radiate. In other words, the degree of temperature of the journal is caused by friction. Friction is the force that acts between the journal and journal bearing. The generating of heat is governed mostly by the speed of the car or locomotive and the quality of lubricating oil; the attention received at the last inspection point is also a strong factor. It is assumed that the inspectors and carmen thoroughly understand the instructions pertaining to the packing and care of journal boxes, but to refresh our memories we will revert to the beginning.

### How Waste Is Prepared

For the care of journal boxes the company furnishes two grades of waste, which are carried in stock by the store department: namely, wool and cotton. Wool waste is of a very high grade, and its use is confined to the packing of locomotive driving boxes, engine trucks, tender trucks on high-class engines and passen-

ger train cars. Cotton waste is a less expensive at least 90 per cent can be traced to inattention. grade, and its use is confined to the packing of journal boxes on freight train cars and tender journal boxes on switch locomotives.

In preparation for use, both wool and cotton waste are separately put through the soaking vat and made ready. After being in service a while both grades can be reclaimed, and it should be borne in the packer's mind at all times that, when removing waste from boxes, he should exercise the utmost care to avoid throwing the old journal packing on the ground, where it will accumulate foreign particles. Instead, the packing removed should be placed in a receptacle and turned over to the attendant in the soaking vat room. Here the old packing removed is hand picked and thoroughly gone over for any foreign matter it may contain. It is then made ready to undergo the resoaking process, similar to that of new waste. All waste, after being in the soaking vat approximately forty-eight hours, is placed on draining rack for twenty-four hours and is then ready for use.

#### Packing the Journal Box

The packing of the boxes, or the manner in which the "dope" is applied to the box, has been discussed so often and the men in the train yards and repair tracks have been instructed so often that it is taken for granted that all understand the principle. In fact, the standard instructions of our road cover the matter so fully that proper compliance and insistence that these rules be compiled with should suffice.

We should bear in mind at all times that under no condition must the journal box be packed too tightly, and not to exceed in height the center line of the journal. The packing of any journal box with an overabundant mass of packing is not only derogatory to good practice but also wasteful.

Periodical inspections and surprise tests should be encouraged and kept up at all times to ascertain if journal boxes are receiving constant attention from oilers and repairmen. We should also embrace in these checks the inspection of the tools the men are using, to know that those using them are properly instructed in their use, as it is the consensus of opinion that proper inspection and proper attention will practically eliminate hot boxes on any railroad. If the inspectors and yardmen and oilers are negligent and we have an abundance of hot boxes, we could safely say that

#### Some Causes of Hot Boxes

The practical man, in the study of hot boxes, can readily see that there are two classifications of hot boxes: First, the boxes that run hot and, after attention, give no further trouble; second, the boxes that run hot, receive attention and continue to give trouble. Analyzing the two classifications, we will enumerate some of the principal causes of each:

##### *First:*

Too much packing crammed into the boxes. Boxes improperly packed, or insufficient packing.

Packing glazed over with journal compound or common soap.

Damp packing, indicating water has been used in the box.

Evaporation of oil, leaving the packing dry.

Packing not in contact with journal.

##### *Second:*

Cut or rough journal.

Burst brass.

Bent journal.

Imperfect journal, not being true and worn tapered.

Use of improperly fitting brass.

Use of improperly fitted wedge.

Use of wrong brass.

Loose trucks or those out of square.

Cast steel or fabricated truck sides sprung out of line.

Overloading of equipment.

#### Real Inspection Needed

From the classifications above there can be no doubt that the defects should have been detected by ordinary inspection. The term "inspection" does not mean merely a passing glance is sufficient. It means that box lids must be raised and a careful examination made of all conditions. If any defects as set forth in the two classifications above are noticed by our inspectors and oilers and the correct remedy applied, a big decline in the number of hot boxes will be noticed shortly.

Too much stress cannot be laid on the interchange inspection. On the shoulders of the interchange inspector devolves a greater responsibility regarding hot boxes than he probably imagines. To a great extent it is in his power, and it should be his duty, to take in hand production of adequate returns for his monthly compensation and not sit calmly by and let bad conditions develop. To obtain

higher efficiency, all inspectors, yardmen and oilers should feel that on the interchange, train yard or repair tracks they are the doctors and the attention given should be paramount. When they have done their duty, and done it well, they will naturally enjoy the satisfaction of knowing they have done their best.

#### Plenty of Time for Care

The average mileage of a freight train car throughout the day or month is rather small, and this affords a great opportunity for closer inspection and greater efficiency in maintaining journal boxes in good condition at all times. Repair and rip tracks are maintained at nearly all junction and division points. When cars arrive at these points the time is most opportune for replacing missing box lids and missing dust guards, detecting defects in the trucks, etc., and all should be attended to. By this action the reportable number of hot boxes on these divisions will be lessened to a very marked degree.

We frequently find cars coming into the train yards with what is commonly termed among our carmen "over-running heat," and the question has often been asked what degree of temperature constitutes a hot box. We think

it safe to say that on freight and passenger trains the normal condition is from 100 degrees to 130 degrees. If the temperature of the box appears greater, the inspector or oiler should look for the cause. Not only do we find in our train yards the journal box packing "dry" but we see reports filed by the conductors and brakemen that the hot box was caused by "dry packing" in the box.

#### A Result, Not a Cause

The impression prevailing that a hot box is caused by "dry packing" is erroneous and should be corrected for this reason: The finding of "dry packing" in any journal box was not the cause for the heating, but was entirely the opposite—the result. The packing was "dry" when discovered; consequently, the journal was hot. Some condition had taken place on the car in transit to cause the box to heat. In heating it caused the lubricant to vaporize or evaporate, leaving "dry packing" in the box. It seems to be an unwritten law prevailing among all, especially the trainmen, that the more packing crowded into a box, the better it will run. We have already said that a box should never be packed above the center line of the journal and not too tightly. Common sense teaches us all that any journal

*The New Orleans terminal division presents herewith photographs of the members of its efficient hot box committee. Left to right: J. D. Ernst, chief car inspector; Joseph Ernst, assistant general car foreman; F. C. Nodier, assistant general yardmaster. These men have done excellent work in eliminating causes of hot boxes, and the results are apparent in the substantially decreased number of hot boxes on cars moving out of New Orleans.*

box crowded too full of packing will hold the heat that is generated from the journal and at the same time will exclude the air from reaching the journal.

A very noticeable first aid is the use of foreign compound, such as crank pin grease, journal compound, common soap, etc. We will admit that any of the above will lubricate at a temperature exceeding that which can be reached by oil; unless, however, their presence in a journal box is noticed by the inspector or oiler or reported by the trainmen at the terminals, it will cause us trouble later. The melting of the substance will form a glazed surface over the packing, which will totally destroy the capillary attraction of the waste.

### Never Use Cold Water

While the practice has not been noticed, nor do we know it prevails, we should at all times discourage the use of cold water in cooling down journals on cars and locomotives. If a journal has heated to such a degree that it is necessary to give immediate attention, we know full well that the heat has penetrated through the entire journal. Throwing cold water on the outside of a hot journal causes a sudden chilling of the outside surface which will be unequal to the heat that is contained on the interior of the journal; consequently, the unequal contraction in all likelihood will cause "water cracks." Unless these cracks are noticed, they will irritate any journal bearing applied to the box, causing hot boxes and possibly the burning off of the journal.

The selection and the application of journal bearings should receive close attention from those applying them. Both repairmen and inspectors, in selecting the bearing, should "sound out" or test each one to determine whether or not the lining is loose. In making ready to apply a journal bearing they should be careful to extract the old packing. They should do this, if possible, before the wheel is jacked up. The new bearing to be applied, wherever possible to do so, should first be placed on the journal and then the wedge, to be sure that both fit. The journal should be oiled also. We have at times seen repairmen experience trouble due to the wheel's rising when being jacked. This could be easily prevented by the use of an ordinary wooden block placed between the top of the wheel and the sill of the car. The rising of the wheel might also be due to applying a brass on a sharp curve of track; consequently, wherever possible, use a straight track to prevent bind-

ing, etc. Repairmen whose duty it is to take care of these requirements should be provided at all times with a jack box, and care should be used in placing it on a good foundation.

### Why Brasses Sometimes Fail

Our attention has often been called to the fact, and we have seen brasses removed on the repair track, with a lining cracked and portions of it flaked out. The great majority of these cases are brasses removed from boxes that have worn pedestals or columns. To be more exact, the lost motion between the pedestal face or column face of the box and the pedestal and column is so great that it allows the box to "cant." It can readily be seen that cracking of the lining is due to this condition, and it is evidently caused by the "springing" of the brass. In applying brakes on a car with journal boxes in the condition described, it becomes apparent that the wheel would have a tendency to "roll"; as the alloys in the brass contain more elasticity than in the babbit, it is indicative that the larger percentage of brasses found with cracked lining can be traced to such existing conditions.

Reviewing lightly the few principles discussed, we should become imbued with the thought that the first thing for any workman to learn is how to use and care for the tools with which he is entrusted and to thoroughly understand the various instructions issued for his guidance. Some workmen are naturally careful and apt in broadening their knowledge, while others are the opposite. The careful man makes the best workman and naturally gets the best advancement. In all walks of life it is the small things that count most, and, if we do not prove worthy in the small matters, we shall never have the opportunity of proving our worth in larger matters.

### Personal Contact Proves Effective

One of the most essential qualities in establishing harmony, co-operation and their result, efficiency, is confidence. To gain this objective, essential to good operation, there is no better method than personal contact. The "personal contact" idea, getting out and talking to the men, was taught us by our master mechanic. Our efforts along this line produced good results on the New Orleans terminal. During the recent hot box campaign, this idea reigned supreme, and the hot box committee, chief inspector, foremen, in fact all of our efficiency force, talked personally to the men as to what could be accomplished.

The method devised on the terminal in our

campaign to eliminate hot boxes introduced nothing new. With the assistance of the hot box committee, plans were worked out and educational meetings conducted where the men were given practical demonstrations and talks. Diagrams showing the proper method of packing journal boxes and other exhibits which were considered incident to good operation were made. At the general car foreman's meeting, all sub and gang foremen were present, and the charts were exhibited and freely discussed. At the meetings with inspectors, repairmen, yardmen and oilers, the charts were again exhibited and hot box prevention explained and discussed. We realize to "overdo" anything is about equivalent to doing it improperly, and we have tried to refrain from overdoing, but at the same time to keep it constantly before our men and to obtain the desired results.

### Committee Went Out in Yards

The hot box committee would visit all yards, day and night, talk to the men and go over some of their work. If the committee found a man a little out of line, he was properly instructed, and a book issued by our general superintendent of motive power, covering the packing and lubricating of cars, was given him. The committee also visited roundhouses and inspected tender trucks and boxes and conferred with the roundhouse foremen. A meeting is still being held once a month by the committee and is producing very good results. The success obtained is discussed at these meetings, which also consider boxes running hot out of the terminal since the last meeting and the reasons advanced, pro and con. The exhibits, which will be discussed later, are always shown and proper methods explained. Likewise, personal injuries, fuel economy, damage to equipment, etc., are touched upon. One of the recent meetings had an attendance of 107.

One of the best systems of keeping a line on hot boxes and tracing the individual responsibility was put into effect some years ago by our master mechanic, E. C. Roddie. The oiler in each yard, either night or day, is assigned a number; whenever he gives attention to the boxes of a certain car, the truck is properly marked with his number and the date. Should the box give trouble on the line of road, the conductor furnishes the master mechanic the oiler's number, and the matter is handled immediately for improvement. If the oiler's number is not shown, the individual car number is furnished and traced to the yard where it originated.

### How Lessons Are Explained

In our hot box meetings, the illustrations governing the packing and care of journal boxes follow strictly A. R. A. and Illinois Central practice, and the exhibits used are for the sole purpose of educating the men so they can follow more closely the instructions. Before these exhibits are shown there is a discussion of the various methods of packing hot boxes, which are gone into thoroughly.

As introductory remarks, items pertaining to the packing of the boxes and the care of the box are thoroughly discussed: first, the preparation of the box for reception of the packing; second, the application of dust guards, bearing and the wedges; third, the care of journals not in service; fourth, assembling the parts; fifth, drawing the packing from the soaking vats, removing old packing from boxes and reclaiming the second-hand packing.

The proper method of packing is explained to the men as follows:

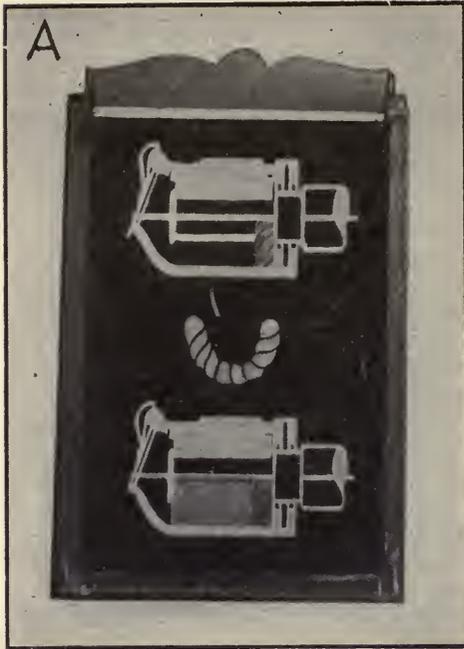

Clean off all scale, sand or foreign particles that may be in the box. The dust guards must be renewed on the replacing of new wheels. Special attention must be given to make sure that they are close fitting. Examination must be made of the packing and the wedge before application to see if the surface of the brass is smooth, clean and free from dirt. If the journal has been exposed to the elements for some time before being used, it may be cleaned with a scraper or a half-inch file. The use of emery paper or emery cloth must be discouraged at all times. A journal not in service and waiting to be used should be coated with a preparation to avoid rusting.

In assembling the parts for application, i. e., box, bearing, wedge, etc., make sure the brass has crown bearing and is not too tight on the sides. In other words, it should be free at the side of the journal. Before beginning operations, apply a heavy coat of oil to the face of the brass at the top of the journal.

After removing the old packing from the boxes, place it immediately in some receptacle and send it to the soaking vat room. It should never be allowed to lie on the ground or exposed so as to accumulate additional foreign particles. That only requires more work in the soaking vat room and adds to the matured deterioration of the packing.

Here are the exhibits we use to explain the proper procedure:

Exhibit A shows the roll before application to the box, the box with the roll applied and

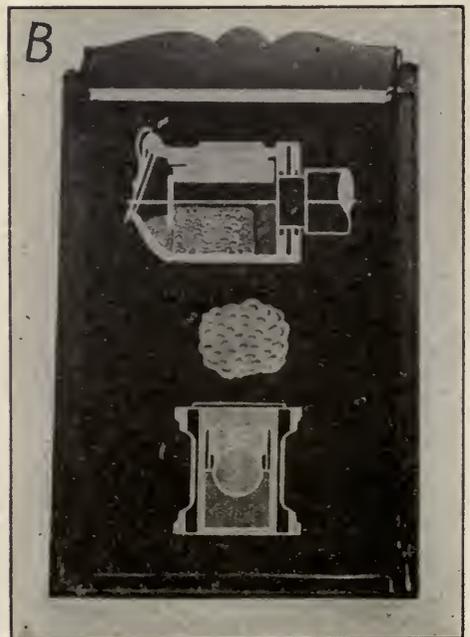

the box properly packed. After the men are instructed as to how to prepare the packing, the explanation leads up to the figures shown in this exhibit.

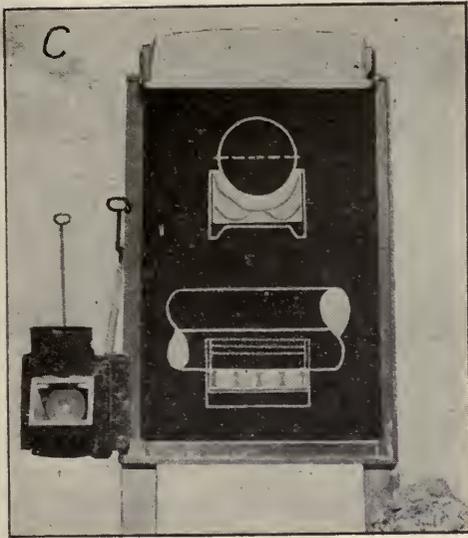

The portion shown in the center is commonly known as the "roll." It is approximately 3 inches in diameter and 12 inches long. It is twisted in the form of a firm roll and is placed at the rear of the collar, as shown at the top of the exhibit, and turned up at both sides of the journal. The roll is generally squeezed moderately dry and packed tightly around the back end of the box, not only to exclude dust that might work in but to prevent oil from working out through the dust-guard openings. To save time on the repair tracks, it is a good idea that rolls be made by the soaking vat attendant and kept in stock until needed.

After the roll is in its position, the space underneath the journal is next to be packed. The packing is placed underneath the journal firmly, but not too tightly, and must not, at any time, be above the center line of the journal, as is shown at the bottom of the exhibit. The idea in packing firmly underneath the journal is to avoid settling away. Loose packing on the side of the journal is encouraged in the belief that it avoids the wiping effect produced when it is pressed too tightly. Attention should also be given to the loose strands or ragged particles, especially on the sides. When a train is moving at a great speed, hitting low places

in the tracks or cross-overs, there will be a tendency toward causing the brass to unseat itself momentarily, and loose particles or ragged edges will no doubt catch underneath the brass, causing what is known as "waste-grab" and resulting in having the box run hot.

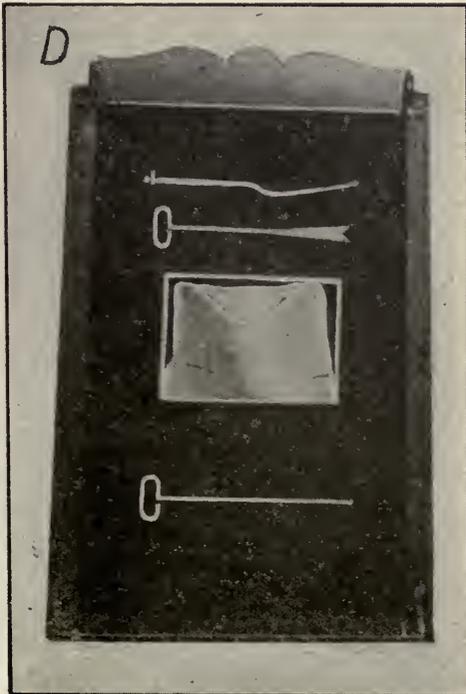

Attention is directed to what is commonly called the "end swab." The top of Exhibit B shows the box properly packed; center, the swab; bottom, a sectional view. Placing the swab is practically the last operation in the proper packing of journal boxes, and it absolutely should not have any connection whatever with the packing underneath or on the side of the journal. The swab lubricates but very little. It is not applied for lubricating purposes. Its prime function is to prevent packing on the sides and underneath the journal from working forward. Were it not for this swab the packing would work forward, leaving a space at the rear of the box without any lubrication whatever, and the box would eventually run hot. This defect could not be detected by ordinary inspection, unless the packing would be worked up by an oiler; however, whenever reworking or repacking the boxes, exercise care not to push the swab back under the journal or on the sides for lubricating purposes. Its duty on the end of the journal is in a way similar to that of the roll at the rear of box; it catches a good deal of grit and cinders that sift through the box lids. In packing the boxes a good packer or good inspector will never allow

the packing or threads of packing to be hanging out in front of the box.

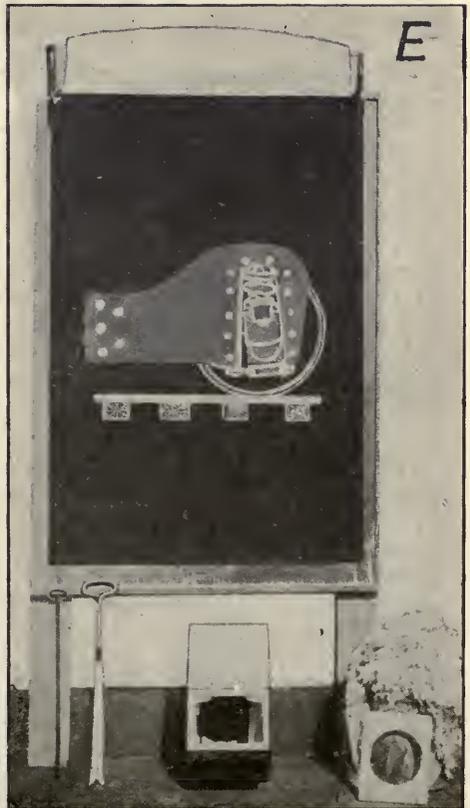

Exhibit C illustrates the correct manner in which engine trucks and driving boxes are packed. The packing used here differs from that used on freight train cars, as a high-grade wool waste is used in all engines, except switch engines, on which cotton waste is used. In the packing of engine trucks and driving boxes, freshly saturated wool waste is always used,

arranged in accordance with the exhibit. Packing is placed in the cellars rather tightly to avoid the settling away, which would occur on account of the jarring effect of the engine in passing over the rail. The packing is placed cross-wise in the cellar in four distinctly formed sections to avoid what we term "waste-grab," similar to that in car journals. With these separated sections, the danger is diminished of having the packing drawn up between the axle and the brass. We always avoid placing packing lengthwise, as it is likely to roll.

Exhibit D shows the standard packing hooks and paddles and the proper manner in which packing tools should be manufactured. In the center of Exhibit D, we endeavor to show a sectional view of a journal "water cracked" due to the use of cold water on the exterior of the journal after it had become heated to a very high degree. This has been explained earlier in this article, and the exhibit is introduced in an effort to impress more strongly on all concerned the danger resulting from the cooling of hot boxes by water and failing to report the effects of emergency treatment.

Exhibit E is used to impress upon the yard-

men, repairmen, etc., the necessity of eliminating excessive lost motion between pedestal faces and boxes. This exhibit has a two-fold purpose: first, to demonstrate more clearly that excessive lost motion between pedestal faces and boxes will cause the lining of journal bearings to crack and break, causing hot boxes; second, to impress upon all concerned the possibility of a break-down as reflected by a binder bolt's being broken, a condition which, if not corrected at once, would result in a serious derailment. Such conditions will cause any fabricated truck to fail sooner or later.

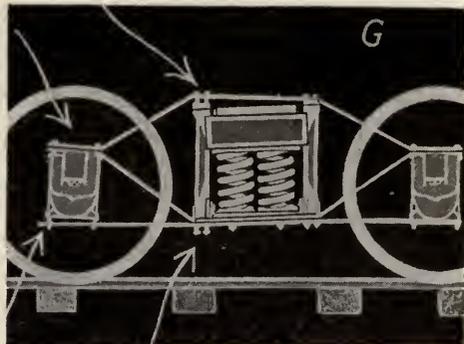

Exhibit F shows the models used for demonstration. The models in question are:

- 1 standard 5x9 journal box,
- 1 standard 5x9 journal bearing,
- 1 standard 5x9 dust guard,
- 1 standard 5x9 journal,
- 1 wedge.

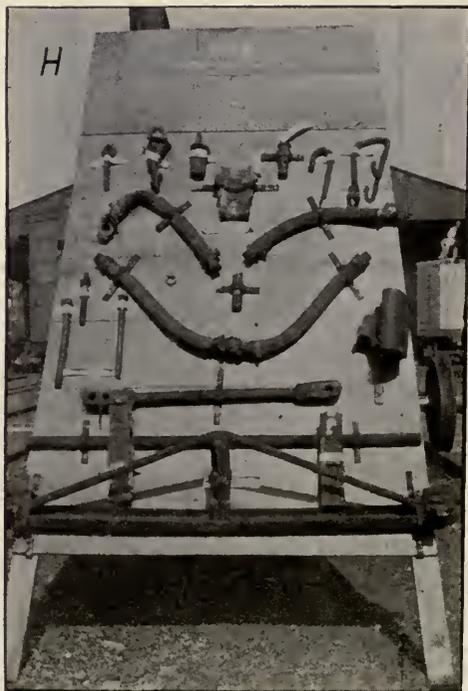

These models are constructed of wood. Practical demonstrations are held with them when the occasion arises. We have one of the men called out at the meeting and ask him, before those assembled, to pack the box as he would in the yard, explaining in detail the operation. Should he err any way, it would be detected. These models were used for demonstration at various meetings conducted by the hot box committee and monthly meetings conducted by the general car foreman and his assistant, and we believe much good has resulted from their use. They are not used to excess but only often enough to keep the interest of the men from waning.

Exhibit G does not come under the head of hot boxes, but is introduced to give further information as to the methods used to educate our men and enlighten them on all things pertaining to good operation in which they are

vitaly concerned. By this exhibit we endeavor to impress upon the men the vital necessity of closer inspection of loose box bolt nuts and worn bolt nuts, also missing nuts. The exhibit shown is a common arch bar truck as it would appear if column bolts or oil box bolts were allowed to run with nuts missing. The arch bars spring and ultimately break, causing delays to trains, damage to equipment and possibility of loss of life. While we have no figures to submit, it is safe to say that a great deal of the money spent on account of damage to equipment for 1921 can be traced directly to cars running with box bolt nuts loose or missing.

Exhibit H is used for educational purposes, explaining to the carmen what they can do by

close inspection to eliminate loss in fuel. On this exhibit we have endeavored to include all parts of a car that break and cause trouble on the line of road, resulting in delay to train and to business and in wasteful use of fuel. This exhibit, we think, carries its own message better than any remarks or explanation we could offer.

### Made Test on Reclaiming Waste

Reclaiming journal box packing is one operation that is carried on extensively, as it saves considerable money for the railroad. To arrive at an idea as to what extent packing is reclaimed, a test was run on ten cars on the New Orleans terminal for the specific purpose of determining what per cent was matured deterioration and what per cent accrued deterioration. The test was as follows:

Ten cars, equivalent to eighty boxes, yielded 973 pounds of journal packing. After being hand picked and shaken out in the soaking vat room, there remained 896 pounds to be reclaimed. In other words, 77 pounds of the original packing pulled had reached the stage of matured deterioration; it consisted of foreign particles, sand, babbit pieces, lumps and other stuff foreign to good lubrication. This loss amounted to 7.9 per cent. The remaining 896 pounds were put through the resoaking and rewashing process in the soaking vat, maintaining approximately 70 to 75 degrees of temperature in oil all the time. After being allowed to soak approximately thirty minutes, the reclaimed packing was allowed to drain thirty-six hours. After this process was completed, there was an additional loss of seventeen pounds; which was attributed to sediment and foreign particles not brought out in the hand picking, but washed out in the resoaking process. This represented a loss of 1.7 per cent.

### 90 Per Cent Could Be Saved

By running this test we found that, in reclaiming the amount of packing we did, there was a grand total of 9.6 per cent attributable to matured deterioration in packing that could not be used and a total of 90.4 per cent accrued deterioration, packing which had never reached the stage of renewing but which could be reclaimed and was reclaimed by the soaking vat process.

As a closing reminder on the elimination of hot boxes, one of the most important features to be considered is periodical examination or inspection of boxes to know that waste or packing is firmly up against the journal, touch-

ing on both sides and at the bottom; however, the fact must not be overlooked that packing, even when in contact with the journal on the sides and bottom, may contain hard substances or have become glazed over by foreign particles. Detecting these things is incident to careful inspection.

In conclusion, I want to bring to your attention the fact that the management of our railroad looks to the shop and yard organization for the detection and suppression of hot boxes. It is in your power to eliminate this source of trouble.

---

### SOME D. & S. C. HISTORY

A \$1 demand note, which once passed as currency in and around Dubuque, Iowa, in the early days of the Dubuque & Sioux City Railroad, now the Illinois Central, was found some years ago in dismantling the old station at Earlville, formerly Nottingham, at one time the western end of the road. With it were found a great many canceled tickets, indicating that Nottingham at one time was the headquarters of a general passenger agent. This impression is confirmed by T. W. Place of Waterloo, Iowa, pensioned master mechanic, who was one of the first engineers on the Dubuque & Sioux City.

"A great many of these notes," writes Mr. Place, "were issued by the Dubuque & Sioux City Railroad for want of a better banking system on or about March 17, 1867. They were signed by James M. McKinley, secretary, and Edward Simpson, president. These notes were used as currency in and about Dubuque and were receivable for freight and passenger charges and also as salaries for the D. & S. C. employes.

"In this connection I remember, when the D. & S. C. was first opened for business, Dubuque to Dyersville, May 11, 1857, Charles B. Stow was appointed general ticket agent with headquarters at Dyersville. When the road was extended to Nottingham, eight miles, Mr. Stow was transferred to this station both as agent and as general ticket agent. This move was made so as to have a traffic man at the western end of the line. This will account for the large number of canceled tickets found in the station attic."

## Has Our Steadiest Commuter Been Found?

*Chicago Suburban Service Started July 21, 1856, and E. P. Buchanan Began Using It in January, 1873*

**T**HE Illinois Central suburban service at Chicago has a patron who has traveled five times around the world on our lines without leaving the city. That is, if Edward P. Buchanan, 4559 Lake Park Avenue, had stretched out his suburban service travels since January, 1873, along the equator east or west, he would now be completing his fifth tour of the world.

Mr. Buchanan is believed to be the most faithful patron that the suburban service ever had. Without getting out of sight of Lake Michigan at Chicago, Mr. Buchanan has traveled close to 122,700 miles as an Illinois Central commuter. This estimate is for forty-nine years of travel at an average of two trips a day for 313 days a year at an average of four miles a trip. This multiplies to 122,696 miles.

### Started Using Service in 1873

Mr. Buchanan is a native of Chicago and has lived in the city all his life. His father came to the city in 1837 from Montreal, Canada. Up to the time of the Chicago fire (1871), the Buchanans lived on the West Side. Mr. Buchanan was in Chicago during the fire. He attended church that night. After he had gone home he saw the light from the fire and walked two miles and a half downtown to Adams

*E. P. Buchanan*

Street and the river, and from that place he watched the fire. He could not get nearer.

In June, 1872, the family moved to the South Side, and Mr. Buchanan believes that it was in January, 1873, that he began using the suburban service. At that time the regular patrons bought quarterly commutation tickets,

*Central Station When Mr. Buchanan Started Using It*

Conductors and engineers, date of entry into service: 1. R. G. Rinearson, August 6, 1882; 2. William Huggett, August 31, 1882; 3. Edward Murphy, December 11, 1882; 4. W. H. Gerry, June 6, 1883; 5. J. E. Zimmerman, December 26, 1883; 6. A. F. Pomeroy,

Suburban Service Veterans

November 10, 1885; 7. John Hall, July 17, 1886; 8. J. J. Moran, October 1, 1886; 9. P. Schlax, August 24, 1888; 10. Charles M. White, January 16, 1890; 11. E. Meritt, June 20, 1893.

which were used much as employes' passes are used now, the holder being entitled to as many rides as he wanted to take between given points until the date of expiration of the ticket. Mr. Buchanan paid \$12 for his first commutation ticket between Randolph Street and Oakland, now 39th street. Later the price of the commutation tickets came down to \$9.75.

**Little Speed in the Old Days**

It was just after the fire that the lagoon between our tracks north of Park Row and Michigan Avenue was filled in. Mr. Buchanan says that much of the refuse from the fire was used for this purpose. The trains then ran on the left-hand side, and the suburban trains used the regular passenger tracks. The running time then was much slower than at present. Mr. Buchanan says that he used to catch a train at what then was the 35th Street station, and if he reached 35th and Cottage Grove, two blocks away, when he could hear the train coming, he knew he could catch it.

Sometimes the Illinois Central commuters would miss their usual train out in the evening and have to take the horse car. It took about an hour, he said, for the Cottage Grove horse car to make the trip from Madison to 39th Street.

Mr. Buchanan tells an interesting story of how he used to go boating in the lagoon formed on the west side of the Illinois Central tracks north of Park Row. He served five years in the First Regiment, Illinois National Guard, from 1874 to 1879. He is a charter member and a past commander of the Veterans Corps, First Regiment.

Mr. Buchanan has no business address, having lately given up his real estate business in the loop.

**A Patron for Thirty-five Years**

W. S. Whiteside of 5417 Cornell Avenue, Chicago, for thirty-five years a patron of our suburban service, recently wrote the following letter to the management:

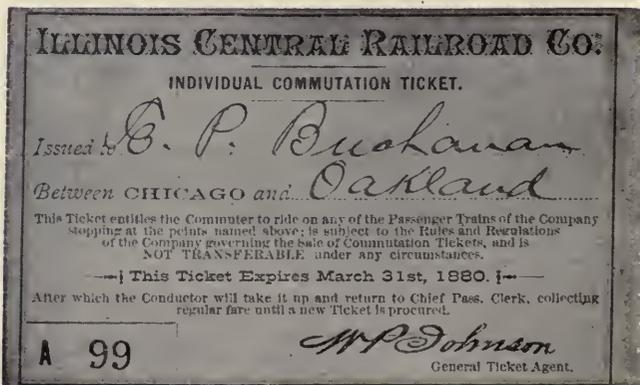

"While I was waiting with

friends for one of your suburban trains a few days ago, the conversation led up to the service given by the employes of this branch of your train service. After I had expressed myself in regard to it, one of my friends said, 'Why not write the Illinois Central just what you have told us?' After thinking the matter over, I have concluded that maybe the company or the employes might be pleased to hear of my experience, which covers about thirty-five years of travel on your suburban trains.

"My recent remark to my friends was that I had never seen a discourtesy or disturbance of any kind caused by the trainmen, not even when they formerly were obliged to go through crowded express trains to punch the tickets, and I must say this at times was a severe test. I want to congratulate the company in having such men who serve the public as they do. I am writing this to express the appreciation of one of your regular patrons, and I feel sure there are many who have had the same experience and would gladly sign this."

**Service Started July 21, 1856**

Officials of the suburban service have been

Two of Mr. Buchanan's Old Tickets

asked a great many times in the past just when the Illinois Central suburban service in Chicago was established. Authentic information on the subject has been hard to obtain, but an old report recently brought to light would indicate conclusively that the service was inaugurated July 21, 1856.

In a letter of that date, written by Benjamin F. Johnson—on the letterhead of "Office of the Illinois Central Railroad Company, No. 48 Michigan Avenue, Chicago"—to S. A. Perkins, treasurer of the company, the following mention of the fact appears:

"The Hyde Park Special Train was put on this morning in accordance with programme hereto attached. First train had 'nary' passenger up or down. 'But good beginning makes bad ending,' and we look to the *vice versa* for salvation."

In another place Mr. Johnson says: "I enclose new time table, embracing 'Hyde Park Special' and all others running out of 'The Great Central Depot.' For an hour or two each morning and evening there is a great

hurrying up of trains on the pile tracks in front of Michigan Avenue."

### Mentions Some Early Officials

Mr. Johnson mentions the construction of our charter lines, in progress at that time; refers to some personal matters, bringing in the names of President Osborne, General Superintendent Done, Chief Engineer Mason and Land Commissioner Wilson of the Illinois Central, as well as Superintendent Rice of the Michigan Central; tells of the recent business of the Cairo train (the longest run on the system at that time), and closes by describing the cool weather.

"The first fourteen miles of the Illinois Central Railroad in Chicago were put into operation May 24, 1852, and through train service, at that time established, was extended as new sections of the line were completed," writes A. Bernard, superintendent of the suburban passenger service.

"This, coupled with the information contained in the advertisement in a Chicago paper and the report of the first day's operation, would lead one to believe that July 21, 1856, was the beginning of the present great Illinois Central suburban train service.

### Optimistic Predictions Fulfilled

"It is interesting to note the optimistic prediction made by Mr. Johnson about the new service starting with 'nary passenger up or down' and 'a good beginning makes a bad ending.' This showed a well-founded faith in the future growth of the sort of business sought.

"The traffic has grown from nothing at its inception to more than 80,000 passengers a day

## Wrung From Us

Trains on two of the Illinois Central suburban tracks were wrecked simultaneously at the height of the rush hour Wednesday evening.

Two things are remarkable. One is that this was the first fatal accident involving a passenger in the Illinois Central suburban traffic in fifty years. The other is that within half an hour from the time of the accident passengers were being steadily moved southward again by the thousand.

The Illinois Central is an eyesore on the lake front; it hung out against electrification in a fashion that made its enemies by the million; its suburban cars are some of them antediluvian; its suburban engines are a joke; and its accommodations at Randolph Street remind the visitor from Pana or Sandwich irresistibly of the arrangements in his home village for loading hogs.

Nevertheless, it moves the largest steam-carried suburban traffic in the world more rapidly and more safely than any other road we know, and it handles emergencies in a fashion that extorts the admiration of the very patrons who call it uncivilized in its appointments and stingy in its expenditures. And we offer this well merited tribute without prejudice to our right to use those adjectives in the future if we choose.—Chicago *Herald and Examiner*, December 16, 1921.

in the sixty-six years of the operation of the suburban train service. It will also be observed the train service grew from 8 trains a day when started to 348 trains at present."

## Dies After 37 Years of Faithful Service

Joseph A. Winkler, machine shop foreman at Centralia, Ill., was born in Centralia, May 22, 1868, and died in Centralia, February 28, 1922, at the age of 54 years. He entered service with the Illinois Central February 7, 1885, as machinist apprentice and was promoted to machinist May 22, 1889. He served as machinist, roundhouse foreman, erecting shop foreman, and machine shop foreman. He was appointed machine shop foreman May 1, 1913, and held the position until his death.

With the exception of a short time at Mounds, his entire thirty-seven years' service was with the Centralia shops.

Mr. Winkler's judgment and advice were held in the highest regard by the entire or-

ganization. His outstanding characteristics were his patience, cheerful disposition and complete knowledge of his work. It is also worthy of note that he was never too busy to explain in detail questions asked by anyone, be it apprentice, clerk or master mechanic. His son, Emory E. Winkler, is employed as a machinist at Centralia.

# C. P. J. Mooney, Prophet of Diversification

*As the Editor of the Memphis (Tenn.) Commercial Appeal,  
He Wields a Great Influence for Good*

By J. H. CURTIS

LET'S introduce C. P. J. Mooney, editor of *The Commercial Appeal*, Memphis, Tenn., who came to Memphis in 1890 as a reporter on another publication and to *The Commercial Appeal* in 1896 as news editor. His progressiveness and judgment of news, the kind the reading public wants, attracted the attention of Frank Munsey of New York, who engaged him as news editor of one of his papers. Then Mr. Mooney went to William R. Hearst as a managing editor and was shifted to Chicago, after being with the *New York Journal*. He was managing editor of the *Chicago American* several years, and then returned to *The Commercial Appeal* as its editor. Mr. Mooney is regarded as one of the most successful newspaper men in the country.

"Funny thing how I happened to return South," said Mr. Mooney. "I was at a small station on the Illinois Central about fifteen miles from Chicago when I noticed several freight trains moving south. They were loaded with meat, farm implements, flour and other provisions. I remarked about it to an official of the road. He said what was moving in those trains was small tonnage compared to that moving via St. Louis into the South.

## A Prophet of Diversification

"Right there I resolved to return to the South and start a campaign to educate farmers to grow something besides cotton."

Mr. Mooney's work in forcing diversification in the South is known to be the first general

effort of that sort by any individual. He has made good his remark; he glories in a statement that the region from Fulton, Ky., to New Orleans will become the greatest diversification section in the United States, and he thinks the Illinois Central System will help to bring this about.

One of Mr. Mooney's most intense desires is to see a time when the railroads will still further speed up freight transportation. "I want to see all freight trains moved at a speed not less than 40 miles an hour," he said.

"I want to—and I will in a few years—see truck and berry farms in this country along the

C. P. J. Mooney

Illinois Central System from Fulton, Ky., to New Orleans. We have the climate. That much is a settled fact. With the splendid double-track line of the Illinois Central System penetrating the heart of the richest country in the world, giving to the people living in it a direct communication north and south, the time is not far off when this is going to be the greatest truck farming section in the world."

That is a pretty strong assertion, but Mr. Mooney made it, and to know him personally is to know he does not often make such strong assertions unless he bases them on a sound foundation.

#### Proud of Illinois Central System

Mr. Mooney is keen on the subject of good transportation. He believes freight rates are a little too high, but he believes officials of the railroads will themselves better this condition. He believes in close relationship between the railroads and the farmer, because, he says, without a dependable transportation system farmers can find no market for their products. "And right here," continued Mr. Mooney, pointing his finger directly and in a meaning way to the interviewer, "I want to brag a little about the great Illinois Central System. It is doing a wonderful work in the South, that part of it through which its tracks extend. It is a great system of railroad. Why, with a connection of only one other railway line, products grown on Southern farms can be transported to all parts of the United States. It is giving to the shippers a quick service, and quick service is going to play a very important part in our country from this day on."

Mr. Mooney is alive to every situation facing the farmers today. He has for several years hammered at them to grow less cotton, more cattle and hogs, more corn, oats, poultry, hay and other crops, that will build up so much of the run-down soil in certain sections of the South. He has advocated, and is now advocating, more dairying. He wants to see the South become the leading dairy section in the world. He is strong in his belief that it will.

"The whole development of the country is between the railroads and the shipper at one end and the seller at the other," is one way he puts it. He says the railroad is the backbone of farming. But to perfect the work, there must be a quickness of service on the part of the railroad and a fairness to the farmers on the part of the seller.

#### He Is a Native of Kentucky

Charles Patrick Joseph Mooney was born

in Bullitt County, Kentucky, September 15, 1865. "I came near being a railway man," said Mr. Mooney, as a smile played about his face. "When a boy, I learned telegraphing at Bardstown Junction, Ky., and worked a while for the Louisville & Nashville Railroad."

But his early railway experience was cut short when he was sent to college. There he remained five years. He came out with big ideas of a railway future; so he went to Pine Bluff, Ark., and began working for the Cotton Belt Railroad.

About that time, however, he met an editor of one of the Pine Bluff papers and was hired. "That is the reason I am not today president of the Illinois Central, the Burlington, the Southern, the Dallas, Memphis & Gulf or, I might add, the New York Central Lines," remarked Mr. Mooney.

Mr. Mooney is always interested in railroads. He watches their progress closely. Very often, when he is alone in his editorial chamber with nothing in particular to do, if visitors happen in suddenly they will find him reading the *Railway Guide*. He studies maps of all systems. He figures how connections might be built and how the transportation systems of the country might be improved.

"I believe I can take a pencil and a piece of paper and draw a fairly accurate map of every railway line in the United States," he said, laying aside the *Railway Guide* when interrupted by the interviewer.

#### Made Bridge at Memphis Possible

There is one great enterprise at Memphis for which the people of the Mississippi Valley must thank Mr. Mooney. It is the construction of the Harahan Bridge from Arkansas to Memphis, spanning the great Mississippi River. Mr. Mooney does not brag about this. His work is kept in the background for that of many others who have been prominently connected with it.

When former President Mudge of the Rock Island had given up the idea of constructing this bridge, Mr. Mooney got busy. He planned. He figured, talked, wrote about it and finally arrived at a conclusion which he telegraphed to Mr. Mudge. That single telegram closed a deal, and the bridge was built. It is double tracked for the railroads using it, with walkways and wagon-ways on each side.

People in the Southland believe in Mr. Mooney because he is accurate in his writings. They know he is not going to advocate something that will not be for their betterment. *The Commercial Appeal* is their daily paper,

and its contents are the preachings of some of the best people in the land, some of the oldest families.

To mention *The Commercial Appeal* and not say something of the publications it absorbed would not be a complete story.

The *Daily Appeal* was established at Memphis in 1840. In the Mexican War there was an "Appeal Battery" that went forward and fought from the start to the end. In the Civil War the paper was printed in Memphis until the city was captured by Federal troops and General Sherman was sent there to handle the military situation. Then the paper moved to other and safer quarters. At times it followed the Confederate Army from section

to section, always giving the Southern people the news of the times. When peace was declared, it returned to Memphis.

In 1857 the *Avalanch* began its career. In 1889 the *Commercial* was established, and in 1894 it purchased the *Appeal-Avalanch*, publications which had consolidated. Owners of the *Commercial* dropped the *Avalanch*.

*The Commercial Appeal's* identification with the upbuilding of the South is well known. It has stood—and now stands—for everything that is good not only for the South but for the country, and Mr. Mooney's broad ideas, his splendid, far-reaching assertions in the daily issues of his paper are read by more than 100,000 persons every day in the year.

## T. E. Hill Officially a Kentucky Colonel

Superintendent T. E. Hill of the Kentucky division is now a colonel—a full-fledged Kentucky colonel—and he has a commission from Governor Edwin P. Morrow of Kentucky to prove it. Governor Morrow's letter of February 27 to Colonel Hill was felicitously phrased as follows:

"It gives me very great pleasure to send you herewith a commission as colonel on my staff.

"This commission is sent in recognition of your faith in, your love for and your service to the Commonwealth of Kentucky. It is also sent as a token of my personal esteem and because I know that you possess in full and rounded measure the genuine quali-

ties, bigness of heart, breadth of thought and kindness of soul which characterized the old and real Kentucky colonel. You have always been a Kentucky colonel. This commission merely confirms the title."

In appreciation of the service accorded by the Illinois Central, under Colonel Hill's direction, to the governor's party and the members of the legislature on the trip to Dawson Springs for the dedication of the new veterans' hospital there February 22, Governor Morrow wrote again to Colonel Hill as follows:

"I want to thank you on behalf of Mrs. Morrow and myself and our friends for the unsurpassed and unsurpassable kindness, courtesy and hospitality shown to us on our trip from Frankfort to Dawson Springs and return on board your office car. Every want was anticipated; every attention was shown us. From soup to nuts and back again, everything was perfect, and, above all else, there was a genuineness of hospitality which made us at home.

"I also want to thank you on behalf of the members of the General Assembly for the care and attention shown, the movements of the train over the Illinois Central, the courtesy of employees and the efficiency of transporta-

tion, train management, etc. I am certain that the spirit of the Illinois Central was made manifest to all on board the special train.

"I will be most happy if you will convey our appreciation to the Illinois Central management."

Fred A. Vaughan, secretary of state, likewise took occasion to express his appreciation of the courtesies shown on the trip.

Superintendent Hill was born in Lynchburg, Va., and was graduated from the Virginia Military Institute in 1892. He entered the employ of the Illinois Central as a track apprentice on the Amboy division in April, 1897. His service since then has been as follows: Promoted to chairman, St. Louis division, September, 1897; rodman, Tennessee division, September, 1898; assistant engineer, construction department, September, 1899; transferred to the Louisiana division as assistant engineer on second-track construction, July, 1900; acting roadmaster, Tennessee division, June, 1903; roadmaster, October, 1903; transferred to Louisiana division, June, 1906; superintendent Louisiana division, June, 1907; authority extended over New Orleans terminal, May, 1910; transferred to Kentucky division as superintendent, November, 1917.

**MAKES HIS CROSSING ACCIDENT-PROOF**

The accompanying photograph shows John Towsley, a veteran flagman on the busy crossing of the Illinois Central Belt Line at Mullen avenue, Waterloo, Iowa. Mr. Towsley estimates that 3,000 automobiles cross this Mullen avenue bridge every ten hours. Up to date Mr. Towsley has not had an accident on this busy crossing.

# The Recent High Ice Water at Dixon, Ill.

## Flood Was Not So Serious As at First Reported, but It Made Some Effective Pictures for Us and Others

By C. G. SHEPHERD,  
Agent, Dixon, Ill.

FOR the benefit of our readers, who have no doubt seen previous accounts of the recent high water at Dixon, Ill., through the daily newspapers, I am submitting a few views of the river and its condition.

Rock River flows from the north until about the city limits, where it makes a sharp turn to the west, passing through the city directly west for about one mile, where it again curves to the southwest, passing under the Chicago & Northwestern Railroad bridge at a point seven miles west of Dixon, near Nelson, Ill.

### Broken Ice Caused Jams

The river at this point was frozen over from shore to shore with about 14-inch ice. Heavy rains in the northern part of the state, in and around Rockford, Freeport and Pecatonica, caused very high water at those points, which had to pass out through this district. It moved down so rapidly that great fields of ice rushed down the river to Dixon, where it would break into smaller blocks in passing over the dam, two hundred feet north of the city wagon bridge.

This move of the solid fields of ice, dropping off in large pieces, caused the flow of ice to become jammed between the dam and the wagon bridge. The ice in this gorge stood up on edge and piled ten feet above the point of high water level.

The danger did not begin to show itself until

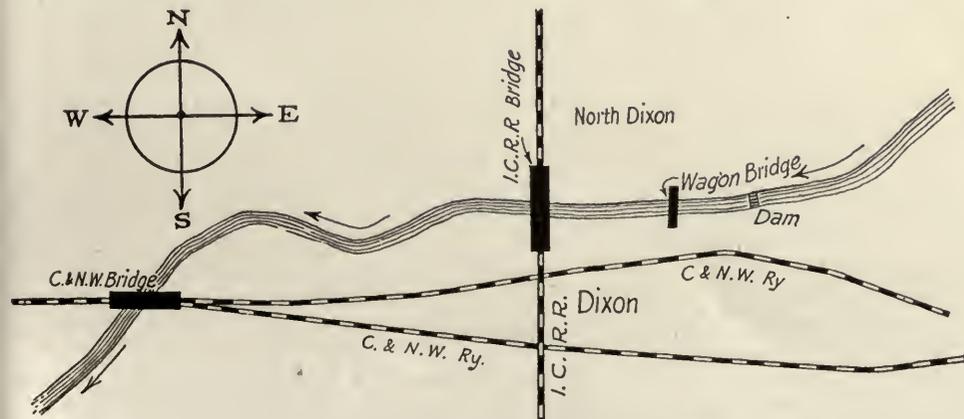

the river became gorged at Sterling, Ill., fifteen miles west, which then caused another gorge at Nelson, where the C. & N. W. bridge is located. These jams held back all the flow of ice between Sterling and Dixon, forcing the water over the banks of the river at many points in the city of Dixon, flooding the gas and electric plant, shutting off lights and fuel. However, light was provided by connecting up with the Joliet power.

Many homes near the river banks were flooded on the first floors, basements were filled with water, and several families had to be taken from their homes in small boats. The Illinois Central industrial tracks in the downtown district were under one foot of water at two different locations, a condition which continued for two days.

### Endangered Illinois Central Bridge

The water reached to within three feet of the top of the piers of the new Illinois Central bridge, which is about one-half mile west of the city wagon bridge. The ice gorge was within three feet of the steel girders, but in every instance, when the ice would move west of the bridge, the ice gorge holding on the upstream side would immediately move out until again held up farther down.

Owing to the construction of the bridge piers, which are built in the shape of a flatiron, there was no time during the high water that this bridge would have interfered with the free movement of the ice. The bridge always

Where the High Water Menaced Dixon

*Looking west from the south approach of the Illinois Central bridge at Dixon, showing Illinois Northern Utilities plant.*

proved ready to release the jam at any time the gorge would let loose west of Dixon.

Several hundred pounds of dynamite were used west of Dixon and near the Nelson bridge in an effort to get the jam of ice moving out, but this only blew out great holes in the ice gorge, which would fill up at once, and the procedure finally had to be abandoned.

#### How Rescue Scenes Are Made

Picture machine men came out to Dixon from Chicago with the expectation of getting motion pictures of a great many heroic rescues, floating bridges, wrecked houses and what all. They got some of this, too, but to make sure of it they brought along a young woman who would walk in through the front door, pass upstairs to a back window, throw out a rope and climb down to the heroes who had waded to the rear of the house to carry her out. In other cases they would load up an old motor car with all it would carry, push it off a grade where it might go out well into the back waters, then haul it forth while the picture machine did the rest.

All the publicity Dixon has received from this misfortune would lead one to believe it to be located in the lowlands and subject to periodical dangers of flood, while in fact it is on rolling land, high and dry, and no city in the state has better drainage. Some persons simply wanted to live too near the water's edge; others

took such locations owing to the scarcity of houses in the city, and we have not as yet seen a citizen who has expressed any desire of leaving the place on account of the recent flood.

We still have the best town in Northern Illinois, and one where you will always find the factories running full force, even while others are idle.

#### FOUND A BROKEN RAIL

Superintendent L. E. McCabe of the Minnesota division on March 9 wrote the following letter to Andrew Rowe, a rural mail carrier at Warren, Ill.:

"It has come to my attention today that at 7:05 this morning you noticed a broken rail in the road crossing just east of the depot at Warren, Ill. I notice you immediately notified Operator Parkins, who in turn stopped two of our important freight trains then coming at Warren and called out section men, who made immediate repairs to the track.

"Your interest and prompt action in this case no doubt removed a serious hazard of accident, and I cannot refrain from writing you at this time, expressing the appreciation of the management of this railroad in your prompt action tending toward our welfare.

"In closing I want personally to thank you."

About eight inches of rail were broken out of the track. The trains stopped were first and second No. 52.

from North Dixit*

# Let the Railroads Adopt the Waterways

## Co-operation, Not Competition, Is Greatest Need Just Now in Providing Our National Transportation

The following article is reprinted by permission from *The Country Gentleman* for March 11:

By C. H. MARKHAM,

President, Illinois Central System

**N**O SURVEY of our waterway problem is significant unless taken from a national viewpoint. There has been too much short-sightedness, sectionalism, partisan bias in the consideration we have given this subject in the past. Railway men have not been free from bias; many have opposed inland waterway development in the belief that the railroads would be injured, not realizing that the waterways, under intelligent development, might prove railway adjuncts of highest importance. Large appropriations of public funds, on the other hand, with consequent haphazard waterway development here and there over the country, have satisfied certain parts of the country for the time being, but have not contributed their proper share, in comparison with the investment outlay, toward a solution of our great national problem of cheap and adequate transportation.

The existence and prosperity of railroads, waterways, motor-truck highways and air lanes are not ends in themselves. Neither is the temporary prosperity of any part of the country, at the expense of any other part, an end in itself. Therefore, in speaking of waterway development from the standpoint of a railway man, I must make clear the fact that my standpoint is first that of an American citizen. I want to see all our means of transportation properly and justly utilized, to the end that the country as a whole will find itself able to move its citizenry and its goods when and where it wants and at a reasonable price.

The railroad has definitely supplanted the inland waterway as the principal means of transportation for the interior of the United States. The change began almost a century ago; and as soon as the steam railroad proved its practicability the day of waterway supremacy was over. It is not beyond the range of imagination that, with the development of the motor truck and the airplane, the day of the

railroad will pass, but that is a far look into the future.

The fact remains that the railroad is still, beyond any dispute, our chief reliance for transportation within the United States. It is the foundation upon which any unified and effective system of transportation must be built. My understanding of the essential stability of the railroads makes it hard for me to accept patiently the arguments of those who would build up this or that competing means of transportation in the hope of impairing the railroads, when it would be so much more sensible—with our national objective of service in mind—to develop these means in their proper places as servants of and assistants to the railroads. This would be building our national transportation system on the foundation that is already laid—an efficient and rational way of doing business.

### Should Have a Fair Trial

Permanent expenditures for waterway development should be made only when the use of waterways has been proved feasible. I firmly believe in giving a fair trial to waterway experiments, such as the one now being made by the Government on the Mississippi and Warrior rivers. If the experiments prove that these inland waterways can feasibly be used as a part of our whole transportation scheme, then I believe that the railroads ought to be permitted by law to operate lines of boats on the waterways in conjunction with their rail services. If the experiments prove successful, I sincerely hope that the American people will have the vision to insert this agency in its proper place in the whole scheme of transportation.

Under existing laws, however, such a union would not be possible, and the probable alternative would be for the Government to intrust the results of its experiments, to private enterprise unconnected with the railroads. The existing law would thus force destructively competitive service in transportation, which would be a positive falling away from the high standard of public policy evidenced in the enactment of the Transportation Act of 1920. Moreover, besides being contradictory in spirit, such a

waterway policy would force such an operation of this act as to place a burden upon the vast majority of the nation's shippers.

One of the products of the war was a new point of view toward the railway problem—toward the whole transportation problem, it is to be hoped, when our thoughts broaden to that. The first tangible evidence of that new point of view was the Transportation Act. This act recognized for almost the first time the duty to the public to allow the railroads to earn adequate returns through which to provide adequate facilities. It directed the Interstate Commerce Commission to fix rates which would provide a fair and reasonable return on the aggregate valuation—determined by the Interstate Commerce Commission—of honestly, efficiently and economically managed railroads.

### The Giant and the Warrior

Under this law, if waterway development were encouraged to an extent that would take freight business from certain lines of railroad, the Interstate Commerce Commission would have to set the rates on the remaining business high enough to make up for this loss, which would be a discrimination against shippers located exclusively upon the railroads involved.

I must warn here, however, against too much optimism in accepting what seem to be favorable reports of the progress of waterway experiments. All the items of operation—interest, depreciation, cost of improvements, and the like—will have to be met by the waterway carriers, as they are met by the railroads, when the protecting hand of the Government is withdrawn.

It must be remembered that the people of the United States, of their own free will and upon their own initiative, have largely removed from railway operation in this country the principle by which the railroads put the waterways out of business. It is the old, old principle—as old as life itself—of the survival of the fittest. As public servants, the railroads have found themselves bound to deliver service and bound in the conditions of its delivery and in the rates they must charge for it, as well as in the wages they must pay. The Transportation Act, as if to make up to some extent for these conditions, recognizes the public's duty to protect the railroads.

If no injury to the people is to be done, the waterways, where found practicable, must be linked to the railroads and included in the provisions of some act of regulation and protection such as the Transportation Act. If not,

we shall have the spectacle of a giant, fettered hand and foot, in battle with an active young warrior whose weapons are supplied by the same agency that bound the giant. It might prove interesting to watch the young fellow whittle the big man down to his size, but it would scarcely be called fair play; and, most important of all, it would not be efficacious in moving the burden that the two should be carrying in common.

As a matter of history it should be recalled that since primitive times man has depended largely upon water transportation for his means of commerce. Some nations depend upon it greatly even today. Recent comment upon a public speech delivered in the new Arabic kingdom in Mesopotamia is a reminder that in such a land thoughts center around rivers. It was not unnatural for the new king to speak of his people as the sons of the Tigris and the Euphrates and to designate British business men as the sons of the Thames. Great cities always have grown up on seashore, lake shore or river side, because water transportation was at hand.

### A Marvel of Development

Until a century ago there was no transportation superior to that furnished by water. Then came the railroads. Everybody knows of the marvels wrought by transportation in the last hundred years. The railroads have made possible the development of the entire United States from the scattered colonies on the Atlantic seaboard to a compact unit of forty-eight states with 110,000,000 inhabitants. Reliance upon waterways alone could never have accomplished that.

The very fact that the cities had sprung up along the waterways, however, proved the downfall of water traffic when railroads were developed. Seeking business, the railroads for the most part found themselves compelled to build from city to city, and consequently to come in direct competition with water-borne traffic. The result was not long in doubt. As the speed and serviceability of rail traffic developed, the waterways gradually lost their business. The public was won over to the new method of transportation, and the railroads took the public's favor permanently by building into the interior, where the waterways did not reach.

One of the first railroads built in this country was the road from Charleston to Hamburg, South Carolina. It was built in the early thirties to enable the merchants of Charleston, on the seacoast, to share with those of Savannah the business carried on the Savannah River.

This line to Hamburg tapped the business at the highest point of navigation and consequently diverted some business from Savannah. In order better to compete, the citizens of Savannah organized the Central of Georgia Railroad and Banking Company—now a part of the Illinois Central System—and constructed a railroad to Augusta, across the river from Hamburg. This was the beginning of railway development in the Southeast. In order to make the line pay the Georgians had to build to all the other river towns and win their traffic.

### The Survival of the Fittest

It was much the same way with the Yazoo and Mississippi Valley Railroad Company, also now a part of the Illinois Central System. When it was first laid out in that region which parallels the Mississippi River south of Memphis, the country was unprotected by levees, and the principal business points were a few isolated river towns, among them Greenville, Friars Point and Rosedale, Mississippi, already served by steamboat. As most of the traffic was to be found at those towns—and not enough for both railroad and steamboat—the Yazoo and Mississippi Valley had to set rates and provide service to get the business. This it did, and the river competition was overcome.

In other cases canals have suffered as have the rivers. In no case has direct competition been long continued. In the fight for survival one has taken all the traffic and the other has given up. Usually the defeated carrier has been the one on the water, and the captain has had to move his boat to some other vicinity. This ready change of locality was something the railroads could not accomplish, and perhaps that is one reason why they almost invariably won the traffic. They had to have it to live, and they had to do business where they had laid down their tracks.

But the inland waterway, although defeated in most cases by the railroad, has proved its value for certain services in certain parts of the country, and in some cases the railroads have not even attempted to compete. Take, for example, the route by which coal from the Ohio and West Virginia fields reaches the Northwest. The advantages of water transportation on the Great Lakes for bulky commodities moving in large volume are so great that the natural route is by rail from the mines to Lake Erie and thence by boat to the head of the lakes. The boats return loaded with ore.

Only a small part of the coal going to the Northwest moves entirely by rail. In conse-

quence, if conditions arise which interfere with the movement of sufficient coal by water, it is practically impossible to get the coal to the Northwest. The same condition was true, prior to the war, of the West Virginia coal which went to New England by way of the coast ports. When many of the coastwise steamers were transferred to transoceanic traffic during the war, it was found difficult to get coal from West Virginia to New England.

The fact, as illustrated, that one means of transportation has driven out the other, wherever direct competition has been practiced, is a weakness in our national transportation system which must be remedied if we are to have the requisite factor of efficiency. But that the two means must forcibly be maintained in competitive service is not the solution as I understand it.

To a considerable extent the railroads and the waterways are supplemental, but the inherent weaknesses of inland waterway traffic are such that the waterways are dependent upon the railroads much oftener than the railroads are dependent upon them. Climatic conditions render impossible inland waterway traffic the year round in the northern half of the United States, where considerably more than half the population resides. For a considerable portion of the year shippers who are patrons of the waterways must fall back on the railroads. This means that the waterways take away from the railroads in the summer much badly needed traffic and throw on the shoulders of the railroads in the winter an excess of traffic just at the time that rail traffic is heaviest. As a particularly forceful example, consider the fact that the parts of the country where coal is most needed cannot obtain it by waterway in the winter when it is most needed.

### A Friendly Alliance

For the good of the nation there is only one solution of the waterway problem. If the inland waterways prove practicable, they must come into friendly alliance with the already existing means of transportation. They must assume their place—and it is a minor place—subsidiary to the railroads in the great national scheme of transportation. Our country is no longer laid out for successful waterway competition, much less supremacy. If transportation facilities are not to be weakened, they must be co-ordinated, and that, in the nature of things, will be when the waterways are enlisted as auxiliaries of the railroads.

Unfortunately, as I said, the law at present

forbids the railroads to enter this particular field of transportation. Legislative restrictions are such that, although a railroad may have all the motor trucks it needs to facilitate its service, it cannot have boats of its own to extend its traffic upon waterways.

I am unable to see any difference in principle between permitting railroads to own and operate boats upon inland waterways and permitting them to own and operate motor trucks upon highways or streets. If the same company owned both a rail and a water line there would be no cutthroat competition between them. The railroad would be able to develop the service of its boat line to whatever extent experience might show was necessary to help its railway lines carry business in seasons of heavy traffic, without developing either rail or water facilities to such an extent as to result in any large economic waste.

#### Co-operation—Not Competition

When the Transportation Act is amended or succeeded by another act to include waterways, I look for a double interpretation of a power at present invested in the Interstate Commerce Commission. That power is the one which requires railroads, before building any new line

or extending any old line, to obtain from the commission a certificate that the convenience or necessity of the public calls for the construction of that line.

That power would be exercised at present, I feel sure, if a railroad planned to build a line in territory already successfully served by waterways. Why, then, should it not be extended to cover waterway developments in territory already successfully served by railroads?

Since the convenience and necessity of the public are now being consulted, I am confident that transportation developments in the future will not confine themselves to drastic regulation of any one kind of carrier.

The railway system I represent happens to lie in the Missouri, Ohio and Mississippi valleys. It has done its share, in the old days of fair but unfettered competition, to knock the bottom out of competitive service on those rivers. If allowed to compete freely on a basis of service and rates, I am confident we could do it again. But, under present conditions, if a successful resurrection is to be made of boat and barge lines on those rivers, my company feels that it will welcome waterway *co-operation*—not *competition*—under the terms I have outlined.

## Shows Value of Organized Safety Work

An interesting story about what the Illinois Central System is doing for the promotion of safety was told in an address delivered by Master Mechanic G. C. Christy at a conference of parents and teachers in Vicksburg March 3.

In order to show what the New Orleans division has accomplished in that direction, Mr. Christy pointed out that, with 3,000 employes, there were twenty-five personal injuries in December, 1919, twenty-four in December, 1920, and only eleven slight injuries in December, 1921.

"From these figures," he said, "you will readily observe to what extent we have progressed, and note that the result is the work of an efficient safety organization supplemented by the whole-hearted co-operation of our 60,000 employes. Our motto is 'The best safety device known is a careful man.'"

In reference to Vicksburg, Mr. Christy said:

"Vicksburg is a growing city, and with its advantages and facilities there is no reason why we should not continue to grow. Natur-

ally, this growth means more people and consequently more children for our schools, and you will agree that it is logical that with our growth the hazard of accident will likewise grow unless active steps are taken to curb it.

"In many cities the size of Vicksburg, the school board, or board of education, has taken up the question of safety first, and appropriately worded signs have been placed on all streets in the vicinity of each school building, thereby establishing what are called 'school zones.' Aided by fitting legislation or city ordinances, properly enforced, this does much toward restricting the speed of vehicles, making the crossings safe for the children, and in this way eliminating a serious hazard. Again, the general enforcement of speed restrictions within the city limits is also to be considered a move in the right direction.

"As a suggestion, and in conclusion, let me say that we should have a safety council in our city, and that it should be organized before we have a serious accident. I feel that we should use the prevention rather than the cure."

## Home After Four Years' Overseas Service

*E. W. Moales, Son of E. M. Moales, O. R. C. Chairman, Was in Army and Later With U. S. Shipping Board*

**L**IUTENANT E. W. MOALES, son of the general chairman of the Order of Railway Conductors for the Illinois Central lines, recently returned home after four and a half years in France, Spain and Gibraltar. He was an officer in the American army in France for two years, and after being demobilized he spent two years in the service of the United States Shipping Board.

It was characteristic of Eddie Junior that he planned his return home as a complete surprise to his folks. They thought he was still in Gibraltar when, on the 13th of February, he arrived in New Orleans, hunted up the family's new address in the telephone directory, went out to the house and rang the doorbell. His mother went to the door, expecting to greet a caller. In a moment her husband and daughter heard her cry, joyously, "Eddie's home!"

### May Enter Business in Europe

Lieutenant Moales is spending a few weeks in New Orleans renewing old acquaintances before settling down for the grind of work again. He is enthusiastic over business possibilities in western Europe, however, and one of the commercial ventures he has under consideration would take him back to the countries he recently left. Quite naturally, however, that doesn't meet with an enthusiastic reception from his mother, and it is possible that he may decide to remain in this country.

Eddie Junior's father, E. M. Moales, has been with the Illinois Central nearly forty years, and Eddie Junior's first job, naturally, was with the Illinois Central System. He was a youngster when he went to work as a file clerk in Superintendent O. M. Dunn's office at New Orleans. Later the New Orleans terminal and Louisiana divisions were consolidated, with headquarters at New Orleans, and Superintendent T. E. Hill, now superintendent at Louisville, was moved to New Orleans from

McComb. J. L. Beven, now assistant to the senior vice-president, was chief clerk to Superintendent Hill, and Eddie was his file clerk. About fifteen years ago Eddie thought he saw greener pastures with the Louisville & Nashville, and he worked as a passenger agent in the L. & N. depot ticket office about eight years. After that, however, he went back to the Illinois Central, and he was in our New Orleans city ticket office two years. He was there when the United States declared war.

### Went Overseas in November, 1917

Two months after the declaration of war Eddie went to work as a civilian employe under Colonel Dulin, constructing quartermaster at Camp McClellan. Colonel Dulin, by the way, is a son of Philip A. Dulin, who for many years was agent for the Illinois Central at Aberdeen, Miss. In September, 1917, Eddie was made a second lieutenant in the transportation corps, and in November of that year he went overseas with a stevedore company, landing at St. Nazaire. Shortly after his arrival he volunteered for the highly unpopular Army Transport Service—unpopular because the officers would not see service at the front. However, it was promised that officers volunteering for this service would later be given their opportunity at the front, and this doubtless influenced Lieutenant Moales in offering to do

*E. M. Moales and E. W. Moales*

*Lieutenant E. W. Moales*

his share back of the lines. He was placed in charge of the checking department, having under his jurisdiction about three hundred clerks from all walks of life, many of whom never had been in an office before.

According to Lieutenant-Colonel W. S. Olsen, general superintendent of the Army Transport Service, Lieutenant Moales "at once started organizing this department and in about three weeks had it running efficiently."

He was later promoted to chief disposition and export officer, handling the disposition of all supplies and cargo received by the Americans in the port of St. Nazaire, and still later he was promoted to the position of paymaster for the Army Transport Service, handling the payroll of about 5,000 civilian employees. It was while he was at St. Nazaire that he was promoted to first lieutenant. Here is another testimonial from Lieutenant-Colonel Olsen, it being an extract from a letter concerning Lieutenant Moales:

#### **His Work Highly Praised**

"It was only through the work of this officer that it was possible for the A. T. S. to close this port with a clean set of records and free from the inspections of inspector generals.

"His services and conduct while here were excellent."

Lieutenant Moales was demobilized October

27, 1919, and on November 1 he went with the United States Shipping Board at Paris. His release was requested at that time in order that he might join the organization of the Shipping Board. In February, 1920, he went to Bordeaux as district auditor for the Bordeaux section of Shipping Board affairs, at which time there were outstanding accounts in that territory amounting to two million francs. Eddie Moales cleared them up. In January, 1920, he was appointed acting port representative and in March was promoted to port representative at Bordeaux, holding that position until June, 1921, when he was transferred to Gibraltar as port representative, having charge of the operations of all Shipping Board vessels operating in the territory of southern Spain, Gibraltar and the north coast of Africa. While at Gibraltar Moales made a trip through Spain organizing the work of Shipping Board representation. In November, 1921, he was relieved from the service because of the reduction of the Shipping Board's staff due to the depression of shipping activities.

Numerous letters from foreign representatives of the Shipping Board attest to the faithfulness and ability with which Eddie Moales performed his work with that organization.

#### **Home After Four Years' Absence**

Leaving Gibraltar December 15, Moales arrived in New York Christmas Day. He spent about forty-five days there before leaving for New Orleans.

It is mentioned above that Eddie Moales, Senior, began working for the Illinois Central forty years ago. He was a caller and a freight brakeman. In 1886 he was made a freight conductor, and about fourteen years after that he began running as a passenger conductor. Six years ago he was first elected to the general chairmanship of the O. R. C. He is a favorite with officers and employes over all parts of the system, and this story of his son is told here because of the thousands who will be glad to know of the fine record Eddie Junior made.

Mr. and Mrs. Moales have recently moved into their new home at 8214 Hickory Street, New Orleans. In addition to their son, their family consists of two daughters, Mrs. W. W. Pope and Mrs. R. D. Gallagher.

## How Paducah, Ky., Employees Avoid Renting

*E. D. Gourieux, for Example, Built His Own House by Night Work While His Wife Held a Lamp for Him*

**E**MPLOYEES of the Illinois Central at Paducah, Ky., own some mighty pretty homes in that city. There are about 500 employes' homes there, and many of them are among the most comfortable houses in the city. About one-third of the employes in Paducah own their homes. The payrolls show a total of about 1,500 employes.

The main reason for so many and such good homes in Paducah is that that city is a desirable place to have a home. Paducah may be said to be a salaried man's town. Taken as a whole, the residents are congenial, courteous, happy, honest and just good folks. The whole city is neighborly.

The employes of the Illinois Central at Paducah realize the value of being thrifty, and yet they do not deny themselves the enjoyments of life. The employes there are contented, and the comfortable homes may be given credit for the condition.

Most of the employes' homes in Paducah were built or bought with money earned while in the service of the company. Some employes, however, were fortunate enough to have a nice bank account or inherit a small fortune.

### Decided to Build a Home

Probably the most unusual example of thrift at Paducah is the story of how E. D. Gourieux, pensioned car foreman, built a home and raised a family of eleven children with a salary of \$2.50 a day at the start.

Mr. Gourieux married a Paducah girl about thirty-seven years ago. They rented rooms the first year, and then decided that the money they were paying for rent might just as well be buying a home for them. Mr. Gourieux's salary would not build an elaborate home, but they concluded that they could have one just as comfortable as the rooms they had been renting, and when it was built they would not have to pack up their furniture and move as they then had to do at times.

In 1886 Mr. Gourieux purchased a small lot near the Illinois Central shops. Land was more reasonable there, and it was convenient to his work. The lot was sold to him for \$150. The initial payment was \$50, and he was

*Home of E. D. Gourieux*

required to pay only \$50 a year until the balance was paid. When the lot was in his possession, Mr. Gourieux began to plan for his home. Plans were drawn for a 2-room cottage, for they could not hope for more at that time.

Mr. Gourieux was a friend of a lumber merchant in Paducah. He went to him, told him his plans and how much lumber he would need, and then asked if the lumber would be supplied as it was needed and payment made

### INKID SAYS—

Employees' homes at Paducah, Ky.: 1, W. H. Bash, conductor, 1728 Jefferson; 2, J. E. Ogles, machinist, 1400 Monroe; 3, A. J. Leutenmayer, general foreman, 1603 Broadway; 4, Louis Rapp, upholsterer, 942 Trimble; 5, M. L. Akers, car foreman, 1911 Guthrie; 6, E. R. Pierce, warehouse foreman, 1426 Trimble; 7, W. M. Stewart, car repairer, 633 Fountain; 8, M. J. Clark, pipe man, 1915 Madison.

on easy terms. His request was granted, and the cost of the lumber was calculated to be \$250. Mr. Gourieux gave his friend \$50 he had saved for the first payment, and then gave him a note for \$200 with the understanding that he was to pay \$20 each month on the note.

**He Built His Own House**

He did not have to worry about paying a carpenter to build his home. Mr. Gourieux was as good a carpenter as could be found in Paducah, and he was determined to build the house himself. Every day after working hours at the shops his wife met him on the little lot. For six weeks he hammered and sawed by the light of a lamp held by Mrs. Gourieux, and at the end of that time the home was completed.

A few years later the increasing family needed more room, and Mr. Gourieux began to plan for an addition to his house. One day when he came home with his money from the shops, his wife picked out a crisp \$50 bill and said that she was going to put it away. She did the same thing after each pay day until \$200 was saved. There were no clothes bought during that time, but they had plenty to eat.

But fate stepped in to prevent the addition to the home at this time. The oldest son be-

came dangerously ill, and before he was out of bed a younger brother was sick. Mrs. Gourieux worked diligently with her two ill sons, and it was not long before she had to go to bed. Then Mr. Gourieux became ill.

During that time, he says, the doctor made twenty-one calls, and each time left a prescription to be filled. When the sick members of the family had recovered, there was only 80 cents of the savings left. But they were not disheartened. The next spring they renewed their efforts to save, and in time had \$450.

Mr. Gourieux had been promoted then, and his increased salary caused the savings to grow a little more rapidly. He was not able to build the addition to the home himself. His new position took him out of Paducah often. A carpenter was hired, and three rooms, a back and front porch were added. When the home was completed, the total cost was \$850.

**Built Home on \$65 Salary**

There are many such examples of thrift at Paducah. There are also those who do not believe in owning homes. E. R. Pierce, warehouse foreman, tells of a friend who did not want to own a home.

Mr. Pierce bought a lot for \$250 and built a home thirty-two years ago, when he was

**HERE IS OUR MONTHLY ROLL OF HONOR**

Below is a list of employes retired at the meetings of the Board of Pensions, February 27 and 28:

Name	Occupation	Years of Service	Date of Retirement
Edward Fulton	Fireman-Engineer, Indiana Division	36	9/30/21
Frank A. Marble	Pumper, Fort Dodge, Iowa	37	10/31/21
Joseph Taylor	Section Laborer, Kankakee, Ill.	35	11/30/21
Charles P. Freeman	Conductor, Springfield Division	31	12/31/21
James J. O'Rourke	Engineman, Mississippi Division	47	12/31/21
George W. Hadaway	Conductor, Mississippi Division	24	12/31/21
Robert Peterson (Deceased)	Track Foreman, Iowa Division	43	1/31/22
Robert G. Stripp	Clerk, Burnside Shops	44	2/28/22
Emile D. Gourieux	Car Foreman, Paducah, Ky.	44	2/28/22
Charles T. Harris	Conductor, St. Louis Division	27	2/28/22
Charles Hatch	Brakeman, St. Louis Division	24	2/28/22
James M. Hollands	Engineman, St. Louis Division	25	10/31/21
Joseph Mulholland	Switch Tender, Chicago, Ill.	15	10/31/21
Horace O. Kelly	Agent, La Salle, Ill.	15	11/30/21
Thomas Whitby	Yardmaster, Chicago, Ill.	26	12/31/21
William M. Adrian	Boilermaker, Waterloo, Iowa	51	2/28/22
Y. & M. V.			
Joseph H. Evans	Engineman, New Orleans Division	39	2/28/22

The following deaths of pensioners were reported:

Name	Last Employment	Date of Death	Term as Pensioner
Sven N. Lofquist	Carpenter, Burnside Shops	1/29/22	16 years
Samuel T. Powles	Conductor, Chicago Terminal	1/27/22	3 years
Joseph Lantrum	Sand Dryer, St. Louis Division	2/11/22	10 years
Michael Dolan	Laborer, Chicago Terminal	2/ 7/22	6 years
John Duncan	Blacksmith, Burnside Shops	12/ 7/21	6 months
Robert J. Williams	Contracting Freight Agent, Traffic Dept.	2/ 3/22	14 years

Employes' homes at Paducah, Ky.: 9, J. L. Keegan, machinist, 309 Harahan; 10, G. W. Mercer, conductor, Harahan Boulevard; 11, H. S. McClure, mill machine operator, 1900 Broadway; 12, J. F. Walker, master mechanic, Monroe and Harahan; 13, George Herms, engineer, 1643 Monroe; 14, H. G. Moffell, engineer, 330 Harahan; 15, L. R. Gleaves, chief clerk, 2310 Jefferson; 16, W. O. Burch, engineer, 340 Fountain.

making only \$65 a month. Before he decided to build, he had been paying \$10 a month rent. He investigated the situation, and learned that through the building and loan association he would be able to have a home of his own, and pay only \$9.65 a month. In eight and a half years his home was paid for.

Mr. Pierce had a friend who censured him for building a home with the aid of the building and loan association. This friend pointed out that the association received much more in return than the money it lent. He cited a case where a \$1,000 house had cost a friend \$1,500, and dangled that before Mr. Pierce's mind as a discouragement.

Mr. Pierce says that his friend moved almost every year and had paid at least \$10 a month rent for twenty years. All that he had to show for his spent money was rent receipts. In a much shorter time than that, Mr. Pierce had built and paid for his home.

The building and loan association has played a prominent part in building homes for the Illinois Central employes at Paducah. Employes who have accumulated or inherited small fortunes have also been a great help. Some of them have built homes for themselves, and then sold them on easy terms to brother employes. The usual terms have been \$500 down and about \$40 a month.

## W. H. Sharkey, "Politest Conductor," Dies

W. H. Sharkey, passenger conductor on the Wisconsin division, died at his sister's home at Amboy, Ill., March 5 after an illness of three days with pneumonia. Mr. Sharkey's story appeared in the January issue of the *Illinois Central Magazine*, and his popularity was attested by the number of newspapers which made mention of his death. Some called him "the politest conductor on the Illinois Central System."

The following is from the Freeport (Ill.) *Journal Standard*:

"William H. Sharkey, well known as the 'politest' conductor on the Illinois Central, with a run between Freeport and Centralia, passed away at the home of his sister, Miss Catherine Sharkey, at Amboy, on Sunday night, the cause of his death being given as pneumonia.

"William H. Sharkey was born on September 16, 1866, and first went into the employ of the Illinois Central Railroad on July 29, 1887, as a brakeman. He rose steadily in the service, and, as a passenger conductor, established for himself the reputation of being the most polite conductor on the system.

"In 1895 Mr. Sharkey was made a freight conductor on the Amboy district. He remained in that position until 1913, when he was promoted to passenger conductor on the same district. March 1, 1918, he was made a local freight conductor on account of taking off some passenger trains. His run was between Clinton and Minonk until November, 1920, when he was returned to the passenger run.

"Although his home was at Clinton, Mr.

W. H. Sharkey

Sharkey possessed a large number of friends, not only there, but in both Freeport and Centralia. He will be greatly missed by all his friends and acquaintances, while the loss of his ever-courteous, ever-genial presence will no doubt be noticed by the frequent passengers on the Freeport-Centralia run."

Mr. Sharkey leaves his wife and four children, John, Mary and Cecelia at home and William, who is attending a medical college at St. Louis, Mo. His aged mother and a number of other relatives survive.

Employees' homes at Paducah, Ky.: 17, C. Hobgood, car foreman, 1831 Guthrie; 18, J. P. McCarty, wrecker foreman, 420 Harahan; 19, S. E. Denker, stenographer, 415 North Eleventh; 20, J. T. Hotchens, blacksmith, 527 Harahan; 21, S. E. Bonner, engineer, 1727 Broadway; 22, P. E. Cheek, machinist, 2012 Jefferson; 23, E. K. Wolff, assistant boiler foreman, 1323 Jefferson; 24, E. C. Schumaker, timekeeper, 1745 Clay.

# Andy Rogers Wins Success on the Stage

*Son of Y. & M. V. Conductor Proves Himself Star in Shakespeare, in Motion Pictures and in Vaudeville*

READERS of the *Illinois Central Magazine* probably need no introduction to Andy Rogers, son of Mr. and Mrs. J. F. Rogers of New Orleans. Andy's father, Joe Rogers, has been an employe of the Illinois Central System since 1890, when the present Yazoo & Mississippi Valley Railroad was the Louisville, New Orleans & Texas, and for sixteen years he has been a passenger conductor, at present running between New Orleans and Vicksburg on Y. & M. V. trains Nos. 12 and 15 and Nos. 30 and 31.

There are doubtless some readers of the magazine who saw Andy Rogers during the season of 1910-11, when he first went on the stage. Shortly before that time he had given up his job as loss and damage clerk at the Southern Pacific offices in New Orleans and had gone to New York to study dramatics with the famous tragedian, Frederick Warde. When his schooling was finished he returned to New Orleans, and after he had been at home a short time he received a message from Warde asking him to come back to New York and take a minor role in "Julius Caesar." Warde himself was cast for the part of Brutus. Andy accepted the offer. One day at rehearsal Warde became dissatisfied with the work of a well-known actor who had been obtained to play Antony, and he demanded that the actor turn over his script. Turning to Andy Rogers, his pupil, he said:

"Here, Andy, take this, and see what you can do with it."

### Made a Place for Himself

Andy evidently did something with it, for when "Julius Caesar" made its public appearance the son of an Illinois Central System passenger conductor was cast for the role that was second only to that filled by his tutor. Andy Rogers played Antony to Warde's Brutus throughout the season.

During the next two seasons Andy was the leading man in a company which played "In Old Kentucky" throughout the United States, Canada and Mexico. Those who missed seeing the play may remember the picture, which was produced a few years ago, with Anita Stewart starring. Andy had the part of Frank Lay-

*Andy Rogers*

son. The next season Andy played the lead in the dramatization of Thomas Dixon's "The Sins of the Father," which, it will be remembered, was a powerful sermon on racial intermarriages.

From the road, then, Andy went into stock companies, playing around New York, and into movies. For a time he was with the old Solax Studio at Lee, N. J., playing opposite Claire Whitney. His best work in pictures, however, was done with the Nola Film Company at New Orleans. Andy played the leading role and served as assistant director in three feature pictures made at New Orleans, "Folly of Revenge," "The Man Who Lost" and "His Turning Point." It will be of interest to Illinois Central movie fans to know that a New Orleans girl who made her first bow in pictures just about that time and played opposite Andy in these three features has since risen to stardom in the movie world. She is Leatrice Joy.

### Played With Walter Hampden

Andy was in New Orleans making pictures for two years. Then he enlisted in the navy as a yeoman, and was promoted to yeoman,

second class, and assigned to the intelligence department at San Antonio. There he was promoted to chief yeoman. Upon his discharge from the navy he went into stock companies in New York. For a while he played with another great tragedian, Walter Hampden, whose Hamlet is yet declared to be one of the classics of the American stage.

Still later Andy played throughout the country in vaudeville, writing his own sketches or adapting for use sketches written for him by a friend in New Orleans. For a considerable engagement Andy played a sketch called "Alias McCloskey" on the Orpheum vaudeville circuit.

Just now Andy is in New York. Producers and friends prevailed upon him to defer his road trip in order to write, rewrite and direct a number of sketches. He recently wrote his father that he is about to sign up for an extended vaudeville engagement. His next vaudeville sketch will be a series of card tricks, with interpolations of prose and poetry recitations.

#### Born in New Orleans 32 Years Ago

Andy came into the world thirty-two years ago, at New Orleans, and was christened Andrew A. Shortly after the boy was born his father obtained a job as a flagman on a passenger train between New Orleans and Baton Rouge, holding it for a year. Then for a year and a half he was a flagman on a freight train, running between New Orleans and Vicksburg. In 1892 he was promoted to freight conductor, and for fourteen years he took freight trains between New Orleans and Wilson, La. His next promotion came in 1905, when he was made a passenger conductor. For some time he ran extra, and then he was seriously injured in a collision at Baton Rouge Junction. He went back to work in 1910, and for twelve years his smiling face has been well known to passengers who use the Valley trains between New Orleans and Vicksburg.

Andy grew up in New Orleans and went through the public schools, being graduated from high school. As a boy in school he was noted for his ability as a speaker and impersonator. He was in great demand for recitations at reunions, and the Confederate veterans at their reunions used to go wild with joy when Andy recited "Little Old Fightin' Joe," dedicated to General Joe Wheeler. When he finished high school he took a course of training at the New Orleans College of Oratory, directed by Misses Lily and Ida Whittaker. He wasn't ready for the stage just then, and he

landed a job as loss and damage clerk for the New Orleans & Northeastern Railroad (now the Southern). Later he went over to the Southern Pacific, and stayed there until he went to New York to study.

#### An Essay on "Being Human"

Andy admits that Illinois Central events have had more than a passing influence in shaping his life. Although he has been away from New Orleans most of the time since he first went on the stage, twelve years ago, he has kept up constant correspondence with his father and mother. Recently Andy's father sent him a copy of a letter he had received from Senior Vice-President Kittle, and Andy was moved by it to write an article on "Being Human," which is reproduced herewith:

"Do you practice 'being human'? Just a

Andy Rogers as Antony

minute before you snort 'whad'dye mean?' and let's talk it over. You've doubtless heard the expression, 'He's human.' Have you ever stopped to analyze just what that means between the employer and the employe? We'll say you have many of the success-spelling requisites; your self-appreciation is such that you feel mighty certain you 'have the goods.' Will an inventory of your stock of success-winners show a supply of 'being human'? Did you know there's a growing demand for this commodity in the market of achievement?

"Corporations of today are choosing as executives men who can handle an employe and not lose sight of his human side. The man who can extend a kindness and touch the human chord invariably succeeds in bringing to the surface the very best that is in the recipient. It is the 'human act' that causes the employe to refer to the man 'higher up' as 'white, through and through.' Ofttimes an executive, noting the good results of one of these instances, credits himself with being a psychologist. He may be just that, but it simmers down to a plain case of 'being human.' And it always secures that valuable asset—

thoroughly loyal workman who, by word and action, betters the morale of his fellow-worker.

#### Good Spirits Improve Work

"It isn't displayed only when the big issue arises. Not so very long ago there was the employer who barely grunted 'good morning' upon entering his office. An effusive greeting might tend to decrease his dignity. He reasoned that he must sufficiently awe his clerks so as to receive a maximum amount of work. He frowned upon anything that resembled 'being human.' The 'human employer' of these times knows that the cheery 'good morning' has the effect of sending the worker to his task with renewed avidity. The day begins with a feeling of good-fellowship toward the 'boss.' Each succeeding 'human act' strengthens that feeling, and the 'boss' soon becomes something bigger—a true pal. And who doesn't find pleasure in serving a pal? But the 'human employer' must have 'human employes.'

"Perhaps you've had occasion to refer to your employe as 'regular.' Are you trying to emulate the man you call 'regular'? Certainly you have the chance. Are you ready with a word of cheer and encouragement when a co-worker is inclined to be disheartened? Are you quick to 'pitch in' and lend a hand if he is hard pressed with work? Do you strive to keep yourself physically fit to do full jus-

Conductor J. F. Rogers

Mrs. J. F. Rogers

tice to your work and thus avoid annoyance to your employer? An affirmative to these questions proves that you are solicitous of the feelings of others and are 'human.' Beginning the day's work by earnestly endeavoring to do a little more than the allotted portion helps others and naturally increases your proficiency. It likewise brings recognition of the fact that you are 'human' and not an automaton, only

capable of performing so much work—and no more. Of course the employer won't sum it up as 'being human' but will jot it down as 'proficiency.' And proficiency begets reward. Let's practice 'being human.'"

Andy has been in practically every branch of the profession, except burlesque, since going on the stage.

## A New Way to Make Motorists Careful

A novel means of protecting automobilists at a grade crossing has been installed by the Northwestern about two miles west of Meadow Grove, Neb. From its appearance in the accompanying pictures it would seem that the crossing is "fool-proof." It practically requires those driving automobiles to slow down and look in both directions before getting on the track. It has been demonstrated that stopping, looking and listening is the one sure prevention of grade-crossing accidents.

In carrying out the construction of these mounds, the Northwestern obtained the cooperation of the division highway engineers and

the county road commissioners. The county did the grading, and the railroad furnished the signs and material. It is understood that the chief engineer of the Northwestern, who is a member of the grade crossing and trespassing committee of the American Railway Association, has recommended this type of crossing protection as a standard.

### HELPED BUILD OUR LINE

S. D. Porterfield of Cullom, Ill., died at his home Monday, March 6. Mr. Porterfield was born near Pittsburgh, Pa., May 26, 1835, and came to Illinois in the fifties. He lived for a time near Freeport, later moving with his bride to Champaign. He helped build the Illinois Central from Rantoul to Centralia and was firing a wood-burning engine on the same line when the Civil War broke out. He twice volunteered his services to his country: first, at the call for ninety days' service, and then as a private in Company A, 7th Illinois Cavalry. After the war he engaged in farming near Sidney, Ill.

# Some Economic Hallucinations Exposed

*There's Nothing in "Cycle" and "Balance of Trade" Theories and Belief That World Is Poorer Since the War*

By THEO. H. PRICE,

Publisher, Commerce and Finance

*An address before the Rochester Association of Credit Men, Rochester, N. Y.*

I HAVE been led to select "Some Economic Hallucinations" as my subject this evening because with every year and every day that passes I become more convinced that what we are depends upon what we believe.

I cannot claim originality for this statement. "Ye shall know the truth and the truth shall make you free" is a promise that has been echoing from the ages for nineteen centuries, but until very recently men have seemed to think that it applied only to religious and metaphysical truth and they have not attempted a scientific verification of the many dogmas and traditions that have come to be accepted as applicable to what we call business. The results are that the science of economics is far behind most others in its development and that many merchants, manufacturers and financiers who take a pride in calling themselves conservatives are in fact slaves of error whose servitude has made them cowards in the pursuit of truth.

## We Are Weak in Economics

Probably because it was until recently assumed that a university training was almost a disadvantage to a business man the science of economics is comparatively young. Adam Smith's "Wealth of Nations," which was about the first book that attempted a scientific correlation of the phenomena of trade, was not published until 1776, and is still regarded by some as sacrosanct.

The collection of the statistics upon a knowledge of which the discovery of economic law depends is as yet but poorly organized, and the relation of psychology to prices and prosperity is an important field in which hardly a furrow has been turned.

Therefore it is not surprising that many mistaken theories should have come to be accepted by business men, and with three of them that are largely responsible for the present world wide depression in business I propose to deal tonight.

The first is the "cycle theory," which assumes an alternation of business prosperity and prostration and insists that because we have been

## Three Hallucinations

Three hallucinations are largely responsible for business depression. They are:

1. The belief that a period of prosperity must be followed by a period of depression.
2. The belief that the world is poorer as a result of the war.
3. The belief that we must export more than we import to be prosperous.

successful for a time we must for a period be unsuccessful. The idea seems to be that human affairs are rhythmic; that pain succeeds pleasure, that plenty is followed by famine, that wealth presupposes subsequent poverty. It runs all through literature and is almost prehistoric. Many books have been written in support of the theory and elaborate diagrams have been drawn to prove it. Most people have surrendered themselves to it so completely that they often bring about hard times by vociferously insisting that they are due, and the agonizing deflation through which we have recently passed was, I think, largely attributable to the fact that some highly placed personages who had the power to make their prophecies come true were obsessed with a belief in the cycle theory.

## Fallacy of the Cycle Theory

From time to time in the past self-appointed seers have predicted the end of the world and if they were well enough advertised they spread terror throughout Christendom. Mackay's "Memoirs of Extraordinary Popular Delusions" is an old book that I keep by me and refer to whenever I find myself yielding to a theory that is in conflict with fact.

It tells of the epidemic of fear which spread over the nations when in the latter half of the tenth century a number of fanatics appeared in France, Germany and Italy preaching that the thousand years prophesied in the Apocalypse as the term of the world's duration would expire in the year 1000 and that the Son of Man would then appear in the clouds to judge the godly and the ungodly. The last judgment was to be held at Jerusalem, and in the year 999 the number of pilgrims proceeding eastward to the

Holy City was so great that they were compared with a desolating army. Most of them sold their goods and possessions before they started and lived upon the proceeds as they traveled. Buildings of every sort were allowed to fall into ruin. It was thought useless to repair them when the end of the world was so near. When the expected debacle failed to arrive some of those who predicted it were murdered, but this did not mitigate the distress of the disappointed pilgrims, most of whom were overtaken by the plague or died on the return journey. Numerous other similar, though less important, popular delusions are reported.

### Belief May Force Bad Results

Mother Shipton, of whom we have all heard, was responsible for many of them, including a belief that London would be destroyed on a certain day, and many of her unfulfilled prophecies are still believed in the rural districts of England.

If it had been possible for those who predicted the end of the world or the destruction of London to vindicate their gift of prophecy by bringing about the things prophesied it is quite possible that they would have done so. The danger of the cycle theory of economics is that a general belief in it will bring about the hard times that it presupposes when as a matter of fact they are illogical.

For some mystical reason, probably because

seven years of plenty were followed by seven years of crop failure when Joseph was in Egypt, a great many people believe that if we have seven years of prosperity nowadays the succeeding seven years will be a period of hard times.

But how absurd this is. If we told a man that he would be ill for seven years because he had been in good health during the previous seven years we would be laughed at, and to argue that because a man had been wise for seven years he must be a fool for the next seven years is manifestly absurd. The presumption is all the other way. The probability is that a man who has been in good health will remain healthy, and sagacity of conduct for seven years is generally regarded as indicative of permanent success. Why should we assume that the reverse is true of the business community as a whole?

### Cycle Theory Is Fatalistic

The cycle theory is also unscientific in that it is fatalistic. In every other department of human endeavor men have discovered and are discovering the natural laws that govern, and they are coming to realize that by obedience to these laws they may escape or ameliorate many hazards and ills hitherto considered unavoidable. By an ascertainment of the law of probabilities insurance has been made practicable and we can now protect ourselves against the insurable risks of life.

By the progress of medical research the death rate has been reduced, longevity has been increased and the epidemic spread of many diseases has become preventable. Most parents used to believe that all children *had* to have certain infantile diseases—measles, mumps, whooping cough and the like. We now know that with care these diseases are avoidable and that the boys or girls who escape them are stronger physically for their immunity.

In mechanics and dynamics wonderful progress is being made in the discovery of methods for the prevention of accidents or breakdowns that were hitherto thought to be unpreventable. The advance recently made in psychiatry is amazing, and Dr. Pearce Bailey, a distinguished neurologist who died in New York recently, told me a year ago that he was confident that the casualties of the war had been enormously reduced because the psychological tests to which the soldiers were subjected led to an elimination of the unfit and enabled those who were organizing the army to come nearer getting the

Theo. H. Price

right man in the right place than ever before in military history.

### How the Chickens Were Fooled

I wish that we had a department of psychiatry by whose findings we could be governed in the choice of both the rank and file of business as well as in the election of our legislators and public officials, and I hope that some philanthropic billionaire will shortly endow a sort of Rockefeller Institute for the scientific collection of economic data and the study and discovery of economic law. The suggestion may seem amusing, but it is seriously made, for Frank Vanderlip was right in saying that we are a nation of economic illiterates though we think ourselves the greatest business people in the world.

Meantime I urge you to discountenance the cycle theory. I really believe that the depression from which we are just emerging was largely the result of auto-suggestion induced by the cycle theory.

When I was a child I was told of a flock of chickens who were induced to keep looking upward because an old rooster went about crowing, "The sky's falling, Henny Penny." The wise old rooster was meantime eating up all the chicken feed on the ground. The story is, I believe, a nursery classic, but it is not without present value for the business men who have missed many opportunities because they have listened to the unscientific predictions of the pessimists.

But I have talked so much about the cycle fallacy that I haven't much time for the other two hallucinations of which many business men are in my judgment the victims today.

One of them I have called "The World's Illusion of Poverty." Your secretary suggested that I should make it the main subject of my address to you, but as I had already used it as the topic of two papers I preferred to give you something fresher. I shall therefore be very brief in dealing with the matter, but shall be glad to send copies of the papers in which it is discussed at greater length to anyone who may ask for them.

### Is the World Poorer Since the War?

There is a widespread belief that the world is a great deal poorer as a result of the war and that its wealth is or was recently about 300 billion dollars less than on July 31, 1914. Just why this figure of 300 billion dollars has been chosen as a measure of the impoverishment I do not know unless it is because it about equals the

total of the war debts created, reckoned in terms of the currencies in which the debts are payable at the gold value of these currencies. This is of course absurd. Germany's debt, for instance, is about 320 billion marks. Calculated upon the pre-war value of the mark in gold, which was 23.8 cents, this would be equal to \$80,000,000,000, but at the current value of the mark, which is about 1/2 a cent, the German debt amounts to only \$1,600,000,000.

But the debt has nothing to do with it. If all the public debts owed by the world's governments or their citizens to each other were forgiven and canceled the sum total of the world's wealth would not be affected by a millionth part of a cent.

Considering the world in its entirety and as a unit its wealth is not increased or diminished by the debts its integers owe one another or the paper money that they possess, but consists entirely of the things that men use or desire: namely, land and the unconsumed products of productive and constructive labor.

The world's stock of such things has not upon the whole been reduced by the war. In the United States we have more things and more productive power than before the war. The same thing is true of Germany, whose boast is that her manufacturing and agricultural equipment is intact and that pre-war production can be resumed as soon as a market can be found for it. Except for the few houses destroyed by air raids England's physical property is unharmed and her productive power has probably been increased. France and Belgium are about the only countries in which there was any destruction of physical property or things, and the value of the things destroyed is probably more than offset by the wealth elsewhere brought into being as a result of the war.

### World's Wealth Shows Increase

In the United States, for instance, our merchant marine has been increased by ships that cost altogether three billion dollars and may now be worth one and a half or two billions. If an inventory of the world's things had been taken in June, 1914, and could be compared with a similar inventory taken today the comparison would, I am sure, show a very substantial increase in the world's wealth. A book upon the income of the United States just published under the auspices of the National Bureau of Economic Research estimates that our national income increased from 32 1/2 billion dollars a year in 1914 to 66 billion in 1919, and while it is admitted that much of this in-

crease is due to the advance in wages it represents nevertheless a gain in the purchasing and productive power of the country.

The meager statistics thus far available seem to indicate that the same statement would be true of most of the other nations at war, and it is admitted that the wealth of the non-combatant peoples was greatly increased by the war.

But what, you may ask, has become of the waste of war of which we hear so much? Is it possible that the world can be richer than it was before the war, and after having devoted four and a half years to the destruction of life and property?

The answer and the explanation is that upon an average nearly all the products of human energy are consumed or wear out in seven years whether we are at peace or at war. About two-thirds of all the human energy that is productively employed at any time is devoted to the production of food, fuel, clothing and transportation. These are consumed or used almost immediately, and certainly within a year.

#### Production vs. Consumption

The remaining third is employed in the manufacture of machinery, the construction and upkeep of roads, railroads, streets, buildings, bridges, etc., the conduct of public utilities such as power plants and water works, and the administration of government, for which soldiers, policemen and public officials are required.

But it is very doubtful whether any of the products of human labor, except buildings, bridges and a few other structures that are called permanent, last more than seven years. Most machinery wears out and most roads and streets have to be remade or repaired after seven years of use, and, taking the mean between the milk that is instantly consumed and the skyscraper that may last fifty years, it is certainly true that the production of each seven years is but very little in excess of the destruction and consumption of that period.

The statisticians figure that in the United States our national wealth has increased during the present century at the rate of about 12½ per cent a year, but as this is largely due to the increase in the value of urban and agricultural land the statistics about bear out my contention. We have but little more than zero left after deducting the consumption and wear from the production of peace time, and we cannot have much less left after deducting the consumption and waste from the production of the war period, for less than zero is unthinkable.

The only difference is that when we are at war we consume and destroy more than when we are at peace, but we produce more because more people are at work, as witness the fact that the ranks of industry during the war were largely recruited by employing women and men who had previously lived lives that were in an economic sense unproductive.

#### World Is Better Off Than It Was

My object in attempting this labored demonstration of what seems to me almost self-evident is to dissipate the gloom and lack of confidence that is engendered by the belief that the world is poorer than it was.

This is not true, and when we realize that it is not true and that the world is really better off than it was not only in things but in experience and the knowledge that we should acquire from experience we will feel more cheerful and be less inclined to yield to the illusion of poverty which discourages us and is largely responsible for the depression of spirit that leads to what we call hard times.

The third hallucination of which I would speak is one that is the result of what might be called the intensely nationalistic and individualistic view that we take of economic questions.

From the time that we became a nation until a few years ago we had always been in debt to Europe, and for this reason we got in the habit of thinking that we must export more than we imported in order to be prosperous. What we called a balance of trade in our favor was an indication that we were producing a surplus that we could use to pay our debts or the interest on them, thereby putting ourselves in a position to borrow more of Europe's capital for the development of our resources.

But now that we have become a creditor rather than a debtor nation this is no longer true, but the old idea persists nevertheless and it is constantly asserted that we cannot expect to prosper unless we continue to sell more than we buy. As during the last three months ending January 31, 1922, the value of our exports exceeded that of our imports by only 203 millions as compared with 1,254 millions during the same period a year ago, it is highly important that we should come to an intelligent understanding of the facts, as we may otherwise argue ourselves into believing that they connote a reduction in our foreign trade that is inconsistent with national prosperity.

#### Must Make Our Own Market

Therefore I take this opportunity to point out that it is absolutely impossible for us to

sell more abroad than we buy, spend or loan there, and that our ability to sell our surplus overseas depends upon our willingness to buy there, to spend there or to lend there the balances that are due us on account of the goods that are sold.

This, I think, is almost as self-evident as the axiom which asserts that the whole is equal to the sum of all its parts. It hardly needs elaboration, but it is nevertheless so at variance with the popular view of our foreign trade figures that I feel that it should be made plain upon every proper occasion.

To these three hallucinations the business depression through which we have recently passed is, I think, largely due. We expected a reaction and induced others to expect it by predicting it. We got what we predicted, mainly because we had predicted it, and when it had come we attributed it to the impoverishment of war, which is another fallacy.

Now that despite our pessimism things are commencing to look up again we are being told that we cannot prosper unless we accomplish what is commercially impossible by continuing to sell more than we buy and collecting the balance of the account in cash. In a wonderful book, called "Natural Law in the Spiritual World," written by Henry Drummond, it is suggested that mankind will attain immortality when it comes completely to understand and obey the natural laws for the transgression of which the penalty is death.

Much the same thing might be said with regard to economic law and our compliance with it.

When we understand it and obey it we shall no longer be subjected to the alternation of prosperity and prostration, of good times and hard times from which we have suffered so unnecessarily in the past, for "we shall know the truth and the truth shall make us free."

## Mississippi Division Loses B. A. Talbert

Gloom was cast over the entire Southern Lines, and more particularly the Mississippi division, when, on the morning of March 2, word was received of the untimely death of Barksdale A. Talbert, supervising agent of the Mississippi division, in a hotel at Amory, Miss.

Mr. Talbert, who was en route to Brilliant, Ala., had retired early, leaving a call for 5 a. m. When he was called, no response was given, and investigation disclosed the fact of his death. He had been somewhat indisposed for a few months and had rested up a month during the early part of last year, but returned to work feeling much better.

Mr. Talbert was born October 4, 1872. He began his career with the Illinois Central as a ticket clerk at Winona, Miss., July 10, 1891, and was promoted to the agency at Holly Springs one year later. In 1897 he was promoted to agent at Winona, and was continuous in the service as agent at that point until May, 1920, with the exception of one year, when he was promoted to traveling auditor. Choosing his first love, however, he returned to his former position. May 1, 1920, he was selected as supervising agent of the Mississippi division, a position which he was filling with ability and distinction at the time of his death.

Mr. Talbert was married when a young man, his wife being Miss Belle Stone of Vaiden, Carroll County, Miss. This union was blessed

B. A. Talbert

with two sons, Joseph T. Talbert, 22 years old, who is now an ensign in the United States Navy attached to the U. S. S. Tennessee, and Clifford Barksdale Talbert, 20 years old, the second son, now a student in the State Agricultural and Mechanical College at Starkville.

There was no official on the Illinois Central System more highly esteemed than Mr. Talbert. His loyalty to the railroad, his home and his friends was the outstanding characteristic of his life. He was a member of the Baptist Church, of which he was an officer, a Royal Arch Mason, a Knight Templar, and a Shriner.

Funeral services were held at Winona with Masonic rites. Paul H. Murphy, Grand Master of Masons of the State of Mississippi, who officiated, was a personal friend of Mr. Talbert.

Friends and acquaintances from nearly all points on the division were present at his funeral, including General Superintendent J. M. Egan of the Southern Lines and Division Superintendent A. D. Caulfield and staff.

# Editorial

## AN EPOCH-MAKING DECISION

On February 27 the Supreme Court of the United States, in unanimous decisions handed down by Chief Justice Taft, upheld the authority of the Interstate Commerce Commission to require state passenger rates to be brought up to the level of interstate passenger rates, laws of the states to the contrary notwithstanding. The cases decided arose in Wisconsin and New York, where 2-cent state laws have been enacted. The Director General, during federal control, advanced these fares to 3 cents a mile, and his right to do so was sustained in the North Dakota Rate Case, decided in 1919.

The Interstate Commerce Commission, by direct order made in the Advanced Rate Case, 1920, advanced all interstate passenger fares to 3.6 cents a mile. In all of the states where these 2-cent laws prevailed the several state railway and public utility commissions took the ground that they were without authority to permit these state passenger rates to be advanced, in view of the laws of the state. When these cases were brought before the Interstate Commerce Commission, orders were entered commanding the railroads to advance state fares to 3.6 cents, to correspond with interstate fares. Litigation naturally followed, the Wisconsin and New York cases being selected for a test.

The Supreme Court decided the cases upon the broadest possible ground. Indeed, the decision is perhaps the most important in this field since *Gibbins vs. Ogden*—that great landmark of the law in which Chief Justice Marshall first asserted the nation's supremacy over the entire domain of commerce.

The importance of the decision is manifest when we consider that it deals with the provisions of Section 15-a of the Transportation Act. That section embodies the feature of the law which lays a mandate upon the commission to divide the country into rate groups, ascertain the value of railway property in each group, and so adjust the rates that the roads will earn a fair return upon that value. This piece of legislation marks a distinct departure in the matter of regulation, since here we find the first evidence, in recent times, of any tend-

ency toward constructive or sympathetic treatment of these great highways of trade. Therefore, the whole course of legislation had been repressive and restrictive.

Chief Justice Taft, in his very clear and strong opinion, goes straight to the heart of the question. Dealing with the Wisconsin case, he declined to uphold the Interstate Commerce Commission's order on the Shreveport theory, finding that there was not enough evidence as to discrimination between persons and localities to sustain a state-wide order condemning all the state rates. But upon the revenue theory, so called, the roads won a sweeping victory. The court explicitly declares:

The effective operation of the act will reasonably and justly require that intrastate traffic should pay a fair proportionate share of the cost of maintaining an adequate railway system.

This is the very essence of the decision. It is now settled law that the task of fixing a rate level necessary to earn adequate revenues is with the interstate body. When that level is fixed, the states must do their share by adopting for state rates the same level or one which will yield substantially the same revenue.

The court is at pains to say that there is still left power in the state commissions to make adjustments of rates as between themselves, as long as the general level of rates fixed by the national body is not disturbed and as long as the carriers' revenues are not substantially impaired.

Necessarily, the court dealt with the constitutionality of those sections of the Transportation Act directly involved—these being Sections 15-a, the rate-making clause, and 13, the state rate clause. The court found no difficulty in upholding these clauses as constitutional, upon the authority of the Shreveport Case, the Adamson Law decision, the Minnesota Rate Case and others of similar tenor.

A desperate effort is being made to persuade Congress to amend the Transportation Act so as to repeal this great constructive decision, so that chaos and confusion will again reign in the field of rate regulation. Indeed, the proposed legislation seeks to give the states supreme power over state commerce, thereby depriving the Interstate Commerce Commission

of power to end clear discriminations against persons and localities.

It is sincerely to be hoped that wisdom will rule the councils of the Congress on this important subject. The Supreme Court in its recent decision stated that approximately one-fourth of the revenue of the carriers was derived from state traffic. If the states are to be privileged to dominate the railway rates on one-fourth of the business by adopting forty-eight different systems of rates, while the national government regulates the remaining three-fourths according to its conception of what is just and reasonable, the plight of the roads will be sad indeed. Such a situation will not help the shippers of the country. Its only effect will be to prevent these national highways from functioning in an orderly way and from fulfilling their purpose as the chief arteries of commerce.

### THE NATION'S RAILROADS

There is evidence that the future of rail transportation in the United States is beginning to awaken the public interest that it deserves by reason of its importance to the life of the Nation. Chambers of commerce, business organizations and civic bodies of all kinds are asking men who have made a study of transportation problems to talk to them about the railroads. The discussion has invaded the publication field extensively, and magazines and newspapers are devoting space liberally to informative and speculative articles and editorials on the subject. As a topic of conversation wherever men meet the railway question has out-lived numerous political and economic issues which have waxed and waned. Conferences are shot through with the interest awakened in the public mind as to how the Nation's railroads are to be administered to obtain that maximum of adequacy and economy so necessary to our economic welfare.

The most remarkable fact about the voluminous discussions which appear on every hand is the preponderance of constructive thought. The canting, reckless, uninformed and destructive criticism which found favor with the last generation is noticeable principally for the small amount of interest it creates. In its place there is an abundance of constructively critical analysis of the problems involved.

The railroads are cursed with too much regulation. Regulated rates, regulated costs,

regulated earnings, regulated services and restrictions upon the freedom of managements in the exercise of the functions of management have combined to create an excess gross tonnage which the railroads are required to pull along in performing their vital services to the public. Their normal load has been increased by this mass of dead weight.

Two of the leaders among the railway executives have recently made striking statements on this subject.

President Markham of the Illinois Central System, in a talk before the Transportation Club at Peoria, Ill., December 8 last, said:

"The functions of management must be returned to the managements of American railroads. The railroads must continue to operate under public supervision, but that supervision must be under a broad, constructive policy. The powers of the public's agencies in the supervision of railway service must be better co-ordinated."

That eminent veteran of railroading, Howard Elliott of the Northern Pacific, speaking out of his forty-two years of service in transportation, declared in an article contributed by him to *The Nation's Business* for March:

"If there is one thing on earth that the railroads of this country need today, it is cessation of the interminable and never-ending investigations, first by one body and then another. Instead of being called upon to appear constantly before various bodies, sometimes about matters which have been investigated before, the managers of these great industrial properties should be given an opportunity to devote their entire time to serving the public and building up their business."

The constructive leaders are fighting shy of any course which promises to lead to government ownership or operation.

Secretary Hoover's testimony before the Interstate Commerce Commission, which was printed in the *Illinois Central Magazine* for March (pp. 25-28 and 120-122), contained this statement:

"No one with a week's observation of government railroads abroad or with government operation of industry in the United States will contend that our railroads could ever be operated as intelligently or as ef-

ficiently by the government as through the initiative of private individuals. Moreover, the welfare of the multitude of railway workers would be far worse under government operation."

Senator Albert B. Cummins of Iowa, chairman of the Senate Committee on Interstate Commerce, writing in *The Nation's Business* for March, declares that government ownership and operation may come to be the only solution of the railway question unless we succeed in carrying out the principle of consolidation of the railroads into a maximum of fifteen or twenty competing systems, and he adds:

"I want it to be understood that I am unalterably opposed to government ownership and operation of our railroads."

What is the railway problem of the United States? It is this, that a means shall be found for assuring that the railroads shall be able to continue to serve the public adequately and efficiently, earning a fair return upon the investment which makes them possible, a return that will permit the railroads to be developed in keeping with the growth of the Nation's business. Shall the accomplishment of that end mean that it will be necessary to turn the railroads over to the government to be operated, admitting that private management is unequal to the task? Shall it mean that the government must provide a subsidy from which the continuity of railway operation may be assured, admitting that we lack the courage to require railway traffic to pay the cost of transportation and prefer to assess the cost through taxation? Shall it mean that the government must underwrite the securities of the railroads and give them the backing of its vast resources, admitting that our plan of suppressive regulation has eaten away the foundation of railway security values and that we lack the courage to attack the cause instead of the effect? Or shall it mean that we as a Nation are going to take a broad, constructive view of the situation, admit our past errors in over-regulation, free railway managements of the restrictions which hamper and embarrass them in the performance of their work, strike the shackles off our foremost industry, and work out the salvation of the railroads in a common sense, American way?

Never before has there been presented the

challenge to railway men which they face today. The empire builders of the last century had no bigger problems to face than those which their successors are facing today. In the final analysis, the public must look to railway men themselves for guidance in solving the problem of the Nation's railroads. The times call for statesmanship of the big, broad-visioned kind.

Success in railway work is going to demand of tomorrow's leaders that they know perfectly the technical phase of their work, and it is going to demand, in addition, that they be statesmen in all that the true meaning of the word implies.

### SMOOTHING THE ROUGH SPOTS

It is easy enough to keep smiling when the course of life runs smoothly. It is when we come upon uneven ways and there are barriers and obstacles across our paths that we need to fortify ourselves with giving thought to the value of being pleasant.

Men and women who work for a railroad have trying circumstances without number to handle every day. To handle them properly demands an infinite amount of patience and tact. There come times when it is the human thing to do to "let go" and give way to our feelings. There are times when to do otherwise is more than can be expected of a harried individual. And yet, right there oftentimes is the dividing point between success and failure.

A person is not entitled to credit for giving a smile for a smile. A cheerful request cheerfully complied with is a case of like begetting like. An individual can claim credit only for returning a smile for a frown, for cheerfully responding to a demand gruffly or grouchy given. And a person who can go through a day smilingly performing his work under the most adverse circumstances is the person who is invaluable to an organization, and especially to an organization which depends upon the good will of the public.

A pleasant countenance is contagious. Put a frown in the midst of a group of confirmed smilers, and watch the corners of his mouth turn up and the twinkle creep back into his eyes.

If we must be grouchy and unpleasant, let's all be that way at once. Let the President declare one day in three hundred sixty-five as a "grouchy day" for the whole United States, and then our unpleasantness will not rob anyone else of his pleasure. But, until everybody de-

cides to concentrate his sourness into one 24-hour span each year, let us each resolve to do everything we can to change grouches and gloom into smiles and cheer. Because someone else radiates gloom is no excuse for us to reflect his countenance and send the gloom waves waving on.

But, after all, the real reason for meeting

the ups and downs of life with a smile is not the social one, but a personal one. Not only does a person who spreads gloom rob the other fellow of a pleasant day, but he turns his own day from one of pleasure into one of unpleasantness. A smile rewards the smiler, as well as the person for whom the smile is meant.

## Proved Eager to Save Company Property

M. A. Bouysou, general foreman at Gwin, Miss., writes as follows:

"I desire to make favorable mention of the unusual loyalty of one of our employes during the recent fire at Gwin, Miss., when our coal chute was damaged.

"Will Hoskins, negro machinist helper, lives at Westfield, Miss., making the trip daily to his work at Gwin. On January 25, at 6:25 p. m., our coal chute was discovered on fire. The alarm was given, and the employes responded promptly and without hesitation, performing whatever service was possible to reduce the damage. During this fire I noticed several instances where the spirit of willing co-operation showed the intensity of loyalty.

"While we were making an effort to get the fire under control, I observed this man Hoskins with others holding the nozzle. I inquired of him how he managed to be at Gwin. He replied that he boarded the north-bound train and came to Gwin to assist us in any way possible to save the property of the company.

"This man lives approximately four miles south of Gwin, and at the alarm of fire he made the effort to come to Gwin and boarded north-bound passenger train, No. 322, due at Gwin at 7:15 p. m. He remained with us at Gwin during the entire night. In my opinion his loyalty is worthy of more than passing notice. He has been in the service since 1902 and has proved a valuable and faithful employe, as in this instance. In his humble way he gave us the best there was in him and worked hard to protect the company's property."

J. M. Egan, general superintendent of the Southern Lines, wrote to Mr. Bouysou and to W. Wicker, general yardmaster at Gwin, as follows:

"Master Mechanic Roddie and Superin-

Will Hoskins

tendent Quigley have called my attention to the interest manifested and activity taken by each of you and many of the other employes at Gwin in the interest of the railroad and protection of its property when the coal chute was recently burned at that point.

"I wish to take this means to thank each of you and to ask that you in turn express my thanks and appreciation to the other loyal employes who responded whether or not they were on duty and worked so loyally to protect the company's property."

# PUBLIC OPINION

What the

World thinks

## THE BUS LINE

A company in Fort Dodge has put on a bus line connecting Fort Dodge with Sac City, passing through Manson and Rockwell City. This may be a strictly business proposition or it may be a plan to divert trade to Fort Dodge; whichever it is, it is perfectly legitimate so far as Fort Dodge is concerned, but it is a different matter with the outside public.

We do not see, with the splendid service which is maintained on the Illinois Central, how a bus can hope to compete between Manson and Fort Dodge; there is some chance between Manson and Rockwell City, but between Rockwell City and Sac the same condition exists as between Fort Dodge and Manson—good railway service.

This brings the matter down to a matter of public policy. Should the public build and maintain roads for the use of trucks and busses which compete with the railroads?

To begin with, if this country is to prosper, or even exist, it must have railroads. It has been shown that cheaper freight rates cannot be secured by encouraging unfair competition, or competition of any kind, but by a larger volume of business only can we hope to secure cheaper transportation. This being true, we are crippling the one thing we depend upon for existence, by encouraging unfair competition when we patronize the bus lines, and that is the railroads.

These bus lines have no money invested in rights-of-way, they pay for no upkeep of the roadbed and are a parasite on the public.

The cities have learned, by severe experience, that they must cut out the bus lines if they wished to maintain street railways, the one thing they must have to exist. In a lesser degree what applies to the cities in regard to street cars applies to the railroads in the country as a whole.

This paper has always maintained that one reason why we should not be taxed to build paved roads was that the public should not build roads for the special use of heavy trucks

and busses. There is no reason why we should build roads for that class of traffic, and there are excellent reasons why we should not encourage and pay for such competition to the railroads, which we must have if we wish to maintain our present standard of living. No one wants to see this country checkered with abandoned railroads and the public forced to depend upon trucks and busses. If such a condition should be brought about, we would be closer to the old time stage coach days than to present day standards.—Manson (Iowa) *Journal-Democrat*, March 9.

## JUDGE FLAYS LAWLESSNESS

One of the strongest charges ever delivered to a grand jury in Mississippi was voiced by Judge E. L. Brien of Vicksburg to the grand jury of Nashoba County at Philadelphia, at the opening of the court there recently. Judge Brien was sitting as special judge for the term, Judge Wilson of Philadelphia, who was recently elected to the office, having so many cases in court to be tried he could not serve.

Judge Brien, in the course of his remarks, said that only once before in his life had he ever considered a single crime of sufficient importance to be discussed in his charge to the jury. "But," he said, "the crime I have in mind is so dastardly and so far reaching in its effects that I shall break my rule." The judge then stated that the crime he had in mind was the shooting of negro employes on the G. M. & N. Railroad Company's trains in that county.

"It is not the crime," the judge said, "that alone prompts me. It takes no brave man to shoot a negro or a dog. But the man who shoots a defenseless negro while that negro is trying to earn an honest living will, when he feels like it, shoot you and me. If such is not stopped, one of us will suffer from the effects of this assassin's bullet whenever the shooting of us will prompt his selfish end."

In conclusion the judge asked if there was any man on the jury who felt he could not

comply with the law, and one man, while declaring himself a law-abiding citizen and anxious to see the law upheld, asked the privilege of taking advantage of the judge's offer to be excused.

The grand jury thus empaneled returned a true bill into open court during the week charging Albert Key and Dave Moore, two white men, with the murder of Henry Akers, a negro who was shot to death from ambush at the Burnside tank on the night of August 26, 1921. Key was formerly connected with the company in the capacity of extra brakeman. He was granted bail in the sum of \$7,500, and Moore was released on bond of \$5,000. Their trial will come up at the October term of court at Philadelphia.—*G. M. & N. News* (Gulf, Mobile & Northern), Mobile, Ala., March 10.

### FEELING AND FIGURES

Roger Babson makes his living out of statistics. He has a staff busy with gathering figures about almost every industry under the sun. And yet Roger Babson said the other day that "the world is ruled by feeling, rather than by figures." The statement isn't remarkable except in connection with its author. Business men are in the habit of listening to Babson. Babson thinks if they would listen to that statement and apply it there'd be a deal more of business to consider.

"Hospitality," he says, "is the one thing which is unlimited in supply, can be manufactured for nothing and without expense, is in great demand and yields huge profits." By hospitality he means human kindness and thoughtfulness. With it he believes that any railroad in the country can declare dividends. He claims that the head of a railroad should have been trained at running a successful hotel. He says that if a hotel were run like the ordinary railroad it would be out of business in no time. But if the railroads furnished hotel hospitality they would make money by it. Hospitality is not merely expensive furnishings and elaborate service—it is willing and courteous and prompt service, as Babson interprets it.

He believes that it is the kind of service that the people are hungry for—the kind that they will cheerfully pay for when they get it. That is what he means when he says that the world is ruled by feeling and not by figures. We buy not in the cheapest market, but in the friendliest, he says. There's something in what he has to say, when you come to think of it.—Jackson (Miss.) *Daily News*, February 21.

### DEFLATION

We hear and read much these days about a necessity for deflation and, as a first step in this, a demand for a reduction of wage rates and freight rates. Let us look into this a little.

Among the things that occurred as a result of a cataclysmic war was a world-wide dislocation of economic conditions that affected all peoples, savage and civilized. \* \* \* \* \*

Now what is our home situation, and what is the sensible thing to do with a view to a restoration of relative prosperity for our own people?

It is to concentrate our energies on our own affairs. There is work for every man and every productive wheel in this country for the next ten years if we but direct our energies in that direction. Competent authorities assert that the railroads of this country really need to expend one and one-half billions of dollars every year for the next ten years to re-equip themselves with locomotives and cars and trackway. Besides, they need enlarged or new terminals, bridges, safety appliances and like things.

Cities and towns and counties and states and the United States need to make large expenditures in order to serve the people under their respective jurisdictions with the comforts, conveniences and safeties for which purpose they are organized. To do these things means billions more of expenditure that would swell the number employed and furnish markets at home for nearly all we can produce.

The world needs, and for years will continue to need, the products of our farms, the milk and meats from our herds, the products of our forests and mines, and not a little also from our manufactories.

Now as to men, money and wages, products and markets.

There has been a considerable outgoing of men from this country to the lands of their birth—some of whom will return. Because of manifest abuses our immigration laws have placed wise restrictions on immigrants from other countries, so that hereafter the increase in number of workers, whether skilled or unskilled, will depend in large degree upon increase of our existing population. Because of more exacting education laws, now common in all the states, the annual increase in number of available workers promises to be greatly restricted as compared with what it has been during the last fifty years. This will be con-

spicuously the case in those employments that are attended by hazard to life or health. It foretells higher wage rates than in 1916. Besides, those who have had large experience in industry have observed that not many boys and girls who are graduates of the public schools will engage in manual employments that soil the hands and require the wearing of work-a-day garments. It is true that water is abundant and that soap is cheap, but we are dealing with human nature as it is, not as many would have it.

Economic confusions incident to a state of war, during which millions of men and hundreds of thousands of women were withdrawn from industrial and commercial activities, caused employers to bid high in wage rates. It is also true that, when measured by commodity values, the war-time wage rates were little higher than they had reached in normal "good times," but the psychological effect of figures to a majority of folk is unexplainable. Although a man might be able to buy as much in food and raiment with \$5 as he did during the war time for, nominally, twice or three times as much, when you offer to pay him one-half or one-third less for his service—although the purchasing value of his day wage is as great—he will spurn your offer. His mind is set on the figures, not on the purchasing power of his dollar. This state of mind among workmen in large part accounts for the antagonisms which proposed readjustments of wage terms develop; but the out-spewings of blatant advocates of Socialism and sovietism have also had a powerful influence.

What has been said applies not a whit less to employers than to workmen and workwomen.

During the war period huge profits were made on capital employed in mining, manufacturing and merchandising enterprises. Many plants' establishments were over-extended—many such extensions being paid for out of advance payments or loans made by the government. As there was before the war greater productive capacity than markets could be found for the products at home, and abroad at that time, so now, when the overseas markets are confused and credits are uncertain, it seems clear that we of the United States should concentrate energies on our own country. We must find use of these over-extended plants, mills and mines. Here are markets worth as much as all Europe's combined; here and in Canada and South America are markets hungry for every commodity we can pro-

duce, and more. In addition to our own products we annually buy the products of other countries to the value of over two thousand millions of dollars. Here is the place to concentrate upon. Here are billions of idle capital, millions of unemployed men and women, countless needs for the beginning of new and much needed enterprises. Why go gallivanting to the other side of the world when so much that offers reward for enterprise and industry is here at home? Let employers and employes get together as man to man—and agree to agree before they adjourn. Let them make the terms of agreement just and fair to both sides, and then observe faithfully the terms of agreement. Under such agreements agitators, Bolsheviki and all mischief-makers would "lose their jobs." No one has any right to more than justice, and "For Justice every place a Temple and all seasons Summer." Let us go!—Pittsburgh (Pa.) *Labor World*, February 16.

### RAILROADS AND ROAD TAXES

The growing competition between motor vehicles and railway trains in handling transportation is giving rise to some new problems which will soon call for definite solution.

One of the most important of these is the question of taxing railway property for the benefit of good roads. A case in point is now before a court in Shawnee County, Kansas, and its outcome will be watched with interest by railway authorities and public officials throughout the country.

It appears that the County of Shawnee is constructing a concrete road and has designated the country lying adjacent to the new highway as a "benefit district" upon which special improvement taxes are being levied. It happens that the new hard-surface road parallels the Union Pacific tracks for a considerable distance and the railway property is thus included in the "benefit district."

But the railway officials contend that, instead of being benefited by the road, the Union Pacific is seriously injured by it, since the new public road opens the way for strong new motor competition. It is their contention that the new concrete road will take away much of the railroad's short haul business, both passenger and freight, and they insist that it is unfair to tax them to build up a competitor which will naturally deprive them of business.

The contention of the railroad in this particular instance appears logical. The railroad was built by private capital and is maintained

and operated by private capital. Its competitor, the hard-surface road, is built and maintained by the public. The motor vehicles operating on the concrete road are, of course, privately owned, but they are using public property and pay only a nominal fee for its use. As a part of "the public," the railroad is expected to pay its share of the taxes to keep up the road, yet by so doing it helps to kill its own business.

This particular case is difficult by reason of

the fact that a "benefit district" was created for special taxation. Where counties act as units in appropriating funds for road building, the railroads running through such counties have less complaint against paying taxes for good roads. But as competition increases between railroads and hard-surface roads, we may be sure that the question of how much railroads should pay towards the maintenance of their competitors will become a lively issue. —Houston (Texas) *Post*, February 20.

## Indiana Division Loses General Foreman

Thomas R. E. Miller, general foreman for the Illinois Central at Evansville, Ind., who died January 21, was born July 1, 1863, at Salem, Ind. He was graduated from grammar school at Champaign, Ill., and attended high school at Brockton, Mass., two years.

He entered the Illinois Central shops at Champaign, Ill., as a machinist apprentice March 1, 1880, and finished his last year of apprenticeship at Weldon shops, Chicago. He was sent to Springfield, Ill., as roundhouse foreman in 1886 and was transferred to Amboy, Ill., in 1888. He left the Illinois Central in 1893, going to the Nickel Plate Railroad,

transferred in 1894 to the Denver & Rio Grande Railroad at Pueblo, Colo., and returned to the Illinois Central at Memphis in 1898 as roundhouse foreman. He was transferred late in the same year to East St. Louis. He returned to the Denver & Rio Grande in 1901 at Helper, Utah, remaining until 1905, when he returned to the Illinois Central at Evansville. He remained there as general foreman until his death, completing sixteen years and eight months of service in one shop. Of the forty-two years of his railway life, he served thirty-three years with the Illinois Central.

Mr. Miller married Miss Margaret Binns at Amboy, Ill., in 1894. He is survived by his widow and three sons, Paul E., Warren H. and Howard L.

The large number of floral offerings at the funeral signified the many friends Mr. Miller had made during his lifetime. His wife and family lose a good husband and father, and the Indiana division at the same time loses a valuable employe who will be greatly missed.

Thomas R. E. Miller

### BACK TO NORMALCY

The management has received the following letter from Max Neuberger, 64 West 23d Street, New York City. Writing from Chicago, he says:

"This expression of appreciation is prompted by the splendid running time of the Seminole Limited on which we arrived from Florida this morning at 8:45 on the dot.

"The dining car service was splendid and courteous; the train crew, ditto. Having made thirteen annual trips to Florida and several to the Coast, I am in a position to applaud when applause is due.

"We are surely getting back to 'normalcy' in railway travel, and your road is doing its share."

## Panama Limited Chef Gives Recipes

**S**TERLING WILLIAMS, whose cooking has pleased the palates of thousands of travelers on the Panama limited, is justly famed as one of the best dining car chefs in the service of the company. Chef Williams was born October 12, 1863, and served as a cook eighteen years at the Merchants Hotel, Pensacola, Fla., under Captain Kryger, before coming to the Illinois Central. He is an expert, particularly, in Southern cooking.

At the risk of offending the Home Division by encroaching on its field, we present herewith some of Chef Williams' best cooking suggestions.

### How to Tell Good Fish

Unless perfectly fresh, fish is unfit for use. Care should be taken to see that the gills are bright and red, the scales shining, the eyes clear and the flesh firm and free from any unpleasant odor.

In the New Orleans fish market, the vendors generally clean and scale the fish if requested to do so, but this cleaning and scaling is not to be entirely depended upon because it is rarely thorough, only the heavier scales and entrails being removed. On being brought home from the market, the fish should be immediately rescaled and thoroughly cleansed and washed without soaking in water. It is far better to let the water run over the fish, for thus the smallest particle of blood is removed. This is important in order to have a good, wholesome, savory dish. Then sprinkle the fish on the inside with salt, and set it in the ice-box. If this is wanting, put it in a very cool place, but it is always best for it to remain on ice until ready to use, especially during the summer.

or soft shell crabs, 1 onion, 6 large fresh tomatoes, 2 pints of okra or fifty counted seeds, 1 bay leaf, 1 sprig of thyme or parsley, spoons of butter, salt and cayenne to taste.

This is a great fast day, or "maigre," dish with the Creoles. Hard or soft shell crabs may be used, though more frequently the former, as they are always procurable and far cheaper than the latter, which are considered a luxury.

Crabs are always sold alive. Scald the hard shell crabs and clean, taking off the "dead man's fingers" and the spongy substances and being careful to see that the sand bags on the under part are removed. Then cut off the claws, crack and cut the body of the crab in quarters, season nicely with salt and pepper,

*Kitchen of dining car No. 4000, Panama Limited. From front to rear: Chef Sterling Williams, Second Cook W. Reynolds, Third Cook A. Anderson, Fourth Cook A. Aaron.*

### Crab Gumbo

Needed: A dozen hard shell

put the lard into the pot and, when hot, throw in the bodies and claws. Cover closely, and after five or ten minutes add the skinned tomatoes, chopped onions, thyme and parsley. Stir occasionally to prevent scorching. After five minutes add the okras sliced fine and, when well browned without the semblance of scorching, add the bay leaf chopped fine and the juice of the tomatoes. Pour over it about two quarts and a half of boiling water, and set back on the stove and let it simmer well for about an hour, having thrown in the pepper pod. When nearly ready to serve, season according to taste with cayenne pepper and added salt. Pour into a tureen and serve with boiled rice. This quantity will allow two soft shell crabs or two bodies of hard shell crabs to each person.

### Lemon Meringue Pie

Needed:  $1\frac{1}{2}$  cups of milk or water,  $1\frac{1}{2}$  cups of white sugar, 3 eggs, 1 tablespoonful of flour or cornstarch, 2 tablespoonfuls of powdered (white) sugar, the juice and grated zest of 2 lemons.

Have ready the pie pans with the baked crust. Beat the sugar and yolks well together and add the juice and grated zest of the lemons. Blend the flour and milk gradually, and pour it through a sieve into the eggs. Mix thoroughly. Fill the lined pans with this and set in the oven to bake for twenty or thirty minutes. Add gradually three tablespoons of powdered sugar to the whites of the eggs, beating steadily all the time, and when it is all absorbed, beat it to a stiff froth. Place this over the top of the pie by spoonfuls and then smooth lightly with the spoon. Place in the oven to let it brown.

This is a delicious pie.

### Pecan Pralines

Needed: 1 pound of brown sugar,  $\frac{1}{2}$  pound of freshly peeled and cut Louisiana pecans, 1 spoon of butter, 4 tablespoonfuls of water.

Set the sugar to boil. As it begins to boil add the pecans, which you will have divested of their shells and cut some into fine pieces.

Dining car No. 4000, on the Panama Limited, all ready for the invasion of hungry diners at noon at Chicago. In the picture are shown, left to right, Steward I. Greenberg and Waiters H. Pierce, E. Dedcaux, C. Williams, G. Meriwether and J. Blouin.

Cooks, dining car No. 4000, Panama Limited, left to right: Chef S. Williams, Second Cook W. Reynolds, Third Cook A. Anderson, Fourth Cook A. Aaron.

others into halves and others again into quarters. Let all boil until the mixture begins to bubble, and then take it off the stove and lay it on a marble slab to dry. Be careful to stir the mixture in the recipe constantly until the

syrup begins to thicken and turn to sugar. Then take it from the stove and turn it on the marble slab. Use just sufficient water to melt the sugar. One pound of unshelled pecans will make a half pound of shelled nuts.

## Our New Master Mechanic at Centralia

The photograph herewith is of C. M. Starke, recently appointed master mechanic at Centralia, Ill., St. Louis division, to succeed J. W. Branton, deceased. Mr. Starke entered the employ of the Illinois Central as a clerk in the master mechanic's office at Water Valley, Miss., April 18, 1891. From 1893 to 1897 he served an apprenticeship in the shops. He served as a machinist and gang foreman until September, 1901, when he was appointed night roundhouse foreman. From June, 1902, to 1905 he served as day roundhouse foreman, and then until 1909 as erecting shop foreman.

In April, 1909, Mr. Starke was transferred to the Indiana Southern as general foreman at Indianapolis. From September, 1911, to September, 1912, he was general foreman at Champaign, Ill. Then he served a year as master mechanic of the Mississippi division at Water Valley, and then four years as master mechanic of the Louisiana division at McComb.

In November, 1917, he resigned from the service of the Illinois Central to go to the Missouri, Kansas & Texas as superintendent of motive power. After a few months in that position, he became supervisor of locomotive maintenance in the Allegheny region for the United States Railroad Administration, continuing in that capacity under Regional Director Markham and later under Regional Director Baldwin. At the close of government

control, in March, 1920, Mr. Starke returned to the service of the Illinois Central. He was assigned to special duties in the office of the general superintendent of motive power and remained there until March, 1922.

# Illinois Central System Shows Railroads Are Growing Safer Constantly

The railroads have been making an excellent record in the reduction of fatalities. The reason for this is to be found in the fact that railway men have been trained to give safety precedence over all other things. To them the most familiar rule in the standard book of railway rules reads: "In case of doubt or uncertainty, the safe course must be taken." While railway traffic has greatly increased in recent years, fatalities on the railroads have been decreasing. The Interstate Commerce Commission statistics on this subject for 1921 are not yet available, but the number of fatalities in 1920 was the smallest in twenty-two years, although 1920 was a record year for heavy traffic. The following comparisons with 1911, covering a 10-year period, tell their own story:

Year	Ton Miles Per Cent Increase	Passenger Miles Per Cent Increase	Total Fatalities Per Cent Decrease
1912.....	4.1.....	0.2 Dec.....	1.8 Inc.
1913.....	19.2.....	4.1.....	5.5 Inc.
1914.....	14.0.....	6.2.....	0.8
1915.....	9.6.....	2.5 Dec.....	17.1
1916.....	45.1.....	5.4.....	9.9
1917.....	57.9.....	19.7.....	3.0
1918.....	62.3.....	29.5.....	10.7
1919.....	45.8.....	40.4.....	32.9
1920.....	64.1.....	42.4.....	33.1

In 1920 the railroads carried 16,239,774 passengers to each passenger fatally injured in a train accident. The reader will better appreciate this comparison when it is understood that to load 16,239,774 passengers into 70-foot coaches having a capacity of eighty-eight passengers each would require 184,542 coaches, which would make up a train 2,446 miles long. Trespassing and automobile grade-crossing accidents contribute heavily to the fatalities on the railroads. In 1920, trespassers fatally injured numbered 2,166, while occupants of automobiles fatally injured numbered 1,273. Together these accounted for nearly one-half of all the fatalities on the railroads during the year. Not many would believe that there are nearly as many persons

accidentally drowned in a year as are fatally injured on the railroads. The following table lists some of the commoner causes of fatalities in the United States in 1920:

Cause	Rate Per 100,000 Population
Falls .....	12.3
Automobiles .....	10.8
Burns (not conflagrations) .....	7.9
Railroads .....	6.6
Drownings .....	5.9

The table below shows that the Illinois Central System has maintained its position among the leading railroads in serving the public with transportation and, at the same time, that the fatalities on its lines have decreased in number substantially, the comparison being with 1911 and covering a 10-year period:

Year	Ton Miles Per Cent Increase	Passenger Miles Per Cent Increase	Total Fatalities Per Cent decrease
1912.....	3.6.....	1.9 Dec.....	12.9 Inc.
1913.....	20.2.....	1.0 Dec.....	11.0 Inc.
1914.....	19.2.....	1.1.....	1.8 Inc.
1915.....	24.4.....	9.2 Dec.....	19.0
1916.....	45.6.....	3.2.....	34.7
1917.....	78.5.....	19.2.....	10.4
1918.....	99.3.....	24.6.....	15.3
1919.....	63.6.....	38.6.....	27.3
1920.....	113.4.....	43.0.....	30.7

The number of fatalities on the Illinois Central System in 1921 was the smallest in twenty-four years. In the road service of the Illinois Central System there has not been a passenger fatally injured in a train accident in more than four years. In the suburban service at Chicago, only one passenger has been fatally injured in a train accident in the entire history of this service, which was established in 1856 and which has grown until it now handles nearly thirty million passengers a year.

We believe the public will agree with us that the handling of a heavier business with a smaller number of fatalities is a barometer of railway efficiency. The Illinois Central System pledges renewed effort toward rendering to the public a transportation service of safety and satisfaction, and asks the co-operation of the public.

Constructive criticism and suggestions are invited.

**C. H. MARKHAM,**  
President, Illinois Central System.

### Success Secrets

WHAT is the secret of success?" asked the Sphinx.

"Push," said the Button.

"Never be led," said the Pencil.

"Take pains," said the Window.

"Always keep cool," said the Ice.

"Be up to date," said the Calendar.

"Never lose your head," said the Match.

"Make light of your troubles," said the Fire.

"Do a driving business," said the Hammer.

"Don't be merely one of the hands," said the Clock.

"Aspire to greater things," said the Nutmeg.

"Be sharp in all your dealings," said the Knife.

"Find a good thing and stick to it," said the Stamp.

"Do the work you are suited for," said the Chimney.—SELECTED.

### In Railway Language

Mrs. Carr had the usual good old-fashioned Irish family, and when the ninth one arrived a neighbor lady came in to felicitate, and said: "Well, Mrs. Carr, I see you have another little Carr."

"Yes," she says, "an' sure it's hopin' I am it's the caboose."—R. O. F.

### Good for Live Stock

Alfred P. Thom, now general counsel for the Association of Railway Executives and one of the ablest railway lawyers in the country, got his first training in this kind of work representing a road in Virginia.

During his first year on the job he was amazed by the number of claims filed against the road by farmers for the destruction of cattle. There seemed to be hardly a man in that part of the state whose cow or steer had not wandered on to a railway crossing and been struck dead by a locomotive.

After this had gone on for a long time, a ragged old fellow came in one morning claiming a hundred dollars for the death of a heifer. The price was out of all reason, and Thom knew it as well as the farmer. They argued at length.

"Oh, I see!" Thom burst forth at last. "Down here in Virginia nothing so improves live stock as crossing it with a locomotive!"

first stop, wise birds alight, Harvey and Home-wood commuters pile on. Grand Crossing a blur as old 1451 does 75 m. downhill. Swish, roar, three seconds to pass under Pa. and Lake Shore tracks. Prairie to right, side door Pullmen to left. 103d St. station, tired business men and flappers awake with start. Pullman, shops to left, Bartlett's money moon to right. Kensington, old 1451 stops for a drink as we hike for home and supper.—ROSELAND (W. E. D.) in A LINE O' TYPE OR TWO, *Chicago Tribune*.

**Ye Flapper**

What is a flapper, and why is a flapper? A flapper is a young girl who puts in most of her time looking about to see who is looking at her. She is a flapper because she has nothing else to be. Her work is usually finished before it is begun. Just because she has been named "flapper" does not signify that she is not a good little girl. The word is a sporting term, and means a young duck, but the present and better-known adaptation came into fashion in England a few years prior to the war, at the time, to be exact, when the school girl, tired of remaining bottled up in the background until her mother saw fit to draw the cork, began resolutely to shoulder her elder sister aside in a determination to taste, over-early, the whirl of pleasure. The young and giddy male, at first uproariously scornful, turned to the indignant elder sister and, contemptuously whisking the schoolgirl's bobbed hair, remarked: "Why, she's nothing but a flapper."

The flapper tossed her head, but she continued to flap, strutting up and down the seaside and boulevard promenades in knitted silk sport coat, diminutive hobble skirt, and wielding her swagger stick, and, sad to relate, in a short time the elder sister found herself basely deserted.

It would thus seem that the genuine flapper comes between the ages of, roughly, 15 to 18.

Men, here's the way to escape the sidewalk siren:

She passes you by, holding her bobbed head high in the air, thinking you are going to make a break and say something to her—but take my word and don't do it.

Just after she has passed you, hear her: "Gee, but he's a conceited bird. Wonder why he didn't notice me?"

(Scene changes to next day.) She again sees you coming down the avenue. This time she relaxes her selfish impulse and doesn't hold her head quite so high or walk quite so gracefully as she did the day before. She swishes by—don't utter a word, men—because up at the next block she is bawling you out for not making a wise crack at her, and is also at the same time kicking herself for being a failure. But just hold on—you will see her again next day.

(Scene three—third day.) She has tried every means to draw your attention and has

failed miserably. She murmurs to herself: "This is one guy who doesn't fall as easy as the rest. Gee, but I'll bet he's a cave man! And I just adore that kind—etc., etc." Her cheeks are flushed this time—she does not walk quite so briskly as before, and her diminutive brain fails to function during these few seconds that are required for the two to pass. Unconsciously she drops both her gloves—there's your chance, men—but keep the faith.

Walk up to her and, "Oh—h—h—h, you scared me," she chirps. "I wouldn't have lost them for anything, as Uncle Ed sent them to mother from Despair."

But, gentlemen, while you are negotiating this proposition, don't let your sweet patootie see you walking with that Flapper or your name is MUD with her next Wednesday night!

As a friend of mine once remarked: "A flapper is a female cake-eater." Judge Martin also added his wits to the dominating epidemic of bobbed hair when he said, "Short hair denotes an abbreviation of the brain."

Don't waste your legs running after a flapper—you'll need them to kick yourself with afterward.—C. M. S.

### But He Got On Somehow

"Does this train make any stops between here and Philadelphia?" asked a rather ragged passenger who had come aboard at New York.

"None whatever," replied the conductor with pride. "This is a through express—wouldn't stop for anything."

"That's all right, then," returned the passenger, settling back in his seat with a relieved air. "You can put me off when we get to Philly. I haven't any ticket."—*American Legion Weekly*.

### Chicago Etchings: The Engines

Portly fellows, sedately smoking; busy black ants in frenzy; lean, graceful hounds of the rails; gossipy sisters, hissing and glaring; black bulks, wheezy tramps, diseased reprobates, old-maidish slatterns; knights of the road, white-plumed and trembling with lust for speed and the smart of the wind. The vibrant language of bells. The speech of whistles deep in the night. Hot oil and the smell of steel bodies. Black breath wickedly belched at innocent towers. Sulphurous souls of symbolic steam, vindictive cinders and derisive snorts. Play things and persecutions.—NEWCOMER IN FROM PILLAR TO POST, *Chicago Evening Post*.

## Good Old Memphis

In transmitting the following verse to the Memphis (Tenn.) News Scimitar, L. S. Pope, general manager, state board of administration, wrote: "Enclosed you will find a piece of poetry written by one of our prisoners at the penitentiary. This being a characteristic eulogy on the city of Memphis, I thought you might be interested to get it." The verse was written by Willie Pearson, alias "Sitting-up-straight."

—1—

De days am sad and dreary,  
Dis Eastland sho am black and cold.  
Mah heart feels lonesome like, weary—  
Like a lamb what's lost from out de fold.

If I wuz jist back down in Dixie,  
In de land o' cotton, whar I uster be—  
Jist once more back in Memphis,  
Good old Memphis, Tennessee.

—2—

White folks, I was bawn in Memphis,  
And done live dere all my life,  
Dat's whar I buried my mammy,  
And dat's whar I married my wife.  
I got friends dere by de dozen—  
White and black—to stan' by me,  
If I could make it back to Memphis,  
Good old Memphis, Tennessee.

—3—

I heerd dem nigger strangers talkin'  
Bout de wages I could get—  
If I'd go up North long wid' em;  
So, like a fish, I up and bit.  
How long go wuz it, nigger?  
Lawsy mussy, limme see—  
Marse Ed Crump wuz mayor of Memphis,  
Good old Memphis, Tennessee.

—4—

Cose sometimes I gits a letter,  
Telling me de latest news,  
An one fool nigger up and write me—  
Memphis folks, done cut out booze.  
Cose I knows he's tryin' to string me,  
But I'se got sense nuff to see  
Dat such as dat don't go in Memphis,  
Good old Memphis, Tennessee.

—5—

I wish dem niggers, down on Beale street,  
Could jist haf no de fix I'm in,  
Dey'd jist git up one more crap game  
And up and send me what dey win—  
Nuff to buy a one-way ticket,  
Dat's jist all 'twould take for me,  
Jist to git me back to Memphis,  
Good old Memphis, Tennessee.

—6—

I kin hear dem niggers strumming  
On de banjo soft and low,  
An' a comin' down de river—  
I can hear Kate Adams blow.  
She's due now, now at de landin',  
And I'm blue as I can be,  
Cause I, too, am due in Memphis,  
Good old Memphis, Tennessee.

—7—

When I goes to church on Sundays  
An' hear de preachin' and de songs,  
I ax de Lord for jist one thing—  
To git me back whar I belongs.  
An' when Gabriel toots his trumpet,  
An' de las' day dawns for me,  
Jist to let me die in Memphis,  
Good old Memphis, Tennessee.

—8—

An' when I gits to heaven,  
An' a passin' down de line—  
To view dem glory mansions,  
All made up of stuff dat shine—  
I'se gwine to tell mah Marster,  
If tain't no place for me—  
He can send me back to Memphis,  
Good old Memphis, Tennessee.

# Five Old-Timers of Our Indiana Division

*List Includes Agent, Chief Accounting Clerk, Section and Blacksmith Foremen and Bridge Carpenter*

THE Indiana division of the Illinois Central System has five men in service who have been employed for a total of 211 years, or an average of 42.2 years each. Three of these men entered the service on that line when it was the Peoria, Decatur & Evansville Railroad, and continued their work when the road was purchased by the Illinois Central.

Milton Dorsey, agent at Mattoon, Ill., heads the list with forty-seven years of service. He is eligible to be placed on the pension list, but his retirement has been indefinitely postponed, much to his pleasure. A. C. Wilcox, chief accounting clerk at Mattoon, has been in the service forty-two years, and says that he has spent most of that time at figures. August C. Krietemeyer helped construct the P. D. & E. near Armstrong, Ind., in 1880, and has continued in section service in that district since. C. T. Miller, blacksmith foreman at Mattoon, entered the service of the P. D. & E., in 1881. He started his training as a blacksmith when he was 10 years old. Charles F. Buchanan, bridge carpenter, is said to have bored 3,000 miles of holes during his forty years of service both with the P. D. & E. and the Illinois Central.

## Still at Work and 71 Years Old

Milton Dorsey, agent at Mattoon, Ill., known because of his courtesy as "the Chesterfield of the Indiana division," passed his seventieth birthday April 1, 1921. Mr. Dorsey has served the Illinois Central Railroad continuously for forty-seven years.

His first employment with the company was as baggageman and check clerk at El Paso, Ill. He remained in that position six years and made many friends among the railway employes. One of his best friends was Conductor Brinkman.

Burton E. Nichols, deceased, was the agent at Kankakee, Ill., then. Mr. Nichols had expressed his need for a ticket clerk at Kankakee, but it was some time before the company gave him authority to employ one. Conductor Brinkman heard that Mr. Nichols was in need of a ticket clerk, and told him that he knew of a young man who was deserving of the position. Mr. Brinkman told the agent

of young Dorsey, baggageman and check clerk at El Paso, and it was not long before the young man was employed in Kankakee as yardmaster. This was a temporary position in order that Mr. Dorsey would be available when the time came that he could be made ticket clerk. It was four months before Agent Nichols was able to employ a ticket clerk, but at the end of that time Mr. Dorsey was given the position.

## Formed a Life-Long Friendship

A life-long friendship between Mr. Nichols and Mr. Dorsey was born in the ticket office at Kankakee.

Mr. Dorsey's efficient work soon attracted the attention of the railway officials, and at the end of five months he was appointed agent at Chebanse, Ill. He had been there five years when he was made the acting agent at Gilman, Ill. After a year at Gilman, Mr. Dorsey was offered the agency at Effingham, Ill., and at Chebanse. He accepted the latter, and remained there two years. At the end of that time, he was transferred to Odin, Ill. He had been the agent at Odin but one year when he was called to Paxton, Ill., to relieve the agent there for six months. He remained as agent at Paxton for twenty-two years. July 16, 1914, Mr. Dorsey was transferred to Mattoon, Ill., as agent, and he retains that position today.

Mr. Dorsey smiles when he recalls the freight trains of his early days of railroad-ing. The longest trains were only twelve cars, and the speed was about fifteen miles an hour. Later, when the large yellow cars with the red cross on their sides were brought into service they were considered monsters. These new cars had a capacity of 30,000 pounds, while the old cars would carry only 24,000 pounds.

## Agents Had the Keys to the Cars

In those days the agents were the only persons who could get into the freight cars. Each agent had a key, much like those used on skates today, with which he could open the door.

Mr. Dorsey's early experience as an agent was different from that of today, he says. His first salary was \$40 a month, and he worked fifteen hours almost every day.

His son, R. B. Dorsey, was freight-house

foreman at Mattoon for six years. He is now in Phoenix, Ariz.

Mr. Dorsey has been a valuable employe of the Illinois Central System, and the indications are that he will give several more years of good service.

#### **A Lifetime Spent at Figures**

A. C. Wilcox, chief accounting clerk at Mattoon, has spent the greater part of forty-two years of his life at nothing but figures for the Illinois Central Railroad, he says. He entered the service of the company in April, 1880, as baggageman at Springfield, Ill., when he was 19 years old. His older brother held that position before him.

In 1887 Mr. Wilcox became accounting clerk in Superintendent T. J. Hudson's office, and his ability won for him the promotion to chief clerk the next year. The superintendent's office was moved to Clinton in 1893, and Mr. Wilcox remained in that city as chief clerk until 1903, when he was transferred to what was then called the Freeport division as chief clerk to the superintendent.

#### **Made Chief Accountant in 1908**

After he had been in Freeport but two months, he accepted a position as chief clerk to the assistant general superintendent. He was given this position on account of the illness of the former chief clerk, and was relieved four months later when the chief clerk returned to work. Mr. Wilcox was then transferred to Clinton as accountant, but was there only a short time when he was sent to Mattoon as chief clerk to Superintendent R. B. Starbuck. That division was then called the Peoria division.

Mr. Wilcox remained as chief clerk on that division until March, 1908, when he became the chief accountant at Mattoon. He has continued in that position since.

Mr. Wilcox says that in his early days as chief clerk there were no trainmasters. The chief clerk had the most of that work to do. When he was chief clerk on the Springfield division he also had the duties of roadmaster to perform for a long time.

#### **Helped to Build the P. D. & E.**

August C. Krietemeyer, section foreman at Martin, Ind., has been in the railway service in that neighborhood since the line was first constructed. He was born June 17, 1862, on a farm near Armstrong, Ind.

When the P. D. & E. started construction of its line between Armstrong and Summit in 1880, Mr. Krietemeyer drove a team to a

scraper. The owner of the team received \$3 a day, and Mr. Krietemeyer was paid \$1.25 for driving it. He rather liked his introduction to the railway work, and the next year, when the line was completed, he obtained a position on the section near Armstrong. His salary was increased to \$1.45 a day. At that time, the section foreman's salary was \$50 a month, he says.

Mr. Krietemeyer proved himself to be such a valuable man to the P. D. & E. that he remained as a laborer only two years. At the end of that time, he was made a section foreman. He attributes his promotion to an incident that happened during the latter part of the first year of his employment as a laborer.

#### **How He Won Promotion**

There were eight men on the section at Armstrong. In those days the ballast was mud, and the track had to be raised frequently to fill in under it. Raising the track then was much more tedious than now. It was pried up with long poles.

Mr. Krietemeyer recalls one hot day when six rail lengths of the roadbed had to be filled in on the section where he was employed. The day was so hot and the work so trying on the men that after the track was raised they had no energy left to do the filling. The afternoon train was to pass over the line, but the men disregarded it, and lay down in the shade near by to escape the intense heat of the sun.

Mr. Krietemeyer took his shovel and packed the mud under every fourth tie of the raised track while the men were resting. He says it seems impossible now that he was able to do it. Packing the mud under the ties with a shovel was very hard work, he says.

He had completed the task single handed and had lowered the track to its proper place by the time the afternoon train was due. The train arrived and passed over that section safely.

The next year Mr. Krietemeyer was made the section foreman at Martin, Ind.

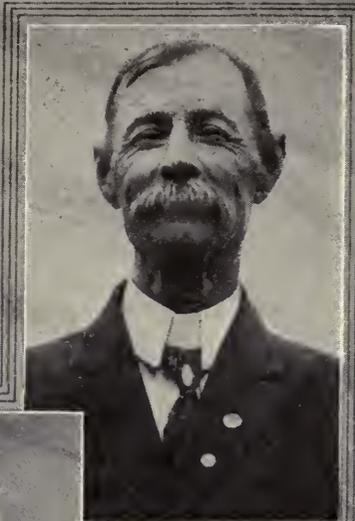

Steel rails were in use when Mr. Krietemeyer first started railroading, he says, but the side-tracks were all iron rails. His older brother worked on the section at Martin under him for about two years, and was then promoted to section foreman at Armstrong. He remains in that position today.

#### **Has Reputation as Sausage Maker**

Many changes were made when the Illinois Central took over the P. D. & E., Mr. Krietemeyer says. The mud ballast was replaced by

C. F. Buchanan

A. C. Kreitemeyer

Milton Dorsey

A. C. Wilcox

Chas. T. Miller

gravel when the P. D. & E. went into the hands of the receiver. When the Illinois Central bought the road, still better ballast was used. The salary of almost every man in the service was increased when the new owners took charge. The same trains were in operation for the first year; then the Illinois Central replaced the light rails with heavy ones and operated its own engines over the line. The heavier trains were operating in 1905.

Mr. Krietemeyer has two sons working on his section. The older has been in the service fifteen years, and the younger eleven years. His section gang is composed of four men, but only one, his oldest son, who is married, is employed steadily. Each of the others works one day and is off two.

Mr. Krietemeyer owns his home at Martin. He raises chickens and uses the right-of-way as a garden. His reputation as a sausage maker is much talked of on the Indiana division. Each year he kills four hogs for his meat and lard supply. From the hogs he killed this year, he obtained twenty-six gallons of lard, two tubs of sausage and enough meat for his family of three for a year. He fries his sausage, and then packs it in 8-gallon jars with lard over the top to keep it from drying out.

#### A Blacksmith Since 10 Years Old

C. T. Miller, blacksmith foreman at Mattoon, Ill., has been a blacksmith since he was a lad 10 years old. He has now passed his seventieth year, and will probably be placed on the pension list before long. He was born March 5, 1852, at Morrow, Ohio.

Mr. Miller's grandfather, father and brother were all blacksmiths, and they worked together in a shop at Rochester, Ohio. When he had reached at the age of 10, he stood on a box and pumped the bellows to the forge.

When the Civil War began, Mr. Miller's grandfather played a drum for a company of local soldiers while it drilled, but his business at the blacksmith shop soon demanded all of his attention. In 1864 his grandfather gave him the drum and told him to take his place with the company. Mr. Miller says that he had the thrill of his lifetime when he strapped that drum around his waist and stepped out with the soldiers. He had watched his grandfather play and had practiced on the drum while it was not in use until he had really become a good drummer. Every day he went out and played while the soldiers marched.

#### Off to Camp With the Soldiers

Then the day came when that company was

to go to camp. Young Miller was only 12 years old then, and his parents considered his joining the army as out of the question. But the soldiers wanted their drummer boy, and when the troop train pulled out of Rochester, the captain lifted the 12-year-old drummer boy to the coach and carried him off to camp.

The company went to Camp Nelson, where it remained for eighteen months. When the war was over, young Miller returned to his home at Rochester.

In 1868 many families were moving to the West. The romance that must lie hidden in such a vast undiscovered country as the West appealed to the younger persons. Those of Rochester were affected just as much as were thousands of others. Mr. Miller joined twenty-seven of his friends who were planning a trip west. They obtained nine wagons and started their horses toward the setting sun with no definite destination in mind.

#### Started Farming at Arcola, Ill.

Many wagons moved along slowly and close together for miles along the road leading west, Mr. Miller says. Occasionally one would drop out of the line and move off into a field, where a camp was made.

As the travelers from Rochester were in no particular hurry, they often camped for two or three days when a good place was found. After each camp was over, the nine wagons had to wedge their way again into the continuous line on the road.

At Arcola, Ill., the travelers from Rochester came to a halt. Many farm hands were needed there, and there was an abundance of land that could be obtained almost for the asking. The farmers there told them to pick out a piece of land and start farming.

Mr. Miller stayed there and farmed three years. At the end of that time, he had 500 bushels of corn, which he sold at 10 cents a bushel. One could have all the potatoes he wanted there if he would carry them off, he says. When Mr. Miller had disposed of his crop, he says, he had just enough money to buy an overcoat.

#### Blacksmith Foreman Since 1888

In 1872 he returned to the blacksmith trade. He worked in the shops of two or three different railroads, and then accepted a position in 1881 as a blacksmith for the P. D. & E. at Mattoon, Ill. A friend was the blacksmith foreman there at that time, and he persuaded Mr. Miller to accept the position.

The training he had received under his grand-

father and father at the shop in Rochester had fitted Mr. Miller to be one of the best blacksmiths. He was made blacksmith foreman at the Mattoon shops in 1888, and he has retained that position.

Throughout his many years of experience as a blacksmith, Mr. Miller was constantly on the lookout for improvements and new inventions. As new power was devised, he employed it in his shop. When oil welding was first brought into use, he went to Pittsburgh to learn of the application, brought the information back to his shop, constructed a similar apparatus and employed oil welding. It has been the same way with many of the later improvements.

Mr. Miller has a son who served as a blacksmith apprentice for the Illinois Central Railroad. He is now a blacksmith at Indianapolis, Ind.

### He Has Bored Miles of Holes

Friends of Charles F. Buchanan, bridge carpenter on the Indiana division, say that he has bored 3,000 miles of holes during the time of his railway employment. Mr. Buchanan says that the estimate sounds a little too high to him, but he agrees that he has bored many more holes than he will be able to bore again.

Mr. Buchanan was born May 1, 1856, in Bass County, Virginia. He entered the service of the P. D. & E., predecessor of the Illinois Central, January 12, 1882, as a bridge laborer at Sand Creek, Ill., and it was at that place that he first started boring holes. His first position was as auger man and flagman on a bridge gang.

The first bridge Mr. Buchanan helped to construct, he says, was made almost entirely of white pine. To build one out of that material now would, in his terms, cost a lot of money.

There were no iron bridges then, and the wooden structures were often swept away by drift that gathered around the supports. High water nearly always meant destruction to bridges on the line, he says.

### How Early Bridges Were Built

In those days, the bridges had 16-foot openings with 2-ply cords and 4 pieces of timber to the opening, the timber being 7x16 inches and 16 feet long. And they were open-top. There was about a foot of space between ties.

During the first year of his employment, the wooden bridge at Greenup, Ill., gave way under the weight of a freight train, he says, and eighteen cars of flour were hurled into the water. Much of it was saved by the fact that a protecting coat formed around the majority of the

sacks and kept out the water. That which the shipper did not salvage was carried off by the employes.

There are still many wooden bridges on the Indiana division, but Mr. Buchanan says it seems to him that, where drifts are most likely to catch, the company has replaced the wooden structures with iron ones. The first iron bridge on the division was erected in 1884 at Black Creek. His arm was injured while that bridge was being constructed.

In the early days of his employment, Mr. Buchanan says, the cattle guards were pits dug in the ground. The construction of one required the labor of several men for a day.

### An Innovation in Switches

Stub switches were in use every place then. A split switch was an unheard-of thing. He says that his gang pumped a handcar six miles to see the first split switch that was installed.

After two years of employment as a laborer, Mr. Buchanan was made a bridge carpenter.

Later Mr. Buchanan was given a position on a pile-driver. He had learned to splice rope under an old sailor at Pekin, Ill., and he kept all the ropes of the line spliced. Later, when wire cables were brought into use, he learned to splice them.

Mr. Buchanan remained on the pile-driver for about twenty years. During most of that time, Vick Higgins was the engineer. Mr. Higgins could not hear, Mr. Buchanan says, and drove the pile-driver entirely by signals. He was considered the safest pile-driver engineer on the road. Mr. Buchanan says that his confidence in Mr. Higgins was so great that he would ride the hammer up to the top instead of climbing the ladder.

### Hard Work During Flood of 1913

When the Illinois Central took charge of the north end of the P. D. & E., the pile-driver on which he was employed was ordered to Paducah, Ky., to assist in building track between that place and Cairo, Ill. Pat Ladon was the roadmaster then, and George Hubbard was the bridge supervisor, he says.

Mr. Buchanan was a hard-worked man during the flood of 1913. For two weeks he had no dry clothes, and he stood on his feet at work as long as possible.

In 1917 Mr. Buchanan's leg was severely crushed while he was working on a washout near Peoria. He was in the hospital for thirty days and then returned to work.

Mr. Buchanan says that he has helped put in some of the bridges on the Indiana division as many as four times.

## Only Two Runs in 35 Years as an Engineer

*Ed M. Coe Has Pulled the "Merry Widow" Between McComb and Canton, Miss., Almost Quarter of Century*

FOR twenty-three years Ed M. Coe, engineer on the Louisiana division, has pulled the "Merry Widow" (Nos. 23 and 24) between McComb and Canton, Miss. He was promoted to engineer thirty-five years ago last October, and the "Widow" is the second run he has had as an engineer. His first was on a local freight train, Nos. 96 and 97, between Hammond and McComb.

Engineer Coe has been in the service of the Illinois Central a little more than forty-three years. He was 15 years old when he got a job in the shops at McComb, and his first employment was scraping rust from pieces of metal. Nick Greener, now deceased, was the master mechanic at McComb then, and Louis H. Kell, who is now on the pension list and lives at McComb, was general foreman. For four years Ed Coe worked around the shops, first at one occupation and then at another. When he went on the road as a fireman, in 1883, he knew as many angles of caring for a locomotive as could be learned in a shop.

After a little more than three years of firing he was made an engineer.

### Keeps a Tank of Goldfish

Mr. Coe has a number of recreations. When he arrives in Canton at 9 o'clock in the morning, with the "Widow," one of his first duties is to look after his aquarium of goldfish. For a good many years he has been developing a tank of goldfish at the Canton roundhouse, and there are more than 200 finsters in the pool now. Two days out of three he is on the road, and on the third day he gives attention to his garden, which comprises an acre of ground in McComb.

His chief delight, of course, is his locomotive. He has recently been assigned to engine No. 1055, and no father was prouder of his first-born than Engineer Coe is of No. 1055.

"If you love horses," he said in discussing his engine, "you may understand how we feel about our engines. Sometimes we think these inanimate things actually have life, that they know when we touch them."

Engine No. 1055 and her veteran pilot. On the gangway is Ernest P. Jones, fireman. The inset shows Engineer Coe—and his Shrine emblem.

Not the least of his pleasant diversions, by any means, is his lodge. For seven years Mr. Coe has been a Shriner, and his chief recreation is the leave of absence which he obtains once in a while to attend a Shrine meeting at New Orleans. He expects to be in New Orleans in April for the conclave of the Grand Commandery, Knights Templar. In the accompanying photograph of Mr. Coe the reader will note the Shrine emblem which he carries just below the window of his cab. It is kept so brightly polished that it radiates the sunlight.

#### Enthusiastic for the Illinois Central

There is conviction in Mr. Coe's voice when he declares that the Illinois Central is the finest railroad in the world. He loves to tell of the progress it has made, of the condition of the track now and at the time he began running an engine, of the fine, upstanding men he has known and worked with. You'll have to use a fine-tooth comb on the Louisiana division

to find a more enthusiastic booster for the Illinois Central than the "Merry Widow's" pilot.

"Next to my chance for a life hereafter, I believe my greatest anticipation is the day when I can retire under my pension rights. I long for my pension, as much as I hate to think of giving up active service," says Mr. Coe.

When Conductor William Trafton of Canton, about whom an article appears elsewhere in this number, first began running as a brakeman on the Louisiana division, Engineer Coe pulled his train between McComb and Hammond. Conductor Trafton's northbound run now is No. 24 between New Orleans and Canton, and over a portion of that trip Engineer Coe is at the throttle.

Ernest P. Jones of McComb, who is shown as the fireman on No. 1055 in the accompanying photograph, ranks as an engineer, and has himself been running engines a decade. His present employment comes about through the reduction in forces because of business conditions.

## SOME OF OUR DISTINGUISHED PATRONS

Governor John J. Blaine of Wisconsin and party on way to New Orleans February 25. Photograph taken by staff photographer at Champaign, Ill. Left to right: Mrs. C. R. Williams, Mrs. John J. Blaine, Governor John J. Blaine, Mrs. J. J. Quill, Colonel G. E. Seaman, Mrs. Robert B. McCoy, Colonel J. J. Quill, Colonel George O'Connell, Colonel Glen Garlock, Colonel C. R. Williams, Colonel W. M. Lee, General Robert B. McCoy, Colonel Smith and Flagman A. Lackman.

## What Patrons Say of Our Service

### Three Kinds of Transportation

The following letter was written to President C. H. Markham by A. E. Weinstein, an attorney of Charleston, Miss.:

"You will no doubt be very much surprised to receive this letter, but I feel it my duty to express my appreciation of the wonderful service of the Y. & M. V. Railroad. You are certainly to be congratulated upon having such competent employes on your road from Charleston to Phillip.

"I was on my way from Clarksdale to Charleston, last Wednesday, and had to change trains at Phillip. My recollection is that there were only two white passengers out of Phillip, and only one, the writer, out of Tippo. When we encountered extremely high water between Cowart and Charleston, which caused a wash-out on your line for some distance, your capable and efficient conductor, Major Jeff Williams, realizing the necessity for my reaching Charleston, consented to carry his train as far out into the water as it was possible to do.

"Your supervisor, a Mr. Meeks of Tutwiler, Miss., a gentleman whom I had never seen before, was called to the high water. Mr. Meeks was advised of my anxiety to get home by Conductor Williams, and he brought a hand car and three section hands there and carried me as far out as it was possible on a hand car. We were then out in the middle of what looked like an ocean; water running over the roadbed had washed out a good deal of the track, and it looked as if we were there to stay.

"A negro section hand, realizing that I weighed only about 130 pounds, requested me to get on his back, and he carried me in this way, in water up to his hips, for a distance of more than half a mile, assisted by Mr. Meeks.

"I had missed my breakfast that morning, and on account of the delay I did not reach home until long after the noon hour. The noon hour had passed when the train had gone as far as it could out into the overflow, and the members of your train crew invited me to dine with them in the express car, where one of the best meals I ever sat down to was cooked and served.

"If this was not service, then I do not know the definition of the word. By having been transferred in the manner above set out, I

reached my office in time to fill an important engagement.

"I am sure your employes would be surprised to know that I have written this letter, but I thought you would be interested in knowing the kind and character of service that you are getting from your employes, and the service they are rendering the public."

### Observed Our Policy of Service

The following letter was written to President C. H. Markham by T. E. McGrath of the McGrath Sand and Gravel Company of Lincoln, Ill.:

"My brother and I have just returned from a very pleasant trip to New Orleans, Miami and Jacksonville, Fla., traveling from Lincoln to New Orleans and from Jacksonville to Lincoln via your line.

"We have studied with keen interest the policy of courtesy and efficiency you have adopted and your methods of keeping the public in touch with your activities through the press and other mediums, and have in a small way applied your methods in our business.

"We were never more courteously treated than we were on your trains—not only by your agents and the trainmen but even down to the Pullman porters. This information is given to you, for doubtless it will be gratifying to learn that the things you are advocating have permeated down through your organization and are becoming more firmly seated every day. I do not believe in flattery, but I do believe in giving credit where credit is due, and also because of the fact that we are an industry of your line and are interested in the success of your company, I take this opportunity of writing to you."

### Interest and Courtesy Marked Trip

The following letter was addressed to President C. H. Markham by J. C. Willever, vice-president in charge of the commercial department, Western Union Telegraph Company, 195 Broadway, New York City:

"In expressing my thanks for your courtesy in arranging the transportation of the company business car No. 100 over your road to New Orleans; I would be remiss in my duty if I failed to mention the exceptional interest and courtesy from all concerned which marked

the trip from beginning to end. I believe that this is characteristic of Illinois Central service at the present time, and I am sure that it will bring large returns, if indeed this is not already evidenced by the train movement, which was perceptibly heavier than on other large systems over which I have recently traveled."

### Good Work on the Seminole

The five engineers who handled the Seminole Limited from Chicago to Birmingham February 8 and 9 have been informed of the compliment to them contained in the following letter from G. J. Bichl, 1120 Chestnut Avenue, Wilmette, Ill., to President C. H. Markham:

"My wife and daughter are in St. Augustine, Fla., having left Chicago on February 8 on your Seminole Limited.

"My wife particularly is not in the best health and rarely sleeps, en route, on trains; at least, I do not recall the incident. Upon their arrival, my daughter wrote me immediately, elaborating upon the wonderful service accorded them while en route, particularly commenting upon the considerateness of the engineer of your train carrying them, her remarks as follows:

"Mother enjoyed the trip, and it was such a clean, smooth roadbed we traveled upon. She was actually wishing she could go up to the engineer and thank him, to tell him how nicely he ran the train. It was really remarkable, compared with the other roads we traveled upon, the way this engineer stopped and started our train, absolutely devoid of any jerking whatever."

"If it is consistent with your policy, I shall consider it a special favor to learn his name and address, for the purpose of sending him a slight contribution for his considerate work.

"You are to be complimented upon the discipline and courteous consideration shown by all your employes, and this bespeaks profusely your administration, which if continued spells none other than success for your road, which it so richly deserves. Keep up to the good work.

"I shall not hesitate to acquaint any of my friends visiting points on your line to travel over the Illinois Central for comfort and service."

### Attention to Sick Woman Praised

The following letter was received by J. V. Lanigan, general passenger agent at Chicago.

from L. C. Lord, president of the Eastern Illinois State Normal School, Charleston, Ill.

"I beg to call your attention to the unusual courtesy and kindness of the Pullman conductor and the two train conductors on February 18 on Train No. 7 to a sick woman and her friends who took the train at Mattoon, Ill., for Memphis, Tenn. They did all that a relative or a friend could have done—much more than any one could have asked from them. I should like to have their names and addresses if not too much trouble for you.

"Mr. Lucas, the efficient and accommodating agent at Mattoon, also did everything possible to make the journey comfortable."

Mr. Lanigan informed Mr. Lord:

"The Pullman conductor in charge of Train No. 7 on the date in question was W. E. Dell, who can be reached in care of F. P. Brown, district superintendent, Pullman Company, Chicago.

"There were three train conductors who had charge of the train in question between Mattoon and Memphis: Conductor J. J. Cavanaugh, care of Station Master, Illinois Central Railroad, Chicago, Ill., was in charge of the train from Chicago to Centralia, Ill.; Conductor Van Smith, care of Trainmaster, Illinois Central Railroad, Centralia, Ill., was in charge of the train from Centralia, Ill., to Cairo, Ill., and Conductor J. M. Northcott, care of Trainmaster, Illinois Central Railroad, Memphis, Tenn., was in charge of the train from Cairo to Memphis."

### Liked Our Dining Service

Among letters recently received by C. B. Dugan, superintendent of our dining service, is the following from F. W. Lincoln, 414 Security Building, Los Angeles, Cal.:

"The writer, with two friends, used your Panama Limited from Chicago to New Orleans on part of the return trip from the East. To say that we were all pleased with the service on dining car No. 4000 is to put it mildly. The writer has traveled all over this country and Canada many times, and he can safely say that he was never in a dining car or on a train where such high-grade service was accorded the traveling public. The steward of dining car No. 4000, while a very quiet man, knew his business thoroughly and gave us every attention. You may rest assured that any time the writer is able to say a good word for the Illinois Central he certainly will do so."

Maintenance

Department

# Material Means Money

## Save It

### Spark Plugs

**T**HE ORDINARY spark plugs used on our motor cars do not appear to represent a very large item of expense when we consider them singly, as most of us do, but it is a different matter when we take into consideration the number used annually over the system.

Thirty-three thousand twenty spark plugs were purchased and used on the Illinois Central during the past four years at a cost of \$16,701. This means that twenty-seven spark plugs were used every working day. As the average cost of each plug was a little more than 50 cents, the daily expense for this item alone was more than \$13.50.

We have 1,600 motor cars in service, about 800 of which are equipped with two engines each. This makes a total of approximately 2,400 engines requiring spark plugs. From this it will be noted that the average life of each spark plug was only 87 days. As an example of the service that should be obtained, one section foreman on the Northern Lines has had one spark plug in use for fifteen months.

By the proper use of spark plugs we can reduce the purchase of new plugs at least 50 per cent. In support of this statement, 362 discarded and damaged plugs were collected and inspected, with the following results: 63, or 17 per cent, needed cleaning only; 252, or 70 per cent, were repaired; only 47, or 13 per cent, were scrapped. The total cost of reclaiming 315 plugs was \$51.89, or a little more than 16 cents each. It is evident from this that many spark plugs are being scrapped that could be continued in service.

Varying the spark gap on plugs is the cause of many igni-

A spark plug saved is half a dollar earned.—Poor Richard III.

tion failures, and often a plug is scrapped when it could be quickly put in good order by adjusting. The spark gap is of particular importance when using a poor grade of gasoline. In cold weather, the points should be spread apart about half the thickness of a dime.

Spark plugs should be carefully handled when they are removed for cleaning or other purposes to avoid breaking the porcelain or damaging them otherwise. They should not be screwed too tightly into the cylinder, especially if the engine is hot, or they will be hard to remove and the expansion of the plug may damage the porcelain.

New spark plugs should be carefully handled to prevent damage to porcelains and points. All old plugs should be saved and turned in to the supply car for repairs.

Remember that, when you waste or throw away a spark plug, perhaps hundreds of others are doing the same thing. In the aggregate the loss is a serious matter.

### Spring Cleaning

Frequent cleaning saves time and strength. Do heavy cleaning a little at a time, and the bugbear of spring and fall housecleaning disappears. It is not always practicable, however, to clean piecemeal. Probably at some time in your housekeeping experience, the decorators have knocked upon the door, trailing boards and ladders and pails. You were not expecting them quite so soon, and confusion ensued. Various hues of calcimine thereafter rioted in the kitchen sink. The man of the house wore a perplexed and helpless air. And when these disturbers of domestic tranquility had departed, you sat down upon a pile of rugs and viewed the wreck of home, sweet home, wondering just where to begin. Try to have a definite time set for the decorating. Then, with a little advance notice, the housecleaning may proceed in a systematic manner. Curtains and draperies are taken down, rugs rolled up, pictures removed from the walls, and bric-a-brac stored in a safe place until calcimining, painting, papering, and wall cleaning have been finished.

A little kerosene added to the water will lighten the labor of washing woodwork. Rugs should be taken out of doors, placed right side down, beaten with a flat carpet beater, swept, turned right side up, and swept again. Upholstered furniture may be beaten with a flat carpet beater, or cleaned with a vacuum cleaner. Windows and mirrors may be washed with water to which ammonia, washing soda, borax, or kerosene has been added, and rubbed briskly with paper, cloth, or chamois. Mattresses should be taken out of doors and beaten with a flat carpet beater, then brushed with a whisk broom. Vacuum cleaning is excellent for mattresses. Dust may be removed from the coils of the open bed spring with a long-handled brush. Box springs should be brushed, or cleaned with the vacuum cleaner.

While on the subject of cleaning, have you discovered what a veritable treasure the broom closet is? A built-in closet is desirable, but an

Introducing our Home Division editor, who contributes herewith her twelfth successive budget of information for the women readers of the *Illinois Central Magazine*. Miss Nan Carter (formally Anne G.) is employed in the company's law offices at Chicago as secretary to Special Attorney G. A. Dupuy. As well as being a practical cook and a home body, she is a most efficient stenographer and secretary, a thorough student of good English, and exemplifies in her own work the good precepts which she places before us in her department of the magazine. Miss Carter is a native of Chicago, has had considerable collegiate work—particularly along literary lines—and is a loyal member of the Illinois Central family.

inexpensive wardrobe will answer. Holes bored in the door provide ventilation. On the high shelf, cleaning preparations, furniture polish, and clean dust cloths are stored. (Incidentally, dust cloths should be washed as soon as they become soiled. Mindful of fire prevention, do not keep oil dust cloths in the house.) The space below the shelf is partitioned by a wide board into two compartments. In the space on one side of the partition, pails and short-handled brushes, whisk brooms, and the like, may be stored; on the other side of the partition, the carpet sweeper, vacuum cleaner, long-handled brushes, brooms, and mops. Screw-eyes are fastened to the handles of cleaning implements so that they may be hung up. The dust pan is placed conveniently (and what a comfort is the long-handled type of pan!) On the back of the door is a hook for the carpet beater.

The spring housecleaning completed, preventive measures to keep dirt out of the house should be employed. Clean the walks, steps, porches, and sills often; use dust screens on the windows near the ground; provide mats and scrapers outside the door; and on rainy days lay a newspaper just inside for muddy overshoes.

If you are one of those women who "just hate housework," get at the root of your dislike. It may be that your methods are wrong or your equipment is inadequate. Plan a working schedule. Of course, certain tasks must be side-tracked now and then, but do your best to adhere to schedule. Distribute the heavy cleaning through the week. Dispose of useless ornaments which add to the labor of dusting. Supply yourself with the best cleaning implements you can procure. Provide a place for everything, and obtain the co-operation of the family in keeping everything in the place provided. "Woman's work never done?" Let us show them!

### Tested Recipes

**WALDORF SALAD**—Four cups chopped apples, 2 cups diced celery, 1½ cups chopped filberts. Mix the fruit with dressing and serve on crisp lettuce leaves. Dressing: Melt 1 tablespoonful butter, add 1 teaspoonful mustard, one teaspoonful sugar, ½ teaspoonful salt, ⅛ teaspoonful pepper, well-beaten yolks of 2 eggs, and 4 tablespoonfuls of lemon juice. Cook in double boiler until thick, then add whites of 2 eggs stiffly beaten. Chill, and add 1 cupful whipped cream just before serving.

**CARLISLE BEETS**—Boil 8 medium-sized beets until tender, remove skins, and cut in dice. Melt 2 tablespoonfuls butter, add 2 tablespoonfuls corn starch, and stir until creamy. Add ½ cup vinegar, ½ cup water, 2 teaspoonfuls sugar, and salt and pepper to taste. Boil until thick, pour over hot beets, and serve in hot dish.

**SAILOR DUFF**—Mix together 1 egg, 2 tablespoonfuls melted butter, 2 tablespoonfuls sugar, ½ cup light molasses, ½ cup hot water in which 1 teaspoon of soda has been dissolved, and 1¾ cups flour. Steam one hour. Serve with sauce made as follows: To the yolks of 2 eggs, well beaten, add 1 cup powdered sugar, 1 bottle whipped cream, and ½ teaspoon vanilla. Beat until well blended.

**FOOD FOR THE GODS**—Mix together 2 cups granulated sugar, 10 tablespoonfuls cracker crumbs, 6 eggs beaten light, 1 large cup nut meats, 1 pound dates, 1 pound figs. Chop or grind nuts and fruit. Bake in moderate oven until brown, and serve with whipped cream sweetened and flavored.

**CREAMED SHRIMP WITH PEAS**—Wash 1 can of shrimp in slightly salted water, and drain. Melt 3 tablespoonfuls of butter in a saucepan, stir in 3 tablespoonfuls of flour, and gradually add 1½ cups of milk, stirring until it thickens. Cook 5 minutes, add the shrimp and 1 cup of peas, and season with salt, pepper, and lemon juice. Serve on toast or with salted crackers.

**SALAD ROLLS**—Scald ½ cup of cream in double boiler, and pour over 2 tablespoons of sugar and ¼ teaspoon salt. When lukewarm, add 1 yeast cake, dissolved in ¼ cup of lukewarm water; gradually stir in 1½ cups of flour. When well mixed, turn on board and knead until smooth and elastic. Cover and set aside to rise. When double in bulk, turn again onto board, knead slightly, and pat to ¼-inch thickness. Shape with a lady-finger cutter, dipped in flour. Arrange in buttered pan, cover and let rise again. When light, put into moderate oven and bake 15 minutes. Just before removing from the oven, glaze by brushing with white of one egg slightly beaten, diluted with tablespoon cold milk.

### Household Hints for Home Makers

Soup or gravy which has been salted too much may be made palatable by the addition of a little brown sugar.

When the food chopper needs oiling, use a drop of glycerine.

To prevent cheese from becoming moldy, wrap in a cloth wrung out of vinegar, and roll in paper.

Paper toweling in the kitchen saves laundry work.

Leather furniture coverings should be rubbed occasionally with castor oil or commercial leather polish to restore the oil that dries out. Care should be taken that the oil is well rubbed in and any excess wiped off.

To keep parsley fresh, wrap it in a cloth wrung out of cold water. Remove the cloth every day, shake, and wring afresh. The parsley will keep green for several days if treated in this way.

Candy will not boil over if the top of the pan is greased with butter.

### The Cable Coil

Part the hair just back of the ears. Tie the back portion firmly. Arrange the front and sides becomingly, and pin the ends in

with the back. Then divide the hair into two strands. Take hold of the right-hand strand and twist tightly in a smooth coil, the direction of the twist toward the neck. Fasten the end of this coil until the left-hand strand has been twisted. Twist the left-hand strand, this time the direction of the twist being away from the neck. Stretch the two coils above the head and cross the right-hand coil over in front of the left-hand coil, at the same time passing the right-hand coil into the left hand and taking the left-hand coil in the right hand. Continue to wrap the coils in this way to the ends of the hair. Arrange the coil in a roll at the back of the head, high or low, as is most becoming, and pin in place. If the sections of the twist are loosened a little, the effect will be that of a cluster of tiny puffs, as shown in the illustration.

## COMMUNICATIONS

This magazine is not responsible for opinions printed under this heading. Initials or pen names will be permitted only when correct name and address of the writer are known to the editor.

### The Canadian Railway Problem

TO THE EDITOR: In the February issue, you reprint from the *Chicago Journal of Commerce* an editorial which begins with this paragraph:

A deficit of \$100,000,000 in the government operation of Canadian railroads last year resulted in the overwhelming defeat at the recent election of the Conservative party, which had fostered the Canadian National Railways plan. It defeated Prime Minister Meighen in some of the provinces that were presumably conservative strongholds and lost for him his home constituency in Manitoba.

The Canadian National Railways were doubtless an issue of the election, but they were a subordinate issue. Not one comment in the Canadian press has suggested that they determined the result. Nominally, all three parties supported the National Railways, but it is true that the Liberal Party, which won a bare majority in the House of Commons, contains an influential group which is hostile to the continued operation of the National Railways by the state. This hostility was most aggressive in Montreal, and it is possible that a mischievous story circulated on the eve of the election, to the effect that, in case the Conservatives won, the headquarters of the National Railways would be moved from Montreal to Toronto, did help to elect Liberals in a few seats which had before been Conservative. But the bulk of the Liberal strength is in Quebec, which is Liberal on racial lines; not a single Conservative was elected in this province.

The Canadian railway situation is most difficult and perplexing. The National Railways are faced not only by appalling deficits but by a demand from the Maritime provinces that the lines which serve that section should have their own organization, which would be, it is hoped, subject to political influences. Railways in Canada have been built, mostly with government aid, far in advance of the population, and those that have drifted under government control have done so through financial collapse.

To a considerable extent, the building of these railways had, in the broad sense, a political object—that of building up the country—and it is believed that the construction of certain lines was influenced by political considerations in the narrow sense, also. At all events, the

railway situation in Canada is quite different from our own.—J., *Springfield, Mass., February 20.*

### That Trainload of Corn

TO THE EDITOR: Referring to page 69 of the February issue of the *Illinois Central Magazine* and to the article under the heading "Trainload of Corn." This item does not do credit to the fact that a spirit of co-operation was prac-

spirit that has put the Iowa division at the head of the Illinois Central.—G. C. ISBELL, *Barnum, Iowa.*

### Little Things That Count

TO THE EDITOR: Having been connected with the Illinois Central Railroad for nearly four years in the chief special agent's department, I would like to tell the readers of the *Illinois*

*That Solid Trainload of Corn at Onawa, Iowa*

ticed by all the employes who helped to put this across.

Attention should be given to the promptness on the part of the operators in the handling of messages, of the quick action taken by the members of Mr. Haydock's office in getting the confirmation of the advancement of the adoption of the reduced grain rates, as proposed by a competing line, and of the promptness in getting the information requested from Mr. Cameron's office. By this promptness, it was possible for Harper & Murphy to contract at an advanced figure of about 3 cents a bushel for about seventy-five cars of corn.

Attention should also be directed to the co-operative spirit as practiced by the chief dispatcher, Mr. Anderson, in furnishing cars, by Mr. Ausman in sending a crew and engines to handle the shipment, and by the wonderful work done by the train crews in placing and switching cars, so that the loading would not be held up. It was this that made it possible to get the grain for Harper & Murphy and, in turn, for us to move a solid train of corn, as shown by the attached photograph, and to make our Onawa station show an increase of about \$20,000 for January, 1922, over the same month in 1921.

It was this spirit that has made many friends for the Illinois Central at Onawa. It is this

*Central Magazine* some of the things I have observed:

First, the handling of freight. The freight is received on the platform and checked by the receiving clerk. He should watch for the little things, be sure that he receives everything that he signs for and see that every piece is in *good condition*.

The next, loading in the car. The trucker should watch and be careful, handling the freight for the company as carefully as he would handle his own material. The stowman should properly stow the freight in the car, so that it may reach its destination and consignee in *good condition*.

Next, the car doors. Each employe should watch closely for loose or swinging doors. An opening into a car that exposes the contents is a temptation to a car thief. Each inspector should watch closely for doors that are eaten out over the shoes, which would allow pulling out the door enough to allow a man to get in to rob the car. Unless the car doors are in *good condition* and properly closed, it is a hard matter to locate where pilfering is done.

Every employe should *watch the little things—they count*. The seal is the smallest thing about a car and yet one of the most important if properly applied, but I find a number of seals that are not properly applied. When a seal

is applied so that a car can be entered without breaking the seal, someone is not watching the *little things that count*. I have found a number of seals that are not fastened at all, simply shoved into the ball of the seal. Just a slight pull would have shown that the seal was not locked. Watch these little things and save the company many dollars.

Getting the correct numbers of the seals, also the letter prefix and name of the seal, is important when needed in tracing records. If proper records of seals are made, it is much easier to locate where exceptions originated. I have found cars loaded with lumber and seals applied without the hasp placed over the keeper, and I noticed one car that had lath sticking up

on the side of the door, coming to a sharp point, and the seal fastened around it. Anyone should have known that this was not any protection to this shipment and should have saved the price of the seal by not applying it at all.

Very often, walking along the tracks, I find air hose, coupling bolts, nuts, etc. I always take them to the nearest scrap boxes placed at different parts of the yards. These are small things, but *little things count*.

It is my wish that every reader of this journal and employe of the company would take interest in the little things and remember that it is the *little things that count*.—O. E. ALLEN, *Special Agent, Louisville, Ky.*

## John W. Branton Was Efficient Organizer

By J. E. WALRAVEN,

Engineer, St. Louis Division

John W. Branton, master mechanic at Centralia, Ill., St. Louis division, notice of whose death on February 15 was printed in the March issue of this magazine, was born November 7, 1875. He first appeared in railway life as a machinist apprentice, August 7, 1894, with the Union Pacific Railroad. From 1898 he was employed as machinist at various places until March 1, 1905, when he was appointed round-house foreman at Fort Dodge, Iowa. In one year he was advanced to general foreman at Sioux City, Iowa. He served as general foreman in turn at Carbondale, East St. Louis and Mounds, Ill.

August 1, 1912, he was appointed master mechanic at Centralia. February 15, 1922, he departed from service through death.

Such is a brief sketch of Mr. Branton's life as a railway man. He died as he lived, in the harness.

February 19, 1922, in the presence of hundreds of his employes, officials from all parts of the system, and citizens from every walk of life in Centralia, he was laid to rest by the order he loved.

The wonderful display of flowers, the outpouring of the people, the eloquent tribute by Reverend Mr. Fannon, all demonstrated the love and esteem in which he was held. His kind-heartedness and strong interest in the welfare of his men endeared him to all of us. His loyalty and devotion to our company's interest,

J. W. Branton

even at the expense of his own, marked him as a most valuable servant.

He was a splendid organizer. When his organization was shattered by strikes or otherwise, under the most discouraging conditions, he gathered up the loose ends and wove them again into the perfect fabric of a good organization.

His slogan was "No Engine Failures," and this slogan became a fact. The Centralia district of the Illinois Central stands out as one of the best, in this respect, on the entire system; hot pins, flue failures, leaking piston rods or valve stem packings have largely disappeared.

To him, as the head, we cheerfully give the credit.

Did he have faults? Surely. Does anyone know of one who does not? Over those faults, we cast the mantle of charity, as we hope it may be cast over ours. His virtues we cherish in our remembrance and leave the faults to Him in whom he trusted. The earthen vase, which has contained precious odors, will lose none of its fragrance though the clay be broken and shattered. So be it with our brother's memory.

# Notes About Sports Among Our Employes

## Bowling Is Getting on Its Last Legs, and There Is Mention Now of Baseball and Horseshoe-Pitching

By **WALTER E. DU BOIS**,  
Voucher Clerk, Chicago

**I**S your team ready to take part in the bowling tournament for employes of railroads, steamships, American Railway Express and Pullman Company? Have you sent in your entry? If not, you must get busy, for all entries must be in the hands of W. P. Enright, Room 305, Central

Station, Chicago, on or before April 12. This tournament will be the largest one ever held by those working for the foregoing companies. Under the circumstances, all entries must be in on time, or you will not have a chance to try your ability in our tournament.

A joint tournament was held on February 26 among those working in the General Offices at 12th Street and 63rd Street, Chicago, and it was the greatest kind of success. Too much credit cannot be given to W. P. Enright, who proposed it and carried it through to a most successful conclusion. Ninety-five bowlers were in the 5-man event, 94 in the doubles and 58 in the singles. The season averages of all were used as a basis for forming the teams, the average coming to 758. The players were then picked so as to average that figure, the result being that all nineteen teams were evenly balanced, on paper. The doubles were worked out in the same way; the best bowler rolled with the one having the lowest average. In the singles it was "dog eat dog"

Before the start of the tournament, all were presented with blue prints showing on which team they were assigned, the alleys they were to roll on and the time, and there was no hitch

of any kind. The first team faced the pins at 9:30 a. m., and the last squad started at 8:30 p. m., making it an all-day event.

Space will not permit a full list of all prize-winners, but the following players won first place in the 5-man event: Koch, Breitzke, P. Ryan, Seiselmyer and Broeker. They upset 2,439 pins. Walker and Grace, with 1,033 pins, won the doubles, with Coble and Henderson only three pins behind. Calloway was high in the singles, with Stone a close second. Callo-

Lee Calloway

Winners in the doubles: Left, H. J. Walker; right, M. A. Grace.

Winners in the 5-man event: Front row, left to right, C. F. Broeker, P. J. Ryan, H. J. Seiselmyer; second row, A. Koch and B. Breitzke.

way was also high in the all events, followed by Hengles and Stone. Those who were "off form" are awaiting another tournament to redeem themselves, while those who were high this time claim they can do it again. Time will tell.

The team representing the Engineer Maintenance of Way walked off with the cham-

pionship of the 12th Street General Office Bowling League at Chicago after a hot fight. Two of the teams are tied for third place and two for fifth place, which shows how evenly matched some of the teams were. Bernbach, as was expected, proved to be the best bowler. The final report for the season is as follows:

Teams	W.	L.	Pct.	Aver. Pins Per Game	High Game	High Series
1. Engineer Maintenance of Way.....	52	14	.788	798	940	2,554
2. Land and Tax.....	50	16	.758	816	909	2,657

Flodin .....	69	210	578	162

Three records were broken in the last month. The New Orleans Special set a high team game record of 1,001 pins. These bowlers also broke the team series record with 2,881. This record didn't stand long, however, as the following week the Seminole Limited rolled 2,883 pins, due to the shooting of "Happy" Hanes, who rolled 648 for a new individual

series record. He was handicapped during the first half of the season by not having a suitable ball. After paying all his Christmas debts, he bought a new ball. He has averaged 207 in his last 18 games.

Reha of the Seminole has also improved since Hanes bought the ball, averaging 180 for 12 games.

Lee Calloway rolled his high series March 8, with 634.

Here is the Burnside Shops' Bowling Club standing for the week ending March 11:

Teams	W.	L.	Pct.	High Game	Team Aver.
Machine Shop.....	44	9	.830	900	777
Carpenter Shop.....	35	18	.660	883	772

**Will Have Baseball Team**

The transportation department at Chicago will have a baseball team again this year, and the players are looking forward to a successful season such as they had last year. The team this year will be greatly strengthened by the addition of Riley and Schneider, pitchers, Fitzpatrick, a catcher, and McCarty, an outfielder. Bob Stump is to have some opposition for the first base job in "Buck Shot" Seiselmeyer, who has had plenty of experience at that station. Higgins at second, Owens at short and Crotty at third round out a fast infield, and the fly chasers will again have Ryan, Butler and Sutherland to complete a fast team.

Division and shop teams may arrange games with the transportation team by getting in touch with Manager C. M. Knodell, Room 306, Central Station, Chicago.

**Horseshoes at Waterloo, Iowa**

The Railroad Y. M. C. A. will conduct another horseshoe tournament at the Waterloo, Iowa, shops, the first games to be played May 15. Games will be played each day thereafter until August 31.

There will be ten or twelve department teams entered in the tournament. Several of the players already have started practice. Silver cups and other prizes will be awarded to the winning teams, the players with the highest averages and the players making the most ringers. The tournament will be conducted under rules framed by a committee which will have charge of the Railroad Y. M. C. A. recreational work.

The tournament last year was successful in every way. The sheet metal workers' team took first place. D. Foutch won individual honors for the high average and total ringers.

It is the intention this year to have a team representing the Illinois Central shops at Waterloo play teams, especially railway teams, in other cities. Games are being booked by K. E. Beal, care of Illinois Central Store Department, Waterloo.

**THEIR FATHERS WERE ACTORS**

The interesting things about a great man never come to light until after he is dead. Very much like the flowers that are spread on his coffin—he can't appreciate them. In this relationship a story of local flavor comes relative to the life of H. J. Phelps, one of the prominent officials of the Illinois Central Railroad Company, who died the other day in Chicago after a most busy and useful career. It will be remembered that at one time he was station agent for the company at Onawa.

In an early day—probably more than forty-five years ago—young Phelps was an apprentice in the telegraph office of the Illinois Central at Ackley, Iowa. While thus employed, a green country boy happened into that town and shortly afterward became a freight brakeman. He met young Phelps, and they became friends and remained so until separated by death a few days ago. The boy in question was Bert Sage, for many years and at present conductor on the Sioux Falls-Onawa branch of the road and a man widely known in the towns up and down this line.

Aside from their duties in the railway service the "boys" had more than a common interest—their fathers were co-laborers, Mr. Phelps' father being ringmaster and Mr. Sage's father a "tumbler" with the famous Dan Rice's circus, then touring Europe.—Anthon (Iowa) Herald.

# Good Coffee—Pride of Our Dining Service

## Brazil Supplies Most of the Raw Material, and There's Skill A-Plenty Needed in Its Preparation

By T. S. ROBINSON,

Chief Clerk, Dining Service Department

THE steward of each dining car orders coffee each trip, the amount depending upon the business transacted on the various runs. The dining car department uses an average of two hundred 10-ounce packages of coffee daily.

When a crew reports for duty, prior to departure for a trip, the first duty is to register out, then check out all supplies previously ordered on the car's requisition. Everything being delivered to the car and stored away, the next thing—in fact, the most important thing—is making the coffee.

The following is a good recipe: Use a high-grade coffee, properly roasted and ground, in a clean urn, ten ounces to the gallon for morning coffee; for after-dinner coffee, which is generally served in *demi-tasse*, sixteen ounces are required. Put in fresh boiling water the minute it reaches the bubbling point—only a little at first, to open the pores of the coffee and get it ready to receive the remainder, which is to be put on a little at a time until all the good and none of the bitterness (tannin) remains. If it is too strong, it can easily be diluted with boiling water when in the cups. Take hot cups first, then the sugar, then warmed (not boiled) milk, then the coffee, and—if you can afford it—put' on the top a teaspoonful of whipped cream. Then you have a veritable nectar. Coffee should never be boiled.

### Why Good Coffee Is Valuable

The proper service for coffee has much to do with satisfaction. A pot of steaming hot coffee, containing one and one-half cups, standing in a No. 1 platter, with a hot cup and saucer, will give the desired results. The best sugar and the highest grade of cream are served with a pot of coffee for 20 cents on all Illinois Central dining cars.

Coffee is valuable for its stimulating effect upon the nervous and vascular system. It produces a feeling of buoyancy and exhilaration, comparable to a certain stage of alcoholic intoxication, but which does not end in depres-

sion or collapse. It increases the frequency of the pulse, lightens the sensation of fatigue, and sustains the strength under prolonged and severe muscular exertion. *A good cup of coffee served to a passenger who has a headache has often made a well person and an everlasting friend of the road.* The Illinois Central dining car department was the originator of serving a free *demi-tasse* to all passengers entering the diner for breakfast, its merit being recognized by many other roads, which later adopted the custom.

In these days, one naturally asks what is the effect of prohibition on coffee-drinking? No statistics are available, but coffee roasters estimate that the consumption of coffee has increased from 10 to 20 per cent.

### A Plea for Coffee vs. Tea

A coffee expert, who also dealt in tea, was rather jealous of the higher social standing of tea. "Coffee has never had the social opportunity that tea has had," he said. "And why shouldn't it? It is one of the graceful things in life. Yet, though it is more generally beloved than tea and much more extensively used in this country, people brew it in metal and serve it in coarser china than they used for tea, and do not surround it with the fine service and ceremony that a skillful hostess feels essential for tea. People sip tea. They too often gulp coffee, and yet coffee is a universal thrill. Nearly everybody likes coffee. Just as sorrow brings a tear, just as emotion floods over you as you hear music, so coffee brings a flash of gratification and pleasure. It is the esthetic thrill the aroma gives when the coffee is properly made."

After each meal is served the dining car steward abstracts each passenger's meal-check, ascertaining how many pots of coffee have been served, thus proving exactly how much coffee has been used for the trip. On his supply report there is a list (alphabetically arranged under proper heads) of every article used on a dining car and the amounts or portions carried on hand when the car starts on a trip. Consequently, when a trip has been completed, it is convenient to determine the amount of supplies on hand by deducting the amounts

consumed, which is shown by the abstract sheet.

### Record Is Kept of Business

The supply report gives a summary of each day's business, the number of passengers served for each meal and the amount of revenue derived from each meal, the grand total being the whole amount of business transacted for the round trip. The commissary, keeping a list of the costs of all supplies, forwards all bills to the commissary accountant, who computes the percentage made by each car. Thus it can readily be seen when a car is managed in a business-like manner—in other words, for example, if the steward has been using enough coffee for the number of pots served or if he has used too much coffee in proportion to the number of orders on the meal-check.

Good coffee, good service, courteous treatment and a good organization are the essentials of a good dining car department.

Coffee comes from a plant indigenous to Abyssinia. The name has been traced to Caffa, a province of Abyssinia in which the tree grows wild. Coffee has been in use about one thousand years. It was introduced in America in 1728. The common coffee shrub or tree is an evergreen plant which, under natural conditions, grows to a height of eighteen to twenty feet, with leaves six inches in length and two and one-half inches wide.

Its flowers are pure white in color, with a rich odor. The fruit is a fleshy berry having the appearance and size of a small cherry; as it ripens, it assumes a dark red color. Each fruit contains two seeds, which constitute the raw coffee of commerce; the flat surfaces are laid against each other in the berry.

### Only a Few Pounds From a Tree

The greatest yield of a tree is sixteen pounds in one year. The plants are taken from a nursery when a few inches in height and are planted from six to eight feet apart. They thrive best in tropical countries and are found as far as 20 degrees on either side of the equator. The plants are trimmed and kept cut low as four to six feet for convenience in gathering, the usual yield of a cultivated plant averaging about two pounds per tree a year. They produce the second year.

The best coffee comes from Yemmen, Arabia, where the celebrated Mocha grows, but on account of its rarity and its unmatched aroma, very little, if any, of the genuine ever leaves the confines of that country, where coffee-making is an art that has been cultivated for many

centuries. The world's annual production of coffee exceeds 1,000,000,000 pounds, of which half is raised in Brazil, where millions of acres are planted. Coffee-raising is the principal industry of this great southern republic. After the coffee is picked and then passed through the mill, freeing the berries from the outer wrappers, the crop is sacked in 160-pound bags and stored in warehouses preparatory for sale and shipment to all parts of the world, for this delicious beverage is used by all countries.

### The Taster an Important Person

Years ago the selecting of coffee (also tea) depended upon men who made their livelihood by their senses of smell and taste. A skilled coffee-taster can distinguish several hundred kinds of coffee. It has been proved that an expert can tell how long a coffee has been roasted. Others claim they can distinguish the ingredients in a blend. The public does not realize the skill required in selecting and blending its beverages. When you drink a good cup of coffee you are as dependent upon someone's highly developed sense of taste and smell as you are dependent upon some musician's ear when you hear a good symphony.

Nowadays the tasters are the buyers; usually they are the members of the firm, often the most important members, although in some establishments the salesmen are expected to learn tasting.

After the coffee has been planted, cultivated, gathered, milled, sacked and stored, it is shipped to the various ports of the world for sale to the coffee dealers. The larger coffee concerns do their own roasting and blending, thus laying the foundation for fame and fortune when they produce a coffee which pleases the public palate.

The coffee cargo, having arrived in the United States, is forwarded to the various jobbers, who roast, blend and retail it to the trade. Our dining car department purchases coffee daily. It is delivered to the commissary in 10-ounce packages, each sealed tightly and stamped with the date of delivery, thus insuring the use of fresh coffee. None is ever allowed to become old and stale in the store-room.

*Must Be In by 15th*

## ACCIDENT AND

## INJURY PREVENTION

## *His Section Stands First in His Regard*

**M**EET "Lem" Clark, section foreman at Olney, Ill., Indiana division, to whom "Safety First" is more than merely a slogan.

Mr. Clark has a clean record and one hard to beat. For the past twenty-five years there has not been a fire or stock claim paid for which the damage occurred on his section. The records will show that but one head of stock has been killed on his section, and that happened on a public crossing. As for fires, the past twenty-five years will show none wherein the fire started on our right-of-way on his section, and but one or two starting off the right-of-way.

In addition to the manner in which Mr. Clark has kept down the claims on his territory, the records will show that he has been just as careful in the maintenance of his track, as he has never had a derailment or other accident chargeable to his record in all his thirty-eight years of service.

"Lem" is still on the job and doing just as good work as he did thirty years ago. When one asks him what things stand out ahead of all others in his life, he replies: "Well, my section comes first; then my wife," and since he bought an automobile for himself and his wife a couple of years ago, he adds that as third. But his section still comes first, and one passing along the track and right-of-way which he maintains can readily see that he means what he says.

"Lem" was born April 29, 1860. He took employment with the Peoria, Decatur &

Evansville, now the Indiana division of the Illinois Central, in 1884 as a section laborer, working on the South Olney, Ill., section.

In 1885 he was made foreman at Bone Gap, Ill., and continued as foreman at that point until 1887, when he was made foreman at Browns, Ill. In 1890 he was made foreman of the North Olney, Ill., section, and he is still foreman at that point. He looks forward to many years of service.

*"Lem" Clark and Some of His Track*

# Why the Illinois Central System Is Great

## Engine Foreman Points Out Good Reasons for Loyalty of the • Employees and Patronage of the Public

Robert S. Murphy, engine foreman, who lives at 6611 Kenwood Avenue, Chicago, recently wrote the following article for the magazine, sending it to President Markham with this explanation:

*"In this article I mention the Chicago terminal particularly because I am more familiar with it, but I would have been glad to say more about the whole system if I had first-hand knowledge of it, because on every division there are many things of which employes should be proud."*

**L**AST year President Markham issued a neat folder under the title of "What Every Employe Ought to Know About the Illinois Central System." This has led me to thinking of the things about our system of which we, as employes, should be proud.

First, we have one of the greatest and most progressive men in the country at the head of our system, our president, Mr. Markham. Mr. Markham is always ready to help all mankind in every way possible, from giving a subscription to grand opera to donating a calf to a small Mississippi farmer. Our president started at the bottom and has risen by hard work and faithful service. He is a man who stands second to none in the country. During the world war, when the United States Government took control of the railroads over night, Director General McAdoo appointed him to one of the most important posts in the Railroad Administration, which he filled with great credit all through the war. He is a man whom President Harding calls into conference often when he has national problems to solve.

### Favors Right Pay on Railroads

Mr. Markham made a speech before the Chamber of Commerce at Peoria recently in which he said he did not want to cut the wages of his employes if it could be helped. This is one reason why we should be proud.

Another reason for pride is that all our officers are practical railway men, who started, as our president did, from the bottom and have risen from the ranks by hard and faithful service, whose offices are always open to any employe who has a grievance. They un-

derstand our conditions because they were once in our ranks, and they can always see a remedy for our difficulties, and are always glad to enlighten us. With such men in control, why shouldn't we be proud?

Another reason why we should be proud is that we have the greatest and safest suburban service in the world. Nowhere on earth, with the same facilities, do they handle the trains that are handled on double tracks between Randolph Street and Harmon Court, a distance of less than one mile. During the busy morning and evening rush a train arrives and leaves every minute, and, after they get south of 12th Street, you can see trains on seven tracks moving in each direction at the rate of forty-five miles per hour. The suburban service handles nearly 100,000 passengers per day, and during the last street car strike handled 4,000,000 in less than a week.

Captain Percy Coffin, president of the Civil Service Commission of Chicago, paid us a high tribute by writing a poem entitled "The Grand Old I. C."

### Kept Suburban Service Open

This suburban service holds the world's record for service and safety. When the terrible blizzard struck Chicago early in 1918, street car service was paralyzed and common labor was paid 30 cents an hour, but President Markham ordered \$1.50 per hour paid for snow shovelers and sweepers to keep this service open.

The Illinois Central holds the world's record for trains arriving and departing on time. The Illinois Central takes all freight offered. We have twelve freight and passenger yards in Chicago which are all on level ground.

We have the finest passenger train in the world. Solid steel Pullman, buffet, diner and observation cars, "The Panama Limited" runs from Chicago to New Orleans daily both ways, less than 23-hour service, never late. Men over at the Board of Trade bet 100 to 5 that this train is on time, and will let you pick the day. We have 1-night service to St. Louis, Omaha, Paducah and Memphis and 36-hour service to Jacksonville. Our divisions are short where the trains can get over the road

safely and quickly. Our equipment is the best, safest and finest that money can buy. Our roadbed is rock ballasted, with the heaviest steel rails, which are elements of safety. Our stations are modern, surrounded by beautiful grounds and nice parks. With all these features, and with our officers, why shouldn't we be proud that we work for the Illinois Central System, and keep it the greatest, safest and most efficient railroad in the world by doing honest and faithful service?

### Employee Affects His Own Pay

Last, but not least, among the reasons for being proud of the Illinois Central is because our president, Mr. Markham, is not opposed to organized labor conducted upon the right principles, and does not desire to place any employe in an attitude which would brand him as a traitor to his organization; but does earnestly urge each employe to prove his loyalty to his organization by seeing that its affairs are conducted in a manner he approves, and which is approved by a majority of its members.

If we work as hard for the Illinois Central System as we would for ourselves, and take care of its property as if it were our own, we would not be afraid of not getting a living wage. But to get good wages we must produce. The men in other lines of business who makes thousands of dollars a year are producing, and, if they did not produce, the business that they represent could not exist and pay them. The same is true of us. How long would a business like Marshall Field, or any other large business in the country, last and prosper if the employes were trying to run it to suit themselves, regardless of their merit or ability, telling the heads of departments where they would work, and what kind of work they would do, and when off duty speaking ill of the firm?

During 1922 let us all try to put forth our best efforts to create greater earnings for the Illinois Central System, instead of dragging along cutting our own wages, for when the Illinois Central doesn't make money, it can't pay good wages.

## McComb, Miss., Plans a Real Homecoming

McComb, Miss., headquarters of the Louisiana division, whose history has always been closely identified with the history of what is now the Illinois Central System, is going to celebrate its half-century of life with a homecoming the first week in April. The program, in brief, will be as follows: Monday, April 3, Railroad and Industrial Day; Tuesday, April 4, Commercial Day; Wednesday, April 5, Anniversary Day; Thursday, April 6, School Day; Friday, April 7, Fraternal Day; Saturday, April 8, Farmers' Day; Sunday, April 9, Church Day.

"This celebration of McComb's fiftieth anniversary will not be the success it should be unless a great many of our former citizens enter into the spirit of the occasion," says the letter of announcement from the committee in charge. "The program is going to be on a big scale. The hospitality accorded you, combined with the great progress the city has made in recent years, will delight and surprise you. Come be with us. Renew old acquaintances and old memories. Enjoy the occasion to the fullest, and have the great pleasure of a solid week of Southern hospitality.

"The old home town is calling," the com-

mittee writes. "This letter is intended as an invitation to you, and others who have left the 'Old Home Nest' and gone far afield to cast your lot, and for the friends of the community, who, while they may have never been residents of McComb, have for one reason or another a warm spot in their heart for this city. This letter is intended as a cordial invitation to former residents, and those who have that cordial feeling of good will for this city, to come to McComb and be with us during Homecoming Week, which is observed in honor of the fiftieth anniversary of the founding of the city.

"Hundreds of you have been gone from us many years. You, no doubt, have fond memories of your childhood days here. Many have memories of old boyhood and girlhood friends, memories which will probably become more distinct on receipt of this invitation. Many will recall the old schoolhouse, the old swimming hole and loved ones who lie at rest in the old home town cemetery, and as you reflect on these memories, some sad, some glad, you are certain to have a longing to visit the scenes of your childhood. Come be with us Homecoming Week."

# CLAIMS DEPARTMENT

## Illinois and Ohio Are in Line

Below is an excerpt from General Order No. 68, Illinois Commerce Commission: "In the matter of rules and regulations governing corporations operating motor vehicles under an act entitled 'An Act Concerning Public Utilities,' approved June 29, 1921, in force July 1, 1921. Paragraph 16—No public utility shall operate a motor vehicle over or across a railway crossing at grade without first having come to a full stop at a point where the driver thereof shall have a clear view of the railway track in either direction for a distance of five hundred (500) feet."

The following rule was issued by the Public Utility Commission of Ohio under date of August 13, 1921: "Drivers of motor vehicles shall slow down to a speed of not exceeding three miles per hour when within fifty feet of any unguarded grade crossing of any steam or electric railroad and shall not cross the track or tracks until fully assured that it is safe to proceed."

## A Lawyer Sues and Loses

An automobile owned and driven by D. K. Lindhout, an attorney of Chicago Heights, Ill., was struck by a north-bound passenger train while being driven across the tracks on the Lincoln Highway near Matteson, Ill., at 9 a. m., December 19, 1919. There was a crossing flagman standing in the road with his stop signal displayed; it was a posted crossing requiring travelers to stop before going on the tracks; there was an unobstructed view of the approach of the train for a distance of 1,000 feet; there was no negligence in the operation of the train; yet, regardless of all these facts, Mr. Lindhout attempted to shift his responsibility and negligence from himself to the railroad (in which he was not different from the majority) and brought suit.

The case was tried in Kankakee County in February, 1921, resulting in a verdict of \$550 in his favor. An appeal was taken, and a decision has just been given out in which the Appellate Court upholds the contention of the

railroad on every material point, reversing the lower court with a finding of facts.

I have no itemized statement of the cost of this litigation, but I judge a conservative estimate to be \$400.—M. B. R.

## Wrecked Motor Car on a Curb

Robert N. Hammons, a young man employed as delivery man for a Jackson, Miss., meat market, ran his flivver down the street toward a railway crossing at a high rate of speed. He failed to stop, look or listen and discovered too late that a switch engine was about to pass over the crossing. He didn't want to take any chances on damaging the locomotive; so he turned his flivver into the curb, causing it to turn over. When Robert was pulled from beneath the wreckage, he admitted it was all his fault, that he was running too fast and had practically no brakes. He was painfully injured; consulted a lawyer, who advised the services of a physician, but filed suit the following day. He later developed appendicitis, attributing it to the accident.

The suit was tried in the Hinds County Court the other day, but the jury, composed of representative citizens, could not accept Robert's version of the unfortunate accident and promptly returned a verdict for the railway company. The railroad was forced to use fifteen or more witnesses in its defense, most of them high-salaried men who will have to be paid by the company. The entire time of the court was consumed for one day at considerable expense to the taxpayers, while Robert is minus his flivver, his doctor and hospital bills, all trouble which could have been avoided by the exercise of reasonable care on his part.—H. G. M.

## Argued With a Policeman

J. E. Jenkins, a citizen of Jackson, Miss., owner and operator of several jitneys at that place, had an altercation with the city police officer detailed at the Union Station at Jackson, relative to an alleged violation of the traffic laws. Jake came out second best in the argument and went to court to find relief for his

wounded pride, etc., filing suit against the policeman, the city of Jackson and the Illinois Central, jointly and for the sum of \$15,000. Some of his erstwhile friends told him that the policeman was an employe of the railroad, paid by the company, and that he would have no difficulty in proving that fact.

The court heard Jacob's testimony, as well as that of his several witnesses, and decided that he had wholly failed to sustain his contention that the policeman was an employe of the railroad. It also held that the city of Jackson was not liable for the acts of the officer. Jake thereupon told the city that if it would pay the court costs he would dismiss the suit against the officer, which was done.

The trial consumed an entire day of the court. The taxpayers of Jackson will have to pay the expense of the trial, while the railroad is out the expense of its officers and attorneys in investigating and trying the case. Jake has returned to his jitneys, firmly convinced that it is easier to make money with them than with a worthless damage suit.—  
H. G. M.

### Some Suits on the Y. & M. V.

Two suits against the Y. & M. V. were tried at the February term of court of Coahoma County at Clarksdale, Miss.

Mrs. A. T. Byars of Texarkana, Ark., sued for \$15,000 on account of a personal injury she claims to have sustained December 19, 1919, while crossing the tracks at Coahoma, Miss., on her way to the depot. A small drain had been dug between two tracks and then under the track to the edge of the right-of-way to carry off water leaking from our water spout, and this drain is what she claims to have stepped into. It did not appear that the railroad was at fault, but to avoid the risk of some verdict and the expense of trial the claims department tried to settle with her for \$300. However, she had much larger ideas, and the compromise was not made.

The case was reached for trial at a previous term of court. She was not ready, and it was continued at her expense. When the case was tried in February, the proof showed she was not in the regularly provided course of travel, but had wandered off on the tracks to a place where the public was not supposed to go; so the court instructed the jury to return a verdict for the railroad. As she was a non-resident, a bond for costs was required. The costs of the previous continuance and of the trial,

together with her expenses in coming from Texarkana for the trial, etc., must be almost as bothersome as the injuries she says she sustained.

The other case tried was that of Frank Cornelius, a negro who sued the railroad for \$30,000, claiming to have been shot by some member of the train crew while riding on a freight train near Lost Lake, Miss., April 19, 1921. The plaintiff was the only witness for himself. He testified that he was shot by some member of the train crew, but he could not identify the man. Each member of the train crew denied shooting him. He was seriously and permanently injured, and there was no dispute that he was shot by someone on the train. The members of the jury evidently thought he was shot by a member of the crew, as they returned a verdict for \$5,000.

The case will be appealed, and probably eventually won by the company. However, it shows how troublesome and expensive cases of this kind are.

Trespassers on freight trains are often shot by other trespassers. However, there have been instances where trainmen have shot at a trespasser to frighten him; in some rare instances they have, no doubt, shot intending to hit the trespasser. Of course, trainmen have much to contend with in keeping persons off the trains and often the circumstances are extremely aggravating. However, they should at all times bear in mind that they have no legal right to use any more force than absolutely necessary to make an ejection and should never shoot, kick or strike a trespasser except in self-defense.

Within the last two years a new county has been formed on the Y. & M. V. from territory formerly in Yazoo and Washington counties. This new county is named Humphreys, and Belzoni is the county seat. Barbour & Henry, local attorneys for the railroad in Yazoo County, were made local attorneys also for Humphreys County. Thus far the railroad has had very little litigation there.

At the February term just passed two cases were tried. R. L. Johnson had a suit against the railroad for \$5,000 actual and punitive damages because he said a train on which he wished to take passage failed to stop at Castleman, causing him to be greatly delayed in reaching home, where he had a sick child. The jury evidently looked with suspicion on his contentions, as it returned a verdict for the railroad.

C. C. Bartlett had a suit whose circum-

stances show how much a little carelessness and bad judgment on the part of an agent or conductor can cost the railroad—and, conversely, what can be saved the railroad by the exercise of care and discretion. Bartlett bought a ticket from the agent of the Southern Railway at West Point, Miss., over that road to Moorhead and thence over the Y. & M. V. to Belzoni. The selling agent made a mistake; instead of retaining the agent's stub he detached the Y. & M. V. coupon and retained it, so that when Bartlett got on the train at Moorhead he presented the conductor with the agent's stub. He claimed the conductor would not listen to his explanation; but abused and greatly humiliated him and ejected him from the train, and that he had to walk fifteen miles, etc. He said

he was without funds with which to pay his fare.

A previous trial resulted in a verdict of \$2,000, but this was reversed on appeal, as the court had instructed the jury that it might allow punitive damages. The second trial resulted in a verdict of \$1,000. Of course, the two trials have been expensive for the company.

The fact that Bartlett presented the agent's stub to the conductor might have indicated to the latter that a mistake had been made by the selling agent. When the passenger said that he did not have funds to pay his fare, it would have been better to have carried him and turned in the stub with explanations. This would have saved the railroad a good many hundred dollars and would have been better advertising for the service than this suit has been.—E. W. S.

## Keeping Up Interest Is a Hard Problem

By L. A. KUHNS,

Master Mechanic, East St. Louis, Ill.

It has been plainly demonstrated what can be accomplished by various departments in the drives or campaigns which have been put into effect in the past.

The results obtained, with few exceptions, so far as one is able to determine, have been gratifying. If the same interest were manifested by all employes at all times as during the drives, I am sure an exceedingly great saving could be made.

If all employes were obsessed with the thought that material of all kinds should be used as sparingly as if they were buying for their own use, there is no telling what could be accomplished. Employes are prone to ask for more than is really required.

For instance, a carman working on repairs to cars who requires four washers to complete a job will invariably ask for six, and consequently two are not used and, no doubt, are lost and never used. Or he may need six carriage bolts and get an order for eight or ten, leaving the extra ones not used, which is waste.

One may direct attention to the fact and for a time the condition is much better, but unless the supervisor in charge keeps watching closely the workmen will get careless and again ask for more than necessary. This applies to all departments.

It is also surprising to note the results ob-

tained in yard damage when all yardmasters and switchmen, and trainmen as well, are interested to the fullest extent regarding the movement of the train or cars they are handling.

Some means of keeping a bulletin in all departments each month showing the name of the employe making the best showing as to the use of material or supplies would create rivalry and consequently the best effort of all employes.

Supervising employes visiting other shops and railroads and studying their methods of doing work not only are benefited but can create interest in any practice they may have observed which is an improvement in their opinion over the method in use on the Illinois Central. Any practice proving good should be given to others over the entire railroad. All employes are interested in new methods and new devices and are willing at all times to do anything to promote efficiency.

In order to create interest among shopmen and shop employes, keep the work up to the men at all times, so that they will always have a job ahead. In the event they are on one job and there is a delay when other workmen or conditions interfere, they can always go to another and thereby lose no time.

The men displaying the most interest and getting the best results are going ahead, while the ones showing no interest and not obtaining the best results are at a standstill and are not desirable.

# Built a Monument for a Negro Employe

## Kentucky Division Honored the Memory of Tom Kennedy, Chainman in the Service for Forty-Four Years

IN the negro cemetery at Louisville, Ky., is a monument that proves how well known to the employes of the Kentucky division was Tom Kennedy, negro chainman who served on that part of the system for forty-four years until his death in 1920.

Tom was known over the division as Tom Bowser, because in his early days of employment he was chainman for E. H. Bowser. He was constantly at Mr. Bowser's side out on the line, and served the engineer faithfully.

The name Kennedy was taken by Tom because he was born as a slave to Tom Kennedy in Virginia. He often spoke of his master, "Cap'n Marse Kennedy."

Tom was a very courteous negro. His hat came off every time he was recognized, and he bowed low with a broad grin when he was spoken to. He never entered the office at Louisville with his hat on, and he was the first one there every morning. He always had the office clean and dusted when his boss came. His disposition was always bright, but he was quiet, and he never had a thing to say unless he was called upon.

### Raised Funds for a Church

The Negro Zion Methodist Church at Thirteenth Street and Broadway in Louisville is the result of Tom's efforts. He was a very religious person and worked night and day soliciting funds for the building of that church. He had complete charge of solicitation and seemed to have a lot to say concerning the plans of the church. The church was built at a cost of \$30,000, and it was paid for before construction started.

Tom could not read and could write nothing except his name, and after that was written it could hardly be read. When he received his pay check at the office in Louisville, someone there always indorsed it for him, because when he wrote his name it required more space than a check allowed.

But Tom could read a tape. Assistant Engineer C. J. Carney, the last man Tom worked for, says that he was one of the best chainmen he had ever seen. He could read a tape forward or backward, Mr. Carney says, and was never known to make more than one mistake.

Although he could not read, Tom could go to the file and pick out any map that was called for. Mr. Carney says that he never could see how Tom was able to do that.

### An Expert in Finding Stakes

His duties about the office in Louisville were varied, and he could always be depended upon to take care of everything left in his charge. He was an expert at making blue prints. Mr. Carney says that no matter what town he and Tom went to they never wanted for stakes. Tom would crawl under a building here and there until he had gathered a great pile of

Tom Kennedy

them. He was never idle while he was out on the road. When there was no work to be done, Tom had his hatchet out chopping stakes and hiding them under buildings as a dog hides bones.

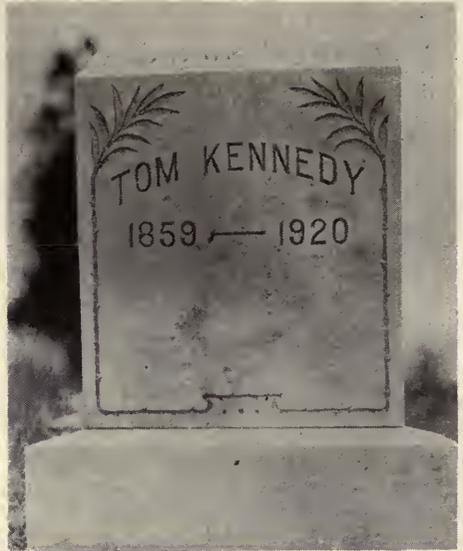

When Tom first entered the railway service, there was no record made that he was a negro. After he had worked several years, an order came to Louisville one day requesting him to report at Freeport, Ill. He was offered a position as assistant engineer.

Tom thought the men in the office at Louisville were joking him when he was told of the order, and he paid no attention to it. And the men in the office thought that it was a joke someone in Freeport was playing on Tom. However, when there came an inquiry as to why Kennedy did not report at Freeport, the Freeport office was informed that Tom was a negro.

#### Raised Money for a Monument

Tom had one bad habit. He was often seen eating canned goods out of the can. He would not empty the contents into a plate before he started eating. It is thought that this is what caused the stomach trouble that probably led to his death.

When Tom died, January 18, 1920, the entire force in the office of the engineer at Louisville went to the funeral. Assistant Engineer Carney started a collection to buy a few flowers for Tom's grave, and when he had seen everyone in the offices at Louisville he had \$50. He

Tom Kennedy's Gravestone

was surprised at the willingness with which each gave to the fund, and he wondered if the entire division would want to contribute. An inquiry to some of the road men brought opinions which indicated that all of the employes who knew Tom wanted to contribute something. Mr. Carney then extended his territory to the entire division, and \$300 was collected. A monument was bought with this money, and it was placed at his grave.

## Conscience Brings Company Old \$25 Debt

*Under the heading, "Where Shall I Spend Eternity? He Cheated Road of \$25 20 Years Ago, Now Pays," the Peoria (Ill.) Journal of February 22 carried the following story under a Decatur date line:*

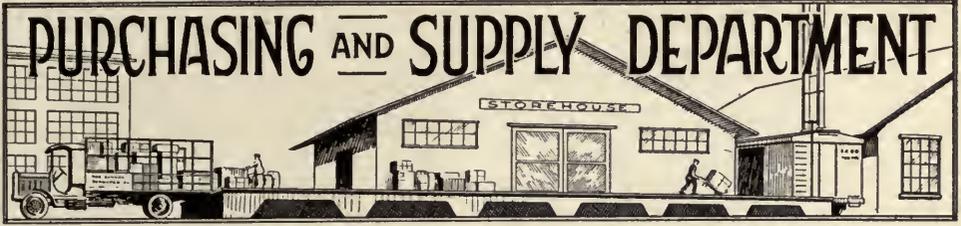

George M. Morgan, passenger agent of the Illinois Central Railroad in this city, got the surprise of his life when he opened his mail this morning, for one letter contained a draft and accompanying explanation, the like of which he had never seen before.

Even the envelope inclosing the letter and draft is interesting. It is addressed to the Illinois Central agent at Decatur, Ill., and is postmarked Pasadena, Cal. On the reverse side of the envelope is printed in red letters, "Where shall I spend eternity?" The letter is neatly done in type, evidently by an expert typist, and one would infer that the writer is prosperous. The letter read as follows:

"About twenty years ago, while shipping a car of race horses from Davenport, Iowa, to Decatur, Ill., over your road, I carried three or four men in my car with the horses. I was only allowed one man in the car, but used a quart of whisky on the conductor and brakeman and got by with it. Since that time the Lord has saved and sanctified me, and I am straightening up my back life. A few weeks ago while lying awake at midnight the Holy Ghost spoke to me about this matter and told me to send the railroad twenty-five dollars. Enclosed find draft for same. If this isn't right I will be glad to make it right. Yours respectfully,

A. SANDUSKY."

Decatur was in one of the big racing circuits and the races attracted thousands of visitors. The transportation of race horses was a most important item of railway business and was eagerly sought by agents.

## Some Qualifications for a Stockkeeper

By F. T. HOWARD,  
Stockkeeper, Clinton, Ill.

**M**ANY a young man working in a storehouse today desires to become a storekeeper at some future date. However, before aspiring to this height, he must serve his apprenticeship in order to acquire the necessary qualifications to fit himself for this responsible position.

The first necessary qualification is common sense. He may have all the other qualifications necessary and, lacking this attribute, be a failure. If in early life we have not acquired it, it should be cultivated in order that we may be successful.

The aspirant should be a close observer, studious, painstaking, methodical, having a place for everything and everything in its proper place.

He should be a man who never quits; a man who does not know the term "failure"; a man who, when he attempts to do a thing, does it and does it right; a man who realizes if he accomplishes what he undertakes, somewhere, sometime and somehow, the powers that be will see and know and reward him accordingly; a man who works with the same energy, the same courage and tenacity when he receives 30 cents an hour as when he receives \$10 a day.

He should be courteous and obliging, willing at all times to accommodate others, always gentlemanly when in conversation or dealing with employes of other departments, furnishing material and delivering it promptly when called for, showing the same courtesies that he would if he were working in a private store.

A stockkeeper located at an outside point or away from the main storehouse who is not directly under the eye of the storekeeper all the time and who is looking forward to promotion must handle his place successfully by always having it neat and clean, being in a position at all times to furnish information which

might be called for by the storekeeper or other officials pertaining to material under his jurisdiction, and by so doing he may be the one recommended for advancement when the opportunity offers.

And, last but by no means least, he should cultivate acquaintance with the officials he comes in contact with, and also go out of his way to serve them efficiently. His associates and environment should be such as to command the respect of all, and he should keep abreast of the times by reading as much current edifying literature as possible. There is no doubt, if he follows persistently the outline embodied herein, he will finally be crowned with success.

### *You Are the Company*

How often we hear the expression, "The company does not treat us right"—although right then the one making the remark is no doubt loafing on the job or, if not, is watching the "boss" for a chance to kill time.

Did you ever think of how much time is killed every day? While we know that time is money, and none of us would reach into the cash drawer and take out money, still we take time from the company for which we give nothing in return, which, in plain English, is stealing, and we know that it is the law of God and man that "Thou shalt not steal."

When we agree to work for the company for a certain amount per day and we are paid that amount, then we should give to the company a full day's work in return. Each of us should feel that we are the "company," that a chain is only as strong as its weakest link and that, when we fail to do our duty, we become the weak link in the chain.—GLEN ROACH, Record Clerk, Telegraph Department, Memphis, Tenn.

# Dawson Springs' New Hospital Dedicated

## Illinois Central Had Prominent Place in Great Kentucky Celebration Held on Washington's Birthday

WASHINGTON'S Birthday, February 22, was a big day for Dawson Springs, Ky. On that day there was dedicated the \$2,250,000 veterans' hospital, said to be the most modern and newest hospital in the United States and the first completed for "our boys" since the world war. Since Dawson Springs is served by the Kentucky division of the Illinois Central and by no other railroad, naturally the Illinois Central took a prominent part in the celebration.

The crowd in attendance was conservatively estimated at 5,000. Special trains were run

from Madisonville and Hopkinsville. The Illinois Central, according to the report of Agent G. C. McAuley, brought Governor E. P. Morrow and the entire legislature from Frankfort. This train consisted of eight Pullmans and two office cars. Superintendent T. E. Hill took these cars to Frankfort and turned them over to the governor and his party for their use. Mr. Hill was in attendance at the celebration, as were notables from many points, including Washington, D. C.

The day was ideal, and the crowd took every advantage of the opportunity to inspect the

Upper left, Major F. H. McKean, medical officer in charge of the new hospital. Upper right, Captain J. J. Cosgrove, executive officer. Below, one of the buildings for patients, showing the open-air arrangement.

buildings and grounds. Among the speakers on the program at the reservation were: Colonel Edward Clifford, assistant secretary of the treasury; Congressman David H. Kincheloc of the Dawson Springs district; Congressman Langley of the Tenth Kentucky District; Will P. Scott of Dawson Springs; Dr. S. M. Rienhart, representing Colonel Forbes of the War Veterans' Bureau; Emmet O'Neil of Louisville, state commander of the American Legion; Miss White of the Red Cross, and Thomas F. O'Connell of the Knights of Columbus. Governor Morrow himself delivered the dedicatory address.

Music was furnished by the Camp Knox military band.

A social entertainment was given in the recreation building in the evening. This consisted of a reception, followed by a dance. Members of the legislature were entertained at dinner.

### To Take Patients From Three States

The Dawson Springs Hospital, the construction of which was described in the July, 1921, issue of the *Illinois Central Magazine*, will receive patients from Indiana, Ohio and Kentucky. Major F. H. McKean is medical officer in charge; Captain J. J. Cosgrove is executive officer.

The story of the hospital at Dawson Springs, if properly written, would read like a romance. At the time it was decided to build this great plant, the first thing that entered into the consideration of a site was the fact that nowhere else on the North American continent could be found the "healing waters" of Dawson Springs. Another consideration was the fact that the scenery and unpolluted atmosphere were second to none.

Inquiry was made by the Public Health Department for a record of the temperature for a number of years past. Everyone thought it was impossible to obtain such a record, but when the inquiry became known Mrs. T. W. Clark came forward and presented an unbroken record for forty years past showing the daily temperature, and the days of sunshine. The average temperature was shown to be 64 degrees Fahrenheit, and 74 per cent of the days were days of sunshine.

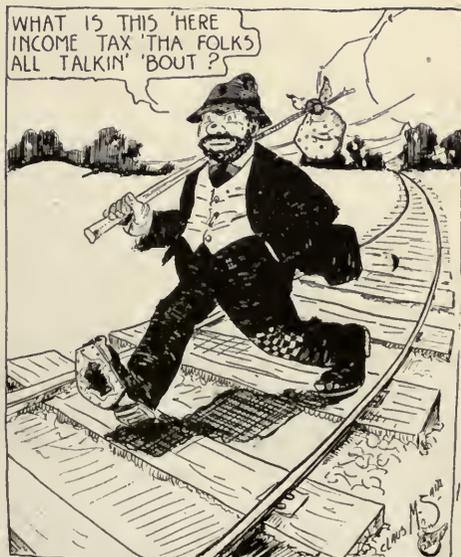

### A Genuinely Healthful City

Next the health of the community was inquired into, and the local physicians showed by their records that Dawson Springs is so healthy that doctors have to make their living off the guests when they first arrive, before the famous water gets in its work.

That this place should be one of the great attractions of Kentucky, to be placed among its places of interest along with the birthplace of Lincoln, Jefferson Davis, the home of "My Old Kentucky Home," Mammoth Cave, etc., it was decided to donate a reservation of five thousand acres of land for a site. It is hoped to turn the whole reservation into a national park, the real playground of Kentucky.

The unit consists of twenty-two large buildings as follows: Infirmery; semi-ambulant; six ambulant; administration; nurses's quarters; junior officers' quarters; attendants' quarters; non-tubercular hospital; senior officers' quarters No. 1; senior officers' quarters No. 2; quarters for officers in charge; chapel and mortuary; dining room and mess hall; amusement building; laundry; power house and gas house. The hospital, when functioning with every bed occupied, will mean an outlay of more than \$100,000 a month. It has been suggested that the capacity of this unit can be doubled by the expenditure of about \$750,000, and this change is now being considered.

According to the circular announcing the dedication, "Dawson Springs is a delightful place in which to live, located in the heart of a beautiful range of low mountains; on a through line of the great Illinois Central Railroad, with splendid passenger, freight and mail service; close enough to a great coal field to insure cheap fuel, and within seventy miles of the center of population of the United States."

# The Traveling Engineer and the Fuel Bill

## Great Economies in the Use of Coal Are Necessary, and He Is the Man Who Must Point Them Out

By J. L. HARRINGTON,  
Traveling Engineer, Tennessee Division

THE fuel bill of the railroads, like other expenses, has increased greatly within recent years. In the year ending June 30, 1915, the fuel used by Class I roads amounted to less than \$210,000,000; in 1916 it cost them more than \$250,000,000, and in 1918 more than \$500,000,000. In 1920, owing to increases, both in amount of fuel consumed and in the average price, the total fuel bill of the Class I roads was \$675,000,000, an increase since 1916 of \$423,000,000, or 170 per cent. This increase was partly due to an increase in the amount of fuel consumed on account of the larger traffic handled, but principally to the increased price of fuel.

Since the end of 1920 there have been substantial reductions in prices paid by railroads for coal. However, it is clear that further reductions must be made in all operating expenses, including fuel. The cost of fuel must be reduced further both by reduction in price and by effecting greater economies in its use. The latter can be accomplished only by the closest supervision on the part of the traveling engineers; in the last analysis, we, more than anyone else on the railroad, control the fuel situation.

### Duty of Traveling Engineers

The various officials, who are always willing to co-operate with us on this question, as a rule have but limited mechanical experience, and we can expect them to call to our attention only a few of the irregularities that come under their notice, these chiefly being black smoke, an engine with valve or cylinder packing blowing, valves out, or maybe power-reversing gear defective. All of the above-mentioned defects waste coal and will pass unnoticed by the inexperienced.

Carbonization in steam chests and cylinders of superheat engines is particularly destructive to the efficiency of a locomotive, and my experience has been that this is largely a matter of supervision on the part of traveling engineers in educating the engineers in the proper handling of the engine. When, from a number of

engines working under similar conditions and making about the same mileage, a few are found badly carbonized and the rest are practically free therefrom, the fault is usually found in the manner in which the engine has been handled; and it can be corrected by properly advising the engineer.

### Surprise Tests Are Valuable

The power-reverse gear is a coal-saving device when properly maintained, but if not properly maintained it plays havoc with the coal pile. Traveling engineers should familiarize themselves with every detail of this feature of operation, and I would suggest that they be permitted to spend a few days out of every six months on Air Brake Instruction Car No. 10 with Mr. Bales, whose experience with the sundry conditions encountered on the system would no doubt be beneficial.

We should recommend the continued installation of devices which result in burning less fuel in proportion to the power produced. Traveling engineers should also spend a portion of their time at shops and roundhouses to become familiar with the manner in which work is done and to advise with the foremen and mechanics.

A check should be made of the manner in which superheat flues are being cleaned, this to be in the nature of a surprise test after the flue borer has OK'd the engine for service. I have known of cases where tests of this kind produced very good results. We all know what it means to the coal pile to have even one superheat unit inoperative.

### On Hiring a New Fireman

The matter of educating firemen has been pretty thoroughly covered. This education begins when he is given an application for employment. In my opinion, the officer having direct supervision over him should employ him, bearing in mind that he is to become a future engineer. Some attention should be given to his mental and moral caliber. The officer who supervises his work is naturally going to be more particular as to what he is getting than the man who merely hires him and dumps him to someone else to educate. It is not so easy

to get rid of an undesirable as it was a few years ago, which is another reason for exercising greater care in their selection.

I am going to take the liberty of digressing from the subject of fuel to make mention of a complaint we hear from many travelers and shippers, that rates are too high. In spite of the relatively high rates, the railroads, as a whole, have not earned the net returns it was expected they would. In fact, most of them have not been earning enough to pay operating expenses and taxes.

### Must Keep Public Informed

I believe we all recognize the fact that, if the railroads are to regain their footing, the

utmost efforts must be made by all of us who are directly connected with the business, first, to obtain efficiency and economy of operation and, second, to keep the public informed in order that many unjust attacks (which will continue to be made upon the management in the future as they have in the past) will not mislead public opinion regarding private management. All of us who are in close touch with railway affairs know that private management is not perfect; but we all have good reasons for believing that it is better than government management or the Plumb plan management. Therefore, it behooves us to do all we can to make private management a success.

## Was Trainman in the Link-and-Pin Days

*John Q. Adams of Pinckneyville, Ill., who signs himself "a 'has-been' employe of the Illinois Central," contributes the following account of hardships of trainmen in the old days:*

When I first entered railway service it was as a trainman with the Cairo Short Line, a road later on acquired by the Illinois Central System and known now as the St. Louis division. I well remember my first trip to this day. It was made on what was known as the Du Quoin-St. Louis local freight. At that time I thought I was very fortunate in catching that job, as it was considered a "preferred" run, inasmuch as it was a daylight run, or at least was considered so. It was, with the exception of having to work a few hours before daylight in order to make up our train before leaving the terminal. It was a job, too, in making up your trains those days. Everything had to be "bunched" and put in station order.

Now this job which I had been striving for for so long and finally landed was all right. It was what I was looking for. Of course, being a new man on the job, it fell my lot to take the "head end," where there was plenty of exercise in the way of setting "binders" every time we had an occasion to make a stop, besides other work, not to say anything about shoveling down ten or twelve tons of coal each trip for the "tallow pot," all of which took a strain off him.

### His Work Started at 4 a. m.

Before leaving the Du Quoin terminal the head brakeman's duty was to get up about 4 a. m., eat his lunch, then go to the round-

house—a distance of a mile, more or less—and get the engine crew (the wise end of the crew, eh?) and return to the yards where the train was to be made up, where the real work began. All he had to do then was to "tie into" the first cut of cars that was handy, as it made very little difference where you began, for you had to shift every track in the yard, anyway, before you got out of town. When heading down the lead with a bunch of cars, say anywhere from twenty-five to one hundred, it would be necessary for this head "guy" to "go high" in order to transmit signals to the head end. After pulling every track in the yard and having our train together, we would proceed on our journey. Maybe we would go in on time, and maybe we wouldn't. That depended, of course, altogether on luck. If we didn't break in two more than seven or eight times or pull out too many "tongues," we would usually go in on the "advertised," but in extremely bad luck the "owls" would be after us about the time we reached Belleville, fourteen miles short of our destination.

### Wages From \$40 to \$50 a Month

As I said before, the head "guy" had to "go high" every time there was a stop made, and especially when making up trains. He took his position near the head end, where his signals could be seen by the "tallow pot," for at that time it was up to the fireman to take them. Outside of standing on the head end for a couple of hours each day while making up the train, I had very little else to do except keep from being knocked off the top of a car once in a while when the "eagle

eye" made a bad job in bunching or taking the slack out of the old "link-and-pin" couplings, especially when the conductor had told the "hog head" how many way cars he would have out on the trip, and all "working." But, after all, why should we have worried? Just think of the salary we were getting—from \$40 to \$50 per for a brakeman and \$90 for the "Johnnie-wise." And to think of it—we got our pay every month, too.

#### Saw the Air Brake Come In

I was working on the Paducah division of the Illinois Central between Pinckneyville and Brooklin, now known as Brookport, about the time the air brake was instituted. John ("Smoky") Allen, my conductor, is still in the service of the company punching tickets. We went down the Ozark Hill many a time with only four or five cars of air, that being the limit of cars we had in the train equipped with air. But the crew thought so much of these "extra brakemen," as we called them, that they would have been willing to rawhide a great deal in order to get them ahead. The fact that we had these air brakes did not exempt the train crew from any further duties; on the other hand, everybody had to do a little "decorating" and set a few brakes in addition to bunch the train and keep control of it. After having set enough brakes immediately behind the air to control the train, the "stinger" would sit down on a brake wheel and take the world easy. Many a time the writer of this article has stood on top of the train all the way down

the hill in all kinds of weather. I have gone over the train when it was absolutely necessary to "coon" the running boards in order to set brakes in controlling the train. Snow, sleet and ice were no bar. It was a case of "have to" those days in order to hold your "office."

#### A Word as to Loyalty

Very few railway men of today experienced the hazardous times of the "link-and-pin" days. And, as a consequence, present-day railway men know very little about the hardships the "old timers" had to contend with. The working conditions of the train service men have been greatly improved, and the hardships, to some extent, have been eliminated. Present conditions are improved especially as to conditions regulating the working hours and compensation. For the present improved conditions the railway organizations are entitled to equal credit with the company. The improvement has been brought about by co-operation. While the organizations deserve much credit for the working conditions they now enjoy, they should also feel grateful to the company in assisting them in getting these better conditions. In other words, always be willing to go "fifty-fifty" with your company.

Every railway man employed by the Illinois Central has a good company to work for and gets fairly well paid for his labor. For these two reasons he should work at all times for the betterment of the company as well as for himself.

## NEWS of the DIVISIONS

#### AROUND CHICAGO

##### Suburban Passenger Service

The following letter, dated February 2, is from our ticket agent at Kensington, Ill.: "About 9 a. m. this date, my baggageman notified me that a fire had been discovered under the suburban platform in the coal bin, caused by some passenger's throwing a cigaret butt through one of the platform cracks. The fire was discovered by Walter De Golyer, who throws switches at 12th Street. Very little damage was done, as M. Masley, baggageman,

put it out with fire extinguisher and water before it got a good start."

The following letter was received from John R. Duffy, a passenger: "Wish you to take into consideration the conduct of one of your employes, E. C. Perlin, 8055 Escanaba Avenue, on the night of February 2, 1922. I was returning to my home via the Illinois Central South Chicago division, and on getting off at Parkside station left a package containing clothing of considerable value on the train. Owing to the honesty and thoughtfulness of Mr. Perlin, this suit was returned to me without loss of

# Hamilton Watch

"The Railroad Timekeeper of America"

"My Hamilton enlisted  
in the 90's"

"I bought this Hamilton in the nineties and am still running trains by it", said Conductor Patrick J. Landy, the efficient Conductor who takes the fast mail No. 9 on the Chicago and North Western out of Chicago.

A feeling of affection is displayed by veteran Railroad men for their Hamiltons, a feeling that has been inspired by the unfailing service which the Hamilton Watch has given them under all the strenuous conditions of railroading. The accuracy and durability of the Hamilton Watch is the result of the skill and brains employed in making it the dependable servant of the Railroad man. "Quality First, to meet Railroad requirements" is the motto of the Hamilton factory.

The Engineers and Conductors who have been long in the service have tested and proven the accuracy and dependability of the Hamilton. To the younger generation of Railroad men we say

*Own a Watch with a Service Record*

The Hamilton Watch has been keeping trains on time for thirty years.

That is the kind of watch you need.

When you buy, inspect the Hamilton models that Railroad men favor, particularly No. 997 (16-size, 21 jewels). Hamilton Watches range in price from \$40 to \$200. Movements alone \$22 (in Canada \$25) and up. Send for "The Timekeeper", an interesting booklet about the manufacture and care of fine watches. The different Hamiltons are illustrated and prices given.

**HAMILTON WATCH COMPANY**

*Lancaster, Penna., U. S. A.*

time or worry. I hope you will take this matter into consideration and accept my word of praise regarding the courtesy and honesty of the Illinois Central employes, and the company's service to the public in general."

**Auditor of Freight Receipts**

Mrs. Pearl Wirsch recently spent a few weeks visiting friends in California; she was in a snow storm in Pasadena and later sweltered in the sun while the ranges above were covered with snow.

Charles Rowe was heartily welcomed on his return after spending ten weeks at the Illinois Central Hospital because of an injured leg. He speaks highly of the service.

On January 29 twins (a boy and girl) came to the home of Mr. and Mrs. Hugh McCormick, but the little girl lived only a day.

Julia Lopeman (with a few others) was a guest of Mary Garden and the Chicago Opera Company at an evening's opera. After the opera Miss Garden served her guests a lunch.

W. L. and David Levin were bereaved in the sudden death of their father on February 21.

Got a card from the girls this morning—dog-gone their travelin' skin—

They're up around Niag'ry Falls, a-writin' home ag'in.

Seems like those girls' one glory is to wander fur and free,

An' farther off they get, the more they write to me.

They send these picture postcards with photos showing that

The world is allus beautiful where you ain't livin' at.

Their messages reads all the same in letters, large an' clear,

They write from Memphis and Champaign an' say: "Wish you were here."

The girls of the tabulating department must have their fun, whether it be in Champaign, Memphis or Niagara.

Many employes read with sorrow the article

in the papers of March 8 regarding the failure of a Chicago stock concern, and now they wish that they had invested in Illinois Central stock. It often takes a good, hard bump to teach us, but we all learn sooner or later. The butterfly has very pretty wings and he is rather attractive, but he does not fly as straight as the crow, although the black fellow is not half so good looking.

**Burnside Shops**

Robert G. Stripp, employed in the master mechanic's office as car clerk, retired on pension, effective March 1, after forty-three years and five months of faithful service.

Mr. Stripp was born in Germany, July 31, 1848. The family arrived in this country in the fall of 1857, settling in New Haven, Conn. In 1860 they moved to Champaign, Ill., and later settled on a farm near Sadorus, Ill.

Robert G. Stripp

In 1869, when 21 years old, Mr. Stripp obtained work as a carriage painter in Champaign, an occupation he followed for nine years. He was married during this 9-year period. September 2, 1878, at the age of 30 years, he entered the service of the Illinois Central at Champaign as clerk.

In October, 1880, he was transferred to the office of the superintendent of machinery as clerk, where he remained until July, 1882, at which time he was appointed storekeeper at the old car works (now 27th street roundhouse, Chicago), and later, in 1884, was advanced to the position of chief clerk at that point. In December, 1896,

This photograph shows the office and staff of the auditor of freight receipts, North Michigan Avenue, Chicago, in 1896. At that time there were seventy-five employes in the office; now there are 450 in that department, which is housed in the 63rd Street office building at Chicago. Thirteen of those shown in the picture are still in the service, some of them with the same department. One of them, B. T. Humphries, has had forty-nine years of service. Photograph and information by courtesy of John J. Enright.

**"Safety-Valve Steve"  
Says:**

Tim, my fireman, can't wear his jumper when he's firing—but when the run's over he slips on a slick jumper—and gives the crowds the once over.

Yes—Tim is careful that all Overalls and Jumpers he buys are made out of Stifel's Indigo Cloth. I switched him in right—twelve years ago when I says—"Tim—always look for this boot-shaped trade mark in your Work Clothes."

All the big Overall and Work Clothes manufacturers use Stifel's Indigo Cloth because it wears best. Well—we're pulling out now. See you later.

*Garments sold by Dealers Everywhere

Standard for over 75 years

the car works were abandoned, and Mr. Stripp and his chair were moved to Burnside shops. Upon his arrival at Burnside, he was appointed car clerk, a position he faithfully kept to the date of his retirement, without complaint. In addition to being a farmer, painter and railway man, Mr. Stripp has been a splendid cornet player. His talent in this line helped in the organization of the Illinois Central Band, of which he was band master for two years.

His retirement will not be lonesome, for he is the proud parent of a sturdy family, consisting of two sons and three daughters. He has eleven grandchildren (two of the youngest ones are sitting on his knee in the picture), who will fill the remaining years of his life.

#### WISCONSIN DIVISION

##### Superintendent's Office, Freeport, Ill.

Clerk Walter Tappe's father died Thursday, March 2.

Agents L. J. Bartle of Argyle, Wis., and F. E. Lomboley of Monroe, Wis., have been praised for courtesy and service in a letter written to Superintendent J. F. Dignan by K. M. Quackenbusch of 1014 Seventh Street, S. E., Minneapolis, Minn. "They both did everything in their power to assist me," wrote Mr. Quackenbusch, referring to bringing the body of his father to Minneapolis.

Conductor J. B. Stewart has been commended several times recently for activity in obtaining passengers for the Illinois Central.

#### Dixon, Ill.

Warehouse Foreman Hugh Curran was on the sick list a few days the last part of March.

Switchman M. J. Reilly spent the last week of March on vacation, his place being filled by D. S. McIntyre.

High water from the Rock River ice gorge did no damage to Illinois Central property other than to put the pumping station out of service for a few days.

Chief Clerk Paul Reilly was off duty March 1 on account of the death of his niece, Mrs. Katherine Burke.

J. W. Skaggs and his outfit returned to Dixon March 1 and will soon resume work taking down the old bridge across Rock River.

Interchange Clerk George McKenny moved on March 1 into new quarters on West Fourth Street.

Hanford McNider, the national commander of the American Legion, reached Dixon March 6 via the Illinois Central. He spoke in Dixon and Sterling.

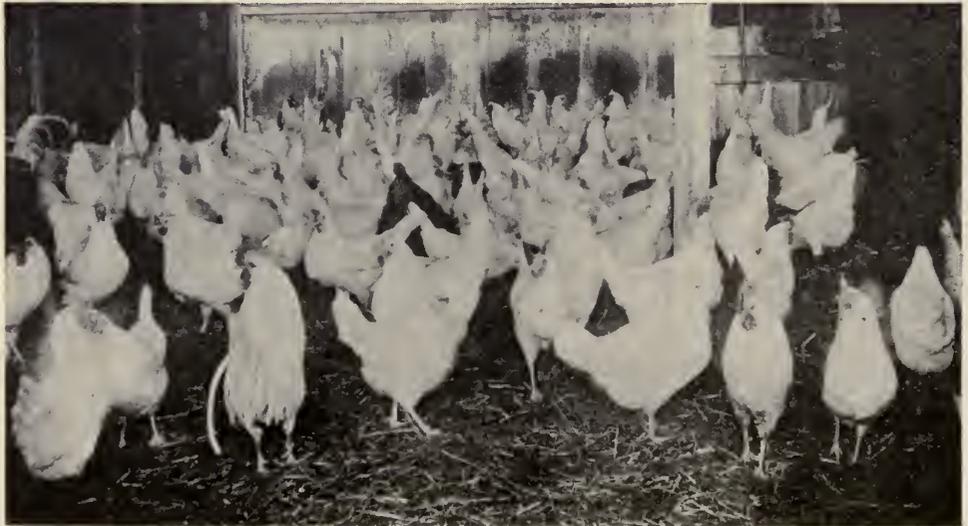

Dixon's new \$250,000 theater was opened to the public Wednesday, March 15. It will seat 1,300 persons, and the stage can take care of the largest show on the road. This gives Dixon two first-class show houses.

The Sandusky Cement Company has taken steps to provide itself with coal in the event of a strike. The company is storing more than twelve thousand tons of coal, and the Illinois Central is getting its share of the business. The cement company uses three hundred tons a day during the busy season.

A meeting of business men, farmers and secretaries of the various Chambers of Commerce between Freeport and La Salle, held in this city recently, forwarded resolutions to Governor Small asking that work on the proposed pavement between Freeport and La Salle be started this summer.

#### La Salle, Ill.

During the past several months Miss Margaret Confrey and Miss Mary Cawley of the local freight office at La Salle have become much in evidence along the line of traffic solicitation. Through earnest efforts they have "landed" routing orders for several valuable consignments from the East, as well as some important business from other sections of the country. These young women are on the alert

E. E. White of Waterloo, Iowa, Minnesota division engineer, uses electric lights in his chicken house, as explained in the February issue of this magazine. This view was taken at 7 p. m. one day in February, when everybody else's chickens were at roost. Mr. White has about 110 hens, and their January record was 1,709 eggs—the highest of ten record flocks in Blackhawk County.

at all times and make it a point to see that the Illinois Central is given a chance to display its ever efficient transportation facilities. Company officials have made considerable mention, through the medium of personal letters recently, of the activity displayed by Misses Confrey and Cawley in obtaining routing orders from eighteen La Salle merchants covering shipments to move in a package car from the East.

**MINNESOTA DIVISION**

E. S. Warren, operator at Nashua, has resumed his duties after a 90-day leave of absence, which was spent in the South visiting relatives.

William Brinker resumed his duties as agent at Waddams Grove after a 30-day siege in the hospital.

C. T. Coffey, genial operator at KB, Dubuque, who has been off duty the last three months on account of illness, is reported slowly improving.

J. H. Wells of East Cabin reports having a fine vacation in California.

W. W. Wheaton, agent at Masonville, reports an addition in his family February 26.

Miss Genevieve Sims has returned to her duties in the superintendent's office after a 30-day leave of absence.

P. J. Printy, pensioned engineer, is spending the winter with his daughter in Wichita Falls, Texas.

Paul Harrington, 18 years old, son of Conductor J. E. Harrington, died Wednesday, March 8, at St. Bernard's Hospital, Chicago, after an illness of one day. Burial was made at Freeport, Friday, March 10.

We have learned of the sudden death of Mrs. J. Thompson, sister of Miss Anna Brauhn, tonnage clerk, superintendent's office.

Ralph Denny has returned to work after a three months' leave of absence spent attending an officers' training camp at Columbus, Ga. Mr. Denny holds the rank of first lieutenant in the Iowa National Guard.

Walter Palmer, brakeman between Dubuque and Chicago, has returned to work after having been called to St. Louis by the serious illness of his sister.

Conductor J. H. Good's home in Waterloo was slightly damaged by fire Sunday, March 5.

Conductor H. Smith has returned from Pittsburgh, Pa., where he visited his mother, who is ill.

Andy Valeske and Mrs. K. Kutsch were married in Freeport recently.

Waterworks Foreman J. C. Landgraf and Mrs. Landgraf have returned from a trip through the South.

Harry Knocke, pumper at Dubuque, has returned from the Chicago hospital, where he went for a slight operation.

John Avory, pumper at Galena, is now in the Chicago hospital to undergo an operation.

H. Rhoads, roadmaster at Dubuque, made a two weeks' visit to Jacksonville, Fla., during the early part of February. Mr. Rhoads is interested in orange groves near there, and kindly remembered the division office force at Dubuque by sending a box of his choice oranges.

**SPRINGFIELD DIVISION**

Thursday, March 2, the regular Transportation Club meeting was held at Decatur, Ill. It was well attended by various interested lines. The attendance from the Illinois Central was larger than usual. Those attending from the division were Superintendent C. W. Shaw,

**Illinois** \$5.75 Per Month

624 F Street

Washington, D. C.

Supervising Agent F. W. Plate, Chief Clerk H. M. Gleadall, Agent C. W. Donaldson, Clinton, Agent G. W. Morgan, Decatur, Ticket Agent G. A. Lavery, Z. Snell, Helen Kraft and Margaret Harris, all of Decatur. These meetings of the Transportation Club are productive of good results and should be taken advantage of to a greater extent than in the past.

The Illinois Central has been recognized by having chosen as a delegate to the International Rotary Convention, to be held in Los Angeles, Cal., June 5 to June 9, 1922. Superintendent C. W. Shaw of the Springfield division. Dr. G. S. Edmonson, district surgeon, is an alternate.

It has been noted from final figures obtained on the February coal drive that the Springfield division was able to take a position ahead of the Minnesota division in fuel conservation. Unfortunately, we did not reach the mark set for the reduction in switch engine mileage, which was occasioned by the heavy switching being performed on account of opening the new yard at Clinton, being furnished with longer yard tracks and permitting Central Type engines to park the trains all on one track instead of doubling over, as had been the practice heretofore.

Charles P. Freemon, 1526 South College Street, Springfield, who was retired on pension effective as of December 31, 1921, has been connected with the Springfield division as brakeman and conductor since May, 1892, and has been in charge of one of our passenger trains for the past several years. About a year ago Mr. Freemon, who is a heavy man, met with an accident to his knee, resulting from a fall. The knee has failed to respond to treatment sufficiently to permit him to continue in active service.

George Jeffrey, engineer, who has been absent on account of sickness, has returned to work.

D. W. Boggs, engineer, has returned to service after several months' leave of absence on account of illness.

George Howard has resumed his duties at the roundhouse office after being absent on account of illness.

Miss Esther Jones, stenographer in the divi-

sion storekeeper's office at Clinton, submitted to an operation for appendicitis in the Illinois Central Hospital at Chicago the morning of March 8. She is getting along nicely.

Conductor M. J. Kennedy, who has been out of service for some time on account of illness, is reported as getting along nicely and will soon return to his duties as passenger conductor.

Mrs. Harry Zimmerli and little daughter, who have been ill for several days, are very much improved.

Conductor E. E. Hilbrant of the Havana-Champaign runs has been off duty on account of illness. Conductor Ira Wallace is filling his run.

Brakeman J. E. Shepherd has returned to work after being absent on account of having pneumonia.

Conductor J. W. Fry is off duty on account of injury to one of his legs when a horse fell on him.

Baggage man John Keemer and Passenger Conductor W. H. Scott are taking a vacation for the purpose of making a trip to Texas to look after their oil interests in that state.

Switchman E. E. Newlin is off duty on account of ill health. He expects to go to Denver.

Brakeman Thomas Duke, Jr., has asked for ninety days' leave of absence. Accompanied by his wife, he expects to spend the leave of absence on his farm in Wisconsin.

Conductor John Lovell of the Springfield-East St. Louis local is absent from duty on account of having the flu.

Caller E. H. Young has been granted thirty days' leave of absence and has gone to Hot Springs for the benefit of his health.

Special Agent Harold Dodd was married Thursday, March 9. After a short honeymoon, the couple will reside in Clinton.

Brakeman Carl Bowers of Clinton and Miss Marie Ashley of Benton, Ill., were married in St. Louis, Monday, March 6.

Conductor Chris Cully was off for a few days looking after business interests. He also attended the funeral of Conductor W. H. Sharkey at Amboy.

Conductor O. H. Lawson of trains 19 and 20 is off duty on account of the death of a relative

Engine 2997, one of the most recent of the Central Type locomotives, has been in service on the Illinois division since November, 1921, between Champaign and Centralia. This class of engine is probably one of the most modern on any road in the United States; the coal is brought forward, elevated and blown into the fire-box by steam, an auxiliary engine being placed under the deck for this purpose. This engine was on exhibition at the Illinois Central station during Homecoming Week at the University of Illinois, Champaign, Ill., and attracted thousands of visitors. The engine is in charge of Engineer A. L. Barnard and Fireman A. M. Wheeler.

# The Best Railway Lubricants

With the same thoroughness that has characterized their successful efforts in furnishing lubricants to other industries, TEXACO is supplying railroads with the best railway lubricants made.

The practically unanimous opinion of enginemen using TEXACO Oils, whose experience includes the use of other railway lubricants, is that TEXACO Oil is the best they have ever used.

No other oil company has better facilities (and very few in fact as good) to furnish railroads with suitable lubricants for the exacting service required. The Texas Company is exceptionally fortunate in that their producing fields are so widespread.

We secure our crudes from a number of oil fields, distributed in various states, and thus when we manufacture a TEXACO lubricant for a special purpose, such as TEXACO Superheat Valve Oil, we can select the crude best adapted from the variety at our disposal.

In addition our own production we have our own pipe lines, refineries, tank cars, tank steamers, shipyard, two research laboratories, and an exceptional organization.

*"The Best Railway Lubricants"*

## THE TEXAS COMPANY

RAILWAY TRAFFIC AND SALES DEPARTMENT  
NEW YORK CHICAGO ATLANTA HOUSTON

OFFICES IN PRINCIPAL CITIES

in Colorado. During his absence, Conductor McIntyre is filling his run.

Engineer C. C. Catlin of the Springfield-Clinton passenger run has been off duty for some time on account of illness. At present he is regaining his health.

#### Road Department

Signal Maintenance Foreman F. W. Yeager of Clinton was married in Springfield, Monday, March 6.

The station building at Radford, Ill., was destroyed by fire the morning of March 11. The fire was discovered about 2:30 a. m. when it was too late to save the building or contents.

Resident Engineer G. C. Harris, who has been in Clinton for some time past, in charge of the construction of the new yards, has moved his headquarters to Monee, Ill., where he will have charge of some construction work on the Illinois division.

Thomas Turney of the engineer auditor's office, Chicago, is now at Clinton working up completion reports for the new yards recently constructed.

Thomas F. Murphy, for many years an employe of the Illinois Central at Clinton, who died in his home December 18, had been ill for several years, but his condition did not become critical until a few days before his death. The son of Mr. and Mrs. Bernard Murphy, he was born in Quincy, Adams County, Ill., January 20, 1862, which made him almost 60 years old at the time of his death. Early in 1890, Mr. Murphy went to Clinton and took up work as a brakeman for the Illinois Central between Clinton and Centralia. For twenty-five years he served the company on the Clinton district. After working as a brakeman for a short time, Mr. Murphy was made a conductor. He was later given charge of a fast preferred freight run between Clinton and Centralia.

While in charge of his train at Pana, July 11, 1915, Mr. Murphy was stricken with paralysis. Other strokes of paralysis incapacitated him to such an extent that he was confined to his home until his death. He was retired from service and pensioned by the company in 1916.

Mr. Murphy and Miss Anna Skelly were married May 22, 1895. To this union two children were born, Bernard R. Murphy, night ticket agent for the Illinois Central at Clinton, and Miss Anna Murphy, employed as a stenographer at the Illinois Central freight house at Clinton. Both children, with their mother, survive. Mr. Murphy is also survived by two brothers, Bernard and John Murphy of Clinton.

Mr. Murphy was highly regarded, especially by the employes at Clinton and other points on the Springfield division. He was a member of the local chapter of the Order of Railway Conductors, and, until he became ill, was an active and staunch worker among railway employes for that organization.

#### INDIANA DIVISION Roadmaster's Office

February 22, 1922, employes of the Mattoon and Peoria districts met at Mattoon to conduct a "spelling bee" on the maintenance of way book of rules and standards. Supervisor T. J. Flynn of the Effingham district conducted the meeting. One hundred questions were asked, and the Peoria district, under Supervisor J. C.

Crane of Mattoon, defeated the Mattoon district, under Supervisor W. O. Chamberlain of Newton. The meeting was of great benefit to all who attended. We are looking forward to another contest where the Peoria district will meet the Effingham district, which recently defeated the Indianapolis district in a similar contest. It is also planned to have a meeting of the two original losers, the Indianapolis and Mattoon districts.

Ditching with the Jordan spreader ditcher, in charge of Engineer Joseph Kenney, has been started on the Mattoon district in the vicinity of Olney.

The division officers attended the annual Washington's Birthday banquet given by the Creve Coeur Club at Peoria February 22.

#### Mattoon Shops

W. C. Johnson, roundhouse foreman at Mattoon, and Mrs. Johnson were called to Cherokee, Iowa, by the death of Mr. Johnson's sister.

H. M. Christian, engineer, underwent an operation for appendicitis in Chicago at the Illinois Central Hospital, and is reported as getting along very nicely.

W. C. Johnson, roundhouse foreman at Mattoon, has been appointed general foreman at Evansville, to fill the vacancy caused by the death of Thomas Miller.

Corporal Frank Brown, son of Mr. and Mrs. William Brown, died at an army camp in California February 25 as the result of a pistol wound received while in the service of the United States Army. Corporal Brown had been stationed in the Hawaiian Islands for two years, and his term of enlistment would have expired within two months. He was regimental band leader, and, as such, had the honor of playing a solo for the Prince of Wales. William Brown is employed at the Mattoon shops as a car carpenter.

Lon Harris, wrecking foreman at Mattoon, has received news of the death of his brother, Tom Harris, in California.

Above is the home of W. D. Morgan at Hodgenville, Ky. Mr. Morgan has been on the run between Cecilia and Hodgenville for twenty-one years. At first he was switchman and flagman; he was promoted to conductor in 1909. He has been in the service of the Illinois Central System for thirty years. In his first service at Louisville, Ky., as flagman, he took the first combination baggage and express run out of Louisville. Mr. Morgan has been married twenty-nine years. For some time he had a farm near Hodgenville. He sold that two years ago and purchased his present home.

W. E. DeLay, fireman, of Palestine, is spending the winter in Florida for his health.

G. W. Fuhr, engineer, of Decatur, is spending the winter in Florida.

**Office of Chief Dispatcher**

During February, 1922, the Indiana division loaded and billed 818 cars of grain, mostly on the north end of the Peoria district. This is the largest business of this kind for February for several years past.

Effective March 16, the Anita, Ind., agency is closed. This station becomes a prepay station.

Operator Carl Edwards, Mattoon yard office, has been ill two weeks with influenza. He was relieved by Operator McGowan.

The banana and perishable movement from the South is growing heavier every day, causing considerable business to move over the Indianapolis district through the Indianapolis gateway.

**Trainmaster's Office, Mattoon-Peoria Districts**

Conductor H. T. Harper, who has been in Tulsa, Okla., for the past two months for the benefit of his health, reports fine warm weather and that he has greatly improved.

Brakeman and Mrs. A. Guess departed March 9 for St. Petersburg, Fla., where they expect to remain until about April 1.

**Trainmaster's Office, Indianapolis-Effingham Districts**

Charles Webster, conductor, has been confined to his room, suffering with an attack of the "flu."

Former Passenger Conductor J. R. Winteringer relieved Conductor H. L. Overburg on Nos. 303 and 324 the first part of March.

Miss Ruth Etherton, formerly clerk in Trainmaster E. N. Vane's office at Palestine, surprised her many friends by getting married. The lucky man is Orville Richey of Palestine. Miss Emma Pearce of Linton, Ind., has become Miss Etherton's successor.

Speaking of stage talent, we must at this time give some of our employes on this district due credit. On March 2, in Palestine, was given a most successful minstrel show by the American Legion of Palestine, with Dale Arnold, clerk for Road Supervisor T. J. Flynn, H. Bruner, conductor, and W. K. Gettinger, brakeman, all taking active part.

**Agent's Office, Indianapolis**

H. G. Powell, who was located in Indianapolis with the Illinois Central as traveling freight agent and later became assistant general freight agent at Chicago, is now traffic manager of the Illinois Terminal at Alton, Ill. He recently visited the Illinois Central offices, renewing old acquaintances in what he calls his home city, Indianapolis.

Charles Englehardt, warehouseman, was called to Houston, Texas, by a telegram announcing a serious accident to his daughter, who is located there.

Miss Nellie Shirts, formerly report clerk, is now Mrs. Earl Cochran, and has gone to Winthrop, Iowa, to live on a farm.

Miss, Wilna Beaver, formerly comptometer operator with the revising bureau, is now Mrs. C. B. Barrickman and living in Detroit, Mich.

**Agent's Office, Evansville, Ind.**

The new loading platform which is being constructed in the Illinois Central Main Street yards is rapidly nearing completion. The construction of this platform in the heart of the business district makes it possible for the Illinois Central to handle many cars of competitive traffic which heretofore have been given other lines.

A. W. Walling, rate clerk, has resumed his duties after a siege of illness lasting five months.

C. C. Kunz, agent, recently received word of the death of his father, Fred J. Kunz, in Hollywood, Cal.

J. S. Markham, crossing flagman, has been in the Illinois Central Hospital at Paducah,

**"The House of Quality"** Capital \$1,000,000  
L. W. SWEET, Inc., Dept. 662-J, 1650-1660 Broadway, N.Y.C.

Turntable, Centralia, Ill., Roundhouse, St. Louis Division

Ky., for the past three weeks, having splintered a bone in his right arm. Mr. Markham also underwent an operation for the removal of his tonsils.

Miss Irma Koelling, revising clerk, has resumed her duties after an illness of three weeks.

#### ST. LOUIS DIVISION

To date there have been twenty-four oil trains run from Centralia, Ill., south. They average sixty cars a train.

Miss Mary Wilhoit, who formerly lived at Carbondale, later moving to Cairo, Ill., and being employed by the Illinois Central at that point, was recently married to a Mr. Nelson, who also is an Illinois Central employe. They made a short trip to New Orleans and points in Texas, and will reside in Cairo, Ill.

Work has started on the extension to the division office at Carbondale.

The Illinois Central is taking an active part in the campaign for the eradication of the mosquito and the prevention of malaria at Carbondale and vicinity.

Fred W. Beineke, warehouse foreman, Belleville, Ill., died March 11, after only a few days' illness, and was buried in Walnut Hill cemetery March 14. Mr. Beineke was a clean, conscientious and loyal worker.

There have been recent heavy spring rains on the St. Louis division.

Will H. Lindsay, 57 years old, for more than twenty years a resident of Carbondale, died at his home, March 11, after an illness of about two months with heart trouble. Mr. Lindsay worked a great many years on the St. Louis division as bridgeman on both division and whole line bridge gangs. At the time of his death he was employed by the Ayer & Lord Tie Co., Carbondale.

Sam Parks was recently appointed road supervisor with office at East St. Louis, Ill. Sam Minton was appointed road supervisor with office at Christopher, Ill. Harry Larson was made clerk for Mr. Parks, and J. A. Baumer clerk for Mr. Minton.

#### TENNESSEE DIVISION

H. G. Frazier, for ten years employed as car inspector in Chester Street yards at Jackson, Tenn., was instantly killed at his home on Wilkinson Avenue, March 8, when struck by a falling tree. The body was taken to Greenfield, Tenn., for burial.

F. B. Wilkinson, agent at Jackson, Tenn., is

able to be back at his post of duty, after being off several days with an attack of influenza.

Conductor J. T. Howard, who has been ill of pneumonia at his home in Haleyville, Ala., is reported much better.

A washout plug which is an improvement over all others, the invention of Hal Howard, boiler foreman, Jackson shops, has been sold to a concern in Canada. Associated with Mr. Howard in getting patent rights and putting the product on the market were several other Illinois Central employes. Jackson shops has received considerable notice as the home of several inventions which have been placed in service. It will be remembered that the Martin tool holder, which is now being sold in Canada and the United States, was the invention of T. O. Martin, formerly blacksmith foreman at Jackson, Tenn.

Mr. and Mrs. Rufus Kemp, Jr., were blessed with an 8-pound daughter, Miss Norma Margaret Kemp, February 27.

Engineer and Mrs. T. E. Ervan of Dyersburg, Tenn., made a flying trip through Florida and returned via New Orleans for the Mardi Gras while on a leave of absence.

Sammie Hudson, negro pensioner, died at his home in Fulton, Ky., March 7. He was born April 25, 1850, and entered the service of the Illinois Central as a laborer at Louisville, Ky., in February, 1870. He later worked on the Tennessee division as a sand dryer. After serving the company for thirty-seven years, he was given a pension in November, 1917, and died at the age of 72.

Section Foreman G. G. Payne of Fulton, Ky., lost his eight-year-old daughter, March 13, from a complication of pneumonia and measles.

According to the Jackson (Tenn.) Sun of March 5: "Owen Durham, who has been in the employ of the Illinois Central Railroad here as night freight clerk, left last week to accept

Home of L. W. Lyle, Agent, Utica, Miss., New Orleans Division

## Look for this stamp on the watch you buy

*Ask your  
jeweler  
for these  
watches*

Then you can't go wrong in buying your watch.  
You need the best there is NOW.

It may be required LATER.

Originally, railroad watches were not adjusted to positions.

Later, three position adjustments were required.

Now, the inspectors are not allowed to pass any watches adjusted to less than five positions.

For the present, five position watches are standard.

But railroad requirements are continually going higher—not lower.

So why take any chances on a five position watch when you can just as easily get the superior

Springfield, Illinois

a position with the same railroad in New Orleans, as a member of the bureau of information staff there. Mr. Durham is regarded as an exceptionally efficient railway man and his promotion is gratifying here."

#### MEMPHIS DIVISION

Conductor J. R. Hoke and Conductor A. C. Henry are at the Illinois Central Hospital at Chicago, receiving treatment.

Traveling Engineer Von Bergen has been assigned to special work on the Southern Lines investigating the cost of lubricants for locomotives. B. J. Feeny has been assigned to take care of work on the Clarksdale district during Mr. Von Bergen's absence.

On passenger train No. 14, March 2, Conductor A. C. Henry discovered a hot box at Tunica, Miss., and had to cool and pack it. At Lake Cormorant he found the same box very hot. Conductor J. C. Richardson, who was deadheading on No. 14, rendered every assistance possible, without being asked, in spite of the fact that he had discarded his working clothes. With the assistance rendered by Mr. Richardson it was possible for No. 14 to reach Memphis in time to make all connections.

J. P. Hairston, agent at Cruger, Miss., while inspecting train No. 51, February 28, discovered a brake beam down in the train, five cars from the caboose. The train was stopped and the brake beam removed.

#### MEMPHIS TERMINAL Mechanical Department

Charles Leonard, machinist, who has been confined to his home on account of illness for a week, has resumed work.

James Hurd, night toolkeeper, who has been ill with the "flu" for two weeks, is able to resume work.

E. Johnson, labor foreman, who was stricken with paralysis at his home, 1084 Greenlow Street, is improving rapidly and may soon be able to resume work.

A. L. Newman, machinist, who has been on the sick list with a severe case of malaria, has resumed work.

Engineer and Mrs. Herman Slusmyer have returned from Paducah, Ky., where they were called by the death of relatives.

Joseph Hamoka, machinist, is confined to his home with a severe attack of the "flu."

William Limeberry, machinist, who has been a victim of the "flu" for two weeks, has so far recovered as to resume work.

A. C. Frozier, machinist, has resumed work after being absent for a week with a touch of the "flu."

W. M. Tlosley, machine shop foreman, has resumed duty after being absent for a few days on account of illness.

L. R. Swofford, chief electrician, who has been confined to his home for a month with a serious case of scarlet fever, is improving rapidly and is now considered out of danger.

P. O. Bailey, machinist, who was stricken with paralysis while at work and taken to St. Joseph's Hospital, is much improved, though not entirely out of danger.

J. R. Dixon, stationary engineer, who was confined to his home for ten days on account of the "flu," is back on duty.

Bruce Myers, blacksmith apprentice, who was confined at St. Joseph's Hospital with a severe case of "flu," has so far recovered as to resume work.

George Cook, blacksmith, who has been ill with an attack of the "flu," has resumed work.

Walter Leech, machinist, has returned from Jackson, Tenn., where he was called by the death of a relative.

Dewey Limeberry, machinist apprentice, had a narrow escape from being seriously injured when his shirt sleeve caught in a lathe he was working on. His clothing was torn from his body, but he escaped with a few bruises.

H. C. Bond, machinist, who has been on the sick list with an attack of the "flu," has gone home to Pensacola, Fla.

G. E. Marchuti, machinist, has gone to Pensacola, Fla., his former home, where he will visit relatives for a few weeks.

H. L. Terry, machinist, has gone to Paducah, Ky., where he will be the guest of relatives.

R. J. Wetzel, track foreman, Greenwood, Miss., who has been confined at St. Joseph's Hospital with a fractured knee cap for a month, has so far recovered as to return to his home. Mr. Wetzel speaks highly of the treatment accorded him.

Charles Schubert, machinist apprentice, has resumed work after being absent for a few days with an injured foot.

M. Griffin, machinist apprentice, is taking an enforced vacation caused by a painful injury to his finger.

Walter Moore, machinist, and Mrs. Moore have gone to St. Augustine, Fla., where they will be the guests of their daughter.

Robert Whitton, machinist apprentice, has resumed work after being on the sick list for a few days.

G. E. Jones, airman, is confined to his home on account of illness.

Here is a picture of Master Paul Saunders Cecil, Jr., grandson of Assistant Engineer J. M. Hoar of the Tennessee division, who says he is going to make a first-class engineer out of the youngster.

Louis Heisler, molder, has resumed work after being on the sick list for a week.

A. R. Lancaster, airman, has returned from Chicago, where he was under treatment at the Illinois Central Hospital.

George Marrero, machinist, has resumed duty after being absent for a few days on account of illness.

E. R. Christmas, machinist, has recovered from his recent illness and resumed work.

Sylvester Mahoney, machinist apprentice, who sustained a painful injury to his finger when he hit it with a hammer, is much improved.

The Lauderdale Improvement Club launched its first semi-weekly entertainment Friday evening, March 10. The school auditorium was filled to its capacity, and "standing room only" was the order of the evening. The following program was rendered:

Address of Welcome.....President W. F. Lauer  
 Address.....Prof. Wharton Jones, Supt. of Schools  
 George Washington's Early Days.....

.....Miss May Class  
 Recitation.....Alberton Gilbertson  
 Camping Out.....Boy Scouts  
 Recitation.....Clifford Davis

Blackface Sketch.....  
 .....Norman McBride and F. Foley

Select Readings.....Mrs. E. N. Taylor  
 Whistling and Plano Solos.....

.....Frank Wright and Miss Thelma Lovingood  
 Songs of the South.....School Children  
 Extracts From Popular Operas.....

.....Mr. and Mrs. O. F. Sodestrom

The liberal applause given the volunteer artists proved the entertainment a huge success.

M. A. Hannah and Professor Toryson supervised the affair.

The Lauderdale Improvement Club held its regular meeting Friday evening, March 10; after a short business session in which twenty-seven new members were enrolled. President Lauer outlined the course to be taught at the Lauderdale night school, beginning Monday evening, March 13. The course consists of the eighth grade bookkeeping, shorthand, penmanship, spelling and mechanical drawing. Any young man who is not advanced to the eighth grade can take up his studies where he left off. Seventy scholars have already been enrolled, and many of the Illinois Central apprentices are expected to take advantage of this opportunity, especially in regard to mechanical drawing, as most of them live in the district. The drums, bugles and fifes have arrived for the Drum and Bugle Corps, and the boys are busy every evening, under a competent instructor, learning to manipulate them.

Mrs. C. C. McCaskill, wife of Engineer McCaskill, has returned home after a thirty days' visit at Baltimore, Washington, Asheville and Birmingham. She was accompanied home by her two nieces, Misses Mildred and Louise Stokes, who will make their future home in this city. A surprise party was given Mrs. McCaskill on her arrival by the McLemore Avenue Presbyterian Church choir, of which she is a member.

A meeting of the Illinois Central employes held at the freight office recently resolved to form a 4-team baseball league, consisting of teams from the Central Station, Freight Offices, Memphis Shops and Nonconah Shops.

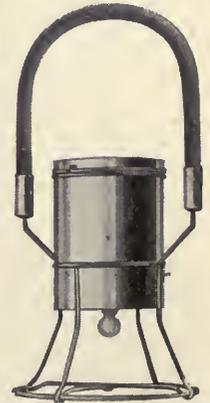

# MEE'S ELECTRIC LANTERN

Especially constructed for railroad service. It is a wireless construction, no wires to break, ground, short circuit or cause a leak in the batteries. The only Lantern on the market that can be operated with one hand satisfactorily. The body of our Lantern is made of 22 gauge tempered brass and heavily nickel plated, guaranteed not to peel off.

**Our Price Direct to Consumer Complete With Battery and Two Bulbs, \$3.75**

Parcel Post C. O. D. only. Don't fail to mention whether drop or stiff bail wanted. Our batteries are the standard size and will fit any Electric Lantern. The price of one battery is 75c, or in lots of three or more, 65c each. Mazda bulbs, 15c each in lots of three or more. Nitrogen bulbs 40c each or three for \$1.00. Your name will be neatly engraved on your lantern if instructed.

They will be under the rules of the M. A. A. and use the grounds of the shop organization. They will not play any team outside the league until the season ends. Players desiring further information should apply to D. C. Hudson, Illinois Central freight office.

The new McLemore Avenue viaduct over the Illinois Central tracks is near completion, and the street car company has begun to lay its tracks across to Florida Street. The organizations of South Memphis are making great preparations to celebrate the opening, which will take place on some Saturday in order that the largest number of people may take part in the exercises. A grandstand will be built in Gaston Park for the county and city officials, committees and invited guests. It is estimated that there will be more than 3,000 school children parade, besides various fraternal and civic orders. Barrels of lemonade will be placed in the park to quench the thirst of everybody, and the day made a gala one in honor of the Illinois Central Railroad and the city officials, who have erected a monument which will stand for a lifetime.

**Nonconnah Car Shops**

The Illinois Central and Yazoo & Mississippi Valley once again joined forces on February 28, when Miss Lillian June Creedon, stenographer in the general car foreman's office, became the bride of W. H. Stovall, fireman on the Y. & M. V.

E. J. Hollanan, foreman, is receiving the traditional hand-shake and slap-on-the-back since February 27. Reason: Baby girl—eight pounds—Name, Patricia.

L. E. Broome, formerly record writer, paid the office a visit recently. Mr. Broome is now practicing law at Parkin, Ark.

W. A. Crawford has returned to work after a few days' absence caused by the serious illness of his daughter, Miss Anna Dean, who underwent a serious operation.

Foreman McAdoo's wife has recovered from the serious operation she recently underwent at St. Joseph's Hospital.

Joseph J. Bennett

Mr. Bennett, whose appointment as purchasing agent of the Illinois Central and Yazoo & Mississippi Valley railroads, with headquarters at Chicago, was announced January 1, was born in Centralia, Ill., July 7, 1885. He was educated in the Centralia schools and was graduated from the Centralia High School in 1902, after which he entered the service of the Illinois Central as expense clerk in the freight office at Centralia. In 1903 he accepted employment with the Centralia Coal Company, performing various duties in the mines, and was later made top superintendent, a position which he filled until July, 1907, when he re-entered the service of the Illinois Central as local coal inspector at Centralia. Following this, he accepted the position of traveling coal inspector, Southern Lines, in March, 1909, with headquarters at Princeton, Ky. He was appointed fuel agent October 1, 1910, with headquarters at Chicago, was promoted to assistant purchasing agent January 1, 1913, and to purchasing agent, January 1, 1922.

## *Buried Treasure at Crystal Springs, Miss.*

### *Annual Vegetable Movement, Now in Progress, Is Expected to Eclipse All Previous Records*

**Y**OU don't have to go back to the days of the pirates to read about buried treasure. The farmers and business men in the vicinity of Crystal Springs, Miss., on our lines, put practically all of their available cash in the ground each spring. The sun and the rain are the treasure seekers who dig up the buried gold, in the form of tomatoes, cabbages, peas, beans, carrots, beets and other vegetables, and the Illinois Central refrigerator cars are the agencies which right now are engaged in transmuting those vegetables back into the original money—and a good bit of profit, to boot.

Although there are other noted vegetable shipping points on our lines in Mississippi—Gallman, Beauregard, Hazlehurst and Wesson, for example—Crystal Springs eclipses them all in the intensity of cultivation and in the total number of carloads shipped each year. Last year Crystal Springs sent out more than 1,900 cars of vegetables, and this year the total is expected to come close to 3,000. As the vegetable shipping season is only slightly more than three months long, this means that as many as sixty cars of vegetables a night moved out of Crystal Springs in the height of the season last year and that probably a hundred a night will be the big rush this year.

For a town with a population of 1,600, this is a wonderful lot of traffic. Our 1921 revenue at Crystal Springs was in excess of \$600,000. Incidentally, there were no outbound exceptions charged against the station in 1921, which is certainly a compliment for Agent R. S. Brent and his force.

But to return to the buried treasure. The vegetable business is the life and hope of Crystal Springs. There are probably 15,000 acres of vegetables in Copeiah County and its environs this year. The average farm is small—probably not more than ten acres. Land, fertilizer, seed and any number of other items put the investment into fairly large figures, even on such small farms, and consequently a good deal of the farming is done with borrowed capital. The merchants of Crystal Springs, in many cases, own and operate their own vegetable farms, as the good gravel roads make such a system practicable; and in other cases they are staking the farmers to the necessary supplies. Every financial facility of the town is behind the vegetable business, and it is no exaggeration to say that Crystal Springs watches the early spring weather, with its constant danger of frost, more closely than any other town in the United States.

#### **A Rush to Protect the Crop**

R. A. McPherson, furniture dealer and manager of the Crystal Springs Canning Company, likes to tell how late one night he decided there might be a frost; so he made haste to cover up his young tomatoes. He passed on the idea to a neighbor, and in almost less time than it takes to tell about it he heard motor cars all over town being cranked and started out to the fields. Paul Revere met no "minute men" readier in response to a call than Mr. McPherson did.

When the vegetable business got its start, almost fifty years ago, it was customary to fire a cannon to notify the growers of approach-

ing frosts; now the same service is officially given by a siren at the town powerhouse.

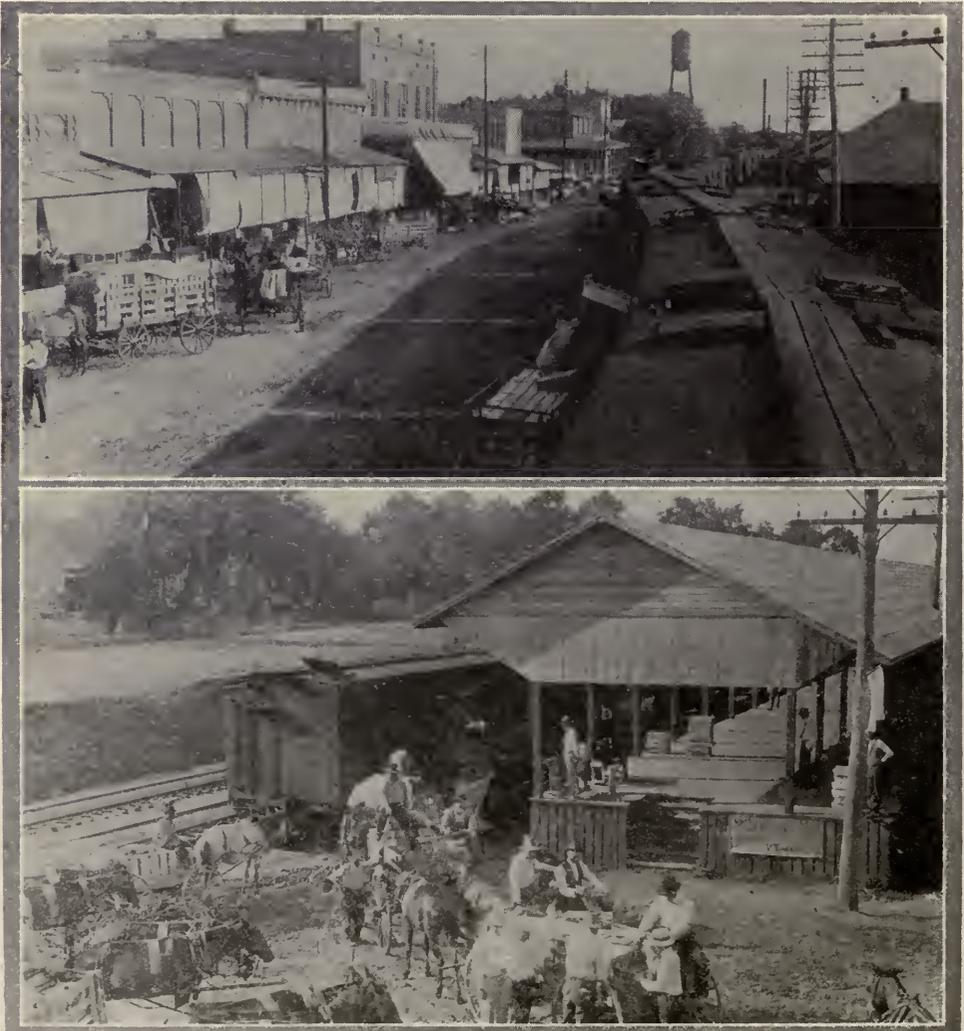

Tomatoes, cabbages, carrots, beans and peas are Crystal Springs' most important crops, and they rank in importance in about the order given. Many other crops are grown, but the acreage is scattering. As the 1922 acreage in all crops is about 25 per cent larger than that of 1921 and the prospects seem more favorable for a heavy yield, it is not unreasonable to look for shipments of between 2,500 and 3,000 cars this year, figuring on last year's basis of 1,900.

Tomatoes, which were set in the fields the last part of March and the first part of April,

will begin to move about June 1. May 1 is the date for the beginning of the cabbage movement. Green peas started moving about the middle of April. Beans will start about the middle of May. Carrots and beets are scheduled for the first part of May.

**15,000 Acres in Vegetables This Year**

I. T. Riser, sales manager of the Truck Growers' Association, is the man who has the statistics on Crystal Springs' vegetable business at his finger tips. Mr. Riser's association has a membership of about 140 farmers and handles about 20 per cent of the total vegetable business out of Crystal Springs. In making his estimates, Mr. Riser multiplies his own

*Loading Scenes at Crystal Springs*

association's figures by 5 to get the total for Crystal Springs, and then he doubles that total, more or less, to get the figures for that vegetable growing region, roughly including Copiah County and adjoining parts of other counties.

Mr. Riser's farmers have 1,775 acres in vegetables this year. This gives 9,000 acres for Crystal Springs and, Mr. Riser estimates, 15,000 for the territory. There are, he figures, 3,500 acres in tomatoes at Crystal Springs and 7,500 in the district. For cabbages the figures this year are, on the same basis, 1,350 acres and 2,700 acres; for carrots, 900 acres and 1,200 acres; for beans, 800 acres and 1,600 acres; for peas, 800 acres and 1,200 acres.

Tomatoes are shipped in 12-quart crates. Last year they made 250 crates to the acre and netted 94 cents a crate at Chicago, according to Mr. Riser's figures. Cabbages made 110 100-pound crates to the acre and netted \$1.92 a crate. Carrots totaled 290 hampers (a hamper holds seven-eighths of a bushel) to the acre and brought in 68 cents for each hamper. Beans yielded 60 hampers to the acre and netted \$1.70 a hamper. Peas made 115 hampers to the acre and brought in \$2 a hamper. These prices were net after transportation and handling charges had been paid, and out of these receipts the farmers had to pay the expenses of raising the crops.

**Some Costs of Raising Peas**

Peas are the coming crop at Crystal Springs. The acreage devoted to them is steadily increasing. Last year they brought in \$230 an

*The King of Them All*

acre. This looks like a lot of money, but Mr. Riser figures that expenses had to be paid something like this: Fertilizer, \$38; hampers, \$20; picking, \$25; jute (string for tying the vines), \$5.50; sticks, \$5.50; seed, \$25; labor, \$10. This cuts the return down to about \$100, not figuring in the use of teams and tools and rent of land, the latter an item of about \$10 an acre. If the farmer clears \$75 an acre, he is doing pretty well—and the average

*Center, our station at Crystal Springs; left, plant of Crystal Springs Manufacturing Company; right, plant of Crystal Springs Canning Company.*

farm, as pointed out before, is only about ten acres. Of course, there are many larger farmers, but for the most part they have to parcel out their land, as the amount of land that can be handled in vegetables is necessarily limited.

Weather conditions, of course, affect the crops. So does the law of supply and demand. Vegetable prices vary greatly from year to year. Mr. Riser, to give an illustration of this, tabulates the net prices for crates of tomatoes and cabbages for the last eight years:

Year	Tomatoes	Cabbages
1914 .....	\$ .62	\$ .61
1915 .....	.36	.69
1916 .....	.62	2.27
1917 .....	.84	3.75
1918 .....	1.11	.95
1919 .....	1.06	3.09
1920 .....	1.26	2.14
1921 .....	.94	1.92

**Fertilizer Means Freight Revenue**

Mr. Riser's association started with sixty-seven members in 1914 and an acreage of 789. Now it has 140 members and an acreage of 1,775. Its average farm has twelve and one-half acres in vegetables. The members sell co-operatively and get their supplies in the same manner. Only eight out of the 140 members do not own their own land, and the association represents considerably more than 20 per cent of the land-owning farmers at Crystal Springs.

Pointing out that the revenue derived from carrying the vegetables is not the only return the Illinois Central gets from the vegetable industry at Crystal Springs, Mr. Riser says that fertilizer is now being used at the rate of almost a ton to the acre. The members of the association imported 1,400 tons of fertilizer this year, and that means that Crystal Springs used

*Home of B. W. Mathis*

about 7,000 tons and the district in the neighborhood of 15,000 tons. The cost to the farmer averages about \$38 a ton, but the farmers realize that fertilizer more than pays for itself in increased yields.

**A Vegetable Grower Since 1884**

B. W. Mathis is one of the veteran vegetable growers of Crystal Springs. The firm of B. W. Mathis & Sons is probably the best known in that region in raising and marketing circles. Mr. Mathis started to raise fruits and vegetables about 1884 on his farm about a mile out of Crystal Springs, and he has been in the business ever since. He has seen many growers come and go. He has about 600 acres under cultivation now, and justly lays claim to the title of being the largest continuous individual vegetable grower in the South.

Mr Mathis manages to get two crops a year, and sometimes three, off his many fertile acres of rolling bottom land. He follows his vegetables with corn and cotton. That he is prosperous is attested by the fine farm home he has, the buildings he has put up for handling the vegetables, the

*A Typical Field of Peas at Crystal Springs*

Peas

## *In the Fields at Crystal Springs*

Carrots

Beans

motor truck he uses, the community store he maintains on the farm and the general air of permanence about the place.

Mr. Mathis says he is convinced that success in vegetable raising can come only to the farmer who is content to play the game over a long term of years, taking his losses as they come and averaging his profits over a considerable time. He does not care to see farmers going into the business just as a "flyer" and expecting to make big money every year. He recalls that a flood one year caused \$10,000 worth of damage to his crops, and he has seen the market so finely balanced that his own output of cabbage—a few cars a day to Chicago—caused a tumble in price from \$6.50 a crate to \$3.50 a crate within ten days.

Nowadays, however, since so many other markets have been developed, particularly in the East, he says that it is almost impossible for such a thing to happen.

There is some difference of opinion among the larger farmers as to the best method of handling their land—hiring labor or allowing the land to be worked on shares. Mr. Mathis believes in hiring his help and working the whole farm as a unit.

#### Firm Has 700 Acres in Vegetables

A. S. Thomas of R. B. Thomas & Company, a firm which farms about 700 acres of vegetables, reports that both systems are in use on the firm's land. About half of the land is worked under the wage system, which Mr. Thomas believes is the more satisfactory. The firm's holdings total from 4,200 to 4,500 acres, but only about a sixth of this is in vegetables.

There are about 300 acres in tomatoes, 200 acres in cabbages, 100 acres in peas and about 100 acres in carrots, beans and beets. The Thomas firm has never experienced a complete failure in vegetables since the members started doing such farming at Crystal Springs in 1896. They have made their money in Crystal Springs, and now they are numbered among the wealthiest citizens of the community. In addition to farming, they are in the shipping business, have a general store on a corner across the street from the Illinois Central station, and A. S. Thomas has an interest in one of the local crate factories.

According to Mr. Thomas, the firm has an increased acreage in peas and cabbages

this year. He looks for a big season in shipping, and his fear is that our loading facilities may prove inadequate, since they have been greatly taxed to handle the traffic in the past.

#### Largest Shippers in Crystal Springs

A. Lotterhos of the Lotterhos & Huber Company, dealer in general merchandise, is another of the veterans of the Crystal Springs vegetable industry. Crystal Springs is said to be the largest tomato shipping point in the United States, and the letterhead of the Lotterhos & Huber firm announces that its members are the largest shippers of tomatoes in the United States.

Mr. Lotterhos, like Mr. Thomas, is a little worried about the Illinois Central's ability to handle the rush of business that is expected this year. It has been hard to load sixty cars a day in the past, he says, and it may be necessary to load 100 a day this year.

Last year his firm handled 823 cars of vegetables, about 40 per cent of the total handled out of Crystal Springs. In the earlier days (the firm was established in 1866) it handled frequently 75 per cent of all the shipments. Vegetable shipments began as early as 1876, according to Mr. Lotterhos, and he remembers that the first car of tomatoes out of Crystal Springs (that was in the 80's) was shipped to Denver, Colo. Now, owing to the improvement in transportation facilities, the whole North is a market for the products of Crystal Springs. Shipments to Canada are not infrequent. Most of the vegetables, however, go to New York, Philadelphia and Chicago.

#### Vegetables Are a Lot of Work

As vegetable brokers, Lotterhos & Huber dispose directly of about 85 or 90 per cent of all the vegetables they handle. The rest are shipped to the markets on consignment. As general merchants, they have supplied about a thousand farmers with an average of three tons of fertilizer this year, and they sell about 10,000 pounds of twine a year. Mr. Lotterhos testifies to the attention vegetables must have, attention which frequently limits a family's farm to five acres. Tomatoes, for example, have to be handled in the hot bed, in the cold frame and in the ground; they have to be staked, pruned and tied; they have to be covered in times of

frost, and finally they have to be picked and crated.

Mr. Lotterhos thanks the refrigerated express service for the fact that the raising of peas has picked up so remarkably in recent years. The acreage increase in peas this year is 60 or 70 per cent, but a lighter yield per acre is expected. Mr. Lotterhos recalls that it was the boll weevil that got Crystal Springs into the vegetable business, and he believes that this was the best change the town ever made.

**Planning to Enlarge Cannery**

The Crystal Springs cannery, previously referred to, has a capacity of 10,000 cans a day. As an adjunct to the vegetable shipping business, by utilizing the vegetables which might not stand shipment, it has proved its worth to the community in the past. It is now planned to extend its operations over the whole year, instead of merely a few months, and to increase the capacity to 20,000 or 30,000 cans a day.

G. M. Cook is president of the Crystal

Springs Canning Company, and R. A. McPherson, previously quoted, is manager. The reorganization project includes plans to increase the capital stock from \$2,000 to \$10,000 or \$20,000, to increase the capacity of the cannery and to run it all year, to install a feed mill and to open a cream station—in other words, to cater to the needs of the farmers and vegetable growers of Crystal Springs in every way possible.

One of the chief products of the cannery in the past has been tomato paste. This is made of the tomatoes which will not stand shipping. The pulp is run through a seeder and otherwise prepared so that it can be used as the base for catsup, tomato soups and the like. The demand for this is growing, and it is planned to turn out at least four times as much each year as at present. Beans also have been put up in the past, and now it is planned to add potatoes to the list.

The cannery is able to pay the farmers \$10 to \$12 a ton for vegetables that other-

*Cold Frames at Crystal Springs*

wise would have to be thrown away, and in this way it adds to the wealth of the community.

### Crystal Springs Is Prosperous

The prosperity of Crystal Springs is reflected in civic enlargements and improvements. It is planned to enlarge the city limits, and thereby to increase the population from 1,600 to 3,000. Every requirement of a little city is found within its borders. Two box and crate factories have been built to take care not only of local needs but also of orders from all over the South. The Crystal Springs Manufacturing Company, which is somewhat larger than the Planters Package Company, is just across the Illinois Central tracks from the latter at the southern edge of town. It runs the year around, has 200 employes and uses up 16,000 feet of lumber a day.

W. B. Lockwood, attorney, town clerk and local newspaper correspondent, reports that the fame of Crystal Springs and its vegetable industry has traveled so far that he is in receipt of a letter from Chicago indicating that 3,000 farmers from others parts of the United States are considering moving to Copiah County. According to Mr. Lockwood, the present building boom in Crystal Springs has brought the following results: W. T. Ellis, a 60-room brick hotel near the Illinois Central tracks, leased for ten years to Bryant & Reese of New Orleans; R. J. Young, a frame furniture factory; E. C. Garland, a \$30,000 brick department store; J. S. Wise of Hazlehurst, a brick automobile service station, 50 feet by 100 feet; F. C. Coker, a brick building for an unbroken package business. The Planters Package Company, mentioned before, is just being completed. It employs 150 persons. The

manager is H. J. Wilson, an attorney of Hazlehurst. Hazlehurst is a larger town than Crystal Springs and the county seat, and the interest Hazlehurst business men are taking in Crystal Springs is regarded with great satisfaction by residents of the latter.

### Industry Got Its Start in 1874

Mr. Lockwood recently wrote for the Memphis (Tenn.) *Commercial Appeal* an account of the vegetable industry, of which the following is an excerpt:

"The idea of growing truck here was first thought of by F. M. Brewer, about 1874, who began to grow it on a small scale as an experiment. As soon as Mr. Brewer demonstrated that vegetables could be profitably grown here others were eager to enter the business, and as soon as means could be devised for handling the truck industry its growth was very rapid. Today Crystal Springs is the largest tomato shipping point in the world, the shipments from 1917 to date being as follows: In 1917 there were 447,267 crates of tomatoes shipped; in 1918 there were 721,675; in 1919 there were 743,120 that made a net cash sale of over one dollar a crate; in 1920, 668,721; in 1921 there were shipped 828 solid cars of tomatoes, containing approximate 850,000 crates.

"In 1917 there were shipped 51,580 crates of cabbages; in 1918, a good year, 151,714 crates were shipped out, some of them netting the growers as high as \$8 a crate; in 1919 there were shipped 85,944 crates of cabbages; in 1920 there were shipped 118,468 crates, while in 1921 there were shipped 729 solid cars of cabbages, containing approximately 150,580 crates.

"Carrots, turnips, beets, and beans are

shipped by the thousands of hampers, and the English pea crop for 1921 netted the growers \$200,000. Note the car-lot shipments for the past 8 years with no failures: 1914, 1,215 cars; 1915, 1,288 cars; 1916, 1,306 cars; 1917, 911 cars; 1918, 1,675 cars; 1919, 1,341 cars; 1920, 1,555 cars; 1921, 1,925 cars.

"The acreage planted to all crops for 1922 is greatly increased over any previous year and bids fair to be the banner year in the history of the industry. To give the reader an idea of what is being done at Crystal Springs and taking the year at random it may be stated that in 1919 there was handled here one thousand three hundred and fifty cars of vegetables, valued at a million and a half dollars; 25 cars of sweet potatoes; 200 cars of cattle, valued at a thousand dollars a car; 20 cars of hogs; 300 cars of box material and 200 cars of lumber; 1,000 bales of cotton, with seed valued at over \$200,000. This performance as to vegetable shipments was increased in 1920, when 1,555 solid cars of vegetables were shipped out, valued at over a million dollars; 1921 there were shipped 1,925 cars, valued at over a million dollars. This shipment of vast quantities of produce is practically made in 60 days dur-

ing May and June. During this time the town is in a constant turmoil; men who at any other time would take time to talk to you by the hour on the topics of the day scarcely take the time to say 'good day.'"

Since the Illinois Central main line is the only railroad serving Crystal Springs, it is needless to say that we have had all this business and that its success has depended largely upon our good service.

### *Five "Young" Folks*

A party of five persons, the youngest 74 years of age and the oldest 81 years old, left here yesterday for St. Louis, going by way of the Seminole Limited on the Illinois Central Railroad. Mr. and Mrs. Duncan, who are winter visitors here, were chaperons of the party and looked after the three other "young people," who are warm friends of theirs. This is the youngest crowd of folks who have lived here for many years to leave this city in several years.—St. Petersburg (Fla.) *Independent*, March 29.

*Picking and Packing Tomatoes at Crystal Springs*

# The Department That Buys Our Supplies

*Purchasing and Storing Organization, Formed in 1912, Now Controls Investment of \$14,500,000*

By A. C. MANN,  
Vice-President

**N**EXT to the payroll, our railroad's largest single item of expense is its purchases of material and supplies necessary for the proper conduct of its business, which is the furnishing of transportation service, both freight and passenger, to the public. The manner in which purchases are made and materials and supplies are distributed and cared for has a direct bearing upon the kind and the cost of transportation service which we can offer to the public.

### Department Formed in 1912

In response to the need for direct and concentrated supervision over this large item of expense, the Purchasing and Supply Department, as at present organized, was inaugurated in our railroad in 1912. Since that time practically every large railroad in this country has adopted this or a similar form of organization, and the purchasing and supply departments of these railroads are now striving to bring about greater economies in the use and care of unapplied material. This department of railroading has been designated as "Division VI—Purchases and Stores" of the American Railway Association. A great deal of good is being accomplished through the interchange of ideas among the employes and officers of the various railroads at the meetings of this division of the association.

No department of a railroad can stand alone, and no departmental organization can be truly successful without the whole-hearted support of each individual member and the willing co-operation of each depart-

ment with which it comes in contact. The Purchasing and Supply Department is a service department; it comes in contact with and serves in some way every department on the railroad, and, in serving, its aim is to serve well. The relation of the Purchasing and Supply Department to other departments is the same as that of the retailer to the consumer; while it is interested in selling as much material as possible to its consumers, it is also vitally interested in helping to conserve and in this way to cut down the ultimate cost of material to the railroad.

Every employe on our railroad, in perform-

Vice-President A. C. Mann

ing his work, uses some kind of material or supplies for which the company has already made an expenditure. Therefore, the measure of thought which each employe gives to the supplies he uses is going to determine the measure of his interest in the economical operation of the railroad. We hear a great deal about efficiency of men, but can a man be wholly efficient if he is careless in the use of such supplies as are furnished him by the company with which to do the work for which he is employed? At various points on the railroad, on shop or other buildings, are to be found such signs as

"Don't Waste Material"

"Avoid Waste"

"Material Saved Means More Men at Work."

At an industrial plant recently were seen the following signs:

"John says, 'There is not a day passes but what I pick up air hose nipples, spikes, bolts, small pieces of scrap brass, etc., lying around the yard, and take care of them.' Why can't you imitate John?"

"It was indeed a wise man who first said, 'A place for everything, and everything in its place'; it is possible, it is practical."

These signs indicate that thought has already been given to the question of conserving material.

### Means an Investment of \$14,500,000

The investment in material and supplies on our railroad is today approximately \$14,500,000. We can reduce this, and thus save to our company the interest on its material investment only when each employe gives personal attention to conservation and the intelligent use of the supplies passing through his hands. Webster thus defines waste: "To spend uselessly or foolishly; to employ or use lavishly, unnecessarily or carelessly." If we form the habit of being as careful in the use of our company's property as we are in the use of our own, we shall certainly accomplish much toward reducing our company's investment in materials and supplies.

One of the surest ways to interest ourselves in the material and supply situation on our railroad is to try to think of these supplies in terms of money or value, rather than their usual designations. For example, let us consider the cost of a few of the items which are daily used in offices. Our plain  $8\frac{1}{2} \times 11$  manila letter paper (Form 1575) costs 78 cents per 1,000 sheets; half size (Form 1576),

40 cents per 1,000 sheets; lead pencils (No. 558), \$2.25 per gross; carbon paper, \$3.90 per 1,000 sheets; pen holders (No. 565), \$2.35 per gross; erasers, \$2.75 per gross; blue black ink,  $8\frac{1}{2}$  cents per quart; No. 6 manila envelopes (No. 860), 55 cents per 1,000; No. 10 manila envelopes (No. 861), \$1.13 per 1,000. If each employe having to do with the use of stationery or office supplies could visualize the value of the supplies he uses each day, he would find many opportunities to save for the railroad.

### Things Lost All Over the System

Those whose work is in the shops or on the roadway can accomplish like results by thinking of the value of the various items of material which are constantly seen about the railway property. A few of the commonest items which are in daily use and which are most likely to be found lying about are track spikes, which cost  $1\frac{1}{8}$  cents each; track bolts, 9 cents each; nut locks,  $1\frac{1}{8}$  cents each; rail anchors, 25 cents each; tie plates, 26 cents each; spark plugs, 37 cents each; dry batteries, 28 cents each; square nuts, 4 cents each; hose couplings, 75 cents each; oil box lids, 90 cents each; brake shoes, 63 cents each.

Much headway has been made in the past few years toward economical use of material through the increased reclamation work which is being carried on by the various departments in co-operation with the Purchasing and Supply Department. Splendid results, too, have been obtained through the various drives which have been made for fuel economy, prevention of personal injuries and prevention of loss and damage to freight. A drive toward careful and efficient use of material would undoubtedly bring about a great deal of good, not only to the individual but to the company, and through such an effort we could materially assist our company in reducing this second largest item of expense which it has constantly to meet.

### C. H. EASUM DIES

C. Harmon Easum, formerly traveling freight agent of the Illinois Central and the Yazoo & Mississippi Valley railroads, with headquarters at Memphis, Tenn., died at his home in Alton, Ill., March 3. He was traffic manager of the Mississippi Lime & Material Company at the time of his death.

# Where Railroads Started a Century Ago

## Equipment and Methods in Great Britain Are Frequently in Remarkable Contrast With Ours

By DONALD ROSE,  
European Traffic Manager, London

**G**REAT BRITAIN is a small country, but it was the first to develop railroads. It has now a population of about 43,000,000 and 21,000 miles of railroad (not including Ireland).

The first railway line designed for public use in Great Britain was built between Stockton and Darlington. It was incorporated in 1821 and opened for business September 27, 1825. This is the oldest public railroad in the world, and is now owned and operated by the North Eastern Railway in connection with the main line from York to Newcastle. The first train consisted of thirty-four vehicles and weighed ninety tons. The engine was built by George Stephenson, who acted as engineer on the first trip. He attained a speed of fifteen miles an hour. Later Stephenson built the famous "Rocket," which ran on its trial trip thirty miles an hour.

This success made railroads popular, and railroad promotion became almost a frenzy.

### Consolidation a Steady Process

In 1836 Parliament passed forty railway bills authorizing the construction of new lines. Many of these were small lines with ambitious plans for development which seldom materialized, with the result that consolidation with other systems was necessary. No important system was planned and carried out in the way originally intended.

After 1850 a gradual process of consolidation went on, and one by one the weaker companies surrendered to their more powerful neighbors. As a result of these consolidations, England has today a comprehensive system of railroads which is practically in the hands of eleven large companies. The premier line, the London & North Western Railway, is said to be made up of about fifty companies, and the Great Western Railway is credited with absorbing more than one hundred smaller lines.

Had there been no war, the old order of things might have continued indefinitely, as change is not popular in this country. As an indirect result of the war, however, public opinion on the question of railroads veered

around to either government ownership or government regulation, and after considerable agitation a form of slight government regulation won out.

During the war the railroads were unified and operated under government direction. The method adopted was different from that used in the United States, in that the entire system of the country was operated by a committee consisting of the general managers of the leading railroads.

### A Great Record in the War

This action was taken August 7, 1914. As war was declared only on August 4, it will be seen that no time was lost. The chairman of the general managers' committee was Sir Herbert A. Walker, general manager of the London & South Western Railway, operating the line from London to Southampton. This line was the natural railway highway from London to the Channel for the conveyance of troops to the Continent. The War Department took up at once with the general managers' committee concerning the transportation of the British troops to France. The conveyance of this army is one of the greatest achievements on record. The force, officers, men, horses, guns, vehicles, cycles and stores required 670 special trains, and they were run at intervals of twelve minutes to Southampton Docks and thence by steamer to Havre. Before the British public fully realized that any action had been taken, the entire expeditionary force not only was landed in France but had taken its place in the battle line.

In one day in September, 1914, the South Western Railway handled 100 special trains with 565 officers, 30,600 men, 5,600 horses, 72 guns, 700 vehicles, 400 bicycles and 502 tons of military stores.

I have heard Sir Herbert Walker tell in his unassuming way the real story of those early and interesting days of the war.

### Parliament Orders Consolidation

The excellent record made at that time was possible only under unified control, and great credit was universally accorded the general managers' committee for the manner in which

it had discharged the exceptional duties placed upon it by the nation in those critical days.

The lesson of what could be effected by co-operative working was destined to bear fruit, and in 1921 a railway bill was passed by the British Parliament, the first section of which runs as follows:

"With a view to the reorganization and more efficient and economical work of the railway system of Great Britain, railroads shall be formed into groups in accordance with the provisions of this act, and the principal railway companies in each group shall be amalgamated, and other companies absorbed in manner provided by this act."

Under this bill, four groups will be formed: the Southern; the Western; the North Western, Midland and West Scottish; and the North Eastern, Eastern and East Scottish.

### Country Opposes Government Ownership

While government ownership had noisy advocates both in and out of Parliament, it was clearly seen that the country was opposed to it. Originally a good deal of opposition developed against even compulsory amalgamation, but eventually, in view of the war experience and the necessity for great economy, this opposition dwindled away.

Amalgamation is already proceeding among a number of the big trunk lines, and the pub-

lic is taking it for granted that the arrangement will prove a beneficial one for the best interests of the country.

In view of questions frequently asked me by Americans as to the differences existing between the American and British railroads, I will endeavor to give some details along these lines.

### Passenger Equipment

When the American traveler arrived at Liverpool ten years ago or less and got his first glimpse of the passenger coaches in which he was to travel to London, he compared them to a trunk on wheels. In this conservative country, the carriages were at first built closely to resemble the stage coaches which they replaced, and only step by step did the stage coach idea disappear. During the last ten years great strides have been made in the improvement of railway carriages, with the result that today on all main-line trains we find strongly built, roomy carriages with corridor and vestibule. These carriages are divided into small compartments with four or six seats in each first-class compartment and ten to twelve in each third-class compartment.

### Non-Stop Runs

Due chiefly to the introduction of corridor carriages and dining cars, the express trains can now run great distances without stopping.

The British railroads are pre-eminent in the

"The engine of the Great Western Railway marked 'Princess Mary,'" writes Mr. Rose, "was the engine which carried Princess Mary and Lord Lascelles on their honeymoon trip from London."

number of long runs which are performed by express trains without a stop. The engine requirements on these long runs are met by the installation of water troughs on nearly all the principal long-distance lines.

The Cornish Riviera Express runs every day throughout the year from London to Penzance, near Lands End, Sundays excepted. Leaving the Great Western Terminus in London at 10:30 o'clock in the morning, it runs right through to Plymouth without a stop—a distance of 226 miles. A few days ago this train ran from London to Exeter, a distance of 173 miles, in 174 minutes, the highest speed attained being 67 miles an hour.

The London & North Western Railway runs from London to Liverpool without a stop, a distance of 200 miles. Many other instances could be given. These trains naturally run at great speed. An American tourist on his first visit to England was traveling from London to Edinburgh on the famous "Flying Scotchman." His one companion was an Englishman, who saw that the American was getting very nervous as the express increased its speed to nearly seventy miles an hour. Out of sympathy he advised the American that there was no occasion for alarm. He assured him that the "Flying Scotchman," with a record of forty years, never had a serious accident. These assurances were repeated several times, and at last the American said: "Oh, I am not afraid of any accident, but this train is running at such a high speed I am afraid she will run off your blooming little island!"

However, the island is not so very little, for when the North Western Group is arranged, it will be possible to travel from London to Wick in Caithness-Shire, Scotland, a distance of 730 miles, with only one change at Inverness, the capital of the Highlands.

### Pullman Cars

Some years ago the Pullman parlor car was introduced, and it has become fairly popular. From London to Dover, Folkestone, Newhaven, Harwich and other ports from which passengers cross to the Continent, the trains are practically composed of Pullman cars. A seat is taken in the Pullman car in London, and the car sets down the passenger alongside the steamer. Full meals or light refreshments are served up when necessary.

As more than 90 per cent of the railway passengers in this country travel third-class,

great improvements have been made in third-class equipment. The modern third-class corridor carriages, found on all long runs, are fairly comfortable.

### Dining Cars

Dining cars were first introduced here in 1879, but made slow progress, as the Englishman had been so accustomed to taking his meals at the various refreshment rooms along the route. It was not until 1893 that the three main routes between England and Scotland placed dining cars on their trains. From that time onward they have increased in popularity. Today the dining cars on British trains are excellent in every respect. Through trains have one first-class and one third-class dining car, both patronized to capacity. The meals are good, well served, and at reasonable prices. The prices for luncheon and dinner are from \$1 to \$1.50. On certain routes where dining cars are not run, a passenger can ask the guard of his train to order him ahead a luncheon or tea basket, and at the desired station, where refreshment rooms are located, the basket is handed in to his carriage with a hot meal or tea. This basket contains the necessary cutlery, paper napkins, etc., so that the meal can be enjoyed in comfort and leisure.

### Sleeping Cars

While this is a small country and the great majority of travelers do their traveling during the day, there is always the busy man who wants to work by day and travel by night. To meet the needs of this class, many of the important lines run a sleeping car service. The British sleeping cars are not so elaborate as the American cars, but they are certainly comfortable. They are built with single and double transverse berths. They have their own electric light and even electric fan, also a good supply of hot and cold water. Each berth is a complete compartment where each passenger has his own quarters, can lock his door, and has complete privacy. The maximum charge in England for one berth is 15 shillings, or from London to the north of Scotland, a distance of 600 miles, 1 pound. If the traveler should get hungry during the night, there is always an attendant to come along and give refreshment, and when he awakes in the morning he can have a cup of excellent tea or coffee with biscuits or roll and butter.

### Heating of Railway Carriages

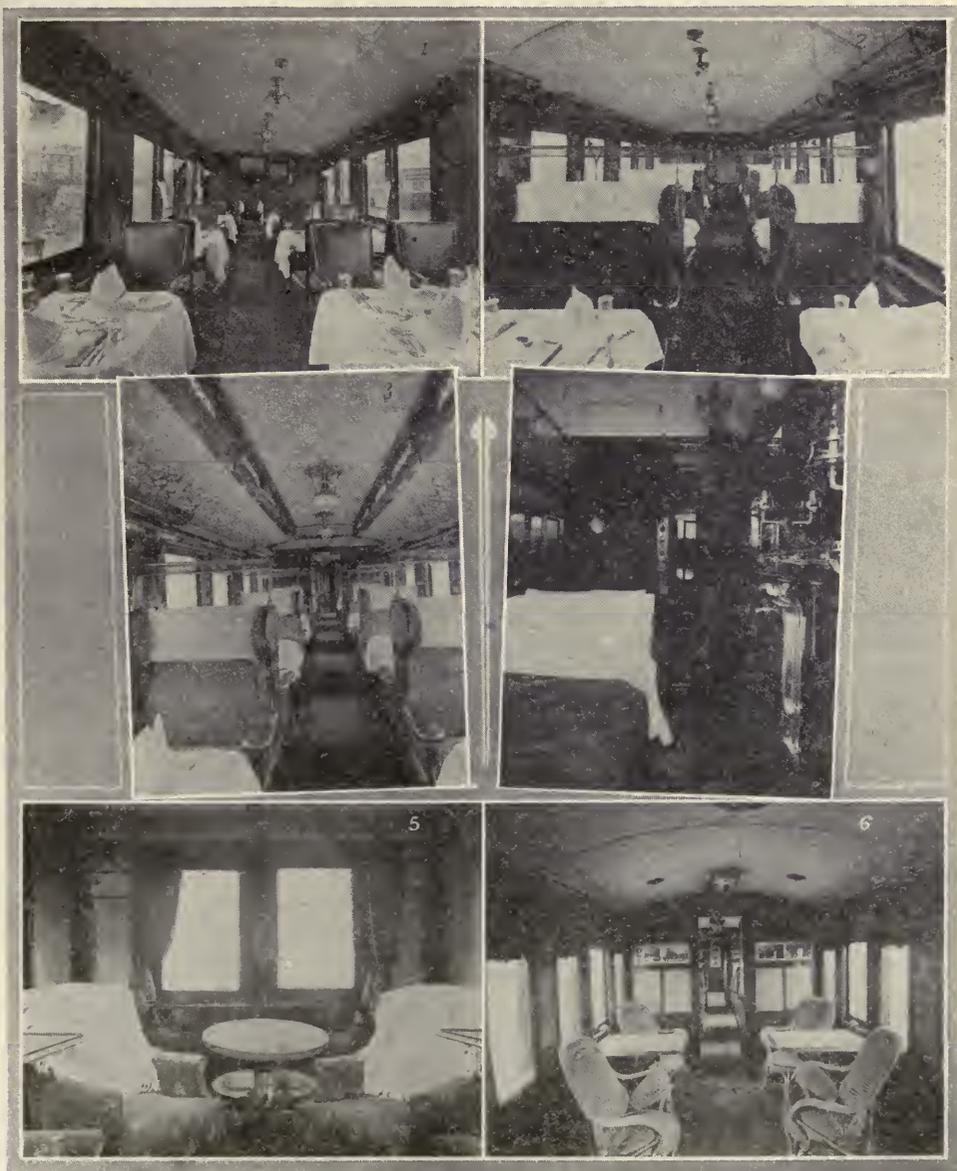

Fifteen years ago the carriages on many

railroads over here were heated by foot warmers. These are still to be found on some of the smaller railroads. They are oval-shaped iron cans containing either hot water or a chemical substance. They seldom retained the heat any length of time, and more often than

not the passengers kicked the can under the seat with language more graphic than elegant. Today all carriages on through trains are heated by steam and are very comfortable.

**Checking Baggage**

As a rule passengers take all their baggage

Interior views of British railway cars: (1) First class dining car of American special train between Liverpool and London on the London and North Western Railway; (2) second and third class compartments of a composite dining car of the London and North Western Railway as viewed from the kitchen; (3) dining car of the London and North Western Railway; (4) single berth in sleeping car in use on the London and North Western Railway between London and Liverpool and Glasgow and Edinburgh; (5) first class private compartment on the American boat special between Liverpool and London on the London and North Western Railway; (6) first class lavatory of the American boat special between Liverpool and London.

along with them on the same train. Their trunks are placed in the luggage van and claimed immediately on arrival at destination. There is no checking or registering. This method is certainly rapid and convenient. Within five minutes of reaching his destination, the passenger is in his cab on his way to his home or hotel with his trunk and other baggage along with him. At the large terminal stations in Great Britain, the cab ranks, with the taxis and cabs waiting, are only fifteen or twenty feet from the carriage door; so no time is lost. Theoretically, it does not seem quite safe to have baggage handled in vans without being checked, but as a matter of actual record the theft of baggage is extremely rare.

The checking system is being introduced in one direction. The leading railroads have arranged what is termed a "Luggage Forward" system. When a ticket is purchased, say from London to some seaside resort, the passenger notifies the railroad that he desires his luggage sent forward. For a small fee his luggage is collected some days before his departure, forwarded to his seaside address and awaits him in his seaside quarters on his arrival.

**Passenger Traffic**

In former days all the railroads carried first-class, second-class and third-class passengers.

A number of the lines have entirely eliminated the second-class, but second-class is still retained on the southern lines, although this is mainly with a view to grading the suburban traffic. Third-class is, of course, the popular class, and in 1920 the figures were (for Great Britain, exclusive of season ticket holders):

Third class—	1,065,000,000 passengers (single journey).
Second class—	5,500,000 passengers (single journey).
First class—	37,000,000 passengers (single journey).

Another class, however, was created some years ago in order to provide for the movement of manual workers, and daily tickets are issued for these to travel before 8 a. m. each day, returning at any time. In 1920, 458,000,000 of these workmen's tickets were issued. Prior to the war the workmen's rates were less than single fare for the return journey, but now they are single fare for the return journey.

This facility is also used largely by the clerical workers in city offices, and the station waiting rooms at the city termini are crowded each morning with clerks, male and female,

*The Safe Way to Cross Tracks*

waiting for the time when their office duties begin.

The average receipts per passenger journey for the whole country are as follows:

First class —	4s. 6d., or about	\$1.00
Second class—	2s. 6d., or about	.56
Third class —	1s. 3d., or about	.28
Workman —	2¼d., or about	.04½

The smallness of these average receipts per passenger emphasizes the average short journey.

The number of season ticket holders for the whole country is just more than a million, of which 73 per cent are third-class passengers, 10 per cent second-class and 17 per cent first-class.

**Suburban Traffic—London**

In view of the suburban traffic problem of the Illinois Central Railroad at Chicago, some details as to how the suburban Londoner reaches his work in the city will be of interest.

The population of London is now seven and a half million. These people are housed in a compact mass of brick and mortar covering an area bounded by a roughly drawn circle fifteen miles in diameter, or nearly fifty miles in circumference.

An inner circle nine miles in diameter covers at the center the business "square mile" and the suburbs of fifty years ago. Outside this "square mile" this former suburban area is now converted to the use of a teeming population of the laboring people, while the main streets are occupied by retail stores. Those other workers, the "city men," have to go farther afield for their dwelling places, and they now occupy the outer circle of London proper and the neighboring townships just outside the circumference.

The large majority of the population is, of course, engaged in work in its own locality, as

storekeepers and craftsmen and in domestic duties, but for a million souls the problem of a daily journey to the city is a pressing one.

Of this million, one-half is catered to by the ten railway systems converging on London, while the other half is carried by electric tram car or motor bus.

**Motor Busses and Tram Cars**

London's motor bus service is unique, and the equipment is constantly growing both in numbers and size. These motor busses are double deckers, and the latest types carry fifty passengers. Their total daily quota of passengers is some two and a half million, and they form the principal means of point to point traffic in the city area, with the underground tubes running a close second in this respect.

The tram cars are not permitted to operate in the city area on account of the immobility of fixed track traffic, and they have their termini at the Thames bridges on the south and various points about a mile from the Thames on the north.

We are concerned in this article, however, with only the half million suburban passengers who are daily carried to their work by the railroads. One of these railroads, the Great Eastern Railway, may be mentioned especially, as in addition to the usual suburban traffic it penetrates a densely populated industrial zone in the east end of London.

Some idea of its problems may be gathered

from the following details of passenger traffic handled during the rush morning hours, 7 to 10 a. m., at its huge terminus at Liverpool Street with eighteen platforms:

Number of trains.....	130
Passengers carried .....	80,000
Average per train.....	615
Number of trains during peak hour (nearly one every minute).....	54

**Cars Are Emptied Rapidly**

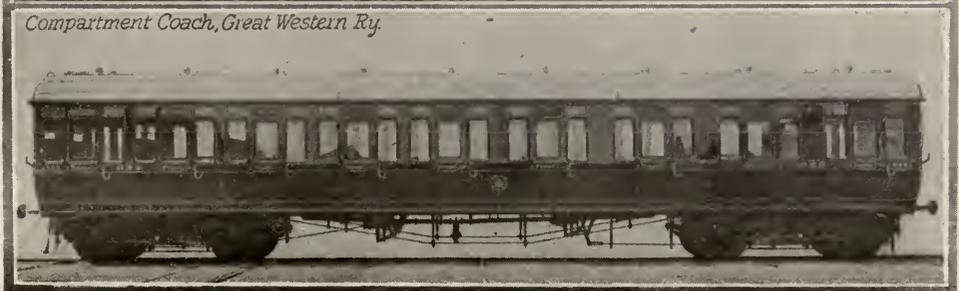

The Great Eastern is closely studying the problem of electrification, and it is expected that conversion to electricity will bring about not only greater facility in dealing with this huge volume of traffic but also greater comfort for the passengers, who are heavily overcrowded under present conditions during the "peak" hour, 8:30 to 9:30 a. m.

The cars are, of course, all of the standard side-door type, which lend themselves to rapid clearance, and the discharge of 1,000 persons from one of the heaviest trains in less than thirty seconds is an interesting sight. Fully 25 per cent are off the train and hurrying to the exit before the train has come to a standstill. Accidents have been conspicuous by their absence, and not only the Great Eastern but all the companies tacitly ignore their by-laws in this respect.

South of the Thames there is also a line which has not yet begun electrification, the South Eastern & Chatham Railway. Its morning quota of suburbanites is 50,000; with much smaller track facilities than the Great Eastern,

*Electric Train, London & North Western Ry  
Operated in London Suburbs*

*Compartment Coach, Great Western Ry.*

this company passes forty trains cityward during the rush hour. This line, which was formerly a byword for bad time-keeping, now has an excellent record, and even during the rush hour the record at the Charing Cross Terminus is 100 per cent on time.

The London & South Western Railway has electrified an important section of its suburban line and installed new and up-to-date termini. It is now reaping the benefit in largely increased traffic and diminished operating costs.

**Freight Equipment**

In Great Britain the freight cars are built to carry small loads, the average or standard being the 10-ton open truck, although trucks of from five to eight tons' capacity are still in use. A long train of these trucks looks like a toy train compared with our American trains of 50-ton cars.

**Freight Charges**

Freight rates are arranged very differently here from America. Goods are divided into eight classes. Three of these classes are distinguished by the letters A, B, C, and the others by the numbers 1 to 5.

Class A traffic, which includes coal and other minerals, is carried at the lowest rates, while the highest rates are charged for goods included in Class 5. This covers the most expensive and fragile articles.

Most of the goods in the lettered classes do not require to be carted by the railway companies and are accordingly carried at what are known as S. to S. (station to station) rates. The numbered classes have as a rule to be *collected and delivered* by wagon at either end of their railway journey, and these rates are known as C. & D. rates.

For general merchandise the average earning per ton is 20 shillings, or about \$4.50, and the average haul ninety-three miles.

The average receipts per ton mile are as follows:

General merchandise .....	about 5½ cents
Coal, coke and fuel.....	about 2 cents
Other minerals .....	about 2½ cents
Average for all traffic.....	about 3½ cents
Average wagon load .....	5.4 tons
Average train load .....	132.5 tons

It is interesting to compare the last two items with the average freight train load on the Illinois Central of 659 tons and the average freight car load of 30.7 tons, both the English and the American figures being those for 1920.

Another comparison which will interest our

freight traffic representatives is that in this country the carload rates on general merchandise apply to 4-ton loads and upward, with lower rates still in some cases for 10-ton loads, as against the usual carload minimum of 36,000 pounds for similar commodities in America.

**London Railway Stations**

We have nothing in London to compare with the Pennsylvania and the Grand Central stations in New York. There are many large and convenient stations here, but none able to boast of greatness. The entrances to many of our stations are very simple and look like the entrance to a hotel. We have one or two striking exceptions, however.

Euston Station of the London & North Western Railway was built many years ago with great solidity. Its precincts are entered through a massive Doric arch said to be one of the finest in Europe.

Waterloo Station of the London & South Western Railway is now one of the largest and most complete passenger stations in Great Britain, covering twenty-five acres. The new station was opened only a few days ago by Queen Mary. It has been under construction for about fifteen years. It will handle twelve hundred trains daily at twenty-one platforms. It was from Waterloo Station that the British Expeditionary Force departed for France in the early days of the war. From the beginning of the war to 1919 the London & South Western Railway ran from Waterloo Station 66,000 trains, with 25,000,000 men, 625,000 officers and 1,500,000 horses.

Paddington Station of the Great Western Railway is large, roomy and convenient.

Liverpool Street Station of the Great Eastern Railway is one of the largest in England and handles 1,260 trains daily.

Victoria, Charing Cross, St. Pancras, King's Cross, London Bridge, Cannon Street and Marylebone are all large, busy and important stations, but have no unusual characteristics.

We have no union station in London. Each important line has its own terminus, and they are scattered far and wide. From Paddington Station of the Great Western to Liverpool Street Station of the Great Eastern, King's Cross of the Great Northern or Waterloo of the London & South Western, the distance is from four to five miles. Transferring is an inconvenient operation, but, in order to reduce such inconvenience to the lowest possible minimum, most of the leading railroads own and

operate their own motor busses for transferring passengers and baggage.

Nearly all British railroads operate their own hotels, which, being generally on the actual sites of the stations, offer to those who use them the maximum convenience. Large hotels are found at nearly all the London termini, and the same is true of all large cities in England and Scotland. Entrance is usually obtained from the arrival platforms. These hotels are generally well-managed and first-class in every respect.

The population of Great Britain is largely dependent on producers abroad for its supply of foodstuffs and other commodities. On account of this condition and Great Britain's insular position, the connection between shipping and the railroads is a very close one.

There is always a large import traffic flowing

from the various ports to the great centers of population, and it is the natural aim of every railway company to obtain as much as possible.

While no shipping company owns a railroad, many railway companies own ships, and a still larger number of railway companies own docks and harbors. Railway companies have created ports at many important places, and nearly every large railway company has a dock or marine department.

There is a railway organization located in London called the Railway Clearing House. Practically all the railroads in Great Britain are members of this organization. Several thousand clerks are employed. Their duties are to check up the rates and fares applied on through rates throughout the Kingdom and apportion the amounts due the various railroads on through traffic.

# Makes Comparison of Locomotive Types

*J. F. Porterfield, General Superintendent of Transportation, Sees Need to Meet Varying Conditions*

*"Locomotive Types From a Transportation Viewpoint" was the subject of the following address which J. F. Porterfield, general superintendent of transportation of the Illinois Central System, made before the Western Railway Club the evening of April 17 at the Great Northern Hotel, Chicago.*

**I**N expressing my views on locomotive types best adapted to the varying operating conditions, I will not undertake to give you many figures or details, as the cost per unit of service and results vary almost as much according to the grade line, character and density of traffic and train schedule as according to the operation of the different types of locomotives. In addition, I have been unable to obtain reliable data covering the maintenance costs of the different types of locomotives and their average mileage.

Locomotives should be designed so as best to meet varying conditions. Consideration should be given to the grade line, to the economical trainload, which will vary according to the character and density of traffic, to the required train schedules and other local conditions.

## Costs Are Not Materially Decreased

The items going to make up the cost of freight train operation—except crew wages—do not materially decrease with the increase in locomotive capacity, as the decreased cost of ownership per unit of service is offset by a material increase in the expense of maintenance and by decreases in the time in service and the average mileage. From various estimates, I figure the increased cost of maintaining the large 2-10-2 type, compared with the cost of the 2-8-2, or mikado type, at about 20 per cent, with a decrease of about 10 per cent in mileage. These items, with the increased cost of ownership, will about equal the saving in crew wages, particularly on lines with favorable grades where the traffic consists of average weight commodities requiring prompt movement.

On train districts with more than one-

*J. F. Porterfield*

half of 1 per cent grades, particularly where the preponderance of traffic is in the heavier commodities not requiring preferential movement, the 2-10-2 and larger type locomotives will sufficiently reduce the freight train cost per 1,000 gross ton miles to justify the additional investment in locomotives, roadway, yard, engine terminal and other necessary facilities.

## Mikado Best Under Certain Conditions

On train districts with grades of one-half per cent or less, where the traffic is fairly well divided between the heavier and lighter commodities, I believe the mikado type locomotive is the proper type to use. These locomotives will handle 75 to 90 loaded cars, which, under average conditions, make up an economical train. While the larger capacity type will show a decrease in crew wage cost per 1,000 gross ton miles, this saving will be more than offset by the increased cost of maintenance, investment in locomotives,

roadway, yard, engine terminal and other necessary facilities. In addition to this there will be a loss in car efficiency incident to greater delay at terminals for full trains and a loss in time on the road on account of the slower speed and delays incident to handling excessively long trains. These disadvantages will apply to even a greater extent on single track.

Take a train district with favorable grades where the density and character of traffic and train frequency prevent increasing the trainload. The cost per 1,000 gross ton miles with 2-10-2 type locomotive would be about as follows:

Wages .....	\$ .079
Locomotive maintenance .....	.113
Interest on investment.....	.058
	\$ .25

The same items with a mikado type locomotive would be about:

Wages .....	\$ .078
Locomotive maintenance .....	.093
Interest on investment.....	.039
	\$ .21

This shows a loss of 19 per cent in the use of the larger locomotive.

**Considerable Saving in Crew Wages**

On an Illinois Central train district with .8 per cent grades, where 60 per cent of the traffic is coal and other heavy commodities, the operation of the 2-10-2 type, with a tractive force of 73,800 pounds, shows a decrease in crew wage cost per 1,000 gross ton miles from 41 cents to 25 cents, or 39 per cent, compared with the operation of the 2-8-2 type, with a tractive force of only 51,630 pounds.

On another train district, with grades and curvature equaling 1 per cent, on which 60 per cent of the traffic consists of high-class freight requiring fast time, the decrease in crew wage cost per 1,000 gross ton miles is only 24 per cent. With a 43 per cent increase in tractive force, the trainload increase is only 19 per cent because the preponderance of high-class commodities requiring fast time prevents hauling and accumulating the tonnage for a maximum trainload. Where similar conditions prevail, I think a careful analysis will show that the increased cost of owning and operating the larger locomotive equals the

crew wage saving. However, even though there were no saving in operating cost, it might be necessary to adopt the larger locomotive to keep the train units within the road capacity.

Because of the increased cost of maintenance and of ownership and the decrease in efficiency of the extremely large types of locomotives, careful study and consideration should be given to the grade and traffic conditions, the train frequency or road capacity, the terminal expense required to reduce or increase trains, and other operating conditions, before making an investment in locomotives of the 2-10-2 and larger types. Consideration should also be given to increasing the hauling capacity and productive time or mileage of the existing types, as well as reducing the fuel cost of their operation.

In offering these suggestions, I have assumed that, first of all, consideration will be given to grade reduction.

**A LINCOLN GRAVE FOUND**

Since the February issue of the *Illinois Central Magazine*, which contained several stories about Abraham Lincoln, who was born and was buried in places now served by our lines, we have learned that the grandfather, also Abraham Lincoln, was probably buried near Louisville, Ky.

Louisville citizens who recently have completed an extensive investigation believe that the grave of Abraham Lincoln, grandfather of the martyred president, has been found in a churchyard near there. The investigators found two stones, their inscriptions blotted away by long exposure, which they believe mark the grave of Mr. Lincoln, who was killed by Indians in 1786 within sight of his cabin.

According to R. C. Ballard Thurston, who has made a preliminary investigation of deeds in the Jefferson County Courthouse, the land composing the churchyard is part of the Lincoln property.

When their father fell mortally wounded, Mordecai ran to the house and procured a rifle. Thomas, then a boy of 9, remained with his father. According to the findings, an Indian seized young Thomas and was about to scalp him when Mordecai returned and shot the savage. Thomas later became the father of President Lincoln.

# Company Wins Hard 3-Year Legal Battle

## Tossine Personal Injury Suit for \$50,000 Involved "Ambulance Chasing" and Perjury of Two Witnesses

ONE day in February, 1919, John Tossine, a coal miner employed at the Midlefork Mine of the United States Fuel Company near Benton, Ill., was seriously injured under the wheels of a train operated by the Illinois Central for the use of miners. The train was carrying a load of miners into Benton after the day's work, and Tossine tried to alight from the moving train at a street crossing near his home. The heel of his shoe caught in a frog, and he was thrown under the train, with the result that he lost his right arm and suffered head wounds which impaired his hearing and eyesight.

Tossine applied for compensation to the Illinois Industrial Commission, and he was awarded \$2,600 against the fuel company. The company appealed from the decision of the commission to the Circuit Court of Cook County, Illinois, and in the period which elapsed between the entering of the award and the hearing of the appeal Tossine fell into the clutches of an "ambulance-chasing" lawyer, John H. Kay of Chicago. Kay permitted the Circuit Court to set aside the award of the Illinois Industrial Commission and immediately began a fight to make the Illinois Central and the government—for the injury occurred during federal control—pay \$50,000.

The accident was a regrettable affair, and no one regretted it more than the Illinois Central management. But a dozen witnesses saw Tossine injured through his own negligence, and the management felt that it would be highly unjust to those who use the passenger and freight service of the railroad to charge them rates to provide the funds for paying the unjust claim.

The 3-year legal battle which followed has recently come to a close in the District Court of Ramsey County, Minnesota, at St. Paul, where a mixed jury brought in a verdict March 21 denying Tossine damages and exonerating the railroad and the government of liability for the accident. A number of startling disclosures were made during the progress of the 3-year battle, principally of how Kay had bribed two Benton miners to testify in Tossine's behalf when they had not witnessed the accident at all.

The moral question involved in the defense of the Tossine case is one which should evoke the real interest of the public, which is demanding that the railroads reduce their freight and passenger rates. The only way to curb the prosecution of unmeritorious damage suits against the railroads is to arouse the public to the seriousness of the situation, to such an

Here is the mixed jury that tried the Tossine case at St. Paul, Minn. Left to right, front row: Mrs. Margaret Dolan, Mrs. Marie Maywood, Mrs. Henrietta Wheeler, Mrs. D. M. Hohkanson, Mrs. Anna C. Moore, Mrs. Thomas Bastyr and Mrs. B. McBride, woman bailiff; left to right, rear row: A. J. Myhie, Miss May Marston, forewoman, Mrs. N. Curan, Irwin J. Morgan, Thomas R. Mulligan, Charles J. Sonnan and J. H. Barrett, bailiff.

extent that juries will treat such cases solely on their merits, that the legal profession will rid itself of the scavengers who prey upon weakness and suspicion for their personal gain, and that those who have a part in such practices will be socially outlawed.

### St. Paul Tired of Such Cases

There is evidence that the people of St. Paul are awakening to the injustice to them of allowing their courts to be overburdened with imported damage suits. On the morning following the jury's report in the Tossine case, the St. Paul *Pioneer Press* published the following ringing editorial:

"Another of the imported personal injury suits has just run its course in the District Court of Ramsey County. We have no interest in the merits of the case and no comment to make upon the verdict for the defendant. The suit grew out of an accident on a railroad in Illinois, and neither party is a resident or citizen of Minnesota. Why should the trial have been taken out of the courts of Illinois, where it belongs, and brought to the courts of Ramsey County, where it should have no place?

"The growth of litigation in Ramsey County has made necessary the creation of an additional judgeship, but this did not contemplate the importation here of foreign damage suits, which should be tried in the states where the causes of action arise and where the attendance of witnesses on both sides is facilitated. There is absolutely no reason why our courts should be congested with these alien suits and our taxpayers subjected to the inconvenience and cost of the trials.

"Everything may be perfectly straight and square in these personal injury suits against corporations. The fact that they are carried for trial so far from home has a sinister suggestion, but that is not the point. The popular outcry against these imported trials was so great that effort was made to put an end to it by legislation, but it developed that under the Federal Constitution the state could not bar the use of its judicial machinery to the outsider. But Iowa, for instance, has a statute which effectually prevents exportation from the courts of that state and which was enacted to meet the protest which came from bar and people alike. Minnesota thanks Iowa for that law and wishes Illinois and other neighboring states would enact similar statutes. Apparently that is the only way we can escape a

*Judge Hugo O. Hanft*

nuisance which is expensive and offensive, to say nothing more."

### A Great Waste of Money

The trial of the Tossine case cost the people of Ramsey County upward of \$1,000, according to a conservative estimate furnished by Major N. C. Robinson of St. Paul, clerk of the District Court. In addition to imposing a burden upon the taxpayers of the Minnesota county, the case consumed the time of the District Court of Ramsey County for a period of fifteen working days, blocking the court calendar and preventing local citizens from securing justice in their own courts. It cost the Illinois Central more than \$15,000, exclusive of attorney fees. It made necessary taking a great number of officers and employes of the St. Louis division away from their work, interfering seriously with the operation of the road. There is no way of estimating the cost to the attorneys who undertook Tossine's case, and who doubtless supported him during the period of nearly three years that the litigation was under way. If all the costs of the case could be estimated, including the loss of productive activity by the

small army of men engaged, it would run into startling figures.

### Would End "Dumping" of Cases

Judge Hugo O. Hanft, who heard the second trial, was asked by the *Illinois Central Magazine* for an expression in reference to the importing of damage suits from outside the state, to be tried in St. Paul, and he made the following statement:

"The courts of this state are opposed to the practice of making them the dumping ground for imported personal injury cases where the litigant has every opportunity for a fair and speedy trial in his own community. This case has been an outrageous expense, both to Ramsey County and to the litigants. Of course, so long as the law permits such cases to be brought into our courts we have no option but to try them.

"My chief reason for objecting to making our courts a dumping ground for these personal injury damage suits is that they block our own calendars and prevent the speedy administration of justice to our own citizens. And then, too, there is the fact that there is no excuse for saddling on our own taxpayers the enormous costs of trying these cases which belong elsewhere."

Judge Hanft had expressed himself vigorously from the bench during the course of the

P. M. Gatch

trial. In overruling a motion for a directed verdict he declared:

"The cost of this case has already been an enormous expense to Ramsey County, and I want to see it disposed of speedily, one way or the other."

### Judge of Former Trial Agrees

The former trial of the suit had been before Judge J. C. Michael at St. Paul in June, 1921. In reply to a request by the *Illinois Central Magazine*, Judge Michael made this statement following the final disposition of the case:

"I am against the practice of making St. Paul the dumping ground for imported damage suit cases. They ought to be tried in the counties where they belong."

Soon after Kay had permitted the Circuit Court of Cook County, Illinois, to set aside the award of the Illinois Industrial Commission, he brought suit for \$50,000 in Williamson County, Illinois, against the Illinois Central and the government. Shortly thereafter the suit in Williamson County was dismissed, and suit was brought in St. Paul by Barton & Kinhead. Kay formerly was a law partner of Humphrey

Ed C. Craig

Barton of St. Paul, and after the suit was instituted in St. Paul he continued to represent the plaintiff in securing witnesses and taking depositions at Benton.

When the case was tried in June, 1921, a jury of men brought in a verdict awarding Tossine \$35,000. In moving for a new trial, the railroad presented affidavits from two of the alleged eye-witnesses who had testified in Tossine's behalf, but who admitted in their affidavits that they had not witnessed the injury, and that Kay had paid them \$20 each to give false depositions. The two witnesses admitting perjury were Charles Baclet and Jacob Oliver, both coal miners at Benton. Judge Michael thereupon set aside the verdict so far

as the Illinois Central was concerned and sustained the motion for a new trial in the case as against the government.

An article in the July, 1921, number of the *Illinois Central Magazine*, pages 88-90, gives an account of the prejudy disclosure.

In the second trial the jury comprised eight women and four men. The jury was out about twenty-four hours, finally bringing in a unanimous verdict.

The investigation of the case was directed by P. M. Gatch, assistant general claim agent, and the legal presentation was made in the first case by C. C. LeForgee of Decatur, local attorney, and in the second case by Ed C. Craig of Mattoon, local attorney.

## Who Is to Blame for Our Freight Claims?

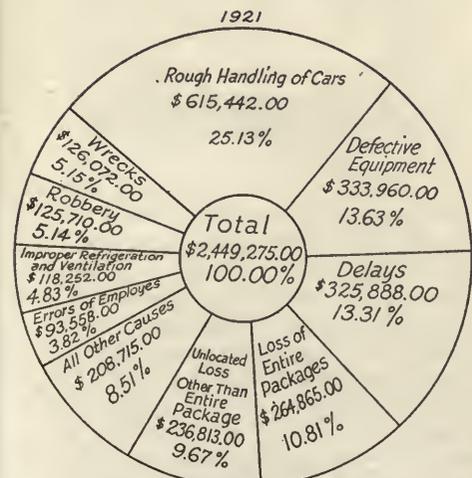

The diagram shown herewith illustrates the distribution by causes of the Illinois Central System freight claim payments for 1921, totaling \$2,449,275. This chart, according to C. G. Richmond, superintendent of stations and transfers, forcibly impresses the need for increased efforts on the part of all concerned to overcome causes responsible for three items—rough handling, defective equipment and delays in transit—which cause 52.07 per cent of the total freight claim payments.

The system freight claim payments during 1920, the preceding year, were \$2,417,498, approximately \$30,000 less than in 1921. The "no exception" campaigns of 1921 materially reduced loss of and damage to freight, but the

results were more than offset by claims arising from the switchmen's strike. These claims, Mr. Richmond says, have been estimated as being in excess of a million dollars.

The following statement shows how the payments for 1920 were divided among the various causes:

Cause	Total	Per Cent
Rough Handling of Cars.....	\$ 439,171	18.18

### A RECORD IN MINING

The Orient Mine No. 1 at West Frankfort, Ill., produced 8,217 tons of coal March 25. That total is 924 tons more than was ever hoisted from a mine in that locality before, and it is said to be a world's record output in a single 8-hour shift. The Bell & Zoller Mine at Zeigler was the nearest rival at that time with a hoist of 7,283 tons on March 23.

# Farewell to America

Our United States as Seen by a British Visitor

*Here we have the occasional opportunity to see ourselves as others see us—or at least as one other sees us. The following "Farewell to America" was written by the correspondent who represented the Manchester (England) Guardian at the recent arms conference in Washington, D. C. The article appeared originally in the London Nation and Athenaeum. That the best test of a sense of humor is to appreciate a joke upon oneself, the author apparently both believes and practices.*

By H. W. NEVINSON

**I**N mist and driving snow the towers of New York fade from view. The great ship slides down the river. Already the dark, broad seas gloom before her. Good-by, most beautiful of modern cities! Good-by to glimmering spires and lighted bastions, dream-like as the castles and cathedrals of a romantic vision! Good-by to thin films of

white steam that issue from central furnaces and flit in dissolving wreaths around those precipitous heights! Good-by to heaven piled offices, so clean, so warm, where lovely stenographers, with silk stockings and powdered faces, sit leisurely at work or converse in charming ease! Good-by, New York! I am going home. I am going to an ancient city of mean and moldering streets, of ignoble coverts for mankind, extended monotonously over many miles; of grimy smoke clinging closer than a blanket; of smudgy typists who know little of silk or powder, and less of leisure, and charming ease. Good-by, New York! I am going home.

Good-by to beautiful "apartments" and "homes"! Good-by to windows looking far over the city as from a mountain peak! Good-by to central heating and radiators, fit symbols of the hearts they warm! Good-by to frequent and well appointed bathrooms, glory

of the plumber's art! Good-by to suburban gardens running into each other without hedge or fence to separate friend from friend, or enemy from enemy! Good-by to shady verandahs where rocking chairs stand ranged in rows, ready for reading the voluminous Sunday papers and the Saturday Evening Post! Good-by, America! I am going home. I am going to a land where every man's house is his prison—a land of open fires and chilly rooms, and frozen water pipes, of washing stands and slop pails, and one bath per household at the most; a land of fences and hedges and walls,

where people sit aloof, and see no reason to make themselves seasick by rocking upon shore. Good-by, America! I am going home.

Good-by to the copious meals—the early grapefruit, the “cereals,” the eggs broken in a glass! Good-by to oysters, large and small, to celery and olives beside the soup, to “sea food,” to sublimated viands, to bleeding duck, to the salad course, to the “individual pie,”

or the thick wedge of apple pie, to the invariable slab of ice cream, to the coffee, also bland with cream, to the home brewed alcohol! I am going to the land of joints and roots and solid pudding; the land of ham and eggs and violent tea; the land where oysters are good for suicides alone, and where cream is seldom seen; the land where mustard grows and whisky flows. Good-by, America! I am going home.

Good-by to the long stream of motors—“limousines” or “flivvers”! Good-by to the signal lights upon 5th avenue, gold crimson, and green; the sudden halt when the green light shines, as though at the magic word an enchanted princess had fallen asleep; the hurried rush for the leisurely lunch at noon, the deliberate appearance of hustle and bustle in business; the Jews, innumerable as the Red Sea sand! Good-by to outside staircases for escape from fire! Good-by to scrappy suburbs littered with rubbish of old boards, tin pails, empty cans, and boots!

Good-by to standardized villages and small

towns, alike in litter, in ropes of electric wires along the streets, in clanking “trolleys,” in chapels, stores, railway stations, Main Streets, and isolated wooden houses flung at random over the country! Good-by to miles of advertisement imploring me in ten foot letters to eat somebody’s codfish (“No Bones!”), or smoke somebody’s cigars (“They Satisfy!”), or sleep with innocence in the “Faultless Night-gown”! Good-by to the long trains where one smokes in a lavatory, and sleeps at night upon a shelf screened with heavy green curtains and heated with stifling air, while over your head or under your back the baby yells and the mother tosses moaning, until at last you reach your “stopping off place,” and a semi-Negro sweeps you down with a little broom, as in a supreme rite of worship!

Good-by to the house that is labeled “One Hundred Years Old,” for the amazement of mortality! Good-by to thin woods, and fields inclosed with casual pales, old hoops, and lengths of wire! I am going to the land of a policeman’s finger, where the horse and the bicycle still drag out a lingering life; a land of persistent and silent toil; a land of old villages and towns as little like each other as one woman is like the next; a land where trains are short, and one seldom sleeps in them, for in any direction within a day they will reach a sea; a land of vast and ancient trees, of houses time honored three centuries ago, of cathedrals that have been growing for a thousand years, and of village churches, built while people believed in God. Good-by, America! I am going home.

Good-by to the land of a new language in growth, of split infinitives and cross-bred words; the land where a dinner jacket is a “Tuxedo,” a spittoon a “cuspidor”; where your opinion is called your “reaction,” and where “vamp,” instead of meaning an improvised accompaniment to a song, means a dangerous female! Good-by to the land where grotesque exaggeration is called humor, and people gape in bewilderment at irony, as a bullock gapes at a dog straying in his field!

Good-by to the land where strangers say

"Glad to meet you, sir," and really seem glad; where children whine their little desires, and never grow much older; where men keep their trousers up with belts that run through loops, and women have to bathe in stockings. I am going to a land of ancient speech, where we still say "record" and "concord" for "recud" and "concu'd"; where "necessarily" and "extraordinarily" must be taken at one rush, as hedge-ditch-and-rail in the hunting field; where we do not "commute" or "check" or "page," but "take a season" and "register" and "send a boy round"; where we never say we are glad to meet a stranger, and seldom are; where humor is understatement, and irony is our habitual resource in danger or distress; where children are told they are meant to be seen and not heard; where it is "bad form" to express emotion, and suspenders are a strictly feminine article of attire. Good-by, America! I am going home.

Good-by to the multitudinous papers, indefinite of opinion, crammed with insignificant news, and asking you to continue a first page article on page 23 column 5! Good-by to the weary platitude, accepted as wisdom's latest revelation! Good-by to the docile audiences that lap rhetoric for sustenance! Good-by to politicians contending for aims more practical than principles! Good-by to Republicans and Democrats, distinguishable only by mutual hatred!

Good-by to the land where Liberals are thought dangerous, and Radicals show red! Where Mr. Gompers is called a Socialist, and Mr. Asquith would seem advanced! A land too large for concentrated indignation; a land where wealth beyond the dreams of British profiteers dwells, dresses, gorges, and luxuriates, emulated and unashamed! I am going to a land of politics violently divergent; a land where even coalitions cannot coalesce; where meetings break up in turbulent disorder, and no platitude avails to soothe the savage breast; a land fierce for personal freedom, and indignant with rage for justice; a land where wealth is taxed out of sight, or for very shame strives to disguise its luxury; a land where an ancient order is passing away, and leaders whom you call extreme are hailed by lord chancellors as the very fortifications of security. Good-by, America! I am going home.

Good-by to prose chopped up to look like verse! Good-by to the indiscriminating appe-

tite which gulps lectures as opiates, and "printed matter" as literature! Good-by to the wizards and witches who ask to psycho-analyze my complexes, inhibitions, and silly dreams! Good-by to the exuberant religious or fantastic beliefs by which unsatisfied mankind still strives desperately to penetrate beyond the flaming bulwarks of the world! Good-by, Americans! I am going to a land very much like yours. I am going to your spiritual home.

## EGG HEADQUARTERS

Left to right: Orville Renshaw, messenger boy; G. R. Wallace, operator; M. A. Kluge, Clerk; O. O. Roberts, agent.

"It probably might be of some interest to the readers of this magazine to know where some of the eggs which are served on their tables come from," writes O. O. Roberts, agent at Golconda, Ill.

"During March, 1922, there were shipped from this station nine full carloads of eggs, in addition to two pick-up schedule cars a week, a total for the month of 4,123 cases, each containing thirty dozen eggs, making 123,690 dozen, or 1,484,280 eggs, shipped during the month—and every one of them strictly fresh!

"We also average several carloads of live poultry each month from this station, and during the warmer months we ship a number of cars of dressed poultry under refrigeration."

# Our Last Echo of the Yard Riots of 1894

## Company Wins Judgment of \$38,000 Against City of Chicago for Damage Done in Railway Strike

By JOHN G. DRENNAN,  
District Attorney, Chicago

PROBABLY the last echo of the great, expensive and useless railway strike of 1894, so far as the Illinois Central System is concerned, was heard in the Circuit Court of Cook County, Illinois, March 27, 1922, when the Illinois Central Railroad Company obtained judgment for \$38,059.56 against the city of Chicago for damage and destruction of its property, principally about seventy-five of its freight and coal cars that were destroyed by fire, at the hands of the mob, at its Fordham Yard, July 5 and 6, 1894. Following the riots and destruction of property growing out of the great railway strike of 1877, Illinois enacted a law which provided that cities and counties should be liable to three-fourths of the amount of actual damage done to property in consequence of the acts a mob of twelve or more persons, provided the owner of the property exercised due care to protect it. See Chapter 38, Sections 256a and 256g, Hurds' *Revised Statutes of Illinois*.

The primary cause of the strike was the refusal of the railway companies to comply with the demand of Eugene Debs, then head of the A. R. U. labor organization, that no Pullman sleepers should be used by any railroad in the United States. So far as the

Illinois Central was concerned, the first strike was that of the switchmen in its Chicago Yards, on the evening of June 26, 1894. This was followed by other railway organizations, until the full fury and violence of the strike resulted in fires throughout various railway yards in and about Chicago destroying property in value of more than a million dollars.

### Asked City for Damages

After the collapse of the strike, the railway companies and others that had lost property to any extent served the notices required by law upon the city of Chicago demanding that the city pay the three-fourths value of the damages provided for by the statute. Two suits were brought by the Illinois Central System: one by the Yazoo & Mississippi Valley Railroad Company against the city of Chicago in the United States Court at Chicago, and the other by the Illinois Central Railroad Company against the city of Chicago in the Cook County Circuit Court. For reasons which we will mention hereafter, these cases remained pending without trial until April 24, 1919, when the case of the Yazoo & Mississippi Valley against the city was tried and judgment rendered in favor of the railway company.

Many similar suits were brought against the city. The city authorities at first gave the respective claimants to understand that when a test case was tried they wished to negotiate

A Scene of Wreckage After the Riots, 1894

*Cars Burned on Our Tracks, 1894*

for a settlement with the parties in interest. I assisted in the trial of the first case in the United States Court on behalf of one of the auxiliary companies of the Pennsylvania System before Judge Kohlsatt. S. B. Shope, former judge of the Supreme Court, also assisted in the trial of this case. It lasted for several weeks. Hundreds of witnesses were examined. The jury returned a verdict for the company. The case was taken by the city to the United States Supreme Court of Appeals, where the decision was affirmed. The opinion in that case will be found in the 119th Fed. 497 (*City of Chicago v. Pennsylvania Company*).

#### **Matter Dragged On for Years**

After that case had been decided against the city, a number of claimants and their attorneys, as well as myself on behalf of the Illinois Central System, appeared before the finance

committee of the city council and presented the matter to the committee for adjustment. The matter was held for some time without action, but finally the finance committee said that it was not disposed to consider the case in the United States Court of Appeals as a test case, but insisted that some case should be tried and taken to the Supreme Court of this state. The Pennsylvania Railroad Company thereupon took a change of venue in its principal case to Lake County. The case was tried about 1908, resulting in a verdict of \$100,000 in favor of the railway company. The case was taken to the Supreme Court of Illinois and decided in 1909. (*P. C. C. & St. L. Ry. Co. v. City of Chicago*, 242 Ill. 178). In the meantime the case of *Sturges v. City of Chicago*, 237 Ill. 46, had been taken to the Supreme Court of the United States, and the liability statute of Illinois fully sustained

*More Evidence in the Riot Cases, 1894*

(*City of Chicago v. Sturges*, 222 U. S. 313). After the disposition of these cases, again negotiations were taken up with the city for adjustment, and the matter dragged along for years.

#### Noted Figures in the Case

The first, and most important, of the many witnesses used in these cases was John M. Egan, now a wealthy farmer residing near Dixon, Ill., who at the time of the strike was made general manager of the general managers' association of all lines leading into Chicago. He is now an elderly man, but has an alertness of mind and memory that made his evidence interesting and conclusive. Our Colonel A. H. Egan of Memphis, Tenn., now general superintendent of the Yazoo & Mississippi Valley, was then trainmaster of the Chicago freight terminals and in the midst of the danger and turmoil throughout the strike. He was an eyewitness to the fires on the night of July 5 and present in the Fordham Yard when the mob of more than fifteen thousand persons took charge

of his train. He was at all times in the thick of the strike on the Illinois Central lines, as was his brother, John M. Egan, in the thick of it for all the lines.

It must not be forgotten that the United States troops, ordered to Chicago by President Cleveland, in command of General Nelson A. Miles, now retired and one of America's most distinguished soldiers, played a most important part. Some years ago it was my pleasure to meet and spend an evening with General Miles at a hotel in Chicago. He related to me fully his interview with President Cleveland just preceding the calling out of the United States soldiers in Chicago. He also related to me the many interviews he had with Mayor Hopkins. I have no doubt that his official report contains all that occurred between him and the mayor, but I have never seen in print the interesting interviews which he related to me that he had with President Cleveland. The history of the strike cannot be complete until he has published it.

## Crew Finds New Use for a Switch Engine

Switch engines are not built to be deer chasers, but one on the Memphis division of the Y. & M. V. was brought into such a use on March 27.

George Starrett, engineer, Paul Riggin, fireman, Harry Smith, engine foreman, W. B. Pace, yardmaster, and J. C. Carey, night general yardmaster, were returning to Memphis on a switch engine March 27 after doing some switching at West Junction when they saw a deer on the right-of-way immediately in front of them.

The water was high in that section then. It had come up to the rails for a long distance, and at one place the track was completely submerged. As far as one could see from each side of the track, there was nothing but the surface of water pierced here and there by trees, houses and barns.

The deer was standing on the railway right-of-way because that was the only strip of dry land about. Where the animal came from, on one knows, of course, but it is thought probable that the high water drove it from its home woods in Arkansas.

The switch engine was many yards from the deer when the animal wheeled about

*The Captive*

and started at a great rate of speed toward Memphis, about three miles away.

Urged on by the other men in the cab, Engineer Starrett shoved more and more steam into the cylinders of the engine, and gave chase. The race was for about one-fourth of a mile, and the deer was leading by nearly that much when it came to a bridge. Water was on all sides of the bridge and just covered the ties. The deer stopped with such suddenness that it almost skidded into the water. After a brief,

pause and a hurried look back at the on-rushing engine, the animal, apparently seeing that the strip of dry land continued on the other side of the bridge, leaped high into the air and splashed into the water on the bridge.

There was a space of about three feet between the ends of the ties and the iron girders of the bridge. The water was about thirty feet deep there. The deer landed in that place and found that it was impossible to swim out.

While the animal was struggling furiously to keep afloat, the engine came to the edge of the bridge and stopped. The five men left the cab of the engine and walked cautiously out on the bridge to where the deer was. Yardmaster Pace brought a rope from the engine, tied a loop in it and gently dropped it over the pointed head of the deer. When the rope was secure about the animal's neck, Mr. Pace raised it from the water, and each man grabbed a foot.

Does fight with their feet. Their hoofs can slash great gashes in flesh as readily as can a knife. And this was a doe.

The five men, especially the four who had hold of the doe's feet, soon learned what a task they had before them. The doe fought her hardest. She tore her own flesh in the effort to slash the rope from her neck. Her mouth was cut and was bleeding profusely during the struggle.

After the doe had succeeded in musing the men up a bit and getting them soaking wet, they "hog-tied" her, placed her in the cab and took her to Memphis.

## A LANDMARK GONE

The coming of spring finds the birds with one less place to build their homes in Centralia, Ill. The one remaining sycamore of all the old Illinois Central shopyard trees crashed down last fall in order that a building might be put up in its place. At the time the *Centralia Courier* said: "Today the last landmark of the old railway shops was taken down. This is the old sycamore tree which has stood in the corner of the old shopyards ever since most Centralia people can remember. It was rooted out today because the new building will cover the spot where it has stood for so many years."

F. Touve-Harris (Mrs. S. H. Harris) is

*The Last Sycamore*

the wife of S. H. Harris, a Centralia business man who from 1890 to 1904 was a freight conductor for the Illinois Central, his last run being between DuQuoin and Mounds. Mrs. Harris writes: "To one who has been brought up under the shadow of the Illinois Central shops and yards with their change and growth and who remembers the original three parks of trees beside those growing in the shopyard, the change awakens a touch of sentiment. This, together with my pride in the progress of our city, caused me to give expression to the following poem, which appeared in the *Centralia Sentinel*:

### TO THE "LONE SYCAMORE"

(The last of his tribe in the city's heart)

Hail! friend and comrade of full two score or more—

With bared head would I greet thee once again!  
Reared with thee in the city's heart,  
Midst thy departed comrades, not a few,  
Thou art of my youth a part.

From out thy sheltering branches  
First I learned the robin's call,  
Counted the empty nests at fall,  
And the seed balls dangling there,  
Studied the sunbeams' light and shade,  
Or, by the shutters of my window hid,  
Let romantic moonbeams, through thy  
Leafy film, lead me to Old Madrid.

No clanking pavement 'neath the horse's hoof,  
No dream of motor or the claxon whoof—  
But often 'neath thy spreading shade  
Fruit-laden beast and weary pilgrim loitered.

Fain would I cry—"O Woodman, spare that tree—

In youth it sheltered me."

Nay—let me rather, silent minister,

Imbibe the spirit of the lesson taught—

In smoke and storm—shine, shower or drought,

To stand—

Until the voice of Progress utters its demand.

"The window referred to is the one just to the right of the trunk of the tree in the picture—in that day they had shutters. The 'fruit-laden beasts' refers to the immense shipments

of strawberries that used to leave these yards. The picture was taken looking north from the new Illinois Central station of which we are now so justly proud."

## Shortest Railroad Has Longest President

What is believed by railway officials to be the shortest rail line in the world is operated from Burnside, La., a station on the main line of the Yazoo & Mississippi Valley, to the Mississippi River, less than a quarter of a mile in length.

So far the "Burnside & River" Railroad has been unable to buy a locomotive, although that was the original intention of its builder. Instead of an engine a mule is used, and officials of the Y. & M. V. say that mule has been in constant service many years. It is fully acquainted with its duties of pulling the only passenger coach attached to its harness. When waiting for arrivals of Y. & M. V. passenger trains the mule often becomes tired, and to rest itself it will lean against a post that was used for a telephone wire, but stands conveniently close to the track.

This coach meets all Y. & M. V. passenger trains. It hauls persons from Burnside to the river, where they can take a steam packet for points south of Burnside not served by the Y. & M. V.—Memphis (Tenn.) *Commercial Appeal*, March 26.

Although the little railroad between Burnside and the river is reported to be the shortest in the world, it has as president Henry C. Braud, who is one of the longest railway presidents in existence. The road is only 850 feet long, and Mr. Braud is a little more than 6 feet tall.

The road is owned by the Burnside & Donald-

*The Railroad's Terminal*

sonville Packet Company, and Mr. Braud is the president of that company. In addition to the railroad, the packet company operates the steamer "Virgie," named for the daughter of Mr. Braud, and a steel ferryboat between Donaldsonville and Darrow, La. "Preston," the "mule-locomotive," pulls the 21-year-old car from one end of the road to the other in seventy seconds. When the end of the line is reached, the passengers are transferred to the boat, and "Preston" goes to his beloved "round-house."

The Y. & M. V. will sell a ticket from any point on its line direct to Donaldsonville. This includes the trip over the short railroad and on the steamboat. The fare from New Orleans to Donaldsonville is \$2.35, competing with the all-rail rate. Donaldsonville is about five miles up the river from Burnside.

Mr. Braud is 70 years old. He has saved the Y. & M. V. large sums of money in exposing fraudulent and excessive claims. Mr. Braud served eight years as a member of the Louisiana State Legislature under Governors Heard and Blanchard.

*Preston and "The Toonerville Trolley"*

# Glenwild, a Plantation Rebuilt to Order

## Mississippi Farm of Lieutenant-Commander John Borden New Show Place of the South

ONE of the newer show places on the Illinois Central lines is Glenwild Plantation, the Mississippi farm home of John Borden, millionaire native of Chicago. Glenwild is five miles south of Grenada, Miss., and our main line cuts it almost exactly in the middle. The result is that the daylight traveler over that track gets a pleasureable eye-full as he views the neatly fenced green acres, the red-roofed, green-shuttered, white-painted buildings and the generally up-to-date appearance of the plantation.

Mr. Borden is not a cotton farmer. He is, in Mississippi, a breeder of purebred stock and an exponent of diversified farming—an example to the farmers of that state.

Livestock breeders from the Middle West and South—but mostly from the South—gathered at Glenwild Tuesday, March 28, for the first Hereford sale to be put on by that rejuvenated institution. Fifty purebred Herefords, forty-five of them females, were put on the block. The average price they brought was less than \$150—far from a profit-making price for the plantation, but a price which enabled some purchasers to get in the game who otherwise could not have stood the pace.

### Works for Good of the South

For two reasons, the sale was no failure: First, because Mr. Borden is so well-to-do that he can afford to sponsor such general improvements at his own expense; and, second, because the dissemination of this blooded stock among the farmers of the South, even at a monetary loss, is one of the reasons for Mr. Borden's interest and investment in Glenwild.

Several of the Illinois Central's faster trains made the unaccustomed stop at the plantation crossing that day in order to accommodate the visitors at the sale. The recent improvements on the plantation have meant considerable freight traffic to the Illinois Central. The attractively painted plantation buildings make up one of the most pleasing sights in that part of the country for travelers on the Illinois Central. For these and other reasons the Glenwild Plantation and its owner have become known practically all over the Illinois Central System. The men who manage the plantation, including

Lieutenant-Commander John Borden, U. S. N.

Mr. Borden himself, are friends of the Illinois Central.

It has been just two years since Mr. Borden began spending his time and his money in building up what is now one of the finest plantations in the South. His holdings at Glenwild now aggregate 6,800 acres, all in one tract. He has 2,500 acres in cultivation—but not an acre of that in cotton. The remaining 4,300 acres, except those that are irreclaimably waste or occupied by the Illinois Central right-of-way or highways or the Bogue River, are pasture lands or virgin timber, mostly hardwood and pine.

### Bought Plantation in April, 1920

Before the Civil War, this piece of land was the old Payne plantation. For many years after the Civil War the land was farmed with cotton and corn in a haphazard manner, and it was in a generally run-down condition when Mr. Borden got hold of it in April, 1920. He immediately set to work to form an organization, to build and remodel buildings and to introduce purebred livestock and new crops to take the place of cotton and to restore the soil.

Panorama of Glenwild Plantation

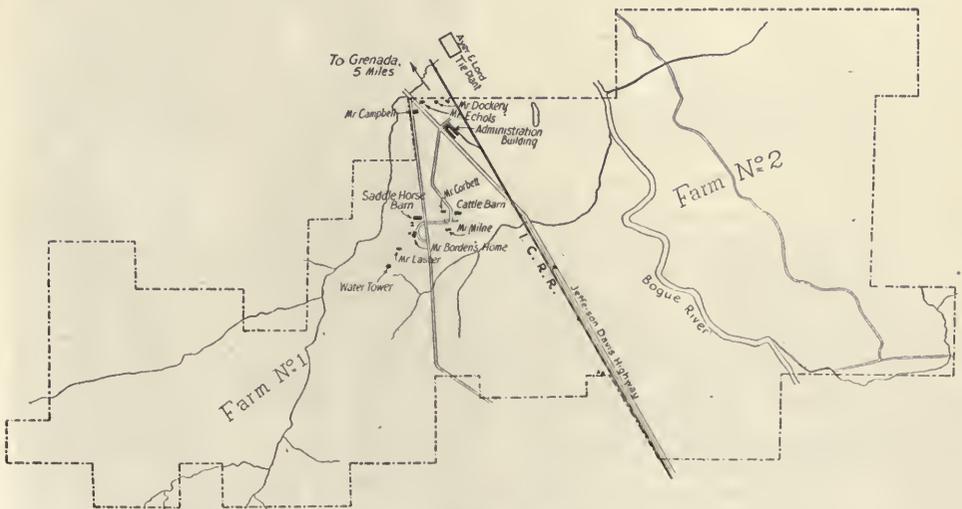

Mr. Borden's organization now consists of himself; W. A. Campbell, general manager; A. R. Dockery, office manager; J. L. Echols, overseer of Farm No. 1 (west of the river); O. W. Scott, overseer of Farm No. 2 (east of the river); Alex Corbett, herdsman; A. W. Milne, assistant herdsman; and R. A. Laster, superintendent of construction, in addition to about forty tenant farmers and numerous mechanics, carpenters and other helpers.

Mr. Campbell, the manager, was once a member of the Illinois Central family. From 1900 to 1905 he served the company as creosote inspector at Carbondale, Ill., and Grenada. Then for fifteen years he was superintendent of the Ayer & Lord Tie Company's plant, just half a mile north of the plantation which he now manages.

The Vantage Point

While building up his organization, Mr. Borden looked around for purebred stock. He got the bulk of his Hereford cattle and his great bull, Donald Woodford, by the simple expedient of buying out the noted Enochs farms at Fernwood, Miss., also on the Illinois Central. Mr. Borden moved this herd to Glenwild, and he is now using the

Map of Glenwild Pantation

7,600 acres of the Fernwood farms, among other things, for his more than 750 purebred Duroc-Jersey hogs. At Glenwild Mr. Borden now has 400 Herefords, 50 Shorthorns, 40 registered Holsteins and a few registered Guernseys. He paid \$14,000 for Maxwalton Rodney, his famous Shorthorn bull, whom he purchased as a junior yearling from Carpenter & Ross, Ohio breeders.

The main buildings on the plantation are the administration building, the cattle barn, the saddle horse barn (now in course of construction), separate dwellings for Mr. Borden and the members of his staff and about forty tenant houses. All of these buildings are painted in the same color scheme—white, with green trimmings and red roofs—and the effect, taken into consideration with the light green of the fields and the darker green of the timbered hills, is most pleasant, as any traveler on the Illinois Central south of Grenada in the daytime can testify. There are no shacks on the Glenwild Plantation; everything is new in appearance, tidy and up-to-date.

#### Headquarters Building a Big One

The administration building, which is the headquarters for the plantation's activities, gives an idea of the completeness with which Mr. Borden is organizing his plantation. This building contains the mule and horse barns, wagon and implement sheds, warerooms, a storeroom and commissary (a general store, with dry goods, groceries, etc.), the plantation offices (so up-to-date they have radio equipment), the tractor garage, the paint shop, the carpenter shop, the blacksmith and machine shop, the feed grinding rooms and the electric light and pumping station.

The water system also includes a 100,000-gallon water tower on a hill back of Mr. Borden's dwelling, giving 60 pounds' pressure by gravity for the buildings on Farm No. 1.

Glenwild Plantation represents an investment of hundreds of thousands of dollars. An idea of its acreage can be gained from the fact that it takes twenty-five miles of hog-proof fence to guard its boundary lines, and that there are forty miles of hog-proof fence and six miles of Kentucky board fence now standing on the property. The cattle barn alone cost \$35,000, and the administration building much more than that. One bull, as mentioned, cost \$14,000. Mr. Borden wants his work done well and substantially, and that makes the reorganization of the plantation run into money.

#### Used Much of Old Material

In remodeling the older buildings, an effort has been made to keep the original design. In the big house, Mr. Borden's country home, the century-old logs have been kept, but the place has been newly weathered-boarded outside and plastered in the interior. Old timber has been used in rebuilding the old plantation blacksmith shop into a garage, and the marks of the axes used by the slaves in hewing out the original wood can still be seen. Mr. Laster, who has charge of the construction, is an expert in his way, and he has worked out ideas to fit the situations as they arise. His Kentucky board fence, for example, which by its whiteness lends much to the scenery, is constructed of wood that has been dipped in white creosote instead of being painted, and the effect is to give it a permanent whiteness as well as to make it proof against the elements.

Mr. Laster's material, as well as most of the traffic of the plantation, comes in carload lots over the Illinois Central, and the railroad has a siding on the plantation for convenience in handling the business. The accounts are taken care of under the Grenada agency.

#### Noted Cattle on the Plantation

Mr. Borden has built and improved his own roads within the plantation. In addition, the Jefferson Davis hard-surfaced highway from Memphis to the Gulf passes just about through

the middle of the land, paralleling for a considerable distance the Illinois Central track.

Glenwild's most noted cattle are: Donald Woodford, head of the Hereford herd, grand champion in 1921 at the Illinois, Indiana, Kentucky and Tennessee state fairs and the Tri-State Fair at Memphis; Maxwell Rodney, Shorthorn bull, five times grand champion at state fairs in 1920; and Lady Dorothy, Shorthorn cow, also a prize-winner.

Mr. Borden is going into the breeding of 5-gaited saddle horses, as the construction of the new horse barn will testify. His best known horse is Wildare, second in the 5-gaited stallion class at the International at Chicago in 1920. The master of Glenwild is a polo player, and he plans to introduce the game at Glenwild. Eight of his polo ponies are stabled there, a polo field is being laid out, and he is planning to put on a series of polo games as a feature of the county fair at Grenada this year.

#### Scientific Farming Is the Rule

The farming plans at Glenwild call for a campaign to building up the soil. Fertilizer is being used extensively, and the tenants are directed to turn under the green crops—cowpeas, soybeans, etc.—and to follow a definite schedule in rotating the crops. The farming is done scientifically, with the most up-to-date implements, and the tenants make regular reports on the condition of the land. An office organization, with offices as finely furnished as you will find in the city, has been built up to direct the affairs of the plantation. Everything is carried on according to plan.

To round out the place, Mr. Borden has fine chickens, fine dogs (Llewellyn setters) and peafowls, all well housed and taken care of.

Glenwild, although a sober business proposition for Mr. Borden, is also his playground and his county home. He spends a great deal of his time at the plantation, and it is his custom to share its enjoyments with his friends. Hunting is one of the favorite sports at Glenwild, and that is why Mr. Borden keeps a kennel of dogs. In order to improve the hunting, which heretofore has been confined mostly to quail and 'coons, Mr. Borden released on the plantation one hundred English ring-neck pheasants. The county board of supervisors, in order to further the plan, has declared a closed season of three years on pheasants, with a \$100 fine for a violation.

#### The Master of Glenwild

This man Borden is no member of the idle rich. He is a noteworthy character. Probably

the best biography of him that has been written came from the typewriters of his Chicago friends, Walter Howey, John P. Brady and William Blake, who enjoyed a 'coonhunt with him at Glenwild last November and then went back to Chicago and published an illustrated souvenir newspaper about Glenwild, calling it *The Glenwild 'Coonhunter*. Under the heading, "Arctic Explorer and Sub Hunter Now Is a Planter; Commander John Borden Exchanges Gold-Striped Cap for Sombrero Down in Mississippi," the following story was printed:

"From the bridge of a sub-chaser in the German ocean to a Mississippi plantation is a far cry; 'tis a long paddle from the Bering Sea to the land of cotton. From the polo fields of the North and West to the sylvan glades of Glenwild is considerable jump, but evidently not far for Lieutenant-Commander John Borden.

"The only sea fighter who owned and commanded his warship in the Great War has exchanged his gold banded cap for the planter's sombrero, the captain's gig for a saddle horse and beaten his 3-inch guns into tractors. In place of leading a one-armed existence in command of the 225-foot Kanawha II, U. S. N., in the pitching waters of the Bay of Biscay, English Channel and the North Sea (it has been called a one-armed existence because one had to hang on with at least one arm all the time in sub-chasers in those waters) he is now boss of more than five thousand acres in Grenada County, Mississippi, where the fields are bounded by forested knolls which must remind him still of stormy seascape suddenly struck stationary.

#### Born in Chicago in 1884

"The quietly humorous master of Glenwild was born with a sextant to his eye, in one of the first houses built on what is now the Lake Shore Drive in Chicago. That was in 1884.

"He neglected his education by graduating with honors from Yale and then when he could have entered any one of Chicago's seven thousand and odd bars without any effort, a-tall, he preferred to go to Northwestern Law School and was admitted to the Illinois Bar. But then he has always worked out his problems in his own way. That he might do this the more accurately, he took a course and became a public accountant.

"He went on shooting expeditions to various parts of the world and became proficient in the handling of small arms. Along in 1912 the whales in the Pacific and Bering Sea became

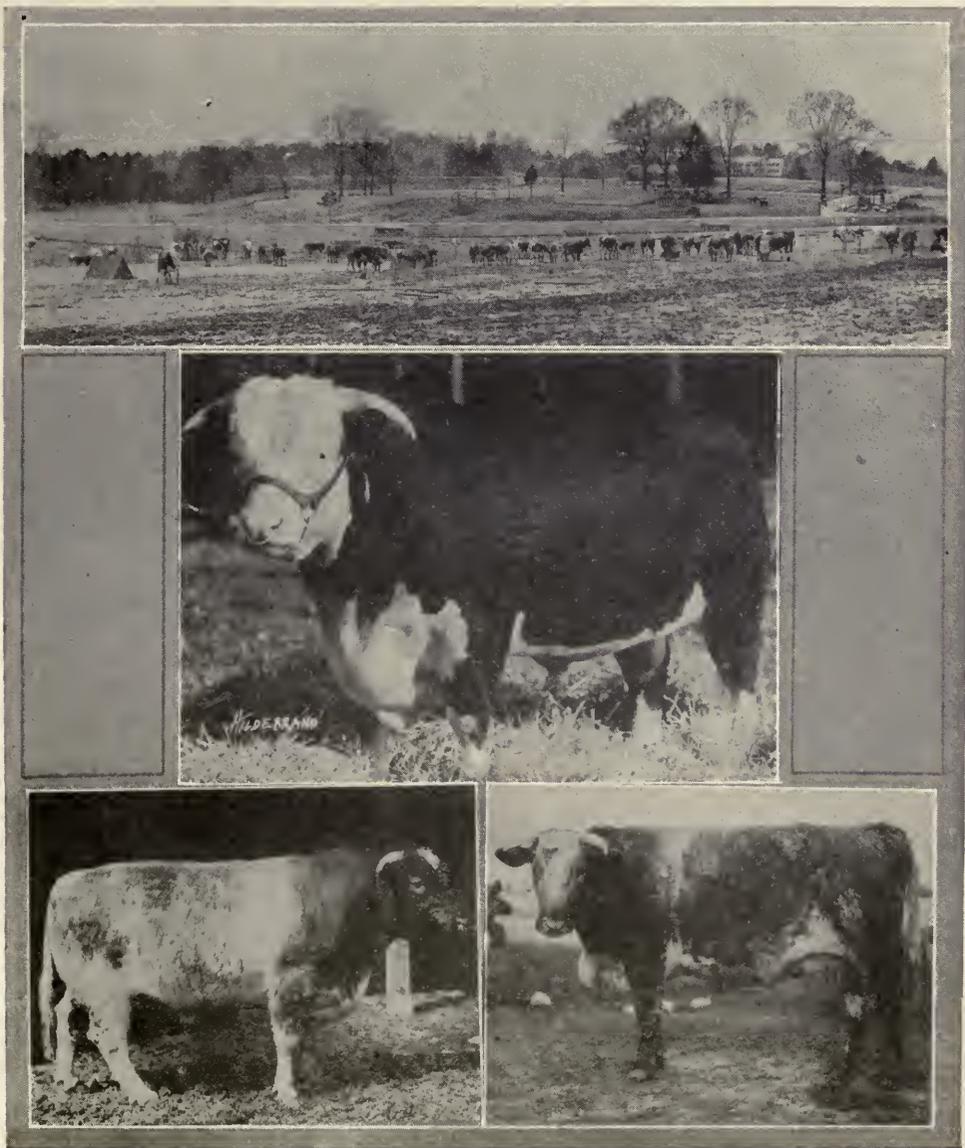

obstreperous, and he built the schooner *Adventress* for a whale hunt. He sent this craft around the Horn and joined it on the west coast in the spring of 1913.

"With this boat he went exploring into the northern waters and hunted whale and bear along the Alaska coast, making several incursions back from the shore into unknown territory. In 1915 he went to Europe as war correspondent for the *Newspaper Enterprise Association* and scooped the world with Italy's

entrance into the war. He had a large acquaintance among diplomatic circles in several European capitals and access to the best informed news channels.

#### Shipwrecked in Alaskan Waters

"In 1916 he built the schooner *Great Bear* and sailed on a fur trading expedition for the Arctic Ocean and northern coast of Siberia. When he reached Bering Sea he was informed a ship had been wrecked and stranded on an island in this body of water and he changed

*Some specimens from the Borden herd; center, Donald Woodford; left, Mawalton Rodney; right, Lady Dorothy.*

*Some of the homes on the plantation: top, home of Manager Campbell; center, home of Herdsman Corbett; bottom, home of Mr. Borden.*

his course to get the crew. In a thick fog the boat carried up against an uncharted reef off one of the islands in the group being sought and sank, but not before the crew had opportunity to get a few things ashore.

"The shipwrecked party saved, among other things, one of the ship's boats. They built a tent and began to figure on staying there all the winter as they were away out of the course of what little commerce obtains in those waters. Their only boat was found drifting away from the shore one day and it looked as if their last hope was gone when Borden stripped and plunged into the cold water and swam out to the craft. He brought it back, although he nearly froze in the attempt.

"In the meantime the government got busy

and sent out ships to scour the sea in search of the missing Great Bear, which long since should have reached Nome. Finally they were picked up by a government ship and taken to port. Lieutenant-Commander Borden's thousand word report written at the request of the editor of a Chicago newspaper is considered a model newspaper story.

**Got Ready Early for the War**

"While in Europe in 1915 he saw that sooner or later the United States would be drawn into the war and he pursued his navigation studies with diligence. He took out his master's papers as soon as possible after buying the fastest steam yacht in the United States, the Kanawha. This boat he got fitted out in the very best condition possible so that when war broke out

it was waiting only for the guns to put to sea. He gathered his old Arctic crews and manned his ship with picked men, among them being an ex-gunner from the United States navy.

"The navy officials were swamped with offers of private yachts when the war broke out. But there wasn't one in ten that could be used for anything and of all the boats the Kanawaha was the only one stripped down to war specifications. As said above it needed only the guns. As soon as they looked into his record the navy bosses commissioned John a provisional Lieutenant Commander and he was at sea with his boat fully manned and equipped for war within a few days after the declaration of hostilities. William Blake, well known in Glenwild as an expert coonhunter and an old friend of Commander Borden's, enlisted as a gob and became master at arms on the ship.

"The Kanawha II, as it was known in the navy, accompanied General Pershing as one of his escort across in June, 1917, and was ordered to Brest, where it was the first American warship in the race to France. It logged fifty

thousand miles in the German Ocean, Bay of Biscay and English Channel in pursuit of subs and the protection of convoys and toward the end of the war was the flagship of Commander Borden in command of a flotilla of chasers. This flotilla took care of several Hun subs.

"With the war ended, he returned to Chicago in the later winter of 1919. He spent most of the summer on his estate at Lake Geneva and then one day there was recorded his purchase of a Mississippi plantation. On the walls of his office in the Tower Building are pictures of the sea and models of the various ships he has commanded. On his desk are plans for the Glenwild Plantation and volumes on agriculture and reports of various agricultural bodies from all parts of the world. It's our guess that Commander John Borden's practical and thorough work together with his experiments at Glenwild will do more to solve the problems of Mississippi than all the theories and advice now being spread broadcast through the various agricultural sections of the country, both North and South."

---

## *An Afternoon in a Special Agent's Life*

"'Ho hum, this spring weather sure makes a fellow sleepy. Believe I will lie down on this hatch and take a little nap,' yawned John Tippitt, special agent for the Illinois Central Railroad, in a sleepy sounding voice Tuesday afternoon as he sat contentedly on top of a hatch on the old steamboat Pete Langan, now owned by the Peterson-Miller Box Company. Tippitt was wide awake and alert despite the sleepy tones of his voice," said the Cairo (Ill.) *Evening Citizen* of March 29.

"Then came a ghostly rap on the underside of the hatch as if the dank and dripping spirit of some deck hand who had long ago died was imprisoned in the hole of the old boat and was trying to open the hatch and escape. The rapping stopped. A sound like that made by a heavy dead body being dragged along could be heard. A voice, seeming to come from the depths below in tones sepulchral and hoarse, began speaking. 'You have got me all right, Tippitt. I am here but please let me out. This foul air is about to kill me. The bilge water in here is deep and I'm wet, slimy and cold.'

"Without any mysterious passes or incantations, Tippitt had conjured up a real live spirit. With a broad grin and a merry twinkle in his

eye, the special agent lifted the hatch and out crawled 'Fisher' Beaver, covered with muck and as submissive as any snow white lamb that ever gamboled in the clover.

"The officer had gone after Beaver with a warrant charging theft of a large quantity of beans from an interstate shipment on the I. C. at Mounds. Beaver was working on a derrick boat just north of the Cairo bridge when he saw Tippitt coming. He left his work, ran off the derrick boat and along the river bank for a distance, then boarded the old Pete Langan and disappeared in a hatch.

"All efforts on the part of Tippitt to coax him out of the hull proved fruitless. The officer decided on a 'wait and see' policy. For five hours Beaver endured, then gave up the ghost. Whistling, idly twiddling his thumbs, humming old-time favorites as he sat comfortably on one hatch while his dog Charlie sat on the other, Tippitt easily outwaited his quarry.

"Beaver, it is said, hails from Boston and, having never served in the army for a long stretch, was a fool about beans. But he spilled the beans, so to speak. Literally, the beans were spilled on a street in Mound City. They furnished the needed clue."

# Winning an Up-Hill Battle for a Home

## Saving Pennies Meant Success to F. J. McGuinness and to Other Employes at McComb, Miss.

**I**F home-owning is a sign of thrift, and it undoubtedly is, then the employes of the Illinois Central at McComb, Miss., are a thrifty lot of workers. It is estimated that 60 per cent of them own their homes in that little city of southern Mississippi. That means that at least 60 per cent of the employes there are or have been making good use of practically every cent of their wages. But 60 per cent do not represent all who are saving part of their incomes. Nearly every employe at McComb lays part of his money away where it can be had for future use. The numerous savings accounts are indicative of that.

There is a satisfied feeling among the employes at McComb. That feeling is apparent over the entire system, but at McComb it seems to be pronounced. The employes at McComb feel they are in the work that they like best, and they feel that they are working for the best railroad in the world.

McComb is an ideal city for a home. The city is built on high ground; the air is fresh, clear and dry, and the residents are healthy.

### Loan Association Is a Help

Those are the conditions that have been the stimulus for thrift at McComb. Some of the employes have thought it best to accumulate enough money for the purchase of a home before they bought or started building. The enthusiasm of others for a home has made it impossible for them to wait that long, and they have either purchased or built through the aid of the Building and Loan Association.

The majority of the home-owners in McComb fit into the latter class. During the last year, about forty new homes have been erected in that manner. The usual initial payment to the Building and Loan Association has been 25 per cent of the total loan, and the monthly payments have been about \$25 for each \$1,000 borrowed. Notes are signed for the monthly payments, and each month one of them is taken up by the home-owner. Five years is about the average time that is required to pay for a home.

Ninety per cent of the engineers working in and out of McComb are the proud owners of homes in that city.

*Present Home of F. J. McGuinness*

### An Up-Hill Fight for a Home

The experience in home-buying of F. J. McGuinness, warehouse foreman, is an example of the way many employes have bought their homes in McComb.

Mr. McGuinness found it an up-hill fight. He was discharged from the army in the early part of 1919, and he had to borrow \$350 to start his civil life. Before he got his military experience he had been an employe of the Illinois Central at McComb, and on his return he was promised another position. To borrow money enough to give him a fresh start did not appear to be a bad thing, he says. He was young and unmarried, and a good position was soon to be open for him.

But the borrowed money did prove to be a handicap to Mr. McGuinness before he had paid it. On April 1 of the same year, only a few months after he had returned from the army, he decided to get married. He was employed as a clerk at that time, and his salary was \$90 a month.

### Couldn't Pay the \$1,000 Down

There was a pretty little cottage in McComb that Mr. and Mrs. McGuinness longed for. They went to the owner and learned that the price was \$4,500. They knew that such a sum was too large for a young man to take upon his shoulders, but at the same time they knew that it was their ideal spot and that it could finally be paid for. But when they asked for the terms of sale, they realized that the initial \$1,000 payment asked was far more than any

*Employees' Homes at McComb, Miss.: 1, C. C. Clement, conductor, Georgia Avenue; 2, C. L. Carroll, train dispatcher, 644 Minnesota Avenue; 3, C. A. Gilmore, engineer, 226 Michigan Avenue; 4, E. L. McLaurine, trainmaster, 424 Third Street; 5, R. M. McEwen, general car foreman, 406 Fourth Street; 6, J. B. Middleton, carpenter, 321 Argyle Street; 7, J. A. Anderson, machinist, 413 Pennsylvania Avenue; 8, J. W. Brown, conductor, Edgar and Virginia streets.*

amount of money they could hope to raise at that time.

Thus the first dream of the young couple was shattered for the time being. But they were not disheartened. There were few houses for rent in McComb; anyway, they were anxious to buy a home of their own. They looked the city over, but everything was out of their reach until one day they found a little house of four rooms. There were no modern conveniences, and the walls were bare. No grass grew in the small lawn, and what few trees were about the place added only ugliness.

But the price of that little home was only \$1,000. That amount was within their reach, and they made arrangements for the purchase.

#### **A Strain on a \$90 Salary**

The owner asked \$100 as an initial payment. Mr. McGuinness had received a bonus of \$60 from the government. He borrowed \$40, made the first payment and signed thirty-six notes for \$30.27 each. That amount took care of the interest, with one of these notes due the first of every month.

A salary of \$90 a month was hardly large enough for the young couple to live on, and to take \$30.27 out of that each month made matters more complicated. On top of all this, there was the \$350 debt which had not been paid, and interest on it was accumulating.

But they had a home, and they began to plan like two veterans of the business world. Their notes had to be paid each month; after that they could make a small payment on the \$350 debt, and the remainder of the \$90 salary was to pay the food and clothes expenses.

Mrs. McGuinness was able to keep the house expenses down to \$1 a day. It was an effort, but with careful buying and cooking it was accomplished. Some days she even went below that mark.

The only furniture the little home had was that which was absolutely necessary. There were no extra chairs for guests. There was no extra room furnished for visitors. Mr. McGuinness made most of the furniture during his hours at home after work in the office. Of course it was not highly varnished, but it served. It was all theirs, and they enjoyed it.

#### **Not Fancy, but a Real Home**

During spare hours they both worked hard to beautify their little home. Grass was planted; the dingy walls of the rooms were papered, and the outside of the house was given a nice, new coat of paint. A little later, electric lights were added; then water connections were

made. Mr. McGuinness did all of this work. Their home was made comfortable by their constant efforts, and they were able to add to the meager supply of furniture from time to time.

After they had lived in their home for fourteen months, kept the notes paid and improved the property every day, a man offered them \$1,600 for it. They asked for time for consideration and talked the proposition over.

#### **Got the House They Wanted**

"One thousand six hundred dollars! That is \$600 more than we paid for the place," they agreed, "and we have already paid \$423.78 in the fourteen months we have lived here. Then, if we sell, we shall have \$934.06 all our own!"

Then their first little dream-cottage flashed back to their minds. If they sold, it would be possible to buy it. They had been happy, but they had suffered hardships; now they were on the road to success.

They went to the owner of the first house they desired to buy and learned that it was still for sale at the same price. They took an option on it and then sold their little home. The purchaser paid them \$960 cash, and signed notes for the remaining \$640. Mr. McGuinness made the first payment of \$1,000 on the new home and signed notes at \$43.75, due each month, for the remaining \$3,500. That was in September, 1920, and, although the task has been hard, he has kept the payments up to date.

Taxes, insurance and the notes make owning his own home cost him \$12.50 a month more than renting, he says; before he bought the place, it rented for \$35 a month.

Mr. McGuinness gives to his wife all the credit for their ability to have a home. If it had not been that she was such a good little business woman, he says, it could never have been done.

#### **Another Example of Thrift**

Another example of thrift at McComb is that of J. A. Jones, engineer. Mr. Jones entered the service at a salary of \$30 a month when he was 14 years old, and now, at the age of just a little more than 50, he owns two valuable pieces of property, in McComb, has stock in two banks, and is a director in one.

Mr. Jones entered the service as a poor boy, and was not able to save any of his salary for himself at first. His father was in ill health, and the son had to contribute to the upkeep of the home.

By 1899 Mr. Jones had worked up to a posi-

*Employees' Homes at McComb, Miss.: 9, Tom Downard, B. & B. foreman, 427 Missouri Avenue; 10, W. T. McGuire, chief clerk, 577 Georgia Avenue; 11, T. A. Home of J. A. Jones

tion as engineer, and he was able to save about \$50 of his wages each month. By 1903, Mr. Jones had about \$2,400 in the bank. He was a home-lover, and he bought a comfortable little home for \$2,000, although he was

not married. Throughout that year he used his savings to buy furniture for his home, and in December he married Miss Ida Fitzgerald of McComb.

Mr. Jones continued to save after he was married. McComb has always been an economical place to live in, he says, and he was always able to save about \$50 of his wages each month.

Five years later, Mr. Jones sold his home for the same amount he paid, and he added that money to his savings for the purchase of a better home. He continued to save and later invested in farm land. He improved his property, sold it at a profit and invested again. He repeated his farm investments several times, and each time realized some profit.

Although comparatively a wealthy man, Mr. Jones continues in the service of the company, and he saves part of his wages each month.

## O. M. Dunn, Former Superintendent, Dies

Oliver M. Dunn, 75 years old, real estate broker and former superintendent of the Louisiana division of the Illinois Central System, and his wife, 68 years old, were found asphyxiated in their home, 4735 Carondelet Street, New Orleans, Tuesday, March 14.

Mr. and Mrs. Dunn were discovered dead in bed by Tom Anderson, their negro house boy. Windows in their bedroom were closed, and gas was escaping from a heater.

Coroner Joseph O'Hara reported the gas in the heater had evidently been turned too low and had gone out during the night. There was no question, he said, that the tragedy was accidental.

Mr. and Mrs. Dunn are survived by one son, Captain Seely Dunn, assistant director of the Bureau of Statistics, Interstate Commerce Commission, Washington, D. C., and a brother of Mr. Dunn, Colonel Frederick W. Dunn of Quartzite, Ariz.

Funeral services were held for Mr. and Mrs. Dunn Friday morning, March 17, at the Napoleon Avenue Presbyterian Church, the Reverend U. D. Mooney officiating. Burial was in Metairie Cemetery. Pallbearers included several Illinois Central System officials.

Mr. Dunn, before his retirement ten years ago, was one of the best known railway officials in the South. He is said to have

been one of the first telegraph operators to learn to receive telegraph communication by sound. This was in the 60's in the days of the "paper mill."

Mr. Dunn obtained a position with the Louisville & Nashville Railroad early in the 70's. After handling several local agencies in Kentucky and Tennessee, he was appointed general freight agent at Owensboro, Ky. Next, through J. T. Harahan, late president of the Illinois Central System, at that time superintendent of the New Orleans and Mobile division of the L. & N., Mr. Dunn was appointed trainmaster at Mobile. Two years later he was appointed superintendent of construction. When Mr. Harahan was named general superintendent of the L. & N. south of Decatur, Ala., Mr. Dunn succeeded him as superintendent of the New Orleans and Mobile division. He was later transferred to Memphis as superintendent of the Memphis Line division of the L. & N. in 1886.

When Mr. Harahan became vice-president in charge of operation of the Illinois Central System shortly afterward, Mr. Dunn went with our road as general superintendent south of the Ohio River. Becoming interested in New Orleans property and business life, he later accepted a position as superintendent of the Louisiana division and the New Orleans terminals. He married Miss Harriet Seely in 1868.

# How a Freight Conductor Sought Traffic

## Impressions and Results of an Inexperienced Solicitor Prove We Have Service Well Worth Selling

By W. J. CALLAN,

Freight Conductor, Illinois Division

**I**N May, when our committee was appointed and I was made a lieutenant in the Illinois division organization to solicit traffic, I did not know exactly where to begin, not being familiar with this phase of railroading. To get myself started, I wrote personal letters to heads of firms who would be interested in a personal appeal of this nature from an employe in train service. One of my letters to a man of extensive properties, for example, read as follows:

"Knowing that you have an estate at Sarasota, Fla., I naturally assume that you need both freight and passenger train service. We run a through scheduled refrigerator car, fully iced, to Florida points several nights a week. This car is routed to Birmingham, Ala., via our lines, connecting at Albany, Ga., with the Atlantic Coast Line, and from Jacksonville, Fla., via the Seaboard Air Line.

"We need business, and as we have the best service in the world to sell, we would be pleased to make you a patron if you are not already one. Our passenger service to Florida points is unexcelled, and our on-time record is nearly 98 per cent, month after month, regardless of weather conditions.

### An Investment in the Company

"It may appear odd to you that a freight conductor should solicit business for the Illinois Central Railroad Company, but as I have the equivalent of \$20,000 invested in this company, figuring my wages as an investment at a certain rate of interest, it is proper that I ask you to help us with your patronage.

"The railroads of this country are in desperate straits, and no one knows it better than the employes. If you will favor me with an answer, and tell me that you or your friends can use our railroad, I will feel that I have done my duty as a faithful employe."

In answer, he promised to bear in mind that which I had written, and in checking up I have found that we have received much perishable loading from the vicinity of his Florida estate. In addition to this, the passenger department

W. J. Callan

benefited, as was attested in a recent letter to our president commending our service.

To be better able to converse with the heads of big business concerns, I enrolled for a course in salesmanship and public speaking. I have found, however, that business men have no time to listen to oratory or studied phrases of salesmanship. All they wish is that you be clear and concise, know your company and be honestly interested in its welfare.

### Found a Firm Preventing Claims

As all freight business is in a sense seasonal, I started on LCL loading. I visited one of the largest wholesale mercantile houses in Chicago. In asking the vice-president for new business, I found it necessary to say that the wages of railway employes had been reduced 12 per cent as a measure of economy and that, to overcome this, we were soliciting to acquire a greater volume of traffic, to increase our earnings and to secure employes who receive a guaranteed or monthly salary against a further wage reduction. I told him also that the railroads returned to the shipper 2 cents

on every gross dollar earned in the payment of loss and damage freight claims, although the carrier as a rule uses ordinary care in handling shipments, that I thought it was due primarily to the fact that packages were not perfect or pilferage proof, were improperly weighed and marked, and that a loss of this nature was an unnecessary drain. My statement impressed this man, whose opinion in both business and civic matters is one of the most valued in Chicago, and he gave me twenty minutes of his valuable time, during which he showed me how his firm, at an initial cost of \$25,000, had installed a system of sealing, marking and weighing cartons and boxes to make them as nearly perfect as possible and pilferage proof to the extent that any tampering will be easily detected.

### Praise for Our Management

It surprised me so much to find at least one firm making an effort to avoid freight claims that I took our superintendent of stations and transfers to this firm. He was much pleased with the honest endeavor made by this concern to reduce claims, which are a loss both to the railroads and to the shipper, from the fact that the consignee is disgruntled when he receives a package broken or with contents imperfect, and it follows that he will buy from a firm which delivers his goods intact.

At the next wholesale concern I visited, the freight traffic manager said: "Yes, we feel friendly toward the Illinois Central for the splendid manner in which we were treated in regard to the Field Museum site. You certainly have a fine set of officials who meet every proposition fairly and squarely. I can truthfully say it is the most public-spirited railroad in the country."

I called on the vice-president of one of the largest coal-mining corporations in Chicago to increase, if possible, our loading 50 per cent from one of his mines, so it would be possible to run a full train each day, instead of using the thirty cars we were receiving as a fill-out. When I told this man my occupation and mission, he did not answer for what seemed to me about a minute. During this time he was gazing at me intently. A man of his caliber can see a proposition from many angles, as he is a graduate of the college where result-getters are produced and where mnemonics heads the curriculum. You know the college I mean—Hard Knocks!

### Some Thoughts and Explanations

While he was looking at me, I figured the

following thoughts were in his mind: "This is splendid, to think Illinois Central employes help their company on their own time. Wish ours would, instead of watching the clock as they would the face of a dying friend, without thought of wasted time." Also: "I read that railroads and their employes are about ready to fly at each other. Didn't someone tell me Messrs. Hocus, Pocus and Buncombe appeared before the Interstate Commerce Commission and made general charges of railway mismanagement?" The first thought was correct. The second might be applicable to some railway employes. The third does not apply to the relations of Illinois Central men and their employers. The fourth I could explain to him thoroughly. Mr. Buncombe has retracted any statement that was made by Mr. Hocus in which it was intimated, by general charges, that the Illinois Central was mismanaged. The head of one of the labor orders has also expressed a feeling of confidence in our management, but he did, however, accuse me of everything from mayhem to murder when I questioned his right to allow defamation of our company.

After thinking these thoughts, this mining authority opened up, just like a new book, right in the center, and explained he could not increase the loading as requested, since a competitive railroad bought its coal from his concern. He said: "If you will get your company to sell me its mine, I can assure you of much more business." In other words, he practically made me his emissary in a deal that would involve from five to eight million dollars. I am pointing this out to show employes that business men have confidence in our effort to help our employers. So that my visit would not be fruitless, he gave me all his miscellaneous business from southern mines.

### Met One Disgusted Patron

About this time I was getting extremely proud of our company and its personnel, and I told one of our general officers that I had been soliciting freight and passenger business for four months and had not heard one word of complaint, nothing but praise. This statement was premature, as my next solicitation proved.

I visited a firm of lumber brokers, asked for their patronage, and received the following answer: "No, I will not patronize the Illinois Central. I am diverting all my cars to other lines." Of course I asked him why. His answer was: "Just pick up that telephone, call

a certain office, give a fictitious car initial and number and see what treatment or abuse you receive." I didn't do as he requested, because I was afraid I might be convinced. This man could not have hurt me more had he pushed me through the window. When I thought that a railway employe whose duties were no more arduous than to shove a lead pencil and talk pleasantly over the telephone could be the means of losing more business in one minute's abuse of patrons than our committee could acquire in a week, I was certainly disappointed. However, one man-failure in 60,000 makes our batting average high still. When our general agent heard of this case, he assured me that this firm would be our friends within ten days.

#### Easy to Get New Passengers

The passenger end of our business is so excellent that employes should experience no trouble in acquiring many new patrons. When it is generally known that the Illinois Central runs numerous trains that would on other railroads be called "de luxe" or "extra fare trains" without additional cost to travelers and that we are repaid by the unstinted praise

of all who use this service, we will need extra trains, instead of extra fares.

In conclusion I can say to all employes that each one is a latent solicitor. To give all an incentive to acquire business and to make the dollar a railroad earns of more value, I will explain where it goes. At present the Class I railway dollar is described as being divided as follows:

- 59.9 cents for labor.
- 17.3 cents for material and supplies.
- 10.9 cents for fuel.
- 4.5 cents for taxes.
- 2.4 cents for depreciation.
- 2.0 cents for losses.
- 1.0 cent for equipment hire.
- 1.0 cent for injury to persons and insurance.

---

99.0 cents total expenses.

A total of 99 cents is expended out of the dollar received. If each of our 60,000 employes would strive for just one additional load or another passenger, we would make the railway dollar mean a great deal more than 1 cent.

---

## Illinois Central Was Alert at Kentucky Fire

A disastrous fire endangered the existence of Sturgis, Ky., March 29. That the Illinois Central was willing to do its share in fighting the fire is proved by the following letter written to J. S. Berry, our agent at Sturgis, by Mayor J. J. Martin:

"I take this means of expressing to you the deep appreciation of all of the people of Sturgis in the prompt action which you took in supplying a locomotive and cars for the transportation of the Morganfield fire department to Sturgis at a time when it appeared that the business section of our city was doomed.

"Had not Providence taken a hand in our salvation by keeping the breeze in one constant direction, still we would not have despaired, because just twelve minutes after you saw the situation a locomotive was being backed up to a flat car in the county seat and twenty-one minutes after the appeal had been made the great Illinois Central System had the Morganfield department whirling to our rescue.

"This action will not be forgotten by our people."

Mr. Berry, on behalf of the Illinois Central,

acknowledged receipt of the letter and assured Mr. Martin of the Illinois Central's continued willingness to serve the people of Sturgis.

The Sturgis *News-Democrat*, in its issue of March 30, had the following to say in its account of the fire:

"At a time when it appeared as if the town was doomed, Agent John S. Berry of the Illinois Central secured an engine from a work train some place along the line, and an appeal was made to the Morganfield fire department for succor. The Morganfield boys responded with alacrity, and just twenty-two minutes after Berry called the Morganfield apparatus was on a flat car and ready to come. Mr. Berry stopped the train at DeKoven and sent it back, however, as by that time a turn had been made for the better and the Sturgis Dry Goods Company and the West Kentucky store and office building were regarded as safe.

"However, the people of Sturgis appreciate the promptness with which the response was made by the county capital and also by the Illinois Central and never will it pass from their memory."

# Studied the Recent High Water Situation

## Experiences and Conclusions of a Division Officer Show That Danger Is Often Greatly Overestimated

By J. M. HOAR,

Assistant Engineer, Tennessee Division

RECENT reports of high water on the division and of levee conditions caused undue alarm on account of being misunderstood.

The 48.53 miles of Chicago, Memphis & Gulf Railroad that the Tennessee division fell heir to in 1913 is the connecting link through the Mississippi Delta between Dyersburg, Tenn., and Hickman, Ky. The line is built through the flat bottom lands of the Obion and Mississippi rivers on a very flat gradient and a number of light curves.

The elevation above sea level of the whole line averages about 290 feet; so a river gauge reading at Cairo, Ill., of 56.4 feet, which is equivalent to 322 feet above sea level, puts sufficient water between the levees of the Mississippi River to stand on the outside of it about ten feet above the rail.

All of the land and the C., M. & G. Railroad between Hickman, Ky., and Tiptonville, Tenn., are protected by a levee built by the Reelfoot Levee District of Fulton County, Kentucky, which has a stretch of nineteen miles with its bends along the river extending from the foothills at Hickman to the Kentucky-Tennessee state line, and by a levee constructed under the Reelfoot Levee District of Lake County, Tennessee, from the Kentucky-Tennessee state line to the high ground opposite Proctor City, on the railroad. All of this portion of the railroad is subject to inundation at times when these levees fail.

### Bad Washout Conditions in 1912

In 1912 the levee gave way seven miles below Hickman, and the waters of the Mississ-

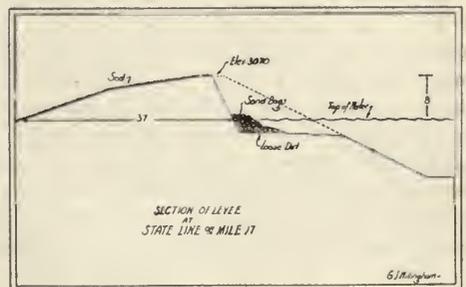

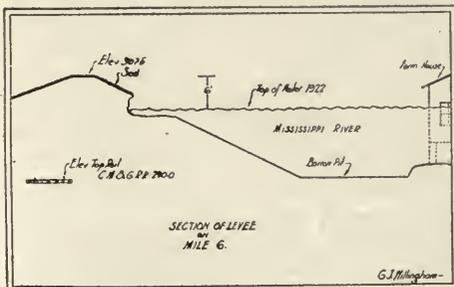

Patrolling the Levee

ippi ran across the bottom lands in the lowest places, causing great damage in its path by washing the soil from the surface of the ground and taking the railway track to the nearest woods; in many places it leveled the embankment to conform to the rest of the bottom land. At the time of this break, the C., M. & G. was operating under its own local officials, and their means of protecting were limited; so practically no work was done to hold the track in place.

The present season's continued high stage of the river caused some intense interest in the patrolling of the levee, and a watchman was located every two miles with orders to patrol his particular beat. The levee is under direct supervision of the Reelfoot Levee Commission, with Captain H. Slade as government engineer in general charge.

### Report of Danger on March 20

By the middle of March, this year, the river had reached a stage that caused more or less uneasiness for the safety of property behind the levee, and the water was gradually getting up into the ballast on the lower end of the C., M.

& G. Monday, March 20, at 5 p. m., a report came by long distance telephone from the upper end of the branch that the levee was breaking off from wave wash at the state line and that in places the levee had broken fourteen feet into the bank for a distance of 200 to 300 feet in a stretch. We had decided not to lose the railroad if it was possible to prevent it; we planned immediately to anchor the track by staking it every two or three rail lengths with 8-foot ties driven down on each side of a tie and spiked together with an angle bar across the top of the ties in the track.

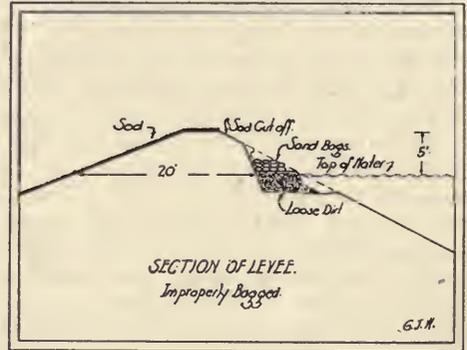

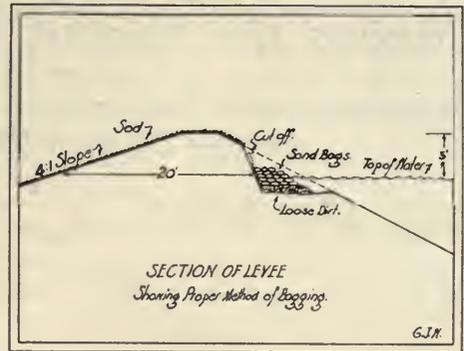

The report sounded serious, and Superintendent Young instructed me to clear for Hickman immediately, obtain horses, make an inspection of the levee that night, give a report as to the weakest spots in the levee and advise as to the points on the C., M. & G. where the water would first hit, so that the staking could be done at this point first.

The pile-driver gang, which had been doing high water work at Wickliffe, was moved to Dyersburg, an extra driver was obtained from the Memphis division, and both were on the C., M. & G. at Tiptonville the morning of the 21st, ready to begin anchoring the track.

### Had to Give Up Night Trip

Saddle horses are not to be had in Hickman for rent, but I arranged to borrow two for myself and Rodman Willingham, so that the report of the first dangerous place found could be sent to the nearest telephone and the inspection could be continued without delay. The night was dark and cold, but the trip down the levee was arranged. As we were about to get on our way, we were prevented from continuing by the secretary of the levee board, who advised us that the guards, located at intervals of two miles, were instructed to permit no one to travel the levee. The government engineer felt that it would not be safe to undertake the trip with such orders in the hands of the guards but promised to furnish a permit for the railway men to ride the levee in daylight, so the night trip on top of the levee was abandoned.

When this permit was granted it read as follows: "To Fulton County Levee Foreman and Watchmen: These two gentlemen, the bearers of this permit, are representatives of the Illinois Central Railroad Company, and are on business connected with the levee, and have permission from the Levee Board to ride horseback on top of the levee from Hickman, Ky., to the state line, this day only." This limited us to one day only, and, as there was a 42-mile

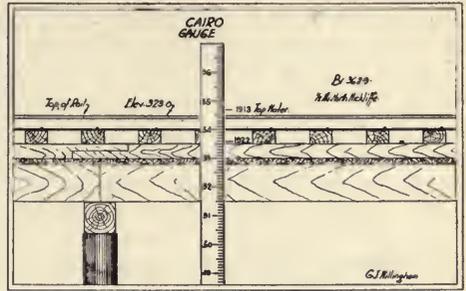

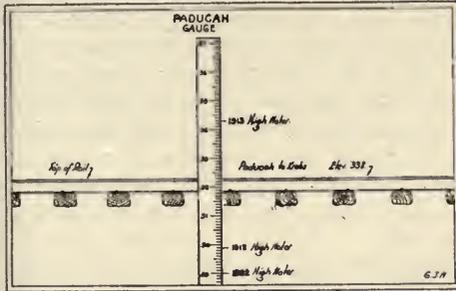

round trip to make, which is a long jaunt for any saddle horse, not taking into consideration the rider, it was considered advisable to work out some other means of more rapid travel by which the inspection could be made, and a report sent to headquarters as early as possible the same day. A motor boat was then obtained, with a skipper who had never been farther than eight miles below Hickman, while the inspection was to cover twenty-nine miles. But he consented to go if I knew the way.

### A Trip on the Mississippi

The trip was made along the outside of the levee on the Mississippi River, following the borrow pits, dodging stumps and willows, riding the waves driven across a 7-mile river by a northwest gale of about forty miles an hour. Where cave-ins were found, we landed, made a minute inspection of each place and measurements of the lengths of the caves, the amount of levee still standing and a careful inspection of the levee for a distance of several hundred feet up and down stream from the bad spot with an observation as to the amount of seepage coming through the levee and the number of feet of water standing above the natural ground behind the protection.

At 2:30 p. m., March 21, the entire line had been given a thorough inspection and a report

dispatched to the superintendent from Phillippy, Tenn., about five miles (air line) from the levee and about seven miles by the mud and horse swimming route, which was the only one available. The earlier danger reports that were telephoned to Mr. Young were found to be practically correct as to the amount of levee that had caved off in the different places, but they failed to indicate the amount of levee that was still left in these places, which could be protected from further wash by sand-bagging.

**Eating and Sleeping on Board**

The accompanying sketches show conditions at these places, the shape of the cave-ins, the method of protection, the height of the water on the river side that was pressing against the levee and its height as compared with the surface of the railroad at the point where the water would have crossed had the levee failed. The sketches should also show those not familiar with conditions that some reports which made things appear to be in a very serious condition did not really indicate immediate trouble. A round-trip inspection of the levee was made on Tuesday, Wednesday, Thursday and Friday, sometimes by day and sometimes by night, and,

while more or less uncomfortable at times, the trips were blessed, with the advantages that few expeditions carry with them, in that we had our own dining car and sleeping quarters on board.

All that was necessary when one of the party got hungry was to reach in his pocket and get a sandwich, and when he found it necessary to sleep he had only to stretch out in the boat with his arm for a pillow and get such rest as his position would permit.

The high water condition, while not altogether safe, was not serious, and anchoring the track was continued with the two pile-drivers.

**Third Work Train Necessary**

The portion of the C., M. & G. below Tiptonville is not protected by any levee, and the back waters from the river continued to lap up into the ties, making it necessary to sandbag in many places for stretches of one-fourth to one-half mile. The work necessitated a third work train with a night and day force, which gave Supervisor P. H. Croft a novel experience soon after he assumed the duties of his new position. B. & B. Supervisor Hubbard was on the job with Croft.

This 1922 river stage reached 53.6 on the

*A Street Scene in Hickman, Ky.*

Cairo gauge, which was  $1\frac{1}{8}$  feet below the stage reached in 1913. While the water lapped the "mile bridge" north of Wickliffe, Ky., it produced two feet higher water at Hickman than in 1913. The main business street of Hickman, which is not protected by levee, was from two to three feet deep in water, many of the business houses being flooded from six inches to two feet deep. The cause of this additional water stage at Hickman and vicinity is attributed to the fact that much levee has been completed on the Missouri side of the river since 1913, and the volume of water was confined between these levees.

The Tennessee division is vitally affected by a 56-foot stage of the Mississippi River from Ballard Junction, Ky., to Wickliffe, Ky., and on the entire C., M. & G.; we have four miles between Paducah and Krebs, Ky., which need constant attention to hold together at a 51-foot stage of the Ohio River at Paducah, so that about every two or three years the men are given high water protection practice.

#### Lots of Preparation for Trouble

To give some idea as to the number of men used and the amount of material, I will say

that the government had about 300 men and 90,000 sacks on hand between Hickman and Tiptonville; and there were 40,000 sacks on the C., M. & G., with three work trains, and one work train, 100 men and 25,000 sacks were on the track between Wickliffe and East Cairo.

Reports of levee conditions should be carefully censored before being permitted to go out, as the effect on the plantation tenants living behind the levees is disastrous. In many cases rumors cause packing up and moving of families and household goods, while no necessity of their being subjected to the moving expense is really justified. This, of course, disorganizes the arrangements of the planters for the oncoming year also.

Of course, the stage of the river this year necessitated many families' moving from their homes outside of the levees, and many dwellings were passed on our motor boat trips where the water of the Mississippi was up to or near the eaves of the building, and maybe a cat or a few chickens were still occupying the high spots to keep out of the flood. In numerous cases, we ran over farm fences and in some cases over the tops of the outbuildings in a farmer's yard.

## Some High Water Scenes at Cairo, Ill.

Cairo, Ill., situated as it is at the junction of the Mississippi and Ohio rivers, is one of the cities on the Illinois Central that is likely to experience flood conditions if there are any to be found in the country. This year has been no exception to the rule, and the last weeks of

March and the first weeks of April have found that city with water on two sides of it higher than the street level, but kept out by an excellently developed system of levees.

At the normal stages of the rivers, Cairo is not far above the water level. Like New Or-

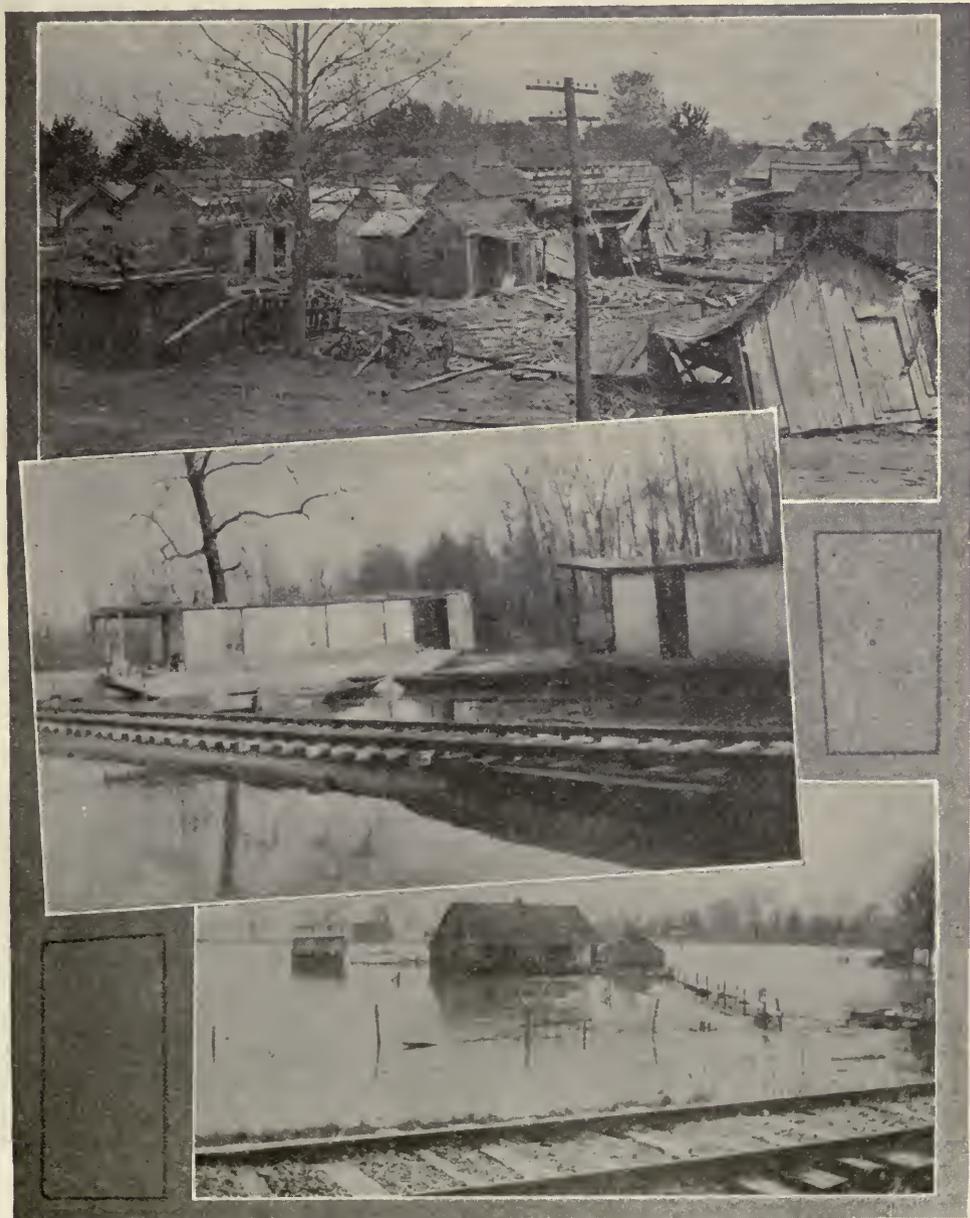

*The Stage at Cairo in March; Going Downhill Off a Boat*

leans, Cairo is a city without graves, as holes dug in the ground will fill with seepage water. New Orleans solves the problem by burying in vaults above the ground, and Cairo works it out by having cemeteries a good many miles from the city, on the higher ground well away from the rivers. Villa Ridge Cemetery, on the Illinois Central lines, is one of Cairo's burying grounds. Most of the funerals at present

are by motor car to these distant cemeteries, but in the old days the Illinois Central had a fixed price for special funeral trains, and such funerals by rail were of almost daily occurrence.

The Illinois Central tracks circle Cairo on the levees, and consequently nearly all the flood pictures at Cairo include Illinois Central scenes. The pictures shown herewith, taken

*At Cairo, Ill. Top, ruins of Future City in 1913; center and bottom, views in March, 1922, along Illinois Central tracks on levee*

*A Boat Beside Our Tracks*

in March this year, are no exception to this rule. The water this year did not rise to the height of the celebrated 1913 flood, but it managed to cut off, to a considerable extent, highway communication with Cairo and to emphasize the value of the levees to that city.

### *THE LOCAL TRAIN*

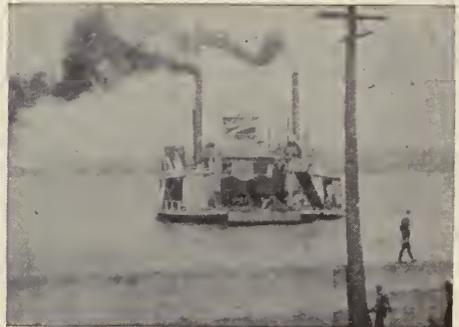

Who has not heard of the Local Train  
That runs without fail every day?  
In all kinds of weather, in sunshine or rain,  
You will meet with her on the way.  
From the dawn of the day till it draws to a  
close,  
'Mid the fierce summer heat and the cold winter  
snows,  
They must work till the sweat falls in drops  
from their nose,  
The Crew of the Local Train.

The switching is tough on the Local Train;  
There are cars to dig out or place,  
Till the "list man" at times has a storm of  
the brain,  
And swears till he's black in the face.  
He rushes around like a wampus cat;  
He waves with his arms and swings his old  
hat,  
Till he looks like a clown or an acrobat,  
While switching the Local Train.

The Crew works hard on the Local Train;  
From the cars to the depot and back  
They must hustle the freight till the heavy  
strain  
Makes them feel like a man on the rack.  
And when hides are to load, there's the deuce  
to pay,

*Water Higher Than Our Tracks*

*A Ferry Boat at Flood Time*

For their sweet perfume makes the girls all  
say

They can easily smell, half a block away,  
The Crew of the Local Train.

The farmers are fond of the Local Train;  
They watch, with a pleasant grin,  
When we pick up their shipments of stock or  
grain;

Then the money comes rolling in.  
And the Local Train is a friend indeed;  
It brings them implements, clothes and seed;  
And everything else that the farmers need  
Is shipped on the Local Train.

Then here is success to the Local Train;  
May the Engineer, Captain and Crew  
Be blessed with good health and an active  
brain

For the work that they have to do.  
And when at last their promotion is won,  
With a record that shows that their work is  
well done,

On the varnished cars may they get a soft  
run—

The Crew of the Local Train.

—Sent in by A. M. STEWART, *Locomotive Engineer, Louisiana Division.*

# His Business Meets Problems Like Ours

*C. A. Morris, Rotary Club President of Waterloo, Iowa, Finds Service Sells Motor Cars as Well as Traffic*

**T**HE problems of selling transportation are much alike, regardless of the kind of transportation you have to offer. The matter resolves itself into a question of service—the day-in-and-day-out kind, without trouble or delay—above all, transportation service that can be depended upon. That is what the Illinois Central, for example, strives to accomplish, and its patrons, who are the final judges, are daily in greater numbers placing the stamp of approval on the service rendered.

There is a striking analogy to the success of the huge Illinois Central System in a man out in Iowa, a continuous patron of the road for more than twelve years and, what is more, a firm friend of the road in all its branches. His relations with the company might be taken as representative of thousands of the road's patrons, and he is a concrete example of the many friends the system has made through its service and good will. His success in his business is due almost entirely to the same factor that the Illinois Central has continually striven to impress upon its men—that factor is service.

This little story is not merely to relate incidents in connection with a pleased customer of the Illinois Central, but rather to show

that service, honestly given, and the cumulative reputation for service, can only result in success to the individual, to the organization of which he may be a part, or to both.

## He, Too, Sells Transportation

The comparison between this man, an individual, and the Illinois Central, an organization of thousands of persons, is brought closer home by the fact that he, too, sells transportation and sells it successfully through constantly giving his utmost in service to those who call upon him. This man is C. A. Morris, owner of the Morris Motor Car Company, Waterloo, Iowa, whose only stock in trade is dependable transportation in the form of automobiles. The Illinois Central sells mass transportation; Mr. Morris, individual; and there are many points in common.

The Illinois Central might have the largest locomotives, the best equipped freight cars and the most comfortable passenger coaches in the country, but without an organization of men dedicated to render true service in connection with them all this fine equipment would rust in the yards for lack of patronage. What would pre-eminence in equipment matter if freight were delayed or mishandled, passenger trains late and employes unwilling? Likewise, Mr. Morris, although the distributor of a fine

*Mr. Morris' Establishment at Waterloo*

car, would find his product of little value and without a market unless his reputation assured his customers that day in and day out the car purchased from him would function satisfactorily, even if Mr. Morris himself should be called from his midnight bed to render prompt assistance in an emergency. (And this has actually been the case!)

More than mere garage equipment and competent mechanics are needed to give the service Mr. Morris believes his patrons are entitled to. More than mere rolling stock, upholstered cushions and smooth roadbeds are required to render true service to the railroad's customers. Were it not for the assurance of service, it is just as likely that Mr. Morris' new cars would be gathering dust in the salesroom instead of furnishing private transportation over the streets and highways of all Northeastern Iowa.

#### Started at Bottom of Ladder

Every man on the Illinois Central System can take a lesson from the success of the 34-year-old Waterloo business man. His life has been dedicated to selling transportation, but it has been with the addition of service to the actual goods sold. No section hand started in more humble circumstances than this automobile distributor, for he began at the bottom of the well-known ladder in the assembly department of a motor car company in Detroit, in 1905, at the age of 18. His soubriquet there was "Kid," and he is still "Kid" to the older officials of the factory, although now one of the factory's hundred prosperous distributors in the country.

Mechanically inclined, he worked his way through the shops and was graduated to road tester. Then he was called to Buffalo and New York as an expert on the company's motors. His belief in the future of individual transportation finally became so great that he determined to sell it. Beginning at Cleveland, Ohio, he soon became a star salesman. With his selling ability recognized, he asked for and received the distributing agency in Waterloo in 1910, and Waterloo has been the seat of his subsequent success.

As he had learned that mere ability to sell would never carry with it increasingly substantial returns, he founded his business on the maxim: "Service first and sales will follow." This is a truth applicable to all businesses, and the Illinois Central also, because of its long recognition of the principle, can

count itself today among the strongest financially in the world.

#### A Steady Illinois Central Patron

Mr. Morris recalls that his first carload of automobiles came into Waterloo over the Illinois Central. (And they have been coming that way ever since!) When he arrived in town himself, a mere youth with but a few dollars in his pocket—his only capital outside of a boundless amount of confidence and courage—he convinced a local banker that he was in town to stay and promptly borrowed \$10,000 to get his automobiles out of the railway cars so that he could begin disposing of them, for then automobiles were shipped on sight draft, as now. During his first three months in Waterloo he sold fifty motor cars through his energy, and within a few years it was found that the little 40-by-70 converted store building was too small for the demands of careful maintenance. So a new site was purchased and a modern garage built which, with additions, now covers nearly half a city block. The business that started with nothing but a good product, accompanied by accommodating service to patrons, now could not be duplicated for half a million dollars.

The service mentioned in this article as applying to Mr. Morris is not the service that is bought and paid for—not merely the delegating of a mechanic to go over a customer's car—it is the service that works through the efforts of Mr. Morris to have every patron pleased; to have every owner obtain the utmost from his private transportation system; to assure future owners that, when they accept his product, it will be maintained for the good of the customer, not merely for the mercenary gain of the company; in short, to give the customer just a little more than the steel, rubber and leather he actually pays for.

Mr. Morris' daily round of service does not wholly confine itself to the business he owns. When his office door closes in the evening he is often just beginning another day's work. He is an active participant in every civic cause, is an officer in most of the civic bodies, and, last but not least, is president of the Waterloo Rotary Club, whose motto he has apparently taken for his own: "Service—Not Self."

#### TO BUILD AT WEST FRANKFORT

Plans have been made for the erection of a 5-story Masonic temple at West Frankfort, Ill. The building is estimated to cost \$150,000.

# Memphis to Celebrate Opening of Viaduct

## McLemore Avenue Structure Over Our Tracks Marks an Advance in Affairs of Important District

**S**ATURDAY, June 10, is expected to be one of the biggest days in the history of the South Side of Memphis, Tenn., as on that date there will come to a climax the celebration of the opening to traffic of the McLemore Avenue viaduct over the Illinois Central tracks. The building of this viaduct, spanning the tracks at South Yards, has eliminated a dangerous grade crossing which had been a hindrance to the development of that part of Memphis for many years, and the consequent celebration is expected to be a big affair.

It is planned to give the entire week of June 5-10 to the celebration, with at least one big feature event for each day. The formal opening of the viaduct will be on Saturday. Gaston Park and the great concrete viaduct itself will be the scene of the festivity. Several bands will furnish music for the dancing and merrymaking which will take place upon the viaduct. A chorus of 3,000 school children from public schools in the vicinity is being organized to take part. A program of amateur and professional vaudeville is being booked.

### Parade to Be Held June 10

A big parade on the closing day will be one feature of the entertainment. Every civic organization in the city is expected to assist in the celebration. Speakers of national reputation have been invited. In addition, there will be speeches by city officials and representatives of the Illinois Central System, the Memphis street

car company the South Memphis Business Men's Club and other civic organizations.

An industrial exhibit also is included in the plans. Particular importance is attached to an exhibit of things made in South Memphis. Booth space is being sold on the viaduct itself, and it is expected that both sides of it will be lined with exhibits and concessions when the celebration begins.

Every department of the city government will be represented in the parade on the closing day of the celebration. Mounted police will head the procession, and the line of march will include detachments of the police, the fire department, the fire-fighting equipment of the city and much of the equipment owned by the various departments which the public never before has had an opportunity to see assembled. Three thousand school children will march, and floats will be entered by many of the organizations of the South Side.

### Campaign in Progress for Queen

There will be a queen of the viaduct celebration, and a contest is now in progress, through the columns of the *Memphis News Scimitar*, for the selection by popular vote of the most popular girl in South Memphis to take the part as the queen. Entered in this contest are two young women who are employed by the company and who are receiving the unqualified support of the Memphis employes of the Illinois Central System. One of the young

General View of the McLemore Avenue Viaduct

Miss Mary McHugh

women in question is Miss Mary McHugh, daughter of Peter J. McHugh, who has been connected with the Illinois Central for thirty-six years and who has been with the special agent's department at Memphis for twenty-five years. Miss McHugh is employed in the office of Terminal Superintendent E. Bodamer. The other young woman is Miss Fannie Lee Simpson, employed as operator on the Memphis division at Lula, Miss.

In view of the fact that the Illinois Central System has contributed a great amount of money for the erection of this viaduct, it is felt by the employes that it would be fitting for one of the young women who are employed by the company to be elected as queen of the celebration.

#### Viaduct Means Much to City

The value of the viaduct to Memphis is hard to estimate. According to the *News Scimitar*, "This 1,100-foot concrete span, South Siders confidently believe, is ultimately to bear the heaviest east and west traffic in the city. Magnolia, Glenview and other rapidly growing subdivisions will have direct street car service to the Memphis business district and to the various industrial sections without the annoying delays and transfers now required.

"All these subdivisions will be within ten

minutes of the Grand Central and Union passenger stations. The viaduct will permit the redistricting of the schools to the advantage of the whole community. The fire departments of South Memphis will be able to cooperate as one unit, where now concerted action is almost impossible on account of the break at McLemore Avenue."

#### Why Viaduct Was Needed

The street, before the viaduct construction was started, was only 25 feet wide, with steep slopes down to the track level; because of buildings located along each side, it formed a rather dangerous grade crossing. There were three main tracks and five switching tracks across the street. The nature of the crossing at McLemore Avenue and the absence of any other satisfactory crossing in that territory combined to restrict the development of that portion of the city lying west of the railway tracks.

The question of eliminating the grade crossing at McLemore Avenue, by the construction of a viaduct to carry the street over the tracks of the Illinois Central and Yazoo & Mississippi Valley, was discussed as early as 1903. Nego-

Miss Fannie Lee Simpson

tiations between the city and the railway companies were carried on from time to time until the beginning of the war, when conditions made it impracticable to consider an expenditure of the magnitude which this would require.

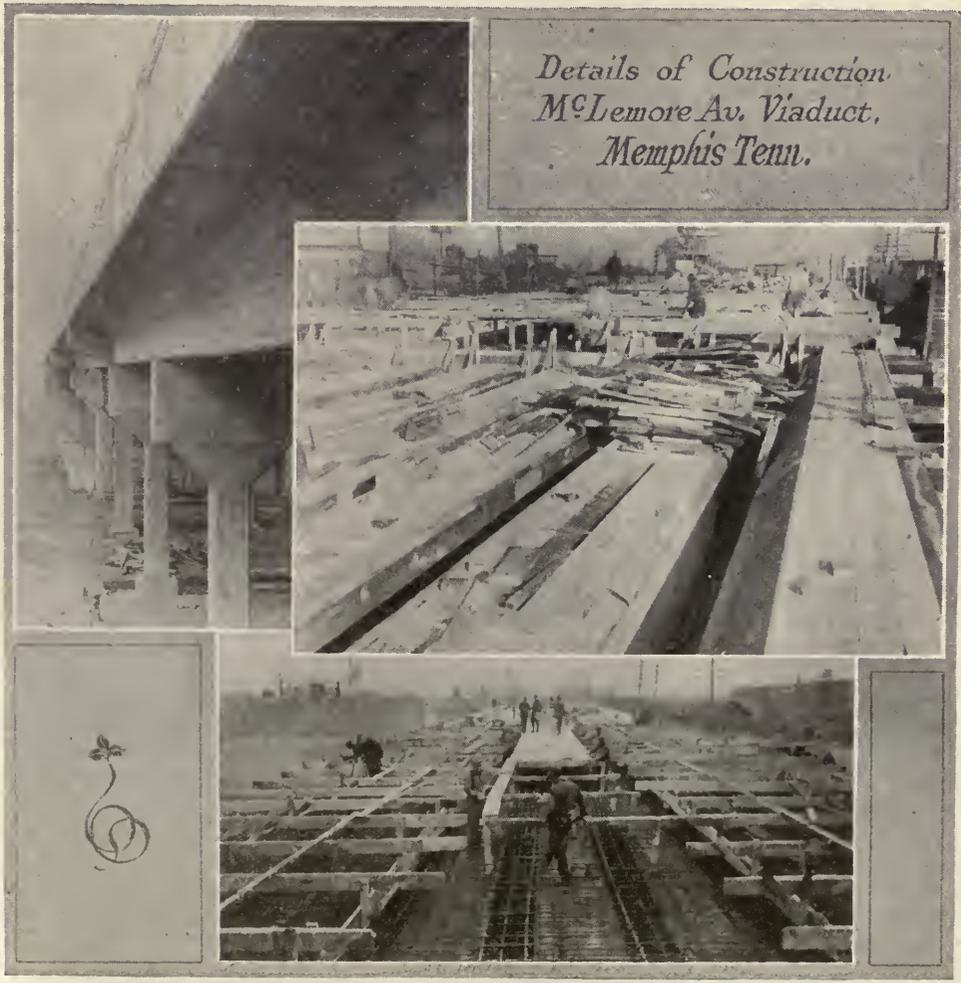

Early in 1919 the matter of grade separation was revived, with a view to having things in readiness to start the work as soon as business conditions would warrant. This led to a complete agreement for the construction of a viaduct in September, 1920, this being covered by a city ordinance accepted by the railway companies and passed in November, 1920.

**Details of the Construction**

This ordinance provided for the construction of a viaduct, describing it in a general way, and provided for the distribution of the cost between the railway companies and the city of Memphis.

The structure has a total width of fifty feet, the roadway being forty feet wide between curbs with a 5-foot sidewalk on each side. Along the outside of each sidewalk there is an artistic hand rail, with a combination lighting and trolley post rising from this railing. The entire viaduct structure is built of reinforced concrete. The approaches consist of retaining walls filled in with earth. Along the south side of the viaduct at each end are inclined approaches leading from the street level to the level of the railway tracks, in order to provide access to property located at the elevation of the tracks. Near the center of the viaduct are two stairways, one on each side, leading from the sidewalks on the viaduct to the ground level.

The viaduct is designed in accordance with the most modern practice, provision being made for two street car tracks in the center of the

*Details of Construction  
McLemore Av. Viaduct,  
Memphis Tenn.*

roadway. The total length, from end to end of the approaches, is 1,134 feet, and the distance from face to face of abutments, which is the total length of the bridge structure, is 867 feet.

At the time the agreement was made with the city of Memphis, it was estimated that the entire project would cost about \$385,000.

#### Cost Divided With the City

Under the terms of the ordinance, the railway companies constructed the main portion of the viaduct and part of the approaches, with the exception of the asphalt pavement. This cost, together with that of the remainder of the approaches, the acquisition of property for the widening of the street and certain other costs, was borne by the city of Memphis. The agreement divided these costs, as estimated at the time, on the basis of approximately 50 per cent to the railway companies and 50 per cent to the city.

The design of the viaduct and all of the detailed plans were prepared in the bridge department of the railway companies and were approved by the city engineer of Memphis before construction was started.

The ordinance provided that construction work should be started on April 1, 1921, and on that date the excavating of the first material was made the occasion of a celebration on the part of the city officials, the South Memphis Business Men's Club and the rail-

roads. Mayor Payne of Memphis removed the first spadeful of dirt.

The contract for the railway companies' portion of the work was awarded to the Unit Construction Company of St. Louis, Mo., which started on the masonry work in the latter part of May.

#### THE BUSIEST TERMINAL

The Melbourne (Australia) Central station is the busiest railway terminal in the world, according to the contention advanced by the Victorian Railway authorities, who say that more trains are handled there daily than at any of the other large stations.

In 1913 a count showed that 1,377 passenger, 114 freight trains, and 176 switch engines passed through the Melbourne station, and recent electrification has raised the total number of trains to 1,500 daily. These carry at least 200,000 passengers, it is said.

Previous to the war, the Liverpool street station in London was regarded as the busiest in the world, with 1,320 passenger trains, carrying between 180,000 and 190,000 persons, daily.

The Victorian authorities contend that the Melbourne station handles more trains and more passengers than the St. Lazare station in France, the South Boston station in Boston or the Grand Central terminal in New York City.

## OWNING A HOME

There is a lot of solid contentment in owning a home. A family which breaks over from the renting class into the home-owning class finds itself embarked upon a second honeymoon; every hour invested in developing and making more beautiful the spot about which the life of the family centers is a pleasure which the renter never enjoys. In the world outside a person is forced to respect the conventions of society, to do a lot of things simply because they are done, while the home is a place for the development of self-expression. You can make mistakes in judging men by the clothes they wear, or the company they keep, but you make few mistakes in judging a man by the home he has—provided, of course you are a good judge of real values.

Owning a home gives the family a feeling of security. It is more valuable than a comfortable balance in the bank; it is the ownership of something which has more value than money. Did you ever see a real home that wasn't worth a great deal more than its cost?

In the pioneer days of railroading the railroader was a nomad. He followed the will of the wisp, and that elusive creature was always just out of reach. Railroading attracted the youngster who was bitten with restlessness; men followed the game because it was absorbing and often because it gave them the opportunity to forget something they wanted to forget. And so the pioneer railroader wasn't the substantial, home-owning sort of fellow that we find today.

The *Illinois Central Magazine* is publishing a series of articles about employes who own their own homes. At Centralia, at Paducah, at McComb and elsewhere, Illinois Central System employes are the solid, substantial sort of citizens who give wealth to a community. A goodly share of them own their homes. More of them are going to be home owners as the days go by.

We hope that our articles will serve as an inspiration to employes who are not home owners; that they will be led to consider the question seriously, to make and carry out plans.

There is no question that the man who owns his home is thereby a better citizen, a better employe, a happier man.

After all, most of the excuses offered for not owning a home are insignificant when a person gets down to brass tacks. Many of the home owners the magazine has found are employes who made a small beginning, paid down a small sum, and have found themselves able to pay out on their investments in monthly payments which are not much greater than others in similar circumstances pay for rent.

The magazine wants to get some interesting stories about how employes found their way into home owning. Your own personal experience may help someone else to find a way.

## NO "CURT" IN "COURTESY"

One of our freight conductors, soliciting traffic, had become prouder than ever of the Illinois Central System by reason of the unanimously good opinion expressed by business men he interviewed, he writes in this issue of our magazine. But pride went before a fall, he continues, for on one occasion he was most unpleasantly disappointed to find that the business of a certain company had been diverted entirely from our lines. The cause was discourtesy shown by a clerk whose duty it was to give information over the telephone.

"That business man could not have hurt me more had he pushed me out of the window," our contributor writes, and he goes on to point out how few such exceptions are among our 60,000 employes.

The pitiful thing about it, however, is the fact that one man tearing down our reputation and running business away from us can offset the work of a hundred building up our reputation and winning business away from our competitors. It is traditionally easier to tear down than to build. What that telephone-misusing clerk cost the company may never be accurately figured in dollars and cents, but it is certain that his salary was the smallest part of it. As a matter of fact, he owes the company money.

Theoretically, business follows the path of efficiency, but actually it is influenced, five times

out of ten, by factors that have little to do with efficiency. Even today, friendship swings business deals that cold statistics couldn't begin to touch. "Well, X— isn't the lowest bidder, but we can rely on him and he is a good fellow to do business with," is the argument often heard, and X— gets the contract.

The maxim that has been the making of some of our greatest business houses, notably the huge department stores, is this: "The customer is always right." With a few slight reservations, that maxim will do well for railway business.

Courtesy is an investment in freindship, and the interest is in dollars and cents.

---

### TRIAL BY JURY

The jury system is a great institution. It represents a first principle in personal rights, and it comes to us clothed with a wealth of tradition extending back into the beginnings of the Anglo-Saxon race. It has had ages of actual use in the courts. Juries, like all things human, are subject to error, but in the great majority of cases the jury system is a means of administering justice. It is to be regretted, however, that jurors sometimes permit their prejudices, passions, and sympathies to overcome their sense of justice, and by their verdicts challenge the jury system as a means of the administration of justice.

These observations are prompted by the case of John Tossine, an Illinois coal miner, whose damage suit for \$50,000 against the Director General of Railroads and the Illinois Central was recently re-tried in the courts at St. Paul. The case is reviewed on pages 26 to 29.

The first trial, before a jury of twelve men, resulted in a verdict of \$35,000 against the Director General and the Illinois Central. A new trial was granted in the case against the government because it was found that two witnesses who had testified for Tossine had not seen the accident and had given manufactured testimony. On the second trial, which was before a jury of eight women and four men, a verdict was brought in exonerating the Director General of any blame for the unfortunate accident.

Under the facts and under the law, Tossine had no claim upon the treasury of the railroad or the government. The verdict of the first jury was based upon prejudice

against railroads and sympathy for an injured man. Verdicts of that sort increase the expense of railway operation, and when jurors decide cases in that way they are deliberately inflicting upon the public, which pays the cost of railway operation, an un-called-for burden. Fortunately, the mixed jury decided the case upon the law and the evidence and prevented the working of injustice.

As brought out in the review of the case, printed elsewhere, the suit has been an expensive one. There is no method of estimating with any accuracy what the burdensome costs have amounted to, other than to point out that they run into thousands of dollars.

The problem involved is one in which the public should interest itself. Shippers and passengers want the cost of railway operation reduced. While the cost of the Tossine case of itself is negligible in comparison with the total cost of running the railroads of the United States, there are thousands of other cases just as lacking in merit as that of the coal miner. One way to combat the problem is through the education of the public, to the end that jurors will be able to lay aside prejudices and sympathies when they enter the jury box and, governed by their oaths, decide the issues before them upon the law and the evidence.

A railroad is entitled to the same fair and impartial trial that an individual is entitled to. If John Tossine had claimed that his injuries arose from the conduct of an automobile driver, for example, the suit would never have been brought, because lawyers would have known that a jury called upon to balance the evidence between two individuals, even where one was an injured man, would render an impartial verdict. But the claim was against a corporation, and it was easy to find lawyers who would be glad to play upon the prejudices and passions of a public which has not yet recovered from the fever of a hatred for all institutions which represent accumulated wealth, even though such wealth is applied to a public service.

If jurors could but understand what it means, we believe verdicts against railroads in unmeritorious cases would be fewer. The recent jury is to be commended for

deciding the case without prejudice. Perhaps this indicates that women are inclined to view their oaths as jurors more seriously than men. If that be true, woman jury service is a welcome innovation.

### SPEAKING OF RATES

Replying to a letter from the *Illinois Central Magazine*, Dr. Julius H. Parmelee, director of the Bureau of Railway Economics and well-known railway statistician, writes that freight rates in Germany are 3,134 per cent greater and passenger rates 1,642 per cent greater than in 1917. If passenger fares in the United States had increased in the same proportion during that period, the cost of travel would now be approximately 49¼ cents a mile!

Doctor Parmelee writes that his bureau's figures on the cumulative increase in freight rates in Germany are based on data received by the government's Bureau of Foreign and Domestic Commerce from its representative in Germany. There were no increases in freight rates on German railroads between 1913 and 1917. On October 1, 1917, there was an increase of 7 per cent, and this has been followed by a series of nine further increases, which total a cumulative increase over the rates in effect prior to October 1, 1917, of 3,134 per cent. On March 1, 1920, when federal control of American railroads ended, the increases in German freight rates amounted to 963 per cent above the pre-1917 rates, and the further increases have come since then.

Up to March 1, 1920, the cumulative increase in first-class passenger fares in Germany reached 658 per cent. There was a general increase of 30 per cent in December, 1921, and another of 75 per cent in February, 1922, making a total cumulative increase over 1917 fares of 1,642 per cent.

It should be pointed out, of course, that the enormous advance in German rates covers a period when the purchasing power of the German mark has declined rapidly, and that the cost of German transportation to a person who buys it with American money has not increased in that proportion. The table does show, however, what the increased cost means to the German, who must spend a mark to buy the same amount of freight transportation service that he got for about three pfennings before the war.

May we suggest that it is little wonder that the propounder of the theory of relativity is a German?

### OUR GOVERNMENT RAILROAD

There is food for meditation in the following editorial from the April issue of *The Observation*, publication of R. P. Studley & Company of St. Louis, railway printers:

"People who discuss the subject of railway ownership by the government are likely to forget that the United States already owns a railroad something less than 500 miles long; but the treasury of the United States is not allowed to forget, because it is still paying the construction costs.

"When Congress authorized the building of a railroad at public expense in Alaska, the estimated cost was \$35,000,000. That was in 1915. Since then \$17,000,000 more has been appropriated and spent and the House of Representatives has just set aside \$4,000,000 more. If this suffices, the road will be completed for \$56,000,000, which is \$21,000,000 more than the original estimate, and the question of whether the road will every pay is still open for debate."

So far, good. The story does not exactly make a case for government ownership. It would seem to prove that government foresight in railway matters is no more infallible than the foresight of private management is. And, unless there are to be definite improvements in the interest of the people as a whole, there is no particular point to advocating government ownership.

Also, although comparisons between conditions in Alaska and conditions in the United States proper may not be entirely fair, it is worthy of notice that the cost of construction per mile of line of this Alaskan railroad will be considerably in excess of \$100,000. When the equipment costs are added, the figures should be considerably higher.

The tentative valuation of the railroads of the United States, based upon everything they own, has been figured by the Interstate Commerce Commission at slightly more than \$70,000 per mile of line. Some advocates of government ownership would cut this valuation to \$40,000 or less. What would they do with this Alaskan railroad, which will cost the government probably three times that merely to build and equip?

### PASSES TO EMPLOYES

The railroads are frequently criticized for the practice of granting travel passes to employes and dependent members of their families. The critics contend that railway employes

not traveling on business have no more right to ride free than anyone else, that the use of passes increases the number of trains that have to be run and consequently the cost of train operation, and that it makes unnecessary inroads upon passenger revenues. They insist that passenger fares could be reduced if passes were limited strictly to business uses.

The argument is not all on one side, however. Railway men look upon the privilege of free transportation as a courtesy from the management, and they greatly appreciate it. The privilege, by being contingent upon continued faithful service, helps to promote loyalty to the railroad by putting a premium upon continuous service, thus also reducing the labor turnover problem, the cost of training employes to fill positions held but a short time.

Except where large numbers of employes are handled to and from their places of employment, the free transportation privilege makes little difference, if any, in the number of passenger train miles, or even in the number of passenger car miles. Likewise, it makes little additional cost.

It must be admitted that the privilege of free transportation is sometimes abused. We trust that Illinois Central employes do not abuse it. We must look upon it as a privilege granted us and guard against any abuse which might lead to revoking the privilege. One way to do that is to remember, at all times, that the pay passenger is our guest upon our trains, and that it is our duty to add as much as we can to the pleasure and comfort of his trip.

At any rate, the problem created by the use of free transportation, or transportation at reduced rates, by employes and dependent members of their families is a minor one, when considered in the light of the entire railway problem of the United States. *The Traffic World*, an authority in transportation matters, recently commented upon a discussion of the use of free transportation by saying that it is foolish to worry about a pimple on the nose of a patient who is afflicted with angina pectoris.

### CANADA'S RAILROADS

Dispatches from Ottawa convey the information that the four government railroads sustained a deficit in 1921 of about \$67,000,000. The Canadian Northern, Canadian Government Railways (including the Intercolonial, National Transcontinental, Prince Edward Island and other lines) and Grand Trunk Pa-

cific had an operating deficit amounting to \$16,339,000. To this must be added fixed charges of \$37,000,000. The Grand Trunk Railway System, the fourth government-controlled road, had a surplus after operating expenses of \$5,678,000, but, as its interest charges amounted to approximately \$20,000,000, its deficit was about \$13,500,000.

J. L. Payne, former controller of statistics of the Department of Railways and Canals, states that the interest on the debts which the government roads of Canada have piled up amounted in 1920 to about \$38,000,000 a year, which brings the cost of government operation well up over the \$100,000,000 mark for 1921. If we are to get a true picture of railway affairs in Canada, however, we must add to this burden the interest on capitalization, which is not included in government reports, and which brings the 1921 bill up to the neighborhood of \$150,000,000, estimating conservatively upon Mr. Payne's figures.

Mr. Payne figured out that the government roads cost the Canadian taxpayers \$140,000,000 in 1920. Deficits for operations and fixed charges, excluding the Grand Trunk Railway, amounted to \$70,000,000 in 1920, to which should be added interest on the debt already incurred and charges for the compensation to capital.

When we consider that the government roads have cost the Canadians upwards of \$290,000,000 in the last two years, we should likewise bear in mind that the government roads have a mileage of approximately one-twelfth that of the railroads of the United States. Multiplying \$290,000,000 by twelve, to see what that would represent to the United States, if similar conditions obtained here, we

### A Wedding

Louis P. Carr, one of the oldest pensioners from Water Valley shops, now making his home at Beauvoir, Gulfport, Miss., was married on March 23 to Mrs. Susie Klych. Mr. Carr is 87 years of age, and his bride is 79. Mr. Carr was employed as a car repairer at Water Valley shops when he was pensioned, May, 1916, and he had been for thirty-three years employed by the company. "Congratulations and best wishes to Mr. and Mrs. Carr and may they both live to reach a hundred years," writes our Mississippi division correspondent.

get the somewhat staggering figure of \$3,480,000,000! And that represents the losses of only two years.

In an article in the *Toronto Saturday Night* of March 25, Mr. Payne exclaims:

"We are asked to give public ownership a fair trial. How long a trial would be considered fair? How much loss must we suffer before we become satisfied that loss on a rising scale is inseparable from that form of administration? If we wait until we have reached the point of exhaustion, until our national credit is seriously impaired, until it is too late to turn back, we shall have no one to blame but ourselves. The real issue is between theory and practice—an academic notion on one side and the stern lessons of experience on the other."

As compared with a deficit, after fixed charges, of \$67,000,000 on the government roads last year, the Canadian Pacific, which exemplifies private ownership and management, had a surplus, after fixed charges, of \$22,682,668.

---

## Stockholders Vote \$50,000,000 Stock Issue

At a meeting of the stockholders of the Illinois Central Railroad Company April 19, Robert S. Lovett and John W. Auchincloss of New York were re-elected as directors for terms expiring in April, 1926. Robert E. Connolly, treasurer of the company, with headquarters at New York, was elected as director to succeed Walther Luttgen, deceased, for a term expiring in April, 1926. Stanley Field of Chicago was elected as director to succeed J. Ogden Armour for a term expiring in April, 1924.

The stockholders voted to authorize the plan for the issuance of \$50,000,000 preferred stock. The new capital is needed largely for the electrification of the Chicago Terminal. The new preferred stock will be issued in series over a period of years as the money is needed to defray the expense of the electrification work.

At a meeting of the Board of Directors which followed the stockholders' meeting, plans were perfected for making immediate application to the Interstate Commerce Commission for the approval of the preferred stock issue. If the approval of the Interstate Commerce Commission is obtained, and it is believed that it will be, there should be no further delay.

The series of preferred stock as issued will be offered to the owners of common stock

The management of the government roads is not without an explanation for the difference in showing between the national roads and the Canadian Pacific. Political influence is denied. The difference is largely blamed upon the territorial disadvantages of the government roads. In 1920 the ton miles of freight per mile of line for the Canadian Pacific amounted to 1,207,269, while the freight traffic density of the Canadian Northern was only 54,075.

W. T. Jackman, associate professor of economics at the University of Toronto, discusses this contention as follows, in an article in the *Railway Age* of March 11:

"It takes more than merely physical operating conditions to make the difference between profit and loss. The clientele which has been built up gradually through the rendering of good service to the public; the allegiance of the whole staff to the directing minds; the pride in the success of the organization—these and many related factors must also be taken into consideration."

ratably. In other words, the common stockholders will be privileged to subscribe for the new preferred stock in proportion to the number of shares of common stock owned.

President Markham expressed the opinion that the common stockholders would take all of the preferred stock as it is issued. He also expressed the opinion that active work on the electrification of the Chicago Terminal would begin within ninety days.

A. S. Baldwin, vice-president in charge of the electrification, and Hugh Pattison of the staff of electrical engineers in charge of the work are now in Europe looking over electrical construction. Immediately upon their return the final touches will be given the plans for the Illinois Central's electrification.

---

### 516 ACCIDENTLESS DAYS

In a letter to the *Illinois Central Magazine* expressing his appreciation of the Illinois Central System and its management, A. L. Konkle, labor foreman at the Paducah, Ky., shops, said that he was doing everything he could to give the claim agents of the company a rest. For 516 days before March 29, the day of writing, not a man of his gang had been injured, and he has an average of forty-five negro laborers under him all the time. He prevents accidents by reminding the men of safety every day.

# PUBLIC OPINION

What the

World thinks

## AGREES WITH MR. MARKHAM

Major-General Lansing H. Beach, chief of engineers, United States Army, in an address recently before the National Rivers and Harbors Congress at Washington, proposed several changes in the laws affecting the status of railroads and waterways. He expressed the conviction that Congress should adopt legislation to permit the railroads to operate boat lines on the inland waterways. His remarks, in part, follow:

The competition between the railroads and the waterways is all a mistake, unfortunately one which has existed for some time but one which will be removed when the parties understand the true circumstances and the true conditions. There will be some legislation necessary to get matters straightened out as they ought to be. There are two or three matters which Congress ought to enact into law to protect the waterways so as to give the people that cheap navigation, that cheap transportation to which they are actually entitled.

The Interstate Commerce Commission should be required to exercise the same supervision over common carriers by water that it now does by rail. There should be no difference between a common carrier on the water and a common carrier on the rails.

The Interstate Commerce Commission should be required to prescribe the minimum rates as well as the maximum rates. That would prevent a carrier's putting the price down below the cost of operation simply for the purpose of squeezing out a rival. I don't care whether the competitor is a rail line or a boat line; he should not be allowed to do it.

I would suggest the repeal of that law which says that a railroad should not operate a boat line, and I would allow the railroads to operate boat lines when the Interstate Commerce Commission believes

that those boat lines are genuine feeders of the railroads or are legitimate extensions of their lines.

There is no reason why the railroads with the organization which they possess today and their trained men should not be allowed to operate the waterways just as well as they do the railroads, and if a railroad can reduce its cost of transportation between its termini by placing a boat line in the haul somewhere, I don't see why it should not be allowed to do it. In fact I believe that it ought to be encouraged to do it. I believe that the day of the waterway is coming back. The hard headed business men, manufacturers, as well as those engaged in transportation, are beginning to understand the matter, and they realize the economic saving, the benefit to the manufacturer, to the consumer, to the country at large, of the waterways.—*Railway Review* (Chicago), March 18.

## A "FREIGHT HIGHWAY"

[Note: In comparison with our tentative railway valuation of slightly more than \$70,000 per mile of line, including all equipment, the editorial below gives the estimated cost of motor truck highway construction as \$50,000 a mile. This, of course, includes no equipment of any kind; it is merely the cost of building the road, the taxpayers' donation toward maintenance of this form of railway competition.—*Illinois Central Magazine*.]

Both urban and rural experience teaches that highway problems multiply as traffic increases. When one such problem is solved, two or more new ones spring up and press for solution. Highway and traffic officials in the South need not borrow trouble of this sort, having enough of their own, but may be interested in the announcement that the state highway commissioner of Connecticut has decided to build a 30-mile highway for the exclusive use of motor trucks. The new "freight road," for which surveys were started a few days ago, will extend from Bridgeport to the Connecticut state

line at Greenwich. Its estimated cost is \$1,500,000.

The decision to build a special highway for motor trucks was forced by congestion of traffic on the Boston Post Road from Bridgeport, which will be paralleled by the proposed new thoroughfare. Ten thousand motor vehicles used this stretch of roadway daily, on the general average, and of these 2,000 are motor trucks—long distance freight carriers whose tonnage complicates the matter of road upkeep, and whose bulk and speed increase the traffic risks. It is noted that the percentage of motor vehicle accidents on that highway last year exceeded that of any other state highway in Connecticut.

The highway commissioner considered two plans for meeting this situation. One contemplated doubling the width of the present road. The alternative was a new "freight highway," which has been selected as less expensive and of greater use and benefit. It is proposed to build a road that will "hold up" under heavy traffic, and to restrict its use as far as the laws will permit to the motor trucks, leaving the present highway to the lighter vehicles. How far these restrictions can be enforced is a debated question. The Connecticut Legislature, which must approve and appropriate for the project before it can be undertaken, will be asked to prescribe the regulations covering its use.

Years probably will pass before we of the South have to consider the problem of exclusive "freight highways," but if the good roads movement continues to thrive and motor vehicle traffic persists in the rate of growth maintained of late, the "motor truck highway" may eventually come to be regarded, the country over, as a necessary "traffic facility."—New Orleans (La.) *Times Picayune*, April 14.

#### A. REVISION OF OPINIONS

Miss Emma Goldman, who used to tell the United States that government is wrong and unnecessary and that revolution is a blessing, has revised some of her opinions after two years in Russia.

She has discovered that government, language, trees and human bodies *grow*. They are not built to order. Miss Goldman is shocked to find, what a woman so well read should have known, that you cannot eliminate power. If you take it from one hand it passes to another. If you take it from the Czar it goes to Lenin and Trotzky. If you take it

from them it goes to the next powerful enough to seize it.—Arthur Brisbane in *The Herald and Examiner*, Chicago, March 28.

#### ANOTHER INSTANCE

Friends of government ownership programs will be hard put to it to find a single circumstance in the failure of the Etat railway system in France through which to escape from the conclusion that something is wrong with their theory. They are in general a pretty agile lot, and usually are able to find half a dozen reasons why failure does not condemn the theory, but it is going to require some extraordinary wriggling this time.

In the first place, the experiment has had plenty of time to prove itself one way or the other. The French government is not going out of the railway business after any mere "flier" into it, but after a trial of fourteen years. If any private enterprise failed to pay or to give satisfaction in any way after a period of fourteen years, there would not be the slightest doubt in the mind of any one but that the business ought to be abandoned or reorganized. The end would have come, indeed, much sooner, but in the case of a government system a drain is connected with the public treasury and the management goes on for fourteen years. Last year alone the Parisian suburban system showed a deficit of 100,000,000 francs.

In the second place, the Etat system has had the reputation of being the worst run road in France for years. If the service had been of a superior type, or the character of the traffic such that a loss could not be avoided, there might be some justification for the deficits. But there is no reason apparent why the state should both cover the deficit and accept inferior service. And lastly, the failure does not come because the road was isolated, or swallowed up in the general transport system. It had every opportunity to succeed that a private line would have had. It serves the west of France, from Dieppe on the north to Bordeaux on the south, and its mileage is the greatest of the five French railway systems.

The plans for the transfer of the system to a private French corporation are now being prepared by a parliamentary commission, and the project will soon come before the Chamber of Deputies with the backing of the government. The career of this system under private management will be watched with interest, for there is little chance that the Cham-

ber will refuse to sanction the transfer. It is evident that the French people are tired of paying more and getting less. It is also evident that they believe the railroads will give better service at the same or at less expense under private than under government ownership.—St. Paul (Minn.) *Dispatch*, March 30.

### THE PLUMB LINE OF REASON

Gleason E. Plumb, who styles himself general counsel of the Organized Railway Employees of America, made a speech in St. Louis recently. Among other things, he charged the railroads with being bankrupted and in such condition of disrepair as to be unsafe to ride upon. The railroads are not bankrupted, but Mr. Plumb is trying as hard as he can to bring about that condition.

While Mr. Plumb has been fortunate in inducing most of the railway employe organizations to furnish him with financial backing with which to wage war against the railway companies, he has been extremely unfortunate in having the props knocked out from under charges which he has made against private operation of the railroads. He seems to have been very unlucky in the particular railway topics which he has selected to discuss before the public. For example, the statement which he made at St. Louis to the effect that the railroads are in such a condition of disrepair as to be unsafe to ride upon is about as wide of the mark as any statement could be.

In another part of this issue of the *Chicago Journal of Commerce* there appears a statement by the Illinois Central Railroad System over the signature of President Charles H. Markham wherein the official figures of the Interstate Commerce Commission are given. They show that there were fewer fatalities on the railroads in 1920 than there have been in any year in the last twenty-two years, and that during 1920 the railroads carried the heaviest traffic in their history. It is explained that the figures on the number of fatalities in the United States for 1921 are not yet available, but that on the Illinois Central System in 1921 there was the smallest number of fatalities that have occurred in any year in twenty-four years.

"We believe the public will agree with us that the handling of a heavier business with a smaller number of fatalities is a barometer of railway efficiency," declares Mr. Markham.

Mr. Markham is right. A good way to study the railroads is to take one branch of the

subject at a time, such as the prevention of accidents, and analyze it. A good many have been doing that and in nearly every instance private management of the railroads has been found to be not only sound but to possess such merit as to deserve special commendation. The fact that there are nearly twice as many people fatally injured each year by ordinary falls as are fatally injured on our railroads is remarkable. Ordinary burns kill more annually than are fatally injured on the railroads, and even accidental drowning is running the railroads a close second on fatalities.

In the face of the official figures, Mr. Plumb's charge that the railroads are unsafe to ride upon is plainly too nonsensical for foolishness. But so long as Mr. Plumb can fool the leaders of organized labor, and they, in turn, can pull the wool over the eyes of the men who pay dues and assessments to the organizations, Mr. Plumb will not worry. A subject on which no light has been thrown, and probably none will be thrown, is how much money Mr. Plumb is making out of his campaign of misrepresentation.—Chicago (Ill.) *Journal of Commerce*, April 1.

### CANADA'S RAILWAY LOSSES

One of the most difficult problems with which the government of the new Premier of Canada, W. L. MacKenzie King, must grapple is presented by the government railroads. The Dominion government is in serious danger of having its credit destroyed by its railway policy. The Dominion is considering trying to float a large loan in the United States. American investors probably will consider Canada's railway policy before deciding on the desirability of buying its government securities.

The deficit officially admitted by the Canadian government as having been incurred by its railroads in 1920 was over \$70,000,000. This, however, did not include interest on the investment in a large part of the railroads owned by it. J. L. Payne, formerly controller of statistics of the Department of Railways and Canals, who is probably the best authority on railway statistics in Canada, estimated the total losses, direct and indirect, at about \$136,000,000.

Complete statistics for 1921 are not yet available. Those that are available, however, indicate that the government railroads as a whole failed by at least \$20,000,000 to earn their operating expenses. To this should be added about \$100,000,000 for interest on the

investment. Therefore, directly and indirectly, government ownership of the railroads last year added to the burdens of the Canadian taxpayer around \$120,000,000.

The government now actually owns about 17,000 miles of railroad. It is still carrying on negotiations for the acquisition of the Grand Trunk, which would make the total mileage actually owned and operated by it about 22,500 miles.

Deficits always have been the result of government operation of railroads in democratic countries. This is not always, or perhaps even usually, due to inefficiency in the official personnel. It is almost always due to the fact that the government owned and operated railroads are subjected to influences different from those to which private railroads are subjected. These influences are chiefly political. They render it impossible for the management adequately to advance rates when they ought to be advanced, or adequately to reduce the number of employes when it ought to be reduced. In many cases they cause expensive service to be rendered which from an economic point of view ought not to be rendered.

Now the railway deficit is becoming an extremely serious thing. Canada has only nine million people, and the Dominion government has an annual revenue of only about \$450,000,000. It needs about \$109,000,000 a year to pay expenses due to its participation in the war, including interest, pensions, etc. Its national debt is heavy, and instead of declining has been increasing since the war ended. This increase in its national debt has been mainly or entirely due to the deficits incurred by its railroads. The government will be positively inviting bankruptcy if it engages in any more railway ventures.

Railway deficits are not peculiar to Canada. Large deficits were incurred by the railroads of the United States in 1918 and 1919 under government operation. They were not due to the official personnel, which was not much changed, but to the system of management, which was radically changed.

Most of the government railroads of Australia incurred deficits before the war. These have been increased since then. The deficits in the year ending June 30, 1921, of the Australian railroads for which we have statistics were as follows: Queensland, \$7,694,000; Victoria, \$3,171,000; New South Wales, \$2,808,000; Western Australia, \$2,000,000. The total for the railroads of these countries was almost

\$16,000,000. The New Zealand state railroads had a deficit of almost \$600,000.

There are six private railway companies in Germany. It is a significant fact that between 1913 and 1920 the ratio of their total expenses to their total earnings increased from only 60 per cent to 96 per cent, while that of the state railroads increased from 70 per cent to 179 per cent. These figures mean that in 1913 the expenses of the German state railroads were 70 cents for every dollar that they earned, while in 1920 their operating expenses were \$1.79 for every dollar they earned.—*The Railway Age* (Chicago).

---

### THE KERNEL OF THE QUESTION

Congress decreed that 6 per cent was a fair return on railway capital. Very well. Isn't it plain as A B C that the railroads cannot, therefore, afford to pay more than 6 per cent for their capital? To pay 7 per cent for capital and be able to earn only 6 per cent would, obviously, be a losing proposition. And who would invest in railway securities under such conditions? The net of it all is this:

Railway credit must be made strong enough to enable the railroads to raise funds at 6 per cent or less. If not, only fools would invest in railway securities. No enterprise can go on paying more for capital than it can earn on its capital. That's what most of our railway systems have been doing. It can't last. The business world, the public, labor must see to it that the railroads are not subjected to conditions which would mean their breakdown, for, if transportation breaks down, so, inevitably, must the whole business structure.

Business cannot move unless it is moved.—*Forbes Magazine*.

---

### WHO GAINS?

B. M. Jewell, head of the railway shop crafts, told the Railroad Labor Board the other day that wages should be maintained even if the roads had to forego all profit on their operations.

That is a fair sample of the logic of some of those who appear to be laboring under the delusion that the function of a railroad is to produce wages and that all else is incidental. The railroad is in the business of producing transportation. Its first duty is to serve the public economically and efficiently.

How long would a man run a factory if not permitted to make a profit, or if required to

operate at a loss? He would quickly close down. But the railroads cannot be permitted to suspend operations. They have to struggle along as best they can, even when there are no profits, so long as they can stave off bankruptcy. They may run without the payment of profits; but anyone who imagines profits are a secondary consideration shows that he has no adequate conception of the subject with which he is trying to deal.

The railroads of the country are not keeping pace with the growth of the country and the requirements of industry. They have made practically no increase in their total mileage in recent years. The purchases of locomotives and of cars last year were far below the normal of wear and tear on equipment. The roads of the country are worse off today than they were five years ago. They were able to avoid a deficit last year only by cutting \$529,000,000 from maintenance items, a process which cannot be continued indefinitely.

That saving of \$529,000,000 on necessary upkeep of roadbed and rolling stock represents a drag applied to industry. It means wages and profits that were not received by men in car shops, locomotive shops, steel mills and other industries. The railroads not only should have been enabled to spend that half billion dollars last year, but several times as much in de-

velopment and expansion projects. Think what it would mean to the prosperity of the nation if the railroads were in a position to spend this season a billion or more in making much-needed improvements. It would mean increased prosperity to everyone, in all lines of activity. It would mean work for men in all directions and employment for thousands more on the railroads themselves—for at present the roads are operating with small forces and are skimping in every way possible.

The railroads cannot expect to get capital for development or any other purpose unless investors are insured of a fair return on their money. Shutting off profits to the railway owners means strangling not only the transportation system of the nation but all industry. The country cannot do any more business than its railroads can handle. Their facilities were inadequate five years ago, when population was less than at present. There were car shortages and delays then. What will not be conditions when business begins to get back to normal volume?

The economists of the Jewell variety, who can see nothing but their own immediate advantage in wages, simply do not grasp the magnitude of the railway problem nor the prompt necessity for beginning to work it out.—Chicago (Ill.) *Evening Post*, March 31.

## Our Monthly Roll of Honor

Below is a list of employes retired at the meeting of the Board of Pensions March 27:

Name	Occupation	Years of Service	Date of Retirement
August Kreibel	Carpenter, E. St. Louis, Ill.	20	10/31/21
Edward Vassiller	Carpenter, Burnside Shops	21	11/30/21
George Mitchell (Col.)	Car Repairer, Durant, Miss.	38	12/31/21
Wayne Holliday (Col.)	Laborer, Aberdeen, Miss.	22	12/31/21
Owen Donnigan	Engineman, Tennessee Division	35	1/31/22
Edwin Barnett	Machinist Helper, Clinton, Ill.	23	1/31/22
John E. Mathews (Col.)	Section Laborer, Cairo, Ill.	40	3/31/22
Charles T. Miller	Foreman Blacksmith, Mattoon, Ill.	41	3/31/22
George H. Bower	Clerk, Passenger Traffic Dept.	34	4/15/22
William Kelso	Section Laborer, Morgantown, Ind.	15	10/31/21

The following deaths of pensioners were reported at the same meeting:

Name	Last Employment	Date of Death	Term as Pensioner
Sidney Decatur (Col.)	Laborer, Kentucky Division	2/21/22	8 years
George D. Moseley	Bridge Carpenter, Tennessee Divn.	2/15/22	5 years
Robert Peterson	Track Foreman, Iowa Division	2/13/22	1 month
Louis Blum	Engineman, Chicago Terminal	2/19/22	6 months
James P. Bradley	Agent-Operator, St. Louis Division	3/ 7/22	7 months
Oliver M. Dunn	Superintendent, New Orleans Terminal	3/14/22	12 years
Michael Holly	Carpenter, Burnside Shops	3/ 2/22	8 years
William H. Hays	Clerk, Freight Traffic Department	3/12/22	10 years

### This Is the Proper Season

THEY were discussing love. "Love," said the bachelor, "is an emotion which never existed. It was first foisted upon the world by a soft-headed novelist who wanted something to write about."

"Ah!" sighed the married man. "Love is an illusion of youth, which only time and a wife will dispel."

"Love," cried a cynic, "is the sentimental outpouring of a moon-struck youngster in the last stages of infancy."

"Oh, no," objected an old maid. "Love is the heavenly reward of all who withstand the temptations of life."

"Tee hee!" laughed a chorus girl. "I think love is a sure road, through a breach of promise case, to enough ready cash to enable you to enjoy single-blessedness."

"Rather," agreed a college chap, "Love is the most expensive form of gambling, with all the odds against the man."

"Oh!" exclaimed the flapper, "If you really love, it is a series of electric shocks, low-whispered confidences and beautiful kisses."

Which only goes to prove that love is a thing which every one seeks, and no one is satisfied with (for long) once it is found.—SELECTED.

### Ah! Life!

The lake is full of water,

So that it

Comes right up to the shore;

And in winter the white snow flakes

Fall in it,

And in summer the rain falls in it;

No wonder it sometimes is wild

And lashes itself into fury dashing its

Billows against the Illinois Central tracks,

As Life dashes itself

Against my heart.

Ah! Life!

—DAVID ROTROFF, in *"Sportively Speaking,"*  
*Chicago Daily News.*

### An Illinois Division Joke

It was in the buffet car. The train stopped. The porter passed through.

"Champaign! Champaign!" he called.

The ex-service man in the corner, whose dreams had been in other lands, half aroused himself as he reached for his wallet and murmured: "Make it a couple of bottles."

### Friends

Old friends, new friends,  
Merry friends and light;  
Tried friends, true friends,  
Friends who treat you right;

Friends who give you greeting,  
Friends to think about—  
What a queer old world 'twould be,  
With all the friends left out.—C. R. C.

### Out and On

A widower had engraved on his wife's tombstone the words: "The light of my life has gone out."

A little later he married again, and one day he was standing with No. 2 before his first wife's grave.

Reading the sentiment on the tombstone, No. 2 inquired in a rather huffy tone, "Is that so?"

"Yes," replied he, "but I've struck another match."—T. T.

### An Enthusiastic Prayer

There have been all manner of exhortations throughout the ages from the chant of the savage tribe of the jungle to the prayer of the polished Broadway pastor, but the oddest supplication probably was that of an old negro minister of Red Banks, Miss.

A white man who happened to be a shorthand expert heard the devout negro's prayer and took it down verbatim.

The dark-skinned advocate was as resourceful as he was devout, for he included in his exhortation all the modern contrivances of the twentieth century and probably some that have not yet been invented.

The prayer follows:

"O Lawd, give Thy servant this mawnin' the eyes of the eagle and the wisdom of the owl. Connect his soul with the Gospel telephone in the central skies, 'luminate his brow with the sun of Heaven, pizen his mind with the love of his people, turpentine his 'magination, grease his lips with possum oil, loosen his tongue with the sledge hammer of Thy power, 'lectrify his

brain with the lightnin' of Thy word, put 'petual motion in his arms, fill him plum' full of the dynamite of Thy glory, 'noint him all over with the kerosene oil of thy salvation and set him on fire. Amen!"—J. C.

**Four Meetings**

Their eyes met;  
 Their lips met;  
 Their fists met;  
 Their lawyers met.—C. R. C.

**The Cake-Eater**

There have been ant-eaters, lotus-eaters and pie-eaters, but who ever thought we would have the cake-eaters?

The last of the species named is a young man of tight-fitting "one flight up" clothes, patent leather shoes, yellow kid gloves, a shoestring tie and a six months' permanent wave.

He is the rabbit who spends his idle moments in a tea room, sipping the intoxicating beverage from a saucer.

The ribbon counter has to be cleared off at 8 o'clock; so our cake-eater has to be on the job early in spite of the fact that he has been polishing the letter boxes in the hallway until 3 a. m. this morning. A mint tablet or two gave him a raging appetite for lunch, and after punching the clock he can be found in the 4-wheel restaurant ravenously attacking a feeble piece of sponge cake and a cup of tea. He then scrapes up the remaining crumbs into his hip pocket, leaving two for waiters' tips, and eats the rest of them for supper.

Cakie then subchases a flapper for a couple of blocks and finally manages to steer her into a jig hall, avoiding the check boy by hiding his hat and coat behind the radiator in the hall. After necking for a few hours, he flatwheels her home, and they park in the hallway against the letter boxes for a couple more turns of the clock.

The janitor is the only one who appreciates these hallway lavaliers. Our janitor now puts

his brass polish on the letter-boxes and door-bells before going to bed, and in the morning he is sure to find them all nicely polished by the hall galloopers.

An anonymous correspondent has given the following definition of a cake-eater:

It is something that is cute and neat, A very small tie, and patent leather feet, A part in his hair, and pants pressed so, Crumbs in his pockets instead of dough, A small black derby and a cute pair of spats; Goes to a dance and thinks he's the cats; Stands on the floor like a lily so pure; Some silly girl comes along, and says sure, She thinks he's as lovely and acts so refined; They board a car, and she pays the dime. Listen, girls, you might like their tie, But remember your mother married a regular guy.

Since presenting the definition of a flapper in the April issue, Mr. Said has received several communications of protest from those who

"tried the shoe and found it to fit." In justice to the fair maidens who feel offended, he has decided to give them an opportunity to come back at him. Inasmuch as a man defined the flapper, he thinks it advisable to give the women a chance to define the cake-eater. He will present a handsome box of candy to the Illinois Central girl who writes the best short definition of the cake-eater. Address him in care of the magazine before May 10.

### All Mixed Up

Cross-eyed judge lines all three cross-eyed prisoners before him charged with disturbance. "What's your name?" he asks the first man. "Jim Dugan," says the second. "I didn't ask you," says the judge. "I didn't say anything," answered the third.

### Thoughtfulness

Happy Harris was known far and wide as an accommodating man who was always trying to help the other fellow. The following story is proof of this.

Happy had undergone an operation and was up and around when he was suddenly called back to the hospital. The doctor explained: "It will be absolutely necessary to cut into you again to remove some stitches."

Happy gave his consent and after a few days was back on his feet after the second operation. He met the amateur doctor one morning and was informed that he must again be opened up.

"I forgot to apply a very necessary medicine," explained the doctor. Happy shuddered and went bravely to the operating table. The medicine was applied, and he was sewed up and taken home.

When he was well and sound again, he strolled into the hospital one fine morning to pay his bill. But they were not yet through with Happy. The young doctor greeted him thus: "I have lost one of my surgical instruments and can't find it anywhere. I'm sure it must have been sewed up inside you during the operation. It's small but valuable, and besides it may cause you great trouble. I think we had better find out about it, don't you?"

Once more Happy was cut open. Sure enough there was the tiny instrument. It was removed, and the doctor started to sew up the opening, but Happy halted him with upraised hand and said: "You're wasting energy, Doc. If it's all the same to you, I'd just as soon you'd sew a button on this time."—M. E. B.

## COMMUNICATIONS

This magazine is not responsible for opinions printed under this heading. Initials or pen names will be permitted only when correct name and address of the writer are known to the editor.

### Ten Thousand Pardons!

TO THE EDITOR: I notice in your March issue "Those Switch Engines," a story written by the late John Kendrick Bangs.

It is well enough that John has passed away, and we are unable to locate Sambo to explain to him that the jolt he received was not at Jackson, Miss., for there is absolutely no rough handling of even box cars at Jackson, Miss., to say nothing of passenger equipment.

I have been in Jackson, Miss., almost four years, and there has not been even a water glass broken on the diner operated between New Orleans and Jackson. The entire months of January and February we did not have one penny terminal damage (knock on wood—the stenographer's head).

Therefore, I am going to ask you in your next issue to correct John's story to read Jackson, Tenn., or some other foreign point. Please post in some conspicuous page, so that all the boys will be sure to see it. However, none has failed to see John's story in the March issue, even though it was down in one corner, from the number of pages that have been cut out and mailed me under personal cover. I have received at least fifty at this writing.—R. W. HARDIN, *General Yardmaster, Jackson, Miss.*

(Editor's Note—Besides the Jacksons mentioned by Mr. Hardin, our dictionary lists others in Alabama, California, Georgia, Kentucky, Louisiana, Michigan, Minnesota, Missouri and Ohio. Take your choice. Of course the story wasn't laid in Illinois Central territory.)

### JOHN W. MIDGLEY DIES

John W. Midgley died April 4 at his home in Evanston, Ill. Mr. Midgley was born in Leeds, England, in 1843. In 1868 he became secretary to the general superintendent of the Illinois Central Railroad. From that time until 1918 he was interested in railway affairs, and for many years was recognized as one of the foremost experts in the country on transportation problems. Mr. Midgley retired from work owing to loss of sight.

# Memphis Division Veterans Still on the Job

## List of Five Includes Water Service Foreman and Four Engineers, Two of the Latter Being Brothers

FIVE employes on the Memphis division of the Y. & M. V. entered the service in the early days of the railroad. When the L., N. O. & T., predecessor of the Y. & M. V., began construction, three of these veteran employes entered the service. And the two others were not far behind.

Henry Brannan, water service foreman, started his railway career as a machinist helper, worked up to engineer, was transferred to the water service department and became the water service foreman of the Memphis division in his 44 years of service. Edward B. Skillman has been an engineer on that part of the system for 38 years, but he has had 52 years of railway experience. His first years of service were with the New York Central. W. H. Wright, engineer, gained his first railway experience on a narrow-gauge railroad 38 years ago. That road was purchased by the L., N. O. & T., which in turn was taken over by the Y. & M. V. Mr. Wright was made an engineer after two years' service as a fireman. Horace Rosson has served on an engine for the Y. & M. V. and its predecessor for 38 years. He entered the service as a fireman, and was made an engineer two years later. Frank Rosson, brother of Horace Rosson, has advanced from engine wiper to engineer in his 36 years of service.

### Into Railway Work at Age of 14

Seniority rights were unheard-of things in railway circles in the early experience of Mr. Brannan, water service foreman on the Memphis division of the Y. & M. V. He says that, when there was a vacancy, anyone who was qualified to fill it was likely to be taken off the job he was on and given the new task. The word of the boss was law, and the men either did his bidding or resigned from the service.

Mr. Brannan started his railway career September 1, 1878, when he was 14 years old, as a machinist helper in the shops of the C. & O. Railroad at Memphis. He liked machinery, and he had the ambition to become an engine-

man. When the L., N. O. & T. began construction between Memphis and Vicksburg, Mr.

Brannan's opportunity presented itself. Engineers and firemen were scarce then. The L., N. O. & T. was in need of men and called upon the C. & O. for assistance. Mr. Brannan was one of six men who were transferred for service on the new road. He was given a position as fireman at a salary of \$45 a month. An engineer's salary at that time was about \$120, he says, and there were no set working hours. When a crew was needed, the men were called and pressed into service regardless of the hour.

Construction on the L., N. O. & T. started north from Vicksburg and south from Memphis at about the same time, Mr. Brannan says. The two lines met north of the curve at Shelby.

### Taken Off Job as Fireman

When the line was completed, Mr. Brannan suffered from the iron-clad rules of the boss. He was taken off his engine and made hostler at the turntable at Memphis. He had no say, but had to abide by the decision of the master mechanic if he desired to continue in the service.

There was no roundhouse at Memphis then. The engines were left in the open close to the turntable, and there was only one overhauling stall there then.

It was not long before Mr. Brannan was again placed on the road as a fireman, this time on a passenger train between Memphis and Vicksburg. While in this service, he says, it was a common thing to see deer leap and bears walk leisurely across the right-of-way in front of the approaching train. Many wild turkeys were ground to death under the wheels of the engine, he says.

In the early 90's Mr. Brannan was made stationary engineer in the shops at Memphis. He remained in that service about five years, and was then transferred to the water service department.

His first position in the new service was as repair man on the Tennessee division of the Illinois Central. He remained there for four years, and was then transferred to the Mississippi division. After two years of service there he was made water service foreman of the Memphis division of the Y. & M. V.

### No 8-Hour Day in Those Times

There was no 8-hour day in his early railway experience, Mr. Brannan says. When a crew took a train out, it stayed on duty as long as possible. When weariness overcame the men, the train tied up until each had sufficient rest. The crews ate in the cabooses then.

The cook in each caboose was generally known as "Rube." He received no salary and was allowed to eat only what food was left. The train crew usually kept him in old clothes.

But a "Rube" had chances of advancement the same as other railway men. If he proved to be a good dependable man, he was given a position as brakeman when such a position was open.

Mr. Brannan says that there are beginners in his department now who make more in a week than he first made in a month.

### Heads Division Seniority List

Mr. Skillman is the oldest engineer on the Memphis division seniority list. He was born in New York State, and began his railway experience in 1870 as a fireman on the New York Central Railroad between Syracuse and Buffalo, N. Y., firing a wood-burner and receiving \$45 a month. He was promoted to locomotive engineer in 1873 on the same road. He left the New York Central in 1876, and visited the Western states, spending considerable time in California and Mexico.

In 1878 he accepted a position as a locomotive engineer with the New Orleans & Pacific Railroad, which is now the Texas & Pacific Railroad. He ran the locomotive that laid the rails into Alexandria, La. He was later transferred to the International & Great Northern Railroad, and helped construct the line between Marshall and Laredo, Texas. That line was completed on Christmas Day, 1881. About

five months later, when the bridge was completed across the Rio Grande River, he ran the first locomotive to cross between the United States and Mexico. He was then assigned to the pay car locomotive, and was called upon to handle Jay Gould and his party over the Gould railroads.

### Joined L., N. O. & T. in 1884

In 1884 he received a 20-day leave of absence from the International & Great Northern and did not return, but entered the service of the Louisville, New Orleans & Texas Railroad (now the Y. & M. V.). Edward Anderson was then master mechanic at Vicksburg. At this time, an engineer's salary was \$115 a month. Mr. Skillman's first running was done between Vicksburg and Huntington, Miss. Huntington was then a terminal where cars were ferried across the river. In a short while he took charge of the locomotive "Robert E. Lee." Locomotives were named instead of numbered at that time. His fireman was the General Lee Christmas of later Central American revolutionary fame.

When this position was abolished, he took engine No. 66 between New Orleans and Wilson, La., and was called upon to handle a special train from Convent, La., to New Orleans. This special train had as its passengers the late Cardinal Gibbons and Bishop Jannsen. This was considered one of the fastest runs of the time, the distance of 50 miles being run in 53 minutes, with two stops.

### Service in Yellow Fever Epidemic

During the yellow fever epidemic in the early 90's, the engine and train crews were allowed to go only as far as the Tennessee and Mississippi state line, where they would give their engines and trains to other crews. The engine and train men relieving each other were

Engineer E. B. Skillman and No. 2004

not allowed to come in contact. The engineers would give the engine steam and get off, and the other engine crew would get on and take the train through to its destination. Several of the enginemen and trainmen were stricken with the fever, and were unable for service. Mr. Skillman and his fireman, George Baker, composed the only engine crew operating between Memphis and Lake View, and they never lost a day's service during this epidemic.

In 1891 Mr. Skillman was transferred to Memphis, where he has made his home since. He has his own home and is the father of two children, Claude F. Skillman, a locomotive engineer on the Memphis division, and Vincent E. Skillman, a student in the Central High School at Memphis. Vincent is also a cornet player in the Boys' Band of the Memphis Rotary Club.

In 1908 Mr. Skillman was appointed traveling engineer of the Memphis division, and continued in this position until July, 1911, at which time he resigned and took the Memphis and Tutwiler local passenger so that he would have more time at home. He has been on this run ever since.

#### More Than Proud of His New Engine

Many of the present locomotive engineers on the Yazoo & Mississippi Valley have fired for Mr. Skillman, and all of them have the greatest praise for his ability as a locomotive engineer.

When engine No. 2004 was modernized and superheated at the Memphis shops, one of the first superheated engines to be placed on the Memphis division, it was assigned to Mr. Skillman. He has made a splendid record on this engine and believes it is the finest piece of machinery that the railway company owns.

He has seen all of the present improved locomotive appurtenances come into existence, such as coal-burning locomotives, air brakes, electric headlights, superheaters, power reversing gear, lubricators, brick arches, outside valve gear, etc.

Mr. Skillman is widely known among the residents between Memphis and Tutwiler. All of his acquaintances call him "Uncle Ed." He is of a charitable disposition, and many instances are known where he has supplied poor families and children with provisions, clothing and shoes. He also distributes magazines and papers to the farmers along the right-of-way.

When at home Mr. Skillman drives a good automobile, and he takes the same pains in

caring for this car as he does his locomotive, making all of his own repairs.

#### Three Engines on His First Road

Mr. Wright received his first railway experience on a narrow-gauge railroad back in 1884. He was a fireman between Glendale and Clarksdale, Miss.

There were only three engines on that railroad, and they were wood-burners. A fireman's job on those engines was a gentleman's job, he says. One could wear a white shirt and collar from one end of the run to the other without getting either soiled.

To look back on those engines now, Mr. Wright says, they seem more like toys than real locomotives. They were profusely decorated with brass railings and bands, and, of course, had to be cleaned every day. The three engines were named after the three counties, Yazoo, Le Flore and Coahoma, through which the railroad had its right-of-way.

Mr. Wright says a cow knocked the little engine off the track one day, and he had to walk fourteen miles for one of the other locomotives.

#### Came Into Service of the L., N. O. & T.

The narrow-gauge line was later bought by the L., N. O. & T. and part of it was converted into a standard-gauge road. A line between Jonestown and Clarksdale was torn up, but the present line to Helena, Ark., is the same right-of-way as when the road was narrow-gauge.

Mr. Wright obtained a position as fireman on a work train of the L., N. O. & T. in February, 1885. He worked out of Memphis about a month, and was then transferred to Port Gibson, where a bridge had been washed out. When the bridge had been replaced, Mr. Wright was given a freight run.

On June of the same year he was made night foreman in the roundhouse at Vicksburg. The L., N. O. & T. had only a few engines in those days. When one came in off a run, it was immediately looked over so that it could go back on the road. Mr. Wright says that engine crews often waited outside the roundhouse until their engines were looked over.

#### Made Engineer at Christmas, 1886

Mr. Wright was made an engineer December 24, 1886. He was on the extra board for six months, and was then placed on a regular freight run between Vicksburg and Wilson. There were no time or watch regulations then, he says. Each engineer bought the watch that

W. H. Wright

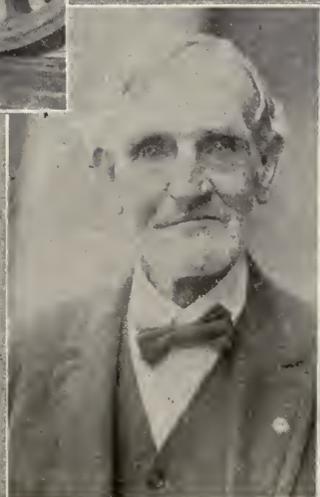

H. Rosson

Frank Rosson

H. Brannan

E. B. Skillman

best suited him. He continued on that freight run until 1893, when he was transferred to a passenger run between Memphis and Vicksburg. In 1917 he was given the run he has today, between Memphis and Tutwiler.

In the early days of the L., N. O. & T., Mr. Wright says, there was much trouble with falling trees. The right-of-way was cleared only seventy-five feet wide, and trees often fell across the track. Much time was lost in chopping trees, and many wrecks occurred. It was a wild country then, he says. Animals could be seen darting behind trees and racing wildly through the forests along the right-of-way.

#### **Began Work at Memphis in 1884**

Horace Rosson gained his first knowledge of a locomotive in the shops of the Southern Railroad at Memphis. He had been employed by that company two years when he accepted a position as fireman for the L., N. O. & T., April 4, 1884.

The L., N. O. & T. was constructing its line between Memphis and Vicksburg when he entered the service. He was given a position as fireman on a work train.

When the road was completed, Mr. Rosson was given a freight run between Memphis and Coleman, Miss. The name of the latter city has now been changed to Cleveland. In a few months, he was made a fireman on a passenger train on the same division.

After two years of experience as a fireman, Mr. Rosson was given a position as engineer to take the place of George Wright, who had been killed at Como, Miss.

Mr. Rosson's first work as an engineer was on a gravel train. It was only a few months until the gravel pits were closed, and Mr. Rosson was placed on a regular freight run on the main line of the L., N. O. & T.

#### **Wrecked After 53 Hours on Duty**

In those days it was a common occurrence for a train crew to remain in continuous service on the line for as long as sixty hours. Mr. Rosson was in a wreck one night in February, 1888, after he had been at his post continuously for fifty-two hours and fifty minutes. His train ran into the rear end of another train which, he says, was twelve hours late and unprotected. Mr. Rosson says that he did not know of the train immediately ahead of him until he saw the cook open the door of the caboose, his white clothes glaring in the rays of the headlight on Mr. Rosson's engine. The

two trains were too close together to prevent the catastrophe. Luckily, no one was seriously injured.

#### **Waterbound for Five Weeks**

Mr. Rosson was expelled from the service on account of that accident, but after six months he was recalled and given a position as fireman. He made three trips and was again reinstated as an engineer. He was put on a work train doing construction work between La Mont and Coahoma, Miss.

In those days, the L., N. O. & T. operated a transfer boat between Arkansas City, Ark., and Huntington, Miss. On the Arkansas side of the river, the transferred cars were turned over to the Missouri Pacific. Mr. Rosson was engineer on the incline engine at Huntington, Miss., for five months. His engine pushed cars on and pulled cars off the transfer boat.

After his experience on the incline engine, Mr. Rosson was placed on a regular freight run between Memphis and Vicksburg. He recalls an overflow at Rolling Fork in 1897 that held his train waterbound for five weeks.

Practically all of the track from Cary, Miss., to the Yazoo River was washed away. After the water subsided, the entire line was relaid in two weeks and traffic was resumed.

In 1904, Mr. Rosson was given a passenger run between Memphis and Vicksburg, and he has continued in that service since.

Mr. Rosson has never experienced but the one accident to his train. Not a wheel has slipped from the rails under him, he declares. He worked straight through the yellow fever epidemics and was never stricken.

#### **Has Always Worked with Locomotives**

Frank Rosson started his railway career working with locomotives and has continued in that line of work ever since.

April 4, 1886, Mr. Rosson, then a husky young lad, obtained a position as engine wiper in the roundhouse of the Mississippi & Tennessee Railroad at Memphis. This road was later purchased by the Illinois Central.

Mr. Rosson had always had a great love for engines. Before he began railroading, he says, he used to watch the puffing locomotives and wonder how it would feel to have such a powerful thing respond readily to the touch of a hand on a lever.

It was that feeling that led him into the railway service, and when he obtained the position as engine wiper for the M. & T. at Memphis he had the opportunity to examine

the engines to his heart's desire. He wiped, patted and polished them with the tenderness of a caretaker of a fine race horse.

### Was Made Engineer in 1889

His interest in engines soon built up a knowledge of the working parts of a locomotive, and in four months he was qualified to accept a position as fireman on the L., N. O. & T. At first he was placed in extra freight service. He was given extra passenger runs later and saw service on all parts of the L., N. O. & T.

In 1889 Mr. Rosson was made an engineer and placed in terminal service at Memphis. He proved his ability as an engineman, and in 1891 he was given a freight run between

Clarksdale and Grenada. Two years later he was placed in passenger service on the same run.

Mr. Rosson was seriously injured while in the latter service. A crosshead broke when he was nearing Money, Miss., and a large piece of the metal struck him just above the left temple. It was an ugly wound and kept him in the hospital in a serious condition a little more than a year. He speaks in highest praise of the treatment he received from the company.

He was returned to the same run after his recovery, and continued in the service until 1917, when he was given a passenger run between Memphis and Vicksburg. He continues on that run today.

## Webb C. Ball, Watch Regulator, Is Dead

Webb C. Ball, general time inspector for more than 175,000 miles of railroad, including the Illinois Central System, died March 7 at his home in Cleveland, Ohio, at the age of 75. As the originator of time service and watch inspection and the head of the Official Bureau of Railroad Time Service, he was known to railway men throughout the United States, Canada and Mexico.

W. F. Hayes, former assistant general time inspector, has been appointed general time inspector to succeed Mr. Ball. Since Mr. Ball's death the service has been organized with H. J. Cowell in charge of the Cleveland office, Laurence L. Doty at the Chicago office, O. H. Pyper at the Winnipeg office, S. A. Pope at San Francisco, and V. A. Corrigan at the Houston office.

During the late war Mr. Ball installed his system of time service and watch inspection at Camp Funston, at the invitation of Major-General Wood, and this service was gradually extended to other training camps.

Mr. Ball was responsible for the standardization of the watches and clocks by which the railroads of America are operated, and it is his work that has made possible the safe and speedy operation of trains today.

The idea of a time service came to Mr. Ball in 1891 when he learned of a wreck on the Lake Shore & Michigan Southern Railroad which was caused by defective watches in the hands of the train crews. Mr. Ball went to the president of the railroad with the idea, and he

Webb C. Ball

was given permission to investigate further the conditions.

In cabooses, Mr. Ball found cheap alarm clocks upon which the conductors of freight trains on some trunk lines depended. Other conductors used watches which were given with

the purchase of a suit of clothes. The clocks of the roundhouses and dispatchers' offices had not been cleaned or regulated for years.

Conditions were such at that time that the conductors and engineers were given five minutes on their orders for safety's sake.

Mr. Ball formulated plans that put an end to such dangerous conditions, and he was given the authority to put them into operation. Local time inspectors were appointed for every division, and the trainmen were required to have their watches examined every fortnight. A variation of thirty seconds in fourteen days

meant that the watch had to be repaired or regulated at once. Each conductor and engineer carried a small card on which the inspector wrote the record of the trainman's watch.

The fundamental principles established by Mr. Ball at that time are still in operation. Today, under his regulations, standard railway watches must contain at least seventeen jewels, be adjusted to temperature and also to five different positions. The watch inspection service thus established on the Lake Shore was gradually extended to include 75 per cent of the country's

railroads. Mr. Ball also made several inventions of great value to watch makers.

In 1911, he established the Webb C. Ball Company in Cleveland, and in August, 1918, he and some others incorporated the Official Bureau of Railroad Time Service, a non-profit-making body that exercises supervision of time pieces as an aid to safe operation of the railroads. This bureau is Mr. Ball's monument.

Mr. Ball was born on a farm in Knox County, Ohio, and started as an apprentice at \$1 a week. After ten years as a jeweler elsewhere, he established his business in Cleveland.

## *Employees Will Give a Musical Recital*

*Miss Margaret Smetacek*

*Elmer Berger*

Miss Margaret Smetacek, lyric soprano, assisted by Elmer Berger, violinist, and Beatrice Byxbee, accompanist, will give a recital at 8:15 p. m., Tuesday, May 23, in Recital Hall, Fine Arts Building, Chicago.

For the past six years, Miss Smetacek has been in the service of the Illinois Central, and she is well known among the employees. She has served as stenographer during this time with Mr. Fairfield, with Mr. Porterfield, and finally with Mr. Thrower, in whose office she now is employed. Her musical career opened in 1917, when she began studying with R. B. DeYoung of the DeYoung Studios. In the past four years she has made remarkable progress toward a brilliant career as a lyric soprano. This will be her second appearance in recital.

During the twelve years of Mr. Berger's service with the Illinois Central he has made many friendships. He started as office boy in the offices of the auditor of freight receipts, then worked in the statistical and valuation departments and became bookkeeper in the comptroller's office during the Federal Control period. At present he is in the accounting department, in Mr. Blauvelt's office. Although hindered somewhat by illness, he has made a steady progress toward a successful business career. As a musician he ranks high. His musical studies have been carried on diligently since 1903. His early violin instructions were received from H. R. Hoare, but he was forced to give up the studies in April, 1909. In 1911 he resumed his studies.

## Spring

DEAR WOMAN READERS: Congratulate us, please! No, we are not to be Queen o' the May—we are a year old this month. We feel quite dressed up with the new heading which adorns our columns, the artist evidently intending it as a birthday gift.

This morning we were routed out early by an invasion of the decorators. The spring house-cleaning drive is on! On the way to the train we noticed that a man on our street is having his house painted. The trees have discarded the ermine mantle of winter for the delicate green cloak of spring. Tulips flaunt their gay bonnets, and fat robins hop briskly about. Spring millinery has been in bloom for some weeks.

This is the time of year to shake off our winter lethargy, just as we lay aside our heavy clothes. Everything takes a new lease of life, and it is a good time to renovate our mental houses, to get a new viewpoint, to see clearly how we stand in relation to our respective jobs and to life in general. Are we making progress? Do we learn a little each day? Are we enthusiastic? Our lives become broader and fuller and sweeter as we advance spiritually and mentally. "But I feel all tired out—my nerves are frayed," someone says. There is nothing so soothing to tired nerves as a hike in the park or woods, with nature's restful green carpet beneath our feet and the fragrance of tender earth in the air. A mile on the hoof three times a day will work wonders for a pale, sluggish complexion, and as a "pep" producer it beats any yeast tablet ever concocted. Try it!

## Household Hints for Home Makers

If a teaspoonful or two of vinegar is added to the water in which they are boiled, cracked eggs may be cooked without the contents' running out.

Rubbing with turpentine will remove tar stains from clothing.

When mashing potatoes, dissolve one-quarter teaspoonful of baking powder in the milk which is used, and the potatoes will be light and feathery.

Wipe grease from the kitchen range while it is hot, using old newspapers.

Fish may be scaled easily by first immersing in boiling water for a minute.

To make leather waterproof, saturate with castor oil.

Before putting stoves away for the summer, apply kerosene with a rag, and they will not rust.

Nuts will not become rancid if kept in a cool place.

## Every Woman's Duty

Chewing a few sprigs of parsley will remove the odor of onions from the breath.

Pat face cream into the pores of the face. This method does not break down the tissues, as rubbing is likely to do.

Cleanliness is essential to daintiness. A warm bath at night takes all the "tired" out after a strenuous day.

## Just to Remind You

On "Mothers' Day" last year one of our forgetful girls received a silent reproof when the florist delivered to her mother a box of lovely ferns and plants with the cards of two of the girl's best friends—motherless girls, by the way.

We who are so fortunate as to have mother with us should need no reminder to send her an offering of posies on Mothers' Day. She will appreciate flowers, but don't you stop with the things that money can buy. Much more precious to her mother's heart are those little expressions of affection which cannot be measured in dollars and cents. Slip your arms around her neck and, with her cheek to yours, tell her that she is the dearest, sweetest, best mother in all the world. You may write that on her tombstone later, but she would rather hear you say it now.

Don't forget that May 14 is Mothers' Day.

## A Time Saver

When making handkerchiefs with drawn threads, instead of hemming them, finish with the picot edge, which is produced by having

the square of linen machine-hemstitched close to the edge, then cutting off the upper half of the hemstitch.—MISS ELOISE CAMPBELL, *Chief Surgeon's Office, Chicago.*

### Like Strawberries?

**STRAWBERRY SHORT CAKE.**—Mix and sift twice 2 cups flour, 4 teaspoons baking powder,  $\frac{1}{2}$  teaspoon salt, 2 teaspoons sugar. Work in  $\frac{1}{4}$  cup of butter with the fingers, and add gradually  $\frac{3}{4}$  cup milk. Toss on floured board, pat, roll out, and bake in hot oven. Individual cakes may be made by cutting the dough with a biscuit cutter. Split and spread with butter. Sweeten strawberries to taste, warm and crush slightly. Spread between and on top of short cake, and serve with whipped cream sweetened and flavored.

**RICH SHORT CAKE.**—Mix and sift twice 2 cups flour,  $\frac{1}{4}$  cup sugar, 4 teaspoons baking powder,  $\frac{1}{2}$  teaspoon salt, a few grains of nutmeg. Work in  $\frac{1}{2}$  cup of butter with the fingers, and 1 well-beaten egg, and  $\frac{1}{2}$  cup milk. Toss on floured board, roll out, and bake. Split the cake and spread with cream sauce, cover with strawberries which have been sprinkled with powdered sugar, again spread with sauce, and cover with top layer of cake. Cream sauce: Beat white of 1 egg until stiff, add yolk of egg well beaten, and 1 cup powdered sugar gradually. Beat 1 cup thick cream until stiff; combine the two mixtures, and add  $\frac{1}{2}$  teaspoon vanilla.

**FRESH STRAWBERRY OMELET.**—Macerate  $\frac{1}{2}$  pint strawberries with powdered sugar for half an hour. Break 6 eggs into a bowl, add a little salt and pepper, 2 tablespoons thick cream, and beat well with an egg whisk or fork. Melt, without browning, one heaping tablespoon butter in perfectly clean frying pan; turn in the beaten eggs, stirring constantly with spoon so that eggs are equally well cooked, keeping soft. Let stand for two or three seconds without stirring; then take part of strawberries and place in center of eggs in pan, then fold omelet in 3 layers; turn the pan on side and slide onto oval-shaped platter. Garnish with rest of strawberries around omelet, placing a row of strawberries on top.—W. H. HUPPELER, *Manager, Central Station Restaurant, Chicago.*

**STRAWBERRY FLUFF.**—Soak  $1\frac{1}{2}$  tablespoons granulated gelatine in cold water, dissolve in  $\frac{1}{2}$  cup boiling water, strain, and add 1 cup sugar, 1 tablespoon lemon juice, and 1 cup strawberry juice. Chill in pan of ice-water; when quite thick, beat with wire whisk

until frothy, then add whites of 3 eggs beaten stiff, and fold in whip from 3 cups cream. Line a mold with strawberries, turn in mixture, smooth evenly, and chill. Garnish with fresh strawberries, sprinkled with powdered sugar.

**STRAWBERRY FILLING.**—Beat 1 cup thick cream until stiff, add  $\frac{1}{2}$  cup sugar, white of 1 egg beaten until stiff,  $\frac{1}{2}$  cup strawberries mashed, and  $\frac{1}{2}$  teaspoon vanilla.

## FASHIONS

(See Opposite Page)

Illustrated herewith are some typical spring and summer fashions. "The flowers that bloom in the spring, tra, la' are not nearly so interesting as the fashions that bloom at that season," says Helen Lydy, employed as a stenographer in the office of H. B. Hull, assistant to the president; and so she has assisted the Home Division by posing in the charming styles illustrated on the opposite page.

No. 1 is a one-piece bathing suit, fiber and wool stripe, long-waisted, skirt short and gathered, color Royal blue. The bathing cape is of Terry cloth bound in silk braid, full length. The cap is of black and white rubber with alternating rows of points.

No. 2 is a three-piece suit of navy poret. The blouse is of Copen Canton crepe embroidered in navy blue silk and has long bishop sleeves which are revealed interestingly through the large eyelets and beneath the scallops of three-quarter length coat sleeves. The coat lining is of the same material as the blouse. The flowered turban is of harmonizing blue.

No. 3 is a white organdy summer frock; skirt trimmed with large applied roses of organdy, picot edge; neck and sleeves edged with double ruffles of points.

No. 4 is a top coat of "Paris la Mode," a new camel's hair material, with raglan sleeves, long revers, leather buttons and inverted plait at back. The color is beaver. The very appropriate hat is of sand colored felt, piped in navy blue grosgrain ribbon and with a blue quill; soft rolling brim. Costumes by courtesy of Marshall Field & Company, Chicago.

### Not the Cake Kind

Mrs. Newlywed (tearfully, after complaints about sponge cake)—"It's that wretched chemist's fault—he must have given me the wrong k-kind of sponges!"—*London Opinion.*

# Got Splinters in His Hand When Firing

*And His Engine Blew Up When He Was Promoted in 1869;  
Ran First Train at McComb in 1872*

By PATRICK GEARY,  
Pensioned Engineer, McComb, Miss.

I ENTERED the service of the New Orleans, Jackson & Great Northern Railroad, now the Illinois Central, April 21, 1866. My first trip as a fireman was made April 22, on train No. 1 from New Orleans to Canton, Miss. It was the hardest trip of my life. I was not used to handling pine wood, and I got my hands full of pine splinters. Oh, but they were sore! When I got back to New Orleans I got a rest for a week, then I was O K for solid work for three years.

About July, 1869, I was promoted to engineer. I took out, on a wood train, an engine that had just been repaired at a big expense. I had no conductor. The roadmaster was with me. The master mechanic gave me instructions to let the fireman handle the engine any time I wanted him to. We loaded wood all night near Gullets and started back to Kenner with eight cars of wood, as Kenner was a wood station. We got there about 11 a. m. and had about fifty negroes unloading. The roadmaster, myself and the fireman went to a house to get dinner.

## Then the Engine Blew Up

The foreman of the gang came in while we were eating and asked me to move about two car lengths. The fireman said to me, "I will go," and I said, "All right." So he went and moved the train and came back to dinner. He was back about fifteen minutes when we heard a sound like that made by a big cannon. I looked right away through a window, and I saw a part of the boiler up in the air. The engine was blown all to pieces.

There was no telegraph office; so the roadmaster and I got the section men to take us to New Orleans, where I reported the facts. I expected that the event would end my career as an engineer, but the instructions I had to let the fireman handle the engine saved me. The master mechanic said I was not to blame. The cause of the

*Patrick Geary*

explosion was that those engines had no injectors, only pumps. You could get no water in them when standing still. The ash-pans and dampers were made air-tight. The fireman pulled the damper open when starting and forgot to close it when he stopped.

This happened in Superintendent Williams' time. When H. S. McComb got control of the company, he had men and officers come from Wilmington, Del., from the P. W. & B. Railroad. Northbound freight had a right over southbound freight. I pulled one of the "smartest" conductors brought down here, and he was with me on the southbound. There was a meeting point at Terry. The rules were that the southbound should wait half an hour if the northbound did not arrive, run half an hour late until meeting, and then make up the time gradually. When I got to Crystal Springs, the conductor gave me a signal to go ahead.

## One Wreck That Was Avoided

I refused to go, and he came to the engine and said: "Why don't you go?"

I said, "Not for fifteen minutes yet."

He replied, "If you don't go, I will hold you responsible."

I said, "All right," and in about fifteen minutes here came the northbound train. If I had pulled out, we would have met just south of Gallman in a curve and a deep cut. When we got to Magnolia, which was a relay, where the assistant superintendent had an office, I went in to see him and told him all about it. He never answered, because this conductor was a kinsman of his. One of the engineers who came down here destroyed seven engines. In fact, they put in a track near the old roundhouse and called it "Randolph's Switch," after him. The imported employes did not last very long.

I am getting back now to railway men. I pulled the accommodation from New Orleans to Magnolia, Miss. We used to lie over at Magnolia. In 1872—I don't recall the month, but it was on a Sunday—we got instructions to get ready and move to McComb as soon as possible. We got up steam and got to McComb the first, turned on the table and turned the combination car. We only had two cars; so I was the first man to run an engine at McComb as a regular train.

Then we had trouble—no place to sleep. We could get a place to eat, all right, but no place to sleep. The Hotel DeSoto had plenty of bed clothing, but no rooms fixed up. We would get in among those blankets and cover up. I could not get a house until March, 1873. The crews on through passenger engines did not stop at McComb for a long time after.

### Was Used to Passenger Engines

In Mr. Greener's time as master mechanic a man who claimed to be an engineer came to him with papers recommending him highly. He sent him out with me on a northbound freight. After I coupled the engine to the train I told him to take the engine. He just sat on the seat box and looked at me. So I said to him again, "Pull out," but he never moved the reverse lever and never put a pump on. All engines those days had pumps. I had to take the engine away from him, but he made the round trip with me. When he got back he told the master mechanic he had never run a freight

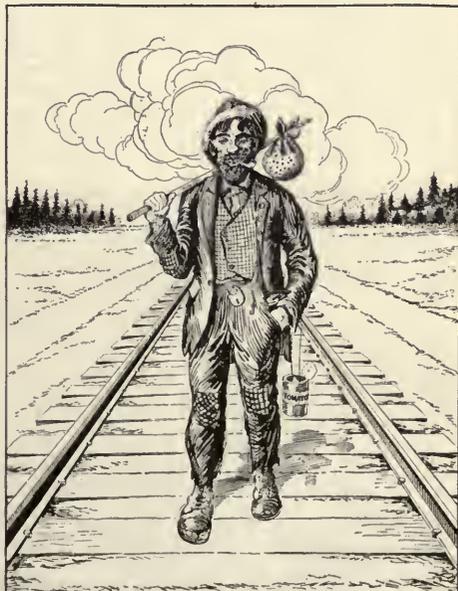

*Mr. Geary on His Porch at McComb*

engine; he always ran a passenger engine—but he did not get any job.

By the way, the first time I came on the Old Jackson there was a whisky shop at every station from New Orleans to Canton. I fired for men that were first-class in every particular. Then some would go to those saloons and stay while I would do the switching.

I left the service of the Illinois Central February 18, 1905. It was a pleasure to work for the company, but I felt that I would live longer if I got off the engine. The Illinois Central, to my notion, is the best railway company in the United States to work for.

*One thing on the railroads that isn't regulated*

# Successful Homecoming at McComb, Miss.

## Parade of Illinois Central Employes Featured Opening Day of Recent Semi-Centennial Celebration

**M**cCOMB, Miss., well known on the Illinois Central System, celebrated its fiftieth anniversary as an incorporated city the week of April 3-9. It was homecoming week for former residents of McComb and friends who have a warm spot in their hearts for the progressive little city on our Southern Lines.

April 5 was the date of the incorporation of McComb, but the enthusiasm of the residents for their home town was far too great to celebrate only the one day. Each day of the week was set aside, and plans for the entertainments were placed in the hands of the various industries and organizations of McComb. A chairman was chosen to have charge of each day to see that the program as planned by his organization was given as smoothly as possible. The expense of each day was borne by the organization which had charge of that day.

Monday, April 3, was Railroad and Industrial Day. John A. Jones, engineer of the Illinois Central, was chairman of that day. He had the support of all the employes of the Illinois Central at McComb, and an elaborate program, was planned.

### Parade Showed Railway Work

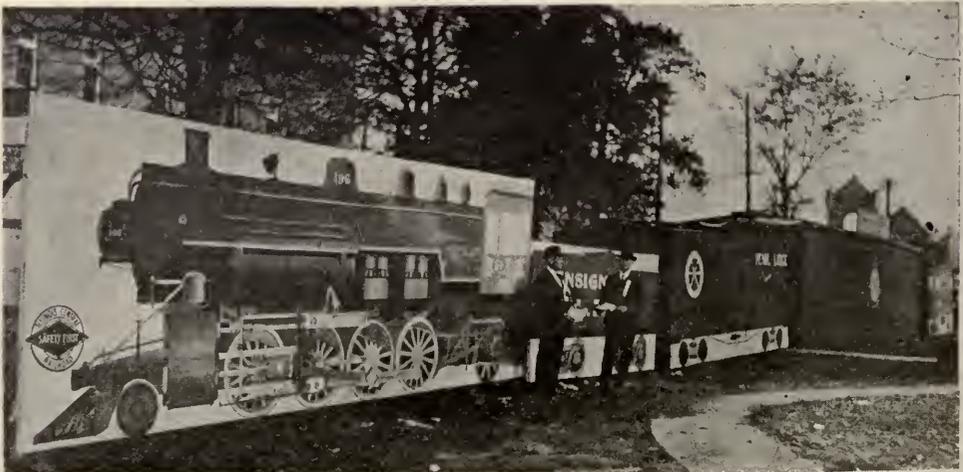

The week of festivities began at 10 o'clock

that day with a great parade of many floats representing the various phases of railway work done in McComb.

Main Street was profusely decorated with flags and bunting that morning. The street was lined with visitors who were nervously waiting for the approach of the much-talked-of spectacle. The number of spectators was estimated at 10,000.

The parade that passed was one of which a city five times as large as McComb might well be proud. The many floats were professional in character and design, and plainly showed that competent workmen did much conscientious work on them.

Three floats at the beginning of the parade represented the past, present and future of the Illinois Central shops at McComb. The first was a painting of the small beginning there; the second was a diagram of the present railway property, and the last was a dream-picture of what the Illinois Central would have at McComb in the future. The last of the three floats showed a great increase in the size of the shops. Large buildings surrounded an immense station, and airplanes and balloons were rising and landing near hangars on the Illinois Central grounds. The three floats

*The Train That Was in the Parade*

# OUR PARADE AT McCOMB APRIL 3

Some of the floats: (1) and (2) floats representing the past and future of the Illinois Central Railroad's property at McComb; (3) railway clerks at work; (4) a modern Illinois Central station; (5) the machinists' offering; (6) Ladies' Auxiliary of the B. of L. F. & E.; (7) a full-size refrigerator car; (8) center section of the train float.

were the product of the paint department of the shops at McComb, and many compliments were expressed concerning the idea and the splendid workmanship.

### Showed Old and New Stations

The maintenance of way and the bridge and building departments represented their work by two floats. The first was a miniature station, illustrating the style of building that was formerly erected by the Illinois Central System, and the second was a small station of the design of the present-day buildings of the company. The first float was labeled, "The Old Way"; the second, "The New Way."

The machinists were there with a machine shop in full progress, and the boiler-makers sprayed the streets with sparks from a piece of metal which was being savagely attacked by an acetylene welding torch.

The engineers, firemen, car carpenters and conductors combined forces, and constructed a train for the parade. The engineers had charge of the engine; the firemen, the tender; the car carpenters, the box car and a refrigerator car; the conductors, the caboose. The refrigerator car was full-size and bore a striking resemblance to the real thing. After the parade, the train was left at the side of a street where it was on display the entire day.

The motor car department was represented by a float which illustrated the old and the new ways of going to work. An old type hand-power car was followed by one of the new motor cars.

The railway clerks constructed a miniature office, and several of them were on the float busy at typewriters, papers and ledgers.

The kiddies of McComb swarmed about two clowns who kept things lively during the morning.

### Speakers Praised Illinois Central

The Illinois Central System was highly praised in several short talks that afternoon. Some gave our railroad most of the credit for the growth of McComb.

Illinois Central speakers that afternoon were: T. J. Quigley, superintendent; E. C. Roddie, master mechanic; James McGuire, veteran passenger engineer, and John A. Jones, chairman of the day.

Mr. McGuire has never made his home in McComb, but his son is chief clerk to

Superintendent Quigley. Mr. McGuire assured the people of McComb that the Illinois Central is the best railroad in the world and would continue as such. He pointed out that the management is always just to its employes and meets them half-way on all occasions.

During the afternoon there were various contests on Main Street. There were a fat men's race, a girls' race, a boys' race, a pig-calling contest, boxing matches, a volley ball game and a tennis match between employes of the Illinois Central and a town team. Main Street was closed to traffic so that the contests could be held where there would be plenty of room.

### Community Dance in the Evening

In the evening there was a band concert and a community dance on Main Street. Hundreds of persons took part in the dancing, and the sidewalks were jammed with on-lookers. The dance started with a grand march, followed by an old-fashioned square dance and a waltz, and then the young folks were permitted to enjoy some of the modern dances.

Tuesday was called Commercial Day. All the commercial interests in McComb combined their efforts to make the parade and program of that day as great a success as those of the preceding one. The parade consisted of floats of most of the stores in McComb from the oldest to the most recent. Many souvenirs were distributed from the floats. A baseball game followed the parade in the afternoon, and that night Main Street was again the scene of dancing.

Wednesday, Anniversary Day, was the feature day of the week. The mayor of McComb proclaimed it a general holiday, and all joined in to make merry. A general parade was held in the morning. In the afternoon the school children of McComb gave a historical pageant of the life of McComb. The pageant was repeated that night.

### Celebration Closed Sunday, April 9

The school children of McComb had charge of the program Thursday, and about 2,000 of them participated. Motion pictures were made of the parade that morning. A girls' track meet was held on Main Street in the afternoon, and various amusements entertained the people that night.

Friday was Fraternal Day. There were

*The Young Folks Enjoyed the Clowns*

many attractions on Main Street in the morning. The parade in the afternoon was under the auspices of the various fraternal organizations of the city. The local post of the American Legion led the parade and it closed the day's festivities with a dance that evening.

The farmers of Pike and near-by counties had charge of the activities of Saturday, Farmers' Day.

Sunday was called Church Day, and a special service was held in all the churches during the morning. In the afternoon a

memorial address was given by the Rev. J. H. Mayfield at the cemetery. All the graves of the cemetery were decorated that afternoon as a tribute to those who had guided McComb through its infancy.

The idea of celebrating McComb's fiftieth anniversary was originated about the first of February by the Exchange Club of that city. The work of organization was completed within a month, and then the work on the floats started. The McComb Board of Trade was active in perfecting the organization.

## Made Record in Extraction of Drawbars

In calling attention to a statement showing the record of his locomotive engineers for the thirteen months from October 1, 1920, to October 31, 1921, Superintendent J. W. Hevron of the Illinois division points out that thirteen of them handled freight trains during this period more than 20,000 miles each and extracted only one drawbar apiece.

"When we take in consideration the tonnage handled on the Illinois division—the heaviest on the system—and the large number of passenger trains operated, necessitating side-tracking these trains for them, I consider it a remarkable record and one, I believe, that cannot be excelled by any division on the system," Mr. Hevron writes.

"You will note that two of these engineers, R. W. Hall on the Chicago district and W. Bates on the Champaign district,

have made a mileage equal to almost one and one-half times the distance around the earth at the equator and extracted only one drawbar."

The 13-month mileage of these engineers is as follows:

Name	Miles Run
R. W. Hall.....	35,263
W. Bates.....	35,080
C. Peterman.....	32,854
G. F. Hauersperger.....	31,449
F. Dunlop.....	30,752
E. R. Bemisderfer.....	27,430
J. J. Arie.....	26,476
P. Farrell.....	26,124
R. E. Dallas.....	24,684
E. E. Pickering.....	24,008
A. F. Ulrich.....	22,559

## *It Pays to Take Good Care of Your Feet*

**T**WO good and faithful servants are the feet. They carry us wherever we may wish to go and at such a rate of speed as is consistent with their structure and speed limitations, uncomplainingly bearing such additional loads as their owner cares to put upon them.

When properly covered and cared for the feet can "carry on" for many years and give the service demanded of them, but when they are improperly cared for and confined in tight fitting, improperly constructed shoes the foundations for trouble are laid, the muscular and ligamentous structures begin to sag and weaken, and the result is flattening of the arches and other signs of weakness.

Did you ever stop to think that your feet are closely confined in leather coverings all day long and have no chance to "breathe," that nine out of ten times they are shut up in improperly fitted shoes and subjected to pressure and strain which make their work doubly difficult?

### **Draw an Outline of Your Foot**

Just place your bare foot on a piece of blank paper some night and trace its outline with a pencil, standing meanwhile so that the weight of the body is placed upon the foot; now take your shoe and compare its outline with that traced upon the paper. Does not this make you realize how you have been mistreating your feet all these years?

Of course you yourself can reform and buy some properly fitting shoes, and it is to be hoped that you do, but in any event be sure to give your children the benefit of your newly acquired knowledge to the end that they may have healthy feet and escape the suffering through which you have gone.

Now let us make such a tracing as has been suggested and right alongside it show the shape of the shoe often worn today.

Figure 1 in Illustration A is the tracing of the natural outline of the foot made while you are standing upon it—that is, while it is carrying the body weight.

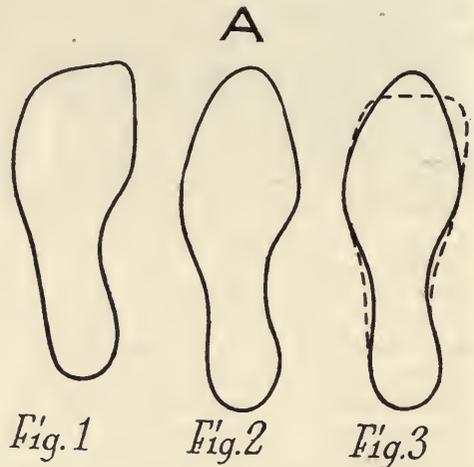

Figure 2 in the same illustration is a tracing showing the shape of the majority of shoes worn today. Comparing the two, as in figure 3, the natural foot being in dotted lines and the shoe drawn solid, gives us a startling revelation on the subject of foot comfort. As absurd as it would seem to be, this picture shows what nine-tenths of us have been doing all these years, and then wondering why our feet hurt so much, why we have so many corns, bunions or callouses.

### **Why the Feet Break Down**

Aside from the production of corns and other callosities, this improper footwear causes other, deeper and more lasting evils which result in the breaking down of the feet and the comparative crippling of their owner. In order to understand why these conditions result a drawing and description of the foot will be necessary.

Illustration B shows: Figure 1, bones of the foot; figure 2, section through bones of the foot (longitudinal).

Each foot consists of no less than twenty-six small bones held together by ligaments and muscles. The fundamental fact to be remembered in the care of the feet is that these muscles perform their function only when given a chance to act, an opportunity which is denied them when tight or improperly shaped

shoes are worn. A look at the illustration of the bones of the foot will show that they are arranged so as to allow for a considerable degree of action aside from the regular function of keeping the body from falling forward, a succession of such falls or relaxations constituting the act of walking.

In observing the illustration of a longitudinal section through the foot-bones, one notices the marked arch in the sole and, to a less extent, the transverse arch across the ball of the foot. It is by improper and restricting shoes that these arches and the muscles which control them are weakened and the foot flattened so that all the spring is taken out of the act of walking. This is not the only important reason for the conservation of these arches; they also help to relieve the joints above them of jar and further protect the underlying nerves, blood vessels and lymphatics, which are subjected to undue pressure when the arch is lost and pressure thus produced. The muscles act like the string of a bow and, by contracting, resist the tendency of the weight of the body to break the arch down.

#### Muscles of Toes Important

The muscles to which particular care should be given to insure freedom of action are those of the toes, and the preservation of their function by properly fitting shoes is one of the fundamental principles in the care of the feet. Stand up and grip the floor with your toes—that is, dig into the floor as if trying to pick up an object with them. This is the action which should be practiced in walking prop-

erly; it is of equal importance with the ankle action upon which the majority of people depend. Disuse of these toe muscles leads to their weakening. After a lapse of years, by failure to support the foot arches, one becomes flat-footed.

Shoes should be flexible enough to permit of the use of the toe muscles; otherwise the act of walking will be carried on entirely by the muscles which act upon the ankle joint. When the toes are squeezed together in the ordinary type of shoe, their freedom of action is interfered with and the foundation of future foot troubles is laid.

Many other matters should be considered in the care of the foot, such as washing, keeping the nails trimmed and cleaned, changing the hose daily and going barefooted as much as possible, but only the fundamental principles from an anatomical standpoint will be considered at this time. Briefly, then, the care of the feet consists of: (1) the use of properly fitting shoes, (2) avoidance of anything tending to interfere with the circulation of blood in the foot and (3) the training and use of the toe-muscles of the foot, so as to keep them strong and active.

#### NIGHT IN JAPAN

It is 10:30 o'clock. A watchman is somewhere in the neighborhood: I can hear his clack, clack as he strikes two pieces of wood together in the cadence, taa, taa ta taa taa! Our three servants, all women, are in the next room, on the other side of the paper sliding walls, chattering and laughing, though they are quieting down as if they would not object to my stopping the clatter of this typewriter and allowing them to go to sleep. The watchman is farther away, but his clack is just as regular. A noodle man in the distance, a couple of blocks down the street, can be heard. His is the flute heard in the orchestration of the Japanese Sandman. His bamboo flute can be heard after the last midnight tramcar has crashed and clanged at break-neck speed on its final run, empty except for an occasional newspaper man or a sake-laden night owl who has to be awakened by the young conductor. Lights in the priest's house on the bank on the other side of our garden can be seen only through a narrow crack in the amada, or outside sliding walls; ours, contrary to all custom, are of glass and leave the house open to the gaze of prowlers and neighbors.—In a letter from B. G. K., Tokyo, Japan.

## ACCIDENT AND

## INJURY PREVENTION

## M. Sheahan's Men Set a Safety Record

THE laurels for the prevention of personal injuries and stock-killing at present belong to M. Sheahan, train-master and road supervisor, and his men on the Rantoul district of the Springfield division, who have passed through an entire twelve months without a single injury or a single head of stock killed on the right-of-way. Working under the jurisdiction of Mr. Sheahan are twelve section gangs, two regular local freight train crews, one regular passenger train crew and the forces at sixteen stations, all of whom have participated in this achievement.

This is, indeed, a wonderful record. Mr. Sheahan, upon being asked to explain for the benefit of others how this remarkable record was attained, gave the following explanation:

"I have been engaged in railway work for forty-two years in various departments. During this time I have had charge of a great many men engaged in work of a more or less hazardous nature. My observations have been that most personal injury accidents are due to carelessness. Men are not purposely careless, however. But personal injuries are usually the result of lack of foresight and thoughtfulness. No one wants to be injured or to see anyone else injured.

"I have always had a horror of personal injuries from a humane point of view as well as when considering the unnecessary expense to the company due to such unfortunate accidents. By keeping the subject of safety constantly before the men and by explaining to them the possibility of disastrous results from taking chances, I find that they are more than willing to co-operate in safety measures.

"Some men are naturally careful. Others apparently are naturally thoughtless of their own

M. Sheahan

safety and of the safety of others. The safe man will take care of himself; if he is given to understand that his aid is earnestly solicited, he will also take care of and protect the men with whom he is working who are not so quick to foresee danger.

"The men of my district are responsible for the prevention of accidents. All I have done is to endeavor to call their attention to any lax practices and teach them to do work without hazard of accidents, to plan their work ahead to foresee and avoid dangerous results, and particularly to avoid haste at the sacrifice of safety. The more experienced employes have assisted in teaching the younger men; in fact, all employes on the district, particularly the older employes, have assumed responsibility along these lines, which has been responsible for the absence of accidents and of stock killed during the past year.

"Our engineers are in a large measure responsible for our success in preventing stock from being killed. They are constantly on the lookout for stock, and, when it has been necessary to do so, they have stopped their trains to avoid striking animals on the track. The section men have also done their part by keeping the fences in the best possible condition."

### Flipping

How often do you swing on a train after it has started to move? Probably with about one-third the frequency that you swing off before it has stopped.

Getting on in this fashion is the more dangerous, no doubt. But either practice is bad enough. In six years, the records of the Interstate Commerce Commission show, 450 persons were killed and 6,857 injured getting on and off in this fashion.

Such statistics mean little. This week one conductor on the Northwestern was seen on three different occasions to pull would-be passengers back from certain injury, when they had tried for the moving step and swung under. If he had not been on the watch an accident would have been, in our judgment, certain in every case. And one of the reckless three was a girl.

The temptation to try getting on at the last second is considerable. But swinging off before the train has stopped is in ninety-nine cases out of a hundred simple asinine. It offers no excuse.

What good to the average citizen is a second of time saved? What will he do with it when he has saved it?

There are many expensive ways of being foolish. But getting on and off moving trains is likely to be one of the most costly, for the least possibility of return.—Chicago *Herald and Examiner*, March 10.

#### A Safe Motor Car

The snapshots herewith, sent in by J. R. Mann, claim agent at Clinton, Ill., are of a motor car in service on the Springfield division assigned to a bridge and building gang under Foreman J. R. Craig.

It will be noted that this car is equipped with a substantial guard made of 1-inch piping, so placed on the car as to prevent the riders from falling in front of the car in case of derailment or other sudden stop and at the same time providing a good hand hold for the riders.

In addition to this safety appliance, the fly-wheel on the car is protected by a screened guard to prevent accidents due to having hands, feet, tools, etc., become entangled in the fly-wheel while it is in motion.

With these safeguards, it would seem that every reasonable precaution in a mechanical way has been taken. However, as a further precaution against accident, an effort has been made to elicit the interest of the gang in this worthy cause by placing a conspicuous sign on the rear of the car showing the number of days that has elapsed since a personal injury occurred in the gang and the total number of personal injuries the gang has had during the present year. The sign is provided with spaces so that the figures may be inserted each day, which enables the foreman to keep it up-to-date.

While only a few of the cars on the division have been equipped in this manner, Roadmaster Russell and Motor Car Repairman McAboy are planning to improve them all.

*A Motor Car Equipped for Safety*

## What Patrons Say of Our Service

### Had a Good Night's Sleep

Paul J. Bierman, adjutor, 1609 Railway Exchange, St. Louis, Mo., recently wrote the following letter to President C. H. Markham:

"You will doubtless receive many letters of complaint at your service, but my experience and observations of it were so excellent that I desire to write you a letter of commendation instead.

"I left Memphis, Tenn., about 10:10 p. m., on February 26, arriving in St. Louis about 7:20 a. m., on the 27th, and I do not know when I enjoyed a night's sleep in a Pullman as well as I did that night. I attribute this to two reasons: first, exceedingly good work on the part of the two engineers who handled the train between Memphis and St. Louis and, second, a good roadbed.

"The quietness and ease with which your train was handled by the engineers was so marked that neither my wife nor myself was disturbed once during the night. This was in such marked contrast with the way in which trains of other lines which we traveled throughout the South were handled that I determined that I would write you a letter at the first opportunity, calling your attention to the good work which these two particular engineers are doing to build up that most valuable asset which any business institution can have—the good will of its patrons.

"It is needless to say that, wherever possible in future, I shall give the Illinois Central preference when traveling, as I take it that the work of these two men is but a sample of the service which you are giving."

### Praise From a Tour Leader

The following letter to President C. H. Markham is from J. O. Joslin, member of the Travel Club of America, Newark Valley, N. Y.:

"I have just returned from my winter tour of nine weeks, conducting a party of twenty-five persons. We left New York February 1 by ship, via Havana, the Panama Canal, to San Francisco, then four weeks' sight-seeing in California, returning via New Orleans.

"It was my privilege and pleasure to use your line and your splendid train, the Panama Limited, leaving New Orleans, 12:30 p. m.,

April 3. The train is splendid and the service the best. After such a long trip, everyone was somewhat tired of the long ride, and it was refreshing to find a train so superior to any we ever used. The dining car service stands out; members of my party were all talking about the food and the service; we have never found its equal in all our travels. I want to thank Mr. Greenberg, the steward, for his attention and the way he cared for my people.

"I am a ticket agent of the L. V. R. R. and organize and conduct two or three tours a year under my own name and management. You will hear from me again in my tours."

### A Word for Our Western Lines

The following letter to J. V. Lanigan, general passenger agent at Chicago, is from B. B. Clarke, editor *The American Thresherman* and *Farm Power*, Clarke Publishing Company, Madison, Wis.:

"This letter is not written soliciting advertising, much as you are losing by not being represented in our publications, but simply to tell you of a most pleasant trip which Mr. Parkinson, our advertising manager, and myself enjoyed between Freeport and Sioux Falls last week over your road.

"The Illinois Central's branch between Madison and Freeport is not supplied with what you might call 'trains de luxe'—in fact I have heard it referred to as the 'jerk-water'—but every official, from the agent in Madison, who secured our reservations, to the porter on the last Pullman, including the dining car service, could not be improved on. It seemed like a real pleasure for everybody to try to contribute to the comfort of the passengers, not with a hand behind them, but with a real desire to be of service to their patrons.

"The conductor in charge of the through train at Freeport in a very friendly way told us right where the sleepers would stop, and assured us that we had plenty of time to board the train. The sleeping car conductor was equally as courteous, and the porter took pains to tell us just when we arrived and just when we could return from Sioux Falls, for we were making a flying trip to that city. He very courteously offered to secure our

reservations and told us how late we could sleep in the morning and still get breakfast.

"In the dining car, the steward was to the manner born, and seemed pleased when we assured him how much we appreciated those little attentions which can neither be bought nor sold. In every instance there was never that air of 'cut and dried' attention, with a suggestion of a 'shake-down,' but a policy of courteous treatment so plainly a part of a master hand was executed to the minutest detail, the like of which I have seldom seen equaled and never excelled by any road.

"It is as great a pleasure to tell you these things as I am sure it will be for you to realize the facts. It's the biggest asset for the outlay that can be offered in the business world—courtesy and kindness always."

#### Handled Message for a Patron

The following letter to M. L. Costley, general freight agent at New Orleans, is from George Schaad, Jr., district manager of the Southern Hardwood Traffic Association:

"I wish to take this opportunity of expressing my appreciation of the service rendered by one of your employes. Due to a mix-up in reconsigning instructions given the writer by the Freiberg Mahogany Company, located at Harahan, it was absolutely imperative that I get hold of this concern over the phone, in order to straighten out the instructions and determine the correct point to which the car was to be diverted.

"I found that the Freiberg Mahogany Company's phone was out of order and would likely be out of order all day, and I called your Harahan office and explained my predicament to Joseph Ernst, assistant general car foreman at Harahan, who very kindly agreed to send a messenger to the Freiberg Mahogany Company, located a considerable distance from his office.

"This was an unusual service for a railway employe to be called upon to perform, and I wish to take this means of expressing to you my appreciation, as well as that of the Freiberg Mahogany Company, and if, at any time, I can be of service to you or your company, please do not hesitate to call on me."

#### Good Care After Missing Train

The following letter to President C. H. Markham is from Harry Goldstine of Harry Goldstine & Company, valuers of real estate, 111 West Washington Street, Chicago:

"Knowing only too well the many complaints

that are lodged with a railway company in the course of its business, I feel that it is no more than fair to acquaint you with an incident happening to the writer while going over your road.

"On the 19th of February I left Chicago for Hot Springs on the 6:15 p. m. train, which was due to lie over in Memphis for about thirty minutes, at which point the diner was disconnected. The train was somewhat late, so that the stop-over was probably only about ten minutes. The writer and his wife and two other gentlemen were in the diner for breakfast. We advised the steward that it was our desire to get through and get back into our car before the diner was taken off. Through some misunderstanding this did not happen, and we were left at Memphis, as our train had pulled out with all our baggage, etc.

"After a series of inquiries we were fortunate enough to meet Colonel A. H. Egan, your general superintendent at Memphis, who came to his office on Sunday morning, and more efficient co-operation and prompt service to make us comfortable and remedy the situation could hardly be imagined. Transportation, proper wearing apparel, luncheon and entertainment until we could leave for our destination were provided so quickly that one would almost have assumed that the untoward circumstance had been anticipated.

"I can only express to you, on behalf of myself and the party, our appreciation for the courtesies extended."

#### A Rotary Club Special Train

The following letter to General Superintendent W. S. Williams of Waterloo, Iowa, from C. A. Morris, president of the Waterloo Rotary Club, has to do with the special train operated by the Illinois Central to the Rotary Clubs' convention at Sioux Falls, S. D., March 21 and 22:

"The service accorded the Waterloo delegates to the Sioux Falls Rotary Conference by the Illinois Central Railroad and its employes was of such an advanced type that I hardly feel competent to describe it in words.

"Our train, as big and grand as it was, was made as wieldy as an automobile or a canoe, through the efforts of the men running it to cater to every whim of the passengers.

"In speaking for our club, I wish to name on the honor roll, together with many others, our brother Rotarian McCabe, Sullivan, Gray, Buckley and the young man who I believe in-

*Rotary Club Special Train at Waterloo, Iowa*

roduced himself as a traveling passenger agent for this district.

"The attention of General Electrician Keisling, his assistant, the inspector of dining car service, who was in evidence in the dining car, the brakeman, conductors, employes of the Pullman Company and, in fact, everyone with whom we came in contact was most commendable.

"I cannot help but believe that the growth and success of a railroad having for its slogan such true and unselfish service to patrons as was shown us is assured.

"It is indeed regrettable that you could not be with us in person to participate in our enjoyment as well as note the appreciation of others.

"In conveying the thanks of our club, please do not overlook any person that contributed to the success of the trip. It shall always be our desire to reciprocate in some manner or other."

#### **Y. & M. V. Pleases Rotary Club**

The following letter to President C. H. Markham is from John J. Heflin, president of the Memphis, Tenn., Rotary Club, and W. J. Prescott, chairman of the club's convention committee:

"Last week the Memphis Rotary Club traveled by special train over your road to Baton Rouge, La., and return. We received such splendid co-operation and such excellent service from P. W. Bell of the passenger department and Colonel Egan and Mr. Feeny of the transportation department that we want to advise you, as head of the road, how completely sat-

isfactory our experience was. Memphis has always felt very friendly toward your road, and our appreciation of it is even greater than it has been heretofore.

"Assistance of importance was given us also by Mr. Dubbs at Greenville and the Y. & M. V. offices at Baton Rouge. We lived on the train for three nights and two days. Everybody is delighted with the trip."

#### **Pleased With Rotary Club Trip**

The following letter to J. V. Lanigan, general passenger agent at Chicago, is from W. C. Stevens, vice-president of the Rockford (Ill.) Rotary Club:

"Rockford Rotary Club has just returned from a conference of the Twelfth District of Rotary held at Decatur. The trip was made over your lines, and it is our desire to make some acknowledgment of the treatment received from Illinois Central men.

"We all feel that we have never taken a similar trip where everyone was so anxious and so willing to make everything comfortable and satisfactory.

"We wish in particular to acknowledge the courteous treatment and help in making our arrangements received from Mr. Wheelless and his assistants in your local office. Their efforts relieved the making of arrangements, securing tickets, etc., of the burdensome annoyance usually experienced by the persons having such an expedition in charge."

#### **Praise from a Traveling Man**

Barney E. Mead of 1419 Stet Street. Little

Rock, Ark., recently wrote as follows to President C. H. Markham:

"You invite criticism. If I had any against your service, I would be just as anxious to voice it as I am to write this.

"Last week I was riding on train No. 33 from Crystal Springs, Miss., to Fernwood, Miss. Something came up to mar my pleasure and to cause me to lose two days in my route. There was a conductor on this train whom I afterward learned was A. E. Broas. This gentleman helped me to get right in my trouble,

which was something outside his duties as a conductor of the train. I have been a traveling man since 1909 and have traveled thousands of miles with as many different conductors, but never in my road experience have I met such a true gentleman as this man.

"This little incident has made me a booster for the Illinois Central, and I shall, whenever possible, patronize its lines. I further wish to say that I believe the Illinois Central is fortunate in having a man of this caliber on its trains."

## *John D. Ladd, Agent at Cairo, Ill., Dies*

John D. Ladd, agent at Cairo, Ill., for thirty-two years and an employe of the Illinois Central System for almost half a century, died at St. Mary's Infirmary at Cairo, Tuesday, March 28, of angina pectoris following influenza. Mr. Ladd was 68 years old and one of the best-known and best-liked employes of the Illinois Central System.

The funeral services were held at the First Presbyterian Church at Cairo, Friday, March 31, conducted by the Rev. William J. Thistle, the pastor, assisted by Dr. William P. Pearce, pastor of the Cairo Baptist Church. The floral offerings which were banked in the church testified to the respect in which Mr. Ladd was held by the people of Cairo. The sixteen active and honorary pall-bearers consisted of prominent Cairo business men and the following railway representatives: W. L. Gillespie and Al Steele of the Illinois Central forces at Cairo; J. H. Jones, pensioned ticket agent of the Illinois Central; H. E. Fitts, agent of the Mobile & Ohio, and John E. Luby, agent of the Iron Mountain.

A special Illinois Central train carried the funeral party to Villa Ridge, where the burial took place.

Among the out-of-town representatives of the Illinois Central who attended the funeral were J. F. Porterfield, general superintendent of transportation; R. B. Goe, supervisor of weighing and inspection; J. F. Shepherd, auditor of freight receipts; W. Atwill, superintendent of the St. Louis division; J. M. Walsh, superintendent of the Memphis division; William Smith, Jr., assistant general freight agent, St. Louis; F. D. Miller, assistant general passenger agent, St. Louis, and W. H. Rhedemeyer, agent at East St. Louis, Ill.

*John D. Ladd*

Mr. Ladd's death came almost without warning. He was at his desk Saturday, March 25. The next day he contracted influenza. Angina pectoris developed, and Monday he was moved to the hospital. His condition was not considered serious until Monday evening.

He is survived by his widow and one son, John H. Ladd of Los Angeles, Cal. Another son, Walter, was drowned several years ago at the age of 16. Mrs. Ladd, who had gone to Rochester, Minn., a few days before with

her sister, was not able to reach Cairo before the death of her husband.

Mr. Ladd was a member of the Railroad Agents' Association and of Lodge No. 51 of the Knights of Pythias. The members of the latter attended the funeral in a body.

Mr. Ladd's career was described in the October issue of this magazine, in connection with the stories of four other veterans of the St. Louis division. He was a native of Grayville, Ill., and a graduate of Mayfield College, Mayfield, Ky. He learned telegraphy at the age of 19 and entered the employ of the Paducah & Memphis Railroad (now the Illinois Central) at Paducah, Ky., in 1873. There he became one of the first telegraphers in the country to learn to read the messages by sound. He went to Cairo from Memphis in 1884 and was made agent at Cairo in 1890.

Mr. Ladd's success as agent at Cairo can be understood from the following editorial which appeared in the March 29 issue of the *Cairo Evening Citizen*:

"It is going to be hard to adjust ourselves to the fact that John D. Ladd has passed away. For years he was very much a factor in this community, more especially in railway

circles, so that when any matter came up regarding railway service, the question was asked, 'Have you seen Mr. Ladd?'

"For a third of a century Mr. Ladd served the Illinois Central Railroad here as its agent. The word 'served' should be emphasized in this statement, for to him serving meant giving all that there was in him. He was the dean of the railway agents of Cairo, and yet in his position of representative of the railroad here he was fair to other agents, helpful often, but always loyal to his own line. To John D. Ladd, living meant promoting the interests of the Illinois Central Railroad.

"Entering the service of the company when a young man of 20, after nearly fifty years in the company's service he was looking forward to the time when he should retire under the rules of the company. Although we miss him from our community, miss him deeply, perhaps it is fortunate that he died in the service of his company. To have stood aside and watched others do the work in which he had always occupied the central position, would not have been an easy task for him.

"Certainly of him it can be said, 'Well done, thou good and faithful servant.'"

## Joe Weir, 28-Year-Old War Veteran, Dies

Joseph A. Weir, Jr., 28 years old, known to his hundreds of friends simply as "Joe," died suddenly in Chicago early Tuesday morning, March 21.

Joe was a veteran of the World War, a member of Battery A, 114th Field Artillery, 30th Division. He served as a private through all the major campaigns in which the Memphis battery was engaged. His conduct as a soldier was of such nature as to win the approbation of his superiors. Of a pleasing personality, he made friends with all whom he knew, and his cheerful and buoyant spirit did much to maintain the morale of the battery during the hectic days of struggle in France.

In civil life, as in his military career, he made friends easily. At the time of his death he was employed as a correspondence clerk in the office of the vice-president and general manager at Chicago. For several years, with the exception of the time he served in the army, Mr. Weir was employed in numerous capacities in the office of former Superintendent V. V. Boatner at Memphis. Two years ago

J. A. Weir, Jr.

he was promoted to the position he held at the time of his death.

Joe was a great promotor of clean sports and was manager of the operating department baseball team in 1921. He was a crack bowler and finished among the winners at the office tournament recently held in Chicago.

Funeral services were held in Memphis, Thursday, March 23. The requiem mass was celebrated at St. Mary's Church, and burial was in Calvary Cemetery. He is survived by his parents, Mr. and Mrs. J. A. Weir, Sr., and three brothers, Raymond, Herbert and Manning. A view of the floral tributes was sufficient to distinguish the lad as one who was well thought of and liked by his multitude of friends.

Maintenance  
of Way  
Department

# Material Means Money Save It

## Track Spikes

A pin a day is a groat a year—  
A track spike saved is two cents clear.  
—Poor Richard III.

A track spike costs only slightly more than 2 cents, and for this reason it perhaps does not appear to be a very important item of expense to the average employe. Yet during 1920 and 1921 the Illinois Central and the Yazoo & Mississippi Valley railroads purchased 19,087,260 track spikes at a cost of \$389,271.21, an average of 9,543,630 spikes a year. On the basis of 300 working days a year, 31,612 spikes were used every day, or enough to spike two and one-half miles of track. A crew working eight hours a day and 300 days a year would have to drive an average of sixty-six spikes a minute to use this amount.

A daily expense of \$648.78 for track spikes should be large enough to convince the most skeptical that they form a substantial portion of the maintenance expense, yet from the very large number of serviceable spikes found in

the scrap and scattered along the right-of-way it is evident that the possibilities for economies in their use are not fully appreciated. The illustration shows a part of fifty-five barrels of spikes reclaimed from scrap at Burnside in three months. These fifty-five barrels contain a total of 77,000 spikes.

More than 300,000 track spikes are reclaimed annually from scrap at Burnside, representing a value of more than \$6,000. It is significant that thousands of these spikes have never been driven in a tie, and their presence in the scrap is due to gross carelessness. While the majority of the spikes have been used, more than 50 per cent are as good as new and should never have reached the scrap pile.

While these spikes will be reclaimed and placed in use again, there is a loss due to the unnecessary expense entailed in sorting them out of the scrap and in rehandling them. There is still greater waste occurring in the use of track spikes from the loss of those that are buried in the ballast and earth along the right-of-way and that will never be reclaimed. Prob-

*Spikes, 77,000 of Them, Reclaimed From Material Shipped as Scrap*

ably the worst waste of spikes occurs in cuts and on fills, where they are scattered about and become buried in the loose earth. A little attention given to the manner of handling spikes to prevent their being lost will result in a substantial saving.

If each of the 60,000 employes on the Illinois Central System will save a track spike or its equivalent in value each working day, it will amount to more than \$360,000 a year and will buy more than 9,000 tons of rail or nearly 400,000 ties.

---

## Stopping Some Leaks in the Use of Fuel

Attention has previously been called to the fuel conservation bulletins of the Illinois division, signed by Superintendent J. W. Hevron and issued at intervals, in which the employes are advised of concrete cases of waste. Here is Bulletin No. 3:

"A local train pulled out of a station fourteen miles from the terminal ahead of a tonnage train, performing work at two other stations before reaching the terminal, causing the tonnage train to consume 1 hour and 14 minutes, whereas the run could have easily been made in forty minutes, had the local let them pass when overtaken. This action on the part of the local caused unnecessary consumption of at least two tons of coal.

"A local train having a meet order with a northward tonnage train made a switch after arriving at the meeting point, instead of getting into clear immediately, although this tonnage train was in sight, resulting in stopping the tonnage train on a heavy grade and causing more delay to a local by the other trains pulling by slowly after stopping than if he had got into clear immediately on arrival and made his switch after the train he met had departed.

"In every case where a local or work train stops a tonnage train, the delay to themselves is more on account of the slow speed of the tonnage train after stopping than if they had got into clear when the other train came in sight."

Says Bulletin No. 4:

"A freight engine cut off for water and popped off four times while standing at pen stock, the pop being open  $4\frac{1}{2}$  minutes in the aggregate, causing a waste of 75 pounds of coal and 20 gallons of water.

"A local freight train working on the main track stopped a tonnage train at a block signal situated on a grade, making it necessary for the tonnage train to back up to get a run for the hill. In doing this,

a drawhead was broken, causing a delay of thirty-five minutes and the consumption of an additional ton of coal. Had the local train got into clear as soon as the tonnage train approached, the delay to the local would have been much less and the delay to the tonnage train would have been entirely eliminated.

"Twelve cars on a tonnage train ran hot within a distance of a few miles from the terminal. After being repacked and given attention at four different points on the district, ten were handled through to the destination, but it was necessary to set out the two others. It is evident that in this case the car men at the terminal from which the train started failed to give the cars the required attention. As a result not only were two cars seriously delayed but the train in which they were handled was also seriously delayed, causing the consumption of additional fuel.

*"If we can stop the little leaks, we won't have the big ones!"*

Here is Bulletin No. 5:

"A terminal organization failed to call a conductor and flagman, causing a delay of two hours to the train and the consumption of at least one ton of coal. This coal uselessly consumed would have hauled 1,000 gross tons a distance of thirteen miles.

"A local freight train, while unloading merchandise and performing station switching, delayed a B rating train twenty minutes. This in turn delayed a banana train that was following and in addition caused the B rating train to remain in siding for two passenger trains; whereas, if the first twenty minutes' delay could have been avoided, the B rating train could have reached the third-track territory. Three tons of coal unnecessarily used is a conservative estimate.

*"Watch for the little leaks and stop them before they become big ones!"*

# Traffic Department

## *Coal Washing Is a Matter of Economy*

By W. T. WRIGHT,  
Supervisor of Coal Traffic

**T**O many, both in and out of the coal business, the method of operation of an up-to-date coal washing plant would, no doubt, be interesting.

That the reader may better understand the great volume of water required in connection with coal washing, the writer has in mind now a modern washery adjacent to an immense reservoir covering two hundred acres and containing 500,000,000 gallons of water from which 600 gallons a minute are pumped into the washery. The washery is constructed of reinforced concrete throughout, has a floor space of about 41,000 square feet and has a storage bin capacity of 4,000 tons. All the coal that is hoisted is conveyed directly into the washery, where all the impurities are removed, after which the cleaned coal is loaded into cars from the washery bins.

### Coal Washing Still a Mystery

When one speaks of coal washing, the mind of the average layman is a complete blank; he either did not know there was such an "animal" or, if he has heard the term used before, he has not the remotest conception of how the process is carried out or upon what theories or facts it depends for its success. Yet it is an industry that affects, to a greater or less degree, almost every user of coal from the man who charges thousands of tons annually in his by-product coke ovens to the householder who uses only a few tons a year. In the future it is destined to play an even more important part in our national life.

Coal washing dates its beginning from the first half of the nineteenth century. Its progress as an industry, especially in the United States, has been comparatively slow until the last ten or fifteen years. This has been mainly due to the fact that good coal has been so abundant that the poorer grades

have been left untouched. The gradual depletion of the better grades of coal has, however, in later years made it necessary to turn to the less desirable grades and consequently has brought the question of their utilization, either as mined or after treatment in some way, very much to the fore.

### Reasons for Washing Coal

There are several reasons which make the washing of coal necessary and desirable before it is put on the market. Some of these are, briefly, as follows: While the quantity of good coals which are available, particularly for the manufacturer of by-product coke, are not near exhaustion, yet they have practically reached the limit of their production. At the same time the demand for coke suitable for metallurgical purposes has grown to such an extent that it has become necessary to use inferior coals, which have to be washed before they can be used.

Another factor that has tended to help develop the coal washing industry is the fact that users of coal are becoming more critical; while they would formerly accept almost any kind of coal which looked good to the eye, they now demand a coal with a low ash and moisture content and high heating value.

A third factor is the possibility of producing a product for which the market will pay a price not only sufficient to pay for the extra expense of washing but to yield a profit on the washing itself.

In order to be available for the manufacture of blast-furnace coke, coal must not only have what are called good coking qualities but must also have a comparatively low ash and sulphur content. The man who uses coal for fuel purposes wants coal with a low ash and moisture content and a high B. T. U. value. The problem for the mine operator becomes, then, one of ridding the

coal of its objectionable constituents and increasing the desirable constituents.

### The Theory of the Process

The main impurities which are removed from coal by washing are slate or shale and pyrite. The reason that these can be removed is simply that they have a higher specific gravity than pure coal—in other words, pieces of these would weigh more than pieces of coal of the same size. Thus, if we assume a 1-inch cube of coal to weigh one ounce, then a similar cube of slate would weigh, possibly, two and one-half ounces and a cube of pyrite four ounces or more.

This difference in weight of pieces of the same size causes them to settle in water at different rates of speed. If the cubes mentioned above were dropped into the water at the same time, the pyrite would hit the bottom of the vessel first; then the slate, and finally the coal.

While this is true of pieces of the same size, yet it does not necessarily hold for pieces of varying sizes. A piece of pure coal of sufficient size might have the same settling velocity as a smaller piece of slate or pyrite.

The shape of the pieces also has some bearing on the speed with which they settle in water. Thus, a spherical piece would naturally settle faster than a flat piece.

It may be stated then that the principle upon which coal washing depends for its success is simply that the impurities and good coal, under similar conditions, settle in water at different rates of speed.

### Crushing Prepares for Washing

Inasmuch as the impurities are attached to and distributed through the coal, it is evident that before they can be separated they must be detached from one another. This is accomplished by crushing the coal.

After the coal has been screened to the sizes which the plant is equipped to handle, it goes to the machines which perform the actual separation of the good coal and impurities. These machines may be divided into two classes: jigs and tables.

Jigs have been and still are the machines most generally used in coal washing.

The first jig used for the washing of coal was simply a tub with a perforated bottom which was alternately raised and lowered

in a tank of water by means of a lever and counterpoise. The jiggling motion caused the heavier particles of slate and pyrite to work their way gradually to the bottom of the tub while the good coal went to the top. The cleaned coal was then scraped off, the impurities dumped out, the tub filled with a new batch of raw coal, and the process repeated.

In most of the present day jigs the separation is effected in just the opposite manner. Instead of a moving screen and a quiet body of water, the present jigs have a stationary screen and moving water. The movement or pulsation of the water is effected by means of plungers. Jigs with a moving basket are still in use, however.

### Coal Must Then Be De-Watered

Before it is available for consumption, washed coal must be de-watered as much as possible for the following obvious reasons: No consumer wants to pay for water when he is buying coal; no one likes to pay freight charges on water; water does not burn, but on the contrary heat must be used to drive it off; it makes the coal mass freeze in winter, and, finally, it has a bad effect on the walls of the coke oven.

De-watering of the coal is accomplished in several ways: By the use of de-watering bins or pits, where the coal is delivered to bins and allowed to de-water itself by draining; by slow moving elevators or conveyors, these being constructed of perforated material to allow the water to run through; by use of centrifugal dryers, where the coal is fed into a basket having sides of perforated metal which, being revolved at a high rate of speed, throws the water out through the holes in the sides and the coal, being scraped off by means of knives, drops through the bottom of the dryer on a conveyor belt below. Filters are used for removing the excess water from the extremely fine coal or sludge. Centrifugal dryers are by far the most efficient of any of the foregoing methods of drying the coal. They will reduce the moisture in coal from 20 per cent or more down to 6 to 10 per cent, handling seventy-five tons an hour.

In some plants the coal is not de-watered at all before being loaded into the cars, but in such cases the car itself acts as a de-watering bin, the excess water draining out the bottom of the car.

# Law Department

## A Long, Troublesome Law Suit Ended

A decree was entered in the Chancery Court at Clarksdale, Miss., April 10, which put an end to one of the most troublesome pieces of litigation with which the Illinois Central System has been confronted. Some of our readers will remember that in 1913 the State of Mississippi brought a suit against the Illinois Central and the Yazoo & Mississippi Valley, seeking to recover millions of dollars in penalties and to secure a decree which would prevent the Illinois Central from exercising any control over the Yazoo & Mississippi Valley, and to force the Illinois Central to sell its stock in the Y. & M. V. The suit attracted a good deal of attention at the time it was brought. A volume of testimony has been taken from time to time, and it was expected that it would be brought to trial some years ago. However, the entrance of our country into the World War, followed by the era of government control, held this suit in abeyance for some years.

Recently the attorney-general of Mississippi has been active in the matter, and has insisted that some disposition should be made of the case. In the meantime the Transportation Act was passed, giving to the Interstate Commerce Commission broad powers in the matter of consolidating railroads and passing upon questions of the right of the officers of one road to be officers of another and of one railroad to own stock in another.

The lack of merit in this case has recently been the subject of one of President Markham's letters to the people of Mississippi.

The case was submitted to the chancellor on what was tantamount to an agreed statement of facts, and the chancellor by his decree has adjudged that the Illinois Central Railroad Company had a right to purchase the stock of the Yazoo & Mississippi Valley Railroad Company, to hold it and to exercise whatever degree of control came from such stock ownership. The chancellor also held that the consolidation of the Yazoo

& Mississippi Valley and the old Louisville, New Orleans & Texas was expressly authorized by the statutes of Mississippi, and was not in contravention of any constitutional provision or law of the state. The bill, therefore, was dismissed as to the Illinois Central and the Yazoo & Mississippi Valley, as well as to the Mississippi Valley Company, the holding company, by means of which the stock of the Y. & M. V. is held by the Illinois Central.

However, the chancellor found that the Mississippi Valley Corporation, a corporation of the State of New Jersey which is entirely distinct from the Mississippi Valley Company, which is a Mississippi corporation, did between 1905 and 1910 buy the capital stock of the Helm & Northwestern Railroad, the Sunflower & Eastern Railroad and the Leland Southwestern Railroad, these being small Mississippi railway corporations owning branch lines connecting with the Yazoo & Mississippi Valley. The Helm & Northwestern and the Sunflower & Eastern are in effect a part of the Y. & M. V. system of transportation. The chancellor found that, prior to April 2, 1910, it was a violation of Mississippi law for one corporation to buy stock in another, even if the two corporations were not in competition. The law was changed in 1910 so as to make the prohibition apply only where the corporations are competitive. For this ancient violation of the law the Mississippi Corporation was adjudged to pay a penalty of \$60,000, in reality made up of a \$50,000 fine and \$10,000, the approximate amount which the State of Mississippi spent in preparing the case for trial.

The Illinois Central and the Yazoo & Mississippi Valley acquiesced in this decree, and the case is at an end. It is of course worth something to the railroads to have an adjudication that every substantial thing which has been done in Mississippi has been in accordance with the law.

The termination of this litigation is believed to mark the beginning of a period of better understanding between the state authorities of Mississippi and these railroads, and it is fervently hoped that nothing will occur that will

interfere with the amicable conditions that now prevail.

### Power of the I. C. C. Over Divisions

Some interesting questions are raised in the suits brought by certain eastern trunk line carriers against the Interstate Commerce Commission to set aside the orders of that commission in what is known as the "New England Division Case."

In that case the New England carriers were granted an increase in their existing divisions amounting to approximately 15 per cent. Of course these increased divisions are at the expense of the connections of the New England roads, particularly the carriers operating in eastern trunk line territory. The Interstate Commerce Commission at first denied the prayer of the New England lines, holding that it had no jurisdiction to increase divisions merely because the railroads asking such increases were in greater distress than those from whom the increases were asked. On rehearing and reargument, however, the commission altered its point of view and held that, although the New England lines might not be entitled to increased divisions on account of their necessities, it was the duty of the commission to take from the strong and give to the weak in order to permit the weaker roads to continue to operate as efficient transportation agencies.

The commission referred to the fact that in the Advanced Rate Case, 1920, a greater advance was allowed to all the railroads in eastern territory by reason of the inclusion of the New England lines, with their high property investment and their small net income. For this reason, and on account of the desperate condition of the New England lines, the commission decided it would require the connections of those lines to contribute to their support to the extent of 15 per cent of existing divisions.

The order applied to class traffic and commodity traffic divided on the class basis, where such traffic moved on joint through rates. A large number of carriers in eastern territory, including all the important lines except the B. & O. and the Pennsylvania, have filed a bill in the United States District Court in New York, seeking to have this order of the commission set aside as in excess of the powers of the commission under the law. One of the contentions of the trunk line railroads is that, if the commission is allowed to divert earnings of the more profitable railroads to the treasuries of the less profitable, there will be no

earnings left for recapture, and that part of the Transportation Act providing for recapture will be practically nullified by the action of the Interstate Commerce Commission.

The result of this case will be awaited with great interest by all students of the railway problem.

### Consolidation of Railroads

Our readers are no doubt aware of that portion of the Transportation Act which provides that it is the duty of the Interstate Commerce Commission to take the initial steps to consolidate the railroads of the United States into a limited number of large systems. The law provides that consolidation is not compulsory, but that the Interstate Commerce Commission shall adopt a plan for consolidating the railroads of the country, and voluntary consolidations that thereafter occur are required to be in harmony with this plan.

Some time after the passage of the Transportation Act, the commission employed William Z. Ripley, professor of transportation at Harvard University and well-known student of railway economics, to make a study of the railroads of the United States and submit a plan for their consolidations. In the course of time, Professor Ripley, after consulting most of the leading railway men of the United States, submitted an exhaustive and carefully prepared report making certain comprehensive recommendations as to how these consolidations should be effected.

Professor Ripley's report dealt rather conservatively with the Illinois Central. He speaks in the highest terms of the Illinois Central's careful development of its properties, asserting that it has always confined itself to its legitimate territory, and that such expansion as has occurred has been consistent with its settled purpose to serve its own territory, the Mississippi Valley, in the most efficient manner. Mr. Ripley's recommendation is that the Illinois Central System be composed of the Illinois Central Railroad, the Yazoo & Mississippi Valley Railroad, the Central of Georgia Railway, the Gulf & Ship Island Railroad and the Tennessee Central Railroad.

The Interstate Commerce Commission, however, when it came to make its tentative report, disregarded some of the suggestions of Professor Ripley, and suggested the creation of a system known as the Illinois Central-Seaboard Air Line System, which should consist of the Illinois Central Railroad, the Yazoo & Mississippi

Valley Railroad, the Central of Georgia Railway, the Gulf & Ship Island Railroad, the Tennessee Central Railroad, the Seaboard Air Line Railroad, the Carolina, Clinchfield & Ohio Railroad, and a small branch line of the Norfolk & Western Railroad.

It was announced the commission would hold hearings on the subject of the suggested consolidations in the Southeast at Washington on April 24, when all the railroads and other interested persons would be heard, in either commendation or disapproval of the proposed system.

It is understood that both the Illinois Central and the Seaboard Air Line are opposed to this unnatural union, the effect of which would be to tie together two railroads in widely separated territories, with greatly differing traffic conditions and with no adequate connecting link. It is presumed that other hearings will be held at short intervals with respect to consolidations in other parts of the country.

### Federal and State Rate Control

In the editorial column last month there was a brief discussion of the Wisconsin Passenger Rate Decision, with reference to the holding of the Supreme Court of the United States that under the Transportation Act the states cannot escape their duty to bear their fair share in the expense of supporting the railroads of the country.

The effect of the decision has been seen in many of the states, where steps have either been taken or soon will be taken to conform the state rates to the level of rates as established in the Advanced Rate Case of 1920. As an illustration of the attitude of the state commissions, reference may be made to the action taken by the Illinois Commerce Commission at a recent session. An order was passed referring to the Wisconsin Rate Case and recognizing fully its authority, under which order intrastate rates in Illinois were advanced in exactly the same measure as were interstate rates in the eastern territory—40 per cent. Of course, these advances have all along been in effect, but they were obtained by force of the order of the Interstate Commerce Commission, backed up by federal injunction. The advances will now rest as well upon the authority of the state commission, which has rescinded all its orders suspending tariffs of the carriers attempting to put these advanced rates into effect. It may be that the Interstate Commerce Commission will now rescind its order condemning

the state rates, so that the injunctions may be dissolved and the state left free to exercise that limited authority which is left to it under the Transportation Act, as interpreted by the Supreme Court in the Wisconsin Rate Case.

It is undoubtedly desirable that harmonious relations should prevail between the Interstate Commerce Commission and the various state commissions, so that each may function within its respective jurisdiction without conflict or confusion. It is understood that action similar to that taken by the Illinois Commerce Commission will soon be taken in Nebraska, Kansas, Missouri, Oklahoma and other states where the freight rate advances have not been fully granted.

### HELPED SAVE A TRAIN

Superintendent W. Atwill of the St. Louis division recently wrote as follows to E. S. Eviland, 111 Very Street, Carterville, Ill., who has been employed as a coal miner at Madison No. 8:

"I understand that on March 11, while you were walking along our track, you noticed a mine sink under the track on our Dew Maine Line and that you took necessary action to protect our trains from running over this track while another person notified our agent of the trouble.

"The work displayed by you in the interest of the Illinois Central is indeed very commendable, and I wish to assure you that this is appreciated by myself and the entire management of this company."

### THOUGHTFUL

# NEWS OF THE DIVISIONS

## AROUND CHICAGO

### Accounting Department

Miss Carol Perry of Mr. Blauvelt's office and Miss Mae Wilner of Mr. Kimbell's office recently spent an enjoyable week-end in Memphis at the home of Mrs. Anita Sigwart, who, it will be remembered, was, until a few months ago, an efficient book-keeper in Mr. Kimbell's general accounts bureau. H. A. Sigwart is a "migratory" representative of R. W. Bell's office, his duties throughout the various shops necessitating their location in Memphis.

Mrs. Anita Sigwart

### Suburban Passenger Service

Louis E. Atkinson entered the service of this company November 11, 1898, as a freight brakeman. He was promoted to the position of con-

ductor December 20, 1901, and spent the last two years of his life in the suburban service. After an illness of several months, Mr. Atkinson died at the Illinois Central Hospital March 14, and was buried at Forest Home Cemetery, March 16. Funeral services were held at Roberts' Chapel, 1411 East 60th Street, and the Rev. R. Scott Hyde of the Woodlawn Methodist Church officiated. Woodlawn Division No. 327, Order of Railway Conductors, of which Mr. Atkinson was a charter member and trustee, conducted the services at the cemetery. The services were performed by Conductor J. J. Tierney, chief conductor, and Conductors Pomeroy, Darling, Fugenschuh, Skibbe, Buckbinder and Tolhurst as guards of honor. The pallbearers were: A. Dietz, R. W. Carruthers, S. P. Buck, W. L. Blake, F. Dunning and E. L. Townsley. They had known and worked with Mr. Atkinson during his years of service with the company.

### 63rd Street Office Sports

The bowling season wound up April 12, with the New Orleans Special taking two out of three from the Seminole Limited, and thereby winning the pennant by one game. The officers also surprised everybody present by winning their second game of the season. The Daylight Special rolled the high team game of the season in the last round. Led by Bobby Goodell with 248, they rolled 1010. Below find the final

The 63rd Street office baseball team, champion of the Illinois Central Railroad League for 1921, has reorganized and is now ready to meet all comers. E. Reha is ready to accept challenges from all out-of-town teams along the Illinois Central System. Address challenges to E. Reha, Office of Auditor of Freight Receipts, 6327 Dorchester Avenue, Chicago. Hank Nelson, last year's captain, is beginning to reduce. Bill Giesecke, the Ray Schalk of the Illinois Central League, is in good condition and is ready to go.

E. A. Axen, formerly chief clerk to Terminal Superintendent A. M. Umshler, was made yardmaster in the Chicago freight yard, effective March 22. Mr. Axen was succeeded by R. W. Watts, former chief clerk at Wildwood.

E. A. Axen

**ILLINOIS DIVISION  
Superintendent's Office**

The marriage of Miss Helen Sullivan of Champaign, Ill., to Paul Somers of Detroit, Mich., was solemnized at 7:30 a. m., Tuesday, April 18, in the Holy Cross Church at Champaign. Miss Sullivan is the daughter of Mrs. Ella Sullivan, and is well known in Champaign. Her father, the late M. W. Sullivan, was an engineer on the Illinois Central. Miss Sullivan entered the service of the Illinois Central as telephone operator when the division offices were moved to Champaign some three years ago. She was transferred to the freight department as stenographer on June 2, 1920, and later was transferred to the accounting department as

Mrs. Paul Somers

stenographer, a position she held until April 5. The bride and groom departed on No. 24, Tuesday noon, April 18, en route Detroit, where they will make their home.

Misses Lona and Blanche Lawson entertained at a miscellaneous shower, Tuesday evening, April 4, in the accounting department rooms in honor of Miss Sullivan. Those present were Misses Zoe and Billie Friend, Miss Marie Capps, Misses Viola and Mildred Monohan, Mrs. Otis

A. Barnes, Misses Ethel and Margaret Baker, Mrs. L. M. Sands, Misses Pauline and Margaret Mallman, Miss Fairy Wand, Miss Katherine Bridges, Misses Lona and Blanche Lawson and Misses Helen and Bernice Sullivan. The evening was spent in dancing and playing cards, and refreshments consisting of ice cream, molded in kewpies and lilies, and cake were served. Miss Sullivan was the recipient of many beautiful and useful gifts.

Trainmaster C. W. Davis of the Champaign district has been removed to his home in Champaign, Ill., having recently undergone an operation at the Emergency Hospital, Kankakee, Ill. Mr. Davis is getting along nicely and will soon be back on the job.

A meeting held in the chief accountant's office the afternoon of March 29, conducted by Chief Accountant E. F. Kremer, took up the subject of railway accounting. Various subjects of importance were brought up at this meeting and discussed among the accountants. During the course of the afternoon short talks were made by the following: M. A. Sheahan, accountant, on "Completion Reports"; Miss Lona M. Lawson, tonnage clerk, on "Tonnage"; J. C. Johnson, timekeeper, on "Timekeeping." It is the intention of the Illinois division to hold these meetings each month hereafter, as it was the consensus of opinion that a great deal of benefit is derived by these gatherings. At the close of the meeting, R. G. Miller, chief clerk to Superintendent J. W. Hevron, dwelt for a few minutes on the importance of these meetings and of benefits derived by each individual.

A sewing club, consisting of eighteen girls, most of whom are Illinois Central employees, met at the home of the Misses Pauline and Margaret Mallman, 709 West Hill Street, Champaign, Ill., Thursday evening, April 6. The evening was spent in hemming dish towels for the bride-to-be, Miss Helen Sullivan. Dainty refreshments were served.

**Champaign Roundhouse**

Mrs. Walter Baum, wife of Engineer W. Baum, died Friday, April 7, the victim of pneumonia.

The employes at Champaign will present the Champaign shops baseball team with new uniforms and sweaters. The uniforms are being presented by the shop employes, and the sweaters by the roadmen and switchmen and other employes at Champaign. The money is being raised by subscriptions, the solicitation being handled by Engineers J. J. Arie and C. E.

Granger for the roadmen and yardmen and P. R. Cain, car repairer, and Thomas McGackle, boiler foreman, for the shopmen.

W. E. Schweinke, machinist, has been confined since March 22 to the Chicago Hospital, where he was taken to have a piece of metal removed from his right eye. Mr. Schweinke was chiseling a piece of material when a splinter of it struck him in the right eye, resulting in the loss of the sight of that eye.

"Al," a member of the office force at Champaign roundhouse, is dead. He was picked up in the storage coal pile at Champaign and assigned to the position of office mascot, a position he filled for four days. He immediately went on a hunger strike which resulted in his death four days later. "Al" was about ten inches long and was of the lizard species. He was christened "Al" by Miss Margaret Cain, on account of having the appearance of an alligator. For all we know, "Al" might have been named wrongly; possibly "Liz" would have been more appropriate.

**Kankakee Roundhouse**

Mr. and Mrs. P. LaGessee are the proud parents of a new daughter, born April 3. Mr. LaGessee is car clerk.

Fireman P. F. Ryan was called to Memphis, Mo., recently by the death of his mother.

Engineer C. N. Weaver has been called to Clinton, Ind., by the death of an uncle.

Engineer C. F. Pangborn has been off duty on account of sickness for the past thirty days.

Engineer M. J. Fletcher has gone to Bessville, Mo., to look after farming interests in that vicinity.

**Signal Department**

The Illinois division signal employes' educa-

tional meeting for April was held at Champaign, Sunday, April 9, with an attendance of twenty-nine. The subject was "Bonding." Bonding embraces the first principle of a track circuit and is, therefore, a most important subject, as our whole signal system depends on the track circuit, both from an operating and a safety standpoint. The last thirty minutes of the meeting were given over to Maintainer Burkitt, who talked on magnetism, in connection with a series of talks to be made on elementary electricity at each meeting during the year.

The signal department installed during March, at Grove street and Sangamon avenue, Rantoul, two of the latest wig-wag type of crossing signals. This is the fourth installation of this type of crossing signal on the Illinois division, one also being installed at Paxton and one at Gibson City.

The first signal work in connection with the new third main, Matteson to Kankakee, was started the first of April. Signal Foreman Dye has been transferred to Matteson to take care of the changes in the two interlocking plants at that point. We shall probably be given "color light signals" for the signal work in connection with this work.

**Kankakee Freight**

On March 30 the first Illinois Central train made a trip to the Lehigh stone quarries via the Lehigh Southern Railroad from Irwin. The train was No. 391, engine No. 573, Engineer Frank Shapland, Conductor Charles Martin in charge. Trainmaster J. T. Stanford of Champaign, Road Supervisor Thomas Conneron of Cabery, Yardmaster J. R. Brayton and Agent J. M. Purtill of Kankakee were in the party. Superintendent J. W. Hevron issued a notice

There was recently installed at Grove Street and Sangamon Avenue, Rantoul, Ill., two of the latest type highway or street crossing signals, at an estimated cost of more than a thousand dollars. The picture above shows the installation at Sangamon Avenue. The visible, or wig wag, signal was furnished by the Bryant Zinc Company; the bell, or audible signal, by the Union Switch & Signals Company; the storage battery, by the Electric Storage Battery Company, and the tripling charge rectifier by the Valley Electric Company, according to the report of S. C. Hoffman, supervisor of signals.

# Hamilton Watch

"The Railroad Timekeeper of America"

## Can You afford to have an inaccurate Watch?

Is it any economy to buy an undependable watch?

Or are you willing to accept the verdict of the thousands of American Railroad men and buy the watch that will render you year in and year out enduring, dependable, accurate time?

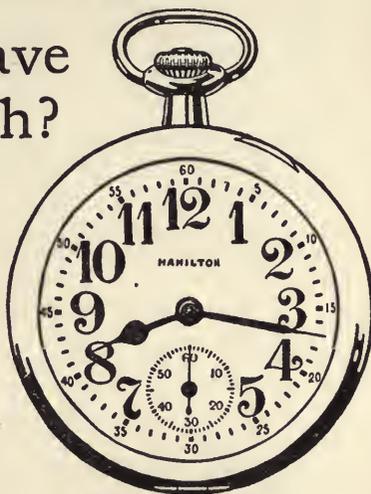

The Hamilton Watch for thirty years has been built to meet the Railroad man's requirements. Built to stand the hard usage to which railroad service puts it. Built with only one idea in mind—to serve the Railroad man for years by giving him true time all the time.

For time inspection service the most popular watch on American Railroads is the Hamilton No. 992—16-size, 21 jewels.

Send for "The Timekeeper," an interesting booklet about the manufacture and care of fine watches. The different Hamiltons are illustrated and prices given.

Prices range from \$40 to \$200; movements alone \$22 (in Canada \$25) and up.

**HAMILTON WATCH COMPANY**  
Lancaster, Penna., U. S. A.

*The "Lackawanna Limited," crack train to New York City on the Delaware, Lackawanna & Western, is piloted by a veteran engineer and run on Hamilton time. Engineer Charles Stevenson has been at the throttle for nearly three decades, and for 19 years has relied upon his Hamilton Watch for the right time.*

that, effective April 1, this company would take over the operation of the Lehigh Southern from the intersection with the Bloomington district south of Irwin to the Lehigh stone quarries, which is about three miles north of that point. For the present or until the business justifies, the loads and empties will be handled to and from the quarry by local freight trains on the Bloomington district.

The entire force was glad to see Warehouseman Roscoe Stith return to work March 1. He has been off duty since September 27 on account of a broken leg which he sustained while attempting to load a heavy crate of machinery on a warehouse truck.

Agent J. M. Purtill spent March 23 in Rockford and March 24 in Freeport, accompanied by Agent A. P. Gorman of Champaign. They made a visit to note the working conditions and the handling of the freight platforms at these two places, the system of receipt loading and checking of freight being practically the same as at Kankakee and Champaign.

What is believed to have been an attempt to hold up the Seminole Limited was made at 11 p. m. April 1 at Rantoul, Ill. An electrical signal in the south yards was not operating, and when John Mahan went to repair it he found a man climbing down the pole. Mahan fired at the man, who refused to halt. Two other men appeared on the scene immediately, and Mahan returned to the city building to obtain aid. A search of the yards was made, but the men could not be found. It was discovered that one of the signal wires had been cut.

The Illinois Central depot at Ashkum, Ill., was broken into March 25. A window on the south side of the office was smashed out. The gum machine was torn down and broken, a bag of parcel post was opened, the speeder used by V. Hyde, signal maintainer, was taken from its shed and driven about half way to Clifton, where it was abandoned. The stations at Danforth, Chebanse and Peotone were also robbed the same night.

#### SPRINGFIELD DIVISION

Conductor M. J. Kennedy is out of service, due to sickness.

Roy Davidson, brakeman, has returned to service after being absent on account of sickness.

Conductor J. B. Stewert is off duty for a few days and will spend the time on his farm at Sandoval. F. Kapelsky of the Centralia-Pana local runs is filling Mr. Stewert's place.

Mr. and Mrs. Titus Hinchcliff of Hinchcliff, Miss., arrived in Clinton April 15 for a visit to relatives and friends. Mr. Hinchcliff is a pensioned engineer, formerly of Clinton.

Jesse Davis, ticket agent, Springfield, was off duty several days during the first part of April.

W. S. Burkham, agent at Lake Fork, will leave in the immediate future for a trip to Portland and other western points.

During March the agents at coal-mining stations were kept busy in billing out coal in anticipation of the miners' strike. From all indications they handled the emergency with great satisfaction.

G. E. Houseman, day leverman at Mount Pulaski, is out of service for a few days.

C. E. Virden has become agent at Thomasville, vice R. F. Harford.

J. S. Vaughan has become agent at Spaulding, vice W. J. Aldrich.

Leo Mowen has become agent at Walker, vice O. L. Oxley.

Mrs. A. H. Wallace, wife of our agent at Lincoln, was called to Iron Mountain, Mich., April 14 by the illness of a relative.

John E. Shrader, checker at Springfield, is taking sixty days' leave of absence, due to sickness in his family.

Olive Draper, tonnage clerk at Clinton, is on a leave of absence on account of sickness.

John Sproat, formerly stenographer in the superintendent's office at Clinton, visited friends in Clinton Thursday, April 13.

Accountant and Mrs. O. D. Moore are the proud parents of a son, Donald Dean, born March 30.

The death of Mrs. Mary Phillips, wife of Engineer Charles Phillips, occurred at the family home in Clinton, March 23, following a prolonged illness. Funeral services were held in Clinton, Friday, March 26.

A new fast freight service between East St. Louis and Chicago was begun with the departure of No. 54 from East St. Louis Wednesday evening, April 12. The schedule between the two cities permits vegetables and other perishables from southwestern points to leave East St. Louis at 4:30 p. m. and be placed at South Water Street, Chicago, for unloading at 6 o'clock the following morning. A speed of approximately 30 miles an hour is necessary to make the schedule covering the entire 293

Name .....

Address .....

miles. Regardless of this fact, the train has maintained a record of 100 per cent on time since the service began.

One hundred twenty-five cars of material for the new hard road work were received at Patoka during March. It is estimated that 3,000 cars of material will be received for unloading at the five stations, Shobonier to Sandoval, inclusive, before the work is completed. The road is to follow the Meridian Trail, paralleling the Illinois Central from Centralia to Mendota.

J. L. Simcox has become agent at Seymour, vice F. D. Plummer.

L. B. Wilson has become agent at Beason, vice O. E. Donaldson.

#### Road Department

Water Service Repairman Litzenger and Mrs. Litzenger have returned home after spending several weeks in Hot Springs, Ark.

F. M. Martin of the engineer auditor's office, Chicago, is in Clinton working on completion reports for the new yard.

Water Service Repairman Ryan of Springfield has been off duty on account of sickness.

#### Clinton Shops

The Illinois Central lost one of its most respected and faithful employes on March 13 by the death of William L. Gambrell, which occurred at the John Warner Hospital. "Lafe," as he was known by everyone around the shop, was a true and faithful friend, and no one was more conscientious with the work than he. He had asked to be absent a few days about the first of the month on account of not feeling well, and from that time his condition became worse. His illness developed into pneumonia, and he was removed to the hospital. Mr. Gambrell had been an employe at the shops since 1903.

The community around Clinton has been stricken with much sickness, and this has been felt at the shops. We have been fortunate in keeping everything moving as we have. Those who have been able to work have given their best efforts to keep trains moving. At the same time, business has been very good on the Springfield division.

Master Mechanic Needham has returned to Clinton after being called to Newtonville, Ohio, by the sickness and death of his father.

Roundhouse Clerk George Howard has resumed his duties after having an operation on his left arm at the Wesley Hospital in Chicago. The operation was successful, and he will have better use of the arm in the future.

Wrecking Foreman Frank Menefee was the victim of an accident the other day when another motor car tried to use the same crossing

at the same time his motor car did. Mr. Menefee's car had both front wheels and axles broken off and the front fenders bent.

#### ST. LOUIS DIVISION

Here is a picture of C. T. Harris, passenger conductor, Centralia, Ill., recently pensioned, holding his grandson, Charles E. Syeller. Mr. Harris began his railway career

C. T. Harris

by braking on the C. & N. W. out of Chicago to Clinton, Iowa, April 4, 1871. He was married in 1881, entered the service of the Illinois Central January 23, 1895, was promoted to freight conductor October 10, 1895, and entered passenger service in 1915, remaining in that service until his retirement.

The March 9 issue of the Centralia Sentinel said:

"Faithful service has its reward. This has been unmistakably demonstrated in Centralia during the past few days in the retirement of Charles T. Harris from the service of the Illinois Central Railroad Company on full pension. Mr. Harris ended his career as a rail-roader after completing fifty-one years in railway work.

"For the past thirty years he has been with the Illinois Central with his home in Centralia and at the time of his retirement held a preferred run as passenger conductor between Centralia and Cairo. Through all the years of service he has maintained an excellent record for efficiency, taking high rank for dependability. He has always been prominently identified with the railway organizations, holding many prominent positions in the Order of Railway Conductors, of which organization he was a factor in the upbuilding. He is known throughout the entire country in union circles for his activities and very few meetings of note among the members of the O. R. C. have been held in late years in the Middle West without being cheered on by the optimism of this veteran railroader.

"Conductor Harris has been relieved on his Centralia-Cairo run by Conductor W. E. Redus, who has been on the St. Louis-Cairo run. The Redus run has been taken over by Conductor C. E. Sessler."

The crew of train No. 293 probably saved the company a considerable sum of money recently when it extinguished a fire in a meadow that was started by the engine at Harrison Mine Switch on the St. Louis division. John McBride was the conductor of the train. A strong breeze was blowing the blaze toward a field of asparagus and a house just on the other side. When the engine, No. 568, was examined, a small crack  $\frac{1}{4}$  by  $2\frac{1}{2}$  inches was found in the right side of the spark arresting appliance just behind the steam pipe.

#### Cairo, Ill., Freight Station

Employees of the freight office here have adopted the following resolutions upon the death of Agent John D. Ladd, the wording being by Miss Minnie Blotkin, clerk:

"As God in His Infinite Wisdom has seen fit

Home of Conductor C. L. Taylor, 301 North Quincy Street, Clinton, Ill.

to take from our midst Mr. John Delaware Ladd, veteran agent at this station.

"Be it resolved, that we bow our heads in humble submission to His immutable will, conceding it is ever beneficently directed towards us in good.

"Be it further resolved that the freight station employes as a whole extend to the bereaved loved ones our sincere sympathy in the affliction they have just sustained.

"The Ship of Life has left its shore  
And we bid you sad adieu,  
Knowing we shall see no more  
The form we knew as you.  
We forward press our daily toil,  
As when you held the helm,  
And think of you so free from care  
Within the mystery realm.

"You have been a faithful servant  
To the company for whom you worked,  
Never trying night or day  
From duty's call to shirk;  
And so within your new found home  
We know, without a doubt,  
You will be as faithful in your quest  
For the spiritual round about,  
And so progress in Heavenly joys,  
Within thy Savior's arms,  
There to be blessed with gracious peace  
And freedom from all harms."

**INDIANA DIVISION  
Superintendent's Office**

Miss Lucille Yount of the superintendent's office has returned to work after a six months' leave of absence. Miss Cora Burch, who was relieving Miss Yount, has taken a position in the office of the agent at Bloomington, Ind.

**Roadmaster's Office**

During the past thirty days the division has experienced much trouble due to high water and slides.

C. L. Adams, supervisor's clerk, B. & B. department, is the proud father of a baby boy.

**Mattoon Shops**

J. H. Phillips, lead bolt man at the Mattoon shops, passed away at his home April 7 after an illness of five months from tumor of the brain. Mr. Phillips was born in Hardin County, Kentucky, November 3, 1863. During the sixteen years of his service with the Illinois Central, he won the esteem of his fellow workmen, and he will be greatly missed by all who knew him. Mr. Phillips left a wife, a daughter and two sons.

J. H. Phillips

Gang Foreman and Mrs. A. B. Roetker were called to Delphos, Ohio, recently by serious illness.

Miss Mildred Bell, daughter of Master Mechanic and Mrs. J. A. Bell, has returned to her school duties at Breneau College, Gainesville, Ga., after spending the Easter vacation with her parents.

April 4, when Benjamin Bosse, mayor for eight years, died of pneumonia. He was just entering his third term as mayor. Mayor Bosse was president of twenty-two industries and banks and a director of many more. He was president of the largest furniture factory in the world, the Globe-Bosse World Furniture Company. During his administration, he brought about many improvements in the way of paved streets, parks, new schools, etc. Evansville will miss him greatly.

Evansville has a new industry, the Icenomor Electric Refrigerator Company. This firm manufactures equipment to abolish the use of ice, by an air-cooling process, generated by an electric motor. The machine is so designed as to permit the installation in any ice-box of ordinary construction. The machine produces a dry, crisp cold. It is equipped with a thermostat which automatically starts the motor when the inside temperature of the refrigerator reaches a certain point.

John R. Moser, inspector at Evansville, recently left for Paducah to undergo an operation for removal of his tonsils at the Illinois Central Hospital.

The marriage of Miss Velda M. Kirwer, stenographer in the Evansville office for the past five years, and Edwin C. Rothert took place Saturday, March 25, in the St. Lucas parsonage. Following the ceremony, a reception was held at the home of the bride in Delaware Street. Mr. Rothert is traveling representative of the Proctor & Gamble Company of Cincinnati.

S. G. Melchoir, clerk in the Main Street yards, has resumed his duties after an illness of several months.

The Evansville Courier of April 10 had the following to say: "Drummers using the I. C. north all know Walter Miller, the good looking brakeman, and they like him, too. You have heard him say, 'All out for Bone Gap, don't forget your packages.' It does not take Walter many trips to know just where you are going, Monday morning. He knows his job and does it like a gentleman."

**MINNESOTA DIVISION**

W. J. Fitz has resumed his duties as third trick operator at the Dubuque dispatcher's office. Mr. Fitz toured Canada and eastern points of interest.

J. L. Heins, dispatcher at Dubuque, is traveling through the East, visiting at Washington, D. C., and New York City.

Agent Weir at Raymond and Operator Hintz at Manchester announce the arrival of new daughters in their respective families.

H. C. Stebbins, recently second trick operator at Winthrop, has been transferred to third trick at Jesup. Operator H. G. Krueger was relieved at Winthrop April 11. Operator H. A. Brown, relieved as car distributor by the reduction in force, goes on the extra list.

S. A. Teeple, train baggageman, has returned to work after a month's leave of absence in Hot Springs, Ark.

Conductor J. M. Joyce has purchased a motor car and has mastered the art of driving so well that he can turn on a dollar and you can still read "In God We Trust."

Conductor G. E. Waugh has returned to work after spending the winter in California.

Fireman W. R. Wright and Mrs. A. Stevens were recently married in Chicago. Both Mr. and Mrs. Wright are well known among the Illinois Central employees.

S. D. Rowe, operator at East Belt Junction, was relieved four or five days by A. J. Beckage in order to look after some of his business.

Ed Gallagher, first trick operator at Galena Tower, was off duty several days recently on account of illness and was relieved by J. E. McGraw.

**Cedar Rapids, Iowa**

Garret Hutton, yard foreman, has returned from the Illinois Central Hospital in Chicago, where he underwent a minor operation. He is getting along nicely and hopes to resume his duties soon.

W. H. Harris has been obliged to give up his work as billing clerk at this station on account of lung trouble which has developed since his return from the army. Mr. Harris served overseas with the 13th Engineers.

C. H. Beeken is our new billing clerk.

Members of the Kiwanis Club and other civic clubs in Cedar Rapids were honored by a talk from Charles H. Markham, president of the Illinois Central, on March 5 at the Montrose Hotel. Reservations were made for 260 men. Mr. Markham, as speaker of the day, was introduced by John M. Grimm, local attorney for the Illinois Central, who also presided as toastmaster. A delegation of local citizens met the party of officials on arrival and took them out for a motor trip about the city prior to the luncheon. Accompanying Mr. Markham were W. S. Williams, general superintendent, Waterloo; L. E. Strouse, division trainmaster, Dubuque, and James Carey, road supervisor, Manchester. They were met at the station by F. E. Wallace, traveling freight and passenger agent, and by Sanford Kerr, local freight agent.

Mildred George, stenographer, took part in a Living Picture Festival given at the Majestic Theater on March 17 and 18 at which many of the old masterpieces were reproduced. Mildred posed very creditably in the picture, "A Pot of Basil."

We extend our sympathy to C. F. Perrill, chief clerk, and Mrs. Perrill, in the recent loss of their grandchildren, Robert and Patricia Perrill, both of whom passed away within a week after suffering from bronchial pneumonia.

Mrs. Van Dyck Fort, a well-known former resident of Cedar Rapids, who died at her home in Chicago on April 1, after an illness of two months, was brought here for burial on April 4. She is survived by her husband, Van Dyck Fort, assistant traffic manager of the Illinois Central, her daughter Rachel, of Chicago, Mr. and Mrs. John W. Witwer, her parents, two sisters and one brother of this city. Services were held at Oak Hill Cemetery. The body was brought from Chicago in a special car. Members of the funeral party besides the immediate family were W. Haywood, general freight agent; B. J. Rowe, coal traffic manager, and F. C. Furry, assistant general freight agent, of Chicago. L. E. McCabe, superintendent, of Dubuque, and F. E. Wallace, traveling passenger and freight agent.

**WISCONSIN DIVISION**

W. J. Henninger, engine foreman at Bloomington, is on the sick list. Mr. Henninger went home for lunch at noon Wednesday, April 5, and was taken suddenly ill. For several hours his condition was very critical. However, at present he seems to be much improved and hopes to be back on the job in the near future.

Richard Devon of Minonk is filling the vacancy caused by the resignation of Yard Clerk L. A. White of Bloomington. Mr. Devon is a former member of the famous Minonk fans' basketball team.

Dixon, Ill., has been favored with a dally

## Look for this stamp on the watch you buy

*Ask your  
jeweler  
for these  
watches*

Then you can't go wrong in buying your watch.

You need the best there is NOW.

It may be required LATER.

Originally, railroad watches were not adjusted to positions.

Later, three position adjustments were required.

Now, the inspectors are not allowed to pass any watches adjusted to less than five positions.

For the present, five position watches are standard.

But railroad requirements are continually going higher—not lower.

So why take any chances on a five position watch when you can just as easily get the superior

### SANGAMO SPECIAL and BUNN SPECIAL

Illinois watches which are adjusted to temperature, isochronism and SIX POSITIONS?

Write for a copy of our new 52-page booklet "Illinois Watches and Their Makers." You will incur no obligation in doing so.

**ILLINOIS WATCH COMPANY**  
Springfield, Illinois

The old and the new at our bridge over the Iowa River at Iowa Falls, Iowa. At left, an old wood-burner of the Dubuque & Sioux City Railroad, our predecessor in Iowa, passing over the bridge; at right, one of our modern passenger engines pulling a train over the same place. Note how the bridge has been changed. Photograph at left by courtesy of F. E. Foster of Iowa Falls.

merchandise car out of Chicago each evening reaching Dixon at 6:30 a. m. The car is doing a nice business which will be greatly increased when refrigeration service is given. The entire office and yard force put a shoulder to the wheel and worked up a business for such a car on short notice.

Carload shipments of eggs have been begun from Dixon. These shipments are handled by the Illinois Central and destined to New England points.

Spring seeding in the vicinity of Dixon is being seriously delayed owing to the April rains and continued cold weather.

Miss Loretta Lampert, bill clerk at Rockford, is on a three weeks' leave of absence on account of illness.

Miss Theresa Johnson, supervisor's clerk, recently won a pretty diamond ring in a popularity contest given for the benefit of the Boy Scouts at Freeport. First prize went to the representative of the Stephens Motor Works, the Illinois Central representative coming in second.

After an illness of three months Joseph Daniel Murphy passed away recently at St. Francis Hospital, Freeport, Ill. Mr. Murphy was born in Freeport March 19, 1892, and was a son of Mr. and Mrs. D. T. Murphy. He spent his entire life there, and he had been in the employ of the Illinois Central for the past five years as a brakeman. He was married to Neva Mullarkey on January 25, 1921. Besides his wife he is survived by his mother, and a sister, Mrs. Frank Smith, of Freeport. His father, the late D. T. Murphy, was depot master for the Illinois Central for many years. Mr. Murphy was a member of the B. of R. T. and was all his life a member of St. Mary's Catholic church.

**IOWA DIVISION**

Engineer H. M. Rhodes resumed work April 3, after spending the winter in California.

Miss A. E. Shaw, agent at Ells, is absent on a thirty days' vacation, visiting points in the Southwest.

W. P. Wall, agent at Steen, has resumed work after visiting his people in the South.

Valuation Accountant A. V. Downing has resumed work after an absence of three weeks on account of an attack of pneumonia.

Dispatcher C. L. Mitchell is absent, now visiting his parents in Missouri.

Miss M. E. Gibson, operator at Fort Dodge, has resumed work after a trip to New Orleans and other points of interest in the South.

**KENTUCKY DIVISION**

Harry G. Schoenlaub and Clifford Slider, clerks in the local freight office at Louisville, have taken the third plunge into the "musical waves." They are credited with composing and publishing the following three song hits: "She Rolls 'Em Down," "My Dream of Heaven and You" and "Swanee River Blues." If you haven't heard them, you're missing something.

Andrew Thome of the local freight office at Louisville will soon wed Miss Elizabeth Pitt.

Conductor R. W. Leroy, Paducah district, who has been off duty for the last five months on account of illness, has returned from Florida, where he went to recuperate.

Conductor F. P. Coburn, Paducah district, who has been off duty for several weeks on account of illness, has returned to the service.

Train Clerk Giles Pickering of Paducah, who underwent an operation at the hospital, has recovered and returned to the service.

Acting Chief Yard Clerk De Vere ("Fatty") Rudolph of Paducah is recovering from an attack of rheumatism. "Fatty" purchased himself a motor car some time ago.

Chief Dispatcher J. W. Taylor, who is on leave of absence on account of his health and who is now in Tucson, Ariz., writes that he is slowly but surely regaining his health, and his many friends on the Illinois Central System send him good wishes.

Signal Supervisor T. L. Davis, who has been dangerously ill at his home in Martinsville, Va., is, we are very glad to report, somewhat improved. He has been granted a leave of absence and will depart for an extended stay in the West as soon as his health permits.

An Illinois Central baseball team has been organized at Louisville. Assistant Engineer C. J. Carney was elected manager and Chief Accountant R. D. Miller was made secretary and treasurer. From the enthusiasm and interest manifested thus far, and the number of applicants turning out, it looks as if we are going to have a first-class team.

TENNESSEE DIVISION

Old Doc Stork paid us another visit March 4 and left a fine baby girl at the home of Trainmaster J. J. Hill, and they called her Caroline.

To prove that he is a little partial to the female sex, Doc Stork made another visit on April 8 and left a fine baby girl at the home of Marshall A. Cole, yard clerk.

Miss Vivian Williams was off a few days recently, on the sick list.

Roadmaster S. J. Holt lost a son and a daughter recently, or we might say he acquired another daughter and son, when his son, T. C. Holt, married Miss Willie Sale of Covington, Tenn., on March 31, and the couple accompanied Miss Virginia Holt and Daus Johnson, formerly of Fulton, but now working in Detroit, Mich., to Chicago, where the latter were married April 1, with the newlyweds acting as bridesmaid and best man. The newest newlyweds left

immediately for Detroit, and the other happy couple returned to Fulton.

J. M. Jackson, J. W. Moorhead, W. A. Love, W. H. Cox and J. M. Hoar attended the Railway Appliance Show in Chicago, March 13 to 16, inclusive, and all report an interesting and educational experience.

R. C. Crocker, fireman, Dyersburg, Tenn., has been commended for interest manifested and action taken when he extinguished a fire on a bridge just south of Dyersburg, March 16, probably avoiding considerable damage to the bridge and delay in traffic.

Conductor W. F. Sutton, Fulton district, has been commended for the interest shown and the course pursued in cutting out of his train, Extra 1864, at Fulton, March 14, car IRCX 1207, oil, which was routed via Corinth and the Southern Railroad to Memphis.

Engineer R. E. Hockersmith, Fulton district, has been highly commended for the excellent

*Billie Brown Dalchite, 2½ years old, is the son of Mr. and Mrs. J. B. Dalehite, 477 Simpson Avenue, Memphis, Tenn. Mr. Dalehite is a conductor on the Tennessee division and has been in the service twenty-three years. Billie has not yet been planned a future, but it looks as if he will be a heart smasher.*

work and good judgment exercised while on train No. 103, Engine 1115, March 29, when the engine was disabled at Rialto, Tenn., and he handled it on into Memphis without serious delay and did not call an extra crew.

J. R. Holley, trainmaster's clerk, Jackson, paid a little visit to the division office at Fulton the first week in April, and acquainted himself with the division employes with whom he has been working for some time but had never met.

#### MISSISSIPPI DIVISION

M. L. Hays, formerly agent at Winona, Miss., has been promoted to be supervising agent of the Mississippi division. G. E. Franklin, who has been employed at Aberdeen as operator for a number of years, has succeeded Mr. Hays as agent at Winona.

H. P. Patten, supervisor's clerk, Sardis, Miss., has been appointed postmaster at that point and will assume his new duties within a short time.

Walter Tate, baggageman, after an extended visit to the Bahama Islands and Cuba, has returned to service with many interesting experiences to relate.

J. J. Ford, accountant, superintendent's office, has returned from a three weeks' stay in Hot Springs, Ark., much improved in health.

The latest report from E. A. Cleveland, D. V. accountant, who has been in the Chicago hospital for several weeks, is that his condi-

tion is greatly improved and he expects to return home shortly.

Miss Mattie Watts, supervisor's clerk, Grand Junction, Tenn., who has just undergone an operation at the company hospital in New Orleans, is reported doing nicely.

J. T. Nason, passenger conductor, is at present in the hospital at New Orleans for expert medical treatment.

Louie Bloom, formerly an employe in the mechanical department of the Illinois Central at Water Valley and Durant, died at his home in Palestine, Texas, in the latter part of March. At the time of his death Mr. Bloom was holding the position of master mechanic of the I. G. N. He was a foster-son of General Car Foreman W. T. Everett, Water Valley.

It is with deep regret we announce the death of J. H. Wilson, pensioned mill man, at the home of his son in Little Rock, Ark., April 7. At the time of his death Mr. Wilson was 79 years of age. His service with this company extended over a period of twenty-six years. The body was brought to Water Valley for burial. Besides his wife, he leaves three sons to mourn his loss, one of whom, Philip, is one of our valued conductors.

A. P. Berglund, carpenter, mechanical department, died at the hospital in New Orleans on April 7, where he had been carried a few days prior in an effort to prolong his life. Mr. Berglund was born in Ulrica, Sweden, January 1, 1851. He was employed as carpenter in the shops at Water Valley in October, 1878, and had been in continuous service from that date until his death. Mr. Berglund was one of the five oldest employes on the Mississippi division, and a sketch of his life with his picture appeared in a recent number of our magazine.

Miss Selma Pitts Blankenship, daughter of pensioned Engineman William Blankenship, was married on April 8 to Henry Welling Davis of New York City. The wedding took place in Bowling Green, Ky., where Miss Blankenship was attending school. After a visit to her parents in Durant, Miss., Mr. and Mrs. Davis will make their home in New York.

Mrs. George Allen, wife of Engineman George Allen of the Aberdeen district, is now in the hospital at Jackson, Miss., seriously ill with pneumonia.

Mr. and Mrs. C. W. Somers of Memphis, Tenn., have been visiting in Aberdeen, Miss. Mr. Somers is a retired Aberdeen district engineman.

The hotel at Castalian Springs is now being remodeled and the grounds beautified by Mr. Caldwell of Chicago, who recently purchased this property. Durant is expecting guests from the North and East shortly after the opening about May 15.

Paul F. Tate, master mechanic's office, Water Valley, has been in the hospital in Chicago since March 7, undergoing treatment for his eyes.

Hays Brister, pipefitter helper, was married in Paris, Miss., April 9, to Miss Orlena Kelly. Jimmie, Jr., the young son of J. G. ("Col.") Bennett, clerk, has been in the Oxford Hospital, where he recently underwent an operation. From last reports, he is improving and will be out of the hospital at an early date.

On April 10, 25 men were suspended in the mechanical department at Water Valley, making a total of 105 men suspended since March 31.

John Bailey, boilermaker, has been in the Illinois Central Hospital at New Orleans since March 28.

Joe Strolln of Chicago, one of the pensioners,

was a pleasant visitor recently. Mr. Strolin is as young as the day he was pensioned. He was employed as a machinist at the Water Valley shops at the time of being pensioned, May, 1916, which was after thirty-seven years' service.

**LOUISIANA DIVISION**

Railroad and Industrial Day of Homecoming Week was, of course, the best day, since the Illinois Central was host. That night everyone was invited to join in a grand march on Main Street which was led by Trainmaster H. P. Campbell and Miss May D. McMichael, stenographer to the chief dispatcher. Following the march there was a quadrille given by the following railway employes: H. P. Campbell, trainmaster, and May D. McMichael, stenographer to the chief dispatcher; W. E. McCloy, supervising agent, and Eva Bennett, clerk to the master mechanic; G. W. Spragins, operator, and Bessie Bennett, clerk to the master mechanic; J. W. McMasters, night yardmaster at Gwin, and Claire Pimm, clerk to the supervising agent; Pat Hanrahan, Sr., plumber, and Neola Ansley, timekeeper to the master mechanic; George Hammond, painter, and Roberta Darville, stenographer to the road supervisor; T. D. Faust, conductor, and M. Q. O'Quin, private secretary to the master mechanic; H. L. Browder, engineer, and Beulah Youngblood, accountant. All the girls were dressed in costumes representing 1872. After several encores, a community dance was begun in which the old and young took part.

We have welcomed during our Homecoming Week numerous former railway employes as well as those who have been promoted and transferred from our ranks. Among the home-comers were: Assistant General Storekeeper and Mrs. W. S. Morehead, Chicago; J. H. Mashburn, local chairman of the O. R. T., and family, Hammond, La.; Conductor and Mrs. Charles Dunbar, New Orleans; Pensioned Engineer and Mrs. Frank Cummings, Pascagoula, Miss.; Engineer and Mrs. J. H. McGuire, New Orleans; General Car Foreman and Mrs. H. L. Arnold, Memphis; Roundhouse Foreman and Mrs. W. J. Lang, New Orleans; Wm. McCubbin, former chief clerk to superintendent, New Orleans; General Foreman M. A. Bouysou, Gwin, Miss.; General Foreman L. Miller, Jackson, Miss.; Night Yardmaster and Mrs. J. W. McMasters, Gwin; Ticket Agent W. E. Pleasants, Jackson; Ticket Clerk C. S. Williams, Jackson; Ticket Clerk J. H. Moore, Jackson; George H. Terry, assistant chief clerk to agent, Jackson; Claim Agent H. G. Mackey, Jackson; Baggage Clerk A. B. Carruth, Brookhaven, Miss.; Yardmaster B. D. Negrotto, New Orleans; A. D. Leopold, chief clerk to district foreman, New Orleans; Joe Hodges, clerk to district foreman, New Orleans; Engineer and Mrs. Albert McFadden, Canton, Miss., and Clerk F. F. Streiblich, Natalbany, La.

Another visitor we heartily welcomed was Talmadge Hardy, former brakeman on the Louisiana division, who was injured during service in the World War. His injury has prevented him from further service with the Illinois Central. He came down from his home in Water Valley to be with us during our celebration, and we hope that he will stay with us longer.

The tennis match between the Illinois Central and the town, with F. F. Streiblich, clerk at Natalbany, and A. B. Simmons, clerk to the master mechanic at McComb, representing the Illinois Central, and with S. S. Stebbins and Professor Gibson representing the town, ended 4 to 1 in our favor.

R. M. Wilson, former clerk at Amite, La.,

**Send No Money**

This 21-jewel Illinois Watch—the Bunn Special sent on trial. Do not send us a penny. The Bunn Special, made to be "the watch for railroad men," is adjusted to 6 positions, extreme heat, extreme cold and isochronism. 21-jewel movement, Montgomery Dial, handsome guaranteed 20-year gold-filled case. *Guaranteed to pass inspection on any railroad.*

**After Trial a Few Cents a Day**

The watch comes express prepaid to your home. Examine it first. Only if pleased send \$5.75 as first payment. Wear the watch. If after ten days you decide to return it we refund deposit immediately. If you buy, send only \$5.75 a month until \$57.50 is paid.

**ORDER TODAY** Just send us your name and address. No red tape. Just say, "Send me the Bunn Special." Do not enclose a penny. Don't delay. Write today.

*Our 128 page catalog, No. 4065 shows more than 8,000 bargains in diamonds, watches and jewelry. Write for it NOW.*

has become ticket and baggage clerk at McComb. J. H. Daughdrill has gone to the Jackson ticket office.

W. T. McGuire, chief clerk to the superintendent, is walking around with a rather dignified air since his farm exhibit took first prize on Farmers' Day of Homecoming Week.

Miss Louise Wheelock, stenographer to the storekeeper, is on a leave of absence on account of ill health. Miss Thelma Smith of Tylertown is filling her place.

G. L. McAllister is our new extra dispatcher. He comes to us from Memphis.

An Illinois Central romance is shown in the marriage April 1 of Miss Gladys Marie Browder, chief performance clerk at McComb, to William E. Berry, operator at Summit, Miss. Mrs. Berry is a daughter of Engineer H. L. Browder.

H. Hays, 72 years old, for many years a resident of Jackson, Miss., and a former traveling freight agent for the Illinois Central Railroad, died at Jackson March 12 after an illness of many months. Mr. Hays is survived by a widow and two sons, Lorraine Hays of New York City and Harry H. Hays of Yazoo City.

#### Jackson, Miss.

Sympathy has been extended to J. L. Morgan, local freight agent at this station, in the loss of his father, J. P. Morgan, who died February 20 and was buried at the family home at Lewiston, La.

Our local force suffered a distinct loss in the death of Frank H. Benjamin of the warehouse section, February 19. Frank was a man of more than usual experience, genial as a friend and valuable as an employe.

Mrs. J. P. Martin, accountant, has been absent because of illness.

The business outlook at this station is favorable. Our tonnage, earnings and expenses compare most favorably with last year at this period, and we are inclined to believe that prosperity and normalcy have actually arrived.

#### MEMPHIS DIVISION

A record run was made over the Memphis division April 6 with a trainload of perishable freight, which included a trial shipment of vegetables loaded at Biloxi, Miss., April 5, for a test run in competition with another car handled direct over another road. This train was handled by Engine 969, Conductor H. L. Scates and Engineer C. W. O'Donnell. It left Gwin at 9:40 a. m. and arrived at Nonconnah Yard at 3:40 p. m., a run of six hours, handling 2,541 tons in sixty-six cars and consuming but thirteen tons of coal on the entire trip. Four stops were made over the entire division, a distance of 146 miles, for water and coal. This is three hours better than the usual banana schedule and one hour and thirty minutes faster than the usual vegetable schedule.

During March thirty-one vegetable trains from the Rio Grande Valley were handled over the Y. & M. V. route from Baton Rouge, all of which maintained schedule or better.

Chief Dispatcher A. A. Freiberg reports that perishable freight business—vegetables, berries and bananas—shows a marked increase for this season over previous years.

A favorable entry has been made on Fireman H. E. Weekley's record for discovering and reporting fifteen inches of broken flange on a car of company coal being unloaded on the coal chute track at Lambert, Miss., April 4.

Division Gardener Wilton Dorsey reports that H. S. Moulder, chief gardener at Champaign,

*Here is Mary Virginia Clark, 8 months old, daughter of D. C. Clark, accountant in Superintendent J. M. Walsh's office at Memphis, Tenn.*

Ill., has furnished several hundred fruit trees, grape vines and shrubs, and many of the homes of the section foremen have been greatly improved. We have thirty parks on the Memphis division, about one-half of which have now been provided with new hedge fences. The work of improving the appearance of our division is making rapid progress.

Mrs. D. C. Clark, wife of Accountant D. C. Clark in this office, who has been in the West on account of ill health, is reported as having improved very much.

Conductor J. H. McCraney returned to service in March. Mr. McCraney has not worked for more than a year, having been on a leave of absence on account of injuries sustained when a negro shot him accidentally while he was performing his duties on a passenger train at Sunflower, Miss. The negro followed his wife on the train, it seems, because she was leaving him, and a bullet accidentally struck Mr. McCraney.

#### Clarksdale, Miss.

Engineer T. G. Paterson, returning from a trip to his old home in Cherokee, Iowa, was accompanied by his sister, Miss Katie Paterson, who will make her home here. Mr. Paterson has purchased a home at Sixth and Le Flore.

Engineer P. C. Barr has purchased vacant property at Sixth and Le Flore and intends to build his new home at an early date.

Mr. Price, coal chute foreman, has erected a new bungalow on Seventh Street, into which Car Foreman Conerly has moved.

Paul C. Gelston and Richard F. Gelston spent several days recently with their parents at Durant, during which time P. C. arranged for improvements to buildings on a farm which he purchased near that city. He reports unusual activity among the farmers in that section in dairying.

Engineer Roy Hiner has completed a garage in which to house his new car. Mrs. Hiner

# Stifel's Indigo Cloth

Standard for over 75 years

## "Safety-Valve Steve" Says:

"I've been railroading for forty years—or thereabouts—and want to tell you fellows right now that the right Work Clothes are made out of Stifel's Indigo Cloth.

All the big Overall and Jumper makers are wise to it—and make their clothes out of it.—If you want a real "go-ahead signal" when buying Work Clothes—just turn up the cuff of the pants.

There it is—big as a semaphore—but shaped like a boot—see:

Look for that trade mark—it'll pay you—well, good luck."

Garments sold by dealers everywhere — We are makers of the cloth only.

City ..... State .....

was one of the successful saleswomen in a recent newspaper subscription contest conducted by the Clarksdale Register, winning a 5-passenger motor car as second prize.

Jesse Gray, machinist, has just completed a new combination store and residence building.

**MEMPHIS TERMINAL DIVISION**

A. W. Giehler, assistant chief clerk to the superintendent, has moved into the new bungalow recently purchased by him in Highland Heights.

W. E. Gerber, B & B clerk, has returned from a recent trip to New York City, being called there by the illness of his father.

The IC-Y&MV baseball league opened its schedule Sunday, April 16, with games between the Power House and Local Office teams and between the Outbound and Memphis Shops teams. The schedule calls for eighteen games, beginning April 16, and closing August 13, all games to be played in Arnuat Field at the Fairgrounds. This league is a member of the Memphis Associated Amateurs. More interest and enthusiasm is being displayed in baseball among the railway employes this year than has been for some time past, and good crowds are expected at all games.

Teams, managers and players are as follows:  
Local Office—R. C. Hudson, manager; Wessell, c.; Hudson and Trouy, p.; Morgan, ss; Halley, J. E., 1b; Leggette, 2b; Walsh, (Capt.), 3b; Trippe, lf; Halley, L. T., cf.; Gayden, rf; Hurt, Alexander, Mable, utility.

Power House—F. M. Welborn, manager; Taylor, c; Weeks, Chase, Davis, p; Arnold, 1b; Mapp, 2b; Stevens, (Capt.), ss; Davis, H., 3b; Maupin lf; Welborn, cf.; Woods, rf; Cardell, utility.

Memphis Shops—George Marero, manager; Miller, c; O'Sheridan, Owens, p; Moore, ss; Carpenter, 1b; Stokes, (Capt.), 2b; Strickland, 3b; Rawles, Jr., lf; Nix, cf; Wilson, rf; Beasenburg, Shepherdson, Geber, utility.

Outbound—W. E. Duncan, manager; Kyle, c; Cross, Moltedo, Jefferson, p; Evans, K., 1b; Worley, 2b; Johns, ss; Nusch, 3b; Maier, lf; Tygard, cf; Jones, rf; Evans, F., (Capt.), Kinney, utility.

**Mechanical Department**

J. W. Cox, boilermaker, whose hand was so badly crushed by being caught in a bending clamp that he had to be taken to St. Joseph's Hospital, is reported much improved.

B. J. Haley, machinist, has gone to Chicago, where he will undergo an operation at the Illinois Central Hospital.

C. W. Miller, machinist, and Mrs. Miller have gone to Paducah, Ky., called there by the death of a relative.

John Casey, drill press operator, is on the injured roster with a sprained wrist.

The members of the Illinois Central and Y. & M. V. baseball teams desire to thank their friends and the many business men who donated so liberally toward the fund solicited to buy uniforms and equipment for the Illinois Central League. The uniforms have arrived, and the club made its first appearance in the M. A. A. parade Saturday afternoon, April 15.

P. O. Bailey, machinist, who was stricken with a second paralytic stroke while at work and taken to St. Joseph's Hospital in a critical condition, has been removed to the Illinois Central Hospital at Chicago.

George Utz, machinist apprentice, and Miss

Marion E. Townes were married at Marion, Ark., recently. The ceremony was performed by the Rev. J. R. Nelson of the Baptist Church. The young couple will be at home at 2086 Jefferson Avenue.

P. Landers, a former employe of the Illinois Central, has opened up a lunch and soft drink parlor in the Darnell Building, near the new viaduct.

Sidney Weaver, pipe filler apprentice, who was operated on at the Illinois Central Hospital at Chicago, is reported much improved.

The Lauderdale Improvement Club held its third semi-weekly entertainment in the school auditorium, Friday evening, March 24. A large audience was present, and the repeated encores given the volunteer talent proved it a huge success. The entertainment was under the supervision of Mr. Pepper, and the following program was rendered:

- Ocarina Solo.....Miss Rose McNichols
- "Just for Fun".....Henry Cook
- Soprano Solos.....Mrs. H. W. Strothers
- Interpretation Dance.....Dainty Dot LaFollette

*Dorothy Jacqueline Smith, 3 years old, is the daughter of Roy L. Smith, who has been in the service of the Illinois Central System at Memphis as hostler for the past eleven years. She is also a niece of Terminal Engineer J. H. Smith. Dorothy has a smile for everybody.*

Saxophone Solos.....Mrs. Heidelberg  
Jazz Songs and Banjo Solos.....

.....Martha Frances McKinney  
Interpretation Dance.....Miss Florence Lauer  
Blackface Sketch,Noble Craig, Laurence Wanen  
C. W. Miller, machinist, Noncannon shops,  
has purchased the property at 310 Simpson  
Avenue formerly owned by Engineer Herman  
Slusmyer and will occupy it shortly.

William Kelley of Helena, Ark., is visiting  
friends and relatives in this city for a few days.

W. L. Gideon, blacksmith, who has been  
confined to his home on account of illness, has  
resumed work.

The equipment for the Lauderdale Fife, Drum  
and Bugle Corps has arrived, and the boys are  
busy taking instructions under a competent  
instructor.

David Barnett, engineer, has purchased a lot  
on Mallory Avenue and will erect a handsome  
residence in the near future.

Miss Kate Barnett, daughter of Engineer G.  
L. Barnett, has been nominated for queen of  
the carnival to be held in South Memphis in  
celebration of the opening of the new Illinois  
Central viaduct. Miss Barnett is popular in  
athletic circles and has a large following of  
friends who will rally to her support.

A. H. Moore, machinist, and Mrs. Moore,  
who have been visiting relatives at St.  
Augustine, Fla., for the past thirty days, have  
returned home.

William Gaffney, a former employe of the  
Illinois Central, who was shot and robbed at  
the Illinois Central tracks, Main and Iowa  
streets, and taken to the General Hospital, is  
in a critical condition at the time of writing  
(April 12). Small hopes are entertained for his  
recovery. Gaffney was formerly a resident of  
Water Valley, Miss., and has lately conducted  
a brokerage business at 919 Barton Avenue.  
He is a nephew of the late W. H. Watkins,  
formerly master mechanic at the shops in this  
city.

Charles Barnett, machinist apprentice, has  
returned home after a two weeks' course of  
treatment at the Illinois Central Hospital,  
Chicago.

W. Simmons, millwright, bridge and building  
department, who has been confined to his home  
with a broken rib, is able to resume work once  
more.

VICKSBURG DIVISION

The water on the Silver Creek district has  
been eleven feet over the rails in the deepest  
place. The trains operating over this district  
were pulled off Sunday March 25.

A number of the Vicksburg division employes  
attended the triennial convale of Knights  
Templar at New Orleans, La., April 23 to 27.

Miss Lucille McCool, stenographer to the di-  
vision accountant, was called to her home near  
Kosciusko, Miss., recently by the death of her  
aunt.

Wave washes on the river front at Greenville  
have caused some little excitement among the  
people; however, there was no imminent danger.

Back water from the Yazoo River was six  
inches below the rail on the main line near  
Smedes. Forces were busily engaged in sack-  
ing and building levees to prevent water from  
coming over the rails and to prevent hamper-  
ing the usual prompt and efficient train serv-  
ice for which the Vicksburg division is noted.

Supervising Agent Regan, Agent Mallory of  
Cleveland and Agent Bounds of Leland spent  
several days visiting the agents at New Orleans

and Baton Rouge in the interest of increased efficiency at their stations.

Everyone on the division is glad that Superintendent T. L. Dubbs has entirely recovered from his recent attack of "flu" and is back on the job.

The work of developing the oil and gas well at Glen Allen is still progressing nicely, and everyone is in the hopes that the work will ultimately bring in a big gusher.

Freight Agent T. A. Noel of Greenville has returned from Chicago with Mrs. Noel, who spent several weeks in a hospital at that city. We are all so glad to know that she was greatly benefited by her trip.

The work of constructing the 18-foot concrete road between Leland and Hollandale is progressing rapidly.

We have learned of the death of E. M. Shropshire of Columbus, Miss., brother of our popular B. & B. supervisor, to whom we all extend our deepest sympathy.

S. Simmons, chief clerk to the superintendent, now travels to and fro from the office in a brand-new motor car.

#### NEW ORLEANS DIVISION

J. H. Evans, veteran engineer, after a long and faithful service has retired on a comfortable pension. After an exceptionally active career Mr. Evans finds it hard to realize that he is at last out of harness. The work seems to call him back. He says he now fully comprehends how irresistible is the lure of the rails.

The death of Paul Bourgeois, signal maintainer at Baton Rouge, La., occurred on March 12. Mr. Bourgeois entered the service of the Y. & M. V. as a helper in 1916. He served two years in the army and upon his return was promoted to maintainer, a position he held until his death.

General Yardmaster F. C. Hattie, after a serious illness, has returned to his duties at Vicksburg yard.

The scene at present (the middle of April) in and about the company's properties at Vicksburg is highly animated and interesting and daily attracts to the vicinity of the passenger and freight depots hundreds of curious spectators. The mighty Mississippi is on one of its periodical floods, and this one promises to be the most formidable in years. Fighting an overflow like that of the Father of Waters is a man's job, and manfully are the railway people fighting it. There are no hurried and futile makeshifts in this game. The fight is conducted scientifically, every move deliberate and designed.

Superintendent F. R. Mays, Roadmaster E. W. Brown, and all the department chiefs are busy men, indeed. Safety assured here, they will move down the line with the progress of the flood to other points which may be dangerously affected.

Bridge gangs, extra gangs, waterworks gangs, all sorts of gangs are here. Rubber-booted men are hurrying to and fro night and day, without ceasing—human ants, each to his appointed task with earnest alacrity—reinforcing levees here, building embankments there, with engine bells ringing, whistles shrieking, pumps pulsating, and all the while the wind-swept river, its waters rolled up into surging billows, pounds the defensive earthworks with merciless fury. To add to the many difficulties which at first sight seem almost insurmountable, the river level being higher than the street level by

several feet, the water oozes through the concrete sidewalks and pavements, wells up through sewers and manholes, and the inevitable back water sneaks up from unprotected territory like a thief in the night—and then it rains!

Lending further interest to the scene, there are two big, noisy hydroplanes operating out in front of the passenger station carrying passengers to dizzy heights to view the mighty spectacle. They circle about like monster gulls, and the passengers look down and marvel at man's diminutiveness and the greatness of his projects.

But the worst is yet to come. Several days must elapse before the crest arrives and when it does we are ready—and we will win, as the saying is, "in spite of hell and high water."

As an example of the enthusiasm and family spirit needed to win a campaign, note the following bit of verse by Engineer Elmer Lees of Natchez, Miss., New Orleans division, summing up the division's efforts in the recent inter-divisional coal campaign in which the New Orleans division participated.

In February, twenty-two,  
A feat we started out to do,  
Show I. C. men we'd win the game  
And thus achieve undying fame.  
We'd win out in the Coal Campaign  
And fuel save, and glory gain.  
The Superintendent sent for me,  
"You're the man I want, Elmer Lee.  
Get every man to do his bit  
And give them all your big, glad mitt;  
And ask them all to do their best  
To win out in this fuel test."  
I packed my grip, went down the line,  
I told you, boys, the trip was fine.  
I shook hands with my many "fren's"  
Among whom were some handsome—hens.  
I talked "Save Coal," dreamed in my sleep  
That in a mine, both dark and deep,  
I picked out coal for us to use;  
Sent I. C. slate and all refuse.  
Co-operation? I should say  
We got it, sure, both night and day.  
For ev'ry man upon our line,  
I'll tell the world, is fit and fine.  
And speaking of Division pride—  
Equals? Not in a whole year's ride.  
The game was won by master plays,  
The cards were dealt by Mister Mays;  
Our good friend, Lynch—he played them  
hard,  
I'm almost sure he worked a card.  
Cronin, with big flush in his sleeve,  
He would have played it, I believe—  
But Christy in the op'ning seat  
Just watched the men—so no "cold feet".  
Old Pete Gallagher watched his stack,  
Tom Carter drafted every "Jack";  
Division men behind their backs  
Watched what went through the kitty  
cracks.  
With J. B. Y. and F. H. A.  
Cutting the game both night and day,  
Now, how the hell could I. C. win  
When up against this game of skin?

O. R. Weitzel, agent at Cedars, Miss., noticed a broken flange on I. C. 53718, a refrigerator car, while it was en route north March 27, and notified F. H. Anderson, trainmaster at Vicksburg. An investigation at Vicksburg showed that the car, which was loaded with vegetables, had a freshly broken flange.

*J. W. Stevenson*

Mr. Stevenson, whose appointment as assistant general passenger agent, Northern and Western lines, was announced effective December 1, 1921, was born in Chicago, September 17, 1888. He was educated in the public and English High and Manual Training schools of Chicago. In July, 1903, he entered railway service as an office boy with the Western Passenger Association in Chicago, later serving in various other positions. On October 7, 1909, he accepted service with the Chicago Great Western Railroad as passenger rate clerk, a position he held until November 15, 1912. On that date he entered the service of the Illinois Central as a rate clerk in the passenger department. He became assistant chief clerk on March 16, 1914, and chief clerk on May 13, 1914, a position he held until March 1, 1920, when he was appointed district passenger agent at Chicago. On April 1, 1920, he became chief clerk in the traffic department, and on December 1, 1921, was appointed assistant general passenger agent.

## Drive to Reduce Accidents at Crossings

### Illinois Central System Will Join With Other Railroads in Campaign June 1 to September 30

#### The Toll

The following table shows the number of persons killed and injured as the result of accidents at grade crossings on the Illinois Central System during the last five years:

	Killed	Injured
1917 .....	53	144
1918 .....	50	201
1919 .....	74	224
1920 .....	47	251
1921 .....	58	207

Cross crossings cautiously!

**D**URING 1921 forty-one persons lost their lives as the result of 406 automobile grade-crossing accidents on the Illinois Central System, and 168 persons were injured. In addition to the accidents in which automobiles were involved, seventeen other persons were killed and thirty-nine other persons were injured at the grade crossings on this railway system.

The 504 accidents at grade crossings on the Illinois Central System last year were preventable. While it was not within the power of the management and employes to prevent them, they could have been prevented by close co-operation between the employes of the railroad and the public.

Beginning with June 1, the Illinois Central System will join with all the other railroads of the country in a nation-wide campaign to prevent accidents at railway grade crossings. As explained in the statement by President Markham in this issue, it would require

billions of dollars to separate the grades at all highway-railway crossings. Therefore, with that alternative beyond reach for many years to come, we are confronted with the necessity of dealing with the problem with the means at hand. Experience has shown that the only method is the exercise of caution by the drivers of vehicles and others who cross railway tracks at intersections with streets or highways.

The nation-wide campaign is under the direction of the safety section of the American Railway Association. The drive will continue until September 30. Elsewhere in this number there is published a transcript of the address which President Markham made before the safety section at the meeting at which plans for the national campaign received their final approval.

No railway employes have had more experience with grade-crossing accidents than locomotive engineers. They are confronted with the problem almost daily. With that in mind, the *Illinois Central Magazine* has asked a number of locomotive engineers for short statements setting forth what they consider to be the means of attacking the crossing problem. Twenty-one engineers have complied, and their statements are given herewith:

C. J. BARNETT, *Memphis:* I do not see how any sane person could drive a car in front of a moving train. I do not claim that every person who drives a car is insane, but I do say that anyone who is struck by a train on a public highway is insane at the time. There seems to be something about the running of the engine and the vibration of the automo-

bile and "floating through the air," so to speak, that makes some people lose all sense of safety for themselves and others, and I am of the opinion that something should be done that will in some way call their attention to the danger of these crossings. So often they will take a chance of losing their lives to cross the track and then stop and watch the train pass. A perfectly sane person would not do such a dangerous thing, and a careful driver would never get his car struck on a railway crossing even if there were no flagman or warning of any kind.

Speaking from a locomotive engineer's standpoint, we are perfectly helpless when a chauffeur drives a car on the tracks just in front of our engine. Surely he should know that we would not hit him could we help it. I have seen men with nerves of iron, men who are gray from years of service as engineers, sit down and weep after striking an automobile and killing the occupants.

Automobiles, due to the careless way in which they are being driven, cause us, as engineers, more anxiety and uneasiness than any other part of our work. We have automatic block signals to protect us from a defective switch or a broken rail, but we have no protection from an insane person who will deliberately drive into the jaws of death.

The drive to get our people to be more careful is a good thing. A constant drip will wear stone; so we will just have to keep constantly at it, and prevent all the accidents we can. Engineers can sound their whistles to comply with the law; they can also sound the same whistle to prevent an accident on the crossing by putting pep in the whistle.

Another suggestion I would like to make is that on each motor vehicle windshield, in small letters, these words appear: "If you don't know, don't go."

#### Urges Law and Common Sense

E. J. BOLIAN, *New Orleans*: Grade-crossing accidents are taking lots of space in the daily papers throughout the United States, and it seems that no effort is being made by the law-

E. J. Bolian

makers to help the railroads prevent such accidents. It appears to me that the majority of people are losing their minds over automobiles. A great many, I am told, mortgage their homes in order to own automobiles and then after getting the machines in their possession start to commit suicide on the installment plan. From personal observation I am inclined to believe that when they start out on a joy-ride they think they have the right of way over any and all things.

I am running a passenger engine on a fast schedule, and, while I have been fortunate in keeping from being tangled up in a lot of scrap iron that once upon a time was called an automobile, I must confess that I have come so near striking them at grade crossings after repeated notice of our approach was given by blasts of the steam whistle that I have wished they were in a place that was not so pleasant as an ice cream parlor.

Grade crossing accidents can be prevented if automobile drivers will use a little common sense. If they will do just half as much as the engineer does to prevent these accidents I am sure there will be no accidents. Since they won't do it of their own accord, then I say laws should be enacted that will compel them to.

The rules of this company require us to sound the whistle on approaching grade crossings. The sound of the whistle should be distinct, with intensity and duration proportionate to the distance the signal is to be conveyed. I wish to say without a doubt that this rule is carried out to the letter by all the engineers on this railroad. I have seen automobiles cross in front of me when I was a couple of hundred feet from the crossing and the whistle valve open at the time.

Since such warning has no effect, I would suggest that the different states pass laws that would impose a fine of not less than \$50 and a jail sentence of not less than ten days on anyone driving or having charge of an automobile who crosses a railway track without first stopping to look and listen for approaching trains, the informant of such a violation

C. J. Barnett

of the law to receive one-half of the fine collected. No one under the age of 18 should be allowed to drive an automobile. If we could get the help as outlined above people handling automobiles would be more careful, and I am satisfied that we would seldom hear of a grade-crossing accident.

"A careful man is the best safety device known" has more truth in it than poetry.

#### From a Panama Limited Engineer

H. D. HOWARD, *Champaign*: I have been in the service of the Illinois Central Railroad for forty-three years as a locomotive engineer, twenty years of this in passenger service, and I am now engineer on the Panama Limited.

I have often wanted to say a few words about the narrow escapes that automobile drivers have with this fast train. Several times they have driven their cars into the side of the train or the engine while the train was running at full speed. Others kill their engines on the track or dodge out from behind cars or elevators, and try to make the crossing ahead of the approaching train without even looking up. On Sunday especially the autoists seem to be carefree and take little notice when crossing the railway tracks, carelessly thinking they can speed up with their cars full of people, and get over the crossing ahead of the train which is in plain view. Why does the driver not think that a minute or two less will not change his plans after reaching his destination? He can stop his car in safety much sooner than the engineer can stop his train. The automobile ought to be under such perfect control that it could stop within a distance clear of danger when approaching all railway crossings.

The majority of these accidents could be avoided if the danger warning signals placed at all railway crossings were heeded: "Stop, Look, and Listen."

The carelessness of automobile drivers is putting many gray hairs on the heads of the engineers running fast trains, making nervous wrecks out of them. This is the greatest responsibility that I have while running this fast

train. I sound the whistle at every road and street crossing, and keep the bell ringing continuously. The fireman and I always maintain a look-out position in the cab and give additional warning if necessary while passing through all towns.

The public demands fast railway service, and my advice to the drivers of automobiles is that when they cannot know positively that the way is clear they set the brakes and stop. That is what a good engineer will do.

#### Nerve-Wrecking for the Engineer

FRANK GALLAGHER, *Clinton*: To the locomotive engineer there is no greater menace, nothing more nerve wrecking and regrettable, than grade-crossing accidents. Yet careful analysis reveals the fact that in most cases such accidents are avoidable, most of them being caused by the carelessness and negligence of automobile drivers.

When we consider that the locomotive has a designated path which it must follow, and that all that is necessary for the automobile driver

H. D. Howard

## DANGER AHEAD!

## LOOK LISTEN

**AT RAILROAD CROSSINGS be careful. Don't cross tracks after train has passed until you can see that a train from the opposite direction is not approaching.**

**If view is not clear take extra precautions. Be careful and happy today, not crippled and sorry tomorrow.**

**Your co-operation in the National Safety movement is respectfully solicited.**

**In six years**

**9,636 Persons were KILLED and 24,855 INJURED at highway crossings because they failed to observe these precautions.**

to do when crossing this path is to satisfy himself that there is no locomotive approaching, it is deplorable that grade-crossing accidents with their attendant destruction of human life, suffering and the saddening of many homes should ever take place.

To maintain the efficiency and high speed schedules in transportation demanded by the public, the engineer must drive his locomotive at a high rate of speed, and he is daily brought face to face with the carelessness of automobile drivers who disregard not only their own welfare, but the welfare of others.

Our slogan on the railroad is: "The best safety device known is a careful man." This slogan can be applied to automobile drivers as well. A careful man will satisfy himself as to his safety when crossing the path of a locomotive.

#### Sees Need for Law on Subject

I. H. MARTIN, *McComb*: There are by far too many crossing accidents. Will the public awaken and do its part in trying to reduce these accidents? Crossing accidents are due chiefly to the recklessness, carelessness, or indifference of the drivers of automobiles. The engineer does not want to kill or injure anyone, but when an automobile is driven directly in front of an engine the engineer is powerless to prevent injury and possible death.

Every state should have a law with a severe penalty requiring the driver of a motor car to come to a full stop before attempting to cross a railway track. All trains do this. It is the only way to prevent accidents. About six persons out of ten do not stop or look in either direction. The other four look in one direction only. Not one driver in a hundred stops, looks, and listens. The law in every state should require the driver of

Frank Gallagher

a motor vehicle to stop, look and listen. If he did this there would be no accidents.

Of all the nerve-racking experiences to which a locomotive engineer is subjected, the worst is to see an automobile dash suddenly into view as a crossing is approached; he has sounded the warning whistle, has the bell ringing and knows that he cannot stop his train, and has no way of telling whether the driver of the automobile is going to stop or not. There seems to be a disposition on the part of some drivers to run their cars at full speed up to a crossing as close as possible, and think it a good joke on the engineer, especially if he applies the brakes and brings his train to a full stop. The automobile driver little realizes the agony it causes the engineer. This very thing has happened to the writer many times, and I will have to admit that it takes all the starch out of me for a while.

As often as I read in the newspapers of some prominent person losing his or her life at a railway crossing, the first thing that enters my mind is this: Now the public will wake up and assert itself, and demand that a law be passed to prevent this carelessness of automobile drivers. But it seems that they soon forget their friends and loved ones, and seek retribution through the courts. And the Grim Reaper takes his toll.

#### Has Watched Situation Develop

FRANK ROSSON, *Memphis*: I have been running a passenger train twenty-one years, or throughout the life of the automobile. It is my observation that most automobile drivers do not take any precautions whatever when approaching railway crossings so far as I can see from my position in the engine cab. They seldom slacken their speed, and if they look they do so without turning their heads perceptibly. Very frequently, when they see me coming, instead of stopping they increase their speed and endeavor to beat the train over the crossing. If their view is obstructed they run blindly on to the crossing and trust to luck or to the engineer exercising more care than they do.

In approaching crossings where the

I. H. Martin

Frank Rosson

view is obstructed I reduce the speed and not only sound the crossing signals at designated places, but sound them repeatedly until the crossing is reached. I also see to it that, so far as practicable, my fireman times his work so as to maintain a look-out when approaching crossings and when passing through towns and villages.

On my run between Memphis and Vicksburg there are several crossings protected by electric bells, but so far as I can observe the average motorist pays no attention to the ringing of such bells.

I do not see how it is practicable for the railroad to do more than it is doing, or for the engineer to do more than I make it a practice to do, without interfering with the service. If the public can be educated to reduce speed or stop, and to use its eyes and ears, crossing accidents would be eliminated.

Perhaps national legislation, requiring motorists to stop or greatly reduce speed before going on to railway tracks, with a heavy penalty for failure to do so, and the construction of humps at obscure crossings, might help to educate automobile drivers to exercise reasonable care.

T. J. Powers

**Cautions Friends to Be Careful**

T. J. POWERS, *New Orleans*: When approaching a dangerous crossing I sound the

whistle three or four times, and also have the fireman on the look-out. At all times I take special care to see that the bell is ringing.

I caution every person I know who has an automobile about railway crossings and the ultimate danger resulting from careless driving. I also tell everyone I speak to about this important matter and ask them to mention it to others.

**Either Unconscious or Daredevils**

GEORGE L. TENNEY, *Champaign*: From the point of view of the engineer, automobile drivers are divided into two classes. The first is the driver who does not think, but who absent-mindedly passes over railway tracks not realizing that they are there. He is more dangerous than the man who tries to beat the train across. The engineer, seeing the car moving at a moderate speed, may believe the driver is aware of his proximity to the

G. L. Tenney

tracks and will stop before crossing or attempting to cross. He is the man who does not hear the whistle and bell, who perhaps sees the train bearing down upon him and, by "stepping on her" to get over when he has gone too far to stop, kills his engine right on the crossing and is in turn killed by the locomotive. When this happens, witnesses should not testify that the engineer sneaked up on him, that the engine bell was

**DISTRIBUTION OF CASUALTIES AT HIGHWAY GRADE CROSSINGS . . . . .**

	1917	1918	1919	1920
<b>CASUALTIES:</b>				
KILLED	1969	1852	1784	1791
INJURED	4764	4683	4616	5077
TOTAL	6733	6535	6400	6868
PEDESTRIANS	982	778	698	687
<b>OCCUPANTS OF:</b>				
AUTOMOBILES	4083	4240	4790	5250
OTHER VEHICLES	1668	1517	912	931

not ringing, that the whistle was not sounded, that he did not have a clear view of the track, or that the headlight was not burning.

Now a word concerning the driver who, seeing the train approaching, decides to beat it to the crossing. Somehow we admire him. Even if he causes the icy hand of suspense and horror to clutch our heart until he is across or dead, we have an admiration for his foolhardiness. We know what he is going to do, in all probability. We know perhaps that he is coming at a speed in excess of that at which we are moving, and we use the emergency clause of our retarding system to prevent him from giving the fool-killer a chance to sit down and rest half an hour. By doing this we sometimes delay things enough to give him a chance to get over just ahead of us, when he almost invariably slows down and looks back at us and laughs. Then we wipe the cold sweat from our brow and say things. This happens on our fast runs almost daily. And sometimes he does not quite make it!

#### Sees Need for Co-operation

H. F. TURNER, *Centralia*: The elimination of road crossing accidents will require co-operation of the railroads, their employes, and the public, with emphasis on the public. The railroads generally have given this matter a great deal of thought and have gone to a large expense to prevent crossing accidents. The employes have been educated to use every precaution. Almost every engineer has had the experience of almost sending some reckless or careless motorist to eternity, and that makes enginemen so much more on the alert to prevent such accidents. Now let the public get the safety habit, and let the slogan of every motorist about to cross a railway track be "Stop, Look, and Listen!" Stop where you can look, take in what you see, listen constantly—and then heed what you see and hear.

I would suggest that at obscure and dangerous crossings the whistle be sounded with a greater degree of volume and intensity than at other crossings. The speed restrictions in smaller towns should be modified, and some of them should be eliminated. We have observed that

H. F. Turner

in the town with a speed restriction of six miles per hour the motorist is often careless and takes unwarranted chances, while in the town with no speed restrictions he is more careful and cautious. Besides, the slow-moving train tempts the small boy to hop, which adds another menace and is often disastrous.

The public should never be led to think a railway crossing is safe, but should be taught that all crossings are dangerous.

#### Bumps for the Thoughtless

R. L. STOKES, *Memphis*: I would suggest that all highways at railway crossings should have humps about 8 or 10 inches high and about 3 or 4 feet wide extending from one side

R. L. Stokes

of the highway to the other, these to be placed 100 feet from the railway crossing on each side of the crossing. This plan would cause the motorist to slacken speed and would be a warning that a railway crossing is just ahead. On stormy and dark nights when signs cannot be seen and electric bells cannot

be heard, this hump would give warning that a railway crossing is just ahead. Safety humps are inexpensive. They may be made from the same material as the highway, and they will last for many years.

From my observation of the majority of motorists, they do not slow down for railway crossings if the crossing is clear ahead of them. I positively know they have run over crossing flagmen who were trying to protect their crossings and give warning that trains were approaching. I was backing my engine through Memphis recently when an automobile approached the railway crossing on Shelby Street so fast that when the crossing flagman held his stop sign out the driver skidded his car 40 or 50 feet in his effort to stop, and stopped on the crossing, killing his motor. To prevent an accident I applied brakes, dropped sand and stopped my locomotive within three or four feet of this automobile.

#### Urges Tuning Up of Whistles

GEORGE W. WILSON, *Clinton*: It looks as if

the "Stop, Look, and Listen" law at highway and street crossings is too slow for the people of today. There is not enough caution and safety at railway grade crossings. I will suggest that Mr. Car Driver slow up at all crossings, shift gear, and, if the crossing is not clear, come to a stop; if the way is seen to be clear, let him then proceed over the crossing. He then has his car set in full power to pull over a grade or rough crossing should there be either or both. Never stop a car on a railway track if it can be avoided.

G. W. Wilson

The engineer should blow the whistle so as to space the blasts from the whistling post and finish close to the crossing. Also, if we see a car driver in doubt about having time to cross we should give him the second alarm. Oftentimes we can put him right, and he will not cross. Engine steam whistles should have good clear tones, carrying to and beyond the crossings. Railroads should tune up their steam whistles that need it before June 1.

If the public in general will take hold in the drive with the same force that the railroads will, much good will follow.

#### Motor Car Bumped Locomotive

JAMES J. ORCHARD, *Freeport*: It is my opinion that the elimination of automobile accidents at railway crossings is beyond human control unless the drivers of such vehicles use the faculty the Lord has endowed them with and consider the risk they take in crossing over a railway track ahead of an approaching train, for various things may happen in the way of a breakdown or accident to their automobile and at that particular time.

J. J. Orchard

I have thought for a long time that some laws should be enacted, making it compulsory, under penalty, for all automobilists to stop,

look, and listen before attempting to cross a railway crossing, but I maintain, as before, that common sense is the main essential.

My observation as to the conduct of motorists is that the majority try to beat the train across at all hazards. I have had some near-accidents by the foolhardiness of these drivers in disregarding the warnings given by the sounding of the whistle and ringing of the bell. I recall one case in particular where an autoist drove his car into the side of the locomotive because he was not watching where he was driving. He claimed he was not looking in the direction from which I was approaching.

#### Suggests Bumps on the Road

J. O. GADSBY, *Memphis*: We engineers can contribute more toward making the nationwide campaign for the prevention of highway crossing accidents a success than any other class of employes, by keeping a close lookout at all times and having our firemen do the same, and by being sure to sound the whistle and ring the bell for all road crossings. We should also see that our bell ringers are in good working order at all times.

J. O. Gadsby

Where practicable grade crossings should be eliminated by putting in subways and overhead bridges, which would eliminate all danger and would pay dividends in the end.

My observation has been that most accidents and near-accidents are caused by drivers of vehicles and pedestrians, instead of taking the safe course and slackening their speed when approaching a railway crossing, racing with the train to beat it to crossing. The sad part of it is that they do not always succeed.

I think the best device to prevent autoists from speeding over railway crossings would be to place a ridge or bouncer in the road near crossings and have a "safety first" sign near. The city of Memphis has this device on its parkway drives at all railway crossings and it is wonderfully successful, for when a motorist speeds over one and bumps his head against the car roof he slackens up for the next one.

#### Most Accidents Due to Speeding

N. W. FRISBIE, *Waterloo*: A study of motor

accidents has revealed that a vast majority of the disasters that overtake motorists are brought upon themselves by their own recklessness, and that 90 per cent of them are due to speeding.

There is no law on the statute books of Iowa requiring a traveler upon our public highways to "Stop, Look, and Listen," but this rule has been generally adopted by the courts. My observation has been that motorists, as a rule, look straight ahead rather than to either side, and, seeing no obstruction, proceed. Time seems to be their main idea instead of safety.

One remedy which might prove effective in averting a great many accidents would be to place distinguishable whistles on passenger and freight engines. The motoring public would soon recognize the difference, knowing that when a fast mail or limited is approaching there is no time to cross.

**Make the Motorist Responsible**

P. G. JOEST, *East St. Louis*: From my own observation, I notice that nine-tenths of the motorists pay no attention to the crossings, never looking in either direction for approaching trains. Most of the accidents are due to exercising poor judgment of distance and speed, thinking that a train could be brought to a stop in as short a space as an automobile.

If a law were passed to reverse the responsibilities—making the motorist take his life at his own risk, eliminating whistling at grade crossings, thereby putting the motorist on his own lookout—grade crossing accidents would be eliminated.

**Keeps a Sharp Look-Out**

AMBROSE G. FINN, *Chicago*: In my opinion the great majority of grade-crossing accidents

N. W. Frisbie

occurs through the carelessness of motorists. If every motorist would stop, look, and listen before crossing a railway track there would not be any such accidents. But the human-being seems to be so constituted that he wants to beat the other fellow to it.

An automobile driver is likely to approach a railway crossing at a high speed and stop within a few feet of the crossing. Often the driver races across just in front of the engine, barely escaping being hit, giving the engineer no opportunity to understand the intention of the motorist.

My idea of the way to obviate motor accidents is for the railroad to build viaducts and subways wherever possible at the main arteries of travel; also to eliminate all objects which obstruct the view of the tracks from approaching motorists, such as buildings, shrubbery, high mounds of earth, etc.

A. G. Finn

My personal attempt to prevent accidents of this kind is to keep a sharp look-out at all such grade crossings, strictly observing all rules as to crossing signals before reaching a crossing, and stop my engine, if possible to do so, to avoid striking an automobile which may have run on the tracks.

**Would Have Motorists Watched**

GEORGE S. HENDERSON, *Mattoon*: I feel that, if some method was installed by which a man was assigned for the purpose of going about from place to place and prosecuting the violators of the present laws, it would have a salutary effect. While I do not believe this would wholly stop it, it would have its effect, for I have noticed on a busy street corner where a traffic officer is on duty a great number have to be forcibly stopped and reprimanded or fined for violation of the law.

G. S. Henderson

P. G. Joest

And I wish to say that the practice of some motorists in dashing up to the crossing, attempting to beat the train or in a spirit of fun, is causing something that has not been made note of by the management, for the engineer will naturally apply his emergency brake, hoping to retard the train enough to let the erring one safely across, and in so doing he often very seriously discommodes the passengers in a passenger train and damages equipment and freight in a freight train.

If anyone is a greater sufferer from the grade-crossing peril than the locomotive engineer, I fail to know who it is. The constant nightmare of this thing saps the vitality of our engineers, and prevents them from giving all their time and attention to the economical, efficient operation of our trains.

### No Judges of Speed or Distance

J. R. TUSSON, *New Orleans*: I have often found automobiles dead on highway crossings and have seen them in time to stop. Motorists change from high to low gear at grade and many times they kill their engines on the crossings. Others try to see how close they can cross ahead of trains at high speed. Motorists should be made to come to a full stop at all grade crossings and know that the way is clear before crossing, as they are no judges of speed or distance.

### Carry Out All Safety Rules

TOM L. CONNOR, *Indianapolis*: In this day of speed and speed kings, it is a matter of much concern to locomotive engineers and everyone else as to the best mode of procedure to avoid accidents at grade crossings, and, if possible, to eliminate both the accidents and the danger. I have given this matter much thought, as there is seldom a trip made but that some autoist has a close call brought about by his own carelessness and his failure to "Stop, Look, and Listen." I have come to the conclusion that it would be an utter impossibility to reform the entire automobile fraternity, so it is up to all of us, both the management and the employes, to try to bring

Tom L. Connor

about as near 100 per cent efficiency as possible in regard to rules and special instructions relating to the safety of the public at large, and to bring before the public the importance of understanding just how dangerous it is to ignore a grade crossing and what results generally accompany the act of ignoring it.

It appears that different localities have different ideas as to how the matter of grade crossings should be treated. At some points on the line automobile drivers race for the crossing, and at other points they treat the train with disdain and seldom condescend to look at it, but drive serenely right in front of it. Sometimes they get over in safety. Of the latter species there is "one born every minute." If it were not for the constant look-out kept by employes they would be leaving this good old world at about the same rate.

The fundamental idea is to carry out the rules to the letter, and, after that is done, and the autoist persists in taking chances of being killed or maimed for life, the engineer should slow the train down and in extreme cases stop before striking him, if possible to do so. A few minutes lost on the schedule of a train mean absolutely nothing in comparison with human lives lost and the damage to property, to say nothing of the wear and tear on the nerves of engineers.

It is to be hoped that some solution of the grade-crossing problem will be brought about in the near future. In the meantime the management and the employes should unite in their efforts to eliminate the grade-crossing menace.

### Careful in Passing Another Train

C. A. GILMORE, *McComb*: Automobile drivers cross railway tracks at high speed, and not one out of a hundred slows down, stops, or looks, and when one does stop he is more than likely to stop in the middle of the track.

Some time ago the driver of an old car stopped in the middle of the track just ahead of my engine, jumped out and ran to a place of safety. Just as soon as I had stopped my engine he jumped into the car and drove off. Since then I encountered a truck which was being driven so fast that

C. A. Gilmore

the driver could not stop it before reaching the crossing. I just beat him to the crossing, but he had the presence of mind to turn the truck and run it alongside the train until it stopped.

There are many who advocate electric crossing bells, but bells, like other machinery, sometimes become inoperative, and then they become man-traps instead of safety appliances.

Under existing laws and rules, I start ringing the bell and sound a long crossing signal the required distance from all crossings, and I repeat it just before I get to the crossing. When I am meeting a train, if the rear end is near or passing over a crossing, I repeat the signal so that the whistle is sounding as I pass the rear end of the train. I also have instructed the fireman to keep a close watch of the rear end of all passing trains. I think this is the most effective accident preventative under existing laws unless the automobile driver is deaf.

As railroads are operated interstate, there should be a national law providing for a fine for the driver of an automobile or other vehicle who crosses a railway track without stopping and knowing the way is clear. The law also should provide that violators should be liable for any injury or damage resulting from their disregard of the law. Some drivers claim that automobilists should not be compelled to stop at crossings any more than railway trains. Railroads are national industries. There are two road or street crossings to the mile of railway track. Would it be just to require the railroads to stop their trains from one to three times in every mile, when an automobile wouldn't have to stop but once in five to fifty miles? If the railroads did the stopping it would take them a week to do what they now do in a day. It should not be necessary to point out the chaos that would cause.

The public is clamoring for a reduction in railway rates. It ought to demand laws to cut down the great expense of highway crossing accidents; then the railroads would be able to reduce rates.

#### Must Watch Motor Busses

M. H. KEMPTON, *Chicago*: Much will yet be said, volumes written, and many yet unborn must die before the grade-crossing problem reaches its final solution.

The files in the office of the claim department will show that warnings were given but to no avail, that bells were rung but they continued on, that gates were used but they were run through, that lights, warning-bells, signs,

M. H. Kempton

and safeguards of the most recent and approved pattern installed, and yet, after all this, death and destruction have materially increased. We may conclude, I believe, that further efforts on the part of one party to protect life and property and no effort on the part of the other party is a pathetic failure.

A new element looms on the horizon which for grewsome and ghastly narratives may tend to hasten the day of final solution. I refer to the bus lines that are being certified to by the state commerce commissions. These heavy and massive things, loaded with women and children, guided and handled by the same intelligence that handles the automobile, will do just what the driver of the automobile does, and there remains yet to be written the appalling disasters that we may naturally expect from the present course of events.

Accidents there will always be, but I do feel that those making and having to do with the execution of the laws of the land should exact from vehicle drivers the same degree of care and caution at crossings that they now demand from railroads and traction lines. They should be made to come to a stop at dangerous places and know, rather than hope, the way is clear.

# Advocates Teeth in Grade Crossing Laws

## Mr. Markham Tells Railway Safety Men That "Stop, Look and Listen" Statutes Should Be Enforced

The following address by President C. H. Markham was delivered before the Safety Section, Operating Division, of the American Railway Association at its meeting at the Congress Hotel in Chicago, May 4.

**I**ESTEEM it both as an honor and as a privilege to be asked to appear before you on this occasion and to have a small part in your proceedings here today.

No branch of railway organization has been more successful in its work than that branch of which you have the direction—the safety section, operating division, of the American Railway Association. Your organization is entitled to receive the congratulations not only of railway managements, but also of railway employes and the public, for the benefits derived from your most worth-while work extend into all departments of the railroads, into the homes of the employes and to the public in many ways.

When we find men who manifest a deep interest in the conservation of the lives and limbs of their fellowmen, leaders who are devoting their time and thought, or a portion of it, to the welfare of humanity, we find men of initiative and probity—men whose type of leadership has reflected the greatest credit upon railway organization.

### The Best Record Since 1889

One of the most helpful things being said about railway management at present is that there were fewer fatalities on the American railroads in 1921 than in any previous year in thirty-two years—or since 1889—notwithstanding that, in the same period, the number of employes increased 136 per cent, passenger traffic increased 223 per cent and freight traffic increased 346 per cent. These figures give some idea of the success of the splendid work in which you are engaged. It is well known that accidents for the most part result from man-failures, rather than from plant-failures. Therefore, the great improvement reflected in the gradually decreasing number of fatalities on the railroads is largely the result of the educational work which your organization has been doing.

A remarkable feature of railway history is this: In spite of the great increase in passenger and freight traffic and the great increase in automobile grade-crossing accidents—the latter having increased in proportion to the increase in the number of motor driven vehicles in use—there has actually been a large decrease in fatalities as a whole on the railroads in the last three years as compared with the number of fatalities on the railroads of twenty years ago. This reflects credit upon railway management all along the line.

The railway business of this country is so large that one cannot make rapid headway if he studies it as a whole. The best way to grasp the railway situation is to study one angle of the business at a time, as, for example, this angle which relates to accidents. If the student finds that the railroads have done well in one particular line, he is justified in assuming that they have done well in other lines. The specialization which has wrought the decrease of personal injury accidents differs but little from the specialization which may be found in all other departments of the railway service.

### Campaign Four Months This Year

I understand that your committee on prevention of highway crossing accidents will make a report to you today on the plans for conducting the Careful Crossing Campaign from June 1 to September 30 and that these plans will have your consideration. I am greatly interested in that movement. In attacking the problem of reducing the number of injuries at grade crossings you are attacking railway accident prevention at its weakest spot—and that is as it should be.

Your chairman has handed me some figures showing that in thirty years crossing fatal injuries on the railroads increased 345 per cent. In the same period crossing non-fatal injuries increased 682 per cent, while the population of the United States increased only 68 per cent.

In 1920 (the last year for which we have complete returns) 1,791 persons were killed and 5,077 persons were injured in grade-crossing accidents. As 116 of those reported as injured

died of their injuries, there were really 1,907 persons killed in grade-crossing accidents during the year. Seventy-six per cent of these deaths and injuries resulted from automobile accidents. There were more than 3,000 automobiles struck on crossings. To put it in another way, about eight automobiles were struck and about four persons were killed and about eleven persons injured every day in the year.

### The Railroad's Part in the Work

This situation is sufficiently alarming to demand our serious and constant consideration. What are we going to do about it? There can be no disagreement among us that the plain duty of the railroads is to do everything within their power to reduce automobile grade-crossing accidents. It may never be possible to prevent them entirely, but it is possible to reduce them substantially. While it is true that the most frequent cause of automobile accidents is carelessness on the part of drivers, the railroads have not yet gone so far in their safety work that they are able to say they have done all they can do to reduce these accidents.

Several years ago we began keeping our records of automobile crossing accidents on the Illinois Central System with reference to the side of the engine from which an automobile involved in an accident approached the crossing—whether from the engineer's side or from the fireman's side. These records disclosed that more than half of the automobile grade-crossing accidents originated on the fireman's side. This indicated that the fireman was not always on the lookout, ready to ring the bell or to notify the engineer to blow the whistle in an emergency while approaching grade crossings. I suppose that what was true of the Illinois Central System in this respect was also true of other railroads—that more than half of the automobile grade-crossing accidents originated on the fireman's side of the engine.

A fireman who is running over the same territory regularly knows where the street and road crossings are located, and he should always so arrange his work as to be on the lookout at these crossings. Running a locomotive over a street crossing or a road crossing without having somebody on the lookout on both sides of the locomotive cannot be successfully defended as a safe operation, any more than the action of the automobilist who drives his car over a railway crossing without looking in both directions. Here is one of the branches

of safety work in which I believe we can make an improvement. I believe we can explain this matter to our locomotive engineers in such a way as to get them interested in seeing that firemen are always on the lookout while approaching crossings. We have been doing this on the Illinois Central System with considerable success.

Another responsibility which devolves upon the railroads is to maintain as clear a view at crossings as is practicable. I realize fully that in many instances the physical conditions make it impracticable for the railroads to clear the view, but it is also true that there are a great many crossings where the view conditions are susceptible of improvement at a comparatively small expense. The plan which we have been following on the Illinois Central System has been to have occasional inspections at crossings made on the ground by a committee composed of division officers and safety men. These committees study the conditions at each crossing carefully and later submit their recommendations with reference to cutting down embankments and removing other obstructions on the waylands. Often their recommendations involve the expenditure of small sums of money to purchase the right to cut trees or remove unimportant structures located just off the waylands.

### Cannot Separate Grades at Once

Of course we always have with us the important question of removing all danger at crossings by separating the grades. The difficulty is that there are about 252,000 highway grade crossings in the United States. To separate the grades at all of these crossings would cost approximately \$12,600,000,000—which, of course, is prohibitory. Some of our prominent railway critics claim that \$12,600,000,000 is more than the total value of the railroads. Of course that is not true, but it is true that the public would not be willing to pay the increase in freight and passenger rates that would justify the expenditure of such a huge sum of money.

I am a firm believer in the elimination of grade crossings, but this improvement will necessarily have to be made gradually. Only 399 crossings were wiped out by grade separation in the United States during 1919. At that rate it would require 631 years to take care of all the crossings. It is clear, therefore, that the comparatively few eliminations of crossings that can be made annually will not greatly alleviate the situation and that, for immediate re-

sults, we must look to other means of reducing crossing accidents.

### Crossing Warnings Have a Use

Crossing gates, electric warning bells and crossing flagmen have their places in preventing accidents. They also have their weaknesses. People become educated to rely upon the gate-man, and if he errs the danger of accident is considerably increased. Electric warning bells ring so much that automobilists come to disregard them. In addition, there is always the danger that a bell may be out of order just at the moment when it is most needed. Crossing flagmen, like other human beings, cannot always be relied upon. Some of the worst grade-crossing catastrophes have occurred where flagmen were on duty.

Do not let the public have a feeling of security, a feeling of safety, at a grade crossing. Above all things, that is an attitude which should be avoided. The public should be taught that all grade crossings are dangerous and that those provided with crossing gates, electric warning bells and crossing flagmen are perhaps a little safer than others, but still very dangerous.

I do not want to leave you under the impression that I am entirely opposed to the use of crossing gates, electric warning bells or crossing flagmen. In some instances, I believe, they are necessary; in some respects, they do good; in others, as I have shown, they do harm, but there is no alternative at present except to have them at some of the crossings.

### The Correct Solution of the Problem

It is the duty of the public to co-operate with the railroads in bringing pressure to bear upon all drivers of motor vehicles to "Stop, Look and Listen" at grade crossings. That, gentlemen, I submit, is the correct solution for this problem. It costs nothing to "Stop, Look and Listen." If practiced faithfully, the custom will give the same results as the expenditure of \$12,600,000,000 in the elimination of grade crossings. To enforce this rule is our great opportunity in the prevention of grade-crossing accidents. We must get behind this thing and push it with all the strength we have.

In 1916 we conducted a campaign on the Illinois Central System to arouse the public in regard to the danger at railway grade crossings. As a basis for the campaign, we had division officers carefully check crossings in communities on all parts of the system. This was done to determine the facts in regard to precautions

taken for their own safety by those who use grade crossings. It was found from these checks that pedestrians and drivers of horse-drawn vehicles took vastly more precaution at such crossings than the drivers of automobiles. Our division officials were instructed to give the results of their checks of the crossings to the local newspapers in the various communities. In every instance the newspapers used the information prominently in their news columns, and in addition many of them commented upon it in their editorial columns. We also distributed thousands of circulars calling attention to the alarming increase in the number of grade-crossing accidents—principally automobile crossing accidents. The circular closed with these words: "We will be glad to receive and consider suggestions in regard to reducing automobile accidents at grade crossings. This railroad is anxious to do its full part."

### How Public Interest Was Aroused

As a result of the checks of crossings, the newspaper publicity, the distribution of the circular and the other preliminary work done by our officials, our entire organization became greatly interested in the campaign, and we succeeded in interesting the public beyond anything we expected. We received many letters containing suggestions. Our correspondents suggested everything imaginable. Some asked that crossings be made so rough that automobile drivers would be compelled to reduce speed before undertaking to pass over them or else be thrown out of their machines. Others wrote that crossings should be maintained in a perfectly smooth condition, so that automobiles could pass over them on high speed without any danger of killing their engines. Some suggested that automobile dealers, when selling new cars, should be required to give instructions about how to approach and pass over railway grade crossings safely. Several said that warning bells should be located 100 or 200 feet away from the track instead of near the track; that automobile drivers should be instructed never to approach a grade crossing with gears in high; that bumpers should be placed on the highway on both sides of grade crossings.

There were many suggestions to the effect that towns and cities should pass ordinances and that states should enact laws requiring all drivers of automobiles to "Stop, Look and Listen" before crossing a railway track at

grade. The newspapers on our lines showed a lively disposition to co-operate with our local officers in agitating this doctrine of "Stop, Look and Listen." They called attention to the fact that an automobile, in proper hands, is an agency of safety at railway grade crossings, because it can be driven up close to the tracks and stopped in perfect safety, while that is not always true of a horse-drawn vehicle. It was argued that the advent of the automobile should have decreased rather than increased the number of grade-crossing accidents. As a result of all this agitation, seventeen towns and cities on the lines of the Illinois Central System passed "Stop, Look and Listen" ordinances, and one state, Tennessee, enacted that doctrine into law. Much favorable publicity attended the passage of the ordinances in the various towns and cities and the passage of the law in Tennessee, and for a while there was a tendency to enforce these regulations; but later, as the agitation on the subject decreased, laxity in the enforcement of the law increased. What is needed now is a constant demand on the part of the public for the passage and enforcement of "Stop, Look and Listen" laws.

**Public in Favor of Safety Laws**

General Order No. 68, paragraph 16, of the Illinois Commerce Commission, effective July 1, 1921, provides that no public utility shall operate a motor vehicle over and across a railway crossing at grade without first having come to a full stop at a point where the driver thereof shall have a full view of the railway track in either direction for five hundred feet. California, Nevada and Ohio, through their public utility commissions, have recently issued similar orders.

These orders indicate the trend of public thought on this question. Many indications such as these have led me to believe, since the public has been so "fed up" on automobile grade-crossing horrors, that it will now respond quickly and effectively to the great work undertaken by you gentlemen. The demand is for leadership and action. Those things I am confident you gentlemen will supply.

The railroads succeeded in reducing the number of deaths of employes on duty from 4,534 in 1907 to 1,505 in 1921, in spite of having a much larger force of employes and a much larger volume of traffic. That achievement convinces me that the railroads—with your able assistance—will succeed in reducing crossing accidents. It is most gratifying to me to

know that your committee on the prevention of grade-crossing accidents will conduct an intensive campaign. This is certainly a work that should commend itself with equal force to the railroads and their employes and to the public. From each it is entitled to receive the fullest co-operation.

To me, the most astonishing feature of this subject is the fact that "Stop, Look and Listen" laws with teeth in them have not before this been passed by all states and all towns and cities. The main thing is to have teeth in such laws and a workable provision for their enforcement. The absence of those features has been the trouble with the "Stop, Look and Listen" laws which have been enacted. Since this crossing problem so frequently presents a matter of life or death, I believe nobody would seriously oppose the enactment of "Stop, Look and Listen" laws. Everybody, on the contrary, would be actively in favor of them, if the matter were properly presented. Now that your organization has undertaken the job of putting the case before the public in the right light, I am confident that we shall get results. When I say that I am 100 per cent with you in this undertaking, I believe that I voice also the sentiment of every other railway executive in the United States.

**LOST PACKAGE RECORD**

Below is a statement prepared in the office of C. G. Richmond, superintendent of stations and transfers, showing the number of claims paid during April this year and last for lost packages or shipments destined to points on each division:

# How We Save Coal on the Illinois Central

## Vice-President L. W. Baldwin, in Address at Convention of Fuel Men, Tells of the Plans We Follow

*The following address by Vice-President L. W. Baldwin of the Illinois Central System was delivered at the Auditorium Hotel, Chicago, Monday, May 22, as the opening address of the fourteenth annual meeting of the International Railway Fuel Association.*

**I** COUNT it an honor to have a part in the opening of this convention. As a Chicagoan I welcome you to our city, and as an operating officer of a railroad which spends millions of dollars each year for fuel I assure you of my deep interest in the problems which you are meeting here to discuss. I trust that your convention will be productive of much good, that your interest in the pressing questions with which railway fuel men are faced will be stimulated. Knowing so many of you as I do, I predict that success for your meeting.

We have made great strides in the conservation of fuel, and we can be proud of that. However, the economies yet to be effected are great; perhaps they are greater than those already accomplished. In my opinion, the conservation of fuel rests largely with these two principles:

1. Interesting and educating the men who place fuel on the fires, and
2. Developing and using proper machinery.

My experience has taught me that each of these constitutes a vast field of opportunity in our common effort to conserve fuel.

### Careful Use Is Necessary

Coal means more now than it did prior to the war. It costs a great deal of money to produce, transport and otherwise handle it until it reaches the fire-box of the locomotive or stationary engine where it is applied to perform its function. We have all been watching the coal bill—not only the railroads but all classes of industrial plants. The increased cost has made it necessary for us to get our coal burned in such a way as to use a minimum amount and get maximum efficiency.

We ought to exert every energy to burn coal scientifically so as to make each ton produce a maximum result. On the railroad of which I am an officer we maintain an organization to educate our men to burn coal scien-

tifically. This organization has a car fitted up for holding fuel conservation classes and is constantly visiting the terminals, large and small alike. The men doing this educational work are peculiarly fitted for their duties. They have studied fuel production and uses from various angles, and they impart their experiences to the men, display films, make replies to questions and exchange views on all phases of fuel conservation in their meetings.

Of course, it is of primary importance to develop and stimulate the interest of the men burning coal, both directly and indirectly. This can best be accomplished by means devised to educate the men along practical lines. After interest is aroused, the next task is to educate the men thoroughly in practical fuel conservation. This means getting the men to apply common sense practices gained through the information imparted to them by the fuel conservation instructors and through good practices occurring to themselves and their fellow workers as a result of the interest aroused.

### Education an Important Factor

The education of the men and the carrying out of good practices cover a wide scope of endeavor on the part of those in charge of and who are to teach fuel conservation. Great care must be taken by managements to insure selection of men for such positions qualified by experience, natural enthusiasts and those in whom all who should be concerned in fuel economy have confidence. They not only explain and demonstrate that it requires air to burn coal, that a clean fire requires less work and is more efficient than a heavy one, that black smoke is a disgraceful waste, etc., but they also must reach such employes as car inspectors, oilers and repairers, for leaky brake pipes and leaky hose burn coal. Machinists are concerned in setting valves properly, making steam and exhaust pipes tight, and making all steam valves and connections—such as blowers, valves, injectors, drain cocks to water glasses and blow off cocks—fit closely. Boiler makers can save coal by applying the front end rigging in such a manner as to draft the engine properly, by having the petticoat pipe in line with the stack, by keeping the ash-pan in good condition and

open so that the necessary amount of air will reach the fire-box unobstructed. Dispatchers and station and yard forces can help in many ways by avoiding delay.

We have distributed a book entitled "Fuel Economy on Locomotives" which deals with the subject at length, but we can't depend entirely on the book to do the work. To get the best results, it is necessary to employ the personal contact method.

### How Fuel Committees Work

In addition, we have a general fuel conservation committee, consisting of the general superintendent of transportation, the general superintendent of motive power, the engineer, maintenance of way, the purchasing agent, the auditor of disbursements, and the superintendent of fuel conservation, and fuel committees on each division consisting of division officers, enginemen, trainmen and others. This general fuel conservation committee has to do with purchase, inspection, storage and handling of coal, including all feasible economies that can be effected, it being the duty of each member of the committee to read all literature on the subject and be in close touch with all modern and new ideas, and to promulgate monthly fuel performance statistical data and circulate good suggestions, including those of the division fuel conservation committees. The duty of the division fuel conservation committees is to study in more detail the ideas of the general fuel conservation committee and general officers, circulating results obtained by individuals and methods, as well as instructing as to the best methods to be used. It is essential that the entire work be constructive and carried on intelligently, and that it be kept before the men in such a way so as to keep them interested every day.

It would require some time for me to go into the details of the many ways various classes of employes can conserve fuel, directly and indirectly. But it is most essential to educate, interest and stimulate all of them all the time. When you have interested division superintendents on a railroad to the extent that they will give fuel conservation their personal and constant attention, then only do you obtain the best results.

On the Illinois Central System we conducted a fuel conservation campaign throughout September and October, 1921. Enginemen and trainmen on the same terminals competed with one another, and divisions competed for

rank. Daily reports of fuel consumed in freight, passenger and yard service were obtained from all divisions, and reports showing the number of pounds of coal consumed per 1,000 gross ton miles, per 100 passenger car miles and per yard engine mile for all divisions were promulgated daily. The campaign was an interesting and successful one and produced a saving on our lines of 30,000 tons in one month alone. I attribute the success of the campaign to the initial interest taken by enginemen, trainmen and other employes concerned in fuel consumption, and the spirited competition which resulted from posting individual accomplishments. Firemen counted the scoops of coal put in the fire-box between terminals and firemen on switch engines counted the scoops used in an 8-hour shift. This created yardsticks for all men running between these terminals and working on switch engines in terminals. This is illustrative of the interest that can be stimulated in the men. Of course, the local officers must be duly credited for the intensive interest developed in preparing for and during the campaign. An important feature I do not want to overlook telling about is that like interest was manifested by stationary engineers and firemen at power plants, pump and heating stations. They too counted scoops, and it was interesting to note the logical reasons they furnished from day to day for increases and decreases.

### What the Management Must Do

I do not want to be quoted as saying that fuel conservation results are entirely in the hands of the men and local officers. There are a great many things for the managements of the railroads and other properties to consider and act upon. We must have fuel inspection at the mines, and, where coal is placed in storage, it must be scientifically handled to insure economical and proper results. Our purchasing departments must surround the purchase of coal with recommendations made by men competent to pass upon the grades and preparation of coal. Power plant and station use of coal on some railroads warrant specialized supervision, with a man in charge who is thoroughly trained in power plant operation.

Distribution of coal needs close supervision. It is sometimes necessary to burn various grades of coal on a railroad. Under such conditions the distribution should be regular, and locomotives should be so draughted as to produce economical and satisfactory results. Proper tonnage rating of locomotives is a factor.

Where engines can be assigned to individual engineers it will go a long way toward conserving fuel because of the personal interest the engineers manifest in the condition of the engines assigned to them. Efficient yard operation and dispatching of engines and trains, as well as not overloading the tenders, are important features. In fact, nearly every phase of operation is directly or indirectly related to fuel consumption, and it is this relation that must be considered to get the desired result.

Our mechanical departments must understand that they are largely responsible for fuel conservation or waste, or at least are to the extent they are permitted to spend money. A locomotive that is a coal waster should not be allowed in the service. Every part of an engine should be inspected and reported frequently enough to know it is in perfect condition from a fuel conservation standpoint, and the handling should be so supervised as to insure that an engine that does not economically burn coal is kept out of the service until conditioned. We have on the market a number of devices and improvements which have been demonstrated as coal savers—superheaters, brick arches, boosters, etc. All may not agree on the merits of these devices, but I think it is well worth every mechanical man's time to watch and study the development and performance of every improvement and device designed to save coal. I have no doubt that some of you may be competent to conceive such devices and perfect them.

Stationary boilers must be kept in good condition and a systematic method of inspection used to insure economical operation, and the results obtained posted to promote interest of the operators.

#### **Roundhouse Equipment Important**

Further, roundhouse equipment, such as hot water boiler washing plants, water treating plants, plenty of ash pit room, modern coaling stations, are important. These, of course, are expensive items, but the savings produced as a result of expenditures have demonstrated that it is money well spent.

It would require a long time to cover every phase of fuel conservation, and what I have said to you is only an effort on my part to emphasize the importance of this work. We could almost say that our existence today depends upon coal. Its use is extremely diversified; it moves commerce, it prepares our food, it heats our offices and homes, etc. Just because

we see it in large volume in cars, yards, etc., should not detract from its value. Therefore, in my opinion, the education of men and officers, the use of good practices resulting from such education, the progressive use of coal saving equipment, together with the many details too numerous to mention here, should be our plan for attacking fuel waste, and indelibly impressing upon the minds of everyone that fuel conservation is needed and can be accomplished to a large extent, and that the money so saved can be applied to the general good of the properties upon which we and our families are dependent for a livelihood.

The public has the right to demand of us as public servants that we exhaust our best efforts to furnish the most economical transportation service possible. That does not mean that, in order to reduce rates, we should neglect these properties which are placed in our care, but it does mean that we should be constantly on the alert to stop all the leaks and wastes in the business of performing transportation service.

#### **The Necessity for Economy**

For some time there has been considerable agitation for reductions in rates. As you well know, it is of the utmost importance that rates not be reduced generally until the spread between operating revenues and operating expenses which was inherited from the war-period and federal control is overcome. We are seeking to do that by the thousands of operating economies with which every one of you are familiar. We must let the public know what we are doing along these lines. If we take the public into our confidence, frankly and fully, we can overcome much of the destructive criticism which finds its expression in harassing legislation and restrictive regulation.

We are passing through a testing period. The future of the railroads for a long time to come will be governed by the developments of the next few months. The spirit of the times demands that we give our best, most conscientious service to our profession.

---

#### **HEADS ROTARY CLUB**

"President John Donovan has started off like the Panama Limited with the Illinois Central's well-known efficiency for delivering promptly," read a recent announcement to the members of the Paducah (Ky.) Rotary Club. The new president of the club is none other than J. T. Donovan, the Illinois Central's popular agent at Paducah.

# Fighting Back the Flooded Mississippi

## Supervisor Eldridge Distinguishes Himself in Battle With Swollen River—Other High Water Notes

### The Thanks of a State

Governor John M. Parker of Louisiana wrote to President C. H. Markham, under date of May 3, as follows:

"I wrote the following letter to Mr. W. T. Eldridge, supervisor of the Yazoo & Mississippi Valley Railroad:

"I have had occasion recently to notice some of the very excellent work performed in the division under your control, and I write to say that your activity and energy have been very marked and I congratulate the Y. & M. V. in having such an official."

"While all officials of your company have been more than obliging, the activity and energy of Mr. Eldridge stood out and I felt the tribute was deserved.

"With grateful appreciation to you and the entire force of the Illinois Central and the Yazoo & Mississippi Valley Railroad for their hearty co-operation in the trials we are undergoing, I am very sincerely yours."

*Hunter C. Leake of New Orleans, La., president of the Board of Commissioners of the Pontchartrain Levee District and district attorney for the Illinois Central System in Louisiana, reviewed Mr. Eldridge's work as follows:*

THE Darrow levee, a short distance above Burnside on the line of the Yazoo & Mississippi Valley Railroad Company, a levee which had recently been enlarged by the United States government, became badly wave-washed about the middle of April on account of the strong south and southwest winds blowing against that levee for a number of days. As a matter of fact, the upper part of almost the entire enlargement dropped into the river, leaving the old original levee, which was barely above the then stage of the river, and the river was rapidly rising.

A conference was hastily summoned to take place on the levee. I was present with Assistant State Engineer Sidney F. Lewis. The mill owners and plantation owners from above and below the levee, as well as those in the immediate vicinity, were present in large numbers. Supervisor Eldridge was present by invitation.

It was decided that the levee should be sacked. It was estimated it would take about

25,000 sacks. The sacks were ordered by telephone and delivered to the levee the following day, and the work was begun early Saturday morning, April 15. By unanimous consent, Supervisor Eldridge was requested to take charge of the work. The job was done in less than ten hours, in a thorough and workmanlike manner, and Mr. Eldridge deserves all the credit we can give him for the efficient manner in which the work was handled.

### Thorough Work by Y. & M. V. Men

After the Darrow job was completed, Mr. Eldridge helped us save the situation at Belmont, between Convent and Lutcher, and also at Sargy, a short distance above the Mexican Petroleum Company's plant at Destrehan. Mr. Eldridge was assisted in the good work by Mr. Reed, foreman of one of your bridge gangs, and I think he is also deserving of praise for the intelligent manner in which he directed his share of the work. In fact, all the employes and labor furnished by the Yazoo & Mississippi Valley Railroad Company were most thorough in the work done by them.

It gives me great pleasure, too, to tell you that Mr. Eldridge received the most complete co-operation from the Godchaux interests, the Mexican Petroleum Company, the Lyons Lumber Company, the Lutcher & Moore Cypress Lumber Company, and all the other large interests in the Pontchartrain Levee District, as well as the fullest co-operation of all the planters, large or small, who would have been affected by a crevasse in our district.

*Mr. Eldridge, writing May 12, made his report to Superintendent F. R. Mays of the New Orleans division as follows:*

In regard to work on the levee at Darrowville and other points, I wish to advise that on April 13, by request from you, I went to Convent, La., to attend a meeting of the Levee Board. At this meeting, all of the representatives of the large interests and plantations between Burnside and Destrehan attended, in order to discuss the condition of the levee at Darrowville, which was washing down very rapidly.

After the meeting had adjourned, we all went to Darrowville in automobile, and it was

decided that the levee should be sacked. Mr. Leake, president of the levee board, asked me to take charge of the work with about 150 men. I told Mr. Leake that it would be much better, if the levee was to be sacked, for us to get a sufficient force and do the work quickly, so that every one concerned could get the job completed, and it would not inconvenience anyone a great deal.

I at once held a meeting on top of the levee, made arrangements for the labor and trucks to handle them, and decided that we would do the work Saturday, April 15. I ran a work train from Harahan to Burnside and arrived at Burnside at 8 a. m. with a force of 600 men. We had a sufficient number of trucks to transport these men to Darrowville, which is five miles from Burnside, in forty-five minutes.

#### Did Work in Less Than Eight Hours

I started the work immediately, and, by organizing the men properly, I was able to complete the work at 4 p. m. the same day. We sacked 1 mile 250 feet, four sacks high, and dressed the levee off so as to give it good drainage in case of rainfall.

The men returned to Burnside, and the work train left Burnside with the men at 5 p. m.

On the night of April 20, after retiring about 9:30 p. m., I was called over the telephone by Mr. Woods, superintendent of the Lutzer-Moore Lumber Company, and Mr. Minuete of the Colonial Sugar Company. They advised me that the levee at Belmont was in very bad condition and asked me to go to Belmont as quickly as possible.

As there were no trains running, Trainmaster Redon and I went in his automobile. We left

*W. T. Eldridge*

Baton Rouge about 10 p. m. and arrived at Belmont about 12:30 a. m. We looked over the levee at Belmont and decided that the levee should be blanketed. Arrangements were made, and we started this work at daybreak with a force of 350 men and 100 wagons. I worked Friday, Friday night, Saturday and Saturday night. I reached home at 1 p. m., Sunday, retired, and at 8 a. m., Monday morning, April 24, I received a call from Mr. Leake, president

*Working on the levee at New Sarpy*

*Looking toward the levee at New Sarpy, showing men at work*

of the levee board at New Orleans. He said that the levee at Sarpy was in a very bad condition and asked that I go to Sarpy at once.

#### **Another Rush Job on a Levee**

I left Baton Rouge at 10 a. m. and reached Sarpy at 3 p. m. Assistant State Engineer Louis met me at Sarpy and gave me a written authority to take full charge of blanketing the levee at that point. It was seeping very badly for a distance of 1,000 feet and was in a dangerous condition. I made arrangements that evening and night and started to work on the morning of the 25th with a full organization of 450 men and mules. I worked practically night and day and completed this work on

the evening of the 27th. I also supervised the repairs to several other small bad places between Garyville and Destrehan.

It was felt by a great many that the levee at Sarpy would not hold. A great number of people moved out of their homes, and I gave out a statement to the New Orleans *Item* and the *Times Picayune*, which appeared in the papers on the 26th, advising them that there was no immediate danger at New Sarpy.

*Mr. Leake wrote to Superintendent Mays as follows April 19:*

I want to thank you for sending Supervisor Eldridge to the meeting of the Pontchartrain

*A view of the top of the levee at New Sarpy*

Levee Board held at Convent on Thursday last, and through you I want to thank Mr. Eldridge for the most efficient service rendered by him in connection with the work of sacking the levee at Darrow. . . .

Everyone in that vicinity and all of those interested are very loud in their praise of this work done under the direction of Mr. Eldridge, and I feel that it is proper this acknowledgment be made thereof and that the thanks of the Levee Board and all others interested be extended to Mr. Eldridge. I trust you will convey them to him.

*Edward Godchaux of Godchaux Sugars, Inc., Reserve, La., wrote to Superintendent Mays as follows under date of May 2:*

We do not want to make ourselves officious, but we want to express our thanks for having been furnished such an able man as your Mr. Eldridge in looking after our levees—not only the New Sarpy, but the Belmont and Darrow levees as well. We feel that it was only through his foresight and executive ability that we were able to have the organization that we had and accomplish the work in such a manner in so short a time.

## *How Y. & M. V. Saved the Day at Vicksburg*

*Vicksburg, Miss., is a city well up on the Mississippi River bluffs, but the Y. & M. V. tracks and the station are on the water front. Consequently, the work of fighting the recent high water at Vicksburg fell largely upon the Y. & M. V. The following is from the Vicksburg (Miss.) Herald of April 15:*

**T**AKE off your hat to F. R. Mays, superintendent of the Yazoo & Mississippi Valley Railroad, whose headquarters are in this city, in recognition of the successful performance of the herculean task of clearing Levee Street of the large volume of water that had been playing an engagement for five days and nights in that street. The water has been pumped back into the Yazoo Canal and has mingled with the Mississippi for the trip to the Gulf of Mexico. The street will be open today.

Likewise, take off your hat to Roadmaster Edwin W. Brown and Trainmaster F. H. Anderson, for they performed their part in keeping the train service up to the highest standard, the former raising the outer tracks in front of the depot almost three feet and the middle and east side tracks more than a foot, all in a few days, so that the passenger and freight trains could continue in operation with more than three feet of water on Levee Street, if the water coming through the sewers had filled Levee Street to that depth.

### **Street Flooded Two Feet Deep**

For the last five days, men, women and children from all parts of the city, together with a number of visitors from various parts of the country, have been going down to the passenger depot and Levee Street to see the "flood." They saw the street from the passen-

*A flood scene at Vicksburg, on the Yazoo Ship Canal*

*Street scenes at Vicksburg; Y. & M. V. station in background*

ger station down to in front of the W. W. Lassiter Company, at Clay Street, covered to a depth of two feet at the deepest place. In addition to this they saw the entire block on the east side of Levee Street, from China to Clay, flooded with the water over the lower floor in every store and house, some of the stores having more than one foot of water on the floor.

Today, they can go down to Levee Street to see what damage has been done to the wood block pavement, for the water has been pumped out of the street, and a great deal has been drawn from the flooded block so that the only water in the street is in pools, where it has not drained off on account of the holes torn into the street by the wood blocks bulging up and

washing away, to be thrown out of the way of trains by the men in the employ of the railroad.

#### Prospects Seemed Dark

Prospects of flooded conditions, with thirteen pumps and eight siphons working for several weeks, with commercial traffic along the river landing out of the question, did not have any satisfying features for Superintendent Mays and the heads of the several departments.

The situation was not at all to the liking of the city officials, nor to the property owners, even though some of the latter did object to work done by the railroad last Sunday to keep the street open, as was done in 1916, with a gauge of 53.9 feet at this point. The property

owners yesterday agreed to let Superintendent Mays handle the matter. The water was getting pretty high, but the railroad was doing business in the same old way, so far as handling passenger and freight trains on time was concerned, and was standing the expense of having a large force of men working night and day doing extra work raising tracks, clearing the right-of-way of floating wood blocks, and pumping the water back into the canal.

### Everybody Was Willing

Superintendent Mays proposed to plug the sewers or manholes again, just as was done last Sunday, so as to keep the water from backing up from the canal, build sandbag levees where needed to keep the water off the street and the

Y. & M. V. pumps would put the water back where it belonged.

The property owners agreed. No time was lost in figuring on anything. The railway men promptly plugged the manholes with sandbags. City Commissioner Hossley and his men went to work with a will, doing their part for the city, arranging for the proper care of the sanitary sewers, and at 9 o'clock last night the water was off the street except in the holes left in the wood block pavement. This will be drained off and further inflow from the canal was brought to a full stop.

### Sandbags Hold Back Seepage

There is some seepage at various places about the brick pavement along the passenger station,

*Showing the recession of the waters through pumping*

and a heavy seepage just inside the sidewalk in front of the 2-story frame building standing at Mulberry and Grove streets. This seepage is held back by a sandbag levee extending from the sandbag well on the corner, south in Mulberry Street for a distance of 100 feet.

Superintendent Mays said that the co-operation on the part of the city commissioners and everybody was splendid and played its full part

in making the work a success. As for the Y. & M. V. men, heads of departments and all employes, he said that no man failed in the full performance of every duty imposed upon him. Every man worked, and every man worked hard. Congratulations were showered on the hard-working superintendent for his great success in handling what appeared to be a hopeless situation.

## *Flood Scenes on the Memphis Division*

Here are some high water photographs taken in April by Road Supervisor J. Crahen of the Memphis division. No. 1 was taken two poles south of the north switch at Ensley, Miss. Both switchstands are on a line, and only one is in evidence. Water was up to the bottom of the green on both stands, standing fifty-one inches over the rail. The view is toward West Junction. Picture No. 2 was taken half-way between Ensley and Mile Post No. 6, looking toward West Junction. Picture No. 3, taken at Mile Post No. 11, Clarksdale district, looking toward Darwin, shows a log across the track on the road crossing at Darwin. Miss Julia Gaven, division correspondent, writing April 14, said: "The southward main track from West Junction to Lake View, a

distance of approximately eight miles, has been covered with from three to five feet of water during the past twenty days, and all trains are using the northward main track as single track, which makes this one of the busiest stretches of single track on the system."

### **A BUSY DAY**

May 5 was a record day on the Illinois division. On that day the division moved into Chicago 26 trains, handling 1,385 loads and 135 empties, totaling 1,520 cars. This is the largest movement into Chicago from the Illinois division of which there is record. The previous record day was November 11, 1920, when 1,519 cars were moved. These included 1,454 loads and 65 empties.

# Where We Cross the Mississippi by Ferry

*View from levee at  
Jeffries, Miss.*

*Loading cars on ferry,  
Jeffries, Miss.*

*Incline at levee,  
Jeffries, Miss.*

*Incline from top of  
levee, Helena, Ark.*

One branch of our service that was immune from high water, because it operates on water, was our ferry from the Mississippi side of the Mississippi River to Helena, Ark. The pictures shown herewith of a trip from Jeffries, Miss., to Helena were taken in April by C. R. Calvert, traveling freight and passenger agent.

In this connection, Miss Julia Gaven, division correspondent, wrote on April 14:

"April 5, water at Helena reached a stage of 52.4 feet, which is the highest water we have had since 1916, the water having reached a stage of 53.4 feet in 1916. In 1912 the water went to 54.5 and in 1913 to 55.2, which was the highest water the levee system in that section has ever had to withstand.

"The Y. & M. V. has three inclines or landings on the Mississippi side, one at Trotters Point, one mile from Helena; one at Glendale, one mile and three-quarters from Helena; and the last one at the Mississippi state levee, about

three and one-half miles from Helena. We discontinued transfer at the Trotters Point incline at 4 p. m., March 22, at a stage of 44.8; discontinued transfer at Glendale, the second incline, at 2:30 p. m., March 28, at a stage of 50 feet; since that date transfer has been made at the incline at the state levee. The stage of water at Helena the morning of April 14 was 51.4.

"During all this time passenger trains, with very few exceptions, have been on time, and no connections at Lula, Miss., have been missed due to high water on the Helena district. Freight has been handled without any delay. Three and one-half miles have to be made with the boat, where we formerly made about one mile."

Mary—"How would you like to go for your honeymoon in an aeroplane?"

Lena—"Not me. I should hate to miss all the tunnels."—*Yale Record.*

# Let's Kill Off Freight Claims at Source

*In Preparation for "No Exception" Drive, Mr. Richmond Analyzes Some Causes of Claims*

By C. G. RICHMOND,

Superintendent, Stations and Transfers

**I**N view of the remarkable results obtained from the "No Exception Campaign" in the handling of LCL freight during June, 1921, it is the desire of the management that another system "No Exception Campaign" be conducted during June this year, which will include carload as well as less-than-carload freight.

While the total exceptions received covering irregularities in the handling of LCL freight for 1921 shows a remarkable decrease as compared with 1920, there is still room for a decided improvement in the number of exceptions being issued, particularly bad order and over reports.

An astray or short report does not always result in claims. If the astray shipment is properly marked it can be forwarded to the correct destination, closing the shortage.

The bad order report, however, indicates that the shipment has been damaged, and in the majority of instances this results in claims.

The over exception covering shipments at the correct destination without waybills frequently results in claims on account of improper delivery and failure to close previous shortages with this or connecting lines.

## **An Annoyance to Consignees**

In addition to the claim hazard resulting from improper delivery of over shipments, consignees are greatly inconvenienced and annoyed when such shipments are held for surrender of bill of lading or proof of ownership, which often results in several days' delay in making the delivery. This is an unnecessary annoyance to consignees caused by careless handling of waybills at either the originating or the destination station.

The object of this campaign will be to increase the efficiency in the handling of LCL and carload freight delivered to the Illinois Central System for transportation and to insure its reaching its destination in the identical condition in which it was received, thereby eliminating the necessity of an exception of any character.

This campaign will be conducted in a manner

similar to the "No Exception Campaign" of June, 1921.

Superintendents, trainmasters, supervising agents, master mechanics, yardmasters and agents should conduct a personal campaign with all employes under their supervision, holding meetings, soliciting the earnest co-operation of the individual employes in each department to obtain the best possible results in the handling of freight during this month.

## **Daily Meetings Should Be Held**

In addition, agents and platform foremen should hold 10-minute meetings daily with their forces to stimulate an active interest of all platform employes in the correct handling of LCL freight.

In handling to overcome exception reports on carload shipments, the mechanical department, yard organizations, agents and local conductors should be impressed with the importance of providing suitable equipment for the commodity offered to prevent the placing of cars not suitable to protect the contents.

In addition agents should solicit the co-operation of shippers, requesting that they instruct their forces to examine all cars being loaded to ascertain if they are in proper condition for the commodity to be loaded, calling attention to the fact that damage frequently results from minor defects, such as protruding nails, splinters or dirty car floors.

Such defects can be corrected with very little expense to the shippers, and this results in their shipments arriving at the destinations without damage and prevents subsequent freight claims.

The management earnestly solicits the co-operation and interest of every employe in making this campaign a success, and it is hoped the result will compare favorably with the June "No Exception Campaign" of 1921.

In his article beginning on the opposite page, Mr. Richmond tells how the employes of the Illinois Central System can save a million dollars a year. In view of the June campaign, the article is of timeliest interest. —The Editor.

# Here's a Way to Save a Million Dollars

## Loss and Damage Claims Paid by the Illinois Central System Amounted to \$2,449,275 in 1921

By C. G. RICHMOND,

Superintendent, Stations and Transfers

**T**HE freight loss and damage claim payments made by the Illinois Central System have been increasing for the last few years. For 1921 they amounted to \$2,449,275. This is the largest amount paid during any one year in the history of our system.

A wonderful opportunity to save a million dollars in freight claim payments during 1922 is presented to the employes of the Illinois Central System. This saving can be accomplished by correcting the many causes responsible for freight claims.

An analysis of the 1921 freight claim payments shows that a total of \$1,710,846, or 69.8 per cent, was chargeable to carload shipments.

A further analysis of the freight claim payments on both carload and LCL shipments shows that five causes were responsible for payments of \$1,776,968, or 72.5 per cent of the total, as follows:

Rough handling of cars, \$615,442, or 25.13 per cent.

Defective equipment, \$333,960, or 13.63 per cent.

Delays, \$325,888, or 13.31 per cent.

Loss of entire package, \$264,865, or 10.81 per cent.

Unlocated loss other than entire package, \$236,813, or 9.67 per cent.

### Seven Commodities Troublesome

Seven classes of commodities were responsible for \$1,216,990, or 49.7 per cent, of the total freight claim payments during 1921, as follows:

Fresh fruits and vegetables, \$470,198, or 19.2 per cent.

All grain, \$185,869, or 7.59 per cent.

Sugar, syrup, glucose and molasses, \$147,636, or 6.03 per cent.

Fresh meats and packing house products, \$145,845, or 5.95 per cent.

All metals and manufactured metal articles, \$134,393, or 5.49 per cent.

Coal and coke, \$133,049, or 5.43 per cent.

From the amount paid out in freight claims in 1921, largely representing obligations incurred during 1920 and the earlier months of 1921, it

is apparent that employes were negligent in many instances. In fact, an analysis of the freight claims received and paid shows that improper handling, negligence and carelessness on the part of operating employes were responsible for the presentation of the majority of these claims.

### Shippers Are Responsible, Too

A large number of claims are the result of negligence and carelessness on the part of shippers, due to their failure to mark and prepare shipments properly according to classification requirements. However, as it usually develops that a clear bill of lading has been issued (which is virtually a contract insuring the delivery of the shipment to the consignee in as good condition as when received at point of origin), the proving of the shipper's negligence rests upon the carrier.

Such claims can be prevented if employes see that shippers comply with the rules and regulations as to the marking and packing of shipments as promulgated in the various classifications now consolidated into what is known as the Consolidated Freight Classification No. 2.

Heretofore, claim prevention activities have been largely directed toward correcting irregularities in the handling of LCL freight, resulting in a markedly increased efficiency. Since the analysis of the 1921 claim payments shows that carload shipments were responsible for 69.8 per cent of the payments, the need for devoting special attention to the handling of carload shipments is apparent.

Following is a brief summary of the principal causes responsible for these excessive claim payments and suggestions which will be helpful in saving the desired million dollars.

### Rough Handling, \$615,442

1. Attention should be given the loading of LCL merchandise cars to insure the proper stowing of freight therein, so as to avoid damage in transit.

2. In the loading of through destination I.C.L. merchandise cars, rough freight should be segregated from light and fragile packages.

3. When the nature of the loading requires it, bulkheads should be used in bracing LCL merchandise cars loaded to through destination or transfer platforms.

4. Cars should be switched at a rate of speed that will not result in damage to their contents.

5. Switchmen should use judgment in kicking cars to avoid the cornering or striking of other cars on leads.

6. Yard enginemen should watch closely for signals and comply promptly. A few additional exhausts of the engine will increase the speed of the cars being kicked and possibly result in damage to the contents by striking other cars.

7. Trainmen and enginemen can prevent rough handling by eliminating rough starting and stopping of trains.

8. Trainmasters, traveling engineers and yardmasters should closely supervise and actively campaign with train, engine and yard service employes with a view toward overcoming the rough handling of cars.

#### **Defective Equipment, \$333,960**

This class of claims results from loss or damage caused by leaky roofs, floors, sides or doors, protruding nails or bolts, dirty or improperly cleaned cars. These claims can be overcome by:

1. Careful inspection of equipment, before it is placed, to see that it is suitable for the loading intended and that it is properly cleaned and prepared before loading.

2. Maintaining a permanent inspection record showing the condition of cars at the point of loading, with the name of the person making the inspection.

3. Arranging, when carload shipments arrive at their destination with damage to their contents due to defective equipment, for a competent inspector to examine the car carefully and make record of the existing defects, using a special car diagram form and being particular to report if the defects were old and could have been observed by ordinary inspection at the loading point.

#### **Delays, \$325,888**

Claims charged to this cause result from loss or damage directly or indirectly due to delayed movement or delivery of freight. These claims can be overcome by:

1. Prompt removal of cars from industry, hold and other tracks as ordered.

2. Proper carding of cars.

3. Proper waybilling of freight and careful checking of shipping orders against billing.

4. Prompt and proper transmission of information to yard forces concerning the disposition of carloads.

5. Having station and yard forces see that cars are moved in the order of rotation and importance of lading.

6. Promptly notifying consignee of the arrival of freight.

7. Prompt placing of bad order carloads on repair tracks and removal therefrom after repair.

8. Prompt inspection of bad order cars to determine whether or not they should be run or transferred; and, when transfer is necessary, seeing that it is effected promptly.

9. Daily check of all cars in yards and terminals, special attention being given to cars on hold, transfer, and repair tracks.

10. Moving live stock, manifest and perishable freight on schedule.

11. Having agents and yardmasters see that carload shipments are forwarded promptly in the proper trains and having the chief train dispatcher see that cars set out between terminals are moved promptly.

#### **Loss of Entire Package, \$264,865**

Claims chargeable to this cause cover the loss of packages which are received at the point of origin and on which delivery to the consignee cannot be established. The causes responsible for these claims can be overcome by observing the following points:

1. Freight checking over or in excess of billing at intermediate transfer points should be promptly forwarded, accompanied by free astray waybill.

2. Freight checking over or in excess at marked destination should have an over tag applied and be segregated from freight received on revenue billing.

3. Freight astray at other than the marked destination should be promptly forwarded, accompanied by astray waybill.

4. Freight unloaded from waycars should be properly checked by agents or station employes at agency stations and by conductors at non-agency stations.

5. Freight delivered to the consignee or his authorized representative should be carefully checked and a receipt taken at the time and place of delivery.

6. Careful checking should be made of freight offered for shipment at originating stations and from connecting lines at junction stations. Freight should be loaded into proper cars; when traveling in waycars, it should be loaded in station order.

7. When the freight is over, in excess or astray at the proper destination, agents should

confer with the consignee and arrange delivery on presentation of bill of lading, invoice or other satisfactory proof of ownership, collecting the charges from the point of origin.

8. The matching of over and short shipments with connecting line agents at common points should be practiced.

#### **Robbery, \$125,710**

Claims charged to robbery can be reduced by overcoming the contributory causes in the following manner:

1. Unauthorized persons should not be permitted to have access to yards, freight houses, transfer platforms and cars.

2. Shipments packed in insecure packages, not complying with classification requirements, should be refused when offered for shipment.

3. Safety is increased by repairing defective car doors, properly sealing cars and having train, yard and station employes protect freight exposed by open car doors, damaged or defective equipment.

4. Inspect seals on cars delivered and received from connections at the time the cars are placed on interchange tracks, making the proper record when doors are defective, improperly sealed or without seal, especially on merchandise cars.

5. Exercise due diligence to avoid acceptance of forged bills of lading, delivery orders or other misrepresentations.

#### **Poor Refrigeration and Ventilation, \$118,252**

Claims charged to this cause are the result of improper icing, failure to ice, improper manipulation of vents, overflow from drip pipes or failure to provide heaters in severely cold weather. These causes can be overcome as follows:

1. Furnish precooled or properly prepared cars for loading, maintaining the proper record.

2. Agents at originating points should obtain proper refrigeration, ventilation or heating instructions from shippers.

3. During the winter months, heaters should be installed in cars containing freight liable to damage from freezing, in accordance with the perishable freight service instructions.

4. Yardmasters and agents at intermediate points and at destinations should see that proper records are maintained covering cars moving under refrigeration, ventilation or heater service and that billing instructions are fully complied with.

#### **Employes Must Study Situation**

An analysis of freight claims indicates that at least 90 per cent are chargeable to carelessness,

negligence, inexperience and lack of training on the part of the individual employe. It is therefore apparent that the solution of the freight claim evil is supervision, education and the interesting of the individual employe in the correct performance of his duties.

A great deal of benefit can be derived from frequent meetings with employes to acquaint them with the causes for freight claims, formulating plans to prevent recurrence.

Superintendents should hold meetings with division staffs; trainmasters, with train and yard forces; supervising agents, with agents; at regular intervals, to discuss freight claims and the causes therefor and to apply corrective measures.

#### **A Good Prospect This Year**

We are now in an era of more nearly stable conditions. The efficiency in all departments during the past year has shown a remarkable improvement in the handling of both carload and LCL shipments. This change in conditions will tend greatly to minimize freight claim payments during 1922.

The remarkable decrease in exception reports as a result of the united efforts of employes during the "No Exception" months—April, May and June, 1921—proved conclusively the accomplishment that can be attained by the co-operation of all employes.

The management feels assured that, by calling attention to the enormous freight claim payments during 1921, the same spirit of co-operation in overcoming causes for freight claims will be obtained as was manifested by all forces during the "No Exception" campaigns referred to—co-operation which will make possible the desired reduction of \$1,000,000 in freight claim payments during 1922.

#### **SOME SPECIAL SERVICE**

"J. W. Carroll, a passenger on No. 10, April 21, notified Conductor J. A. Cunningham that he had left his pocketbook and money under the pillow in the Empire Hotel at Birmingham," writes Superintendent C. R. Young of the Tennessee division. "Conductor Cunningham notified Conductor R. B. Kennedy, who was on train No. 9, the same date. On the arrival of No. 9 at Birmingham, Mr. Kennedy went to the Empire Hotel and obtained the \$120, which was found under the pillow. Mr. Kennedy sent Mr. Carroll his personal check for this amount and has received acknowledgment of the check."

# Big Meeting of Fuel Savers at Waterloo

## More Than a Hundred Men Representing the Western Lines Generate Enthusiasm for Coal Conservation

THE Illinois Central System holds a leading position among American railroads in the conservation of fuel. There are a number of factors which enter into our success in fuel economy—the fact that our motive power is ample and well maintained, the close supervision and inspection with which the purchasing of coal is surrounded, the use of machinery and devices for getting more heat units from coal consumed, the educational plan of having instructors hold classes among the men who place coal on the fire and of having general and divisional fuel conservation committees which are constantly studying the problem and circulating information and data. But the most important factor has been the interest which individual officers and employes have taken in the conservation movement.

Further evidence of the spirit which moves among the men who are engaged in turning the raw fuel into productive energy was brought out at the meeting held at Waterloo, Iowa, Tuesday, May 9, under the direction of the General Fuel Conservation Committee. More than 100 men representing virtually every branch of the operating department and every section of the Western Lines took part in the meeting. After Chairman J. F. Porterfield had opened the meeting and General Superintendent W. S. Williams had made an introductory talk, the meeting was turned over to the men. Superintendents, trainmasters, yardmasters, engineers, firemen, conductors, brakemen, traveling engineers, supervising agents, agents, operators, switchmen, foremen, roadmasters, supervisors, section foremen, master mechanics, roundhouse foremen, storekeepers, claim agents, stationary engineers, machinists, signalmen, clerks and others took part. Even two pensioned engineers dropped into the meeting and gave the others the benefit of their experiences.

### Everybody Had Chance to Talk

It was largely an "experience meeting." Traveling Engineer S. B. Chapman of Fort Dodge started it by telling what is being done by the enginemen of the Iowa division. Some of the points he raised led to questioning, and within a few minutes everyone in the

room was interested. As the meeting progressed, every person present was afforded an opportunity to tell his experiences and make suggestions.

Notes were made by the chairman of conditions which the men reported as hindering their work of making a minimum amount of coal perform a maximum service. Some of the numerous suggestions included the rearrangement of storage facilities, changes in the method of accounting for coal placed on the locomotive tenders, the distribution of coal so that 6-inch mine run coal will be made available for the 2,900-class engines, which are stoker fired, and lump coal furnished the locomotives fired by hand, ways of reducing terminal delays and delays to trains on the line, the method of firing up locomotives at the roundhouses before they are turned over to the enginemen, etc.

Three of the "star witnesses" who turned up at the meeting were Supervising Agent B. L. Bowden of Dubuque, Engineer Harry J. Reynolds of Waterloo and Fireman Thomas Joyce of Freeport.

### Will Investigate Stoves

Supervising Agent Bowden gave a report on a study which he had been making of the performance of stoves in

B. L. Bowden

the stations of the Minnesota division, which showed that the stoves commonly used are not more than 12 to 15 per cent efficient in turning coal into heat units. He recommended that the use of a more efficient stove be considered, and A. F. Blaess, engineer, maintenance of way, announced that an investigation will be made of the subject at once. Mr. Bowden also recommended the use of nut coal at the stations, which is in line with a recommendation already being handled by the general committee.

Engineer Reynolds took a leading part in the discussion of locomotive firing and the direction of transportation movement in such a way as to economize on fuel. As every train delay means a waste of fuel, he emphasized the importance of avoiding delays and told how he tries to eliminate them by planning his work. At another point in the discussion he raised a question as to whether a locomotive should be brought out of the roundhouse under low water and steam, or with a half gauge of water and about 120 pounds of steam. He gave it as his opinion that the latter plan is better.

*H. J. Reynolds*

Fireman Thomas Joyce made what was perhaps the most interesting talk at the meeting. There had been considerable discussion of the method of accounting for coal taken on the tenders, and some had complained that inaccuracies in accounting practices destroy the confidence of the men in the individual performance reports made.

*Thomas Joyce*

#### **Saves His Back**

"I don't worry about whether I am charged with more coal than I burn," was Fireman Joyce's comment on this discussion. "I save coal not for the credit of it, but because in saving coal I am saving my own back."

The two veterans of fuel conservation on the Illinois Central System were present and took part in the meeting. Transportation Inspector O. L. Lindrew gave some of his experiences and took an active part in the questioning which followed the remarks of each speaker. Superintendent of Fuel Conservation J. W. Dodge made an inspirational talk urging everyone concerned in the handling of fuel to watch his opportunities to make savings.

The members of the General Fuel Conservation Committee who were present are: J. F.

Porterfield, chairman; J. J. Bennett, purchasing agent; R. W. Bell, general superintendent of motive power; A. F. Blaess, engineer, maintenance of way; J. W. Dodge, superintendent of fuel conservation, and J. L. Marley, secretary. Others from Chicago in attendance were J. F. Raps, general boiler inspector; L. J. Joffray, general fuel inspector; O. L. Lindrew, transportation inspector, and George M. Crowson, editor, *Illinois Central Magazine*.

#### **Among Those Present**

Among those representing the Western Lines who attended and took part in the meeting were the following named:

General Superintendent W. S. Williams; H.

### *Thrift*

Thrift is the foundation upon which the structure of success is built.

Without the thrift habit, the wage earner cannot hope to attain a greater degree of independence than that which he already enjoys. And, regardless of what his income may be, unless he sets aside a fixed amount of his earnings each month he is making no progress.

Workers, individually or collectively, desiring to improve their standard of living can employ no better medium than the systematic practice of economy. Back in the industrial world they have been frequently told of the necessity for economy, and they should realize that the need is equally as important in the management of a home. The knowledge that your income is steadily increasing will generate enthusiasm in your work and stimulate an interest in your home.

It may seem impossible, with the exorbitant prices that we now have to meet, to save a dollar; but, before you buy, demand that the price be right and eliminate non-essentials until such time as the retail prices are in line with the prices paid for raw materials. Pass by the merchant who offers freight rates and similar excuses as being responsible for unreasonable prices, and encourage the merchant who is fair by giving him your business.

The man who can save a portion of his salary is the man who is most valuable to his company, and he is usually the one who is offered more responsible work at a larger salary.

The reward for thrift is a comfortable home, a better job, education for your children and the ultimate fulfillment of every man's desire—a greater degree of independence.—H. O. VOEGELI, *Chief Shop Accountant, Jackson, Tenn.*

S. Taylor, chief clerk to the general superintendent; E. J. Riley, secretary to the general superintendent; District Engineer M. M. Backus; H. G. Bridenbaugh, chairman of the Western Lines traveling engineers committee, all of Waterloo.

Superintendent J. F. Dignan, Freeport.

Trainmasters—L. E. Strouse, Dubuque, Harry G. Brown, Waterloo; G. S. Rought, Freeport; M. G. Flanagan, Freeport; N. P. Mills, Fort Dodge; W. E. Ausman, Cherokee.

Master mechanics—N. Bell, Waterloo; W. J. Ormsby, Freeport.

Traveling engineers—W. L. Ickes, Dubuque; S. B. Chapman, Fort Dodge; W. T. Getty, Freeport.

Yardmasters—Phil H. Waldorf, Council Bluffs; H. A. Clancy, Dubuque; H. O. Dahl, Waterloo; L. L. Earnest, Freeport; C. C. Garlick, Fort Dodge.

Supervising agents—B. L. Bowden, Dubuque; J. A. Hurley, Fort Dodge.

Agents—Sanford Kerr, Cedar Rapids; F. Higgins, Waterloo; S. V. Braden, Independence; O. W. Reid, Osage; H. L. Day, Galena; T. A. Gilbert, Iowa Falls.

Roadmasters—H. R. Rhodes, Dubuque; E. J. Boland, Freeport; J. E. Fanning, Fort Dodge.

Storekeeper—E. Shapland, Waterloo.

Claim agent—H. D. Smith, Waterloo.

Supervisor, bridges and buildings—H. Calahan, Dubuque.

Supervisors—J. W. Sims, Dubuque; James Cary, Manchester; G. W. Parker, Waterloo; H. Huffstetter, Iowa Falls.

Signal supervisors—F. J. Ryan, Freeport; H. E. Bishop, Dubuque.

Operators—F. Belscamper, Waterloo; H. J. Baker, Waterloo.

Pensioned engineers—D. R. Evald, Waterloo; B. F. Fox, Pasadena, Cal.

Engineers—J. Horsley, F. B. Morris, F. F. Burgess, H. C. Boehmler, J. F. Mulkern, T. L. Tollefson, M. F. Whitney, R. Robbins, H. P. Hansen, E. E. White, H. J. Reynolds, John Reilly, H. A. Smith, all of Waterloo; Ralph Winterland, Freeport;

Engine foremen—A. J. Shadle, Waterloo; W. P. Carver, Waterloo.

Firemen—E. Nelson, A. M. Enfield, J. P. Sexton and A. Nelson, all of Waterloo; Thomas Joyce and Thomas E. Kessel, both of Freeport.

Conductors—Fred Chevalier, R. C. Walker and J. H. Good, all of Waterloo.

Brakemen—C. J. Poyner, C. C. O'Kane, W. J. Briggs and W. G. Butters, all of Waterloo.

Section foremen—George Larson, Osage; D. M. Reilly, Amboy.

Switchmen—J. Malone, J. L. Condon, J. J. Leser, J. J. Ackerman, all of Waterloo.

General Foreman—W. C. Dick, Freeport.

Roundhouse foreman—J. F. O'Connor, Freeport.

Assistant roundhouse foreman—C. E. Horsley, Waterloo.

Division electrical foreman—F. A. Kressley, Waterloo.

Stationary engineers—Alfred Ackerman, Waterloo; William Casey, Cedar Falls.

Boiler foreman—Adolph Feisner, Waterloo.

Chief engineer, shops—W. J. Mulvaney, Waterloo.

Machinist—J. W. Martin, Waterloo.

Air foreman—H. C. Steinmayer, Waterloo.

Bill clerk—A. B. Magnussen, Waterloo.

## QUEEN OF CARNIVAL

Miss Verenus Dye, 17-year-old daughter of Putnam Dye, general chairman of the B. of R. T. for the Yazoo & Mississippi Valley Railroad since 1905, was the successful contestant in the race for queen of the celebration June 5 to 10 which is to open the new McLemore Avenue viaduct at Memphis, Tenn. An account of the plans for this celebration was given in the May issue of the *Illinois Central Magazine*. Miss Dye, with a vote of 2,632,050, was winner by 352,330 votes over Miss Mary McHugh, who placed second. There were seventeen contestants. Miss Dye was born and reared in Memphis and is now a sophomore in Central High School. Her victory brings her, besides the honor of being queen, a piece of jewelry toward which the Memphis *News Scimitar*, which conducted the contest, contributed \$250. The newspaper awarded Miss McHugh \$100 for jewelry.

### A TEMPORARY APPOINTMENT

Effective April 15 Walter Wicker was appointed acting trainmaster, Mounds-Cairo terminals, with headquarters at Mounds, Ill., vice W. R. Givens, who was granted a leave of absence on account of sickness.

## *Killing the Weak Lets the Strong Live*

### *Mr. Lee Points Out How Oppressive Laws Often Work to the Advantage of Their Intended Victims*

By BLEWETT LEE,

New York Counsel

THAT oppressive laws are of possible advantage to their victims is perhaps a little startling. That there are laws which weigh heavily on unpopular classes of corporations is a matter of ordinary business observation. There is a class of the heavy-laden. Some kinds of corporations, such as insurance, railway, express, telegraph and sleeping car companies, meat packers, various so-called industries and the like, fairly groan under the weight of adverse laws, licensing, taxing, supervising and regulating them. Penalties lurk for them everywhere. A vast system of administrative law has been created especially for

*Blewett Lee*

them, giving rise to many more or less honorable and lucrative offices, and creating an artificial world of examinations, reports and accounts, in which it costs such corporations enormously to live. They are exceptionally burdened with taxation and accounting, and all manner of supervision. The verdicts in the courts against them reach the high water mark.

To find consolation in this situation from any corporate point of view is perhaps unexpected, yet there is a very powerful factor which results therefrom in favor of the great companies—the state is cutting down their competitors and making it impossible for new enterprises to enter the field against them. The few powerful insurance companies are protected against having to share their preeminence with newcomers. The strong railway systems are made secure against rivalry and are practically left in possession of the field. If any considerable new railway lines are to be built, the old companies have to build them, for no new enterprise would be able to bear the crushing burdens which the state lays upon all companies

alike. So the tough old corporation, which has weathered many a storm, beholds with a certain grim confidence the weaker companies go to the wall, the wreck of new enterprises, the discouragement of possible competition, the harvest left only to the strong. To the Legislature, or to the Congress, it may be said:

*Thou hast put down the lowly from their seat  
And hast exalted them of high degree.*

The economic protection which the great company enjoys is that it will be the last to survive and that, before the Destroying Angel shall wade through sufficient slaughter to reach that survivor, of necessity he will have to stay his hand. The state is all the time pruning off the little rosebuds and letting whatever strength there is left go into a few great blossoms.

One effect of the drastic early statutes of the states on the subject of trusts was to make combination closer and more intimate than ever—to substitute corporations where there had been previously only trustees or agreements. Capital was fairly driven to combine in forms more concentrated and powerful than were previously necessary or had been intended. These fierce laws created the very condition they were intended to prevent.

The operation of oppressive laws against unpopular corporate enterprises is upon similar lines. A few corporations are made stronger and more important than ever, while the lesser multitudes are overwhelmed, fairly drowned, by legislative enterprise. The rules are made so hard for the strong that, when applied to the weak, the latter simply succumb and leave everything to the strong. The process of elimination is now active in the railway world.

This is, of course, not a very happy result, for it is easy to see that laws which treated corporations of the unpopular classes named as fairly and justly as, let us say, farmers are treated would on the whole be much more to the public interest, would increase competition and reduce the cost of living. But, as things now are, the managers of the great corporations, so indispensable to modern business, are permitted to draw what consolation they can from a hard situation by observing that the state is all the time putting their weaker competitors to the sword.

# Our "City on Wheels" Was Great Success

## Housing Facilities Provided by Illinois Central System Big Feature of Conclave at New Orleans

SIR KNIGHTS AND LADIES: We are pleased to have had you as our guests en route to New Orleans. We trust the facilities provided have pleased you, and that our service was not lacking in any of the things that tend to make traveling a pleasure. We indulge the hope that you may be our guests again, and wish you a pleasant trip home. ILLINOIS CENTRAL SYSTEM.—From card distributed at New Orleans.

ONE of the features of the conclave of the Knights Templar at New Orleans, April 24 to 27—as was expected—was the Pullman city maintained by the Illinois Central System to house its guests. An account of the preparations for this hotel on wheels was carried in the April issue of this magazine. That it fulfilled its mission is to be understood from the statistics on the service given and from the pleased comments of those who made their headquarters in our parking yard.

A member of one of the commanderies declared that he had been attending these conventions for the last twenty-five years, that good parking facilities had always been promised be-

fore, but that never before had he found the comfort he experienced on his New Orleans trip. The visitors agreed, among other things, that the shower bath arrangement was the finest thing ever provided at parking locations at their conventions. As a matter of fact, Illinois Central representatives at New Orleans received a succession of compliments from practically all who had occasion to use our facilities.

### Accommodated 2,500 Guests

According to the report of W. H. Brill, general passenger agent at New Orleans, the following are the statistics of the service in our parking yard for the week of the conclave:

Number of cars handled.....	124
Number of persons housed.....	2,500
Number of meals served.....	3,211
Number of shower baths taken.....	1,185

We provided twenty-four shower baths and a locker room with seventy-two steel lockers. The whole arrangement had a country club appearance. The barber shop provided four barbers, two manicurists and one hair dresser. At a stand, cigars, soft drinks, newspapers, candy, etc., were sold. A park was also provided for private automobiles.

The laundry company handled approximately

five hundred bundles of laundry. Dry cleaning, shoe shining and pressing establishments were well patronized.

The information booth was handled by the following passenger representatives: Traveling Passenger Agent S. W. Adams, District Passenger Agents F. L. Jones and W. Byrns, Traveling Passenger Agent A. A. Williams.

Service was maintained both day and night, and a Knight Templar had but to express a wish to have it granted.

**Dining Service Kept Busy**

That the dining service department did its part nobly during the week is proved by the following report from C. B. Dugan, superintendent, covering the Knight Templar service on line and at the parking yard in New Orleans:

Number of cars used in extra service.....	16
Number of passengers fed.....	7,788
Extra employes used.....	121
Number of pieces of linen used.....	30,000

While the dining cars were at New Orleans, there were 11 stewards and 110 cooks and waiters in service. Not a reprimand was given; not a man was dismissed; every man who went down came back in line.

The Pullman Company, in serving the Knights Templar at New Orleans, used on all the railroads entering the city 175 cars on the per diem basis and 109 on the berth rate basis, a total of 284. During five days of the conclave the Pullman Company had to have washed 175,000 pieces of linen.

Sixteen special trains were scheduled into New Orleans by the Illinois Central System

*How's this for Service?*

to handle the convention crowds. All of the railroads operated a total of thirty-eight special trains to the conclave.

Woodlawn Commandery of Chicago, which includes many Illinois Central employes, boasted at the conclave of being the only body in attendance to travel on a special train of which all on the crew were members of the order. The enginemmen and trainmen on the special train of fourteen cars used by Woodlawn Com-

masonry were Templars, members of the commandery using the train.

### All the Comforts of Home

Under the heading, "Every Convenience, From Meals to Manicure, Greeted K. T. in 'Sleeper City,'" the New Orleans *Item* of April 25 carried the following story:

"All the comforts of home.

"A hard thing to live up to at a convention that brings 30,000 extra visitors into the city, but 'Pullman City,' established by the Illinois Central in the Poydras Street yards, is making the phrase a fact.

"Monday special train after special train pulled into 'Pullman City.' Each glided into its appointed place without the slightest hitch or confusion and came to a stop. 'Here we are,' cried the Sir Knights. 'Now show us the town, and tell me, for the love of Mike where I can get a bath?'

"'Just right over here, capt'n,' said a singing Pullman porter. 'Right over there. Bath, hot or cold, shave, shoe shine, laundry, manicure yuh finger nails, press yuh trousers or get a fresh curl in yuh ostrich plume. Hit's all there, boss.'

"And 'all there' it surely is. The Pullman authorities, when the conclave hosts were planning their pilgrimage to the Crescent City for the thirty-

fifth triennial knew that it would be up to them to provide a 'city on wheels' for the visiting Sir Knights as the hotels and private homes positively could not take care of the great increase to the normal population for the four or five days the Knights would be in New Orleans.

### Solve "Conveniences" Problem

"A 'city on wheels' was easy, just provide enough tracks and an engine to shunt the cars on them, and there you were. Yeah, but what about water, light, sewerage and baths, for the Sir Knights, be it known far and wide, are not 'Saturday nighters.'

"'Leave that to us,' said the Illinois Central officials, 'we got a leedle idea buzzing 'round our heads. Leave us think—leave us think.'

"The result of the think is now an actual city, with all the comforts of home right on the spot. Pullman specials from every part of the country tapped by the Illinois Central, Southern Pacific and the Rock Island have pulled into the 'Pullman City,' and here the visiting Sir Knights, their wives and daughters, will live while the greatest Templar conclave in history is being held with all the pomp and ceremony dear to the sturdy Knight's heart.

"Imagine if you can eleven long tracks completely covered with steel and Pullmans. If you cannot imagine the sight, take a few minutes off and visit the new city that has sprung up like magic in the very heart of New

*Illinois Central and Pullman Knights Templar who took the special train of the Woodlawn Commandery from Chicago to New Orleans. They are all members of the Woodlawn Commandery. Left to right, upper row: Walter Kloster, Pullman conductor; D. S. Paige, Pullman conductor; C. E. McMillan, baggageman. Left to right, lower row: D. E. Eakins, flagman; L. N. Turpin, conductor; Benjamin Erwin, fireman; L. C. Thornton, engineer.*

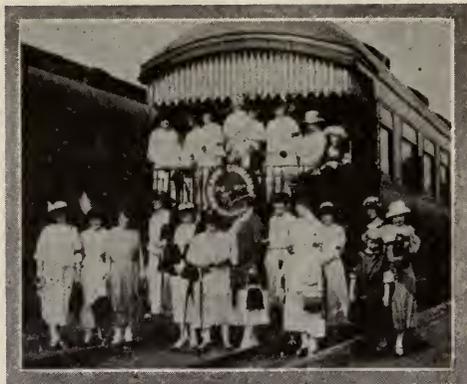

Orleans. See for yourself the hundreds of cars, the diners, and best of all, the big warehouse that has been converted for the nonce into a big clubroom.

"Here are the barbers, the same talkative kind you are used to, ready to run the keen-edged steel over your jowls; here are the regulation, pretty, vivacious manicure girls, who will trim your nails and make them glow like the first rosy gleam of morning; here are the shower baths—hot or cold, take your choice. Here, too, are the steam pressing machines, ready to put a razor-like edge to your trousers, or take the wrinkles out of your long-tailed full-dress coat. Here is a laundry ready to take your linen one minute and return it the next; anyway, it seems that quick. Smokes, soft drinks, etc., and so forth are also here.

#### "Dixie Line Service"

"The impresario de bath is Max N. Kohler of the Dixie laundry, who is giving personal attention to the concession.

"We are prepared to do everything for the inhabitants of the Pullman City," said Mr. Kohler. "Nothing is too good for the Knights and we want them all to 'hang their clothes

*Ladies of Woodlawn Commandery*

on the Dixie line." There are two hours each day set aside for the visiting ladies—from 2 to 4 p. m.

"The dining service of the 'city on wheels' is being handled by the dining car service of the various lines. The Illinois Central is serving an a la carte breakfast, a lunch for \$1.25 and a dinner for \$1.50. 'This includes our very best service,' said H. E. Holt, assistant to the superintendent of the Illinois Central din-

*A view of the parade on Canal Street*

*At the "City on Wheels"*

*Watching the Parade*

ing car service. 'We have brought eleven of our very best men to New Orleans and our best chefs and waiters. If there is a restaurant in New Orleans that can best us at the eating game we want to be shown.'

"The corps of men in charge of this most important phase of life in the 'Pullman City'—that of feeding the inner man—are: G. W. Harrison, F. M. Daniels, Sam Fink, W. E. Linden, L. B. Frame, B. K. Simmons, I. Greenburg, F. T. Richards, John Simpson, J. T. Carey and Charles Trczuayly.

#### Food Is of Best

"The meals served in the dining cars are not only for the visiting Sir Knights but a general invitation is given to the public to eat a meal in a diner for the same price.

"The diners carry special pasteurized milk for any one of the babies that may be attending the conclave with daddy, bottled waters are on tap, and all the delicacies of the sea-

son are served. Each car consumes from 1,200 to 1,400 pounds of ice to keep things cool.

"In the club rooms, where the shower baths are located, hot water is on tap all the time.

*The Arch on Canal Street*

It comes from one of the big Illinois Central locomotives parked near the warehouse, and the water is kept at all times boiling hot.

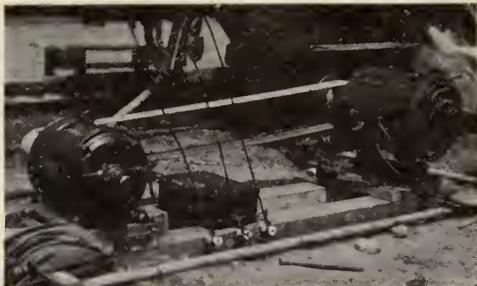

"'Gimme the cold water, boy,' said one of

*Here is the original Pullman porters' quartet on the Illinois Central System, organized in connection with the Pullman Company's plan of musical education, singing as the special train of the Woodlawn Commandery, Knights Templar, pulled out of Chicago for the recent conclave at New Orleans.*

*Lee Circle at Night*

*A Transforming Unit*

the heavyweights from California. 'Turn it on full force and let me get some of this desert dust off. Say, I call this treatin' us like home folks.'

**City Decorated for Conclave**

New Orleans welcomed the knights by decorating profusely. Canal Street, the principal thoroughfare of the city, was conspicuous with a great arch spanning sixty-six feet of its neutral ground between Carondelet and Baronne streets. Atop the arch was a statue of a mounted knight in armor, built of papier

mache. The week's program included banquets, receptions, parades, boat rides, fireworks and exhibition drills. Four of the five drill prizes were won by Chicago commanderies.

A final celebration was held at the trains at the time of departure. When the trains pulled out, buglers stood on observation platforms and, as the trains cleared the city, blew taps. In many instances, the return trips were made the occasion for sight-seeing. Some of the Chicago trains returned by way of Florida and Alabama, while many of the eastern commanderies took the middle western trail home.

**ILLINOIS CENTRAL BIBLE CLASS AT CANTON**

# How an Engineer Looks Upon Fuel Saving

## Charles J. Barnett Addresses Fourteenth Annual Meeting of International Railway Fuel Association

*Below is a paper read by Charles J. Barnett of Memphis, Tenn., Illinois Central locomotive engineer, before the fourteenth annual meeting of the International Railway Fuel Association at the Auditorium Hotel, Chicago, the afternoon of May 23. Mr. Barnett was the second Illinois Central representative on the program, the first being Vice-President L. W. Baldwin, who delivered the opening address the morning of May 22. Mr. Barnett's subject was "Fuel Conservation From the Standpoint of the Locomotive Engineer." Other angles of the same subject were presented by a division superintendent, S. U. Hooper of the Baltimore & Ohio, and by a representative of the department operating coaling stations, W. S. Burnett, division engineer, maintenance of way, of the Big Four.*

**I**N being asked to prepare a paper for this association, I feel that you have conferred an honor upon me and the railroad I represent. I am going to give you what I consider some of the essentials necessary for fuel conservation that I have gained from thirty years' experience on a locomotive.

Where there are many factors involved in fuel waste, I will not attempt to cover the loss between the mine and the engine tender or the condition of the locomotive; these are conditions that cannot be controlled by the engineer; but I will confine my remarks to the time after the engineer takes charge of the locomotive. The greatest asset an engineer has is to be known as a dependable man. A dependable engineer is always loyal, and loyalty is an obligation we all owe to the company that furnishes us employment. To prosper we must put our heart and mind in our work.

### Co-operation Is Vitally Necessary

As locomotive engineers, we are guided by rules and instructions, backed by experience, to govern our work, and unless we comply with them we are not going to get the co-operation of our fellow employes, which is vitally necessary for good service.

Fuel waste on a locomotive by engine crews may be caused by lack of knowledge, neglect,

or indifference, and it is necessary to find by education, experience and observation how best to operate the locomotive to conserve fuel, and after this information is obtained constant attention is required.

In the past, locomotive engineers and firemen have been looked upon more or less as the employes who wasted the fuel. No doubt this impression was formed because the locomotive consumed the largest percentage of the fuel purchased by the railroad, and this was being used by the engineer and fireman, but the educational program of the railroads has gone farther than the engineer and fireman and has included all departments in fuel conservation.

The fuel, supplies and other materials may not be just what is wanted, but every engineer should endeavor to get the most from what he already has. A skilled engineer will get the full use from them. Suggestions for betterment should be made to the proper authorities.

### Learn Causes of Fuel Waste

Running a locomotive is an exacting task, and any instructions given on the line of road on the deck of the locomotive must necessarily be brief. Where any irregularity occurs on the line of road, it must not be overlooked, but a careful explanation should be made after trip is completed to prevent a similar occurrence.

When an unusual amount of coal or water is used on a trip, a careful study should be made to determine the cause of this excessive consumption. Where conditions on the line of road are a factor in increasing fuel consumption on the locomotive, the attention of the trainmaster or traveling engineer (road foreman of engines) should be called to them.

Every trip made should be equal to or better than any previous one. Then we will have a fuel test every trip, and the engineman will have a comparison to guide him to improvement.

An engineer taking an observation of the fuel furnished his locomotive cannot tell whether it contains large quantities of heat units or not. The burning of the fuel in the locomotive fire-box is the only test an engineer has; there-

fore, there should be a uniformity in the quality of fuel furnished.

The engineer should arrive at his locomotive in sufficient time to inspect it properly and prepare it for service and to make tests and observations that are necessary for good service. This, when properly done, will give him confidence that will insure him of maintaining the schedule of his train. Extra precautions must be given to the parts that have had repairs made. Any neglect of the locomotive at the initial terminal usually results in waste of fuel to your engine and sometimes to other trains on line of road.

No argument is needed to convince you of the large number of men necessary to equip and prepare a locomotive for service or that this work should be done in advance of the arrival of the engine crew. The engineer makes the final inspection. This inspection should be made when oiling, as every part that needs lubrication needs inspection. Locomotive appliances should be inspected and tested to be known in good working condition. Engineers must have a thorough knowledge of these appliances, so that full use of them may be had. Where stops are made that will allow for additional inspection, they should be carefully made, as "a stitch in time saves nine." When locomotive or train trouble is apparent, judgment should be used as to where the stop is made, to prevent loss of time to your train or others. Consult the engineer who last ran your locomotive and see if he can offer any suggestions for improvement. Inquire what kind of service the engine gave. Get his ideas; ask what his experiences were. Learn his methods, and see if he has anything to offer that will benefit you. Every failure teaches an engineer something if he will learn to profit by his own and others' experiences.

### Leaks Help to Waste Fuel

Water, steam and air leaks not only create a loss of fuel but are expensive in damage to locomotives and probably delays on line of road. Engineers should see that they are eliminated.

When he arrives at the district terminal, after reporting the engine's condition, it is well for the engineer to consult with the foreman in charge as often as possible, because through this personal contact a better understanding will be obtained.

When fuel meetings are held, attend them. This will set an example for the firemen. Then discuss the many points brought out that are

of value. Encourage firemen to read literature of fuel economy on locomotives.

All firemen should be questioned as to their general knowledge and understanding of their duties. Engineers should teach the firemen why they should save fuel and how it can be burned to produce the best results. One of the most vital essentials in fuel conservation in locomotive operation is friendly co-operation of the engineer and fireman, and this can be had if the engineer will lead and help the fireman by giving him the benefit of his experience. Thought and consideration should be given to firemen of limited experience. When this knowledge and experience is given to firemen, engineers will insist on its being applied in a practical way, as the best asset a fireman has is to be well trained. Encourage the fireman to learn something about firing and locomotive operation each day. Firemen must recognize the authority and responsibility of engineers.

### EMPLOYEES SUPPORT NURSE

One of the twelve trained nurses suspended in February because the Child Welfare Association lacked funds to maintain its full staff will be replaced for five summer months, through the generous support of the Illinois Central System employes, who have turned over to the Child Welfare Association treasurer, Walter A. Brandao, a check for \$577.60, the net proceeds of the dance and boat-ride on the steamer Capitol last month.

"This is most gratifying," Miss Mary Railey, executive secretary of the association, said Friday. "It comes just when we need it most, for the twenty-four nurses on our staff are hard put to it, to answer all the emergency calls in our large field, with the number of babies ill as usual at this season. This nurse can care for a field of many blocks, with at least 250 babies in it. We are deeply appreciative of the aid given by the employes and officers of the Illinois Central System, realizing how much work this has cost the committees in charge."

The committees which carried the benefit through were headed by C. T. Seiler, chairman of arrangement; C. A. Ahern, chairman of finance; C. T. Beven, reception; W. J. Mora, floor; Henry Reinhardt, publicity; A. V. Bertaut, president of the organization. William A. Delph and A. E. Scaife were also active.—*New Orleans Times-Picayune*, April 29.

# FINDERS IS KEEPERS

By HORACE

*A Short Story—Complete in This Issue*

JOHN MILTON BECK was rising three score. He was entitled to the honorary appellation of "old settler," seeing that he had homesteaded the quarter section of good loam land called the Home Place, where he lived. In succeeding years he had acquired other quarter sections besides the Home Place and also stock and money and a few bank shares and loans and whatnot, for Uncle Milt was canny and so was Uncle Milt's wife; both were of the old-time, far-seeing brand of pioneer stock. There were four children: John, Jr., married and on a farm of his own; Naomi, married and a city-dweller; Mabel, about to be married, already sewing the last odds and ends of her going away regalia—a young man named Walter Sampson being the exciting cause; and Roderrick. His mother called him the "baby," although he stood 5 feet 11 and was pretty husky.

Uncle Milt was one of those ruddy, robust old codgers who grow gnarled but never palsied, crusty but never vacillating. He might have slid easily into a serene and easy old age; he had plenty, and the Home Place was snug. But no! There was one cloud on his horizon. Uncle Milt hated motor cars. He made no distinction between big ones and little ones. He hated 'em all. He even hated motoreycles, hybrid offshoots from the malignant parent stem. "Devil-machines," he called them all. "Hoss-searers, dust-raisers, chicken and pig killers, menaces to the bodily, moral, and spiritual well-being of the country, sir!"

Roddy, home from college for the summer vacation, did not share this prejudice.

"You can't block the wheels of progress, Dad," he said. "You only get yourself steam-rollered. What you ought to do is buy a big 7-passenger Six, or Eight, and get in the procession. Mother would like to have a car. I heard her say so. All the neighbors are getting cars. Do you want to be called a back number?"

For some seconds the old gentleman was

not master of his tongue. He could only sputter and roll his eyes. And it was his own flesh and blood, too, that dared thus to speak heresies. But then the boy was only a fool boy. What could one expect when all the rest of the world had gone stark crazy—

"H'r-rumph!" he snorted explosively. "My son, there was a time when I hoped you'd grow up to have the sense that the Lord distributed to geese. I see I'm doomed to be disappointed."

Roddy laughed.

"Wait till you've learned to drive," he said, not seeming to realize that he was capering about on mine-sown ground. "I'll bet you'd be some fan, once you got started. They say the harder you are opposed to a thing the greater enthusiast you are if you ever switch to the other side."

"Bah! Rubbish! I won't even discuss the subject," exploded Uncle Milt. "I ain't never set foot inside one of them Beelzebub's contraptions yet, and I reckon it'll be a red letter day when I do."

"It will," agreed Roddy. "It'll be a revelation to you."

Uncle Milt again became momentarily clogged up with emotions words could not express.

Summer came on apace. On at least two occasions, callow and venturesome automobile salesmen foolhardily sounded the old gentleman upon the subject of buying a car. They plumbed abysses of vituperation that discouraged them from further researches. Uncle Milt almost came to fisticuffs with the rural mail carrier when that innocent devotee to duty brought a motor-car catalog in the mail.

On the fifth day of July, Fate lighted a belated firecracker and placed it quietly under John Milton Beck's coattails. Fate has a way of doing such things. But Uncle Milt was not yet aware of such a move. A cooling shower had fallen during the night. The old gentleman, having breakfasted beatifically and noted the smiling sky and

a southerly wind, decided to drive into town.

"Hitch up old Bill, Roddy," he said. "The dust'll be laid after the rain so a body can breathe. Put that broken sickle-bar under the buggy seat so I can get it fixed at the blacksmith shop."

Half an hour later the young man returned to the house carrying an empty bridle on his arm. "I can't find old Bill," he reported. "Bess and Nell are in the big pasture, but old Bill's nowhere in sight."

"Likely enough some fool's left that north gate open again," the old gentleman surmised. "I guess I'll have to padlock it. Did you notice if it was open?"

"Well, no—"

"No, of course not. No college-edicated scatterbrain would. I'll have to go find the hoss myself." He settled his sunburned panama on his capable head and struck off through the orchard, Roddy following silently behind.

Descending a long grassy slope of the pasture, they came presently to a little dell where a thick clump of willows grew along a shallow ravine. It was there that Uncle Milt made an exciting discovery.

A big, glossy, olive-green, white-tired automobile stood fairly well hidden in the densest part of the thicket.

"Gee!" exclaimed Roddy, "Somebody has hidden a car here."

"A devil-wagon on my land!" rumbled his father. "Who'd have the brazen impudence to fetch one of them things here! I'll set a match to the thing—"

*A big, glossy, olive-green, white-tired automobile stood fairly well hidden in the densest part of the thicket. "A devil-wagon on my land!" rumbled old Milton. "Who'd have the brazen impudence to fetch one of them things here!"*

Roddy was investigating. "There's nobody anywhere in sight. Whoever left it has clear skidoosed. I'll bet you it's a stolen car, and the thieves are figuring on coming back after it later—" He stepped up on the footboard.

Uncle Milt glanced about him gingerly.

"I'll thief 'em," he said with lessening vehemence. "Maybe they took old Bill when they left this thing here—"

"I see what was the matter," Roddy remarked after some more projecting. "They ran out of gas and were afraid to stop anywhere. The car's been stolen, and they were hard pushed. You can see it hasn't any license tags on it—"

Uncle Milt rested a hand thoughtlessly on the shining fender. He removed it jerkily as if he had been burned. His gaze wandered from the luxurious leather upholstery to the array of nicked dials and buttons and levers under the steering-wheel. "H'r-rumph! You might be right," he said grimly.

Roddy opened a door and slid confidently into the driver's place. He manipulated certain buttons and levers with hands and feet. There followed a purring whine of hidden machinery, then the throbbing patter of a smoothly firing motor. At the first whirr of the starting-mechanism, Uncle Milt had leaped ten feet away in two frightened bounds.

"Hey, Rod, you infernal idiot, stop fooling with that thing!" he yelled. "Do you hear me? The condemned outfit might blow up and kill us both!"

"Don't get flustered, Dad," Roddy laughed. "I know this make of car pretty well. My room-mate at school had one just like it, only his was a roadster. I learned to drive his. Just listen to her talk. She's got probably a quart of gas left in the tank—I'll back her out of these bushes—"

His father stood rather weakly watching as the big car rocked slowly out into the open level. He sidled a step or two nearer.

"You say you can run one of these here things?" he quavered. "Well—I'll be dod-swatted! Look out—she's makin' for a stump behind you—"

"Maybe there's enough gas to take us up to the house." Roddy brought the car to a stop. "Hop in here with me, Dad, and we'll scoot around by the main road—"

"Nope—I won't do it!" The old gentleman's tone was not so determined as it might have been, however.

"Ah, come on, don't stand there arguing. If the car's a stolen car, we'll claim a reward for finding it. And it'll be proper and right to put it under shelter. Get in before all the gas is gone."

Uncle Milt crossed the Rubicon, the Alps, the Rhine, and all the rest of the famous frontiers of history by getting into the car. They drove out by way of the north gate and around on the main road. They drew up in luxurious majesty in front of the barn-lot gate. Mrs. Beck came out to gaze awesomely at the purring monster. After some urging she was prevailed upon to enter and sit in the soft and inviting back seat.

"Lawsy, it certainly is easy and comfortable," she said.

"Rod's a fine driver," Uncle Milt reassured her. "He's a reg'lar expert with the condemned thing."

"I'll borrow a couple of gallons of gasoline out of the can up at the house," Roddy proposed. "You don't use the stove only on wash-days, mother, and you've got a full can. I want to take you folks a little ride down the road a ways—"

His father seemed suddenly, unaccountably docile. He made no demur. The young man hurriedly replenished the tank, clambered in, and swung the car out into the road. He drove a mile along the straight, level lane at a gentle, smoothly gliding pace. The car seemed merely to float along the ground. It was the poetry of motion. Uncle Milt sighed contentedly as Roddy turned with skillful adroitness at a crossroad and they headed toward home.

"It ain't hard to handle, seemingly," he said. "How do you like it, Ma?"

"It's perfectly heavenly," his wife said devoutly.

A little later, Uncle Milt decided that they might as well take the broken sickle bar to town in the car.

"I want to notify Constable Carothers that old Bill has been stolen, anyhow," he said. "We found the gate shut and fastened; so he didn't get out without help. It'll save time, and we might as well use this machine till the owner comes f'r it."

It was a matter of fleeting minutes to

cover the three miles between the Home Place and the village. Roddy stopped at one of the filling stations on Main Street. Uncle Milt walked on to the postoffice, where he expected to find the visible embodiment of law and order in the person of Harve Carothers. Roddy had the man measure in ten gallons of gas on suspicion. Roddy had inherited a canny discretion. He was presently aware of his father's sturdy figure approaching. Uncle Milt was accompanied by a long, lean, neutral-tinted man dressed in drab pants and horizon-blue shirt. The two were in somewhat heated confab.

"Of course," Carothers was saying as they came up, "a stolen car nes'sar'ly has t' be turned over to a reg'lar officer o' the law. I'll jes' take charge o' her, Beck, an' save you all bother—"

"H'r-rumph!" rejoined Uncle Milt. "I guess I'm pretty permanent around here. I found the car in 'my pasture, and if the owner wants it he can come to me. I don't need no officers of the law to tell me what to do, sir. What was you aiming to do with it, anyway?"

"Why," said Carothers pleasantly, "I'd wait for the owner to come get it."

"And what if he don't never show up?"

"Well, I guess in that case I'd jes' sort of keep on waitin'."

"H'r-rumph! I guess not. I found the thing. If the owner don't show up, finders is keepers. You don't get this here car to gallivant around in, Harve Carothers, not if I know myself, and I've had up'ards of seventy year to get acquainted."

Uncle Milt climbed in beside Roddy. "Drive on," he said grandly.

"Halt!" shouted the constable. "I say

Carothers clutched at a rear fender as it passed him, missed it and ran stumblingly in pursuit. He did not catch up.

you cain't take that car away. It's under my pertection. Halt, or I'll arrest both of ye!"

"We can't take it, hey?" roared Uncle Milt. "You watch and see!"

Carothers clutched at a rear fender as it passed him, missed it and ran stumbly in pursuit. He did not catch up. The car disappeared from his view around the next corner. But Constable Carothers was no quitter.

Before noon his weatherbeaten flivver hove to at John Milton Beck's front gate. Carothers limped officiously up to the front porch and tendered Uncle Milt an imposing looking document.

"You done a foolish thing a while ago, Milt Beck," he said, "but I don't aim to be harsh with you unless you fo'ce me to it. This here's a summons from the Squire to have you show cause why you resisted an officer an' refused to give up stolen propoty."

Uncle Milt adjusted his specs with precision and perused the paper.

"Roderick," he called, "fetch the auto around, will you? We'll run in to town a few minutes. Ma, I reckon we'll be back in plenty of time for dinner."

Squire Wilfrid Teegarten looked up from his checker game with Colonel (by courtesy) Jackson Mabry to view with some circumspection the unceremonious entrance of Uncle Milt Beck. The latter did not waste words in unnecessary preliminaries.

"You summonsed me, Bill Teegarten," he said. "Here I am. Whatever you've got to say to me, open your mouth and say it."

The Squire fumbled with his chin whisker.

"Why—why—I did invite you to drop around, on complaint o' Carothers," he stammered, "but 'twas merely informal. Seems there's some dispute about a stolen autymobile the constable's located—ahem! Here comes Carothers now—"

The officer, having anchored his ancient rattler, hurried in.

"The situation's this," said Uncle Milt belligerently: "I've lost a good hoss by thievery. And I find a auto hid in my pasture. This so-called constable, who I've knowed for forty-odd year and never thought much of as a man or boy, instead of searchin' for my lost property gets the idee he wants to cabbage on to this car I found.

It looks suspicious to me. I might wonder if there ain't a reward offered, or something, or maybe he just wants to ride around in a real auto for nothing—"

Carothers thrust himself forward.

"That's a mistake, Squire," he sputtered. "The prisoner is misrepersentin'—"

"Prisoner!" Uncle Milt glared around pugnaciously.

"Don't git excited, gentlemen, neither one of you," soothed the jurist. "Uncle Milt ain't hardly a prisoner, constable. Do I understand, Uncle Milt, that you refuse to give up stolen property?"

"Not to the real owner, whenever he shows up—"

"Then that's all," announced the Squire learnedly. "The case is dismissed. I find that when title is proved to the property, the defendant is glad to surrender possession of same. Until such time, the law of finders is keepers prevails."

Along in the afternoon, Uncle Milt roused up from his nap.

"Have you got plenty of gasoline, son?" he asked. "Maybe your Ma would like to drive down to town and back after supper."

Within the next three or four days, the Becks were frequently seen about the countryside in a shining, soft, purring, new, 6-cylinder motor car. They went and came by various roads and by-roads. There came a time when Uncle Milt himself was beguiled into taking the steering-wheel. From that point it was, as Roddy said, easy sliding into the knack of shifting gears and stepping on the accelerator. To use another of Roddy's expressions, his father rapidly acquired the bug for motoring, too. He wanted past all other cars they might chance to catch up with.

"Why, Pa," remarked Mrs. Beck, one day, "that was Joe Peters we just passed. That's their new auto he's in. But our car is easy a foot longer than his is—"

"H'r-rumph! Nigher two feet longer than one, I'd say."

They ran down and killed a chicken.

"Let people keep their poultry fowls off the public roads," snorted Uncle Milt. "An auto can't be stoppin' every few yards to let a passel of fool hens get across."

They drove over to young John's farm one day. In the course of casual conversation, John remarked that old Bill was in the

pasture down west of the house. He had been there for something like a week, it seemed, where somebody had left him.

"Why didn't you phone and tell us?" asked his father.

"I've noticed," said the other, "that folks who run to the phone every time a mouse squeaks are always getting themselves or somebody else into hot water. I knew old Bill was perfectly safe where he was."

Constable Carothers arrived at the Home Place one Thursday afternoon in his gasoline-propelled vehicle. A smooth-shaven, well-dressed stranger was with him. They came up to the house.

"This here," said the constable, "is a feller which has lost a car. The one you people have been havin' sech a fine time ridin' round in lately answers pretty well to the description—"

"H'r-rumph!" said Uncle Milt dourly. "What was the name, did you say?"

"Nichols," the stranger said. "I'm a dealer in cars over at the county seat."

"Come right in," invited the old gentleman. Carothers, ignored, sat himself down on the porch edge to wait. Inside the house, Uncle Milt spoke mildly.

"How would you be able to tell if this auto was yours or not?" he asked.

Nichols explained about serial numbers on car and motor. Roddy appeared and was sent to compare certain figures on a slip of paper with those on the visiting machine.

Later on, Nichols came out on the porch and addressed the waiting Carothers.

"It was a false alarm," he said. "Thanks for your trouble. Young Mr. Beck has offered to drive me back to the county seat."

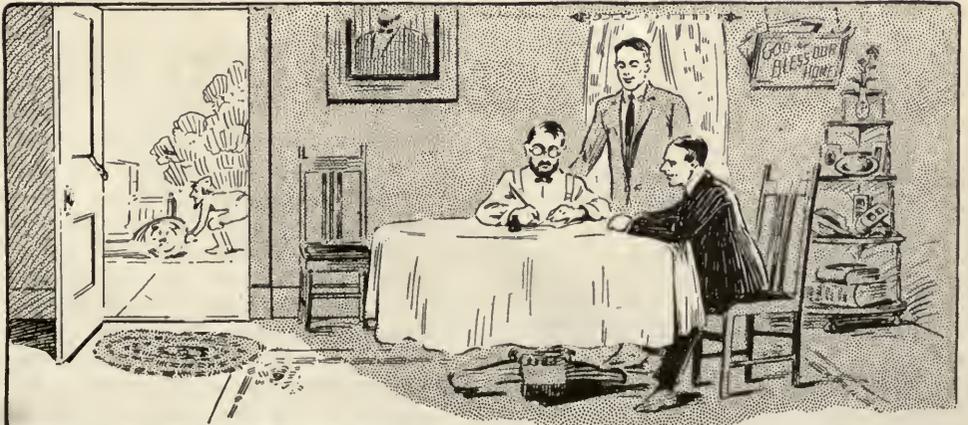

Carothers numbled in his neck and took his departure.

"Of course, if I hadn't took a likin' to this here partic'lar auto, I wouldn't buy it," Uncle Milt said as he blotted the check. "But it's a mighty slick running piece of machinery, I'll say that. They tell me there's a sight of difference in 'em; so when you get hold of a good one, you hate to part with it. And there's no doubt in my mind but what the car was yours, all right."

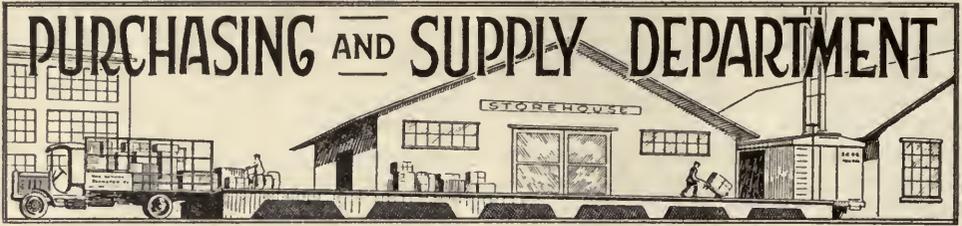

"Sure," said Nichols. "Well, thank you, Mr. Beck, and I hope you have good luck with your purchase. If anything goes wrong, let me know."

Nichols stood in the door of his place of business that July evening and watched Roddy bowling away homeward.

"That was a pretty cute piece of head-work on the part of young Beck," he said to a man nearby. "The kid came in here one day a couple of weeks ago and made arrangements for me to bring a new car down to their farm and hide it in a patch of brush. He said he'd do the rest. It was agreed that I should ride one of their horses over to his brother's place, and his brother would bring me back home. Well, the kid sold the car to his dad, all right. But he's not overlooking any bets. He made me split my commission with him on the deal. That young man will go a long ways."

"Of course, if I hadn't took a likin' to this here partic'lar auto, I wouldn't buy it," Uncle Milt said as he blotted the check. "But it's a mighty slick running piece of machinery, I'll say that."

## The Importance of Well-Kept Files

By R. R. MAULDIN,

Accountant, Water Valley (Miss.) Storehouse.

**P**ROPER filing of records is an important feature of railway accounting and one of which many employes do not realize the advantage. Frequently it will save hours of search for some record that, when filed, we thought would not have to be referred to again.

On a hot summer's day, when you go to the record room for a file and do not know just where to look for it, and you begin to tear down records, and you get your mouth and nose full of dust and grit, and great beads of perspiration roll down your face, and you fuss and fume about "somebody" not filing them properly, and at last you find it—"Oh, boy, ain't it a grand and glorious feeling?"

Do you think that your worries are over? Suppose some time later you have to refer to another old record, and you go through the same experience—don't you think it time for a change? Begin right then, and all the spare time you have arrange your record room in order and mark each record plainly, getting together all records pertaining to the same subject; after this is done to your satisfaction, keep them in that particular place. Instruct everyone who has to do with the filing of records that they must be plainly labeled and put in their proper place in the record room and that, if necessary to refer to them some time later, they must be replaced exactly where originally filed.

### Filing Purchasing Agent's Invoices

Among the most important files in the store department are the purchasing agent's invoices. These invoices have to be referred to dozens of times a year, and it has been my experience that the best way to file them is to order from the stationer a supply

of transfer file boxes, Form 609, and use each box for filing invoices taken into account for the first three months in the year and so on; this will take only four boxes for the entire year's record. If the large amount of invoices taken into account will not permit the filing of three months' records in one box, a box will surely take care of two months' records, which will require six boxes for the year's record.

I believe these should be filed in numerical order, as this has advantages over any other method. If we have to refer to an invoice we of course look in the receiving record or ledger to see the month taken into account and the serial number; after obtaining the serial number, we can easily and quickly find the invoice wanted, if it is filed in numerical order. Another item in regard to the filing of purchasing agent's invoices is the matter of folding them to prevent their becoming torn or mutilated. To my mind, all invoices, Form 1548, should be folded to correspond in size with the smaller Form 1549, and any papers or attachments to them should be folded together; when this is done it will make a neat and orderly file.

### Give File Numbers in Dictating

Another system of proper filing I would recommend would be for the person who handles correspondence, in dictating, to give the file number covering the subject to the stenographer, who will enter it in her notebook, as well as on the letter. Then if the person addressed, in replying, does not quote the file number but refers to your letter of a certain date, it will be easy for the stenographer to refer to the notebook on that date and ascertain the file in which the papers were put. This will no doubt save a lot of time looking through the numerous boxes for the office file, as well as familiarizing clerks handling correspondence with the file numbers used.

Another thing of interest, especially to store department forces, is the filing of receiving records, Form GSK-35. This is another record that has to be referred to a great many times after it is filed away, and I think the most durable and convenient way to file it is to take a year's record and insert a  $\frac{3}{8}$ -inch or  $\frac{1}{2}$ -inch bolt, as long as necessary, through the binder post holes, putting a washer on each side; then screw the nut on, and after labeling it you have a complete and serviceable file.

I also find that priced invoices from the general and division storehouses, when inclosed in envelopes, Form 864 or Form 875,

for each month and then filed in transfer file boxes the same as the purchasing agent's invoices, make a file that is quickly referred to and requires only four of these boxes for a year's record.

There are many other records in this department which it is necessary to file in a convenient manner, but space will permit details of only a few of them. What I desire, however, is to bring to the attention of employees of this and other departments the many hours of wasted labor which may be saved by keeping the records intrusted to them in an orderly manner readily accessible at all times.

## Girl Invades Suburban Smoking Car

Gone are the days when a man would seek the smoking car of a train, find a comfortable seat and loll back in solid pleasure with his cigar, cigaret or pipe, with the satisfied feeling that he need not surrender his seat to a woman passenger, as is the case in other coaches. A woman has invaded the smoking car of an Illinois Central suburban train at Chicago!

Women frequently enter the smoking cars of the suburban trains by mistake, but the smoke-laden air soon informs them of their error, and they do not tarry. Others turn sharply about when the conductor tells them that they are about to enter the smoker.

Imagine the surprise of one of the conductors when, after he had informed Miss Mary Foley, a stenographer, that she was headed for the smoker, she smiled and flatly said, "Yes, I know it is the smoking car—that's why I'm going there."

It all happened at the 53d Street station. Miss Foley calmly walked into the smoking car, sat down among the men, drew forth a neat cigaret case, placed a slender white cigaret in a long holder and settled down for a nice little puff.

And she got away with it!

"The idea came to me the other day when I could not find a seat on a train," Miss Foley said. "I happened to look into the smoker, and saw the men lolling back comfortably in the half-filled car, puffing away in the greatest contentment. I said to myself, 'Why shouldn't I do this? Am I prohibited from enjoying a seat and a smoke just because I'm a woman?'"

"So I started out to see. Some of the men

tittered when I entered the coach, and a sailor said, 'My Gawd!' But they soon saw that I was serious about this thing and not merely trying to show off. They soon seemed to forget me, and maybe some of them respected me—who knows?"

"Men used to keep us out of bars, and now the men have no bars. But they can't keep us out of smoking cars, because we have a right to go there."

"And furthermore," she continued, "hereafter when I want to smoke anywhere, I'm just going to light up just like a man does."

## Special Train Carries Fine Greyhounds

### Dogs Travel in Luxury Over the Route of the Seminole Limited to East St. Louis Races

PERSONS along the route of the Seminole Limited from Florida to St. Louis were treated to a real novelty on April 13, 14 and 15, when the movement of the first "Greyhound Special" was handled by the Illinois Central.

After the greyhound races closed at Miami, Fla., on April 10 and after a thorough investigation of the service of the various lines by the officials of the Miami Kennel Club, the Illinois Central was given the distinction of handling the first special movement of racing dogs that has ever been "staged" anywhere. Circus and horse race movements and various other trains of a novel character have been run in the past, but a train of greyhounds and the owners, trainers and officials connected with this new sport was a new one for all concerned. Evidence of this was demonstrated by the fact that crowds turned out at all stops along the line to get a view of

something entirely foreign to special trains of the past.

#### Five Cars in Train at Start

The party included approximately fifty-five passengers, occupying two sleeping cars, and one hundred racing dogs, loaded in three Illinois Central baggage cars.

This train left Miami over the Florida East Coast Railway at 4:40 p. m., Wednesday, April 12, as the first section of No. 38, arriving in Jacksonville the following morning. A lay-over of a day, Thursday, permitted all members of the party to visit the points of interest in the latter city and to exercise the dogs, feed them and attend to their other comforts. These dogs are valuable and are becoming more so as the new sport increases in popularity; consequently they receive the finest of care and are not allowed out of the sight of their trainers at any time day or night.

Followers of greyhound racing. Photograph taken at Haleyville, Ala. Left to right: Judge Sullivan; "Cotton" Davis; Mr. and Mrs. George Sawyer; Carl Shuttle; Mr. and Mrs. O. P. Smith; George Smith; Cecil Wilson; Walter Garvey.

The train was left standing intact all day at the station at Jacksonville, conveniently located, so that the members of the party had the equivalent of a hotel at the station during their stay.

The call of "all aboard" was sounded at 10 p. m., and the train moved out of Jacksonville on the time of the Seminole Limited. An early arrival in Columbus, Ga., saw the diner and sun parlor observation car attached to the train. Members of the party welcomed the two cars with open arms, as was evidenced by the fact that good use was made of both cars and compliments were heard on all sides both for the cars and for the arrangement of the train.

#### Stopped to Stretch at Haleyville

The next stop of importance was Birmingham, where the cars were iced and watered and the dogs were given a little exercise around the Union Station.

A stop of an hour and a half was made at Haleyville, Ala., where all the dogs were taken out on the roads and the passengers were permitted to enjoy the "seventh inning stretch." Photographs of the entire party and of various groups were taken by a photographer who boarded the train at Birmingham.

Leaving Haleyville, the train was given clear sailing into East St. Louis, where the passengers were unloaded and the baggage cars were placed near the race track of the St. Clair Amusement Company, where a race meeting started April 29.

Every member of the party was enthusiastic about the whole trip and took special pains to compliment all the Illinois Central men who looked after every detail throughout the trip. Much credit is given S. C. Baird, district passenger agent at Jacksonville, and W. B. Pearce, Miami representative of the Illinois Central, who obtained this movement and left nothing undone in giving this train service de luxe. Mr. Pearce accompanied the train from Miami to East St. Louis and was instrumental in seeing that everything was just a little better than "all right."

#### Popularity of Sport Increases

Greyhound racing is the modern method of the hare and hounds brought up to date by the invention of O. P. Smith of Chicago, who has perfected and patented the electric rabbit around which the new amusement is built. Racing in Florida has proved a huge success. Another track is to be built at Jacksonville during the summer for racing during the win-

*Mr. and Mrs. O. P. Smith and family. Mr. Smith is the inventor of the mechanical rabbit used in greyhound racing. As general manager of the racing association, he expects to establish greyhound racing in the East.*

ter season of 1922-23. In addition to these tracks, plants are in operation at Emeryville, Cal., Tulsa, Okla., Chanute, Kan., and East St. Louis, Ill. The East is to be given a look at greyhound racing, as a track is to be constructed in New York this summer.

#### How the Races Are Run

The Miami (Fla.) *Herald*, in announcing the opening of the races there, had the following explanation to make of dog racing:

"Dog racing in many respects is fashioned after horse racing, but with the professional 'fixer's' taint removed. There can be no 'fixing' in hound racing. No jockey sits astride his mount to steer him into pockets or to trail the bunch. The dog is his own whip and he has but one object in life—to catch the mechanically propelled rabbit that always keeps a length or so in front of his speeding snoot.

"Form sheets, exactly as used with the horses, keep tab on the hounds, charting their efforts in the various events from day to day and serving as a guide to followers of the sport. Entries and results also are printed daily as at the horse tracks.

"All entries in dog races are conducted on

a plan similar to that in horse racing. When a stable arrives they are sent out and, paced by the mechanical rabbit, are timed over each distance they are to be entered in. Before each race, the six dogs entered in it are weighed and must tip the beam at a difference of not more than half a pound from the weight shown when they took their qualifying trial. These six dogs must be in the paddock twenty minutes before the race. Each of the dogs wear a knitted, colored collar, the colors being the six primary shades, red, blue, white, green, yellow and black. The attendant of the dog wears a cap and coat to match.

"The hounds are then led over to the starting cages, each of which has six compartments, enclosed by glass, so the dogs can see the speeding bunny and start at top speed when the door lifts open. This gives each one an equal chance in getting off. The rabbit then is whirled around the track so the dogs may see it. When it passes the cages once, each racer becomes frantic to go, and as the rabbit speeds by the second time the doors fly up and the hounds are after it.

"The engineer in the tower regulates the

speed of the rabbit, so that it is always a few feet ahead of the leading dog, increasing its speed as the dog's flight increases. At the end of the race, the rabbit automatically disappears through a runway at one side of the track and the dogs are leashed and led back to their kennel.

"Will they always run?" an old-timer at the game was asked yesterday.

"Will they?" was his reply. "Those dogs are bred to run and they'd die of a broken heart if they couldn't."

#### How the Dogs Caught a "Rabbit"

A Jacksonville, Fla., paper chronicled the passing of the "Greyhound Special" through that city as follows:

"The dogs which have been racing at the Miami dog course are in the city today on their way to East St. Louis, where a meet will be opened at the new \$150,000 dog track there on April 29. The meeting there will last until June 4, when the dogs will be moved on to New York, where a track is being built in the Bronx.

"The dogs and party of owners with them

Men, left to right: C. R. Sterling; O. P. Smith; Arch De Geer; Lawrence Freeman; Jack Fischer. Dogs, left to right: Out for Sport, Buck Saw, Timothy, Snookum, Mission Boy Louis L. Mr. Freeman is holding two of the best racing greyhounds in the country, Snookum and Mission Boy, who have been his biggest winners.

are in charge of O. P. Smith, inventor of the electrical rabbit, who is attempting to form a circuit in the Southeast for dog racing. Mr. Smith became an inventor for the old reason, 'necessity,' because the humane societies were after him because of the alleged brutal treatment to live rabbits used in dog races. The mechanical one has proved even more successful than the use of live ones, as the dogs very seldom catch it.

"Dogs in the shipment which is now passing through Jacksonville are owned by about forty persons. They are raced in stables similar to those in the horse racing game, classified as to time they can make on the track and limited as to weight. They have just finished a meeting of thirty-eight days in Miami which proved greatly successful. In the Miami meeting the dogs caught the rabbit but once; that was when a black cat got into the mechanism of the track on which the rabbit runs and stopped it. The dogs tore the stuffed rabbit to bits before attendants could pull them off."

#### Thank for the Good Service

Mr. Smith, upon arrival in St. Louis, wrote to Mr. Baird as follows:

"To say that I was pleased would be expressing myself mildly, and all the members of our party join me in thanking all the officials who had the handling of this train collectively and yourself and Mr. Pearce individually for the very exceptional service we received.

"The movement of this train was evidently well advertised in passenger circles around St. Louis, as we no sooner arrived there than a representative of another road called on me regarding our going east after this meeting. He said that he understood our train on the Illinois Central was met at every station by someone with a piece of ice in one hand and a pail of water in the other, and he assured me that, in case the business was given his people, they would do even better than this; they would have men waiting with two pieces of ice in one hand and two pails of water in the other."

E. B. Deen, judge at the dog races, wrote as follows to W. H. Brill, general passenger agent at New Orleans, and F. D. Miller, assistant general passenger agent at St. Louis:

"I have just arrived in St. Louis after a wonderful trip on what we have named the 'Greyhound Special.' The service we received on the trip was indeed a revelation, and every member of the party is more than satisfied.

"Everything promised by Mr. Baird and Mr. Pearce when they solicited this business in Miami was given us and a great deal more than I know the number of passengers in our party was entitled to receive.

"You can rest assured that all the people who made this trip are from now on enthusiastic boosters for the Illinois Central and that they know Mr. Baird and Mr. Pearce are true representatives of a great railroad."

#### NOT ONLY GOING

Jones brought a business from an agent who advertised it as a going concern. After six months of "going business," Jones failed. Meeting the agent some time later, he said: "Do you remember selling me a business as a going concern?"

"Yes, of course I do," replied the agent.

"Well," said Jones, "it's gone."—C. R. C.

Miss Mabel Thorpe, 3417 North 9th Street, St. Louis, Mo., a devotee of the sport. The second dog from the left is her favorite and best dog, Oakland Charter. The second dog from the right is a consistent winner known as Oakland Hero. Miss Thorpe is one of the most prominent dog fanciers in the United States. Her Boston terriers have been exhibited in all the bench shows throughout the country, and she has won many blue ribbons with them. Last winter she acquired a string of racing greyhounds, which are shown in this photograph.

## The Month of Brides and Roses

Do business girls make good wives? None better. They know the value of a dollar. They are expert in the art of dressing well at moderate cost. They are companionable and tactful. They will not meet friend husband at the door with a recital of the day's trials when they can see that he is fagged out. They know what team work will accomplish. They are aware that men like to be "jollied," not nagged. They are less likely to be jealous of their husbands' office assistants. They are efficient—no back fence gossip for them while the breakfast dishes lie in the kitchen sink. They have been trained to get things done. And when they leave the business world we hate to see them go, but we rejoice in the good fortune of the man who by our loss gains a real life partner.

Here are five charming recruits to the army of home makers—June brides, bless 'em! Anybody can furnish a house, but home making is an art, and we are informed that these young women are well equipped for the new life which they will take up this month.

No. 1 is Miss Florence Immekus, stenographer in the telegraph department, Chicago, in the service for the past five years. On June 3 Miss Immekus will be married to R. O. Williams, sales manager for the Harter Manufacturing Company. Mr. Williams was formerly employed in the electrical department of the Illinois Central.

No. 2 is Miss Billie Shumway, secretary to H. G. Morgan, signal engineer, Chicago, in the service for the past eight years. Miss Shumway will become the bride of W. P. Neekamp of Huntington, W. Va., on June 5.

No. 3 is Miss Marjorie M. Schuler, stenographer in the office of the engineer, maintenance of way, Chicago, in the service for the past six years. Miss Schuler will become the bride of an Illinois Central employe on June 3. The fortunate man is Emil P. Buechler, employed in the office of C. C. Haire, engineer auditor, Chicago.

No. 4 is Miss Ethel R. Blade, private secretary to W. A. Summerhays, lumber and tie

agent, Chicago, in the service for the past four years. Miss Blade will become Mrs. William Kibbe on June 17.

No. 5 is a representative from the Southland, Miss Ophelia Williams, clerk in Road Supervisor R. D. Day's office, Baton Rouge, La., who will be married to Irving Rondolson. Mr. Rondolson is employed by Simon Brothers, Alexandria, La.

## Silk Hosiery Notes

Never run your hand into silk stockings while wearing rings.

Soak the stockings in cold water before the first wearing, to set the threads.

Wetting the broken thread or rubbing with moistened soap will stop a run until it can be caught with a needle and thread.

Wash stockings after each wearing. Always wash them on the wrong side, using lukewarm, soapy water. A little vinegar added to the rinsing water sets the color. Wring the stockings carefully.

White silk stockings should be hung in a dark room to dry, to prevent their turning yellow.

When putting on the stockings, turn wrong side out. Run the hand through the stocking and pull the toe inside. Fit the foot into the opening thus made, and draw on the stocking, keeping the seam straight.

Tight garters cause the threads to break and run when the knee is bent.

Buying two pairs of the same kind of stockings is an economy. Then, if one stocking in each pair should give out, one still has a pair of stockings by matching up the good ones.

## Ice Box Cake

At last our search is rewarded, for we have found a recipe for Ice Box Cake. Miss Olive O'Reilly, stenographer in the law department at Chicago, has kindly given us the recipe used by her aunt, Mrs. M. Sullivan, which is printed below:

Take  $\frac{1}{2}$  lb. unsalted butter,  $1\frac{1}{2}$  cups powdered sugar, 5 eggs, almond and vanilla flavor

June

Brides

to taste. Cream butter and sugar, beat for one-half hour, add egg yolks, one at a time, beating each one five minutes. Add the flavoring. Beat whites until stiff and dry, and add a portion at a time. Line tin, sides and bottom, with split lady fingers, add a layer of filling, then lady fingers, another layer of filling, then lady fingers on top. Place in refrigerator for 24 hours. Add 1½ bottles of cream, whipped stiff, to top just before serving, after unclamping side of tin. Cherries or nuts may be added, the cherries making it look very attractive. The special tin necessary for ice box cake may be procured in any of the department stores under the name of "ice box cake tin," or the cake may be made in a deep mixing bowl.

### Good Things on Our Dining Cars

Chef-Cook A. G. Ferguson, whose picture appears herewith, has been in the Illinois Central service since 1903.

Prior to that time he worked successively for the Crescent News and Hotel Company, the Pennsylvania Railroad, and on the private car "Zamora" of the Waters-Pierce Oil Company. Chef Ferguson's fine pastry has earned for him a reputation with the patrons of our Western Lines. He has given us some of his favorite recipes for the Home Division.

A. G. Ferguson

Here they are:

**RHUBARB PIE.**—Wash and peel rhubarb and cut in inch pieces (there should be a little more than one pint), add 1 teacupful of sugar, 1 teaspoon of melted butter, and a little grated nutmeg. Do not add water. Place mixture on fire, stir until it becomes hot, dredge in 1 tablespoonful of flour, and remove from fire. Line a pie tin with pastry, fill with half cooked rhubarb mixture, cover with narrow strips of paste crisscross. Bake in moderately hot oven.

**ROAST SWEETBREADS.**—Choose large white sweetbreads. Put them into warm water to draw out the blood and improve the color, and let them remain for one-half hour; then wash them, put into boiling water with an onion, a little mace, salt and pepper, and allow to sim-

mer for twenty minutes. Take up the sweetbreads, drain, and dip into beaten eggs; roll them in bread crumbs and place in a buttered baking pan with a little of the stock in which they were boiled; dredge in a little flour, put into a moderately hot oven and roast gently until a delicate brown in color. Serve on toast with brown gravy made from stock in which sweetbreads were boiled.

**ROAST LAMB.**—Place prepared meat in a roasting pan, season with salt and pepper, add a little water, put into a brisk oven and baste constantly until the moment of serving. Lamb should be thoroughly cooked without being dried up, and not the slightest appearance of red juice should be visible, as in roast mutton. This rule is applicable to young white meats. Serve with a little gravy made in the dripping pan and a tureen of mint sauce on the side.

**BAKED TROUT.**—Take the sides of fish freed from bones, season with salt and pepper, dust with paprika, dredge with flour, and arrange with a little butter in a baking pan. Cover well with tomatoes, add a minced green pepper, a little minced shallot. Bake and baste till done. Serve with sauce in which baked.

**CURRIED LOBSTERS.**—Remove the meat of two red lobsters from the shells, place the meat, together with a little thinly sliced ham, into a shallow sauce pan, add a little cayenne pepper and a scant teaspoon of salt. Mix half a cupful white soup or stock and half a cupful of cream, and pour over the meat. Put it on the fire and let it simmer for about an hour. Then add a dessertspoonful of curry powder and another of flour rubbed smooth in a little of the stock. Cook three minutes longer. Serve with boiled rice.

**SAUTE CHICKENS.**—Disjoint two fat spring chickens and put into a frying pan with two ounces of sweet oil or butter, season with salt and pepper, and fry quickly until light brown on both sides. Add a chopped onion and two ounces of ham cut in small squares, and fry a little longer. Dredge in 3 tablespoons of flour, stir and dilute with broth. Add 6 peeled and seedless tomatoes cut small. Cover and cook slowly until done. Add a little chopped parsley and serve with boiled rice.

**SALAD DRESSING FOR MEATS OR VEGETABLES.**—Mix together 1 tablespoonful of dry mustard, 2 tablespoonfuls of sugar, a pinch of cayenne pepper and 1 dessertspoonful of salt. Stir into this slowly to prevent lumping 2 teacupfuls of oil (olive oil preferred), the juice of ¼ lemon, 1 teacupful of vinegar and 1 teacupful of water.

Place the mixture on the fire. Have ready 3 eggs well beaten, add 1/2 cup of water to beaten eggs. When the ingredients reach the boiling point, stir in the beaten eggs very rapidly to prevent curdling. Cook for one minute and remove from the fire.

**Household Hints for Home Makers**

Fresh fruit stains—even the stubborn peach—may be removed from white goods by rubbing the spot with pure glycerine and then washing in the regular way.

Remove strawberries from the box immediately, pick them over and discard any soft

berries, but do not hull them. Place in a mason jar, cover, and keep in the refrigerator until ready for use.

The use of borax, if persisted in, will exterminate roaches. Scatter the borax near the holes and cracks.

If a little cornstarch is dusted on top of the cake, the frosting will not run off.

A quarter of a teaspoon of cornstarch added to the salt shaker will keep the salt from becoming lumpy.

To clean piano keys, rub with alcohol.

To dust reed or rattan furniture, use a small paint brush.

## Louisiana Division's Youngest Agent

The youngest agent on the Louisiana division is Arthur Clyde Ellzey, appointed agent at Amite, La., effective May 2, 1922. He entered the service as clerk at Tickfaw, La., May 1, 1913, at the age of 17. During his service at that point he studied telegraphy. January 1, 1914, he started to work as extra agent-operator for the Louisiana division. Mr. Ellzey

worked in this capacity until June 22, 1918, when he entered the United States Navy, enlisting in New Orleans. He was sent to the naval station at Algiers, La., and from there to the Naval Radio School, Harvard University. Upon completing his course, he was assigned to the radio repair shops, United States Marine Base, New London, Conn. After serving about a month, he was assigned to Submarine E-1 as radio electrician. In January, 1920, he was discharged from the service. He was re-employed by this company as relief agent until November, 1920, when he was given a position as second trick operator at Kentwood, La., remaining there until his recent appointment as agent at Amite.

Arthur C. Ellzey

### THREE DISTRICTS' RECORD

W. E. Ausman, trainmaster of the Cherokee, Sioux Falls and Onawa districts of the Iowa division, had the following to say in a recent circular letter to his men:

"I wish to call attention to the splendid record, in the matter of accident prevention, made by you men during the past several months.

"The Onawa district has not had a reportable accident for eighteen months; the Sioux Falls district, for one year; and we have had only one accident on the Cherokee district since December, 1920.

"I do not believe this record can be equaled or excelled by any other three districts on the system or in the country at large. Everyone who contributed, in any way, to this performance has a right to feel proud of the record."

# Mr. Brumley Wins Fame With His Garden

*Chief Engineer of Chicago Terminal Improvement and Son Joe Find Vegetable Growing Worth While*

*The following story, reprinted by permission from the May 14 issue of the Chicago Tribune, was written by Frank Ridgway, agricultural editor of that paper:*

**I**N visualizing the gigantic engineering project of transforming the steam railroad along the lake front into a modern electrified system, D. J. Brumley, chief engineer of the Chicago terminal improvement of the Illinois Central System, uses his vegetable garden plot at Flossmoor, Ill., as a drafting board.

Series of rows of vegetables streaking across his garden are so many railway tracks to him, enabling the engineer to picture the network of steel rails that will be needed to meet the demand on the system fifty years from now. Whether the trains are to be run by a low voltage direct current or a high voltage alternating current system is one of the problems Mr. Brumley studies as he hacks away in his garden each evening after leaving his office at the Central Station.

He hurries home every afternoon to his garden instead of stopping at some of the golf courses on the way out. He even rides the Golf Special, where he is tantalized by the rattling of golf sticks as the passengers drop off at the six or seven golf courses along the way, but he says he would rather have a good sharp hoe that will clip off the weeds smoothly than the best brassie that can be bought.

Gardening is not a fad with him, either, for Mr. Brumley and his 12-year-old son, Joe, have kept their  $\frac{1}{8}$ -acre plot green with vegetables from early spring until late in the fall for seven years. Everything is in tip-top shape for the 1922 season—all of the early vegetables are planted and plans are made to keep every inch of space busy throughout the summer.

In addition to raising one of the best gardens in Chicago suburbs and working on his engineering plans, Mr. Brumley has found time to help write a book, "Preparation and Care of a Garden for Vegetables." He is co-editor

*Mr. Brumley and son Joe at planting time*

and the chief author of this book, which is filled with practical hints for home gardeners, extracted from notes taken by the writer as he worked in his own garden.

There is nothing Mr. Brumley enjoys more than donning his garden togs—hickory hat, khaki shirt, blue denim overalls, and brick colored goo-goo-eyes shoes—and going out into the garden with Joe for the daily lesson in horticulture. "I know of no better method of teaching nature lessons to children than for parents to work with them in the garden," he says. "Joe knows the common and botanical names of all the vegetables, flowers, shrubs, fruit trees, and small fruits that are grown around the home. Most children enjoy working with plants, and it gives them a better insight into nature than they can get from books."

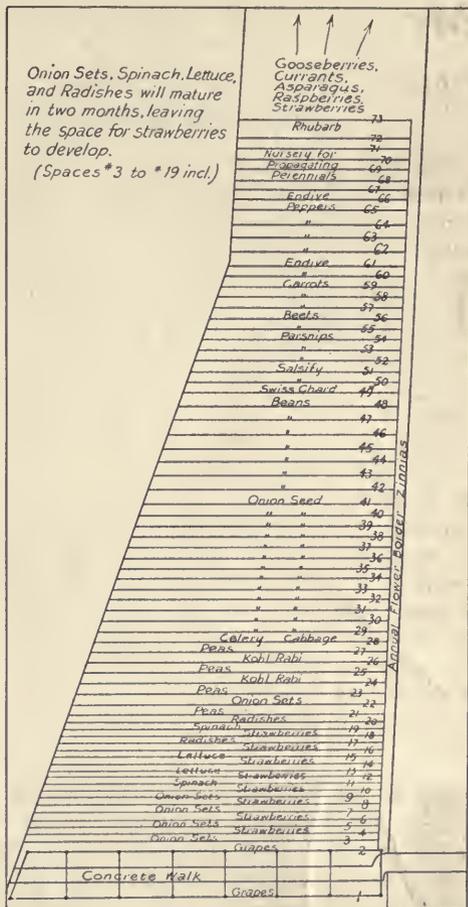

Mr. Brumley started his first garden during the war. Like most beginners he grew the common vegetables at first, and kept adding a few more to his list every year. He makes a careful study of the plants, and is continually working out new ways of improving his crops and gardening system. He is pointed to as one of Chicago's best home gardeners.

After the first plantings have been made he finds it requires about two hours each day to keep the garden in good condition. Before planting a hill all of the plans are carefully made, the ground is staked off, each stake with a number corresponding to the number in the plan book where the vegetable to be planted in that particular row is listed. Dates of planting are given, making it possible for rows to be seeded at different times without interfering with the seeds or plants in the adjacent row. For example, rows 1, 3, and 5 may be planted May 14, and rows 2, 4, and 6 left to be planted later. The stakes are left in the garden throughout the growing season.

**Knows Intensive Principles**

Planning the garden and driving down the stakes in advance makes it possible for more effective work to be done in growing a succession of crops, Mr. Brumley says. Where the crops do not require the full season to mature he raises at least two different kinds of vegetables in the same row, planting a second crop after the early one has been harvested.

This year he is growing onions, kohlrabi, spinach, lettuce, and radishes set two feet apart, so that the same ground can be used in starting a new strawberry bed by setting the plants in between the rows. The vegetables will be out

of the way before the strawberry plants are large enough to interfere.

Following the first crop of radishes, peas, onions, kohlrabi, and celery cabbage, celery will be set about the middle of July, when the early vegetables will be off the ground. The celery is set in rows four feet apart, allowing plenty of soil between the rows to be used for banking and blanching the celery later. In another part of the garden Mr. Brumley has onions growing from seed. He says they will be pulled and out of the way by August 15, and the ground will then be used for the second crop, using endive, kohlrabi, turnips, and an early maturing variety of bunch beans. He leaves the kohlrabi, endive, and turnips in the ground until it freezes.

In other rows he has the first crop of snap bunch beans planted, and will follow them with endive, spreading the plants six inches apart in

the rows. When the endive plants get to be three or four inches high he ties the outer leaves up with a string in order to blanch the inside ones.

**Grows Rough Stuff**

Such crops as Swiss chard, salsify, parsnips, beets, carrots, and peppers require the whole season to mature. In another section of the garden Mr. Brumley grows what he calls the "rough stuff," including navy beans, okra, cucumbers, cantaloupes, sweet corn, squash, and tomatoes. He plants navy beans about May 15. They ripen the last of August or the first of September in his garden, which is twenty-five miles south of the Chicago River, fifteen miles from the south end of the lake, and 110 feet above the water level of Lake Michigan. It is a few degrees warmer in his garden than in gardens in and immediately around Chicago.

The okra was planted as soon as the ground was warm enough to work, and he expects to cut pods about July 15. The cucumbers in this garden were started about May 10, and by careful spraying, hoeing, and watering will be made to last until September. The cantaloupes are planted about May 20, maturing the first half of August. The late varieties last until frost. Sweet corn is planted at various times, in order to have a succession throughout the season. The first planting in the Brumley garden was May 6. Three varieties were used—early, medium, and late—golden bantam, golden cream yellow, and black Mexican, a blue kernel variety.

The winter squash, warted hubbard, and marblehead varieties will be planted May 20 and more sweet corn May 15. On the same day summer squash will be planted. The

crook necked and patty pan varieties are used. The latter is the white scalloped squash, ripening about July 20. The skin, seed, meat, and all are good to eat. Cucumbers will not be planted until June 1.

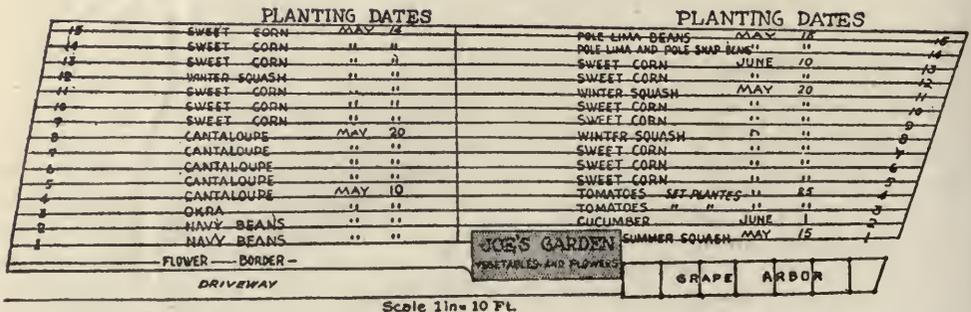

The tomato plants will be set out in the open this week. Trellises are used to support the vines, allowing the plants to grow about six feet tall, pruning and budding whenever needed.

In pointing out some of the common mistakes made in gardening Mr. Brumley offers this advice to beginners: Do not plant too thick; hoe the ground frequently and regularly; weeds and vegetables are not good neighbors; kill the weeds; never work the ground when it is wet; sprinkling does little good, soak the soil and rake it lightly as soon as the surface is dry.

**Stocking the Cellar**

More than a third of the vegetables grown in the Brumley garden are given away. Enough, however, are produced to last a family of four throughout the year, supplying green vegetables for four months during the summer and fall, leaving plenty to store for winter use. Around the offices at Central Station on hot summer days Brumley's big red tomatoes are strong competitors for ice cream cones and cold drinks.

Mrs. Brumley has the most interesting cellar around Flossmoor—row after row of shelves are filled with canned vegetables every fall. Last fall 105 quarts of tomatoes, twenty quarts of beets, and other vegetables in about the same proportion were canned and lined up on the shelves in the cellar. There's enough to last until fresh vegetables are ready to gather from the garden this year.

Section of Brumley Garden. In this part of his garden Mr. Brumley plants what he calls the "rough stuff." All of the planning and staking is done before the seed is planted; stakes are numbered to correspond with the vegetable number in a plan book. In the other section of the garden the cropping scheme is so arranged that two crops are grown in one season. Knowledge of engineering comes in handy in mapping out a garden, according to this engineer.

# Editorial

## HELP STOP ACCIDENTS!

We have much to say in this number of the *Illinois Central Magazine* about the nation-wide drive beginning June 1 and continuing until September 30 for the prevention of accidents at highway-railway grade crossings. The Illinois Central System will co-operate fully with the safety section of the American Railway Association in carrying on this campaign. Every officer and employe of this railway system is expected to do his part.

The promotion of safety is not new to the railroads. We have been engaged in this work for years. As pointed out in a recent statement by President Markham, the railroads of the country are growing safer each year. The number of accidents is being reduced. In spite this, however, there has been an alarming increase in one class of railway accidents—those involving motor vehicles and their occupants at grade crossings.

There are two solutions of the grade-crossing menace. One is the separation of grades at all crossings. That, however, is so costly that we cannot expect to attain it for many years to come. Grade crossings are here, and a great many of them must stay for years to come. Electric bells, crossing gates, flagmen and other safety devices have been tried and, while they have in some instances helped to prevent accidents, they hold forth no promise of a permanent solution of the problem. The only solution left, therefore, is for all persons to be educated to the fact that all highway-railway intersections are extremely dangerous. Children should be taught to observe the same care when passing over a railway crossing that they would observe while passing a point where blasting is going on or while handling firearms.

Grade crossings are never safe. They are highly dangerous. The national welfare demands that trains be moved on rapid schedules. Trains are heavy objects, and cannot be brought to a stop at each crossing without interfering with the service. They must have the right of way. The pedestrian or driver of a vehicle must be the one to stop.

One phase of this grave problem which we

do not consider sometimes is the effect upon railway locomotive engineers of the fool-hardy chances which motorists take at grade crossings. An engineer wants to preserve human lives. Charles J. Barnett of Memphis, who pulls the Panama Limited between Memphis and Canton, writes as follows in an article published elsewhere in this magazine:

"We are perfectly helpless when a chauffeur drives a car on the track in front of our engine. Surely he should know that we would not hit him if we could help it. I have seen men with nerves of iron, men who are gray from years of service as engineers, sit down and weep after striking an automobile and killing the occupants."

I. H. Martin of McComb, a Louisiana division engineer, writes as follows in the same article:

"There seems to be a disposition on the part of some drivers to run their cars at full speed up to a crossing as close as possible, and think it is a good joke on the engineer, especially if he applies the brakes and brings his train to a full stop. The automobile driver little realizes the agony it causes the engineer. This very thing has happened to the writer many times, and I will have to admit that it takes all the starch out of me for quite a while."

We commend the testimony of twenty-one engineers who have contributed statements to this number for your careful reading. We venture the assertion that anyone who reads their statements will be impressed with the seriousness of this national menace.

It is going to take more than extraordinary watchfulness and carefulness on our part. An observance of the rules will help toward preventing accidents, but we must do more. We must make ourselves a part of this vast educational movement which is being carried on.

We call attention to what T. J. Powers, a New Orleans engineer, does. He writes, in his statement:

"I caution every person I know who has an automobile about railway crossings and the ultimate danger resulting from careless driv-

ing. I also tell everyone I speak to about this important matter and ask them to tell others."

There's a good suggestion for the rest of us. Let's show what we can do.

### THE SPIRIT OF COURTESY

James Ball Naylor, who conducts a column in the *Chicago Journal of Commerce*, pays a fine compliment to courteous ticket agents in an article published April 29. One acquainted with conditions on the Illinois Central System feels that Mr. Naylor is writing about the men and women of our railroad when he refers to the present situation. However, he declares that the spirit of courtesy wasn't so marked during federal control, and we hope that applies to some other railroad than ours.

Referring to the conditions of three and four years ago, Mr. Naylor says:

"We received courtesy—yes; but it was icy courtesy, cold-storage courtesy. There was no warmth, no geniality, no friendliness about it. We were made to feel that we were outsiders, intruders; we were treated with frigid condescension."

That spirit is contrasted with present conditions by quoting from an editorial, of which the following is a part:

"The atmosphere now is entirely different. Now these same bright young men cannot do enough for you. They voluntarily, and with a show of real interest in your welfare, relieve you of all trouble about your trunk, checking it for you from your residence to your place of destination. They offer to wire ahead for you to the place where you must change cars and secure reservations for you the rest of the way. They anticipate the questions, which, if asked, would make you feel foolish. They show real appreciation of your patronage and a desire to serve you in every possible way."

We believe our readers will appreciate the sentiment of the verse which Mr. Naylor quotes as the text of his discussion. It is:

How sweet and gracious, even in common speech,

Is that fine sense which men call courtesy!  
Wholesome as air and genial as the light,  
Welcome in every clime as breath of flowers—  
It transmutes aliens into trusting friends  
And gives its owner passport round the globe.

### THE AGRICULTURAL INQUIRY

Railway men will not agree with everything which Representative Anderson of Minnesota, chairman of the Joint Congressional Commission of Agricultural Inquiry, says about the

railroads in his preliminary summary of the report of the commission, but we believe they generally will agree that the commission seems to have made an honest effort to go to the bottom of the situation and bring out a report which will be helpful. The commission comprises Senators Lenroot of Wisconsin, Capper of Kansas, McNary of Oregon, Robinson of Arkansas and Harrison of Mississippi, and Representatives Anderson of Minnesota (chairman), Mills of New York, Funk of Illinois, Sumner of Texas, and Ten Eyck of New York. The subject of their inquiry is "The Transportation Problem as Related to Agriculture." The following are some of their decisions, according to Representative Anderson's advance summary:

"The railroads are not self-sustaining and are therefore not on a sound credit basis. If this condition continues, transportation service will be crippled, and the country will suffer accordingly.

"It has been found by the commission, and we intend to report, that the revenue return to the railroads should be sufficient to enable them to sustain the value of their properties put to public use and to obtain the capital required for the expansion and improvement of property, facilities, and service.

"In the public interest the railway industry must rest upon its own foundations, and its revenues must be so constructively regulated that their operations will produce enough to pay fair wages, cost of materials, taxes, meet the fixed charges, pay a fair dividend, and leave a margin to attract investors of new capital.

"Attention will be called by the report to the tax burden of the railroads. In 1911, railway taxes amounted to \$98,626,848. In 1913 this had increased to \$118,386,859, of which \$113,660,997 was paid as state taxes and \$4,725,862 as federal taxes. In 1920 state taxes had risen to \$223,291,201, and federal taxes to \$48,619,308, a total of \$271,910,509, or an increase of 175.7 per cent over the year 1911.

"New and varied forms of taxation are constantly being levied. Some of them are intended to reach railroads to the exclusion of other forms of business. Railroads should, of course, pay a proper amount of taxes, but it should be remembered that whatever they pay is passed on to the public through rates.

"The capital fund of the country lent by the investors and the banks is the surplus derived from the enterprise, thrift, and sacri-

fices of all hard-working, prudent citizens and conservatively managed corporations, and is a species of general reservoir from which all forms of industry must draw.

"It is important to the agricultural industry, which depends on that reservoir in the same way as the railway industry, that the rate of interest should not be unduly raised to the railroads because of reduced net earnings or because of large issues of tax-free securities. If the interest rate to the railroads rises, the interest rate to the farmer will also increase, for the capital market is on a competitive basis, and what affects the interest rate for one industry affects the rate for all industries.

"The Joint Commission has, therefore, concluded that the issue of tax-free securities and large expenditures for non-productive purposes by the federal, state, and municipal governments be reduced to the smallest possible limits, so that taxation can be reduced and capital funds be allowed to increase for the use at fair interest rates by agriculture, industry, and the railroads, and thereby help to promote prosperity.

"An examination of the operation of government-owned railroads in foreign countries during the post-war period affords some basis for estimating the relative efficiency of private management in this country and government management in foreign countries in meeting the dislocations and abnormal conditions which followed the war period. It may be said that, measured by the relative performance and cost of service, private management in this country shows greater efficiency than governmental management."

### GUARANTEED EARNINGS

The fact that the claims of the railroads against the government growing out of federal control and the six months' guaranty period which ended August 31, 1920, have not yet been settled in full and adjustments are being made constantly has led some persons into the erroneous impression that railway earnings are still guaranteed by the government. Railway men can help to correct that false idea by keeping themselves informed on the subject and joining in the discussion whenever it comes up. We owe that much to ourselves and our profession. If the railroads are to be treated fairly by the public—and that is what each one of us wants, whatever may be our shade of belief on various railway questions—the public

must get the right impression of the situation in which the railroads are today.

The Bureau of Railway Economics estimates that losses to the government as a result of the twenty-six months of federal control will aggregate, when all claims are disposed of, about \$1,222,539,030. Of this amount, \$720,524,281 represents the estimated excess of operating expenses and rentals over operating revenues of the railway properties under federal control, \$38,111,742 the excess of operating expenses and rentals over operating revenues of the American Railway Express Company, and \$2,449,739 the excess of operating expenses and rentals over operating revenues of the inland waterways which were under federal control. The other items included in the estimate are the expenses of the Railroad Administration, the amount needed to replace materials and supplies taken over, net interest and other debit adjustments, shortline claims, fire losses, loss and damage, etc., undermaintenance, net payments on account of deficits of the railroads not under federal control, and the like.

The Interstate Commerce Commission, in its most recent annual report, estimates that the cost to the government of the six months' guaranty period of March 1 to August 31, 1920, will aggregate \$536,000,000. This brings the total estimated loss to the government growing out of the operation of the railroads during the war-period to \$1,758,539,030.

The provision in the Transportation Act which directs the Interstate Commerce Commission to make rates at such a level as to provide, as nearly as possible, a net operating income which shall be a "fair and reasonable return" upon the valuation of railway property by territorial groups has been confused by some persons as a guaranty of earnings. Of course, that view is incorrect. The act does not guarantee even the "fair and reasonable return" which it contemplates. If a railroad isn't able to earn such a return, it doesn't; that's all there is to it. The fact that the Transportation Act specified 5½ or 6 per cent as the "fair and reasonable return" for the period ending February 28, 1922, also led to some confusion and the reference, by some persons, to the Transportation Act as containing a guaranty of earnings. As a matter of fact, the railroads of the country as a whole, during the calendar year 1921, earned a net operating income of about 3.31 per cent, which, as has been pointed out frequently, was not enough to pay fixed charges, leaving nothing,

when we consider the railroads as a whole, for the payment of dividends or for the making of investments in enlarging and improving their properties.

There has been only one "guaranty" in the Transportation Act since September 1, 1920. That is the provision that no railroad shall be allowed to earn more than 6 per cent upon its valuation without turning one-half of such surplus amount over to the government.

### That Fuel Saving Campaign

To THE EDITOR: In looking over the magazine for March, I noticed the kick registered by Brother Harley of the Memphis division, in which he takes exception to the award granted to the Louisiana division as a result of the fuel campaign of September and October, 1921.

I enclose herewith the official figures of the two divisions for the 2-month period, September-October, 1921, from which any one can see that we put it all over the Memphis division:

only thirteen engines of this type in freight service, out of a total daily average of 34.3, as the last four Mikado type engines did not reach us until the end of September. As we had also, in addition to the above, ten engines of the saturated type in local freight service, it will be seen that the Mikado type engines did not enter so largely into the result as your correspondent would lead you to believe.

I would also like to point out that a very large part of our saving was effected in passenger service, and as there was no change in passenger power this knocks another prop from under his argument.

The question of double track does not enter into the fuel saving question at all, as the figures are based on the consumption for the same period in the preceding year, the conditions being the same as at the time of the campaign.

Now, sir, I am going to let your readers, especially Brother Harley, into the secret of our success in this and other campaigns, as I have just learned we again lead in the "No Accident" Campaign. A number of years ago we were pretty much like all other divisions, neither better nor worse so far as the ordinary man could see. But a few years ago we got for a superintendent a man whom I shall not

Now, while we must concede in all fairness that the Mikado type of locomotive is a great fuel saver, on September 1, 1921, we had

name, as no one hates flattery worse than he does; suffice it to say that, by his kind and considerate treatment of the employes under

him, by his absolute fairness to all from the highest to the lowest, he earned the love and respect of every man on the division and led us to feel we were all members of a large family of which he was the local head. It might well be said of him that, if for any reason he was compelled to refuse a request from any of his men, "He could kick you down stairs with such a sweet grace, you would think he was handing you up."

Although he has gone from us, his successor is ably carrying out his policy, so that now the Louisiana division is one large family; the higher officials represent the heads of the house, the subordinate officials are our big brothers, and the rest of us are the happy-go-lucky family. When we go wrong (as

some of us do), if our offense is not too bad, our big brothers talk to us and show us the error of our ways, and we promise to be good and that ends it. However, if we are too bad, it may be necessary to have us up before the old man, who may have to give us a spanking, and we may growl about it a little, while it smarts, but after a while we generally get to see that it was all for our good. When we enter into a campaign it is a matter of family honor for us to put it across, and we generally do it.

So now, Brother Harley, you have the secret, and the next time we put on a campaign, work up the family spirit, and who knows but what you will lick us! Maybe.—A. M. STEWART, *Engineer, Louisiana Division.*

---

## The Inconsistency of Glenn E. Plumb

The following quotation is from "Things to Talk About," our monthly bulletin of information:

In an open letter addressed to President Markham of the Illinois Central System which was published January 21, last, in *Labor*, Glenn E. Plumb, author of the Plumb plan of operating the railroads, declared that the "market value" of the railroads of the United States on January 4 was about \$10,640,000,000. This estimate was arrived at by averaging the quotations on the first twenty-five railway stocks and bonds reported in the *Wall Street Journal* of the following date, using the averages thus obtained to estimate the so-called "market value" of all railway securities outstanding in the hands of the public.

Mr. Markham pointed out in a reply to Mr. Plumb that the method he used was misleading because at that time railway securities were at the bottom of a prolonged and disastrous business depression resulting from the convulsions caused by the war. A striking example of how misleading is Mr. Plumb's method is afforded by the developments of the past four months.

Taking the closing New York prices of April 26 on the first twenty-five railway stocks and bonds listed in the *Wall Street Journal* of April 27, we find that the stocks average slightly more than 61 cents on the dollar, instead of 46 cents, and that the bonds average more than 91 cents on the dollar, instead of 77 cents. Carrying out Mr. Plumb's method of

calculation, it is found that in less than four months the "market value" of the railroads, which Mr. Plumb brought forward as indicative of their "actual value," has increased \$2,409,000,000—or from \$10,640,000,000 to \$13,049,000,000!

Does Mr. Plumb, or any of his associates, contend that the railroads of the United States have appreciated in value nearly two and a half billion dollars in three months and twenty-two days? His estimate was introduced in an effort to show that the Interstate Commerce Commission had over-estimated the value of the railroads in its 1920 rate case, and that the public was being required to pay rates on a fictitious basis. Does he believe that the railroads, having appreciated in "market value" more than one-fifth in less than four months, should increase their rates in that proportion?

Mr. Plumb's method of computation is so ridiculous that it does not deserve to be treated seriously, except for the fact that many persons not familiar with the facts might be misled thereby.

The public should bear in mind that its protection lies in a favorable market for railway investment securities. The public must have adequate transportation service, and the railroads, in order to give such service, must be constantly enlarging and improving their machinery, which they do with funds obtained by marketing securities.

# *Improper Superheating Is Cause of Waste*

## *Illinois Division Engineer Contributes a Practical Discussion of Locomotive Fuel Loss*

*Signing himself "Will Burnwell," in the interest of fuel conservation, one of the experienced locomotive engineers on the Illinois division contributes herewith a practical discussion of fuel loss from an engine not properly superheating.*

**A**MONG the many causes of fuel loss on the modern superheated locomotive, there is probably none more frequently met with than failure in superheating properly. This fault of the superheater locomotive may properly be classed as a "hidden loss," as it is not visible; only by the characteristic symptoms that are nearly always present may the fault be readily detected.

Several causes contribute to the total failure or failure in part to superheat, too many to enumerate here; so we shall deal only with the most commonly occurring cases. The most commonly occurring cases may be classed as follows: Carrying water in boiler too high; coal-heaving fireman; exhaust nozzle tip too large; diaphragm too low.

We shall first go into the direct cause of the fuel loss in an engine that is not superheating properly, and it may then be plainer to the inexperienced why the fault is not apparent even to the engineman who runs the engine regularly.

### **The Reason for the Superheater**

In one of the pamphlets published by the Railway Educational Bureau it is said: "The superheater itself, under normal working conditions, shows a fuel economy of from 20 per cent to 25 per cent compared with the performance of locomotives which do not use superheated steam."

Steam at 170 pounds gauge pressure, passing directly from a boiler to the cylinders of an engine, is at a temperature of 375 degrees Fahrenheit. If this steam is cooled below this temperature, it will immediately be converted back into water, or, to use the common expression, it will be condensed.

Water in the cylinder has no expansive force like steam and therefore is of no use

in the cylinders. There is always a certain amount of condensation in the cylinders of an engine using saturated steam, with a consequent loss of efficiency. On the average, this amounts to about 20 per cent, and it may run as high as 50 per cent. The problem of preventing this condensation is a very important one in the saving of fuel.

A superheater engine that is not superheating properly and is delivering saturated steam to the cylinders or steam that is only slightly superheated is doing just as the saturated engines do. The steam is condensing in the cylinders. Though not visible to the eye, the constant waste is going on. Part or all of the 25 per cent that the superheater is supposed to be saving in fuel is not being saved at all, if this condition is not recognized by the engineman and steps taken to correct the fault.

### **Must Rely on Engineer's Judgment**

To prevent the condensation taking place in the cylinders, the steam must be superheated considerably in excess of the normal temperature of saturated steam. At 170 pounds this would be 375 degrees Fahrenheit. Since the engines are not equipped with any device to register the degree of superheat that is being obtained, if any, the engineman must rely on his own resources to obtain this information.

The maximum temperature that the steam may reach when superheated may be as high as 700 degrees Fahrenheit, but on the average it would probably be between 450 and 600 degrees on engines that are in good superheating condition. On engines not superheating properly, it probably would seldom get as high as 475 degrees under favorable conditions. Under unfavorable conditions it is doubtful if any superheating would take place at all.

Water consumption has a direct relation to this condensation that is taking place in the cylinders. If superheating is not taking place, more water as a result will be evaporated in the boiler, all other condi-

tions being equal. Therefore it would seem that the water level in the tank would be the best place to look for information as to good or bad superheating conditions.

### Most Defects Easy to Find

Excessive water consumption may be caused by other conditions than superheating, such as blowing cylinder packing or valves, the piston or valve stems blowing, leaky flues, etc., but it must be remembered that these other faults are either visible or can be detected by sound or other well-known tests. The lack of superheating is detected by certain characteristic symptoms in connection with excessive water consumption. These characteristic symptoms have no relation to any of the other causes of excessive water consumption. If there are none of the other faults known to be present but the evidence of improper drafting is apparent by the symptoms and the engine uses excessive water, there need be no doubt of lack of superheating.

Now to get at the causes that contribute to prevent proper superheating. We shall begin with the fault that the writer has found to be the most common one—improper drafting. Strange as it may seem, this is usually charged to poor coal. Nearly as often the fireman is blamed for the results of this faulty condition, and if he does not understand the fundamentals of combustion and proper drafting he will actually consider himself to blame.

Improper drafting would include anything that in any way increased the draft to a point greater than that needed or that in any way decreased the amount of draft to a point that would be less than the required amount. Too-large nozzle, too-low diaphragm, stopped-up flues, too-small ashpan openings, stack too wide to fill or nozzle out of line with it, air leaks into the front end or steam leaks within the front end—all are contributing causes. The too-low diaphragm, because of its invisible effect on the fire, is probably the cause of more trouble than any other single thing.

### How the Draft Is Formed

The draft is created in the fire-box by the exhaust steam from the exhaust nozzle in the front end passing up through a petticoat pipe and then through the stack to the atmosphere. This in turn tends to

create a vacuum in the front end, and if the front end is air-tight, as it should be, the vacuum can be filled but from one source, viz., the air in the fire-box coming through the flues to the front end. This in turn tends to create a vacuum in the fire-box. As the air under the grates is at atmospheric pressure, it tries to push its way up through the fire to replace that drawn from the fire-box.

This action of the two different air pressures trying to maintain a balance is what we ordinarily refer to as the draft. The differences in the two air pressures above and below the fire will vary from  $1\frac{1}{3}$  to  $2\frac{2}{3}$  ounces of pressure. To obtain this difference in the fire-box it is necessary to obtain a difference of from 8 to 10 ounces lower pressure in the front end.

The degree of vacuum to be obtained in the front end depends upon several factors, viz., the velocity of the steam jet through the stack, the size of the nozzle tip to obtain the desired velocity, an absence of air leaks around the front end tending to destroy the vacuum, an absence of steam leaks of any kind within the front end tending to destroy the vacuum, the complete filling of the stack by the exhaust jet to create the vacuum, a plentiful supply of air under the grates, and the absence of any restricting influence such as a low diaphragm or stopped-up flues to hinder the free exit of the gases from the fire-box.

### Concerning the Exhaust Nozzle

The size of the exhaust nozzle may be roughly estimated as one-quarter the diameter of the cylinders, but a hard and fast rule cannot be laid down, due to the varying conditions of speed, tonnage and grade of coal used. It is a matter for experiment by one well informed on combustion and fuel conditions, and each district will usually require its own particular adjustments according to local conditions.

The best rule, in the writer's opinion, is to use a nozzle as large as possible that will give sufficient draft to burn the poorest grade of coal ordinarily used on that district, and there will certainly be no trouble with good coal when it is used. Drafting the engine for good coal means trouble when poor coal is placed upon the tender. The engines can be drafted for poor coal and give very good results with it. As it is a matter of air delivery properly equalized as between the upper and lower flues

and the front end and back end of the fire-box, it will not in the least cause fuel waste when good coal is used, as seems to be the popular impression among enginemen. Just the reverse occurs. This erroneous impression undoubtedly arises from the fact that the fireman who has never been upon a properly drafted engine will invariably raise the pop valve by trying to fire it as he has been used to firing an improperly drafted engine that burns excessive fuel, and he cannot immediately adjust himself to the unusual condition of a perfect steamer.

### Perfectly Steaming Engine Is Rare

The term "unusual condition of a perfect steamer" is indeed a truth. A free-steaming engine that is light upon water and coal is indeed a rare thing upon any American railroad. It has been the writer's experience that few enginemen know enough to leave a good steamer alone. It seems to be an obsession with some enginemen to have the nozzle opened up a little if they are running an engine that the fireman can easily bring up to the popping point and inadvertently open the pop valve several times over the road.

An engine in condition to pop easily is in the best condition to economize on fuel that can possibly be found. Making the engine steam hard to keep the pop closed is about the most wasteful method of fuel economy practiced at the present time.

Any interference with the free admission of air to the firebox, such as a closed damper, will immediately result in making the engine steam poorly. If the pop is open it almost instantly closes. This effect while the engine is working steam is known to all who have run engines with dampers that could be operated from the cab. It is caused by changing the condition of complete combustion of the gases in the fire-box into the condition of incomplete combustion. If, before closing the damper, the engine was throwing a little smoke or none at all, it will, with the closed damper, throw a very heavy smoke. This represents waste, not a saving. The valuable gases are now going out to the atmosphere unburned as smoke. After the pop valve is closed, every one is satisfied.

### Another Way to the Same Result

Exactly the same thing results with an engine that is steaming well when the nozzle is opened to a point where air starvation takes place. The engine begins to throw smoke and steam

hard. The smoke hangs on until the steam begins dropping, and the fireman has to put more coal on the fire in an endeavor to hold up the falling steam.

The waste may run anywhere from 5 per cent to 20 per cent due to this waste of valuable gases that might just as well be utilized. Under no stretch of the imagination can blame for this condition rightly be placed upon either the fireman or the grade of coal furnished, but, sad to say, it usually is placed there, and that ends it for the time being.

The writer, having had about eighteen years' experience running engines in both assigned and pooled service on several divisions and having had about six or eight years' experience as an extra engineman in passenger service, has had unlimited opportunities to observe the many ideas of drafting engines under practically every condition of speed schedule, tonnage and grade of coal under which the Illinois Central lines operate. This included the observation of fuel economy or lack of economy under every condition of high and low diaphragm, large and small nozzle as used in the past and at present.

It has often been the writer's experience to run an engine as an "extra" man that was improperly drafted and burning too much fuel. It has never been the writer's policy to interfere in any way with any regular engineman's engine, but if the opportunity presented itself he would call the regular man's attention to the fault.

### Advice That Went to Waste

In not one single case can I recall where any attention was paid to any suggestion that I ever made to an engineman. In many cases I was told I did not know what I was talking about. In calling attention time and again to engines with diaphragm too low, I have been told time and again that "This engine burns the prettiest fire I ever saw in an engine" or "This engine has a standard front end, and I could not get any changes if I wanted to."

Asking the fireman if he considered the engine a good free steamer and light on coal would bring the average reply that "She does pretty well on good coal, but if I get slack I can't do anything with her."

With the glaring symptoms present and the statement from the fireman that "She does pretty well on good coal, but when I get slack I can't do a thing with her," I have all the information I need to convert this engine into a

# PUBLIC OPINION

What the

World Thinks

## THE RAILS AND THE PEOPLE

C. W. Shaw, local superintendent of the Illinois Central, made a few pertinent remarks Tuesday at the meeting of the Clinton Rotary Club, in connection with the business methods program of the club, which are deserving of wide publicity.

Mr. Shaw mentioned a number of the things railroads have to combat which the public in general is either unacquainted with or indifferent to. Notable among these was the frequently heard complaint, "The railroads don't give travelers the service they ought to have."

As an example of what causes this remark, and which shows its thoughtless injustice to the roads, Mr. Shaw cited a recent occurrence. During the Easter vacation at the University of Illinois, probably 5,000 students wanted to get home; and they wanted to get there immediately. To accommodate them, the Illinois Central supplied ample haulage facilities in the way of special trains, specially routed. But the station at Champaign, a city of less than 15,000, is not equipped to take care of the wants of an additional 5,000 persons on a moment's notice.

It is impossible, as Mr. Shaw pointed out, to get a force of ticket sellers, even if there were room to accommodate them, large enough to sell tickets at the normal station rate to an abnormally large number of persons. But the ticket buyer almost universally fails to recognize this fact. He wants immediate attention, and is impatient when he does not get it.

Another of the more common examples of lack of sympathy of the people with the carriers is shown in the following incident, related by Mr. Shaw: "There was to be a hard roads meeting at an Illinois city. More than 500 persons from various towns through which this road passed intended to go to the city where the meeting was to be held. No notice was given the railroad of this intended excursion by 500 persons, and, accordingly, the usual train, accommodating about 150, was all that was available for the 500 when the time came. Most of them stood up. And they blamed the railroad for not giving service to its patrons."

Examples of this sort could be multiplied many fold, but these two have been chosen as contemporary and typical manifestations of a lack of thoughtfulness on the part of the traveling public—a thoughtlessness which causes the railroads, always the goat when nothing else can be attacked, to be blamed with what is nothing else than the fault of the ones who are doing the blaming.

The rails have as their slogan "Stop, Look, Listen." The traveling public might well make theirs "Think, Consider, Try to Help."—Clinton (Ill.) *Journal*, April 22.

## A LITTLE GIRL'S KISS

The *Prairie Farmer's* editorial comment on a recent episode at Pana that caught the attention of the entire country when it was carried broadcast by the press is as follows:

"A little girl waved her hand excitedly to the engineer of an Illinois Central train at Pana the other day, and he stopped the train and waited three minutes while she climbed aboard and kissed her aunt good-by. Why not? What's a train schedule compared to a little girl's happiness? Too many of us run our lives on schedule, with no time to stop for happiness and children's kisses. I wonder if those kisses aren't worth more, after all, than anything else in the world?"—Clinton (Ill.) *Register*, April 14.

## WHERE POLITICS CONTROLLED

As *The Enquirer-Sun* has remarked on more than one occasion before, if there ever was a railroad run with due regard for the rights and interests of the people along its lines, it is the old Central of Georgia under its present management. The Central is and always has been essentially a Georgia institution, and as such has remained very close to the people. Its policy is broad and constructive, and, in every way possible, the road has been helpful to the vast territory in Georgia and Alabama which it serves.

But the Central, like most other railroads,

despite the most rigid economy, has been losing money for the past year or more; a great deal of money—a million dollars a year, or more.

In order to stop some of this terrific loss, the road's management sought to discontinue the running of certain unprofitable and, more or less, useless trains, as follows: Nos. 25 and 26 between Dover and Dublin; 21 and 22 between Macon and Millen; 104 and 105 between Atlanta and Jonesboro; 19 and 20 between Covington and Macon.

In order to discontinue these trains, of course, the Central had to go before the State Railroad Commission and set up its reasons therefor, these reasons being that these trains lacked \$300,000 taking in as much money last year as it cost to operate them, or nearly one-third of the Central's total loss for the year.

It was shown that the "Shoo-Fly" train operated between Millen and Macon—a train put on a few years ago as a booster for Macon's retail trade—cost \$36,000 more to operate last year than it earned. And for the very simple reason that Macon's trade in that particular territory has dropped off to almost nothing. It is said that this train earned about 49 cents a mile—almost nothing—whereas it cost about three times that amount to operate it.

All this was clearly shown to the Railroad Commission, but that august body promptly turned down the Central's petition to be allowed to discontinue these unprofitable and useless trains. So the road must go right along losing money and performing a service which is not necessary.

And why? We suspect that you know the answer quite as well as we do. Because a certain number of people along the lines over which these trains run—a majority of whom, no doubt, never contribute a dollar to their support—signed a petition opposing their discontinuance. And all of these people have votes. And the railroad commissioners have to be elected by the votes of these people—and not by the votes of the railroad.

When you come to think of it, it's a fine old thing for any business to have to be managed that way—with a lot of politicians having the say-so as to what may and may not be done with it.

And we haven't the slightest idea that any member of the Railroad Commission voting for the continuance of these unprofitable trains, with their continued loss of \$25,000 a month to the Central railroad, gave the matter a

thought beyond the political effect upon himself of their discontinuance. And we say this, because we know them, both personally and politically.—Columbus (Ga.) *Enquirer-Sun*, April 10.

## TRUCKS AND HIGHWAYS

The following is an excerpt from the decision of the Colorado Commerce Commission in the case of an application for a certificate for the operation of an automobile freight and passenger line in that state:

"The record in this case shows the Denver & Rio Grande Western Railroad (the protestant) in 1921 paid in Garfield and Eagle counties (the counties through which applicant was seeking to operate an automobile freight and passenger line) taxes totaling \$153,896.94 and that over \$38,000 went into the road fund of these counties. Viewing this whole matter from the point of present adequacy of transportation facilities, and in the light of a decent regard for the rights of others, it would seem unequitable and unjust that the vast sums wrung from the railroads, especially in the shape of road taxes, should be used to provide means to encompass their own destruction.

"Looking at all the facts in this case, it would seem manifestly unfair for this commission to grant a certificate to this applicant that he may skim off the cream of the passenger traffic during the summer months and then leave the railroad to battle with the elements during the balance of the year when railway operations are a heavier financial burden and passenger travel is exceedingly light.

"But leave the railroad entirely out of the case and view it only from the standpoint of the farmer and city home owner. They pay a very large proportion of taxes assessed for highway construction and maintenance. Some of them own and operate automobiles and some do not. If they do, the damage to roads from the occasional operation of their light, pneumatic tired cars is practically negligible. They seldom use the roads under weather conditions such that their use is destructive, while at certain seasons the heavily loaded freight and passenger trucks plow back and forth making great furrows in the roads, regardless both of conditions and consequences. Under weather conditions producing softened roadbeds, the passage of a single heavily loaded truck will do greater damage to a highway than would the passage of hundreds of ordinary cars. The farmer and the city home owner pay the bill,

and the 136,336 passenger car owners of the State are grievously wronged.

"Public convenience and necessity, by which must be understood the convenience and necessity of the people at large, as contra-distinguished from the convenience and necessity of a very small number of persons who seek to derive a profit from the farmers' and home owners' investment in roads, never contemplated that the truck driver should destroy that to the cost of construction of which he contributed little or nothing or that one should reap where he has not sown.

"When the taxing laws of this state are so amended that the truck driver operating over state highways shall contribute his due proportion to the cost of construction and maintenance of our highways, then, and not until then, can this commission regard his use, under proper conditions and restrictions, of a great and tremendously expensive public facility as of equal dignity and equal benefit to the people with the moderate use thereof by the ordinary taxpayer."

#### WOULD WRECK ROADS

The utter bad faith of the proponents of the Plumb plan for government acquisition of the railroads is demonstrated by their attitude on the question of railway income and railway expense.

The leaders of the Plumb plan movement are either railway employes or profess to speak in behalf of men engaged in railway employment. One of their demands is higher wages for the railway employes. If they were asking this in good faith they would also desire that the railroads have financial resources which would enable them to pay the higher wages they demand. But instead of advocating higher incomes for the railway companies they advocate a reduction in freight and passenger rates, which would necessarily mean a smaller income.

When these radical leaders advocate higher expenditures for the railroads on the one hand and a lower income on the other, their ultimate purpose can be only one thing—bankruptcy of the railroads and their taking over by the government.

The country is presented, therefore, with the question whether it prefers private operation of the railroads on a basis of income which will permit the payment of reasonable wages to employes, or government ownership with operation by a committee of employes who

will fix their own compensation and turn to the government for federal appropriations to make up deficits that may be incurred. The advocates of the Plumb plan, who speak in behalf of the employes, are thoroughly satisfied on one point—that government ownership with operation by representatives of the employes will mean higher wages and shorter hours, both wages and rules of work being fixed by political managers who will have continually in mind the votes to be cast by the employes at the next election.

The advocates of the Plumb plan for government acquisition of the railroads are consistent in one respect—they advocate similar government acquisition of coal mines, of timber resources, water power, ocean shipping, steel mills, and other large manufacturing enterprises. They advocate for all of these large industries the same scheme of ownership and management that they advocate for the railroads. Practically the only producing industry they would not have taken over and paternally maintained by the government would be the farms. What the farmer's wage or his hours shall be have no concern to the advocates of government ownership. They want free trade in farm products in order that they may buy their food at the lowest possible price. They want agriculture and small merchandising to be practically the only important industries not under government management. How they expect the government to raise enough revenue by taxing the minority to pay the deficits that would be incurred by the government-operated industries it is difficult to imagine.

This, however, is their program when carried to its ultimate results, and it is this program the more conservative element of our citizenship must combat.—Dubuque (Iowa) *Times-Journal*, April 9.

#### NO CONFLICT

Through loose thinking or careless writing, it has become the custom in news and editorial articles relating to strikes, lockouts and other disputes between employers and employed, for the writers to speak of these disturbances as conflicts between Labor and Capital. Labor is represented as invariably hostile to Capital, while the capitalist is supposed to be eager to take advantage of Labor's necessities to obtain larger profits through lower wages or longer working hours. That the prevalent labor troubles are due to an inevitable clashing of interests between two great opposed forces ap-

pears to be the accepted explanation of what is often termed industrial warfare. This view is strongly maintained by various schools of radicals, liberals and progressives, who claim that Capital is necessarily antagonistic to the demands of Labor for better conditions, and that harmony cannot be established until society is reconstructed along the lines of some particular scheme for social and economic regeneration.

George Eliot, writing of a Bishop's confused opinions, said: "It is the mixing of unrelated things that is the Great Bad." In discussing labor problems and their suggested solutions, it is the misunderstanding of fundamental facts that is the "Great Bad." Much of the confusion over the alleged "rights" of Capital and Labor would be avoided by agreement on a definition of terms. Thus if the word "Capital" is used in its correct economic sense it will be readily seen that to talk of Capital warring on Labor is an absurdity. Capital is nothing more nor less than wealth—useful labor products, devoted to the production of more wealth. It may be food that is used to maintain workers, or machinery that aids labor to produce more goods by making man power far more effective. In any case it is an inert thing, having utility value only through its employment by labor, directed by ability. It does not, and cannot, have any rights or interests. Its owners have unquestionable rights to its use or enjoyment, but capital of itself is not a party to any dispute between its owners and the workers employed to utilize it. Whatever the owners of Capital or managing directors of the industry in which it is engaged may do, it should be clear that their action cannot properly be ascribed to Capital.

Capital cannot oppress Labor. It is simply stored-up labor, that, wisely used, gives Labor greater returns and adds to the comfort and happiness of mankind. The men who own it, or who borrow it for use in productive industry, naturally desire to secure as large a return for it as conditions will allow. They may often be mistaken in their judgment as to their own best interests; as for instance when they favor wage reductions to a point that lowers the standard of living, and by cutting down consumption decrease the demand for goods. The questions arising out of these mistakes are matters to be settled by arbitration or such other methods as will adjust the disputed points on a basis approximating as nearly to justice as fallible humanity can es-

tablish it. Their solution will not be furthered by keeping up the popular misunderstanding as to the real nature and functions of Capital.—*Christian Science Monitor* (Boston) April 7.

### A POINT CLEARED UP

*The following colloquy between the Chairman of the Senate Committee on Interstate Commerce, Senator Cummins of Iowa, and other senators and witnesses, covering "a point not sufficiently understood by the people," is taken from the stenographic reports of the proceedings of the committee in its hearings on the railway situation.*

THE CHAIRMAN (Senator Cummins). I feel like making a comment at this point, and I would like Senator Kellogg to hear it—to clear up the situation a little.

I think the most serious complaint that can be made of the Railroad Administration lies in the fact that *it did not return the railroads to their owners self-sustaining; it ought to have established rates before the railroads were returned that would make the railroads reasonably self-sustaining.*

The failure to do that not only imposed upon the railroads a most unpopular duty, but it imposed upon Congress the requirement to make the guaranty running from the first of March, 1920, to the first of September, 1920.

If the Railroad Administration, in anticipation of the increase in wages which it knew would come about, and in consideration of the existing fact that the rates were not even then maintaining the properties—if it had increased the rates as it should have done, the railroads at least would not have inherited that very disagreeable performance; and the guaranty that the Government has to bear now for six months would not have drawn upon the Treasury as it has drawn, and as it must continue to draw.

I feel that there is a very just complaint against the Railroad Administration in that regard, far beyond any other controversy that it may have with the railroads.

*It was just as much the duty of the Government to return these roads with rates that would sustain them in their operation as it was its duty to return them in as good condition physically as it took them.*

And that is a matter that has not been sufficiently understood by the people of the country. And I think when it is fully understood, that very much of the criticism that has fallen upon the railroads since that time will disappear. I have had that in my mind so long

that I felt bound to give it expression at this time.

MR. KRUTTSCHNITT (of the Southern Pacific). I am very glad you did, because your concluding words are absolutely as true as gospel; that the great trouble with the public is that they hold the railroads responsible for these things, whereas they should have been corrected before they were returned.

SENATOR POMERENE. I had the same thing in mind when I called attention to the fact that they increased the expenses and made no attempt to increase the revenues, during the first five months of 1918.

MR. KRUTTSCHNITT. The roads had made repeated requests on Director General Hines in the last half of 1919 to increase the rates, and he kept saying, "Wait, wait, things will probably improve; prices may fall and you will be better off," and it was finally delayed until it was not done at all.

MR. THOM (counsel of the Association of Railway Executives). I have never felt, Mr. Chairman, that you could say that a property was returned in as good condition as it was received when the whole equilibrium of its earning capacity was entirely destroyed, and the relation between its expenses and revenues was disrupted to the extent that you have mentioned.

SENATOR POMERENE. I simply want to make this observation in connection with what has

been said here, but directed toward another matter. It was the very distinct understanding of the Congress, as well as the President, that when it would come to the matter of rate-making and classification of traffic, and so forth, the Interstate Commerce Commission would continue to function as it had prior to Government operation; but the Director General's office saw fit to have its own rate-making body, and I guess, from what I have heard, whatever they did was OK'ed by the Interstate Commerce Commission without taking any responsibility itself.

THE CHAIRMAN. With regard to the authority of the Interstate Commerce Commission. *If the roads had gone back with the proper rates established, all this trouble would have been avoided.*

**SURGEONS IN CONVENTION**

The Joint Association of Surgeons of the Illinois Central and Yazoo & Mississippi Valley Railroad Companies held its thirteenth annual meeting in New Orleans, May 5 and 6. More than two hundred surgeons attended the meeting. The second day's meeting was featured by a clinic at Charity Hospital, conducted by Doctors F. W. Parham, J. A. Danna, M. J. Gelpi and H. W. E. Walther. The business sessions of the association included discussions of the rapid strides in surgery in recent years.

*Our Monthly Roll of Honor*

Below is a list of employes retired at the meeting of the Board of Pensions April 28:

Name	Occupation	Years of Service	Date of Retirement
Robert A. Oxley.....	Engineman, Illinois Division.....	37	1/31/22
Gus Luckett .....	Engineman, Louisiana Division.....	28	1/31/22
Washington F. Hardgrove.....	Switchman, Kankakee, Ill.....	22	4/30/22
Hughley Scanlon .....	Engineman, Chicago Terminal.....	40	4/30/22
James McClarey .....	Switchman, Kankakee, Ill.....	28	4/30/22
John Halburg .....	Section Laborer, Cloverdale, Ill.....	26	4/30/22
Joseph Fulton .....	Section Foreman, Centralia, Ill.....	35	4/30/22

The following deaths of pensioners were reported at the same meeting:

Name	Last Employment	Date of Death	Term as Pensioner
Michael Carney .....	Laborer, Minnesota Division.....	3/18/22	17 years
Joseph Dangelmayer.....	Crossing Watchman, Minnesota Division.....	3/23/22	13 years
John W. Bobbit.....	Engineman, Tennessee Division.....	4/ 4/22	2 years
Martin Irvin .....	Crossing Flagman, Tennessee Division.....	4/ 2/22	7 years
Samuel Hudson (colored).....	Sand Dryer, Tennessee Division.....	3/ 7/22	4 years
John H. Wilson.....	Mill Man, Mississippi Division.....	4/ 6/22	10 years
John B. Cornelius.....	Conductor, Minnesota Division.....	4/ 1/22	9 months
August Kreibel .....	Carpenter, St. Louis Division.....	4/22/22	6 months

### The Telephone

I AM a telephone. When I am not broke, I am in the hands of a receiver. I have a mouthpiece; but, unlike women, I never use it. Fellows use me to make dates with girls, and girls use me to break said dates. Husbands call up their wives over me, and wives call their husbands down over me. I never go anywhere, but sometimes the company comes and takes me out; it all depends on whether you pay your bill or not. I am not a bee, but I often buzz in your ear. I am the bell of the town; and, while I do not wear jewelry, I often get rings. Whether I do things or not, a lot of people nail me to the wall; and I like music, but the only music I get is chin music. I get all the popular airs, and the most popular one is hot air.—SELECTED.

### Days Gone Forever

We used to be scared to death when a man reached for his hip-pocket—now we are tickled to death.—C. D. C.

### She Knew

June Bride—"I would like to buy an easy chair for my husband."

Salesman—"Morris?"

June Bride—"No, Clarence."

### Fair Enough

Out in Wyoming a train ran over the cow of a farmer named Ole Oleson. The claim adjuster went out to the home of Ole to adjust the claim likely to be made by Ole for the loss of his cow.

"Well, Mr. Oleson," said the claim adjuster, "I came out to see you about your cow being killed on our track. What are you expecting to do about it?"

"Vell," said Ole stolidly, "I ban a poor man, an' I cannot do much because I ban so poor, but will try to pay you five dollars."—*Judge.*

### The Point of View

Points of view vary.

A man and his wife were watching a cockroach on the floor of a railway carriage. "I never see one of those things," said the man, "but I wonder where it has come from."

"And I never see one," said his wife, "but I wonder where it is going."—*London & Northwestern Railway Gazette (England).*

### Must Have Been in the Army

Incident in the telegraph department, as relayed by A. A. F.:

Telegram (as filed by sender): "To Jack Johnson, Johnsonville—Camp car on 96 tomorrow. John Henry."

Telegram (as received by ham operator):

"To Jack Johnson, Johnsonville—Call P C Carr on K P tomorrow. John Henry."

### Encouragement

Chemistry Professor—If this experiment is not successful, it will blow us and the entire laboratory sky high. So come closer now, boys, that you may follow me.

### Knew a Switchwoman

Little Sammy, who had had an application of the rod at school, climbed upon his daddy's knee (daddy was a switchman) after supper and inquired if they needed any switchwomen.

"No, son—why do you ask?"

"Well, I was just thinking if they did, I had one in mind I could recommend highly."

Two met on the bridge at midnight,

Never to meet again—

One was a southbound yaller mule,

The other a northbound train.

—A. A. F.

### The Pullman Porters' Quartet

The following excerpts are from an editorial in the *Sioux City (Iowa) Tribune of April 26:*

"The Pullman Company in ordering its negro porters to take up singing lessons means to be kind to the traveling public. . . .

"Possibilities of the use of the quartet in making traveling a joy forever cannot be overstated. When the conductor gets ready to 'high ball' his engineer and bawl out, 'All aboard, git out of this burg,' in the familiar rough and ready manner that takes all the romance out of leaving somewhere for somewhere else, he now can turn about and signal

the quartet. Whereupon, in mellow strains the first tenor shall warble:

All aboard.

"And the second tenor joins in:

All aboard.

"With baritone next:

ALL ABOARD.

"Now all together, with the bass hanging to the notes:

ALL ABOARD!

"This might, indeed, make parting a joy, in place of a regret.

"But once inside the Pullman and the pleasure a quartet may afford in whiling away the dreary hours hardly can be overestimated. While pulling down and making up the berths the quartet can soothe to drowsiness by chanting softly, 'Just a Song at Twilight.' While to mothers, trying to travel with babies, the quartet will indeed be a blessing. All the squalling future citizens may be lulled to sleep at one time if the quartet will put its heads together and sing softly, 'Rock-a-bye Baby in the Tree Top.'

"Or when the wrathful gentleman in Upper 10 buzzes the bell along about 2 o'clock in the morning and fretfully wants to know if 'this car is mounted on rockers,' the singers may look at him reproachfully while the bass rumbles 'Rocked in the Cradle of the Deep.'

"The more one thinks of the utility of this innovation, the more enthusiastic one becomes. Stalled, with a livestock train on the siding nearby, the quartet should break gently into the strains of 'Blow Gently Sweet Afton'; and in place of the morning jab in the back, one may be coaxed back to consciousness with 'It's Nice to Get Up in the Morning, But It's Nicer to Lie in Bed.'

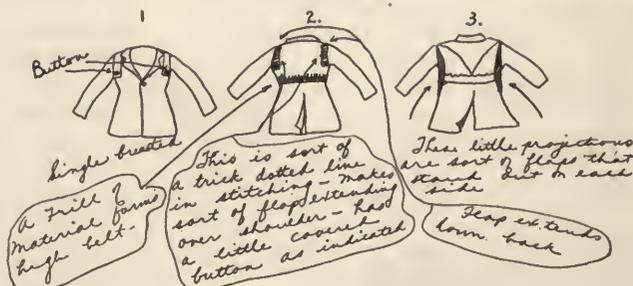

"But there's a seed in every prune, a thorn to every rose, as travelers will discover when they make ready to depart. In place of the customary one upturned palm there will be four.

"Then it will be the passengers' turn to whistle."

### The Cake-Eater Again

In the May issue of this magazine, C. M. Said invited the Illinois Central System girls to give their views on the Cake-Eater, the modern derivative of the Cave-Man. Considerable close study of the subject was shown in the replies. The honors go to Miss Julia Gaven, Memphis division correspondent for the magazine. Miss Gaven ventured even so far as to make a pattern for the Cake-Eater's coat, which is presented herewith, although naturally it won't be of use to any Illinois Central employe. Outside of the winning division, the 63d Street Office Building at Chicago and the New Orleans Terminal deserve credit for their definitions, according to Mr. Said. Miss Gaven's definition follows:

"Trip to the barber shop—preparation for Wednesday night date—shave, massage, manicure, hair shampooed, oiled and combed until each hair is in its certain place with a very perfect part in the middle (the alley)—shoes shined until each one reflects just the proper degree of light—suggestion of sweet-scented talcum (not Mennen's Talc for Men, either). Pongee handkerchief top pocket—striped socks—moustache—(misplaced eyebrow, as the saying goes)—derby or fedora sky piece—cigaret holder 1/2-foot long for receiving borrowed coffin nail. Moonlight garden—garden seat—jelly bean (Cakie) and girl. Usual line. . . . 'Darling I love you; you are the only girl I have ever loved—I cannot live without you, etc., etc.' Inexperienced girl swallows it whole and makes grand hit with Cakie. Flapper gives line of her own in return—very pleasing to Cakie if she knows how to put it over so he will fall for it. In garden scenes, actions speak louder than words. Jelly bean on corner, windy day, watching not a Flapper but a real Vamp—'clingy' dress, etc., etc. Jelly bean just knocked cold with admiration—Jelly bean regular killer in own estimation—Vamp accidental-

Miss Gaven's Pattern for a Cake-Eater's Coat

ly looks his way, and he is convinced that she has fallen for him. I kinda' think a Cake-Eater is because a Flapper—or the other way round—a Flapper is because a Cake-Eater."

### Our Garage

A boiler and a kettle lid,  
Some plates that Maggie broke and hid,  
A chopping block, a knuckle bone,  
A phonograph that doesn't phone,  
Some lingerie that lingered long,  
A mattress with the mat all gone,  
A bustle out of grandma's trunk,  
A rat trap and some other junk,  
A demijohn of faint bouquet  
(Sweet hundred proof of yesterday),  
The sticks and tail of Johnny's kite,  
A table lamp I dropped one night,  
Tomato cans of "Auld Lang Syne,"  
A hundred feet of washing line,  
One pair of pants (demobilized),  
One garden hose (derubberized),  
Gas fittings from a former age,  
One rocker, one canary cage,  
A niblick and a baseball bat,  
A bedstead and a broken slat,  
The box in which the rabbit died,  
The bike that mother used to ride,  
Of many things a sundry crop—  
All but the car—THAT'S IN THE SHOP.

### Reminiscences

Engineer Robert A. Oxley of the Illinois division, who was pensioned January 1 after fifty years of service, has prepared the following article for the Illinois Central Magazine:

I was born in Centralia, Ill., October 2, 1856, in a house erected by the Illinois Central and purchased from the company by my father, R. D. Oxley. (So you see I entered the service at birth.) My actual service began October 10, 1871, when I was employed as a boiler-maker helper (heating rivets, toddling tools, etc.). Very soon after this I was assigned as a helper to the inspector of stacks, front ends and ash pans. W. A. Mathis was the inspector.

Robert A. Oxley

A short time after this Mr. Mathis was transferred to the transportation department as a fireman, and I succeeded him as inspector

To say that I was puffed up at this would hardly express it. Later I was transferred to the machinery department as a machinist apprentice, serving four years as that—you see I have done time. I served as machinist until April, 1878, when, owing to a reduction of the shop force, I was transferred to the transportation department as a fireman. As such, I served until December 11, 1881. At that date I was promoted to locomotive engineman, and I served as such (with the exception of one and one-half years) until December 31, 1921.

Marvelous changes have taken place during this time. The locomotives and cars, both passenger and freight, have grown larger; automatic coupling devices, air brakes, electric headlights for engines, electric car lighting, steam heat for passenger trains, concrete bridges and other structures, the automatic block signals—all have come in in my time. In 1873, I assisted in equipping engine No. 87 with air brakes applied to the driver and tender. This was about the first, if not the first, engine equipped with driver brakes.

### INKID SAYS—

BACK-BONE WONT GETCHA ANYWHERE AT ALL - IF - THAT KNOB AT THE TOP OF IT IS MADE OF THE SAME MATERIAL

# We Save Money When We Save Water

## Stopping the Leaks Has Resulted in Conservation of Half a Million Dollars in Seven Years

By C. R. KNOWLES,  
Superintendent, Water Service

THE following tabulation shows the saving accomplished through our campaign against water waste during the past seven years at fourteen of our largest city water stations, representing approximately 70 per cent of the total city water purchased:

	Gallons	Cost
1915 .....	467,042,350	\$ 27,910.53
1916 .....	612,913,240	35,796.34
1917 .....	360,565,900	20,746.72
1918 .....	299,453,410	17,589.98
1919 .....	364,206,930	22,272.10
1920 .....	152,082,970	10,170.50
1921 .....	419,047,885	35,846.34

2,675,312,685 \$170,332.51

Only three of the fourteen stations show an increased consumption of city water over 1914, although the gross tonnage during this period increased 24 per cent, while the total amount of water saved during the period above mentioned was nearly 3,000,000,000 gallons, representing a net saving on the face of the water bills of \$170,332.51.

### Saving Despite Increased Tonnage

The average annual tonnage increase during the 7-year period 1915 to 1921 inclusive, as compared with that of 1914, was 6,026,456,714 tons. The actual increased demand for water equals an increase of at least one-half of the percentage of the increased tonnage. Therefore, a conservative estimate of the legitimate increased demand for water during this period is 2,171,696,688 gallons, representing a cost of approximately \$126,826.28, this making the total actual saving in cost of city water during the seven years \$297,158.79. It is almost impossible to reduce to figures the economies effected in saving of water pumped by our own facilities, although substantial savings were made at all stations. While the cost of production of our own water is in most cases less than the cost of city water, the saving during the 7-year period at all water stations would easily bring the total figure in excess of \$500,000. It should be remembered that this saving of more than half a million dollars in seven years has been accomplished without any expenditure

whatever and without restricting the legitimate use of water in any manner.

One of the best examples of what we have accomplished through prevention of water waste is at Centralia, Ill., where from 1915 to 1921, inclusive, the expense of city water on the face of the bills rendered has been reduced \$33,320.94 as compared with 1914. As during the same period the business at Centralia increased at least 100 per cent, the saving was due entirely to reasonable economy in the use of water.

### Stopping One Building's Waste

The monthly water bills at the 63rd Street General Office Building, Chicago, offer another good example of what may be accomplished through prevention of waste. A tabulation showing the cost of water at the 63rd Street offices for 1919, 1920 and 1921 follows:

	1919	1920	1921
January .....	\$ 262.50	\$ 116.72	\$ 121.88
February .....	113.91	147.19	167.81
March .....	111.56	132.19	169.69
April .....	185.16	148.13	188.91
May .....	189.84	190.78	191.72
June .....	196.41	201.09	221.72
July .....	275.16	159.38	209.53
August .....	270.47	223.12	210.47
September .....	339.84	155.16	213.75
October .....	419.38	163.13	163.59
November .....	286.41	182.82	126.09
December .....	330.94	145.31	140.62

\$2,981.58 \$1,965.02 \$2,125.78

It will be noted that in October, 1919, the consumption of water had increased to such an

ILLINOIS CENTRAL RAILROAD CO.

# WHAT SMALL LEAKS MEAN UNDER THE AVERAGE WATER PRESSURE

SIZE OF  
HOLE

•		A LEAK THIS SIZE WILL WASTE	62,000 GALLONS A YEAR.
•		A LEAK THIS SIZE WILL WASTE	354,000 GALLONS A YEAR.
•		A LEAK THIS SIZE WILL WASTE	1,314,000 GALLONS A YEAR.

**MORAL: PREVENT LEAKAGE AND SAVE MONEY.**

OFFICE OF SUPT. WATER SERVICE, CHICAGO.

extent that the monthly bill was \$420, yet after a careful survey and corrective measures the monthly bill had been reduced to \$116.72 in January, 1920. Since October, 1919, the monthly bill has averaged \$170 a month, a reduction of 60 per cent.

### Where Losses Were Found

The conditions causing this heavy purchase of water at 63rd Street were due to waste through almost every water facility in the building. For example, the controlling valves on the boiler feed water heater were not operating properly, allowing unlimited quantities of water to pass through the heater to the bilge tanks, where it was being pumped by an electric bilge pump to the sewer, this waste causing three distinct losses:

1. The cost of city water;
2. The loss of the coal required to heat the water, which was estimated to be 5 tons a day;
3. A loss of electric current required to pump the water from the basement level to the city sewer, the bilge pump operating at intervals of 50 seconds at the time the investigation was made.

The urinal tanks, eighteen in number, were found to be flushing at intervals of from 50 seconds to 1 minute and 10 seconds. These tanks are of the 3-gallon flush type, and probably 2,000,000 gallons of water monthly were wasted in this manner. The controlling valves to the house tanks were in bad order, and the overflow from these tanks to the sewer was continuous. In addition to these large wastes there were minor wastes of hot and cold water in the restaurant and other places throughout the building.

There are innumerable ways in which water

may be wasted through the thousands of connections and fixtures in use on a railway system such as the Illinois Central, and it is within the power of every employe to effect a saving through the proper use of those fixtures and economy in the use of water.

The fact that we have made a saving of more than \$70,000 a year for the past seven years should be sufficient proof of the possibilities in saving water and an incentive to effect greater economies in its use.

## Our Bowlers Win High Honors

By WALTER DuBOIS,  
Voucher Clerk, Chicago

ILLINOIS CENTRAL bowlers led the way in the first annual American Railway Bowling Association tournament, April 29 to May 10 in Chicago, when the Panama Limited 5-man team from 63rd Street landed in first place with 2,885 pins. The Seminole Limited, also from 63rd Street, captured fourth place. Silverberg and Leonard were tied with Does and Heimsath for fifth place in the doubles with 1,156 pins to their credit. Du Bois, high man for the Illinois Central in

the singles with 595 pins, finished in twentieth place in the tournament. Tersip was No. 33 with 585 pins.

A total of 129 5-man teams, 310 2-man teams and 597 individuals took part in the tournament. The Illinois Central was represented by thirteen teams, two of which were from out of Chicago. Only two railroads, the C. B. & Q. with 22 and the C. & N. W. with 15, had more teams than we did. Thirty-three railroads from all over the country and the American Express Company were represented. Our team from Kankakee, Ill., did some good

### THE PRIDE OF OUR FANS AT CHAMPAIGN

Front row, left to right: John Steffin, Jr.; Charles J. Owens; J. W. McQuay; J. Hart; L. High; C. E. Buckley; Louis Schaeede; George Steffin; John High. Second row, left to right: Charles W. Pearce (team representative); Charles H. Watson; Charles W. Thompson (team manager); George Martin; D. O. Howard; Herbert Earl; W. H. Donley (sponsor).

The picture above shows the Illinois Central shopmen's baseball team at Champaign, Ill., which during 1921 won the championship of the Illinois division, for which Clinton, Kankakee and four Illinois Central teams of Chicago were contending. The Champaign players were not defeated by any other Illinois Central team during the entire season, and they tied the winning team in the Champaign Commercial League for the pennant, but were defeated when playing off the tie. The team has been strengthened considerably by several new players and promises to make even a better record this year

than last. Under the management of C. W. Thompson, who has made baseball a study as well as a pastime, this team has developed beyond the highest expectations of its followers, who include every Illinois Central employe in the vicinity of Champaign, from Superintendent J. W. Hevron down. The unusual success of this team is attributed principally to the loyal, whole-hearted support given it by the Illinois Central employes. The uniforms and sweaters seen in this picture, which cost \$400, were presented to the team at the opening of the 1922 season by the Champaign employes.

work and finished in sixteenth place, well with in the money. West did the best work for that team with 583 pins. The traffic department team from St. Louis, the other visiting team, finished in fifty-ninth place.

Illinois Central bowlers in Chicago were disappointed when teams failed to show up from Dubuque, Waterloo and Fort Dodge. The bowling tournament will be an annual event. Much credit for its success is given to E. W. Hampton of the C. B. & Q., secretary of the association.

Here is what our Panama Limited team did.

Miller's 631 pins were good for high series among the Illinois Central bowlers. Mr. Breidenstein, our freight claim agent, had his hook ball working to perfection. Smith of the Seminole Limited rolled the high individual game when he upset 256 pins in his last game with that team.

Below you will find the unofficial standing of the teams and individuals, the figures shown at the left being their rank in the tournament:

Of the 5-man teams listed in the table above, the first six finished in the money, as did all of the doubles teams and individuals listed above.

Plans are under way for a 16-team league for next year among the offices at 12th Street, Chicago, to take the place of the 12-team league we had this past year. The league will also move. Arrangements have been made to roll on the sixteen new alleys to be erected at 63rd Street and Cottage Grove Avenue.

Employees Organize Golf Club

Setting a precedent that would make it worth while for other divisions to follow, the Chicago general offices have organized what is known as the Illinois Central Golf Club, perhaps the only one of its kind on the system composed entirely of Illinois Central men. The club boasts of fifty-two active members, all men. Games are played at Jackson and Marquette parks.

Dues are collected each month, and cash

prizes are awarded at intervals for the best scores. The beginner has an equal chance to take the money as the old-timer, since his handicap is figured from the last four games played. With each score turned in, the records of the players are changed accordingly. This makes plenty of work

for the secretary, who is F. I. Lucius of the vice-president and general manager's office. C. C. Haire, engineer auditor, is president.

An interesting feature of the organization is the friendly spirit each member carries, and this helps to make the association a success. Games are played ordinarily on Saturdays and Sundays, but not a few of the players are out week days and can easily make the eighteen-hole course before time to catch the express for work.

The Chicago offices are noted over the system for their promotion of the various sports, but the organizing of a golf club is thought to be first time such a step was ever undertaken. It promotes clean and healthful sport. Toward the

C. C. Haire

end of the season the club will hold its tournaments.

The following is the list of members: F. M. Freeborn, J. S. Collar, A. B. Weston, C. C. Haire, F. A. Stone, C. A. Church, A. H. Coates, E. A. Courtney, B. M. Hamilton, J. R. Anderson, A. L. Church, J. M. Dorsey, C. L.

F. I. Lucius

Combs, V. J. Hight, J. E. Welsh, W. P. Enright, F. I. Lucius, George Turner, E. P. Beuchler, H. D. Walker, W. D. Peeso, George Bramfeld, S. B. Christopher, A. B. Johnson, N. A. Howell, M. B. Davis, E. J. Carr, E. F. Barnes, Jr., J. R. Lessel, A. E. Lawler, A. F. Cox, E. P. Baker, W. S. Camp, E. K. Collier, J. B. Hamilton, A. A. Hurlbut, Charles King, Jr., F. T. Pulley, C. M. Said, E. Skoog, W. Stone, G. M. Crowson, C. E. Kane, H. F. Dischinger, L. L. Purvis, B. T. Bristow, L. S. Marriott, C. E. Butler, Jr., R. W. Leonard, A. G. Moody, F. M. Branner.

### A New Team at Louisville

The Kentucky division reports that the recently organized Illinois Central baseball team, composed of employes working in and out of Louisville, has met and defeated some of the fastest organizations in that vicinity, among them the Davidson Athletics, 8-2, St. Matthews, Ky., 7-5, and the Calumet-Glenwoods, 4-0. The roster of the team is as follows: S. W. Overstreet, catcher, signalman; W. T. Allen, catcher, clerk; C. L. Monaghan, pitcher, baggageman; R. A. Crawford, pitcher, fireman; C. H. Wilson, pitcher, fireman; J. J. Finn, infielder, engine foreman (captain); H. G. Devinney, infielder, clerk; Ben Bossmeyer, infielder, switch tender; J. B. Murphy, infielder, engine foreman; J. A. Sauer, infielder, signal testman; W. H. Murphy, outfielder, yard clerk; C. J. Crawford, outfielder, telegrapher; B. R. Cunningham, outfielder, accountant; Ed Rittner, outfielder, baggageman; R. D. Miller, manager, chief accountant. This organization is playing independently and would like to arrange games with any first-class amateur or semi-pro team.

### Auditor of Freight Receipts

"McCarthy's 1922 Ball Team," composed entirely of A. F. R. employes, has finished its spring training and is prepared to play any Illinois Central team in Chicago. Call or address E. A. McCarthy, Ninth Floor, 63rd Street Office Building. Probably the most spectacular game in Chicago this season was staged in Jackson Park on Thursday, May 11. The closeness of the score makes it hard to say which team was superior. There were many good plays on both sides. McCarthy's team tackled the 1921 champions of the Illinois Central and was beaten 2 to 1.

## Looking Backward With Our Veterans

### Four of the Five Oldest Employes of the Springfield Division Are Section Foremen

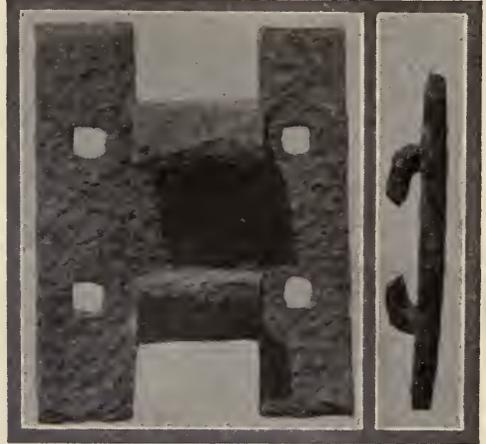

**F**IVE employes on the Springfield division have worked continuously for a total of 226 years, or an average of forty-five years and a little more than two months apiece.

George F. Shimp, section foreman at Patoka, claims to have laid more steel in one day than any other man on the Illinois Central System. He has been in the service fifty years. James Grady, engineer at Rantoul, has not missed a pay check in forty-six years. Thomas Hughes, section foreman at Champaign, has not lost a day on account of injury during his forty-four years of service. John Purtil, section foreman at Rantoul, has been contented with his work for forty-three years. John Moore, section foreman at Havana, has served forty-three years on that one section.

#### Claims Record in Laying Steel

George F. Shimp, section foreman at Patoka, claims the record of laying more steel in a day than any other man on the Illinois Central System. Between Patoka and Fairman on December 4, 1907 (and he has records verifying the fact), his gang of sixty men laid one mile of 85-pound rails, bolted and spiked them, tamped the ballast, saw that there were twenty ties to the 33-foot rail and kept the traffic moving. The longest he had to hold a train that day was fifteen minutes, he says.

Mr. Shimp entered the service of the company as a section laborer at Vandalia on April 15, 1872. Among his trophies is an old iron chair that was used at the joint of the iron rails in the early days of his railway work. These chairs were spiked to the ties with four spikes, he says, and the ends of the rails were slipped in, but the rails were not bolted together. The rails were spiked to the ties. The chair iron rails of this pattern were shipped to this country from England, Mr. Shimp says. They were received at New Orleans, shipped up the Mississippi River on flatboats to Cairo and unloaded. They were a source of constant trouble to the sections, he says. It was a usual thing to find four or five broken rails in a 3-mile stretch. The breaks were usually at the joints. And noise? My, how the wheels did clatter and bang over the joints of the rails! Whistles were hardly

Two Views of Iron Chair for Rails

necessary as a crossing warning then, Mr. Shimp says.

And in those days he did not have to worry about either walking or pumping a handcar to the point on his section he wished to visit, he says. The trains ran so slowly that he could board one at the station with the confidence that he would be able to step off safely at the desired place.

#### Made Section Foreman in 1877

Mr. Shimp had been a laborer on the section at Vandalia five years and two months when he was placed in charge of the section at Patoka, June 15, 1877. He remained as foreman of that section until 1900, and was then made supervisor of the Freeport-Dodgeville and Freeport-Madison lines.

He resigned this position after three years, and was appointed temporary supervisor on the line between La Salle and Freeport. After he had been in that position three months, he worked eight months on placing new ballast on the right-of-way between Freeport and Rockford. Then he was sent to Clinton, where he remained two years constructing track in the east yards.

When new and heavier steel rails were put on the line between East St. Louis and Carbondale, Mr. Shimp was transferred to that sec-

John Moore

Geo. F. Shimp

James Grady

John Purtil

Thos. Hughes, Sr.

tion. Grades were cut down, and the entire line was practically rebuilt within four years.

Mr. Shimp was sent out on extra work to various parts of the northern lines after that. He laid switches between Patoka and Clinton, placed new rails between Alhambra and Mount Olive, raised the bridge seven feet near Vandalia, put in new ballast at Moweauqua and then returned to his section at Patoka.

About eight years ago, Mr. Shimp invented a frogless switch. He patented the idea, and is soon to have a law suit with a Kansas City firm for making the very switch he invented, he says. The frog is eliminated from the new switch by a section of rail working on a pivot when the switch is thrown.

#### **Started Railroading at Age of 15**

James Grady, engineer on the Rantoul district of the Springfield division, entered the service of the Illinois Central as a section labor at Pesotum, Ill., October 1, 1876, and he has not missed a pay check since. His record extends over a period of forty-six years, and he looks to be good for at least ten more years of capable service.

Mr. Grady was only 15 years old when he started railroading. He was born July 31, 1861, at Martinsburg, W. Va.

He labored at Pesotum for three years, and in the winter of 1879 he helped lay track near Chatsworth, Bloomington, Kempton Junction and Pontiac. The latter work was completed April 1, 1880, when he returned to the section at Pesotum and remained two years.

A temporary section foreman was needed at Paxton on April 1, 1882, and Mr. Grady was sent there to take charge of the gang for eight months. On December 1 of the same year he was made the foreman of the section at Rantoul.

The Illinois Central bought the Havana, Rantoul & Eastern Railroad, a narrow gauge line, on January 1, 1887. Mr. Grady was made a fireman on that line January 31 of the same year. He was placed on a regular freight run without having had previous experience as a fireman. He fired for four months and was then made a brakeman. He remained in the latter position until August 1. The company decided to make a standard gauge road out of the line that summer. There were few trackmen to be found, and Mr. Grady assisted in laying the steel rails and putting in switches.

#### **Couldn't Stand Heat in South**

On December 1, 1890, he was promoted to supervisor of trains and track on that district.

Mr. Grady was sent to New Orleans as road supervisor between that city and Vicksburg, August 1, 1893, but, on account of the heat, he remained there only a short time. His request to be returned to the Rantoul district as fireman was granted. He remained in that work for seven years, and was promoted to engineer November 25, 1900. He has continued as an engineer on that line since. He was freight engineer fourteen years, passenger engineer five years and asked to be returned to a freight run in 1919. He preferred the latter work, he says, on account of his desire to have his home in Rantoul. He goes out on his run about 8 o'clock each morning and returns about 4 o'clock in the afternoon. His engine makes a trip to the east end of the line one day, and to the west end the next.

Mr. Grady has three sons in railway work. James P. has been an employe of the Illinois Central for thirteen years, William has worked for the C. & E. I. for eight years, and Edward has been employed by the Northwestern for two years. He has two daughters, who are married.

#### **Not an Accident in Forty-Four Years**

Thomas Hughes, section foreman at Champaign, has been in continuous service for the Illinois Central and its predecessors on the Champaign-Havana line for forty-four years. He has not lost a day on account of injury, and every man who has worked on his section has been just as lucky. He attributes this good record to the fact that he continually cautions his men against danger and pays strict attention to safety instructions.

Mr. Hughes was born in 1851 near Loughrea, Ireland, and came to America when he was about 20 years old. At Champaign he met a girl who had come from Ireland. Her home in the foreign land was not far from his, but they had never seen each other before. It was not long before they were married.

He entered the service of the Champaign, Havana & Western Railroad as a laborer on the section at Champaign January 1, 1878. For the following seven years he labored on various sections, and in 1885 he was promoted to foreman of the section at White Heath.

Mr. Hughes remained at White Heath for seventeen years. He has four sons, and each of them helped him on the section there. The four boys are out of the service now.

In 1902 he was transferred to the section at Champaign, and has remained in charge there since.

### Has Been a Contented Employee

John Purtill, section foreman at Rantoul, Ill., says that the contented employe is the one who does the best work. He has always been satisfied with his position and has put his whole interest in the work. His record extends over a period of forty-three years. With a record like that back of a man, it is evident that he has done good service for the company.

Mr. Purtill entered the service of the Illinois Central Railroad when he was 16 years old as a section laborer at Farina, Ill. Section work was hard for a lad of that age. The ballast was dirt, the rails were iron, and only sixteen ties were placed to the rail length. Even when constant attention was given to the right-of-way and light trains were run, the rails broke frequently. It was tump, tump, tump every day, he says. One thing that probably held him on the job was the fact that his uncle was the section foreman.

For ten years, Mr. Purtill worked on various sections between Farina and Neoga at \$1.10 a day. He was made the foreman of the section at Rantoul in 1889.

When he learned that steel rails were to replace the iron ones, Mr. Purtill says that he thought such a change would do away with the need of section gangs. But he found out, he says, that the heavier trains caused even greater care to be taken of the right-of-way.

Up until six years ago the ballast on his section was dirt. In 1916 he placed eighteen ties to the rail, and put in cinder ballast.

Mr. Purtill lost a son who was in the service of the company in 1919. He was an engineer and was scalded so badly in an accident that he lived only eleven days. The son had been in the service of the company for fifteen years.

### Forty-Three Years on One Section

John Moore, section foreman at Havana, Ill., has had forty-three years of railway experience on that one section, and in all of that time he says that he has not had an accident on his section. Nor has he been injured while in the service.

Mr. Moore smiles when he says: "And I worked back in the days of the old iron rails, too. To escape injury while working with them seems miraculous to me now."

Mr. Moore was born February 27, 1853, at Castle Comer, Ireland, and came to this country when he was 19 years old. The chances for a young man to get ahead were much better in America, he says.

October 11, 1879, he entered the service of the Champaign, Havana & Western Railroad as a laborer on the section at Havana. The section was six miles long.

For five years Mr. Moore labored on that section under trying conditions. The ballast was sand, and the slightest puff of wind stirred up a cloud of the fine particles. The men often had to stop their work to protect their eyes. But the 56-pound iron rails had to be looked after every day. They battered badly, and it was nothing to find from three to six broken rails on every trip over the section. The battered ends had to be cut off, and many rails reversed.

Such constant attention to the rails in his early days is what trained him to be extremely careful for the safety of the trains, he says. He watches the steel rails of today just as carefully as he did the iron ones of his first experience.

### Started Work at \$1 a Day

The pay of section laborers was \$1 a day when he entered railway work, Mr. Moore says. Ten tons was the average capacity of a car, and the trains never had more than twenty cars. A 700 class engine would have scared all the people out of the country then, he says. The section gang worked only twenty-six days a month, but there was no limit to the number of hours for work in each of those days, he says.

The Wabash Railroad took charge of the line in 1883, and the salary of the section laborer was increased to \$1.10 a day. Working conditions, except for the sand, were bettered, too, he says.

Mr. Moore was appointed foreman of that section in June, 1884, at a salary of \$40 a month.

In 1888 the road went into the hands of a receiver, and was known as the Champaign-Havana Line. In 1890 the Illinois Central had charge of it.

The winters between 1880 and 1890 were very severe on section men at Havana, Mr. Moore says. The temperature often went to 26 degrees below zero, and heavy snows fell. He was called out into blinding snow storms many nights. The snow had to be scooped away so that the trains could pass.

### Helped Others in Laying Rail

Mr. Moore helped each section foreman lay the steel rails from Clinton to Havana. When he reached his section, he could find only in-

experienced men to work for him. And even the inexperienced ones were hard to keep, he says. About the time they learned enough about the work to be of service, they went off into some other work.

Mr. Moore has two sons, John, Jr., and James C., who worked with him on the section at one time. John, Jr., is now in the service of the Illinois Central as baggageman on the train between Champaign and Havana. He has

served as a brakeman and has passed an examination for a position as conductor, Mr. Moore says. James C. Moore is now a plumber in Havana. He was in the army two and one-half years and served about a year with the 113th Engineers during the recent war.

Mr. Moore does not look to be a man 69 years old. He is very energetic and full of good wholesome Irish wit. He has an army of friends on the Springfield division.

## *Fine New School at Rolling Fork, Miss.*

The handsome new consolidated school at Rolling Fork, Miss., near the southern end of the Delta section, which is one of the best agricultural sections in the state, is one of the best buildings of its kind in Mississippi. The building, constructed at a cost of approximately \$140,000, was completed in 1921. It is of mission type, constructed of pressed brick, with a tile roof, and the interior is beautifully decorated and furnished.

The building consists of ten class rooms, offices, rest rooms, a laboratory and an auditorium. It is steam heated and electrically lighted, has an up-to-date basement with shower baths, lockers and dressing rooms for athletic teams.

The auditorium has a seating capacity of 572, with a stage 25 by 13 feet and dressing rooms on both sides. A motion picture machine is included in the equipment.

The grounds around the school, comprising fifteen acres, are well laid out, with gravel drives, concrete walks, shrubs planted along the drives, flower beds and forty oak trees planted on the campus, this having been laid off under the supervision of the state landscape gardener.

A modern brick bungalow on the campus just south of the main building is used for the teachers' home. It is steam heated and

electrically lighted. This home has a spacious living room, six bed rooms, a dining room, a kitchen, linen and clothes closets, bathrooms and a basement. This home is in charge of a matron and is completely furnished in every detail by the school board, the only requirement of the teachers being that they furnish their own bed linens and table napkins. The expense of running this home is pro-rated and averages from \$18 to \$20 a month for each teacher.

The main playgrounds are fully equipped. The athletic fields consist of four basketball courts, a football gridiron, a baseball diamond and tennis courts.

At present 140 pupils attend this school, 105 in grammar and 35 in high school. Forty of these pupils from the surrounding country come to school in motor trucks, the expense of which is taken care of by the school district. The classes held are from kindergarten to the 12th grade, inclusive.

The high school faculty is made up of "A" grade graduates, and the grade teachers are specialists in their respective lines of work. Salaries of the women range from \$115 to \$150 a month, while the salaries of the men range from \$1,500 to \$3,000 a year.

J. P. McCain, principal, extends to visitors a cordial invitation to inspect the school.

Vicksburg, Miss.*

# How Abraham Lincoln Asked for a Pass

## Son of Former General Superintendent of Chicago & Alton Gives Mr. Drennan Copy of the Letter

Abraham Lincoln, besides serving as an attorney for the Illinois Central in its early days, also served the Chicago & Alton. The facsimile of Mr. Lincoln's request for an annual pass, shown herewith, was recently sent to District Attorney John G. Drennan of Chicago by Edward R. Morgan of Bloomington, Ill., with the following explanation:

In 1854 my father, Richard Price Morgan, was engineer in charge of the construction of the Chicago & Mississippi River Railroad (now the Chicago & Alton Railroad) between Chicago and Alton, with headquarters at Bloomington, Ill.

Mr. Lincoln, then a practicing attorney of Springfield, had gone to Bloomington to try some cases before the Supreme Court, which at that early date traveled about the state to the more important county seats to accommodate the public, it being easier and more convenient for the court to move from point to point than for the public to reach the state capital at Springfield.

Mr. Lincoln was unable to obtain hotel accommodations at Bloomington, and went to a

boarding house kept by Mrs. John Dawson, applying to her for board and lodging. Mrs. Dawson's house was occupied to its capacity, and among her guests was my father, who occupied a large room on the ground floor.

Mrs. Dawson had informed Mr. Lincoln she had no accommodations for him, when father, who happened to be in his room, overhearing the conversation, offered to share his room with Mr. Lincoln. The proposal was accepted, as a "very clever offer," which proved to be the beginning of a friendship that lasted up to the time of Mr. Lincoln's assassination. Upon the completion of the railroad in 1854, father was made general superintendent, and appointed his former roommate and friend, Mr. Lincoln, local counsel for the railway company at Springfield, Ill., sending him an annual pass as compensation for any services rendered.

The pass for 1855 had expired, and in returning it for renewal he enclosed it with the letter, a facsimile of which appears herewith. The letter is self-explanatory to the older generation in railway service, but to the present generation some of the early railway parlance

Springfield, Feb 13. 1857

R. P. Morgan, Esq.

Dear Sir:

Says Tom to John "Here's your old rotten wheelbarrow" "I've broke it, use it out" "I wish you woud mend it, cas I shall want to borrow it this after noon"

Acting on this as a precedent, I say "Here's your old 'chalked hat'" "I wish you woud take it, and send me a new one, cas I shall want to use it the first of March's"

Yours truly,  
A. Lincoln-

Fac-Simile.

Richard Price Morgan 1909

has entirely disappeared, and comes to light only when sages in the service get reminiscent. The term "chalked hat" arose from the practice of the train conductor in placing a white ticket in the hatbands of deadhead passengers, when he passed through his train collecting fares. Those who had passes used the expression "I chalk" in order to inform the con-

ductor of their holding annuals. This is how the term "chalked hat" is used by Mr. Lincoln in his letter.

This bit of railway history is for my father's friends, who are also my friends, and for my friends, whom I also know would be his friends, if he were living, and they knew his sterling qualities of integrity and personal worth.

## A Dispatcher on the Subject of Safety

By J. S. TERRY,

Dispatcher, Vicksburg Division

In the interest of the safety movement on the Illinois Central, as well as on other railroads, it is worth while to quote from Doctor Schneckler of Munich, who is reputed to be an authority on the distances from which objects and human beings, and their movements involved, can be recognized:

"In daylight, even if you have good eyes and the visibility is good, you cannot ordinarily recognize a person whom you have seen but once before, if he is at a greater distance than eighty feet. If he is well known to you, you may be able to recognize him at from 160 to 330 feet; and if he is a member of your family, even at about 500 feet. Under the same conditions, the whites of the eyes can be seen at about 90 feet; and the eyes themselves at about 240 feet. The slightest movements of the head, arms or legs are distinguishable at 300 feet; larger movements, at 1,000 feet; but at about 1,750 feet a human being appears an indefinite form, and at more than about 2,300 feet movements of the body cannot be detected.

"These estimates apply when visibility is greatest; that is, in broad daylight. Under other conditions it is less, being reduced almost to zero on a dark night, or in a very dense fog by day."

According to Doctor Schneckler's estimate of visibility, a train of seventy freight cars of average length would constitute the limit of visibility, upon the assumption that ordinary arm movements are the basis of his observations. However, with the present method of transmitting signals from the rear to the head-end of a train of this length, no weakness or defect is suggested in our system, if the work of such a train is so organized that each member of the crew understands just what kind and extent of work is to be performed at each

point of detention; but to say the least of it, without this unit of organization under such circumstances, serious delay, and necessarily loss to the railway company, ensues.

Nothing is of more importance in the movement of trains out on the line and the assembling of cars in terminals, contributing more to safety and economy, than for each member of a train crew to be familiar with the progress authorized by train order or special instructions on the line; and terminal organizations should be conversant with all plans authorized by the general foreman in the process of assembling cars. With such a degree of organization, engineers, conductors, flagmen or brakemen suffer no dread of accidents or delays, because safety follows.

---

### HELPED RIVER TOWN

The Illinois Central recently handled a train-load of levee bags to be used in protecting the banks of the Mississippi River at Greenville, Miss., against the present rise of the Mississippi River.

The railroad, knowing the need for these bags on account of its past experience with high-water troubles, ran the train special from its eastern connection at Kankakee, Ill., to Greenville, Miss., a distance of 623 miles, in record time of twenty-nine hours.

The prompt movement of this emergency traffic shows what an important part our modern railroads play in aiding the communities which they serve in times of public calamities.—Chicago (Ill.) *Evening Post*, May 2.

## Some Facts About King Cotton

By L. W. HAZLEHURST,  
Commercial Agent, Memphis, Tenn.

**C**OTTON is the world's greatest fiber crop. It is extensively grown in twelve of the southern states and exceeds in total value any other crop in the United States except corn. The cotton plant furnishes the raw material for the greatest textile industry of all time. The volume of the export trade it supports is enormous. Cotton has been used as a fiber since the earliest civilization, although the important part it was to play in the economic adjustment of the world was not realized until after the American Revolution. The original home of the cotton plant, from the best information obtainable, was probably the West Indies. Hindoo history four thousand years old speaks of the fiber, evidently cotton, and leads us to believe it was manufactured into fabrics at this early period. Some species of the cotton have been found growing wild in practically all countries lying between the 37th degrees of latitude north and south of the equator, except the present cotton area of the United States. It is said that Magellan found the Brazilians using cotton for beds and fabrics in 1519.

### First Export Shipment Made in 1747

The first record of its being grown as a fiber in the United States was in 1621. The first foreign shipment of cotton from this country was from Savannah, Ga., in 1747, the shipment consisting of three bags. No authentic record of the crop seems to have been kept prior to 1791, but records show that the entire American crop for this period was 8,889 bales weighing 225 pounds each.

The cotton gin was invented by Eli Whitney in 1792. Prior to the invention of the gin, the lint had to be separated from the seed by hand, which was a very difficult task. Whitney's gin marked the beginning of an industry which has steadily increased in volume and importance, the market price of cotton being to a great extent a barometer of the financial situation in certain sections of the South. The crop for 1921 aggregated 11,377,316 bales, with

a market value of \$940,537,360. The 1921 crop was one million bales less than the crop for 1920, the short crop being brought about by the reduction in acreage and the ravages of the boll weevil.

The weevil is a very prolific insect. Each female weevil lays during a lifetime about one hundred and forty eggs. During a season, it is estimated, one pair of weevils may have, under favorable conditions, a living offspring of 250,000. The cotton boll weevil feeds upon nothing but cotton. It attacks the cotton boll in its early stages of development. On account of the multitude of these insects, they soon make their ravages felt in the cotton crop. The government has made every effort to combat the boll weevil evil, but so far with no great success.

### Ours Is a Cotton Carrying System

The Illinois Central and the Yazoo & Mississippi Valley railroads are both large cotton carrying lines, not only for distribution to the different mill points in the East and the Carolinas but also for export shipments through New Orleans. This export movement is principally destined to Great Britain, France, Germany, Italy and other European countries. During 1921 there were exported through New Orleans 1,348,677 bales of cotton, this movement being greater than the movement through any other port in the United States, with the exception of Galveston. The movement through Galveston, of course, consists principally of cotton originating in Texas.

A number of cotton compresses are located at stations on the Illinois Central and the Yazoo & Mississippi Valley. These are what might be termed concentration points, where the cotton is graded, compressed and reshipped to the different textile mills, the compression of the cotton reducing the size of the bale very materially—to such an extent, in fact, as to permit of the loading of seventy-five bales in a 36-foot car, when properly stowed. The principal compress in Memphis, owned and operated by the Memphis Terminal Corporation, covers one hundred and seventy acres of

ground. It is of concrete construction having up-to-date protection against fire and every facility for the economical handling of cotton. This compress handles, under normal conditions, approximately 500,000 bales a year.

In speaking of the cotton crop, we must not overlook the cotton seed, which is the chief by-product of cotton. It was formerly the custom of planters to dump the cotton seed into way places or streams, anywhere to get it out of the way, the planter not realizing the value of the seed as a fertilizer and stock feed. It is also strange that the first manufacture of cotton seed products did not begin in the United States, but in England, where no cotton is grown. In 1870, it is said, England had an annual crush of about 200,000 tons, and we were shipping cotton seed across the ocean to English mills. The first cotton seed oil mills were built in the United States in 1840, and as late as 1860 there were only seven oil mills in actual operation in the United States. At this time the number will approximate one thousand.

#### Cotton Seed an Important Product

There are altogether more than sixty useful products made from cotton seed. The by-products are classified as linters, hulls, cake or meal, and crude oil. The linters are used in the manufacture of such articles as batting, hats, rope, twine, carpets, cellulose, paper and explosives. Hulls are used as a feed for live stock and as a fertilizer, besides being manufactured into paper and other commodities. Cake, or meal as it is called when subjected to a grinding process, is used as a feed for live stock and for fertilizer. The oil is used in the manufacture of lard, cottolene, compound butter, salad oil, olive oil, miner's oil, lubricating oil and paint. For a long time there was a strong prejudice against the use of cotton seed oil in food products. This has now been largely overcome by deodorizing the oil, and at this time nearly all the compound oils now used in this country are composed largely of cotton seed oil, the cheaper grades being used largely in making soap and other useful articles. The oil is also used to some extent for medicinal purposes.

A company has recently been formed to build a plant which will utilize the stalk of the cotton plant. It is claimed that, by a newly discovered patent process and at a small cost, these stalks can be manufactured into many useful articles, such as shingles, wall board, containers, pipe covering, automobile wheels,

paving and building brick, floor and roofing tile and articles of a similar nature. In the event that this newly projected plant is a success, it will be of material benefit to the cotton planter, as at this time these stalks are of no service except for their fertilizing value, since it is customary to allow them to rot in the field.

It will be of interest to know that, exclusive of the business in cotton seed oil, the Yazoo & Mississippi Valley and the Illinois Central railroads during 1921 handled 1,076,789 tons of cotton and its products, with a net freight revenue of \$4,310,504, which was 2.26 per cent of the total tonnage handled by these lines and 3.52 per cent of their total revenue.

Frank P. Ryan, shown herewith, was appointed assistant commercial agent of the Illinois Central, with headquarters at 29 South La Salle Street, Chicago, effective May 4. He succeeded W. L. Convery, transferred. Mr. Ryan entered the service of the Illinois Central in August, 1902, as an office boy in the chief special agent's department. He held various clerical positions in the accounting, transportation and traffic departments, becoming secretary to the president July 1, 1912, and office secretary in 1916. He left the service in November, 1918, to engage in the bond business.

Maintenance  
of Way  
Department  
**Material Means Money**  
**Save It**

*Gasoline*

It is easier to buy two motor cars than to keep one in gasoline.—Poor Richard III.

Gasoline purchased by the Illinois Central and Yazoo & Mississippi Valley railroads during 1921 would run a popular make of automobile 8,812,560 miles at the rate of 20 miles to the gallon of gasoline, or more than 400 times around the earth. It would keep that same motor car going continuously 24 hours a day at a speed of 20 miles an hour for a little more than 50 years.

The total gasoline purchased was 440,628 gallons. It cost \$97,051.39. Of this amount, the maintenance of way department used 332,417 gallons at a cost of \$72,709.84.

The consumption by divisions was as follows:

Division	Gallons	Cost
Chicago Terminal.....	2,534	\$ 501.78
Illinois .....	35,252	8,044.50
St. Louis .....	34,420	7,518.72
Springfield .....	16,145	3,619.10
Indiana .....	10,552	2,292.03
Wisconsin .....	13,439	2,988.95
Minnesota .....	11,327	2,684.25
Iowa .....	27,066	6,293.71
Kentucky .....	24,996	5,955.54
Tennessee .....	15,839	3,745.35
Mississippi .....	19,943	4,499.61
Louisiana .....	28,348	5,603.15
New Orleans Terminal...	3,050	572.05
Memphis Terminal.....	6,118	1,239.99
Memphis .....	34,183	7,046.38
Vicksburg .....	25,343	5,423.25
New Orleans .....	23,862	4,681.48
<b>Total .....</b>	<b>332,417</b>	<b>72,709.84</b>

This represents an expense to the maintenance of way department of more than \$6,000 a month, or \$200 a day, for gasoline. The delivery of this gasoline required the use of 6,648 drums, which, if placed end to end, would extend nearly four miles.

Practically all of this gasoline was used

in the operation of motor cars, the exceptions being on four divisions, two of which operate gasoline-driven tie-tampers and two of which use gasoline engines to propel weed-burners. The work of the tie-tampers and weed-burners is seasonal, while the motor cars are used throughout the year. It is safe to say that 90 per cent of the gasoline was used in motor cars, and it is there that the greatest maintenance of way department economies are possible.

It is not at all difficult to waste gasoline in many ways, but space will permit of mentioning only a few. A great deal of gasoline is wasted by careless handling and in storage: for example, when drawing gasoline from a drum or transferring from one can to another or supplying tanks on motor cars. Gasoline spilled in this manner is not only a waste; it is also a serious fire risk. Gasoline is volatile, and if drums or cans are left open the loss through evaporation is rapid. Washing the hands and pieces of machinery in gasoline is a wasteful practice. More gasoline is wasted in this manner than is generally realized.

Perhaps the greatest waste of all is in the improper operation of gasoline engines. A motor car will consume just as much gasoline while coasting down hill with the throttle open and spark off as when pulling a heavy grade.

Improper adjustment of the carburetor

or mixing valve is a prolific source of waste, and these devices should never be tampered with by anyone not thoroughly familiar with their operation.

Reasonable care should reduce the cost of gasoline at least 20 per cent, which represents a saving of \$20,000 and will purchase eighty new motor cars.

## Daughters of the Illinois Central Meet

Some of our readers remember 'way back when the car accountant's office was on the fourth floor of the Central Station office building in Chicago—long before the short-haired flapper made her debut. If they remember the office, they will ask themselves what became of all the pretty girls who used to work there. Some of those girls changed their names; others changed their jobs, and even the office joined the procession and removed itself to the 63d Street office building. And so it goes. But just let two or more of the old crowd meet—in the shopping center, say—and you can almost see the exclamation points and question marks in the air. Miss Harriet Sullivan and Mrs. Fred Burlew had that experience some time ago, and the outcome of their meeting was the idea of a reunion.

Did the former employes come back? They did, fifty strong! The place of reunion was the Central Station dining room; the time, Saturday, April 1. They met at 2 p. m. for

luncheon. If you could have looked in upon the meeting of that crowd—some of them returning after sixteen years' absence—you would agree that under the Illinois Central roof-tree lasting friendships are born. The tables were arranged in two parallel rows, extending the entire length of the dining room. In furnishing a touch of spring, stylish costumes and modish hats vied with the roses, jonquils and ferns which graced the tables. A delicious luncheon was served. And you should have seen the photographs of tiny tots—in many cases pocket editions of their pretty mothers—which were proudly exhibited and admired! Mrs. Burlew voiced the appreciation of herself and Miss Sullivan for the hearty response to their suggestion. Miss Sullivan's remarks were in verse, and at the close of each stanza at least one of those present was called upon. It was voted to make the luncheon an annual affair, and the first Saturday in May, 1923, was selected for the next meeting.

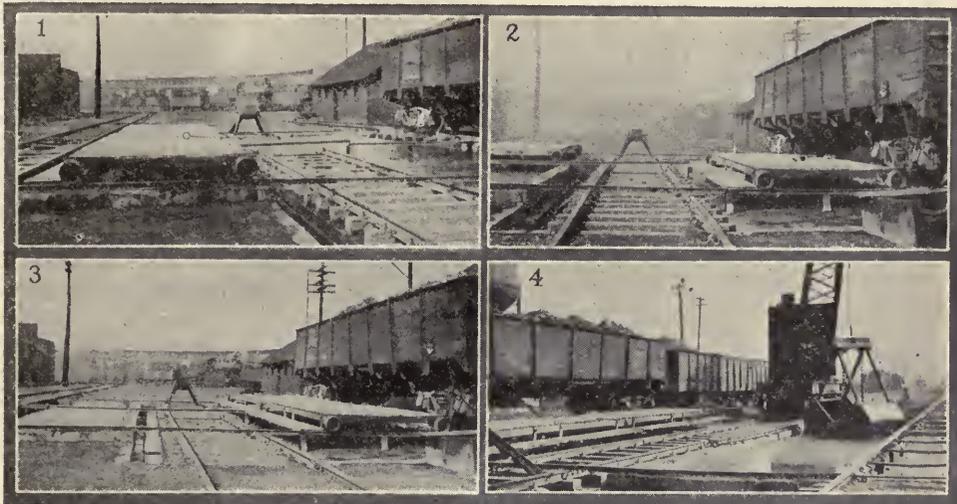

Those in attendance at the luncheon (1) Mrs. Fred Burlew, (2) Mrs. W. Landolf, (3) Miss Lola Zeno, (4) Mrs. J. Phillips, (5) Mrs. T. McGrogan, (6) Miss Mayme Mochell, (7) Miss Jane Carter, (8) Miss Frances Sheridan, (9) Mrs. Lucille Jurgs, (10) Mrs. Jeannette Briesenecht, (11) Miss Agnes Burke, (12) Miss Hazel Anderson, (13) Mrs. E. Waller, (14) Miss Katherine Ryan, (15) Mrs. E. O. Warndorff, (16) Mrs. George Cunningham, (17) Mrs. Fred Hendrick, (18) Mrs. Albert Lambert, (19) Mrs. Kenneth Bullard, (20) Mrs. William Lake, (21) Miss Martha Alexander, (22) Miss Kitty Martin, (23) Miss Harriet Sullivan, (24) Miss Millie Partridge, (25) Miss Maude Annable, (26) Miss Nettie Obenshain, (27) Miss Mayme Sweetman, (28) Mrs. K. C. Sawin, (29) Miss Lucy Lewis, (30) Mrs. E. T. Mulvaney, (31) Mrs. J. C. Orr, (32) Miss Bess Nicolay, (33) Mrs. L. S. Dromgold, (34) Miss Florence Partridge, (35) Mrs. Walter Boyter, (36) Mrs. Tessie Meising, (37) Mrs. F. L. Smith, (38) Mrs. H. Bowen, (39) Mrs. Lillian Froelick, (40) Mrs. Sheldon Kuhns, (41) Miss Vera Jackman, (42) Miss Anna Fitzgerald, (43) Mrs. W. Daggott, (44) Miss Charlotte Scanlan. Also attending, but not shown in the picture, were Misses Mary Clark, Anna Jackman, Katherine Looney and Marie Stewart, Mrs. J. H. Christensen and Mrs. Tom Paul.

## ACCIDENT AND

## INJURY PREVENTION

*Keeping Covers on the Cinder Pits*

By **W. H. DONLEY,**  
General Foreman, Champaign, Ill.

The matter of keeping cinder pits well protected by suitable covers, to eliminate a possibility of falling into the pits and becoming seriously or fatally injured, is a very important subject.

Our standard cinder pit covers, which are built up in five sections and which are handled to and from the pit by the locomotive crane, answer the purpose very nicely. As these covers are handled by the locomotive crane, the operator of the crane of course has to call on one of the cinder pit employes to assist him in removing the covers so that he may be able to clean the pits. By the time he has finished cleaning one of the pits, the employe who assisted him in removing the covers may possibly be engaged in knocking out a fire or cleaning an ash pan or perhaps placing coal on the tenders; the crane operator, being unable to replace the covers on the pit by himself, would move on to the next pit, thinking perhaps that after he had finished cleaning the second pit the cinder pit man would not be so busy and would be able to help him replace

the covers. This would leave the cinder pit open for an indefinite period, during which time some employe might accidentally fall into the pit and become seriously or fatally injured.

To eliminate this hazard, a cinder pit cover has been designated mounted on wheels, which can be handled by the operator himself. It is shown here in four views. The first view shows the pit covered; the second shows one cover removed and another remaining over the pit; the third shows both covers removed, with the rails on which the covers roll still remaining over the pit, and the fourth view shows the pit cleared of covers and rails and the cinder crane in action.

It will be noted from view No. 2 that this style of cover is made in two sections, each section mounted on four flanged wheels, running on 25-pound rails. The rails at the ends of each pit are so arranged that a piece of rail ten feet long can be lifted out of its position easily by one man; the center rail, being mounted on a pivot bearing, can be turned lengthwise with the pit and rests on the wall of the pit, as shown in view No. 4. The pit is then cleared for the cinder crane either to

pass the pit or to clean it as the case may be.

This style of cover has been installed at Champaign for three years, with very little cost of maintenance. Since it is possible for one man to remove or replace the covers, this makes it possible to keep the pit covered almost constantly. Furthermore, the design of the covers greatly assists the cinder pit man in cleaning ashpans on the large power, since, on account of their elevation, the ashpans can be easily reached.

Too much cannot be said about the covering of the cinder pits or the proper maintenance of the covers. This matter is of vital importance in preventing injuries, either serious or fatal, which have occurred many times, due to the fact that cinder pits were improperly covered or the covers themselves were allowed to get in a hazardous condition.

#### Made a Record in Safety

After twenty-nine years of faithful service as a bridge carpenter and foreman on the Amboy district, W. H. Cramer was retired on a pension the first of the year on account of ill health.

"Bill" Cramer was born in Jo Daviess County, near Galena, Ill., February 6, 1863.

He started to work for the Illinois Central as a bridge carpenter under Foreman J. S. Shepherd on August 8, 1892, when the bridges were 2-ply chord and 56-pound and 60-pound rail was used. In the early days, the gangs worked ten hours each day and often rode all

W. H. Cramer

night to get to the next job by morning. In addition to regular work, they built all the water tanks and put in all of the small iron bridges. Mr. Cramer was made foreman on March 27, 1906.

During Mr. Cramer's long years of service with the Illinois Central, he never had a man injured under his supervision; neither did he have the misfortune to have a hand car or motor car accident. He practiced "Safety First" at all times, and he says this is the main reason for his splendid record.

Mr. Cramer has been a conscientious employe who could be depended upon at all times.

George C. Dean

he ever had a serious accident with his train.

Mr. Dean began railroading at East Broad Top, Huntington County, Pennsylvania, as fireman on the East Broad Top Railroad Company, a narrow gauge coal- and iron-carrying railroad running between Mount Vernon and Robertsdale, Pa. He left that company and went to the Chicago, Burlington & Quincy Railroad as locomotive fireman, working in the Chicago terminal of that company. After leaving the C., B. & Q., he took service with the Chesapeake & Ohio Southwestern Railroad, which then ran between Louisville and Memphis. That road was later purchased by the Illinois Central, and at present this line is known as the Kentucky and Tennessee divisions of the Illinois Central.

#### Six Months Without An Injury

Here is W. J. ("Bill") Lange, for twenty-two years roundhouse foreman at the New Orleans terminal and five months without overtime at the Government Yard roundhouse. Mr. Lange has gone 176 days (practically six months) without a personal injury at the Government Yard roundhouse, in spite of handling 140 men and 57 locomotives daily. According to A. A. Dodson, claim agent at Vicksburg, Mr. Lange scores 100 per cent in the cleanliness and neat appearance of his premises, particularly in the condition of his storage coal. He has been personally complimented by the general officers for his care in regard to the coal. "Small of stature, but big of heart; looks sleepy, but is always on the alert to increase the surplus of the Illinois Central," says Mr. Dodson.

W. J. Lange

#### A Safety Veteran

For the past twenty-two years Engineer George C. Dean of the Tennessee division has been handling trains No. 4 and No. 1 between Memphis and Cairo, and during this time he has never injured a passenger or an employe, nor has

## Save Stationery by Planning Ahead

By C. R. CREEDON,

Nonconnah Car Shops, Memphis, Tenn.

**A**N idea originated by E. A. Rodgers, clerk in the Nonconnah car department, and sponsored by every clerk in the department—that of saving company stationery by a consistent system of “spare-time” stock keeping—has proved such a success that it is being adopted by many other departments on the system.

A few months ago, when his clerical duties became rather slack, Mr. Rodgers endeavored to straighten up the stationery and aid with the commissary spring cleaning in general. He arrived at the conclusion that, if just a little more care were exercised and if each clerk were to take it upon himself to see that no unnecessary waste was allowed, there would be no need of spring cleaning, and the great number of loose, soiled and crumpled forms, particularly envelopes, would be eliminated.

Consequently, a list of every form in use on the terminal was compiled and placed in a convenient place in the stationery room for ready reference. A dozen packs of each form were placed in their own particular wall box, on which was painted the number of the form it held. There were six tiers of boxes, each tier containing twenty boxes. If a clerk was not familiar with the particular box in which the form desired—for example, Form 860, small envelopes—was kept, he would go to the reference table, on which Form 860 was shown to be in Box 13, Tier 3, and the form was at once available without any of the unnecessary “rooting and rumpling” of stationery which is so prevalent among inspectors and yardmen who have small opportunity of becoming familiar with all the boxes.

To further the movement of “Save More—Waste Less,” the following commandments

were put into use, thereby saving a good many dollars for the company and at the same time establishing a habit of neatness and thought for the employes themselves:

1. If you don't like the way you've addressed an envelope, don't throw it away. Use your eraser; the company furnishes you one.

2. Don't use Form 1575 to say “Dear Sir—Yours truly” on when Form 1575½ or even Form Y-1576 would suffice. You can save from 6 to 10 inches of stationery. It's up to you.

3. Never destroy a sheet of stationery that cannot be saved by erasure. There are two sides to everything; you've ruined one; let the bill clerks use the other.

4. Don't tear off those first few sheets from the pack. If you use our system, they're not soiled; it's your imagination. Besides, don't forget the eraser.

5. Those 2-inch and 3-inch pencil stubs are still good. Use some of that scrap paper and glue to make a good, stiff pencil-holder. It'll write much better.

6. Don't try to keep a package of every form in the stock room in your desk, when you have no need of it. That promotes waste, and besides we said “save,” not “hoard.”

7. Report carbon that is worn out on both sides and like new in the middle can be re-cut and used by the A. R. A. clerks. “Let it earn time and a half.”

8. “Weigh,” “Transfer,” “Bad Order” and similar cards should not be carried around in dozens by foremen and inspectors for book marks and then thrown away. Treat them like dollars; they're just the same.

9. If you were paid a bonus for saving company material, would you not be more careful of it? By doing so, you are promoting a habit of neatness and frugality, and, besides, the “bonus” of a diligent employe is the unre-

served right to win the highest office on the Illinois Central System. Ask Mr. Markham.

P. S. If you just don't care, then at least be human and think of the porter. His back is not rubber, and even a porter hates to be emptying "wasty" waste baskets all the time.

---

### Keeping a List of Reports

The prompt report is a boon to the efficient office. The busy clerk who has many different reports to make—daily, weekly, monthly, yearly, etc.—will find something handier than a pocket memorandum book in a tabulated list of the various reports to be made, grouped as to the time they are due and specifying the date. The clerk should make a separate list of reports that are due him from other offices. Then he should place these lists under the glass on his desk or paste them in a conspicuous

place where they can be glanced over at any time. This will save considerable time, correspondence and tracing for neglected or delayed reports, and also insure the prompt rendering of reports. I would suggest that all lists be headed with the word "Suspense," as the most important correspondence is usually in this file. —RUFUS KEMP, JR., *Superintendent's Office, Fulton, Ky.*

---

### The Wandering Waste Basket

H. L. Martin, chief clerk, has invented a novel way to keep his waste basket from straying. He placed a small hook in the leg of the desk, just high enough to permit the waste basket to rest on the floor, and fastened the top wire in the hook. The basket is so placed as to permit its being readily unfastened and waste-paper emptied.—AGENT'S OFFICE, *Evansville, Ind.*

---

## A Minister Who Preaches Safety by Radio

A minister who takes a great deal of interest in safety work is the Rev. Walt Holcomb of Cartersville, Ga. Mr. Holcomb recently delivered, in Atlanta, Ga., what is believed to be the first safety speech ever broadcasted by radio. The following is a portion of the broadcasted address, which the editor has received from Mr. Holcomb:

"Here is a paradox of safety. At one moment we are the calm, careful, cautious 'Dr. Jekyll,' and the next minute the careless, criminal, chance-taking 'Mr. Hyde.' We are swallowing thrill pills and being overtaken by death, the last great accident.

"Many an automobilist, just for the thrill of racing with a street car, has left the street red with the blood of helpless children or decrepit old age. Just for the thrill of scaling across the track in front of a limited train, the right-of-way has been stained with the blood of bruised, mangled, dead bodies.

"We will never play safe until we put the proper value upon life. Jesus Christ was the first exponent of the principle of the 'safety first' movement. He did not care whether a man wore broadcloth or overalls, but he was immensely concerned about the conservation of life. Since capital and labor have caught the spirit of safety, they have bound themselves together in the bond of brotherhood. While our city officials and railway employees

are cautiously careful, the general public is criminally careless.

"The philosophy of safety is thought; the psychology of safety is reminder. We can make a tremendous pull for safe practices when we remind people of their love for life. Everybody wants to live and provide for and protect his own. The best safety device is a safe mind.

"Man's greatest jeopardy is at the grade crossings. Everybody rides on trains, and almost everybody rides in automobiles. The grade crossing is where the automobile and the locomotive collide. The iron mogul and the tin lizzie meet here. Some persons seem to believe the engineer ought to stop and let the lizzie go by, but he cannot always do it.

"In my county, a woman out driving with her mother, friend and children rolled her high-powered car down the hill toward a dangerous crossing and stopped it in front of a big, deep cut. Her little girl started to get out to see if the train was approaching, when the big engine came dashing across the road. The other women screamed and said, 'Oh, how near we came being killed!' But the cool, calculating driver smiled and replied: 'We were in no danger; I always stop my car at a grade crossing.' If every automobilist would do that, there would never be another accident at a grade crossing."

# Law Department

## Two Interesting Decisions

It is probable that Title III of the Transportation Act, 1920, has given rise to more discussion and bids fair to give rise to more contrariety of decision than any other portion of this very important act. Title III constitutes the Labor Board legislation. This legislation is novel, in that it provides no method whereby it can be enforced other than an appeal to public opinion. Those who suggested the enactment of legislation designed to put an end to disputes in the railway field between employer and employe originally proposed a statute with severe penalties and with remedies by injunction somewhat after the order of the act establishing the Kansas Court of Industrial Relations. Proposed legislation of this kind was strongly opposed by the leaders of union labor. This attitude on their part was entirely consistent with their steadily maintained position that labor and capital should be free to negotiate and thresh out their differences with the minimum of interference from official sources. So strong was the opposition to putting into the law measures for its enforcement through the courts that Congress eventually provided a scheme for arbitration, more or less voluntary, with no provisions for penalties if the orders of the Board were disregarded. Whether the decisions of the Board could be enforced by injunction or mandamus at the instance of the prevailing party in a dispute, or at the suit of the Board itself, has been somewhat discussed, although this feature of the Transportation Act has not been before the courts.

However, two opinions bearing on the scope and authority of the Board have recently been rendered. One is expressed in the decision of the District Court of the United States in the Northern District of Illinois, in the equity suit of the *Pennsylvania Railroad Company vs. the Labor Board*, in which Circuit Judge Page, holding the District Court, holds in a somewhat elaborate opinion that the Act is constitutional, and that the courts have jurisdiction to enjoin the Labor Board from entering an order under Section 313, declaring that the orders of the Board have been violated by a

carrier, provided of course that the orders which the railroad has ignored were beyond the jurisdiction of the Board to enter. The decision held further on the facts made by the bill in this case that the Labor Board is without jurisdiction and authority to enter any order under Section 301, where there had not been a joint submission of the controversy to the Board, since the court held that under this section no controversy could reach the Board except upon joint submission. The Court did not hold, however, as some have thought, that the Board cannot take jurisdiction under Section 307 of a dispute which is submitted to the Board upon the application of the chief executives of a carrier or an organization of employes, although the opposite party may not have joined in the submission. On the question of a joint submission the court seems to have limited its finding to procedure under Section 301. The court held, however, that it was beyond the power of the Board to interfere with the method of selecting representatives who should join in the conferences provided in Section 301, and to that extent the order of the Board was held to be illegal in the particular controversy involved.

The other decision of interest is by the Supreme Court of Mississippi in the case of *Rhodes vs. the New Orleans Great Northern Railroad Company*. In that case it appears that Rhodes, who was a track laborer on the New Orleans Great Northern Railroad, brought suit against the company for wages earned between January 1, 1921, and June 30, 1921. He based his suit upon the claim that he was entitled to the wages fixed by the Labor Board in its decision of July 20, 1920, these wages being on the basis of 36½ cents an hour, and that in fact he had received only 20 cents an hour, this being the amount fixed by the company itself in alleged violation of the Labor Board's order. A demurrer was filed to the declaration on the grounds: First, that the act creating the Labor Board is unconstitutional, and, second, that the order of the Labor Board had no validity in the sense that it could furnish the basis for a suit at law. The Mississippi Supreme Court disallowed both these

contentions, holding, upon the authority of *Wilson vs. New*, 243 U. S. 332 (the Adamson Law decision), that the Act was constitutional, and in the second place that the decision of the Labor Board fixing a scale of wages gave to the employe the right to enforce the award in a court of law, provided the employe by his conduct had not estopped himself to claim the amount awarded by the Labor Board or otherwise waived his right to demand that amount of wages. Just what action on the part of the employe would constitute an estoppel or waiver was not before the court and was of course not decided.

The difficulty about these two decisions as furnishing definite and satisfactory authority is that both of them were decided upon pleadings which consisted only of statements of cause of action by one side and demurrers by the other, which demurrers, of course, upon familiar principles admit all the facts alleged by the plaintiff. In the Federal Court case at Chicago there was nothing before the court but the bill filed by the Pennsylvania Railroad, the government's motion to dismiss, and an answer filed by the Labor Board, which, according to the statement in the opinion, is no more than a statement of grounds urged for dismissal. In the Mississippi case the only thing before the Supreme Court was a declaration and a demurrer. It will be seen, therefore, that neither of these courts properly had before it all the facts necessary to final and conclusive adjudication of these issues. This is particularly true in the case of the Mississippi decision. It is possible that upon the retrial of this case in the state circuit court it will be shown that the employe acquiesced in the decision of the management to reduce his wages from 36½ to 20 cents an hour, this acquiescence being manifested by remaining in the service, accepting the basis of pay or doing some other act which would amount to an estoppel. Furthermore, it is commonly understood that the decision of the Labor Board of July 20, 1920, fixing the wages of track laborers, had no application to the New Orleans Great Northern, which was not a party to the proceeding leading to that order.

It is difficult to see how the decision of Judge Page in the Federal District Court in Chicago as to the limited character of the submission under Section 301 can be of great significance, in view of the admitted fact that, under Section 307, disputes not settled under 301 can be taken before the Labor Board upon ex parte

submissions. It is understood that the government and the Labor Board have appealed from Judge Page's decision to the Circuit Court of Appeals, and that this appeal will probably be heard some time in June. Just what course will be taken by the New Orleans Great Northern in the Mississippi decision is not known, although it is probable that the case will be heard on its merits in the lower court before any attempt is made to appeal to the Supreme Court of the United States.

Both opinions agree that the Act is constitutional upon the authority of *Wilson vs. New*, and this finding seems to be the most important result of both decisions. In addition to this view the decision in the United States District Court at Chicago contains the very important holding that if the Labor Board exceeds its jurisdiction it may be enjoined in the courts by a carrier (and of course the same remedy is open to the employes), to prevent the Board from denouncing either party as a violator of the order of the Board, if that party chooses to ignore or disregard this *ultra vires* decision of the Labor Board. That is a wholesome finding, and it is to be hoped that the higher courts will ultimately affirm the decision of the District Court on this point. Beyond these two questions it does not seem that the decisions are particularly enlightening.

#### "MARSE" HENRY IS HOME

"Marse" Henry Watterson came home to Kentucky April 4, to rest for all time. A great assemblage of Louisville citizens and men of national prominence who knew him in life came to honor his memory. Flags on public buildings flew at half mast while simple services at the First Christian Church were being held for the dean of American journalists, who died in Jacksonville, Fla., about three months before.

The services were in line with that simplicity which had marked the life of Mr. Watterson. A ritualistic reading, a hymn, a prayer, an anthem by the choir, and an eulogy were the outward tributes.

"He leaves no successor." Dr. E. L. Powell, pastor of the church, said, "for 'only Ulysses can wield the bow of Ulysses.'"

A plain block of granite in Cave Hill cemetery marks his grave. From its eminence it overlooks the city where the veteran editor spent his most active years.

# CLAIMS DEPARTMENT

## Injuries on Cattle Guards

The railroad has several times been sued at various places for injury to animals which had attempted to pass over surface cattle guards, with the result that the prong of the guards damaged their feet. In most instances the courts have held that recovery could not be had.

Oscar Wainwright brought suit against the Illinois Central Railroad Company and the Roseland Gravel Company for \$316 in Tangipahoa Parish, La., claiming that two mules owned by him were ruined in this way. The suit was tried at the March term of court and a verdict rendered for the railroad.

There seems no more reason why the owner of stock injured in attempting to pass over a cattle guard should recover than should the owner whose stock persists in disregarding a barbed-wire right-of-way fence and is thereby injured.—E. W. S.

## Wouldn't Enter a Claim

Edgar E. Evans is the owner of several splendid farms about three miles north of Clinton, Ky., along the Illinois Central tracks, and it is his pleasure to live upon one of the farms and supervise the cultivation of all of them. Also he has engaged extensively in buying and shipping stock to the different markets for the last twenty years. It can be said of him that he has never presented a claim for damage to or the loss of stock in transit or otherwise, even though he has averaged the shipment of about seventy-five cars of stock each year.

Furthermore, to prove the character of the man, it is worth noting that on March 2 a cow, one of a number that he was driving near the station grounds at Clinton, became frightened and ran upon the track immediately in front of extra north No. 1504 and was killed. Mr. Evans immediately notified the section foreman that no claim would be presented for the loss of the cow, inasmuch as it was an unavoidable accident. Such men are assets to any community.—M. C. P.

## Trespasser Killed During Storm

Molly Ash, widow of Henry Ash, brought

suit for the death of her husband, alleging that the engineer of passenger train No. 124 willfully, negligently, etc., ran down and killed Ash near Sardis, Miss.

Henry and his wife and family were in the cotton field working their crop when a storm came up; they started for home and took the railroad as the most convenient way home; they were caught in the worst of the storm and were overtaken by train No. 124, and Henry Ash was struck and killed; it was raining so hard at the time that the engineer could not see beyond the front end of his engine; passengers on the train declared that, sitting in the coaches, they could not see the right-of-way fence, only fifty feet from the train; the engineer did not see Ash; had not a passenger standing at the rear door of the rear car in the train seen the body and notified the trainmen, the crew would not have known that the man was struck.

Ash was a trespasser, pure and simple. Notwithstanding this fact and the opinion of the company that there was no liability in the case, a reasonable settlement was offered his family. The offer was declined, and suit was filed, resulting in a verdict of \$2,309.09 in favor of the plaintiff.

In the trial of the case, the court overruled the company's motion for a directed verdict, and the jury did the rest.

As a rule the concluding chapter of any book is the most interesting, and so it is with law suits: The Supreme Court of Mississippi reversed the trial court and entered judgment there for the railway company.—F. F. M.

## Hoped to Cover Up a Murder

The engineer handling an Illinois Central freight train on our belt line at Memphis the night of March 12 saw something on the track which he took for a human body. He was unable to stop until part of the train ran over the object, which upon investigation proved to be the body of a negro woman. Although the body was somewhat cut up by the train, suspicion was aroused as to the cause of death from the fact that no blood was found on the track. The chief special agent's depart-

ment investigated, located the woman's husband and had him arrested. A confession was obtained from him that he and another negro had killed his wife and put the body on the track. He will probably be indicted by the grand jury and prosecuted for this crime.

Crimes of this sort are not by any means unknown. They have probably been committed many times and never been discovered, and perhaps not even suspected, since it is presumed that death was due to being run over by a train.

This illustrates the great injustice which can be done railway companies under the *Prima Facie* Act in Mississippi. The act referred to is a statute which provides that proof of death or injury to an individual by a moving train shall be *prima facie* evidence of negligence. Under this statute the courts of Mississippi have repeatedly held that the railroad must prove that it did not negligently kill or injure the individual. This is sometimes practically impossible.

Had the incident referred to occurred in Mississippi and had it been charged that the railroad was responsible for the death and had suit been filed, the party suing would only have to show that the body was found on the track and had been run over by a train. If the railroad were unable to prove that the death was not so caused, the jury would find that death was due to a running train, and then the railroad would be held liable unless it was able to prove it had not negligently killed the person. Had neither the engineer nor any member of the crew seen the body, there would be no way to explain the occurrence, and the company would have to pay.

Mississippi is the only state touched by the Illinois Central System that has this drastic statute. Under it railway companies are annually compelled to pay considerable sums for death of trespassers and perhaps for the death of persons who were not killed by a train at all but murdered and placed on the track as was this negro woman.—E. W. S.

#### Tried to Blame the Railroad

Christ Adams (or Adamopolous, if you prefer the Greek style) was employed as a section laborer on the Illinois Central at Omaha for some time prior to November, 1920. Christ had a condition which is common among Greeks and some other races, which the learned doctors tell us "predis-

poses to hernia." In other words, Christ was walking around with a hernia, or rupture, which was ready to show up at any time on the slightest provocation. In fact, Christ had had two previous double hernias.

About November 18, 1920, this latest hernia developed, and the nearest Christ could figure out was that it was caused while handling a rail—and to make it good he claimed there were not sufficient men on the rail and, of those that were furnished, one was old and had slipped, causing the bulk of the weight to be thrown on Christ. He refused the service of the Illinois Central hospital department, and went to other doctors.

When he returned, of course, a claim was presented. After an investigation, an attempt was made to explain to him that ruptures are not caused by strain, but are brought on by the condition of the man himself, and that particularly in his case there was no possible connection between the railroad and the rupture, except that he was in the employ of the railroad when he first discovered the rupture. Adams must have passed through Missouri on his way from Greece, as he insisted on being shown before he was convinced; consequently a few months later, when the gang was laid off, he obtained a lawyer (always an easy thing to do) and a suit was filed, charging the railroad with having permanently injured one otherwise first-class Greek.

The case was tried at Omaha during a recent term of court. The trial was remarkable in showing how clearly a man can sometimes remember details of an accident almost two years afterward when a month after the occurrence he admits that he knows nothing at all about it. Harry Pappas, a discharged assistant foreman, the star witness for the plaintiff, admitted on cross-examination that his memory of the details had been materially refreshed after a conference with the plaintiff and his attorney. At the conclusion of the plaintiff's evidence, a motion was made for a directed verdict for the defendant, and the plaintiff's attorneys, being skilled in reading the handwriting on the wall, dismissed the suit.—W. J. H.

#### JUNE—"NO EXCEPTIONS"

Every employe should strive to prevent the cause of freight claims in June.

## What Patrons Say of Our Service

### Pleased the Knights Templar

The following letter to C. B. Dugan, superintendent, dining service, is from Harry C. Walker of Binghamton, N. Y., formerly lieutenant-governor of New York and past grand commander of the New York Knights Templar:

"This is my first opportunity to express to you the appreciation of the party composing the Grand Commandery of the State of New York, on its trip to New Orleans and return, of the splendid service received from your department while going to and returning from New Orleans. Your Mr. Castle was with us on the trip from Mattoon to New Orleans and did everything possible to contribute to our comfort and convenience. The marked attention and courtesy on the part of all of your employes connected with the car which served us so efficiently both ways were thoroughly appreciated, and your service has won a lasting friend in every member of the party.

"For myself, I enjoyed it so thoroughly that I shall take advantage of every opportunity presented to use the service of the Illinois Central."

### Official Thanks From Vicksburg

Mayor J. J. Hayes of Vicksburg, Miss., recently wrote the following letter to President C. H. Markham:

"As mayor of the city of Vicksburg, I feel that it will not be amiss for me to express to you and, through you, to the Yazoo & Mississippi Valley Railroad Company and its employes our deep gratitude for your and their splendid efforts in fighting the high water in this city and in the surrounding Delta section of this state. But for the active efforts and work of the Yazoo & Mississippi Valley Railroad Company and its employes in this city, one of the substantial portions of this city would have been under water for a long period, and great and irreparable loss and damage would necessarily have followed.

"I desire also especially to commend the active and efficient work of General Superintendent Egan and of Superintendent Mays of the New Orleans division and Superintendent Dubbs of the Vicksburg division.

"We want you to know that the people of

this city and the people of this section of Mississippi appreciate more than you can know your active efforts and support in protecting us as far as possible from this constantly recurring peril, high water, during this season. It looks now as if we have the fight almost won, and if the levees do not break on the Mississippi side it should not be long before the high water will recede.

"We hope to see existing conditions on Levee Street of this city relieved, and we believe that, by the hearty co-operation of the property owners, the officials of this city and the railway company, we can relieve the situation. I shall be very glad indeed to confer with you or the proper railway authorities, along this line, on your first trip through the city of Vicksburg in order that we may arrive at some conclusion whereby your property will be greatly benefited as well as the property owners and citizens of this city.

"Again I desire to assure you of our appreciation of the efforts you have made, and we hope that the worst is over and that before another high water period the conditions here and in the surrounding territory may be changed so that the recurring floods will not damage us so greatly."

### Surgeon Noted Good Service

The following letter to President C. H. Markham is from Dr. Frank W. Porterfield, division surgeon at Waterloo, Iowa:

"I have just returned from New Orleans, where I, with many others, attended the annual convention of the Joint Association of Surgeons of the Illinois Central and Yazoo & Mississippi Valley Railroad Companies, and it occurred to me that you might be interested in knowing what splendid and practically perfect service our road is giving to the traveling public.

"The equipment was unsurpassed, and every possible comfort was provided for the passengers. Without a single exception, every employe was courteous and thoughtful to a superlative degree, and nothing was too much for any of them to do for any passenger, old or young, lady or gentleman. This was especially noticeable among the more subordinate types of employes, who are sometimes not al-

ways agreeable, but not so with any of the Illinois Central boys whom we met on this trip.

"The road bed was solid and smooth; the engineers ran the heavy trains without jar or rough handling of the train; the dining car service was of the highest class, and it was the general remark of all I met on the trains, both going and coming, that the Illinois Central was giving its patrons the highest possible type of transportation service.

"This opinion was not alone among the company surgeons, traveling on passes, but was shared by many others who were riding on tickets at the usual rates, and the commendation of everything connected with the service was so unanimous—and, I may add, unusual—that it occurred to me that you, as the executive officer, would be glad to know about it."

### Some Constructive Criticism

The following letter to President C. H. Markham is from R. F. Morse, general manager of the Long-Bell Company at Quitman, Miss.:

"Having noted with unusual interest your articles appearing in the daily press concerning the operation of railroads, may I not advise you of an instance occurring on your road yesterday?

"Four citizens of this place, of which the writer was one, representing the Bank of Quitman, visited various points on your line looking into the dairy and truck-growing business with the view of helping the farmers in this section. We were passengers on Illinois Central train No. 1 out of Jackson at 5:30 a. m., getting off at Wesson, Miss. The conductor in charge of the train—we believe his name is Mr. Ashton—was one of the most courteous and accommodating men we have ever met.

"The service of your road in every particular seemed to us perfect, and it is gratifying to come in contact with such able men as Mr. Ashton was in the handling of his work."

### Praises Service to Flood-Sufferers

The following letter to President C. H. Markham is from J. B. Benton, vice-president of the Yazoo Valley Plantation Company, Hardee, Floweree P. O., Miss.:

"Certainly you are aware of the fact that our country is inundated by the most disastrous flood or back-water that has ever been known, and I deem it my duty to thank you and your able assistants for the most wonderful fight

that has ever been made in a crisis like this. I don't know what on earth the poor people who live along the line of the Y. & M. V. would have done but for the fact that your able and generous-hearted superintendent, Mr. T. L. Dubbs, and his assistants came to their rescue. I don't believe that any set of men could have combined their efforts in a more successful way than they have. They have kept the trains running when it looked almost impossible to observers, and they have never been too busy to assist anyone who called on them or whom they found in distress.

"They have shown the same consideration for all kinds of live stock and fowls, even to stopping their trains to keep from killing a chicken.

"And, in speaking for this entire community, I wish to say that, through your able management, the people of this country have been taught what a great thing a properly managed railroad means to them.

"Through Mr. Dubbs' benevolence, we have been furnished box cars for the people to live in at no expense to them, and people who were unable to pay transportation or freight have never been refused transportation for themselves or their effects.

"I am in charge of 13,000 acres of land here, of which 5,000 are in cultivation, populated by 118 families, and but for the fact that your superintendent of this division came to our relief when he did there, would not be a single family living on the property today, except a few that we have been able to place in the gin houses.

"I also want to thank you in behalf of the company I represent and, through you, all of the officials from the superintendent down to section foremen of the Vicksburg division for the help they have given us."

### Liked Our Dining Service

The following letter to C. B. Dugan, superintendent, dining service, is from Henry F. Hooper, 436 Stock Exchange Building, Chicago, Ill.:

"On April 3, while traveling from Freeport, Ill., to Chicago on the train arriving at Chicago at 9:30 p. m., I had occasion to dine in your dining car operated by Steward Sherman Primley, and I take this opportunity to congratulate you upon having men of his type in your employ. He took particular pains to see that each guest was well satisfied with the meal, service, etc., and in my particular

case it was a pleasure to be dining on his car."

#### Watching the Little Things

President C. H. Markham, under date of April 27, wrote the following letter to J. A. Rouse of the Thos. D. Murphy Company, Peoria, Ill.:

"I beg to acknowledge receipt of and thank you for your letter April 25 regarding action taken in connection with your suggestion that flagmen and porters assist passengers in boarding trains. Our organization is putting forth every effort to render a quality of service that will appeal to our patrons, and it is very pleasing to know that some of them think we are making progress in the right direction."

Mr. Rouse's letter of April 25 said:

"I beg to acknowledge receipt of your kind favor of March 9. In reply I want to apologize for not having done so before, but I wanted to wait until I had seen if there was any improvement in your service. I am pleased to say there has been a decided one, which speaks very highly of the quick way which you take care of the little things, which, as a matter of fact, count far more than many of the larger deeds and add prestige to the high class service your road puts out under your management."

#### Liked Opportunity for Breakfast

The following letter to General Superintendent W. S. Williams of our Western Lines is from C. A. Morris of Waterloo, Iowa:

"I boarded your No. 15 train at Dubuque this morning and was delighted to find a dining car included in the equipment.

"I could not help but notice during the trip and upon arrival at Waterloo how much happier every passenger seemed to be for having had breakfast. As has often been said, 'The world looks brighter on a full stomach,' and this was very noticeable among your patrons this morning.

"While only nineteen persons patronized the dining car this morning, it is my guess that business will be better after the service is more generally known."

#### More Praise for Y. & M. V. Service

L. Pink Smith, secretary of the Rotary Club of Greenville, Miss., recently wrote as follows to President C. H. Markham:

"I am directed by the Greenville Rotary Club to express the deep appreciation of the members of the club who attended the recent district meeting of Rotary in Baton Rouge for the

splendid service given by the Y. & M. V. Railroad of the great Illinois Central System, through the capable and painstaking efforts of your Division Superintendent, Rotarian Tracy L. Dubbs. A special sleeper was placed on the side track at Greenville for the Greenville delegation of twenty-five in time for a full night's rest going to Baton Rouge, while on the return trip the same thoughtful arrangements were in effect, thus giving the Rotarians an all night sleeper, part of the night in the yards at Greenville. Superintendent Dubbs and the train crews showed the Rotarians and their party every thoughtful consideration. We are proud of your railway system, and are grateful for the superior service you are now giving the public. Hence this letter."

#### Perfect Service to Rotary Club

E. M. Allen of Helena, Ark., Rotary Club governor-elect for the Fourteenth District, recently wrote the following letter to President C. H. Markham:

"The delegation sent to the Baton Rouge conference in March by the Helena Rotary Club traveled on the special train provided by the Y. & M. V. from Memphis to Baton Rouge and return. In the opinion of the twenty-two Helena representatives who made the trip, much of the pleasure and comfort of the trip was made possible through the courtesy and enterprise of your railroad and the officials who were present on the train. The special train was handled without interruption or delay of any sort, and we wish to speak particularly of the attention given by Superintendent T. L. Dubbs of Greenville and by Mr. Bell and Mr. Feeney. These gentlemen, together with the members of the train crew, were courteous at all times and did everything possible for the comfort of the various delegations. The service was perfect from start to finish."

#### Appreciation From Flood Sufferers

President C. H. Markham is in receipt of the following letter from G. T. Darden of the Darden Mercantile Company, Inc., Blanton, Miss.:

"I wish to express my thanks and appreciation of the stupendous and successful effort made by the Yazoo & Mississippi Valley Railroad Company to keep all trains moving at a time when they are so badly needed not only to bring food and mail to the people but to carry bags and labor to the levees. Although the track is covered with water about three

feet deep for twenty miles, the service has been remarkable.

"This has been done at a big loss to the railway company. In many instances cars have been furnished to flood sufferers, and I have heard many expressions of appreciation from prominent citizens and others. All of your employes, conductors of freight and passenger trains and section foremen need to be commended for courtesy and efficiency in handling the situation.

"I wish, however, especially to mention your division superintendent, Mr. T. L. Dubbs of Greenville, Miss., in this connection, as a large measure of the successful operation is due to his energy and good judgment."

---

#### Praises Traveling Passenger Agent

W. S. Walker, president of the Peoples Trust and Savings Bank of Iowa Falls, Iowa, recently addressed the following letter to President C. H. Markham:

"I was one of a party of Knights Templar who made the journey to New Orleans to the triennial conclave. Accompanying the train which we were on was your congenial traveling passenger agent, Mr. G. R. Kimbel, whose home is in Dubuque, Iowa.

"We want you to know that Mr. Kimbel was very courteous on this trip, and we take this opportunity of expressing our deep appreciation of his services and consideration shown us during the time he had us in charge.

"This letter voices the sentiment of the Sir Knights who were in the Iowa party on this train."

---

#### A Chicago Commandery Pleased

The following letter to President C. H. Markham is from George F. Schoel, recorder of the Woodlawn Commandery No. 76, Knights Templar, 6107-6125 Cottage Grove avenue, Chicago:

"It gives me great pleasure to advise you that, at the stated conclave of our commandery, held Tuesday evening, May 2, a unanimous vote of thanks was tendered you for the very excellent manner in which Woodlawn Commandery No. 76 was cared for by the Illinois Central Railroad Company during its trip recently made in connection with the 35th Triennial Conclave at New Orleans.

"All who made the trip were most favorably impressed with the service and com-

forts provided. The entire arrangements made were so thoroughly and ably handled in every detail that not a single thing happened to mar what I believe you would call a 100 per cent performance.

"Your various departments interested in this undertaking are surely entitled to the warmest praise and thanks for the manner in which we were taken care of. The train itself, from engine to observation car, was one of the finest trains that pulled into New Orleans on this triennial occasion. The courtesy shown us by the train crews, station forces, in fact, everybody along the way and at New Orleans, will long be remembered. The dining-car service en route, as well as the service furnished at 'Railroad City', provided all that one could desire. At New Orleans it was truly astonishing to find a city worked out in such elaborate detail with not the slightest thing overlooked that could possibly be done for comfort.

"To us it seems a remarkable achievement that a city of such proportions could be built and managed so as to furnish so many comforts and conveniences and without embarrassment of any kind to its 'citizens.'

"What I have said may seem to be inspired by *personal* enthusiasm, but I assure you I am only expressing the sentiments of a well pleased and grateful number of Sir Knights whose good fortune it was to experience this trip on the Illinois Central."

---

#### LINCOLN ON LITIGATION

A quotation from Abraham Lincoln on the subject of litigation forms part of the Canons of Ethics adopted by the American Bar Association. It is as follows:

"Discourage litigation. Persuade your neighbors to compromise whenever you can. Point out to them how the nominal winner is often a real loser in fees, expenses and waste of time. As a peacemaker, the lawyer has a superior opportunity of being a good man. Never stir up litigation. A worse man can scarcely be found than one who does this. Who can be more nearly a fiend than he who habitually overhauls the register of deeds in search of defects in titles, whereupon to stir up strife and put money in his pocket? A moral tone ought to be enforced in the profession which would drive such men out of it."

## Superheating Waste

(Continued From Page 72)

good steamer, one that would steam on slack as well as on good coal.

With the widely divergent views among enginemen as to the proper size nozzle and height of diaphragm and the inability to read the plainest symptoms of the most commonly occurring faults, no wonder the mechanical department officials do not want to make front end changes each time an engineman requests a front end change to be made.

Many enginemen stoutly maintain that the draft conditions are perfect on their engines, regardless of the plainest symptoms being present indicating otherwise. With such a condition existing, it seems that the only remedy would be to employ draft specialists to check up on each district and do nothing else, for if this work be done properly the specialist will have plenty to do until his district is brought up to a standard of efficiency that should pay his salary over and over again. Once draft conditions are brought up to an efficient condition, they should be easily maintained with an occasional check up.

### The Place for Fuel Economy

When it is considered that two detrimental effects occur on a superheater locomotive from one common fault, improper drafting, from too-low diaphragm or too-large nozzle or both combined, and each contributes its share toward consuming an excessive amount of fuel, it must be apparent even to those who know nothing of draft conditions that here is where fuel economy should begin.

Unequal draft in the fire-box is today a greater source of fuel waste, in the opinion of the writer, than any other single cause that has come under his observation. Being in the "hidden loss" class, like blowing cylinder packing and valve rings, it does not bother anyone as much as a pop valve letting go once in a while with a loud noise.

The great stress that so many writers lay on the waste from the pop valves being open is more of fallacy than anything else. The agitation results more from the fact that this is a visible and noisy loss than from a true understanding of where the real losses are occurring on a locomotive.

A locomotive that the fireman cannot raise the pop on easily whenever he desires to is

the really wasteful coal-eater. It is claimed that fifteen pounds of coal are wasted for every minute that the pop is open. I have witnessed a train of about 4,000 tons moving at about 5 miles an hour going up grade and the pop open for practically the best part of thirty minutes in a vain endeavor to prevent delay to a following passenger train, with the fireman taking things easy and practically no smoke at the stack. The drafting being perfect, the engine reached its destination without any necessity for pulling coal down.

### A Difference in Another Case

On the next trip with another engine, the same fireman seemed unable to get coal enough into the fire-box going up the same grade. Without any exaggeration, he shoveled at least one-third more coal and the pop never even simmered; the engine gave no evidence of blows in the valves or cylinder packing, but did show glaring symptoms of unequal draft. This engine needed pulling down of coal more than twenty miles before reaching its destination.

I have no hesitation in declaring that, as between a properly drafted engine with the pop valve wide open going up any grade and an improperly drafted engine going up the same grade with pop valve closed, the properly drafted engine will reach the summit with the smaller number of scoops of coal used. The improperly drafted engine is actually wasting more by not completely burning the gases than would supply the pop valve. By all means let us have pop valves that will open, if wanted, and with just one or two additional scoops of coal when working the engine hard. This is not to be construed as a reason for opening the pop unnecessarily. No engineman cares to hear a pop valve blow off unnecessarily if it can be avoided. However, let there be no misunderstanding. The engine that is easy to pop is the genuine fuel-saver.

An engine that is drafted to give the maximum superheat ordinarily to be obtained and that steams freely will as a natural result be light on smoke and be the lightest on coal under any and all circumstances.

### One Cure for All Diseases

If there is anything present tending to destroy the vacuum in the front end or any restriction of any kind whatever that retards the free exit of the gases from the fire-box to the front end, and it is not readily seen upon examination by the engineer or roundhouse man, the most common remedy is to bridge or re-

duce the nozzle. It reminds one of the old-fashioned doctor who prescribed calomel for anything and everything.

One of the most common causes of restricted air, and the one to which least attention is given, is the adjustment of the diaphragm. The diaphragm serves to distribute the draft as between the upper and lower flues and the back and front ends of the fire-box. It is also used to some extent as a means of keeping the front end clear of cinders. It must be clearly understood that the diaphragm is not a compelling factor insofar as the increase of draft is concerned, but it positively is a restricting agency if placed any lower than its proper height to equalize the flow of gases through the flues. It does little harm to be a little too high, but the fuel waste becomes excessive if adjusted too low. It is in a study of the draft conditions as affected by the position of the diaphragm that the writer believes the best results may be obtained in any effort toward fuel economy. The reducing or bridging of the nozzle is a makeshift at the best and should only be used as a last resort.

#### **Make the Adjustment Permanent**

Once the proper height for the diaphragm has been determined on any particular engine and it has been set at that height, it should be made permanent. An adjustable diaphragm that the front end man can tinker with is a nuisance, as it invariably results in having him experiment with the removal of the few cinders that are always found in the front end and do no harm there. If the front end fills up with cinders, it is not due to the position of the diaphragm. It is usually due to some fault of the netting, mesh too small or angle at which netting is set not permitting proper pulverization of the cinders that they may pass through the netting. A too-large nozzle, with consequent lack of draft, is sometimes another contributing cause. Therefore the diaphragm is not the proper thing to use to get rid of cinders. Any change in its position to lower the cinder line usually results in spoiling the steaming and superheating qualities of the engine, and invariably results in an unwarranted increase of fuel consumption.

The direct fuel loss from a low diaphragm results from having the total volume of air that would otherwise pass through the fire slightly restricted all over the fire-box and in addition distributing this lessened volume of air unequally as between the upper and lower flues and the back and front ends of the fire-

box. Thus there is the reason for reducing the nozzle to restore the volume of air that should otherwise freely flow through the fire-box. This is partly accomplished without doubt, but the uneven draft still remains.

#### **A Puzzle to the Fireman**

The uneven draft, not being visible unless it is very extreme, puzzles the fireman. He has been instructed to fire evenly all over the fire-box (at least most of the fuel instruction articles I have read so instruct), and he finds holes developing in the front end of the fire-box and banks forming at the back end of the fire-box, and most likely the steam is lagging, which, with holes appearing, would seem to call for more fuel—and more fuel she gets. If he is a skillful fireman he will soon learn to fire where the holes are and disregard the places where the banks form. If he finds this out before the clinkers have formed, all well and good, but if the clinkers once get a start a hard battle is ahead of him for the rest of the trip.

The clinkers begin to form under the banks at the back end of the fire-box. By gentle and skillful manipulation of the grates the clinkers might possibly be broken up and the light fire partly restored without filling the ash pan with fire, but this is doubtful, as the only thing that will shake down out of a bank is unburned coal and fire, which immediately ignites in the ash-hopper, as the drop doors seldom fit tight enough to exclude air. For this reason it is not advisable to shake the grates unless the engine is stopped where the hopper can immediately be dumped.

The low diaphragm, causing an unequal draft by restricting the flow of gases through the upper flues, likewise restricts the amount of air drawn through the fire at the back end of the fire-box and, in addition to preventing complete combustion of the gases at the back end of the fire-box and helping to create clinkers, also fails to deliver hot enough gases to the upper flues.

#### **Fuel Consumption Is Affected**

The superheat units are contained in the upper flues, and the natural result is a lack of superheated steam. Between the loss in cylinder condensation from saturated steam and the loss due to incomplete combustion at the back end of the fire-box, the fuel consumption is affected in a very marked degree. It is affected to the extent of having to pull coal down to reach a coal station that could otherwise,

on a properly drafted engine, be reached without pulling down or even requiring the fireman to reach for coal, all other conditions being equal as to time on duty and tonnage hauled.

The nozzle that is too large under existing conditions to draw enough air through the grates for complete combustion, even if the draft may be evenly distributed, is another cause for fuel waste, but is less often met with. In combination with an unevenly drafted firebox, it represents the poorest type of engine in service so far as draft conditions are concerned. Clinkered heavy fires that often have to be cleaned on the road are common on this type. Other results are ash-pans full of fire that have to be frequently dumped, lagging steam, poor handling of trains, especially on grades, where stalling sometimes results, frequent running for water due to poor superheating, excessive consumption of fuel due to greater evaporation of water required, also added fuel consumption to make good the wasted gases resulting from incomplete combustion.

This is the type of engine that just seems to crawl over the road, always on the verge of an engine failure, sometimes having one on account of the "poor coal." The members of a crew that can take an engine over the road without an engine failure in this condition deserve credit for the performance, but all they usually get from the train dispatcher is abuse and the familiar "why" messages.

### Carrying the Water Too High

Carrying the water too high in the boiler is a fault for which the blame can be placed upon the engineman, unless the engine is such a poor steamer that an excess of water must be carried to get the train started while the fireman is struggling with the fire to get up steam enough to maintain the schedule, if on a scheduled run.

If the engine steams properly, there is little excuse for carrying the water too high all the way over the road. The results are that water is continually being carried through the superheat units along with the steam, tending to lower the temperature of the units so that superheated steam is not being obtained. In addition, the continual evaporation of water within the units soon results in a scale formation that eventually prevents the heat from being absorbed from the hot gases that are passing to the front end through the flues and around the outside of the units. The engine eventually loses most of its power to superheat at all due to this scale formation.

Where the water is carried high on a poor steaming engine to enable it to get the train started and maintain its schedule, the trouble lasts for a few minutes only and there are no noticeably bad results from it, unless the water might start a leak or crack some part of the header. If the poor steaming fault were overcome, the necessity for starting out with high water would be eliminated.

The fireman who fires too heavily regardless of how well the engine may be drafted may next be considered. If the engine is known to be in good steaming and superheating condition and not "assumed" to be in such condition without knowing it, then it becomes an easy task to instruct the fireman as to the proper method of firing.

### Don't "Show Up" Your Fireman

If, on the other hand, the engine is "assumed" to be in proper condition and is not (a common condition), it is almost useless to say anything to the fireman about proper firing, as you probably could do no better than he with the scoop and might do even worse, in which case he would tell his fellow firemen that the engineer tried to show him how to keep her hot and instead let her lose ten or fifteen pounds of steam.

Having heard this told many times, I know better than to take the scoop on a poorly drafted engine after I have become convinced that the trouble is from poor drafting. It becomes a case of "passing the buck," to use a slang expression. The roundhouse passed it to me, and I pass it on to the fireman. A very bad condition, I will admit, but the trip, once begun, must be finished under these conditions until a report can be turned in.

Often have I pitied a hard-working, industrious fireman, almost sweating real blood in his efforts to make steam on a poorly drafted engine that needed only the slightest change in the position of the diaphragm or the size of the nozzle to convert it into a fuel-saving, good steamer. A request to the foreman would bring the customary answer: "Can't do anything for you; the front ends are standard; we are not permitted to make any changes."

### Faults Not Visible in the Fire

Most of the faults of poor drafting are not visible in the actual burning of the fire, except that the fire does not appear to be bright enough. One of the most common faults, that of the too-low diaphragm, is an invisible fault and is apparent only by certain characteristic symptoms. It creates a slightly unequal draft,

burning intensely at the front of the fire-box and poorly at the back end of the fire-box. Since the smoky fire at the back end prevents the fireman from seeing that the fire has burned out at the front end, he cannot understand why the steam drops. If he has unusual intelligence, he will know it without seeing it. But if you try to tell a fireman who is not overly intelligent that he is firing too lightly up ahead, where he cannot see what is going on, he will soon kill the engine with a banked fire.

The characteristic symptom of the too-low diaphragm on an engine without a brick arch is in the location of the honey-comb on the flues. If it mostly forms on the lower flues, it is evidence of too sharp a draft up ahead. The *amount* of honey-comb on the flues must not be confounded with the *location*. The amount indicates the grade or quality of the fuel as regards its honey-combing qualities. The location indicates the degree that the draft is equal or unequal. If the honeycomb is evenly distributed all over the flue sheet and evenly distributed on the crown bar bolts, the draft is undoubtedly equalized properly.

The symptom of a low diaphragm on an engine with the brick arch would be bricks at the front of the arch burned to a greater degree than bricks at the back end of the arch. The burning of the bricks evenly all over the arch would indicate the draft was about equalized. Superheating with a low diaphragm is more or less doubtful. If the engine has no speed or snap handling a train, it is pretty sure that very little superheating or none at all takes place.

### Use of Water Is a Test

One of the most reliable means that the engineman has to indicate faulty conditions that tend to increase fuel consumption is the amount of water used between points where water is taken.

An engineman running regularly over the same district should note the amount of water that his engine uses between certain water tanks for the regular tonnage hauled over that district, compare his measurements with others and in this way ascertain if his engine is using more or less water than others handling the same kind of trains.

The engines that emit dense clouds of smoke on light firing and whose smoke does not clear up quickly after the fire has been placed in the fire-box and the door closed are proper subjects for examination as to unequal draft and poor superheating qualities.

Smoke issuing from the stack gives a good index of what is going on in the fire-box to one who is trained to read its meaning.

On an engine hauling a heavy train and working steam, smoke is created by two causes. The fireman may be firing too heavily or the drafting may be improper. To differentiate between the two, the fireman should be requested to put fires in of not exceeding ten scoops of coal, and if this makes a dense smoke that does not almost immediately clear up it is safe to say that the draft is improper in some way or other.

If the smoke does clear up quickly and the engine can be run for a considerable distance before another fire is needed, it is plain that the combustion in the fire-box must be about right.

There will always be a little smoke present on a perfectly drafted engine when fresh fuel is thrown upon the fire. If no smoke were made at all it would indicate another faulty condition, that of too much air.

This is due to the gases' being released from the coal and not reaching a semi-igniting temperature, which would produce the condition called smoke. There would be excessive mixing of air and of partly burned or unburned gases—in other words, a cold-air diluting effect that would be just as hard on the fuel consumption as an improperly drafted engine that was not getting air enough. Happily this type is seldom seen.

---

### A COMPLIMENT

"Aims to Please the Shipper, the Traveler. Try It." The above is the slogan of the Illinois Central System as it appears on a very neat and attractive little thermometer that up-to-date, progressive and popular line is distributing to its patrons. The editor has just been handed one of these useful little office helps by his friend, Jere Convery, who so ably represents the Central Mississippi Valley Route in this territory. A glance at the aforesaid slogan recalls a very splendid trip we had via the Illinois Central from Louisville to New Orleans just before Christmas, 1919. It was our thought on that trip that if there was any better equipped, smoother running train than that particular train we were then riding we simply didn't know of it—had never heard of it.—Editorial in the March-April issue of *Traffic News and Notes*, official publication of the Houston (Texas) Traffic Club.

## ILLINOIS DIVISION

### Superintendent's Office

Cupid is working fast in the Superintendent's office at Champaign. J. C. Johnson, time-

## OUR CORRESPONDENTS

No. 1

MRS. OTIS A. BARNES (formerly Bernita Thayer) is the efficient secretary to Superintendent J. W. Hevron, Illinois division, Champaign, Ill. She entered the service of the Illinois Central when the Illinois division offices were moved from Chicago to Champaign in October, 1918, and was appointed division correspondent for the *Illinois Central Magazine*, May 26, 1921. She received her education in the Champaign schools.

## AROUND CHICAGO

### Auditor of Freight Receipts

Wedding bells rang on April 15 for Miss Caroline Lobell and William Lindeman. At a dinner party, following a performance at the Illinois Theater, Miss Lobell was presented with a chest of silver.

J. B. Craemer was called to Cincinnati on account of the death of his father on April 6.

The marriage of Miss Bernice Eix, which took place October 5, 1921, has just been announced. Her husband, R. N. Sandusky of Nashville, Tenn., is serving in the Navy.

Miss Edna Johnson, who resigned April 8, was presented with a remembrance by her girl friends.

Miss Mabel Sublette was married on April 29 to Jack Roadnight. Miss Sublette is the daughter of T. N. Sublette, for many years assistant agent at South Water Street station, Chicago.

Edwin M. Stel has received his commission

keeper, left Champaign on No. 4, en route to Chicago, Saturday, April 22, and Miss Kathryn Faker, stenographer, departed on train No. 24, en route to Chicago. On the arrival of No. 24 in Chicago, Johnny and Katie (as we all know them) met and were married at 5 p. m. in St. Mary's Church. They were both back on the job the following Monday morning, but left May 8 for Niagara Falls, where they are enjoying a honeymoon. The Illinois division offices presented Mr. and Mrs. Johnson with a beautiful set of silver.

Effective May 1, the division office hours were changed to conform with the daylight saving plan in Chicago. The hours are now from 7 a. m. to 4 p. m.

Supervising Agent H. Kabbes is riding back and forth in a new motor car.

Chief Dispatcher W. G. Tiley departed on train No. 3, May 3, for Memphis, Tenn., where he met a committee of chief dispatchers which is making a tour of inspection. The committee, consisting of E. C. Russell, Dubuque, J. E. Schneider, McComb, A. A. Freiberger, Memphis, and W. G. Tiley, Champaign, visited the Champaign offices Thursday, May 11.

Miss Kathryn Kelliger, stenographer to Trainmaster J. T. Stanford, was taken suddenly ill while at work Thursday morning, May 11, and was removed to Burnham Hospital, where she was operated on for appendicitis.

Chief Clerk R. G. Miller is on a 30-day leave of absence. Mr. Miller and family expect to visit relatives in Carbondale. Assistant Chief Clerk G. E. Webster is assuming the duties of chief clerk.

Miss Mildred Monohan is assisting as stenographer in the superintendent's office, in the absence of Mrs. J. C. Johnson.

**Kankakee, Ill.**

Engineer C. F. Pangborn, who has been off duty on account of illness, has resumed his duties.

A new run has been put on at Kankakee, known as the Lehigh run, to handle ballast for the Lehigh quarry.

Car Inspector H. A. Wakat and family have returned from a trip to New Orleans. Mr. Wakat attended the car men's convention at New Orleans while there.

Yard Clerk W. C. Cox is off duty on account of sickness.

Switchman James McClarey, who was pensioned May 1, entered the service of the Illinois Central August 26, 1894, as a switchman at Fordham yard, where he remained for seven years, until September, 1901, when he was transferred to the Kankakee yard, where he has since been in continuous service.

James McClarey

Superintendent J. W. Hevron recently wrote as follows to Brake-man E. Harris and Fireman S. Brewer of Cham-paign:

"It has just been called to my attention that you gentlemen offered to fire engine No. 2990 by hand, on account of stoker trouble, from Alma to Champaign, on May 10. I want you to know that the interest you gentlemen displayed in bringing this train to Champaign is very much appreciated, and no doubt prevented a large claim which would have resulted had berries been delayed in getting to market."

The Illinois Central type of service with a smile is bound to pay in the long run, according to the experience of Miss Ethel McGee of

Miss Ethel McGee

Champaign, Ill., a waitress in the Illinois Central lunch room there, who recently was awarded tickets to a motion picture show because she had her usual smile on tap when the person distributing the tickets to smilers came around. Only three persons won tickets that day—a blue Monday. According to the Cham-paign News-Gazette, which had the distribu-tion in charge. "After another search of faces, the pleasant-est smile yet was found in the Illinois Central lunch room on Miss Ethel McGee, 201 West Church Street, a waitress. Miss McGee, a pretty girl with a smile which all the railway

men will tell you is permanent, was pleasantly surprised at her luck and said she didn't know a smile was anything to be rewarded for."

**SPRINGFIELD DIVISION**

**Decatur, Ill.**

On May 1 a daily through steel sleeper was put on between Decatur and Chicago. This service is much appreciated by the traveling public, and its success is already assured. Assistant General Passenger Agent Truesdale spent a day in Decatur boosting the new sleeper service, and he was greatly encouraged by the many expressions of good will manifested by the traveling public.

E. H. Smith, first trick operator, has just moved into his new home.

"Col." Ed Wills, our baggage agent, is being favorably mentioned as a candidate for mayor of Decatur in our coming spring election.

It will be only a short while until it will be necessary to add on the passenger station a new room to take care of the monthly and weekly magazines that are now coming into Decatur in carload lots to be distributed out of Decatur for a radius of two hundred miles. As a temporary solution, there is being built a plat-form in the open space between the baggage room and mail room so as to keep the mag-azines from getting wet.

Tom Gilliland, first trick operator at Maroa, did himself proud as an entertainer at the Pennsylvania "Old Veterans' Association" recent meeting at the Orlando Hotel. Tom has it over many professionals as a monologist.

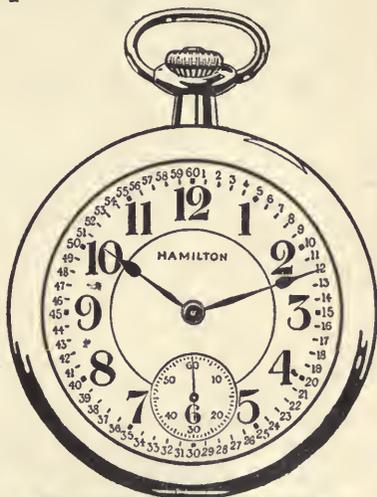

# Hamilton Watch

"The Railroad Timekeeper of America"

## Long Term Watch Insurance

It is policy to buy a good watch.

The Railroad man who buys a Hamilton is insured against inaccurate time. He buys a watch that has to its credit the record of wonderful service under hard usage—a watch that will tell true time year after year.

The Hamilton Watch is preeminently the watch of successful Railroad men. They lean heavily on their timepieces and must have a watch sturdy enough to bear the responsibility imposed upon it.

We suggest the No. 992 Hamilton, 16-size, 21 Jewels, for the most exacting Railroad service.

Hamilton Watches range in price from \$40 to \$200; movements alone \$22 (in Canada \$25) and up.

Send for "The Timekeeper," an interesting booklet about the manufacture and care of fine watches. The different Hamiltons are illustrated and prices given.

*Conductor J. County and Engineer E. T. Reed, together run an Erie train. They both carry Hamilton Watches. The accuracy of their Hamiltons has helped both men to a reputation for precise and punctual service.*

HAMILTON WATCH COMPANY  
Lancaster, Penna., U. S. A.

The Illinois Central was represented at the meeting by Trainmaster Golze and Chief Dispatcher Mallon of Clinton and G. A. Lavery, ticket agent at Decatur.

#### Clinton, Ill.

Miss Clara Hoyt, who has been on leave of absence the past year account of ill health, has returned to service, relieving Miss Gladys Westerholt as stenographer in the trainmaster's office.

Conductor Hilbrant of the Havana-Champaign passenger run, who recently underwent an operation in the Chicago hospital, has returned to work. Mr. Hilbrant says that he is feeling very much improved.

H. M. Gleadall, chief clerk, recently spent several days in the Chicago offices, getting acquainted with the different officials and looking over the work.

Agent A. H. Wallace of Lincoln, Ill., recently received and passed on to Superintendent C. W. Shaw \$1.26 in "conscience money" which came to him with the following note: "A cash fare from Pekin to Lincoln which your conductor failed to collect and which it hurts my conscience to keep. A Patron."

#### ST. LOUIS DIVISION

John Sproat, formerly statistician in superintendent Atwill's office, has accepted a position in the office of Acting General Superintendent Patterson at Chicago. Mr. Sproat's position in Mr. Atwill's office has been filled by H. E. Craiger of Chicago.

There has been a considerable reduction in force on the St. Louis division due to the recent coal strike. The St. Louis division supplies a large amount of coal.

Work on the extension of the division office, Carbondale, Ill., is progressing nicely under the supervision of Foreman Montgomery. It is thought the work will be completed within the next two weeks.

William Watson, who was a member of Company E from Carbondale, Ill., and who was killed in action in France on November 10, 1918, was buried at Carbondale, April 19, 1922, with all military honors. He was at one time a yard clerk for the Illinois Central at Carbondale.

On April 16 there was a bad cyclone at Irvington, Ill., on the Illinois Central, near Centralia, Ill., and one of the strange things about it was that the Huddleston Home orphanage located there was not harmed in the least while buildings all around it were wrecked. There are a hundred or more orphans cared for at the home.

Prof. T. L. Bryant, head of the commercial department at the Southern Illinois Normal University, had his students through the Illinois Central division office April 22, in order that they might get some idea as to how division railway matters are handled.

George Robinson, caller, Carbondale, Ill., was married recently.

Chief Dispatcher D. B. Dickey was called to his old home in Kentucky recently by the death of his mother, who was 75 years old.

The Illinois Central detoured a number of trains for the Cotton Belt between Olive Branch and East St. Louis, Ill., during the recent high water.

Agent L. E. Doley, Elkville, Ill., in looking over train No. 252 as it was passing his station May 8, noticed a break beam dragging and took the necessary steps to have the train stopped and the beam removed.

Track on the Murphysboro district (Mud Line) has been put in shape to resume traffic since the recent high water. There were places from twenty-five to forty feet deep washed out under the track.

Brakeman M. Conder, Centralia, Ill., in looking over Extra 1835 at DuQuoin, Ill., recently, found about twelve inches of flange gone from I. C. 128297.

Walter Wicker has been appointed acting trainmaster at Mounds, Ill.

Conductor J. R. Brown, Benton, Ill., recently reported that he and his crew turned to the car department at Benton the following: 13 old angle cocks, 102 old air hose connections, 1 old draw bar.

F. M. Block, formerly agent at Mounds, Ill., has been appointed agent at Cairo, Ill., to fill the vacancy made by the death of J. D. Ladd.

Conductor M. C. Hammer, Benton, Ill., recently reported that he and his crew picked up twelve draw bars and seven knuckles at Zeigler, Ill., and turned them over to the car department at Christopher, Ill.

Miss Lenore Barker, stenographer in Roadmaster Kern's office, resigned recently, and her place has been filled by Eunice Rentfro. O. C. Richardson of Bonne Terre, Mo., is taking the place made vacant by Mrs. Rentfro in the accountant's office.

#### INDIANA DIVISION

##### Superintendent's Office

The landscape gardener has been busy around the premises of the division offices, and the pleasing change in appearance is noticeable.

The Indiana division had its share of high water during that period of April; probably much disaster was avoided by the constant attention and tireless efforts on the part of officials and employes.

There has been an unusual amount of business on the Mattoon district, beginning the latter part of April, coming through Evansville, mostly coal from the Kentucky mines.

##### Mattoon Shops

Earl Hayes, engineer on the Mattoon district, is off duty on account of the death of his father, G. W. Hayes, who recently passed away on his rice plantation in Arkansas.

Paul B. Myers, clerk in the office of Master Mechanic Bell, is attending convention of the clerks' union at Dallas, Texas.

It was observed that Conductor Wright was escorting passengers to his train from the station under an umbrella on the morning of April 17, on account of an extremely heavy rain. This action on the part of Conductor Wright is a fine example of the courtesy and consideration which the Illinois Central expects of its employes in their dealings with its patrons.

##### Trainmaster's Office, Palestine, Ill.

W. H. Hildebrandt, operator at Linton, Ind., left May 10 for Grayville, Ill., to meet his fiancée, Miss Mary Johnson. The two then went to Carmi, Ill., where they were married, after which they started on a short honeymoon trip. On their return they will make their home at Linton.

Dale Arnold, formerly clerk in Supervisor T. J. Flynn's office at Palestine, has resigned his position. "Chick" Adams, who will succeed Mr. Arnold, has been employed as clerk for Mr. Flynn once before.

C. E. Fulling, conductor in freight service,

left a few days ago for Toronto, Ontario, Canada, as a delegate of the B. of R. T. to attend the convention being held in that city.

L. H. McCain, freight conductor, has recently taken a position as brakeman on the passenger train and is moving his family to Effingham, Ill.

R. B. Smith, agent at Palestine, played his first game of baseball this season on May 7 with the Flat Rock team against the Clinton, Ind., team. His team was defeated.

Paul Maddox, conductor, recently returned from Chicago, where he underwent an operation, and is now able to be on duty.

F. P. Mills, conductor, has given up the Centralia run and has gone into yard service in Palestine yards.

Among the railway employes here at Palestine who have been in the automobile market this spring are J. S. Creswell, conductor, purchasing a coupe; Aaron Nutting, engine inspector, a coupe; Clair Walters, machinist, a roadster.

Harve H. Cordier, supervisor, Mattoon district, who has been at the Olney Sanitarium for the last six weeks, is recovering slowly.

B. Banta, conductor on Nos. 297 and 298, is off duty on account of sickness.

Brakeman C. G. Carlyle, on Nos. 297 and 298 with Conductor Akers, has been promoted to conductor.

Brakeman M. D. Alsop has given up the local freight and is braking for Conductor Huffcut on Nos. 273 and 252.

The Maltese shown herewith strayed "out of the nowheres" several months ago into the office of Agent J. B. Ryan at Olney, Ill., was

duly christened "Tom" and has become the pet of the office. In addition to this, Tom has taken upon himself, as one of his duties, the privilege of killing outright each and every rat that presumes to gnaw on the sacks containing meal, grain, and other foodstuffs in the freight office, thus becoming a claim pre-venter for the Illinois Central.

Tom

#### WISCONSIN DIVISION

Miss Theresa Johnson, supervisor's clerk at Freeport, has accepted a position as claim clerk at Bloomington on account of being displaced by the recent reduction in force at Freeport.

The engagement of Miss Frances Lavell, stenographer in the accounting department, Freeport, and John McGowan, operator at Amboy, has recently been announced.

We are grieved to learn of the death of Mrs. J. G. Swartwout, wife of J. G. Swartwout, pensioned engineer, which occurred at Jacksonville, Fla., April 20.

Dr. George Patrick Gill, Illinois Central surgeon at Rockford, who served as medical officer in the world war and was widely and favorably known as a practicing physician and surgeon and a patriotic citizen, died May 5 at Rockford after a brief illness, induced by overwork in his ministrations to his patients. In 1901 in a competitive examination he won an appointment to the U. S. Military academy at West Point. A year later he entered the medical school at Northwestern University, from which he was graduated in 1906. In 1909 he began a period of four years as examining physician for the U. S. Medical Corps, and when the war began he volunteered in the Murphy unit for service in the British Medical Corps with the rank of major and served from June of 1915 to the spring of 1916. When the United States entered the war in 1917 he volunteered for service and was at a port of embarkation to go overseas when the armistice was signed. He was instructor in surgery at Fort Riley, Kan., and Fort Oglethorpe, Ga., with the rank of lieutenant. On June 19, 1912, he married Miss Genevieve L. Petritz, who survives him, with two children.

#### Dixon, Ill.

F. J. McCoy was on the sick list the latter part of April, his place being filled by Charles O'Malley.

The Illinois Northern Utilities Company of this city is going to spend more than half a million dollars in this city, covering a period of two years, building a new power plant and an addition to the plant it now has here. When this is completed, Dixon will be the center of a chain of power plants owned by the Insull interest.

Dixon is in the middle of a building boom. Some twenty homes are being built, and more planned for the near future.

#### MINNESOTA DIVISION

James Hardy, 65 years old, died at St. Francis Hospital, Waterloo, May 5. Funeral services were held from St. Joseph's Church, Waterloo,

and burial was made in Calvary Cemetery. Mr. Hardy worked for the Illinois Central almost all his lifetime. He was the father of Frank Hardy, trainmaster's clerk, Waterloo.

Miss Martha Wunderlich, telephone operator, is on a leave of absence. Miss Bell Connors is relieving her.

J. D. Lavell, chief yard clerk, is spending an extended leave of absence in Seattle, Wash.

J. H. Pogle, switchman, and J. A. McDonnell, brakeman, have returned to work from an extended leave of absence taken on account of illness.

P. J. Smith, section foreman at Galena, Ill., has moved to Independence, Iowa, where he has accepted a position as foreman. W. R. Rolfe relieved Mr. Smith as foreman at Galena.

President C. H. Markham addressed the Shippers' and Manufacturers' Association at a dinner given at the Chamber of Commerce, Dubuque, Iowa, May 9. He talked on railway problems and inland waterways. Mr. Markham also addressed the Rotarians at their noon-day luncheon the same day.

#### Dubuque Freight Office

J. E. Allison, freight agent at Dubuque, has been confined to his home for some time with a severe cold and an attack of the grip.

We were recently honored by a visit from J. W. Rhodes, foreign freight agent at Chicago, accompanied by Mr. McDowd of the United Fruit Company, also of Chicago.

Owing to a reduction in the forces of the revising bureau, we were forced to lose Teddy Reigner from our office. Mr. Reigner has accepted a position with Morrison Brothers Company.

#### IOWA DIVISION

J. M. Finn, yard checker at Omaha, accompanied the body of his brother, Michael Finn, to Boston, Mass., leaving Omaha May 7. Michael Finn was secretary of the Omaha Western League baseball team and died suddenly in the grandstand while witnessing a game.

Yardmaster P. H. Waldorf of Council Bluffs is now making a trip over the system, in company with other yardmasters, as arranged by the management. The trip is to acquaint yardmasters with methods of operation at various points.

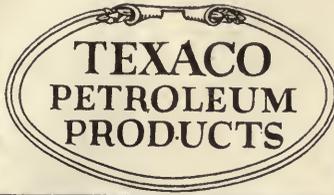

On May 13 Fort Dodge was favored by a visit from the chief dispatchers' committee, composed of W. G. Tiley of Champaign, E. C. Russell of Dubuque, J. E. Schneider of McComb and A. A. Freiburger of Memphis, who were making a trip over the system to acquaint themselves with conditions existing on divisions on which they are not employed.

Dispatcher H. T. Lindsay, Fort Dodge, is in the Illinois Central Hospital at Chicago for treatment and is getting along nicely.

Engineer A. G. Haines, assigned to service on the Omaha district, was selected to represent the Western Lines at the International Railway Fuel Association convention held in Chicago May 22 to 25. Mr. Haines was accompanied by Mrs. Haines.

Traveling Engineer S. B. Chapman attended the meeting of the International Railway Fuel Association at Chicago, May 22 to 25.

James P. Haynes, commissioner of the Sioux City Traffic Bureau, who has been appointed traffic director of the Chicago Association of Commerce, effective June 1, was presented with a gold watch by members of the Board of Trade

RAILROAD LUBRICATION

## A Few Valid Claims for Texaco Railway Lubricants:

### *Economical Fuel Consumption*

Central of Georgia during 1921 saved 91,265 tons of coal through better performance.

Another road in the Southeast saved approximately \$17,000 on their fuel consumption in month of February, 1922.

### *Increased Life of Cylinder Packing*

"This engine has made 75,000 miles, cylinder packing has not been removed in over 18 months. Valve chamber head has never been removed since engine received general repairs in May, 1919."

Roundhouse foreman states they are getting better results from cylinder packing than at any time prior to the use of Texaco products.

### *Minimum Carbon Trouble*

"Master Mechanic showed us cylinder packing taken from Pacific Type passenger engine after making 71,000 miles. This packing was only broken and was free from carbon."

### *Thorough Satisfaction*

"We have been using Texaco products for the past 14 or 15 years. Their service and products have always been thoroughly satisfactory."

### **The Best Railway Lubricants**

**THE TEXAS COMPANY**  
RAILWAY TRAFFIC & SALES DEPARTMENT  
New York Chicago Atlanta Houston

St. Louis, New Orleans, Dallas, Cleveland, Los Angeles, St. Paul

THERE IS A TEXACO LUBRICANT FOR EVERY PURPOSE

at a complimentary luncheon in the Elks club-rooms at Sioux City recently. Mr. Haynes was formerly traffic representative at Calro, Ill. He went to Sioux City from Calro in January, 1918, and has since been very successful in securing adjustments on grain and grain product rates for Sioux City, which has, on account of these rates, become one of the primary grain markets of the United States. Mr. Haynes has handled many other rate cases, such as coal, lumber, etc., adjusting Sioux City rate conditions in accordance with other large commercial centers. Mr. Haynes has received many compliments for his satisfactory work at Sioux City.

**KENTUCKY DIVISION**

R. A. Mock, for twenty-seven years employed as air brake man at Louisville, Ky., died at the home of his daughter, Mrs. W. W. King-ton, Mortons Gap, Ky., May 6, of nephritis. He was in his 70th year.

Mr. Mock entered the service at Louisville, June 24, 1895, and had been in continuous service since that date. He was always a faithful employe, worked regularly and had the interest of the company at heart. During the past five or six years he had been put on lighter work on account of his falling health, and his hopes were that he would be able to work until June 24, when he would be entitled to a pension.

Mr. Mock lost his wife in January, 1922, after a happy married life of nearly forty-five years,

R. A. Mock

and the shock and grief of her death are supposed to have hastened his end. He worked up until April 29, when he laid off to go to his daughter's home for a short rest. He had been there only a few days when he died.

Mr. Mock for many years was prominent in fraternal activities. He had been past master of Willis Stewart Lodge No. 224 of the Masons, and at the time of his death he was its tyler. He was also an honorary member of Kilwinning and Excelsior Lodges and also a member of Jr. O. U. A. M.

Funeral services were held May 9 at the Broadway Christian Church, Louisville, and burial was in Cave Hill Cemetery. Members of Willis Stewart and Preston Lodges of the Masons were active pall-bearers. Mr. Mock is survived by two sons, Otto D. Mock and E. O. Mock of Louisville, and three daughters, Mrs. W. W. Kington, Mortons Gap, Ky., Mrs. W. W. Franklin, Chicago, Ill., Mrs. J. M. Canfield, Harrisburg, Pa., a sister, Mrs. Annle Sweets,

New signal installations on the Kentucky division. No. 1 shows the method of mounting the rectifiers, lightning arrestors and charging switch in a style K relay box on the line side of the track. No. 2 shows the new automatic signals in Paducah yard. These are the northward signals B and C and the southward signal D mounted on a cantilever bridge at the North Yard office. This arrangement was necessary at this point because there was not sufficient clearance between the main track and the yard track for signal D. Foreman Pfeiffer and his gang are shown in the foreground. No. 3 shows the local wiring of signal J2262. Lightning arrestors, the charging switch and the signal mechanism are in the upper case, while the lower contains the charging rectifiers and control relays.

Montgomery, Ala., and two brothers, W. R. Mock, Ocala, Fla., and R. M. Mock, Louisville. —George Duckett, District Foreman.

A new daughter, Mary Louise, arrived at the home of Mr. and Mrs. A. H. Morton on May 5. Mr. Morton is chief clerk of the revising bureau, local freight office, Louisville.

Clifford Slider, clerk in the freight office, Louisville, has written both the words and music of another beautiful song, entitled "Dreams of Mother." While this song has not as yet been published, it was sung on May 14 in almost every church in New Albany, Mr. Slider's home, in commemoration of Mothers' Day. This young composer is also an accomplished musician of some note.

**Signal Department**

T. L. Davis, supervisor of signals, who is on leave of absence on account of ill health, has arrived at Phoenix, Ariz., where he will stay for some time.

The regular monthly signal department educational meeting was held at the Union Depot, Paducah, Sunday, April 23, with an attendance of thirty-five. Track circuits and mechanical interlocking were the subjects under discussion. Dinner was served at the Palmer House, and in the afternoon an inspection was made of the new signals recently installed through Paducah yard.

The work of installing the new automatic signals between Fox Run and Ilsley is progressing nicely, and Supervisor of Signals J. P. Price expects to get these signals in service before June 1. These signals are of the latest improved type and are equipped with electric lights for the night indications. The approach lighting circuit is used for the control of the electric lights.

New automatic signals of the 3-position, upper quadrant semaphore type have now been placed in service from the North Yard, Paducah, to Mile Post J229 on the Tennessee division. These signals represent the last word in improved signal design. An excide storage battery is used for the operation of the signal motors, line relays and track circuits. The battery is charged by the trickler charge system, by use of the Bryant Zinc Company's non-tune rectifier. The power for the 110-volt charging line is obtained from the city of Paducah. This installation also includes one 3-indication color light signal, Model L, furnished by the Union Switch & Signal Company, for governing train movements over the new hump yard. A separate transformer is included in each light

unit, the 110-voit A. C. being stepped down to 6 volts for the main lamps and 60 volts for the pilot lamps.

The regular signal department educational meeting was held at Leitchfield, Ky., Saturday, May 20. The subject discussed at the May meeting was insulated joints. The June meeting will be held at Central City on Saturday, June 17. The subject for discussion at the June meeting will be track relays.

Signal Gang No. 3, in charge of Foreman M. D. Weld, which has been on the Kentucky division since February, repairing the L. H. & St. L. interlocker at West Point, Ky., has been transferred to the Illinois division to take care of the signal work in connection with the construction of the new third track between Chicago and Kankakee.

Signal Foreman A. M. Pfeiffer is the successful applicant for the position of signal maintainer at Paducah, Ky.

Signal Maintainer E. F. Oates of Nortonville, who underwent an operation at Evansville, has now returned to work.

Signal Maintainer J. C. Martin of Rockport, who was temporarily assigned to Signal Gang No. 2, to take care of the wiring on the new signals through Paducah Yard, has now returned to his regular position at Rockport.

Signal Maintainer E. J. Davis, who accompanied his brother, T. L. Davis, on his trip to Arizona, has now returned to his regular position at Central City.

The Illinois Central is now a dollar better off by reason of the strange happening recorded in the following letter from Master Mechanic J. F. Walker at Paducah, Ky., to Superintendent T. E. Hill:

"Engineer Trantham was taking coal at Daniel Boone on April 19, train No. 176, engine No. 2949, when a man got up on the engine and put his hand in his overall pocket, standing very close to him. Trantham did not pay any attention to him, but after leaving Daniel Boone he ran his hand in his pocket and found a dollar bill. The man mentioned to Trantham that he appreciated a good run, which is evidence he rode on the train from somewhere besides Daniel Boone. Trantham did not know the man and know anything about if he rode on the train. He found the dollar bill in his pocket and brought the money to me. I am attaching it to this letter for your handling."

#### TENNESSEE DIVISION

E. N. Goddard, section foreman at Jackson, Tenn., has been commended for the unusual interest displayed by him while on train No. 6, en route to Fulton, Ky., when he noticed the north switch to the house track at Medina, Tenn., was unlocked, and got off, went back and locked the switch, returning in time to catch No. 6 and continue his trip to Fulton. It is gratifying to the management to note such interest displayed by the employes while off duty as well as on.

Alex Deeslie, who has been serving as general chairman for the B. of L. E. since January, 1919, has resumed his run on the Cairo district.

Mr. and Mrs. J. L. Joiner will represent the Jackson lodge of B. of L. F. & E. at the convention in Houston, Texas, this month.

Mrs. Wordie Brooks, stenographer to the agent, Jackson, Tenn., was one of the lucky

winners of the season ticket given by the baseball club for guessing nearest the correct number of paid admissions to the opening game on May 1.

S. A. Reed, Sr., father of Engineer Reed, who has been seriously ill, is reported to be much better.

Herbert Rankin, clerk in the superintendent's office, was called to St. Louis recently. His wife was ill in a hospital at that place.

J. S. Willingham represented the clerks of the Tennessee division at the convention held in Dallas, Texas, the first two weeks in May.

Switchman M. T. McLean, Jackson, Tenn., has been highly commended for discovering a defective wheel under C. & E. I. 1865, April 16, at Jackson, Tenn., which probably prevented a serious accident and the loss of many dollars.

Mrs. L. Castleberry has been granted a ninety days' leave of absence on account of the reduction of forces in the superintendent's office, Fulton, Ky.

#### MISSISSIPPI DIVISION

Major O. A. Harrison, who was born September 30, 1863, and died April 28, 1922, at the age

O. A. Harrison

of 59, began his career as an Illinois Central employe as a flagman out of Water Valley, August 10, 1882, when he was 19 years old. When 21 years of age he was promoted to conductor. He was in continuous service until his retirement on pension on account of ill health, March 31, 1921. At the time of his retirement he was running a passenger train between Canton and Holly Springs.

Mr. Harrison was Chief Conductor of Lodge No. 304, Order of Railway Conductors, located at Canton, and had been at the head of this lodge for twenty years. He was also chairman of the committee of conductors on legislation for Mississippi. He was honored by three governors of Mississippi as a staff officer, with the rank of major, which is a record excelled by few.

Mr. Harrison was happily married at Water Valley in 1885 to Miss Eva Henry, and his wife, two sons and a daughter survive him. Funeral services were held at Water Valley with Masonic rites, conducted by the Rev. L. P. Wasson of the First Methodist Church and brother Masons of Water Valley Lodge No. 402. Mr. Harrison was a member of the Methodist Church, a Mason and an Elk.

The body of Miss Georgia P. Calloway, formerly an agent for this company at Raine, Tenn., arrived in Oakland, Miss., April 26, from San Fernando, Cal. Miss Calloway was one of the occupants of an automobile that was struck by an engine on the railroad at Sylmar, a crossing near San Fernando. In the car with her were six persons, five of whom lost their lives. At the time of her death she was employed in Olive View Sanitarium at San Fernando, specializing in X-ray and laboratory work. During the World War she served in the American Medical Corps in Italy. Miss Calloway is survived by three brothers, two of whom are employes of this company, G. E. Calloway, agent at Oakland, and Albert Calloway, operator at Ackerman, and one sister.

## Look for this stamp on the watch you buy

*Ask your jeweler for these watches*

Then you can't go wrong in buying your watch. You need the best there is NOW.

It may be required LATER.

Originally, railroad watches were not adjusted to positions.

Later, three position adjustments were required.

Now, the inspectors are not allowed to pass any watches adjusted to less than five positions.

For the present, five position watches are standard.

But railroad requirements are continually going higher—not lower.

So why take any chances on a five position watch when you can just as easily get the superior

### SANGAMO SPECIAL and BUNN SPECIAL

Illinois watches which are adjusted to temperature, isochronism and SIX POSITIONS?

Write for a copy of our new 52-page booklet "Illinois Watches and Their Makers." You will incur no obligation in doing so.

**ILLINOIS WATCH COMPANY**  
Springfield, Illinois

Mrs. V. V. Styers, wife of Section Foreman Styers at Strong's, Miss., has just returned home from the hospital at West Point, Miss., where she has been for several weeks.

Last reports from Conductor J. T. Nason, who is still in the hospital at New Orleans, do not report much improvement in his condition.

J. R. Moorhead, engineman, Water Valley and Jackson districts, left May 10 for the Chicago hospital for treatment. He was accompanied by his wife and daughter, Miss Katie May, an employe of the superintendent's office.

T. H. Harper, timekeeper in the superintendent's office, displaced Miss Lola Bell Wiggs as

supervisor's clerk at Grenada because the position of timekeeper was cut off at Water Valley. Miss Wiggs in turn bid in the position of supervisor's clerk at Sardis, lately made vacant by the resignation of H. P. Patton.

We are glad to report E. A. Cleveland, D. V. accountant, back at his post of duty much improved in health after an extended stay in the hospital at Chicago.

J. P. Benson, local committeeman of the trainmen, Mississippi division, left Friday, May 5, for Toronto, Canada. He was selected as delegate from the Mississippi division to the convention of trainmen. Mrs. Benson accompanied him on the trip.

Here is J. M. Colson, Jr., 2 years old, son of Dispatcher J. M. Colson, Water Valley, Miss. He doesn't think dolls were made only for girls.

Conductor J. C. Turner, one of the old reliables, running on trains Nos. 7 and 8, has been off on leave of absence attending the convention of the O. R. C. at Cleveland, Ohio.

District Surgeon and Mrs. S. E. Cooper attended the annual convention of the Illinois Central surgeons at New Orleans recently.

We regret to announce the death of the wife of Engineman George Allen, Aberdeen district, recently.

Mrs. R. E. Howard, wife of Dr. R. E. Howard, company surgeon at Durant, Miss., died May 11 after an illness of several weeks.

Conductor H. B. Carr has returned from the hospital in Chicago and is now able to resume work.

R. E. Hall, conductor, Grenada district, surprised his many friends recently by announcing his marriage to Miss Ethel Moore of Grenada. After a short wedding trip, they returned to Grenada, where they will make their home.

A. S. Pate, fireman, Grenada district, after his recent promotion to the position of engineer, decided the next best step was to acquire a wife, which he lost no time in doing. The bride was Miss Barnes of Grenada.

J. Madden Smith, timekeeper in the master mechanic's office thirty-five years ago, was a pleasant visitor here recently. He is now living in Memphis, where he is the successful manager for a large insurance company.

Eris McCarley, formerly an employe at the Water Valley shops, recently married Miss Lillian Bell of Water Valley, Miss.

Engineer and Mrs. P. Ohlson have returned from a pleasant visit to Elkhart, Ind.

The first shipments of vegetables by the Yalobusha County Farmers' Bureau are beginning to move. It is believed that this is the beginning of an extensive movement toward the growing of the more valuable truck and farm crops in this section. The Illinois Central Development Bureau is co-operating with the local truck growers and rendering valuable service.

To date (May 10), fifteen cars of strawberries have been shipped from Batesville. This is a

**"Beautiful Durant"**  
 On The Illinois Central  
**Association**  
 See Other Side of This Card

**Objects**

OF THE ASSOCIATION

- To make Durant known as the best town of its size between Chicago and New Orleans.
- To interest Illinois Central employes in promoting the welfare of Durant.
- To improve the town by rendering the best and most courteous railroad service practicable.
- To interest the business men of Durant in promoting the welfare of the Illinois Central.
- To assist the Railroad by directing travel and traffic over its lines.

**FACTS**

- Fifty per cent of Durant's population is made up of Illinois Central employes.
- Seventy-five per cent of Durant's population is dependent, directly or indirectly, on money paid out by the Illinois Central Railroad.
- A town usually prospers according to its Railroad facilities
- A Railroad prospers according to the business activities of its towns.

Resolved, Let us go forward.

*The card shown herewith, which is self-explanatory when handed out by an Illinois Central employe from Durant, Miss., was originated by Trainmaster W. H. Petty of the Aberdeen, Grenada and Winfield districts of the Mississippi division.*

new business with the farmers of that territory and is in a somewhat experimental stage this year. About 200 acres were planted this year, and this will be increased to 400 next year.

J. A. Young, bridge foreman, has returned from the hospital at Paducah, where he has been for treatment.

LOUISIANA DIVISION

H. A. Mercer, supervisor, Yazoo district, was slightly injured in an automobile accident at Yazoo City on April 30 and was absent from his work for several days.

Miss Jesse Lee McEwen, bill clerk in the agent's office at McComb, and Robert Rueff, yard clerk at McComb, were married on April 29 at the residence of the Rev. F. Z. Brown, pastor of the Presbyterian Church. Miss McEwen has been in the service since May 18, 1920, while Mr. Rueff has been an employe since June 8, 1917.

J. T. McMaster, night yardmaster at Gwin, has been promoted to be general yardmaster at that point in place of W. Wicker, who accepted a position as trainmaster at Mounds, Ill. Mr. McMaster entered the service as a switchman July 13, 1918, and was promoted to night yardmaster, February 8, 1919, and to general yardmaster, April 15, 1922.

I. T. Grafton, engine foreman at Gwin, who entered the service August 21, 1913, was promoted to night yardmaster at Gwin, effective May 2, 1922.

Louis Billar, formerly secretary to the superintendent, now residing in Big Creek, Cal., was a recent visitor to the office.

Wiley Wilkinson has accepted a position as assistant statistician in the superintendent's office.

Mrs. Margaret McCullough, file clerk in the agent's office at McComb, entertained a few friends at 500 on May 3. Della M. Dougall, Artis Albritton and Tom Evans of the superintendent's office were among those present.

C. Bourgeois, chief accountant in the superintendent's office, now on leave of absence, is spending the summer at Covington, recuperating.

Curtis J. Wepler, masonry inspector, and Miss Irene Taylor, formerly employed in the master mechanic's office, were married at Hammond, La., April 22. Miss Taylor is the daughter of John Taylor, engineer, Louisiana division.

NEW ORLEANS TERMINAL

The New Orleans terminal store department, formerly under the jurisdiction of C. B. Sauls, division storekeeper at McComb, is now supervised by I. S. Fairchild, lately of Chicago, who has his office at the Union Station, New Orleans.

The superintendent's office will soon be kept posted on radio news. J. T. Hallam, clerk, is constructing a complete radio receiving and amplifying set at his residence.

Yard Clerks Stein, Spraul and Meirer recently obtained a camp at Manchac, on the Illinois Central, where one may hunt and fish to his heart's content. They are planning to spend some enjoyable week-ends at that point this summer.

H. E. Boudreaux, clerk in the accounting department at Stuyvesant Docks, and Miss Thelma Daigle of Houma, La., were married on Saturday, April 29, at St. Lawrence Church, Houma.

J. Kenner Donnelly, chief claim clerk at the local office, journeyed to Beaumont, Texas, April

J. M. LYON & CO. 2-4 Maiden Lane New York

Scene in City Park, New Orleans

8, as a visitor to the freight claim prevention meeting of the Gulf Coast Lines, representing Agent Seiler, who was unable to attend.

Henry Reinhardt, our "live wire" publicity man, left Saturday, April 29, for Dallas, Texas, to attend the convention of the Brotherhood of Railway Clerks.

L. C. Wright, foreman in the LCL department, Poydras Yard, assisted in entertaining the Knights Templar during the conclave.

The New Orleans terminal freight station excelled its previous record in claim payments for loss of entire package (outbound shipments) in April, 1922. Only one claim was paid—\$7.52.

**MEMPHIS TERMINAL DIVISION**

**Mechanical Department**

(W. A. Frost)

W. J. Rapp, pipefitter, has returned from New Orleans, where he attended the International Association of Machinists' convention.

Andrew J. Taylor, 44 years old, better known to his friends as "Jack," died in the General Hospital a few hours after being taken there. He had been employed for some time by the Illinois Central in the general storeroom department, and his sunny disposition won him a large circle of friends among his fellow-workers. Mr. Taylor is survived by three sisters, Mrs. Carl Dick of Indianapolis, Mrs. Walter Barnes of Chicago, and Mrs. Allie Cootsworth of Long Beach, Cal. Burial was at Evansville, Ind.

Mrs. John Caséy, wife of Drill Press Operator John Casey, who has been in the General Hospital for an operation, has so far recovered as to be removed to her home.

B. M. Turner, machinist, and family have removed to Springfield, Mo., where they will make their home.

Miss Hazel McDonald of the store department has been absent from duty for a week. Her mother, Mrs. Kate McDonald, was operated on at St. Joseph's Hospital.

L. R. Swofford, foreman of the electrical department of the Illinois Central, his wife and son have gone to Vicksburg, Miss. Mr. Swofford has but recently recovered from a severe case of scarlet fever.

J. H. McGregor, machinist, who has been on the sick list for a week, has resumed work.

John Staneup, accountant in the storeroom department, has resumed work after being on the sick list for a week.

Roy Smith, night hostler, who was operated on at St. Joseph's Hospital for tonsillitis, is improving rapidly.

W. J. McNulty, boilermaker foreman, has removed from McLemore Avenue to 572 Mallory Avenue.

M. L. Alvarez, Illinois Central brakeman, who suffered the loss of a leg in a rail accident and was removed to St. Joseph's Hospital, is reported very much improved.

B. J. Haley, machinist, who recently underwent an operation at the Illinois Central Hospital in Chicago, has returned home.

Joseph Peters, former Illinois Central employe, who has been visiting friends in this city, has returned home. Mr. Peters is traveling airman for the L. & N., with headquarters at Birmingham, Ala.

Sidney Weaver, Illinois Central apprentice, has returned home from Chicago, where he underwent a successful operation at the Illinois Central Hospital.

What is considered a record was made by the Illinois Central in handling the trains carrying the Knights Templar delegates to the conclave held in New Orleans recently. On the night of April 22 and 23, fifteen trains, aggregating 150 Pullmans, were handled. The coaches bearing the Memphis delegates were attached to these trains going through to New Orleans.

At the last meeting of the Lauderdale Improvement Club, the members indorsed Professor Toryson of the Lauderdale School for principal of the new South Side school. Mr. Toryson is one of the oldest principals in service in Memphis, having been connected with the public schools for more than twenty years. He is a fine disciplinarian and an up-to-date school man. Should the Board of Education see fit to select him for this place, the appointment would give great satisfaction to the patrons of the school in the South Side. He was also indorsed by the South Memphis Business Men's Club at its regular meeting.

At the regular meeting of the Greenwood Civics Club, the members indorsed Professor Toryson for principal of the new South Side school. Addresses were made by W. F. Lauer, president of the Lauderdale Improvement Club, and Dr. Booker Leroy of the Oakville Sanitarium. A short musical program was also given by members of the Cummins' School.

Flagman W. R. Thompson, Tennessee division.

*"More miles to the pint;  
Better service to the mile!"*

*"When Galena Oils go in  
Lubrication troubles go out."*

## The Test of Railway Lubricants

There is nothing to compare with the test of actual service in determining the quality and durability of railroad lubricants.

The very nature of the work—its widely varying degrees of weight, speed and temperature—demands strength and stamina far beyond the capacity of the average "good lubricants."

Oils that may satisfactorily fill the requirements of ordinary machine lubrication will invariably break down under the strains of railroad work, unless endowed with essentials of strength and endurance peculiar to basic quality.

Galena lubricants, above all, are quality products. The stocks from which they are manufactured are built to Galena specifications from the finest crudes that nature produces. The exclusively Galena Compounding processes—developed by this company through its more than half century of specialization—adds the further physical properties necessary to the high type of lubricating efficiency always identified with the use of Galena Oils.

The superior quality of Galena lubricants and the exceptionally valuable lubrication service that accompanies them, make possible the unequalled performance records on hundreds of American railroads—records that prove by both mileage and fuel saving their ultimate economy.

**Nonconnaah Car Shops**

(C. R. Creedon)

General Car Foreman Arnold was among the notables present at the fiftieth anniversary celebration held at McComb, Miss., recently.

*Card Used at Memphis*

has moved from Fulton, Ky., to Memphis and will make his home at 339 Laclede Avenue.

John Wix, engineer, who has been in the Illinois Central Hospital at Paducah, Ky., for an operation, has returned home.

E. E. Sledge, conductor, Mississippi division, is building a handsome new bungalow on the speedway. When it is completed, he will occupy it as his home.

T. J. Evans, night yardmaster, who has been confined to his room by malaria, has so far recovered as to resume work.

A. C. Frozier, machinist, has returned home from New Orleans, where he has been representing the Illinois Central shopmen at the International Association of Machinists' convention.

George Utz, machinist apprentice, who has been confined to his home on account of illness, has resumed work.

A. J. Nil, machinist, received a painful injury recently. While he was playing ball, a batted ball struck him in the mouth, knocking out four teeth.

The Illinois Central call boys held a May Day ball at Samuelson's Hall, May 1. It was largely attended, and an enjoyable evening was spent.

Miss Mary Britt of Eaufula, Ala., who has been visiting her sister, Mrs. J. Newman Jones, 558 Lucy Avenue, has left for an extended tour of Southern cities, including New Orleans, Algiers, Jackson, Ashville and Birmingham. She has a large number of friends in railway circles in Memphis. A card party was given in her honor by Mrs. W. B. Malone, wife of Federal Inspector Malone, 558 Lucy Avenue.

Conductor A. E. Bookwright has resumed work after a minor operation at St. Joseph's Hospital.

F. J. Reedy, blacksmith, has returned to work after being absent for a week on account of illness.

A. E. Fox, machinist, who has been confined to his home with an injured foot, has returned to work.

The Parent-Teachers' Association, through its president, Mrs. Gilberson, has presented the Lauderdale Fife and Drum Corps with a handsome flag.

P. O. Bailey, machinist, who was taken with a stroke of paralysis and taken to St. Joseph's Hospital, has not recovered his reason. He will be removed to the county asylum for observation as regards his sanity.

Engineer von Bergen has returned to Memphis after a two months' absence. He was recently appointed lubricating engineer for the Southern Lines of the Illinois Central and the Y. & M. V., and he has been investigating automatic train control in Chicago, Washington and New York.

R. H. Tinsdale, engineer, who was injured at Gibbs, Tenn., and taken to St. Joseph's Hospital and later to his home, 298 Edith Street, is reported on the road to recovery.

Fred Jones, blacksmith, has returned to work after being on the sick list for two weeks.

*E. E. Arnold, 2½ years old, is the son of Mr. and Mrs. E. E. Arnold, 568 Lucy Avenue, Memphis, Tenn. By heredity, he is a future railroader, as his father, at present assistant general car foreman at Memphis, has been in the employ of the company twenty-three years. His grandfather, the late Martin Arnold, who served the company thirty-four years, was a passenger conductor on the Louisiana division at the time of his death.*

Prior to his acceptance of his present post at Memphis, Mr. Arnold held municipal office at McComb for fourteen years, seven of which he served as mayor.

G. L. O'Connor and W. B. Higgins are again on duty at the shops after six months' supervision at the American Car & Foundry Company, Binghamton, Tenn., where they were in charge of the Illinois Central's rebuilding of equipment program at that shop.

Car Inspector F. L. Haire suffered the loss of his left arm and received several minor injuries in an accident on April 5.

J. R. Lee, tool foreman, is back on the job after a week at the bedside of his son, J. R., Jr., who is now on the road to recovery after having undergone a serious operation.

M. L. Thompson was confined to his home several days, due to an attack of the flu.

Foreman Harry Dubowich let a contract recently for two new bungalows to be built adjacent to his home on Trigg Avenue.

Inspector R. T. Laird is on the convalescent list, having recently undergone an operation for appendicitis.

The Car Department players were the lucky contenders in the J. A. Keefe Indoor Baseball League for the loving cup awarded by J. A. Keefe, in whose honor the league was named. The league consisted of two Illinois Central teams, the Auditors and the Car Department, one Memphis business firm team, Orgill Bros., and one fraternal team, the Y. M. I. The Car Department came out victorious in every game played during the season.

Foreman and Mrs. G. L. O'Conner are being congratulated upon an addition to the O'Conner

family—a little son, George Lawrence, Jr., born May 4.

R. L. Christie, formerly chief clerk to the master mechanic of the Southern Pacific at Tucson, Ariz., is the new chief A. R. A. clerk to the general car foreman. Prior to his affiliation with the Southern Pacific, Mr. Christy

**L. W. SWEET, Inc., Dept. 662-L, 1650-1660 Broadway, N. Y. C.**

was a traveling M. C. B. checker for this company out of Chicago from 1913 to 1915.

Foreman and Mrs. M. L. Thompson are spending several weeks in Sunny California, Los Angeles being the main point of interest.

**VICKSBURG DIVISION**

An agent's life is full of queer experiences. Agent A. M. Mallory of Cleveland, Miss., recently wrote several letters to Thomas E. Ogden, negro, requesting payment of an undercharge. Eventually this reply showed up:

"Dear Sir: Received your letter as per other side. In reply to same, beg to state:

"I owe you six and eighty four;  
I would love to pay it somehow,  
But I haven't any money;  
So you see I can't do it now.

"If I have luck in making cotton,  
Why, I'll gladly pay it this fall,  
But I'm damn 'fraid the boll weevil  
Won't allow me to pay it at all.

"You may oblige me by being assured that I shall make this remittance at my earliest possible date, probably in this inst."

**NEW ORLEANS DIVISION**

The high water situation, generally speaking, along the line on the New Orleans division is as satisfactory as can be expected, and a spirit of optimism prevails among those in charge. There is no relaxation of vigilance among the workers, and if present conditions (the middle of May) can be maintained the fight will be highly successful. Press and public are united in their appreciation of the efforts of the railroad, and when the time comes to tell the final tale there will be lots of interesting details to relate.

Few accidents have marked the high water fight, the most serious being that which befell O. W. Penalver, switchman at Vicksburg. Mr. Penalver had a leg broken, the result of un-

avoidable contact with floating pavement blocks while riding on a footboard when the engine was plowing through an inundated section of Levee Street. Mr. Penalver is rapidly recovering.

Conductor R. B. Cooper recently departed for Cleveland, Ohio, to attend the convention of the O. R. C.

Trainmaster F. H. Anderson has returned from Harrisburg, Pa., where he was called by the death of his sister, Mrs. Anna Carlson.

Engineer Elmer Lees and Fireman J. D. Coffey were recommended by the division and selected by the general superintendent to attend the convention of the International Railway Fuel Association as representatives of the Y. & M. V. Both men were untiring in the recent fuel campaign, and their appointment gives general satisfaction.

Lloyd Kiernan of Superintendent Mays' office has been transferred to the office of the general superintendent.

The Y. & M. V. Baseball Club, which won most of the games among the amateurs in the season of 1921, is in process of reorganization. The club will meet all comers in its class and hopes to make even a better record than last year.

Roy Terrell, vice-president of the Gulf Coast Line, recently made a friendly call on Superintendent Mays.

V. V. Boatner, president of the Peoria & Pekin Union, was an appreciated visitor recently.

# Illinois Central System Calls Attention to the Careful Crossing Campaign

The safety section of the American Railway Association has announced its "Careful Crossing Campaign," to be in progress from June 1 to September 30. In the past, these four months have been the worst third of the year for motor vehicle grade-crossing accidents. In preparation for the campaign, the country has been covered with posters and stickers bearing a picture of a grade-crossing scene, showing a locomotive in the act of striking an automobile occupied by men, women and children. Above the picture are these words in large letters: "Cross Crossings Cautiously."

The public will understand the seriousness of this problem when it is explained that the number of motor vehicles registered in the United States increased from 1,033,096 in 1912 to 10,449,785 in 1921. There is now one motor vehicle for every ten persons in the United States.

Some believe that it is the duty of the railroads to protect motor vehicle users from their own carelessness by separating the grades at crossings. There are 252,000 railway grade crossings in the United States. It has been estimated that it would cost \$12,600,000,000 to eliminate them, or two-thirds of the total value of the railroads, as established by the Interstate Commerce Commission for rate-making purposes. It will be seen, therefore, that grade-crossing elimination is out of the question, at least for a long time to come. If the drivers of motor vehicles can be educated to "Stop, Look and Listen" at crossings, this will give the same result as the expenditure of \$12,600,000,000, so far as safety is concerned.

The railroads have made splendid progress in reducing the number of accidents resulting in injury to their passengers and employes. However, motor vehicle grade-crossing accidents have been steadily increasing for years. These accidents are caused almost entirely by the negligence of motor vehicle drivers, and for that reason the efforts of the railroads to reduce them have been unavailing.

During 1920 there were 3,012 automobiles struck on grade crossings. In these accidents there were 1,273 persons killed and 3,977 persons injured. If the drivers of the motor vehicles involved in these accidents had "Stopped, Looked and Listened" at the crossings, not one of the accidents would have occurred.

A motor vehicle in the hands of a careful driver is an agency for safety. It can be driven up close to the railway track and stopped in perfect safety—differing from horse-drawn vehicles in that respect.

The Illinois Central System heartily approves the "Careful Crossing Campaign" of the safety section of the American Railway Association. We appeal to our patrons and friends and our employes to co-operate in every way possible to make the campaign successful.

We want the public to know us and what we stand for. Our motto is "Service." By co-operation with our patrons we have found many ways in which we can render them exceptional service, and our patrons, in turn, have served us well.

Constructive criticism and suggestions are invited.

**C. H. MARKHAM**  
President, Illinois Central System.

# Do You Want \$200 a Week?

## The Amazing Story of Carl Rowe, Who Rose From An Income of \$50 A Week To \$1,000 A Month

### These Men Are Making Big Money

Here are just three of the Comer Representatives who are making large profits and making them easily. They find that they can take an hour or so of spare time any day and make plenty of extra money. Or they can devote all their time to Comer work and make large and steady income. Read their records and hear what they have to say regarding the Comer Way of making big money.

Carl P. King, of Kentucky, a machinist, says: "Since I received my outfit the time I've spent calling on customers has paid me \$3.00 an hour profit."

F. E. Wright, South Carolina, railroad man, finds the Comer Agency a great profit maker. \$256.56 for one month's leisure hours' effort.

J. J. Maher, of Maine, finds the Comer Business a sure way to steady and large profits. He averages \$250 to \$350 a month and frequently goes over the \$500 mark.

You can make profits like these just as easily as King, Wright and Maher. You don't need experience or previous training to start. The Comer Way shows you how to make big money from the first day, and how to keep right on making it.

My name is Rowe—Carl Rowe. I live in a small city in New York State.

I am going to tell you an amazing story about myself. It may seem too strange to believe, but you can easily verify everything I have to say.

Two years ago I was a baker. I was struggling along, trying to make the money in my pay envelope meet the increasing expenses of our family. There was no prospect for the future.

Today, just two years later, I am a successful business man. I have plenty of money for all the things we need and want. Last month I made \$876 during my spare time, and was able to put \$200 a week in my savings account.

I am going to tell you how it happened. Please remember that two years ago I had no surplus cash. I was in the same fix as nine out of ten other men. Expenses were constantly mounting and my salary, although it had increased, could not keep pace with the cost of living. My wife had to do without things that I knew she ought to have. We wanted an automobile, but we couldn't afford it. We wanted to buy our own home, but we couldn't afford that.

It made me desperate to think of what might happen if I became sick or lost my job. I worried about it, and so did my wife. We were living from hand to mouth, and we didn't know what calamity and hardships might be lurking just around the corner.

And yet—today—I own our nine-room house. I have an automobile. I have money for books, the theatre, or any other pleasures that I may want. I have the cash today to educate my son and send him through college.

Here is how it happened. One day in glancing through a magazine I read an advertisement. The advertisement said that any man could make from a hundred to three hundred dollars a month during his spare time.

I didn't believe it. I knew that I had worked hard eight hours a day for \$50.00 a week, and I figured that no man could make that much during a couple of hours a day spare time.

But as I read that ad I found that it pointed to men who had made that much and more. In the last paragraph the advertiser offered to send a book without cost. I still doubted. But I thought it was worth a two-cent stamp, so I tore out the coupon and put it in my pocket and next day on my way home from work I mailed it.

When I look back to that day and realize how close I came to passing up that ad, it sends cold chills down

my spine. If the book had cost me a thousand dollars instead of a two-cent stamp, it would still have been cheap. All that I have today—an automobile, my home, an established business, a contented family—all these are due to the things I learned by reading that little eight-page booklet.

There is no secret to my success. I have succeeded beyond any dream I may have had three years ago, and I consider myself an average man. I believe that I would be criminally selfish if I did not tell other people how I made my success.

All the work I have done has been pleasant and easy, and withal, amazingly simple. I am the representative in this territory for a raincoat manufacturer. The booklet that I read was one issued by that company. It tells any man or woman just what it told me. It

offers to anyone the same opportunity that was offered to me. It will give to anyone the same success that it has brought to me.

The Comer Manufacturing Company are one of the largest manufacturers of high-grade raincoats on the market; but they do not sell through stores. They sell their coats through local representatives. The local representative does not have to buy a stock. All he does is to take orders for Comer raincoats and he gets his profit the same day the order is taken. Fully half my customers come to my house to give me their orders.

My business is growing bigger every month. I don't know how great it will grow, but there are very few business men in this city whose net profit is greater than mine, and I can see only unlimited opportunity in the future.

### A Special Offer to Railroad Men

If you are interested in increasing your income from \$100 to \$1,000 a month and can devote all your time or only an hour or so a day to this same proposition in your territory, write at once to The Comer Manufacturing Company, Dayton, Ohio. This is their special offer. They will send you, without any preliminary correspondence or red tape, a complete selling outfit with full instructions, samples, style book, order book and everything you need to get started. Sign and mail the coupon now and in less than a week you can be making more money than you ever believed possible.

### Cut Out and Mail

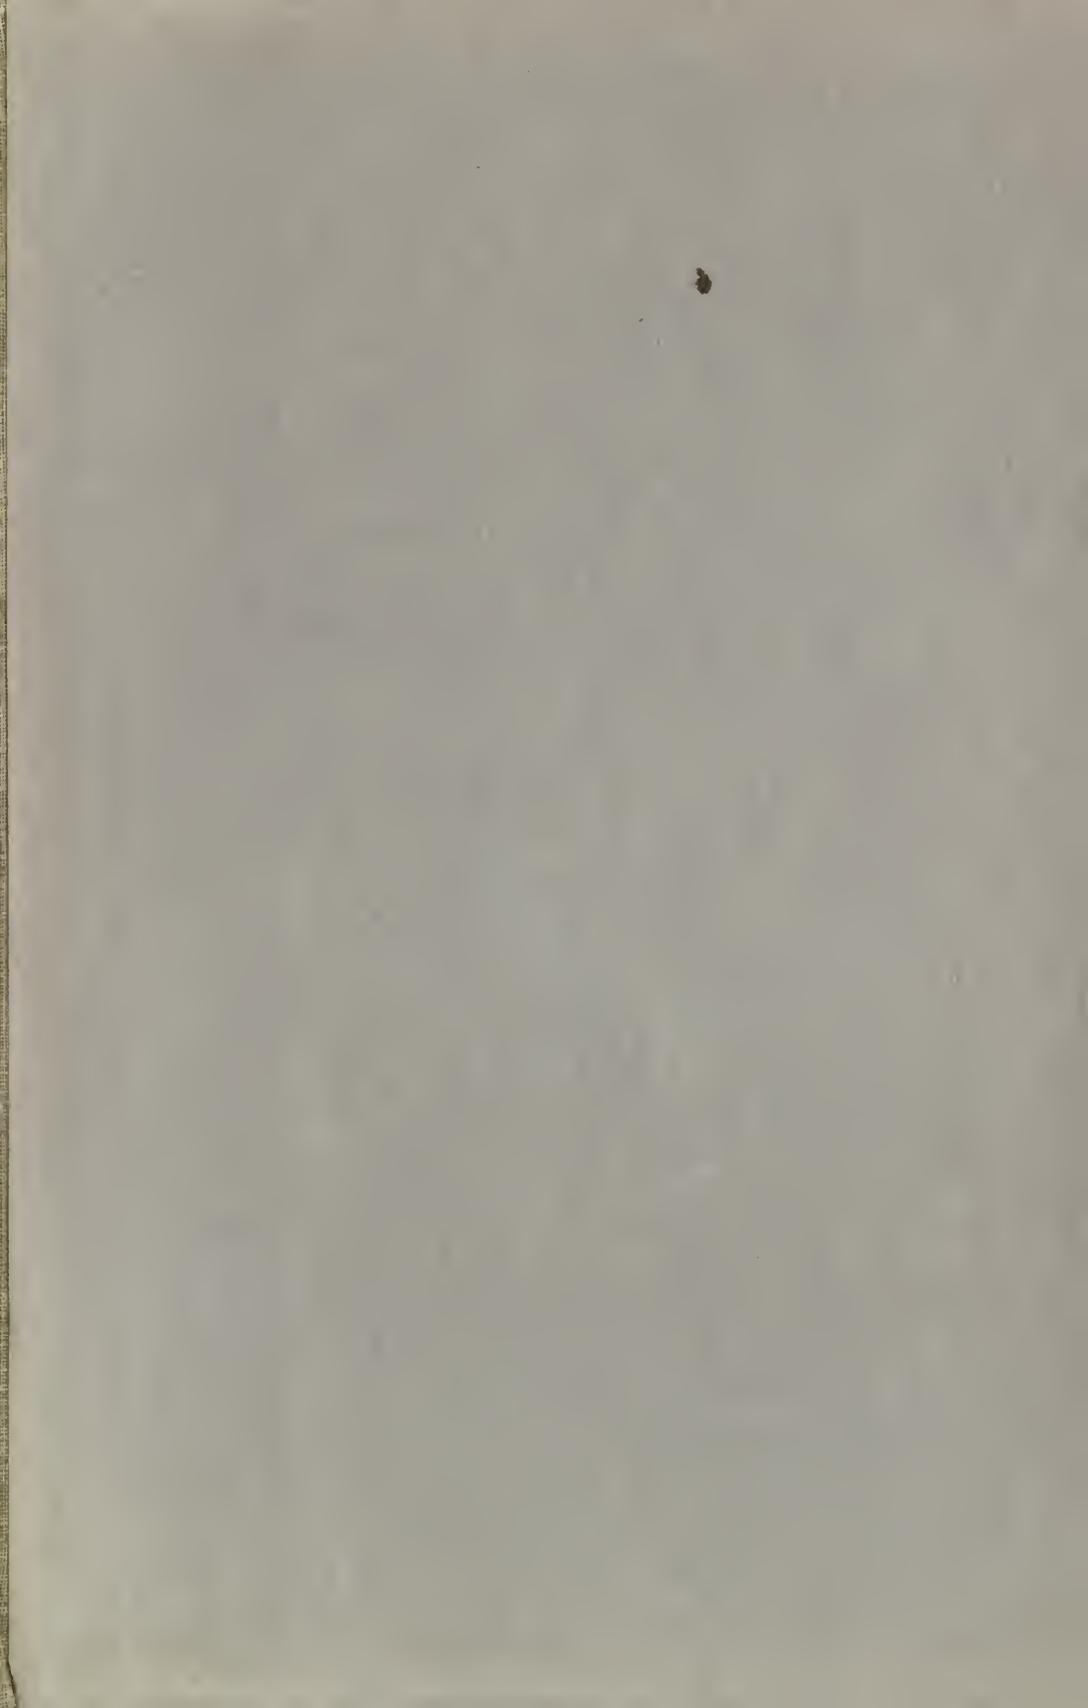

The Comer Mfg. Co., Dept. Y-61, Dayton, Ohio. I am ready to start as a Comer representative if you can show me how I can make from \$50.00 to \$200 a week. Please send me, without any expense or obligation to me, complete outfit and instructions. Name ..... Address .....
