not lost itself while Mr. Funk has been in the railway business. It has always been in his heart, and is again showing itself.

#### Part Owner of a Garage

September 6, 1920, he and his brother, C. W. Funk, purchased the Cofer-Kennady Garage in Hodgenville. Mr. Funk says his desire to work with engines during the hours he is not on railway duty prompted him to go in the garage business.

His wife is the general manager of the garage while he is on his run. She keeps the correspondence and the books. His brother is the chief mechanic, having been a first-class landsman mechanic in the aviation service of the Navy. Besides these two, four men are employed.

When Mr. Funk completes his work at the

*Mr. Funk and His Garage*

train after each run, he goes to the garage to see how the business is. He surveys the stock, looks over the books, dictates orders for materials that are needed and looks over the work that is being done by the mechanics. After he makes the last run in the afternoon, he often puts on a mechanic's suit and crawls under a balky automobile. He takes out a car that has been mended, turns on a highway, opens the throttle wide and listens to the motor purr. He says that is music to his ear.

#### Lincoln's Birthplace There

Mr. Funk has hope that his garage business will steadily increase. The Dixie and the Jackson highways intersect at Hodgenville. Many tourists visit the city. There seem to be more and more all the time, he says. This last summer, there have been more tourists through Hodgenville than ever before in the history of the town. Many of them make the trip there especially to see the memorial at the birthplace of Abraham Lincoln.

Mr. Funk and his brother did not change the name of the garage when they purchased it. The former company had done a great deal of advertising and had become well known in that part of the state.

Once each year, Mr. Funk plans to have a large banquet in the garage. This year it was held on July 15, and plates were served for 240 persons.

## Some Good Work, Both North and South

Section house and grounds at Colvin Park, Ill., Wisconsin division. "Not very much improvement this year, but hope to make more next year," writes J. Rodgers, section foreman, to E. J. Boland, roadmaster.

Improved section house grounds at Slaughter, La. Home of Section Foreman I. D. Wildblood, who entered service with this company as section laborer September 19, 1910, became assistant foreman October 1, 1910, and was promoted to foreman March 1, 1912. Mr. Wildblood has additional improvements to his home planned for next year.

## Our Cotton Pickers Visit Our Snow Diggers in Interest of "No Exceptions"

### Supervising Agents and Agents of Southern Lines Make Inspection of Methods in North and West of System

By J. S. REEDY,  
Inspector, Stations and Transfers

**W**E have been getting acquainted with ourselves. The management, desiring to show its appreciation for the excellent record made by the Illinois Central Southern Lines in the efficient handling of freight during the June "No Exception" campaign, arranged for the supervising agent and two agents from each Southern Lines division to make a trip over the Illinois Central Northern and Western lines.

The object of the trip was educational and also to enable the Illinois Central Southern Lines agents to become acquainted with the agents at the principal stations, familiarize themselves with the physical aspect of the property and observe the platform operation and office methods in practice on the Northern and Western lines.

#### Ten Visitors on the Trip

The supervising agent on each division selected two agents under his jurisdiction to make the trip, and the following reported

to C. G. Richmond, superintendent of stations and transfers, in Chicago, on August 24:

W. S. Thomas, supervising agent, Louisville, Ky., Kentucky division; W. E. McCloy, supervising agent, McComb, Miss., Louisiana division; B. A. Talbert, supervising agent, Water Valley, Miss., Mississippi division; T. D. Clark, supervising agent, Fulton, Ky., Tennessee division; W. G. Crawford, agent, Greenville, Ky., Kentucky division; F. B. Wilkinson, agent, Jackson, Tenn., Tennessee division; A. N. Waggoner, agent, Dyersburg, Tenn., Tennessee division; J. P. Phillips, agent, Water Valley, Miss., Mississippi division; M. L. Hays, agent, Winona, Miss., Mississippi division; J. P. Murphy, agent, Yazoo City, Miss., Louisiana division.

Agent Morgan at Jackson, Miss, and Agent Richmond at Central City, Ky., were unable to make the trip on account of illness.

Superintendent Richmond held a conference with the supervising agents and agents,

Among Those Present: Left to right—J. P. Phillips, agent, Water Valley, Miss.; B. A. Talbert, supervising agent, Water Valley, Miss.; W. S. Thomas, supervising agent, Louisville, Ky.; T. D. Clark, supervising agent, Fulton, Ky.; M. L. Hays, agent, Winona, Miss.; J. S. Reedy, inspector, stations and transfers, Chicago; W. G. Crawford, agent, Greenville, Ky.; A. N. Waggoner, agent, Dyersburg, Tenn.; J. P. Murphy, agent, Yazoo City, Miss.; W. E. McCloy, supervising agent, McComb, Miss.

expressing the appreciation of the management for the excellent results attained during the "No Exception" campaign, explaining the object of the trip, and arranging the itinerary and necessary transportation. The writer was instructed to chaperon the party over the Northern and Western lines.

#### Looked at Chicago Stock Yards

August 25 the party visited the Chicago Union Stock Yards, where General Agent Kemp arranged a visit to the Swift & Company packing plant. Traffic Manager Crowe of Swift & Company conducted the party through the plant, explaining the operation of each department and also the loading docks, where meat peddler cars were being loaded, asking for any suggestions which might benefit the service.

That evening the party departed on the Illinois Central's famous Hawkeye Limited, the finest train west out of Chicago, arriving at Sioux City August 26, where they were met by Supervising Agent Hurley and Agent Austin, who conducted them through the Illinois Central freight station and explained the details of operation and expense.

A visit was then arranged to the Chicago & Northwestern freight station, where Agent Struve of that line took pains to explain details of platform and office operation. The Illinois Central agents were very much interested in observing how other lines handle freight and incident expense.

#### Studied Creamery Operation

After luncheon at the Elks' Club, a visit was made to the plant of the Fairmont Creamery, including the loading of their cars, after which the party motored through the parks and residential section of the city, departing for Omaha on Train 612.

Upon their arrival at Omaha August 27, Agent Beatty conducted the party through the Illinois Central freight station, and arranged a visit to the Burlington freight station, which is an elaborate plant, in the operation of which motor trucks are used to handle freight. The party remained over Sunday in Omaha and were impressed with the progressiveness of this western metropolis.

Supervising Agent Hurley and Agent Francois met the party at Fort Dodge,

Iowa, August 29, and entertained them with an auto trip through the city, after which they departed for Waterloo, where Trainmaster Brown and Agent Higgins had automobiles in readiness for a tour of the city, which included a stop at the Illinois Central shops. Master Mechanic Bell conducted them through the various shops, explaining the operation of the snow plows, which were an innovation to the Southerners. The party had opportunity for close inspection of the new 2900 Central type freight locomotives and also the new 3500 switching engines.

#### Inspected Icing Platform

A visit was made to the icing platform, which is the most up-to-date plant on the Illinois Central System, and the party was interested in observing how natural ice is stored to be used for icing during hot weather.

General Superintendent Williams met the party, asking for any suggestions that might benefit the operation on the Western Lines.

The party arrived at Dubuque on August 30. They were met by Superintendent McCabe, Supervising Agent Bowden and Agent Allison, who entertained them, arranging an auto trip to all places of interest in and about the city. The party welcomed the sight of the Mississippi River at Dubuque, as they felt that it was like meeting one of the "home folks" in a strange land.

Upon their arrival in Chicago August 31, Agent Wells and General Foreman Tiernan conducted a tour through the various freight houses at South Water Street, explaining the methods of operation of the Illinois Central's largest freight station. The agents were impressed with the motor truck operation, commenting upon the great efficiency obtained at South Water Street.

#### Saw South Water Street Methods

An inspection was made of the tunnel system for handling freight, which is radically different from any system obtaining at any other Illinois Central freight station. A visit was also made to the "Old Horse" warehouse, which is the final depository of all refused, bad order and over freight from the entire system, and the agents were en-

abled to understand how the disposition of the "Old Horse" freight is being handled.

After luncheon at the Central Station Restaurant, the party called upon Official Photographer John K. Melton, who made motion pictures of them and also made the group picture accompanying this article. This opportunity was the first afforded the party to break into the movies, and they are all anxious to see how the pictures turned out.

#### They Appreciated the Trip

Mr. Richmond again conferred with the party. They expressed appreciation of the trip and mentioned the benefits which all had derived. They promised to return home and work for a better record than the enviable one made during the June campaign.

The party departed from Chicago on the Diamond Special August 31, arriving at East St. Louis September 1, where Trainmaster White, Supervising Agent Williams and Agent Rhedemeyer met them with automobiles. After viewing the Illinois

Central freight station they made a trip to the Armour & Company packing plant, where all the details of the assorting, handling and stowing of the route peddler cars were explained and an inspection was made of the cars then loading. These cars work over the Southern Lines, and the agents were interested in observing the performance.

After luncheon at the National Stock Yards, the party was taken to St. Louis to visit the warehouses of the Columbia Terminals Company and the Fidelity Transfer Company, also the Cupples freight station, so that the agents might gain an intimate knowledge of how freight is handled through this large terminal.

The party disbanded at St. Louis, all leaving for home on Train No. 1, September 2. They were all much pleased with the trip and expressed appreciation for the hospitality extended by officers and agents on the Northern and Western lines. They all agreed that the "Snow Diggers" were regular folks.

## Trust Us—We Carry Even Baby Elephants!

Among various peculiar kinds of live stock the Illinois Central is called upon to handle, we now have baby elephants crated and traveling by express. The September issue of the *Express Gazette Journal* quotes the *Springfield Illinois State Journal* as follows:

"Virginia," the 4-mouth-old infant elephant, weighing only six hundred pounds, was welcomed to the John Robinson circus management last evening, when she arrived from Lancaster, Mo., where she was born and raised.

With all the tenderness of a mother the female elephants of the herd in the big menagerie tent at Eleventh street and Black avenue caressed the youngster of their kind as it was taken from the crate on the show grounds.

For two days, the 4-month-old baby elephant had been shut up in a crate that would barely permit it to lie down. It came by express over the Illinois Central arriving at 8:25 o'clock last evening. The father, Major, the giant tusker with the show, fought for a chance to caress his offspring, as the

females of the herd fought for the possession of the baby jumbo.

Virginia is the fourth baby elephant to be raised in the United States in the last fifty years, according to the trainers of the John Robinson circus, who are familiar with the goings and coming of all animals in the various circuses. The baby jumbos born in captivity seldom reach the 3 months' age that insures long life. For this reason the Robinson management kept the birth and development of the animal a secret until it was determined that the animal would mature.

Last evening, as "Virginia" was released from its crate in the menagerie tent, the elephants of the herd became all but unmanageable in their efforts to reach the baby. Big Major, the tusker, pushed the females aside and attempted to reach his babe. As the smallest animal of the kind brought to the circus menagerie in years was introduced to the elephants one by one, each caressed it until they were forced away by the trainers.

# Development of Valuation Work Extends Over More Than 30 Years

*Attention Was Called to Necessity in 1888; Much Painstaking Effort Is Found Necessary in Inventory*

By M. BLOCK,  
Assistant Engineer

A REVIEW of the developments which ultimately resulted in the passage of the Valuation Act clearly indicates that methods of valuation were discussed and plans formulated shortly after the formation of the Interstate Commerce Commission in 1887.

Section 20 of the Act to Regulate Commerce, as originally enacted, provided that the commission might require the carriers to submit annual reports showing in detail the cost and value of property, franchises and equipment. In the discussion which followed, the commission, in its annual report of 1888, called attention to the fact that "it was manifestly the desire of Congress to assure it a trustworthy estimate of the relation existing between the present worth of railway property and its cost to those who are proprietors of it."

Further study indicated, however, that it was impossible satisfactorily to obtain immediate information showing the cost of railway property, inasmuch as the methods of accounting pursued by most of the carriers in their corporate accounts were in no way uniform or consistent and did not indicate the true value as desired. The commission recognized the necessity for an immediate valuation, but no provision was made by Congress for funds necessary to carry on such work, and nothing further was attempted at that time.

## The Need for Valuation Work

In 1903 the commission again emphasized the fact that additional legislation by Congress was necessary. Complaints were being received in regard to the taxation of railway property and the reasonableness of rates, and in its arguments the commission contended (1) that no tribunal could pass upon the reasonableness of rates without taking into consideration the value of railway property and (2) that, although the taxation of railway property was a matter over which the several states had jurisdiction, in some cases railway taxes amounted to 4 or 5 per cent of the operating expenses.

M. Block

Various methods of valuation were discussed at that period: namely, (1) the acceptance of book costs; (2) the stock and bond plan, or the valuation of properties on the basis of market quotations of their securities, the only plan which had to date received the qualified approval of the courts; and (3) the inventory method, which required first an appraisal of the physical elements of the property and second a study of the history of the property and analysis of the operating accounts, in order to determine the commercial conditions and business prospects.

The discussion was renewed from time to time and new questions brought to light, such as the reasonableness of capitalization and the administering of depreciation accounts. There were, however, no actual developments until the presentation of the Adamson Bill in the House of Representatives in 1913, which pro-

posed an amendment to the original Interstate Commerce Act of 1887. This amendment provided for the physical valuation of the property of common carriers and securing information concerning their stocks and bonds. The bill was amended to some extent in the Senate. March 1, 1913, it was approved and became a law, commonly known as the Valuation Act.

#### What the Valuation Act Is

This law vested in the commission the authority to investigate and report on all property owned or used by every common carrier and to make a complete inventory and list such property and the value thereof.

It further provided, among other things, that such a report should embrace (1) property owned or used by the common carrier for its purpose as a common carrier (this to include the original cost to date, the cost of reproduction new, the cost of reproduction less depreciation and an analysis of the methods by which these costs were obtained); (2) the original cost of all lands, rights-of-way and terminals owned or used for the purpose of a common carrier and their present value, as well as the original and present costs of condemnation proceedings and damages; (3) the original and present costs of property held for purposes other than those of a common carrier; (4) the history and organization of the present or previous corporations, increases or decreases of stocks, bonds or other securities, the net and gross earnings of any corporation and the expenditures and purposes for which they were expended, and (5) any aid, gift or grant of right-of-way made to a carrier by the United States, state, county, or municipal governments or individuals, and the amount of money derived from the sale of any portion of such grants.

No doubt it was also the intention of Congress to make such a valuation perpetual insofar as it was possible. To this end, the act further provided that the commission should keep informed of all extensions and improvements and changes in the value of railway property. At the present time all carriers are required to make a report on all additions, betterments and retirements to property since their respective dates of valuation, as covered by an order of the Interstate Commerce Commission known as Valuation Order No. 3.

#### Governmental Organization

Immediately after the passage of the Valuation Act, the commission appointed three of

its members to act as commissioners of appraisal work, and C. A. Prouty, also a member of the commission, resigned to become director of valuation. At the same time, to assist the director, an advisory board of five members was appointed. This board included a solicitor, a supervisor of accounts and a supervisor of land appraisals.

In order to facilitate the work and to insure closer supervision, the United States was divided into five districts according to geographical location: namely, (1) the Eastern, with headquarters at Washington, D. C.; (2) the Southern, with headquarters at Chattanooga, Tenn.; (3) the Central, with headquarters at Chicago, Ill.; (4) the Western, with headquarters at Kansas City, Mo., and (5) the Pacific, with headquarters at San Francisco, Cal. Each district, however, contained railroads so located that field work could be carried on in both winter and summer.

An engineering board was appointed, consisting of five members, a resident engineer and cost engineer. Each of the five members had direct charge and supervision of the inventory in his respective district.

#### Co-operation From the Railroads

In each district the organization was composed of (1) an engineering section, which supervised the inventory of roadway and track items, bridges, buildings, signals and interlockers, etc., (2) a land section, which determined the ownership and value of right-of-way and other lands of the railroads, and (3) an accounting section. The members of the engineering board had direct supervision of the engineering section, subordinated by a district engineer and assistant district engineer. In turn, the engineering section was divided into bridge, building, road and track, signal and mechanical and equipment sections. The land section was under the supervision of valuation attorneys, and the accounting section under the supervision of district accountants.

In order to conform with the provisions of the Valuation Act and also those of Valuation Circular No. 1, stipulating that the carriers should co-operate in furnishing information, maps, profiles and such data which the commission might require, the presidents of most of the railway companies having earnings of more than \$1,000,000 met on April 24, 1913, to work out plans toward this end. A resolution was adopted requesting that a committee be appointed to formulate plans for such co-operation, with the authority to employ such

experts and assistants and to obtain data and information as, in its judgment, the committee deemed proper. This committee was known as the presidents' conference committee.

The executive branch of the committee consisted of a general chairman and a general secretary, assisted by groups of presidents of several railroads, divided as to location: namely, the Eastern group of seven members, the Western group of seven members, and the Southern group of four members. Each group was represented by counsel.

The subordinate committees consisted of (1) an engineering committee for each group, whose duties were relatively similar (but in an advisory capacity) to those of the engineering section of the commission, (2) a land committee, and (3) a committee on the preparation of financial histories and accounts. Group engineers entrusted with the duties of gathering cost data and equipment officers assisted the engineering committee in its work.

#### Kept Informed of Developments

These committees co-operated with the railroads collectively and individually, and also with the commission, and attempted to develop a standard practice of valuation. Each railway company was requested to establish a valuation committee which would lend assistance toward this end. At all times, the railroads were kept informed as to the results obtained, and from time to time bulletins and circulars were distributed showing developments and quoting interpretations of opinions by the commission.

Among the many problems which the committees sought to investigate were the developing of tentative specifications for the completion and submission of plans, maps, etc., the valuing of railway lands, the planning of methods to be used for disclosing hidden and obscure quantities and, probably most important of all, the development of unit costs to be applied. In this connection, the individual railroads were requested to submit actual costs of typical facilities.

While it is premature to discuss or analyze the results obtained by the presidents' conference committee, yet it is known that the committee has, by careful investigation, brought to light some basic principles of valuation which no doubt will be precedent.

#### The Illinois Central's Part

The commission ruled that the end of the fiscal year, or June 30, would be considered as the "Date of Valuation," beginning with

1914, and issued a bulletin designating the respective year for every carrier. June 30, 1915, was assigned to the Illinois Central System as its "Date of Valuation." Although most of the inventory was made subsequent to that date, yet the condition of facilities and values placed thereon were referred to this date of valuation as a basis.

In June, 1914, a department, formally known as the valuation department, was established by the Illinois Central by the appointment of D. J. Brumley as valuation engineer, and an organization was completed to assist in the inventory. The department comprised several sections to conform with the organization as developed by the commission: namely, bridge and building section, roadway and track section, land and tax section, mechanical section and signal and interlocker section.

As proposed by the presidents' conference committee, a standard form of co-operative working agreement for making the inventory was adopted. Several carriers, however, deviated from this procedure and entered individually into an agreement with the commission. The Illinois Central was among these.

The agreement, as entered into by the Illinois Central, specified the methods to be followed in regard to the furnishing of pilots by the railway company, and the authority to be assumed by them, the signing and delivery of field notes and the filing of objections covering omissions or errors.

#### Pre-Inventory Data

Prior to the date of inventory, an exhaustive study of all available records was made by each section, and the results were compiled and assembled into what was known as pre-inventory notes. Contracts were abstracted, and the specific ownership of all structures, crossings and property determined. In some instances where maps were not complete, resurveys were made. Copies of these notes, together with available plans and maps, were furnished to the commission.

The railway system was divided into valuation sections first according to operating railroads and second according to states, the sections in each state being numbered consecutively. For instance, "Section Y-Miss-1" signified the first valuation section on the Yazoo & Mississippi Valley Railroad in Mississippi.

#### Method of Inventory

The actual inventory was conducted by representatives of the commission, accompanied

by a railway representative, or "pilot," whose duty it was to point out the property of the carrier. Any objection as to method of inventory or conclusions stated in the field notes was made in writing in the field and presented to the commission's representative.

Notes were taken and sketches were made in enough detail to compute quantities. Plans, where applicable, were used, and photographs often assisted in disclosing the conditions as they existed.

After a copy of the notes had been transmitted by the commission to the railway company, the latter made a check as to errors and omissions and submitted its objections in accordance with the terms of the co-operative agreement. If these objections were not submitted before the expiration of ninety days, the railroad accepted the inventory as taken.

#### Summarizations and Computations

The summarizing of notes and computations of quantities immediately followed the field inventory. This was carried on separately by the commission and the railway company, and from time to time comparisons were made and agreements reached as to what quantities should be considered final.

The question of joint ownership of facilities also became a topic of discussion, and in cases where the use of such facilities was not covered by a specific contract the commission requested the respective claims of all carriers participating in such ownership. In nearly every instance, an understanding was reached by a common agreement among the carriers.

A cost data section was established by the railway company to make exhaustive studies of new line construction and to arrive at unit prices applicable as of date of valuation. The commission likewise established a cost division. The results of computations by the commission relative to the Illinois Central System were embraced in a report known as the engineering report, which covered the costs new and costs less depreciation of facilities, according to accounts, but did not include land values. In a manner similar to that of the inventory, this report was checked and objections to omissions, errors and inadequate prices were submitted.

After the land and accounting reports are finished, the Interstate Commerce Commission will serve a tentative valuation on the railroad, against which protest must be made within thirty days. Hearings will be held and

arguments presented, and after consideration of the evidence a final valuation will be made by the commission which may be used, in accordance with the Valuation Act, as *prima facie* evidence of the value of the property.

#### Expenditures and Benefits

Both the government and the carriers have spent considerable time and money to reach the conclusion desired. At the present time, no prediction can be made of the results to be obtained from the valuation of the railroads. A great many carriers have received the engineering reports and some have received their tentative valuations; but few have obtained final figures, so that the issues of over-capitalization or under-capitalization or adjustment of rates are still questions for future development.

There are in evidence, however, benefits derived which probably could not have been accomplished in any other manner. Contracts with other carriers in regard to joint facilities have been more clearly defined; the question of ownership of waylands and other property, which until recently had been a matter of uncertainty, has reached a definite basis of settlement; results have been brought about by means of subsidence tests, which clearly indicate that the true investment in road-bed is not always disclosed by a casual observance of surface conditions; carriers have assurances of more complete records, and, finally, there has been a complete revision of accounting methods which ultimately will fulfill the general desire for perpetual valuation.

---

#### THE RED CROSS AT WORK

In announcing its Fifth Annual Roll Call, to be held November 11-24, the American Red Cross calls attention to the following facts: There are eight times as many disabled ex-service men in hospitals today as there were in 1919; more are reporting for treatment at the rate of a thousand a month; the Red Cross served 1,508,640 of these men and their families last year; it has been asked by the government to co-operate with the American Legion in a canvass of the entire country, so that all disabled men may be located and given aid; it spent last year on the disabled men alone \$10,000,000, yet it took in only \$6,000,000 in membership dues; if the work is to continue, its membership must be increased this year.

# Some Random Thoughts on Railroading

By W. J. CALLAN,  
Conductor, Chicago, Ill.

Here are a few random thoughts on railroading, for which I have chosen as a text a moral which every employe should adopt: "Conduct the company's affairs as you would your own."

Recently I saw a cartoon in a Chicago paper in which the artist attempted to portray the public as asleep at a railway switch which was set for private ownership. It was described as a track for graft, incompetency, soft jobs, etc., while the main track, according to the artist's idea, led to government ownership, competency and numerous other things. I used to know a reporter who could sit at a table in a *weinstube* on Washington street, Chicago, and write a realistic story of a fire. The reader could see engines responding, firemen carrying unconscious victims down scaling ladders, women jumping and children being thrown into fire nets. Very vivid, but no truth! The reporter was using his imaginative power to lengthen his pay. He was a space writer. So with some cartoonists—anything to fill space. In this case not a fire but railroads happened to be first in his mind. The cartoonist uses his art to instruct and through his portrayal of the subject has influenced public opinion.

It would be a timely subject for some good artist, after reading scare-heads of the winter's papers, which usually read "Railroads Rushing Coal to Freezing Chicago," to show that the climatic conditions of this country are not changing and winter follows fall as usual.

## How Easy to Get Business!

How easy for employes to acquire business for the company! Recently while conversing with a coal dealer, being interested to know whether he was successful, I inquired as to future loads for us. He opened his order books and added 500 cars to be sent over Illinois Central rails. He mentioned a town, about fifteen miles east of a junction point, to which he was sending from twelve to thirty cars a month over another road. I told him that we could handle the business better at the same rate. We now have that business. All employes need do is to talk to everyone about the splendid

service we have to sell. I firmly believe we will have to change our motto to read: "If you don't use our railroad, you are cheating yourself."

Speaking of supervision: We have no officials who frantically ride a swivel chair and spur the top of a varnished desk with their heels. John Gallagher, the famous Irish wit, in speaking of supervision, remarked: "Ye don't have to do a damn thing; just be there." How true! Be there, mingle with the employes, get their ideas. For, as Herbert Spencer said: "Even a fool may have a brilliant idea." We have no fools in our personnel, but we have many employes who through timidity do not present their thoughts to higher officials. Subordinates to an official are like the rudder to a ship. A great executive, with the cooperation, good will and enthusiasm of his co-workers, will always make port; without them, he will flounder aimlessly.

## Use Judgment in Saving

Save, but don't practice false economy, like the man who put off painting his house from year to year, giving as an excuse that white lead and paints were too high. The result was that, when he did get ready to paint, his structure had deteriorated to such an extent that he had to rebuild it.

We have an asset which, if the public knew its intrinsic value, would make Illinois Central stock sell at 994 instead of 94. That is the "Illinois Central spirit."

Being imbued with the Illinois Central spirit, I can't help being enthusiastic. I have crawled through barbed wire fences to get the farmers' ideas of the times, knowing that they had been hit hard. All had virtually the same answer: "Well, I am no worse off than I was before the war, and I saved up some during the war." This is optimism from true Americans.

*Remember*

*October, Too!*

# What Came to Pass When Marko Asked, "Why Is He a General?"

## Serbian Bishop Relates True Story of an Incident Proving the Dignity of Service

The following article, reprinted by permission from the *Atlantic Monthly*, begins with the following editorial explanation: "The circumstances under which this brief parable was written deserve to be told. When Bishop Nicholai, of Serbia, was in this country, pleading for funds for Serbian children, a friend presented him with a copy of Elbert Hubbard's 'Message to Garcia,' the point of which, as readers will commonly remember, was the absolute importance of giving genuine service for wages or for contract. A few days later the Bishop wrote his friend: 'After I read your "Message to Garcia" I remembered a happening (which occurred during the tragic retreat of the Serbians), which I have tried to describe in this brief paper. The moral of it is similar to that of the "Message."'"

By NICHOLAI VELIMIROVIC

NIGHT and rain. Three of us were riding in a coach, ten miles away from our destination. One of the horses collapsed and fell down. Stop. No star in the sky, no counselor to comfort. What to do?

A man appeared, as a nightmare—as if he came out of the rocks on which we were leaning.

"My name is Marko," he said. "Don't worry. In a few minutes everything will be all right."

And he disappeared. But soon after, we found that our second horse had disappeared, too.

He had stolen it; all of us thought so, smiling ironically at the unfair game of fate.

Yet, in a few minutes, Marko returned, riding on the horse, and leading another horse by the string.

We asked questions: Who was he? where did he find a horse? and so forth. He murmured something, and kept busy about the horses and the coach.

"Ready!" he said. "Good-night to you."

And the darkness of night swallowed him up.

"Thank God, there are still Christian men in this world," we thought, and started.

I visited Mrs. Haverfield's orphanage at Uzice. She said,—

"The peasants of the surrounding villages are most helpful to me, especially Marko. He is beyond description."

"But who is Marko?" I asked, remembering a dreadful emergency in my life.

"Don't you know Marko? He is a man of perfect service to everybody. You will see him tomorrow."

We were sitting at the open fire and listening to Marko. He is nothing more than an ordinary Serbian peasant.

"Everybody must have learned a lesson in the war. Mine is a strange one, and yet the most valuable for the rest of my days."

Then he became reluctant. But we insisted and he continued:—

"My sin against our General M—— was the cause of the lesson. We were ten privates under the same tent. Our duty was to attend the general and his staff. We did our duty half-heartedly, and the officers often complained. One day the general called all of us and said,—

"'Brothers, you are called to do service to me and to my officers. Do it perfectly and joyfully!'

"We corrected ourselves a little. But war continued endlessly. Day and night we were filled with the dreams of our homes, and we walked ceaselessly in the camp like shadows, and did our service very badly. Water for the officers was not brought always in time; boots were not dried at fire and cleaned, as they ought to be. And again and again officers remonstrated. They must

have complained to the general. One night the general opened our tent, looked in, and asked,—

"Brothers, are you all right?"

"He went off. And I—"

There Marko stopped, and his eyes were shining with tears.

"And I said loudly: 'Why is he a general? He does nothing. We are doing everything. It is easy for him.'

"The night was a very long one, but our sleep fast and our dreams of home very vivid.

"'What is that?' we all asked, as with one voice, looking at a marvel. And the marvel was this: all the boots, both of the officers and our own, were perfectly cleaned and arranged at our feet. We went to the officers' rooms. There, again, all the uniforms nicely hung up and cleaned, water-jars filled, and a big fire made in the hall, and the hall swept and put in order properly.

"Who did it?"

"No one of us knew. Of course, all day we were talking of that.

"The next morning the same thing happened. We were quite startled and confused. 'Is God perhaps sending an angel to do this service for us?' This we asked each other, and retold all the fairy tales we remembered from our childhood:

"But now, behold.

"We decided to watch. And our sentinel saw, soon after midnight, our general creeping into our tent. Oh, shame! the mystery was now revealed and the lesson learned.

"That day the general asked for me. I was trembling with all my body and soul. It was clear for me that he must have heard my remark about him two nights before.

"But, O Lord, he was all smiles.

"Brother Marko, did you ever read the Gospel?"

"My lips were trembling, and I answered nothing.

"Well," he continued, 'take it once more today and read the story how the Captain of men, who is called by us the Lord of Lords and the King of Kings, was the perfect servant of men.'

"I cried like a child found in a theft."

And Marko began to cry once again in

telling his story, and we all were very much moved.

Then he took courage again, and continued:—

"Then the general said: 'My brother, two nights ago you asked a question which I have to answer now. Listen: I am your general because I am supposed to be able to do my own "invisible" and "lordly" duty, but also because I am supposed to be fit to do in a most excellent way the service you, the privates, are called to do.'

"The general stopped and closed his eyes. I never shall forget that moment. I wished I were killed instantly by a bullet, so overwhelming was the presence of the general. I stood there all misery and fear.

"Finally the general lifted up his head and said,—

"'You must try your hardest to do your service to men perfectly and joyfully, now and always, not because of the severe order

### *Tell Him Now*

If with pleasure you are viewing  
Any work a man is doing,  
If you like him or you love  
him, tell him now;  
Don't withhold your approbation  
Till the parson makes oration  
And he lies with snowy lilies  
o'er his brow;  
For no matter how you shout it,  
He won't really care about it;  
He won't know how many  
teardrops you have shed;  
If you think some praise is due him  
Now's the time to slip it to him,  
For he cannot raise his tomb-  
stone when he's dead.

More than fame and more than  
money  
Is the comment kind and sunny  
And the hearty warm approval  
of a friend;  
For it gives to life a savor,  
And makes you stronger, braver,  
And it gives you heart and  
spirit to the end;  
If he earns your praise bestow it;  
If you like him let him know it;  
Let the words of true encour-  
agement be said;  
Do not wait till life is over  
And he's underneath the clover,  
For he cannot read his tomb-  
stone when he's dead.

—Exchange.

and discipline, but because of joy hidden in every perfect service.'

"The general walked two or three steps toward the window and turned to me and said,—

"Now, brother Marko, I tell you honestly, I enjoyed greatly cleaning your boots, for I am greatly repaid by doing so. Don't forget, every perfect service hides a perfect payment in itself, because—because, brother, it hides God in itself.'

"Of course, after that, the service in the general's camp was all right, and the officers never since had to complain."

Thus finished Marko his story. The soft words of his good general were softened still more, and all the time, with Marko's warm tears.

Later on, I was told by many people that Marko, who before the war was not at all considered a very kind man, and much less

a man of stern principles, has become, through his perfect service to everybody within a time of existence of eighteen months, the most beloved human being in his mountains. At the last election the people unanimously asked him to go represent them in the Parliament; but he declined. He said,—

"That post is for the generals, and I am merely a private still."

This is Private Marko's lesson from the war, through which he has become involuntarily a captain of men.

*For I have given you an example, that ye should do as I have done to you. Verily, verily, I say unto you, the servant is not greater than his lord; neither he that is sent greater than he that sent him. If ye know these things, happy are ye if ye do them.—ST. JOHN 13, 15-17.*

## Picks the Best Season for Track Work

By J. M. GARNER,  
Supervisor, Carbondale, Ill.

After a little more than thirty-four years' experience in maintenance of way work on the Illinois Central System, one among the best in the United States, handling almost all kinds of ballasted track, including dirt track under all conditions, my observation has been that work done from April 1 to July 31 holds better than work done in any other month in the year.

Track work done in August and September usually does not stand well, due to heat, which seems to take the life and qualities out of ballast of all kinds, even dirt.

In other words, work done when ground is seasonable for the farmers to farm and cultivate their crops is always best for putting up track which stands better. This may seem out of place, but it is a fact. To plow wet ground injures the land and growing crops. To do track work during wet weather does the track no good. To plow land in August and September is injurious to the farm land, as it is dry and lifeless, and so is railroad ballast.

Track should be disturbed as little as possible during December, January, February

and March, as the more that track is disturbed during these four months the worse it gets. If we cannot put up our track so it will hold up when weather is seasonable, we are going to be in a bad way when we have to spend money trying to keep up track during wet and unseasonable weather.

Some may differ with me in regard to the force that should be worked on track maintenance, but from my experience I will say that a good force should be put on the first of April and get as much track work done just as early and quickly as possible, before vegetation gets so rank. Track work done early usually holds better.

And again when vegetation gets rank in most localities, it will require about every ninth man to clean away vegetation for the eight other men to do their work properly. This ninth man is an entire loss over work done early, before vegetation gets in the way of doing work properly.

Through the four months of December 1 to March 31, inclusive, only small forces should be worked, just enough to maintain a good safe condition. It is not the amount that is done that counts, but the way it is done, and this is to leave nothing undone.

# Editorial

## DEATH OF MRS. MARKHAM

Mrs. Anna Smith Markham, wife of the president of the Illinois Central System, died Sunday, September 18, at the Chicago Beach Hotel, Chicago, after a protracted illness. The funeral service was held Tuesday, September 20, at the Oakwoods cemetery chapel. Mrs. Markham is survived by her husband and one son, Fred S. Markham.

## CONFER ON UNEMPLOYMENT

A vast army of workers is without employment. There is danger that hunger and want will stalk the streets of the nation's great cities this winter if some means is not found to lessen the unemployment, for the small stores which those who are now jobless had laid by during the era of unprecedented prosperity which marked the war period have been depleted. It is to consider this situation that President Harding has called into conference at Washington a group of men and women representing the nation's industries and laborers.

In opening the conference September 26, Mr. Harding said:

You are not asked to solve the long controverted problems of our social system. We have

built the America of today on the fundamentals of economic, industrial and political life which made us what we are, and the temple requires no remaking now. We are incontrovertibly sound. We are constitutionally strong. We are merely depressed after the fever, and we want to know the way to the speediest and most dependable convalescence.

Mr. Harding does not believe the situation should be met by recourse to the already-strained public treasury. He does believe it can be met by an appeal to the consciousness of the people, their business and their industries. There have been suggestions that industries shorten the working week for individuals, thus distributing employment to a greater number of workers; that restrictive agreements in the building trades be eliminated to stimulate needed construction; that public works already authorized be undertaken immediately. These, of course, will be taken up extensively by the conferees. The organization was perfected under committees, each committee to go into the subject assigned to it and make a thorough report.

It is a great compliment to the Illinois Central System that President Markham was chosen to participate in the conference, the only railway executive to be selected.

## SERVICE AS SCHEDULED

A railroad lives by the service it gives. Railway service means a lot of things, among which dependability is by no means least important. In dependability, the Illinois Central System, as in the other phases of its service, is a leader.

When an Illinois Central passenger train starts out for its terminal, the passenger has an assurance not only that it will get there on time but that it will maintain its schedule all along the route. No other railroad in the country of a size to compare with the Illinois Central has anything like the record of passenger train performance that is offered the patrons of our lines.

It was announced a few months ago that 99.2 per cent of the passenger trains operated

## For Earlier Issue

In order to get out a little earlier each month, the *Illinois Central Magazine* requests contributors to try to get their material in the office several days earlier than usual, beginning right now. The magazine would appreciate having material for the November issue sent in by the twentieth of October, if that is at all possible. The previous "deadline" has varied from the twenty-fifth to the last of the month, and the result has not been entirely satisfactory. It has required too much confusion and rush to get the magazine out on schedule. So let's speed up. Remember the twentieth.

over our lines maintained their schedules during May, breaking all previous records on our road and, it is believed, breaking all records. For the three months since May, our passenger trains have averaged a 99.1 per cent schedule maintenance record, and for the eight months of the year, including the adverse conditions of winter, the record has been 98.8 per cent. It is a service of which every member of the Illinois Central family may be proud.

The figures for the year to September 1 follow:

	Total Trains Run	Total Maint'g Schedule	Per Cent Maint'g Schedule
January .....	13,535	13,246	97.8
February .....	12,252	12,075	98.5
March .....	13,623	13,399	98.3
April .....	13,176	12,986	98.5
May .....	13,567	13,461	99.2
June .....	13,178	13,072	99.1
July .....	13,619	13,497	99.1
August .....	13,679	13,563	99.1
Eight Months.....	106,629	105,299	98.8

### HERE'S WHAT'S WRONG

That market conditions, and not the scale of freight rates, form the restriction of which the agricultural industry is complaining is the view which the railroads have taken in meeting the agitation for a general reduction in the scale of railway rates. The railroads hold that a reduction of rates, without an improvement in the markets, would not materially benefit the farmers; that, on the other hand, an improvement in markets would benefit them materially regardless of the scale of railway rates. Under the present condition of their revenues the railroads could not sustain a lopping off of their earnings to decrease rates without incurring the danger of an impairment of railway service.

One newspaper published in the heart of the agricultural section of Iowa has the courage to present this situation to its farm readers. The Webster City *Freeman-Journal* says:

"There would be very little complaint of present freight rates on farm produce if the produce were bringing remunerative prices. If the railway managers will put their heads together, devising some plan by which the products of the farm will be increased to fair values, they can maintain present freight rates without protests from agricultural interests."

This editorial comment seems to sum up the whole agricultural rate situation in a mighty few words. While it must be generally understood that railway managements

have no voice whatever in the making of marketing conditions for farm produce, the statement of the *Freeman-Journal* plainly shows that that newspaper, for one, holds no misconception of what is the matter with the agricultural industry.

### WHAT COURTESY IS NOT

From time to time the editors of the *Illinois Central Magazine* and the contributors to its pages have attempted to define courtesy by telling what courtesy is. As a further contribution to the definition we desire to mention a few things that courtesy is not.

The "political handshake" is not courtesy. All of us, probably, are acquainted with the beaming countenance, the freely-given hand and the big, black, smelly cigars of the candidate for political office. There seems to be a tradition that such are friend-makers and vote-getters, but we doubt it. There is something superficial about it all, something that has a tendency to curdle the milk of human friendship. The courtesy that begets friendship and patronage must be more deep-seated than is evidenced by such superficiality.

The "Sunday smile," put on and taken off like the false face of the masquerade ball, is not courtesy. The story of the minister whose church entered upon a vigorous campaign to make strangers welcome at the services probably is familiar to most readers. While the benediction was being pronounced by a member from his pew, the minister hurried to his post at the door and began greeting the parishioners as they passed out.

"So glad to see you, my dear woman," he said to one of the worshippers. "Are you a stranger in the city?"

"Hardly," she replied. "I am your cook."

Friendship is not based upon the "Sunday smile."

A cringing, fawning manner is not courtesy. The Uriah Heeps of the world do not hold a host of friends; their manner begets suspicion, rather than confidence, and the inspiring of confidence is one of the foundation stones of courtesy. True courtesy looks a man in the eye with the gleam of love for a fellow man. It does not bow and scrape and cringe and fawn. This is an age of democracy, and such manners are not the mark of true democrats.

An obvious attempt to put one's self on

the level of those he meets is not courtesy. We once knew a candidate for a political office which was being hotly contested, who, a few days before the election, donned overalls and joined a group of manual laborers on a prominent corner of the county seat town, where all who ran might see him. He lost the race, and it is probable that his unwise action in making his appearance in overalls was the cause. Courtesy does not consist of doing obvious things. It is the unexpected act of kindness or attention which reveals a truly democratic heart and proves the winning way.

The list might go on, *ad infinitum*. We shall let it end here, for we have not intended to make this a complete enumeration, but rather a summary, an outline,

### A LESSON FROM DES MOINES

The trolley situation at Des Moines should be a lesson in the relation of public service institutions to their patrons, a lesson for both the service concerns and the public.

"Des Moines presents an odd picture to the stranger," writes Richard Spillane, business correspondent of the *Public Ledger* papers, under date of September 12. "The trolley system is out of commission. Such an assortment of queer vehicles masquerading as auto busses is in commission as one will see nowhere else in America. . . .

"The busses operate on a permit from the city, revocable at any time. At first the bus people thought there was a fortune in the business. They rigged up all sorts of chasses and went to it. Now the number of busses is lessening. Some routes have not been found to pay. When the bus man quits he just quits and lets the public go hang. At first everybody with an auto was willing to give a lift to anybody afoot. Now men are getting tired of it. To get from home to town in the morning is not difficult, all vehicles being pointed toward a common center, but to get home in the evening is another matter. People line up at the curbs and wait. Vehicles are sadly overcrowded. Most of them are ill designed for the business. There is inconvenience, discomfort and delay."

The trolley company has struck. The causes of the situation, as they appear in the public prints, are conflicting. We believe the whole situation can be summed up in these words: A lack of understanding.

The success of any public service venture

depends upon the measure of support which it receives from the public. If there does not exist a mutual confidence between the concern and its patrons, if each is constantly engaged in making war upon the other, the one attempting to secure a maximum of service for beggarly pay, the other maximum pay for a minimum service, there are only two paths open: The course of continued hostility, which seems to have been followed at Des Moines, with the results mentioned by Mr. Spillane; or the adoption of a new attitude by both the public and the public service institution.

It probably is making a statement of the obvious to say that Des Moines is learning her lesson. Niggardly treatment of a public service concern, which must have the confidence of its patrons to give adequate service, is poor civic politics. The pursuit of a policy which does not overcome such treatment is poor politics for the public utility.

The Illinois Central System is engaged in an effort to build up further the wholesome mutual understanding which exists between it and the public. It is doing a work which is fundamental in public utility management in the 20th century. Every employe can help by pursuing a course which will inspire confidence and good-will.

### WHY RATES CAN'T WOBBLE

The present price of cotton affords a good example of the need for stabilized railway rates. On June 20 middling cotton was quoted on the New Orleans Cotton Exchange at 10 38-100 cents a pound. Since that time there has been a great improvement in the price of cotton, while railway rates, of course, have remained unchanged. The quotation on middling cotton in New Orleans September 7 was 20 cents a pound, thus almost doubling in price in a period of less than three months. Cotton is moving to market because the demand for it has brought prices up.

If the railroads had lowered their rates on cotton substantially last June, does anyone believe that it would be possible or practicable for them to double their rates now that cotton has doubled in price? There is no way rates could be restored in so short a period of time, nor would it be practicable to restore them, any more than it would have been practicable to reduce them three months ago.

Business needs to know ahead what

the cost of transportation is going to be when marketing time is reached. That would be impossible if railway rates followed the ascending and descending scale of commodity prices. The public welfare demands that railway service be maintained at a certain standard. Railway service cannot fluctuate up and down with commodity prices, for that would prove ruinous to the railroads. Railway managers must know in advance what the rates are going to be so that they can provide transportation service accordingly.

During the war, when prices of commodities soared, many contended that railway rates should be based upon the cost of producing transportation service. That class now declares that rates must be deflated to correspond with deflation in prices. The position is obviously inconsistent. As to whether the present rates form an actual restriction upon business may be learned from a glance at the reports on the marketing of farm products.

Railway rates were advanced as greatly on farm products as on other commodities, and since the most recent rate increase the prices of farm products have declined more than the prices on most other commodities. However, while the total traffic moving on the railroads this year has been unusually small, shipments of farm products have been unusually large. For example: The Bureau of Markets reports that for the 1921 season, up to August 6, the total shipments of fruits and vegetables on all the railroads were 171,390 carloads, as compared with 145,316 carloads in the corresponding period of 1920.

The only fair basis for rate-making is the cost of producing the service of transportation, and the railroads have repeatedly shown that this cost has not been reduced sufficiently to permit rates being reduced without jeopardizing railway earnings and railway service. The costs of operation are still far above their pre-war level.

## TRAVEL IN STYLE

The chariot shown above was constructed by Ben McAboy, who is shown beside it. Mr. McAboy is an expert motor car repairman at Clinton, Ill., where the Springfield division offices are located. The motor car is for official use. Mr. McAboy has been commended as a workman who is on the job all the time, and his production of this car speaks for itself.

### MORE STOCKHOLDERS

More people are owning the Illinois Central every day. According to a recent report on distribution of stock and proportion of shares held, in the four months from April 6 to August 5 the number of stockholders increased from 14,225 to 14,563, an addition of 338, or 2.37 per cent. This is even a faster rate of increase than in the preceding seven years, from August 10, 1914, to April 6, 1921, when the total climbed from 10,872 to 14,225, an increase of 3,353, or 30.84 per cent. More than 98 per cent of the stockholders are now in the United States, as compared with less than 82 per cent in 1914. England now has .7 per cent; Holland, .1 per cent; Canada, .27 per cent; other countries, .91 per cent. The American stockholders now have 95.99 per cent of the stock, or 1,049,122 shares. The number of small stockholders has shown a steady increase. The report shows that 12,645 of our 14,563 stockholders own less than 100 shares each. Only 9,020 were in this class in 1914. Eight persons now own 5,000 shares or more; 83 own from 1,000 to 4,999 shares; 89 own from 501 to 999 shares; 31 own 500 shares even; 1,016 own from 101 to 499 shares; and 691 own 100 shares even.

*Remember  
October, Too!*

# PUBLIC OPINION

What the

World thinks

## STILL ON THE JOB

Some time ago we ventured to inquire what had become of the old-time railway executive who showed indomitable courage and fighting spirit in the face of great difficulties. A veteran of the railway service, C. H. Markham, president of the Illinois Central, answers this as follows:

"There are two answers to your query as to what has become of the railway executive who 'waxed fat on surmounting the insurmountable.' One is that he is bound hand and foot by restrictions against which he has consistently fought and which he has no power to remove. The other is that, in spite of these restrictions, he is actually still 'surmounting the insurmountable.' I do not believe that the railway service has lost the glamour and romance which it held in the early days of railroading. I believe there is now opportunity for great service, for men of initiative and imagination, although the transformations which have come about in the last generation have made it necessary for their talents to be applied in a somewhat different direction."

Mr. Markham goes on to show that so far as his line is concerned economies are being effected and also that farmers are being consulted to learn what improvements in service are needed. But he points out that the railroads "are required to produce service at costs which are determined either by economic factors—similar to those which control farm costs—or by governmental regulation—a factor with which the farmers do not have to deal—and sell it at a price fixed by a governmental body." This we reckon is not a pleasant fix to be in, as any farmer or other business man can easily imagine. Transportation is necessary, and those who provide it should have the power to get its cost as well as the price charged for it down to a reasonable basis, or they should not be blamed for failure to do so. The railway business is hedged about with restrictions

that are a liability rather than an asset to the country, and so 'should be got rid of. Public opinion put them there, and the same force will have to remove them if they are not desired.—Chicago (Ill.) *Drovers Journal*, September 21.

## COURAGE, THE REAL CURE!

We have passed through several depressions since the Civil War, and we have already turned the corner of this one. . . . But when all is done the real cure for all depression is courage and applied intelligence and the return to primary virtues of hard, conscientious toil and economy in living. On every side there is evidence that the vast majority of our whole nation is making again an effort in those directions equaled only by that of 1918, and the day some months ago when we entered this effort we fundamentally turned the corner of this depression. While our recovery may be slower than some may expect, nothing can prevent the prosperity of a country where the people have enlightenment, wish to work, wish to produce and wish to do right by their neighbors.—HERBERT HOOVER, *Secretary of Commerce, addressing the National Shoe and Leather Exposition in Boston, Tuesday, July 12.*

## TAXATION AND RATES

That the imposition of taxes upon an article adds to the consumers' cost is a generality that often escapes application. That the Illinois Central Railroad, for instance, collected in 1920 a tax on freight and passengers of \$5,338,329, as the road advertises today, brings home to the average citizen the real meaning of the government tax upon fares and rates. The total amount of tax money collected for and handed over to the government last year by the railroads of the United States was almost a quarter of a billion dollars. And in addition are the state

and federal taxes which the people pay direct. The Illinois Central is paying about treble the taxes it paid in 1914.

No wonder rates and fares are high. You pay 8 per cent more on your railway fare than you would if the tax was not there. The roads are not complaining; they are doing their share. But it would help clarify the tangled question of rate reduction if the public realized that taxation is here, too, an important fundamental influence in the wrong direction.—Chicago (Ill.) *Evening Post*, September 1.

### IT CAN'T BE DONE

Almost every day we read about some reckless automobile driver trying to butt a mogul engine off the track at a grade crossing. But we have never yet seen where he made a complete success of it. Sometimes he has wrecked the train and killed a lot of passengers, but it was after the locomotive had been derailed by running over his car, maiming and killing the human freight it contained.

How much better it would be if drivers of cars would slow down and look and listen for trains when approaching grade crossings. Many of those who have not are maimed for life, and are grieving for loved ones whose lives were lost by their heedlessness and recklessness.—Raymond (Miss.) *Hinds County Gazette*, September 2.

### A MARVEL OF POWER

One of the most interesting exhibits this year at the Interstate Fair is that of the Illinois Central Railroad, which is showing two remarkable engines. The contrast between the two is amazing. It shows what wonderful strides have been made in transportation power and facilities since 1834, and how progressive the Illinois Central is. The old engine, "the Mississippi," built in 1834, weighs only 14,000 pounds and cost about \$2,000. It is a pigmy alongside the great new engine, which is known as the Illinois Central type 2-10-2. This giant among engines weighs 382,000 pounds and has a working weight of 590,600 pounds and a tractive power of 73,000 pounds. It covers 96 feet of track and cost \$88,819.

In recognition of Sioux City, the Illinois Central executives sent the two engines to be shown at the fair. Both are unique and attract much attention. The old engine is historical, and the new one will make history.

The new one develops 43 per cent more tractive power than any other engine. It indicates what efforts the Illinois Central is making to be ahead of the demand for service, to be ready to carry more freight and passengers in faster time. The engine shown here is the first of one hundred to be delivered.

Fair officials and Sioux City appreciate the recognition of the fair in sending the exhibit here. They enjoy having T. H. Sullivan, division superintendent, in charge for a week and hope that the day is not far distant when the Illinois Central may build fine new terminals in Sioux City, with yards and shops commensurate with its other service. Sioux City returns the Illinois Central's compliments two-fold.—Sioux City (Iowa) *Tribune*, September 21.

### RAILWAY TAXES

President Markham of the Illinois Central System, in a signed statement, says that the Class "I" railroads, those having an operating income of a million dollars or more a year, paid in 1911 total taxes of ninety-eight and one-half million dollars. In 1920 the same roads paid taxes totaling two hundred and seventy-nine million dollars, an increase of one hundred and eighty-three per cent.

Mr. Markham's object is to show what a large part taxes and their increase play in the cost of transportation.

Without questioning the accuracy of his figures, it would be interesting to know whether taxes of various industries and businesses and of the individual have increased during this period in the same proportion. If they have not, why? For what reason have the railroads been singled out for increase in taxation at a greater rate than has been imposed on other business?

Mr. Markham's statement starts other queries. For that reason it is one of the most important of its kind in recent months.

It should be said in explanation that he has not included in these sums the United States revenue collections on freight shipments and passenger tickets.—Springfield (Ill.) *State Journal*, September 3.

### TWO LOCOMOTIVES

One of the interesting exhibits at the Interstate Fair is that made by the Illinois Central Railroad. The exhibit consists of two locomotives, which illustrate effectively

the progress of locomotive construction during the last eighty-seven years. One of these locomotives was built in 1834, twenty years after George Stephenson had built his first successful steam locomotive in England, and was placed in service in 1836. The other locomotive, the latest word in engine building, is a product of 1921. Almost the entire history of railway building lies between these two locomotives.

It was the steam locomotive that made the railroad practical. Railway development in England quickly followed the building of the Stephenson locomotive, but it was not until sixteen years thereafter, or in 1830, that the construction of steam railroads was begun in the United States. Therefore, when the "Mississippi," the old engine now being exhibited by the Illinois Central, was placed in service in 1836 on a short line of railroad in the state of Mississippi, it was almost the beginning of railroading in America. It has seen many years of service, having been in actual use as late as 1890, and it is still capable of traveling under its own steam, a fact that is creditable to its early builders.

Great interest attaches to the "Mississippi" as an example of pioneer locomotive construction. It is well to preserve it as a reminder of the small beginnings of the American railway system and of what American genius has accomplished toward making it the finest system of the kind in the world. The steam locomotive had its conception in England, but it is in the United States that the locomotive and everything connected with the railroad have been brought to the highest development. The giant modern locomotive, in the shadow of which the little "Mississippi" is dwarfed, is typical of American railway progress and of what has been achieved by American railway engineering. If George Stephenson could return to earth and view this monster, with its tremendous power and its complex machinery, would he not be impressed, if not astounded? One can imagine what he might say in his amazement.

The Illinois Central could make no better exhibit than to place these two locomotives, the old and the new, side by side, and allow them to tell their own story. It is a story that tells itself at a glance. Twenty-eight years ago, at the World's Columbian Exposition in Chicago, the New York Central Railroad exhibited its famous ancient loco-

motive alongside the latest product of the engine builders' art. Today the locomotive of 1893 is almost as far behind the locomotive of 1921 as the locomotive of 1830 was behind the locomotive of 1893. What will the locomotive be twenty-eight years hence?—*Sioux City (Iowa) Journal*, September 22.

### PLENTY OF TALK

"You don't mind if I give you a little advice on how to conduct your agricultural enterprise?"

"No, sir," answered Farmer Corntossel.

"Turn about is fair play. Us farmers has been givin' advice for years on how to run the railroads and the government and all kinds of enterprises."—*Washington (D. C.) Star*.

### A LAY SERMON

For a long time the public was deluded into thinking that anything that could be taken away from the railroads, street railroads, lighting companies, and other public-service corporations was pure gain for the public. They succeeded, it is true, in taking enormous value away from the utilities, but the value was not transferred to the public; it was only destroyed. The value that attached to these utilities existed under conditions that induced owners to put new capital into them, extend the use, and maintain the greatest service. When the public attempted to take value away from the owners by loading the properties with burdens and by insisting upon prices that were less than worth and cost, the public did not add to their own profit, but began to lose conveniences they wished to have, and, in some cases, even ran the risk of losing service, or did lose it altogether, to their own great hardship and cost.

It is curious that property of this kind has been conspicuously selected for attack. It represents a large portion of the country's permanent investment, and the investment has been made to give the public generally the advantages of the great useful agencies that have been the outcome of the last century's scientific discoveries. It is not property carefully sequestered behind a barbed fence, holding to itself technical knowledge devoted to creating benefits and luxury for a favored class. It is for the very purpose of adding to the national life the most widespread use of advantageous service. Of all forms of private property, no other approaches so nearly

to the ideal of socialized property. It is devoted to the service of the whole public, regulated by bodies chosen by the public and plainly put at their mercy. It is not like land, which the individual owner may build upon or not, may use or not, as he pleases; it is not like buildings, which are too similar in kind to the property of the majority to meddle with; it is not like manufactories, which may be operated wholly, or in part, or not at all, which may be torn down or built up or changed, which may produce goods to be sold at the price that seems best for the good of the property; it is not like mines or timber tracts, whose owner disposes of them or keeps them, like any personal property; it is not like the thousand and one objects of portable property, still the most sacred kind and the

best protected because most people have some of it.

We hear very much of the "common good," and of the Utopian condition when all property will be for the service of all; when the old rights of ownership will be less inviolable; when control of all property will rest with the common people; and yet the first movement that leads away from purely individualistic control and use is met, not with encouragement, but with suspicion and attack. It seems a pity that so much experience and loss is necessary before the public learns the difficulties in the way of taking value to themselves. The heartening fact is that they do learn it.—RUSSELL ROBB of Boston, in the *Atlantic Monthly* for September.

## Names Benefits of the Revising Bureau

By C. J. WALKER,  
Supervising Agent, Indiana Division

The revising bureau is, in my opinion, one of the greatest assets to the railroad. Although during federal control these bureaus were abolished, it is with much interest we saw the re-establishment of this department on our own division June 1, controlled by the auditor of freight overcharge claims, with W. H. Turner of the Chicago office in charge.

This bureau handles and revises all the inbound billing for sixty-four agency stations and fifty-six non-agency stations on the Springfield and Indiana divisions, including the large stations of Decatur, Ill., Evansville, Indianapolis and Bloomington, Ind.

On account of the close proximity of the bureau to the stations under its jurisdiction, all waybills received by the bureau are revised the day after their receipt by the local agent, thus eliminating the excessive delay under the old practice of sending waybills to Chicago for revision.

By this prompt method of handling, it furnishes the agent with correct figures, and any errors may be corrected while they are fresh in the minds of all concerned. Thus the bureau serves to localize the business in the territory affected.

In order to be able properly to revise the billing before mentioned, this bureau has a complete tariff file, containing all tariffs

which in any way affect the stations handled by the bureau, together with all supplements to tariffs affected. This affords our agents on the division an opportunity to obtain correct information on any of their outbound business which they do not have tariffs to cover. All agents should take advantage of this opportunity, as the correct application of rates saves the railroads of the country great amounts in revenue.

### TO SHOW DEVELOPMENT

Birmingham, Ala., will celebrate its fiftieth anniversary October 24 to 29 with an exposition and historical pageant depicting the development of the South's leading industrial city from the building of its first house in 1871. Today the city has almost reached a population of 200,000. President Harding has arranged to visit Birmingham on this occasion, spending the entire day of October 26 there. The pageant will be a record of Birmingham's remarkable industrial development. Its chief episode will show the mining of coal, iron ore and limestone within sight of the steel plants of the city, fabrication of plates for shipbuilding, their transportation down the river to a subsidiary of Birmingham's steel industry that builds great ocean liners, which in turn carry the city's iron and steel all over the world. No other city, it is said here, equals this combination of favorable circumstance.

It has been suggested that we have a column of humor, something on the line of the newspaper "columns" that have made certain initials famous. Here is our start. Most of it is borrowed material—just for a starter. The only initials the column will make famous—or otherwise—are these: "I. C." Come in, folks; the column is yawning for your contributions. There's humor on the Illinois Central. Let's make 'em all believe that the song-writer was thinking of the Illinois Central when he inquired of the world at large: "Ain't We Got Fun?"

**O**PTIMISM is the kernel of the nut, not the shell.

It's the fine traits of your friend, not his faults.

It is the flowers on the hillside, not the dead leaves under the snow.

It is the opportunity in your job, not the grind.

You choose the kind of world you will live in—and you paint its hue golden or drab, as you will.

Optimism, in a word, is the eye of the soul.

It is the color of your vision, that makes you see the fine beyond the coarse, the best beyond the worst.

A guy we hate	A bird we like
Is Alex Bunn;	Is Willie Fry;
He always says:	He always says:
"It can't be done."	"I'll surely try."

"Let me have sleeping accommodations on the train to Ottawa," I said to the man at the window, who didn't seem at all con-

cerned whether I took the trip or stayed at home.

"For a single passenger?" he finally said.

"No," I replied, "I'm married, but I'm not taking anybody with me. A single shelf will answer."

"Upper or lower?" he asked.

"What's the difference?" I inquired.

"A difference of 50 cents," came the answer. "Our prices to Ottawa are \$1.50 and \$2."

"You understand, of course," explained the agent, "the lower is higher than the upper. The higher price is for the lower berth. If you want it lower you'll have to go higher. We sell the upper lower than the lower. It didn't used to be so, but we found everybody wanted the lower. In other words, the higher the fewer."

"Why do they all prefer the lower?" I broke in.

"On account of its convenience," he replied. "Most persons don't like the upper, although it's lower, on account of its being higher, and because when you occupy an upper you have to get up to go to bed, and then get down when you get up. I would advise you to take the lower, although it's higher than the upper, for the reason I have stated, that the upper is lower than the lower because it is higher. You can have the lower if you pay higher, but if you are willing to go higher it will be lower."—

A touching little ballad entitled, "I Wonder If He'll Miss Me," was received one day by a music publisher from a young woman. He read it through and then replied:

"Dear Madam: If he does he should never be trusted with firearms again."

Father—"No, my son, I don't know the Latin for 'people'."

Johnny—"Populi."

Mother—"Johnny! How dare you accuse your father of lying?"

"Mummie, why does Uncle John eat off his knife?" queried the young hopeful.

"Hush, dear!" replied mother in an agonized whisper. "Uncle John is rich enough to eat off the coal shovel if he prefers it."

A couple of old rounders in the old days were sitting in a barroom imbibing cocktails.

Presently one of them remarked, "Do you know, Bill, I think I'll buy this hotel?"

"Wait till we've had a few more drinks," said Bill, "and I'll sell it to you."

She was a fair-haired, fluffy little thing, who had taken a position as saleswoman in a department store. A few days later she met a boy friend and both stopped to have a little chat.

"How do you like your job?" inquired the boy friend.

"Oh, I like it very much," said the fluffy one, "only, they shift me around too much. At twelve o'clock I'm in hats, at three I'm in dresses, at four I'm in lingerie, at six I'm in stockings, and—"

"I'll look you up tomorrow at eight," said he.

"'Tis verra r-reemairkable," remarked Scotty, "how it is ye Amer-ricans make money."

"No more than you Scotchmen," returned the Yank politely.

"I once heard of a couple of Scotchmen who got cast away on a desert island. When they died, years later, they had both made millions trading their clothes back and forth to each other."

He—"We are now coming to a tunnel. Are you not scared?"

She—"Not a bit, if you take that cigar out of your mouth."

Fond Mother to Young Son: "My boy, you must not shoot craps, for life is just as precious to the little craps as it is to us."

Waiter—"Tea or coffee?"

Waitee—"Don't tell me; let me guess."

"Men are really too mean for anything."

"What's the trouble now?"

"Why, I asked John for an automobile today and he said that I must be contented with the splendid carriage nature has given me."

The Father—"How is it, sir, that I find you kissing my daughter? How is it, sir?"

The Suitor—"Great! Great!"

The discharged soldier hastened gladly home to see his wife. He found her polishing

the kitchen stove. He slipped quietly up and put his arm around her.

"Two quarts of milk and a pint of cream tomorrow," she said, without looking up.

The young man was telling his sweetheart how he had been attracted to her.

"You were a lovely flower and I was a bee," he explained to her. "I was a mouse and you were a piece of cheese."

And then he wondered why she rose and left the room.

The station master, hearing a crash on the platform, ran out of his room just in time to see the express disappearing around the curve and a disheveled young man sprawled amid several overturned milk cans and the contents of his traveling bag.

"Was he trying to catch the train?" asked the station master of a small boy who stood by admiring the scene.

"He did catch it," said the boy, happily, "but it got away again."

A certain rather well known American writer, while riding in a Pullman car near Winnipeg, fell into discussion with an Englishman from London and a Canadian from Montreal, and was worsted because he failed to have the statistics of the American Navy at his tongue's end. This caused the Londoner to say:

"You Americans are very odd. You seem to know so little of your own history."

A little later a discussion arose as to who was the best known man in England. Dinner hour was approaching and the American said: "I'll wager dinners for the party that the best known man in England is George Wettin, and that I can prove it to your satisfaction."

His companions stared. "George Wettin," said one of them, "I've never heard of him."

"You Englishmen are very odd," drawled the American; "you know so little of your country's history. George Wettin is the present King of England."

*Remember  
October, Too!*

### That "Want-To" Attitude

"All my life I have wanted to do this or that," we hear a woman say. And straightway we think of something that we have wanted to do and have not done. Why? Because most of us have a fatal habit of putting off the thing we want to do. Perhaps we have wanted to study French, or read Thackeray, or learn a favorite poem. We feel a certain satisfaction in saying that we have "wanted" to do these things. We fancy it impresses our listener with the idea that we are progressive and not hopelessly in a rut. But talking about the thing is as far as most of us get. Have we really *wanted* to do the thing we talk about? The other day a woman of 56 years received her degree from a great western university. She had the courage to attack the thing she wanted to do, and had been storing up credits by taking subjects in her spare time. It was a slow process, to be sure, but she has accomplished her heart's desire, and her life will be fuller and happier therefor. Don't plead that you are too busy. It is the busy people who get things done.

Perhaps you have wanted to learn to sew or make a hat. In most of the large cities there are afternoon and evening classes in dressmaking and millinery, and by the co-operation of the family the busy housewife can slip away after dinner to attend the coveted class. Tell the family what you want to do. Perhaps they will be mildly surprised; they may even exchange a "What's the big idea?" look. But let them see that you are in earnest, and they will relieve you of the washing of the dinner dishes or of some task which is included in your evening routine. Perhaps it will mean shunning the movies for a season, but what of that? The movies are here to stay, the

wise folk tell us, but you may not have another opportunity to do the thing you claim you have all your life wanted to do.

There isn't any reason why you cannot study French or Spanish if you feel so inclined. While you are making the beds or preparing the vegetables for dinner, you can *parlez vous* or *habla espanol* to your heart's content. I will let you in on a secret: I have learned half a dozen favorite poems while ironing. And I have had to blink my eyes to make sure that I wasn't "wandering on some foreign strands"—to the utter destruction of Dad's best silk shirt.

Select the book you want to read and set aside at least one hour in the day for your reading. You will find a book more restful than the details of the latest murder mystery.

Most women feel impatient with the routine of household tasks, and, looking into the future, wonder whether they will go through life suppressing a wild desire to throw off the yoke and get away from the cares of the home. Inject some new interest into your life. Whatever it is you have all your life wanted to do, make a start. Live each day as though it were an adventure. In this way you will get the most out of each twenty-four hours and will come to know the truth of that beautiful line, "Life is just living this day, today—not far ahead."

### Household Hints for Home Makers

When making starch, add a teaspoonful of melted paraffin to the hot starch. This improves the finish of all fabrics.

Green vegetables retain their color better if left uncovered while cooking.

Keep dry rolls and leftovers of bread in

an earthen crock—to be ground or rolled and used for crumbing.

Three things to remember about table serving:

1. Food should always be set down before the guests from the right.

2. When a dish is presented from which a guest is to help himself, it should be passed to his left. He can then use his right hand without awkwardness.

3. When a course is finished, remove the plates from the left.

### Tested Recipes

**BROWNIES.** One cup sugar,  $\frac{1}{4}$  cup melted butter, 1 egg (unbeaten), 2 squares chocolate (melted),  $\frac{3}{4}$  teaspoon vanilla,  $\frac{1}{2}$  cup flour,  $\frac{1}{2}$  cup chopped walnut meats. Mix in order given. Line a square cake pan with paraffin paper, put the mixture into it, and bake in a slow oven. When done, take from pan and remove paper at once. As cake cools, cut in pieces and roll in powdered sugar.

**PUMPKIN PIE.** Mix together  $1\frac{3}{4}$  cups canned pumpkin, 2 large or 3 small eggs. 1 cup milk, 1 teaspoon cinnamon,  $\frac{1}{2}$  teaspoon salt,  $\frac{1}{2}$  teaspoon ginger,  $\frac{1}{4}$  teaspoon allspice,  $\frac{1}{4}$  teaspoon cloves,  $\frac{3}{4}$  cup brown sugar. Line a pie tin with paste, add the mixture, and bake three-quarters of an hour in hot oven. Serve with whipped cream on top, sprinkled over with finely chopped nuts.

**COFFEE SAUCE FOR PUDDINGS.** Mix 2 eggs with  $\frac{1}{2}$  cup sugar, a dash of salt, and  $\frac{3}{4}$  of a cup of strong coffee, and cook in a double boiler until slightly thick. When chilled, add half a cup of thick cream, beaten stiff.

**PRALINES.** Two cups confectioners' sugar, 1 cup maple syrup,  $\frac{1}{2}$  cup cream, 2 cups nut meats. Boil the sugar, maple syrup and cream together till a little dropped in cold water forms a soft ball. Cool and beat till creamy. Add the nuts and drop the mixture by spoonfuls on greased paper or plates.

**BUTTER SCOTCH.** One cup karo syrup, 1 cup brown sugar, 1 tablespoon butter. Boil until it makes a hard ball when dropped in water. Pour into square tins, buttered and thickly spread with nut meats.

When cold cut in squares and wrap in oiled paper.

### What Can a Poor Man Do?

She: "Dear, that shirt just matches your lovely blue eyes."

He: "Yes, and there ain't a darn button on it."

### Waves of the Dune Country

I wandered o'er  
The sand-white shore,  
Where wave-crests dip and fall;  
In whitish foam  
They journey home,  
Like troops at bugle call.

On Earth's dark breast,  
Where heavens rest,  
The stately moon sailed by;  
Its silver sheen,  
A pallid scene,  
Surprised my wond'ring eye.

O cresty waves  
By moonlight rays  
Lit up, in wondrous glory;  
In evening's hush  
Your swishing rush  
Becomes a silent story.

My ear I lend  
Your rolling trend,  
Whose echo I'll remember;  
An interlude  
In rhythm smooth  
That wooed me in September.

—F. S. CERNY,  
*Law Department, Chicago.*

### Every Woman's Duty

If you are slender and would be plump, drink malted milk, chocolate and cocoa instead of coffee and tea.

Back-combing or "roughing" to make the popular puffs plays havoc with the hair. Save your torn hair nets and roll them into little wads to use for stuffing the puffs. Or if you save your combings, these can be made into small pads and will answer the purpose admirably.

### From the Shops

Neat and handy is a recipe box. A box  $5\frac{1}{2}$  by  $3\frac{1}{4}$  by  $4\frac{1}{4}$ , with a fascinating index

for beverages, breads, cake, candies, canning and so on, and a package of one hundred ruled cards on which to write the precious formulæ, can be purchased for 65 cents.

A narcissus bowl makes the home cheery on the bleakest winter day. A dozen bulbs can be bought for 50 cents.

Sunfast, fifty inches wide, comes in charming color combinations, and is most practical for draperies.

Satin Canton crepe, plain Canton crepe, crepe de chine, chiffon velvet and crepe satin are among the approved materials for the new fall gowns.

## COMMUNICATIONS

### How the Typist Can Save

TO THE EDITOR: "Back to Normalcy." This expression is a present-day synonym for getting to work and avoiding waste. There are various ways of avoiding waste, and this article deals with one—a small one, it is true, but "many littles make a mickle."

The other day the typewriter repair man came in response to a call. Do you know the accusation which he made against our stenographers? It was that 25 per cent of the machine trouble is due to the dirty and gummed-up condition of the typewriters. My machine wasn't any too clean, but he said that it was in good condition compared with some typewriters on which he had to work. To use his expression, one in particular was so thickly covered with eraser debris that one "could sow potatoes in it."

Visits by the repair man mean money out of the company's pocket. If 25 per cent of the machine trouble is due to failure to keep the machines clean, then 25 per cent of the expense can be avoided. Unnecessary expenditures are wasteful. It cannot be said that any stenographer is thoroughly efficient who permits his or her typewriter to get out of repair through neglect. Take a look at your typewriter.

Typewriters, like other fine mechanisms, should be oiled occasionally at frictional points. A small drop of oil will be sufficient. Dirt and dust accumulate rapidly and will, in time, clog the parts. Therefore, the machine should be freed from dust daily by use of a

soft brush and rubbing with a slightly oiled cloth.

You should see my machine now. It shines like a cat's eye in the dark.—TILLIE THE TYPIST.

### A Suggestion

TO THE EDITOR: In the interest of establishing one name for Central Station, Chicago, and the elimination of the others, have written up a true-to-life sketch of calls heard on various trains pulling in at that station.

"Chicago—all out—far's we go," called out Smiling Bill, as the palatial Panama drew in.

Pulsating alongside the Panama Limited was the suburban train where Handsome Harry was calling off the approaching stop as Central Station.

Lanky Larry, at the same time coming from the north, was informing the patrons that Roosevelt Road was the next stop.

Another conductor yelled Twelfth Street as the name of the same station, while, for variety's sake, Pat put it Park Row.

Let's get together and call it Roosevelt Road Station.—FRED ABRAHAMSON, *Office of General Superintendent of Transportation.*

### Some Words About Old Bill

TO THE EDITOR, DERE SIR: Old Bill who runs our drill press and punches the holes in the biler plates and truck patches etsetry is a wiked & sinful old feller and has no hoapes for a futer beyond the grave. He heard the feller argify in favor of a hoss-pittle in our town, and he noticed that the speker was pade grate attenshun to. Then Old Bill the sinful sed:

"I notice that lots of fellers harts are just a bustin with symperthy for there feller man, and that these fellers are plum anxius to help there feller men and willing to split there last \$ with them. And wood do it! Only gasserline is so darned high and movie tickets kost so mutch and with Kamels sellin at 20 cents a pack they just kant do it and live on there inkum."

Also he sed: That nobody needs a hoss-pittle anyway as long as they air helthy and aint ingered anywhere. And that of kourse anybody kan see that they aint nessery if they aint never needed one or bin in one. (Old Bill hez bin in 5 kountin army hoss-pittles.) I herd him tell a aprentise one day that if he wood reed 10 minits every day at noon insted of shootin kraps or playin

7 up that it wood be a big help to him if he didn't reed nuthin but the want adze in the noospaper or Shake a speer.

And he sed: That there is a heap of Sunday religion in this vale of teers and a hole lot of weak day kussedness and he beleeves that the latter poles the biggest vote.

Also: That if musick was took out of this world there wood be mighty little war, dancin or religion going on.

And: That its plum skanderlous for a man with a chaw of terbacker in his mouth to lick his son fer smokin of cigarets.

Then when a feller came a solisitn money for the Chinese Old Bill sed that the Chinks kant help bein yaller in color becus they was borned that way. And he sed that he reckons they think just as much of their children as any other folks do, and that they kant be blamed fer not knowin what they was never taught and that they orter be helped. But I kant see how I kan afford to help them with

### Someone's Mistake

Ten years ago or more I had two immigrants out of Freeport on No. 401. They were ticketed from New York City to Nashua, Iowa, via Chicago and the Illinois Central. I left them at their destination about 2:30 a. m. and thought no more about them until five days later, when I was on No. 401 again and the same two fellows boarded the train at Dubuque with local tickets to Nashua. My curiosity was aroused, but as they could not understand or talk English I could get no information from them, and we left them at Nashua again. I forgot all about them until five nights later, when I was on No. 402 and who should board the train at Nashua but the two immigrants with tickets from Nashua, Iowa, to Nashua, N. C.?

The night watch at Nashua, Iowa, gave me the story:

When they first arrived there they were out of money. To get them off their hands, the authorities bought them tickets to Dubuque. When the Dubuque authorities found out the deal they sent them back to Nashua. Then the Catholic priest took the case up and located their brother at Nashua, N. C., and he telegraphed them a money order. —T. M. JOYCE, *Conductor, Waterloo, Iowa.*

near beer at 15 cents a bottle and spring chickens 50 cents a pound.

And his idee is plum skanderlous that if everybody was to tend to there own bizness that they wood have a skanderlous hard job every day of the weak, month & yeer.

He sez that the factk that wimmen folks marry men folks dont give the men folks the rite to boss the wimmen and make there lifes mizerabul. He beleeves that his wife hez just as mutch rite to smoke & cuss as he hez and that there is a wide yaller stripe in the man that dont treet his wife as an ekual.

He told a aprentise that when he got to lookin back over 45 or 50 yeers of travelin in the rode to the grave that the aprentise wood be plum skared stiff to think how mutch he knowed when he was 18 or 20 yeers old. He sed it was a paneful thing to reckerlect, and that he hez tride reel hard to fertig it.

Old Bill sez that no one aint obligerd to be a sinner if he dont want to. And se sez that outside of kids he aint never herd of no one bein forsed to go to church.

He sed that the averidge man who is a kussin the plutykrats & korperations and who is ginnerally quotin skripter about the rich mans chases of gittin to heven wood be perfectly willin to resk his own immortle sole if he hed as mutch money as the man he wuz a kussin.

These foregoin ideas of Old Bill air jist samples of his wikedness and sinful disposishun. He orter be expectorated.

Yours very severely,

D. O. GONNIT.

### A Place to Live

TO THE EDITOR: The great question of the day for people is how to combat the high cost of living and the excessive high rental of houses and apartments, also the high cost of the necessaries of life. It can be done if people will take the right road to economy.

Here is Peotone, forty miles from the Twelfth Street Station, Chicago, on the Illinois Central. Many houses for sale. Some as large as eight and nine rooms, and smaller ones with large lots, and moderate in price and in the reach of persons who wish to buy a home. There are plenty of building lots for sale 75 by 160 feet. Peotone has waterworks, electric light, sewers and paved streets, also beautiful shade trees and many fine residences. No factory is here to poison the air with smoke.

We have a fine school-house and high school,

five churches of different denominations, two banks, fraternal orders. We have the Knights of Pythias, the Masons and the Odd Fellows.

The cost of building material is much cheaper here now. Here you can build your house, have a garden and produce your own vegetables for your table. You can have chickens and have fresh eggs every day. A family can live and save 40 per cent on the cost of living, including house rent or payments on a home.

This is not a dead town. We have our social entertainments, a movie show of a very high order, and other attractions come to town.

The Illinois Central runs trains early in the morning and in the evening which will accommodate people who wish to go north and return in the evening.

If the Illinois Central should run suburban trains from Chicago to Kankakee, it would bring many people to live south of Matteson, and so it would be a boom to this town. The price of property will rise with the demand. Here you can have your own home and garden. If anyone wants to see this place, I shall be pleased to show them the town any day, if they will mail me a postcard. We have an efficient station agent, who is always ready to serve the public with smiles for the best interest of the Illinois Central.

Children here have plenty of room to play and live in pure air. I have lived here nearly two years and never would want to live in a large city again or leave this beautiful town, which is more of a summer resort than a small country town.—S. DAVIES, *Pensioned Foreman, Peotone, Ill.*

## What an Old Exhortation Means Now

*Reprinted, by permission, from the Chicago (Ill.) Herald and Examiner.*

By **GEORGE WHEELER HINMAN**

Judge Gary exhorts all Americans who labor for a living to work together for better times. If they do this, the "biggest boom this country ever has witnessed" is ahead of us. This is the burden of his latest interview as given in yesterday's newspapers.

The exhortation sounds old and stale to many, no doubt. Yet, old and stale as it seems, it is just about the freshest and fittest message that applies to business just now.

To a certain extent the controversies that penetrate all American activities are quite natural. Hard times are hard times. Everybody attributes his difficulties to somebody else. Millions are filled with resentment. Multitudes, with little else to do, devote themselves to trying to "get even."

### Delaying Prosperity

Let anybody who doubts these statements read the speeches made in industrial and trade and labor conferences, peruse the class and trade newspapers, take note of the speeches in Congress and legislatures.

It is this sort of thing that retards business, checks growth, delays prosperity. England is an instance today of the harm such pulling apart can do. Germany, with all her fathomless troubles, is an example of the good that a little pulling together can accomplish.

These two countries show how practical is Judge Gary's message. Here in America the same lesson may be learned. For instance:

Many men in Congress and out exert themselves daily to excoriate the "war millionaires"—23,000 of them created in a year by profiteering; that is the charge. Other men, in Congress and out, cannot forget the riveters who riveted for \$175 and \$225 a week or the camp carpenters who got \$20 or \$25 a day at the beginning of the war.

### Can't Forget War Incomes

That four-fifths of the \$50,000 or \$60,000 war incomes have faded away, that the \$20-a-day wages have gone the way of \$2.50 wheat, that the business situation of 1918 and 1919 is past, gone and not to be recalled, do not seem to impress these men. They find the old outrages and resentments useful in their politics; they figure that they profit politically by controversies among American producers. They incite one group against another, they appropriate money for special groups and classes, send others away empty handed and often unheard, and generally do all in their power to pull apart and embroil the people at a time when co-operation is more important than at any time since the Civil War.

That is not pulling together for national welfare. It is pulling apart for political and personal advantage.

But the inspirational orators of Congress are

not the only ones who daily retard prosperity by their counsels of division and resentment. While many leaders of labor have shown real appreciation of the present emergency, others have been as inept and untimely as any congressman in Washington. Some miners demand that the workers get, all the profits of industry and that the employers get nothing for their money. This demand is repeated at a miners' convention in West Virginia. Here is the idea:

#### Claim Coal Belongs to Miners

The coal miners produce the coal; its value is what they give it by their labor; beyond that, it has no value; therefore the whole value belongs by rights to the miners; the mine owners and mine operators should be thrown out, should get nothing; what they get now is no better than stolen goods.

That is the old Marxist idea, that never was tried until Lenine and Trotsky tried it. What does it mean? Well, roughly, that a thing is worth just the amount of labor put into it. Therefore, if a blacksmith works as hard to produce a woman's hat as does a milliner, the hat he produces should be worth just as much as the milliner's hat. For further information the reader may submit the question to his wife.

If anything could be more calculated to stop prosperity than this madhouse proposition to drive out of great industry what money there is in it—at the very time when more money is the demand and need of nearly all going concerns—we should like to know what and where it is. Yet the idea, as stated, is being preached throughout the United States to promote controversy, to frustrate employment, to prolong unemployment. In the Chicago building trades it has done its evil work. For setting class against class, neighbor against neighbor, trade against trade, and occupation against occupation, there is nothing like it. Such an idea, if spread widely enough, would pull apart the whole American people.

One cannot enumerate all the influences that retard prosperity by starting industrial quarrels and controversies. The two large examples—one from Congress and one from the industrial field itself—must pass as enough.

Judge Gary's old phrase covered a world of wisdom. We do not have to go to England and Germany to see it. If we want prosperity as soon as possible, we can learn the lesson of how to get it by looking around us any day in the United States.

*A Busy Corner—State and Madison Streets, Chicago, Looking North*

# Them Was the Days

By HORACE

THE other day I turned the clock back forty or fifty years by visiting the quaint and picturesque little hamlet of Jogville-on-the-Lea. It was an experience to set a body to thinking. I used to live in Jogville twenty or thirty—well, quite a while ago. Maybe it was only fifteen years or such matter; time flits rather swiftly, and it's easy to lose count in the hurry and hullabaloo. Say it was twenty-one years and an odd affair of months—that would make me—but you must remember I was only a kid at the time. I went to school in the village. Great period of one's life, school days. So carefree and irresponsible. No suspicion of what we're going to be up against very shortly. The sad part of it is we don't appreciate the fact at the time. We're just rearing to go.

But what I had in mind to say was that my visit to Jogville was a great eye-opener. Jogville stands as a monument to a Bygone Age. It occupies pretty much the same social, economic, intellectual, and moral place in the world's affairs as it did half a century ago. Ancient customs and views of life still survive there. Jogville, like Rip Van Winkle, has slept undisturbed, only there is this difference—Jogville never has awakened. It doesn't know that the war is over because it had no knowledge of the war's having begun. Very likely if you mentioned the war in Jogville they would ask you, "What war?" Theirs is the simplicity of the simplified order of existence reduced to its simplest terms.

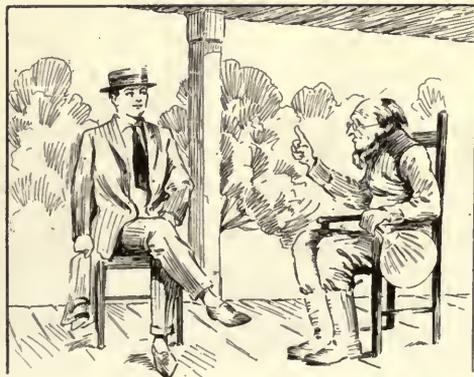

In this learned diatribe of mine I propose to prove that Jogville has adhered to the true principles of human destiny, while the rest of the world has wandered off on a wild goose chase after false gods. Time was when the whole country was like Jogville—serene, easy-going, somnolent, unharassed, loitering in green pastures and drifting on placid waters, basking in the summer sun and dozing before wood-fires in winter—but the world outside of Jogville has run amuck.

There must have been some initial cause for so disastrous a consequence. There is a cause—a prime factor behind the thing. Old Uncle Jason Mosscluster of Jogville put his gnarled and ancient finger squarely on the point of the matter when I talked to him on his gray, weathered, clapboard-roofed front porch. Uncle Jason is rising four-score, but spry of wit. He sat in his hickory chair and plied a big palm-leaf fan betimes. His beard is yellowed with the tobacco juice of many philosophical communings and discussions.

"The railroads is what's ruined the country," he said sagely. "They was the first departure from the old way of doing. All these other things follered after as a matter of course. Steam engines came first—then these here other foolishnesses was only a question of time. Electric telegraphs, telephones, phonographs, and then street cars, autymobiles, and now they've got flyin' machines. One buzzed over here not long ago and like to skeered all the chickens to death. They thought is was a new kind of hawk, I reckon. But it was the railroads that started the world wrong. I recollect when they first built 'em through this state."

"That was before my time," I remarked rather cleverly.

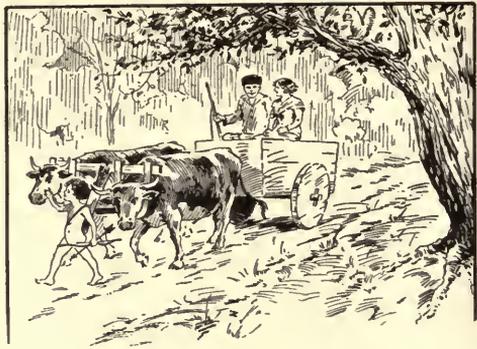

"Was it?" said Uncle Jason. "So it was.

But I was here then, and I didn't let 'em bamboozle me with their fine palaver. No, sir, not for a minute. I fit 'em right from start to finish. They made their survey smack through the center of this town. Allowed they'd make a city out of Jogville in a few years. They even set stakes where the depot was to be built. And they wanted we should give 'em right-o'-ways and yard sites and what-not, as well as a passel of cash money besides. There was half a dozen of us smarter ones that fit 'em to a standstill. Not only fit 'em but we beat 'em, too. In the end they built their durned railroad another way. Eight miles was as close as they ever come to us. Most of the others are dead and gone now, but I'm still here and I take credit for keepin' the railroad out. Yes, sir. They never succeeded in gettin' in their work on Jogville."

The old man went on to say a great deal more. I learned much from his talk. His store of knowledge was like some untapped reservoir in the midst of a primeval forest. It gushed out pure and undefiled, a virgin stream.

I was able to visualize conditions as they might have been all over this broad land, but for the coming of the railroads with their attendant disturbing features, in a striking contrast with the actual situation as it is. In my fancy I could gaze upon a land flowing with milk and honey—an elysian garden where the meek and kindly oxen yoked to a safe and slow-moving cart furnished the means for rapid transportation. I could see Strephon and Chloe, fond and happy, starting upon their journey to seek their fair fortune in the wilds of the far frontier, thirty or maybe thirty-five miles distant from the spot where they were born. It was a hazardous and thrilling traverse, beset by unheard-of dangers. The country through which they would pass was a wilderness, unkempt, untamed, unshorn. Wild game teemed in the thickets, wild birds chattered in the trees. Wild animals—wildcats, wild deer, wild squirrels, wild rabbits, and other wild and untamed beasts—scuttled amongst the tall grass and wild hazelnut bushes. Any minute, our timorous travelers might be assaulted by wild hornets who deem every stranger fair prey, or half-asphyxiated by the awful fumes of the wild,

spotted polecat, that terrible dragon of the North American continent!

But daring and dauntless those hardy explorers pressed on, and yet on, into deeper fastnesses. Now and then one came back to the old home village, on foot or horseback, bearing tales right brave and heartening, of farther and more remote hunting grounds in the land of the setting sun—a land where the buffalo ranged in herds which blackened the earth and where all manner of fish, fowl, fruit and forage abounded in lavish abandon. It was an attractive picture as those homespun Hotspurs saw and described it, no doubt. Food was plenteous and easy picking—not only food but raiment and fuel. One had but to put out one's hand and pluck what one wanted whenever one wanted it. There was more than to spare. If one's breakfast or dinner flew away or ran into a hole, it wasn't gone for good, merely for the time being. Butter, eggs, mast-fed pork, venison, wild turkey, grouse, quail, geese, duck—those were some of the things our ruddy-cheeked forebears had to eat, all for the asking. They had no use for money. Money was only an incumbrance.

Then the railroads and telegraphs were built. What happened? The wilderness was wiped off the map. Wild game scooted into the gloaming to return no more. The buffaloes vanished, and with them the deer and wild turkey and wild bee-trees. Where the squirrels once chattered and the lark and redbird once piped a merry lay sprang up smoky and clangorous cities. The 6-o'clock din of factory whistles drowned out the musical crowing of the barnyard cock and

the gentle lowing of Minnie, the red cow. Vast and tremendous industries came into being—lumber and brickmaking mills to manufacture materials for no other purpose than to build more and more enormous buildings. The land became cluttered with houses. People engaged in a mad scramble to invent and set going all sorts of complicated machines. They burrowed in the earth to get various metals to make more machines to manufacture more different commodities to sell to more people who must busy themselves at all sorts of work to obtain money to purchase more commodities. Somebody invented a cookstove to take the place of a hook to hold a kettle over the fire, and then another genius contrived a lamp to take the place of the tallow candle for illuminating purposes. The rest was merely a process of mathematical progression. Puncheon floors were replaced by polished hardwood, and so on to marble tiles; hot-air and steam heating plants supplanted the ancient backlog, and the porcelain bathtub came into vogue. Edison and his contemporaries tamed and harnessed the lightning.

Progress seized the bit in its teeth and bolted.

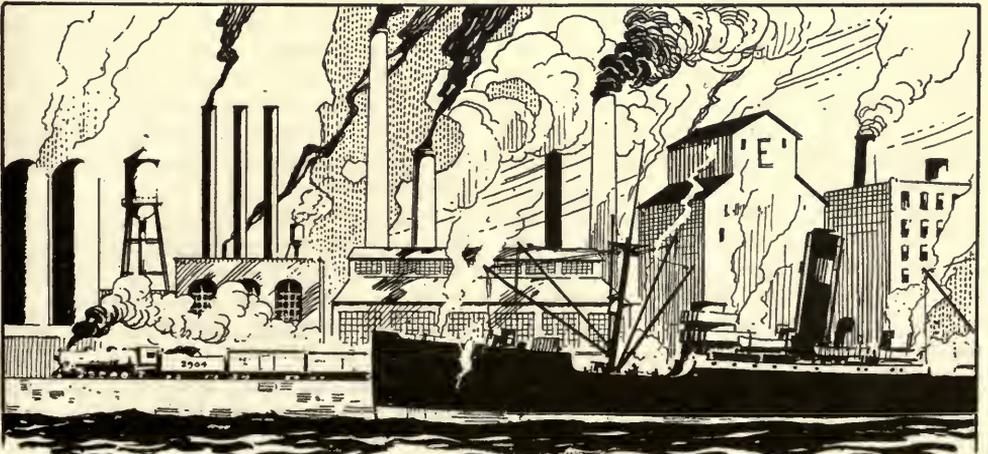

Today we whirl in a frenzied dance of delirious energy. We seethe in a never-ceasing, intense and feverish orgy of strenuous endeavor. Our modern world is engaged in a mad race to do it all in a day.

Strephon reserves a Pullman drawing room

for Chloe on the Limited, and they hie them a couple of thousand miles across country for a couple of weeks' vacation. From the observation platform they can glimpse an occasional humble tiller of the soil perched upon his tractor riding the waves as his gang-plow cleaves a 10-foot swath across the fertile main. That gink will plow more ground in a day than his ancestors could have accomplished in a week. Perhaps Strephon and Chloe will stop off for an auto trip through a park or around a lake, or to see a canyon, going or coming. And in a month's time at most you'll find them back in their modern apartment on Boulevard A with S. about to close up a contract involving a couple of millions just for a starter.

Money has got to be one of the mighty essentials.

Meanwhile the twin tapes of steel, over which purr the giant locomotives with their trailing appendages of luxurious, vestibuled coaches or mile-long strings of freight cars, stretch like a spider's net over all the land. They reach and touch every dim and outlying corner, bringing the delirium of Progress into every nook and cranny. There are very few spots, I reckon, where they haven't brought the smell of coal smoke and the clang and clatter of commerce. They've surely put the everlasting period to the lazy quietude of simple life. Look what they've brought to every little village in their path! Moving pictures, player pianos, vacuum

cleaners, ice in summer, strawberries out of season, electric lights, mail order catalogs, daily newspapers, tin lizzies—I could go on and on and enumerate a list of plagues until Congress got through debating the disarmament question and still not get half through.

To a person of my phlegmatic temperament, with a growing tendency to rest upon my laurels rather than lunge and cavort about in an endeavor to supplant somebody who really wants to work, the railroads have disrupted the country. They've destroyed all chance for a fellow to sit on the front stoop of his little log cabin and listen to the jimson weed pods popping open in the sunshine. The whippoorwills have just about all vanished, and nobody ever goes 'coon-hunting on drizzly nights in the fall of the year, any more. It doesn't hardly pay a person to keep a hound dog these days—some tourist will come rip-roaring down the public road and run over him and be fifty miles away before his dying yelp has quit echoing.

People have quit wearing boots and knitted mufflers, and going barefoot in summer time. This is an age of shoes and silk shirts. We've reached the point where we've dispensed with the necessities of life and gone in for the luxuries. Why, people would look askance at a man who would wear a coonskin cap and let his hair go without cutting for a year! My word! And you don't shave with soap nowadays; you shave with *cream*.

Just a little picture in closing to give you all an idea of what this country would be like if it weren't for the confounded railroads overrunning the earth in every direction. The best way to drive a fact home through the solid osseous and stucco structure which encloses the average intelligence is to drive it.

Geographically speaking, we would still be where we are, nationally known as the United States of America, and able to lick all comers. Boston, Mass., would still be at one end of the famous Post Road, a couple of days' fast drive from the thriving city located where the Hudson empties into the bay. Washington, D. C., probably would have been abandoned as the national capital in favor of Princeton, N. J., or Mauch Chunk, Pa., or some other place closer in

to the center of population. There would be a mail stage twice a week to Philadelphia from Trenton. Pittsburgh, Cleveland, Cincinnati, Indianapolis, Toledo, Milwaukee, Detroit—and all such places—would be merely trading points where folks could buy calico, yarn for knitting, powder, bar lead, cowhide boots, and steel traps. Chicago would be too windy and cold for anybody except the hardiest to try to stay in from November to June. St. Louis would be a big city of five or six thousand population when the trappers were all assembled in the spring. Kansas City would be a village of five hundred souls, and Little Rock, Fort Worth, Albuquerque, Phoenix, Los Angeles, Portland, Seattle, Spokane, Butte, Cheyenne, Denver, Lincoln, Omaha, St. Paul, Minneapolis, and Des Moines probably wouldn't have ever happened at all, or if so, only very slightly.

The South would have prospered in spots, no doubt, and would have taken pride just the same as it does now in its horses and its women. The Robert E. Lee and the Natchez would still be in commission as fast packet boats between St. Louis and New Orleans. The rest of the country would be a trackless virgin empire dotted with an occasional clearing where the sound of the wood-chopper's axe might be heard when the supply of firewood happened to run low, but otherwise with silence unbroken save by the rat-tat of a festive woodpecker or the honk of the wild goose at eventide.

No smoke, no noise, no dust. No pandemonium of hooting whistles calling people from their beauty sleep at sunrise; no glare of blinding lights to cleave the sable curtain of night; no raucous squawking of motor horns to wake the sainted dead sleeping so quietly in the burying grounds on the shadowy hillside.

No clamorous factories and mills. No foul-odored packing plants with their endless strings of refrigerator cars. No teeming beehives of 30-story office buildings with their innumerable thousands of ant-like workers. No nothing.

Nothing but peace and quiet, except for the evening song of the katydids and the matin madrigals of the birds. If a boy wanted a taste of fresh meat for a change, all he'd have to do would be reach down

the old squirrel rifle from its pegs over the cabin door and take a little saunter around down the ravine below the spring, presently to knock over a fat yearling buck or a turkey gobbler. No work; no worry; no money to be afraid somebody might try to take away from you by hook or crook; no income tax returns to stew over; no tires or gasoline to buy.

No gas, water, and electricity bills to pay; no plumbing to keep in repair; no coal shortage to watch out for. Of course, in case of emergency when somebody broke a leg and needed a doctor, he'd have a neat little spell to wait, but he wouldn't have anything else to do while he was doing it.

If a man were elected to Congress from Northwestern Montana, for instance, his term of office might expire before he ever reached the capital, but it would make him famous as a traveled person if he ever lived to get back home.

Best of all, there wasn't so much law-making and law-giving in the early days, and wouldn't be now if it weren't for the railroads. Somebody is always trying to pass a new law to regulate the railroads, or to unregulate 'em, or something. They've made it too easy to hold office and draw money for mileage. That's another count against 'em.

I hope I have drawn a lifelike and clear-cut picture of America as it is and as it might have been. It seems to me that it ought to give us pause when we consider all the things we can lay at the railroads' door. Think of the countless grafting politicians who made their first steps on a downward path by trying to practice blackmail tactics on some railroad. Think of the absconding bank cashiers who have found it possible to get away by means of a passing passenger train. If there hadn't been a train handy the country constabulary would have nabbed these villains in short order. The railroads have much to answer for besides bringing phonographs into our midst.

I hark back again to Jogville-on-the-Lea. Thanks to Uncle Jason Mosscumber and Old Man Skinner and others like them, the railroad passed Jogville by. That was forty-odd years ago. Jogville at that time had a population of perhaps three hundred. Some have died and moved away since, in the natural course of events. I have an idea

that there are at least a hundred and fifty left in the village—maybe there are only a hundred and forty-five, but anyway the town is just like it was. There isn't a tiled bathroom in it nor an electric fan, washing-machine, or vacuum-cleaner. It has remained pure, unsmirched, chaste and undefiled. There isn't a paved street, hardly a sidewalk even. It is placid, serene, untroubled, remote from the hustle and blatant blather-scather of so-called civilization. It would, to my mind, be one of the quietest places in the United States in which to live and move, and have one's being. And I don't know of a quieter place one could find in which to die.

Thanks to the fine foresight of a few far-seeing and devoted men, the railroads utterly failed in their nefarious purpose of making Jogville into a City.

---

#### FARMERS PRAISE US

The Illinois Central has recently been getting some effective publicity from farm organizations, such as the American Farm Bureau Federation and the Illinois Agricultural Association, because it was the first railroad in Illinois to make a reduction in carload rates on agricultural limestone handled within the state. This reduction, figured on shipments from Kankakee to eight other stations on the Illinois Central which formerly cost from 70 cents to \$1.12 a ton, averages 15 cents a ton. It went into effect September 26. The total consumption of agricultural limestone in Illinois last year has been figured as 359,000 tons. A 15-cent reduction on this would save the farmers almost \$54,000. The Illinois Agricultural Association predicts the use of approximately a million tons a year. On this the new rate would mean a saving of approximately \$150,000 a year to the farmers. According to the American Farm Bureau Federation, Illinois has 20,000,000 acres of acid soil needing lime treatment. Half of this acreage is in southern Illinois. For proper treatment this should have 10,000,000 tons of limestone in one year, and 5,000,000 tons annually after that. An increase in corn production of five bushels an acre could be looked for, which would add 100,000,000 bushels a year to the state's production.

# CLAIMS DEPARTMENT

## Some Tales of Sheep

*The morning dawned; the locomotive belled,  
Once, twice, and again,  
And a sheep leaped up, a sheep leaped up  
From the pond in the grass  
Where the wild deer sipped . . .*

—(APOLOGIES TO KIPLING).

By J. O. S. SANDERS,

District Attorney, Jackson, Miss.

AS an Illinois Central train sped along through the gray of early morning, the engineer was startled to see a number of shadowy forms leaping and tumbling along the track, directly in front of his train. The bell was set ringing, and the sharp staccato lasts of the whistle, known as the stock alarm, were promptly sounded, but the impact of the pilot with solid bodies warned the engineer that the unavoidable had happened. Investigation disclosed that a flock of sheep (Southdowns and Cotswolds, of course) had strayed upon the track. Eighty-five of them were killed and counted on the track and right-of-way. How many more died was never known, as the waters of the Yacona River, near by, probably swallowed up many more, which seems likely, in view of certain rather *outré* results which shall be set forth later on.

The owner of the sheep promptly filed his claim for damages—Southdown and Cotswold

valuation. The claims department of the railroad promptly and fully investigated the claim, and the legal department, with the return of the file, advised "no liability." The claim was rejected, and suit was brought, the amount demanded being on the same basis as the claim: viz., Southdowns and Cotswolds.

### A Verdict for the Defendant

Thus far there is nothing unusual about the case, but here we strike the unusual note, which, with other unusual things, justifies the telling. Upon proper instructions, the case went to the jury, and that apostolic twelve promptly returned a verdict for the defendant.

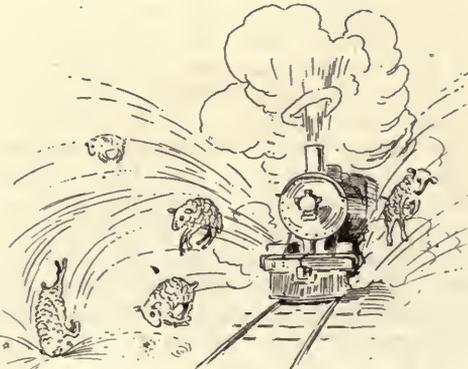

Evidently the capable local attorney of the railroad had hypnotized the jury; the plain-

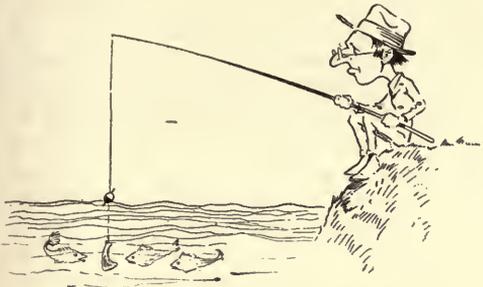

tiff's attorney felt justly outraged, and, of course, he took an appeal. But the railway company's luck was not to be broken, and the Supreme Court affirmed the judgment, *per curiam*. *Per curiam* literally means "by the court"; the lawyers say, freely translated, it means the appellant was a nut for taking the appeal. Howbeit, the plaintiff had just that much more costs to pay.

This would seem to be the end of the story, but wait and you shall see that these sheep, like some of their famous predecessors, had brought their tales behind them.

There is a saying among lawyers that it is a poor law-suit that won't breed many more. This one is no exception to the rule. Not long since an ingenious young lawyer wrote the claims department of the Illinois Central for one of his clients, saying that the dogfish in Yacona River, having had a taste of mutton from the sheep knocked into the river by our

train, had left their watery abode nightly to invade his client's pasture, killing his sheep (Southdowns and Cotswolds). Our chief of the department of ichthyology advised the claims department that dogfish never inhabit fresh-water streams, but are salt-water fish. A near cousin to the dogfish, found in fresh waters, is the catfish, but cats have never been known to kill sheep. After receipt of this information, the claim was declined on the advice of the legal department.

#### The Fish as an Epicure

The next claim made was by another resourceful limb of the law, who said that his client was a fisherman who earned his livelihood by selling catfish and buffalo which he caught from the Yacona River. Since the drowning of the sheep in the river, the fish had developed a taste for mutton and would take no bait except lamb chops or lamb fries or mutton broth. He found this bait too expensive, as there was nothing but purebred Southdowns and Cotswolds in that neighborhood. As to the broth, there was no way to stick it on his hooks. In consequence, his method of livelihood was completely gone, and he thought the railroad ought to pay for it. The legal department advised that this claim be rejected on the ground that, while the story might be deemed sufficiently plausible to be accepted by the jury, the damages were too remote.

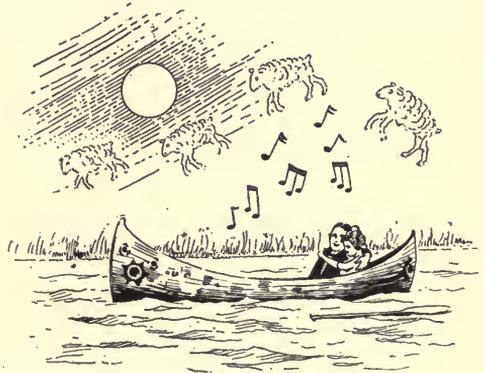

Another has complained that the ghosts of the departed sheep bleat in the river at night and disturb his slumbers. He wants damages. This claim was declined for obvious reasons.

There is one break in the chain of complaints. The last communication on the subject was from a young couple who are carrying on an industrious courtship and go canoeing on the river on moonlight nights. They say that the moaning of the spirits of the departed lambkins, rising from the river at night, is most romantic—in fact, that it rivals the

music from the Singing Sands of Pascagoula, named after the final wail of a maiden of the Pascagoula Indians who, despairing because her lover returned not from the wars, committed suicide by plunging into the river.

#### Thanks for the Words of Cheer

Our chief of the department of ichthyology says the sounds heard by the courting couple are most likely caused by the drumfish, which abounds there and makes a sound which, with the aid of a healthy imagination, can easily be likened to the moaning of the departed sheep. Nevertheless the claims department wrote a letter thanking this couple for their words of cheer, the chief saying he was glad to know that someone was getting pleasure out of a

deplorable accident. He admitted privately, however, that it made him feel sheepish to write such a letter.

The plaintiff's attorney is threatening to have the law amended, requiring engineers in charge of locomotives to keep a look-out for trespassing rams, lambs, sheep and mutton, and he may succeed—much unwise legislation originates with dissatisfied litigants. Until the law is changed, however, the railroad may hope to continue to defeat sheep cases like the one that furnished the foundation for this story.

The file in this case is being kept open for the reception of other consequential claims. It is apparent that the result of knocking a ram into a river is as uncertain as shooting an arrow into the air or singing a song.

#### A Good Law Enforced in Iowa

A recent decision of the Iowa Supreme Court brings to mind the statute enacted by the legislature of that state in 1917 to curb the activities of a certain class of lawyers who were engaged in soliciting personal in-

jury cases and bringing suits outside of the state. The decision in question is in the case of a suit brought by a widow through the solicitation of a firm of lawyers located in Minneapolis. Under the heading, "A Salutory Check," the St. Paul *Pioneer Press* has the following to say about the decision referred to:

Iowa has a good law intended to prevent citizens of that state from carrying personal injury cases into other states, when the injury occurred in Iowa and the defendant can be legally served in that state. It is a good law, and the supreme court has upheld it. If the same law were general in the states Minnesota would be spared the nuisance and expense of the imported damage suits which take the time of our courts and do not, as a general proposition, make for exact justice.

The case in question may or may not have involved ambulance chasing. It appears, however, from the records, that a man named Spoo was killed on the Rock Island road in Emmet County, Iowa, and his widow appointed ad-

ministratrix of his estate. It was represented to her—the same old story—that it was easy to get heavy damages in the Minnesota courts, and a Minneapolis law firm was recommended for the job. Terms were arranged and suit instituted in Alexandria, Minn. Then a new phase was introduced.

The railway company applied to the Emmet County Court for an order directing the widow to dismiss the action in Minnesota—where obviously it had no business—leaving her unrestricted in the right to sue in the Iowa courts. The Emmet County Court did not see the point and denied the order, but the supreme court brought it up with a turn, citing the state law, reversing the lower court and remanding the case for action accordingly. The widow can sue the railway company and get all the damages to which she is entitled, but she must go into court where she lives, where the accident occurred and where all the witnesses are at hand.

Good for the Iowa law and the court that upheld it! Iowa at least will bother Minnesota courts with no more of these pestiferous imported cases. Now if all of the states would write this law in their statute books it would end a system of which Minnesota long has complained and of which advantage was taken by not over-scrupulous attorneys.

### Sample Conversation

"Hello, dear."

"Well, how do you do?"

(Smack! Smack!)

"Did you have a good trip?"

"Splendid! It was perfect! You know the Illinois Central started a 'Fuel Economy' month September 1, and the perfectly wonderful engineers and firemen don't make a bit of black smoke now. Just out of Louisville, the conductor asked if I were comfortable, and then he told me I could look forward to a delightful trip to New Orleans. He explained all about their 'Fuel Economy' month during September, how much money it would save the railroad and how nice it would make traveling for the public, with no more black smoke to dirty our faces and soil our clothes.

"At first I thought he was trying to jolly me, but he wasn't. He was a perfect gentleman and told me nothing but the truth. I watched all the way to New Orleans, and, sure enough, there was no black smoke.

"The train arrived here on time and was on time at every station.

"I'm surely glad I came on the Illinois Central!"

—OVERHEARD IN WAITING ROOM  
AT NEW ORLEANS.

### The Passing of "Beauty Boy"

Frequently our domestic animals display more good common sense than some persons do, but they, as well as humans, seem to have an uncontrollable desire to frequent railway tracks. An occasional claim is received because of the sudden death of a dog who has miscalculated the speed of a train, but until recently the Illinois Central System has not, so far as is known, been asked to pay for a cat. If any cat has heretofore permitted a train to cross its carcass, no complaint thereof has been filed by its owners.

However, such a claim has now been made at Shaw, Miss. The cat in question was no common barn-yard or house variety. The claim is accompanied by a written and registered pedigree which bears evidence of the fact that the subject of the claim, a Persian cat, was known as "Beauty Boy," that his blue-blooded sire was "Black Ballywoo," and that his mother took first prize in the white, golden-eyed class of 1917.

"Beauty Boy" was born July 15, 1920, in the aristocratic state of New Jersey, which

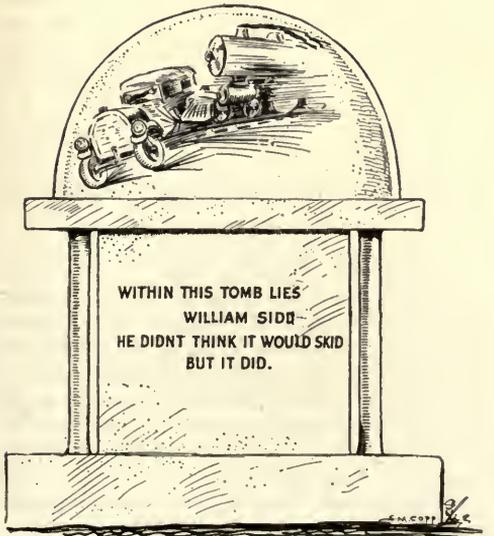

makes proud boast of the number of presidents who have hailed from its confines. It also raises a fine grade of peaches (both human and fruit) and has the largest mosquitoes on the American continent.

"Beauty Boy," like many two-legged aristocrats, had probably had his blood enriched at the expense of his gray matter, impairing the natural shrewdness, sagacity and fleetness of eye and foot of the feline family. His mistress had considerably provided him with a consort of his own class, but, true to the instincts of the male of some human as well as animal families, he wandered from home. Because of his ancestry he disdained the back-yard fence, which is the common courting ground of the less noble representatives of his tribe. Instead, he betook himself to the railway track.

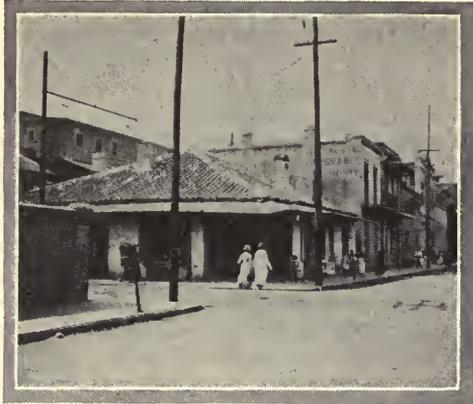

No doubt he relied upon the fact that in New Jersey blue blood is given the right of way, but in the Delta of Mississippi blue blood rides in the parlor and buffet cars and flirts with death by railway train only when ensconced in a high-powered 7-passenger automobile approaching a grade crossing, when the result is too often the same as that which happened to "Beauty Boy."

When one thinks of the lightning swiftness with which a cat pounces upon a mouse or a rat, it is almost a compliment to note that a Y & M. V. train came out best in a speed contest with "Beauty Boy."

S. M. Copp and C. D. Cary herewith present No. 5 in their series of epitaphs:

# AT NEW ORLEANS

The old Spanish tiled building shown above is the oldest house in New Orleans. Situated at Chartres and Ursuline streets, it lies within the "Vieux Carre," or "Old Square," of the French Quarter. It was constructed in the early part of the eighteenth century.

## WATER SOFTENING PAYS

The Illinois Central during 1920 made a saving of about 120 per cent on its investment in water softening, according to figures quoted in the September 17 issue of the *Railway Age*. The investment was \$247,801 in treating facilities, represented by twenty plants, and the cost of the treating process was \$69,684. The gross annual saving was \$382,684, while the net saving was \$292,456. Water treated amounted to 1,149,370,000 gallons, and 2,547,609 pounds of scaling solids were removed. The gross saving from water treatment was arrived at by taking 15 cents as the aggregate saving effected for each pound of scaling matter removed by the treating process and prevented from entering the boiler, from which the net saving was obtained by subtracting the interest and depreciation of the treating plant, the cost of chemicals, and the cost of operation, maintenance and superintendence. The value of 15 cents was taken as the equivalent for 1920 of the value of 7 cents arrived at in 1911 and incorporated in the report of the water service committee of the A. R. E. A. for 1914.

## What Patrons Say of Our Service

### Some Extra Service on Freight

The following letter was written by J. R. Henderson, a patron at Shelby, Miss., to Agent P. J. Rhyne of that station:

"I thank you very kindly for tracing the shipment of a car of feed. This car had been delayed in reaching Shelby and had seriously inconvenienced my customers. As I understand it, you located this car in Memphis this morning, after your local freight had arrived here without this shipment, and late this afternoon the car was delivered here by an 'extra,' which will certainly be of much more benefit to my customers than for this car to have remained over in Memphis for the regular routine of business Monday and possibly longer. So I want you to know that I appreciate your effort to get this shipment to me and if you have an opportunity, thank the fellow at the other end, too, for I know it required the efforts of your co-workers as well."

### A Word for the Dining Service

The following letter was received by the dining car department from the Rev. P. N. McDermott, pastor of SS. Peter and Paul Church, Atlantic, Iowa:

"Permit me to send a word of commendation relative to the excellency of the service in your dining car department. I especially want to commend the 100 per cent service on the part of one of your stewards, William Schott. I dined under his supervision some few weeks ago and want to tell you how much I did appreciate his efforts on that occasion. Last Sunday evening I had a similar experience with another of your men. It was on the evening train out of Council Bluffs, leaving there at 5:25 p. m. and destined for Chicago. I did not get his name, but I want to include him as well. You are sure lucky to have such efficient men in your employ."

### Appreciates a Personal Effort

Following is part of a letter written by the Calumet Baking Powder Company, Chicago, to Local Freight Agent I. C. Barber at Herrin, Ill.:

"We thank you for your letter, and we certainly appreciate the personal effort which you made in this case. While we cannot re-

quest local agents to go too far beyond their local duties in the interest of a shipment, we certainly appreciate it when the agent handles the case as efficiently and completely as you did this one. We trust the opportunity will present itself to reciprocate the favor you have done us in this case."

This excellent service rendered the Calumet Baking Powder Company was given by Clerk H. L. Tygett at Herrin, according to the report of Superintendent W. Atwill of the St. Louis division.

### Recovered a Lost Package

Mrs. W. E. Doerle, 1610 Maple avenue, Evanston, Ill., recently wrote to the baggage and mail traffic department as follows:

"A letter of praise and appreciation in behalf of one of your employes is the object of the present writing. I left Chicago Monday, May 9, at 9:45 p. m., and my husband and I in some way left a small parcel containing two hats on the counter of the ticket office windows. When I arrived in St. Louis I expected to find them checked with my suitcase, which was not the case; then it occurred to me that they were left at the place they were found.

"Someone was kind enough to turn them in, and the baggageman on the train, a Mr. D. L. Trotter, I believe his name is, put himself to the trouble of looking the package up, finding it, putting it on his train and bringing it back to St. Louis; then he called me.

"If you can reward this man for his kind interest, courteous manner and obliging honesty to your passengers, I shall consider it a personal favor. I always travel to and from St. Louis and Chicago on the Illinois Central. I truly appreciate this favor and recommend him to your favorable consideration."

### Gave the Panama Limited a Trial

Adolph Mueller of the H. Mueller Manufacturing Company, Decatur, Ill., recently addressed the following letter of appreciation to Agent George A. Lavery at Decatur:

"I visited New Orleans this week, going via Illinois Central to Mattoon, making connection with the Panama Limited and returning on the same route.

"The Panama Limited has fine equipment, and the accommodations are, without a doubt,

equal to those of any train in the United States. The conductors, the porters and the waiters in the dining car do everything within their power to make the trip of those traveling a pleasant one, and I greatly enjoyed it.

"I thought you would be interested, and for that reason am writing you this letter."

#### A Suburban Service Incident

Commending efficiency on the Chicago suburban service, W. R. Betham, 137 North Wabash avenue, Chicago, recently wrote the following letter:

"I take great pleasure in highly commending for exceptional efficiency your rear man on northbound train leaving South Shore at 5:11 p. m., city time, today, which I boarded and handed him my South Shore to Hyde Park (home station) ticket. I intended to go to Randolph and thought I would see if he would let me go through on the short ride ticket, so I changed my seat for that purpose.

"I had played golf all day and was very tired, which caused me to doze off; so I did not hear him call Hyde Park, but he had his eagle eye on me and asked me to hand over 22 cents, the fare from Hyde Park to Randolph.

"I told him that his failure to have me get off at Hyde Park would cause me a lot of trouble and delay to a dinner engagement and that I certainly would call your attention to it. He begged me not to do so, as he was making every effort possible to render good service, and he certainly succeeded in this instance.

"In order to relieve his feelings of anxiety and to encourage him in his good efforts, I sincerely hope that you will kindly apprise him of this letter."

#### Praise Like This Is Praise Indeed

The following letter to A. U. Sawbridge, city passenger agent at Chicago, is especially important because it was written by Harry M. Eastman, assistant manager of the *Hotel Bulletin* and chairman of the transportation committee at the recent convention in New Orleans of the Greeters of America, an organization of hotel men:

"Have only been home a short time from the convention at New Orleans and I want to take this occasion to thank you, and through you the officials of the Illinois Central Railroad, for the courteous treatment and splendid service accorded those who traveled to New Orleans over your line.

Every one was thoroughly pleased with the way the special train was handled and with the general courtesy shown by you and also by the officials in New Orleans in arranging for the return of those coming back via the Illinois Central. It will always be a pleasure for the Greeters to recommend your road and to use it whenever possible.

"Your dining car department is also to be especially congratulated for the wonderful breakfast given to those on the train going into Memphis. Many of the delegates stated that it was the best meal of the convention."

#### Took Care of Sick Traveler

The conductor referred to in the following letter from E. C. Correll to Superintendent J. M. Walsh of the Memphis division is Mack Mahoney, referred to in a letter from Superintendent Walsh's office as "one of our oldest and most efficient passenger conductors and thoroughly imbued with the spirit of chivalry." Mr. Correll writes:

"The writer wishes to express his appreciation for the treatment tendered him on your Clarksdale train leaving Memphis at 4:45 p. m. May 17.

"I was taken suddenly ill after the train left Memphis, and both your conductor and flagman rendered every assistance that they possibly could. The conductor endeavored to have me transferred at Lula, Miss., but due to the painful conditions that would have arisen from this transfer, he found it impossible to do.

"However, your conductor wired physicians at Clarksdale, Miss., made reservation at the hotel, also had an automobile in waiting on arrival of the train, and, as I have mentioned above, rendered assistance that will never be forgotten by the writer.

"I feel that, in justice to the conductor, your company should be commended for the spirit of personal efficiency and would appreciate your advising the writer of the name of the conductor handling this train, in order that I may personally write him a letter thanking him for the attention shown me.

"The writer has occasion to use the Illinois Central a great deal in traveling out of Memphis for his firm, and I want you to understand that treatment extended me was of such a personal regard as to prompt me to write this letter."

#### Sends Business Our Way

Fred Parkinson of the Hood Rubber Products Company, 31 South Franklin

street, Chicago, recently wrote from Springfield, Ill., as follows:

"In appreciation of the excellent service the Illinois Central has maintained during the past troublous times, I wish to express my personal thanks. While most other roads allowed their service and equipment to get badly disarranged, the Illinois Central remained as usual.

"As a traveling salesman, you can rest assured, I gave the Illinois Central preference whenever possible during my travels. You can also credit me with considerable freight tonnage, as I always routed freight by Illinois Central unless a dealer wished otherwise, and was always glad to inform the dealer why."

#### Praise From a Band Leader

The following letter to General Manager A. E. Clift is from R. F. Riley, major in charge, Alee's Band and Patrol, A. A. O. N. M. S. It was written from the Hotel Savannah, Savannah, Ga.

"Having just returned from the Des Moines trip, we would be very ungrateful if we did not give some expression of appreciation for the wonderful service rendered while on your road.

"Out of Birmingham we found Captain A. W. Ellington on board, with Captain C. B. Blackman in charge of the train. Mr. Ellington was most gracious in his eagerness to see to our comfort, while Mr. Blackman left nothing undone to see that we had everything that could be had, and to make our trip one never to be forgotten.

"As a gentleman and a real train conductor we have never met his equal. He can answer more questions in the nicest way than anyone else we have ever known.

"On our return, we found him at Jackson, Tenn., ready to bring us back, and we were a happy bunch to see him.

"We go to 'Frisco next year, and we want your road to handle us. We want Mr. Blackman with us, as he is the kind that we like. You have a wonderful railroad, and the service could not be improved upon."

#### Attention to a Baseball Team

The following letter is from Theo. F. Nehlsen, manager of the Simmons baseball team of Kenosha, Wis.:

"I wish to take occasion to compliment

the Illinois Central on its treatment of the Simmons baseball team, on the trip to Springfield and Decatur, Ill., the past week. According to the plan laid out by your Mr. Mottz, when he solicited the business, we left Chicago on your Diamond Special Thursday evening for Springfield. One of your representatives came down to the train to ascertain if everything was satisfactory. This little personal touch was very much appreciated.

"On our return trip from Decatur, your Decatur local representative called us on the 'phone at the hotel Sunday morning, informed us that our car was in town, told us where it was placed, and what time we would leave that evening. This relieved us of the necessity of running around to ascertain details. When we came to take the train that evening, we found everything just as your representative had said we would.

"And I want to compliment the operating department, the switchmen at Decatur and Clinton, on that freight train. Never have I experienced such careful handling of a passenger coach on a freight train. One would not know that he was being handled on a freight train.

"Just want you to know how splendid everything was, and how much we appreciate the handling by all concerned.

"Hope to have occasion to use the line again in the near future."

#### Look Back With Pleasure

The following letter to City Passenger Agent A. U. Sawbridge at Chicago was written by Peter M. Munn, secretary of the Chicago Master Plumbers' Association:

"On behalf of the Illinois-Wisconsin delegations of master plumbers to their national convention at New Orleans, June 7, 8 and 9, 1921, I desire to express our sincere appreciation for the most delightful trip over the Illinois Central lines.

"Leaving Chicago Sunday morning, June 5, on four special Pullmans, including parlor-library observation car as well as a special dining car, we feel that we have good reason to look back with pleasure to our trip to the South. We certainly feel indebted to you, not only for your courteous and considerate treatment at all times, but for the very excellent arrangements so suc-

cessfully carried out by you during the entire trip.

"Our delegates were particularly impressed and pleased with the table d'hôte meals served enroute. It was expressed by Jacob Schuh, chairman of the Milwaukee delegation, that never at any previous convention had we traveled under such excellent arrangements and his opinion is the unanimous view of all of those who made the trip. The courtesy and attention of your train crew were all that could be desired, and the fact that you were able to land us in New Orleans two hours ahead of our schedule was something we all greatly appreciated."

#### One Trial Convinces

The following letter was addressed to President Markham by A. Good, secretary of the Marks Isaac Company, New Orleans, La.:

"At the urgent request of your city passenger agent, S. B. Mitchell, I have just returned from a round trip to New York City, via the Panama Limited.

"You know when something fails to suit a man he loses no time in sending in his complaints to headquarters; rather poor rule that does not work both ways, so why not go to headquarters when something pleases, just as well?

"Just to let you know how I enjoyed both the trip up and home, all I can say is that it will be Panama Limited for me all the time, after this. I wish especially to compliment you on the excellent service both my wife and self enjoyed on your train, from the conductor down to porters. The uniform courtesy and ever-readiness to please, and to insure the passengers' comfort, our best roads can take an example from."

#### Some Successful Solicitation

The following letter to H. J. Phelps, general passenger agent, was written by E. P. Howard, 325 Camp street, New Orleans, La.:

"I think it only fair that you should know the circumstances of one of the men in your service being responsible for my trip over your road.

"I had a party of three guests—Adolph Dumser, vice-president of the Whitney

Central Trust & Savings Bank, New Orleans; Dr. P. Jorda Kahle, a well-known physician of this city, and Charles T. Henshall, a broker—and we arranged to visit Jersey City on the occasion of the Dempsey-Carpentier fight.

"I spoke to the head porter, Mr. King, at the St. Charles Hotel, about securing me accommodations for this trip, planning my trip to Jersey City via other railroads. While I was talking to Mr. King at the desk, a gentleman presented his card (Ike Greenberg, whom I subsequently learned was in your dining car service), and he suggested that the best way to go to Jersey City was via the Illinois Central to Chicago and from there to New York City.

"Mr. Greenberg appeared rather plausible in his representations of the merits of your road, and accordingly I instructed Mr. King to buy for me five round-trip tickets (including one for my negro servant), to Asbury Park, via Illinois Central Railroad, which he did and for which I gave him my check.

"When I got ready to leave here, much to my surprise I found the same gentleman who had induced me to make this trip, in uniform, in one of your dining cars on the Panama. He was uniformly courteous to my party, and I take this occasion of saying to you that in my thirty-five years of travel, I never had better service or better food anywhere.

"I am not in the habit of writing letters commending or decrying service, because I am too busy, but I think this is a circumstance which should be brought to your attention."

#### Whole Service Complimented

The following letter was addressed to C. M. Kittle, senior vice-president, by C. L. Wallace, receiver for the Texas & Pacific Railway, New Orleans, La.:

"Unfortunately it has been necessary for me to travel rather extensively during the last six or eight weeks, but fortunately I have been able to make use of a considerable number of your trains, especially the 'Panama Limited' between Chicago and New Orleans. The courtesy and attention given by your employes on this train is particularly noticeable, not only by myself, but by other patrons, and I wish to assure you that the many compliments I have heard

with respect to your passenger train service would be of great pleasure to you and your associates.

"The compliments speak well for, not only your passenger, but also your freight train, service, and I am sure that each of your patrons will provide a soliciting agency for your property which will well repay you for the earnest endeavors you have given to provide a service equal to, or greater than, what the public pays for."

#### Train and Service Unexcelled

The following letter to President Markham was written by Joseph Haspel of the firm of Haspel Brothers, New Orleans, La.:

"It was my pleasure to travel on the Panama Limited, Train No. 7, from Chicago to New Orleans on July 1.

"After having made a trip from New Orleans to the Pacific Coast and after having traveled on a number of railroads, I feel that I am in a position to express to you what a great train the Panama Limited really is. It is unexcelled for cleanliness, safety, speed and service.

"I want to give special mention to your dining car No. 3991. I can truthfully say of the service on this car, the meals and the prices by far excel those of any railroad on which I have ever traveled, and I have traveled on most of them, South, East and West.

"I feel that the traveling public must appreciate this service."

#### Likes the Dining Service

The following appreciation of our dining service is from Charles W. Cuddy, sales manager of the Home Furniture Company, Fort Dodge, Iowa:

"It has been necessary for me to use the Illinois Central a good deal during the past few months, in fact more than ever before, and I believe in telling the good things as well as complaining about the bad. I wish to state I have never received more courteous treatment than at the hands of your stewards. In particular I would like to mention the name of Mr. Teal. He surely has been fine, and men like him place one in a home-like position on a dining car. Your service is splendid."

#### Restored a Lost Pocket-Book

J. J. Hayes, of Amboy, Ill., writes:

"I wish to compliment you on the honesty

of John Krueger, employed by the Illinois Central at Freeport. I was a passenger on Train 132 on July 19, 1921. I had the misfortune of losing my purse while on this train, but thanks to the honesty of Mr. Krueger and the courtesy of the Illinois Central in their efforts to locate me, the purse was returned to me. I thank you and Mr. Krueger and trust this example of honesty will be followed by other employes and the Illinois Central will maintain its 100 per cent efficiency always." (Coach Cleaner John Krueger found this pocket-book and turned it over to the chief clerk, who found a registration card showing Mr. Hayes as being connected with the Fruit Dispatch Company at Dubuque. The superintendent's office at Dubuque advised that Mr. Hayes was at Amboy. The chief clerk then took the matter up with the agent at Amboy, and Mr. Hayes was located and identified the pocket-book. The pocket-book contained \$40 and a few receipts.)

#### Quick Action on Lost Keys

M. T. Normoyle, 4542 Indiana avenue, Chicago, Ill., writes as follows:

"I take the liberty to let you know that I appreciate the kindness and courtesy that was extended to me last night while looking up a bunch of keys that I lost on the South Shore Line coming from Hudson Lake, Ind. I dropped them while changing from one car to another to make room for more people getting on at Lake Park and never realized it until after getting off at Woodlawn, when someone told me that he heard something drop when we changed to the other car. I notified the information woman at Woodlawn, and she said she'd phone to have the car man look out for them and for me to phone Wabash 2200, or better still, take the next train to Randolph street and inquire at the Lost and Found Office, which I did. To my surprise a man was waiting for my train to come in to give them to me. They had been found, and in a hurry to get them. I forgot to get his name. Will you see that he knows, as well as the others who made it possible for me to receive them so quickly, that I appreciate all that was done for me in such a short time? I surely will boost the Illinois Central."

#### Service by a Pullman Conductor

The following letter is from C. E. Durst, department of fruit and vegetable marketing,

Illinois Agricultural Association, 608 South Dearborn street, Chicago, Ill.:

"I want to take this opportunity to tell you of the kind treatment I received from one of your employes. This incident happened some time ago. I got off the Pullman at Carbondale and while I was talking with some people that met me there my suitcase was carried away with other baggage.

"J. R. Wooldridge, in charge of the Pullman, went to a great deal of trouble to locate this suitcase. He finally found that it had been put on another train and sent to-

ward Benton. He followed it up by wire and succeeded in getting the suitcase returned.

"In these days we expect to see more or less inconsiderate treatment on the part of railway employes. This condition is, however, not nearly so bad on the Illinois Central as on most other railroads. Mr. Wooldridge's desire to be of service to patrons was outstanding, and I am writing this letter to let you know about it. If more railway employes were like Mr. Wooldridge, it would be a fine thing, both for the railroads and for the general public."

## *Two Little Incidents of War and Peace*

On a memorable day in October, 1918, when the woods of the Argonne Forest should have been shining peacefully in the haze of fall, but instead were torn with the shells and trembling with the thunder of the American advance, two young men, both Mississippians, went forward with the 114th Infantry of the 29th Division to do their bit for the freedom of the world. One was an Illinois Central employe; the other, a young planter from Tchula. They had gone overseas together from Camp Gordon, Ga., had been assigned to the same replacement division, and were buddies. Fate held in store that day for one the supreme sacrifice, for the other a return to his native land, though gassed and wounded. James W. Nash, carrying ammunition, fell dead not twenty feet from L. D. Myers, his tentmate.

Mr. Myers returned to Jackson, Miss., and resumed his duties as night baggage agent in the Illinois Central passenger station. For some inexplicable reason, the record of the death of Nash was not made clear, and fully a year after the armistice his parents were obliged to advertise in the papers for any available information as to his whereabouts. An ex-service man in Texas told the parents they could obtain positive information from Mr. Myers. They visited him and heard the history of their son's faithful service and heroic death. After this, the matter passed gradually from Mr. Myers' memory, only to be brought to his attention again a few days ago in a most unusual manner.

When he arrived at the station one even-

ing to enter upon his regular duties, his attention was first directed to a coffin, draped in the glorious Stars and Stripes, bearing on its lid a wreath of palm leaves tenderly placed there by the Veterans of Foreign Wars when the coffin passed through Atlanta, Ga., from Hoboken, N. J. With no particular thought of who it might be, but in accordance with his usual custom, he looked for the name and regiment on the box. To his startled gaze there appeared "James W. Nash, Private, Company I, 114th Infantry." The buddy who had fallen by his side three years before had come home to be buried in Jackson, in beautiful Cedarlawn Cemetery, guarded on his long journey by a detail from headquarters, and covered with the flag for which he had given his all.

The world is small, indeed. From the Argonne Forest to Jackson, Miss., is a long journey; yet it was not too far for many of our boys to travel when Freedom called, nor was it too far for a paternal government to carry back the body of one whose parents desired that he should lie in the soil of his native land.

This little incident carries no particular moral or message. Many Illinois Central men were among those who went to France; many returned, some did not. It is, however, interesting to note that three years after they had been separated by death in a foreign land, one, still in the pursuit of his railway calling, should handle, in the course of his routine duties, the body of his tentmate from whom he had parted long ago in battle.

# ACCIDENT AND INJURY PREVENTION

## Shop Keeps a Score

**O**UR shop force at Centralia, Ill., is alive to the prevention of accidents and injuries, as is evidenced by the plan, put into effect January 1, to create a spirit of rivalry among foremen. The plan is to determine who can run his department with the least number of personal injuries.

A daily record is given on a bulletin board, placed in a conspicuous place in each department, as is shown in the pictures appearing with this article. This record gives the number of days this year that department has been run without a personal injury. When an injury occurs, the foreman of the department is required to change the number on the sign to 1 and begin over again.

In the car department Gang Foreman J. R. Stull, Air Foreman J. Lipsey and Mill

Foreman Sisson had a clear record to September 22, having gone 265 days each without an injury in their departments. In the locomotive department, Tin Shop Foreman C. E. Knight had a clear record for 174 days, and Roundhouse Foreman Westbrook had a record for 123 days. The records of the other locomotive and car department foremen are shown below:

### Locomotive Department

J. A. Winkler, Machine Shop.....	79 days
J. A. VanPatten, Erecting Shop.....	72 "
L. R. Porter, Blacksmith Shop.....	71 "
D. W. Potts, Boiler Shop.....	43 "
R. A. Willard, Night Roundhouse.....	15 "
Fred Eller, Carpenter.....	7 "

### Car Department

R. D. Sheetz, Gang Foreman.....	84 "
J. Schneider, Wrecker Foreman.....	61 "
B. F. Correll, Gang Foreman.....	32 "
C. T. Hill, Steel Car Foreman.....	32 "
L. E. Sinks, Gang Foreman.....	119 "

*Safety Score Boards in the Centralia, Ill., Shops*

# Safety Work Shows Results at Burnside

By R. T. NEWBERRY,

Chairman, Burnside Safety Committee

**S**AFETY in a railway shop carries a meaning of greater significance than is realized by the average employe. It is not so much the continuous cautioning by the safety committee, posting of illustrated bulletins on the bulletin boards, and the constant warning of "Be careful" by the foremen—the co-operation of the worker himself counts most.

Our plant is one of the largest of its kind in the Middle West, and, as everyone knows, the larger the plant and the greater the number of employes, the greater the increase in the risk and probability of accident. Here, however, an organization has been perfected whereby each individual senses the responsibility not only of his own welfare but of that of his co-worker also.

The railway shopman of today fully realizes that this great safety movement, which was put into effect about twelve years ago with great expense to the company, has been the means of saving the lives and limbs of probably thousands of men. I honestly believe that it would be impossible to find a railway shop anywhere in the country with more fully equipped safety devices, better sanitary conditions and a supervisory force readier to give their hearty co-operation to the committee than we have at the Burnside Shops.

Since each member on the committee is instructed to keep a close watch for any irregularities in his department, he is always ready to make reports when we have our regular inspection of the plant, the first of each month. A full report is written up and forwarded to the general foreman, who in turn notifies the foremen in whose departments defects have been reported, so that they will give them prompt attention.

Accidents, as a rule, are more numerous at times when business increases on the road, which requires an increase of the working force in the shops. New men are hired. Being unaccustomed to their new surroundings, strange faces and so on, they naturally become nervous and excited. In an unguarded moment, with their minds on

something other than work to be performed, they meet with an accident. This applies to practically all industrial plants, statistics will show.

In the freight car repair department, a dangerous problem has been solved by the general foreman of the car department, making it possible to place a blue flag—which is so important in this branch of work—on a car in any position so that it cannot be blown off or knocked off, but must be removed or put on in a mechanical way in a very short time (an up-to-date safety device).

Many such improvements have been made in the locomotive department also. These improvements have been the means of reducing our accidents, as the following figures will show. They cover all accidents to shopmen under the jurisdiction of the shop superintendent.

	1920	1921
January .....	90	47
February .....	93	48
March .....	122	43
April .....	102	69
May .....	116	83
June .....	128	108
July .....	149	134
<b>Total .....</b>	<b>800</b>	<b>532</b>

## CO-OPERATE FOR SAFETY

The Illinois Central is co-operating with the Chicago Safety Council in carrying out a "No Accident-No Fire" week in Chicago from Saturday, October 8, to Friday, October 14, inclusive. The effort is effective within the Chicago manufacturing zone. The campaign is being conducted as a part of the semi-centennial of the date of the Chicago fire, which occurred October 9, 1871.

## SPOKE AT PADUCAH

Judge R. V. Fletcher, general solicitor, as a representative of the Illinois Central, spoke on the railway situation while a guest of the Rotary Club at Paducah, Ky., September 7.

# St. Louis Banker Points Out Necessity for Priming Business Pump

*John G. Lonsdale Declares That Governmental Encouragement of the Railroads Is the Biggest Thing Just Now*

*The following interview with John G. Lonsdale, president of the National Bank of Commerce, St. Louis, Mo., and vice-president of the national bank section of the American Bankers' Association, was recently given at Los Angeles, Cal., in connection with the convention of the association.*

**E**CONOMISTS are talking in deductions, theories and charts of what caused the business hesitancy, or what will revive the already improving business conditions.

To me, the necessary remedial measures are more nearly typified by my remembrance of "down on the farm" days. I recall that on excessively hot days when fagged human energy necessary to the harvest of a bountiful crop was revived by the cooling drafts of good old well water and when the securing of that trickling coolness depended often on the half-dipperful of water necessary to prime the old pump. Sometimes, through oversight, no water was saved at the pump, and I've walked a mile or so for enough water to prime the old pump. Once started, the refreshing water flowed freely, but the half-dipper of priming water was the important factor in obtaining it.

## Business Needs "Priming"

Certain conditions have used up all the "priming water" around the "pump" of American business, and while the same attributes of prosperity are just below the surface, it is the duty of American business men, and especially bankers, to use the tremendous power of their collective efforts toward the supplying of "priming water," that the golden stream of prosperity may again flow through America. There exists every incentive for the "priming" of business; first of all, we are the richest, strongest nation on earth, and it is not becoming to our war valor to allow nations far more affected by the conflict to "beat it back" to normal ahead of us.

The growing army of unemployed, now officially estimated at five million, should of

itself spur the desire to speed up before winter is too far advanced.

Bankers of the United States should, with proper caution, further extend, in the intelligent use of our growing reserve, for the irrigation, the "priming"—the rejuvenation of legitimate business enterprise.

The financier worthy of the best traditions of American financing is, and has been, extending efforts along these lines, and it remains for the public to engender stability through a similar courageous attitude. These two elements, backed by a more solid and sympathetic disposition of the government toward a general resuscitation, will "round the corner" in trade.

## Start With the Railroads

The government's further assistance could in no wise be so effectively and substantially expressed as in "priming" the railroads back to normal through the passage of legislative measures, making available for the transportation system of the country a half-billion dollars in credits. Such action seems especially feasible, as it involves merely the transfer of financial holdings from one governmental agency to another, and does not necessitate raising additional funds.

While every industry is entitled to, and should get its share of assistance, the most effective stride toward more healthful conditions lies with the railroads. Transportation forms the artery feeders and the basis for our commercial life. America's commercial life can never far exceed its railway facilities.

The mileage, motive power and rolling stock of the railroads are on a pre-war basis; there has been no railway development in more than five years.

The normal growth of traffic in the country has during that period been very rapid. It can be fairly demonstrated by figures on tonnage at the St. Louis gateway. For the five years ending with 1920, tonnage in and out of St. Louis by rail and water increased substantially 40 per cent; that is to say, in 1915 the tonnage was substantially 52,000,000

tons and in 1920 substantially 72,000,000. Obviously, to keep pace with this growth of traffic, carriers should, of course, increase their facilities to the same extent.

### On a Return to Recovery

With the helpfulness of the so-called Transportation Act, the railroads are in much better shape now than a year ago, and with the kindly interest of the public until the full effect of the Transportation Act can be brought to bear, plus governmental extension of further credits, these keystones of American progress, the great continental carriers, are on a fair return to recovery.

It is estimated that in 1921 railway earnings will amount to \$500,000,000, or about 3 per cent on the investment. It is fully apparent from this that the railroads are in need of governmental "priming." Few investors can be expected to hurry their funds into the development of the transportation system for a 3 per cent earning; the roads must be restored to their once attractive, though not excessive, earning power.

There are those in this connection who maintain that the high level of rates is responsible for the decline of business. Rates have little to do with the situation. As a result of the power delegated to the Interstate Commerce Commission, rates are now practically made by that body, and are in substantially all important cases the same between given points, thus eliminating competition so far as rates are concerned. Service, however, is much more improved in developing and sustaining the commerce of this country than the measure of freight rates. Service is dependent on the ability of the carriers—a matter of more equipment and development; more directly, credits. This the government is in a position to extend.

### Start a Cycle of Activity

Aside from the pivotal position of the railroads in our commercial life, and the supreme importance of speeding up the head of the procession of progress first, the stimulating of the railroads to activity in replenishing and improving their facilities by the purchase of material and supplies will establish a cycle, not the vicious cycle of war wages and commodity prices, but one of healthful commercial activity. The placing of equipment orders means a quickening in American business in all the ramifications of the hundreds of plants making railway supplies. When it is considered that the railroads

alone normally consume 35 per cent of the lumber output of the country, the importance of immediately applying the "priming" process to American railroads as a means of general business resuscitation is only too fully apparent.

There is business in America today in every nook and corner, in just as good a measure as ever. Although dormant now, it merely needs "priming" like the old country pump, to start the profitable flow—the interchange—which, in its total volume, spells prosperity.

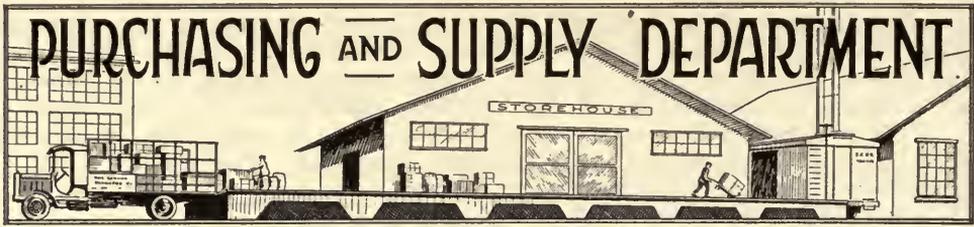

### ABOUT TRAVEL IN JAPAN

Travel in Japan has long ceased to be what Kaempfer described it two centuries ago, when the backs of men or horses bore the traveler and his belongings along the highways. All along the seafront the steamers ply; narrow roads penetrate most parts of the interior and Japan now has a good railway system throughout the main island, with shorter lines in the three other large islands.

One of the transforming agencies has been the jinrikisha—properly called "kuruma"—which is used throughout the empire and has forced good roads. This big baby carriage takes only about three and a half feet of space, weighs as little as twenty-five pounds and will carry a load of 250 pounds.

The railways, now taken over by the government, are rather of the European than the American type, remarks an exchange. They are built with great care and solidity, the slopes exactly shaped and grassed, the short bridges of stone, the longer ones of iron. The stations are at present in about the same condition as those in America forty years ago; but the government has under construction a splendid central terminal in Tokyo. Trains run very slowly; even the expresses make under thirty miles an hour, but make up for it by remarkably low fares—about 2 cents a mile for first class and a third as much for third class. The cars resemble those of Switzerland, always with connection through the train; but the first and second class coaches are more or less subdivided into coupes and staterooms. With few exceptions the train and station hands are all Japanese; but among them one person at least is likely to speak English, so that the foreigner gets on easily by himself.

*Remember October, Too!*

## Saving Stationery

*Reprinted by permission from Railway Purchases and Stores Magazine, August issue. Illustrations by courtesy of same magazine.*

By G. W. SCHROEDER,  
Stationery Storekeeper

**R**ETRENCHMENT, not at the present time or future alone, but at all times, should be looked upon with utmost consideration. This, I presume, has been witnessed by everyone during the past three years, at least. However, it seems that procrastination is being practiced too extensively in connection with retrenchment along certain lines, which is primarily due to inadvertence on the part of various persons in the progress of their daily work.

First of all, the average person who is employed in the capacity of clerk or stenographer in a large corporation is not in close touch with the department handling vouchers or invoices, and consequently has no conception of the enormous amount of money that is expended each month for stationery. The result is that little or no attention is given to the use of stationery or office supplies by many individuals, and the consequence is a large disbursement in the stationery account each month.

How often are requests made for certain forms to be printed on expensive bond paper, when, if the matter were carefully scrutinized, it would be found that common manila paper would serve for the purpose required. Undoubtedly many thousands of dollars are spent each year by various companies for the sole reason that matters of this kind have not been taken into consideration along the lines of retrenchment. Additional expense is also incurred when

this so-called bond paper reaches the office and is promiscuously strewn about the desk, with the result that from five to ten sheets from each pad are rendered unfit for the purpose required, due to careless handling. Often a pad of forms is allowed to remain on a desk at night and become soiled with dust, instead of being carefully placed in a drawer. An average loss of this amount on each hundred sheets purchased would no doubt prove to be a considerable amount if a report were submitted in dollars and cents.

### Use the Right Sort of Paper

It will also be found that many clerks have acquired the costly habit of using bond paper for scratch paper instead of some cheap paper which would serve the same purpose, thus entailing unnecessary expense. I can safely say

Figure 1.—Showing the general bin arrangement for storing stationery.

that a precedent has not as yet been established in many places to retrench along these lines on many railroads.

Furthermore, it might be well to look into the loss caused each year by misuse of envelopes. Did it ever occur to you that your office boy is using a large number of No. 14 envelopes for letters or notes that could possibly be sent out in a much smaller envelope, such as a No. 6 or No. 10? This is done frequently, and the additional expense involved in so doing will no doubt represent a large figure at the end of each year.

The abnormal amount of pencils used each year is undoubtedly due to inadvertence on the part of the consumer when he or she puts the pencil in the sharpener and forgets to remove it until a great part of the pencil has been cut to shavings.

There are many other items classed under stationery where heavy losses are unconsciously being experienced each year by many companies, and, inasmuch as stationery used by the majority of corporations represents a great amount of money, I am sure a close check on its use would warrant the time spent and result in retrenchment.

### Should Estimate Needs Carefully

Another important factor is making requisitions on the storekeeper for stationery, for, by anticipating your wants and not overestimating them, a great waste is eliminated. Paper, above all other supplies, when exposed for any length of time, deteriorates in value and is rendered unfit for the purposes required. Great care should therefore be exercised when making requisitions for it in order to avoid carrying on hand a large surplus which will deteriorate and later be sold as scrap paper, at a great loss. The phrase "Anticipate your needs" cannot be too strongly emphasized when contemplating retrenchment. It should also not be overlooked if you are underestimating your wants, necessitating the use of the telegraph wires for such items as have been omitted; by entailing this additional expense for your company by having to work telegraph operators overtime in order to get out all telegrams, you also necessitate placing of special rush orders at an abnormal price.

In connection with what has already been

Figure 2.—Illustrating the method of filling orders by employing trucks.

said, there is outlined in the next few paragraphs the system which has been adopted by the Illinois Central to curtail all stationery expense wherever possible.

In Figure 1 you will note the bin arrangement by which most of the stationery is taken care of. All bins bear form number of item carried in them and are arranged in numerical order according to form numbers used. This facilitates handling of requisition, for all items ordered by the various offices are arranged in numerical order on requisition, and consequently it is not necessary to travel through any aisle more than once in the process of filling an order. All printed forms are placed in bins face downward in order to protect them from dust. This system, you can readily see, is one of utmost importance, for if it were not enforced a great loss would be experienced each year due to destruction of expensive forms on account of being soiled by dust. This is a matter that should be taken care of not only by the stationery storekeeper but by all using stationery.

### Trucks Used in Filling Orders

Trucks as shown in Figure 2 are used when filling orders. They are wheeled from one

Figure 4.—Shipments being packed in stationery cases all of which are numbered and record carefully kept of routing

order number. Listing of order number on this record facilitates handling of invoices, for this information must also be shown on invoice when submitted for payment, in order that it may be readily checked against order. All shipments, whether special or stock, must be forwarded to stationery storekeeper for original checking. The shipment listed on form 1169, shown in Figure 3, was purchased for the agent at Coles, Ill., and this information must always be given in order to show what disposition was made of material and that transfer bill may be issued to cover.

**Handling Records**

storehouses along the line. Section 5 should show requisition number for material ordered during the current month. The other sections not mentioned are used to record receipts, there being 100 of form 230 received on January 6, leaving a balance of 200 still due on requisitions dated prior to January. The balance still due is carried forward to the section provided for this information under the heading "February," thus enabling the person placing orders to anticipate intelligently the requirements for the following month.

Necessary columns are provided on this blank for invoice reference and the information in connection with the freight bill covering the shipment in question. After a double check of material received and all information avail-

The receiving record, or form 1169, as shown in Figure 3, is without doubt the most important record kept in the stationery department, and it is needless to say that such a record cannot be given too close attention. This record provides place for car number and initial in which material was received, and the necessary column for requisition or

able has been shown on this receiving record by receiving foreman, the records are delivered to the accounting department, where they are filed in alphabetical order according to firm name from which material is received, and also in numerical order, thus enabling the accounting department to locate them rapidly when checking invoices against them, ascertaining whether or not material as listed on invoice has actually been received.

All invoices covering material purchased are forwarded directly to the purchasing department, where they are checked against order. Original and storekeeper's copy of invoice are then sent to storekeepers for their approval as to receipt of material. Invoices after being checked against the requisition in the storekeeper's office are checked against receiving record, and when found to be correct are approved, given serial number and listed on an abstract, which, together with original copies of invoices, is forwarded to the purchasing agent, where vouchers are issued to cover.

**Things We Should or Should Not Do**  
Save steam and you save coal.

We must all lend a helping hand and get power and equipment ready for business when needed.

Make your steps count.

The Illinois Central is making a fine showing. Are you helping to do this?

Prepare for the winter.

Pick up all old material. If it cannot be used again, it can be sold for scrap. This will help the treasury.

Strike the iron while it is hot.

Watch instructions on loading and handling of cars. Considerable saving can be made by carrying out instructions.

Wrap up your electric fan for the winter. You will need it next summer.

Clean up before the snow covers those dirty spots.

Do you help to reduce fuel costs? If so, keep it up. If not, get busy.

Keep your cattle guards in good condition. It may save a stock claim.

Why not have all your steam joints tightened for the winter?

Help get some more business—freight or passenger. We can handle it.

Now that you have had your vacation, help the other fellow. He helped you while you were gone.

**PLANNING FOR EXERCISE**

"Grab an oar in the Ship of Youth, bound for the State of Good Health, in the Gulf of the Great Out-Doors. Banish from your mind all thoughts of old age. Retain your youth through health-giving exercise." Thus reads the organization prospectus of the Illinois Central Athletic Association of New Orleans, plans for which were being laid about the middle of September. An initiation fee of 25 cents and a desire to qualify in some sport were the only requirements laid down by the organization committee, which was composed of Henry Reinhardt and Remy Bosio, addressed at the local freight office, Saratoga and Poydras streets.

Remember

October, Too!

# Traffic Department

## *Getting Foreign Freight*

By J. W. RHODES,  
Foreign Freight Agent, Chicago

**T**HE solicitation of foreign business is deeply interesting, even more so than the solicitation of domestic traffic, although both are fascinating work. There is something about this work that compels one to keep plugging to obtain a shipment, even though he learns it has been routed via a competing line.

The routing of export freight may be controlled by shippers, consignees, forwarders, steamship agents, or sales agencies; therefore the opportunity to obtain it may occur only just before a shipment actually goes forward. This, of course, is not true of large or regular movements, such as grain, foodstuffs, implements, iron or steel, etc.

Inland rates are fixed, and there is little difficulty in convincing patrons of the most favorable port in this respect, but the ocean rates are variable, making it necessary to ascertain rates on individual shipments from different ports. Generally the freight will move via the port through which the total inland and ocean rates, insurance and other costs, are lowest; however, this is not always the case. The purchaser in the foreign country may stipulate the route in his contract; he may be buying freight near some particular port and desire it all forwarded on one steamer; therefore, a slight advantage in costs may not control the movement. Again, the sailing date or the class of service controls the business.

### **Work After Shipment Is Booked**

When a shipment is booked, it is then necessary to have it forwarded in ample time to make the steamer. Bill of lading, export declarations, and documents must be prepared, consularized, and forwarded to the steamship agent. Our work is completed only when the shipper is furnished with the date of clearance.

At present there are sailings by reliable steamship lines from New Orleans to prac-

tically all the principal ports of the world. Shippers and others interested are furnished by our department with circulars which show steamship lines, ports of call, dates of sailings and other general information, and we are in a position to obtain favorable ocean rates.

The movement at present consists largely of foodstuffs. Because of the exchange condition in foreign countries, general commodities are not moving so freely as they would under normal conditions; however, it is but a question of time until they must move because of surplus production in this country and the needs of others.

### **Some Angles on Import Work**

In import work it is necessary to solicit manufacturers. Frequently the reply is that they are not importing anything. We then ascertain from them what materials are used in their manufactured articles, and very often find they are using at least one imported raw material. Names of brokers or others from whom they buy such materials are developed and followed up, with a view of finding out from whom and from what countries shipments are moving.

Many of the larger firms have separate foreign departments. In such cases it is comparatively easy to obtain information of movements of raw materials and products, as those in charge of such departments are fully informed and can give us complete information. Advice is given them as to advantages through New Orleans in the way of rates, etc. On shipments from Europe, full information is also given Donald Rose, our European traffic manager at London, who calls on shippers and endeavors to arrange for bookings and forwarding on New Orleans steamers.

The brokers frequently sell to the manufacturer on a basis of c. i. f. (cost, insurance and freight) at port-of-entry, in which cases we endeavor to have the purchaser ask his broker for quotations c. i. f. New Orleans.

### **Gulf Rates Give Advantage**

Through rates from Europe, Asia, Africa, South America, the West Indies, Central

America and Mexico, via the Gulf, are favorable when compared with rates via Atlantic ports, resulting in a substantial movement of business, especially products of the tropics, such as bananas, pineapples, coffee and sisal.

When arrangements are completed for shipments to move through New Orleans, it is necessary to prevail upon the consignees to instruct forwarding via the Illinois Central. When shipments reach New Orleans, we ascertain from the purchaser whether he desires to clear them at the port or to have them brought through in bond to destination. If the former, arrangements are made with the New Orleans foreign office to make consumption entry, and custom charges are billed against the consignee on the waybill. Should he desire shipments to move through to des-

tination in bond, the shipment is handled as an i. t. (immediate transportation) entry, and the New Orleans office is notified accordingly, such shipments being cleared at the destination by the United States customs office.

The assistance of all of our employes is needed to develop our foreign trade. The Mississippi Valley is an empire capable of supplying the world with its products and at the same time furnishing an equally extensive consuming market. There is really nothing very difficult in the handling of foreign business, the essential details merely making it necessary that those in charge have full information. With this at hand and the exercise of proper care, it is an easy matter to give our patrons most satisfactory service.

---

## *What California Means to a Traffic Man*

By T. H. FOX,  
General Agent, San Francisco, Cal.

Salesmanship is an important factor in the success of a traffic man. He must have implicit confidence in the commodity he is selling and be fully informed as to its use, its cost of production and its value to his customer.

In his field as a salesman of transportation, the traffic man of the Illinois Central has an almost unlimited opportunity. He does not have to confine his efforts to a restricted territory nor to any single class of persons. In daily touch with the public on street cars, in hotels, on passenger trains and in business houses, he can present information and arguments to the uninformed, pointing out the facilities his company has to offer and the benefits to be derived by the community from efficient transportation.

While the duties of all traffic representatives have been to increase the business and further the interests of their own individual company, we now have an added obligation. We must convince the public that the prosperity of the country is as dependent upon the successful maintenance and operation of our railroads as our health is dependent upon the normal circulation of blood through our bodies.

### **Each Must Boost Transportation**

The great world war has placed all industries in a chaotic condition, and the

transportation companies have not been exempted. In defense of our great organization in particular and of the transportation world in general, each should constitute himself a committee of one and consider it his solemn duty to enlighten the public with facts. The great transcontinental railway systems of the United States today are main arteries of world commerce, and we have every reason to look forward to a return to normalcy in the not distant future.

California offers a wide and interesting field of endeavor for the traffic man. The past twenty-five years have noted a remarkable growth in the state, which is largely attributed to the transcontinental railroads reaching from the Pacific to the Atlantic. They have with remarkable vision kept a little ahead of the demands of the country by building and maintaining first-class equipment and courageously constructing "feeder" lines into territory which at the time offered nothing for the immediate future.

About forty-five years ago California entered the citrus growing arena in an exceedingly modest way with a few stray trees which had been imported from South America. Fortune smiled upon this meager beginning, and today the state devotes 235,000 acres to the growing of citrus fruits, which is believed to be the greatest acreage of citrus fruits to be found in the world. During 1920 the total shipments of oranges and

lemons from the state was 46,757 carloads. Just pause a moment and visualize 47,000 carloads of one crop from one state! And what has made this possible? It was the co-operation of the railroads, affording privileges and facilities that would enable growers to market their product, and incidentally increase their acreage from year to year.

### A Big Business in Grapes

What is true of citrus fruits is also true of other products of the soil in California. There were 200,000 acres devoted to raisin grapes in 1920, 70 per cent of which were in Fresno County alone, 70 per cent of the remainder being scattered among Kings, Tulare and Madera counties. Grapes thrive in these counties, and the climatic conditions for their sugaring and curing into raisins are ideal. The state produces approximately 75 per cent of the world's total production of raisins, exclusive of the Grecian currant. Spain grows about 18,000 tons; Australia, about 2,000. No figures are available for the new raisin-growing fields of South America and South Africa. The success of the raisin-growing industry has been due to its being built upon a foundation of co-operation and the realization upon the part of the grower that the successful marketing of a crop is just as necessary as the successful growing thereof.

When California shipped its first five carloads of walnuts thirty-five years ago the opinion was freely expressed that if it did not go slow it would find itself with too many walnuts. However, during the past winter walnuts rolled out of the state in solid trainlots—the 1920 production was nearly 50,000,000 pounds. These trains dropped their cargo in the principal cities of the Union until today the crop has disappeared. Distribution has automatically increased consumption. The walnut in California dates back to the early Franciscan fathers in the days of '49. These founders of the early missions planted walnuts, but obviously no real development could be made until distribution had been perfected.

### See What 23 Years Have Brought

Deciduous fruits, such as apricots, cherries, grapes, peaches, pears, plums, etc., have grown from a total shipment of 5,300 cars in 1897 to 35,000 cars in 1920.

Space will not permit even a brief outline of the various other industries that have been

built up around distribution, which means railway service and co-operation.

During 1920 California shipped, in addition to the above-mentioned crops, 15,000 cars of dried fruits, 17,000 cars of fresh mixed vegetables, 12,000 cars of canned fruit, 4,500 cars of prunes, 12,000 cars of cantaloupes and several thousand cars of lumber, fresh and canned fish and meats, cotton, minerals, etc. Without an effective method of distribution, this enormous production would have been valueless, and California well realizes that its present-day development is largely due to the great trunk and overland railroads and the fact that they have always been a trifle (and in most cases years) ahead of the country's demands by foreseeing its possibilities and taking practical and adequate steps to furnish it with modern transportation to the world's markets.

The fact that the Illinois Central has been a party to this wonderful development some 2,500 miles from home makes it easy to understand just what the transportation systems of the United States mean to our individual, state and national prosperity.

### THE CHECKER

Tell me not in mournful letters

Shorts are not just what they seem;  
We must check our shipments better,  
Or ne'er realize our dream.

Shorts are real; shorts are many;  
And we will not reach the sky,  
Till we get to checking better,  
As we did in years gone by.

Check freight in, and check it out, sir;  
Check all sides and check the backs;  
Check all old marks scribbled on it;  
Check the nails driven in the cracks.

Check the waybills when we get them;  
Check the freight bills when they go;  
Check the drayman both ways surely;  
Check the train crews to and fro.

Shorts and O. S. & D's remind us  
We should make our records clear;  
So we will not leave behind us  
Claims to last another year.

Let us then be up and doing;  
Hearts to win and full of pep,  
Knowing that the lines we're viewing,  
Are a note to keep our step.

# Law Department

## A Lack of Co-operation

In a recent case in the Circuit Court of Appeals of the Eighth Circuit (*Atchison, Topeka & Santa Fe Railroad Company v. Merchants Live Stock Company*, 273 Fed. 130), it appeared that the general manager of the live stock company and three other care-takers accompanied a shipment of poor, weak cattle, moving from a point in New Mexico to Kansas City. Under the provisions of the 28-Hour Law, these cattle had to be unloaded, fed, watered and reloaded twice during the journey. They were first unloaded at Strong City. At that time they had been thirty-four hours in the cars. It was impossible to reach the next unloading point within the 36-hour limit.

The general manager got into an altercation with the employes of the train as to the proper place for unloading, and refused to allow his care-takers to give any assistance whatever in unloading and loading the cattle at Strong City and Amarillo. They stood to one side, with their hands in their pockets and looked on while the cattle were being unskillfully handled and fed by the train crew, and then sued for damages because of this poor handling.

The court was not sympathetic with this contention. It held that there was a clear, legal duty and obligation on the shipper to render such aid and assistance through the care-takers from time to time as would be helpful in protecting the shipment against loss and damage. It is apparent that the petulant general manager will suffer a considerable amount of loss by reason of his mood.

## More About Employer's Liability

A rather interesting case arose in South Dakota in connection with the Workmen's Compensation Law of that state. It is provided in the South Dakota statute that an employer who has not repudiated the act is required to insure his liability or, in lieu thereof, furnish proof of solvency or financial ability or deposit security, and if he did

not take any of these courses he could not defend on the ground of contributory negligence, as could employers who complied with the statute.

In a suit against the Director General by an employe who was not engaged in interstate commerce, the question arose as to whether the Director General was required to insure his liability, furnish proof of solvency or financial ability, etc., in order to avail himself of the defense of contributory negligence on the part of the plaintiff.

The Circuit Court of Appeals of the Eighth Circuit (*Hines, Director General, v. Meier*, 273 Fed. 168), has just held that the Director General, being an agency of the government, and indeed a part of the government, was exempt from all these requirements of the statute, although there was no express statutory exemption in his favor. The court further held that he was an employer of labor and was subject to the general features of the law, but could no more be required than could the state to furnish security for payments.

## Not So Much Responsibility

Out in Iowa the Chicago & Northwestern Railroad Company and the Director General were sued by one D. Medema, because the plaintiff, who was driving a motor car, ran into the railing which protected an embankment constituting an approach to a bridge over the railway tracks. The railing gave way, and the plaintiff was thrown to the ground, sustaining serious injuries.

The plaintiff contended that the railway company was negligent in two particulars: first, that it was negligence to approach the bridge on a curve; and, second, that the railing should have been strong enough to resist the assault of the automobile. It happened to be a rainy day when Mr. Medema was crossing, and his car skidded a good deal. He insisted that if the approach had run off in a straight line from the bridge, when the skidding occurred he would not have been thrown against the railing, and

further that if the railing had been unusually strong it would not have broken with him.

The case stood for trial in the federal court, and Judge Reed held that the plaintiff could not recover. This judgment has just been affirmed by the Circuit Court of Appeals of the Eighth Circuit (*Medema v. Hines, Director General*, 273 Fed. 52), the holding being that there was no obligation upon the railroad to provide either a straight road leading away from the bridge or a railing strong enough to resist the pressure of the automobile.

### Limitations in Liability Cases

Two interesting and important points arising under the Employers' Liability Act have recently been discussed by state courts. One of these relates to the question of whether, in the case of the accidental death of an employe, the 2-year statute of limitations provided in the act begins to run from the time of the death of the employe or from the time when the administrator is appointed. The question is, of course, a federal one and has been variously decided by the federal courts. In *Bixler v. Pennsylvania Railroad Company*, 201 Fed. 553, it was held that the limitation began to run from the death of the employe, while in *American Etc. Railway Company v. Coronas*, 230 Fed. 545, it was held that the limitation ran from the time the administrator was appointed.

The case which has just come to our attention is *Seaboard Air Line Railway Company v. Brooks*, 107 S. E. 878, in which the Supreme Court of Georgia, reviewing all the authorities, state and federal, finally reaches the conclusion that the statute runs from the time of the death of the employe, and not from the time of the appointment of the administrator. The court was evidently influenced in some degree at least by the fact that any other holding would leave cases of this kind open so that suit could be brought many, many years after the death of the employe, provided that an administrator had not in the meantime been appointed.

The other interesting case relates to the question of whether the Transportation Act, which provides, among other things, that the period of federal control shall not be computed as a part of the period of limitation in actions against carriers, so applies as to extend the 2-year period provided in the federal Employers' Liability Act. The question

was before the Court of Errors and Appeals of New Jersey, in *Jones v. Delaware, Lackawanna & Western Railway Company*, 114 Atl. 331, and it was ruled that this provision of the Transportation Act did not stop the running of the statute of limitations. The court held that the 2-year provision in the Employers' Liability Act was a limitation on the extent of the cause of action itself, or in other words a limitation on the liability, and that the suit must be brought within two years or else no cause of action exists. The court did not find it necessary to pass upon the constitutionality of the limitation provision of the Transportation Act, a question which has been much mooted.

### The More You Do

Did you ever notice, the more you do,  
The more you are fit to try?  
And the harder a fellow climbs a hill,  
The easier he goes high?  
The harder the job, the firmer the jaw  
That's set to the task; there grows  
A confidence backing the man who tries,  
And the farther ahead he goes.

When a job is easy, one falls asleep—  
Is asleep when the game is called;  
And the man who could run can hardly creep  
When his engine of luck has stalled,  
But the keener the fight when a man runs right,  
The easier things come through.  
And the easiest job when it's finished is that  
Which at first was hardest to do.

The more you do, the harder you hit,  
The faster you run, old friend,  
Just that much easier is your bit,  
With a victory at its end.  
The world is looking for square-jawed men  
And not for the fools that shirk—  
We've played long enough with painted toys,  
For this is the Age of Work.

# Hospital Department

*That Illinois Central employes appreciate the excellent hospital service they have is evidenced by the many letters received by Dr. G. G. Dowdall, chief surgeon, from patients and members of their families. Letters representative of many different departments of the system are given below.*

## Had to Lose His Left Foot

I feel that I owe to you and your staff that are in charge of the hospital department my hearty thanks and appreciation for the kind treatment and service I received while I was in the Illinois Central Hospital at Chicago. After the long time I was in the hospital under your care while I was undergoing three operations in which it became necessary to lose my left foot, I cannot speak too highly of the care and also the treatment I received. I think that any employe could not invest in any better cause which would produce more returns to him or to her than the hospital department. Experience is the best teacher, and I have come to feel the greatest gratitude and appreciation toward the Illinois Central hospital department.—JULIUS WEBER, *engineer, 315 South Sycamore street, Centralia, Ill.*

## Had a Fractured Elbow Fixed

I have arrived at my home after a sojourn of several months at the Illinois Central Hospital in Chicago, where I have been undergoing treatment for a badly fractured elbow.

I want to take occasion to express my appreciation of the kindness and attention shown me while there by everyone with whom I came in contact. This consideration was shown by our nurses, doctors and attendants at the hospital from the superintendent down. At all times I found them cheerful and willing when called for.

Without doubt the Illinois Central Hospital at Chicago is one of the best in the country, and the railway employes are fortunate in having such an institution for their benefit, and with such capable and efficient nurses, surgeons and attendants to look after their

welfare.—WALTER A. WYLY, *conductor, Y. & M. V., Memphis, Tenn.*

## Calls It the Best Insurance

Just a word of appreciation for the good treatment and attention I received during my stay at the Illinois Central Hospital, Paducah. I had a very painful accident, necessitating my leaving the road and entering the hospital for treatment.

In a short time I was able to be back home again and will soon be able to return to my work. I received the very best care and attention from the doctors, nurses and attendants at the hospital, to which I attribute my speedy recovery.

I have never before been able to appreciate just what our hospitals meant to the Illinois Central employes and wish to say that the amount donated to the maintenance of our hospitals each month is the best insurance that any employe can carry.—T. E. HARPER, *section foreman, Princeton, Ky.*

## Relatives Write Appreciation

We wish to let you know of our appreciation of the service and attention given to our late husband and father, William R. Murray, formerly employed as flagman, Burnside Shops, Chicago, during his illness from November 19, 1920, to February 20, 1921, at the Illinois Central Hospital, Chicago, and also of the courtesy extended to us by all employes of that hospital. We cannot speak too highly of the way the Illinois Central Hospital is supervised, the attention given its patients, and the courtesy extended by its employes.—MRS. WILLIAM MURRAY AND FAMILY, *7204 University avenue, Chicago, Ill.*

## Result a Wonderful Success

January, 1921, I was operated on at the Illinois Central Hospital, Chicago, and through you I desire to express to the surgeons and nurses at the hospital my sincere appreciation for the kindness received while in their care. I have now returned to work and I consider the

results of my operation a wonderful success.—  
ARTHUR L. CRYER, *freight checker, Kankakee, Ill.*

#### Reports His Leg as Being Well

I am going to write a few lines regarding my leg. I wish to express to you and your efficient staff and nurses many thanks for the good treatment accorded me while a patient at the Illinois Central Hospital, Chicago, the latter part of November, 1920. It is now three months since I left the hospital, and I will say that my leg is well—JOHN VOELKEL, *car carpenter, 2821A Cass avenue, St. Louis, Mo.*

#### Kindness Outside of Duties

My wife and I wish to thank you for all the good treatment and kindness shown me while a patient at the Illinois Central Hospital, Chicago. The many little acts of kindness on the part of the nurses outside of their regular duties are never to be forgotten. Our best wishes to the future success of the Illinois Central Hospital Department.—J. D. BULL, *machinist, 215 Summit street, Freeport, Ill.*

#### On Duty Most of the Time

I was in Chicago in March, 1921, for an examination of my foot, which was badly crushed at Lambert, Miss., on November 3, 1920.

I wish to extend my greatest appreciation for the treatment which was accorded me and the considerate attention which I received. I have been at work since I was directed by you to return to duty, and have lost only two trips on account of the injury.

I wish to ask you to thank the company surgeon at Memphis for the most excellent attention which I received while under the care of the hospital department at Memphis. I appreciate very much indeed the sympathy shown me by the officials as well as other employes since my injury.—R. H. EMERSON, *flagman, Y. & M. V., Memphis, Tenn.*

#### A Hospital Just Like Home

Feeling a deep appreciation for the excellent treatment received by me in the Illinois Central Hospital at Paducah, I desire to take this means of expressing my thanks to the hospital department and to the management of the Illinois Central. I was taken in the Illinois Central Hospital June 10, 1921, with a severe case of appendicitis and was operated on on that date,

being released a well man on June 21, 1921. During the time that I was in the hospital I received the very best of treatment from the hospital staff and from the nurses; in fact, I could not have received better treatment in my own home. My operation was a success, everything possible was done for my comfort, and I must express my appreciation for this excellent treatment.—MARTIN STANDFIELD, *machinist apprentice, Paducah, Ky.*

#### Urges All to Support Work

As an employe of the Illinois Central Railroad Company for the past eighteen years, I wish to say something in behalf of the Illinois Central Hospital, Chicago.

I became ill the first part of March, 1921, and, after having been treated at home several days, I was finally persuaded to go to the Illinois Central Hospital. At that time I was hardly able to walk or stand alone, but after receiving eleven days' treatment there, I have felt like a new man and have gained fifteen pounds in one week. In short, I want to say that the treatment and attention which I received while in this hospital could not have been better.

I am telling all of my fellow employes of the wonderful benefits that are available through the hospital department, and, after having been a patient at the company hospital at Chicago and seeing and once knowing the great privilege offered to the employes of this company through the hospital department, I hold that we should all do our best to help support this great institution.—SCOTT STEELE, *section laborer, Bloomington, Ind.*

#### Treatment Kind and Good

I take this means of expressing my appreciation of the treatment which I received recently from the hospital department while I was a patient at the Illinois Central Hospital, Chicago. I wish to thank the nurses and all others who came in contact with me for the very kind and good treatment.—W. L. REAMS, *machinist, Mattoon, Ill.*

**October, Too!**

# Empty Sack Question an Important One

By W. F. CONFREY,  
Chief Clerk, La Salle, Ill.

One of the most, I dare say the most, important items of the transportation situation today is the prevention of freight claims. From time to time meetings are held by officials of the various carriers and this topic is thrashed over time and again with the end in view of reducing the work of the "OS&D" clerk to the lowest possible minimum. I am confident that the agents, at stations where cement is a prominent industry, will quite agree with me when I say that by employing a little more caution in the acceptance for shipment and the handling enroute of returned empty cement sacks, the various agents can effect an enormous betterment under the heading of "Claims." I feel that this subject is not being given the careful attention it commands and in a great many cases we find where the governing classification is being ignored from every possible angle. When the forwarding agent signs a bill of lading for a consignment of cement sacks to be returned to the shipper, he at that time assumes a liability, which is prorated in accordance with the number of carriers, handling, and which amounts approximately to 15 and 25 cents per individual sack depending on the grade of the sack. The sacks, as a rule, are bundled 50 to the bundle, though in some cases we receive bundles of 100.

Those in general use now are valued at 25 cents—you can readily figure what it means to pay for a bundle of cement sacks. You will find the following, by turning to page 73, item 21, of incidentally both the Illinois and Consolidated Classifications: "Note 2—Old (used) cement bags, must be prepaid. Less than carload shipments of old, used cement bags in bales, bundles or rolls, must be securely bound with not less than three separate wire or rope ties (rope to be not less than 3-16 inch in diameter), each bale bundle or roll must be marked with linen address tag securely attached by wire, which must show name and address of both the consignee and consignor." There is not the least doubt in my mind but what the billing agents can effect a great improvement by following this matter up and refusing to

accept sack shipments unless the classifications are complied with to the letter. It is greatly in evidence that some shippers prepare or bundle their shipments so they will "get by" the agent signing the bill of lading and then it's a case of the carriers handling the shipment to destination as best they can—and if they cannot make an A No. 1 delivery it's up to them to entertain a claim. The aggregate capacity of the three cement mills at this station represents a round figure of twenty thousand barrels daily or eighty thousand sacks. During the cement season I have known one of the mills to bill out twenty thousand barrels in one day, this, of course, taken from their storage along with their daily output. At the time this cement is billed, the customer to whom the consignment is billed to is charged with the sack and when he returns same he is allowed an offsetting credit. It is easy to understand, taking these various points into consideration, why it is very much to the interest of the various consignees to return these sacks, and you can draw your own conclusions as to the number of cement sacks returned to this station during the year. The cement people at this station furnish each of their customers with a linen tag for marking each bundle of sacks to be returned. These are an excellent tag and should be used in all cases where sack shipments are returned.

When these tags are properly filled out they will show shipper, point of shipment, number of sacks and number of bundles in shipment, and they being a form tag will show the consignee and destination. In a great many cases we have been able to effect proper delivery and secure revenue billing to cover astray shipments through medium of properly tagged bundles while in other instances we have been swamped with astray sacks being at loss to know with whom to handle for billing. We are receiving tracer upon tracer daily from different interested parties requesting that we show delivery of shipment that should have been delivered during the past six months and which would have been properly delivered had the proper precaution been taken in the bundling and tagging of the shipment. We had an instance here not long ago where we received an astray bundle of

cement sacks marked for "The Portland Cement Co., La Salle, Ill." We have three companies here and they all manufacture Portland cement—the bundle contained sacks belonging to all three mills, which the brand on the sacks indicated. Hence—a case where a bundle of fifty 25c sacks went to the over pile and someone was called upon to pay a claim for \$12.50. Had this bundle been properly tagged we would have been in a position to handle at once for revenue billing and eliminate the possibility of a claim.

We had another case where we received a shipment of twenty-five bundles astray marked for the Alpha Portland Cement Co., total number of bundles in shipment not shown on tags. We at once handled with the billing station shown on the tags citing the name of the shipper as shown and were informed by the agent that the consignee mentioned had made several shipments that week and we did not furnish sufficient information for him to furnish copy of way-bill. It required just three weeks for us to straighten this matter out and it developed that the twenty-five bundles we were over constituted a twenty and a five bundle shipment—all this maneuvering required time as

well as extra work and during this time the contractor was obliged to wait for an adjustment of his sack account. The agents at our various junctions can do a lot toward correcting these irregularities by insisting that the connecting lines deliver such shipments to us in the proper condition—because when we give them a clear receipt, which is done in a good many places, it is up to us to bear the claim. The two other roads in this town, the C., R. I. & P. and C., B. & Q. are in pretty much the same predicament we are, which is very much in evidence at our weekly O. S. & D. meetings, and we frequently check over sacks they are short and vice versa. The auditor of freight receipts, in his circular No. 1, par. 124, touches on the acceptance of cement sacks and sets forth that all shipments must be fully pre-paid. We also find this rule invoked in a good many cases.

I am of the opinion that a good many of the agents do not know the vast importance there is connected with the transportation of empty cement sacks. Too much care cannot be taken from the time the sacks are accepted for shipment until they are delivered at destination.

## "No Exception" Effects Prove Permanent

Payment of claims for short packages destined to points on each division continue to show remarkable decreases as compared with a year ago.

August, 1921, compared with August, 1920, shows a decrease of 927, or 79 per cent.

Considering that the LCL tonnage shows a decrease of only 23 per cent, a reduction of 79 per cent in the number of claims paid for lost packages is a remarkable reduction, according to C. G. Richmond, superintendent of stations and transfers. It shows the good results which have been obtained from the three months' "No Exception" campaign and the increased interest of the employes in all departments in seeing that LCL shipments are properly checked, trucked, stowed and delivered.

These four features in connection with the proper handling of freight practically solve

the problem of claims on LCL shipments, Mr. Richmond believes.

The decrease of 927 in claims paid for lost packages was accomplished as follows:

## Mr. Ford's Railway Miracle

(Continued from Page 43)

between departments have been found to be duplications and have been eliminated.

### The Station Agent's Opportunity

One of the simplifications of the organization which the new management is developing is the utilization of local station agents in the settlement of freight loss and damage claims. It is believed that the best interests of the road demand that the local agents be among the biggest men in their communities and that all matters affecting the relations of the railroad with the community should be handled by the agent if he is to justify his title. Furthermore, placing this responsibility on the agent is expected to effect a material saving in legal fees, which will be confined as far as possible to cases requiring technical legal advice. It is the belief of the present management that the legal department is too frequently made a dumping ground by other departments for many difficulties which, were they required themselves to settle, they would be more careful to prevent.

Local agents are given complete jurisdiction over their territory. If a small force of car repairers or an inspector are employed at an interchange point where conditions do not provide enough work to keep them steadily engaged, they are subject to the orders of the agent for warehouse work, or clerical work if they prove adaptable for such duties and as circumstances require.

### No More Off-Line Traffic Agencies

The discontinuance of off-line agencies, effective July 1, is based on the belief of officers of the Ford Motor Company from their own experience that off-line traffic representatives seldom represent their railroads effectively. Few of such representatives, they believe, have an adequate knowledge of the percentages of through rates accruing to their railroads or of the kind of service their roads can render economically. They are, therefore, neither in a position to serve the best interests of their roads intelligently nor to guarantee the performance of the service they will promise in order to secure the routing of a few carloads of freight over their lines.

Expressing the belief that competition

for traffic should aim at the development of a freight movement along natural channels and that solicitation should be based purely on the service which the road can render, the present management proposes to substitute for the frequent calls of a local representative, out of touch with the actual conditions on the property, the less frequent calls of an officer thoroughly conversant with the operation of the road, the class of traffic it is best adapted to handle and the kind of business producing the best revenue—an officer who can represent the company adequately and who knows that the kind of service promised can and will actually be performed. In order to provide close co-operation between the traffic and operating departments, the head of the traffic department has been made an assistant to the chief operating officer, with duties somewhat similar to those associated with the title of superintendent of transportation.

### What Have the New Policies Accomplished?

There are two distinct possibilities for changes in the net operating return under the new management. The marked improvement in revenues is a matter of business relationships which would not have been essentially different had the D. T. & I. purchased the Ford Motor Company. The effect of the policies of Mr. Ford's management on the cost of operating the property is quite a different matter and must be studied apart from consideration of the revenues. A comprehensive judgment of the effect of the more distinctive Ford policies must await the returns from several months' operation. But the effect of the reductions in the number of employes and changes of organization which have been referred to above should already be reflected in the operating expenses for April, May and June.

Owing to the inability to allocate operating expenses to freight and passenger service and because of the fact that maintenance expenditures over a short period may have little relation to the volume of traffic, it is impossible to compare total operating expenses to determine with any degree of accuracy what effect certain policies may have had on operating costs. A rough comparison of the train mile cost of conducting transportation, however, indicates that there has been a well-defined tendency

toward improvement since last October. By referring to the table of operating statistics it will be seen that since October there has been a steady decline in the transportation expense per train mile (passenger and freight) from \$3.01 to \$1.98 in June of this year. This well-marked decrease has been steadily maintained, except for increases in January and March, through a period during which there has been both a sharp decline and a sharp increase in the volume of traffic, and a decrease followed by an increase in the gross tons per train. It is evident that well-defined improvements had been made prior to the time when Mr. Ford assumed active control of the property on March 4, 1921, but the reduction of transportation expense per train mile to \$1.98 in June, as compared with \$2.10 in March and April, 1920, under lower wage scales, marks a distinct accomplishment.

permits the delivery to interchange points of a considerable portion of the movement in train-load lots.

Another important factor is a decrease in unit coal consumption, amounting to about 20 per cent as compared with the same months last year. This is largely owing to a marked improvement in quality; the freedom from confiscation, generally practiced last year, has also tended to reduce the prices.

The important question with respect to maintenance is not so much the relation of expenditure to volume of traffic as whether or not the property is being currently maintained. An extensive program of track improvement was inaugurated under the former management. J. A. Gordon, the former president of the road, is quoted in the *Wall Street Journal* to the effect that up to the

\*Some back pay, incidental to the wage award of July 20, 1920, included in this month's accounts.

**Most Traffic on One Division**

Aside from the effect of the decreased payroll, one of the factors entering into the decreased transportation expense is the fact that a large part of the traffic during recent months has moved over the Northern division, which extends from Detroit to Springfield, Ohio, with a branch from Dundee, Mich., to Toledo, Ohio. During a recent month the total car movement on this division amounted to about 42,000, while that over the Southern division was about 12,400. The greatest improvement in the track has been made on the north end of the line. Furthermore, the nature of the traffic

fall of 1920 most of the 220 miles between Detroit and Springfield, Ohio, was laid with 60-pound rail more than twenty-five years old. Its rehabilitation to a standard justified by the present prospects of the property has not yet been completed. It is not the policy of the present management to carry out this rehabilitation faster than is justified by the earnings of the property. The railroad must pay its own way.

During 1919 the total maintenance of way expenditures ran at the rate of \$2,490 per mile of line. Last year, with a considerable amount of rehabilitation work, they

averaged \$4,170 per mile of line, the greater part of which were made after Mr. Ford acquired control. For the four months since Mr. Ford has had active charge of the property, they have run at the rate of \$2,540 a mile per year. Tie renewals and ballasting are being carried on at a rate which, except for that during the last half of last year, is probably a record for the property. Track conditions are improving rather than deteriorating.

**Maintenance Is Keeping Up**

Maintenance of equipment expenditures have followed a general course similar to those in the maintenance of way department. A comparison of the Detroit, Toledo & Ironton with all Class I roads shows that the average expenditures for locomotive maintenance have closely approximated the average for all of the Class I roads, indicating a fair average condition. But the expenditures per unit of freight and passenger car equipment have been decidedly less than the Class I average. Retirements have been especially heavy during the past two years, for, from an ownership of 3,006 freight cars in 1918, the number has now decreased to a total of only about 1,700 in revenue service.

During the four months of the current year since March 1, the expenditures for maintenance of equipment were \$334,479 during the same period of 1920 the amount was \$317,836. During the last four months of 1920 maintenance of equipment expenditures aggregated \$646,314. Here again Mr. Ford has the benefit of an intensive maintenance program of several months' duration, particularly with respect to cars, carried out by the former management, but the amount of work being obtained for the present expenditures is probably meeting current requirements.

While these general conclusions can be drawn on the basis of the data available, no adequate comparison of the effectiveness of maintenance expenditures can be drawn until the maintenance programs of the present management have reached a current level, free from the disturbing influence of much needed rehabilitation.

Traffic expenses during the four months of Mr. Ford's management averaged \$6,942 monthly, as compared with \$8,469 during the last four months of 1920. General expense

decreased to an average of \$16,997 a month from \$20,493 a month during the same periods.

**Improvements in Operating Expenses**

Again applying the conditions created by Mr. Ford's management to the operations of the month of December, 1920, a rough idea may be obtained as to the effects on the operating ratio of the operating economies effected by Mr. Ford. An estimate of the effect of the improvement in operating expenses is shown in the following table. No allowance has been made for decreased maintenance expenditures, as the present operation of the property is undoubtedly benefiting from the comparatively heavy maintenance program in progress at the close of the year and it is impossible to estimate with any degree of accuracy the extent to which productive efficiency in the maintenance department has increased. Transportation expense is estimated on the basis of June conditions, and the reductions in traffic and general expenses, as reflected in the March to June average, are taken at their face value.

**Operating Expense Rates Under the Ford Management Applied to December, 1920, Operations of the D. T. & I.**

	Actual	Estimated
Maintenance of way and structures .....	\$185,354	\$185,354
Maintenance of equipment.....	244,676	244,676
Traffic expense .....	8,908	6,942*
Transportation expense.....	224,183	178,200*
General expense .....	20,706	16,997*
<b>Total .....</b>	<b>\$683,827</b>	<b>\$632,169</b>
Revenues .....	508,666	508,666
Operating ratio .....	134	124

\*Four months' average, March to June, 1921, inclusive.  
+90,000 passenger and freight train miles at \$1.98 per mile.

On this basis credit may be given to the new management for a decrease in the operating ratio from 134 per cent to 124 per cent, without any allowance for legitimate decreases in maintenance expenses of uncertain amount.

**The Public Service of the D. T. & I.**

The D. T. & I. has been called a plant facility of the Ford industries in and around Detroit, rather than a common carrier. It is this relationship in a large measure which has made possible the immediate financial success of Mr. Ford's management. The D. T. & I. has always lacked certain essential features of a common carrier. In the

The freight earnings of the D. T. & I. are now running at the rate of approximately \$8,000,000 a year. Therefore, other things remaining equal, a reduction of 20 per cent in them would reduce the road's earnings by about \$1,600,000 a year. On the other hand, the freight bills paid by the Ford industries to all the railroads amount to from at least \$15,000,000 to \$20,000,000 a year. Therefore, a reduction of 20 per cent in freight rates by all the railroads would reduce the freight bills of the Ford Motor Company by \$3,000,000 to \$4,000,000 a year. In other words, Mr. Ford as a shipper would be sure to gain millions of dollars more by a reduction in rates than he could possibly lose as a railway owner.

his own combined industrial and railway problem with results mutually advantageous to both businesses. But what is enriching the D. T. & I. has formerly gone into the pockets of competing roads. To the extent that he has been able to increase the intensity with which the D. T. & I. property is utilized, other roads have become idle. Mr. Ford has reduced local rates on the D. T. & I. But a comparatively small proportion of the D. T. & I. traffic originates and terminates on its own line. It is estimated that 60 per cent of the present traffic of the road is controlled by the Ford Motor Company, little of which originates or terminates on its own rails.

#### Not Likely to Lose by It

Mr. Ford has started a movement for a general rate reduction of 20 per cent, contending that lower rates will do much to stimulate business. The freight bills of the Ford industries are estimated to aggregate from \$15,000,000 to \$20,000,000 a year. At the rate maintained in April, May and June the freight revenues of the D. T. & I. will aggregate \$8,000,000 a year. Although, Mr. Ford is said to have been unaware of the obvious effect of this fact until it was called to his attention, it insures him against the consequences of his act in case it should

first place, it has no terminals in the city of Detroit, the one point on the line offering a large volume of traffic. The service of such terminals cannot be dispensed with although the investment required to provide them is a burden on the remainder of the properties. Mr. Ford's ownership of the D. T. & I. has not provided the city of Detroit with any additional terminal facilities; it has made possible the diversion of traffic to other channels of main line movement.

Again, many of the through routes in which the D. T. & I. is now participating are not the most direct routes. In each case, however, even where the haul exceeds the direct route as much as 100 to 300 miles, a much quicker delivery is claimed. It has been stated this improvement has reduced the average time in transit for the Ford Motor Company from three weeks to two weeks, thereby reducing inventories by approximately \$22,000,000. Typical of the measures by which this has been accomplished is the demand of the D. T. & I. on its connections that transfer tracks must be pulled within twenty minutes of the time of the D. T. & I. delivery. The delivery of traffic in many cases in train load lots is a factor in securing favorable action from connections. It must be remembered that this improved service is being obtained at a time when no road is suffering from congestion.

#### The General Application of Ford's Methods

Mr. Ford has applied business methods to

The facts show that under the Ford management the financial results of the Detroit, Toledo & Ironton has been very greatly improved. They also show that no miracle has been worked. The results obtained thus far have been due almost entirely to the circumstances that the ownership of the Detroit, Toledo & Ironton has been acquired by one of the largest manufacturers in the country, and that Mr. Ford has used his position as a very large shipper in the country to do things on the D. T. & I. which neither he nor anybody else could have done without being such a large shipper. \* \* \* Furthermore, the management of the D. T. & I., in common with all the other railroads, was able, partly because of the smaller traffic handled by it and partly owing to other causes, to make large reductions in its operating expenses.

fail to effect the improvement in railway conditions which he expects.

Consideration of these facts does not encourage the belief that Mr. Ford has discovered a panacea for all railway ills. His operating policies, however, have so far been marked with a degree of success sufficient to justify the railway world in watching their continued progress with an open

mind. Time alone will demonstrate their wisdom, or otherwise. If they are successful the entire railway industry will profit therefrom; if they fail, the loss will be Mr. Ford's. But in measuring their results, the marked effect on revenues of the business relationship between Mr. Ford the shipper and Mr. Ford the railway man must be kept clearly in mind.

### THE NEW RUSSIAN WAGE SCALE

[Copyright: 1921: By The Chicago Tribune.]

Showing it isn't how much wages you get, but how much they will buy, that is the important thing.

# NEWS of the DIVISIONS

### AROUND CHICAGO

#### Dining Service

Everything is running well at the Illinois Central commissary. Business is picking up, and the outlook for the future seems bright.

Our superintendent, C. B. Dugan, spent a pleasant two weeks' vacation touring the West. He was accompanied by Mrs. Dugan. He combined business with pleasure by seeing just how the other railroads were running their dining cars.

Frank Brown has returned from a week's vacation in the South. He had the pleasure of calling on James Price, former commissary accountant. Mr. Price and his family are now on a farm near Mobile, Ala., and doing well.

Martin Carroll, clerk, was fortunate in getting a little freight business for the Illinois Central—a carload of marble chips from Evansville, Ind., to Chicago.

Johnnie Burke, our office boy, had a pleasant vacation. He visited his soldier friends at Camp Grant. Johnnie wants to be a soldier, but he can't get his parents' consent, and so he will have to stay with the Illinois Central.

Harry Deal, steward on the Panama, took a trip to Binghamton, N. Y., and visited in the mountains for a couple of weeks. He also made a side trip to Saratoga. Owing to increased

business, we had to wire him to return to Chicago, and he is now back on the Panama.

Everybody at the commissary was surprised when paid an unexpected visit by William Elliott, former chief clerk. He has been away in California for seven months, trying to regain his health.

#### Baggage and Mail Traffic Department

Ralph Spiro, stenographer in this department, has resigned to enter the University of Illinois.

The girls of the department held a dinner and theater party September 22.

Ray Goldberg of the mail room spent his vacation at Neenah, Wis.

Miss Irene Nolan attended the wedding of Miss Lillie Brann, a former employe of this department, and Harry Hertzog, Illinois Central electrician, which took place September 27.

Mrs. Ella Clark has been absent on account of the death of her mother, Mrs. T. Berkley, wife of Tom Berkley, who has charge of the in-baggage room at Central Station. The Baggage and Mail Traffic employes desire to extend their deepest sympathy in the time of their bereavement.

#### Suburban Passenger Service

William Kircher has been commended for

Maintenance and construction force, Wisconsin division, at work on signal changes necessary in the extension of Wallace Yard at Freeport, Ill. Left to right: A. Long, assistant maintainer; A. J. Johnson, maintainer; E. J. Schultz, signalman; F. J. Ryan, supervisor of signals; R. S. Jephson, foreman; C. A. Mikeworth, signalman; J. Harenski, helper; J. Tace, assistant signalman. At right, interior of automatic block signal W 1147—three position, upper quadrant, style K type, operated by portable type lead storage battery which is charged at the signal location by a mechanical rectifier, using the trickling charge method. The signal is electrically lighted, the current for the light traveling on the same line that serves the rectifier.

his thoughtfulness in carrying on to Matteson by automobile a woman passenger who had bought a ticket to that place but who was unable to ride beyond Flossmoor owing to the fact that service to Matteson had closed for the day. "It is acts of this kind that make our service and its employes popular with the public," wrote A. Bernard, superintendent of the suburban passenger service.

#### ILLINOIS DIVISION Superintendent's Office

Miss Fairy Wand has resumed her duties as assistant tonnage clerk, after a three months' leave of absence.

Timekeeper R. J. Truitt has moved to his little farm in East Champaign, and we wonder what he is going to do next. A sign on the gate in the front yard reads, "Rooms for rent and milk for sale."

Miss Blanche Lawson, accountant, accompanied by her mother and sisters, is spending a two weeks' vacation in New Orleans, La., and points in Texas.

E. L. Milne has again resumed his duties as professor at Lake Forest after spending a summer with us.

Our chief clerk, Wayne A. Johnston, has been promoted to be assistant chief clerk to the general superintendent, Chicago, and expects to leave about the last of September. While we all regret seeing Mr. Johnston go, yet we must say that we are glad, as we know that this is just a stepping stone to something better. R. G. Miller, chief clerk to Superintendent H. J. Roth at Mattoon, will succeed Mr. Johnston.

G. E. Webster, report clerk, has been promoted to be assistant chief clerk.

Hard Walters, car distributor's clerk, was operated on for appendicitis at the Burnham Hospital September 10 and is reported to be getting along nicely.

Trainmaster's Clerk Arthur Donnals, who submitted to an operation for appendicitis August 8, has resumed his duties.

Miss Irene Connor, daughter of Mr. and Mrs. Patsy Connor, became the bride of M. A. Sheehan, son of Mr. and Mrs. Michael Sheehan, at St. Malachy's Church, Rantoul, September 20. The bride was a resident of Rantoul. Mr. Sheehan is an accountant in the division offices at

Champaign. The couple will spend their honeymoon in Chicago and Oklahoma, returning to Champaign about October 15, after which they will be at home in the O'Byrne Apartments, 111 East Springfield avenue.

#### Champaign Freight

Miss Helen Sullivan, expense clerk, has returned from a two week's vacation in Denver and Colorado Springs.

D. V. Harris and family left Saturday, September 17, for a visit in Richmond, Va., Mr. Harris' former home.

The September Illinois division signal employes' educational meeting at Champaign Sunday, September 18, had an attendance of forty-nine. The Electric Storage Battery Company was represented by Mr. Beck and Mr. Crantford. Mr. Beck's address on the storage battery was as much in detail as time would allow, and with the stereopticon views, given by Mr. Crantford, the subject was not sacrificed from a maintenance standpoint. At the end of the address everyone was so interested that Mr. Beck was bombarded with questions from every angle. Both he and Mr. Crantford declared after the meeting that they had been agreeably surprised at the attendance and interest taken by the organization.

Roadmaster J. L. Downs attended the last half of the meeting and listened to the questions. He said it was gratifying to learn that the men were so hungry for knowledge, and he believed that the meetings were forming supervising timber, as well as timber for the signal engineer's office.

#### ST. LOUIS DIVISION

Caller E. D. Barnes spent his vacation in Louisville, Ky., visiting relatives and friends.

The Chicago Chamber of Commerce recently made a tour of the St. Louis Division. The visitors were highly pleased with the conditions as found. They spoke favorably of the possibilities of southern Illinois when brought to its highest point of development.

A fuel conservation meeting was held recently, with Traveling Engineer J. H. McGuire presiding.

Mrs. Nell Harris, message operator, spent

Illinois Division Signal Employes' Educational Meeting, Champaign, Sunday, September 18.

# Hamilton Watch

"The Railroad Timekeeper of America"

*Engineer Frank Fitzsimmons of the Rock Island Lines*

## The Tiny Wheels of the Hamilton Watch Regulate the Big Drivers

On America's fastest trains, it is the Hamilton Watch that helps the engineers to bring their trains in on time. They carry Hamiltons because they have found them to be entirely trustworthy as timekeepers under all conditions of railroading.

Are you worrying along with a slightly inaccurate timepiece? Does the time inspector ever shake his head over your watch? Then it's time for you to think about getting a Hamilton.

When you buy a Hamilton you buy accuracy and durability—you buy a

watch that will give you a lifetime of satisfaction and safety.

For time inspection service, the most popular watch on American railroads is the Hamilton No. 992 (16 size—21 jewels).

Write today for the Hamilton Watch Book—"The Timekeeper." It pictures and describes the various Hamilton models, with their prices, beginning at \$22 (\$25 in Canada) for a movement alone, up to \$200 for the Hamilton Masterpiece. Also other interesting watch information that makes it especially valuable to railroad men.

HAMILTON WATCH COMPANY

Lancaster, Pennsylvania

several days in Denver, San Francisco and other western cities.

A contract has been let to a St. Louis concern to construct at Scott Field, Belleville, Ill., on the St. Louis division, a dirigible balloon hangar at a cost of \$1,089,360.

Miss Helen Greif, personal injury clerk, visited friends in Washington, D. C., during her vacation.

Chief Accountant L. F. Foley spent his vacation in Chicago.

L. L. Heilig, chief clerk to the roadmaster, has been having considerable sport recently duck hunting.

Engineer L. T. Bebee and Fireman Ray Kelley took banana extra 1831 from Mounds to Centralia, or 101 miles, on 6 1/2 tons of coal. This is a good fuel conservation record, taking into consideration the hills of southern Illinois.

Brakeman C. A. Houston, Dongola, Ill., was slightly injured September 23 while looking over his train in the vicinity of Pulaski.

**WISCONSIN DIVISION**

"Ed Luby is dead"—those were the sad words passed along the line Friday, September 2.

Edwin Luby was born in Tipperary County, Ireland, January 2, 1841, and died at his home at Minonk, Ill., September 1, 1921. Mr. Luby came to the United States when a mere boy. He entered the service of the Illinois Central in 1871, half a century ago, and remained in the service, a faithful and loyal employe, until July 7, 1912, when he was awarded a pension. Mr. Luby was a veteran of the Indian Wars, having served as a corporal in Company C, 23rd Infantry, for three years, and having been honorably discharged June 12, 1870. He was married twice. There survive four children: John, Cairo, Ill.; Mrs. John McGough, near Rutland; Josie, at home, and Thomas, whose whereabouts at present are unknown.

Ed Luby

Mr. Luby's good disposition and kind feeling for his fellow man were well known. When someone was telling of a railway or other accident, he would stand with eyes wide open, listening with intense interest, and would, at the first opportunity, ask, "Was anybody hurted?" Upon being assured there was not, he would say, with a smile, "Divil a bit do we care," and walk away.

Minonk employes sent an appropriate floral design, as did the maintenance of way employes of the division. Burial was at El Paso, Ill.

**INDIANA DIVISION**

R. C. Miller, chief clerk to Superintendent H. J. Roth, has accepted a similar position in the office of Superintendent J. W. Hevron at Champaign, Ill. Mr. Miller is succeeded by E. E. Batson, formerly assistant chief clerk in the office of the superintendent; K. C. Holmes fills the position of assistant chief clerk to the superintendent; Harry Seibert becomes roadmaster's chief clerk, vice Mr. Holmes; Dale Arnold of the office of the superintendent of bridges and buildings takes the position of material clerk in

Roadmaster O'Rourke's office, and C. J. Hess succeeds Mr. Arnold.

Carlton Schlicher is a new clerk in the office of the superintendent.

Miss Lucille Yount has gone to Kansas City on an extended leave of absence.

Miss Victoria Gustafson of Trainmaster Keene's office is home from a week in Peoria.

Miss Catherine Stephenson has returned from her vacation in Mattoon.

**Mattoon Shops**

Harold Roetker, machinist at Mattoon Shops, underwent operation for the removal of his tonsils in the Chicago Hospital recently.

George W. Hampson, safety appliance man, is now in New York visiting his son, who recently returned from Paris, France, where he studied music.

Jim Phillips, carpenter, is confined to his home on account of illness.

C. M. Schatz, assistant accountant in the office of the master mechanic, has returned from his vacation.

C. N. Parks is planning a vacation in the West.

**SPRINGFIELD DIVISION**

John O'Brien, who died August 30 at Pana, Ill., was born at Cappamore, Ireland, in 1862, and entered the service of the Illinois Central as a track laborer in 1895. First employed on the Chicago terminal, he was successively promoted to assistant foreman and extra gang foreman. He was appointed track supervisor at Pana in 1902, serving in that capacity successfully until his death.

John O'Brien

Mr. O'Brien began complaining about the first of August of lumbago, which later developed into pneumonia.

Funeral services were held at Pana September 1, with full solemn requiem mass, Father J. P. Moroney officiating, during which Father S. N. Moore of Clinton delivered one of the finest eulogies that could be passed. Burial was at Manteno, Ill.

The many friends and the large number of floral offerings at the funeral signified the many friends Mr. O'Brien had made during his lifetime. Not only do his loving wife and family lose a good husband and father, but the Springfield division at the same time loses a valuable employe who will be greatly missed by all who knew him.

Among those attending the funeral were G. E. Patterson, acting general superintendent, District Engineer Bond, Superintendents J. W. Hevron and C. W. Shaw; Roadmasters J. L. Downs and W. E. Russell; Supervisors T. J. Connerton, J. Gallagher, E. R. Fitzgerald, S. C. Draper, C. F. Weld, M. Sheahan, P. Cheek, E. Wood, M. Doyle, and every track foreman on the Clinton district.

**TENNESSEE DIVISION**

Fulton, Ky.

The sweet chimes of the wedding bells were heard again August 14, when Trainmaster's Clerk Frank P. White and Miss Dow James of Paducah were united in marriage at Padu-

picture series to be shown this winter. Everybody marched and counter-marched, or tried to appear busy, while the camera clicked off the reels.

Among the younger men in the office, C. H. Williams, Jr., leaves for the Mississippi Agricultural and Mechanical College, Charlton Roberts goes to Millsaps College, and Lee Cotten back to Jackson High School."

Engineer I. H. Martin of the Louisiana division has received much praise for the efficient manner in which he brought his train (No. 4) to a dead stop about two miles north of Gallman, Miss., recently and saved two motor cars which had collided on a crossing just ahead of him. A bakery truck going one way and a touring car going another attempted to beat No. 4 to the crossing. In the effort they met in collision on the track. According to the conductor's report: "Engineer Martin, at the bat of an eye and without the loss of a second, shut off steam, applied all the air he had and brought the train to a stop only a short distance from the two dead cars on the track blocking his way." Mr. Martin joined the Illinois Central as a fireman in 1883 and was promoted to engineer in 1887. His efficiency record shows only one mark against him since 1908 and only ten in his whole thirty-eight years of service.

I. H. Martin

#### KENTUCKY DIVISION

Miss Mary Leitchfield, telephone operator at Louisville, has returned from an extended trip through the West, during which she visited Yellowstone National Park.

T. L. Davis, supervisor of signals, has been granted six months' leave of absence on account of ill health. His position is being filled temporarily by J. P. Price, formerly water supply foreman.

J. S. Stinebaugh has been appointed temporary water supply foreman during the absence of Mr. Price.

Miss Marion Waggener, supervisor's clerk at Princeton, has returned from an extended tour of Europe, during which she visited Italy, Switzerland, Germany, England and France.

Miss Louise Leitchfield, message clerk at the Louisville offices, has returned from the Kentucky state fair, where she was one of the alto singers in the Community Concert chorus.

## RAILROAD POLICIES FOR RAILROAD MEN

### An Income for Life

is provided for you and your family if you are a Continental policyholder,—the latest policies issued by the "Railroad Man's Company" pay as long as the insured is totally disabled by accident or illness. See our agent on your line or inquire by means of the coupon.

About \$27,500,000 paid to 1,000,000 policyholders and their beneficiaries.

### Accident and Health Insurance

(Cut out and mail today)

Continental Casualty Co.  
910 Michigan Ave.,  
Chicago, Ill.

I am employed by the ILLINOIS CENTRAL RAILROAD. Please send me information in regard to your accident and health insurance such as is carried by hundreds of my fellow employees.

*H. J. Roth*

Mr. Roth, superintendent of the Indiana division, with headquarters at Mattoon, Ill., was born October 21, 1870, at Fairfield, Iowa. He was educated in the public schools at Red Oak, Iowa, and Osceola, Neb. His record since then has been as follows: Entered service in 1885 as messenger for the Union Pacific Railroad at Osceola, Neb.; 1886-1888, operator, freight agent, ticket agent; 1889-1890, dispatcher; entered service of the Northern Pacific Railroad; dispatcher 1891-1892; returned to Union Pacific as dispatcher; chief dispatcher, trainmaster and assistant superintendent, 1893-1912; entered service of Illinois Central as inspector of transportation and trainmaster, St. Louis division; April 1, 1917, appointed superintendent of the Indiana division.

# ILLINOIS CENTRAL MAGAZINE

NOVEMBER

NINETEEN TWENTY-ONE

Published monthly by the Illinois Central System in the interest of the system, its officers and employes, and the territory served by its lines.

Address all communications to: The Editor, Illinois Central Magazine, Room 817, Central Station, Chicago. The return of manuscripts, photographs, etc., except upon request, is not guaranteed.

Advertising rates upon application. Subscription rates: 15 cents a copy, \$1.50 a year.

## September Coal Saving Thousands of Tons

*Less Than 300,000 Tons Used First Month of Campaign;  
Decrease Seen in Each Class*

**T**HE Illinois Central System effected a saving in the consumption of coal in September, the first half of the two months' fuel conservation campaign, of 30,991 tons as compared with September, 1920, and 25,187 tons as compared with August, 1921, according to reports compiled in the office of Vice-President L. W. Baldwin. The estimated saving is based upon the saving in consumption per unit of service and the number of service units rendered during the conservation month.

In other words, if the rate of coal consumption per unit of service had been the same as in September, 1920, the system would have burned 30,991 tons more than actually were consumed; or, if the rate of consumption per service unit had been the same as in August, 1921, the system would have burned 25,187 tons more.

Without calculating the saving upon the basis of the amount of transportation service performed, the system actually burned 380,499 tons of coal in September, 1920, 324,314 tons in August, 1921, and 294,676 tons in September, 1921.

### Saving Shown Over Last Year

The report from Vice-President Baldwin's office shows that a saving was made in September, as compared with that month last year, of 6 pounds per 1,000 gross ton miles in freight service, 195 pounds per 100 passenger car miles in passenger service, 10 pounds per switching locomotive mile in switching service, and a total of 3,147 tons in miscellaneous service.

In addition to this direct saving, it must

also be considered that the system used approximately 47,000 tons more of 6-inch egg mine run coal in September, 1921, than in September, 1920, due to the storing of lump coal. Tests show that there is a loss in the use of 6-inch egg mine run coal, compared with straight mine run coal, of approximately 7.3 per cent, due to incomplete combustion and loss through stack cinders. It is estimated that the total coal consumed was increased because of this approximately 3,430 tons, and that factor has been considered in the estimate of the saving which the conservation efforts of September produced over September last year.

The report shows that the September saving, as compared with August this year, was 5 pounds per 1,000 gross ton miles in freight service, 155 pounds per 100 passenger car miles in passenger service, 15 pounds per switching locomotive mile in switching service and a total of 4,536 tons in miscellaneous service. The consumption of 6-inch egg mine run coal was approximately 9,500 tons greater than in August. It is estimated that this increased the September consumption approximately 694 tons, and that factor has been considered in estimating the saving produced over August by the September conservation efforts.

### Looks for Good October Results

Mr. Baldwin has expressed himself greatly pleased with the results obtained in September. He believes the October results will be likewise gratifying.

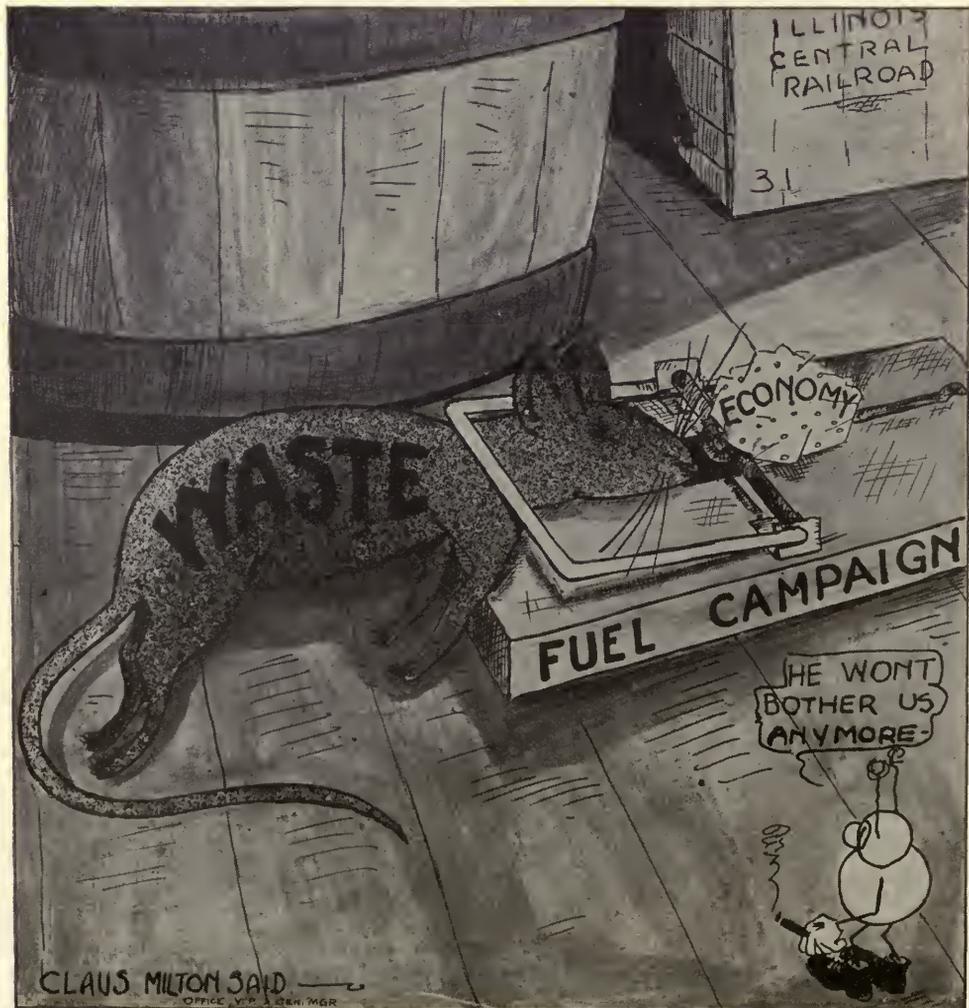

In a message to General Manager A. E. Clift, the members of the General Fuel

Conservation Committee, the chairmen of the division fuel conservation committees, and the chairmen of the traveling engineers' fuel conservation committees, Mr. Baldwin conveyed to them, and all other officers and

employees, his appreciation for the splendid September showing.

The following is a comparative statement of locomotive performance for the Illinois Central System:

	September 1920	August 1921	September 1921
<b>Freight Service:</b>			
Gross ton miles.....	3,160,256,000	2,579,683,000	2,544,299,000
Coal consumed freight service.....	235,998	191,477	181,336
Lbs. per 1,000 GTM.....	149	148	143
<b>Passenger Service:</b>			
Passenger car miles.....	8,316,167	8,200,023	8,079,178
Coal consumed passenger service.....	74,225	71,559	64,214

## FUEL SAVING

Aug., 1920-Sept., 1921

The tables presented on this page show the number of service units performed by the Illinois Central System in freight, passenger and switching service in August, 1921, and September, 1921, together with the total number of tons of coal consumed in performing this service and the percentages of increase or decrease in both units of service and tons of coal.

# November to Be "Strike No Stock" Month

## Effort Is Intended to Cut Down Loss Both to Company and to Owners of Animals

A CAMPAIGN to reduce the killing of livestock on the waylands of the Illinois Central System will be made during November. Four hundred eighty-five head of livestock were struck during November, 1920, against which the results of the campaign will be compared. In announcing the campaign, the management instructed division officers to hold meetings and secure the distribution of information.

The following report shows the number of head of stock struck on each of the four grand operating divisions during November, 1920:

	Horses Mules Cattle	Hogs Sheep
Northern Lines .....	7	70
Western Lines .....	11	7
Southern Lines .....	54	71
Yazoo & Mississippi Valley.....	136	99
	<hr/> 238	<hr/> 247

The following is a record of the number of head of stock struck on each operating division during November last year:

	Horses Mules Cattle	Hogs Sheep
Northern Lines		
Illinois .....	2	5
St. Louis .....	1	5
Springfield .....	2	57
Indiana .....	2	3
Western Lines		
Wisconsin .....	2	1
Iowa .....	5	5
Minnesota .....	4	1
Southern Lines		
Kentucky .....	12	24
Tennessee .....	11	6
Mississippi .....	34	22
Louisiana .....	27	19
Yazoo & Mississippi Valley		
Memphis .....	49	16
Vicksburg .....	6	5
New Orleans .....	81	78
	<hr/> 238	<hr/> 247

"Past campaigns have demonstrated that with intense interest it is possible to avoid the striking and killing of stock to a large extent," reads the letter from the management announcing the campaign. "It is hoped that such interest will be maintained by all concerned during November."

### SOME WELL-KEPT STATION GROUNDS

Station at Wheeler, Ill., Indiana division, showing the well-kept lawn at that place. The two men in the picture are H. H. Hildebrands, agent, and Sam Ward, section foreman. Both of these men are very proud of their station and grounds.

# Safety Campaign Planned for December

## Attempt Is to Better Record of Last Year in Personal Injuries, Train Accidents and Equipment Damage

By L. W. BALDWIN,  
Vice-President

A CAMPAIGN for the prevention of personal injuries, train accidents and damage to equipment will be conducted on the Illinois Central System during December. The month will be divided into two periods, the 1st to the 14th, inclusive, and the 15th to the 31st, inclusive. Our goal will be to reduce injuries, accidents and equipment damage at least one-half during the first period of the month and at least one-third during the second period, compared with the corresponding periods of last year. The division into periods of fourteen and seventeen days is made because of the safety drive conducted from December 15 to 31 last year, when an excellent record was made.

### Record for December, 1920

The following table shows the number of personal injuries which occurred on the Illinois Central System during the two periods of December, 1920:

	1-14	15-31	Total
Employees, killed .....	0	1	1
Employees, injured .....	206	204	410
Trespassers, killed .....	2	6	8
Trespassers, injured .....	7	4	11
Passengers, killed .....	0	0	0
Passengers, injured .....	20	10	30
Others, killed .....	3	1	4
Others, injured .....	12	7	19
Total, killed .....	5	8	13
Total, injured .....	245	225	470

The following table shows the number of accidents and the total damage resulting therefrom under the classification, "numbered accidents," on the Illinois Central System during the two periods of December last year:

	1-14	15-31	Total
Number ....	37	44	81
Damage ....	\$27,509.46	\$45,619.85	\$73,129.31

Figures are now being compiled on the number of accidents resulting in damage to equipment and the losses therefrom, other than "numbered accidents," according to the campaign periods. The total damage to

equipment under this classification in December, 1920, was \$23,886.18.

### Performance of Duty Expected

The December drive should have the loyal support of every officer and employe. We expect no one to do more than his duty, but we do expect the performance of duty from every person. The rules of the operating department and other departments are framed with a view of preventing the occurrence of injuries, accidents and damage. A compliance with the letter and the spirit of the rules will go far in the promotion of safety.

The railroad is not responsible for every injury, accident and damage. The carelessness of outsiders, a defect in equipment which cannot be detected, or something else over which officers and employes have little or no control causes many of the regrettable occurrences which it is our endeavor to prevent at all times. But we should not allow ourselves to accept these causes as excuses. We are going to count every accident, injury and damage, regardless of where the blame lies, and we shall expect every individual to do his utmost to prevent accidents, injuries and damage.

The carelessness of automobilists and pedestrians in crossing railway tracks at grade and of passengers in boarding and alighting from trains and crowding to the edge of platforms is a constant cause of injuries. We should make every effort to prevent both such injuries and their causes. Passengers exhibiting carelessness should be admonished, politely but firmly. Engine-men should be constantly on the alert in approaching crossings, the engineer giving clear and ample warning, and the fireman arranging his work so as to keep a sharp lookout from his side of the locomotive cab.

### Watch Rules 837 and 838!

Trainmen and yardmen are admonished to comply strictly with rules Nos. 837 and 838. Lookout must be maintained when-

ever cars are moved over crossings. Cars must not be shunted over crossings unattached to the engine. Proper warning must be given at all times when cars being unloaded are to be moved; a shouted warning is never sufficient, unless it is clear beyond all doubt that the persons concerned have understood it.

Our division officers have manifested the Illinois Central spirit in the work of injury and accident prevention. Staff and safety meetings at regular intervals to discuss and fix the blame for accidents and injuries are a fine step, but such meetings are only a step unless the members earnestly seek the real cause of an accident or injury and apply the proper remedy to prevent its recurrence.

Inspectors of equipment fill important posts. The management places a great trust in their faithfulness to duty and their efficiency. They often have the safety of thousands of lives in their hands in a single day, and the safety of many thousands of

dollars represented in equipment. Their work should be painstaking and thorough.

The particular point about this campaign is that we are asking of every person concerned only the performance of his duty, the maintenance of watchfulness at all times, and a spirit of loyalty and service—a spirit, we are sure, which marks every man and woman in the ranks of the Illinois Central System. The success of the campaign will depend upon the support which officers and employes give.

What nobler cause is there than preventing accidents resulting in the death or injury of human beings? None. This is a cause that we can all enter into with heart and soul, because it is one that not only helps the railroad but also helps humanity. Failure to enlist under this banner may result in your own injury or death or the injury or death of someone dear to you.

I earnestly hope that every officer and employe will do his part to make the campaign a success.

---

## *The Boss Sees More Than You Believe*

When Carnegie made Schwab general manager of his principal steel plant he gave him this little advice: "In going through the works, Charlie, you will see many things that you mustn't see." Every employer and every executive sees far more than some employes imagine. If you are an employe, don't fool yourself that you fool the boss one little bit. While he may keep his mouth closed when he walks through the place, he doesn't keep his eyes closed. He takes in everything. He makes lots of mental notes. It doesn't take him long to size up the people working with him.

He knows very well the employes who stick industriously to their tasks, and those who finds all sorts of pretexts for getting away from the spot where they belong. He knows the employe who has a habit of sneaking out to wash up before lunch-time or closing-time, and he knows the ones who do not. He knows the employe who is eager for an excuse to talk instead of working, and the ones who would rather work than talk. In time, too, he discovers who turns

out the best work, who do only fairly good work and who are slipshod.

And when the time comes to make changes, his mind immediately flashes to the employe or employes who are most worthy of promotion, just as his mind turns to the least meritorious employes when working forces have to be reduced. In a great many places the workers complain that the bosses have favorites. Of course they have. Every intelligent boss looks with favor upon those who are serving the organization best. The employes who have become "favorites" usually deserve to have favors shown them.

The best way to become a favorite with the boss is not to go out of your way to attract his attention or to fawn upon him, but to keep your eyes, your hands and your mind on the job, and to keep on keeping them on the job. He is looking for results, not for obsequiousness, not for flattery.—FORBES, quoted in September 20 issue of *Tick Talk of the Western Clock Company, La Salle, Ill.*

## All Together Now for Perfect Packages!

November Will See Illinois Central Co-operating in General Drive for Careful Preparation

**N**OVEMBER will be "Perfect Package" month on the railroads, steamship lines and express companies of the United States and Canada. Special efforts will be made to reduce the loss and damage of freight attributable to imperfect packing. There will be great rivalry among the various cities and communities to make their records perfect.

The Illinois Central System will co-operate fully in the movement, which is sponsored by the American Railway Association and the American Railway Express Company. C. G. Richmond, superintendent of stations and transfers, held a meeting with the supervising agents of the Northern and Western lines of the Illinois Central October 18 in Chicago, and W. M. Hale, chief clerk in Mr. Richmond's office, held a similar meeting with the supervising agents of the Southern Lines of the Illinois Central and the Yazoo & Mississippi Valley October 19 at Memphis. Mr. Richmond had planned to hold the second meeting, but illness in his family prevented.

### Special Notations to Be Made

"We are going to do everything possible to make the Illinois Central System stand at the head of the list of railroads in the number of exceptions noted against shipments forwarded for transportation in November," Mr. Richmond declared.

When shipping errors are found during the month by railway and express employes, notations will be made on special "exception reports" and sent to shippers of the packages. A record will be kept of these reports.

"Help us make this city's record 100 per cent" will be the slogan of a poster to be placarded through the two countries. Plans for the month's campaign on the Illinois Central System include the posting and distribution of circulars; meetings of agents with shippers, chambers of commerce and other civic bodies; bringing out and passing on of suggestions; the organization of central committees in cities served by more

than one railroad; the publication of local bulletins and circulars, giving daily or weekly results; the holding of frequent meetings between the agents and their platform organizations; the instruction of receiving clerks, and an intensive effort to see that all packages accepted for shipment are in an acceptable condition.

### Shipments to Be Refused

Mr. Richmond has instructed the supervising agents to carry out a program of having receiving clerks refuse shipments under the following conditions:

In fiber boxes tied with rope, flaps not glued or sealed,

In fiber boxes with flaps not glued or sealed,

In second-hand fiber boxes unless in perfect condition,

In fiber boxes where edge seams are torn.

In packages without rope, contents protruding,

In packages with contents rattling.

In packages requiring recooling,

In packages insecure or weak,

In packages without marks.

In packages illegibly or not properly marked,

In packages with old consignment marks,

In packages with consignee or destination abbreviated,

In packages with improper tags,

In packages with insufficient nails,

In packages with loose boards,

In barrels overloaded.

## Strong for "Barnyard Golf" at Waterloo

Madison Square, New York, may be the fight center of the world, and Cuba the mecca for the ones that are seeking refreshments, but what the participants call the greatest sporting event that has taken place anywhere among the employes of the Illinois Central System was staged during September at the Waterloo (Iowa) Shops in the form of a horseshoe pitching contest. As is well known, the game of "barnyard golf" has been more than popular this fall, and this has surely been true among the shopmen at Waterloo. These games have drawn unusually large crowds.

The tournament started the first of September and ran for thirteen days, with seven courts in operation, all on company property, and fourteen teams participating, composed of men from fourteen departments in the shops. Each team played every other team a set of three games. These sets were all run on a regular schedule. Lists of rules and score cards were printed. A complete daily score was kept, and each day a record was posted of the points made by the teams. Three silver loving cups were awarded, the largest to the highest scoring team and two smaller cups to the first and second highest individuals. The latter cups are now the per-

sonal property of the winners, but the team cup has to be won three seasons to become the property of any department.

The sheet metal workers' team, composed of Charles Harp and D. B. Foutch, won the team trophy, while D. B. Foutch is the possessor of the highest individual cup and W. J. Mulvaney of the second highest individual cup.

A committee composed of Roy Jackson, cab foreman, K. E. Beal, chief clerk to the division storekeeper, and Roy A. Graham, secretary of the Railroad Y. M. C. A., was appointed to have complete supervision of the tournament. The cups were purchased through contributions of the men, while the shoes, printing and other items were furnished through the Railroad Y. M. C. A.

All the welfare and recreational work at the Waterloo Shops is promoted and directed through the Y. M. C. A., and this event was the opening of the fall and winter program for the Illinois Central men. A full set of winter events being planned by the committee of management of the "Y" promises to be one that will rival any other on the Illinois Central. The accompanying picture was taken at the noon hour when two of the teams were playing on the car department court.

# President Markham on the Rail Situation

## Points Out to Mining Congress Necessity for Adequate Return Upon Investment in Roads

*The following is a transcript of an address delivered by President Markham Wednesday, October 19, before the American Mining Congress, in session at the Coliseum, Chicago:*

**T**HE railroads of the United States occupy a unique relationship to other business institutions. They are the arteries through which the life-blood of the nation's business flows. In no other industry is there found the fundamental dependence of virtually every business institution upon a single one that marks the relationship between the railroads and their patrons.

The service of transportation by rail is the foundation of American business life as it is now constituted. Only a small fraction of the products of the nation's toil is consumed within a radius from the point of production which can be served adequately other than by the railroads. If Illinois mine operators were denied the service with which to market their products outside a radius which might be reached by purely local transportation facilities, their industry would be comparatively valueless. Products of the farm would be worth little if the farmers did not have the service of the railroads to ship their products into the markets of the world. The same thing is true of foresters, manufacturers, wholesale dealers—in fact, of virtually every business other than those which are purely local in their nature, and even those depend in some measure upon railway service for their continued activity. We have grown out of our swaddling clothes, industrially, in the United States by the aid of the railroads, which have furnished a service that has come to be indispensable. Were that service to be greatly impaired, the commercial structure of the country would collapse, like a building from which the foundation is torn away.

### A Heavy Responsibility

Such a relationship as the railroads have toward American business life, therefore, implies a great obligation upon the men who

are responsible for the conduct of the railroads. Being the producers of a service which is the cornerstone and the foundation of industry, it becomes the duty of railway men to regard their tasks in the light of service to the public welfare. I speak on behalf of my associates in the business of transportation when I say that we have such an ideal set before us.

The revolutionary changes which have transpired in the transportation business during the last generation have made the railroads increasingly dependent upon public opinion. The Interstate Commerce Commission, forty-eight state commissions, the federal and forty-eight state legislative bodies, and the Railroad Labor Board are constantly laying down limitations upon railway managements—ninety-nine public bodies whose duties and responsibilities are neither adequately defined nor sufficiently co-ordinated. This situation, for which the public is responsible, has created what is frequently called the "transportation tangle." It makes for a division of responsibility. Neither the Interstate Commerce Commission, any of the forty-eight state commissions, the Congress, any of the forty-eight state legislatures nor the Railroad Labor Board is responsible for the railroads. Ostensibly their management is in private hands, but the private managers, under present conditions, do not have the authority and responsibility which they must have to obtain efficient service at a cost which will not be burdensome to the public.

### Costs Out of Railway Control

An important witness before the hearing which the Senate committee on interstate commerce conducted in Washington last May testified that 97.5 of the cost of producing transportation service in 1920 was entirely outside the control of railway managements—vested either in governmental agencies or market conditions over which the railroads have no control.

I believe the public does not adequately realize what these limitations upon railway

management amount to. The railroads are not protesting against public supervision. Theirs is a public service, and it is entirely right and proper that it should be performed under the supervision of the public's agencies. But when these agencies take over the functions of the management to the extent that they control, without being responsible to the public for it, virtually the entire operating costs of the railway industry, a disastrous situation results.

The remedy for it is to place once more in the hands of railway managements—under competent and broad-minded supervision—the control of operating costs, in such a way that responsibility may properly be fixed upon the managements for the operation of their properties.

The managements of the railroads of the country are the trustees of the nation's greatest industrial investment—an investment which has been valued by the Interstate Commerce Commission for rate-making purposes at nearly \$19,000,000,000. With the successful operation of the railroads dependent upon public opinion, it behooves their managements, as trustees of a great industry of such fundamental importance to the country, to be constantly on the alert to exercise their influence upon public opinion in such a way that the railway policies which the people of the country decide upon shall be to the nation's best interests. Railway men are coming to take a greater interest in what the public is saying about the railroads, casting off their old attitude of reticence and aloofness and endeavoring to meet the public on the common ground of mutual confidence and good will.

#### Rapid Changes in Situation

The railway situation changes with kaleidoscopic swiftness. What today looms as the most important phase of the situation may be relegated tomorrow to comparative insignificance by the development of another aspect. A year ago the railroads were being called upon to move a greater volume of traffic than they ever had moved in a like period of time. Every ounce of man power and every piece of railway equipment had to be utilized to the fullest extent in expediting traffic movement. Within a few months the business depression which came with the move toward deflation had actually made a problem for the railroads in the stor-

age of idle equipment! This was followed by the need for the greatest possible retrenchments as railway earnings diminished with the decrease in traffic. Net earnings were cut below the vanishing point, and the railroads were driven by necessity to take drastic action in laying off men, deferring maintenance work and pinching their expenditures all along the line to make both ends meet. Some even had to break long-established dividend paying records.

During 1920 the railroads realized a net operating income equal to approximately one-third of 1 per cent upon the valuation placed on railway property by the Interstate Commerce Commission—practically nothing for the payment of either interest or dividends. During the first six months of 1921, the railroads should have earned, to make a 6 per cent return upon the valuation of their properties, a net operating income of \$447,256,000. They actually earned \$128,912,000, a shortage of \$348,344,000. Instead of 6 per cent upon their valuation—a return established by the Transportation Act as "fair and reasonable" for the present period—their net earnings for the first six months of 1921 were at the rate of only 1.8 per cent upon their valuation. There has been a perceptible improvement in the situation since the middle of the year, but, taking the first eight months of the year as a whole, net railway operating income has been at the rate of only about 2.6 per cent on the valuation of railway properties.

#### No Guaranty of Earnings

There is no way this shortage can be made up, for, mind you, the rate-making provision of the Transportation Act is in no sense a guaranty of earnings. If the rates fail to earn a "fair and reasonable" return, the only recourse is for the railroads to ask higher rates, which it is then the duty of the Interstate Commerce Commission to grant. The railroads have refrained from taking this step, believing it more in the interest of the public welfare to take their losses, making every reduction in expenses possible and allowing the situation to work itself out. A great deal of misconception of railway problems is based upon a misunderstanding of the rate-making provisions of the Transportation Act. Unfortunately, many persons believe the act does constitute a guaranty to the railroads, and the term

"guarantee" is frequently used in press reports and comment upon the railway situation. There seems to be an organized effort to make the farmers, especially, believe that in some way or other the railroads are receiving earnings which constitute a 6 per cent return upon the valuation of their properties—if not directly from the rates, then from governmental funds. While such an idea is absolutely at variance with the facts in the case, it has taken root and has been the foundation of much misunderstanding and unjustified criticism.

It should be pointed out that even the almost negligible return that the railroads have obtained thus far this year—a return insufficient to pay even the interest on their outstanding bonds—has been realized only at the cost of deferring important maintenance work which will have to be performed in the near future. Although the wage decrease which went into effect July 1 made possible the resumption of considerable maintenance work on some of the railroads, revenues have been so small in comparison with expenses that the present rate of maintenance work is still far from adequate. For example, in August of this year the railroads spent approximately \$182,000,000 for maintenance purposes, which was a reduction of \$151,000,000, or 45.3 per cent, as compared with expenditures for maintenance work in August, 1920. It was largely because of this reduction that the railroads were able to show a net operating income of \$90,000,000 in August. If they had spent the same amount in maintenance work that they spent for that purpose in the corresponding period of 1920, they would have incurred an operating deficit in August this year of more than \$60,000,000.

#### Railroads in Readjustment, Too

The country is going through a period of great readjustment. The railroads have been taking their share of the losses, in spite of the fact that during the years of prosperity, when other industries were permitted to lay by earnings to prepare them against such a period of depression, when farm products soared and wage costs mounted to new levels, the railroads were not permitted to profit in the same degree. Instead, their earnings were limited under governmental operation to the average net return of pre-war years, and since governmental opera-

tion their earnings have declined progressively.

The country demands adequate transportation. The railroads are responsible for providing it. Their managements would be derelict to duty if they failed to exert their utmost efforts to provide it, or if they adopted, even in response to the demands from the public, a course which would result in impairing the efficiency or adequacy of transportation service. Because of the limitations upon their earnings and upon their initiative by the Interstate Commerce Commission, the forty-eight state commissions, the Congress, the forty-eight state legislatures and the Railroad Labor Board, the managements are not able to respond to every demand for readjustment.

There has been an insistent demand for a reduction in rates to correspond with the general trend of liquidation. However, while transportation charges admittedly are high, the costs of virtually everything which goes into the production of transportation service are still relatively much higher than the general scale of rates. The average increase in freight rates since 1916 has been 74 per cent and in passenger rates 53 per cent, including the surcharge on sleeping car fares. Compare these with the pre-war costs of labor, fuel, materials, taxes and interest rates paid by the railroads.

#### Pay Still Shows 108 Per Cent Increase

After the 12 per cent wage cut July 1, the average annual compensation of railway employes is \$1,695, as compared with \$815 in 1914, an increase of 108 per cent. Road locomotives which cost \$21,485 in 1914 now cost \$48,000, an increase of 123 per cent. Switch engines which cost \$14,511 in 1914 now cost \$35,500, an increase of 144 per cent. Gondola cars which cost \$824 in 1914 now cost \$1,990, an increase of 142 per cent. Refrigerator cars which cost \$1,323 in 1914 now cost \$2,950, an increase of 123 per cent. Box cars which cost \$859 in 1914 now cost \$1,910, an increase of 122 per cent. Steel passenger coaches which cost \$13,827 in 1914 now cost \$27,654, an increase of 100 per cent. Locomotive fuel which cost \$1.70 a ton in 1915 now costs \$4.07 a ton, an increase of 139 per cent. Interest rates have increased greatly. The Illinois Central System sold bonds in 1914 on a basis yielding less than 5 per cent to purchasers, and it re-

cently sold a large issue of bonds which yield more than 7 per cent to purchasers. The direct taxes paid by the railroads in 1911, taking a ten-year period here for comparison, were \$98,628,848, and last year they were \$278,868,668, an increase of 183 per cent. In addition to that, users of transportation paid a war tax of \$232,809,963.16 in 1920, which the railroads collected as agents of the government and turned over to the government. This entire amount represents an increase over 1914, when no such tax existed.

Labor costs are principally responsible for the present rates charged for transportation service. Prior to 1917 the labor costs of the railroads had not exceeded \$1,500,000,000 annually. In 1920 the labor costs of the railroads of the country were more than \$3,500,000,000. In 1916, 40 cents of the railroads' revenue dollar went to pay labor costs. In 1920 it took more than 60 cents of the revenue dollar to pay labor costs. Even at the present time, with the reductions which were made July 1, labor costs are running at the rate of about 55 per cent of all railway income.

#### To Ask a Further Reduction

With a consciousness of their obligations to the public service, the managements of the railroads of the country have recently announced that they will ask the Railroad Labor Board for a further reduction in wages, the entire benefit of which they propose to pass along to the public in reduced freight rates. This puts the situation up to the public, which exercises the balance of control on the Railroad Labor Board. If the public wants reduced rates, its representatives on the Labor Board have the opportunity to secure them by granting such wage reductions as will make reduced rates possible. The basic principle of rate-making is the establishment of a rate level which will permit earnings to meet the cost of operation under efficient, honest and economical management, with a fair and reasonable return upon the valuation of the properties engaged in the railway service. This principle is adopted as a public policy in the Transportation Act.

The proposed reduction is in line with the policy which has been followed by the railroads since their return from federal control. Since the general rate increase of Au-

gust 26, 1920, the railroads have made many reductions in individual commodity rates. These reductions have amounted to large savings by shippers. They were made voluntarily. At no time since August 26, 1920, have the roads been bound, under the law, to make reductions, for at no time have their earnings justified such action. The present rate level was attained through a series of blanket increases. These increases resulted in many inequalities, and since then economic readjustments have taken place and further inequalities have manifested themselves, especially in the agricultural field, where the greatest liquidation has transpired. The railroads have been attempting to meet the demands for readjustments of rates, but they have been limited by the control which public agencies hold over wages, working conditions, etc.

#### What Reductions Are Planned

The cuts in wages which the managements propose that the Railroad Labor Board shall authorize are these: That the wages of train service employes be reduced sufficiently to remove the remainder of the increase granted by the Labor Board's decision of July 20, 1920, (which would involve a further reduction in the wages of this class of labor of approximately 10 per cent) and a reduction be made in wages of all other classes of labor to correspond with the wages being paid for similar work in the territories in which the railroads operate. Unskilled labor cost the railroads of the country last year more than \$1,300,000,000. Other industries have been liquidating labor costs, especially the wages of unskilled labor. It is utterly unfair that the farmer, for instance, should have to pay freight rates sufficient to make it possible for the railroads to employ labor at three or four times the price which he is paying for exactly the same kind of labor.

Frankly, I wish it were possible to maintain the present scale of wages on the railroads of the country, and particularly on the railway system over which I have the honor to preside. I have a great sympathy for the man who works and who is struggling to better his own position in life, and I would favor paying those who are doing honest and conscientious work for the welfare of their employers the limit justified by economic conditions. To go beyond that limit

would be equally inimical to the workers and the general public.

It is in the interest of the public welfare that the men who operate the transportation systems of this country—so vital and indispensable to the public—should be dealt with fairly and paid reasonably well for their services, but it is not in the interest of those men themselves to exact more than that, or to bring about a condition that would permit them to profit at the expense of other groups.

#### Reduction Is Not Excessive

The extent to which the railroads will ask the Labor Board to reduce wages is not excessive. The railroads need the support of the public to bring about this liquidation. Upon whether the public responds will depend the issue of reduced freight rates.

It is most important that the public understand clearly the issue involved in the order for a general railway strike which has been formulated by the railway labor brotherhoods. The thing it is proposed to strike against is the decision of the Railroad Labor Board authorizing a reduction of approximately 12 per cent in wages, which the railroads put into effect July 1. There is at present no other possible grounds for a strike.

The situation, in important respects, is more serious than that created by the strike order issued by the labor organizations in 1916, which precipitated the passage of the Adamson Act. At that time, while the railroads had asked for arbitration, there had not been any arbitration because the labor unions had refused it. Therefore, the labor unions were technically within the law. The present case is entirely different. The Transportation Act of 1920, a law of the United States, created the Railroad Labor Board. The act requires the railroads and their employes to submit to the Railroad Labor Board disputes over wages and working conditions which might interrupt the flow of transportation.

#### Increase Made in July, 1920

Demands for advances in wages made by the railway employes last year were submitted to the Railroad Labor Board, and in July, 1920, it granted them advances averaging about 22 per cent, retroactive to May 1. The railroads, in accordance with the law, put these advances in wages into effect.

This year the railroads applied to the Labor Board to cancel this entire advance in wages, and the board authorized a reduction, effective July 1, of only about 12 per cent, or approximately half of the July, 1920, increase. While the railroads complied with the decision last year for a retroactive advance in wages, the labor brotherhoods propose now to defy the law and strike, rather than accept a reduction in wages substantially less than the increase last year. The course of the labor unions in ordering a strike is in violation of the decision of the Railroad Labor Board. It is a strike against the lawful act of a governmental body. The main object of the labor provisions of the law is to prevent an interruption of the vital service of transportation. If strikes occur regardless of them, these provisions will be rendered void.

The issue is one of vital concern to the public. Railway managements are not trying to escape their responsibilities in calling attention to that fact. We are conscious of our obligations to the public, and we shall make every effort to fulfill those obligations. Should the threatened strike take place, we shall do our utmost to move necessities, utilizing to the fullest possible extent all the man power available.

### THE RIGHT IDEA

Here is A. D. Walker, Jr., son of Chief Clerk A. D. Walker in the agent's office at Dyersburg, Tenn., Tennessee division. This youngster when he turns on the water, says: "Daddy, I am going to turn on the water bill."

*Save Lives in December!*

## How British Look at Rail Rate Problem

*It's a Matter of "Tempering the Wind," Writes Authority, Taking Up Situation Much Like Ours*

*What the other fellow thinks is always interesting, but never more so than when he is pondering a problem similar to ours. Our brothers across the water in Great Britain have also a railway problem, and here we have an authoritative opinion on the way they look at it. This article is from a railway supplement of the London (England) Times, published the day not long ago when British railroads were returned to private ownership under a Railways Act in many ways similar to our own Transportation Act. The author has served in numerous public capacities in connection with railroads, notably in recent years upon the Canadian Commission and the Royal Commission Upon the Railways of India.*

By SIR WILLIAM ACWORTH

THE economic man—if a specimen of that interesting animal could really be captured—would doubtless assert that the economic basis of railway rates is merely the law of supply and demand. And he would be quite correct. But the edifice is subject to such thrusts to one side or the other, now by positive legal enactment, and again by the force of custom lying upon us with a weight deep almost as life, that the superstructure often rocks upon its foundations.

### Three Kinds of Cost

Let us first consider the theoretical working of the law. Railroads will not be supplied unless there is evident demand for them—that is, unless somebody will provide the money that they cost. And that somebody will normally be sooner or later the customers who use the railroads and pay rates and fares. Even when built, railroads will not be worked unless somebody meets the costs involved. These costs are of three kinds—actual out-of-pocket cost of working the service, mainly wages and coal; cost of maintaining the plant and equipment, and return on capital. Unless the first set of costs is covered by the receipts, the railroad has to shut down pretty quickly. The second set can be postponed, if not wholly, at least to a considerable extent, for a long

time in the hope of better days to come. As for the third set of costs, a railroad can continue indefinitely as a going concern even though the return on capital be nil.

There is nothing in this peculiar to a railroad. Compare the position of the rubber industry at the present moment. A rubber company will come to a stand-still unless it can sell its output at a price to cover coolies' wages and minimum establishment charges, but it will probably make drastic cuts in its expenses for cultivation and manure, and it has no need to pay dividends. Even if it has issued debentures the holders will probably prefer to wait rather than foreclose on a valueless property.

### Where the Analogy Ends

But the analogy with the rubber company is not on all fours. Rubber companies are purely private enterprises. There are many hundreds of them. No one of them is indispensable to the community. Each is at liberty to make any profit it can at one time, and correspondingly is permitted to go down unaided if it ceases to be self-supporting. Railroads are few and far between. Even in countries well supplied with railroads the proportion of the area which is served by them is very small. And consequently railroads are very seldom abandoned, however unprofitable they may be as commercial enterprises. In some shape or form the public is forced to come to their assistance, as has happened more than once, for instance, in French railway history. And indeed this peculiarity of railroads goes farther. It is taken for granted that the law of supply and demand will induce private enterprise to produce all the rubber required. But in almost every country—Great Britain is the only serious exception—public money has been devoted to the construction of railroads considered to be necessary in the public interest.

To turn from construction to day-to-day working, how far does the law of supply and demand govern the rates and fares which a railroad charges? In an old, rich, and fully

populated country such as England the working of the law is obscured by so many outside things, statutory restrictions, legal and administrative regulations, competition—not only by other railroads but by water—and so forth, that it is difficult to see the wood for the trees. Let us imagine a railway company in *vacuo*, subject to no restrictions and substantially free from competition. How will it fix its rates? Presumably it will act like any other trader, who charges for his wares not, as is sometimes supposed, the highest price at which he can get them sold, but the price which he believes will give him the largest net profit on his business as a whole.

### Two Factors in Making Money

Now this profit is the product of two factors: The number of articles sold and the amount of profit on each. And this figure can be ascertained only by the method of trial and error. Normally reduction of price increases consumption. It may or may not increase net profit, for clearly a profit of 20 per cent on the sale of 50 articles is greater than a profit of 8 per cent on the sale of 100. The merchant or shopkeeper is permitted to solve these questions for himself. But in countries where public opinion rules, the railway manager is not usually undisturbed in his study of them. The old apple-woman who, though she knew she sold each apple at a loss, believed she made a substantial profit because she sold so many has left a very large family of descendants.

The average passenger who uses an excursion train carrying twice as many passengers as an ordinary train refuses to believe that it may be less profitable. Still less does it occur to him to remember that possibly half the passengers in the excursion train would have paid full fare had the cheap train not been available. To the railway manager, on the other hand, an excursion train corresponds to an after-season sale, at which, once the demands of customers ready to pay full price are satisfied, the rest of the stock is sold off at prices sufficiently reduced to effect clearance. Or, to take another illustration, a railroad when it reduces rates or fares may be compared to a hotel which in the fashionable season charges each guest 30 shillings a day and gets it, but in the off-season offers *en pension* terms of 3 guineas a week, for they cover

out-of-pocket expenses for food, wages, and firing, while otherwise the rooms would stand empty, and even the running expenses would not be met.

### Cost Plus a Profit

There is another respect in which railway management may usefully be compared with ordinary business. No manufacturer, except where by patent or otherwise he has a practical monopoly of an article in general demand, expects to sell his output at cost plus a fixed profit. He balances large profits here against small profits or even probable losses elsewhere. What he looks to is the total profit on the whole business. A merchant or shopkeeper, if he is to retain his customers, has to keep a stock of things so seldom demanded that he can hardly hope to make a profit on them. He has to sell articles of small value but of high utility—sugar is the stock instance—almost at a cost, and to rely on the sale of articles of comparative luxury to redress the balance. So too with a railroad. A railroad carries pigs of iron at a low rate, pigs of lead at a higher rate, and ingots of copper at a yet higher rate, not because the cost of carriage differs appreciably, but for precisely the same reason that the grocer makes a bigger profit on tea than on sugar. Or, again, a railroad runs suburban passenger trains at frequent intervals in the middle of the day and late at night, though the passengers are few and the service unremunerative, because otherwise the suburb would cease to be residential and the crowd in the trains in the morning and the evening would tend to disappear.

### Tempering the Wind

No dissertation on railway rates would be complete without discussion of the famous phrase "charging what the traffic will bear." This has been described as a "vile phrase," a "maxim of extortion." Had the railway men been wise enough to lengthen it by two syllables and express it as "not charging what the traffic will not bear," they would have escaped criticism more easily. The present writer once ventured to suggest that the true phrase should have been "tempering the wind to the shorn lamb," for this is really the underlying principle.

Railway business differs from most other businesses, though not from all, by the fact that the standing charges represent a very high proportion of the total cost of carriage.

Roughly speaking, taking the world over, we may say that out of every sovereign charged to the public one-third only represents actual cost of operation; another one-third is absorbed in general establishment charges and maintenance of the plant; the remaining one-third goes to remuneration of capital. We may go a stage farther, and say that of the third which represents actual cost of operation only a fraction is chargeable against any individual consignment, though there is a partial exception to this in the case of articles such as coal, where the individual consignments may be so large as to have a specialized carriage cost of their own.

### Need for Classification

Now the result of this is twofold: the one aspect is represented in the railway maxim, "Any rate is better than no rate," which means to say that the extra cost of what the French economists call the extra ton is almost negligible; and therefore even a minimum rate yields some margin of direct profit, and accordingly the railroad is better off with the traffic than without it. The other aspect is that, as the minimum rate on the extra ton may do little more than cover the extra cost of carrying it, somehow the deficiency must be made up; some traffic must not only pay its share of total cost—operation, maintenance, and capital charges—but must make up the share of these charges which the traffic carried at the lowest rates fails to pay, either because at higher rates it would not be profitable to send it, or because it has access to a cheaper form of transport.

The railway companies then temper the wind to the shorn lamb by the establishment of what is known as a classification—that is, a division of all the articles known to commerce into categories, based mainly on values, coal, iron ore, and dung coming at the bottom, tea and cotton cloth half way up, and silk and cigars at the top. If for the lowest class the rate is 1 penny per ton per mile, it will probably be 3 pence for the intermediate class and 6 pence for the highest. Now it does not cost twice as much to carry a bale of silk or a chest of cigars as to carry a bale of gray shirtings. But whereas the latter may be worth £100 a ton, the value of the former may be 50 times as much. Railroads being, as they are, a necessary of modern life, is it not reasonable and in ac-

cordance with the accepted principle of taxation as exemplified in our own graduated income-tax and the *ad valorem* customs duties levied in most foreign countries, that more than a percentage proportion of the cost of providing the railroads should be laid on commodities so valuable that the charge for their carriage never can amount to more than a fraction of their value—that is, that a larger than average share of the burden should be imposed upon the shoulders best able to bear it?

### True in Other Fields Also

This principle of charging what the traffic will bear is really in no way peculiar to railroads. Many other instances of its application in other fields than that of taxation can be given. Stockbrokers, auctioneers, and so on charge a fee based not upon the amount of work which the transaction involves, but on the value of the property to which the transaction relates. Solicitors in carrying through the transfer of property are required by statute to charge, not as in former days according to the length of the deed, which was supposed to be a rough measure of the cost of service, but fees calculated as a percentage of the value of the property. Indeed, one may say that in this instance cost of service as the basis of charge is deliberately set aside by Parliament, for it is not as a rule the large properties where the titles need the most careful investigation. One may even go on to point out that a doctor charges more for attending the master than attending his servant, though we may assume that he places his best skill equally at the service of both; and that a cemetery chaplain, acting presumably with episcopal sanction, charges different fees for reading the burial service according as the corpse is placed in the common earth, in a brick grave, or in a family vault.

But it is not therefore to be supposed that railway rates are based solely upon value of service. Cost of service also has to be taken into account. It is usually higher where the articles are more valuable, mainly because they are handled in much smaller consignments; but not always. Empty fruit baskets, for instance, are of small value and occupy space out of all proportion to their weight. They naturally therefore form a bone of chronic contention between the railroads and the traders, the one side arguing justifi-

ably that the rate should be high because the cost is great, and the other side arguing, equally justifiably, that the rate should be low because the value is small.

#### Points in Railway Catechism

Bearing then all these different considerations in mind, we may sum up the railway rates experts' catechism in the following precepts:

(1) Charge no rate so high as to stop the traffic passing, provided the rate be not so low as to cease to cover the extra cost of dealing with it.

(2) Distribute the general expenses incident to the business as a whole over the whole traffic, on the basis of a rough equality of sacrifice, up to the point where the total receipts cover the total expenses plus a reasonable return on the capital involved, corresponding to the accepted return on capital taking equal risks in an ordinary business.

(3) Always bear in mind that, though within limits the same required net return can be obtained by a large profit on a small turnover as by a small profit on a large turnover, the former policy has nothing to recommend it except that it saves the management trouble; the latter not only inures to the benefit of the public at large, but forms a stronger basis of security for the future welfare of the undertaking from the shareholders' point of view. Or, to translate this last precept into concrete form: Keep up the fares for first-class passengers so long as you do not drive them into the third class, but reduce the fares for the mass of the people as far as you can afford to do so, even though this makes it necessary to run a larger number of trains to earn the same net revenue.

#### What Immediate Problems Are

It is by these principles that enlightened railway management is guided. But the British public has refused hitherto to entrust railway management to enlightened self-interest, and has thought it well hitherto to restrict the limits within which it may operate. The statute-book contains whole series of acts fixing maxima beyond which the companies may not charge. In 99 cases out of 100 these maxima have been superfluous; in the 100th case they have usually been harmful. Under the new Railways Act they will be swept away and replaced by a new

system under which railway companies will in effect be authorized to charge such rates as they believe to be commercially justifiable, if and when they can obtain the sanction of an expert tribunal after it has heard all that those who will have to pay the rates and fares can urge on the other side.

The railway companies in framing and the tribunal in sanctioning the scales of rates and fares for the future have before them an extraordinarily difficult task. We have compared railway rates to taxation because they are adjusted in relation to ability to pay. But the analogy fails at an important point. Income-tax has to be paid if the taxpayer can pay. He is not asked whether he is willing. But railway rates and fares can be avoided by the simple method of not traveling or not consigning traffic. And our railroads, in common with those of almost all other important countries, are today face to face with a novel situation. Working costs have risen enormously. Rates and fares have everywhere been put up to meet them. The increase since the war is estimated to be roughly 112 per cent in the case of goods and something like 100 per cent in the case of passengers. The percentage increases in America are hardly less. On the Continent they are far greater. Even at these rates railroads in America are at present hardly covering their working expenses. On the Continent they are being worked at an actual loss.

Where our railroads would stand if they could carry on for a consecutive six months without strikes it is difficult to say. But on all hands our railway men are wondering whether rates and fares can be profitably maintained at their present level—that is, whether they will not cause such a shrinkage of traffic that the railroads in their own interest will find it desirable to reduce the general level. It is not only that traffic may fall off because in railway phrase it cannot bear the rate—in other words, that the railway rate absorbs all or almost all the margin between cost at the point of origin and selling price at destination—but also that no one yet knows what are the potentialities of road motor competition.

#### A Vision of the Future

It may be that we are on the eve of a revolution. Railroads are as necessary as roads. And roads have long been recognized

as public necessities to be provided mainly—till the last few years one might have said wholly—at public cost. For certain essential public services, for the carriage of bulk commodities of low value, and for long distance traffic of all kinds, we cannot imagine that railroads will be superseded. The future may show, and not in England only, that it is necessary for the public purse to bear at least some portion of the cost of providing and maintaining our highways of steel just as it does now in the case of ordinary highways, leaving the charges made to the users

to cover the remaining cost of provision and maintenance and the whole cost of actual carriage.

This is in one sense a vision of the future. But once Parliament has accepted the principle of adjusting charges to revenue, and has provided that they shall be so fixed as to yield as far as practicable, with efficient and economical working and management, an annual net revenue equivalent to the pre-war net return, the question has been brought within the scope of practical politics.

## KNOW THIS GUY?

## Locomotive Exhibit Wins Blue Ribbon

*Kentucky State Fair Officials High in Praise of Illinois Central's Study in Contrasts*

**I**N the office of Superintendent T. E. Hill at Louisville, Ky., there is displayed under a glass cover a handsome blue silk ribbon on which is printed in letters of gold: "Kentucky State Fair, 1921, Locomotive Exhibit, First Prize." This blue ribbon was presented to Superintendent Hill on the last day of the Kentucky State Fair at Louisville by G. Carney Cross, secretary of the fair, on behalf of the Kentucky State Board of Agriculture.

In making the presentation, Mr. Cross thanked Superintendent Hill, and through him the Illinois Central System, for the effort that had been put forth to make this exhibit possible, and expressed the wish that at the 1922 Kentucky State Fair the Illinois Central would have even a larger engine to exhibit. He further declared that the Illinois Central had the finest motive power in Kentucky, which is saying a great deal, as there are twelve other trunk line railroads in the state.

All of this was very gratifying to Superintendent Hill and the other division officers who had worked hard to make this exhibit a success. The result is another example of what the Illinois Central organization can do when it makes an effort.

### Had Engine Trimmings Burnished

The exhibition of the old Mississippi and No. 2956, the new 2-10-2 engine, at the fair, September 11 to 17, was arranged by Superintendent Hill, Roadmaster P. Glynn and Master Mechanic J. F. Walker. The 2-10-2 was spotless, and the trimmings were burnished with gold leaf. Traveling Engineers J. J. Miller of Louisville and John McIntyre of Clinton, assisted by Engineer John ("Carhauler") Trantham of Paducah, were in attendance at the exhibition at all times, explaining to the thousands of visitors the various features in connection with the operation of our newest engine.

Pamphlets giving descriptions of the two engines, with their photographs, were distributed by Ivan Atcher, dimunitive file

*Our Blue Ribbon*

clerk of the Louisville office. Superintendent Hill estimates that more than 225,000 persons attending the fair viewed the exhibit. Steps were built to the cabin of each engine, so that the spectators could pass through and get a close view of the heart of the machines. Throughout the days and nights there was a constant stream of interested persons passing over the steps, 602 passing over in one hour. Nearly 50,000 pamphlets were given out.

### Needed Police

The engines were moved into place the opening day of the fair. The Mississippi was received from Indianapolis loaded on a coal car, which was pushed into the fair grounds by a switch engine for unloading. The 2-10-2 was received from the Paducah district Sunday morning and placed at the fair grounds Sunday afternoon. Twelve hundred feet of track was built into the fair grounds to the exhibit. The crowds attending the fair crowded around the engines as they were being moved in, making it necessary for a special detail of police to prevent interference with the work.

The engines were placed on exhibition next to the new \$300,000 Merchants and Manufacturers Building and were beautifully illuminated at night by a battery of flood-lights. The headlight, marker lights, cabin and

tender lights on the engine were lighted by a separate circuit. The fire-box was also illuminated at night by a special arrangement of flood-lights.

Many business men of Louisville and from out in the state declared that the en-

gine exhibit was the outstanding feature of the fair. Commissioner Hanna of the State Board of Agriculture said that the engine exhibit was the best he had ever seen and that he intended to have a complete machinery exhibit next year.

*The Engine Exhibit That Won the Blue Ribbon*

## *Employes After Business in Tennessee*

That not all of the organized solicitation of business for the Illinois Central and Yazoo & Mississippi Valley railroads is confined to the Western Lines is made plain by a letter from Superintendent C. R. Young of Fulton, Ky., recently printed in the Jackson (Tenn.) *Sun*.

Addressing the business men of Jackson, Superintendent Young says:

"Several days ago a committee of our employes voluntarily organized for the purpose of soliciting freight and passenger business for the Illinois Central Railroad, and obtaining the views from our patrons concerning our service, called upon you.

"I take this means of conveying to you our appreciation for the courteous treatment which you extended to the committee, and of advising you that this committee is a permanent organization, and that the members thereof, individually or collectively, shall be glad to have you feel at liberty to call on them for assistance, or

convey to them any information which you may wish to give, with a view of better service to our patrons.

"The committee is composed of the following employes, all located at Jackson, Tenn.:

"Messrs. W. L. Jones, machinist, chairman; W. H. Brooks, chief clerk to agent, secretary; M. L. Larkin, boilermaker; E. M. Scarborough, car inspector; E. N. Goddard, section foreman; N. T. Witt, switchman; J. J. Ryan, pipe fitter.

"I assure you, that, not only the committee mentioned above, but all officers and employes of the Illinois Central Railroad are interested in the service accorded to our patrons, and solicit any suggestions contemplating an improvement in the service."

*November—A Month  
for Perfect Packages!*

# Would Make Allied Debt a Trust Fund

## Judge Robert S. Lovett Outlines Plan to Win Friendship and Business for the United States

The following letter by Judge Robert S. Lovett, member of the Board of Directors of the Illinois Central System, was printed in the *New York Times* of Sunday, October 2. It was addressed to the editor.

THE amounts due the United States by our European allies for various advances made to them during the war under the Liberty Bond acts, excluding interest thereon (and not including amounts due for sale of surplus war materials, nor for American Relief Administration, nor to the United States Grain Administration, nor by some of the newer governments, such as Poland, Czechoslovakia, etc.), are as follows:

Belgium .....	\$ 347,691,566.23
France .....	2,950,762,938.19
Great Britain .....	4,166,318,358.44
Greece .....	15,000,000.00
Italy .....	1,648,034,050.90
Roumania .....	23,205,819.52
Russia .....	187,729,750.00
Serbia .....	26,175,139.22
<hr/>	
Total .....	\$9,364,917,622.50

All this money was lent after we declared war in April, 1917. It was not sent to Europe nor taken there by the Allies for their own use. Practically all of it was spent in America—paid to our own people. It went to pay for guns, shells, powder and other munitions of war made here to use against our common enemies, and for foodstuffs from our farms to prevent the collapse of our allies from starvation and enable them to continue the struggle until our troops could be trained, transported and brought into the battleline. Every battle fought with these munitions while we were getting ready counted for us as much as if fought by our own men—with this difference: It was the lives of the men of our allies and not of our own men that were lost in these battles. They were fighting our battle as well as their own. They furnished the men—we the

munitions. They must pay for the munitions if we demand it; but what of their loss?

### Our Enviably Position

Moreover, it is not as if we all entered the war simultaneously, each country bearing its own losses. For three years before we entered, the Allies had strained every resource of men and money in the struggle and had already piled up a legacy of debt that will burden their children for generations, if indeed they can extricate themselves at all from the financial and economic chaos that involves some and threatens all of them. We, on the other hand, are in every way the richest and most powerful nation on earth; and while they were devastated and almost ruined by their four and a half years of warfare, we, with our few months, are practically unscathed. For us in these circumstances to demand the pound of flesh as stipulated in the bond of our allies for materials and munitions to carry on the fight which we had taken up is not in keeping with American character and American tradition for generosity and big-heartedness, and would leave upon us as a nation an everlasting stain.

Measures for the collection of this debt are now pending before Congress, and we should consider carefully what the terms shall be. No one suggests the cancellation or the unqualified remission of the debt. It is true that this would reduce by these millions the billions of indebtedness of the allied countries previously incurred and due mostly to their own citizens, but the effect of this would not be immediately and directly felt by the allied people most in need of help.

### Make Debt a Trust Fund

Let us make of the allied debt a perpetual trust fund to be administered by the allied governments for the direct and immediate benefit of the allied people, free from any political purposes or other exploitation. Let us make a special treaty with each allied country, binding it to treat as a sacred trust the amount of its indebtedness to us and

providing that it shall apply the interest thereon, say at 5 per cent per annum, first to the payment of such pensions as it should prescribe to surviving widows, minor children and dependent parents of men who lost their lives in the war, and to incapacitated soldiers of the war; second, to the establishment and maintenance of hospitals for all classes of its inhabitants; and the bal-

ance, if any, to the care and support of orphans and of the aged and infirm, or to educational or other benevolent purposes to be specified.

This would bring relief directly to the most helpless victims of the war in the allied countries, which, on account of the huge burden of debt under which they are staggering, are unable to give such relief

Judge Robert S. Lovett      Photograph copyrighted by Gessford.

in full measure; and would be an example of American benevolence and generosity in keeping with the real character of our nation. It would endear us to the hearts of our allies from generation to generation and relieve us of the suspicion of sordid selfishness which otherwise must grow into a moral conviction. And especially it would give us a better opinion of ourselves, exalt us in our own faith in our unselfishness and belief in the fellowship of man, and give us more respect for ourselves as a great and benevolent nation.

It would revive the spirit in which our young men fought the war with such glorious success and remove the impression now settling over the world from our apparently cold indifference to the sufferings of Europe that we went into the war only to "save our own skins" and that we have withdrawn to our own selfish concerns and the enjoyment of the money we made from munitions and otherwise out of the war necessities of our allies. The benefit of concessions we make should be apportioned among our allies—not according to the amounts advanced to each, but in proportion to the lives lost in the war by those who stayed in to the end.

### Our Opportunity Waits

Without stopping now to inquire whether it is due to unreasonable stubbornness of President Wilson or to narrow partisanship of the Senate in respect to the Treaty of Versailles or whether the present administration has any responsibility for it, the fact in any case is that nothing but our great resources and wealth and power and the still lingering hope that we may yet help saves us as a nation and people from the open contempt of the whole world. What is worse, we must ourselves have a feeling that we deserve it. After achievements in the war becoming our power and greatness, we withdrew from the ruin and misery and suffering of Europe, refused to help bind up her wounds and, like the Levite, "passed by on the other side"—even refusing to assist, until they could stand alone, the peoples we had just liberated. And we are now claiming all the benefits falling to us under the peace treaty that was made, while refusing to assume any of the burdens imposed by the same treaty that gives the benefits! This is no expression of opinion about the League of Nations or other political subject,

but only a plain statement of facts about our international position.

Furthermore, the disposition of the allied debt above suggested would be "good business"; and I urge this consideration for that small minority of our people who put business above everything. Assuming a rate of 5 per cent, the interest alone on the debt would amount to almost \$500,000,000 per annum. This means that in addition to the ordinary exchange of goods between nations the allied countries would have to overcome, somehow, a balance of \$500,000,000 every year in excess of what we buy from them. The balance of trade with the allied countries throughout the entire period of the war ran largely in our favor because they were buying enormously from us in munitions and foodstuffs and were producing but little to sell, since all their productive resources were required for war purposes. In addition to this, they sold back to us during the war nearly all the American securities in which their people had invested, and borrowed in this country through bankers large sums of money to carry on the war. This condition has drawn to us already gold in such quantities that we are even now, as is sometimes said, the "storehouse of the world's gold."

### Will Drive Away Customers

If to the trade balance already existing against them with resulting exchange rates we require our allies to pay us \$500,000,000 per annum in gold as interest on their indebtedness to our government, we not only diminish by that much their power to buy our products, but we inevitably drive them elsewhere and to other sources of supply. Or, since they have not the gold, they must pay us in goods; and to do this they must underbid our manufacturers and, in spite of protective tariffs, sell to us, or to others, goods cheaper than we can produce them and to that extent take employment from our labor. Is it not obvious, therefore, that it will be to the interest of France, Italy, England and Belgium to buy grain and other foodstuffs of all kinds from South America and other foreign countries rather than from us and thus seek to overcome our balance against them; and is it not plainly to the interest of all European countries to develop other sources of supply for grain,

cotton, hides, wool, etc., rather than buy from this country?

When order is restored in Russia, as it now seems likely to be, they will go there for their grain and foodstuffs, for which they can exchange goods or deal in money or exchanges at favorable rates and pursue with renewed energy the development in other parts of the world of cotton and other products hitherto obtained from us. It is well known that even now Europe is taking from us the Central and South American trade which drifted to us during the war, and probably the same will be true of other countries of the world, because our accumulated balance against Europe and the resulting exchange rates are such that she can pay good prices for what she requires from those countries and still pay less than if she bought from us.

#### Advantages of the Plan

By requiring the Allies to pay \$500,000,000 per annum as interest on the debt to our government, to say nothing of the principal, we aggravate to that extent and render almost unendurable the conditions operating against us in international trade. If we do not utterly bankrupt and ruin our allies, we will at least impair and drive to other sources of supply (perhaps not even yet developed) a very large demand for our cotton, grain, other foodstuffs and products upon which our prosperity is dependent or force them to pay us in goods at sacrifice prices, taking employment from our labor and manufacturers. If, however, we leave with the Allies this interest charge of nearly \$500,000,000 per annum to assist them in caring for the most helpless victims of a war as much ours as theirs, we will revive their spirits and hope, secure their goodwill and affection forever and, at the same time, avoid piling up steadily a great barrier against the export of our products to our oldest and best customers, upon whose trade the welfare of so many of our people is dependent.

Hence, I say that "good business," as well as our conscience and character as a nation, forbid that we shall demand from our allies the full payment of the principal and interest of the loans we made to them during the war to carry on the fight while we were preparing to take it up.

## WISCONSIN VETERAN

*Walter M. Palmer*

Here is a veteran of the Wisconsin division, Walter M. Palmer, engineman, who was retired on a pension at the close of 1920, after forty-eight years of service with the Illinois Central. Mr. Palmer was born in Biddeford, Maine, May 1, 1850, and entered the employ of the Illinois Central in October, 1872, as a fireman at Amboy, Ill. In October, 1880, he was promoted to engineer, in which capacity he served at Freeport, Ill., until his retirement. Mr. Palmer reached the age of 70 on May 1, 1920, but was retained in service until retired, at his own request, on December 31. He lives at 608 South Chicago avenue, Freeport.

# Trouble-Makers in Our Boiler Waters

## Non-Technical Explanation of Impurities That Clog Pipes, Cause Foaming and Eat Iron

By C. R. KNOWLES,  
Superintendent, Water Service

**W**ATERS obtained from streams, lakes, reservoirs, wells and other sources of supply usually contain considerable foreign matter, in suspension, in solution or in both. From the chemist's standpoint, all foreign substances in water are considered impurities, but for a boiler supply we need consider only impurities causing corrosion, pitting, foaming, priming and the forming of scale.

Incrusting waters form a scale deposit on the boiler sheets and tubes, resulting in crystallization, granulation, burning and a general weakening of the parts, as well as an enormous waste of fuel.

Corrosion is caused by the presence of acids in the water. These become separated when heated and are among the most destructive agents to which boilers are subjected.

Priming is the formation of wet steam, in which small globules of water are carried with the steam.

Foaming is a more aggravated form of priming, where the water is carried by the steam in slugs instead of in smaller particles.

5-Inch Pipe Almost Closed by Scale

### Here Are Incrusting Solids

Impurities coming under the head of incrusting solids and their effect on boilers are:

*Iron and alumina:* These are generally present in water in the form of bi-carbonates, but iron bi-carbonate, being a very unstable compound, giving out its excess of carbonic acid and absorbing oxygen, is converted into iron rust. This is the cause of many waters' turning red when standing exposed to the air for a short time. Carbonate of iron causes boiler scale. Ordinarily alumina is present in minute quantities only.

*Silica:* Common sand is nearly pure silica. Silica is contained in almost every water, but to the greatest extent in warm waters. It is frequently in combination with alumina, and except in some few cases is present in such a small quantity that it has little to do with the formation of boiler scale.

*Calcium carbonate* (commonly called chalk or marble): Carbonate of lime is the commonest form in which lime occurs in water. It is but slightly soluble in chemically pure water, but when carbonic acid is present it dissolves in water in the form of bi-carbonate of lime, which is soluble. Bi-carbonate of lime, when carried into a boiler, is decomposed by the heat. The carbonic acid is driven off with the steam, and normal carbonate of lime is formed, which is practically all precipitated in the boiler when the temperature reaches 300 degrees Fahrenheit.

8-Inch Pipe 85 Per Cent Closed by Scale

Carbonate of lime alone does not form a very hard scale, but it is responsible for a good deal of the mud which is found in the boiler. However, carbonate of lime may form part of a very hard scale when other materials are present which cement it to the sides and flues of the boiler.

### Gypsum Forms a Scale

*Calcium sulphate* (commonly called gypsum or plaster of paris): Sulphate of lime or gypsum is a common constituent of natural water and is responsible for the hardest kind of boiler scale. Scale formed from sulphate of lime is sometimes as hard as porcelain. It is almost entirely precipitated when the boiler pressure is at fifty pounds. This precipitation is in the form of heavy crystals fastened to the sides of the boiler, forming a scale of great hardness. Sulphate of lime attaches itself to the sides of the boiler much more firmly than carbonate of lime.

*Calcium chloride*: Chloride of calcium is sometimes found in natural water, in which it is very soluble. It is classed among the corrosive minerals found in water. It does not of itself form scale, but when other sulphates are present a transfer of acids takes place, and calcium sulphate is formed, which acts as described under that head.

*Magnesium carbonate* (magnesia): Magnesium carbonate, in its commonest form, is used as a toilet preparation. It is much more soluble in water than calcium carbonate, but is ordinarily found in water as the bi-carbonate. The bi-carbonate decomposes in a boiler into carbon dioxide and magnesium

carbonate, just as in the case of calcium bicarbonate. Magnesium carbonate is itself tolerably unstable in boilers, and decomposes into carbon dioxide and magnesium hydrate or the magnesium compounds usually found in the scale.

Magnesia is much used as lagging for boilers. It is an excellent non-conductor of heat, but when in the form of boiler scale it is on the wrong side of the shell.

*Magnesium sulphate* (commonly known as epsom salts): Sulphate of magnesium is a common constituent of natural waters, in which it is extremely soluble. It does not of itself form a boiler scale, but it is broken up by lime salts in the water and thus forms a scale.

### Causes of Foaming and Priming

Non-incrusting solids causing foaming and priming are:

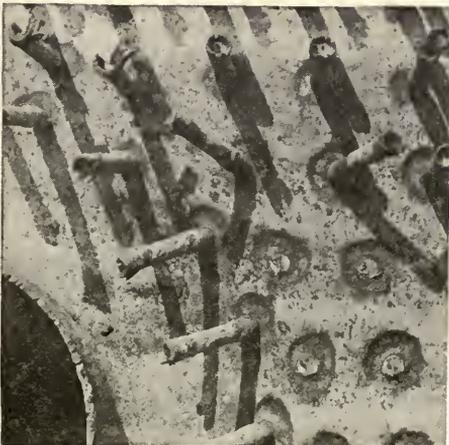

*Sodium chloride* (common salt): Sodium chloride is composed of two substances. One of them is metallic sodium, an extremely poisonous substance; the other, chlorine, which is even more objectionable. Metallic sodium is so active that, if a piece is thrown in water, it decomposes the water, igniting the liberated hydrogen, giving off a report like an explosion. Metallic sodium in contact with the flesh would eat its way to the bone. Chlorine is a gas and is even more obnoxious, objectionable and poisonous than sodium; yet the two united chemically produce a substance that is not only harmless, but absolutely essential.

*Sodium sulphate* (glauber salt): Sulphate of soda is simply a combination of that same vicious metallic sodium and sulphuric acid. The sulphuric acid is also a very objectionable material. As a solution of it would readily dissolve iron, it is extremely troublesome when present in boiler feed water.

*Sodium nitrate*: This is commonly called Chile saltpeter and is rarely present in waters on the Illinois Central. It is extremely soluble, and its only effect on boilers is probably that of aiding corrosion, because it gives up part of its oxygen readily.

*Sodium carbonate* (soda ash): This neither forms boiler scale nor corrodes, but it is objectionable when present in large quantities, as it causes foaming.

*Suspended matter*: This is either organic

Corrosion of Boiler Sheet

Examples of Pitted Boiler Tubes

or inorganic matter held in suspension in water. It is variable in quantity, depending upon the source of supply of the water, the rainfall and the season. Suspended matter forms boiler scale only by being cemented to the boiler by other materials.

#### Elements That Eat Boilers

Elements causing pitting and corrosion are:

*Magnesium chloride:* This is a very objectionable mineral when present in boiler water. It is corrosive in its action, quickly pitting and grooving boilers which use water containing it.

*Magnesium nitrate:* The action of this salt in boilers is the same as that of magnesium chloride.

*Free sulphuric acid* (oil of vitriol): This non-volatile acid occurs most frequently in mine waters, in the effluent of coke ovens and in rivers of coal-mining districts. When introduced into boilers, it immediately attacks the metal, forming sulphate of iron, which by decomposition yields hydrate of iron and the sulphuric acid again, and this acid repeats its action upon the metal, and so on through an indefinite number of destructive cycles. From this can be seen the deadly effects of only a trace of sulphuric acid.

*Free carbon dioxide* (carbonic acid gas): This gas is present in a free state in prac-

tically all natural waters. It is the gas we know in soda and seltzer waters. The presence of this acid in boilers favors pitting and corrosion. Treatment removes it completely.

*"Half-bound" carbon dioxide:* One-half the carbon dioxide in calcium, magnesium and sodium bi-carbonate is held in a much less stable combination than the other half, and for this reason is termed "half bound." Its action is the same as that of free carbon dioxide.

The list given above is not complete in its classification, but presents only the most common substances present. It covers practically all of the impurities found in waters used for boiler purposes on the Illinois Central System.

# Things That Make Boilers Good or Bad

**Best Possible Construction Will Not Avail Against Stupid Maintenance, Says Expert**

The following address on "The Construction and Maintenance of Locomotive Boilers" was delivered at one of the fuel conservation meetings of employes held at the 63d street office building of the Illinois Central at Chicago.

By J. F. RAPS,

General Boiler Inspector

**I**N the construction of locomotive boilers, specifications and blue prints are carefully prepared covering the methods of construction and for the manufacture and testing of materials, and a rigid inspection is maintained at the various mills furnishing the materials and at the locomotive works during the fabrication of the boiler, in order to detect any defects that might occur in either the workmanship or the material.

The size and weight of the boiler are governed by the permissible weight of the locomotive and the construction required in order to obtain as nearly 100 per cent capacity as possible, making the boiler and cylinder horsepower nearly equal, which is determined by the following calculations:

Cylinder horsepower;

Steam consumption per hour;

Pounds of water evaporated per square foot of heating surface per hour;

Quantity of coal burned per hour and grate area required.

## Elements of Safety Figured

In preparation of the specifications and blue prints, special attention is given to the thickness of the plates in the various parts of the boiler, the lay-out of the longitudinal seams, the spacing and diameter of the stay-bolts, crown stays and braces, in order to keep the stresses within certain limits, thereby maintaining a large factor of safety on all parts of the boiler while carrying maximum steam pressure.

After the material has been received at the locomotive works, the railway company's inspectors check over the lay-out of the sheets and follow the work through the

J. F. Raps

various stages until the boiler receives the hydrostatic and steam tests, after which it is ready to be placed upon the frames.

The grates, ash-pan and front-end draft appliances are then installed in accordance with the railway company's blue prints.

The grate area required for bituminous coal is based on the assumption that 120 pounds of coal per square foot of grate per hour is the maximum figure for economical evaporation.

As to the form of grates, whether finger or table, both are used with success when well designed and properly applied; the percentage of air openings should be made as large as possible without causing weakness of the parts or losses of fuel through the grates.

## Ash-Pan an Important Factor

The ash-pans applied to modern power require careful designing in order to obtain ample capacity, so that the accumulated ashes do not interfere with the air supply.

Air ingress openings in the ash-pan should be of sufficient area to insure the presence of atmospheric pressure under the fire when the grate is working at its maximum fuel rate.

It has been the general practice on this road to make the total unobstructed air opening in the ash-pans not less than 14 per cent of the grate area, as exhaustive tests have demonstrated this to be about the correct proportion.

The primary function of the front-end, or smoke-box, and the draft appliances is the production of draft to burn the fuel economically at a proper rate, drawing air through the ash-pan, grates, fuel bed and tubes, discharging through the stack with the aid of the exhaust steam from the cylinders. These qualifications depend largely upon proper proportions: the location, height and diameter of the exhaust nozzle and stack; location of the table plate, deflector plate and petticoat pipe; an ample area of netting to arrest the sparks and control the maximum size of sparks emitted from the stack.

It is essential that the exhaust nozzle, petticoat pipe and stack be in alignment, and that the deflector plate be constructed in two pieces, so that it can be adjusted, as the distance from the bottom of the smoke-box to the lower edge of the deflector sheet is largely an experimental adjustment. The raising or lowering of the deflector plate will affect the condition of the fire. If the fire burns particularly hard at the rear of the fire-box, lowering the plate will develop a sharper draft through the lower flues and cause the fire to burn more evenly.

#### Use of Arches Is Modern

All modern locomotives are equipped with arch tubes and brick arches, the tubes extending from the rear flue-sheet below the fire tubes to the upper portion of the door-sheet. Because of their location they absorb a large amount of heat, giving a high rate of evaporation per square foot of heating surface, and greatly facilitate the circulation of the water throughout the boiler, making all of the other heating surfaces more effective.

The brick arch rests on the tubes and extends from the flue-sheet to about half the length of the fire-box. The function of the arch is (1) to assist combustion by maintaining a high fire-box temperature, retard-

ing and burning much of the coal dust and fine particles of coal that would escape as smoke or cinders, (2) to retard and mix the rich hydro-carbon gases with the oxygen, compelling them to burn before they escape into the flues, and (3) to cause the heat to impinge against the fire-box sheets instead of having a direct flow to the flues. The removal of the arch would cause a waste of from 15 per cent to 20 per cent of the coal fired, resulting in a decrease in capacity and efficiency of the locomotive.

#### Advantages of Superheater

With the advent of the heavier and more powerful locomotives designed and constructed to meet the demand of increasing freight and passenger traffic has come the application of superheated steam, which has resulted in lower boiler pressure, increased diameter of cylinders to overcome the low boiler pressure when starting the train, and a higher efficiency without altering the size of the boilers. The superheater has become recognized as one of the most efficient and economical additions to the locomotive that has been made in recent years. Without the superheater, the steam consumption would be so great that it would be necessary to force the boilers beyond their economic capacity or construct larger boilers.

The types of superheaters vary greatly in the degree of superheat produced. Those of the smoke-box type produce from 30 degrees to 90 degrees of superheat, while those of the fire-tube type produce from 200 degrees to 250 degrees of superheat. The fire-tube type superheater consists of a top-header, side-headers, or comb-headers. As the top-header type is standard on this system, I will deal with it exclusively.

The top-header is supported on brackets in the smoke-box, joining with the dry pipe in the same manner as the tee-head of a saturated engine. Attached to the header are the units, a continuous tube formed of four 1½-inch seamless steel tubes forged together at three ends, forming return bends. The end which is clamped to the header is upset sufficiently to form a ball joint. The units are located inside of the large 5¾-inch or 5½-inch flues, of which there are four or five horizontal rows in the upper part of the boiler, these flues being swaged to a 4½-inch diameter at the fire-box end.

The flow of gases through the large tubes is controlled by a damper placed in the bottom of the chamber which encloses the header and front end of superheater units in the smoke-box. The damper protects the units from becoming overheated while the throttle is closed and no steam is passing through them. This damper, which is opened automatically at the opening of the throttle valve, should be maintained in perfect working condition at all times, as the failure of the damper to open properly will prevent the hot gases from flowing through the large flues, thereby reducing the degree of superheat and causing the locomotive to be less efficient and consequently less economical to operate.

The general operation of the superheated locomotive is the same as that of the saturated steam locomotive. The water in the boiler should always be carried as low as the service conditions will permit, in order to obtain the highest degree of efficiency. Carrying the water at a level which results in priming reduces the superheating capacity of the superheater, is injurious to the extent of causing scale to form in the units and is conducive of cracked headers and leaky units.

After all of the care which is exercised in preparing the specifications and blue prints, constructing and assembling the boiler and the various parts necessary for its economical operation, it must be borne in mind that there is no part of the locomotive that requires more attention and care than the boiler. Each employe, from the engineer to the cinder pit men, should exercise the utmost care to keep it in serviceable condition and in the highest state of efficiency. This can be accomplished only by the hearty co-operation of all employes concerned with the handling and operation of the locomotive.

#### What a Thorough Inspection Is

After the locomotive has been received from the locomotive works or turned out of the shop after receiving heavy repairs, the roundhouse inspector should make a thorough inspection of the front-end appliances, ash-pan and grates in order to ascertain if they have been properly applied and are in perfect working condition. He should make sure that the petticoat pipe is properly laced, well bolted in place and in perfect alignment with the exhaust nozzle and

stack. The table plates and netting should fit tightly along the smoke-box in order to prevent the throwing of large sparks. The front-end should be examined for air leaks by applying the blower and going over the various joints with the flame of a torch, as air leaks around the front-end will spoil the vacuum, necessitating the reducing of the nozzle tip in order to secure sufficient draft on the fire, which means a needless waste of coal due to improper maintenance.

The inspector should try the grates to see that they shake easily, are properly installed and set level when in locked position. Grates with fingers that do not mesh properly or do not set level when in locked position will ruin a fireman's coal record in a very short time. The inspector should see that the ash-pan is properly bolted in place and is free from holes or openings through which the fire can drop, thereby setting fire to bridges or right-of-way, that the air openings along the side of the pan are unobstructed, that the hopper doors or slides work easily and are tight and properly locked when closed. After steam is raised on the boiler, it should be gone over carefully for steam leaks and made perfectly tight before being allowed to go into active service.

#### Proper Care on Road Essential

After the locomotive has been placed in active service, it should receive special attention from the enginemen, particularly in regard to the amount of coal burned and the manner in which the fire burns, as it may be necessary to make some slight change in the adjustment of the draft appliances. Always remember that the shop organization installs the front-end appliances according to standards and does not have an opportunity to see how they perform in actual service. On the other hand, when proposing changes, you should be sure that the trouble lies with the present draft arrangement, as we are continually required to make changes in the draft appliances, only to change them back to their original position after a few trips.

The cleaning of flues is an important factor in the successful and economical operation of the locomotive, as stopped-up flues will cause a poor steaming engine, due to impaired draft and a reduction in the heating surface, as a trifle more than .52 of a square foot of heating surface is lost for

each lineal foot of 2-inch flue or 10.47 square feet for each 20-foot flue that becomes stopped up. Flues should be thoroughly blown out with air at the end of each trip. Special attention should be given to the cleaning of flues in superheated locomotives and those equipped with the brick arch, and no locomotive should be allowed to go into service with any flues stopped up.

#### How Leaks Are Developed

It is also essential to know that the flues and fire-box sheets are in good condition before the locomotive is offered for service. The prevention of engine failures due to leaky flues, however, does not rest entirely with the roundhouse organization, as the leakage of flues and fire-box sheets is primarily caused by sudden and unequal expansion and contraction of the metal, due to the varying temperature of the water in different parts of the boiler, caused by:

(1) Improper handling of injectors, thereby admitting an excessive amount of water at low temperature to the boiler;

(2) Improper firing, which permits sudden rushes of cold air to chill the flues and sheets.

The liability of flues to leak is greatest when covered with scale, which interferes with the transmission of heat, resulting in the metal's becoming much hotter than it would if clean, and contraction will be correspondingly greater when the flues are suddenly chilled.

Enginemen should endeavor to leave their locomotives at the cinder pit with a full boiler of water and a good fire, in order that the hostlers will not be required to fill the boiler just before blowing off. Boilers should not be blown off when the fire is dirty, and too much water should not be blown out at one time, to be replaced by water at a temperature about 200 degrees lower than that of the water in the boiler, as this is injurious to the fire-box sheets and flues by causing cracks and leaks.

#### Scale Increases Use of Fuel

The washing of boilers is one of the most important operations performed by the roundhouse organization, and it is necessary to exercise the greatest care to prevent mud or scale from lodging on the flues or the fire-box sheets. The arch tubes and the fire-box sheets should be examined on the fire

side for any indications of mud or scale. After the boiler is washed out, it should be thoroughly inspected through all wash-out holes before the plugs are replaced, and any scale found should be removed. The arch tubes must be turbinized each time the boiler is washed, and examined with a light to make sure they are perfectly clean, in order to prevent them from bagging and cracking. It has been demonstrated that  $\frac{1}{8}$  of an inch of scale on the flues or fire-box sheets results in an increase of fuel consumption of 10 to 12 per cent, according to the mechanical structure of the scale, as a hard scale is more impervious to heat transmission than a soft or porous scale. Consequently, any additional increase in the accumulation of scale on the tubes or fire-box sheets will cause a corresponding increase in fuel consumption.

The maintenance of the locomotive boiler depends on the co-operation of all concerned. It is first necessary to furnish good water. Where good water cannot be obtained, the water should be treated. A greater saving can be made in the conservation of fuel by the use of good water than by any other method, and the installation of treating plants shows a wonderful return on the investment. The care exercised by the engine crew has a great deal to do with the life of the flues and the fire-box. The careless handling of the engine on the cinder pit will cause a great deal of unnecessary work to be performed. The firing of the engine several hours before listed in order to make house room is detrimental, due to the uneven water and fire-box temperatures. The care with which the roundhouse organization does its work in keeping the boiler tight and free from mud and scale will greatly add to the life of the boiler, but the roundhouse men must have help to maintain boilers in 100 per cent condition, as the best care and workmanship will be of no avail if the boiler does not receive intelligent and careful treatment while in service.

---

#### PASSES BAR EXAM

W. J. Heckmann, claim agent of the Iowa division, stationed at Fort Dodge, Iowa, has recently become a lawyer, by virtue of passing the state bar examination held at Des Moines, October 4, 5 and 6.

# Heads Interstate Commerce Commission

*Introducing Chairman C. C. McChord, Who Is Named Successor to Edgar E. Clark, Resigned*

COMMISSIONER CHARLES CALDWELL McCHORD was unanimously elected chairman of the Interstate Commerce Commission October 3. He succeeds Edgar E. Clark, who resigned from the commission recently to engage in the practice of law. Since Mr. Clark's retirement, Mr. McChord had been serving as acting chairman. He was chairman of the commission during the year beginning in March, 1915. His appointment to the commission was made in December, 1910, by President Taft. His recent election is for the period ending December 31, 1922. For several years the chairmanship of the commission has been rotated annually in the order of the seniority of its members, each term ending in March. The election of Mr. McChord will make his chairmanship terminate with the calendar year.

Commissioner McChord was one of the two dissenting commissioners in the 1914 eastern rate advance case as originally decided. He and Commissioner Daniels expressed the opinion that the railroads should have been granted the increases asked. The majority of the commission accepted this view upon a rehearing.

## Saw Commission's Responsibility

When the commission decided the general rate case in 1920, Ex Parte 74, Commissioner McChord wrote a separate opinion as a reply to the objections made in separate opinions by Commissioners Woolley and Eastman. He took the position that the commission had attempted to deal with this case under the law in a broad, comprehensive, common-sense way, realizing that the primary responsibility for the future of the railroads rested upon its shoulders.

He also wrote a strong opinion in the Illinois intrastate passenger fare case last November, expressing the attitude of the commission, that its power to remedy state discrimination against interstate commerce had been broadened by the Transportation Act.

Commissioner McChord wrote the commis-

*C. C. McChord*

sion's opinion in the long-contested railway mail pay case, issued in 1920, in which the commission ordered large increases in the rates for the transportation of the mails and provided for retroactive payments to the railroads by the Postoffice Department for the period during which the case had been pending.

## He Is a Native of Kentucky

Mr. McChord was born December 3, 1859, at Springfield, Ky. He attended Center College at Danville, Ky. After leaving college he became a member of the bar of Kentucky and engaged in the general practice of law. He was prosecuting attorney at Springfield from 1886 to 1892. He was appointed a member of

the Kentucky Railroad Commission in May, 1892, and elected chairman.

He resigned in 1895 and was elected a member of the Kentucky State Senate, serving four years. He was again elected a member of the railroad commission in 1899 and was

again made chairman. He was re-elected commissioner and chairman in 1903 and in December, 1910, was appointed to the Interstate Commerce Commission. He was re-appointed by President Wilson for the term expiring at the end of 1922.

## *How Imagination Can Help Railroading*

By D. M. EVANS,

Freight House Foreman, Rockford, Ill.

When God created man, he also endowed him with the image-forming power of the mind commonly known as imagination.

This gift, properly applied, is a valuable asset to any person in railroad service. It can be employed to eliminate much of the needless expense of the railroad itself in the matter of claims for loss and damage.

Too frequently, however, railway employes do not imagine that, from the moment a bill of lading has been signed for a shipment, the railway company is responsible for the invoice value of that consignment until delivered and signed for by the consignee. In the handling of freight an employe may not imagine a particular shipment as being anything more than a box, a barrel or a crate—not imagining that it has any particular value—and may imagine his work properly performed when this box, barrel or crate has been placed in a car for transportation.

### **What Happens on the Road?**

Men do not imagine what takes place in a freight car while on its way with its load—do not imagine that a shipment loaded properly will ride safely or loaded wrongly will become useless and involve the payment of a claim twice the size of a two weeks' pay check as a result. After loading freight in one car and billing it in another, does anyone imagine what takes place with a shipment wandering over the country, the vast amount of clerical work necessary to correct the error, or the shipment's becoming lost altogether and a claim instituted?

In the handling of incoming freight, does the average person imagine a shipment as having traveled safely for a thousand miles perhaps and through an act of carelessness being broken or utterly destroyed at its journey's end? Does he imagine the care of men loading the shipment, of the pains taken by those handling the car in transit? Can he imagine

the waste of time, the waste of thought, the waste of material and the final waste of the company's money in paying for a loss that could have been avoided?

### **We Handle Real Money**

Trainmen and switchmen too frequently fail to imagine that the cars they handle contain real money—thousands of dollars' worth of goods intrusted to their care. Do they imagine their duty as being any more than that of throwing the car in the train, or throwing it out on a siding or a lead track, or for convenience's sake making a "drop" of it somewhere, letting it crash into another car containing thousands of dollars' worth of goods? Do these men imagine that the infinite care and pains of someone else have been knocked into a cocked hat by a move made to save an extra switch, in order to save an extra few seconds of time—and expensive time it is in the long run?

Do railway men in the transportation department imagine why they are employed at all? Do they ever stop to imagine the mental attitude of the patron of the railroad who, after spending money to sell his goods, promising a customer a certain article at a certain time, intrusting his property to the railway company, perhaps banking on a particular shipment's being the means of enlarging his business, finds when the shipment does arrive that it has been put out of commission by rough handling or delayed by misloading or improper billings? The mental attitude of the shipper or of the consignee in such a case is not pleasant to contemplate.

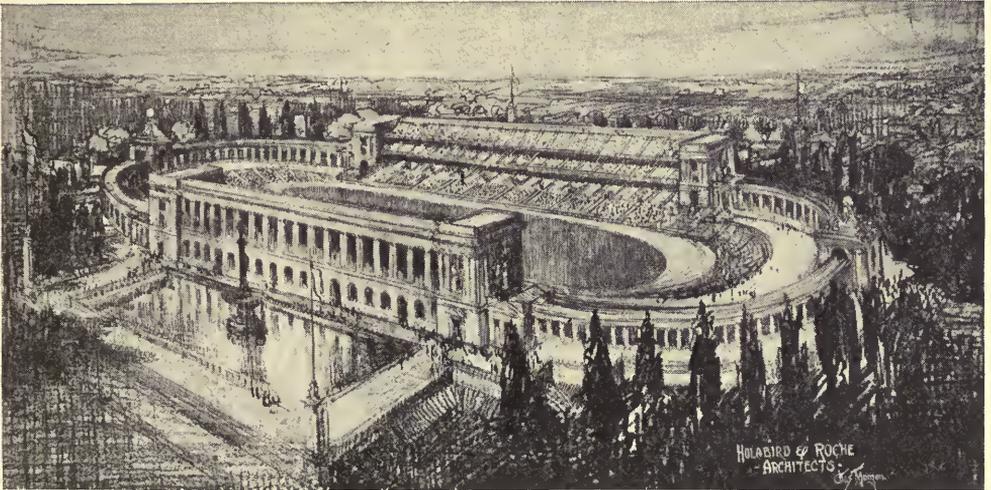

### **What Co-operation Can Do**

On the other hand, can railway men imagine what happens when each and every employe uses his imagination in the betterment of service? Can they imagine what a shipper thinks when a certain railroad has demonstrated that its employes are thinking men, are careful men and concerned only in the correct

and absolutely safe movement of freight intrusted to their care? If they will only imagine this far, they will find the shipper is imagining that particular railroad as being a pretty safe line to ship over as well as to travel on. Thus the railroad has gained friends and business, and, were it not for the latter, none of us would be drawing salary. The "No Exception" campaigns inaugurated

by the Illinois Central have gone to prove the necessity for imagination. They have done much to eliminate those who cannot or will not employ their imaginations sufficiently to study their business or perform their work well. The persons who have not the ambition to study the work in hand—to use their heads, no matter in what department of railroad service—are better out of service than in it.

## Praise for Our Public Relations Work

### *Railway Age Devotes Space to Explaining and Commending Policy of the Illinois Central*

THE Illinois Central occupied positions of considerable importance in the October 8 issue of the *Railway Age*. Of the three articles featured in that issue, two pertained to the Illinois Central. One was an article on "The Division of Interline Passenger Fares," by L. C. Esschen, auditor of passenger receipts, and the other was an article on "Public Relations Work on the Illinois Central." In addition, there were carried an editorial commenting favorably on the public relations effort and a short digest of the material in the October statement of our public relations series.

What the *Railway Age* thinks about our public relations work is expressed in the following editorial, reprinted from that issue:

"Every railway executive is painfully aware that government regulation has become such that it exerts a dominant influence in determining whether the railroads as a whole and individual railroads can be developed and operated successfully from the standpoint of either the public or their owners. The governments represent the public, and in the long run public sentiment determines how the various governments, municipal, state and federal, regulate the railroads. It necessarily follows that if the railroads are to be successfully developed and operated public sentiment must be made and kept so intelligent and fair regarding railway matters that it will cause regulation to be intelligent and fair.

#### **An Executive Duty**

"On whom devolves the plain duty of causing presentation to the public of the information and arguments which will cause it to understand railway matters and to favor fair and constructive regulation? It devolves upon the railway executives themselves. It is under present conditions as much their duty constantly to present the facts about the railway business to the public so as to bring about intelligent and fair regulation as it is to present facts to their officers and employes which will bring

about intelligent and energetic operation of the properties. There are many thousands of people in this country who find, or believe they find, it is to their selfish interest to attack and misrepresent the railroads. If these attacks and misrepresentations are not constantly met with presentations of the facts and of counter arguments public opinion will be constantly misled and regulation of railroads will be unfair and harmful.

"Of course we do not mean the executives of the railroads should personally be constantly engaged in presenting to the public facts and arguments regarding the railway situation. There is no more reason why they should personally do all of this kind of work than why they should personally perform the duties of the superintendent of motive power, the general manager, or the general counsel. But they should see that the relations of the railroad with the public are properly handled just as they should see that the equipment is properly maintained, that freight and passenger service are properly rendered and that the legal interests of the company are properly protected.

#### **Need for Work Apparent**

"It is a remarkable fact that, although public sentiment, acting through government regulation, has become within recent years such an important, and even dominant, influence in the development and management of the railroads, only a comparatively small number of railway executives have created and maintained on their railroads special departments adequately equipped to present constantly and effectively to the public the facts about the railway situation and to make replies to the innumerable misrepresentations of the railroads which constantly are being given dissemination. The worst troubles of the railroads for fifteen years have been mainly due to unfair regulation, and unfair regulation undoubtedly has been mainly due to failure of the railroads per-

sistently and adequately to present the facts about their business to the public.

"The education of public opinion concerning the railway situation demands not only organized action by the railroads as a whole regarding problems of national scope, but also persistent and intelligent public relations work by each individual railroad in its own territory. This is a vast country, with a population of over 100,000,000. The railroads ramify into every part of it, and they must carry on their public relations work in every part of it if they are to make the public understand their problems and through fair and reasonable regulation help to solve them.

### "An Unusual Campaign"

"Among the comparatively small number of large railroads on which the problem of educating the public regarding the railway situation recently has been boldly, persistently and skilfully attacked is the Illinois Central. President Markham is an ardent believer, first, that the public will deal fairly with the railroads if it is given an opportunity to understand the conditions under which they are operated and the problems their managements have to solve; and, second, that a railway management can and should so present the facts and principles of railway economics and administration to the public as to create a friendly and intelligent public sentiment regarding the railroads. Therefore, within the last year, he has carried on a very unusual campaign to improve the relations of the Illinois Central with its public. An account of what has been done under his direction and of some of the results that have been obtained is given elsewhere in this issue.

"Some minor details of the work Mr. Markham has done and of the way it has been done may be open to criticism, and, indeed, have been criticised. One thing, however, is certain. This is that the work which has been done has had, from a railway standpoint, a very favorable effect upon the attitude of the press and of the public in the territory that the Illinois Central serves. The facts regarding the railway situation which have been presented in the Illinois Central's advertising and the public statements made by its president and other officers have caused the press and public in its territory to understand the railway situation

far better than they otherwise would have understood it. Under present conditions a better understanding by the press and public of the railway situation is bound to rebound to the advantage of the railroads. Therefore, the work Mr. Markham has done and caused to be done has been beneficial not only to the Illinois Central but to the railroads of the country as a whole. It may or may not be significant in this connection that during the last year the Illinois Central has shown as good operating and financial results relatively as any other railroad in the country.

### Work Necessary and Important

"There are certain important things about railway public relations work which many railway officers seem surprisingly slow to learn. One of these is that this is work which always will have to be done as long as the railroads are privately owned, or they will never be intelligently and fairly regulated. Another is that it is important work. The most able and energetic management of the railroads in other respects will never make and keep them prosperous unless their public relations work is so done as to secure intelligent and fair regulation. Another fact often overlooked is that effective public relations work requires the employment of able men with special qualifications and the giving to them of opportunity to devote their whole time to it. Recognition of these facts must carry with it recognition of the further important fact that effective public relations work cannot be done without the expenditure of substantial amounts of money in perfectly legitimate ways.

"Mr. Markham has recognized and accepted all these facts and acted accordingly. His example, his methods and the results obtained merit just as serious and careful consideration by other executives as a plan that his or some other railroad might adopt and carry out to increase train loads or promote safety in operation; for the intelligent and adequate handling of public relations has become just as important and integral a part of railway administration as the adoption of methods of increasing economy of operation or of reducing accidents."

in November!***

# How Isaiah Saved One-Third of His Coal

## Pumper's Typewritten Reports Were Unusual, to Say the Least, but He Made Good

PROBABLY nobody on the Illinois Central System made a better record in the recent coal-saving campaign than did Isaiah Smith, pumper on the Memphis division, who succeeded in cutting his coal consumption by 33 1/3 per cent. At the beginning of September, according to Isaiah's daily typewritten report to Division Accountant Joe Concklin at Memphis, the pumping station at Phillip's Bayou, Miss., over which he presides, was using coal at the rate of three wheelbarrow loads a day. By the middle of the month the consumption was wavering between three and two a day, and at the end of the month it had definitely subsided to two, with a new low record on the twenty-sixth of one wheelbarrow and a half.

Although he types it "Smitch," Isaiah's correct name is Smith. He is 53 years old and has been employed on the Memphis division twenty-two years. As his picture indicates, he is a typical old Southern negro. He lost one of his legs in an accident at Glendora,

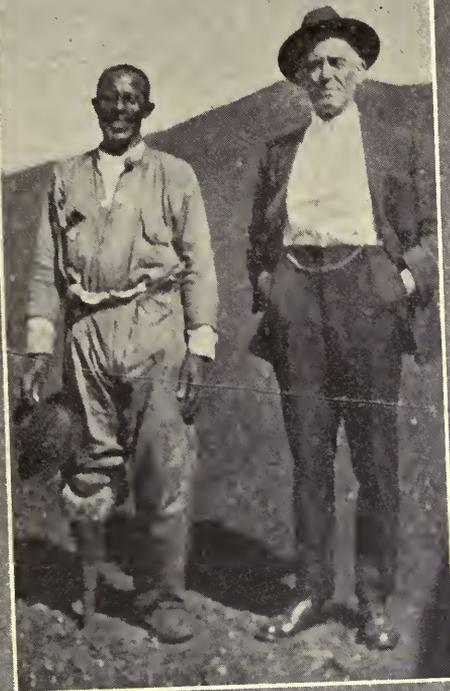

Miss., twelve years ago, but this has not handicapped him in the least in the performance of his duties. He has a brand new typewriter, and Mr. Concklin reports that he is as happy and care-free as people get to be, even though he is marooned in the woods midway between Lula, Miss., and Helena, Ark. He has his troubles, however, as witness the fact that he recently lost his lifetime savings of \$1,160 cash in a fire that destroyed his father's home.

Isaiah's reports, in style and method, are not expected to set precedents on the Illinois Central System, as they might require the services of the chief special agent's sleuths for proper interpretation, but his heart was in the right place in the fuel conservation campaign, as evidenced by the occasional comment he threw in, and he made good, which is perhaps most important of all.

During the fuel campaign on the Memphis division it was the practice to have pumpers keep a record of the number of wheelbarrow loads of coal used each day and report

<p style="text-align: center;">Peculiar Typewriting, but Darn Good Fuel-Saving!</p>	<p>B</p> <p>Mr Joe Concklin, Divn Accountant, 318 Central Station, I Bount 3 Bors Of Col On The 12 Of September I Mest The Tran On The 11 It Did Not Stop At Warter Tank To,Set No Water But I Hop That Is All Rite I Sent In The Rite Report Your Trouly Isiah Smitch Pumper</p>

*Isaiah and "I bor coal." The pile should last several years.*

*Isaiah and his new typewriter. He uses the H&P (hunt and peck) system.*

the result to the local agent, who would transmit it to the superintendent.

However, there is no agent at Phillip's Bayou, and it was necessary for the pumper to make out the report himself. Isaiah, who is the oldest pumper on the division, cannot write with a pen or pencil, but he has a typewriter which Mr. Concklin reports he has mastered to the *n*-th degree—if not the *xyz*-th degree also.

Samples of his reports are attached herewith. For the first week or so they were stiff and formal, and the figures stuck right around three barrows a day, with an occasional flight to three and a half. In the middle of the month, the reports loosened

up a little, and by the twenty-fifth they were becoming positively conversational—as well as conservalational. Said Isaiah, verse 23: "September The 23 1921 Mr Joe Conklin I Only Youse 2 Bors Of Coal To Day I Am Saven All The Fuel I Can That Is The Best I Can Do I Dont Wast A Bit I Keep My Yard Clen Of All Wast Coal Yours Trouly Mr Joe Conklin, Divn Accountant, Central Station, Memphis Tenn, Isiah Smitch Pumper."

And that's that. If any of the rest of us can give a better report of better spirit in better words when he speaks of his own job, let him hop to the front and submit it.

## How a Grouch Can Lose a Road Business

*The following is from a circular recently sent out by W. H. Brill, general passenger agent at New Orleans, to passenger department representatives, ticket agents and ticket sellers under his jurisdiction:*

How courtesy will obtain business for a company and the lack of it drive it away are clearly shown in the article below, which appeared recently in the house organ of a large commercial concern:

"The other evening we came out of Chicago on a first-class but lightly patronized passenger train. The service was excellent and the equipment unusually good. We were bound for Minneapolis, and it occurred to us at the time that we would use the train in the future—it deserved patronage and it was more comfortable than trains carrying more passengers.

"In a few days it was necessary to return to Chicago accompanied by half a dozen other men who asked us to secure transportation for the six. Naturally we thought of the good service we had experienced a few evenings before, but when we came to make reservations we called up the city ticket office of the road in question, and were greeted with a snappy and rather unpleasant 'Hello.'

"'We would like to talk to a ticket seller,' we informed the person at the other end of the line.

"'Which one?' curtly.

"Not knowing any of the gentlemen, we had to confess that we didn't know which

one. This did not set well with the afore-said employe.

"'Well, what did you want?' was the rather frigid comeback.

"'A reservation,' we timidly ventured.

"'Seven-twenty or nine-thirty?' crankily.

"'Neither one,' we hastily replied, as we hung up the receiver and gladly got out of range of the quarrelsome person who got peeved when we tried to do business with the people who paid his salary.

"There was a time when getting a ticket on a railway train was a harrowing experience, but the time is past. Railway officials never stood for such tactics, but the individual who met the public was unable to stand the gaff. It was his or her daily pleasure to insult as many would-be patrons as possible.

"The one in question hasn't kept up with the times and is now driving patronage away. People are no longer compelled to travel over this road, but 'why worry,' is the thought of this telephone operator. The officials are breaking their necks to render a service, but sales are being killed off to the road with impudence faster than they can make them by giving good service.

"In this instance millions had been spent in building roadbeds and for unequalled equipment, train crews had been carefully schooled, officials had been instructed—everything was set to produce a service which would be so good that the traveling

public would favor the road with its patronage.

"The employe in question was a sore head. Probably he had been up late the night before or may have been peeved because some more ambitious employe was getting ahead faster.

"Regardless of what the trouble was, the employe was null and void as a business getter, and the peevishness and bad manners cost his employers the opportunity of making six additional boosters to say nothing of depriving them of the opportunity

of annexing some very badly needed revenue."

I am glad to say this did not occur on the Illinois Central and I hope it never will. Now, more than ever before, we need all the business we can handle, and if any one is not upholding our slogan, "Courteous and Efficient Service Always," I hope this case will bring home to him the necessity for a change in his methods of handling the traveling public.

Never forget the value of courtesy—it always pays sure dividends.

## Passing of Old Cupola at McComb Shops

By MISS MILDRED ABBOTT,  
General Foreman's Office, McComb, Miss.

One spring morning in 1874 when the sun peeped over the horizon at McComb, Miss., he was surprised; he looked again, and climbed a little higher. What a sight greeted "Old Sol's" eyes! A new cupola had been built at the big shops that had just a few years before been moved to that country town.

Not only was "Old Sol" surprised; every-

one in the country, far and wide, was astonished. This cupola represented the highest art that had been attained in the melting of iron and the molding of castings.

We, of the progressive twentieth century, can with a little stretch of our imagination realize just how eager each of the employes was to look over this new equipment. Perhaps reverently they watched the big doors as they opened to be loaded with iron and other metals. When they saw the stream of

At top, front view of McComb, Miss., foundry and old cupola. At bottom, the new cupola. At left, P. J. Somers, veteran molder. At right, J. A. Abbott, present foundry foreman.

molten metal pour forth, perhaps they even shuddered.

It was almost impossible then to imagine that such a thing could be possible. The first heat that was taken off was the topic of conversation for many days.

**New Cupola Is Up to Date**

In September, 1921, when the same old sun rose, a different sight greeted his eyes.

This cupola that just such a short time ago had been the wonder and pride of the shop had been torn away. He saw the bricks of the wall being torn down. Around this shrine were gathered just two or three of the old-timers.

The dust that falls on the heads of the workmen is historic; it has not seen the light of day in forty years; it is like the remaining few—it does not belong to this age.

Later the old-timers return. What sight greets their eyes? Surely the same old building where they had served their time, the same place where they once worked for a dollar a day, but what a change!

In the broad light of day they behold rising a new cupola; it is equipped with all modern implements, a labor and material saver. It means increased out-put and better castings, parts for our great mikados and 2-10-2 type locomotives, an increased production of chime whistles, that are heard

with delight on the great iron steeds that travel through the night with their cargo of human freight on high-class passenger trains or again on almost endless freight trains, carrying food and supplies over this vast country of ours.

The people of today do not express wonder and consternation as they did forty years ago; they have become accustomed to changes and wonders.

**One Real Veteran Left**

Surely they are proud of this new achievement. As the foundrymen mold castings each day for our locomotives and cars, who can tell what thoughts, aims and ambitions are being molded within their souls? Our new cupola represents the highest attainment in this art for the twentieth century. Will the old maxim hold true? Ere forty years have rolled over our heads, shall we stand in awe at some greater product of genius along this line?

The old cupola has remained longer than all of those who first worked around it, with the exception of one man. This man still works eight hours a day. He is the only one remaining of the foundrymen who greeted with astonishment the cupola of forty years ago. This man is P. J. Somers, molder, who has the distinction of being the first apprentice who completed his trade with the Illinois Central at McComb.

**Lost Package Payments Down 87 Per Cent**

Lost package claims paid during September, 1921, reflect further results of the "No Exception" campaign, conducted in April, May and June.

The tonnage handled, compared with September, 1920, shows a decrease of 20 per cent, while lost package claims paid decreased 86.9 per cent.

This item of claim payments is one of the most reliable to use as a basis on which to judge the actual result of the "No Exception" campaigns. The evidence as shown here is concrete and also final.

The total of 198 claims paid for lost packages in September, 1921, is the lowest number paid for in any one month during the last five years, according to C. G. Richmond, superintendent of stations and transfers. This excellent record is the result of

the united effort of all employes concerned in the handling of LCL freight, he adds.

## *With Our Wisconsin Division Veterans*

### *Group of Five Includes One Who Started When 14 and Another Serving 44 Years in One Place*

**T**HE Wisconsin division of the Illinois Central System has five men in service who have records ranging from 54 to 39 years of service. The total number of years of service of these men is 223, an average of 44 years, 7 months and 6 days.

H. S. Wyman, engineer on the line between Freeport, Ill., and Clinton, Ill., heads the list with 54 years of service. He entered the service at the age of 14. Next comes A. C. Fisher, engineer on the same line, with 45 years of service. He is followed by William Delano, agent at Heyworth, Ill., who has a record of 44 years of service in the same place. J. H. Enright, section foreman at El Paso, Ill., is next with 41 years of service, and C. H. Stocks, car distributor at Freeport, Ill., follows with 39 years to his credit.

#### **Started Work at Age of 14.**

H. S. Wyman, engineer on the line between Freeport, Ill., and Clinton, Ill., has probably spent a greater percentage of his life in the service of the Illinois Central than any other employe. He started to work for the company when he was only 14 years old, and he has been in the service continuously for about fifty-four years, as nearly as his record can be estimated.

Mr. Wyman was born at New Haven, Conn., June 12, 1853. His father was a railway man, employed as superintendent on the Connecticut River Railroad.

When he was less than a year old, Mr. Wyman's parents moved to Chicago, where his father accepted a position as superintendent of construction on the Illinois Central Railroad.

In 1854, the Illinois Central was building up its line north and south of La Salle, Ill. Superintendent Wyman was assigned to that place. Later the shops were opened at Amboy, Ill., and he was sent there.

#### **Father Killed in Civil War**

When the construction on this part of the system was completed and turned over to the company, Superintendent Wyman resigned his position. Soon afterward the Civil

War began, and Mr. Wyman joined the 13th Illinois regiment. During the siege of Vicksburg, December 28, 1862, he was killed. Mrs. Wyman then sent her son to his grandfather in the East that he might be educated. The grandfather was a car builder—probably the builder of one of the first railway coaches in America.

Young Wyman went to school there until he was about 14 years old. He was growing into a boy of unusual size for his age. The East was proving to be too tame for him, he says. He had a desire to go back to his western home and get into the railway business, which had so earnestly held the interest of his father. Young Wyman had inherited railroading as a profession, and could not bring himself to the conclusion that he should study to become a physician, as his grandfather was planning for him.

He left his home in the East, and went directly to Amboy. On account of his youth, he was unable to obtain employment at first. However, his size and fast-developing muscles took the attention of the Illinois Central men there, and a position checking way freight was created for him in a short time. Mr. Wyman says that the excellent service rendered the company by his father probably prompted the men to give him this position. As far as he knows, there was no record of his employment sent into the general office; but his salary, however meager, was regular.

#### **Laid Off in the Summer**

With the approach of summer, the railway business became dull. This was the case each year in those days, Mr. Wyman says. After six months as freight checker, he was taken off. He then worked as an extra brakeman until the fall of 1870, when he obtained a position as a regular freight brakeman between Amboy and what is now East Dubuque, Ill. After six months, dull business again took his position, but he was out of employment only two weeks this time. He was made passenger brakeman between Amboy and Centralia.

At the age of 19, he was of unusual

physique. He was strong, robust, had an iron constitution, and looked to be several years older than he was. He had always heard of the physical effort required of firemen on the engines. This created a desire in him to try it. In November, 1872, he was given a position firing between Amboy and Wapella. After the first year, his services in this capacity proved so valuable to the company that he was made fireman on the crack engine, No. 23.

In fact, No. 23 was a remarkably fine engine. Mr. Wyman smiles with pride when he speaks of the beauty of the engine and the perfection of every part. The pilot was painted a deep red, and the entire outside was trimmed with brass. The engine crew was proud of it, and kept every part bright and clean. It was made as thoroughly and carefully as a watch, Mr. Wyman says. Every part fitted perfectly. It was a specially built engine, and cost in the neighborhood of \$19,000, Mr. Wyman says.

#### Became Engineer in 1879

He fired No. 23 between Amboy and Dubuque for four years, then went to La Salle, where he was given charge of a switch engine in the yard there. He worked extra at this and fired on the line until 1879, when he passed the engineer's examination and was given a regular position, with headquarters at Amboy.

Mr. Wyman's early experience as an engineer was on the line between Amboy and Dubuque, and later between Amboy and Clinton. When the division offices were moved from Amboy to Freeport, Mr. Wyman took charge of an engine between Freeport and Clinton. He has continued that run since.

Mr. Wyman, although 68 years old, is sturdy and in the best of health. His appearance is that of a man not more than 50. His walk is firm, and he towers a whole head above most men. He insists that he is 68 years young instead of old.

#### Started as a Carpenter

A. C. Fisher, engineer on the line south of Freeport, Ill., has been in the service of the Illinois Central for 45 years. His father was foreman of carpenters on the line between Dubuque and Centralia for about twenty years.

Mr. Fisher was born June 22, 1859, at Sycamore, Ill. When he was 9 years old,

his father moved to Amboy, where he accepted a position as foreman on the Illinois Central.

Mr. Fisher's first employment on the Illinois Central was as a carpenter. However, he did not start work as a member of his father's gang. His first position, in 1876, was on a gang between Dubuque, Iowa, and Centralia, Ill., which did general repair work and constructed new bridges.

In 1881 Mr. Fisher obtained a position as fireman on the line between Amboy and Clinton. The first engine he fired, he says, was No. 99. Its cylinders were only sixteen inches.

For three years, Mr. Fisher was the fireman on No. 23, which has been previously mentioned. His run at this time was also between Amboy and Clinton.

#### Borrowed No. 23 for Speed Trial

During the life of No. 23, Mr. Fisher says, a foreign road borrowed it for a trial run over its tracks in the effort to establish a speed record. The event was for the landing of a government contract for carrying mail from the East to Chicago. Seth Battles, Mr. Fisher says, took the engine over, and out-classed all other competing roads.

Mr. Fisher fired between Amboy and Clinton for some time, and was then transferred to the line between Amboy and Dubuque. He continued in the latter position for four years, and then passed the examination to become an engineer. He was immediately given a position running from Amboy to Clinton and to Dubuque.

In the spring of 1894, he was transferred to Freeport, and was given the run south from that city.

Mr. Fisher was one of the first on the scene of the wreck in which Engineer Oscar Spangler, whom all Illinois Central old-timers remember, was seriously injured. A wild car on the main line was the cause of the accident. Some mischievous boys had turned it loose from a siding. The entire train was thrown into a ditch. Mr. Spangler's back was painfully injured. After his recovery, he refused to return to railroading.

Mr. Fisher is hale and hardy, but has snow white hair. He has many friends on the line between Freeport and Clinton, and seems to be fit for many years of service yet.

#### In One Station Forty-Four Years

The station at Heyworth, Ill., Wisconsin division, would indeed feel a loss if William

J. H. Enright

H. S. Wyman

William Delano

A. C. Fisher

C. H. Stocks

Delano, the agent, were transferred. He has been in service at the one place for forty-four years, and has been well satisfied during all that time.

Mr. Delano was born in Heyworth October 6, 1859, lived his boyhood days there, went through eight grades in school, learned to be a telegraph operator on his own initiative and attained his ambition of becoming station agent.

Mr. Delano says he really started in the railway business before he obtained his first position with the Illinois Central as operator.

His father, the postmaster of Heyworth, was appointed by President Lincoln in 1861. When 10 years old, William carried the mail from the postoffice to the station. This he considered a railway job. At that time, the total mail of Heyworth consisted of one stingily filled sack of letters. But his job was important and a lot of work for a 10-year-old boy.

In 1876 the Illinois Central opened a telegraph office in the station at Heyworth. But the place was not large enough to warrant a steady operator. Student operators were usually sent there to complete their training. They stayed just long enough to gain confidence in their ability in handling the wires.

#### Volunteered as an Operator

There were times when the company had no operator at Heyworth, and yet there was an operator there. This mysterious operator was no other than young Delano. Between mails and between the visits of the student operators, William sat at the key, diligently trying to learn the secret. When the student operators arrived, they were always put through a grilling by William. And he kept at it until he finally learned.

When the last student operator was about to leave Heyworth in 1877, he told Mr. Delano to try to hold the position. The next day he did try and found that he was able to receive and send as well as many of the students that had come. He then took it upon himself to take charge of the keys. The same day he wrote to the superintendent and told him that he had taken charge. Mr. Delano was then officially given the position. The salary was a commission on the money taken in for the Western Union Company. One month, Mr. Delano says, he received 98 cents for his service, and nearly lost a penny of that.

Later the company offered him \$25 a month to go to the station at 5 o'clock every morning to receive orders and give them to a freight train due there at that time. In accepting, he became the first steady operator at Heyworth, and there has been no other there since.

#### Had a Bad Freight Wreck

One morning when he went to the station to meet the freight train, he saw it standing about a mile north of the city. Shortly afterward the engine pulled up to the station. Mr. Delano was told that the train had been wrecked. In describing the accident, the engineer said that while crossing the Kickapoo bridge one car jumped the track, rose into the air and came down with such force that the bridge was completely demolished. The stream below was filled with cars, as was the ditch at the approach to the bridge. Some of them were destroyed by fire.

The result of the wreck was that all passengers, mail, baggage and freight had to be transferred around the damaged track by wagon road. For four days trains from Clinton ran to the scene of the wreck, discharged their cargo and returned to Clinton. Trains on the other end of the line returned to their starting point in the same manner. The strip of country road used for the transfer was about two miles long.

#### Made Agent in 1882

Mr. Delano had been the operator at Heyworth for four years when the company decided to have only one man in charge of

*Mr. Delano's Home*

the station, with the combined duties of operator and agent. November 1, 1882, Mr. Delano was appointed agent.

During his forty-four years of service, Mr. Delano says, he has not lost more than sixty days. He is still living on the site of his old home place. However, a new house has been built. The ground, he says, was purchased by his father when Heyworth was in the making.

Mr. Delano says a family by the name of Delanoye, his ancestors, came over from the old country on the second ship, "Fortune," with the Pilgrims. His mother was born in the Ormond Castle of Tipperary County, Ireland, and his father was born in a lighthouse off the coast of Maine. He has a picture of the lighthouse, and has been trying to obtain one of the castle, but as yet he has been unsuccessful.

#### With Illinois Central Since 1880

J. H. Enright, section foreman at El Paso, Ill., has made one of the best records in that position of any on the Illinois Central. He has been in the service for 41 years.

Mr. Enright's connection with the company dates back to April 5, 1880, when he was given a position as laborer on a section at Panola, Ill. His willingness to work and the thoroughness of the work he did won for him the promotion to fence foreman May 4, 1884. In this capacity, he had charge of the fence repair men on what is now the Wisconsin division. Cattle guards were kept in repair, and new fences were built.

His ability to handle the men of a section was brought to the attention of the higher officers of the company, and on September 4, 1884, J. O'Connor, then supervisor of that district, promoted him to foreman in charge of a section at Panola, Ill. He continued to prove himself of much worth to the company. He built his section up into one of the best on that line. His men all respected him, and worked earnestly to accomplish the desired results. He was in charge of this section for about ten years.

#### Two Foremen Traded Sections

July 28, 1894, Mr. Enright was to be transferred to a section near Minonk, Ill., but traded sections with the foreman who was at El Paso. This was Mr. Enright's home. The foreman there desired a change. He and Mr. Enright persuaded the supervisor to allow them to trade.

Mr. Enright doubled his efforts on the

section at El Paso. He saw that the work was done just as planned and desired.

In those days, the various sections of the system were gone over by the supervisors and graded on the work done. A blue post was placed at the tool box of the section which received the highest grade. Generally, there was a blue post at the tool box on Mr. Enright's section at El Paso.

He is determined that no other section in that district shall be in better shape than his. He often rides over the neighboring sections, after the work on his own has been completed, to see how they are kept and to watch for improvements that might be likewise made on his. His section is noted for being neat and clean. No coal is allowed to go to waste on the right-of-way.

Mr. Enright is now chairman of the right-of-way organization. He says that he is always working to keep his men satisfied, for that is when they do the best work.

#### Studied Under Station Agent

C. H. Stocks, car distributor at Freeport, Ill., has put in thirty-nine years of good, hard, conscientious service for the Illinois Central. He started as extra agent and operator at Elroy, Ill., in 1882.

When a young boy, Mr. Stocks learned to be a telegraph operator. The agent at Elroy was his instructor. Mr. Stocks paid him \$40 for his time and practiced on a set of instruments set up in the station there. It took him about a year, he says, to be able to understand the messages that came over the regular wires.

He obtained his first position through the agent at Elroy, who wanted to take a short vacation. The agent recommended Mr. Stocks to the company as being able to handle the position in his absence.

Mr. Stocks says that when the responsibility of the entire office was thrown on him he surprised himself by the ease with which he did the work. The first message he received was a train order sent by Charlie Dixon, then dispatcher at Amboy. That was the one Mr. Stocks said he was afraid of. He asked Mr. Dixon to send slowly so that he would be sure to receive the message correctly. Before the message was completed, he says, he was asking for more speed.

#### A Series of Changes

Mr. Stocks worked extra at Elroy for two years, then was transferred as night operator

far better than they otherwise would have to the old passenger station at Dubuque, Iowa. He continued there for about two years, and was again returned to the extra list. Among the various places he worked during his year as extra was Wenona, Ill., where he stayed six months.

Later he was made the agent at Elroy, where he stayed for four years. After this, he was transferred to the yard office at Freeport, where he was operator for two years. Mr. Stocks was then sent to East Dubuque, Ill., as operator in charge of the bridge crossing the Mississippi River there. His duty was to direct the trains of the three railroads which used that bridge. After five years, he was transferred to

Bloomington, Ill., as operator and ticket clerk. He remained there two years, and was then returned to the yard office at Freeport for a short time.

In 1907, Mr. Stocks was promoted to operator and car distributor at Freeport. He has continued in this position since.

Mr. Stocks is a man of unusual kindness. He has taught many boys telegraphy. Some of them are now in the service of the Illinois Central. He always has a kind word for everyone, and has a host of friends in Freeport. His service for the company has always been satisfactory. As one of his closest friends expressed it, "Mr. Stocks is a man through and through."

## Getting Acquainted at Clinton, Ill.

Nearly 150 business and professional men of Clinton, representing probably every trade in the city, were the guests of the local officials of the Illinois Central Railroad Company October 13, when they visited the shops and the new yards.

The party, after meeting on the public square, went first to the division offices, located in the station, where they were met by Superintendent Shaw, and taken through the offices in this building, and then on throughout their route of inspection. The visitors greatly appreciated the courtesy of Mr. Shaw and of Roadmaster Russell, General Foreman Holsinger, Shop Foreman Bogan, Traveling Engineer Zanies, Master Mechanic Needham and Trainmaster Walker, who all helped materially in showing the visitors about, and in explaining the many points of interest in the vast properties of the company there.

After being shown about the general offices in the depot building, where there are eighty-four employes, the party, under the guidance of Superintendent Shaw, went through the roundhouse and shops, where they were greatly interested in seeing the big machines used in car building and repair in operation. Just recently two machines, costing nearly \$100,000 each, have been added to the shops equipment in Clinton. The automatic coal chutes for loading engines, and having 500 tons capacity, were seen in operation by the visitors.

After going through the various shop buildings, the party journeyed two miles north to the central portion of the new north

Many of the visitors were making their first trip through the Illinois Central shops, and were amazed at their extent and at the number of different sorts of work being efficiently carried on at all times. While the party was in the shops, they got to see steam riveters at work on boilers, wheel pullers in operation, gigantic turning lathes cutting through steel as rapidly as a saw cuts pine, acetylene cutting torches burning a thin line through heavy steel plate, and many other novel sorts of work which held the visitors' attention at every turn.

"Believe me, I'm a booster for the Illinois Central as the big thing at Clinton from now on," said one man after his trip. "I got a different and bigger idea of what it all means to this town."

"The people of Clinton have not shown sufficient interest and appreciation of the Illinois Central holdings at Clinton," said one business man who was interviewing the merchants before the trip. "Only two of the merchants that I visited," he said, "have ever inspected the shops, and the biggest part of them have never been inside of the division offices at the station."

The action of the business men in making the tour of inspection is to show to the Illinois Central that Clinton appreciates and is interested in the present property, the improvements and any contemplated improvements for the terminal of the Springfield division, which Clinton people say is the "one and only" division of the "best railroad of the country."—Clinton (Ill.) *Morning Journal*.

## Outlines Some Problems of Supervision

### General Superintendent W. S. Williams Points Out Ways of Building a Healthy Organization

The following remarks on "The Problems of Supervision" were part of an address on that subject delivered before the Kiwanis Club of Sioux City, Iowa, September 22, by W. S. Williams, general superintendent of the Illinois Central Western Lines.

**S**UPERVISION, properly applied, is the same in all lines of industrial activities. An efficient supervisor has born in him certain qualifications that are not possessed by every individual. He must be a man whom the individual employe respects and has confidence in. To secure such recognition he must be a man of moral habits and temperament and a qualified judge as to the correctness of work under him. He must be firm but fair in the application of discipline, continually going among the workmen to observe if the individual is familiar with and properly performing the work assigned, never failing to call attention to the slightest neglect or infringement of rules or instructions. He should, however, be just as free to commend good work, regardless of the fact that it may be work the employe is paid to perform, and he should go out of his way to compliment an employe who is going beyond his own assignment of duty to perform a service for his employer, even though efforts on the part of this employe fail to produce exactly what he sets out to accomplish.

If this form of discipline is carried out, more serious discipline will not be necessary. The presence of an efficient supervisor, though there may not be a word spoken, has its moral effect and is productive of good results.

#### Discipline Is Necessary

No institution can be successful without first establishing a substantial supervisory organization, and such an organization cannot be successful without firm and just discipline. Just discipline cannot be administered by one who has not himself been trained as a competent judge of the work

W. S. Williams

and the proper application of discipline. Neither can two employes be disciplined alike for the same offense and the same good results obtained.

In the application of discipline the record of the employe being tried must be given careful consideration. His record must be viewed in the light of a bank account. Where it is found that an employe has been loyal and efficient and has stored up a good record, he must be permitted to draw on that account when in trouble, just the same as one draws money deposited in a bank, and such a record should be given favorable consideration over that of an employe who has not been loyal and whose record is shady.

Organization is the result of supervision,

and the demand for efficiency is greater today than ever before. We all know there has been more or less of a struggle between organized labor and their employers in every line of business, and especially so since the beginning of the World War, which called to arms not only many promising young men who were in training for supervisory positions but also many of the supervising officers. This pressed into industrial service in the ranks and as the heads of departments old and young of both sexes, many of whom were without proper training and incompetent to handle the work. Some of the employes, it seems, did not realize their chance for advancement, but did appreciate the scarcity of competent help and became extremely independent, taking advantage of opportunities that would not have been thought of under normal conditions. This had a demoralizing effect on the whole operating machinery of the country, straining supervision almost to the breaking point.

#### Best Efforts Are Called For Now

Conditions, however, have now almost reshaped themselves into a normal stage, and competent material is more plentiful for all classes of service. It therefore behooves every employe, be he in the ranks or at the head of a department, to set forth his best efforts to increase efficiency in his class of business.

Railroads have more positions with attractive salaries and offer greater opportunity for advancement to young men than any other business in the world, but young men must realize that they are living in a fast age, and they should also understand that their advancement depends on their own personal loyalty and ambition. The employe who seeks advancement is one who does his own work well, giving a full day's service for a full day's pay; he is ambitious not only to master the work of which he has charge but to learn the work of the man ahead of him, thus fitting himself for promotion to a position of greater responsibility.

Every employe is a spoke in the wheel of progress, and his advancement depends on the portion of the load he is able to stand up under. If one employe through his ambitious efforts is of greater service to his

company than another older in the service, there should be nothing strange about seeing him advance in preference.

#### An Example of Advancement

Those who have not already done so will make no mistake by obtaining a copy of the October *American Magazine* and reading the story of C. H. Markham's advancement from office boy to president of one of the great trunk line railroads.

Every well-organized institution should have understudies in the ranks, and (having in mind that fundamental principle that the supervising officer will have charge and be the teacher of those under him, and that the fitness of his understudies for advancement to more responsible positions depends largely on their own efforts plus the teaching and examples of their superiors) it is my belief the best results are obtained by selecting men from the rank of employes to fill supervisory positions. In such selections, the one fully qualified should be chosen without regard to seniority except where merit and ability are equal; then the employe longest in the service should be given the place.

An employe should never be selected through relationship or friendship only, but must travel on merit alone. If a junior employe is advanced over a senior employe who is better qualified, it has a discouraging effect and is viewed in the light of discrimination, leaving the senior employe to feel keenly that he has not only been ignored but mistreated. Such propaganda spreads rapidly to other employes and has a demoralizing effect on the whole situation, leaving the newly appointed officer in a position where it is difficult for him to manage efficiently.

#### How the Right Man Makes Good

On the other hand, where a junior employe is selected from the ranks for a supervisory position ahead of a senior employe, because through thoroughness, close study and observance he has fitted himself as an efficient leader, and he is conscious of his ability, his fitness as a leader cannot escape the recognition of other employes. They must realize that his selection was made because of his superior qualifications and was fair; therefore, the only regret for the senior employe to brood over is his failure to qualify by placing himself in the

running for the place. If these principles are carried out, they will result in a healthy organization, which is so necessary for the successful operation of any line of business.

One in the ranks aspiring to promotion is not only figuring out the best methods to handle a more responsible position but also studying the peculiarities of the employes doing the work, which it is important for anyone to know who is seeking advancement. An employe carrying on such study is usually known to the men higher up, and he stands a good chance for promotion although he may be young in the service.

#### Personal Contact Important

By close personal contact better acquaintance is established. This prompts employes to feel free in going to their superiors with problems concerning their work, which is beneficial to both the employe and his employer. A man who makes a success in a supervisory position not only watches and weighs the efficiency of his

men but also weighs his own efficiency by watching the comparison of daily expenses and man hours, more particularly the man hours, as expenses may fluctuate from uncontrollable causes, such as increase or decrease in wages, while the man hours always remain the same from a comparative standpoint.

My advice to young men is that they start at the beginning to be efficient and loyal to the concern employing them. This will be to the advantage of both employer and employe, and sooner or later brings recognition to the employe. The young man entering any position who spends more time in learning the rights of the man set up by schedules covering working conditions than he does in learning the rules covering his employment will soon become known and will stand out prominently in the eyes of his superior, like a sore thumb. Too much schedule and not enough rules is a poor line to follow in securing advancement.

---

## Beware the "Get-Rich-Quick" Appeals!

By appealing to the "get-rich-quick" ambitions of employes, many salesmen of fake stock the country over have been reaping harvests from the pay envelopes and giving nothing in return. Some of the arguments advanced by these salesmen to separate the worker from his hard-earned cash have been brought to light by the Investors' Protective Committee of Rochester, N. Y., which recently had one of its agents pose as a workman in a Rochester factory to study the situation.

Strange as it may seem, the desire of the employe to get rich like his employer is played upon most frequently. The employer had the nerve to take a chance, make an investment in a business enterprise, and thereby become wealthy, the salesman explains; why cannot anyone do the same? "The thing, my boy, is to strike out for yourself; you are just as intelligent as the man for whom you are working; all you need is a little nerve." One good investment should lead to another, and in a short time should make the investor wealthy. Then he would not have to work, but could as imagination.

Investigation of the schemes by the in-

vestors is not encouraged by these salesmen. If the prospect says he is going to ask his banker about the matter, the salesman discourages the idea, declaring that the bank would "knock" anything it was not in on itself. It was also hinted that the employe should not be "misled" by the advice of his employer, as it was to the interest of manufacturers to "keep the workingman down."

In one case, at least, the investigator who was asked to invest was unable to get any definite information regarding a patent the company was said to hold, the standing of the officers of the company, the assets, liabilities, factory space or numbers of men employed. The company also was unable to give Rochester bank references. In spite of all these things, however, considerable sums were taken in from workmen who were wheedled out of their savings.

**Strike No Stock  
in November!**

# How Operating Department Can Save Coal

## Careful Direction of the Engine on the Road Does Much to Cut Down Fuel Consumption

By R. W. BELL,

General Superintendent of Motive Power

A LOCOMOTIVE may leave the roundhouse for service in first-class condition and be handled by the engine crew throughout the trip in a most successful and economical manner as far as the complete development of power and its transmission from the coal consumed is concerned, but this does not mean that the trip itself was a success from a coal- and equipment-saving point of view, unless the operating department made every move count in putting the train over the road. With unnecessary delays and damage to equipment (all of which require extra coal), the trip would be a failure, the efforts of the mechanical forces and the engineer and fireman would be in vain, and a certain percentage of locomotive efficiency would be lost.

It requires from 750 to 1,500 pounds of coal, depending on grade and weather conditions, to start a tonnage train and get it moving up to the required speed. Now we shall assume that three unnecessary or avoidable stops were made on a trip; basing the coal used on 750 pounds for each start, it would mean that 1 ton and 250 pounds, representing approximately \$3, were wasted on the trip, in addition to the extra burden placed on the fireman in shoveling this coal into the fire-box.

### Co-operation Does the Work

After a railroad is constructed, the first and most essential requirement is properly designed and properly maintained power, which is of course a mechanical problem; but the matter of getting efficient service from this power is a problem that concerns the operating department as well as the mechanical department. Hence the closest co-operation of the two departments is absolutely necessary to bring about the highest possible fuel efficiency. Superintendents, trainmasters and train dispatchers should keep in close touch with traveling engineers, in addition to making careful observation of

road performance, and should have frequent conferences with roundhouse foremen, so that all may have a thorough knowledge of the performance of the locomotives on the road. This will also insure prompt action on needed work, thereby possibly avoiding the use of a defective locomotive, not only of itself an added expense but the cause of expenses and fuel waste by delays occasioned to other trains and to the traffic in general. Advance information given to the roundhouse foreman by train dispatchers relative to engine arrivals is of great value to him in anticipating and lining up his work.

Close co-operation on the part of the dispatcher and yardmaster in giving foremen probable locomotive requirements prevents firing up too far in advance or the necessity of forced firing, either of which adds materially to fuel waste.

### Give Time to Get Trains Out

Sufficient time should also be given to foremen in ordering trains of certain classes, taking into consideration the additional time necessary for dispatching the larger engines and engines that have just been washed, and allowing ample time for the calling and reporting of engine crews, so that they may leave the roundhouse or outgoing track in time for an "on-time" departure from the yard.

Yardmasters should use deliberation in ordering trains, and then arrange so they can actually know each train will be ready at the time called to leave.

The matter of proper inspection of trains cannot be over emphasized, particularly as to the air-brake equipment, running gear and lubrication, the latter being one of the most important features in freight train operation. If we expect a successful movement, the first and most important essential is to start right.

A careful analysis must be made of the methods followed in the different yards in figuring the tonnage of trains to see that the proper maximum rating is given. Overloading causes extravagant waste of fuel on

that particular train and consequent delays to other trains, and every ton underload is an absolute loss from a revenue and operating point of view.

The elimination of short cars in through trains will help materially in the total fuel consumed. It is important that train dispatchers and yardmasters anticipate and make proper allowance for weather conditions in making up the tonnage for trains. This is a good method of economy if carefully watched and of great waste if overlooked.

Trainmasters, train dispatchers and traveling engineers should acquaint themselves not only with the conditions of operation but with the individuals actually responsible for the operation, as well. There should be division staff meetings to analyze general conditions, and the men who actually do the work should be invited to attend these meetings occasionally. By this a thorough understanding and a spirit of sympathetic co-operation may be gained, all of which will automatically result in better train movements and consequently in better fuel performance

## Collecting Children's Fares Is Difficult

By EDWARD S. SHARP,

Conductor, Y. & M. V., Jackson, Miss.

I find from close observation of my fellow employes that a great many of them are not fully interested in enforcing the rule in collecting children's fares. The practice should be uniform. Both agents and conductors should give the matter serious thought, for, because of their carelessness, the railroads suffer a loss of thousands of dollars annually. That the railroads have no commodity except transportation to sell should make each employe alive on this subject.

Agents should be particular to inquire as to the ages of children when half-fare tickets are sold. In my experience I have found many instances where whole tickets should have been sold instead of half.

If in doubt, the conductor should ask the child's age of the parent, in the presence of the child. The same question should be asked if there is no ticket offered for a child who the conductor may have a good reason to believe is 5 years old. The failure of some conductors to enforce this rule makes the conductor unpopular who does enforce it.

If every conductor and agent would give this matter close attention, it would eliminate the practice of patrons' not buying tickets for children and would save a delicate situation for conductors working trains. I could relate thousands of cases where I have collected children's fares and had patrons tell me: "Why, the other conductors did not make me pay for them," or, "The

*Fireman McGhee, Engineer McClintock and Conductor Sharp*

agent said it wasn't necessary to buy a ticket." I am often accused of being the "meanest ol' conductor" on the railroad.

Some of the patrons seem to think it is all right to beat the railroad. Why they think so is something I cannot understand. We show them every courtesy, and accommodate them in every way possible.

I am reminded of a story I heard Evangelist Sam Jones relate some thirty years ago. The renowned Sam could tell you just how low-down and mean you were by illustrating your case. On this occasion he had just pitched his tent for a general revival, and had this to say about railway conductors and the traveling public:

"I came over with a splendid conductor in charge of the train—a large, handsome, clear-eyed, honest-looking fellow. You know, most of the people believe conduc-

tors split about half with the railroad in cash fares. You wouldn't think so when this conductor looks you squarely in the eye. But that is easy for him, for he knows there is not a one of you that would not beat your train fare if you thought you possibly could, and the conductor knows that he is better than any of you."

I was in charge of one of our fast trains into New Orleans a few years ago. On one of the Pullman cars were a man and his wife and a little boy 7 years old, a nephew of theirs. After leaving Hammond, the last stop before reaching New Orleans, I was picking up my trainchecks and discovered they did not have a ticket for the

little boy. The little fellow proudly said that he was 7 years old. I explained to the man that it was necessary to collect half-fare for the boy from Matteson, Ill., to New Orleans, which was about \$12. They had taken the train at Matteson, traveling from Detroit.

The loss of 50 cents on each train daily on the entire system would amount to a considerable sum. Should anyone get interested enough to investigate, he would find that this is not one-fourth the real loss.

Let every employe get alive on this subject, and in the meantime, as travelers, let's give the conductor who is making an effort to do his duty a square deal.

## *What a Big Little Place in Mississippi!*

By J. B. TERRELL,  
Car Inspector

There are many officers and employes with the Illinois Central and Yazoo & Mississippi Valley railroads who have many a time heard of Tutwiler, Miss., but they have not the slightest idea of the vast amount of business that the Y. & M. V handles at that place.

Just recently we had with us two representatives from Mr. Porterfield's office, who have been with the company for more than twenty years. Both of them had heard of Tutwiler, always it seemed, but they were surprised to learn that Tutwiler is in the center of a network of lines branching out in four ways through some of the most fertile delta lands of the South.

We handle daily sixteen passenger trains, sixteen local freights, (except Sundays), numerous through and extra freights, two switch engines, man and operate one wrecker—the X56—keep up from ten to fourteen locomotives, and handle no less than three hundred cars. We also make one thousand and receive two thousand shipments during an average month, load two hundred outbound and unload three hundred inbound cars a month, repair from twelve hundred to fifteen hundred cars and have an average monthly sale of fifteen thousand passenger tickets.

The question has been asked—how do you handle this amount of business with the facilities that you have? The answer is easy—co-operation.

Co-operation is second nature with us—we have lived and practiced co-operation until we find ourselves working hand in hand with one another without realizing the many little things we do each day to help the other fellow along.

Ours is team-work all the way from top to bottom. The traveling engineers, train masters, general shop foreman, agent, engineers, conductors, switchmen, machinist, inspectors, supervisors, clerks and foremen come together in a perfect harmony for the same purpose: to keep the company's business growing and moving rapidly without delays, wrecks, damage, claims, waste or personal injuries.

Economy has always been an important factor and is now as much as ever before, due to the decline in freight and passenger traffic. We consider that we might just as well rob the company's vaults as to waste its material, and in passing through Tutwiler one will not find material left lying about in the yards along the tracks where it might have fallen from a car, and, instead of leaving one or more nuts, bolts or washers about a car that has been repaired, inspectors and carmen have formed the habit of picking up every nut, bolt, washer, cotter key or piece of material that they come across as they go about inspecting and repairing cars in the train yards.

By co-operation we will in the future, as we have strived to do in the past, make Tutwiler the busiest for its size and the most economical point on the Memphis division.

## Favors Studying the Other Fellow's Job

### Roadmaster Points Out Advantages of Co-operation Within the Railway Organization

By G. M. O'ROURKE,  
Roadmaster, Indiana Division

THE wayland along the track was a smudge prickly with charred stalks of weeds where it had been burned over. The thin hedge along the right-of-way fence shut it off from the shorn wheat lands of autumn, thin and gray nearby, but like tawny velvet stretched over hillocks in the distance. Black spots of newly plowed fields lay on the distant slopes.

The expanse was relieved by clumps of oaks with patches of wild grass, and, as the railway motor car descended the grade, there came in sight a chain of sloughs, with the flicker of blackbirds' wings across them.

Both men on the car were familiar with the changing landscape and knew there were bad curves ahead where the view of the track would be obstructed. The roadmaster was driving the car and, as the trainmaster, his companion, studied their line-up of trains and compared time, brought the motor car to rest opposite a hand-car run-off.

They agreed that the safe course was to set off there and wait for the extra about due from the south. While waiting they walked on toward the curve, the roadmaster examining the track.

#### A Story the Track Tells

"See here," he said, "this is where the brand of the rail is found; this is the heat number; here, the manufacturer's name. These are our new oil-treated angle bars; note the difference between them and the old bar in the distribution of metal. See these small round metallic numerals. They are tie-dating nails, enabling us to tell readily how long the ties have been in the track."

He talked on, as they walked, of the many details of track construction and maintenance, with the trainmaster an interested listener. Both had been present a short time before when a superior officer, long in the service, had told the division officers they could be of inestimable assistance to one another by imparting the particular knowledge necessary for the conduct of their own work.

"I am telling you these things because I believe you are as interested in maintenance

of way and structures as I am in transportation," the roadmaster continued.

"The boss' talk the other night, when he told us to get together, impressed me very much. Unless we do work closely together, we shall both be embarrassed some day through our ignorance of features pertaining to the other fellow's job."

#### Should Know Other Man's Work

"Go on; I am listening attentively," said the trainmaster. "You have already cleared up some questions I had in mind a long time, but hesitated about asking. The Big Boss is, as usual, exactly right. Few trainmasters manifest interest in maintenance department affairs or the various other accounts. Some should know more about what work done by the maintenance and mechanical departments is charged against their transportation accounts. The trainmaster knows there is nothing more important in the economical operation of the railroad than the maintenance of a full trainload. He supervises this closely and tries to be sure that a maximum trainload is being handled at all times and that trains are not operated in the direction of light traffic that can be avoided, in order that there may be a full trainload for each run; but he often does not know that many jobs performed by the maintenance department are transportation charges. Some trainmasters believe they are not held accountable for the prompt handling of work extras, gravel trains, American ditchers, and the like.

"The trainmaster," he continued, "is responsible, with the traveling engineer, for the conduct of an engine after it passes out over the turntable, and he is solely responsible for the trainmen. He must be considerate of his men and exercise diplomacy in the choice of time to criticize a man. A trainman or engineman can be talked to while on duty about the conservation of coal, observation of rules, or such, but when a man is to be severely criticised he should be caught before or after a run, while alone. A man must not be discharged without an investigation, and, after an accident, the trainmaster should handle the subject diplomatically with the entire crew."

"There is no more important feature of

maintenance work than the development of personnel," the roadmaster remarked. "This can be more readily understood when one considers how scattered are our employes in the maintenance of way department. Without their undivided loyalty we would be lost. A great deal of credit is due them for their stand against the misleading doctrines which would tend to develop a belief that the officers are not putting forth their best efforts toward economical maintenance. They have shown a splendid willingness to co-operate to bring about the efficient and economical maintenance prevailing."

"Concerning the technical details of transportation work there is much to be said," the trainmaster resumed, as they turned back toward the motor car, "and the trainmaster must give his personal attention to them. He must keep in constant touch with the chief dispatcher regarding the classification of trains, and with the master mechanic on the program of engine repairs. The study of tonnage must be constantly given attention, to see that power is properly rated and loaded. Trains must not be loaded to a point where a reasonable average speed cannot be maintained. Neglect of this attention will ultimately mean the loss of power resulting from necessary tying up of crews and engines short of the terminal to avoid violation of hours-of-service laws. Road overtime should be reduced to a minimum, and initial and terminal overtime avoided. A daily study of conductors' reports of delays is required, and close analysis of 10- and 20-day performance statements is advisable."

#### Must Study Yards and Terminals

"Yard and terminal study," he continued, "is interesting, educational and beneficial. A trainmaster will be wise to keep himself informed every morning of the cars on hand in each yard. He must know the cause of a surplus of cars at terminals and the probable number he will receive from other districts or divisions in their efforts to clean up by midnight. He will watch interchange where other roads may give us a greater number of cars. We must insist that the receiving line takes cars off interchange tracks as well as signs a receipt for them. We must watch for and obtain equated business into and out of terminals to balance traffic more evenly. A most important duty is to reduce standing time at terminals. Deliveries to other lines should be completed before midnight, and the trainmaster must, with the yardmaster, have a system for re-

corded cars on hand at midnight, regardless of the time received, showing date of arrival, yard and junction station. The fluctuation of these cars must be closely watched to see whether engine hours fluctuate in a corresponding ratio. Reports of cars handled through the yards must be studied in comparison with yard engine service now and last year. Yardmasters and engine foremen must study their work in making up trains and notify the dispatcher of anticipated delays, so that road trains can be advanced. The trainmaster must know how long belt lines and terminal railroads require to deliver to connecting lines the business given them.

"I have touched on a few of the duties of a trainmaster," he concluded, as the extra came in sight, "and I shall be pleased to be an attentive listener on the subject of railway maintenance at your first opportunity."

"The information you have given me is

### *No Knocker*

You've heard of a fellow refusing  
to drink

And of others refusing to eat;

You've heard of a fellow refusing  
to smoke

And a fellow refusing a seat.

There are men who are famed for  
refusing to run

For office or safety or pelf,

But here is a scrawl for the man  
who, of all,

Has the finest control of himself.

I speak of the man with a clamp on  
his voice,

Whose talking is tight under lock;

The man with a muffler attached to  
his mouth—

The man who refuses to knock.

The man who won't knock is a cu-  
rious chap.

He often goes out with a crowd,  
Where grouches are aired and the  
grievances bared

In fault-finding candid and loud;  
Where only his friends are around  
him to hear

The hurts that he probably feels,  
And everyone revels in woes and  
complaints

And mention of villainous deals;  
Where hammers go ringing with  
vigor and zest

On anvils that shudder and rock;  
Yet calmly and firmly he passes his  
turn,

The man who refuses to knock.

—EXCHANGE.

appreciated, I assure you," the roadmaster said as they started away, "and I shall be only too glad to talk with you of the duties of the maintenance department soon. How

nice it would be if a portion of the *Illinois Central Magazine* could be devoted to encouraging the expression of opinion concerning work among the allied officers."

---

## Money in the Maximum Loading of Cars

By R. B. GOE,  
Supervisor of Weighing and Inspection

Maximum loading of cars is necessary in the conservation of equipment during periods of car shortage and is highly important to the economical conduct of transportation during periods of car surplus.

Every ton decrease in the load increases the cost per net ton mile in freight train operation proportionate with the tare and net weight of car and contents. For example: Ten cars weighing 20 tons tare, 30 tons net, moving 200 miles, or 100,000 gross ton miles, would cost approximately \$500 gross or \$1.66 per net ton. Ten cars at 20 tons tare, 35 tons net, moving 200 miles, or 110,000 gross ton miles, would cost \$550 gross or \$1.57 per net ton, a saving of 9 cents per net ton in transportation cost when the car is more heavily loaded. To this may be added the cost of maintaining two additional cars required to haul the same tonnage at the reduced tons per car, per diem and yard operation expense required to handle such additional cars.

The critical period during the great war just passed has taught transportation carriers the importance of intensive loading to car conservation, and although the necessity for such conservation has been temporarily decreased the requirement for economy is now greater than ever before. Great progress in this direction can be made by keeping up the carload to as near the maximum as possible. There are, of course, a great many commodities which from their inherent nature cannot be loaded to or near the load limit of cars, neither can railroads be expected to build equipment that will be 100 per cent efficient for all commodities, but there are certain kinds of freight adapted to heavy loading on account of density, weight and large quantities shipped, such as ore, iron, stone, sand, gravel, bulk grain and other similar commodities that can and

should always be loaded to journal carrying capacity as provided for in column A, M. C. B. Rule No. 86, under special circular instructions of owner or as stenciled on car.

With bituminous coal great care must be exercised in loading to obtain capacity weight, as a great many coal cars are not of sufficient cubical capacity to carry the capacity in weight, especially when loaded with prepared sizes of coal.

It is important to efficiency that cars be built of sufficient cubical capacity to carry the maximum load limit of the principal commodities transported, and that the marked capacity of each car be the highest consistent with the requirements of safe operation. With cars of sufficient cubical capacity properly rated it is next in importance that they be properly distributed, using cars of high capacity for long haul and for commodities loading nearest 100 per cent, keeping in mind always that every mile an excess tare ton is hauled costs money for which no return is received.

Statements are compiled in this office weekly showing by commodities just what is being accomplished. These statements should be analyzed carefully at division headquarters, and all concerned shown just what it means in loss of earning power to cars and increased cost of transportation operation. The division staff and all others coming in contact with shippers should lose no opportunity to impress all concerned with the importance of heavier loading to the earnings and expenses of the railroad.

Cars should be ordered and furnished to fit the load. We find almost every day way-bills bearing the notation "small car ordered, large car furnished at carrier's convenience." This not only allows the application of tariff minimum on the size of car ordered, but will increase the transportation cost. Investigation frequently discloses the fact that cars of suitable size were available, but through error were not placed.

# TIME-TABLE AND RULES OF 1857

on Road Now Part of Our Western Lines

## DUBUQUE AND PACIFIC RAIL ROAD.

### TIME TABLE NO. 1.

TRAINS MOVING WEST.			TRAINS MOVING EAST.		
Mail Train.	Accommodation Train.	Names of Stations.	Mail Train.	Accommodation Train.	The Full Faced Figures denote passing places.
7 A. M.	3 P. M.	Dubuque.	5 P. M.	11 A. M.	The Red Flag or Lantern denotes danger, and must not be passed.
8 " "	4 " "	Julesburg.	4 " "	10 " "	Red and White Flag or Green Lantern denotes caution—run slow.
8.30 " "	4.30 " "	CALEDONIA.	3.30 " "	9.25 " "	
9 " "	5 " "	EPWORTH.	3.05 " "	9 " "	
9.25 " "	5.25 " "	FARLEY.	2.35 " "	9.30 " "	
10 " "	6 " "	DYERSVILLE.	2 " "	8 " "	

The Accommodation Train will, when practicable, switch for the Mail Train.

Any damage the Engine, Tender, or Train, may sustain by neglect of instructions, or carelessness of the Engineer, the net cost of repairs of the same will be charged to him, and the amount deducted from his wages. The same will hold good against the Conductor for any damage the Train, Engine or Tender may sustain by his carelessness or neglect of duty. The Whistle must not be used except in extreme cases of danger, in giving the necessary signals, and on approaching Stations. Great care must be observed in approaching Public Crossings to reduce the speed and commence ringing the bell at least 80 rods from the crossings. Each Train will wait on the other at regular passing places, 30 minutes after the regular arrival time, and then proceed, keeping the 30 minutes good until the expected time is passed. Conductors will attend personally with their men to making up their own Trains, which must be done in the most careful manner so as not to injure the Cars. Being that the Road is not fenced and no Cow-catchers, Engineers must keep a sharp lookout for Cattle, and in no case run so as to risk the safety of the Train, this making of time at present being only a secondary object. Let your motto be—'Safe first and fast afterward.' Engineers with their Fireman will be on hand in time to oil their machines, see that they are provided with all the Tools and Fixtures required by the Regulations, in good order, and have their Engine in position ready to take their Train at least 20 minutes before their advertised time for starting. In the absence of the regular Switching Engine, the through Engines shall make up their own Trains. Conductors will make it their duty to provide themselves with a Switch Key, Time Table, and all the Rules and Instructions regulating the running of Trains and the safety of the Road, all of which may be had by applying at the Superintendent's Office. Conductors will be very particular to see that the Bell or Whistle Cord is always properly attached before leaving a Station. Engineers will be responsible for any damage that may occur from obstructions that may interfere with the free working of the Cord in passing over the Tender, &c. It shall also be their duty, in case the Cord should become detached in running to re-attach it immediately. Foremen of Construction Trains will have at all times a trusty man placed with a Red Flag at least one thousand feet from the extreme point of their working, in the direction of approaching Trains; and when the place of their switching is in the direction that approaching Trains are moving, they must continue their work until the expected Train is in sight, and then Switch as soon as possible. When their Switching place is in the direction of the arrival of the Trains at the place they are working, and be very careful to see that the expected Train is due at that point. Men in charge of the Track and Bridges will keep well posted on the time of the arrival of the Trains at a Red Flag at least one thousand feet from the point of danger, in the direction of the approaching Train, and under no circumstance to leave his post until the arrival of the expected Train, or until the Track is made safe. If it is only required that the Train should run slow, send out a Red and White Flag, which is a Signal of Caution, and a Red Flag, a Signal of Danger, stopping the Train

**D. H. DOTTERER,**  
Superintendent.

MAY 11TH, 1857.

## RAILROADING AS A LIFE BUSINESS

The message from President Markham to the public on the attractiveness of railroading, which was published in the *Illinois Central Magazine* for October (pp. 18-19), contains a triumphant declaration of our leader's faith in the railway service as a calling which challenges the ambitions and imaginations of young men. In the Public Opinion section of this number will be found some interesting newspaper editorial comment upon the statement.

Every officer and employe of the Illinois Central System should be proud of that statement, and should find in it the inspiration for greater achievement. It is a clarion call to service, sounded by a man who has devoted thirty-four years of a highly useful life to a business which he has the faith to say excels all others in what it has to offer young men in the way of romance, compensation and opportunities for service.

There are too many gloom dispensers in the railway ranks—in all industrial ranks, for that matter. The physician urges his son to take up the law, the minister pleads with his son to become a farmer, the farmer's son enters business, and the business man's son takes up farming. The man who has grown old in the service of his calling looks back over his life and, too often, advises his son that following in his footsteps will lead him only into drudgery. The "old head" is too eager to tell the beginner that the tasks and difficulties he faces are too much, and his plaintive song is to forsake the field and go into something else. Such advice doesn't always come from those whom the world terms "failures." Lots of railway men who have climbed to the top in their departments of the service have been engaged in painting a gloomy picture of the railway career.

It ought to give us new heart in our work to read this message from our leader—for it is not a breach of confidence to say that he aimed it at us just as much as he did at the

general public. He wanted us to find encouragement in it.

There are approximately 2,000,000 railway workers in this country, and the number of general and division railway officers totals only about 22,000, or about one to each 100 employes. It is obvious that we can't all be superintendents or general managers or traffic managers, but we can perform the tasks we have with the knowledge that our bit is a definite contribution to the greatest industrial enterprise of the modern world—and if we prove ourselves more capable than the ninety-nine others who are in competition with us there is a big chance that we are going to be given the opportunity, in some way, of showing whether we are fitted for the job ahead.

It would be a fine thing for the Illinois Central System if every officer and employe could catch the spirit of President Markham's message—that railroading today offers an opportunity for advancement as good as, if not better than, that in any other line of business.

If you happened to miss the message, it is earnestly recommended that you look it up, and read it.

## A STUDY OF CONTRASTS

The march of progress in the field of railway transportation is represented in a series of exhibits made by the Illinois Central System at various state fairs and other expositions since August 20. Alongside one of our new Central Type locomotives is displayed "The Mississippi," a wood-burning engine which was in use in 1836 on a railroad between Natchez and Foster, Miss., which later became a part of the Illinois Central System. The great steel monster which is the pride of the Illinois Central System forms a contrast beside its tiny predecessor that cannot fail to impress the spectator with the great strides the railroads have made since the transportation industry was in its infancy.

"The Mississippi" is believed to have cost

about \$2,000. Its crew consisted of an engineer, a fireman and a wood chopper. It ended its career of active service and was put on the pension list in 1890. Since then it has been exhibited at the Columbian Exposition in Chicago in 1893, the World's Fair in St. Louis in 1904, and various other places. Its home is at Burnside Shops, Chicago. Compared with the interesting old relic, one of our modern 2-10-2 locomotives cost \$88,819, the fireman operates a mechanical stoker, and its tractive power is more than fifteen times as great.

The exhibit has made a great hit at the fairs. Thus far the engines have been on display at Springfield, Indianapolis, Louisville, Sioux City and Peoria, and recently they have been sent into our Southern territory, being placed on exhibit at the Mississippi State Fair at Jackson, October 17-22 and the Florida Parishes' Fair at Hammond, La., October 24-29.

As an advertising proposition alone, the exhibits have been worth while. Many thousands of fair visitors have been given a graphic illustration of the great advancement which the Illinois Central System has made since its humble beginning in building up a modern, efficient service which takes second place to none.

### NO PLACE FOR THE GROUCH

The railway service is an exacting profession. It has its compensations, but it also makes definite demands upon the individual who engages in it. It requires respect for the ideals of public service which move the great organization of which the employe is a part and unswerving devotion in the performance of that character of service. Out on the advance line, where the railroad establishes its contact with the public, the service demands that employe be courteous at all times and under all conditions. The discourteous individual will never be a howling success anywhere. If he hasn't the faculty of being courteous he is marked for defeat before the battle is begun. His services may well be dispensed with. But under no force of circumstance should he be placed in a position where it is possible for him to send his gloom waves out upon the public consciousness.

An ill-chosen word, an act performed in a

surly or careless manner, or a lack of attention to what may seem even the most trivial request may work a harm which cannot be undone. It may start a tide of ill will against the company which will take years of the most careful and painstaking cultivation to stem. The employe on the line of advance has it within his power to make the company which he represents respected in his community, merely through his demeanor while on duty and his conduct as a citizen. If he succeeds, he enhances his value to the organization. If he fails, he is headed for the scrap pile. He may stick on for a few years, but his term of real usefulness is ended.

Courtesy is founded upon a pride in one's calling. If an individual is thoroughly imbued with the spirit of his profession—if he feels that his mission is a genuine one, that his is a definite contribution to the work of the world—courtesy should come involuntarily, unless he has an ingrown grouch which even the most favorable mental background cannot cure. And the railway man, or woman, ought certainly to have that pride in the profession. It's a great game. Rising to the responsibilities of it ought to be a pleasure.

### PUBLIC RELATIONS

Elsewhere in this issue of the *Illinois Central Magazine* there is reproduced an editorial from the *Railway Age* of October 8 commenting upon the public relations work of the Illinois Central System. The *Age* frankly tells other railroads to "go thou and do likewise," if they would obtain results similar to those which the Illinois Central System has obtained in the fifteen months that its present public relations policy has been in effect.

Readers of the *Illinois Central Magazine* were given a summary of the method and practice of the system's public relations work on pages 30-32 of the June number. The work is carried on under the direction of President Markham, its aim being to build up a spirit of friendship on the part of patrons for the railway system, founded upon a more thorough knowledge of the workings of the railroads, their problems and their ideals.

From time to time editorials from the newspapers which are published in the ter-

ritory of the Illinois Central System commenting upon the progress of the public relations work have been published in the Public Opinion department. Officers and employes have been kept in touch with the progress of the work in other ways.

It will be interesting to employes generally to know that the Illinois Central System is being generally recognized as the leader in this field in which President Markham has been the pathfinder. Other railroads have been studying our plan, with a view of making use of what we have learned, what methods we have employed and what we have accomplished. Newspapers and magazines published outside our territory have come to look upon our work as a meaningful departure from the former attitudes of railway managements.

These compliments are greatly appreciated. The *Railway Age* editorial reprinted elsewhere says: "The intelligent and adequate handling of public relations has become just as important and integral a part of railway administration as the adoption of methods of increasing economy of operation or of reducing accidents."

### SOME TESTS OF LOYALTY

Are you loyal to the company that employs you?

You would be deeply disappointed if the company failed to produce a pay check for you on the date assigned. But what are you doing to make the company strong within as well as without and thoroughly able to make that pay check good?

When you make a mistake—as we all do—do you seek to cover it up, in the hope of escaping detection? Or do you report it promptly, in order to save the company the trouble and expense that the mistake may entail?

Are you indifferent? Do you let something go wrong that you might have prevented, but did not, simply because it was the other fellow's look-out?

How do you speak of the company when off duty? Does your loyalty end when the day's work is over?

Are you putting the proper team work in your job? Are you anxious to show the other fellow up? Or to help him make good? Are you trying to bridge over the good? Are you trying to bridge the gaps in organization that every business has?

Are you spending your employer's money as you would your own? Are you making the best use of the materials with which you are supplied?

Waste is disloyalty. And disloyalty is inefficiency. Maybe it hadn't occurred to you just that way, but think it over.

### BUSINESS WITH A HEART

A note of humanity and fellow-feeling, refreshing in these strained days of every man for himself, is to be found in the letter Judge Robert S. Lovett recently wrote regarding the disposition of the debts the allied nations owe the United States. That letter is reprinted in another part of this magazine.

Judge Lovett is a successful business man, hard-headed and practical, as befits a director of several great railroads, including the Illinois Central System. He has had long experience in administration, in handling great properties, in dealing with men. No one would call him a sentimentalist.

Yet Judge Lovett seriously proposes that the United States should not insist upon direct payment of the debt of many billions that was built up during the war. He would have us turn loose of that obligation, keeping only one string to it—an exact statement of where the remitted debt is to be applied. He urges that this money be made a perpetual trust fund, to be administered for the direct benefit of the allied people, "free from any political purpose or other exploitation."

In short, he would have these debtor nations apply our money to the relief of their own peoples through humanitarian agencies—pensions to the war orphans and other dependents, hospitals, schools and benevolences.

This looks like bad business. But it isn't, Judge Lovett declares. The debt, as it now stands, is a barrier to the resumption of business relations on a permanent and satisfactory basis between the United States and these countries which owe us so much money. The rate of exchange is such that a demand for payment will force these manufacturing countries to seek their raw materials outside the United States and underbid our own tariff-protected manufacturers in selling in the United States. In two ways will our business be hurt.

Judge Lovett's proposal, he points out, would remove these difficulties. In addition,

it would re-establish international friendships which suspicion and ill-feeling have strained. It would, Judge Lovett holds, be an investment in good-will.

#### A LESSON FROM ISAIAH

This is not to be a Biblical quotation. It is from another book of life, the one we are writing every day. It has something of service in it, a little of dedication, a whole sermon on doing your job the best way you know how.

Isaiah Smith, a negro, is a pumper on the Memphis division of the Yazoo & Mississippi Valley. He works at Phillip's Bayou, Miss., which is such a little spot on the map that we don't even keep an agent there. Isaiah therefore had to typewrite his own

coal-saving reports on a wheelbarrow load basis to the division accountant. Isaiah is no H. G. Wells, but this is part of what he wrote:

"I Only Bunt 2 Bors Coal At The Pumpin Station I Am Try To Save All The Fuel I Can Dont Bourn Over 2 Ar 3 A Day I Am Savein All I Can For The Company." And again: "I Only Yourse 2 Bors of Coal An A Half To Day That Ant Bad On Fuel I Dont Yours No Mor Then I Can Help."

Isaiah won't get a job as a clerk or stenographer on the Illinois Central System on the strength of those reports, but the chances are there's an angel clerking for him somewhere, making credit entries in the ledger that's reserved for folks who do their best wherever they happen to be.

### A TENDER ON WHICH COAL IS SAVED

Here is shown the tender of Engine 1054 on Train 123, handling four steel cars on the Springfield division, September 22. As an instance of fuel-saving, note the small empty space on the tender, which shows the small amount of coal used in fifty-four miles of service. It is estimated that fewer than 1,200 pounds of coal were used on this engine between Clinton and Pana. The photograph was taken at the suggestion of Supervisor Fred Johnson, who was on the engine between Decatur and Pana. In the photograph, left to right, are Conductor J. B. Stewart, Fireman C. I. Klinghammer and Engineer J. J. Tracey.

# PUBLIC OPINION

What the

World thinks

## CAPITALISM FEEDING ITS ENEMIES

Great truths often shine forth in little incidents and brief stories. The imagination of newspaper men is particularly fertile in the invention of logical dialogues that carry needed lessons. Here is one of them from the Birmingham (Ala.) *Age-Herald*:

"Here's a bowl of soup, some good white bread, and a plate of beans."

"Does that food come from the capitalistic country, America?" asked the Bolshevik.

"Yes. If it's against your principles to eat it, stand aside."

"I'll take it. It may give me strength to finish my pamphlet on the Curse of Capitalism."

Capitalism is feeding starving Russians who would destroy it and bring America to their own plight. Capitalism has much to its credit, in spite of the charges against it. Even those newspapers which rant against it to reap pennies from the multitude are a result of capitalism and owned by capitalists. Every man who owns a home, or a farm, or a business, who has a little bank account or an investment, is a capitalist. Every employer is a capitalist. If he were not he could not be an employer, and the witless cranks who are fed by the savings of others would be running through the woods eating berries and bark, but for the comforts capitalism has provided for them.—Chicago (Ill.) *Journal of Commerce*, October 8.

## APPRECIATION OF RAILROADING

Blazing trails of steel across the Rockies, developing millions of virgin acres through effecting systems of transportation, bringing millions of bushels of wheat across the great American Steppes to hungry millions east of the Mississippi River, were tasks for the early railway captains. These are not jobs for the future. The tasks faced by American rail-

roads today must lie in concentrating and co-ordinating the vast trunk lines. And because within the spaces of a half century the United States has become a network of systems through the romantic achievements of a few great way-showers does not mean that the romance of modern railway work is any the less appealing than it was fifty years ago.

President Markham of the Illinois Central Railroad began his experiences years after James J. Hill opened that great empire of the West. And, whereas Hill was one of the beginners, laying the groundwork for future development, Markham and his contemporaries have built the superstructure. Somewhat of the fascination of the labors that have engaged him are told in the form of an advertisement in the *Birmingham News* of yesterday. The great captain regards railroading as a fit vehicle for the exercise of all the initiative, the ambition, the energies of the young men of the present generation. Touching upon those opportunities, he says in part:

"In place of the old frontiers, we have something far more productive of opportunities for service—a large population busy in the further development of our country. In this development the railroads play a part of tremendous importance, for business of every kind is dependent upon adequate transportation. In providing that transportation at minimum cost and at the same time improving and enlarging the transportation plant, to keep it abreast with the country's growth, the present-day railway man has a problem bigger than his grandfather and his father faced in the days of pioneer railroading, and he is better paid.

"But how about advancement? Has a young man in railway work a chance as good as those in other lines? Will merit find its own place at the top? We believe no other busi-

ness offers better opportunity for advancement to the young man who insists upon advancement. Inertia won't push him to the top any more today than it would forty years ago, but his boss' job is always just in front of him, and the pursuit is still the same old game.

"The young men who are now coming along in railway service don't know much about the conditions that prevailed a generation ago, and we doubt that many of them care. All that a young man who has the right kind of stuff in him is concerned about is the problem of tackling the task confronting him today, and he doesn't care a rap about how somebody did the job before. He has his own future to carve—and many young railway men are carving theirs rapidly today. For example, of the official positions on the Illinois Central system, 85 are held by men less than 30 years of age, 122 are held by men between 30 and 35 years of age, and 213 are held by men between 35 and 40 years of age. Three of the executive positions are held by men less than 40 years of age. This proves that opportunity still exists in the railway business. The best man will seize it, as he always did and always will. The same effort wins in railway work as in other lines, and the final rewards compare favorably with those in most industries."

That is a high and serious challenge to the young men of today. It is a challenge that might be issued by any great captain of any industry soever. Railroad, iron manufacture, electrical development and a hundred other professions and callings offer infinite opportunities for success and for service.

If President Markham stresses the opportunity in railway work, it is because he is more than a business man, more than a successful railway official. Markham has vision, and he knows that the railway business offers opportunities for service today such as perhaps no other instrument can render. But more than its offering of success to those who will follow it and stick to it, railroading of the future is going to require great leadership to solve the problems now facing the country. Shoals and breakers lie ahead. It is going to require great caution, great powers of reconciliation, strong executive ability without selfishness, powerful initiative that can see two sides of a question to har-

monize the differences that exist between the owners and the users of the tools of transportation.—Birmingham (Ala.) *News*, October 2.

### NEEDLESS SLAUGHTER

The statement of President C. H. Markham that the Illinois Central paid out of its treasury during the first eight months of the current year the sum of \$108,024.96 in payment for live stock killed on its right-of-way, furnishes the farmers of Mississippi a subject of serious thought.

During the period named 24,000 head of stock were struck by trains on the system, and either killed outright or so badly maimed that they had to be killed.

Of course, the railroad company had to pay for this stock, regardless of the question of whether or not it was actually liable. The owners of the animals received full value therefor, and of the total sum \$53,129.05, or nearly one-half, went to the farmers of Mississippi.

This slaughter was utterly senseless because it was unavoidable. In some instances, of course, owners deliberately "sold" their decrepit cattle and bone-spavined horses to the railroad, purposely permitting them to stray on the railroad right-of-way, and getting more than the animals were really worth in their settlements with the claim agents. In a majority of instances, however, we may safely assume that the slaughter was due to carelessness. Not all owners of live stock who have animals killed on railroad tracks are unscrupulous, but all of them are careless, and all of them are very much mistaken in believing that a horse or cow has sense enough to keep out of the way of a fast train.

Aside from the fact that the payment of these claims was a heavy burden for the railroad, and must eventually come out of the pockets of the people in the form of freight rates and passenger fares, the economic loss is to be greatly deplored. We have today in Mississippi a serious shortage of live stock, especially hogs and cattle, and it is a downright shame to permit animals to be chopped up by trains when they are needed for the upbuilding of our herds.

The only solution of the matter is for our farmers to wake up to a realization of the

fact that railroad trains are dangerous, and that they should keep their live stock off the right-of-way.

If we had a law on our statute books denying right of recovery when animals are killed while trespassing on rights-of-way, this \$53,000 loss of property in Mississippi wouldn't have happened.—Jackson (Miss.) *Daily News*, October 8.

## OPPORTUNITY AND RAILROADING

Mr. C. H. Markham, president of the Illinois Central System, is a good press agent for the business in which he is engaged. For some months he has been publishing in the newspapers of the Illinois Central territory a series of advertisements in which he has discussed various phases of the railway business, including the grave and complicated problems by which railway managements are confronted. These advertisements have been filled with valuable facts and information, as well as persuasive and oftentimes convincing argument. Mr. Markham is a railway man of what is called the old school. He had only a public school training, and he began his railway career as a section laborer.

From this lowly station he progressed through the various grades of railway employment to his present position. Somewhere along the way he acquired exceptional facility for clear thinking and expression. Understanding the railway business thoroughly, he discusses its problems masterfully. It is impossible not to admire his presentation, though one may not always be in agreement with him.

Mr. Markham's latest advertisement, published last week, is typical of the series to which his name has been attached. It is an argument in opposition to effort that is being exerted to make railway work appear unattractive to young men. It is Mr. Markham's contention, that opportunity still exists in the railway business, that opportunities for advancement are as good as they ever were. Indeed, he asserts that the modern railroad demands a higher type of men than ever before—men better trained and more resourceful. It still offers, he declares, opportunity, compensation and adventure. In his opinion, the present day railway man has a problem bigger than his father or his grandfather faced in the days of pioneer railroading, and he is better paid. He believes

that no other business offers better chances for advancement "to the young man who insists upon advancement." "Inertia," he points out, "won't push him to the top any more today than it would forty years ago, but his boss' job is always just in front of him, and the pursuit is still the same old game."

Mr. Markham concludes that it all depends on the kind of stuff there is in a man, and he cites some statistics to prove that there are still young men with the right stuff in them. For example, on the Illinois Central eighty-five official positions are held by men less than 30 years of age, 122 are held by men between 30 and 35 years of age, and 213 are held by men between 35 and 40 years of age.

"This proves," says Mr. Markham, "that opportunity still exists in the railway business." There is no doubt about it. It exists in the railway business just as it exists in every other business. It does not exist, however, for any young man who is lacking in initiative, energy and ambition.

"The best man," Mr. Markham points out, "will seize it, as he always did and always will."

Romance and opportunity survive in the railway business, as they survive in every business. Every business, no matter what it is, can be made an adventure and an opportunity for advancement. It all depends upon the man.

Mr. Markham himself is an example of what a man may do for himself in the railway business. Having accomplished what he has, it is entirely proper that he should extol the railway business as a vocation second in attractiveness to none. He thus declares his faith in his own business, and without that faith he would not be where he is. The railway business is still a man's game, and ambitious young men should not permit themselves to be persuaded that it no longer invites them to achievement and a career.—*Sioux City (Iowa) Journal*, Oct. 4.

## TWO KINDS OF WORKERS

B. C. Forbes, whose writings have been reproduced before in the magazine, preached an effective little business sermon the other morning, based upon an incident which he related as follows:

"A wagon loaded with huge bundles of an

evening newspaper was dashing toward a ferryboat when the horse slipped and fell. The driver and his fellow-worker jumped down and hastily tried to induce the animal to get up. It refused to budge.

"It was within four minutes of the boat's sailing time, and the papers were still two or three hundred yards from its dock. For a second, but only for a second, the men were in a quandary as to what to do. Their whole action, however, indicated that they meant to do something and do it quickly. An express wagon came thundering down the street. They stopped it and, without taking time to enter into any elaborate explanation, began shouldering the enormous bundles of papers and pitched them into the express wagon. No machine gunner ever worked faster than those fellows worked. The operation finished, the express wagon dashed for the ferryboat and reached it in the nick of time.

"The papers went according to schedule."

As an illustration of the other attitude sometimes found in industry, Mr. Forbes describes the cartoon in which Ethelbert is pictured as obtaining a new job.

"Well, Ethelbert, old boy, how's business?" asks the fond uncle.

"Pretty bad, Unk!" is Ethelbert's reply. "All we sold today was a couple of brass candlesticks."

"But you don't seem to be worried?"

"I'm not; I don't own the store."

The contrasting incidents give Mr. Forbes the opportunity to say:

"Now, the wagon driver and his fellow-worker didn't own those newspapers. They would have had an excellent excuse to give if they had missed the boat. They could have claimed that they couldn't prevent the horse from falling. Their boss would have been able to find no fault with the excuse. Yet he would have felt keenly disappointed that so many readers were not able to get their paper as usual that night. Had the same workers come every now and again with beautiful excuses for failing to deliver the goods, he would have felt compelled in the course of time to get rid of them and try to find men who would not be delivering excuses instead of delivering the goods:

"The horse in many a business wagon has slipped and fallen during the last eighteen months. A good many business drivers

have proved themselves less resourceful than were those \$25-a-week workmen. Not a few men handling business reins have simply sat and contemplated the collapse of their horse and waited for him to make up his mind to get up of his own accord. They have resigned themselves to misfortune instead of doing hard thinking and hard work to overcome the misfortune.

"They have not said to themselves, as Napoleon once said, 'Circumstances! I make circumstances.'

"Is it not true, too, that an unconscionable number of Ethelberts were developed among employes during the days of more jobs than workers to fill them? A great many of those who find themselves out of work today had the same attitude toward their jobs and their concerns as Ethelbert expressed. Why should they worry about how things were going? They didn't own the business.

"Having refused to become interested in the welfare of the business when they had the chance, they find no employer interested in their welfare."

## THE YOUNG MAN

Elsewhere we publish an article quoting Mr. Charles H. Markham, president of the Illinois Central System. The subject matter deals with the opportunities offered the young men of this generation, and the advice comes from a man who started at the bottom round of the ladder and has worked himself on up to the head of the greatest railway system in the South and among the greatest now operating anywhere. Mr. Markham dissipates the idea that the railroad of this day fails to attract young manhood, whose alluring fancies are wont to seek more glittering vocations. Modern railroading, such as the Illinois Central is now able to give the public, has all the environments that go to make the business an inviting one. Ambitious young men are quickly recognized, and promotions come much sooner than anticipated.

Mr. Markham refers in his article to the fact that, among the leading officials of his company, 85 of the number are men less than 30 years of age; 122 positions are held by men between 30 and 35; 213 by men between 35 and 40. This is ample proof of the opportunities offered the young fellows by

a great railway system. It clearly refutes the statement that railroading is losing its attractiveness.

The gradual rise of Charles H. Markham is proof sufficient that a man of intelligence, perseverance and ambition can overcome many of the obstacles that most men do not care to confront. Mr. Markham, we believe, at one time during his career, served as water boy and section man, subsequently holding many of the positions known in railroading, until the time arrived for him to be placed at the head of the great system he now serves. What he says on the subject of opportunities is said from experience, gained by years of arduous toil. His example stands out as one of the most conspicuous of what the young man may accomplish in railroading.—Hammond (La.) *Vindicator*, October 7.

#### FOR LOWER FREIGHT RATES

The railroads are common carriers—but of passengers and freight; not of the country's economic troubles. This, you may say, is obvious. It once was, but has apparently ceased to be so. The railroads themselves have encountered occasion for reminding the country of the fact.

Certain eloquent advocates from the West appeared before the Interstate Commerce Commission the other day with a plea that it take 25 per cent off the hay and grain rates. They said such action would be the salvation of the farmers. Without conceding that it would, but on the contrary contending that it would profit the farmers only from \$8 to \$56 per capita, assuming that they were allowed to mobilize the reduction in the freight charges, the railroads asked those eloquent appellants what it would do to the railroads to take 25 per cent off the hay and grain rates. Apparently they were not prepared to answer that question. The likelihood is it hadn't occurred to them. Certainly it doesn't appear conspicuously in the outgivings of those who are demanding a steep and wholesale reduction in freight rates. They give us glowing prophecies of the revivifying effect which a reduction would have on this, that or the other industry. They have no eye to see, or at least no tongue to tell what the eye may see would be the effect on the railway industry. They tell us, to be sure, that lower

rates would make more traffic. But they neither attempt to prove it nor to show that with the lowered rates more traffic would be financially desirable to the railroads.

The fact seems to be that, in their commendable zeal for the industries for which they speak, these appellants for lower rates forget that the railroads have a legal as well as a moral right to earn a reasonable return on their investments. They seem to think it enough to convince the Interstate Commerce Commission that the reductions they ask for would, if made, be beneficial to the country; whereas the only question which that body is allowed to concern itself with is whether, if the reduction asked for were made, the rates would be fair by the test of the right of the railroads to earn a reasonable return on their investments.

Their failure to address themselves to that one pertinent question is the more remarkable—and possibly the more significant—because, if they should prove that lower rates would be more profitable than existing rates, then demonstration would not only put the Interstate Commerce Commission under a legal obligation to make the reduction, but would enlist the railroads as partisans of their plea. There can be no doubt that the railroads want rates put at exactly that level which will make them most productive of net revenue. If, therefore, those who are demanding a reduction of freight rates will first recognize that it is both right and expedient that the railroads make a fair profit from their operations, and then set out to prove that lower rates will be more profitable than existing ones, they will at least be engaged in a rational undertaking; whereas they are engaged in one that is hardly that, so long as they try to prove merely that lower rates will be more profitable for the industries which are their clients. They might prove that and yet fail to establish either a legal or a moral reason why rates should be reduced, or, for that matter, even a ground of policy. For the financial health of the transportation industry is a matter of as much importance to the country as is the financial health of any other industry, with the possible exception of the farming industry.

The case might be otherwise if the railroads were reveling in the accumulated pros-

perity of many years. And it might be otherwise if they were free agents rather than wards of governmental bureaucracies. In the one contemplation, it would be neither unjust nor unwise to require them to forego profits for a season as a means of nurturing into health other industries whose welfare is essential to theirs. And, in the other contemplation, high rates might be offered as evidence of extravagance in management for

which they were responsible. But neither contemplation would correspond to the realities. There is probably no other great industry that has been so nearly reduced to bankruptcy as has the railway industry, while, as for extravagance in management, that, if it may justly be charged, is more the fault of government agencies than of the railroads.—Galveston (Texas) *News*, September 6.

## Taking Friction Out of the Organization

By J. O. COOPER,  
Conductor, Palestine, Ill.

It is a fundamental truth of mechanics that the useful work of a machine cannot exceed the energy with which it is supplied. When there is friction within the machine a certain amount of energy is lost. Friction may be carried to such a point that the machine breaks down, or friction may be so minimized that the machine's efficiency will approach that ideal state of perfection spoken of as unity.

No device invented by man has ever reached 100 per cent efficiency, yet 100 per cent is the goal for which the true mechanical genius always strives. Little by little he eliminates the points of friction, establishing harmony, congeniality and happiness, so to speak, to improve the individual efficiency of each part and obtain its co-operation with the various other parts.

A great railway system is a machine in the world's truest sense. The parts of this machine are employes, which includes every person in the pay of the company.

If the railway system is to meet success 100 per cent efficiency must be striven for. Each human part of the machine must be made to fit into its place as nearly perfectly as possible. The fitting of these parts is charged to a large army of mechanical geniuses, namely the officials of the road and all persons, high and low, supervising the work of others. To make these parts fit, harmony and congeniality are imperative. It is up to the supervising genius to establish harmony and congeniality.

How may this be accomplished? Well, certainly not by driving your man or "riding" him or making him dislike his work. Some of these numerous overseers labor under the delusion that they must make themselves feared

in order to prove their own efficiency. Others stalk demerits as the buzzard hunts carrion, apparently believing this to be the right road to proof of personal efficiency.

Now, there are times when demerits should fall and there are times when reprimand is quite necessary. But it is not at all necessary that demerit hunting be made an exclusive specialty. The "big" men of the system are all too big for this petty indulgence. It belongs entirely to that class commonly characterized as "small potatoes."

Far better it is to specialize in more gentle processes. If you are a supervising genius one big duty is to make your man like his work, and you cannot make him like his work by "riding" him incessantly.

Often you can make a good man out of a poor one by being his real, sympathetic friend.

You can help your man measurably in his struggles by liberal bestowal of encouragement.

Always remember that your own ratio of efficiency largely depends on what you make of those working under you, on how well you make the parts fit their respective places in the machine, on how well you establish harmony, congeniality and happiness in your department. Superior executive work it certainly is to convert a force of blunderers into a force of competent workers.

It is easy to prove your personal efficiency if your heart is as big as your ability. The inferior may thank you for a sip from the cup of human kindness, but you owe him equal thanks for the privilege of serving him. His reaction, in more earnest effort because you have made him like you and like his job, is the very thing that contributes to recognition of you as a leader and an executive worthy of advancement.

### Evolution

**T**HE caravan. Hurrah! Haste to the gates and cheer.  
Slow-footed camels from afar with welcome loads draw near.

The coach and four. Hurrah! How great the horses' power!  
With pride the people watch it fly so fast—eight miles an hour.

The railway train. Oh dear! So slow! What makes it wait?  
We've traveled scarce a thousand miles, and fifty seconds late! —SELECTED.

### Some Printer

"May I print a kiss on your lips?" I asked,  
And she nodded her sweet permission,  
So we went to press, and rather guess  
We printed a full edition.  
"But one edition is hardly enough,"  
She said with a charming pout,  
So again in the press the form was placed,  
And we got some "extras" out.

—Bessemer *Headlight*.

### Nothing Like It

Recipe: Take one reckless, natural-born fool. Two or three big drinks of white mule. A fast high-powered motor car. Soak the fool well in the liquor, place in the car and let him go. After due time, remove fool from the wreckage, place same in black, satin-lined box, and garnish with flowers. Serve cold.—C. D. C.

### The Cheerful Mind

Why should a fellow want any kind of mind but a cheerful one? It's the best kind of mind to live with personally; sick

or well, rich or poor, it's the only kind of mind that will give you contentment. It's the best kind of mind to live with in business. It disarms the fellow who would envy you, and puts you beyond the necessity of envying others. It's the best kind of mind to live with socially. It opens every door to you, makes everybody glad to know you and offers you every opportunity in the world for personal advancement. The smile or frown which you see on the face of the world is the reflection of your own.—SELECTED.

### Probably Hops a Ride, Too

C. E. F. of the general freight department slips us this from the *Chicago Evening Post*: My dog  
Gets lots of exercise.  
He goes for a tramp  
Every day.

### Bill's Bull-etin

One born every minute—two to take him—landlord and grocer.

Landlord soaks him with rent. Roof leaks and soaks him with rain. Wife gets mad and soaks him with iron.

Pay good prices for poor food. Grocer calls it pure food. What you call it won't print. Will burn paper.

Shoes are down—down at the heels. Ladies' stockings are down—rolled, not in price.

Women's clothes are reduced—almost to nothing. If price of sister's dress was in proportion to its yardage, soda money would buy wardrobe.

Two can live as cheaply as one; they can—live cheaply. Man gets married to avoid income tax. Gets fooled—marriage taxes income.

Wife wants new evening gown; hubby needs new shoes. They compromise; wife gets gown.

Life is game of put and take. Put money in bank and cashier takes it for a ride to

Mexico. I'll put down pencil and take the air.—W. L. M.

#### A Prophet Without Honor

Reminiscent of the stories of "way back when" that the recent semi-centennial celebration of the great Chicago fire brought forth, we have the following account of the

opening of the Illinois and Michigan canal, July 4, 1836. It has to do with Chief Justice Theophilus W. Smith.

Several barrels of whisky had been opened (barrels, think of that!), and when the justice got up on one of the empties to deliver his Fourth of July speech he began to play the prophet.

"In ten years," he declared, "there will be 10,000 people in Chicago."

That sounded mighty big to the crowd, but the justice went on: "Yes, in fifty years there will be 50,000 people, and in 100 years there will be 100,000 people—"

Then the deputy sheriff pulled the justice off the barrel by the leg; his friends began to fan his face, and someone rushed to get water. "Poor feller; pity he drinks. What'll we tell his wife?" they were saying.

But the justice yelled: "Lemme up! I want to finish my speech!"

To which an old Irishman replied: "Arrah, your honor, if we had let ye go on ye wud have made it a million."

---

What the electrician's wife greets him with, as quoted, with variations, from an exchange: "Watt, is that you, John? Ohm at last? Wire you insulate?"

---

The fact that business is slow should not worry our friend, the undertaker—as far back as he can remember, his business has always been dead.

---

"How would you like to sign up with me for a life game?" was the way a baseball fan proposed.

"I'm agreeable," replied the girl. "Where's your diamond?"—*Indianapolis (Ind.) Star*.

---

The "column" editor is generally known as a column *conductor*, on most newspapers. We have freight conductors and passenger conductors on this railroad. This new conductor's job is probably more along the line of passenger work—collecting the pasteboards and punching holes in things in general—although it has a freight aspect when it comes to picking up the empties. Luckily, we are never bothered with deadheads.

---

"All out! Far's we go!"

# Points on Handling Heavy Tonnage Train

## Memphis Division Conductor Outlines Suggestions for Gaining 100 Per Cent Efficiency

By L. C. GAERIG,  
Conductor, Memphis Division

From an operating viewpoint the movement of the heavy freight train, 3,000 tons or greater, is a question of paramount importance. Upon the proper and advantageous movement of heavy dead freight trains depends in a great measure the success, stability and future volume of business of any great competitive trunk line whether it is an originating revenue system or a connecting link in some large traffic groups of railroads handling trans-continental traffic.

Prosperity of employe is co-existent with and dependent on the profitable and expeditious movement of freight. Several factors enter into the attainment of success in dependable and consistent operation of the main revenue producer, namely "the heavy drag," as it is currently designated in railway circles.

Manifest freight service and passenger service are operated on a close margin of profit; as a rule the percentage of loss from various causes is greater in manifest movement than in dead freight operation. Upon the conductor of the heavy freight train devolves the major portion of the responsibility for its successful movement after the train leaves the terminal.

### Where the Conductor Figures

There are several features that make for 100 per cent or maximum efficiency, and over these features the conductor exercises control—if he fails, the desired standard is not attained. Personal efficiency on the part of the conductor is essential to successful operation of his train. If the conductor understands the work he is always in a position to show his crew how to do it and can more easily detect any tendency toward artful loafing on the job. If he is unusually efficient and capable his crew usually emulates his example and strives harder to please. It is an ill omen when one of the brakemen even thinks he is more competent than the conductor. The most efficient brakemen generally work for the most efficient con-

ductors and when promoted are the future capable men on the division. Know thy business and have it well done are two good axioms in the philosophy and practice of good railway workmanship.

Executive ability, referred to, is also a prime factor in handling men in heavy train service and in no phase of industrialism is this one quality so essential to success. The right man in the right place at the right time is a cardinal principle in the attainment of railway success. Any man can follow, but the real conductor is the cheer leader of his crew. The crew never loses heart if the old man of ability is on the job—his ability and leadership are manifested in the good results attained.

### Initiative Is Important

Initiative is a virtue that is the fruit of intense earnestness, a quality of the mind that differentiates the "artist" in his line from the ordinary run of men. The man who does not lose his mental equilibrium in the moment of danger, who in the midst of the unexpected development of circumstances does the right thing at the right time, not as a matter of display but in the line of conscientious duty, is an employe of sterling worth.

There are many in railway service who follow blind habit and when the emergency arises they are paralyzed into inactivity and the worst always occurs. "Nobody home."

Co-operation, not only as a beautiful theory but in reality a live issue with the conductor and made a daily part of your work, often makes possible a successful trip where others who cannot co-operate or secure co-operation would fail. Remember your crew cannot read minds. Genuine co-operation in all branches of service is the ideal desired by a live, efficient railroad. When the men on the crew are convinced that the conductor means everybody "hit the ball" every trip, they either become a crew of live energetic workmen or they work on a crew with an indifferent pilot in

charge, and if they do not lose out they keep the grievance committee and the officers busy explaining "how it happened."

The correct co-operative attitude on the part of the train crew exerts a powerful influence on the work of your engine crew; so don't let the engine crew pull the train and drag you over the division; remember it takes the co-operation of every man on the crew to accomplish a successful trip. Practical co-operation, discussion with your engine and train crew of work to be performed, causes every one of them to feel a personal interest in the accomplishment of your aims. It makes for intelligent, efficient operation and the old saw "I didn't know" becomes a stone age relic.

#### **Be Ready on Time**

When called for duty see that your crew is on hand, caboose equipped and ascertain the location of your train. Railroads are selling service and you are a salesman of service. Upon the faithful performance of your duties depends the present and future business of the road. If you fail in your portion of the work, business will soon desert the line and you can undo the work of the most efficient corps of solicitors and deplete the revenues of the company.

You should be selfishly interested in pleasing the patrons of the company, for a dissatisfied customer not only withdraws his patronage but usually becomes a knocker instead of a booster. Do your part at all times in your sphere and you accomplish your assignment. When your train is made up look it over yourself. The car men are paid to do it but you may prevent a claim, a wreck or a serious delay by detecting a bulging door, a fire risk in cotton or hay loading and you may find high and low draw bars a source of damage and delay that the car men didn't see.

The terminal should furnish your train to you 100 per cent—see that it does it. The company pays for and expects the delivery of the train O. K. for movement. You will assist in reducing the bad orders set out on the line between terminals and often prevent loss of valuable loading, a source of heavy claims to a company that paid out over four million dollars last year in claims and most of it caused by someone's inefficiency. Especially check the condition of doors and open loading on the opposing

double track side; your first stop may be too late to prevent damage to property and maybe death to the innocent caused by side swiping of trains on opposing main track.

Having secured your bills, carefully checking them against train book or train sheet, and securing your orders and check of register, be sure to inform engineman as to number of loads and empties, tonnage, and whether you have any short loads to deliver. This information makes for intelligent handling of a train. If you have a cut of high speed braking empty refrigerators on rear of your train, inform your engineman; then he can move intelligently, apply the air brakes often, saving draw bars and broken knuckles and consequent serious delays.

When your drag pulls out of the yard listen carefully as the cars pull by, bleeding off any brakes that have not released. Remember a 100 per cent car rolling has a music all its own and a defective car has a discordant note awaiting the trained and alert ear. Look and listen. When cars are loaded to maximum capacity the trucks need special attention, being the weak point in carrying the maximum loading. At your first stop give the train a thorough inspection, for most of the hot boxes are detectable in fifteen or twenty miles, usually the distance of the first run to a tank.

#### **Handling Hot Boxes**

Don't set out a car that is hot on suspicion; use good judgment, examine the brass closely, also the journal. In many instances you can repack box and often eliminate the cause of the hot box by removing the grit or cinders that a careless employe allowed to get into the box because of failure to keep packing hook and paddle clear of dirt.

A car set out for defects that can be remedied is a dead loss in days of car movement and a consequent loss of available revenue producing cars.

Study the action of steel under heat—cool journal with water and oil; never dash cold water against red hot metal, for if you do you weaken the steel structure of the journal, producing crystallization and a future potential wreck.

Impress upon your crew the importance of delivering a 100 per cent tonnage train to the opposite terminal. It means money to the company and more business for the line.

If you set out cars for defects mark cars plainly; also, indorse defects on waybill and notify the dispatcher. It will assist in moving the car—an idle load means loss of time and money that benefits no one.

Watch your train line closely, eliminating the leaks, thereby having draw bars and preventing air pump from burning up.

A leaky train line on a drag is a menace and burns up expensive fuel, that one item alone being an expensive and useless waste of energy and money. A coal saving campaign is valueless unless you assist the engineman in saving coal. Do your part. Watch your air gauge closely on your ca-boose. It is no ornament. Its close and frequent inspection reveals the pressure of the proper air braking power—a most useful and absolute essential in heavy train operation.

### Coupling Should Be Easy

Coupling crossings or doing switching with long cuts of cars, place your men to advantage, using the easy signal before coupling, bringing cut down to a slow, safe speed, almost a stop, before contact is made.

Many crews make a heavy couple that raises the dust out of the cars, jars the rear end of train with its impact and because the draw bar doesn't fall out the movement is O. K. The damage to the loading doesn't manifest itself there, but the company pays the claim for internal damage to loading, and no division terminal acknowledges the rough handling.

The really interested conductor and crew will watch this feature closely and help reduce this useless expense and source of many claims.

Co-operate with the train dispatcher by giving him accurate information, for he is no mind reader. Be on the level; if it takes thirty minutes to do a piece of work, don't say, "Will be ready in five minutes." In single track operation this one feature alone costs delays to other trains that are expensive, and in this day of competitive rail-roading it costs loss of business.

Work at all times in accordance with the rules—protect your train, see that it is done; you may save a disastrous wreck. "There is nothing close behind us" has cost millions in property loss and many lives. Insist on close inspection at all stops; your

crew will do it, if you are firm and in earnest about it. Don't be a martinet on duty, but don't stand for any slackers on your crew.

The man who is indifferent or careless is a menace on a railroad, a square peg trying to fit in a round hole. Eliminate him if you are not able to change his style of work.

Practice safety first 365 days in the year; don't get interested during a drive and then lapse into a state of careless passivity the rest of the year.

Do not set a bad example by indulging in dangerous practices yourself, and when you see members of your crew violating safety first requirements caution them; if you can't correct their attitude, let the trainmen do it before the funeral occurs.

When your train is stopped in an unusual place by a train ahead of you and your flagman is out protecting, go ahead along your train, give it a close inspection and take your headman with you. Give the crew ahead your hearty co-operation and assistance.

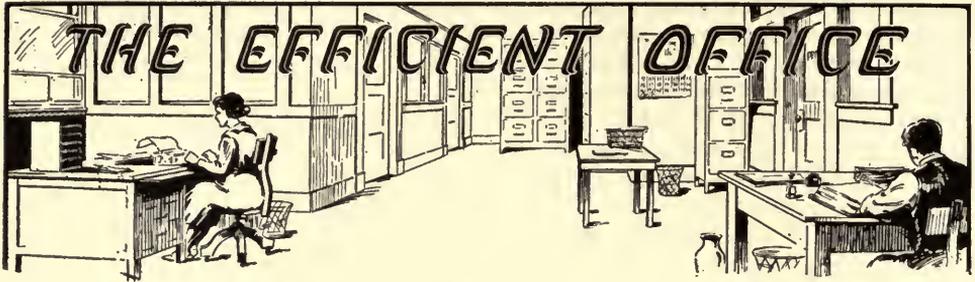

### A Chance for Co-operation

When the other crew has a derailment or draw bar out the assistance of your crew opens the line more quickly, and to use the words of a popular cartoon the other follow may well say, "Ain't it a grand and glorious feeling" to see the co-operative spirit assert itself.

An intent mind coupled with true efficiency, a determination to deliver the goods and the conscientious performance of your many duties will show you to be an artist at your business—a valuable man in your line.

In case you make mistakes, and we are all human, as one beloved general manager once stated, "Your good service is a bank account on which you may draw in times of trouble." Due diligence, courtesy to patrons and due care in all your work are characteristic of an A1 conductor. Do the little things well and the big task, the ideal 100 per cent, will be accomplished. There is no more vital factor essential to success than to know your business and have it well done when you go over the line.

The A1 conductor is truly an artist in his line. Be one and help the company as well as yourself and your organization.

In the Illinois Central Magazine for August (p. 69) editorial mention was made of the suggestion that a department of special interest and helpfulness to office workers be made a part of the magazine. The suggestion came from a chief clerk in Mississippi.

Herewith is presented the initial effort. The chief clerk who made the original suggestion—he insists that his contribution be anonymous—has been of further material assistance in compiling the material used in the department this month.

The department must be self-supporting as regards the material used. If office workers are sufficiently interested to give us the material for it, the department will be continued. If not, it will be laid aside. The editors of the magazine want to be of whatever assistance they can in carrying on such a worthy effort, but the material must come from the men and women who are actually meeting office problems and finding solutions. So the co-operation of every person interested is invited.

Short articles about up-to-date methods in filing, handling correspondence, making reports and the like will be welcome. The uses of expensive machinery are well known, or should be exploited through the advertising columns; but methods by which machines in general use may be made to accomplish more will be welcome. It is a rich field. Doubtless every office on the system has found some worth-while labor-saving practice. The other fellow ought to know about it.

### Stationery Cases

A map recently gave us an idea as to indexing a case where our reserve stock of stationery is kept. Use letters for the sections across the top and numbers for the shelves. All forms placed on the first shelf between the partitions called Section "A" would be indexed as "A-1" and so on. It works as well on stationery as it does on maps.

### Freight Train Performance Report

We all know what the freight train performance report is. It takes lots of hard work to get it out. One of our men recently visited the Tennessee division and learned that, instead of having it called to a stenographer to copy with a hectograph ribbon, the rough copy is made up in lead pencil, and the stenographer runs it into the typewriter and copies right over the pencil figures. Fine idea, we think, and saves lots of

time. We are sure the originator won't mind our telling it, for it's good enough to use on any division.

### File Numbers

The file numbers are put on letters when written, so that when reply is made reference can be given. This helps the file clerk, who is really a most important man in any organization; yet there are those who don't furnish this assistance, although it would take but a moment and save several in each case.

### Payroll Books

We did have trouble and lose time finding roll references in old payroll books, but we finally indexed each book and gave it a number; now we go to the index; then, without hesitation, take up the book we want. Try it, and see how fine it works.

### Home Made Forms

We make up a number of forms on the mimeograph machine. Instead of lining them with the typewriter, by use of the line or colon, get a steel ruling pen, tear off the tissue sheet over the wax and draw your lines. It's quicker and makes a neater job.

### Address Book

There was a time when we had trouble keeping up with the initials, names and titles of officers of various industries on our line; but, after getting our agents to give us a line on them, advising us from time to time of changes, we have a nice address book, in alphabetical order, both as to names of firms and officers.

### Queries

Who knows how to run off forms on the hectograph pan in the summer time without making the lines look "wavy"?

We wonder who has the best system of marking neatly and legibly bound volumes of records, bound with the McBee binder.

We need one. Tell us about it in the magazine—maybe some other fellow is in the same fix.

### Filing Periodic Reports

We have recently started a system of having all periodic reports kept on an open ledge at a convenient place in the office. The old method of having each clerk retain in his desk the reports he compiles was unsatisfactory, for it did not make them ready of access and did not provide the means for a ready checking to insure their publication when due. The present plan gives division officers and clerks readier access

to all reports, makes the information in the reports of more general value and insures a check on their being kept up to date. Needless to add, it eliminates a lot of work in hunting out and passing the reports back and forth.

The plan applies not only to reports compiled in our office, but to all the regular reports from other offices in which division information is given. Furthermore, the reports are grouped by subjects—reports on engine hours, cars handled, overtime, damage to equipment, passenger train performance, etc.—E. A. AXEN, *Chief Clerk to Terminal Superintendent, Chicago.*

## Called on Courtesy in the Nick of Time

*"I am enclosing an article of personal experience of courtesy. I hope that it is in such shape that you can see the heart of it. I am not much of a writer and trust if you use the article that you will lend it more style, which you will do, I am sure," writes the author of the following, who signs himself as a station agent on the New Orleans division of the Yazoo & Mississippi Valley. In accordance with his request, some style has been lent, but not enough, it is hoped, to detract from the earnestness and sincerity of his contribution.*

One of the most absurd things to be found in this old world is discourtesy. If any man believes that discourtesy has ever helped him on his way through this life, then that man is unfortunately out of balance and doesn't know it.

Courtesy, on the other hand, is just another name for civilization, riveting together all the small and large actions that will some day array this old world in the cloak of peace and good will forever.

Had courtesy been a strange and impractical thing in this world, I would stop right here to shiver in thinking what would have become of me. I have found so much courtesy shown me by other people, most of them perfect strangers, that if it were possible to show it all at once to an old grouch he'd die instantly. It tickles me to find a grouchy person and jerk a courtesy out of him before he knows it's coming—folks, it's plumb fun.

One critic will say of me: "Well, I can't

see where courtesy has ever got that dub anywhere; he's just a common ordinary old station agent at a one-horse town."

My answer to this particular line is this: "Brother, it's about the only thing I've got that's even led me to this one-horse town and allowed me to stay in it, paying me to do so all along."

Possibly another critic will figure: "With all that amount of courtesy, that boob certainly ought to get to a place where he could just naturally hand it out in great big gobs."

My answer to this particular critic is: "Brother, the Lord is all wise and will look after my particular brand."

Courtesy is the one practice that causes me to look back over a trail of thirty-five years and see little treasures laid up here and there

I easily recall to mind one foggy morning in November, 1916. I stepped out on our main line track to flag an accommodation train that was supposed to take on passengers from my station if properly flagged. I had sold thirty-six tickets on this particular morning. One man was going to the bedside of a very sick person, and cautioned me to be and again not to fail to flag the train. Others were just as anxious to have the train stop. The fact was that that train meant to those thirty-six persons the most important part of their day.

Yet when I went to flag the train the fog was so heavy the engineer did not see me. I had neglected to place the torpedo or display a red light, when I knew it should have been done.

When the train had passed I was confront-

ed by an angry and disappointed crowd. Some who did not know me wanted to fight me, and those who knew me shook their heads and roared. "I'll sue your company," they said; "I'll make it cost them for this day."

For a few minutes I was almost paralyzed, but back came the thought of *Old Man Courtesy*. I remembered how all along I had dished out courtesy, and I thought, "Now, if there is anything to it, here is the place for it to show up." The baggage truck fortunately was in the center of the turmoil. I climbed up on this timely platform and raised my hand for silence. I had never before made a speech nor had I ever thought of making one, but all I had was about to go down and out—my job and one great principle.

So it was I tremblingly told those people that I had lived among them, fortunately, without inconveniencing them but once. Could they not sacrifice this one disappointment, remembering me and me alone in this calamity, allowing me to keep the sentiment alive that it paid to forgive and forget? I said a great deal more, and I don't remember now what it all

was, but when I stepped off that truck I had thirty-five of the sold tickets returned. The thirty-sixth one was in the possession of a minister of the gospel.

Some hours afterward the mayor of the little town brought me this one ticket and said nice words that almost made me feel like being thankful for a foggy morning and thirty-six passengers left behind.

All that our company ever heard of the incident was through a telegram I sent to the superintendent's office, advising him of the trouble, and a later one telling of its happy ending forever.

There are many incidents, both little and big, that creep into my memory as I write this article. They seem to say: "Tell about me; I am important; I made you glad once; tell about me so that I may visit somewhere that I'm needed. I may seem little to you, but I'm courtesy, and must serve to live."

I find it to be a positive fact that one can err in all things of life and regret it, but no one has ever been or will ever be courteous and regret it.

## *You Are in Business With the Company*

By A. L. CHAPIN,  
Assistant Electrical Engineer

We often see in the Magazine the statement that Mr. So-and-So has resigned his position to go into business for himself. This statement should read that Mr. So-and-So has dissolved partnership with the Illinois Central to enable him to seek or accept another partner, where he believes the results will be more in his favor.

Every employe of the Illinois Central is as much in business for himself, and on the best-paying basis a person can secure, as if he had purchased an interest in a going proposition, and he has done this without the expenditure of one cent of his personal funds.

The employe puts his brains or muscle in the firm against the cash and good will of the company, the company assuming all the overhead expense, such as rent, insurance, taxes, depreciation and interest.

The employe receives a fixed return on his investment in the shape of salary, while the company takes a chance on getting its in the amount of revenue it receives through the efforts of the employe.

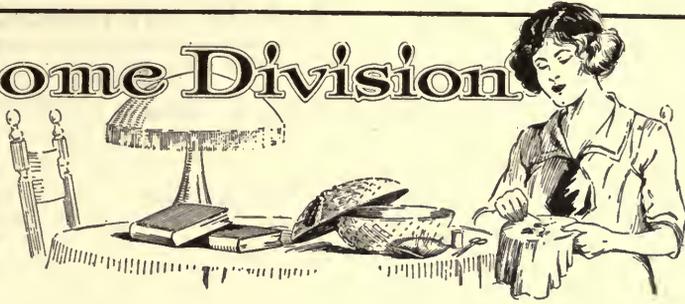

The company also permits the employe to share in the profits by joining the hundreds of employe stockholders who now hold stock in the Illinois Central, who are buying this stock on favorable terms, payable so much each month.

The company also provides an adequate hospital department which gives prompt attention when calls are properly made, and also renders the best of hospital service provided it is necessary for an employe to go to the hospital, there being several of these located at convenient points on the system.

After an employe has served a number of years and has arrived at an age when he wishes to take things easy, or is totally incapacitated for work, the company provides a pension, depending upon the number of years of service and the salary he has earned.

There is no doubt that in prosperous times and with everything progressing smoothly the employe might earn a larger figure at some other business, but when things begin to go hard and money is scarce, the railway company keeps on paying the employe his share while it at times does not earn its own share.

## Do Clothes Make the Woman?

Perhaps not; but they give her a tremendous advantage. And you would have thought so, too, had you seen the charming woman whose appearance suggested that question. She stood alone in the elevator as I entered it. My first impression was that here was a well-dressed woman. The simplicity of her dress spoke volumes. Except for the smart stone marten fur which encircled her throat, her costume was black. The gown, almost severe in its simple lines, was of Canton crepe, her hat was a small fall model, and as she stepped out of the elevator I glimpsed neat black stockings and oxfords. She was stunning!

In sharp contrast I thought of a young woman who had sat opposite me in the train that morning. Her flimsy tan dress, sleeves and skirt both abbreviated, was slightly soiled—not really dirty, but just noticeably past the spick-and-span stage; tan stockings were combined with high-heeled slippers which boasted many straps, and a lace hat dipped over her white nose. Now, a lace hat is a thing of beauty—for dress occasions; for business it is an atrocity.

For the hot summer day, light clothes are cooler in appearance and in fact than those of darker shades, but this article does not deal with the dress problem for those days when comfort is our first consideration. For ordinary street and business dress, if we could suppress our hankering for clothes which shout, what an improvement it would be, and how many more of us would be really well-dressed women. Almost every one can wear navy blue, while black, which makes the tall woman statuesque and the stout woman slender, is also the thing these days. Darker colors stand the wear better,

look better and require less expense to be kept in order. Light-colored garments must forever be in the cleaning shop.

Every woman wants to look stunning. And by "stunning" I mean well-dressed and stylish. For fall wear, a one-piece dress of some moderately heavy material is almost indispensable. Select a model with simple lines, and don't be penny wise and sacrifice becomingness for a difference of a dollar or two in price. Look upon your expenditure for wardrobe as an investment—something to be thought about carefully and selected with a view to yielding the greatest possible return. And let us not choose lace or malines or other perishable hats for everyday wear. After the first rainstorm they will be a sorry sight.

Thinking and talking clothes all the time is to be deplored, but it is necessary to give a certain amount of thought and attention to this important subject. Try to be a well-dressed woman. This not only will give you poise, but will cause you secretly to exult, for a well-dressed woman is always an attractive one.

A word about the woman who is the moving spirit in the home: I think there was a time, before the use of electric contrivances for housekeeping, when some housewives went about their tasks presenting a disheveled and "Don't I look a fright? but it's wash day" appearance, and with good reason. Nowadays, an untidy working outfit is inexcusable, and I know at least one John who thinks his Mary never looks so sweet as in her dainty blue and white apron dress. To be presentable at all times is to save flurry and embarrassment, and every woman in the business of home making owes herself the duty of appearing as well on the scene of her activities

as does her sister who labors perhaps less strenuously outside the home.

### Household Hints for Home Makers

Save empty baking powder cans. Remove the paper from the outside and use them for cooking puddings, as cooky and biscuit cutters, receptacles for twine and corks, or to hold small pieces of soap for use in the wash boiler.

Croutons for soup garnishing: Cut slices of stale buttered bread, from which crusts have been removed, into ½-inch cubes, and brown in oven.

Use worn bath towels as pads for the ironing board.

Always make meat soups with cold water to which salt has been added, and gradually heat to boiling point, but never boil.

Holders for hot pans may be made from the upper part of old stockings or the cuffs of worn shirts. Sew a loop of tape on one corner, and hang them near the stove.

Freshen velvets by steaming from the wrong side. Draw the velvet through the steam from a teakettle. To "pan" velvet, steam it and iron in one direction.

If you like to do patchwork, buy remnants of cretonne. They come in pretty designs, and can be made into attractive quilts.

### Every Woman's Duty

Are you tragically fat? If so, and you want to reduce, the following, says an authority, are "forbidden foods": Pork, ham, bacon, and the fat of any meat; bread (except gluten bread), biscuits, cereals; rice, macaroni, potatoes, corn, dried beans, lentils; milk, cream, butter, cheese; olive oil; pies, cakes, pastries, custards; ice cream, candy.

For an excessively oily skin, use hot water and a pure soap with a camel's hair complexion brush. Then apply an astringent. One dram of boracic acid mixed with four ounces of rosewater will be found beneficial. Witch hazel also is an excellent astringent.

Oiliness of the hair necessitates frequent washing, else there will be a disagreeable odor which is the arch enemy of daintiness. Castile soap with a pinch of borax added to the water is a good cleanser.

If your crown of glory is silver white, a few drops of bluing in the last rinsing water will keep it so.

## FOR THANKSGIVING

### Blue Point Cocktail

*Cream of Tomato or Beef Bouillon, Vegetables*  
*Roast Turkey Giblet Dressing, Cranberry*  
*Sauce*

*Mashed Potatoes Baked Sweet Potatoes*  
*Head Lettuce French Dressing (or Tomato*  
*Mayonnaise*

*Suet Pudding or Plum Pudding*  
*Pumpkin Pie or Mince Pie*

*Fruit Ice Cream Assorted Nuts*  
*Camembert Cheese With Toasted Rye Bread*  
*Coffee*

**GIBLET DRESSING.** Skin giblets and cut off all hard parts. Cut up fine, add ½ cup chopped celery, 1 cup chopped onions, 3 slices bacon or salt pork, diced. Put in frying pan, let simmer until almost done, frying it to a light brown. Season with salt and pepper. Mix ½ small loaf bread, diced, with 2 beaten eggs, and add a little sage. Combine with the first mixture and add water to moisten well. Mix with a spoon but do not mash. Stuff this into turkey and roast.

**SUET PUDDING.** 1 cup light New Orleans molasses, 2 tablespoons brown sugar, 1 cup chopped suet, 1 cup hot water, 2 eggs, 1 teaspoon baking soda, 2 cups (or a little more) flour, 1 teaspoon salt, 1 small teaspoon cinnamon, nutmeg and vanilla, 1 cup raisins, 1 cup chopped nuts. Steam three hours.

**Sauce.** Beat to a cream 1½ cups granulated sugar and ½ cup butter, add 1 well-beaten egg and vanilla. Add 4 tablespoons of hot water just before using.

**PLUM PUDDING.** Sift 3 cups flour with 1½ teaspoons each of salt, nutmeg, cloves, and cinnamon. Add 1 cup each of raisins, citron, currants, and almonds (fruit and nuts chopped fine), and 4 eggs well beaten. Mix 1 cup suet (chopped fine) with 1 cup molasses and a pinch of baking soda dissolved in a little milk. Combine the two mixtures, turn into a buttered mold, and steam 3 hours. Serve with hard sauce.

**PUMPKIN PIE.** 2 eggs, ½ cup sugar, 1 cup stewed pumpkin, 1½ cups milk, ¼ teaspoon allspice, ¼ teaspoon cloves, ¼ teaspoon ginger. Beat eggs, add to them the sugar, pumpkin, and spices. Beat all

thoroughly and then add milk. Bake in crust of pie paste.

*Pie Paste.* 3 cups flour,  $\frac{3}{4}$  cup lard, 1 teaspoon salt, cold water.

**MINCE MEAT.** 2 pounds lean beef, 1 pound suet, 5 pounds apples, 2 pounds raisins, 2 pounds currants, 1 pound sultana raisins,  $\frac{3}{4}$  pound citron, 2 tablespoons each of cinnamon and mace, 1 tablespoon allspice, 1 tablespoon salt, 1 teaspoon ground nutmeg,  $2\frac{1}{2}$  pounds brown sugar,  $1\frac{1}{2}$  quarts of cider. Boil beef and when cold chop fine. Mince the suet. Peel and chop apples, add raisins, currants, sultana raisins, cinnamon, mace, allspice, nutmeg, salt, and brown sugar. When well mixed, stir in cider. Pack down in stone crock. Mince meat should be prepared several weeks before it is used so that it may ripen.

In making mince pies, have the best pie paste. Line pie plate with this, fill the crust shells with the mince meat and lay strips of pastry latticewise across the top. Bake in moderate oven. The pies may be kept for weeks but must be reheated before serving.

**MAYONNAISE.** 1 small can condensed milk, 1 level teaspoon each of dry mustard, sugar and salt,  $\frac{1}{8}$  teaspoon paprika or less. Put this mixture into a bowl and beat slowly into it with an egg whip salad oil until thick as wanted, then beat in 3 tablespoons vinegar. This will make  $1\frac{1}{2}$  pints of excellent mayonnaise dressing in about 5 minutes.

(Menu and recipes were contributed by W. H. HUPPELER, *manager, Central Station Restaurant, Chicago.*)

## On Making Friends Over the Telephone

By C. A. KEENE,  
Trainmaster, Indiana Division

The impression made, either by personal interview or telephone, generally makes a friend or an enemy, especially so if the person making inquiry is seeking information.

The telephone has made it possible for conversations to be held without leaving the home or office; many times persons would rather use the 'phone than go to a railway office, as they feel more like asking questions that way than they would in front of a ticket window or cashier's desk in a freight office. In fact, it is more private, and if the person giving the information is polite and civil, he or she has made a good impression and no doubt added another patron to the list; on the other hand, if replies to questions are gruff and no attempt is made to assist the would-be patron, perhaps he will call our competitor, and our chances to sell that person some transportation are lost, maybe forever.

The familiar "yeah" or "uh-huh" instead of a prompt "yes, sir" makes a decided difference. The manner in which you speak into a transmitter is another important matter—speak distinctly and directly, so that the receiver will be able to understand every word; otherwise the person at the other end will not get all that you say, which will ir-

ritate him, and you will be condemned along with the telephone.

Let's make friends instead of enemies. Friends make patrons; enemies drive would-be patrons away. Hold patrons by courteous treatment and good service.

### TWO LETTERS GONE

Strange, isn't it, what a difference a letter or two can make? A printer somewhere out in the Rocky Mountain district gave real individuality to a circular announcing the beginning of a newspaper by merely eliminating all use of two letters.

"We began the publication of the Roccy Mountain Cyclone with a phew diphphiculties in the way. The typephounders phrom whom we bought our output phor this printing ophphice phailed to supply us with any ephs or cays, and it will be phour or phive weeques bephore we can get any. The mistake was not phound out till a day or two ago. We have ordered the missing letters, and we will have to get along without them till they come. We don't lique the loox ov this variety ov spelling any better than our readers, but mistaix will happen in the best ov phamilies, and iph the ph's and c's and x's and q's hold out we shall ceep (sound the c hard) the Cyclone whirling aphter a phashion till the sorts arrive. It is no joque to us—it is a serious aphphair."

## Illinois Central Loses Its Band Director

*Burnside Organization Made Leaderless by Death of George F. Fraser at the Age of 82*

THE Illinois Central lost a faithful and valued employe and the Illinois Central Railroad Union Band and Orchestra of Chicago lost its organizer and director when George F. Fraser died September 29 at the age of 82. Mr. Fraser, who was a world traveler and a band leader of long experience, became identified with the Illinois Central in 1892, and four years later organized and became director of what is still said to be the only railway band and orchestra in Cook County. Up until the time of his death he held a position as price clerk in Burnside Shops, working among the men whose musical efforts he directed.
