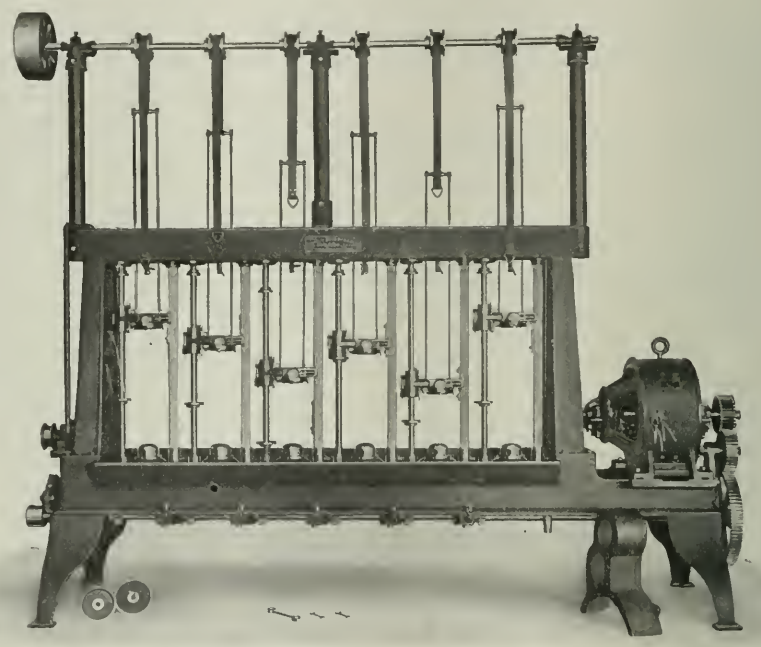
The experience of locomotive builders and railroads has proved the superior advantages of using boiler staybolts which have been turned to a reduced diameter at the center over the old method of using bolts threaded for their entire length. When the center portion of the staybolt is reduced, a smooth surface comes in contact with the water and the strains due to expansion and contraction of the firebox sheets have less tendency to break off the stays. The Harrington staybolt threading and reducing machine shown herewith cuts the threads accurately and automatically reduces the center of staybolts to any desired form in one operation. The machine has six spindles and will thread staybolts of any length up to 30 in. They can be inserted and removed while the machine is running. The capacity of the six-spindle machine at a spindle speed of 80 r.p.m. is 225 staybolts per hour, $7\frac{1}{2}$ in. long and 12 threads per inch, threaded and reduced in the center. For a working day of 10 hours, the average output would be 2,250.

The heads which carry the dies and reducing tools are each mounted on two upright guide bars. They are fed downward by lead screws to correct any inaccuracy of the threads cut by the dies. The threading dies and reducing tools are both automatically thrown in and out, and the split nut engaging the lead screw is thrown open at the bottom of the cut. The head is quickly returned by a strap over a pulley lift and requires no appreciable effort by the operator. The threading dies have four cutters of high-speed steel. They are adjustable and of the quick opening and closing type. There are two reducing tools mounted in each head and acting opposite ly to each other to prevent side strain. They are both controlled by one former, the shape of which is exactly similar to the desired reduction in the stay rod. It is fastened to the square guide bar by bolts in T-slots and is adjustable the entire length. The spindles and lead screws are controlled by two horizontal shafts underneath the bed. The change feed gearing is at the outside end and easily accessible.



Harrington Staybolt Threading and Reducing Machine.

The machine is built either for belt or motor drive, as may be desired. The cutting oil is carried from the large reservoir in the tank overhead by a geared pump and is fed directly onto the work in a stream. With each machine is provided one set of high-speed steel threading dies per spindle for any one pitch, one pair of reducing tools and one former per each spindle, and the necessary change feed gears for 10, 11 and 12 threads per inch. The floor space occupied is 4 ft. in width and 11 ft. 6 in. long for belt, or 13 ft. 6 in. long for motor drive. The height to top of pulley on lift shaft is 11 ft.

The machine is made by Edward Harrington, Son & Co., Inc., Philadelphia, Pa.

Fuel Department on the Santa Fe.

For the purpose of maintaining a more complete supervision of the receipts, issues, distribution and accounting for fuel the Atchison, Topeka & Santa Fe has established a fuel department, with C. F. Ludington as Chief Fuel Supervisor, with headquarters at Topeka, and H. E. Westcott, Fuel Supervisor for the Coast Lines, with headquarters at San Bernardino. These men will appoint and be responsible for the work of all employees engaged exclusively in receiving, storing, delivering and accounting for all fuel. The fuel department will receive and compile all reports from fuel stations, making such reports to the audit and other departments as may be necessary. It is the intention to relieve agents and others in the transportation and mechanical departments, as fast as practicable, from responsibility in fuel department matters.

Per Diem on the New Haven.

The disagreement between the New York, New Haven & Hartford and its western connections, concerning rates for car service, remains unsettled. Elaborate statements on both sides of the controversy have been published but little or nothing is brought out that is new. On behalf of the New Haven, it is declared that the rental should not be the same for an old $300 car as for a new one worth $1,200; that the average gross receipts per carload on the New Haven line for freight received from the West are $18; and that the average freight car interchanged is worth about $475, making the annual rental 40 per cent. of the value of the car.

On the other hand, someone representing the American Railway Association says that the New Haven is little if any worse off than the Reading, the Central of New Jersey, the Long Island and other eastern roads; that at the former rates for freight cars the New Haven has always had an advantage over the other roads; that a scale of different rates for different sizes of cars would afford opportunity for juggling in interchange; that the New Haven is already receiving a very much larger share of the through revenue on through shipments than its mileage entitles it to; that the "four days free" law of Connecticut is not so important as it seems, because the average consignee unloads cars in $2\frac{1}{2}$ days, which is only 25 per cent. longer than in other states, and no longer than in Virginia; that the New Haven might defy the Connecticut law on interstate shipments if it saw fit but from motives of policy does not do so. The latest demand of the New Haven is for equal interchange and $1 per car reclaim. This proposition has been declined by the connecting roads.

Following this statement an officer of the New Haven has issued a rejoinder in which he says:

The New Haven road is a great switching yard for its trunk line connections. It does not receive for the character of business it does a large division of the rates—no more of a division than would any other road similarly situated and obliged to furnish the enormously expensive terminals that the New Haven does. The average detention of a freight car in the territory served by the New Haven is approximately nine days, which, at 50 cents a day, averages a charge of about 30 per cent. of the gross receipts of the New Haven for doing the business. The New Haven road knows of no reason why it should arbitrate a matter of this kind, believing the best arbitration in the world is that of the courts. It has no objection to arbitration beyond the fact that it is generally a

compromise. * * * It would be a relief to the New Haven road if it could go out of the all-rail coal business, but that would inflict loss upon individuals. It is true that the law of Connecticut may not be applicable to interstate shipments, but it was intended by the legislature that it should apply to all shipments, and it would be impolitic for the New Haven to try to accomplish by indirection an evasion of the will of the people of the state. The New Haven has ordered a large equipment of freight cars, and when well equipped its policy will be to require the use of its own equipment on shipments to and from its own stations, and not to permit the nondescript equipment now being delivered it by its connections to remain in the service, 50 per cent. of which is worth not to exceed one-third of the average of what it will be prepared to furnish upon request. It is unfortunate that the roads should be unable to agree among themselves. It is not going to be productive of benefit to the New Haven to even win in such a controversy, but an indisposition to be fair on the part of its connections forces its hand to a tribunal wherein neither party will have any advantage and where it is willing to rest its case.

"Say, Doc, if I have to have a doctor, I'd rather trust to you than to that bunch over there."

—McCutcheon in *Chicago Daily Tribune.*

Deaths from Concrete Collapses.

A New York press agency reports that in the half year ending Dec. 31, 1906, 31 persons were killed by collapses of concrete buildings in the United States. The accidents occurred at South Framingham, Mass.; Elyria, Ohio; Mineola, N. Y.; Long Beach, Cal., and Rochester, N. Y. This year two persons were killed in the failure of a concrete building in Philadelphia. In every case, it is said, the builder claimed that he had taken all known precautions against collapse.

The "Montreal" Street Car.

The New York City Railway has ordered 155 new cars to be used on its Madison and Fourth avenue (surface) line, which are similar to those in use for the last two years in Montreal with entrances and exits so arranged that fares can be collected as the passengers enter, and the company promises that these cars shall be put in service early in December. The new cars are 48 ft. long and 32 ft. long over the body, seating 36 passengers. Each car has four motors and air-brakes. The rear platform, which is 7 ft. 6 in. long, is divided by a railing into two parts, one for passengers entering and the other for passengers going out, and the entrance portion will hold 20 passengers, so that that number can be admitted and the car started and the fares then collected, as the passengers pass into the car, during its passage to the next stopping place. The platforms are enclosed or vestibuled. The conductor will ordinarily stand on the rear platform, there being no necessity for him to go inside the car to collect fares. Push-buttons are provided between each two windows, by which passengers can signal to have the car stopped. Passengers may leave the car at the front end, but all must enter at the rear. The cars cost $7,200 each.

It is said that since the Montreal lines have been fully equipped with cars of the new style passenger receipts have increased 27 per cent. and more in single months as compared with the business under old conditions, and some of the increases per car per hour have been as high as 50 per cent. At the same time cars are averaging 10 per cent. better speed, and there is a striking decrease in pattern accidents, in consequence of the conductor's desk in front of the entrance and exit of passengers.

Report on the Meat Industry.

A capital of $10,625,000,000 is directly concerned in raising of meat animals and their slaughtering and packing, according to a report on meat supply issued by the Department of Agriculture. This amount is five-sixths as large as all capital invested in manufacturing in 1904. Seven-eighths of the meat and meat products was consumed within this country. The stock of meat animals has increased since 1810, but has not kept pace with the increase in the population.

The welfare of the raisers of meat animals and of the slaughterers and packers is dependent upon finding foreign markets for the surplus of the production of meat above the home consumption. There was a total of 93,502,000 meat animals slaughtered and exported in 1900, of which the exported live animals numbered 276,000. The dressed weight of the 93,502,000 meat animals constituting the meat supply of 1900 was 16,549,921,000 lbs., of which 14,116,886,000 lbs. entered into domestic consumption, lard being included with the dressed weight of pork.

The report adds: "That meat consumption per capita has declined in this country since 1810 is plainly indicated. There is some ground for believing that at that time meat constituted about one-half of the national dietary in terms of total nutritive units consumed, whereas now it constitutes about one-third."

How important meat is in the diet of different countries is shown in the following meat consumption per capita in 1904 in dressed weight: United States, 185 lbs.; United Kingdom, 121; Australia, 263; New Zealand, 212; Cuba, 124; France, 79; Belgium, 70; Denmark, 76; Sweden, 62; Italy, 46.

1908 M. C. B. and M. M. Conventions.

At a meeting of the Executive Committees of the Master Car Builders' and American Railway Master Mechanics' Associations at the Hotel Belmont, New York City, October 21, it was decided to hold the 1908 annual conventions of those Associations at Atlantic City, N. J. The Master Car Builders' Association will meet June 17, 18 and 19, and the American Railway Master Mechanics' Association June 22, 23 and 24. The headquarters of the Associations will be at the Marlborough-Blenheim. The same special rates made by certain of the Atlantic City hotels last June will apply for the 1908 conventions. The meetings of the associations as well as the exhibits, excepting track exhibits, will be on Young's "Million Dollar" Pier. The track exhibits will be placed not more than four blocks from the pier. The same uniform decorative scheme that was so successful at this year's conventions, with some modifications to suit the new pier, will be provided. Nearly all of the exhibits will be under cover, 60,000 sq. ft. net (exclusive of aisles) of space having been allotted for exhibits. In June last the exhibitors on the Steel Pier used about 55,000 sq. ft., exclusive of aisles. The charge to exhibitors in June next for space, including building of booths, crex matting for the floors, enamel letters for signs, and telephone service, will be not more than 33 cents a square foot as against 50 cents a square foot paid for space on the Steel Pier in June last.

Troubles Not Exactly Like Ours.

The auditing department of the Mexican Central is ferreting out dishonest employees. Ticket sellers overcharge passengers, and several arrests have been made, the first being of the ticket agent at Juarez. The auditing department has now succeeded in having guards put on all trains, save a very few, and an armed force is always handy in case of need to protect the baggage of passengers at stops when the passengers may desire to leave the car.—*Mexican Herald.*

INTERSTATE COMMERCE COMMISSION RULINGS.

Interstate Commission vs. Georgia Commission.

In an opinion by Chairman Knapp the Commission has announced its decision in the case of the Paper Mills Company, of Baltimore, Md., against the Pennsylvania Railroad and others. The defendants refused to apply carload rates to the transportation of paper bags and wrapping paper in mixed carloads in southern classification territory. The Commission held that this is not unlawful.

It appeared that complainants, as compared with their Atlanta competitors, are handicapped where they undertake to sell in the state of Georgia. So far as this results from differences in location

between the different manufacturing plants it is natural and therefore legitimate; but the positions of the competing parties would be reversed if the Atlanta concerns should undertake to make sales in the vicinity of Baltimore. The handicap results in large degree from a rule of the railroad commission of Georgia requiring defendants and other carriers to apply their carload rates to the intrastate transportation of wrapping paper and paper bags in mixed carloads. The Commission decided that a like rule should not be required as to interstate shipments unless, in view of all the conditions, some provision of the regulating statute would otherwise be disregarded. The Commission further declared that where a regulation pertaining to transportation has been in force a long time business interests become so adjusted thereto that any abrupt and material change is almost certain to produce undue and therefore unlawful discrimination.

Reparation for Increase in Grain Rates.

The Commission, in an opinion by Commissioner Harlan, has announced decision in the cases of the Harth Brothers Grain Co. v. the Illinois Central et al., A. Waller & Co. v. Illinois Central et al., and Waller, Young & Co. v. Illinois Central et al.

For several years defendants maintained uniform rates on shipments of grain and kindred products to Atlanta, Ga., and points beyond, from a group of towns on their lines beginning on the north with Henderson and Uniontown, Ky., and including Morganfield, Henshaw, Corydon, Grove Center, and other nearby points; but on December 15, 1904, defendants increased the rates to said destination points by adding 4 cents per 100 lbs. on all shipments originating at any point in the group described except Henderson and Uniontown. This gave to Henderson and Uniontown lower rates than those applicable from the intermediate points. On April 5, 1905, defendants canceled the increased rates from the intermediate points, restoring the former rates, and thus again putting all points in this group upon an equal rate basis. Complainants filed petitions to obtain reparation on their shipments of hay and grain made from said points under the increased rates. Defendants stipulated that they would submit to a reparation order on the basis of 3 cents per 100 lbs. on all shipments made during the period of the effectiveness of the higher rates. Upon that basis final adjustment of the controversy was agreed to, and reparation orders aggregating $1,333 were entered.

MANUFACTURING AND BUSINESS.

Edward G. Buchanan has been elected Vice-President of the Carbon Steel Company, New York, with headquarters, as heretofore, in New York.

It is said that land has been bought at New Chatham, N. S., for a new car building plant. The name of the new company has not been announced.

The Dominion Car & Foundry Co., Montreal, Que., has begun a 500 ft. long extension of its car shops. It is also building a forge shop and a power plant.

The Raymond Concrete Pile Co., Chicago, has been awarded the contract for the foundations of the power house of the Home Electric Light & Power Co., at Tyrone, Pa.

E. A. Pittis, southern representative of The Midvale Steel Company, Philadelphia, Pa., who has been on leave of absence for a year, has fully recovered his health, and will resume his duties on November 1.

The A. B. C. Bearing Corporation of Virginia, has acquired from the Atlantic Brass Company, of New York, all the patent rights and licenses of the A. B. C. journal bearing and wedge. The offices of the new company are in the American National Bank building, Richmond, Va.

Beyer, Peacock & Co., Manchester, Eng., are believed to have bought land near Lachine, Que., for a large locomotive building plant. It is said that the Grand Trunk has guaranteed orders for 60 locomotives a year from the new plant for five years, and the Canadian Pacific, 10 locomotives a year.

The Pressed Steel Car Co., New York, and the Western Steel Car & Foundry Co., New York, have established a branch office in St. Louis, Mo., to take care of business in what is to be known as the Southwestern district. W. P. Coleman is Manager of Sales and C. D. Terrell, Assistant Manager of Sales. The office is in the Bank of Commerce building.

Julian L. Yale & Co., Chicago, have been awarded a contract by the Canadian Northern for the complete Miller system of heat distribution for the shops at Winnipeg. This firm has also received an order for the Miller system from the Dominion Car & Foundry Co. for its Montreal shops. In all, 12 contracts for equipping Canadian Northern shops at different points have been awarded to the firm.

The Railway Equipment Co., Portland, Ore., has bought six acres of ground on the Willamette river about 3 miles from Portland, and will build shops for repairing locomotives and rebuilding cars. Machinery for making frogs, switches, and general track work will also be installed. The tract has both water and rail facilities. The company would like to receive catalogues from manufacturers of railroad shop tools.

The Natural Carbon Paint Co., Freeport, Ill., had a group picture made of delegates and guests at the Milwaukee convention of the Association of Railway Superintendents of Bridges and Buildings. Each member of the association is to be presented with a copy bearing the name of the company on the back. It will form an acceptable souvenir of the convention. The idea was that of A. M. McFarland, Eastern Sales Manager, who had charge of the exhibit at Milwaukee.

Receivers were appointed on October 22 for the Westinghouse Electric & Manufacturing Company, the Westinghouse Machine Company and the Security Investment Company. It was expected that receivers would be appointed the next day for the Nernst Lamp Company. All the companies are solvent, but their capital is tied up in plant and material. The tight money market made it so difficult to get working capital to meet obligations that it was decided that all interests would be best served by receiverships. The Westinghouse Air Brake Company and the Union Switch & Signal Company are not affected. The receivers are as follows: For the W. E. & M. Co., T. Hart Given, President of the Farmers Deposit National Bank; H. S. A. Stewart, real estate dealer, and E. M. Herr, Vice-President of the W. E. & M. Co.; for the W. M. Co., William McConway, President of the McConway & Torley Co., Pittsburgh; W. H. Donner, President of the Union Improvement Company, and E. E. Keller, Vice-President of the W. M. Co.; for the S. I. Co., the Fidelity Trust Company, of Pittsburgh.

David B. Carse, M. Am. Soc. M. E., has resigned from the chairmanship of the Advisory Committee of the U. S. Steel Corporation. Mr. Carse and his brother, John B. Carse, have composed this committee since its formation five years ago, the duties of the committee being to keep track of all expenditures of the company under the appropriations by the Finance Committee. John B. Carse will take care of the future work of the committee. David B. Carse, before going to the U. S. Steel Corporation, was president of Carse Brothers Company, Chicago, and, before that, General Manager of Greenlee Bros. & Co., Chicago. He was the resident engineer in charge of the construction of the Hegewisch Works, now known as the Burnham Works of the Pressed Steel Car Co., New York. Mr. Carse is now taking up again the business of Carse Bros. Co., dealing in machinery and supplies for railroad work. It has been reorganized and its headquarters removed from Chicago to New York, with offices at 12 Broadway. A department of electrical specialties has been added.

Iron and Steel.

The Baltimore & Ohio has ordered 300 tons of steel for bridges.

The Erie is said to be in the market for steel for four or five small bridges.

The Pennsylvania has ordered 300 tons of bridge steel from the American Bridge Company.

The Pittsburgh & Lake Erie has ordered 500 tons of bridge steel from the American Bridge Company.

The Southwestern Railroad of Texas has ordered 2,000 tons of rails from the Carnegie Steel Company for delivery this year.

ELECTIONS AND APPOINTMENTS.

Executive, Financial and Legal Officers.

Chicago & North-Western.—E. E. Osborn, Vice-President and Secretary, has been elected also a Director, succeeding Albert Keep, deceased. See Chicago, St. Paul, Minneapolis & Omaha.

Chicago, St. Paul, Minneapolis & Omaha.—Marvin Hughitt, President, has been elected Chairman of the Executive Committee. W. A. Gardner, Vice-President of the Chicago & North-Western, succeeds Mr. Hughitt, and has also been elected a Director, succeeding Albert Keep, deceased. T. A. Polleys, Tax Commissioner, has been elected Secretary, succeeding E. E. Woodman, who resigned on account of ill-health, but who remains Right of Way Commissioner.

Lehigh & New England.—R. H. Wilbur has been elected Vice-President and General Manager. See Lehigh Coal & Navigation.

Lehigh Coal & Navigation.—R. H. Wilbur, formerly General Manager of the Lehigh Valley, has been elected Vice-President of the Lehigh Coal & Navigation Co. George B. Harris, Vice-President, has been elected Second Vice-President.

New York Public Service Commission.—Archibald Buchanan, Jr., Superintendent of Motive Power of the Central Vermont, has been appointed Chief of the Bureau of Inspection of the Public Service Commission, Second district, with office at Albany, N. Y., effective November 1.

Pennsylvania.—Percival Roberts, Jr., M. Am. Soc. C. E., etc., a Director of the Philadelphia National Bank, has been elected a Director of the Pennsylvania, succeeding A. M. Fox, deceased.

Operating Officers.

Atchison, Topeka & Santa Fe.—F. A. Lehman has been appointed Superintendent of Transportation, succeeding C. W. Kouns, promoted.

Canadian Northern.—W. A. Brown has been appointed Superintendent of the Fourth district, with office at Edmonton, Alb., succeeding C. Carey, resigned.

Chicago & Alton.—See Toledo, St. Louis & Western.

Chicago, Burlington & Quincy.—Frank E. Ward, General Manager of the Great Northern, has been appointed General Manager of the Burlington Lines East of the Missouri River, with office at Chicago, succeeding J. M. Gruber, resigned.

James Russell, Superintendent at Beardstown, Ill., has been appointed Superintendent at Brookfield, Mo., succeeding J. E. Votaw, resigned. P. H. Hough, Trainmaster at La Crosse, Wis., succeeds Mr. Russell. F. C. Heisel succeeds Mr. Hough.

Chicago, Rock Island & Pacific.—A. B. Copley, Superintendent of Terminals at Kansas City, Mo., has been appointed Superintendent of the Indian Territory division, with office at Halleyville, Ind. T., succeeding W. Rudd, resigned. M. J. Kennelly has been appointed Superintendent of the Louisiana division, with office at Eldorado, Ark., succeeding J. C. Nolan, resigned.

El Paso & Southwestern.—The office of F. B. King, Superintendent of the Western division, has been moved from El Paso, Tex., to Douglas, Ariz.

Erie.—T. O'Neill, Trainmaster at Galion, Ohio, has been appointed Assistant Superintendent at Kent, Ohio, succeeding E. C. Allen, promoted. C. G. Smith succeeds Mr. O'Neill. F. M. Hawley, Trainmaster at Salamanca, N. Y., has been appointed Trainmaster at Susquehanna, Pa., succeeding C. A. Ford, resigned to go to the Pennsylvania Steel Co. W. H. Daley, chief despatcher at Salamanca, succeeds Mr. Hawley.

Great Northern.—See Chicago, Burlington & Quincy; also Northern Pacific.

Kansas City Southern.—F. B. De Garmo, Trainmaster at Pittsburg, Kan., has been appointed Superintendent at that place, succeeding H. E. Whittenberger, who is now Superintendent of the Eastern division of the Grand Trunk. J. E. Murphy succeeds Mr. De Garmo.

Missouri, Kansas & Texas of Texas.—R. J. Sullivan, Superintendent of the Shreveport and Mineola divisions and the McKinney branch, has returned from leave of absence. George Stoner, who has been acting in his place, has resumed his office as Trainmaster of the Dallas and Denton divisions and the Bonham branch.

Mt. Jewett, Kinzua & Riterville.—George W. Johnson has been appointed Superintendent, succeeding D. W. Boh, resigned.

New York Central & Hudson River.—F. N. Melius, Jr., has been appointed Assistant Trainmaster, with office at Poughkeepsie, N. Y.

H. Scott, Assistant Trainmaster at Clearfield, Pa., has been appointed Trainmaster of the Beech Creek district of the Pennsylvania division, with office at Jersey Shore Junction, Pa. W. A. Hammer, chief despatcher at Jersey Shore Junction, succeeds Mr. Scott.

Northern Pacific.—George T. Slade, formerly General Superintendent of the Great Northern, has been appointed General Manager of the Northern Pacific Lines East of Trout Creek, succeeding Henry J. Horn, resigned.

Portland & Seattle.—Mott Sawyer has been appointed Trainmaster, with office at Vancouver, Wash.

Toledo, St. Louis & Western.—The authority of W. A. Freese, Superintendent of Telegraph of the Chicago & Alton, has been extended over the Toledo, St. Louis & Western.

Vera Cruz & Pacific.—T. J. McCune, Superintendent of Transportation, has been appointed Superintendent, with office at Tierra Blanca, Vera Cruz.

Traffic Officers.

Louisville & Nashville.—L. R. Wasson, General Agent at Detroit, Mich., has resigned to go into other business.

Southern Indiana.—J. T. Averitt has been appointed Assistant General Freight Agent with office at Chicago.

Engineering and Rolling Stock Officers.

Atchison, Topeka & Santa Fe.—Alfred Lovell, Superintendent of Motive Power, has resigned.

Boston & Albany.—A. J. Frick, Master Mechanic of the Boston division, has been appointed Master Mechanic of the Albany division, with office at Springfield, Mass., succeeding P. T. Lonergan, resigned. E. H. Smith succeeds Mr. Frick with office at Allston, Mass.

Central Vermont.—See New York Public Service Commission.

Chicago & Alton.—See Toledo, St. Louis & Western.

Hocking Valley.—Winford L. Mattoon, who was recently appointed Principal Assistant Engineer of the Hocking Valley and the Zanesville & Western, was born in 1881 at Plain City, Ohio. He took a classical course at Denison University, Granville, Ohio, and then went to the Ohio State University for three years. In 1903 he went to the Pennsylvania Lines West, where he had already worked for one summer during his college course. After a few months he went into an engineering corps on the Hocking Valley and the next year was appointed Assistant Engineer of the Chicago, Rock Island & Pacific at Trenton, Mo. After serving as Assistant Roadmaster and again as Assistant Engineer on different divisions of this road, he was last winter appointed Engineer of Maintenance of Way of the Corning division of the Toledo & Ohio Central and the Zanesville & Western, where he remained until his recent promotion.

Illinois Central.—J. H. Nash, Master Mechanic at East St. Louis, Ill., has been appointed Master Mechanic at Paducah, Ky., succeeding R. E. Fulmer, resigned to go to another road.

Lehigh & New England.—R. G. Kenly, General Superintendent, has been appointed also Acting Chief Engineer, with office at Bethlehem, Pa., succeeding W. J. Young, resigned.

New York Central Lines.—R. D. Smith, who was recently appointed Assistant Superintendent of Motive Power, in charge of all matters pertaining to the Boston & Albany, was born in New York and educated at Albany, N. Y. He worked as a machinist in the Delaware & Hudson shops, and then went to the Kansas City, St. Joseph & Council Bluffs as a gang foreman. He worked as fireman and then engineman, and, after the road was absorbed by the Chicago, Burlington & Quincy, was made assistant foreman of the machine shops at Aurora, Ill. He was later made foreman at that place and then general foreman of the locomotive and car departments. In 1888 he was appointed Master Mechanic at Chicago, where he remained until 1902, when he was made Superintendent of Motive Power of the Lines West of the Missouri River. In 1906 he was appointed Mechanical Expert for the Lake Shore & Michigan Southern, where he remained until his recent transfer.

Seaboard Air Line.—A. J. Poole, who was recently appointed General Master Mechanic, was born in 1869 in Sumter County, Ga. After a common school education, he began railroad work in 1886 as an apprentice on the Central of Georgia. After working in several railroad shops in the South, he went to the Seaboard Air Line, in 1894, as a machinist. After two years he was made roundhouse foreman at Americus, Ga., and in 1900 was appointed general foreman of shops. Three years later he was made Master Mechanic of the Fourth and Fifth divisions, and was later transferred to the Third and the Atlantic & Birmingham divisions, where he remained until his recent promotion.

Toledo, St. Louis & Western.—The authority of W. D. Taylor, Chief Engineer of the Chicago & Alton, has been extended over the Toledo, St. Louis & Western.

Western Maryland.—R. C. Evans, Master Mechanic at Elkins, W. Va., has been appointed Superintendent of Motive Power, with office at Union Bridge, Md., succeeding W. Miller, resigned.

Special Officers.

Atchison, Topeka & Santa Fe.—C. F. Ludington has been appointed Chief Fuel Supervisor, with headquarters at Topeka, Kan., and H. E. Westcott, Fuel Supervisor of the Coast Lines, with headquarters at San Bernardino, Cal.

LOCOMOTIVE BUILDING.

The Baltimore & Ohio, it is said, will soon be in the market for 50 locomotives.

The Quebec & Lake St. John is said to have ordered 150 box cars from Rhodes, Curry & Co.

The Southern has ordered one Shay locomotive from the Lima Locomotive & Machine Company.

The Carolina & North-Western has ordered one Shay locomotive from the Lima Locomotive & Machine Company.

The Manufacturers' Railway, St. Louis, has ordered one Shay locomotive from the Lima Locomotive & Machine Company.

Vickers Sons & Maxim, London, Eng., have ordered one four-wheel saddle tank switching locomotive from the Davenport Locomotive Works.

The Boston & Maine has ordered 15 six-wheel switching locomotives from the American Locomotive Company for January, February and June, 1908, delivery.

The Canadian Northern has ordered 500 thirty-ton box cars from Rhodes, Curry & Co., and is said to have ordered 300 Hart convertible ballast cars from the Canada Car Co.

The Kansas City Southern has ordered 21 consolidation locomotives and nine switch engines from the Baldwin Locomotive Works. All these engines are to be delivered during December, 1907.

The Wisconsin Central, as reported in the *Railroad Gazette* of October 11, has ordered eight simple consolidation (2-8-0) locomotives and two switching locomotives from the American Locomotive Co. The consolidation locomotives are for January, 1908, delivery, and the special equipment for them is as follows:

General Dimensions.

Type of locomotive	Consolidation
Weight, total	163,400 lbs.
Weight on drivers	142,000 "
Diameter of drivers	63 in.
Cylinders	21 in. x 26 "
Boiler, working steam pressure	200 lbs.
" number of tubes	306
Firebox, length	108 in.
" width	63 "
Tank capacity	6,000 gals.
Coal capacity	12 tons

Special Equipment.

Air brakes	Westinghouse
Bell ringer	G. Ilmar
Piston rod packings	Jerome
Steam heat equipment	Wisconsin Central

The switching locomotives are exact duplicates of the last locomotives ordered from the American Locomotive Co.

The Eagle Lumber Company, Eagle Mills, La., has ordered one consolidation (2-8-0) locomotive from the Davenport Locomotive Works.

General Dimensions.

Type of locomotive	Consolidation
Weight, total	90,000 lbs.
Weight, on drivers	80,000 "
Diameter of drivers	48 in.
Cylinders	16 in. x 24 in.
Boiler, diameter	50 "
" working steam pressure	160 lbs.
" material	Worth steel
" number of tubes	160
" diameter of tubes	2 in.
" length of tubes	13 ft. 8 "
Firebox, length	72 "
" width	42 "
" material	Worth steel.
Tender	1 tank
Tank capacity	2,700 gals.
Coal capacity	3½ tons.

Special Equipment.

Air brakes	Westinghouse automatic
Injectors	Monitor
Lubricator	Detroit Bull's-eye
Sanding devices	Leach
Packing	Jerome metallic
Tires	Midvale

CAR BUILDING.

The Chicago & North-Western has ordered 25 passenger coaches from the Pullman Co.

The Wabash, Chester & Western has ordered 25 cars from the American Car & Equipment Co.

The Buffalo, Rochester & Pittsburgh is said to be in the market for 750 gondola cars of 100,000 lbs. capacity.

The Missouri River & North Western has ordered 15 gondola cars from the American Car & Equipment Co.

The Arkansas, Louisiana & Gulf has ordered 25 cars from the American Car & Equipment Co. J. M. Parker, Monroe, La., is General Manager.

The Harriman Lines, as reported in the *Railroad Gazette* of October 18, have ordered 16 passenger cars from the American Car & Foundry Co. and 10 from the Pullman Co.

The Idaho & Washington Northern, as reported in the *Railroad Gazette* of October 18, has ordered four cabooses from the Pullman Company, for November delivery. These cabooses will be 34 ft. 9½ in. long, 9 ft. 10¼ in. wide, over all and 14 ft. 4¼ in. high, over cupola. The special equipment includes:

Brakes	Westinghouse
Couplers	Tower
Draft rigging	Westinghouse friction

The San Antonio & Aransas Pass, as reported in the *Railroad Gazette* of August 9, is asking prices on 200 ventilated box cars and 275 plain box cars for December, 1907, delivery.

The Atchison, Topeka & Santa Fe, as reported in the *Railroad Gazette* of October 18, has ordered 100 refrigerator cars of 60,000 lbs. capacity from the American Car & Foundry Company. These cars will measure 32 ft. 6 in. long, 8 ft. 2¾ in. wide and 7 ft. 3 in. high, inside measurements. The special equipment includes:

Bolsters	Atchison, Topeka & Santa Fe standard
Brake beams	Crewo
Brakes	Westinghouse
Draft rigging	Miner
Trucks	Atchison, Topeka & Santa Fe standard.
Wheels	American Car & Foundry Co.

The Long Island, as reported in the *Railroad Gazette* of October 18, has ordered 50 all-steel vestibuled passenger coaches, of which 30 will be without saloon and will seat 72 persons, and 20 will have saloon and will seat 69 persons. Delivery is to be made February 15, 1908. The cars will measure 53 ft. 8¼ in. long, 8 ft. 11⅜ in. wide and 8 ft. 4⅞ in. high, inside measurements, and 64 ft. 5¾ in. long, 9 ft. 11½ in. wide and 13 ft. 8 in. high, over all. The special equipment includes:

Bolsters, truck	Pennsylvania R. R. standard, built-up type
Brake-shoes	Christie
Brakes	Westinghouse
Brasses	Ajax (as to bronze
Couplers	Janney, three stem
Curtain fixtures	National Lock Washer Co.
Curtain material	Pantasote
Door fastenings	J. L. Howard & Co.
Draft rigging	Westinghouse friction
Heating system	Long Island R. R., straight steam
Light	Pintsch gas, mantle lamps
Springs	Union Spring & Mfg. Co.
Trucks	Pennsylvania R.R. special steel, 4 wheel
Wheels	Schoen rolled steel

RAILROAD STRUCTURES.

ALIQUIPPA, PA.—The Pittsburgh & Lake Erie has decided to make additions to its yards. All the land necessary for the improvements has been bought. The yards will be more than a mile long.

ALTOONA, PA.—It is said that the Pennsylvania is negotiating with the city officials to abolish grade crossings at 37th, 33d and 29th streets, by building overhead bridges.

ASTORIA, ORE.—The Harriman interests, it is said, have bought 4,000 ft. of water frontage on the west side of Young's bay as a site for future terminals.

BEAVER, PA.—The Pittsburgh & Lake Erie is planning to build a bridge over the Ohio river at the mouth of Beaver river to cost about $350,000. The company has bought a large amount of land for approaches and as a site on which to relocate its tracks. A new passenger station is also to be built and other improvements made at a total cost of about $2,000,000.

CAMPBELLTON, N. B.—It is said that the proposed bridge over the Restigouche river here, which is to be 3,330 ft. long, is assured. The structure will cost about $600,000. T. Malcolm can give information.

COATESVILLE, PA.—Contracts are reported let by the Philadelphia & Reading for building a four-span steel girder bridge 250 ft. long over the west branch of Brandywine creek.

EVANSVILLE, IND.—The Evansville & Terre Haute is putting up a new passenger station here, to cost about $125,000.

GOMEZ PALACIO, MEX.—The Mexican Central, it is said, is planning to put up large shops and terminals here.

HARRISBURG, PA.—An ordinance is before the City Council for building a bridge by the Philadelphia & Reading over its tracks at Thirteenth street.

HOUSTON, TEX.—The International & Great Northern has finished its docks on the Houston ship canal just below Houston. The company owns a frontage of several miles on the canal, and will construct extensive terminal facilities on this property.

JERSEY SHORE, PA.—A contract has been given to the York Bridge Company at $51,945 for the new bridge over the Susquehanna river here.

LANCASTER, PA.—The Board of Trade is trying to secure the building of bridges over the Pennsylvania and the Philadelphia & Reading tracks here. The question is now being considered by a special committee.

MILWAUKEE, WIS.—The planing mill of the Chicago, Milwaukee & St. Paul shops was this week destroyed by fire; loss $100,000.

MONTREAL, QUE.—The Montreal City Council has appointed a committee to consider a proposition to depress the tracks of the Grand Trunk in this city 15 ft. The plans call for the construction of overhead bridges at street crossings.

NEW YORK, N. Y.—The city has bought additional land for the

new Brooklyn bridge terminal in the Borough of Manhattan and for the subway loop connecting the Brooklyn and Williamsburg [illegible].

Ottawa, Ont.—A number of satisfactory bids were recently received for the foundations for the new Grand Trunk passenger station, baggage annex, train shed and concourse and also for the hotel and subway connecting same with the station by B. L. Gilbert, of New York, the chief architect of the buildings. The company is ready to begin work on the station to cost $1,000,000 and on the hotel to cost $1,500,000 this fall or next summer. The commencement of the work depends on the carrying out of the agreement made by those interested in Ottawa with the Grand Trunk as to the fixed assessments. (Aug. 23, p. 215.)

Rockport, Ind.—Surveys are being made to locate the site for the proposed railroad bridge over the Ohio river, to be built by the Owensboro & Rockport Terminal & Bridge Co. A. S. Kennedy, President, Rockport.

Terre Haute, Ind.—The Evansville & Terre Haute will enlarge its freight house here at a cost of about $16,000.

Waycross, Ga.—The new shops for the Atlantic Coast Line under construction for the past year, are about finished, and will soon be put in operation. The cost of the buildings is about $300,000 and other improvements and machinery bring the total up to about $2,000,000.

Williamsport, Md.—At a recent meeting of the Washington & Potomac Bridge Company, the report of the Engineer was accepted. It has been decided to shortly ask bids for building a concrete bridge about 1,500 ft. long and 30 ft. wide over the Potomac river here. W. D. Byron & Sons are said to be interested.

The Town Council has granted permission to the Washington & Berkeley Bridge Company to enter the town. The company proposes to build a bridge over the Potomac river.

RAILROAD CONSTRUCTION.

New Incorporations, Surveys, Etc.

Atchison, Topeka & Santa Fe.—Local reports say that this company has given contracts for rebuilding its line from Cicero, Kan., to Mayfield, and for enlarging its yards at Wellington.

Baltimore & Ohio.—This company, it is said, will build a large freight classification yard at Somerset, Pa.

Work is under way on a five-mile line from Boswell, Pa., to the Somerset Coal Company's works.

Boston & Eastern (Electric).—Under this name a company will apply to the Massachusetts Legislature for authority to bore a tunnel under the harbor to East Boston. The plans filed by Engineer James Bickford with the State Railroad Commission call for a tunnel over a mile long, to cost with approaches, about $11,000,000.

Butler & Chicora (Electric).—Application has been made by this company for a charter to build an electric line from Brady's Bend, Pa., southwest to Chicora, with a branch south to Kaylor, a total of 15 miles. John Daly, W. G. Stern, W. Criswell and W. J. Burgan, of Pittsburgh, and E. W. Dewey, of the Allegheny River Improvement Association, are interested.

Chicago, Milwaukee & St. Paul.—This company, it is said, has begun operating its Pacific extension from Mobridge, S. Dak., on the Missouri river, west 100 miles, to Lemmon, in Butte county. This, added to 95 miles of completed road in Montana (from Harlowton west to Lombard on the Montana Railroad), which was bought by the company, and 40 miles laid from the end of that section east, makes a total of 235 miles ready for business out of the 731 miles from the Missouri river to Butte. Work is progressing at various points in Washington and Montana.

Chicago, Rock Island & Pacific.—Reports from Waurika, Okla., say that this company is carrying out work to cost about $500,000, improving its yards and adding new stations, switches and terminals.

Cleveland, Cincinnati, Chicago & St. Louis.—Announcement is made by this company that it now has in operation 42 miles of double track between Terre Haute, Ind., and Indianapolis. About 32 miles of second track remains to be built.

Dallas Interurban.—Contracts, it is said, will shortly be let by this company for building an electric line from Dallas, Tex., east via Mesquite and Forney to Terrell, 30 miles. The names of the promoters are not given.

East Erie Commercial Railroad.—A charter has been granted this company, with $25,000 capital, to build a line 2½ miles long from Erie, Pa., south to a connection with the Lake Shore & Michigan Southern. It is proposed also to connect with other lines in Erie. Directors are: M. E. Griswold, Jr., President; F. C. Pratt and J. C. Sherwin.

Evansville & Terre Haute.—This company will build an industrial extension 1½ miles long at Vincennes, Ind., to cost about $21,000.

Galveston & Houston (Electric).—Contract for building this proposed electric line from Houston, Tex., southeast to Galveston, about 51 miles, it is said, will be let as soon as plans for building the causeway are accepted by the railroads interested. The county of Galveston has authorized an issue of bonds to pay for its share of the work on the causeway. Stone & Webster, of Boston, Mass., are interested in the proposed line. (Apr. 26, p. [illegible].)

Inter-California.—See Southern Pacific.

Kentucky North and South.—Surveys are reported made and work soon to be begun, on this proposed line from Fullerton, Ky., south to Bristol, Tenn., about 200 miles. The work will include a tunnel about half a mile long through Cumberland mountains at the Kentucky-Virginia line. (July 26, p. 111.)

Mexican Central.—The extension of this road from Marfil north to Guanajuato, five miles, it is said, will soon be finished.

Mexican Roads.—It is said that the Mexican Government will grant a liberal subsidy to the company which is to build a line from Balsas, on the Mexican Central, west to the Port of Zihuatanejo, on the Pacific Coast, about 125 miles. Preliminary surveys are now being made by Gen. Henry Ide Willey, of Mexico City, who represents a syndicate, having funds to carry out the project. At the Port of Zihuatanejo, the Government proposes to make extensive harbor improvements. (Oct. 4, p. 103.)

Surveys, it is said, have been made for a proposed line from Salvatierra, Guanajuato, on the National of Mexico, west to Puruandio, Michoacan, 50 miles. Andrez Bermejillo, of Mexico City, is the principal promoter. C. A. Malau, of Guadalajara, is Chief Engineer.

Minneapolis, St. Paul & Sault Ste. Marie.—This company, it is said, will build a railroad from Garden, Mich., north to its main line at Cook's Mills, ten miles. The Vans Harbor Land & Lumber Company will provide the right of way and the railroad company is to furnish the rails and other equipment.

Missouri Roads (Electric).—Plans are being made by a company to build an electric line from Mexico, Mo., north to Memphis, 90 miles. A. W. Carpenter, of Memphis, and D. Fitzgerald, 80 Wall street, New York, are said to be interested.

Nevada Roads.—Plans are being made by a company to build a line from Ely, Nev., southwest to Goldfield, 180 miles. The estimated cost of building the line will be $1,800,000. It is said that the Guggenheimer interests, associated with Tex Rickard, of Salt Lake City, are back of the project.

New York Subways.—The Public Service Commission of the First district, it is said, will report favorably on the proposition to build a subway on the East Side of the Borough of Manhattan. The proposed route, as laid out by the old Rapid Transit Commission, is from a point in the Bronx through Third avenue, across Manhattan bridge to Brooklyn, and thence under Flatbush and Fourth avenues to Coney Island. The cost of the section on the Manhattan side of the East river will be between $35,000,000 and $40,000,000, and if contractors fail to bid on the work, the Commission will recommend that the subway be built by the city. The Commission has already authorized the Brooklyn part of the line.

Parral & Durango.—This company has under consideration the question of building an extension of its road from its present southern terminus, at Mesa de Sandia, Durango, southeast to Tepehuanes, 80 miles, where connection is to be made with the Mexican International. This would furnish a new and shorter line between Parral and Durango.

Pennsylvania Roads.—Announcement is made that surveys have been made for a line from Uniontown, Pa., west to Wheeling, W. Va. J. V. Thompson, and associates, of Uniontown, who were interested in the Uniontown & Wheeling Short Line, which has been taken over by the Wabash, are interested in the project.

Pennsylvania Roads (Electric).—A proposition is under consideration to build an electric line from New Castle, Pa., northeast via Harlansburg, Slippery Rock, Grove City, Raymilton and Polk to Franklin, 51 miles. B. E. Cutler, of Grove City, is the chief promoter.

Philadelphia & Reading.—Contracts are reported let by this company for a change in alinement on about half a mile of road at Coatesville, Pa., and for a steel bridge over Brandywine creek.

Pittsburgh & Lake Erie.—J. M. Schoonmaker, Vice-President of this company, denies that the traffic arrangement recently effected with the Coal & Coke and Morgantown & Kingwood, owned by the Davis-Elkins interests in West Virginia, means running over the latter road in the route to Bellington, instead of building a new

line. The original plan to build along the Monongahela river through Morgantown to Fairmont, thence up the Tygart Valley through Grafton to Bellington, is to be carried out. This will give connection with both of the Davis-Elkins roads. (Apr. 5, p. 499.)

San Antonio & Mexico.—Application will soon be made by a company under this name for a charter to build about 500 miles of railroad; a main line from San Antonio, Texas, south to Brazos Santiago, near the mouth of the Rio Grande river, 200 miles, a branch from a point north of Pleasanton, Atascosa county, west via Eagle Pass to Del Rio, 170 miles, and a branch from near Oakville, east through Bee and Refugio counties to San Antonio Bay, 80 miles. A branch is also projected through the northern part of Nueces county to Aransas Pass, 50 miles. Surveys are to begin at once. The incorporators include: Colonel Uriah Lott, of San Antonio; D. J. Woodward, J. J. Stevens, G. W. West and J. E. Jarratt.

Shamokin & Edgewood (Electric).—This company has been granted permission to build about 53 miles of extensions, including a line west to Sunbury, 18 miles; also through Irish Valley, 15 miles, and from Paxinos to Seven Points, 10 miles.

Southern Pacific.—The Inter-California, projected from Calexico, Cal., near the international boundary southeast through Mexico, thence northeast across the boundary near the Colorado river to a connection with the Southern Pacific near Yuma, Ariz., of which 15 miles was built last year, will shortly be put in operation from Calexico south to Paradones, 37½ miles. (Mar. 12, p. 392.)

Texas Roads.—The official statement recently issued by the Texas Railroad Commission for the fiscal year ended June 30, 1907, gives the total mileage of track as 15,482 miles, consisting of 12,575 miles of main line and 2,907 miles of sidings. During the year 517 miles of main track and 314 miles of side track were added. Of this the following companies added new mileage: Abilene & Northern, 38 miles; Beaumont & Great Northern, 20; Burrs Ferry, Browndell & Chester, 7; Caro Northern, 16; Houston Belt & Terminal, 8; Wichita Falls & Northwestern, 16; Wichita Valley, 60; Galveston, Harrisburg & San Antonio, 26; Houston & Texas Central, 94; Pecos & Northern Texas, 57; Texas Central, 41, and Trinity & Brazos Valley, 144. The statement does not include the logging roads, of which there are a large number, having an aggregate length of more than 1,000 miles.

A project is being promoted by James W. Swain, of Fort Worth, Tex., to build a line about 400 miles long from Fort Worth, Tex., west to Roswell, N. Mex.

Texas Roads (Electric).—Contract is reported let to the Suderman-Dolson Company, of Houston, to build an electric line from Fort Worth, Tex., to Mineral Wells, about 50 miles. Work is now under way. C. M. Davis, Chief Engineer.

Contract is also reported let to the American Engineering Company, of Indianapolis, for building an electric line from Fort Worth west to Mineral Wells by a different route.

Rights of way, it is said, have been secured and financial arrangements are being made by Dr. T. M. Barnes, of Fort Worth, for building an electric line from Waco, Tex., southeast to Marlin, 25 miles, thence southwest to Temple, 30 miles.

Waco, Hamilton & Brownwood.—It is said that financial arrangements have been made by this company and contracts will shortly be let for building its proposed line from Waco, Tex., west to Brownwood, about 120 miles. Stephen Turner, Chief Engineer. (Oct. 4, p. 403.)

Western Illinois Traction.—Incorporated in Illinois with $100,000 capital and office in Chicago. The company proposes to build an electric line from Lyons, Cook county, west through Du Page and Kane counties to Aurora, 30 miles. The incorporators include: M. M. Miller, L. Michael, L. Crollin, E. J. Schmidt and W. Klein.

Wisconsin Central.—A franchise, it is said, has been granted this company to enter the city of Duluth, Minn., and a contract has been made with the Northern Pacific to use its bridge over the St. Louis river. (Sept. 23, p. 372.)

Wisconsin Roads (Electric).—Contract is reported let to the Milwaukee Construction Co. for building an electric line from Fond du Lac, Wis., north along the east shore of Lake Winnebago, connecting with the Knox Transportation Company either at Appleton or Kaukauna, about 50 miles. The promoter's names are not given.

RAILROAD CORPORATION NEWS.

Bloomington, Pontiac & Joliet Electric.—Control of this company has been bought by interests in control of the Joliet, Plainfield & Aurora. The Bloomington, Pontiac & Joliet Electric has 20 miles of road in operation from Pontiac, Ill., to Dwight, and it is understood that the extensions to Bloomington and to Joliet will be completed. The Joliet, Plainfield & Aurora runs from Joliet, Ill., to Aurora, 20 miles, and is the connecting link between the Chicago & Joliet Electric and the Aurora, Elgin & Chicago. It is owned and operated by the Joliet & Southern Traction Company.

Central of Georgia.—Oakleigh Thorne, President of the Trust Company of America, New York, has sold his share in the stock of the Central of Georgia. Mr. Thorne and Marsden J. Perry bought all the stock of the road last June. (June 28, p. 949.)

Cleveland & Pittsburgh.—The New York Stock Exchange has been asked to list $796,250 additional special guaranteed betterment stock, making the total listed $8,274,050.

Evansville & Terre Haute.—Results of operation for the year ended June 30, 1907, are given in the following table. The company is to spend $183,000 on a passenger station and the improvement of freight terminals at Evansville, Ind.

	1906-'07.	1905-'06.	Change.	
Average miles operated	310	310		
Freight earnings	$1,586,742	$1,489,423	Inc.	$97,319
Passenger earnings	587,885	585,219	"	2,667
Mail earnings	54,487	53,788	"	699
Express earnings	36,464	33,511	"	2,953
Miscellaneous earnings	1,637	1,740	Dec.	104
Gross earnings	$2,267,215	$2,163,681	Inc.	$103,535
Maintenance way and structures.	$280,144	$226,477	Inc.	$53,667
Maintenance of equipment	403,082	308,496	"	94,585
Conducting transportation	386,076	495,538	Dec.	109,462
General expenses	74,308	80,906	"	6,599
Operating expenses	$1,143,609	$1,111,418	Inc.	$32,192
Net earnings	$1,123,606	$1,052,263	Inc.	$71,343
Other income	25,514	24,612	"	902
Total income	$1,149,120	$1,076,875	Inc.	$72,245
Taxes	$103,278	$92,284	Inc.	$10,993
Interest and rentals	580,622	550,281	"	30,341
Net income	$465,221	$434,310	Inc.	$30,911
Dividends	223,662	223,662		
Additns., improvemts, betterms..	.....	42,921	Dec.	42,921
Year's surplus	$241,559	$167,727	Inc.	$73,832

Illinois Central.—At the annual meeting called last week, the counting of proxies was stopped when it became evident that Stuyvesant Fish had more than the Harriman interests. According to the provisions of the temporary injunction, the meeting was accordingly adjourned to December 18 to allow time to decide the question as to whether the 286,731 shares owned by the Union Pacific, the Railroad Securities Company and the Mutual Life Insurance Company may be voted by the Harriman interests. It is said that, of the remaining stock, Mr. Fish controlled 40,000 shares more than the Harriman interests. (Oct. 18, p. 474.)

Joliet & Southern Traction Company.—See Bloomington, Pontiac & Joliet Electric.

Joliet, Plainfield & Aurora (Electric).—See Bloomington, Pontiac & Joliet Electric.

Kansas City Southern.—Results of operation for the three months ended September 30 were as follows:

	1907.	Change.	
Gross earnings	$2,654,690	Inc.	$604,806
Operating expenses	1,633,065	"	308,128
Net earnings	$1,021,625	Inc.	$296,678
Taxes	55,327	"	7,215
Net earnings, taxes deducted	$966,298	Inc.	$289,463

Lehigh Valley.—This company has sold to Brown Bros. & Co., New York, the First National Bank, New York, and Drexel & Co., Philadelphia, $2,000,000 4½ per cent. car trust notes, maturing in 20 equal semi-annual instalments up to and including September 1, 1917. They are secured on steel frame box cars, gondolas and steel coal cars.

McCloud River.—This company has made a new first mortgage to the Mercantile Company, San Francisco, as Trustee, securing an issue of $1,200,000 5 per cent. 30-year bonds. The old bonds, amounting to $316,000, have been retired. The road runs from Sisson, Cal., on the Southern Pacific, to McCloud and other points, 50 miles in all.

Pere Marquette.—Judson Harmon, Receiver, and W. W. Crapo, of the stockholders' protective committee, are to act as arbitrators to complete the reorganization of this company. The plan has been approved by Judge Horace Lurton in the Federal Court, and it is expected that the receivership will be terminated within a month.

Wrightsville & Tennille.—The Georgia Railroad Commission has given this company permission to issue $250,000 bonds secured on its 105 miles of road. The proceeds are to be spent for betterments, mostly on the Dublin & Southwestern, a 31-mile subsidiary. (Aug. 1, p. 138.)

RAILROAD GAZETTE

ESTABLISHED IN APRIL, 1856.

PUBLISHED EVERY FRIDAY BY THE RAILROAD GAZETTE AT 83 FULTON STREET, NEW YORK
BRANCH OFFICES AT 376 OLD COLONY BUILDING, CHICAGO, AND QUEEN ANNE'S CHAMBERS, WESTMINSTER, LONDON

EDITORIAL ANNOUNCEMENTS.

THE BRITISH AND EASTERN CONTINENTS edition of the Railroad Gazette is published each Friday at Queen Anne's Chambers, Westminster, London. It contains selected reading pages from the Railroad Gazette, together with additional British and foreign matter, and is issued under the name Railway Gazette.

CONTRIBUTIONS.—Subscribers and others will materially assist in making our news accurate and complete if they will send early information of events which take place under their observation. Discussions of subjects pertaining to all departments of railroad business by men practically acquainted with them are especially desired.

ADVERTISEMENTS.—We wish it distinctly understood that we will entertain no proposition to publish anything in this journal for pay, EXCEPT IN THE ADVERTISING COLUMNS. We give in our editorial columns OUR OWN opinions, and these only, and in our news columns present only such matter as we consider interesting and important to our readers. Those who wish to recommend their inventions, machinery, supplies, financial schemes, etc., to our readers, can do so fully in our advertising columns, but it is useless to ask us to recommend them editorially, either for money or in consideration of advertising patronage.

CONTENTS

VOL. XLIII., No. 18. FRIDAY, NOVEMBER 1, 1907.

The New York, New Haven & Hartford has dismissed between 2,500 and 3,000 men, most of them working hitherto on its improvements. This is a direct result of the financial stress and the necessity of providing for the cash payments of the future. The incident has its quick and sharp lesson for labor and is not limited to this particular case. The New Haven had a large amount of cash on hand. It expected to go on with its improvements. It wanted these improvements finished as soon as possible, and partly relied on them as a basis for increased future earning power. But in spite of these favoring conditions the sudden intensifying of the general financial trouble forced a change of policy. And the labor force of the corporation felt instantly the strain on capital. It illustrates a broader truth, prosaic but powerful. Capital is at one end of a rope, labor at the other. Capital is jarred and the rope begins a series of wave movements. They may be rapid, they may be slow, they may be long, they may be short; but, in all cases, they reach the whole length of the line from capital to labor. And when tight money, tight capital and tight credit, albeit somewhat identical terms, unite in a convulsion, the man at the shovel and tamping bar feels an impact like that felt by the man in Wall street. The truism has had many and familiar examples; but not often has it been shown up so suddenly, so uniquely, so quickly and on such a scale as in the New Haven case, where the wage earner's prosperity abruptly shifts to adversity. The political workers in our legislatures, more versed in railroad baiting than in handling the pick, have opportunity to take notice and warning. A great political campaign is set down on the calendar for next year. The enthusiasms of full-dinner-pail constituents are the extreme reverse of the complaints of men with empty dinner pails. "You have hurt the railroads, but what have you done to us?" The men at the other end of the rope already know what has been done to them.

The standards for parts of electric motor trucks, which were recently adopted by the American Street and Interurban Railway Engineering Association, are shown in another column in this issue. They represent the first serious attempt to bring about some uniformity in electric truck building and, no doubt, are only a forerunner of future work toward standardization in other details of street and interurban car construction which will be no less far reaching and important than the last 30 years' work of the Master Car Builders' Association. Present practice in electric car and truck building is a curious mixture of the old ideas handed down from the days of horse cars and of many details of steam railroad car construction. Variety and individuality have marked the development, with the result that on the same road or system of roads many widely different patterns of trucks and truck details are in use. This works a hardship alike on the manufacturer of equipment and the officers and men in charge of the repair and maintenance of the cars. Of course, such a situation is not so bad on most electric roads as it would be on steam roads because as yet there is no general interchange of equipment. The value of standardization, however, is now well known to those steam roads which, in the last few years, have systematically carried out the idea in every possible detail of car and locomotive building. The individual electric roads will find it no less valuable in reducing the cost and time of making repairs and promoting generally a higher standard of maintenance.

The standards adopted by the Association include axles, journal bearings and boxes, brake-shoes and wheel contours. These are the essential elements of the running gear. Axles are perhaps the most important, since the dimensions of wheels, journal bearings and the motor attachments depend on the size and shape of the axle with which they are used. The general design of the six standard axles adopted is similar to the M. C. B. standards in respect to size of journals and capacity, the sizes ranging from $3\frac{3}{4}$ in. x 7 in. to $5\frac{1}{2}$ in. x 10 in., with capacities from 15,000 lbs. to 38,000 lbs. The diameter of the wheel fit has been enlarged, somewhat, because the axles are used for driving; and the center portion between gear fits is made of uniform diameter without taper towards the center. In the five largest axles the diameter is made larger than that of the three corresponding M. C. B. axles to provide for the additional stresses imposed by the weight of the motor and the torsion of driving. The journal bearings and boxes are substantially M. C. B. standard with alternative designs of boxes to be used with trucks having springs over the journals. More confusion existed in the

matter of brake heads and shoes than in any other detail considered by the committee and the two designs adopted are radical departures from the present practice on many roads. M. C. B. standards were here again used as a working basis and the design of head and shoe for wide tread wheels (3-in. and over) are both interchangeable with the Christie head and shoe. For wheels with treads narrower than 3-in., a modified Christie head and shoe were adopted. It was found to be impracticable to design a single head which would take shoes varying from 2¼-in. to 4-in. tread, and these are the wide variations which are found in practice. Two designs of wheel treads were adopted, both differing widely from the M. C. B. standard, which is recognized in the report of the committee but not shown as a third alternative although it is in increasing use on heavy interurban roads which have entrances into cities over private right-of-way. The light wheel has a tread only 2½ in. wide and a flange 1 1/16 in. thick and ¾ in. deep. The existing franchises in some cities, particularly in the New England states, prevent the use of tracks and special work suitable for wheels of wider tread and deeper flange and the design adopted is an undesirable makeshift to provide for conditions which cannot at present be changed. The heavy design A is intended for combined city and interurban work and has been found in service to give the required safety for any but the highest speeds and at the same time to run over all modern special work without damage. The deeper flange is no wider than in the light wheel and can be run on either grooved or girder rail. The wide tread materially reduces the wear on the surface of special work. In conclusion it may be said that these standards are not experimental, having all been tried in the most severe service, and that they meet with the unanimous approval of all the manufacturers.

GEORGE WESTINGHOUSE.

For a second time in a crisis this wonderful engineer appears near the center of the stage with the light turned on his financial constructions, and by the results of inspection and full knowledge these essential, but to him incidental, products of his genius must stand. Some things are certain in this uncertain world, and among them is the human certainty that his work will go on and will be conducted by him without other than slight check, because it is World's work, making materials which are the results of original study, invention and adaptation for the most part having to do with the arts of transportation, and all for saving life and producing better implements of civilization. If there were doubt of this, if there were fear of his "going to the wall," it would be a matter of concern to every railroad officer who respects his profession and takes it seriously; and also to his business rivals, commercial enemies, who have never failed to acknowledge the indebtedness to this great inventor and producer.

There are 21 American and 10 foreign Westinghouse companies,* with 210 officers, $120,000,000 capital, $90,000,000 annual output, 24 factories with 7,000,000 ft. of floor space, and an army of 38,000 employees. And these huge machines are not simply notable because they make most of the automatic brakes and a fair share of the signals, draft gear and electric light, power and traction materials for the civilized world. Their beneficent power and influence is due rather to the original investigation, invention and design and development which have been an incentive and a spur to other engineers and manufacturers.

So swift a pace was never before known as that set for getting full knowledge of how to control electric force for the uses of mankind; and few indeed of the great men who have made their mark in this field fail to credit that pace to Mr. Westinghouse. Probably the greatest single thing in this way which he has done was in introducing and developing in America the use of the alternating current for transmitting and applying electricity. He was one of the first to see the possibilities of the applications of the alternating current, and with his characteristic courage and vigor he proceeded to buy patents, to invent, to develop apparatus and methods and to push forward commercially along that line. He had a tremendous fight against established interests, but he has revolutionized practice, and the theories he sustained with such vigor and at such expense in money and personal comfort, are now accepted by the electrical engineers of the world.

He has sole credit for originating a method of stopping trains and controlling speed so as to make high speed and heavy train movement possible, and with the help of his staff he has been able during the past 38 years to successively improve and adapt that method to all new conditions. In doing this he has saved thousands of lives, directly in the actual train service, and indirectly, to a degree not measurable, in the resultant quick transportation of food, materials and people.

What may be called his second important series of studies for securing safety and increasing the capacity of railroads was to the same end of preventing collisions and permitting increased density of traffic. In invention and development of automatic block signaling and power interlocking he was one of the pioneers, and in results undoubtedly the most important of all of them. Our readers are fairly familiar with his work in these lines. They can, however, have no conception of the tenacity of purpose and the prodigal expenditure of mental energy that have gone to develop the special arts and apparatus which are the reason for existence of the Air Brake Co. and the Union Switch & Signal Company.

In the same line of thought he began more than 20 years ago studies and experiments in draft gear for the purpose of making it possible to haul long trains of heavily loaded cars, reducing the shocks and preventing the disastrous breakaways. Early failures in his friction draft gear meant nothing to him. He is classed as one of those who have "the courage of their convictions," but this is not accurately descriptive. His belief becomes his principle, and when he believes he acts on it with no thought of the quality of courage and no need to muster it. To him the success of the friction draft gear and its useful function were foreordained.

The briefest enumeration of the ways in which Mr. Westinghouse has made high speed, heavy trains and more frequent trains possible and safe sounds like a eulogy, but there is no intention of that sort in this writing. It is, rather, to remind every railroad officer who honors his calling that this man who has done so much for us is facing a financial storm with the same quiet confidence that he has shown with hundreds of mechanical difficulties, and that he deserves to have the support of railroad officers, engineers, and business rivals. He is capable of great work in this world for many years to come, and we must not lose the benefit of that work.

One contribution made by Mr. Westinghouse to the welfare of mankind is not known by many people outside of a limited district. He was a pioneer in the development of the method of using natural gas as a fuel. When he took up the matter its use was quite limited and was crude, wasteful and dangerous. He saw the methods of transportation in handling gas must be revolutionized before it could be successfully used in a large and general way, and to his engineering sense is due the development of the successful method of transmitting gas in large volumes at low velocity and under low pressure.

At this time, in addition to an enumeration of his work, something about Mr. Westinghouse's personal characteristics may aid the younger generation to understand the situation. He is a man of great physical strength, he has lived an abstemious and sober life. He has never smoked a whiff, he never drinks anything but possibly a glass of wine with his dinner. He has always eaten sparingly and carefully and, while he has worked tremendously, his work has been widely varied and a succession of mental diversions, a substitute for amusements in keeping mind and body stimulated and elastic. Physically he seems as young as an ordinary business man of 45 or 50, and he has a reasonable expectation of 20 years of valuable work, although he was born in 1846.

Intellectually, he was probably never more powerful than he is to-day. It is to be supposed that the imaginative side of his mind is less vigorous now than it was twenty years ago, although that is by no means certain, because he is a man so phenomenal in

*The principal American companies are: American Brake Co., Athn Steel Casting Co., Bryant Electric Co., Canadian Westinghouse Co., Cooper-Hewitt Electric Co., East Pittsburgh Improvement Co., Nernst Lamp Co., R. D. Nuttall Co., Perkins Electric Switch Mfg. Co., Pittsburgh Meter Co., Security Investment Co., Union Switch & Signal Co., Westinghouse Air Brake Co., Westinghouse Automatic Air & Steam Coupler Co., Westinghouse, Church, Kerr & Co., Westinghouse Electric & Mfg. Co., Westinghouse Foundry Co., Westinghouse Inter Works Railway Co., Westinghouse Lamp Co., Westinghouse Machine Co., Westinghouse Traction Brake Co.

The principal European companies are: The British Westinghouse Electric & Mfg. Co., Ltd., Societe Anonyme Westinghouse, Le Havre, France; Societe Electrique Westinghouse De Russie, Traction & Power Securities Co., London, Westinghouse, Cooper, Hewitt Co., Ltd., London; Westinghouse Electrizitats Actiengesellschaft, Westinghouse Metal Filament Lamp Co., Ltd., London; Westinghouse Metallfaden Gluehlampen fabrik Gesellschaft m. b. H., Westinghouse Brake Co., Ltd., Compagnia Italiana Westinghouse Die Frenl.

Some idea of the scope of the several manufacturing companies can be got from a brief list of their more important products. Electric apparatus of all kinds. Train brakes. Locomotive brakes. Electric-car brakes. Automatic slack adjusters. Automatic air and steam couplers. Friction draft gear. Automatic and manual block signals. Hand-operated and power operated interlocking machines. Gas producers. Gas and water meters. Steam and gas engines. Turbines. Mechanical stokers. Air compressors. For installation and construction work, one of the larger corporations is occupied exclusively as designing and constructing engineers. For example, the company had charge of the layout and construction of the Boston South Terminal and now has the mechanical and electrical engineering and equipment of the Pennsylvania's New York terminal, involving an expenditure of $25,000,000.

make-up. In capacity for sustained attention, in power of analysis and reason, and in command of a vast store of experience, he is probably to-day a better man that he ever was before. All of this being so, it is impossible for those who know him to think of him as relaxing his efforts or suffering any diminution of power or control.

It would be quite impossible to even attempt to give any notion of the multitudinous interests into which his restless mind has penetrated, always with the aim of producing practical and useful results. For while he is a man of imagination and of visions, the governor of his mind is always set to the end of utility.

Why has he done this? Why has he set aside ease and pleasure? Why has he given his years to unceasing toil? Why has he repeatedly ventured fortunes in great enterprises? He might have retired at 40, a very rich man with a name known and honored all over the civilized world, with a great capacity for enjoyment and with abundant means to gratify all the tastes and desires of his enterprising and versatile spirit. Probably Mr. Westinghouse himself could not answer these questions. He has worked as all great men have worked—in obedience to an internal, compelling force. It is certain that the desire to amass and leave behind him a colossal fortune has been the most insignificant element in the forces that have driven him forward. It is certain, also, that he has always felt a noble aspiration to do good in the world, to really serve mankind. Unquestionably, he loves power and responsibility. Unquestionably, too, he is keenly alive to the good opinion and the approbation of the best minds. But it is very doubtful if these recognized incentives to exertion and to self-sacrifice have been other than contributory to the main result. Behind it all lies that mysterious, impelling force (the definition or analysis of which is perhaps impossible) which pushes men forward as fast and as far as their powers permit them to go. The directions which they take, the results which they achieve, depend upon the qualities of their minds and on their moral natures; and these we can discern and analyze, but the driving power behind is often beyond our comprehension.

The sources of his power over men are perhaps easier to discern than are the underlying motives of his conduct. Men feel immediately the dominating force of his will. They recognize at once when they come in contact with him the breadth and power of his intellect. And then, as they go on, they discover his generosity, his magnanimity, the loftiness and purity of his motives, and they are attracted by the simplicity of his manners. People often say that he has great personal magnetism. So he has—whatever that may mean. But, after all, that is merely an easy phrase in which to sum up the resultant of the noble qualities of his mind and character.

THE NEW PSYCHOLOGY OF RAILROAD INVESTMENT.

As distinguished sharply from "high" financiers and minor groups of speculators who have their daily flights, high and low, in railroad securities, the real investors who buy railroad stocks to have and to hold may be roughly divided into two classes, each large. There is the ultra conservative who always writes big the word "security." His objective point is almost always the railroad bond of senior place and quality and generally the first mortgage bond, though now and then he may take a shallow dip into, what seems to him semi-speculative, the junior mortgage of a dividend-paying line. But a mortgage security on railroad property he craves and must have. The second class of investor has its special affinity for railroad stocks, dividend paying or likely to become so. The psychological influence in that class is the little touch of the gambling instinct which, to the assured and regular dividend, adds the uncertainty, tipped with hope, of larger dividends or "rights" to come. It is interesting to trace in the case of both these large groups of investors some of the changes of mental action and reaction which the remarkable drop in railroad values of the last two years has brought about.

Take first the ultra conservative or mortgage seeker in railroad investment who was content with his 3.75 per cent. return two years ago. Since then he has had no diminution of income nor, on the other hand, has he had an increase. His double gilt edged bonds have not defaulted nor are they likely to unless the heavens fall. But he has seen the purchasing power of his well-secured income diminish probably 10 per cent. in two years; and, what is more puzzling to him, not to say disquieting, he has seen the market appraisal of his solid security shrink 5, 10, 15 per cent., sometimes more. It is, in its outward phases, as though the holder of a time mortgage, secured by triple value of realty, were to be told that its assignment value were below par—as indeed is true nowadays in some cases. What wonder that, under such conditions, the conservative old investor in railroads moving in his narrow fiscal groove, finds his old standards confused, and, if he be not endowed with broad knowledge and instincts, finds also his timidities increased. Nor, safe as he may be in fact, is he exempt from the revelations of official turpitude which seem to him a present fact and liable to be a future one though in reality they have in nearly all cases been the transactions of the past the exposure of which now is the prime medicament in the cure. In the secondary causes of the existing stress in railroad loans this new psychological condition of fear, sometimes definite, more often vague, may be counted among the first. Nor is the bondholder comforted much or his fears allayed by his opportunity to secure on the senior railroad mortgage a three-quarter per cent. added interest return, if he happens to have funds to reinvest. It rather accentuates his discomfort over the low return on the "long" bonds which he bought with such placid assurance two years ago.

The investor in conservative railroad stocks has also had his mutations, mental and sentimental. Some of his standards likewise seem lost or perverted. His values have contracted, not so much in ratio to be sure as speculative shares, but to an absolute amount much greater and which often signifies greater loss, but meanwhile dividends in the case of some great lines have been increased, non-dividend roads have begun to pay dividends and income has gained. Along with this anomaly have gone others. The new stock which used to be watched for by him with hope is now a thing of dread. It used to "bull" a stock—now it "bears" it; and the certainty of its outcoming depresses usually shares below the mathematical point normally fixed by ratios of issue and the original price. He, too, thus falls into mental confusion and uncertainty. The old Latin maxim, "everything that is unknown is magnified," applies as much to railroad investment as to the general affairs of the world at large. Under the old psychology of railroad investment plus force of habit the investor who "never sold" and always "held on" and whose conservatism was such that he was even apt to decry the quoted value of his railroad securities is generally holding on still. But he is not holding on with quite the old confidence, nor, on the other hand, is he crying down now his investments. His mental attitude is mainly one of perplexity, the results of which in so large an investment class one dislikes to think of should ever dividends as well as principal be reduced.

The "locality" idea as a mental factor in railroad investment is another psychological force which has undergone a change. Up to two years ago there was a proneness on the part of the old-fashioned investor to put his money into the securities of the local line whether it was a small line or part of a great system—this under the theory, not always sustained by facts, that the security could then "be watched." It was this *motif* which has gone so far in building up localized street railways by enabling their owners to place underlying bonds. Those bonds, like all others, have shrunk to near a 5 per cent. basis. Partly owing to that fact, partly because large issues of "localized" securities have overloaded local holders there is now a distinct drift away from the "local" idea which, incidentally, has been farther warped by the magnetism of Wall street bargains in such forms, for example, as the best railroad notes. When the present anomalous condition of financial affairs, with tight capital rather than tight money as its basic cause, comes to an end it will be instructive to see how far that local investment motive resumes its sway. It is but one of the many problems of the new railroad investment psychology the solution of which challenges the curiosity of economist and philosopher.

Finally, if we turn to the immediate present and to the existing parlous and convulsive state of the investment market, we find the old-time railroad investor the mark of some novel mental forces. He sees yet another shrinkage of his standard railroad shares to a 6 per cent. basis or below, credit depressed while railroad traffic is high, and almost imperative railroad extension and improvements halted by semi-panic prices of railroad loans. But he has also his visions of reassurance. He notes the power of organized capital to resist deadly financial convulsion; the relative strength of the high grade railroad security as compared with many other forms of investment; and last but most impressive, the way in which low finance is asserting itself against high finance, and old-fashioned conservatism proving its merits over new fashioned speculation. But in that there is nothing new, psychologically or otherwise.

Southern Railway.

"The conditions of operation during the past year have been extraordinary. Great as are the burdens upon the operation of a railroad to-day by reason of the increased cost of material of all classes and the unabating expectations of labor, on the one hand, and legislative reduction of revenue and increased taxes, on the other hand, the crying need of the railroads of the South is more track, more equipment, more terminal facilities. With the strategic position and established relations which the Southern Railway now has, there would be no stint in the amount of traffic it could obtain and profitably handle if it had the facilities necessary to afford to those who offer traffic, the service they demand. During the past winter there were serious congestions of freight on the lines of this company, which were due, almost without exception, to the failure of the plant to respond to demands which were made upon it beyond its capacity. While exasperating the public, congestion rolls up the expense of operation, and both shipper and carrier suffer.

"Apart from congestion of traffic, the expenses of operation, of which mention has been made, have been extraordinary. To illustrate: during this fiscal year the rates of pay of machinists, boilermakers, blacksmiths, tinners and pipemen, car-men, engineers, firemen, conductors, trainmen, operators and maintenance of way employees were substantially increased, this increase approximating $1,250,000 per annum; while the greater price at the mines, together with freight charges paid for coal purchased for the Virginia and North Carolina lines from mines on other railroads, added nearly $250,000 to the cost of fuel in the same period. If comparisons are made with the costs of material and labor several years ago, the present burden is still more apparent. Since 1898, the cost of bridge timber has increased from $9.36 to $23.59 per thousand feet; cross-ties from 28 cents to 37.6 cents per tie; steel rails from $17.75 per ton to $29 per ton; fuel coal from 89 cents to $1.37 per ton; the cost of labor, per mile of road, has increased from $1,621.67 in 1895 to $2,513.64 in 1905, with a further advance to $3,189.11 in 1907."

Thus does President Finley sum up the causes which have brought the Southern Railway in one year from a condition of abounding prosperity, with great hopes for the immediate future, to a point where it is for the moment hard pressed on every hand. Extraordinary is a fair word to use to describe the operating conditions of the year.

The income account strikingly shows the company's changed position. Gross earnings increased $3,000,000, or 6 per cent., over 1906, but operating expenses were $4,700,000 larger, leaving net earnings smaller by $1,700,000. There was an increase of $1,600,000 in fixed charges which, added to the decrease in net earnings, caused a falling off of $2,900,000 in net income, a decrease of 56 per cent. Net income was $2,300,000, against $5,200,000 in 1906.

Two semi-annual dividends of $2\frac{1}{2}$ per cent. each on the preferred stock were charged to income in the previous year. In April, 1907, the regular semi-annual dividend of $1,500,000 was paid out of the income of the year. This year's October dividend, however, was only $1\frac{1}{2}$ per cent., calling for $900,000, and instead of being charged to the income account, as the October, 1906, dividend had been, was charged to profit and loss. With even this smaller distribution charged to the year's income, there was a deficit for the year of $616,000 instead of a surplus of $240,000, according to the company's showing.

Moreover, if the same dividends had been paid out of income and the same amount appropriated for improvements in 1907 as in 1906, the year's deficit would have been over $1,700,000, against a surplus in 1906 of $1,200,000. This is a remarkable change for the worse within a twelvemonth. As its further result, there was a decrease during the year of over $2,000,000 in the Southern's total profit and loss credit balance.

Yet in the following statement, President Finley shows the reasons why the future of the property, in spite of last year's bad record, should be bright and prosperous:

"The remarkable growth of diversified industry in the South in recent years, particularly along the Southern Railway lines, has created an internal traffic largely local as to its origin but covering a wide field in its distribution. This has given the company a sound basis of independent operation and a commanding position in its negotiation for traffic from outer sources. The extent and diversity of this commercial expansion and its beneficial effect on the interests of the company can only be fully appreciated by close and careful analyses. The main facts are that the South now melts more than half the pig iron and converts into cloth and garment more than one-fifth the cotton which it produces. Its phosphate beds have formed the basis for the manufacture of commercial fertilizer on such a scale as to make the South independent of outside sources of supply and to add greatly to her agricultural productiveness. The manufacture of furniture has grown to such proportions as are not exceeded in any other like section of the country, yet without decrease in the volume of lumber sent from the South to other markets of this country and abroad. The production of coal has, with difficulty, kept pace with the development of industry, not because of inadequate supply, but because of restricted transportation facilities. The cultivation of fruits and vegetables has afforded a large and increasing flow of that class of traffic to the eager markets of the East and North.

"That this commercial growth will continue along healthy lines is assured by profitable operation in the past and a continuing increase in demand. That it must take place in a large measure along the lines of this company is certain, because of the abundant supplies of fuel and raw materials originating along its rails, and because of the outlet it affords to all consuming markets. The Southern is therefore assured of a continued increase in its internal traffic of both raw materials and manufactured products. A single industry, the operation of which will soon begin, will add 500,000 tons to its freight traffic and as many dollars to its annual gross revennes.

"The existing relations with connections by land and sea are most satisfactory. The conditions of interchange are such as to justify the claim for increased tonnage on reciprocal grounds. Traffic arrangements with steamship connections at Virginia, South Atlantic and Gulf ports afford the fullest opportunity for the development of the largest amounts of export, import and coastwise traffic. Through service and a complete package car system operated with chief connections and supported by efficient traffic organizations guarantee a large increase in the higher classes of traffic. Reciprocal relations with lines serving the great grain and grazing sections of the North and West have enabled the company to share in a large way in the movement of meat, grain and grain products from those sections to the South and East. The large consuming section served and the important milling interest located on the lines of this company add greatly to its strength in the control of this important traffic.

"Southern Railway lines have enjoyed and are destined to increasingly share in the extraordinary industrial opportunity which exists in the South. Those lines penetrate a territory whose resources fully justify the rapidly increasing interest manifested in its economic development and progress. The minerals, timber and soils, all important elements in the best development of the nation's wealth, are paramount in the Southern country. The promotion of their proper development has received the particular attention of this company, and the policy pursued in bringing the latent resources of the South to the attention of the world is redounding to the advantage of the railroad and the rich territory it serves. This territory is being covered with new manufacturing plants (the records show 860 new industrial enterprises completed and placed in operation during the year), while the numerous existing factories established since the organization of the company are most successful and are being generally enlarged.

"Particularly the forests of the South have attracted capital for their development. Several hundred wood-working plants alone were established in Southern Railway territory during the year. The second largest furniture industrial center in the United States (High Point, N. C.), is located on this company's tracks; along the lines of the company 27 new furniture factories began operations during the year. The manufacture of wood pulp is a recent important industry, from which an entirely new and large volume of traffic may be expected. The abundant supply of necessary raw material and cheap power is attracting to the territory capitalists interested in the manufacture of paper, a promising industry from which large traffic may be ultimately expected. It is important, however, to remember that these industries can be perpetuated only if the sources of the supplies of raw materials are preserved. The forests of the South are to-day one of its chief assets, and there is opportunity to preserve them as such for all time. While other sections, by the indiscriminate cutting of their forests, have in great measure consumed their supplies of raw material for the manufacture of lumber, and of everything in which wood is used, the South still has great areas in which the forests have been practically untouched. It is hoped that the Southern people will benefit by the mistakes of others. By the adoption of a system of intelligent forestry, the woodlands of the South may be so used as to yield a substantial immediate profit, and, at the same time, be so preserved and reproduced as to be a continuing source of wealth for future generations. The railroad companies which depend so largely upon the forests for the material they consume, not to speak of commercial traffic, are fully alive to these considerations, and this company is co-operating in all reasonable ways to preserve this important element in the inherent strength of its commercial position.

"The textile industry of the South is largely confined to the districts reached by this company's lines, and gives premise of great future growth by the erection of more mills and enlargements. During the year 48 new textile manufacturing plants were completed and placed in operation in the territory served by Southern Railway lines. The electrical power developments directly tributary to the lines, and the mining districts supplying cheap coal, make beyond all peradventure the districts served pre-eminent in the South for profitable manufacturing.

"Co-ordinate with the promotion of the industrial development

is the practical solicitation of immigration. The general advertising by this company of the merits and possibilities of the country has proven an influential factor in introducing prospective immigrants to the possibilities of the South. A line of work has been carried on which tends to very greatly diversify the agricultural products of the territory and to establish the value of southern lands for a widely varied husbandry. More skilled methods of agriculture are greatly increasing the amount and value of farm products, of which there is direct evidence in the substantial increase of land values throughout all the southern states."

This is a clear, full statement of the possibilities of the property in existing and potential traffic and in industrial opportunity. It is seldom that the traffic strength of a great railroad has been thus summarized to its stockholders. President Finley's plea for intelligent forestry is particularly to be commended as an example of intelligent foresight.

What the Southern Railway needs is not traffic or opportunity, but facilities, particularly in tracks and terminals. President Finley considers that the territorial relations of the road have now been established and the policy of the future should be to strengthen the established lines, on which earnings are no longer problematical. As most important, this policy requires new second track and revision of grades and curvature on the lines of heaviest traffic.

On its total mileage of over 7,500 miles the Southern Railway had on June 30 1907, only 207 miles of double track, although as soon as work now under construction is finished there will be 292 miles. In supplying second track the first efforts have been directed to points where two or more lines converge and heavy traffic is thrown over the road. Such gauntlets exist between Salisbury, N. C., and Greensboro; Knoxville, Tenn., and Morristown; Atlanta, Ga., and Austell, and Chattanooga, Tenn., and Ooltewah Junction. At Lynchburg Va., where much freight is received from the Chesapeake & Ohio and Norfolk & Western, a new line around Lynchburg has become necessary, and double track for about 30 miles south is essential. These five gauntlets, as single-track lines, limited the capacity of the whole system, since practically all of the traffic handled between the East and the West and between the North and South had to pass over one or more of them and their maximum capacity as single-track lines had been reached. This throttling of the gauntlets affected the development of the branch lines and of the whole system. With the exception of the Lynchburg line these gauntlets will shortly be double-tracked, but there is further necessity of three other stretches of second track not yet undertaken, as well as double track for 5 to 10 miles outside of all principal terminals. What has been done to carry out this general policy of second track and line improvement and the new construction of the year is listed in the report in great detail. It was summarized in the Railroad Construction section of the *Railroad Gazette* of October 18, 1907. Profiles of five of the new lines are also given in the report.

Another important department of new work is that on the union passenger stations now building in several of the more important cities of the South. These are being built by terminal companies whose properties are guaranteed by the railroad companies which will use the stations. During the year the Southern has joined in guarantees on bonds or notes issued by the Gulf Terminal Company of Mobile, the Birmingham Terminal Company, the Charleston Union Station Company, the Meridian Terminal Company and the New Orleans Terminal Company.

Turning to the operating results, the increase in cost of conducting transportation over the 1906 year was 15 per cent. Maintenance of equipment increased 12 per cent. and maintenance of way and structures 8 per cent. Maintenance of way cost $1,415 per mile of line, against $966 in 1906. There were 358 miles of track laid with new rails, against 543 miles in 1906. The tie renewals averaged 358 per mile, against 404 in 1906, the decrease largely due to the difficulty of getting ties. Repairs and renewals cost $2,324 per locomotive against $2,632 in 1906, $842 per passenger car, against $956 in 1906, each a decrease of 12 per cent., and $74 per freight car, against $72 in 1906, an increase of 2 per cent.

The benefits of the improvements to the line are not yet shown

Southern Railway.

in the operating statistics. Although the average carload increased 2 per cent., the revenue trainload decreased from 204 tons in 1906 to 201 tons last year. Including company freight, the trainload was 236 tons in each year. The average distance haul per ton was 158 miles, against 165 in 1906. There was a decrease of 5 per cent. in the ton-mile rate. The freight earnings increased 3 per cent., while the passenger earnings increased 11 per cent.

The state railroad legislation of the year has been more uniformly severe in the southern states than in any other part of the country. The Southern Railway, penetrating as it does almost every one of the southern commonwealths, has been to a remarkable degree exposed to this hostility. So important have its relations with the public become that President Finley since his election has spent much of his time and taken advantage of every opportunity to bring before the people of his territory the ideal which he has set up of a railroad's duties towards its patrons. He sums up this ideal, and the rate legislation of the year as follows:

"As a railroad must depend for its prosperity on the confidence and support of the public served by it, the policy of Southern Railway is to merit the confidence and support of every community which it serves. Efforts are being made to cultivate closer relations with all the public and especially with the men in all lines of business who are most directly interested in the adequacy and efficiency

of transportation facilities, and to bring about a realization on their part that the company has a direct and vital interest in the success of their individual enterprises and in the prosperity of their communities. In all dealings with the public it is the purpose of the management to cultivate a spirit of co-operation, to deal justly with all the patrons of the company on the basis of sound business and economic principles, and to this end in particular special efforts have been made to bring about courteous and considerate treatment by all employees of every person transacting business with the company. These endeavors have not been fruitless. There is increasing evidence that the thinking people in the territory served by the Southern Railway appreciate the fact that they can only attain the highest degree of prosperity if they are served by carriers able to increase their facilities so as to keep pace with the growing demand for their service, and also that increased transportation facilities are of much more importance to them than any possible reduction in charges. There is a growing public opinion, among those who actually use the railroads of the South, in favor of legislative and administrative policies that will recognize that a railroad company is a business institution, subject to the same economic laws that control all other business enterprises, and that it cannot obtain new capital for the enlargement of its facilities unless investors can have a reasonable assurance that its income will be sufficient to defray its operating expenses and fixed charges, and leave a reasonable balance for dividends and surplus.

"It must be recorded, however, that during the year drastic action was taken by some of the states in which this company operates (similar to action taken in many of the other states of the Union) to reduce the maximum passenger rates. In Illinois and Indiana, where the interests of this company were small in comparison with other lines, it followed the lead of the roads having most at stake, and put the reduced rates in effect under protest, reserving the right to contest them in the future. In Alabama, where a 2½-cent rate was established by the legislature, in North Carolina, where a 2¼-cent rate was established by the legislature, and in Virginia, where a 2-cent rate was established by the Corporation Commission, the interests of this company were so large, and the effect of the reduced rate so hurtful to its revenues, that, by direction of the board of directors, suits were brought in the appropriate Federal courts to test the constitutionality of the rates, and to secure for the property the protection of the fourteenth amendment to the constitution of the United States.

"The disputed rates have been put in effect pending determination of these cases on their merits. This was not done, however, until the record was put in shape to present the fundamental questions involved to the United States Supreme Court. The board has considered it essential, not only in the interest of the owners of the property, but in the interest of the public (whose interest it is that the railroads shall not be deprived of the means of providing adequate facilities for the commerce of the country), that the issues raised by the action of these states, whether investments in railroad properties are entitled to the same measure of protection as other property and whether they can be deprived, by any form of state action, of the effective protection of the constitution of the United States, shall be finally settled with the least possible delay."

The following table summarizes, according to our usual method, the results of operation of the last two years ended June 30:

	1907.	1906.
Mileage worked	7,547	7,374
Passenger earnings	$14,683,006	$13,259,114
Freight earnings	37,368,095	36,141,547
Gross earnings	56,657,991	56,641,139
Maint. way and structures	7,660,168	7,122,355
Maint. of equipment	9,576,042	8,588,452
Conducting transportation	23,941,599	20,816,940
Operating expenses	43,068,547	38,274,102
Net earnings	13,589,145	15,367,337
Other income	1,597,225	1,214,125
Total income before charges	15,186,670	16,581,462
Fixed charges and taxes	12,896,349	11,352,396
Net income	2,290,321	5,229,066
Dividends	2,400,000*	3,000,000
Improvement appropriations	536,331	999,827
Year's surplus	646,013†	1,229,239

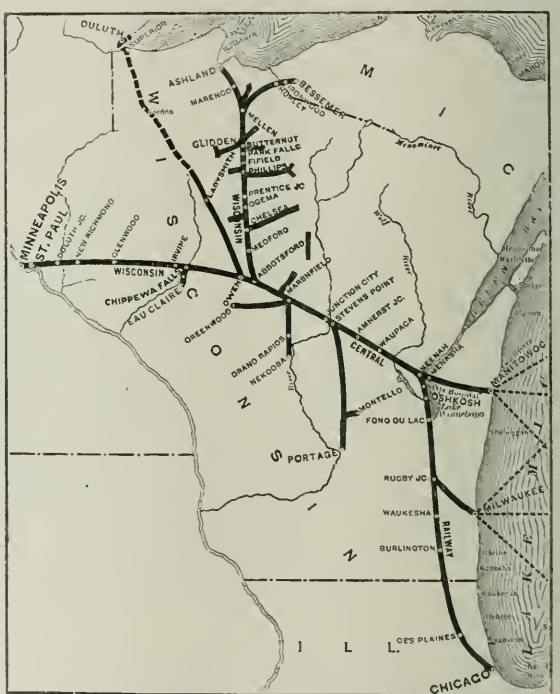
*The October dividend in 1907, amounting to $900,000 (1½ per cent. on the preferred stock) was charged to profit and loss, leaving a surplus for the year shown in the income account of $253,987. The October, 1906, dividend (2½ per cent.) was charged to income.

†Deficit.

Wisconsin Central.

In October, 1906, W. A. Bradford, President of the Chicago, Cincinnati & Louisville, having with associates bought control of the majority of the stock of the Wisconsin Central, was elected President. The current report for the year ended June 30, 1907, therefore, covers the results of eight months of operation by the new management. Gross earnings show an increase of 6 per cent., from $7,100,000 to $7,600,000. Operating expenses increased 4 per cent., leaving net earnings of $2,850,000, against $2,580,000 in 1906, a gain of 11 per cent. The operating ratio was reduced from 63.5 to 62.4 per cent. There was a net income after charges of about $1,000,000, against $737,000 in the previous year. This was carried to profit and loss, without any improvement appropriation, making a balance to the credit of profit and loss, after a deduction of $28,000, of $1,852,377. This is on the whole a satisfactory showing for the year. It must be observed, however, that operating expenses were kept down through the maintenance rather than the conducting transportation accounts, and the year's surplus increased by not making an appropriation for improvements.

While there was a trifling increase in maintenance of equipment and a decrease in maintenance of way, conducting transportation increased $240,000. Maintenance of way and structures cost $828 per mile of road (average mileage operated) against $880 in 1906. There was spent on equipment repairs $1,539 per locomotive, against $1,683 in 1906; $654 per passenger car, against $558 in 1906, and $44 per freight car, against $40 in 1906. The figures for maintaining the locomotives and freight cars are



Wisconsin Central.

decidedly low as compared with other railroads in the same territory. Thus it appears that the favorable operating results of the year were gained by keeping down the maintenance figures to about minimum requirements.

No figures are given of freight traffic by commodities, the only information on this subject being the statement that there were 4,397,000 tons of freight carried, against 4,343,000 in 1906. The average distance haul per ton was 184 miles, against 185 miles in the previous year. The ton-mile rate, however, increased from 0.66 cents in 1906 to 0.69 cents last year. On the other hand, earnings per freight-train mile decreased slightly and the average trainload (whether revenue or including company freight is not stated) fell from 325 tons to 308 tons.

On April 25, 1907, the company's large freight station at Minneapolis and its contents were burned, a loss half of which was covered by insurance. Of the other half (amount not stated), $20,000 was charged to operating expenses. To replace this station and at the same time enlarge the road's facilities at Minneapolis in proportion to the growth of the traffic, contracts have been let for a reinforced concrete freight station 117 ft. long, 66 ft. wide at the north end, 98 ft. wide at the south end and four stories high. The south end is to front on Hennepin avenue, the principal commercial street of Minneapolis. A viaduct connected with the second floor will extend from Hennepin avenue to First avenue north. The

cost, including the necessary brick paving, changing of tracks, etc., is estimated at $180,000.

Work is actively under way on the extension of the line from Ladysmith to Superior and Duluth. Ten miles of track had been laid on October 8, 1907, and more was to be put down as soon as the grade was available. Most of the clearing, grubbing, grading and pile driving was finished. Steel bridges will be erected as soon as the track is ready for them. After prolonged negotiations, a franchise for entrance to the city of Duluth has been secured. Contracts for the construction which it involves have been made and work is now in progress. Agreements for crossing other railroads and a contract for use of the Northern Pacific's bridge across the St. Louis river have also been made.

The following table shows for the last two years the principal results of operation:

	1907.	1906.
Mileage worked	1,018	977
Passenger earnings	$1,627,492	$1,481,175
Freight earnings	5,610,733	5,317,237
Gross earnings	[illegible]	7,118,576
Maint. way and structures	[illegible]	859,723
Maint. of equipment	[illegible]	806,666
Conducting transportation	[illegible]	2,618,451
Operating expenses	[illegible]	4,542,477
Net earnings	2,817,086	2,576,100
Net income	998,206	[illegible]
Improvement appropriations		[illegible]
Year's surplus	998,206	363,517

Cincinnati, Hamilton & Dayton.

It was not possible to bring about such satisfactory results on the Cincinnati, Hamilton & Dayton as those described in the review of the annual report of the Pere Marquette last week. The same methods have been applied and in the same way, but whether because as the head of the "Great Central" consolidation it became more deeply involved than its controlled road, or because, lying in more competitive territory than the Pere Marquette, it has not been able to compete as favorably with other solvent railroads, the Cincinnati, Hamilton & Dayton has not yet progressed to the point at which it can stand on its own feet, as a result of its earnings. The real reason for this state of affairs is probably contained in the concluding statement of the receiver's report, commending the results obtained by the officers and employees, which is as follows.

"The year's business has been done without additions to the motive power, equipment and facilities, which have been in view for several years and are sorely needed. The results accomplished nevertheless would not have been possible without the greatest care and intelligent devotion to their duties on the part of the officers and employees. I cannot close this report without giving them the credit which is justly due."

Apparently, it has been a case of a railroad weakened by past mismanagement and in need of new locomotives, cars and operating facilities trying to hold its own in a territory richly supplied with competing railroads. Part of the Pere Marquette's progress, on the other hand, is no doubt due to the fact that its equipment is much of it new and the rest in good condition.

As in the case of the Pere Marquette, a number of entries in the report suggest faulty accounting methods in earlier years. For instance, among last year's additions and improvements $118,000 is shown as a credit to new bridges and culverts. This amount was at the same time charged to operating expenses to adjust charges for bridges rebuilt during 1905 and 1906 charged to additions and improvements, but not properly so chargeable. There has also been $107,000 charged to profit and loss as depreciation on equipment; depreciation which was all prior to the last fiscal year and on cars and engines of obsolete type which could not be used for present day operation.

The past year's unit maintenance charges, though scarcely adequate, show up better than those of the preceding years. The following table shows the comparison:

	1907.	1906.	1905.	1904.
Maintenance of way, per mile	[illegible]	[illegible]	871	767
Repairs, locomotives, per locomotive	[illegible]	[illegible]	[illegible]	[illegible]
passenger cars, per car	[illegible]	[illegible]	[illegible]	[illegible]
freight cars, per car	[illegible]	[illegible]	[illegible]	[illegible]

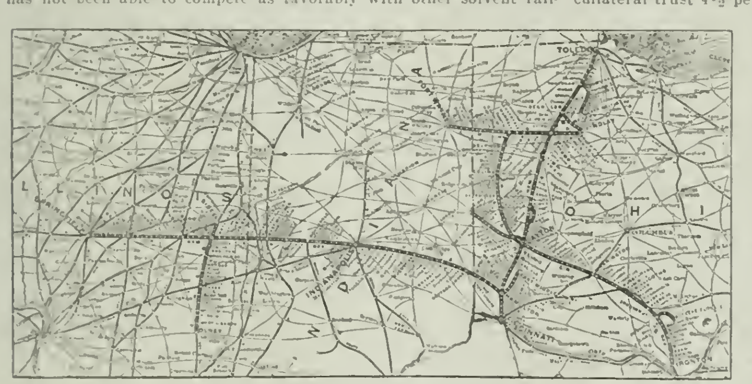
The equipment figures for 1907 are really somewhat lower than they seem, because no new equipment has been added during the year, for the cost of repairs per locomotive and per car was more than if some proportion of the equipment had been new, requiring few repairs.

The outstanding 6 per cent. receiver's certificates are shown in the following list of those issued during the year:

Outstanding June 30, 1906		[illegible]
Issued [illegible] 1906, to provide funds to pay interest due July 1, 1906, on the following bonds:		
Dayton & Michigan R.R. consolidated mortgage 5 per cent. bonds	$68,200	
Cincinnati, Hamilton & Dayton Ry. 2d (now 1st) mort. 4½ per cent. bonds	45,000	
Refunding mortgage 4 per cent. bonds	226,140	
Cincinnati, Indianapolis & Western Ry., 1st and refunding mort. 4 per cent. bonds	[illegible]	
Indiana, Decatur & Western Ry. 1st mortgage 5 per cent. bonds	79,050	
		[illegible]
Total outstanding June 30, 1907		[illegible]

The January, 1907, interest on these same bonds was paid out of earnings.

Gross earnings were $8,900,000 against $8,400,000 in 1906. Most of this increase, however, was used up in operating expenses, leaving net earnings of $2,165,000 against just under $2,000,000 in 1906. The payments for taxes were a little more than half as much as in 1906. The reason for this was that in that year a half year's taxes omitted in 1905 were charged to the 1906 earnings, for which no corresponding deduction appears in last year's account. There was a deficit after fixed charges of $861,000, which is less by $286,000 than in 1906. It must also be remembered that the item of fixed charges includes interest amounting to $675,000 on the $15,000,000 collateral trust 4½ per cent. notes which are in default.



Cincinnati, Hamilton & Dayton.

The expenses show no especially striking changes during the year. There was a decrease of $65,000 in maintenance of way, an increase of $167,000 in maintenance of equipment and of $251,000 in conducting transportation. General expenses increased $9,000. Under this head there was an increase of $22,000 in salaries of clerks and attendants and a decrease of $13,000 in law expenses. The expenses were increased and at the same time the earnings reduced by winter and spring floods throughout the Ohio valley and especially in the vicinity of Cincinnati. These caused considerable business to be temporarily diverted to other gateways and railroads. In the vicinity of Chillicothe on the Ironton line extraordinary repairs to embankments were made necessary by unprecedented floods during the month of March.

The operation of the road during the year was more efficient. The revenue ton-miles increased from 940,000,000 to over 1,000,000,000, or 6 per cent., yet there was an increase of only 2 per cent. in the freight-train mileage. While the miles run by loaded freight cars increased from 47,000,000 to 49,000,000, the miles run by empty freight cars decreased. The revenue trainload rose from 371 tons to 397 tons, and the revenue carload from 20 to 21 tons. In face of a decrease in the ton-mile rate received, the average revenue per freight-train mile increased from $2.37 to $2.45. In this respect the passenger results furnish a parallel. The passenger-mile rate decreased but the average passenger revenue per train-mile increased from 61 cents to 68 cents. Including mail and express, the passenger-train earnings per mile rose from 78 cents to 83 cents.

The net amount spent during the year on additions and betterments was about $100,000, or $100 per mile. There were 12 miles of new 85-lb. rails laid on the northern end of the Cincinnati-Toledo main line between Hamilton and Toledo. This released 70-lb. rail which was relaid partly further south on the Cincinnati-Toledo line and partly on a branch line. Work has been begun on the enlargement of the yards at Toledo and at Lima. Most of the new 85-lb. rails laid by the Pere Marquette during the year were on its Toledo division, showing that both roads have joined in the improvement of their through line between Cincinnati and Detroit.

The income results of the last three years are shown in the following table:

	1907.	1906.	1905.
Mileage worked	1,038	1,038	1,028
Passenger earnings	$1,871,019	$1,813,561	$1,912,855
Freight earnings	6,374,235	5,996,802	5,694,283
Gross earnings	8,946,935	8,398,418	8,008,918
Maint. way & structures	1,078,613	[illegible]	903,936
Maint. of equipment	1,571,756	1,404,704	1,201,603
Conduct'g transportat'n.	3,891,011	[illegible]	3,661,326
Operating expenses	6,782,126	6,419,140	6,004,966
Net earnings	2,164,809	1,979,278	2,003,952
Net deficit	861,354	1,147,631	241,224

Mexican Central.

The Mexican Central is still a nominally independent property, for the financial upheaval has prevented the Mexican government from finally carrying out the terms of its merger with the National Lines of Mexico. The government, however, holds a majority of the Mexican Central stock and has not abandoned its plans for the consolidation.

The report for the year ended June 30, 1907, is more complete than those of previous years, which have been silent in regard to many important details of the company's operations. Two needed tables are added, one showing in considerable detail the classification of freight by commodities, the other the operating statistics for the freight, passenger and total traffic and the figures for train and car loading and mileage.

Gross earnings were $15,600,000, an increase of 10 per cent. over 1906. This total includes $85,000 earnings from construction freight, following the outworn practice reintroduced in 1906 of including earnings from company business. Operating expenses increased 11 per cent., leaving net earnings of $4,580,000, an increase of 7 per cent. There was, however, owing to the increase in fixed charges through large note issues, a net deficit after charges of $140,000. It was therefore only by withdrawing $1,450,000 from the subsidy trust fund—made up of payments originally made by the Mexican government as subsidies—that it was possible to use $1,315,000 for betterments and improvements. Even by so doing, the profit and loss surplus of the preceding year which is also the total profit and loss surplus of the company had to be called upon for a few thousand dollars.

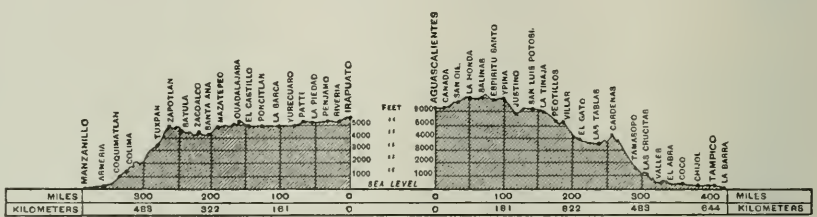
This bolstering up of the net income from operation cannot last much longer for only $1,186,000 which is less than the amount withdrawn last year remains in the subsidy fund. When this is gone the Mexican Central as an independent property would be likely to have a hard time to meet its fixed charges, and a harder to appropriate anything for betterments and improvements. It has $35,600,000 notes, collateral and equipment, outstanding, most of them maturing within the next four years. Even with higher freight rates, some of which were put in effect on August 9, 1907, with others still to be sanctioned by the government, the road would hardly be in a position by 1911, with its subsidy trust fund probably used up three years before and the consequent stopping of general improvements, to successfully refund this large amount of maturing indebtedness. The government's consolidation, however, as soon as it can be carried out, is expected to solve these difficulties by refunding the outstanding notes in the new securities of the consolidated company.

The increase in earnings during the year came almost wholly in the passenger department. Freight earnings increased only $25,000 over the previous year. This small increase is due, according to the report, to bad washouts during the rainy season in August and September, 1906, and to a serious strike in the mechanical shops during the same period. Passenger earnings, however, rose $1,250,000, or 47 per cent., over the previous year. This was due only in part to an increase in passenger travel, for it is estimated undermaintained. Maintenance of way cost $624 per mile against $514 in 1906, an increase of 21 per cent. to be sure, but by no means enough to adequately maintain a large railroad system with much through line, even in Mexico.

Repairs, including expenditures for converting locomotives into oil burners, cost $3,135 per locomotive, against $2,430 in 1906; $553 per passenger car, against $583 in 1906, and $79 per freight car, against $99 in 1906. The reduction in the freight car figure is due to the fact that 2,142 freight cars were added to the equipment during the year, while the amount spent on freight car repairs was almost the same in the two years. Besides the freight cars, 60 locomotives and 29 passenger cars were added to the equipment at a total cost for the three classes of new equipment of $3,900,000. There are now 150 oil burning locomotives on the Mexican Central, 60 of which are new, as against 50 oil burners a year ago. The effect of this change is shown in a decrease of 18 per cent. in the cost of locomotive fuel, including coal, wood and oil; with an increase in the revenue train mileage from 7,700,000 in 1906 to 8,200,000 last year.

There was a decrease in the revenue ton mileage, the freight density, the average haul and the freight earnings per mile of road and per train mile. On the other hand, the total freight earnings and the ton-mile rate were larger. The train-load, including company freight, was 227 tons, against 250 tons in 1906.

The passenger density increased from 56,372 passengers one

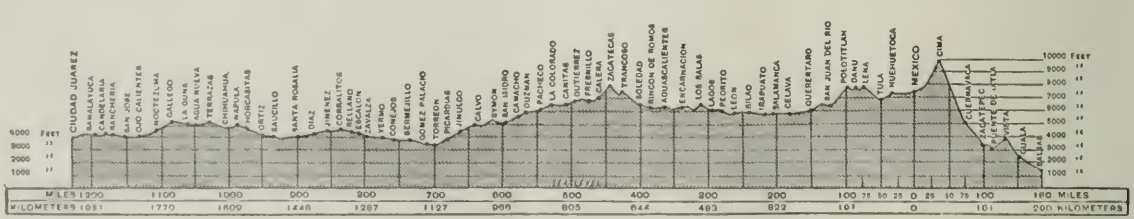


Profiles from Manzanillo to Irapuato and from Aguascalientes to Tampico; Mexican Central.

mile per mile of road to $5,656, or over 50 per cent. The average passenger trip rose from 50 miles to 64 miles, and the total passenger revenue from $2,650,000 to $3,900,000. Even with a slight decrease in the passenger-mile rate, the passenger earnings per train-mile were $2.91, against $2.13 in 1906.

Pulque, native wines and liquors, and ixtle, henequen and other fibers are unusual commodity classifications to come upon in a railroad report. They suggest the semi-tropical character of the southern part of the Mexican Central's territory. Pulque is the fermented juice of the maguey or century plant. Ore makes up 24 per cent. of the total tonnage and metals and mineral products together, 55 per cent. Forest products include 9 per cent., of which the largest classification is firewood, 5 per cent. Agricultural products cover 22 per cent., with corn 5 per cent., the largest item. Miscellaneous, including manufactures, make up 11 per cent. of the total, against 10 per cent. in 1906.

The extension of the Guadalajara division from Tuxpan to the Pacific coast at Manzanillo is now progressing rapidly. This construction was begun three years ago and was to have been finished on January 1, 1908, but in October of last year there came a disastrous flood "which was so extraordinary as to be a marvel of nature." Part of the construction work was washed out and the whole line



Profile of Main Line from the United States Boundary to Mexico City and Balsas; Mexican Central.

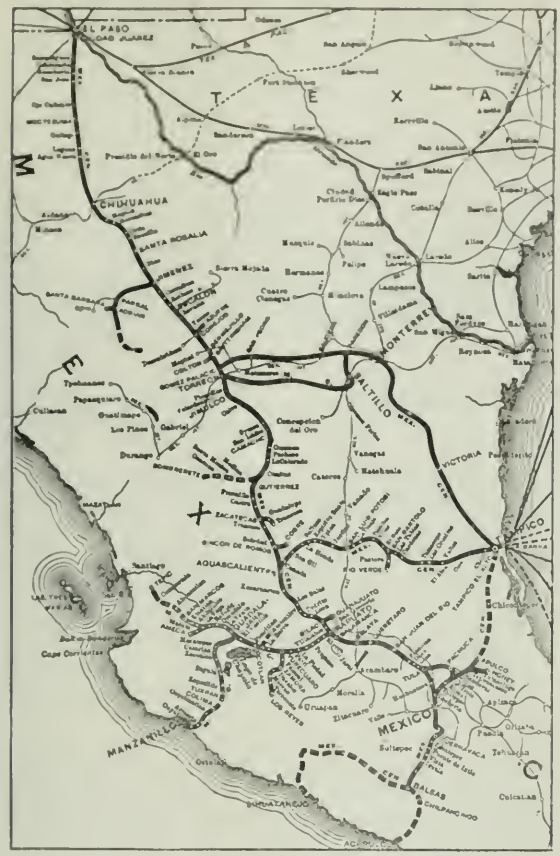
that over $500,000 of the increase is the direct result of having tickets and cash fares collected by train auditors instead of by conductors. This system was begun in the fall of 1906 and is now used on every passenger train on the road. Many Mexican Central conductors must be economizing as a result.

The unit charge in operating expenses for maintenance of way shows that without the help of the subsidy trust fund, and the resulting money for betterments and improvements, all of which were spent on way and structures, the line would have been greatly had to be rebuilt above this extraordinary flood level. This has increased the estimated cost and delayed the construction so that the road will not be opened for business before July 1, 1908. Construction of another important line long planned was begun during the year. This is the cut-off from Apulco to Tampico, which will shorten the distance between Mexico City and Tampico from 778 to 278 miles. Work was begun on the first 31 miles of this line about May 1, 1907.

Profiles of the new through line to the Pacific coast, of the

line from Aguascalientes to Tampico and of the main line south from El Paso, Tex., are shown herewith.

The following table summarizes the results of operation of the last two years. Where figures are shown only in Mexican currency



Mexican Central.

in the report they have been converted into United States currency at the rate of $2 per United States dollar:

	1907.	1906.
Mileage worked	3,195	3,156
Passenger earnings	$3,900,335	$2,650,011
Freight earnings	10,814,225	10,788,449
Gross earnings	15,618,008	14,188,403

Improvement appropriations	1,315,430	695,546
Year's income deficit	1,456,904	581,160
Profit and loss surplus	208,330	210,710*
Used from subsidy trust fund	1,450,000	1,000,000
Final total profit and loss surp.	201,226	208,130

*Deficit.

Chicago & Eastern Illinois.

This year's report of the Chicago & Eastern Illinois is for the first time issued in the same form as the annual statements of the larger Rock Island properties. It is large size (9 x 12), and contains full tables of the operating and other results of the year and information describing the securities of the company. This is a change much to be commended, as the reports of the Chicago, Rock Island & Pacific and the St. Louis & San Francisco are among the best railroad reports issued. The entire capital stock of the Chicago & Eastern Illinois is owned by the St. Louis & San Francisco, all of whose common stock is in turn owned by the Rock Island Company. The Chicago & Eastern Illinois in turn owns $3,161,450 of the $3,987,383 common stock of the Evansville & Terre Haute, with which is now consolidated the Evansville & Indianapolis.

The Chicago & Eastern Illinois and its subsidiaries are shown on the accompanying map. As will there be seen the Chicago & Eastern Illinois gives the Rock Island a short through line between Chicago and St. Louis and also connects Chicago with the coal fields in eastern Illinois and western Indiana. With the Louisville & Nashville it forms part of a through line to Nashville, Tenn., Birmingham and Mobile, Ala., and New Orleans. In connection with the Nashville, Chattanooga & St. Louis, the Western & Atlantic, the Central of Georgia, the Georgia, Southern & Florida and the Atlantic Coast Line, it forms a through line from Chicago to Jacksonville, Fla. Bituminous coal furnishes over 60 per cent. of its tonnage.

Like all Rock Island lines, the most striking thing about the past year's operations is the betterment of the property out of earnings. There was 25 per cent. more spent on maintenance of equipment and 37 per cent. more on maintenance of way and structures than in the previous year. Per mile of road owned and leased, maintenance of way cost $792, compared with $511 in 1906. There were on the average 324 ties renewed on each of the 1,061 miles of main, second and third track, against 224 per mile in 1906. Over 10 miles of 85-lb. rails were laid to replace lighter sections, so that on June 30, 1907, 18 per cent. of the mileage was laid with 85-lb. rails as compared with 14 per cent. a year earlier. Heavy expenditures were made in replacing old wooden bridges with new and stronger wooden structures, also in strengthening other existing bridges to provide for heavier equipment now in use. Yet in spite of the large increase in maintenance of way expenses, even last year's figure seems low for a road with a freight traffic density of over 2,000,000 tons one mile per mile of road.

Equipment maintenance cost $2,007 per locomotive, against $2,084 in 1906; $872 per passenger car, against $884 in 1906; $45 per freight car, against $43 in 1906, and $43 per work car, against $20 in 1906. Under modern conditions it is probable that the average freight car now in service cannot be adequately maintained for $45 a year. The Chicago & Eastern Illinois, however, has a large proportion of new and modern steel coal cars which do not cost much for repairs during the first few years of service. Furthermore, a coal car does not cost as much to repair as a box car of the same age, and the Chicago & Eastern Illinois has somewhere nearly twice as much flat and coal cars as box cars.

There were put in service during the year 63 new locomotives, 10 passenger-train cars and 3,250 coal cars at a cost of $3,231,800. Ten of the new locomotives were fast passenger Atlantic engines, 30 were heavy consolidation freight, and 23 switching. There were 15 locomotives and 2,458 freight cars, mostly of small capacity, dropped from the equipment register. This throws another explanatory sidelight on the low charge for maintenance per freight car. For delivery before January 1, 1908, there have been ordered three library-baggage and three chair cars and 2,000 steel underframe National dump cars of 100,000 lbs. capacity.

Although there was an increase of 5,600,000 passengers carried one mile and 221,000,000 tons of freight moved one mile, the expense of getting and carrying the business decreased 6 per cent. This is remarkable not only because of the increased business, but also because the year was an expensive one in cost of wages, supplies and almost everything else. The decrease in conducting transportation was brought about through the changes in the items of per diem and hire of equipment. Instead of paying out $106,000 for per diem and $49,000 for equipment hire as in 1906, the company was a creditor to the extent of $402,000 under the first and $26,000 under the second head, a total decrease in these payments for the year of $583,000. There was also a large decrease in the amount paid out for injuries to persons, most of it due to smaller payments under that head but part of it to the fact that last year part of the injury payments were charged to maintenance of way and structures and part to maintenance of equipment, a new refinement in dealing with this account.

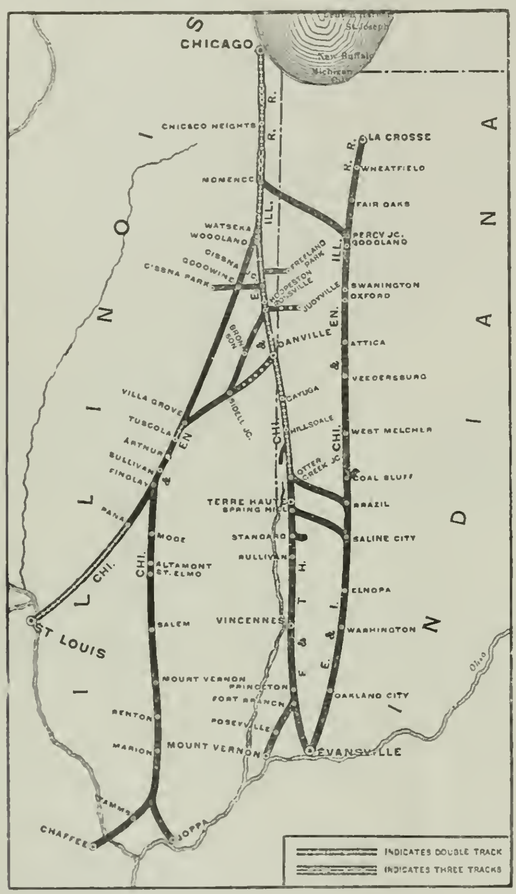
Gross earnings were $11,300,000, an increase of $1,400,000, or 14 per cent. Operating expenses increased $600,000, or 9 per cent., leaving net earnings of $4,200,000, an increase of $800,000, or 24 per cent. The net income after charges was equal to 6 per cent. on the preferred stock, which was paid, and 15.8 on the common stock, on which 10 per cent. was paid, these payments going to the St. Louis & San Francisco to pay interest on its Chicago & Eastern Illinois stock trust certificates.

The revenue trainload was 576 tons, against 565 tons in 1906, while the average trainload including company freight, was 605 tons, a high figure. This large trainload makes it all the more remarkable that more has not been spent in the past on maintenance of way. The average haul per ton of revenue freight was 163 miles, which is just about the distance from the coal fields about Terre Haute, Ind., to Chicago.

The relative changes in the operating expense accounts due to the larger amounts spent on maintenance are sharply shown in the ratios of each class of expenses to total expenses and to gross earnings. Of the total expenses, maintenance of way was 18 per cent., against 12 per cent. in 1906, while conducting transportation was 52 per cent., against 60 per cent. in that year. Of gross earnings, maintenance of way was 11 per cent., against 8 per cent. in

1906, and conducting transportation 33 per cent., against 40 per cent. in 1906.

The locomotive repair shops and engine houses at Oaklawn (Danville, Ill.) are being enlarged at an estimated cost of $560,000. Up to July 1, 1907, $286,700 had been spent there, of which $56,000 was for shop machinery and tools, $223,000 for shops, engine houses and turntables, and $7,000 for yard and other tracks. The plan of enlargement of these shops was described in the *Railroad Gazette* of November 2, 1906.



Chicago & Eastern Illinois; Evansville & Terre Haute, and Evansville & Indianapolis.

The results for the past two years are given below:

	1907.	1906.
Mileage worked	948	948
Passenger earnings	$1,684,848	$1,603,016
Freight earnings	9,320,192	8,086,593
Gross earnings	11,337,714	9,928,563
Maint. way and structures	1,286,615	818,994
Maint. of equipment	1,812,550	1,452,005
Conducting transportation	3,706,285	3,958,130
Operating expenses	7,177,309	6,570,489
Net earnings	4,160,406	3,358,074
Net income	1,670,168	1,144,958
Dividends	1,251,622	1,187,266
Year's surplus	418,546	37,692
Depreciation*	823,166	226,469

*Charged to profit and loss.

NEW PUBLICATIONS.

Substitution of the Electric Locomotive for the Steam Locomotive. By Lewis B. Stillwell and H. St. Clair Putnam. New York: American Institute of Electrical Engineers. [illegible] pages; 6 in. by 9 in.; 18 illustrations. Cloth.

This book is a reprint with the discussion, of the paper presented by the authors before the publishing association in January, 1907, from which liberal extracts were reprinted in the *Railroad Gazette* Feb. 1, 1907 together with an editorial comment on the position that had been taken. In this comment attention was called to the fact that it seemed to be assumed that the substitution of electric for steam power on all railroads is economical, and the authors and speakers went far beyond calculations for specific installations and entered the broad field of the entire railroad mileage of the United States from which they drew staggering totals. It seemed to be apparent that if the railroads would only make haste to get $2\frac{1}{2}$ billions of new capital they could save 250 millions each year in operating expenses." In short, the paper with the discussion that followed may be considered as the ultra-electric viewpoint of the situation, in which the electric locomotive is to shortly usurp the place of the steam-driven machine, provided only the railroad managers will view the case in the light of their own true economical interests. The weak point in the paper is its neglect of financial and operating requirements and conditions. It seems to have been taken for granted that all of the gains that have been found to obtain in a congested territory and short distance transmission could be secured on long distance traffic handled far from the source of supply. And in the conclusion it was claimed that on "certain railroads, trains are now so heavy and run at such high speeds, as to tax the capacity of the most powerful steam locomotives to the limit, and the headway between trains is as small as permissible. Here, then, electrification becomes an absolute necessity if the traffic capacity of the lines is to be increased without the tremendous expense of adding new lines." The conclusions then go on to advocate the use of enough electric locomotives, in multiple control at the head of the train, to produce the increased capacity, evidently forgetful of the fact that the tractive power of some of the steam locomotives already in service is greater than the capacity of drawbars to resist it; so that it becomes difficult to understand how the use of more electric locomotives will relieve the situation.

The inference should not be drawn from this, however, that the paper is superficial or that it is valueless because it contains what may appear to some to be the exaggerations of enthusiasm. This is far from being the case. It is a careful and painstaking review of the possibilities of electric traction when viewed in its most favorable light. That the utopian condition of affairs is likely to be realized at once is not claimed, for the authors must understand that it would be impossible at once to raise the capital for the expenditures required.

As this point is the one that stands most prominently forth it overshadows the question of the relative superiority of alternating and direct-current for railroad work, though the merits of each are ably set forth by the representatives of the two great electric companies that are identified with the exploitation of one or the other system.

Locomotive Breakdowns and How to Repair Them. By W. G. Wallace. Chicago: Frederick J. Drake & Co. 285 pages; $4\frac{1}{2}$ in. x 7 in.; 56 illustrations; flexible leather.

This book is a separate imprint on smaller pages, much thinner paper and a different binding, of the book on the same subject forming one of the set of seven volumes on the Art of Railroading, reviewed in the *Railroad Gazette* Oct. 11. The printed page, however, is the same and the two books bear strong evidence of having been printed from the same plates, the difference in size being made up in margin and thickness of paper. Of the two editions the single book is the more attractive though not quite so pretentious as the one in the set.

The First Steam Superheaters.

BY CHARLES R. KING.

A study of the records of drawing offices in many locomotive works brings to light the remarkable fact that steam superheaters and desiccators were designed, if not made, over half a century ago, and that some of the devices then employed would, if reconstructed experimentally with all the improvements available at the present day, answer the same purpose as many new types. The circumstance that such reheaters were abandoned sooner or later proved that the methods of construction, both of boiler and engine, with the materials formerly employed, and the lubricants available, were all unsuitable; but the principle of the superheaters was frequently good, and some of the arrangements here illustrated will be found to be very interesting.

So far as present knowledge goes the first application of a superheater to a locomotive boiler appears to be that made in 1848 by John Cockerill, of Seraing, near Liège, Belgium, and in which the steam-drying pipes were lodged in the smokebox and continued up a casing concentric with the chimney.

But the first superheaters suggestive of modern forms were, so far as is at present known, designed and patented in 1850 by M. Moncheuil, Director of the Montereau & Troyes Railroad, France. These patents belong to a series granted in 1849 for "the employment of non-saturated, superheated, steam in the boilers of stationary engines" in the name of A. de Quillacq, founder of the de Quillacq Engineering Works, who died in 1903. The additions made to these patents for locomotive boilers comprise the ordinary

types of locomotive boilers fitted with, (A) a large flue traversing the bottom of the boiler and containing superheating pipes bent backwards and forwards, (B) large flame flues between the two flue-sheets containing superheating steam-pipes also bent backwards and forwards the length of the tubes with U-caps connecting the extremities of the pipes, and (C) a superheater placed outside, on top of the boiler.

The flame-tube or fire-flue superheaters, A and B, were for

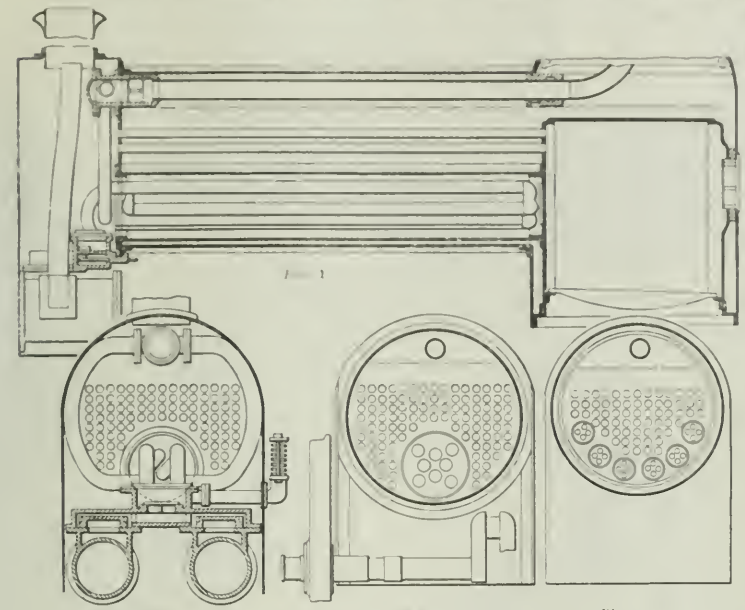


Fig. 2. Fig. 3. Fig. 4.

Fire-tube Superheater Applied in 1850 to Express Passenger Locomotive; Montereau & Troyes Railway.

highly-superheated steam and designed for application to the boilers of the 2-2-2 type express engines of the Montereau & Troyes Railroad that had been built by the firm Hallette in the year 1847. The details relating to the first form of superheater are shown in the Figs. 1, 2 and 3, but the high firebox usual to the engines of that period, and other features, are omitted from the present reproduction. The direction of the superheater pipes is as follows: From the saturated steam-pipe to the two lowest superheating pipes and back to the firebox end; forward, through the two intermediate pipes; backward, again, through the two upper

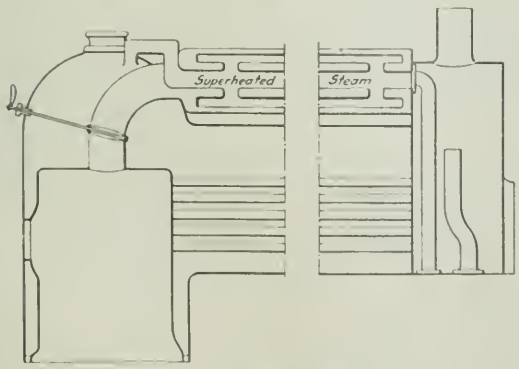

Fig. 5—Moncheuil Superheater Outside of Boiler; 1850.

pipes—the connection of their extremities with those of the lower row being by means of the two U-caps that are shown, in a diagonal position, in the smokebox section, and then forward, once more, through the two topmost pipes which are visible in both the longitudinal and cross sections of the boiler. The ends of all the pipes appear to be connected in series by means of cast U bends. No headers are shown nor any dampers for regulating the heat. It is, however, apparent that Moncheuil understood the importance of

"heated by series, in tubes of suitable dimensions fixed by ferrules as are the other tubes of locomotives. In each series one extremity of a group receives saturated steam; the other extremity of the series leads the de-saturated steam to the reservoir." (See Fig. 4.)

The third superheater, referred to previously as "C," in the Moncheuil-de Quillacq patents, is contained in a long barrel on top of the steam boiler as shown in Fig. 5. In this the heat is led upwards, through the high firebox of that period, by means of a large vertical and curved flue, thence passing into the horizontal drum and enveloping a concentric superheated-steam chamber supplied with saturated steam by means of a short pipe connecting it to the domed top of the firebox. A damper for cutting off or regulating the amount of heat to be passed to the superheater is shown in the curved flue.

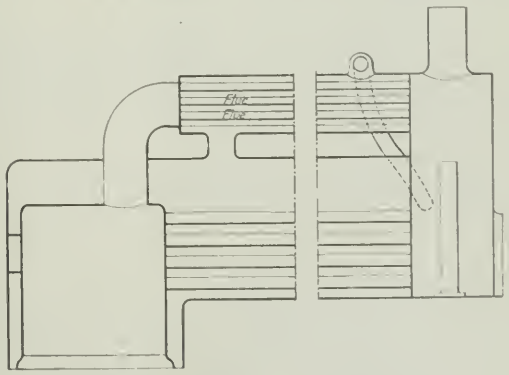

Fig. 10—Hittorf Superheater; 1869.

Next in order of priority appears the serpentine firebox-superheater of John Haswell, Director of the Vienna Locomotive Works of the Privileged State Railway Association. The first superheater of this Scotch mechanical genius is dated 1852 and the old draw-

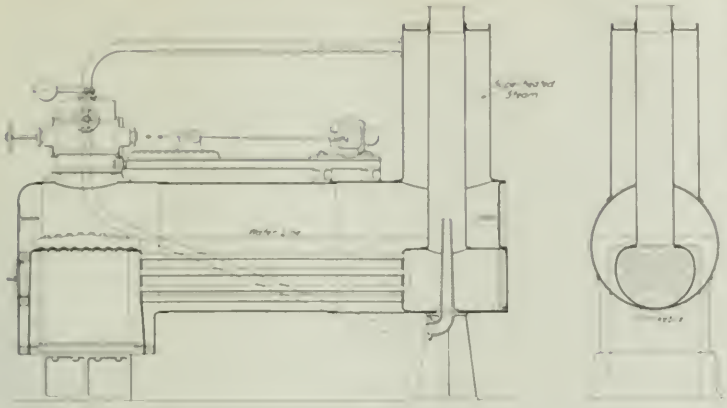

Fig. 12—Chimney Superheater or Economizer of John Haswell; 1862.

ing, recently coming to the knowledge of the writer, has been specially redrawn for reproduction in the present review. It will be seen from Fig. 11 that the Haswell superheater embodies the constructive principle of modern flash boilers although no pump or feed pipes below the water-line of the boiler are visible. Otherwise, all the other details are so fully shown as to require no description. The connection of the reversing lever to the saturated steam-inlet valve, giving automatic admission, and the stop-cock on the superheated steam pipe show the methods of control, but there is no indication as to a stop-valve being placed over the valve-

[illegible] engine. The records of the Austro-Hungarian Westbahn do not show whether this superheater was actually constructed or tried.

After Haswell, the superheater invented by M. Monroy, a French engineer, in 1855, came to attention. It comprised a large internal flue almost filling the lower part of the boiler and containing a serpentine coil precisely as set forth in the patent of Monchenil, but with this difference, that the saturated steam supply and reheated steam pipe connecting to the extremities of the double coil of serpentine, ran longitudinally along inside the coils the whole length of the large internal flue. In addition, there were steam reservoirs answering practically to the intention of "headers" in present forms of superheater. Thus, in the details, the Monroy apparatus represented a certain improvement over the Monchenil large flue-type superheater.

Between the years 1855 and 1860 steam superheaters and driers, or desiccators, were patented and made by so many persons that months rather than years would be better suited for indicating their dates. A small steam desiccator or heat economizer was applied about this time, but with no certainty as to date, by Messrs. Sharp, Stewart & Co., of Manchester, Eng., to one of several engines built for Egypt, as shown by the drawing reproduced in "Colburn's Locomotive Engineering," which work is to be consulted in most of the important engineering libraries. This was not a superheater properly so-called, and having but small heating surface its utility must have been doubtful.

After the high-temperature superheaters of Moncheuil and then

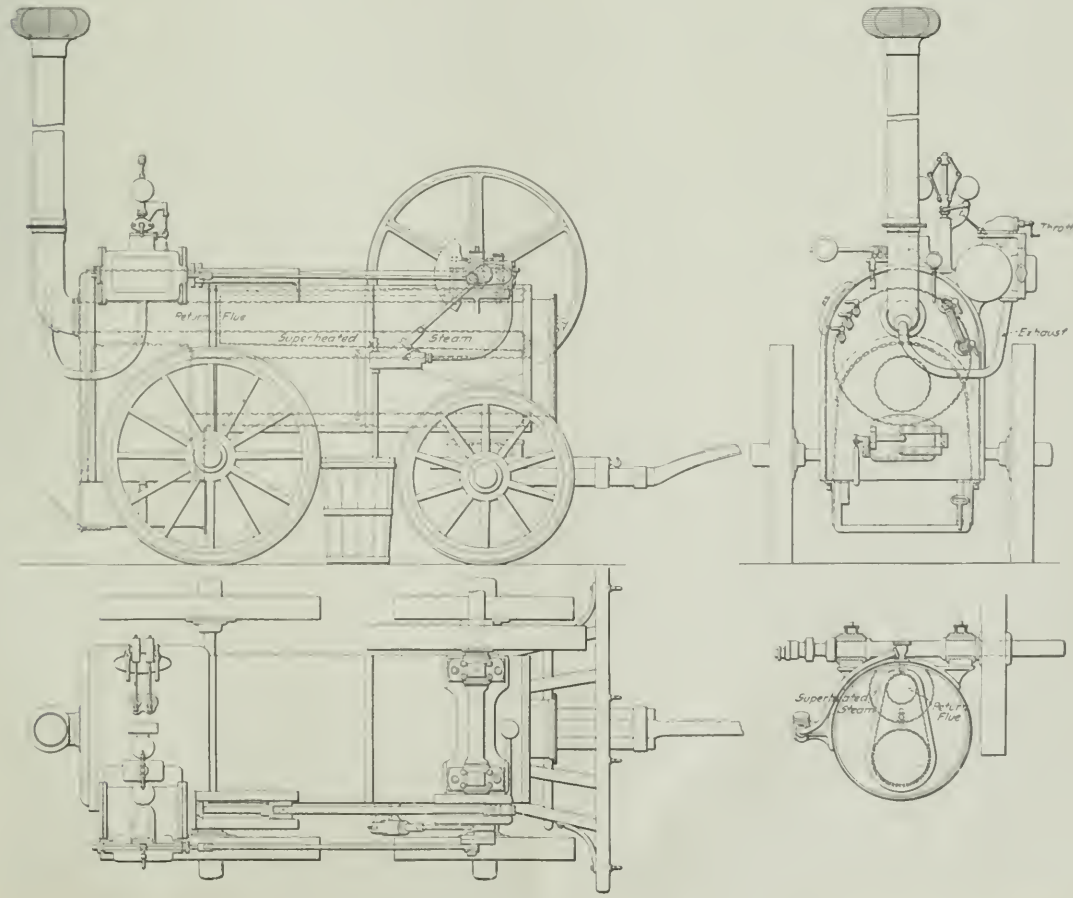

Fig. 13—Return-Flue Superheater of John Haswell; 1862.

of Montety, the experiments made in 1856—not in 1850 as sometimes stated in error—by Hirn, an Alsatian engineer, were principally of interest for the results obtained with a form of superheater better adapted for use in stationary boilers, as in the case of the de Quillacq patent of July, 1849. The Hirn cumbersome superheater in cast-iron was unsuited for regular locomotive practice, but it enabled the publication of data which his predecessors in superheating practice had neglected to record.

From 1855 onwards superheaters and steam-driers became so numerous for locomotive and fixed engines that the interesting stage in their history may be said to have passed, but a few interesting patterns will be selected for mention here. It is a significant fact that as the years progressed designers of superheaters began to place their superheating pipes farther and remoter from the action of the firebox gases.

In the year 1862 John Haswell, of the Privileged Austro-Hungarian Steel and Engineering Works of the State Railways at Vienna, designed the very simple superheater illustrated by the copy of the original drawing, Fig. 12. It will be seen that it is, in reality, a very good form of heat-economizer since even the smokebox is almost entirely surrounded by water; and the heat of the chimney, due both to the waste gases and also to the exhaust steam discharged into it, has to pass through a high steam cylinder, or dome, concentric to the chimney. For a small boiler of locomotive type this simple steam-drier has much to commend it. Incidentally the reader will remark the bed-plate carrying the crosshead and engine shaft for relieving the boiler barrel of all engine motion fatigue and for avoiding injurious expansive movements of the boiler in respect to the engine.

About the same time, though the date is not quite certain, John Haswell produced the simple return-flue superheater for small road engines shown in the Fig. 13. The details are sufficiently clear in the illustration which is made direct from the original. It comprises a 12-in. internal flue between the two flue sheets and a 6⅜-in. return flue from the smoke-chamber to the chimney, the latter flue being enveloped nearly the whole of its length in an outer casing forming a superheater within the usual steam space of the boiler. The design is extremely neat and, relatively to its steam and superheating surfaces, is suggestive of considerable efficiency. The drawings are dimensioned in English measures according to the practice that was so much observed by English industrial pioneers on the European continent.

John Haswell appears to have been the first engineer in the world to introduce, in 1862, four-cylinder balanced, non-compound, locomotives.

About the same year, in 1863, one of the most interesting forms of superheaters patented up to that time was the invention of Benjamin Crawford, United States, contrived by simply partitioning off the forward end of the boiler barrel, traversed by the fire flues, and reserving it for superheated steam, with due provision of a vertical deflector-plate or baffle in the superheater for diverting the steam to the bottom rows of tubes and thus insuring circulation around all tubes before its passing to the steam pipe at the top of the smokebox. This arrangement is probably the first of that category of moderate heat superheaters of which the best known examples are the Pielock and the Clench.

Since the creation of distinctive types of superheaters by Monchenil, one of the most frequently employed forms of superheater has been the outside barrel-type, probably for the reason that it has been so much employed, in Europe, as a steam reservoir for increasing the boiler capacity more effectively than steam domes. The example here given, Figs. 6 to 9, relates to a series of four-cylinder express and also series of four-cylinder freight locomotives designed about 1860 by M. Jules Petiet, Chief Engineer of Traction, Northern Railways of France, and built in 1862 by Gouln & Co., of Paris. Similarly to one of the Haswell superheaters, the "steam-dryer" of Petiet is of the return-flue type, but multitubular. The steam-drying tubes of the return-flue were 80 m.m. outside diameter and from 80 in. to 13 ft. in length according to the type of locomotive fitted with the apparatus. Some of these engines are still at work on the Chemins de fer du Nord, but with the outside barrel converted into a saturated steam reservoir, for this railroad, noted for its "de Glehn" engines, is largely operated with half-century old locomotives.

Another example of the reservoir superheater type is that illustrated in Fig. 10, and patented some years later, in 1869, by M. Hlittorf, a German engineer resident in Paris and author of an interesting little work on superheating at that period. Placed under the boiler in pairs, such outside superheaters are to be found in first class modern express locomotives and yield an economy, as compared to similar engines in similar service without them, of 9 per cent. on an average, and without costing a penny for repairs in the first three years of service—1901 to 1907. This latter arrangement has no nearer resemblance to the Hlittorf, the Petiet or the Monchenil superheaters, other than the external barrel for superheater pipes—but the fact shows that such dispositions are not without value.

Car Efficiency.*

Mr. Boyd's Address.

Nothing less than a determined, spontaneous effort on the part of shippers and railways will evolve a plan by which this problem of car inefficiency can be solved.

Adequate facilities, without which the most reasonable of rate adjustments is rendered more or less ineffective, must now command our attention. Car efficiency, therefore, is a leading unsolved transportation problem. No feature of transportation is so vital to the shipper as ample car supply and rapid service; no cause can be held so responsible for his loss when those facilities are denied him. He who relies on railway service cannot cease operations and view with indifference deficient transportation. There is no middle ground; he must go forward or drift backward; show a profit or take a loss. His duty to himself, and to others, is not only to refrain from unjust detention of cars, but also to demand from the carrier efficient service.

* * * Only two questions need be considered: (1) Are transportation facilities sufficient to present needs? (2) Are we obtaining from the facilities available all that they are capable of giving?

To the first question answer has already been made by those high in authority, who say that railways in their development are far behind the commercial world. Here it would seem the shipper scores the first point, for with this admission we may logically infer that commerce in its superior growth has naturally developed its own facilities correspondingly to take care of such increase. This acknowledgment is not made with respect to cars and engines solely, but as to other means of transportation as well. Here another point is scored, for in this delinquency we find one great cause of the failure to promptly move loads when tendered. As to the direct question, "Are we getting all we can from the means at hand?" we all find common ground in the negative. Who is responsible? Again we stand together. Then, what is the direct cause? This: First, unnecessary delays of cars; second, insufficient loading; third, delays in transportation; fourth, unnecessary work and consequent inefficient service at terminals, resulting from the continued use of methods long since outgrown.

In discussing the first of these features we must divide shipping interests into two classes: Those who by the investment of capital or otherwise have provided themselves with ample facilities to conduct their business; and those who by their wits and shrewdness have prevailed upon our railway friends to grant special privileges at out-of-the-way places where no means are provided for handling. This results in pressing cars into service as warehouses. With this latter class we have nothing in common; for their existence the railways are primarily responsible, and the railways must find and apply the remedy. We protest strongly against the disposition of carriers to generalize on the sins of the public in respect to car abuses. We object to their taking an incentive from the omissions and acts of this second class to saddle the responsibility for abuses on those who, having pursued a wiser course, are made to suffer in common with the carriers.

With regard to those who have warehouses of their own, it will not do to say out loud there have been no delays. There have been many and they are to some extent indefensible. Convenience often leads those possessing means for prompt unloading to prefer the use of the car instead. This is unfair not only to the carrier, but also to others awaiting equipment. The percentage of delay from abuses of this kind is small when compared with the total. * *

We often hear the expression that no one should purchase more than he can accept and handle promptly. No exception can be taken to this. But is that practice generally followed? What protection is there in so limiting purchases? The most carefully laid plans to order as facilities will permit are neutralized in times of congestion by failure of carriers to perform their duty in delivering the property promptly as ordered. No one can be expected to furnish facilities that will meet the most exacting demands, due almost entirely to slowness of others. No one expects carriers to have at any or all times a car supply equal to the greatest demand, nor in justice can the consignee be considered differently; both are subject to human limitations. What, then, is the result? Cars started in time and at regular intervals are delayed and days will pass with little or no delivery, to be followed by a deluge of deliveries and demands from carrier to accept, unload or pay the penalty. No account is taken of the loss suffered by the consignee from idleness. The answer of the carriers is that they are not bound to place freight at destination at any given time, losing sight of the fact that reasonable dispatch is imposed upon them by law. No one can object to economy in operation, since the greatest saving obtained from any given factor of transportation is a benefit to all; but economies that lean all to the railway's side at the expense of the public are false and unfair. Happily, such "economy" is on the wane.

*Addresses before the Traffic Club of Chicago, Oct. 25, by E. B. Boyd, Manager of the Transportation Department, Chicago Board of Trade, and Arthur Hale, Chairman of the Car Efficiency Committee of the American Railway Association.

Again, the shipper is often called upon to stand between carriers disputing with regard to the use of cars in times of scarcity, a practice altogether too prevalent. It has become a recognized practice for carriers to take possession of all cars in sight, regardless of ownership or from whom received, and apply them to orders for empties. Shippers availing themselves accordingly are met with a protest from the owner, the intimation being given that a repetition of the offense will prevent further deliveries from the complaining road. To ignore this protest means punishment, to comply means loss. Last winter afforded many examples—which doubtless will be repeated in the near future—in which shippers who, in their efforts to act fairly and while suffering for empties, found that as soon as a foreign car was unloaded by them it was not returned, but delivered to others, often their competitors, located on the same switch road. But this was not all. Notice to consignees on connecting lines was given by some railways that none of their cars, whether received under load or set in as empties by the line on which they were located, must be used or penalty would be inflicted, to be followed, on the other hand, by notice from switch road that failure to use cars set in would operate as a cancellation of a corresponding number of orders. Thus, "damned if you do and damned if you don't."

Inasmuch as the two interests—carrier and patron—are interdependent, is it not better to recognize that the impairment of one reacts to the detriment of the other?

There are too many cars traveling over the country under one-half or three-quarters load, even giving due consideration to conditions. It is not long since the maximum capacity of cars was 15 or 20 tons, and small dealers adjusted themselves accordingly. Units of sale as to car lots were based upon the prevailing carload minimums until it became a custom; but, as progress was made, and cars increased to 20, 25 and 30 tons capacity, the retailer and the consumer did not keep pace, nor have they caught up. The manufacturer and large distributors, on the other hand, have been alive to the conditions and stand ready to utilize to the full extent large cars, but are prevented from doing so by failure of the purchaser to co-operate. The public should realize that the carrying capacity of the railroads has been practically doubled in the last ten years, and at a great cost, to meet the rapid increase in commerce; and it is unjust and almost criminal for one portion of the public, for selfish reasons and through false ideas of economy, to deprive the other part, and the carriers, of the benefits of progressive action. If commerce has increased so rapidly, the consignee in consuming territory must have handled his business with wofully inadequate facilities, and this has been reflected in the insufficient loading of cars.

Prompt and regular service from initial point to destination must precede the quick disposition of freight at terminals, especially the larger ones. The delayed freight after arrival is thrown at the consignees in bunches, temporarily blocking not only his facilities, but also the carrier's, thus causing delays to multiply upon themselves. This is not an exceptional condition, as some would have us believe. It is common, it is here to-day; later on it will play an important part in the tabulations of the railways as to the idle time of equipment, probably finding its way eventually to the shipper's door.

In the unnecessary service at terminals we find the greatest source of our troubles and also one of the greatest fields for improvement. It can be said without exaggeration, I think, that there is wasted at terminals in money and energy from 25 to 40 per cent. through the loss of the service of cars, owing to the demand for the return of empties and to the unnecessary switching incident thereto. In consequence of misuse of cars the dreaded embargo notice appears and car inefficiency is started on its way. Freight in carloads on arrival at destination is refused delivery to owners located on connecting or switch lines. Cars accumulate until the dispute between carriers is settled, and then go forward after delays of from two to ten days. This may be justified, but it means, nevertheless, loss of utilities, and a maximum of annoyance and an expense to owner of the property, with minimum good to the carrier.

Great evils result from the enforced return of empties and the extra switching required. Every car returned empty means time wasted; and just now time is money. From two to six days is usually consumed. Within the past two weeks in a number of cases three and as many as seven days have been consumed in delivering to consignee where only the initial road was concerned. The consignee who receives also ships, and had he been permitted in the first instance to use for the outward movement the car he made empty, there would have been saved another day or two lost in supplying an empty to take its place. All this is accomplished at an expense in switching for which the carrier, as they would have us believe, is poorly paid. Very often this expense is included in the rate. It is an outlay in money or services that with improved methods would be saved.

Another source of inefficiency and of great annoyance and expense to owners of freight is found in the strict enforcement of arbitrary and exacting rules governing cars in bad order. Cases of delay from one to ten days are known, and sometimes 30 days. This condition arises from the too close enforcement of rules. Family rules as to demurrage are also responsible. To require a consignee to unload within a given time after notice of arrival imposes the obligation upon the carrier to make a proper delivery. This the carriers do not do. The latest cars are delivered first, while the earliest ones are held back. The consignee, in self-protection, exercises his right to call for the cars in the order of their arrival that he may unload within the free time and the carrier is at the expense of shifting trains backward and forward to get the cars desired. Is this not a case of waste of energy? Why make rules which in their operation must become boomerangs? Here is an opportunity for reform.

The Remedy.—We support the demand so persistently made of the railways for a number of years, namely, that those who require transportation should provide themselves with facilities adequate to their needs. Cars are built to transport, not to store, and if some of the good advice the railways have been giving the public in this respect were followed with regard to company material, especially coal, a great many more cars would be available to commerce.

To the retailer and heavier consumers: Increase the load in cars, increase your facilities, make your purchases conform to the new order of things, or expect to make your contribution in another form—increased cost of transportation.

High speed is not necessary, but regularity of service is. The feast and famine practice of delivering freight can have but one result—congestion. Avoid this and give shippers an opportunity to do their best.

Last, but not least, permit cars, without regard to ownership, to go to any place served by a railroad. Eliminate the delays that now attach to every car because of the name painted on its side. Handle cars on the line of least resistance and better results will follow. So long as a consignee unloads a required number of cars a day, why should it be any particular car first? The "average plan" of assessing car service (demurrage) would here quickly demonstrate its superiority over present methods. The cry is for uniformity, but what shall be the standard? If free time is to be determined by the needs of the smaller communities, where conditions under which traffic is handled are dissimilar to those at greater centers, then injury and injustice is done the many in the interest of the few. If, on the other hand, the needs of the larger terminals, where they receive and ship daily train loads of freight, is to determine the standard for all, then the door is open to abuse by giving those who do not require it free time in excess of their needs.

Co-operation as a means of settlement is the demand. Mutual consideration is essential. It is only by placing ourselves in the other fellow's shoes that we can properly determine our duties. But are we doing it? Is there not a disposition all too prevalent to consider as unfounded and worthy of little attention, even in advance of investigation, complaints made in good faith?

Is it not now time to recognize the palpable fact that the day of car aristocracy is passed? Whether bearing the name of the Pennsylvania Company or the Arcadia & Betsey River Railway, the effect is the same; it is but a car; it is built to carry freight and the freight should be that which could be secured the quickest and with a minimum cost in switching. Car efficiency of that character means an increase of equipment without the addition of a single car.

MR. HALE'S ADDRESS.

I understand I am to speak for the railroads. It has been so unusual for anyone to speak for the railroads in the last year or two that I fear we are all a little out of practice on this subject. We have been, however, so very pleasantly reminded to-night by Commissioner Clark that some can speak for the railroads and speak very well; and we were so pleasantly reminded in this city, not so long ago [by Mr. Mather] that we still exist, that I take up the subject with less diffidence than I might otherwise have done.

The term "car efficiency" is a new one—less than a year old. It is a good term because it needs no definition and no explanation. It was invented by our friend, Mr. Allen, secretary of the American Railway Association, the father of standard time.

As has been said before, the highest car efficiency can only be obtained by co-operation among the railroads, and between the railroads and the public. Much, however, can be done by the railroads individually, and much is being done. Many of the railroads which need cars the most are buying at an unprecedented rate. A shining example of this is the New York, New Haven & Hartford, which is doubling its equipment this year. Again, other railroads are doing better work with the equipment they have. One during the last year has increased the average movement of its cars from 29 miles to 36 miles per day—an increase of 25 per cent. This is the Chicago, Burlington & Quincy. Other roads have done almost as well in this particular.

The railroads, in conjunction with each other, have also taken action to improve the efficiency of cars. As I need not tell you, they have doubled the per diem rate between themselves, with the

objects of stimulating the building of new cars, improving the movement of cars, and of returning them to their owners. The railroads of the country have over 700,000 of their cars on each other's tracks, and the payment for the use of cars is something like $350,000 a day. Payments this year will be $60,000,000 more than last year, and we feel confident that in their efforts to gain or save, as they can, considerable parts of this $60,000,000, the railroads will improve the movement of cars. Improvements are being made as well in the relations between the Trunk Line railroads on the one side, and the Belt roads, the Switching roads and the Industrial roads on the other. Too often in the past the division of responsibility for car delay as between such roads has been ill-defined, resulting in considerable delays to cars. Problems involved in properly determining such relationships are difficult, but they are being handled with diligence, and progress is being made.

And now we come to the relations of the railroads with the public and the industries. Such concerns load and unload cars, and therefore have it in their power to affect the car efficiency of the country by their quick or slow work. If the public were to change their practice 10 per cent., for the better or worse, it would mean that there would be 100,000 or 200,000 cars affected, and the car efficiency of the country would be changed correspondingly for the better, or for the worse. The demurrage rules have been devised, not for the immediate profit of railroads by the collection of moneys, but for the reduction of car delay. As I have said in another place, every dollar collected for car service is a misfortune, and the total amounts of car service earnings are simply measures of the extent of the calamity.

From $20,000 to $25,000 are collected daily in the form of car demurrage. This means that there are from 20,000 to 25,000 cars not available for loading, which might be available. The total shortages in the country are now little more than 60,000 cars. If we could supply 25,000 cars more, daily, to be loaded with freight, these shortages would soon be wiped out. Whenever an industry handles a car inside the free time it is helping the general situation. If it handles the car in half the free time, it is helping the situation still more.

There are something like forty different sets of car demurrage rules in effect in different parts of the country. The American Railway Association has had prepared, through one of its committees—with the help of a suggestion of the Interstate Commerce Commission, and with the hearty concurrence of the Car Service Managers—a set of car service rules, which it will consider at its meeting in New York next week. This set of rules is intended to embody the best practice that can be found. It is quite possible that some of these rules are so stringent that they cannot immediately be adopted in all parts of the country. This is felt to be the case by a number of our most important shippers, and I have been asked to give my views on this subject here. I have been reminded that I have been a consistent advocate of the so-called Pittsburgh Car Service Rules and have helped to secure their adoption, not only in Pittsburgh, but also through Ohio and the various other places where there are similar industries. It is true that I have done this, and that I think the Pittsburgh rules were better adapted for such trades last year than any other rules I know of. The Pittsburgh rules are better adapted to-day, in their entirety, for such industries than any other rules I know of; but I do not mean by this that the Pittsburgh rules are the best rules than can be devised for the whole country, any more than I think the new rules are the best that can be devised for every city in the whole country. My opinion is that the new rules, approved by the Committee on Car Service of the American Railway Association, are better adapted for the larger portion of this country than any other rules I know of, and that they can be adapted—with very few modifications—for immediate use all over the country and even in Pittsburgh.

Now, gentlemen, this is all I had intended to say, but there have been some things said here that make me want to say something else. Mr. Boyd, for instance, has said a great many things about the railroads which are true, and he has given us some excellent recipes for improvement.

Two of his recipes are first, that the railroads improve their facilities, and, second, that the railroads give regular time, as I understand, to all classes of freight. Two good recipes, but they cost a great deal of money and we do not know where to get it. All of us know that improved facilities cost money, that nothing costs more money than interfering with the face of Mother Earth and buying steel rails. But the cost of regular time for all freight is more than is fully realized by the shipping public. Mr. Boyd, having said, and justly, that the good shipper must not be judged by the bad shipper, will allow me to say that the good railroad must not be judged by the bad railroad. Not all the railroads in this country do all the awful things he has spoken of. I am afraid some of us do, but all of us do not, and I think it can be justly said that high-class freight moves in this country, on most of the roads, with fairly reasonable time, and indeed, with better time than is absolutely necessary. But the low-class freight does not move regularly, and the only reason why it does not is that it would cost enormously to move it regularly. To move all your freight regularly means to clean out every yard every day, and that means to run a light train from every yard every day. There is not a railroad manager in this room that has money enough now to clean up every yard every day. Much has been said about the railroads guaranteeing time on all freight, on low-class freight. To do that will greatly increase cost. The rate per ton per mile on coal, grain and flour, on our road [B. & O.] runs mighty near three mills per ton per mile. I would not undertake to give absolutely regular time, even slow time, on freight that only pays three mills per ton per mile. When you are ready to pay more, the railroads will give you regular time on low-class freight as well as on high-class. Another thing in regard to the bunching of freight on arrival: remember how often freight is bunched in shipment. That is something that must be considered, too.

I want to thank both Mr. Bentley and Mr. Boyd for what they have said about the common use of cars. That is a question which you shippers really feel more deeply than the railroad manager does. I want to say as to our present attempts, futile as they may seem, in regard to the ownership of cars, that after a good deal of experience with railroad men in urging the common use of cars, as I have been constantly doing for the last ten months, publicly and privately, I have found such difficulties, such natural difficulties, that I look to the industries of the country, to the shippers of the country to bring that change about, if it is brought about shortly.

The common use of cars is unpopular with railroad men, and very naturally so. The railroad that has not the use of all its equipment, the railroad that owns 20,000 cars and has only got 10,000 cars on its line, does not want to go into a pool; that railroad wants the right of the owner of the car recognized. Anyone can see that. Suppose, for instance, that all of my cars are away, and in their place I have only half that number of foreign cars. I do not care about a pooling scheme; I want my rights as owner recognized.

Now, take the other fellow, using the other man's cars, the man who owns 20,000 cars and uses 30,000 cars; that man does not want a pool, because he wants the 10,000 cars that do not belong to him. When you undertake to advocate pooling to the railroad men, their individual point of view, their duty to their stockholders, makes them very careful about going into a pooling scheme. I am not opposed to car pools—they are right; Mr. Bentley is right, and Mr. Boyd is right. But it is a very difficult thing to get the railroads to agree to a pool in the first place, and it will be very much more difficult to carry out the pool afterward.

That is something I would like to speak to you about a little further. When I was with the Pennsylvania Railroad, we used to say that if you let the cars alone they would all go to Jersey City, and it looked so, because the traffic on that road practically all took an eastward course. When I was in the transportation department we were always hauling empty cars out of Jersey City—sometimes we could not haul them fast enough, and we would have a blockade there. You will find, on every road, the trend of traffic in one direction, and there has got to be some power to take the empty cars back to balance the equipment up.

Just what kind of power can do that as between the railroads, I do not very well know. I think that a very much higher per diem rate to be imposed on the roads that are using more cars than they own, would work. I think so, and the American Railway Association has said they thought so, but I have never been able to get enough roads to come into a plan for a common use of cars to make it go. The sentiment must be worked up, it seems to me, by you gentlemen who feel the pinch of it every time you have to give up a western car when you have a load for the west.

If we could devise and get adopted an equitable scheme for the common use of cars, I believe we might make enough money out of it to give more regular movement to low-class freight.

Rensselaer Polytechnic Institute.

The Rensselaer Polytechnic Institute, Troy, N. Y., has opened with the largest freshman class in its history, numbering about 270. This makes the number of students in the school about 600. Courses in mechanical engineering and in electrical engineering, leading to the degrees Mechanical Engineer and Electrical Engineer, have been inaugurated this year. These courses will be four years long and will be very general engineering courses. The first two years will be nearly identical with the course in civil engineering. This makes four different courses now given at the institution. The fourth course leads to the degree Bachelor of Science and has a great deal of chemistry in its curriculum.

Plans for the new Russell Sage Laboratory are about ready. This building will contain the mechanical and electrical engineering laboratories. It will be 244 ft. long, 80 ft. wide and five stories high. It will be finished in 1908. The boiler house, with a capacity of 800 h.p., is now being built and will be finished this year.

Opening of the Washington Union Station.

The first regular passenger train to use the new $20,000,000 Union Station at Washington, D. C. entered the station over the Baltimore & Ohio tracks early in the morning of Oct. 27. The Pennsylvania will not abandon its Sixth street station for some months. The new terminal was built by the Washington Terminal Company, owned jointly by the B. & O. and the Pennsylvania. In addition to these two roads all the roads entering Washington from the south will run trains from the present tracks on Virginia avenue through the double-track approach tunnel under Capitol Hill into the station. These include the Southern, Chesapeake & Ohio, Atlantic Coast Line, Seaboard Air Line and the Richmond, Fredericksburg & Potomac.

The station building fronts on a wide plaza and faces the Capitol and the new Senate office building. It is of white Vermont granite, 632 ft. long, 210 ft. deep and 120 ft. high in the center. The passenger concourse between the station building and the train platforms is entirely roofed over and has an area of 97,500 sq. ft. There are 33 tracks in the terminal, each 1,200 ft. long, giving a capacity of 66 trains in the station at one time. The platforms are protected by inverted umbrella sheds.

The terminal express building, north of the station, is 420 ft. long and 60 ft. wide. A large power house and a 25-stall roundhouse have also been built near the station. New freight houses are under construction at New York and Florida avenues. The house tracks will hold 200 cars and the team tracks adjoining will hold 450 cars.

The terminal has been built under the supervision of D. D. Carothers, Chief Engineer, B. & O., and W. F. Strouse, Assistant Engineer, Washington Terminal Co., representing the B. & O., and A. C. Shand, Chief Engineer, and Robert Farnham, Assistant Engineer, representing the Pennsylvania.

The New Union Station at Washington, D. C.; Opened Oct. 27, 1907.

For complete descriptions of this terminal improvement work the reader is referred to the *Railroad Gazette* of Dec. 4, 1903; Jan. 15, 1904; June 3, 1904; Nov. 11, 1904; Aug. 31, 1906, and April 5, 1907.

Maintenance of Automatic Block Signals.*

Your committee has had in mind an installation of electro-motor signals operated by the ordinary track circuit system. On a road operating under a divisional organization, there should be a Signal Supervisor on each division, reporting to the Division Superintendent and having charge of all signal maintenance matters on the division. The efficiency of signal maintenance will depend to a great extent upon the degree to which he devotes his attention to personally inspecting in detail the work of those under him. The division should be further divided into districts 100 to 150 miles in length, each in charge of a district foreman reporting to the Signal Supervisor and directing the work of maintenance and repairs on his district. * * *

The chief factor in successful maintenance then remains in intelligent inspection—daily on the part of the maintainer, and as frequently as possible on the part of his superiors. Conditions will be still further bettered by a regular inspection of details by some representative of the Signal Engineer's office. Close inspection in anticipation of trouble is the most important duty of a maintainer.

For the use of the maintainer in his daily rounds, we recommend a light motor car, not with the idea of gaining speed, but to relieve him of much of the hard labor expended in traveling against winds and ascending grades. The maintainer's fixed duties should not be so great as to preclude the possibility of his accomplishing all without undue haste, and still with a balance of at least 50 per cent of his time remaining available for patrolling and inspecting.

* * * Bond wires and other track connections frequently break apparently from no other cause than the vibration from passing trains. Inspection will discover these, and no failure will have resulted ordinarily if the construction has provided for double connections at points where breakages cannot be avoided and must even be expected.

We question the wisdom of establishing a fixed schedule of daily duties to be performed by the maintainer. Much the greater part of maintenance work is irregular, and best results will be obtained by allowing maintainers to carry out their work much on their own initiative. It is perhaps too much to expect all maintainers to become capable to take part and adjust a relay, but there is no reason why some of them should not attain proficiency and be permitted to do such a thing when necessary. In any event they should not be discouraged by peremptory orders forbidding their opening a relay.

The renewal of track batteries should not be determined entirely by the condition of the battery, and should not be at the end of an arbitrarily fixed period, as it will vary at different times depending on the cross resistance of the track circuit and other local conditions. The battery will require an inspection about once a week to insure that all connections are tight and that the general condition of the battery is good. Zincs weighing less than 1¾ lbs. and coppers weighing more than 2 lbs. should be scrapped. With glass jars there is a difficulty in preventing breakages by temperature changes and this has suggested the use of one glass and one earthenware jar in a battery. The earthenware jar will not break and will hold the track circuit alone should the glass jar break. The glass jar will serve as an index to the condition of the battery, but probably this indication should be checked by a Baume hydrometer test of the earthenware cell. The prevention of freezing should not be a maintenance matter at all but should be provided for in construction.

Bond wires and other track connections should be closely inspected at least twice a month. At road crossings and station platforms the character of construction should be such as to make this necessary less often—probably not oftener than twice a year. Switch boxes should be adjusted to close the circuit when the switch has been opened ¼ in. and throughout the remainder of the stroke. They should be closely inspected at least once each week and tested first by slowly opening the switch noting at what point the box operates, then opening and slowly closing the switch to note at what point the box ceases to operate. Next by closing the switch with moderate pressure against a stop ¼ in. in thickness, placed between the point and stock rails, to test for lost motion.

Experiments to determine the effect of Burnettized ties on track circuits are not quite complete, but it is probable that the result will be to make it necessary to reduce the length of track circuits. A form of ballast section which will leave the rails entirely clear of the ballast should be adopted within block signal limits to avoid circuit troubles during wet weather.

Modern glass-enclosed relays very seldom require adjusting. They should be kept sealed by the district foreman, and when necessary to break the seal for repairs of any description, all facts in connection with the matter should be given to the district foreman for transmittal to the Signal Supervisor. Comparatively inexperienced maintainers should not attempt to make such adjustments, but should replace the relay with a spare one provided for that purpose and notify the district foreman. Each maintainer should be provided with one spare relay of each type used on his section.

Within the experiences of the members of this committee it has not appeared necessary to use an additional relay of high resist-

*Extracts from report of Committee No. 2, Railway Signal Association.

ance at the battery end of a track circuit. Under ordinary conditions and where a substantial type of insulated joint is used, the increased cost and complication of wiring would not appear to be warranted.

Line Circuits.—The maintenance of line circuits free from interference with other circuits, such as telegraph and telephone lines, is of extreme importance since such interference might easily result in a false clear indication. Yet the maintainers can do little to prevent such trouble unless the signal line circuits have been properly guarded when constructed. A separate pole line for signal wires, and the erection of guard wires at the intersection of other lines greatly reduce the liability of trouble and make possible the maintenance of signal lines with a fair degree of certainty through watchfulness on the part of the maintainer to insure that all foreign lines are maintained in good condition where they cross above signal lines, and that no new lines are strung at any point without the necessary guard. Aside from this little should be required in the maintenance of a well constructed line except the replacing of an occasional broken insulator.

Operating Battery.—We strongly recommend the use of storage battery in the operation of signal motors, on the score of economy and reliability of maintenance. Where a power line for charging the cells in place is not practicable, they should be of the portable type. One battery may with entire satisfaction be used for the joint operation of signal motors and line circuits. With portable cells there should be a charging plant of two or three horse-power for each 100 miles of continuous block system. At isolated points this building is made large enough to include two or three rooms as living quarters. Where electric power is not available for a mercury arc rectifier or motor generator set a small gasolene engine is used. Each individual cell is numbered and a complete record kept of its performance while under charge and also of any unusual occurrence while in service or in transit. Ordinarily circuits are so arranged that a battery will require recharging but once a month. Where grade will permit, cells are transported one way by small gravity cars, returning by freight train. An experiment is being made with distributing cells from the charging plant by means of a small flat motor car capable of carrying 60 cells. Another experiment on different lines is being made with a portable charging plant, consisting of a complete charging outfit erected in a box car. One end of the car is made suitable for living quarters for the attendant. This outfit is set out at each successive way station, and from it the maintainer distributes cells for three or four miles in each direction by means of his velocipede or small motor car. The means most generally adopted for distributing cells from the charging station, however, is by way freight train, and with this object in view the plant is usually located at some way freight terminal. Shipments are made in lots of about 50 cells to some point on each section where the maintainer may pick them up and distribute with his car. Shipments by way freight should always be accompanied by the district foreman or an assistant to insure careful treatment of the cells while in transit.

During the 30 days in which the cells are in active service the only attention required will be a little watchfulness on the part of the maintainer to insure that all connections are kept tight and free from corrosion and that evaporation does not expose the tops of the plates. This is prevented, of course, by the addition of pure water as often as may be necessary. The voltage of each individual cell should be taken twice each week to insure that none are failing. Each maintainer should have a low reading voltmeter for this purpose.

Signal Mechanism.—* * * Neatness should always be insisted upon and daily inspection and observance of the mechanism in operation should be made. If oil lamps are used use long burning founts with reflectors. These lamps require attention only once in seven days, but daily inspection of lamps and colored roundels should not be neglected.

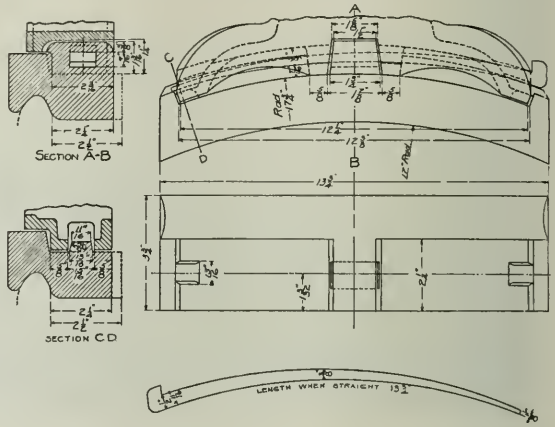
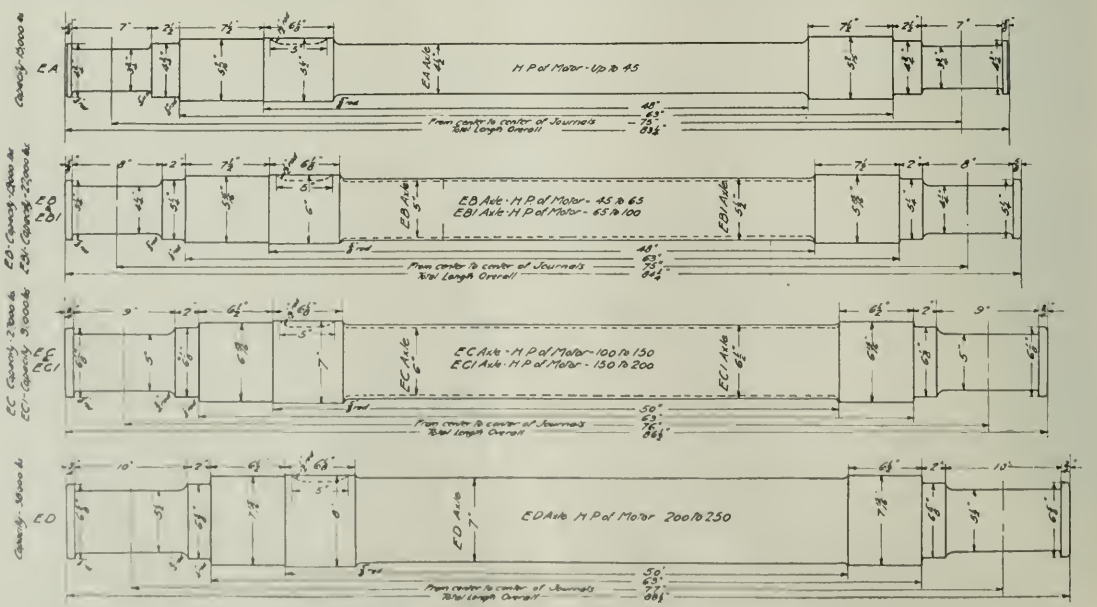
Standards of the American Street and Interurban Railway Engineering Association.

The report of the Committee on Standardization, of the American Street and Interurban Railway Engineering Association, which was presented at the recent convention of that association at Atlantic City, was unanimously adopted and later ratified by the American Street and Interurban Railway Association. The report represents



Standard Brake Head and Flanged Shoe for Narrow Treads.



Standard Axles for Electric Motor Trucks.

two years' work on the part of the committee and the standards recommended are a general compromise of as many as possible of the widely varied existing designs. They are not, however, experimental and they met with entire approval by the manufacturers, who were freely consulted and who aided materially by advice in their preparation. The following is an abstract of the committee report, which is signed by W. H. Evans (International Ry. Co., Buffalo, N. Y.), Chairman, J. M. Larned (Pittsburg Railways Co.); H. B. Fleming (Chicago City Ry.); R. C. Taylor (Indiana Union Traction Co., Anderson, Ind.); H. A. Benedict (United Traction Co., Albany, N. Y.), H. W. Blake (Street Railway Journal, New York); C. B. Fairchild (Cleveland Electric Ry.); H. Wallerstedt.

This committee appointed to investigate the subject of standardization of electric traction equipment considered the following topics: (a) Standard axles, journals, journal bearings and journal boxes; (b) Standard brake-shoes, brake-shoe heads and keys; (c) Standard section of tread and flange of wheel; (d) Standard rails.

It was decided to have the subject of rails considered by the Way committee, and all the information received on this subject was turned over to that committee, which submits a separate report. This committee has considered the subject of rails and special work only as affecting the recommendation of a standard wheel tread and flange.

Table 1.—*Summary of Axle and Gear Data.*

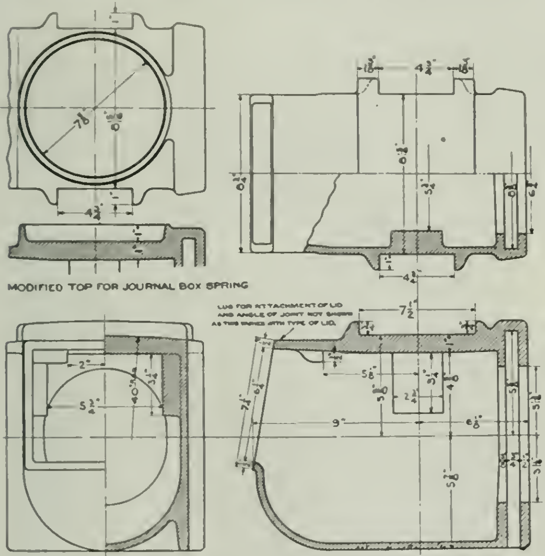
Standard Axles.

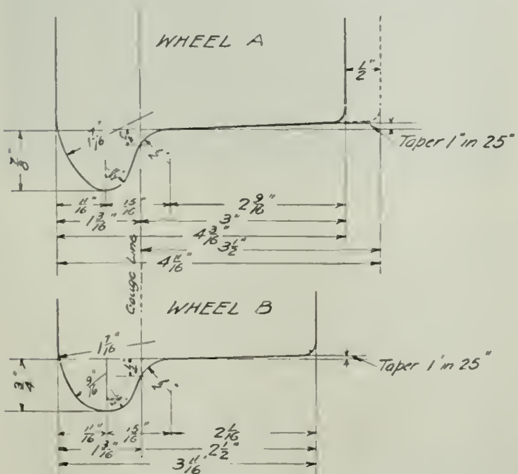
It was early found that it would be very difficult to adopt standard designs of these parts which would accommodate, to any general extent, the equipments already in service. After a thorough discussion by the representatives of all the interests involved, the committee decided to recommend arbitrary dimensions which conform to what is believed to be the best recommended practice, at the same time meeting as nearly as possible the requirements of the existing conditions. The dimensions proposed very nearly approach the standards adopted by many of the important electric railways.

The committee recommends the axles shown in Fig. 1 and designated as EA, EB, EB-1, EC, EC-1 and ED. A general summary of the axle and gear data is given in Table 1.

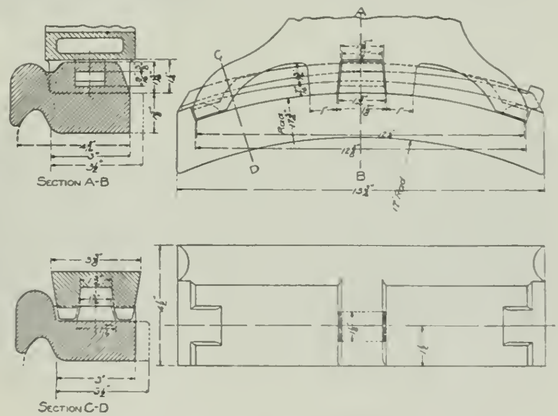
Particular attention is directed to the diameter and length of



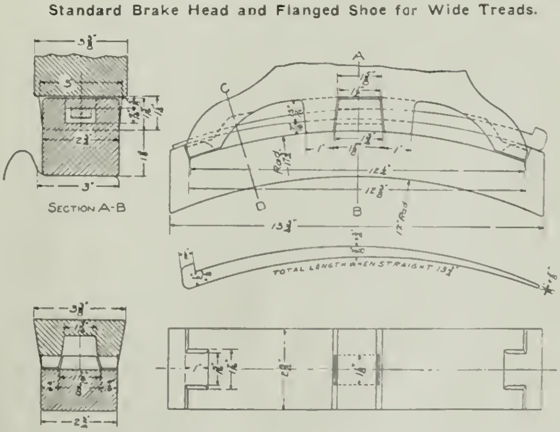
Standard 5-in. x 9-in. Journal Box.



Standard Contours of Wheel Tread and Flange.



Standard Brake Head and Flanged Shoe for Wide Treads.



Standard Brake Head and Unflanged Shoe for Wide Treads.

wheel-fit, diameter and length of gear-fit, the gear keys and the diameter of the motor-fits. The dimensions recommended by the committee are desirable and acceptable to the manufacturers of the different parts of the equipment. Their adoption will result in eliminating a great variety of dimensions of these parts. This lack of uniformity in the past has worked a particular hardship, not only on the manufacturers, but also upon the companies operating the equipment. The motor builders will now be able to arrive at a uniform gear practice.

It is further recommended that for motors not to exceed 100 h.p., a 3-in. pitch gear with 5-in. face be adopted as standard; and that motors exceeding 100 h.p. should have a 2.5-in. pitch gear with a 5.25-in. face.

Journals and Journal Bearings.

For journals and journal bearing keys the committee recommends the use of the four sizes adopted by the Master Car Builders' Association as standards. These are the result of years of experience in equipments of similar character and generally familiar, and are specified in reports of the proceedings of that association.

Journal Box.

In connection with the axles already recommended, the committee recommends the adoption of standard journal boxes for each of the different journals recommended, with two designs for the tops of the boxes to accommodate the two styles of trucks generally used in electric traction equipment. The interiors of these boxes are arranged to accommodate the journal bearing keys referred to above and will be subject to the test gages in common use for journal boxes of this character. (The proposed 5-in. x 9-in. box only is shown.—Ed.)

Brake-Shoes, Brake-Shoe Heads and Keys.

This feature of the equipment most readily permits of standardization and the results obtained therefrom, both mechanically and commercially, will be most desirable. At the present time there are innumerable styles and patterns of brake-shoes and brake-heads in use throughout the country, many of which vary but slightly from the recommendations which the committee herewith submits.

For wheels having a tread 3 in. wide and over, the committee recommends a design of brake-head and shoe (see Figs. 3 and 4), both of which are interchangeable with those in general use in steam railroad practice. The brake-head recommended is adapted to both the flanged and unflanged shoes. The unflanged shoes to go with this head are reversible on their own wheels, and the flanged shoes may be reversed by changing the shoe from end to end on the brake-beam.

To accommodate wheels in service, with treads narrower than 3 in., the committee recommends the brake-head and shoe illustrated in Fig. 5. This head is adapted for use on any of the narrower tread wheels, viz., those less than 3 in. wide. The brake-shoe can be used either flanged or unflanged, the unflanged shoe being reversible upon the same wheel and the flanged shoe reversible by changing it to the other end of the brake-beam, thus requiring but one pattern of brake-shoe for all equipment which will be standardized with this brake-head.

No attempt has been made at this time to suggest a standard for the brake-head hanger arrangement, as the patterns submitted are simply for the brake-shoe attachment. For the brake-head shown in Figs. 3 and 4, it is intended to use the brake-shoe key now in general use.

Standard Section of Tread and Flange of Wheel.

The investigation by this committee of the various types of wheels in service on electric roads throughout the country showed that there is a very wide variation of wheel sections in use, especially as regards flanges and treads, and it was almost impossible to select one wheel which would meet all the varying conditions. It also showed conclusively that wheels of a considerably narrower tread than the increased weight of the equipment requires, are being operated. The committee, therefore, recommends as standard for street and interurban railways as far as it can be applied, a wheel tread and flange contour which conforms to that shown in Fig. 6 and indicated as wheel A, this wheel to have a tread 3 in. wide and a flange $\frac{7}{8}$ in. high and $1^{3}/_{16}$ in. thick at the throat. It is the opinion of the committee that this wheel tread and flange can be applied with little difficulty to a great majority of the roads forming the association.

A number of roads are using wheels with a tread 3.5 in. wide for combined city and interurban work, and there is a decided tendency in this direction. This wide tread assists in carrying the load across special work without running on the flange, and avoids the necessity for flange bearing on the special work. The committee therefore also recommends wheel A with the width of tread increased to 3.5 in. for interurban work, and also for city work where it can be used. It is especially desirable to work toward the general adoption of wheels having this tread.

The committee recognizes the fact that local conditions on many roads are such that it will be difficult for a number of years to operate a wheel of the dimensions represented by wheel A. To meet these conditions the committee recommends wheel B (Fig. 6), with a tread of 2.5 in. wide and a flange 0.75 in. high, this flange to have the same general dimensions as wheel A with the exception of the height above the tread line.

In mounting and gaging wheels it is understood that the gage line is at a point on the flange 0.25 in. above the wheel tread, and the committee recommends that the wheels be gaged 0.25 in. narrower than the gage of the track, the track gage being measured between points 0.25 in. below the tops of the rails.

Union Pacific All-Steel Fireproof Passenger Car.

The accompanying photographs show the new all-steel passenger coach which has just been completed at the Omaha shops of the Union Pacific. It is quite similar in general appearance to the gasoline motor cars of this company and it is therefore a wide departure from conventional designs. The length over vestibule diaphragms, 68 ft., is the same as the present standard 60-ft. coach, and only in this respect does it bear any similarity to equipment now in service. A decrease in height from rail to roof of 24 in. is a noticeable change from the dimensions of the regular equipment.

The underframing is composed of two 12-in. I-beam center sills, spaced 16 in. apart, and 6-in. x 3-in. x $\frac{1}{2}$-in. angle-iron side sills, all securely fastened by cross-ties, needle-beams and diagonal bracing. The 12-in. center sills are intended chiefly to transmit the

End View of Union Pacific Steel Passenger Car.

buffing and pulling stresses, and in reality do not carry any load, as they themselves are carried by the sides of the car, which are of girder construction. The double body bolster, sills and end bracing of the underframe are made of a one-piece steel casting, 11 ft. long by 9 ft. 9 in. wide, weighing 3,700 lbs. This cast-steel end construction greatly reduces the number of parts.

To the top of the underframing is riveted a bottom floor of $^{1}/_{16}$-in. sheet steel, forming a fire protection from below. On these steel sheets is a layer of $\frac{3}{4}$-in. hair-felt and on top of this is a flooring of fireproof composition in pressed sheets, 3 ft. by 4 ft. and $\frac{1}{2}$ in. thick, laid on nailing strips $\frac{3}{4}$ in. by 2 in., embedded in the hair-felt. The whole floor construction is securely bolted together by small stove bolts, the heads being let in flush with the top of the floor.

The side posts and carlines are integral, being one continuous piece of 3-in. channel iron, bent to a U form, inverted, extending

from side sill to side plate and forming the contour of the half oval roof. To these channel-iron posts, which are formed with the flat side outward, is riveted the ⅛ in. steel side sheathing, which together with the posts is riveted to the angle-iron side sills. The steel sheathing extends from the bottom of the side sills to the top of the 4 in. channel side plate, forming a deep, substantial girder, which is stiffened additionally by diagonal braces below the windows and riveted to the sheathing. Holes 25 in. in diameter are cut out of the sheathing for the windows.

Interior of Union Pacific Steel Passenger Car.

ceiling is ⅛ in. thick. All are of the same fireproof composition as the floor.

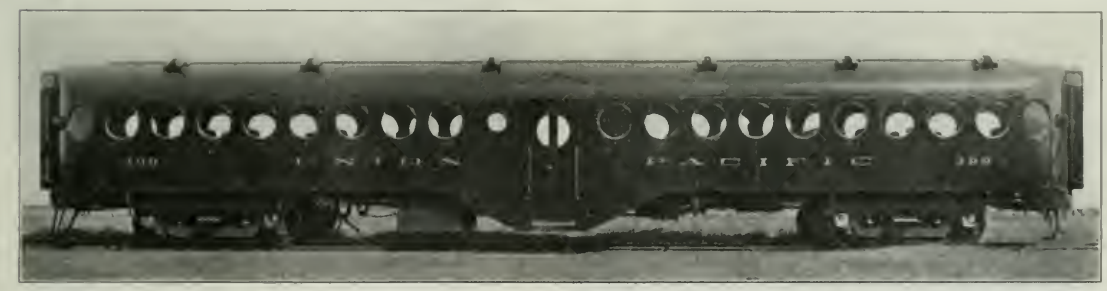
The walls of the car are only 2 in. thick from outside sheathing to the finished surface of the interior wall, a reduction of 3½ in. from present designs. This allows an increase of 7 in. in the width of the aisle.

Comparatively little wood is used in the construction of the car, there being about 200 lbs. of small filling blocks only. All mouldings, etc., are made of fireproof material.

Particular attention was given to the ventilation and fresh air supply. Cottier suction ventilators of an improved design are placed along each side of the center line of the car. Fresh air is admitted at the ends of the car, about 5 ft. from the rail, at each side of the door, through intakes 12 in. in diameter, covered with a fine brass netting. It passes downward to an air-tight galvanized sheet-iron box beneath the car containing two sets of removable dust-collecting screens set vertically. The purified air passes upward to the inside of car through a galvanized sheet-iron duct which runs along the sides of the car with perforations at each seat for discharging the air. The steam heating pipes are placed outside of this air duct to heat the incoming fresh air to the desired temperature. The "Vapor" heating system of the Chicago Car Heating Co. is used. The amount of fresh air admitted to the car is regulated by dampers in the intakes.

The car has an axle-light electric system. There is an 8 c.p. lamp, with frosted globe at the side of the car at each seat just above a sealed passenger's head.

The drinking water is contained in a large, flat, galvanized iron tank, set vertically, back of a removable partition at the center of the car. From this tank, which is filled by a hose fastened to a connection at



New Steel Passenger Car; Union Pacific.

The usual form of square wooden window sash, and the gothic sash above, have been discarded for a circular aluminum sash with a 24-in. glass. This metal sash is provided with a half-round rubber gasket and forms a weather and dust proof window, far surpassing the best type of double sash now in general use. These circular windows are similar to ship porthole windows, being hinged at the top. They are opened by swinging upward toward the ceiling, where they are secured by a special catch.

The oval form of roof does away with an upper deck. It has been a success on the gasolene motor cars, affording extreme lightness, strength and low cost of construction, with simplicity and beauty of design.

The interior arrangement likewise differs considerably from present designs. The four entrances, steps and end vestibules, found in the ordinary coach, have been discarded and a single vestibule at the center of car, with an entrance on each side, has been used instead. This style of entrance proved very satisfactory on the motor cars. Both ends of the car are rounded to eliminate the danger of telescoping and to decrease air resistance. The usual end doors have been retained in order to allow a continuous passage through the train.

The toilets, two in number, are placed at diagonally opposite sides of the steps, at the center of car, and have an efficient system of ventilation and fresh air supply. Standard reversible plush coach seats have been placed in the car temporarily. Fireproof seats are to be used, however, as soon as they can be secured from the makers. All partitions and inside walls of the car are ¼ in. thick and the side sill of the car, the water flows through a coil of pipe in an ice box below the car, to the water alcove at the center vestibule.

The principal dimensions are:

Total weight	80,250 lbs.
Length over vestibule diaphragms	68 ft.
Height, rail to roof	12 ft. 1¾ in.
Height, floor to ceiling	7 " 8¼ "
Width, inside at wainscot	9 " 5⅝ "
" of aisle between seats	2 " 5⅝ "
" of car over side sills	9 " 9⅝ "
Roof sheets, galvanized iron	[illegible] in. thick
Side and end sheathing, steel	⅛ in. thick
Seating capacity	78
Trucks	Four wheel cast steel

The car was designed and built under the supervision of W. R. McKeen, Jr., Superintendent of Motive Power and Machinery of the Union Pacific.

It is reported that the Siemens-Halske Co., after consultation with the railroad administration, has submitted plans for a new underground electric railway through Berlin. It is to connect the Potsdam station with the Stettin station, thus furnishing communication between the southwest and the north of the city. The road is to be double track and standard gage, and of such construction that it can be used by the standard rolling stock of the steam railroads. Besides furnishing through connection for trains from the south to the north and vice versa, the local passenger traffic of the city is to be taken care of by trains running with 2½ minutes headway. The diameter of the tunnel in the clear is to be 27.9 ft.; height, 14.4 ft. No curves are to have less than 482 ft. radius.

Causes of Defects and Failures of Steel Tires.*

BY GEORGE L. NORRIS, M.E.
Chemist, Standard Steel Works.

(*Continued from page 500.*)

The heat treatment of any piece of steel, as shown by its microstructure, is important. On the proper heat treatment depends, first, the ability to produce the steel, and second the quality of the steel. The phrase "improper heat treatment," however, has of recent years been much abused to explain "mysterious" failures. In the manufacture of tires, it is practically impossible to make a tire from an overheated or underheated ingot, as such an ingot would not withstand blooming under the hammer without failure.

Fig. 29.

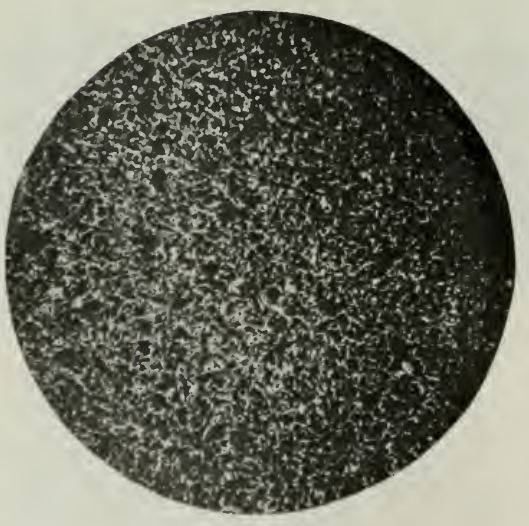


Fig. 30.

The examination of the microstructure of hundreds of discarded tires which have given good service shows what would usually be considered large grain structure. The natural micrograin of steels of the carbon percentage used for tires is quite large. To obtain a fine microstructure it is necessary to anneal the tires. This treatment, however, has no effect in preventing shelliness. It is conceivable that under the heaviest wheel loads the annealed tire with the fine microstructure and large amount of isolated ferrite, or pure iron, would not give mileage results equal to the unannealed tire from the same steel, with its larger area of pearlite and greater resistance to distortion under compression. In the case of the comparatively large, natural grain of the tire as rolled, a greater area of pearlite is presented for wear than in the case of the annealed steel, as is shown in the illustrations, Figs. 29 and 30. Pearlite is the eutectic or saturated steel. It is composed of an intimate mixture of cementite (carbide of iron) and ferrite, (pure iron)

Fig. 31.

Fig. 32.

Fig. 33.

*A paper read at the October meeting of the Western Railway Club.

usually in a lamellar structure (Fig. 31). An ideal steel would be one whose structure is entirely made up of pearlite. Such a steel would contain about .85 per cent. carbon, and would be too hard for most conditions of service.

The macro, or visible structure, rather than the microstructure, plays the most important part in the life of the tire. Unlike rails, and blooms, it is not possible to roll tires direct from the initial casting heat of the ingot, consequently the ingot solidifies undisturbed by work under the hammers or in the rolling mill, and pra-

Fig. 34.

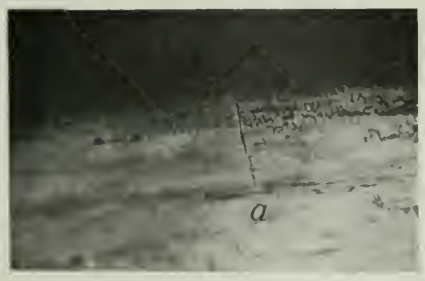

Fig. 35.

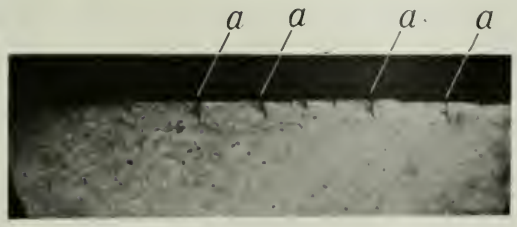

Fig. 36.

tically never shows the pronounced porosity so common in the center of the rail head. Working from a cold ingot which has solidified undisturbed, the maximum effect of the work under the hammer and in the rolls is obtained, increasing the density and homogeneity of the macro, or visible structure.

The causes producing broken tires are: excessive shrinkage, inherent defects in the steel, transverse fracture of the flange, and loose tires.

Failures from excessive shrinkage take place soon after application of the tire to the center and always before the tire has had any appreciable service. After the tire has been in service a short time, molecular readjustment has been completed in the form of motional annealing. This increases the density of the steel, as shown by increased elongation and reduction of area of comparative test pieces from tires from the same heat before and after service.

Inherent defects in the steel are usually due to piping. In some cases the pipe is present as a cavity (Figs. 32 and 33), which causes the tire to burst with a sharp transverse fracture. In other cases the pipe is present as in Fig. 10 and then a piece of the flange or tread is broken off. Tire failures from these defects are practically eliminated by the method of manufacture from long ingots.

Transverse fractures of the flanges are detailed fractures originating on the point of the flange from heat cracks produced by the action of the overlapping brake-shoe. Most of the failures of this kind have been tender and coach wheels in service over long heavy grades where the brake applications are especially severe. It has been observed that wheels which have so failed are generally

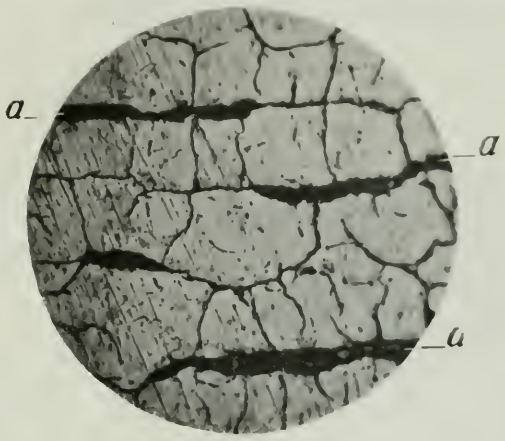

Fig. 37.

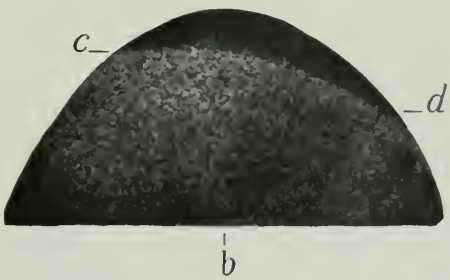

Fig. 38.

equipped with brake-shoes without inserts. Such brake-shoes generate much more heat on the flange than those with inserts, and are not so effective in scouring off the heat cracks formed by long continued brake application. In the case of the brake-shoe with inserts in the flange groove, there is quite an effectual cutting or scouring out of the heat cracks and they are therefore less liable to start a fracture.

The illustrations, Figs. 34 to 40 show plainly the origin of the flange fracture from the heat cracks, and its development into a full fracture of the tire. Fig. 34 is a view of a tire showing several small flange fractures, *a*, *b*, *c*, and their relation to the heat cracks on either side is obvious. Fig. 35 shows a portion of the flange, full size, showing more clearly than Fig. 34 the heat cracks with a fully developed fracture (*a*) in the midst of them. Fig. 36 is a longitudinal section through the flange, line *a*—*b* on Fig. 38, and magnified four diameters. This shows the depth to which pronounced heat cracks *a*—*a*—*a* will penetrate before developing a flange crack. Fig. 37 is a portion of the flange which has been polished and magnified 50 diameters and shows how the surface of the steel is broken up by heat cracks, like sun-dried clay. The

large cracks *a—a—a* are the transverse cracks from which the flange fractures originated, and correspond to those shown in Fig. 36. Fig. 38 is a cross-section through the flange, magnified about two diameters, and lightly etched to show the depth to which the heating effect of the shoe has hardened the steel. This is shown on the illustration by the line *c—d*. Figs. 39 and 40 show the

Fig. 39.

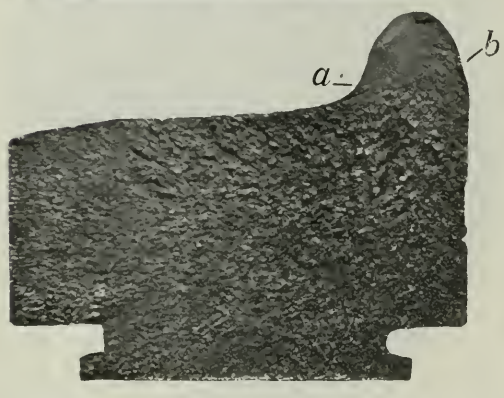

Fig. 40.

fractured surfaces of two tires and the origin of the fractures is clearly traceable to a detailed flange crack. The extent of the crack before the tires broke is plainly shown on the lines *a—b*.

Broken driving wheel tires are found to have usually closely approached or passed the limit of road wear. In addition to failures from flange fractures originating from heat cracks, there have been quite a number of failures due to the lightness of design of cast-steel driving wheel centers. On account of this lightness of design, the tire has not a sufficiently rigid backing, and when it begins to approach or reaches the usual limit of road wear the strains due to flexion of the tire are likely to cause failures.

Fig. 41.

Breakages from loose tires are confined usually to thin tires, and are due to detailed fractures, originating in the bore from repeated bending stresses. Fig. 41 shows the fracture of such a tire and how the fracture progressed by detail until only the light colored area remained when the break took place. Failures of this kind are not common as the tires are readily detected and are generally removed by the inspectors on account of being loose.

Concrete Building Construction.*

Concrete building construction can be divided into four classes: Solid heavy walls; solid light walls reinforced with rods; building blocks made with machines for that purpose, having hollow spaces at intervals throughout the wall; metal lath plastered with a Portland cement mortar.

The objections to solid walls for building purposes are: Liability to crack; expense on account of forms, and dampness seeping through the wall. The last two of these objections are found also in reinforced concrete walls.

These objections may be overcome if proper precautions are taken in the construction. The dampness of the walls may be prevented by painting the exterior surface with a waterproofing compound. There are many of these on the market to-day which answer the purpose admirably and give the surface of the building a nice and even appearance.

In making buildings of solid concrete, pilasters should be built separately as columns with anchor rods projecting from them, and the intervening wall built after the pilasters have hardened so as to make a joint at intervals in the concrete. Where reinforced concrete is used, these joints are not necessary, and, in fact, not desirable as the wall should be built as a unit. The forms are an expensive item in both kinds of construction, but their cost can be largely reduced by making a standard section which can be used many times during the construction of the building. As the appearance of the building is one of the essentials, forms should be constructed so that a tier of the building may be completed in one day and the forms from that tier moved after 24 hours and used for each succeeding tier. In this way the face of the concrete can be treated or patched successfully while green without marring the outside face.

To overcome the objections to the above, many advocate the use of the concrete building block, and there are a large number of different makes of machines on the market for molding them. These blocks have a hollow space to prevent the moisture from reaching the inside of the building. The objections to these blocks are:

It is difficult to form them without some blemish on the surface, which it is impossible to properly remedy. The molded blocks never have the sharp outlines necessary for good appearance.

The construction of blocks must be very carefully watched, otherwise, through the incompetence of the workmen or dishonesty of the maker, a very small amount of cement is used in their composition, with the result that they are very fragile and readily broken. Several cases have occurred where buildings built of blocks have fallen down of their own weight on account of the "lean" mixture used in the make-up of the blocks. Most of these blocks are very porous because they have to be made with a dry mixture. Only those blocks should be used that can be made with a wet mixture and pressed with great power. Blocks made by hand tamping with dry mixture should never be used.

The last form of construction named—plaster on expanded metal—is cheap and answers the purpose satisfactorily for all kinds of shop buildings and for cheap small buildings. This construction, however, has been used with success for elaborate buildings in California and the Southern states, and many beautiful residences are being built to-day by this method. It consists of a framework of wood or steel, with metal lath attached to the outside surface, which is coated with mortar on both sides, forming an exterior wall over 1½ in. thick. On the interior framework, metal lath may also be attached and plastered on the inside. A hollow wall is thus formed with an air space which affords perfect protection against dampness and is a good insulator for heat and cold. The outer face of the exterior wall is usually coated with a waterproofing compound. This form of construction permits of elaborate details at small expense.

Foreign Railroad Notes.

According to Russian official statistics the railroad mileage of the Russian empire at the end of 1906 was:

State railroads in Europe	20,086 miles.
State railroads in Asia	6,735 "
Private railroads	11,426 "
Branch lines	1,436 "
Railroads of the Grand Duchy of Finland	2,058 "
Total	41,741 miles.

In the Portuguese possession of West Africa 37 miles of the Lobito Railroad, from the bay of Lobito into the interior, have been completed and 15 miles have been opened for traffic. To avoid driving a tunnel, as had been originally planned, a part of the road, 6,960 ft., has been built as a rack road with 6 per cent. grade. The road has six locomotives, four passenger cars, 90 freight cars and two water cars.

*From a committee report to the Milwaukee convention of the Superintendents of Bridges and Buildings. A. O. Cunningham, T. J. Fullem, M. Riney, Committee.

GENERAL NEWS SECTION

NOTES.

The aggregate excavations on the Panama canal in the month of September amounted to 1,517,412 cu. yds., the largest month's record since the United States took control.

The Erie Railroad proposes to contest in the courts the law of New York state limiting the working hours of telegraphers, but, pending the outcome of the suit, will observe the provisions of the law.

After November 4 there will be only three five-hour trains each way between New York and Boston. The fourth, which was the last train put on, the one leaving either city at 8 a.m., has not proved profitable and is to be taken off. The train has been running 14 months. The five-hour trains run daily except Sunday.

A press despatch from the City of Mexico says that after a long investigation by a special commission, appointed by the President of Mexico, the government has decided to authorize a general increase in railroad rates, amounting to about 12 per cent. The officers of the railroad desired to make the increase 20 per cent.

The New York State Public Service Commission, First district, has issued an order requiring railroads to file their tariffs with the Commission. Until further orders these may be in any suitable form, but companies for whom a form has been prescribed by the Commission for the Second district are to follow the Second district form, so far as it is applicable.

At Toronto October 25 the Michigan Central was fined $25,000 for neglecting to take reasonable precautions in the handling of dynamite. At Essex, Ont., an explosion occurred while a car containing the explosive was being switched (next to the engine), and evidence showed that the car had been treated like an ordinary car of freight. Two men were killed and 40 injured.

The New York, Chicago & St. Louis has now been in operation 25 years, and 75 officers and employees who have worked for the company throughout that time met in Cleveland last week and formed a Veterans' Association. Among these veterans are: B. F. Horner, General Passenger Agent; S. K. Blair, Division Superintendent; E. A. Miller, George James and R. S. Miller.

At Charleston, Ill., October 28, the Grand Jury, after spending several days investigating the collision of electric cars, which occurred near that place last August, killing 15 persons, returned indictments against both motormen, the President, the Treasurer and other officers of the company, and also against Judge Peter S. Grosscup, Judge of the United States Circuit Court in Illinois, who is a director of the railway company.

Vice-President Thornwell Fay, of the Southern Pacific Lines in Texas, has written to the President of the Agricultural College of the state, asking for the names of graduates or students who want to learn railroading. Students coming to the road will be placed first in the accounting department, and then in district superintendents' offices; then with section crews, under road masters and engineers, and so on through every department necessary to a thorough education in railroading.

The New York State Public Service Commission, First district, has ordered the Brooklyn Rapid Transit Co. to hold westbound elevated trains at the Brooklyn terminal of the Brooklyn Bridge on Saturday afternoons until they can be taken care of at the Manhattan end. The commission's inspectors have reported that it is the practice of the company, despite the larger terminal facilities at the Brooklyn end of the bridge, to send on the trains to Manhattan faster than they can be received.

The attorneys for the Standard Oil Company will ask the United States Circuit Court of Appeals to reverse the decision in which Judge Landis fined the company $29,240,000, alleging that the government attorneys failed to inform the defense of the Alton immunity agreement; that as the Hepburn act was passed before indictments were returned, prosecution under the provisions of the Elkins law was illegal; that Judge Landis did not compute the number of violations correctly, and 22 other points.

Locomotive Fireman C. H. Rutledge, of the Philadelphia, Baltimore & Washington, lately risked his life to save that of a little child, and has been commended by General Superintendent E. F. Brooks, President McCrea and General Manager Atterbury. While firing the engine of a work train rumbling along the track near Port Deposit, Maryland, Rutledge saw a small child playing between the rails a short distance ahead. The brakes could not be applied in time to avert a catastrophe, for the approaching train had scared the little one, and instead of getting out of the way he fell on the track. He made his way along the running board, and, with a flying start from the front of the engine, reached the child and grabbed it out of harm's way before the train passed, using less time than it takes to tell about it.

The New York State Public Service Commission, First district, has ordered an increase in service on the Broadway (surface) line of the New York City Railway consisting of an extension southward of the runs of certain cars heretofore terminating their runs at Houston street. In the same order the Commission requires better destination signs on the cars. Another order requires an important increase in the number of cars on the Fourth and Madison avenue lines. The order gives in detail the number of cars which must be run at different portions of the day.

Consolidated Steamship Lines.

Some of the constituent companies of the Consolidated Steamship Lines have resumed management of their lines, and it is said that ultimately the Consolidated Steamship Lines will cease to be an operating company and be only a holding company. The changes in officers, so far, include the resignation of Calvin Austin as President of the Ward Line and the Mallory Lines. Mr. Austin has heretofore been President of all the companies except the New York & Porto Rico Steamship Company. He has been succeeded by H. P. Booth on the Ward Line and by H. R. Mallory on the Mallory Line. F. B. Mooney has been elected President of the New York & Porto Rico Steamship Company, succeeding J. E. Berwind. Other changes in these companies have been also made. The management of the Eastern Steamship Company and the Metropolitan Steamship Company remains as before. It is said that the Santo Domingo service of the Clyde Line will be consolidated with the New York & Porto Rico Steamship Company, and that the rest of the Clyde Line will be consolidated with the Mallory Line.

Good Safety Records Broken.

Press despatches from London, October 26, report a rear collision at West Hampstead, on the Metropolitan Underground, killing three persons. The second train had run past a signal in a fog. It is said that this is the first accident that ever occurred on the road resulting in fatal injury to passengers, and it is the first rear collision of passenger trains since this line was electrified. On the same day a collision near Dallas, Texas, on the Missouri, Kansas & Texas, caused the death of two passengers and one trainman and the serious injury of a large number of other passengers; and this is said to be the first fatal accident to a passenger, in a train accident, on that railroad. The road is over 35 years old.

That Awful Engineering Mistake.

Vice-President Samuel Rea, of the Pennsylvania Railroad Company, referring to recent sensational newspaper articles says:

"It was originally intended to change from steam to electric locomotives near the Hackensack portal of the New York tunnels, and the alinement of track from Harrison to this portal was made accordingly. It having been decided, however, to change locomotives at Harrison, this short section of track is being improved by reducing the curvature at a very moderate expenditure. The report that this revision of line is due to an engineering mistake, and involves a million dollar expenditure, is incorrect and grossly exaggerated."

Chicago Track Elevation to Date.

Steam railroads have 1,600 lineal miles of tracks in use within the city limits of Chicago, 188 square miles, and the amount of road elevated would make a single track line 700 miles long. This work has included 3,000 subways. The cost has been $35,000,000, divided among the larger roads as follows: Pennsylvania, $11,000,000; Rock Island & Lake Shore, $7,000,000; Northwestern, $6,500,000; St. Paul, $2,500,000; Illinois Central, $2,000,000; Burlington, $1,100,000; Chicago Terminal, $1,150,000. The work yet to be done is in the south and southwest sections of the city. For elevation of the tracks between Englewood and Beverly and as far as South Chicago, the Rock Island and allied roads have accepted city ordinances providing for the expenditure of $5,000,000. The Burlington will spend in the next year or so $1,125,000.—*Wall Street Journal.*

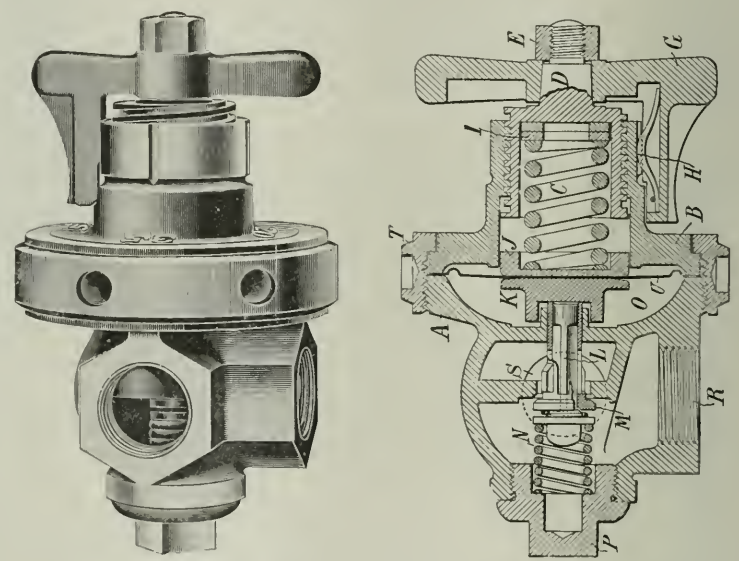
United States Steel Corporation.

The report of the United States Steel Corporation for the quarter ending September 30, 1907, shows net earnings of $43,804,285, the largest in the history of the corporation with the exception of the

June 30 quarter of the present year, when the net earnings were $45,503,705. The amount of unfilled orders on hand, 6,425,008 tons, is the smallest for the end of any quarter since that of September 30, 1905, when they were 5,865,377 tons. The present total of unfilled orders is 1,178,870 tons below the amount on the books on June 30, 1907, and 2,064,710 tons below the high record point, which was on December 31, 1906. While there has been a decrease in the orders booked for various products of the mills, the falling off in the orders for rails is presumably responsible for most of the decrease. The surplus for the September quarter, after all charges and dividends, was $4,911,711, which compares with $3,497,080 in the quarter ended June 30, and $14,697,318 for the corresponding quarter in 1906. There has been, so far, reserved and set aside for the Gary plant $49,000,000. Of this amount $18,539,000 has already been spent.

Gold's Improved Temperature Regulator.

The Gold Car Heating & Lighting Co., 17 Battery place, New York, has recently perfected an improved form of temperature regulator for railroad car heating systems which is shown in the accompanying illustrations. It is smaller than the regulator formerly made by this company and is designed to be applied under the seat in the main supply pipe in place of the angle valve heretofore used, without disturbing any of the other equipment already installed in the car. The dial on top of the regulator is calibrated to show 5, 10, 20, 35 and 50 lbs. pressure in the radiator and by turning the handle any of these pressures desired may be obtained and automatically retained in the radiators as long as the train pipe pressure is in excess of the desired radiator pressure. Variation in train pipe pressure and in radiator condensation are taken care of equally well. When the regulator handle is in the closed position a minimum pressure of 2 lbs. is admitted to the radiator, and this is sufficient to keep the condensed water always moving to the blow-off trap. In case the supply needs to be shut off entirely a globe valve under the seat in the pipe connecting the regulator with the radiator may be closed tight.



Gold's Improved Temperature Regulator for Car Heating.

The principle of the device is that steam at any given pressure has a corresponding temperature. At atmospheric pressure its temperature is 212 deg. Fahr. and at 2 lbs. it is 219 deg. The temperatures corresponding to the pressures obtainable with this improved regulator are 219 deg., 227 deg., 240 deg., 258 deg., 279 deg. and 297 deg. Referring to the sectional drawing, steam from the train line enters at R. As handle G is turned from left to right spring C is compressed and acting through the diaphragm U and the plate K, the valves L and M are opened, admitting steam through the outlet S to the radiator and into the chamber O under the diaphragm U. After the required pressure has been obtained in the radiator any increase will lift the diaphragm U and overcome the pressure of spring C. The valves L and M are perfectly balanced and when the pressure of spring C is overcome the lower spring N will immediately lift them to their seats and stop further admission of steam. As pressure decreases in the radiator it also relaxes under the diaphragm, allowing the spring C to again force L and M off their seats until enough steam has been admitted to compensate for the condensation due to radiation. A friction lock for the handle is provided by the spring H, which engages in grooves cut in the dome casting corresponding to the several positions of the handle to give the required pressures.

Advantages claimed for the device are that it will maintain practically an atmospheric pressure if desired for moderate temperatures or any degree of high pressure heating for extreme weather. It admits only enough steam from the train pipe to maintain the desired temperature and any excess pressure is directed to the rear of the train. A minimum pressure of 2 lbs. gives the required force to expel condensed water and air from the radiators when heating up a car. The device can be applied to any system of direct steam or hot water heating.

Richard Bell, M.P., Labor Leader.

Almost exactly $26 a week is the salary of Richard Bell, General Secretary of the [British] Amalgamated Society of Railway Servants, and, by virtue of his position, a more prominent figure in the public eye for the time being than the Prime Minister or the King himself. He is two years on the right side of 50. He is just a trifle over the average height, deep-chested, powerfully built, and straight as a pine tree. When I called to see him at the London headquarters of the society a batch of English reporters were interviewing him on the developments of the day; and I had to wait until they had done pumping him. Now, around the American headquarters of a powerful labor organization, when there is a crisis at hand, one always finds a lot of hangers-on, eager to load up the journalist with tales of grievances and fight talk. But there were no agitators of that sort here. The staff were all busy earning their pay. As the door of Mr. Bell's office opened to admit me I caught his last words to the representatives of the London papers: "Bear in mind that we want to get this thing settled without a strike if possible. Don't write anything that is going to stir up strife and ill feeling, and make it harder for a policy of conciliation to prevail."

Speaking of strikes he said: "A strike is a form of war—industrial war—and war, as your General Sherman said, is hell. It is only to be thought of when all other means of settling a dispute fail. But just as there comes a time when a nation feels compelled to submit its cause to the arbitrament of the sword, so in the struggle between capital and labor a crisis may be reached when the workers have to appeal to the only weapon they can command to which the other side is vulnerable—a strike."

"Do you consider that a strike is inevitable?"

"If the railroad companies persist in refusing to recognize the union—yes. For two years the men have been pressing the executive committee to sanction this movement. Last November we formulated our programme of grievances. To them was attached a demand that deputations to the employers should be accompanied by their official representatives. Three times we have made overtures to the companies, and each time the companies have replied, in effect, with a point blank refusal to discuss the affairs of their employees 'with a third party.' In other words, they refuse to recognize our union."

"Why do you regard that as the one point of vital importance?"

"Because it is vital to the men's own interests and the principle of trade unionism. It lies at the root of collective bargaining. The railroad companies of England are really composed of some 100,000 or 500,000 shareholders. They make their bargains and conduct their negotiations with their 400,000 or 500,000 employees by means of their official representatives—experts. The employees have an equal right to be represented on their side by experts of their own choice.

"Industrial history proves conclusively that trades unions have been a powerful factor in securing improved conditions for the workers. But to be of material benefit to their members they must be 'recognized.' It is in those industries in which labor is best organized and is afforded the fullest recognition that conditions are most stable and profitable and strikes least frequent. Of that the great cotton industry and the coal mining industry are shining examples.

"Yet the directors of several of the railroad companies say that the recognition of our union means transferring the management of the roads to the men, chaos and bankruptcy. Such state-

ments are insults to public intelligence. The Northeastern—the one great railroad company which recognizes our union—has suffered no diminution of dividends or decrease of efficiency in consequence. The post-office employs more labor than any concern in England. That now recognizes the unions of its employees, with the result, as the Postmaster-General has acknowledged, that there is much less friction than formerly."—*Springfield Republican*

Brilliant Plan of Two Irish Gentlemen for Saving a Lady.
—*Sketch.*

MANUFACTURING AND BUSINESS.

The Central Inspection Bureau, New York, has an order from the Newburg & South Shore for inspecting a number of trucks to be built at the Middletown Car Works.

The Northern Electrical Manufacturing Co., Madison, Wis., has established a district office at Pittsburgh, Pa., in charge of C. A. Poe, formerly of C. A. Poe & Bro. The office is at 618 Park building. Mr. Poe has represented the company in the Pittsburgh district in conjunction with other lines for several years, but his entire attention is now devoted to this company.

The town of Lachine, Que., has, it is said, voted a bonus of $50,000 as well as exemption from local taxes for 20 years to the Imperial Locomotive & Machine Company. This company, a subsidiary of Beyer, Peacock & Co., Manchester, England, is to build locomotive works at Lachine, as mentioned in this column last week. The cost of the plant is estimated at $2,250,000.

The Willard Storage Battery Co., Cleveland, Ohio, is occupying its new factory, on Marquette road and Lakeside avenue. It is much larger than the old factory. There is a large three-story brick building, and a one-story frame building. The total floor space of the two is 80,000 sq. ft. Power is supplied by three Crocker-Wheeler generators, driven by two Bruce-Merlam-Abbott gas engines and a steam engine. Rolling, cutting, forming, lead-burning, assembling, etc., is done on the ground floor, and the assembling department and offices are on the second floor. The third floor has the carpentering and painting departments. The company makes storage batteries for all purposes, particularly train lighting, automobile, signal, telephone and stationary.

H. B. Ayres, Manager of the Locomotive & Machine Company of Montreal, has resigned to become General Manager of the H. K. Porter Company, Pittsburgh, Pa. A. W. Wheatley, General Inspector of the American Locomotive Company at Schenectady, N. Y., succeeds Mr. Ayres. Forrest M. Titus, Resident Inspector at Schenectady, succeeds Mr. Wheatley. Mr. Titus began railroad work on the New York, Chicago & St. Louis as a machinist in the fall of 1903. He later went to the Union Pacific, where he worked in the same position until he was put on the staff of the Superintendent of Motive Power as shop demonstrator. He was later appointed inspector for the Harriman Lines at the Baldwin Locomotive Works. He has been with the American Locomotive Co. only since October 1 of the present year.

A statement made by the Receivers of the Westinghouse Machine Company is to the effect that the company is entirely solvent, that the receivership was simply a logical measure for conserving the interests of customers, creditors and stockholders, that there has been no pause in the operations of the company, and that the personnel remains the same as before. George Westinghouse said that both the Westinghouse Electric & Manufacturing Company and the Westinghouse Machine Company are solvent and doing the largest and most satisfactory business in their history. Each is earning liberal dividends and has quick assets about equal to its liabilities. The loans made to the Securities Investment Company and to Mr. Westinghouse are secured by stocks of the Westinghouse operating companies, and he strongly advises holders of these loans to hold their collateral until its market value is restored to its normal figure. The sacrifice of collateral at present can benefit no one. It is understood that the property of the Westinghouse Machine Company will probably be returned to the stockholders in three or four months. A plan is under way to extend for three years loans amounting to about $8,000,000 negotiated personally by Mr. Westinghouse. Most of this money was used to help the different companies, including the foreign ones. Three trustees have been appointed in whose hands the collateral securing the loans has been placed. The par value of the collateral amounts, it is said, to $20,000,000. The idea in appointing the trustees was to keep the collateral intact until the loans can be met without losing the collateral. T. W. Selman, E. W. Childs and C. B. Hill have been appointed Receivers in New York for the Westinghouse Lamp Company. Mr. Selman and D. W. Cooper have been appointed Receivers of the company's property in New Jersey. William McConway and W. D. Updegraff are the Receivers of the Nernst Lamp Company.

MEETINGS AND ANNOUNCEMENTS.

(For dates of conventions and regular meetings of railroad conventions and engineering societies, etc., see advertising page 24.)

American Society of Mechanical Engineers.

The fifty-fourth annual meeting of this society is to be held in the Engineering Societies building at 29 West 39th street, New York, December 3-6, 1907. There will be symposiums on foundry practice. Other subjects are: The specific heat of superheated steam, with a paper by a Professor of Engineering at Cornell; the utilization of low grade fuels in gas producers; industrial education; power transmission by friction driving, and cylinder port velocities.

ELECTIONS AND APPOINTMENTS.

Executive, Financial and Legal Officers.

Chesapeake & Ohio.—Martin Erdmann has been elected a Director, succeeding J. B. Thayer.

Chicago & Eastern Illinois.—The office of W. H. Lyford, General Counsel, has been moved from New York to Chicago.

Lehigh Valley.—L. D. Smith, Assistant Secretary, has been appointed Assistant to the President, with offices at New York and at Philadelphia, in charge of finance and accounting and such other duties as may be assigned to him. The General Auditor, the Treasurer and the Secretary will report to him.

F. L. Blendinger, Purchasing Agent and Superintendent of Telegraph, has been appointed Assistant to the Vice-President, with office at New York, in charge of the purchasing and fuel departments and such other duties as may be assigned to him.

Union Pacific.—The authority of A. L. Mohler, Vice-President and General Manager of the Lines East of Green River, has been extended to cover the lines and branches from Green River, Wyo., to the east switch of the Ogden, Utah, yards.

Operating Officers.

Atchison, Topeka & Santa Fe.—G. E. Ayer, Superintendent at Dodge City, Kan., has been appointed Superintendent at Newton, Kan.,

succeeding F. J. Easley, resigned to go to the Chicago, Rock Island & Pacific. H. A. Tice, Superintendent at Arkansas City, Kan., succeeds Mr. Ayer. W. K. Etter, Superintendent at San Marcial, N. Mex., succeeds Mr. Tice. F. L. Myers, Trainmaster at Wellington, Kan., succeeds Mr. Etter. Payson Ripley, Trainmaster at San Marcial, succeeds Mr. Myers. Daniel Orr, general traveling roadmaster of the Rio Grande division, succeeds Mr. Ripley.

Canadian Pacific.—J. K. McNeillie has been appointed Assistant Superintendent of Terminals at Toronto, Ont., succeeding F. S. Martyn, transferred.

Chicago & North-Western.—T. A. Lawson, Assistant General Superintendent, has resigned.

Colorado Southern, New Orleans & Pacific.—W. H. De France, Superintendent of the Southern division of the Kansas City Southern, has been appointed Superintendent of the Colorado Southern, New Orleans & Pacific, with office at Baton Rouge, La., with jurisdiction over the line from Baton Rouge, La., to De Quincy, which, it is expected, will be open to traffic by January 1.

Denver & Rio Grande.—R. R. Sutherland, Assistant Superintendent of the Rio Grande Western at Helper, Utah, has been appointed Superintendent of the Second and Third divisions of the Denver & Rio Grande, with office at Salida, Colo., succeeding I. H. Luke, resigned. See Kansas City Southern; also Rio Grande Junction.

Great Northern.—J. M. Gruber, General Manager of the Chicago, Burlington & Quincy Lines East of the Missouri River, has been appointed General Manager of the Great Northern, succeeding F. E. Ward, who took Mr. Gruber's place on the Burlington. Mr. Gruber will have charge of operation and maintenance.

E. L. Brown, General Superintendent of the Eastern district, has been appointed General Superintendent of the Western district, with office at Spokane, Wash., succeeding F. S. Forest, resigned. W. B. Scott, Superintendent at Everett, Wash., succeeds Mr. Brown, with office at St. Paul, Minn. J. H. O'Neill, Superintendent at Whitefish, Mont., succeeds Mr. Scott. W. B. Smith, Assistant Superintendent at that place, succeeds Mr. O'Neill.

Kansas City Southern.—I. H. Luke, Superintendent of the Second and Third divisions of the Denver & Rio Grande, has been appointed Superintendent of the Southern division of the Kansas City Southern, with office at Texarkana, Tex., succeeding W. H. De France, resigned. See Colorado Southern, New Orleans & Pacific.

Louisville & Nashville.—J. D. Patterson, formerly Superintendent of the Mobile, Jackson & Kansas City at Laurel, Miss., has been appointed Superintendent of the joint terminals at Atlanta, Ga., acting also as Superintendent of the Louisville & Nashville lines south and east of Hills Park, Ga.

New York Central & Hudson River.—J. P. Leahy and M. E. Welsh have been appointed Assistant Trainmasters at East Rochester, N. Y. W. D. Lawson has been appointed Assistant Trainmaster at Batavia, N. Y. C. H. Calkins, Trainmaster at Oswego, N. Y., has been appointed Trainmaster of the Watertown district. F. L. Whitney has been appointed Assistant Trainmaster of that district. J. A. Ashe succeeds Mr. Calkins at Oswego. W. H. Hartney has been appointed Assistant Trainmaster at Oswego. C. F. Moyer has been appointed Assistant Trainmaster at Richland, N. Y. H. J. Avery has been appointed Assistant Trainmaster of the Auburn branch, with office at Rochester, N. Y.

New York, Chicago & St. Louis.—G. C. Todd has been appointed Trainmaster of the Eastern division, with office at Conneaut, Ohio, succeeding F. T. Deahl, deceased.

Northern Pacific.—I. B. Richards, Superintendent of Transportation, has been appointed Acting General Superintendent of the Yellowstone, Montana and Rocky Mountain divisions, with office at Livingston, Mont.

Rio Grande Junction.—J. H. Brinkerhoff, Assistant Superintendent of the Fourth division of the Denver & Rio Grande, has been appointed Superintendent of the Rio Grande Junction, with office at Grande Junction, Colo.

Rio Grande Western.—See Denver & Rio Grande.

Seaboard Air Line.—J. J. Puller, division passenger agent at Philadelphia, Pa., has been appointed Assistant General Passenger Agent at Atlanta, Ga.

Traffic Officers.

Annapolis, Washington & Baltimore.—W. E. Slaughter, General Superintendent and Traffic Manager, has resigned to go to the Washington, Baltimore & Annapolis Electric as General Passenger Agent.

St. Louis, Brownsville & Mexico.—William Doherty, who was recently appointed Traffic Manager, with office at Corpus Christi, Tex., was born in Ireland. His first railroad work was in 1887 as weighing clerk of the Texas Traffic Association. The next year he went to the Gulf, Colorado & Santa Fe as a clerk in a local freight office. He remained with this company until 1897, serving as assistant city ticket agent, then passenger agent, and finally as traveling passenger agent, with headquarters at Fort Worth, Tex. He then went to the Houston East & West Texas as traveling freight agent. In 1900 he was appointed Assistant General Passenger Agent of this company, having also the same title on the Houston & Texas Central. In 1904 he was appointed General Passenger Agent of the St. Louis, Brownsville & Mexico, which office he held until his recent promotion. Mr. Doherty is also Editor of the *Gulf Coast Magazine.*

William Doherty.

Engineering and Rolling Stock Officers.

Beaumont, Sour Lake & Western.—See Colorado Southern, New Orleans & Pacific.

Boston & Albany.—Everett Stone, who was recently appointed Engineer of Maintenance of Way and Construction, with office at Springfield, Mass., was born in 1865 at Leicester, Mass. After graduating from Worcester Academy he began work in 1887 in a survey on the Boston & Albany. After a few months he was appointed assistant division roadmaster and in 1890 was made division roadmaster. Four years later he was appointed Assistant Chief Engineer, where he remained until his recent promotion.

Buffalo, Rochester & Pittsburgh.—E. F. Robinson, Assistant Engineer of Track, has been appointed Acting Chief Engineer, succeeding to the duties of J. M. Floesch, Chief Engineer, resigned.

Central Vermont.—William Kennedy, Master Mechanic of the Grand Trunk at Toronto, Ont., has been appointed Superintendent of Motive Power of the Central Vermont, with office at St. Albans, Vt., succeeding Archibald Buchanan, Jr., resigned to go to the New York Public Service Commission.

Chicago, Burlington & Quincy.—I. N. Wilber, Master Mechanic at Hannibal, Mo., has resigned, effective January 1, after 50 years of railroad service with the Burlington and its predecessors.

Chicago, Rock Island & Pacific.—E. J. Harris, general foreman at Valley Junction, Iowa, has been appointed Master Mechanic at that place, succeeding B. W. Cunningham, resigned to go to the Missouri Pacific.

Colorado Southern, New Orleans & Pacific.—A. L. Moler has been appointed Master Mechanic of this company and of the Beaumont, Sour Lake & Western and the Orange & Northwestern, with office at Beaumont, Tex., succeeding J. A. Baker, resigned.

Erie.—E. A. Wescott, Assistant Mechanical Superintendent, has been appointed to the new office of Superintendent of the car department, and his former office has been abolished. E. I. Dodds, Assistant to the Mechanical Superintendent, and Thomas Tracy, Assistant Master Car Builder, have been appointed to the new offices of Assistant Superintendents of the car department, and their former titles have been abolished. The headquarters of all are at Meadville, Pa.

Grand Trunk.—See Central Vermont.

New York Public Service Commission.—Henry B. Seaman, Consulting Engineer of the Bridge Department of New York City, has been appointed Chief Engineer of the Public Service Commission, First district, effective December 1. George S. Rice, heretofore Chief Engineer, has been appointed Assistant Chief Engineer in charge of construction work now under way. Mr. Seaman graduated from Swarthmore College in 1881. He worked for three years on the Erie and then went to the Kings County Elevated in Brooklyn. After working in the bridge

department of the Pennsylvania Railroad, he was for three years Principal Assistant Engineer of Wilson Bros., Philadelphia. He was then appointed Bridge Engineer of the Erie and two years later went to the New York, New Haven & Hartford in active charge of the physical improvements inaugurated by President Mellen. He was in direct charge of the four-track bridge work on the New York division and had supervision over the New Haven cut. He then went to New York as Consulting Engineer of the Bridge department of the city.

Orange & Northwestern.—See Colorado Southern, New Orleans & Pacific.

Tonopah & Goldfield.—E. F. Van Hoesen has been appointed Chief Engineer, with office at Tonopah, Nev., succeeding W. B. Chapin, who resigned last spring.

Purchasing Agents.

Lehigh Valley.—See this company under executive, financial and legal officers.

LOCOMOTIVE BUILDING.

The Denver & Rio Grande is said to have ordered 28 locomotives for January delivery.

The New York, New Haven & Hartford, it is said, is figuring on electric locomotives.

The Northern Pacific is said to have ordered 26 oil burning locomotives from the American Locomotive Co.

The Laramie, Hahn's Peak & Pacific has ordered one consolidation locomotive from the Hicks Locomotive & Car Works.

The Fresno Valley Lumber Company, Davenport, Iowa, has ordered one locomotive from the Davenport Locomotive Works.

The Toronto, Hamilton & Buffalo is said to have ordered four locomotives from the Locomotive & Machine Co. of Montreal.

The Baltimore & Ohio has not yet authorized the purchase of the locomotives for which the mechanical department has asked.

The Kansas City Southern, as reported in the *Railroad Gazette* of October 25, has ordered 21 simple consolidation (2-8-0) locomotives and nine simple switching (0-6-0) locomotives from the Baldwin Locomotive Works, for December and January delivery.

General Dimensions.

	Consolidation.	Switching.
Types of locomotives	Consolidation.	Switching.
Weight, total	324,680 lbs.	213,600 lbs.
Weight on drivers	185,000 "	128,800 "
Diameter of drivers	55 in.	51 in.
Cylinders	22 in. x 30 in.	19 in. x 26 in.
Boiler, type	Straight.	Straight; radial stayed.
" working stm. press.	200 lbs.	180 lbs.
" number of tubes	376	276
" material of tubes	Tyler charcoal iron.	
" diameter of tubes	2 in.	
" length of tubes	14 ft. 6 in.	11 ft.
Firebox, length	120 in.	108 in.
" width	40¾ in.	41⅞ in.
" grate area	33.5 sq. ft.	31.4 sq. ft.
Tank capacity	6,000. gals.	4,000 gals.
Coal capacity	10 tons.	8 tons.

Special Equipment.

Air brakes	Westinghouse
Axles	(for consolidation) Taylor iron; (switching) Otis
Bell ringer	Western Railway Equipment Co.
Boiler lagging	Keasbey & Mattison
Brake-beams	Simplex
Brake-shoes	"Perfecto"
Couplers	Climax
Headlights (for consolidation)	Pyle-National electric
Injector	Ohio
Piston rod packings	Sullivan metallic
Valve rod packings (for switching)	Sullivan metallic
Safety valve	Consolidation
Sanding devices	Kansas City Southern standard
Sight feed lubricators	Nathan
Springs	Railway Steel-Spring Co.
Steam gages	Ashcroft
Tires, driving wheel	Latrobe
Tires, truck wheel (for consolidation)	Latrobe
Tires, tender wheel (for consolidation)	Latrobe
Wheel centers, drivers (for consolidation)	Cast steel; Davis counterbalanced

The Boston & Maine, as reported in the *Railroad Gazette* of October 25, has ordered 15 simple six-wheel switching (0-6-0) locomotives for January, February and June, 1908, delivery.

General Dimensions.

Type of locomotive	6-wheel switching
Weight, total	114,000 lbs.
Weight on drivers	114,000 "
Cylinders	19 in. x 24 in.
Diameter of drivers	51 in.
Boiler, type	Straight top; radial stay
" working steam pressure	160 lbs.
" number of tubes	259
" material of tubes	National Tube Co.; Spellerized steel
" diameter of tubes	2 in.
" length of tubes	11 ft.
Firebox, length	102 5/16 in.
" width	32⅛ "
" material	Worth steel
" grate area	22.8 sq. ft.
Heating surface, total	1,635.7 "
Tank capacity	4,000 gals.
Coal capacity	7 tons

Special Equipment.

Air brakes	Westinghouse
Axles	Carnegie
Boiler lagging	Franklin Mfg. Co.
Brake-beams	Buffalo
Brake-shoes	Ibberson & Major standard
Couplers	Tower
Headlights	Dewey
Injector	Hancock
Journal bearings	Hardy, bronze
Piston rod packings	Hayden
Valve rod packings	Hayden
Safety valve	Ashton
Sanding devices	Hanson
Springs	Railway Steel Spring Co.
Steam gage	American
Tires—driving wheel	Midvale
Tires—tender wheel	Chilled cast iron

CAR BUILDING.

The Barnett Manufacturing Company, Chicago, is in the market for 15 tank cars.

The Boston & Maine is understood to have ordered 1,000 freight cars from the Laconia Car Company.

The Lehigh Valley has not yet ordered the 1,000 freight cars for which it was in the market some time ago.

The Nashville, Chattanooga & St. Louis is in the market for 100 hopper bottom gondola cars of 100,000 lbs. capacity.

J. G. White & Co., New York, are in the market for combination parlor and first class passenger coaches for the Philippine Railways.

The Norwood & St. Lawrence has ordered one first class combination baggage and passenger car from the Hicks Locomotive & Car Works.

The Buffalo, Rochester & Pittsburgh, as reported in the *Railroad Gazette* of October 25, has prepared specifications for freight cars, but no action will be taken for some weeks at least.

The Erie, as reported in the *Railroad Gazette* of October 18, is converting fifty 20-ton box cars into cabooses; half the cars are being rebuilt at the Buffalo shops and half at the Kent shops.

The City of Chicago, as reported in the *Railroad Gazette* of August 23, has made requisition for about 50 gondola cars, either new or second-hand, for which bids will be asked this fall and appropriation made next spring.

The Harriman Lines are asking bids on a number of passenger coaches, baggage cars, combination passenger and baggage cars and dining cars. Comparative bids on both steel and woden cars in each class are asked. It is denied that 26 cars have been already bought, as reported in the *Railroad Gazette* of October 25, 1907.

The South & Western, as reported in the *Railroad Gazette* of October 18, has ordered 100 self-cleaning hopper cars of 100,000 lbs. capacity from the Pressed Steel Car Company. These cars will weigh 29,583 lbs. and will measure 30 ft. 2½ in. long, and 9 ft. 5⅝ in. wide, inside measurements, and 31 ft. 11 in. long, 10 ft. wide and 10 ft. high, over all. Bodies and underframes will be of steel. The special equipment includes:

Bolsters	Simplex
Brake-beams	Simplex
Brake-shoes	Congdon
Couplers	Janney
Draft rigging	Miner
Journal boxes	Symington
Trucks	Diamond

The Philippine Railways, through J. G. White & Co., New York, has ordered 40 20-ton box cars, 40 10-ton box cars, for December, 1907, delivery, and 15 second class passenger cars for February, 1907, delivery from the American Car & Foundry Company. The 20-ton box cars will measure 31 ft. ¾ in. long, 7 ft. 6¾ in. wide and 7 ft. high, inside measurements, and 32 ft. 9⅝ in. long and 8 ft. 1⅜ in. wide over all. The 10-ton box cars will measure 17 ft. ¾ in. long, 7 ft. 6¾ in. wide and 7 ft. high, inside measurements, and 18 ft. 9⅝ in. long and 8 ft. 1⅜ in. wide, over all. The passenger cars will measure 41 ft. 11½ in. long, 7 ft. 8½ in. wide and 6 ft. 9 in. high, inside measurements, and 43 ft. long and 8 ft. 4½ in. wide, over all. The bodies of all cars will be of wood and the underframes of steel. The special equipment for all cars includes:

Axles	Philippine Railway standard
Brake-beams	Buffalo
Brake-shoes	Congdon
Brakes	Westinghouse
Brasses	Brady
Couplers	Major
Draft rigging	Miner
Platforms	Passenger cars, Standard Coupler Co.
Roofs	Box cars, Murphy galvanized iron
Springs	Philippine Railway standard

The Central of New Jersey, as reported in the *Railroad Gazette* of October 18, has ordered 12 passenger coaches and eight combination passenger and baggage cars from Harlan & Hollingsworth. The coaches will seat 81 and the combination cars 58 persons. These cars will weigh 89,000 lbs. and will measure 65 ft. 3½ in. long and 8 ft. 10 in. wide, inside measurements, and 74 ft. long, 10 ft. ½ in.

wide and 13 ft. 11 in. high, over all. Bodies and underframes will be of wood. The special equipment includes:

Bolsters	Commonwealth
Brake-beams	Simplex
Brake-shoes	Diamond S
Brakes	Westinghouse
Brasses	Magnus
Couplers	Buhoup; 3-stem
Curtain fixtures	National
Curtain material	Pantasote
Draft rigging	Miner
Dust guards	Symington
Heating system	Gold direct
Journal boxes	Symington
Light	Pintsch
Platforms	Standard Coupler Co.
Springs	Simplex
Trucks	Commonwealth, steel frames
Vestibules	Pullman
Wheels, make of	Taylor

RAILROAD STRUCTURES.

Alexandria, La.—The St. Louis, Iron Mountain & Southern, it is said, will build a brick passenger station 200 ft. long, and a frame freight house on land between Elliott and Jackson streets, and also make other improvements to cost $70,000.

Buffalo, N. Y.—Contract is reported let by the Erie to Mosier & Summers for rebuilding its freighthouse recently destroyed by fire. The proposed structure will be of brick 32 ft. x 200 ft. and two stories high.

Defiance, Ohio.—The announcement is reported made by the Baltimore & Ohio that the company will spend $53,000 putting up a passenger station and freight house here.

East Buffalo, N. Y.—The Delaware, Lackawanna & Western has made plans for a new coal trestle to be built entirely of concrete, 1,000 ft. long and with a capacity of 4,000 tons.

Eugene, Ore.—Contracts are reported let by the Southern Pacific for a new freighthouse, train sheds and additional tracks. The cost of the improvements will be about $25,000.

Kingsville, Tex.—The shops of the St. Louis, Brownsville & Mexico Railroad at this place are being enlarged and other improvements of the terminal facilities are being made.

Lafayette, La.—The Southern Pacific, it is said, has bought a large plot of land here as a site for shops, a roundhouse and large switching yards.

Matamoros, Mex.—The Interoceanic is making many improvements, rebuilding a number of bridges, and erecting a new station here.

Minneapolis, Minn.—The Wisconsin Central has given contracts for putting up a reinforced concrete freight station 66 ft. wide at the north end and 98 ft. at the south end, 417 ft. long and four stories high. A viaduct is also to be build leading from the second floor at the south end to First avenue. These improvements will cost about $180,000.

Nuevo Laredo, Mex.—The National of Mexico is erecting machine shops, boiler shops, a foundry, blacksmith shops and other buildings here. It is also building roundhouses at Venegas and Nuevo Laredo.

Ottawa, Ont.—A contract is reported let to John Quinlan & Co., of Montreal, at $60,000 for the excavation work for the new Grand Trunk hotel and station.

Port Arthur, Ont.—The Canadian Northern, it is said, is planning to put up car shops here, providing concessions are granted by the town.

Poughkeepsie, N. Y.—Announcement is made that repairs on the bridge over the Hudson river, which have cost the New York, New Haven & Hartford about $1,500,000, will be finished about December 1.

Reading, Pa.—The Board of Public Works has given to Hawman Bros. a contract for the Spring street subway at $110,480. The next lowest bidder was David B. Peoples, who offered to do the work for $110,945. The contract will have to be ratified by the Council and approved by the Mayor.

Sabinas, Mex.—The Mexican International is constructing steel bridges across the Sabinas and Tepehuanes rivers. The Sabinas bridge will be 826 ft. long and will consist of 10 steel girders. The Tepehuanes structure will have six steel girders. The large shops of this road at Durango were recently finished. The roundhouse at Monclova has just been rebuilt, and the additions to the shops of the road at that place will soon be finished.

Sharon Springs, Kan.—The Union Pacific has work under way putting up roundhouses, making a new yard and putting in tracks. It has been decided to make this place a division point in place of Cheyenne Wells, Colo.

Vancouver, B. C.—Arrangements have almost been finished for building the second Narrows bridge, and it is expected that bids will shortly be asked for.

RAILROAD CONSTRUCTION.

New Incorporations, Surveys, Etc.

Bangor & Aroostook.—The report of this company for the year ended June 30, 1907, shows that work on the Medford extension from South La Grange north through Medford to a junction with the main line about four miles north of Seboois is about ready for operation. The line has low grades and is shorter than the line via Milo Junction, Brownville and Schoodic. No mention beyond indicating it on the map is made in the report of the line projected north from the main line at Seboois along the east bank of the Allagash river to St. Francis, 140 miles.

Beaumont & Great Northern.—This company expects to let contracts this year for an extension from Livingston, Tex., southeast to Beaumont, 70 miles. Surveys made. (Oct. 18, p. 472.)

Big Fork & International Falls.—See Northern Pacific.

Buffalo & Susquehanna.—Estimates of the cost of rebuilding portions of this road south from Juneau junction southwest to Sagamore, 23 miles, are being prepared. When the road was built from Juneau junction to Sagamore, light rails were used, and many curves and grades prevent the hauling of heavy traffic. The company owns sufficient right of way to rebuild the line and the work is to be rushed. No action has been taken on the proposed extension south from Sagamore toward Pittsburgh.

Cananea, Yaqui River & Pacific.—See Southern Pacific.

Canadian Pacific.—An officer writes concerning the proposed line from Killam, Alb., northwest to Strathcona, about 80 miles, that although this company has made a reconnoissance, no authority to build the line has yet been asked for. (Oct. 18, p. 472.)

Surveys, it is reported, have been made by this company for a branch from Michel, B. C., to the company's coal mines in the upper Elk valley. Grading is to be started at once.

Charleston & Paris Interurban.—Grading is reported under way by this company on its proposed electric line from Charleston, Ill., northeast via Ashmore, Kansas, Dudley and Conlogue to Paris, 28 miles. W. R. Patton, of Charleston, is President.

Chicago & North-Western.—The new steel bridge over the Missouri river between Pierre and Fort Pierre, S. Dak., connecting this company's line with its new line, the Pierre, Rapid City & North-Western, from Pierre, S. Dak., west to Rapid City, has been opened for traffic. Plans are being made by the company to run trains between Chicago and Rapid City via Pierre.

Chicago, Burlington & Quincy.—During the year ended June 30, 1907, this company finished work on its line from Frannie, Wyo., south to Worland, 91 miles, and the line is now open for traffic. The extension from Worland south to Kirby, 20.45 miles, is expected to be finished this year. The line from Centralia, Ill., south to Herrin, 53 miles, was also finished and placed in operation. A new line is being built to reduce the grades from Lincoln, Neb., including a new yard at that place, west to Milford. A line is projected from Newark, Neb., west to Bridgeport, about 240 miles.

Chicago, Indianapolis & Evansville.—The initial construction work on this line projected from Evansville, Ind., north to Indianapolis and Indiana Harbor, 346 miles, with a branch from Logansport, Ind., north to South Bend, 70 miles, will be the building of a bridge across White river, 10 miles below Petersburg, Ind. The first rails on the road will be laid in Vanderburg county in a few days, the contracts for the rails having been let in Chicago. It is believed the line from Evansville north to White River, 45 miles, will be finished by the time the bridge is in place. (July 5, p. 27.)

Chicago, Weatherford & Brazos Valley.—This company, organized to build a line from Weatherford, Texas, to Bridgeport, 38 miles, it is said, has made arrangements for financing the project, and construction is to begin within 90 days. G. R. Turner, of New Orleans, is interested. (March 15, p. 381.)

Coffeyville & Memphis.—This company, which was incorporated about a year ago with a capital of $1,000,000, has surveys made for its proposed line from Coffeyville, Kan., southeast through Centralia, Vinita and Afton, Okla., to Little Rock, Ark., about 300 miles. Work on the line is to be begun this year. (March 15, p. 382.)

Decatur, Sullivan & Mattoon (Electric).—Work, it is said, is soon to be begun on an electric line from Mattoon, Ill., northwest to Sullivan, 15 miles. R. D. Starbuck, President, Mattoon.

GOTEBO & SOUTHWESTERN.—This company, chartered to build a line from Gotebo, Kiowa county, Oklahoma, south to Frederick, Tillman county, 45 miles, has filed an amendment providing for the construction of 125 miles of railroad from Clinton, Custer county, south via Gotebo to Frederick, and increasing the capital stock to $1,000,000. (May 17, p. 695.)

GRAND TRUNK.—The annual report of this company says that the line between St. Lambert, Que., at the east end of the Victoria bridge and St. Rosalie, 31 miles, used jointly by this company and the Intercolonial, is being double tracked. The work is expected to be finished this year. The double-track work between Lynden, Ont., and Brantford, and London and Hyde Park Junction gives a continuous double-track from Montreal to Chicago, 850 miles, with the exception of the St. Clair tunnel, which is single-track, and about five miles at Valparaiso, Ind., where work has been delayed owing to arrangements yet to be made to cross the tracks of other companies.

HOUSTON & BRAZOS VALLEY.—Vice-President Felix Jackson is quoted as saying that the present plans only include building the extension from Anchor, Tex., north to a connection with the Gulf, Colorado & Santa Fe, at Duke, 25 miles. It has not yet been decided whether a line will be built from Duke north to Houston, or traffic arrangements made over some existing road. About four miles of the extension from Anchor has been built. (July 5, p. 27.)

IOWA & NORTHWESTERN.—This company, incorporated about a year ago to build a line from Waterloo, Iowa, east for about 75 miles, it is said, has secured money from the Carnegie Trust Company and the work will soon be begun. (March 15, p. 385.)

KANSAS & TEXAS.—Incorporated in Oklahoma to build a line from Garden City, Kan., on the Atchison, Topeka & Santa Fe, south via Guymon, Okla., to Amarillo, Tex., and thence southeast to Houston, 800 miles. The estimated cost of the proposed line is $5,000,000. The incorporators include J. H. Barnard, of Boston, Mass.; J. L. Gilson, W. C. Crow, G. W. Gilson, C. M. Funk and E. Gilson, of Guymon.

KENTUCKY ROADS (ELECTRIC).—Residents of Carlisle, Sharpsburg and Salt Lick recently held a meeting at Owingsville, Ky., to raise a bonus of $80,000 to build an electric line from Salt Lick northwest via Owingsville and Sharpsburg to Carlisle, 36 miles. The Kaufman-Shaw Construction Company, of Dayton, Ohio, is expected to build the line.

LAWTON, WICHITA FALLS & NORTHWESTERN.—J. M. Bellamy, of Lawton, President of this company, is asking for bids, and it is said that contracts will shortly be let for grading this proposed line, projected from Lawton, Okla., south to Wichita Falls, Tex., 49 miles. A. J. Robinson, Chief Engineer, Frederick, Okla. (May 24, p. 727.)

LOUISVILLE & NASHVILLE.—The report of this company for the year ended June 30, 1907, shows that the reduction of grades from Corbin, Ky., south to Saxton, has been finished. Work has been started reducing the grades and putting in double-track from Corbin north to Livingston. When this work is finished, the company will have double-track between Sinks and Corbin, 35 miles.

The Morganfield & Atlanta from Providence, Ky., to Morganfield, 25.33 miles, has been finished and placed in operation.

MEXICAN CENTRAL.—The report of this company for the year ended June 30, 1907, shows that work is progressing rapidly on the extension of the Guadalajara division from Tuxpan to Manzanillo on the Pacific coast. It is expected to have the line finished by July of next year. During the year the branch from Ocotlan to Atotonilco, 22.22 miles, was finished and opened for traffic. The extension from Marfil northeast, five miles, giving an entrance into the city of Guanajuato, will be finished this year. Contracts have been let and work is under way on the first 31 miles of the short line from Tampico to the City of Mexico.

MEXICAN ROADS.—Construction work, it is said, has not been suspended on the Mineral Belt line in the Guanajuato district. Interests closely identified with the Guanajuato Development Company are building the line, which is to be about 40 miles long. The construction work is in charge of E. J. White.

MIDLAND VALLEY.—Plans, it is said, are being made to extend this road from Arkansas City, Kan., northwest to Wichita, 55 miles.

MISSOURI, OKLAHOMA & GULF.—Announcement has been made by President William Kenefick that $6,000,000 will be spent for extensions. This includes work on the main line from Dustin, Okla., the present southern terminus, south to Denison, Texas, 128 miles, and probably a branch from Wapanucka on this extension northwest, via Connersville and Pontotoc to Sulphur. (June 14, p. 878.)

MISSOURI PACIFIC.—Passenger service over the St. Louis, Iron Mountain & Southern, it is said, is to be extended. This is to be accomplished by connecting the St. L., I. M. & S. with the Coal Belt Electric road at No. 7 mines near Herrin, Ill., and from that point trains are to be run to Marion over the electric road, which is owned and controlled by the Gould interests. The electric service is not to be abandoned. By this extension the Missouri Pacific system will be in shape to compete with the Illinois Central for the passenger traffic to and from St. Louis of a great section in Southern Illinois.

MORGANFIELD & ATLANTA.—See Louisville & Nashville.

NEWBURG & NORMAN.—Incorporated in South Dakota with $50,000 capital and office at Pierre. The company proposes to build a line from Douglas county, S. Dak., southwest to a point in Rock county, Neb., 75 miles. The incorporators include E. Benning, T. C. McPhillon, P. M. Banning and O. W. Boyd, of Chicago; C. A. Miller of Minneapolis, Minn.; I. W. Goodner and M. P. Goodner, of Pierre, S. Dak.

NORTHERN PACIFIC.—The report of this company for the year ended June 30, 1907, shows that the Big Fork & International Falls, building from the terminus of the Big Fork & Northern, at Big Falls, Minn., northeast to International Falls on the Rainy Lake river, 34 miles, is to be finished and put in operation this year. Work on the Oregon, Washington & Idaho, which is being built jointly by this company and the Union Pacific from Texas Ferry, Wash., on the Snake river east to Grangeville, Idaho, is under way. The part of the line between Texas Ferry and Lewiston, Idaho, 72.3 miles, is being built under the direction of the Union Pacific and is almost finished. The work includes a bridge over the Snake river at Lewiston, which is to be finished this year. The extension from Culdesac, Idaho, southeast to Grangeville, 55 miles, has 80 per cent. of the work finished and is expected to be put in operation this year.

The Portland & Seattle, which is being built jointly by this company and the Great Northern from Portland, Ore., east to Spokane, Wash., with a branch to Texas Ferry, where connection is to be made with the line owned jointly by the Northern Pacific and the Union Pacific, is nearing completion between Kennewick and Vancouver, 220.6 miles. Work is under way on the large bridges over the Columbia and Willamette rivers, and is expected to be finished by June, 1908. The line between Pasco and Spokane, 145.1 miles, and the branch to Texas Ferry, 40.6 miles, is expected to be finished next summer. The total mileage from the connection with the Northern Pacific in Spokane to the connection with the same road near Portland and the branch to Texas Ferry will be 415.1 miles. A new line is being built from Alta, N. Dak., to Berea, 9.4 miles north of Valley City, to give an alternate line for heavy freight and fast passenger trains. A new track on revised grade is being built for westbound trains from Wheatland, N. Dak., to Buffalo, 11.2 miles; the present line will be used for eastbound trains. The surplus material taken from cut is being used as filling for double-track work between Casselton and Wheatland, which is to be finished next year. Work is under way, which it is expected will be finished this year from Livingston, Mont., west to Muir, 11.5 miles, to provide a double-track between Livingston and the east end of the tunnel on the Bozeman mountain. The distance will be reduced 1,142 ft. and the curvature 642 deg. Second main track is now under construction from the west end of the tunnel to Bozeman, 11.8 miles. This work is expected to be finished and put in operation next year. Work is under way changing the line and grades in connection with the second track between Garrison, Mont., and Missoula, 69.1 miles. When finished the new line will be 5.2 miles shorter than the existing line. There will also be an alternate line to eliminate mountain grades from St. Regis, Mont., to Paradise, 21.8 miles; this in connection with the proposed line and grade revision between De Smeth and St. Regis, now operated as a branch line, will reduce the eastbound grade to 0.3 per cent. and westbound grade to level between Tunah and Paradise. It is expected to have this work finished next year.

On the White Pine Hill line, 28.4 miles, work is under way on a change of line to reduce grades; the distance will be increased 1.3 miles. In Washington between Kalama and Vancouver second main track work and improving line and grades on 29.9 miles is under way, and is expected to be finished in the fall of 1908. This work will reduce the distance 358 ft. curvature, 329 deg., and rise and fall 98 ft.

OREGON, WASHINGTON & IDAHO.—See Northern Pacific.

PECOS, SARAGOSA & BALMORHEA.—This company is being organized to build a line from Pecos, Texas, southwest, 40 miles, down the valley of Toyah creek. The headquarters of the company is at Pecos.

PENNSYLVANIA LINES WEST.—This company has under consideration the question of shortly making improvements on the Waynesburg & Washington. This line, which is 28.15 miles long, is narrow gage, and is to be made standard. It is said that a line is now building from a point near Ellsworth, Pa., south to Zollarsville, under the name of the Pennsylvania Southern, to relieve the freight congestion in that section. The line is eventually to be extended

from Zollarsville west via Bissel to Hackneys on the Waynesburg & Washington.

Pennsylvania Southern.—See Pennsylvania Lines West.

Portland & Seattle.—See Northern Pacific.

St. Louis, Bartlesville & Pacific.—This company, it is said, is building its proposed line from Bartlesville, Okla., west to Pond Creek, Okla., and has filed an amendment to its charter authorizing it to extend its line from Pond Creek west to a connection with the Kansas City, Mexico & Orient, about 40 miles. (Oct. 11, p. 435.)

St. Louis, Brownsville & Mexico.—It is announced that this company will begin to operate its passenger trains into Galveston and Houston this year. Trackage rights over the Gulf, Colorado & Santa Fe have been obtained from Algoa into Houston and south into Galveston. This arrangement will go into effect as soon as the Santa Fe completes the work of enlarging its terminal facilities at these places to accommodate the additional traffic.

St. Louis, Iron Mountain & Southern.—See Missouri Pacific.

Southern Pacific.—According to Vice-Consul A. W. Brickwood, of Nogales, the Cananea, Yaqui River & Pacific has let the contract for its line in the state of Sonora, from a point on its Naco-Cananea line northwest to Nogales, 100 miles. The entire line must be built within 18 months. Surveys are made and grading has already been done from the east end of the new line from Verde for 10 miles, and rails are being laid on this portion. A large force is also to be started grading from the west end at Nogales. The line will connect important mineral regions. (Oct. 4, p. 403.)

It is stated by J. H. Cashion, General Manager of the Grant Brothers Construction Company, of Los Angeles, Cal., which has the contract for the construction of the greater part of the Cananea, Yaqui River & Pacific, in Mexico, that more than 6,000 men and 2,000 teams are now at work. The laborers are divided into four large camps. The largest gang is working on the main line from Guaymas, southeast to Mazatlan, 600 miles. About 300 miles of this division is finished. Another gang is working from Mazatlan southeast to Tepic, 200 miles; another on the branch from Corral north to Nacozari, and another between Nogales and Del Rio. The main line is to run from Guaymas southeast to Orendain, 25 miles from Guadalajara, where connection is to be made with the Mexican Central. A branch line is also being built from Del Rio on the north, south to Nogales. The Mexican Engineering and Construction Company, of Mexico City, has the contract to build the first division out of Orendain toward Tepic. Many Yaqui Indians are employed in the work.

Texas Central.—This road, it is said, is to be extended from its present western terminus, in Fisher county, Texas, northwest, traversing the upper part of the Brazos river valley for some distance to Emma, about 90 miles. The construction work is to be started as soon as the survey is finished.

Union Pacific.—See Northern Pacific.

Vancouver Island & Eastern.—Application is being made to the Dominion Parliament to incorporate this company. The company proposes to build a line from a point near Victoria, B. C., northeast via Yellow Head Pass to Edmonton, Alb., 500 miles. Connection would be made with Vancouver Island either by ferry or a bridge across the strait. R. Chowe, Victoria, is the attorney.

Vera Cruz Terminal.—It is authoritatively announced that this company, now organizing in London, with a capital of $6,000,000, will let contracts for the construction of the new terminals at Vera Cruz within seventy days. The company is to be composed of representatives of the Mexican (Vera Cruz), the Interoceanic, the Vera Cruz & Pacific and the Alvarado railroads, all of which enter the port of Vera Cruz. The proposed improvements, according to the plans and estimates, will cost $6,000,000. The work includes customs warehouses and a union station.

Washington, Frederick & Gettysburg (Electric).—Rights of way have been secured for about 12 miles by this company for its proposed electric line through Montgomery county, Maryland. The company is now building 16 miles in Frederick county, on a line which is eventually to be extended to Emmittsburg and to Gettysburg. D. C. Kemp, President, Frederick.

Waynesburg & Washington.—See Pennsylvania Lines West.

Wisconsin Central.—Contract is reported let by this company to the Lantry Construction Company of Kansas City, for piercing a tunnel 2,000 ft. long at Duluth, Minn.

RAILROAD CORPORATION NEWS.

Central of Georgia.—See Norfolk & Southern.

Central Vermont.—Gross earnings for the year ended June 30, 1907, were $3,833,088, a decrease of $3,888, net earnings, after taxes, $688,381, an increase of $1,753. The net income was $1,813, a decrease of $2,703.

Chesapeake & Ohio.—The President is quoted as having said, at the annual meeting on October 22, that, judging from the earnings for the last few months, the net earnings for the present year would be the largest in the history of the company, and that the stockholders might expect an increased dividend.

Kanawha & Michigan.—Gross earnings for the year ended June 30, 1907, were $2,377,662, an increase of $224,899; net earnings, $515,695, a decrease of $20,434. The net income was $267,076, and $384,869 was spent for additions and betterments and for retiring equipment trust obligations, leaving a deficit to be carried to profit and loss account of $117,793.

Louisiana & Aarkansas.—Gross earnings for the year ended June 30, 1907, were $1,216,837, an increase of $159,312; net earnings, after taxes, $368,078, a decrease of $3,266. The surplus after charges was $225,484, a decrease of $13,175.

Millbrook Company.—See New York, New Haven & Hartford.

New York & Portchester (Electric).—See New York, New Haven & Hartford.

New York, New Haven & Hartford.—The Millbrook Company, which owns all the stock of the New York & Portchester and a majority of the stock of the New York, Westchester & Boston, has been sold by Oakleigh Thorne and Marsden J. Perry to the New York, New Haven & Hartford. The routes of the projected electric lines of the Westchester and Portchester companies were parallel and close together. They were to run from the northern part of New York City to White Plains, N. Y., and to points on the north shore of Long Island Sound. The companies opposed each other for some time until last November, when Messrs. Thorne and Perry bought control of both. It is said that the two companies have spent between $4,000,000 and $5,000,000, most of the actual construction work having been done by the New York, Westchester & Boston, which has graded most of its four-track line from 177th street, New York, to Mount Vernon, and has erected many steel bridges. The New Haven, it is now learned, has been financing this work for the past year. The Harlem branch of the New York, New Haven & Hartford runs close to the 177th street terminus. (See New York, Westchester & Boston; November 23, 1906, p. 146.)

New York, Westchester & Boston (Electric).—See New York, New Haven & Hartford.

Norfolk & Southern.—It is said that this company is ultimately to acquire the stock of the Central of Georgia, all of which was bought last June by Oakley Thorne and Marsden J. Perry. Mr. Thorne was quoted last week as saying that he had already sold his share. Mr. Perry is Chairman of the Board of the Norfolk & Southern.

Pennsylvania.—About $37,000,000 of the $50,000,000 4½ per cent. notes maturing on November 1 were redeemed in advance by Kuhn, Loeb & Co., New York, up to October 30. The remaining $13,000,000 are to be redeemed by the railroad company to-day.

Pere Marquette.—The special meeting of stockholders called for October 28 to approve the reorganization plan has been postponed for two weeks.

Toledo & Ohio Central.—Gross earnings for the year ended June 30, 1907, were $4,866,661, an increase of $794,499; net earnings, after taxes, $1,547,031, an increase of $542,757. Net income was $1,185,295, and out of this $826,765 was appropriated for additions and betterments, new equipment, payment of equipment notes and for retiring a special equipment and betterment loan, leaving $358,530 surplus for profit and loss.

Union Pacific.—At a meeting of the Directors, held on October 30, a committee was appointed to consider plans for forming a holding company to take over the Union Pacific's interests in other companies. The committee consists of E. H. Harriman, Henry C. Frick, Marvin Hughitt, R. S. Lovett, James Stillman, Oliver Ames, P. A. Valentine and Robert W. Goelet. The par value of the securities of other companies held by the Union Pacific amounts to about $300,000,000, yielding about $15,000,000 annual income; none of these securities are pledged as collateral for loans, except $108,000,000 of the Southern Pacific stock, which is part security for an authorized issue of $100,000,000 refunding mortgage Oregon Short Line bonds, of which $45,000,000 have been issued.

Wichita Falls & Northwestern.—A morigage has been filed with the Commonwealth Trust Company, of St. Louis, securing an issue of, it is said, $640,000 bonds.

RAILROAD GAZETTE

ESTABLISHED IN APRIL, 1856.

Published Every Friday by The Railroad Gazette at 83 Fulton Street, New York
Branch Offices at 376 Old Colony Building, Chicago, and Queen Anne's Chambers, Westminster, London

EDITORIAL ANNOUNCEMENTS.

THE BRITISH AND EASTERN CONTINENTS edition of the Railroad Gazette is published each Friday at Queen Anne's Chambers, Westminster, London. It contains selected reading pages from the Railroad Gazette, together with additional British and foreign matter, and is issued under the name Railway Gazette.

CONTRIBUTIONS.—Subscribers and others will materially assist in making our news accurate and complete if they will send early information of events which take place under their observation. Discussions of subjects pertaining to all departments of railroad business by men practically acquainted with them are especially desired.

ADVERTISEMENTS.—We wish it distinctly understood that we will entertain no proposition to publish anything in this journal for pay, EXCEPT IN THE ADVERTISING COLUMNS. We give in our editorial columns OUR OWN opinions, and these only, and in our news columns present only such matter as we consider interesting and important to our readers. Those who wish to recommend their inventions, machinery, supplies, financial schemes, etc., to our readers, can do so fully in our advertising columns, but it is useless to ask us to recommend them editorially, either for money or in consideration of advertising patronage.

OFFICERS.—In accordance with the law of the state of New York, the following announcement is made of the office of publication, at 83 Fulton St., New York, N.Y., and the names of the officers and editors of The Railroad Gazette:

OFFICERS:

W. H. Boardman, *Pres. and Editor*
E. A. Simmons, *Vice-President*
Ray Morris, *Secretary*
R. S. Chisolm, *Treas.*
L. B. Sherman, *Western Manager*

EDITORS:

Ray Morris, *Man'g Editor*
Braman B. Adams
Charles H. Fry
Rodney Hitt
George L. Fowler
Frank W. Kraeger
Hugh Rankin
Bradford Boardman

CONTENTS

Vol. XLIII., No. 19. Friday, November 8, 1907.

The long-expected crisis in British railroad labor troubles was reached last Sunday when Richard Bell, M.P., Secretary of the Amalgamated Society of Railway Servants, the strongest of the British railroad labor unions, announced that the recent balloting in the Society had resulted in a vote of 76,925 in favor of a general strike and 8,773 against. The Executive Committee of the Society was empowered to declare the strike at any time, but it expressed a desire to meet with Mr. Lloyd-George, President of the Board of Trade, and a committee of railroad directors and arrange, if possible, a compromise or truce. This meeting was held on Wednesday, and it is reported that the railroads agreed to accept the principle of arbitration of disputes through representative committees of their employees without openly recognizing the existence of the union. The strike was for recognition of the Society and the right of its officers to treat with the railroads on behalf of its members. This claim of recognition arose primarily from the passage last year of the Trades Dispute Act which in effect reversed the famous Taff Vale decision which held any trade union and its treasury funds responsible for acts done by its officers within the scope of their authority. The railroads were unanimous in resisting the demand because if recognition of the union were granted, the directors would be compelled to meet representatives of the union and agree on a settlement of disputes between the company and its employees. The directors would then be bound by law to make good their promises and the stockholders would be liable to pay any damages awarded for failure to carry out the promises. The union, on the other hand, is not responsible in money, and the members could repudiate at will any of the agreements made by their officers. The A. S. R. S. has over 100,000 members in all of the lower grades, or one-sixth of the total number of employees. These include trainmen, switchmen, trackmen, porters and signalmen. The engine drivers and firemen are not in sympathy with the idea of a strike.

FAILURES OF STEEL TIRES.

The discussion of the paper on "Causes of Failures of Steel Tires*" by G. L. Norris, at the October meeting of the Western Railway Club, developed wide differences of opinion as to the cause of shelling out, the most common defect of steel tires. The author of the paper attributed most of the failures in service from shelling out to conditions over which the maker had no control, such as brake burns and bad mating of wheels on the same axle, causing eccentricity and pounding. Some of the members who took part in the discussion believed the trouble to be due to inherent defects of the steel for which the maker was responsible, basing this belief largely on the absence of any other explanation so far advanced which would cover all of the peculiar circumstances under which such failures usually occur. While Mr. Norris may be right in his contention that the maker is not responsible, the fact remains that tires are failing in service from this cause, and, as in many other details of railroad equipment, it devolves on the maker to produce tires which will not fail under the conditions as they exist. Heavy wheel loads must be used in building locomotives powerful enough to haul long trains at high speed, and powerful brakes must be used on the wheels to stop such trains. These may be conditions over which the tire maker has no control, but they are conditions which his product must be made to meet.

The careful methods of mechanical and heat treatment in use to-day have undoubtedly reduced to a minimum the inherent defects in the steel used for tires, but they cannot eliminate the inherent ductile properties of steel. The trouble from shelled out spots in steel tires can be explained in almost every case by going back to the inherent property of steel to stretch or flow under pressure. A steel tire on a locomotive in road service revolves in one direction probably 95 per cent. of the time. This long-continued rolling action causes the metal in the tire to gradually flow back around the wheel in the opposite direction to the normal direction of rotation, and the metal near the surface of the tire becomes more or less laminated. Eccentricity of wear due to weak centers or eccentricity of mounting on the axle produce hammer blows which intensify the rolling action and tend to break up the flowing metal into layers. When the brakes are applied the drag of the brake shoes tends to force the metal back to its normal condition, and if the applications are moderate and frequent, they may almost entirely counteract the rolling action. However, when the brakes are applied hard enough to lock the wheels and cause skidding, the small area of overlapping metal in contact with the rail is suddenly heated to a high temperature, and at the same time is torn partially or wholly away from the layer underneath, with the result that a piece shells out. The size of the shelled out spot will depend on the extent to which the lamination of the metal has progressed, the length of the skidding and the friction between the sliding

*This paper was reprinted in full in the *Railroad Gazette*, Oct. 25 and Nov. 1, pages 495 and 532.

wheel and the rail. Only slight differences in the relative ductility of two tires mounted on one axle, accompanied by a difference in brake shoe friction, will result in different degrees of flowing and lamination. It will also be seen that any difference in the wheel loads due to imperfect equalization or in the character of the surface of the two rails over which the wheels slide, would affect the force tending to tear away the laminated metal in the tire. This explains in most part the curious cases of shelled out wheels sometimes cited in defence of the theory of inherent defects in the steel in which only one wheel out of a set of eight will develop such spots.

Chilled cast-iron wheels under the same conditions develop cracks along the cleavage lines of the crystals of chilled iron, that is, at right angles to the surface of the tread. The intense heat generated by the skidding wheel breaks down the adhesion between the grains, and the drag of the rail opens up the cracks.

The tendency of truck and tender wheel tires to shell out quicker and more frequently than driving wheel tires can be explained by their smaller diameter and the fact that they skid more often. The area of contact between the wheel and rail is less with a small wheel than with a large wheel, and the intensity of unit pressure is correspondingly greater for the same loads. Truck wheels often carry loads as great as driving wheels carry. This increased unit pressure has more effect in producing a deeper rolling action and a pronounced flow of metal. For the same reason, when the wheel skids the adhesion is localized and tends to tear loose the laminated metal deeper down into the tire, thus producing larger shelled out pieces. Other causes which tend to intensify the rolling action are slight eccentricity in the tire and the pounding action of the wheels when running with a light load carried on stiff springs. It is also true that truck and tender wheels are often braked with a higher percentage of brake shoe pressure than driving wheels. As they are not coupled with other pairs of wheels and are frequently imperfectly equalized, local conditions of excessive brake shoe friction or instantaneous reduction of pressure on the rail may produce skidding.

If this theory is true, the remedy is obviously to use steel with a higher carbon content and having less ductility. But another cause of tire failures, heat cracks in the flange, is probably due to a lack of sufficient ductility. When a tire expands from the heating action of the brake shoe the flange stretches more than the tread, and if the ductility is low, small cracks appear at the point of the flange and gradually work in. What can be done to produce a steel of mean ductility to meet both of these conditions is a problem for the tire maker to solve. If it was possible to make a tire with a deeply case-hardened tread and annealed flange, the trouble from both causes might disappear. That the tire makers are bending every effort toward producing satisfactory tires is shown by the statement made during the discussion of the paper by Samuel M. Vauclain: "The question of cost has not the slightest influence on the quality of the material which goes into a tire. We are determined that if a better tire can be made and if these defects which are found in service can be eliminated, they will be eliminated." How different from the attitude of the rail makers!

COMPETITION AND CONFISCATION UNDER THE ANTI-TRUST LAW.

There have been a good many indications in the last few months that the crudely drawn and ill-defined portions of the Sherman Anti-Trust Law which make it impossible for any two or three gathered together in one place to know whether they are malefactors or not, might be the subject of revision by Congress this winter. We have always maintained that the language of the Sherman law was little short of ridiculous, and that it was so sweeping in its interdictions that only the courts knew what it meant, and then only in cases that had come before them.

The whole fabric of American railroad legislation rests on two principles which are all but irreconcilable with each other; first, that carriers serving the same or adjacent territory must compete with each other; second, that rates for like and contemporaneous service under substantially similar circumstances and conditions must be the same to all comers; that is to say, not competitive, and that one city or territory must not be built up at the expense of another (long-and-short haul clause), a process which is fundamentally and naturally the result of competition. The Act to Regulate Commerce prohibits pooling, and the Anti-Trust law apparently makes every kind of agreement between persons engaged in the same kind of business an act of conspiracy, so that Congress has thus strongly affirmed the competitive principle. Yet the 1906 revision of the Commerce act makes it specifically impossible for a carrier to change its rates without giving 30 days prior notice to the Interstate Commerce Commission, unless the commission exempts it by special action. This provision is, of course, along lines the reverse of competitive, since a 30-day-notice cut rate is not an effective competitive device. In a word, the railroads are told with blunt plainness that they must compete and are then immediately reminded that they must not.

The Sherman Anti-Trust Act of 1890 says definitely that every person who shall make a contract or engage in any combination in the form of a trust or otherwise, in restraint of trade or commerce, shall be guilty of misdemeanor and subject to severe penalties, which have been made cumulative by subsequent court decisions, and eminent corporation counsel have expressed the opinion that it is technically impossible for two grocers in the same block to walk down the street together and agree on the price at which they will sell eggs without rendering themselves liable to fine, imprisonment and three-fold damages payable to any other grocer whose business had been injured by the reduction in prices upon which they had agreed. Thus the doctrine of individual competition is upheld with tremendous vigor, while trade agreement or collective competition, is strongly repressed.

What unrestricted competition means in the transportation field need to be told no one who has in mind the history of the years when the trunk line territory was aroused by new comers, or of the period prior to the formation of the Southern Railway & Steamship Association, in the South. Albert Fink estimated that the rate wars of this period reduced gross earnings of the southern railroads about 42 per cent. below what regular rates would have allowed, a sum equal in many cases to the entire net earnings which could have been derived from the competitive business at the regular rates, and in 1876 a committee of stockholders of the Central Railroad & Banking Company of Georgia reported, "it is conceded that the property of your stockholders is on the brink of being sunk forever, and the bankruptcy of a number of your roads is imminent if not even now a fact." It is, of course, familiar history how the association stopped this era of frightful waste and how the rate committee of the association divided business between competitive points, established differentials betwen different towns and made classifications of freight. The roads were assigned a percentage which they could carry, similar to the coal agreements of recent years, and these percentages were determined with the greatest care and were at all times subject to revision under protest. To facilitate payments, a deposit of 20 per cent. of the receipts from pooled business was made by each road, and weekly and monthly balances were cleared with great precision.

The passage of the original Interstate Commerce Law of 1887 stopped the pooling feature of this agreement, the 20 per cent. payments, and the payment by one road to another of whatever excess that road may have earned above its due allotment, but reports of business and earnings were continued daily, and through rates were still very largely under the influence of the rate committee of the Southern Railway & Steamship Association, although each road tried to conform to the requirements and decisions of the newly formed Interstate Commerce Commission. The association thus maintained its usefulness as a guarantor of harmony and used its power to fine roads which attempted to make trouble. But even this was stopped by the passage of the Sherman act. The associations are now become only conferences, and destructive and long-drawn-out competition has been in the main prevented probably not so much by the strength of these conferences as by the fact that the roads of which they are formed realize that they have all to lose and nothing to gain by contests of this kind.

But a stronger reason than this for harmony has been the fact that the Sherman law, in its earlier days, was construed loosely. It was well known that the law was not aimed at railroads, and only the Roosevelt administration has sought to apply it to railroads with any real show of vigor; consequently, in the last period when railroad facilities really exceeded the demands upon them—for about 18 months, in 1897 and 1898—the railroads throughout the country did not have the same fear of maintaining rates by agreements that they have now, while since that time traffic everywhere has been so much in excess of facilities that it has not much mattered whether agreements were in effect or not. With the exception of a few sporadic struggles for grain traffic, and especially Gulf-bound grain traffic, it may be said that there has been no rate war of consequence since the passage of the Sherman act.

The extremely interesting question of the present day is, what

will be the effect of the government's heroic efforts to require competition between carriers if we are to go through a year or so of diminished business activity, and if the facilities of the carriers overtake and really pass by the traffic offered them. Are we then to maintain rates by that strangest of phenomena—an agreement entirely unenforceable,—are we to have the destructive competition of the sixties and the seventies, or are the peculiarly childish and uneconomic features of the Anti-Trust law that forbid combination to prevent wasteful competition, to be abolished?

It is well known that in the days of highly unrestricted competition the general public did not gain thereby. Henry S. Haines believes* that much of the present hostility towards corporations, and especially towards railroads, is the outgrowth of the rather barbarous efforts of lines suffering from unrestricted competition to recoup themselves from non-competitive territory, until the manner in which service should be performed in non-competitive regions became a political issue, while all through the latter part of the strongly competitive period (1870 to 1880) the railroads were busy making enemies and competing themselves into bankruptcy. Charles Francis Adams, Jr., in reviewing the history of railroad traffic in England, called attention 20 years ago to George Stephenson's remark that where combination is possible, competition is impossible, and pointed out that in the face of all the legislation designed to require competition in Great Britain the lines obstinately refused to compete. In 1872 a British Committee on Railroad Amalgamation was appointed including in its number two very able men, the Marquis of Salisbury and the Earl of Derby, and this committee showed with great precision how, in 40 years of railroading, English railroad legislation had never accomplished anything which it sought to bring about nor prevented anything which it sought to hinder, while the cost to the companies of the useless mass of legislative enactments (3,300 of them) was placed at £80,000,000. The conclusion of the committee at that time was that competition between railroads existed only to a limited extent and could not be maintained by legislation. The committee showed further that the North-Eastern Railway was composed of 37 independent companies, several of which had formerly competed with each other, and that prior to their consolidation these lines had, generally speaking, charged higher rates and been able to pay small dividends. But now (1872) the North-Eastern was the most complete monopoly in the United Kingdom. From the Tyne to the Humber it held the whole country to itself, and it charged the lowest rates and paid the highest dividends of all the great English combinations. It was not vexed by litigation, and while numerous complaints were heard from Lancashire and Yorkshire, where railroad competition existed, no one had appeared before the committee to prefer any complaints against the North-Eastern.

In view of such facts as these, the committee reported that amalgamation had not brought out the evils that had been anticipated, but, in any event, long and varied experience had fully demonstrated the fact that while Parliament might hinder and thwart, it could not prevent it, and it was equally powerless to lay down any general rules determining its limits or character.

This report is so excellent a document on the subject of legislative prevention of competition that we have quoted freely from Mr. Adams, who refers to it in his Railroad Problems (1886). It now remains to be seen whether this country has learned the lesson as well as England did or whether there must be more harsh and futile law making before we reach the state of legislative intelligence which England arrived at 35 years ago. As if to give special point and appropriateness to the urgency of a wiser law at this time, it is not yet a month since the Department of Justice, acting under section 6 of the Sherman law, directed the seizure of some $7,000 worth of tobacco in transit from factories of the British-American Tobacco Company Limited, located at Petersburg, Va., and at Durham, S. C., to New York and foreign countries, on the ground that the property was owned under a contract entered into by two American tobacco companies and three English concerns to limit competition. This is the first time that the seizure clause of the Sherman law has been employed. Its practical effect, of course, is to make the owners of the tobacco come into court and prove their own innocence, in reversal of the established common law principle; and its indirect effect is to make substantially every corporation within the length and breadth of the United States realize that it exists and does business only because it has not as yet been the whim of the government to attack it. We pointed out in reviewing the Northern Securities' decisions that the language used by the court would apply equally well to a very large number of other great railroad combinations in this country, and this was brought home so strongly to the government that it felt compelled to announce at that time that it did not intend to "run amuck." The tobacco seizure under the Sherman law only brings new force to the contention that the prosperity of the country and the stability of its great and law-abiding corporations, railroad and other, should be entrenched a long way beyond the powers of the government or of any officer of it to "run amuck."

*Railway Corporations as Public Servants.

Reading Company.

The Reading Company controls the operations of two principal subsidiaries, the Philadelphia & Reading Railway and the Philadelphia & Reading Coal & Iron Company. In addition it owns all the capital stock of the Reading Iron Company, but the operations of this company are not made public. Under the arrangement which is in force between the two subsidiaries, the Coal & Iron Company usually shows a deficit and the income of the Reading Company which goes to pay dividends on its stocks comes from the Railway company. The Reading Company's report includes a great deal of information about the different companies, but, on account of the bookkeeping involved in the relations between the three, and because considerable necessary information is not given, it is not easy to get a clear and complete view from it of the operation and standing of the railroad and coal companies.

The year's production of anthracite coal from lands owned, leased and controlled by the Coal & Iron Company, was 11,655,100 long tons, an increase of 996,000 tons, or 9 per cent. over the previous year. The company's coal sales increased 12 per cent. over the previous year. The cost of coal mined and purchased was 14½ cents less per ton than in 1906 and the price realized 3.1 cents a ton more, making an increase in the net amount received of 4.6 cents per ton. Receipts from the sale of anthracite were $4,500,000 larger than in 1906, and receipts from the sale of bituminous and from other sources $200,000 larger, so that there was an increase of $4,700,000 in the Coal & Iron Company's gross receipts. Its expenses, however, rose $4,400,000, so that the net earnings of the year were only $300,000 larger than in 1906. The principal increases in expenses were $1,800,000 in cost of mining and repairs (there were 900,000 more tons mined by the company) and $1,600,000 in cost of transportation by rail and water (there were 1,200,000 more tons sold). The net earnings were $3,500,000, from which $1,300,000 was appropriated for new work at collieries; $1,600,000 paid to the Reading Company as interest at 2 per cent. on money advanced, and $500,000, being 5 cents a ton on coal mined from the company's lands during the year, put in the Depletion of Lands fund. In addition there were fixed charges and taxes amounting to $115,000, leaving a final deficit for the year of $71,000.

The Philadelphia & Reading Railway, on the other hand, had a net income of $7,900,000 for the year. Out of this, $1,800,000 was appropriated for improvements and $6,000,000 paid in dividends to the Reading Company, leaving a small surplus. The increase in gross earnings was just under $3,000,000. Operating expenses however, increased $3,800,000, leaving net earnings smaller than in the previous year. Both because of this increase in net earnings and because there was a special call for funds in the 1906 year to complete unusually extensive work which had been in progress for some time, the improvement appropriation was $1,700,000 less than in 1906. No new work of any importance was undertaken last year, so that the improvement expenditures could be reduced. The principal item of the $1,800,000 spent for improvements was $990,000 for main, second, third, fourth, yard and station tracks.

Earnings from coal and from merchandise traffic both increased, the former by $1,500,000, the latter by $1,100,000. The anthracite tonnage carried was 13,200,000 tons, an increase of 1,400,000 tons, or 12 per cent. over 1906. The bituminous tonnage was 11,200,000 tons, a gain of 700,000 tons, or 7 per cent.. The revenue from coal traffic increased 9 per cent. The merchandise traffic increased 9 per cent. and the merchandise earnings 7 per cent. There was an increase of 3 per cent. in the passenger earnings.

Operating expenses were 17 per cent. larger than in 1906. Maintenance of way increased 13 per cent., maintenance of equipment 26 per cent. and conducting transportation 14 per cent. A statement that these increases were in general due to "the increased volume of business handled, the increase of wages and the higher price of materials" sums up succinctly the increased costs which most railroad companies have been facing during the year.

Maintenance of way cost $3,610 per mile owned and leased, against $3,195 in 1906. Repairs and renewals cost $3,245 per locomotive, against $2,228 in 1906, a very large increase, due apparently to specially large expenditures necessary to keep the locomotives owned under equipment trusts at their original value and efficiency as provided in the leases. The passenger car figure was $591, against $610 in 1906, and the freight car, $73, against $62 in 1906.

The report records that on November 1, 1906, one-way passenger fares were reduced to 2½ cents a mile over the whole system with-

out disturbing commutation or excursion rates. On May 25, 1907, fares in the suburban district of Philadelphia were advanced to make them correspond with rates in force on other parts of the system. On November 1, 1906, there was also an increase of 10 per cent made in the wages of all employees receiving less than $200 a month. An increase in the same proportion had been made in November, 1902.

The Reading's tidewater terminal is at Port Richmond, near Philadelphia. Tables are given showing the outbound ocean business to foreign and domestic ports during the past six years and also the shipments from Port Richmond to rail points, mostly on the line of the Philadelphia & Reading. The merchandise shipments last year outbound were 1,130,000 short tons, the anthracite coal shipments 1,900,000 long tons and the bituminous coal shipments 1,800,000 long tons, this last an increase from 1,400,000 tons in 1906. The rail shipments from Port Richmond have increased from 850,000 short tons of merchandise and iron ore in 1905 to 1,400,000 tons last year.

No table of commodity tonnage figures is given, so that it is impossible to form an accurate idea of the extent and character of the road's traffic. The ton-mile rate for coal traffic is not given, but works out at 0.691 cents. The rate on merchandise was 0.946 cents. The passenger-rate reduction seems to have affected the passenger-mile rate only slightly. The decrease is less than 1 per cent.

The only information published about the Reading Iron Company is a few facts about its balance sheet. The assets stand at $13,400,000, an increase of $1,000,000 during the year. The capital stock remains at $1,000,000, all owned by the Reading Company, and the outstanding mortgage bonds have been reduced during the year; at the same time current liabilities, accrued interest and dividends are less. It is evident that there is a profitable equity.

The accompanying map shows the Reading Company's system, including the Central Railroad of New Jersey, whose report is reviewed below, and the Lehigh & Hudson River, which gives the system an outlet to the Campbell Hall gateway and thence by the New Haven system over the Poughkeepsie Bridge to New England.

The results of the last two years' operation of the Philadelphia & Reading Railway are summed up in the following table:

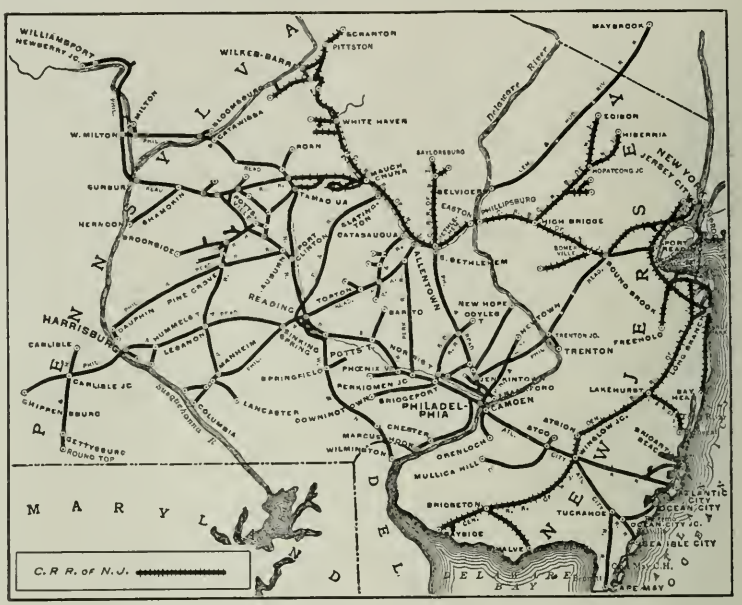
	1907.	1906.
Mileage worked	999	1,000
Passenger earnings	$6,399,173	$6,216,316
Mdse. freight earnings	16,360,170	15,220,441
Coal freight earnings	18,730,190	17,198,247
Gross earnings	42,676,278	39,658,041
Maint. way and structures	3,606,192	3,195,152
Maint. of equipment	7,971,544	6,330,882
Conducting transportation	13,564,854	11,896,376
Operating expenses	25,889,331	22,137,172
Net earnings	16,786,947	17,520,869
Net income	7,892,359	8,923,824
Dividends	6,000,000	6,000,000
Improvement appropriations	1,847,934	3,539,352
Year's surplus	44,425	615,528*

*Deficit.

Central Railroad of New Jersey.

The Central Railroad of New Jersey is a splendid railroad, but its annual reports are among the most unsatisfactory of any issued. They are exceedingly incomplete and also are not clear in all of the facts which they do give. For instance, the operations are divided into two groups, "rail lines" and "other operations including New York & Long Branch Railroad." The first group includes the bulk of the operations, but the second is by no means unimportant, for it adds nearly $3,000,000 to gross earnings. Yet the operating expenses of the whole property are lumped in one figure. For the rail lines to be sure, the four operating expense accounts are given separately, but even these do not go into details. Owing to these and many other lacks, it is difficult to review the operations of the road with any accuracy. The best that can be done is to give certain results; some of them stated in the report; some a matter of opinion.

In spite of the fact that only a nominal surplus for the year is shown, it is certain both from the few figures given in the report and from acquaintance with the property that the road is unusually strong both financially and physically. On the "rail lines" there was spent, as nearly as one can tell when no figures of mileage operated are given, $2,961 per mile for maintenance of way. In 1906 this expense was $2,683. Besides this on the whole property $2,362,062 was charged against income for renewals and improvements made or to be made, making a total charge against income for maintenance of way of at least $4,280,680, or $6,606 per mile of line. It is a prosperous railroad which can spend anything like this sum, when most roads get along with from $1,000 to $2,000 a mile. Of course the fact that the Central of New Jersey has 263 miles of second and 71 miles of third and fourth tracks—these figures gleaned from the Reading Company's report—must be taken into consideration, but, even so, the expenditures on the line are very high. For lack of the detailed figures of repairs and renewals, it is not possible to work out the unit figures for equipment maintenance. However, including $1,150,000 appropriated out of income to the equipment fund, the maintenance of equipment expenditures were enough to provide $3,000 per locomotive, $800 per passenger car and $93 per freight car. These also are high figures. It is evident, therefore, that during the past year the road has been lavishly maintained. And not only last year but for years before has this general policy been followed out.



Reading Company's System.

Gross earnings, including all operations, were $25,700,000 against $23,100,000 in 1906, a gain of $2,600,000, or 12 per cent. Operating expenses increased $1,400,000, leaving a gain of $1,200,000 in net earnings. Freight earnings were $19,400,000, a gain of 12 per cent. over 1906, and passenger earnings $5,500,000, an increase of 9 per cent. The revenue trainload was 520 tons, about the same as in 1906.

There were 81 miles of track relaid with 90-lb. rails during the year and 61 miles relaid with second-hand rails, chiefly of 70, 80 and 85-lb. section. The improvement of the ferry facilities at the foot of Liberty street, New York, is well under way. Up to July 1 there had been $172,565 thus spent. In August the Newark Warehouse Company, a subsidiary corporation, opened a large new freight warehouse at Newark, N. J., which was described in the *Railroad Gazette* of August 30, 1907.

One four-wheel switching locomotive, 15 unvestibuled passenger cars, five combination cars, 50 special ore cars, 2,000 steel underframe box cars, 1,000 steel hopper bottom coal cars and 1,000 steel underframe gondola cars were bought during the year. Another 1,000 steel hopper bottom coal cars, these of 100,000 lbs. capacity, and 20 passenger train cars have been ordered for delivery during the present fiscal year.

As the New York passenger entrance of the Philadelphia & Reading and the Baltimore & Ohio, the Central of New Jersey has been brought to a high standard of efficiency. It has the unusual distinction of being popular with its commuting patrons. This is all the more remarkable because their loud praises of its service have followed a period of the bitterest complaint against the suburban working of the road. There could probably be no more sincere tribute to the success of its present managing head. It would be more in accord with the high standard of the road to issue an annual report which really described the operations of the year and the condition of the property.

The mileage of the road is shown in the map of the Reading

Company's system above. The results of the last two years compare as follows:

	1907	1906
Mileage worked	618*	618*
Passenger earnings	[illegible]	[illegible]
Merchandise freight earnings	[illegible]	[illegible]
Coal freight earnings	[illegible]	[illegible]
Gross earnings	[illegible]	[illegible]
Maint. of way and struct.	[illegible]	[illegible]
Maint. of equipment	[illegible]	[illegible]
Conducting transportation	[illegible]	[illegible]
Operating expenses	14,161,118	12,779,867
Net earnings	[illegible]	10,321,223
Income from investments	[illegible]	1,151,197
Fixed charges	[illegible]	[illegible]
Net income	[illegible]	[illegible]
Improvement appropriations	[illegible]	[illegible]
Year's surplus	[illegible]	91,482

*Not including New York & Long Branch Railroad, which is controlled by the Central of New Jersey and the Pennsylvania jointly, and some other operations.

Missouri Pacific.

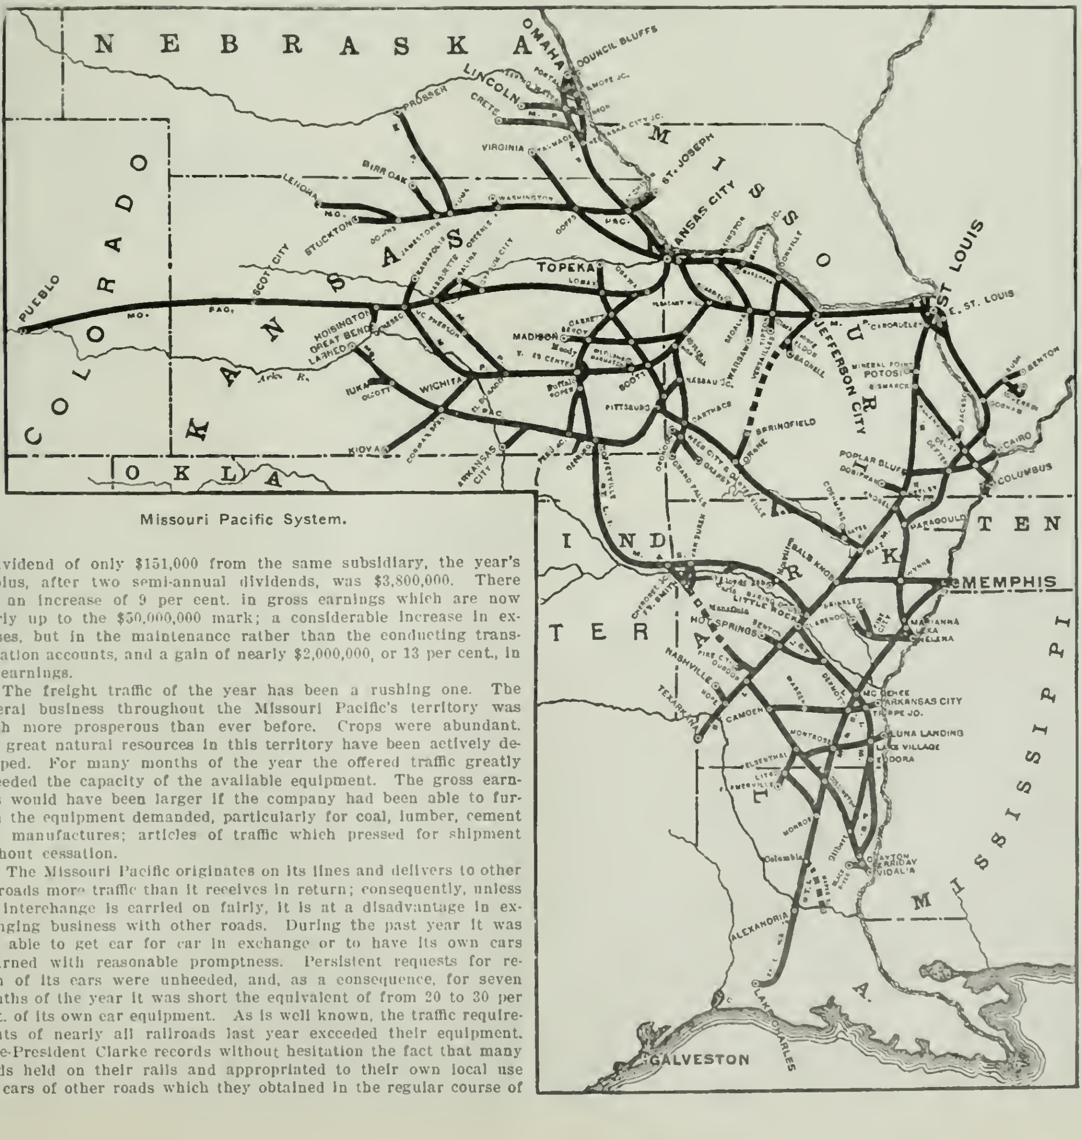
The Missouri Pacific has had a very prosperous year. In 1906, even after calling on its subsidiary, the Central Branch Railway, for over $1,000,000 in dividends, it showed a surplus for the year of less than $500,000. This, however, was largely due to the fact that owing to a change in the fiscal period three semi-annual dividends were charged to the year's income. If only two had been so charged, the 1906 surplus would have stood at nearly $2,500,000. Last year, with a dividend of only $151,000 from the same subsidiary, the year's surplus, after two semi-annual dividends, was $3,800,000. There was an increase of 9 per cent. in gross earnings which are now nearly up to the $30,000,000 mark; a considerable increase in expenses, but in the maintenance rather than the conducting transportation accounts, and a gain of nearly $2,000,000, or 13 per cent., in net earnings.

The freight traffic of the year has been a rushing one. The general business throughout the Missouri Pacific's territory was much more prosperous than ever before. Crops were abundant. The great natural resources in this territory have been actively developed. For many months of the year the offered traffic greatly exceeded the capacity of the available equipment. The gross earnings would have been larger if the company had been able to furnish the equipment demanded, particularly for coal, lumber, cement and manufactures; articles of traffic which pressed for shipment without cessation.

The Missouri Pacific originates on its lines and delivers to other railroads more traffic than it receives in return; consequently, unless car interchange is carried on fairly, it is at a disadvantage in exchanging business with other roads. During the past year it was not able to get car for car in exchange or to have its own cars returned with reasonable promptness. Persistent requests for return of its cars were unheeded, and, as a consequence, for seven months of the year it was short the equivalent of from 20 to 30 per cent. of its own car equipment. As is well known, the traffic requirements of nearly all railroads last year exceeded their equipment. Vice-President Clarke records without hesitation the fact that many roads held on their rails and appropriated to their own local use the cars of other roads which they obtained in the regular course of business as [illegible] from which the Missouri Pacific seems to have been one of the worst sufferers. He hopes, however, that the per diem charge of [illegible] a day per car and other [illegible] taken will prevent a repetition of this abuse.

Attention is called to the fact that the Missouri Pacific should no longer be considered as depending on the products of the farm. It is true that at least [illegible] per cent. of its lines run through the prairie country, but with last year's crops increasing on the [illegible] and a full measure of traffic derived from these agricultural and animal products contributed only [illegible] per cent. of the total freight revenue, while products of mines, forests and manufactures furnished [illegible] per cent. There were established on the lines during the year [illegible] new industries, employing nearly $[illegible] of capital. These include 166 lumber plants, 14 coal mines, 19 lead and zinc mines and 43 cement, brick, stone and other plants for manufacturing building material. Cement in particular is an important and growing article of traffic. The whole country's consumption in 1906 was 45,600,000 barrels, against only one-tenth as much ten years earlier. It is not possible to tell how much of this product the Missouri Pacific carries, but it is evident that it is one of its valuable assets from a traffic standpoint.

The passenger revenue was reduced during the last four months of the fiscal year by legislative rate reductions. Two-cent fare laws took effect in Nebraska in March; in Arkansas in April; in Kansas in May, and in Missouri in June, besides in Illinois later. The number of passengers increased 21 per cent., the number of passengers



Missouri Pacific System.

carried one mile, 9 per cent. and the passenger earnings, 11 per cent. As the increase in passenger earnings is greater than the increase in passenger miles, it would hardly seem that the result of the lower rates had been severely felt. The report, however, makes the comparison between the passenger earnings and the number of passengers, which increased nearly twice as fast, and implies that this came as a result of the rate reductions. In spite of a large movement of home-seekers to the Southwest, there was a reduction of 10 per cent. in the length of the average passenger trip, which now stands at 46 miles.

Operating expenses as a whole increased 7 per cent. The increase in maintenance of way and structures was 10 per cent., in maintenance of equipment 21 per cent. and in conducting transportation 3 per cent. The small increase in this last group of expenses is notable. In December last a concerted movement of the various organizations in the train service was made for a decrease in hours and an increase in wages. After a protracted conference at Chicago between representatives of the railroads of the West and Southwest and of these various labor organizations, during which both the Chairman of the Interstate Commerce Commission and the Commissioner of Labor intervened to bring about a settlement, a general wage increase of about 10 per cent. was made, taking effect in February and in April. An increase in the wages of yardmen on the Missouri Pacific had been made in November. As a result of these various increases, the wage payments to employees of the transportation department have been increased by about $625,000 a year. About one-third of this expense only, however, fell on the expenses of the year ended June 30, 1907.

The maintenance of way expenditures per mile operated were $926, against $857 in 1906. This figure has of late years shown a steady increase and is now high enough so that it should be about sufficient for maintaining the lines. Whether it provides anything to make up for the smaller expenditures of previous years is not so certain. Part of the larger unit charge represents merely increased cost of material or labor rather than any additional improvement of the lines. The cost of ties, for example, has increased 22 per cent. during the year. The wages of section hands were increased about 20 per cent. during the latter half of the year. As a further fact in this connection, it should be remembered that about half of the Missouri Pacific's track is still unballasted.

The great increase in expenses during the year came in maintenance of equipment. This was partly due to an average increase of 9 per cent. in the wages of employees of the machinery department in force from six to seven months of the year, and partly to a large advance in the cost of materials for repairs. Repairs cost $3,008 per locomotive, against $2,840 in 1906; $746 per freight car, against $625 in 1906, and $68 per passenger car, against $51 in 1906.

The operated mileage was increased by 135 miles, all on the St. Louis, Iron Mountain & Southern's lines. Of this, 34 miles on the Springfield (Mo.) branch was opened April 20, 1907, and 37 miles of the branch from Eudora, Ark., south to Gilbert, La., was opened June 1, 1907. The rest of the increase was made up of new trackage rights over the St. Louis Southwestern from Dexter, Mo., to Paragould, Ark. The Eudora-Gilbert branch, when completed, is to be part of the Gould low-grade line from St. Louis to New Orleans.

President Gould sums up the rate reductions of the year and the general railroad financial situation as follows:

> While the passenger business of the year shows an increase of $942,923, the marked general prosperity in the territory traversed by your lines of railroad would have contributed a larger increase to the revenue from passenger traffic had it not been for the 2 cent a mile passenger legislation, enacted early this year, by the states of Illinois, Missouri, Arkansas, Kansas, and Nebraska. This low rate by its application to state business, affects the interstate business as well, and its effects are far reaching. With the limited volume of local travel in those states, a 2 cent rate is not deemed compensatory for the service rendered.
>
> Adverse legislation affecting train and station operations in Arkansas, Missouri and Kansas, coupled with the general advance in wages of employees and the increased cost of materials and supplies, tends to enlarge cost of operation. Freight rates on certain commodities were reduced in Arkansas, Missouri, Kansas and Nebraska by legislative act and orders of state railroad commissioners, which will have the effect of limiting net revenues. Litigation is now pending in the courts to test the validity of these enactments and orders.
>
> Railroads cannot meet the requirements of the public so long as the adverse wave of sentiment now prevalent throughout the land is directed against them and given concrete expression in the form of drastic laws, which increase their expenses, reduce their revenues and render them incapable of improving their service and enlarging their facilities. It is essential to the industrial progress of the country that the transportation facilities shall not only be maintained, but improved and enlarged. To accomplish this, the railroads must receive remunerative returns for the services rendered. In this way only can they maintain their credit and that degree of confidence in the financial world that will enable them to command capital for additional facilities to meet the increasing requirements of the great business development now taking place throughout the country. Time will surely show that it is only through fair and reasonable treatment by the state, that the railroad will be enabled to best subserve the public interest.

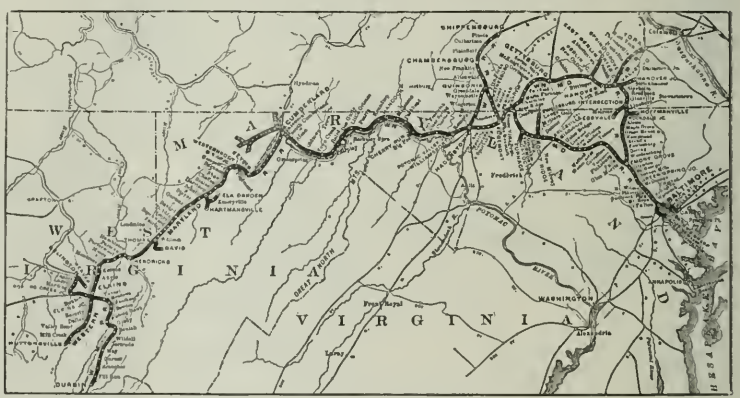
The following table gives the results of operation of the Missouri Pacific, St. Louis, Iron Mountain & Southern and Central Branch for the last two fiscal years:

	1907.	1906.
Mileage worked	6,375	6,276
Passenger earnings	$9,696,064	$8,753,141
Freight earnings	35,500,580	32,563,507
Gross earnings	48,703,343	44,566,821
Maint. way and structures	5,906,121	5,378,125
Maint. of equipment	6,998,863	5,781,532
Conducting transportation	17,595,101	17,141,984
Operating expenses	32,515,070	30,282,405
Net earnings	16,188,272	14,284,416
Dividend from Cent. Branch Ry	1,061,900	151,700
Net income	7,698,103	6,329,015
Year's surplus	3,807,228	2,438,140*

*The actual reported surplus was $492,740, because a third semi-annual dividend of 2½ per cent., amounting to $1,945,430, was charged to the 1906 income. This was on account of a change in the fiscal year.

Western Maryland.

The first full year of operation of the united lines of this road ended June 30, 1907. During this whole year the connection between the original Western Maryland and the West Virginia Central & Pittsburgh was in operation. The filling in of this gap between Big Pool on the east and Cumberland on the west was of vital importance to the success of the Western Maryland, for the lines



Western Maryland.

west of Cumberland originate large quantities of coal, which find a ready tidewater market at Baltimore. Before the connection was built this traffic had to be sent from one road to the other over the Baltimore & Ohio at large expense. The connecting line, which had to make many crossings of the Potomac river in mountainous country, was costly. It has many tunnels and a large amount of cutting and filling was necessary. On one part of the line whole hillsides were blown out and across the river at one blast to make a place for the grade. Yet in spite of the difficult nature of the country the road was built for economical operation. The connection is 59 miles long, of which 37 miles are tangent, and has maximum gradients of 26.4 feet to the mile westbound, and 15.8 ft. eastbound, which is the important direction of traffic, with a maximum curvature of 6 degrees. It has been in operation for both passenger and freight since June 17, 1906, so that the present report of the Western Maryland covers almost exactly the first full year of its operation.

This new line was financed by a first mortgage bond issue of the expanded Western Maryland. During the past year the fixed charges resulting from the large capital expenditures for this and other improvements were in full operation, while the advantages of these improvements were only beginning to show. In the first half of the fiscal year the net earnings did not keep pace with the rapid increase of fixed charges, though they did overtake these charges in the latter part of the year. As a result, the net income was only $11,000, against $252,000 in the previous year. During the first quarter of the present fiscal year, however, there has been no further advance in fixed charges, while earnings have continued to grow, so that for the three months ended September 30, 1907, the estimated net income over the proportion of fixed charges applicable to that quarter was $82,000.

There was an increase of 17 per cent. in gross earnings, though the increase in gross per mile was only 8 per cent. Net earnings, however, increased only 10 per cent., and per mile, 4 per cent. This

relatively smaller increase in net is a result of a number of different causes, particularly the increased costs and traffic congestion resulting both from difficult weather conditions and from the disturbances and interruptions caused by the various physical improvements which were under way in the first half of the fiscal year. At the beginning of the year these disadvantages were particularly strong because of the company's inability to secure free interchange of equipment with connecting lines. By the close of the year, however, most of the construction work was finished and there was in general a marked improvement in these operating features.

As the plan of the Gould interests to connect the Western Maryland with the Wabash-Pittsburgh Terminal or the Wheeling & Lake Erie, so as to make it the eastern end and Atlantic tidewater outlet of the various Gould railroads throughout the country, appears to be for the time being in abeyance, the Western Maryland must for the present be considered purely on its own merits as a local road. As such, its prosperity depends largely on coal traffic. Last year, with the two parts of the system united, there was a much larger volume of coal and coke tonnage. The total handled at the Port Covington (Baltimore) piers was just under 500,000 tons. During the present year there are to be, based on existing contracts, 900,000 tons thus shipped. The total bituminous coal tonnage carried was 2,941,847 tons, against 1,681,171 tons in 1906. Coal and coke together contributed 58 per cent. of the total tonnage, as against 47 per cent. last year; and 41 per cent. of the 1907 gross earnings. The company is now securing a longer haul on its coal traffic, fuller use of its large terminal facilities, and more active and profitable movement of its equipment. The number of miles run daily by the average system car on the home road increased from 15 to 19 miles, or 27 per cent., during the year. Between June 30, 1907, and October 16, 1907, there was a further increase of 3 miles. This makes an increase of 47 per cent. in car movement during the 15 months. The train load, which is not given in the report, was 371 tons, against 354 tons in 1906. Owing in particular to the increased coal traffic, total freight earnings increased 22 per cent.

There was a total of $4,691,957 of capital expenditure during the year. Of this amount $1,400,000 was for main line improvements, $1,300,000 for new equipment, and $214,000 for the coal department. Under the first item $556,000 was spent in double-tracking between Baltimore and Emory Grove. The main line between Big Pool and North Williamsport, 13 miles, which adjoins the Cumberland extension on the east, has been revised. There have also been considerable improvements on the Gettysburg line, which has lower eastbound grades than the main line via Rocky Ridge, and over which most of the tidewater coal is to be handled. When the double-tracking from Emory Grove to Baltimore is finished there will be what amounts to a double track from Baltimore to the junction of the Gettysburg and the main lines at Highfield.

The average weight of rail in main and second track (34 miles of the latter) was 78.4 lbs. to the yard on June 30, 1907, against 76.8 lbs. to the yard a year earlier. The average weight of rail on the main line from Baltimore, Md., to Elkins, W. Va., is 87 lbs. to the yard. Of the 574 miles of main and second track, 403 have stone ballast. Maintenance of way and structures cost $1,027 per mile, against $1,028 in 1906.

During the year the George's Creek & Cumberland Railroad was bought at a cost of $1,816,307. This is a self-supporting local road, 33 miles long, from Cumberland north to the Pennsylvania state line and southwest through the George's Creek coal region. It is valuable to the Western Maryland both because it contributes a large and profitable traffic, because its terminal facilities supplement the Western Maryland's, and furthermore, and this, perhaps, the deciding reason for its purchase, because it affords the only available outlet through the Cumberland Narrows for the shortest connection of the Western Maryland with Pittsburgh and the West.

The following table summarizes the results:

	1907	1906
Mileage worked	543	543
Passenger earnings	[illegible]	$876,426
Freight earnings	[illegible]	[illegible]
Gross earnings	[illegible]	[illegible]
Maint. way and structures	[illegible]	497,478
Maint. of equipment	[illegible]	[illegible]
Conducting transportation	[illegible]	1,761,023
Operating expenses	[illegible]	[illegible]
Net earnings	2,019,127	[illegible]
Net income	[illegible]	[illegible]

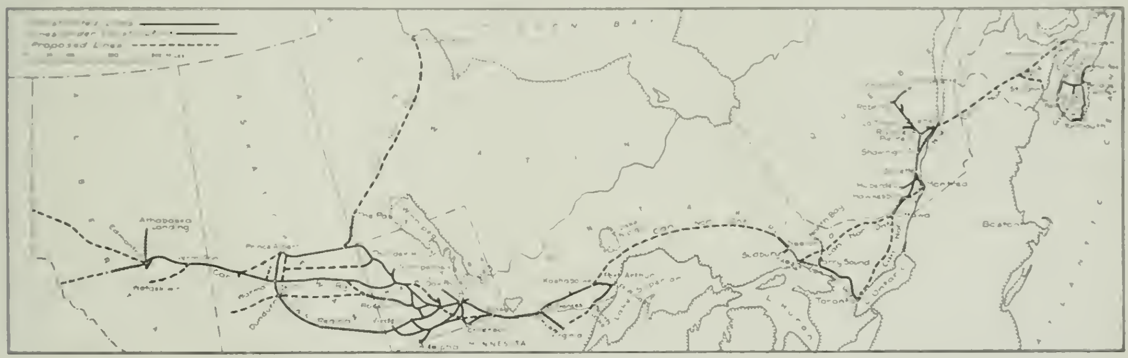
Canadian Northern.

The Canadian Northern is still rapidly expanding. In spite of a winter which, according to the report, was the severest ever known in western Canada, the road has progressed during the last year not only in mileage and in earnings, but in net earnings per mile. Gross earnings per mile of road were $3,328, a gain of 16 per cent. over the previous year, while operating expenses per mile rose 21 per cent., leaving net earnings of $1,166 per mile, an increase of 8 per cent over the previous year. The year's record is specially interesting, first, because it shows growth in every feature and second, because the circumstances of the year's operation are fully and interestingly discussed in the report.

From the last of November, 1906, to the first of April, 1907, the operating department had to devote itself to keeping the lines open. During this period, therefore, the traffic did not earn expenses. There was continuous low temperature with deep snow, and, on the whole, an extraordinary winter. President Mackenzie says that while the extremely rapid development of the road and the unexampled growth of traffic have made necessary the addition of new equipment as fast as possible, the delays of last winter were primarily due to weather conditions and not to equipment shortage. He also feels that the fertility of the soil of the Canadian Northwest and the character of the climate have been put to an extreme test, and the company having come through successfully, the future can be regarded with every confidence. But the road is in need of much. In Manitoba, Saskatchewan and Alberta much equipment of all kinds and other means for handling business faster must be provided. New lines are under construction to meet the demands of farmers who are already producing quantities of grain which will soon be ready for shipment. Other lines are planned not only to serve new localities, but as feeders to protect the enormous revenue-producing areas opened up by the Canadian Northern. The development of new districts during the past year has required considerable expenditures on structural and mechanical improvements. Roadbed has been ballasted, many new stations have been built, new sidings laid, engine houses at division points improved, coal handling plants installed and water stations increased and enlarged. Besides erection of freight sheds in many towns, there have been new freight accommodations built at Port Arthur in particular; stock yards have been built at various points. That much remains to be done, however, is shown by the maintenance of way expenditure per mile of road, which was $490, against $391 in 1906 and $351 in 1905. These sums are much too small even in prairie country to keep a road in good condition.

Over $3,000,000 has been collected and $4,871,000 more is due from lands sold. Against this there are $2,000,000 land grant bonds outstanding. The company also controls the Canadian Northern Prairie Lands Company, an investment which shows a profit. There are still 1,828,251 acres of land unsold. In regard to immigration from the United States, President Mackenzie speaks thus frankly:

"While it is especially gratifying to your directors that the



Canadian Northern System.

company's lands have proved so attractive to settlers from the Middle and Western States, because they are thoroughly experienced in prairie farming, and, besides, being good judges of land, bring it rapidly into cultivation and thus create traffic for the railroad, it is more desirable than ever to encourage the immigration of families of good British stock. The Dominion government is doing admirable work in this direction, and a large proportion of the arrivals of recent years are settled near your railroad."

Special attention is called to the increased value of the road's terminals at important points in the Canadian Northwest. There has been a general land boom in that territory, but terminal property is least likely to suffer from a reaction.

The new iron ore traffic from the Atikokan (Ontario) mines to Port Arthur, referred to in the report of a year ago, has begun. The new blast furnaces at Port Arthur have since July been producing good grade pig iron. It is understood that the output of these furnaces is to be doubled, with the idea of establishing steel works at Port Arthur and supplying the western market from that point. The iron ranges tapped by the main line west of Port Arthur lie north of and are similar to those in the northern part of Minnesota, which have proved so rich in both quality and extent, and it is believed that the movement of ore from the Atikokan and Mattawin ranges will ultimately be a source of great profit.

Port Arthur and Fort William, the ports on Lake Superior, are still expanding, and new industries have been established there. The Canadian Northern coal docks at these points are capable of handling 600,000 tons a season, and so expeditiously as to effect a considerable saving in the cost of water-borne fuel for which the demand in the western provinces is increasing enormously year by year. Direct water connection was established during the year between these ports and Parry sound on Georgian bay, whence a line of the Canadian Northern Ontario runs south to Toronto. This has already begun to carry a large amount of profitable traffic to and from the West. Thus, in addition to the agricultural possibilities on which the road has heretofore had almost its whole dependence, other traffic is springing up and through routes are being developed.

With an increase of 22 per cent. in the average mileage operated, passenger earnings increased 45 per cent. and freight earnings 32 per cent. The principal increases in freight traffic were in flour, grain, logs and lumber, and immigrants' effects. This last item increased from 2,614 cars in 1906 to 4,647 cars in 1907, a gain of over 75 per cent., which vividly suggests the rapid settling of the Canadian Northern's territory. The traffic in both live stock and in firewood fell off sharply.

There were 190 locomotives on June 30, 1907, as compared with 141 a year earlier. In the same period the sleeping and dining cars increased from 18 to 29, passenger cars from 77 to 108, other passenger train cars from 35 to 48, cabooses from 69 to 97, work cars from 83 to 123 and freight cars from 5,437 to 6,868.

The principal extensions during the year were in Manitoba and Alberta. An important addition to the system in the East was the Quebec & Lake St. John, which added a valuable piece of railroad to the Canadian Northern Quebec, for which it previously furnished a Quebec entrance. As shown by the map, however, a cut off is proposed which will considerably shorten the route from Montreal to Quebec.

The following table summarizes the results of the last two years' operations. It shows the rapid growth of the road:

	1907.	1906.
Mileage worked	2,509	2,064
Mileage June 30	2,639	2,482
Passenger earnings	$1,464,256	$1,062,639
Freight earnings	5,741,729	4,335,933
Mail earnings	58,231	23,172
Express earnings	85,124	53,941
Miscellaneous earnings	1,000,858	428,070
Gross earnings	8,350,198	5,903,756
Maint. way and structures	1,228,957	807,692
Maint. of equipment	852,800	585,602
Conducting transportation	3,097,495	2,072,057
General expenses	241,912	209,382
Operating expenses	5,421,164	3,674,733
Net earnings	2,926,034	2,229,023
Net income	1,913,545	719,574

NEW PUBLICATIONS.

Railway Corporations as Public Servants. By Henry S. Haines, M. Am. Soc. C. E., M. Am. Soc. M. E., ex President of the American Railway Association. The Macmillan Co., New York. 1907. 233 pages; 5x7¾ in., cloth. $1.50.

This work contains the substance of a course of lectures delivered in May, 1907, at the Boston University of Law, and to a certain extent supplements the author's previous book on Restrictive Railway Legislation. Mr. Haines expresses his aim as an effort to better the existing relations between railroad corporations and the public whom they serve, and the book at hand is well adapted to this purpose. Dealing first with the nature of public service, then with the public service done by railroads, and by the public benefits which they confer, he follows the line of gradual evolution, and shows the commercial needs that required railroad transportation and the way in which these needs were met.

After the period of early necessity came the period of the promoter and of needy and bankrupt companies, with reorganizations and a general tightening of charter privileges. Then followed the years of unrestricted competition, with discrimination between communities accompanied by a further discrimination between individuals, heightening public indignation in the non-competitive regions, and making new enemies in the competitive regions of shippers who were suffering from this secret discrimination. Meantime, net revenues were being depleted, and by the beginning of the decade of 1880, over one-fourth of the country's railroad mileage was in receivers' hands.

Mr. Haines describes the decade of 1880-1890 as the renaissance of the railroad system in the United States; a period of dissolution followed by reorganization and rebuilding. But railroad managers had now learned the cost of free competition, and began to protect themselves by consolidation. This consolidation and its results, together with a mingling, in legislative enactments, of the results of all the woes and griefs, real and fancied, which shippers had derived from conditions past and present, constitutes the basis of the present situation. Mr. Haines discusses in detail the aims and motives of the original Act to Regulate Commerce and of subsequent additions, including the crude and hasty Sherman Act, and shows clearly some of the evil conditions which this legislation, together with the Elkins Act and the revised commerce Act of 1906, was aimed to remedy.

The latter part of the book deals with the complex questions of present-day inequalities in law and in service; of "reasonable" rates, the effect of ineffectual control, and the standards of railroad service. In these chapters Mr. Haines has handled a matter of much difficulty with clearness and in a conservative and fair spirit, and his book deserves recognition as an excellent picture of conditions old and new, with helpful suggestions for the future. His suggestion that the Interstate Commerce Commission should cooperate with the American Railway Association and draw upon the full store of technical knowledge in the possession of that body, strikes us as excellent.

CONTRIBUTIONS

Firing Stationary Boilers.

Norfolk, Va., Oct. 24, 1907.

To the Editor of the Railroad Gazette:

"There is vastly more difference between a good fireman and a bad fireman than between a mechanical stoker and a good fireman."

"Economy of boiler management is dependent upon the skilful handling of the fuel. The fireman can save more to the plant than anyone else."

"Improper firing is probably the most common cause of the poor economy of boilers. For every ton of coal burned we throw away nearly 7½ tons, losing 88 per cent."

These conclusions have been reached by three of the best-known authorities on steam engineering in the country, Professors Thurston, Hollis and Kent, and it is probable that no one will dispute their truth and accuracy. Is it not time for us to give more attention and thought to improving the work of the fireman?

The technical papers and magazines are very much exercised at present over the great waste of our coal supplies. The President has taken a hand in the matter and the United States Geological Survey people are crying out over it. Even the daily papers are printing interviews on the subject. But in all the articles that have appeared on the subject, both in the technical and daily press and in the Geological Survey papers, very little, if anything, has been said about the question of improving the work of the firemen.

Improvements are made and suggested in boilers and combustion methods and appliances, etc., but apparently no thought is given to the man who has the most to do with making such improvements successful. A poor, careless or ignorant workman will never do a good job even with the best tools.

Most people seem to think that anyone with enough physical strength will answer as a fireman, that it is just ordinary manual labor and requires no special skill or aptitude or intelligence. Now the writer believes, knows that the first-class, skilful fireman, like a true poet or musician, is born and cannot be made. There is just as much difference between the best fireman and the average one as there is between Robert Browning and the average rhymemaker, or between Beethoven and the modern comic opera composers.

We have often seen men who have been firemen for eight or ten years that did not know the first principles of proper firing, and, working alongside of them, others who had been firing only a few months, doing much better work and burning less coal.

It is of great importance to us, as a nation, that prompt and

efficient steps be taken to bring up the average of efficiency of the men who burn our coal. The immense increase in the amount of coal used by the country during the last few years has called the attention of our technical men to the absolute necessity for taking effective and immediate steps to get a greater amount of work out of a pound of coal.

Up to so far these efforts have been mainly altogether in the direction of improving the appliances for burning coal and utilizing the heat into effective work.

Along these lines the United States Geological Survey has done and is doing most effective work, which, however, is not so well known as it should be.

As far as the writer knows, however, there has been no concerted or comprehensive attempt on the part of any government body or engineering society to increase the efficiency of the fireman, the man who handles all the improved appliances and on whose skill and work a large amount of their success depends. The railroads, it is true, make spasmodic attempts to give their firemen instructions in combustion and firing, and the average intelligence and skill of the locomotive fireman are above those of the stationary fireman. This, however, is largely due to the better pay, more interesting work and better chances for promotion given the former. A good locomotive fireman can fire stationary boilers very readily, but it takes the stationary fireman some time to keep up steam on a locomotive. In other countries, notably in Germany, there is much more practical interest taken in improving the firemen. The German government includes a course of lectures on fuel and its combustion in its educational curriculum, and gives a sum annually to lecturers and instructors to boiler firemen. In many cities of German schools for their training are established. These schools give two weeks' instruction for the sum of $3.

The writer has had numerous opportunities of seeing the work of boiler firemen in other countries, and has no hesitation in saying the average fireman in many of them does much better work in handling coal than in our country. This is especially true of Chile and Mexico, countries that we are rather inclined to look down upon. Of all the stationary-boiler firemen he has seen, the best was a Finnlander and the next best a Mexican.

This condition of things in the United States is almost entirely due to the steam-plant owners and to the low price of coal as compared with that in other countries. As stated elsewhere by the writer (see *Black Diamond*, Oct. 5, 1907), it is believed to be a conservative estimate that, at the average hand-fired steam-plant in the country, at least 5 per cent. of the coal used could be saved by possible improvements in firing methods alone. At many plants this amount could be doubled.

Actual tests have shown that there may be a difference of 20 per cent. in evaporation as between two firemen under the same conditions, with the same boiler and same quality of coal.

What we need in this country to improve efficiency of our boiler-plants, is education and instruction for the firemen and the steam-plant owners. We can't get the best results from our automatic stokers and other appliances for saving fuel unless we have intelligence and knowledge to handle them. We can't do more work with a pound of coal unless the men who burn the coal are shown how to do better work themselves and are given some incentive to improve themselves.

Increased knowledge on the part of the firemen and increased attention to their work would surely lead to improvements in the steam-plants, which would add still further to the savings to be effected. In many parts of the country the low wages paid and the long hours of work will not attract young men of intelligence to the hard task of boiler firing. This is a matter that must be remedied gradually, but that it must and will be remedied is apparent to anyone who has given it attention.

The steam-plant owner must decide between low wages and high fuel and repair bills and low efficiencies or good wages, lower bills and more uniform steam pressure and longer life of his boiler plant.

The whole question comes to this, that if we want to increase the length of time that our unused coal supplies will last, we must take practical and concerted steps to add to the efficiency of the men who burn our coal, not only by giving them improved appliances of every kind, but also by increasing their knowledge of combustion.

This can be done by instruction, both practical and theoretical, by showing an increased interest in their work and by giving them better pay and shorter hours and by making the boiler rooms more comfortable places to work in. The writer has in mind boiler rooms (and they are not so exceptional, either) that are not fit for a self-respecting man to work in.

Prof. William Kent says in his "Steam-Boiler Economy" that all kinds of hand firing with ordinary furnaces are improper. Some kinds are worse than others, but all are bad.

The writer believes that, given a first-class fireman and up-to-date tools and appliances, together with close attention on the part of the chief engineer or manager to the handling of the coal, automatic stokers will give no better results. This, of course, does not include the saving of labor, a large point due to the use of stokers.

Considerable publicity has been given recently in the papers to a letter sent out by the President with a view to withdrawing from entry a large amount of coal-bearing coal lands belonging to the Federal Government in the West, with the object of protecting the coal reserves from waste. The suggestion has been made by the writer in another paper (see *Engineering News*, Dec. 19, 1907), and it is now reported that the present wasteful method of burning coal could be greatly improved on and our coal supply made to last longer, if instructions and object lessons in combustion and firing should be given by competent men to firemen all over the country. These instructions should be under the direction of the United States Geological Survey. Such a method would be similar to that now in use by the United States Agricultural Department, and of some of the states, giving instructions to farmers in the best methods of farming.

A board of experts, who should be able to practise what they would preach, appointed by the Geological Survey, should be at the service of every steam plant owner in the country, and their work could be made of great value along the lines indicated above.

Take the conditions that now exist at many smaller boiler plants. The boilers are overloaded, worked day and night without proper cleaning, cheap and badly designed grates are used, the boiler settings and arches are allowed to crack and remain so, and the bridge walls and side walls stay clinkered and choked up. No attention is paid to the ventilation, cleanliness or comfort of the boiler-rooms, and little or no attempt is made to keep accurate records of the coal used each day. The fireman is generally allowed to do as he pleases in regard to firing and water feeding, and as long as sufficient steam is kept up to run the plant, nothing is said to him. The "boss" walks through the boiler-room possibly once a day or more often once a week, satisfied if the machinery is running at its usual speed, and he sees the firemen working. The fireman is paid about the same as an ordinary laborer and works from 10 to 13 hours a day, or even longer; cleaning the fires from once to four times a day, after wheeling out ashes and bringing in coal himself.

At a plant of this kind, and there are a good many of them, it would really seem as though the "boss" should be the one to be instructed and taught the first principles of economy and efficiency in operating a steam-plant.

F. R. WADLEIGH,
Chief Inspector, Casiner, Curran & Bullitt.

Railroad Law in August.

The following abstracts cover the principal decisions in the Federal courts:

Discrimination in distribution of cars.—A rule of a railroad company in distributing coal cars for use between mine operators on its lines in times of shortage of cars not to charge against a mine as part of its quota the cars of other railroad companies for carrying coal bought by them for their own use does not amount to an undue advantage in violation of Section 3 of the Interstate Commerce Act particularly where the coal so carried is not taken into consideration in computing the mine's percentage. And this would be the rule in the case of coal purchased by any buyer for its own use to be delivered into its own cars at the mine and which does not become a subject of interstate commerce. Neither is the statute violated by the allowance by the railroad company of an extra percentage of cars to an operator which during the preceding month has unloaded and returned its cars within a certain average time; this practice having been adopted instead of charging demurrage to encourage prompt return of the car and to enlarge the available supply of cars. United States v. Baltimore & Ohio Railroad Co., 154 Fed. Rep. 108.

Contributory negligence of licensee on track.—A person using a railroad track as a footpath is guilty of contributory negligence where at the approach of a locomotive he steps to the side of the track but not at a sufficient distance to avoid being struck by the bucking beam of the engine pilot, and hence he cannot recover damages for injuries thus received. Delaware & Hudson Railroad Co. v. Wilkins, 153 Fed. Rep. 845.

Jurisdiction of Federal Courts in cases of discrimination.—A shipper cannot maintain an action in the Federal courts against an interstate carrier for damages because of a discrimination in rates where he does not allege that the charge complained of was not in accordance with a schedule of rates duly published and filed with the Interstate Commerce Commission or that any application had been made to the commission to correct such alleged discrimination. Neither can he litigate the matter in the Federal courts under the $2,000 clause by including in his demand a claim for damages which he cannot recover and without which the demand is less than $2,000. Clement v. Louisville & Nashville Railroad Co., 153 Fed. Rep. 979.

Right of insurance company to sue for fire loss.—The Circuit Court for the Western District of Louisiana holds that an insurance company which has paid a loss to the owners of cotton de-

stroyed by fire set out by a railroad company may sue the railroad company for such loss in place of the owner. On the trial the railroad company is entitled to invoke the same defenses that it could against the owner. Svea Insurance Co. v. Vicksburg & Shreveport Railway Co., 153 Fed. Rep. 774.

Safety appliance law.—The safety appliance law makes a railroad company liable unconditionally for its violation and hence in an action for the penalties imposed by the act it is not necessary for the plaintiff to allege and prove that the railroad company did not use due care or ordinary diligence in making an inspection or in repairing such defects as the inspection would have disclosed. United States v. Atlantic Coast Line Railroad Co., 153 Fed. Rep. 918.

Removal of causes.—The Circuit Court of the Southern district of New York in a suit by a stockholder to have stock and bonds issued by a railroad company, to be exchanged for a prior issue of bonds, to be declared beyond the power of the company and void, holds that the company is the only necessary party defendant, and the fact that the directors or persons interested in the bonds to be issued have been joined as defendants will not prevent a removal

Curve and Switch Tables.

The tables reproduced herewith were compiled under the direction of Everett B. Wilson, M. Am. Soc. C. E., in connection with the design and construction of several extensive yard and track schemes. They will doubtless be found very helpful to other engineers on similar work.

It is not expected that they will be generally applicable in their present shape, inasmuch as the "practical leads" and "slip switch lengths" are based on Pennsylvania Railroad standards, but the work of adapting them to the needs of a particular road involves merely the changing of the "SL," "PrL" and "SS" columns to conform with the standards of that road. Copies of these tables as here shown, also copies with these columns left blank, printed on tough paper for "tipping" into hand-books, or for drafting table use, can be had for the asking. Mr. Wilson is now Secretary-Treasurer of The American Bureau of Inspection and Tests, Monadnock Block, Chicago. The following explanations for using the tables are given by the author.

THE AMERICAN BUREAU OF INSPECTION AND TESTS
Consulting and Inspecting Engineers
New York CHICAGO Pittsburg

Degrees of Curve, Radii and Curve Numbers for Plotting Railroad Track Work.

of the cause to the Federal courts if the citizenship of the person instituting the action and the company are diverse. Pallitz v. Wabash Railroad Co., 153 Fed. Rep. 941.

Indictment for failure to make switch connections.—An indictment of a railroad company for refusal to make switch connections where these facilities are furnished to other shippers is defective unless it charges that the connections demanded are reasonably practicable and could be put in with safety and the business of the shipper would justify the expense of their construction and maintenance. It should also aver that the shipper making the demand offered to pay such portion of the cost as is usual and reasonable. United States v. Baltimore & Ohio R. R. Co., 153 Fed. Rep. 997.

Reconsignment charges.—The Circuit Court of Appeals of the Seventh Circuit holds that an additional charge by carriers of two cents per hundred weight for the privilege of reconsigning hay from the northwest at St. Louis and shipped into southeastern territory was excessive under the Interstate Commerce Act, and that a rate of one cent per hundred weight as found by the commission was reasonable. Southern Railway Co. v. St. Louis Hay & Grain Co., 153 Fed. Rep. 728.

TABLE I.

Railroad Curves.

This table is for use in plotting railroad curves and switch work, and can also be used by interpolating, to a limited extent, for ascertaining the degree of curvature for a given radius, or vice versa. The curve numbers shown are the numbers of curves (for plotting) and are equal to the radii of the same in inches—this system of numbering being best adapted to general uses. Should any other scale be desired, a multiple of one of those shown can be used.

TABLE II.

Turnouts, Crossovers, Ladders and Slip Switches.

The three "Curve No." columns are on the same basis as Table I. and are to be used in plotting both theoretical and practical turnouts from straight jackets only. The rest of this table is self-explanatory when taken jointly with the sketches below it. It is to be noted that the radii of the theoretical turnouts are not of the center of track, but of the gage of the "curved lead rail."

The distances in "SL," "PrL" and "SS" columns are practical, being based on Pennsylvania Railroad standards. The practical

leads, "Frl.," are measured between actual points along the "straight lead rail" and are based on 1' 11. R standard length straight switch points (5¾ in. spread at heel) and frog toe rails connected by regular curves.

Following is an example of the combined use of Tables I. and II. In plotting or laying out a theoretical No. 8 turnout from the inside of a curve of 2,865 ft. radius, scale 40 ft. = 1 in.

The degree of a curve of 2,865 ft. radius is 2 deg. 00 min. (Table I.) By subtracting this from 9 deg. 29 min., which is the degree of curve for a No. 8 theoretical turnout from a straight track (Table II.), the degree of curve of the desired turnout, 7 deg. 29 min., is obtained. Therefore, the nearest curve (Table I.) for plotting the turnout is No. 19. Where the turnout is from the inside of the main track the degress of the two curves should be added.

American Railway Association.

The fall session of the American Railway Association was held at New York City, October 30. There were present 75 members, represented by 175 delegates. The present membership of the Association is 331 members, operating 235,457 miles, and 46 associate members, operating 1,457 miles.

The committee on car service reported having held five meetings. Twenty-four roads have joined the Per Diem Rules Agreement and three have withdrawn. Two of the three have been put on a car demurrage basis, and the other one is the New York, New Haven & Hartford. The committee recommends to the favorable attention of the members the interline card way bill which has been prepared by the Accounting Officers' Association.

The committee recommends a new code of demurrage rules, which with a few minor changes, was adopted. This code is the result of a careful study of all demurrage rules now in use, and careful consideration of criticisms of members of the association. While the free time prescribed is 48 hours, and while, therefore, some roads may not be able to adopt the rules without modification, the committee hopes that such modification will be found necessary only for a short time. The committee has restored the use of the word "demurrage" in place of the meaningless term "car service." This change has been made after careful consideration. The committee strongly recommends that demurrage be collected with the same strictness as freight bills.

The committee recommended and the Association adopted changes in car service rules 1 to 4, in line with the recommendation which was made six months ago when a penalty for diversion was proposed. As the Association, in rejecting the penalty rule, did not disapprove the regulations governing the use of foreign cars, these regulations are now again recommended. A slight change is recommended also in car service rule No. 5; also in rules Nos. 9 and 10, to make these rules consistent with the new demurrage rule. Rule 3, which was cut out when the penalty for delay was abolished, is restored, in suitable form to give a road the right to demand the return of its cars. Rule 6 is modified for the same reason. Rule 9 is modified to require the numbering of the sheets of interchange reports. The committee recommends that five copies be made of interchange reports, and that rule 11 be amended to forbid the presentation of corrections in per diem reports until after three months. Premature checking of these reports has caused some difficulty. Rule 15 is amended so that an embargo shall not take effect until after 24 hours. The whole report was accepted after slight modifications.

The Committee on Statistical Inquiry presented an interesting report as to its work, covering the past six months. The report included a report of a sub-committee in regard to tests to determine the mileage allowance to be made engines in switching service. The name of the Committee on Statistical Inquiry was changed to the Committee on Accounting and Statistical Inquiry.

The Committee on Standard Cipher Code reported that 2,995 copies of the Standard Cipher Code are now in use by members of the Association. The committee has authorized the publishers of the "Pocket List of Railway Officials" to designate in that publication all officials who use a Standard Code.

The Committee on Transportation of Explosives included in its report a list of manufacturers of explosives and a list of magazines. It referred to the work accomplished by the Bureau of Explosives, and also submitted for consideration revised regulations for the transportation of explosives and regulations for the transportation of inflammable substances.

The recommendations of the Committee on Standard Rail and Wheel Sections were for the most part approved, and the points of disagreement were referred back to the committee with instructions to investigate further, and with authority to employ experts for this purpose.

The Committee on Standard Location for Third Rail Working Conductors, in its report, embodies a series of definitions, which were adopted.

The Committee on Car Efficiency presented an elaborate report, together with statistics showing car performance. Most of these statistics have been reported in previous issues of the *Railroad Gazette*. The report says in part:

The roads which normally hold and use cars in excess of the number they own are still found chiefly in New England, the Southwest and on the Pacific Slope. Most of the roads holding such an excess have ordered a considerable amount of new cars. The committee has been able to suggest in a number of cases, transfers of equipment which have taken care of surplus cars and reduced shortages. Better results would be obtained if all roads were to send in regular statements showing the location of their cars as well as copies of their daily interchange reports showing cars delivered to their connections. Demurrage rules covering bituminous coal handled at tide-water were adopted April 1, by six of the seven roads handling such coal at New York, Philadelphia, Baltimore, Norfolk and Newport News; and the seventh line will probably adopt rules on the first of April next. The rules are in effect on anthracite coal on one road, and will probably be put into effect on anthracite coal on other roads shortly. The rules are supervised by a committee, which meets monthly. Its chairman is also chairman of this committee. The roads are handling more coal this year than last, and in less cars. Demurrage rules covering bituminous coal handled on Lake Erie were adopted July 1 by all roads handling such coal. These rules are supervised by a committee, with chairman and secretary, the same as those of the Tide-Water Committee. The committee has attempted to secure the formation of a box car pool, one of the essential rules of which would be the imposition of a very high per diem or penalty charge at times when cars are scarce, but it has not succeeded in securing the promise of enough cars for such a pool to warrant a trial. The attainment of this principle will be impracticable so long as so many roads are without the equipment necessary to do their own business. The increase of the per diem rate to 50 cents has made it profitable to own cars. * * * The committee recommends a strict adherence to the 50-cent rate and a prompt reporting of freight car interchanges, locations, shortages, surpluses and congestions to the Clearing House in Chicago. Daniel Willard was elected First Vice-President. The next meeting will be in New York City on April 22, 1908.

Car Efficiency for April.

The American Railway Association Committee on Car Efficiency, Arthur Hale, Chairman, has issued Bulletin No. 6 showing car balances and performances for the month of April, 1907. The principal results, as compared with preceding periods, are summarized in the bulletin as follows:

During the month of April, 1907, the severe shortage which had existed throughout the previous winter had been relieved to some extent, although it was still severe enough to warrant a continuation of the earnest efforts which were made by the railroads of the country to secure a greater efficiency from their freight cars. The marked improvement in the performance denotes the success which rewarded those efforts.

The "average miles per car per day" shows an increase of 1.3 miles over the first quarter of 1907; the per cent. of loaded mileage about held its own and the "average tons per loaded car" shows a slight increase. The net result of these factors is represented in the "average ton miles per car per day," which shows an increase of 22 ton miles, or 6.7 per cent. The improved performance is also reflected in the earnings, which show an increase of 14 cents per day in the average "per car on line."

While this improvement in performance is quite gratifying, it is to be regretted that it was not accompanied by a similar improvement in the situation as regards car balance. Although there have been gains on a number of the large owning lines, it will be noted that as a rule those roads which habitually use more cars than they own still show large excesses on line, while several of the large car owners have lost equipment.

The losses which car owners suffer from an unequal balance may be graphically demonstrated by comparing the per cent. of cars on line with the average earnings per car.

Taking for instance Group 3, which during the period of this report shows the largest net loss in equipment, we find that the total shortage on roads having less than 100 per cent. on line is 48,615 cars.

Based on the average daily earnings per car on line, and assuming that these roads could have used their full quota of cars, the loss in gross freight revenue which these lines sustain by reason of this condition aggregates $110,356 per day. As a credit against this loss, these roads earned per diem on 48,615 cars, which at 40 cents per day (the approximate average for April), amounted to $19,446, making the net loss in revenue $90,906 per day, $2,727,180 per month, or 18.25 per cent. of the gross freight earnings of the roads which are short their equipment. The loss for any particular road may be similarly calculated.

The increase in the per diem rate to 50 cents, effective July 1, 1907, will decrease these net losses somewhat, and a further increase in the rate, or the adoption of a graded per diem would reduce the margin of loss which the lending roads must suffer in

times of car shortage. However, from the standpoint of the car owner a partial compensation is unsatisfactory, and under any per diem rate the compensation will be but partial until the amount of per diem received equals the net daily value of the car as a producer of revenue. Too much should not be expected from the per diem rate. In the effort to secure a rate which will be compensatory to the car owner when he has use for all his cars there is danger of fixing the rate at a point where it will become burdensome when cars are easy, or greatly increase the empty haul, which would be wasteful. The general interchange of cars being an established order, the necessity for its regulation already exists and it would appear that there is less necessity for an immediate change in the per diem rate than for some regulative system to which the per diem rate will be supplementary, and to which it would, in time, naturally adjust itself.

Pacific Locomotives for the New York, New Haven & Hartford.

The Baldwin Locomotive Works has recently delivered 21 Pacific (4-6-2) locomotives to the New York, New Haven & Hartford. These engines are of special interest, as they are the first locomotives with trailing wheels to be built for this road. Their calculated tractive force is 31,560 lbs., and as the weight on the driving wheels is 134,250 lbs., the factor of adhesion is 4.25. The adhesive weight is thus used to excellent advantage.

The boiler is of the straight top type, with sloping throat and back head. The barrel is built up of four rings with the seams placed on the top center line. On the third ring, which carries the dome, the seam is welded throughout its entire length on each side of the opening. The other seams are welded at the ends. All inside welt strips are of the diamond form, as frequently used by

Pacific Locomotive for the New York, New Haven & Hartford; Built by the Baldwin Locomotive Works.

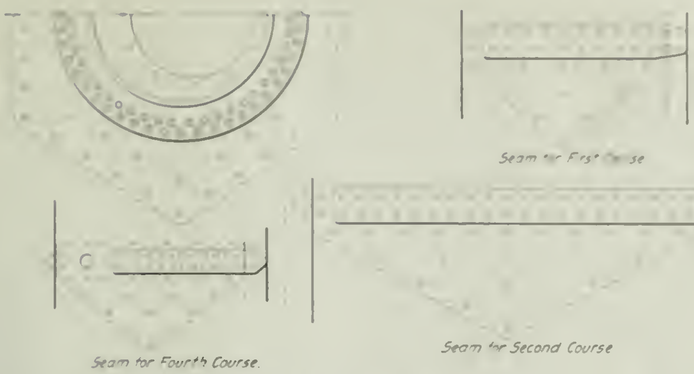
Longitudinal Section of Boiler for Pacific Locomotive; New York, New Haven & Hartford.



Details of Boiler Riveting.

the Baldwin Locomotive Works. In this seam the outside welt is of simple rectangular form with rounded corners, while the one on the inside tapers off in diamond shape on each side, with riveting spaced at longer pitches than at the center as shown in the engraving of the boiler.

The firebox is radially stayed with the crown and sides in one piece and the outside and roof sheets also in one piece. Two rows of T irons support the front end of the crown, while flexible stays are distributed in the sides, throat and back head. The throat is of ample width and narrows down to 5 in. at the mud ring. The firebox is supported by sliding shoes in front and a buckle plate in the rear. The brick arch is supported on four tubes each 3 in. in diameter. An interesing feature of this firebox is one to which attention has often been called before, the method of distribution of the flexible staybolts. In this distribution it is customary to group them in the vertical rows at the front and back of the side sheets and across the whole length at the top, while common practice does not always put them in the back or tubesheets. In this case there is the usual grouping in the vertical rows at the front and back, while none is used in the top row for a space covered by 15 stays. On the other hand there is a single row at the side of the back sheet and in the throat sheet the four upper rows are all flexible with the exception of six scattered ones that would interfere with the attachments if they were made flexible. Attention is called to this because of the lack of uniformity of practice on different roads in this matter of the use and distribution of flexible bolts. It would appear that each responsible official is using them where it seems that they are needed, as shown by personal experience, and personal experiences evidently differ widely. It would be interesting to know to what extent the quality of the water used as well as the service demanded has upon the breakage and strain of staybolts.

The smokebox has a short extension, with an adjustable diaphragm plate in front of the nozzle, and double petticoat pipes. The stack is of cast-iron, 32 in. high. It is $15^7/_8$ in. in diameter at the choke and $17^3/_4$ in. at the top.

The cylinders are single-expansion, equipped with slide valves and lined with cast-iron bushings $^3/_4$ in. thick. They are double bolted to the smokebox and also in the vertical flanges, and are built with heavy walls and ribs to insure strength against breakage. In accordance with the most recent practice in locomotives equipped with the Walschaerts valve gear, the center lines of the ports are placed 2 in. outside the cylinder center lines, and the use of rock shafts is thus avoided. The valves are set with a constant lead of $^3/_{16}$ in.; the steam lap is $1^1/_{16}$ in., and the exhaust clearance $^1/_8$ in., while the maximum travel is $6^7/_8$ in. The links and reverse shaft are supported on a substantial cast-steel crosstie, which spans the frames between the first and second pairs of driving wheels. The radius rods are supported directly on the reverse shaft arms by means of sliding bearings, and the links are arranged with cast-steel side plates and double trunnions. Cast-steel is also used for the reverse shaft arms and eccentric cranks.

The main frames are of cast-steel with double front rails of the same material. The rear sections are in the form of slabs, [illegible] and provided with supplementary frames which are secured to the main frames by steel castings. The pedestal binders are of cast steel, and are lugged and bolted to the pedestals. The driving boxes, driving wheel centers, equalizing beam fulcrums, crossheads and foot plate are also of cast steel. The trailing truck has outside journals, and is provided with a spring centering device which is placed under the foot plate.

The tender frame is built of 10 in. steel channels, and the trucks are of the arch bar type equipped with steel tired plate wheels, cast steel and double elliptic springs.

An interesting comparison is afforded between these engines and the latest ten-wheel passenger locomotives built for this road, which were delivered by the Baldwin Locomotive Works in June, 1907. The dimensions are given in the tables, and the photograph shows the principal features of the ten-wheel engines. The superiority of the new locomotives, as far as power and capacity is concerned, is clearly indicated.

The following is the comparative table of the principal dimensions of these engines.

	Pacific (4-6-2)	10 wheel (4-6-0)

Certificates of Public Necessity and Convenience in Massachusetts.

Following is the report of the Massachusetts State Railroad Commission on petitions of the Boston & Providence Interurban, the Boston & New York, the Boston, Lowell & Lawrence and the Boston & Eastern electric railroad companies for certificates of public necessity and convenience allowing the construction of the lines described in their respective proposals. As the chairman of the commission, James F. Jackson is the most accomplished writer in America of lucid reports on subjects of this kind, the present report will be found of interest outside of Massachusetts.

The vigorous rivalry among four groups of promoters, each asking a special charter to authorize the building of an interurban electric railroad between Boston and Providence, and the feeling that the time had come for general legislation with reference to such railways, led to the passage in 1906 of the electric railroad act, under which these petitions are brought. Owing to the close resemblance between the new electric and the old steam railroad, the act provides that a company which desires to build an electric railroad must first secure a certificate that public necessity and convenience require its construction. This had long been the law governing the building of new steam railroads. In effect the statute declares that indiscriminate competition is undesirable, and that the resources of a monopoly, provided the management be efficient and progressive, may provide the largest and best public service; that established companies conducting their business in a proper manner are to be given a reasonable measure of protection, and that the extraordinary right of eminent domain is not to be exercised at the will of those who, professing public purposes, have in view merely private gain.

The question to be decided under each of these petitions is whether, upon the whole, the net results of a proposed undertaking promise public gain or public loss. It surely cannot be said that public necessity and convenience require the building of an additional railroad, if the effect upon existing railroads is so disastrous that the service as a whole is impaired, rather than improved. Men keenly interested in the development of interurban railroads have long had in mind an electric road between Boston and Providence. Though it must openly compete with an excellent steam railroad service, it would offer equal speed with more frequent trains and with freedom from smoke and cinders. Physical conditions are favorable for an electric road of modern type, and as matters now stand it cannot be said that the adventure would be unprofitable. Without exception cities and towns in this section welcome the new service, and no similar accommodation is offered in connection with any existing lines. The question is simply which of the two companies that desire to build shall receive the necessary certificate, for it has been taken for granted from the first that there is room for only one.

The route of the Boston & Providence Interurban is the choice of experts who in the beginning had different lines in view. Their investigation has been exceptionally thorough and their plans have on the whole popular preference in the communities that would be served. This railway would connect existing street railways with a high-speed main line, manifestly a great convenience to patrons. Home capital is largely interested in the road, and the acquaintance of the men behind it with the conditions to be met would warrant the expectation of a high standard of service. The route of the New York & Boston Electric Railroad is of recent suggestion. While this project, as the name indicates, is more ambitious than that of the Boston & Providence, its future would be far more uncertain and speculative, success being dependent upon the ability of the company to prosecute the enterprise in other states where as yet nothing of a definite or tangible nature appears to have been accomplished. In our opinion a certificate ought to be issued to the Boston & Providence Interurban Electric Railroad Company as the company by comparison is in better position to make use of it for the public advantage.

The Boston, Lowell & Lawrence Electric Railroad as planned would pass through Charlestown, Somerville, Medford and Arlington, connecting with the Boston Elevated system in Charlestown. Residents of these cities and towns earnestly remonstrate against the building of this railroad. Though these remonstrants cannot rightfully set up their local interests as an impassable barrier to all new facilities for travel between Boston and more distant cities and towns, they may reasonably ask that their interests shall not be heedlessly overridden. It cannot be gainsaid that the railroad which is proposed would interfere with important street railway extensions of the Boston Elevated system, which have long been awaited as a public blessing in these suburban towns. Are prospective benefits from the new enterprise such as to justify the sacrifice of these other public interests? New freight facilities and low fares were prominent features of the prospectus of the Boston, Lowell & Lawrence Electric Railroad. The suggestion of better freight accommodation was attractive in Lowell and would explain much of the interest in the enterprise at first aroused in that quarter; but all intention of carrying on a freight business has since been disavowed. A five-cent fare from any point in Arlington, Medford and Somerville to all parts of Boston was attractive in those communities and explains certain support secured in each; but it has since become evident that this assurance had no substantial basis. The freedom with which stations have been promised and the manner in which methods of operation have been explained challenge faith in the fulfilment of prophecies regarding train service. In general it may be said that the method pursued in placing this project before the public at different times and in different places in the early days of its promotion was notable for indifference to law and conditions and to the possibility that promises made might call for performance. Then, too, the structure which the company proposes in Sullivan square is undesirable and unsightly and the selection of that connection with the elevated system makes rapid transit improbable and aggravates conditions that already vex and menace the public at this terminal. Nor can the company build the structure which it has planned without special legislation, and such legislation has been expressly denied.

Stripped of all the glamor given it by unsubstantial proclamations there is little in the enterprise to recommend it to the business judgment of investors or to give it standing with the public: too little to warrant the exercise of the right of eminent domain or the interference with other public works that the building of such a railway would involve. The standing and character of members of the temporary board of directors who were enlisted in the undertaking cannot be challenged, and able counsel have endeavored to show substantial merit in what the company proposes to accomplish, but the more careful the study and the closer the scrutiny of the history and character of this transportation scheme the less there is found in it to call for a certificate that public necessity and convenience require it.

It does not follow from what has been said that there is no call for an electric railroad in the territory which lies to the north of Boston, and a carefully studied plan for such a railroad has been presented by the Boston & Eastern Electric Railroad Company. Existing railroad and railway companies have argued that they are now giving all needed facilities in this territory, but the argument falls short of the mark. It is true that the Boston, Revere Beach & Lynn Railroad, within the limitations of a steam railroad hampered by ferry connection, is furnishing an admirable service to and from Lynn, and that much commendation is due the management of the Boston & Maine for a service along the north shore that proves its interest in the comfort and convenience of patrons. But this is not the whole story. With all the railroad and railway lines that now serve it, this densely populated territory, especially its rapidly growing cities, needs additional facilities both for immediate use and for its development of a commercial prosperity that might be realized were larger instrumentalities at hand.

As we have before stated in criticising recent exasperating delays in the running of trains, it is apparent that railroad terminals, yards, tracks, rolling stock and motive power are to-day inadequate for the demands of traffic. With passengers and freight overtaxing present accommodation, there can be no doubt about the benefit that might be received from a quick and frequent electric service in this section of the state, a service distinctly different from any now given upon railroad or street railway. If the Boston & Maine were making, or were in a position to make, immediate and extraordinary expenditure for track extension and new equipment to meet the situation, and were ambitious to itself provide electric interurban trains, we would agree that better things for the public could be secured through the enlargement of this service than through the wasteful expedient of inaugurating competitive enterprises. It is idle to argue, however, that in the present state of affairs the service given by steam railroads and street railways is supplying the transportation facilities upon which the commercial prosperity of this section of the state must depend for a wholesome existence and growth.

Of equal importance with the recognition of an opportunity is the selection of the right way to meet it. The plan of the Boston & Eastern Electric Railroad, though carefully studied, is not satisfactory in the way it provides for Lynn, and is fatally defective at the Boston end of the undertaking, in proposing a connection with the Boston elevated railway at Sullivan square. That feature of the enterprise is absolutely prohibitive. The travel which now comes to Sullivan square as a connecting point between elevated and surface lines overloads the railway, and the relief which is promised through changes soon to be completed cannot with our consent be endangered by conducting an additional tide of travel to this point.

The Legislature of 1906 in distinguishing the new electric railroad from other railroads and railways calls for a broad outlook on the part of those who make use of it and for the adoption of a far-sighted policy that will not shrink from large outlays in bringing about the benefits that are possible under it. It would be a lamentable mistake to indorse an enterprise that fails to fully grasp the opportunity presented, and to permit the construction of a railroad which in a few years would probably be only a stumbling block in the way of carrying out larger plans for the public good. In our opinion no electric railroad can successfully reach Boston from the north that does not secure an entrance to the city independent of the existing elevated structure in Charlestown. Without intending to define any exclusive route it may be suggested that the present tunnel or a second tunnel under the harbor might well be the connecting link.

Our conclusion is that while public necessity and convenience call for enterprise in this field, the present route of the Boston & Eastern Electric Railroad does not meet the emergency. Its petition, however, is not dismissed, but held to await further study and development of plans by this or by any other public agency desirous of furnishing additional transportation facilities in this territory.

Commissioner Clark on the Freight Car Situation.*

* * * In the year ended June 30, 1896, the railroads of the United States, with 20,300 freight locomotives and 1,200,000 freight cars, moved 95 billions of tons of freight one mile. In the year ended June 30, 1900, with 21,600 locomotives and 1,365,000 cars, they moved 141⅘ billions of tons. In the year ended June 30, 1906, with 30,000 locomotives and 1,800,000 cars, they moved 216 billions. That is, in 1896 each locomotive moved 4⅔ million ton-miles, and each car moved a little less than 50,000 ton-miles. In 1906 each locomotive moved a little less than eight million and each car 120,600. Thus, the actual efficiency of each locomotive and each car was increased about 50 per cent. It may be said that the numbers of locomotives and of cars did not increase as much as they should, but in that period a very large proportion of the locomotives and cars were replaced with new ones of greater capacity, the construction of which kept builders busy.

The history of the winter of 1906 and 1907 in the Northwest is one of unheard of difficulty for shippers. Severe weather conditions added greatly to the hardships of both shippers and would-be shippers who could not get cars and also to the difficulties under which the carriers labored. And yet it was testified by a well-informed witness, who was a complainant against the carriers before the Interstate Commerce Commission, that the amount of lumber actually moved by the railroads out from the state of Washington, exclusive of movements between points in the state, was 800 per cent. greater than in 1900.

During the same season an up-to-date double-track railroad in the East became so congested with traffic that was poured in upon it from the West that its principal connection held back loaded cars until many miles of one main track were occupied with cars so held, until tracks and terminals of the delivering road could be relieved. And not long thereafter one of the states served by that road passed a law giving consignees 96 hours' free time within which to unload a car, thus doubling the delay that may be indulged in before demurrage may be assessed.

A large syndicate owning mines, smelters and a railroad, anticipating a proposed increase in the transportation charges on coke, bought up large quantities of it, had it loaded into cars and started on its way nearly across the continent. The price of copper took a bad slump, and hence the coke was not immediately needed. And so some 8,000 cars of this commodity are now, and for some two or three months have been held back by some influence other than air-brakes, accumulating demurrage against the consignees not at destination, but at various points on the lines of various intermediate carriers, not only unavailable for use of other shippers who are clamoring for cars, but actually obstructing the free movement of other traffic. These are the things that account for the low average mileage which carriers get from cars and which affect seriously the efficiency of the cars. Why should the carriers be expected to provide storage in such manner? And why should they permit one shipper to thus, through them, impose such injustice upon other patrons, to say nothing of the imposition upon the carriers, whose earnings upon the traffic will seemingly be eaten up in per diem rental on the cars?

I will not stop to suggest the multitude of smaller ways in which the same principles of selfishness and favoritism contribute to the sum total of lack of efficiency of cars and other facilities of transportation.

The whole situation has been summed up in the inaccurate phrase, "car shortage." In such blockades as have been referred to on an eastern road, how would a larger number of cars relieve the situation? As has been seen, there is a substantial portion of the year during which these troubles are not present. Manifestly if the carriers were to provide themselves with enough cars so that everyone could have all he wanted in the busy season, they must also provide corresponding motive power, terminals, tracks and extra employees. This would mean thousands of locomotives and hundreds of thousands of cars standing idle upon storage tracks (which would have to be provided) during a substantial portion of the year. It seems clear that such an increase in facilities could be had only by the expenditure of many millions of dollars, would be inexcusable economic waste and could be provided and maintained only by largely increased transportation charges. It may be that they could be provided by interring all of the carriers in the graveyard of bankruptcy, but even that would not maintain them.

The communities served by a railroad prosper and fail to prosper just as the railroad is or is not prosperous. Prosperity showered upon the community by nature and Providence brings corresponding prosperity to the railroad if it chooses to place and keep itself in a position to reap that advantage. But if a railroad upon which the community is dependent for transportation fails to furnish reasonably adequate service, the blessings of nature and Providence are to a corresponding degree nullified and wasted. It can bring no good to the community to unnecessarily or unwarrantably impoverish the railroad. It can bring no good to our country to unnecessarily or unwisely or unwarrantedly cripple these arteries of our national life upon which so much depends.

It is because of this reflection in all of our affairs of the effects of the conduct of our common carriers that it is not possible to apply, in dealing with or in regulating them, just the same business principles that apply in transactions between private parties. To hold that in collection of transportation charges the carrier should be held to the rate erroneously quoted by its agent would be to give widest license to the very discriminations which the law condemns, and would place in the hands of the carriers absolute power to make and break individuals and firms and to create and destroy communities and commercial centers almost at will, deterred only by consideration of their own financial welfare and the possibilities of construction of new and rival railroads. And like results would follow the application of the theory that the man who owns a business may do with it as he wills.

Regulation of railroads by state and national governments, each within its proper sphere and lawful limits, is essential. Such regulation must be firm, sane, reasonable and just. Those who administer it must be actuated solely by a desire and a determination to do the right thing by both sides, and must not be influenced by the clamor of the extremists on either side. In that way only can lasting good be done and substantial progress be made.

The American people will not object to paying whatever transportation charges may be necessary to permit the railroads to keep the properties up to date and to earn fair and substantial profit and return upon capital invested therein when they, the people, can feel assured that the capital is in the property and that stocks and bonds are not being added to in multiples of millions with no corresponding investment for the welfare or earning power of the property. The people will never fail to disapprove such tricks of

*Address at Chicago, Oct. 25, by Hon. E. E. Clark, member of the Interstate Commerce Commission. Addresses given by Messrs. Boyd and Hale, at the same time, were reported in the *Railroad Gazette* of Nov. 1, page 524.

high finance as have recently been exposed. The people desire and would be willing to pay for high grade and efficient service. The people must have that kind of service, and, having it, must expect to pay for it that which it is really and fairly worth.

If the railroads cannot secure the co-operation of shippers in the effort to get the highest efficiency from cars in congested seasons, and if the railroads are not strong enough to adopt and enforce adequate rules to that end, it would seem that the only thing left would be for the Federal Government to take the matter in hand as a regulation of commerce and apply such rules and practices regarding use and interchange of cars as will provide the best and most equitable service and results. In that, as in any other feature of regulation of the carriers, care must be taken to do simple and even-handed justice, regardless of what would be popular at a certain time. The carrier that has neglected to provide itself with its proper quota of cars may not expect that its needs will be supplied from the equipment of its more provident neighbor. The shipper who has neglected to provide himself with facilities for doing his business as economically and efficiently as his more enterprising competitor may not expect special consideration of his needs at the expense of others or of the carriers.

The privately owned or exclusively leased car should be eliminated from use in moving ordinary traffic. Satisfaction among shippers may not be expected so long as certain of their number are given exclusive use of facilities which the carrier should furnish to all alike and which, in fact, perhaps, are the property of the carrier. There is and probably always will be room and reason for using special and privately owned cars for certain classes of traffic which require refrigeration, tank cars, poultry cars, etc. But even then their use must be open to all and for all alike.

The railroads have upon them, and must struggle from under a heritage of woe resulting from the mistaken policies, evil practices and unreasoning competition in the past. The shippers are not blameless, and now there is nowhere to turn for relief and correction except to Government regulation.

* * * Only a year has passed since the law became effective which contemplated and which brought about more radical and sweeping changes in practices in the conduct of transportation and in the relations between shippers and carriers than any law has ever effected before. It is not surprising that the magnitude of the work so undertaken is wholly unappreciated by the average citizen. And so now we are met with many proposals for amendment to the law. No doubt some amendments would be beneficial, but it may well be doubted if it is wise to now open the law for amendment and so jeopardize all the constructive work that has been done under it, especially in view of the readiness with which the commission's interpretations and rulings are being accepted.

In some way the impression has gone out that the commission is hopelessly buried in an avalanche of complaints, and some suggestion has been made that its work should be divided. It is true that the commission has many and varied and important duties to perform, and that it has much work to do. But the commission is by no means appalled nor discouraged. Constant progress is being made. It is true that certain cases before the commission have a somewhat prolonged existence, but it is also true that it is the exception and not the rule to find parties to a case ready to proceed with it when the commission is ready to hear it. The commission pushes the cases before it much more than the cases push the commission.

If the spirit announced by a prominent railroad president* is adopted and adhered to by railroads generally, and by shippers, upon whom the obligations to observe the law rests just as clearly as upon the carriers, and the commission exercises in a broad, fair and practical way its administrative functions and powers, the occasion for judicial work will be reduced to a minimum and will be limited largely to two classes of cases—those in which honest error or oversight has worked injustice, and those involving the rivalries of commercial centers. A commission so exercising its administrative functions will acquire that special and expert knowledge which is essential to a proper exercise of the judicial functions in determining the reasonableness of a rate or of a practice.

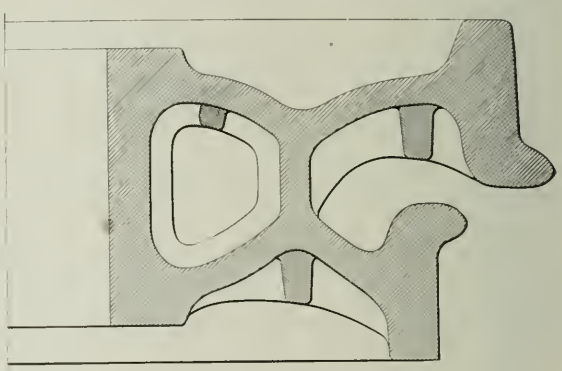
*Robert Mather, President of the Rock Island Company. His address was published in the *Railroad Gazette*, of Oct. 18.

A New Idea in Car Wheels.

A patent was granted Oct. 22, 1907, to P. H. Griffin, President of the New York Car Wheel Co., Buffalo, New York, on a double tread car wheel which is as revolutionary in design as the double plate wheel was when it was first proposed. Summed up, Mr. Griffin's purpose is to divide the destructive effects of heavy wheel loads and the wear and heating action of the brake-shoe between two substantially similar treads and thus to more than double the life of the wheel. The accompanying drawing shows the form of the double trend wheel. The outer tread, of large diameter, rolls on the rail and carries all of the load. The inner tread, of smaller diameter, is used only for braking, but like the outer tread is cast with a chill ring in the mold. The web of the wheel is made with double plates and curved brackets under the outer flange. The inner tread is supported by a single plate with brackets, springing from the junction of the double plates. This construction requires a longer hub than the ordinary double plate wheel and adds between 200 lbs. and 250 lbs. to the weight of a 700-lb. 33-in. wheel. A wheel of this design is no more difficult to cast than a single tread wheel, the brackets under the inner and outer treads being formed by dry sand pan cores. The claims allowed in the patent specification are very broad. They include all possible arrangements for supporting the inner tread integrally with the web and also provide for cast-iron center, steel-tired wheels.

The principal advantage of this construction is, of course, in relieving the rolling tread from all heating and abrasion of the brake shoe. It is generally admitted that the trouble with ordinary cast-iron wheels under high capacity cars is due largely to the increased severity of the brake-shoe action in combination with the heavier load supported by the wheel. Minute heat cracks are opened in the tread and at the root of the flange and under the action of the load stresses and the flange pressure in rounding curves, these cracks develop into fractures. Such cracks would not be started in a tread not subjected to brake-shoe heating and would not develop so rapidly in a braking rim carrying no load. There is nearly twice as much radiating surface on the double tread wheel to give off the heat generated by the brake-shoe and the temperature of the whole wheel would be lower. This in combination with the longer hub would prevent almost entirely trouble from loose wheels.

The smaller diameter of the braking tread and the narrower gage between the two treads on the same axle might be considered objectionable because they would require brake-shoes and brake-



Griffin Double Tread Cast Iron Car Wheel.

beams of different dimensions than the standards now in use. There are a number of advantages, however, to offset any such objection, in addition to the important advantage of a separate braking tread. The stiffness of a brake-beam varies as the cube of its length and a reduction of 10 in. to 12 in. in the gage of the brake-shoes would result in reducing the deflection of the beam nearly one-half under the same load. The brake-shoes are supported inside of the track rails and if they break off or the brake-beam hanger breaks the shoe will drop down on the ties clear of the rails and will not derail the car. Because of the smaller diameter of the braking tread there will be a slight gain in brake-shoe efficiency because of the lower speed of the two surfaces in contact.

Steam and Trolley in Indiana.

In the July number of *Appleton's Magazine*, Merrill A. Teague prints the following table showing the relative frequency of service and passenger fares of steam and electric lines in the vicinity of Indianapolis:

		1899		1906		
		Trains		By trolley		
To Indianapolis from	Miles.	Per day	Fare.	Trains.	Trains.	Fare.
Anderson	39	6	$1.10	9	20	$0.60
Muncie	54	5	1.65	7	18	.85
Marion	70	3	2.10	3	16	1.05
Wabash	90	3	2.70	3	11	1.40
Union City	85	4	2.55	6	17	1.55

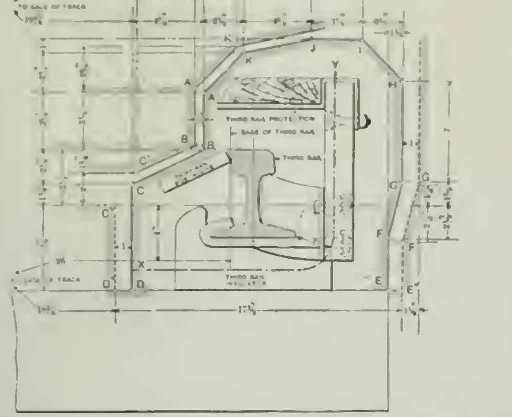
Richmond	68	6	2.05	7	14	1.05

Standard Location for Third Rail Conductors.*

The committee on Standard Location for Third Rail Working Conductors submitted the following definitions of terms which were adopted by the association.

1. THIRD RAIL.—An electrical conductor placed adjacent and parallel to the track rails as a means of conducting electric current to the locomotive or cars. It is maintained in permanent relation to the tracks by suitable supports and is insulated from ground.



Clearances for Top Contact Third Rail; West Jersey & Seashore.

2. THIRD RAIL CONTACT SHOE.—A conductor attached to the car or locomotive for the purpose of collecting current from the third rail.

3. THIRD RAIL CONTACT SURFACE.—The surface of a third rail with which the contact shoe makes contact.

4. TOP CONTACT THIRD RAIL.—A third rail with the contact surface on the top.

5. UNDER CONTACT THIRD RAIL.—A third rail with the contact surface on the bottom.

6. GAGE OF THIRD RAIL.—The distance measured on the plane of the track between the gage line of the nearest track rail served to the nearest gage line of the third rail.

7. ELEVATION OF THIRD RAIL.—The distance at right angles to the plane of the track between the top of track rail and the contact surface of the third rail.

8. THIRD RAIL SUPPORT.—The support which holds the third rail in position as regards elevation and gage.

9. THIRD RAIL INSULATOR.—That part of the third rail support which isolates, electrically, the third rail from the ground, ties, track work and other grounded structures.

10. THIRD RAIL PROTECTION.—A covering employed to guard the third rail against the weather and from accidental contact of persons and material.

11. THIRD RAIL PLATFORM PROTECTION.—The guard used at low station platforms to protect the contact shoes from persons on the platform. This term applies principally to the protection along edges of platfroms when the third rail is on the opposite side of the track from the platform.

*Abstract of committee report presented at the October meeting of the American Railway Association.

12. THIRD RAIL INCLINE.—The sloping approach at the end of a section of third rail made to receive contact shoes moving in line with the third rail and bring them from their free position to contact with the normal surface of the third rail.

13. THIRD RAIL SIDE INCLINE.—The sloping approach at the side of a third rail made to receive contact shoes moving sidewise toward the third rail and guide them from their free position to contact with the normal surface of the third rail.

14. THIRD RAIL TIE.—The tie which is extended beyond the end of the standard track tie to provide a base for the third rail support.

15. THIRD RAIL ANCHORAGE.—A device that holds the third rail in position longitudinally, preventing creeping.

16. THIRD RAIL JUMPER.—A cable connecting the ends of the third rail at openings made necessary by track and road crossings or other local conditions. On surface roads the third rail jumpers are usually placed in conduit under ground.

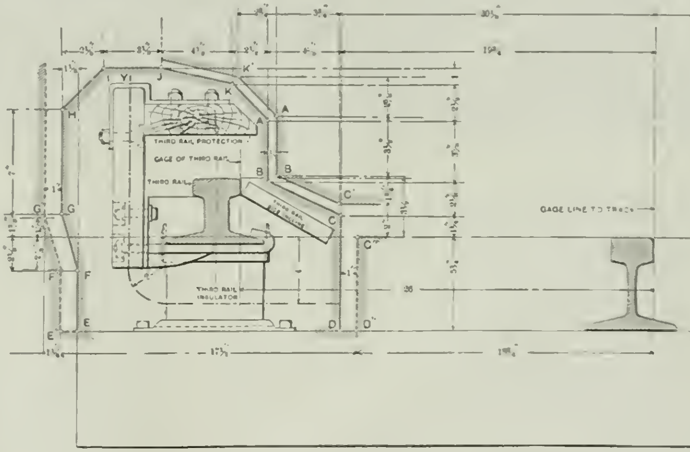
17. THIRD RAIL JUMPER HEAD.—A device placed at the end of a conduit for third rail jumper to protect and insulate the end of the conduit. This is usually an insulated structure projecting above the track ballast and from which the third rail jumper may be flexibly connected to the third rail.

18. THIRD RAIL BOND.—An electrical conductor bridging a joint in the third rail used to secure electrical continuity of the third rail.

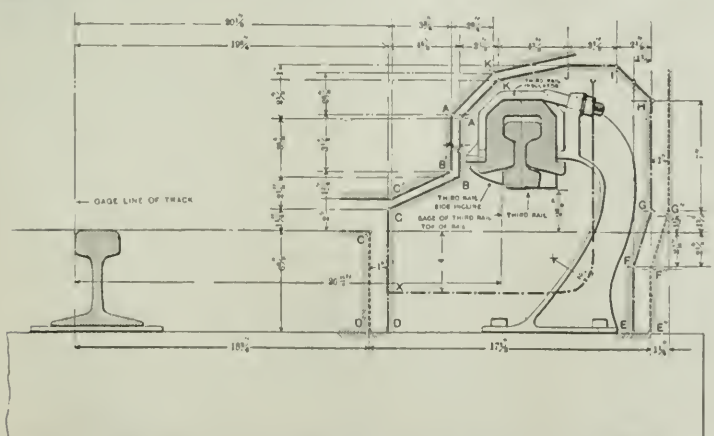
19. THIRD RAIL FEEDER.—The connection between the source of power supply and the third rail. This is usually a cable carried either overhead or in conduits underground.

The committee was also instructed to establish a standard location for third rail working conductors on electrically operated railroads for the purpose of facilitating interchange of equipment, electric or otherwise, between different roads. As the third rail must be located adjacent to the track rails, the question of interference with existing permanent way structures and with existing rolling stock is important. In order that the committee may establish a location for the third rail which will interfere least with existing equipment, diagrams were submitted for criticism showing the two types of existing third rail construction in most extensive use, i.e. the "top contact" type, as used by the Pennsylvania Railroad, the Long Island Railroad and others, and the "under contact" type, as used by the New York Central & Hudson River Railroad and others.

The line A-B-C-D-E-F-G-H-I-J-K shown thereon is the limiting line for third rail structure, and is determined by the composite sections of the different types. In preparing this outline, allowance



Clearances for Top Contact Third Rail; Long Island Railroad.



Clearances for Under Contact Third Rail; New York Central.

has been made for the variations which will necessarily occur in the alinement with respect to the gage line of the track and in the elevation with respect to the top of the track rail. These variations occur, due to the wear of the rail head and to the fact that the rail may be deflected from weight of passing equipment, between those ties which support the third rail, without equal deflection of the third rail. Another cause for variations is the wear which takes place in the tie, lowering the track rail without a corresponding lowering of the third rail. It should therefore be understood that the line A-B-C-D-E-F-G-H-I-J-K is the line beyond which the third rail structure shall in no case extend, all variations in the third rail with respect to the base line (top of rail and gage of track) being included.

The line K'-A'-B'-C', the limiting line for rolling stock, has been plotted by allowing ½ in. working clearance between this line and the limiting line of third rail structure, and it is considered that rolling equipment should under no conditions of wear or dis-

tortion due to broken springs, etc., extend beyond this line.

As the third rail contact shoe is carried on the truck, which has usually a very short wheel base, the distance from the end of the shoe to the gage line of the track is not appreciably affected by curvature of the track, and it is therefore not possible to place the third rail structure at an appreciably greater distance from the gage line of the track on curves than on tangent track. It should therefore be understood that the line K'-A'-B'-C' is the limiting line for rolling equipment on curved as well as tangent track. Allowance in equipment clearance, however, should be made for curved track, depending on the degree of track curvature and the distance between truck centers of the cars, and, to cover yard conditions, the offset of rolling equipment should be figured on curves as sharp as 20 deg. In making this allowance, the side throw of car body as a whole, due to truck bolster end movement, should be added to the total of the horizontal variations, given in the table below, and the effect determined upon clearances of such portions of equipment as steps, truss rods, hoppers, tool boxes, etc. This end movement of bolsters may be taken as 2⅝ in. for passenger, and ⅜ in. for freight equipment. It should also be noted that the third rail may be placed on either the inside or the outside of the curve.

Horizontal Variations in Rolling Equipment Should be Allowed as Follows:

Wear of axle, collars and boxes	9/16 in.
End play of brasses	1/8 "
End wear on brasses	1/4 "
Wear on wheel flange	3/8 "
Clearance between new flange and rail	3/16 "
Constructional variations	1 "
Total	2 1/2 "

Vertical Variations in Rolling Equipment Should be Allowed as Follows:

	Passenger.	Freight.
Wear of journals and brasses	3/4 in.	3/4 in.
Radial wear on wheels. (Passenger, steel tires; freight, cast iron tires)	1 1/4 "	1/4 "
Compression of springs	4 1/4 "	1 5/8 "
Sagging at center of car	1 "	1 "
Constructional variations	1 "	1 "
Total	8 1/4 "	4 3/8 "

The line C"-D"-E"-F"-G" represents what is considered the desirable clearance line for continuous permanent way structures. This has been determined by allowing a working clearance of 1 in. between it and the limiting line of third rail structures, and applies particularly to such permanent way structures as station platforms and bridge girders. As the station platforms are usually supported independently of the ties, and the third rail structure is supported by the ties, and as the ties are occasionally shifted with respect to the platforms, the considerable clearance shown is deemed necessary. All variations in the permanent way structures, due to variations in dimensions, warping or deflection of material, should be allowed for, and the results should not encroach beyond the line C"-D"-E"-F"-G", the clearance of 1 in. net being allowed for the possible subsequent shifting of the track as a whole.

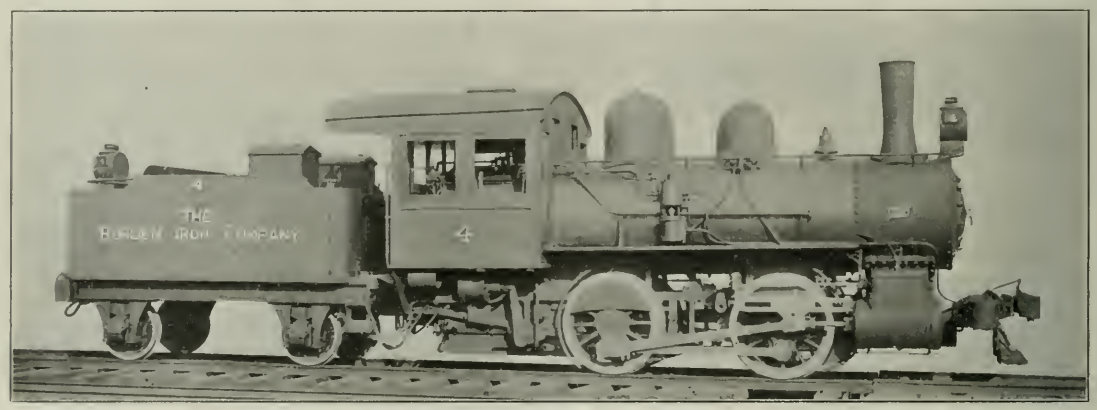
The line XY is the allowable clearance line for non-continuous permanent way structures, such as bridge gussets or other structures which are not continuous for length greater than the distance between the third rail ties or between the brackets supporting the third rail protection. In other words, it is a line to which the permanent way may project, provided it comes between the third rail supports and between the third rail protection brackets.

In the year 1906 the number of tickets sold at the stations in Berlin and its 12 suburbs was 136,000,000, 14 per cent. more than in the previous year. Many of these tickets were for two or more journeys, and the total number of journeys was 252,000,000, or about 700,000 per day, and 12 per cent. more than the year before.

Four-Wheel Switching Locomotive.

The accompanying engraving shows the general appearance of a four-wheel switching locomotive that has recently been built for the Burden Iron Co. by the American Locomotive Co. It is intended for service in the yards of the manufacturing company, and is the standard design of the builders for an engine of this type, having cylinders 16-in. diameter with 24-in. stroke. Within the past few years the American Locomotive Co. has been standardizing its designs for small locomotives, and this example is well worked out for the service for which it is intended. The four-wheel switcher has almost disappeared from the railroad yards, where heavy trains are to be handled, and is now confined, for the most part, to the yards of manufacturing firms. The wheel base is well adapted for use over light rails, a poor roadbed and sharp curves, while the adhesive weight and tractive power is sufficient to handle such loads as are likely to be encountered.

The cylinders are 16 in. in diameter by 24 in. stroke, and are actuated by Richardson balanced slide valves. The total weight



Four-Wheel Switching Locomotive; Built by the American Locomotive Co.

in working order, all of which is, of course, on the driving wheels, is 85,000 lbs. With a boiler pressure of 180 lbs. and driving wheels 50 in. in diameter, this engine has a maximum tractive power of 18,800 lbs., which, using the usual figures for resistance on the level and 20 lbs. per ton for 1 per cent. of grade for grade resistance, gives this engine a net hauling capacity exclusive of locomotive and tender on a 1 per cent. grade of 640 tons, and on a 2 per cent. grade of 330 tons. With 18,800 lbs. of tractive power, it will be noticed that the weight on drivers gives a factor of adhesion of 4.52, which is an excellent figure for an engine of this type designed for switching or industrial purposes. With a wheel base of 84 in. this engine will easily negotiate a curve of 65 ft. radius.

In this design, particular attention has been paid to securing the proper ratios between heating surface, grate areas and cylinder volume, as will be seen by a reference to those given below. With 85,000 lbs. on drivers, the engine has a load per wheel of 21,250 lbs., which can easily be carried on a 60-lb. rail. In this design the tender, which is of the "U" shape flat top type, has a capacity of 2,500 gallons of water and three tons of coal. The tender frame is built of steel channels, as will be seen from the drawing.

By changing to a wood-burning stack, the design is well adapted to logging service, as the water and fuel capacity is ample for that class of work.

The following are some of the principal dimensions of the engine:

Cylinder diameter	16 in.
Piston stroke	24 in.
Valves, travel	5 1/2 "
" lap	3/4 "
" exhaust lap	
" lead	1/16 "
Stack, diameter	14 in. & 16 7/8 "
Stack, above rail	12 ft. 10 "
Boiler, diameter	54 "
Steam pressure	180 lbs.
Firebox, length	72 5/16 in.
" width	33 1/4 "
" thickness, back sheet	5/16 "
" " crown and sides	3/8 "
" " tube sheet	1/2 "
" water space, front	4 "
" water space, sides and back	3 "
Tubes, number	178
" diameter	2 in.
" length	11 ft. 1 "
Heating surface, firebox	113.8 sq. ft.
" " tubes	1,025.2 "
" " total	1,139.0 "
Grate area	16.6 "
Wheels, diameter, driving	50 in.
Wheels, diameter, tender	33 "

Journals, driver	8 in. x 9½ in.
Journals, tender	5½ x 9
Wheel base, engine	7 ft.
Wheel base, engine and tender	29 ft. 4½ in.
Weight, engine	85,000 lbs.
Weight, engine and tender	132,700
Tender, capacity, water	2,500 gals.
Tender, capacity, fuel	3 tons
Tractive effort	18,800 lbs.
Weight on drivers / Tractive effort	4.51
Tractive effort x diameter of drivers / Heating surface	825.29
Heating surface / Grate area	68.61
Firebox heating surface / Total heating surface	10.0*
Weight on drivers / Total heating surface	71.63
Total heating surface / Volume of 2 cylinders	6.28 cu. ft.
Total heating surface / Volume 2 cylinders	181.41
Grate area / Volume 2 cylinders	2.61
Tube heating surface, equated to firebox heating surface (Vaughan formula), sq. ft.	388.0
Total equated firebox heating surface, sq. ft.	421.8
Total actual heating surface / Total equated heating surface	2.46

*Per cent.

Investigation of Steel and Structural Members by the Watertown Arsenal.

An increased governmental appropriation has been made available for the current fiscal year for the extension of the work carried on in the past at the Watertown Arsenal in the investigation of the properties of materials of construction. It is proposed to conduct this investigation along lines of the greatest practical value to users as well as manufacturers of materials. In the experimental study of steel and steel products it is proposed to begin with the metal in the ingot and thence to follow it ont to the finished sections and to built members.

By authority of the Ordnance Department, William R. Webster, consulting engineer, and Edgar Marburg, professor of civil engineering at the University of Pennsylvania, have been engaged to cooperate in the preparation of the program of tests, and in the prosecution of the work. A meeting attended, at their invitation, by about twenty-five consulting engineers and representatives of leading consuming and manufacturing interests was recently held at the Engineers' Club, New York City, for the purpose of meeting Major C. L. H. Ruggles, Commanding Officer, Watertown Arsenal, and J. E. Howard, in charge of the Watertown Testing Laboratory, with a view of determining the most desirable program for the proposed investigation. This meeting was held in two sessions.

One session, presided over by Dr. Charles B. Dudley, Chemist, Pennsylvania Railroad, was devoted to a discussion of metallurgical questions applying to ingot structure, blooms, billets, slabs and forgings, and it was the sense of the meeting that it was desirable to make a study of these questions a special feature of the proposed work.

The second session, at which J. V. W. Reynders, Vice-President Pennsylvania Steel Co., presided, was devoted to the consideration of a preliminary program for tests of structural members, including columns, riveted tension members, riveted splices, riveted connections in building construction, and the general subject of riveting.

At the opening of the meeting Major C. L. H. Ruggles, Commanding Officer U. S. Watertown Arsenal, explained that the work was not to be regarded in any sense a government investigation of steel, but that it was the desire of the Ordnance Department to utilize the increased appropriation with a view not only to the needs of the government, but also to making the results as valuable as possible to all persons interested in the subject of steel, whether as consulting engineers or as representatives of consuming or manufacturing interests.

J. E. Howard, in charge of the testing laboratory at Watertown Arsenal, presented in abstract his report to the Ordnance Department in which attention was drawn to the desirability of making provision for the extension of the usefulness of the testing laboratory, and indicating in detail numerous lines of research that might be taken up to advantage.

It was the sense of the meeting that the extension of the testing facilities in this country has not kept pace with the advance in engineering construction, and a resolution was adopted by unanimous vote that the enlargement of the present facilities at the U. S. Watertown Arsenal by the erection of a testing machine of at least 10,000,000 lbs. capacity was desirable. It was also decided to authorize the Chairman, Dr Charles B Dudley, to appoint two committees, subject to the approval of the Watertown authorities, one on Ingot Structures, Billets, Blooms, Slabs and Forgings, and the other on Tests of Structural Materials. These committees have since been appointed and much preliminary work has already been accomplished, which will be submitted at an early date to the engineering profession for criticism and suggestions.

The Bureau of Explosives.*

This bureau has been organized in pursuance of action by the American Railway Association at the March, 1907, meeting, and already has a membership of 78 railroad companies, operating 130,026 miles.

Major B. W. Dunn, detailed from the Ordnance Department, U. S. A., began his duties as chief inspector of the bureau on June 11th, Mr. C. P. Beistle having begun work as chemist about a month previous to that date, and Mr. J. L. Taylor, who has had broad railroad experience, was temporarily taken on to assist in getting the work started.

Arrangements were made with the Pennsylvania Railroad Company to furnish a site and erect thereon a building for the laboratory at South Amboy, N. J., and at this date the laboratory is nearly ready for occupancy. The site chosen is easily accessible, there being quite a number of trains each way daily, connecting with New York and Philadelphia, both by the Central Railroad of New Jersey and by the Pennsylvania Railroad, and at the same time the location of the building is far enough away from surrounding property to be entirely safe and to offer ample facilities for experimental tests of dangerous articles.

Local inspectors have been appointed in the manner provided for by the constitution and by-laws, and have begun their work under the supervision of the chief inspector. The total number of local inspectors authorized to date is 12, and the number in actual service at the present time is eight. As soon as practicable four additional inspectors will be placed on duty.

The method adopted is to begin with lines that, having factories located upon them, handle a large volume of shipments of explosives. Under the direction of the general managers, the local inspector makes a general inspection of factories and magazines, and of the principal stations, transfer stations and junction points, where shipments of explosives are handled. All violations of regulations observed are reported by the local inspector to the proper official of the line and to the chief inspector.

Upon completion of this general inspection, the chief inspector compiles, for the information of the general manager, a condensed report of the more important violations reported and the action taken by the local inspector to secure correction.

The local inspector is then transferred to another locality and, pending the inauguration of a second inspection, the enforcement of these regulations is left to the officials of the line with the exception that, in case of emergency, an inspector is always available for temporary duty.

Experience teaches that constant inspection on all lines is more than desirable, and, as the work develops, it will be for the members of the bureau to decide whether they will authorize that material increase in the expense of the bureau that will be necessary to enable it to take entire charge of inspection work.

It is believed that the work of the bureau will be of great value to the association, and especially to its own members. As the result of practical experience, a large amount of valuable information, leading toward greater safety in the transportation of explosives, has already been obtained.

Based partly on this information, and partly on the fact that owing to the large number of interpretations which have necessarily been made of the regulations for the transportation of explosives adopted by the association, it has been deemed wise to revise those regulations, and present them for your consideration. The development of the explosive business is very rapid, and new questions are constantly coming up. A number of points have already been found in which the old regulations are defective. The amount of work involved in this revision of the regulations is so great that, although your committee, with the chief inspector, have devoted two meetings to the subject, in addition to the time spent individually over the printed matter, the regulations are not yet deemed sufficiently perfect to be submitted to you for adoption. It has, accordingly, been deemed advisable to present them as proposed regulations, and to ask for criticisms of them by the members of the association.

Special attention is invited to Rule 106 relating to the precautions deemed necessary in accepting shipments of explosives from connecting lines that have not made due provision for enforcing

*From a report of the committee on transportation of explosives to the American Railway Association, Oct. 30, 1907.

the regulations. To prescribe and publish regulations is not sufficient to insure their enforcement. As practice is corrected and improved on lines which are members of the Bureau of Explosives, it is to be anticipated that inspection of shipments, offered at junction points, will be more rigid and rejections for failures to comply with the regulations will increase. This may produce considerable local friction, and the only satisfactory remedy will be found in a uniform enforcement of the regulations by an extension of the inspection facilities and other assistance that are offered by the Bureau of Explosives to all members of the association.

The reports of the local inspectors of the bureau show that the regulations are not properly enforced at the present time, and there is reason to assume that it is only on the lines of members of the bureau that improvements are in progress.

Attention has been attracted to the large number of distributing magazines in various parts of the country from which reshipments of dynamite and other dangerous articles may be made. Such reshipments are more liable to involve defective material than are the original shipments of freshly made explosives offered by the factories.

As an example to show the necessity for competent inspection over non-membership lines, attention is invited to those distributing magazines which have been found to contain deteriorated and dangerous explosives and whose location permit them to make shipments of such explosives over several lines, including members and non-members of the bureau. The inspectors of the bureau have reported a number of such cases, and its members have been duly warned and protected. A dangerous shipment, once en route, may result in widespread danger and disaster in spite of careful handling.

A great deal of progress has been made in securing the co-operation of manufacturers in the difficult task of enforcing the regulations. All permanent reforms in their practice must be based very largely on this co-operation.

A revised list of the manufacturers of explosives in the United States, arranged according to location on railroads, and so far as it has been possible to secure the correct data, has been prepared by the chief inspector.

A start has been made toward providing regulations for the transformation of inflammables and other dangerous articles, and a copy of proposed regulations is likewise submitted herewith for your criticism and suggestion. These regulations may require some modifications before they are quite ready for final action. It is hoped that each member of the association will feel sufficiently interested to carefully study both sets of proposed regulations, and to send their criticisms at an early date to the Secretary, Mr. W. F. Allen, 24 Park place, New York City.

Lack of space prevents us from republishing the interesting circular which follows in its entirety, especially since it is readily obtainable by those interested, and is, at present, only recommended practice. We wish to reprint the following portions, however, to illustrate the principles which governed the committee in its work, and the care with which that work was done.

REGULATIONS FOR THE TRANSPORTATION OF EXPLOSIVES.

General Notice.

1. The safe transphrtation of explosives is largely influenced by the manner in which they are made and packed for shipment, as well as by the careful and intelligent handling of them by railway employees. Information in regard to the kind of explosives is necessary so that railway employees may not ignorantly incur danger or endanger lives or property.

2. Shipments made by the United States Government will be accepted upon the certificate of an army or navy officer or duly authorized non-commissioned or warrant officer, or civilian employee of the Government, that the shipments are made in accordance with United States Government regulations, including limitations of weight, for which the form of certificate entitled "United States Government Certificate of Explosives Offered for Transportation," will be used and kept on file. All the following regulations, provided for other shipments, must be observed for Government shipments except as to packing and weights.

3. Other explosives, except such as are forbidden, will be received for transportation on the ..... on and after ..... 190..., provided the following regulations are complied with, and provided their method of manufacture and packing, so far as it affects safe transportation, is open to inspection by a duly authorized representative of this company or of the Bureau for the Safe Transportation of Explosives and other Dangerous Articles.

4. All explosives, in the form of powder or grains, containing no liquid ingredients, must be packed for shipment in "double packages." The inner package must be securely closed and made of such material that it will prevent leakage of the explosive even if any ordinary defect or injury should develop in the outer package.

Standard Test for all Double Packages.

5. When fine sand, filling the interior package, is substituted for the powder and the complete double package is dropped in any manner from a height of four feet on a steel rail, neither package must rupture nor must any of the sand escape.

Connecting Lines.

6. Shipments of explosives destined to points beyond the lines of this company will only be accepted subject to these and any additional regulations of the roads over which the shipments are to be moved. Shipments offered by connecting lines will be received subject to the following regulations:

Classification.

7. For transportation purposes, all explosives are divided into the following groups:

1. Forbidden Explosives.
2. Common Black Powder.
3. High Explosives.
4. Smokeless Powders.
5. Fulminates.
6. Ammunition.
7. Fireworks.

SECTION I—INFORMATION AND DEFINITIONS.

Group 1—Forbidden Explosives.

See Rules 24 *to* 26.

8. The following are forbidden explosives:

(*a*) Liquid nitro-glycerine.

(*b*) Dynamite, containing over 60 per cent. of nitro-glycerine (except gelatine dynamite).

(*c*) Dynamite containing an unsatisfactory absorbent.

(*d*) Nitro-cellulose in bulk, in a dry condition.

(*e*) Fulminate of mercury in bulk, in a dry condition, and fulminates of all other metals in any condition.

Group 2—Common Black Powder.

See Rules 27 *to* 31.

9. Common black powder embraces all explosives having the constituents of ordinary gunpowder or similar in composition. This group includes rifle, sporting, blasting, cannon and the prismatic powders.

SECTION II—RULES.

Group 1—Forbidden Explosives.

24. Forbidden explosives must not be accepted for shipment.

25. Should any packages of high explosives, when offered for shipment, show excessive dampness or be mouldy, or show outward signs of any oily stain, or other indication that absorption of the liquid part of the explosive is not perfect, or that the amount of the liquid part is greater than the absorbent can carry, the packages must be refused in every instance and must not be allowed to remain in the property of the company.

26. Station agents should know that a shipment of leaking dynamite is liable to cause a disaster in spite of careful handling; and that storage, especially in warm and damp magazines, tends to cause leakage. They must for this reason examine with more than usual care all shipments not offered by factories, especially shipments that have been stored during the summer months, as shown by dates of manufacture.

Group 2—Common Black Powder.

27. Packing—Packages containing less than twenty (20) lbs. of rifle, sporting, blasting or cannon powders must be enclosed in a tight wooden box so that the filling holes of the packages will be up. If the small packages comply with paragraphs 4 and 5 a strong crate may replace the box.

28. Twenty (20) lbs. or over of common black or brown powder must be packed as prescribed by paragraphs 4 and 5.

29. Weight—Packages containing over 125 lbs. net will not be received.

30. Marking—Each exterior package must be plainly marked "COMMON BLACK POWDER," or "BLACK POWDER," or "BROWN POWDER." Additional marks, trade names, etc., may appear if desired by shipper.

31. Car—A car containing shipments exceeding 50 lbs. gross weight must be certified and placarded as prescribed by paragraphs 91 and 92.

Group 3—High Explosives.

32. No high explosives containing over 60 per cent. of nitro-glycerine, or an unsatisfactory quality or quantity of absorbent material, will be received. The 60 per cent. limit does not apply to gelatine dynamite. Explosives like Rack-a-Rock, one constituent of which is liquid, will be accepted if the liquid is not explosive and is not packed in the same boxes with the other constituent.

33. High explosives consisting of a liquid combined or mixed with an absorbent material must have the absorbent material, in sufficient quantity and of satisfactory quality, properly dried at the time of mixing; and the ingredients must be uniformly mixed so that the liquid will remain thoroughly absorbed under the most trying conditions incident to transportation.

34. Explosives containing nitro-glycerine must have uniformly mixed with the absorbent material a satisfactory antacid having, at least, the acid neutralizing powder of an amount of magnesium carbonate equal to 1 per cent. of the nitro-glycerine.

35. Packing—High explosives, containing more than 10 per cent. of nitro-glycerine, must be made into cartridges not exceeding 2 in. in diameter, or 8 in. in length, and must not be packed in bags or sacks. Bags or sacks of high explosives containing not more than 10 per cent. of nitro-glycerine and not over 12½ lbs. each of explosive, will be accepted as cartridges. The covering of all cartridges, consisting of paper or other material, must be so treated that it will not absorb the liquid constituent of the explosive.

36. All boxes in which nitro-glycerine explosives are packed must be lined with a suitable material that is impervious to liquid nitro-glycerine. Cardboard cartons closed at the bottom and coated with paraffine form a satisfactory lining. Dry sawdust or similar material must fill all the space in the box not occupied by the cartridges. These cartridges, except the bags or sacks authorized in paragraph 35, must be so arranged in the boxes that when they are transported all cartridges will lie on their sides and never on their ends.

37. The boxes must be strong and, when made with lock corners, the lumber throughout must be free from loose knots and not be less than ½ in. in thickness. When nailed boxes are used, the ends must not be less than 1 in., nor the sides, top and bottom less than ⅛ in. in thickness. The limits for thickness refer to the finished box and not to the undressed lumber. A box must not be too large to be handled readily by one person.

38. High explosives not containing an explosive liquid ingredient and not having a sensitiveness to percussion greater than measured by the blow delivered by an 8 lb. weight dropping from a height of seven (7) in. on a compressed pellet of the explosive .03 in. in thickness and .2 in. in diameter, held rigidly between hard steel surfaces, as in the Standard Impact Testing

Apparatus of the Bureau of Explosives, may be securely packed in bulk in double packages that will stand the test prescribed in paragraph 5. These explosives may also be packed in cartridges.

(c) Nitro-cellulose.—Packages containing not more than 1 lb. of dry nitro-cellulose, wrapped in strong paraffine paper, or other suitable spark proof material, will be accepted for shipment if securely packed in double packages that will stand the test prescribed in paragraph 5.

(d) Weight.—Packages containing over fifty (50) lbs. net of cartridges will not be accepted. For explosives defined in paragraph 88, when packed in bulk, the net weight in one package must not exceed 125 lbs. One box must not contain more than ten (10) lbs. of dry nitro-cellulose.

41. Marking.—The boxes must be plainly marked on top and on one side or end "HIGH EXPLOSIVE—DANGEROUS." On the top must appear "THIS SIDE UP," and a diagram showing the position of the cartridges in the boxes. Boxes containing nitro-glycerine explosives must also be marked on one side to show plainly (not in cipher) the date of manufacture and the percentages of nitro-glycerine and of wood pulp, or of other non-deliquescent absorbent.

42. Car.—For shipments of high explosives exceeding 50 lbs. in gross weight, the car must be certified and placarded as prescribed by paragraphs 91 and 92.

43. Wet Nitro-Cellulose.—Nitro-cellulose, uniformly wet with not less than 25 per cent. of water, wrapped in water-proof material, securely packed in a strong and tight wooden box containing no other explosive and marked "WET NITRO-CELLULOSE—25 PER CENT. WATER," will be received for transportation without other restrictions than a limit of 220 pounds for gross weight. Nitro-cellulose uniformly wet with not less than 30 per cent. of a volatile solvent, such as fusel oil, or alcohol of any kind, must be packed in strong galvanized iron vessels of the milk can type, with a satisfactory means for keeping them hermetically sealed. Packed in this way it will be transported under the restrictions that apply to packages containing dangerous inflammable liquids. It must be marked "WET NITRO-CELLULOSE—INFLAMMABLE LIQUID."

SELECTION AND PREPARATION OF CARS.

86. For the transportation of common black powder, or smokeless powder for small arms, or high explosives, or fulminates in bulk, or blasting caps—all in quantities exceeding fifty (50) lbs. gross weight—or explosive projectiles, or detonating fuses in any quantity—only certified box cars in good condition (see paragraph 88), or not less than 60,000 lbs. capacity, must be used. Steel underframe box cars or other cars with friction draft gear must be used whenever practicable.

87. Shipments of a combined gross weight not exceeding fifty (50) lbs. may be transported, when properly stayed and protected from injury, in box cars that comply with paragraph 89, and such small shipments will not require a placard on the car. This relaxation of precautions is authorized, however, solely to decrease the number of placarded cars and with a view to more rigid general enforcement of rules for handling cars containing the more dangerous shipments.

88. Certified cars (see paragraph 86) must be as follows:

(a) Equipped with air-brakes and hand-brakes in condition for service.

(b) Must have no loose boards or cracks in the roof, sides or ends.

(c) The doors must shut so closely that no sparks can get in at the joints, and, when necessary, they must be stripped. The stripping for Wagner doors should be on the inside and nailed to the door frame where it will form a shoulder against which the closed door is pressed.

(d) The journal boxes and trucks must be carefully examined and put in such condition as to reduce to a minimum the possibility of hot boxes or other failure necessitating the setting off of the car before reaching destination. The car must be carefully swept out before it is loaded.

(e) Holes in the floor or lining must be repaired and special care taken to have no projecting nails or bolts or pieces of metal which may work loose and produce holes in packages of explosives during transit.

(f) When the car is to be fully loaded with explosives, or when explosives are loaded over the draft bolts or king bolts, these bolts must have short pieces of hardwood, 2-in. plank, spiked to the floor over them to prevent possibility of their wearing through the floor and into the packages of explosives.

(g) The roof of the car must be carefully inspected from the outside for decayed spots, especially under or near the footboard, and such spots must be covered to prevent their holding fire from sparks. A car with a roof generally decayed, even if tight, must not be used.

(h) Agent or inspector must examine each car, see that it is properly prepared, and sign a "Car Certificate" upon the prescribed form (paragraph 91) before permitting the car to be loaded.

89. Small arms ammunition or smokeless powder for cannon, or gun ammunition with empty projectiles, or primers, percussion or combination fuses, or fireworks, may be loaded in any box car in good condition, into which sparks cannot enter and whose roof is not in danger of taking fire through unprotected decayed wood. These cars may be transported without being certified and placarded as prescribed by paragraphs 91 and 92.

PLACARDING OF CARS AND CERTIFICATION OF CONTENTS.

90. Uniform practice is important, and the prescribed forms of car certificates, placards and shipper's certificates must be used.

91. Car Certificates.—The following certificate, prescribed by paragraph 88 (h), must be signed by the car inspector before loading and by the shipper, or the railway agent, who inspects the loading and staying of packages. It must be made out in triplicate, one copy to be filed at the receiving station, and the other two to be attached to the car, one on each side, and not less than 4½ ft. above the floor level.

.....It....

CAR CERTIFICATE.

.....Station.....190....

We hereby certify that we have this day personally examined ..... car No. ..... and that the roof and sides have no loose boards, holes or cracks; that the doors close so tightly, or have been stripped so that sparks cannot get in at the joints; that the king bolt or draft bolts are properly protected, and that there are no bolts or nails projecting from the floor or sides of the car which might injure packages of explosives; also, that the floor has this day been cleanly swept before the car was loaded, and that we have examined all the axle boxes and that they are properly packed and oiled, and that the explosives in this car have been loaded according to paragraphs [illegible] of the Regulations for the Transportation of Explosives (General Notice No.).

.....

Car Inspector. Inspector of Loading and Staying.

NOTE.—For all shipments loaded by the shipper he or his authorized agent, must sign this certificate as Inspector of Loading. The shipper should decline to use a car not properly prepared. A car inspector who is also the inspector of loading will sign twice.

92. Placard.—Each car containing any of the explosives specified in paragraph 86, and in the quantities specified (the limit applying to the aggregate gross weight), must be protected by attaching to both sides and ends, not less than 4½ ft. above the car floor, a placard 16 x 18 in., on which will appear in conspicuous red and black type, on strong white paper, the following:

.....It....

EXPLOSIVES.

HANDLE CAREFULLY—KEEP FIRE AWAY.

.....Station. .....190...

This car must not be moved in a train carrying passengers, and, if for through road movement, must not be handled in the local freight trains.

Through Road Trains.—Not more than three (3) cars containing explosives will be handled in a train for through road movement, and they must not be placed closer than five (5) cars from each other.

Unless length of train will not permit, this car must not be closer than fifteen (15) cars from the engine or ten (10) cars from the caboose.

This car must have air-brakes and hand-brakes in service, and be placed between box cars in good condition with air-brakes in service. The cars between which it is placed must not be loaded with oil or other inflammable material, charcoal, lumber, iron, pipe or other articles liable to break through end of car from rough handling. If this car has a steel underframe it may be placed between steel coal cars.

Shifting and Local Freight Trains.—Shifting and local freight trains may handle more than three (3) cars of explosives per train, provided they are coupled in the air service and placed as near the center of train as possible and every precaution taken to insure safety.

Handling in Yards.—When handling cars containing explosives in yards or placing them on sidings they must, unless it is practically impossible, be coupled to engine protected by a car between, and the cars not cut off while in motion. When this is not possible in placing cars, the hand-brakes must be examined and known to be in perfect working order. Other cars must not be allowed to strike a car containing explosives. This car must be so placed in yards or on sidings that it will be subject to as little handling as possible and removed from all danger from fire.

Agents at destination and transfer stations must see that these cards are removed from car as soon as the explosives are unloaded.

93. The agent will be held responsible if a car containing any of the explosives (as prescribed in paragraph 86) leaves his station or a siding within his jurisdiction without having the certificates and placard prescribed in paragraphs 91 and 92 securely and properly affixed.

94. Shippers' Certificate.—Before any package containing one or more of the following articles: Black or Brown Powder, High Explosives, Wet Nitro-Cellulose, Smokeless Powder for Cannon, Smokeless Powder for Small Arms, Fulminates, Small-Arms Ammunition, Ammunition for Cannon, Explosive Projectiles, Detonating Fuses, Blasting Caps, Primers, Percussion or Combination Fuses, Common or Special Fireworks, can be accepted the shipper must deliver to the receiving freight agent a duly executed certificate on the prescribed form. The shipper must obtain these forms from the station agent, who must keep an adequate supply on hand.

SHIPMENTS FROM CONNECTING LINES.

106. Cars offered by connecting lines, not known to have adopted and made due provision for enforcing these regulations, will be thoroughly inspected and if it be found that either the car or its lading is not in the condition required by these regulations, the car will not be received until the defects are corrected by the line offering it.

HANDLING OF EXPLOSIVES.

107. In handling packages of explosives at stations and in cars, the greatest care must be taken to prevent their falling or getting shocks in any way. They must not be thrown, dropped nor rolled on the platform or car floor, but must be either carried by one or more men or handled on trucks well adapted to this service, and in such a way that the packages cannot fall.

108. The agent must choose careful men to handle explosives, must see that the platform and feet of the men are as free as possible from grit, and must take all possible precautions against fire. No unauthorized person must have access to the explosives at any time while they are on the property of the company. Suitable provision must be made for the safe storage of explosives and every effort possible must be made to reduce the time of this storage. Prompt removal by consignees must be enforced.

LOADING IN CAR.

109. Boxes of high explosives must be loaded in the car, top side up, so that the cartridges will be on their sides and never so that the cartridges will be on end.

110. All other boxed explosives must be loaded with the boxes top side up. Explosives packed in round kegs, except when boxed, must be loaded on their sides in rows across the car if there is more than one tier. Larger casks, barrels or drums may be loaded on their sides or ends as will best suit the conditions.

111. Whatever the kind or form of the packages, after they are loaded they shall be so stayed by whomever loads the car that they cannot change position under the ordinary shocks of transportation. Special care must be

used so that they cannot fall to the floor or have anything fall on them during transit. Shippers must furnish the lumber and labor required for staying all shipments loaded by them, and this lumber should not be less than two (2) inches thick, except in cases where this thickness is manifestly not required.

112. Detonating fuses and blasting caps must not be loaded in a car or stored with high explosives of any kind, including wet gun cotton, nor with smokeless powder for small arms.

113. Fulminates in bulk must not be loaded with any explosive or inflammable material.

114. When necessary, detonating fuses may be assembled in explosive projectiles shipped by the Government.

115. Fireworks must not be loaded in the same car with any other explosive or inflammable substance, except small-arms ammunition, safety fuse and safety squibbs.

116. With the exceptions noted in paragraphs 112, 113 and 115, packages of explosives may be loaded in the same car.

117. No inflammable substance, including nitro-cellulose wet with an inflammable liquid, and no shipment of an acid or of other chemicals, must be placed in a car containing explosives of any kind, or stored on railway property near an explosive. When practicable, special and separate days should be assigned for receiving shipments of explosives and of inflammables respectively. Samples for shipment to the Chemical Laboratory, Bureau of Explosives, should be accepted at any time.

118. In a car containing explosives, all packages of other freight must be so loaded and stayed as to prevent all injuring of packages of explosives during transit.

Handling Cars Containing Explosives.

119. Cars containing explosives must not be hauled in a train carrying passengers.

120. The conductor must under no circumstances take a car containing explosives from a station, including transfer stations or a siding, unless it is properly carded as per paragraphs 86, 91 and 92, and unless the car appears to be in first class condition. He must also have in his possession the special card way bill for explosives, paragraph 102, showing record of movement of car over his line.

121. The conductor must in all cases notify the enginemen and trainmen that a car containing explosives is on the train and where it is in the train before leaving the initial station.

122. Conductors must frequently inspect such cars to see that the carding is intact. When any of these cards become detached or lost in transit, the conductor will give notice thereof on arrival at the next division terminal yard to the yardmaster or other person in charge, who must attend at once to recarding the cars as required.

123. When such a car is destined to be transferred, unloaded or stored for any purpose at a given junction, station or yard, the conductor must give due notice to such station by wire of the probable time of arrival and the number of cars (not car numbers), in order that proper provision may be made at that point for handling the car or cars.

124. At points where trains stop, trainment must examine cars carded as containing explosives and adjacent cars to see if they are in good condition and free from hot boxes or other defects liable to cause damage. If cars are set off short of destination for any cause, the conductor must notify the nearest agent, who must see that every precaution is taken to prevent accident. The conductor must also notify the superintendent from the first telegraph office.

125. Whenever a car containing explosives is opened for any purpose, inspection must be made of the packages of explosives to see that they are properly stayed and in good condition, and that no boxes of dynamite are standing on end. Upon the discovery of leaking dynamite or loose powder the defective packages must be removed to a safe place by careful handling. If necessary, place the car carefully on an isolated siding and notify superintendent by wire.

126. In a through train, a car carded as containing explosives must be placed as near center of train as possible, and not closer than fifteen (15) cars from the engine or ten (10) cars from the caboose, unless length of train will not permit; it must have its air-brake and hand-brakes in service and be placed between cars with air-brakes in service. It must be placed between two box cars in good condition not loaded with oil or other inflammable material, lumber, iron, pipe or other articles liable to break through end of car from rough handling. Cars containing explosives must not be placed in a train within five cars of each other, and not more than three such cars must be placed in any one train. For branch lines special regulations will be made by individual lines and only necessary departures from these regulations will be authorized. See paragraph 92.

127. If the car containing explosives is a steel under-frame car in first-class condition it may be placed between two coal cars.

128. Handling in Yards.—In handling cars carded as containing explosives in yards or placing them on sidings, they must, unless it is practically impossible, be coupled to the engine protected by a car between, and the car must not be cut off while in motion. It must be known that the hand-brakes are in good condition. Other cars must not be allowed to strike a car carded as containing explosives. They should be so placed in yards or on sidings that they will be subject to as little handling as possible and removed from all danger of fire.

129. Agents at destination and transfer stations must see that the certificates and placards prescribed in paragraphs 91 and 92 are removed from car as soon as the explosives are unloaded.

Distribution of Regulations.

130. Agents must furnish all the shippers of explosives within their territory with copies of these regulations, and the receipts of the shippers must be mailed to the Division Superintendent.

In Case of a Wreck.

131. In case of a wreck involving a car containing explosives, the first and most important precaution is to prevent fire. Although most of the group, "high explosives," will burn in small amounts quietly, and without causing a disastrous explosion, yet it must be remembered that it is the characteristic of most explosives to burn, and consequently everything possible must be done to keep fire away. Before beginning to clear a wreck in which a car containing explosives is involved, all unbroken packages should, if possible, be removed to a place of safety, and as much of the broken packages as possible gathered up and likewise removed. Furthermore, it should be borne in mind that many "high explosives" are readily fired by a blow, and many explosives, except when they are wet, by the spark produced when two pieces of metal or a piece of metal and a stone come violently together. In clearing a wreck, therefore, care must be taken not to strike fire with tools, and in using the crane or locomotive to tear the wreckage in pieces, the possibility of producing sparks must be considered. With most explosives thorough wetting with water practically removes all danger of explosion by spark or blow; but with the dynamites, wetting does not make them safe from blows. With all explosives, mixing them with wet earth renders them safer from either fire, spark or blow. In case "fulminate" has been scattered by a wreck, the ground involved after the wreck has been cleared should have the top surface removed and after saturating the area with oil, replaced by fresh earth. If this is not done, when the ground and fulminate get dry, small explosions may constantly occur whenever the mixed material is trodden on or struck.

RULES FOR TRANSPORTATION OF INFLAMMABLE MATERIALS.

Section I—Rules for Shippers.

1. It is the duty of the shipper to deliver his goods properly manufactured, packed, marked and labeled, and to permit any inspection of his works by duly authorized railway officials deemed necessary to check the proper performance of this duty. The bill of lading prepared by the shipper should also give complete information as to the nature of the material in his shipment. For example, the word "Cement" does not properly describe a shipment consisting of "Rubber Cement—Volatile Liquid."

Labels.

2. All exterior packages containing inflammable materials or acids, including tank cars, must have securely and conspicuously pasted on them when presented for shipment a label of diamond shape. In pasting his label on tank cars the shipper must be careful to remove the old label. The color of the label will be red for packages in Group 1, yelow for packages in Group 2 and white for acids.

3. With these rules as a guide, shippers will have no difficulty in reaching a prompt and accurate decision as to the proper label to apply to a given package; and they will appreciate the importance of the label when informed that rules are based on them for the guidance of railway employees in handling, storing and loading packages protected by them.

4. Any deception, by a shipper or his agent, consisting in a misrepresentation of the nature of his shipment, by the use of the wrong label, or otherwise, and for any improper purpose, will be prosecuted under any law applicable to the offense.

5. Each label must bear the signed, stamped or printed name of the shipper, or of a party or firm for whom the shipper has assumed the responsibility in writing, as an assurance that the shipper has complied with these regulations. Blank labels will be supplied by station agents, or shippers may have them printed for their own use.

CLASSIFICATION OF INFLAMMABLES.

Group 1—Volatile Liquids.

6. This group includes any cement, drier, lacquer, paint, paste, solvent, varnish or any other compound or mixture that gives off inflammable vapors (as determined by the "open test" known to all chemists) at or below a temperature of 100 deg. F.

Some examples of substances that may place any mixture containing one or more of them in this group are:

Acetone.	Ether.
Alcohol, Amyl.	Fusel Oil.
Alcohol, Grain.	Gasolene.
Alcohol, Wood.	Naphtha.
Benzine.	Petroleum Ether.
Benzole.	Tar, Coal, Undistilled.
Bisulphide of Carbon.	Toluol.
Coal Tar Naphtha.	Turpentine.
Crude Oil.	Xylol.

Cylinders Containing Inflammable Compressed Gases.

Packing for Group 1.

7. All materials must be packed in strong and tight barrels or preferably in metal drums or vessels, and all packages must be securely closed.

8. Packages must not be entirely filled. Sufficient interior space must be vacant to permit expansion of liquid and vapor, and prevent distortion of containers.

9. A red label, of diamond shape, measuring 5¾ in. on each diagonal, and bearing the following inscription in black letters, will be pasted on each exterior package that contains any interior package belonging to this group: [Caution Label omitted.—Editor.]

Group 2—Inflammable Solids.

10. This group includes all materials subject to spontaneous combustion; or liable to cause fires when packages containing them are ruptured; or of a highly inflammable nature when ignited. The following list shows prominent examples, but is not intended to be complete:

Barium Peroxide.	Phosphorus, Yellow.
Calcium Carbide.	Potassium Chlorate.
Cotton Waste (oily).	Potassium Permanganate.
Matches, Friction.	Potassium Peroxide.
Metallic Sodium or Potassium.	Celluloid.

Packing for Group 2.

11. Packages must be tight and strong, and the interior packages must

be so cushioned and secured that no rupture of either package can result from the ordinary shocks incident to transportation.

12. A yellow label, of diamond shape, measuring 5½ in. on each diagonal, and bearing the following inscription in black letters, will be pasted on each exterior package containing one or more packages belonging to this group, and no package belonging to other groups. [Caution Label omitted.—EDITOR.]

GROUP 3—ACIDS

13. This includes the liquid mineral acids, that may cause fires or damage other shipments, and consists principally of the following:

Hydrofluoric Acid.	Sulphuric Acid.
Hydrochloric Acid.	Nitric Acid.

PACKING FOR GROUP 3.

14. Hydrofluoric acid in india rubber or ceresine bottles, hermetically sealed, or in lead carboys, packed in strong cases, barrels or casks, or acid may be packed in tight hardwood barrels lined with asphaltum. Barrels to be painted on outside with acid-proof paint, securely hooped and carefully inspected by shipper.

15. Sulphuric or hydrochloric acids in earthen jars, or glass bottles, or carboys, all hermetically sealed. Jars or bottles must be packed in a strong case and well cushioned; carboys must be packed in special cases provided with strong handles.

16. Nitric acid of gravity below 1.48 must be packed as prescribed for sulphuric or hydrochloric acid, except that the bottles, jars or carboys must be well cushioned by elastic incombustible dunnage. When the gravity is above 1.48, the bottles, jars or carboys must, in addition to the elastic dunnage, be surrounded by an equal volume of incombustible absorbent material.

17. Mixed nitric and sulphuric acids may be packed as prescribed for nitric acid, or shipped in strong iron drums or tank cars.

18. A white label of diamond shape, measuring 5½ in. on each diagonal and bearing in black letters the following inscription, will be pasted on each exterior package containing an acid of this group: [Caution Label omitted. EDITOR.]

SECTION II—CAUTIONS AND RULES FOR RAILWAY EMPLOYEES.

PACKAGES OF INFLAMMABLE LIQUIDS PROTECTED BY RED DIAMOND LABELS.

1. Leakage forms gas that may be ignited by a flame of match or lantern.

2. L.C.L. lots of explosives and inflammables should be received on different days. Return to shippers all packages of inflammables not properly labeled.

3. Must never be stored nor loaded in car with explosives, nor with valuable freight; when necessary, may be loaded with packages protected by yellow diamond labels, kerosene oils, etc.; but, as a rule, try to keep these packages separated from all other inflammable articles.

4. Packages must be loaded in car so that all labels of diamond shape, and especially the red ones, are as conspicuous as possible to freight handlers.

5. Load in box cars in good condition, but clear the doors back six inches for ventilation.

6. When practicable store these articles away from other freight in stations and on platforms. Replace lost or detached labels.

7. If necessary to enter at night a placarded car, use electric light only. Station agents will keep portable electric lanterns on hand when other electric lights are not available.

8. Enforce prompt removal by consignee.

9. Upon detection of any strong odor, similar to that of gasoline or of alcohol, seek the broken package and remove it, but do not search at night with lantern. If necessary, place guard on car to keep lanterns away.

The Action of Sea Water on Concrete.

A committee of the Superintendents of Bridges and Buildings Association reporting on the above subject sent a circular letter to members asking information on the following points:

1. Concrete made in air and sunk into sea water.
2. Concrete deposited direct into sea water.
3. What effect has the rise and fall of tide water on concrete?
4. What effect has the frost on concrete where the tide rises and falls on same?

A New York member wrote:

1. Where there is no ice formation, concrete, if made in air with fresh water and then sunk into sea water works well, but shows a tendency to disintegrate slightly on the faces between low and high water levels.

2. I would not deposit concrete direct into sea water. Where the salt water permeates the whole mass of concrete the faces disintegrate faster than where the concrete mixed with fresh water is made in air and then sunk into position in the sea water.

3. Between low and high water the faces of the concrete show a tendency to disintegrate.

4. Where there is severe cold and a large ice formation concrete exposed to the rise and fall of the tide will disintegrate on the exposed faces; (in my experience to a depth of ⅛ in. to ¾ in.). If this disintegrated portion is faced up with cement mortar each spring there will be no further trouble until the ice goes out the next winter. Bridge piers and abutments should be built from about 2 or 3 ft. below extreme low water to the top of the masonry, of granite ashlar dressed smooth on the faces exposed to the ice and salt water and backed with concrete.

Another New York member wrote:

1. Mix it dry and put it through chutes into the water; never mix with water before putting into bed.

2. Concrete deposited into sea water will be covered under 'I. In the vicinity of New York there is very little of this done, most of the concrete handled at this point is made into blocks and sunk to the depth required and handled by divers. This seems to be the better method and gives more satisfaction than trying to put it in in any loose form.

3. The rise and fall of the tide seems to have no effect whatever on the concrete blocks when placed as mentioned above. The frost does not seem to have any appreciable effect on the concrete. Very often granite blocks are placed above the substructure of granite blocks, as granite is known to be much stronger than concrete. In places where foundations are on a slope concrete filled in bags are sunk, which makes a very solid foundation.

A Boston member says:

2. So far as I know this gives perfectly satisfactory results if the material and method of work are right. The cement should contain not over 2 per cent. sulphuric tri-oxide and a low content of magnesia; the sand should be good and crushed stone should be used rather than pebbles; the mixture should be not leaner than 1:2:4, and it should be deposited either with a tube or a bucket on the O'Rourke pattern, which opens wholly inside the bucket, making practically a closed tube for the concrete to drop through. In using a tube the first charge is bound to be washed, hence it is best to begin operations each morning out in the area well away from the forms, so as not to have washed concrete on the outside of the mass when finished. This is difficult to impress on the workmen, as they always want to start operations at one corner. At times there is trouble from the milk of lime, which is too heavy to float away in the water. If it collects more than about 3 in. thick, it should be pumped off or otherwise disposed of; it will not harden, and if covered into the mass will make a weak section. If concrete is properly deposited in pure sea water it sets even stronger than in air, but I prefer to have a stone masonry facing between high and low water. If concrete is exposed to the sun's action between tides it must be extraordinarily good to withstand the combined action of all the forces acting to disintegrate it. An example given as successfully deposited under water, is shown on pages 60 and 61, Proceedings of our association for 1901. There are a large number of piers around Boston built similarly to this, and there has been no failure or trouble with them due to lack of integrity of the concrete. Above low water the pier is faced with stone. Attention is always given to the chemical constitution of the cement used, and it is tested for soundness in sea water by the so-called barrel test. This consists of placing a small barrel in a large cask filled with sea water, and then filling the small barrel with cement through a small tube. After 24 hours the cask is dumped and the barrel cut off from the concrete. If the cement is suitable to use, the concrete will be quite hard and will require a pick to break it up. Analysis for sulphuric acid should accompany this test, as the barrel test alone will not prove durability. A remarkable instance of concrete made in air and sunk into sea water (item 1) has just been executed at Brunswick, Ga., where reinforced concrete piles 18 in. square, 41 ft. long, tongued and grooved, have been placed for a pier facing. These are rodded back to a double row of timber piles and the pier is filled solid with earth. Timber fender piles are driven in front of the concrete face to take the blows from vessels. The concrete piles are sunk by water jet through a pipe cast in the center of the pile.

The report states that all of the replies seem to agree that concrete should be faced with granite above low water, as the rise and fall of the tide has a tendency to disintegrate the concrete. Also that frost and ice formation, where tide rises and falls, has a greater tendency to disintegrate the concrete. A number of structures of concrete in tide-water in the vicinity of Boston were examined and in every structure disintegration was taking place with more or less rapidity between high and low water, in some cases, notably the arches under the piers at Charlestown Navy Yard, this disintegration being to such an extent as to seriously affect the stability of the work. The committee is informed that this disintegration was considerably more rapid in cold weather when frost was experienced that at other times, although disintegration occurs even in warm weather. In some cases the concrete scales off in quite large patches, but in most of these cases it comes out in small particles, so that the stones which form a part of the concrete were left projecting from 1 in. to 2 in. beyond the general surface, or until such time as the weight of the stone would offset what little holding power remained to the concrete at the inner point of the stone. The same trouble occurs with granite above low water. Several places examined showed the mortar had disappeared in the joints and had to be repointed after three or four years.

A concrete pier on the Providence river, at Warren, R. I., was built about 25 years ago with a mixture of sand and cement of about 1 to 3. This concrete is in a good state of preservation, except between high and low water, where it is worn away in places from 4 to 8 in., which looks as if it was done more by the current and ice as the tide ebbs and flows, than by the combined action of frost and tide water rising and falling. The current at this point

runs at about the rate of eight miles per hour, which is pretty fast, and causes quite a whirlpool as it passes the pier. The granite abutments mentioned above, where the pointing was all gone between high and low water, was near this place, above high water the pointing was in good condition.

It is the opinion of the committee that Item 2 is the cheapest and best method of sinking concrete into sea water, and if properly mixed with proper material and properly handled and faced with granite above low water, with a suitable number of headers to make the granite masonry firm, it will do good service. Also that it would add to the stability of the granite if the joints were calked with lead.

The report is signed by G. Aldrich, Chairman; Willard A. Pettis, Geo. W. Andrews and John E. Barrett.

Some Early Royal Railroad Journeys.

BY W. B. PALEY.

The connection of royalty with railroads in Great Britain is of very old standing and certainly does not tend to diminish as time goes on. In fact, it began so soon as the first line of any considerable length was completed. On September 17, 1838, the section of the London & Birmingham Railway between Denbigh Hall, near Bletchley, and Rugby was brought into use and the great work finished after more than four years of unparalleled toil and difficulty. On that day a special train conveying the directors, Robert Stephenson and others, left Euston for Birmingham at 7.15 a.m. Among the passengers was H. R. H. the Duke of Sussex, the Queen's uncle, who took much interest in scientific developments of all kinds. He was attended by a small suite and had with him two private carriages on trucks, but left the train at Rugby to proceed by road to Newstead Abbey, in Nottinghamshire. Contemporary accounts say that the Duke was "introduced into the spacious area and anxiously watched the operation of arranging the order of the carriages." It is further stated that he "appeared throughout the whole of the journey to be highly delighted with railroad traveling," which must have been extremely gratifying to the directors! From the guard's journal, quoted by *The Times*, it appears the engine was taken on at the top of the rope-worked incline at Camden (Chalk Farm) at 7.20 and Tring reached at 8.25. Water was taken here, and the engine changed at Wolverton at 9.16. The new piece of line, for 30½ miles further, was run over so cautiously that Rugby was not reached till 11 o'clock.

It is not recorded that King William IV. ever traveled by rail, but his widow, the Queen-Dowager Adelaide, first did on Oct. 15, 1839, when she went from London to Rugby by the 12 o'clock ordinary train. When returning, however, on Nov. 30 a special train of seven coaches was used, the journey of 83 miles being made in 2 hours 50 minutes. As "some unavoidable delay occurred in passing the 10 o'clock up train at Tring," and the engine was probably changed at Wolverton, this must have been decidedly a fast run for those days. The vehicle used by the Queen-Dowager is still preserved at Wolverton. It is not really a "saloon," however, in the modern sense, but merely a three-compartment first class of the type then used on the mail and express trains, with two ordinary compartments and another "coupé," that is, with only one seat and having windows in the front. It was run over many lines on Queen Adelaide's numerous visits to the nobility in the early forties.

The late Prince-Consort seems to have made his first railroad journey in England on Nov. 14, 1839, at the conclusion of his second visit. Accompanied by his elder brother, he traveled from Slough to Paddington by the Great Western, continuing his way by road to Dover. No particulars of the trip are given in the papers, but after his marriage to Queen Victoria the following year the Prince frequently used the railroad, and, in fact, seems to have preferred it to the uninteresting journey by road. On Sept. 21, 1840, he had a fast run up. A special had been kept in readiness, the Princess Augusta, aunt of the Queen, being on her death-bed in London. The train left Slough at 3.06 p.m. and reached Paddington 3.28½, the 18 miles being run in 22½ minutes, or at the rate of 48 miles per hour. It consisted of an open-sided carriage containing "two old and experienced guards for the purpose of using the break in case of need," and the new saloon just built for the Queen's use. The engine was the "Sun," a 6-ft. "single" of Hawthorn's design, just built by them at Newcastle-on-Tyne. Including the drives at each end, the Prince reached Buckingham Palace in 59 minutes from leaving Windsor.

One of the most famous broad-gage runs made by Prince Albert in those days was on July 19, 1843, when returning from witnessing the launch of the "Great Britain" steamship at Bristol. According to the diary of Sir Daniel Gooch, the trip of 118 miles was done in 124 minutes. This may have been the actual running time, though if it was there must have been much delay somewhere, but the diary is not very trustworthy, and *The Times*' statement that the Prince left Bristol at 4 p.m. and reached Buckingham Palace at 7.15 is far more likely to be correct.

The Great Western had been open between London & Slough for about four years before Queen Victoria ventured upon it, or indeed upon any railroad. In this, possibly, she was guided by the advice of others, and for some time, too, there was no proper station at Slough. However, on June 13, 1842, the Queen made her first railroad journey. Accompanied by Prince Albert she left Slough by special train at 12 noon and reached Paddington at 12.25, Mr. Daniel Gooch, as Locomotive Superintendent, driving the engine "Phlegethon." Brunel also was on the foot-plate, in fact, for many years one or both of them was on the engine of the Royal special on the G. W. R.

Having satisfied herself by personal experience of its comfort and safety the Queen soon entrusted her family to the care of the rail. On Saturday, July 23, 1842, she left Paddington about 3.40 p.m. with Prince Albert, the Princess Royal and the Prince of Wales. The train consisted of four vehicles, namely, the usual open-sided second class, followed by two firsts with the Royal saloon between them, and 'the Mentor engine having been attached to the train the signal was given and the royal party were quickly out of sight." It is further stated that "Her Majesty and Prince Albert appeared much pleased with the animated scene they beheld." This was the first railroad journey made by the present King, who was at the time only eight months old. Both "Phlegethon" and "Mentor" were 7 ft. "single driver" engines of Gooch's design, similar to the one illustrated in the *Railroad Gazette* of January 8, 1904.

More than a year elapsed after this before Queen Victoria traveled on the narrow-gage, as it was then termed. The occasion was a journey to Southampton, on August 28, 1843. Farnborough was the point at which the railroad was taken, after a drive of 15 miles from Windsor. Prince Albert went with the Queen, the trip of 45½ miles being run in 81 minutes without a stop. The train, consisting of five vehicles, was worked by a new engine named "Elk," and left Farnborough at 9.19 a.m.

Royal Saloon at Slough Station, 1842.

The Prince of Wales, now King Edward, made his first journey on what is now the standard gage on Sept. 10, 1844. Traveling up to Paddington by the Great Western, the party, consisting only of the royal children under the care of the Dowager Lady Lyttelton, drove by Bramhall Bridge to New Cross station, where they took train for Brighton. The special arrived at 5.45 p.m., the engine being driven by Mr. Benjamin Cubitt, the head of the Locomotive Department. The object in going to New Cross was to avoid the dangerously narrow and crowded streets that then existed near London Bridge station.

It is remarkable, however, that the first railroad journey made in this country by a crowned head was run, not by our own sovereign, but by a foreigner. This was on January 24, 1842, when the King of Prussia, Frederick William IV., who had come over to attend the christening of the Prince of Wales, went up to London by the Great Western for a day's sight-seeing. We are indebted to the *Great Western Railway Magazine* for the illustration.

The average annual mileage of freight cars on the Prussian railroads is stated as follows:

	Miles.		Miles.		Miles.
1851—1860.....	9,247	1881—1890.....	9,832	1901—1905.....	10,384
1861—1870.....	9,750	1891—1900.....	10,251	1905.....	11,127
1871—1880.....	9,186				

Allowing 300 working days in a year, this gives for the year 1905 37 miles for the average daily travel per car loaded or empty.

GENERAL NEWS SECTION

NOTES.

The Pennsylvania now has about 1,000 acres of forest under cultivation, containing 2,250,000 young trees in addition to the seed planted.

The Fall River Line, between New York and Boston, has made its usual autumn reduction in the through fare, which is now $2.65, instead of $3.65.

The Baltimore & Ohio is now using fuses with two colors. They burn red five minutes and then five minutes green. Heretofore the company has used fuses burning red ten minutes.

The New York State Public Service Commission, second district, has summoned the railroads of the state to show cause, November 25, why an order should not be issued requiring the sale everywhere of interchangeable 1,000-mile and 500-mile tickets at 2 cents a mile.

The railroads of Chicago have decided to no longer furnish men to assist consignees in unloading those classes of carload freight which, by the terms of the traffic, are required to be unloaded by the consignee himself. It is estimated that in the city 300 railroad employees have constantly been employed in this kind of work.

The New York, New Haven & Hartford has proposed to its western connections that it will pay 50 cents a day for foreign cars, provided the connections will accept enough New Haven cars to make the interchange equal, and also that the New Haven be allowed $1 a car reclaim, this reclaim to be in the nature of an allowance for the two days' additional free time which it is necessary to give consignees in Connecticut under the law of that state.

In the Federal Court at Little Rock October 25 the suit for an injunction to prevent the Railroad Commission of Arkansas from enforcing the flat cotton rate was dismissed. By a compromise, offered by Commissioner Allen, the railroads may charge a minimum of 50 cents on cotton hauled from one to 15 miles, instead of 25 cents, as originally set by the commission. The compromise carries with it the agreement of the various railroads to continue the concentration rate and to allow the shipper to choose what rate he prefers at any time. Thus is settled a serious controversy.

The Texas State Railroad Commission reports the mileage traveled on free passes over Texas railroads in the year ending June 30, 1907, as follows: Exchange, 21,062,065, or 17.02 per cent. of total free travel. By employees and members of their families, 81,307,345, or 65.69 per cent. of free travel. On account of newspaper advertising, 5,866,836, or 4.73 per cent. of free travel. By public officials of United States, state, county and municipal governments, 7,968,421, or 6.44 per cent. of free travel. By other persons, charity, religious, etc., 7,569,895, or 6.12 per cent. of free travel. Grand total, 123,774,562 miles traveled free, or 11.66 per cent. of the entire travel in the state.

Press despatches from St. Paul say that the shortage of freight cars in the Northwest has now become acute. Although the railroads have bought large numbers of new engines and freight cars during the past year, and although 500 new grain warehouses have been built in Minnesota and North and South Dakota, the increase in population has more than kept pace with these improvements, so that hundreds of shipments of merchandise are now from four to six weeks behind time. Much freight for the East is being transferred so as to insure the retention of home cars at home. At Buffalo, N. Y., all the eastbound roads are reported short of cars. Traffic in the city has become so heavy that a blockade is on, though as yet it is small, as compared with last year. At Chicago the railroads are strained to their utmost to handle freight without delay. Not only is there a larger grain movement than usual at this season, but there is a heavy traffic in live stock, coal and merchandise.

At Seattle, Wash., October 31, the Pacific Coast Lumber Manufacturers' Association secured from the Federal court a temporary injunction against the increase of 25 per cent. in through eastbound rates on lumber, which had been announced by all the railroads and which was to go into effect November 1. In consequence of the court's order the Northern Pacific has announced that no more lumber shipments will be received for the East until further notice. This move is expected to be followed by all the railroads affected by the injunction. The decision requires shippers to give bonds to pay the increased rate, if it shall hereafter be decided to be just, but the roads claim that they would be taking too great a risk to allow the excess freight charges to accumulate until a final decision is made. Litigation will ensue and many of the lumber firms may have gone out of business before the legality of the rate is settled. Another contingency the railroads have to face is the law providing that all rates must be published and posted thirty days in advance. In case they decide to go back to the old rate they cannot do it now without such notice.

Merchants' Despatch Absorbed by N. Y. C.

The New York Central & Hudson River Railroad announces that it has leased the Merchants' Despatch Transportation Company, and henceforth that name, like the names of other fast freight lines, will be only a form for use in advertising. The Merchants' Dispatch was organized in 1856, and is believed to be the oldest organization of its kind in the country. Primarily, it was a soliciting agency, employing agents of its own, and paying commissions to the local freight agents of the railroads, to secure competitive westbound freight. Later it built large numbers of cars, and the management of these cars became a chief part of its business. Many of these cars were refrigerators, for use in carrying eastbound freight, and the profits from car rentals constituted the main part of the company's income. Claims for loss, damage and overcharge on freight will hereafter be settled by the individual roads. No change has been announced in the soliciting agencies.

New York-Boston Steamers.

The Metropolitan Steamship Company has discontinued for the winter its through 15-hour all-water passenger line between New York and Boston. This line, which was operated by the turbine steamers "Harvard" and "Yale," had been running only six weeks. The gossips are undecided whether this sudden cessation of business is due to an agreement with the New Haven road or to a lack of profitable patronage.

The Joy Line has been bought by the United States Transportation Company, operating the Neptune Line. The United States company was formed early this year under Connecticut laws, with $750,000 capital, and its two boats plying between New York and Fall River were purchased from the New England Transportation Company. The new company is looked upon as a New Haven railroad concern.

"Mauretania" 27.36 Knots.

The new Cunard turbine steamship "Mauretania," on a trial November 5 off the Irish coast, made an average of 27.36 knots (31.5 miles) an hour over a 300-mile course. This is nearly one knot faster than the "Lusitania" made for the same distance on her trial. The "Mauretania" is due to arrive in New York for the first time November 21.

A Hundred-Ton Wagon.

J. A. Shephard & Son, of Brooklyn, N. Y., have built what is believed to be the most powerful wagon-road truck ever constructed. It was built especially to carry the heavy iron girders and columns for the new Pennsylvania Railroad terminal in Manhattan and has a capacity of 100 tons. It is owned by the Meade Transfer Company. The wheels are 3 ft. in diameter, with tires 14 in. wide, and are made of cast-steel. They weigh 3,000 lbs. each. The front axle is 14 in. in diameter in the center and 7 in. at the ends. The rear axle is smaller. These axles weigh about one ton each. The reach is 37 ft.

Panama Canal Record in October.

The Washington office of the Panama Canal reports that in the month of October 1,844,471 cu. yds. were dug from the prism of the canal, an increase of more than 23 per cent. over the quantity excavated in September. The rainfall in October was 17.1 in. In the same month 24,258 cu. yds. were excavated on accessory works.

Protection of Track Circuits from Foreign Currents.

Henry Bezer, whose invention for insuring the safety of automatic block signal operation by neutralizing the effect of stray electric currents in the rails has been in use on the Central of New Jersey for 15 months, has made a radical improvement in his designs, and the improved apparatus is to be put in use on a section of the Cincinnati, New Orleans & Texas Pacific, as well as on another section of the Central of New Jersey. In this latest arrangement the track circuit of a given block section has a battery at the outgoing end, as usual, and at both this end and at the entrance of the section there is an arrangement of special relays by means of which a vibrating current is temporarily produced each time the signal is to be cleared. The signal cannot clear unless an instrument at the track battery end of the block, vibrating at the rate of about two vibrations per second for from 3 to 6 sections, operates the circuit; and when a train is in the block the instrument does not vibrate. There is therefore next to no wear and tear upon contacts. The system is so arranged that the signal is held clear by a direct cur-

rent which follows in and takes the place of this temporary intermittent current. A foreign current, whether direct or alternating, could not produce the vibrations necessary to operate the relays.

The relays will operate with the track battery generally in use, but for the sake of smart vibration Mr. Bezer plans to use 2 volts.

From the exhaustive tests which have been conducted on the Central of New Jersey, it is practically certain that with the new arrangement 2 volts of track battery will be sufficient to combat foreign currents usually met with on steam roads, with the track and the insulated joints kept in reasonably proper condition. That is to say, 2 volts will be sufficient to prevent foreign current holding a signal in the stop position. But whatever the strength of the track battery, neither neglect in track maintenance, nor a broken rail, will enable foreign current to clear a signal. Means are provided also to prevent foreign current from causing the track relay to hold its armature when a train enters the block either from a siding or from the track-battery end.

The installation already in service on the Central of New Jersey is "wireless" and the signals stand normally at clear. A brief description of this was given in the *Railroad Gazette* of January 18, last. With this installation, which is still in service, it is necessary that the maximum foreign current be ascertained and that the apparatus be adjusted accordingly; and in order to give adequate protection in case of a broken rail or adverse traffic conditions, a powerful track battery has to be used. With the intermittent current arrangement now to be used, a foreign current is inoperative, whatever its power, and without regard to whether it is direct or alternating.

By the use of this apparatus and arrangement, the employment of an alternating current is made unnecessary, and it is thus possible to avoid the cost and inconvenience of a power house and long stretches of copper conducting wire, with the increased chances of failure which are inseparable from the added complication.

Steam Consumption in a Curtis Turbo-Generator.

In a paper read before the American Street & Interurban Railway Engineering Association, A. H. Kruesi gave the results of tests at Chicago with a Curtis turbine coupled to a 9,000 k.w. generator. The steam consumption of the turbine per horse-power hour, at the ratings given, was as follows:

Rate	Steam consumption, per h.p. hr.	Rate.	Steam consumption, per h.p.-hr.
7,200 h.p.	9.81 lbs.	16,125 h.p.	9.74 lbs.
10,814 "	9.70 "	18,625 "	10.15 "
13,650 "	9.62 "		

In which it appears that the steam consumption increased as the power varied in either direction from the normal rating of 13,000 h.p.

Engineering Societies' Libraries.

The reference libraries of the American Institute of Electrical Engineers, the American Society of Mechanical Engineers, and the American Institute of Mining Engineers, at the Engineering Societies' building, 29 West Thirty-ninth street, New York City, will hereafter be open evenings until 9 o'clock on all week days except public holidays. These libraries are available to members of the above societies, to engineers and to the public generally, subject to proper regulations. Strangers are requested to bring letters of introduction from members or to secure cards from the secretaries of the respective societies.

Adams Express Company.

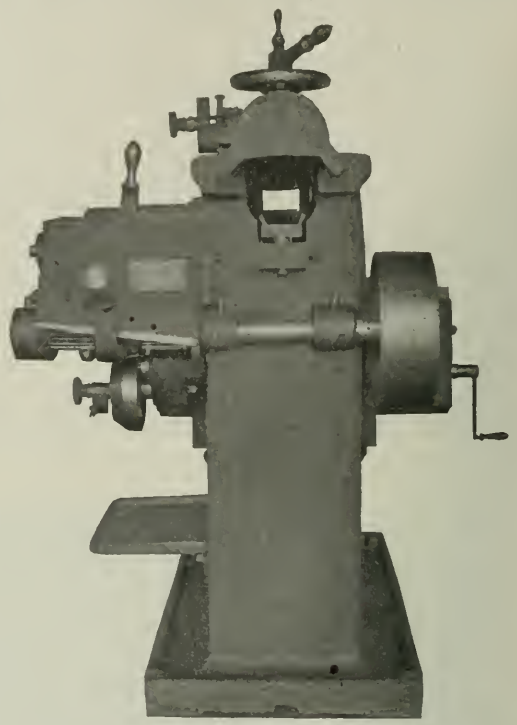
W. W. Barrett, Resident Manager of the Adams Express Company at Philadelphia, Pa., has been elected Vice-President in charge of the territory east of Pittsburgh, Pa., with office at New York City. H. E. Hoff, Superintendent at Baltimore, Md., succeeds Mr. Barrett. G. B. Curtis, Superintendent at Columbus, Ohio, has been appointed General Manager in charge of the territory west of Pittsburgh, with office at Chicago. This is a new office, the work having heretofore been in charge of Vice-President W. H. Daniels.

Reason and Red Tape Coincide.

Army or navy officers desiring to make use of the fastest trains between New York and Chicago must themselves pay the additional rate charged for riding on such trains. A paymaster's clerk received orders to take station at Bremerton, Wash., and he traveled on one of the "flyers" and paid $7 over the usual rate. His orders made no mention of any need for unusual haste, and in the adjustment of his accounts the extra rate was deducted. The regular overland trains are fast enough to transport officers from one point to another unless they receive specific orders to the contrary. The clerk asserted that he did not know when he purchased his ticket that he was entitling other than a first-class ticket, but his duties, it is held, should make him more particular [intelligent?] in his business transactions.—*New York Tribune.*

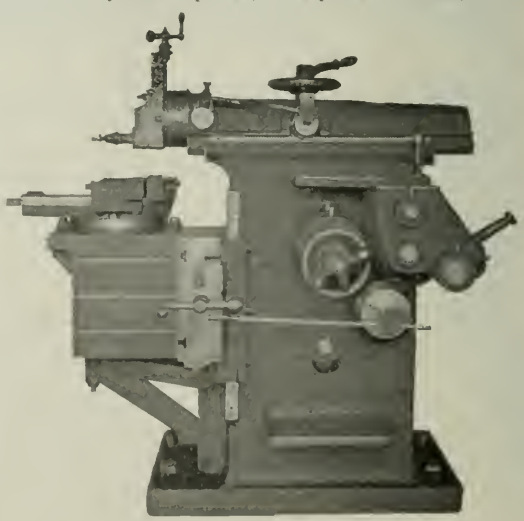
A New Flather Shaper.

The accompanying engravings show a new 16-in. shaper built by the Mark Flather Planer Co., which embodies several improvements. The ram bearings are of an entirely different type from those furnished on shapers heretofore, in that the alinement is



Rear View of Flather Shaper, Showing Gear Box.

maintained by means of the V-way, and that gibs have been entirely eliminated, while at the same time provision has been made for taking up wear. The ways are oiled by a V spring oiler, such as is ordinarily used on planers, and wipers are furnished for both



Side View of Flather Shaper.

ends of the ram bearings. The gear box is designed for heavy duty. All gears are made of steel cut from bar stock and each gear is cut with a cutter made to the exact number of teeth. Ten changes of speed are secured.

The machine is driven by a 4-in. belt and is ordinarily fur-

nished with a tight and loose pulley to be belted directly from the main line. This avoids the necessity of mounting a counter shaft on the ceiling, and at any future time the shaper can be equipped with a motor drive by simply attaching the motor to the rear of the column and connecting the driving shaft with suitable gears.

This shaper is furnished with power down feed of a new design. It may be made to feed either down or up and its construction makes it impossible for the feed attachment to get out of order or wear out. The support for the box table which is furnished with each machine, is always in position and needs no adjustment.

The Sherwin-Williams Convention.

The Sherwin-Williams Paint Co. held in Chicago last week its twenty-seventh annual convention of officers and representatives, more than 250 of which were in attendance from all parts of the world. The meetings were held at the company's plant at Pullman, there being two sessions a day from Monday to Friday inclusive. At each session there was an address on some matter of special importance to the sales representatives. These conventions serve the dual purpose of a school of instruction and of bringing these men into closer relationship with each other and with their officers. Prizes are awarded to the men having the best records. The program for the week was as follows:

Monday Morning, Oct. 28.—Reception from 8.45 to 9.15 a.m. Address of welcome by W. H. Cottingham, Vice-President and General Manager. Address by S. P. Fenn, Secretary and Treasurer. Distribution of "top-notcher" and other prizes. Inspection of Chicago plant.

Monday Afternoon.—"The Fundamental Principles Governing the Right Use of Paint," by J. C. Beardslee, General Superintendent. "The Fundamental Principles Governing the Right Use of Varnish," by M. L. Sims, General Superintendent of varnish manufacturing department.

Tuesday Morning, October 29.—"S. W. P.—Knowledge of the Goods and Their Proper Application," by A. E. Schafer, Manager General Sales Department.

Tuesday Afternoon.—"Floor Finishes, Painters' Goods, Sundry Shelf Lines—Knowledge of the Goods and Their Proper Application," by A. E. Schafer, Manager General Sales Department. "Dry Colors," by H. M. Ashby, Superintendent Dry Color Works.

Tuesday Evening.—Smoker at Chicago Beach Hotel.

Wednesday Morning, October 30.—"C. & M. Paint and Color Specialties," by W. J. Sohlinger, Manager C. & M. Sales Department.

Wednesday Afternoon.—"C. & M. Paint and Color Specialties" (concluded). "Credits," by S. P. Fenn, Secretary and Treasurer.

Thursday Morning, October 31.—"C. & M. and Trade Sales Varnishes," by W. W. Mountain, Manager Varnish Sales Department.

Thursday Afternoon.—"C. & M. and Trade Sales Varnishes" (concluded). "Railroad Street Railway and Marine," by E. M. Williams, Manager Street Railway Sales Department.

Friday Morning, November 1.—"Salesmanship—Application of Practical Knowledge to Salesmanship," W. H. Cottingham, Vice-President and General Manager, chairman; assisted by J. F. Hommel, General Supervisor, and A. D. Joyce, Manager Southwestern District.

Friday Afternoon.—"Advertising and Promoting," L. R. Greene, Manager Advertising Department.

The entertainment features included the smoker mentioned in the programme, and a banquet on Friday evening. At the latter there were some important addresses made, the speakers including ex-Senator W. E. Mason; L. A. Goddard, President Fort Dearborn National Bank, Chicago; President Sherwin and Vice-President Cottingham, of the company.

In connection with the convention there was an exhibit of the various products of the company and a full line of advertising literature.

TRADE CATALOGUES.

Business Atlas and Shippers' Guide.—A new feature of the 1907 edition of the Business Atlas and Shippers' Guide, published by Rand, McNally & Co., Chicago, is the printing in red, on the state maps, of electric railways. An alphabetical list of all electric lines in the United States, including a complete index of all terminal points of the main and branch lines, is given. The list of steam railroads of the United States, Canada and Mexico, which is a regular feature of this atlas, is brought up to date, a special index giving the names of through lines and branches and points between which they run. The book is almost indispensable to the business man, and is useful to the railroad man.

Track and Railroad Supplies.—General catalogue No. 20, just issued by the Kalamazoo Railway Supply Co., Kalamazoo, Mich., covers the principal articles made by the company. They include track drills, hand and push cars, velocipede cars, gasoline motor cars, jacks of several types, rail benders, [illegible] machines, replacer frogs, cattle guards, steel water tanks, water columns, pumping engines, snow scrapers, track gages and levels and curve lining gages. The book is 4½ in. x 7 in. [illegible] and has 144 pages, with index and considerable useful information in the back.

Santa Fe Employees' Magazine.—The October number of this magazine is larger than previous issues. "An Old Train Register", "Teamwork—Employees and the Public," and "Railroad Regulation," the last named being Walker D. Hines' address to the New York Traffic Club, are leading articles. An article on "The Grand Canyon" is reprinted, and there is a story, "The [illegible] Engineer," by a fireman on the road. The magazine has offered prizes to Santa Fe men for short stories—$50, $30 and $20 for the first, second and third best, the time limit being the end of the year.

Murali & Co., Engineers, 114 Liberty street, New York, have begun the issue of a small monthly bulletin under the title "Electric Trunk Line Age," of which the first number is dated October, 1907. The publication is to be a record of what electricity can do as a motive power under steam railroad conditions, with particular reference to the three-phase alternating current system. This first issue contains an illustrated description of the Simplon tunnel electric locomotives and an analysis of a typical steam road electrification problem.

MANUFACTURING AND BUSINESS.

The Isthmian Canal Commission has ordered 12 steam shovels from the Marion Steam Shovel Co., Marion, Ohio.

F. G. Whipple, formerly with the Weber Concrete Steel Chimney Co., Chicago, has been made Manager of the Sales Department of the Wiederholt Construction Co., Chicago.

S. T. DeLaMater, formerly with the Standard Construction Company, Chicago, has gone to the General Fireproofing Co., Youngstown, Ohio. He will be in the Youngstown office for the present.

The Tweedy-Randolph Co., Chicago, has been succeeded by Tweedy, Hood & Finlen, Inc., who will conduct the business under the same policy, and represent the same lines as heretofore. The office is in the Fisher building.

Joseph R. Foard and Arthur G. Wellington have been appointed receivers of the South Baltimore Steel Car & Foundry Co., Baltimore, Md. It is said that the receivership was caused because of the delay in collecting payment for cars delivered to railroads.

The Expanded Metal & Corrugated Bar Co., St. Louis, Mo., is furnishing the reinforcement for concrete work in the Pennsylvania Railroad's new terminal station in New York City. An order for 1,000 tons of corrugated bars was given by the contractor, The National Fireproofing Co.

The Pressed Steel Car Co., New York, and the Western Steel Car & Foundry Co. have opened offices in the National Bank of Commerce building, Fifth and Olive streets, St. Louis, with W. P. Coleman and his assistant, C. D. Terrell, in charge. They will handle business in the southwest.

With some ceremony and many speeches by the Mayor, railroad officers and guests, the first sod was turned, on October 26, at Ottawa, Canada, and work was begun on the new Central Union station, hotel and subway. The plans were made by Bradford Lee Gilbert, 50 Broadway, New York, and he will superintend the construction.

The Atha Steel Casting Co., Newark, N. J., was put in the hands of receivers last week. All of the stock of the company is owned by the Securities Investment Company, Pittsburgh, Pa., which is the holding company for the Westinghouse companies. The Atha company sells a great part of its output to the Westinghouse Electric & Manufacturing Co. and the receivership of the last named company tied up the funds due the Atha company, so that its receivership also became necessary.

The United States Steel Corporation has acquired control of the Tennessee Coal, Iron & Railroad Co. The T., C., I. & R. operates coal and iron mines, blast furnaces, foundries and 26 miles of railroad in Alabama and Tennessee and is the largest maker of open hearth rails in the country. It has outstanding about $30,000,000 common stock and about $15,000,000 bonds. The Steel Corporation is offering its 5 per cent. bonds in exchange, dollar for dollar, for the remaining T., C., I. & R. R. stock.

C. L. de Muralt, Consulting Engineer and Professor of Electrical Engineering at the University of Michigan, has been granted leave of absence from the university to supervise the electrification of the Arlberg tunnel under the Tyrolean Alps. Mr. Muralt has

been appointed Consulting Engineer of the Austrian State Railroads. The work to be done under his supervision will probably be the longest stretch of steam railroad electrified in either Europe or the United States, there being about 140 miles of road exclusive of the tunnel. The tunnel is on the main line from Paris to Vienna and is seven miles long, with steep grades from each mouth to the middle. When the plans developed by Mr. Muralt are carried out, the speeds of the trains passing over this line will have been increased 25 per cent. and the capacity of the road 50 per cent. Three phase alternating current locomotives will be used, developing 3,000 h.p., or about three times as much as the New Haven locomotives used in the New York suburban service. The locomotives designed for the Arlberg tunnel will, when coasting down the grade out of the tunnel, generate and return to the system about 60 per cent. of the energy used to pull the train up the grade into the tunnel.

Iron and Steel.

About 1,500 tons of rails have been ordered by traction companies.

The Great Northern has ordered 12,000 tons of rails for immediate delivery.

An inquiry is reported in the market for 7,500 tons of girder rails for Australia.

The Chilian State Railway has ordered 1,750 tons of light rails for delivery this year.

The United States Steel Products Export Company (United States Steel Corporation) has an order from the Japanese Government for 12,000 tons of 75-lb. rails. The price is said to be a little less than $30 a ton.

OBITUARY NOTICES.

C. W. Sanders, Chief Engineer of the Copper Range Railroad, died of pneumonia a few days ago at Houghton, Mich.

Hugh B. Ely, who has been Superintendent of the Insurance Department of the Pennsylvania for 25 years, died last week at his home at Beverly, N. J.

MEETINGS AND ANNOUNCEMENTS.

(For dates of conventions and regular meetings of railroad conventions and engineering societies, etc., see advertising page 24.)

Canadian Railway Club.

At the meeting of this club November 5, a paper on Standard Time by W. J. Camp, of the Canadian Pacific, was read.

Canadian Society of Civil Engineers.

At a meeting of the electrical section November 7, a paper on "The Calculation of Copper Conductors for Alternating Current Three-phase Transmission Lines," by F. B. Brown (M. Sc., S. Can. Soc. C. E.) was read.

American Society of Civil Engineers.

At the meeting of this society November 6 a paper on "Water Purification at St. Louis, Mo., by Edward E. Wall, was discussed. This paper was printed in the October "Proceedings."

St. Louis Railway Club.

At the meeting of this club November 8 a paper will be presented for discussion on the "Preservation of Wood Ties and the Forestry Department of a Railroad," by Chas. E. Koons.

ELECTIONS AND APPOINTMENTS.

Executive, Financial and Legal Officers.

Cincinnati, Hamilton & Dayton.—Edward Colston, a law partner of Judson Harmon, has been appointed General Counsel of the Cincinnati, Hamilton & Dayton, succeeding F. W. Stevens, resigned.

Galveston, Houston & Henderson.—See this company under operating officers.

New York, New Haven & Hartford.—John G. Parker, Secretary; Edward D. Robbins, Attorney, and Augustus S. May, Treasurer, have been elected Directors, succeeding Charles M. Pratt, Louis C. Ledyard and Richard Olney, who resigned last summer.

Tonopah & Goldfield.—C. K. Lord, formerly Third Vice-President of the Baltimore & Ohio, and later President of the Consolidation Coal Company and of the Cumberland & Pennsylvania, has been elected President of the Tonopah & Goldfield, succeeding J. W. Brock, resigned.

Operating Officers.

Atlantic Coast Line.—V. R. C. King has been appointed Trainmaster of the Wilmington division, with office at Wilmington, N. C., succeeding T. L. Dumas, transferred to the Second division.

Canadian Pacific.—R. W. McCormick, Assistant Superintendent at Montreal, Que., has been transferred to Ottawa. W. B. Cronk succeeds Mr. McCormick.

Chicago & North-Western.—See Southern Pacific.

Chicago, Milwaukee & St. Paul.—L. R. Clausen, Signal Engineer, has been appointed Superintendent of the Prairie du Chien and Mineral Point divisions, succeeding E. D. Wright, resigned. Alexander Brown succeeds Mr. Clausen.

Chicago, Rock Island & Pacific.—H. R. Saunders, Superintendent at Little Rock, Ark., has been appointed Superintendent of Terminals at Kansas City, Mo., succeeding A. B. Copley, transferred.

Delaware, Lackawanna & Western.—J. G. Sickles, Trainmaster of the Morris & Essex division, has been appointed Assistant Superintendent of that division, with office at Hoboken, N. J. F. Cizek, Assistant Trainmaster, has been appointed Passenger Trainmaster. W. H. Bailey, Assistant Trainmaster, has been appointed Freight Trainmaster of that part of the division east of Dover, N. J., with office at Hoboken, N. J. M. J. McGowan, assistant chief train despatcher, has been appointed Freight Trainmaster of the part west of Dover, with office at Port Morris, N. J.

Galveston, Houston & Henderson.—J. H. Hill, who has for some months been Secretary and Treasurer, has been reappointed to his former office of Manager.

Great Northern.—J. M. Gruber, who was recently appointed General Manager of the Great Northern in charge of operation and maintenance, was born in 1868 at Iowa City, Iowa. After a High School education he began railroad work as a stenographer in the general freight office of the St. Paul, Minneapolis & Manitoba. He later worked in the office of the General Manager and in 1889 went to the Atchison, Topeka & Santa Fe as a stenographer to the President. After a year he went to the Gulf, Colorado & Santa Fe, where he was chief clerk for a few months in the office of two superintendents, and was then appointed Assistant Trainmaster of the Northern division. After a year he was made Trainmaster of the Southern division and was then appointed chief clerk to the Superintendent of Transportation. After being chief clerk to the General Manager, he went to the Eastern of Minnesota as Assistant Superintendent. In 1895 he was appointed Superintendent of that road and in 1896 was made General Superintendent of the Montana Central. A year later he was appointed Assistant General Superintendent of the Eastern district of the Great Northern. In 1903 he was appointed General Superintendent of the Western district of the Chicago, Rock Island & Pacific, and the next year he went to the Union Pacific as General Superintendent. In 1905 he was appointed General Manager of the Chicago, Burlington & Quincy Lines East of the Missouri river, where he remained until he returned to the Great Northern last month.

J. M. Gruber.

Lehigh Valley.—C. T. O'Neill has been appointed Superintendent of the New York division, with office at Jersey City, N. J. This division consists of the road east of and including Parkview Station, N. J., together with the National Docks, Jersey City and Newark terminals.

Louisville & Nashville.—F. S. Griffin has been appointed General Agent at Detroit, Mich., succeeding L. R. Wasson, resigned to go into other business.

Mobile, Jackson & Kansas City.—Albert Franklin Church who was recently appointed Superintendent at Laurel, Miss., was born in 1858 at New Iberia, La., being the eldest of a family of three. When he was five years old his father died. He went to school for five years and then, when he was 14 years old, went to sea. After four years he began railroad work on Morgan's Louisiana & Texas as a switchman. He was made a brakeman in 1878, freight conductor in 1880 and passenger conductor in 1882. Six years later he was made yard despatcher. In 1903 he was appointed Trainmaster and in 1906 was made Train Inspector of the Atlantic system of the Southern Pacific, which includes the road he had been serving on. This position he recently resigned to go to the Mobile, Jackson & Kansas City.

New York Central & Hudson River.—H. J. Avery has been appointed Assistant Trainmaster of the Rochester division, with headquarters at Rochester, N. Y., succeeding M. E. Welch, transferred. The following have been appointed Assistant Trainmasters of the Mohawk division: L. Phelps, with office at Utica, N. Y., and W. H. Leonard and C. H. Steckel, with offices at Hoffmans, N. Y.

Pennsylvania.—C. R. Cosgrove has been appointed Assistant Trainmaster of the Buffalo division, succeeding D. C. Daley, transferred.

Panama Railroad.—J. Q. Matthews, Acting Superintendent of the Rio Grande Junction, has been appointed Superintendent of the Panama Railroad, succeeding J. A. Smith, promoted.

Rio Grande Junction.—See Panama Railroad.

St. Louis Southwestern of Texas.—C. J. Larimer has been appointed Superintendent at Mount Pleasant, Tex., succeeding W. N. Neff, transferred.

Southern Pacific.—W. R. Scott, General Superintendent of the Northern district of the Pacific system, has been appointed to the new office of Assistant General Manager of the Pacific system, with office at San Francisco, Cal. J. H. Young, Superintendent of the Western division, succeeds Mr. Scott, with office at San Francisco. T. A. Lawson, Assistant General Superintendent of the Chicago & North-Western, succeeds Mr. Young, with office at Oakland Pier, Cal.

See Union Pacific.

Union Pacific.—W. A. Worthington has been appointed Assistant to the Director of Maintenance and Operation of this company and of the Southern Pacific, with office at Chicago. Mr. Worthington will have special duties to be defined from time to time.

Traffic Officers.

Arkansas, Louisiana & Gulf.—T. J. Shelton has been appointed Traffic Manager, with office at Monroe, La.

Southern.—R. W. Hunt has been appointed Assistant General Passenger Agent at Atlanta, Ga.

Engineering and Rolling Stock Officers.

Buffalo, Rochester & Pittsburgh.—E. F. Robinson, who was recently appointed Acting Chief Engineer, has been appointed Chief Engineer, with office at Rochester, N. Y. G. C. Cleaver, roadmaster at Punxsutawney, Pa., succeeds Mr. Robinson as Assistant Engineer of Track, with office at Rochester, N. Y.

Chicago, Milwaukee & St. Paul.—See this company under operating officers.

Grand Trunk.—J. Markey, Master Mechanic of the Northern division, has been appointed Master Mechanic of the Middle division, with office at Toronto, Ont., succeeding W. Kennedy, resigned to go to the Central Vermont. J. R. Donnelley, Master Mechanic of the Ottawa division, succeeds Mr. Markey, with office at Allandale, Ont. W. Gell succeeds Mr. Donnelley, with office at Ottawa, Ont.

Houston & Texas Central.—Frank Cain, Master Mechanic of the St. Louis Southwestern of Texas at Texarkana, Tex., has been appointed Assistant General Master Mechanic of the Houston & Texas Central, with office at Houston, Tex.

Missouri Pacific.—J. J. Reid has been appointed Master Mechanic at Fort Scott, Kan., succeeding R. G. Long, resigned.

New York Central & Hudson River.—F. B. Freeman has been appointed Engineer of Construction in charge of track construction outside of the electric zone, with office at Grand Central Station, New York.

Pennsylvania.—H. H. Russell, supervisor of the Maryland division, has been appointed Assistant Engineer of the Allegheny division, with office at Pittsburgh, succeeding J. R. McGraw, who has been given leave of absence.

St. Louis Southwestern of Texas.—W. D. McDermott has been appointed Master Mechanic of the St. Louis Southwestern of Texas, with office at Texarkana, Tex., succeeding Frank Cain, See Houston & Texas Central.

LOCOMOTIVE BUILDING.

The Southern is said to have ordered 25 locomotives from the Baldwin Locomotive Works.

The Maine Central is said to have ordered 10 locomotives from the Baldwin Locomotive Works.

The Peruvian Government has ordered one mogul locomotive from the American Locomotive Co.

The Florida East Coast is said to have ordered 12 locomotives from the American Locomotive Company.

The Southern Indiana is said to have ordered 10 locomotives from the American Locomotive Company.

The Isthmian Canal Commission has ordered four locomotives from the Davenport Locomotive Works.

The Dolese & Shepard Co. has ordered one six-wheel switching locomotive from the American Locomotive Co.

The Muscatine, North & South has ordered one mogul 50-ton locomotive from the Hicks Locomotive & Car Works.

The United States Engineering Office, through S. W. Roessler, Portland, Ore., is in the market for three locomotives.

The Chicago & Illinois Western has ordered one switch engine from the American Locomotive Co. for January delivery.

The Taiwan Sugar Refinery, Formosa, has ordered three four-wheel tank locomotives from the American Locomotive Co.

The Howell-Hinds Consolidated Mining Co. has ordered one four-wheel tank locomotive from the American Locomotive Co.

The Japanese Government is said to have ordered six locomotives from the Baldwin Locomotive Works through Fraser & Sale, New York.

CAR BUILDING.

The South Georgia is said to be in the market for 100 freight cars.

The Grand Trunk is asking for bids in the United States on 1,000 steel coal cars.

The Atlantic & Western has ordered 60 box cars from the Lenoir Car Company.

The Kanawha & West Virginia is still in the market for from 700 to 1,500 freight cars.

The Northwestern Pacific is asking prices on trucks for 10 flat cars of 70,000 lbs. capacity.

The Tonopah & Goldfield has ordered four chair, one smoking and one baggage car from the Pullman Company.

The San Antonio & Aransas Pass has ordered 25 standard Hart convertible cars from the Rodger Ballast Car Co.

The Duluth, Missabe & Northern, as reported in the *Railroad Gazette* of July 5, is asking new bids on passenger equipment.

The New York City Railway has ordered 120 standard type street cars since it placed the order for 155 Montreal type cars.

The Nevada Northern is said to have ordered 100 all-steel gondola cars of 100,000 lbs. capacity from the Pressed Steel Car Company.

The Choctaw Railway & Lighting Co., McAlester, Okla. T., has ordered two standard interurban cars from the Niles Car & Manufacturing Co.

The Chicago & Illinois Western has ordered two cabooses from the American Car & Foundry Company, and will be in the market for passenger cars in about two months.

The South Manchuria has ordered through Mitsui & Co., New York, three dining, three sleeping, six passenger and baggage, four baggage and mail cars and six coaches from the Pullman Co.

The Nashville, Chattanooga & St. Louis, as reported in the *Railroad Gazette* of November 1, has asked preliminary bids on 100 composite hopper bottom coal cars of 80,000 lbs. and 100,000 lbs. capacity. The special equipment has not yet been considered.

The Brooklyn Rapid Transit, which, as reported in the *Railroad Gazette* of September 20, was in the market for 100 surface cars and 100 elevated cars, has, it is said, decided not to order the surface cars, but will order the elevated cars within a few months.

The Philippine Railways, as reported in our advance sheet of October 26, are in the market for four combination parlor and first class passenger cars. The order is to be placed through J. G. White & Company. These cars will measure 42 ft. 3½ in. long and 7 ft. 9¼ in. wide, inside measurements, and 43 ft. 1½ in. long and 9 ft. 6 in. wide, over all. The bodies will be of wood and the underframes of open hearth steel. The special equipment includes:

Axles	Philippine Railways standard
Bolsters	Philippine Railways standard
Brake-beams	Buffalo
Brakes	Westinghouse automatic
Brasses	Phosphor bronze
Couplers	Major
Draft rigging	Miner
Heating system	None
Journal boxes	Cast iron; Philippine Railways standard
Light	Adams & Westlake oil lamps
Paint	Dixon's Graphite, for steel work
Platforms	Standard Coupler Co.
Seats	Wheeler
Trucks	Philippine Railways standard

The Boston & Maine, as reported in the *Railroad Gazette* of November 1, has ordered 1,000 box cars of 60,000 lbs. capacity from the Laconia Car Company for July, 1908, delivery. These cars will measure 36 ft. long, 8 ft. 6 in. wide and 8 ft. ½ in. high, inside measurements; 37 ft. 6 in. long, over end sills; 9 ft. 7¼ in. wide, over eaves, and 13 ft. 11⅞ in. high, over brake staff. The bodies will be of wood and the underframes of steel. The special equipment includes:

Brake-beams	Buffalo
Brake-shoes	Steel back; American Brake-Shoe & Foundry Co
Brakes	Westinghouse automatic
Brasses	Boston & Maine specifications
Couplers	Gould steel
Door fastenings	Boston & Maine standard
Draft rigging	Miner tandem
Dust guards	Wooden
Journal boxes	Boston & Maine standard
Paint	Boston & Maine specifications
Roofs	Murphy No. 2 inside
Springs	Railway Steel-Spring Co.
Wheels	Laconia

The Duluth & Iron Range, as reported in the *Railroad Gazette* of October 11, has ordered three first class coaches and two combination baggage and mail cars from the American Car & Foundry Co., for January, 1908, delivery. These cars will be 60 ft. 7 in. long, 10 ft. ⅛ in. wide and 14 ft. 1⅝ in. high, over all. The special equipment for both includes:

Bolsters	Commonwealth
Brake-beams	National-Hollow
Brake-shoes	Christie
Brakes	Westinghouse
Brasses	American Car & Foundry Co.
Couplers	Buckeye
Curtain fixtures (for coaches)	Forsyth
Curtain material (for coaches)	Pantasote
Door fastenings (for coaches)	Adams & Westlake locks
Draft rigging	American Car & Foundry Co.
Heating system	Safety Car Heating & Lighting Co.
Journal boxes	McCord
Light (for coaches)	Adams & Westlake; Acme
Light (for combination)	Bliss electric
Paint	Duluth & Iron Range standard
Platforms	American Car & Foundry Co.
Trucks	Commonwealth Steel Co.
Vestibule	Pullman

RAILROAD STRUCTURES.

Bellaire, Ohio.—Plans, it is said, are being made by the Baltimore & Ohio for improvements to its freight terminals here to cost $25,000.

Brooklyn, N. Y.—The new concrete car barns, 86 ft. x 352 ft., for the Brooklyn Rapid Transit Co. at Fresh Pond station, on the Ridgewood line, have been finished. The cost of the improvements was $125,000.

Bluffton, Ind.—The Lake Erie & Western and the Cincinnati, Bluffton & Chicago, it is said, will jointly build a union passenger station here.

Grand Forks, B. C.—The Canadian Pacific, it is said, will make this place a division point, and next year will spend about $100,000 for a roundhouse, shops and a new yard.

Lawrenceville, Pa.—An ordinance is being prepared for a bridge from Liberty avenue and 37th street over the Pennsylvania tracks to Grant Boulevard.

London, Ont.—The Southwestern Traction Company, it is said, will rebuild its car barns recently destroyed by fire, at a loss of $150,000.

St. Stephen, N. B.—The New Brunswick Southern has asked for authority to build a bridge over the St. Croix river at this place.

Swissvale, Pa.—The Pennsylvania will shortly ask bids for a new passenger station. Grade crossings are to be eliminated and other improvements made to cost $75,000.

Wichita, Kan.—General Manager J. E. Hurley is quoted as saying that the Atchison, Topeka & Santa Fe will make improvements next year to include a passenger station here to cost about $200,000; also a roundhouse to cost $16,000.

Winnipeg, Man.—Work, it is said, has been started on the new union terminal station here. Contracts for the excavation work let to S. Brown, of this place.

The Canadian Northern, it is said, in addition to improvements under way will put up a roundhouse here, to cost $50,000.

RAILROAD CONSTRUCTION.

New Incorporations, Surveys, Etc.

Atchison, Topeka & Santa Fe.—President E. P. Ripley, of this company, is quoted as saying that proposed extensions in Texas to cost $7,000,000 will not be made this year, perhaps not for many years, on account of the financial stringency and adverse legislation in Texas.

Atlantic City Railway (Electric).—See Philadelphia, Delaware & Montgomery.

Baltimore & Ohio.—See Pennsylvania Roads.

Belleville & Interurban.—Incorporated in Illinois with $100,000 capital and office at Belleville. The company proposes to build an electric line from Belleville south eight miles to Smithton. The incorporators and first board of directors are: J. Gundlach, Jr., B. H. Gundlach, R. W. Hofsommer, G. Hippard and T. A. Bell.

Bloomington, Pontiac & Joliet (Electric).—This company, which operates an electric line from Pontiac, Ill., northeast to Dwight, 20 miles, it is said, is now controlled by H. A. Fisher, of the Chicago & Joliet Railway. It is the intention of the company to extend the line on the north to Joliet, about 40 miles, where connection is to be made with C. & J. to Chicago. The line is eventually to be extended from its southern terminus at Pontiac southwest to Bloomington, 35 miles, where connection is to be made with an electric line to St. Louis.

Bristol & Kingsport.—Incorporated in Tennessee to build a line from Bristol, Tenn., southwest to Blountville, thence west to Kingsport, 45 miles. The incorporators include: J. L. Cox, F. H. Cathran, F. Percell, J. B. Cox and S. L. King, of Bristol.

Brookville & Mahoning.—See Pittsburgh, Shawmut & Northern.

Chicago & Milwaukee (Electric).—Albert C. Frost, President and General Manager of this company, says that the extension to Milwaukee will be finished and cars will be put in operation from Chicago to Milwaukee on December 1.

Chicago, Burlington & Quincy.—This company, it is said, has surveys made for building a line from Frannie, Wyo., northwest along Clark's Fork river to Fromburg, Mont., on the Northern Pacific, about 35 miles.

Chicago, Fox Lake & Geneva.—Incorporated in Illinois with $2,000,000 capital and office at Chicago. The company proposes to build a line from Chicago, northwest through Cook, Lake and McHenry counties to the Illinois-Wisconsin state line, with branches to Fox Lake and to Woodstock, a total of 90 miles. The incorporators include G. H. Soward, H. R. Yaryan, L. E. Starr, S. E. Malette and M. L. Louis.

Canadian Pacific.—This company, it is said, has been making surveys for several weeks for an extension of its Nicola, B. C., branch, south to Princeton in the Similkameen Valley, about 72 miles.

Chicago & East St. Louis Short Line.—Incorporated in Illinois to build a line from East St. Louis, Ill., northeast to Chicago, 275 miles. The proposed route runs through coal fields and is almost parallel to the Chicago & Alton all the way. Surveys are to begin at once. The incorporators and first board of directors include: H. C. Osterman, W. M. Dronnan, H. C. Dolph, T. W. Flynn and W. Anderson, all of Chicago.

Chicago & Joliet (Electric).—See Bloomington, Pontiac & Joliet.

Cincinnati Belt Line.—The proposed belt line around Cincinnati, Ohio, is to be double-track and will be about 20 miles long. Right-of-way is being secured and surveys made. The promoters say that necessary capital has been secured. E. E. Williamson, Union Trust Building, Cincinnati, is interested. (July 26, p. 111.)

Eastern Pennsylvania (Electric).—J. G. White & Co., operating managers and purchasing agents for this company, have ordered $200,000 worth of electric supplies for the Tamaqua and Middleport connecting link between Mauch Chunk, Pa., and Pottsville. The order includes all the material required for the permanent way and overhead electrical work. Considerable grading has already been done.

Gilmore & Petersburg.—The Gilmore Mining Company, it is said, is making surveys for a line from Gilmore, Idaho, on the Lemhi Valley northeast through a pass in the Rocky mountains to a point

in Beaverhead county, Mont., about 10 miles W. A. McCutcheon, Gilmore, Idaho, is Manager.

ILLINOIS CENTRAL.—This company, it is said, will spend about $10,000 improving its yards at Duquoin, Ill.

MILWAUKEE NORTHERN (ELECTRIC).—This line was opened from Milwaukee, Wis., north via Cedarburg to Port Washington, 30 miles, November 2. The company will occupy jointly with the Chicago-Milwaukee Electric Railway a large station to be built at Second and Wells streets, Milwaukee, at an estimated cost of $100,000. (Sept. 20, p. 339.)

MISSOURI & NORTH ARKANSAS.—This company will let contracts for 650,000 cu. yds. of side borrow, and three miles of pile trestle on its extension from Kensett, Ark., southeast to Cotton Plant 28 miles. (Sept. 27, p. 371.)

MISSOURI PACIFIC.—The report of this company for the year ended June 30, 1907, shows that the branch of the St. Louis, Iron Mountain & Southern from Eudora, Ark., south to Calvit, La., 37.49 miles, was finished, and put in operation June 1. On the Gurdon & Fort Smith, which extends from a connection with the Arkansas Southwestern near Antoulne, Ark., northwest through Clark and Pike counties to Caddo Gap, on Caddo river, 3.85 miles, grading, bridging and track laying has been finished and ballasting is now under way. The continuation of this line, the Gurdon & Fort Smith Northern, from Caddo Gap north to the Ouachita river, 23 miles, has the grading, bridging and track laying finished on the first 5.74 miles to a point near Black Springs. Its further extension is not now contemplated. On the Springfield Southwestern from Crane, Mo., to Springfield, regular service was begun last April. Work on the extension through the city of Springfield is now in progress. On the Illinois division second main track has been finished from Valley Junction south for 8.9 miles, and at the yards at Dupo, Ill., grading for 38 miles of tracks, culverts, bridging, drainage system, coaling station, 18 stall engine house, power house and employees' hotel is finished, and yard tracks aggregating 21.61 miles have been laid. Track laying and ballasting is now in progress. On the Wabash Southern, grading, bridging, track laying and some of the ballasting on nine miles from Ziegler, Ill., to Benton is finished. The Coal Belt Railway lines in Williamson county, Ill., to the Cartersville District Coal Company's mines and to the Chicago & Big Muddy Coal & Coke Company, aggregating 5.01 miles, have been finished and are now in operation. Grading for an extension of the Coal Belt Electric on Park avenue, Herrin, Ill., north 4,935 ft. to a connection with the Herrin Railway is finished. The main line of the Herrin & Johnson City from Herrin, Ill., to a point near the west limits of Johnson City, 4.5 miles, is finished, and 2.5 miles of side tracks have been laid to the various mines. The Marion & Harrisburg, which diverges from the Coal Belt Electric west of and extending east through the city of Marion, Ill., 1.95 miles, has been finished and is now in operation. The Marion & Johnson City, a continuation of the Marion & Harrisburg, from a point east of Marion north 5.87 miles toward Johnson City with connections and yards approximating 6.81 miles to various coal properties, is finished. Work is now under way extending the line to Johnson City. The Natchez & Western has been changed to standard gage, the work of widening embankments and filling and reconstructing bridges is now in progress.

NEWPORT & SHERMAN'S VALLEY.—This company, which operates a 29-mile line in Pennsylvania, intends to change its track from narrow to standard gage.

NEW YORK, NEW HAVEN & HARTFORD.—Contractors double-tracking the Naugatuck and Highland divisions of this road have received orders to rush the work as fast as possible.

OKLAHOMA CENTRAL.—This company, it is said, has finished eight miles of the extension it is building from Blanchard, Okla., west to Chickasha. (Aug. 9, p. 164.)

OKLAHOMA, MEXICO & PACIFIC.—Incorporated in Oklahoma with $500,000 capital and office at Oklahoma City. The company proposes to build a line from Oklahoma City southwest through Oklahoma, Canadian, Caddo, Washita and Kiowa counties to Hollis, in Greer county, 200 miles. The estimated cost of the proposed line is $35,000 a mile. The incorporators include: J. E. Kirkes, O. S. Rice and T. H. Lindlay, of Oklahoma City; F. D. Kroeger and J. M. Kroeger, of Guthrie.

OMAHA, NEWPORT & NORTHERN.—Under this name a company is reported being organized in South Dakota with $8,000,000 capital to build a line from Omaha, Neb., northwest, traversing the counties of Douglas, Washington, Dodge, Colfax, Platt, Boone, Wheeler, Holt, Rock and Keyapaha in Nebraska, to a point in South Dakota, 250 miles. C. A. Miller, of Minneapolis, Minn.; O. W. Boyd, P. M. Banning, of Chicago, and M. P. Goodner, of Pierre, are interested.

PENNSYLVANIA.—This company has put in operation its new yard at Pitcairn, which has a capacity for 3,300 cars.

PENNSYLVANIA ROADS.—Final surveys, it is said, are being made for a line from Ohio Pyle, Pa., on the main line of the Baltimore & Ohio south to coal fields in West Virginia. Grading work will probably be begun next month. The project is backed by capitalists interested in the recently organized Preston Coal Company which is to develop the coal lands along the proposed line, and it is thought that the Baltimore & Ohio also is interested.

PITTSBURGH, SHAWMUT & NORTHERN.—Work, it is said, has been finished on the Brookville & Mahoning, building the southern extension from Brookwayville, Pa., south via Brookville to Ramseytown, and the line is ready for operation. (Aug. 30, p. 247.)

PHILADELPHIA, DELAWARE & MONTGOMERY (ELECTRIC).—A number of New York and Philadelphia capitalists have secured control of this company, organized by B. A. Hughes and associates to build an electric line from Lafayette, Pa., on the Schuylkill Valley division of the Pennsylvania, south to the Delaware river in Delaware county, at which point a two track tunnel to cost $2,000,000 is to be driven under the river. East of the river at Woodbury, N. J., the line is to connect with the West Jersey & Seashore or a new line is to be built to Atlantic City. Surveys to the Delaware river have been made. The following are officers of the Atlantic City Railway, which, it is said, will build over the same route: W. J. Thompson, President; G. A. Muller, Treasurer, and Edward Butler, Secretary, Philadelphia.

ST. LOUIS, ROCKY MOUNTAIN & PACIFIC.—Surveys reported made for building the Cimarron & Northwestern from Cimarron, N. Mex., northwest up the Ponil river to Ponil Park, 22 miles. Grading finished on 15 miles, and three miles of track laid. General contract reported let to the Whitescarver Construction Company, of Trinidad, Colo., and sub-contracts to Maney Bros., of Oklahoma City, Okla. (May 3, p. 632.)

SASKATOON, SASKATCHEWAN, PEACE RIVER & DAWSON.—Application will be made at the next session of Parliament for the incorporation of this company, which proposes to build a line from Saskatoon, Sask., northwest via Langham, Athabasca Landing and Peace River Landing in Alberta to the crossing of the Dease river, B. C., about 15 miles west of its outlet into Laird river, thence by the most direct route to Dawson, in Yukon territory. Smith & Britton, Confederation Life Building, Ont., are the attorneys.

SOUTH & WESTERN.—This company, building from Elkhorn, Ky., south to Rutherfordtown, N. C., has 75 miles in operation; 7.4 miles from Dante, Va., south to Fink, and 67.6 miles from Johnson City, Tenn., south to Altapass, N. C. Contracts are let for 82 miles from Johnson City north to Fink, Va., on the north end, and from Altapass south to Bostic, 62 miles. An extension is also to be built under the name of the Spartanburg & Northern, from the southern end, south to Spartanburg, S. C., 40 miles. It is said that the contractors who are most advanced in their work have begun to lay off men. This is being done to allow the contractors who are behind with their work to catch up. About 10,000 men are at work on the southern line, and about two-thirds will be kept at work. (March 15, p. 392.)

SOUTHERN PACIFIC.—Twenty-four sidings between Roseville and Truckee are being lengthened, so that after this month trains of 45 instead of 30 cars can be sent across the Sierra Nevada mountains. These 700-ft. additions to 24 sidings had to be built mostly on mountain ledges, an enormously difficult and expensive undertaking. One-half the sidings are in the 46 miles of snow-sheds which enclose the road between Blue Canyon and Truckee. The extension of the snow-sheds alone required 7,000,000 ft. of lumber. At Summit an entirely new track 3,100 ft. in length was put in. The company is laying a second main track between Truckee and Winsted, and also between Elvas and Loomis. This work is almost completed, and with the terminal improvement at Roseville will double the capacity of the division. In the new Roseville classification yard 50 miles of track will be laid. Work is also being pushed on additional roundhouse facilities and repair shops at Roseville.

TACOMA-SEATTLE SHORT LINE (ELECTRIC).—Incorporated in Washington with $6,000,000 capital to build an electric line from Tacoma north to Seattle, 30 miles. Most of the right-of-way has been secured, and it is expected to have the line finished early in 1909. The proposed line is to be six miles shorter than the present interurban line belonging to the Stone & Webster Syndicate of Boston. T. Coleman Dupont, President, of Wilmington, Del., and A. C. Degraw, of New York, represent Eastern financial interests, which are back of the project.

TEMISKAMING & NORTHERN ONTARIO.—This company expects to finish the branch it is building from Cobalt, Ont., to Kerr Lake, four miles, about the first of next month. (March 15, p. 396.)

TEXAS MIDLAND.—See Texas Roads.

TEXAS ROADS.—Plans are being made for building a line from Ennis, Tex., the southern terminus of the Texas Midland, southwest to Waco, 75 miles. This is supposed to be a project of the Texas

Midland, as D. Quill and W. J. Newcom, of that company, are interested.

Topeka-Southwestern.—An officer writes that contracts have been let to the Southwestern Construction Company, of Topeka, Kan., for building this proposed line from Topeka, Kan., southwest to Council Grove, with a branch from the main line just west of Topeka north to the Kansas river, 60 miles. There will be a steel bridge at Dover. Maximum grades will be 1 per cent. and maximum curvature 4 deg. The company has preliminary work under way for building extensions and branches as follows: From Topeka north to Willis, 45 miles; from a junction with this north extension at North Topeka east to Leavenworth, 32 miles; from a point seven miles southwest of Topeka south via Scranton and Lyndon to Burlington, 60 miles, and from Council Grove, to which the main line is now being built southwest via Diamond Springs to Marion, 40 miles. W. L. Taylor, President; V. R. Parkhurst, Chief Engineer, Topeka. (April 5, p. 500.)

Union Central.—This company proposes to build a line from Dallas, Tex., southeast to New Orleans, La., 500 miles (225 miles in Texas and 275 miles in Louisiana). It is reported that contracts are to be let about Jan. 1. The proposed route is via Wortham, Palestine and Nacogdoches, Tex., and Pickering, La., with a branch from Wortham, Tex., northeast to Tyler, 90 miles. Surveys on the main line are under way from Dallas to the Louisiana state line, and surveys for the branch from Wortham to Tyler have been made. Grading is finished on the first 20 miles from Wortham. J. A. Lucas, Edgewood, Tex., is Secretary and Treasurer.

West Penn Railways (Electric).—Rights-of-way, it is said, have been secured by this company for a new line from Hunkers, Pa., west to Scotthaven, 10 miles.

RAILROAD CORPORATION NEWS.

Baltimore & Ohio.—See Chicago Terminal Transfer.

Boston & Worcester Street.—The Massachusetts Railroad Commission has given this company permission to issue $300,000 new stock to shareholders at par to retire floating debt incurred for construction, equipment and the purchase of property. The company had asked permission to issue $500,000 new stock.

Chicago, Burlington & Quincy.—According to a press despatch, this company has taken over the operation of the Great Northern's line from Sioux City, Iowa, to O'Neill, Neb., 130 miles. The Burlington controls all the other Hill mileage in Nebraska.

Chicago Terminal Transfer.—The minority stockholders' protective committee, which represents 38 per cent. of the preferred stock and 14 per cent. of the common stock of the Chicago Terminal Transfer, has sent out a circular letter announcing that the Baltimore & Ohio has suggested that the stock deposited in accordance with the offer of the last named company to buy it at $25 a share, be left on deposit until December 31. This is because it is not considered advisable for the Baltimore & Ohio to make the purchase under present market conditions.

Cincinnati, Hamilton & Dayton.—See Pere Marquette.

Georgia Coast & Piedmont.—The Georgia Railroad Commission has given this company permission to issue $2,700,000 of its $3,500,000 authorized consolidated mortgage 5 per cent. bonds of 1947. The proceeds are to retire $1,000,000 authorized first mortgage bonds, $550,000 for construction and acquiring additional mileage and the remainder for equipment, terminals at Brunswick and to pay other indebtedness. The road runs from Darien, Ga., to a connection with the Seaboard Air Line at Collins, Ga., and is projected to Brunswick, 15 miles.

Great Northern.—See Chicago, Burlington & Quincy.

Metropolitan Street Railway.—See Third Avenue Railroad (Electric).

Mexican Central.—See National of Mexico.

Minneapolis, St. Paul & Sault Ste. Marie.—It is said that the stockholders have so far subscribed to three-quarters of the additional stock of this company, and that the Canadian Pacific will take whatever stock is not subscribed to by other stockholders. The new issues consist of $1,400,000 preferred and $2,800,000 common. One share of new preferred and two of new common are offered to holders of each 15 shares of either class of old stock.

National Lines of Mexico.—The attorney who represents the Mexican Government in the proposed merger of the National of Mexico and the Mexican Central is quoted as saying that no further steps can be taken at present because the bankers who were to underwrite the proposed bond issue cannot do so at present. (July 12, p. 54.)

New York Central & Hudson River.—Results for the last quarter and for nine months were as follows:

Quarter Ended Sept. 30, 1907.

	1907.	Change
Gross earnings	$27,069,728	Inc. $2,286,761
Expenses	18,579,635	" 1,285,494
Net earnings	$8,490,093	Inc. $1,001,267
Other income	2,523,560	" 953,774
Gross income	$11,013,653	Inc. $1,955,041

Rutland	314,342	" 40,727

New York, New Haven & Hartford.—At a meeting of the shareholders, held last week, the directors were authorized to either issue $35,469,500 new stock to be offered to stockholders at $125 at the rate of one new share for every four shares already held, or instead to issue $43,121,200 new stock to be offered to stockholders at par at the rate of one new share for every three shares held. The first plan was the one originally proposed when the meeting was first called. The proceeds of the new stock are to be used for finishing the six-tracking of the Harlem River branch, the improvements at the New Haven cut and at Providence, R. I., and also to pay for new equipment costing $18,000,000 ordered some time ago. It is said that part will be used to retire $8,500,000 debenture bonds.

Oregon Short Line.—See Union Pacific.

Pennsylvania.—President McCrea announced last week that, because of the unsatisfactory outlook for raising new capital in 1908, the company would not begin any new work except when absolutely necessary for handling traffic. Work on the New York tunnels and terminals would not, therefore, be pushed as rapidly as heretofore and their completion will probably be six months later than has been expected.

Pere Marquette.—The meeting held on October 28 to approve the reorganization plan was adjourned without final action because the committee representing the holders of $8,500,000 C., H. & D. refunding 4 per cent. bonds protested against the plan. These bonds were given to the present holders in exchange for $11,000,000 Pere Marquette common stock which is deposited as collateral for the bonds, and the committee objected to the voting of this stock in favor of the reorganization plan, on the ground that this plan, which provides for the issue of two classes of preferred stock, would hurt the holders of the common stock.

Rutland Railroad.—At the annual meeting the minority stockholders' committee voted 22,826 shares of 7 per cent. preferred stock out of the total of 69,750 shares voted. The Directors passed a resolution to take up the question of accumulated dividends on the preferred stock, which now amount to 17½ per cent. In 1906 and 1907 1½ per cent. annually was paid. (Nov. 16, 1906, p. 138.)

Southern Pacific.—See Union Pacific.

Third Avenue Railroad (Electric).—The quarterly dividend of 1½ per cent. on the $15,995,800 outstanding stock of the Third Avenue Railroad, which is the rental paid by the lessee, the Metropolitan Street Railway, has been defaulted by order of the receivers of the last-named company. The Third Avenue was leased to the Metropolitan in 1900 for 999 years, and the lease provides that six months after a dividend default the property shall be returned to its stockholders.

Union Pacific.—The lines of this company from Green river, Wyo., to Ogden, Utah, will hereafter be operated by the Union Pacific, and the Southern Pacific lines between Ogden, Utah, and Sparks, Nev., will be operated by the Southern Pacific. Hitherto the Oregon Short Line has operated these lines.

RAILROAD GAZETTE

ESTABLISHED IN APRIL, 1856.

Published Every Friday by The Railroad Gazette at 83 Fulton Street, New York
Branch Offices at 376 Old Colony Building, Chicago, and Queen Anne's Chambers, Westminster, London.

EDITORIAL ANNOUNCEMENTS.

THE BRITISH AND EASTERN CONTINENTS edition of the Railroad Gazette is published each Friday at Queen Anne's Chambers, Westminster, London. It contains selected reading pages from the Railroad Gazette, together with additional British and foreign matter, and is issued under the name Railway Gazette.

CONTRIBUTIONS.—Subscribers and others will materially assist in making our news accurate and complete if they will send early information of events which take place under their observation. Discussions of subjects pertaining to all departments of railroad business by men practically acquainted with them are especially desired.

ADVERTISEMENTS.—We wish it distinctly understood that we will entertain no proposition to publish anything in this journal for pay, EXCEPT IN THE ADVERTISING COLUMNS. We give in our editorial columns OUR OWN opinions, and these only, and in our news columns present only such matter as we consider interesting and important to our readers. Those who wish to recommend their inventions, machinery, supplies, financial schemes, etc., to our readers, can do so fully in our advertising columns, but it is useless to ask us to recommend them editorially, either for money or in consideration of advertising patronage.

OFFICERS.—In accordance with the law of the state of New York, the following announcement is made of the office of publication, at 83 Fulton St., New York, N.Y., and the names of the officers and editors of The Railroad Gazette:

OFFICERS:

W. H. Boardman, *Pres't. and Editor*
E. A. Simmons, *Vice-President*
Ray Morris, *Secretary*
H. S. Chilcott, *Treas.*
I. B. Rines, *Cashier*
L. B. Sherman, *Western Manager*

EDITORS:

Ray Morris, *Man'g Editor*
Braman B. Adams
Charles H. Fry
Rodney Hitt
George L. Fowler
Frank W. Kraeger
Hugh Rankin
Bradford Boardman

CONTENTS

Vol. XLIII., No. 20. Friday, November 15, 1907.

The Stahlwerks-Verband, the association which fixes prices and controls the sale of about 95 per cent. of the product of the steel works in Germany, in answer, apparently, to charges that it is using its power to maintain monopoly prices, says that while it has concluded contracts with the State Railroads to supply rails at 120 marks per kilometric ton (=$29.05 per 2,240 lbs.) and ties at 111 marks, for the next three years, this is only $1.90 per ton more for rails and $1.43 more for ties than in 1904, which is not nearly so much as the increase in wages and raw materials. It has sold 20,000 tons to Japan and 16,000 to Holland at prices higher than the above. Meanwhile rails cost $32.50 to $33 per ton in England; the Belgian State Railroads recently contracted to pay $31.19 to Belgian works; and the Austrian State Railroads are paying the Austrian works $36.82 per ton.

These parlous times in railroad financing bring in some singular situations—one of them just revealed in the case of the New York, New Haven & Hartford Railroad. That corporation's board of directors some months ago voted to issue about $35,000,000 of new stock at $125 a share to its shareholders and its convertible debenture holders, subject to ratification of the plan by the stockholders at the annual meeting on Oct. 30, 1907; and that recommendation, usually in such cases final, definite and antedating a fact, was published in the annual report of the corporation. On the strength of it a considerable number of shareholders sold their new stock rights to be delivered "when, as and if issued." Suddenly during the panic period the stock fell to a point which made the issue inadvisable and it has been shifted by the directorate into an issue of $10,000,000 new 6 per cent. convertible debentures put out at par. Where does such a change leave the original "personal" contracts in which, say, A sold his rights to B a broker, and B sold the same rights to C, a customer. The New Haven company is obviously not responsible legally, whether or not, morally, as it merely made a recommendation which the stockholders might or might not approve, though in fact they did so and gave the directors permission to issue, should they see fit, an even larger numberof shares than had been recommended. But how stand legally the private contracts of A, B and C, the interests of whom vary according as the market values of the rights may be higher or lower? Are the contracts vitiated by the change of the stock issue to a debenture issue? Are the contracts at the contractors' risks and, if so, what are the legal scope and limitations of those risks? And would the courts decide such contracts a mere "gamble" and therefore invalid? In not a few cases nowadays "rights" are, as one may say, sold under similar conditions and by contracts based on good faith and resting on official announcement. The legal status of contracts of the sort as fixed by an authoritative finding of the courts would have a moral as well as a material significance.

The railroad superintendent must see that the discipline of enginemen is well maintained, in spite of anything or everything tending to impair it, instead of asking that signals or signal practices or rules be so designed or arranged as to make discipline easy. This would seem to be the lesson of the increasing use of overlaps and automatic stops. One time-honored argument against these two adjuncts is that they make an engineman less watchful of the visual signals because they assure him that watchfulness is unnecessary (as with an automatic stop) or less necessary (as with the overlap). To tell him to stop at a place where he knows that there will be no danger in keeping on is like crying "wolf" when no wolf is near, which puts in contempt the one who cries. But whatever there may be in our theories, practice is changing. The New York Central has had 800-ft. overlaps in its Park avenue tunnel, New York City, for over four years. It has now established longer ones throughout its electric zone, 10 or 12 miles of very busy four-track railroad, which will be increased to three times that mileage. The New York subway has had automatic stops in use for three years, and the officers believe them to be a useful, important and satisfactory safeguard. The same arrangement is in use on the Boston Elevated, and has been installed on the Philadelphia Rapid Transit lines. The Philadelphia & Western has the overlap, with signal arrangements similar to those on the New York Central just mentioned; and the railroad under the Hudson River, between Jersey City and New York, to be opened within a month or two, will have a similar arrangement. Many roads whose lines are neither elevated nor underground seem to be showing increased favor to new devices, such as torpedo machines, cab signals and automatic stops, although, according to the theory, the use of such things must result in weakening discipline. And the roads thus encourage inventors, while yet the inventors' devices are designed and operated according to the objectionable plan of acting to indicate stop, and remaining inactive to indicate proceed. The only thing to do, under these new conditions, of course, is to see that enginemen do stop at stop signals. Theirs not to reason why. Surprise checking will do it. Surprise checking seems to be becoming more

general, and some of the roads on which it is practised allow their press agents to use the records as an advertising text. If those roads need it to prevent collisions, roads with overlaps would seem to need it to restore to their discipline the vigor which the overlaps have taken out of it. Possibly we may wake up some morning and find our discipline reformed. It is true that the motive for introducing the overlap has been the same as that which has retained the flagman and his torpedoes; and that in thus continuing to sit on two stools, we must look sharp that we do not fall to the ground. There remains, however, this important difference, that with the overlap we have a stool which can be watched and can be rationally managed. The flagman, however, defies all discipline, and the flagging rules not only defy systematic treatment, but are absolutely inconsistent with the short time interval which is necessary to the economical use of a railroad which carries a large passenger traffic.

WHEEL PRESSURES ON CURVES.

In the *Railroad Gazette*, Sept. 20, 1907, George L. Fowler reported the results of some tests made with a special track dynamometer which registered the actual pressures against the outside rail exerted by the flanges of the wheels of a consolidation locomotive when running around a 4½ deg. curve. Through the courtesy of the Schoen Steel Wheel Co. we reprint elsewhere in this issue a chapter from a forthcoming book by Mr. Fowler, which gives an account of the complete series of experiments made with this instrument to determine primarily the lateral thrusts exerted by the wheels under loaded cars. The experiments were made as nearly as possible under ordinary running conditions and covered a fairly wide range of moderate speeds. They were not carried far enough to obtain complete data from which a general formula could be derived which would take into account weight, wheel base, speed, curvature and superelevation. Nevertheless interesting conclusions have been drawn as to the effect of some of these factors, which seem to be supported by the records of the dynamometer.

The commonly accepted theory of the relative pressures exerted by the four outside wheels of a double truck car is corroborated by the average pressures recorded at all speeds. The front wheel of the first truck exerts the greatest pressure; the front wheel of the second truck is next in order, followed by the rear wheel of the first truck and the rear wheel of the second truck. The front truck exerts approximately 60 per cent. of the pressure required to turn the car around the curve. There are, of course, wide variations in the pressures, but in general when either wheel on a truck exerts an excessively high pressure, the other wheel exerts a correspondingly lower pressure.

The effect of speed is given by the tentative formula $T=333V-800$, but this holds good only between 7 and 16 miles an hour, where a series of nine records lie in approximately a straight line. Inasmuch as these records represent less than 30 per cent. of the total, not much reliance can be placed on an equation derived from them. The fact that the thrust varies directly with the speed and not with the square of the speed is explained by the fact that the curve was super-elevated for a speed of 36 miles an hour and hence at the low speeds at which the pressures were recorded, centrifugal force was more than balanced by the super-elevation. The force required to deflect the car from a tangent in rounding the curve varies directly as the rate of deflection or, in other words, as the velocity, and it is this force which is exerted between the wheels and rail. However much the exact form of the equation given is criticized, it must be remembered that it gives values which are conservatively low and on the safe side for comparing the relative factors of safety of wheels.

The relation of weight to thrust cannot be worked out from the data at hand because all of the experiments were made with one weight of car. It is probable, however, that the thrust varies directly as the weight, if it is true that the only forces acting are those tending to deflect the car from the tangent. Similarly, the thrust would probably vary inversely as the radius of curvature at speeds below that for which the outer rail was elevated. It is evident that only a long and complete series of experiments would establish the exact relation between all of these factors, if such a relation exists. The effects of impact and other forces due to slight variations or imperfections of the cars and track may be so great as to prevent the formulating of a general equation which would be anything more than a rough approximation.

As a result of his experiments, Mr. Fowler estimates the maximum lateral thrust of car wheels in ordinary service to be 30,000 lbs. at 45 miles an hour. The tests of breaking strength of cast iron wheel flanges, made in 1905 by Prof. Goss, gave a minimum of 47,750 lbs., a maximum of 109,900 lbs., and an average of 80,440 lbs. This would indicate an average factor of safety of 2.5 and a minimum of 1.5 for new wheels. Wear and brake-shoe heating would undoubtedly reduce these values, possibly as much as 25 per cent. It is not to be wondered at, in view of these facts, that flange breakages under high capacity cars have been so frequent.

MAINTAINING LOCOMOTIVE POWER BY A STANDARD OF EFFICIENCY

A method designed to systematize and regulate the shopping of locomotives in order to maintain a certain standard condition of power is described elsewhere in this issue. Entire novelty is not claimed for the ideas set forth, although certain features, including the plan for recording graphically the condition of power, as illustrated in two of the figures shown, are new so far as we know. Neither are radical or revolutionary results, evidenced by an immediate marked improvement in the condition of power, expected to follow its application to a division. It is being introduced gradually on the road with which the author of the article is connected, the Atchison, Topeka & Santa Fe, without any desire to upset suddenly the existing order of things, it being considered that the fact that the divisions to which it has been applied know they are under this constant surveillance and that careful comparative graphical records are being kept at headquarters, is of itself a sufficient advantage to make it worth while, as they are thus spurred to make as good a showing as possible.

Establishing a standard, as described, places the condition of power on an efficiency basis; the average of all of the engines on a division must therefore be 100. If it is less than this they are dropping back, while if it exceeds this they are in highly satisfactory condition. It follows then that in order to maintain the standard, a certain percentage of the engines must be shopped each month. The article explains how this percentage is determined, the resulting figure being the "standard per cent. to be overhauled" forming part of the graphical record of condition of power accompanying the article.

The limit for light repairs is $500; therefore if the cost of work on an engine exceeds this amount, the engine loses its mileage and must start afresh. Naturally, where the figure for cost of work runs close to this dividing line, the master mechanic will try to keep under the limit in order to save his mileage. Some juggling of figures will doubtless result in such instances, but granted that it does, it is regarded as a hopeful feature rather than the reverse, indicating a striving after a good record.

As an educational feature, and for application where conditions warrant, the general scheme has much to commend. The practical motive power man might object that the life insurance comparison used in the article is hardly a true one from the power standpoint, since the latter must include, not "selected risks," but all locomotives which happen to fall to the lot of a division, regardless of age, inherent weaknesses and other physical disabilities; therefore, that the matter of average condition of such a group of engines and the laws for its care are hardly susceptible of the exact mathematical treatment of life insurance, claimed near the end of the article. But it must be borne in mind that the outline given is made up in part of theoretical considerations and must be examined from this standpoint. Of course, all sorts of complicating factors can be enumerated which will militate against the practical application of any scheme having in view the objects of this one. Conditions are seldom if ever the same on any two roads, and are constantly changing on every road, influenced by traffic fluctuations, labor conditions, changes of policy, and other such forceful elements.

Transferring locomotives between divisions is another disturbing factor, especially where the operating conditions differ greatly. The two divisions may be totally unlike. One may be single track, on which a freight engine starts and stops its train 20 or 30 times in a trip, while the other may be double track, and engines of the same class and in the same service will stop only for water and make the same mileage in one-half the time. There is no reason, however, why the plan cannot be adjusted to suit such conditions.

The system is capable of being extended in a number of ways. One, which has been partially worked out in theory, is the adjustment of repair activity to traffic needs. To do this the periods of light and heavy tonnage on each division must be studied. By plotting these for a series of years it is possible to say well in advance, in a general way, when the engines on a particular division

will be needed for heavy service. In preparation for this demand the condition of power would need to be brought above standard, so that during the period of heavy movement it would not fall too far below the normal level, and a balance thus be maintained.

SOME PROGRESS TOWARD GETTING BETTER RAILS

At the October meeting of the American Railway Association the rail committee reported unanimity on all except two points in the proposed specifications. But these exceptions—the percentage of phosphorus and the percentage of discard—are of high importance, and two members, Mr. Isaacs, of the Southern Pacific, and Mr. Richards, of the Pennsylvania, submitted minority reports. Because of these differences of opinion the report was not received for discussion by the association, but was returned to the rail committee with instructions to continue its work, with authority to make such expenditure as may be required to secure the assistance of a number of experts of the highest standing.

Although it comes as a severe disappointment to those who hoped for an immediate reformation of thoroughly bad practice in making rails that break and wear out too soon, nevertheless the committee has accomplished much in having agreed among themselves, and having secured assurance of acceptance by the rail makers, on nearly all the propositions involved in making safe rails. If the railroads will insist on observance of these agreed clauses in the specifications in their rail orders for 1908, it will save some lives and some money. They have a basis for requiring that the ingots be kept vertical until solidified; that no bled ingots be used; that "at the final pass the temperature of the rail will not exceed that which requires a shrinkage allowance at the hot saws, for a 33-ft. rail of 100-lb. section, of 6 1/16 in., and 1/16 in. less for each 5-lb. decrease of section"; that the drop tests (a 2,000-lb. weight dropped 22 ft. on a 100-lb. rail) shall be made on a sample from each blow of steel; that the process of hot straightening shall leave the rails substantially straight; and that the facilities for the inspectors shall be such as to secure good product.

The recommended adoption of two standard sections, instead of one, for service under differing conditions is a result of the highest importance. The redistribution of the metal in the head and base so as to make a nearly balanced rail, and the reformation of the base so as to reduce the strains developed in cooling, will meet the approval alike of the makers and the users. With these practicable sections, with inspection fully as thorough as can be expressed in words, with competent inspectors and plenty of them, so that the processes can be watched from beginning to end, and with the specified tests rigidly adhered to, good rails can be got by those railroads who can afford to refuse to be baffled. It would be well, too, to mark the rails in such a way that each rail can be identified in relation to its place in the ingot.

There are two plain results so far secured from the agitation of the subject and the work done by the American Society of Civil Engineers, the Maintenance of Way Association, the Society for Testing Materials and the American Railway Association: The absolute necessity for better rails is recognized by all, and the chief executive officers of the railroads and the rail mills are now in closer touch than they ever have been, and they will do their utmost to secure sound material. It is now to be expected that those who buy and those who sell, realizing that a great responsibility rests on them, will treat the subject in a dignified but very thorough fashion.

Concerning the percentage of phosphorus: Mr. Kruttschnitt's supplementary report is so clear that it is a great pity that a construction of the rules of the American Railway Association prevents its publication in these columns. He admits the claim of the manufacturers that there is not enough American ore of such composition as to supply all American railroads with rails with a maximum of .085 phosphorus, but shows that the manufacturers are now filling Canadian and foreign orders from this best quality ore. He justly demands that the manufacturers use this best quality ore, as far as it will go, in supplying American railroads.

The important specification for a fixed percentage of discard from the ingot is far from acceptance. It has been shown by reports and photographs of broken rails to be the overwhelmingly important specification in the present state of the art of making ingots. The manufacturers firmly oppose it, and are technically right in saying that this is a crude and wasteful way of attempting to correct an evil. Although it cannot be denied that a fixed minimum cut of the inferior metal from the top of the ingot is the only present known way (after complying with all the other specifications) of improving quality, nevertheless this received final support in the committee of nine from the representatives of the Pennsylvania and the Southern Pacific only. This is however a time for suspending judgment. The committee is authorized to employ the best talent in the world and we may hope for some better solution than an arbitrary rule for this one specification.

Further discussion of this subject is invited.

The fine of $25,000 which was imposed on the Michigan Central at Toronto, Ont., recently for criminal negligence in connection with an explosion of dynamite in a freight car, killing two persons and injuring many, was based on circumstances which the judge declared made his "blood run cold." A car containing boxes of the explosive, also other freight, was so roughly handled that some of the boxes of dynamite shifted in their places and were found on edge. Besides this, the liquid explosive leaked from the boxes and ran from the floor to the ground, so that while the car was being switched crackling noises were heard. This condition lasted a day or more while the car was moved in two different local freight trains. Even when the conductor finally righted the boxes he did not wash the floor or the running gear on which the liquid had leaked. A suitable placard was tacked to the outside of the car, and this was considered by the Railway Commission a compliance with the law, or at least enough of a compliance so that the commission declined to prosecute the road; but the court (Mr. Justice Riddell) holds that the company was grossly negligent in not instructing its trainmen or taking the special care which was obviously necessary in handling explosives. A common carrier need not accept explosives, but if it does accept them it must take all necessary precautions. A grand jury had exonerated the trainmen, but the judge says that the question of the guilt of those men is not before him in the present case. The railroad company pleaded guilty. It was claimed that the explosive had not been correctly described by the shipper, but the judge does not accept that as an excuse. He deplored the lack of a public officer to watch for such offenses against the law, the evidence convincing him that the bad practice here shown had been of long standing. The amount of the fine was fixed (apparently smaller than otherwise it would have been) after the road had stated that it would have to pay at least $15,700 in damages, besides settling with other parties who are asking for $50,000. Justice Riddell finds that no officer or employee of the road (except the trainmen, whose chief fault is ignorance) is within the jurisdiction of the court. If any such officer or employee could be found he would recommend his indictment.

The Railroad Commission of Wisconsin has rescinded an order, issued by it early in September, requiring the Marathon County Railroad, owned by the R. Connor Company, lumbermen, to provide weekly passenger service. The report of the railroad for the period of September 5 to October 22 showed that the entire passenger revenue was $1.10. Trips were made on Tuesdays of each week. The cost of each trip, including only the wages of the trainmen and the fuel, was $4 for each trip. The road charged 2 cents a mile, although not required to do so under the Wisconsin 2-cent fare law, which applies only to roads earning more than $5,000 a year. The Wisconsin commissioners seem to lean toward conservatism. Why didn't they order two trains to be run daily each way, so as to "develop" traffic?

Kansas City Southern.

The Kansas City Southern has had a memorable year. The twelve months ended June 30, 1907, covered a period in which the road not only found itself and secured the most favorable results in its history, but in which the Kansas City Southern led the other railroads of the country in its gains in operating results. This last comparison, of course, is not altogether a fair one, for no large well equipped system had the same opportunity to progress. Two years ago the Kansas City Southern, cheaply built to begin with, had been allowed to run down and rust out. The independent management which took hold in May, 1905, began at once to improve and rehabilitate. These improvements began to show their effect during the past year. This was one reason for the favorable results. Another was the great prosperity of the Southwest, through the heart of which the road runs following roughly the boundary lines between Kansas and Missouri, Indian Territory and Arkansas, and Texas and Louisiana. A third influence, perhaps most important of all, though not so obvious, was the election in June, 1906, of L. F. Loree as chairman of the executive committee. His wide experience in railroad operation was actively used in meeting the problems of the Kansas City Southern.

The road's gross earnings for the year were 20 per cent. larger than those of 1906, yet operating expenses decreased 3 per cent. As a result, net earnings were $3,700,000, against $2,000,000 in 1906,

an increase of 83 per cent. Fixed charges were 20 per cent. greater as a result of the larger amount of 5 per cent. negotiable gold notes outstanding, leaving a net income of $2,450,000, against $930,000 in 1906, an increase of 163 per cent. The most remarkable feature of this showing is that in a year when railroad expenses generally grew almost as fast or faster than gross earnings, the Kansas City Southern's operating ratio dropped from 73.10 to 58.78 per cent.

The traffic of the road is largely made up of forest, agricultural and mineral products, which move in large quantities in full carloads but at low rates. The largest single article of traffic is lumber, which comes from great tracts of southern pine timber which it is estimated will last for a generation. Large bodies of hard wood timber are also now just beginning to be developed.

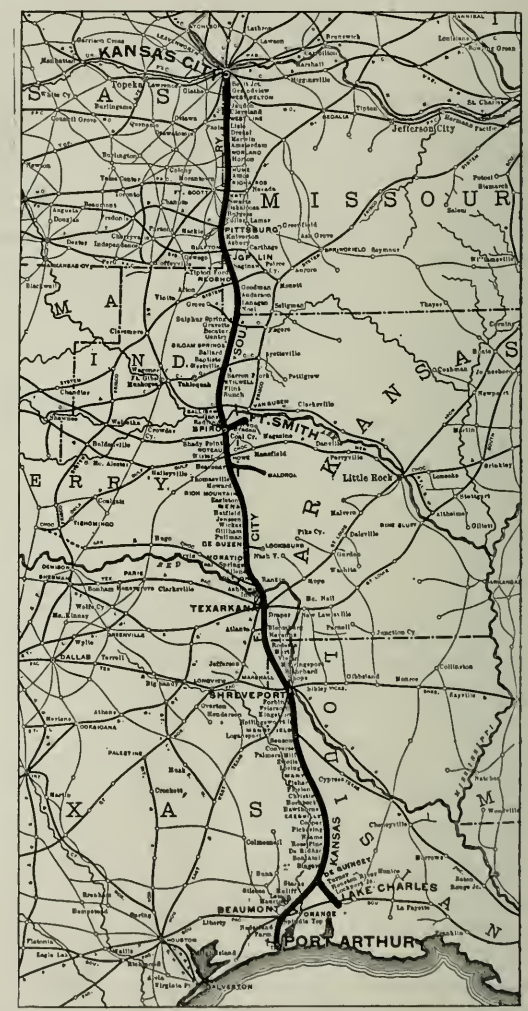
The next most important traffic group is agricultural products. Yet south of the Missouri state line, only about 18 per cent. of the land tributary to the road is under cultivation. The lands in Indian Territory and in Kansas are rapidly filling with new settlers and will soon be made much more productive. The principal agricultural tonnage, however, must always come from Kansas City and its tributary agricultural territory. Kansas City is the second primary grain market of the United States. In 1905, of the 358,000,000 bushels of grain produced in its territory, over 66,000,000 bushels centered on Kansas City for trans-shipment. This is the region to which the advantages of the Gulf ports for export over the Atlantic seaboard harbors are greatest. The southbound grain movement from this section is constantly growing and is likely to receive still greater impetus when the Panama canal is built.

This traffic is at the moment especially valuable to the Kansas City Southern because it tends to balance its traffic. The principal traffic movement has been the lumber tonnage from the southern and central parts of the line, north to the Kansas City gateway. Much of this in the past has been unbalanced traffic resulting in a large southbound empty car movement. The southbound grain movement is highly competitive but, nevertheless, because it is southbound traffic, is especially profitable. When it grows so much that it becomes necessary to load more cars south than north, the margin of profit will be greatly reduced. If it should grow still further so as to necessitate a considerable northbound empty car movement, the profit may be entirely wiped out.

Coal is the third most important article of traffic, though the Kansas City Southern's possibilities of mineral tonnage are, as yet, little developed. The district bounded by the Mississippi river, the Gulf, the Rocky mountains and Canada, is an area 900 miles wide and 1,300 miles long, approximately equal, excluding Russia, Norway and Sweden, to continental Europe. There are in it only three fields of commercial coal. Of these, the Indian Territory-Arkansas field is the most important. The Kansas-Missouri field comes second and the Missouri-Iowa field third. The first is about 30,000 square miles and the second 20,000 square miles in area. The Kansas City Southern crosses both of these two principal coal fields, but for a number of reasons, principally for lack of branch lines, this traffic has not been developed. Coal furnishes only about 18 per cent. of the Kansas City Southern's total tonnage while on comparable railroads it makes up from 40 to 50 per cent. The road's share in this business is so small that in 1906 it carried only 3.2 per cent. of the total output of these two most important fields. Besides these three principal sources of low grade traffic there are the zinc mines in the Joplin district of Missouri and the Pittsburg district of Kansas, the oil fields in southern Kansas and Indian Territory which are now being rapidly developed, and many stone and slate quarries.

These are the principal traffic resources of the railroad. The profits which it can gain from the rich resources of its territory depend on the extent to which it is able to rise to its opportunities. The Kansas City Southern is to-day one of the most striking examples of a railroad which could make money by spending money. It is probable that it could profitably use from $10,000,000 to $25,000,000, or from about one-ninth to one-fourth of the sum at which all its properties are carried on its combined balance sheet, in betterments, improvements and extensions. With funds to that extent at its command, a sweeping campaign of improvement could be applied to the whole property, the rich sources of its local territory protected by building branch lines, and an extension to New Orleans, already surveyed, carried out. Barring a severe industrial depression in the Southwest, every one of these expenditures would not only pay a reasonable return on their cost, but would earn profits besides.

In the present state of the investment market it is out of the question to secure any such sums. Nevertheless, the company was fortunate in getting enough money to provide for considerable improvements before railroad securities became unsalable. On April 2, 1906, an issue of $5,100,000, six-year 5 per cent. notes was underwritten. On June 30, 1907, $4,806,000 of these were outstanding, from which the Kansas City Southern had received $4,443,612 as net proceeds. Of this sum $3,949,537 had been spent; $3,400,000 for general improvements, the rest for equipment, real estate and advances to Port Arthur Canal & Dock Company for improvements. Including the $294,000 notes unissued which will net $270,950, the unexpended balance of about $500,000 of the net proceeds earlier received, and the sum of $263,115 which is the unexpended balance from track and bridge materials taken out of service in the course of improvements and available as a fund for further improvements, the Kansas City Southern had on June 30, 1907, $766,000 still available as an improvement fund. There was required $1,780,000 to finish the authorized improvements not completed on that date. It will therefore be necessary to provide $1,014,000 from surplus earnings from operation. This is to be and can be done. Thus, it is within the power of the road to carry out the first and most important section of the improvement expenditures. This definite statement of the sources of the funds for improvements



and their application informs the stockholder of exactly what has taken place in this most vital and at the same time uncertain department of a railroad's finances instead of giving him incomplete figures or no figures at all. It takes him into the confidence of the management instead of making it difficult or impossible for him to know the facts.

The improvements now authorized when finished will not make the Kansas City Southern an efficient operating property. They are made up mostly of improvements to freight stations, new sidings, reconstruction of bridges, ballasting, widening embankments and terminal betterments. The next vital need of the road is for grade reduction. The work of investigating such possibilities was vigorously carried on during the year. Thorough examination of the whole territory from Kansas City to the Gulf was made both by reconnoissance and by instrument surveys. It was found that

the grades on the 433 miles from Kansas City to DeQueen, Ark., which is at the southern foot of the Ozark mountains, can be revised to a maximum of one-half of one per cent. and no lower. From DeQueen to Port Arthur, Tex., 353 miles, it is feasible to reduce the grades to three-tenths of one per cent. With the existing volume of traffic, however, it is for the present preferable to plan for a revision on the same basis as on the northern end of the line. At present the road has grades of 1 per cent. or steeper on every operating division. As a result, train operation is most costly, particularly because most of the business, as already described, is low-grade heavy traffic. Grade reduction is vitally important both for this reason and because of the highly competitive nature of the southbound grain traffic from Kansas City to the Gulf. When the line betterments which are planned are carried out, the expenses of moving the traffic are to be cut in half and the export grain business, now profitable, will come to be a source of much larger profit.

The Kansas City Southern is considerably shorter from Kansas City to tidewater than any other railroad under single ownership, and President Edson states that the changing rate conditions, due to legislation and commercial activity, are giving the factor of relative distance more value than heretofore. If the Kansas City Southern can add to its advantage in distance over its competitors, an advantage in grades, its command over the export grain traffic, potentially enormous in volume, will be greatly strengthened. While it is not possible for the company to begin at once all of the grade improvement, arrangements have been made to begin this work on the heavy mountain division of the road between Spiro, Ind. T., and Shreveport, La. This is a territory where the traffic is heaviest and growing most rapidly. This stretch when improved will give a low-grade line for the development of the Arkansas-Indian Territory coal field, and will also greatly reduce the cost of operation.

The next work of this sort which is likely to be undertaken, but which as yet is not authorized or arranged for, is a change of line for 41 miles in the neighborhood of Fort Smith, Ark. The importance of this place as the commercial center of the middle Arkansas valley its situation in the coal and natural gas fields and its rapid growth in population and manufactures, are all arguments for putting it on the main line of the Kansas City Southern. This can be done by building a new line from Stilwell, Ind. T., to Fort Smith, and using the branch from Fort Smith to Spiro to complete the new line, which would be 40.79 miles long, 2.55 miles longer than the present line. In case this were done the old line between Stilwell and Spiro would be abandoned as a through line.

The necessity of carrying out these various betterments of the operated line arises from the character of the Kansas City Southern as a trunk line from the grain producing states to the gulf of Mexico. The road lies surrounded by powerful neighbors and competitors, aggressive in their development. Its profitable future depends on so improving its facilities as to put it in a commanding position for inviting business and economically handling it.

It is fair to attribute the splendid showing of the road during the past year largely to the management. Mr. Loree and President Edson have a record of which they may well be proud. The railroad improved not only in earnings, but in operating efficiency. The most obvious way to increase the efficiency of operation was by reducing grades and curvature but as this relief was not at hand, other means were used. Largely as a result of the weak position which the road occupied in competitive traffic, shippers had been allowed to be slow in handling their cars. This general laxity had a serious effect on the operation of the road, for largely on account of it the average car movement in the first half of 1906 was about 20 miles a day. As a result, freight moved slowly and the road was handicapped as against other railroads. During the last fiscal year more prompt handling by shippers was insisted on. As an immediate result the average car movement was increased in three months to 34 miles a day. The resulting quicker movement of freight attracted southbound traffic. This was the traffic which was especially valuable on account of the back haul. The increase in the revenue trainload from 289 tons to 332 tons, or 15 per cent., came as a result not of using heavier power, but of filling out the southbound trains. The same cause is largely responsible for the increase in the revenue carload from 14 tons to over 15 tons and in making 120,000,000 more ton-miles with a decrease of 22,000 train-miles. Conducting transportation increased only $31,000 not because the Kansas City Southern did not have to pay larger prices for its materials and labor, but because of these operating economies.

There was a decrease of $160,000 in cost of maintenance of way and of $76,000 in maintenance of equipment, but both of these expenditures are to be compared with a year whose expenses included large amounts spent for rehabilitation. Furthermore, as a result of the "bonus" system adopted in the maintenance of way department, which was described in the *Railroad Gazette* of August 2, 1907, in an article describing in detail the methods employed by the management to bring about the results of the year, it is probable that the lower maintenance of way figure represents almost as much actual improvement of the line. The unit maintenance charges for the two years were as follows:

	1907	1906
Maintenance of way per mile	1,095	1,201
Repairs and renewals per locomotive	2,713	2,850
Repairs and renewals per passenger car	740	883
Repairs and renewals per freight car	50	65

The amount spent on freight car repairs seems too small for a year when cost of materials increased but there is no doubt that the freight cars are generally in good shape, which is quite the opposite of their condition on June 30, 1905.

No table of commodities carried is included in the report probably because in the case of this road such information would be of great value to competitors. It is, therefore, not possible to analyze the traffic except by the three large groups already described.

The Arkansas Western, which runs from Heavener, Ind. T., east to Waldron, Ark., 33 miles, is owned by the Kansas City Southern but operated separately. It had gross earnings of $88,000, against $75,000 in 1906. It is shown on the accompanying map.

The Kansas City Southern is an unusually interesting railroad because it is a trunk line, independent, and small and compact enough so that its operations stand out clearly instead of in totals so large that the individual tendencies are obscured. The road has, largely from the development of its local resources, reached a self-supporting position. Its future success depends largely on the amount of money which it can command to improve its property and extend its influence. It has a magnificent opportunity. With a return to normal conditions in the security market this opportunity is not likely to be wasted.

The following table summarizes the operating results:

	1907.	1906.
	$16	$16
Mileage worked		
Passenger earnings	$1,343,354	$945,208
Freight earnings	7,018,633	5,058,153
Gross earnings	9,084,332	7,568,332
Maint. way and structures	819,859	980,104
Maint. of equipment	1,108,521	1,184,080
Conducting transportation	2,885,780	2,854,696
Operating expenses	5,339,519	5,532,275
Net earnings	3,744,813	2,036,057
Fixed charges	1,367,608	1,131,900
Net income	2,455,339	933,055
Dividends	840,000	
Year's surplus	1,615,339	933,055

Louisville & Nashville.

President Milton H. Smith, of the Louisville & Nashville, evidently does not consider an annual report to stockholders a desirable publicity medium for his opinions, which are by no means mild, on the subject of railroad legislation. The Louisville & Nashville, though hard-pressed by legislation, makes no reference, directly or indirectly, to the subject, in the report for the year ended June 30, 1907. Yet in Alabama, in which it has an especially large mileage, it is at the moment facing a special session of the legislature called largely because of its refusal to acquiesce as the other railroads of the state had done in the reduced rates passed by the legislature at its last regular session. In connection with this special call of Governor Comer of Alabama, President Smith is making his opinions known at some length. The following quotation is a fair summary of his position:

"Will the citizens of Georgia or other states or other countries invest their savings, on which they may desire to receive a satisfactory return, to create railroads in a state or country where the remuneration received for the transportation of persons and property is fixed by the agents of the state, without the state's assuming any responsibility for the result, and where, in addition to fixing the rates and exacting onerous taxes, the state enacts laws regulating the conduct of business and the relations between the carrier and its patrons in a manner that, if enforced, will greatly harm and probably financially embarrass the carrier?"

The sphere of influence of the Louisville & Nashville lies between a line drawn from Cleveland, Ohio, south to Jacksonville, Fla., and another line drawn from St. Louis, Mo., south to New Orleans, La., the whole bounded by Chicago on the north and the Gulf on the south. The bulk of its lines lie in an even narrower north and south belt, bounded on the east by a line from Toledo south to Cedar Keys, Fla., and on the west by a line from Chicago south to Mobile, Ala. It owns or controls, directly or indirectly, 6,891 miles of line, of which 4,306 miles are directly operated. Its own northern terminals are at Cincinnati, Louisville, Evansville and St. Louis, but jointly with the Southern Railway it controls the Chicago, Indianapolis & Louisville, which gives both of the southern roads a Chicago connection. The annual report of this road is reviewed in another column. The Louisville & Nashville itself owns the majority of stock of the Louisville, Henderson & St. Louis, 218 miles, which runs from Louisville west to Evansville, and of the Nashville, Chattanooga & St. Louis, 1,230 miles, which runs from three terminals on the Mississippi river southeast through Chattanooga to Atlanta. With the Atlantic Coast Line, of which it is itself a subsidiary, it leases the Georgia Railroad and its dependencies, the Atlanta & West Point and the Western of Alabama, these three roads together forming a line from Selma and Montgomery, Ala., east through At-

lanta to Augusta, Ga., with branches, 571 miles. The map published herewith, even though it does not bring out the subsidiary and controlled roads, gives an indication of the widespread influence of the road in its particular territory. With the other lines brought out in full relief, this showing would be even more striking.

Last year's operations were affected by the influences of higher costs and congested traffic, which seem to have been stronger in the South than in any other part of the country. The Louisville & Nashville also suffered especially from the heavy damages of the Gulf storm of September, 1906. However, the company was not as hard hit by the other difficulties as the Southern Railway, for instance, because it was better prepared to meet the rush of traffic. It has more double track (though the report gives no information on this point) than the Southern, and also more and better equipment. This superiority is due to large betterment expenditures out of earnings during recent years.

Gross earnings were $48,200,000, against $43,000,000 in 1906, an increase of $5,200,000, or 12 per cent., but straight operating expenses rose almost $42,000,000, or 16 per cent., leaving net earnings of $16,100,000, against $15,000,000 in 1906. The increase in earnings came from both the freight and the passenger departments. Freight earnings increased 11 per cent., and passenger earnings 16 per cent. The operating ratio was 74 per cent., against 72 per cent. in 1906.

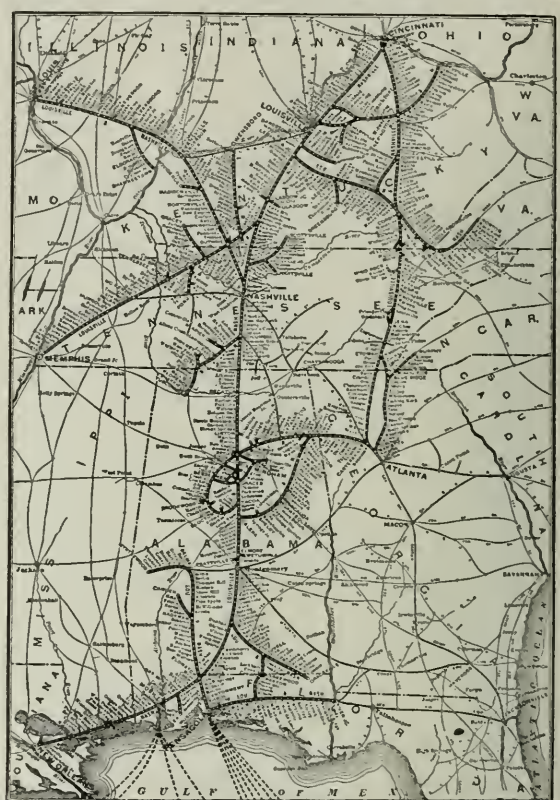
The large increase in operating expenses was in conducting transportation. The operation branch of this account in itself was $1,400,000 larger than the conducting transportation expense for both operation and traffic in 1906. Owing to a rearrangement of the conducting transportation expenses, including the separation of the account into the two separate branches, accurate comparisons cannot be made of most of the separate accounts, but where the same accounts appear in both years the increased cost is very noticeable. Among the individual accounts which can be thus compared are engineers and firemen; fuel, water supply, oil and waste for locomotives; switchmen, flagmen and watchmen; telegraph expenses; clearing wrecks; loss and damage-freight; damage to stock; injuries to persons, and stationery and printing, all of which largely increased. Under general expenses there was a large increase in the salaries of clerks and attendants. Thus the ordinary, necessary non-productive expenditures cost a great deal more than in the previous year.

Like the Lake Shore & Michigan Southern, the Louisville & Nashville includes in its maintenance operating expense accounts money spent for betterments and improvements. Including such improvement costs, the total amount spent on maintenance of way was 23 per cent. larger than in 1906. In 1906 it was 15 per cent. larger than in 1905. The part of this cost which went for improvements was $2,545,988, against $1,785,196 in 1906 and $1,574,428 in 1905. Including these, maintenance of way cost $1,873 per mile, against $1,583 in 1906 and $1,490 in 1905. Straight maintenance of way, excluding betterments, cost $1,282 last year against $1,150 in 1906 and $1,079 in 1905.

Equipment expenditures are described in great detail. Repairs cost $3,080 per locomotive, against $3,844 in 1906; repairs and renewals, $3,188, against $4,031 in 1906. Besides this $337,500 was charged to operating expenses under improvement account for new locomotives, $216,000 to the capital accounts, "improvements and betterments" and "South & North Alabama Railroad" and $895,000 to cost of road and equipment for the same purpose. There were 865 locomotives owned on June 30, 1907, against 745 a year earlier. Repairs cost $924 per passenger car, against $1,003 in 1906. Including renewals, the passenger-car cost was $1,004, against $1,039 in 1906. At the same time there was $57,560 charged to improvement account and $68,000 to cost of road and equipment for new passenger cars. Freight car repairs cost $67 per car, against $56 in 1906. Repairs and renewals were $91 per freight car, against $761 in 1906. At the same time $656,520 was charged to improvement account and $1,400,000 to cost of road and equipment for new freight cars. These are very liberal charges. When a road spends as much as this on each unit of its equipment it is not easy to make careful comparisons between different years. The decrease in locomotive repairs, however, follows a year when this expense increased over 50 per cent., due to a number of special causes, including the repairing of old locomotives taken over with the Atlanta, Knoxville & Northern and repairs postponed during the time of removal from the old to the new shops at South Louisville. The increase in freight car repairs, on the other hand, reflects the greatly increased cost of materials and labor.

During the year reduction of grades between Saxton, Ky., and Corbin, on the Cincinnati-Atlanta line, was finished and work begun on grade reduction and double-tracking from Corbin north to Livingston. When finished, this will give a double track for 35 miles north of Corbin, with a maximum grade from Saxton north to Sinks, 61 miles, of 0.65 per cent., compensated in both directions, except for one southbound pusher grade four miles long.

In order to provide funds for finishing construction work and improvements under way and authorized, the company in February issued $6,500,000 three-year 5 per cent. notes, which were sold at 95¼, a net return to the company of $6,207,500. As a result, the Louisville & Nashville is to-day in a better position, from the standpoint of cash resources, than many other railroads. Within the past few years it has come to be one of the strongest of the country's railroads. This is indicated by the fact that at the extreme low prices now prevailing Louisville & Nashville stock sells little lower than New York Central. Both are 6 per cent. stocks, but the New York Central has a long record of dividend payments behind it and tremendous equities in controlled companies, while the Louisville &



Louisville & Nashville.

Nashville paid no dividends in the five years from 1894 to 1898 and is a minority stock.

The following table shows the income results of the last two years:

	1907.	1906.
Mileage worked	4,306	4,131
Passenger earnings	$10,417,470	$8,985,216
Freight earnings	35,235,787	31,536,207
Mail earnings	883,434	907,339
Express earnings	1,078,601	958,886
Gross earnings	48,263,945	43,008,996
Maint. way and structures	5,510,910	4,752,501
Maint. of equipment	7,628,006	6,623,706
Conducting transportation.	17,972,348	15,639,420
Operating expenses	32,153,711	27,982,111
Net earnings	16,110,235	15,026,888
Net income	10,078,114	9,299,728
Dividends	3,600,000	3,600,000
Improvements:		
Maintenance of way	2,545,988	1,785,196
Maintenance of equipment.	1,081,604	1,166,157
Year's surplus	2,850,522	2,748,375

Wabash.

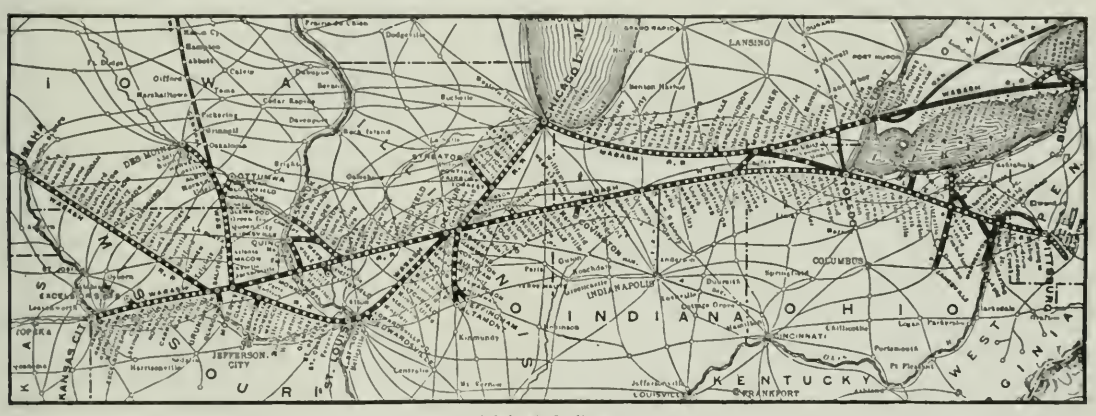
Last year was the second year in which the present management of the Wabash, with Frederic A. Delano as President and Henry Miller as Vice-President and General Manager, was in charge of the road. The 1906 report told of the introduction of many changes in organization and operation. Last year these changes had a chance to show their effect. In general it was a very favorable one.

The handicaps of the road may be considered first. It lies in highly competitive territory surrounded by competitors stronger in traffic advantages and financial resources. As a result it receives low freight and passenger rates. To get a satisfactory profit from such competitive business a railroad needs to have facilities as nearly perfect as possible. The Wabash has lacked much in this respect

and still lacks a great deal. The bright promises of its future cannot be carried out until its general financial plan is successful. This was delayed by opposition of some of the holders of the debenture B bonds, but has since been postponed far more decidedly by the depression in the financial markets. How hard this has hit the financial plan of the Wabash is shown by the price of 10 at which the new 4 per cent consolidated mortgage bonds, of which a few have been put out are selling.

In passenger earnings the Wabash is especially hard pressed by the competition of the most highly developed system of interurban lines in the country. The effect is clearly shown in a reduction last year of the number of passengers carried, but an increase in the number of passenger miles. President Delano frankly says that the electric lines are being used more extensively for the shorter trips, leaving to the steam railroads only the long haul business. The Wabash is also in particular a sufferer from 2-cent fare laws which are now in effect in Ohio, Iowa, Indiana, Illinois and Missouri. Except in Ohio the new laws have not had time to fully show their effect. Passenger earnings showed only a slight increase last year and are still more than $2,000,000 less than in 1905, which was the year of the heaviest traffic to and from the World's Fair at St. Louis.

The work of the past year has been toward the improvement of the property to the extent of funds available and the attraction of traffic by more efficient operating methods. The report of the Traffic Manager which was included in the 1906 annual report is not published this year, so that changes in traffic methods can be seen only indirectly. The train and mileage statistics are given in exceptional detail. One important feature closely associated with the growth of traffic, however, is not included—the average distance haul of each passenger and each ton of freight, nor is any list of



Wabash Railroad.

tonnage by commodities included in the report. Probably these facts are not made public for the same reason as in the case of the Kansas City Southern, reviewed in another column; because this information would be of considerable value to competitors.

Among the more important measures which have been taken toward more efficient operation of the property, the new car shops which have been built at Decatur, Ill., are important. These are run by electric power and have a capacity of building 25 new freight cars and one new passenger car a day. They are, however, now being used for repairs. These shops were described in the *Railroad Gazette* of January 25, 1907. There has also been established at Decatur a new fireproof supply depot, material and scrap yard to concentrate the material and supplies of the lines east of the Mississippi river which heretofore have been at various scattered points in frame buildings. At Moberly, Mo., the principal division and shop point west of the Mississippi river, a new reservoir with a capacity of 65,000,000 gallons has been finished. More than 200,000 gallons of water are used daily at Moberly and for nine months of the past year before completion of the reservoir, it was necessary to haul water by train to that point. Terminal improvements were made at Chicago, St. Louis, Detroit, Decatur, Kansas City, Council Bluffs and Moberly. Second track for 25 miles was built on the Decatur division between Decatur and St. Louis. A complete change of grade and alinement for five miles with new double track and a large concrete bridge over the Sangamon river will be finished this fall between Decatur and Sangamon, the next station east. This bridge was described in the *Railroad Gazette* of December 21, 1906. There were 80 miles of 80-lb. rail laid in the main line and 200,000 yards of ballast. This completes the ballasting or reballasting of all the main line and important branches. There are now being delivered 60 additional heavy freight locomotives and 10 large switching engines which will be important in cheapening the cost of operation.

Arrangements have been made for the use of about 56 miles of track of other companies on the St. Louis-Kansas City line as new double track. The Chicago & Alton track between Mexico, Mo., and Clark, 26 miles, and the Wabash track between these points are to be operated as double track. A similar arrangement has been made with the Santa Fe between Carleton, Mo., and Camden, 30 miles. A double track arrangement was already in force with the Burlington between Birmingham, Mo., and Harlem, 10 miles, so that by the small investment necessary for new crossovers and interlocking at junctions, the Wabash will have the use of 66 miles of double track between St. Louis and Kansas City. As a further operating economy, on July 1, 1907, the division headquarters of the Detroit-Chicago line was moved from Ashley, Ind., to Montpelier, Ohio, thus doing away with one of two division points which were located within 24 miles of each other.

Gross earnings were $27,400,000, an increase of $2,400,000 and the largest in the history of the road. Operating expenses increased $2,000,000, leaving net earnings larger by $300,000 than in the previous year. This is after eliminating the amounts shown in the maintenance accounts as spent for improvements in the two years. Besides the larger costs of labor and material the operating expenses were increased by strengthening bridges and turntables, raising coal chutes and water tanks, extending engine houses for larger engines and increasing siding accommodations for the resulting heavier trains. The use of metal instead of wood in renewing box car roofs and draft attachments of freight cars and the equipping of freight cars with air brakes also added to the operating costs. From the net income of the year a 6 per cent. dividend was paid on the debenture A bonds and a 1 per cent. dividend on the debenture Bs. There was also $3,000,000 appropriated in one way or another for improvements, against $3,500,000 in 1906. The advance in operating results is shown in the statement that gross earnings per mile increased from $9,938 to $10,904 and net earnings per mile from $2,756 to $3,151.

The maintenance expenditures are analyzed in detail in the report so that on these points it is unusually clear. Maintenance of way expenses both with and without improvement costs are shown. Straight maintenance of way cost $927 per mile, against $983 in 1906. Including additions and improvements, the figures were $1,093 last year and $1,235 in the previous year. The 1905 costs were $1,360 per mile and, including improvements, $1,592, but this was an exception because of the disorganization of the road by the World's Fair traffic. On the line from Moberly, Mo., east to Hannibal, 70 miles, maintenance of way cost $2,644 per mile last year, against $1,377 in 1906. This stretch of line was relaid with heavy rail, completely ballasted and embankments and cuts widened to take care of the heavy traffic which increased from 33,000 tons per mile of road in June, 1905, to 86,000 tons per mile of road two years later.

Repairs of locomotives cost $2,460, against $2,037 in 1906; of passenger cars $612, against $597 in 1906, and of freight cars $57, against $50 in 1906. These figures are based on straight maintenance and do not include any payments for new equipment. The number of locomotives, passenger cars and freight cars is computed from the average number in use on and maintained by the Wabash. These are the ideal conditions for working out these unit figures, but most roads not only do not do it themselves for the information of their stockholders, but give no figures which make possible such accurate averages.

Increased operating efficiency is shown in a number of different

ways. Earnings per freight train-mile increased from $1.89 to $2. With an increase of 353,000,000 revenue ton-miles there was a decrease of 4,400,000 empty freight-car miles. Including caboose cars, the empty freight-car mileage was only 24 per cent. of the total, against 27 per cent. in 1906. The revenue trainload increased from 348 tons to 360 tons. Gross earnings per loaded freight-car mile were 10 cents, against 9½ cents in 1906. The average miles run to one ton of coal, however, decreased from 15.8 in 1906 to 14.1 last year, probably owing to the heavier traffic.

The Wabash is steadily progressing under the present management which, though limited in its opportunities, is making a splendid record. This, after all, is the greatest test of ability, to produce good results from insufficient materials.

The following table, rearranged according to our usual method, summarizes the results of operation for the last two years:

	1907.	1906.
Mileage worked	2,517	2,516
Passenger earnings	$6,891,289	$6,723,658
Freight earnings	18,465,286	16,138,466
Gross earnings	27,432,474	25,015,379
Maint. way and structures	2,329,510*	2,475,560*
Maint. of equipment	3,379,648†	2,739,283†
Conducting transportation.	12,153,324	10,629,921
Operating expenses	18,551,377	16,503,760
Net earnings	8,881,096	8,511,618
Net income	3,505,046	4,057,613
Dividends on debenture bonds	475,000	...
Improvements, etc.	3,043,381	3,548,280
Year's suplus	13,335‡	509,333

*Maintenance of way betterment expenditures, included by the Wabash in operating expenses, amounting to $418,157 in 1907, and $633,462 in 1906, are incinded in "Improvements, etc.," below.

†Expenditures for new equipment included by the Wabash in operating expenses amounting to $535,613 in 1907, and $940,665 in 1906, are included in "Improvements, etc." below.

‡Deficit.

New York, Ontario & Western.

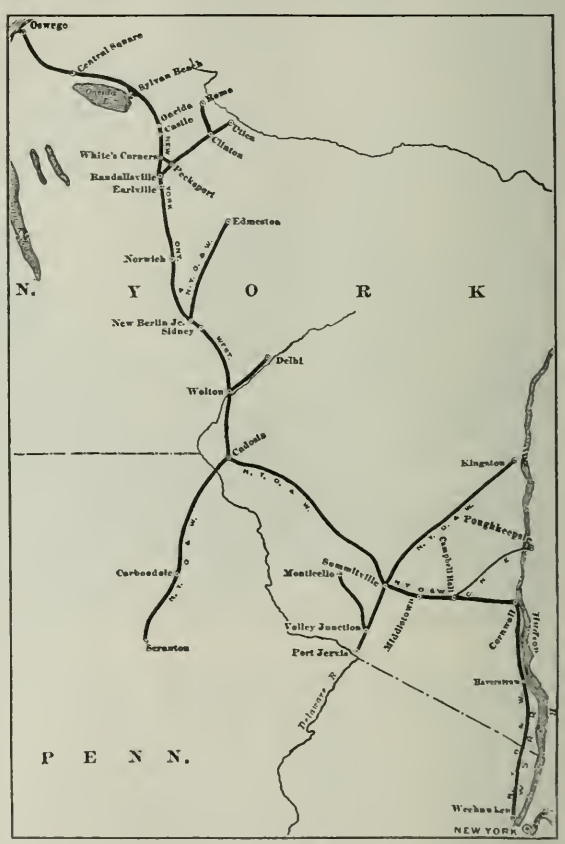
The New York, Ontario & Western was organized in 1880 as the successor of the New York & Oswego Midland, an unimportant line which ran from Middletown, N. Y., to Oswego, on Lake Ontario. The road was little more than a struggling competitor for odds and ends of trunk line traffic until the middle of 1890, when the Scranton division was acquired, which brought the New York, Ontario & Western into the northern anthracite field. Through purchase of the Scranton Coal Company, in 1899, and the Elk Hill Coal & Iron Company in 1900, a large anthracite tonnage was assured. Since then the road has prospered. Gross earnings per mile, which were $5,188 in 1890, the year before the Scranton division was acquired, rose in ten years to $10,331 per mile, and last year were $15,026. Net earnings were $1,020 per mile in 1890, $3,233 in 1900 and $4,686 last year. Net income per mile during the 17 years, during which the Scranton division has been included in the mileage of the road and its cost in the fixed charges, has increased from $210 to $3,031.

As may be judged from this showing, the Ontario & Western's main dependence is on its coal traffic. Out of total freight earnings of $6,300,000 last year, earnings from the transportation of coal were $3,600,000. The total shipments over the Scranton division were 2,700,000 gross tons, of which 200,000 tons were company coal. Of the total output of 55,700,000 tons of the anthracite fields, the Ontario & Western therefore carried 5 per cent. The bulk of this coal was shipped to tidewater, either at Cornwall, 60 miles up the Hudson river, or at Weehawken. There were handled over the company's docks 1,440,000 tons of coal, 761,000 tons at Weehawken, 531,000 tons at Cornwall and 148,000 tons at Oswego. The explanation of the fact that nearly as much was handled at Cornwall as at Weehawken, with its advantages of the New York market and the longer haul, is that the Ontario & Western owns no track south of Cornwall. For the 52 miles between Cornwall and Weehawken it uses the West Shore tracks, paying as rental a proportionate share, based on train mileage, of the cost of maintenance, and a like proportion of interest at 4 per cent. on $2,000,000, plus the amount spent since the contract went in force on January 1, 1886, for necessary improvements to the line. It is therefore profitable for the Ontario & Western to limit its freight traffic over this stretch of track. Instead of carrying its whole anthracite tonnage to the New York market it distributes a great deal of it at Cornwall by barges and canal-boats, besides what it ships northbound over the West Shore.

The New York, New Haven & Hartford, in October, 1904, bought control of the majority of the common stock as a protection of its sources of coal supply and also as a potential club with which to resist possible severe demands of the trunk lines for new divisions of earnings on through business to New England. The New York, Ontario & Western connects with the Central New England at Campbell Hall, N. Y., from which there is access over the Poughkeepsie bridge to the New Haven system in New England. The extensive improvement of the Poughkeepsie bridge, to put it in shape for heavy traffic, is still under way, as well as improvements to the New Haven's lines east of the river, so that there has never yet been a full test of the new line. However, even with the inadequate facilities, there has been a largely increased movement of coal traffic over this route since the New Haven bought control. Besides this there was established a year or more ago the Ontario Central Despatch, a fast freight line between the West and New England, operating over the New York, Ontario & Western and the Poughkeepsie bridge, and this has increased merchandise shipments through this gateway.

When the New Haven bought control of the Ontario & Western the common stock was not paying dividends. The $2,000,000 preferred stock—all but $4,000—having been exchanged for mortgage bonds, was deposited in a voting trust which elected a majority of the directors. In order to get actual control it was necessary to pay a dividend on the common stock. A dividend of 3 per cent. was paid on January 16, 1905. The voting trust was therefore terminated and the New Haven elected a majority of the directors. In July, 1905, 1½ per cent. was paid and in each of the two succeeding years 2 per cent. has been paid on the common stock.

Next to coal and local freight, through freight and milk furnish the most important sources of freight revenue. Each of these classes of traffic brought in between $700,000 and $800,000 last year, while



New York, Ontario & Western.

local freight earnings were $1,177,196. Passenger earnings were $1,550,000, against $1,380,000 in 1906, of which $1,288,000 came from local passengers and $267,000 from through and immigrant business. There is a large business from New York to summer resorts in Orange, Sullivan, Ulster and Delaware counties, which last year was so large that few passenger coaches could be spared for excursions. There were, however, 52 excursions run, carrying 17,881 passengers, with a revenue of $20,067, or $5.29 per train mile.

Gross earnings were $8,200,000, against $7,300,000 in 1906. Operating expenses increased $400,000, leaving net earnings of $2,750,000, against $2,200,000 in the previous year. The surplus of the year was $490,000, against $25,000 in 1906.

Conducting transportation increased only 5 per cent., while more was spent on both classes of maintenance. Maintenance of way cost, $2,035 per mile, against $1,810 in 1906. Repairs and renewals cost $2,636 per locomotive, against $2,568 in 1906; $789 per passenger car, against $594 in 1906, and $68 per freight car, against $58 in 1906.

President Fowler records that the physical condition of the

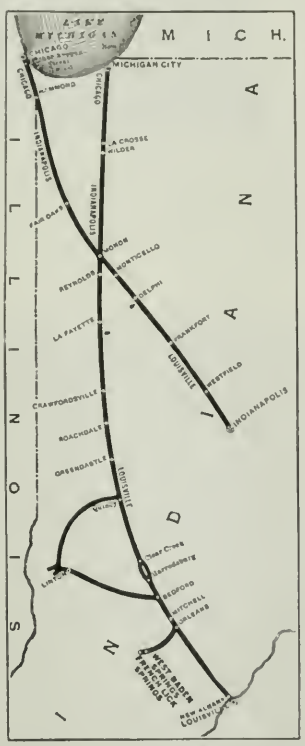
property is much better than at any time in the previous history of the company. Except for about six miles in the vicinity of Liberty, N. Y., which is under construction, and certain tunnels, second track from Catlosta to Cornwall, 108 miles, is in operation. New equipment was bought during the year to meet the increasing requirements of the summer passenger traffic. Eight or ten new coaches should be bought during the present year for this same purpose. The rest of the rolling equipment is said to be in excellent condition and sufficient. In order to increase the boat equipment used for carrying coal from terminal points, 10 small boats for river and harbor deliveries and 3 barges for use to more distant parts were bought. Two tugs are also under contract for the same service. With this increased floating equipment it is expected to make coal deliveries more satisfactory and economical.

The operations of the last two years are shown below.

	1907.	1906.
Mileage worked	546	546
Passenger earnings	$1,553,997	$1,376,043
Freight earnings	6,326,642	5,589,444
Gross earnings	8,202,361	7,265,058
Maint. way and structures	1,002,729	892,100
Maint. of equipment	1,250,562	1,104,855
Conducting transportation	3,027,418	2,895,393
Operating expenses	5,449,968	5,059,090
Net earnings	2,752,393	2,205,968
Net income	1,654,782	1,187,501
Dividends	1,162,302	1,162,296
Year's surplus	492,480	25,205

Chicago, Indianapolis & Louisville.

This railroad has a line from Indianapolis to Chicago and another north from Louisville, Ky., to Michigan City, Ind. The two cross at Monon, Ind., whence the familiar name of the road, the "Monon Route." Except for two short branches to reach the coal fields south of Terre Haute and a branch to the pleasure and health resort of French Lick Springs, the road has through lines and nothing else. The branch from Quincy southwest to Shirley Hill was finished in September, having been built under the name of the Indianapolis & Louisville Railway. Locally, stone, sand and other like articles furnish the largest proportion, 28 per cent., of the tonnage. For miles the road runs through the Bedford stone region. Bituminous coal comes next with 11 per cent. of the total tonnage. On through business the greatest strength of the road lies in the fact that it is controlled jointly by the Louisville & Nashville and the Southern Railway and furnishes both of them, from Louisville, a northern outlet to Chicago. For this reason it gets an added share of traffic destined to and from both of these great southern systems.



Chicago, Indianapolis & Louisville.

The past year's record is not a particularly encouraging one from the standpoint of earnings. Gross earnings increased only $68,000,000, or 1 per cent., a small increase for so generally prosperous a year. Operating expenses increased $182,000, or 5 per cent., leaving a decrease of $114,000 in net earnings. An increase of $41,000 in taxes made a total decrease in net earnings after operating expenses and taxes, of $158,000. In this connection President McDoel states that the valuation of the main line has been increased by Indiana 39 per cent. in two years. Net income was $995,000, against $1,198,000 in 1906. As the dividend disbursement was the same in each year, the year's surplus was $480,000 last year, against $683,000 in 1906.

There were small increases in each of the operating expense accounts, the largest being in conducting transportation, which rose from $1,987,000 to $2,082,000. This, however, was an increase of only 5 per cent., which is not a bad showing in a year of largely increased costs. There was spent for maintenance of way $1,369 per mile of road, against $1,328 in 1906. Repairs and renewals of equipment cost $2,958 per locomotive, against $2,632 in 1906, $1,044 per passenger car, against $1,087 in 1906, and $62 per freight car in both years. These are liberal figures, particularly for locomotives and for passenger cars. The company owned, on June 30, 1907, 300 less freight cars than a year earlier.

The rate received per ton of freight per mile has shown a steady increase during the last three years. It was 0.790 cents in 1905, 0.796 cents in 1906 and 0.810 cents last year. The passenger-mile rate, on the other hand, decreased from 2.074 cents to 2.027 cents during the year owing to the 2-cent-a-mile law in Indiana, which was in force for several months. Next year it is likely to show a further decrease. There were less tons of freight carried and more passengers. The train-load fell off from 312 tons to 307 tons.

The total tonnage is divided by general groups as follows: Agricultural products, 14 per cent.; animal products, 4 per cent., mine products, 41 per cent.; forest products, 11 per cent., and manufactures, merchandise, miscellaneous, salt, ice and fertilizer, 30 per cent. Of this last group, manufacturers make up 14 per cent., miscellaneous 8 per cent., and merchandise 5 per cent. The interchange traffic with the southern roads is here reflected. It was this group of traffic, too, which specially increased last year, while there was a falling off in bituminous coal, stone and sand tonnage.

Of the 518 miles of line owned, 428 miles are laid with 75-lb. rails, the rest with 67- and 60-lb. steel. During the last year 63 miles of new 75-lb. rail were laid. There were other improvements such as extensions of sidings, new bridges, a new 9-stall engine house and co-ordinate facilities at New Albany, which is across the river from Louisville, new interlocking at crossings with other railroads and new track scales.

President McDoel speaks as follows in regard to the railroad legislation of the past year:

"All laws passed by the last session of the legislature of Indiana with reference to railroads and their operation, notably the Railroad Commission Act., the Shippers' Bills, the Railroad Passenger Rates, Two Cents per Mile, Railroad Baggage Act, Employees' Act, etc., have the effect of decreasing our earnings and increasing our expenses, to what extent we are not yet able to determine."

The following is a summary of the income account for the past two years:

	1907.	1906.
Mileage worked	600	591
Passenger earnings	$1,432,978	$1,402,347
Freight earnings	4,199,673	4,166,413
Gross earnings	5,988,867	5,921,002
Maint. way and structures	837,805	785,278
Maint. of equipment	839,466	812,278
Conducting transportation	2,081,946	1,987,334
Operating expenses	3,899,595	3,717,924
Net earnings	2,089,273	2,203,078
Net income	995,027	1,197,637
Dividends	515,000	515,000
Year's surplus	480,027	682,637

NEW PUBLICATIONS.

Strength of Structural Timber. Circular No. 115 of the Forest Service. Published for free distribution by the Department of Agriculture, Washington, D. C.

Before putting a timber into a structure every builder must know the strength of the timber and the maximum load it will have to carry. Building laws generally require that the material used shall be from three to six times as strong as is actually necessary.

Loblolly, longleaf and Norway pines and tamarack are among the principal structural timbers of the eastern United States, and Douglas fir and western hemlock of the western states. In the trade, loblolly pine is classed both as Virginia pine and as North Carolina pine. Virginia pine is made up principally of timber from the northern part of the loblolly pine belt, and is inferior in quality to the North Carolina pine, so that the distinction is one of grade rather than one of locality. Longleaf yellow pine, as known on the market, may include the better grades of shortleaf pine and Cuban pine. It has for a long time been the standard construction timber of the East. Norway pine, also known as red pine, is cut principally in Michigan, Wisconsin and Minnesota, where it is marketed with white pine as northern pine. Douglas fir, called in different localities yellow fir, red fir, Oregon pine and Douglas spruce, is cut most extensively in Washington and Oregon. Western hemlock, which is obtained from the same region, is far superior to the eastern hemlock for structural purposes. On account of the prejudice against it, it is often sold under such names as Alaska pine and Washington pine, spruce or fir.

Recent tests made by the Forest Service on full-size structural timbers of commercial grades show longleaf pine to be the strongest and stiffest of all the timbers named, with Douglas fir a close second; while western hemlock, loblolly pine, tamarack and Norway pine follow in the order given. Fortunately, Douglas fir and western hemlock, of which there are comparatively large supplies, have high structural merit, as has also loblolly pine, the chief tree on which the southern lumber companies are depending for future crops.

Much of the information hitherto available concerning the

strength of timber has been secured from tests of small pieces without defects. This cannot safely be assumed to hold good for large-sized timbers as found on the market, since these commonly contain such defects as checks, knots, cross grain, etc. The location of the defects varies the extent to which they lessen its strength; and the proportion of heart and sap wood, and the state of seasoning, must also be considered.

Freight Car Bulletin No. 8.

The Committee on Car Efficiency of the American Railway Association, Arthur Hale, Chairman, has issued its statement of freight car balance and performance for May, 1907. The introduction summarizes the results as follows:

With a lessening demand for cars during the period covered by this report, the tendency was toward home movement. The increase in the "Average Miles per Car per Day," in the face of a marked reduction in the shortages which had existed for some months on a majority of the roads, can also be partially accounted for by the homeward movement of foreign cars, as indicated by the decrease in the "Per Cent. of Loaded Mileage." That there was a net improvement in performance, however, is denoted by the increase in the "Average Ton Miles per Car per Day" and the "Average Earnings per Car on Line." With an increased empty haul and a stationary "Average Loading per Car" the credit for this improvement must be given to the "Miles per Day."

While the percentage of cars in shop shows an increase over April, this is by no means a discouraging sign. In fact, a noticeable decrease in this figure at this time would be an indication of the retrenchment which too frequently follows a falling off of business, especially toward the close of the fiscal year.

This policy, when persisted in, results in neglect of car and engine repairs during periods of comparative plenty, and has a serious effect on efficiency when business picks up and cars are in demand. Cars which have been allowed to deteriorate while not needed soon give way under the strain of heavy traffic, and the result is a high percentage of cars in shop when they can least be spared from revenue service.

Similarly, a failure to keep the motive power in first-class condition further impairs the efficiency of cars. In many cases the cause of a local shortage may be traced directly to poor car performance, which in turn is frequently due to inadequate motive power.

The committee, in its work of transferring equipment from roads which are over to others which are short, has encountered instances where a lack of motive power has prevented the short roads from promptly handling empty cars offered them by roads which held a surplus. The results in these cases were loss of earnings on the one hand and increased per diem charges on the other.

If all railroads would avail themselves of the opportunity which a slack season affords to put their equipment and power in the best of condition, the result would be apparent on the resumption of heavy business, in a higher efficiency and increased earnings.

There is one feature of the shop situation which has a marked effect on car efficiency but which does not appear in the performance statements except as it affects the results. We refer to the practice of routing cars home on account of bad order.

The committee has frequently observed that even during times of extreme shortage, large numbers of cars with defects which prevent their use under load but do not render them unsafe for empty movement, are carded home, involving long hauls, in many instances over roads which are short of cars for loading in the same direction or which could furnish them to their connections for loading if the necessary repairs were made.

This condition is largely under the control of the individual roads whose earnings and expenses are affected. Possibly as the common use of cars is extended there will be less distinction made in the matter of repairs as between foreign and home cars.

Grain Shipments in Russia.

At a conference of railroad managers in Russia recently to consider the best means of forwarding the last crop of grain and to avoid the blockades and accumulations at stations which have been great in many previous years, it was decided to require the shippers to deliver the grain sacked, so that open cars might be used. It is something like 30 years since the American system of shipping grain in bulk was introduced into Russia, with important saving to the shippers; and it is not probable that the shippers can possibly obtain sacks in time for this year's crop.

Audible Distant Signals on the Great Western.

The audible distant signals installed on the Witney & Fairford line of the Great Western Railway of England, acting in the cab of the locomotive, have now been in use more than six months since the provisional approval issued by the Board of Trade, and their behavior is reported as highly satisfactory. In this apparatus connection is made from the signal tower or cabin to the apparatus on the locomotive without the use of any movable parts on the road-

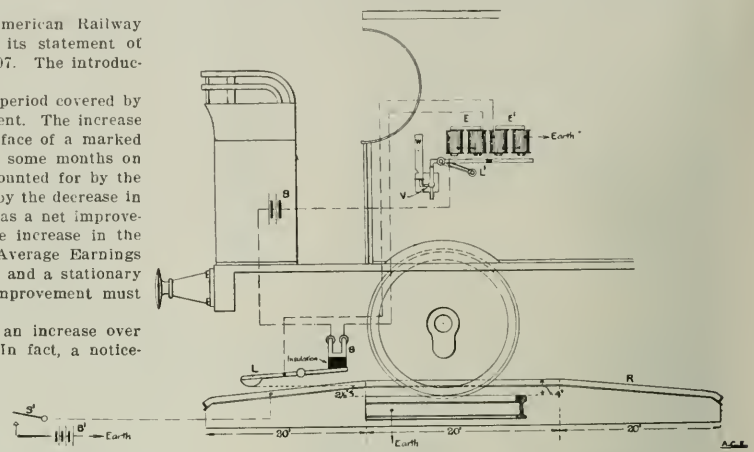


Fig. 1—Audible Cab Signal; Great Western Railway.

way. A bell is rung in the cab to indicate all-clear, and a whistle is blown to indicate caution. The arrangement is depended upon for actual service, the visual signals formerly in use having been taken down. The approval of the Board of Trade was given with this understanding; that is to say, the audible signals are used as a substitute for the visual distant signals and not merely as an adjunct. The clear signal is given by the closing of an electric circuit in the signal cabin, and the circuit closer, by which this is effected, is interlocked with the home signal levers the same as in

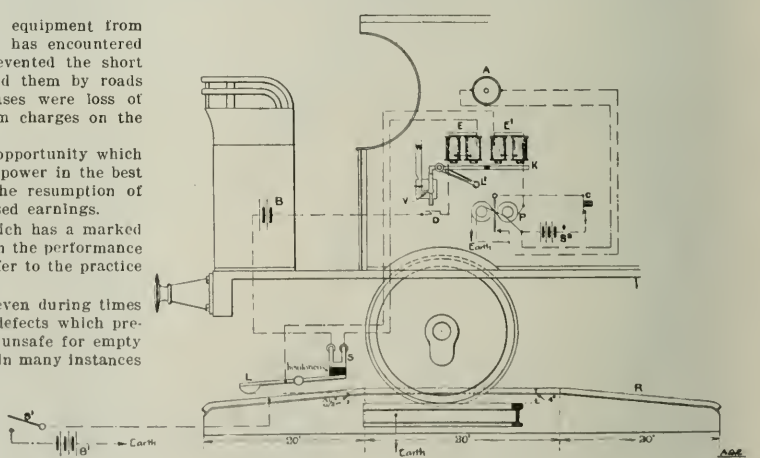

Fig. 2—Audible Cab Signal with Polarized Relay.

the case of an ordinary distant signal. The line on which this device is used is in Gloucestershire, and is 22 miles long.

The arrangement of the principal parts of the apparatus is shown in the accompanying drawing, Figs. 1 and 2. There is a single contacting device on the engine. The "caution" signal is given by the destruction of a local electric circuit on the engine, through the lifting of a lever or plunger, which invariably occurs at each signaling position. The "clear" signal is actuated by an electric current, picked up from the ground apparatus by the lever or plunger. The current in addition to causing the bell to ring prevents the giving of the "caution" signal. Since the operation of the "caution" signal depends upon the lifting of the shoe, while the suppression of this signal depends upon the successful picking up of an electric current, it will be seen that neither snow

Fig. 3—Ramp Between Rails.

nor electrical failure can have the effect of preventing the giving of a caution signal.

At each signaling position there is fixed in the center of the track a ramp R, Fig. 1, consisting of a bar of T-iron, suitably mounted and insulated on a timber base, the highest point of which is 4 in. above rail level. The iron bar is electrically connected by means of a telegraph wire to a switch S^1 in the signal cabin. By means of the switch, a battery B^1 is put in connection with the ramp when it is desired to give the "clear" signal on the engine. Normally, the switch S^1 is not closed. The contacting shoe L on the engine is insulated from the mass of the engine, and the switch S, which is mechanically connected to the shoe, is insulated both from it and the mass of the engine. The normal position of the shoe is such that its lowest point is $2\frac{1}{2}$ in. above rail level. When it comes in contact with the ramp it is raised $1\frac{1}{2}$ in.

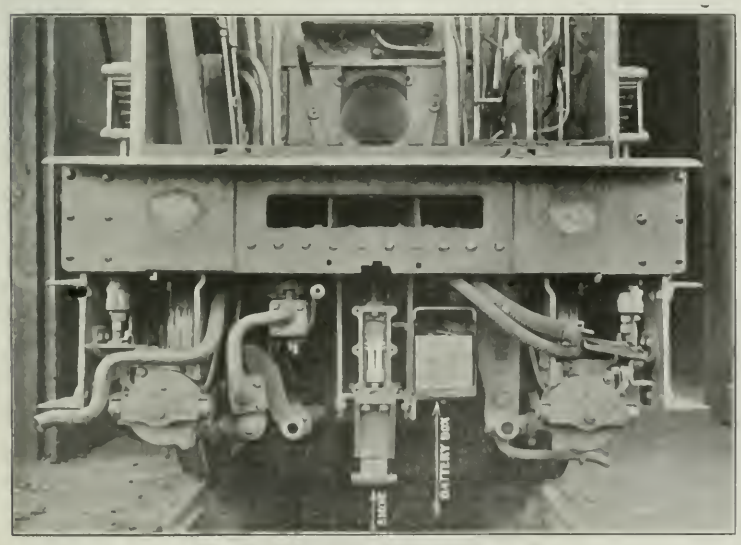

Fig. 4—Contact Shoe on Locomotive.

The electro-magnets E and E^1 on the engine have armatures yoked together and the compound armature K (Fig. 2) thus formed, when held up by either magnet keeps closed the valve V of the whistle W. The whistle valve is constructed on the principle of a safety valve, and is normally prevented from opening by the armature being held by the electro-magnet E. This electro-magnet forms part of a local circuit on the engine, which includes the battery B and the switch S. When shoe L is in its normal position switch S is closed, the local circuit then being complete, the electro-magnet holds the compound armature and keeps the whistle valve closed. The lifting of the shoe L less than $\frac{1}{2}$ in. above its normal position will open the switch S, and electro-magnet E being no longer energized, the compound armature will drop. Thus, when the shoe passes over the ramp (the ramp not being electrified), and is raised $1\frac{1}{2}$ in., the local engine circuit is opened and the whistle sounded, indicating caution. On the shoe clearing the ramp and the local circuit being again completed, the electro-magnet is once more capable of holding the compound armature, but in order that it may do so, the engineman must lift the armature near to the poles of the electro-magnet, for which purpose a small lever L, is provided.

So much for the "caution" signal. To suppress this and give an all-right signal, the signalman, having cleared his home and starting signals, closes the circuit of battery B^1 at switch S^1. Electro-magnet E^1 is electrically connected on one side to the shoe L and on the other side to earth through the mass of the engine and the running rails. The shoe, in passing over the ramp will then, in addition to opening the switch S, also complete the circuit from battery B^1 to the electro-magnet E^1. Consequently the latter will be energized and be capable during the passage of the shoe over the ramp, of holding the armature and keeping the whistle valve closed.

The suppression of the "caution" signal is not in itself a positive "clear" signal, this consisting, as already mentioned, of the ringing of a bell. Fig. 2 is an amplification of Fig. 1, showing on the engine in the circuit of the electro-magnet E^1 one winding of a polarized relay P. When current is picked up from the ramp, it will, in addition to energizing the electro-magnet E^1, also energize the polarized relay, the armature of which will close a local circuit and ring bell A. The second winding of this relay is for the purpose of keeping the local bell circuit closed, so that the bell may continue to ring after the shoe has passed over the ramp and until the bell circuit is momentarily opened by the engineman pressing on circuit-breaker C.

Switch D is controlled by a steam-operated valve, so arranged as to open the circuit when the boiler pressure falls to about 20 lbs. This automatically opens the circuit of battery B, and prevents waste of current when the engine is not in running condition.

Battery B^2 consists of about 16 No. 2 Lechlanché cells; battery B of two large dry cells, and battery B^2 of four small dry cells.

For fast-running lines a ramp 60 ft. long has been found suitable; for moderate speeds 40 ft. The ramp must be long enough to ensure the switch S being open a sufficient time to de-energize electro-magnet E.

In connection with the Witney & Fairford line installation, two short ramps are provided in the locomotive yards at Oxford and Fairford, so that the signals may be tested before an engine passes out for use. The highest point of the "caution" testing ramp is only 3 in. above rail level, therefore the "caution" signal sounds when the shoe is lifted $\frac{1}{2}$ in., or one-third of its working lift. The shoe is 7 in. wide and its face is case-hardened. A strong spiral spring is provided to ensure prompt return of the shoe to the normal position on leaving the ramp.

Single-Track Working.—An engine in passing from one station to another, say from A to B, will pass over two ramps, one applying to trains coming from B, the other to trains going to B, and it is desirable that it should only receive a signal at the latter. Referring to Fig. 2, it will be seen that the ramp is electrified by the signalman connecting the negative end of the battery B^1 to the ramp. If, instead the positive end of the battery were to be connected to the ramp, the "caution" signal would still be suppressed, but the bell would not ring, since the armature of the polarized relay would

tend to move away from instead of toward its contact post. Thus when an engine passes over a ramp applying to the opposite direction to that in which it is running, provision is readily made for suppressing both the caution and the clear signal. In order that it shall not be possible for the signalman to wrongly electrify a ramp when a train is approaching his station, the levers in the locking frame controlling the hand switches used for electrifying the ramp are interlocked with the electric train staff or tablet circuit, so that the wrong lever cannot be thrown.

The apparatus is covered by patent No. 12,661/05, granted to Messrs. Jacobs, Insell, Newton and Bowden, and patent No. 25,955/05, granted to Messrs. Insell and Jacobs, all of the company's staff. The installation has been made under the direction of Mr. A. T. Blackall, the company's Signal Engineer.

Interurban Fares.*

BY THEODORE STEBBINS.

The subject of interurban fares is one of immediate interest because matters connected with the transportation of persons and property by railroads have been the subject of very active and even violent popular discussion. The state legislatures have been taking blind actions and state executives have been advocating and adopting arbitrary measures with the railroads. Twenty state legislatures have passed restrictive legislation on passenger rates, and fourteen states now limit passenger rates to two cents a mile. In this situation, it is important to understand the position of the interurban railway.

All interurbans are anxious to serve the public and to earn reasonable dividends for stockholders. It is not so clear, however, how rates shall be adjusted to satisfy these ends. It is customary to measure the service and its cost on the basis of cents per passenger-mile. The charges range from three cents per mile in unsettled sections down to half a cent per mile for commuters in thickly settled districts, who use the cars twice each working day, or where excursions are handled in bulk. The ordinary range of fare, however, is between two cents and one cent per mile. We find the two cents per mile charge prevailing in the Middle West, and the one-cent rate common in thickly settled districts, mostly in the East. Tables have been published showing the charges made by various roads. For example, the convention issue of the *Street Railway Journal* for October, 1906, on page 672, gives the rates for various classes of tickets charged in Ohio and adjoining states, and shows that the average single trip fare in this locality is upward of two cents per mile. It will also be observed, however, that other and lower rates are made on such roads for regular daily passengers down to about one cent per mile. These western roads sell forms of tickets and make rates corresponding in a variety of forms and variation of rates with the steam roads.

At the other extreme we find certain interurban roads charging one cent per mile, and the majority of such roads make this a uniform charge to all adults, and their character of travel approaches that of the ordinary street railway company.

Tables can be prepared, giving the rate charged by the various companies, but these are meaningless without knowing at the same time the coaditions under which such roads are operating, and so we will seek to indicate the justification for these variations in fares.

The cost per car-mile of operation does not afford a direct measure of the rates that should be charged to passengers. The density of travel has a far greater influence on rates. The road must be built and furnish a service to suit the distribution and density of population, and the fares that can be collected follow as a consequence of this environment. The cost per car-mile may not vary much between properties quite different in character, but it is the commercial and social habits of the people which determine the quantity and times of traveling as well as the percentage of the car-load (that is, passenger-miles divided by seat-miles) and thus the passenger rates are determined.

COST OF SERVICE.

The seat-mile cost can be figured as shown for illustration in the following table, which indicates also the effect on such cost of more frequent service:

	A	B	C
Annual cost per mile of track	60	30	15
Headway (minutes)	15,000	30,000	60,000
Car miles (plus extras)	$1,800	$3,600	$7,200
Cost of operation	2,700	3,600	4,500
Interest and depreciation	$4,500	$7,200	$11,700
Cost per car mile (cents)	30	24	20
Car seating capacity	40	40	40
Car seat-mile cost (cents)	75	6	5

The actual passenger rate per mile must be more than the car-seat cost as a minimum in proportion, as the passenger-miles are less than the car-seat miles. If the passenger load averages 40 per cent. of the seating capacity then, on a 60-minute headway, the average cost would be $^{100}/_{40}$ times 0.75 cents, or 1⅞ cents per mile. This indicates how much rates might be decreased if full loads were constantly carried, and why some roads can afford to make mileage rates less than other roads.

The distribution and occupations of the population along the line are the powerful elements affecting the percentage of load. Assume two roads, each fifteen miles long; the first joining two cities of large size with little intermediate population, and the second leaving a city and traversing a succession of villages growing smaller and terminating in a country hamlet. The first road may prosper on one cent per mile and the second starve on two cents, even though operating the same number of cars with the same number of passengers to and from the principal terminal. In the first, the loads are carried through; in the second case, two-thirds of the load may be dropped within the first four miles. Assume a third case where a succession of towns of equal importance are traversed. The cars may load and unload several times in the course of the trip, and this makes for an intermediate policy on rates.

DENSITY OF TRAVEL.

To give some idea of the variation in density of travel on electric railways, the following figures are given:

Territory.	Passenger per mile.	Average fare	Receipts per mile.
United Kingdom	939,658	2.26 cents	$21,240
United States	333,862	3.76 cents	12,553
Indiana	133,000	5.6 cents	7,500

The above figures for the United States and Indiana include all electric railways; that is, both city and interurban. The density of travel on the Ohio interurbans is indicated in the following table, grouping them together according to principal terminal:

Extending centrally through the building from main waiting

Principal Terminal.	Its population.	Receipts per mile.
Cleveland	500,000	$5,045
Columbus	200,000	3,829
Toledo	225,000	3,257
Dayton	90,000	3,137
Miscellaneous	.....	3,542

Twenty-eight interurbans in this same section are classified in annual receipts as follows:

0	$2,000	4	8	19
2,000	2,500	4		
2,500	3,000	7	11	
3,000	3,500	4		
3,500	4,000	1	4	9
4,000	4,500	3		
4,500	5,000	1	5	
5,000	up	4		
		28		

Most of these roads furnish hourly service, so that by making some additions for limited and excursion cars, the receipts per car-mile can be calculated, and assuming the average rate to be 1.5 cents per mile, the number of passenger-miles and its relation to the car-seat mile capacity can be determined.

As indicating the variation in car-miles per mile of road, it may be stated that the elevated roads in New York operate 1,635,000 miles per mile of road, as against 15,000 or less for the ordinary interurban road in the Middle West, while the expenses per car-mile on the elevated are nine cents per mile, as compared with about 14 cents for the Middle West interurban.

The expenses per car-mile and per seat-mile for a known service are capable of calculation with mathematical precision, but the density of the traffic can only be learned by experience, and this experience indicates how much the rates charged must be increased beyond the basic seat-mile cost.

WESTERN INTERURBANS.

For the average conditions prevailing throughout the Middle amount of testimony is available to show that the basic single trip rate should be upwards of two cents per mile. If less is charged, not enough additional travel is secured to increase the gross receipts. If more is charged, travel is curtailed and the gross is reduced. In stating this it must be understood that mileage, commuter and other lower rates are granted and maintained at proper relation to the single trip rate.

The widest consensus of opinion on the subject is found in a resolution passed by the Ohio Interurban Railway Association on May 25, 1905. This association represented about 2,000 miles of interurban roads and the matter was given earnest consideration in private discussion between the members and in the open meeting. The resolution reads as follows:

"Whereas, A demand for improved service on interurban roads has very largely increased the operating expenses of such roads, and many roads have met this demand; and,

"Whereas, In order to obtain their share of the business many other roads contemplate improving their service in like manner; and,

"Whereas, The prevailing low rate of fare on most interurban roads will not permit of such improvement in service, therefore, be it

"Resolved, That the Ohio Interurban Railway Association recommend a uniform base rate of two cents per mile, and a minimum charge of 10 cents."

Mr. A. H. Royce, secretary and treasurer of the Canadian Street Railway Association, writes:

"Since the reduction to two cents a mile (by legislative act) the

*A paper read before the American Street & Interurban Railway Association at its Atlantic City Convention, 1907.

companies have done away with all commutation tickets and charge a flat rate of two cents a mile. We find that it is impossible to operate a road properly and keep up the rolling stock and equipment even at that rate.

"In the other provinces of Canada, the rates of fare are regulated by agreements with the municipalities through which they operate. There is no legislation affecting these rates, and as a rule the charge is three cents a mile."

Mr. J. McM. Smith, General Manager of the Southern Michigan Railway Co., writes:

"We started out a year or two ago on the rate basis of 1½ and 1¾ cents per mile, but we found this to be entirely too low, and accordingly we made a uniform raise. It is my belief, based on long years of experience in this business, that a road must be exceptionally well located if it can be made profitable on a rate less than two cents per mile."

Mr. S. Hendrie, General Manager of the Grand Rapids, Holland & Chicago Railway, writes:

"I am inclined to think that all our interurban passenger fares in Michigan are too low in view of the increase in the wages and in the cost of all materials which enter into the construction and operation of electric roads to-day. In 1894-96 I took franchises for a road on the average of one cent per passenger mile, but new steel then cost $16 per ton, copper 13 cents per pound, number one standard ties 35 cents each, common labor $1.50 per day, etc. At that time, conductors and motormen were paid 17.5 cents per hour, and other labor in proportion. The same road could not be built to-day for twice its cost, and although the fixed charges are low, the present owners are not satisfied with its net earnings."

Mr. H. H. Polk, President of the Inter-Urban Railway Company of Des Moines, Iowa, writes:

"The rates generally charged are as follows: Two cents a mile for single trip tickets; 1.5 cents for round trip tickets, good for one day; 1.25 cents for mileage. (These mileage books are for any three people, and good until used.) However, I am of the opinion that our round trip and mileage rates are too low, and we are seriously considering the raising of these rates. With the universal two cent fare now forced on the steam railroads by state legislatures, I am of the opinion that it will be rather up-hill work for interurbans to exist at the present rates."

Mr. C. N. Wilcoxen, general manager of the Cleveland & Southwestern Traction Company, writes:

"There are very few roads in this state operating at less than two cents per mile, with the usual reduction for commuters' tickets, etc. The average rate obtained by the Ohio roads is approximately 1.65 cents per mile. To attempt to operate on a 1.25 cents per mile basis would mean bankruptcy to the interurban roads of this state."

Mr. H. A. Nicholl, of the Indiana Union Traction Co., writes:

"Our single trip tickets are 1.5 cents per mile. This is as low a rate as I believe any electric road can carry passengers with a reasonable profit."

EASTERN INTERURBANS.

From the average conditions prevailing in Massachusetts, New Jersey, some parts of Pennsylvania and other sections with considerable density of population, a large amount of testimony is available to show that the heavier travel, the more frequent trips, the shorter rides, and repeated loading and unloading in a trip, make profitable and advisable no variety of tickets, but only a single adult rate.

Mr. M. C. Brush, Vice-President of the Newton Street Railway Co., and associated companies, writes:

"I find upon careful investigation that on about 50 per cent. of our lines our fares vary from 1 cent per mile to 1.5 cents per mile. On the remaining 50 per cent. it varies from 0.4 to 0.9 of a cent per mile. The average New England street railway manager does not believe that under present operating conditions it is possible to carry a patron more than five or six miles for 5 cents. That is, I think you will find that the average New England manager believes that 1 cent per mile is a fair charge in this territory."

NOTE.—The Massachusetts law requires half rate for school tickets.

Mr. F. L. Fuller, Vice-President and General Manager of the New York & Queens County Railway Co., writes:

"The rates on Long Island are 1 cent per mile, collected in 5-cent zones."

Mr. F. W. Bacon, General Manager of the New Jersey & Hudson River Railway & Ferry Co., writes:

"I do not think the rates in New Jersey on interurban roads are in excess of 1.25 cents per mile, and our average rate is 1.15 cents per mile, but we do not issue commutation tickets or other forms at any cheaper rates, and only make 25 per cent. reduction on school tickets."

CALIFORNIAN INTERURBANS.

The extremes on rates seem to exist in California. Mr. Schindler, of Chico, Cal., makes most interesting statements. His line, in the Sacramento valley, has steam railroad conditions, and charges 3 cents per mile and his patrons are well satisfied. In the southern part of the state business is done mostly on round trip tickets at 0.6 of a cent per mile. He states:

"It is a curious fact that in the southern territory where existing rates are already extremely low, there is a strong movement toward a further reduction of rates, while here where the highest rates exist, the public is generally well satisfied."

The above quotations are taken from letters on the subject of rates, addressed to our secretary, Professor Swenson, to whom I am much indebted for this and some statistical information.

Examination shows a clear distinction in conditions and practice between the 2 and 1 cent rates per mile.

The 1 cent rate applies to conditions approaching those of the city railway, 5 cent zones, no tickets, a succession of towns, with contiguous population limits.

The 2 cent rate applies to cities and towns considerably separated, where passengers may travel 25, 50, 100 or 200 miles, and this rate applies to occasional travelers on single trip or interline tickets. Tickets are also sold and gradations of adult rates for commuter and school travel are made down to 1 cent per mile. For interurbans of this character, we will describe the kind of tickets sold.

KIND OF TICKETS.

1. The single trip ticket (good between specified points for an adult) is the basis of maximum charge on each interurban line. Occasionally, a higher rate is charged for fare paid on the cars, but this practice is diminishing, because it entails a greater variety of fares and discriminates against the farm community boarding the cars where ticket offices cannot be maintained, and this farm community is often the most important class of customers for the road. To increase the sale of tickets in order that cash may be taken at the offices and not by the conductors, it has been proposed to charge higher cash fares on the cars and give receipts with a redeemable value to any ticket office the same as some steam railroads do, but this is impracticable for interurban conditions and in one case only to my knowledge has been adopted.

2. The round trip ticket, good for an adult, is the most common form of ticket, in fact is sold by some roads where single trip tickets are not sold, and is ordinarily sold at a 10 per cent. reduction over double the single trip rate. In a few cases the reduction is 20 per cent.

3. Interline tickets are those sold by one road for transportation over its own line and one or more connecting lines, usually not more than three. Such a ticket, when sold for a round trip may be nearly a yard long and practically correspond in form and appearance to the familiar steam railroad ticket. The interurbans of the Central West sell large numbers of these tickets and they are essential in competition with the steam railroads.

4. Mileage books, so-called, are sold at 16⅔ per cent. to 33⅓ per cent. reduction from the base rate. If such books are good for a specified number of miles, 500 or 1,000, then the conductor must carry a sheet of mileage distances between points and detach coupons accordingly. The reservation is commonly made that no less than five coupons shall be detached. Since the rates per mile charged on different roads and often on various sections of the same road vary for franchise or other reasons, it has therefore been found expedient to issue "Mileage Books" not for a specified number of miles but containing a certain number of 5 cent coupons. This avoids the necessity of conductors carrying mileage cards, permits detaching coupons of a face value equal to the single trip ticket; reduces the complexity of accounting and in general is practical where mileage coupons are impracticable. Properly these are called Coupon Ticket Books and if good on one road "Local"; if good on a group of roads, "Interchangeable"; but we continue to speak of them in common parlance as "Mileage Books." Such interchangeable books issued by certain members of the Central States Interurban Association contain 240 5-cent coupons, face value $12, sold at a net price of $10. These books are good for use over some 37 railways and their underlying companies all operating several thousand miles of track. This book is good for one person only, usable within one year and not less than two 5-cent coupons are detached for any ride, no matter how short. Each individual company is free to issue, also, mileage books good over its own line under such conditions as it may see fit. In some cases these are good for use without restriction as to name and number of persons and at a slightly lower rate.

5. Commuter books are also sold, good commonly only for either 30 days or a calendar month, and containing 40, 50 or 60 rides, each book limited to one name. Such books are not in as common use now as the writer believes they will be in the future, as they form a means of building up a steady suburban travel, the same as steam roads operate so profitably out of our large cities and without interfering with higher charges for occasional travelers.

6. Book tickets are sold for 10, 20, 30, 40, 50 or 100 rides, with or without limitation as to name or family, or length of use and on some roads serve the same purpose as commuter books.

7. Excursion tickets are sold by almost all roads for special occasions, usually limited to one day and issued for summer riding to

parks, church picnics, political meetings, city shopping and a great variety of purposes.

8. Half rate tickets are sold for single and round trips of children from 5 to 12 years of age.

9. Party tickets are sold for a specified number of persons traveling together between specified points within a time limit.

10. Special carload rates are made for excursions at the lowest rates. The car is permitted to carry a full seated load and usually a limited additional number of standing persons.

Twenty-six interurbans in Ohio, Indiana and Michigan are reported by the *Street Railway Journal* to sell these kinds:

Tickets.	No. of Companies.
Single trip	24
Round trip	24
Commutation (individual)	13
Commutation (family)	11
School tickets	14
Mileage books	10
Interchangeable coupons	15
Sunday	7
Week-end	4
Not selling tickets	2

All the above and many more forms of paid transportation are used in the development of the interurban business. The writer, on undertaking the management of an interurban system, found in use tickets of as many as 400 kinds; that is, differing in form and points between which they were usable.

GRADATION OF RATES.

The gradation of price between these various forms of tickets must follow a consistent sequence in order that each ticket may find its proper use. To illustrate: If the mileage book price is less than the commuter rate, there would be no sale for commuter books. The gradation is commonly something like this: Assume the base rate for a single trip ticket is 2 cents per mile, round trip ticket will be 10 per cent. off, or 1.8 cents; the interline single trip ticket will be the sum of the single trip rates of the connecting roads and the interline round trip ticket will likewise be the sum of the round trip rates of the connecting roads, or less if there is a competitive route; the mileage book will be 16⅔ per cent. off or 1⅔ cents per mile net; the commuter book ticket rate will be about 1.25 cents; the school rate will be 1 cent and the excursion rate and party rate will vary from 0.5 of a cent to 1.5 cents, according to distance, size of excursion and other conditions. This gives a general idea of the consistent relationship between these various rates, but, of course, there are considerable departures from this practice in individual cases.

The average gradation of rates in cents per mile, in three Western states, is shown in figures from the *Street Railway Journal*, May 5, 1905, as follows:

	Issued by Ohio.		Issued by Michigan.		Issued by Indiana.	
Cash fare	1.84	23	1.58	5	1.68	8
Single trips	1.77	17	1.48	4	1.68	6
Round trip	1.63	20	1.34	4	1.45	6
Commuters (family)	1.45	12	1.10	2	1.23	3
Commuters (individual)	1.09	17	1.00	2	1.20	5
Mileage	1.37	6	1.25	1	1.22	2
Interline coupons	1.48	10	1.30	1	1.67	1
School	1.03	12	0.87	2	0.94	4

THE ESTABLISHMENT OF RATES.

Mr. C. L. S. Tingley, Vice-President of the American Railways Company of Philadelphia, speaking of Pennsylvania conditions, states:

"The whole thing is a matter of ordinance regulation and not a question of scientific rate making."

This is true for many roads elsewhere.

For the short interurban with the dense traffic, 5 cent zones and no tickets are clearly indicated.

For the long interurban, experience has clearly indicated the expediency of a mileage basis of charge with tickets and a graduation of rates for different classes of travel. The western interurban connection with other interurbans and having steam or electric competitors will need (a) cash receipts for use on the car, (b) single and round trip tickets, (c) interline single and round trip tickets, (d) interchangeable coupon books, (e) commuter or book tickets, (f) school tickets, and (g) excursion tickets. A consistent relation in rates for each kind of ticket has been specified in the preceding sections.

The interline tickets and interchangeable coupon books are required for steam competitors. The commuter tickets are required to build up a travel of wage earners working in one place and living in another. Excursion tickets are required for those who might not otherwise ride, and school tickets are ordinarily an unprofitable concession to education.

The profit from traffic should not be estimated too narrowly on a cents per passenger-mile basis. If a car receives all its load at the terminal and does not pick up passengers along the way, the space taken by the passenger is worth as much whether he rides all or part of the trip; or to make specific application, commuter rates should be determined more by what the passenger can afford from his daily wage and by seat-trip cost than by mileage rates.

Excursion rates and carload rates are subject to the greatest variation and the cost of such business may be figured progressively lower as one in turn omits interest, depreciation, general expense, track maintenance and other items that are not affected sensibly by the operation of an additional car over the road. If platform wages, power and car repairs are figured as the only cost of the additional service, very low mileage rates may be made. Such reduction of excursion rates is justified within limits to the extent upon which the largest annual receipts may be secured.

A company may make money on excursions at half a cent a mile where it is losing on regular travel at 2 cents a mile. For the same reason, commuter travel at a cent may be a desirable addition to the business where general travel will hardly yield a profit at 1½ cents. By commuters we mean those persons traveling back and forth between work and home every working day. The lower rate enables certain people to take employment in the city when they could not afford to pay fares at full rates out of their daily wage, and enables workmen in the city to move to the country when otherwise they would locate along some city line reached by a 5 cent fare.

Roads differ greatly in regard to the possibilities of commuter travel. On some a large feature can be made of this business; on others, it is not worth while to even put the books on sale. In conclusion we may state the rate which may be profitable for one road may be unprofitable for another and, in each case, the distribution of the population along the road and the character of the travel must be studied carefully to determine the rates charged. The heavier the travel and the more miscellaneous its character, the greater reason for making a uniform and low rate for all classes of travel. On the other hand, the less the density of the population, the greater reason for making an initial single trip high rate for the occasional traveler and creating, in addition, a large regular travel by other forms of lower rate tickets.

In conclusion we may state that, before attempting to fix rates, the first thing is to study the density of the population along the line, and its location, to estimate how much will be through travel, how much short ride travel out of the terminals, how much loading and reloading of passengers will occur in the course of the trip, what pleasure resorts exist, or may be built up, what commuter travel will be created, that is, working people in the city drawn into the country to live, and country people secure employment in the city, and all of these and other elements are more vital in determining the rates of fare than the car-mile cost, trip-seat cost, or the seat-mile cost. In fact, the character of the travel should determine the kind of road built and the choice of rolling stock. After a study of all the conditions a determination must be made of various kinds of tickets to be sold and the gradation of rates between them.

Ticket offices should be established wherever ticket sales will justify it, and in the Middle West about 60 per cent. of receipts are collected through such offices. Reasonable care will insure that such receipts reach the treasury of the company. Tickets have the advantage of keeping money out of the conductors' hands, but, as a considerable amount will be collected by the conductors, it is of vast importance to secure a proper account of it.

West and other sections of medium density of population, a large

Large sums remain to be collected by the conductors on the cars from passengers boarding them where ticket offices cannot be maintained and from passengers failing to buy tickets where they are sold. Every safeguard should be provided for such collections in order to check fully the work of the conductors.

The cash fare receipts issued on the cars should show at least from what point to what point fare is paid, and the auditor's stub must give corresponding information. The tickets and stubs turned in by the conductor will then show how many passengers should be in the car at each point along its trip. An actual count of passengers at one or more points thus affords an exact check on the conductor's returns.

Accident Bulletin No. 24.

The Interstate Commerce Commission has issued Accident Bulletin No. 24, giving the record of railroad accidents in the United States during the three months ending June 30, 1907, and yearly tables for the 12 months ending with June. The number of persons killed in train accidents in the quarter was 250, and of injured 4,124. Accidents of other kinds bring the total number of casualties up to 19,711 (1,065 killed and 18,646 injured). These reports deal only with (*a*) passengers and (*b*) employees on duty.

TABLE No. 1.—*Casualties to Persons—April, May and June, 1907.*

	Passengers.		Employees		Tot'l persons reported	
	Kil'd.	Inj'd.	Kil'd.	Inj'd.	Kil'd.	Inj'd.

Total (other than train accidents)..	63	1,137	752	13,385	815	14,522
Total, all classes	111	3,191	954	15,455	1,065	18,646

*Including locomotive boiler explosions.

The quarter ending with June usually shows lighter accident records than any other quarter of the year, and this is generally

true in the present instance, but the principal totals are all larger than in the same quarter one year ago. This may in large measure be accounted for by the marked and constant increase in railroad traffic. The number of passengers killed in train accidents, which fluctuates more than any other item, is very much larger than one year ago, but there is a marked diminution from the high figure reported three months ago. In the present bulletin, derailment No. 6* (Table 2a), killing 33 and injuring 19 and collision No. 1,† killing eight and injuring 37, are the extraordinary items.

Comparison of Principal Items with Last Bulletin and With One Year Back.

	Bulletin No. 24	Bulletin No. 23.	Bulletin No. 20
1 Passengers killed in train accidents	48	129	25
2. Passengers killed, all causes	111	184	81
3. Employees killed in train accidents	202	295	167
4 Employees killed in coupling	72	62	68
5 Employees killed, all causes	954	1,109	852
6. Total passengers and employees killed, all causes	1,065	1,293	934

The total number of collisions and derailments was 3,777 as follows:

TABLE NO. 2.—*Collisions and Derailments.*

	No.	Loss.	Persons Killed.	Persons Injured.
Collisions, rear	402	$472,031	26	419

The following, Table 2a, is a list of train accidents in which the damage is reported at $10,000 or over, and other notable cases:

TABLE 2a.—*Causes of Thirty-two Prominent Train Accidents (Class A).*

(NOTE.—R., stands for rear collision; B., butting collision; M., miscellaneous collisions; D., derailment; P., passenger train; F., freight and miscellaneous trains.)

COLLISIONS.

No.	Class.	Kind of train.	Killed.	Injured.	Damage to engines, cars & roadway.	Reference to record	Cause.
1	B.	P. & F.	8	37	$695	91	Disregard of telegraphic orders. See note in text.
2	M.	F. & F.	0	0	2,100	42	Collision on side track; train moving only 1 mile an hour, but enginemen fell asleep and slept 2 minutes; had been on duty 21 hours.
3	B.	P. & F.	0	13	6,800	11	Eastbound freight encroached on time of westbound passenger train (1 a.m.). Engineman did not know road; had taken this run by making misrepresentation; conductor and 2 brakemen asleep.
4	B.	F. & F.	1	4	7,000	16	Runaway on steep grade 3 a. m. See note in text.
5	B.	P. & F.	4	33	8,000	68	Engineman of westbound freight (who was killed) evidently forgot regular eastbound passenger train; passenger train scheduled for only 2 days in the week—Saturday and Sunday.
6	R.	F. & F.	0	2	10,000	7	Flagman of pushing engine failed to signal following train.
7	R.	F. & F.	0	5	10,000	45	Operator, 20 years 10 months of age, neglected to deliver meeting order. Cleared signal for another train and forgot to restore it to the stop position.
8	B.	F. & F.	0	2	10,220	1	Operator, 17 years of age, accepted order after train had left.
9	B.	P. & F.	4	5	10,400	36	Flagman failed to signal following train; 5 a. m.; foggy.
10	B.	F. & F.	0	4	10,600	72	Freight train entered yard 1 a. m. with speed not under control.
11	B.	F. & F.	1	2	10,935	33	Butting collision at water station; engineman asleep.
12	R.	P. & F.	2	21	12,000	5	Failure of block signaling and flagging. See note in text.
13	R.	F. & F.	0	2	13,000	9	Runaway, due to failure of air pump; neglect to slacken speed on passing over summit, and failure to apply hand brakes.
14	B.	P. & F	1	7	13,000	12	Empty engine encroached on time of passenger train. Engineman's watch slow, not having been wound; engineman's experience as a runner, six months.
15	R.	F. & F.	0	1	16,000	18	Signal cleared when track was not clear. This was made possible by the breakage of a connection at an interlocking cabin. Signalman held negligent.
16	B.	F. & F.	0	4	36,670	14	Operator accepted order after train had passed. See note in text.
17	R.	F. & F.	0	2	56,889	6	Rear collision of freight trains in tunnel. A comparatively light train overtook a heavier one. Time interval at last station 10 minutes. Leading train held blameworthy for not signaling by fusee, and the following train for running too fast. Tunnel lining took fire and was damaged $50,000.
Total			27	144	$234,309		

DERAILMENTS.

No.	Class.	Kind of train.	Killed.	Injured.	Damage to engines, cars & roadway.	Reference to record	Cause.
1	D.	P.	2	0	$5,400	31	Excessive speed on curve running ten miles per hour.
2	D.	F.	1	2	11,000	52	Spread of rails; engineman killed by rails.
3	D.	P.	0	26	11,000	86	Unknown.
4	D.	P.	1	20	13,000	51	Train diverted to siding; broken switch.
5	D.	F.	0	0	14,000	82	Broken flange. Derailed cars smashed a bridge.
6	D.	P.	33	19	14,200	63	Unknown. See note in text.
7	D.	F.	0	1	15,000	88	Unknown; damage due mainly to explosions of naphtha and gunpowder.
8	D.	F.	1	1	19,930	59	Failure of bridge; bridge damaged by blasting near by at the moment the train entered upon it.
9	D.	P.	0	26	20,032	62	Rails maliciously loosened.
10	D.	F.	1	1	25,000	28	Landslide in the night. Inspector had detected no indication of trouble.
11	D.	P.	2	26	30,000	23	Roadbed undermined by water from springs not before known to exist.
12	D.	P.	2	5	32,000	30	Switch maliciously misplaced.
13	D.	F.	1	10	34,000	58	Rock slide; this occurred on an old railroad. It is believed that blasting 1,000 ft. distant had fractured the rock so as to permit vegetation to disintegrate it.

Derailment No. 6, by far the worst accident in the present record, causing the death of 33 persons and the injury of 19, is reported as due to some cause undiscovered. A passenger train, running at regular speed, was derailed at a facing point split switch and the two cars next behind the engine were completely wrecked. When these came to rest they were lying close to the engine, so that steam escaping from the boiler scalded the occupants of the cars. The engine appears to have passed over the switch in safety, and the two cars next following evidently were thrown off by the partial movement of the switch. Of the seven cars in the train the two at the rear passed over the switch without being derailed. It would appear that some part of the engine broke and fell to the track, causing the movement of the switch rails, but it was impossible to discover any positive evidence of this. The side track leading from the switch diverged to the left, and the switch rail on the left side of the track was found after the accident in proper position and undamaged. The engine and tender, though they passed over the switch without being derailed, were knocked off the track in some way, presumably by the derailed car next behind them, and the tender was pushed against the engine in such a way as to overturn it. It is possible that the leading truck of the tender was the one that caused the damage to the switch and that first left the track. The switch was fitted with a circuit breaker so adjusted as to set an automatic block signal against an approaching train if the switch point were more than one-quarter of an inch away from the stock rail. This circumstance affords additional evidence that the switch was in proper position when the leading wheels of the engine ran onto it.

Collision No. 1 was between a westbound passenger train and an eastbound work train, and all of the victims were employees, except three passengers slightly injured. All of the eight killed and 32 of the injured were laborers riding in the leading car of the work train, the engine of this train being at the rear end. The collision occurred on a line where, although the railroad is double-tracked, one of these tracks for a few miles is used for suburban trains in both directions and the other one for other trains. On the day in question, which was Sunday, the suburban trains were run on the track usually used by other trains, in order to facilitate repairs on the suburban track. This temporary arrangement was to last from 7 a.m. to 7 p.m. The collision occurred at 6.50 p.m. A supplementary order had just been issued extending the temporary arrangement, but it appears to have been misunderstood. The passenger train was made up on the proper track, but it was run through a crossover to the other track, the conductor adjusting the switch himself, and it proceeded on the wrong track in disregard of the special orders, which were clear and which no one claims to have misunderstood. The collision occurred before the passenger train had run more than a half mile. The conductor of the passenger train is reported as having left for parts unknown soon after the accident.

Collision No. 4, causing the death of a fireman 21 years old and the serious injury of one other trainman, was due to inefficient management of the air-brakes on a heavy freight train descending a 2½ per cent. grade at 3 a.m., the engineman at that time having been on duty about 21 hours. The grade in question is 26 miles

*Honda, Cal., May 11, *Railroad Gazette*, May 17 and July 12.

†Hartford, Conn., June 23; *Railroad Gazette*, July 26. In this case the conductor and engineer were tried for manslaughter, convicted and sentenced to imprisonment for 9 months.

long, and the train had been run safely for 23 miles when the engineman appears to have allowed the speed to increase to such a rate that there was not sufficient time to recharge the air-brake main reservoir. He had made repeated applications of the brakes, and finally was unable to apply them with sufficient force. The train consisted of 18 cars, weighing about 600 tons, and after it became uncontrollable it collided with an engine standing at a water tank. The engineman at fault had been in the employ of this company about two months, but had been an engineman elsewhere three and one-half years and had served as a fireman, before that, for over five years. One of the cars in the train had no air-brakes working, and two others had leaky brake cylinders. Although the engineman had been on duty 21 hours, he avers that he did not feel sleepy. This crew had been assigned to a work train during the day, and the men had had some time to sleep while the engine was at rest waiting for the laborers to load material. The report says that the brakeman on the forward end of this train was intoxicated at the time of the runaway, so that his services were of little or no value in controlling the speed of the train.

Collision No. 12 was due to an erroneous signal given by a block-signal operator and to the failure of the conductor and the rear brakeman of a freight train to flag a following passenger train. The collision occurred at 2.20 a.m. The freight train was standing partly in a yard, and the block-signal operator reported it as having gone out of the block section, thus allowing the passenger train to come on from the block station in the rear, when in fact a part of the freight train had not cleared the block. The signalman, who had been in the service three years, offered the inadmissible excuse that he had been assured by the yardmaster that the block section was clear. The rear brakeman of the freight endeavored to excuse himself by asserting that the conductor had passed the rear end of the train, apparently going to signal the passenger train. The conductor, who had been in the service four years, refused to attend the hearing on the accident. He, as well as the brakeman and the block signalman, was dismissed from the service, as was the engineman also, for not sounding a whistle signal to notify the rear brakeman to go back with a red signal.

Collision No. 16, causing six deaths and four injuries, occurred at 3 a.m., and was due to wrong information given by a telegraph operator to the train despatcher. This operator was 18 years 8 months of age, and had been in the service 11 months. The train passed his station at 2.50 a.m., and he made the proper entry in his book; but 10 minutes later, when the despatcher inquired if that train had passed, the operator, without looking at the book, replied that it had not, whereupon the despatcher sent an order for this train to meet another one, and a few minutes afterwards permitted the opposing train to proceed from the other station. The operator at fault soon discovered his mistake, but not in time to prevent the collision.

Derailment No. 14 is reported as due to defective track. An eastbound passenger train, running about 35 miles an hour on an easy curve, ran off the track, and the whole train, consisting of an engine and eight cars, fell down a bank about 20 ft. high. As soon as the train left the track a gas tank attached to the bottom of the dining car exploded, setting fire to the train, and all of the cars, except the mail car, were burned up. Another passenger train had gone over this track in the opposite direction about 30 minutes before the occurrence of the accident, and the engineman and fireman of that train say that they felt a slight irregularity in the track, apparently a low joint, but did not deem it dangerous. It is believed, however, that as there was not quite enough ballast to the track on the outside of the curve the rails were thrown out of line by the rear end of the westbound train. One 75-lb. rail, nine years old, was found broken, but it is not certain that this break occurred before the train ran off the track.

Derailment No. 15, causing the death of three passengers and the injury of 19 passengers and two trainmen, is reported as due to some cause unknown. The train consisted of an engine and eight passenger and baggage cars, and it was running at about 50 miles an hour. The derailment occurred at 1.20 a.m. The wreck took fire from an explosion of illuminating gas, and was destroyed by fire, with the exception of one sleeping car. The report says that the track, which consisted of rails weighing 75 lbs. per yard and sleepers in first class condition, was in good line and surface, and that there were no indications either of a broken rail or of loosened spikes.

YEARLY TABLES.

This bulletin completes the publication of the accident records under the law of March 3, 1901, for six years, and the double column table (A) gives the aggregates for the year ending June 30, 1907, of the items which are given in Table No. 1 of the quarterly returns. There have been heavy increases in all of the items, except accidents in car coupling and from striking against overhead obstructions. The number of passengers killed and injured in collisions and derailments has increased to an alarming degree. (See Table B, first item.) In this item the very large total reported in 1905 is now exceeded by 17 per cent. The disastrous record of casualties to passengers in train accidents (410 killed) is due in large measure to 10 accidents which caused the deaths of 291 persons. These have been explained in the four quarterly statements. Nine of the 10 accidents occurred in six states—California, Indiana, Kansas, New Jersey, New York, North Carolina—and one in the District of Columbia.

Following is a list of these 10 cases:

Ten Prominent Accidents in the Year Ending June 30, 1907.

Quarter.		Killed.	Injrd.	State.
First ...	Collision—Confusion of despatcher's orders...	17	56	N. Car.
Second..	" —Disregard of rules and signals....	43	63	D. of C.

Lateral Thrust of Car Wheels Against the Rail.

BY GEORGE L. FOWLER.

From advance sheets of a report made to the Illinois Steel Wheel Company, and shortly to be published in book form by that company.

It is generally admitted that cast-iron wheels under high capacity cars are giving unsatisfactory service and because of their inherent lack of strength are a source of danger. Prior to 1905 little was known of the strength of these wheels except that they had a shorter life and gave far more trouble from flange breakage under the high capacity cars than under cars with a capacity of only 60,000 lbs. In that year, Prof. Goss made some tests in the laboratory of Purdue University to ascertain the strength of the flanges of cast-iron wheels.

Track Apparatus for Testing Lateral Thrust of Wheel Against Rail.

Six new wheels and one wheel which had broken in service were tested. The wheel to be tested was mounted on a strong mandrel secured to the base of the testing machine in such a manner that it could not slip and a punch was forced down against the flange in the same way that the rail presses against it in service. Pressure was applied until the flange broke. The general arrangement of the apparatus is shown in Fig. 1. The punch A was bolted to the head of the machine. It was prevented from springing away from the flange by a roller bearing against a bracket which was bolted to the platen of the machine.

Three of the wheels tested, Nos. 19,413, 19,410 and 19,251, were new wheels of M. C. B. dimensions. The fourth, No. 10,558, was a piece of a wheel which had broken in service. In addition to these specimens, three new wheels were tested which were especially designed to give increased flange strength. These were marked (e) 650 lbs., (f) 700 lbs. tape 1, (g) 700 lbs. tape 2. Wheels (e) and (f) were the American Car & Foundry Co.'s reinforced flange design and wheel (g) was the then proposed standard of the M. C. B. Association with reinforced flange.

Four tests were made with each of the M. C. B. standard wheels and from two to four tests with each of the others. Three of the tests made on the American Car & Foundry Co.'s wheel (e) showed a flange strength of approximately 100,000 lbs., while the fourth test gave only 68,200 lbs. In view of this wide difference an attempt was made to get a fifth test from this wheel by applying pressure to the flange midway between two of the breaks previously made, with the result that the wheel broke through the rim at 105,000 lbs.

These tests showed that not only were there wide variations in the strength of flanges of wheels of similar design but in different parts of the flange of the same wheel. Reinforcing the flange added to the strength, but even in wheels thus reinforced there was a variation from 68,200 lbs. to 105,900 lbs. in the breaking strength.

These tests cover practically all that is known of the strength of the cast-iron wheel to resist the thrust on the rail. In order to ascertain approximately the relative strength of the steel wheel under similar conditions a Schoen wheel was tested in the same way. The work was done under a powerful hydraulic press and the flange broke off under a load of 526,612 lbs. This was more than 4.7 times the load required to break the strongest part of the flange of the American Car & Foundry Co.'s or the M. C. B. reinforced flange cast-iron wheels and more than 11 times the load required to break the weakest of the M. C. B. plain flanges.

The ratio of 4.7 to 1 corresponds fairly closely with the ratio of the tensile strength of the two metals. The tensile strength of the steel of the Schoen wheel is about 124,000 lbs. In some tests of cast-iron that have been made it was found that samples of gray iron made from first class wheel mixtures broke at from 16,000 lbs. to 17,000 lbs., while test specimens, carefully ground from the white chilled iron of a car wheel, broke under loads as high as 36,000 lbs.

The total lack of any data on the stresses to which wheels are subjected in service other than that based on theoretical calculations necessitated the carrying out of a series of investigations which would throw some light on the subject from a purely practical standpoint. The object of this part of the work was to determine the lateral thrust to which the wheels under high capacity freight cars may be subjected, when moving over curves at different speeds and, if possible to develop the law in accordance with which the thrust increases as the speed of the car is increased.

As an investigation of this kind had never before been undertaken, it was necessary to design and build a special piece of apparatus. The method pursued was to place in the track at some point on a curve an instrument which was capable of registering the lateral thrust against the outside rail of each wheel of a car or a train of cars as it passed. To do this it was necessary that the short section of rail which came in contact with the wheel, together with its supports, should have a strength sufficient to sustain the lateral thrust of the heaviest locomotives and that the registering apparatus should be so sensitive and rapid in its action that it would register the thrust of a passing wheel and come back to zero pressure in time to register the next wheel. At the same time, the registering apparatus had to be so light that the effect of the inertia of its moving parts was reduced to a minimum. The registering apparatus was designed to give a record of each wheel of an ordinary freight car, with a truck wheel base of 5 ft. 2 in., moving at a speed of 40 miles an hour. The interval elapsing between the passage of two such wheels over a given point is .088 sec.

The apparatus as a whole may be divided into two parts: the track apparatus and the recording instrument.

The track apparatus consisted of a section of rail 3 ft. long fastened so that it was firmly held in position in the track and yet was free to move outward by an amount sufficient to exert a pressure on a hydraulic cylinder, in proportion to the lateral thrust against it.

The recording instrument was set on a small table placed about 7 ft. from the track and was connected with the cylinder of the track apparatus by a ¼-in. brass pipe. It consisted of an ordinary pressure gage, having a maximum registration of 200 lbs. per sq. in., a recording pressure gage and a pressure pump by which an initial pressure could be put on the whole system of piping. The ordinary pressure gage was made by the Utica Steam Gage Co. and was fitted with a diaphragm spring. It was carefully tested and the dial calibrated before being put in service.

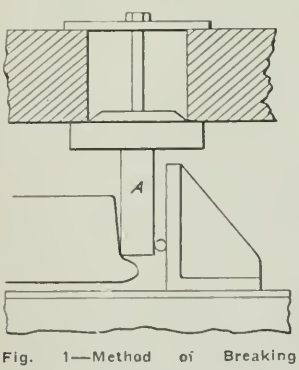

Fig. 1—Method of Breaking Wheel Flanges in Testing Machine.

The recording pressure gage was a modification of the Metropolitan recording gage, made by Schneffer & Budenberg. The clockwork in it was removed and the paper drum driven by hand, so that a record of indefinite length could be obtained. The fact that this paper was driven by hand explains the irregularity of the intervals elapsing between the passage of the several wheels of the cars. This gage also had a maximum registration of 200 lbs. per sq. in. with a pen travel of 4 in., the width of the paper. A Bourdon tube was used as the spring for this gage. It was calibrated for each set of tests by the Utica gage and its indications marked on the paper on which the record was taken.

The piping and all spaces filled with liquid were so arranged that air pockets were entirely eliminated and before work was commenced it was definitely ascertained that the whole

space was completely filled with liquid free from bubbles of air.

The speed of the experimental car as it passed the instrument was registered by means of two trips placed alongside the track and arranged to be struck by one of the journal boxes of the car as it passed. The trips closed an electric circuit passing through one of the coils of a double registering Morse telegraph instrument. When the trip was struck by the journal box, the circuit was temporarily broken and the pen lifted, leaving an opening in the line drawn on the strip of paper traveling through the instrument. The time was indicated by a clock making and breaking an electric circuit at half-second intervals. This circuit passed through the other coil of the register. The two records were made side by side and the intervals between the breaks, on the otherwise continuous line, showed the time elapsing between the striking of the two trips. These trips were spaced 66 ft. apart so that the speed of the passing car could be readily calculated. Specimens of these records are shown in the accompanying engraving, Fig. 2, where the car was moving at 9.14, 13.26, 14.21, 12.81 and 30.61 miles per hour, respectively.

Through the courtesy of the Pittsburgh, Cincinnati, Chicago & St. Louis, facilities were supplied for making this investigation of wheel stresses on the Hickory Branch extending south from Burgettstown, Pa. The instrument was placed in the outer rail near the northern end of a curve of 1,307 ft. radius, or about 4 deg. 25 min. The elevation of the outer rail was 3⅞ in., which is correct for a speed of 36.66 miles per hour. As the trips for registering the speed could work for only one direction of motion, they were set for the northbound traffic, which was the direction of the loaded trains. At the point where the records were taken the car was well in on the curve, with the trucks set in the normal position, and all the elements of entering the curve were removed. It may be added that the curve had no easement at either end.

On the approach of a train, or the experimental car, an initial pressure was put on the piping system, in order that the movement of the registering pen might be reduced to a minimum and with it the effect of the inertia of the parts. This initial pressure was varied according to the speed. In operation, the actual movement of the floating rail was imperceptible. The levers divided the actual movement by five at the diaphragm, which yielded only enough to take the expansion of the Bourdon tube and the diaphragm of the pressure gage, when delivering from a cylinder 6 in. in diameter.

Records were taken of a number of passing trains, and also a special series of measurements was made with a loaded coal car run at different speeds over the apparatus. Some of the records are shown in the accompanying diagrams, Figs. 3 and 4.

In the records of the loaded coal trains, taken as they passed, no memorandum of the weights of the cars was obtained. The weights were, however, approximately the same, and yet there were wide variations in the lateral thrusts of the wheel against the rail. For example: In the train moving at 9.35 miles per hour, these thrusts varied from 2,260 lbs. to 7,210 lbs., with an average of 4,835 lbs. On another train, moving at 12.05 miles per hour, the thrust varied from 7,070 lbs. to 10,605 lbs., with an average of 8,205 lbs.; while on another, moving at 4.04 miles per hour, the average was 5,543 lbs., with a range from 4,450 to 6,635 lbs. In one case a car registered a thrust of 16,175 lbs. when moving at 14.35 miles per hour. This wide variation in the lateral thrust of different cars in the same train at the instant of passing the apparatus was still more strikingly shown in the series of tests made with a single car.

The tests with a single car consisted of 33 runs over the apparatus, at speeds varying from 4.57 to 31.25 miles per hour. The car used was a hopper-bottom coal car, No. 210,512, of 100,000 lbs. capacity and weighing, when empty, 39,500 lbs. It was designated as of the G1 class by the Pennsylvania Lines West. The total weight of the car loaded with coal was 142,300 lbs.

This car, after being started some distance from the apparatus, was cut loose from the engine and allowed to drift over the track instrument. The accompanying table gives the records that were made.

The column headed "Wheel No." indicates the order in which the wheels passed over the apparatus. Thus: 1 indicates the front wheel of the forward truck; 2, the second wheel; 3, the front wheel of the rear truck, and 4, the rear wheel. The blank spaces in the column of lateral thrust indicate no record obtained, because of the fact that the initial pressure put on the apparatus was greater than the wheel thrust, so that the thrust produced no movement of the pen. Throughout the whole series of tests the weather was fine and the rail dry.

For convenience of reference and comparison, the lateral thrusts of the front wheel of the forward truck have been plotted on the accompanying diagram, Fig. 5. This diagram shows graphically the wide variations in the lateral thrust of the wheel. From it, it is impossible to deduce any positive ratio between the speed and the thrust, but it shows that there is a relationship and that the higher the speed the greater the thrust. There are a number of records for the first wheel, extending from about 9.60 miles an hour to 16.21 miles an hour that lie in a straight line drawn from just below the record of 31.25 miles an hour of 10,035 lbs. The line drawn through these points is represented by the equation:

$$T = 333\ V - 800$$

in which

T = Lateral thrust of wheel in lbs.
V = Speed in miles per hour.

This must be regarded as a tentative formula only and one which evidently will not hold for very low speed. But from the records that have been obtained, it gives the lowest values and therefore it cannot be criticized as being too high.

Attention is also called to the fact that the pressure seems to increase directly as the speed and not as the square of the speed which is the rate of increase of the centrifugal force. The probable reason for this is that none of the speeds recorded were equal to or exceeded the speed corresponding to the superelevation of the outside rail. Therefore, centrifugal action has no effect. In running around a curve, the car must be deflected from the tangent at a certain rate, and this requires a certain definite amount of power. If, then, this power is exerted in a short period of time, a higher pressure will be put against the rail than if the time was longer, and, therefore, the pressure will vary inversely as the time. So that if the car passes around the curve in half a minute, the pressure will be twice what it would be if a minute was required. Hence, the pressure at 30 miles an hour would be twice that at 15 miles an hour.

When the speed exceeds that for which the superelevation is

calculated, centrifugal action will then begin to manifest itself, and there will then be a more rapid rise of pressure than would be found from the equation given above. This additional increase would be in the ratio of the square of the speed. For example. At a speed of 36.66 miles per hour, the centrifugal effect is balanced by the superelevation of the outer rail on the curve on which these investigations were made. At 40 miles per hour, the centrifugal force is 1.19 times as great, and this 19 per cent additional manifests itself as additional lateral thrust above that called for by the formula.

Taking the car under consideration, weighing 142,300 lbs., the

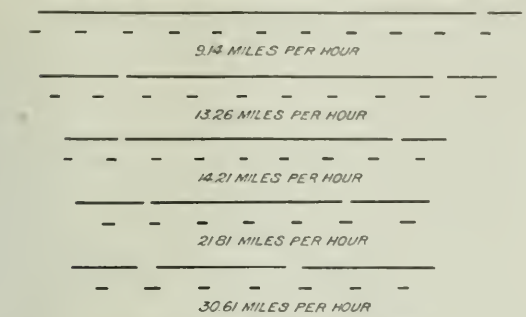

Fig. 2—Time and Speed Records.

centrifugal action would be 9,648 lbs. at 36.66 miles per hour; 11,481 lbs. at 40 miles per hour, and 14,568 lbs. at 45 miles per hour. The excess centrifugal force to be distributed among the four wheels of the car at 40 and 45 miles an hour would be, therefore, 1,733 lbs. and 4,920 lbs. respectively. If 25 per cent. of this is taken by the front wheel, which is a low estimate of what would actually be imposed, there would be an extra load of 433 lbs. and 1,230 lbs. added to the stress given by the formula for that imposed on the front wheel. This then becomes

11,408 lbs. at 36.66 miles per hour.
12,953 lbs. at 40 " " "
15,415 lbs. at 45 " " "

It must be remembered that these are minimum values, and that blows due to soft spots in the track, kinks in the curve, bent rails, low joints and cramped side bearings will greatly increase

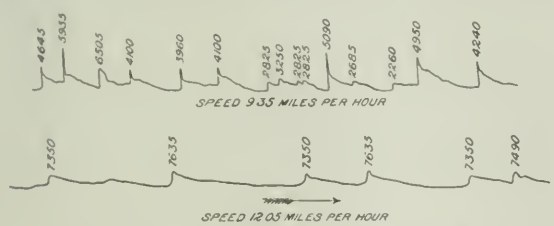

Fig. 3—Parts of Records from Passing Trains.

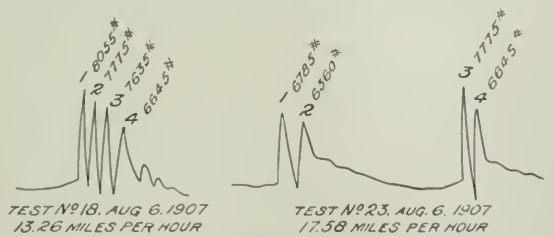

Fig. 4—Typical Records of Experimental Car.

this thrust. Sufficient data, however, has not yet been obtained to warrant any estimate of how much this increase would be. The diagram shows that stresses far above those found from this tentative formula are imposed on the wheels.

The extreme case occurred in test No. 19, where the thrust was 10,460 lbs. in excess of that found from the formula. If the blow or cramping which caused this excessive thrust at 13.66 miles per hour was to occur at a speed of 45 miles per hour, the thrust that might be expected would be 20,886 lbs., and if it were to be increased in proportion to the speed it would become more than 36,000 lbs. This may be an extreme and exceptional case, but the results obtained seem to indicate that at least as great a stress as this should be provided for.

Referring again to the tests of flange strength made in 1905 by Prof. Goss in the 25 tests that were made, the pressures required to break the flange ranged from 47,750 lbs. to 109,000 lbs., with an average of 88,149 lbs. This gives a possible factor of safety of a little more than 2.5 when the maximum stress is taken at 30,000 lbs., and the average strength at 80,000 lbs., but it drops to a little more than 1.5 when the strength of the weakest wheel is taken as the basis of comparison. This is for new wheels. When they have become somewhat worn, the strength of the flange is less and the factor of safety is decreased still more. If this loss of strength in the old wheel is taken at 10 per cent., because of metal worn away, the strength of the weakest wheel used in the tests referred to would be 42,975 lbs., and this would allow a factor of safety above a maximum load of 30,000 lbs. of about 1.4.

In this comparison it has been assumed that a car of 100,000 lbs. capacity will deliver the maximum thrust to the wheel on a 4½ deg. curve at 45 miles per hour. This assumption was made because the data was obtained from such a curve. It is evident that greater stresses would be imposed on curves of sharper radius. The outer thrust, where centrifugal action is eliminated, would probably vary inversely as the radius of curvature. There is no data, as yet, to support this position, but it appears probable. If, on further investigation this relation is found to hold, then, instead of a thrust of 12,520 lbs. being put on the wheel, as in the case of a car moving over the 4 deg. 25 min. curve at 40 miles an hour, there will be a thrust of nearly 22,800 lbs. when the same speed is maintained

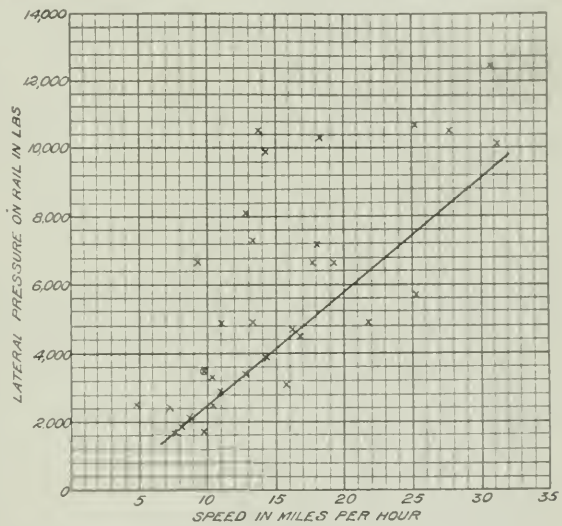

Fig. 5—Diagram Showing Relation of Thrust and Speed.

over a curve of 8 deg. To this must be added the extra stresses that may be set up by blows, cramping of the wheels between the rails, the binding of side bearings and other causes which may result in an increase in the normal stress.

But one weight of car and one arrangement of wheel base has been here considered. There is, as yet, no data to give any idea as to the effect of weight, its distribution on the wheels or the height of the center of gravity, all of which are undoubtedly important.

On the other hand, in this discussion, the whole lateral thrust is considered as resisted by the flange. Under ordinary running conditions this is not the case, for the frictional resistance of the tread of the wheel on the rail must be subtracted from the total thrust. In the car under consideration, the weight on the front wheel was 17,900 lbs. If the coefficient of friction is taken at 0.25 then 4,475 lbs. should be subtracted from the pressure given. This would reduce the maximum pressure, as it had been calculated for a speed of 45 miles per hour, to 31,525 lbs. and the probable minimum to 10,930 lbs. It must be remembered, however, that the frictional resistance is apt to fail suddenly and that, at all speeds, even where the frictional resistance of the tread on the rail is greater than the lateral thrust, there must be a pressure on the flange in order to effect the deflection of the car on the curve.

In this comparison the front wheel of the leading truck only has been considered because it is on this wheel that the heaviest lateral thrust is imposed. The table shows that, in general, the maximum lateral thrust is on the first wheel; the thrust on the

second is less; on the third it falls between the first and the second, and on the fourth it is the lowest.

In considering the advisability of using cast-iron wheels under high capacity cars, it should be borne in mind that the cast-iron wheel averages approximately one-half the life under the cars of 100,000 lbs. capacity that it does under cars of 60,000 lbs. capacity. The use of the heavy braking pressure on long grades has been the cause of many failures, because of the additional strains set up due to the heating by the brake-shoe. There is a consequent expansion of the rim, and the actual resisting strength of the flange is lowered below that shown in the laboratory tests, which were made with the wheel cold and the metal at its maximum strength. Roads having long, steep grades usually have numerous sharp curves also, and the wheels are likely to be subjected to the most severe stresses when they are least able to resist them. If the lateral thrust on the flanges of wheels, under a loaded car of 100,000 lbs. capacity runs up as high as 30,000 lbs., and the actual breaking strength of the flanges of cast-iron wheels varies from 45,000 lbs. to 105,000 lbs. under the most favorable conditions, the question may be asked whether it is safe to use cast iron wheels under cars of 100,000 lbs. capacity, especially when the breaking strength is likely to be greatly reduced by wear and brakeshoe heating? The answer to this question depends on what the railroads consider the proper factor of safety and legitimate risk in such work.

Proposed Enlargement of the Kaiser Wilhelm Canal.

The present dimensions of the Kaiser Wilhelm Canal, connecting the North Sea with the Baltic, no longer meet the needs of commerce. To make the canal adequate, not only for the present traffic but also to care for any future advances in shipbuilding, the following enlargements are proposed:

The locks are to be changed so as to permit the passage of vessels up to 984 ft. long and of corresponding draft and beam. The proposed dimensions are: length between gates, 1,083 ft.; width, 147½ ft.; depth at mean water level of canal (the same as mean water level of the Baltic Sea), 45 ft. Even at low water this depth would be 39 ft. The present canal profile at mean water level is 29 ft. 6 in. deep, 72 ft. wide at bottom, 220 ft. wide at the surface of the water. The change proposed will make it 36 ft. deep, 144½ ft. wide at bottom, and 334 ft. wide at the surface of the water. The area of the water cross-section will be increased from 4,307 sq. ft. to 8,613 sq. ft.

The line of the canal will not be materially altered. In two places it will be necessary to replace curves of a radius of 3,935 ft., which are no longer safe for modern steamships, by curves of 5,866 ft. radius, the width of the normal profile being increased at the same time. The number of passing stations is to be increased, and they are to be placed about 6 miles apart. The normal cross-section is to have a width of 440 ft. at the bottom and 624 ft. at the surface of the water. Four of these passing stations are to be expanded to serve as turning stations with a length of 3,919 ft., a width at bottom of 538 ft., and at the surface of 722 ft., and they will be connected with turning basins of 984 ft. diameter.

The Relation Between the Condition of Motive Power and Its Repair.

BY CLIVE HASTINGS.*

The life of a locomotive between shoppings may be likened to the span of a man's life, if we consider that each engine mile corresponds to each year of life. The number of years a man's condition would warrant his life expectancy to equal, added to his present age, should equal the average span of life. Any difference in this may be due to two causes: (1) The estimate of his life expectancy is not correct, or (2) his condition is not what it should be for his age, due to the manner in which he has lived or the constitution he may have inherited.

The laws of life expectancy and average age are so constant that life insurance companies with safety stake fortunes on them. An insurance company must know a man's age and also subject him to a medical examination to determine his condition.

So with locomotives. The man or master mechanic in charge of a number of these engines should know:

1. The miles each engine has made since last shopping (this corresponds to the man's age)

2. The general condition the engine is in (this corresponds to the doctor's report).

3. The miles the engine is in shape to make before it must go to the back shop (this corresponds to life expectancy).

Miles between shoppings for separate engines will vary from the average the same as the length of life of the individual man will vary from the average span of life.

Engine repairs may be divided into two classes:

1. Running and Light Repairs.—This class of repairs should include all minor and other repairs which do not include going over the entire engine and putting every part in as good condition as when new. The major part of this class of work should be done in the roundhouse.

2. Complete Overhauling.—This class of repairs is such that when properly done each part, and therefore the whole engine, is as good as new, except for depreciation. This work is done in the back shop.

When an engine is in shape to make the maximum miles expected between complete overhaulings, that engine is in first class condition; and when an engine is in such shape that it cannot make another mile before receiving a complete overhauling, that engine

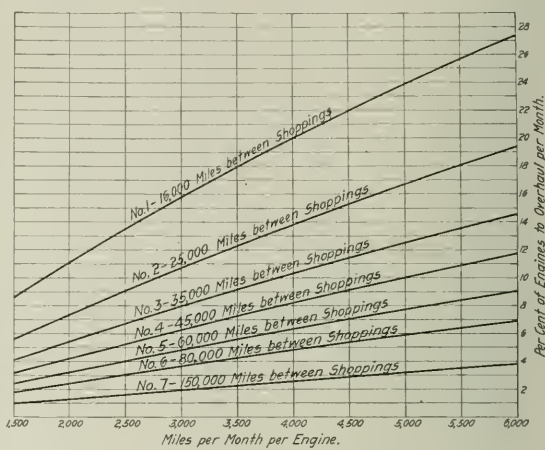

Fig. 1—Chart Showing Percentage of Locomotive Power to be Repaired Each Month So as to Maintain Efficiency of Total Power.

is in zero condition. It is desirable to have all engines as near first class condition as possible, but as on any division there will be some engines just from the shop, others just ready to go into the shop and others in all the intermediate stages, it is impossible to have every engine in first class condition. With a steady flow of engines through the shop there will be an even variation in individual engine conditions, varying all the way from those in shape to make the total miles expected between shoppings to those ready for the shop. The average miles that all engines of a particular class and service will be in shape to make should therefore be one-half the total miles expected of the individual engine between shoppings. This is standard condition and is really one-half of the impossible state of having each and every engine in first class condition.

It should be borne in mind that "condition" used in this sense does not have reference to the efficiency of the engine. Fifty per cent. condition does not mean 50 per cent. efficiency. Engines may have made almost the total of the miles possible to make between shoppings and still be in shape to haul full tonnage. Such engines would be considered good engines by the operating department, yet measured on the basis mentioned they would be in very low condition. The term "degree of wear" probably expresses more nearly what is meant by "condition of power." If the "degree of wear" is assumed to vary from 200 per cent. in the case of a new engine to 0 per cent. in the case of an engine ready for the shop, this term may be used as synonymous with "condition of power" in this article. The department having in charge the maintaining and shopping of engines is concerned with degree of wear. The department having in charge the moving of trains is concerned not with degree of wear, but with engine efficiency.

Standard condition, or 100 per cent., then exists when the average miles the engines on a division are capable of making is equal to one-half the miles expected from the individual engine between shoppings. The average miles the engines are in shape to make is a measure of the condition, hence to determine condition of power in per cent., divide the average miles all the engines are in shape to make before next shopping by one-half the miles expected of the individual engine between shoppings.

The miles the engines are in shape to make before shopping should be estimated by the master mechanics and road foremen. As a check on the estimate we have the actual record of miles al-

*Mechanical Department, A., T. & S. F. Ry.

ready made since shopping. The sum of the miles an engine has already made and the miles the engine is estimated to be good for should approximate the miles expected between shoppings. If several engines are under consideration the same applies to averages. On a division on which we expect to get 30,000 miles between shoppings out of each of a certain class of engines, an individual engine may have made 30,000 miles. If the estimate of the miles that engine is still good for is 20,000 miles we have a very close check that a proper state of affairs exists. If the sum of the average miles made and average miles good for is less than miles to be made between shoppings, it shows that the engines have not received proper treatment either in the roundhouses or on the road since last shopping (wrecks can be considered in this connection as improper treatment). If this sum is more it shows that the master mechanic, in his desire to make a good showing, has probably estimated more than he can do, or it may mean that the standard set for total miles to be made between shoppings is too low.

To determine the number of miles that should be made between shoppings it is possible to go over past records, and also take the personal opinion of division mechanical officers. The division officer will almost without exception set the mileage that his engines should make between shoppings higher than the past records will show he has attained. His figure, however, will usually be a good one to take, as it will more nearly represent what should be done than the figure obtained from past records.

The percentage of engines that should be shopped each month is a figure that can be determined to a mathematical nicety. A certain number must be shopped to make up for wear and tear. If condition of power is below standard, or 100 per cent., a greater number should be shopped so as not only to make up for wear and tear, but to improve condition also. The number of engines it is necessary to shop for complete overhaulings per month depends upon two things: (1) The number of miles made between complete overhaulings per engine, and (2) the number of miles made per month per engine. The more miles made between shoppings, the fewer engines it is necessary to shop per month. The more miles the engines run per month the faster they wear out, hence the more must be shopped per month.

The total number of engine miles made per month on any

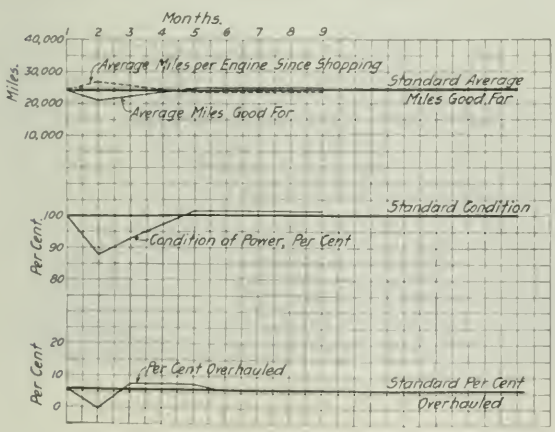

Fig. 2—L., R. & C. Division.

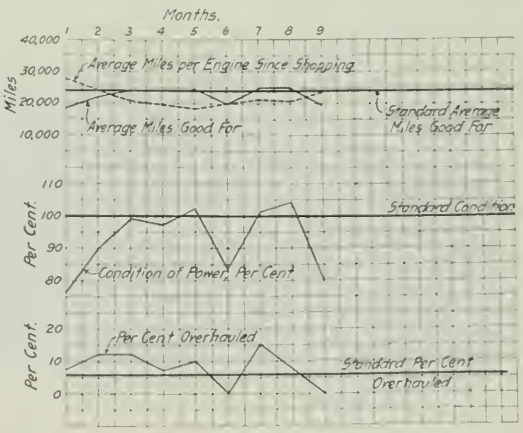

Fig. 3—X., Y. & Z. Division.

Condition of Power on First Day of Each Month; Freight Service.

division, divided by the average number of miles made per engine between complete overhaulings, will give the number of engines which it will be necessary to get from the shop each month in order to maintain power. This may be illustrated by considering that the miles all the engines are capable of making before their next shopping are like the working balance of a bank account. Each mile can be treated as one dollar. When condition of power is standard, or 100 per cent., the working balance is a satisfactory amount. Every time an engine runs a mile it is like drawing a dollar from the bank balance. Conditions are not satisfactory when this working balance is less than the standard amount. As the engines on the road use miles the account is depreciated. The only way to replace those spent is by adding to the account the miles which engines coming from the shop are good for.

If the miles which engines coming from the shop in any one month are capable of making before next shopping are equal to the engine miles used on the division during the month, the balance has been maintained and condition of power is the same at the end as at the beginning of the month. If the miles which engines coming from the shop in any month are capable of making are more than the engine miles used on the division during the month the balance has been increased or condition of power has been raised, but if the miles which engines coming from the shop in any one month are capable of making are less than the engine miles used on the division during the month, the balance has been decreased and condition of power has been lowered.

The accompanying chart, Fig. 1, shows the relation between miles made between shoppings, miles made per month and percentage of engines that must be shopped each month to maintain the condition the same at the end as at the beginning of the month. This chart can be used in several ways. For example:

1. If it has been decided what mileage should be made between shoppings and what mileage should be made per month it is possible from the chart to determine what percentage of the engines should be given complete overhaulings per month.

2. If it is known what mileage engines have averaged per month and what percentage have received complete repairs during the month, the chart can be used to determine what mileage is being made between shoppings.

These matters have to do entirely with complete overhaulings in back shops. The result of neglecting running and light repairs will be to reduce the miles made between shoppings, thus rendering figures based on a fair mileage between shoppings of little use. Checks as to whether running and light repairs are being maintained are:

1. Actual records of miles made between complete repairs. If the proper mileage is not made between these shoppings it is due to lack of running and light repairs.

2. The number of engine failures. Running and light repairs have more to do with failures than condition of power.

3. The amount of money being spent on this class of repairs. These repairs cannot be kept up unless a reasonable amount is spent on them.

Per cent. of condition of power is then an accurate figure, obtained by dividing the average miles engines are in shape to make before next shopping period by one-half the mileage expected of the individual engine between shoppings. Number of engines to shop each month can be determined by dividing total engine miles made by average miles per engine between shoppings. If condition is below standard a greater number must be shopped in order to bring condition up; or if condition is above standard, less may be shopped, thus allowing condition to fall. This method is systematic. The method of running engines until they fall down, then crowding them into the nearest shop, is not systematic. The division mechanical officer who, because his power is in fair shape, is not shopping the correct number of engines and maintaining this fair condition, is following a course which will lead to low condition of power, and necessarily to a high percentage in the shop in order to again bring the condition up to the point desired.

Thus the matter of condition of motive power and the laws for timely shopping of same may be reduced to a rational mathematical basis quite like life insurance. Individual engines and individual men may not follow the laws, but groups of engines and groups of men will be found to do so exactly.

Fig. 2 herewith illustrates the condition of power on a division which keeps very close to standard conditions. The broken line in the top record, or graph, represents the average miles run per engine since shopping for repairs costing $500 or over. The light

full line represents the average miles-good-for per engine on the first of each month as estimated by the master mechanic.

The light line in the middle graph of the figure represents the condition of power in per cent. determined by dividing the average miles-good-for by the standard average miles-good-for. The heavy line shows the standard condition, 100 per cent.

The lowest graph shows the percentage of total number of engines assigned which are repaired each month. The standard is 5.9 per cent., represented by the heavy line.

Engines in freight service on these divisions should make 3,000 miles per month, and 48,000 miles between shoppings costing $500 or over.

During the second month no engines were overhauled on account of unusually heavy traffic. As a result the average miles-good-for dropped and the condition of power went down 12 per cent. It was necessary to overhaul almost 2 per cent. more than the standard for three successive months in order to get the condition of power to where it should be. Aside from that one month the conditions are practically ideal.

Fig. 3 illustrates the condition of power on a division having a poor and irregular record. The mileage lines remain low because the mileage was not being made by the engines between shoppings. Only by repairing each month a larger number than the standard was it possible to keep the condition of power at all near 100 per cent., and even then only spasmodically. The failure of the shop to overhaul any engines in the sixth month brought about the same results as shown in Fig. 2.

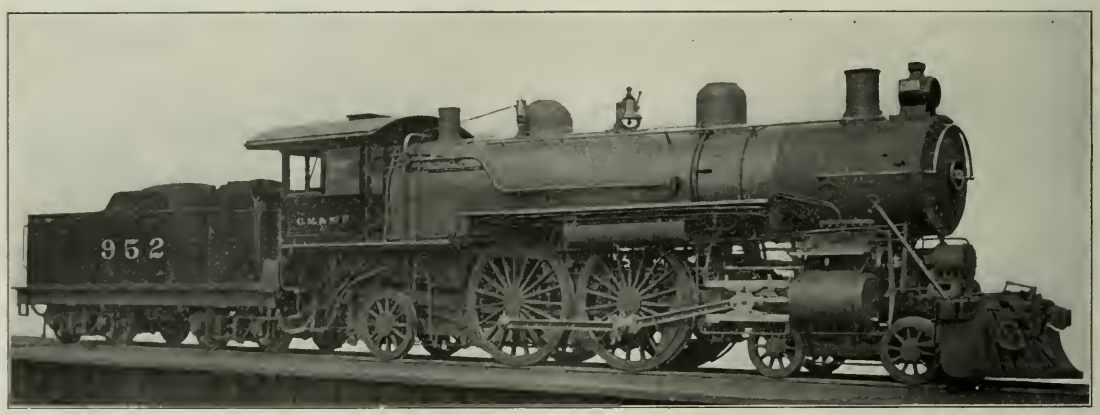
Completing the Simplon Tunnel.

The general directorate of the railroads of the Swiss Confederation has reported to its executive council recommending the completion of the second Simplon tunnel in the near future. The plan for tunneling the Simplon provided for two parallel tunnels connected by cross cuts. One of these tunnels is finished and in operation, while the second is driven through in the rough. The object of the second tunnel was to provide for a second track and also to furnish better ventilation. In its present incomplete condition at some points the floor has been forced up and falls of rock have occurred from the roof and from the sides. The principal reasons urged in favor of the prompt completion of the second tunnel are: That where heavy pressure and movement of the rocks in the second tunnel make lining of the present cross-section necessary, it will be better economy to complete the tunnel to the full cross-section rather than put in heavy temporary masonry, which would have to be removed in a few years if the completion is postponed. In a long, narrow tunnel in which the movement of trains occupies 20 hours of the 24, there is considerable difficulty in carrying on the work of repairs and of maintenance. Even with the use of electric power, under the existing conditions of moisture, the life of the 100-lb. rails used cannot be more than 10 to 12 years. As replacement of rails in the Simplon tunnel cannot be made more rapidly than at the rate of 1½ to 2 miles a year, it will be necessary to begin the work of replacement under present conditions at the end of 6 or 7 years. The heavy pressure to which the masonry of the completed tunnel is subjected at some points, and the action of the hot waters on the mortar will before long make repairs necessary. With a single tunnel these can only be made during a stoppage of traffic or at an exceedingly heavy expense. They would be materially simplified by having the use of a second tunnel.

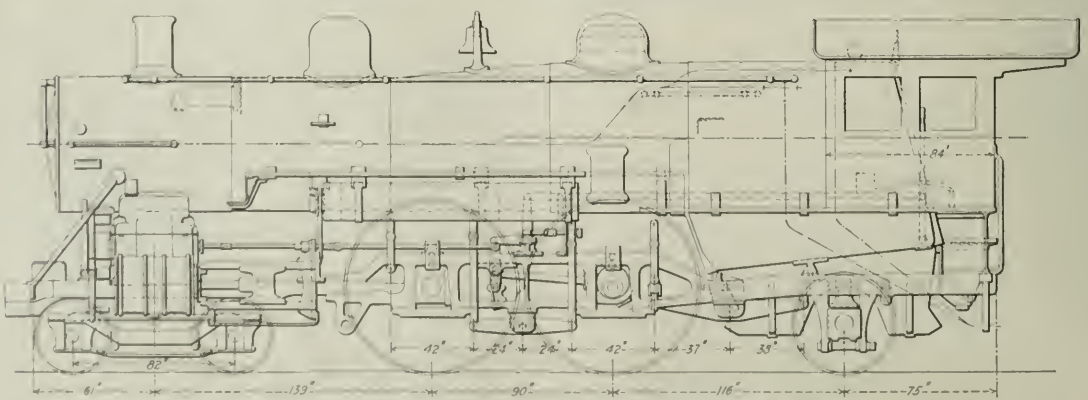
Balanced Compound Atlantic Locomotive for the Chicago, Milwaukee & St. Paul.

The Baldwin Locomotive Works has recently built two balanced compound locomotives for the Chicago, Milwaukee & St. Paul. These engines are of the Atlantic type, and have a tractive power working compound of 22,200 lbs. They will be used in fast passenger service. The maximum curves which they will traverse are of 20 deg. radius.

The principal features of the design are shown in the photograph and drawings. The cylinders are located in the same horizontal plane, and the four main rods are all connected to the leading pair of driving-wheels. With this arrangement the guides are all of the same length. They are supported by cast-steel bearers



Baldwin Four-Cylinder Balanced Compound Atlantic Locomotive; Chicago, Milwaukee & St. Paul.



Baldwin Compound Atlantic Locomotive; Chicago, Milwaukee & St. Paul.

which are bolted to a heavy cross tie. The crank axle is of the built-up type, with cast steel central web. The driving tires are secured by retaining rings.

The Stephenson link motion is used in this design, with eccentrics placed on the second driving axle. The eccentric rods are straight and the link blocks are connected directly to the rock shafts. The long valve rods are placed above the frame center lines; they are supported by the guide bearer knees, and are provided with knuckle joints to avoid springing. The valves are of the piston type 15 in. in diameter, and working in cast iron bushings.

The main frames are of cast steel 4½ in. wide, with single front rails of wrought iron. Above the rear truck wheels the frames are in the form of slabs, 2¾ in. wide by 10 in. deep. Bosses are cast on the frame ahead of the leading pair of driving wheels, thus providing supports for the driver brake shaft. The brake cylinder is placed immediately back of the front bumper, and the brakes are operated by a push rod which passes through a 3½ in. hole located on the center line of the cylinder saddle. This arrangement avoids the necessity of placing the brake cylinder support above the inside guides. The leading truck is of the usual swing bolster type, while the rear truck is of the "Bevoy" design, built in accordance with drawings furnished by the railroad company. The truck boxes and cross frame are of cast steel in one piece and the weight is transferred to the spring seats through roller bearings. The method of equalization is shown on the accepting card.

The boiler is of the wagon top type with butt jointed longitudinal seams having diamond welt strips. A notable feature is the ample depth of firebox especially at the throat. The depth from the bottom of the mud ring to the under side of the barrel is 30 in. and to the center of the lowest row of tubes 24½ in. The mudring, which is of cast steel and double riveted, is supported by sliding shoes in front and a bumkin plate at the rear. Two rows of T irons support the front end of the crown sheet, otherwise the staying is radial. The brick arch is supported on four water tubes. The fire door opening is circular, 16 in. in diameter.

The construction of the tender calls for no special comment beyond the fact that the frame is built of oak.

These are the first balanced compounds purchased by this road, although the line has had a large number of four-cylinder compounds and locomotives in service for some time. Opportunity should therefore be given for securing interesting comparative data relative to the performance of the new engines.

The following are some of the principal dimensions of these engines:

Cylinders, diameter, h. p.	15 in.
Cylinders, diameter, l. p.	25 in.
Piston stroke	28 "
Valves	Balanced piston
Boiler, diameter, shell	66 in.
Boiler, thickness sheets	⅝, ¹¹/₁₆ and ¾ in.
Steam pressure	220 lbs.
Firebox, length	108 in.
" width	69⅛ "
" depth, front	70 "
" depth, back	63⅛ "
" thickness, sides	⅝ in.
" thickness, back and crown	⅝ "
" thickness, tube sheets	½ "
" water space, front	4½ in.
" water space, sides and back	4 "
Tubes, number	268
" diameter	2¼ in.
" length	19 ft.
Heating surface, firebox	155 sq. ft.
" " tubes	3,015 "
" " arch tubes	28 "
" " total	3,198 "
Grate area	45.8 "
Wheels, diameter, driving	85 in.
" " front truck	36 "
" " back truck	49 "
" " tender	38 "
Journals, main, driving	10 in. x 11 in.
" trailing, driving	9 " x 12 "

Frame of Atlantic Locomotive; Chicago, Milwaukee, & St. Paul.

Americanizing Brazilian Railroads.*

As a result of concessions secured and purchases made within the past year American interests, including Canadian interests and supported largely by French capital, have secured more or less perfect control of a system of rail and water transportation forming a "belt line" about the whole of the better portion of Brazil and which, with Government railroad lines and Government subsidized steamships, reaches almost every portion of the immense republic. This great system is composed of parts which may be conveniently grouped under three heads, as the Sao Paulo-Rio Grande railroad lines; the Amazon-Bolivian system, and the Paraguayan-Bolivian connections.

The first of these subsidiary divisions will cover to a greater or less extent the southeastern portion of Brazil, reaching the coffee and live stock country and connecting them with the seaboard. The third will connect this coast system with the Paraguayan railroad, reaching eventually up into Bolivia, and by means of its own and Government lines, penetrating the great grazing country in the interior table-lands and valley country of south-central Brazil. The second system represents the connection of Bolivia with the Atlantic ocean by means of the Bolivian railroads and rivers, and the Madeira river, the Madeira-Mamore Railway, and the Amazon river.

The tangible outline of the first division is represented by the Sao Paulo-Rio Grande Railroad, the Sorocabana Railroad, and the port works at Rio Grande do Sul. The tangible outline of the second is represented by the concession for the Paraguayan railroad connections in relation to the line of the Brazilian Government into Matto Grosso and Goyaz, while that of the third division is represented by the port works at Para, the Madeira-Mamore Railroad, and the connections of the Bolivian railroads under contract held by what is known as the Speyer syndicate of New York.

About a year ago a concession was granted certain American-Canadian capitalists for the construction of docks and port works, and the removal of the sand bar which has concerned the port of Rio Grande do Sul and Port Allegre, on the Laguna dos Lagos. Within a very short time thereafter this same syndicate purchased the Sao Paulo & Rio Grande Railroad and proceeded to open up that portion of Brazil. A well-known American railroad builder and manager was brought down for the completion of the road, the enterprise was put upon the way to immediate completion, and the development of that portion of Brazil with American capital seemed about to commence. Within the past month this same syndicate leased the Sorocabana Railroad.

The work on the Sao Paulo railroad now represents the construction of the remaining parts of a railroad system which will reach from Rio de Janeiro to Sao Paulo over the Central Railroad of Brazil (Government owned and managed), and thence by the new lines to the extreme southern portion of Brazil. It will force the English monopoly between Sao Paulo and Santos to afford reasonable rates for Sao Paulo's products, to be collected largely by the new American system, or will afford an outlet to the seaboard for such products either over its own lines to the south or by a new line to be constructed direct to the seaboard.

The great country to the south of Sao Paulo—live stock, farming, timbering and mineral—will be opened up by affording it a route to the sea. That portion of Brazil which is susceptible to the most immediate and satisfactory development is reached by this American-Canadian railroad property.

The feeling shown by English residents and English investors in Brazil over the turn of events is not so much due to disappointment over the loss of any single particular investment as it is to the fact that the American-Canadian syndicate has undertaken development in Brazil upon so extensive a scale that its ultimate effects will be felt in every line of foreign business in Brazil. The actual work to be done by the syndicate in Sao Paulo and through the interior to Rio Grande do Sul, and thence in fact to Montevideo, is to be strictly up to date, representing the best there is in American railroading. It represents American materials and methods, American locomotives and American rolling stock. The port works at Rio Grande do Sul are indicative of the whole. There will be a double stone jetty extending over the bar, and within the port there will be a quay wall like that at Antwerp and the one at Hamburg. The railroads will come to the quay. There will be electric cranes, fireproof warehouses and the most modern equipment. The equipment of the railroads will be in keeping with the ports they are to serve.

Part of the work of this syndicate in connection with the Sao Paulo-Rio Grande Railroad is the construction of a line 600 miles into the interior of the country to Iguassu Falls, starting from the port of San Francisco. This line will open up Paraguay to the Atlantic by rail and will, by means of the Paraguayan railroads now existing and under concession, form connection with the new Bolivian railroads, for Bolivia is to be thoroughly developed in a railroad way and will have connections with the Atlantic ocean, both to the north by way of the Amazon and to the south through Paraguay. There are interests in the United States now organizing for the further development of the Paraguayan and Bolivian connections. Independent of them, however, there are to be notable changes in Bolivia under the direction of the Speyer syndicate.

About three years ago there was signed in Petropolis, Brazil, a treaty between the Government of Brazil and that of Bolivia for the settlement of the boundary between the two countries—a boundary which had been the subject of dispute since the two Governments were founded. The chief dispute was over the large territory known as the "Acre," chiefly important for the amount of rubber it produces. In this treaty Bolivia quitclaimed its rights in the Acre for $9,733,000. This money it has contracted with Speyer Brothers, of New York, to spend for over 300 miles of railroad to cost $26,766,000, the balance of cost of the roads to be covered by bonds upon the railroads themselves. The connections with the southeast, which it is expected will be effected through the railroads mentioned as forming the second part of the system outlined, will probably be secondary to the principal system in Bolivia formed to connect with the great Amazon system, forming the third heading above indicated. This connection is to be effected by means of the Mamore river, the Madeira-Mamore Railroad and the Madeira and Amazon rivers.

In some respects the development of this great line of transportation is the most important of all those undertaken by the American-Canadian syndicate. The beginning of this line came in the granting of a concession about a year ago to the American syndicate to construct port works at Para (Belem), at the mouth of the Amazon river. Soon after the signing of the treaty of Petropolis the Brazilian Government, in line with the provisions of the treaty, granted a concession for the construction of a railroad from San Antonio, on the Madeira river, to a point on the Mamore river above the falls, which have made navigation by that river impossible.

The concession was granted to a Brazilian as against an American syndicate, which bid for it, and it was understood that French capital was secured to work it as a Brazilian concern. The announcement was made a short time since, however, that the American-Canadian syndicate constructing the Para port works and operating in other portions of Brazil had bought the concession and had men on the way to begin work under it. A party of 30 men, under the charge of H. C. Miller, at one time chief assistant in a Nicaraguan canal survey, are now engaged in the preliminary work, and men and materials for the construction of the road are now on the way, the plans calling for the construction of warehouses, workmen's cottages and even a cold-storage plant.

Commencing with the railroad development of Bolivia and with fully 3,000 miles of navigable rivers to feed the new railroad between the Madeira and Mamore rivers, the line of traffic from La Paz, the capital of Bolivia, to the Atlantic, with the exception of the rivers and the river traffic, which will always be more or less under the control of the Brazilian Government, will be American in control and methods. The principal product of that country at the present time is rubber, but what the limits are of the country's production in other lines no one can tell. The Bolivian country opened up by the new railroad system and connected with the sea, as well as the Brazilian territory reached in the lines west from the southern ports of Brazil, is one of the finest in the world for live-stock raising and for general agriculture. In a climate both temperate and healthful, free from malarial and similar diseases, with a soil more fertile and less subject to deterioration than that of almost any other portion of Brazil, there is apparently no limit to possible development.

EFFECT ON BOLIVIA.

It is important as well as interesting to note the possible effect of this development upon Bolivia. A correspondent of the *Financial News*, who is evidently acquainted with conditions in Bolivia, says of the matter:

> It is, however, interesting to consider the effect on a country hitherto so isolated as Bolivia of the expenditure of so large a sum of money as £5,500,000 on development in any form. Among other things, increased means of transportation and locomotion will induce a great deal of traveling in the country. There will be an enormous inrush of foreigners to Bolivia. These people will secure the major portion of the better-paying industries, and most of the Bolivians will accept minor posts, for out of a population of 1,750,000 there are 1,500,000 Indians, speaking only native dialects. There will be a great expansion in most branches of trade and industry. Banking will increase and there will be a great accession of wealth, most of which will be secured by the new arrivals. Stronger characters will bear down the passive and inexperienced Bolivians. The mining industry, already encouraged by high prices in Bolivia's special products, is likely to progress in an astonishing degree, and all existing commercial mechanism will be strained to keep pace with expanding trade. How much attention from neighboring nations this will attract can be understood, and, in one way and another, Bolivia's awakening will be watched with interest by many persons.

The amount of money invested and to be invested immediately in the several enterprises, including the Bolivian development, will probably exceed $150,000,000. The movement of American railroad and other material in this direction for such works represents the most active and the most considerable element in the export trade of the United States to Brazil and Bolivia.

*Consular report.

GENERAL NEWS SECTION

NOTES.

The Grand Trunk expects to begin operating a car ferry between Grand Haven and Milwaukee next week. The terminal in Milwaukee is practically completed.

Beginning December 8, the Southern Pacific will run two passenger trains daily each way between Houston, Tex., and the Pacific coast, instead of one a day, as at present.

The Huntingdon & Broad Top, after a strike lasting two weeks, has granted the demand of its trainmen that they be paid at the rates prevailing on the Pennsylvania Railroad.

At St. Louis the Wabash Railroad has been fined $200 for failing to promptly report train accidents, as required by the Interstate Commerce Commission, under the Act of 1901.

The Baltimore & Ohio, which is using coke on some of its locomotives in the residential part of Pittsburgh, intends to fit a considerable additional number of engines for burning that fuel.

The Official (Freight) Classification Committee has announced that henceforth no changes will be made in the classification of commodities in freight tariffs until after the proposed changes have been published 30 days.

J. N. Seale, Manager of the Northern and Eastern districts of the Southern, had a stroke of paralysis last Saturday while at Salisbury, N. C. He was taken to Washington, where his condition is said to have improved.

The Atlanta & West Point reports an increase of 18 per cent. in passenger receipts for the month of September over the corresponding month of last year. On this road the state rate, now in force, is 2 cents a mile.

In Macon, Ga., Wilmington, N. C., and other cities business men have combined to request the governors to be less severe in their demands on the railroads, declaring that their radical action has disturbed business seriously and that at the present time it is highly important to allay unfavorable criticism on the railroads.

The Pennsylvania has issued an order to its agents that freight must be kept moving on Sundays to avoid a congestion of loaded cars at the terminals, and to meet the largely increased demands of freight traffic at this time. For several years the movement of much of the low-class freight has been practically suspended on Sunday.

The people of Middletown, N. Y., are complaining because the Erie Railroad has covered "nearly every available space" on the outside of its handsome station in that city, with billboards. It is reported that the Erie intends to do a general advertising business. Billboards have been put up at Erie stations all the way from Jersey City to Middletown.

The State Railroad Commission of Georgia, acting on a report of an inspector and on personal inspections by two of the commissioners, has ordered the Georgia Railroad, within 30 days, to replace defective ties and within 10 days to replace defective spikes, bolts and angle plates at certain specified places. According to the newspapers the defects found were numerous.

In the Federal Court at Little Rock, Ark., November 9, the Arkansas Railroad Commission was temporarily enjoined from carrying into effect its recent order instructing the Prosecuting Attorney to institute suit against the Iron Mountain to collect penalties aggregating $990,000 for alleged discrimination in furnishing coal operators with cars in the Spadra and Denning coal fields.

The Supreme Court of the United States has affirmed the validity of the South Carolina law providing for a fine of $50 upon a railroad for failing within 40 days to settle claims for damage to freight carried between points within the state. The court held that the act applied only to intrastate traffic, and as the State Supreme Court held it was valid there was no Federal question involved.

The Chicago, Rock Island & Pacific is now among the roads which publishes "merits" credited to employees for doing more than their duty. Some of the credits appear to have been made with a liberal hand, as for example, one to a man who was very prompt in responding to a call for the wrecking car. A passenger brakeman in Oklahoma received 10 merits because, while his train was delayed a long time by a washout, he borrowed a broom and swept and dusted the coaches.

The Wabash has notified its competitors that it may decide to give store-door freight service, or its equivalent, in St. Louis because of the disadvantage which it suffers by the absorption of cartage charges to and from East St. Louis by the other roads. It appears that these charges are such that from parts of St. Louis it is cheaper for shippers to send freight across the river than to send it to the Wabash freight house.

The Southern Kansas Railway, a line of 120 miles in the western part of Texas, operated by the Atchison, Topeka & Santa Fe, owns no cars or engines of any kind, and Mr. Colquitt, member of the State Railroad Commission, has formally moved that the Commission order the company to at once buy five passenger and 12 freight engines, 12 passenger cars, four express and mail cars, 500 cattle cars and 200 box cars, all for use in Texas.

The Boston & Albany, already burdened with the autumn rush of freight, has issued appeals through the advertising columns of the newspapers of the principal cities, calling on consignees to promptly unload bulk freight. At Worcester on a given day last week the number of bulk cars waiting to be unloaded was 352, while the number waiting on side tracks to be brought into the city was 912. Springfield and Pittsfield were in a similar condition.

At the shops of the American Locomotive Company at Dunkirk, N. Y., the working day has been reduced from 10 hours to nine, and the shops will be closed Saturday afternoons. The New York Central has canceled a part of its last large order for locomotives. The New York Air Brake Co., Watertown, N. Y., has reduced the pay of officers and employees 10 per cent. The Illinois Central has reduced the working time of its shops at Burnside, Ill., from 10 to nine hours a day.

On the Boston & Maine, passenger tickets which are sold at reduced rates to compete with electric lines are made good only for continuous passage and no baggage is checked on them. This no-baggage arrangement has been in force over three years and appears to be entirely satisfactory. Between Springfield and Greenfield, Mass., where the regular rate is 73 cents, the conditional ticket is sold at 50 cents. Similar tickets, with a less marked difference in rates, are sold between Portland, Me., and Kennebunk.

The Southern Pacific reports that from $3,528,199 in 1902, the cost of locomotive repairs increased to $5,717,667 in 1907. The average of $2,666 per locomotive in 1902 rose to $3,381 in 1907. From 1902 to 1907 the average cost of repairs per passenger car increased from $741 to $801 for this year. Repairs of freight cars increased in cost from $2,380,410 in 1902 to $3,875,956 in 1907. The value of freight cars withdrawn from service, largely because too small and weak to be run in trains with large cars, averaged $732,128 for each of the six years covered by the figures.

The Southern Pacific, which for the past six years, has been occupying the Illinois Central passenger station at New Orleans, bringing its passenger trains across from the other side of the Mississippi on ferry boats, has abandoned that station, at least temporarily, and all passengers will leave and take the cars at Algiers, being carried across the river on ferry boats to and from the Southern Pacific station at the foot of Esplanade street, New Orleans. This change has been made necessary by the caving in of a bank. The new place of landing in New Orleans is close to the station of the Louisville & Nashville.

At a hearing in Albany on a complaint of a brotherhood representative that insufficient men were employed on trains, it was testified that the Erie Railroad now has its colored porters on passenger trains qualified for flagging duty. The brotherhood representative said that he could not get trainmen to appear and testify because they feared dismissal, whereupon Vice-President Place, of the New York Central, announced that no employee of that company would be discharged for testifying. The commission will send an inspector over the Pennsylvania division of the New York Central to examine the ground for the complaint concerning that line.

Judge Calhoun, of Texas, has sustained the validity of the full crew law of that state, prescribing the number of men to be assigned to trains, and assessed a fine of $2,000 and costs against the Missouri, Kansas & Texas for violating it. The case will be appealed. The Pennsylvania and other companies are named as defendants in a suit to test the constitutionality of the "full crew law" passed by the last Legislature of Indiana. The railroads and the railroad commission have submitted an agreed statement of facts. A press despatch says that most of the roads are obeying the law on trains carrying intrastate freight exclusively, but on interstate trains are employing the same number of men as before the law was passed.

It appears that the Merchants' Despatch Transportation Co. has not been dissolved, nor has it abandoned all of its business. As before reported, the fast freight line business will now be done by the railroads, but the Merchants' Despatch will continue to exist as

a car-owner, and it retains its car shops at Despatch, N. Y. The ice houses at East Buffalo and Karner have been sold to the New York Central; the ice house at West Seneca, N. Y., has been sold to the Lake Shore & Michigan Southern, and that at Detroit to the Michigan Central. The several thousand M. D. T. box cars have been sold to the New York Central and the Lake Shore, as have the carriage cars owned by the company; but the 5,284 refrigerator cars are retained. Thus, the box cars will hereafter be paid for by borrowing roads at the per diem rate, while the refrigerators will continue to be paid for by the mile.

Chicago railroads now report that miscellaneous freight business has slacked sufficiently to enable them to accept all shipments offered. At Pittsburgh, however, reports continue to indicate a shortage of cars, and many industrial establishments are said to be suffering loss by delays. A despatch from that city, November 10, says that orders for 500,000 tons of coal for points in the Northwest have been refused because it was impossible to secure coal cars before the close of navigation. An officer of the Burlington road says that that company now has 1,400 box, coal and cattle cars standing idle. The state railroad commissioners of Montana have approved an order of the Northern Pacific suspending the operation of six passenger trains for 90 days in order to enable the road to relieve the congestion of freight; this notwithstanding loud complaints from citizens of the towns on the branches where the trains are to be taken off.

Twenty-two railroads, most of them prominent companies, have invited all the other roads to attend a meeting in Chicago next week, Wednesday, to see if they can agree to adopt a penalty of $5 for wrongful diversion of cars in switching territory. The proposed rules are similar to those which were proposed in connection with the rule for a general diversion penalty (which failed of adoption) except that they apply only to movements in switching territory. The 22 roads have agreed with each other, already, to abide by the proposed rules for six months, on the understanding that they shall not be changed in next Wednesday's meeting, except in accordance with the rules of procedure, which are followed at the meetings of the American Railway Association. The 22 roads are: Chicago, Burlington & Quincy; Chicago, Rock Island & Pacific; Illinois Central; Pennsylvania Lines West; Chicago & North-Western; Atchison, Topeka & Santa Fe; Baltimore & Ohio; St. Louis & San Francisco; Belt Line Railroad of Chicago; Quincy, Omaha & Kansas City; Chesapeake & Ohio; Buffalo & Susquehanna; New York, Chicago & St. Louis; Detroit, Toledo & Ironton; Ann Arbor Railroad; Norfolk & Western; Erie Railroad; Louisville & Nashville; Hocking Valley; Lehigh Valley; Mobile & Ohio, and Louisville, Henderson & St. Louis.

The state railroad commissioners of Massachusetts, reporting on the records sent in by the railroads showing delays for passenger train say that:

"The record of train delays upon the Boston & Albany Railroad for the three weeks ended October 19 is so bad that there is no occasion to analyze it. The service as a whole has been growing worse rather than better during the last eight months, as must have been the case with locomotives overtaxed and tracks overloaded.

"It has become evident that the expenditures authorized were on too frugal a scale, and that the work of improvement was tardily begun and ineffectively prosecuted; in brief, that there has been a failure to meet the emergency which the situation presented.

"Discouraging as this conclusion is and destructive as it must be of faith in assurances, the vital question is whether the outlook to-day is any better than it was six weeks ago. That question, in our opinion, ought to be answered in the affirmative. No impartial critic in possession of all the facts can fail to note the signs of a thorough understanding, at least of the troubles which have caused disaster, and of a new administrative purpose to drop superficial treatment of symptoms and to get at the real disease.

"* * * A part of the criticism which has been so lavishly expended upon the Boston & Albany might well be diverted to the record of trains upon other railroads, where, in varying degrees, there have also been delays. * * *"

Reciprocal Demurrage in Texas.

At a conference between the principal railroads and a large number of representatives of shippers, an agreement has been reached for the establishment on the railroads of Texas of "reciprocal demurrage," and it is expected that the Railroad Commission will adopt and promulgate the rules which have been formulated. The conference recommends that a railroad shall have five days in which to fill orders for not over five cars and an additional day for each car. Demurrage is to be $1 a day as now; and the penalty for failure to furnish cars 50 cents a day. The same penalty applies for failure to move cars at least 25 miles a day. The railroads agree that the shippers shall be represented on the Texas Car Service (Demurrage) Association.

The "Aero" Vacuum System for Cleaning Cars.

The Chicago, Milwaukee & St. Paul has installed in its Western avenue yards, Chicago, the "Aero" vacuum system for cleaning cars. This system, which has been in use for some time for house cleaning and similar purposes, has lately been adapted to car cleaning, the installation on the C., M. & St. P. being the first. The plant is portable and the mechanism simple. There are no vacuum pumps and elaborate piping system. Instead there is a dust separator tank on wheels, the mechanism for producing the vacuum, which is affixed to the side of the tank, and the necessary hose and nozzles.

A jet of compressed air blowing through a special designed aspirator produces a vacuum of about 10 in. The compressed air is taken from the yard pipes, and if an air cock is not convenient to the car to be cleaned the aspirator can be connected to the air line of a string of cars standing on the cleaning tracks and the air cock reached in that way.

The dust-laden air is drawn from the car into the separator tank, where the dust is removed from the air partly by centrifugal force and partly by a special strainer. The exhaust air is discharged at the bottom of the tank. The dust is removed from the tank through a door at the bottom.

The novel feature of the system is the dust separator, which it

Cleaning Parlor Car by "Aero" Vacuum Machine.

is claimed is quite efficient, separating all entrained dust from the air. Each outfit has several nozzles of different shapes for the different kinds of work. A tool with an opening 10 in. wide is used for carpets, curtains and bedding. For the seats a 4-in. upholstery nozzle is used, and for the arm-rests and other surfaces there is a special curved nozzle.

The C., M. & St. P. adopted the system after a series of tests lasting for months. These tests brought out several interesting facts. Cars cleaned by the system have the dust so completely removed that a thorough cleaning is necessary only every third or fourth trip. On intermediate trips a simple brushing is sufficient. This keeps a cushion in better shape than when cleaned every trip by the beating or blowing method. The vacuum system saves so much time and labor that three men have been dispensed with at a saving of $150 a month. Other tests to compare the vacuum with the blowing method showed that after sleeping cars had been thoroughly blown by compressed air and were ready for the station, the vacuum apparatus would remove 1 to 2½ lbs. of dust from the seats and carpets.

There are two machines in use in the Western avenue yard of the St. Paul, and at present they take care of 12 to 15 sleeping cars a day and an equal number of coaches. A cleaning outfit complete costs $350. The American Air Cleaning Co., Milwaukee, Wis., is the maker.

Atchison Fined $330,000.

In the United States District Court at Los Angeles, Nov. 7, Judge Olin Wellborn fined the Atchison, Topeka & Santa Fe $330,000 for paying rebates illegally. The company was convicted on October 11 last by a jury in the Federal court of granting rebates to the Grand Canyon Lime & Cement Company of Arizona. It was found guilty on all the 66 counts. The rebates were given on shipments of lime and cement from Nelson, Ariz., to Los Angeles. The company claimed that these amounts were allowances for damages to goods which were allowed after such claims had been regularly presented and proved in each instance. Judge Wellborn says: "I am inclined to think that the defendant's underlying purpose in the transaction complained of was to foster on its own lines any industry which would permanently contribute to its traffic against competitors in other localities. But the evidence shows that the concessions were intentionally and systematically made, and it is hard to believe that the defendant did not know that they were unlawful departures from its established tariff. At all events, ignorance of the law under the circumstances in this case would imply a degree of negligence well nigh equivalent to guilty knowledge. The judgment of the court is that the defendant be sentenced to pay a fine of $5,000 on each count of the indictments."

Judge Wellborn allowed a stay of 30 days, with the privilege of an extension. Judge Wellborn is 64 years old, a native of Georgia and a Confederate veteran. He went to California in 1887, and was appointed to the Federal bench by President Cleveland in 1895. He served in Congress from the Dallas (Tex.) district in the 46th, 47th, 48th and 49th Congresses.

An officer of the Atchison, Topeka & Santa Fe in New York said: "This entire case is an outrage and the matter will certainly be appealed. A man in a remote section of Arizona asked us to name a rate on lime shipments to Los Angeles. We stipulated that the minimum carload should consist of 40,000 lbs. The place was so small that there were no track scales there. The shipper at times did not send the minimum load, and many of his carloads on arrival at Los Angeles showed only 35,000 lbs. The man said he could not help having sent an insufficient amount, owing to the absence of track scales, and asked that in such instances he be charged only for the amount sent.

"The adjustment of his claim did not even reach the officials of the company. It came under the eye of a clerk, to whom the claim seemed so just that he granted it without even presenting the matter to his superiors, who were unaware of it." * * *

Rochester-Coburg Car Ferry.

The Buffalo, Rochester & Pittsburgh and the Grand Trunk have established a car ferry across Lake Ontario between Rochester, N. Y., and Coburg, Ont. A steamer with capacity for 26 cars has been put in service and it is expected to be powerful enough to cut its way through the heaviest ice. Its ordinary speed is 15 knots an hour. The B., R. & P. has built a dock on the Genesee river, which is reached by its Charlotte branch. It is expected that the ferry will secure a good traffic in coal from the Pittsburgh district to points in Canada. The boat was built by the Canadian Shipbuilding Company. It is the largest ever used on Lake Ontario, being 316 ft. long, 57 ft. 7 in. beam and 17 ft. draft. While especially designed for carrying freight, accommodations in keeping with the best modern sea going vessels have been provided on the upper decks for passengers, comprising 32 staterooms, dining saloons and lounging rooms. The distance between Rochester and Coburg is 60 miles, and it is expected that the boat will make two round trips each 24 hours.

Alabama Legislature.

The special session of the Alabama legislature opened November 7. Gov. Comer in his message declared that the control and regulation of the railroads by the state is a question more important than the making of rates or any other matter, in that it involves the question of the right of the state to control its internal affairs. He says that President Smith, of the Louisville & Nashville, has held out against the Alabama laws, while others have put them into effect; has defied the state and its people by conducting a lobby at the Capitol, openly admitting that his company influenced legislation in the past; has called the Governors of Alabama and Georgia Populistic; has raised rates overnight in defiance of state laws, and has generally refused to recognize the right of the state to make laws applying to transportation companies. That the Alabama rate laws are not confiscatory is evidenced, the Governor says, by the fact that they prevail in other nearby states, and provide profit. Financial troubles, he says, are due to the rascality of the high financiers, and the producer of the cotton of the South is now coming to save the country from panic. The Louisville & Nashville is charged with manipulation to prevent use of waterways, to make rules for handling coal and as to demurrage and freight rates, which are arbitrary.

President Smith has issued a pamphlet replying to Governor Comer's charges.

Eight bills have been introduced in the legislature to carry out the Governor's proposals, and some of the bills under consideration in the house were passed by that body on Tuesday of this week. The maximum rate bill, which was enjoined by the railroads, was repealed, the authority given the railroad commissioners to bring suit was revoked with a view to preventing the railroads from enjoining the state. The bill providing for penalties for failing to put in effect the state laws was passed. The passage of these bills and of the eight bills known as "the 110 commodity rate bills" is expected to put the low rates into effect without going to court. Each of the bills provides a heavy penalty. There is another bill, providing that a passenger who tenders the amount required by state law for passage and is ejected from a train may bring suit within ten years. The bills are carefully drawn by the most prominent constitutional lawyers in the state.

New York State Commission Orders.

The Public Service Commission of New York, Second district, has ordered the railroads of the state to report all important improvements to roadway, buildings, bridges and terminals and all additions to rolling stock, made during the year ended June 30 last, and also improvements of this kind now unfinished. The Commission calls on the roads for full and prompt responses, believing that by furnishing the desired information, to be laid by the Commission before the Legislature, the roads will be promoting their own interests and disarming prejudice.

The Commission has also ordered the railroads of the state to have their local agents report, direct to the Commission, all cases in which it is impossible to provide cars for shippers within four days of the time the cars are required.

The Commission has also ordered all railroads to promptly report to the Commission, with full particulars, any embargo which may be laid on intrastate traffic; also to send notice when any embargo is revoked or modified.

Cement Show in Chicago.

The first annual cement show will be held in Chicago at the Coliseum, December 17 to 21 inclusive. It will be under the auspices of the Cement Products Exhibition Co., which was formed to hold annual expositions of cement products. The enterprise is being promoted by Portland cement manufacturing interests of the Middle West. Its scope may be judged from the classifications of exhibits, which include: Cement, concrete mixers, block machines, brick machines, cement pipe machines, cement tile machines, cement post machines, cement coloring mixtures, reinforcing metal, cement publications, testing machinery, sheet piling, aggregates, sand and technical institutions. L. L. Fest, who has been manager of several large trade exhibitions of this kind, is in charge. It is hoped that the attendance will be increased by the fact that the date set will allow visitors to do their Christmas shopping in Chicago. It is desired that everybody directly or indirectly interested in the cement industry will do something to contribute to the success of this demonstration, which is intended to exploit cement as the leading building material of the future.

A State Rule for Distributing Coal Cars.

The State Railroad Commission of Indiana has given to the Southern Indiana Railroad an order directing in detail how that railroad shall distribute cars to the coal mines dependent upon it for transportation, leaving no discretion to the management of the road. The order is the result of an investigation of charges by the Calora Coal Company that the Southern Indiana was grossly discriminating against it and in favor of the mines owned wholly or in part by John R. Walsh, who controls the road. The commission directs that the distribution of cars shall be based on the average daily capacity, or on the daily requirements, of each mine. If the daily requirement of a mine is 100 cars and there are only 500 cars to be distributed, the mine will receive one-fifth of the cars available. The mine, however, has the right to increase its daily requirements up to its average daily capacity, but not beyond this point.

Each mine must furnish by telephone daily, between 5 and 6 p.m., all information necessary to enable the company to make a distribution of cars in accordance with the rules of the commission. The road must include in the "total equipment" on its line "available for the operation of all mines" all "system" coal cars that day apportioned to the mining district; all foreign cars available for use in the district; all foreign cars specially assigned to or requested by particular mines for loading with commercial coal;

all foreign cars specially consigned for loading with fuel coal for foreign lines, and all private cars owned by mines on the line of the Southern Indiana.

On any day when the allotment of cars due the mines which furnish the Southern Indiana with fuel coal [for its locomotives] does not equal the requirements of the railroad, such mines shall be served first despite the lack of cars in the general distribution.

The commission requires the road to arbitrarily assign from its equipment before distribution a reasonable number of cars for the development of new mines. This shall be continued until the capacity of the new mine is equal to the lowest capacity of any mine operating on the road.

TRADE CATALOGUES.

Welded Pipe.—The National Tube Company, Pittsburgh, Pa., has published an exceptionally well illustrated pamphlet entitled "The Manufacture of Modern Welded Pipe." It describes the older process of making wrought-iron pipes, taking up each step beginning with the ore, and then goes on to tell the history of pipe steel and the stages in the making of steel pipe nowadays at the company's works. The last part of the pamphlet is taken up with a comparison of the relative value of steel and iron pipe.

Friction Draft Gear.—The Republic Railway Appliance Co., St. Louis, Mo., has a new catalogue of its "Republic" friction draft gear. It is a 6-in. x 9-in. pamphlet presenting in concise form essential information concerning the device. The construction of the gear, the parts in detail and their relation are shown by half-tone engravings and the different applications by line engravings. The action of the gear and its advantages are briefly given in the text.

MANUFACTURING AND BUSINESS.

The Schoen Steel Wheel Co., Pittsburgh, Pa., has opened an office at 1407 Fisher building, Chicago, with J. T. Milner as Western Sales Agent.

The jury of awards for the Jamestown Exposition has awarded the Baldwin Locomotive Works, Philadelphia, Pa., a diploma of a gold medal for installation of exhibit.

During October of this year, the American Car & Foundry Company, New York, built 10,780 cars and repaired 626 cars. Its output of cars during the quarter ended October 31, 1907, was greater than in any previous quarter.

S. T. Callaway has been elected Secretary of the American Locomotive Company, New York, succeeding Leigh Best, who has been Secretary of the company since its organization. Mr. Best remains Vice-President. Other officers were re-elected, as follows: President, W. H. Marshall; Vice-President, R. J. Gross; Vice-President, H. F. Ball; Vice-President, David Van Alstyne; Treasurer, C. B. Denny; Comptroller, C. E. Patterson.

Contracts for erecting buildings and for other structural work at the $1,000,000 open hearth steel plant and finishing mills at McKees Rocks, Pa., of the Schoen Steel Wheel Co., Pittsburgh, Pa., have been let to the Riter-Conley Manufacturing Co., Pittsburgh, Pa. The Shaw Electric Crane Co., Muskegon, Mich., has the contract for a number of heavy cranes, and the Porter-Miller Co. will install a large gas producer. It is expected that the plant will be in operation next spring.

The Westinghouse air-brake equipment specified for the six switching locomotives, which, as mentioned in another column, are to be built by the Davenport Locomotive Works, Davenport, Iowa, for John Marsch, Cleveland, Ohio, consists of Westinghouse automatic and straight air-brakes with two 9½-in. pumps and triple train lines for operating brakes and pneumatic dump cars. These are equipped with two-way cocks so that all pneumatic operations are handled from the cab.

Richard D. Hurley, Manager of the Pittsburgh office of the Independent Pneumatic Tool Company, Chicago, died at Chicago on November 5 of heart trouble, which did not develop until about a month ago. Mr. Hurley was 39 years old and had been in the pneumatic tool business for 10 years. He was a brother of John D. Hurley, Vice-President and General Manager of the Independent Pneumatic Tool Company, and of Edward N. Hurley, formerly President of the Standard Pneumatic Tool Company.

The United States Steel Corporation is exchanging its 5 per cent. sinking fund bonds for Tennessee Coal, Iron & Railroad stock at the rate of $120 face value in bonds for each share of stock. At the end of last week, $21,500,000 of the about $33,000,000 outstanding T. C. I. & R. R. stock had been exchanged and it was expected that nearly all the rest would be turned in on the same basis. G. C. Crawford, of the National Tube Co., Pittsburgh, Pa., has been elected President of the T. C. I. & R. R., succeeding J. A. Topping.

A cash dividend of 3 per cent. and a scrip dividend of 20 per cent. on the $17,240,000 outstanding 6 per cent. cumulative preferred stock of the American Steel Foundries, New York, has been recommended by the Board of Directors. The cash dividend will be a semi-annual dividend and the scrip, which is to bear interest at 4 per cent., represents back dividends, nothing having been paid since the 2½ per cent. in 1904. A stockholders' meeting is to be held soon. The above dividends are to be paid only on condition that preferred stockholders exchange their stock for an issue of new preferred stock which will not be cumulative.

The General Electric Company, Schenectady, N. Y., has been awarded two gold medals and a bronze medal for its exhibit at the Jamestown Exposition. The company's exhibits are grouped in three departments: machinery, manufactures and liberal arts, and mining. In the first classification, a gold medal was awarded for a collection of motors applied to various machine tools and other devices. In the second department, a gold medal was given for an exhibit of arc and incandescent lamps and electric cooking applications. The bronze medal was awarded for a special motor designed particularly for use with an Ingersoll-Temple pneumatic rock drill. The company was also awarded a silver medal for installation of exhibit.

The Buffalo Brake Beam Co., New York City, is now occupying its new plant at West Seneca, Buffalo, N. Y. The plant covers five acres. The buildings consist of the main shop, 60 ft. x 200 ft., with an adjoining open shed extension 100 ft. x 24 ft.; they are equipped with modern machinery and have twice the capacity of the old plant, which was recently destroyed by fire. The fire occurring, as it did, when the new plant was nearly ready for occupancy, the company was hampered very slightly in making deliveries. A siding from the South Buffalo Railway runs into the yard of the new plant, with a track on each side of the main building on a 1 per cent. grade, so that when empty or loaded cars are switched on to these tracks they return to the main line by gravity, thus saving time and expense in switching.

Iron and Steel.

The Bessemer & Lake Erie has ordered 183,000 steel ties.

The Harriman Lines are in the market for 30,000 tons of rails.

OBITUARY NOTICES.

Frank H. Earle, President of the Raritan River Railroad, died of heart disease on November 7 at his home in Newark, N. J. Mr. Earle was 65 years old.

Charles E. Perkins, formerly and for many years President of the Chicago, Burlington & Quincy, died on November 8 at his home at Westwood, Mass.

MEETINGS AND ANNOUNCEMENTS.

(For dates of conventions and regular meetings of railroad conventions and engineering societies, etc., see advertising page 24.)

New England Railroad Club.

At the meeting of this club in Boston, November 12, a paper on the "Trials of a Master Mechanic," by R. H. Rogers, was discussed.

Canadian Society of Civil Engineers.

At a meeting of the Mechanical Section, Thursday, November 14, a paper on "Hydraulic Turbines," by W. Kennedy, Jr., was read by the author.

Western Railway Club.

At the November meeting, which will be held Tuesday, the 19th inst., at 8 p.m., in the Auditorium Hotel, Chicago, a paper entitled "The Influence of Heat Value and Distribution on Railway Fuel Cost" will be presented by J. G. Crawford, Fuel Engineer of the C., B. & Q. Ry.

Car Accountants.

The winter meeting of the Association of Transportation and Car Accounting Officers will be held at the Auditorium Hotel, Chicago, December 10 and 11. There will be reports from the Committees on Car Service and Per Diem, on Office Methods and Accounting, on Railroad Business Mail, on Conducting Freight Transportation, and on Conducting Passenger Transportation.

New York Railroad Club.

At the meeting of this club November 15, a paper on the Brass Foundry, Modern Method of Melting and Handling Metal," by W. S. Quigley, will be presented for discussion.

ELECTIONS AND APPOINTMENTS.

Executive, Financial and Legal Officers.

Astoria & Columbia River.—The office of M. P. Martin, Secretary and Treasurer, has been moved from Tacoma, Wash., to Portland, Ore.

Central of Georgia.—William Nelson Cromwell and J. W. Castles have been elected Directors, succeeding Oakleigh Thorne and Marshall J. Perry, resigned.

The title of W. D. Beymer has been changed from Auditor to Comptroller. His office is at Savannah, Ga.

Chicago & Alton.—The accounting departments of this company and of the Toledo, St. Louis & Western are to be combined, effective December 1. W. D. Tucker, General Auditor of the Toledo, St. Louis & Western, has been appointed General Auditor of both companies, with office at Chicago.

Chicago & Eastern Illinois.—H. J. Cronin, Auditor of Disbursements of the St. Louis & San Francisco, has been appointed Assistant Auditor of the Chicago & Eastern Illinois, with office at Chicago, succeeding John J. Duck.

Chicago, Ziegler & Gulf.—W. B. Clark, Traffic Manager, has been appointed also Auditor, succeeding I. F. Neltz.

Lehigh Valley.—E. A. Albright, Assistant to the President, has been appointed Assistant Secretary, succeeding L. D. Smith, who has succeeded Mr. Albright in his former position.

Louisville & Atlantic.—A. E. Richards, Vice-President and General Counsel, has been elected President, with office at Louisville, Ky. E. M. Wallace, Secretary, has been appointed also General Counsel.

St. Louis & San Francisco.—See Chicago & Eastern Illinois.

Tehuantepec National.—H. O'Connor, Auditor, has resigned.

Toledo, St. Louis & Western.—See Chicago & Alton.

Wabash.—James L. Minnis, General Attorney, has been appointed General Solicitor, with office at St. Louis, Mo., succeeding C. N. Travous, deceased.

Operating Officers.

Alabama Great Southern.—R. E. Boswell, Superintendent, has resigned to go to the Seaboard Air Line.

Beaumont, Sour Lake & Western.—H. Hall, trainmaster of the St. Louis & San Francisco at Chaffee, Mo., has been appointed Superintendent, with office at Beaumont, Tex.

Central Vermont.—W. E. Costello, formerly Superintendent of the Union Pacific at Salt Lake City, Utah, has been appointed Superintendent of the Southern division of the Central Vermont, with office at New London, Conn., succeeding E. D. Nash, resigned to go to another company.

Chicago, Rock Island & Gulf.—H. E. Allen has been appointed Superintendent at Amarillo, Tex.

Chicago, Rock Island & Pacific.—Ariel B. Copley, who was recently appointed Superintendent of the Indian Territory division, is 43 years old, and all his railroad work has been done on the Rock Island. He began in 1881 as a messenger boy. From 1886 to 1893 he was a trainman on the Iowa division, and was then made assistant yardmaster at Des Moines, Iowa. In 1901 he was made general yardmaster of the Des Moines and Valley Junction yards, and two years later was made Trainmaster of the Dakota division. In 1904 he was transferred to the East Iowa division and the next year to the Illinois division. At the end of 1906 he was made Trainmaster of the Colorado division and last spring was appointed Superintendent of the Kansas City terminal division, where he remained until his recent promotion.

Detroit, Toledo & Ironton.—J. M. Jones, chief despatcher at Springfield, Ohio, has been appointed Trainmaster at Napoleon, Ohio, succeeding D. J. Hardy, resigned.

Gila Valley, Globe & Northern.—L. H. Landis has been appointed General Agent at Globe, Ariz.

Gulf Line Railway.—D. L. Turner, Jr., is Superintendent, with office at Sylvester, Ga.

Kansas City Southern.—Frederick B. De Garmo, who was recently appointed Superintendent at Pittsburgh, Kan., was born in Kentucky in 1867. He went to the State Normal School at Warrensburg, Mo., and began railroad work in 1889 as a telegraph operator on the Missouri Pacific. He remained on this road and the St. Louis, Iron Mountain & Southern until 1901, serving as despatcher, chief despatcher, Trainmaster and Superintendent. He then went to the Denver & Rio Grande as Assistant Superintendent and in 1905 was made Trainmaster of the Cincinnati, Hamilton & Dayton. During the present year he went to the Kansas City Southern as Trainmaster at Pittsburgh, Kan., where he remained until promoted to be Superintendent at that place.

Kansas City, Mexico & Orient.—Edward Harrison has been appointed Superintendent of the Montana division, with office at Creel, Chihuahua, Mex.

Louisiana Railway & Navigation.—C. L. Vaughn has been appointed Superintendent of Transportation, with office at Shreveport, La.

Midland Valley.—R. Ward has been appointed Trainmaster, with office at Muskogee, Ind. T., succeeding W. J. Weir.

Missouri, Kansas & Texas of Texas.—C. M. Bryant has been appointed Acting Trainmaster of the Fort Worth and Henrietta divisions and of the Sherman and Cleburne branches, succeeding to the duties of J. E. Farrell, assigned temporarily to other duties. J. R. Shaughnessy has been appointed Acting Trainmaster of the Dallas and Denton divisions and of the Bonham branch, succeeding to the duties of George Stoner, assigned temporarily to other duties.

Missouri Pacific.—R. E. Cahill, Superintendent at McGehee, Ark., has been appointed Assistant Superintendent at Kansas City, Mo., succeeding G. W. Inge, resigned to go to another company. T. M. Wallace succeeds Mr. Cahill. W. S. Coffin, chief despatcher at Wynne, Ark., has been appointed Trainmaster at that place, succeeding T. R. Nash, who takes Mr. Coffin's position.

Northern Pacific.—George Theron Slade, who was recently appointed General Manager of the Lines East of Trout Creek, with office at St. Paul, Minn., was born in New York City in 1871. He graduated from Yale College in 1893 and the same year began railroad work as a clerk on the Great Northern. The next year he spent in the track department and in 1895 was appointed chief clerk to a Superintendent. He was made Assistant Superintendent in 1896 and Superintendent in 1897. Two years later he went to the Erie & Wyoming Valley, now part of the Erie, as General Manager, and in 1901 was made General Superintendent of the Erie division of the Erie. In 1903 he returned to the Great Northern as General Superintendent, where he remained until his recent promotion.

Southern Pacific.—The authority of B. A. Campbell, Trainmaster at Sparks, Nev., has been extended to include the territory heretofore in charge of W. J. Stinson, Trainmaster at Winnemucca, Nev., who has been assigned to other duties. Mr. Campbell's territory now extends from Carlin, Nev., to Sparks, and his headquarters are at Winnemucca.

Union Pacific.—W. A. Worthington, whose appointment as Assistant to the Director of Maintenance and Operation of the Union Pacific and the Southern Pacific was announced last week, has been connected throughout his entire railroad career with the latter company. Starting as stenographer and clerk in the office of the Superintendent at Sacramento, Cal., he shortly afterward was made Secretary to the Engineer of Maintenance of Way at San Francisco and three years later became chief clerk. In 1893 he went to the General Manager's office as statistician, and at the end of two years was promoted to chief clerk. He remained in this position until 1901, when he was made executive secretary to the Assistant to the President. In 1894 he was transferred to Chicago as executive secretary and chief clerk to the Director of Maintenance and Operation of the Union Pacific and the Southern Pacific, from which he was advanced to his present position.

Traffic Officers.

Central Vermont.—J. W. Hanley has been appointed General Passenger Agent, with office at St. Albans, Vt., succeeding J. E. Bentley, assigned to other duties.

New York Central Lines.—Carl Howe, Traffic Manager of the Merchants' Despatch Transportation Company, has been appointed Manager of all New York Central fast freight lines except on the New York, Chicago & St. Louis and the Canada Southern.

Engineering and Rolling Stock Officers.

Ann Arbor.—See Detroit, Toledo & Ironton.

Atlanta, Birmingham & Atlantic.—J. E. Cameron, Superintendent of Motive Power, has resigned and the office has been abolished. R. L. Doolittle, Assistant Master Mechanic of the Cen-

tral of Georgia at Macon, Ga., has been appointed Master Mechanic of the Atlanta, Birmingham & Atlantic, with office at Fitzgerald, Ga.

Baltimore & Ohio.—W. I. Rowland, general foreman locomotive department at Grafton, W. Va., has been appointed Master Mechanic at that place, succeeding O. J. Kelly, resigned.

Central of Georgia.—See Atlanta, Birmingham & Atlantic.

Chicago & North-Western.—W. H. Hufman, Master Mechanic at Baraboo, Wis., has retired after 50 years of service on the road.

Detroit River Tunnel.—W. J. Wilgus, formerly Vice-President of the New York Central & Hudson River, has been appointed Consulting Engineer of the Detroit River Tunnel. The peculiar and entirely novel method of construction of this tunnel was designed by Mr. Wilgus and its contract cost is only one-half the amount bid by Sir Weetman Pearson's firm, who are contractors for the Pennsylvania tunnel under the East river, New York City. It is probable that Mr. Wilgus will also act for the New York Central in the construction of the Buffalo union terminal.

Detroit, Toledo & Ironton.—R. Tawse is Superintendent of Motive Power of this road and of the Ann Arbor, with office at Jackson, Ohio.

Georgia Southern & Florida.—W. C. Shaw, Jr., has been appointed Chief Engineer, with office at Macon, Ga., succeeding G. B. Herrington, resigned.

Grand Trunk.—M. Stansfeld Blaiklock, who was recently appointed Engineer of Maintenance of Way, with office at Montreal, Que., was born in Quebec in 1859. He was educated by private tuition under engineers and architects and began railroad work in 1880 as Assistant Engineer on the St. Clair tunnel construction and two years later was made Inspector of Transportation. In 1897 he was appointed Resident Engineer of the Eastern division. Five years later he was appointed Superintendent of that division, where he remained until his recent promotion.

M. S. Blaiklock.

Midland Valley.—James Carr has been appointed Master Mechanic, with office at Muskogee, Ind. T., succeeding C. H. Welch.

New Orleans Great Northern.—J. F. Coleman, Chief Engineer, has resigned, effective January 1, to become a Consulting Engineer.

New York Central Lines.—See Detroit River Tunnel.

Wisconsin & Michigan.—B. W. Hicks has been appointed Chief Engineer, with office at Peshtigo, Mich.

Purchasing Agents.

Lehigh & New England.—J. B. Whitehead has been appointed Purchasing Agent, with office at Philadelphia, Pa.

LOCOMOTIVE BUILDING.

The Pittsburgh, Shawmut & Northern is said to have ordered 10 freight locomotives and two passenger locomotives.

The Maine Central did not recently order 10 locomotives from the Baldwin Locomotive Works, as reported in the *Railroad Gazette* of November 8.

The Southern denies that it has ordered recently 25 locomotives from the Baldwin Locomotive Works, as reported in the *Railroad Gazette* of November 8.

The Topeka-Southwestern will soon ask for bids on locomotives. Contracts have been let for building the road. W. L. Taylor, Topeka, Kan., is President.

The Pennsylvania has ordered 25 simple, class H6B, consolidation locomotives from the Baldwin Locomotive Works for December, 1907, delivery. These locomotives will be equipped with Walschaert valve gear. The specifications are as follows:

General Dimensions.

Type of locomotive	Consolidation
Weight, total, in working order	204,470 lbs.
Weight on drivers	181,170 "
Diameter of drivers	56 in.
Cylinders	22 in. x 28 in.
Boiler, type	Belpaire, wide firebox
" working steam pressure	205 lbs.
" number of tubes	373
" diameter of tubes	2 in.
" length of tubes	164¼ "
Firebox, length	107 "
" width	66 "
" grate area	49.11 sq. ft.
Heating surface, total	2,842.4 "
Tank capacity	7,000 gals.
Coal capacity	27,000 lbs.

John Marsch, Cleveland, Ohio, has ordered six (0-4-0) switching locomotives from the Davenport Locomotive Works for January, 1908, delivery.

General Dimensions.

Type of locomotive	Switching, four-wheel
Weight, total	60,000 lbs.
Cylinders	15 in. x 20 in.
Diameter of drivers	44 in.
Boiler, diameter	42¾ "
" material	Worth steel
" number of tubes	160
" material of tubes	Detroit seamless
" diameter of tubes	2 in.
" length of tubes	10 ft.
Firebox, length	60 in.
" width	34 "
" material	Worth steel
Tender	Sloping type
Tank capacity	2,800 gals.
Coal capacity	3½ tons

Special Equipment.

Air brakes	Westinghouse
Holsters	Bettendorf
Couplers	Washburn
Injectors	Ohio
Lubricators	Chicago
Metallic packing	Jerome
Springs	Pittsburg Spring & Steel Co.
Tender trucks	Bettendorf
Tires	Midvale

CAR BUILDING.

The Grand Trunk is said to be building four dining cars at its own shops.

The Virginian Railway is preparing specifications on 100 or more coal cars.

The Metropolitan Street Railway, Kansas City, Mo., has ordered 25 city cars from the St. Louis Car Co.

The Chicago & North-Western has asked bids on 1,000 steel ore cars of 100,000 lbs. capacity, the purchase of which has been postponed.

The Atlantic & Western denies that it has ordered 60 box cars from the Lenoir Car Company, as reported in the *Railroad Gazette* of November 8.

The Topeka-Southwestern will soon ask for bids on cars. Contracts have been let for building the road. W. L. Taylor, Topeka, Kan., is President.

The Missouri, Kansas & Texas is said to have canceled contracts for 500 of the 2,000 box cars ordered from the American Car & Foundry Co. last spring.

RAILROAD STRUCTURES.

Cleveland, Ohio.—The Cleveland Electric Railway is said to have agreed to construct subways at the public square and to build a high level bridge over the Cuyahoga flats.

Denver, Colo.—A final conference is soon to be held between the city authorities and the representatives of the railroads regarding plans for the Nineteenth street viaduct, which has been under construction for a number of years. The cost is to be divided among a number of railroads.

East Stroudsburg, Pa.—The Delaware, Lackawanna & Western, it is said, will put up a passenger station here 175 ft. long with a 150-ft. platform extension to replace the present structure. The cost will be about $60,000.

Hagerstown, Md.—The Western Maryland shops at this place have been opened for operation. The locomotive and machine shop building is of brick 150 ft. x 300 ft.

Norfolk, Va.—The Virginian Railway is building a coal pier at Sewells Point. It is to be 1,000 ft. long and 65 ft. wide. It will be 69 ft. high at the outer end and 75 ft. high at the inner end. The sub-structure is to be concrete, on piling. The steel superstructure will be 1,045 ft. long between the bulkhead and pierhead. There will be three tracks on the pier and 31 chutes with pockets of 60 tons capacity.

ROCHESTER, N. Y.—Contract is reported let to J. W. Dwyer, of Buffalo, at $100,000, for constructing a subway under the New York Central tracks at Culver road.

RAILROAD CONSTRUCTION.

New Incorporations, Surveys, Etc.

ALABAMA & NORTHWESTERN.—Rights-of-way, it is said, are now being secured by this company for its proposed line from Gadsden, Ala., northwest to Tuscumbia, 120 miles. S. E. Gardner, President, Landersville; J. B. Sherrill, Chief Engineer, Falkville.

AMERICAN RAILROAD OF PORTO RICO.—This company, which early this year finished its line from the western end of the line on the north coast at Camuy west and thence south to Aguadilla, 27 miles to a connection with the line south along the west coast, is now running trains through from San Juan to Ponce. (April 12, p. 531.)

CANADIAN PACIFIC.—On the Central division a new route has been opened from Molson, Man., west via Hazel Ridge to Whittier Junction, 36.7 miles. Trains between Fort William, Kenora and Winnipeg are now run over the new line.

An extension has been opened on the Pheasant Hills branch from Strassburg, Assn., west to Nokomis, 31.2 miles.

CATAWBA VALLEY.—See Seaboard Air Line.

CENTRALIA EASTERN.—Bids, it is said, are being asked for by a company under this name to grade its proposed line in the state of Washington from the coal mines of the Mendota Coal & Coke Company to the Northern Pacific, near Centralia, about 10 miles.

CENTRAL OF OREGON.—This company is building from Union, Ore., northwest to La Grande, 45 miles. It has opened the road for business from Union Junction to Valley Junction, 1.5 miles, and from Valley Junction to Cove, 10.5 miles. (March 29, p. 467.)

CENTRAL ONTARIO RAILWAY.—Bids are wanted by this company December 2, at Trenton, Ont., for clearing, grading, track laying, ballasting and other work on its extension between Lake St. Peter and Whitney, about 18 miles. The road is now in operation from Picton, Ont., north to Bancroft, 116 miles, from which point an extension is being built north to Whitney, 43 miles. Contracts for some of this work have been let to William G. Gibson, of Port Hope, Ont. Grading work has been finished on 14½ miles and track laid on four miles. (March 15, p. 395.)

CHICAGO, BURLINGTON & QUINCY.—An ordinance, it is said, will be passed by the Hannibal (Mo.) city authorities, granting permission to this company to lay a double-track line along the river front. The company is to reconstruct and extend its yards at this place, and a union passenger station may also be put up.

CHICAGO, ROCK ISLAND & PACIFIC.—This company, it is said, has work under way at El Reno, Okla., involving the handling of 500,000 cubic yards of earth raising the grades from 3 ft. to 7 ft. on a plot of ground 600 ft. x 7,000 ft. as a site for freight yards. There are to be 24 freight tracks each 7,000 ft. long.

CHICAGO, ST. PAUL, MINNEAPOLIS & OMAHA.—The extension of the Nebraska division from Newcastle, Neb., to Wynot, 18.3 miles, was opened for traffic on October 28. (Sept. 27, p. 370.)

COPPER RIVER & NORTHWESTERN.—Contracts are reported let by this company to M. J. Heney for some of the work on its proposed line from Cordova, Alaska, north to the Copper river, thence along that river. It is said the company will spend $25,000,000 in building the line and adding a large smelter at tidewater. (April 26, p. 599.)

DALLAS INTERURBAN (ELECTRIC).—This company, it is said, will soon start work on its proposed electric line from Dallas, Tex., east via Mesquite and Forney to Terrell, 30 miles. The company also proposes to build a line from Dallas south to Waxahachie, 30 miles. D. E. Waggoner is President. (Oct. 25, p. 509.)

GREAT NORTHERN.—It is announced that the Spokane Falls & Northern, building in the United States under the name of the Washington & Great Northern, has been opened for freight traffic to a point north of Chopaka, Wash., and across the international boundary into Canada, where the line is being built under the name of the Vancouver, Victoria & Eastern to Keremeos, B. C., 15 miles north of its junction with the Washington & Great Northern, and 122 miles west of Grand Forks, B. C. The line is eventually to be extended west to Vancouver and east to Winnipeg. Contracts let from Keremeos northwest to Princeton, 45 miles.

GREENVILLE & KNOXVILLE.—This road has been extended from Travelers Rest, S. C., north to Marietta, six miles. (Sept. 6, p. 277.)

JEFFERSON CITY, ALBUQUERQUE & SAN DIEGO VALLEY.—Incorporated in Oklahoma with $7,000,000 capital and office at Carthage, Mo. The company proposes to build a line from Jefferson City, Mo., southwest through Missouri, Kansas, Oklahoma, New Mexico and Arizona to San Diego, Cal., 1,600 miles. The incorporators include: J. H. Langston, J. H. Harris and O. S. J. Guymon, of Carthage; C. R. Wright, Liberal, Kan., and W. F. Burt, Wichita, Kan.

LIMA & TOLEDO TRACTION.—This company building an extension from Lima, Ohio, north to Toledo, 40 miles, has grading about finished and track laid on 32 miles. It is said that work is to be suspended with the exception of finishing the reinforced concrete bridge over the Maumee river at Waterville, until next spring, when the line is to be finished to Toledo. (March 15, p. 361.)

MEXICAN CENTRAL.—This company, it is said, has adopted plans for extensive terminals at the new port of Arina, nine miles north of Tampico.

MEXICO, SANTA FE & PERRY TRACTION.—Work is reported under way and contract let to J. M. Wolf, of Collinsville, Ill., for building this proposed electric line from Mexico, Mo., northeast via Molino and Santa Fe to Perry, 27 miles. S. L. Robinson, President, Mexico, and C. O. Thon, Chief Engineer, Belleville. (May 24, p. 727.)

MISSOURI ROADS (ELECTRIC).—The Chippewa Valley Construction Co., of Ashland, Wis., will, it is said, build next spring an interurban electric line from Ashland north to Washburn, ten miles. About one-third of the right-of-way has been secured.

MORGAN'S LOUISIANA & TEXAS.—See Southern Pacific.

NORFOLK & SOUTHERN.—The Raleigh division of this road has been extended from Zebulan, N. C., east to Farmville, 48 miles. This entire division is now finished and open for traffic from Raleigh, N. C., east to Washington, 105.3 miles. (July 19, p. 83.)

NORFOLK & WESTERN.—On the Radford division, the Speedwell branch has been extended from Cripple Creek, Va., west to Speedwell, seven miles.

The Dry Fork branch on the Pocahontas division has been extended from Berwind, W. Va., southeast to Canebreak, 2.3 miles. (Sept. 20, p. 339.)

NORTHERN PACIFIC.—President H. Elliott, of this company, is quoted as saying that in Washington and Montana construction work is to be continued; but in Wisconsin and Minnesota the forces will be reduced.

OREGON & WASHINGTON.—See Oregon Railroad & Navigation Company.

OREGON RAILROAD & NAVIGATION COMPANY.—Bids are reported asked for this week for work on the Oregon & Washington between Portland, Ore., and Seattle. The work includes many trestles and bridges and a long tunnel. (July 19, p. 83.)

OREGON TRUNK LINE.—Preliminary surveys, it is said, are being made by this company for its proposed line from The Dalles, Ore., south through the canyon of the Deschutes river, about 125 miles. Work on the line is to be begun early next year. W. S. Nelson, President, and F. S. Gordon, Chief Engineer, Seattle, Wash. (Aug. 9, p. 164.)

PITTSBURGH RAILWAYS COMPANY (ELECTRIC).—Work has been resumed on the Canonsburg branch of this road. It was stopped some months ago because of difficulties in securing the right-of-way. It is from Finleyville, Pa., on the Charleroi division, west to Canonsburg, about 12 miles, to a connection with the company's line running south from that place to Washington. Almost all of the line will be over a private right-of-way, and the company plans to run express trains from Pittsburgh to Washington, whence connection may be made with an electric line now partly built to Wheeling, W. Va. The company is also considering the double-tracking of the entire Charleroi division. The line has double-track bridges and all of the cuts and fills are wide enough for second track. During the year the company has lengthened many of the sidings on this division.

PLANT CITY, ARCADIA & GULF.—See Seaboard Air Line.

QUEBEC & LAKE ST. JOHN.—The branch from La Tuque Junction, Que., west to La Tuque, 38.6 miles, has been opened for business. (Oct. 11, p. 435.)

A new line called the Gosford branch has been opened for business from Valcartire Junction, Que., (formerly Valcartire) northwest to Clarks, 5.5 miles.

RED RIVER (ELECTRIC).—Incorporated in Oklahoma with $5,000,000 capital, and offices at Oklahoma City and at Durant, the company proposes to build an electric line from a point in Oklahoma at the Texas-Oklahoma state line north of Bonham, Texas, northwest to Oklahoma City, about 200 miles. The incorporators include: E. M. Abernathy, S. C. Hawk and F. J. Hawk, of Lexington; D. F. Robertson, of Atoka; F. P. Kibbey, of Byers; J. W. Hocker, of Purcell; A. Rennie, of Pauls Valley, and T. H. Bayless, of Durant.

ROBERT LEE & FORT CHADBOURNE.—Grading work is reported under way by E. Hunter, of Robert Lee, who has the contract for 30 miles of this proposed line from Robert Lee, in Coke county, Tex.,

northeast towards Fort Chadbourne. The line is projected east to Winter, about 50 miles. J. H. Spencer, President, and S. J. Bross, Chief Engineer, Robert Lee. (Sept. 27, p. 371.)

Seaboard Air Line.—A new line, the Catawba Valley, has been opened for business from Spence, S. C., south to Great Falls, 21 miles.

The Plant City, Arcadia & Gulf has been opened for business from Plant City, Fla., south to Nichols, 16 miles.

Southern Pacific.—Tracklaying has begun on the extension of Morgan's Louisiana & Texas from Lafayette, La., which is 145 miles west of New Orleans, east to the west bank of the Mississippi river opposite Baton Rouge, 53 miles. By cutting out the long detour southward to New Orleans this line saves 180 miles on through shipments. The most difficult part of the work was over the Atchafalaya swamp, where it was necessary to construct 12 miles of trestles. This will be filled in as soon as rails are laid to the eastern boundary of the swamp. The Atchafalaya river is crossed by a 450-ft. truss bridge. From Lafayette the extension passes through the Anse La Butte oil country and the Grand Point Prairie, a fertile cotton section. Between the swamp section and the Mississippi the line traverses about eight miles of valuable hard timber land. At the river there will be a passenger and freight ferry to Baton Rouge. (Jan. 7, p. 819.)

Spokane Falls & Great Northern.—See Great Northern.

Texas Roads.—It is said that preliminary plans are being made by residents of Denton, Tex., and Krum to build a line to connect these two places, which are five miles apart. C. B. Duffy, of Boston, Tex., is said to be the principal promoter.

Texas Roads (Electric).—Residents of Greenville, Wolfe City and Bonham are organizing to build an electric line to connect these places. The length would be about 35 miles. J. C. Russell, of Bonham; J. H. Blocker, of Wolfe City; J. T. Jones, G. H. Collins and Y. O. McAdams, of Greenville, are interested.

Tonopah & Tidewater.—This road is now in operation from Ludlow, Cal., north to Leeland, Nev., 144 miles; also from Death Valley Junction, Cal., west to Lila C. It is reported that regular freight service is to be extended north to Beatty, Nev., and to Rhyolite November 25, and passenger service is to be started about December 1. (Sept. 6, p. 278.)

Tulsa-Sapulpa Interurban.—Residents of Tulsa, Okla., have applied for authority to build this line from Sapulpa northeast to Tulsa, 20 miles, with a connection to the Glenn oil fields. They propose to begin work at once and expect ultimately to extend the line east through Broken Arrow to Muskogee.

Union Pacific.—At the offices of this company in Omaha, Neb., the report that construction work on this system has been abandoned is denied. Vice-President A. L. Mohler is quoted as saying that there is much unnecessary sensation over the reduction in track forces which always takes place at this season of the year on account of the shorter hours and cold weather. "We have been making a large amount of improvements and have put our property in the best physical condition it has ever known, and the opportunity for reducing forces earlier than usual has been acted upon. We are continuing all improvement work which can be done to advantage and which we can utilize. Work which cannot be carried on at normal expense will be discontinued."

Vancouver, Victoria & Eastern.—See Great Northern.

Washington & Great Northern.—See Great Northern.

West Texas & Northern.—This company, which has projected a line from Stanton, Tex., north to Hereford, 225 miles, is said to have given contracts for building the first 75 miles from Stanton north to Tahoka. S. G. Bon Durant, of New York, is said to be promoting this project.

Woodstock, Marengo, Genoa & Sycamore (Electric).—Incorporated in Illinois with $25,000 capital and office at Chicago, the company proposes to build an electric line from Woodstock, Ill., southwest through McHenry and De Kalb counties to Sycamore, 30 miles. The incorporators include: C. A. Spenney, M. W. Powell, E. B. Horang and H. S. Hedberg.

RAILROAD CORPORATION NEWS.

Chicago Junction.—See Indiana Harbor Belt.

Connecticut Railway & Lighting Company.—See New York, New Haven & Hartford.

Consolidated Railway.—See New York, New Haven & Hartford.

Denver & Intermountain.—See Intermountain Railway.

Hocking Valley.—See Kanawha & Michigan.

Illinois Central.—Arguments are to be heard on November 25 on the question of the voting of 5,500 shares of Illinois Central stock held by the Mutual Life Insurance Company, New York. These shares are among those whose voting rights were enjoined just before the annual meeting last month.

President Harahan has sent to stockholders a circular letter, in which he answers criticisms which have been made of the management. In reference to Stuyvesant Fish's statement that exclusive traffic alliances with east and west connecting roads are undesirable, President Harahan says that the Union Pacific and the Southern Pacific have, during the past six years, delivered to the Illinois Central 46 per cent. more tonnage than they received from it; that these two roads are the only lines of those connecting with the Illinois Central which do not own eastern outlets, and that the Illinois Central has to compete with other eastern roads for this Union Pacific and Southern Pacific traffic.

Indiana Harbor Belt.—This company has made a mortgage to the Guarantee Trust Company, New York, as trustee, securing an issne of $25,000,000 50-year 5 per cent. general mortgage bonds. It is understood that plans are under way for making the Indiana Harbor Belt the owner of all New York Central terminals in and near Chicago. It is said to have bought the Chicago Junction Railway's belt line around Chicago from Whiting, Ind., to Franklin Park, Ill., 27 miles. This does not include the branch from Chappell, Ill., to the union stock yards. An option of the property was taken by New York Central interests last Jnne. (June 28, p. 949.)

Intermountain Railway.—This company has been incorporated, with $1,000,000 capital stock to take over the Denver & Intermountain and electrify it from Barnum, Colo., to Golden, seven miles. The five miles of road from Denver to Barnum are already operated hy electricity.

Kanawha & Michigan.—It is said that arrangements have been made for issuing $2,000,000 of the $2,500,000 second mortgage, 20-year 5 per cent. bonds authorized last Jnne. Part of the proceeds are to be used to pay off $1,800,000 floating debt, of which $1,600,000 is due the Hocking Valley and $200,000 due to the Toledo & Ohio Central.

New England Investment & Security Co.—See New York, New Haven & Hartford.

New York, New Haven & Hartford.—The Directors have decided to issue about $40,000,000 6 per cent. convertible 50-year debenture bonds instead of new capital stock. The debentures will be convertible into stock after January 15, 1923, at the rate of one share of stock for each $100 face value in debentures. The debentures are to be offered to stockholders of record December 2, 1907, for snbscription at par up to January 15, 1908, at the rate of $100 in debentures for every three shares of stock already held. The subscriptions are payable in four instalments, falling due January 15, 1908, and at six months intervals thereafter. The proceeds of the debentures, it is understood, will pay for improvements amounting to $17,000,000 and $21,000,000 worth of new equipment. (Nov. 8, p. 574.)

The regular quarterly dividends of 1 per cent. on the $8,142,900 4 per cent. cumulative preferred stock, 1 per cent. on the assenting common stock and 0.15 per cent. on the non-assenting common stock of the Connecticut Railway & Lighting Co. have been declared. The company was leased in August, 1906, to the Consolidated Railway, which has since been merged with the New York, New Haven & Hartford. The majority of the common stockholders agreed to pay the Colonial Trust Company, as Trustee, $10 a share on their stock, which amount, with the rental received under the lease, provides a fund for dividend payments on both common and preferred stock.

President Mellen has retired from the Presidency of the Springfield (Mass.) Street Railway, and it is said that he will also resign from offices in other electric railway companies in Massachusetts which are controlled by the New England Investment & Security Co., a subsidiary of the New York, New Haven & Hartford.

North American Company.—The directors have announced that payment of the usual quarterly dividend of 1 per cent. on the $29,791,300 capital stock will be postponed. The company controls street railways and other electric properties in and near St. Louis, Mo.; Milwaukee, Wis.; Cincinnati, Ohio; Detroit, Mich., and other cities. It has made loans amounting to over $3,600,000 to subsidiary companies for improvements and extensions, and these companies cannot repay these loans without selling at large sacrifice their own mortgage bonds; therefore, the North American Company is for the present short of ready money.

Southern.—This company has asked the New York Stock Exchange to list $1,964,000 additional first consolidated 5 per cent. bonds and $300,000 additional Memphis division first mortgage 5 per cent. bonds, making the total amounts listed $50,101,000 consolidated and $6,883,000 Memphis division bonds.

Toledo & Ohio Central.—See Kanawha & Michigan.

RAILROAD GAZETTE

ESTABLISHED IN APRIL, 1856.

PUBLISHED EVERY FRIDAY BY THE RAILROAD GAZETTE AT 83 FULTON STREET, NEW YORK.
BRANCH OFFICES AT 375 OLD COLONY BUILDING, CHICAGO, AND QUEEN ANNE'S CHAMBERS, WESTMINSTER, LONDON.

EDITORIAL ANNOUNCEMENTS.

THE BRITISH AND EASTERN CONTINENTS edition of the Railroad Gazette is published each Friday at Queen Anne's Chambers, Westminster, London. It contains selected reading pages from the Railroad Gazette, together with additional British and foreign matter, and is issued under the name Railway Gazette.

CONTRIBUTIONS.—Subscribers and others will materially assist in making our news accurate and complete if they will send early information of events which take place under their observation. Discussions of subjects pertaining to all departments of railroad business by men practically acquainted with them are especially desired.

ADVERTISEMENTS.—We wish it distinctly understood that we will entertain no proposition to publish anything in this journal for pay, EXCEPT IN THE ADVERTISING COLUMNS. *We give in our editorial columns* OUR OWN *opinions, and these only, and in our news columns present only such matter as we consider interesting and important to our readers. Those who wish to recommend their inventions, machinery, supplies, financial schemes, etc., to our readers, can do so fully in our advertising columns, but it is useless to ask us to recommend them editorially, either for money or in consideration of advertising patronage.*

OFFICERS.—In accordance with the law of the state of New York, the following announcement is made of the office of publication, at 83 Fulton St., New York, N. Y., and the names of the officers and editors of The Railroad Gazette:

OFFICERS.

W. H. BOARDMAN, *Prest. and Editor*
E. A. S[illegible], *Vice-President*
RAY M[illegible], *Secretary*
R. S. CHI[illegible], *Treas.*
I. B. RI[illegible], *Cashier*
L. B. SHERMAN, *Western Manager*

EDITORS.

RAY MORRIS, *Man'g Editor*
BRAMAN B. ADAMS
CHARLES H. FRY
RODNEY HITT
G[illegible] L. FOWLER
FRANK W. K[illegible]
HUGH RANKIN
[illegible] BOARDMAN

CONTENTS

VOL. XLIII., NO. 21. FRIDAY, NOVEMBER 22, 1907.

At a conference held in Chicago Wednesday representing 37 roads and over 1,000,000 cars a resolution was adopted approving rules providing that when a car is received from its owner in switching service, it is not to be moved out of the switching district, and must be returned to its owner. The penalty for violation was fixed at five dollars, but it was further provided that the agreement should be obligatory only at points where all roads agree and that it could be put in effect at any point where a number of roads centered. The roads opposed were those objecting to the old diversion agreement, chiefly the New York Central lines and the Southern, making practically a Chicago road agreement.

Further discussion of one highly important but still unsettled rail specification appears elsewhere in the correspondence column. The writer is a railroad officer to whom high credit is due, not only for assembling and presenting the dangerous and costly results of using bad rails, but also for recognizing that railroads separately negotiating with the makers can only in individual cases get a better product. He is a sturdy advocate of requiring a fixed percentage of discard from the top of the ingot, pending a possible improvement in the homogeneity of the ingot and has a common-sense notion that discard, based on present practice, will hasten rather than hinder the improvement of the ingot, and that the arbitrary percentage may be relaxed as progress is made.

The annual reports for the year ended June 30, 1907, of the three Hill railroads—the Great Northern, the Northern Pacific, and the Chicago, Burlington & Quincy, which last year together operated an average mileage of 20,548 miles—are reviewed in this issue of the *Railroad Gazette*. The map published with these reports is drawn from the latest official one, and is a striking picture of the territorial extent of the Hill system. In earnings, the three railroads together have now for the first time passed 200 millions. Their gross earnings last year were $208,000,000. This year the tremendous growth of the Northwest affected the Great Northern and the Northern Pacific in a new way. The 1906 year was a high record one not only in gross but in net earnings and profits after all charges. In the 1907 year the increases in gross earnings continued but the business was handled at a rapidly decreasing margin of profit, so that net earnings of the Northern Pacific were little larger than in 1906 and on the Great Northern were smaller by nearly $3,000,000 than in the previous year. Both roads have reached the point where large expenditures must be made on double tracking, cutting down grades and reducing curves in order to maintain the same proportion of profit from operation which has been received in the past. Fortunately for their stockholders, they are both supplied with funds with which to carry out these vitally necessary improvements, through the new stock issues of $60,000,000 for the Great Northern and of $93,000,000 for the Northern Pacific, subscribed for by the stockholders early in the year. If any more traffic is to be poured over these lines—and the Northwest is slow to admit that it will long suffer from industrial depression—these sums in full will be needed to fit the roads for the task which lies before them. The case of the Burlington is different. During the past six years it has been built up out of earnings to a remarkable degree, while there has been an equally remarkable development of operating efficiency. A granger road with a vast branch-line mileage, it spent nearly $1,600 a mile last year on maintenance of way, while the Chicago & North-Western and the Chicago, Milwaukee & St. Paul, which are comparable, spent from $400 to $750 less. Meanwhile its gross earnings have risen from $53,800,000 in 1907 to $82,500,000 last year. Few roads are in so strong a position as the Burlington to meet industrial depression, yet 20 or even 10 years ago few roads were so vulnerable. The showing of these three great railroads is in itself the best of proof of the past wisdom and present foresight of that great railroad manager, James J. Hill.

According to the old theory of the duties of a State Railroad Commission, the most useful function of such a body is that of an illuminator; not exactly a publicity bureau, for the matters with which it deals are in many cases accessible to the public already; but an instrumentality to make the public see things which people lack the discernment to pick out for themselves. It is encouraging to see evidence that this old theory is still alive and in the hands of competent men, who try to throw light into fields where it is needed rather than on things which mostly please the galleries. Mr. Clark, of the Interstate Commerce Commission, set a good example in this line when he told an Ohio road how to distribute coal cars to the mines. We do not know that the plan which he laid down was exactly right; possibly a year's trial may be necessary to justify any plan of that kind; but it is good to have that troublesome subject brought out into the light, so that everybody can have authoritative knowledge concerning it. In a matter which, like the distribution of cars when cars are scarce, the railroad manager cannot possibly handle to the satisfaction of everybody, managers ought to be glad to let the government step in. The Indiana commission

has adopted Mr. Clark's rule, in substance, for one road in that state. The commissioners may not have a pleasant task in justifying their rule, if shippers who are short of cars make complaint, but it ought to be much pleasanter for them than for the railroad manager, for they are looked upon as the avowed friends of all shippers. The demand for a uniform classification of freight is another matter which a commission can deal with much better than can railroad managers. If, as all experts have long believed, the scheme is unworkable, it is highly desirable that a government body declare the fact. If, on the other hand, the thing can be accomplished, it will be only by arbitrary raising or lowering of a great many rates; and only a governmental body, with its unparalleled inertia to resist disturbers, should take such arbitrary action. We do not say that the government ought to decree uniformity, but it is quite plain that the railroads ought not to. The only way to do it is by leveling down or leveling up; but the first would be unjust to the railroads and the second would be intolerable to the shippers.

The Albany Commission—New York State Public Service Commission, Second District, is an intolerably long name—has announced plans for desirable publicity in three important matters—freight movement (embargoes and car shortage), passenger movement (in one feature, engine failures), and permanent improvements. The public is entitled to accurate knowledge on these matters, but has to put up with what the newspapers can get. Usually the reader gets fragmentary material prepared by poorly qualified reporters. Embargoes have lately had to be declared against apples and vegetables at Pittsburgh and Cleveland, against grain at Buffalo and Galveston, and on various commodities at several other places. An embargo has great possibilities of injustice, and a statement of the facts in any given case from an impartial state authority ought to be a benefit to the railroads. The New York Board's call for records of engine failures is significant mainly because the Board has engaged an experienced locomotive superintendent to receive and digest the reports, instead of entrusting the matter to an amateur, as has been done with many subjects in many states. Indeed, this last is an essential feature in all these publicity movements. A competent editor is an important man in a state commission. It is the disposition, already shown at Albany, to fairly use and temperately set forth the facts gathered from the railroads, which gives to the Commission's action such a hopeful look. To digest the reports of permanent improvements which the railroads have made will perhaps be the most difficult task of all, and show the quality of the Commission in this respect. The large railroads have spent enormous sums of money and probably without exception have aimed to use their resources for the best interest of the public. If the Commission finds this to be the fact it will, of course, put its finding on record, while at the same time it is bound to report cases of money ill-spent and also those where the public really needs more than a railroad can or will furnish. In contrast with the sane acts of the New York Commission, the reader will be interested in an order recently issued by the Railroad Commission of Missouri, which had to be suspended before it went into effect. According to a St. Louis paper "the Board on November 12 decided to suspend the greatly reduced rates on coal, which had been ordered to go into effect November 15, because their enforcement would have resulted in closing many of the coal mines in Missouri, throwing thousands of miners out of employment and affecting some of the manufacturers who have cheap rates on coal for industrial purposes. The coal operators informed the Commission that operators in Iowa and Illinois could ship their coal to St. Louis and Hannibal and reconsign from those points and thus take advantage of the low rates in Missouri. Coal may be mined so cheaply in Illinois and Iowa, as compared with the cost of mining in Missouri, that such a reduction in rates would make the Illinois and Iowa operators dangerous competitors in the Missouri market."

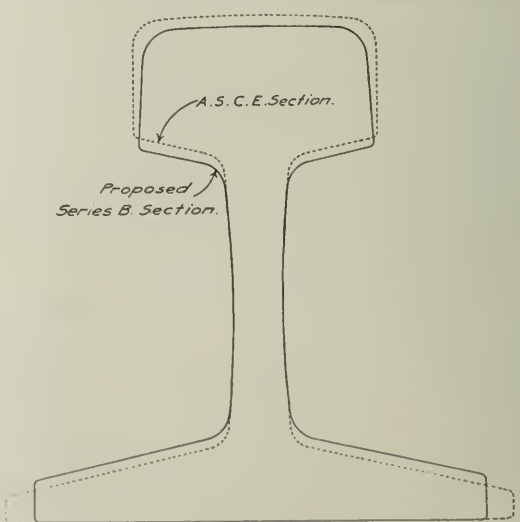
SETTLEMENT OF THREATENED BRITISH STRIKE.

On November 6, a King's messenger traveled by special train and motor to Sandringham to tell His Majesty that the railroad crisis was at an end. The happy result is due in the first place to the skill and efforts of the President of the Board of Trade, but that his efforts were so rapidly brought to a satisfactory conclusion is doubtless the result of the firm attitude maintained by the companies up to the very last, on the question of recognition. While willing to make every concession in the interests of industrial peace which their duty to their shareholders justified, they refused to the last to allow the interference in management which this would inevitably have entailed. The solution now reached does not include recognition of the unions, and, in consequence, does not meet with any warm welcome from the other trade unions in the country. For while in the agreement recently made with the Amalgamated Engineers' Society any employee had the option of going straight to his union, the railroad employee now can only take the matter to the Conciliation Board after it has been put before his employers.

But although the companies were unable to accede to the request of the unions for recognition, they have shown themselves quite ready to modify the present system for the removal of disputes, and to extend the means for bringing about the peaceful settlement of questions relating to hours and wages, to the consideration of which, it will be noted, the Conciliation Boards are limited by the agreement. Briefly, the arrangement arrived at is this. Boards are to be appointed for each railroad company to deal with questions of hours or wages referred to them by employers or employed, after such questions have failed to be settled by the means at present in vogue. The union officials, as such, have no *locus standi* in the earlier stages of the dispute. If, however, they are employees, they may of course be elected members of the conciliation boards, or they may appear before them to represent the men before the boards, for neither solicitors nor barristers will, wisely we think, be allowed to appear. The various grades and the various districts will be separately dealt with, the boards will have two chairmen elected by the two sides, and the two sides will vote separately and subsequently agree. Nominations for the boards are to be submitted to and approved by the Board of Trade. The term of each board will be three years, but the present agreement is to last seven years. In the event of either masters or men failing to accept the decision of the board, the matter may, on the motion of either party, be referred to a Central Conciliation Board. Failing agreement again, the matter goes to arbitration. As the law now stands, there is nothing of course to compel the union to abide by the decision of the arbitrator. But in Great Britain public opinion would be a weighty factor in the matter, and in any case legislation making the arbitrator's award compulsory, could and probably would, if necessary, be resorted to.

TWO TYPES OF RAIL SECTIONS.

The two types of rail sections proposed by the Rail Committee of the American Railway Association represent two different ideas in rail design, while at the same time both approximate the requirement that the metal be equally distributed in the head and base. The origin of the two sections is not hard to trace. Series A is a modification of the Dudley section used on the New York Central,



and Series B is a redesigned A. S. C. E. standard section. In the accompanying engravings the original and modified sections have been superimposed on each other to show geographically the changes proposed. In the Series A section metal has been taken from the sides and bottom of the head of the Dudley section and added to the

top of the base. The web has been thickened $\frac{1}{16}$ in., but otherwise no change has been made. P. H. Dudley has long been an advocate of a rail section designed as a stiff girder, and approximately the same vertical strength has been retained in the Series A section with some sacrifice in the amount of metal which can be worn off of the head. The Series B section has a slightly better distribution of metal than the Series A section. It meets the requirements where the wear of metal in the rail head is a matter of more serious consideration than additional strength as a beam. No sacrifice in the depth of the head has been made over the A. S. C. E. section, and only a small decrease has been made in the width of the head. Such metal as has been taken from the head has been added to the thickness of the base, which is also increased by reducing the width of the base from 5⅜ in. to 5¼ in. in the 100-lb. section. The stiffness has been reduced also from a moment of inertia of 44.4 to a moment of 41.3, or 7 per cent. The relative distribution of metal and moment of inertia of 100-lb. rails of the four sections is given in the following table:

	Distribution of metal in per cent.			Moment of inertia of 100-lb. section.
	Head.	Web.	Base.	
Am. Railway Assoc., Series A.....	36.9	23.4	39.7	48.94
P. H. Dudley—N. Y. Central lines...	40.8	23.5	35.7	48.5
Am. Railway Assoc., Series B.....	40.2	19.2	40.6	41.3
Am. Society of Civil Engineers	42.0	21.0	37.0	44.4

The superimposed outlines of 100-lb. sections are shown here simply to indicate the changes graphically. In other pages are shown the proposed sections and data for rails of different weights.

SMOKE ABATEMENT ON RAILROADS

Nowadays it is generally admitted that the smoke from soft coal in thickly settled districts is a decided nuisance, and an unnecessary nuisance at that. Attention has been directed to the large stacks of power plants and factories and the unpleasant effects of the volumes of smoke and soot which pour from them and over the surrounding country.

In many localities the smoke from locomotive engines is more annoying than that from stationary plants. The constant passing to and fro of the locomotives distributes the smoke over a large area and the low level of the stacks causes most of the smoke to linger near the ground. In the neighborhood of union stations and of railroad yards in our large cities this is especially noticeable. The southern part of Chicago, the lake front in Cleveland and the neighborhood of the university in Philadelphia are striking examples.

The conditions on a locomotive are particularly trying, and there are many difficulties which are absent in the stationary plant. The engineer in the latter usually grumbles if the load varies 25 or 50 per cent. and complains that he cannot keep his fires in good condition. If the grade of coal is changed two or three times in a season, he considers himself a much-abused man. The locomotive engineer, on the other hand, finds his load increased in a few minutes from nothing to 25 per cent. overload, and is fortunate if he can have the same grade of coal on two successive days. In yard service the conditions are oftentimes particularly trying, and the fireman has enough to do to keep his engine moving without giving much thought to careful firing. Starting a heavy passenger train from the station with a new fire, taking a through freight over bad grades and curves inside the city limits, or starting any train when the rails are slippery, gives the engine crew enough to think of beside smoke abatement. However, "nothing is so bad that it may not be better," and there is a trace of silver even in the smoke cloud.

Perhaps the first thing which should receive attention is the quality of fuel supplied to the engine. Different coals require different treatment and different methods of firing. No fireman can expect to get good results when he has to change without notice from one grade to another. The coal should not only be of good quality and uniform in its characteristics, but should be so prepared before reaching the tender as to be of the right size for firing. It is a waste of a good fireman's time to ask him to break coal at the engine. Locomotives will probably be stoked by hand for the present, as so far no mechanical device has met with general adoption or approval. The adoption by several roads of rules for firing on the "single scoop" plan has resulted in a marked reduction of the amount of smoke. These rules vary somewhat on the different lines, but may be summarized as follows:

One shovelful to be fired at a time and the door left slightly ajar for a few seconds, but no longer than is necessary to burn the gases. The fire to be kept as light as possible. In starting, the blower to be put on, and after a sufficient supply of coal has been shoveled for a good fire the door to be left open an inch or so until all smoke disappears, when the door is to be closed.

Water to be supplied to the engine continuously when possible and the engineer and fireman to work together for uniform conditions.

Blower to be used when approaching a station and on down grades.

Doors not to be left open except as herein noted.

Attention to such rules has reduced the amount of smoke emitted more than 50 per cent. in several cases which have come to our notice. The brick arch is an efficient smoke abater, as it helps to burn the gases and to prevent their being chilled by striking too soon on the tube sheets. A deflector plate above the fire door, which shall direct downward the currents of cool air entering the door, is another useful adjunct. If the plate burns away the expense of renewal is not great, while it is possible to protect it with firebrick if necessary. If steam jets are used, they should be located just above the door on either side. Two-inch steel tubes can be inserted through both plates and expanded in the usual way. The steam jets can be directed through the openings thus provided and pointed in the way which shall be most effective. It would seem that some automatic apparatus of the door-check type might be used to advantage in operating both fire door and steam jets. A dash pot could be so arranged as to rise by the action of opening the fire door and to turn on the steam jets. It could then be set so as to close the door and shut off the steam after a proper time had elapsed.

But no mechanical apparatus or devices for abating smoke can take the place of care and intelligent co-operation on the part of both engineer and fireman. There must be a thorough understanding between the two, so that the fireman may not have unexpected demands for steam, but may know for a reasonable time beforehand what is to be expected of him. The engineer should use all the means in his power to make the conditions of firing as uniform as possible and to prepare in season for any unusual fluctuations of service. Engineers and firemen are human, like the rest of us, and the exigencies of train service are such as to turn their thoughts entirely away from any such æsthetic subject as smoke abatement. The experience of those who have dealt with this problem in the neighborhood of our large cities has shown it to be necessary to institute a careful system of inspection of all locomotives inside the city limits, and especially of those used in yard service. Every supervising engineer or chief smoke inspector should have in his employ a sufficient number of subordinates for this work, who are themselves trained railroad men, capable of appreciating the trials of the engineer and firemen and of making allowance for necessary infractions of the rules. Careful and systematic observation of each locomotive as long as it is in sight of the inspector, with a grading of the smoke density on a ruled chart prepared for the purpose, will enable the inspector to speak with knowledge which will command respect. These smoke charts can easily be made in duplicate by the use of carbon paper and one copy sent to the railroad office, the other being retained for reference. Comments written on the charts will express the opinion of the inspector as to whether the smoke observed was necessary or unnecessary. In most cases the officials of the railroads have been glad to co-operate with the inspectors in this work and to call upon the carpet employees who are manifestly careless or inefficient in this regard. It is perhaps needless to say that

the improvement in smoke conditions obtained in this way will also mean an improvement in the efficiency of the locomotive and in the condition of the firebox and flues. In fact, some roads have found it advisable to enforce some such rules as these throughout their lines merely as a matter of economical firing. Until such time as some suitable mechanical apparatus shall have been devised for this purpose, reliance will have to be placed on the means just outlined.

The question of the use of smokeless fuels is to a large extent a local one. The use of either Pocahontas coal or coke involves certain changes in the firebox and grates which make it decidedly inconvenient to change from the use of these fuels inside the city limits to the use of soft coal on the lines. In many cases, however, fuels of this kind can be used for switching service with good results, and it may be possible to change engines at the yard limits and employ smokeless fuel within the confines of the city. Without doubt, the electric locomotive will take every year a more prominent place for interurban service and for most of the work in the neighborhood of large cities. The ordinary soft coal-burning engine is, however, destined to be with us for a considerable period, and the importance to the community at large and the railroads themselves of reducing the consequent smoke cannot be stated too strongly.

The Hill Railroads—Western Section.

Great Northern.

The Great Northern is the railroad which J. J. Hill created and which he himself has managed. Therefore it reflects both the high standard of railroad construction originally carried out and the operating methods continuously applied over many years which made this railroad builder again famous long after his road was put through to the Pacific coast.

To the Great Northern, the past year has brought many changes. The annual report for 1906 was reviewed in the *Railroad Gazette* of November 16, 1906. On that day Great Northern stock sold at 330. In December, 1906, each shareholder was given as many certificates of beneficial interest in the company's ore properties as he held shares of stock. These ore certificates sold for about 85 at the time of their issue and are selling at about 40 to-day. On December 11, 1906, an increase of $60,000,000 in the capital stock was authorized and offered to stockholders at par, with payments in instalments running up to May 1, 1908. The rights to this new issue were quoted at about 35 when it was announced. The high price at which Great Northern stock was selling last fall was due in large degree to the expectation of these valuable distributions to stockholders. Furthermore, the road had just had the largest earnings and most prosperous year in its history. Now Great Northern stock sells around 110.

This tremendous decline in price is due to a number of different

influenced. In the first place there is no expectation now of valuable rights in the near future; in the second place, there has been a tremendous drop in the prices of all securities. In the third place, though gross earnings have again increased, the Great Northern has been very hard hit by increases in operating expenses. With gross earnings about $4,000,000 larger than in 1906, net earnings last year were nearly $3,000,000 less.

Like all other roads the Great Northern suffered from increases in wages and in the cost of material and supplies. There were two other special influences which reduced its net earnings, from which it suffered more than most other roads. These were a large number of rate reductions, voluntary and forced, and a very severe winter during which the depth of snow in northern Minnesota and North

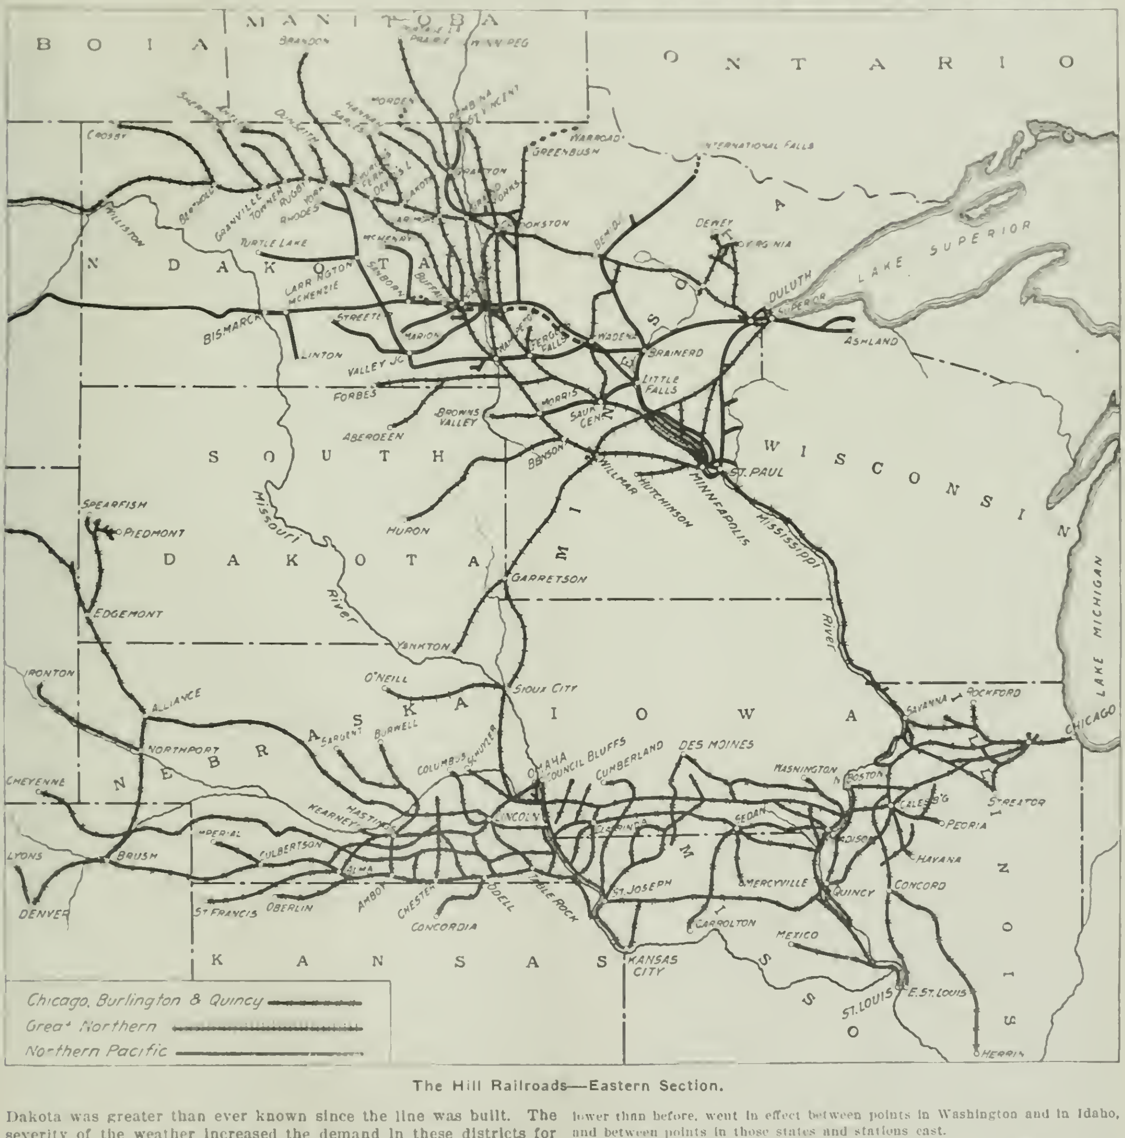
South Dakota, Iowa and Nebraska were reduced, causing a loss of revenue for the ten months of $[illegible].

On Sept. 1[illegible], 190[illegible], a reduction of about 1[illegible] per cent. in class rates was made from far Western points to Montana points.

On Oct. 2[illegible], 190[illegible], rates on coal from Duluth, St. Paul and Minneapolis, Minn., and Superior, Wis., to stations in Minnesota, North and South Dakota, Iowa and Nebraska were reduced, causing a loss up to June 30, 1907, of $[illegible].

On Nov. 1[illegible], 190[illegible], reductions were ordered by the Minnesota Railroad and Warehouse Commission on [illegible] between [illegible] points in Minnesota. As a result, reductions had to be made in interstate rates so as to grade into the Minnesota rates in the bordering states. During the 7½ months in which these rates were in effect the Great Northern's revenue was reduced $[illegible], or at the rate of over $500,000 a year.

On Dec. 12, 1906, a new distance tariff with rates about 10 per cent.



The Hill Railroads—Eastern Section.

Dakota was greater than ever known since the line was built. The severity of the weather increased the demand in these districts for fuel at the same time that it made it almost impossible to keep the railroad lines open. Some towns ran out of fuel altogether and for a week or two were in desperate straits. Fuel and supplies had to be moved to save lives whether other traffic moved or not. This caused a direct and unusual expenditure of over $950,000, which does not include the loss of earnings due to delays and suspension of the movement of traffic.

The various rate reductions caused an actual loss in earnings of about $1,000,000. They are important enough to be listed in detail, as follows:

On Sept. 1, 1906, grain rates from stations in Minnesota, North and lower than before, went in effect between points in Washington and in Idaho, and between points in those states and stations east.

On March 11, 1907, on the opening of the line north to Portage la Prairie, Man. (the line to Brandon, Man., was opened April 4, 1907), the rates from Port Arthur to Manitoba points were applied to shipments from Duluth and eastern terminals to points in Manitoba reached over either of these new lines. This, however, was a rate reduction made necessary in order to compete with the Canadian Pacific and the Canadian Northern, which both use the Port Arthur gateway.

On March 18, 1907, new rates ordered by the South Dakota Railroad Commission went in effect. These reduced by about 10 per cent. the rates on live stock and traffic shipped on class rates.

On June 3, 1907, new rates ordered by the Minnesota Railroad and Warehouse Commission on various staples in carloads from Eastern terminals to 11

different jobbing centers became effective. The average reduction under this order amounted to about 14 per cent.

On June 1, 1907, maximum freight rates on grain, coal, lumber, live stock, and other commodities, were to have taken effect. The Great Northern prepared new tariffs in accordance with these rates, but on May 31, 1901, on the prayer of certain stockholders, the United States Circuit Court in Minnesota granted an injunction to remain in force until suit was decided, forbidding the company to adopt the rates on the ground that they were unreasonably low and confiscatory. This suit has not yet been decided.

These reductions, it will be observed, are all of freight rates. Freight earnings are a railroad's strong dependence, and thus far few railroads have had any serious reductions by law in their freight rates. The Great Northern has been peculiarly unfortunate in this respect.

Nor has it been free from passenger-rate reductions. By legislative act passenger rates were reduced from 3 to 2 cents a mile in Nebraska, effective March 6, 1907; in Minnesota, effective March 6, 1907; in Iowa, effective July 4, 1907, and in Wisconsin, effective August 15, 1907. Passenger rates were reduced from 3 to 2½ cents a mile in North Dakota, effective July 1, 1907, and in South Dakota, effective August 15, 1907. President L. W. Hill (James J. Hill being now Chairman of the Board) states that the minimum reduction in the Great Northern's revenue by reason of these passenger-rate reductions, based on the passenger business handled this year, will amount to $1,180,000 a year. It is therefore evident that the Great Northern has been and will probably be in the year now passing a heavy sufferer from enforced rate reductions.

The increase in operating expenses was $6,700,000, or 26 per cent. Maintenance of way increased 24 per cent., maintenance of equipment 17 per cent. and conducting transportation $4,160,000, or 33 per cent. Of this last increase $799,000 came from "station service," due to more stations, increase in station forces and higher rates of pay. In the past the Great Northern has been accused of maintaining stations only where it wished to do so, and the large increase in this item, especially as it was stated in the 1906 report that part of the increased expenses of that year came from the opening of additional stations, looks as though the road had been compelled to follow a more liberal policy in this respect. There was an increase of $373,000 in "train service," due to additional train mileage and increased wages. "Engine service" increased $1,745,000, due to 12 per cent. more engine mileage, an increase of $550,000 in wages of enginemen, an increase of $75,000 in cost of "other supplies," and an increase amounting to $1,020,000 in the cost of coal, of which there were about 300,000 more tons used than in 1906.

These are the only detailed figures given in regard to any of the three great operating expense accounts. As a consequence, no unit maintenance of equipment figures can be worked out. Maintenance of way, however, cost $1,342 a mile, against $1,093 in 1906 and $973 in 1905. The 1907 increase in this figure is an important one and raises the standard of the road in maintenance of way per mile to a figure which, if the road has been so well maintained on so much less during previous years, ought to be more than adequate for keeping up the condition of the property.

There was more traffic throughout the year than could be conveniently handled, an underlying factor which counted for a great deal in increasing the operating cost. The trainload was increased, but at the expense of the helping mileage. The Great Northern, with its nearly 6,000 miles of line and its many branches and feeders, carries an average revenue trainload of 549 tons. This is an increase of 3½ per cent. over 1906, when the revenue trainload was 530 tons. Including company freight the trainload was 625 tons, against 590 tons in 1906. As remarked in the review of the 1906 report, Mr. Hill's average trainload on his pet property has long been, and still continues to be, the marvel and the despair of other railroad managers. The increase in total trainload was 6 per cent.; the increase in freight and mixed train mileage 5 per cent. Against these the mileage of locomotives employed in helping freight and mixed trains increased 30 per cent., following an increase of 32 per cent. in 1906. Furthermore, the mileage of locomotives helping passenger trains increased 45½ per cent., following an increase of 113 per cent. in 1906.

These figures in themselves are enough to justify the new stock issue of December 11, 1906. Traffic has grown so great that the existing line, strikingly efficient as it always has been, is outgrown. Grades must be reduced, curves straightened and double track laid or each new increase of traffic will return a smaller proportion of net earnings than the one before. It is true that one result of the new stock issue has been to depress the market value of Great Northern stock, but the road now has funds assured for carrying out these necessary improvements. Such expenditures are not doubtful investments, but outlays necessary to maintain operating profits.

Construction advances during the year to various companies amounted to $23,314,945. For new equipment $6,000,000 was paid. Out of earnings $3,000,000 was credited to "fund for replacement of equipment" on account of depreciation of equipment caused by its use during the year. At the same time there was $2,000,000 appropriated out of income to "fund for permanent improvements and renewals" to provide for future contingencies and the cost of such additions and improvements as cannot properly be included in operating expenses, but which on the other hand should not be capitalized. There was charged against this fund during the year $4,000,000. These several expenditures suggest the large increase in equipment during the year (there were 943 locomotives on June 30, 1907, against 786 a year earlier, an increase of 20 per cent.), the various improvements to the property, and the construction of new lines to develop new territory and facilitate operation. Of the lines built for the last purpose there are two most important: The connecting line from a point near Great Falls, Mont., southeast to Laurel, on the Northern Pacific, which is to be a short connection between the Burlington through line to Huntley, Mont., and the Great Northern; and the Portland & Seattle, which is described in the Northern Pacific review, below. The most important construction work done during the year is listed in this week's Railroad Construction column.

The following figures of mileage, earnings and operating expenses cover the Great Northern system, not including the Spokane Falls & Northern lines, 390 miles, which are operated separately. The figures for net income, improvement appropriations and final surplus are those of the Great Northern Railway proper:

	1907.	1906.
Mileage worked	5,982	5,906
Passenger earnings	$10,605,598	$9,460,659
Freight earnings	41,270,192	39,044,732
Gross earnings	55,144,402	51,276,280
Maint. way and structures.	8,924,889	6,453,240
Maint. of equipment	5,622,513	4,820,650
Conducting transportation	16,833,854	12,676,737
Operating expenses	32,562,776	25,852,923
Net earnings	22,581,626	25,423,357
Net income	17,897,824	19,464,000
Improvement appropriations	4,034,976	5,130,910
Year's surplus	2,155,703	5,184,569

Northern Pacific.

The Northern Pacific came formally into the Hill system as a result of the famous Northern Pacific corner. When the Northern Securities Company was broken up by the government, control of the Northern Pacific was handed over to the Hill party, while the Union Pacific in return for almost a majority of Northern Pacific stock which it turned over to the Northern Securities Company, was given merely its pro rata share of the Northern Pacific stock held by the Northern Securities Company, which amounted to much less than a majority. The difference in value was made up by receiving its pro rata share of the Great Northern stock held by the Northern Securities Company.

In 1896 the Northern Pacific was in the hands of a receiver. Its career since the formation of the new company, with J. P. Morgan as the leading spirit, has been a brilliant one. It has profited from the tremendous prosperity of the Northwest in a remarkable degree. At the same time it has been improved not only on capital account, but out of income. Up to June 30, 1906, there had been spent out of income for additions and betterments $18,162,598. A new policy was last year adopted in regard to these improvement expenditures. This sum was transferred to capital account and at the same time added to the profit and loss credit balance. This is improving on the Chicago & North-Western's example of stopping appropriations for additions and betterments out of current income. The Northern Pacific has not only stopped making these appropriations out of earnings but has capitalized all such expenditures which have been made in the past. Probably the reason for this is that the company, believing that the value of its property is at least as great as the total amount charged to capital account and spent out of income, wishes to put itself in a better light for a possible valuation by the states or the national government. This change is really one of accounting rather than of general policy. The present management has made improvement appropriations out of income in every previous year in which it has been in control of the road. It is certain that the improvements will go on, though charged in a different way.

The Northern Pacific had the same difficulties to contend with last year as the Great Northern, but judging by results did not suffer so severely. It shows a small increase in net earnings instead of a large decrease. More detailed facts are given in regard to the severity of the winter. From November 18, 1906, to March 18, 1907, four months, the movement of all business both on the main line and branches in Minnesota, North Dakota and Montana was seriously affected by snow and cold weather. Train movement was greatly interfered with for about 100 days during this period; for over 60 days in North Dakota there was scarcely any freight moved, except fuel and supplies sent through behind snow plows. In Washington during part of the same period, that is between November 13, 1906, and February 23, 1907, the Northern Pacific suffered from serious washouts which stopped through train service between Spokane and Puget Sound and Portland for a total of 25 days. Besides this, during much of the winter the snow and bad track on this part of the railroad made the movement of trains very difficult.

The capacity of the road was overtaxed by the volume of busi-

ness at various points. The Northern Pacific had literally more traffic than it could carry, and much more than it could carry economically and expeditiously. It shows this in the same way as the Great Northern. The revenue trainload increased slightly, from 490 to 497 tons, the total trainload more, from 468 to 492 tons, and the empty freight-car mileage decreased by over 26 per cent. With an increase of 5 per cent. in revenue ton mileage, the mileage of revenue freight and mixed trains increased 3 per cent. But there are other results which spell congestion of traffic rather than economy in operation. The mileage of locomotives employed in helping mixed and freight trains increased 35½ per cent., following an increase of 33 per cent. in 1906. With an increase of 11 per cent. in mileage of revenue passenger trains the passenger locomotive helping mileage increased 31 per cent., following an increase of 59 per cent. in 1906. Within two years the passenger helping mileage has increased from 3 per cent. to 5 per cent. of the total revenue passenger train mileage, and the freight helping mileage from 13 per cent. to 21 per cent. of the total revenue freight train mileage. Here is convincing proof that the road's traffic has outgrown its economical capacity. Here also is good reason for the new stock issue authorized January 7, 1907.

Of the authorized issue of $95,000,000, $93,000,000 was subscribed for by stockholders at par, payments to be made in instalments up to January, 1909. A year ago to-day Northern Pacific was selling at 225. This month it has been down almost to par. Of course, the new stock issue is responsible for much of this decline but, nevertheless, the stockholders of the Northern Pacific are fortunate that their company for the next few years will have funds at its command to make the improvements which are vitally necessary to maintaining the maximum rate of profit on its fast growing business.

Already during the past year there have been large expenditures for improving the property. There appear to have been more improvements to the line than on the Great Northern, but this is no proof that the Great Northern is falling behind its southern neighbor and ally in the condition of its railroad. The Northern Pacific was built as most other railroads were built, by speculative methods. It has been said, perhaps unfairly, "The Great Northern was built to carry freight; the Northern Pacific, to carry bonds." At any rate, the Northern Pacific needs grade revisions and line changes where the Great Northern does not and never has needed them. There are listed in the Northern Pacific report 20 distinct pieces of double tracking, grade revisions and line changes; two in Wisconsin, four each in Minnesota and North Dakota, eight in Montana and two in Washington. The most important of these are in Montana, where work is now under way on a total of 157 miles. Besides this, one grade revision in that state, 1.75 miles long, has lately been finished. The most important of these improvements were listed in the *Railroad Gazette* of November 1, 1907, in the Railroad Construction column. How much work they really represent can be judged from the fact that on the important pieces of work under construction during the 1907 year there were 10,900,000 cu. yds. of material moved, of which 8,000,000 cu. yds. were earth, 1,200,000 hard pan and 1,700,000 rock.

The same figures are given for the work done on the Portland & Seattle, the low-grade line along the north bank of the Columbia river from Pasco, Wash., to Portland, Ore. In contrast they are mute testimony of the difficulty of the work on the new low-grade connection. During the year there were 12,500,000 cu. yds. of material moved on the Portland & Seattle, of which 3,200,000 were earth, 4,000,000 hard pan and 5,300,000 rock. On the Northern Pacific construction work there were over twice as many cubic yards of earth moved as of the two harder materials. On the Portland & Seattle there was nearly twice as much rock alone moved as earth, and rock and hard pan together made up more than three times as many yards as the earth moved.

Naturally the amounts spent during the year on the Portland & Seattle have been large. On June 30, 1906, the Northern Pacific had advanced $5,600,000 to that road for construction. During last year it made additional advances amounting to $11,400,000. Up to June 30, 1907, the Great Northern had made advances on account of the Portland & Seattle amounting to $9,200,000, making a total expenditure by both roads up to June 30, 1907, of $26,200,000. The Portland & Seattle line between Kennewick, Wash., and Vancouver, 221 miles, is rapidly approaching completion, and track should be laid by 1908. The large bridges over the Columbia and the Willamette rivers between Vancouver and Portland are well under way and to be finished by June, 1908. Then the through low-grade connection for the Northern Pacific from Pasco, Wash., to Portland, Ore., will be finished. The Portland & Seattle is also building a line from Pasco northeast to Spokane, 145 miles, which will connect it with the Great Northern. This is to be finished next summer. It is also building a branch from a connection with this Spokane line east to Texas Ferry, 41 miles, which also is to be finished in the summer of 1908. The Portland & Seattle lines are shown on the accompanying map.

This is to connect the joint lines which are being built by the Northern Pacific and the Union Pacific together between Texas Ferry and Lewiston, Idaho, 72 miles, and between Cullulac, Idaho, and Grangeville, 55 miles. The Lewiston line is being built by the Union Pacific and is mostly finished, but the bridge over the Snake river at Lewiston will not be finished until next month or later. The line to Grangeville, which is an extension of an existing Northern Pacific branch, is being built by the Northern Pacific. On June 30, 1907, when 80 per cent. of the construction work was finished, the Northern Pacific had advanced for construction of this road $2,274,279. It is expected that this extension will be finished by January 1, 1908.

The new projects and revisions of line already mentioned do not include all the improvement activities of the Northern Pacific during the past year. There were 480 miles of track laid or relaid with new 85-lb. rail against 168 miles in 1906. On the main line 1,162,754 ties were renewed, against 946,087 in 1906. There were five miles of timber bridges replaced by permanent structures and embankments, against two miles in 1906, and 340 timber culverts replaced by stone, iron or tile, against 177 in 1906. On June 30, 1907, the company owned 250 more locomotives than a year earlier, 85 more passenger train cars and 6,223 more freight cars. In addition there were to be received between June 30 and December 31, 1907, 52 new locomotives, 28 new passenger-train cars and 1,537 new freight cars. The increase during the last fiscal year in locomotives amounts to 25 per cent. in number and 31 per cent. in total weight on drivers, and in freight cars to 17 per cent. in number and 26 per cent. in capacity.

Gross earnings were $68,500,000, an increase of $7,500,000, or 12 per cent. over 1906. Operating expenses were $6,600,000, or 21 per cent. larger, leaving net earnings of $30,900,000, against $30,100,000 in 1906, an increase of $740,000, or 2 per cent.. The operating ratio was 55 per cent., against 50.8 per cent. in 1906. From the net income $5,926,753 was appropriated for depreciation of equipment and written off from the capital account "equipment." This charge, which compares with an appropriation of $2,000,000 in 1906, was arrived at by computing the depreciation to June 30, 1907, of all equipment owned on September 1, 1896, and purchased and built since then. The equipment account of the company is stated to represent the fair value of all equipment owned on June 30, 1907, after making full allowance for depreciation according to the principles laid down by the Interstate Commerce Commission. As already mentioned, no appropriation was made out of income for additions and betterments. The extra amount shown in the table at the end of this review, as appropriated in 1906, was $1,081,980 for the insurance fund. The surplus of the year was $6,700,000, against $8,600,000 in 1906.

Freight earnings increased 10 per cent., while the revenue ton miles increased only 5 per cent. The gain in earnings was due to a larger rate per ton-mile which resulted from a greater proportion of high-class tonnage and a shorter average haul, and not to an increase in rates. The same thing was true in the passenger department, where the rate per passenger-mile increased 8 per cent. The lower rate for 1906 was due to the large amount of low-rate traffic to the Portland Exposition; there has been no actual increase in passenger rates. It is a striking indication of the prosperity of the Northwest that, compared with 1906, the year of the Portland Exposition travel, passenger earnings of the Northern Pacific increased 18 per cent.

The great increase in operating expenses was in conducting transportation, which rose 33⅓ per cent. Maintenance of way increased 18 per cent., while maintenance of equipment decreased 7 per cent. As in the case of the Great Northern, no detailed figures of operating expenses are given, so that the increases in the conducting transportation accounts cannot be located nor the unit maintenance of equipment charges discovered. Per mile of road, maintenance of way cost $1,680, against $1,387 in 1906, and $1,382 in 1905, a distinctly higher standard of maintenance expenditure and one which represents more than necessary requirements.

The income account for the last two years is shown below:

	1907.	1906.
Mileage worked	5,444	5,401
Passenger earnings	$16,924,188	$14,568,221
Freight earnings	48,395,878	44,011,467
Gross earnings	65,534,832	61,223,476
Maint. way and structures	9,145,547	7,493,729
Maint. of equipment	5,542,209	5,944,119
Conducting transportation	20,887,730	15,673,348
Operating expenses	37,664,317	31,095,432
Net earnings	30,870,516	30,128,043
Net income	23,473,929	22,487,700
Improvement appropriations	5,926,753	3,081,980*
Year's surplus	6,697,176	8,555,760

*There was an additional improvement appropriation of $3,000,000 in 1906 for additions to and betterments of existing lines, but this has since been transferred to capital account and therefore is shown, not in this figure, but in the year's surplus.

Chicago, Burlington & Quincy.

Last and greatest of the Hill roads is the Chicago, Burlington & Quincy. It was in 1900 that Mr. Hill set out to buy a Chicago connection for the Great Northern, which he owned, and the Northern Pacific, in which he was interested. He tried in the open market to buy control of the Chicago, Milwaukee & St. Paul and failed. Nothing daunted, he took the Burlington, which connected with the Great Northern only at St. Paul and with the Northern Pacific

only at St. Paul and at one point in Montana, with most of its nearly 8,000 miles of line hundreds of miles away from either of the northern trans-continental roads. During 1900 Burlington stock fluctuated between 120 and 144. Mr. Hill paid $200 a share for it. He was severely criticised for this purchase, both on account of the high price paid and because it was buying thousands of miles of railroad for the sake of a 500-mile connection. He said little, but began to send men trained in the Great Northern service to manage the Burlington. More and more Great Northern men came to the road as time went on and with them came Great Northern operating methods. The results which have been accomplished during the six years of Hill management are remarkable.

When the Burlington was taken over by the Great Northern and the Northern Pacific it was, like the Chicago, Milwaukee & St. Paul, essentially a local railroad, with the operating methods of a local railroad—small trainloads, light equipment and slow service. In the year ended June 30, 1902, the first year under Hill management (the Burlington was taken over April 1, 1901), the revenue trainload was 218 tons and the total trainload 251 tons. Last year the revenue trainload was 389 tons and the total trainload 444 tons. In 1902 there were 4,000,000,000 tons carried one mile with a freight train mileage of 18,300,000; last year, with a freight train mileage of 18,400,000, there were considerably over 7,000,000,000 tons carried one mile. Meanwhile the railroad lines have been greatly improved; old equipment of small capacity has been scrapped with what might seem like wasteful rapidity and replaced with new equipment, fast freight service has been established between Iowa, Nebraska and the Black Hills and Chicago, passenger service both through and local has been brought to a high standard of excellence and the road stands to-day strong, efficient and well equipped.

Since 1902 there has been an increase of 53 per cent. in gross earnings. Last year gross earnings were $82,500,000, against $74,100,000 in 1906 and $66,000,000 in 1905. Net earnings have not increased so fast but this is because the Burlington includes large improvement expenditures in its regular operating expense accounts instead of making special appropriations out of earnings.

It is particularly unfortunate that where this is the case no detailed figures of operating expenses are given, for this makes it impossible to analyze the expenditures in detail and form an opinion as to the amount spent on betterments. The only unit maintenance figure which can be obtained is that for maintenance of way per mile of road which on all roads operated and controlled, including some narrow gage mileage, was $1,584 last year, against $1,272 in 1906. It is necessary to look at the map to realize how generous is this figure. The Burlington is essentially a granger road with most of its mileage in the level prairie country between Chicago and the eastern line of Colorado and with a great clustering network of branch and feeder lines. If the records of the other two leading granger roads count for anything, this type of railroad is the cheapest kind there is to maintain. The Chicago & North-Western and the Chicago, Milwaukee & St. Paul each have a large mileage of branches and feeders in the prairie country. Last year the North-Western spent $1,185 for maintenance of way per mile, and the St. Paul $827 per mile. There is no obvious reason why the Burlington should have to spend any more than these roads. Therefore it is clear that an expenditure of nearly $1,600 a mile by the Burlington means that large improvements are being made directly out of earnings.

The same process of analysis cannot be applied to the maintenance of equipment accounts. But from indirect evidences it is likely that betterments are being charged to operating expenses almost as heavily in equipment. There were added to the equipment during the year 136 locomotives, 712 stock cars and 1,000 coal cars. This, however, probably does not by any means represent the value added to the equipment during the year. It appears that when an old worn out Burlington car of 30,000 or 40,000 lbs. capacity is broken up, it is replaced with a new and modern car of 60,000 or 80,000 lbs. capacity, and the whole cost of the new car charged to maintenance of equipment. This process is said to have been going on with especial rapidity of late.

With such limited figures at command, the most concise and accurate way to estimate the results of the money spent in operating expenses is to observe the proportion of gross earnings which was used on each of the separate accounts. Last year maintenance of equipment expenses amounted to 17.9 per cent. of gross earnings, against 18.4 in 1906 and 14.8 in 1905. Maintenance of way amounted to 17.5 per cent., against 15.2 per cent. in 1906 and 13.8 per cent. in 1905. These figures are clear proofs of the large and increasing amounts spent on improvements through the maintenance accounts.

Similarly the conducting transportation ratio shows the operating efficiency of the year as nothing else can. In 1906 of the gross earnings 30.2 per cent. went for conducting transportation. Last year, with all the wage increases, higher prices of supplies and other influences tending to raise the costs of getting and moving the business, and with 869,000,000 more tons moved one mile and 98,000,000 more passengers carried per mile, only 30.6 per cent. of gross earnings was required for conducting transportation. This small increase is a triumph of good management. General expenses, the other non-productive operating cost, was only 5.4 per cent. of gross, against 5.6 per cent. in 1906.

The few traffic statistics given show this operating efficiency. With an increase of 23,800,000 miles run by loaded freight cars, there was a decrease of 8,400,000 in the empty freight car mileage. The revenue trainload increased from 365 tons to 389 tons, and the total trainload from 420 tons to 444 tons. With a decrease in earnings per ton-mile, earnings per freight-train mile increased. An increase of 12 per cent. in passengers carried one mile was handled with an increase of 7 per cent. in mileage of passenger trains.

Neither the Great Northern, the Northern Pacific nor the Burlington give figures of tonnage carried by commodities. This would be particularly interesting in the case of the Burlington, because its mileage is so much more compact than that of either of the other roads. It is certain that one economy which has been gained during recent years—partly by the natural growth of the territory, partly by special efforts—is the development of a westbound back-haul. This would be indicated by the reduction in empty car mileage. The Burlington is a corn road rather than a wheat road, and is therefore likely to fare well during the next six months, for the corn crop is not only large, but the price is high. It also carries a great deal of live stock eastbound and merchandise westbound which it distributes to the various jobbing centers in Iowa, Missouri, Nebraska and Colorado. A description of its traffic by commodities would, in fact, be a summary of the products and business of the strip of territory between Chicago and Denver, which it so completely occupies.

In July, 1906, the line from Frannie, Wyo., south to Worland, 91 miles, was opened for traffic. An extension of this line from Worland south to Kirby, 20 miles, is now being finished. Since the close of the fiscal year the annual dividend rate on Chicago, Burlington & Quincy stock has been increased from 7 to 8 per cent., with an extra dividend of 6 per cent. This extra disbursement exactly refunds to the Great Northern and the Northern Pacific the amounts which they have paid during the last six years as the difference between the 7 per cent. received on the Burlington stock which they own and the 4 per cent. which they have paid on the joint Burlington bonds, which were issued at the rate of $200 for each $100 of Burlington stock.

The fifty-third annual report of the Burlington covers 36 printed pages. In proportion to its length it probably gives less real information than any other railroad report issued. The Great Northern and Northern Pacific reports are lacking enough, omitting as they do detailed figures of operating expenses, classification of tonnage by commodities and other important information, but the Burlington goes a step further. It is a pity that so great a railroad makes so incomplete an annual showing.

The following table shows the income results of all roads operated and controlled by the Chicago, Burlington & Quincy:

	1907.	1906.
Mileage worked	9,122	8,896
Passenger earnings	$18,666,973	$16,409,104
Freight earnings	56,516,689	51,168,339
Express earnings	2,000,149	1,456,990
Gross earnings	82,473,251	74,146,671
Maint. way and structures.	14,445,867	11,312,712
Maint. of equipment	14,725,632	13,639,942
Conducting transportation.	25,224,272	22,354,707
Operating expenses	58,904,988	51,463,642
Net earnings	23,568,263	22,683,029
Net income	13,155,207	12,742,430
Year's surplus	4,320,333	3,907,572

Detroit, Toledo & Ironton-Ann Arbor.

This is a combination of two small weak railroads. The combined lines run from the Ohio river to the northern part of Lake Michigan, from which there is connection by car ferry with a number of different ports on the western shore of the lake. The northern end of the line, from Frankfort, Mich., to Toledo, Ohio, is the Ann Arbor Railroad. The southern line, from Detroit, Mich., south to Ironton, Ohio, is the old Detroit Southern, now reorganized as the Detroit, Toledo & Ironton. The two roads were united in the hope of developing a larger aggregate of traffic by the alliance. This was successfully accomplished in 1906, the first year of combined operation, in which the combined net earnings were $1,300,000, against $739,000 in 1905 and the combined operating ratio 67 per cent., against 78 per cent. in the earlier year. The second annual report of the two roads shows that in 1907 there was only a slight increase in gross earnings, a decrease in net earnings and, owing to the application for the full year of the interest charges on new Detroit, Toledo & Ironton bonds, a large decrease in net income. The consolidated results for the last two years are shown in the table at the end of this review. In general the report takes up each of the two roads separately.

The Detroit, Toledo & Ironton, which showed great progress in 1906, went backward last year. Freight earnings decreased 4 per cent. and passenger earnings 3 per cent., while operating expenses increased 12 per cent. The reason gross earnings were larger than

In 1906 is that earnings from car per diem, car mileage and hire of equipment, which are included in gross earnings, were over twice as large as in the previous year. Receipts from these sources amounted to $434,334, against $205,584 in 1906, an increase of 111 per cent. The 1907 figure is over twice as large as the total receipts from passenger, mail and express earnings. It is probable that there is no other railroad with as much mileage (438 miles) which makes this showing. These earnings, instead of being an advantage to the road, are small recompense for being deprived of a large part of its equipment for several weeks or months of the year. It has a large tonnage of coal for domestic consumption which moves mostly in the fall and early winter and is destined to a great many different points off the line. Once these cars leave the road they are generally not returned till spring. Meanwhile the company is unable to satisfy the legitimate demands of its own shippers. Last year these shippers, unable to obtain cars, complained to the Railroad Commission of Ohio. In reply the Ohio authorities threatened to revoke the charter of the company if cars were not furnished more promptly to shippers. The company's

Detroit, Toledo & Ironton-Ann Arbor.

position is that if it had ten times as many cars they would, under present conditions, be loaded out during October and November and not returned, and shippers would be little better off than they were last year during the winter months. The Detroit, Toledo & Ironton, therefore, is a road on which the present conditions of car interchange have fallen with particular severity. The raising of the per diem rate from 25 cents to 50 cents a day last summer will increase its car service earnings, but it is obvious that even this increase will nowhere nearly make up for the hardship of being deprived of large numbers of cars for which loading is available. This state of affairs is probably largely responsible for the decrease in freight earnings.

One reason for the increase in operating expenses was that more was spent on the maintenance accounts. There was only a small increase in the non-productive accounts. Maintenance of way cost $723 per mile, against $628 in 1906; and repairs and renewals of equipment $1,701 per locomotive, against $1,055 in 1906; $474 per passenger car, against $322 in 1906, and $28 per freight car, against $22 in 1906. These are low figures, particularly in the freight car item. An average of $25 a year will not maintain modern freight equipment. The showing is made worse by the fact that no new equipment of any kind was bought during the year.

Net earnings were $[illegible] while fixed charges amounted to $927,000, leaving a deficit for the year of $[illegible]. There was a previous profit and loss surplus of $[illegible], so that the Detroit, Toledo & Ironton on June 30, 1907, showed a total profit and loss deficit of $677,000.

The Ann Arbor had a trifling increase in gross earnings and a decrease in net earnings. Freight earnings increased 1 per cent and passenger earnings 5 per cent. Net earnings and other income were $794,000 with which to meet fixed charges of $417,000. This left net income of $377,000 which carried to profit and loss, made a profit and loss credit balance of $1,[illegible]. It will be observed that the year's net income overbalances by $5,819 the deficit, Toledo & Ironton's net deficit.

The Ann Arbor spent less than in the previous year on maintenance. Its increase in operating expenses was in conducting transportation. Maintenance of way cost $864 per mile, against $1,029 in 1906. This is a large decrease, particularly for a year when costs were generally higher. Equipment repairs and renewals cost $1,337 per locomotive, against $1,462 in 1906; $678 per passenger car, against $519 in 1906, and $63 per freight car, against $69 in 1906. The locomotive figure is low, the others fairly adequate.

The prospects for the present year are said to be favorable for both roads. Whether the increased capacity and activity of the different industries mentioned will continue in face of the present depression is a question. A new traffic development is the beginning of special train service from Toledo to Detroit to handle coal for the Solvay Process Company and coal dealers in Detroit. This train has had an average of about 20 cars a day since it has been running. The Ann Arbor is increasing its summer tourist travel. To extend its possibilities in this direction it has canceled its contract with the American Palace Car Company and made a contract with the Pullman Company. As a result a Pullman sleeping car line was established on July 1, 1907, between Columbus, Ohio, and Frankfort, Mich., in connection with the Hocking Valley between Columbus and Toledo. This car was operated in each direction three times a week until September 1 and brought satisfactory returns.

The following table shows the results of the past two years, during which time the two roads have been operated together. The detailed figures of earnings and expenses of the Detroit, Toledo & Ironton and the Ann Arbor are added so as to show them for the combined properties.

	1907	1906
Mileage worked	734	728
Passenger earnings	$637,474	$618,715
Freight earnings	3,001,368	5,056,050
Per diem & equip. earn'gs	434,334	224,702
Gross earnings	4,298,925	4,118,809
Maint. way and structures	572,404	574,228
Maint. of equipment	699,140	602,626
Conducting transportation	1,624,783	1,510,564
Operating expenses	2,978,604	2,775,628
Net earnings	1,320,320	1,343,181
Net income	5,819	159,764
Year's surplus	5,819	159,764

Bangor & Aroostook.

This is a local railroad operating nearly 500 miles of line in northeastern Maine. Its southern terminus was at Oldtown up to the latter part of 1905. On November 4, 1905, the extension south to Searsport was opened for operation and since that time a branch has been built connecting this line with Bangor. Work was begun last spring on a cut-off from South Lagrange north to the main line between Schoodic and Seboois. This is to be put in operation shortly. It is a shorter route with lower grades than the old line. As shown by the map, an extension of this line, known as the Aliagash Line, is projected north through the wilderness about Mt. Katahdin, to a connection with the Temiscouata Railway at its eastern terminus on the St. John river.

The Bangor & Piscataquis Railroad and its leased line, the Bangor & Katahdin Iron Works Railway, were the beginning of the Bangor & Aroostook. Together in 1893 they had 95 miles of main line and gross earnings of $185,000. The Bangor & Aroostook in the next near operated 112 miles with gross earnings of $246,000. The year ended June 30, 1907, shows an average operated mileage of 482 miles and gross earnings of $3,200,000. Yet President Cram believes that the development of the natural resources of northern Maine is but fairly begun.

Certainly the record of the past year shows a gross traffic which last year increased too fast for the most profitable results. Even after an improvement appropriation smaller by $65,000, there was a deficit for the year of $28,000 compared with a surplus of $73,000 in 1906. This was the result of payments amounting to $152,000 on new car trusts. These were charged by the company to profit and loss instead of to income, so that the company's income account shows a surplus for the year instead of a deficit.

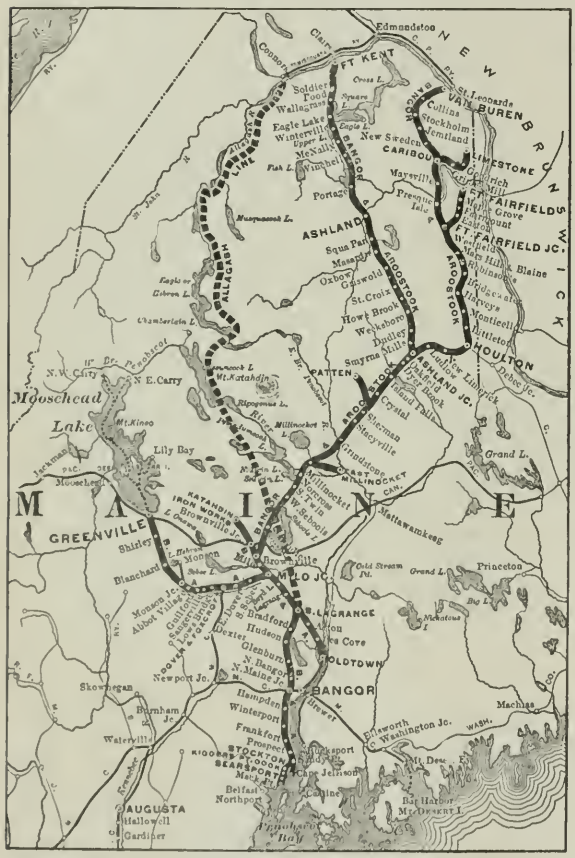
Gross earnings were $3,200,000, against $2,500,000 in 1906, an

increase of $700,000, or 29 per cent. Operating expenses increased $600,000, leaving net earnings of $1,088,000, against $952,000 in 1906. Fixed charges and taxes increased $281,000, as a result of additional bonds and car trusts issued during the year, so that the net income was only $143,000, against $300,000 in 1906.

Freight earnings increased from $1,700,000 to $2,300,000 or 35 per cent. Passenger earnings increased 11 per cent. There were large increases in each one of the four operating expense accounts.

Maintenance of way cost $1,141 per mile, against $859 in 1906, a distinct advance in the standard of roadway maintenance. Repairs and renewals of equipment cost $886 per locomotive, against $625 in 1906; $360 per passenger car, against $338 in 1906, and $40 per freight car, against $33 in 1906. The locomotive figure in both years is extremely low; most large railroads spend twice as much, or more.

Conducting transportation cost $1,100,000, against $830,000 in the previous year, an increase of 33 per cent. There were particularly large increases in wage payments. Wages have been advanced,



Bangor & Aroostock.

according to President Cram, beyond the company's reasonable ability to pay them. He hopes, however, that the company will be compensated by increased fidelity to duty.

The winter was the most severe in the history of the road, in its effect on both roadway and equipment. At the same time the offerings of traffic were unprecedentedly large. These difficulties were aggravated by delay in the delivery of new freight cars, which were to have been received in September. They did not arrive until several months later, after the potato crop, one of the most important items of the Bangor & Aroostook's traffic, had been harvested. It is estimated that the direct and indirect cost of operation was increased from $10,000 to $50,000 above the usual cost during the winter and that there was a decrease of from $50,000 to $75,000 in earnings, through the severity of the weather and the lack of expected equipment.

Freight traffic by commodities for the last seven years is reported. This shows that the potato traffic has increased from 98,000 tons in 1901 to 382,000 tons last year. Forest products, which were 381,000 tons in 1901, amounted to 540,000 tons in 1907. Paper tonnage has risen from 36,000 tons in 1901 to 97,000 tons last year. There has been a specially large increase within a year in the tonnage of cement, brick and lime, which rose from 19,000 tons in 1906 to 54,000 tons last year. The average distance which each ton of freight was hauled increased from 106 tons in 1906 to 121 tons last year. The train load increased from 192 tons to 221 tons, and the loaded carload from 16 tons to 17 tons.

The following table, rearranged according to our usual method, shows the operations of the last two years:

	1907.	1906.
Mileage worked	482	456
Passenger earnings	$615,908	$544,870
Freight earnings	2,340,390	1,743,267
Per diem & equip earnings	152,916	129,925
Gross earnings	3,221,696	2,496,547
Maint. way and structures.	552,010	391,565
Maint. of equipment	344,000	210,803
Conducting transportation.	1,093,465	829,733
Operating expenses	2,133,295	1,544,670
Net earnings	1,008,401	951,877
Net income	143,439	299,773
Dividends	71,840	62,000
Improvement appropriations.	99,626	164,842
Year's surplus	28,027*	72,931

*Deficit.

CONTRIBUTIONS

Rail Specifications—The Discard from the Ingot.

To the Editor of the Railroad Gazette:

Beyond question the railroads of the country rightfully bear the full responsibility for laying safe rails in their tracks. On neither moral nor legal grounds can they claim exemption because they have bowed to the arbitrary power of the steel rail pool that has fixed both price and quality. It is true that a condition that thus places responsibility without voice in the determination of quality is unfair. But what have the injured parties, the railroads, done to assert their rights?

Over five years ago the rail manufacturers unitedly deprived the railroads of the inalienable right of the purchaser to specify the quality of the material for which his money is expended; and the railroads meekly submitted, against the protests of their technical advisers. It is only within the past year that the alarming increase of rail breakages, even with larger sections and weights, have awakened the railroads and the public to the necessity of action compelling the manufacturers to improve their output.

That the manufacturers should be most interested in profits is but natural. That is what their stockholders demand. On the other hand it is equally the duty of the railroads, in the interests of their stockholders and the public, to insist on getting that for which they are paying—a safe, sound rail.

The technical officers of the railroads, through the more prominent technical societies of the country, have endeavored to bring about the desired result by drafting rail specifications; but the manufacturers have been successful in preventing their adoption, by indifference and antagonism. For traffic and other reasons no one railroad could singly compel the needed reforms.

Realizing the necessity of united action, the executive officers of all railroads, through the American Railway Association, took up the question about a year ago. Its Standard Rail and Wheel Section Committee has had many meetings, attended by representatives of the manufacturers, technical societies and prominent metallurgists, and unanimous agreements have been reached on various details, including amended rail sections and chemical composition. The question of discard, however, is still unsettled.

Regarding rail sections, all interests have agreed that to secure proper working of material, with uniformity of texture and absence of internal strains, the metal must be more evenly distributed between head and base than is done in the sections now in use. This conclusion has resulted in the selection of two types of rail sections, one with a high moment of inertia and wide shallow heads, for use by railroads preferring stiffness and smooth-riding qualities; and the other with less height and with deep, narrow heads for withstanding heavy traffic on tortuous alinement.

As to chemical composition, the railroads desire as low as possible percentage of phosphorus, so that the proportion of carbon may be correspondingly raised with safety, and thus produce a rail that will wear well. An attempt has been made to secure .085 phosphorus, but the ores available for the great majority of the rail tonnage of the country makes impracticable the securing by the Bessemer process of less than .10 per cent. It is true that foreign demands are often met with the better class of ores to the detriment of the domestic product, but the quantity is comparatively so small as to not affect the situation. Therefore until the open hearth process is more widely employed, the railroads are forced to the use of .10 phosphorus, with a correspondingly low percentage of carbon. This means a safe but soft rail.

The minimum discard continues to be a bone of contention,

and is really the most important of all. No matter how carefully the section is designed for obtaining suitable heat treatment, nor how the chemical composition is regulated, if the material in the rail is not homogeneous and contains hidden defects the result will be an unsafe rail. The manufacturers all agree that the upper part of the ingot contains cavities and segregated elements which cause pipes, flaws, brittleness and other undesirable faults in the rail rolled from that portion, and they agree that the nearer the bottom is approached the better the material. But with the discretion of one company the makers claim that an arbitrary discard is unfair, and that the inspectors of the railroad companies should require the removal of only such part of the ingot as in each instance demands for the security of sound metal. The Steel rail company, one of the best in the country, admits that for average conditions a discard of less than 20 per cent. is not to be recommended, and that company is now making a specialty of supplying rails with that amount of discard.

Such experts on rail manufacture as Dr. C. B. Dudley, of the Pennsylvania, and Capt. R. W. Hunt assert that the railroads cannot afford to do otherwise than unite on the requirement of a definite discard, and the latter believes that not less than 20 per cent. is essential for a safe rail under the usual methods of casting ingots. Both the American Society of Civil Engineers and the American Railway Engineering and Maintenance of Way Association have declared in favor of a 25 per cent. discard.

To leave this most important matter for the railroads' inspectors to decide appears to be very unwise, for how can they be expected to secure from the manufacturers that which their superior officers, the highest engineering officers of the railroads, have for five years been unable to get?

It is true that a definite discard will work some hardship to those progressive mills that cast a superior ingot, but for such exceptions special agreements can be made for a modified discard. The arbitrary standard is absolutely necessary for the protection of the railroads. It can of course, be modified by the united railroads from time to time as improved methods of casting the ingot show the safety of so doing.

To summarize: The agitation of the rail question seems to be leading the united railroads of the country to the ultimate adoption of the following policies.

(1) Two alternative types of rail sections, with a distribution of metal that will be favorable to proper rolling.

(2) Chemical composition in which the relation of carbon to .10 phosphorus in the Bessemer process of manufacture will insure safe but soft rail.

(3) Definite discard from the top of the ingot, probably not less than 20 per cent. and enough more in the inspector's opinion in each instance to secure sound metal.

(4) Gradual supplanting of the Bessemer by the open-hearth process of manufacture, so that with the lower phosphorus thus obtainable the carbon may be raised and thereby overcome the objectionable uneconomical softness of rail that seems inseparable from the Bessemer process.

When it is realized that the safety of travel on American railroads is even more dependent on the quality of rails than on the bridges that are the subject of so much solicitude and expense, is it too much to ask that no efforts be spared by all those burdened with the responsibility of safeguarding the traffic entrusted to their care, to get the best rail that money will buy?

RAILROAD OFFICER

The Prussian railroad loan bill of April 13, 1907, provides funds for the following purposes:

1. For building new railroads	$26,688,960
2. For double tracking and construction connected therewith	17,191,200
3. For various short connections and to cover deficits in construction previously authorized	5,889,200
4. For material for lines being built	2,100,000
5. Subsidies for building light railroads	1,250,000
Total	$53,319,360

Charles E. Perkins.

Charles E. Perkins.

Charles Elliot Perkins, who died recently at his home at West Newton, Mass., was President of the Chicago, Burlington & Quincy for 24 years up to 1901, when he resigned a directorship in the company until his death. The importance of this latter office, to Mr. Perkins' mind, may be judged from a piece of activity which has been made public only since his death. He had been made without his knowledge a director of a bank. The institution was not solvent and Mr. Perkins served as a director under protest. The bank failed and although he owned only $1,000 of its stock and accordingly was liable for but $20,000, he contributed $1,000,000 to reimburse depositors. This he did feeling that the use of his name on the list of directors had made him morally liable for losses sustained by those who may have been influenced by his presence on the board to deposit their money. Mr. Perkins was born in Cincinnati, Ohio, on November 24, 1840. All his railroad work was on the Chicago, Burlington & Quincy, where, although he held the highest operating offices, his work was primarily in the financial department. He began when he was 19 years old as a clerk in the office of the Assistant Treasurer of the Burlington & Missouri River (later merged with the Burlington). He was made cashier of the company and in 1862 was appointed Assistant Treasurer and Secretary. Three years later he was made General Superintendent. He served in this office for eight years and was then made Vice-President of the lines in Nebraska. In 1880 he was elected Vice-President and General Manager of the Chicago, Burlington & Quincy, at the time of the consolidation, and a year later was elected President. He retired from this office on February 20, 1901.

The Present Status of Mechanical Refrigeration in Railroad Work.

BY JOS. H. HART
Randal Morgan Laboratory of Physics, University of Pennsylvania.

Mechanical refrigeration in the production of ice and cold storage is no longer a novelty in the industrial world to-day. Being a somewhat modern application, however, its development has steadily progressed with considerable change from time to time, so that there has been no opportunity for general standardization of plants as yet, and in some fields the development of this particular branch has scarcely commenced. This is particularly so in the railroad world. Mechanical refrigeration has proved its efficiency and ability in cold storage plants, department stores, hotels and in the large ocean steamers, both for freight and passenger service. However, in railroad work natural ice still holds its original position in the great majority of cases, in spite of the fact that in other departments it is hopelessly outclassed. The reason for this is not entirely clear. It is probably due to the fact that cold storage has been considered of minor importance in railroad transportation up to the present time, but this department of the business of a railroad is steadily becoming more and more important with enormous opportunities for profitable development in this field.

In order to understand the position of mechanical refrigeration in regard to natural ice, it must be remembered that both exist to-day on the market, in apparent competition. There exists, however, no real competition, in the strictest sense of the word. Artificial ice can be produced much cheaper than natural ice under almost any conditions. When the fact is considered that natural ice merely involves first cost on plant, cost of harvesting, storage and conveyance to the market, together with loss due to melting, this is no small achievement. Artificial ice can be produced in large plants readily at a cost of about 50 cents a ton, if the plant is of ordinary efficiency. In isolated cases this cost can be lowered as far as a minimum of 43 cents a ton, and this represents about the lowest limit. Thus, natural ice, except in a few isolated cases, where the cost of plant and equipment become practically negligible, is no competitor. The reason for the existence of natural ice in the market to-day, under any circumstances, is merely due to the fact that

sufficient artificial ice to satisfy the demand is never produced. Practically, artificial ice men have a ready market for their output at prices fixed to allow natural ice a reasonable profit. As an illustration of the remarkable progress of artificial ice to-day, and the inadequacy of the supply, it can be stated that over 4,000 new refrigerating plants were installed in the United States alone last year.

The situation in railroad work is essentially as follows: Natural ice is the chief source of cold storage here, and the competition with artificial ice in this department has not been as great as in other lines, owing to the fact that freight charges are generally negligible. Thus, ice is generally cut and stored at points along the railroad, wherever obtainable, and at the same time in locations suitable for utilization. When it is necessary to convey this ice to other points, the freight rate is not considered in the great majority of cases as a cost factor in its production. Thus, natural ice occupies a stronger position in the railroad world in regard to its competitor than in any other of its utilizations. That it is incorrect for the railroads to neglect freight rates on their own ice in a consideration of the cost of production is a foregone conclusion.

Another reason of considerable importance, tending to explain the backward position of the railroads in regard to mechanical refrigeration, is due to the fact that the applications of mechanical refrigeration for cooling purposes in railroad work are varied often almost as much as the different kinds of perishable freight. Further, mechanical refrigeration has been in a constantly changing development, and the manufacturers of refrigerating machines have readily found a wide open market without entering this field. The field is a difficult one to satisfy, since perishable freight requires different kinds of refrigeration for its transportation. Thus, most fruit cargoes require a temperature of about 60 deg. Fahr. maintained throughout transit for their best conveyance. Milk and dairy products suffer less when conveyed at a temperature of about 50 deg. Fahr. Meats and many additional provisions carry best below the freezing point, whereas eggs and other commodities utilize 35 to 40 deg., and are spoiled with much variation from this temperature. Again the nature of the business itself, namely, transportation, renders the application of mechanical refrigeration to cold storage when in transit a necessarily difficult matter. Thus, mechanical refrigeration loses a number of its advantages of direct application for a definite purpose, and generally wherever applied it has been as an intermediary in the process. The mechanical refrigeration has almost invariably been used to produce artificial ice, and this ice in turn used to produce the refrigeration, and hence it loses much of the economy due to its direct utilization. Hence, when all these conditions are considered, it is not surprising that mechanical refrigeration has found easier lines of development, and has not troubled the railroads to any great extent. To-day, however, mechanical refrigeration is applied in a number of developments of railway work. The United Fruit Company has a number of cooling plants in operation throughout the country for the refrigeration of its product in transit. A large number of railroads have cold storage houses operated by mechanical refrigeration in existence in the large cities for the storage of the perishable products immediately after transit. These houses, of course, in some places also utilize refrigeration in ice production, which sometimes finds its way into the cars in transit, but this is of comparatively minor significance in regard to the entire output. The Railway and Stationary Refrigerating Company utilizes mechanical refrigeration in car units for the conveyance of milk in the vicinity of New York, as has been said. This requires a temperature of about 50 deg. and has been fairly efficient in this application. The general development of single refrigerating car units has not progressed, however, to such an extent as at one time seemed inevitable. This is due almost entirely to mechanical difficulties. A refrigerating machine requires power and cold water for its operation, and considerable care in its maintenance. These three factors tend largely to eliminate the use of the unit car refrigerating plant. Ammonia is generally recognized as the best substance for the conveyance of heat in refrigeration and occupies a place analogous to water in the production of power in the steam boiler. However, the difficulties encountered in the use of ammonia, due to its high pressure and the large quantity of cold water required for its condensation, has resulted in the adaptation of other less efficient fluids for the operation of these machines in this field. Thus, in the example mentioned, methyl chloride is used as a refrigerating agent, with considerable saving in the design of the machine and the difficulty of maintenance, but with a remarkable diminution in efficiency in comparison to the ammonia type. The fact that this substance can be used in this application with any degree of success whatever speaks volumes for the availability of refrigeration in this field.

Among the other points which apply throughout the development in the application of mechanical refrigeration in this field is the fact that a large number of different types of refrigerating machines and systems are used. Thus, there are in existence to-day refrigerating machines using three different principles in their operation. The air machine, which uses air, either at atmospheric pressure or under pressure and cools the same by causing the compressed air to do work, thus changing the heat in the air into work, which is taken out, leaving the air cooled. Air as low as 140 deg. Fahr. below zero has been obtained readily by this method. This machine is often convenient on shipboard where the use of ammonia or other refrigerating substances may prove undesirable, but it is clumsy and inefficient in operation, and the first cost is from two to three times that of an ammonia machine. In addition, it never exists in large units, and all statements which have ever been made in regard to increased efficiency of large plants over small ones in any field whatsoever almost without exception apply equally in this field.

The liquifiable gas machine utilizes the latent heat of vaporization of water liquids for the production of cold. Thus, in order to make water boil, heat must be applied. If the water can be made to boil without this application, heat is taken from the water itself with a consequent cooling effect on the water. The boiling point of water is too high to use in this application, hence a class of substances known as volatile liquids are used. Ammonia, sulphurous acid, methyl chloride, benzine and a large number of other substances have been used. Even gasolene has been developed as a refrigerating agent in this field. The material produces the refrigeration automatically by boiling away, if its boiling point is below the temperature of surrounding bodies.

The sole end of the machinery in mechanical refrigeration as developed in this type is for the purpose of saving and reutilizing the refrigerating material. As has been said, ammonia is by long odds the most efficient agent for this purpose. It operates, however, at about a pressure of 180 lbs. for the regeneration device, and this has been a serious objection to its utilization and development in the unit car system. The regeneration of ammonia is accomplished in two ways, by means of a compressor, which compresses the exhaust gas until it attains a condensing temperature and pressure above that of the atmosphere, whereupon it is spontaneously condensed. The absorption machine, on the other hand, utilizes the absorption power of water for ammonia gas and the loss of this power with rise in temperature to produce the same effect. Regeneration is accomplished by the application of heat to the mixture with the evolution of the gas at a temperature and pressure sufficient to permit condensation.

Now these two types, the ammonia compression and absorption machines, are the only really efficient types on the market. The compression machine is much simpler in theory and operation, but has considerable less efficiency in the actual process of production than the absorption type. This latter has comparatively few moving parts, is almost automatic and is generally installed in large units.

In the application of mechanical refrigeration in railroad work, not only must all of these types be considered with their relative efficiencies and various advantages for different purposes, but a host of other conditions arise, since the mere installation of a refrigeration plant at certain localities along a railroad is not the accomplishment of transportation of perishable freight. As has been said, the cheapest and best method of applying this mechanical refrigeration has been through the production of ice as an intermediary. Further, the efficiency of the various types of refrigerating machines depends almost absolutely upon the duty they are to perform. Thus, the compression machine is superior for mild refrigeration, whereas the absorption is infinitely superior for sharp or extreme refrigeration. In the production of ice the absorption is superior, depending only upon the size of the plant. For large plants its relative efficiency increases almost in direct proportion to the size of the plant. The use of ice as an intermediary involves a selection from several different methods for its production. All these factors must be considered in the installation of mechanical refrigeration in railroad work. Further, its situation with respect to available coal and water is a matter of much importance, and many of the large refrigerating plants in large cities have their scale of profit dependent almost absolutely upon this supply and the temperature of the water. Large quantities of cold water are required in the operation of a refrigerating plant of any type, and it can be said in a general way, the more water and the colder it is the greater will be the efficiency and the profit resulting in mechanical refrigeration.

Individual unit refrigerating cars probably will never attain any great amount of success. A refrigerating machine is a complicated mechanical mechanism and requires care and attention, and practically all automatic machines at present on the market have proven failures at the present stage of development. With the large variations in mechanical refrigeration design and its various applications in transportation, the use of ice or possibly cold brine as an intermediary in the application of the refrigeration is extremely probable in this field. The chief development in railroad work of this department will be in the construction of larger and larger refrigerating units, with special care paid to the distribution of these units, not only in respect to freight transportation, but also cost of production of refrigeration, not only from a coal and water consumption viewpoint, but also from a cost of handling the refrigerating material and making it available in transportation. Many

improvements are possible in this line, and it is unfortunate that the great majority of railroads do not consider the mechanical end at all in the installation of such plants. They appear to be interested merely in the transportation end of the business and the two are so irrevocably connected in this particular field that it is not surprising that the results obtained in the present actual developments have not been as satisfactory as could be desired.

Ten-Wheel Locomotive with Superheater for the Canadian Pacific.

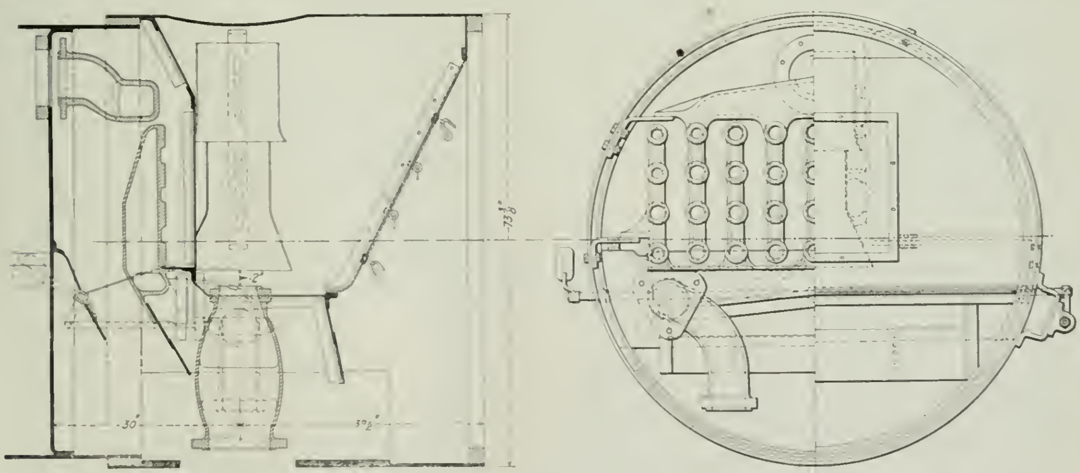
The Canadian Pacific has been the pioneer in the introduction of the superheater on American railroads. In April, 1906, H. H. Vaughan read a paper on the subject before the New York Railroad Club, an abstract of which was printed in the *Railroad Gazette* of April 27, 1906. At that time there were nearly 200 locomotives in service or on order with superheaters, the majority being fitted with the Horsey-Vaughan type which has been developed on the Canadian Pacific. It resembles the Schmidt firetube superheater in the general principle of a return tube for the steam located in the fire tube. In the newest ten-wheel engine, shown in the accompanying illustration, the arrangement of the front end is essentially the same as in the design of a year ago. A header taking steam from the dry pipe is placed just back of the petticoat. Steam enters the top of this header and passes out through solid drawn, weldless steel tubes having an inside diameter of $^{15}/_{16}$ in. These tubes are upset at one end and are forged and bent by a bolt header and bending machine to the shape shown. They are connected by bronze union nuts to special cast-steel fittings which screw into the header; a $^{1}/_{16}$-in. copper gasket being used in the union nut. These small tubes extend into large 5-in. superheater firetubes to within about 30 in. of the back tubesheet, where they connect with heavy cast-steel return bends. The steam returns from the return bends through $1\frac{1}{4}$-in. tubes which connect through union nuts and special cast-steel fittings similar to those mentioned above, with the fingers of the bottom header which is shown in detail. The steam pipes which connect this header with the cylinder casting are very short and there has been no difficulty in keeping the joints tight. Each large superheater firetube contains two of the small tubes from the top header and the corresponding tubes to the bottom header. The return bend has lugs cast on it which space it properly from the sides of the large tube and the other set of small tubes so that there is a uniform circulation space about them all.

The gases as they leave the superheater firetubes enter an enclosed space that is controlled by a damper. When this damper is closed there is no circulation of gas through the tubes and danger of burning is obviated by so closing it when steam is shut off.

As a result of the work that has been done with the superheater on the Canadian Pacific there has been a lowering of the steam pressure on these engines with a corresponding increase in the size of the cylinders. This is in accordance with the possible economies that have been outlined from time to time since the subject of high steam pressures and the use of superheated steam has been under discussion. It is also expected that this reduction will result in the lessening of boiler troubles.

Ten-Wheel Locomotive with Superheater; Canadian Pacific Railway.

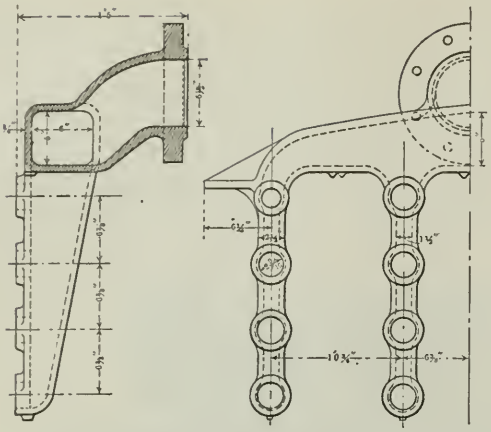
The engines illustrated, which were built by the Locomotive & Machine Co., of Montreal (American Locomotive Company), are practically identical in design with a previous order, also equipped with superheaters, built by the same company for that road, except for an increase of $1\frac{1}{2}$ in. in the diameter of the cylinders and a reduction of 20 lbs. in the boiler pressure. In working order they have a total weight of 192,500 lbs., of which 142,500 lbs. is carried on the driving wheels. The cylinders are $22\frac{1}{2}$ in. in diameter by 28 in. stroke, and with driving wheels 63 in. in diameter and a working pressure of 180 lbs., the engines have a theoretical tractive power of 34,410 lbs.



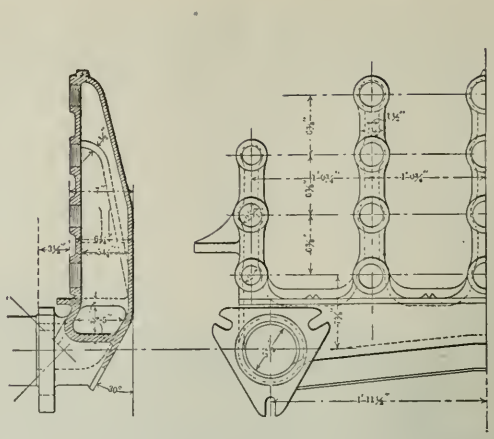
Smoke Box Arrangement with Superheater; Canadian Pacific Railway.

The boiler is of the wagon top type, the outside diameter of the first and smallest course being $70\frac{5}{8}$ in. It is fitted with 240 boiler tubes, 2 in. in diameter, and 24 superheater firetubes 5 in. outside diameter. The total heating surface is 2,403 sq. ft., of which the tubes contribute 2,237 sq. ft. and the firebox the remainder. The firebox is $102\frac{1}{8}$ in. long and $69\frac{7}{8}$ in. wide, and has a grate area of 50 sq. ft.

These dimensions and this data take on a new significance when the ratios that are given in the table to follow are compared with



Top or Saturated Steam Header for Vaughan Superheater; Canadian Pacific Railway.

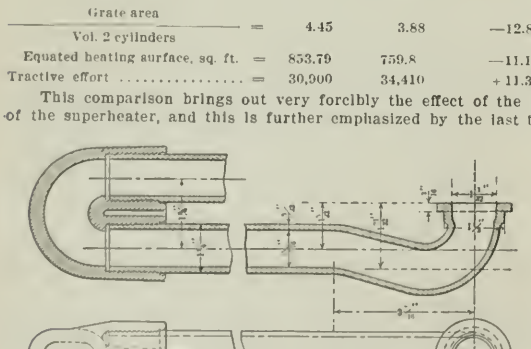


Bottom or Superheated Steam Header for Vaughan Superheater; Canadian Pacific Railway.

those of engines built along the usual lines. There are two influences that predominate in these changes of ratio: the diameter of the cylinders, and the reduction of the heating surface by the use of a fewer number of large tubes. To make a specific comparison, take the ten-wheel (4-6-0) locomotive for the Chicago & North-Western illustrated in the *Railroad Gazette* of July 5. That engine has approximately the same weight on drivers (134,000 lbs.), and is the same type of locomotive. The ratios are, however, quite different. For example:

		C. & N.-W., without superheater.	C. P. R., with superheater.	Difference in per cent. Chic. & N.-W. as base.
Weight on drivers / Tractive effort	=	4.37	4.14	— 5.27
Tractive effort x diam. drivers / Heating surface	=	666.0	901.4	+ 36.57
Heating surface / Grate area	=	64.0	48.1	—24.85
Weight on drivers / Heating surface	=	46.0	59.28	+ 28.52
Total weight / Heating surface	=	59.48	80.09	+ 51.39
Volume of 2 cylinders, cu. ft. / Firebox heating surface	=	5.09	7.00	+ 37.52
Heating surface / Vol. 2 cylinders	=	284.0	186.72	—34.25
Grate area / Vol. 2 cylinders	=	4.45	3.88	—12.81
Equated heating surface, sq. ft.	=	853.79	759.8	—11.11
Tractive effort	=	30,900	34,410	+ 11.36

This comparison brings out very forcibly the effect of the use of the superheater, and this is further emphasized by the last two



Superheater Tubes with Upset Ends and Return Bend Connection; Canadian Pacific Railway.

figures of the table where it appears that with 11.36 per cent. more tractive effort the engine with the superheater requires 11.11 per cent. less equated heating surface. All through the list the differences will be surprising to those who have not already made similar comparisons. And it must be remembered that these ratios and dimensions are not the result of theoretical calculations based upon assumptions, but are those that actual practice has found to be such that satisfactory and economical results will be obtained in the every-day working in regular service. And whether it is conceded or not that the superheater is an economical device to apply, when everything is taken into consideration, these figures are at least an interesting exhibition of what can be done.

The following are some of the principal dimensions of these engines:

Cylinders, diameter			22½ in.
Piston stroke			28 "
Wheel base, driving			14 ft. 10 "
" total engine			26 " 1 "
" engine and tender			54 " 6½ "

*Per cent.

Cost of Ballasting Old Track and Renewing Ties.*

On a northern division of the Chicago & North-Western, to ballast a mile of track with unscreened and unwashed gravel, as it comes from the pit, for a 12-in. raise, with a standard gravel roadbed of 11 ft. 6 in. on the top, slope 1½ to 1 on the bottom, 16 ft. from bottom ballast line to ballast line, the cost is as follows:

Cost of gravel loaded on cars in pit, per cu. yd.	$0.07
Hauling and unloading, 50 mile haul	.10⅔
Ballasting	.12⅓
Total cost, per cu. yd.	$0.30

*A committee report to the Chicago convention of the Roadmasters' and Maintenance of Way Association.

At 3,400 cu. yds. per mile, it will cost $1,020 for one mile of finished work with this kind of ballast.

For tie renewals in this ballast, 425 ties per mile, evenly distributed over the entire mile, where track is in such condition that re-surfacing is not necessary and the old ties have to be dug out of the roadbed and new ties inserted, properly tamping with either tamping bars or picks, the roadbed properly dressed and old ties gathered up and neatly piled, it will cost 16½c. per tie.

On a division of the Lake Shore & Michigan Southern for the year 1906, the cost of ballasting with washed gravel and with broken stone was as follows:

Gravel washing and loading, per cu. yd.	$0.18
Hauling, per cu. yd.	.07
Digging out old ballast, per cu. yd.	.15
Unloading and placing in track, per cu. yd.	.15
Total, per cu. yd.	$0.55
Crushed limestone, ¾ to 1½ in. in size	
Cost of stone, per cu. yd.	$0.535
Digging out old ballast, per cu. yd.	.15
Hauling, unloading and placing in track	.40
Total, per cu. yd.	$1.085

Renewing ties cost $0.138 per tie in gravel ballast.

On a division of the Santa Fe the cost was:

Crushed stone, at crusher, loaded on cars, per cu. yd.	$0.61½
50-mile haul, per cu. yd.	.05½
Inserting (Mexican labor)	.333
Total cost, per cu. yd.	$1.00

For a 12-in. raise 3,400 cu. yds. are required per mile, making the total cost per mile, $3,400.

This road tried sloping the ballast, with a scant shoulder, for several years, but found it impossible to keep the track in line and surface. It therefore changed to the present standard, which requires the ballast dressed level with the top of the ties for the full length of the tie and extending 6 in. beyond the ends of the ties, making the top width of the ballast 9 ft. and giving it a slope of 1¾ to 1; this gives a roadbed 16 ft. wide from ballast line on one side to ballast line on the other side, with a 12 in. raise. Center-drop Rodger ballast cars, 80,000 lbs. capacity, drop the ballast in center of track and a center plow is used to plow the ballast off the track, leaving the track clear. The $3,400 per mile covers all costs for the ballast and inserting the ties, using not more than 425 ties per mile. It is very expensive work renewing ties in track that has been ballasted in this way. Renewing ties in the track where it is up to grade and cannot be given a raise, costs about 25c. per tie to renew the ties. It costs approximately 25c. to dig out an old tie, insert the new one, tamp it up properly, spike it and dress the track up in first-class shape. Where the track has to be re-surfaced the old tie can be removed and the new one inserted for about 8½c. per tie.

The report is signed by A. E. Hansen, Chairman; C. Buhrer, J. W. Guffey.

Automatic Block Signals on the Philadelphia & Western.

The General Railway Signal Company of Rochester, N. Y., which has put in automatic signals on the above named railroad, has issued a description of the apparatus, from which we take the following account. The installation is in many respects like that furnished by the same company for the Electric Zone of the New York Central.

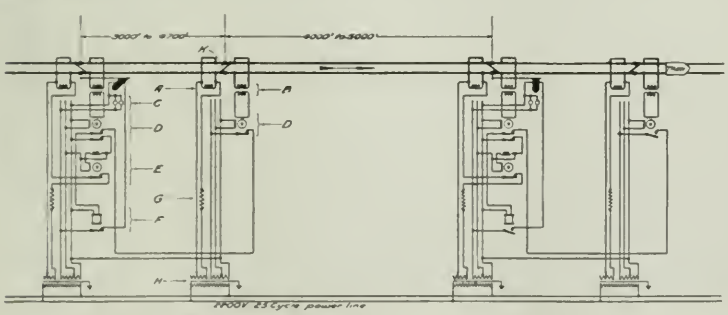

Fig. 1—Circuits.

This road is a double track, high-speed, direct-current electric line from 69th street, West Philadelphia, west to Strafford, Pa., 11½ miles. Both rails of each track are used for the return of the propulsion current and there is cross bonding between all rails of both tracks at the ends of all track circuits and from one rail of each track to one of the other track at some places intermediate between the ends of said sections. Ironless reactance bonds are used, permitting very long track circuits to be operated with a minimum expenditure of energy. Alternating currents are used for the track circuits and for the operation of all the devices connected with the system, thus doing away with all batteries.

There are on the line nine block sections on the eastbound track and nine on the westbound. The four long sections are made up each of two track circuits with relays in the middle.

Single arm, two position home signals are used, arranged normally clear, with an overlap between West Philadelphia and Beechwood Park, 2½ miles, the signals average about 3,300 ft. apart and a full block overlap is employed, permitting a two minute time interval. West of the park the signal spacing averages 1½ miles with a uniform overlap of about 3,700 ft., allowing trains to follow one another at five minute intervals.

Twenty-five cycle single phase alternating current is used for the operation of the entire signal system. It is obtained from the secondaries of the railroad company's power transformers at Beechwood Park. Two feeder circuits run in either direction from the power house. Power is delivered to the switch-board through a remote controlled automatic oil switch. Each feeder circuit is equipped with an ammeter and an electrically tripped, hand operated oil switch whereby the system may be relieved in case of a cross on either transmission line. The transmission line consists of two No. 6 B. & S., hard drawn bare copper wires strung on cross arms (used only for these) on the railroad company's high tension pole line. The line is protected at intervals by suitable lightning arresters.

"Line transformers" are installed at all signal and overlap locations. They step down directly from the transmission line voltage of 2,300 to the various voltages required for the signal system. These transformers are protected on the primary side by suitable cartridge fuses mounted in water-tight cast-iron boxes and so arranged that a fuse can be replaced without danger. The secondary windings are three in number, a 55-volt winding for the operation of the signal motors, lights and line relays, and provided with a tap for the local phases of all polyphase relays and two windings for supplying energy to the track circuits, taps being provided on these windings so that the voltage can be varied from 2½ to 15, as required for track circuits of different length. A copper shield is placed between the primary and secondary windings and connected to ground, affording protection in case of a breakdown in insulation. These transformers are made with great care. All coils are insulated with an oil and moisture resisting compound by the "vacuum treatment" process, in which the coils are heated in an air tight tank. After a vacuum has been secured and the moisture thereby extracted, insulating compound is forced into the coil under heavy pressure, which causes the liquid to penetrate to the heart of the coil, with the result that every individual wire is surrounded with a covering of high insulating power.

Both rails of each track are made available for the propulsion current by the use of ironless "reactance bonds" connected to the rails as shown at A and B on the circuit plan, Fig. 1. When so connected they form a path of low ohmic resistance and large current capacity for the traction current, while at the same time they offer an impedance to the passage of the alternating current from rail to rail. The reactance bond A at the transformer end of the track circuit has a single winding connected directly to the rails. The bond B at the other end of the circuit has two windings, one connected to the rails and the other directly to the relay. The winding connected to the relay acts as the secondary of a transformer, its object being to prevent an excessive flow of direct current through the relay which, owing to the low ohmic resistance of the relay, would otherwise result were the relay connected directly to the track rails. As these bonds are of the ironless type they are not subject to saturation due to an unbalanced condition of the traction current in the rails, and their reactance remains constant under all such conditions. Alternate rails in adjacent track circuits are connected by heavy "diagonal bonds" K so arranged that the breaking down of any insulated rail joint will short circuit either the relay or the transformer and prevent the giving of a false clear indication. Cross bonding between tracks may be effected by making connection, at any point desired, to the rails which are made continuous by the diagonal bonds K.

The reactance bonds are made up of flat copper strips of large cross section wound in the form of a spiral, the turns being suitably insulated from each other. The coils when wound are heavily taped and then "impregnated" as in the case of the transformer

coils. These coils are assembled in pairs in flat iron cases and mounted on extended ties. A connecting chamber is provided in the case between the coils in which all the coil ends terminate and where all connections to the rails, relays and transformers are made and then concealed by a suitable cover. The copper connections to the rails after leaving the bonds go directly downward and under ground to the rails where, after passing for a short distance above ground to insure flexibility, they are connected to the rails. This construction conceals the copper as much as possible and reduces theft to a minimum. Energy is supplied to the track circuits directly from the low voltage high current windings on the line transformer through adjustable cast-iron resistance grids which limit the current flow when a train is standing at the transformer. These grids are mounted in separate perforated cast-iron boxes.

The track relays are shown at D. The various moving contacts are mounted on a horizontal wooden bar to which motion is imparted by means of a small split phase induction motor having two stationary windings. One winding is connected directly to the reactance bond secondary, as shown in Fig. 1, and the other directly to a low voltage tap on the line transformer. When thus connected, a phase difference exists between the two coils and rotation of the armature is thereby produced.

Of the energy in the two relay windings, that supplied by the transformer direct is by far the greater. This requires but a small amount of energy from the track to give positive action of the relay and as a result very long blocks can be operated with a comparatively small amount of energy, as evidenced by the fact that track circuits 8,800 ft. long are operated with energy fed in at one end. Alternating current only can cause the relay to operate and hence it is absolutely immune to the effects of direct current. All contacts and other working parts are made visible by means of glass covered openings, and the case is made water tight by the use of rubber gaskets. These relays are thoroughly reliable, positive in action and give an exceptionally heavy rubbing pressure between the contacts in closing and an extra wide opening when de-energized. Contacts can be provided, as required, up to a maximum of four front and four back per relay. They are insulated to withstand a breakdown pressure of 3,000 volts alternating.

The function of the track circuit control relays, as shown at E, is to hold a given signal at stop until the train is out of the overlap for the next signal in advance. These relays have to carry continuously and break the entire current flowing to the track circuit at the rear of a signal, and of course must continue to do so without injury. They will actually carry an alternating current of from 50 to 75 amperes and break the same at 25 volts continuously without overheating and without perceptible arcing; but the current required to be carried in practice is much less than this. The construction and operation of these relays is similar to that of the track relays except that the contacts are made very much heavier and the necessary phase displacement to produce rotation is effected by a small reactance coil, placed in series with one of the relay windings.

Polyphase relays can be adapted to a variety of uses by the mere changing of the windings or contacts or by the addition of stock parts. When wound to a low resistance they may be used as track relays with contacts to the number of four front and four back, and when equipped with heavy contacts they can be used for the control of low voltage heavy currents, all as described above. When equipped with carbon to carbon contacts they will break small currents of high voltage (up to 600). When wound to a high resistance they may be used as line relays with any reasonable equipment of contacts desired. By adding an upward extension to carry a miniature semaphore arm they can be used as tower indicators and, when placed in a suitable case, as switch indicators.

The movements when placed in a suitable case and equipped with a shutter and suitable contacts can be used as light signals in tunnels. Furthermore, the feature which this relay possesses of operating in one direction with a given phase relation and in the opposite direction when said phase relation is reversed, and since a given reactance or resistance is necessary to produce rotation in a given direction, the possibility of false operation due to foreign currents or crosses is much more remote than in the case of direct current relays and other designs of a. c. relays. This feature also makes it possible in many cases to use but one line wire where two would otherwise be required.

The motor control relay shown at F is controlled by the three track circuits in advance of a given signal in such manner that it cannot close until the train is out of the overlap for the next signal in advance. This relay directly controls the clearing of the signal and is of the alternating current tractive type. It is so designed that a uniform magnetic pull is exerted on the armature notwithstanding the fact that the current in the magnetic coils alternates.

The signal mechanism is operated by a small single phase induction motor which is connected through suitable gearing to a "slot wheel." Projecting from the sides of the slot wheel are pins which as they come around engage the "slot dog" so as to clear the signal in case the slot is energized

The slot magnet is designed to operate on alternating current and to give a uniform pull without noise or vibration. It has a high "drop away" point.

The movement of the blade in clearing is limited by the "stop arm." The arm is brought precisely to, and held at, the clear position no matter what the speed of clearing. The circuit breaker contacts are enclosed in a dust proof case with a glass front, which is mounted at the top of the mechanism. The dash pot is of the "buffer type," allowing a free initial movement of the blade in returning to the stop position. All signals are lighted by two 4 c.p., 50-volt lamps in multiple. All relays are housed in wooden boxes which in turn are enclosed in cast-iron boxes.

Keeping Track in Line and Surface in the Winter.*

I knew track, laid upon a sub-grade of deep uniform red clay, which heaves high in the winter, but requires very few shims because the heaving is uniform. This material heaves excessively, as is proven by the fact that it rises at the ends of a spot where some special cause dries the clay and reduces the quantity of moisture which it contains. For instance: A large steam pipe was carried in a box under the track where the soil was of this kind. The heat from the pipe prevented heaving at that point, but on each side of it the track rose several inches above the level of the ties over the pipe, making an abrupt drop in surface over the latter spot. This spot was shimmed every winter, as the difference in height was sudden and severe enough to break an engine frame or cause other damage. When the frost came out of the ground in the spring the level of the track on each side of the pipe gradually subsided until it was the same as that over the pipe; when this occurred the shims were withdrawn. The thickness of the shims was gradually increased while the frost was entering the ground, and reduced while it was leaving.

In territories where the soil varies greatly in character—sandy, gravelly, various kinds of clay and loams, marshes, quick-sand, wet and dry cuts, springy soil, etc.—much shimming is required. In January, February and March frost enters the ground to a depth of from 3 to 6 ft. and maintenance of line and surface becomes difficult. In such territories it is a common thing for 5 or 6 ft. of track to rise, in a single day or night, 1 or 2 in. above the normal level. It is not uncommon to have a continued rise within a distance of 10 or 15 ft. that will, in a few days, reach a maximum of 5 or 6 in.

Of course, it is out of the question to run trains safely at schedule speed over such abrupt and excessive humps. Gradual run-offs must be introduced on either side of the high spots. But the ties being frozen solidly in place and the ballast frozen so solidly together that it can only be picked in irregular sized hard lumps unsuitable for surfacing, it is manifest that making a run-off as it would be done in summer is both impracticable and expensive. Again, when spring arrives this would make soft, mushy spots at the worst period of the year's work. The ties, if adzed to reduce the height of the rails at the point of heaving, would be ruined. So, in such cases it is customary to raise the run-off by drawing the spike on each side of the high spot, letting the rails spring up part way to surface, then introducing shims between the rails and the ties until a run-off of fairly uniform surface is provided. The rails then being raised, as it were, upon pedestals, are not so strongly held to gage as when resting upon the ties and are braced on the outside with special braces, usually devised by the foreman or roadmaster to fit the individual case.

Shims are sawed from hard wood, seasoned and clear. They are bored with holes for the spikes, which are staggered, there being sometimes two holes, sometimes four, to fit different widths of rail base. For shimming to a raise of ¼ in. the shims should be 4½ in. x 8 in.; for a raise of ½ in. up to 1¾ in. the shim should be 5 in. x 8 in. Above that height, up to 3 in., the shim should be 5 in. x 12 in. When necessary to shim 4 in. or higher a plank of about the same area as the surface of the tie, and extending almost or quite the length of the tie, should be used, fastened to the tie with boat spikes. The rails should be spiked through the shims to the ties with 8-in. spikes, which are longer than ordinary track spikes. For the planks referred to, they should be 8 in. long, or 2½ in. longer than ordinarily. To brace the rails on shims cut a light notch outside of the rail transversely across the tie, put a shim 2 or 3 in. thick with one end against the shoulder of the notch and the other a close fit at the fillet where the head and web of the rail meet, and drive 8-in. spikes into the tie at the lower end of this makeshift brace.

The foregoing has reference to ways and means to do things that it really ought not to be necessary to do. In other words, these are ways of meeting conditions that ought not to exist. The better way to maintain line and surface in winter is by proper drainage.

*A report presented to the Roadmasters' and Maintenance of Way Association by C. H. Cornell, Roadmaster of the Ashland Division of the Chicago & North-Western.

A Large Hydraulic Dredge.

The dredge illustrated herewith is a large and powerful machine built to the order of the Commissioners of Lincoln park, Chicago, to be used for filling in the new park extension to the north of the present park. The plan is to reclaim from Lake Michigan an area approximately 1,500 ft. wide by about a mile long by enclosing it with a stone revetment or breakwater and filling in behind it with

Hydraulic Dredge Francis T. Simmons, at Work.

material taken from the bed of the lake. For much of the distance the breakwater lies in 18 ft. of water and the total volume of fill is about 4,000,000 cu. yds. The breakwater is now partly completed and is made of stone from the spoil-banks of the Chicago drainage canal. A fleet of large scows and several powerful tugs bring the stone from the canal by way of the Chicago river out into the lake and to the site of the work.

The conditions surrounding the dredging and filling were difficult and peculiar. The work had to be done in deep water and exposed to the storms of Lake Michigan, which often rise with suddenness and severity, and the soil to be dredged consisted of the tough blue clay which underlies the Chicago area, compacted by the storms of the lake and mixed with more or less gravel and stones. The ordinary hydraulic dredge as used on the lakes was unsuitable because of unseaworthiness and because it could only deal effectively with soft material. The usual floating pipe-line connected by rubber sleeves and mounted on a number of small scows or floats would be disabled by every windstorm.

The economy of the hydraulic process of dredging and filling, if it could be successfully applied, led Francis T. Simmons, President, and R. H. Warder, Secretary, of the Park Commission, to pursue the subject further to see if these difficulties could be overcome, and they commissioned A. W. Robinson, M. Am. Soc. C. E., to examine and report on the conditions, and if possible to design a dredge that could cope with the difficulties presented. Mr. Robinson had previously designed and built several large hydraulic dredges, notably the "Tarte," which is employed in dredging clay from the bed of Lake St. Peter in the River St. Lawrence, and which is provided with a special pipe-line for withstanding heavy storms. This dredge is of great power and holds the world's record for output, having dredged 750,000 cu. yds. in a calendar month and delivered 2,000 ft. The original pipe-line of this dredge is still in use after five years.

It was, of course, realized that Lake Michigan during a storm would be too rough to attempt continuous dredging operations, and that the most that could be done would be to provide a plant of large capacity, so that the required output could be made after making allowances for weather interruptions, and also seaworthy enough to increase the working time to the largest possible amount. It should also be designed for safe and rapid picking up of anchorages and pipe-line in case of storm and to safely withstand any rough weather when not working. To meet these conditions Mr. Robinson designed the dredge now on the work, which was built by the Atlantic Equipment Company, 111 Broadway, New York, and put in service in June, 1907.

The hull is of steel, 148 ft. long, 38 ft. wide by 10 ft. 6 in. deep. The main pump has 30-in. suction and discharge, and the main engines are of the triple-expansion marine type of 1,200 I.h.p. There are two double-ended marine boilers 11 ft. 6 in. diameter by 18 ft. long, with eight corrugated furnaces. The installation of engine-room auxiliaries, such as condensing apparatus, pumps, electric light, is complete and well arranged, the engine-room space, in fact, resembling a small ocean liner. On the upper deck is a pilot-house with large plate-glass windows, where all the levers which control the operation of the dredge are arranged. Here are also pressure and vacuum gages for all purposes, indicating exactly the work that is being done.

The suction-pipe is carried by a very strong steel frame and is fitted with a powerful cutter for digging the clay. This cutter is an improved development of a number of earlier machines, and has demonstrated its efficiency by being able to handle the heaviest clay up to the full capacity of the pump. It is 9 ft. in diameter and weighs about nine tons, being formed of eight steel blades of peculiar curvature cast in one piece and having renewable hard steel cutting edges attached. The mechanism for driving and feeding this cutter is very powerful. The secret of success of this dredge is that the excavation of the stiff clay is done by an efficient cutting tool that will not clog and provided with a powerful feed, the main pump being only employed for transportation of the spoil. A capacity rate of 3,000 cu. yds. per hour has frequently been reached in clay, the entire under side of the discharge appearing as continuous slices of blue clay, some of the pieces being 4 or 5 ft. long.

One of the most difficult problems to be dealt with was the floating pipe-line. This is the most seaworthy pipe-line on the lakes, and is formed of semi-submerged steel pontoons about 100 ft. long, connected by ball-and-socket joints having spring connections of great strength. Long lengths of pontoon were necessary to give steadiness in waves, and a yielding connection was essential to relieve the joints of the great stresses due to surging. The springs are of locomotive drawbar size and are arranged in a manner similar to railroad car draft-rigging. There are also tension and compression springs to control the side deflection of the joint. In wave action this pipe-line is very satisfactory. A special flange connection is provided at the dredge, so that the pipe-line can be instantaneously disconnected from the dredge at any time by pulling out a toggle-lever. On several occasions when it became too rough for the

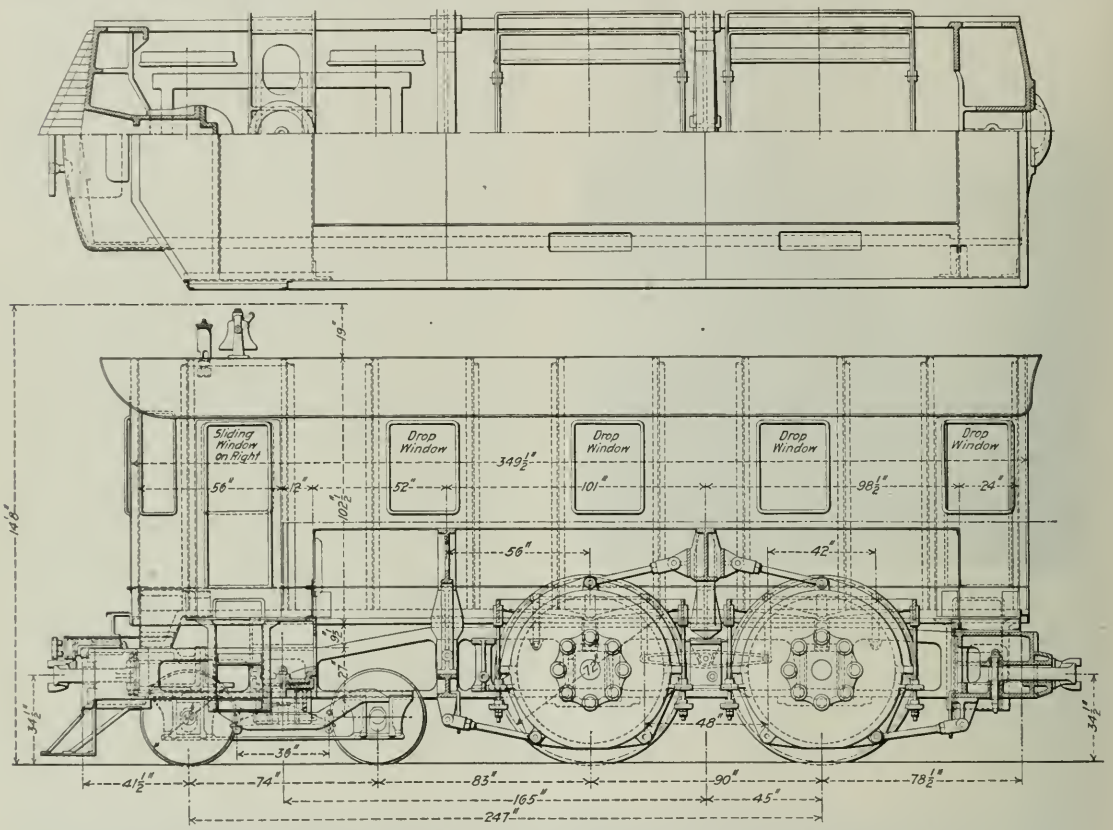
Hydraulic Dredge Francis T. Simmons, Built by Atlantic Equipment Company for Lincoln Park Commissioners, Chicago.

dredge to work, owing to the difficulty of discharging over the breakwater, the pipe-line was discontinued and towed to harbor by a tug through a rough sea which broke over both tug and pipes continuously, with no harm whatever to the pipe-line. These occasions, however, are relatively rare, and the operation of the dredge has proved not only that the clay of the bed of Lake Michigan can be dredged by this method, but also that the seaworthiness of both dredge and pipe-line is sufficient to reduce the delays on account of weather to a comparatively small amount.

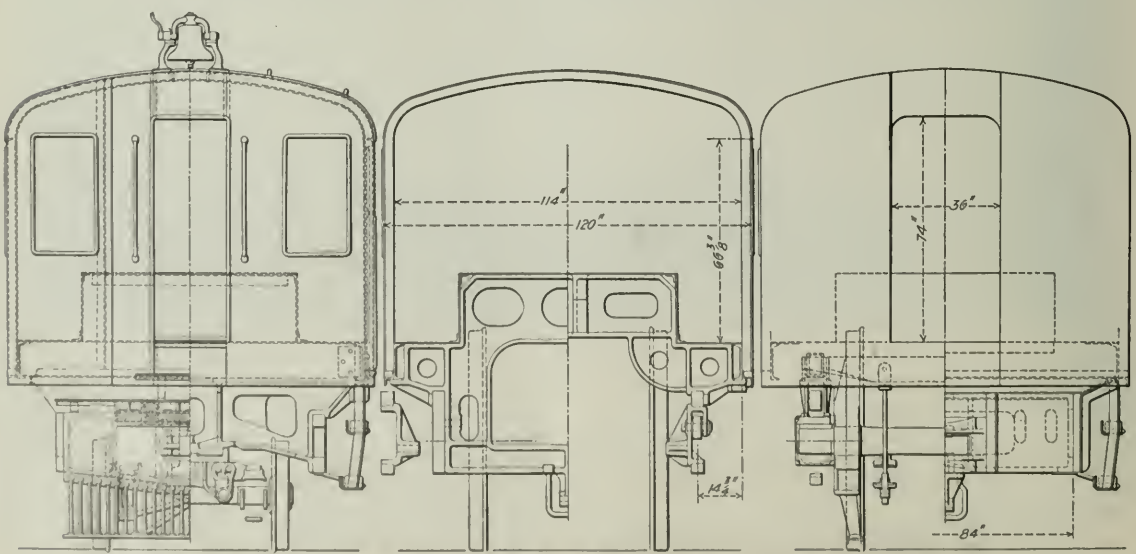
The dredge is named the "Francis T. Simmons," and its operation is in charge of Murphy & Barrett, contractors.

Electric Locomotive for the Pennsylvania Railroad.

The Pennsylvania is now testing, on the West Jersey & Seashore division, three electric locomotives with a view to determining the track stresses and other questions in heavy electric traction. One of these, No. 10,001, built at Altoona, is a single-reduction,



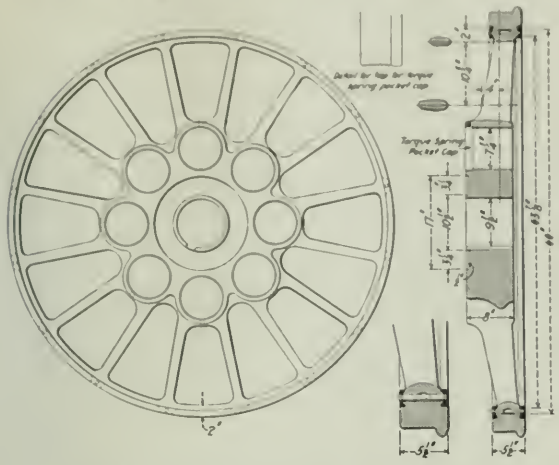
Plan and Side Elevation of Experimental Single Phase Electric Locomotive; Pennsylvania Railroad.



End Elevation and Cross Section of Single Phase Electric Locomotive; Pennsylvania Railroad.

direct-current geared type; another, No. 10,002, built at Altoona, is direct-current gearless, the third, No. 10,003, built by the Baldwin Locomotive Works, is alternating current gearless, and is shown in the drawings herewith. This Baldwin design is intended as a unit, one-half of an articulated locomotive adapted to handle a 400-ton passenger train, but complete in itself.

It is interesting to note that in the development of the electric locomotive, comparatively little attention has been paid to the experience of steam locomotive builders, and many provisions that these designers consider essential to satisfactory operation have been ignored. The electric locomotive has been looked upon merely as a vehicle on wheels, all of which could be used for driving purposes, and it has, therefore, apparently followed the lines of the street car design, from which it was directly evolved rather than those of the steam locomotive which it is intended to supplant. The axles are set in the frame and the wheel arrangement resembles that of European locomotives in the absence of the leading truck.



Driving Wheel of Single Phase Electric Locomotive.

The truck has been characteristic of and considered a necessity for the American engine since the early days, but was very slow in gaining recognition and adoption abroad. The design for the New York Central electric locomotives included a two-wheeled truck at each end, and then, after the Woodlawn derailment of last winter, a four-wheeled truck was put upon one locomotive for experimental purposes. The New York, New Haven & Hartford locomotive, on the other hand, is merely a short, heavy car carried on two bogie trucks. This engine should evidently have the same flexibility of motion as an ordinary double-truck motor car.

An entirely different view of the problem has evidently been taken in the latest design of electric locomotive built for the Pennsylvania Railroad by the Baldwin Locomotive Works, which is now being tested on the West Jersey & Seashore. In this electric locomotive the wheel arrangement of the American (4-4-0) has been followed; an arrangement that was so long and so successfully used in high-speed passenger service, and afterwards amplified for heavy trains by the addition of a third pair of driving wheels, making the ten-wheel type. Not only has this novel wheel arrangement for electric locomotives been adopted, but the diameter of the driver has been increased to 72 in., and it only remains now to increase it still further to 80 in. to parallel the standard Pennsylvania construction. As it is, the center of gravity has been carried to as great a height as possible with this diameter of wheel, and it is thought that, as it stands, it can be coupled to any number of locomotives of the same character without any danger of the engine buckling or pushing the track out of place.

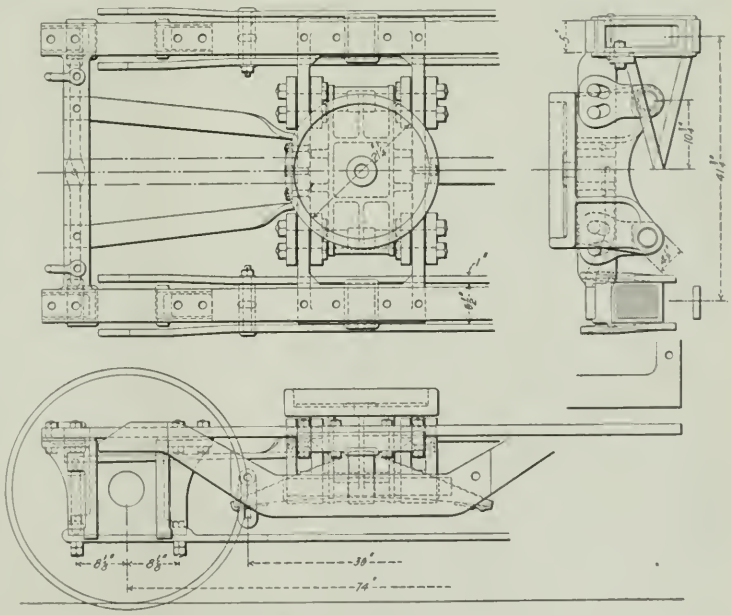
It is claimed that, inasmuch as a certain diameter of driving wheel is needed in order that the steam locomotive may be run successfully without undue heating, the same rule should hold true for the electric locomotive, or else that much less should be expected of it.

It will be noticed that almost all of this locomotive is above the springs and that even the armatures themselves are supported by springs of a peculiar design inserted in pockets in the driving wheel center. In this particular it resembles the New York, New Haven & Hartford engine which was illustrated in the *Railroad Gazette* April 13, 1906. At that time, half-tone reproductions of photographs were used to illustrate the wheels and quill with its bosses that enter the pockets. A detail drawing of the wheel is shown here from which a clear idea of its construction can be obtained. With this arrangement the armature is not placed directly on the axle but is built up on a quill through which the axle passes with a small clearance all around. The bearings which carry the field frame are mounted on this quill and from a flange at each end of the quill round pins project parallel to the axle into the pockets in the driving wheel. The torque of the motor is transmitted from these pins to the wheel through helical steel springs which are wound with their turns progressively eccentric, and which are contained between two steel bushings, the smaller of which slips over the pins, and the larger fits in the pocket of the wheel. These springs are under compression both longitudinally and horizontally so that, at all times, they fill the sockets in the wheel but permit a vertical and lateral motion.

With the heavy armatures thus provided with a spring suspension the frame and superstructure is carried in exactly the same manner as in its prototype, the 4-4-0 steam locomotive. That is to say, the weight on the driving wheels is equalized between the two with semi-elliptic springs over the driving boxes and an equalizing lever between.

As in the case of other electric locomotives, advantage is taken of the absence of rods to use outside bearings.

The truck resembles the ordinary four-wheeled truck. The load is carried on a center-plate of large diameter and ample depth of pocket, and this forms a part of the bolster which rests upon inverted semi-elliptic springs at each side, suspended between flat equalizers by which the weight is transferred to the boxes. With the long wheel base of 74 in. that is given to the truck the danger of flange binding should be entirely obviated and the action should closely resemble that of the standard 4-4-0 locomotives. Already speeds of 60 miles an hour have been obtained in the experimental work that has been undertaken.



Leading Truck; Pennsylvania Railroad Single Phase Electric Locomotive.

The principal dimensions and data relating to the locomotive are as follows:

Weight, total	140 tons
" on each of the four drivers	50,000 lbs.
" on each of the two pony trucks	40,000 "
" on each motor	19,500 "
Diameter of drivers	72 in.
Diameter of pilot wheels	36 "
Wheel base, total (half locomotive)	20 ft. 7 in.

Wheel base, rigid	7 ft. 6 in.
" pony truck	6 " 2 "
Length over bumpers (half locomotive)	31 " 0 "
Height of locomotive	13 " 4 "
Width of locomotive	10 " 0 "
Number of motors per locomotive	4
H.p. of each motor (one hour rating)	500
" " " " (maximum)	800
" " " " (cont. cap.)	375
" " " locomotive (maximum)	3,200
Tractive effort of locomotive (maximum)	40,000 lbs.
" " " " (at 1-hr. ratiog)	14,700 "
" " " " (at cont. cap.)	9,200 "
Speed, miles per hr. (at 1-hr. rating)	51
Speed, miles per hr. (at con. ratiug.)	61
Voltage on trolley	11,000
Voltage on each motor	275

Massachusetts Law Requiring Carriage of Public School Pupils at Half Price.

The Supreme Court of the United States, in an opinion prepared by Justice Holmes, has affirmed the judgment of the Superior Court of Massachusetts sustaining a law of that state requiring street railroads to carry public school pupils at half fare. The suit was brought by the Interstate Consolidated Street Railway Company. The decision in substance follows:

This was a complaint against the plaintiff in error for refusing to sell tickets for the transportation of pupils to and from the public schools at one-half the regular fare charged by it, as required by Mass. Rev. Laws, c. 112, Sec. 72. At the trial the railway company admitted the fact, but set up that the statute was unconstitutional, in that it denied to the company the equal protection of the laws and deprived it of its property without just compensation and without due process of law. In support of this defence it made an offer of proof which may be abridged into the propositions that the regular fare was 5 cents; that during the last fiscal year the actual and reasonable cost of transportation per passenger was $3^{86}/_{100}$ cents, or, including taxes, $4^{19}/_{100}$ cents; that pupils of the public schools formed a considerable part of the passengers carried by it, and that the one street railway expressly exempted by the law transported nearly one-half the passengers transported on street railways and received nearly one-half the revenue received for such transportation in the Commonwealth. The offer was stated to be made for the purpose of showing that the plaintiff in error could not comply with the statute without carrying passengers for less than a reasonable compensation and for less than cost. The offer of proof was rejected, and a ruling that the statute was repugnant to the Fourteenth Amendment was refused. The plaintiff in error excepted and, after a verdict of guilty and sentence, took the case to the Supreme Judicial Court; 187 Mass. 436. That court overruled the exceptions, whereupon the plaintiff in error brought the case here.

This court is of opinion that the decision below was right. A majority of the court considers that the case is disposed of by the fact that the statute in question was in force when the plaintiff in error took its charter, and confines itself to that ground. The act of incorporation went into effect March 15, 1901. The plaintiff in error was "subject to all the duties, liabilities and restrictions set forth in all general laws now or hereafter in force relating to street railway companies, except," etc. * * * The contents of a document may be incorporated or adopted as well by generic as by specific reference, if only the purport of the adopting statute is clear.

Speaking for myself alone, I think that there are considerations * * * that made it unsafe not to discuss the validity of the regulation apart from the supposition that the plaintiff in error has accepted it. Therefore I proceed to state my grounds for thinking the statute constitutional irrespective of any disabilities to object to its terms.

The discrimination alleged is the express exception of the Boston Elevated Railway Company and the railways then owned, leased or operated by it. But, in the first place, this was a legislative adjudication concerning a specific road, not a general prospective classification. A general law must be judged by public facts, but a specific adjudication may depend upon many things not judicially known. Therefore the law must be sustained on this point unless the facts offered in evidence clearly show that the exception cannot be upheld. But the local facts are not before us, and it follows that we cannot say that the legislature could not have been justified in thus limiting its action. In the next place, if the only ground were that the charter of the Elevated Railway contained a contract against the imposition of such a requirement, it would be attributing to the Fourteenth Amendment an excessively nice operation to say that the immunity of a single corporation prevented the passage of an otherwise desirable and wholesome law. It is unnecessary to consider what would be the effect on the statute by construction in Massachusetts if the exception could not be upheld. For, if in order to avoid the Scylla of unjustifiable class legislation, the law were read as universal, it might be thought by this court to fall into the Charybdis of impairing the obligation of a contract with the elevated road, although that objection might perhaps be held not to be open to the plaintiff in error here.

The objection that seems to me, as it seemed to the court below, most serious is that the statute unjustifiably appropriates the property of the plaintiff in error. It is hard to say that street railway companies are not subjected to a loss. The conventional fare of 5 cents presumably is not more than a reasonable fare, and it is at least questionable whether street railway companies would be permitted to increase it on the ground of this burden. It is assumed by the statute in question that the ordinary fare may be charged for these children or some of them when not going to or from school. Whatever the fare, the statute fairly construed means that children going to or from school must be carried for half the sum that would be reasonable compensation for their carriage, if we looked only to the business aspect of the question. Moreover, while it may be true that in some cases rates or fares may be reduced to an unprofitable point in view of the business as a whole or upon special considerations, it is not enough to justify a general law like this, that the companies concerned still may be able to make a profit from other sources, for all that appears.

Notwithstanding the foregoing considerations I hesitatingly agree with the state court that the requirement may be justified under what commonly is called the police power. The obverse way of stating this power in the sense in which I am using the phrase would be that constitutional rights like others are matters of degree and that the great constitutional provisions for the protection of property are not to be pushed to a logical extreme, but must be taken to permit the infliction of some fractional and relatively small losses without compensation, for some at least of the purposes of wholesome legislation.

If the Fourteenth Amendment is not to be a greater hamper upon the established practices of the states in common with other governments than I think was intended, they must be allowed a certain latitude in the minor adjustments of life, even though by their action the burdens of a part of the community are somewhat increased. The traditions and habits of centuries were not intended to be overthrown when that amendment was passed.

Education is one of the purposes for which what is called the police power may be exercised. Massachusetts always has recognized it as one of the first objects of public care. It does not follow that it would be equally in accord with the conceptions at the base of our constitutional law to confer equal favors upon doctors, or workingmen, or people who could afford to buy 1,000-mile tickets. Structural habits count for as much as logic in drawing the line. And, to return to the taking of property, the aspect in which I am considering the case, general taxation to maintain public schools is an appropriation of property to a use in which the taxpayer may have no private interest, and, it may be, against his will. It has been condemned by some theorists on that ground. Yet no one denies its constitutionality. People are accustomed to it and accept it without doubt. The present requirement is not different in fundamental principle, although the tax is paid in kind and falls only on the class capable of paying that kind of tax—a class of quasi public corporations specially subject to legislative control.

Thus the question narrows itself to the magnitude of the burden imposed—to whether the tax is so great as to exceed the limits of the police power. Looking at the law without regard to its special operation I should hesitate to assume that its total effect, direct and indirect, upon the roads outside of Boston amounted to a more serious burden than a change in the law of nuisance, for example, might be. Turning to the specific effect, the offer of proof was cautious. It was simply that a "considerable percentage" of the passengers carried by the company consisted of pupils of the public schools. This might be true without the burden becoming serious. I am not prepared to overrule the decision of the Legislature and of the highest court of Massachusetts that the requirement is reasonable under the conditions existing there, upon evidence that goes no higher than this. It is not enough that a statute goes to the verge of constitutional power. We must be able to see clearly that it goes beyond that power. In case of real doubt a law must be sustained.

Mr. Justice Harlan is of opinion that the constitutionality of the Act of 1900 is necessarily involved in the determination of this case. He thinks the act is not liable to the objection that it denies to the railway company the equal protection of the laws. Nor does he think that it can be held, upon any showing made by this record, to be unconstitutional as depriving the plaintiff in error of its property without due process of law. Upon these grounds alone, and independent of any other question discussed, he joins in a judgment of affirmance. Judgment affirmed. Mr. Justice Moody, having been of counsel, did not sit in this case.

The plans for the Rove tunnel through which the canal from Marseilles to the Rhone is to pass have been approved. While not the longest tunnel in the world, it will have the largest cross-section of any. Its length will be 4⅛ miles, width 72 ft., height

46¾ ft., and the total cubic contents twice that of the Simplon tunnel. On either side there will be a 6½-ft. roadway for an electric railway. The cost is estimated at $6,900,000, and the time required for its construction seven years.

Car Efficiency Reports.

The Committee on Car Efficiency of the American Railway Association has issued its statement of freight car balance and performance for June, 1907, Bulletin No. 10. The introduction gives the principal results as follows.

This Bulletin is more nearly representative than any previous issue, comprising reports from roads with an aggregate mileage of 211,314, and a total of 2,014,069 cars in service.

The car situation during June was, in general, much easier than at any previous time during the current year. The home movement of foreign cars continued until the average home cars in service during this period was 57 per cent. as against 54 per cent. and 55 per cent., respectively, in April and May; the per cent. of foreign cars utilized dropping from 44 per cent. and 43 per cent. in April and May to 41 per cent. in June. As a rule this condition would result in a decrease in loaded mileage. However, during June the shortages were still general enough to permit of the handling of the homeward movement of foreign cars with a minimum of empty mileage. As a consequence the per cent. of "loaded mileage" shows a slight improvement.

There is a slight falling off in the "average miles per car per day" as compared with May, and also in the "average ton miles per car per day," with a corresponding drop in the "average earnings per car on line."

Possibly the most gratifying feature of this report is the increase in "average tons per loaded car" from 19.8 in April and May to 20.4 in June. This item has shown a gradual increase since our first compilation, including tonnage figures (July-December, 1906), which is indicative of partial success in the efforts being made to reduce the wide margin between average loading and average capacity.

The increase in average capacity by building large cars is in the direction of economy, but to secure the full benefit of this economy it is essential that the increased capacity be fully utilized. With the exception of coal, ore and a few other dense commodities, it is doubtful if the average loading of cars has followed the increase in capacity. Roughly, the proportion of capacity utilized is about 60 per cent. Considering that approximately 64 per cent. of the tonnage of the country consists of coal, ore and other heavy commodities which should average close to 100 per cent., it is obvious that the loading of the lighter commodities falls far short of the capacity. Of the numerous causes for this condition, some are beyond the control of the railroads, but there are many which can be remedied by systematizing the loading and giving it proper supervision.

The handling of L. C. L. shipments especially is attended with considerable waste of capacity, and on railroads where this matter has been given close attention, a great deal has been accomplished in the way of improving not only the loading but the movement of L. C. L. business. The minimum loading provided by the various freight classifications also has a marked bearing on the utilization of car capacity. While the average capacity of freight cars has increased approximately 40 per cent. during the past few years, there has been little change in the classifications as regards minimum loading. The recent revision of the official classification increased the minimum on a number of commodities, which action should have a good effect in the territory covered by the change. A movement is under way for the adoption of one classification for the entire country. The proposed consolidation would undoubtedly have a beneficial effect on car efficiency, provided the question of minimum loading is given the consideration which its importance warrants.

The committee has issued Bulletin No. 9, showing car surpluses and shortages on October 16 and October 30, the number of roads reporting on the 16th being 162 and the number on the later date only two less. The shortages have reached the maximum since last winter. The shortage of stock cars in the West was severe in the first part of October, but was much improved at the end of the month. The aggregate of the shortages October 16 was 85,764, while on the 30th it was 90,757. West of Chicago the shortages were considerably smaller on the 30th, but in the eastern, central and southern states they were decidedly larger, making a net increase of about 5,000, as shown. In the central states, including the Pittsburgh district, the shortages increased from about 14,000 to about 20,000. The surpluses are small, everywhere, aggregating only about 4,000 in the whole country. The figures are net for each road and the statement gives no statistics of the number of cars owned by any road or the number on its line. Since the statement was made, that is to say, from November 1 to November 15, there has been a marked falling off in the demand of cars, principally on the grain-carrying roads in the middle west.

Proposed Standard Rail Sections of the American Railway Association.

The accompanying illustrations, which are all drawn to the same scale, accompanied the report of the American Railway Association's Committee on Standard Rail and Wheel Sections, dated Oct. 1, 1907. Further reference to these sections is made in the editorial columns.

Light Freight Handling by Electric Lines.*

BY P. P. CRAFTS.
General Manager, Iowa & Illinois Railway Co., Clinton, Ia.

Although some of the older and slower roads began to conduct a so-called express business several years ago, the freight carrying field was not entered with spirit until the modern high-speed road, built on private right-of-way, with heavy construction, was developed. It was then discovered that the interurban could not only compete with the steam roads and express companies, but that, due to its frequent and reliable service, it could also develop a freight business that could not have been developed by them.

Whether or not a freight business will be profitable depends somewhat upon the following conditions:

1. The population served outside of the main terminal and its dependence upon that terminal as a trading center.

2. The proximity of other trading centers to the population served outside of the main terminal, and the railway facilities tending to attract business away from the main terminal.

*From a paper read before the American Street & Interurban Railway Association at its 1907 convention at Atlantic City.

3. Steam trunk line connections leading to the main arteries of commerce and the ability of interurban roads to establish joint rates with them.

A full exposition of the third condition cannot be given without consuming too much time. In general, however, an interurban road with proper freight handling and terminal facilities, which offers quick and efficient service, together with joint rates with some trunk line, in competition with other trunk lines operating between competitive points, may reasonably expect a fair division, or a greater portion, of the freight traffic. As stated earlier in this paper, shippers desire the best service with lowest rates, but, assuming rates to be even, shippers are generally favorable to the roads which provide good passenger accommodations, consequently the interurban roads reap the reward of frequent passenger service.

Owing to the antagonistic attitude of the steam roads, however, it is generally difficult to establish joint rates except where competition does not exist between them, unless connection may be made with some competing road which disregards the pooling or territorial agreements.

Let us trust that the day is rapidly approaching when the national and state commissions will take such action as will induce our larger and more powerful brothers to recognize the despised interurban. The progressive and aggressive attitude of the interurban managers, if continued, will exert more influence in that direction than anything else that can be done.

Interurban freight traffic may be properly divided into the following classes:

1. Strictly light packages, transported only in baggage rooms of passenger coaches, at express rates or at a fixed charge per package or per hundred pounds, regardless of class, and generally termed express business.

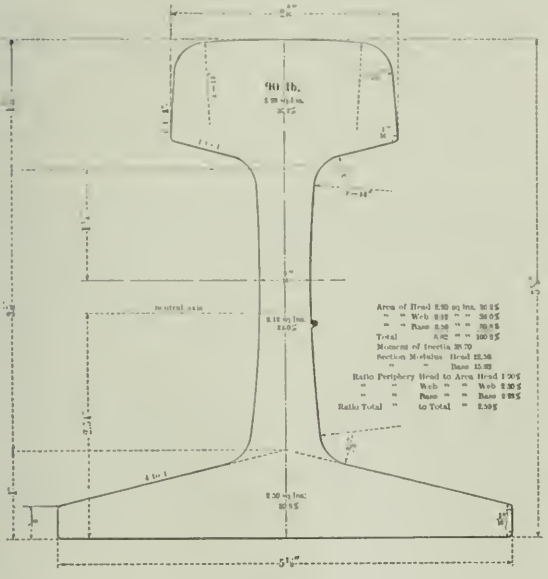
2. Less than carload freight transported on fast baggage cars at regular freight or special tariffs under regular or special classifications, generally the former.

3. A combination of class two and the haulage of a few carload shipments daily at regular tariffs and classification.

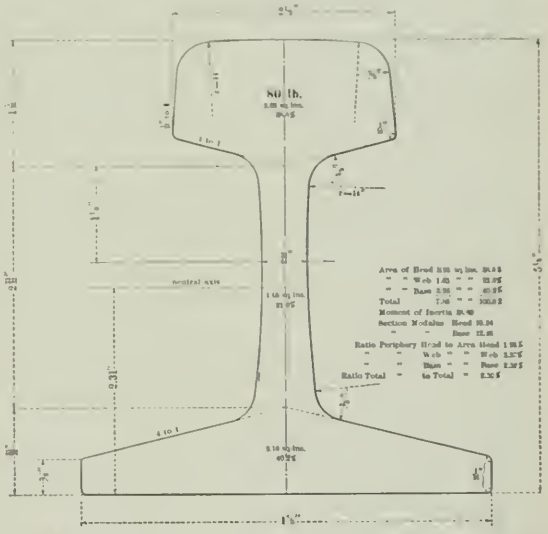
4. Regular carload tariff hauled by steam or heavy electric freight locomotives at regular tariffs and classifications. Or any combination of the above-mentioned classes.

Depending upon local conditions the freight traffic of a road may be confined to any one of these classes or it may be started in the first class and grow to the fourth class. As the fourth class will be discussed in another paper, I will treat only the first three classes, particularly the second class.

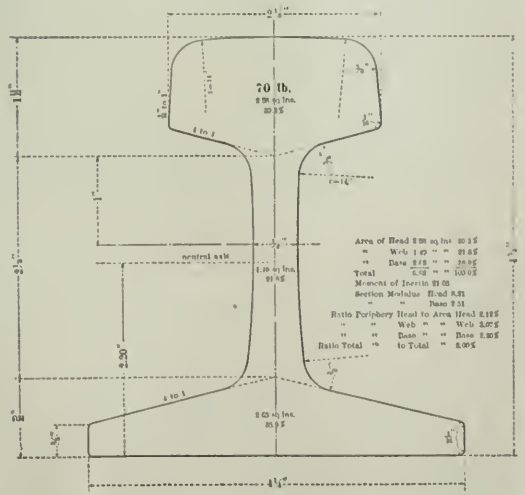
A freight business of class one may be conducted at small expense and is of material assistance in the earnings of a road.



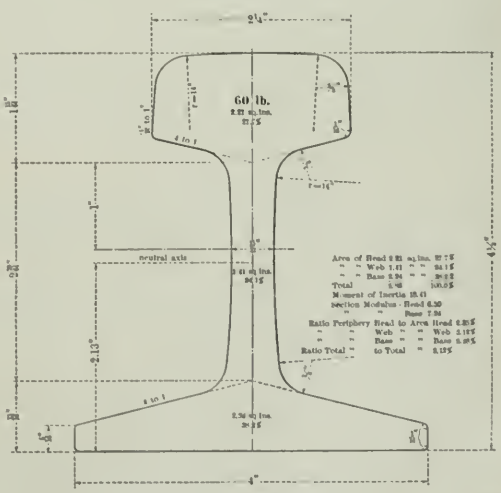
Series A.



Series A.



Series A.



Series A.

The freight carried consists generally of packages easily transported in baggage compartments of passenger cars, which are usually empty except for a very few trips per day. Usually no extra office force is required, the only expense being for stationery, books, and possibly a small storage space at the main terminal. In some cases, when the charges are a certain rate per package, regardless of weight within reasonable limitations, a proper system of tickets dispenses with way-bills, expense bills, etc.

Inasmuch as the majority of freight-handling interurban roads comes under the head of class two, that part of the paper will probably be of interest to the greater number of managers, so I shall enter into greater detail in handling the subject.

Interurban roads which conduct their freight business under the head of class two more nearly approach operating conditions parallel to the time-freight business of steam railways. The ability of the interurban roads to make fast time and to deliver at highways, farm crossings and warehouse or store doors is an inducement to either the shipper or the receiver, which assists in obtaining the business. Being usually restricted, however, to a narrow car similar in appearance to a passenger car, due to operating over city streets, an interurban road has limitations of its freight earning capacity.

The profits of such a business depend largely upon the opportunity of the management to secure combined freight and passenger depots at the terminals and in the larger local towns, so that extra labor in billing and handling at stations may be avoided, upon the charges of terminal city railways for the right to haul freight over the tracks, and upon the hour of day when freight may be delivered to receivers.

Generally speaking, the margin of profit in this class is close and only careful management will produce a profit, particularly during the first few months after the business is started. Expenses must be carefully watched and attractive freight houses and convenient hauling facilities at terminals sacrificed for something which costs less to maintain.

Damage claims must be very carefully handled, and to that end it is advisable to adopt some system of billing and accounting which permits a shipment to be easily traced from its starting point to the final destination. Some interurban roads have adopted simple billing systems, requiring only one writing to make the receipt, way-bill, expense bill and office copy. Such a system, however, does not permit of proper checking, particularly if merchandise is transported over more than one road.

After an interurban road enters class two, a good local commercial agent is a necessity. The business, consisting of a great number of small shipments, requires constant development and care, particularly if competition exists. A live commercial agent, who is a good street man, and not a desk man, earns his salary many times over, particularly if he understands how to deal with shippers. The business obtained depends considerably on the personality of the commercial agent.

I fear that many managers, in charging expenses to the freight business, do not give proper consideration to such items as additional clerks, printing and stationery, insurance on goods in freight houses, a proper percentage of the receipts to cover loss and damage, power for freight cars, proportion of track and line maintenance, telephone service, interest on the freight handling investment, etc. Neglect of these items deceives the manager as well as his stockholders, and unless receipts grow beyond the safe point the awakening will be painful and embarrassing.

Perhaps a brief description of the freight business conducted by the Iowa & Illinois Railway Company may be of interest as illustrating the point brought out in the foregoing paragraph. We went into the freight business in a very tentative manner. In fact, it took considerable time for us to decide whether or not there was sufficient business in less than carload lots to warrant the purchase of a freight car and the expense of operating a freight business.

The next grave question was that of rates, and, after considering for some time a reduction of the rate below that permitted by the Iowa state laws for class "A" roads, we finally concluded to adopt the maximum tariff and to consider the business as freight and not express.

At first our old passenger depot in Davenport served also as a freight depot, but within a very few months we outgrew the capacity of the space allowed to freight and were forced to take our passenger business to a new location. In Clinton we still have sufficient space to handle the business, but within a very few months we will be compelled to seek additional storage room.

Immediately upon starting the business, we engaged a commercial agent, and the quick growth of the receipts to the point where we are paying expenses showed our wisdom in so doing. Within one year, with one freight car engaged in the business and the use of passenger coaches to carry some freight, the business grew to a gross exceeding $10,000 a year. During the summer and fall of 1906 we were compelled to operate our freight car two round trips per day for nearly 75 per cent. of the time, and after the contract with the American Express Company was put into effect, we purchased and placed in service a trailer freight car, having the same capacity as the motor. The improved facilities which we have been able to offer shippers since purchasing the second car have increased the business at a very rapid rate.

We make a specialty, on less than carload business, of beating the time of the steam railroads twenty-four hours between Davenport and points on the Chicago & North-Western Railway in the western part of the state. For this reason we obtain considerable business which is transferred to that road.

Besides the rush shipments in small quantities of perishable goods, such as milk, cream, butter, eggs, fruit, etc., from certain stations are handled in the baggage rooms of the passenger coaches.

We find that a trailer freight car is much cheaper to operate than a motor, but, of course, it can handle only through business. It does not seriously delay the passenger coach to which it is coupled.

When the freight business was started, we adopted what we considered to be a very simple set of forms for billing and accounting, but we soon ascertained that the tracing of damaged and stray shipments was very difficult, and after carefully looking over the field we finally adopted the forms used by the Chicago & North-Western Railway. These appeared at first to be very complicated, but a short acquaintance indicated their simplicity and the ease of tracing damaged and stray shipments.

We make a specialty of rush orders by telephone via our private line. Often a merchant in Clinton who finds himself short of some particular article telephones to us, and through our Davenport office via the private line, we transmit the order to the shipper in Davenport. Shipments so ordered are frequently in Clinton within two hours from the time we were called up at the Clinton office.

At the present time the earnings from this business amount to 15 per cent. of the total gross, and we hope to see it reach 20 per cent. on the same basis, i. e., while our freight business comes under the head of class two.

Our transfer business has been developed under heavy steam road competition at lower rates, for in obeying the state laws we have been compelled to charge two local rates which are higher than the rate for the same mileage in a continuous haul on one road. The saving of time mentioned above has accomplished that result.

A recent ruling by the Iowa Railway Commission reduces the tariff on two locals 20 per cent., and although our receipts per shipment will be naturally reduced, the increase in volume of business will be gratifying.

This exposition of the freight business as conducted by the Iowa & Illinois Railway is not made so much to indicate what is being done by that road, but is rather intended to illustrate the methods generally pursued by interurbans of like character.

An investigation made of a number of roads has brought out the fact that the average interurban conducting a freight business pursues practically the same methods described in this paper. There are of course a number of roads which pursue other methods, and successfully, too, but in such cases local conditions govern to a great extent.

The percentage which earnings from freight traffic bear to the total gross earnings, of course, depends largely on local conditions, but of those roads which have favored me with statistics, I have ascertained that these earnings vary from 5 to approximately 40 per cent. of the total gross. Interurbans which handle carload business, in addition to the traffic of which this paper treats, in some cases enjoy gross earnings from freight exceeding those derived from passenger traffic.

I believe the experience of interurban railways to this date is that such satisfactory results are now being obtained, I am safe in predicting that any average interurban railway, the existence of which is warranted by prospective passenger traffic, can be assured of a profitable freight business, which within a few years, if not immediately, will become an important factor in its earnings.

The French have for some time had in operation in their northernmost Asiatic possession, Tongking, a railroad from the sea at Haifong northwesterly up a river for about 200 miles to the Chinese border at Laokay. Hoping to draw traffic from China over this railroad and to ports in Tongking, a company was organized to build from Laokay in China further northwest through a mountainous country, a further 200 miles to Yunnan-sen. The colony advanced 12½ millions of francs, bonds were issued for 76 millions, and the stockholders of the company subscribed 7½ millions. This has all been spent and the road is far from completion. From 50 to 60 millions more are required, 35 millions of which is needed in 1907. There is a controversy as to whether the company or the colony should make up the deficit; but pending arbitration the money will be advanced by the government. This indicates that the whole cost of the railroad will be something like $29,000,000, or about $145,000 per mile.

GENERAL NEWS SECTION

NOTES.

The Erie Canal will be closed December 10.

On November 4 the Pennsylvania Railroad had 52,622 stockholders, as against 49,572 on October 1. This is an increase in 25 days of 3,050, or a little more than 6 per cent.

The individual car owners have again failed to perfect their proposed organization, a meeting called to be held at Cleveland having been so poorly attended that no action was taken.

The superintendent of railway mail service at Houston, Texas, has called upon the railroads to remove from the windows of mail cars all iron bars which would prevent a man from getting out of the car through the window in case of accident.

The State Railroad Commission of Louisiana has amended its rule concerning reports of accidents, and hereafter will not require telegraphic reports except of accidents where persons are killed or seriously injured by the operation or wreck of a train.

At San Bernardino, Cal., W. A. Basore & Sons have moved an oil tank belonging to the Atchison, Topeka & Santa Fe, weighing 300 tons. The tank, used for locomotive fuel oil, is 96 ft. in diameter and 80 ft. high. It was moved from the old to the new yards of the road.

At Easton, Pa., last week $5 checks which had been issued by the Central Railroad of New Jersey, in consequence of the scarcity of currency, were counterfeited, and it was said that forged checks aggregating $8,000 face value had been presented at the railroad company's offices.

The Union Pacific has run a train wire into a business college in Omaha, in pursuance of an arrangement to have the college teach telegraphers for the service of the railroad. The Atchison, Topeka & Santa Fe is to open a school for apprentices at the company's shops in San Bernardino, Cal.

United States steamer "Marine" reached Rock Island, Ill., November 15, from Hennepin, Ill., completing the first trip through the recently opened Illinois and Michigan canal. The steamer was met by a delegation of citizens and by the blowing of whistles. The canal is 60 miles long, connecting the Illinois and Mississippi rivers.

In the United States Circuit Court at Boston, November 17, Hollis R. Bailey was appointed receiver for the Enterprise Transportation Company of Worcester. The company has been in operation for about two years as a competitor of the Fall River Line, running steamers between Providence, Fall River, Newport and New York.

The new Constitution of the state of Oklahoma went in effect November 16 and the railroads of the state (which include the former Indian Territory) are carrying passengers at 2 cents a mile. The Rock Island announces that it will ask the State Corporation Commission to exercise its authority to exempt the road from the law.

The New York City Railway Company, operating the surface street car lines in Manhattan, in the year 1904 discharged 3,491 conductors, of whom 3,017 were dismissed for dishonesty. In 1905 2,448 were dismissed for that reason, in 1906 3,924 and in the first six months of 1907 2,792. Officers of the company believe that dishonest conductors pocket about $35 a week each.

A press despatch from Montgomery this week says that the Seaboard Air Line has agreed with the Governor of Alabama to withdraw its suits against the state, brought to contest the legality of the reduced passenger fares ordered by the legislature, and that on December 1 it will reduce fares to 2½ cents a mile. On freight the Seaboard Air Line will make rates on the same basis as those charged by the road in Georgia.

In the United States Circuit Court at Buffalo, November 18, on application of the Delaware, Lackawanna & Western, a temporary injunction was granted restraining the Switchmen's Union from breaking its agreement with the railroad company. The union threatens to strike if the road does not grant a large increase of wages, though its members are working under an agreement which does not expire before January 31.

The Interstate Commerce Commission has issued general authority to make rail and water freight tariffs with a provision that they will be suspended, at the close of navigation, on seven days' notice. The resumption of such tariffs in the spring must be preceded by ten days' notice. If a shipment forwarded on a rail and water rate has to be sent through all the way by rail, the line (or combination of lines) which accept it at the low rate must pay the difference between that and the all-rail rate. On the opening of navigation shipments may be received under the rail and water rate for concentration at the port on the date that the rates take effect.

The Attorney General of Nebraska has entered suit against the Union Pacific, asking an injunction against E. W. Jones, who was "disciplined" by the road for driving his cattle into Nebraska to take advantage of reduced rates. Jones ordered cars at Big Springs, and after he reached that place with his cattle was compelled to pasture them about in the hills for twenty-five days before he could get cars. In the meantime shippers on either side of Big Springs were furnished with cars.

With a view to complying with the Federal 16-hour law, the New York Central has made experimental changes in the runs of certain freight trainmen. Men running through from Albany to Syracuse, 148 miles, are to be taken off at Utica, 95 miles, though the trains and engines will be run through precisely as before, not going into the yard at Utica. On some of the trains the crews have for some time past changed at Little Falls, half-way between Albany and Syracuse. This practice will be continued.

The Post Office Department has ordered that until December 25 equipment, supplies and empty mail bags, which for the past six months have been sent mostly by freight, shall be sent in the mail cars. The order appears to be based on the fear that in the holiday season there will be intolerable delays in freight transportation. Some of the Chicago roads are complaining at this action of the department, declaring that the additional matter will have to be carried without remuneration. This year's appropriation for the Post Office Department includes $250,000 for the outside transportation of the articles above named.

At Chicago, last week, before the Illinois Railroad and Warehouse Commission, W. A. Gardner, Vice-President of the Chicago & Northwestern, declared that the present charges for switching in Chicago are less than the actual cost of the service. The hearing was on a complaint brought by the Illinois Manufacturers' Association and the Chicago Association of Commerce that switching charges are excessive. "Switching rates are lower than they were fifteen years ago, taking into consideration the fact that the capacity of cars has doubled since that time," said Mr. Gardner. "Yet, during these years the cost and the intricacy of the work has greatly increased. The payrolls for switching are 33 per cent. greater than a year ago, but the increase in the number of cars handled has been only 10 per cent." Mr. Gardner advocated a rate per ton and a classification of freight to apply to switching movement.

The Pennsylvania Railroad announces that shop men working on repairs will henceforth work eight hours a day. Reductions will be made in the track forces and in other departments where the business of the road will not suffer. Superintendents have been ordered to suspend men wherever it can be done without crippling the forces. Similar reports of retrenchment are published concerning many railroads, but few of these reports are given with definiteness. At Chicago, Slason Thompson, representative of the General Managers' Association, estimates that 25,000 men have been dismissed by Western railroads. A considerable part of these men were engaged on new construction, but no information is given to show how many. The Chicago, Milwaukee & St. Paul has dismissed 50 freight solicitors, mostly in cities off the line of the road. The Northern Pacific has taken similar action in the Eastern states. The Erie has dispensed with the services of a number of traveling passenger agents.

Mr. Hill on the Financial Crisis.

The following extracts are taken from an address made by James J. Hill at Kansas City, November 19:

"Perhaps the controlling factor of the situation in this country is the shock given to confidence in our investments all over the world and the consequent limitation of credit. Credit is the atmosphere which inflates the lungs of business, and when it is greatly lessened business must be reduced in proportion or be quietly smothered. For this reason attacks, not on individual transgression, not on dishonest finance, but upon existing business systems representing the fabric of society itself, may destroy by impairing credit what a generation could not rebuild. Political campaigns in many states have been made on the issue of a general assault on the integrity of railroad property and management. There followed a wild raid in which over 170 acts more or less confiscatory of railroad property were enacted by the legislatures of more than a score of states. The consequences to the transportation system, to railroad construction, and through these to the price of farm products and to the success of every form of business have already made themselves felt and the country shivers under the blow. If such continue to be the atti-

tude of the public mind there will presently be no power, short of a pledge of the credit of the Government itself, able to secure the funds necessary to provide more tracks.

"Before we again realize a favoring disposition to invest, there must be a different temper, a larger view of justice, a better appreciation of what the railroads of the United States have done and are doing as compared with those of the rest of the world, and a settled policy of fair and reasonable liberal treatment, and protection for the future. The duty of the state toward the railroad property, which should have the rights common to other property, must be considered, as well as the duty of the railroad to the public.

"It is necessary to this end that the operations of our railroads should be regulated properly by wholesome and fair laws, and quite as necessary that they should not be regulated improperly. Regulative statutes are now in force of such scope and stringency that no one denies their efficacy.

"It would be easy so to multiply and add to their burdens that the confidence necessary to investment would be entirely destroyed and the development of the country prevented.

"Whether this is a time for new enactments or for a patient, fair and just enforcement of the laws as they stand may be judged from the records of the past.

"We have read of a conflict between righteousness and business. There can be no such conflict unless there is fraud at the business end or hypocrisy and cant at the righteousness end. If any man has done evil, if any corporation is sinning against the laws, let him or it be punished under the law. But put an end to wholesale denunciation and wholesale proscription, destructive of all credit and repugnant to all sense of justice, as well as hostile to every business interest in the land.

"There are but two reasons, actual scarcity of money and reluctance to invest, which overshadow the outlook. Promising enterprises can no longer be financed on any basis consistent with present rates and conditions.

"The transportation facilities of the whole country are and have been unequal to its present means. They must be made equal to the burdens they bear or the country cannot prosper. The railroad men of this country have a right to be proud of their record, and resent criticism supported by nothing better than ignorant declamation."

Profit Sharing by Stock Ownership.

Employees of the United States Steel Corporation will probably this year get their preferred stock under the profit sharing plan very much cheaper than a year ago, when $102 was agreed on. Since the profit sharing plan became operative in 1903, the corporation has sold to employees 150,496 shares, the present market value of which, at $81 a share, is $12,190,176. The amount paid for the stock was $12,558,445, so that apparently the employees have lost on paper a little over $350,000; but rebates and dividends received by employees offset this loss many times over. On Dec. 31, 1906, there were 15,568 employees who had purchased stock under offers made by the corporation. This indicates that considerable stock has been liquidated.

The Pullman Company.

Gross earnings for the year ended July 31, 1907, were $32,186,013, an increase of $2,597,371. Operating expenses were $17,388,741, an increase of $2,044,000. Dividends amounted to $7,476,878, an increase of $1,556,894. These dividends do not include the distribution of accumulated surplus made in November, 1906. The surplus for the year was $4,149,455, a decrease of $820,619. The mileage of road over which the company operated cars was 195,250, an increase of 4,817. The number of passengers carried increased 11 per cent. and the number of miles run increased 7 per cent. The company built $37,019,627 worth of cars, an increase of $9,300,635. At the annual meeting, George F. Baker, New York, was elected a Director, succeeding Charles S. Sweet, Chicago.

Irrigation in Southern Pacific Territory.

Nearly a million acres of land is being reclaimed by irrigation along the lines of the Southern Pacific. In the neighborhood of Yuma, on the Colorado river, 100,000 acres, partly in Arizona and partly in California, will be served by the canals now building, on which rapid progress is being made. Profitable cultivation of this soil has heretofore been impossible owing to the destructive floods of the Gila river. Now this section is being made ready for the settler by a dam across the Colorado above Yuma, by canals under the Gila and a system of levees which will protect the territory from overflow. The lands saved from destruction by the Southern Pacific's success in closing the breach in the Colorado are yielding phenomenal crops. Yuma has about 2,000 population. With Phoenix as a center, another vast irrigation work, covering 200,000 acres, is being carried out. Here, as around Yuma, the climate is favorable to oranges, and other fruits of many kinds, all served by the lines of the Atchison, Topeka & Santa Fe from the north and the Southern Pacific on the south.

On the Truckee-Carson project in Nevada, the government is spending $9,000,000 in reclaiming 350,000 acres. From the Southern Pacific a branch line has been built diagonally across the newly irrigated area. Further north, on the border line between California and Oregon, is the Klamath project. Through this territory the Southern Pacific is building a line which will eventually run from Weed, Cal., to Natron, Ore., and become the main line of the road in place of the present Shasta route. Nearly 250,000 acres of a fertile soil will be affected by the irrigation work now well under way here.

Railroad Strike in India.

Traffic on the East Indian Railway, 2,165 miles long and the second largest railroad in India, is rapidly becoming paralyzed by a strike, according to a Calcutta despatch dated November 20. The trouble began with the European engineers. The most important section of the road from Calcutta to Allahabad, is tied up and several thousand passengers are stranded at the junction of the road with the Bengal-Nagpur Railroad. Many engineers in their engines have left their trains at remote stations. This is an especially serious time for a strike because famine is spreading and there is need for speedy transportation of relief supplies.

American Blower Company's Exhibit at Atlantic City.

A view of the exhibit of the American Blower Co., Detroit, Mich., at the recent convention at Atlantic City of the American Street and Interurban Railway Association is shown herewith. It

American Blower Company's Exhibit.

will be observed that it includes the same interesting feature that attracted so much attention at the railroad mechanical conventions in June—that of a light sphere suspended in the blast from a high-pressure blower. It is reported that members of this convention were no better able to offer a satisfactory solution of the phenomenon than were those of the previous convention.

Inquiry on British Rates.

Now that the long strike agitation in England is satisfactorily settled, the President of the Board of Trade intends to devote his attention to another railroad matter of almost equal importance to British railroads, and that is the question of rates. It is his intention at an early date to appoint a commission, or rather committee, in which will be included several practical railroad men to consider, among other things, the whole question of railroad rates and the desirability of revision on a larger scale than could conveniently be carried out by the Railway and Canal Commission. At the same time the possibility of lowering working expenses by reducing competition and in other directions will probably be discussed. It is expected that the chairman of one of the southern lines will be asked to assist the committee with his long experience in all departments of railroad work, and a leading general manager will probably be added. Mr. Lloyd-George has been much impressed with the great waste which necessarily results from such cases as the working of three competitive routes to Scotland or four routes to Manchester. British railroad managers will be the first to welcome any means of reducing this expenditure, which does not lay them open to the charge of pooling.

Taxation Without a Hearing.

The decision of the Georgia Supreme Court holding valid an assessment of back taxes for ten years on 6,000 shares of the Western Railroad of Alabama, a foreign corporation, has been reversed by the Supreme Court of the United States. The decision will upset the laws of many states on the taxation of property upon which the owners fail to make returns. The Western Alabama shares were held by the Central of Georgia and the Georgia Railroad & Banking Company, as trustees. They refused to make returns on the ground that the shares of a foreign corporation were not subject to taxation; but taxes were assessed and the companies sought to restrain their collection by claiming discrimination in that the shares of domestic corporations were not taxed, that under the Georgia law a hearing was denied them and that the property itself was taxed in another state. The only question considered in the appeal to the Supreme Court of the United States was whether the Georgia law providing for assessment of taxes on omitted property without hearing was due process of law. The court held that it was not and that it fell within the intention of the Fourteenth Amendment to protect property from such impairment by state action.

Indian Railroad Organization.

In consequence of representations made by the Indian Railroad Board, the Government of India has decided on some modifications of the control which it has previously exercised over the capital expenditure of Indian railroads through the consulting engineers. This control, indeed, has been of a minute character, and extends not only to matters of engineering and of expenditure, but to practically all questions, both executive and administrative, connected with railroad working. The Government now admits the force of the board's argument that the altered conditions and revised contracts under which the companies now construct and work the railroads give scope for more liberal and elastic methods. The following changes in organization are, therefore, says a correspondent of *The Times* (London), to be brought into force from January 1 next. Certain powers of sanction and administration are to be delegated to the companies' boards, which are to be requested to entrust their chief representatives in India with a considerable portion of their own powers, Government reserving the right to re-impose more detailed powers of control should circumstances require it. The appointment and duties of provincial consulting engineers are to be abolished, except that their work as inspectors will be carried out by officers specially charged with that duty.

INTERSTATE COMMERCE COMMISSION RULINGS.

Rates on Butter and Eggs Reduced.

In an opinion by Commissioner Lane decision has been announced in the case of the Morse Produce Co. v. Chicago, Milwaukee & St. Paul et al. It appeared that the rate on butter and eggs from Granite Falls, Minn., to Chicago, Ill., is 56 cents per 100 lbs. in car load lots, while from Pipestone, Minn., to Chicago the rate is 43 cents, although Granite Falls is 41 miles nearer Chicago. The Commission held under the facts and circumstances of this case that the 56-cent rate of the Chicago, Milwaukee & St. Paul is unreasonable and unjust and should not exceed 43 cents per 100 lbs.

Violations of Rate Law Must be Substantial, Not Technical.

The Commission, in an opinion rendered by Commissioner Harlan, has announced decision in the case of Missouri and Kansas Shippers' Association v. Missouri, Kansas & Texas. This was a proceeding based on an infraction of the long and short haul section and involved reparation for shipments of hay from certain points in Kansas to Kansas City and St. Joseph, Mo. The Commission held that a merely theoretical or paper rate that has not been used and was unknown to the defendant until casually discovered will not be accepted as affording a just basis for an order for reparation on shipments made to an intermediate point at a slightly higher rate. The Commission is essentially an administrative body, and in the examination of formal complaints ought to get at the real substance of the issue presented unembarrassed by technical considerations.

Joint Rates Need Not be Made.

The Interstate Commerce Commission, reporting on the application of the Loup Creek Colliery Company, of Page, W. Va., refuses to order the establishment of a through joint rate where the railroads have not made one. The complainant is on the Virginian Railway, nine miles from its junction with the Chesapeake & Ohio, and desires to ship coal and coke over the Chesapeake & Ohio at the same rates which are paid for shipment from points in the same vicinity, which are situated on the C. & O. The freight is carried satisfactorily now but the roads refuse to make through rates. The Commission finds that the prices paid are reasonable, and that the rates from C. & O. points are also reasonable; that to make the desired order would compel the C. & O. to discriminate between its own shippers or else make an unnecessary reduction in some of the rates. The decision is by Commissioner Clements.

Coal Rate Upheld.

In the case of The A. M. Fellows Coal & Material Co. v. the Missouri Pacific, opinion by Commissioner Clark, the complaint was dismissed. It was alleged in this case that the rate on coal from a mine at Jewett, Kan., to Kansas City, Mo., is unjust and unreasonable. The record showed that the rate is the same as from other mines in the same field—the same as that on a competing railroad in the same field—and that it is fixed in accordance with an established relation of rates on coal from other producing points to the same market. It also appeared that the rate complained of could not be changed without disturbing rates on coal, not only from other neighboring mines, but from all coal-producing centers the product of which is sent to Kansas City. The Commission decided that under the circumstances and conditions disclosed by the record there is no justification for ordering the rate changed or declaring it unreasonable.

Express Rates Ordered Reduced.

In the case of McLaughlin Bros. v. Adams Express Co. (opinion by Commissioner Lane) it was shown that the Adams Express Co. charged a rate per car for the transportation of horses from New York to Columbus, Ohio, of $200; from Columbus to Kansas City, Mo., $350; from Columbus to St. Paul, Minn., $350. The rate per car from New York to St. Louis is $300; from St. Louis to Kansas City, $150; from New York to Chicago, $250; from Chicago to St. Paul, $200. Thus the total charge from New York to Kansas City when the shipment is stopped at St. Louis is $450; when stopped at Columbus, the total charge is $550. Similarly, the charge from New York to St. Paul is $450 when the shipment is stopped at Chicago, and $550 when the shipment is stopped at Columbus. The Commission decided from all the facts presented that the rates west of Columbus are unreasonable and excessive, and ordered that the rate from Columbus to Kansas City and from Columbus to St. Paul shall not exceed $250 per car.

Switching Charges May Legally Fluctuate.

The Commission, in an opinion rendered by Commissioner Clark, has announced its decision on six separate complaints against the Chicago, Milwaukee & St. Paul by J. H. Leonard and others. Coal carried by this road to Kansas City was delivered on the lines of other carriers which assess a switching charge of $3 a car. At one time the defendant absorbed the switching charge, later discontinued the practice and subsequently resumed it. The complainants allege that as the defendant indulged in the practice and after discontinuance resumed it that it has committed itself to the unreasonableness of requiring shippers to at any time pay switching charge and therefore reparation was asked for. The Commission decided that to support the contention of complainants would be to say that transportation charges must in every instance remain at a fixed figure or be reduced by the carrier at the peril of being called upon to respond in damages on all charges that have before that time been collected under the rates so reduced. It was admitted that there was no discrimination between shippers and the Commission ordered the complaints dismissed.

Switching Charges Upheld.

The Commission, in an opinion by Commissioner Clark, has announced decision in two cases brought by the Laning-Harris Coal & Grain Co. against the Atchison, Topeka & Santa Fe. It appeared in these cases that after arrival, and usually after sale, of grain transported in carloads by defendant to Kansas City, the owners direct the delivery to points on the lines of other carriers which assess a switching charge which defendant collects for and pays to said other carriers. The complaints in these cases alleged that defendant's published rate on grain to Kansas City includes delivery at any point in Kansas City desired by the shipper, whether on the line of defendant or on the lines of any other carrier, and that the switching charge is therefore unlawful and unreasonable.

The Commission decided that the law in specific terms provides that a common carrier shall not be required to give the use of its tracks or terminal facilities to another carrier engaged in like business. In the absence of tariff provisions to the contrary, the transportation rate shown in a carrier's tariff on a certain commodity to a given point is understood to include delivery only to industries or unloading points located on its own rails. If a consignee

or owner of the shipment desires delivery to a point located on the line of another carrier, it must pay the lawful charge for such service. The complaints in these cases are of no merit and should be dismissed.

TRADE CATALOGUES.

Storage Batteries.—The Gould Storage Battery Company, New York, has published a pamphlet which describes and illustrates the construction of the company's storage battery. Both positive and negative plates are of the Planté type; that is, pure lead plates whose active material consists of thin layers of lead peroxide on the positive plates and spongy lead on the negative, these layers being renewed by chemical action from the pure lead. The pamphlet goes into the advantages of the design of construction, describes the preparation of the material and concludes with a resumè of the general advantages claimed for the battery. It is illustrated with half-tones of separate plates, of different types of batteries and of complete installations.

Valves.—The October issue of *The Valve World*, published in the interests of the Crane Company, Chicago, contains articles on pipe threading and cutting machines, improvements to back pressure valves for non-condensing engines and a large installation of piping for the Calumet & Hecla Mining Company. Among other articles there is an interesting one on the methods employed by the Crane Company for taking care of the health of their employees.

Storage Batteries.—The General Storage Battery Co., New York, has issued a pamphlet describing an installation of Bijur storage batteries at the Johnstown, Pa., works of the Cambria Steel Company. A striking feature is the reproduction of recording ampere meter charts indicating the comparative fluctuations of current at the power house before and after the battery was used, showing the effect which the installation had on handling of high intermittent loads.

Steam Shovel News.—The October number appears with a new cover design which greatly improves the appearance of the magazine. "Steam Shovels on Light Railroad Construction" is the leading article, and is well illustrated with good half-tones from photographs. A special high-crane shovel for a clay pit is described and illustrated at work; there are a number of shorter articles and notes of interest.

Poles.—The John Simmons Company, New York, has published a folder describing the construction of tubular steel poles and the advantages of them as compared with wooden poles. The folder is illustrated with photographs of the 92-ft. steel pole made and erected by the company on top of the Singer building in New York, and by drawings of other types of flag poles and fittings.

Coal and Ash Handling Machinery.—Catalogue D of The Jeffrey Manufacturing Co., Columbus, Ohio, illustrates a large number of coal and ash handling machinery installations at different plants throughout the country. There are 56 pages of line and half-tone engravings which show the general features of the different installations.

The Otto Gas Engine Works, Chicago, is distributing a map of the Panama canal, including a profile of the canal and a cross-section of the Culebra cut. A printed note gives briefly the final plans of the canal. Above the canal map is one showing shipping routes of the three Americas.

Air-Brakes.—Two recent bulletins of the Allis-Chalmers Company, Milwaukee, Wis., deal with air-brake equipment for electric cars. One of the bulletins is devoted to type O-B pneumatic emergency equipment and the other to the type J emergency valve for straight air-brake.

MANUFACTURING AND BUSINESS.

The New York offices of the Raymond Concrete Pile Co., Chicago and New York, have been moved to 140 Cedar street, the new West street building.

The Canadian Steel & Wire Co., Hamilton, Ont., has received the contract for fencing the Grand Trunk Pacific between Edmonton, Alb., and Winnipeg, Man., about 1,000 miles.

George A. Gallinger, heretofore connected with the Chicago office of the Independent Pneumatic Tool Co., Chicago, has been appointed manager of the Pittsburgh, Pa., office at 1210 Farmers Bank building.

W. Martin Johnson has been elected Second Vice-President of the Schoen Steel Wheel Co., Pittsburgh, Pa., in charge of the sales department. Mr. Johnson's headquarters will be in the New York office of the company, 11 Broadway.

J. G. White & Co., New York, recently shipped to Manila, P. I., on the steamship "Croydon" $250,000 worth of locomotives, cars and construction material for the Philippine Railways Company.

The Allis-Chalmers Company, Milwaukee, Wis., has been awarded a gold medal for electric generators and motors exhibited at the Jamestown Exposition. A second gold medal was granted for the design and erection of the exhibit.

The Central Inspection Bureau, New York City, has an order from the Northern Electric Street Railway, Scranton, Pa., for the inspection of a number of passenger and baggage cars to be built by the J. G. Brill Company, Philadelphia, Pa.

The Expanded Metal & Corrugated Bar Co., St. Louis, Mo., is furnishing the reinforcement for the construction of three circular reservoirs, 100 meters in diameter, for the Potable Water Commission, City of Mexico. The order is for 2,600 tons of corrugated bars.

The United States Engineering Office, through S. W. Roessler, Portland, Ore., has been in the market for four hoisting engines, in addition to the three locomotives reported in the *Railroad Gazette* of November 8. Proposals for locomotives and hoisting engines were opened November 18.

Harry A. Houston, Springfield, Mo., won this year the Joseph T. Ryerson scholarship of the American Railway Master Mechanic's Association at Purdue University. This scholarship is awarded after competitive examination. Mr. Houston, who is 20 years old, entered Purdue at the opening of the fall term and will take the course in mechanical engineering.

Net income of the Union Switch & Signal Co., Swissvale, Pa., for the year ending December 31, 1907, is estimated at $1,100,000. The company has about $1,250,000 of accounts receivable and enough money in bank to meet the payroll for two months. For the nine months ended September 30, net income, after charges amounting to $2,930,000, was $853,000, an increase of $125,000.

Civil service examinations will be held on December 11 and 12 of candidates for the following vacancies: topographic draftsmen on Panama Canal, salary $125 to $175 a month; assistant superintendents of construction, quartermasters' department, at Cheyenne, Wyo., $1,200 a year, and at Fort Sam Houston, Tex., $900 a year; engineer draftsman, office of the supervising architect, treasury department, $1,600 to $1,800 a year.

The contract for the three large skylights for the new national museum, at Washington, D. C., has been awarded to Arthur E. Rendle, of New York, Chicago and Montreal, to be glazed on his Paradigm skylight system. Eleven firms bid on the work and Mr. Rendle's bid was the lowest. The glass roof and skylights (80,000 square feet) on the new union station buildings at Washington were also glazed by the same contractor.

A test was made recently by the engineers of the New York Edison Co. at the Waterside station, near Thirtieth street, New York City, of a Westinghouse turbine of 10,000 h.p. capacity. It had been sold under a steam consumption guarantee of 15.9 lbs. of steam per kilowatt hour, but the test recorded less than 14.9 lbs. per kilowatt hour. This result gained a bonus for the Westinghouse turbine of over $25,000. This steam consumption figures less than 1½ lbs. of coal per kilowatt hour.

The Societe Electrique Westinghouse de Russie has nearly finished its work of electrifying certain horse-car lines in St. Petersburg. There have been rumors lately to the effect that the company has been fined for failure to complete parts of the work by specified dates. No such fine has been imposed. The company has been paid in instalments, amounting, so far, to $2,400,000. Of the remainder due, $88,000 has been reserved by the government as a contingent fine, but the company is confident that this penalty will not ultimately be imposed.

A. L. Whipple, Assistant Treasurer of the Curtain Supply Company, Chicago, has resigned, effective November 25, to become Second Vice-President of the Telharmonic Securities Company, with office at Broadway and 39th street, New York. This company is in charge of the finances of the Cahill Telharmonic Company of New York. This company's system of transmitting music electrically consists of a number of dynamos each generating such a current as will cause a resonator to give out a particular musical note. A keyboard controls the different circuits, so that by playing on the keyboard, music can be produced at the resonator. The company plans to have central stations in different cities. One is now in operation in New York and there are a number of subscribers to the service, the installation of resonators and the terms on which they are used being similar to that of telephone service. Mr. Whipple has been in the railroad supply business for fourteen years and with the Curtain Supply Company for nine years. He became interested in

the Telharmonic company last June while trying to have its music transmitted from New York to Atlantic City for the Master Car Builders' and Master Mechanics' conventions.

Iron and Steel.

Japanese railroads are in the market for 1,500 tons of light rails.

The Mexican government is said to have issued an order permitting the free entry of 6,000 tons of rails from Russia for lines being built by the Southern Pacific in Mexico.

OBITUARY NOTICES.

N. Staat, Assistant General Freight Agent of the Chicago, Indianapolis & Louisville, died on November 13 of appendicitis. Mr. Staat was 30 years old.

Jesse Newton Seale, Manager of the Northern and Eastern districts of the Southern, died on November 11. A few days before, he had a stroke of paralysis at Salisbury, N. C., and pneumonia developed while he was being taken to Washington. Mr. Seale was born in Mississippi in 1862. He went to school at the East Mississippi University at Columbus and began railroad work in 1875 as a messenger boy on the Mobile & Ohio. He worked as telegraph operator, agent and train despatcher until 1881, when he went to the Cincinnati Southern, where he was in the office of the General Manager. The next year he went to the Texas & Pacific as chief clerk to the Superintendent and in 1883 spent a few months in the Western Union Telegraph and the Associated Press at New Orleans. He then returned to railroad work as a train despatcher on the Southern Pacific and soon went to the Alabama Great Southern as chief despatcher. In 1886 he returned to the Mobile & Ohio, being made Trainmaster. Two years later he was appointed Assistant Superintendent, and in 1890 was made Superintendent at Jackson, Tenn. In 1899 he was appointed Superintendent of Transportation and three years later went to the Southern with the same title. He was later appointed Manager of Transportation, and in the spring of the present year was advanced to the office he held at the time of his death.

MEETINGS AND ANNOUNCEMENTS.

(For dates of conventions and regular meetings of railroad conventions and engineering societies, etc., see advertising page 24.)

Canadian Society of Civil Engineers.

At a meeting of the mining section Nov. 21, a paper on "Chrome Iron Mining in Canada," by Henry F. Strangways, B.A., was read by the author.

Franklin Institute.

At the section meeting in Philadelphia November 21, a paper was presented by Dr. Allerton S. Cushman on the "Corrosion of Iron and Steel."

Railway Club of Pittsburgh.

At the meeting of this club in the Monongahela House, November 22, an address on "Car Wheels," illustrated by stereopticon views, will be given by George L. Fowler, of New York.

ELECTIONS AND APPOINTMENTS.

Executive, Financial and Legal Officers.

Ann Arbor.—See Detroit, Toledo & Ironton.

California Railroad Commission.—A. M. Wilson has resigned.

Corvallis & Eastern.—The authority of the following officers of the Oregon Railroad & Navigation has been extended over the Corvallis & Eastern: M. J. Buckley, General Superintendent; J. F. Graham, Superintendent of Motive Power; R. B. Miller, General Freight Agent; William McMurray, General Passenger Agent; R. Koehler, General Purchasing Agent, and G. W. Boschke, Chief Engineer.

Detroit, Toledo & Ironton.—George K. Lowell, General Manager, has been elected Vice-President of this company and of the Ann Arbor.

Oregon Railroad & Navigation.—See Corvallis & Eastern.

Pennsylvania.—The legal department has been reorganized, so that instead of a General Counsel, a General Solicitor and three Assistant General Solicitors, there are now a General Counsel with three assistants and a General Solicitor with two assistants. G. S. Patterson and P. B. Prince, heretofore Assistant General Solicitors, have been made Assistant General Counsels, the third being H. S. P. Nichols. S. B. Liggett and H. W. Bikle have been appointed Assistant General Solicitors.

Toledo, St. Louis & Western.—The office of G. H. Ross, Second Vice-President and General Traffic Manager, has been moved from Toledo, Ohio, to Chicago.

Western Pacific.—J. D. Brown, Treasurer, has resigned.

Operating Officers.

Alabama Great Southern.—J. W. Evans, Master Mechanic, has been appointed Superintendent, with office at Birmingham, Ala., succeeding R. E. Boswell, resigned to go to the Seaboard Air Line.

Boston & Albany.—J. L. Truden has been appointed Acting Superintendent of the Albany division, with office at Springfield, Mass., succeeding to the duties of Charles Flinn, who has been given leave of absence.

Chicago, Burlington & Quincy.—H. W. Hamm, Trainmaster at St. Joseph, Mo., has been appointed Superintendent at Centerville, Iowa, succeeding J. P. Boyle, resigned.

Chicago, Rock Island & Pacific.—E. S. Moore has been appointed Assistant Superintendent of Terminals at St. Louis, Mo.

International & Great Northern.—E. E. Johnson, Assistant Superintendent at Mart, Tex., has been appointed Superintendent at that place, succeeding C. J. Larimer, resigned to go to another company. J. D. Whittington succeeds Mr. Johnson.

Kansas City Southern.—J. P. Spivey, chief clerk to the Superintendent of Transportation, has been appointed Superintendent of Transportation, with office at Kansas City, Mo., succeeding F. S. Rawlins, resigned to go to the Northern Pacific.

Lehigh Valley.—J. N. Haines has been appointed Inspector of Transportation, succeeding G. B. Minshull, promoted.

Mexican Central.—C. T. Norton has been appointed Superintendent of the Coahuila & Pacific division, with office at Saltillo, Coahila, succeeding E. R. Walter, resigned to go to another company.

Oregon Short Line.—See Union Pacific.

St. Louis & San Francisco.—F. D. Hahnskeen has been appointed Trainmaster at Sapulpa, Ind. T.

Trinity & Brazos Valley.—F. J. Norris has been appointed Trainmaster of the Dallas and Fort Worth branches, with office at Teague, Tex. Patrick Owens remains Trainmaster of the rest of the road.

Union Pacific.—W. E. Whitney, Superintendent of the Denver union station, has been appointed Superintendent of a new division consisting of the Union Pacific line from Rawlins, Wyo., to Green River, now part of the Wyoming division, and the Oregon Short Line's road from Green River to Ogden, Utah. Mr. Whitney's headquarters are at Ogden.

Traffic Officers.

Canadian Pacific.—W. M. Kirkpatrick, General Freight Agent of the Atlantic division, has been appointed General Freight Agent of the Ontario division, with office at Toronto, Ont., in charge of through traffic. M. H. Brown remains General Freight Agent in charge of local traffic. H. E. McDonnell, General Freight Agent at Nelson, B. C., succeeds Mr. Kirkpatrick, with office at St. John, N. B. W. C. Bowles, Assistant General Freight Agent of the Pacific division, succeeds Mr. McDonnell. G. H. Smith, Assistant General Freight Agent of the Central division, succeeds Mr. Bowles, with office at Vancouver, B. C. W. H. Robertson succeeds Mr. Smith, with office at Winnipeg, Man.

Engineering and Rolling Stock Officers.

Alabama Great Southern.—See this company under Operating Officers.

Canadian Pacific.—A. L. Hertzberg, Engineer of Maintenance of Way, has been appointed Division Engineer of the Ontario division, with office at Toronto, Ont., succeeding J. M. R. Fairbairn, who has been appointed Division Engineer at Montreal, Que. The office of Engineer of Maintenance of Way has been abolished, and its duties will hereafter be performed by F. P. Gutelius, Assistant Chief Engineer.

Purchasing Agents.

Chicago & Eastern Illinois.—See Chicago, Rock Island & Pacific.

Chicago, Rock Island & Pacific.—J. M. McCarthy, chief clerk in the General Purchasing Agent's office, has been appointed General Purchasing Agent of this company and of the Evansville & Terre Haute and the Chicago & Eastern Illinois, effective December 1, succeeding F. P. Jeffries, resigned. M. E. Towner has been appointed Assistant to E. L. Pollock, Vice-President in charge of the purchasing department.

Evansville & Terre Haute.—See Chicago, Rock Island & Pacific.

Special Officers.

Pennsylvania.—R. H. Newbern, Assistant Superintendent of the insurance department, has been appointed Superintendent of that department, succeeding Hugh B. Ely, deceased.

LOCOMOTIVE BUILDING.

The State Railroads of Chili are in the market for 60 locomotives.

The Chicago & North-Western, it is said, is considering the purchase of 10 locomotives.

The Florida East Coast did not recently order 12 locomotives from the American Locomotive Co., as reported in the *Railroad Gazette* of November 8.

The Hocking Valley, according to press despatches, has reserved space with the American Locomotive Co. for 10 switching and two passenger locomotives for 1908 delivery.

The Pittsburgh, Shawmut & Northern has not ordered 10 freight locomotives and two passenger locomotives as reported in the *Railroad Gazette* of November 15, and it does not expect to do so this year.

The Denver & Rio Grande, as reported in the *Railroad Gazette* of November 1, has ordered 28 simple consolidation (2-8-0) locomotives from the American Locomotive Co., for January and February, 1908, delivery. The specifications are as follows:

General Dimensions.

Type of locomotive	Consolidation
Weight, total	220,000 lbs.
Weight on drivers	192,000 "
Diameter of drivers	57 in.
Cylinders	23 in x 28 in.
Boiler, type	Radial stay; extended wagon top
" working team presssure	200 lbs.
" number of tubes	364
" material of tubes	Charcoal iron
" diameter of tubes	2 in.
" length of tubes	15 ft.
Firebox, length	108 in.
" width	65¼ "
" material	Worth steel
" grate area	48 sq. ft.
Heating surface, total	3,028 "
Tank capacity	8,000 gals.
Coal capacity	14 tons

Special Equipment.

Air brakes	Westinghouse
Brake-beams	National-Hollow
Couplers	Tower
Injector	Simplex
Piston rod packings	Paxton-Mitchell
Valve rod packings	Paxton-Mitchell
Safety valve	Coale
Sanding devices	Hanlon
Sight-feed lubricators	Nathan
Springs	Railway Steel-Spring Co.
Tires, driving wheel	Midvale
Wheel centers	Standard Steel Co.

CAR BUILDING.

The Pere Marquette has asked bids on 1,000 box cars.

The Detroit, Toledo & Ironton has asked bids on box and flat cars.

The Canadian Pacific has been receiving bids on some 40-ton tank cars.

The Boston & Maine is said to be in the market for passenger equipment.

The Chicago, Rock Island & Pacific is asking prices on 30 miscellaneous cars.

The Chicago, Rock Island & Pacific has been asking bids on box, gondola and flat cars.

The Chicago, Indianapolis & Louisville has asked bids on several hundred box and gondola cars.

The Tonopah & Tidewater recently ordered three chair cars, one baggage car and one smoking car from the Pullman Company.

The Coney Island & Brooklyn has ordered 10 electric car bodies from the J. G. Brill Co., but the trucks and motors have not yet been decided on.

The Grand Trunk has decided not to order the 1,000 steel coal cars for which they recently asked bids, as reported in the *Railroad Gazette* of November 8.

The New York, Ontario & Western has postponed its proposed order for 10 passenger cars, on which it asked bids, as reported in the *Railroad Gazette* of October 18.

The Zanesville & Western, according to press despatches, has ordered 500 drop bottom coal cars of 100,000 lbs. capacity from the Ralston Steel Car Co., for December delivery.

The Virginian Railway, it is understood, will not for the present buy 100 coal cars, as reported in the *Railroad Gazette* of November 15, but it is said that the company will soon buy eight special cars.

The Mexican Railway, as reported in the *Railroad Gazette* of June 7, is considering the purchase of six chair cars, six first class coaches and six third class coaches, for which they were reported in the market.

RAILROAD STRUCTURES.

Iselin, Pa.—The Buffalo, Rochester & Pittsburgh has plans ready for a number of freight and passenger stations at important points on its Pittsburgh extension. The work is to be started this winter.

Ottawa, Ont.—The Ottawa Electric Railway, it is said, will pay part of the cost of the proposed viaduct on the Richmond road.

St. Thomas, Ont.—The Michigan Central, it is said, has plans made for putting up a new roundhouse here.

Vancouver, B. C.—The British Columbia Electric Street Railroad has plans made for putting up a combined station and office building to cost $100,000. R. H. Sperling, General Superintendent.

RAILROAD CONSTRUCTION.

New Incorporations, Surveys, Etc.

Allegheny Coal Railroad.—Incorporated in West Virginia, with office at 1 Broadway, New York. The company proposes to build a line from the Baltimore & Ohio near Fairmont, W. Va., southwest through Marion, Harrison, Lewis and Gilmer counties to Glenville, 65 miles. The incorporators include Harry Smith, Baltimore; U. Hanmann, G. M. Dodge and A. Lerinsohn, of New York, and F. S. Landstreet, Davis, W. Va.

Ashcroft, Bakersville & Foat Geoage.—Application will be made at the next session of the Dominion Parliament for an extension of time to start work on this proposed line. The line is projected from Ashcroft, B. C., north to Fort George, about 300 miles. Eberts & Taylor, Vancouver, B. C., are the Attorneys. (March 15, p. 394.)

Atchison, Topeka & Santa Fe.—Although President Ripley recently announced that improvements to be made by this company were to be curtailed, according to reports from Texas, engineers are still at work on final surveys for the proposed cut-off to be built from Brownwood, Tex., northwest to Texico, N. Mex., about 300 miles. (March 15, p. 379.)

Ballinger & Abilene.—This company, it is said, will let contracts this year for building its proposed line from Ballinger, Tex., north to Abilene, 55 miles. W. J. McDaniel, Chief Engineer, Ballinger.

Baton Rouge, Hammond & Eastern.—See Illinois Central.

Billings & Northern.—See Great Northern.

Brandon, Saskatchewan & Hudson's Bay.—See Great Northern.

Canadian Northern.—This company, it is said, has graded 30 miles on a line which is projected from Saskatoon, Sask., southwest to Calgary, about 300 miles. This line is eventually to form part of a through line between Calgary and Ft. Churchill on Hudson Bay. Connection is also to be made with the line under construction north from Etlomani, Sask.

Canadian Pacific.—Officials of this company at Vancouver are reported as saying that bids will at once be asked for clearing and grading 48 miles of the Esquimault & Nanaimo extension from Nanaimo, B. C., west to Alberni. (Aug. 30, p. 247.)

Surveys are reported being made to extend the Manitoba & Northwestern from Sheho, Sask., northwest to Quill Lake, approximately, 62 miles.

Chicago & Southern Traction.—This company, it is said, recently finished an extension of its road and the line is now in operation from Chicago, Ill., south to Kankakee, 65 miles. The line is eventually to be extended southwest to Indianapolis, Ind.

Chicago, Burlington & Quincy.—An officer writes in reference to the proposed line from Frannie, Wyo., northwest, to Fromburg, Mont., 35 miles, that some surveys have been made, but there is no immediate prospect of the company building the line. (Nov. 8, p. 572.)

Crow's Nest Southern.—See Great Northern.

Cumberland River & Nashville.—Rights of way have been secured and work, it is said, will at once be begun by the Monticello Construction Co., of which J. H. Shearer is President, for building the section of this proposed line from Toteville, Ky., on the Cincinnati, New Orleans & Texas Pacific, southwest to a point 15 miles beyond Monticello. The line is to run from Corbin, Ky., southwest to Nashville, Tenn., 160 miles. (April 19, p. 564.)

Dakota & Great Northern.—See Great Northern.

DENVER & RIO GRANDE.—The work of double-tracking the Eagle River Canyon on the main line of this road, just west of Leadville Colo., is finished. The contractors, the Phillips Construction Company and O'Gara, commenced work about a year ago. The new second track, built through the narrow canyon, cost more than $100,000 a mile to construct. In the five miles there are three tunnels, with a total length of 800 feet, being 100, 300 and 400 feet respectively. There are five steel bridges with solid concrete floors. The new line, which is to be used for the eastbound or uphill haul, reduces the grade from 3.3 per cent. to 2.3 per cent., and the curvature is also greatly lessened.

ERIE, LONDON & TILSONBURG (ELECTRIC).—This company is applying for an extension of time for the construction of its line already authorized. The projected route is from Port Burwell, Ont., northwest to London, 40 miles, with a branch east to Tilsonburg, 15 miles. (March 15, p. 395.)

ESQUIMAULT & NANAIMO.—See Canadian Pacific.

GREAT NORTHERN.—The report of this company for the year ended June 30, 1907, shows that during the year the Dakota & Great Northern from Aneta, N. Dak., northwest to Devils Lake, 57.72 miles, was opened for traffic; also an extension from Thorne, N. Dak., northwest to Dunseith, 7.61 miles, and the extension from Berthold, N. Dak., northwest to Crosby, 89.09 miles. The line from Walhalla, N. Dak., north to the International boundary, 5.35 miles, where connection is to be made with the Midland of Manitoba, is to be opened this fall. The Billings & Northern from Armington, Mont., southeast to Laurel, 194.29 miles, has grading about two-thirds finished, and tracklaying was started last May. Up to June 30, 17 miles of track had been laid.

The Brandon, Saskatchewan & Hudson's Bay from the International boundary north of St. John, N. Dak., north to Brandon, Man., 69.45 miles, has been opened for traffic. The Midland of Manitoba from the International boundary north of Neche, N. Dak., northwest to Portage la Prairie, Man., 77.01 miles, has been opened for traffic, and the line from the International boundary north of Walhalla, N. Dak., to Morden, Man., 15.54 miles, is to be opened this fall.

The Vancouver, Victoria & Eastern and the Washington & Great Northern have been opened for operation from Midway, B. C., to the International boundary near Molson, Wash. (V., V. & E.), 28.89 miles, and from the International boundary near Molson to Oroville, Wash. (W. & G. N.), 27.82 miles. On the section from Oroville west to the International boundary at Chopaka (W. & G. N.), 20.64 miles, and from that place to Keremeos, B. C. (V., V. & E.), 18.20 miles, tracklaying has been finished. The V., V. & E. is also building from the Pacific coast east to meet the line building west from Keremeos. On this section work is under way from Cloverdale, B. C., east to Abbotsford, 26.25 miles. The V., V. & E. and the Victoria Ferry & Railway Company is building a low-grade line from New Westminster, B. C., south to Blaine, Wash. The portion of the line from New Westminster to Olivers, 9.89 miles, is being built by the V., V & E., and from that place to the International boundary north of Blaine, 11.32 miles, is being built by the V., F. & R.

Work is under way on the Crow's Nest Southern, building a 24-mile extension from Fernie, B. C., north to the mines of the Crow's Nest Pass Coal Company at Michel, B. C.

To facilitate the handling of iron ore, a line has been built from Kelly Lake, Mich., southeast to Fermoy, 23.40 miles, which was opened for traffic in September. An extension 1.67 miles long of the Stevenson mine spur has been finished. The company also built from Neche, N. Dak., .64 miles, to a connection with the Midland of Manitoba at the International boundary. A new line from Schurmeier, N. Dak., south to Grand Forks, permitting the abandonment of the old line between these places and giving a more direct connection with the new yards at Grand Forks, was built. The extension of the Brown's Valley branch in Minnesota to Lake Traverse, 1.92 miles, was put in operation last year.

The following work has been finished or is nearing completion: New terminals, including buildings and six miles of yard tracks, at Casselton, N. Dak.; similar work, including 11 miles of yard tracks, at Devils Lake, N. Dak.; also at Grand Forks, including 10 miles of yard tracks, and a 25-stall engine house at St. Paul, Minn. Grade reduction work between Minneapolis, Minn., via Wayzata, Willmar and Breckenbridge to Aneta, N. Dak. A number of smaller stations and buildings were also put up during the year. About three miles of sea wall has been built, and 4½ miles of double-track laid between Everett, Wash., and Seattle. The net increase in side track mileage during the year, not including the tracks on new lines under construction, or opened for operation during the year, was 132.13 miles. In addition 6.44 miles of side tracks were laid in connection with the Seattle passenger station, and track material for 10 miles of extensions to logging spurs near Solway and Akeley, Minn., were furnished by the company. During the year the main tracks were relaid with 85-lb. rails on 377.86 miles, and with 70-lb. rails on 45.87 miles. Several changes in the location of lines at various points have been made to improve the alinement, aggregating 9.41 miles. During the year the company replaced wooden and iron bridges and trestles with steel bridges, aggregating 1,667 ft. and 5,429 ft. of fills. Some of the work now in progress includes: Second main track between Devils Lake, N. Dak., and Churchill's Ferry, between Everett, Wash., and Ballard, the latter including the completion of the sea wall. The erection of terminal buildings and enlargement of yards at Kelley Lake, Minn., and at Allouez, Wis. A new yard is being built on the bay front, Superior, Wis., for coal traffic, preparatory to building a new elevated line for an entrance into Duluth, Minn., over the Duluth and Superior bridge controlled by the company. A change of line at Albany, Falls, Idaho, includes putting up a new steel bridge over the Pend d'Oreille river. A new dock and grain warehouse are also to be put up at Everett, Wash., and timber bridges are to be replaced with steel structures aggregating 2,900 ft.

HIDALGO & NORTHEASTERN.—See National of Mexico.

ILLINOIS CENTRAL.—A statement is made that the present plans for the construction of the Baton Rouge, Hammond & Eastern projected from Baton Rouge, La., east to Merrill, Miss., about 170 miles, call for building the line from Baton Rouge east to Covington, 65 miles, as rapidly as the work can be done. East of that place there will be nothing done at present. (June 14, p. 878.)

ILLINOIS TRACTION.—The St. Louis & Staunton has been incorporated, with office at Champaign, Ill., to build a line from the main line of the Illinois Traction at Edwardsville, Madison county, northeast to Staunton, Macoupin county, 20 miles. The St. Louis & Northeastern, a subsidiary of the Illinois Traction, now operates a line between these places. The incorporators include: G. N. Mattis, W. H. Carnahan, R. H. Watson, Jr., B. M. Bramble and C. Zille.

LEHIGH & LAKE ERIE.—See Lehigh Valley.

LEHIGH VALLEY.—The Lehigh & Lake Erie, a 10-mile double-track terminal line in Buffalo, is finished. The line has not yet been opened for traffic.

MANITOBA & NORTHWESTERN.—See Canadian Pacific.

MEXICAN CENTRAL.—Work is under way on the Manzanillo extension, repairing the damage caused by floods last summer. About 10 miles of grade and track were washed away.

MIDLAND OF MANITOBA.—See Great Northern.

MISSOURI PACIFIC.—Contracts are reported let to L. J. Smith, of Kansas City, Mo., at $1,500,000, for ballasting with gravel the tracks of the St. Louis, Iron Mountain & Southern in Arkansas and Louisiana. It will require eight months to finish the work.

NATIONAL OF MEXICO.—Plans, it is said, have been made to extend the Hidalgo & Northeastern from Beristain, Hidalgo, northeast to the port of Tuxpan, on the Gulf coast, about 125 miles. It is said that the Government will carry out extensive improvements to make a deepwater harbor at Tuxpan.

NEW YORK CENTRAL & HUDSON RIVER.—The New York State Public Service Commission, First district, has begun legal action to condemn the rights of this company on Eleventh avenue in New York City. This is in pursuance of the law under which the company's tracks in Eleventh avenue, used mostly for freight, will have to be taken up and rebuilt either above or below the surface.

NEW YORK & STAMFORD (ELECTRIC).—This company, which operates a 16½-mile electric line from New Rochelle, N. Y., northeast to the Connecticut state line, has been granted permission to double-track its line in Larchmont, Rye and Portchester.

NORTHERN PACIFIC.—It is expected that this company will soon let contracts for piercing a tunnel from the Narrows to the water front in Tacoma, Wash. When this work is begun, it is said, contracts will be let for the new $500,000 passenger station.

ONTARIO ROADS (ELECTRIC).—A franchise has been granted to build an electric line from Cobalt, Ont., north to Haileyburg, about five miles. The line is eventually to run south from Cobalt to the Silver Queen mine and north from Haileyburg to New Liskeard. Judge C. M. Stone, of Cleveland, Ohio; M. J. O'Brien, R. J. Fitzpatrick and Frank Latchford, of Ottawa, Ont., and T. Fitzpatrick, of New Liskeard, are interested.

OREGON & WASHINGTON.—See Union Pacific.

OREGON RAILROAD & NAVIGATION COMPANY.—See Union Pacific.

OREGON SHORT LINE.—See Union Pacific.

PHILADELPHIA & READING.—Bids are wanted December 17 at the office of W. Hunter, Chief Engineer, Philadelphia, for grade crossing elimination work on the Philadelphia, Germantown & Norristown, as follows:

Contract No. 5.—Masonry, trestle and embankments from south side of Berks street to the south side of Susquehanna avenue.

Contract No. 7.—Similar work from south side of Susquehanna avenue to Broad street.

Contract No. 8.—Bridges from Berks street to Broad street.

Contract No. 14.—Masonry, embankment and paving for yards between York street and Cumberland street.

Contract No. 26.—Temporary engine yard at Wayne Junction.

St. Louis & Staunton.—See Illinois Traction.

St. Louis, Iron Mountain & Southern.—See Missouri Pacific.

San Antonio & Aransas Pass.—Plans are reported being made by this company to lay heavier rails on its road from San Antonio, Tex., east to Houston, 239 miles.

Southern Utah.—This company, it is reported, will soon let contracts for building its proposed line from Price, Utah, on the Rio Grande Western south about 20 miles to Miller creek. L. P. Elliott, Chief Engineer, Salt Lake City.

Texas City Terminal.—H. B. Moore, General Manager of this company, is quoted as saying that in the last year the railroad built four miles of track to a connection with the Gulf, Colorado & Santa Fe, and also built six miles additional, for increasing the terminal facilities at Texas City. The road now has connection with all lines entering Houston from Galveston.

Tuscarawas Valley Transit & Power Co.—Under this name a company proposes to build a line from Canal Dover, Ohio, north via Zoar and Bolivar to Canton, about 25 miles. The line may eventually be extended from the proposed southern end at Canal Dover southwest via Coshocton to Columbus. The promoters' names are not given .

Union Pacific.—This company recently opened a new branch to coal mines on its Colorado division at St. Vrain which may eventually be extended north to Fort Collins. Double-tracking work is in progress on a large section of the road through Nebraska and Wyoming. The double-track in operation and on which work is under way is shown in the following table:

	Tracks		
	Double, in operation.	Second, under construction.	Single.
Council Bluffs, Iowa, to 13th St., Omaha	3.1	.....	.....
Add'l tracks, 13th St. to Omaha city limits	.....	2.0	.....
S. O. & W. R. R.	.....	11.6	.....
Lane to Valley	11.3	.....	.....
Valley to Benton	.....	48.9	.....
Benton to Columbus	7.9	.....	.....
Columbus to Silver Creek	.....	17.5	.....
Silver Creek to Lockwood	.....	38.5	.....
Lockwood through Grand Island to Alda	13.7	.....	.....
Alda to Buda	.....	29.8	.....
Buda through Kearney to Watson's Ranch	10.1	.....	.....
Watson's Ranch, Neb., to Archer, Wyo.	.....	.....	36.7
Archer to Buford	35.3	.....	.....
Buford to Hermosa	.....	.....	11.9
Hermosa to Laramie	17.9	.....	.....
Laramie to Lookout	.....	.....	27.6
Lookout to Hanna	49.3	.....	.....
Hanna to Rawlins	.....	.....	39.9
Rawlins to Wamsutter	.....	41.4	.....
Wamsutter to Point of Rocks	.....	.....	52.9
Point of Rocks to Rock Springs	26.2	.....	.....
Rock Springs to Green River	.....	.....	13.9
Total	174.8	189.7	182.9

The Oregon Short Line is making improvements in Salt Lake City to cost $1,800,000. About 25 miles of sidings, a freight house 600 ft. long, and a passenger station to cost $300,000 are being built. A new branch is projected from Sugar, Idaho, on the Yellowstone Park branch southeast to coal fields at Victor, below the South Fork river, about 50 miles. Work is also under way building a branch from Huntington, Ore., at the junction of the Oregon Railroad & Navigation Co.'s line, north along the Oregon-Idaho state line, following the Snake river, to be built eventually to Lewiston, Idaho. This line will probably form part of a through transcontinental line; 59 miles of the line has been authorized and grading is finished for 25 miles. (Oct. 1, p. 403.)

The Oregon Railroad & Navigation Company is extending its branch from Elgin, Ore., east to Joseph, 63 miles. From The Dalles, Ore., west to Portland, 88 miles, the company has been at work for the past year reducing the heavy grades and the worst curves and improving the track; about $1,500,000 is now being spent on this work. The longest stretch of straight track between The Dalles and Portland on the present line is about two miles. On one of the improvements now under way, that between Troutdale and Bonneville, 17.48 miles, the reduction in curvature will amount to 1,454 deg. 51 min. The amount of bridging is also being greatly reduced between The Dalles and Portland, where five years ago there were 7½ miles of bridges there is now but about half a mile. Terminals have been bought at a cost of about $20,000,000 and a considerable amount of the right-of-way has been secured for the proposed Oregon & Washington, projected from Portland, Ore., north to Tacoma and Seattle, about 230 miles. This line will cost about $15,000,000. Announcement is made that work is to be begun next month at Tacoma, Wash., on an 8,700-ft. tunnel to have two tracks for this line. The cost of the tunnel will be about $3,000,000. (Nov. 15, p. 665.)

Announcement is made that this company will build a 20 mile branch from Rock Springs, Wyo., north to extensive coal fields. There are also to be three or four laterals, with a combined length of about six miles.

Vancouver, Victoria & Eastern.—See Great Northern.

Victoria Ferry & Railway Company.—See Great Northern.

Washington & Great Northern.—See Great Northern.

West Side Belt.—Work has been started by this company, rebuilding the Banksville branch, which is to be extended later to Washington county, where the Gould interests own extensive coal lands. The rebuilding of this line is thought to be the first step toward the development of the Washington county property.

RAILROAD CORPORATION NEWS.

Atlantic Coast Line.—The Directors have decided not to take action on the annual dividend on the common stock until some time in December, when a special meeting will be called. The company has been paying 6 per cent. on its $47,537,600 common stock for the last two years.

The New York Stock Exchange has listed $383,000 additional first consolidated mortgage 50-year 4 per cent. bonds, making the total listed $43,524,000. The additional bonds were sold to pay for new rolling stock.

Boston & Maine.—Gross earnings for the three months ended September 30, 1907, were $11,607,602, an increase of $388,446; net earnings $3,541,722, an increase of $188,287. The surplus after charges was $1,293,507, a decrease of $141,007.

Chicago, Indianapolis & Louisville.—Millett, Roe & Hagen, New York, are offering at 111 and interest $50,000 refunding mortgage 6 per cent. bonds of 1947, being part of an outstanding issue of $4,700,000. This offering of an underlying long term bond secured by a direct mortgage lien at a price to yield 5.35 per cent. is an illustration of the present low prices for railroad securities. These bonds sold at from 128 to 137 in 1906.

Chicago Union Traction.—A modified plan of reorganization has been approved by Judge P. S. Grosscup and Professor J. C. Gray and the reorganization committee has asked the holders of the securities of the different street railway companies in Chicago to deposit their holdings on or before November 25 under the terms of the new plan.

Illinois Central.—To President Harahan's circular letter mentioned in this column last week, Stuyvesant Fish replies that the fact that the personnel of the management has so far not been changed and is considered efficient is gratifying to him, since these appointments were made under his administration. He says that he is making the contest not because the present condition of the Illinois Central is alarming, but because he believes that domination by the Harriman interests will result in future changes which will hurt Illinois Central stockholders.

Mexican Railway.—Gross earnings for the six months ended June 30, 1907, were $1,986,162, an increase of $237,833; net earnings, $870,594, an increase of $58,782. Net income, after charges, was $635,801.

Pere Marquette.—The meeting to approve the reorganization plan has been postponed to December 9. (Nov. 8, p. 574.)

Pontiac, Oxford & Northern.—The sale of this road under foreclosure has been ordered by the Circuit Court, but pending an appeal to the Supreme Court no date for the sale has been set. The road runs from Pontiac, Mich., to Caseville, 100 miles, and has been in the hands of a receiver since March, 1905.

Southern Pacific.—Gross earnings for the three months ended September 30, 1907, were $34,254,658, an increase of $5,740,151; net earnings, after taxes, $10,062,657, a decrease of $743,623.

Tampa Electric.—This company has declared a semi-annual dividend of 2 per cent. on its $1,700,000 capital stock. The annual rate had been 10 per cent. for several years. The company owns all the street railways, 36 miles, and electric lighting plants in Tampa, Fla., and Port Tampa.

Union Pacific.—Gross earnings for the three months ended September 30, 1907, were $21,192,742, an increase of $2,493,242; net earnings, after taxes, $8,415,452, a decrease of $898,236.

Wabash.—The New York Stock Exchange has listed $416,000 additional first refunding and extension 50-year 4 per cent. bonds, making the total listed $24,366,000. These additional bonds were issued in exchange for debenture "B" bonds and the Stock Exchange has authorized the listing of $584,000 more as issued from time to time in exchange for debenture "A" and "B" bonds up to July 1, 1908.

York Railways Company.—The Governor of Pennsylvania has approved the merger of the electric railways in York county under the name York Railways Company. The new company will have $5,000,000 capital stock and will assume $3,431,000 bonds of the old companies. W. F. B. Stewart, York, Pa., is President.

RAILROAD GAZETTE

ESTABLISHED IN APRIL, 1856.

PUBLISHED EVERY FRIDAY BY THE RAILROAD GAZETTE AT 83 FULTON STREET, NEW YORK
BRANCH OFFICES AT 3715 OLD COLONY BUILDING CHICAGO, AND QUEEN ANNE'S CHAMBERS WESTMINSTER, LONDON

EDITORIAL ANNOUNCEMENTS.

THE BRITISH AND EASTERN CONTINENTS edition of the Railroad Gazette is published each Friday at Queen Anne's Chambers, Westminster, London. It contains selected reading pages from the Railroad Gazette, together with additional British and foreign matter, and is issued under the name Railway Gazette.

CONTRIBUTIONS—Subscribers and others will materially assist in making our news accurate and complete if they will send early information of events which take place under their observation. Discussions of subjects pertaining to all departments of railroad business by men practically acquainted with them are especially desired.

ADVERTISEMENTS—We wish it distinctly understood that we will entertain no proposition to publish anything in this journal for pay, EXCEPT IN THE ADVERTISING COLUMNS. We give in our editorial columns OUR OWN opinions, and these only, and in our news columns present only such matter as we consider interesting and important to our readers. Those who wish to recommend their inventions, machinery, supplies, financial schemes, etc., to our readers, can do so fully in our advertising columns, but it is useless to ask us to recommend them editorially, either for money or in consideration of advertising patronage.

OFFICERS—In accordance with the law of the state of New York the following announcement is made of the office of publication, at 83 Fulton St., New York, N. Y., and the names of the officers and editors of The Railroad Gazette.

CONTENTS

VOL. XLIII., No. 22. FRIDAY, NOVEMBER 29, 1907.

At last the financial disturbances and threatened industrial depression which have for some time been showing their effect by reducing the percentages of increase of railroad gross earnings have brought about the first actual decrease for over two years and a half. For the second week of November the gross earnings of 42 railroads, as summarized in the *Commercial & Financial Chronicle*, showed a decrease of 1.80 per cent. This is the first decrease so reported since the fourth week of February, 1905, when 50 roads reported a decrease of 6.30 per cent. in gross earnings. Gross earnings decreased in each of the last three weeks of that month, and for the month as a whole 117 roads reported a decrease of 3.01 per cent. in gross. Forty-seven roads reported a decrease of 3.39 per cent. in gross earnings for the second week in January, 1905. The loss in this one week, however, was swallowed up in the gains of the other three weeks so that this month showed an increase. Except for these four weeks in the winter of 1905 gross earnings have shown an increase up to this month in every week since July, 1904. In the fourth week of that month, 45 roads reported a decrease of 4.35 per cent., and in the third week 49 roads showed a loss of 1.54 per cent. in gross. For July, 1904, as a whole, 125 roads reported a decrease of 5.35 per cent. in gross earnings. Thus, the weekly figures, though for a much smaller number of roads, are typical of the trend of earnings throughout the bulk of the country's railroads. No figures of course are available for the current month. For October only 56 roads have reported to the *Chronicle*, these showing an increase of 5.91 per cent. in gross. In September 118 roads showed an increase of 9.71 per cent. following gains of 12 per cent. in August (121 roads); 14 per cent. in July (116 roads); 14 per cent. in June (121 roads); 18 per cent. in May (121 roads), and 21 per cent. in April (118 roads). The April increase followed a gain of 9 per cent in March and was the high-water mark of the present year. Since then there has been a steady and continuous decrease. Now that it is a fact that gross earnings are falling off, it is important to consider the effect of this change. What this will be depends entirely on the extent to which earnings decrease. In many ways a moderate falling off in gross would be a relief and an advantage. One great reason for the rapid rise in operating expenses during the past year was the increase of traffic beyond facilities. One year of congestion and strain had been piled on another until the tracks, terminal facilities, locomotives, cars and most of all perhaps the men, both employees and officers, were overburdened by the continued pressure. A small falling off in gross earnings will give a breathing space in which to strengthen all these different factors in railroad efficiency and straighten out difficulties whose settlement has been brushed aside by the one urgent necessity of moving the traffic. How far the decrease in gross earnings can go before it begins to reduce net in the same proportion or faster is a question which the experience of the next six months will go far to answer.

THE WANING SUPPLY OF HARDWOOD IN THE UNITED STATES.

An apparently well founded guess as to when the hardwood supply will be exhausted has some interest both as an incentive to the development of substitutes and to planting and reforestization. The Forestry Bureau gives us some facts, some estimates and some well founded guesses. Heretofore we have had treatment by the bureau of the timber supply as a whole and not separating the hardwoods as it has done in this instance. In the past the center of hardwood supply may be said to have been in Ohio and Indiana; the far western states produce so little, that the quantity is negligible. At the present time the Ohio-Indiana supply, so easily accessible, has been exhausted and west of the Mississippi river the only state that need to be considered as a producer of hardwoods is Arkansas, which furnished about seven per cent. of the whole amount cut in the United States in the year 1906.

Of the hardwood trees cut into lumber, the production in 1899 was 8.6 billion board measure feet. In 1906 this cut was reduced 15.3 per cent. to 7.3 billion, although the wholesale prices of hardwood lumber advanced from 25 per cent. to 65 per cent. It is plain, therefore, that the decrease of production was due to a waning supply. The main production is now in the Lake states, especially in Michigan and Wisconsin, the lower Mississippi Valley and in the states containing portions of the Appalachian mountain ranges.

There is little hope for successful reforestization of lands adaptable to agricultural or other purposes, and this consideration disposes of any hope for other than sporadic reforestization in the Lake states and Mississippi Valley. The Forestry department believes, however, that there is a chance for successful work in the Green mountains, the Alleghany, the Blue Ridge and minor ranges

in the Appalachian group. The present lumber cut of 7.3 billion board measure feet is probably less than one-third of the amount of hardwood cut and used; for the records do not include the amounts cut for railroad ties, poles, piles, fence posts and fuel based on the measured cut, the guessed cut is therefore 25 billion board measure, or a trifle more than 3 billion cubic feet a year.

The amount of standing hardwood is also uncertain, but there are a number of reasonable bases for estimate, and the highest estimate is 50 billion cubic feet. At the present rate of cutting, therefore, the supply will be exhausted in about 16 years.

As to the chance of reforestization with a view to making a constant supply of three billion cubic feet a year, the Forestry department has made estimates by counties in the Appalachian mountain ranges south of Pennsylvania, and less accurate estimates in the mountains of Pennsylvania, New York and New England, and finds that there are 75 million acres primarily adapted for hardwood timber and having little or no value for other purposes. Most of this has been more or less closely cut over, but its reforestization is not considered difficult. The careful studies made by the department in East Tennessee show that under protection from fire and with good management, such lands are capable of producing 50 cubic feet of hardwood per acre per year and these figures applied to the 75 million acres in the Appalachians would make a possible annual production of between three and four billion cubic feet. Of course, at the beginning of the undertaking the maximum production would not be reached.

The Forestry department estimates that at the beginning the average production would be 10 cubic feet per acre, increasing gradually to the estimated 50 cubic feet per acre per year. It seems probable, therefore, that if active steps were taken now by this Government to so make permanent its hardwood supply the product would soon keep pace with the demand. There is a wide difference between constructive and destructive governmental enterprise. A man does more good, but attracts less attention when he is hoeing potatoes than when he is killing snakes.

THE LIQUIDATION IN RAILROADS.

It is a good time now when the word "liquidation" comes up so often in the vocabulary of stressful finance to recall briefly, for comparison and contrast, some of the phenomena of the panic of 1873 and the long strain which followed it for several years. That long crisis, it will be remembered, had its origin in railroad finance and, in one sense, "high" finance, though of a different, less malignant and less culpable type than the high finance of to-day. High finance then was simply a kind of honest craze for railroad overbuilding. It was only in a limited way speculation. It was still less stock watering. And it was not in any noteworthy degree stock manipulation, recapitalization, holding corporations and other recent devices of control. Municipalities shared in the frenzy of railroad construction and inflated ideas of its local benefits, and put the dollars of the taxpayers into railroad projects only to see the dollars swept by the board and the obligations incurred by "loan aid" bonds remain—and many of them remain unto this day. Still it was generally cash and not water that went into the unwise railroad enterprise. It was the railroad project, not the railroad security that, in the up-to-date adjective, was "undigested."

But the results were profoundly disastrous. As it was the railroads that brought on the 1873 crisis so it was the railroads that felt its brunt. Other and normal symptoms of general financial contraction—tight money, trouble in banking institutions, recession of business—were apparent enough; but it was upon railroads that the hardest shock fell and among the railroads that the longest and widest swath of calamity was cut. The shock came very suddenly and at a time when ever so many railroads were either under construction or had barely passed that stage. They were unfinished or had not reached a period of earning power and had also, at that initial stage, been incompletely financed. Hence the sequel in receiverships, foreclosures and reorganizations on a great scale attended with heavy losses in junior railroad securities and often in senior securities also. And it took years to "liquidate" and set the crippled roads on a bedrock of solvency during a painful process of cure in which the roads which were "going" concerns had to suffer too.

It is from history with its parallels and contrasts that we best learn. When we apply that "liquidation" experience beginning in the autumn of 1873 with the situation now, almost exactly a third of a century later, one finds some important elements of reassurance. On the negative side we of course have just had the high finance which we did not have then or, at least, not in anything like the same degree. But of late high finance has had some awful and disciplinary jars which ought to give it a quietus for a good while to come. On the same negative side we have the state and federal attack on capital mixing innocence and guilt in its assault. But is not experience now beginning to teach also federal and state authority its sharp lesson to be driven in yet deeper when the courts, on the one hand, and popular sentiment on the other, responsive to the pocket nerve, begin to get in their work? On the positive side the contrast with 1873 is cheering. There has been, to be sure, vast shrinkage in railroad values. But the financial trouble has not focussed on the railroads in anything like the same measure that it did in 1873 and after; it has hit them not as inchoate ventures half born or newly born but as going concerns with earning power often very high and not even yet much diminished; it has struck at a single branch of railroading, the financing of improvements, not at the original values; and the losses in such financing have fallen in a large number of cases on the underwriters, not on the railroad corporation. The long trail of railroad receiverships that began so quickly in 1873 has not begun now nor is there the slightest probability that it will begin at all. Even dividends remain almost entirely unaffected. The fundamental conditions of the two periods of "liquidation" are different—all the difference, in fact, between railroad stability and railroad infirmity and their relative power in resisting adverse market prices.

One can go farther and point out other disparities between the "liquidations" of 1873 and of 1907 in their bearing on railroad investments as well as others. The protective high organization of conservative capital at the later period might, for example, be contrasted with the looser and less effective organization of 1873 as well as differences in the character and size of the national prosperity. But such broader reasonings are needless. That liquidation of 1873 as a starting point of time and reaching through the painful years in railroad affairs which followed, finds in 1907 a railroad condition not only not analogous but, intrinsically, almost exactly the reverse. A few months, perhaps weeks, will set forth the fact in clearer terms of railroad stability.

AN EQUIPMENT ACCOUNT FOR EACH CAR AND LOCOMOTIVE.

Equipment accounting is a subject of particular interest at this time because the rules of the Interstate Commerce Commission covering this department of railroad accounting are still under discussion and are soon to be decided—in time to be put in force to cover the year beginning July 1, 1908. The Baltimore & Ohio's system of keeping a separate account with each locomotive and car is therefore of interest. A debit and a credit account is opened with each individual unit of equipment. This is done in books 18½ in. x 24 in. of 150 folios each. Each "folio" represents two facing pages, so that when the book is open on the desk the space occupied is 18½ in. x 48 in. The left-hand page is for the debit and the right-hand page for the credit account. Four such books are used for the individual record of locomotives and 60 for the individual passenger and freight car record.

Each page contains in three parallel columns space for the record of 50 cars, so that each book of 150 folios contains the complete debit and credit record of 7,500 cars. The debit page shows the number of the car, the month, day and year on which it was put in service, the builder and the original cost; these each in parallel columns. The last column shows the cost and character of betterments; which, for passenger cars, are listed under eight heads, as follows: Brakes, couplings, Westinghouse air signal, heating apparatus, vestibuled, capacity increased, number of wheels, lighting. There is a further column for remarks. This side of the account records the existence of the car, its cost and the kind and cost of betterments applied.

The credit account, on the right-hand page, records for the same 50 cars individually the month, day and year on which put out of service, how this came about, the book value of the car ("amount in rolling power"), how this amount was credited and a column for remarks. The credit side, therefore, records the going out of existence of the car, the amount at which it stood in the equipment account and the name of the account to which this amount is credited. Each page has a recapitulation at its foot, of the cost or value items of the 50 cars recorded on that page.

While it is not pretended by the company that this individual

record represents the actual value of each car based on a set percentage of annual depreciation, it is found valuable because it results in having a pretty accurate knowledge and necessitates constant and careful checking of the equipment, a process of which there can hardly be too much in keeping track of the rolling stock of a large system. The individual record was established at the time of the financial reorganization of the company. At that time the equipment was much overvalued and the records were in unsatisfactory shape. The company had an indicated profit and loss credit balance of about $50,000,000, but its rolling stock was badly run down and insufficient for its needs. At the time of the reorganization a revaluation of the equipment was made and the individual record established on the basis of this revaluation. For a time the locomotives and cars stood in the equipment record at this revalued figure or, in the case of new cars, at their original cost.

Then the company began to burden operating expenses with cost of replacement. Since that time the amounts charged to operating expenses for depreciation, and as credit to equipment account because of locomotives or cars put out of service, have been distributed among the individual cars and locomotives. This is a process which cannot be done with exactness. In practice it is done largely according to the judgment of the man in charge of the record, which is guided by the principle that the older the car, the more it will naturally require of the depreciation expenditures. Dividing the total amounts set aside for depreciation and because of destroyed cars, among the different cars individually, the total of the individual record agrees with the monthly summary of depreciation charges. Although this is an arbitrary process, the individual record has to be carefully checked over in doing it, which means increased watchfulness over each unit of equipment.

It is not always realized how difficult it is to keep track of 80,000 to 100,000 cars scattered over the 400,000 miles of track on the continent of North America. The individual equipment account helps to do this because the men in charge of the record (which is kept in the motive power department) check once a month with the men in the office of the superintendent of car service who keep the record of car movement. This is done in order to keep track for the individual car record of cars which have for one cause or another gone out of service. All cars which in this monthly check between the two departments are found not to have moved for a month are at once traced by the car service department. Thus the individual book-keeping account for each locomotive and car serves as an added check on the transportation records.

As the individual record is entirely too detailed to be used for getting a general view of the changes and the condition of the equipment as a whole, these facts are summarized in a monthly statement covering the whole rolling equipment. This is printed on a sheet 24 in. x 19 in., on one side of which is a summary of the individual physical changes in the equipment and on the other a summary of the result of the changes in the value of the equipment during the month and period from the end of the last fiscal year. Both statements are summarized under the four general classes of equipment: locomotives, passenger equipment, freight equipment and work equipment. In the value statement these four classes are summarized in totals.

Under the summary of physical changes, each of these general classes is separated into the individual kinds of equipment. Locomotives, for instance, are divided as passenger, freight and switching each with a further division for narrow gage, and electric motors. Passenger equipment has 18 sub-divisions, freight equipment 40, and work equipment 42 sub-divisions. The separate columns opposite each of these accounts are as follows: "On hand ....., 19...," "Bought during month," "Built," "Rebuilt," "Change of class," "Put out in error—now brought back," "Total additions," "Total to be accounted for," "Put out of service," "Sold," "Change of class," "Total deductions," "On hand ....., 19...," with a further column for remarks. This, therefore, is a complete summarized record of all equipment changes during the month. If more detailed information is wanted it can at once be found by turning to the individual record.

The statement of changes in value during the month and period is called a monthly balance sheet of rolling equipment. This has recently been revised to conform to the tentative rules of the Interstate Commerce Commission for equipment accounting. In this statement freight-train equipment is divided in two groups, wooden cars and steel cars. Opposite the classes are four double columns, one-half of the column for the month, the other half for the period. The first is for Capital Value (General Ledger Account—"Equipment"), the second for Depreciation (General Ledger Account—"Replacement"), the third for Changes in Equipment (General Ledger Account—"Equipment Renewals"), and the fourth a total of the three previous. As thus revised, the Interstate Commerce Commission headings of "depreciation" and "renewal" are kept separate. In the left hand margin under each class of equipment, including the two kinds of freight cars, there are the following headings, each on a separate line:

Capital value as of——
Increase in value by change of class
New equipment added
Equipment erroneously reported "Out of Service" now brought back.
Betterments applied.
Total,
From which should be deducted
Deductions by reason of change of class
Equipment put "Out of Service" by reason of sale, wreck or condemnation.
Monthly depreciation
Total deductions.
Net total.

This is as complete a summary of the changes in value of the equipment during the month as the statement on the other side of the same sheet is a summary of the physical changes during the same period. By the three parallel columns for Capital Value, Depreciation, and Changes in Equipment, a complete record of the changes in value as distributed among these three separate accounts is kept. The fourth column gives the total of the other three. Thus on the two sides of one sheet can be summed up all the changes in number (physical) and in value (financial) of the entire equipment of the Baltimore & Ohio system.

These two summaries combined with the individual locomotive and car record form a complete detailed showing and at the same time a clear and understandable record of the condition, value and changes in the equipment. Keeping the individual equipment record on the Baltimore & Ohio takes the whole time of two men at a cost of $175 a month, or $2,100 a year. As the books in which the record is kept are so ruled as to give three or, at a push, four lines for each locomotive or car, the books will last for many years. There is nothing automatic about this system. It does not ensure an accurate record of the value of each locomotive or car, nevertheless it records the life history, makes re-inventorying or corrections easy, and the results when summarized in totals by classes of equipment are likely to be much more accurate than when records by classes are the most detailed that are kept. The fact that the Baltimore & Ohio and the Pennsylvania both keep such records of each locomotive and car is some proof of the value of such individual equipment accounting.

Train Accidents in October.[1]

Our record of train accidents occurring on the railroads of the United States in October, 1907, includes 14 collisions, 14 derailments and three other accidents, 31 accidents in all. This record is not published in full except in the cases of the few accidents which are especially prominent—in the present instance four collisions and one other accident. The record of "ordinary" accidents—which term includes, for our present purpose, only those which result in fatal injury to a passenger or an employee or which are of special interest to operating officers—is given at the end in the shape of a one-line item for each accident, showing date, location, class and number of deaths and injuries. In this tabular statement italics are used to indicate the items concerning which details are given. This record is based on accounts published in local daily newspapers, except in the cases of accidents of such magnitude that it seems proper to send a letter of inquiry to the railroad manager.

The record for October shows no collision or derailment of

[1]Abbreviations and marks used in Accident List:

rc.....Rear collision.
bc.....Butting collision.
xc.....Other collisions; as at crossings or in yards. Where only one train is mentioned, it is usually a case of a train running into a standing car or cars, or a collision due to a train breaking in two on a descending grade.
b.....Broken.
d.....Defective.
dr.....Defect of roadway.
eq.....Defect in car or engine.
n.....Negligence.
unf.....Unforeseen obstruction.
unx.....Unexplained.
derail....Open derailing switch (negligence of engineman or signalman).
ms.....Misplaced switch.
acc. obst..Accidental obstruction.
maltce....Malicious obstruction of track or misplacement of switch.
boiler.....Explosion of boiler of locomotive on road.
fire.....Cars burned while running.
Pass.....Passenger train.
Fr.....Freight train (includes empty, engines, work trains, etc.).
*Wreck wholly or partly destroyed by fire.
†One or more passengers killed.

startling magnitude, and in this respect October is the lightest month of the year, thus far. January had the Alta Vista collision and February the Williams-Bridge derailment; March, Colton, Cal.; May, Honda, Cal.; July, Salem, Mich., and September, West Canaan, N. H. June had the Hartford collision, killing eight. April and August were free from cases causing more than six fatalities, and in the present report the maximum appears to be three.

Perhaps the worst case in October is the collision at Rudd, N. C., on the seventeenth. The only report which has been published concerning a cause is that it was due to a misplaced switch opened by the front brakeman of a freight train. Press despatches say that this brakeman had been on duty for 23 hours without sleeping, but this is a statement which lacks confirmation. The facts will probably come out in the government report.

The collision at Chicago, on the 19th, is peculiar in that Engineman Cushing, an experienced runner, had with him, as passenger on the engine, another runner of experience who testified that Cushing was at fault for overrunning a signal, having taken his fireman's word for it that the signal indicated "all right." The collision occurred not far from the terminal station and the trains were running at very moderate speed. It occurred at 7 o'clock in the evening, a westbound passenger train running through a crossover and striking an eastbound train on the adjacent main track.

The collision at Leiters Ford, on the 25th, affords an illustration of lax discipline in block signaling. A freight train entering a side track broke in two before it had fully cleared the main line, but the block signalman, who was unable to see the whole of the train, assumed that it had cleared the main line when it had not.

The collision at Dallas, Tex., is notable as being the first train accident in the history of the Missouri, Kansas & Texas Railway in which a passenger has been killed. The passenger train was filled with about 1,000 excursionists. Only one of them was fatally injured, the other two fatally injured being an engineman and a fireman.

Near Fontanet, Ind., on the 15th, all of the windows in the cars of a passenger train of the Cleveland, Cincinnati Chicago & St. Louis were broken by an explosion at a powder magazine, four miles distant. The explosion destroyed a village, killed 20 or more persons and injured several hundred others.

Of the 18 serious accidents to electric cars noticed in the newspapers in October, eight were reported as having been attended with fatal results. In one case, a butting collision in the city of Chattanooga, four persons were reported killed. The other seven fatal cases were in Steubenville, Ohio; Rapid City, S. Dak.; Cincinnati, Ohio (2), Worcester, Mass.; Cuyahoga Falls, Ohio, and Chicago, Ill.

We have received the return of the total number of persons injured by the third rail in England from 1901 to 1907. The return undoubtedly shows that as people become more accustomed to the third rail, the number of accidents tends to decrease and this in spite of the steady increase in the electrified mileage. While in 1904 there were 28 accidents, eight of which were fatal, during the first eight months of the present year there were only 14 accidents, two of which were fatal, and even this small number of accidents was largely made up of trespassers. The grand total, 1904-07, is 16 killed and 71 injured, but out of this number 12 of the fatal accidents and 25 of the injuries were to trespassers. On the whole, in view of the increase of third-rail mileage which has taken place, more especially in the London district, the number of accidents from this source seems small. It is very doubtful if the record would have been any better with overhead conductors.

NEW PUBLICATIONS.

Railway Enterprise in China. By Percy H. Kent. 304 pages; 5½ x 9 in.; with maps. Published by Edward Arnold, London, 1907; agents for the United States, Longmans, Green & Co., New York. Price, $3.50.

The transportation system of the Far East, and especially of China, has recently been discussed by a number of authors and has been made the subject of magazine articles and consular reports, but we have seen no other reference book which goes into the subject in as full and orderly a manner as the book at hand. The author divides the history of railroad enterprise in China, covering a period of rather more than 40 years, into three stages, the first being that of foreign attempts to persuade the Chinese to allow the introduction of railroads, between 1863 and 1878. The next development was a progressive movement emanating from the Chinese themselves (1879 until the outbreak of the Chinese-Japanese war in 1894), while lastly comes the era of concessions in which the dominant feature is foreign control, this period extending from 1894 to the present time. The author comments that a history of this sort reflects the main characteristic of the Chinese official classes and the tendency of the Far Eastern policy of foreign powers, and says wisely that it is not best to prophesy of the future, but that it may be remarked that the tendency at the moment is towards the elimination of foreign control.

The enthusiastic promoter of railroad enterprises in far lands and the prospective investor to whom the promoter talks, should both of them read this book, because it shows with picturesque clearness some of the kinds of trouble that can be gotten into by well-intentioned business men in the Orient. Those who sought to build railroads in China in early days found that Chinese official relations with foreigners were characterized with deep-seated and bitter prejudice and hostility, a feeling which reflected long years of unjust usage of the Chinese people by foreign nations with which they came in contact, as well as it did the natural disposition of the people. On the other hand, Chinese merchants, always characterized by a strong utilitarian sense, had only to be convinced of individual benefit to adopt the means that conduced to so desirable an end; therefore railroad builders had support on the one hand and constant discouragements on the other. Many queer things happened to concessions, both before granting and after, but apart from this preliminary and fundamental difficulty, petty annoyances which often assumed first-class magnitude sprang up on all sides. For example, in a land of ancestor worshippers you cannot build a line through or over a graveyard. As it is customary in China for most families to have their own graveyard, this becomes at once a serious obstacle, which will only occasionally yield to the influence of silver.

In 1876, a few weeks after the first completed part of the line between Shanghai and Woosung was opened, another source of trouble arose. A native, who committed suicide by throwing himself in front of a train, started a state of hostility so great that the viceroy ultimately ordered the line demolished and the rails and rolling stock dumped on the beach of the island of Formosa, while a temple to the Queen of Heaven was erected on the site of the Shanghai station.

An entirely different difficulty against which early builders of railroads in China had to struggle was that of receiving too much assistance from local authorities. In 1887, prior to the conclusion of the Japanese treaty with regard to Formosa, the governor of the neighboring province in which Formosa was at that time included, decided to build a railroad connecting the capital with the sea. It was necessary, of course, to employ foreign engineers, and the Chinese governor found that one of his hardest tasks was to reconcile this with the anti-foreign feeling prevalent at the time. The governor, therefore, decided to superintend the survey of the first few miles himself, and cheerfully laid out a route so widely at variance with the recognized principles of railroad building that his railroad either washed away or filled up with mud after every rain. Moreover, the Chinese soldiers employed on the necessary earthworks were only answerable to their own officers, and persistently ignored the instructions of the engineers. As might have been expected, most of the railroad built in this way had to be built over again, and the work took a long time.

But from first to last there were always some wise ones in the government councils who saw the need of railroads, so that railroads were gradually built and extended. From localized con-

lists between individual railroad builders and individual viceroys, the diplomacy of communications shifted to a contest between foreign nations to obtain concessions and the objections to the fundamental idea of a railroad gradually faded away. The author shows that there are at the present time 3,539 miles of railroad in operation in China, of which Russian capital has built 1,596 miles (the Chinese Eastern Railroad), Belgian capital 760 miles (the Peking Hankow Railroad), Chinese and British capital together have built 588 miles (Imperial Railroads of North China), German capital has built 280 miles, Chinese capital working alone has built 143 miles; British capital working alone has built 95 miles, Japanese capital has built 48 miles and American capital, 30 miles. There are also 1,285 miles of road now being built, and the French are interested in a greater amount of this new mileage than any other nation, with Great Britain second and native capital third. An additional mileage of 4,174 miles has been projected and sanctioned by the Chinese government, something like half of the whole amount to be built by Chinese capital and the rest to be divided between German, British, French, Belgian and Japanese capital. Including railroads which have been built and those now building in China (1907), and comparing returns with Japan, India and the Russian Empire (1901), it appears that China and Manchuria have almost 369 square miles to every mile of railroad, as against not quite 221 in the Russian Empire, $40\frac{1}{5}$ in India and $38\frac{1}{3}$ in Japan, while the population to one mile of railroad amounts to 77,114 in China and Manchuria, 10,446 in Japan, 8,603 in India and 3,379 in Russia.

At the present time, with the apparent exception of the German line in Shantung, there is not one line built or authorized in China of which the government has not secured the right to assume at some time or other the sole control; therefore it may be said that a state system of railroads has been evolved, and that, so far as can be seen, the Chinese policy of the day is to follow in the same path. But as the author points out, these things cannot be considered in the light of adherence to a well-planned policy, but rather as the designedly chosen form of the expression of the native dislike to foreign enterprise.

The three principal economic questions that now present themselves in China are: (1) How far will the policy of foreign powers interfere with the future development of this state system; (2) is a system of state railroads the most desirable for China, and (3) assuming such a system to be the most desirable, on what lines can it be most usefully developed? The author believes that, at least for the present, the development by the Chinese of their own system of railroads on their own particular lines is not likely to be interfered with by the territorial aggressions of foreign powers. He believes also that government ownership is preferable to private ownership in China on account of the peculiar conditions which obtain there. As regards future development, the Chinese are determined at all hazards to preserve their sovereignty in railroad matters, and yet the railroad question of the future must be primarily a financial one; since the Chinese investor is a negligible quantity, foreign money will inevitably be required. It is incumbent on the Chinese government, therefore, to provide sufficient guarantees to the investing public to tempt this foreign capital to come. The great difficulty arises from the fact that China has not a strong central government really capable of controlling the powerful viceroys throughout the empire. The author believes that the policy of the future should be to weld the existing railroads as far as possible into one uniform system under a central authority, but he is not sure that China has the will to face the situation and give up or alter the policy of seclusion that has been its fundamental characteristic since the memory of man.

Deformations of Rail and Tracks and the Means of Remedying Them. By G. Cuenot, Chief Engineer Bridges and Highways, Paris, Lyons & Mediterranean Railroad. Translated by W. C. Cushing, Chief Engineer of Maintenance of Way, Pennsylvania Lines West. 6 in. x 9 in., 150 pp.; 50 drawings. Price, $2.00. The *Railroad Gazette*, New York, Chicago and London.

The author sets his pace in these words: "The time seems to have come, therefore, for making a minute study of the track, to ascertain what forces it is subject to, and how it can be made stronger." His study is minute and covers five years of accumulation of facts, including accurate observations, with cunningly contrived instruments of precision, of rail and tie movements and bending.

The results of his experiments to determine the economic length of ties are particularly interesting. Under both a stationary and moving load he finds that "the most advisable length for a tie for diminishing its flexure ought to be in the neighborhood of 7 ft. $2\frac{1}{2}$ in." With longer and shorter ties there is a greater deformation of the ballast. He goes farther than this:

"Therefore it is impossible to diminish the sinking of ties by increasing their length; moreover, independent of its uselessness, this elongation produces a grave disadvantage, for it increases the bending. It is not by this means that we should seek to reduce the deformation of track, but by widening the crosstie, by concentrating the material about the points of support, and, above all, by increasing its moment of inertia."

The engineer should carefully study the experiments leading to this highly important conclusion, which largely affects the amount of first cost and maintenance of ties. He makes both service and instrumental observation tests of wooden metallic and composite ties, with a resultant strong leaning toward a composite tie. In the form of an inverted channel slightly widened at the base with a wood filler 27½ in. long, under each rail. In detail this seems to be an economical design, six times as rigid and in all observed ways more effective than wooden or all metal ties. The short length and position of the wood fillers make an automatic guide to tamping only in the proper place under the rail. It would be difficult to tamp this tie so as to make it "center bound" and also, the design prevents lateral movement.

The observations on the creeping of track and resultant effects on gage are minute and interesting and some of them are new.

The value of the book lies in its success in developing, by painstaking empirical methods, a true science in track work. It is quite in line with several present undertakings in this country to find and record the stresses on track, such as George L. Fowler's "Pressure of locomotive wheels against rails," in the *Railroad Gazette* September 20, and the elaborate experiments now being made by the Pennsylvania, on the West Jersey & Seashore division, to determine the actual and comparative blows delivered by electric and steam locomotives, and the experiments for a like purpose now being made at Schenectady by Mr. Fowler for the New York Central.

Two things are evident. We are wasting money in the attempt to make track strong enough to meet the new kinds of traffic, and, we are running great risks in using electric motors for heavy service and high speed without knowing more precisely their effect on track. As a basis for study, no engineer can afford to ignore the experiments detailed in Mr. Cuenot's book.

The Way to Ship from Chicago to the South.

The Freight Traffic Committee of the Chicago Association of Commerce has issued a 69-page pamphlet of shipping instructions, which it describes as intended for the protection and acquisition of Chicago's freight in the Southeast. The committee believes that every package of goods for the Southeast shipped by routes listed in this guide will be delivered with the greatest safety and despatch possible under present conditions and arrangements and received with satisfaction to the consignee and increasing prestige to Chicago. Every road serving southeastern territory from Chicago is now operating a system of through package cars, each car performing a particular service which cannot be duplicated. Every shipper shipping by these routes at once profits by one of the important constructive acts of the Chicago Commission of Commerce, acting through its Freight Traffic Committee to promote the efficiency of through car service. In the routes given, every effort has been made to use to the fullest extent the through package car service, thereby placing the shipment as near its final destination in through cars as is possible, so that transferring at a large number of points is avoided. Every effort has been made to route shipments into joint transfer stations, thus avoiding delays caused by team or switching transfers.

The plan followed is to give an index number to each of the 12 main routes to the Southeast from Chicago and to each of 22 connecting routes, and an index letter to each of 33 junction points involved. The succeeding pages in the pamphlet are devoted to a list of each railroad station in the states of Alabama, Florida, Georgia, Kentucky, Louisiana, Mississippi, North Carolina, South Carolina, Tennessee and Virginia, and each station has after its name the index numbers and letter which determine the route. Thus: Biltmore, N. C., is indexed 2-B, which indicates that the route is by the Monon, via Asheville; West Point, Miss., is indexed 6-M-55, indicating that the proper route is over the Wabash and the Mobile & Ohio, via East St. Louis.

The pamphlet puts at the service of every shipper advice which is usually confined to houses having a well organized traffic department and is a very convenient and valuable publication. The Association is now working up the Southwest and ultimately expects to work up the northwestern territory in the same manner. It has spent nearly a year in working up the territory covered by the guide at hand.

Walschaert Valve Gear.

Boston, Mass., Nov. 13, 1907.

TO THE EDITOR OF THE RAILROAD GAZETTE:

I notice in various accounts of locomotives that the name of the valve gear that is now being put on so frequently is spelled "Walschaerts." This I believe to be erroneous, and that the final "s" should be omitted. The error appears in so many accounts that I am afraid it will mislead people and cause them to believe that the "s" belongs there.

F. W. DEAN.

Tank Locomotive for the Midland Railway.

A large tank locomotive has recently been built at the Derby shops of the Midland Railway, which is intended for long distance running in a service somewhat similar to that performed by the suburban class of locomotives used in the United States. The cylinders are inside-connected and the engine is intended for working in either direction after the manner of the Forney engines, to which class it belongs. The wheel arrangement is 0-6-4, which in itself marks a departure from previous Midland Railway standards, and apart from this the engine is considerably in advance, both in size and power, of the largest tank locomotives hitherto used on this line. In designing the new engines, R. M. Deeley, M. Inst. C. E., Locomotive Engineer of the Midland Railway, has kept in view the inevitable requirements of traffic in the future at the present rate of expansion, and he has provided a locomotive which is capable both of exerting a high tractive power and of running reasonably long distances without having to stop to replenish the water and coal supplies.

The cylinder and boiler volumes are large for a tank engine, and by the use of six-coupled wheels distributed favorably for weight carrying, the adhesion force is well calculated to be in ratio with the tractive effort. The substitution of a four-wheel truck for the more common single radial axle under the bunker permits of an ample coal carrying capacity without undue heaping, the latter being a highly objectionable if not dangerous practice in engines which run as frequently bunker first as the other way about.

The customary practice, in radial or other tank locomotives with shorter bunkers, is to pile the coal up almost to a level with the cab roof, with the result that the engineman, when the locomotive is running cab in front, is obliged to lean over the side to obtain a view of the line ahead. With the longer and lower coal bunker, certainly does not accord with the idea of the fitness of things. The reason for it is to be found in the occupation of the whole space between the frames by the cylinders and the crowding of the crank pins in toward the center of the engine and beyond the cylinder centers by the boxes and the cheek pieces of the axles. The virtual offset in the connecting rods that is thus occasioned is about ½ in.

The equipment includes automatic vacuum and steam brake, also hand brake, and carriage warming apparatus.

Steam sanding gear is fitted, sand being delivered under the tread of the driving wheels on both sides. Lubrication is effectively performed by sight-feed lubricators to each axle-box, sight-feed displacement to the cylinders, and special suction lubricators for the slide valves.

Below we give the leading dimensions:

Cylinders, diameter	18½ in.
Cylinders, stroke	26 in.
Cylinders, stroke	26 "
Coupled wheels, diameter	5 ft. 7 "
Bogie, diameter	3 " 1 "
Boiler, barrel, length	4 " 9⅛ "
" barrel, length	10 " 5¹⁵/₁₆ "
" length between tube plates	10 " 10⅝ "
Tubes (copper) number	242
Tubes External diameter	1¾ in.
Tubes, length	10 ft. 10⅝ "
Fire-box shell, length	7 ft.
Firebox shell, width at bottom	4 ft. ½ in.
Heating surface, firebox	125 sq. ft.
" " tubes	1,206 "
" " total	1,331 "
Grate area	21.1 "
Working steam pressure	175 lbs.
Weight on drivers	117,960 lbs.
Weight, total	162,200 "
Wheel base, rigid	16 ft. 6 in.
Wheel base, total	29 " 0 "
Total length over buffers	40 " 4½ "
Tank capacity, water	2,250 gals.
Coal capacity	3½ tons.
Tractive effort	19,756 lbs.

Six-Coupled Tank Locomotive for the Midland Railway.

unprovided with railings, of the present case it should be at all times possible to look ahead through the end windows.

The engines are fitted with water pick-up apparatus adapted for operation in either direction. The scoops let down between the rear coupled and forward bogie wheels, the apparatus being manipulated by hand gear, while a flap valve closes the mouth that is not in use. The water is taken up through a Y pipe to the hind tank and it passes thence into the two side tanks through other pipes having equilibrium connections.

The boiler is of the Midland standard pattern with semi-circular fire-box shell, the barrel portions being built in two rings with a telescopic joint just in front of the steam dome.

The engine main frames are of steel plate 1 in. in thickness. The valve motion is of the Stephenson link pattern actuating balanced slide valves which work between and at the sides of the cylinders, the latter being bolted to the insides of the frames. Special attention has been given to rendering the movement of the engine around curves easy. The small ends of the connecting rods are fitted with a ball and socket arrangement, and the side rods are provided with ball and socket bushes at the pin joint connection in front of the driving wheel crank pin. The leading axle has the Cartazzie axle boxes in a modified form, allowing of 1¼ in. side play. The bogie at the trailing end has a total side play of 5½ in., and by the combined means adopted for imparting to the engine a readiness to take curves it will be possible to pass around curves of four chains radius with ease.

There is one feature of this engine that is a decided novelty. The centers of the crank pins are not in line with the centers of the cylinders and piston rods. It is doubtful if this has ever been done intentionally before. It may have occurred through a mistake of the designer or in the shop, but to do it with deliberate intention

$$\frac{\text{Weight on drivers}}{\text{Tractive effort}} = 5.97$$

$$\frac{\text{Total weight}}{\text{Tractive effort}} = 8.21$$

$$\frac{\text{Tractive effort x diameter of drivers}}{\text{Heating surface}} = 980.96$$

$$\frac{\text{Heating surface}}{\text{Grate area}} = 53.60$$

$$\frac{\text{Firebox heating surface}}{\text{Total heating surface}} = 11.05^{*}$$

$$\frac{\text{Weight on drivers}}{\text{Total heating surface}} = 104.29$$

$$\frac{\text{Total weight}}{\text{Total heating surface}} = 121.86$$

Volume, 2 cylinders = 8.09 cu. ft.

$$\frac{\text{Total heating surface}}{\text{Volume 2 cylinders}} = 164.52$$

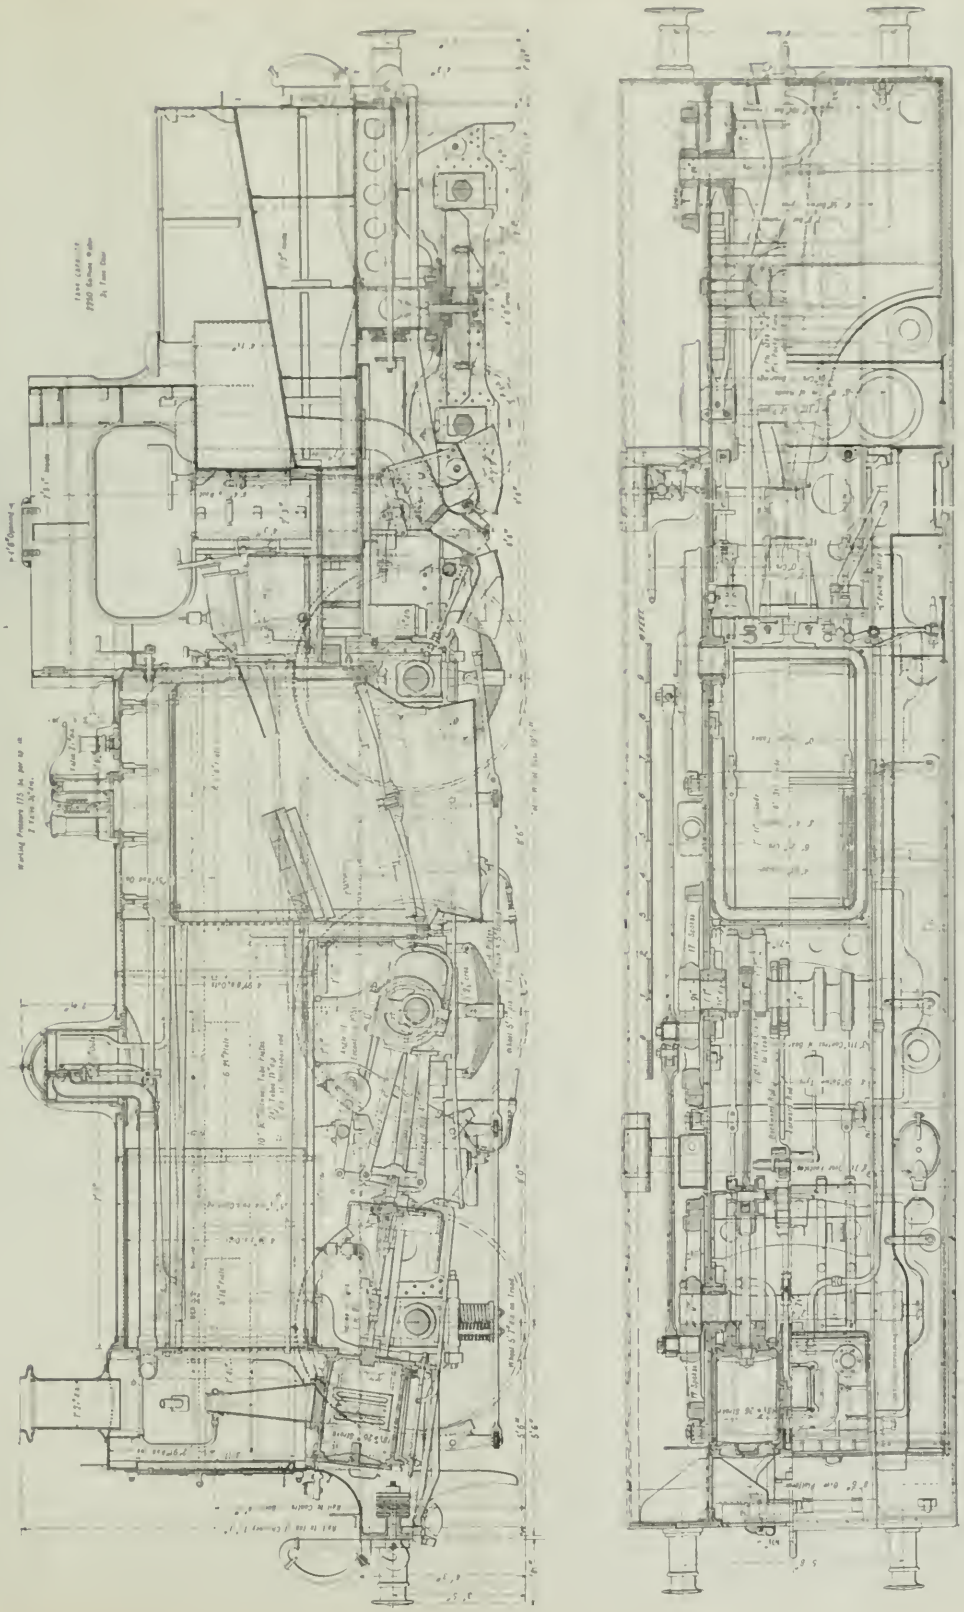
$$\frac{\text{Grate area}}{\text{Volume 2 cylinders}} = 2.60$$

Tube heating surface equated to firebox heating surface (Vaughan formula) sq. ft. = 368.48

Total equated firebox heating surface = 493.48

$$\frac{\text{Total heating surface}}{\text{Total equated firebox heating surface}} = 2.69$$

*Per cent.



Plan and Elevation of Tank Locomotive for the Midland Railway.

New Haven Suspended Signals.

The semaphore blades shown herewith, Fig. 1, are those recently adopted as standard by the New York, New Haven & Hartford, of which C. H. Morrison is Signal Engineer. The different forms, Nos. 1, 2, 3, 4 and 5, are described on the drawing. The principal difference between these standards and the standards approved by the Railway Signal Association is the addition of the round-end stop-signal blade, which is designed for home signals at interlockings and other places where it is desired to allow trains (when necessary) to pass a signal in the stop position by the use of a hand signal. The permissive signal blade, No. 3, can be used not only on automatic signals, but also, in special cases at the approach to a facing-point switch. It is proposed to use No. 4, not only as a distant signal, but also at any place where it is desired to control the speed of trains.

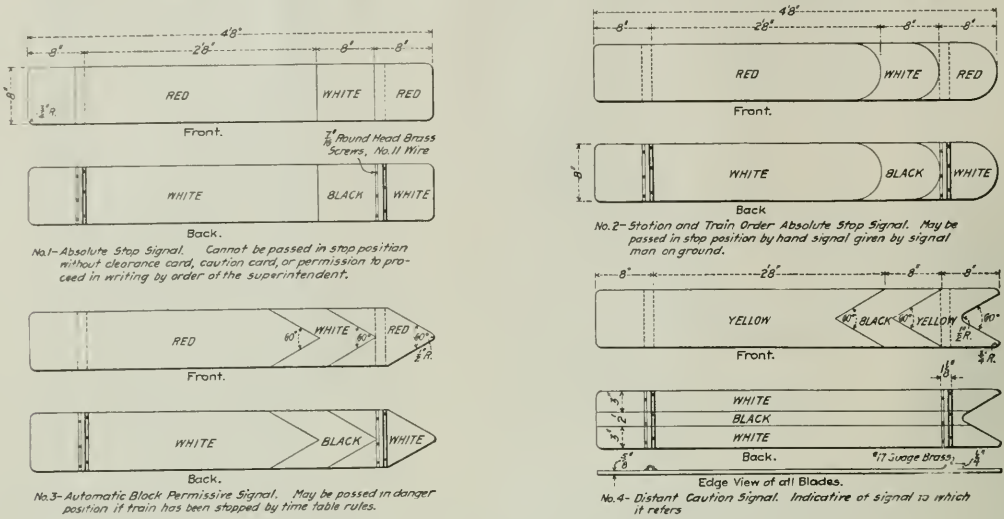


Fig. 1—Standard Signal Blades; New York, New Haven & Hartford.

Blades made by these standards are now in use. Square-end blades are used at drawbridges, as no train is allowed to pass such a signal when in the stop position without a written order. At interlockings where, in case a signal is deranged, engines are allowed to pass on receiving a hand signal, the round end blade will be used.

The blades shown in Fig 1 are designed for suspended signals like those shown in Fig. 2. These are used on the electrified lines between Stamford and Woodlawn, where bridges span the main tracks every 300 ft.; but the designs of blades are standard throughout the whole of the company's lines, except in regard to the details of fastening to the spectacle casting. The standard dwarf (not shown) has a round-end blade. A number of suspended signals are already in use and are said to give entire satisfaction. Although in this arrangement the benefit of a sky background is often sacrificed, the system has the advantage of a uniform height for all signals and the signals can be better seen under highway bridges. As indicated in Fig. 1, the stop signals are always painted red, and the distant signals yellow. The vertical member of the suspended signals, which takes the place of the post, is painted black, the same as the rest of the bridge.

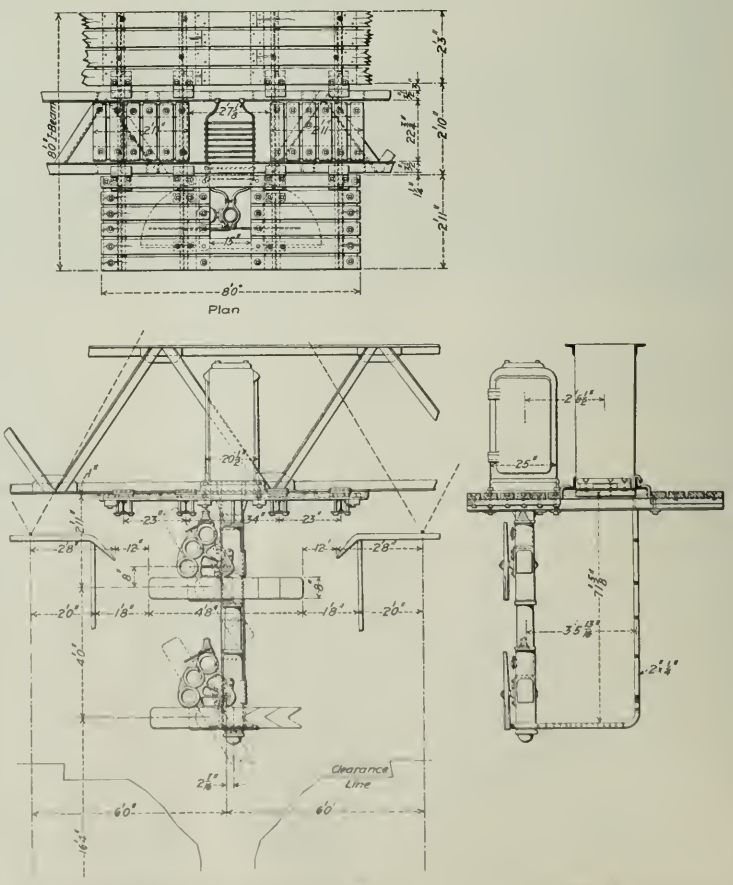

Fig. 2—Suspended Semaphore Signals; New York, New Haven & Hartford.

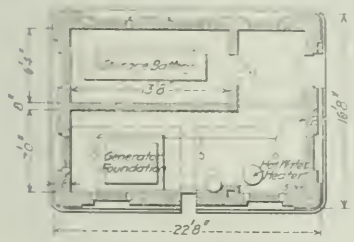
The Austrian State Railroads, which bought its lines of the state at a time when the latter had to have money and had no credit, is accused of letting its property fall greatly out of order in anticipation of its re-acquisition by the state, which has been decided upon, though the time for it is not yet fixed. Among other things cited in evidence of its inadequacy to meet present requirements is the fact that 5,700 of its freight cars, more than half the whole number, are more than 40 years old, while it runs 23 passenger cars built before 1849, 136 built before 1857, and 330 built before 1872.

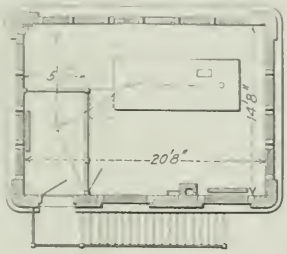
Concrete Interlocking Tower on the New Haven.

The New York, New Haven & Hartford has recently installed a new all-electric interlocking plant at Naugatuck Junction on the New York division and the machine, storage batteries and charging generator are housed in a concrete tower. The tower is 22 ft. 8 in. by 16 ft. 8 in., two stories high, of plain concrete with concrete arch floors supported on I beams. On the ground floor are the generator

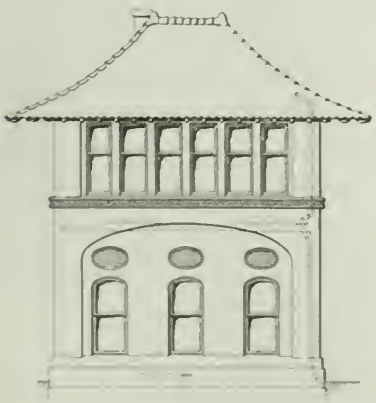
Concrete Interlocking Tower at Naugatuck Junction.



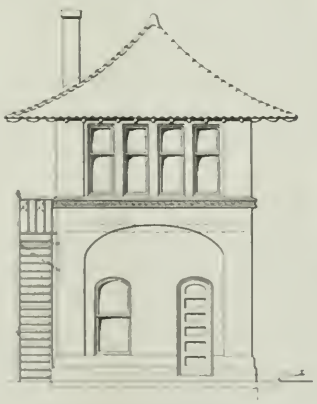
First Floor Plan.



Second Floor Plan.



Front Elevation.



End Elevation.

Concrete Interlocking Tower at Naugatuck Junction; New York New Haven & Hartford.

set, storage battery room, heater and lavatory. The battery room is 13 ft. 8 in. by 6 ft. 4 in., and is partitioned off by an 8-in. concrete wall extending from the floor to the ceiling. The batteries are mounted on shelving in the center of the room, so that they may be examined from all sides. There are two large windows on the side, and at the end so that good light is obtained to look through the battery jars. The main battery for the interlocking plant consists of 55 cells, of 120 ampere-hours capacity, delivering 119-volt current to the switch and signal motors. In addition there are two sets of 6-cell, 84-ampere-hour capacity batteries for operating the lock and block instruments. The generator set is a Fairbanks-Morse 6 h.p. direct-connected gasoline engine and dynamo mounted on a concrete foundation.

In the second story is mounted the 47-lever Union all-electric interlocking machine, which occupies a space 10 ft. 9 in. by 4 ft. 5 in. The track side and both ends of the tower are practically solid glass and there are two large windows in the rear. Entrance to the second floor is by an ornamental iron stairway on the outside of the building at the rear.

Electric Railway and Public Service Legislation.*

BY HENRY J. PIERCE,
President of the International Traction Co., Buffalo.

It would be well for the country, for the welfare of its financial institutions, for its business prosperity, for the stability of the investments of people both rich and poor if, when those high in authority speak, they should not judge all corporations by the few who have done wrong, but also should bear in mind that the great majority of corporations are conducting their affairs honestly and in the interests of the people whom they serve.

During the Old Home Week celebration in Buffalo a few weeks ago the greatest curiosity was a street car drawn by horses, yet it was an exact reproduction of the mode of transportation furnished only so short time ago as 1891. The very car had been pulled through the streets at that time by the horses which hauled it in 1907. The driver and conductor had performed similar service in horse-car days. The straw was on the floor to keep the feet warm. The four oil lamps were in their places. It seemed the product of a thousand years ago compared with the 30-ton electric cars between which it was sandwiched—vehicles lighted with half an hundred electric lamps, heated by electricity, and which it would have taken the power of 100 horses to propel at speed.

In 1891 the horse-car plant was sold for scrape and replaced by electricity. By 1896 increase in travel made it necessary to practically rebuild the entire system, requiring the installation of heavier rail, larger cars, up-to-date machinery, and within the past three years many electric railway systems have again, for similar reasons, been practically rebuilt. These expenditures could not be paid for out of earnings, and had to be provided for by new issue of bonds and stock. Thus while many electric railways could be replaced for less than their capitalization, yet the excess is accounted for largely in many cases by the cost of rebuilding to meet new conditions.

The dual duty of a public utility corporation is to provide good service to the people from whom its franchise was obtained, and to return to its stockholders a reasonable profit on their investment. The electric street railway may not increase its fare, yet wages have increased, and the cost of material has advanced over 40 per cent. in three years. The public are ever expecting greater facilities, which require heavier track, larger cars, increased power, more car-houses, more efficient and therefore higher-priced trainmen, better and more frequent renewal of pavements, extension of tracks into sparsely settled neighborhoods, while the state and municipalities are constantly increasing taxation.

Under the combination of circumstances one of four things must inevitably occur.

First.—Poor service.

Second.—Price of labor and material reduced.

Third.—Rate of fare increased.

Fourth.—Taxation reduced.

The manufacturer or the private corporation may close their plant for a time when business is not profitable, or need not maintain their plant at a high state of efficiency; but the public service corporation is always in the public eye—it must keep on, it must keep up the quality of its service to highest standard. The business of an electric railway in fast growing communities is increasing to be sure, but not nearly in the ratio of increase of expense of operation, maintenance and necessary betterments. Of course poorer service cannot be permitted under any circumstances; in fact it

*From an address at Madison Square Garden, New York City, Oct. 1, 1907.

should be constantly improved. A proposal to increase the rate of fare is not practical.

Real estate may be developed and a building left for years without improvement, addition or even a coat of paint on its woodwork. Not so with a street railway. The public, not unnaturally, insists on the newest type of cars, on more cars, on better and still better service, on greater comfort, on perfect hygienic conditions. An unpainted or old-time battered car would no more dare to run on a modern city street railway system than a caravel of Columbus would dare venture to cross the bows of the "Lusitania" in defiance of the new queen of the seven seas. In Buffalo there are buildings on the foremost streets which are three and four and even five and more times as old as the oldest type of street cars in the entire system. And Buffalo is no eyesore in this respect—not at all. The same is true in other cities. The public is more exacting with street railroads than with any other form of business.

Public officials reflect the attitude of the public in this regard. Municipalities yearly require more and more from street railways. Repaving, re-tracking and new paving, new tracks, new cars, care of street and other items, constantly increasing in number, heavily swell the total of expenditures. Added thereto are taxes; and all these requirements causing increased expenditures to the street railway are in turn used as a basis for increase in taxes. Here we find the one feasible and valid method of relieving the existing situation. The municipality or state can lighten the burden. In view of the heavy expenditure yearly required and the tremendous cost of operation and maintenance, resulting in greater conveniences and facilities to the public and materially benefiting the municipality as a whole as well as each individual citizen thereof, this added load of taxes could or should be greatly lessened or removed. The street railway then could better fulfill the public demand and could turn to its owners for authority for further improvements, at the same time permitting a reasonable income on genuine investment.

When the Public Service Commission Act was in process of passage, I opposed it for two fundamental reasons—the bestowal of such vast powers for the regulation of the business affairs of corporate citizens, and because it denied the foundation principle of our Republic that every citizen should have the unrestricted right of appeal to the courts. But the Public Service Commission Act has now become a law, and while if in the hands of unjust or arbitrary commissioners it would bring hardship and perhaps ruin upon the corporations affected, yet the wise choice of commissioners by Governor Hughes insures that while the interests of the people will be looked after, yet that corporations, which are citizens of the state, will undoubtedly be treated fairly, and no unjust demand be made upon them. I am confident that in requiring that betterments and changes be made in the plants of the corporations over which they have supervision, the commission will take into consideration the almost impossibility of raising money at this time, a condition largely brought about by unwise, cruel and sometimes unwarranted attacks made upon public utility corporations.

The majority of street railways are no more overcapitalized than real estate is overcapitalized. I believe every fair and informed student of conditions will corroborate this. Whether it be a trolley line or a 10 or 20-story building, the method and proportionate extent of capitalization are the same. But there the similarity ceases, for after capitalization the building goes its way serenely, the initial cost being the final cost as well; but the street railroad through the long period of construction encounters difficulties on every hand, not only labor but questions of consents and adjustments, and through each succeeding year the demands in service and maintenance and operation increase and multiply.

Capital requires and is entitled to a fair return on investment. It is estimated that fully 80 per cent. of the street railways of the United States are not paying dividends. Capital invested in street railways finds the electric railway situation of to-day a problem requiring the most serious consideration. Any who would blindly heap further burdens of expense on the electric railways of the country, either know little of or care less for the best interests of the people at large.

This is no calamity cry. I have endeavored briefly to outline conditions as we who are in the street railway business know them to be. I believe that to-day, considered from the business standpoint as between the electric railways and the "value received" which they give to the people in return for their fare, in most communities the people have the best of it, that the electric railways that are in need of the most help from their father (the state), their mother (the municipality), that they require the "first aid for the injured" from their doctors (the Public Service Commission) to keep them out of the ravenous clutches of their uncle, the money lender. The electric railway cannot sell its bonds, and the only money it can secure is what it can beg from its stockholders, borrow from the banks, or coax from its conductors.

Trolley lines are no experiment in the upbuilding of the country. They are welcomed and sought. Where they are wanted to-day, they should be built not later than to-morrow. The future years should hold in their history a wondrous record for electric railways—a record dependent on fair and liberal treatment of one of the foremost utilities of the world.

Suppose at this moment that every electric railway in the state were to be blotted out of existence—not a return entirely to primitive conditions, but simply so far as street railroads and trolley lines are concerned. A glance at a map will show what disaster would be wrought—not with a view to invested capital, but to communities. The mere loss of power and stopping of cars for an evening hour throws a whole city into confusion, inconveniences thousands of people and causes complete rearrangement of countless plans. The withdrawal of suburban and interurban trolley service would well nigh isolate whole sections of the state. Electric railways not only are essential to the development and prosperity of the state, but they are an institution, a utility in closer constant contact with the people than any other form of services known to society.

The electric railway situation of to-day, summed up, shows existing systems beset by tremendous expenses, which make relief from heavy burdens of taxation imperative. It shows the great need for extension of electric railways, with capital hesitant to enter where the risks are so numerous and the financial burdens so heavy, and the dividends return on the investment practically nothing. It shows the whole nation eager for the closer communication of localities. Where trolleys were fought bitterly a decade ago, the opening of new lines to-day is the occasion for a holiday and celebration, with congratulatory speeches, blowing of whistles, ringing of bells, music and cheers of welcome.

It is well for the community; it is well for the passenger; it is well for the employee. In all fairness, should it not be made well also for the man whose money makes all this possible? Is he also not entitled to a fair return on his investment—a fair return, a moderate dividend? I tell you, gentlemen, the government of a state or city or town can far better afford to throw off the burdens of taxation in such an instance as this of an electric railway. In the country the farmer is allowed to work out his road tax, and why not let the street railway perform its full duty to the state and municipality through furnishing every reasonable facility for the comfortable, rapid transit of all the people, instead of compelling it to cripple its resources by paying money into the public treasury for the benefit of other taxpayers who do not represent one-tenth of those who daily utilize the street cars, and whose constant comfort would be thus vastly improved?

We can picture the future day—the day of accomplished deeds, the day of satisfied needs—when that which waited to be done waits no longer. Between now and then lies an era of tremendous endeavor, of ceaseless labor—and through it all we will have no time for needless turmoil, we want no senseless strife. We do want earnest, honest co-operation, not alone with the private investor, but also with the public official—and the day of complete success will come when the investor, builder, operator and official, all four act in a harmony and unison, based on a common confidence that all are working together for the common good.

Individual Car Owners' Association.

Mr. C. O. Johnson, President of this Association, writes that the meeting called to be held at Cleveland was not a failure, as reported. At the first meeting, held in Cleveland last summer, the attendance represented about 25,000 private cars of all lines of trade. At Chicago in September a constitution and by-laws were adopted and a temporary organization was formed. It was deemed best to give ample opportunity to all new members to have a voice in the election of permanent officers, and for that reason the election of permanent officers was deferred until November. At Chicago last week permanent officers were elected, as follows:

President, C. O. Johnson, H. J. Heinz Company, Pittsburg.
First Vice-President, Geo. Oslus, Michigan Ammonia Works, Detroit.
Second Vice-President, W. E. MacEwen, National Refining Co., Cleveland.
Third Vice-President and Secretary, R. J. Bailey, Monongahela River Consolidated Coal & Coke Co., Pittsburgh, Pa.
Treasurer, A. M. Bell, Fayette Coal Co., Pittsburg.

Executive Committee.

Silas A. Shafer, Assumption Coal Company, Assumption, Ill.
Geo. Oslus, Michigan Ammonia Works, Detroit.
Chas. P. Fink, Louisville Cotton Oil Co., Louisville.
R. L. Somerville, Georges Creek Coal & Iron Co., Farmington, W. Va.
H. D. Williams, H. D. Williams Cooperage Co., St. Louis.
Davis Elkins, Elkins Coal & Coke Co., Morgantown, W. Va.
W. E. MacEwen, National Refining Company, Cleveland.

The purpose of the Association is to bring about a uniform, lawful and equitable system for the handling and use of individual cars throughout the United States, and to provide for a just and legal compensation to be paid for the use of individual cars by others than their owners.

The Association was not formed in any spirit of antagonism. It seems desirable that the different conditions applying in different parts of the country on different classes of private cars shall be discussed at called meetings of the private car owners. In dealing with the difficulties experienced, it is hoped to have conferences with railroad officers, discussing all matters from the standpoint of both classes of owners.

Home Route Slip Bill Used by the N. C. & St. L.

On account of the increase in the per diem rate, and to facilitate the prompt home movement of foreign and line cars, the Nashville, Chattanooga and St. Louis began using on August 1 the "home route" slip shown herewith. It is not original with this line, some other roads already having it in use, but information concerning its object and advantages will doubtless be of interest to roads not acquainted with it. Its purpose is to inform all concerned in handling cars the home route, or the point where and road from which such cars were received on the N. C. & St. L., thus reducing all unnecessary delay and facilitating the home movements of cars in accordance with the code of car service rules. In addition, the slip shows all road movements and the date the car arrived at its destination, thus enabling the agent to know at a glance how long the car has been delayed. The original home route and number of days the car is delayed at stations is reported on the daily car report to the superintendent or car distributer, enabling him to make prompt and proper distribution of all foreign road and line cars on his division.

At large terminals unnecessary delays to cars are minimized, since the persons handling the cars have the proper home route, thus facilitating the movement of cars through the terminal. Another objectionable feature obviated by the use of this slip is that of telegraphing for information necessary to dispose of cars, which lightens the burden on the wires.

The instructions governing the use of the slip are as follows:

(1) The agent at point where car is originally received from a connection makes out the home route slip and attaches it to the way-bill or slip-bill that accompanies the car.

(2) Conductors are not allowed to take cars from stations unless accompanied with slips properly made out.

(3) Slip must follow car to destination if on this line, or to junction point where delivered to a connection for final destination, and when car is returned, or ready for return home movement, the original slip will follow car to point where car was originally received.

(4) Conductors moving cars must indorse on the back of this form, train number from, to, date and name of conductor handling car.

(5) When car is returned to road from which originally received, agent must show to what road, and date, delivered, and send slip to the office of the superintendent of transportation for future reference.

Form 1340

Nashville, Chattanooga & St. Louis R'y

HOME ROUTE SLIP BILL FOR FOREIGN CARS

Initial ..... Car No

HOME ROUTE

Received from

at ..... Date ..... 190.

Made by

INSTRUCTION

Agents at all Junctions where cars are originally received must fill in accurately the above information for each foreign road, or line car received from connections.

Conductors must not take cars from stations unless accompanied with slips properly made out.

When handling cars from stations where there is no agent, conductors must deliver to car receiver from the agent who makes billing for such stations a card of this form. When empty foreign cars are handled on running slip, Form 1344, such form must be attached to this card.

Conductors will turn in slips at terminals to be delivered to conductors moving car from terminal to final destination if on this road, if beyond this road slip must follow car to junction point where delivery is made to connection.

Slips must be conveniently filed at junction points or destination until car is returned or ready for return home movement, then to follow car to junction point car was originally received from.

If slip is lost ask Car Accountant for Home Route, and make new slip. Conductors must carefully fill in the movement spaces on the back hereof.

M. J. C WRENNE,
Superintendent of Transportation.

Home Route Slip Bill; Front.

Conductors' Movements

FROM	TO	TRAIN	DATE	CONDUCTOR	FROM	TO	TRAIN	DATE	CONDUCTOR

The final Junction Agent on the return Home Movement will fill in space below, and promptly mail slip to Superintendent of Transportation, Nashville, Tennessee.

Delivered to *R.R. at* *Station* *190—*

Agent.

Home Route Slip Bill; Back.

The pigeon holes of the left hand half of the case are numbered with the odd numbers and those of the right-hand half bear the even numbers. This case being for the double ending numbers, a slip for a car numbered 14,165, for instance, would be filed in pigeon hole 65.

The smaller case, for small terminals and intermediate stations, has only 10 of the two part pigeon holes for filing slips according to the single ending numbers of the cars. The upper row of five holes has the even numbers and the lower ones the odd. The dimensions of the compartments are the same as for the large case.

We are indebted to J. T. Manry, Car Accountant of the N. C. & St. L., for information. He advises that the good results of the scheme have fully met their expectations.

African Railroads.

The total length of all railroads in Africa is 17,500 miles, divided as follows:

Gage	Gages and mileage of railroads in the possessions of: Eng land	Fran ce	Ger many	Portu gal.	Italy	Congo	Egypt	Miles, total
4 ft. 10 in.	120	2,165	..	..	..	555	555	2,880
3 " 6 "	7,214	..	93	461	..	2,865	2,865	14,653
3 " 3½ "	584	1,107	423	226	71	..	..	2,700
Various gages, less than 3 ft 3½ in	227	..	689	41	..	..	..	1,727
	8,145	3,512	1,205	728	71	399		17,500

The costs per mile of finished road are:

	Cost per mile
1 ft 10½ in. Gage.	
Otavi R. R. (German West Africa)	$9,750
Swakopmund Windhoeck (German West Africa)	15,150
Mayumba R. R. (Congo)	26,280
2 ft 5½ in. Gage	
Congo R. R.	50,250
2 ft 6 in. Gage	
Freetown-Baima (Sierra Leone)	20,430
3 ft. 3½ in. Gage.	
Togo Coast R. R. (West Africa)	9,670
Bingerville Kong (Ivory Coast)	19,500
Lome, Palime (West Africa)	24,740
Usambara R. R. (Ger. East Africa)	28,960
Dar-es-Salaam Mrogora (Ger. East Africa)	36,150
Dona Manongo R. R. (Kamerun)	41,070
Massaua-Asmara (Eritrea)	61,840
3 ft 6 in. Gage	
Egyptian private railroads	14,030
Port Herald Chiromo (State of East Africa)	14,790
Tugela Somkole (Natal)	25,950
Natal State railroads	80,780
4 ft 10 in. Gage	
Egyptian State railroads	51,900
Algerian state railroads	40,200 to 210,260

The Maintenance of Way Painters' Convention.

The Maintenance of Way Master Painters' Association held its fourth annual convention in the Great Northern Hotel, Chicago, November 19 and 20. The association now has 57 members, about one-third of whom were in attendance. Capt. Robt. W. Hunt made the opening address. The President, A. B. Phelps (L. S. & M. S.), was in the chair, and in his address said:

"I doubt if the maintenance of way painting of our railroads is given the thought and attention by the maintenance of way engineers that it should receive. Painting is done primarily for protection, and secondly, which to my mind is of equal importance, for appearance sake. Too often we get the order to "do no painting for looks sake," to paint only such buildings or bridges as are in actual need of it to protect them. Thousands of dollars are spent in some cases in grading and seeding lawns, horticultural display, in landscape gardening and the like for no purpose but appearance sake, while the buildings are left in a shabby and unkept condition. There is nothing, I think, that adds more to the apparent thrifty condition of any railroad than neatly, tastefully painted buildings and structures. And I

An essential feature to the successful use of this slip is the filing system. Agents at large terminals are supplied with cases for filing slips with the double ending numbers of cars, and small terminals and intermediate stations are supplied with cases for filing slips with the single ending numbers of cars. The larger case has 100 pigeon holes, each divided into an upper and lower part. The upper part is for through cars and the lower for local cars. The upper part is 4 in. x 4 in. x 8½ in. deep, and the lower is the same, with the exception of the height, which is 2 in. The

believe that this condition is somewhat of a revenue magnet.

"The maintenance of way painting should, I believe, be a separate and distinct department on all roads, accountable to no one below the engineer of maintenance of way, or possibly the general manager, reporting the expense, of course, to the accountant of the engineering department. The best results are not usually obtained when we are placed under the master car and locomotive painter, the superintendent of bridges and buildings, or the master carpenter. There is always a temptation, and sometimes more than a temptation, to make the road painting stand a portion of the expense which should be charged to other parts of the work; besides, the road painting is not always looked after and kept up as it should be when it is made a part of some other department. No matter how small the road may be, even though but one man be required to do it all, it should be given to some one with proper judgment, and allow him to use that judgment at all times, subject, of course, to certain limitations."

The old officers were re-elected for another year. They are: President, A. B. Phelps (L. S. & M. S.); First Vice-President, W. D. French (N. Y., O. & W.); Second Vice-President, M. F. Ebel (C., H. & D.); Secretary and Treasurer, H. J. Schnell (New York). The next meeting will be held in St. Louis, Nov. 17 and 18, 1908.

Extracts from some of the papers are given below.

OBSERVATIONS FROM PRACTICAL BRIDGE PAINTING EXPERIENCE.

By J. R. Shean, Pacific Electric Railway.

The whole future of a bridge depends upon the thoroughness of the cleaning it gets when new, as well as the first coat of paint applied. Most bridges get a coat of linseed oil or red lead at the works. The oil is to be preferred for two reasons, (1) because it is transparent and allows any rust or dirt to be plainly seen and removed, and (2) because the red lead coat usually applied at the bridge works is nothing more than an oil stain, which runs down and forms pools on the flanges and in the corners, and which covers up every sign of rust that may have been left on the iron, which it is so essential to remove at this time. The only way to get these light rust stains entirely out of the pores of the iron is the sand blast. This can get as deep into the iron as the rust can, while steel brushes and scrapers get only the top of the rust, and the real seat of the rust is still left deep in the pores.

As it is seldom that a painter has a sand blast at his disposal, the best known method of painting the bridge to keep the moisture and gases away from the iron should be used and thus retard the action of the rust as much as possible. Nothing will do this as well as the first coat of good solid red lead well brushed on. Red lead will keep the moisture away and will withstand the action of the gases as well as any of the other pigments. This fact was established several years ago when pieces of bridge iron painted with red lead, graphite, white lead, lampblack and mineral red were placed in the Hoosac tunnel for a test. This tunnel is nearly always filled with coal gas. When the pieces were taken out all traces of paint were gone except on the ones painted with red lead and mineral red, the former being the better of the two.

There has always been a prejudice against red lead on account of its liability to run unless brushed out evenly and with much care. This objection can be overcome by mixing the dry red lead with boiled oil and adding about one-fourth white lead and a little dryer. The white lead will serve to hold the red lead in suspension, and will help it to dry as hard as flint.

After the first coat comes the problem of getting a paint for the finishing coats which will not dry so hard. For general results, so far, carbon is far ahead of any other paint base, although the writer has seen mineral red give better satisfaction around the coal mines in Indian Territory. The greatest trouble with rust is encountered on low overhead bridges, where no paint seems to stand. The writer has a belief that the quick destruction of the paint on these bridges is caused by the red hot sparks being driven with such force against the parts overhead that the paint is burned off or pitted so badly that the iron is left bare and at once becomes a prey to the rust, induced by the soot that the smoke deposits on it and which forms an acid of some kind by absorbing the moisture from the air and from the steam that condenses on it. This conclusion is strengthened by the fact that the higher a bridge is over the track the longer it will take for the rust to eat through; also, from the fact that a bridge over double track on a hill will be affected quicker over the track used by the trains going up the hill than over the track on which they run down without using steam at all. A wooden shield shaped like an inverted V, as wide as the track and placed over the center of it so as to take the force of the sparks and smoke and deflect them downward, would do much to prolong the life of these bridges; or a galvanized or corrugated iron shield might be used.

There are two tools which deserve mention for the removal of rust which the writer uses. One is a short steel bar made of ¾ in material and sharpened at one end like a cold chisel. This bar is invaluable for getting into the corners of chord boxes, footings, between the ties, and any place where it is impossible to use a hammer. The other is a hammer first used by the Terminal Railroad of St. Louis. It has a cold chisel edge at both ends of the head. One is parallel to the handle, the other at right angles to it. It is exceptionally good for getting around rivets on the flanges, webs, etc., and it is light enough to keep from cutting the metal too much.

The length of time which should elapse between general paintings of a bridge is a matter of location and of the thoroughness of the previous painting. A bridge across the Hudson river at Mechanicsville, N. Y., was given one coat of red lead and two coats of white lead paint colored with chrome yellow, and at the end of nine years was in fair shape. It was gone over and the rust scales knocked off and touched up every three years. The best painted set of bridges on any one road which has come to the writer's notice are on the Oregon Short Line. These bridges get one coat of lampblack every four years and are bright and clean all the time.

Cinders and dirt should not be allowed to collect on the abutment of bridges until the bridge seat is buried in them. The water which soaks through these cinders and dirt forms an acid which no paint can stand, and many a bridge has been practically ruined by the part resting on the abutment being eaten up with rust from this cause.

PAINTING STRUCTURAL STEEL.

By H. Clapham, Louisville & Nashville.

Contracts for structural or bridge iron call for one coat of paint at works before delivery. This paint often contains, beside the specified amount of oil, an equal amount of turpentine or benzine.. It is applied by incompetent workmen working piece-work. There is no cleaning or scraping; the paint is simply slushed on. As soon as the steel is erected, trouble begins. We should receive our steel without the shop coat.

CARE OF BRIDGES AND STRUCTURAL STEEL WORK.

By W. S. Morgan, Pennsylvania Lines.

The only way to get the blue mill scale off is to let the steel stand from six to eight months after erection, then go over it thoroughly with chipping hammers and steel wire brushes, wiping it off with benzine, always allowing plenty of time for this to evaporate. From my experience I find that no matter whether the steel has been covered with paint or oil, this is the only way to get an absolutely clean surface to begin painting upon, and we all know that this is about half the game in this work. We have had bridges sent to us both with and without shop coats. I have found that those sent with shop coats, although we gave them exactly the same care as those without shop coats, seldom last over four years before requiring repainting, while those sent us clean have lasted in a great many instances seven and eight years. On the first coatings I have had better results from red lead than any other pigment, it being the firmest of all paints, although it is necessary to watch the painters pretty closely to see that they brush it out thoroughly.

PAINT STOCK ON THE ROAD.

By H. J. Barkley, Illinois Central.

Many different ways of handling paint supplies have been tried. On some roads it is the custom to ship only enough material from headquarters to do each piece of work. Often some item is forgotten or enough not sent, and the crew must either wait until it arrives or make some change to get through on the estimate of cost. The most satisfactory way is to have a car with the necessary tools and a supply of paint—a paint shop on wheels, with tanks for turpentine, oil and other supplies, and racks for barrels to avoid loss from rough handling of trains.

On roads where standard colors are used for bridges or buildings the paint should be sent to the crews mixed. The mull stone and paint mill have no place in a paint car. They are not only inconvenient and expensive, but impractical. When a batch of color is needed the cars may be switching or the foreman gone, or the light not good, and the color will not be exact. Often new and inexperienced men will not know every condition, and all these difficulties are expensive.

While the material sent out will not always be suitable for every structure, it should be thick enough to allow re-mixing or thinning, as conditions require, either for new or old work, or as the weather conditions demand. Very often colors mixed in a steam heated shop will be too thin to use in the hot summer months, or too thick in the winter. Often it is necessary to change the color for first or second coats or for jobs where smoke, steam or dust are troublesome. These are things which can be overcome easily enough, and at a reasonable expense, if the color is sent out of the proper consistency. The principal thing is to have all structures of a uniform color, and it is next to an impossibility to obtain these results with "batch mixing" in the cars on the job.

It often happens that a crew will run short of a certain color and must either write or wire for supplies, and either the supply

department or the office does not know what is wanted. To prevent this it is best to have all standard colors numbered and a color board in the paint car, at the division offices and in the supply department.

Painters generally are not in favor of supplies coming to them ready to use, arguing that all paints are not suitable for all kinds of work and that the "stir and use" system is not best, but it has been proved that if proper care is taken and the maker and the supply department understand what is wanted the work can be done cheaper and more satisfactorily. Often those who purchase or mix the paint for use out on the road have not had sufficient experience in this particular line of work, and do not realize how important it is that material should and can be had that will be better suited to the work, all of which will help to lighten the cost and bring better results.

It is the practice on the Illinois Central to carry a stock of material in the cars as nearly suitable for the work as possible, so that a crew could go to any piece of work as it often happens, on short notice, and be prepared to finish it. Generally speaking, this system has proved satisfactory and has been the means of saving much inconvenience and expense. While there are some objections to this plan, yet it has many advantages over the "batch mixing" and proves that mixed color for road work has come to stay and is the best means of bringing uniform results at a minimum cost.

Floral Prizes on the Boston & Maine.

The Boston & Maine has lately announced its regular annual prizes to station agents for the best flower displays. The first prize is $50 and others are $40, $25, $20, $15, $10 and $5. Altogether several scores of prizes were granted. The first prize went to Lake Street station, Arlington, Mass., and second-class prizes to Brattle (also in Arlington), and to Hill Crossing, in Belmont. From photographs with which we have been favored by the *Boston & Maine Messenger* we show views of the floral displays at Lake Street, Brattle and Meadowview.

Lake Street Station, Arlington, Mass.; Boston & Maine.

Keeping Track Free of Vegetation.

In a report on this subject to the Roadmasters and Maintenance of Way Association J. W. Coffey, Roadmaster of the Santa Fe at Guthrie, Okla., said:

I have about 35 miles of dirt track with a rich sandy soil. It is in a hilly country where it is necessary to keep the track almost clear of weeds and grass, and we have to keep it out about six months in the year. In the spring when the weeds and grass get up high enough to commence to give us trouble we take our shovels and cut the grass from the ends of the ties and between the ties from the outside, and only cut inside the rails as far as the shovel will cut by running it under the rail between the ties. This can be done at a cost of about $7.50 per mile. We repeat this about every six weeks, just cutting the grass from the outside until about the first of October, we then cut it clean, inside and outside at a cost of about $12.50 per mile. The total cost is:

Three cuttings at $7.50 each	$22.50
Final clean up.	12.50
Total per year per mile	$35.00

This will keep the grass out of the way of trains, but will not keep the track clean, as it provides for a thorough clean-up once a year only. We use a light steel shovel with a handle about 3 ft. 10 in. long.

I have had no experience with a weed burner and understand that so far they have been a failure, as they do not kill the grass, but only crop it off, and the grass is as fresh and green as ever in a few days, just as plentiful as it was before the burner was run over it. Thirty-five dollars a mile looks to be a big cost for cutting grass for one season, but it is approximately what it has cost this year on the dirt track that I have charge of.

The mileage of steam railroads in Greece is 865 miles, and their total capitalization $42,200,000. They are not owned by the Government, but are built after its permission, supervision and control through the department of public works, railroad section. The state shares in part of the construction, and hence controls the passenger and freight rates and other details. The Government participates in the benefits and has the option of buying over the roads within a specified period, while at the lapse of another period the railroads become the property of the state. The motive power of the first railroad built in Greece was put in operation in 1869, running from Athens to Piraeus, six miles. Its motive power was changed from steam to electricity about two years ago.

Brattle.

Meadowview.

Boston & Maine Station Grounds at Brattle and Meadowview, Massachusetts.

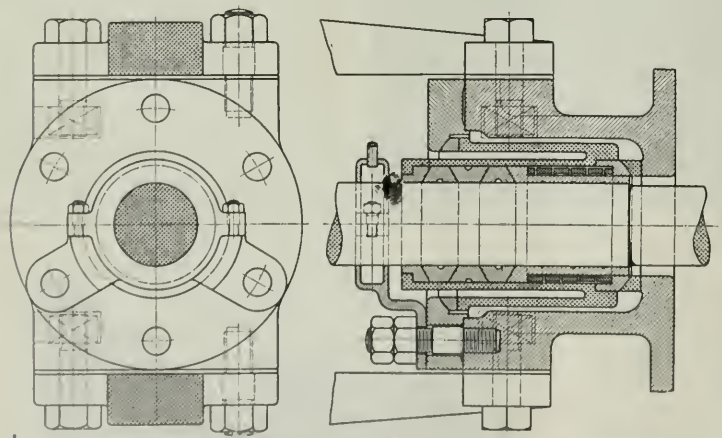
Pistons and Valves for Superheated Steam.

When superheated steam was introduced on the Prussian State Railways as few changes as possible were made in the regular standard running parts of the locomotives to which it was applied. At the same time there was a full appreciation of the fact that it would be necessary to make some changes in those parts with which the steam came into direct contact. The redesigning of these parts was undertaken by Herr Schmidt, and this has been so successfully accomplished that the usual wear and tear of the valves, cylinders, pistons and stuffing-boxes, inherent previously to the use of superheated steam, does not now exceed that of ordinary saturated steam locomotives. Even where the temperature has been as high as 720 deg. Fahr. no trouble has been experienced, though the ordinary temperature of the superheat is but 650 deg.

In working out these details it was found that the cylindrical walls of the valve chest should be separated from the shell of the cylinder itself in order that injurious strains, due to the inflowing superheated steam and the unnecessary transmission of heat and consequent heat losses, may be prevented, as would be the case if the piston-valve casing and cylinder were made in one. Relief valves must be fitted to the cylinders, and snifting valves to the valve chest or steam pipe. Forced lubrication, with mineral oil having a high flash point is essential for the purpose of ensuring efficient lubrication.

In order to insure that the piston shall be steam-tight and produce the minimum amount of friction, the so-called Swedish pistons are generally used. These are provided with three small rings, having specially arranged circumferential grooves and holes, so that the steam entering behind the rings merely presses them lightly and evenly against the cylinder walls. Neither the piston-rings nor the stuffing-boxes ought to carry the weight of the body of the piston; for this reason tail-rods are employed, so that the weight of the piston is taken at the front end by a specially provided guide and at the back by the cross-head.

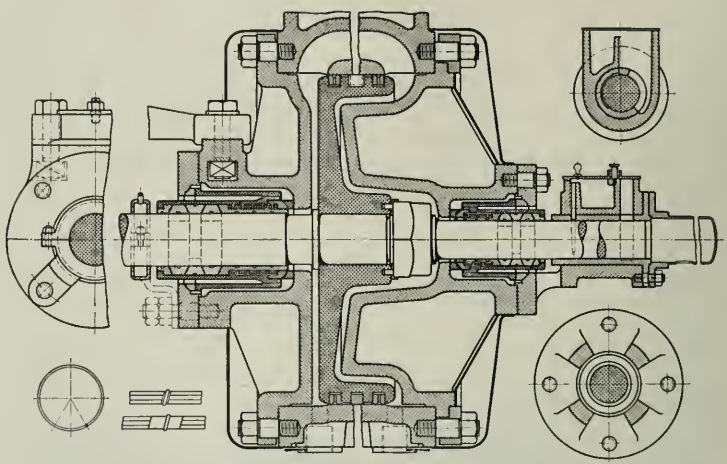
In order to obviate overheating of the stuffing-boxes special provision is made for cooling them by air. As the rigid stuffing-box had no provision at all for cooling, it was not at all satisfactory when superheated steam was used. For such conditions metallic packing only is suitable, and the stuffing-boxes have been so designed as to allow of a lateral movement of the piston-rod without, at the same time, permitting leakage, while the gland containing these rings has been so designed as to be continually cooled by air, so that a moderate temperature may be maintained. As may be seen, each stuffing-box is fitted with movable spherically seated packing rings. The sleeve containing the white metal packing rings and the cast-iron ground ring is cored out to obtain cooling by air over its entire length. The necessity for this air-cooling was forcibly illustrated at the trials of the first superheated steam engine, in which no provision for cooling had been made, and, consequently, the white metal rings melted as soon as a high degree of superheat was reached.



Stuffing Box for Piston Rod.

The outer packing ring is placed in the same transverse plane as the middle packing rings, in order to avoid canting the latter. In the same manner excessive pressure of the cast-iron ground ring against the piston-rod is prevented, so that overheating of the rod is impossible. The packing rings are held in position by the steam itself, aided by a spring. The latter prevents the rings from being carried along by the returning rod, and it also forces the packing rings on their seats without in any respect impairing the flexibility of the whole arrangement.

In order to reduce the frictional resistance of the valves, and with it the wear, to the smallest amount solid rings have been used.



Piston for Superheated Steam Locomotive.

As the difference in expansion between the valve and its case would be considerable, it was necessary to reduce the diameter to a minimum. For this reason double admission ports have been adopted, so that it is impossible to keep the diameter of the valve almost as small as the exhaust pipe. This has made it possible to use a diameter of but 6 in. on all of the engines of the Prussian State Railway, and this has been found to be amply sufficient.

The tendency of ordinary piston valves to seize, if too tightly fitted, has been avoided by jacketing the walls of the valve case with steam. This insures a uniform expansion throughout the whole length of the case and steam leakage is reduced to a minimum, and even this loss is more than compensated for by the reduction of friction. Preliminary warming up of the casing, before starting the engine, is unnecessary; nor is there any liability of the valve seizing during working. The wear, also, is very slight, and, in some cases, none can be detected after a year of service. The quantity of lubrication required is very small and the load on the reversing gear is light. The construction of the valve is clearly shown in the engraving.

Although excellent results have been obtained with this valve, one with a split ring has also been designed in order to avoid the accuracy of manufacture that is required with the solid ring.

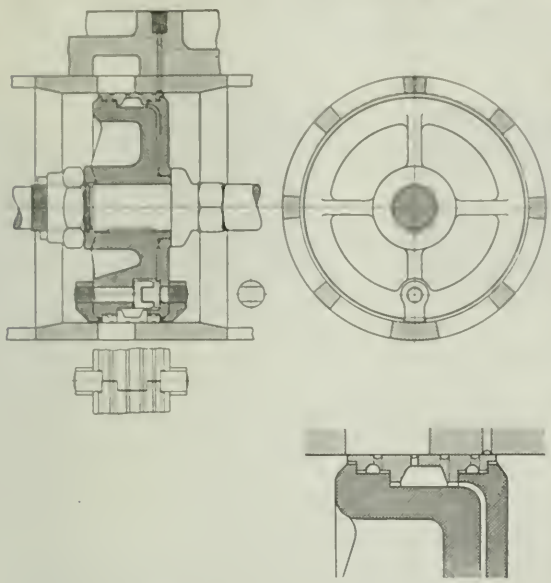
In this second type wide rings are used instead of the usual narrow ones, as experience has shown that the narrow are not suited for use with superheated steam. These broad rings are provided with several steam-tight spaces on the inside of each ring, which communicate with the steam port by means of radial holes about $^{3}/_{16}$ in. diameter, arranged circumferentially around the ring. Thus pressure on both sides of the ring is equalized, so that it is only pressed against the lines by its own tension which is sufficient to secure tightness.

In order to obtain a good fit between the valve end and the ring, and between the ring and the valve body, without jamming the ring between the two, the valve end is made with a certain amount of elasticity, and is only screwed up against the valve body at the center, leaving the outer periphery to be pressed on by the steam.

The steam pressure in the valve chest is thus made to insure the tightness of the rings, while at the same time the elasticity of the cover gives the ring sufficient freedom for expansion. As during admission the pressure on both sides of the cover is the same, the ring adjusts itself independently of the valve end or cover. During

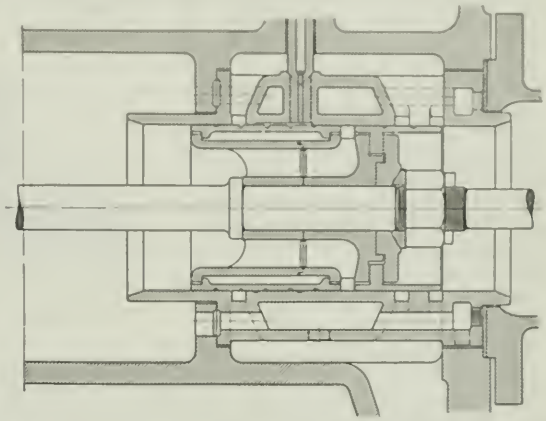
exhaust, however, the ring is held in position by the cover until readmission takes place. Excessive outward pressure of the ring against the liner, and consequently excessive friction is thus prevented.

The resistance to motion of this type of piston-valve is very small and the wear of the rings correspondingly slight.



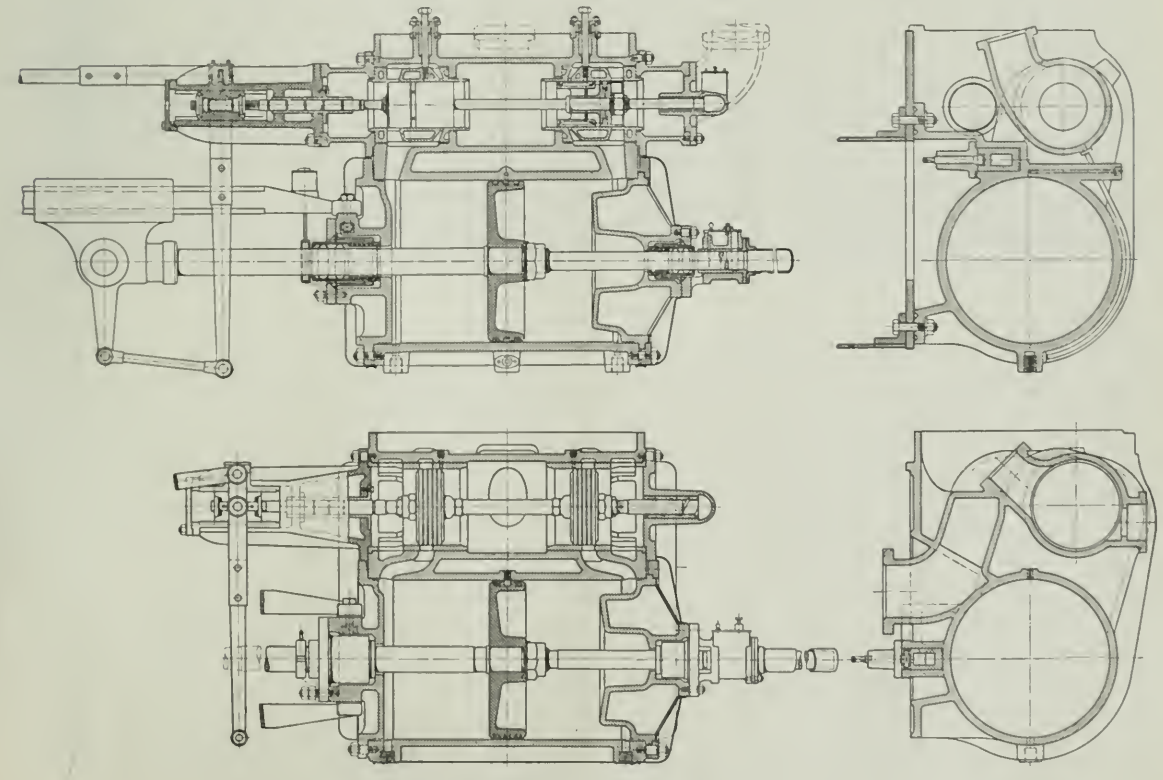
Schmidt's Piston Valve with Steam Jacketed Casing, Double Admission and Solid Rings.

As compared with the solid ring type of valve, this modified type has the advantage of remaining absolutely steam-tight so long as there is any elasticity in the rings. The split or cut in the rings must always be placed opposite the broad bridge of the liner, so as to prevent leakage through the cut. The cut in the ring is protected on the outside by a cover, which is fixed respectively to the valve body and to the valve end or cover. The screws holding the split covers prevent the rings from turning. Hence, in cases where the split covers are cast on, special set-screws must be provided for this purpose.



Schmidt's Piston Valve with Steam Jacketed Casing, Double Admission and Solid Rings.

These piston-valves, with split-rings, have been in use for a number of years with marked success, and have been adopted by most railways using superheated steam.



Cylinder and Valve for Superheated Steam Locomotive; Schmidt's System.

A Removable Driving Box Brass.

The scheme illustrated herewith for holding driving box brasses, instead of pressing them in, was devised by Charles Markel, shop foreman of the Chicago & North-Western at Clinton, Iowa. It is simply the use of a wedge-shaped steel key, which is driven between one extremity of the brass and a shoulder of suitable size and shape in the box. A movement of the key of 1⅝ in. is provided for, and it is claimed that when driven home it holds the brass so securely that a hydraulic pressure of 40 tons is required to start it. Removal of the key is accomplished in the manner shown in one or the illustrations. There is a tapped hole in the end of the key for this purpose, and also for the insertion, loosely, of a hexagonal-head bolt which, besides keeping the hole closed ordinarily, is used to drive against, saving the end of the key from injury. Also, there is a tapped hole in one end of the brass to receive a bolt for removing the brass by hand. A set-screw through the side of the box prevents the key from working out.

The scheme insures an effective fit of the brass in the box, it is claimed, avoiding one of the bad points of the pressure method. For in the latter, even though 30 or 40 tons pressure may be exerted in forcing the brass in, the bearing is uncertain and may be on a few points only. The working of the locomotive soon pounds it to a better bearing, producing a loose brass. By the method here shown the brass is turned $\frac{1}{32}$ in. smaller than the box fit, and when the key is driven the brass is forced to a tight, solid contact with the box.

If heating or some other cause loosens the brass it can be tightened at once by further driving of the key. To remove a brass for shimming or replacement it is only necessary to lift the weight of the box from the journal and pull key and brass; the operation is as simple in reverse order, the whole being done in a minimum of time. This latter is one of the important advantages, of course, as a full change of brasses by present methods means two or three days' work and $16 to $24 in labor cost. By the new method it can be done in from two to 12 hours, depending on the number of driving wheels and the kind of valve gear. The new method also permits satisfactory shimming of the brasses, a practice which most roads have abandoned because of the troubles with it; the brasses may therefore be worn down as thin as desired and be held tight at all times by the key.

The boxes are in service on several North-Western locomotives and the results have been entirely satisfactory. The first engine equipped was an Atlantic type, in fast passenger service, in April, 1906. There has been no trouble with the brasses and they are in good condition at the present time. Other engines of the same type have been equipped since with equally good results. The Duluth, Missabe & Northern has had a box in very heavy service since May, 1906, likewise with satisfactory results. In the general use of the device the box openings can be made to a standard for each class of locomotive and brasses and keys kept in stock. The only machine work at time of application therefore is to fit the brass to the journal. Jigs and templets and methods of machining to produce all parts in exact duplicate with the least work have been devised by the Inventor. The Locomotive Improvement Co., Clinton, Iowa, has been formed to sell this and other devices. As the removable brass can be applied to boxes now in service, the company does not intend to make boxes and brasses at present. Instead, the use of the scheme by railroads will be licensed on a royalty basis.

Roadmasters' and Maintenance of Way Association Convention.

The Roadmasters' and Maintenance of Way Association held its twenty-fifth annual convention in the Sherman House, Chicago, Nov. 12, 13 and 14. President C. H. Cornell (C. & N.-W.) was in the chair and about 70 members were in attendance. The opening address was made by R. H. Alshton, General Manager of the Chicago & North-Western. President Cornell followed with an address in which he stated that the association, which for a time was exhibiting signs of weakness and decline, is again in vigorous and prosperous condition. The secretary reported the addition of 48 members. The subjects discussed by the convention were: Maintaining Track in Line and Surface in the Winter; Wrecking Outfits—Organization and Working; Cost of Ballasting Old Track and Renewing Ties; Organization and Working of Rail-Laying Gangs; Method of Destroying Vegetation in Track.

Two of these reports were reprinted last week; others will be found in the present issue and in subsequent issues.

At the Thursday forenoon session, W. M. Camp, editor of *Railway and Engineering Review*, read a paper entitled "Why Efficient Track Work is Skilled Labor."

Following the custom recently adopted by this association, the supply men were given the privilege at one of the sessions of explaining their devices, five minutes' time being allowed the representative of each firm. A number availed themselves of the opportunity.

The officers for the ensuing year are: President, J. A. Kerwin (Mo. P.); First Vice-President, A. E. Hansen (C. & N.-W.); Second Vice-President, W. A. Brant (C. & N.-W.); Secretary and Treasurer, W. E. Emery (C. & A.), re-elected; Members Executive Committee, T. Thompson (A., T. & S. F.), W. H. Kofmehl (C., M. & St. P.), J. Muschott (P. M.), and B. A. West (A., T. & S. F.). The next place of meeting is Milwaukee, Wis.

Following is a list of the exhibits at the convention:

Adams & Westlake Co., Chicago.—Switch, semaphore and other signal lamps.

American Flange Frog & Railway Improvement Co., St. Louis, Mo.—Models of the "Graham" flange frog.

American Hoist & Derrick Co., St. Paul, Minn.—Photographs of "American" ditchers.

American Rail Joint Company, Niagara Falls, N. Y.—Models of the "American" rail joint.

American Railway Device Co., Chicago.—"Economy" separable switch joints, "Odenkirk" switchstands, anti-rail creepers.

American Steel & Wire Co., Chicago.—Samples of woven wire fencing, wire rope, "Cooper" rail bonds and electrical wire.

The American Track Barrow Co., Lowell, Mass.—Models of track barrows and rail pony cars.

American Valve & Meter Co., Cincinnati, Ohio.—"Economy" switchstands, and catalogues of Ponge water columns and tank fixtures.

Atlas Railway Supply Co., Chicago.—Atlas rail joints, braces and tie-plates; Atlas improved switchstands.

Louis Blessing and Alfred Johns, Jackson, Mich.—Cable-loop reinforced concrete ties and adjustable keyed nut-lock.

Border Bolt & Nut Lock Co., Richmond, Ind.—Samples of bolts and nut locks.

Buda Foundry & Manufacturing Co., Chicago.—Track jacks and rail drills; hand and push car wheels; switchstands; track gages and levels; track-tool grinders.

The Cleveland Frog & Crossing Co., Cleveland, Ohio.—The "Prentice" anti-rail creeper.

Commonwealth Steel Co., St. Louis, Mo.—Photographs and pamphlets of cast-steel gasolene weed burner.

Cook's Standard Tool Co., Kalamazoo, Mich.—Track drills, track tool grinders and cattle guards.

Coulter & Paxton, Longmount, Colo.—Models of improved track wrench and clamp.

Dilworth, Porter & Co., Ltd., Pittsburgh, Pa.—Samples of Glendon flange and Goldie claw tieplates.

The Eyeless Tool Co., Newark, N. J.—Eyeless picks and solid steel track tools.

Fairbanks, Morse & Co., Chicago.—Gasolene motor car, Barrett track jacks and rail drills.

Gibraltar Manufacturing Co., Chicago.—Model of "Gibraltar" pumping post.

Wm. Goldie, Jr., & Co., West Bay City, Mich.—Goldie perfect tie plugs.

Grip Nut Company, Chicago.—Samples of grip nuts.

Hart Steel Company, Elyria, Ohio.—McKey rolled steel shoulder tieplates and open hearth steel spikes.

Hayes Track Appliance Co., Geneva, N. Y.—Hayes derails, with operating and target stands.

Hussey Binns Shovel Company, Pittsburgh, Pa.—Shovels, spades and scoops.

Kalamazoo Railway Supply Company, Kalamazoo, Mich.—Hand and velocipede cars, Moore track drills, and Kalamazoo track jacks; track gages and levels, and curve lining gages, pressed steel wheels.

National Lock Washer Co., Newark, N. J.—Samples of spring nut locks.

Pennsylvania Steel Co., Pittsburgh, Pa.—Manard manganese anvil-faced frog, design 160.

Quincy, Manchester, Sargent Company, Chicago.—Bonzano rail joint, Q & C compromise and insulated joints, Cafferty tie tongs, anti-rail creepers.

The Rail Joint Company, New York.—Rail joints of the continuous, Weber and Wolhaupter types.

Railroad Supply Co., Chicago.—Tieplates and derailers.

Railway Specialty & Supply Co., Chicago.—Mansfield combination guard-rail, clamp and tieplate, manufactured by the Otto Gas Engine Works, Chicago; P. & M. and vise grip rail anchors, Smith improved nuts.

M. M. Riley, Ironwood, Mich.—Model of steel tie and rail.

John M. Scott & Son, Racine, Wis.—Models of "Hercules" and "Little Giant" bumping posts; Racine nut locks.

Sellers Manufacturing Co., Chicago.—Tieplates, rail joints and splice bars.

Stover Motor Car Co., Freeport, Ill.—Gasolene motor car.

Thomas Boltless Rail Joint, Watertown, Wis.—Model of boltless rail joint.

Universal Portland Cement Co., Chicago.—Samples showing different stages in the manufacture of "Universal" Portland cement.

United States Wind Engine & Pump Co., Batavia, Ill.—Switchstands, semaphores and water supplies.

Worth Wire Works, Kokomo, Ind.—The "Clinch" wire fence stay.

The Beech Grove Shops of the Big Four.

The Cleveland, Cincinnati, Chicago & St. Louis (Big Four) expects to have the locomotive department of its new shops at Beech Grove, Ind., ready for occupancy by December. The principal buildings, with the exception of the storehouse, are near completion and the installation of tools and equipment will follow as fast as practicable. This plant, when fully completed, will be one of the notable railroad shop plants of the country both in size and all other features that characterize the most recent practice in such shops. It is of interest therefore to review briefly the conditions attending the inception and planning of the plant, as well as to study the grouping and operating conditions.

Indianapolis is the central and most important point of the Big Four system, with lines radiating in six directions. At the present time the road is without facilities suitable to care properly for modern motive power. The Brightwood shops at Indianapolis, which were built when 35-ton engines were the standard, have long been hopelessly outgrown, with no room for enlargement and rebuilding. Some of the shops at other points, while more modern than the Brightwood plant, have neither the capacity nor the facilities for present needs. The construction at Indianapolis of a new plant entire to care not only for the equipment of the divisions entering there, but also for the heavy locomotive repairs of the whole road, and on a scale which looked well into the future, had therefore become a necessity. Preliminary work was begun early in 1906. It will be recalled that a committee of motive power men of the New York Central Lines, of which the Big Four is a part, was appointed to visit the largest of the different new railroad shops and from their study of same determine the nature and general characteristics of the plant required for the Big Four. This committee consisted of Messrs. H. F. Ball, E. D. Bronner, F. M. Whyte, R. T. Shea, W. Garstang and B. D. Lockwood.

Besides shops, the Indianapolis situation also required relief in the matter of freight yard facilities. It was therefore decided to build the new shops and a large concentration yard on a new site where not only would there be ample room for present needs, but where future growth would not be restricted. The tract selected is at Beech Grove, about six miles southeast of the city on the line to Cincinnati—the Chicago division of the road. The proximity of shops and freight yards naturally influenced the layout of the former.

The Arnold Company, Consulting Engineers, Chicago, was commissioned to prepare a preliminary report and estimate of cost of the proposed shop plant. Several block plans suitable for the particular requirements at Beech Grove were prepared and fully discussed with the railroad company's engineers, and the decision was finally made in favor of the one shown herewith, in which the eastbound classification yard is immediately north of the shops. The Arnold Company then prepared complete plans and specifications for the entire plant, including buildings, water and sewer systems, power plant equipment, air, heating and steam systems, together with electric light and power systems. This company is now acting as inspector for the entire work.

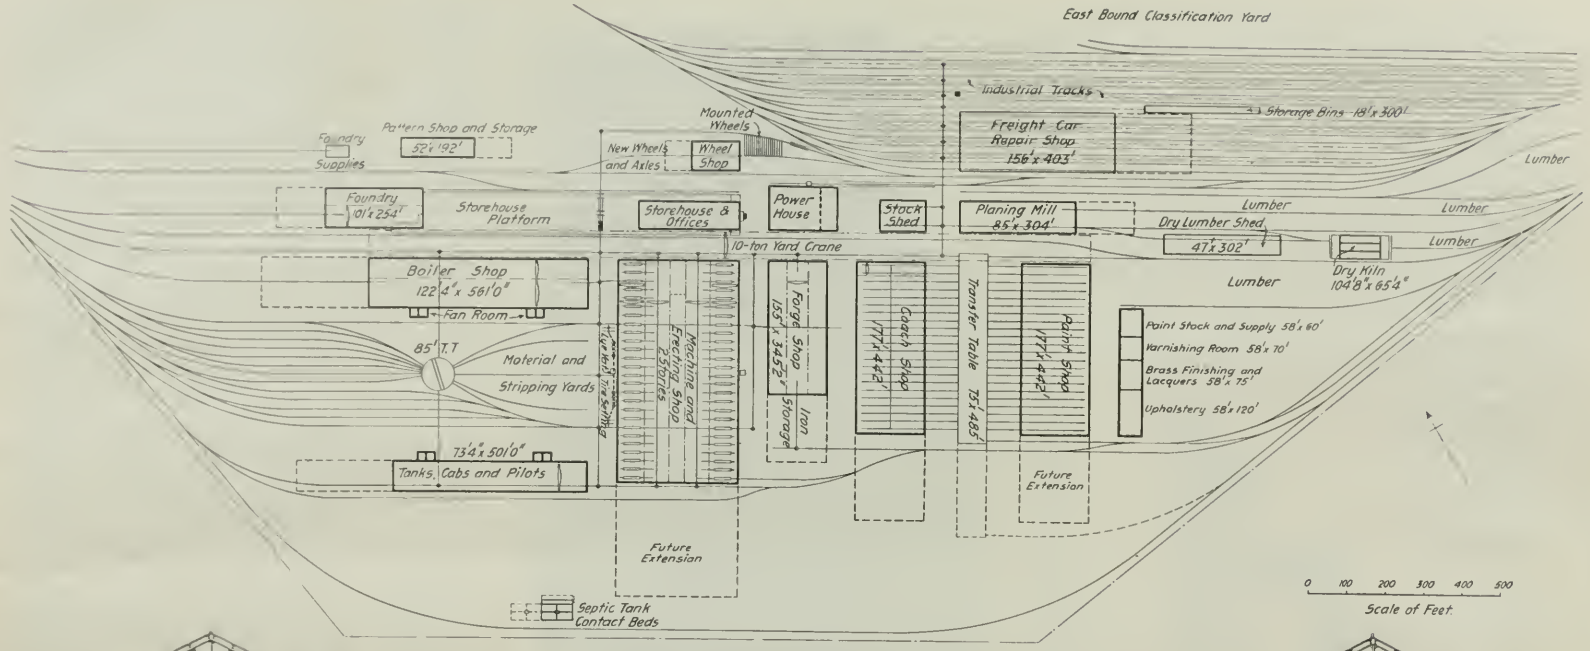
Examination of the general plan shows the central feature to be a "midway" or general supply avenue on which all of the important buildings front. This is midway is 75 ft. wide, about 2,000 ft. long and is served by a 10-ton overhead traveling crane. There were no site limitations on the arrangement of the plant, so that the engineers were without any restrictions of this sort in their effort to secure the most efficient grouping. One of the basic conditions governing the arrangement and relation of the different departments was that the forge shop should be able to serve conveniently all three of the principal departments, the locomotive and the two car departments. Another was to have the planing mill serve the latter two and also be convenient to the power station for disposal of its refuse. The car departments have been assigned to the east end and the locomotive department to the west end of the site, the machine and erecting shop, as the central and most important unit of the latter was put on the south side of the midway where it can be extended to double its present length if need be. The forge shop was put east of it, between it and the passenger car shop, and where product for the freight car shop can be carried across quickly and easily by small cars and the midway crane. Locomotives to be shopped are brought in at the western end of the shop yard to the hospital tracks, a part of which lead to an 85-ft. turntable, which feeds the machine and erecting, the boiler and the tank shop as the case may be. The engines

Blacksmith Shop; Beech Grove Shops of the C. C. C. & St. L.

will stand with their head-ends toward the center of the machine and erecting shop and therefore will cross the table in entering and leaving this shop only when a reversal of direction is necessary. Likewise, the normal routing for the cab and tank shop is through the end doors. For the boiler shop it is by way of the turntable, with emergency entrances at the ends.

The storehouse is placed nearest to the locomotive shop—directly across the midway from it—since the majority of the supplies carried are for the locomotive department, but is where the supplies may be received with freedom and distributed to the different departments with equal ease by means of the yard crane, its length being parallel to the runway. The location of the foundry gives plenty of scrap yard room adjacent to it and also permits raw material to be received and castings to be delivered without unnecessary handling or reverse movement. A heavy-material platform 460 ft. long, connects foundry and storehouse and has its south side under the yard crane. The pattern shop is close to the foundry, but is isolated from the rest of the plant for fire protection.

The power station has a central location on the midway and all electric cables, steam, air and water piping, etc., are carried from it to the principal buildings in a large reinforced concrete tunnel, 6 ft. 9 in. x 7 ft., under the midway. The car departments receive and store their lumber at the east end of the yard, from which it progresses through the dry kiln and dry lumber shed to the planing mill and thence to the car shops on each side. The transfer table of the passenger department connects with the yard



General Layout of the Beech Grove Shops.

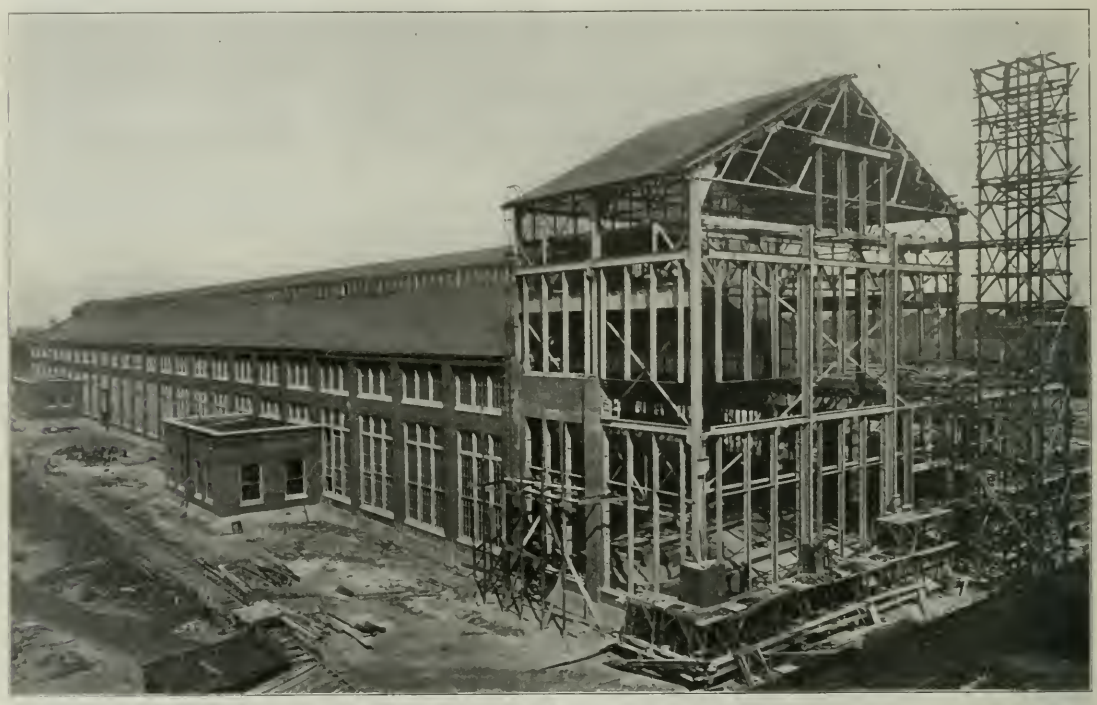
Sections Through Erecting Pits in Locomotive Shop.

crane. The freight car repair yard is adjacent to the large switching yard where cripples may be classified for the shop repair tracks and delivered to them with the least amount of switching. A minimum spacing of 75 ft. has been observed for all buildings for fire protection.

Exterior and interior views of the machine and erecting shop are shown which give an excellent idea of the building. It is 315 ft. wide and 578 ft. long. It is a structural steel building with 17 in. Colonial brick curtain walls and is supported on ample concrete foundations reinforced with steel bars. There are five bays—an erecting

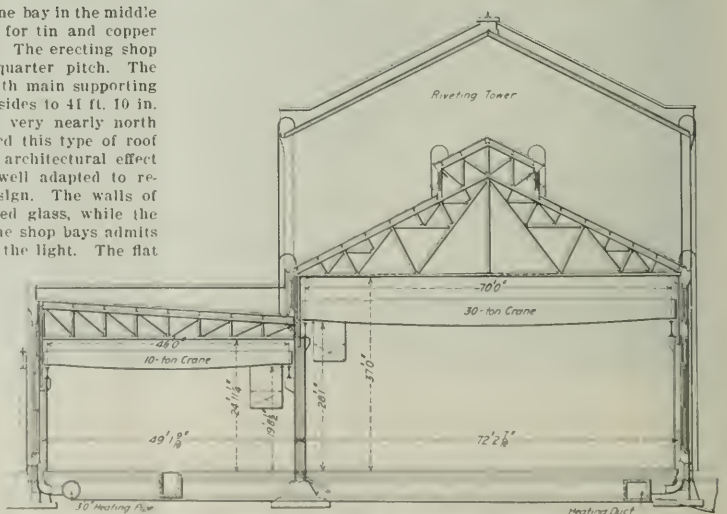
umns of the middle bay. The remaining space between machines and material track is for the storage of material, and the space on the opposite side of each material track is for locomotive wheel storage, as shown.

A detail of the erecting pits is shown. They are concrete, with bottoms lined with vitrified brick. The heating duct runs along the outer, or wall, ends of the pits, with connections to the latter as shown. Each pit is supplied with air, steam, water and electric connections. There are two of the air outlets equipped with air-hose connections. When not in use these fit into recesses in the



Boiler Shop; Beech Grove Shops of the C. C. C. & St. L.

and a machine bay on each side and a light machine bay in the middle common to each. Over this latter is a balcony for tin and copper shop, lavatories, locker rooms and heating fans. The erecting shop roofs are covered with slate and have a one-quarter pitch. The three intermediate bays have a saw-tooth roof with main supporting trusses rising from a head room of 35 ft. at the sides to 41 ft. 10 in. at the center. The fact that the building lies very nearly north and south in the direction of its length permitted this type of roof to be used to the best advantage. The general architectural effect of the building is good, while the section is well adapted to requirements, as well as being economical in design. The walls of the building are fully 60 per cent. factory ribbed glass, while the difference in height between erecting and machine shop bays admits of large clere-story windows, further increasing the light. The flat portion of the roof surrounding the saw teeth is to serve as a hose cart runway for fire protection. All roof drains are inside, as will be observed from the cross-section of the building. Each erecting bay has a 120-ton crane 50 ft. above the floor for traversing locomotives, and a 10-ton messenger crane 28 ft. above the floor. Each machine bay likewise has a 10-ton crane. The heavy cranes have two trolleys and with full load, trolleys 30 ft. apart, they are to maintain a hoisting speed of 8 f.p.m., 100 f.p.m. trolley speed, and 175 f.p.m. bridge speed. The small cranes have a hoisting speed under load of 25 f.p.m., a trolley speed of 125 f.p.m., and a bridge speed of 400 f.p.m.



Cross Section of Boiler Shop.

There are 52 erecting pits divided equally between the two outside bays. There is about 1,100 sq. ft. of machine floor space per pit, on the basis of 48 pits, since the four pits on the through tracks are for wheeling and unwheeling locomotives. The machine floor comprises a central section extending 15 ft. out from the col-

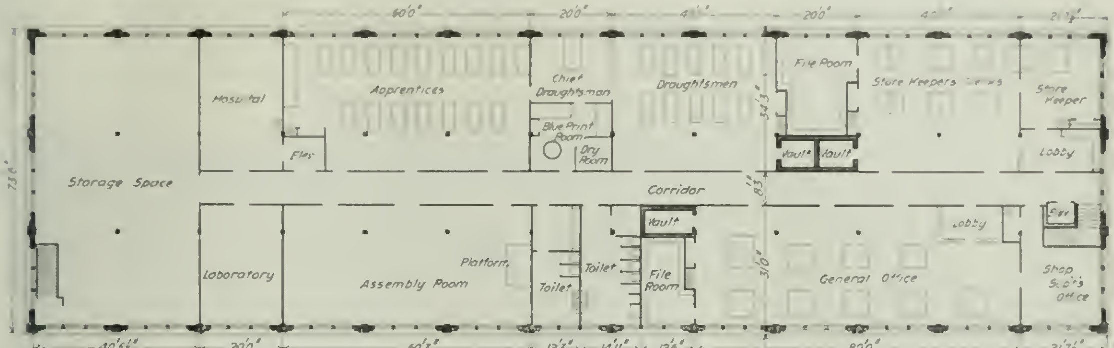
sides of the pit. The steam is supplied at 225 lbs. pressure for testing. Heavy work benches with cast-iron frames, fitted with drawers and tool racks, will be placed between pits. On the posts at each bench, 8 ft. above the floor, are triple outlet boxes for either light or power connections. Two air outlets fitted with air-hose connec-

tions, and one 2½-in. hose valve water connection, are located on alternate columns between machine and erecting bays at a suitable height above the floor. The air piping is run overhead with drops at these columns. There is also an air connection on each alternate column on both sides of the light machine bay. Water hose connections are made to the roof at intermediate points for fire protection. The floor of the shop is 1⅝-in. maple covered on 3-in. hemlock planks, the latter nailed to 4 in. x 6 in. sleepers bedded in 7 in. of bituminous concrete. Beneath the concrete is 6 in. of screened gravel. The balcony floor is concrete.

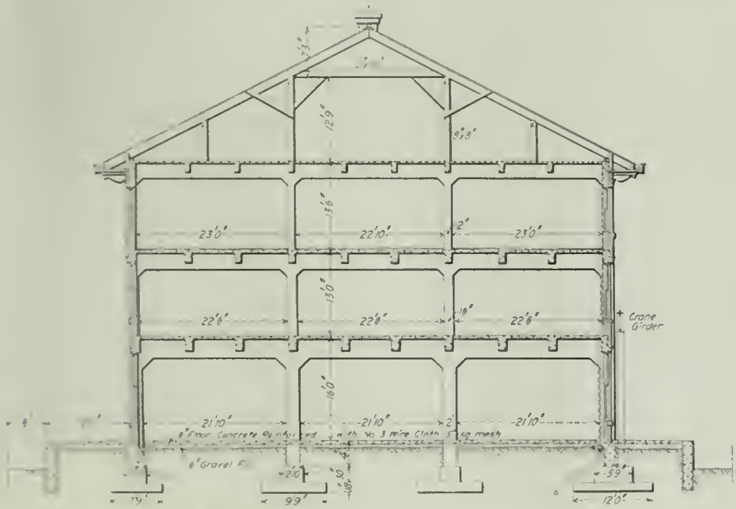
The building is heated by six separate hot blast outfits. Each outfit consists of two 210-in. full-housed fans, each fan direct connected to a 12 in. x 12 in. vertical enclosed side-crank engine. The intake of air is through 20 sections of heating coils, 9 ft. x 9 ft. 3 in., arranged in four groups. The coils are heated by exhaust steam from the power station. A vacuum system is maintained by piping condensed steam returns to vacuum pumps in the power are built on the south side of building, as seen in the photographic view.

The blacksmith shop is 1?? ft. x ??? ft., in three bays. The dimensions and details of the main and side bays are the same as the similar bays of the boiler shop and [illegible] a cross-section is not shown. The central bay will have a 10-ton electric overhead travelling crane, a feature which few railroad blacksmith shops possess as yet. The operator's cage will come to within 8 ft. 6 in. of the floor to get below the smoke and gases as much as possible. The floor of the shop is formed of 2 in. of front-end sparks over laying 6 in. of cinders on a foundation of 10 in. of clay and gravel. There is a mezzanine floor for the foreman's office [illegible] et. The building is heated directly from steam piping.

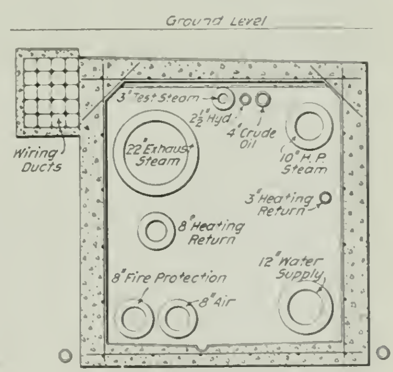
The storehouse and office building is to be of fireproof construction, except the roof timbers and their supporting [illegible]. It will be 73 ft. x 263 ft., three stories high. It will have a self-supporting reinforced concrete frame with Colonial brick exterior



Third Floor Plan of Storehouse; Beech Grove Shops.



Cross Section of Storehouse; Beech Grove Shops.



Section Through Power Tunnel, 6 ft. 9 in. x 7 ft.

station. The fans and coils, as already mentioned, are located in the balcony. They discharge downward to reinforced concrete ducts under the floor, each of which runs across to connection with a duct which encircles the entire building just inside the walls. Outlets from the latter discharge into the erecting pits and through registers in the floor under each window. The duct around the building also carries the air, steam and water piping for pit service.

The boiler shop is 126 ft. x 564 ft. A view of it from the riveting tower end, which is the end adjacent to the machine and erecting shop, taken before completion, is shown. The cross-section of the building shows it to consist of a main bay and a side bay, 72 ft. and 49 ft. wide respectively. The former is served by a 30-ton, and the latter by a 10-ton crane. The general structural features of the building are similar to the machine and erecting shop. However, the west wall of the riveting tower, which is carried by the main bay truss, is made of concrete on expanded metal in order to minimize the weight. The building will be heated in the same way as the machine and erecting shop. The fan rooms

walls, cut stone sills, slate roof and copper cornice. A 12-ft. platform will extend the full length of both sides of the building. It also will be reinforced concrete, with a granitoid top finish, which will likewise be the finish for the storehouse floors. The two lower floors are to be for store purposes and the upper floor for offices, as shown by the plan of same. It will be seen that it includes a hospital, to care for employees injured in the shops, and a room for apprentices, where they will be given daily instruction in accordance with the scheme now in force on all New York Central Lines. The third floor offices will have maple floors and be trimmed in oak. The hospital and toilet rooms will have tile floors with marble base. There is also a large assembly room on this floor for committee meetings, conventions, lectures to shop men, etc., and a lavatory. There will be one electric elevator for passengers and two for freight. The building will be heated directly from steam radiators. It will be equipped with a telephone exchange with connections to all departments of the shops.

The power station is shown partially completed in one of the

views. It is 114 ft. wide and 128 ft. long, the architecture harmonizing with the buildings already described. The substructure is concrete, the column piers being reinforced, and the substructure masonry is shale brick of a dark color lined with sand lime brick. The turbine room is finished with a red pressed brick wainscoting about 6 ft. high. The roof is slate on wood sheathing.

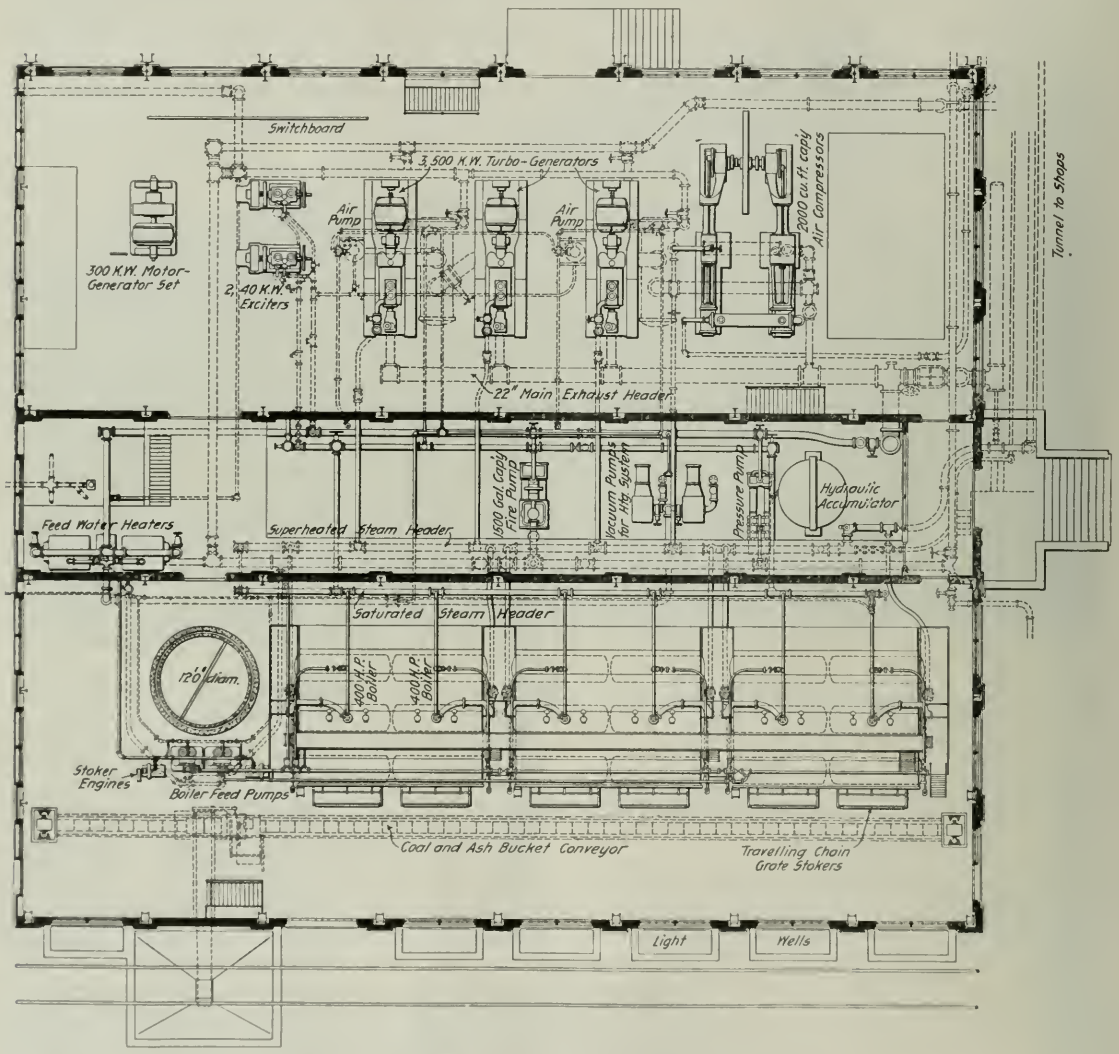
The liberal use of large windows in the side walls, and monitors and skylights in the roof, give a well-lighted interior. The building at present is closed at the east end by a wooden bulkhead to allow for future extension, which is contemplated at an early date. The power station will ultimately be twice its present size.

The boiler room is 46 ft. x 128 ft. It contains three batteries of two 415 h.p. Stirling water-tube boilers, each equipped with Foster superheaters and Greene chain-grate stokers. The boilers are connected to the stack by an underground reinforced concrete flue. The chimney is a Weber concrete-steel design, 12 ft. in diameter and 200 ft. high, equipped with lightning conductors.

Coal is stored in overhead reinforced concrete bunkers, and is fed direct to the stoker hoppers by steel spouts. The coal and ash handling machinery is the Link-Belt design. The coal is dumped from cars into a track hopper outside the building, and is carried to a crusher inside the building by a small apron conveyor. It falls from the crusher onto an endless bucket conveyor in the basement which passes up over the storage bunkers, automatically dumping into same. The ashes are fed to this same conveyor by spouts from the doors in the ash bins of the boilers. They are dumped into overhead ash pockets, located in front of the stack, from which they may be loaded through spouts into cars outside the building. The boiler feed pumps are of the Dean duplex, upright, Admiralty type. The boiler room contains a number of structural steel runways, making all piping and apparatus easily accessible for repairs.

The turbine room is 46 ft. wide and 128 ft. long, with a 12 ft. basement underneath. The main generating units comprise three Westinghouse-Parsons steam turbines, direct-connected to 500 k.w., 60 cycle, three phase, 3,600 r.p.m., 480 volt generators. There are two steam-driven, direct-connected 40 k.w. exciter units, and adjacent to same is a 300 k.w. Westinghouse motor-generator set for supplying 250 volt direct-current to variable speed tools. There is room for another exciter unit and a motor generator set.

It is the intention to run the compressor, which is a Laidlaw-Dunn-Gordon 2,000 cu. ft. cross-compound type, and the turbines



Plan of Power House; Beech Grove Shops of the C. C. C. & St. L.

condensing, and there are two wet vacuum system condensing outfits, consisting of two Wheeler Admiralty-type surface condensers and two steam-driven air pumps. The condensers each take care of two units, so that each unit may be run condensing or thrown on to the heating system at will. The exhaust steam from the auxiliary units is carried to the feed water heater by a separate system of auxiliary piping.

The generators connect to the switchboard by lead-covered, paper-insulated cables laid in the ducts in the concrete floor. The switchboard has 15 panels, 12 of which are for present use. It is equipped with Westinghouse instruments and I. T. E. circuit breakers, and is built by the Walker Company. In the floor back of the switchboard and running its entire length is a slate covered trench 14 in. wide and 8 in. deep. All ducts to the switch-

board lead to this trench and tubes turn up through openings in the slate cover to the circuit breakers. Feeders go out at right angles to the switchboard in clay ducts in the floor to the south basement wall, where they drop 6 ft. in split tile ducts laid in chases in the wall to the underground conduit system. Thus all power house cables are separately encased in tile duct embedded in the floor or basement wall.

Between the boiler room and turbine room is the pump room, 22 ft. wide and running the length of the building. It is open to the basement floor with the exception of a gallery along one side and the connection between the boiler and turbine rooms. This gallery supports two 2,500 h.p. Webster feed water heaters, equipped with purifying, filtering and oil separator accessories, and working automatically. Other apparatus in the pump room includes a 1,500 gal. Blake underwriters' fire pump, two Marsh vacuum pumps for the heating system, and a hydraulic pump and accumulator to furnish water at a pressure of 1,500 lbs. per square inch to the hydraulic riveter in the boiler shop. The turbine room has a 15-ton, hand-operated crane, and the pump room a 5-ton hand crane.

The main source of water supply for the plant is three deep wells worked by Blake motor-driven, deep-well pumps having a capacity of 250,000 gals. each per 24 hours.

The superheated steam piping and the saturated steam piping form separate and distinct systems; the saturated steam being used for auxiliaries and the superheated steam for the turbines and compressors only. There is, however, a cross connection between the two headers for use in case of emergency. All steam leads from the boilers contain automatic stop and check valves and all steam leads to units, except those to pumps, contain receiver-type steam separators.

The sanitary question has been given careful attention. There will be two separate sewer systems, one sanitary in which the sewage will be purified in septic tanks and sand filters. The other system will care for the storm water which is to be discharged into large storage reservoirs. Each building will be equipped with full toilet facilities. The machine and erecting shop, for example, will have 56 water closets, 12 shower baths, 190 lavatories and 24 urinals in two toilet rooms on the balcony. There will also be eight urinals on the main floor located about 100 ft. apart on the columns between erecting and machine bays. Another feature of importance is 12 drinking fountains on the main floor, direct-connected to the deep wells already mentioned, which will supply pure cold water of even temperature the year through.

The five buildings here described are all of the locomotive department that will be built at present. They are estimated to be able to care for 1,900 locomotives a year—25 per cent. more than the present equipment of the road. The general plan of the shops indicates a 50 per cent. extension for all buildings and for most of them there is room to double their length, so that the needs of the Big Four at Indianapolis are amply provided for for a long time to come.

The work has been under the constant supervision of W. Garstang, Superintendent of Motive Power of the Big Four, and H. D. Lockwood, Mechanical Engineer, and has the approval of J. F. Deems, General Superintendent of Motive Power of the New York Central Lines. The tool layout and equipment is directly in the hands of the motive power department, and will be treated in a subsequent article, after complete installation has been made.

The Münster-Schlucht Electric Railway.

BY E. OMMEGANCK.

The Münster-Schlucht electric railway, in Alsace, has been opened for traffic this year, and is interesting on account of the heavy grades encountered. The object of the railway is to establish communication between Stossmeier, Ampfersbach, Schmelzwasen and the town of Münster, and also in summer to convey tourists to the Schlucht, a locality also accessible from the French side by the existing Schlucht-Gérardmer railway. Schemes for building this railway have been long on foot, as two alternative projects were under consideration. One was entirely an adhesion railway, some nine miles long, with a maximum gradient of 8 per cent., while the other scheme contained a section with a gradient of 22 per cent. on which a rack rail was required, but the maximum gradient was 5.5 per cent. on the adhesion portion. The route in this case was shorter by more than two miles.

Car on Münster-Schlucht Electric Railway near Beginning of Rack.

Various local conditions and other considerations were in favor of the combined rack and adhesion scheme, which was accordingly decided upon.

The first one and three-quarter miles of the route out of Münster lies along the main road. The line then leaves the road, but rejoins it in about half a mile at the transforming station. From this point the road has been widened to accommodate the line, which continues in this fashion until the commencement of the rack section, nearly four miles from Münster. This portion has a maximum gradient of 22 per cent., and terminates at Altenberg, about one and a quarter miles further on. The final section, rather over a

mile long, follows the picturesque road to the Schlucht, in the direction of the French frontier. The total length of the line is about six and a half miles, of which about one and three-quarter miles is equipped with a rack. The station at Münster is at an altitude of 1,250 ft., and the line rises to 3,740 ft. at the Schlucht. Grooved tramway rails are used in the streets of Münster, and ordinary bullheaded rail for the rest of the line. The sleepers are partly of impregnated oak. The gage is one meter.

The rack is of what is known as the Strub construction, similar to that in use on the Jungfrau, Vesuvius, Brunnen-Morschach and Monthey-Champéry railways.

Like the running rail, it is mounted on iron chairs. The top of the rack is about 2 in. above the head of the running rails. The maximum pressure on the teeth of the rack is 3.5 tons, from each of the two wheels which engage with it. Tangential pressure on the rack is taken in the usual way by concrete blocks. The rails were laid in lengths of 34.5 ft., and the rack in lengths of 11.5 ft. There are in all seven stations on the railway. The generating station is at the end of the line at Münster. Two belt-driven, three-phase alternators capable of an output of 200 k.w., at 7,000 volts, 50 cycles, are provided, driven by horizontal steam engines.

Power is taken to the sub-station referred to above, by an overhead line, partly on the same poles as the trolley wire. Here there are two 160 k.w. motor generator sets, which supply continuous current at 750 volts to the trolley wire. A buffer battery of 390 cells of a capacity of 296 ampere-hours is used in parallel with these machines.

The overhead construction is partly of the span wire and partly of the bracket arm type. Two conductors are used, each 9 mm. in diameter. Owing to the position of the sub-station a feeder has not been thought necessary. The return is by the rails, which are bonded in the usual manner. The collectors on the cars are of the bow type. Two of these are carried on each car, both of which, of course, make contact with the two overhead wires.

The normal traffic in summer is nine trains per day, but a service every quarter of an hour both ways can be maintained on special occasions. In winter four or five trains per day suffice. Each train consists of a four-axled motor car, with usually one trailer. The motor car is provided with four motors of 85 h.p. each, two of which are for driving the running wheels in the usual manner, while the remaining two are permanently connected to the gearing which engages in the rack. All four motors are used on the rack section, so that the full 320 h.p. is available. This arrangement of two motors for the rack and two for the adhesion wheels has been developed by the Alioth Company, of Basle, under the Strub patents, and permits of the same rolling stock being used on the rack and adhesive portions of the line. On the adhesion section only the two motors are in use, and these drive the wheels through a single reduction gear in the ordinary way. The other two motors are not then in use. On the rack sections, however, all four motors are employed as just said. The rack motors work with a double reduction gear, and the adhesion motors are connected in series to run with a high torque at a low speed. All four motors are controlled by a single controller, which is interlocked, to prevent any wrong combination of connections being used. Series parallel control is employed, and reversing and braking positions are provided. The driver cabs are provided with ammeters for both motor circuit voltmeters, and the necessary fuses and circuit breakers, and a lightning arrestor equipment is installed on the roof. The carriages are heated and lighted electrically.

The motor car is provided with the following independent systems of brakes: (1) A mechanical hand-brake, acting through eight brake-shoes; (2) a band brake on the shaft of the motors driving on to the rack; (3) a rheostatic brake, and (4) an automatic brake which grips the sides of the rack when the speed exceeds six miles per hour down the steep grade. This form of brake is fitted to both trucks. The brakes can at any time be worked from either end of the car. In addition to these four brakes, the following safety devices should be noted. In order to prevent all possibility of derailment a pair of jaws are fitted under each truck surrounding the head of the rack rail, and a disc clutch is provided between the rack motors and their gearing, which permits of a certain amount of slip in the event of a sudden stoppage of the motor in a serious short circuit, so the enormous strain of a sudden jerk upon the rack is avoided and only a normal braking effect given.

Rack Construction; Munster-Schlucht Electric Railway.

The carriages are all of one class, and, as may be seen from the illustrations, are of the compartment type, with ordinary side doors. In the case of the motor cars one compartment is fitted with removable seats, so that it can be used for luggage if required. Each motor car weighs 25.5 tons, including passengers, and the fully loaded trailer weighs 6.5 tons, giving a total weight for the train of 32 tons. Each train contains accommodation for 72 passengers. The maximum speed on the level is 10.6 miles per hour, and on the steep portion 4.7 miles per hour. The total journey occupies about an hour. The main contractors were the Société d'Electricité Alioth, of Basle.

GENERAL NEWS SECTION

NOTES.

The Chicago, Milwaukee & St. Paul has made a reduction of 25 cents a day in the pay of the thousands of laborers working on the construction of its Pacific coast extension.

Following the imposition by a Canadian court of a fine of $25,000 for negligence causing an explosion in a freight car, the Michigan Central has canceled all rates on explosives destined to or from Canadian territory.

The Chicago & Alton, which some years ago turned all news agents off its trains, has now made a rule allowing rear brakemen to sell newspapers. They must ask not more than 1 cent above the regular price for a paper.

The Trunk Line Association has issued a new freight tariff on westbound merchandise imported from Europe, which goes into effect December 2. Many articles have been increased from 2 cents to 10 cents per 100 lbs. (New York to Chicago).

The Indiana State Railroad Commission has issued an order under which railroads will have to treat the crossings of interurban electric lines on the same basis as other crossings, at crossings not properly signaled and protected trains must come to a stop.

The second section of double steel tubes for the Detroit river tunnel was sunk on November 25, in a trench 40 ft. deep in the bed of the river, near the American shore. The sections are 262 ft. long. It is understood that no more sections will be sunk until spring.

The employees of the Nashville, Chattanooga & St. Louis have erected a monument to the late Major John W. Thomas, former President of the road, who died on February 12, 1906. The monument, a statue of Major Thomas, stands in Centennial park, Nashville, and it was dedicated on Sunday last.

A press despatch from Winnipeg says that the Canadian Pacific on November 25 put in effect a new freight tariff, making important increases in rates. The government had ordered the suspension of the tariff because of complaints which had been made against it, but on the 24th the suspending order was rescinded.

The Seaboard Air Line has issued an order forbidding the sale of liquor in its dining cars while in the state of North Carolina, except to passengers. Since the prohibitory laws of that state have become so strict there has been, it is said, a large demand for drinks from "crowds" at the stations where the through trains stop.

The Willamette valley, Ore., has marketed a prune crop valued at $1,500,000 this year. The packers shipped 7,000 tons, beginning about September 15, and 5,000 tons more were to go to market this month. The bulk of this crop went to the Atlantic seaboard, but heavy shipments were also sent to the Middle West, Canada, Europe and several carloads to London.

The Interstate Commerce Commission rules that where a passenger on a railroad is sick sufficiently to make travel dangerous to his health, a stop-over (including extension of time on limited ticket) may be granted; and not only to the sick person, but to one or more members of his family, if traveling with him. The same privilege may be granted to persons who are detained by an established quarantine.

Beginning December 1, the Detroit, Toledo & Ironton will run its through trains both freight and passenger, via Toledo, Ohio, instead of via Adrian, Mich., Tecumseh and Wauseon, Ohio. The three towns last named will be served by a branch from Napoleon, Ohio. The new route will be from Detroit, Mich., to Dundee, then over the Ann Arbor tracks to Toledo, and Wabash tracks to the D., T. & I. tracks again at Napoleon.

The new railroad commission of the state of Oklahoma has begun business with steam at full pressure. A number of complaints have already been received, and an order has been issued to the Fort Smith & Western to reduce passenger fares to 2 cents a mile. This road did not make the reduction on the establishment of the new state, as did most or all of the other lines. The names of the members of the new commission are given in the Elections column.

Governor Comer of Alabama has signed all the railroad regulation rate bills, and they become effective December 1. The Louisville & Nashville had declared that nothing would keep it from testing the laws in the Federal courts, but the reporters now think that the legislature in passing the penalty bills has caused the railroad to reconsider. The bills now signed include all the maximum rate bills, known as Group 8, and all the penalty measures. Some other bills signed prescribe procedure for taking appeals from the orders of the Railroad Commissioners; provide for litigation in the state courts on causes of action arising in other states; forbid common carriers charging more than the rates fixed by law, and give the Railroad Commission new authority and power.

In the Federal court at Salt Lake City November 20, indictments were returned against the Union Pacific, the Oregon Short Line, the Union Pacific Coal Co. and officers of the several companies, charged with violation of the anti-trust law by combining to force out of business D. J. Sharp, a coal dealer of Salt Lake City. The complaint alleges that Sharp was "punished" because he reduced the price of coal. The indictments are said to have been made in place of some which were returned several months ago but which were found defective.

Press despatches from Chicago say that the Erie Railroad, on the first day of its $10 passenger rate from Chicago to New York, took 2,400 passengers out of that city, all carried on four trains. The rate is made only in connection with steamship tickets to Europe, and these hundreds of passengers consisted almost wholly of foreigners who are going to Europe to spend the winter at their old homes. The same despatch says that the Grand Trunk and the Wabash will make a $10 rate to meet that of the Erie.

The number of emigrants going from New York to Europe is now far greater than in any former autumn, most of the steamships having all their low-class accommodations engaged weeks before sailing.

The Appellate Division of the Supreme Court of New York, third department, by a vote of three to two has sustained the constitutionality of the law of 1905, empowering a state commission to fix the rates at which gas shall be sold. The decision is looked upon as sustaining the Public Service Commission law of 1907 as regards the fixing of rates by a body to which authority has been delegated by the legislature. The decision is by Judge Smith, concurred in by Judges Chester and Cochrane. Judges Kellogg and Sewall dissent. The law in question authorizes the gas commission, after hearing and investigation, to fix the price of gas "within the limits prescribed by law." The court holds that, having thus fixed limits, the legislature has delegated only an administrative power. The only "limit" named in the press despatches reporting this decision is that of reasonableness—on the one hand, to the public, and on the other hand, to the producer; but this, according to the court, is sufficient. These limits are fixed, not by statute, but by the common law; but this makes no difference.

Coal Companies Sell Cars.

The Fairmont Coal Company has sold 2,223 and the Somerset Coal Company 1,000 coal cars. The Baltimore & Ohio has bought 1,700 of the Fairmont cars, and the Cumberland & Pennsylvania takes the rest and all the cars sold by the Somerset Company. These coal companies are now on the same footing as other coal shippers in the Fairmont and Somerset regions.

Railroad Disaster at Barcelona, Spain.

A press despatch of November 25 reports the derailment of a train on a bridge at Barcelona, Spain, on that day, in which 12 persons were killed and 22 injured, the train falling into the river.

Brown's (?) Discipline.

Several notices of dismissal have been posted at Sayre by the superintendent of the Pennsylvania division of the Lehigh Valley, as follows:

A brakeman failed to properly secure cars on a grade and an accident resulted.

An engineman permitted water to get low in a boiler with the result that considerable damage was done to the engine.

A yard brakeman was intoxicated when he reported for duty.

A brakeman failed to carry out instructions received from conductor, and a derailment resulted.

A conductor failed to carry out instructions received from a yardmaster, resulting in damage to cars.

A yard conductor was intoxicated while on duty and refused to work.—*Exchange.*

Law for Little Malefactors.

Passenger Traffic Manager C. S. Fee, of the Southern Pacific, has issued a circular of instructions giving interpretations of the revised Interstate Commerce law. This circular deals with extensions of tickets, stop-overs, charges for excess baggage, charges for

children, redemption of tickets and many other subjects. Any parent or guardian who endeavors to take a child of 12 or over across a state line on a half-fare ticket is subject to both fine and imprisonment. The man who induces a station agent to check a few pounds in excess of the 150 lbs. allowed free of charge across a state line is apt to get himself and the baggageman in jail. The man who beats his way on the cars across a state line breaks enough laws to keep him in prison for the rest of his life. A lineman in the service of a telegraph company, if making an interstate trip to repair some line which carries railroad business, can ride free, but if he rides across a state border on private business, then he violates the law and is liable to be sent to jail.

Need of More Track in Alabama.

The following extracts are from a letter from General Manager H. E. McCormack, of the Pratt Consolidated Coal Co., Birmingham, Ala., to Milton H. Smith, President of the Louisville & Nashville.

The company with which I am connected has shipped to the general markets in the South, for several years, about one and three-quarter millions tons of coal a year. This tonnage is equal to something more than half the tonnage of the entire cotton crop of the country, and the coal is sold and delivered in eight states. Rates that enable us to compete with the mines in Kentucky, east Tennessee, Virginia, as well as the output of Pittsburgh, which comes down the Mississippi river, and that of West Virginia and Virginia which comes down the Atlantic coast out of Norfolk, Va., are so carefully adjusted that for the several years that I have personally seen to the marketing of our product, I have not asked the railroad people for a reduction in the rate of freight to a single point. On the contrary the present rates would admit several million tons of coal to be marketed in excess of that now being produced in Alabama. In other words, if we could produce the coal, and the railroads were in position to handle it, we could enlarge our market very greatly by pushing back the coal from the North and West in the sections where we now meet them.

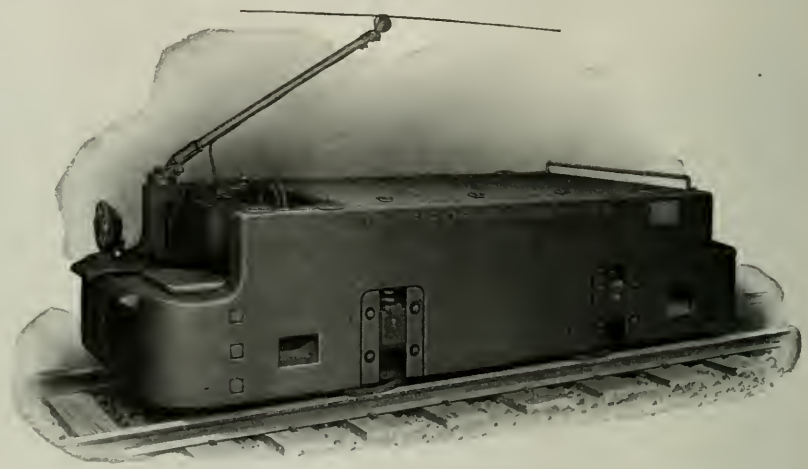
The Louisville & Nashville has always shown a friendly feeling to the Alabama coal field. Had it not been for you the rate to New Orleans would have been put, three years ago, to a point that would have virtually prohibited shipment of Alabama coal to that market, and thus deprived the mines of Alabama of a market for 2,000 tons daily, or 600,000 tons a year. I have been told that you informed the man who suggested it to you, that this advance in the rate of freight would shut down, or seriously injure, the mines along the line of the Louisville & Nashville in Alabama, and that you would, under no conditions, agree to the advance suggested.

I am unable to recall a single instance where a serious complaint has been made by our customers as to the rate of freight. I have come to the conclusion that practically all of the shortcomings of the Southern transportation lines are to be charged to two causes. Lack of funds is the principal one, lack of time is the other. At the beginning of the period of prosperity some of the Southern roads did not have the additional capital required to add to their equipment as fast as their necessities demanded it. My observation is that the railroad is just getting in shape to need money when it is graded, rails laid and operation commenced.

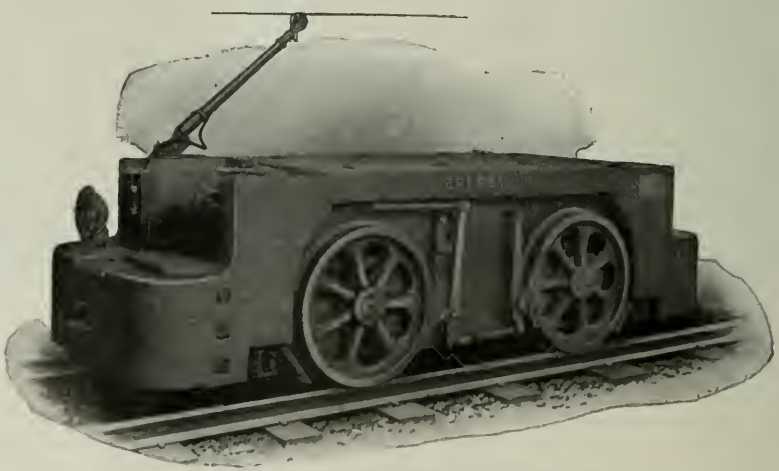
I have read that the Pennsylvania and the New York Central have spent for many years more money yearly in double-tracking, reductions of grades and curvatures than it cost to build their main lines originally. All the main lines in the Birmingham district move such a large tonnage that they will have to provide double tracks on which to move it. These cannot be built in a half century if it has to be paid out of earnings, and railroads cannot, of course, sell securities to the investing public unless they are able to show ability to earn interest on their bonded indebtedness, and a reasonable dividend above fixed charges. All of the main lines of the principal roads of Alabama were built hurriedly and by men whose capital was limited, and for that reason the double-tracking of our roads is a very much greater undertaking than is thought by most people. But if double-tracking is not done speedily, Birmingham and the mineral districts of Alabama will be brought to a standstill in so far as increased production is concerned.

Recent Types of Mine Locomotives.

The accompanying illustrations show recent types of electric mine locomotives built by The Jeffrey Manufacturing Co., Columbus, Ohio. The designs embody the latest ideas in mine locomotives and street railway construction. Every part has been made amply strong and is simplified as far as possible without losing any of the desirable features. The design is made to secure the smallest overall dimensions and at the same time allow access to all of the parts. The motors include the latest ideas in street railway practice, such as drum armatures with form-wound coils, laminated pole pieces, ribbon-wound field coils impregnated with solid compound, oil lubrication with auxiliary grease boxes and liberal wearing surfaces. The magnet frames are arranged so that the complete motor may be removed from the locomotive by taking off the axle caps, or the frame can be taken apart and the armature removed with very little trouble. The inside-wheel type is to be preferred where the mine entrance is wide enough to accommodate the increased width, as the wider locomotive allows more space for the electrical equipment and consequently easier access to the motors, rheostat, controller and other parts.



Inside-Wheel Type of Jeffrey Mine Locomotive.



Outside-Wheel Type of Jeffrey Mine Locomotive.

An Electric Switch Lock.

An electric device for locking and controlling outlying switches is shown in Figs. 1 and 2. This lock is connected to the switch point

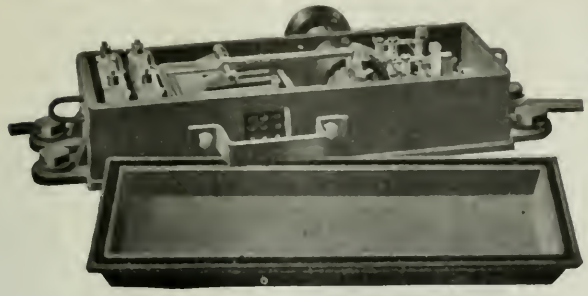


Fig. 1.

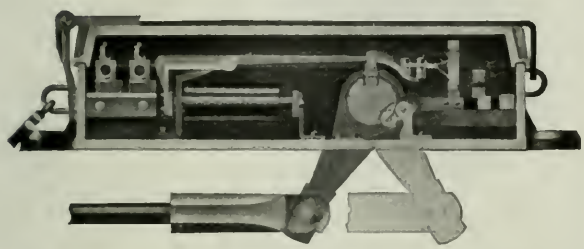

Fig. 2.

to make it impossible to throw the switch except with the co-operation of the nearest telegraph operator or towerman. The lock may be controlled at any reasonable distance from the switch. It is not necessary that the switch be in sight of the operator, as the lock is arranged with contact points so controlled as to indicate to the operator the exact position of the switch and the condition of the lock.

Fig. 1 shows the lock with the cover removed, and Fig. 2 is a sectional view. The locks are equipped with lightning arresters and two sets of contacts, one set being controlled by the movement of the switch point and the other by the lock mechanism. Visible or audible indications are given to the operator by these contacts and other circuits for electric signals may be opened or closed if need be. The contacts are either graphite or platinum. The use of these locks will save valuable time in train movements. A train may pull into a long siding and go to the far end, perhaps two or three miles distant, and there await permission from the tower operator to proceed to the main line. Trainmen cannot throw the switch and get on the main line without the towerman's co-operation.

A siding bell is placed at outlying switches for communication between same and interlocking towers or telegraph offices. Fig. 3 shows the signal bell box in combination with an indicator. The bell box contains the signal bell and keys for communicating between operator and trainmen. The indicator gives the trainmen the necessary stop or proceed signal. This is the device used in towers to give the switch lock operator indications of the switch movements. The siding bell is furthed either with or without the indicator.

These devices are made by the Railroad Supply Co., Chicago. Diagrams and circuits for electric lock applications will be furnished on request.

Fig. 3.

Muirhead's Station Indicator.

The Grand Central Station, New York City, has lately been equipped with new indicators, used to show the time and destination of departing trains, and one of the new pattern is shown in the illustration given herewith. Outwardly these indicators differ from the style formerly used chiefly in the use of white letters on a black ground instead of black letters on a white ground, but the mechanism by which the slats are turned has been simplified also. The slats bearing the station names are four-sided and three of the four sides are available for lettering, so that any one indicator will carry enough names to accommodate almost any train on any one of the three roads leading out of this station—the New York Central, main line, the Harlem division of the same road, and the New York, New Haven & Hartford. Thus any train may be started from any track. Each slat is moved by a vertical rod reaching down to the bottom of the case and it is turned so as to show the proper name for a given train by pushing the rod upward. A portion of the rod is notched so that a rack-and-pinion movement is accomplished, with the minimum of friction. The selection of the proper rods to be pushed is made by means of a card, perforated with holes opposite those rods which are not to be lifted.

Muirhead's Station Indicator.

The necessary supply of cards for use in connection with the trains usually departing from a given track are kept in the bottom of the case for that track, and the closing of the bottom door, after the card has been adjusted, lifts all the desired rods at a single stroke. On some of the indicators as many as 70 stations may be shown at one time. The cylinder bearing the name of the road and the figures showing the time are put in position by the same movement which turns the slats, and at the end of the stroke the slats are locked and kept in perpendicular position. The opening of the door releases every part and shows blanks throughout. The names and descriptions of the different trains are on a cloth curtain operated with a small crank from the side of the indicator near the bottom. The indicators are from 3 ft. to 3½ ft. wide; from 8½ ft. to 9½ ft. high and 7 in. thick. They are made by W. R. Muirhead, Bridgeport, Conn.

Boston & Albany Improvements.

Four-tracking is now under way on the Boston & Albany from Lake Crossing, Mass., to South Framingham, five miles, and it is expected that it will be finished by the middle of next month. The

road will then have four tracks from Boston to South Framingham, 21 miles; traffic is particularly heavy on this section of the main line because of the connections at South Framingham with the Milford branch of the B. & A. and with the New York, New Haven & Hartford. Five miles of third track from the South Spencer yard to the Charlton yard are in use, but there is more work to be done on it. Repairs are under way in the Worcester yard. Enlarged repair shops are being built at West Springfield, and part of the shops are to be in use within a few days. When finished they will have capacity for 38 to 40 engines a week; the old shops handle only 12 to 14 locomotives a week. These improvements consist of extensions to the old shops, new buildings and a new coal trestle. Long passing sidings are being built near Huntington, Chester and Middlefield. A siding has been put in at South Framingham, and another will be built west of East Brookfield. Several miles of third track near North Adams Junction and also east of the New York-Massachusetts state line are being laid. An eight-stall engine house is being built at Pittsfield, to be finished by the end of next month. Work is also under way for the 40-stall Beacon Park engine house at Boston. Plans are being made for new signals, to cost about $900,000. Three-quarters of the road will have new signals, and the installation, which is to be started next spring, is to be finished in two or three years. Other improvements include: a coaling plant and water station at East Brookfield, a water station at Rochdale, remodeling of the water supply system at Chester and new stations at Brookview and Payn's Mills.

Mileage Books in New York.

At Albany, N. Y., November 25, the State Public Service Commission held a hearing on its proposal to regulate and extend the sale of its interchangeable mileage tickets. Most of the railroads of the state were represented, and some of them protested strongly against the use of mileage tickets. Mr. Fort, of the New York Central, said that the use of interchangeable books would necessitate a large increase in the clerical forces of the railroads. Mr. Wallace, of the Erie, said that to make mileage tickets interchangeable would unjustly reduce the revenue of his road, and there would be a general traffic in the books by storekeepers. Chairman Stevens of the commission said that the Erie had encouraged the sale of books to ticket scalpers, knowing that coupons would be sold to users at less than the regular rate.

Mr. Carr, of the Delaware & Hudson, said that as the mileage book was a discrimination, the universal enforcement of its use by law would compel the roads to sell all tickets at the mileage book rate, 2 cents a mile. Mr. Carr doubted the legality of the present practice of selling mileage books at less than the regular one-way fare. Mr. Lee, of the Lehigh Valley, declared that the railroads had gone far enough in the use of mileage books; he would like to see them wholly abolished.

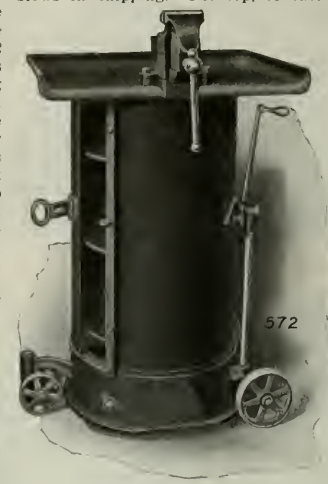
Vice-President Kerr, of the New York, Ontario & Western, told how his road had adopted a general 2-cent rate in 1898 in order to be able to abolish mileage books, because their use was a source of a great loss of revenue to the road. He considered mileage books the most vicious system of handling passenger transportation which has been introduced in railroad laws. Vice-President Caldwell, of the Lackawanna, agreed with Mr. Kerr that the mileage book was an abomination. Mr. Wood, of the Pennsylvania, said that the mileage book now in use on his road reduced the revenues $1,500,000 a year, as compared with the fares formerly paid by the users of the mileage books. The Commercial Travelers' Association was represented by Daniel Gray and George W. Driscoll. They did not ask for discrimination, but wanted a low mileage ticket rate for all. Mr. Driscoll said that he should come later and ask for a general 2-cent rate for everybody.

Profitable Electric Railway in Korea.

The American-Korean Electric Company operates at Seoul the only street railway in Korea. The average number of passengers carried daily in 1904 was 11,442; in 1905, 12,963; and in 1906, 13,714. The car mileage was 145,110 miles in 1904 (five months), 326,793 in 1905, and 398,616 in 1906. The equipment included 37 passenger and 18 freight cars. The company operates 12 miles of tracks with overhead electrical equipment. The gross receipts in 1906 were $98,221 and the net earnings $25,321, the increase in net earnings in 1906 over 1905 being 48 per cent. The company announces that the operating expenses have been reduced from 80 per cent. of the receipts in 1905 to 74 per cent. in 1906, but with the decrease in the cost of coal and with an increased service without addition to the expense of management it is hoped that a further material reduction will occur in 1907. With the exception of an injury to a boy, who fell under the car while stealing a ride, no accidents occurred during 1906, and the efficiency of the Korean motormen and conductors is becoming more and more apparent. A reward, in the nature of a bonus, is paid by the company at the end of each month in which no accidents occur.—*Consular Report.*

A Portable Vise Stand.

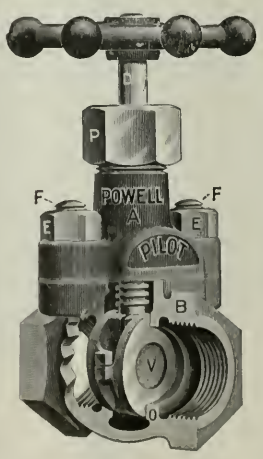
The accompanying illustration shows a portable vise stand made by the New Britain Machine Co., New Britain, Conn. The circular column of rolled boiler plate, firmly held between the base and the top, makes a rigid support for the vise, and withstands hammer blows in chipping. The top, of cast-iron, is so shaped that tools or work may be laid upon it, and in moving from place to place they will not jar off. The interior of the column is provided with three beaded edge shelves, two of which are adjustable, for holding or storing tools, and the sliding door with hasp closes the column. This door sets into jambs, travels in slides top and bottom, and can be padlocked. The position of the door is such that it is easy to open it without moving from working position; also, the column is not weakened under the vise. The base, of cast-iron, gives ample spread for floor support, and on the vise side is far enough back from the working line so that in standing at the vise nothing is in the way of the workman's feet. To move the bench from one palce to another, is is necessary only to raise the self-locking handle to the position shown in the cut which lifts the stand from the floor and throws the weight on the three wheels, two of which are dead and one swiveled. The stand can then be easily pushed over rough or smooth floors, the swiveled wheel trailing. The stand is built in two sizes, one in which the top tray is 20 in. x 26 in., carrying a 3½-in. vise, and another in which the top tray is 24 in. x 32 in., carrying a 5-in. vise. In each case, the vise is the right height for filing 41 in. They are usually equipped with a standard make of vise, but special vises can be provided or the stands can be furnished without vise, where it is to be used as an inspector's cabinet.



A Portable Vise Stand.

The "Pilot" Gate Valve.

The William Powell Co., Cincinnati, Ohio, has added the "Pilot" iron-body gate valve to its steam specialties. This valve is strongly and compactly built. The iron body, as shown in the illustration, has heavy lugs on each side of the neck, carrying stud bolts, F, and the bonnet cap, A, has corresponding lugs drilled to template to insure a perfect joint and constant alinement; this also allows the bonnet to be replaced without unusual care after taking apart for inspection or repairs. Two semi-finished hexagonal nuts, E, large enough to allow wrenching down hard, with a joint of good packing material between the faces of bonnet and body, make a tight joint for all pressures up to 100 lbs. The large brass packing nut, P, affords plenty of room for packing around the stem. The brass stem and bonnet are chased and cut to a true "Acme" thread of unusual length. This length of thread keeps the stem in a true axial position at all times whether open or closed. The hand wheel gives a firm grip, even with oily hands.



The "Pilot" Gate Valve.

The discs are double with ball and socket back, making them adjustable. They are hung in recesses to the collar on the bottom of the stem. The discs, working in a tapering seat, expand or collapse in opening or closing, so that the valve can be closed down tight without straining, or opened easily under all conditions. This valve is also made of all iron, that is, discs, stem and packing nut are iron, no brass being used at all. This iron valve is intended for use with ammonia, cyanide solutions, acids and other liquids or gases that attack brass.

The Battery Tunnel.

The second railroad tunnel under the East river New York City, between Manhattan and Brooklyn is now completed sufficiently to permit the running of cars, and a train carrying a party of guests was run on November 27 from Wall Street station in Manhattan to the Borough Hall in Brooklyn This tunnel forms an eastward extension from the south end of the present subway in Manhattan.

MANUFACTURING AND BUSINESS.

The Rail Joint Company, New York, has equipped the Panama Railroad with base supporting rail-joints.

The Railway Board, Calcutta, India, is asking bids until January 6, 1908, for 60,000 wooden ties for the Oudh and Rohilkhand Railway, delivery to begin April 15 and to be finished by June 30, 1908.

The Central Inspection Bureau, New York, have a contract with the American Railways Co. for the inspection of a number of single-truck cars to be built at the Kuhlman plant, Cleveland, Ohio, of the J. G. Brill Co., Philadelphia, Pa

The American Creosoting Co. has just begun operating its new plant lately built at Springfield, Mo., at a cost of $200,000. About 75 men are employed. The company will treat ties for the St. Louis & San Francisco. More than 500,000 ties are already on the ground.

W. A. Cornelius, Superintendent of the Monongahela furnaces of the National Tube Co., at McKeesport, Pa., has been appointed General Manager of the National Tube Co., succeeding George G. Crawford, who was recently made President of the Tennessee Coal, Iron & Railroad Co.

The Ball & Wood Co., Elizabethport, N. J., makers of engines, has added to its business a line of air compressors. Features of the design are: Large bearings and wearing surfaces, rigid frames, effective lubrication, ample valve areas and intercooling capacities, and high efficiency due to compactness of the engine.

The Expanded Metal & Corrugated Bar Co., St. Louis, Mo., has been awarded the gold medal by the jury of awards of the Jamestown Exposition for the Johnson corrugated steel bar. This is the fourth gold medal awarded to the corrugated bar, the last previous one having been given at the International Exhibition of New Zealand.

James H. Baker has resigned as President and General Manager of the Solid Steel Tool & Forge Co., Brackenridge, Pa., to establish an independent office in Pittsburgh. Mr. Baker has had a wide experience in the manufacture of drop forgings and will devote himself in future to the development of forging machinery and forgings, including car wheels.

The contract for the concrete pile foundations of the new conduit in the North Shore yard of the Long Island at Long Island City, N. Y., has been awarded to the Raymond Concrete Pile Co., of Chicago and New York. The conduit, which will be of concrete, will be 1,100 ft. long and will carry electric feed wires. The Abbott-Gamble Company, New York, has the contract for the conduit.

The National Foundry Co., Erie, Pa., recently made 275 molds from an 18-ton heat. Although some of these castings weighed only about two pounds, the average was about 60 lbs., there being 583 pieces in the heat. It took 1 hr. 35 min. to pour this heat, and most of the castings in it were about $\frac{1}{2}$ in. thick. It is the usual practice of the company to pour 200 molds or more from each heat. It was a 25-ton acid open-hearth furnace.

The American Blower Co., Detroit, Mich., has received the following orders: Heating apparatus for the Oswego and Rensselaer roundhouses and Depew boiler shop, New York Central & Hudson River, and for the Washington, Baltimore & Annapolis Electric at Odenton, Md.; large pressure blowers for the Grand Trunk at Stratford, Ont., and for the Duluth & Iron Range at Two Harbors, Minn.; a special blower for the Dominion Car & Foundry Co. at Montreal, Que., and a three-compartment lumber dry kiln for the General Electric Co. at Schenectady, N. Y.

The Technical Publicity Association held its November meeting on the evening of the 21st in New York and listened to an address on "The Evolution of Fine Printing and its Influence on Advertising Literature," by Paul Pfizenmayer. Among the companies represented by those present were: A. Allen & Son, New York; Yale & Towne Manufacturing Co., New York; Ridgerwood Manufacturing Co., New York; Sprague Electric Company, New York; General Electric Company, Schenectady, N. Y.; R. R. Almond Manufacturing Co., Brooklyn, N. Y.; Crocker-Wheeler Co., Ampere, N. J.; American Locomotive Co., New York; Goldschmidt Thermit Company, New York; A. S. Cameron Steam Pump Works, New York; Crane Co., Chicago, Ill.; International Silver Co., Meriden, Conn.; Traylor Iron & Steel Co., High Bridge, N. J.; Standard Roller Bearing Co., Philadelphia, Pa., and J. G. Brill Co., Philadelphia, Pa.

Iron and Steel.

The 6,500 tons of rails ordered from the Russo-Belge rail mill at Odessa for the Canadian Yazoo River & Pacific, the Mexican line of the Southern Pacific are now afloat, to be landed at Tampico, Mexico. The route is through the Black sea the Dardanelles, the Mediterranean and across the Atlantic and the Gulf of Mexico to Tampico some 6,700 miles

OBITUARY NOTICES.

Storm Bull, Mem. Am. Soc. Mech. Engrs., Professor of Steam Engineering at the University of Wisconsin died on November 19 at his home in Madison, Wis

Corwin V. Howell General Claim Agent and Attorney at Chicago for the Pennsylvania Lines West of Pittsburgh, died on November 20 of Bright's disease. He was 59 years old and had been with the Pennsylvania Lines since 1889. Before coming to the Pennsylvania, he was with the Canadian Pacific as claim agent of the Western division. He was buried at Chicago.

Michael Gilleas, formerly Third Vice-President of the Yazoo & Mississippi Valley, died last Monday at Los Angeles, Cal. Mr. Gilleas was 63 years old and all his railroad work was done on Illinois Central lines. He was born in Ireland and when he was 15 years old began work as a porter in the Superintendent's office at Amboy, Ill. He spent two years in a freight office and then, until 1877, was in the office of different Division Engineers. He was then appointed roadmaster of the Iowa division and in 1883 was made Superintendent of that division. Four years later he was appointed Superintendent of all lines in Iowa and in 1891 was made Superintendent of all lines west of Chicago. The next year he was appointed General Superintendent of the Yazoo & Mississippi Valley. In 1893 he was made Assistant General Superintendent of the Y. & M. and the southern lines of the Illinois Central, giving him authority over all lines south of the Ohio river. In 1902 he was elected Third Vice-President and General Superintendent of the Y. & M. V., and from November, 1905, until his retirement at the end of 1906, was Third Vice-President of the company.

Edward A. Handy, General Manager of the Lake Shore & Michigan Southern, died at Chicago on November 21 of pneumonia, after only three days' illness. Mr. Handy was born in Massachusetts in 1855 and educated at the Massachusetts Institute of Technology. His railroad work began in 1878, when he started as an assistant engineer of construction on the Atchison, Topeka & Santa Fe. After a year he was made Assistant Engineer of Bridges and Buildings and in 1880 went to the Mexican National, now the National of Mexico, as locating engineer. He was made Principal Assistant Engineer of the Northern division of that road in 1881 and two years later was appointed Chief Engineer. In 1888 he went to the Lake Shore as Engineer of the Lake Shore division. He was made Chief Engineer of the road in 1891. He held this office for 14 years and then, in 1905, was made Assistant General Manager, remaining in particular charge of engineering work. He was made General Manager when W. H. Marshall left the road last year to become President of the American Locomotive Company.

E. A. Handy.

ELECTIONS AND APPOINTMENTS.

Executive, Financial and Legal Officers.

Atlantic Coast Line.—W. W. Mackall, Savannah, Ga., has been elected a Director, succeeding Col. J. H. Estill, Richmond, Va., deceased.

Chicago & Alton.—S. M. Felton, President, has resigned. T. P. Shonts, Chairman of the Executive Committee of the C. & A. and President of the Toledo, St. Louis & Western, is to succeed Mr. Felton; a meeting of the Board of Directors is to be held in a few days. See Mexican Central.

Lehigh Valley.—J. W. Robbins, transfer clerk in the Secretary's office, has been appointed Assistant Secretary.

Mexican Central.—S. M. Felton, President of the Chicago & Alton, has been elected President of the Mexican Central, succeeding A. A. Robinson, who resigned a year ago. Eben Richards, who has been acting in Mr. Robinson's place, resumes his former office of Vice-President and General Counsel.

Missouri Pacific.—J. M. Johnson, Assistant to Vice-President C. S. Clarke, has been elected Vice-President in charge of traffic of this road and of the St. Louis, Iron Mountain & Southern. E. M. Boyd succeeds Mr. Johnson.

Pennsylvania Lines West.—C. G. Johnston has been appointed General Claim Agent and Attorney at Chicago, succeeding C. V. Howell, deceased. Mr. Johnston was assistant to Mr. Howell.

St. Louis, Iron Mountain & Southern.—See Missouri Pacific.

Operating Officers.

Boston & Albany.—J. H. Relyea, night chief train despatcher of the Albany division, has been appointed Trainmaster of that division, with office at Springfield, Mass., succeeding J. L. Truden, promoted. W. D. Anderson has been appointed Trainmaster, reporting to the Superintendents of the Boston division and of the Albany division. W. H. Brown has been appointed Trainmaster of the Boston division.

Canadian Pacific.—A. Price, General Superintendent at Winnipeg, Man., has been appointed General Superintendent at Calgary, Alb., succeeding R. R. Jamieson, who takes Mr. Price's place at Winnipeg.

Cincinnati, New Orleans & Texas Pacific.—W. E. Wheelock, Trainmaster at Somerset, Ky., has been appointed Superintendent of Terminals at Chattanooga, Tenn.

Mexican International.—W. F. Sheridan, Superintendent of Transportation, has resigned and the office has been abolished.

Mobile & Ohio.—H. W. Clarke, Superintendent of Transportation, has resigned, effective December 31.

St. Louis, Brownsville & Mexico.—E. L. Burke has been appointed Superintendent of the Second and Third divisions, with office at Kingsville, Tex., succeeding Oliver Rowe, effective December 1.

Southern.—E. H. Coapman, General Superintendent at Danville, Va., has been appointed Manager of the Northern and Eastern districts, with office at Washington, D. C., succeeding J. W. Seale, deceased. A. H. Westfall, Superintendent at Atlanta, Ga., succeeds Mr. Coapman. E. E. Norris, Superintendent at Knoxville, Tenn., succeeds Mr. Westfall. W. M. Deuel, Superintendent of Terminals at Atlanta, Ga., succeeds Mr. Norris.

Traffic Officers.

Chicago, Rock Island & Pacific.—See Missouri Pacific.

Missouri Pacific.—B. M. Flippin, Assistant Freight Traffic Manager, has been appointed Freight Traffic Manager of this road and of the St. Louis, Iron Mountain & Southern, succeeding W. C. Smith, resigned. The office of W. B. Knight, Assistant Freight Traffic Manager, has been moved from Kansas City, Mo., to St. Louis. He will be hereafter in charge of rates, divisions and publication of tariffs. K. M. Wharry, Assistant General Freight Agent of the Chicago, Rock Island & Pacific at Kansas City, has been appointed General Freight Agent of the Missouri Pacific, in charge of freight traffic in Kansas, Nebraska and Colorado, including Kansas City and St. Joseph, Mo. His office is in Kansas City. J. P. Burnett, Assistant General Freight Agent at St. Louis, has been appointed General Freight Agent in charge of the St. L., I. M. & S., with office at St. Louis. R. H. Eggsbrocht succeeds Mr. Burnett. J. N. Gibbens, General Agent at Chicago, Ill., has been appointed General Freight Agent of the Missouri Pacific in charge of solicitation at St Louis. See this company under executive, financial and legal officers. The office of D. R. Lincoln, Assistant General Freight Agent, has been moved from St. Louis to Kansas City.

Oklahoma Railroad Commission.—The Commissioners are as follows: John Love, Chairman, of Woodward; J. J. McAllester, of McAllester, and A. P. Watson, of Shawnee. W. L. Chapman, of Pawnee, Secretary of the Democratic State Committee and Editor of the *Shawnee Daily Herald*, is Secretary of the Commission. Mr. Love serves for six years, Mr. McAllester for four years and Mr. Watson for two years.

St. Louis, Iron Mountain & Southern.—See Missouri Pacific.

Wabash.—H. H. Taylor, traveling freight agent, with headquarters at Toledo, Ohio, has been appointed General Agent at Danville, Ill.

Engineering and Rolling Stock Officers.

Lake Erie, Alliance & Wheeling.—See Lake Shore & Michigan Southern.

Lake Erie & Western.—See Lake Shore & Michigan Southern.

Lake Shore & Michigan Southern.—J. W. Senger has been appointed Supervisor of Material, with office at Collinwood, Ohio, of this company and of the Lake Erie & Western and the Lake Erie, Alliance & Wheeling.

Purchasing Agents.

Chicago, Rock Island & Pacific.—J. M. McCarthy has been appointed Purchasing Agent. The office of General Purchasing Agent, formerly held by F. P. Jeffries, who has resigned, has been abolished.

CAR BUILDING.

The Baltimore & Ohio is in the market for one postal car.

The Baltimore & Ohio is said to be in the market for cars.

The Atlanta & West Point is in the market for one passenger car.

The Agar Packing Company, Des Moines, Iowa, is figuring on about 25 refrigerator cars.

The Pere Marquette denies having asked bids on 1,000 box cars, as reported in the *Railroad Gazette* of November 22.

Virginian Railway denies that it is in the market for eight special cars as reported in the *Railroad Gazette* of Nov. 22.

The Boston & Maine is said to have ordered 25 passenger cars from either the Pullman Company or the Laconia Car Company.

The Detroit, Toledo & Ironton denies having asked bids for box and flat cars as reported in our advance sheet of November 16.

The Chicago, Indianapolis & Louisville denies that it has asked bids on several hundred box and gondola cars, as reported in our advance sheet of November 16.

The Tonopah & Goldfield denies having ordered four chair cars, one smoking car and one baggage car from the Pullman Company, as reported in the *Railroad Gazette* of November 8.

The Duluth, Missabe & Northern, as reported in the *Railroad Gazette* of November 8, is about to order 19 passenger cars. Contracts for specialties for these cars are now being closed.

The Duluth, South Shore & Atlantic is in the market for three second class passenger coaches, 67 ft. 6 in. long; one first class passenger coach, 52 ft. 5 in. long, and one baggage car 52 ft. 5 in. long.

The Philippine Railways, as reported in the *Railroad Gazette* of November 8, have bought, through J. G. White & Co., four combination parlor and first class passenger cars. The special equipment, in addition to that formerly reported, includes: Congdon or Diamond S brake-shoes, natural varnish finish inside and out, Walkover chairs in the parlor compartment and triple elliptic springs.

The San Antonio & Aransas Pass, as reported in the *Railroad Gazette* of October 25, is asking prices on 200 ventilated cars and 275 plain box cars of 60,000 lbs. capacity. These cars will measure 36 ft. long, 8 ft. 6 in. wide and 12 ft. 9¼ in. high, over all measurements. The special equipment includes:

Brakes	Westinghouse
Brake-shoes	Christy
Brasses	More-Jones
Couplers	Janney
Door fastenings	Security
Draft rigging	Farlow
Journal boxes	McCord, Symington or Franklin
Paint	Sherwin-Williams
Roofs	Murphy
Springs	Standard Steel Works

The Intercolonial has ordered 130 hopper cars of 30,000 lbs. capacity from Rhodes, Curry & Co., and 70 Hart convertible cars of 80,000 lbs. capacity from Rhodes, Curry & Co., to be built by the Dominion Dump Car Co., at Montreal. The hopper cars will weigh 20,000 lbs. and will measure 15 ft. 10½ in. long and 8 ft. 3 in. wide, inside measurements, and 16 ft. 10 in. long, 8 ft. 8 in. wide and 9 ft. 5 in. high, over all. The Hart convertible cars will weigh 37,000 lbs., and will measure 32 ft. 2 in. long, 8 ft. 8 in. wide and 5 ft. ¼ in. high, inside measurements, and 34 ft. long, 9 ft. 10 in. wide and 9 ft. 3½ in. high, over all. The bodies and underframes of all cars will be of wood. The special equipment for all cars includes:

Bolsters (for Hart convertible cars)	Simplex
Brake-beams	Simplex
Brake-shoes (for hopper cars)	Christy
Brakes	Westinghouse
Draft rigging	Miner Tandem
Dust guards (for hopper cars)	Harrison
Paint	Red oxide
Springs	Coil
Trucks (for Hart convertible cars)	Simplex
Wheels	Cast Iron

RAILROAD STRUCTURES.

Coburg, Ore.—The Southern Pacific, it is said, has resumed work on the new steel bridge over the McKenzie river, near this place, on the Woodburn-Natron branch.

DENVER, COLO.—The Chicago, Burlington & Quincy, the Chicago, Rock Island & Pacific, and the Atchison, Topeka & Santa Fe, according to local report, are jointly planning to build a union passenger station here.

EDMONTON, ALB.—The Canadian Northern, it is said, will put up shops here next spring, to employ 200 men.

EVANSVILLE, IND.—The East Princeton & Vincennes Construction Co. will establish its power plant and headquarters here.

FORT SMITH, ARK.—The Kansas City Southern has recently bought ground for freight terminals within a block of the business center of this city. The present freight station is too far out to enable this company to obtain its share of business. Plans for a brick freight house, 40 ft. x 250 ft. have been recently revised, and bids for the work will soon be asked for.

KANSAS CITY, KAN.—It has been announced that at a recent meeting of the directors of the Kansas City Terminal Railway Co. in Chicago, it was decided to build a union station and passenger tracks to serve same in Kansas City, Kan., in connection with the proposed union station which is to be erected in Kansas City, Mo. Actual work will be held in abeyance until a more favorable time for financing the project.

KANSAS CITY, MO.—The Kansas City Southern is making plans for a new inbound and outbound freight house soon to be built on the old Union Elevator property in the west bottoms. The building will consist of a two-story brick structure for office purposes, and a one-story freight warehouse. The dimensions over all will be 40 ft. x 500 ft.

MINNEAPOLIS, MINN.—The Minneapolis, St. Paul & Sault Ste. Marie has started work on additions to its shops here. The cost of the improvements will be about $200,000.

TAMPICO, MEX.—The Mexican Central has adopted plans for important harbor improvements at this place. The plans will have to be approved by the Federal Government before the work will be begun.

TOLEDO, OHIO.—The Board of Public Service has approved the plans of the Lake Shore & Michigan Southern for its proposed steel bridge over the mouth of Swan creek, from the foot of Monroe street to Goose Point. (Oct. 11, p. 434.)

RAILROAD CONSTRUCTION.

New Incorporations, Surveys, Etc.

ATLANTA, BIRMINGHAM & ATLANTIC.—Plans are being made by this company to begin running regular trains January 1 on the Atlanta branch from Chalybeate, Ala., north to Atlanta, 77 miles. (Oct. 18, p. 472.)

BALTIMORE & OHIO.—This company, it is said, will lay additional sidings along its Pittsburgh & Western division to the Ohio state line, in addition to the work now under way straightening the line.

CHICAGO, MILWAUKEE & ST. PAUL.—It is reported that this company has opened its Pacific extension from Mobridge, S. Dak., west to Bowman, N. Dak., 200 miles from the Missouri river. (Oct. 25, p. 509.)

CINCINNATI, BLUFFTON & CHICAGO.—This company is pushing work on the remaining 15 miles of the line it is building from Bluffton, Ind., northwest to Huntington. A bonus of $98,000, it is said, is to be given by residents of Huntington if the line is in operation to that place by January 1, 1908. The road is now in operation from Bluffton southeast to Portland, 30 miles, and is eventually to be extended south from Portland to Union City, thence east to Versailles, Ohio, 35 miles. The company has bought land in Huntington on which it will put up shops, to cost about $75,000. (March 15, p. 382.)

COLUMBUS, MAGNETIC SPRINGS & NORTHERN (ELECTRIC).—This company, operating an electric line from Delaware, Ohio, northwest to Richwood, 18 miles, is building an extension north to Larue, 13 miles.

DULUTH & THUNDER BAY.—See Minneapolis, St. Paul & Sault Ste. Marie.

EDMONTON, DUNVEGAN & BRITISH COLUMBIA.—Application will be made by this company for an extension of time to build its proposed line from Edmonton, Alb., to Fort George, B. C. Pringle & Guthrie, solicitors. (Mar. 15, p. 395.)

GRAND TRUNK PACIFIC.—Grading on the main line has been finished from Portage la Prairie, Man., west toward Saskatoon for 412 miles, and track has been laid for about three-fourths of this distance. Work is being pushed to finish the line to Saskatoon. About 60 per cent. of the 318 miles from Saskatoon to Edmonton is also graded.

Surveyors are active now on both sides of the Yellowhead Pass, as the company desires to ask for grading bids early next spring.

ILLINOIS CENTRAL.—This company expects to begin running regular trains on its Birmingham line about the first of January. (Oct. 4, p. 403.)

ILLINOIS ROADS (ELECTRIC).—Rights-of-way are being secured by President Patton, of Charleston, for the proposed Mattoon Hillsboro electric line. Application will be made for franchises through the towns along the proposed route from Mattoon west via Shelbyville, Tower Hill and Pana to Hillsboro, about 60 miles.

KANSAS CITY SOUTHERN.—Work is in progress on a three-mile cut-off on this road just south of Howe, Okla., where this line is crossed by the Rock Island. The new line is to have a maximum grade of five-tenths of 1 per cent., and is a part of the plan for the contemplated reduction of the grade on this road, extensive surveys for which were made during the past year.

KETTLE VALLEY LINES.—Rights-of-way have been secured and work, it is said, will be started about February 1, by this company on its proposed extension from Spokane, Wash., northwest to Republic, 145 miles. (Mar. 15, p. 396.)

LAKE ERIE, ALLIANCE & WHEELING.—See Lake Shore & Michigan Southern.

LAKE SHORE & MICHIGAN SOUTHERN.—It is officially announced that on December 1 the Lake Erie, Alliance & Wheeling will be opened to Dillonvale, Pa., five miles south of Piney Fork, its present southern terminus. The line may eventually be extended south to Wheeling, W. Va., 17 miles.

LIGONIER VALLEY.—Plans are being made for extending this road from the new coal town of Wilpen, Pa., in Ligonier township, northwest to New Florence on the Pennsylvania Railroad about 12 miles. Surveys made. A branch has been built from Ligonier to Wilpen.

MARIETTA-MACLAND.—Application will be made by a company under this name for incorporation in Georgia with a capital of $500,000. The company, it is said, has options on the right-of-way for a railroad from Marietta, Ga., southwest ten miles to Powder Springs. J. N. McEachern and other Atlanta capitalists; also E. P. Dolls, J. P. Cheney, W. J. Manning, J. M. McEbreth and R. R. Petrie are interested.

MEADVILLE & CONNEAUT LAKE TRACTION.—Superintendent Kellenbaugh is quoted as saying that this company will build an electric line from Linesville, Pa., south to Greenville, 21 miles, if the Mahoning & Shenango Railway & Light Company will extend its line from Sharpsville, north to Greenville, 11 miles, to complete a through line from Youngstown, Ohio, to Greenville.

MINNEAPOLIS, ST. PAUL & SAULT STE. MARIE.—This company, it is said, will build under the name of the Duluth & Thunder Bay, a new line from its proposed Duluth line northeast to a connection with the Canadian Pacific at Fort William, Ont., about 200 miles. About half the distance is now covered by logging roads which will be used as parts of the through line. The line to Duluth is to run from Brooten, Minn., northeast via Freeport, Royalton and Superior, Wis., to Duluth, 300 miles.

PENNSYLVANIA.—Plans, it is said, are being made by this company to begin double-track work next year on the Belvidere division from Trenton, N. J., north to Manunka Chunk.

RIO GRANDE, SIERRA MADRE & PACIFIC.—Work on the extension of this road toward the Pacific coast, it is said, has been suspended, on account of the financial stringency. Grading has been finished from Nueva Casas Grandes to a point about 25 miles south of that place and rails are on the ground. A bridge has also been built over the Guerrero river. It is understood that the Government will grant an extension of time in which to finish the line. The projected route is from Nueva Casas Grandes, Chihuahua, southwest via Santa Elena and Ocampo to a point on the Pacific coast either at Guaymas or at Topolobampo, 300 miles. (Oct. 4, p. 403.)

SOUTH & WESTERN.—President Carter, of this company, has announced that this line, which is under construction from Elkhorn, Ky., south to Bostic and south of that place, under the name of the Spartanburg & Northern to Spartanburg, S. C., a total of about 300 miles, is to be extended. Plans are being made to build from Spartanburg southeast to a point on the Atlantic sea coast early next year, 250 miles. (Nov. 8, p. 573.)

SOUTHERN PACIFIC.—This company, it is said, will shortly begin laying double track on its line from Tracy, Cal., north to Sacramento, 68 miles.

SOUTHERN PENNSYLVANIA.—Under this name a company has been organized to consolidate a number of small projected lines which have been granted charters to build. It is proposed to build a line

from Summerville, W. Va., north to the Pittsburgh district, 160 miles, with a branch from Waynesburg, Pa., northeast to Millsboro, 15 miles, and another branch west to Marietta, Ohio, 50 miles. T. F. Barrett, of New York, also Pittsburgh capitalists are said to be interested.

Spartanburg & Northern.—See South & Western.

Texas Roads.—Location surveys are being made for a line from San Antonio south to a point in Live Oak county, 70 miles. Dr. C. F. Simmons, San Antonio, is in the market for relaying rails to be used in building the line.

Tintic Railroad.—Work, it is said, will shortly be started on a 10-mile line to connect certain mines with a smelter which is to be built near Eureka, Cal. Jesse Knight is the principal promoter.

Tombigbee Valley.—This company, operating 52 miles of railroad from Calvert, Ala., where connection is made with the Southern Railway north to Healing Springs, has opened for operation an extension north to Silas, 11 miles. The line is being extended north from Silas to Butler, 24 miles. The railroad runs through a timber section and hauls large quantities of lumber to its water terminal at Nannahubba Bluffs on the Tombigbee river near Calvert. (March 15, p. 393.)

Union Pacific.—This company has suspended work on its Marysville cut-off. This cut off is to run from Onaga, Kans., to Marysville, 32½ miles. About 15 miles was ready for the track, and the grading and bridging were about three-fourths finished on the rest of the line when work was suspended.

Washington, Baltimore & Annapolis (Electric).—An officer writes that this company has finished its double track electric line from Washington, D. C., northeast to Baltimore, Md., 40 miles. (Oct. 18, p. 473.)

Washington-Oregon Traction.—Incorporated in Washington with $1,500,000 capital to build 75 miles of electric lines in the vicinity of Walla Walla. The incorporators include A. H. Reynolds, C. K. Holloway, N. Baumeister, S. Drumheller, J. Smith, E. S. Isaac, W. A. Ritz and J. L. Sharpstein, of Walla Walla.

Westchester & Wilmington (Electric).—Application has been made in Pennsylvania for a charter by this company with a capital of $54,000. The company proposes to build 17 miles of electric line through West Goshen, Westtown and Thornbury townships, Chester county, and Birmingham and Concord townships, Delaware county. T. E. O'Connel, President, Westchester; C. P. Faucett, Treasurer, Westtown; J. A. Kirkpatrick, Birmingham; C. Gleason, Brandywine Summit; N. O'Connell, Westchester; W. Passmore, Brandywine, Del., and F. H. Day, Tallyville, Del., are interested.

Western Pacific.—Freight, it is said, is now being carried over this road from New Hope, Cal., to Stockton, and regular trains will soon be running on the line from Stockton to Sacramento.

Wyoming Short Line.—Incorporated in Wyoming with $2,500,000 capital to build a line from Grey Bull at the junction of the Big Horn and Grey Bull rivers, west via Germania and Wiley to the eastern boundary of Yellowstone Park, 100 miles. Isaac M. Hamilton, President, Chicago; C. A. Guernsey, Vice-President, Cheyenne, and S. L. Wiley, Treasurer and General Manager, Wiley, Wyo.

RAILROAD CORPORATION NEWS

Atchison, Topeka & Santa Fe.—See Union Pacific.

Boston & Albany.—Gross earnings for the three months ended September 30, 1907, were $3,501,159, an increase of $363,226. Operating expenses increased from $1,932,519 to $2,642,831 and the surplus after charges was $95,787, a decrease of $336,949. These figures, which indicate uneconomical handling of increased traffic, show strikingly the road's pressing need of those improvements which, as mentioned on another page, it is now making.

Boston & Northern Street Railway.—See Massachusetts Electric.

Canada Southern.—The $11,000,000 first mortgage 5 per cent. bonds of this company, maturing January 1, 1908, are to be extended for five years with interest at 6 per cent. The Michigan Central, which leases the road, is to pay this interest. The bonds can be deposited for extension with J. P. Morgan & Co., New York, up to December 21, 1907, and the interest coupon payable January 1 will be paid at the time of deposit.

Central of Georgia.—The United States Supreme Court has reversed the decision of the Georgia Supreme Court, which held that the Central of Georgia and the Georgia Railroad & Banking Co. were liable for 10 years' taxes, 1895 to 1904, on their holdings of $1,500,000 each of Western of Alabama stock. The amount of taxes concerned is said to amount to $800,000.

Chicago, Indiana & Southern.—See New York Central & Hudson River.

Cincinnati, New Orleans & Texas Pacific.—This company has, it is said, sold to Cincinnati, Ohio, bankers, $500,000 three-year 6 per cent. notes dated December 2, 1907. The proceeds are to be used for new construction and improvements.

Cleveland, Cincinnati, Chicago & St. Louis.—See New York Central & Hudson River.

Denver & Rio Grande.—E. T. Jeffery, President, is quoted as saying that the 2½ per cent. regular semi-annual dividend on the $45,761,400 preferred stock was earned in the first three months of the present fiscal year. No dividend is paid on the company's common stock. The preferred dividend will be acted on at a directors' meeting on December 5.

Georgia Railroad & Banking.—See Central of Georgia.

Illinois Central.—The injunction restraining the voting of the 5,500 shares of Illinois Central stock held by the Mutual Life Insurance Co. has been dissolved, Stuyvesant Fish having asked that the suit be dismissed on the ground that the Illinois law concerning the control of Illinois railroads by outside corporations did not apply to insurance companies.

Lake Shore & Michigan Southern.—See New York Central & Hudson River.

Massachusetts Electric.—The Massachusetts Railroad Commission has given permission to the Boston & Northern Street Railway to issue $410,000 4 per cent. 50-year bonds, and to the Old Colony Street Railway, $200,000 4 per cent. 50-year bonds. The securities are to fund floating debt incurred for construction and new equipment. Both companies are subsidiaries of the Massachusetts Electric.

Michigan Central.—See New York Central & Hudson River; also Canada Southern.

New York Central & Hudson River.—An equipment trust agreement has been made with the Guarantee Trust Company, New York, securing an issue of $30,000,000 5 per cent. equipment trust notes. The equipment covered has been delivered or is about to be delivered to the New York Central & Hudson River, the Lake Shore & Michigan Southern, the Michigan Central, the Cleveland, Cincinnati, Chicago & St. Louis and the Chicago, Indiana & Southern, and these companies jointly subscribe to the agreement. Of the total issue, $20,387,000 is said to be wanted at once and it is said that this amount has been already underwritten. The notes mature in 15 equal annual instalments beginning November 1, 1908.

New York, New Haven & Hartford.—This company, under date of November 18, has announced the terms of the new issue of 6 per cent. 40-year debentures of which $39,029,600 are to be issued. These were described in this column November 15. They will be either coupon debentures for $1,000, or registered debentures for $100, $1,000, or $10,000. Besides being offered to stockholders at the rate of $100 in debentures for $200 in stock, they are offered to the holders of 3½ per cent. convertible debenture bonds, registered and coupon, at the rate of $100 in new debentures for each $450 of the 3½ per cent. issue. Holders of the new debentures will have the right to subscribe for any future stock issue on the same terms as stockholders; these debentures are to share pro rata in the security of any mortgage which may be created on the main line between Woodlawn, N. Y., and Springfield, Mass., or on the main line between New Haven, Conn., and Providence, R. I. Subscription warrants are to be issued in amounts of $100 and multiples. Fractional warrants are to be issued in terms of ninths. For instance, the holder of four shares of New Haven stock will receive a warrant to subscribe for one new debenture of $100 and a fractional warrant for three-ninths of a right to subscribe for such a debenture. The holder of a 3½ per cent. convertible debenture certificate for $100 will receive a fractional warrant for two-ninths of such a right. Fractional rights must be combined into subscriptions for $100 to be accepted. Holders of 3½ per cent. debentures must have their certificates stamped by the fiscal agent of the company to secure the right to subscribe. (November 15, p. 606, and November 8, p. 574.)

Old Colony Street Railway.—See Massachusetts Electric.

Union Pacific.—It is said that this company some time ago sold about $20,000,000 Atchison, Topeka & Santa Fe common stock, which it owned last winter. Mr. Harriman and associates are understood to still hold $10,000,000 Atchison common, and the Oregon Short Line holds $10,000,000 Atchison preferred stock.

Western of Alabama.—See Central of Georgia.

RAILROAD GAZETTE

ESTABLISHED IN APRIL, 1856.

Published Every Friday by The Railroad Gazette at 83 Fulton Street, New York
Branch Offices at 870 Old Colony Building, Chicago, and Queen Anne's Chambers, Westminster, London.

EDITORIAL ANNOUNCEMENTS.

THE BRITISH AND EASTERN CONTINENTS edition of the Railroad Gazette is published each Friday at Queen Anne's Chambers, Westminster, London. It contains selected reading pages from the Railroad Gazette, together with additional British and foreign matter, and is issued under the name Railway Gazette.

CONTRIBUTIONS.—Subscribers and others will materially assist in making our news accurate and complete if they will send early information of events which take place under their observation. Discussions of subjects pertaining to all departments of railroad business by men practically acquainted with them are especially desired.

ADVERTISEMENTS.—We wish it distinctly understood that we will entertain no proposition to publish anything in this journal for pay, EXCEPT IN THE ADVERTISING COLUMNS. We give in our editorial columns OUR OWN opinions, and these only, and in our news columns present only such matter as we consider interesting and important to our readers. Those who wish to recommend their inventions, machinery, supplies, financial schemes, etc., to our readers, can do so fully in our advertising columns, but it is useless to ask us to recommend them editorially, either for money or in consideration of advertising patronage.

OFFICERS.—In accordance with the law of the state of New York, the following announcement is made of the office of publication, at 83 Fulton St., New York, N.Y., and the names of the officers and editors of The Railroad Gazette:

OFFICERS:

W. H. Boardman, *Pres't. and Editor.* — Ray Morris, *Secretary*
E. A. Simmons, *Vice-President.* — R. S. Chisolm, *Treas* / H. H. Rines, *Cashier* / L. B. Sherman, *Western Manager*

EDITORS:

Ray Morris, *Man'g Editor* — George L. Fowler
Braman B. Adams — Frank W. Krueger
Charles H. Fry — Hugh Rankin
Rodney Hitt — Bradford Boardman

CONTENTS

Vol. XLIII., No. 23. — Friday, December 6, 1907.

In another column we print a letter from A. W. Heinle, of Pittsburgh, on the recommended rail sections. Mr. Heinle objects that distortion, on the one hand, and imperfect granular structure, on the other, will not be prevented by the proposed sections, but says that he is ready to state, through the columns of the *Railroad Gazette*, how a large rail can be rolled successfully without distortion or curvature, and so that it will cool evenly and separately within its different parts. We hope that he will do so at his earliest opportunity, and we trust that his letter will bring out interesting information and stimulate discussion, especially with regard to the most desirable number of passes.

The official statement in another column of the Yale-Princeton football traffic on the New Haven Railroad has several striking features to which the earlier tabulations of receipts in other years give emphasis. Unfortunately one cannot in all the returns separate the football traffic from the regular business. But the New York excursion business alone on the day reached 13,418 one-way passengers, and the total for both ways, with some local trains added, rises to 21,711. This, however, does not nearly represent the total volume of football traffic. To it must be added the football business of the regular trains unknown but very large, and, besides that, the considerable increment of traffic on the day before and the day after a big game which does not appear in the returns. More impressive are the returns given in receipts for last year of the Harvard-Yale football traffic which shows more accurately the real dimension of a "big" football game at New Haven in which the New Haven road gets the "long haul" from Boston as well as the short haul from New York. The total of $62,001 of football money carries the single day's revenue in 1906 well towards the average day's passenger receipts on the whole system which may be roughly given as $70,000 from the whole passenger department. In any computation, too, must be reckoned in the second big game this year played at Cambridge. No direct returns are available for it but the single item of 15,000 admission tickets to the Harvard stadium sold through the Yale ticket agency gives a clue to the volume of the business. Most gratifying of all is the way in which this vast amount of condensed passenger travel was handled. Here upon the lines of a system with extreme passenger density was poured within a few hours a volume of additional passenger traffic represented on the last football day at New Haven by forty special trains besides the overload of the regular passenger service. The big trains ran on the shortest headway and the New Haven station is far from vast in dimension. Yet the huge traffic was handled back and forth without mishap or even delay worth the mention. Such a record is in the highest degree creditable even on a road used to great currents of the passenger traffic which was ardently extolled by one of the road's old directors as "the freight that handles itself."

That a large majority of railroad officers are opposed on principle to the use of mileage tickets, admits of little doubt. For reasons of policy most of them keep their opinion to themselves; but at Albany, before the Public Service Commission, last week (*Railroad Gazette*, page 666), two or three of them spoke out with refreshing frankness. It would be good if this Albany example should be followed elsewhere. The mileage ticket is simply a dam to hold back the flood of public opinion when public opinion ignorantly demands that fares shall be made lower than the railroads can afford to make them. Legislatures or "commercial travelers" demand a low rate and the mileage ticket, available only for persons who are ready to pay for a lot of rides some time in advance, is the most convenient means of satisfying this demand without at the same time reducing fares to everybody. The excuse is the "wholesale principle"; but this is a false argument, except as regards the clerical labor of selling the tickets, for the riding is at retail. Users of mileage tickets do not ride in bunches, any more than when they traveled on ordinary tickets. The clerical labor of collecting and auditing the coupons is far greater than that saved by the change, and the work of the conductors is much increased. A dishonest conductor, however, will comply willingly, for, as has been found by experience, the mileage ticket is a very convenient thing with which to juggle, in conspiracy with a dishonest passenger, to cheat the railroad company. From the average state commission one can hardly expect a scientific decision on this subject. For knowledge of the railroad side the commissioners have to depend on the testimony of officers with minds distracted by opposing opinions and in some cases unwilling to tell all they know. On the other side the most numerous class of passengers, those not traveling regularly or all the time, is far less conspicuous in demanding its rights and expressing its desires than the class which wants mileage tickets. The Albany Commission, however,

is far above the average, and we may expect a philosophical study of the situation. By the most rational theory the fare should be fixed at some figure, below the present single trip rate and above the mileage book rate, at which the railroads could afford to carry all passengers alike, except when they travel in parties or excursions large enough to justify a reduction on the true wholesale principle. Probably this figure could not be closely calculated, except arbitrarily. Mr. Wood, of the Pennsylvania, said at Albany that his road was giving the mileage-book riders $1,500,000 a year. Assuming that this represents a reduction of 20 per cent (from 2½ cents a mile to 2 cents) it means that the benefit went to passengers paying the company (after the reduction) $6,000,000 yearly. But the total passenger receipts of Mr. Wood's lines are about 44 millions a year, so that other passengers, paying the road 38 millions, enjoyed no reduction. Half of this sum, or 19 millions, probably came from passengers paying over 2 cents a mile. If the 1½ millions had been divided among all these, the average reduction would therefore have made the average fare of these passengers much nearer 2½ cents than 2 cents. If the Pennsylvania were to give the 2-cent rate to all passengers who have been paying more than that, it would reduce its passenger receipts probably about six millions.

CAR EFFICIENCY IN PROSPEROUS TIMES AND DULL.

We have several times taken occasion to comment on the excellence of the reports of the Car Efficiency Committee of the American Railway Association, with their fullness of detail constantly increasing as the shyness of some of the backward companies wears off, but the reports only partially reveal the work of the Committee. The address which Arthur Hale made before the New York Traffic Club, November 26, discussed rather fully some of the Committee's aims and the measure of its accomplishments, and it is quite without exaggeration to say that in the brief half-hour's talk, Mr. Hale gave to his audience more real information about car efficiency than was available from any source whatever, as recently as a year ago.

It seems that, at the outset, the Committee itself was scarcely able to explain why it sought so earnestly to obtain the detailed information from the railroads, except that it was convinced that this information ought to be in somebody's hands. People have assumed, for example, that the car congestion of the fall and winter of 1906 was the worst in the history of the country, but nobody knew or could possibly know whether this was so or not, because no comparative statistics were available. Moreover, although the Committee itself took great pains not to point comparisons between roads, it was obviously desirable that the roads should be able to make these comparisons for themselves. If the General Manager or the General Superintendent saw that his freight cars had an average record of 400 ton-miles per car per day, while his neighbors' cars had an average of 350, he would know that he was doing well. If, without the assistance of predominating coal traffic, he attained an average of 450 ton-miles per car per day, he would know he was doing extremely well, while if he averaged 250 ton-miles per car per day, he would not only know that he was doing badly, but he would know how badly he was doing, for the average for the whole country is around 350. A comparison of this kind is, of course, a very desirable and helpful stimulus, yet it has remained for the Car Efficiency Committee to introduce it at this late hour in our railroad development. Similarly, the General Manager can find out what relation the average daily earnings per car owned bears to the average daily earnings per car on line, and he may thus prove definitely that it is worth his while to build new cars rather than to continue borrowing.

Mr. Hale brought out the interesting point that at the 25-cent rate, in prosperous times, it did not pay anybody to build cars who could steal them, while at the 50-cent rate it did not pay anybody to borrow cars who could build them, the average cost of owning a car, including interest and depreciation, figuring at about 37 cents a day. Consequently, the introduction of 50 cents per diem, together with the full working information supplied by the Car Efficiency bulletins, may be assumed to have occasioned the building of a great many cars this year that would otherwise not have been built.

But a peculiar and interesting circumstance has an important bearing on the results reached by the Committee. The Committee has done all its work, so far, in a time of car shortage. Its values are calculated for times when traffic exceeds facilities, and the same thing is true of the 50 cents per diem. But, broadly speaking, at the present time cars are scarce only in the coal trade. Elsewhere there is a surplusage of equipment, which is becoming greater and greater every day. It remains for the next few months to disclose whether the 50 cents per diem rate is going to result in a scramble by the roads to get their own cars off their lines instead of the characteristic strenuous efforts of the last year to get their own and other people's cars on their lines. If so, the 50-cent rate is going to do harm, and may perhaps have to be amended temporarily. For example, the Baltimore & Ohio is now beginning to return cars to their owners at large cost at just the time when economy is urgent. Yet the manner of temporary amendment is so cumbersome that it seems to us likely that it will be effected through the individual initiative and agreement of a half dozen roads, rather than through action at the April meeting of the American Railway Association. The per diem rate bears a certain rough analogy to the price of gold; cars will flock towards the premium in dull times and nearly disregard it in busy ones, and a semi-annual conference to recommend practice is, of course, insufficiently flexible as a device to keep the rate constantly at the proper balance.

Of course the remedy for this situation is a really efficient method of pooling cars between companies, but this is a matter so beset with practical difficulties that although it was the original object of the Car Efficiency Committee, very little progress has been made. The shipper has a real grievance at points such as Cleveland and Pittsburgh when the railroads insist on western route and eastern route movements, and do not allow finished products to move out, eastbound, in the same car in which raw materials came in from the west. The car is at hand and the goods are at hand, but the car is not allowed to go in the same direction in which the goods must move. Yet, when pooling arrangements are proposed, originating roads, which have a large equipment supply of their own, want their cars back, and are not interested in pooling, while lines which are chiefly participators in through hauls are not at all anxious to compensate owners for the cars they use, but much prefer to take cars when they can get them, without pooling arrangements which place reciprocal burdens upon themselves. Consequently, the large car owner who wants to put a penalty on diversion is the only party at interest who has really been moving vigorously, and his efforts are not at all directed towards the establishment of a system of pooling. It was pointed out by Mr. Hale that all foreign countries except Russia use systems by which each railroad gets its own cars home again as soon as possible; a system expensive both to the carrier and to the shipper, which it is not advantageous to imitate in this country.

The Committee has had better success in another important branch of its work—although this particular task has been a self-imposed one—and that is in its effort to convince shippers that car movement is good and that car delay is bad, no matter from what cause it arises. Every day that a freight car stands idle it incurs for its owners a gross loss, in times of dense traffic, of about $2.50 a day, as an average for the entire country, and a loss of perhaps $1 net. The net loss to the coal shipper when a car stands idle is somewhat greater, perhaps $1.25 a day, because the coal trade probably operates upon a somewhat smaller margin, net to gross, than a railroad does, and when coal does not move for long periods it simply is not burned; other forms of fuel are temporarily substituted or plants are closed. At all events, there is a real loss which is never fully recovered. Mr. Hale admitted that demurrage was the hardest problem with which the Committee was confronted, particularly as the question is now a burning one on account of reciprocal demurrage legislation in the states, but he thought that a good many shippers had been persuaded to expedite movement at sidings and industries and that further progress will be made. The information about the position of a large group of roads as to surplus or shortage, has also enabled the committee to suggest home routings where they would do the most good and yield the most revenue to one party or the other; a form of assistance which should be greatly appreciated by railroads and shippers alike.

Mr. Hale made a closing suggestion which is of first-class importance and has appeared before in the *Railroad Gazette;* that the Interstate Commerce Commission and the American Railway Association should work together more closely. The Association is peculiarly well fitted to supply the Commission with an enormous amount of technical data which it needs, and use is already being made of this data, but the existing state of harmony is surely capable of very great extension, which must necessarily be of the highest benefit to all concerned.

A STUDY IN RAILROAD BAITING.

The economist of a generation or, perhaps, half a generation hence, who looks back upon our present epoch of anti-railroad state legislation, before he solves its problems or even measures its forces, will have to face some striking anomalies. Reasoning from the natural order of things he will be called upon to infer that in the old and highly populated states railroad baiting, so-called, would reach its highest intensities. Changing the tense from future to present, theoretically we should look for an anti-railroad movement soonest and strongest in a region of high and varied industries, many cities and large towns and thickly crossed by railroad lines. It would be New England and Massachusetts rather than the South and Alabama or North Carolina. In a region of the kind first named, the contacts with the railroad of the average community and average man are many and varied whether in his relation as freighter or passenger; in a region of the latter kind those contacts are relatively few—in theory—certainly so as regards passengers. It is in the thinly settled region, where railroad facilities are most craved, that one would expect public opinion and its expression in law-making to be most tolerant and merciful.

For the time being the reverse seems to be true. Radicalism in the public policy toward railroads is most rampant in the states of low rather than high population and in states where railroad lines are relatively far apart. It is true there are some apparent exceptions. The new and drastic railroad laws of Vermont, the Public Utilities statute of New York and the passenger rate mileage law of Pennsylvania are Eastern examples of the exception, though the Vermont instance falls in a thinly settled state, albeit in New England. But in all these states we have yet to wait and find out the teacher and spirit of enforcement, and the presumption is that the outworking of the new statutes will be along law-abiding and considerate lines. In such states we do not find the fierce and almost savage ardor of enforcement as at the South, where one governor holds up a railroad by executive threat; where another governor calls an extra legislative session and signs in a batch twenty-one anti-railroad bills rushed through both houses with scant discussion and most of them likely to be declared unconstitutional; where a conference of governors of three states is held to secure joint and severe anti-railroad legislation; and where one sees such an inequitable railroad hold-up as in North Carolina where, pending the decision of the United States Supreme Court, the railroad must adopt lower fares as against its own "recovery" ticket plan, and they be forced to lose money on fares during the period of litigation even if it wins the suit. Even the states newest made, like Oklahoma and the two Dakotas, where the railroad is the pledge of prosperity, have the anti-railroad ailment in pretty acute form.

One does not have to hunt far, however, to discover why the natural law seems reversed and commonwealths with apparently the fewest railroad contracts are first in the "baiting" order. Such states in this country are mainly agricultural; and agriculture seems to lend itself peculiarly to the railroad and anti-corporation motif, especially when a President of the United States sets the pace and fires the train. It is not merely because agriculture must often depend on railroad rates and "long hauls" to get its product to market. The farmers of Connecticut have thrice balked any modification of the four days car detention law although their railroad business is of the slightest. The cause rather seems to inhere in the nature of the farmer and the influences upon him of his vocation. He is apt to be isolated, not in touch with men in general, with affairs, with other vocations or with the fundamental principles of business. His life is apt to be narrowed down to the bucolic furrow and his special interest fills his whole mental horizon. Hence any agrarian movement encoils him easily. Such was the populist outbreak of the early nineties; such the western anti-railroad impulse of the early seventies; and such, saying nothing of recent anti-railroad legislation of the West, the extremes to which it has been in southern states but confined there somewhat strictly to the cotton-growing regions rather than to the larger towns and cities. As the anti-railroad fever thus seizes a homogeneous industrial group it is in that sense limited. But it becomes serious when the group is so large that it controls the electorates of whole states and their law-making bodies in which politics is apt to interpret with redoubled energy the sentiment of the constituency.

This political phrase of the subject challenges special attention. It is most marked at the south, less so at the west, least in our eastern states but strong in all three great divisions of the country. The South and its present legislative foray on the railroads culminating in the astonishing new statutes of Alabama may be used as the best illustration. Recent observers of events in the New South have noticed its great industrial development, particularly in manufacturing, but they have also noticed, partly as a request of its own momentum, the tendency of business to separate itself more and more from politics. Commercial business and politics do not mix with civics at the south so much as North and West where, indeed, they do not mix enough. It was even more so in the old slaveholding days but, commercially speaking, the situation was then modified by the aristocratic cult, now all but extinct, which, with all its faults, was at least highly educated, personally honest and versed in economic law. The change is showing itself in the personnel of southern legislatures and to a degree in Congress also. Would such men as Lamar or Wade Hampton be found to-day abetting legislation like that leveled against the railroads of Alabama, and in that state it is a federal Circuit Judge, an ex-Confederate and "old school" southerner, who has just enjoined the amazing new "injunction proof" railroad law—exactly such a statute as a legislature made up from the politics that veer to every popular and demagogical breeze might be expected to enact. To the purely political motive and influence at the south, no doubt, much of the recent rash legislation, sure to be crushed by the courts, must be charged. From the same shifting and erratic motive any southern legislation of the kind is also likely to be transitory.

In the deeper study of these southern legislative raids on the railroads the most cheerful view is their summing up as a power of popular economic education not unmixed with their sharp lesson against high finance and other corporate misdoing. Communities and legislatures learn, on the whole, more from mistakes than from the statutes that prove effective and wise. The process even with the court to aid it, is sometimes protracted and fraught with some calamity. But usually it is short and, whether short or long, its final teaching strikes deep.

Car Service Disturbances.

The New York, New Haven & Hartford has given notice to the Interstate Commerce Commission and to the interested roads that after December 17 it will refuse to participate in through rates on freight from the railroads terminating in Jersey City, except the Pennsylvania. The reason given is that the New York division of the New Haven road is overcrowded with trains, and that the company desires to have this western freight go over the Poughkeepsie bridge. It appears that the number of cars transferred by boat to the New Haven road from its Jersey City connections is 800 daily, of which 500 are from the Pennsylvania and the rest from the other roads. The transfer floats are overworked and there has been congestion at Jersey City. The Central of New Jersey and its western connections have complained of this action to the Interstate Commerce Commission. They declare that the Poughkeepsie bridge route is not in condition to handle any more freight than is now carried over it. The New Haven people say that the dispute between themselves and their western connections concerning the car service rate has nothing to do with the present action; but some of the officers of the other roads claim that, nevertheless, the difficulty about per diem is the real cause. For most of the freight starting from points on the Central of New Jersey the distance to Hartford or Boston by way of the Poughkeepsie bridge would be greater than by way of New York, so that, no doubt, the complaint of the Central of New Jersey is based largely on the reduction which it would suffer in revenue if it were to send freight by the more northern route.

The Boston & Maine and the Boston & Albany have given notice that they will back out of the per diem agreement after 90 days. No reasons are given; but as the New York Central, which operates the Boston & Albany has been very critical in its attitude toward the car service plans which have been adopted at Chicago it may be conjectured that the B. & A. and the New Haven are in sympathy, at least to some extent. As the New Haven owns a big block of B. & M. stock the action of the B. & M. is supposed to have been influenced by the wishes of the New Haven.

If freight traffic becomes dull, an event which, though unexpected two months ago, now seems possible, the position of the roads which claim that 50 cents a day is too high a price for freight cars will be somewhat stronger. It will not be stronger in reason, for the only reasonable basis for car interchange, under present general conditions, is for every road to furnish as many cars as it uses, thus making the rate unimportant, relatively; but the objectors can get more friends to support their arguments. Borrowers can get cars more easily, and roads with a surplus will be anxious to lend. It may be assumed from the present action that the New York Central is willing to lend to the B. & A.

at less than 50 cents a day; and if to the B. & A., perhaps to the New Haven also.

If and whenever a rate less than 50 cents is fair to the lender the New Haven road's claims ought, of course, to be listened to, not only by the New York Central but by the other trunk lines as well; but still it will be regrettable to have uniformity disturbed even a little. Uniformity is almost synonymous with arbitrariness, of course, and in car service exchanges it often means superficial or temporary injustice; but it is a great promotor of smooth and economical operation nevertheless. It would be easy, of course, for the New York Central to make a separate agreement with the three New England roads to lend N. Y. C. cars to them at the old rate of 25 cents a day or even less. To do so would be only the perpetuation of a method of strengthening its hold on New England traffic, which the New York Central began forty years ago. But the Pennsylvania would have to follow, or else lose some of its New England business, and so the uniform rate would be badly jostled throughout the country. If the Pennsylvania has use for all its cars west of New York it can ignore the reduction, of course.

Well, the New Haven has succeeded in keeping things stirring; who knows but that next May, when it has received its thousands of new cars, it will move for an *advance* in the per diem rate?

In a police court in New York City this week a magistrate ruled that the Grand Central Station was a public place, and that a public porter could go into the station and solicit trade. A porter had been arrested by a special policeman of the Grand Central Station, charged with loitering about and refusing to leave when ordered. The policeman cited a previous decision sustaining his action, but it was not recognized. These "public porters" are a nuisance. Licensed by the city at one dollar a year they hang around the main entrance of the station for the purpose of earning money in performing a service which the railroad company's porters will gladly do; that of carrying hand baggage into the station. But, by meeting people farther from the door, and grabbing their baggage, the self-appointed porters "secure the business," as a G. P. A. would say. A half dozen of them, more or less, seem to make a living at this one point. These porters are a nuisance because they are irresponsible. Wearing caps or badges that look like an official uniform they deceive green passengers into employing them; yet their qualifications are an unknown quantity. Recently one of them led a woman into danger—in front of a team of horses. Boys on the sidewalk a block away from a station asking to carry one's grip are perhaps an incurable nuisance; but grown men, occupying room around a crowded entrance and smoking in passengers' faces, ought to be suppressed by the police.

Chicago Great Western.

As on many other roads, operating expenses of the Chicago Great Western during the year ended June 30, 1907, increased faster than gross earnings. Therefore, although the road had the largest year's traffic in its history, its financial condition is weaker than it was a year ago, both in its income and capital accounts.

The decrease in net earnings was $253,000, or 10 per cent. The net income after charges was $1,460,000, against $1,740,000 in the previous year. The company has no bonds, but interest on its debenture stock though not an absolutely necessary payment amounts to a fixed charge. Net income after debenture interest therefore really represents the amount available for dividends on the three classes of the company's stock, of which a little more than $78,900,000 is outstanding. This net income was $414,000 last year against $695,000 in 1906, a decrease of 40 per cent. As two semi-annual dividends of 2½ per cent. on the preferred "A" stock were paid instead of one as in 1906, there was a deficit from the year's operations of $153,000, against a surplus of $412,000 the previous year.

The balance sheet showing is also not encouraging. On June 30, 1906, the company had total cash on hand amounting to $1,340,920. On June 30, 1907, the cash item was $224,000. On the same date, bills payable exceeded accounts receivable by $337,000 and current liabilities exceeded current assets (not including fuel and material on hand) by $612,000, making a total excess of items payable above corresponding items receivable of $989,000.

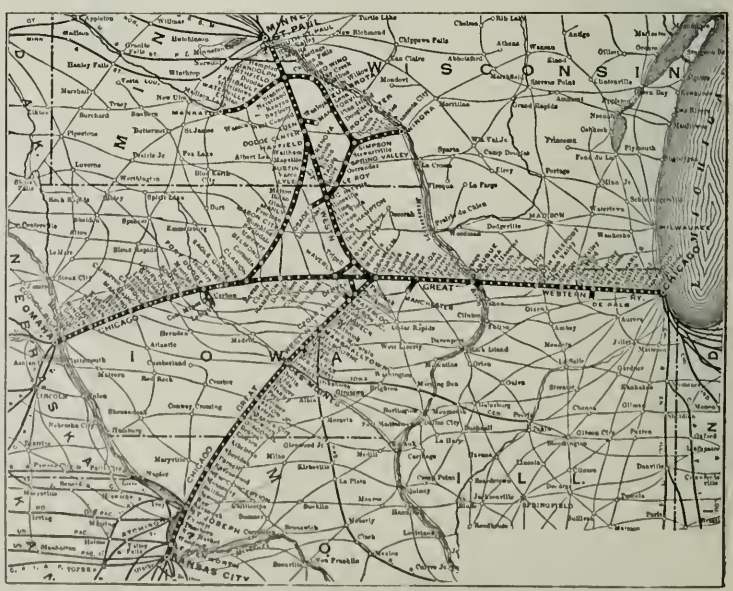
Freight earnings for the year increased 6 per cent., passenger earnings 8 per cent. and express earnings 25 per cent. Operation was more efficient than in the previous year. With an increase of 11 per cent. in revenue ton mileage there were only 6 per cent. more revenue freight train miles and 7 per cent. more miles run by helping locomotives in freight service. Loaded freight car mileage both east and westbound increased; at the same time there was a decrease of 14 per cent. in empty freight car milage eastbound and of 13 per cent. in empty freight car mileage westbound. The revenue trainload rose from 295 tons to 308 tons, or 4 per cent. In comparing this figure with trainloads on other roads it must be remembered that these traffic statistics cover only the 818 miles of the Chicago Great Western proper of which 787 miles are main line. This, therefore, is essentially a main line trainload.

Among the operating expenses, the largest increases were in the maintenance accounts. General expenses increased 4 per cent. and conducting transportation 10 per cent., while maintenance of way "and renewals" increased 15 per cent. and maintenance of equipment 29 per cent.

Maintenance of way cost $1,027 per mile of line, against $894 in 1906. This figure is for the largely main line mileage of the Chicago Great Western proper. On the 386 miles of the Mason City & Fort Dodge, including the line from Oelwein to Omaha and the connecting branch to the Minneapolis line, maintenance of way cost $438 per mile, against $372 in 1906. The Wisconsin, Minnesota & Pacific, operating most of the branch lines, spent an average of $470 per mile in 1907 and $415 in 1906 on each of its 271 miles. This makes a total maintenance of way expenditure for the 1,476 miles of the whole system of $770 a mile, against $669 in 1906. Of this 1,476 miles, 1,151 miles, or 78 per cent., is included in the main lines to Chicago, Minneapolis, Omaha and Kansas City. An average maintenance of way expenditure of $770 a mile is small, even for a prairie railroad, particularly when less than one-quarter of its mileage is branch line. As an extreme contrast, the Burlington with about 50 per cent. of its mileage branch line spent $1,584 per mile last year. The $1,027 spent on the Chicago Great Western proper might well have been the average for the whole system.

There was spent on capital account during the year $936,000 for new equipment, including 480 box cars of 70,000 lbs. capacity and 320 stock cars and 100 furniture cars of 60,000 lbs. capacity. On line improvements $1,400,000 was spent, of which the largest items were $252,000 for an extension of the freight house at Chicago and $365,000 for double track between Galena Junction and Stockton, 27 miles east. During the summer this work was continued from Galena Junction west to Dubuque, and this section is reported to be now finished. This, with five miles of double track directly east of Oelwein, makes a total of 46 miles of double track on the 240 miles of line between Oelwein and Chicago. This line connects all the rest of the system with Chicago and carries a traffic larger than it can economically handle as a single-track line. Double tracking of the remaining 200 miles is greatly needed.

President Stickney makes no comment whatever on the year's results or the prospects for the future. One incident which may be mentioned is the report of a committee of the Minnesota Senate



Chicago Great Western.

made last April to the effect that the road was worth only $28,000 a mile, but was capitalized at over $140,000 a mile. Of course, this latter figure represents the total of securities at their par value. Chicago Great Western preferred A stock is now selling at about 30, the preferred B at 10 and the common stock at 8. The committee also reported that the company was carrying at full cost on its balance sheet locomotives now in the scrap pile. This is a more vital criticism. If true, it means that the company has not been maintaining its equipment. The statement of locomotives owned seems to bear out this contention, for in 1907 there were only 259 locomotives as compared with 265 in each of the three previous years, while no deduction was made from the balance sheet item "equipment" to show this decrease. It is noticeable that since 1903 the company has had no new locomotives and that last year, the busiest year of its history, it had less locomotives than in any of the preceding three years.

The Chicago Great Western is capitalized on the English plan and derives most of its strength from the support of its English shareholders. Last summer President Stickney was able to secure a loan abroad on terms reported to be more favorable than stronger roads could get in this country. Its policy has always been not to accumulate a large surplus, but to pay out most of its net income to stockholders. An industrial depression may furnish an interesting test of the reserve power in hard times of a company which has followed this policy. Already it has begun to suffer. In the three months of July, August and September gross earnings decreased 4 per cent. and net earnings 36 per cent., while the operating ratio rose from 69 to 77 per cent.

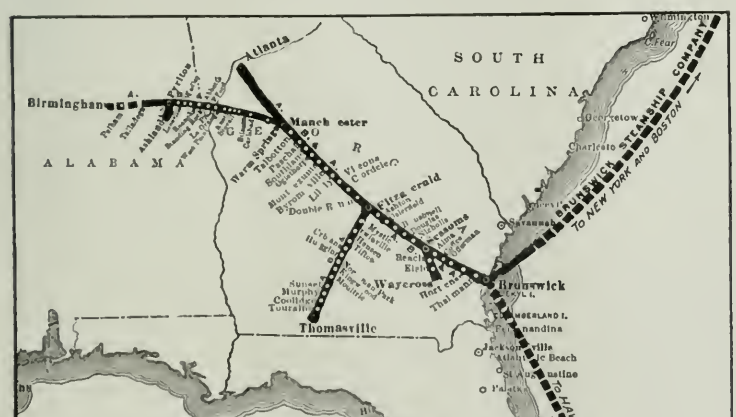
The following table gives for the Chicago Great Western proper the results of the last two years:

	1907.	1906.
Mileage worked	818	818
Passenger earnings	$2,148,219	$1,984,403
Freight earnings	6,333,699	5,993,374
Gross earnings	8,859,047	8,345,717
Maint. way and structures	840,101	730,961
Maint. of equipment	1,263,502	982,709
Conducting transportation	3,974,931	3,617,125
Operating expenses	6,583,808	5,817,655
Net earnings	2,275,239	2,528,062
Surplus earnings of prop. lines	280,040	227,431
Net income	1,459,010	1,740,504
Interest on debenture stock	1,044,978	1,044,978
Net income after debenture int.	414,032	695,326
Dividends	566,845	283,423
Year's surplus	152,813*	411,903

*Deficit.

Atlanta, Birmingham & Atlantic.

Two small railroads in southeastern Georgia were the nucleus of the Atlanta, Birmingham & Atlantic—the Atlantic & Birmingham and the Brunswick & Birmingham. Both of these together carried the line only as far as Montezuma, 194 miles northwest of Brunswick. From here the road has been extended westward until now track is laid as far as Talladega, which is about 75 miles from Birmingham, and track laying on the 76-mile branch to Atlanta is just being finished. It is expected that grading on the Birmingham line will be finished by March 1, 1908, and track laying somewhat later. Terminals are being built at Birmingham, Atlanta and Brunswick. The Brunswick Steamship Company is owned by the Atlanta, Birmingham & Atlantic and now has four steamships in operation between Brunswick and New York. A fifth steamer is to be completed this month. There is also a semi-monthly service between Brunswick and Havana. The new extensions, particularly the one to Birmingham, are likely to change the road from a local to a through carrier. Coal and iron companies affiliated with the railroad own mineral tracts in the district about Birmingham. The new road should also get traffic from the Illinois Central and the St. Louis & San Francisco, which it will reach at Birmingham. No doubt a through route will be developed from New York via Brunswick and Birmingham and over one or both of these roads to the Mississippi valley region and the Southwest.



Atlanta, Birmingham & Atlantic.

The new construction is being financed through the funds received from the sale in May, 1906, of $5,000,000 5 per cent. 4 year joint notes of the Atlanta, Birmingham & Atlantic and the Atlantic & Birmingham Construction Company, which is building the new extensions. These notes are secured by stocks and bonds of the Brunswick Steamship Company, stock of the allied coal and iron companies and common stock, preferred stock, equipment notes and first mortgage bonds of the railroad. The total advances on June 30, 1907, to the Atlantic & Birmingham Construction Company by the railroad company were $18,260,500.

With an increase of 70 miles, or 22 per cent., in the average mileage operated, gross earnings rose last year from $1,130,000 to $1,590,000, or 41 per cent. Operating expenses increased 48 per cent., leaving net earnings of $419,000, against $339,000 in 1906, a gain of $80,000, or 24 per cent. These results made an increase in the operating ratio from 70 to 74 per cent. Fixed charges increased from $271,000 in 1906 to $368,000, owing to the larger amount of bonds outstanding. As this increase was larger than the gain in net earnings, the net income of the year was less—$49,000 against $74,000 in 1906. This is a decrease per mile of road of 45 per cent. This result is due, according to President Atkinson, to the fact that construction work has been going on over nearly all the road from Brunswick to the end of the track. The road therefore was operated under disadvantages. In order to put the railroad as a whole in shape for carrying through traffic, it seemed wise to bend every effort to finishing this construction work, even though it interfered with the operation of the line already built. Increased cost of fuel, wages and taxes have also done their part in reducing the year's profits.

Freight earnings increased 40 per cent. as a whole, and 15 per cent. per mile of road; passenger earnings increased 29 per cent., and 7 per cent. per mile of road; while gross earnings increased 41 per cent., and 16 per cent. per mile of road.

Maintenance of way increased 56 per cent., maintenance of equipment 47 per cent. and conducting transportation 46 per cent. The unit maintenance charges are interesting because the road has been under construction or reconstruction. Maintenance of way cost $595 per mile, against $463 in 1906. The 1907 figure will be found inadequate if a large through traffic is developed.

Repairs and renewals of equipment cost $1,513 per locomotive, against $1,427 in 1906; $406 per passenger car, against $609 in 1906, and $22 per freight car, against $32 in 1906. All of these figures are low, and the freight car figure very low. This is largely due to the fact that the company has recently bought a large amount of new equipment of modern standard. Its old freight equipment is light and of small capacity, but it is not yet suffering from operation in heavy through trains. The old and lighter freight cars are probably held on the line for the local freight traffic.

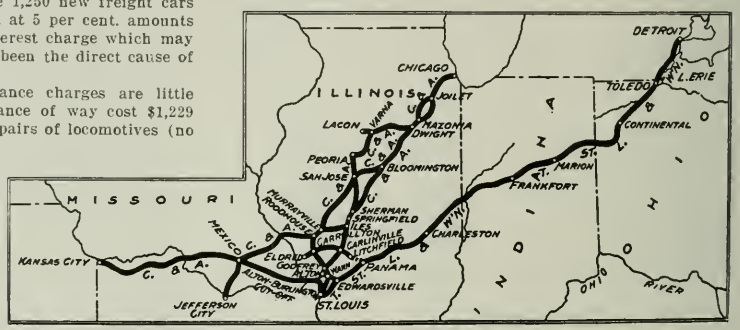
The Eastern Railway of Alabama and the Alabama Northern, two small roads connecting with each other at Pyriton, Ala., were bought during the year from the Louisville & Nashville. The 20-mile line of the former is to be used as part of the Birmingham extension. The Atlanta, Birmingham & Atlantic has had the misfortune to be carrying on its construction work at the time of a financial crisis. It is reported, however, that it has funds in hand to carry out its plans for the development of its system. With its extensions and terminals completed, its old roadbed reconstructed, its new lines built to modern standards and its steamship line, it should come to be an important outlet from Georgia and Western Alabama to New York and the East. The following table sums up the results of the last two years:

	1907.	1906.
Mileage worked	393	324
Passenger earnings	$360,593	$278,591
Freight earnings	1,083,129	771,939
Gross earnings	1,589,148	1,128,327
Maint. way and structures	233,722	149,977
Maint. of equipment	213,916	145,141
Conducting transportation	636,331	434,826
Operating expenses	1,169,935	788,984
Net earnings	419,213	339,342
Net income	49,077	73,858

Toledo, St. Louis & Western.

The Toledo, St. Louis & Western had in two respects a different experience during the past year from most railroads in this country. In the first place its gross earnings decreased; in the second place its operating expenses decreased still more, so that net earnings were the largest in the company's history. This second very favorable result can be traced directly to the fact that the road during the year received 500 new coal cars and 750 new box cars, all of 80,000 lbs. capacity. The two largest single savings among the individual operating expense accounts were in per diem payments, which were $84,000, against $202,000 in 1906, and in repairs of freight cars, which cost $133,000, against $206,000 in 1906. Furthermore, the new cars made possible a much heavier trainload. This was 471 tons, against 398 tons in 1906, an increase of 18 per cent. Correlative with this was a reduction of 6 per cent. in the loaded and of 26 per cent. in the empty freight car mileage, and a saving in the amounts paid for freight conductors, brakeman, engineers and firemen, engine despatchers, wipers and roundhouse laborers, and fuel for locomotives—this with 359,000 more tons of freight hauled during the year. The average haul, however, decreased from 221 miles to 197 miles, and earnings per ton and per ton-mile fell off, so that freight earnings and also gross earnings were less than in the previous year. Nevertheless, as a result of these various operating economies, there was an increase of 16 per cent. in net earnings. The 1,250 new freight cars cost $1,217,375, on which one year's interest at 5 per cent. amounts to $60,869. In this one year at least, an interest charge which may be estimated at this amount seems to have been the direct cause of an increase of $190,000 in net earnings.

With one exception the unit maintenance charges are little changed from the previous year. Maintenance of way cost $1,229 per mile of road, against $1,238 in 1906. Repairs of locomotives (no renewals appear to be included in any of the maintenance of equipment accounts) cost $2,588 per locomotive, against $2,501 in 1906; $851 per passenger car, against $831 in 1906, and $35 per freight car, against $76 in 1906. The fact that the 1907 freight car figure is less than half of the amount spent in the year previous is the direct result of the increase of 39 per cent. in the number of freight cars. The previous year's figure was high because the older freight cars, particularly since they were overburdened with traffic, needed heavier repairs than normal. Last year's figure is low, because 188 old cars had been disposed of and one-third of the freight equipment were new cars.



Toledo, St. Louis & Western and Chicago & Alton.

The road is a through line from the Mississippi river at St. Louis, Mo., and at Alton, Ill., northwest to Lake Erie at Toledo, and over the Detroit & Toledo Shore Line, which is controlled jointly with the Grand Trunk, to Detroit. It has no branch lines. Its traffic is highly competitive and moves at low rates. With 34 per cent. of its tonnage made up of manufactures, merchandise and miscellaneous, its average rate is little more than one-half a cent per ton mile. Last year there was a great development of bituminous coal tonnage, which rose from 20 per cent. of the total to 29 per cent. Mineral products, as a whole, make up 37 per cent. of the total tonnage; agricultural products, 16 per cent.; animal products, 5 per cent. against 10 per cent. in 1906, and forest products, 7 per cent. The most marked decrease during the year was in packing-house products other than dressed meats, the tonnage of which decreased from 113,000 tons to 34,000 tons.

Recently the road has assumed a new prominence through its purchase in August of a property much larger in mileage and in earning capacity—the Chicago & Alton. The process of combining the two properties is already under way. The executive, financial and accounting departments are now being combined, and it is probable that eventually the two roads will be operated very much as one property. This acquisition brings the "Clover Leaf," as the Toledo, St. Louis & Western is generally called by traffic officers and shippers, as far west as Kansas City. As soon as the short connecting line from Panama, Ill., west to Litchfield is built, new through traffic between Kansas City and Toledo and Detroit should be developed. The extent of the combined system is shown on the accompanying map.

Results for the years ended June 30, 1907 and 1906, are shown below:

	1907.	1906.
Mileage worked	451	451
Passenger earnings	$547,017	$549,967
Freight earnings	3,415,402	3,468,593
Gross earnings	4,181,966	4,205,051
Maint. way and structures	551,663	558,145
Maint. of equipment	488,768	558,287
Conducting transportation	1,454,842	1,615,474
Operating expenses	2,803,155	3,016,026
Net earnings	1,378,810	1,189,025
Net income	645,067	472,324
Dividends	200,000	.....
Year's surplus	445,067	472,324

NEW PUBLICATIONS.

A Text-Book on Roofs and Bridges. Part IV.—Higher Structures. By Mansfield Merriman and Henry S. Jacoby. Third edition; revised and enlarged. New York: John Wiley & Sons. 374 pages; 6 in. x 9 in.; 181 illustrations; cloth. $2.50.

As its name implies, this book is intended as a text-book for the student and not simply to be read by the engineer. It has apparently been prepared for the classes of the two professors who are the authors and who are at the Lehigh and Cornell universities respectively. It is a continuation of the previous parts I. to III. of the same work, and deals with those structures which have more than two supports, as continuous, draw and cantilever bridges, or which have two supports, whose reactions are not vertical, as suspension and arch bridges. The investigations given are those of the theory of stresses and their determination by analytic or graphic methods, with no attention whatever to the details of construction or erection beyond the bare description of the general types represented by those structures that are selected for purposes of illustration. With this limitation the book necessarily deals almost exclusively with bridges to the exclusion of roofs proper, though the latter are represented in the discussion of two and three-hinged arches as applied to train sheds. The discussion of this part of the subject is in great detail; the actual maximum and minimum stresses being computed for several cases. This for three-hinged structures, while, for arches with two hinges and with no hinges the reactions are determined analytically and the stresses by simple graphic constructions. In this especial emphasis is placed upon the importance of proper methods of erection in order to hold the subsequent stresses down to a minimum. For example, it is shown that, for a no-hinged arch it is well to erect and join as a three-hinged structure, changing then to a two-hinged and finally to a no-hinged in order to compensate for the dead load and temperature stress due to inequalities of conditions during erection.

The method of presentation of the subject is to state the proposition as the heading of an article, such as the "Deflection of a Swing Truss" or the "Anchor Span," and then, after a brief statement of the question involved to enter at once upon the mathematical or graphical solution of the case. Usually these articles, which are really sub-heads of the several chapters, conclude with the presentation of a problem that is left for the student to solve. Sometimes it is of a purely theoretic or hypothetical character, while again it is the determination of the stresses set up in some structure that has been erected and is in service. Incidental to this work the adaptability of various types of bridges to different classes of traffic is shown, and the reasons that should govern a choice, as in the case of the preference of a two-hinged to a three-hinged bridge for heavy railroad work for example.

The chapters on suspension, two-hinged and no-hinged arch bridges open with a brief historical sketch of the introduction and development of the types which is sufficient to give a clear idea of what has been done. And all through the book there are references to an elaborate series of illustrations accompanying the last chapter on modern bridges of all of the types discussed. In this chapter, instead of increasing the size of the volume by complete descriptions of the structures illustrated, there is simply an excellent half-tone engraving of a bridge with a caption stating its character and accompanied by a paragraph that merely refers to the engineering publications in which a description of that specific structure can be found. In this way the book becomes not only a text-book adapted to the needs of the student who is at work upon the theories and intricacies of bridge stresses, but a valuable book of reference for those who wish to examine in detail the methods of construction and design of modern examples of those types of bridges that fall within the general scope of the work.

CONTRIBUTIONS

The Recommended Rail Sections.

Grafton Station, Pittsburgh, Pa., Nov. 27, 1907.

TO THE EDITOR OF THE RAILROAD GAZETTE:

Regarding the respective merits of the rail sections shown in your issue of November 22d and those proposed by the rail committee of the American Railway Association on Rail and Wheel Sections, prompts me to ask the following relative questions. Aside from the mathematical value of these sections, what real benefits do the proposed forms disclose, and where do the designers expect them to contribute to the betterment of the granular structure of large rail sections? Will they actually have any practical advantages in rolling, and enough to compensate for the additional metal which has been added at the flange points?

If the diametrical effects of certain roll surfaces cause a passing or sliding of the crystals where longitudinal tensions take place in the base of the rail now, what benefits can be expected by just increasing the thickness of the whole flange and permit the identical mechanical conditions of the rolls to remain unchanged? Further, will these sections, with a little more material in a uniform flange, prevent the chill of the metal traveling slower toward the rail head, resting there last, and forming a crystalline structure? Will not this condition in cooling be about the same as found with the 90 or 95-lb. standard section, with the exception that larger sections will cool slower, with the resultant crystallization coarser; it ought to be well known by this time that metal 1 in. x 4 in. cools about 50 per cent faster than the same area 2 in. x 2 in.

If these sections are increased in height, with the base remaining about the same width as in the old sections, what is to prevent the metal in the head from swinging in a curve at a more rapid rate over the flange in the rolling, and effectually setting up a greater disparity in elongation on opposite sides of the section? Quite enough trouble is already experienced from curvature in rolling a rail where the height equals the width, while if the height exceeds the width a corresponding increase of curvature can be expected. If more roll passes are demanded, together with less reduction per pass to reach low finishing temperatures, what will eventually happen? There is only one result, distortion, unless the form of the flange is changed in a manner to promote an equal elongation.

The mechanical actions of the rolls on the thicker flanges will have no more effective advantages than in the present practices, unless the thicker flange is expected to keep the metal in a more workable state, by reason of being slightly warmer. But in consideration of the fact that larger ingots will be contemplated and more roll passes will also be required to reduce to the desired sized bloom, then the metal in the flange points will become as nearly refractory as in the present practice. This being the case, what diametrical roll influences are going to elongate the metal uniformly on both sides of the section, or rather the flange and the head, and pass them at the same speed safely through more roll passes?

With the general shape of the rail flange unchanged, how are the parties responsible for these new designs going to clear up the fact that larger rails must be continuously rolled to gain toughness, stiffness, tenacity and granular superiority by reason of colder rolling? While if they are aware of this requisite, how is the present or proposed large rail shapes going to safely reach the final passes in the rolls without excessive curvature and distortion; which in turn necessitates gagging. On the other hand, are the proposed sections purposely designed to suit rolling in fewer passes, to assist rapid and economical manufacture at the expense of the final granular structure? Is not the elimination of roll passes an inevitable approach to a "cast-steel" rail?

So far as the rolling of these new sections is concerned, it would seem to be a digressive step, and that the inclination is towards a rail made in the laboratory. The sections as they now are, represent nothing more than an intentional disregard for the mechanical features that was so apparent and beneficial in former days, and where a good rail was produced from poorly regulated properties while other good factors were supplemented by the use of many more roll passes with less reduction per pass. More roll passes and colder rolling is the only compensation for chemical shortcomings in either the Bessemer or the open hearth process.

I am prepared to state through the columns of the *Railroad Gazette* how a large rail can be successfully rolled without distortion or curvature, and will cool evenly and separately within its different parts. If the railroad officials desire a strong and lasting rail, why not design one that is more in accord with the fundamental principles for rolling it and where the proper mechanical effects can be applied in the rolls and thus produce a rail of superior internal character something more than a mathematical figure which invites a return to molecular crudeness.

A. W. HEINLE,
Consulting Roll Turner.

Train Robbery in Russia.

Russia seems to have taken the lead in train robberies, in which heretofore we have had the first rank. The latest was in northwestern Russia, the train carrying collections from stations, under the guard of three policemen. Just after leaving a station, two men with pistols appeared in the car carrying the money. They opened fire on the cashier in charge and wounded him. A policeman fired on the robbers, who ran out of the car, shot down one of the policemen who got in their way and killed one passenger and wounded another by stray shots. One robber climbed to the roof of a car and there was shot dead and the other was killed as he was jumping from one car to another. Meanwhile the engineman knew nothing of it and kept on to the next station. One of the policemen had, at the first alarm, cut the bell rope, which probably prevented an accomplice from signalling the engineman to stop in the woods, where the main force of the robbers is supposed to have been stationed.

The Crops of 1907.

The following extracts are taken from the 1907 report of the Secretary of Agriculture to the President of the United States:

It has been a year of untoward conditions requiring all the industry and skill of the farmers to grow an average crop. They have struggled not only with an erratic season but with a scarcity of help in all the states and territories of the Union. Such a year as 1907 has been, with its hard winter, summer weather in March, and late cold spring, gives exceptional emphasis to the wisdom of this department's policy of diversifying farm products and of establishing new crops. A general crop failure in a field as large as the chief part of the temperate zone of a continent must be a rare occurrence.

No general crop failure afflicts the farmer this year, not even within small areas. The production of the farms, all things considered, is well up to the average of the previous five years in quantity, while its value to the farmer, as now appears at this annual day of reckoning, reaches a figure much above that of 1906, which by far exceeded any previous year's wealth production on farms.

Out of the farming operations of 1907, the railroads will get an average haul of freight, and foreign countries will take a heavy excess above home consumption. The farmer will have more to spend and more to invest than he ever before had out of his year's work.

DURUM WHEAT.

When the Department of Agriculture brought durum wheat to this country from Russia and Africa during 1899 to 1902 the seed was sown that formed practically the entire foundation of the present crop of durum wheat. At a cost of $10,000 in the beginning, a crop worth $30,000,000 now grows in regions of low rainfall, where in the day of stock ranges the steer roamed on 20 acres to find his cud. This crop has encroached on the home of the prairie dog and of the cactus. It has spread throughout a wide strip of country, extending from northern North Dakota to southeastern New Mexico and northwestern Texas. It is a common crop in Montana and Idaho and in parts of Washington, Oregon and Utah.

This variety of wheat has entered into home industries. To a considerable extent it is mixed with other wheat in making flour for bread. It is promoting the manufacture of macaroni and kindred paste products in this country and is prepared as a breakfast food. It is the grain through which the desert feeds the cities of the east at home and abroad.

As an export crop durum wheat has become prominent. In 1905 Europe took nearly 10,000,000 of the 20,000,000 bushels produced; in 1906 about 20,000,000 bushels of the crop of that year.

Last year two-thirds of the exports went to Mediterranean countries. The former sheep and cattle ranges sent macaroni material to Marseille, Naples and Venice; to Greece, Spain and the countries of western Europe; and even to the old homes of durum wheat—northern Africa and Russia. Shipments of this wheat were made to 43 ports in Europe and Africa named in trade reports of the collectors of customs, and to other ports unnamed.

With an average production of about 15 bushels per acre, durum wheat this year covered an area of over 3,000,000 acres, many of them valueless for agricultural purposes before the advent of this new crop. Its value to the farmer is over twice the entire cost of the Department of Agriculture during the current fiscal year, including the Weather Bureau, the costly meat inspection, and the Forest Service.

BEET SUGAR.

The beet-sugar industry in this country had not advanced beyond experiment and given promise of prominence until about 1888. Since that year it has rapidly grown, under aid and encouragement from the Department of Agriculture and the experiment sta-

tions and with favorable legislation by Congress and several state legislatures.

About 560 short tons of beet sugar were made yearly from 1879 to 1887; in 1891 the quantity was 6,000 short tons; in 1892, 13,460 short tons; in 1893, 22,344 short tons; in 1897, 45,246 short tons; in 1899, 81,729 short tons; in 1901, 184,606 short tons; in 1903, 240,604 short tons; in 1906, 483,000 short tons, and in 1907, 500,000 short tons.

Sugar factories occupy a belt across the continent in the sugar-beet zone and a belt from Washington to Arizona along the Pacific coast. From the easternmost factory in western New York they extend through Ohio, Michigan, Illinois, Wisconsin, Minnesota, Kansas, Nebraska, Montana, Colorado, Utah and Idaho; and from eastern Washington through Oregon and California to southern California and Arizona. In 16 states there were 64 factories in 1906, with a capacity of working 49,500 tons of beets daily. Factories with more than three-fifths of this capacity are situated in the western division of states, and in that region this new crop has so well established itself and the growing of sugar beets has proved to be so remunerative that sugar-beet farms of the medium sort increased in value $42.49 per acre from 1900 to 1905, as determined by special investigation by the Department of Agriculture, or from $99.47 per acre in 1900 to $141.96 in 1905.

To the fostering of this industry by nation and states, to the instruction provided by the Department of Agriculture, by experiment stations, and by agricultural colleges, it has responded by increasing the value of its production 543 per cent. in nine years. The factory value of the refined sugar made in 1899 was $7,000,000, and in 1907, $45,000,000. More than $60,000,000 is now the value of the beet-sugar farms and factories.

One-third of the value of the beet-sugar made this year would be enough to pay the cost of the Department of Agriculture during the current fiscal year and the National expense of the 60 experiment stations of contiguous United States when they shall have received the ultimate appropriation of the Adams Act.

ALFALFA.

Alfalfa, that extraordinary plant for producing wealth and doing wonders to farms, is occupying an important place in the plans of the Department of Agriculture, the experiment stations, and the agricultural colleges. Through their efforts largely it has rapidly gained success in cultivation throughout a vast area. The value of the crop as hay this year is supposed to be $100,000,000, and if the plans and efforts now under way to promote its extension receive a reasonable reward the value of the future crop will be several times the present amount.

This forage plant is a chemical laboratory in which nitrogen is taken from the air. It is a soil improver of the highest merit. As a flesh-forming feed for growing live stock, and as a milk and egg producer, it is unexcelled by any plant of large production.

It grows 2½ tons of hay to the acre as an average for the whole country where it is grown, or twice the average for all kinds of hay, and, besides this, is more nutritious than other hays.

The cultivation of alfalfa has been pressing eastward until now it has established itself as far as the longitude of eastern Kansas, except in southern Texas. It is established in some areas still farther to the eastward—in spots in Arkansas, in southern Wisconsin, northern Illinois and northern Indiana, in the limestone regions of Kentucky and Tennessee, and in the southeastern corner of Michigan.

This plant is semi-established in Minnesota, Iowa, Missouri, Ohio, and is making its way in Illinois and Indiana. Elsewhere the growing of this plant is mostly experimental, but with promise of success.

IRRIGATION.

Among the large efforts that have the effect of giving steadiness to the agricultural production of the nation at times of threatened adversity is irrigation. This is almost entirely confined to the arid and semiarid regions west of the 100th meridian and to the rice coast of the Gulf of Mexico in Texas and Louisiana, but will move eastward as its value is learned. The area now under irrigation is 11,000,000 acres, or a surface equal to the improved farm land of Georgia, or Virginia, or Michigan, or equal to one-third of the cotton area.

At the census average income per acre, with allowance for subsequent increase of price of products, the value of the crops raised on irrigated land this year would appear to be worth at least $175,000,000, an increase of 75 per cent. over the value of 1899. In 1908 an additional area of 5,000,000 acres will be under ditch and ready for settlement. When this additional area is settled, the total will be 16,000,000 acres. If the new area were at once productive, the irrigated crops of 1908, at the price of 1907, would be worth $250,000,000 or more, and would support a population of over 1,000,000 persons

CORN.

Four fifths of the world's production of corn, as nearly as can be determined, grows in the United States, and in the world's international trade in corn this country contributes one-third to one-half of the exports, not including the products of corn-fed animals. Fears of a failure or a large degree of failure of the corn crop this year diminished after mid-summer and at last the harvest secured 2,553,732,000 bushels, a production that is almost exactly the average of the crops of the preceding five years. There have been three larger corn crops—those of 1899, 1905 and 1906.

In value the corn crop of this year is much above the high-water mark of 1906. On the assumption that the crop will be sold by farmers at an average price not below the present one, its value is estimated to be $1,350,000,000, or 26 per cent. above the average value of the previous five crops. Four crops before had exceeded one billion dollars in value.

The farm value of the corn crop of eight such years as 1907 would pay for duplicating every mile of steam railroads in the United States and pay for their costly terminals, rolling stock, and all property. In 13 years it would replace the present banking power of this country in banking capital, surplus, deposits and circulation, and in 17 years it would replace the banking power of the world.

HAY.

Apparently the hay crop this year is more valuable than the cotton crop. On account of the varieties and qualities of hay its average price is difficult to determine without reports from crop correspondents. The computed value of the 61,420,000 tons of the crop is $660,000,000. The tonnage has been exceeded several times, but the value is $65,000,000 above the highest previous value, that of 1906. Compared with the average of the preceding five years, the quantity of the hay crop of this year is 2½ per cent. higher and the value is 20 per cent. higher.

COTTON.

If the cotton crop of this year does not eventually occupy second place in value instead of hay in the final estimates of the Department, if seed be included, it certainly has third place, even without seed.

The farm value of the 1907 crop of cotton and its seed is estimated to be from $650,000,000 to $675,000,000. The commercial expectations are that the crop will be found to be the third one in size ever raised, and perceptibly larger than the average crop of the previous five years. Its farm value is probably a little below that of last year's crop. Otherwise it will be the most valuable cotton crop ever raised in this country and 7 per cent. above the average farm value of the crops of the previous five years.

The year was a trying one to cotton from planting time to nearly the end of the summer, but even under adverse conditions a crop has been produced that will be sufficient, with the surplus of last year, to meet the requirements of spinners until the next harvest. The fears of a cotton famine that followed the low production of this country in 1901 have not been justified, and in the meantime efforts to make European spinners partly independent of the Upland cotton of the South by aiding the growing of "colonial" cotton have not made themselves felt. Outside of the British East Indies, the production of cotton in the British colonies, possessions and protectorates was 7,553 bales of 500 lbs. gross weight in 1904 and 10,016 bales in 1905. In the French colonies, except French India and Indo-China, 400 bales were produced in 1904; in the German colonies, 1,500 bales in 1905.

Among the strong points of advantage possessed by this country's cotton is the low cost of transportation to market. Recent investigations by this Department indicate that the average cost of transporting cotton per 100 lbs. from farm to local shipping point is about 16 cents; from local shipping point to seaport, about 40 cents; and from seaport to the United Kingdom, about 32 cents; the total being only 88 cents per 100 lbs., or less than a cent a pound.

WHEAT.

Wheat, the fourth crop of the year in value, is deficient in quantity by 5 per cent. when compared with the average crop of the preceding five years. The 625,576,000 bushels produced will be enough for a large per capita consumption, with a remnant of many millions of bushels for export, although not as many as usual. During the last five years the wheat exports, including flour, have averaged 122,411,110 bushels, and during that period 18.6 per cent. of the crops was exported.

Although wheat is 5 per cent. in quantity below the average crop of five years preceding, it is 5½ per cent. above the average value of these crops, or a little over $500,000,000. The crops of three years, 1901, 1902 and 1905, had a slightly higher value than this one.

OATS.

The only large crop to which a great degree of failure attaches this year is oats. Only 741,521,000 bushels were harvested and these were of low quality. In number of bushels this is the tenth oats crop ever grown in this country, and it is 19 per cent. below the average crop of the previous five years.

In value the story is different. Contrasted with the loss of 19 per cent. in quantity is a gain of 26 per cent. in value in comparison with the five-year average; so that this year's crop is worth $360,000,000, or much more than the most valuable oats crop heretofore produced.

POTATOES.

The sixth crop in value is potatoes—292,427,000 bushels, worth $190,000,000. Three potato crops have exceeded this one in size—those of 1895, 1904 and 1906—but it is 2 per cent. above the average of the previous five years. Its value is 26 per cent. above the five-year average.

BARLEY.

Barley has pushed its way upward in production until it is now the seventh crop in value. The 147,192,000 bushels of this year are estimated to be worth $115,000,000. Only the crop of 1906 was larger, and the crop of 1907 is 2 per cent. above the average of the previous five years. The value of barley this year indicates an extraordinary situation, the price per bushel being about double what it was last year, hence the value of the crop is about 85 per cent. above the average of the previous five years.

TOBACCO.

The tobacco crop has declined to 645,213,000 lbs. this year and is smaller than the crops of many years. It is 11 per cent. under the average of the preceding five years, yet the value is the highest ever reached, except in 1906, and is estimated to be $67,000,000, or 16 per cent. above the five-year average.

SUGAR, MOLASSES AND SIRUP.

As farm crops, sugar beets and sugar cane are valued herein as such, except that the cane products are taken into account if the cane is crushed on the farm. The large cane-sugar mill is classed with manufacturing instead of with agriculture; this is to preserve the census basis for comparison.

The farm value of the sugar beets in 1907 and of the sugar cane and sorghum cane and such molasses and sirup as were made on the farm is estimated to be $64,000,000. The sugar-beets value is slightly above the figure for 1906, and is 50 per cent. above that for 1905, and twice the amount for either 1903 or 1904. The farm value of sugar cane, molasses and sirup is estimated to be $33,500,000, which was exceeded only in 1904.

The popular interest in this subject is so large that it is worth mentioning as a manufacturing industry. The raw cane-sugar mill production of 1907 is estimated at 389,000 short tons, with a factory value of $28,000,000, the year 1904 alone exceeding this amount. The estimate for refined beet sugar is 500,000 short tons, worth $45,000,000.

Both kinds of sugar add to 889,000 short tons, worth $73,000,000. When mill molasses and sirup and sorghum and maple products and beet pulp are added, the total value of the ultimate products of the sugar, molasses and sirup industry (the refining of cane sugar not included) in 1907 is $95,000,000.

FLAXSEED.

The 25,420,000 bushels of flaxseed of this year's crop are worth about $26,000,000, the quantity being 5 per cent. under and the value 3 per cent. over the average of the previous five years. The crop of 1902 is the only one that exceeded this one in value.

RYE.

With a production of 31,566,000 bushels, or 4 per cent. above the average of the five previous years, the rye crop has a value of $23,000,000, or 29 per cent. above the five-year average. In three years, going back to 1891, the production has been greater, and the value has been higher in two years, 1867 and 1901.

RICE.

Rice is the twelfth crop in point of value this year and in both quantity and value is the record rice crop. The preliminary estimate is a production of 21,412,000 bushels of rough rice, or 963,540,000 lbs., an amount a little above the great crop of 1904 and 98 per cent. above the average crop of the previous three years. This year's crop is worth $19,500,000 to the farmers, or 36 per cent. above the three-year average.

The exports of domestic rice in the fiscal year following the crop year 1904 were 75,000,000 lbs. of cleaned rice, 4,000,000 lbs. in 1906, and 2,443,000 lbs. in 1907. The imports of rice, less the foreign and domestic exports, were about 64,000,000 lbs. yearly from 1900 to 1903, and about 62,000,000 lbs. in 1904. After the crop of 1904 the tide turned and in 1905 there were net exports amounting to 41,000,000 lbs., followed the next year by net imports of 43,000,000 lbs., and in 1907 of 61,000,000 lbs. The only year before 1907 when the production was greater than the consumption was 1904, and the production in 1907 is greater than in that year. The Department of Agriculture has been helping the rice grower to get better varieties from the Orient, which has changed imports into exports.

BUCKWHEAT.

Buckwheat was a crop of larger production before 1860 than it has been in subsequent years, but it has revived during the last half dozen years. The production in 1907 is 13,911,000 bushels, or 4.7 per cent. below the average of the previous five years, and its value is $10,000,000, or 14 per cent. above the five-year average.

HOPS.

The hop crop has lapsed somewhat from its position in 1905 and 1906. The production of 1907 is estimated at 48,330,000 lbs., or 4.6 per cent. below the five-year average, while the value of the 1907 crop is placed at a little less than $5,000,000, or 29 per cent. below the five-year average.

TOTAL OF CEREALS.

Upon consolidating the seven cereal crops and comparing the production of 1907 with the average of the preceding five years, a loss of 214,000,000 bushels is observed, or 5 per cent. That is, the average of the five years was 4,349,000,000 bushels, and the production in 1907 was 4,135,000,000 bushels. The oats crop was 175,000,000 bushels under the average, and wheat 32,000,000 bushels, while rice was 11,000,000 bushels above, and rye and barley a little above.

Regarding corn as at the average of production and excepting oats, the other cereals show a net reduction below the five-year average of only 18,000,000 bushels, and this in a total production, omitting oats, of 3,393,000,000 bushels, so that the percentage of the net reduction is only one-half of 1 per cent.

In total value the seven cereal crops make a new high record that is above that of 1906 by $296,000,000. The farm value of the cereals of this year is estimated to be $2,378,000,000, or 23 per cent. above the average of the previous five years.

SUMMARY OF CROPS.

In the production of crops the year 1907 has been a good one to all of the people as well as to the farmers. It has averaged with the previous five years after a general balancing of gains and losses. A great fall in oats below the average and much smaller declines in wheat, tobacco, hops, flaxseed and buckwheat have been counterbalanced, and more than that, by increases above the average in cotton, hay, barley, rye, rice and potatoes. This means material commodities and not the value placed upon them.

No such high aggregate of crop values has ever before been reached by farmers as for the crops of 1907. In estimating these, little if any use is made of the high prices before the break in the latter part of October. The present indication is that every crop except hops will considerably, if not very much, exceed in value the average of the previous five years. Extremely large rates of gain are observed for corn, oats, barley, rye, hay, tobacco, potatoes, rice and cotton seed, and the rates of gain would be notable in any ordinary year in the case of wheat, cotton lint and buckwheat.

In the grand total income from his crops of this year the farmer finds himself in better financial condition than before. He reckons his income in ten figures and he is still improving his farm, buying bonds, lending to his neighbors, and putting his money into the vaults of banks.

Wealth production on farms in 1907, as expressed in value, transcended the high record of 1906, which was itself much above the highest amount before reached. In arriving at the total the farm products of the year are estimated in value for every detail presented by the census and at that point in production at which they acquire commercial value.

The grand total for 1907 is $7,412,000,000. This is $657,000,000 above the value of 1906, $1,103,600,000 above that of 1905, $1,253,000,000 above that of 1904, $1,495,000,000 above that of 1903, and $2,695,000,000 above the census amount for 1899.

The value of the farm products of 1907 was 10 per cent. greater than that of 1906, 17 pr cent. over 1905, 20 per cent. over 1904, 25 per cent. over 1903, and 57 per cent. over 1899.

A simple series of index numbers shows the progressive movement of wealth production by the farmer. The value of the products in 1899 being taken at 100, the value for 1903 stands at 125, for 1904 at 131, for 1905 at 134, for 1906 at 143, and for 1907 at 157.

During the last nine years wealth estimated as above explained was created on farms to the fabulous amount of $53,000,000,000.

EXPORTS.

Food and fiber were provided in such enormous quantities in 1906 that a great national surplus went abroad to feed and clothe many millions in foreign countries. High prices helped to swell these exports as expressed in money, and for the first time in the history of the world a country exported agricultural commodities of home production to a value greater than $1,000,000,000.

In the year ending June 30, 1907, the domestic exports of farm products were valued at $1,055,000,000, or $79,000,000 above the high record of the previous year. Four-fifths of these were plant products, and chief among these was cotton, with a port value of $182,000,000, an amount much above the highest value of any former year.

The exported grain and grain products were valued at $184,000,000, the unmanufactured tobacco at $33,000,000, the oil cake and oil-cake meal at $26,000,000, the vegetable oils at $20,000,000, and the fruits at $17,000,000. All were gains over 1906, except the item of grain and grain products.

Animals and animal products were exported to the value of $255,000,000, mostly composed of packing-house products, worth $203,000,000, or only $4,000,000 under the high-water mark of 1906. Exported live animals were valued at $41,000,000 and dairy products at $6,600,000.

IMPORTS.

Agricultural products valued at $627,000,000 were imported in the fiscal year 1907, of which the plant products were $403,000,000, chief among these being sugar and molasses, valued at $94,000,000; coffee, $78,000,000; vegetable fibers, $62,000,000; fruits and tobacco,

each valued at $26,000,000, and vegetable oils, with a value of $15,000,000.

Animals and their products were imported to the value of $224,000,000, with packing-house products, mostly hides and skins, valued at $96,000,000; silk valued at $71,000,000, wool at $42,000,000, and dairy products at $6,000,000.

FOREST PRODUCTS.

Never before 1907 were the year's exports of forest products so valuable as in this year. With an increase of $16,000,000 over 1906, the total of these exports ran up to $93,000,000, of which $52,000,000 was the value of lumber, $22,000,000 naval stores, and $18,000,000 timber.

On the other hand, the imported forest products were valued at $123,000,000, mostly composed of india rubber, valued at $59,000,000; lumber, valued at $21,000,000; gums, not including rubber, valued at $15,000,000; wood pulp at $6,000,000, and unsawed cabinet woods at $5,000,000. The total imports of forest products were valued at $26,000,000 above the total of 1906, which was the highest amount hitherto reached.

The Fort Dodge, Des Moines & Southern Railway.

During November a new electric road operated by overhead trolley was put in operation from Fort Dodge, Iowa, south to Des Moines, 92 miles. This is the Fort Dodge, Des Moines & Southern, which includes part of the Newton & Northwestern, a steam road from Rockwell City, Iowa, south through Boone to Newton, 101 miles; and two new pieces of road, one south from Fort Dodge, the other north from Des Moines. Forty-two miles of the Newton & Northwestern lying almost in a direct line between Fort Dodge and Des Moines were electrified, and two extensions of 25 miles each were built, one from Lanyon, at the northern end of the electrified section of the steam road, the other from Huxley, at the southern end, thus establishing the through line between the two cities.

Local Freight Train; Ft. Dodge, Des Moines & Southern.

Wood Trestle and Bridge at Crossing of Des Moines River near Fraser, Iowa.

This section of Iowa is well supplied with railroads, but they are mostly east and west lines. The new road is crossed by the Chicago Great Western and the Illinois Central at Fort Dodge, the Chicago & North Western at Boone, and the Chicago, Rock Island & Pacific at Des Moines. These three cities are active business and railroad centers, and there has been need of direct railroad connection between them. There has been no direct railroad connection between either Fort Dodge and Boone, or Des Moines and Boone, while other important points such as Ames have not been easily accessible. The Fort Dodge, Des Moines & Southern now makes a through line connecting all these points. Besides the direct local traffic between these three cities, it should get considerable traffic as a distributor of the through traffic of the trunk lines which it crosses. Already joint passenger traffic arrangements have been made with the Illinois Central and the Chicago Great Western at Fort Dodge. The Fort Dodge, Des Moines & Southern will also carry express and freight.

The passenger train service now established between Fort Dodge and Des Moines is based on an average speed of 27½ miles an hour, including 15 regular stops. A maximum speed of 55 miles an hour is frequently made between stations. From terminal to terminal the total running time is 3 hours and 50 minutes, but 6½ miles within city limits consumes 43 minutes of the total running time. The 42 miles between Huxley and Lanyon, the electrified section of the Newton & Northwestern, is covered by all the electric trains in 1 hour and 36 minutes, including seven regular stops. This stretch was generally covered by the steam trains in about two hours.

The electrified section of the steam road was improved for this service, and the extensions are gravel ballasted and equipped with 70 lb. rails. The country is fairly level except near Boone, where the road crosses the Des Moines river. Here the country is rugged. Deep ravines lying at right angles to the river abound. On this part of the line is the maximum grade, 2½ per cent. To get over this grade it was necessary to build a succession of trestles over the ravines along the edge of the plateau above the river. One of these trestles, shown herewith, is one of the longest and highest in the country.

Car Barns at Boone; Fort Dodge, Des Moines & Southern.

High Trestle near Des Moines River West of Boone; Fort Dodge, Des Moines & Southern.

In traffic and operating methods the road uses steam railroad practice wherever possible. There are ticket, baggage, express and freight offices at all regular stations. One-way passenger fares are sold at about 2 cents a mile, while a rate of about 1¾ cents a mile is made for round-trip tickets. Five-hundred-mile mileage books cost $7.50.

The cars are shown in the photographs. They are of the best

interurban standard. Passenger and express cars are similar, each having four 75-h.p. Westinghouse motors and equipments. They are 53 ft. long over buffers and 9 ft. 6 in. wide over sills, which is nearly as wide as a standard steam railroad coach. They are single ended and have locomotive pilots, standard radial drawbars and also M. C. B. couplers. Westinghouse multiple unit control apparatus is used on all cars for operation in trains. Passenger cars are finished inside in mahogany with semi-Empire ceilings and plate glass windows. The seats are upholstered in leather. At one end of each passenger car is a smoking compartment containing eight seats and also a baggage compartment fitted with movable seats. When the seats are filled, the passenger cars weigh about 76,000 lbs.

A turbo-electric plant at Frazer, which is midway between the terminals and on the Des Moines river, supplies the power. Near Frazer slack coal in mined and is a cheap fuel. The power is generated as alternating current and transmitted at 20,000 volts to five sub-stations which are an average distance of about 15 miles apart. At the sub-stations the alternating current is transformed to direct current at 600 volts, which is supplied directly to the trolley wire. All the principal electrical apparatus is of Westinghouse manufacture.

The engineering and electrical construction and equipment of the system were carried out by J. G. White & Co., of New York City. The grading and track work was done by the Northwestern Construction Company. J. L. Blake, General Manager of the Fort Dodge, Des Moines & Southern, representing the owners, had general supervision of the undertaking.

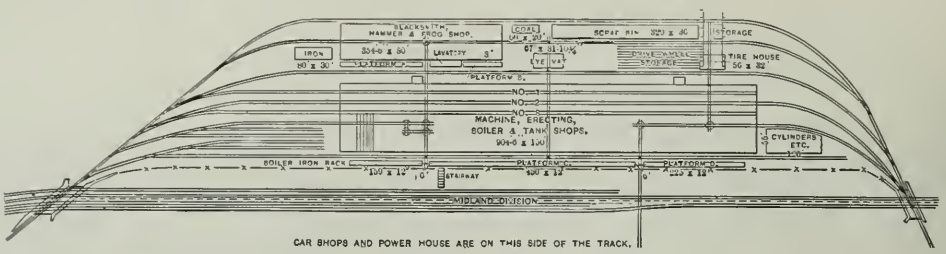
Foreign Railroad Notes.

The Prussian State Railroads have concluded a contract with the German steel combine for their supply of rails and steel ties for the next three years at 120 marks for rails and 111 marks for ties per kilometric ton = $29.02 and $26.84 per ton of 2,240 lbs.

In an address before the German Society of Mechanical Engineers recently, Herr Wichert, an eminent electrical expert, who, with others, had recently returned from a mission to America, to study the application of electricity to transportation, declared that a satisfactory solution of the question of the use of electricity on ordinary railroads has been found only by the invention of the single-phase, alternating-current collector motor.

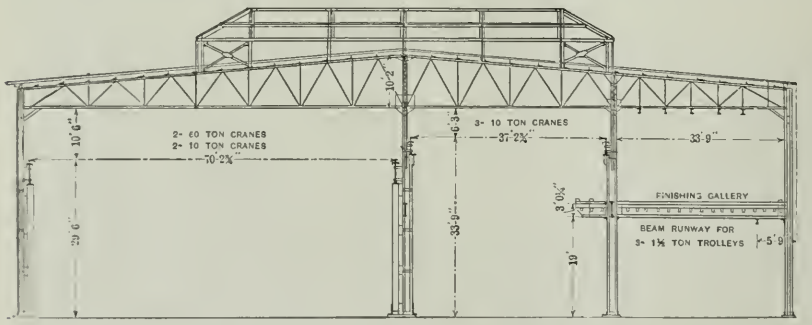
Readville Locomotive Shops; New York, New Haven & Hartford.

When it became necessary for the New York, New Haven & Hartford Railroad to increase its locomotive shop facilities, it was decided that the most suitable location for new shops would be at Readville, Mass., where the main car repair shops of the company were. Such an arrangement would concentrate the repair work, and Readville was in other ways a good location by reason of its being at the junction of two main divisions of the road. Additional property was bought south of the tracks of the Midland division, and the locomotive and car departments united by subways at the east and west ends of the grounds where main line trains pass under the Midland division; also by a subway about the middle of the grounds for pushcar service and foot passengers, and by conveniently located stairways over the Midland division fill. One main entrance serves both departments and the yard tracks of each are connected. One shop superintendent has charge of both departments with a general foreman for each department; the plants are therefore substantially a unit.



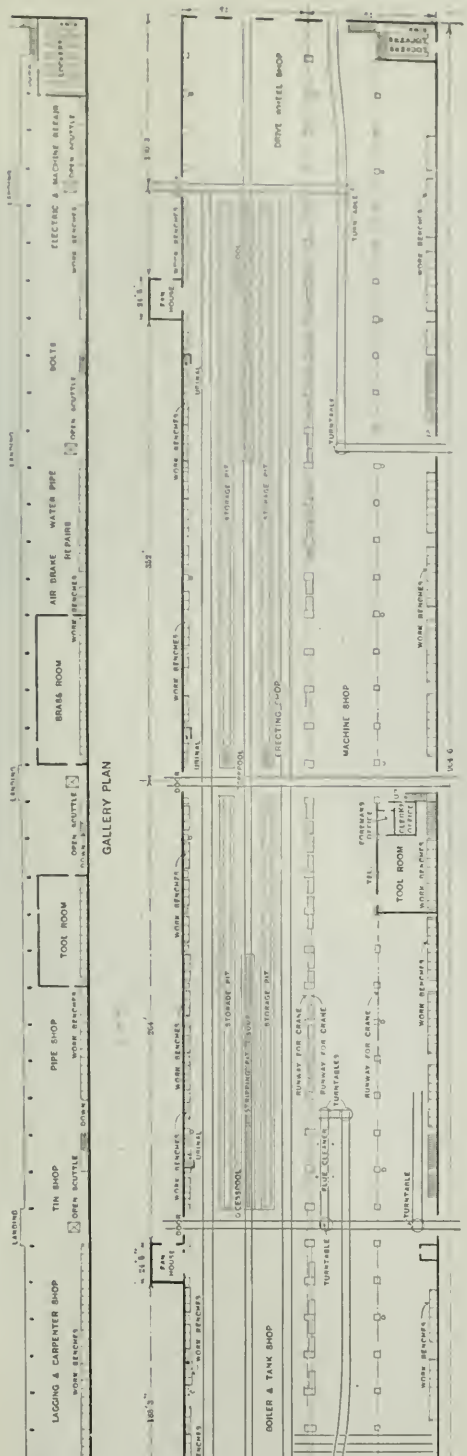
General Plan of Locomotive Repair Shops at Readville, Mass.; N. Y., N. H. & H.

The car shops have been in operation for several years; the locomotive shops have only recently been put in operation. The principal building of the new shop plan is 904 ft. 6 in. x 150 ft., which includes the machine and erecting, boiler and tank shops. The long axis of this building is parallel to the tracks of the Midland division and the building and yard tracks are connected with the main line of the Providence division at the eastern end. By means of a crossover from the Providence division to the Midland division access to the shops from either division is obtained. Other buildings are a blacksmith and frog shop 354 ft. 6 in. x 80 ft., an iron shed 80 ft. x 39 ft. adjoining, a tire house 56 ft. x 32 ft., a lye house 67 ft. x 31 ft. 10 in., and a coal house 60 ft. x 20 ft. In the yard are numerous storage platforms; one 12 ft. wide extending the length of the main building and terminating at the boiler shop end of the building in a boiler iron rack 159 ft. x 12 ft.;



Cross-Section Through Erecting and Machine Shop.

Interior of Erecting Shop; Readville Shops.



Plan of Machine, Erecting and Boiler Shop; Readville Shops.

a platform for cylinders at the opposite end of the building 120 ft. x 55 ft. at its greatest width; a scrap platform 320 ft. x 36 ft. provided with bins for assorted material. Three tracks entering from the east pass entirely through the main building, three others are carried through and along each side of the blacksmith shop and alongside the scrap bins, while another passes between the long platform previously mentioned and the north side of the main building. Adjacent to the tire house is a yard for driving wheel storage.

Locomotive Shop.—A number of features in the design, construction and equipment of the main building are of interest and particular attention has been given to details. The materials are steel, brick and concrete with mill construction and roof covered with five-ply asphalt and gravel. The concrete foundations are carried to a height of 5 ft. from grade, and the sills of the first floor windows are formed directly in this material, no stone sills being used. The concrete floors in the machine shop are laid in squares, although the method of laying is not apparent in the finished floor, the outline of the blocks being formed of a strip of tar paper rising to within ½ in. of the surface and folded underneath the lower edge of the block. All the steel work was fabricated and

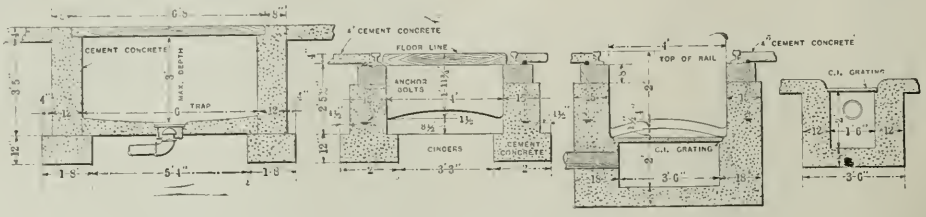
Part Exterior of Main Building.

erected by the New England Structural Steel Company, Boston and Everett, Mass.

The shop was designed to afford facilities for repairing 45 locomotives a month. The erecting shop floor occupies half of the width of the building for about two-thirds of its length, a space approximately 200 ft. long at one end being used for a boiler shop and 100 ft. at the other being used for a driving wheel shop. Stripping pits each 150 ft. long are located at each end of the stripping track, which is the center track of the erecting floor. The stripping pits are flanked on each side by storage pits which extend the whole length of the erecting floor, or about 600 ft., with the exception of a 20-ft. passageway in the middle of the length of the buildings are a blacksmith and frog shop 354 ft. 6 in. x 80 ft., in the engravings. The storage pits are 6 ft. wide, built entirely of concrete with walls 12 in. thick supported on foundations 18 in. wide and 12 in. deep of the same material. At the ends these pits are 2 ft. 10 in. deep and the floors drain longitudinally on a slope 2 in. in 30 ft. to the maximum depth of 3 ft. in the center. The pits are covered with loose 4-in. x 12-in. yellow pine plank and every tenth plank is provided with a pair of heavy malleable iron handles set flush with the surface.

The walls of the stripping pits are of concrete 15 in. thick on foundations 12 in. x 14 in. The walls are capped by 8-in. x 12-in. yellow pine stringers secured by ¾-in. anchor bolts spaced every

6 ft. The space under the floor of the pit, which is raised in the center to a height of 1½ in. in the width of 4 ft. is filled in with gravel and the floors slope longitudinally 4 in. in 50 ft. to sumps covered with cast-iron gratings. The rails resting on stringers extend ¼ in. above the floor level, and the concrete floor is carried against the outside of the rail and under the head, the space between the rails being made concave and sloping longitudinally to bell traps.



Cross-Sections Through Locomotive Pits.

Work benches line the entire outer wall for the length of the erecting and machine floors, and are also conveniently located in bays between center lines of columns. The erecting floor is served by two 10-ton and two 60-ton cranes, each of the latter having

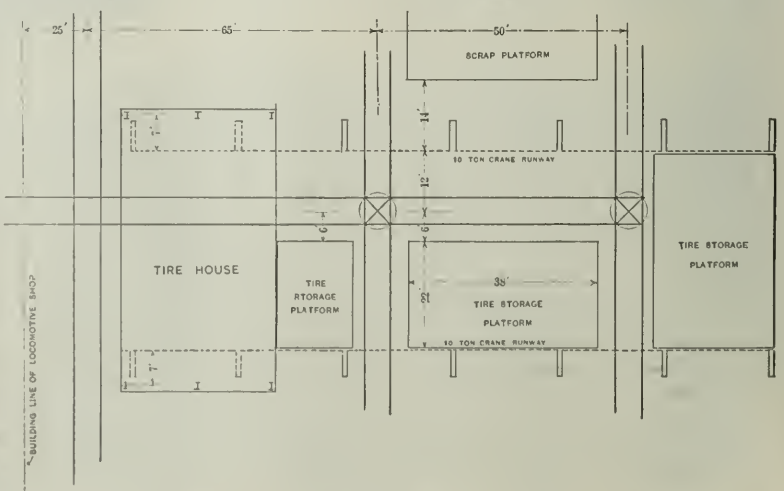
10-Ton Crane and Runway over Tire Storage Yard.

10-ton auxiliary hoists. The 60-ton cranes are located in the middle and those of 10 tons capacity at each end. All cranes throughout the shop were built by the Shaw Manufacturing Company, Muskegon, Mich., and are equipped with G. E. Type M induction motors.

Machine Shop and Gallery.—The machine shop space is divided longitudinally by a row of columns supporting a gallery used for the lighter classes of work. The tool room and brass room are separated from the remaining open space by partitions 12 ft. high, consisting of a wainscot 4 ft. high with crimped wire netting above. Other space is devoted to electric and machine repair, finished bolt department, air-brake and water pump repairs, tin shop, pipe shop, lagging and carpenter shop, etc. Four landings projecting beyond the edge of the gallery are convenient for crane service from the erecting floor cranes. The gallery is also served by the three 10-ton cranes which serve the machine shop floor, and in addition by two 1½-ton electric trolley hoists, built by Maris Brothers, Philadelphia. Three of the same kind of hoists travel under the gallery and run the full length of the machine shop. At convenient distances are located four open hatchways by means of which the upper hoists can drop material through the gallery floor to be taken up by the hoists below and distributed to the benches which line the outer wall. All hoists are electrically operated by induction motors and runways are of single I-beam section. Both the edges of the gallery and the hatchways are protected by a 1¼-in. pipe railing carried on 2-in. pipe supports, the posts at the landings being removable. The hatchways are 8 ft. x 7 ft. 4 in. The gallery floors are of 2-in. x 6-in. spruce laid diagonally on 8-in. x 16-in. Oregon fir joists and covered with 1-in. x 4-in. square-edge maple.

Each end of the gallery floor is provided with a locker room containing 110 lockers with suitable lavatory accommodations, and on the first floor immediately below are rooms similarly equipped with 63 lockers each, while on mezzanine floors are located closets and urinals. The space under the gallery is devoted to department grouping of machine tools, the heavier motor-driven tools being located in the space covered by electric cranes. All motors, both on the gallery and on the floor below, are mounted on steel brackets on the nearest row of columns and not against the side walls, thereby leaving light and space near the benches unobstructed in any manner by belting. The neat and substantial appearance of these brackets, as well as freedom from obstruction afforded by their location, is shown in the illustrations. The brackets differ slightly according to the columns on which they are located, but consist generally of a frame built of channel sections, fastened together by angles and attached to the columns with a plate floor 28 in. x 50 in. and ½-in. thick. Where crane girders interfere, the brackets are braced to the bottom flange of the girder.

A complete scheme of line shafting was worked out by the engineering department before any of it was put in place. The main line shaft is erected in one continuous straight line throughout the whole length of the shop, motor or group sections being on an average 44 ft. long, and provided with flange couplings at the ends, a space of ½ in. being left between the faces of the flanges. In the event of the failure of any motor, it is possible to throw off its belt and by slipping a ½-in. filler between its shaft coupling and the next one, and bolting the two together, the group load can be carried by the motor in the next group. While the group sections are 44 ft. long, each piece of shaft is 22 ft. long;



Plan of Tire House and Storage Yard; Readville Shops.

this feature introduces further flexibility as the section may be divided in the center and half the load distributed to each motor on either side of the one in trouble.

The Sturtevant hot-air system is installed for heating and ventilating the main building. Two fans are located in lean-to extensions on the ground and two more are located on the gallery. The fans are spaced so as to divide the periphery of the building into four equal parts. The main artery of the system is a concrete duct built entirely around the building under the floor in the shop near the outer walls, varying in width from 1 ft. to 2 ft. 6 in. and ordinarily 3 ft. high except where some obstruction made necessary a change in section. Ten manholes afford access to the interior. The underground duct obviates the use of unsightly overhead pipes, and the only parts of the system that appear are the galvanized iron risers next to the outside wall. A novel plan was adopted for making the connections between the duct and the risers. Space was too limited to use the ordinary vitrified elbow, and as a substitute an elbow of No. 20 galvanized iron was used as a form and around this was built a shell of concrete of not less than 2 in. thickness. This elbow was made to project 2 in. above the floor level and on this projection the riser was fitted, the joint then being sealed with a collar of cement. At points where the duct is crossed by the tracks entering the erecting shop the rails are secured to an I beam reinforcement embedded in the concrete cover of the duct. A gravity return from the heating system drains to a receiving tank under the floor of the machine shop and the water of condensation is forced back by a pump to the boiler room. In the boiler shop end of the building is a high-pressure pump capable of pumping up to 300 lbs. pressure and connected with this is a line of extra heavy piping along the center and side columns for use in testing boilers.

The tool room on the gallery is a manufacturing tool room only, and the corresponding room on the ground floor is for issue, dressing and grinding tools. A central station for a complete shop telephone system of 51 extensions is located in the distributing tool room. The installation of the telephone system with switchboard in the tool room and stations at numerous points saves the time required for mechanics to go to the tool room for tools. When any special tool is required the mechanic calls for it by telephone and the tool is sent by messenger, who takes a check for it.

Interior of Blacksmith Shop at Night, Showing Illumination.

All tool-dressing is done in the tool room and not in the blacksmith shop, a suitable forge and power hammer being provided for the purpose. Cast-iron boxes in the floor between the tracks of the erecting shop are provided for the attachment of hose to the air-pipe system and a large number of portable lathes, forges and rivet furnaces as well as electric drills are in daily use on the erecting floor and in the boiler and tank shops. Twenty portable forges were recently supplied by the W. N. Best American Calorific Company, New York, to these shops.

Good provision has been made for natural lighting in the new shop building. The windows are large and set close together, especially along the sides. Each bay of 22 ft. between pilasters contains two sets of triple sash, the second floor windows being 15 ft. 8 in. x 13 ft. $1\frac{1}{2}$ in. (three sections of 50 10-in. x 14-in. panes). The lower windows are 15 ft. 8 in. x 17 ft. 8 in. and consist of three pairs of sash each containing 60 10-in. x 14-in. panes. Over each alternate bay in the roof is a skylight of ribbed glass and the lighting is further improved by the white paint of the interior.

Artificial lighting in high bays, over erecting floor and in the yard is by series arc lamps with Nernst four and six blower lamps for general illumination over and under the gallery and along the central row of columns. On the outside walls over the benches Faries articulated fixtures with incandescent lamps are used and each machine tool is provided with an incandescent lamp. A plentiful supply of Chapman light sockets is provided, along the center line of columns, outer walls and in the pits.

Tire House.—A useful adjunct to the locomotive shop is the

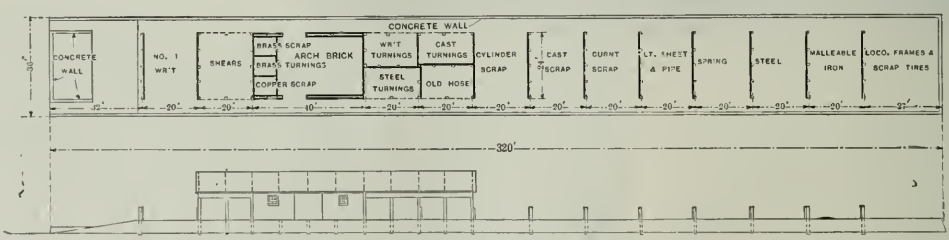
Motor Bracket on Intermediate Column.

Riser from Heating Duct.

tire house with its adjacent yard for the storage of mounted driving wheels. This is located next to the section of the main building in which the driving wheel work is done and is a fireproof building of corrugated steel. It is equipped with a 10-ton traveling crane which operates within and outside of the building over the tracks in the yard. It contains also a Ferguson oil furnace supplied by the Railway Materials Company, Chicago, and of a sufficient capacity to heat a nest of eight tires at one time. For the removing tires on a pair of mounted wheels the crane supports them in the ordinary fire on the floor until sufficiently heated.

The lye cleaning house is a separate structure. There are two lye vats and two draining platforms. The vats are 18 ft. 8 in. by 10 ft., inside dimensions, and the least depth is 7 ft., the bottom sloping 4 in. in 20 ft. Each pit has a concrete platform having a similar slope and covered with a grating of 3-in. x 6-in. yellow pine strips spaced 2 in. apart on a frame of 4-in. x 4-in. spruce joists. The floor not occupied by pits and platform is of macadam. The walls of the pits are 18 in. thick and the floor is 9 in. thick, of concrete. The walls of the pits were waterproofed with soft soap and alum solution. It has been found, however, that the oil from the greasy parts which were dipped into the lye has been absorbed by the walls to such an extent as to increase the waterproofing. The usual steel tank inside of the lye pits has therefore been omitted. The space afforded by the tanks, cleaning and draining floors is ample and the usual litter around this department is not in evidence. The service track passes through the middle of the house between the two sets of pits and platforms.

Blacksmith and Frog Shop.—The blacksmith shop, one end of which is fitted up as a frog shop, is unusually light and fully equipped with ventilating apparatus. The tool equipment includes McCaslin forges, Ferguson furnaces, etc., and an extension, 68 ft. 6 in. long x 15 ft. 4 in. wide, is devoted to locker and toilet rooms.



Plan and Elevation of Scrap Storehouse and Platform; Readville Shops.

The monitor roof is provided with swinging sash and louvres. All sash is p voted and arranged to operate from the floor. Service tracks extend through the middle of the building longitudinally and transversely.

Platforms.—Reference has been made to the platform space in the yard and the dimensions of the principal ones have been given. These are all built with concrete walls and floors with a gravel filling. The arrangement and construction of the scrap platform is shown in the illustrations. The covered scrap bins occupy 100 ft. of the length. The roof of this part is three-ply Paroid roofing and the doors are hung on Coburn trolley hangers. The open space is divided into spaces 20 ft. wide for the various classes of scrap.

The yard also contains a fuel oil storage tank in the form of a depressed covered pit containing steel tanks into which the oil is taken by gravity. Oil is drawn from the tank by means of a pump provided with a pressure regulator and the oil is distributed at a fixed pressure to all parts of the shops and is shut off automatically at a fixed pressure. The system is so arranged that at night or when the furnaces are not in operation all oil in the pipes returns by gravity to the tank.

Adjacent to the blacksmith shop is the iron shed provided with the usual rack space and room for weighing and cutting at the ends. The coal shed has a concrete floor throughout and is divided into spaces for coke, charcoal and coking coal.

Power House.—The power house is on the car shop side of the plant, and originally was a sub-station taking current from a power station belonging to the railroad company at Hyde Park, one mile away. The boiler plant which was added consists of five 400 h.p. Babcock & Wilcox boilers, four of which are equipped with Roney stokers, one being reserved for burning shavings, etc. They are provided with Sturtevant economizers and operate under induced draft. The original chimney still remains, however, and provision has been made by which the economizers can be bypassed and induced draft used or both by-passed and natural draft used. The equipment includes Hancock injectors and Warren-Webster feed water heaters, open type. There are two Worthington duplex outside center-packed plunger feed-water pumps, each having a sufficient capacity to supply water for the entire plant. In process of installation is a coal handling system with a clam-shell bucket working on a single I-beam trolley. This is supplied by the Whiting Foundry & Equipment Company, Harvey, Ill. This will handle coal from the storage to the stokers and will also be used for the removal of ashes, the apparatus being electrically operated.

In the engine room are three 400 k.w. G. E. a.c. generators, 25 cycles, 600 volts, direct-connected to three 600 h.p. cross-compound non-condensing Hamilton-Corliss engines equipped with Locke safety stops; two G. E. exciters direct-connected to 90-h.p. Watertown engines; one Franklin cross-compound air compressor having a capacity of 1,700 cu. ft. of free air per minute, supplied by the Chicago Pneumatic Tool Company; two Franklin compressors of 1,100 cu. ft. capacity each; three Brush dynamos for series arc lighting

The switchboard is equipped with a Tirrell voltage regulator, station watt-meter and separate lighting watt-meter together with a full complement of volt-meters, ammeters, switches, etc. The car-shop transfer table was formerly operated with a direct-current motor, but this and the motor generator set have been removed and an induction motor installed. In the process of remodelling the power-house equipment for present purposes all 60-cycle transformers for lighting were removed and 25-cycle transformers installed. As a result of these changes all electric apparatus on both the locomotive and car-shop side now operates on three-phase, 25-cycle alternating-current, power voltage being 550; Nernst lamps 220 volts, incandescent lamps 110 volts.

All steam pipes between buildings are encased in Wyckoff sectional covering and are carried underground. As an interesting detail may be mentioned the color scheme in the various piping systems in the locomotive shop. The colors and their significance are as follows: White, high-pressure steam; yellow, exhaust and low-pressure steam heat; black, water, including boiler feed and feed water heater; green, air; blue, drip and return, including the Holley system; red, fire service.

All wiring, switchboard and pipe work and the installation of the Holley system were done by Westinghouse, Church, Kerr & Co., H. C. Pond, engineer in charge, under the direction of the railroad company. All wiring is overhead and is carried across the Midland division in tile conduits built into the concrete arch, affording access from one side to the other.

E. H. McHenry, Vice-President, has had general supervision of the design and erection, and F. K. Irwin, Constructing Engineer, was in charge under Mr. McHenry. S. Higgins, General Manager, and the mechanical superintendent assisted in the consultation with reference to the general scheme and in the selection and arrangement of machinery. C. A. Dodge & Co., Boston, were general contractors, and Babcock & Wilcox had the contract for the boiler room, including all apparatus except the coal-handling plant.

The Japanese Railroad Commission reports that there were in the country March 31, 1907, 4,783 miles of railroad, of which 1,532 miles belonged to the state. During the year previous 89 miles were added to the system, and at the end of the year work was progressing on 821 miles more. The average cost per mile of the completed roads has been $43,056. The train service was at the average rate of 10.4 each way daily, and the average number of cars per train was 15.8. The traffic amounted to 2,505 millions of passenger miles and 1,352 millions of ton-miles, which is at the rate of 717 passengers and 387 tons each way daily. (In this country 154 passengers and 1,318 tons.) Thus there is 4⅔ times as much passenger traffic per mile in Japan, but not one-third as much freight traffic as here. The gross earnings per mile in Japan were $7,309; the working expenses, $3,404, and the net earnings, $3,905. Here the contrast with the results in this country are striking. Our railroads earned per mile $3,151 *more* gross, but $357 *less* net, owing to the fact that working expenses were $6,912 per mile here against $3,404 in Japan. The Japanese net earnings were 9 per cent. on the cost of the roads. The number of employees was 73,754, which is nearly 15½ per mile against 6.9 here.

Retirement of James F. Jackson.

On Nov. 30, James F. Jackson retired from the chairmanship of the Massachusetts Railroad Commission in order to be able to devote more time to his private business. In these days of radical and half-baked action by the state commissions it is pleasant to turn to the intelligent and efficient work which has been done in Massachusetts, and the retiring chairman of the board of commissioners has been a worthy successor to Charles Francis Adams, Jr., in his own policies as well as in his efforts to carry out the long established principles of the commission since its earliest days. The Massachusetts commission is endowed with full police powers; in other matters it works with publicity and suggestion as its tools, and its opinions and decisions, carefully made, carry with them such weight of public opinion that they have nearly the force of statute, and can usually command new legislation.

We take the following comment on Mr. Jackson's administration from a careful review published in the *Springfield Republican*:

Those who have watched the administration of Chairman Jackson realize what his decision to resume the practice of law means to the state. It has been evident in watching his conduct of hearings and in reading the orders and other decisions of the board, that he has aimed to be absolutely impartial between the corporations and the public. He has laid down certain principles and tried to supervise the roads—both steam and electric—in accord with them. During his administration many new deliverances have been made and these few years have been of large value to the people. Quite a development of railroad and railway law has occurred. Not only has the commission laid down principles of action, but it has had a share in the passage of legislation. It has continued to keep Massachusetts at the head of the development in the relation of the public to their transportation servants and its reports are in wide demand all over the country, and in foreign countries on the part of governments and of individuals.

James F. Jackson.

Chairman Jackson has been particularly careful and painstaking in the drafting of the orders and other decisions of the board. His writings have struck out new lines of practice and they have been followed with precision. He has the remarkable fact to his credit that not a single decision which he has made, not a single principle of administration which he has formulated, during his whole eight years in the chairmanship, has been set aside by any court. Not only that, but each party in the transportation field, the corporations and the public, has accepted his decisions as good law and good sense and have lived up to them as embodying substantial justice for both parties. Many new questions have arisen where new precedents had to be set. He has been very thorough in his study of separate subjects, in order that the body of principles he was building up should not only be the best for their special cases, but should be consistent with each other throughout and make a harmonious whole upon which future action could be taken with assurance that the principle was sound in both theory and practice.

Chief Justice Knowlton of the Supreme Court once said to a legal friend that Chairman Jackson's decisions were remarkable for their inclusion of the essentials and their omission of the non-essentials. Plenty of evidence of this trait will be found running through the decisions printed in the annual reports of the board. It has been the aim to be guided only a little by technicalities, but largely by the general principles at issue. This element, too, will be found abundantly in the decisions in the annual reports.

A further principle of general policy has been co-operation with local authorities, and not antagonism to them in the settlement of local issues, with clearly marked distinction between state policies and matters of purely local concern. This grows out of the supremacy given by recent law to the board over the local authorities, in order that there might be uniform application of the same principles all over the state. Subject to these general principles the board has regarded the local authorities as largely as possible, and the consequence has been harmonious working together of the board with city governments and selectmen. In numberless cases the board has acted as advisor rather than supervisor in adjusting questions between selectmen and street railway management.

The Massachusetts anti-stock watering laws have been carefully guarded in spirit and letter. Western Massachusetts will remember the defeat of the proposed legislation to permit the western Massachusetts street railway company to secure special privileges that would have overthrown fundamental principles of an anti-stock-watering nature. Another illustration is where the board was instrumental in the defeat of the proposition of the Boston & Maine Railroad in trying to get authority to capitalize the purchase price of street railways, where such price might include value of franchise and of earning capacity. Besides these conspicuous instances, the board is giving illustrations constantly on a smaller scale in its decisions regarding the issue of stock and bonds by railroad and street railway companies. The spirit of the law has never been violated.

Massachusetts leads in the use of block signals. An illustration of the force emanating from the board is seen in the case of the disaster two years ago at Baker's bridge, near Concord, resulting in a thorough overhauling of the system on the Boston & Maine, involving the expenditure of a large amount of money. The board has urged similar action upon other railroads.

In regard to the service the companies must render the public and which the public can demand from the companies, the writer has heard it stated over and over again at hearings—and the same principle is embodied in repeated decisions—that capital has a right to a reasonable return; that private persons cannot reasonably be expected to put their money into a means of serving the public and be expected to perform the service at constant loss. A company is justified in charges sufficient to yield a reasonable dividend upon the investment. On the other hand, the franchise is given by the public in order that the public may be served. Therefore a company is not justified in cutting off a particular train or car because it is unprofitable taken by itself. But if it serves a public need, and the company, considering all its income, can perform the service, it must do so. Necessities of transportation must be provided as far as possible. But when it comes to giving the public luxuries, then it is a question how far the income justifies it.

During this administration the powers of the board have been increased in respect to the elimination of grade crossings, and have been extended over street railway locations and over methods of constructing and operating street railways. Recent laws also give authority over steamships and express companies. In practice but little has been done under this law, but it is a fair presumption that the same principles will be applied as hitherto in the regulation of transportation companies. Special duties have been imposed upon the board from time to time, showing the confidence of the Legislature and its readiness to use the board as a sort of public utility commission. It was put in charge of the construction of the new bridge between Fall River and Somerset. It has supervisory powers over the construction of the Cape Cod canal, and at the last session of the Legislature it was given the determination of questions affecting important public improvements in Springfield. The board, further than this, has been many times consulted by the committees on railroads and street railways, officially, as well as by members of the Legislature individually, in regard to pending

legislation. Some particular measures of high importance are as follows: In 1901 the board recommended the 500-mile mileage book. This was adopted and put in force by all the railroads. The next annual report said: "This was a step toward bringing about a rate of two cents a mile for long distance travel. Under continued conditions of prosperity such standard charge is to be expected at an early day." Under the lead of President Mellen, of the New Haven road, the board's suggestion of a standard rate of two cents a mile has been carried out. Discussing a reduction of rates the board said: "It is at times necessary to make demands upon companies which involve a possible loss of revenue in order to secure what is due to the public. This should be done, however, only after careful inquiry and study of consequences. Any policy which jeopardizes the prosperity of a company through reckless interference with earning power is as unfortunate for the public-at-large as for the stockholders."

As to workingmen's fares, the board after an investigation in England and in this country, established the state policy that such fares rest not upon class distinction, but upon business principles, saying: "This question is a business problem to be solved upon business principles and not one of enforced contributions to a public charity, either from the railroads or from the more prosperous to the less prosperous part of the community. The true ground for a cheap morning and evening service is the fact that daily travel between home and place of business at fixed hours affords the carrier the most favorable condition for economical operation, and therefore entitles those who so travel to the lowest fares which are consistent with a reasonable return upon capital."

The board has consistently favored a monopoly in the street railway service of a large municipality. It applied that principle in Boston and later in Springfield. As stated in the decision in the Springfield case: "A monopoly in local street railway service under proper supervision should give the public a better service than the efforts of contending companies in infrequently struggling to keep alive enterprises which ought never to have been undertaken. Under our laws such a monopoly is founded upon statutes which protect the public interests by making street railway locations not only subject to supervision, but to revocation for cause, practically, therefore, dependent upon good behavior of the company."

Malay Railroad Projects.

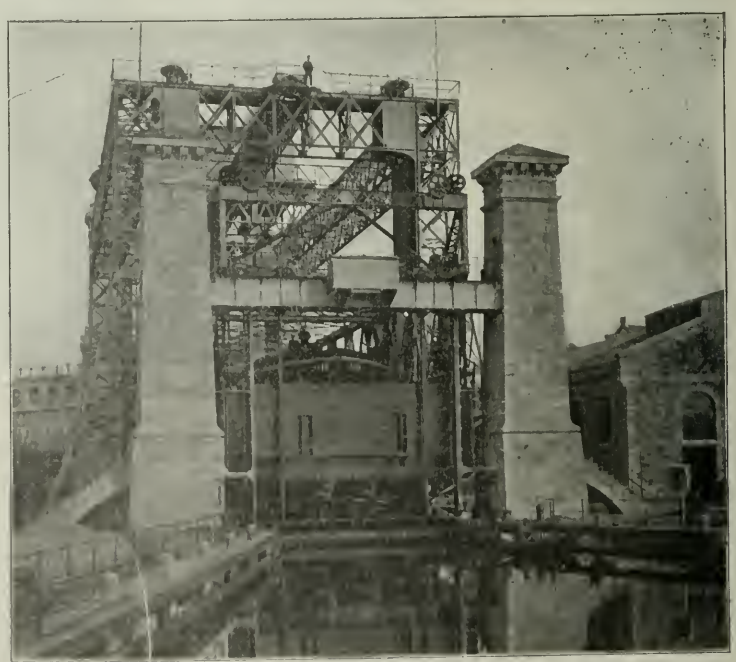
The Federated Malay States Railways are about to build a line from Gemas, Negri Sembilan, to Kuala Semantan, Pahang. The permanent survey has been made, construction authorized, and work is to be started almost immediately. It is difficult to over-estimate the importance of having railroad communication in a state like Pahang, which is still almost entirely undeveloped, where distances are great, and where the mineral and agricultural possibilities are admittedly promising. This road, together with the 150 miles of trunk line now under construction between Benta and Kuantan, will pass through and throw open a large area of hitherto practically unknown and inaccessible country, valuable for mining and plantations. The line is about 70 miles long, and up to December 31, 1906, $44,482 had been spent on its survey. At that time over $7,560 had been spent on railroad surveys in Pahang. These included a trial survey from Kuala Semantan, the terminus of the Gemas line, to Kuantan. This line will be a little over 76 miles long, and is estimated to cost $4,635,368. Another trial survey was made from Kuala Semantan to Lipis, via Kuala Tembeling, 47 miles. This line, if built, will tap the Tembeling Valley midway between Lipis and Temerloh, and will open up a large area of agricultural land. A survey was also finished last year, at a cost of $10,000, from Kuala Semantan to Lipis via Bentong, on the Pahang trunk line, to Kuala, 58 miles. This line will not go nearer than eight miles to Bentong, which will have to be reached by a branch from Kuala Semantan.

The Ship Lift on the Dortmund-Ems Canal.

At the present moment when so much interest is being taken in large canal construction schemes in several countries, it is of interest to show views of an important piece of work that was carried out a few years ago on the Dortmund-Ems canal—the ship lift, situated near Henrichenburg.

The highest level of the canal between Munster and Herne is situate about 192 ft. above the mean level of the North sea, and this difference of elevation is met by a series of locks. The section from Munster to Herne is about 42 miles long, and it crosses the Stever and Lippe rivers by strongly built aqueducts. The industrial town of Dortmund is connected with the canal, and therefore with the North sea ports, by means of a 10-mile branch canal to the highest level. There is a difference of elevation at the junction of this branch with the main canal of from 45 to 52 ft., according to conditions, and instead of employing a series of locks this difference is overcome by means of the ship lift near Henrichenburg. In this way delays are avoided, and several additional locks would also have involved the consumption of great quantities of water.

View in the Trough During Construction of Ship Lift.



Transfer of a Vessel from Upper to Lower Level.

The apparatus, as built by Haniel & Lueg, of Dusseldorf, con-

sists of a vertical floating lift with several submerging floats, by means of vertical cylinders standing in single wells, with parallel guidance on the Jebens' system for the trough, by vertical and revolving screw spindles.

The movable tank is filled with water, and in it the vessel can be lifted or lowered. There are five floats which entirely submerge in five shafts which are completely filled with water. These floats are connected to the water tank by built up columns. The floating

Shafts for Ship Lift While Being Built.

capacity of the five floats, which is always constant, is exactly equal to the weight of the water tank. The result is that the weight of the tank moves up and down at any height without the expenditure of power.

A screw gear is connected with the "trough" to regulate the movements as required. Four screw nuts are secured to the trough and move over four strong screw spindles, which are connected to a common gear, whereby the trough is moved up or down. The screw spindles and their neck bearings are of such dimensions that the whole weight of the trough, or even the whole lifting power of the floats, can if necessary be borne by them.

The trough is closed at each end by a vertical lifting gate, having at its periphery a ledge of rubber jointing which rests against a ledge projecting inside the trough. Similar gates separate the canal levels from the lift. In order to open the gates, when the trough is in the correct position against the level, the corresponding gates of the level and the trough are coupled and lifted together. The gates can only be lifted if the trough is in the exact position; otherwise the gear is locked. The trough cannot be moved unless the gates are closed.

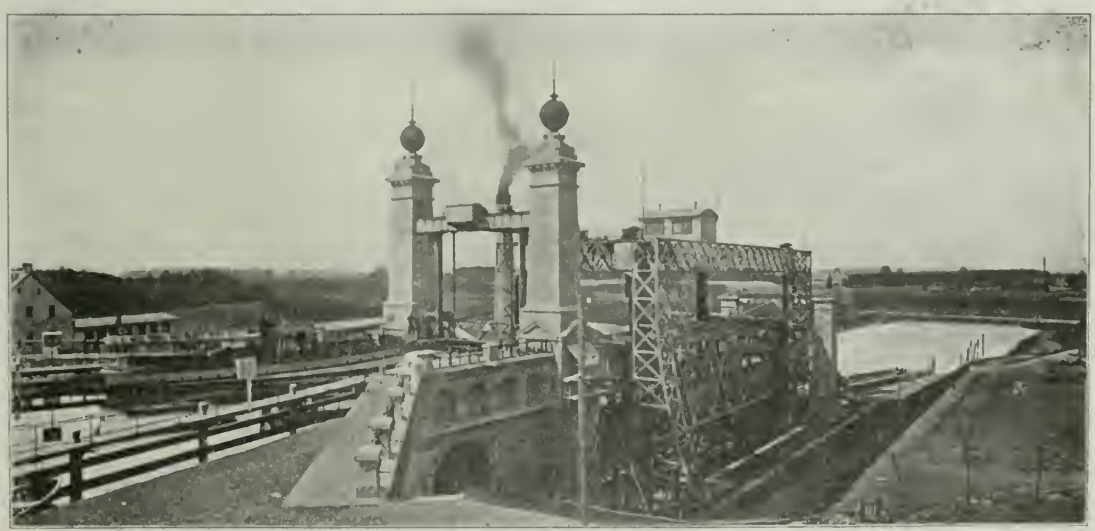
As to the capacity of the lift, the vessels to be transferred have the normal burden of 600 tons. The length of the largest regular vessel is 223 ft., breadth of hull 25 ft., with a draft of 5 ft. 7 in. The vessels are transferred over the lift afloat. The depth of water in the trough under ordinary conditions is 8 ft. 2 in., so that with the greatest immersion there is still ample water beneath the vessel. Therefore when necessary a burden of 1,000 tons can be borne. The speed of the trough in the vertical ascent and descent is about 4 ft. per second. The weight of the filled trough, its supports and five floats is 3,100 tons.

The large screw spindles of the gear for regulating the ascent and descent of the trough are driven by an electric motor, and all other movements of the lift are done electrically, such as the lifting devices for the lift gates at the divisions of the trough and levels, also the capstan for handling the vessels in and out of the trough. There is a special generating station from which the necessary electric power is obtained. In the case of self-propelled steamers, such as passenger vessels, one can be transferred from one level to the other in from four to five minutes, during which it has gone some 100 to 150 meters of its journey. Heavy vessels which have to be hauled in and out by capstan occupy 12 minutes.

We understand that it has been found possible in 21 working days of eight to ten hours each, to effect 600 single transfers.

The working expenses for a single transfer amount to two to three shillings (average), reckoning that the full use of the lift is required. The cost of the undertaking was approximately $625,000.

The Shantung Railroad, which is 271 miles long, on the average ran 2.5 trains each way daily in 1906, the regular service being two mixed trains daily, and the remainder consisting of special,



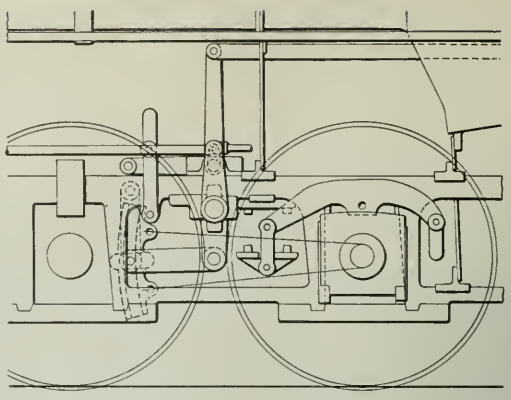
Henrichenburg Ship Lift, from Upper Level.

extra and work trains. The average train had 34½ axles, and more than two-thirds were under freight cars. The average passenger movement was 786 each way daily, and the average freight movement 237 tons each way daily. Of the total 419,814 tons of freight shipped, 54 per cent. was coal, 9½ per cent. beans, and 6⅔ per cent. cotton. The road passes through a densely peopled district, and

the small amount of freight, aside from coal, indicates that the Chinese have not yet learned to use the line. The gross earnings were $1,084,448 in our money, or $4,002 per mile. Of this amount 42 per cent. went for working expenses, leaving net $2,321 per mile, which is moderate interest on the cost. The road has 481 employees, all but 57 of whom are Chinese. There is a considerable number of railroads in China, and there will certainly be a great many more; but it is not often that we have definite reports of their traffic and earnings.

Locomotives for South Manchurian Railroads.

The Baldwin Locomotive Works have recently built for the South Manchurian Railroads 20 consolidation locomotives for freight service and two steam inspection cars. These engines are of the standard 4-ft. 8½-in. gage and were built to American designs throughout. The consolidation locomotives will be used on a section of the line, where the grades are 1 per cent. and where the curves are of 990 ft. radius, or of about 5 deg. 45 min. The cylinders are single-expansion with slide valves, which are driven by the Stephenson link motion. As will be seen by the engraving the link itself is set well ahead and up close to the second driving axle, in order to secure as great a length of eccentric rod as possible, and then a short transmission bar is used to deliver the motion back to the rocker, which is set between the main and second drivers where there is a space to receive it.



Link Motion of Consolidation Locomotive; South Manchurian Railroads.

The boiler is straight topped with a wide firebox which is supported by buckle plates at each end. The equipment includes automatic air-brakes, the Le Chatelier water brake and steam heating appliances. The engine truck and tender wheels are of rolled steel.

The inspection cars are each carried on a four-wheeled passenger car truck at the back end, and on a single pair of driving wheels and a two-wheeled leading truck at the front end. The leading truck is of the Rushton type, and is equalized with the driving wheels. The frames which support the boiler and machinery are of the usual bar form and are held in rigid alinement with the car body. The boiler is reversed in position, having its firebox over the truck, while the steam pipe passes out through the back head. On emerging it curves out and passes down on the left-hand side of the fire-door, returning again to the center line below it and ending in a tee from which branch pipes lead out on either side, to cast elbow connections bolted to the saddle just inside the frames, from which there is a passage of the ordinary type to the steam chests. This arrangement of placing the cylinders at the firebox end of the boiler requires the use of a rather long exhaust pipe; one that extends the whole length of the firebox and shell to the smokebox. It is, however, comparatively free from bends.

The operating mechanism is conveniently located at the forward end of the car, and the enginemen have an unobstructed view through the front and side windows. The coal box is placed on the left-hand side. It is 17 in. wide by 2 ft. high and 8 ft. long, and has a hinged cover extending its whole length. The capacity is about 22¾ cu. ft., or a storage for a little more than a half ton of coal. The water tank is suspended from the body back of the engine frame, and extends the full width of the car, having a capacity of 875 gallons. It is filled by a funnel extending up through the roof.

Air sanding devices are applied to the driving wheels and air-brakes to both the driving wheels and those of the rear truck.

The car bodies were built by the Pennsylvania Railroad. They have a timber frame measuring 36 ft. long over the end sills and 9 ft. 9 in. wide over the side sills. The rear truck is of the usual construction, having a wheel base of 7 ft., with chilled wheels 33 in. in diameter. The passenger compartment is handsomely fitted up, and is furnished with eight arm chairs. The lighting throughout is by electricity and steam heating equipment is provided. The

Football Travel on the New Haven Road.

The annexed tables give returns for passenger travel on the New Haven road on the day of the Yale-Princeton football game Nov. 16, 1907, as well as comparative tables of receipts for corresponding games and for the Yale-Harvard games of 1904 and 1906, some of which have never heretofore been printed. The figures are official.

Special "E" of the outgoing trains to New York with its 1,203½ passengers in 12 cars, or more than 100 passengers per car, suggests the elasticity of a train immediately after a big football match.

Some returns of the regular trains for the day, with four trains containing 33 cars excluded for which no figures for passengers are returned, are also of interest:

Going to New Haven

The outgoing and incoming passengers at New Haven by the regular trains for which returns are given number 8,711, of whom a large but uncertain number were undoubtedly football passengers.

The official schedule shows that of the 22 special trains reaching New Haven 12 were from two to 23 minutes ahead of time, most of them ahead by double figures; five trains were from five to 26 minutes late from various causes; and five were on time. Of the 17 outgoing specials no returns are given. The schedule for the regular trains shows that, as was to be expected, it was deranged considerably by the football traffic. Out of 18 incoming trains all but two were late by from one to 54 minutes. No returns are given for the outgoing trains from New Haven.

The official tables annexed show graphically the great volume, the increase and the remunerative character of the New Haven's annual football traffic:

STATEMENT SHOWING APPROXIMATE AMOUNT OF BUSINESS ON ACCOUNT OF YALE-PRINCETON FOOTBALL GAME AT NEW HAVEN, NOV. 16, 1907, COMPARED WITH BUSINESS OF THE SAME OCCASION, NOV. 18, 1905.

Wastes of Fuel, Power and Time in Railroad Operation.*

* * * The problem of fuel consumption or better combustion of fuel is a serious matter. On most roads there is no one man who is held accountable for the amount of fuel used. It would seem that there is room on a railroad to-day for a man whose title might be fuel superintendent, who would have charge of and direct the work now done by the fuel agent, including inspection of coal and the assignment of certain grades of coal to various coaling stations. He would be so closely in touch with the mechanical department that he would be able to advise what class of coal was to be furnished each division point, so that engines might be drafted for the class of fuel to be burned, and he would have on his staff a corps of traveling firemen to see that the men were properly instructed concerning the principles of combustion and were firing their engines according to correct principles, and that the engines were drafted so that they would burn the fuel in an economical manner when properly fired. Such a man should be able to effect a wonderfully large saving when it is considered that to-day the fuel agent in some cases is trying to make a record by buying cheap fuel and will not admit there is such a thing as poor coal. The mechanical department, to avoid steam failures, is drafting engines to handle the poorest fuel, and the men on account of poor coal, improperly drafted

*From a paper presented to the Traveling Engineers' Association Convention by D. C. Buell.

engines or lack of interest are burning from 10 to 20 per cent. more fuel than necessary.

Of other channels through which energy is wasted may be mentioned the following.

Coal Wasted.

Coal not properly inspected at the mines, allowing slack and dirt in considerable amounts to take up space in cars, tanks and fire boxes that the coal should occupy, to say nothing of the loss caused by dirty fires, clinkers, etc.

Coal spilled at coal chutes and not picked up.

Coal stolen all along the line.

Coal wasted on account of improper or wasteful methods of firing up engines at the roundhouse.

Coal spilled from engine tanks being filled too full.

Coal spilled from engine deck on account of its not being kept clean.

Coal wasted through grates on account of the fireman shaking grates improperly.

Coal wasted on account of firing not being properly done.

Heat Wasted on Account Of—

Ash-pans not properly made for admission of air to give proper combustion or not kept cleaned out.

Engines not drafted right to give proper combustion.

Boilers or flues being dirty.

Steam leaks in firebox or front end that interfere with the proper combustion of the fuel as well as wasting heat by the leakage.

Forcing the fire too hard, drawing the gases out of the stack at too high a temperature.

Engines not properly lagged.

Heat wasted which might be saved by hollow fire-brick arches, combustion tubes, feed-water heaters or special devices of this nature that have been proven economical.

Steam Wasted Due To—

Valves or cylinder packing blowing.

Cylinders not smooth. That is, where the inside of the cylinder wall has not become glazed so as to reflect the heat and keep it in the cylinder, instead of absorbing it and radiating it out as a cylinder which is pitted or unglazed will do.

Leaks across steam passages.

Leaks in steam valves.

Pipes or fittings leaking, either on the engine or in the cab.

Improper location or piping or working of the injectors.

Air leaks on the engine or cars.

Steam heat leaks.

Hot water leaks at any point from boiler or fittings.

Steam wasted through the pops on account of the engine not being fired properly.

Power Wasted on Account Of—

Valves set improperly.

Lack of lubrication.

Improper feeding and firing of the boiler.

Improper running and handling of the engine.

Drafting the engine so as to give excessive back pressure.

Improper handling of the air.

Brakes set up too close.

The waste of time on a railroad is almost always accompanied by a waste of energy because cars, engines and men are lying around when they might be doing useful work.

Time Wasted at Roundhouse Due To—

Engineers not making proper work reports. Some one has said that the word "examine," as used by engineers on work book reports, has cost the railroad companies hundreds of thousands of dollars. Get the men to make correct work reports.

Inefficient or insufficient force not getting work done promptly, thus delaying a $15,000 machine for want of a machinist or helper.

Sand house, coal chute, water tank and cinder pits not properly arranged. A study of the terminal may suggest some improvement in the layout that can be made at reasonable cost and would save more than enough in the cost of handling engines to pay the expense.

Lack of proper supplies at storehouse, requiring engineers to hunt up foremen and then spend more time robbing other engines to get what they want.

Lack of tools on engines, so that engineers cannot do necessary work promptly. A good locker room where tools, oil cans and overalls can be locked up will save most of this trouble.

Employing a boy who cannot be depended upon to do calling, when a few dollars more a week would pay for a man who would have some judgment and discretion and would save five times that amount in terminal overtime.

Not having a proper record of where men live and can be called.

Not having extra men enough to keep power moving as fast as ready and wanted.

Not having men called in time so they can get ready to go out on their call.

Time Wasted on Road Due To—

Not having proper tools on engines in case anything happens.

Trying to spot an engine at water tank with a long train instead of stopping short and cutting the engine off.

Not having fire in condition to go after meeting a train or getting orders.

Not oiling around promptly.

Engineer and conductor not working together to make meeting points or figure on station work.

Careless handling of train and pulling out drawbars and bad ordering cars.

Not watching for signals from train crew.

Not having a supply of sand at convenient points between terminals for bad weather or emergencies.

Engines not properly washed out, causing foaming and consequent loss of tonnage or time.

Allowing coal to get into tanks, stopping up injector supply pipes.

Not cleaning strainers in injector supply pipes at frequent intervals.

Water accumulating in main reservoir, thus requiring a longer time than necessary to release brakes.

Not keeping sanding devices in good working order, with result that engine slips badly in starting train or on hard pulls.

Engineer and fireman not working together so they will have steam and water where needed.

Fireman not awaking to the fact that ash-pan needs cleaning until engineer and train crew are ready to go.

Engineer "lying down" when something goes wrong with his engine when with a little thought and some energy he could have fixed things and brought his train in.

Crew stopping to eat just where it suits them without notifying the despatcher or regarding the possible disarrangement of his plans.

Engineer or conductor not advising despatcher if anything is going wrong so they cannot make the time expected of them. This hurts the other fellow at meeting points and maybe ties up the road.

Engineer not willing to admit there is anything wrong with his engine, resulting in long argument between engineer, conductor and despatcher with consequent waste of time. This is due in many cases to the fact that the engineer is "burned up" so badly if he admits an engine failure that he will deliberately say there is nothing wrong with his engine when he knows he could not make ten miles an hour with the train. Do not let the men get false ideas about not admitting there is anything wrong so the train can be reduced if necessary.

There is a great deal of energy wasted in the yard and on the road directly chargeable to the transportation department, part of the cost of which in many cases falls on the mechanical department. For example, time wasted in not having trains made up, crews ready or the yard open so the engine can get to the train and get out on call.

Indifference in matter of switching coal to chutes, cars of company material to the rip track or roundhouse, switching bad orders to the "rip" track and pulling and setting "rip" tracks properly, pulling cinder track, etc. Along this line may be mentioned the seeming delight some switchmen take in blocking the roundhouse leads, so engines cannot get in or out.

There is also time wasted getting the bills and orders, all of which is reflected in cost of coal charged against engines and wages of enginemen, etc.

On the road there may be waste due to poor distribution of time on schedules, poor despatching, slow orders out which should have been canceled, orders put out at points where it is hard to stop and start when some place where train would have to stop for water or a meeting point could have been used just as well.

Another waste is due to trains being made up improperly, loads behind instead of ahead, empty car doors open, short loads in what is supposed to be a through train, etc.

Slow orders put out by the maintenance department also add to the fuel bill, because unfortunately they are usually necessarily placed on track just at the foot of a grade or on a curve on some hard pull.

Many water tanks are located so that it is up-hill both ways away from them. Of course, the streams are usually found at the bottom of hills, but it is cheaper to pump water to a tank at the top of the hill than to pull the train from a standstill to the same point; stations are located so the train has to be stopped on a curve, and sidetracks so that with a full train the brakeman has to jump off and sprint for the switch, because "if they stopped they would have to double in."

Some one has said that "the eye of the master is worth the hands of all the servants." What a waste it is to have the master mechanic walk back and forth from office to office four or five times a day when a telephone would save him that time, and think of the two or three months' old correspondence the road foreman must answer, many times in long-hand, when he might be out on the road with some new man or new engine, saving energy instead

of wasting it. Work should be so arranged that it would not be necessary to keep a high-priced man doing cheap jobs. Following this same thought, some roads are noted for their prompt and courteous service and the fine discipline and loyalty of their men. Is it not due to good management, fair treatment and an example of loyalty, courtesy and fairness among their officials? The old saying, "Like master, like man," is true on railroads as elsewhere, and the waste of energy among a set of men who are not disciplined, are not loyal to the company or courteous to its patrons, is perhaps the greatest loss of all.

In view of the many ways in which energy may be wasted it may seem surprising that there really is any left. One must be alert and watchful to keep them down to a minimum for waste is a prolific creature and unless watched and controlled increases and multiplies to such proportions as to ruin good men's careers and wreck good roads.

Samuel M. Felton.

The resignation of Samuel M. Felton as President of the Chicago & Alton was announced last week. Control of the Alton passed to the Toledo, St. Louis & Western last August, and on December 4 Theodore A. Shonts, its President, was elected to take Mr. Felton's place. The consolidation of various offices of both roads has been gradually going in effect. Mr. Felton now goes to the Mexican Central to take the place of A. A. Robinson, who resigned as President a year ago. The new President's first training in the railroad service was as an engineer, and he has since had charge of both traffic and operation. Mr. Felton was born in 1853 in Philadelphia, Pa., and began railroad work as a rodman. He worked for six years in the engineering department of different roads in Pennsylvania which are now part of the Philadelphia & Reading. The next year he was made General Superintendent of the Pittsburgh, Cincinnati & St. Louis, where he remained for eight years. He was then appointed General Manager of the New York & New England, but in a few months went to the New York, Lake Erie & Western as Assistant to the President, in particular charge of the New York, Pennsylvania & Ohio, which is now part of the Ohio division of the Erie. He was made General Manager of the New York, Pennsylvania & Ohio at the end of the year, and the next year was elected Vice-President of the New York, Lake Erie & Western in charge of traffic; in a few months he was given charge of the operating department also. In 1890 he left to become President of the East Tennessee, Virginia & Georgia, now part of the Southern Railway. This office he held until 1899. During part of this time he was also Receiver of the Cincinnati, New Orleans & Texas Pacific; President of the Alabama Great Southern; Receiver of the Kentucky & Indiana Bridge Company, and Receiver of the Columbus, Sandusky & Hocking. In the fall of 1899 he was elected President of the Chicago & Alton, succeeding E. H. Harriman, who then became Chairman of the Executive Committee.

Samuel M. Felton.

Injunctions in Alabama.

At Montgomery Nov. 27, Judge Thomas G. Jones, of the United States District Court, granted a restraining order temporarily suspending all the railroad legislation just passed by the Alabama Legislature as it applies to the Louisville & Nashville, the South & North Alabama, the Nashville, Chattanooga & St. Louis and the Central of Georgia. In the case of the Central of Georgia the order was made returnable December 16, and in the case of the other railroads December 2. These orders are directed to the sheriffs, solicitors and clerks of the counties and to all citizens, restraining them from attempting to enforce the laws until the court disposes of the litigation. Scores of deputy marshals were employed to serve the processes throughout the state. The Central Trust Company of New York, owner of the second preferred bonds of the Central of Georgia, was complainant in the bill against the Central, but the other bills were filed by the railroads against the state. The bills attacked the classification acts of the special session as being "manifestly unfair and unjust." Railroads which entered into agreement with Governor Comer, it is alleged, received unjust and illegal preference over the railroads which refused to enter into the agreement. The Louisville & Nashville has filed a bill in the United States Court, praying that the litigation on the docket of the court in respect to the old laws shall not be dismissed.

It appears that, in all, 21 laws were passed affecting railroads. They were enacted indiscriminately, and almost without discussion. Governor Comer having declared that the contents of the bills did not much matter, the only issue being whether the state or the railroads should be supreme. It was boasted that the laws were "injunction-proof." The penalties for their violation were to be enforced from the day that the railroads took any of them into court to test their legality—either a Federal or a state court. Even the lawyers have difficulty in analyzing the acts or making sense of them.

As long as any state officer by designation had the power to enforce a rate law, that officer could be served with an injunction by a Federal judge; so the Legislature, in one of these laws, repealed an act which placed the enforcement of the rate law in the hands of the Railroad Commissioners, the Governor and the Attorney-General, and also enacted laws which made it a misdemeanor for ticket and freight agents to charge more than the maximum rates and gave passengers and shippers charged excessive rates a right of action, for 10 years, for damages against the railroad companies. It was supposed that there would therefore be no state officers to enjoin, but Judge Jones decided that the attempt to deprive the Federal court of jurisdiction could be met by employing a large number of special deputies and serving writs on practically everybody; the sheriffs, their deputies, solicitors, law clerks, passengers and shippers; and that was what was done.

Foreign Railroad Notes.

Investigations by the railroad administration at Königsberg showed that the heating value of the locomotive smokestack cinder produced varied from 6,930 to 11,160 B.t.u., depending on the kind of coal burned. In recent years the better grades of cinder have been sold for 40 cents per ton, a low price considering their heat value. With a view to a more profitable utilization of this material experiments were made with it for the production of power gas. As the result of these experiments two power gas plants using smokestack cinders have been built, the gas being used for the production of electric current. At the main shops at Königsberg there are three generators built by Julius Pintsch, and three double-acting Deutz gas engines, each with an output of 180 h.p. and direct-connected to a dynamo of 230 volts. The second plant, at Insterburg, has two gas generators supplying two single-acting Nuremberg gas engines of 90 h.p. each, each of these being belted to a dynamo of 230 volts. Both installations have proved in every respect highly satisfactory. At first the cinder consumption was rather high, 2.75 lbs. per h.p. hour. Changes in the gas generators have reduced this to 1.33 to 2.1 lbs. per h.p., according to the load on the dynamo. On the average 12 tons of smokestack cinders are produced per locomotive per year. Based on this a third installation, calculated for 150 h.p., is to be made.

The Prussian State Railroads have comparatively recently had a limited number of freight cars equipped with continuous brakes. It is now decided to increase the number, and during the current year 320 cars are to be equipped, and 140 next year, making a total of 600, which will for the most part be run in certain fast freight trains making regular trips. Heretofore, on certain lines, no more than 60 axles were permitted in such trains, but hereafter there may be 80.

GENERAL NEWS SECTION

NOTES.

The yard trainmen on the Grand Trunk throughout Canada have had their pay increased 12 per cent. The change affects about 600 men.

The Chicago & Alton announces that henceforth in the state of Missouri passengers will be admitted to trains only on showing their tickets.

Judge Munger in the Federal court at Omaha, Neb., November 26, made perpetual the injunction granted a year ago forbidding ticket scalping in Nebraska.

At Bloomington, Ill., recently a fireman of the Illinois Central had an arm blown off by the explosion of a fusee. It is said that the fusee had not been lighted.

Freight trainmen on the New York Central heretofore running through between New York and Albany, 142 miles, will henceforth turn around at Poughkeepsie, about half way between the two cities.

One day last week the Wabash took out of Chicago on a single train 500 passengers bound for St. John, N. B., over the Canadian Pacific. At St. John the passengers were to take the steamship "Empress of Ireland" for Europe.

The lumber producers of Oregon, Washington and Idaho who complained against the increase in eastbound freight rates, announced by the transcontinental railroads a month ago, have filed a new complaint with the Interstate Commerce Commission. It is signed by 41 lumber companies.

The Brotherhood of Railway Trainmen has sent to the Postmaster-General a complaint charging that the tracks of the Missouri Pacific are in some places unsafe. The reason given for sending the complaint to the Post Office Department is that the lives of railway postal clerks are endangered.

The Texas State Railroad Commission on Nov. 26 ordered 38 railroads to purchase cars and engines. Fourteen roads had already been ordered to buy. It does not appear that these roads are insufficiently supplied with rolling stock, but, rather, that the orders are issued because the cars and engines in use are owned by parent companies not domiciled in Texas.

In the Federal court at Atlanta, November 30, Judge Newman refused the application of the Central of Georgia for an injunction against the reduced rates ordered by the State Railroad Commission. Judge Newman says that the railroad should put the new rates in force for six months so as to afford ground for a study of results, as compared with a similar period under the old rates.

Bank checks, issued in large quantities, payable to bearer, for use in place of currency, because of the scarcity of the latter have appeared in New York this week, the New York Central paying part of its December wages in such orders, marked payable through the Clearing House. At Chicago more than $7,000,000 of this currency is in circulation. According to the New York *Sun's* reports from cities in central New York this so-called currency is usually cashed only at a 10 per cent. discount.

The Interborough Rapid Transit Co., operating the elevated and subway lines in Manhattan, New York City, has organized a uniformed police force for service at its most crowded stations. These officers will have full police power. The men appointed have been approved by the police commissioner of the city, after a thorough inquiry into their records, and regular city policemen will co-operate with the railway company's police when necessary. Fifty men began work in this service November 29.

The Supreme Court of the United States has decided that the Pennsylvania Railroad must show its books in the cases of the coal companies suing on a complaint of discrimination. The Webster Coal Company and the Pennsylvania Coal & Coke Company sued to recover damages alleged to have been sustained by reason of the road's discrimination in favor of other companies in the transportation of coal. The Supreme Court holds that officers of the railroad can be required to exhibit its books for inspection by the coal companies before the trial of the case itself.

On Monday last the Supreme Court in the case of the Louisville & Nashville vs. Bitterman and others, involving the right of the defendants to engage in scalping the tickets of the railroad company, decided in favor of the company, the decision being handed down by Justice White. The United States Circuit Court for the Eastern district of Louisiana held the practice to be wrong, but decided that relief could only be granted in individual cases, thus requiring a separate action for every offense committed. The Circuit Court of Appeals for the Fifth Circuit held that the wrongdoing was of a continuing nature and granted a permanent injunction. The scalpers then carried the case to the Federal Supreme Court and have now lost it.

Stereopticons, as introduced on the Cincinnati, New Orleans & Texas Pacific several years ago by W. J. Murphy, are now in use on the Union Pacific, for testing the familiarity of trainmen with the indications of fixed signals. An officer of the Union Pacific says that the use of this means of education is to be allowed a part of the credit for the excellent records made by the enginemen on that road, as shown by the surprise tests. On the Union Pacific and the Southern Pacific together the number of surprise tests now averages 45 a day throughout the year. In the last monthly record published, the number of surprise tests was 1,360. Imperfect compliance, 17. In 12 classes, including the most important, the record was perfect.

The Union Pacific reports that under the special reduced rates offered by that company to stimulate the shipment of coal before winter a heavy movement has been going on from the fields of Utah and Illinois. The company itself has stored hundreds of thousands of tons at points along its lines and those of its allied roads nearly to the Pacific coast. The railroad company has furnished free storage ground, wherever necessary, to stimulate the shipment of coal from the mines. A record has been kept of the action of the shippers and consignees in response to the company's efforts to avert a coal famine, and if there should be a scarcity of fuel the records will be brought out to show who is responsible. New mines are to be opened near Kemmerer, Wyo., to produce 3,000 tons of coal a day, and another new mine near Rock Springs, Wyo. These mines will be opened by independent interests and the railroad companies are going out of the commercial coal business.

Honduras Railroad Building.

The Vaccaro Brothers Railroad, now being built along the north coast of Honduras from Laceiba west to Porvenir, Salado, San Francisco and Santiago, 35 miles, is expected to be in operation some time in the spring of 1908. Three spurs from the main line at different points will penetrate five to eight miles inland, tapping farming country, while projected extensions of these spurs will eventually reach hard-wood timber some 20 miles from the coast. The completion of this first instalment of the 150 miles of projected road is expected to divert the greater part of the marine commerce from the towns mentioned and centralize it in Laceiba.

Oregon's Forest Wealth.

The state forestry authorities report that Oregon has 300 billion feet of standing timber, substantially all of it soft woods. This is more than is reported for any other state in the union, and one-sixth of the estimated supply of the United States. At the present rate of consumption, not allowing for any new growth, Oregon's timber supply would last 150 years. At $12 per 1,000 feet, the state's timber is now worth $3,600,000,000, or more than the total amount of money in circulation in the United States. The most productive area lies west of the Cascades, where the average of standing timber is 17,700 feet to the acre, but many tracts are found that yield 50,000 feet, and single logs, that in the form of sawed lumber are worth from $50 to $100, are common. Six hundred saw-mills, employing 15,000 men, besides 7,000 men in the logging camps, produce two billion feet of lumber every year, for which the world's markets pay Oregon nearly $45,000,000, including forest products of all classes. Federal withdrawal of extensive forest reserves and the state's new laws for the protection of its forests are depended upon to prolong indefinitely the existence of Oregon's timber supply as its principal source of revenue.

Alabama's Injunction-Proof Rate Laws.

Any one owning a patent process for turning out railroad-rate laws that are Judge-Jones-injunction-proof could probably get immediate employment with Governor Comer, of Alabama. The Governor will provide the legislature.

Governor Comer has just suffered another heart-breaking disappointment. He had tried one experiment with the Alabama rate laws and at once found himself tangled up in some of Judge Thomas Goode Jones' federal injunctions. At first it looked as if Governor Comer would join Governor Glenn, of North Carolina, and secede from the Union. On second thought, however, he decided to call his Alabama lawyers and Alabama legislators together and enact new anti-railroad laws that Judge Jones could not temporarily suspend by any of his federal restraining orders.

There were about 20 bills in all. They regulated passenger rates. They classified all kinds of freight. They fixed fares for

certain distances and between certain cities. They were to go into effect Dec. 1. And they were "injunction-proof."

The legislature passed them all and adjourned Saturday evening. Governor Comer signed the last of them Tuesday night and was waiting for the ink to dry when Judge Jones stepped in with another federal order restraining the State Railroad Commission, all solicitors, clerks of court, shippers and passengers from obeying or enforcing the Governor's injunction-proof laws until it could be ascertained whether they violated the Constitution of the United States.

It was tragic. And to think that it was all due to the notions about the United States Constitution held by a Southern jurist who had fought and shed his blood for the Confederacy, who had once been Governor of Alabama himself and who had been appointed United States District Judge by that other celebrated railroad regulator Theodore Roosevelt! Instead of going into effect next week, Governor Comer's injunction-proof laws must withstand the test of the courts. And the worst of it is, Governor Comer knows that if he interferes he is liable to go to jail by Judge Jones' orders for contempt.—*New York World.*

Reciprocal Demurrage in Texas.

The Texas State Railroad Commission has promulgated its order establishing "reciprocal" demurrage rules, effective December 10. The rules provide that freight in carloads must move at the rate of at least 30 miles a day and less than carloads 25 miles. Sundays and legal holidays are excluded and the rules do not apply to live stock and perishable freight. The time of the movement of a car is counted from the beginning of the second day after it is loaded. One day additional is allowed at division terminals. A 25-bale lot of cotton is to be treated as a carload. For failure to move freight promptly railroads must pay shippers as follows: Delay of 10 days or less, 2½ cents per 100 lbs.; 20 days and over 10 days, 3¾ cents; 30 days and over 20 days, 5 cents; 40 days and over 30 days, 6¼ cents; 50 days and over 40 days, 7½ cents, and for each additional 10 days or part thereof 1 cent per 100 lbs. Forty-eight hours' additional time shall be allowed at junction points or division terminals when it is necessary to transfer a shipment.

Shippers applying for cars must be supplied within three days, if five cars or less; within five days if nine cars; within eight days if 10 or more. In furnishing cars to shippers there must be no discrimination in favor of shipments going to stations on the home road. Failure to furnish a car according to the rule imposes a penalty of 50 cents a day, but only provided the shipper has deposited $2 a car, which is to be retained by the company if he does not load. If empty cars have to be hauled 50 miles to deliver to a shipper he may be required to deposit $5 a car; if hauled 100 miles a deposit of $7.

Ordinary demurrage is $1 a day after 48 hours. Failure to notify consignee of the arrival of freight involves a penalty of 50 cents, and the same is the penalty for failure to place a car promptly after a consignee has stated his wishes as to placing.

The rules for supplying cars to shippers allow less time than was stipulated in the suggestions offered to the Commission by the recent conference of railroad officers and shippers. It is now made obligatory upon the roads to furnish as many cars as are desired within eight days. Roads are required to average 30 miles for each 24 hours in the movement of freight. When the conference was called, the shippers asked for an average of 2½ miles an hour, or 60 miles a day. The cutting down of the time to 25 miles a day was a concession from the shippers which was made after much parleying. In the Commission rules no provision is made for the exemption of railroads from penalties in cases of accident or other causes over which the roads have no control.

South Manchurian Railroad Rebates.

According to a consular report, the South Manchurian Railroad has decided to give rebates to heavy shippers. Those paying freight charges amounting to $19,800 during the 12 months beginning October 1, 1907, will receive a rebate of 3 per cent. and one-half of 1 per cent. additional rebate for each additional $24,900 in freight payments up to $249,000. The rebate thus amounts to 7 per cent. at the last named figure and it remains at this percentage on all amounts greater than $249,000. It is pointed out that Japanese merchants, as the largest shippers, will get most of the benefit of the system, giving them distinct advantages in competition with the exporters of other countries.

A New Builder of Gas Engines.

The Wisconsin Engine Co., Corliss, Wis., builder of Corliss steam engines, has begun the manufacture of gas engines for all services, in sizes from 400 b.h.p. to 5,000 b.h.p. The engines use natural, producer, coke-oven or blast-furnace gas in the Otto cycle, and are of the horizontal tandem and twin-tandem double-acting types. The company controls the Sargent patents on internal combustion engines, and has Charles E. Sargent as the engineer of the gas engine department. Mr. Sargent is well known as an engineer, and in 1898 designed a horizontal tandem double-acting gas engine, which was a wide departure from the common practice of those days. It was then considered an impracticable type by many. Now, with one exception, all large units in this country are being built in that type.

The gas engines of the Wisconsin Engine Co. have some of the distinctive features of their large Corliss engines, and utilize in design most of the Sargent patents. The design is simple. There is but one poppet valve for each explosion chamber. It is located on the bottom of the cylinder and thus avoids cumbersome and unsightly air and gas pipes, as well as stairs, galleries and railings about the engine. Provision is made against the occurrence of dangerous pressures caused by possible pre-ignitions. The engines are started automatically. Tests of these engines, even small units, show a heat consumption of less than 9,000 b.t.u. per brake horsepower hour.

This company recently shipped some large steam engines to a number of large concerns, including the Illinois Steel Co., Jones & Laughlin Steel Co., Packard Motor Car Co., American Sheet & Tin Plate Co., Amoskeag Manufacturing Co., New Hampshire Spinning Mills, National Tube Co., the city of Milwaukee, Carnegie Steel Co., American Woolen Co., United States Envelope Co. and the Carnegie Natural Gas Co.

Fairbanks-Morse Motor Inspection Car.

The accompanying illustration shows the new type C gasolene motor inspection car sold by Fairbanks, Morse & Co., Chicago. The car is built by the Sheffield Car Company, Three Rivers, Mich. Much of the value of this kind of inspection car is due to its convenience.

Gasolene Inspection Car; Fairbanks, Morse & Co.

It can be kept ready for immediate use, as in a gas engine there is not the delay as in the case of the steam locomotive of getting up steam. Its maximum speed is comparatively high. One of the first cars made, which was sold to the Michigan Central, traveled 2,327 miles, consuming one gallon of gasolene in 19 miles and one gallon of lubricating oil in 17 miles. On this trip it ran 66.4 miles at the rate of 40 miles an hour and 39.6 miles at the rate of 53 miles an hour. The car illustrated here embodies several changes and improvements over this early machine.

Oklahoma Orders.

The Corporation Commission in the new state of Oklahoma issues a number of sweeping orders almost every day. One promulgated last week requires all railroads to build stations at state boundary lines, in order that passengers may have advantage of the 2-cent fare for interstate traveling as well as within the state. All trains will be compelled to stop at the state line stations, giving passengers time to secure 2-cent fare tickets within adjoining states.

On the 22d of November the commission notified all railroads that a 60 per cent. reduction in coal rates would go into effect January 3. The notice was issued after a lengthy conference with Attorney-General West. It specifies that the rate to be established shall be similar to the one maintained in Arkansas.

The board also issued orders requiring the railroads to submit the extent of their holdings to ascertain the value of the properties

and to make known in writing the method employed in leasing rights of way.

November 27 the commission issued a number of orders, including the following: Requiring railroads in case of wrecks or washouts, to run special trains immediately from both directions; when a regular passenger train is an hour or more late, to run a special on the regular schedule; requiring station agents to report correctly on bulletin boards in conspicuous places the running of trains, showing what the delay, if any, and despatchers to notify agents truthfully regarding running of trains; requiring railroads to submit all depot plans to the commission for approval before construction is commenced, and in case depots are built at state lines, they must be erected on site selected by the commission, compelling railroads to haul lumber, coal and other products, interstate shipments, at the same rate in Oklahoma as in adjoining states.

An order requiring separate coaches for whites and blacks was issued on the 27th.

At El Reno separate cars will be required, by the city, on the street railroad.

Work on the Panama Canal in 1907.

The annual report of the Isthmian Canal Commission for the fiscal year ended June 30, shows the following financial statement:

Total available appropriations to June 30, 1906		$26,990,786
Total appropriation, year 1907		25,456,415
Total appropriation, year 1908		27,161,367
Total appropriations		$79,608,568
Expenditures		
Total construction and engineering		$39,452,498
Total civil government		2,948,276
Total sanitation		5,530,208
Total miscellaneous	$6,442,906	
Less	5,478,779	
		964,127
Total expenditures		$48,285,110
Balance available July 1, 1907		31,323,458
Total		$79,608,568

The foregoing tabulated statement of appropriations and expenditures shows that $79,608,568 have been appropriated for the construction of the canal between the Atlantic and Pacific oceans, and that of this amount, at the close of the fiscal year a total of $48,285,110 was expended. The project adopted by Congress was estimated by the board of consulting engineers to cost $139,705,200, exclusive of sanitation and the expenses of the Zone government; the estimates submitted did not contemplate or provide for waterworks, sewers and paving in Panama and Colon, made necessary to secure improved health conditions, nor is any provision made for the re-equipment of the Panama Railroad. Under the circumstances, the foregoing table is prepared with a view to showing the amount expended for the construction of the canal on estimates under which the commission is operating.

The completion of the canal will necessitate the abandonment of the present main line of the Panama Railroad, and the preliminary surveys for the location of a new line on the east side of the canal were commenced the latter part of July and completed in November. The location of the line was practically determined in March and involves the excavation of 1,600,000 cu. yds. of material and the placing of 12,000,000 cu. yds. of embankments.

The skilled labor supply from the United States numbered 4,400 on June 30, 1907. The unskilled labor from the West Indies and Europe on this date numbered 4,317 Europeans and 14,600 West Indians. The total labor force was 29,446, compared with 19,600 on June 30, 1906, an increase of nearly 10,000.

From the Culebra division 5,570,432 cu. yds were cut during the year. On the Chagres division only preparatory work was done. In the Colon district the excavation in the year amounted to 1,112,321 cu. yds. From La Boca division 1,235,897 cu. yds. of material were dredged.

West African Railroads.

The work of opening up West Africa by railroads and harbors is one that is proceeding continuously on a large and wise scale, but which attracts little attention from the general public. In Sierra Leone actual construction of the railroad was begun in 1896, and by 1905 222 miles was completed. It is 2 ft. 6 in. gage, and the main line between Freetown and Baüma taps extensive palm oil forests, and serves a large population. There are numerous steel viaducts and long bridges, and, in places, feeders are being built. On the Gold Coast the line from Sekondi, on the coast, to Tarkwa, the center of the mining district, was begun in 1898. In 1900 it was decided to extend to Kumasi, the capital of Ashanti, and this was finished in 1903 after great difficulties. Other lines are projected. In Nigeria the line from Lagos was started in 1896, reaching Ibadan by December, 1900, and is now being extended to Ilorin, some 250 miles from the coast. Great cotton-growing areas are thus opened up, and will be available as soon as there are harbor facilities to enable steamers and railroads to transship without difficulty.

The British Strike Settlement.

State regulation is a safeguard against socialism. An approach is made to it in the settlement of the threatened railroad strike and consequently extremists in the Labor party are critical and discontented. They think that the trade unionists have been outmanœuvred by Mr. Lloyd George, President of the Board of Trade, and the railroad chairmen. Free labor rather than trade unionism will be represented in the various conciliation boards, and anything like all-grades cohesion will be impossible. The federation of masters will carry every point when the workmen are split up into sections. The Amalgamated Society, after expending $35,000 in rallying the workers and getting them to authorize a strike, has enabled non-unionists to talk over grievances and reforms with the railroad directors. It is a victory for free labor rather than the trade union. Yet something has been done. Arbitration is provided automatically, if disputes are not adjusted by conciliation. Thus we have a tentative application of compulsory arbitration to railroad controversies for seven years. For seven years the community has an adequate safeguard against railroad strikes, and a system not differing essentially from compulsory arbitration. Mr. Bell, not being a socialist, pays little heed to the reproaches of extremists. He knows that so stupendous an experiment in collectivism as public ownership cannot be tried under existing financial conditions. Instead of disarming the workmen he has taken all questions relating to wages and hours of railroad servants of every grade out of the hands of the employers and put the directors under bonds to accept the decisions of arbitrators at least for seven years. —*New York Tribune's London Letter.*

Colorado & North-western Subject to Federal Law.

The United States Circuit Court of Appeals at St. Louis on Nov. 29 reversed the decision of the United States District Court in Colorado, which had held that a railroad wholly within a state, though carrying goods consigned from a point in another state, was not subject to the interstate commerce law and to regulation by the Interstate Commerce Commission. The decision is given in the case of the United States against the Colorado & North-western, which operates a narrow gage railroad of 40 miles in Boulder county, Colorado.

The government sued to recover penalties for failure to have air-brakes on freight cars. The Court of Appeals orders a new trial.

The majority opinion, written by Judge Sanborn, of St. Paul, and concurred in by Judge Van Deventer, of Cheyenne, says in part: "Every part of every transportation of articles of commerce in a continuous passage from an inception in one state to a prescribed destination in another state, is a transaction of interstate commerce. The rebilling practised by railroads without any new consent or contracts with the owners could not destroy or affect the interstate character of the shipment or of the transportation. The constitution reserved to the nation the unlimited power to regulate interstate and foreign commerce, and if that paramount power cannot be effectually exercised without affecting interstate commerce, then Congress may undoubtedly, in that sense, regulate interstate commerce."

In a dissenting opinion Judge Phillips, of Kansas City, says: "The philanthropic feature of this prosecution is but the rose in the mailed hand." The inspectors of the Interstate Commerce Commission "discovered this inconsequential, neighborhood road, out in the mountains of Boulder county."

INTERSTATE COMMERCE COMMISSION RULINGS.

No Coast Terminal Rates for Santa Barbara.

The Interstate Commerce Commission has denied the petition of parties in Santa Barbara and Ventura, Cal., that these points be given the benefit of coast terminal rates. The opinion, by Commissioner Lane, says: "Although there is active competition between ocean and rail carriers to Pacific coast points, Santa Barbara does not enjoy such water competition as to compel the installation of terminal rates voluntarily by the carriers. No steamship line from Atlantic ports stops at Santa Barbara. Eastern traffic destined to Santa Barbara and coming by boat is either unloaded at San Diego or at San Francisco, and thence transshipped either by rail or water carrier. In the absence of any showing adverse to the reasonableness of the transcontinental westbound rates to Santa Barbara in and of themselves, we are constrained to deny complainant's petition."

Through Rate Reduced to Sum of Locals.

The Commission has announced its decision in the case of the Coffeyville Vitrified Brick & Tile Company against the St. Louis & San Francisco and the Rock Island. Complainant shipped a car of brick, a through shipment, but the joint through rate was more than the sum of the locals. The complainant asked that the through rate should not exceed the sum of the locals, and for a general ruling that through rates must not exceed the sum of the locals. The Commission decided in favor of complainant on this car but held that it can make no such general ruling; each case must be disposed of upon its own merits.

Commission Divides a Through Rate.

In the case of the Birmingham Packing Company against the Texas & Pacific and others, the Commission established a joint rate of 50 cents per 100 lbs. on cattle from Fort Worth to Birmingham. This rate was put into effect but carriers were unable to agree upon the divisions of the rate and made application to the Commission to fix these divisions. The Commission held that considering the terminal charges of the receiving and the delivering lines and the ferry charge of the intermediate line the rate should be divided upon a mileage basis, but declared that this conclusion should not be taken as implying that all joint rates established by the Commission should necessarily be divided upon a mileage basis.

TRADE CATALOGUES.

Santa Fe Employees' Magazine.—The November number is one of the most interesting numbers of the magazine yet published. The opening article, "Atchison Claims the Honor," tells why that city, rather than Topeka, claims to be the birthplace of the Atchison, Topeka & Santa Fe. "Camels in the Southwest," by Sharlot M. Hall, is reprinted from *Out West*. It tells of the experimental attempt of the Government in 1855 to introduce camels into the Southwest. "The History of the Gulf Lines," "Modern Brake Practice," "Teamwork—Its Power to Win," and "Taking Care of Hot Bearings" are other articles. There is also an account of the dinner and presentation of a chest of silver to Alfred Lovell, the retiring Superintendent of Motive Power, by officers of the mechanical department of the road and others of his friends.

Pipe Coverings and Weather Proof Sockets.—The H. W. Johns-Manville Company, New York, is distributing a folder telling of the advantages of asbestos sponge felted pipe covering. This covering, it is claimed, is particularly advantageous because of its sponginess, which increases its non-conductivity of heat; also because of its long life and because it can be removed and replaced without injuring it. Price lists are given. Another folder issued by the company concerns J-M moulded weather proof mica electric lamp sockets. A photograph shows an incandescent lamp fitted to one of these sockets, the lamp being lit and both lamp and socket immersed in a bowl of water. Price lists for different sizes suited to various makes of lamp are given.

Hydraulic Jacks.—Richard Dudgeon, New York, has published a pamphlet describing his universal hydraulic jack, on which the last patent was taken out on October 15 of this year. The pamphlet devotes some space to the history of the hydraulic jack and then describes in detail the improvements and advantages of the newest form. The types in which the jack is furnished include: plain jack for use in presses or where there is a firm foundation; railroad jack where both stability and portability are required; and the base jack, which has a broader base than the other types. The pamphlet is illustrated with perspective and sectional views of different jacks and their prices. Full dimensions and price lists are given.

Turret Lathe.—The Niles-Bement-Pond Co., New York, has issued a pamphlet describing its rigid turret lathe. It is designed for work ordinarily done on engine lathes, and is especially adapted to work on gear blanks, fly wheels and gas engine cylinders. It can also be used for heavy bar work. It is regularly built in two sizes: 21 in. and 28-in. Different views of the machine show its advantages, and a series of line drawings show the kinds of work which can be done on it.

Gas Engines.—The Lazier Gas Engine Co., Buffalo, N. Y., has issued a pamphlet describing multiple cylinder vertical gas engines. Tables showing comparative operating costs of producing 100 h.p. by simple and compound steam engines, by electricity and by engines using illuminating, natural and producer gas are given. The pamphlet is well illustrated with perspective and sectional views of the Lazier two cylinder engine and its important parts.

Rheostats.—Bulletin No. 4,532 of the General Electric Co., Schenectady, N. Y., describes some direct-current motor starting rheostats in sizes up to 50 h.p. and 550 volts. There are two types, S. A. and S. O. Each type has the no-voltage release attachment, which allows it to be used with either shunt, compound or release wound motors, while the type S. O. has an overload coil in release with the motor armature. In the smaller sized rheostats, a new resistance unit is used, known as form P. The wire is wound on a tube, which is afterwards coated inside and out with a reinforcing compound, then fitted with porcelain bushings at each end and finally baked.

Track Drills.—The Cook Standard Tool Co., Kalamazoo, Mich., has issued a pamphlet on labor saving track appliances. Most of the space is devoted to the Climax track drill made by the company. The Standard track tool grinder and Cook's combination chuck are also illustrated and described in this connection. Prices of bits and parts of the grinder and of the track drill are given. Cook's steel and wooden cattle guards are also illustrated. The company also makes car and track jacks.

Rock Island Employees' Magazine.—The December number is the sixth to be issued. "The Passing of the Hobo" and "The Rock Island Testing Department," are the chief articles. Other shorter articles of interest describe the dining car service of the Rock Island, tell why it is better for a railroad to buy equipment and supplies rather than manufacture them, and how and why the Rock Island now erects its own steel bridges.

Water Gage.—A folder issued by the Ashcroft Manufacturing Co., New York, describes the Ashcroft prismatic water gage. The glass is fluted on the inner surface so that it gives a prismatic effect, breaking up the light so that the water shows black and the steam space looks silvery; the water level is thus most clearly indicated. Price lists of different types and parts are given.

Storage Batteries.—Catalogue T, of the Westinghouse Machine Company, East Pittsburgh, Pa., deals with portable storage batteries. Types suitable for electric vehicles and for car lighting are illustrated and described, with weights, capacity and price for each type and size. This is the first catalogue which the company has issued dealing with portable storage batteries.

Valves.—Catalogue H, of the Nelson Valve Co., Philadelphia, Pa., describes globe valves, check valves and gate valves of different types for various uses. Full dimensions and price lists are given of both valves and parts. The larger sizes are made up to 24 in. diameter of pipe. The catalogue is fully illustrated with half-tones and line drawings.

MANUFACTURING AND BUSINESS.

John C. McMynn has resigned his position with Robert W. Hunt & Co., Chicago.

The name of the Dominion Dump Car Co., Ltd., Montreal, Que., owner of Canadian patents for Hart convertible side and center ballast cars and Otis drop bottom dump, coal and ore cars, has been changed to the Hart-Otis Car Co.

W. H. S. Wright, St. Paul, Minn., representative of the Railway Steel-Spring Company, New York; the Adams & Westlake Company, Chicago; the Latrobe Steel & Coupler Company, Philadelphia, and the Railway Materials Company, Chicago, died on November 28.

The Expanded Metal & Corrugated Bar Co., St. Louis, Mo., has shipped 1,000 tons of open-hearth steel corrugated bars for the United States Reclamation Service. The bars are being used on irrigation works in connection with the Tieton project. This order is one of several for corrugated bars for irrigation work.

The new locomotive shops of the Grand Trunk at Stratford, Ont., are to be equipped with 55,000 sq. ft. of Paradigm skylights by Arthur E. Rendle, of Montreal, Que.; New York and Chicago. Mr. Rendle also has the contract for about 17,000 sq. ft. of skylights for the Grand Trunk car shops at London, Ont.

F. Weber & Co., Philadelphia, Pa., makers and importers of artists' materials and draftsmen's and engineers' supplies, have been made sole agents in the United States for Fabriano hand-made drawing paper. This paper, which is made in Italy, is furnished in three styles, with surface suitable for pen, pencil and water color work.

Iron and Steel.

We are informed, generally but indefinitely, by the United States Steel Corporation, that correspondence and inquiries from railroads concerning rail orders for 1908 delivery are much increased, and that the situation is distinctly encouraging. It is believed that

the rail makers and the railroads generally are in accord and accept as settled all of the specifications upon which agreement was reported by the rail committee of the American Railway Association and that this, by so much, clears the air and helps the situation. The one remaining unsettled rule as to discard from the ingot and also, the price are for the present the sole subjects of inquiry

OBITUARY NOTICES.

Robert Angst, Chief Engineer of the Duluth & Iron Range, died at Duluth, Minn., on November 30 after a short illness. Mr. Angst was 60 years old.

MEETINGS AND ANNOUNCEMENTS.

(For dates of conventions and regular meetings of railroad conventions and engineering societies, etc., see advertising page 24.)

Engineers' Club of Philadelphia

At a business meeting to be held December 7 a paper on "Foundations," by A. B. Clark, illustrated by lantern slides, will be presented.

Franklin Institute.

At a section meeting of the Institute, December 5, the subject was "Process and Apparatus for the Production of Carbon Bi-Sulphide in the Electric Furnace," by Edward R. Taylor, of Penn Yen, N. Y.

American Society of Civil Engineers.

At a regular meeting of this society December 4 a paper on "Invar (Nickel-Steel) Tapes on the Measurement of Six Primary Base Lines," by Owen B. French, was presented for discussion. This paper was printed in the October number of "Proceedings," 1907.

Railway Signal Association.

The next meeting of this association will be held at the Engineering Societies' building, 29 West 39th street, New York City, Tuesday, January 14, 1908. At that meeting there will be a paper on "Economical Operation of Electric Signals and the Care of Storage Batteries," by T. R. Cook.

Canadian Society of Civil Engineers.

At a meeting of the general section Dec. 5 a discussion took place on the paper by T. M. Fyshe entitled "Discussion, Designs and Specifications for a Reinforced Concrete Bridge Abutment," which was read at the October 17 meeting.

A paper by J. S. Armstrong entitled "Schemes Showing the Possibilities of St. John, N. B., as a Great Port, and how the Interior of New Brunswick can be Opened up to Ocean Traffic," was also read by the author.

Wood Preservers' Association.

The fourth annual meeting of the Wood Preservers' Association is to be held in Kansas City, Mo., on the third Tuesday in January, 1908. The headquarters will be at the Baltimore Hotel. The topics for discussion are as follows: Impurities of foreign matters in creosote oil that should be avoided. Cylinder cars, tracks and guard rails; how they should best be constructed. Should the supply tank be overhead or under ground? Best methods of measuring oil. Best method of impregnating wood with preservatives of ordinary use, when pressure is not available. Method of treating wood that is refractory to treatment, and at the same time very subject to decay. Results thus far accomplished in the United States in preserving wood. Discuss best method of treating piles to use in southern waters. Can freshly cut timber be well treated, and how? Best method of keeping records of treated ties in the track. Compilation of various data in reference to the life of treated timbers, especially ties, in the United States under all treatments. Best practice of treating butts of telegraph poles, telephone poles and signal poles. Is it necessary, practical or otherwise, to correct oil measurements for temperature?

ELECTIONS AND APPOINTMENTS.

Executive, Financial and Legal Officers.

Chicago & Alton.—Theodore P. Shonts, President of the Toledo, St. Louis & Western and of the Interborough-Metropolitan, has been elected also President of the Chicago & Alton. George H. Ross, Second Vice-President and General Traffic Manager of the T., St. L. & W., has been elected also Vice-President of the C. & A.

Cincinnati Southern.—D. G. Edwards, formerly General Passenger Agent of the Cincinnati, Hamilton & Dayton, has been appointed a Trustee of the Cincinnati Southern, succeeding Amor Smith, Jr., resigned. This road is owned by the city of Cincinnati and leased to the Cincinnati, New Orleans & Texas Pacific.

International & Great Northern.—H. W. Clarke, Superintendent of Transportation of the Mobile & Ohio, has been elected Second Vice-President and General Manager of the International & Great Northern, effective January 1, succeeding Leroy Trice, resigned.

Kansas City Southern.—F. W. Meyer, freight and passenger accountant, has been appointed Assistant Auditor, succeeding E. P. Hall, resigned to go to another company.

Louisville & Nashville.—T. B. Harrison, Jr., General Attorney, with office at Louisville, Ky., has resigned to practice law in New York City.

Tampa & Jacksonville.—H. W. Waite has been appointed Auditor with office at Gainesville, Fla., succeeding C. R. Wood, resigned.

Toledo, St. Louis & Western.—See Chicago & Alton.

Operating Officers.

Boston & Albany.—J. L. Truden, Acting Superintendent of the Albany division, has been appointed Superintendent of that division, with office at Springfield, Mass. Charles Firth, formerly Superintendent of this division, is now agent at Worcester, Mass. T. W. Carter has been appointed Trainmaster of the Boston division.

Chicago Great Western.—Otto Cornelison, Superintendent of Transportation, has been appointed General Superintendent, with office at St. Paul, Minn., succeeding G. A. Goodell. See Great Northern.

Chicago, Rock Island & Pacific.—M. L. Ellis, chief despatcher at Goodland, Kan., has been appointed Assistant Trainmaster at Limon, Kan.

Durham & Charlotte.—John H. Kennedy, Auditor, has been appointed also General Manager, with office at Gulf, N. C.

Great Northern.—G. A. Goodell, General Superintendent of the Chicago Great Western, has been appointed General Superintendent of the Central district of the Great Northern, with office at Minot, N. Dak.

Louisiana Railway & Navigation.—E. C. Hastings has been appointed General Agent at Kansas City, Mo.

Mexican Central.—J. N. Galbraith, who resigned last summer as General Manager of the Tehuantepec National, has been appointed General Manager of the Mexican Central.

Mobile & Ohio.—E. C. Rendell, chief clerk to the Superintendent of Transportation, has been appointed Superintendent of Transportation, succeeding H. W. Clarke. See International & Great Northern.

Northern Pacific.—F. S. Rawlins, Superintendent of Transportation of the Kansas City Southern, has been appointed Trainmaster of the Northern Pacific at Missoula, Mont.

Rio Grande Southern.—A. S. Meldrum, General Superintendent, has resigned and the office has been abolished. C. D. Wolfinger has been appointed Acting Superintendent, with office at Ridgway, Colo.

St. Joseph & Grand Island.—James Berlingett, General Superintendent, has been appointed to the new office of General Manager, with office at St. Joseph, Mo.

Southern Pacific.—J. W. Metcalf has been appointed Assistant Superintendent at Los Angeles, Cal., succeeding T. McCaffery, resigned.

Traffic Officers.

Chicago & North-Western.—J. E. Brittain, General Agent of the passenger department at Boston, Mass., has been appointed General Agent of both the freight and passenger departments at that city, assuming the duties of C. H. Wise, General Agent of the freight department, who has been assigned to other duties.

Delaware & Hudson.—Duncan I. Roberts, formerly General Passenger Agent of the Erie, has been appointed General Canadian Freight and Passenger Agent of the Delaware & Hudson and General Passenger and Freight Agent of the Quebec, Montreal & Southern. Mr. Roberts, who is 54 years old, was born in Pennsylvania and began railroad work in 1873 as a clerk in the office of the General Freight Agent of the Pittsburgh, Cincinnati & St. Louis. He worked up through the car service and traffic departments, being made district passenger agent of the road in 1885. The next year he was made Assistant General Passenger Agent of the Pennsylvania Lines West, and in 1890

went to the New York, Lake Erie & Western, now the Erie, as Assistant General Passenger Agent at Chicago. He was General Passenger Agent of the Erie from 1891 to 1901. He was then for three years Vice-President of the Little Kanawha and President of the Marietta, Columbus & Cleveland. He has been out of railroad service since 1905.

Intercolonial.—D. A. Story, division freight agent at Halifax, N. S., has been appointed General Freight Agent, with office at Moncton, N. B., succeeding J. J. Wallace, who retired last August.

Missouri Pacific.—H. B. Kooser, General Agent at Dallas, Tex., has been appointed General Agent at Omaha, Neb., succeeding J. O. Phillippi, resigned. S. W. Bradford succeeds Mr. Kooser.

Quebec, Montreal & Southern.—See Delaware & Hudson.

St. Louis, Brownsville & Mexico.—The office of William Doherty, Traffic Manager, has been moved from Corpus Christi, Tex., to Kingsville.

Engineering and Rolling Stock Officers.

Boston & Albany.—L. G. Morphy, Assistant to the Principal Assistant Engineer of the New York Central & Hudson River, has been appointed Assistant Engineer of Maintenance of Way and Construction of the Boston & Albany, with office at Boston, Mass.

New York Central & Hudson River.—S. P. Hull, Engineer of Signals, has been appointed Engineer of Maintenance of Signals, with office at New York City, with authority over all divisions except the Electric division. He will report to the General Superintendents. W. H. Elliott, an Assistant Signal Engineer of the Electric division, succeeds Mr. Hull, with office at New York, with authority over all divisions except the Electric division. See Boston & Albany.

Purchasing Agents.

Chicago & Alton.—The authority of E. S. Wortham, Purchasing Agent of the Toledo, St. Louis & Western, has been extended over the Chicago & Alton. E. V. Dexter, Purchasing Agent of the Chicago & Alton, has been appointed to the new office of General Inspector of Fuel, Equipment and Material.

Toledo, St. Louis & Western.—The office of the Purchasing Agent has been moved from Toledo, Ohio, to Chicago. See Chicago & Alton.

LOCOMOTIVE BUILDING.

The Peoria & Pekin Union has ordered three switch engines from the American Locomotive Company.

The Grand Trunk, which was reported to be in the market for locomotives in the *Railroad Gazette* of July 19, 1907, has ordered 10 simple mogul (2-6-0) locomotives for September, 1908, delivery; 10 simple switching (0-6-0) locomotives for August, 1908, delivery; 10 simple ten-wheel (4-6-0) locomotives for May, 1908, delivery, from the Baldwin Locomotive Works, and 20 Richmond compound consolidation (2-8-0) locomotives for September, 1908, delivery from the Locomotive & Machine Company of Montreal. The specifications are as follows:

General Dimensions.

	Mogul.	Switching.	Consolidation.	Ten-wheel.
Type of locomotive	Mogul.	Switching.	Consolidation.	Ten-wheel.
Weight, total	161,976 lbs.	139,500 lbs.	211,200 lbs.	167,300 lbs.
Weight, on drivers	138,176 "	139,500 "	184,800 "	126,420 "
Cylinders	20 in. x 26 in.	20 in. x 26 in.	22½ & 35 x 32 in.	19 in. x 26 in.
Diameter of drivers	63 in.	56 in.	63 in.	73 in.
Boiler, type	Ext. wagon top.	Straight.	Ext. wagon top.	Ext. wagon top.

Tender	Hopper style.		Hopper style; water bottom.	Hopper style.
Truck	Grand Trunk stand. with wooden bolster		Grand trunk stand.; metallic bolster.	
Water capacity	6,000 gals.	5,000 gals.	7,000 gals.	6,000 gals.
Coal capacity	10 tons.	8 tons.	10 tons.	10 tons.

The San Antonio & Aransas Pass, it is said, has decided not to order the ventilated box cars and the plain box cars on which they asked bids, as reported in the *Railroad Gazette* of November 29.

The Galveston, Houston & Henderson, as reported in the *Railroad Gazette* of August 9, has ordered two six-wheel switching (0-6-0) locomotives from the Baldwin Locomotive Works.

General Dimensions.

Type of locomotive	Switching
Weight, total	120,000 lbs.
Diameter of drivers	51 in.
Cylinders	19 in. x 24 in.

The Grand Trunk Pacific, which was reported to be in the market for locomotives in the *Railroad Gazette* of July 19, 1907, has ordered 30 simple American (4-4-0) locomotives from the Locomotive & Machine Company of Montreal for March to July, 1908, delivery, and 20 simple American (4-4-0) locomotives from the Canada Foundry Company, Toronto, for April to August, 1908, delivery. The specifications are as follows:

General Dimensions.

Type of locomotive	American
Weight, total	121,688 lbs.
Weight, on drivers	74,060 "
Cylinders	18 in. x 24 in.
Diameter of drivers	69 in.
Boiler, type	Extended wagon top
" steam pressure	200 lbs.
" outside diameter at smallest ring	55¼ in.
" tubes, No.	210
" tubes, diameter	2 in.
" tubes, length	11 ft. 2¾ "
Firebox, length, inside	95¾ "
" width, inside	41⅞ "
" depth, front	63 "
" depth, back	50 "
Heating surface, tubes	1,259 sq. ft.
" " firebox	126 "
" " total	1,385 "
Grate area	28 "
Tender	Hopper style, water bottom
Truck	Grand Trunk standard with cast-steel bolster
Water capacity	7,000 gals.
Coal capacity	10 tons

CAR BUILDING.

The Northern Pacific is reported to be considering the purchase of new passenger equipment for the coming year.

The Utilization Co., Grand Rapids, Mich., has ordered two steel gondola cars of 100,000 lbs. capacity from the Pressed Steel Car Co., for January, 1908, delivery. These cars will be 40 ft. 4 in. long, 9 ft. 4⅞ in. wide and 4 ft. 6 in. high, inside measurements. The special equipment includes:

Brakes	Westinghouse
Couplers	Climax

The Northwestern Pacific has ordered 13 coaches, one mail and express car and one baggage car from the American Car & Foundry Company. The coaches will weigh 88,000 lbs., and will measure 67 ft. 8¾ in. long, 10 ft. ⅜ in. wide and 14 ft. 1″/₁₆ in. high, over all. The special equipment includes:

Brake-beams	Diamond special
Brake-shoes	Diamond S, flanged
Brakes	Westinghouse
Couplers	Janney
Curtain fixtures	Forsyth
Curtain material	Pantasote
Draft rigging	Sessions
Heating system	Frumveller
Light	Pintsch
Paint	Sherwin-Williams
Vestibules	Pullman

RAILROAD STRUCTURES.

Buffalo, N. Y.—The New York Central & Hudson River, it is said, has plans made for at once putting up a new roundhouse to cost about $125,000.

The New York Central & Hudson River, it is said, will build a new swing bridge to be operated by electricity to replace the present structure connecting with Tonawanda Island.

Houston, Tex.—The Colorado Southern, New Orleans & Pacific, it is said, has given a contract to the Union Bridge Company, of Kansas City, Mo., for building the sub-structure for a bridge over the Trinity river. There will be four piers.

Mission City, B. C.—A proposition is under consideration to build a combined steel highway and railroad bridge, to replace the present wooden bridge over the Fraser river.

NEW YORK, N. Y.—Plans have been filed by the New York City Railway Co. for a new office building and car-house to be built at the northwest corner of Lenox avenue and 146th street, adjoining the power station and car sheds in 146th street, which were damaged by fire last April. The new building is to be of brick, two stories high, fronting 199.10 ft. on the avenue and having a depth of 469 ft. on 147th street. It is to cost $400,000. The power station and shops are to be finished about the same time, making of them a four-story building as originally designed; the work of completion costing an additional $25,000.

PRESCOTT, ONT.—The Canadian Pacific, it is said, will spend $40,000 on its yards here this winter. An appropriation of $100,000 has been made for a new station.

VICTORIA, B. C.—A contract has been given by the British Columbia Electric Railway Company to W. A. Gleason of Victoria, at $10,000 to put up a brick car barn 82 ft. x 200 ft.

WILLOW, CAL.—The bridge to be built over the Sacramento river here by the Northern Electric Railway Company of Chico, is to be a combined railroad and toll bridge 570 ft. long.

RAILROAD CONSTRUCTION.

New Incorporations, Surveys, Etc.

ABERDEEN & TOMBIGBEE.—The surveys for this proposed line have been made. It is from Okolona, Miss., southeast via Woodson, Aberdeen and Columbus to Pickensville, Ala., 65 miles, of which 59 miles is in Mississippi and six miles in Alabama. Grading is finished between Okolona and Aberdeen 17.5 miles, also from Columbus to Pickensville, 11.5 miles. The company is building the line with its own men. W. T. McKee, Chief Engineer, Aberdeen, Miss.

AKRON & YOUNGSTOWN (ELECTRIC).—Rights of way are reported secured and application has been made in Ohio for a charter by a company under this name with a capital of $100,000. The company proposes to build an electric line from Akron, Ohio, east to Youngstown, about 50 miles. T. L. Childs, E. F. Veris, Judge J. A. Kohler and others are interested.

ATCHISON, TOPEKA & SANTA FE.—The Guthrie, Fairview & Western, chartered early in 1904 to build a line from Guthrie, Okla., west through Logan, Kingfisher, Blaine and Woods counties to Fairview, to a connection with the Kansas City, Mexico & Orient main line, has been sold to the Santa Fe. J. S. McCaul was the promoter and general manager of the line. The company had a portion of its proposed route graded west from Darrow in Blaine county and some track laid within the city of Guthrie. Valuable traffic arrangements had been made with the Denver, Enid & Gulf and other Oklahoma roads.

CANADIAN NORTHERN.—Application will be made to Parliament by this company to build extensions in the west as follows: Humboldt, Sask., southwest to Calgary; Brandon-Regina line near west boundary of Manitoba west to Lethbridge, Alb.; North Battleford, northwest to Athabaska Landing with a branch to Green Lake; Strathcona, Alb., south to Calgary, with a branch to connect with authorized line from Regina to Red Deer river; Regina southwest to international boundary; Edmonton to headwaters of McLeod and Brazean rivers; Russell, Man., via Yorkton to authorized line near Goose Lake, Sask.; south of Neepawa, Man., to main line crossing of South Saskatchewan river. Application will also be made for extending the time for commencement and completion of the following lines: North of the line between Winnipeg and Ste. Anne to international boundary; between Port Arthur and Fort Frances to Quebec, with branches to Port Arthur, Ottawa and Montreal; Battleford west to the Brazean river; Regina to Humbolt and via Carrot river to Pas Mission, and between Humbolt and South Saskatchewan river to crossing of same river south of Prince Albert; and to authorize the increase of the capital stock of the company by $19,250,000.

CANADIAN NORTHERN ONTARIO.—This company will apply to Parliament for authority to build a line from a point on the line already authorized between Udney and Rathburn, to Orillia.

CANADIAN PACIFIC.—According to reports from the state of Washington, this company is making surveys for two lines, one from Spokane through the Yakima valley across the Cascade mountains to Tacoma and Seattle, and the other a connecting north and south line from Sumas on the international boundary to Seattle and Tacoma. Permanent surveys have already been made for a coast line from Sumas south to Deming, 40 miles. The company, it is said, has options on 200 acres of Tacoma deepwater terminals.

CLEVELAND, CINCINNATI, CHICAGO & ST. LOUIS.—Contracts are reported let by this company for straightening its line and reducing grades from Bellefontaine, Ohio, north to Harper, about six miles.

DELAWARE & HUDSON.—Work on the contract given to O'Brien & Mularkey, of Montreal, extending the Quebec, Montreal & Southern from Pierreville, Que., to St. Jean des Chaillons, 48½ miles, towards Quebec, has made satisfactory progress. About three-fourths of the tracks are on the ground and sub-structures of the bridges at Nicolet, Becancourt and East Gentilly as well as for several smaller structures are about finished. Contracts for an additional 41 miles will probably be let this winter. (March 15, p. 383.)

FLORIDA EAST COAST.—In reply to the report that work had been abandoned last spring on the Key West extension of this road, L. Larson, Northwestern Agent is quoted as follows: A large force of men has been at work all summer, and the number has been increased to 3,000 to finish the line as far as Knight's Key, 50 miles from Key West, this year.

GEORGIA ROADS (ELECTRIC).—Surveys are being made by the Columbus Power Co. for an electric line to be built from Columbus, Ga., north along the Chattahoochee river to West Point, 34 miles.

GRAND TRUNK PACIFIC.—G. O. Leask, Assistant Chief Engineer of this company in the West, announces that the final route through the Rocky mountains has been located through the Yellow Head Pass. The surveyors are now working on this route from the pass to the Nechaco and Bulkley valleys. This section of the road will be 400 miles long and 150 men will be engaged on the surveys all winter. The company is planning to begin construction work in the mountains in the spring. Two years will be required to complete the road from Edmonton to the Pacific coast.

GUTHRIE, FAIRVIEW & WESTERN.—See Atchison, Topeka & Santa Fe.

HOUSTON & TEXAS CENTRAL.—See Missouri, Oklahoma & Gulf.

IDAHO & WASHINGTON NORTHERN.—This company was incorporated last April in Idaho with $5,000,000 capital to build a line from McGuire's Station, Idaho, on the Coeur d'Alene & Spokane division of the Spokane & Inland Empire north to Newport, Wash., thence north along the Pend d'Oreille river to Metaline near the British Columbia boundary. The line is finished from McGuire's Station to Newport, 51 miles, including a seven-mile branch. F. A. Blackwell, President, Coeur d'Alene.

ILLINOIS CENTRAL.—The new double-track belt line, which this company has been building around Memphis, Tenn., is to be put in operation about the first of next year. (Oct. 4, p. 403.)

INTERCOLONIAL.—Hon. George P. Graham, Canadian Minister of Railways, states that a large amount of money is being spent for improvements on this road. New concrete shops and terminals are being constructed at Moncton, N. B., large enough to accommodate the Grand Trunk Pacific as well as the Intercolonial. A contract for a gas-producer plant for the supply of power and light has been let. Double-tracking work has been started from Moncton to Halifax. New and heavier bridges are being put in on the line of the old Canada Eastern from Chatham, N. B., to Fredericton, which is now part of the government system.

LIMA & TOLEDO TRACTION.—This company, it is said, has opened part of the extension it is building from Leipsic, Ohio, north to Toledo on the section from Leipsic north to Deshler, about 10 miles. (Nov. 15, p. 665.)

MISSOURI, KANSAS & TEXAS.—Engineers are laying out extensive improvements in the yards and on the main line of this road near McAlester, Ind. T. This change is in accord with the plan to double-track the entire line from Denison, Tex., north to Muskogee and later to Parsons, Kan.

MISSOURI, OKLAHOMA & GULF.—This company, operating a line from Wagoner, Ind. T., south to Dustin, 75 miles, is building an extension north to Joplin, Mo., 120 miles. It is said that the road is now the property of E. H. Harriman and associates. The northern extension is to be continued north to a connection with the Union Pacific at Lawrence, Kan., 240 miles, and on the south from Dustin south to Denison, Tex., 128 miles. The new road will give the Harriman system in Texas and the Southwest a direct outlet to the Middle West and the Northwest. It will connect with the Houston and Texas Central at Denison. Construction work is now in progress south of Wagoner, Okla. A gap of about 45 miles remains to be built between the two places. The final location of the route north from Wagoner to Lawrence is being made. The building of an outlet for the Harriman lines in Texas was made necessary by the recent completion of the Trinity & Brazos Valley between North Texas points and Houston. The traffic of the Rock Island, the Frisco and the Colorado & Southern, which formerly went to the Houston & Texas Central, is now being turned over to the Trinity & Brazos Valley. (Nov. 1, p. 541.)

NORTH & SOUTH.—Surveys are being made for this proposed line from Portsmouth, Ohio, south to Pound Gap, Ky., 180 miles. Construction is to be started in the spring. The line lies through

a rich ore territory. Major T. J. Kirkpatrick and Dr. L. E. Niles, of Springfield, Ohio, are interested. E. Parsons, Chief Engineer.

North-Western Pacific.—Application will be made to incorporate this company, which proposes to build a line from Fort Churchill on Hudson Bay west to the Pacific coast. Murphy & Fisher, 46 Elgin street, Ottawa, are the Attorneys.

Ontario & West Shore (Electric).—This company, with office at Goderich, Ont., proposes to build an electric line from Goderich northeast to Owen sound, about 75 miles.

Pennsylvania.—Plans are reported made by this company to double-track the Belvidere division from Trenton, N. J., north to Manunka Chunk. Work is to be started in the spring.

Public Service Corporation of New Jersey.—President T. N. McCarter is quoted as follows: The Public Service Corporation is now operating all the gas and electric properties which it controls, having merged them into a new company known as the Public Service Railway Company. The company has decided for the present to stop new construction on every work that will bear postponement.

Public Service Railway.—See Public Service Corporation.

Quebec, Montreal & Southern.—See Delaware & Hudson.

St. Louis & San Francisco.—President A. J. Davidson, of this company, is quoted as saying that it is expected that trains of the Frisco will be running from St. Louis direct into Dallas over the Carrollton and Irving cut-off by January 1. Track laying is finished. (March 11, p. 391.)

Temiskaming & Northern Ontario.—Plans are under consideration by the Ontario Railway Commission to reduce the grades from 1.25 per cent. to 0.5 per cent. on 21 miles of this railroad from a point ten miles north of North Bay, Ont. The road will be made seven miles longer but the grade-reduction will more than offset the loss.

Texas & New Mexico.—Surveys have been made by this company for 80 miles, and grading has been finished on four miles of its proposed line from McKinney, Tex., west via Denton, Krum, Bridgeport and Jacksboro to a point 175 miles west of McKinney. Contract has not yet been let for the work. The company wants to negotiate with a railroad contractor to form a construction company to finish the line. Right-of-way and the sites for terminals are assured. W. J. Healy, V.P., McKinney.

United Railways Company of St. Louis.—John I. Beggs, President of this company and the Laclede Gas Light Company, is quoted as saying that all employees of the construction and extension departments of these corporations, as well as of the Union Electric Light & Power Company, have been laid off indefinitely. No new work is to be carried out until conditions change and confidence is restored.

Valley River.—This company, with office at Mill Creek, W. Va., is said to be buying material to build its proposed line from Mill Creek southwest to Clover Lick, 43 miles. Surveys made and right-of-way and capital partly secured. W. A. Dromgold, President, York, Pa.; J. G. Hoffman, Jr., Vice-President; L. E. Shull, General Manager; John Alden, Chief Engineer, Elkins, W. Va. (July 12, p. 51.)

Wichita Falls & Northwestern.—Announcement is made that this company has opened its line for freight and passenger service between Wichita Falls, Tex., and Frederick, Okla., 50 miles. (Sept. 13, p. 308.)

RAILROAD CORPORATION NEWS.

Alabama Great Southern.—The $1,750,000 first mortgage 6 per cent. bonds maturing January 1, 1908, are to be extended to December 1, 1927, with interest at 5 per cent. The Guaranty Trust Company, New York, which is receiving deposits of the present bonds up to December 20, 1907, for extension, will pay the January 1, 1908, coupon on each bond as soon as deposited.

Burr's Ferry, Browndel & Chester.—The Texas Railroad Commission has given this company permission to register an issue of $165,000 bonds on 11 miles of completed road from Rockland, Tex., west. The road has been in operation from Aldridge to Rockland, eight miles, for some months, and is being extended to Browndel, 22 miles. It is projected from Chester, on the Missouri, Kansas & Texas, east via Rockland and Browndel to Burr's Ferry, 80 miles.

Canadian Northern.—This company is to ask the Canadian Parliament for permission to increase its authorized capital stock from $30,750,000 to $50,000,000.

Chicago, Burlington & Quincy.—This company, according to press despatches, has bought the Colorado & Wyoming, a subsidiary of the Colorado Fuel & Iron Company. It has $100,000 capital stock and $4,500,000 first mortgage 4 per cent. bonds of 1953 outstanding. It owns 53 miles of road, of which 15 miles are from Hartville Junction, Wyo., to Sunrise, connecting with the Burlington at Guernsey and with the Colorado & Southern at Hartville Junction. The rest of the mileage is mostly in Colorado without connection with the road in Wyoming.

Colorado & Wyoming.—See Chicago, Burlington & Quincy.

Evansville Railways.—This company, which was incorporaaed last June as a consolidation of the Evansville & Eastern Electric and the Evansville & Mount Vernon Electric, has issued $500,000 6 per cent. cumulative preferred stock. The company has $900,000 common stock outstanding and operates 38 miles of road from Newburg, Ind., to Rockport and from Evansville to Mount Vernon, with a three-mile branch. It has trackage rights from Newburg into Evansville.

Hocking Valley.—See Kanawha & Michigan.

Illinois Central.—A circular signed by most of the directors has been sent to stockholders. The circular reiterates the criticisms already made of Mr. Fish's actions while President.

Interborough-Metropolitan.—The $3,000,000 6 per cent. six months' notes sold last May are to be taken care of by paying 30 per cent. in cash and extending the remainder for about six months at 6 per cent. These notes were to have been retired with the proceeds of part of the $15,000,000 collateral trust 5 per cent. three-year notes which were authorized last spring, but never issued.

Kanawha & Michigan.—Of the $2,500,000 second mortgage 20-year 5 per cent. bonds authorized last June, $2,078,000 have been issued. The proceeds have been used to pay off the $1,095,000 special equipment and betterment loan and other debts to the Hocking Valley and the Toledo & Ohio Central.

St. Joseph & Grand Island.—This company is one of the few to show large increases in net earnings for the fiscal year ended June 30, 1907. There was but a slight increase in operating expenses, the increased cost of conducting transportation being nearly offset by a decrease in the amount spent on maintenance of way and structures, while maintenance of equipment increased a little. The accrued surplus on hand at the end of the year was $982,417. The company has $5,500,000 5 per cent. non-cumulative first preferred stock, $3,500,000 4 per cent. non-cumulative second preferred and $4,600,000 common. The Union Pacific acquired, in 1906, 63 per cent. of the common, 17 per cent. of the first preferred and 36 per cent. of the second preferred. No dividends have been paid on the first preferred since 1902 and none have ever been paid on the other classes. The surplus earned last year would be just enough to pay full dividends on both classes of preferred. Nothing was appropriated out of earnings for betterments in 1907. In the previous year $62,000 was so spent. The income account is as follows:

	1907.	Change.
Gross earnings	$1,734,558	Inc., $212,511
Operating expenses	1,068,844	" 4,581
Net earnings	665,713	" 207,930
Taxes, interest and betterments	247,379	Dec., 67,475
Surplus for the year	418,335	Inc., 275,406

Toledo & Ohio Central.—See Kanawha & Michigan.

Toledo Railway & Terminal.—A reorganization plan for this property, sold under foreclosure last May to a committee of the bondholders, has been prepared. A new company is to be organized with $6,000,000 capital stock and $6,000,000 4½ per cent. 50-year bonds. Of the bonds $4,000,000 are to be issued and the remainder reserved for extensions, etc. The $382,856 accrued interest on the old $3,500,000 4½ per cent. bonds is to be paid in new bonds and cash at the rate of $100 in bonds and $10 in cash for each $110 of interest. The Pere Marquette, the Cincinnati, Hamilton & Dayton, the Pennsylvania Company, the Lake Shore & Michigan Southern, the Michigan Central, the Grand Trunk Western and the Toledo, St. Louis & Western are to guarantee the new bonds, and the entire capital stock is to be held by these companies as follows: Pere Marquette and Chicago, Hamilton & Dayton, 20 per cent. each, and the other five companies, 12 per cent. each.

Underground Electric of London.—Speyer & Co., New York, and their allied banks abroad, have arranged to buy at face value the coupons falling due December 1 of the $33,000,000 5 per cent. profit-sharing notes, whose principal is due June 1, 1908. A plan is being prepared for the extension and conversion of the notes and the raising of additional money, and the note-holders are asked to deposit their holdings for provisional agreement with the plan with the Guaranty Trust Company, New York.

RAILROAD GAZETTE

ESTABLISHED IN APRIL, 1856.

PUBLISHED EVERY FRIDAY BY THE RAILROAD GAZETTE AT 83 FULTON STREET, NEW YORK
BRANCH OFFICES AT 375 OLD COLONY BUILDING CHICAGO, AND QUEEN ANNE'S CHAMBERS WESTMINSTER, LONDON

EDITORIAL ANNOUNCEMENTS.

THE BRITISH AND EASTERN CONTINENTS edition of the Railroad Gazette is published each Friday at Queen Anne's Chambers, Westminster, London. It contains selected reading pages from the Railroad Gazette, together with additional British and foreign matter, and is issued under the name Railway Gazette.

CONTRIBUTIONS.—Subscribers and others will materially assist in making our news accurate and complete if they will send early information of events which take place under their observation. Discussions of subjects pertaining to all departments of railroad business by men practically acquainted with them are especially desired.

ADVERTISEMENTS.—We wish it distinctly understood that we will entertain no proposition to publish anything in this journal for pay, EXCEPT IN THE ADVERTISING COLUMNS. We give in our editorial columns OUR OWN opinions, and these only, and in our news columns present only such matter as we consider interesting and important to our readers. Those who wish to recommend their inventions, machinery, supplies, financial schemes, etc., to our readers, can do so fully in our advertising columns, but it is useless to ask us to recommend them editorially, either for money or in consideration of advertising patronage.

OFFICERS.—In accordance with the law of the state of New York, the following announcement is made of the office of publication, at 83 Fulton St., New York, N.Y., and the names of the officers and editors of The Railroad Gazette

OFFICERS:

W. H. BOARDMAN, *Presi. and Editor.* — RAY MORRIS, *Secretary*
L. A. SIMMONS, *Vice-President.* — R. S. CHILDLOM, *Treas* / I. B. HINES, *Cashier* / L. B. SHERMAN, *Western Manager*

EDITORS:

RAY MORRIS, *Man'g Editor* — GEORGE L. FOWLER
BRAMAN B. ADAMS — FRANK W. KRAEGER
CHARLES H. FRY — HUGH RANKIN
RODNEY HITT — BRADFORD BOARDMAN

CONTENTS

VOL. XLIII., No. 21. FRIDAY, DECEMBER 13, 1907.

The relief which the railroads are now experiencing from the tremendous traffic pressure of the past two years gives opportunity to get back to normal economical conditions of operation. During the long period of congestion and stress, under the constant urgent need of moving the tonnage, conducting transportation costs were necessarily a secondary consideration. Train after train had to be made up and sent out whether the locomotives had full tonnage or not; in fact, so accustomed have division officers on some roads become to running such trains that many of them, as one officer puts it, "probably have forgotten how to run full-tonnage trains." Already alert managers are busy correcting this condition. One large western system has had an officer of special capabilities traveling over the different lines for a month or more for the sole purpose of investigating such conditions and of taking such measures to tone up the service and increase efficiency as the situation may require. A lowered operating ratio will doubtless reward his efforts.

REPORT ON MELBOURNE ELECTRIFICATION.

An extended abstract of a recent report of Thomas Tait, Chairman of the Victorian Railways Commissioners, to the Minister of Railways on his inquiries in Europe and America about steam railroad electrification, is published on another page. Although this investigation was made with the particular object of getting information which would be helpful in considering the question of electrification of the Melbourne suburban lines, it is of great general interest as a summary by a skilled railroad officer of the progress and results of electrification of steam railroads throughout the world.

Mr. Tait, as need hardly be mentioned to readers of the *Railroad Gazette*, resigned his position of Manager of Transportation of all the Canadian Pacific's railroad lines to go to Victoria in 1903 as managing head of the Government railroads and tramways. His accomplishment in this work has been described by a Melbourne paper as "a story of almost romantic success." Instead of a yearly deficit the roads now return year by year a surplus; this after providing for deferred payments bequeathed by the previous administration. Thus his viewpoint is that of a trained and successful manager completely equipped for observation and investigation, who has the advantage of not having been in close touch with any electrification project. This very aloofness tends toward sharp and impartial judgment.

Pending the report of the consulting electrical engineer, whose engagement was one result of his tour of inspection, Mr. Tait does not attempt to choose between the different systems of electric traction or, finally, to pass upon the desirability of electrification of the Melbourne lines. Charles H. Merz, who had charge of the electrification of the Tyneside lines of the North Eastern Railway, has been selected for this important post. Mr. Tait shows, however, that many of the steam railroad electrifications have been made because of special reasons which do not apply in the case of the Melbourne lines. The Valtellina line, for example, had water powers available which made electric motive power much cheaper than steam. The electrification of the New York Central and of the New York, New Haven & Hartford at New York was undertaken as a result of a legislative act. Neither of these arguments apply in the case of the Melbourne lines.

Again he alludes to the statement of J. A. F. Aspinall, General Manager of the Lancashire & Yorkshire—to which we have often alluded in the *Railroad Gazette* as a fundamental truth about electrification that often seems to be forgotten—that the company undertook electrification not to save money but to make money. Previously the train service was infrequent and the passenger traffic was being lost to competing tramway lines. The gains from electrification have come, not from reducing operating expenses, but from increasing the expenses and the gross earnings still more, so that the net result is profitable. Mr. Tait points out that this argument does not apply at Melbourne because the train service on six of his steam suburban lines is now greater than the service on the electrified Liverpool and Southport line; on two of these it is greater by a third. Furthermore, Melbourne is not growing, and as all the lines are owned by the government, there is no incentive to attract suburban travel away from one line to another.

It is evident that Mr. Tait does not make out a case for general and speedy electrification of the Melbourne suburban lines. On the other hand, without prejudging Mr. Merz's conclusions, he points out that there are two stretches of track which seem to be specially adapted for electrification. These are two short and busy lines close together but separated from the rest of the system, leading from the busiest stations in the city south to the ocean, one to

Port Melbourne, the other to St. Kilda. Not only are these lines separated from the others even at the junction stations, but they have no through traffic, so that if electrified, the experiment could be carried out without interfering with the working of the other lines.

More than this, steam locomotives and cars which are greatly needed on the other lines would be released. As Mr. Tait points out, this is one of the important things to be considered in any proposed electrification. If the steam locomotives and cars used on a particular line before electrification are needed to augment the rolling stock on other lines for which new locomotives and cars would otherwise have had to be bought, then the value of the rolling stock relieved from service on the converted line can, to the extent it is useful on the other lines, fairly be offset against the cost of the new electric rolling stock. The interest charges on the cost of the electrification of that line would in such case be reduced accordingly. As a shortage of locomotives and cars now exists on the Melbourne lines, this factor will be an important one in the final decision.

EQUIPMENT PURCHASES ORDERED IN TEXAS.

We reproduce herewith an exact copy (except for the corporate name) of an order which the Texas Railroad Commission has recently promulgated. According to our advices, every railroad doing business in the state of Texas has received a similar one, except, of course, that the equipment required to be ordered is different in each case.

OFFICE OF
RAILROAD COMMISSION OF TEXAS.
Austin, Texas, Nov. 23, 1907.

HEARING No. 765.—Order requiring the Rome & Athens Railroad Company to purchase and acquire additional rolling stock and equipment.

In pursuance of notice, Circular No. 2641, dated July 30, 1907, the above numbered and entitled cause, having been called for hearing before the Railroad Commission of Texas, at its office in Austin, Texas, on the 10th day of September, 1907; and the said Commission having heard the evidence and statements presented pertaining to the matters embodied in said notice;

It is therefore ordered by the Railroad Commission of Texas, in pursuance of the authority conferred upon it by the Act of the 30th Legislature of the state of Texas and published as Chapter 155 of its general laws, that the Rome & Athens Railroad Company be, and it is, hereby ordered to purchase rolling stock and equipment, in addition to that now owned and contracted for delivery during the year 1907, for use in the operation and business of its line of railway, as follows:—

1. For delivery during the year ending Dec. 31, 1908, twenty (20) locomotives; fifteen (15) passenger cars; and four hundred (400) freight cars, including one hundred (100) stock cars and fifty (50) coal cars.

2. For delivery during the year ending Dec. 31, 1909, twenty (20) locomotives; fifteen (15) passenger cars; and four hundred (400) freight cars, including one hundred (100) stock cars and fifty (50) coal cars.

3. For delivery during the year ending Dec. 31, 1910, sixteen (16) locomotives; six (6) passenger cars; and two hundred (200) freight cars, including fifty (50) stock cars and twenty-five (25) coal cars.

All of the above specified equipment to be of first-class standard and design, suitable for the business of its railway, and suitable for interchange with other railways.

It is further ordered that the said company shall maintain all equipment which it now owns in first-class condition, suitable for its own business and for interchange with other railways in this state, and shall at once replace such equipment as may be dismantled or destroyed by other similar equipment in addition to that hereinbefore ordered.

It is further ordered that should the said company find it necessary to issue additional stock, bonds or other obligations in excess of those now outstanding to provide for the purchase of the additional equipment herein ordered, this Commission will approve and authorize the issuance and registration of same as provided by law, provided that the contracts for the purchase of said equipment shall be submitted in advance for the approval of this Commission in order that it may determine the reasonableness of same.

It is further ordered that this order be held open subject to amendment without further notice.

. . . . . Chairman.

(Signed) L. J. STOREY,
(Signed) O. B. COLQUITT
[SEAL.] Commissioners.

I. B. McLEAN, Secretary.

We can learn from Mr. Hale's car efficiency bulletins that his Group 9 covering roads in Texas, Louisiana and New Mexico, had, in June, 1907, slightly fewer cars on line per mile of line worked than any of the other groups, although the averages for Group 8 (Missouri, Arkansas, Kansas and Colorado) and for Group 6 (Iowa, Illinois, Wisconsin, Minnesota and the Dakotas) were not very much higher. But it must be only too obvious to the Texas commissioners at the present time that the roads under their supervision are not facing car shortage. What with the cotton growers holding back for 15c., and the threat of hard times, it is apparent enough that the roads in the Southwest, just like the roads in every other part of the country, are soon going to begin to play hearts with their cars for the 50 cents per diem, so that if Texas should develop a need for freight cars, there will be states anxious to accommodate her on both sides and at the top.

Now, the Texas Commission has had far too much experience not to understand this. What, then, made it send out an order which, if carried out, would require new capital at a time when it cannot be had, for a purpose for which it is not needed, and would stop dividends and cause insolvency and receiverships? Was it the personal folly of the commissioners and their desire to earn their pay as corporation oppressors? We can freely acquit them; they were carrying out the instructions of the last state legislative session, and had no choice. The real motive of the legislation appears in the clause in the last paragraph but one, with reference to the approving of contracts. It would be a simple matter for the road upon which the attached order was cited to transfer equipment into Texas from its lines in other states, but if it did this, Texas would lose a golden opportunity of raising new tax funds. So, at a time when traffic was in excess of facilities, the state ordered its roads to supply new equipment in such a manner that the taxes on this equipment would stay at home, but the order is not actually promulgated until a time comes when facilities exceed traffic, and when every conservative manager is making whatever retrenchment lies in his power.

We presume that this particular order can be set aside, or at least tied up in the courts until it becomes possible to raise money again. But no better example could be given of the fatuity and harmfulness of direct legislative interference with railroad operation. Since we are discussing Texas and not Alabama, we may assume that the Governor and the legislature do not really wish to cause receiverships, yet, if sustained by the courts, they have taken an infallible means to that end. The Texas Commission is no longer to be classed among the radical bodies; it has learned much, and has made honest, if occasionally wrong-headed, efforts to do its duty. But the legislature is not content to leave the Commission in charge of detail; it must needs interpose its own superior wisdom. There used to be a saying that *noblesse oblige*. Is it no longer true that those in authority have responsibilities, and that their duty to be fair and intelligent increases in proportion to their power to be unfair and to wreak havoc by their lack of intelligence?

A NEW PHASE OF RAILROAD MONOPOLY.

The contention of President Mellen before the Interstate Commerce Commission for the New Haven's right to cancel the New Jersey Central through freight tariff suggests a situation big with possibilities. In proportion as it shuts down on a certain part of the freight business via Jersey City so does it open up the question of the New Haven's transfer of business to its Poughkeepsie Bridge route and its getting an outlet via the Lehigh & Hudson River. The latter road, some 81 miles long, connects with the Poughkeepsie Bridge route at Maybrook, N. Y.; extends to Easton, Pa., and connects with or crosses five important lines—the New York, Susquehanna & Western; the Delaware, Lackawanna & Western; the Lehigh Valley, the Central Railroad of New Jersey, and the Pennsylvania. On business with the New Haven it would give that line a longer haul than now and to the other lines a shorter haul; and the business to be thrown upon the L. & H. R. by the New Haven will naturally involve the question of an increase of L. & H. R. facilities by the six companies owning it, or its continuance as a line which the owners do not want the New Haven to use. This shifts the objective point of future interest to the Lehigh & Hudson and its status as a line held under a tenure which is "in restraint of trade," a point pressed strong by President Mellen in last week's hearing.

It is not likely that President Mellen will yield easily that point which involves a southern and western outlet for his system via the Poughkeepsie Bridge. Nor is it by any means impossible—it is even probable—that he may himself take the case of the Lehigh & Hudson before the commission. Should he succeed in such a contention and open up the Lehigh & Hudson to a large volume of business, the diversion of freight traffic from the Jersey City-Harlem transfer route can hardly be measured nor its ultimate effect on terminal plans at New York and Brooklyn bearing upon New England business. For these reasons the Lehigh & Hudson now becomes, we repeat, a line for acute watchfulness in the eastern railroad situation.

But the situation is larger than that. It involves a new and important phase in the development of close territorial control. Heretofore such control under the trite term "monopoly" has been viewed chiefly in its public relation often as an object of censure and criticism, sometimes just, sometimes unjust. Railroad companies, as a rule, each seeking monopoly more or less and pushing a policy of absorption and consolidation, have not been in a position either to obstruct the doctrine or to criticize it. But the swift policy of President Mellen, accentuated by his Poughkeepsie Bridge plan, now shifts the view-point of territorial control from its relations to the public to its relations with connecting lines. And the per diem dispute leads up to the same subject.

Step by step but with unfaltering purpose and with results nearly accomplished the Mellen policy has advanced forward its territorial supremacy in New England. It embraces all but one of the really profitable railroad lines in six states. It is protected locally by ownership of nearly all the trolley lines of Connecticut and Rhode Island and large trolley systems in central and lower Massachusetts. It has its dominating navy on the Sound and by the Ontario & Western it reaches to the coal fields and the lakes—this less as an affluent of business than of future opportunity. It controls coastwise lines externally; and, internally, it reaches every New England city of even secondary size and importance. A region of the country with a population of some 7,000,000, thick with population, of high industrial energy and a great producer of railroad freight of the upper class is now in the New Haven grasp with all the vantage powers which such control implies. It can fix rates. It can divert traffic to long hauls and points of greatest profit. It can throw its valuable business so as to extort concessions. New England, as producer and consumer, supplies a huge volume of railroad traffic to the country. Its interior must be reached, and to its interior, as to its ports, the New Haven company holds the key which now, with control assured, it is beginning to turn. Other railroad systems of the country have monopoly of extensive regions but none under such ramified and unique conditions as the New Haven and with so close and varied relations with connecting lines.

As distinguished from the public aspects of monopoly, so often discussed, this new aspect of a railroad monopoly's policy toward other railroads, all of them strong systems, rises to vivid prominence and challenges attention not less as a dramatic situation in itself than for the other dramatic situations to which it may lead. The Interstate Commerce Commission has just passed upon one of its issues. There are others yet to come which may be writ large in our railroad history.

THE CONGO RAILROAD.

The Congo Railroad, the building of which was a tragedy for the first three years, has turned out to be a very profitable enterprise. The Congo and its tributaries form a navigable system of more than 9,000 miles, which was substantially isolated from the rest of the world by rapids and shoals beginning about 100 miles from its mouth. The only outlet for the basin of the river below Stanley Pool, about 350 miles from its mouth, was by a foot-path through the wilderness, over which porters could carry a burden of 66 to 77 lbs. in 17 to 20 days, at the risk of their lives and with incredible fatigue. In 1887 about 2,200 tons were so carried—largely ivory—and the path was lined with the skeletons of those who had succumbed on the way, and men could not be had to carry more. The railroad was planned to give an outlet to the thousands of miles of navigable streams above Stanley Pool. Its lower terminus was established at Matadi, 90 miles from the mouth of the river, which is reached by ocean steamers. Thence to Stanley Pool, 250 miles, it was estimated that a railroad of 30-in. gage could be built for 25,000,000 francs. Actually when 25 miles had been built this original capital was all gone, and only by a loan from the Belgian government could the work be continued. It was two years before six miles of track could be laid, and at the end of the fourth year there were but 65 miles, and it was eight years before the road was completed, at a cost of 82 millions, instead of the 25 of the original estimate—at the rate of $63,632 per mile for a light 2½-ft. gage road with very little equipment.

After following the precipitous left bank of the Congo for a little distance the road goes up a tributary toward mountains, and there the climate threatened to kill off the whole working force, white and black. The negroes deserted by the hundred and fled into thickets, where as the work went on many of their bodies were found. When a steamboat arrived with materials it was fairly stormed by men who were eager to return to Europe. The work had such a bad name all along the African coast that very few negroes could be had, and an importation of Chinese coolies was made. These, usually considered climate-proof, fared so ill that many deserted and started for the rising sun on foot, and some of them have been found since up the river some 600 miles from where they were working. The total number of deaths was 132 whites and about 1,800 others.

The railroad does not follow the river, but for the most part is 30 or 40 miles distant from it. Beginning at Matadi, 86 ft. above sea level, it climbs a coast mountain range, the summit of which it crosses 144 miles from Matari at an elevation of 2,432 ft., descending thence 1,483 ft. to Stanley Pool. At places there are grades of 185 ft. and even 238 ft. per mile, and curves of 164 ft. radius. Ascending the range not far back of Matadi the road rises 710 ft. in 4 1-3 miles. There are 99 bridges, the longest only 328 ft. long, and 1,250 culverts. All but three of the bridges have but a single span. The torrents carrying trees are hard on bridge piers. There is no tunnel.

At present there is a passenger train three times a week in both directions. It does not run at night, but makes the trip in two days, remaining overnight at the mountain summit. There is traffic for three freight trains daily in both directions, but to avoid crossings, six trains are dispatched every other day. They are three days on the road.

The net earnings of the road last year were about 7 per cent. on the whole capital; but as most of this is in bonds at a low rate of interest, the surplus over fixed charges was about 17 per cent. on the stock. The working expenses are very heavy. White employees must be paid nearly five times European wages, and a very large number of negroes is required for the work which they can do—1,850 in all.

When the road was opened in 1898, it seems to have been the policy to make the rates not very much lower than the old foot-path charges. All freight up the road, except salt, was charged 70 cents per ton per mile; salt, half as much, making about $12.50 per barrel for salt! The 70-cent rate was charged only on ivory shipped down the road, which could very well bear it, though it amounted to nearly 9 cents per pound. India rubber was taxed at the rate of $3.80 per 100 lbs. for the 250 miles; coffee, $2.50, and some articles which are cheap on the coast as low as 88 cents, which is about 7 cents per ton per mile. But reductions have been made from time to time, and now very few up freights pay the 70 cents per ton-mile rate. Rice pays half as much; most other provisions, clothing, machinery, etc., 14 cents. On down freights the original high rates are maintained only on ivory and india rubber, and the rate on all other down shipments is about 12½ cents per ton-mile. There is not much other down freight, however, about half of the cars which go up loaded coming down empty. The original passenger fares of 39 cents per mile, first class, and 3.9 cents second class (natives), have been reduced to 15½ and 2 cents.

The traffic, considering the enormous region which the railroad serves, is light, and at the lowest of the above rates cannot be expected to become very large. The first year the road was open through it carried 10,522 passengers and 14,062 tons of freight, and earned gross $1,961,053. In 1905-6 it carried 22,331 passengers and 31,715 tons of freight, and earned gross $2,209,223. The reductions in rates have attracted some business which the old rates prohibited, but have added not much to the earnings. These last were largest in 1899-1900, when they amounted to $2,557,463, or $10,230 per mile.

The various lines to be built above the rapids on upper reaches of the Congo are not enterprises of the Congo Railroad Co., but of the Congo Free State. The railroad company is required to carry materials and men for them at cost. They are mostly in a high and healthy country and should not cost nearly as much per mile as the Congo Railroad. The traffic which they and the connecting lines of steamboats develop will chiefly pass over the Congo Railroad. There is a possibility of a very large development of traffic in this enormous region, one of the lines reaching what are said to be very rich copper mines a little north of Rhodesia; but there are two other railroads progressing towards these mines, and the distance by the Congo route must be over 2,500 miles. There must be a very great reduction of rates over the Congo Railroad to make large and long-distance shipments possible; and the road must be substantially rebuilt to be able to carry large shipments. Its largest traffic heretofore has been at the rate of 30 passengers and 42 tons of freight each way daily, which can be handled very well on

a 30-in. railroad with 43-lb. rails 23 ft. long. But changing into a heavy railroad fit for trunk-line business will be child's play compared with the original construction.

Cincinnati, New Orleans & Texas Pacific.

The Cincinnati, New Orleans & Texas Pacific leases the Cincinnati Southern, which was built by the city of Cincinnati and finished from Cincinnati south to Chattanooga, Tenn., in 1880. The road has 336 miles of line between these two cities and is one of the most important through routes between the southern and gulf states and trunk line territory. It forms the northern end of the Queen & Crescent Route, which is made up of the Vicksburg, Shreveport & Pacific; the Alabama & Vicksburg; the New Orleans & North-eastern; the Alabama Great Southern, and the Cincinnati, New Orleans & Texas Pacific, leading from Shreveport and New Orleans, La., north through Birmingham, Ala., and Chattanooga, Tenn., to Cincinnati. More important still, it forms the connection between the Southern Railway lines in the south and the St. Louis-Louisville lines of the Southern as well as with the Chicago, Indianapolis & Louisville, in which the Southern controls a half interest, and the other connecting lines north of the Ohio river. For these reasons and because it has no branch lines, it is primarily a through traffic road.

Control lies with the Cincinnati, Hamilton & Dayton and the Southern Railway jointly, with Southern Railway interests actively in control. Their policy has for years been to improve the property out of earnings. Maintenance of way cost $3,893 a mile last year, against $4,901 in 1906 and $4,562 in 1905. A through line naturally requires more maintenance than a branch line especially if it carries heavy traffic, but this road, mostly single track, never required $5,000, or for that matter $3,000, a mile for actual maintenance. Maintenance of equipment expenses have also been heavy. Repairs and renewals of locomotives cost $3,774 per locomotive in 1907, against $3,751 in 1906; repairs and renewals of passenger cars, $1,479 per car in 1907 and $2,086 in 1906, and repairs and renewals of freight cars, $66 per car, against $65 in 1906. These are all large unit charges—the passenger car figure probably the largest on any road in the country.

One result of the large maintenance of way expenditures is that the road now has automatic block signals protecting all but ten miles of its line. It had no double track three years ago. By the end of 1907 it is to have 64 miles in service. Sixty-three miles of this is north of Harriman Junction, Tenn., most of it between this point and the St. Louis-Louisville line connection. This is greatly needed. Harriman Junction is the principal connecting point on the south with the Southern Railway. According to President Finley, writing not as President of the Cincinnati, New Orleans & Texas Pacific but of the Southern Railway in that company's last annual report, last winter this connection was paralyzed. During the rush of traffic of the last two years the Cincinnati Southern line has suffered greatly from traffic congestion, principally because the northern part of the road had more trains than it could handle. Still more double-tracking will undoubtedly be done when funds are available.

Besides the improvement expenditures included in operating costs, appropriations are also made out of net income for permanent improvements, new and additional tracks, etc., which are known as rental betterments and revert eventually to the lessor, the city of Cincinnati. Under this head only $115,000 was appropriated last year, against $440,826 in 1906. President Finley states, however, that expenditures amounting to $359,837 for permanent improvements were charged direct to expenses. The policy of the owners is apparently to go build up the property out of earnings during the present years of the lease that during the latter part of the lease, which runs till 1966, they will reap correspondingly large benefits in dividends. At present payments at the rate of 5 per cent. are being made both on the $2,000,000 preferred and the $3,000,000 common stock.

Freight earnings for the year decreased 2 per cent., probably owing to the traffic congestion. Passenger earnings rose 10 per cent., and there were increases of from 8 to 16 per cent. in mail, express and miscellaneous earnings. The increase in gross earnings was $309,000, or 4 per cent. While maintenance of way decreased 21 per cent., maintenance of equipment increased 22 per cent. and conducting transportation 23 per cent. Operating expenses, therefore, were $639,000, or 10 per cent. larger. There was in consequence a decrease of $330,000, or 14 per cent. in net earnings. Also fixed charges were larger than in the previous year, so that net income was only $450,000, against $830,000 in 1906, a decrease of 46 per cent. By sharply reducing the appropriation out of income for permanent improvements, a surplus for the year or $85,000 was shown instead of a deficit. The 1906 surplus after an improvement appropriation three times as large was $138,000.

The difficult operating conditions of the year are shown in other ways. There was a decrease of 8 per cent. in the revenue trainload, which fell from 424 tons to 396 tons. The total trainload was 447 tons in 1906 and 413 tons last year. On the other hand, the average amount of revenue freight in each loaded car increased 4 per cent., from 17 to 18 tons. There was a decrease in the number of tons carried one mile but as the average ton-mile rate increased, there was a small rise in freight earnings instead of a decrease.

Over 3,000 new freight cars were added during the year of which 1,000 were box cars and 1,500 coal cars. The balance sheet shows that on June 30, 1907, the construction and improvement fund of $1,500,000 for which 5 per cent. notes, payable in ten semi-annual installments, were issued on April 1, 1906, was all used except for a small balance. The financial depression kept the company from getting any new funds until recently, when $500,000 three-year 6 per cent. notes dated December 2, 1907, were sold to provide for immediate necessities of improvement work.

The income account for the last two years ended June 30 is shown below:

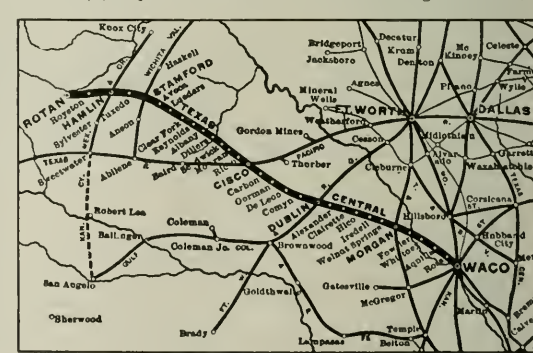
	1907.	1906.
Mileage worked	336	336
Passenger earnings	$1,587,238	$1,440,359
Freight earnings	6,521,220	6,406,587
Gross earnings	8,763,775	8,454,897
Maint. way and structures	1,307,917	1,646,706
Maint. of equipment	1,751,771	1,436,275
Conducting transportation.	3,540,459	2,880,083
Operating expenses	6,815,433	6,176,670
Net earnings	1,948,341	2,278,227
Net income	449,645	828,590
Dividends	250,000	250,000
Improvement appropriations	115,000*	440,826
Year's surplus	84,645	137,764

*There was also $359,837 included in operating expenses for "permanent improvements."

Texas Central.

This small railroad in the interior of Texas has had a prosperous year and makes a strong financial showing. A 42-mile extension from Stamford west to Rotan was put in operation February 22, 1907. The road now has a total mileage of 268 miles of line, the eastern terminus being at Waco on the Houston & Texas Central; Missouri, Kansas & Texas; International & Great Northern; St. Louis Southwestern, and San Antonio & Aransas Pass.

The company has $650,000 first mortgage bonds outstanding, or less than $2,500 per mile of road. The interest charges on all of these



Texas Central.

are only $31,000 a year, which is an annual fixed charge on each mile of road for bond interest of $116. There is consequently a large amount available for dividends. The company has $3,973,800 common and preferred stock outstanding. Five per cent. dividends amounting to $198,690 are paid on each class. Last year 5 per cent. was earned on the preferred and 15 per cent. on the common. Most of the balance went for improvements, $60,000 going to the general improvement fund to be spent for ballasting and for rebuilding the bridge over the Brazos river at Fowler and three other iron bridges that were put in when the road was built 25 years ago and are not equal to the present heavy loading, and $195,734 for additional equipment, including three sleeping cars rebuilt from parlor cars, and electric headlights which had to be put in on locomotives according to the Texas law passed last spring. The company, therefore, is both making a good return to its owners and improving its property. Last year it did better than "a dollar in improvements for a dollar in dividends," and spent about $1.30 in improvements for each dollar returned in dividends.

At the same time unit maintenance expenditures were not skimped. Maintenance of way cost $783 per mile, against $767 in 1906. This would not be a large figure for a large railroad, but it seems ample for a single-track line through agricultural territory in Texas. Vice-President Hamilton, however, says that the track has not been improved to the same extent as in other years because labor has been scarce and power and rolling stock much in demand, so that it was not possible to do any ballasting during

the year. The appropriation for new equipment included dump cars and a rock crusher and as soon as this is in operation the whole line is to be ballasted.

Maintenance of locomotives cost $1,700 per locomotive, against $2,092 in 1906, maintenance of passenger cars $607 per car, against $461 in 1906, and maintenance of freight cars $71 per car, against $79 in 1906. These are liberal charges for a small road.

Gross earnings rose from $945,000 to $1,244,000, a gain of 32 per cent. Operating expenses increased 31 per cent., leaving net earnings of $508,000, against $385,000 in 1906, an increase of 32 per cent. The operating ratio stands at 59 per cent. as in the previous year.

The following table sums up the operations of the last two years ended June 30:

	1907.	1906.
Mileage worked	241	227
Passenger earnings	$380,000	$281,404
Freight earnings	778,556	616,209
Mail, express, misc. earngs	84,650	44,031
Gross earnings	1,244,106	945,241
Maint. way and structures	188,704	174,182
Maint. of equipment	99,905	78,791
Conducting transportation	405,558	274,260
Operating expenses	736,491	560,614
Net earnings	507,615	384,627
Net income	458,870	345,316
Dividends	198,630	198,630
Improvement appropriations	255,734	115,269
Year's surplus	4,456	31,357

NEW PUBLICATIONS.

National Association of Railway Commissioners; Proceedings of Eighteenth Annual Convention. Edited by H. B. Meyers, 334 Dearborn street, Chicago. Price, $7.50 in buckram, and $10 in leather.

This report, a thick book 9 in. x 12 in., contains not only the proceedings of the meeting held in Washington in 1906 (not 1907), but also full copies of the Interstate Commerce law, and other laws which the Interstate Commerce Commission deals with; the Anti-Trust law; the laws of the several states establishing railroad commissions; and a digest of federal and state court decisions pertaining to and construing the Interstate Commerce act and the state laws pertaining to railroad commissions. The laws fill 250 pages and the digest of decisions fills 135 pages. The whole work has been compiled by Herman B. Meyers under authority of the association. Many pages of advertisements are interspersed with the other matter in the first half of the book, the advertising being introduced apparently to insure the financial success of the compiler. Full page portraits are given of many of the members of the association. The work is edited by Elmer E. Barrett, a lawyer of Chicago, whose chief work apparently has been that of making the digest of decisions. The chapter containing the state laws includes every such law pertaining to state railroad commissions in effect at the date of publication, September 15, 1907.

Locking. By Frederick C. Lavarack. 1907. Published by the Author, 114 Park street, East Orange, N. J. Cloth, 80 pages, 40 plates. Price, $2.

The basic principle of any interlocking machine, whether it be a mechanical or a power-operated unit, is the means whereby the levers controlling the movements of all the switches and signals are interconnected and locked with each other in such a way that no two conflicting routes can be set up at the same time. The mechanism used to accomplish this end is termed mechanical locking or more often simply locking. It is of this single detail which the author treats in this book, in an elementary but, nevertheless, exhaustive way. The introductory chapter explains the fundamental theory of interlocking and the uses of all the accessory apparatus commonly employed. This is followed by a full explanation of the construction and operation of the Saxby & Farmer improved mechanical interlocking machine together with brief explanations of the other common types of machines, including the Style A, Johnson, National, all-electric and electro-pneumatic. Chapter IV. takes up the theory of designing the locking for these machines as affected by the track layout with which they are to be used. There are certain principles to be followed in this and the author discusses some of the common mistakes made in applying the locking, mistakes which do not necessarily involve danger in actual use but which burden the signalman with unnecessary work and inconvenient manipulation. The preparation of locking sheets and "dog charts," the use of specials and the numbering of dogs are fully explained in connection with typical interlocking plants covering the usual arrangements of tracks and signals. Chapter V. describes the usual methods of testing interlocking machines after they are built and in place to detect any errors in the design or construction of the locking. Both methods of testing, by the locking sheet and by the interlocking plan, are considered. A thorough knowledge of the principles of locking is essential to the person making such a test. The last two chapters cover installation and maintenance of locking and tower diagrams and manipulation charts.

The book is written by a practical signal man for signal engineers, inspectors and maintainers. It combines theory with practice. The many diagrams have been prepared with the utmost care and accuracy. The text is technical in terms but clear as to meanings. The layman with a little application can understand it as well as the signal man. An excellent index adds to the value of the book as a reference work.

CONTRIBUTIONS

Pennsylvania Electric Locomotive No. 10,003.

TO THE EDITOR OF THE RAILROAD GAZETTE:

Referring to an article in your issue of November 22, on the Pennsylvania electric locomotives, and specifically to No. 10,003, the mechanical parts of which were built by the Baldwin Locomotive Works, we beg to call your attention to an omission which makes the article incomplete. The construction of this electric locomotive was undertaken at the instance of Mr George Gibbs, Chief Engineer of Electric Traction of the Pennsylvania Tunnel & Terminal Railroad Company, by and at the expense of the Westinghouse Electric & Manufacturing Company. The designs were worked out under Mr. Geo. Gibbs' direction at Pittsburgh, through the continuous co-operation of the General Superintendent of Motive Power, Mr. W. A. Gibbs, and the Mechanical Engineer, Mr. A. S. Vogt, of the Pennsylvania Railroad Company. The mechanical parts were constructed and erected in our works in Philadelphia, and were then shipped to the Westinghouse Electric & Manufacturing Company, Pittsburgh, where the electric equipment, which had been by them manufactured, was applied. BURNHAM, WILLIAMS & CO.

The Recommended Rail Sections.

Philadelphia, Pa., Dec. 9, 1907.

TO THE EDITOR OF THE RAILROAD GAZETTE:

I have read the contribution entitled "The Recommended Rail Sections," by the Consulting Roll Turner, which you printed last week. I rather think the manufacturers can answer these questions quite fully. What we are in hopes of getting by making a better balanced rail section is a rail that can be rolled with metal in the head of greater density and finer grain, to be stronger, wear longer and require less cold straightening under the gag. The "Consulting Roll Turner" is well aware that a rail with a thin flange and a large head will, when cold, have "excessive curvature and distortion," due to the hot head contracting more than the cold base. He must also know that a better balanced rail section will permit more roll passes, making a finer grained metal in the head, consequently a better wearing and stronger rail. The thin base cools rapidly, preventing any further passes, however much they might be desired. It would be interesting if he would give us the information he withholds instead of saying he is prepared to do so. The man who objects should present something better. Glittering generalities to tear down are easy; to build up is the better plan. C. E.

Pittsburgh, Pa., Dec. 9, 1907.

TO THE EDITOR OF THE RAILROAD GAZETTE:

Franklin E. Abbott in his article, "Rail Mill Practice and Rail Service," published in the *Iron Age*, Nov. 14, 1907, says in regard to the "crescent break" in the base of rails: "There are more failed rails from breaks of this character than from any other cause. It is found in varying degrees on all railroads and in all rails from all mills. The principal peculiarity of this break is that it starts at the center of the rail base, directly under the web, and develops longitudinally, extending from 6 to 18 in., and will then run out to the edge of the flange, resulting in a 'half moon' or flange break, and in many cases also extending upwards through the rail, causing a complete fracture of the entire section. It is safe to say that in more than 90 per cent. of the rails reported by the railroads as simply broken, the failures originate as above described, in the base, and more than 99 per cent. of such breaks occur on the ties. These are actual conditions as found by investigation. How can they be explained?"

There is a cause for these breaks that is easily explained. It is purely a mechanical defect caused by over strain, that is brought about by excessive gagging of a badly cambered rail with a defective gag, or a perfect gag imperfectly applied. This over strain causes the starting of the longitudinal seams along the base of rail, and the bearing of rail over the tie at point of gag mark completes the break as the rail sinks down in the tie, bringing more than its share of weight of traffic upon the edge of weakened flange. This is the reason the break so often comes on the ties. If the weakened flange has no bearing, or comes between ties, there is no pressure to complete fracture. This where the piece broken out of flange is short, the longer break comes from the fact that there are two defective gag marks, the distance apart that the break extends, and the rail bears on the tie between these defective gag marks, or weakened points, and the break extends from the one mark, across the tie, to the other. Where the break extends up into and through the rail, causing complete fracture, the heavy or

defective gagging is undoubtedly helped along by the minute cracks, coming from the too heavy reduction of the steel during period of rolling of rail section, as mentioned in my recent paper on the mechanical treatment of steel rails.

In substantiation of these facts relating to the improper application of the gag in straightening, and the excessive reduction in rolling, having to do with the crescent break in base of rail as stated by me, A. W. Heinle, Consulting Roll Turner, maintains that these injurious effects can be traced to first causes, namely: "In the manner in which the rail is produced in rolling and where the standard rail section is formed with approximately one-half the metal body proportioned to the flange and in such form that it (the flange) is shaped with about 50 per cent. greater reduction of the steel." The metal for the flange is therefore greatly reduced over that which is to form the head and at the same time is subjected to diverse conditions in both roll action and temperature. The rail head and web is formed more generally by a vertical pressure of the roll surface while the flange is latterally compressed by roll surface varying widely in diametrical speed. It is obvious that at the converging, and principally at the meeting place of these contrary surface actions, a difference of mechanical effect due to peripheral speed is encountered which advances the metal irregularly through the roll grooves, the effect of which is bound to materially alter the internal characteristics of the metal at the junction of the flange with the web and which subsequently assists in breaking up any natural arrangements of the crystals.

Mr. Heinle also says that certain internal stresses, besides the sliding of the crystals, are established in the rail section at a point where the web and flange meet, and the material is affected in a manner that would not show signs of failure until exposed to severe elastic strains in track. The internal stresses thrown into the metal while rolling at a low flange—combined with a higher head—temperature, would tend to weaken the structure of the rail as a whole, principally, because when cooling unevenly, there are certain diverse strains set up that contribute to the rail breaking more readily.

It can be readily seen that any rail section carrying internal conditions and characteristics of this kind in the rail base, is further injured by the improper application of the gag, and is the initial application, which causes a separation of the strained relations that exist at point of connection between base and web of all standard sections.

The mere fact that so many base breaks, compared to the total breaks of this nature, comes across the tie should prove that the break is a fulfilment of a previous strain, and not a break coming from any detrimental chemical action. If the fracture came from poor metallurgical conditions, it would be as likely to come at a suspended point as at point where it was supported.

S. T. FIERO,
Inspecting Engineer.

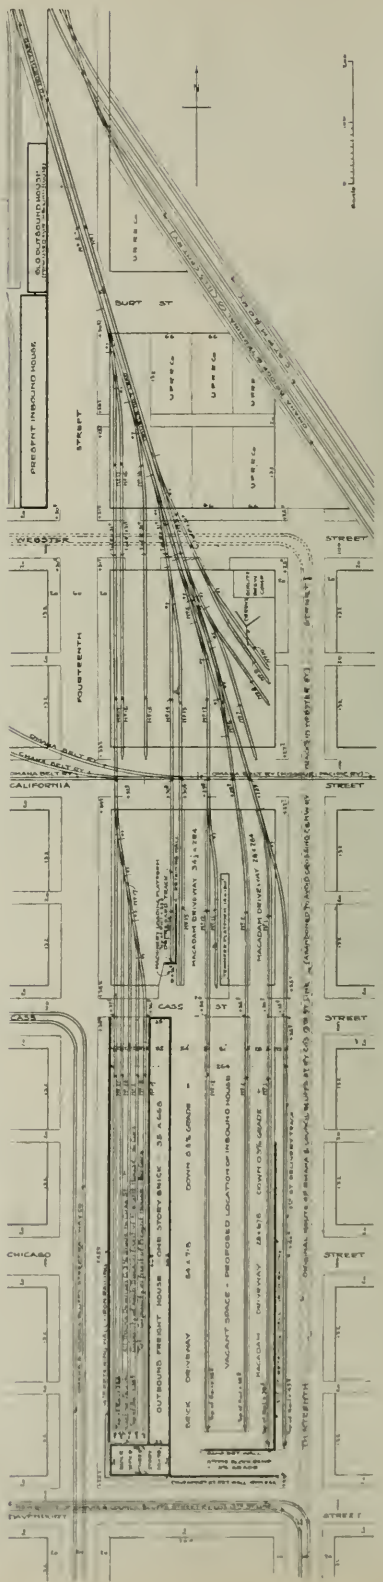
New Freight Terminal of the Chicago & North-Western at Omaha.

The Chicago & North-Western has opened its new freight terminal at Omaha, Neb., work on which has been in progress for more than a year. It is adjacent to the old terminal, and therefore is situated in a thickly settled portion of the east part of the city. To provide room for the new terminal it was necessary to buy improved property. Four and a half city blocks were secured, from which over 100 buildings, comprising residences, stores and a three-story brick hotel, were removed to make way for the improvements. Work was commenced in July, 1906. A large amount of grading was done, about 70,000 cu. yds. of material having been removed and deposited about a mile north on some swamp land owned by the company, on which new freight yards are to be built. The preparatory work included the construction of retaining walls along Davenport street between 13th and 14th streets, and on the latter two streets between Cass and Davenport, a distance of two blocks. These walls contain over 3,000 cu. yds. of masonry, the footing being of concrete, the body of sandstone and the coping blue Bedford limestone, the whole surmounted by an iron fence. Considerable changes had to be made in the city sewer system, water and gas pipes, electric conduits, telephone, telegraph and electric light wires. The electric railway lines on 13th street were diverted from Webster street to Davenport street to avoid crossing the terminal tracks in the former thoroughfare.

The new terminal is planned for both outbound and inbound freight houses. Erection of the latter house has been deferred for the present. The new outbound house is a one-story brick building with slate roof, 35 ft. wide by 668 ft. long, with a room for perishable freight at the north end, 20 ft. x 30 ft. The track side has Cross horizontal folding doors the entire length.

A three-story brick office building, 50 ft. x 98½ ft., is under construction at 11th and Davenport streets, adjoining the south end of the freight house. The principal offices will be on the second floor, which is at the street level.

For the driveways different materials were used. The main



Omaha Freight Terminal; Chicago & North-Western.

driveway in front of the freight house is brick, along the delivery tracks macadam is used, and the inclined entrance has stone block to furnish a good footing for horses.

The work has been directly under the supervision of F. Walters, General Manager of the Lines West of the Missouri River. A. A. Schenck, Engineer of Maintenance, and C. W. Engel, Assistant Engineer, planned and directed the work.

Theodore P. Shonts.

Theodore P. Shonts is now President of the Chicago & Alton, the Toledo, St. Louis & Western, and the Interborough-Metropolitan Company. On the face of it the holding of these offices would indicate that Mr. Shonts' activities were those of a man in particular charge of the finances of a company, the Interborough-Metropolitan being the holding company for the elevated, subway and surface lines in New York City. His reputation, however, is based on his success in building and operating railroads and in organizing their forces. One of his associates characterizes him as forceful, progressive and conservative. On the Interborough-Metropolitan he is also Chairman of the Executive Committee, which is composed of the operating heads of the component parts. As President of the Chicago & Alton, his duties will be similar to those he has performed on the Toledo, St. Louis & Western, that is, general supervision over the operation of the road. Besides this, as a member of the Alton's executive committee he will be in close touch with its finances.

Copyright, C. M. Bell.

Theodore P. Shonts.

Mr. Shonts was born in Crawford county, Pennsylvania. He graduated from Monmouth College, Monmouth, Ill., in 1876 with the degree of B. A., and was given his M. A. degree three years later. He then studied law for two years. His first railroad work was on construction, beginning in 1881, when he was made Superintendent of the Iowa Construction Company. The next year he was appointed General Superintendent of the Indiana, Illinois & Iowa, which he helped to build. He was made General Manager in 1886 and in 1898 was elected also President. At this time, in conjunction with Paul Morton, then Second Vice-President of the Atchison, Topeka & Santa Fe, he acquired control of the Indiana, Illinois & Iowa. They eventually sold out to the Vanderbilt interests and in 1902 Mr. Shonts resigned. He then became interested in the Toledo, St. Louis & Western and was elected President and General Manager in 1904. In the spring of 1905 he was appointed Chairman of the Isthmian Canal Commission, which office carried with it the presidency of the Panama Railroad. In the two years which he spent on the Isthmus he began the building of a complete water and sewage system, the paving of Panama and Colon, the cleansing of both cities and the organization of a efficient sanitary force. He built quarters for the workmen, opened the commissary stores and arranged for the regular and prompt transportation of food supplies. He resigned last January to become President of the Interborough-Metropolitan, succeeding August Belmont.

Foreign Railroad Notes.

The Austrian State Railroads recently made contracts for 1,754,000 ties. Of these 28.9 per cent. are to be oak, 26.5 larch, 42.4 fir and 1.8 beech.

The Belgian Parliament recently provided for the purchase of one of the few remaining private railroads, which is 112 miles long. There remain but 200 miles outside of the state system, and these are worked by six different companies.

A local railroad in Munich, the favorite city of King Gambrinus, is attempting what might seem the hopeless task of tempting his subjects to desert by offering them soft drinks at cost price. It produces aerated waters and lemonades at its own works and sells them to its employees at the rate of ¾ cent for plain soda and 1¼ cents for lemonade for a bottle holding a plump tumblerfull. In each of the hot months last summer it disposed of nearly 6,000 bottles of these beverages which cool but do not muddle.

It is reported that the two most influential men in China, both of whom have been viceroys of provinces on the line, are ready, backed by European capital, to build a railroad from Tientsin (the port of Peking), south by east 515 miles in an air line to Chin-Kiang, which is on the lower course of the Yang-tse-Kiang, the great navigable river of China, a little below Nan-King. A capital of $25,000,000 is said to have been secured, and materials and equipment are to be taken for the amount of the foreign subscriptions. The railroad from Shanghai to Chin-Kiang, 185 miles, was to be opened Oct. 15. It is to be extended further west to Nan-King.

Those of us who are old enough may remember that before the days of electric trolley lines, hot-water locomotives, designed by Lamm and Franck, were urged as the motive power of street railways. After what seemed a total eclipse for more than ten years, they again make their appearance, said to be greatly improved. Three works in Germany are making them, and one of these is said to have disposed of no less than 163, of which 41 were for street railroads and the rest for manufactories.

Wisconsin Railroad Commissioners' Report.

The Railroad Commissioners of Wisconsin, B. H. Meyer, H. Erickson and J. H. Raemer, have issued their first general report covering the seven months from December 1, 1906, to June 30, 1907. There was an increase of railroad mileage in Wisconsin during that time of 278.22 miles, and there are now in the state 51 railroads operating a total of 7,292.38 miles of road in Wisconsin. In the seven months covered by the report there were were filed with the commission 72 formal complaints and 413 informal. The formal complaints are divided as follows: relating to taxes, 27; relating to station facilities, 16; relating to railroad crossings, 3; relating to train service, 20; relating to express and service, 4; relating to claims, 4.

The commission has undertaken on its own motion investigations relating to the weighing of freight; the testing of scales; sanitation of stations and cars; express rates; rates of service of sleeping car companies, and rates charged on milk and cream; also on the cost of track wear; on measures of safety in railroad operation; on dangerous highway crossings; on track inspection and on side track locations. At many crossings alarm bells have been ordered installed, in one case a subway ordered, and in others protecting gates.

An Investigation of Steam Railroad Electrification, with Particular Reference to the Suburban Lines at Melbourne, Victoria.

BY THOMAS TAIT,
Chairman of the Victorian Railways Commissioners.

It was the desire of the Government that I should, while on leave of absence, make inquiries in Europe and America in regard to the electrification of steam railroads in connection with the question of adopting electric traction instead of steam locomotives for the movement of suburban trains on some or all of the Melbourne suburban lines, and also select and engage a Consulting Engineer to visit Melbourne and report fully as to the advisability of such conversion, and as to the best system and methods to be adopted.

We are required on the Melbourne suburban lines to deal with a very large inward traffic in the morning and a similar outward traffic in the evening, a traffic so large at these periods of the day that it is necessary to work several of the lines to substantially their present full capacity; that is, to run trains with as large seating capacity as can be hauled with the locomotives we are now able

to employ, and following each other as closely as their speed and the length of the block sections will allow. A similar state of affairs occurs on the Essendon and Caulfield lines on the occasion of the larger race meetings at Flemington and Caulfield respectively, and on the former line at the time of the Agricultural Show. It is essential, moreover, that these trains should be run at a comparatively good speed between stations, and that they should not be burdened with too many stoppages, for otherwise too much time would be occupied in making the trip between the more remote suburban stations and the city.

The following statistics have recently been compiled about the Melbourne suburban railroad and tramway systems and their traffic:

For year ended June 30, 1907:	
Population of Melbourne and suburbs	531,000
Mileage of suburban railroads	149
Mileage of suburban tracks	263
Number of suburban stations	148
Suburban train mileage	2,992,283
Suburban car mileage	24,455,631
Number of suburban passenger journeys	64,162,344
Number of miles traveled by suburban passengers	305,071,565
Average distance traveled per suburban passenger (single trip)	4.76
Average cars per suburban train mile	8.17
Average seating capacity per car (suburban trains)	52
Average seating capacity per suburban train mile	420
Average number of passengers per car mile (suburban trains)	12.47
Suburban revenue, not including parcels, mails or miscellaneous	$3,227,240*
Suburban revenue per train mile	$1.0354†
Suburban revenue per car mile	12.66 cents.
Suburban revenue per passenger mile	1 cent.
Suburban revenue per passenger journey	4.82 cents.
Suburban revenue per mile of line	$21,660*
Suburban revenue per mile of track	$12,270
Number of passenger journeys on Melbourne tramways	60,974,203
Total railroad suburban and tramway passenger journeys	125,136,547
Average number of journeys per head of population per annum by suburban railroads	121
Average number of journeys per head of population per annum by tramways	115
Average number of journeys per head of population per annum by suburban railroads and tramways	236
Revenue, Melbourne tramways	$2,604,985*
Average fare per passenger on Melbourne tramways	4.10 cents.
Approximate annual amount paid in fares to and from Melbourne on suburban railroads and tramways per head of population	$11*
Approximate average number of passengers arriving at and departing from Flinders Street and Prince's Bridge stations on each week day	140,000

*Pounds transferred to dollars by multiplying by 5.
†Pence transferred to cents by multiplying by 2.

It would be manifestly impracticable to deal with such a traffic and meet these requirements with a service analogous to a street railway service—that is, a service consisting of one or two cars, or, in other words, smaller trains, making many stops. The capacity of a line for the conveyance of passengers is limited by the number of passengers which can be carried per train, and the number of trains which it is practicable to safely run within a given time, which latter is governed by the maximum time occupied in passing through any one of the block sections. To run lighter trains (which means trains with less seating capacity) would not enable us to run them much more frequently, that is, to follow each other throughout the block sections much more closely than at present during the busy hours of the day, for they would not take much less time to pass through the block sections, and what little gain there might be owing to the quicker time possible with lighter trains would be far more than offset by the reduction in the number of passengers per train such trains would be capable of accommodating.

As the Melbourne suburban lines were built originally for and are still operated by steam locomotives, we are chiefly concerned with railroads constructed originally for operation by steam locomotives and subsequently electrified. Inquiry as to the reasons for the conversion of such railroads to electric traction discloses the fact that in the case of most of them special conditions existed which made it more advisable than it would otherwise have been to electrify them, and which reasons favorable to electrification do not apply in the case of the Melbourne suburban lines.

In the case of a number of these converted lines the cheap generation of current from water power was the main factor which led to their electrification. This is true, for instance, of the converted lines using current generated at Niagara, of most, if not all, of the lines in Switzerland, and of the Valtellina and Milan-Varese lines in Northern Italy.

A number of other lines in the second group are largely underground railways, such as the Paris-Juvisy line, or have many or long tunnels, such as the New York Central and the Pennsylvania at New York; the Paris-Versailles; the Mersey, Simplon, and Baltimore & Ohio tunnels, and the heavy gradients existing on some of these lines have been an additional special reason favorable to electrification, as for instance the Simplon and Mersey tunnel lines. By the use of electric traction on such lines, all smoke in the subways and tunnels and the noise therein attendant on working such lines with steam locomotives were got rid of, and the air and ventilation were immensely improved, and, in addition, a cheap and convenient method of lighting the subways and tunnels as well as the trains, provided.

In other cases the relief afforded by electric traction (multiple unit control system—not electric locomotives) in inadequate and congested terminal stations and yards was an important factor in favor of electrification. By the use of electric traction with the multiple unit control system, that is, with the motors under the cars all operated as a unit from either end of the train, trains can be switched or despatched on their return trip with a considerable saving of track space in a congested terminal station or yard, for there being no locomotive and it being possible to drive the train from either end, no track is required to permit of the locomotive being got around from one end of the train to the other either for a return trip or for switching, and time is also saved in despatching such a train on a return trip or in switching, for it is only necessary for the motorman to transfer from one end of the train to the other. This was one of the reasons for the electrification of the North Eastern Railway's suburban lines on the north side of the Tyne at Newcastle, and of the Liverpool-Southport section of the Lancashire & Yorkshire.

Again, in other cases, it has been necessary to electrify lines owing to connecting lines adopting electric traction, as, for instance, the Hammersmith line (London) of the Great Western connecting with the Metropolitan Undergrounnd Railway, and the New York, New Haven & Hartford line connecting with the New York Central line near New York.

And still, again, in other cases electrification has been considered advisable either to meet the competition of electric street railways, by providing an improved and especially a more frequent train service, or to head off the construction of competing electric lines. In these cases especially, the train service, before conversion—unlike that on the Melbourne suburban lines—was, as a rule, infrequent, as for instance, on the Newcastle lines of the North-Eastern Railway, on the principal line of which there was before conversion approximately only an hourly service, except during the morning and evening, while on the other lines there were intervals of from one hour to two hours. In these cases the fact that in the event of the line's not being electrified a considerable part of the expenditure which would be involved for electrification would, in order to give the desired more frequent service, be required to provide additional steam locomotives and coaches and enlarge inadequate terminal stations and yards, has no doubt been an important factor in the decision to convert such lines.

As a matter of fact, and contrary to the general impression, there have been few lines (other than street railway lines), converted to electric traction except those in respect of which special conditions existed making it more advisable than it would otherwise have been to electrify them, and which reasons favorable to electrification do not apply in the case of the Melbourne suburban lines.

In this connection, it must be mentioned that there are many lines in the world to-day operated by steam locomotives on which there is a much heavier train movement than on any of our suburban lines, and that the administration of these lines have not yet deemed it advisable to adopt electric traction for them. A case in point is the Illinois Central, between Chicago and Woodburn Park, 7.71 miles, over which between 120 and 130 suburban trains are scheduled to run each way every working day, and this in addition to a large number of through passenger trains, goods trains and shunting movements. The management of that company at a comparatively recent date went most carefully into the question of the advisability of electrifying this portion of their line, and came to the conclusion that the financial results would not justify the expenditure involved. There is a very dense train movement on a number of the railroads running out of London, but, although in some cases the advisability of electrification has been inquired into, in only one case, except the Hammersmith line of the Great Western before referred to, has it as yet been actually taken in hand, viz., on the London, Brighton & South Coast, between London Bridge and Victoria Stations—a distance of about eight miles, where there is an exceptionally dense train service. There is also a very heavy suburban traffic on the lines of the Pennsylvania Railroad at Philadelphia, and on those of the Boston & Maine, and the New York, New Haven & Hartford at Boston, but those companies have not yet undertaken the electrification of their lines.

The progress which has been up to the present time made throughout the world in the electrification of lines originally built for operation by steam locomotives, apart from those converted by reason of special local conditions which rendered the conversion more advisable than it would otherwise have been, is not, it must be admitted, as strong an indication as has been supposed that the general electrification of the Melbourne suburban lines is advisable, but, as I shall explain later on, there are special reasons which may justify us in proceeding at an early date with the conversion of two of these lines to electric traction.

While in Europe and America, I made a special inspection of

the following lines originally built for operation by steam locomotives and subsequently electrified:

	Length of Route, Miles
Italian State Railways:	
Between Milan, Gallarate, Varese and Porto Ceresio	45.6
Between Lecco, Colico, Chiavenna and Sondrio (known as the Valtellina line)	67
Germany, Prussian State Railways:	
Hamburg, Altona	17
France:	
Orleans Railway, between Paris and Juvisy	12
Western Railway, between Paris and Versailles	11
England:	
North Eastern Railway, Newcastle-upon-Tyne (suburban lines on north side of Tyne)	41
Lancashire & Yorkshire Railway, between Liverpool and Southport	18.5
America:	
New York Central & Hudson River, New York (Grand Central Station) to Wakefield, and Mott Haven to King's Bridge	17

I also traveled frequently over many sections of the Underground railways in London, England, and obtained considerable information about those lines, and visited Chicago mainly for the purpose of inspecting and traveling on the new type of suburban coach in use on the Illinois Central. I also obtained considerable valuable information about the electrification of the West Shore (New York Central), between Utica and Syracuse, and as to the conversion to electric traction of some of the lines of the Long Island and the New York, New Haven & Hartford. Sir George Gibb was kind enough to provide a special train for the inspection of the North-Eastern electrified lines at Newcastle-upon-Tyne, and Mr. Aspinall and Mr. Wilgus were equally kind in according a similar privilege and convenience for the inspection of the electrified lines of the Lancashire & Yorkshire at Liverpool and of the New York Central at New York.

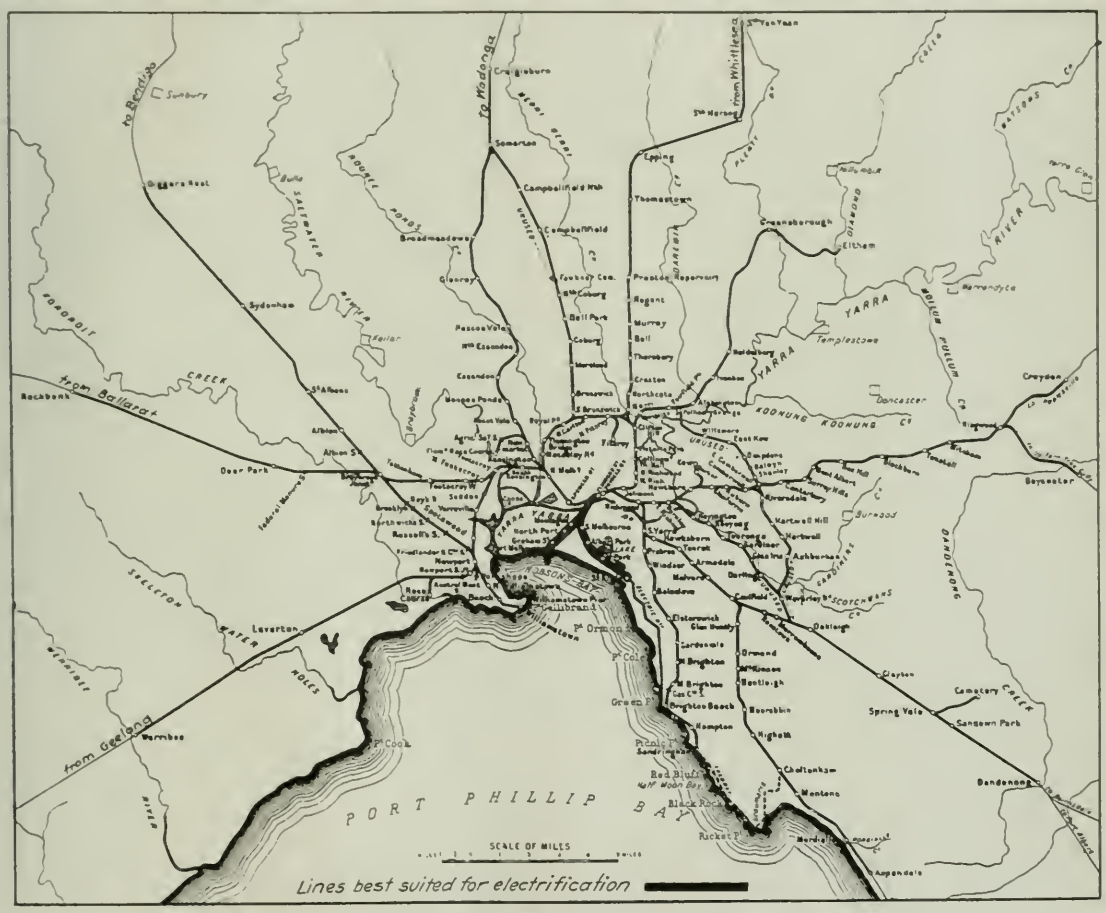
MILAN-GALLARATE-VARESE-PORTO CERESIO LINE.

This line, now owned and operated by the Italian Government, was converted to electric traction in 1901. It is 45.6 miles long, and is the main means of communication between Milan and the most important industrial and densely populated district of Northern Italy. It taps Lakes Maggiore and Lugano, and has a large tourist excursion traffic during the summer months.

The current is generated at Torre Avento, a steam plant having been first installed for use while the adjoining hydraulic plant was being constructed. Horizontal tandem compound engines of the Corliss type, and three phase 25-cycle alternators, with a normal rating of 750 k.w., were used in the steam plant. The high tension transmission system is nearly all in duplicate, consisting of two three-phase lines carrying 12,000 volts, which is reduced and transformed at rotary converter sub-stations to direct current at 650 volts for delivery to the motors through a third rail. The possible cheap generation of current by water power was doubtless the main factor in determining the authorities to adopt electric traction on this line.

VALTELLINA LINE.

This line, which is operated and owned by the Italian Government, was converted to electric traction in 1902. It is about 67 miles long, extending from Lecco, at the southwest end of Lake Como, along the west side of that lake to Colico, and from there northerly to Chiavenna and easterly to Sondrio. The possible cheap generation of current from water power, and the existence of many tunnels, doubtless led to the substitution of electric for steam traction on this line. The power plant is at Morbegno, 9½ miles from Colico, and 15½ miles from Sondrio. The water is brought between two and three miles by a raceway to turbines, to which are directly connected Schuchert three-phase alternators of the revolving field type of 1,500-k.w. capacity. These alternators supply current at 20,000 volts and 15 cycles directly to the high tension line which feeds the nine sub-stations where the pressure is stepped down to 3,000 volts. The locomotives and motor cars are equipped with three-phase motors which are fed through two overhead trolley wires and the track as the third conductor. Motor cars are used on the passenger trains, and electric locomotives for hauling the freight trains.



The Suburban Lines at Melbourne, Australia.

Port Melbourne and St. Kilda lines indicated by heavy shading.

HAMBURG-ALTONA LINE.

This line is owned by the Prussian Government. It was not finished when I visited Hamburg, but it will extend from Hamburg in one direction to Ohlsdorf, and in the other direction to Altona and Blankenese, a total distance of about 17 miles. It is being equipped, and will be worked on the single-phase system—the Winter-Eichberg system of the Allgemeine Elektricitäts-Gesellschaft.

PARIS-JUVISY LINE OF THE PARIS-ORLEANS RAILWAY.

This line forms the approach of the Paris-Orleans Railway to the new Quai d'Orsay station in Paris, and for a considerable distance cut from that station is a tunnel or subway line, which no doubt was the main consideration for the adoption of electric traction, as the smoke from steam locomotives would have been very objectionable, not only in the tunnel, but in the station itself where the tracks are below the level of the ground, and in the waiting rooms, etc. Indeed, the conditions on this line are very similar to those at the Grand Central Station in New York. The distance from Juvisy to Paris is 12 miles, and part of the line has been operated electrically since May, 1900, and the balance since July, 1904.

The current is generated by a steam plant (reciprocating engines) at a station about three miles from the Quai d'Orsay station, and is transmitted at 5,500 volts, 25 cycles to two sub-stations, where it is reduced and transformed by rotary converters into 600 volt direct current for delivery to the motors, partly by the third rail, and partly by overhead conductor. All the through trains between Juvisy and Paris are hauled by electric locomotives, weighing (the latest type) 55 tons, the change from steam to electric locomotives or vice versa on these trains being made at Juvisy. The local suburban service between Juvisy and the Quai d'Orsay station is performed by trains operated by the multiple unit control system.

PARIS-VERSAILLES LINE OF THE WESTERN RAILWAY COMPANY.

This line extends from the Invalides station of the Western Railway, in Paris, to Versailles, about 11 miles, and is operated electrically only in so far as the local suburban trains are concerned. The current is generated by a steam-driven plant at Moulineaux on the line at 5,500 volts, 25 cycles, which is reduced and transformed by rotaries at three main sub-stations into direct current at 550 volts, and conducted to the motors by a third rail. The trains were at first hauled by electric locomotives, but these have been abandoned in favor of the multiple unit system. The nuisance caused by the smoke from the steam locomotives in the partially-underground Invalides station and in a long tunnel was the main reason for the electrification of this line.

NORTH EASTERN RAILWAY LINES ON NORTH SIDE OF TYNE AT NEWCASTLE.

In 1904 the North Eastern converted most of its suburban lines on the north side of the Tyne to electric traction, and up to the present time about 41 route miles have been electrified. The direct-current third-rail system was adopted with electric locomotives for the goods work, and the multiple unit system for the suburban passenger trains. The current is purchased from the Newcastle-upon-Tyne Electric Supply Company which has at Newcastle one of the largest and most efficient electric power stations in the world. Three-phase current is generated by steam turbo-alternators (5,000-k.w.) at 40 cycles and a pressure of 5,750 volts, which is reduced and transformed at five sub-stations by stationary transformers and rotary converters to continuous current at 600 volts, at which pressure it is fed to the third rail.

Prior to the conversion of these lines, there was a comparatively sparse train service on them, especially during the slack hours of the day, viz., only about an hourly service, and consequently the North Eastern's traffic was seriously cut into by the competing tramway lines. One difficulty in the way of increasing the steam service was the lack of sufficient station and track room at Newcastle, and one of the reasons for the electrification of these lines was to permit of more trains being run on them without necessitating the provision of additional terminal accommodation at Newcastle. As I have previously explained, multiple unit trains require less track space and time at terminals than trains hauled by steam locomotives.

LIVERPOOL AND SOUTHPORT LINE OF THE LANCASHIRE & YORKSHIRE.

This line, about 18.5 miles long, extending from Liverpool to Crossens, was electrified in 1904, the direct-current third-rail system being adopted. Three-phase current is generated at Formby—about midway on the line—at 7,500 volts pressure, 25 cycles, which is stepped down by static transformers and converted by rotaries to direct-current at 650 volts. The power house was originally equipped with four 1,500-k.w. and one 750-k.w. alternators driven by reciprocating engines, but at the time of my visit a steam turbo-alternator was being installed. All trains are operated on the multiple unit system.

Prior to conversion there was a comparatively infrequent service between Liverpool and Southport (only 36 trains per day), and one of the advantages of electrification was to render it possible by the multiple-unit system of operating trains (no locomotive) to largely increase their number without providing any additional track or station accommodation at the congested Liverpool terminal.

NEW YORK CENTRAL & HUDSON RIVER—NEW YORK APPROACH.

The New York Central, to comply with the provisions of a legislative act requiring the discontinuance of the use of steam locomotives in the Park Avenue tunnel, a part of the company's approach to the Grand Central Station, has, within the last year, completed the conversion of its lines between that station and Wakefield on the Harlem division and King's Bridge on the Hudson division, a total distance of 17 miles, for electrical working.

The current—three-phase 11,000 volts, 25 cycles—is generated by a steam-driven plant at Port Morris (situate on the water front, but not directly on the electrified line), consisting of 5,000-k.w. steam turbo-alternators, and is reduced and transformed to a direct current of 660 volts for delivery to the third rail, which, it may be observed, is in this case effectively protected throughout. Local trains, that is, trains which do not run beyond the electrified sections, will be operated on the multiple unit system, while all through trains will be hauled by electric locomotives within the electric zone, and by steam locomotives beyond it. A very extensive rearrangement and enlargement of the Grand Central terminal, and, indeed, of all the accommodation and facilities within the electric zone, has been undertaken in connection with this conversion, and it is interesting to note that car-floor level platforms have been adopted at the suburban stations.

WEST SHORE ELECTRIFICATION BETWEEN UTICA AND SYRACUSE.

Within the last few months the West Shore, and a number of the principal electric lines in the central part of the state of New York, have, for the purpose of uniting several of these electric lines and affording a direct and frequent service between Utica and Syracuse, electrified the double-track West Shore line between these two large centers of population—a distance of about 44 miles. It should be explained that the New York Central had six tracks between these two places, viz., its own four-track line and the double-track West Shore line, and that very little use was made of the latter line for passenger traffic, its use being confined mainly to the movement of freight trains. The current is purchased from the Hudson River Electric Power Company, and is generated temporarily by a steam plant at Utica, and delivered at 60,000 volts, three-phase, 40 cycles. The current is reduced and converted at sub-stations to 600 volts direct-current for delivery to the third rail.

LONG ISLAND RAILROAD AT BROOKLYN AND LONG ISLAND CITY.

Under an agreement with the municipality, the company undertook to remove certain of its tracks from the street surface and to operate its passenger trains on certain lines by a motive power not requiring combustion on the trains themselves, and this has led up to the conversion to electric traction in 1905 of about 42 miles of railroad in the neighborhood of Brooklyn and Long Island City, on which there is a very heavy suburban and excursion traffic. The third rail 600-volt direct-current system was adopted, this current being reduced and transformed at sub-stations from a three-phase current at 11,000 volts generated by steam turbo-alternators (5,500-k.w. capacity) in a power house located on the water front at Long Island City. The trains are operated on the multiple unit control system.

NEW YORK, NEW HAVEN & HARTFORD—MAIN LINE TO STAMFORD.

This company's trains run over the same tracks as the New York Central between Woodlawn Junction and the Grand Central Station in New York, and, as in the case of the New York Central, it was required by an act of legislature to substitute some power for the movement of its trains through the Park Avenue tunnel, which did not involve combustion on the trains themselves. The New Haven has electrified its line between Woodlawn Junction and Stamford—a distance of 21 miles. Owing to the New York Central's having adopted the third-rail direct-current system, it was necessary for the New Haven to so equip its trains as to use direct-current with third-rail contact while on the New York Central line, but it is equipping its own line for single-phase alternating current at 11,000 volts, and overhead conductor. The current is generated by steam turbo-alternators (3,000-k.w. capacity) at Cos Cob power station, located on the Mianus river.

SWEDISH STATE RAILROADS.

The Swedish Government is making a very thorough inquiry as to the advisability of using electric traction on the State railroads, and of generating the necessary current by water power. In this connection it is converting some short lines as experiments.

RELATIVE ADVANTAGE OF THE TWO CONTACT CONDUCTORS.

I will mention briefly the principal relative advantages of the two methods of delivering the propulsion current to the trains or cars. The following are the principal relative advantages of the low-tension, protected third-rail conductor:

The third rail can be effectively protected so that there is very little liability of personal injury to shunters, trackmen, or others working on or walking along or across the tracks, as has been done, for instance, on the New York Central.

Can be maintained by trackmen, and does not require the use of special [illegible] tools and work cars for repairs as is the case of overhead conductors.

Ease of satisfactorily [illegible], [illegible] on account of location, where relative motion between track and rail is small and because there is no variation in grade of conductor as in the case of overhead conductor at low bridges or tunnels.

Can be readily inspected by track walker, whereas overhead conductor requires specially trained inspector.

Easier of sectionalization.

Much longer life, the life of overhead conductor being comparatively short on account of wear and where [illegible] are also in use by the [illegible] from them.

Less danger to men on top of cars.

Less danger generally from low tension than from high tension current.

Easier to make repairs, as can generally be worked on without shutting off current to make changes or repairs. Current must be shut off high tension overhead conductor to make slightest repairs.

No interference with view of signals, and no danger to men repairing or attending to signals.

Freedom from disturbance by lightning.

Less interference with telegraph, telephone and signal wires.

Additional electrified running track or sidings can be provided at less expense.

There are three principal relative advantages of the high-tension overboard wire conductor:

Entirely clear of roadbed, and therefore less interference with track maintenance.

No need to break contact at level crossing of public thoroughfares, except perhaps where there are street railway trolley wires.

Less danger to shunters; but there is very little danger to any one, if the third rail is well protected.

These relative advantages are not to be taken as indicating the comparative cost, economy and efficiency of the direct and single-phase alternating, and three-phase alternating systems.

EFFECT OF ELECTRIFICATION ON TRAFFIC AND GROSS EARNINGS.

Electrification has undoubtedly in most cases resulted in an increase in the traffic. A superior service in many respects over steam locomotive working is afforded by electric traction. With electric working there is no smoke, and consequently possible better ventilation; less noise; smoother starting and running; better means of lighting and heating; greater acceleration (that is trains gain speed more quickly on starting from stations), and consequently less time occupied, especially on runs with many stops; and last, but by no means least, there is considerably less additional expense involved in increasing the frequency of the train service than in the case of steam locomotive working. All these factors have attracted additional traffic.

In considering this almost universal result, however, in connection with the question of electrifying the Melbourne suburban lines, it must be pointed out that on most of the steam lines which have been converted to electric traction, a comparatively meagre train service existed prior to their conversion, and that in the case of a number of these lines the main object which the management had in view in undertaking electrification was to provide a more frequent train service, either for the purpose of developing possible traffic or to meet the competition of tramways, and, as regards the development of possible traffic, it must be borne in mind that in most large cities where conversion has taken place, there are two or more railroads, each of which has suburbs along its line, which it endeavors to develop at the expense of, or in any event, in preference to those lying along the lines of its rivals. A very good case in point is the conversion of the Southport line of the Lancashire & Yorkshire, at Liverpool. This line serves some pleasant suburbs and golf links to the north of Liverpool. The management desired to improve the train service to these suburbs, and thus make them more attractive for residents and others than the suburbs of the other railroads running out of Liverpool, and thus induce people to settle along its line instead of along the lines of its rivals. Before conversion, there were 40 trains each way between Liverpool and Southport; now there are 65.

Now, what is the situation in Melbourne? As all of the suburban lines are owned by the State, one of the objects which, for instance, the Lancashire & Yorkshire had in view, namely, to develop the suburban traffic on its line in preference to the lines of other companies, would be of no advantage to the State from a railroad point of view, for it would mean a large expenditure of money to attract traffic to one line which would to a considerable extent be obtained on that or other suburban lines without incurring the expenditure.

As a matter of fact, however, the existing train service, generally speaking, on the Melbourne suburban lines, compares favorably with that provided on electrified suburban lines elsewhere, especially as regards frequency, comfort and regularity. For instance, as I have mentioned, the Lancashire & Yorkshire now run 65 trains a day on its electrified Southport line. The North Eastern which, prior to conversion, only ran 16 trains each way between Newcastle and Tynemouth, and 52 between Newcastle and Monkseaton, now runs 44 and 84 respectively. But with steam locomotive working the number of trains run each way between Melbourne and the stations named hereunder is as follows:

	No. of trains each way daily
Hawthorn	[illegible]
Clifton Hill	95
[illegible]	76
[illegible]	74
[illegible]	72
St. Kilda	71

While therefore we may fairly anticipate that some gain in traffic and gross revenue will result from electrification due to improved train service, especially a slightly quicker and possibly somewhat more frequent service, no such proportionate increase can be looked for as the result of the conversion of the Melbourne suburban lines as in the case of electrified lines on which there was before conversion a considerably smaller service than now exists on most of our suburban lines, and, consequently, the results in the way of increased traffic resulting from conversion in such cases as the Lancashire & Yorkshire and North Eastern cannot be taken as a criterion of the results which will be obtained by the electrification of such of the Melbourne lines as already enjoy a frequent train service. In this respect, as in others, the proposal to convert any or all of our suburban lines must be considered with regard to local conditions.

An improved service under electrical working would, no doubt, bring some traffic to some of our suburban lines which is now carried on the tramways, but the gain in this direction would be comparatively limited, for our suburban railroads with trains stopping only at stations from half-a-mile to a mile apart, and terminating in the city at the Prince's bridge cannot, even if electrified, compete successfully for short distance travel with tramways running along the streets and stopping to set down or take on passengers as desired, and conveying their patrons to and from the business streets in the heart of the city. As for the longer distance suburban travel, that is, for distances over, say, three miles, we now hold our own very well on the whole as against the tramways wherever there is competition, but there would no doubt be some gain in respect to this traffic by electrification. Where we would probably gain principally in traffic by electrification would be from the transfer to the more distant suburbs along our lines of people now living in the city proper, or in the inner suburbs, especially in the case of people served exclusively by the tramways, or by both the tramways and the railroads, as a result of the improved accessibility of these more distant suburbs, that is, by the quicker, more comfortable, and possibly more frequent service afforded by electric trains.

It must not be overlooked, in considering the effect of electrification on the traffic and the gross revenue, that there is comparatively little increase taking place in the population of Melbourne, especially as compared with cities in America, Germany, and even England and Northern Italy; and that there are ample suitable vacant areas along existing lines available for a large increase in the present suburban population, and that there is now along most of these lines a suburban train service which, on the whole, for comfort, frequency, speed and regularity compares very favorably with the suburban train service of any other city in the world, not even excepting those where some of the lines have been electrified.

EFFECT OF ELECTRIFICATION ON OPERATING EXPENSES.

It has been the experience in most cases elsewhere that a dense train service—fairly steady throughout the hours during which trains are run—that is, with not too much difference between the minimum and maximum service, and employing sufficient power to require an electric generating station of fairly large capacity, in fact, substantially such a service as that existing, for instance, on several of our suburban lines, can be operated for less expense per train mile (exclusive, of course, of the increased interest charges) by electric traction than by steam locomotives; and, therefore, in the event of at least two of our busiest suburban lines being electrified, we may, I think, look for some reduction in the working cost (not including interest charges) of the existing service on those lines.

It is generally conceded that expensive coal is somewhat in favor of electrification, and, therefore, as the cost of coal in Melbourne is high, we may look for some saving in our fuel bill by electrification. One of the principal ways in which the working cost per train-mile can be reduced is the saving of the wages of the firemen now employed on the steam locomotives. It is generally recognized that with the "emergency" lever, it is safe to run electric trains with only one man—the driver or motorman on the front end.

In connection with this question of the comparative cost of electric traction, it may be mentioned that it appears to be rather the general impression that the weight of the steam locomotive is much greater than the weight of the electrical motive equipment on an average railroad train. At the last International Railway Congress, J. A. F. Aspinall, General Manager of the Lancashire & Yorkshire, speaking of his electrified Liverpool-Southport line, said:

"We do not find the weight of what we may call the locomotive

equipment of the train is any less than it would be with the steam locomotive; and dealing with main line work, there is no doubt that the aggregate weight of the motors, the collectors and electrical equipment will, in almost every case, come to as much as, if not more than, the weight which would be required if the train were going to be hauled by a steam locomotive."

This statement, however, does not, of course, apply to small units—for instance, the weight of the motive equipment on a two-car electric train (motor car and trailer) would not be nearly as much as on a two-car train hauled by one of our standard suburban locomotives, and in this fact—that the weight of the motive equipment under electrical working is much more nearly proportionate to the weight of the train than with steam locomotive working—lies one of the advantages of electrification.

FINANCIAL RESULTS OF ELECTRIFICATION.

The financial results of electrification depend, of course, not alone on the amount of the gross revenue, but on the amount of the net revenue (that is, the excess of the gross revenue over the working expenses) and on the sufficiency of the increase in the net revenue to pay the interest charges on the cost of electrification. In considering the financial results of electrification, regard must, therefore, be had to its effect on the gross revenue, the working expenses, and the interest charges.

As I have mentioned, we may fairly anticipate some increase in the traffic, and, therefore, in gross revenue, as a result of the more comfortable, quicker and possibly more frequent service accompanying the conversion of our suburban lines, but not nearly as large a proportionate increase as has been obtained on converted lines which, before electrification, had a comparatively infrequent service, and which, even after conversion, have not as frequent and, in many cases in other respects, as good a suburban service as now given on the Melbourne lines. It would appear, therefore, that the increase in net revenue after conversion to be applied against the increase in the interest charges will not on our suburban lines be as largely derived from an increase in traffic and gross revenue as has been the experience elsewhere. We have, therefore, to rely more largely than elsewhere on a reduction in the working expenses being effected by electrification to provide the additional net revenue required to meet the increased interest charges.

As I have already mentioned, we may look for some reduction in the cost of working the present train service (exclusive, of course, of the increased interest charges) in the event of at least two of our busiest lines being electrified. The question to be determined is whether the gain in traffic, and therefore the increase in gross revenue and the reduction in working cost (based on the existing train service), will together produce sufficient additional net revenue to meet the interest charges on the cost of electrification, or, if not, how far towards meeting these interest charges the additional net revenue will go.

Of any increase in traffic and gross revenue, a considerable proportion is anticipated by reason of a more frequent train service; but such additional train service may eat up the anticipated saving in working cost (based on the existing service). In this event, we would have to look entirely to the gain in traffic to provide the additional net revenue required to meet the increase in interest charges. Here again, regard must be had to the local conditions, and probably only experience will demonstrate what electric train service will be productive of the greatest net revenue.

What an important factor the interest charges on the cost of electrification are will be understood from the statement made by George R. Henderson, Consulting Electrical Engineer, of New York, that, broadly speaking, the cost of a steam locomotive is at the rate of $10 per horse-power, while that of a power house and line and other electrical equipment is at the rate of about $100 per horse-power. On this point, the following remarks made by George Gibb, Consulting Electrical Engineer of the Pennsylvania Railroad and in charge of that company's extensive electrical work in and around New York City, are interesting and valuable:

"The cost of inaugurating electric traction on a steam railroad has almost invariably been underestimated. Of its very high cost the public is absolutely ignorant, and to the few railroad men who have had occasion to inquire into the matter the figures have appeared staggering, and the reasons therefor incomprehensible. I shall not attempt in this brief talk to elucidate the matter further than to say that electric traction requires power plants of a capacity to take care of the peak load; the trains must be supplied with motive power, which displaces steam locomotives only at a much higher cost than the latter; lastly, an expensive continuous contact system over the entire line to supply current from the power plants to the trains. These items foot up to a very heavy total cost per mile of road; but, in addition—and this is a point which is often ignored by estimators—is the fact that electric apparatus cannot be supplied to any existing steam railroad without many changes in its physical feature and equipment. These changes amount in some cases to a virtual rebuilding of the line, and, according to my experience, the electric items making up the equipment of a steam railroad under average conditions are from one-half to two-thirds of the total cost only. Furthermore, it may not infrequently result that a steam railroad wishing to electrify and to properly adapt its lines to secure the legitimate advantage of same will be found obliged to double its capitalization per mile. This is a contingency which can be complacently faced by few railroads, and does not argue for early or wholesale conversion. * * *

"There has been a tendency for the public to generalize on the advantages of electric traction from too few examples, and this tendency promises to work injustice and hardship to the railroads unless growth of electric traction is guided along national lines. It is certain that heavy electric traction work may be called in the tentative stage at present, and its development must be accomplished for some time to come at heavy cost to the pioneers. Its introduction, as in the case of the terminals in New York City, is sometimes a public and operating necessity, but these conditions do not obtain to like extent in smaller centers of population, and the cost of introduction elsewhere for like purposes may easily be a crushing burden."

A factor which has an important bearing on the financial results of electrification and may frequently determine the advisability of conversion from a financial point of view is the extent to which the interest on the cost of the electrical rolling-stock is fairly chargeable against the cost of electrification. If the steam locomotives and the coaches employed in working a line before conversion are needed to augment the rolling-stock on other lines—that is, new rolling-stock would have to be provided for such other lines unless stock is made available from the converted line—then the value for service on such other lines of the rolling-stock relieved from service on the converted line (having due regard for its suitability and condition in arriving at such value) can fairly be off-set against the cost of the new electric stock and the interest charges on the cost of electrification be reduced accordingly. This consideration may have an important influence on the decision as to the advisability from a financial point of view of electrifying any of our Melbourne suburban lines.

It is to be regretted that the financial results obtained on steam railroad lines as a result of their conversion to electric traction are not more generally and readily available, but, generally speaking, it is difficult, if not impossible, to obtain this information. Sir George Gibb has promised to let me have it in respect of the electrified lines of the North Eastern at Newcastle, but I have not yet received it. It is generally understood that the increase in the net revenue since the conversion of these lines yields a fair return on the additional capital expenditure. The Lancashire & Yorkshire is not disposed to furnish the financial results of electrification of its Liverpool and Southport line, and this is the case in respect of other electrifications; while in other cases, where both steam and electric traction are used, on the same line, reliable data is not available; and again, in other cases, the conversions are of such recent date that no complete reliable figures as to the financial results have yet been compiled. The financial results of the conversion of lines for which the current is generated from water power would, of course, be practically of no use to us, and, as a matter of fact, the financial results obtained on any converted line would be of very little if of any assistance in enabling us to determine whether or not the electrification of any or all of our suburban lines is advisable from a financial point of view, for the conditions in our case are, to a great extent, different from those in any other place where steam suburban lines have been electrified, and, therefore, the financial results of electrification obtained elsewhere cannot be taken as indicating the results which will follow the conversion of any of the Melbourne suburban lines to electric traction.

While the financial results of the conversion of the Manhattan Elevated Railway of New York are generally understood to be satisfactory, this cannot be said in regard to the conversion of the Metropolitan District Railway of London.

At a half-yearly meeting of shareholders of the latter company last year, Sir George Gibb is reported to have said that:

"The total capital expenditure up to June 30, 1906, in connection with the electrification of the railway and all its concurrent improvements amounted to £1,783,000, and during the half-year under review the company had carried over 32,750,000 passengers, which is an increase of 5,000,000. As far as numbers are concerned, this is a record but, unfortunately, the expenses have also increased in an almost alarming ratio, and the net result is that after paying the dividends on the *guaranteed* stocks there is a deficiency of nearly £5,000."

It is of interest to note that the Metropolitan District Railway carried 32,750,000 passengers on its 24 miles of route in six months, while the Melbourne suburban lines with 149 miles carried 64,162,344 passengers last year. That is substantially the same number of passengers on six times the mileage. But, of course, much of our suburban mileage has but a sparse traffic, while the Metropolitan District line has a very dense traffic throughout its whole length.

While I was in London, all of the underground electric railway companies, owing to unsatisfactory financial results, entered into an agreement to raise their fares, and in this connection the Central of London (the "twopenny tube") has abandoned the principle of a uniform fare, irrespective of distance, and adopted graduated fares according to distance—the same practice as prevailed on the other London underground lines.

The appointment of a Consulting Electrical Engineer, to investigate thoroughly and report fully as to the use of electric traction instead of steam locomotives for moving and dealing with the traffic on any or all of the Melbourne suburban lines, has been made.

Charles H. Merz, of Newcastle-upon-Tyne, who has an office

also in London, is to undertake the work. Mr. Merz was strongly recommended by Sir George Gibb, Managing Director of the Metropolitan Railway, and in fact of all of the London Underground Railways except the Central of London, by Mr. Granville Cunningham, General Manager of the Central of London (Twopenny Tube), Mr. J. C. Inglis, General Manager of the Great Western of England, and many others. Mr. Merz acted as Consulting Engineer for the North Eastern Railway in the electrification of their suburban lines on the north side of the Tyne at Newcastle—indeed, he had full charge of the conversion of those lines, and Sir George Gibb, who was at that time the General Manager of the North Eastern, speaks in the highest terms of the manner in which this work was planned and carried out by Mr. Merz.

SPECIAL REASONS FOR ELECTRIFICATION OF ST. KILDA AND PORT MELBOURNE LINES.

Without in any way anticipating the recommendations which the Commissioners may make after consideration of the report and recommendations of Mr. Merz, I may mention that there are special reasons in connection with the question of electrifying the St. Kilda and Port Melbourne lines which may turn the scales in favor of the conversion of those two lines, although from a financial point of view only—that is, an increase in the net revenue sufficient to meet the additional interest charges—their conversion may not be quite justified.

First.—It is necessary that additional locomotives and cars be built for our Melbourne suburban traffic at an early date; indeed, they are now much needed. We are now compelled, owing to shortage of the suburban type of locomotive, to use ten-wheel and other types of locomotives, built and suitable for country trains, for hauling suburban trains. These locomotives are unsuited and too costly in construction and working for this service, and should be relieved by suitable suburban type locomotives. We are also frequently compelled to make use of cars built for country traffic on our suburban trains, but the principal need of additional cars for the suburban traffic is to replace the obsolete stock which, I regret to say, it has been necessary to still continue to use for that traffic. By converting the St. Kilda and Port Melbourne lines to electric traction and building new electric rolling-stock (motor cars and trailers) for them, the steam locomotives and cars now running on these lines would become available and could be used for replacing the country traffic locomotives and cars now employed on the other suburban lines and replacing some of the obsolete cars still employed in the suburban traffic. The value of the steam locomotives and coaches thus relieved from the St. Kilda and Port Melbourne lines (having due regard to their condition and their suitability for service on other lines) would be a credit to the cost of the electrification of these lines, and the interest charges be reduced accordingly. In view of the possibility of the electrification of our busiest suburban lines, it would appear to be unwise to build more steam locomotives and cars of the suburban type.

Second.—The St. Kilda and Port Melbourne lines are practically isolated from the balance of the railroad system. The tracks of these two lines are separate from those of the other lines at Flinders street station, lying as they do on the extreme river side of that station, and there are no country trains running over these two lines. There would, therefore, be less complication arising out of the conversion of these two lines than of any other lines of our suburban system.

Third.—If the St. Kilda line be electrified, current from the power house supplying it can be used for working the St. Kilda & Brighton Electric Tramway, and the power house at Elsternwick, at which the current for that tramway is now generated, can be abandoned.

Fourth.—The financial and other results of the electrification of these lines would be of great assistance in determining the advisability of converting our other suburban lines. Their conversion would especially be of value in enabling us to ascertain the expense of electrification, the cost of electrically working our suburban trains and lines as compared with steam locomotive working, and the increase in traffic and in revenue which may be anticipated from the improved electric service, especially in competition with the tramways.

An official survey of the water powers of Bavaria has been made for the purpose of determining their availability for generating electric power which may be economically applied, primarily as motive power on railroads. Recently a report of this survey has been made in a stately volume, and an atlas of plates, which costs nearly $15 and is doubtless worth hundreds to those who have similar investigations to make elsewhere, not to speak of its direct use in Bavaria. It contains an elaborate discussion of the conditions which make either electricity or steam the more economical motive power, and the expenditure for plant and for operation per horse-power per year in various locations, for both steam and water power, showing immense variations from place to place. That the report is likely to have immediate practical results is shown by the introduction of a bill appropriating $1,700,000 in the next fiscal year for the introduction of electricity as motive power on certain specified lines of railroad.

Double Tracking Through Eagle River Canyon on the Denver & Rio Grande.

The through line of the Denver & Rio Grande about half way between Pueblo, Colo., and Grand Junction, crosses the continental divide by a tunnel 2,572 ft. long through the main range of the Rockies at Tennessee Pass. From Pueblo to the headwaters of Tennessee fork the road closely follows the Arkansas river. The highest elevation reached by the track is 10,239 ft. above sea level. The maximum grade on the eastern slope between Pueblo and Tennessee Pass is 1.42 per cent.

On the Pacific slope of the divide the road follows the course of the Eagle river from its head to its confluence with the Grand river, thence down the canyon of the Grand river to the mouth of the Gunnison river at Grand Junction. The first 21 miles from the summit west to Minturn is a descent on a 3 per cent. grade. From Minturn west to Glenwood Springs, 58 miles, the maximum eastbound grade is 1.33 per cent., and from Glenwood Springs west to Grand Junction, 90 miles, 1 per cent. Minturn is a terminal for freight locomotives, engine crews and train crews, and for locomotives and engine crews in passenger service. The other end of the engine district east of Minturn is at Salida, 66 miles east of Tennessee Pass. Salida is a division terminal where all locomotives, engine crews and train crews are changed. Thus the 87 miles of main line between Minturn and Salida form an engine district for both freight and passenger service.

Tunnel at Belden.

A great many helping engines are used on the 21 miles of 3 per cent. grades between Minturn and the summit. These helpers start out from Minturn and return light to that point from Tennessee Pass. This tends to double the train movements over this stretch of track. This has led to congestion of traffic and the necessity of building second track over part of this distance. A further argument for building this second track was the expected increase in business on completion of the Western Pacific, which is to be in operation in about a year.

Some years ago the Denver & Rio Grande, in order to facilitate the despatch of trains entering and leaving freight terminals, adopted the policy of building double track for a short distance on each side and through the yards of such terminals. Double track was built through the Minturn terminal as far east as a point called Rex. The new double-track work began at Rex and the road is now double-tracked from Rex east to Red Cliff, five miles. This is a short stretch in distance but on account of the mountainous nature of the country it was a very difficult and expensive piece of work. This new second track through the Eagle river canyon

cost more than $100,000 a mile. The accompanying photographs show the nature of the country through which this line passes and explain the high cost of the work.

The Eagle river here flows through a narrow and sinuous canyon, so narrow that it was not possible to lay a second track side by side with the existing single-track line. Therefore the new second track for most of its length is on the opposite side of the river from the original line. The natural difficulties of the location were complicated by the fact that this is a mining region and that the land on both sides of the original right-of-way is taken up by numerous patented lode and placer mining claims, of which many are operated. Shaft houses and ore bins are perched high up on narrow ledges above the river and mining operations come down to the stream at many points. Some of these can be seen in the largest of the accompanying photographs. The new line passes through numerous claims with their various surface improvements, tunnels and waste dumps. Long and careful negotiations were necessary before the new right-of-way was obtained. In some cases in order to provide ground space for mining operations to replace that used by the new line, retaining walls were built on the river side of the roadbed.

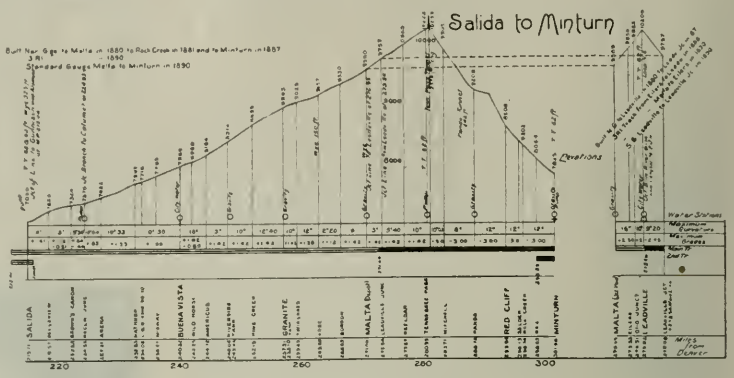
The maximum curvature of the new second track is 10 deg. and there are only three curves of this radius. In order not to exceed this curvature five crossings of the river and 31 tunnels were necessary. All but one of the bridges and three tunnels are on curves. The five steel bridges have reinforced concrete floor slabs with fine crushed rock ballast under the track. The three tunnels are about 100 ft., 300 ft. and 400 ft. long respectively. The maximum grade on the new line was reduced from 3 per cent. to 2.30 per cent. In consequence the new line is to be used for east-bound or up-hill trains.

The rock drilling was done by air. A compressing plant was installed at Belden, midway between the two ends of the work. From this plant compressed air was piped in both directions to be used as power both in the tunnels and in the open cuts. The classification of pay quantities was as follows:

Embankment	135,220 cu. yds.
Loose rock excavation	115,315 "
Solid rock excavation	153,705 "
Rip rap	2,670 "
Retaining wall	6,150 "
Tunnel	760 lin. ft.

The tunnels were all driven through solid rock without timbering or other lining. They are notable because of their large section, 18 ft. x 25 ft., which was adopted in order to conform to the Denver & Rio Grande standard clearance diagram for steel bridges. As so large a part of the grading quantities was rock excavation, the work was carried on through the winter. Great care in setting off blasts was necessary on account of the frequent movement of trains passing very close to the work. In this the contractors made a fine record.

Of the five bridges, one 80-ft. deck girder span is on a tangent;



Profile Across the Continental Divide, Salida to Minturn, and Leadville Branch; Denver & Rio Grande.

the other four bridges, one double-track 48-ft. through girder; one single-track 80-ft. deck girder, and two single-track 80-ft. through girders, are on sharp curves. The abutments were built of plain concrete masonry founded on rock. The girders were designed for a reinforced concrete slab floor and track ballast conforming to the Denver & Rio Grande specifications for steel bridges. As a result they are very heavy The ballast used is the best quality of broken stone. Great care was taken to get the right kind of concrete in the floor slabs. Riveting in the field was accomplished by air power obtained from a flat car fitted with a steam-driven air plant. For the smaller drainage openings under the roadbed cast-iron pipe culverts and reinforced concrete box culverts were used. The construction of the concrete abutments and all other field work on the bridges and culverts was done by the company's forces.

The contractors for this work were the Phillips Construction Company & O'Gara, who began work in the fall of 1906.

Weaver's Rail Lock for Drawbridges.

Mr. E. M. Weaver, Signal Engineer of the Long Island Railroad, has designed and patented a rail lock for drawbridges which serves both to keep the rails in line and to hold them to the sleepers and, therefore, takes the place of the rigid trough usually used for the lift rails at the ends of swing drawbridges. As shown in Fig. 1, which represents half of a double-track swing drawbridge, enough of these locks are used to hold each rail as firmly as though it were spiked. In this case, it will be seen, there are five pairs of locks for each rail. The bridge shown in the drawing is that at Broad Channel, on the Rockaway Beach division. The movement and locking of the bridge are done by manual power. *C* represents the connection to the lever which moves the signal regulating the approach of trains to the bridge, the locking being so arranged that the bridge lock, *A*, cannot be released until the signal is set to indicate stop. *B* is the connection for electric circuits where such are used on the draw. The tumbler lock at *A* being released, the bridge and the rails are unlocked by the lever at *E*, actuating longitudinal rod *D*. The rail-locks are released by revolving the transverse rods on their axes.

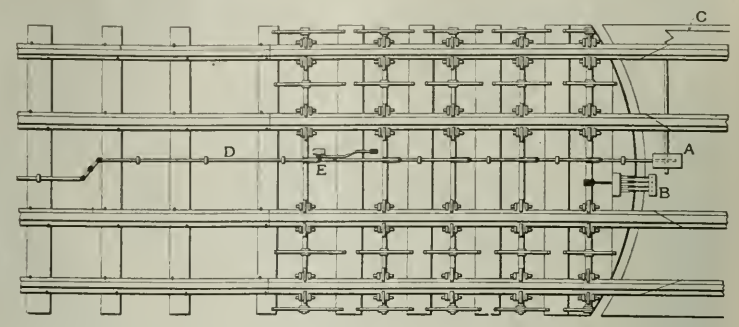

Fig. 1—Rail Locks for One End of Drawbridge, Long Island Railroad.

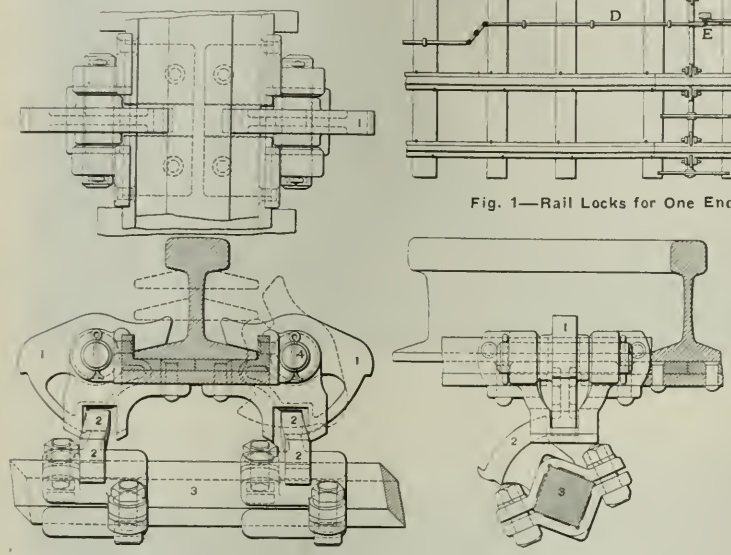

Fig. 2—Weaver's Rail Lock for Drawbridges.

The lock itself is shown in Fig. 2, in which 1 is the rail-dog, a steel casting; 2 is a projection on the transverse rod 3, which locks 1 in position. This projection is fixed in an inclined position, and it locks the dog as by a wedge, thus perfectly taking up all lost motion. The dog revolves on the pin 4. To take up excessive lost motion due to wear the lock bars (2, 2) may readily be moved on the transverse bar. The dotted lines show the position of the dog when it is open to allow the rail to be lifted preparatory to swinging the bridge.

The lock bars (2) being withdrawn so as to leave dog (1) free, the lifting of the rails turns the dogs; and on closing the bridge the dropping of the rails pulls the dogs down into the lock position.

The appearance of the dogs is better shown in the three views in Fig. 3, made from photographs, where a pair of dogs is shown in three different positions. The lock (2) is in the same position, the unlock position, in all three of the photographic views. The working of the lock may be understood by reference to *a*, Fig. 3. Lock bars 2, 2 are seen in the unlocked position. To lock they are pushed forward by the revolution of transverse rod 3.

On the drawbridges of the Long Island road the rails at the ends are mitered, as shown in Fig. 1, and there is a mitered joint farther back with a less acute angle, to provide for expansion. All of the rails used for joints of this kind are bent before being planed, thus strengthening the rail by utilizing the web for the whole length, as shown by the dotted line in Fig. 4.

Fig. 5 shows the Long Island Railroad standard arrangement of rails, guard rails and guard timbers for drawbridges.

These locks have been in use on Broad Channel drawbridge for four months and have given excellent service. The design appears to combine cheapness, simplicity and efficiency.

The Smoke Consuming Question Forty-Eight Years Ago.

BY C. H. CAUTHERS.

"Is it practicable to avoid smoke from locomotive engines using bituminous coal?

"Is the prevention of smoke in locomotives attended by economy of fuel?

"What are the relative values of Pittsburgh and Broad Top coals for use on locomotives on this road?"

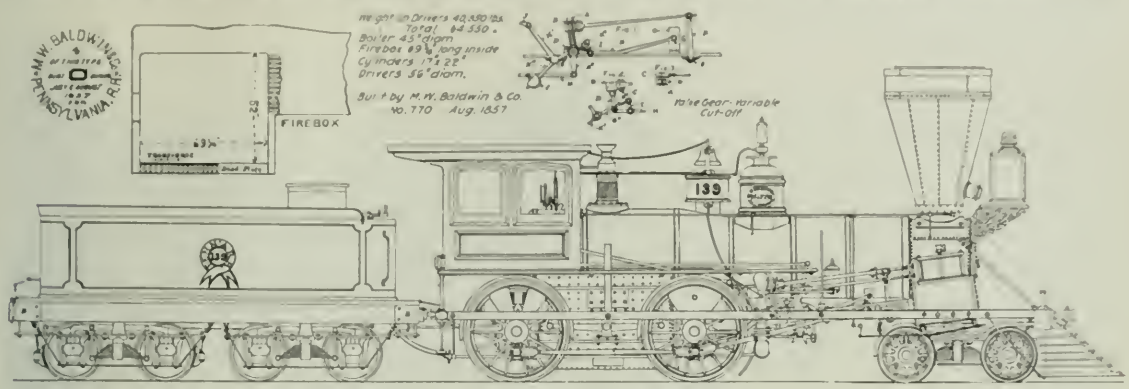
In the *Railroad Gazette* of December 1, 1905, the writer in an article entitled "Early Experiments in Smoke Consuming," referred to a series of experiments conducted on the Pennsylvania Railroad in 1859 under the auspices of General William J. Palmer, who was at that time connected with the motive power department of the company.

Since the publication of the article referred to, there has come into my hands, through the courtesy of General Palmer, a copy of the pamphlet describing these experiments in detail, and with the pamphlet the full permission of its author to publish any desired parts of the report in connection with the present article. Hence I cannot imagine a more fitting introduction than the three opening sentences, which are copied from the front cover and the title page of the work referred to.

While the third of these sentences quoted pertains simply to the coal most available at that time in the practice of one railroad, the other two are just as pertinent to-day to every road using bituminous coal of any brand as fuel in its locomotives, and if one may form an opinion from the emission of smoke from the stacks of the average passenger or freight locomotives now using bituminous coal, the first query does not seem to have fully approached a solution after all these years.

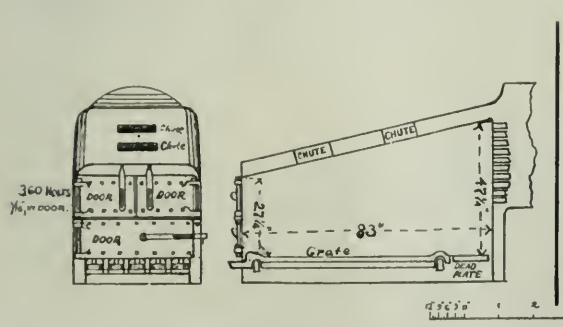
Of course the best arrangements of fireboxes, and other parts of the engines directly used in connection with the fuel and the resultant gases, etc., of combustion, are after all under human control, and undoubtedly much depends on the discipline of the company and the degree of strictness with which the employees are required to conform to such discipline. It should also be remembered that in practice, conditions are continually arising which upset the best of theories. In other words, sitting in a cosy office and devising mechanism or methods for handling locomotives is a vastly different proposition from filling the position of engineman or fireman and keeping a locomotive drawing a heavy train up to time and to all the requirements of a necessarily strict discipline amid all sorts of conditions, and withal meeting the approval of the officials of every rank and the patrons of the company.

Up to the time of conducting the experiment referred to, all the passenger engines and a large number of those in the freight service of the company used wood as fuel, and in the opening chapter of the report its author in enlarging on the questions quoted, asks if it is practicable to use raw bituminous coal of the various kinds found along the road, in passenger engines without emitting cinders to an extent that would annoy passengers; and if this would be found practicable what would be the best device for obtaining that object, and what saving would result from the substitution of coal for wood as fuel in such engines? It must be borne in mind that at that period the forests of the state existed in almost their primal glory over a large part of its territory and the cost of obtaining an ample supply of wood was not such a serious matter as it has now become; still the probabilities of the future and the excellent service derived from the freight engines using bituminous coal even then induced the company to consider its use in passenger locomotives.



Number 139.

These experiments were conducted from April, 1859, to August of the same year, and were made on two different portions of the road; one consisting of the ascent of the Allegheny mountains from Altoona to Gallitzin, a distance of 12 miles, with an average ascent of 95 ft. to the mile, and the other the division between Altoona and Mifflin, $82^{3}/_{10}$ miles, in which the heaviest grade was 21 ft. to the mile.



Firebox of No. 51.

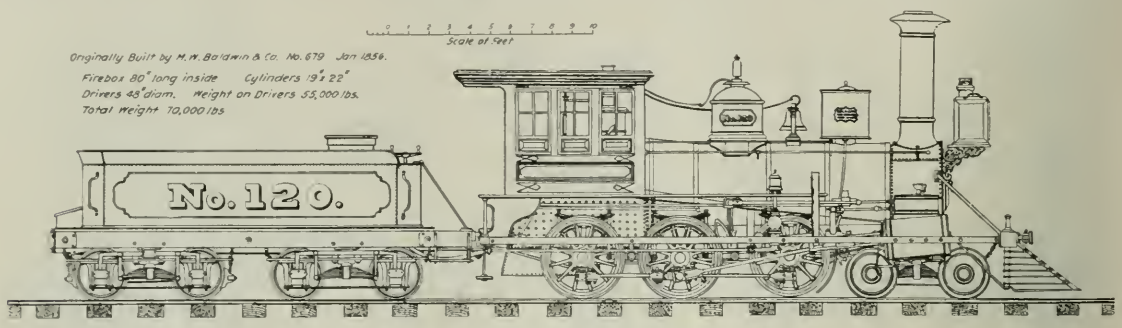
Average curvature on 5 miles	.....	.....	4¾° per 100 ft. or 1,207 ft. radius.

The train hauled on the mountain trials consisted of eight

"eight-wheel" box cars (four-wheel cars were in use in those days, hence the statement of the number of wheels per car), all loaded and forming with their load an average weight of 138½ net tons, or 188½ tons including engine and tender. The train used between Mifflin and Altoona consisted of 20 similar cars amounting with their load to a net weight of 347 tons and 397 tons with the engine and tender.

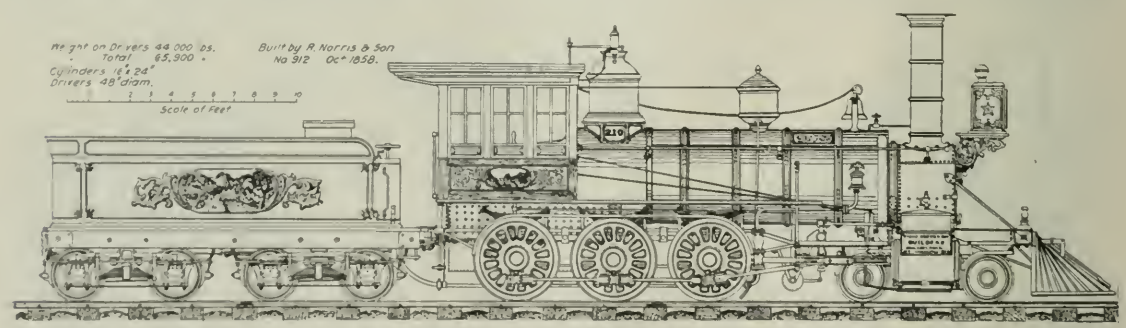
All details pertaining to the coal, wood and water used were attended to with the utmost care. Coal and wood were weighed in every instance and the engines were charged with the amount used in each from the moment of lighting the fire. Each engine boiler was washed out and refilled with cold water before every test in order to effectually prevent danger of priming. This water was of as nearly a uniform temperature in each instance as possible and all measurements of water in the tenders were taken accurately



Blue Ridge, No. 120, Rebuilt at Altoona Shops in 1857.

on a level. When water was supplied at points where the track was inclined, the tenders were raised to a level by screw jacks carried along for that purpose on the engines. The temperature of the feed water was also carefully noted. It ranged from 42 deg. to 72 deg. Fahr., the evaporation was calculated for the standard of 62 deg. Fahr., and the temperature of the latent heat of steam was assumed at Professor Johnson's calculation of 1,030 deg. In regard to the temperature of the feed water, it must be borne in mind that all these engines supplied the boilers by means of force pumps with plungers attached directly to the crossheads, and unless the heater provided to prevent freezing in cold weather was used, the water entered the boiler at about the same temperature as when it left the tender. Injectors had not at that time been applied to any engine on the Pennsylvania Railroad.

The coal was of uniform quality in each of the two kinds used



Number 210, Built in Oct., 1858.

in the tests, and the wood was an equal mixture of hard and soft varieties.

This interesting series of trials was made with six freight engines taken from the regular equipment of the company, and they will now be described in connection with the results of the tests, beginning with the least successful.

This was a 4-4-0 coal burner, No. 139, built by M. W. Baldwin & Co., in 1857, and taken from the regular service without any alteration to adapt it to smoke consumption. It had a long, deep firebox, and a "balloon" smoke-stack of the type in use on both the coal and wood burning engines of the company at that time. But a single firedoor was used with only one air-opening in it. A blower was also used and one ashpan damper.

This engine emitted the most smoke, especially heavy when Pittsburgh bituminous coal was used, but even with Broad Top coal a considerable amount passed from the stack and in either case the smoke and cinders would have been very annoying to passengers. When running with the firedoor open the smoke discharge was of much less density, showing that with a better provision for air admission than the single opening in the firedoor the smoke would have been greatly diminished. It is rather remarkable that although giving the poorest results of the six in smoke consumption, No. 139 was the most economical in consumption of fuel.

No. 51 was simply a Ross Winans "Camel" unchanged in most features from its advent on the road six years before; in fact, about the only alterations consisted in the closing of the "chutes" which Mr. Winans had placed on the top of the firebox to enable coal to be readily placed at the forward part of his 83-in. grate, and a damper arranged for covering the top of the stack at stations. This, however, does not appear to have been a part of the "outfit"

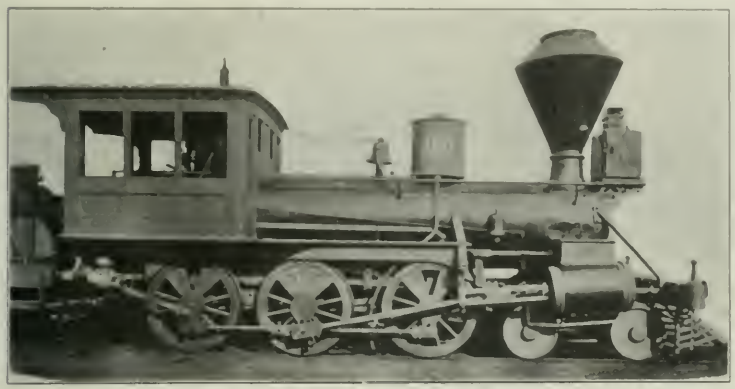
accompanying any other camels which the writer has ever seen or of which he has examined drawings. With these exceptions the open firebox end with its three large doors; the straight stack with its surmounting box-shaped top covered with coarse netting, and the dependent pipe, or dust receptacle; the Winans rocking grate and variable exhaust; no blower; no ashpan dampers; in fact, all the more striking features of this remarkable type of engine were retained, and No. 51, like No. 139, simply entered the trials "on her merits" for purposes of comparison only, and without additions of any sort. With its long firebox which subjected the gases for a longer time to the action of the fire, and the 14-in. deadplate next the flues, it showed much less smoke than 139. On Pittsburgh coal the discharge ceased a short time before the next charges were necessary. With Broad Top coal the results were very fair, the discharge from the chimney being only dark brown in color, and that but momentary after charging. This "Camel" engine proved the extent to which smoke consuming could be carried in locomotives with the largest practicable admission of air over the fire by jets through the firedoors, but without a combustion chamber or deflector. The air entering in this manner appears to drive the gases to the flues before a proper combination can be effected in the time and space afforded.

The next engine, 190, had a Dimpfel boiler similar to that shown in the *Railroad Gazette* of December 1, 1905, in the article referred to. It will be seen that this type of boiler is formed with a semi-circular water-space on the inner circumference of the sheets forming the barrel. This space is connected to the usual crown and side sheets at the back, and to a transverse water space closing the end next to the smoke arch, except where it is pierced vertically by a long, narrow opening for the passage of the smoke and gases to the chimney. Thus the interior portion of the barrel forms a

large combustion chamber which is filled with 1½ in. water tubes, 142 in number, instead of flues. These tubes are attached to the transverse space at the front and are then carried back into the firebox, at which point they are curved sharply upward and enter the crown sheet.

The chimney was straight and unobstructed by netting or cone, but wire gauze covered the opening from the combustion chamber to the smokebox. Due provision was made for controlled admission of air at various points on the boiler and firebox.

This engine emitted but little less smoke than 51, the difference being hardly discernible. On Pittsburgh coal, with full steam, the discharge soon vanished, but when engine was working light, it was of a deep color and continued for a long time. With Broad Top lump coal the results were better, but with fine coal from the [illegible] of smoke and gases especially on the [illegible] trips. Here with Broad Top coal the only [illegible] was a momentary whiff after each charge of fuel. It was necessary, however, to keep the door slightly ajar for a brief time after firing to produce this effect. On the trip between Altoona and Mifflin the results were not so good owing to the [illegible] being worked [illegible] on account of the very light grades. On this part of the road it emitted smoke during one-half to two-thirds of the trip. The successful results obtained on the mountain are ascribed to the long grate, the transverse bridges and the large combustion chamber, and the failure to attain even better results is attributed to the shallow firebox and its equally shallow ashpan which allowed the ashes to lie too close to the grate and thus cut off a proper amount of air, and also to the transverse bridges being formed of iron water spaces instead of firebrick, thereby cooling the gases and impeding their proper combustion.



Pennsylvania Engine Blue Ridge in 1868.

Cylinders, 19 in. x 22 in.; drivers, 49 in.; weight on drivers, 59,900 lbs.; total weight, 72,300 lbs. Worn out and scrapped in 1872. Engine originally had 30 in. dome on waist sheet, and small dome in cab on rear sheet, as some arrangement of boiler. Top as No. 206. It also had hook-motion with an independent variable cut-off. Built by M. W. Baldwin & Co., 1856; No. 679.

No. 120 was an engine which had been rebuilt at Altoona with a firebox somewhat differently arranged from that of 206, the next on our list. An arched deflector of firebrick extended from the front of the firebox for a distance of three and one-half feet toward the doors, rising from a height above the grate at the front of 32½ in. to 35 in. at the rear end. This arch was supported on eight hollow water plugs, four on each side of the firebox. The grate was composed of water tubes starting from the back sheet and extending to within about 18 in. of the front end of the fire-space, at which point they curved sharply upward and finally entered the crown-sheet. In front of the vertical portion of these tubes was thus formed a combustion chamber which extended 21 in. to the tubesheet. The firedoors were four in number, arranged in two tiers, and firing was done through these tiers alternately. These doors had 340 quarter-inch holes in their inner plates. A blower and an unobstructed straight chimney were used, but there were no dampers.

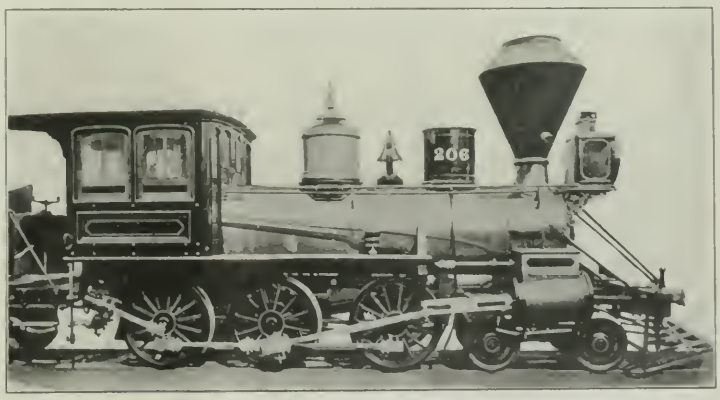
same mines the smoke amounted to a nuisance. The causes of unsatisfactory results in this engine were insufficient admission of air at the sides of the firebox, defective supply at the firedoor, and the position of the vertical air pipes leading to the long combustion chamber. The water tubes were also thought to cool the gases too much and thus retard their proper combustion.

No. 210 was a comparatively new engine from the shops of R. Norris & Son, and had a "Phleger" boiler. The barrel of this boiler was filled with 2-in. flues, and had an inverted semi-circular section attached to its top extending from the front of the wagon-top to within about 10 in. of the smoke arch. This communicated with the interior of the barrel and also contained the dry-pipe which terminated on the outside of the superstructure in the usual "T" and was there divided into two parts which were carried downwards on the outside of the boiler to the cylinders. The firebox was very shallow, and as it was set high it allowed the driving wheels to be placed closely together and further back than was customary on 10-wheel engines. This enabled the main rods to be attached to the first pair of wheels, the axle of which also carried the eccentrics and did away with the necessity of curved eccentric rods as on engines using the second pair of drivers as the main one.

The firebox contained two transverse water bridges set 10 or 12 in. apart in a horizontal position. One rose directly from the grate at the front of the firebox, and the other was suspended from the crown sheet in the combustion chamber to a depth of about 9 in. below the top of the other. A combustion chamber 30 in. long was placed immediately in front of the firebox and the flues, of course, were attached to the front of this space. The only air which entered the firebox, aside from that passing through the 78-in. grate, was admitted through a few small holes in the firedoors, and the efficiency of these was much impaired by an oversight in not connecting the inner and outer plates of the doors. These doors were double, the grate bars were hollow tubes 2 in. in diameter, through which water circulated, and the ashpan also was formed with a water-space surrounding it.

This engine showed a still greater improvement in consumption

No. 120 did much better than the preceding two engines, being better adapted to the desired objects on account of its large firebox, abundant admission of air at the four firedoors, and the high temperature which the firebrick arch soon attained and kept, thus ensuring a more thorough consumption of the gases. This engine showed no smoke with Broad Top coal except a momentary whiff of a light brown color just after charging, but never sufficient to annoy passengers if the engine were run in that service. With



Pennsylvania Engine No. 206 in 1868.

Originally built for Allegheny Portage Railroad Co., in 1865, by M. W. Baldwin & Co. (Construction No. 687) and bought by P. R. R. Co., with state improvements in 1857. Previous to this purchase it was known as "William Hopkins." Cylinders, 19 in. x 22 in., driving wheels, 49 in.; total weight, 63,300 lbs.; weight on drivers, 47,900 lbs. Cut up in 1872. This engine originally had hook-motion with an independent variable cut-off.

Pittsburgh coal the amount of smoke visible was little in excess of that from Broad Top.

Engine 206 was originally built in 1856 by M. W. Baldwin & Co. for the Allegheny Portage Railroad, and came into possession of the Pennsylvania Railroad Co. in 1857 with the other state improvements. It had been rebuilt at Altoona a short time previous to the experiments in smoke-consuming, and was fitted with the coal-burning firebox of Gill & Co., also illustrated in the preceding article. This device consisted of a water space forming a diaphragm or deflector extending with an upward slope from the

front of the firebox to within 16 in. of the firedoor, and thus forming an air chamber under the crownsheet. This deflector was formed of two sheets of copper placed 4 in. apart and stayed by means of 600 hollow stays with openings through them of three-sixteenths of an inch in diameter and a roof of firebrick two inches above it. In front of this, and extending from the front of the firebox a distance of 30 in. into the barrel of the boiler, was a combustion chamber and in this was placed a bridge at a distance of 24 in. from the flues and rising to within 10 in. of the top of the chamber. Two bridges also surmounted the diaphragm, both rising to a height of 8 in. The firedoor was double and contained 333 holes, each one-quarter of an inch in diameter in the inner plates, and a number of large holes in the outer plates. A blower and tight-fitting ash-pan dampers were used. The chimney was straight and unobstructed by any spark-arresting device whatever.

The Gill device on 206 proved best adapted to the purpose of all. With Broad Top coal only a tinge of smoke was visible at any time, and with Pittsburgh coal very little more appeared, and that no greater than shown from pine wood but without the acrid properties of the latter. With this engine the smoke would never have amounted to an annoyance to passengers if used in that service. This remark will also apply to engines 120 and 210 to a great extent.

With 206 the point is reached which is directly opposite to that shown in the first engine considered, No. 139. In this engine a large amount of air was necessary to reduce the smoke perceptibly, while with the 206 the reverse was found to be the case.

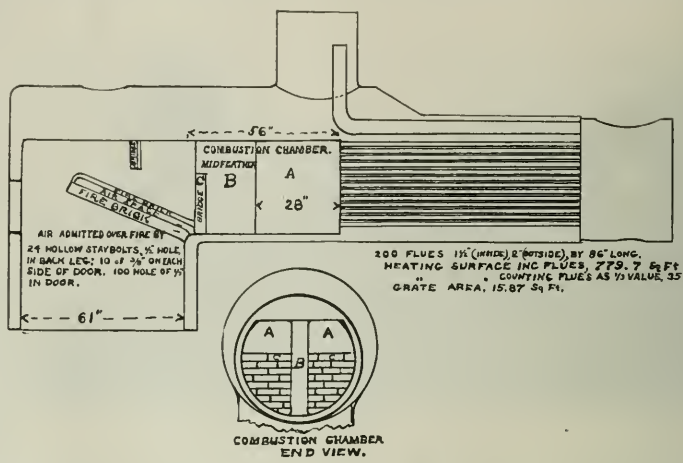
The information gained from these tests proved that the admission of air for the proper combustion of the gases must enter above the fire, and for the coke produced in combustion must enter under the grate bars.

The air to aid in the combustion of the gases must enter through small holes at a great velocity, and at the earliest possible moment after these gases are evolved to ensure a thorough combustion.

It was further developed that mechanical devices to properly admit air to the gases and mix it with them were very desirable, and that this mixture of gases and air should be afforded as large a "run" as possible before passing into the flues.

The general results of these experiments may be summed up as follows:

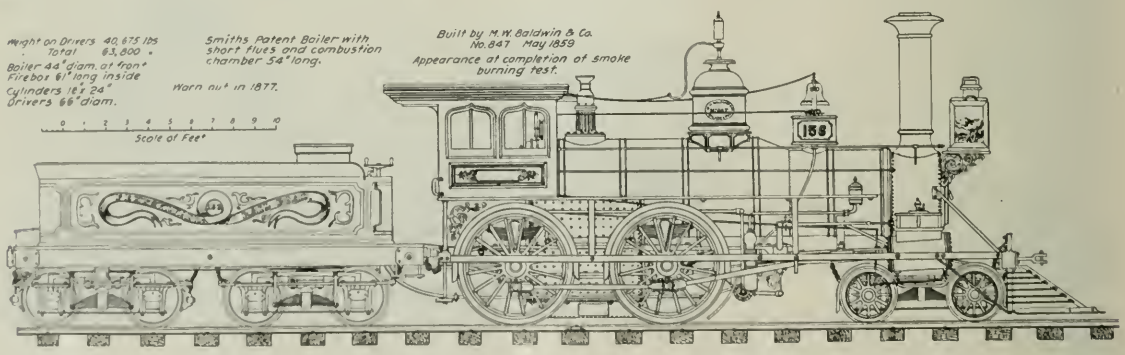
First.—In the order of comparative freedom from smoke, engine 206 is first; Phleger, 210, second; Blue Ridge, 120, third; Dimpfel, 190, fourth; Camel, 51, fifth, and Baldwin, 139, sixth.



Firebox and Boiler of No. 156.

three pounds of wood were equivalent to one pound of coal, and on the longer but less arduous Mifflin trip, two and one-half pounds of wood were equal to one pound of coal. A special experiment demonstrated that one pound of coal was equal to two and thirty-one one hundredths pounds of wood, but as the heat developed in kindling is necessarily left in the engine at the end of the trip, the ratios of one-third and two-fifths are believed to be more nearly the correct figures, both absolutely and for purposes of comparison between the engines used in the test. The quantity of wood used in kindling the fires was nearly the same for each engine, viz., from 300 to 500 lbs. No account was taken of the deposits left on the grates at the end of the trips. This varied from 100 to 500 lbs., but it would have been impossible to correctly estimate this mixture of coal, clinker and ashes.

In the railroad practice of that epoch each engine had its own engineman and fireman, and these men naturally became so accustomed to their respective machines that they could obtain better results from them than from others, even of the same type. In these trial runs the enginemen were not always on their own engines except in the case of three, and the firemen were also different except on the Gill and Dimpfel (206 and 190) engines. Some of these men were also unfamiliar with the portions of the line upon which they handled the experimental trains, and these facts in



No. 156, at Completion of Smoke Burning Test.

Secondly.—The first four, with some modifications to 210, could be used for passenger trains with Broad Top coal.

Thirdly.—The Gill plan, 206, is the only one which can be run as constructed for the trials, with Pittsburgh coal for fuel on passenger trains. Phleger, 210, however, might be brought up to this standard by arranging the openings in the firedoors and sides of the firebox to properly increase the admission of air.

In freedom from sparks and cinders the order was somewhat different, being: First, Phleger, 210; second, Blue Ridge, 120; third, Gill, 206, and Dimpfel, 190; fourth, Baldwin, 139, and last, Camel, 51.

It was also found that on the short but severe mountain trip connection with other conditions are stated in the report as somewhat against accepting the results as thoroughly reliable standards of the comparative heating value of the two coals, as the unfamiliarity of the men with some of the engines and with some parts of the line would naturally affect the economical use of fuel. The table compiled from data contained in the report and from other sources will convey a fair idea of the two parts of the road on which the trains were run, while another table collated from the report and from other Pennsylvania Railroad literature, furnishes the principal dimensions of the six engines participating in the trials.

It has been ascertained that on the Allegheny mountain trips

with six locomotives using Pittsburgh and Broad Top coals on alternate days, each engine consumed 148.25 lbs. of Pittsburgh coal per mile and evaporated 6.22 lbs. of water to each pound of coal, while with Broad Top coal the consumption was 143.83 lbs of coal per mile, with an evaporation of 6.02 lbs. of water to each pound of coal.

On the Mifflin trip the consumption of Pittsburgh coal averaged 48.67 lbs. to one mile, and one pound of this coal evaporated 8.01 lbs. of water, and 45.14 lbs of Broad Top coal were consumed to the mile, with an evaporation of 8.27 lbs. of water to each pound of coal

These tests having been made with Pittsburgh and Broad Top coals, the difference in heating values having been ascertained, and the cost of each coal varying considerably with the proximity of the different divisions of the road to the source of supply it was deemed best to confirm the results of these trials by separate tests with two engines of widely different characteristics and by a chemical analysis of the two kinds of coal.

This final test was made between Altoona and Mifflin with engines 206 and 139, the trips covering a period of eight days and using Pittsburgh and Broad Top coal on alternate days. The entire distance run was 660 miles; the road, train and engine crews were the same throughout, the same care as on the former tests was taken to accurately weigh the fuel and measure the water; the weather conditions and temperature continued uniform. The resulting general averages were 39.43 lbs. of Pittsburgh coal consumed to the mile, and 39.19 of Broad Top, with an evaporation on the former of 8.21 lbs. of water to 1 lb. of coal, and 8.29 lbs. of water to 1 lb. of Broad Top coal, a difference of three-fifths of 1 per cent. on consumption and ninety-seven one hundredths of 1 per cent. on evaporation in favor of the Broad Top coal, but really leaving the inference that practically no difference existed between the two coals in the two features named, as the different lots of the same coals often varied sufficiently to cause a greater variation either way.

The Pittsburgh coal used in the trials was taken from the railroad company's storage bins, being the same as was used for all engines, but the Broad Top on account of its greater susceptibility to deterioration under lengthened exposure to the air was mined for the experiments.

The feasibility of using bituminous coal in the fireboxes of passenger locomotives having been demonstrated, the problem which next presented itself was to ascertain the comparative economy in the use of wood and coal in such service. To estimate correctly the relative heating value of a ton of coal and a cord of wood, the relative cost of the same delivered on the tender, and the increased cost of engine repairs due to the substitution of coal for wood, a new passenger engine which was believed to be especially fitted for such a test was selected. It was No. 156, built in May, 1859, by M. W. Baldwin & Co., with a Smith, or "Hudson River" type of boiler. The peculiarities of this boiler were a large, deep firebox, a combustion chamber 4 ft. long, and a considerable admission of air through 24 hollow staybolts in the back leg of the firebox and about 100 perforations in the door. All these apertures were ½ in. in diameter, and in addition to these were 10 air openings on each side of the door. These were three-eighths of an inch in diameter. The combustion chamber was divided for half its length into two compartments by a longitudinal midfeather 6 in. wide, beginning at the firebox end of the chamber. The stack used at first was of the ordinary balloon type with cone and netting as used on most of the company's engines at that time. A variable exhaust was also used. The principal dimensions of 156 were as follows:

Cylinders	16 in. x 24 in.
Driving wheels (feet)	6.66
Heating surface, including flues	779.7 sq. ft.
Heating surface, counting flues as one-third value	259.7 "
Grate area	15.87 "
Flues, number	220
" length	86 in.
" diameter, inside	1¾ "
Weight on drivers	19,675 lbs.
Weight, ready for service	63,500 "

The trials of 156 were first made on the mountain grade already described, between Altoona and Gallitzin, 12 miles, and on account of its heavy grades being considered equal to an ordinary piece of railroad four times as long. Four loaded eight wheel box cars were used, and both train, enginemen and firemen were the same during all the tests. The weight of the train was:

Cars	34½ net tons
Load on cars	37 "
Total weight of train	71½ net tons
Total weight of train, engine and tender	118 net tons

The engine had shown itself to be an excellent wood-burner in a previous short service on the Philadelphia division, but was not satisfactory when tried with coal until a perforated firebrick deflector, a hanging bridge of firebrick immediately over the deflector, and another bridge of similar material in the firebox end of the combustion chamber had been added. The cone and netting were also removed from the stack, and after these alterations the

engine had practically the Gill arrangement of firebox in an improved form.

The results obtained are embodied in the following table:

Fuel.	Miles.	Average—Consumption of fuel.	Average—Water evaporation.
Pittsburgh coal	12	1,073 lbs.	6,480.93 lbs.
Dry oak*	12	2,483 "	6,748.0 "

*Chiefly white oak, 3,500 lbs. to the cord.

From this data is shown, first, an average consumption of 81.92 lbs. of Pittsburgh coal per mile against an average of 206.92 lbs. of hard wood per mile, and from this was derived the estimate of 1 lb. of coal being equal to 2.31 lbs. of hard wood in heating power.

The second point established was that taking the weight of 128 cu. ft. of hard wood at 3,500 lbs. it follows that one net ton of coal is equal to 1½ cords of wood.

The third point was that taking the evaporation of water as a standard, we have for 1 lb. of Pittsburgh coal an average evaporation of 2.72 lbs. of water—which would make 1 lb. of coal equivalent to 2.22 lbs. of wood, and one net ton of coal equivalent to 1.27 cords of wood.

On account of this experiment with 156 being made on a short run, and on the 95-ft. grade which rendered the accuracy of measurements of water in the boiler by the gage cocks only, somewhat problematical, and from other reasons referred to in the report, it was deemed wise to "assume as a basis of our calculations that 1 lb. of Pittsburgh coal is equivalent in heating value to 2.31 lbs. of hard wood, and that one net ton of coal is equal to 1½ cords of hard wood."

It is also stated at this point of the report that the comparative value of good hard wood, in connection with experiments in the use of coal and wood on other railroads, had up to that time been

generally underrated, but various reasons are assigned for this, the chief of which is that the trials of the two fuels on those lines were made with different engines, of which those used with coal were new and possessed features giving a more perfect combustion of any fuel, and thus affording the coal burners the advantage among other things of a combustion chamber, which is equally adapted to improve the results obtained from a woodburner as from an engine fired with coal. The report states further that "as our result was obtained by the use of two kinds of fuel in the same engine (the combustion of both wood and coal being nearly perfect); the engineer and fireman, train, road, speed, condition of rail, weather, etc., being uniform, and the wood selected of one quality and carefully measured, I believe that it may be relied upon as practically correct." The relative cost of a cord of wood and a ton of coal varied on the different divisions of the road but was averaged at $3 per cord of 128 sq. ft. for hard wood, $1.84 per ton for Pittsburgh coal (2,000 lbs.) delivered on the tender; $2.22 for Broad Top coal, and $1.78 per ton where Pittsburgh coal was used on one part of the line and Broad Top on another.

Having by this test of 156 arrived at the comparative heating value of coal and wood in passenger locomotives, with the cost of each on the various divisions of the road, and having satisfactorily tested the practical working of a coal-burning passenger locomotive in all conditions of service, No. 156 was next run in both directions over the various divisions of the road on regular passenger trains. In these trips different enginemen ran the engine over the different divisions, but on account of the other passenger firemen being unaccustomed to the use of coal, her own fireman attended to her over the entire road.

The analyses of the Broad Top (semi-bituminous) and Pittsburgh (bituminous, or gas) coal made by Professor James C. Booth, of Philadelphia, Pa., at the time of the tests, are as follows:

General Analysis.

	A (Broad Top) Barrel vein.	B (Pittsburgh) Irwin, Pa.
Water	0.30	1.30
Bituminous matter	17.55	31.45
Fixed Carbon	74.65	61.45
Ash	7.50	5.80
	100.00	100.00

Organic Analysis.

Carbon	79.59	78.26
Nitrogen	1.39	1.67
Hydrogen	4.35	5.20
Oxygen	5.02	6.73
Water	0.30	1.30
Sulphur	1.85	1.04
Ash	7.50	5.80
	100.00	100.00

Heating Power.

1 lb. Broad Top coal heats 77.16 lbs. water from 32 to 212 deg. F.
1 lb. Pittsburgh coal heats 78.96 lbs. water from 32 to 212 deg. F.

Thus the results of the trials and of the analyses are found to agree quite closely.

As to which of the five smoke-consuming devices tried would be best adapted to apply to the rest of the company's equipment, the conclusion reached favored the modification of the Gill arrangement as was used in 156, as it could be applied for $660, if engine were taken out of service to make the change, or for $500 if deferred until coming in for new firebox. As the inventors of the Gill device were Pennsylvania Railroad employees they offered the company the free use of the patent during its continuance, hence the features retained in the plan used on 156 would incur no risk of infringement.

This arrangement was found by an experiment with a woodburning passenger engine 135, recently illustrated in the *Railroad Gazette*, to give very fair results on coal without the use of a combustion chamber, and therefore would enable the existing equipment to be quickly adapted to the use of coal with no especially annoying result to passengers, and to run until extensive repairs warranted adding the chamber.

The "Blue Ridge" arrangement also commended itself from a standpoint of economical application, and excellent work on semi-bituminous coal; and the Phleger and Dimpfel each from various features, but the results in their case did not appear to offset the high cost of changing old engines to such designs, nor was it probable that they would continue free from the need of costly and frequent repairs.

TABLE 3. *Average Cost of Hardwood and Coal Developed from Tests of Six Freight and One Passenger Locomotives.*

Fuel	Passenger.	Freight
Hard wood per cord of 128 cu. ft.	$3.00	
Pittsburgh coal per 2,000 lbs.	1.84	$2.30
Broad Top coal per 2,000 lbs.	2.22	3.03
Above coals mixed, per 2,000 lbs.	1.78	

These prices are delivered on engine tender at any point between Pittsburgh and Philadelphia.

One system of practice which afterward was adopted and followed by the company for a long time was suggested, viz., paying a premium to enginemen and firemen on all fuel saved over the maximum amount fixed for each engine's use within a certain time. Another suggestion which is just as pertinent to-day as then was that firemen use good judgment in firing as not only could a higher degree of perfection in burning the gases, etc., be attained, but also a greater economy in the use of fuel with better results in all types of engines.

The performances of 156 were so satisfactory that no new wood-burning passenger engines were afterward built for the company; and as rapidly as those already in service came in for general repairs or new fireboxes, they were changed to coal-burners with smoke-consuming devices, until by 1865 all except a very few had been so dealt with.

The trouble which arose from the use of the open straight stack allowing large cinders to be ejected at times with consequent frequent setting fire to property along the line, led to the use of the Laird stack about the middle of 1862. This stack having a cone, and a piece of netting extending downward for several inches below the opening above the cone, somewhat vitiated the perfect burning of the smoke and gases, but results were still fair, and passengers had also become accustomed to the fuel, so the coal-burning passenger engine had come to stay.

The writer has at no time found records of experiments in this line on any other road so carefully conducted as those which have been drawn on so freely for this article, and much yet remains embodied in the report which is interesting and profitable; indeed my efforts may be considered as but a superficial review of the whole matter, yet withal it is to be hoped that this reference to them may be of use to some railroad official who is desirous of solving the "smoke problem," and may also afford a pleasant satisfaction to General W. J. Palmer, who by his unflagging zeal and attention to their every detail, united with a careful recording of the same, has preserved them for the good of those who guide the performances of the iron horse to-day.

Controlling Earth Slides.*

BY H. ROHWER,
Consulting Engineer; Late Chief Engineer, Missouri Pacific Railway.

Earth slides are formed when masses become disconnected, and hang on a slope steeper than the plane of friction due to the character of the material and its resistance to movement. Water being one of the most influential elements in reducing this resistance to a minimum, it is well to provide for proper drainage before slides set in. The golden rule is to "keep the water away from the roadbed." It is well-known that the study of geology is frequently overlooked by the engineer in charge of location, and he often gives but little attention to the possibility of encountering slides caused by either the grade or location of line. Drainage is of so much importance that the line, circumstances permitting, should be located where drainage can be rendered most effective, allow sun and wind to act upon the roadbed, and pay close attention to the manner

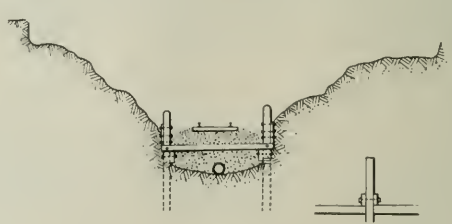

Fig. 1.

of building it. One very important factor is the selection of the material to be employed in making fills.

When investigating the cause of slides in an embankment of one of the main trunk lines in the Middle West, constructed about the year 1861, the writer found the slopes considerably deranged. The embankment, about a quarter of a mile long and over 22 ft. high in the middle, was continually settling, and notwithstanding the attention given it by the operating department, this settling continued. Trackmen, when called upon to remedy similar breaks, usually apply stone, which on account of the greater weight, increases rather than diminishes the evil and the cause of the slide is thereby not removed. The method employed not being effective, piles were driven and a bridge built along and over the fill for such distance as was deemed necessary. As the piles did not rest in original ground, they swayed to and fro, and the maintenance of the line and grade became a matter of great annoyance and cost. About the time this pile bridge required renewal, the writer was asked to make an investigation of the trouble and to recommend what should be done to improve the safety of the road, and, if possible, prevent the slides and dispense with the trestle.

In digging a trench on each side of the track along the foot

*Reprinted from *Bulletin No. 90* of the American Railway Engineering and Maintenance of Way Association.

of the slope and parallel with the track, considerable seepage from the bank poured forth, leading to the belief that the water was retained in the bank by some cause or other, and was seeking an outlet. The writer then had intercepting drains dug, extending towards the center of the embankment at intervals of 25 to 50 ft., according to the amount of water apparently confined in the embankment. The drains were then filled with stone—the heavier stone at bottom and the lighter stone on top—covered with cinders. This accomplished the draining of the embankment and rendered it stable so that the trestle could be removed, and no further difficulty at that point has been experienced.

In prosecuting this work, the drills were extended into the center of the embankment, and it was discovered that a number of partly decayed logs were embedded therein. Upon inquiry it was ascertained that the contractor at the time of construction had logs hauled in at night, and one of the farmers, residing in the

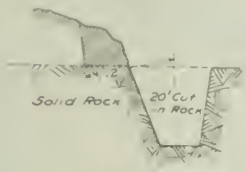

Fig. 2.

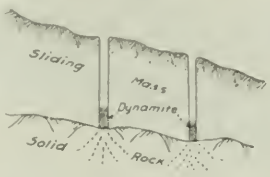

Fig. 4.

vicinity, informed the writer that he had been one of those employed to perform that work. The earth on the outside covered up this deception and the water was retained in the inside of the embankment, softening the material dropping into it. With the heavier material on top, the soft material was forced to the sides, and thus creating slips or slides. In the case above cited, the slide sounded a timely warning, so that the proper remedy could be employed. However, crevices formed *under* the roadbed are much more dangerous, the latter producing slides without giving notice. This is often the case where the roadbed rests on the debris hanging on the side of bluffs, especially when bordering on a treacherous stream like the Missouri river.

Water coming down ravines can be readily conducted across the roadbed by bridges or culverts, but in such cases care must be exercised as to outlet. However, water falling on the sidehill between ravines or creeks and dropping from bluffs into the debris where it cannot readily be intercepted, will enter the roadbed, penetrate the underlying loose strata and find its way over and along the harder strata, thus creating earth slides. This water keeps the

Fig. 3.

ground under the track in a constant moist state, which is a menace to the safe operation of the road. Oftentimes it will form crevices, and when once formed they will increase and may reach to the very surface, only to be discovered after a wreck has occurred, and are then usually termed "a washout." Again, the water may soften the material until it becomes slushy and will produce a slip at the foot of the lower slope. Borings made by the writer over a distance of seven miles on parts of tracks so situated developed the fact that the roadbed developing such defects was invariably located directly against a bluff or perhaps resting on material underlaid by slanting rock, which rock forming a part of the bluff had been eroded by the action of the water, either river or surface, or both combined.

If the water is collected at frequent intervals and conducted across the track either by means of small boxes (if pipe cannot be utilized) or conveyed in open ditches plastered with cement or rammed with small stone so as to prevent the water from penetrating into the roadway, the danger referred to can be greatly diminished.

Drainage is the most essential factor in creating and maintaining a good roadbed; and is most often neglected. After we have discovered the effect and are forced to face the consequences of a badly drained roadway we form [illegible] only to abandon them again as soon as dry weather sets in, for the temptation to make a good financial showing is often too strong to be overcome; we will not carry an umbrella while the sun shines nor prepare for war while living in peace, but rather charge it up to accidents or to an "act of nature," unavoidable and unforeseen, place it under that heading and foot the bill, taking credit for (false) economy.

Slides occurring in cuts during construction and later are oftentimes caused by surface ditches, giving the water an opportunity to enter the ground instead of draining it off to the sides. After the water once enters the slopes, it is very difficult to drain them, and every rain will have a tendency to increase the difficulty.

At the west entrance to the Oregon Short Line Tunnel in Idaho, where the sides broke off vertically and heaved the track at times to such an extent as to seriously interrupt and delay the handling of material from the tunnel, the writer applied with good results ordinary horizontal bracing, in the manner shown in Fig. 1.

The most remarkable slide coming to the notice of the writer was encountered on the White River Railway, at the entrance of tunnel No. 3, at Omaha Drive, Ark., its magnitude precluding all thought of removing it. The disturbance first manifested itself at what might be termed a sidehill cut. In removing the footing, the mass of clay seemed to lose its hold on the rock whereon it rested, and began breaking off, first showing cracks insignificant in size and confined to the right-of-way, but later reaching far out into the adjoining hills, bringing down trees and forming breaks in the surface 15 to 25 ft. in height and perpendicular in appearance.

The Omaha tunnel (2,650 ft. long) penetrates a sag in the Ozark mountains, consisting of a so-called boulder formation, lime and rock being found intermixed with clay, a hydrated silica of alumina of brownish color, due to the presence of iron oxide. This clay is very plastic, especially so in the approaches where action of water is not constant as in a tunnel. Here the layer of clay was from 5 to 100 ft. thick, underlaid with a strata of solid rock of smooth surface and slanting at an angle of from 5 to 10 deg. toward the creek along which the line had been located.

The grade of the roadbed entered the rock 20 ft. below the surface; in other words, the approach to the tunnel has a 20-ft. rock cut with clay in the overlying slope.

As soon as cracks appeared on the surface, extra precautions were taken against surface water. The surface ditches were given steeper grades, and, where possible, bottoms were cemented so that the water could drain off more quickly, thus reducing chances of penetration to a minimum.

In spite of this the ground continued to break and started to move toward the open cut, at first dropping into it little at a time, gradually increasing until after a rather heavy rain the entire cut filled up with this stuff, involving an expenditure of $1 per cubic yard for its removal. Though the moving masses had adopted a slope of nearly two horizontal to one vertical, the breaks continued, stretching for more than 150 ft. into the hill above the grade of the roadbed, and over 500 ft. distant from same.

To prevent similar occurrences during the time of operation, involving delay and expense, the writer had the rock cut arched over for a distance of 600 ft. from the portal of the tunnel. But an arch, framed of timber in order to furnish clearance, without protection against "side pressure," cannot be relied upon as a permanent safeguard against slides. To make it serve, however, should the mass continue to move, the clay bank was removed for a distance of 12 ft. from the edge of the rock cut (see Fig. 2) and holes were drilled into the rock 8 to 10 ft. deep, and from 10 to 15 ft. apart in a row along the foot of the new bank, shots being placed therein and fired simultaneously by means of an electric battery. The rock was broken but not scattered, a trenchlike crack appearing at the surface. The writer then had logs cut from the timber, of which an abundance was found in the immediate neighborhood, and these logs were placed alongside each other with the butt end in the rock crevices, the other end overhanging the timber arch, and resting upon its top (see Fig. 3).

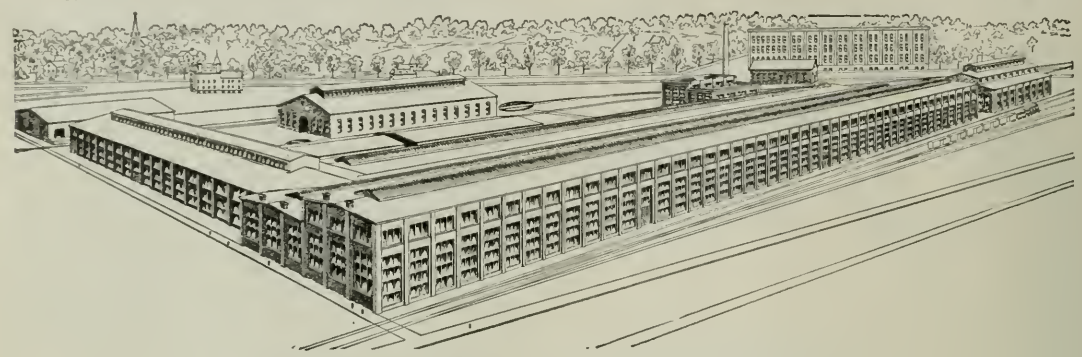
The material under the logs and between the logs and the arch was tamped, thus forming a solid flooring over which the material could slide, as was contemplated, distributing it over the entire arch and serving as weight instead of a thrust. The further object of cracking the rock was to permit the water coming through the clay to escape, thus leaving the footing dry and in better position to act as a support. The plan worked very satisfactorily. The first rain produced another slide, the logs carrying the material over the arch. With the drain in the rock at a distance of 12 ft. from the edge of the cut and over 30 ft. from the foot of the new slope, a good foothold had been created which served the purpose, for no further movement of the overhanging masses (estimated by the engineer in charge as reaching the enormous quantity of 130,000 cubic yards) has taken place since that time (1904), now three years ago. The few sticks of timber in the arch which had moved were displaced not more than an inch.

This experience has led the writer to the conclusion that many similar slides formed by masses moving along a rock surface might

be checked by boring holes down to rock, lowering dynamite and breaking the surface by means of blasts (see Fig. 4), and actual practice has confirmed this view.

The New Shops of the Grand Trunk at Stratford, Ontario.

The Grand Trunk is now building new shops at Stratford, Ont. The general layout is shown below in the accompanying engravings. In the foreground are the large machine and erecting shop, 616 ft. x 75 ft., and at right angles to it the boiler shop, 154 ft. x 135 ft. The construction of these is now being



General Layout of Proposed Grand Trunk Shops at Stratford, Ontario.

rushed as fast as possible, and it is hoped to have 15 bents under cover and in operation this winter. These two shops occupy nearly three acres of floor space. The small building at the extreme left is already built and is used for repairing locomotive tenders.

The buildings in the background are proposed additions to be made later. They are, from left to right: Storehouse, 60 ft. x 200 ft.; blacksmith shop, 100 ft. x 300 ft.; power-house, 90 ft. x 90 ft., and foundry, 110 ft. x 140 ft. These buildings will be put up in order of their importance after the machine and erecting shop is well under way. The old machine shop, which is being torn down in sections as fast as the new shop is erected, occupied part of the space covered by the new building.

The ground required some filling and levelling before beginning construction work. In the foundations of the new boiler shop and part of the new machine and erecting shop, concrete piles were used. These piles were driven from 15 ft. to 18 ft. below the average surface of the ground to provide sufficient bearing power for the foundations. The walls of the buildings are reinforced concrete with the outside surface finished.

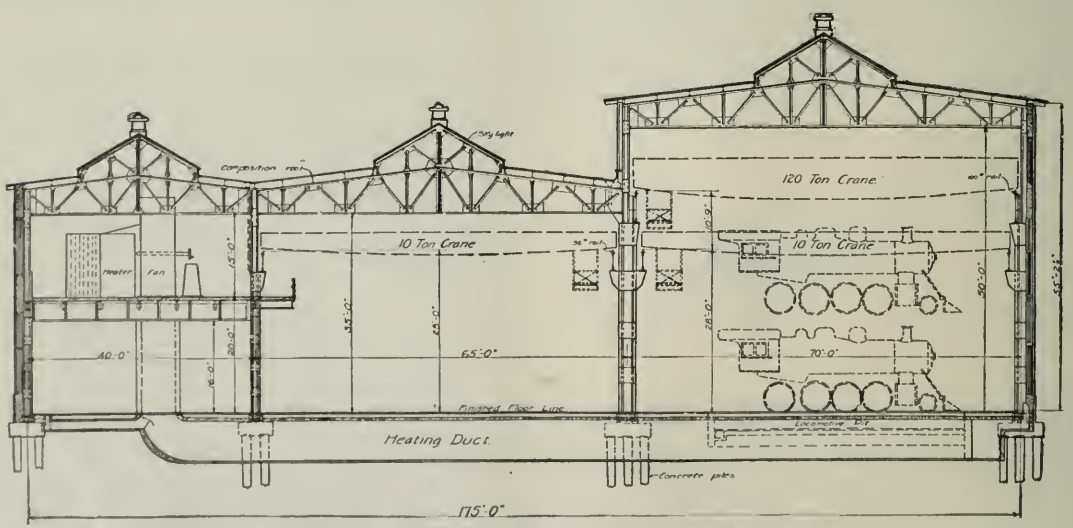
Individual electric drive is to be used for most of the large machine tools. Belt drive will be used for the smaller machine tools. Compressed air is to be used for driving the riveting machines, chisels, the turntable motor and for forge fires, blowing out engines and painting. The new shop will be able to repair 28 engines standing over pits at the same time. The layout is so arranged that the capacity can be increased if more space is needed in the future.

The heavy lifting work is to be done by a 120-ton electric traveling crane that spans the engine pit bay. In the cross section through the center of the machine and erecting shop, shown herewith, this is shown lifting a heavy consolidation locomotive and carrying it to a repair pit. In the same bay with the large crane and directly below it is a 10-ton electric crane for handling lighter work.

The heating ducts shown under the floor line distribute warm air from a heater on the balcony floor. Exhaust steam from the power house and from the fan engine is to be used in the heater coils.

Individual lockers for the shopmen are to be provided. In some cases these lockers will be portable so that men working on odd jobs around the shop can move the lockers near their work. There are to be drinking fountains with a continuous flow of artesian water throughout the shop. At night the shops will be lighted by mercury vapor lamps.

The engineering and construction work is under the supervision of the Arnold Company, Engineers and Constructors, Chicago, Ill. The work is under the authority of E. H. Fitzhugh, Third Vice-President of the Grand Trunk, and designs are subject to his approval as well as that of W. D. Robb, Superintendent of Motive Power. R. Patterson, Master Mechanic of the Grand Trunk at Stratford, has had a large share in helping along the construction work and has been notably successful in carrying on the necessary repair work on locomotive boilers while the new work was under way. He is also at present designing the machine tool layout. The concrete piles were furnished by Davidson & Von Auelberg of Montreal. The foundation concrete work is under the charge of George Mitchell, Master of the Bridges and Buildings Department of the Grand Trunk. The structural steel is being fabricated and erected by the Canadian Bridge Company, of Walkerville, Ont. B. V. Hole, of London, Ont., has the general building contract.



Section of Machine and Erecting Shop Now Building; Stratford Shops of the Grand Trunk.

GENERAL NEWS SECTION

NOTES.

The Alabama Railroad Commission has invited the railroad commissioners of the states around Alabama to meet with it and discuss the question of state regulation of railroad rates.

The Railroad Commission of Alabama has announced the suspension of all cases at issue before the board affecting railroad rates until the powers of the commission shall be more clearly defined.

The Western Union Telegraph Co. has declared a dividend of 1½ per cent., payable in stock. At the present market price, the dividend amounts to about 55 per cent. of what it would if paid in cash.

Officers of the Southern Pacific in Texas say that the double daily passenger train service between New Orleans and San Francisco, discontinued last spring, will not be resumed this month, as had been announced a few weeks ago.

Street cars with very large rear platforms, arranged to permit the collection of fares as passengers enter, are to be tried not only in New York City but also in Buffalo and in Chicago. In Chicago a number of these cars are already in use.

It is said that the order of the Chicago, Milwaukee & St. Paul, given about three weeks ago, dismissing some of its traveling freight and passenger agents in eastern states, has already been rescinded, and the men restored to their former places.

The State Railroad Commission of Missouri has announced that from January 15 it will require the express companies of the state to reduce their rates according to a tariff to be issued by the commission this week. This tariff makes reductions of 20 per cent. and more in the present rates.

The Atlantic Coast Line has agreed to put in effect the reduced passenger and freight rates ordered in Alabama on the same conditions under which the Southern and other companies adopted the reduced rates some weeks ago. Press despatches from Montgomery say that all of the injunction suits will be considered by the courts on January 6.

The indictment against Ira A. McCormick for manslaughter, in connection with the derailment at Williams Bridge last February, has been dismissed, the district attorney having asked the court to take this action in order to enable him to compel Mr. McCormick to testify against General Manager A. H. Smith, who was indicted at the same time. The trial of Mr. Smith began in New York City on Tuesday.

The Mexico-St. Louis Special has been put in service for its third season. This train, running over the Iron Mountain, the Texas & Pacific, the International & Great Northern and the National of Mexico, leaves St. Louis Tuesdays and Fridays and the city of Mexico Tuesdays and Saturdays. The time through is about 65 hours. The trains are vestibuled throughout and they have dining cars all throughout the journey.

On the Pennsylvania Railroad in October there were 2,215 surprise tests, with a record of 98.8 per cent. satisfactory. Fifteen divisions showed a percentage of 100 per cent. On the New York division out of 77 tests there was but one failure; out of 952 tests on the Schuylkill division there was but one; out of 102 on the Buffalo division there was none. All the failures were slight, the engines passing the signals only a few feet.

The St. Louis & San Francisco is to use the electric train staff on two block sections near Birmingham, Ala. Interlocking signals are being put up on this road near Kansas City, at the junction with the M., K. & T.; at four places in Louisiana, and at Beaumont, Tex. All home signals will be worked by rods and all distant signals by electric motors. Semaphore train-order signals have been put up at a large number of stations on the company's lines.

The Erie Railroad has given notice of withdrawal from the Central Passenger Association. The action of the Erie in reducing its second-class rate eastward from Chicago to New York to $10 which went into effect a few weeks ago, and which was followed by the Grand Trunk and the Wabash, is said to have been due to the belief on the part of the Erie that other lines were paying commissions; and commission payments are forbidden by a rule of the Central Passenger Association.

The New York State (Albany) Public Service Commission, in a decision affecting the Rockland Railroad Company, defines the understanding of the Commission relative to the law requiring a street railway to begin construction within a certain time after receiving from the state a certificate of convenience and necessity. Attempts to obtain local franchises are not a beginning of construction, neither are surveys and engineering work done before the granting of the certificate. It is said that this decision affects at the present time only street surface railroads, as all steam railroads have had their time extended by a special act of the legislature.

At a competitive exhibition of "First aid to the injured" recently given at Lekerman, Pa., "first aid" teams of the Hillside Coal & Iron Co. and the Pennsylvania Coal Co. exhibited their methods of removing a man from a live electric wire, of carrying a man over a fence on a stretcher; of a similar performance where there was a rock obstruction, and of carrying an injured man on a stretcher over a car of coal with limited head room. Each performance took from 1½ to three or four minutes. *Mines and Minerals* for December prints half tone photographs taken during these exhibitions.

The Supreme Court of the United States, deciding a case which arose in South Carolina, holds that the Atlantic Coast Line need not comply with the wishes of the citizens of Latta, S. C., who desired to have the privilege of flagging two fast mail trains which pass through that town daily. The State Railroad Commission ordered that stops be made whenever the flag was displayed, and the state Supreme Court sustained the commission. The railroad, however, took the case to the Supreme Court of the United States and now, in a decision by Justice Peckham, the railroad is sustained. The court holds that the proposed action would be an interference with interstate commerce.

According to a press despatch from St. Louis the Rock Island and the St. Louis & San Francisco roads on January 1 will abolish separate freight soliciting offices at Oklahoma City, Wichita, San Antonio, St. Louis, Chicago, Kansas City, Memphis, Dallas, Fort Worth and Houston and passenger offices at Kansas City, Wichita and Oklahoma City. One force at each of these cities will attend to the business of both roads. At St. Louis the 'Frisco employs four freight solicitors and the Rock Island three. The force will be reduced, probably to four, and it will represent both roads. It is said that few men will be dismissed, but several agents will be reduced in rank and salary and may be assigned to other work.

Following an informal hearing before the Interstate Commerce Commission at Washington last week, the New York, New Haven & Hartford has been requested by the Commission to postpone for at least 90 days the taking effect of its notice canceling through rates on freight from the Central of New Jersey and other western connections by way of New York City. The Commission makes this request with the purpose of enabling the communities, shippers and carriers affected by the proposed action to determine what course they will pursue with respect to the future movement of the traffic involved. President Mellen, of the New Haven road, has signified his willingness to make any reasonable postponement asked for by the Commission. The Central of New Jersey wanted the Commission to ask a Federal Court to enjoin the proposed action of the New Haven, but the Commission declined to do so.

The Chicago Association of Commerce, in its weekly paper, gives the records of some of the "through package cars" which are being run from Chicago to a number of southern cities, in response to a request of the association. As noted recently in the *Railroad Gazette*, the association has issued a pamphlet informing shippers how they may take advantage of these special freight cars in shipping to any town in the southeastern states. The records published in the last issue show that cars to Montgomery, Ala., ran through uniformly in three days; to Mobile, three days; to New Orleans, five, seven and eight days, and to Macon and Augusta, four days. The time is given, however, in even days, so that the reader is left in the dark as to whether the goods could be delivered on the third day. To Jacksonville, Fla., the time appears to average better than to New Orleans, six cars to Jacksonville arriving in an average of 5⅝ days.

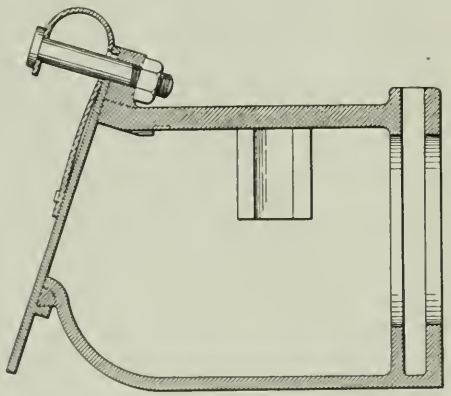
The New York Central announces that beginning next Sunday the Twentieth Century Limited Express trains will be scheduled at 19½ hours between New York and Chicago instead of 18 hours, the present schedule. Westbound the train will leave New York at 3 p.m., Eastern time, and arrive in Chicago at 9:30 a.m., Central time. Eastbound the train will leave Chicago at 1 p.m. and arrive in New York at 9.30 a.m. This is called a "winter schedule," which implies that in the spring the 18-hour schedule will be resumed. An officer of the Pennsylvania has said that that road will make no change in the schedules of its 18-hour trains. The Central's announcement says that the change is made in compliance with the wishes of patrons, "as expressed by petition and individual request." It is said that the object of the company is to avoid the disturbances of the schedules which are likely to be caused by snow storms in central New York. To run from New York to Chicago, 964 miles, in 19½ hours, the train will have to make an average of 49.4 miles an hour.

In about 558,000 records of freight car deliveries received on

junction card reports by railroads in the eastern states, in the month of May, the receiving roads found 14,000 errors and 21,000 omissions, or 6.3 per cent. of defects. The largest numbers of errors were made in the cases of roads the initials of which are the same as those of other roads, or so nearly like them as to lead to errors. These figures are published in the *Railway Equipment Register* as a part of the report of the last meeting of the Eastern Association of Car Service Officers. In the cards received by the Boston & Albany the percentage of errors to the total number of items was 19.6; on the Intercolonial, 25.1 per cent.; Maine Central, 17 per cent.; Pennsylvania, 5.8 per cent. In the same report a number of roads include statements of junction reports received by them not properly addressed and reforwarded by them to the proper addressee. The Pennsylvania, for example, received 3,468 reports which did not belong to it, and received 4,301 of its own which had first been sent to some other road and reforwarded. This last statement seems to refer to the number of cards, while the one first mentioned refers to the number of items on cards.

An Improved Journal Box.

An improved design of journal box on which patent has recently been granted is shown herewith. Its special feature is a lid of the swinging or pivoted type, arranged to remain in any position when open, and when closed to be secured in position to prevent accidental opening. The lid is flat, with an upper lug or extension for pivoting to a corresponding lug on the journal box, and a lower lug or handle by which to swing it. The lower under side of the lid has a curved rib which engages a circular ledge or lip under the lower edge of



The Sorensen Journal Box.

the box opening concentric with the lid pivot pin. The adjacent surfaces are slightly dove-tailed, and on the ledge of the box, at the center, is a small lug which engages a corresponding recess in the rib of the lid for locking in the closed position.

The lid is held to position, and caused to lock, by the usual U-shaped spring on the pivot pin. The pivot hole of the lid and the corresponding hole in the spring are elongated vertically to permit the lid to latch when closed and to be held secure. A modification of the design provides for pivoting the lid at the side of the box. The inventor is Frederick C. Sorensen, who is in the Chicago shops of the Armour Car Lines. Some of the lids have been applied to cars of this company.

Private Siding Ordered.

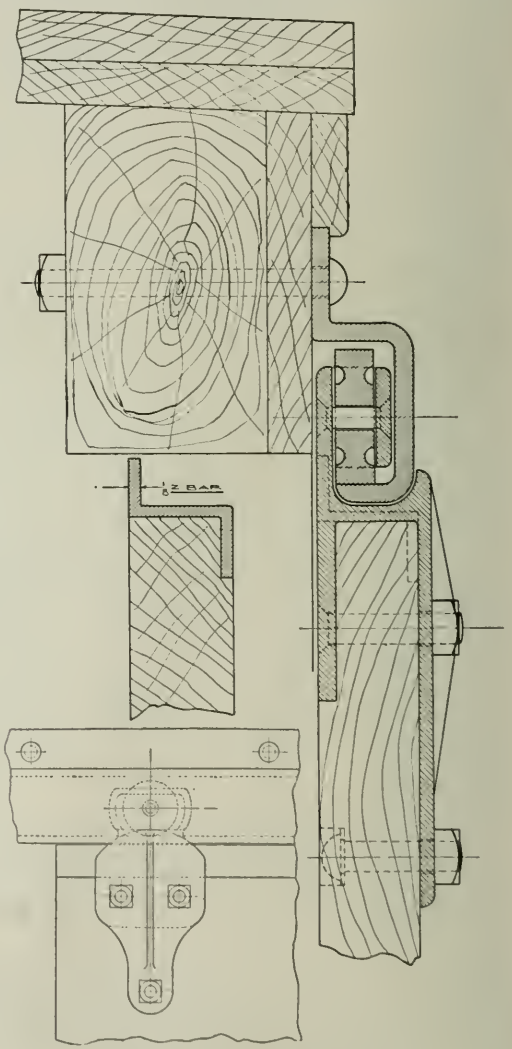
In an opinion by Commissioner Harlan the Commission has announced its decision in the case of the Weleetka Light & Water Company against the Fort Smith & Western. Complainant asked for an order requiring the carrier to put in a track connecting its main line at Weeletka, Indian Territory, with the plant of complainant. The Commission held that while retaining the right to control the location of tracks to private industries in accordance with the evidence, it is disposed, in recognition of the risk that arises from such interruptions of main line rails, to leave the location of such tracks largely to the discretion and wisdom of the carrier.

The practice among the carriers of repaying advances made by shippers for the construction of tracks by making an allowance of a definite amount on each carload of freight is disapproved by the Commission on the ground that it presents too much the appearance of a purchase of property by the carrier with transportation, this being contrary to law. While settlements may be based on the number of carload shipments, repayments must not be made out of the rate but of available funds at the end of definite intervals. A copy of such contracts ought to be filed with the Commission and when the transaction is complete a verified statement of it, by a responsible officer of the company, ought also to be filed with the Commission.

The Commission holds that a connection should be afforded to the complainant, but in recognition of the risk as before mentioned decided to enter no order; expecting the parties to confer and arrive at an agreement. Unless such an agreement be reached within 30 days the Commission will enter an order as to the location of the track.

A New Car Door Hanger.

A simple and efficient freight car door hanger and track is illustrated in the accompanying drawing. The track and cap are made in a single channel-shaped piece. As the drawing shows, the roller and track are thoroughly protected from the weather, so that it and the track are always dry, while a Z bar along the top of the door



Bundy Car Door Track and Hanger.

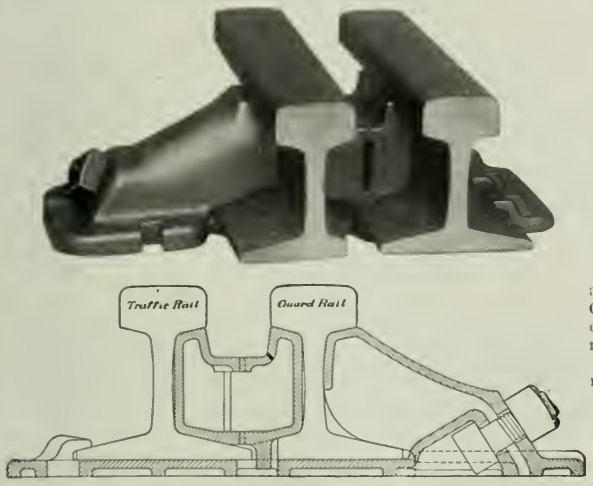
protects it, and keeps water from getting into the car. A slight lifting of the door brings the roller in contact with the upper shoulder or flange of the track, and, with suitable end stops, it is impossible for the door to drop off. The construction is simple and the device should give good service. It was invented by C. L. Bundy, Superintendent of the coach department of the Hicks Locomotive and Car Works, Chicago Heights, Ill. F. L. Holmes, until recently Advertising Manager of the company, has charge of the sale of the hanger at 277 Dearborn street, Chicago.

New Line Into San Francisco.

On Sunday last the Bay Shore cut-off of the Southern Pacific's Coast Line route was opened, doubling the available industrial area of San Francisco. This line pierces the five ranges of hills which have heretofore formed a barrier against the expansion of the city southward. In traversing this 10 miles of road passengers will pass through two miles of tunnels with the ground surface 300 ft. above their heads; over two miles of trestle with the water 50 ft. below them, through a cut 95 ft. deep, and under six streets supported by iron overhead bridge. Nineteen towns from San Francisco to San Jose will have the advantage of a gain of 17 minutes in time to and from San Francisco. At Visitacion Point the Southern Pacific is making a hump yard to distribute the freight handled here.

Combination Guard-Rail Clamp and Tie Plate.

The combination guard-rail clamp and tie plate illustrated herewith was invented by George L. Mansfield, mechanical engineer in the engineering department of the Chicago & Alton. As its name indicates, it combines a tie plate with the rail clamp and brace, the whole being secured and bound together by a single bolt, $\frac{7}{8}$ in. in diameter, which has a lock nut. The filler block, which is made



Mansfield Guard-Rail Clamp and Tie Plate.

either solid or adjustable, is locked to the tie plate by a downwardly-projecting lug to prevent slipping. One design has braces on each side so as to brace both rails. The simplicity of the device and the few parts are its chief advantages. All parts are on top of the tie, and adjustments are easily and quickly made. It is already in use on the Southern and the Indianapolis Union and has been made standard on the Alton. It is made and sold by the Otto Gas Engine Works, Chicago.

The Constitution of Oklahoma.

The railroads of Oklahoma are not so helpless under the two-cent fare prescribed by the constitution of the new state as has been supposed.

The framers of the constitution of Oklahoma appear to have been without a copy of the Constitution of the United States for their guidance.

This antiquated document has not yet been repealed. Article XIV. of the amendments, ratified July 28, 1868, provides that "no state shall make or enforce any law which shall abridge the privilege or immunities of citizens of the United States; nor shall any state deprive any person of life, liberty or property without due process of law."

Article VI. of the Constitution adopted in 1787 follows: "This Constitution, and the law of the United States which shall be made in pursuance thereof, and all treaties made, or which shall be made under the authority of the United States, shall be the supreme law of the land; and the judges in every state shall be bound thereby, anything in the constitution or laws of any state to the contrary notwithstanding."

A state enactment prohibiting railroads from charging more than two cents a mile passenger fare, if it results in confiscation of property, is no less void, as contrary to the Constitution of the United States, when embodied in the constitution of a state, than it is when contained in a law enacted by a state legislature.—*Wall Street Journal.*

Locomotive and Rail Exports for October.

The *Wall Street Journal* gives the following information about exports of locomotives and of rails for October, and for the first ten months of the calendar year.

The value of locomotives exported in October showed a gain of more than $500,000 from October of 1906, which reflects most favorably the condition of the foreign markets. A satisfactory increase is also shown by the figures for the 10 months.

The exports of locomotives for October follow:

Exported to:	1907.	1906.
Europe	$10,307	.....
British North America	72,501	$89,084
Central American States and British Honduras	47,550	33,314
Mexico	6,150	143,625
Cuba	249,794	85,376
Argentina	.....	12,610
Brazil	54,345	8,159
Other South America	468,286	3,484
Chinese Empire	6,310	.....
Japan	.....	481,807
British Australia	20,440	8,716
Philippine Islands	50,010	.....
Other Asia and Oceania	401,850	.....
Total	$1,387,403	$886,775

The exports for 10 months follow:

	1907.	1906.
Europe	$592,332	$353,850
British North America	1,386,215	527,550
Central American States and British Honduras	824,542	1,095,445
Mexico	358,808	641,335
Cuba	509,132	425,010
Other West Indies and Bermuda	12,688	14,000
Argentina	206,491	208,355
Brazil	616,056	559,529
Other South America	1,022,903	497,090
Chinese Empire	12,235	22,207
Japan	406,918	635,456
British Australasia	104,603	40,158
Philippine Islands	60,148	.....
Other Asia and Oceania	1,420,319	106,500
All other Africa	.....	30,119
British Africa	.....	.....
Total	$7,623,390	$5,062,605

Several striking facts appear in the statement for October, chief among which is the absence of record of a single purchase by Japan. On the other hand, a large gain is recorded by Cuba, and the railroad development of South America continues to make increasing demands on American manufacturers.

The exports of steel rails for railroads for October and the 10 months, in tons, were as follows:

Exported to:	1907.	1906.
Europe	.....	$320
British North America	$225,884	10,544
Central American States and British Honduras	7,537	2,570
Mexico	38,811	48,254
West Indies and Bermuda	149,039	30,093
South America	82,423	226,790
Japan	268,877	211,810
Other Asia and Oceania	358,529	101,060
All other Africa	2,322	.....
Total	$1,133,362	$632,041

The exports for 10 months were as follows:

	1907.	1906.
Europe	$1,778	$11,681
British North America	915,860	1,832,399
Central American States and British Honduras	585,166	491,938
Mexico	919,371	607,166
West Indies and Bermuda	780,446	765,876
South America	2,148,203	2,441,876
Japan	850,901	606,880
Other Asia and Oceania	2,550,682	514,957
British Africa	7,741	514,957
All other Africa	23,004	7,628
Total	$8,783,153	$7,290,259

The increase was about $500,000 for the month and $1,500,000 for the 10 months. Much of the gain in October was made in shipments to British North America. The West Indian demand also increased heavily.

Lower Price for English Coal.

The Western Railway of France is reported to have ordered for 1908 delivery 65,000 tons of best Monmouthshire semi-bituminous coal, delivered in cars at $5 a ton. This is about 50 cents below the previous price, f. o. b., at Newport harbor.

The Alabama Extra Session.

The second extraordinary session of Extra Session Comer has adjourned sine die. It better had died before a-bornin'. It leaves but a legacy of vengeful deeds, which we believe will fortunately be wiped out and their baleful influences neutralized by the courts of the country. But the stigma of the attempt at vengeance, of vicious resentment against the greatest benefactor Alabama ever had, remains.

The legislation of this extraordinary session in its attempt to

injure and thus punish the Louisville & Nashville Railroad Company, for the sole reason of its appealing to the proper courts of the land to have properly and constitutionally construed prior acts of this Legislature, is a disgrace to American civilization. The attempt to enact legislation grossly discriminating against the Louisville & Nashville and favoring other lines, is something unique in American history.

"Vengeance is mine, saith the Lord." Oh, no! Vengeance is mine, said Extra Session Comer and his following.

We hope that we shall see a thing or two, and we believe that we will. We want to see the L. & N. enjoin every act of this so-called legislation affecting its interests, and the United States Supreme Court determine the question if a vindictive official and his retinue can use the powers of his office to oppress citizens or to discriminate to the prejudice of some, while favoring others. What else has this extraordinary session to its credit or discredit? It passed a state prohibition act. In a matter of so vital importance to individuals and communities, should not the establishment of prohibition be a matter of local option, and not be forced upon an unwilling people or community? This Legislature thus previously legislated. Then, what possible credit to this extraordinary session in this stultification of its membership and discrediting its previous commendable action by now vitiating it? If there is glory in Comer legislation, it will take a shrewd historian to discover it, and if there is profit in it, the people will essay in vain to realize it. The Comer administration will be the synonym of hard times in Alabama.—*Bessemer, Ala., Weekly.*

Collapse of a Bridge Over the Susquehanna River.

A bridge which was being built by the state of Pennsylvania across the north branch of the Susquehanna river in the eastern part of Columbia county, near Berwick, Pa., was carried away by a flood on the afternoon of December 10 and eleven workmen were drowned. The bridge was being built by the York Bridge Company, of York, Pa. The substructure was finished, the superstructure in position and the flooring half completed. The flood, which followed the melting of snow by warm rains, undermined the piers. On the same day there was much damage by floods at Scranton, Carbondale, Hazleton and all along the Delaware, Schuylkill and Susquehanna rivers. Many small bridges were destroyed.

M. C. B. Association Circular of Inquiry.

The standing committee on tests of M. C. B. couplers has sent out the following list of questions to members, the answers of which will be used in designing a standard uncoupling rod rigging:

1. Cause of broken links and clevises?
2. Causes of bent uncoupling rods?
3. Are these failures more prominent on wooden or steel cars?
4. Are these failures more prominent on cars equipped with spring or friction draft gear, and if so, on what specific type?
5. Style and description of uncoupling arrangement with which most trouble is experienced and wherein the specific troubles lie?
6. To what extent is freight equipment used in passenger service and what provision is made to prevent the buffer of the passenger car interfering with the uncoupling arrangement on the freight car?
7. Which form of release is preferred by the trainmen?
8. What form of universal release rigging is recommended to suit all types of M. C. B. standard couplers? (Send sketch.)
9. Send prints or sketches of your present standards of uncoupling arrangements.
10. Give any additional information not covered by the above questions which would further the solution of this subject.

Replies should be forwarded to R. N. Durborow, Chairman Committee on Tests of M. C. B. Couplers, Altoona, Pa., not later than January 15, 1908.

The committee on tests of M. C. B. couplers has been instructed:

(a) To recommend a standard maximum capacity for friction draft gear.

(b) To recommend the most desirable resistance during each ¼-in. compression.

(c) To report on the value of friction draft gear in reducing damage to cars and their contents.

To further the committee's investigation the following questions are asked:

1. Considering conditions which your road may have, such as locomotives with large tractive force, double-heading of trains, mixed trains of steel and wooden cars, low capacity cars, etc., what is considered a desirable maximum capacity for friction draft gear?
2. How should this be distributed through each ¼-in. travel of the gear to meet the special condition outlined with least damage to equipment?
3. In general has the value of friction or other improved draft gear had the effect of reducing damage to cars and contents in the yards and on the road?
4. To what extent has increased capacity of motive power, introduction of gravity yards, etc., influenced the use of improved draft gears on your road?
5. Have you noted any wide variation in cost of maintenance in the draft gear itself, comparing the older spring gears with the recent large capacity spring and friction gears?
6. From your experience with friction gears on tenders and cars, is it found that the gears require any considerable attention to keep them to their original capacity, and are many gears found jammed and failing to release in freight cars?
7. On cars and engine tenders built since January 1, 1900, what form of draft gear is your road using? Give number built, kind and capacity of cars for each type of gear used.

Replies should be sent to R. N. Durborow, Chairman Committee on Tests of M. C. B. Couplers, Altoona, Pa., not later than January 15, 1908.

Automobile Speed Records.

At Weybridge, England, December 10, on the cup-shaped track where Mr. Edge made his 24-hour record, a 60-h.p. motor was run 50 miles in 39 minutes, 10 seconds. This record, made by Clifford-Earp, is said to beat all previous records. On the same day a distance of 150 miles was made in one hour, 58 minutes, 34 seconds. He also broke the world's one-hour record, running in that time 76 miles, 1,359 feet.

Two-Cent Fares on the Burlington.

Two-cent fares have been in effect in a few states since last spring, but in most of them since the summer. Up to the middle of November we found that in spite of the reduction in the revenue per passenger per mile, the passenger revenue was no worse than before. The passenger departments of the railroads never did pay, and they do not pay any better since the rates have been reduced, but we have succeeded in equalizing the reductions pretty well. The average passenger rates in Illinois, Iowa and Missouri, on the Burlington, in July, 1906, was 2.11 cents, whereas last July it was 1.96 cents.—*P. S. Eustis.*

A Half-Million-Dollar Cargo.

The 605-ft. steel steamer "Legrand S. DeGraff" of the Western Transit Company arrived in Buffalo December 8 from Superior with 421,000 bushels of wheat, the largest cargo ever loaded on the Great Lakes. The rate paid for transportation was 2½ cents a bushel (or about one-half mill per ton per mile), making the gross income of the vessel for the trip $10,525.

INTERSTATE COMMERCE COMMISSION RULINGS.

Cotton Seed Rates Reduced.

In the case of Pressley against the Gulf, Colorado & Santa Fe et al. it is held that the rates of 27 and 29 cents on cotton seed from Marietta and Berwyn, Okla., to Cleburne, Tex., are unreasonable, and should not exceed 16 and 18 cents; that the rate of 45 cents on cotton seed from Marietta, Okla., to Plano, Tex., is unreasonable and should not exceed 25 cents.

Transfer Charges Must be Published.

In the case of Schwager & Nettleton against the Great Northern the Commission held that the act to regulate commerce does not bar a carrier from providing for costs of transfer in making delivery to a certain carrier, but if it so provides, it must publish and file a tariff showing the conditions, etc. A carrier cannot excuse the collection of an unpublished and unknown drayage and transfer charge by proof that it had a rule which forbade the sending of its own cars beyond its own line during a period of car shortage.

Chicago Live Stock Delivery Charge Again Condemned.

In an opinion rendered by Commissioner Prouty, the Commission has again taken up the case of the Cattle Raisers' Association of Texas and the Chicago Live Stock Exchange against the Chicago, Burlington & Quincy and others; and it again declares the two dollar rate unjust. The so-called terminal charge of $2 per car is imposed by the carriers for the delivery of carloads of live stock at the Union Stock Yards in Chicago. This matter has been before the Commission for ten years, and four reports have been prepared.

The Commission decides, as before, that the terminal charge of $2 per car is unduly discriminatory, and that the charge should not exceed $1 per car. The Commission holds that the decree of a court dismissing a bill brought to enforce an order of the Commis-

sion made previous to the amendment of June 29, 1906, is not a bar to the right of the Commission to examine with respect to a date subsequent to June 29 the same rate involved in that proceeding. Commissioners Clark and Harlan dissent.

TRADE CATALOGUES.

Industrial and Mine Cars and Railways.—Catalogue No. 5 of the Kilgore Peteler Co., Minneapolis, Minn., describes industrial and mine cars, narrow-gage industrial railways and kindred products of the company. The types include all kinds for handling material on railways in mines, shops, sawmills, power plants, plantations, docks, warehouses, quarries and jobbing and manufacturing plants. Industrial railways are furnished complete with all equipment. A line of contractors' buckets is also shown. The book is 6 in. x 9 in. and has 56 pages.

The Obermayer Bulletin.—The current number of this bulletin on foundry information is a special edition devoted exclusively to the core room. The leading articles are "The Core Room—A Few Suggestions," which is a plea for better conditions and better appliances in the core room, and "The Selection of Core Sands," a discussion of the various grades and their uses. "Ovens for Drying Cores" and a description of a new Chicago foundry are other shorter articles. There are also miscellaneous items of interest.

Cyclopedia of Engineering.—The American School of Correspondence, Chicago, has issued a circular describing its holiday offer of the six volumes of the Cyclopedia of Engineering for $14.80. The same offer was made last year. As this is a large reduction from the list price and is payable in monthly installments, it is an unusual opportunity. The offer expires December 25.

Graphite.—The December number of *Graphite*, published in the interests of the Joseph Dixon Crucible Co., Jersey City, N. J., devotes a large part of its space to photographs and descriptions of that company's exhibit at the Atlantic City convention of the American Street & Interurban Railway Association.

MANUFACTURING AND BUSINESS.

All the Boston offices of Stone & Webster are now at 147 Milk street.

The Northern Engineering Works, Detroit, Mich., have installed in the power station of the St. Clair Tunnel Co., Port Huron, Mich., one 15-ton, 43-ft. span traveling crane.

The Pullman Company's large paint shop at Buffalo, N. Y., was burned on the evening of December 2. Twenty-one Pullman cars were destroyed and the total loss was about $400,000.

Alfred Lovell, who resigned in October as Superintendent of Motive Power of the Atchison, Topeka & Santa Fe, is now a Consulting Engineer, with office at 819 Harrison Building, Philadelphia, Pa. He is making a specialty of inspecting railroad materials, equipment, supplies, tools and machinery.

The Wyckoff Pipe & Creosoting Co., of Stamford, Conn., has an order from the New York Central & Hudson River for creosoted paving blocks 3 in. x 8 in. x 3½ in., to be used in the roundhouse at Gardenville, N. Y. The Pennsylvania has ordered, from the same company, creosoted piles, timbers and bridge ties for use in construction work at Larabee, Pa.

The American Car & Foundry Co., Berwick, Pa., has declared its regular quarterly dividend of 1 per cent. on the common stock. The net earnings for the quarter ended October 31, 1907, out of which this dividend is paid, were $2,775,643, the largest in the history of the company, being $186,000 more than the largest previous quarterly net earnings and nearly $1,000,000 greater than the figure for the corresponding period of 1906.

OBITUARY NOTICES.

Charles E. Lambert, formerly General Passenger Agent of the West Shore, died last Tuesday at his home at Thiells, N. Y.

Charles S. Horton, President of the Susquehanna & New York, died on December 4 at Williamsport, Pa. Mr. Morton was 44 years old.

Captain Spencer Eakin, General Agent at Nashville, Tenn., of the Nashville, Chattanooga & St. Louis, died of paralysis recently at his home near Shelbyville, Tenn.

Robert Angst, the late Chief Engineer of the Duluth & Iron Range, was widely known as an authority on ore dock construction. He was born in Switzerland in 1847 and educated in his native country. He came to the United States when he was 22 years old, and began railroad work on the Jackson, Lansing & Saginaw, now part of the Michigan Central. After serving on several other roads he was made Chief Engineer of the Duluth & Iron Range in 1887.

Charles P. Matthews, Professor of Electrical Engineering at Purdue, died at Phoenix, Ariz., on Saturday, November 23, 1907. He was born on September 18, 1867, and was graduated at the St. Johnsbury (Vt.) Academy and at Stanford University, where he graduated in 1892 as Mechanical Engineer. In 1901 he was given the degree of Ph. D. by Cornell. For four years after his graduation he was instructor in physics and applied electricity at Cornell, then he went to Purdue as Assistant Professor of Electrical Engineering. In 1905 he succeeded Professor Goldsborough as head of the School of Electrical Engineering. During his connection with the school it has grown to be the largest in the country in point of numbers. His most valuable contribution to science was an investigation of photometric standards for arc lamps, a work done in connection with the National Electric Light Association.

MEETINGS AND ANNOUNCEMENTS.

(For dates of conventions and regular meetings of railroad conventions and engineering societies, etc., see advertising page 24.)

Central Railway Club.

At the annual meeting of this club to be held at Buffalo, N. Y., January 10, 1908, Dexter C. Buell, of Chicago, formerly with the Missouri Pacific Railroad, will read a paper on some joint problems of the mechanical and operating departments. At the annual banquet to be held in the evening of the same day the programme will include addresses by W. G. Besler, B. D. Caldwell and George A. Post.

ELECTIONS AND APPOINTMENTS.

Executive, Financial and Legal Officers.

Durham & Charlotte.—John L. Tull, Chief Engineer, has been elected Vice-President and Traffic Manager, with office at Hemp, N. C.

El Paso & Southwestern.—W. C. Crane has been appointed Comptroller, with office at New York, and A. L. Hawley, General Auditor, with office at El Paso, Tex.

Massachusetts Railroad Commission.—Walter P. Hall, of Fitchburg, has been nominated by Gov. Guild as a Member and Chairman of the Commission, succeeding James F. Jackson, resigned.

Raritan River.—W. G. Bumsted, Vice-President and Treasurer, has been elected President, succeeding F. H. Earle, deceased. E. W. Harrison succeeds Mr. Bumsted as Vice-President, and C. H. Sisson, Secretary and Purchasing Agent, succeeds him as Treasurer.

Santa Fe, Raton & Eastern.—C. W. Barden has been elected President, with office at New York. E. F. Morrow is General Manager, with office at Raton, N. Mex.

Tehuantepec National.—E. M. Dillon has been appointed Auditor and Car Accountant, succeeding H. O'Connor, resigned.

Western Pacific.—W. J. Bartnett, Vice-President and General Attorney, has resigned. Warren Olney, Jr., a Director, has been appointed General Counsel. W. A. Magee succeeds Mr. Bartnett as a Director. Mariel Cerf, Assistant General Attorney, has resigned.

Wisconsin & Northern.—H. F. Whitcomb has been elected President.

Wisconsin Central.—The general offices have been moved from Milwaukee to the new International Harvester building, Michigan avenue, Chicago.

Operating Officers.

Ann Arbor.—See Detroit, Toledo & Ironton.

Canadian Pacific.—James Oborne, General Superintendent of the Ontario division, has been appointed General Superintendent of the Eastern division, with headquarters at Montreal, succeeding H. P. Timmerman, resigned. F. T. Brady, General Superintendent of the Lake Superior division, succeeds Mr. Oborne, with headquarters at Toronto, Ont. C. Murphy, Superintendent at London, Ont., has been appointed General Superintendent of the Lake Superior division, with headquarters at North Bay, Ont., succeeding Mr. Brady. The eastern boundaries of the Western division are now Portal, Sask., Arcola and Broadview, but the division does not include the Arcola and Broadview terminals.

Chicago, Rock Island & Pacific.—F. J. Easley, formerly Superintendent of the Atchison, Topeka & Santa Fe at Newton, Kan., is now Superintendent of the Chicago, Rock Island & Pacific at Little Rock, Ark.

Denver & Rio Grande.—C. L. Eaton has been appointed Assistant Superintendent at Alamosa, Colo.

Des Moines, Iowa Falls & Northern.—F. C. MacMillan has been appointed General Manager, with office at Des Moines, Iowa.

Detroit, Toledo & Ironton.—J. H. Jones has been appointed Trainmaster of this road and of the Ann Arbor, with office at Napoleon, Ohio, succeeding D. J. Hardy.

El Paso & Southwestern.—The office of L. U. Morris, Superintendent of the Eastern division, has been moved from El Paso, Tex., to Tucumcari, N. Mex.

Lake Shore & Michigan Southern.—D. C. Moon, Assistant General Manager, has been appointed General Manager, succeeding E. A. Handy, deceased.

Mexican Central.—J. J. Lewis, formerly Superintendent of Terminals of the Tehuantepec National at Coatzacoalcos, Mex., has been appointed Superintendent of Terminals of the Mexican Central at Tampico, succeeding R. N. Elliott, transferred. W. T. East, Assistant Superintendent of Terminals at Tampico, has been appointed Trainmaster of the San Luis division.

Mexican Southern.—J. H. Chisholm has been appointed General Manager, succeeding W. L. Morkill, who resigned last fall. Vernon Cooper has been appointed Assistant to the General Manager.

Missouri Pacific.—J. T. Nedwideck, Trainmaster at De Soto, Mo., has been appointed Trainmaster at Poplar Bluff, succeeding R. E. Ryan. Mr. Ryan has been appointed Trainmaster at Little Rock, Ark., succeeding H. J. Scheuing, who takes Mr. Nedwideck's place at De Soto.

New Jersey, Indiana & Illinois.—W. A. Ballard has been appointed Acting Superintendent, with office at South Bend, Ind.

Northern Pacific.—Newman Kline, Assistant Superintendent of the Middle division, has resigned.

Oregon Short Line.—C. L. Elared, Trainmaster of the Montreal division, has been appointed Trainmaster of the Third, Fourth, Fifth and Boise districts, and of the Menidoka & Southwestern and the Malheur Valley railroads, with headquarters at Pocatello, Idaho, succeeding C. M. Hunt, resigned. The position of Trainmaster of the Montreal division is now vacant and probably will be for some time.

Pittsburgh & Lake Erie.—F. M. Brown, chief train despatcher, has been appointed to the re-established office of Superintendent of Telegraph.

Portland & Seattle.—F. S. Forest, formerly General Superintendent of the western district of the Great Northern, has been appointed Superintendent of the Portland & Seattle.

Southern.—A. Ramseur, Superintendent at Asheville, N. C., and W. G. Fortune, Trainmaster at that place, have resigned, effective December 15.

Traffic Officers.

Chicago & North-Western.—C. F. Miley has been appointed General Agent at Des Moines, Iowa, succeeding L. F. Berry, transferred.

Chicago, Burlington & Quincy.—W. H. Hill, division freight agent of the lines in Iowa, has been appointed Assistant General Freight Agent at Kansas City, Mo.

E. F. Bisbee, General Agent of the freight department at Kansas City, Mo., has resigned.

Chicago, Lake Shore & Eastern.—See Elgin, Joliet & Eastern.

Chicago, Peoria & St. Louis.—P. S. Easterbrook has been appointed General Eastern Agent at New York.

Des Moines, Iowa Falls & Northern.—W. R. Sterritt has been appointed General Freight and Passenger Agent, with office at Des Moines, Iowa.

Elgin, Joliet & Eastern.—F. L. Koontz has been appointed Freight Claim Agent of the Elgin, Joliet & Eastern and the Chicago, Lake Shore & Eastern, with headquarters at Chicago, Ill.

Great Northern.—M. J. Costello, General Industrial Agent, has been appointed Assistant Traffic Manager at Seattle, Wash., succeeding H. M. Adams. See Portland & Seattle.

Louisville & Nashville.—D. B. Briggs has been appointed Master Mechanic at Mobile, Ala., succeeding C. B. Gifford, resigned.

Louisiana Railway & Navigation.—W. E. Scott has been appointed Trainmaster of the Western division, with office at Shreveport, La. A. L. Day has been appointed Trainmaster of the Eastern division, with office at Baton Rouge, La.

Mexican Northern.—J. Deemer has been appointed Passenger Traffic Manager.

Minneapolis, St. Paul & Sault Ste. Marie.—E. L. Cardie, Contracting Freight Agent at St. Paul, Minn., has been appointed General Agent at Portland, Ore.

Missouri Pacific.—John Mitchell Johnson, who has been elected Vice-President of the Missouri Pacific and the St. Louis, Iron Mountain & Southern in charge of traffic, was born in Cincinnati, Ohio, on May 31, 1845. He was educated in the public schools of that city and entered railroad service when he was 25 years old as station agent at Franklin, Ind., on the Indianapolis, Cincinnati & Lafayette, now part of the Cleveland, Cincinnati, Chicago & St. Louis. Three years later, in 1873, he became General Freight and Passenger Agent of the Cincinnati & Martinsville, which was taken over by the Indianapolis, Cincinnati & Lafayette in the fall of 1875. Mr. Johnson then became traveling auditor for the larger company. In 1879 he was appointed Assistant General Freight Agent of the road. On February 20, 1884, he went to the Chicago, Rock Island & Pacific as First Assistant General Freight Agent. Four years later he was appointed General Freight Agent and eight years after that Freight Traffic Manager. In 1899 he was elected Third Vice-President of the Rock Island. He resigned on April 1, 1903, to become Assistant to the Vice-President of the Gould lines. On December 1, 1907, he was elected Vice-President of the Missouri Pacific system in general charge of the traffic department.

J. M. Johnson.

A. T. Stewart, Assistant General Freight Agent at St. Louis, Mo., has been appointed also Assistant to Vice-President Johnson.

W. C. Staley has been appointed General Agent at Chicago, succeeding J. N. Githens, promoted.

Portland & Seattle.—H. M. Adams, Assistant Traffic Manager of the Great Northern at Seattle, Wash., has been appointed General Freight and Passenger Agent of the Portland & Seattle.

St. Joseph & Grand Island.—W. H. Brying has been appointed Assistant General Freight Agent.

Seaboard Air Line.—R. E. Boswell has been appointed Assistant Superintendent of Transportation.

South & Western.—J. A. Muse has been appointed Acting General Freight and Passenger Agent, with office at Johnson City, Pa., succeeding to the duties of Lewis Walker.

Engineering and Rolling Stock Officers.

Boston & Albany.—L. H. Muzzy has been appointed Assistant Engineer. E. McCabe has been appointed Supervisor of Bridges and Buildings, with headquarters at Springfield, Mass.

Buffalo, Rochester & Pittsburgh.—W. H. Williams has been appointed Master Mechanic of the Buffalo & Rochester division, with headquarters at East Salamanca, N. Y., succeeding H. C. Woodbridge, transferred.

Butte County Railroad.—F. G. Somner has been appointed Chief Engineer, with office at Chico, Cal.

Chicago, Indiana & Southern.—R. B. Seymour has been appointed Chief Engineer, with office at Gibson, Ind., succeeding B. C. Rich.

Chicago Junction.—O. F. Cole, Principal Assistant Engineer, has been appointed Chief Engineer, succeeding J. B. Cox.

Chicago, Rock Island & Pacific.—The office of S. W. Mullinix, Superintendent of Motive Power of the Southwestern district, has been moved from Topeka, Kan., to Horton.

Des Moines, Iowa Falls & Northern.—F. R. Doxey has been appointed Master Mechanic, with office at Iowa Falls, Iowa.

Missouri Pacific.—F. W. Schultz has been appointed Master Mechanic at McGehee, Ark., succeeding I. T. Johns, resigned.

LOCOMOTIVE BUILDING.

The Northwestern Pacific has ordered two mogul locomotives, cylinders 18 in. x 24 in., from the American Locomotive Co.

The Western of Havana has ordered three consolidation locomotives, cylinders 20 in. x 24 in., from the American Locomotive Co.

L. J. Smith, Kansas City, Mo., has ordered five ten-wheel loco-

motives, cylinders 19 in. x 28 in. from the American Locomotive Co. for immediate delivery.

The Peoria & Pekin Union advises that it has ordered three switching locomotives from the American Locomotive Co., as reported in the *Railroad Gazette* of December 6.

The Great Northern has ordered four 100-ton three-phase electric locomotives from the General Electric Company. Each will have four 325 h.p. motors and the driving wheels will be 60 in. in diameter.

CAR BUILDING.

The Boston & Maine has ordered 20 passenger cars from the Laconia Car Co., and is considering 20 more.

The Missouri, Kansas & Texas is understood to have replaced with the American Car & Foundry Co. the order for 500 freight cars canceled in November.

RAILROAD STRUCTURES.

EAST CAMBRIDGE, MASS.—The Boston & Maine shops have been almost entirely destroyed by fire; loss $150,000.

MEMPHIS, TENN.—The Memphis Railroad Terminal Company has submitted plans for a proposed passenger station, also a round-house and power house to be built here.

MEXICO CITY, MEX.—On the extension of the Mexican Central from Mexico City to Tampico, a high bridge will be built over the Panuco river.

Plans will be taken up for consideration about February 1 next for building a large union passenger station here.

MINNEAPOLIS, MINN.—The Minneapolis, St. Paul & Sault Ste. Marie has begun work on additions to its shops here, to cost about $200,000.

RAILROAD CONSTRUCTION.

New Incorporations, Surveys, Etc.

ATCHISON, TOPEKA & SANTA FE.—An officer writes that surveys are being made for the proposed line from Texico, N. Mex., south to Brownwood, Tex., about 250 miles.

ATLANTA & ST. ANDREWS BAY.—This road has been extended from Cottondale, Fla., south to Youngstown, 31 miles. (Aug. 23, p. 215.)

ATLANTA, BIRMINGHAM & ATLANTIC.—It is reported that this company is planning to buy the South Georgia-West Coast Railway, operating a line from Adel, Ga., about 15 miles from the A., B. & A., south to Perry, Fla., 77 miles, as soon as its two lines now being built to Birmingham and Atlanta are finished. At Perry connection is to be made with the Tampa Northern, projected north to Perry, which will give the A., B. & A. a direct route to Tampa and the west coast of Florida.

BEAUMONT & SARATOGA TRANSPORTATION.—An officer writes that this road proposes to extend its line from the present end of track to Saratoga, Tex., 13 miles. (March 15, p. 380.)

BIG FORK & INTERNATIONAL.—See Great Northern.

BROOKVILLE & MAHONING.—See Pittsburg, Shawmut & Northern.

CANADIAN PACIFIC.—Bids, it is said, are being asked for by this company for clearing 65 miles of the right-of-way across Vancouver island, B. C., from Wellington to New Alberni, on the Esquimalt & Nanaimo. (Nov. 22, p. 636.)

CENTRAL RAILWAY OF OREGON.—An officer writes that this company's road will extend from Union, Ore., southeast to Cornucopia, 60 miles; and from Con to La Grande, 20 miles. Last year the company built 6.75 miles between Union Junction and Con, to which point the line has been extended this year.

CHARLOTTE HARBOR & NORTHERN.—The Liverpool branch, a new line, has been opened for business from Fort Ogden, Fla., to Liverpool, four miles.

CHERRY TREE & DIXONVILLE.—See Pennsylvania.

CHICAGO & NORTH-WESTERN.—On the Ashland division, a new branch has been opened for business from Marathon City, Wis., to Rib Forks, 5.8 miles. (Sept. 27, p. 370.)

CHICAGO, BURLINGTON & QUINCY.—On the Sheridan division, the line from Toluca, Wyo., to Worland has been extended from Worland south to Kirby, 20.45 miles. (Nov. 1, p. 540.)

CHICAGO, INDIANA & SOUTHERN.—The Indiana Harbor Belt has projected an extension from Dune Park, Ind., east to Michigan City, about 20 miles.

DULUTH, RAINY LAKE & WINNIPEG.—See Great Northern.

EAST CAROLINA.—This road has been extended from Farmville N. C., south to Hookerton 13 miles.

ESQUIMALT & NANAIMO.—See Canadian Pacific.

GALVESTON, HARRISBURG & SAN ANTONIO.—See Southern Pacific.

GRAND TRUNK PACIFIC.—At a recent meeting of this company President Charles M. Hays submitted a report showing that the total length of all the lines to be built by this company will be 7,900 miles. A length of 988 miles is under contract in charge of the Grand Trunk Pacific Company from Winnipeg, Man., west to Edmonton, including the 210 miles Lake Superior branch. The National Transcontinental Commissioners, building the eastern section of the line from Winnipeg east to Moncton, N. B., 1,800 miles have let contracts for 852 miles. Of this a length of 112 miles is in New Brunswick, 417 in Quebec, 213 in Ontario, and 81 in Manitoba, making a total of 1,840 miles under contract. The Transcontinental Commission report shows up to March 31, 1907, a total expenditure of $6,117,494, of which $5,537,807 is for the fiscal year ending March last. This has been spent on the east end of the line as follows: Cost of headquarters staff, $166,191; location of lines, $355,896; transportation service, $225,920, and actual construction, $4,569,859.

Bids, it is said, are wanted December 23 for building a 120-mile section of this line from Edmonton, Alb., west, and contracts are soon to be let for an additional 125 miles, which will bring the line to the summit of the Yellow Head Pass in the Rocky mountains.

GREAT NORTHERN.—Regular train service was recently started from Duluth, Minn., via Bemidji over the Minnesota & International, and the new extension built under the name of the Big Fork & International north to International Falls. A more direct service will shortly be started from Duluth over the Duluth, Rainy Lake & Winnipeg to the Canadian boundary.

ILLINOIS CENTRAL.—On the Yazoo & Mississippi Valley a new line called the Charleston district has been opened for business on the Memphis division from Philipp, Miss., north to Charleston, 26 miles.

KANSAS CITY, MEXICO & ORIENT.—The International Construction Company, of Kansas City, Mo., is building this road from Dill City, Okla., to the North Fork of the Red river, 12 miles; from Elmer, Okla., to Benjamin, Tex., 73 miles, and from Stillwater, Tex., to a point 11 miles north of San Angelo, 67 miles.

Train service has been started between Blair, Okla., and the Red river, 22 miles.

KEWEENAW CENTRAL.—Contract has been let by this company to J. J. Byer & Co., of Houghton, Mich., for extending this road from Mohawk, Mich., southwest to Calumet, six miles.

LONG ISLAND.—This company has work under way on subsidiary lines as follows: Huntington extension (electric) from Huntington, N. Y., south to Amityville, 15.75 miles; Jamaica & South Shore branch from Springfield Junction south to Cedarhurst, 3½ miles. Surveys are also being made on the Babylon extension (electric) from Babylon west to Amityville, 5.82 miles.

MINNESOTA & INTERNATIONAL.—See Great Northern.

MISSOURI, OKLAHOMA & GULF.—This company has extended its main line from Dustin, Okla., south to Rose, 25.6 miles. The line from Dewar, Okla., north to McDonald has been extended north 4.5 miles to Walters. A new branch has been opened for business from Muskogee, Okla., east to Loweree, five miles.

NEW YORK CENTRAL & HUDSON RIVER.—Announcement is made that after January 1 local Yonkers trains will be run by electric power through between the Grand Central station, New York, and Yonkers, 15 miles. At present the electric operation extends only from the Grand Central Station to High bridge, about six miles.

NIAGARA, ST. CATHARINES & TORONTO.—Contract let to D. R. Campbell for extending this road from Fonthill, Ont., south to Welland, 4½ miles.

NORTHWESTERN PACIFIC.—This company has given a contract to the Warren Improvement Company, of San Francisco, for extending its line from Willits, Cal., north three miles. Surveys made from Willits north to Shively, 108 miles, on the main line, and from Elodgate, south 63 miles, on the branch from Albion to a junction with the main line at Healdsburg.

PENNSYLVANIA.—On the Cambria & Clearfield division of this road the Cherry Tree & Dixonville has been extended from Dixonville, Pa., to Idamar, .8 miles.

PITTSBURGH, SHAWMUT & NORTHERN.—On the Brookville & Mahoning train service has been started from Brookville, which is 20 miles southwest from Brockwayville, on the main line, to Ramseytown, five miles. (Nov. 8, p. 573.)

St. Louis Southwestern.—This company has under construction a terminal extension, about three miles long at Argenta, Ark., and the St. Louis Southwestern of Texas is planning to make a similar terminal extension about 2.75 miles long into Fort Worth, Tex.

Announcement is made that an extension of the Lufkin division of the St. Louis Southwestern of Texas has been opened for freight and passenger service from Warsaw, Tex., east to Broaddus, 5.6 miles.

St. Louis Southwestern of Texas.—See St. Louis Southwestern.

Santa Fe, Liberal & Englewood.—Construction work, suspended during the recent financial depression, has been resumed on the Oklahoma portion of this line projected from Raton, N. Mex., east to Liberal, Kan. It is stated that the line will be finished as rapidly as possible. (March 15, p. 391.)

South Dakota Central.—This road has been extended from Nunda, S. Dak., north to Arlington, 16 miles. (Aug. 9, p. 164.)

Southern.—The Jasper-French Lick extension from Jasper, Ind., northeast to French Lick, 24.7 miles, has been opened for traffic. (Oct. 18, p. 473.)

Southern Pacific.—Surveys have been made for extending the Texas & New Orleans from Gallatin, Tex., south to Rusk, eight miles.

The Galveston, Harrisburg & San Antonio is building an extension from Alleyton, Tex., west to Columbus, about two miles.

South Georgia-West Coast Railway.—See Atlanta, Birmingham & Atlantic.

Temiskaming & Northern Ontario.—Contracts have been given by this company to A. N. McDonald, of New Liskeard; McRae, Chandler & McNeil, of Dufiwood City; McQuigge & Hunt, of Cobalt, and to the Canadian Construction Company, of Englehart, for work as follows: On the main line from mile post 208 at the Wataybeag river to mile post 251 near the transcontinental junction, 43 miles; on spurs from Englehart to Charlton, eight miles, and from Cobalt to Kerr Lake, four miles. Surveys are also being made from Sudbury to Cobalt, about 110 miles.

Tennessee Railway.—This company has 10 miles of grading finished on its line in Tennessee and will begin track laying shortly. Walton Wilson, Rodes & Co., of Knoxville, Tenn., have contracts for some work on the line. Surveys are being made for spurs from Straight Fork, Tenn., to coal mines, about four miles.

Texas & New Orleans.—See Southern Pacific.

Texas & Pacific.—The Weatherford, Mineral Wells & North-Western has been extended from Mineral Wells, Tex., north to Oran, 16 miles (March 15, p. 393.)

Toledo, St. Louis & Western.—Plans, it is said, are being made by this company to secure an air line from the intersection of this road and the Cincinnati, Hamilton & Dayton at Metcalf, Ill., west to Springfield, about 100 miles. Such a line would provide a short and direct line from Toledo west via the Iles-Murrayville line, which the Alton recently finished to Kansas City. From Metcalf to Springfield the Cincinnati, Hamilton & Dayton has a line. It is understood that the plans call for buying and reconstructing this line or building a new one next spring.

Vancouver, Victoria & Eastern.—Contract is reported let to Fred. Lane, of Spokane, Wash., and Grand Forks, B. C., for grading five miles on the extension of this road from Keremeos, B. C.

Wisconsin Central.—An officer writes that on this road there remains about 28 miles to be built to finish the line from Ladysmith, Wis., north to Superior. In Duluth the company is building about 4½ miles of road. Contracts are let to H. F. Balch, of Rice Lake, Wis., and to the Lantry Construction Company, of Duluth, Minn., for the work.

Weatherford, Mineral Wells & North-Western.—See Texas & Pacific.

Wisconsin & Northern.—This company has opened for traffic an extension of its road from Neopit, Wis., north to Van Ostrand, 16 miles.

Yazoo & Mississippi Valley.—See Illinois Central.

RAILROAD CORPORATION NEWS.

Ashland & Western.—It is said that this road has been bought by Joseph Ramsey, Jr., and associates, who are building the Lorain & Ashland. The latter runs from Lorain, Ohio, south to Wellington, 22 miles, and it is planned to build from that point south to Londonville, on the Pennsylvania Lines West, 39 miles, and eventually to the Ohio river. The Ashland & Western runs from Ashland, Ohio, to Custeloga, 23 miles, and most of it could be used in the Lorain & Ashland proposed extension south from Wellington.

Baltimore & Ohio.—It is said that this company will take over the operation of the Little Kanawha Railroad, which runs from Parkersburg, W. Va., on the Baltimore & Ohio, to Creston, 50 miles. The road is owned by New York Central interests.

Chicago Great Western.—The regular semi-annual dividend on the outstanding $28,127,089 4 per cent. cumulative debenture stock, usually paid January 15, has been withdrawn. It is not announced whether it is passed or simply postponed.

Chicago Union Traction.—Over two-thirds of the outstanding bonds and over 60 per cent. of the receivers' certificates and other indebtedness of the Chicago street railways have been deposited in accordance with the modified plan for reorganization.

Illinois Central.—In a circular sent to stockholders last week, Stuyvesant Fish declares that he never assumed for himself authority as sole trustee for the stockholders, but always laid everything before the directors. He emphasizes the point that the present issue is simply whether or not Harriman policies shall be put in force in the Illinois Central management.

Little Kanawha.—See Baltimore & Ohio.

Lorain & Ashland.—See Ashland & Western.

Midland Valley.—The Cherokee Construction Company's $5,000,000 three-year 6 per cent. notes, which matured December 1, 1907, are to be exchanged for 70 per cent., par value, in Midland Valley first mortgage 5 per cent. bonds at 80 and 30 per cent. in new five-year 6 per cent. notes of the construction company. The old notes were secured by all the $5,980,000 outstanding stock and the $5,854,000 first mortgage 5 per cent. bonds of the Midland Valley, as well as by mortgage on 18,500 acres of coal lands. The new notes of the construction company are secured by mortgage on the coal property and on its railroad construction equipment. Over four-fifths of the holders of the old notes have agreed to the exchange on the above terms, and a syndicate, of which Drexel & Co., Philadelphia, Pa., is Treasurer, has agreed to buy from the construction company all the bonds of the railroad and also all the new notes.

New Orleans, Fort Jackson & Grand Isle.—Control of this company has been acquired by a syndicate headed by Charles D. Haines, of New York. The road runs from New Orleans, down the west bank of the Mississippi to Buras, 60 miles, and a branch is to be built to Grand Isle. It has $236,500 capital stock outstanding.

New York Central Lines.—Gross earnings for the month of October, 1907, are shown in the following table. For the first time in over a year, at least, every road's earnings increased as compared with the figures for the corresponding period of the previous year. The Lake Erie & Western and the Peoria & Eastern have most frequently, heretofore, reported decreases in the monthly statements.

	1907.	Change	
New York Central & Hudson River	$9,059,633	Inc.	$467,174
Lake Shore & Michigan Southern	4,315,713	"	554,049
Lake Erie & Western	512,330	"	61,557
Chicago, Indiana & Southern	261,576	"	49,975
New York, Chicago & St. Louis	990,378	"	141,769
Michigan Central	2,837,509	"	416,184
Cleve., Cin., Chic. & St. Louis	2,587,212	"	317,116
Peoria & Eastern	336,691	"	54,050
Cincinnati Northern	104,524	"	19,794
Pittsburgh & Lake Erie	1,508,390	"	236,222
Rutland	307,188	"	40,392
Total	$22,821,144	Inc.	$2,358,262

New York, New Haven & Hartford.—A cash offer has been made by an interest competitive to the New Haven to buy the New Haven's ownership in the Boston & Maine. This offer probably comes from the Canadian Pacific. If the sale should be carried out, the New Haven's interests will be safeguarded by contract. The New Haven owns about $10,900,000 of the $28,291,790 Boston & Maine common stock.

Pere Marquette.—At a meeting of the stockholders held on December 9 the reorganization plan was approved. The plan includes the cancellation of the lease of the road by the Cincinnati, Hamilton & Dayton, the issue of $5,000,000 debentures and the issue of new first and second preferred stock in exchange for present preferred stock. (Aug. 23, p. 216.)

Warren & Corsicana Pacific.—The district court at Austin, Tex., December 4, handed down a decision declaring forfeited the charter of this company for failure to provide cars and engines as ordered by the State Railroad Commission. The road made no defense. This road is 15 miles long, running from Warren, on the Texas & New Orleans, westward to Big Kimbrel, and has been in the hands of a receiver since 1905. On June 30, 1906, it had three locomotives, one passenger car, one box car, three platform cars and 40 log cars. The gage of the track is 3 ft.

RAILROAD GAZETTE

ESTABLISHED IN APRIL, 1856.

PUBLISHED EVERY FRIDAY BY THE RAILROAD GAZETTE AT 83 FULTON STREET, NEW YORK
BRANCH OFFICES AT 870 OLD COLONY BUILDING CHICAGO, AND QUEEN ANNE'S CHAMBERS WESTMINSTER, LONDON

EDITORIAL ANNOUNCEMENTS.

THE BRITISH AND EASTERN CONTINENTS edition of the Railroad Gazette is published each Friday at Queen Anne's Chambers, Westminster, London. It contains selected reading pages from the Railroad Gazette, together with additional British and foreign matter, and is issued under the name Railway Gazette.

CONTRIBUTIONS.—Subscribers and others will materially assist in making our news accurate and complete if they will send early information of events which take place under their observation. Discussions of subjects pertaining to all departments of railroad business by men practically acquainted with them are especially desired.

ADVERTISEMENTS.—We wish it distinctly understood that we will entertain no proposition to publish anything in this journal for pay, EXCEPT IN THE ADVERTISING COLUMNS. We give in our editorial columns OUR OWN opinions, and these only, and in our news columns present only such matter as we consider interesting and important to our readers. Those who wish to recommend their inventions, machinery, supplies, financial schemes, etc., to our readers, can do so fully in our advertising columns, but it is useless to ask us to recommend them editorially, either for money or in consideration of advertising patronage.

OFFICERS.—In accordance with the law of the state of New York, the following announcement is made of the office of publication, at 83 Fulton St., New York, N. Y., and the names of the officers and editors of The Railroad Gazette:

OFFICERS

W. H. BOARDMAN, *Pres't. and Editor.*	RAY MORRIS, *Secretary*
E. A. SIMMONS, *Vice-President.*	R. S. CHILDS, M., *Treas.*
	L. B. SHERMAN, *Western Manager*

EDITORS

RAY MORRIS, *Man'g Editor*	GEORGE L. FOWLER
BRAMAN B. ADAMS	FRANK W. KRAEGER
CHARLES H. FRY	HUGH RANKIN
RODNEY HITT	BRADFORD BOARDMAN

CONTENTS

VOL. XLIII., No. 25. FRIDAY, DECEMBER 20, 1907.

The rumors piled on rumors, combined with admissions of President Mellen that two large railroad interests have been seeking the New Haven's holdings in the Boston & Maine, allow a good deal to be read between the printed lines. One of the interests referred to undoubtedly is the Canadian Pacific, which touches the Boston & Maine at several points, the other the Delaware & Hudson, which reaches the Boston & Maine at Troy, N. Y. Transfer to either corporation would shift the Boston & Maine to a foreign control not directly hit by Massachusetts politics; and, by an exchange of the Boston & Maine stock for new shares of the Delaware & Hudson the New Haven could acquire an interest which, in alliance with others in the D. & H., might still control the Boston & Maine after receiving its price. A sale to the Canadian Pacific, on the other hand, would only have the protection of traffic contracts and, spite of such international analogies as the Grand Trunk and Great Northern, would be viewed with federal disfavor. Sale to any interest, however, is very unlikely and remote. Not lightly, even for a great price, will the New Haven split the monopoly of New England so carefully built up, so strategic in its relations with connecting railroad systems, and just beginning to demonstrate its powers. It will be surrendered only in extremity and under the spur of legislative acts akin to persecution. Meanwhile the outside offers supply the New Haven with the metaphorical "big stick" which, raised in menace of a sale, keeps the Massachusetts politician at bay.

We learn as we go to press that the case against A. H. Smith, Vice-President and General Manager of the New York Central & Hudson River, whose trial for manslaughter began December 10, in New York, has been dismissed by Judge Kellogg, following the summing up of the prosecution. Criminal negligence was alleged, and the district attorney endeavored to show that the Williamsbridge derailment was due to the inexperience of the motorman in charge of the double-headed electric train; that he exceeded safe speed on the curve, and that the general manager of the road was responsible for the selection of the motorman, and for not prescribing adequate rules for safety. But it should be noted that there have been several opinions on the moving cause of the derailment, each backed with sufficient plausibility so that a jury might be expected to disagree if asked to decide categorically whether or not the derailment was caused by the incompetence of the motorman. Even if definite proof of this point had been brought forward, it is difficult for a layman to see how a criminal charge would lie against a general manager who had selected a division superintendent with care and impartiality from a number of highly-trained candidates, and had detailed to that division superintendent the power to make minor appointments either directly or through an assistant superintendent—especially when all parties concerned were continuously engaged in the performance of their regular duties as they best understood them. The case appears quite different from that of a steamer captain who is absent from the bridge or pilot house at a time when special danger is to be anticipated, as in a narrow channel, or during a fog. In such a contingency the captain is able actually to use his training and ability in directing the helmsman, while the railroad manager can by no possibility actually supervise the routine work performed by all his subordinates. It seems entirely right, since this is the case, that a general manager should be held strictly to accountability in the selection of these subordinates, and if it can be shown that he has made the best selections in his power, and then supervised their work in accordance with the best standards of supervision, we cannot see that justice can require more. If a manager lacks capacity or initiative to do these things, it ought not to take long for his president to find it out and to supersede him. But criminal law is singularly ill adapted as an instrument with which to reform bad railroad practice; the suspension of a sea captain's license is a better kind of remedy, because it reflects on the captain's efficiency rather than on his integrity. The nearest approach to license suspension in the railroad business is the kind of supervision by the highest officers of the road that makes every lesser officer and employee realize that somebody knows what he is doing, whether good or ill, and that his career is going to be determined accordingly.

RAIL SPECIFICATIONS.

The Proceedings of the October meeting of the American Railway Association have just been issued, containing the report of the Committee on Standard Rail and Wheel Sections. This report consists of a majority report on rail sections and on specifications for Bessemer steel rails, and a minority report by Mr. Kruttschnitt on specifications for Bessemer steel rails. Several members of the committee also dissent from certain clauses in the majority report relating to rail section, discard and chemical composition.

The subject of rail sections was discussed in the *Railroad Gazette*, Nov. 22, and the proposed new sections were also presented. In order that the reader may be fully advised as to the latest developments in the important matter of rail specifications, we reprint

below in full the majority report on specifications, following the same with extracts from other specifications, covering all points of difference.

The committee prefaces its report by an introductory statement, from which we quote such parts only as have an important bearing on specifications:

Chemical Composition.—In the matter of chemistry specification for Bessemer rails, there was a strong desire on the part of the railroad members to specify a lower phosphorus content than has been generally accepted in recent years; but the testimony of the manufacturers was to the effect that the available supply of low-phosphorus ores would make it impossible to manufacture more than a small percentage of the total rail requirements of the country to a maximum phosphorus limit less than 0.10, and the manufacturers, on this account, unanimously object to the incorporation in the Bessemer rail specifications of anything suggesting the adoption of .085 phosphorus.

Discard.—In the matter of discard, there was a desire on the part of the railroad members to arrange for a greater discard, and a strong disposition to insist upon a uniform minimum percentage. The manufacturers, however, presented considerable evidence which tended to show that a fixed minimum percentage requirement would be not only unfair but unscientific, claiming that the extent of piping and segregation is influenced by the size of the ingot, the rate of pouring into the mold, and other details of mill practice.

The committee desires further time to investigate these matters, and in the meantime arrangements have been made for comparative tests in service of a large number of rails rolled under each of the suggested specifications, so that more definite knowledge may be had of the effect on the actual life of the rail.

SPECIFICATION FOR BESSEMER STEEL RAILS.

Process of Manufacture.

1. (*a*) The entire process of manufacture and testing shall be in accordance with the best current state of the art, and special care shall be taken to conform to the following instructions:

(*b*) Ingots shall be kept in a vertical position in the pit heating furnaces until ready to be rolled, or until the metal in the interior has time to solidify.

(*c*) Bled ingots shall not be used.

(*d*) There shall be sheared from the end of the bloom formed from the top of the ingot sufficient discard to ensure sound rails, and if after the first cut the steel is not solid, the shearing shall continue until it is.*

Chemical Composition for Rails Designed According to Cardinal Principles.

2. Rails of the various weights per yard specified below shall conform to the following limits in chemical composition:†

(*a*) For Bessemer Steel with Maximum Phos., 0.085.

	80 lbs.	90 lbs.	100 lbs.	110 lbs.	120 lbs.
Carbon	0.50 to 0.60	0.53 to 0.63	0.55 to 0.65	0.55 to 0.65	0.55 to 0.65
Manganese	0.80 to 1.10	0.84 to 1.14	0.86 to 1.16	0.88 to 1.18	0.90 to 1.20
Phosphorus, not to exceed	0.085	0.085	0.085	0.085	0.085
Silicon, not to exceed	0.20	0.20	0.20	0.20	0.20
Sulphur, not to exceed	0.075	0.075	0.075	0.075	0.075

(*b*) For Bessemer Steel with Maximum Phos., 0.10.

	80 lbs.	90 lbs.	100 lbs.	110 lbs.	120 lbs.
Carbon	0.43 to 0.53	0.45 to 0.55	0.46 to 0.56	0.48 to 0.58	0.50 to 0.60
Manganese	0.80 to 1.10	0.84 to 1.14	0.86 to 1.16	0.88 to 1.18	0.90 to 1.20
Phosphorus, not to exceed	0.10	0.10	0.10	0.10	0.10
Silicon, not to exceed	0.20	0.20	0.20	0.20	0.20
Sulphur not to exceed	0.075	0.075	0.075	0.075	0.075

3. The number of passes and speed of train shall be so regulated that on leaving the rolls at the final pass the temperature of the rail will not exceed that which requires a shrinkage allowance at the hot saws, for a 33-ft. rail of 100-lb. section, of 6¼ in. and 1/16 in. above or below for each 5-lb. increase or decrease of section. No artificial means of cooling the steel shall be used after the rails leave the rolls, nor shall they be held before sawing for the purpose of reducing their temperature.

4. *Drop Test.*—One drop test shall be made on a piece of rail rolled from the top of the ingot and be not less than 4 ft. and not more than 6 ft. long, selected from each blow of steel. The rails shall be placed head upward on the supports and the various sections shall be subjected to the following impact tests under a free falling weight:

80-lb. rail	20 ft.
90-lb. rail	21 ft.
100-lb. rail	22 ft.
110-lb. rail	24 ft.
120-lb. rail	25 ft.

If any rail breaks when subjected to the drop test, two additional tests may be made of other rails from the same blow of steel, also taken from the top of the ingots, and if either of these latter rails fail, all the rails of the blow which they represent will be rejected, but if both of these additional test pieces meet the requirements, all the rails of the blow which they represent will be accepted.

The drop-testing machine shall have a tup of 2,000 lb. weight, the striking face of which shall have a radius of not more than 5 in. and the test rail shall be placed head upward on solid supports 3 ft. apart. The anvil block shall weigh at least 20,000 lbs., and the supports shall be part of, or firmly secured to, the anvil. The report of the drop test shall state the atmospheric temperature at the time the test was made. The testing shall proceed concurrently with operation of the mill.

5. *Section.*—The section of rail shall conform, as accurately as possible, to the templet furnished by the railroad company, consistent with the paragraph relative to specified weight. A variation in height of 1/64 in. less, or 1/32 in. greater than the specified height, and 1/16 in. in width will be permitted. The section of rail shall conform to the finishing dimensions.

6. *Weight.*—The weight of the rails shall be maintained as nearly as possible, after complying with the preceding paragraph, to that specified in contract. A variation of ½ of 1 per cent. for an entire order will be allowed. Rails will be accepted and paid for according to actual weights.

7. *Length.*—The standard length of rails shall be 33 ft. Ten per cent. of the entire order will be accepted in shorter lengths, varying as follows: 30 ft., 28 ft., 26 ft., 24 ft., and all No. 1 rails less than 33 ft. long shall be painted green on the ends. A variation of ¼ in. in length from that specified will be allowed.

8. *Drilling.*—The holes for splice bars shall be drilled circular and in accordance with the specifications of the purchaser. The holes shall conform accurately to the drawing and dimensions furnished, in every respect, and must be free from burrs.

9. *Straightening.*—Care must be taken in hot straightening the rails, and it must result in their being left in such condition that they shall not vary throughout their entire length more than 4 in. from a straight line in any direction when delivered to the cold straightening presses. Those which vary beyond that amount or have short kinks shall be classed as second quality rails and be so stamped. The distance between supports of rails in the gagging press shall not be less than 42 in. Rails shall be straight in line and surface when finished—the straightening being done while cold—smooth on head, sawed square at ends, variations to be not more than 1/32 in., and, prior to shipment, shall have the burr occasioned by the saw cutting removed and the ends made clean. No. 1 rails shall be free from injurious defects and flaws of all kinds. Rails whilst on the cooling beds shall be protected from coming in contact with water or snow.

10. *No. 2 Rails.*—A No. 2 rail is a first quality rail with some imperfections, and shall be accepted up to 5 per cent. of the entire order. They shall not have flaws in their heads of more than ¼ in., or in the flange of more than ½ in. in depth, and, in the judgment of the inspector, these shall not be so numerous or of such a character as to render them unfit for recognized second quality rail uses. The ends of No. 2 rails shall be painted white and shall have two prick-punch marks on the side of the web near the heat number brand, and placed so as not to be covered by the splice bars. Rails from heats which failed under the drop test shall not be accepted as No. 2 rails.

11. *Branding.*—The name of the maker, the weight of the rail, and the month and year of manufacture shall be rolled in raised letters on the side of the web, and the number of the blow shall be plainly stamped on each rail where it will not subsequently be covered by the splice bars. Where practicable, a figure or letter shall be stamped on the web to indicate the portion of the ingot from which the rail was rolled.

12. *Inspection.*—(*a*). The inspector representing the purchaser shall have free entry to the works of the manufacturer at all times when the contract is being filled, and shall have all reasonable facilities afforded him by the manufacturer to satisfy him that the finished material is furnished in accordance with the terms of these specifications. All tests and inspection shall be made at the place of manufacture prior to shipment and so conducted as not to unnecessarily interfere with the operation of the mill. On request of the inspector, the manufacturer shall furnish drillings for check analysis.

(*b*) The manufacturer shall furnish the inspector daily with carbon determinations for each blow and a complete chemical analysis every 24 hours representing the average of the other elements contained in the steel for each day and night turn. These analyses shall be made on drillings taken from small test ingots. The drillings for analyses shall be taken from the ladle test at a distance of ¼ in. beneath the surface.

Note.—In view of the necessity of rails being ordered and furnished at once, before the new sections embodying the cardinal principles are designed, the sub-committee recommends that the specification herewith recommended be used, modified as to the following clauses:

2 (*b*).	Wt. per yd. 75-lb.—80-lb.	Wt. per yd. 85-lb.—90-lb.	Wt. per yd. 100-lb.
Carbon	0.40 to 0.50	0.43 to 0.53	0.45 to 0.55
Manganese	0.75 to 1.05	0.80 to 1.10	0.84 to 1.14
Phosphorus, not to exceed	0.10	0.10	0.10
Silicon, not to exceed	0.20	0.20	0.20
Sulphur, not to exceed	0.075	0.075	0.075

3. The amount of shrinkage shall be fixed at 6¾ in. at the hot saws for a 33-ft. 100-lb. rail, with a decrease of 1/16 in. for each 5-lb. decrease in weight of section.

4. Height of drop:

75-lb. per yd.	17 ft.
80-lb. "	18 ft.
85-lb. "	18 ft.
90-lb. "	19 ft.
100-lb. "	19 ft.

5. The maximum amount of camber to be 5 in.

In order that the above specifications, recommended by a majority of the committee, may be conveniently compared with those embodied in the minority report and the specifications of other leading engineering associations, we give below extracts covering all points of difference.

The various specifications will be referred to by the letters (a), (b), (c) and (d). The side numerals refer to parts designated by like numerals in the majority report. For convenience of comparison we have further italicised all matter at variance with the majority report.

(a) American Railway Association—Minority Report.

(b) American Society of Civil Engineers—Specifications recommended for Bessemer Steel Rails.

(c) American Railway Engineering and Maintenance of Way Association—Specifications for Bessemer Steel Rails.

(d) American Society for Testing Materials—Standard Specifications for Steel Rails.

*Mr. John D. Isaacs and Mr. Joseph T. Richards favor "a discard of 20 per cent., with a further stipulation that should this discard not provide a sound ingot, additional cropping must be done until such ingot results."

†Mr. John D. Isaacs does not favor specifying a phosphorus content exceeding 0.085

1 (a) *With the present temperature and speeds used in pouring ingots there shall be sheared from the top of ingots approximately 17 x 19 in. in cross section not less than twenty (20) per cent, and if from any cause the* steel does not then appear to be solid, the shearing shall continue until it does. *If by reduction of temperature and speed of pouring or the use of any improvements in the process of making ingots, the defect known as piping shall be prevented, the above shearing requirements may be modified by the purchaser.*

(b) and (c) There shall be sheared from the end of the blooms formed from the top of the ingots *not less than 25 per cent*, and if, from any cause, the steel does not then appear to be solid, the shearing shall continue until it does. *If, by the use of any improvements in the process of making ingots, the defect known as piping shall be prevented, the above shearing requirements may be modified.*

(d) There shall be sheared from the end of the blooms formed from the top of the ingots *not less than* *per cent*,‡ and if, from any cause, the steel does not then appear to be solid, the shearing shall continue until it does.

2 (a) For Bessemer steel with maximum phosphorous 0.085.

	80 lbs.	90 lbs.	100 lbs.
Carbon	0.50 to 0.60	0.53 to 0.63	0.55 to 0.65
Manganese	0.80 to 1.10	0.84 to 1.14	0.86 to 1.16
Phosphorus, not to exceed	0.085	0.085	0.085
Silicon, not to exceed	0.20	0.20	0.20
Sulphur, not to exceed	0.075	0.075	0.075

Does not consider 110-lb. and 120-lb rails.

(b)	70 to 79 lb. Percentage.	80 to 89 lb. Percentage.	90 to 100-lb. Percentage.
Carbon	0.50 to 0.60	0.53 to 0.63	0.55 to 0.65
Phosphorus shall not exceed	0.085	0.085	0.085
Silicon shall not exceed	0.20	0.20	0.20
Sulphur shall not exceed	0.075	0.075	0.075
Manganese	0.75 to 1.00	0.80 to 1.05	0.80 to 1.05

Does not consider 110-lb. and 120-lb. rails.

(c)	70 to 79-lb. Percentage.	80 to 89-lb. Percentage.	90 to 100 lb. Percentage.
*Carbon	0.50 to 0.60	0.53 to 0.63	0.55 to 0.65
Phosphorus shall not exceed	0.085	0.085	0.085
Silicon shall not exceed	0.20	0.20	0.20
Sulphur shall not exceed	0.075	0.075	0.075
Manganese	0.75 to 1.00	0.80 to 1.05	0.80 to 1.05

**Carbon may be reduced to suit local conditions.*

Does not consider 110-lb. and 120-lb. rails.

(d) Does not consider maximum phosphorus 0.085.

Does not consider 110-lb. and 120-lb. rails.

(a) Does not consider maximum phosphorus 0.10.

(b) Does not consider maximum phosphorus 0.10.

(c) Does not consider maximum phosphorus 0.10.

(d)	*50 to 59-lb. Percentage.*	*60 to 69-lb. Percentage.*	*70 to 79-lb. Percentage.*	80 to 89-lb. Percentage.	90 to 100-lb. Percentage.
Carbon	0.35 to 0.45	0.38 to 0.48	0.40 to 0.50	0.43 to 0.53	0.45 to 0.55
Phosphorus shall not exceed	0.10	0.10	0.10	0.10	0.10
Silicon shall not exceed	0.20	0.20	0.20	0.20	0.20
*Manganese	0.70 to 1.00	0.70 to 1.00	0.75 to 1.05	0.80 to 1.10	0.80 to 1.10

*Manganese content, 90 to 100-lb. rails, also differs from majority report.

Considers 50-lb. to 80-lb. rails, but not 110-lb. and 120-lb. rails.

3. (a) Same as majority report.

(b) and (c) The number of passes and speed of train shall be so regulated that on leaving the rolls at the final pass, the temperature of the rail will not exceed that which requires a shrinkage allowance at the hot saws, for a 33 ft. rail of 100-lb. section, *of $6^7/_{16}$ in., and $^1/_{16}$ in.* less for each 5-lb. decrease of section. *These allowances to be decreased at the rate of $^1/_{00}$ in. for each second of time elapsed between the rail leaving the finishing rolls and being sawn.* No artificial means of cooling the steel shall be used after the rails leave the rolls, nor shall they be held before sawing for the purpose of reducing their temperature.

(d) The number of passes and speed of train shall be so regulated that on leaving the rolls at the final pass the temperature of the rail will not exceed that which requires a shrinkage allowance at the hot saws, for a 33-ft. rail of 100-lb. section, *of $7^8/_{16}$ in.*, and $^1/_{10}$ in. less for each 5-lb. decrease of section. *These allowances to be decreased at the rate of .01 in. for each second of time elapsed between the rail leaving the finishing rolls and being sawn.* No artificial means of cooling the rails shall be used between the finishing pass and the hot saws.

Omits: "Nor shall they be held before sawing for the purpose of reducing their temperature."

4. (a) Does not cover 110-lb. and 120-lb. rails.

(b) and (c) *Drop Test.*—One drop test shall be made on a piece of rail, not less than 4 ft. and not more than 6 ft. long, selected from each blow of steel. The test piece shall be taken from the top of the ingot. The rails shall be placed head upward on the supports, and the various sections shall be subjected to the following impact tests under a free falling weight:

70 to 79-lb. rails	18 *ft.*
80 to 89-lb. rails	20 *ft.*
90 to 100-lb. rails	22 *ft.*

Does not cover 110-lb. and 120-lb. rails.

(d) One drop test shall be made on a piece of rail not less than 4 ft. and not more than 6 ft. long, selected from every fifth blow of steel. The test shall be taken from the top of the ingot. The rail shall be placed head upward on the supports, and the various sections shall be subjected to the following impact tests under a free falling weight:

	Weight of rail, Pounds per yard.			*Height of drop.*
	45	*to and including*	55	15 *ft.*
More than	55	" "	65	16 *ft.*
More than	65	" "	75	17 *ft.*
More than	75	" "	85	18 *ft.*
More than	85	" "	100	19 *ft.*

Does not cover 110-lb. and 120-lb. rails.

‡*The percentage of minimum discard in any case to be subject to agreement, and it should be recognized that the higher this percentage the greater will be the cost.*

(b), (c) and (d) Do not state

"The testing shall proceed concurrently with operation of mill."

5. (c) *Unless otherwise specified the section of rail shall be the American Standard, recommended by the American Society of Civil Engineers,* and shall conform as accurately as possible, to the templet furnished by the railroad company, consistent with paragraph No. 8 relative to specified weight. A variation in height of one sixty-fourth ($^1/_{64}$) inch less or one thirty-second ($^1/_{32}$) inch greater than the specified height, and one-sixteenth ($^1/_{16}$) inch in width, will be permitted. The section of rail shall conform *perfectly* to the finishing dimension.

(d) *Unless otherwise specified, the section of rail shall be the American Standard, recommended by the American Society of Civil Engineers,* and shall conform, as accurately as possible, to the templet furnished by the railroad company, consistent with Paragraph No. 8, relative to specified weight. A variation in height of $^1/_{64}$ in. less, or $^1/_{32}$ in. greater than the specified height, and $^1/_{16}$ in. in width will be permitted.

Omits: "The section of rail shall conform to the finishing dimensions.

7. (b), (c) and (d) "*Length.*—The standard length of rails shall be 33 ft. Ten per cent. of the entire order will be accepted in shorter lengths varying *by even feet to 27 ft.*, and all No. 1 rails less than 33 ft. long shall be painted green on the ends. A variation of $^1/_4$ in. in length from that specified will be allowed.

(b) "*Straightening.*—Care must be taken in hot straightening the rails, and it must result in their being left in such condition that they shall not vary throughout their entire length more than 5 *in.* from a straight line in any direction, when delivered to the cold straightening presses. Those which vary beyond that amount, or have short kinks, shall be classed as second-class rails and be so stamped.

"Rails shall be straight in line and surface when finished, the straightening being done while cold, smooth on head, sawed square at ends, variation to be not more than $^1/_{32}$ in., and, prior to shipment shall have the burr occasioned by the saw cutting removed and the ends made clean. No. 1 rails shall be free from injurious defects and flaws of all kinds.

Omits: Distance between supports in gagging press.

(c) Rails shall be straight in line and surface when finished—the straightening being done while cold—smooth on head, sawed square at ends, variation to be not more than $^1/_{32}$ in., and, prior to shipment shall have the burr occasioned by the saw cutting removed and the ends made clean. No. 1 rails shall be free from injurious defects and flaws of all kinds.

Care must be taken in hot straightening the rails, and it must result in their being left in such a condition that they shall not vary throughout their entire length of 33 ft. more than 3 *in.* from a straight line in any direction, when delivered to the cold-straightening presses. Those which vary beyond that amount, or have short kinks, shall be classed as second quality rails and be so stamped. The distance between supports of rails in the gagging press shall not be less than 42 in.

(d) Care must be taken in hot-straightening the rails, and it must result in their being left in such a condition that they shall not vary throughout their entire length more than 5 in. from a straight line in any direction when delivered to the cold-straightening presses. Those which vary beyond that amount, or have short kinks, shall be classed as second quality rails and be so stamped. The distance between supports of rails in the gagging press shall not be less than 42 in. Rails shall be straight in line and surface when finished—the straightening being done while cold—smooth on head, sawed square at ends, variations to be not more than $^1/_{32}$ in., and, prior to shipment, shall have the burr occasioned by the saw cutting removed, and the ends made clean. No. 1 rails shall be free from injurious defects and flaws of all kinds.

(b), (c) and (d) *Omit*: "Rails whilst on the cooling beds shall be protected from coming in contact with water or snow."

10. (c) No. 2 rails will be accepted up to to five (5) per cent. of the whole order. *Rails that possess any injurious defects, or which for any other cause are not suitable for first quality, or No. 1 rails, shall be considered as No. 2 rails; provided, however, that rails which contain any physical defects which impair their strength shall be rejected.* The ends of all No. 2 rails shall be painted white in order to distinguish them. Rails rejected under the drop test will not be accepted as No. 2 rails.

(d) No. 2 rails will be accepted up to 10 per cent. of the whole order. *Rails which possess any injurious defects, or which for any other cause are not suitable for first quality, or No. 1 rails, shall be considered as No. 2 rails; provided, however, that rails which contain any physical defects which impair their strength shall be rejected.* The ends of all No. 2 rails shall be painted white in order to distinguish them.

Omits: Rails rejected under the drop test not acceptable.

12. (b) Does not specify:

"The drillings for analyses shall be taken from the ladle test at a distance of ¼ in. beneath the surface."

(c) and (d) Do not specify:

(1) On request of the inspector, the manufacturer shall furnish drillings for check analysis.

(2) The drillings for analyses shall be taken from the ladle test at at distance of ¼ in. beneath the surface.

In an editorial appearing in the *Railroad Gazette*, Sept. 6, we printed in parallel columns the specifications (b), (c) and (d), following the same with a discussion of their principal features. The subject of rail specifications was also discussed editorially Oct. 18 and Nov. 15. We shall now summarize the situation in the light of the report of the committee of the American Railway Association. Before doing so, however, we shall quote in full the introductory statement of the minority report prepared by Mr. Kruttschnitt, in which he endeavors to present the position both of the railroads and the manufacturers on the principal points at issue.

To the Members of the American Railway Association:

I respectfully present my views on rails, with sections and specifications as a minority report of the Committee on Standard Rail and Wheel Sections.

Rail breakages, which lately have been increasing at an alarming rate, seem to be due to three principal causes:

1. *Improper Chemical Composition*, due either to improper specifications or to segregation.

2. *Insufficient Discard*, causing concealed defects, which result in breaks in service, sometimes with, but frequently without warning.

3. *Too Great Haste in Manufacture of Rails*, which are finished at too high temperatures, due partly to faulty distribution of material in cross-sections and partly to improper manipulation or work on the head in the rolls.

Improper Chemical Composition.

The position of the manufacturers and the railroads is summed up as follows:

The Manufacturers Claim:

(*a*) Insufficient ore supply for phosphorus below 0.10.

(*b*) Safe rails can be made with 0.10 phosphorus.

Railroads Claim:

(*a*) Admitting that ore supply to make rails with phosphorus below 0.10 is limited, yet as the United States mills make rails for export with phosphorus below 0.10 and Canadian mills using ores imported from the United States are making rails with 0.085 phosphorus for Canadian roads, it is not unreasonable for the railroads of the United States to want all 0.085 rails that can be made, and unless specifications call for them they will never get any. Foreigners should not be favored with the highest grade of rail produced in our mills.

(*b*) Not denied that safe rails can be made with 0.10 phosphorus, but as carbon has to be reduced 7.5 points for the increase of 1.5 points in phosphorus, the resultant rail is softer, deficient in wearing qualities, and not nearly so desirable and efficient as one with less phosphorus and more carbon.

It is not expected that with the recommended specifications all of the Bessemer rail made in the United States can be furnished with a phosphorus content as low as 0.085, but as this committee is expected to recommend specifications that will give the best rail obtainable, we are convinced that prescribing a phosphorus content that shall not exceed 0.085 will result in securing for domestic lines the highest grade of product, leaving the lower for export. Under the specifications of 0.10 phosphorus heretofore forced on the railroads by the manufacturers, the reverse has been the case. The committee should not lend itself to a perpetuation of this condition. Prescribing 0.085 phosphorus does not condemn a rail, with higher phosphorus content, but it operates as a constant caution to the purchaser against raising phosphorus and lowering carbon, thereby getting a less desirable and efficient rail.

Insufficient Discard.

A sub-committee, as well as the entire committee, has devoted a great deal of time in the past year and a half conferring with manufacturers trying to obtain promises for safer and better rails. The position of the railroads and manufacturers is outlined as follows:

The Manufacturers Claim:

(*a*) That many breaks are improperly attributed to piping, and all except one claim that no fixed percentage of discard will insure sound rails.

(*b*) That the increased number of broken rails is caused by greater speeds and wheel loads.

The Railroads Claim:

(*a*) That this may be a question of nomenclature, but the fact is the breaks do occur more frequently than formerly, especially in the heavier sections. * * * * * Segregation and piping take place in the top of the ingot, and whilst impossible to locate them definitely so that we may be certain in discarding a particular fraction of the ingot that we have done away with all danger from their presence, it seems to be conceded beyond reasonable doubt that as we increase the discard we eliminate more and more of the trouble; just what the per cent. should be is doubtful, but it may be inferred from the following evidence:

1. The president of one of the largest steel works in the United States states that the depth to which piping extends in a 17 x 19 ingot (and this is the size of ingot most commonly used in rolling mills) is about 18 per cent. of the depth of the ingot.

2. The same works are selling premium carbon rails, which they claim are of the highest grade they are able to make on specifications of their own, which prescribe 20 per cent. discard.

3. The recommended specifications of the American Society of Civil Engineers prescribe 25 per cent. discard.

4. The recommended specifications of the American Railway Engineers and Maintenance of Way Association prescribe 25 per cent. discard.

5. The head of an eminent firm of inspecting engineers, which does the inspecting for many large systems of railroads, recommends 25 per cent.

6. One of the largest railroad systems in the United States, which seems to have been singularly and suggestively exempt from rail breakages, has been prescribing and obtaining a discard of 25 per cent. A Canadian mill whose output has been singularly free from breakages used a discard of 16 per cent.

7. Mr. H. M. Howe in an article on "How May Quality of Steel Rails Be Improved," in the *Engineering and Mining Journal*, says: "The richest of the segregate lies near the top of the ingot, usually in the upper 20 per cent."

(*b*) The alarming increase in breakages is not due to increase of speeds and loads, but to poorer quality due to careless manufacture. Rails of 70, 60 and even 50 lbs. per yd. are to-day safely carrying the same loads at the same speeds under which 80, 90 and 100 lb. rails are breaking in large numbers.

The proposal of the manufacturers that the percentage of discard should be left open to agreement with the purchaser in each case, recognizing at the same time the principle that the higher the discard the greater the price, would leave matters just as they stand and would perpetuate conditions that have caused the increased breakages and the feelings of alarm and insecurity shared by the railroad managers and the public. We think it is the duty of the committee to make some recommendation based on the best evidence obtainable, to serve as a guide to the purchaser, who should understand that whilst it seems impossible to fix a percentage that will guarantee the absence of internal flaws, it seems nevertheless reasonably certain from the evidence before us that the present practice of discarding 10 per cent., as the manufacturers claim to be doing, is insufficient, and that an increase to about 20 per cent. on ingots of the size most commonly used would practically eliminate breaks from piping and segregation and give a safe rail.

Too Great Haste in the Manufacture of Rails.

The Manufacturers Claim:

(*a*) Faulty distribution of metal in sections, forcing them to stop rolling the head when the base has cooled, and whilst the head is still hot enough to be worked.

(*b*) No greater speed of rolls than formerly used.

The Railroads Claim:

(*a*) The present sections of A. S. C. E. were approved by the rail makers. They admit reasonableness of manufacturers' claim, and concede that a change of sections is desirable.

(*b*) Whilst speed of rolls may be no greater, the number of passes has been reduced, and the manipulation of work done on the metal has been cut down so that closeness of texture or fineness of grain, on which wear depends, has been correspondingly reduced and sacrificed.

Your committee has been convinced by the manufacturers that a change in the sections whereby the metal would be more equally distributed between the base and the head, thereby allowing rolling to be done at a lower temperature, would be beneficial.

Two sets of sections[1] are submitted herewith and recommended for adoption, our preference being strongly for those marked A, in designing which great weight was given to the consideration of the rail as a girder and its function to distribute a load over a number of supports. To do this efficiently it must be stiff, that is, deep. These A sections have high moments of inertia, and for the same weights are much stiffer, admit of very much stiffer splice bars, and will, therefore, make smoother riding track than the sections marked B.

Respectfully submitted,

J. Kruttschnitt.

The specifications embodied in the minority report are substantially the same as those recommended by the committee of the American Society of Civil Engineers and those adopted by the American Railway Engineering and Maintenance of Way Association, except that the percentage of discard is reduced from 25 to 20 per cent.

The specifications contained in the majority report follow more closely the lines of those of the American Society for Testing Materials, so far as present rail sections and the use of steel with a phosphorus content not exceeding 0.10 per cent. are concerned. They make provision also, however, for revised sections with increased heights of drop, and for steel with a phosphorus content not exceeding 0.085 per cent.

In the matter of discard these specifications are disappointing, in that they stipulate "sufficient discard to insure sound rails," as against fixed minimum percentages in specifications (a), (b) and (c), and a blank percentage, subject to agreement, in the Specifications of the American Society for Testing Materials. It is true that the American Railway Association has not adopted these specifications, and that they have been referred back to the committee with instructions to make further investigation.[2] The proper percentage of discard may in time be determined by an extensive series of tests, but pending the results of such tests, it is to be regretted that the more conservative policy of specifying a definite minimum percentage of discard was not recommended.

It is pertinent in this connection to quote from the report of the committee of the American Society of Civil Engineers, presented some two years ago, a statement made in connection with the discussion of the question of discard: "* * * it is well known that one of the frequent causes of failure of steel rails is due to piping, and that this comes from unsound ingots. Unfortunately, such failures often cause accidents, which result in large material damage, and, what is worse, the loss of life. Frequently such interior defects cannot be detected until after the rails have been subjected to traffic, hence it is of the greatest importance that care should be exercised in the manufacture with a view of reducing the danger to a minimum."

Since the usual mill practice involves a discard of from 7 to 10 per cent., it would have been more satisfactory if the committee had specified at least a moderate increase, say to 12½ per cent., which would not impose a hardship on the manufacturers, and which might reasonably be expected to lessen the danger from de-

[1] Shown in the *Railroad Gazette* Nov. 22.

[2] Two reports have been presented to the Association by the Committee on Standard Rail and Wheel Sections, a majority and a minority report, and the chairman requests further time. Your executive committee is of the opinion, therefore, that action on both of these should be deferred, on the ground that no benefit to the members of the Association can be derived from the discussion on the floor of the convention at this time of a subject which is so full of undetermined technical points.

Your committee further recommends that the Committee on Rail and Wheel Sections be requested to continue its investigations, to employ competent experts, and to expend such sums necessary for this purpose as may be authorized by the executive committee.

The attention of the members, however, is called to the fact that the members of the Committee on Rail and Wheel Sections are unanimous in all of their recommendations, except as to chemical composition and discard, among others concerning better rail sections and an improved form of report of rails, and that any member may avail itself at once of these recommendations. *Report of Executive Committee.*

festive rails. It is, of course, recognized that the percentage of discard depends somewhat on the size of the ingot and other circumstances. The moderate fixed percentage suggested is, however, believed to be sufficiently conservative for all prevailing conditions. Moreover, the railroads would doubtless be entirely willing to bear the slightly increased cost due to added discard. It is, of course, to be understood that such percentage should be subject to change in the light of further information obtained either by tests or by experience in service.

In the matter of height of drop, it is to be noted that the heights specified by the committee for the present rail sections are practically the same as those in the specifications of the American Society for Testing Materials. For the proposed new sections the height of drop is increased 3 ft. for a 100-lb. section and 2 ft. for weights of 90 lbs. and under.

Conceding the validity of the claim of the manufacturers that the ore supply permits of only a limited supply of Bessemer steel rails with a phosphorus content not exceeding 0.085, recourse must be had either to Bessemer rails of sufficiently increased section to meet safely the requirements of modern traffic conditions, or to the use of open-hearth steel rails, which may be obtained to a limited extent to-day, with a phosphorus content ranging from 0.03 to 0.06 per cent. and with discard from 15 to 25 per cent.

The committee embodies in its report "cardinal principles" governing the design of rail sections. It is to be hoped that the further investigation of the committee will lead to the establishment also of cardinal principles governing the manufacture of steel rails, especially in the matter of lighter reductions in rolling, from the ingot to the finished section, with due regard to the influence of the finishing temperature. The specifications in the majority report are in the right direction, in that they provide for a drop test on every heat of steel on rails made from the top of the ingot, and in that the permissible percentage of No. 2 rails is limited to 5 per cent.

It is especially reassuring to find that these changes were accepted by the representatives of the leading manufacturing interests who were invited to confer with the committee. It is not to be doubted that the work of the committee of the Railway Association has considerably advanced the harmonization of the conflicting specifications, and it is to be hoped that at no distant date a specification will be evolved which will be acceptable to all parties in interest, and which will be generally adopted by the various engineering societies. With this end in view, it is greatly to be desired that the committee of the Railway Association will prosecute the further investigation of the subject vigorously, and that the results of their study will be laid before the profession at the earliest possible date.

Train Accidents in November.[1]

Our record of train accidents occurring on the railroads of the United States in November includes 20 collisions and four derailments, 24 accidents in all. This record is not published in full except in the cases of the few accidents which are especially prominent—in the present instance two collisions. The record of "ordinary" accidents—which term includes, for our present purpose, only those which result in fatal injury to a passenger or an employee or which are of special interest to operating officers—is given at the end in the shape of a one-line item for each accident, showing date, location, class and number of deaths and injuries. The items of which details are given are indicated in the tabular statement by the use of italics. This record is based on accounts published in local daily newspapers, except in the cases of accidents of such magnitude that it seems proper to send a letter of inquiry to the railroad manager.

The collision at Larimer, Pa., on the 12th, occurred about 1:30 a.m. Passenger train No. 28 eastbound, the 18-hour Chicago-New York train, was turned through a crossover to the westbound track and ran into a westbound freight train which was standing near the tower. Both engines were badly damaged, as were the first car of the passenger train and six cars of the freight. One freight train trainman and four other employees and six passengers were injured, none of them badly hurt. The signalman had orders to send the passenger train out to the next station on the westbound track, after that track should have been cleared, but he appears to have forgotten that the westbound freight was standing near the tower.

The rear collision of freight trains at Towanda, Pa., on the 10th would not have been unusually disastrous so far as the destruction of property is concerned, had it not been for a fire which immediately broke out and which destroyed everything combustible about the wrecked cars and engine. Indeed, the colliding train—a regular freight train—was running slowly, under a permissive signal; but the case is of interest as one in which an inquest brought out the real cause. As reported in a local paper, the engineman who was at fault frankly testified that he saw the train ahead, knew about how far it was from him, and yet instead of keeping a close watch on its movements he turned his eyes away and assisted the fireman. Because of the poor quality of the coal or the inexperience of the fireman, the engineman deemed it necessary to attend to the fireman's work instead of to his own immediate duty, a plain case of trying to do two things at once and not putting the first duty first. But as is usual in such cases the jury tried to exonerate the engineman, declaring that the collision was caused by "the engineer and others not being in position to see signals given by the flagman and through escaping steam through defective packing of the piston valve."

Of the nine serious electric-car accidents reported in the newspaper in the month of November, five resulted in fatal injury to one or more persons, namely, Indianapolis, Ind.; Woonsocket, R. I.; Chicago, Ill.; Fort Worth, Tex., and Waterbury, Conn. In the last named case, which occurred on the 29th, a street car stalled on a railroad crossing was struck by a freight train and five persons were killed.

Two collisions on elevated lines in New York City, while not particularly disastrous in their results, are noticeable by reason of the circumstances attending them. On the 11th, at Thirty-fourth street, on the Sixth avenue line, a northbound train, just starting away from the station, ran into the rear of a preceding train which had been stopped, and the momentum of the moving train was such that its leading car was lifted about 7 ft. and pushed to one side so that it barely escaped falling into the street. The explanation—common in cases where trains are required to run under control—is that the motorman thought that the preceding train would start before he got to it. A collision of loaded passenger trains on the Manhattan elevated lines is noticeable by reason of the remarkable infrequency of such collisions on these lines throughout a period of 25 years and more.

The other collision, which occurred on the 25th, was on the Subway line, but on that portion of it which is on an elevated structure. In this case a northbound train, leaving the last station before reaching the terminus, ran at unchecked speed into the rear of a preceding standing train, and the motorman was killed. There were few passengers in the trains, however, and only four were injured. The motorman, although a faithful and sober employee, who had been several years in the service, proceeded on his way without even noticing the preceding train, although it was in broad daylight and there was nothing in the way to prevent him from clearly seeing it, the rear car being only about 300 ft. away. As the physicians who examined the motorman's body found no evidence of heart disease or apoplexy, and as he had not had time to fall asleep after starting, this would seem to be a simple case of absent mindedness. The man must have allowed his attention to be distracted by something at the side of the road.

[1] Abbreviations and marks used in Accident List:
rc.....Rear collision.
bc.....Butting collision.
xc.....Other collisions; as at crossings or in yards. Where only one train is mentioned, it is usually a case of a train running into a standing car or cars, or a collision due to a train breaking in two on a descending grade.
b.....Broken.
d.....Defective.
dr.....Defect of roadway.
eq.....Defect in car or engine.
n.....Negligence.
unf.....Unforeseen obstruction.
unx.....Unexplained.
derailt....Open derailing switch (negligence of engineman or signalman).
ma.....Misplaced switch.
acc. obst..Accidental obstruction.
malice....Malicious obstruction of track or misplacement of switch.
boiler....Explosion of boiler of locomotive on road.
fire.....Cars burned while running.
Pass.....Passenger train.
Ft.....Freight train (includes empty, engines, work trains, etc.).
*Wreck wholly or partly destroyed by fire.
†One or more passengers killed.

Lehigh & Hudson River.

This is the road over which President Mellen wishes the Central of New Jersey, the Philadelphia & Reading and the Baltimore & Ohio to send all their traffic for the New York, New Haven & Hartford, which would receive it over the Poughkeepsie bridge and the Highland division, now double tracked from Hopewell as far as Danbury, Conn., and soon to be double tracked and improved as far as Waterbury. For over two years now the Lackawanna has been sending its shipments for New Haven territory by this route with apparent satisfaction to all concerned. The Central of New Jersey is at present also sending some traffic over the Lehigh & Hudson River. This route, however, would give, in most cases, to the roads in the Reading system a shorter proportion of the haul on New England shipments. The corresponding advantage would go mostly to the Lehigh & Hudson River.

This railroad is not controlled by the New York, New Haven & Hartford. Of the 13 directors of the Lehigh & Hudson River, the presidents of the Lackawanna, the Ontario & Western, the Erie and the Lehigh Valley and the fourth vice-president of the Pennsylvania make up five. The other eight include George F. Baer, President of the Reading and of the Central of New Jersey; Joseph S. Harris, a director of the Reading Company, the Philadelphia & Reading Railway, the Philadelphia & Reading Coal & Iron Company and the Lehigh Coal & Navigation Company; J. Rogers Maxwell, Chairman of the Executive Committee of the Central of New Jersey; Robert W. de Forest, Vice-President, General Counsel and a director of the Central of New Jersey; Lewis A. Riley, President, who is also President of the Lehigh Coal & Navigation Company, which leases 192 miles of railroad to the Central of New Jersey; Morris Rutherfurd, Vice-President and General Manager, and James M. Duane, a member of the banking firm of Brown Bros. & Co., and a director of the Lehigh Coal & Navigation Company. The remaining member of the board is Alfred Ely.

Thus, four directors are closely associated with the Reading-Central of New Jersey interests and three others with the Lehigh Coal & Navigation. At the recent hearing before the Interstate Commerce Commission at Washington in regard to the New Haven's proposed cancellation of through tariffs with his companies via New York harbor, President Baer was quoted as saying in reply to a suggestion of President Mellen that the Lehigh & Hudson River was available for moving such shipments, that "I do not control one-tenth of it." This seems a remarkable statement, for judging by the directorate of the Lehigh & Hudson River, the Reading-Central of New Jersey interests and the Lehigh Coal & Navigation together have actual control, with the other anthracite coal railroads owning the rest of the stock. More important still, on the official map in the last annual report of the Reading Company, issued October 14, 1907, the Lehigh & Hudson River is shown as a line "controlled through ownership of majority interest." Why then is President Baer so loath to have it used?

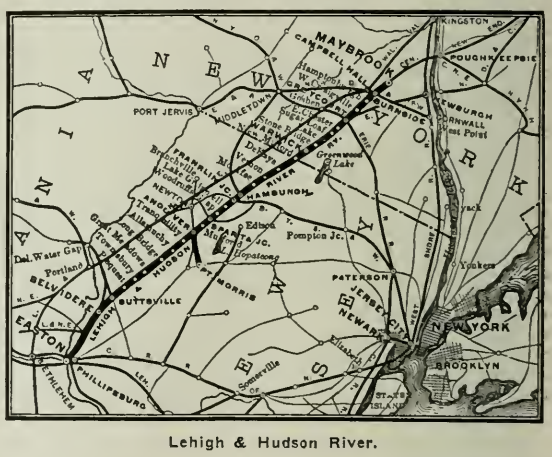
The beginning of the present interchange traffic between the Lackawanna and the New Haven marked a new era in the history of the Lehigh & Hudson River. From that time it began to take shape as a through modern railroad, instead of being a local line moving enough traffic to keep itself alive. Gross earnings, which were $482,000 in 1905, rose to $844,000 last year. Net earnings were $167,000 in 1905 and $304,000 last year. The increase of 1907 over 1906 in gross earnings was 30 per cent., and in net, 19 per cent.

Last year there was an increase of 93 per cent. in tax payments, owing to the new law in New Jersey, and a considerable increase in fixed charges because of the issue of $239,000 of debenture bonds and $400,000 of equipment trust certificates; so that net income was not much larger than in the previous year. As over twice as much was charged off for depreciation and adjustments, the year's surplus was only about half as much as in 1906. The year, however, has been a prosperous and favorable one, for the business of the road and its capabilities for handling it have grown.

The cost of additions and betterments made during the year was $993,893, which is an expenditure of over $10,000 a mile for each of the 99 miles operated and of $13,250 for each of the 75 miles owned. This is probably a larger expenditure per mile for additions and betterments, especially since it includes no increase in mileage, than was made last year on any other railroad in the United States. The largest items under this head are $414,000 for new freight cars and $100,000 for new locomotives. The bridge over the Delaware river at Easton, Pa., which is 1,034 ft. long and was built partly of second-hand material in 1899, is being rebuilt. This bridge forms the link between the connecting railroads south of the Delaware river and the southern terminal yard of the Lehigh & Hudson River at Phillipsburg, N. J. The bridge is to be made strong enough to carry the heaviest locomotives in use on any of the connecting roads. Masonry for the new piers has been finished and the new bridge is being erected. The cost will be about $125,000, part of which was advanced during the year. There was also $38,000 spent out of capital for part of the cost of new passing sidings and switches at 11 different points along the line.

Many other improvements were charged to maintenance of way and structures under operating expenses. This expense increased 19 per cent. over the previous year and amounted to $989 per mile, against $821 in 1906. There were 21 miles of 80-lb. rails laid during the year, and since June 30 enough more 80-lb. rail has been received to lay the entire line with that weight. Most of this has already been laid. Although there were less than 2,000 more ties placed in track than in the previous year, the cost of tie renewals increased 50 per cent., due to the fact that formerly the supply of ties was cut along the line but last year yellow pine ties from other regions had to be bought.

There was a large decrease in maintenance of equipment expenses, which were 44 per cent. less than in the previous year. Repairs and renewals of locomotives cost $595 per locomotive, against $1,838 in 1906; of passenger cars $239 per car, against $176 in 1906, and of freight cars $13 per car, against $30 in 1906. The 1907 figures are in each case the lowest of those for any railroad whose report has been reviewed in the *Railroad Gazette*. There is a reason for this. Under the equipment trust for $400,000, dated May 10, 1906, there were put into service last year 250 hopper bottom gondola cars; 10 low-side gondolas and 25 steel ore cars, all of 80,000 lbs. capacity; 75 box cars of 60,000 lbs. capacity, and six locomotives. Six more locomotives were bought on locomotive rental notes for $68,594, payable quarterly over a period of three years, a cash payment of $15,742 having been made when the locomotives were received. On June 30, 1906, the company owned only 18 locomotives, so that this increase of 12 was an increase of two-thirds in the total



Lehigh & Hudson River.

locomotive equipment. The number of freight cars rose from 790 in 1906 to 1,088, an increase of 38 per cent. Considering that two-fifths of the locomotives were new, the small amount spent on locomotive repairs can be explained. The same argument does not apply to the passenger cars; their maintenance charge in each year is very low. One-third of the freight cars were new, but even so, the average repair cost of $13 per car is low, particularly after a year when, with no new cars whatever to bring down the average, the freight car repair cost was only $30. One explanation of these low charges is probably that almost all of the road's high grade traffic is carried in cars of other companies. New shops are now under construction.

Conducting transportation expenses increased 53 per cent. over the previous year, and general expenses 55 per cent. Conducting transportation amounted to 43 per cent. of gross earnings, against 36 per cent. in 1906. This was due both to the increased volume of traffic, the greater cost of labor and material and a further special cause. The increase in traffic is shown by the increase of 50 per cent. in the freight-train mileage and of 45 per cent. in the ton mileage. There were large increases in cost of fuel for locomotives and in all accounts involving wage payments. Hire of equipment, which appears to include per diem payments, rose from $90 in 1906 to $2,305 last year, an increase of 2,460 per cent. During November and December, 1906, and January, February and March, 1907, the conducting transportation costs were particularly high in proportion to the amount of traffic. This was due to the hacking up of traffic on the line, with consequent congestion and added expense, by the inability of the New York, New Haven & Hartford to promptly move the through traffic to the east.

Ores were the largest single item of tonnage, amounting to 22 per cent., most of which originated on the line. Limestone, which also originated mostly on the line, furnished 10 per cent. of the tonnage. Merchandise amounted to 8 per cent., and miscellaneous to 9 per cent., both of these groups of high grade tonnage being almost

entirely received from other carriers. The traffic in grain, flour, other mill products, cotton, other packing house products; wool; hides and leather, anthracite coal, bituminous coal, iron products, and cement, brick and lime, which were the most important of the other tonnage groups, was all or nearly all received from other carriers. The total tonnage originating on the road was 735,000 tons, of which 561,000 tons were ores and limestone. Outside of these two commodities, the tonnage of no commodity originating on the line amounted to as much as 25,000 tons. The interchange tonnage amounted to 1,240,000 tons, or 63 per cent of the total. The Lehigh & Hudson River has one advantage which counts for much in the economical operation of the road: the traffic is almost evenly balanced. Last year 52 per cent of the total was carried eastward and 48 per cent. westward.

The future of this small property is a matter of great interest. There is no doubt that the transfer by car floats from the New Jersey side of the Hudson river around the south end of Manhattan Island and up the East river to the Harlem river terminal of the New Haven is a costly, slow and dangerous method of interchange. It is also true that the New York division of the New Haven is overburdened with traffic and that the interchange traffic with the Pennsylvania and Lehigh Valley, the most important of the New Jersey connections of the New Haven, is likely to be all that can be conveniently handled on that division. Also, the Poughkeepsie bridge route is being steadily improved. If President Mellen is successful in his contention that the roads in the Reading system shall follow the example of the Lackawanna and send their traffic for New England by this route, the importance of the Lehigh & Hudson River will necessarily be greatly increased, particularly as on this traffic it will secure a haul over the whole length of its line, while on the Lackawanna's business, which is received at Port Morris, it gets a haul of little more than half its length. If in this way the Lehigh & Hudson River is to be a main gateway for traffic between points west of the Hudson river and New England, there is a possibility that the Lehigh & New England, which parallels it for its whole length on the west and is owned by the Lehigh Coal & Navigation Company, in spite of its worse grades and curves, may also be used as a through connection.

The results of operation of the Lehigh & Hudson River for the last two years are shown below:

	1907.	1906.
Mileage worked	99	99
Passenger earnings	$44,414	$40,429
Freight earnings	781,866	601,891
Gross earnings	844,335	662,386
Maint. way and structures	97,951	82,015
Maint. of equipment	45,199	65,240
Conducting transportation	362,485	237,454
General expenses	34,417	22,437
Operating expenses	540,051	407,145
Net earnings	304,283	255,241
Net income	125,177	108,132
Depreciation and adjustments	81,790	35,641
Year's surplus	43,387	72,492

NEW PUBLICATIONS.

The Car Wheel. Giving the results of a series of investigations by George L. Fowler, M.E. Published for private distribution by the Schoen Steel Wheel Co., Pittsburgh, Pa., 1907. Boards, 5 in. x 9 in.; 161 pages, and numerous illustrations.

It is seldom that the results of such an exhaustive series of investigations, primarily carried out for the sole purpose of determining the standards of quality and workmanship which must be met by a new product in competition with old and well tried products, are given to the public in such complete detail. Mr. Fowler in the beginning was confronted with an almost total lack of published data as to many of the properties of car wheels which were later investigated, and practically the whole of the contents of this book is original data here made public for the first time. One chapter on the lateral thrust of wheels against the rail has already been reprinted by special permission of the Schoen Co. in the *Railroad Gazette* of Nov. 15, 1907, and another on the areas of contact between wheel and rail is reprinted in another column in this issue. These will give a better idea of the character of the investigations made than any extended review. Other chapters consider the design of the solid rolled and forged steel wheel; comparative physical and chemical properties of solid rolled and forged steel wheels, steel tires and cast-iron wheels; studies of heat treatment and penetration of physical work in rolling from the micro-structure of the metal; co-efficients of friction between wheel and rail. The last chapter is a presentation of advantages claimed for the Schoen solid rolled and forged steel wheel based on the tests recorded in previous chapters, together with the results of a number of actual service tests.

The investigations which were made covered a period of over two years. Perhaps the most striking thing about them is the fact that they reveal how completely unexplored as yet is the field of railroad dynamics. Wellington and Forney touched on the edges and Fowler has here gone somewhat deeper into some of the unsolved problems, but there yet remains a vast and profitable field of investigation. While the book is intended to promote more extended knowledge of the properties of the Schoen wheel, at the same time one is struck by the impartial presentation of the results of the various investigations and the value of the data given is by so much increased.

As a piece of book making the volume is a work of art. It is printed on heavy vellum paper with illuminated chapter headings, and the illustrations are printed on loose leaves of cream-colored plate paper, pasted to blank pages. The binding is plain board with embossed gold letters. The book is intended for private distribution among railroad officers interested in the service requirements of car wheels.

Railway Shop Up to Date. A reference book of up-to-date American railway shop practice. Compiled by the Editorial Staff of the *Railway Master Mechanic*. Chicago: Crandall Publishing Co. 243 pages, 9 in. x 12 in. Cloth. Price, $4.

The purpose of the compilers of this volume was to present a record of the best existing practice in railroad shop design, construction and equipment. It has been about three years since any comprehensive work of this character has appeared and in that time there has been material progress. There was need, therefore, of bringing the record up to date, and this has been well done in the present volume. Data has been selected with care and logically arranged, the idea being to make it equally serviceable in designing new plants or improving existing ones. This book contains some good features not found in earlier volumes, particularly in the matter of tool and electrical equipment. For the former, tables are prepared for machine and erecting shops on a pit basis. The proportion of different machine tools for a single pit is worked out and figures then derived for shops of 12, 15, 24 and 48 pits, simply by multiplying the pit figure by these numbers. The tabulation also includes the total of each kind, and the number of each size, or class, of tool for shops of a given number of pits. The basis on which the tables have been worked out is stated to be more liberal in its allowance of tools than is the general practice. Lists of the machine tool equipment for several representative shops are given, also for blacksmith and woodworking shops. For the power plants there is a table of data of 15 representative power houses, and diagrams of the power distribution at four large electrically-driven plants. The illustrations for each chapter are grouped at the end of the chapter instead of being scattered through the discussion. They are all line engravings, except for a number of storehouse photographs. The compilers of the volume were assisted by an advisory committee consisting of C. A. Schroyer, Superintendent Car Department, C. & N.-W.; M. K. Barnum, General Inspector Machinery and Equipment, C., B. & Q., and R. D. Smith, Assistant Superintendent Motive Power, B. & A.

Rail Specifications—the Discard from the Ingot.

Altoona, Pa., Dec. 12, 1907.

TO THE EDITOR OF THE RAILROAD GAZETTE:

I do not know which of my many utterances in regard to steel rails your correspondent, "Railroad Officer," has chosen to base his statement on in your issue of November 22d, that I with others "assert that the railroads cannot afford to do otherwise than unite on the requirement of a definite discard." It is quite probable that something which I have said would give color to such a view, but it is fair to say at the present time that the more the question of discard is studied, the more difficult it becomes to have a positive and definite view in regard to it.

It would hardly be wise, at this time, to go into the whole question of discard. There is too much lack of positive information as to how the majority of rails fail, to tie up these failures satisfactorily with the discard. This lack of positive information on the part of the railroads was, as we understand it, the principal cause of the inability of the committee of the American Railway Association to make a more satisfactory report at the recent meeting of that body. It is hoped and believed that by means of a careful study within the next year or two, of rails which fail in track, a good deal more definite information will be obtained. At the present time we hardly feel willing to say more than that probably the poorest steel for rails in the ingot is somewhere from 15 to 18 per cent. down from the top. Also that there are two points involved in this poor steel, namely, segregation and physical defects in the metal. Under the head of physical defects are embraced all that is commonly known as the "pipe," and bubbles or cavities or sponginess which does not weld up under the rolling. We have fairly positive evidence that a rail having internal physical defects is almost always a segregated rail. We do not have as definite information that a segregated rail, free from internal physical defects, will fail in service. The great need to-day in rail manufacture is

some test by which internal physical defects in the rail can be detected. Many rails fail in the middle of the length of the rail, and an examination of these failures shows almost without exception that there was an unwelded up portion in the rail, which, under the pounding of the traffic, gave way. If now we had some means of telling whether there was an unwelded portion in any part of a rail, the whole question of discard could, we think, be ignored. It is believed with good reason that the drop test as at present conducted, is not sufficient for this purpose although this point needs further study.

Our ideas at the present time are: (1) that a test should be made from every blow; (2) that the inspector should be entitled to select a crop end, or a portion of a rail which shall be used for the test; (3) that he should choose for test steel that came from 15 to 18 per cent. down from the top of the ingot. At present it will be necessary, of course, to use the drop test or some modification of it. (4) In case the sample fails, the whole heat should be rejected, or at least the top rail from each ingot in that heat; and, (5) and, perhaps most important of all, no retests should be made. If this scheme could be carried out, we think the whole pestiferous question of discard could wisely be left in the hands of the manufacturers.

It may not be amiss to add that this proposed method of testing commercial steel products, without any reference whatever in the specifications to discard, has worked charmingly for a number of years now. Driving axles, car axles, crank pins, billet steel, etc., are and have been for years tested and accepted, or rejected in accordance with the methods outlined above, with no reference whatever in the specifications to discard.

In the matter of rails it is a fair question, I think, whether in the past, the railroads have not made a mistake in that they have specified too much. It is, of course, difficult to draw the line and say positively how much should be specified and how much left to the manufacturer, but I think it hard to refute the statement that the assumption by the consumer of the right to specify a discard has resulted in relieving the manufacturer of a responsibility which he should bear. It is the function of the manufacturer to make rails and offer them for acceptance. It is the function of the consumer to apply such tests and inspection as will prevent the acceptance of inferior or hazardous material, and properly safeguard the interests for which he is responsible. If a portion of the energy that has been spent in contending over discard had been spent in devising proper tests and methods of making these tests efficient in excluding rails that are piped or otherwise inferior, I am confident that so many poor rails would not now be in track, and that, as already stated, the question of discard could safely be left entirely to the manufacturers.

CHAS. B. DUDLEY.

William Cotter.

Foreign Railroad Notes.

The Traffic Commission of the city of Berlin has decided to build a subway running northwest and southeast through the heart of the city from Charlottenburg to Rixdorf. The estimated cost is $15,000,000. Five new surface lines are also projected.

The people of the village of Simplon, on the famous Simplon road, have trouble in communicating with their Swiss fellow-countrymen in the winter. The highway is no longer kept open in the winter, but can be traveled down the Italian slope, and thence by the tunnel the way is open to Switzerland, but if any goods are taken, they have to pass through the custom houses of both countries, and cattle are subject to veterinary inspection as exports from Switzerland to Italy, and then in two or three hours as exports from Italy to Switzerland. The highway is closed from Oct. 1 to May 1.

William Cotter.

William Cotter, General Manager of the Pere Marquette, was elected President of the company on December 14, succeeding President Underwood, of the Erie, who was elected President of the Pere Marquette in the fall of 1905, succeeding Eugene Zimmerman, but whose resignation has been merely a formal one, as Judson Harmon, Receiver, has been in charge of the road. The stockholders recently approved the reorganization plan. This provides for the cancellation of the Cincinnati, Hamilton & Dayton's lease of the property and the issue to stockholders of $5,000,000 in debentures, the proceeds of which will retire receiver's certificates and other indebtedness and so put the company on its feet. It is expected that the receivership will be wound up early in 1908. All of Mr. Cotter's railroad experience has been in the operating department, and in this work he has developed marked ability in handling men. In his direct relations with employees, he is a rigid and dispassionate disciplinarian. He followed Russell Harding to the Pere Marquette from the Missouri Pacific. On that road he had been Manager, while Mr. Harding as General Manager was his immediate superior. In this position Mr. Cotter spent his time dealing directly with the operating forces and thus encountering all labor troubles. He was born in 1858 at Bloomington, Ill., and began railroad work when 16 years old as a telegraph operator on the Chicago & Alton. From 1878 to 1880 he worked as operator on the St. Louis, Iron Mountain & Southern and was then appointed train despatcher and later Trainmaster of the same road at Little Rock, Ark. He served for a year as despatcher on the Chicago, Milwaukee & St. Paul and then went to the Wabash, St. Louis & Pacific, serving as train despatcher on that road and its successor, the Wabash, until 1890. He was then appointed Trainmaster of the St. Louis division. Six years later he went to the Grand Trunk as Superintendent of the Eastern division and in 1899 was made Superintendent of the Western division of that road. In 1901 he was appointed General Superintendent of the St. Louis, Iron Mountain & Southern and the next year was promoted to the position of Manager of the Missouri Pacific system. He went to the Pere Marquette as General Manager in 1904 and has continued in that position since that time.

Car Accountants' Meeting.

The regular meeting of the Association of Transportation and Car Accounting officers was held at Chicago, December 10. At the opening session Hon. W. J. Calhoun gave an interesting address on the relations of the transportation department to the commercial world.

The Committee on Car Service recommended that Per Diem Agreement Rules No. 5 be eliminated from the code of per diem rules, and that all terminal expenses be included and adjusted in the switching tariff. The rule has been in force five years and has had the desired effect of inducing the switching roads to become parties to the Per Diem Rules Agreement.

The Committee on Office Methods and Accounting has in preparation a complete set of abbreviations to be used in reporting all freight cars, and proposes that every box car shall have at the lower left-hand corner of the side of the car the number of the car with these reporting initials immediately above it. If it is desired to show the name of the road in a less abbreviated form, the right-hand end of the car may be used.

The association approved the committee's proposal, but other associations will be conferred with before final action is taken.

The committee recommends that tracers for carload shipments be indexed according to the two ending figures of the car number. Each item thus indexed can be given a consecutive file number, and thus it will always be easy to quickly find all the papers relating to a certain tracer. This the association approved.

Regarding average miles per car per day, this committee reaffirms the recommendation adopted at St. Louis in 1905 that in such

statistics all cars be included, except those in use by the maintenance of way department. Bad order cars should be included, but may be entered as a separate item. This subject was referred back to the committee, as was its recommendation to charge interest on per diem not promptly reported. Unreported per diem is constantly increasing, and the committee recommends therefore that on amounts not reported within 30 days, interest be charged at one-half of 1 per cent. a month, to continue until the end of the month in which the per diem is reported.

The committee offered a resolution providing for having daily junction reports covering receipts as well as deliveries, also that junction card reports be always sent by United States mail. This was adopted.

The Committee on Conducting Freight Transportation, reporting on weight marks on freight cars, recommended a better compliance with the rules of the American Railway Association and the Master Car Builders' Association. Where a number of new cars are turned out of a shop together, the weight of one or a few is frequently taken to indicate the true weight of each car in the entire series.

The [illegible] by the United States Post Office Department of the practice of stamping the day and hour of arrival on letters has caused some inconvenience in railroad offices where it has been necessary to fix the responsibility for delays, and the committee suggests that large railroad offices use a hand stamp to "back-stamp" United States mail immediately on receiving it from the Post Office carrier. Both of these recommendations were concurred in.

Seven Years' Progress on the Wheeling & Lake Erie.

The following charts graphically show the changes during the past seven years in several important factors affecting the operation of Wheeling & Lake Erie. Figure 1 shows the tons of freight hauled per locomotive mile. The locomotive mile is generally considered to be one of the most valuable units by which to judge railroad operations. Beginning with 1905 there has been a striking increase in the amount of work done per locomotive per mile, partly due to the acquisition of 80 large consolidation locomotives, 50 of which were put in service in 1904.

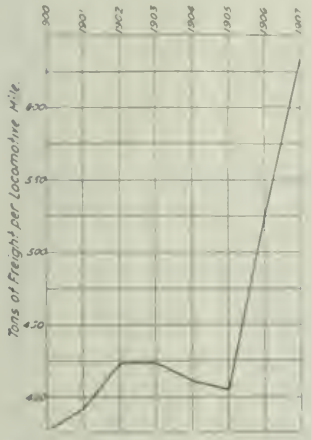

Fig. 1.—Tons of Freight Per Locomotive Mile.

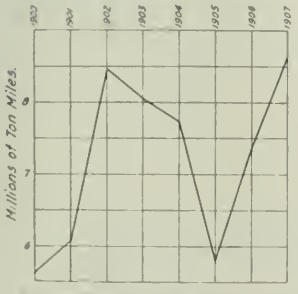

Fig. 2.—Ton Miles of Freight Handled per Locomotive per Year.

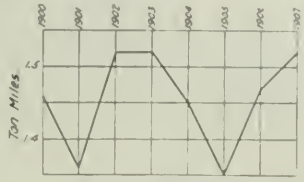

Fig. 3.—Ton Miles of Commercial and Company Freight Handled per Pound of Coal Consumed.

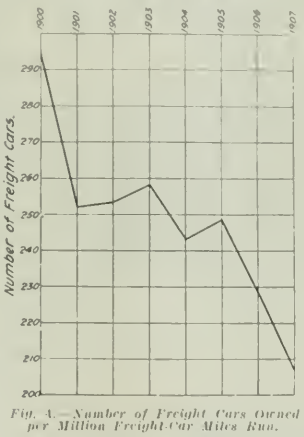

Fig. 4.—Number of Freight Cars Owned per Million Freight-Car Miles Run.

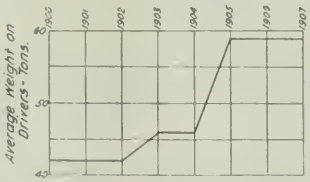

Fig. 7.—Average Weight on Drivers of Locomotives.

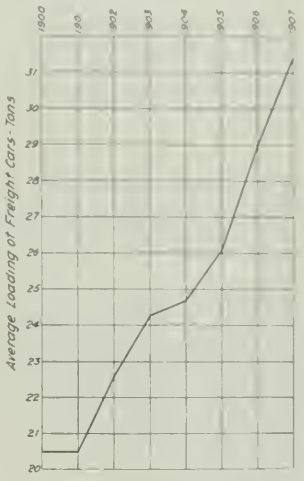

Fig. 5.—Average Loading of Freight Cars.

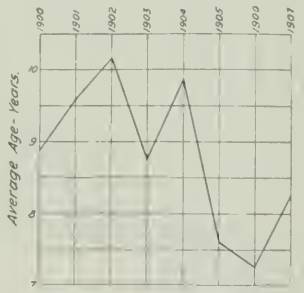

Fig. 6.—Average Age of Locomotives.

Graphic Records of Seven Years' Results on Wheeling & Lake Erie.

The committee recommends that the scales used to weigh new cars be tested by the railroad company's inspector; that wooden cars be reweighed after one year and a star be marked upon the car; after two years to be again weighed and the weight figures to be followed by two stars; and after three years the final weight put on, with three stars. Steel cars should be reweighed after one year and marked with three stars, indicating final weight.

The association adopted the committee's recommendation.

The Committee on Railroad Business Mail finds that labels designed to secure the registration of valuable packages are used for many articles which should not be classed as valuable, and this leads to delay in delivery. The committee recommends that this irregular use of the labels be stopped, and thinks it will reduce the number of registered packages 50 per cent. Where registration is asked for simply for the purpose of securing a receipt from the consignee, the better way would be to enclose with the package a receipt, to be returned as a letter.

Figure 2 shows the ton miles of freight handled per locomotive per year. This record is also based on the locomotive mile, and beginning with 1905 shows a marked increase in the trainload.

Figure 3 shows the ton miles of commercial and company freight per pound of coal consumed and discloses that the amount of work gained from each pound of fuel has since 1905 greatly increased.

Figure 4 shows the number of freight cars owned per million freight-car miles run, and brings out the fact that the volume of business has in general increased much faster than the car equipment.

Figure 5 shows the average freight car loading, which shows a steady increase since 1901, particularly in the last two years, a result due partly to the use of 1,000 new large capacity cars.

Figure 6 shows average age of locomotives and Figure 7 average weight on drivers. In 1904, 50 new consolidation engines were bought, and in 1905, 38 more, as well as 12 new switching engines, making 100 new locomotives in those two years. These purchases

are reflected in the decrease in the average age of the locomotives. As these new engines were large modern locomotives, the average weight on drivers of the locomotive power has greatly increased.

In all of these charts the great progress which has been made during the last three years is noticeable. This is the period during which the present management, headed by B. A. Worthington as First Vice-President and General Manager, has been in charge of the property.

Single Phase in Switzerland.

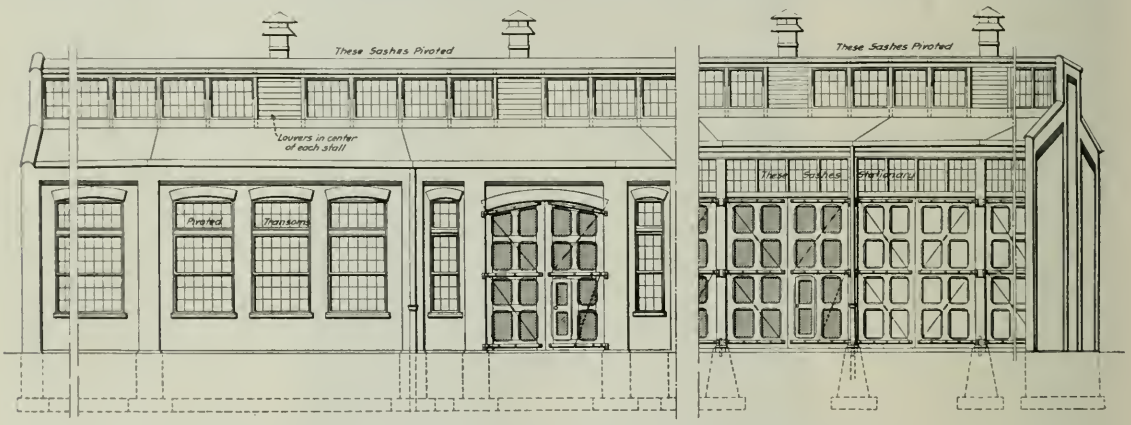
The Oerlikon Machine Works in Switzerland have for several years been conducting experiments with electrical trains on 14 miles of railroad assigned for that purpose, intended to ascertain the best methods and appliances for heavy railroad work. The experiments are now closed, and the line will be regularly worked hereafter with a single-phase alternating current of 15,000 volts, and 15 current periods per second, with overhead conductors. The experiments are said to have determined that there is no danger in the high currents.

The New Locomotive Terminal of the Chicago Junction.

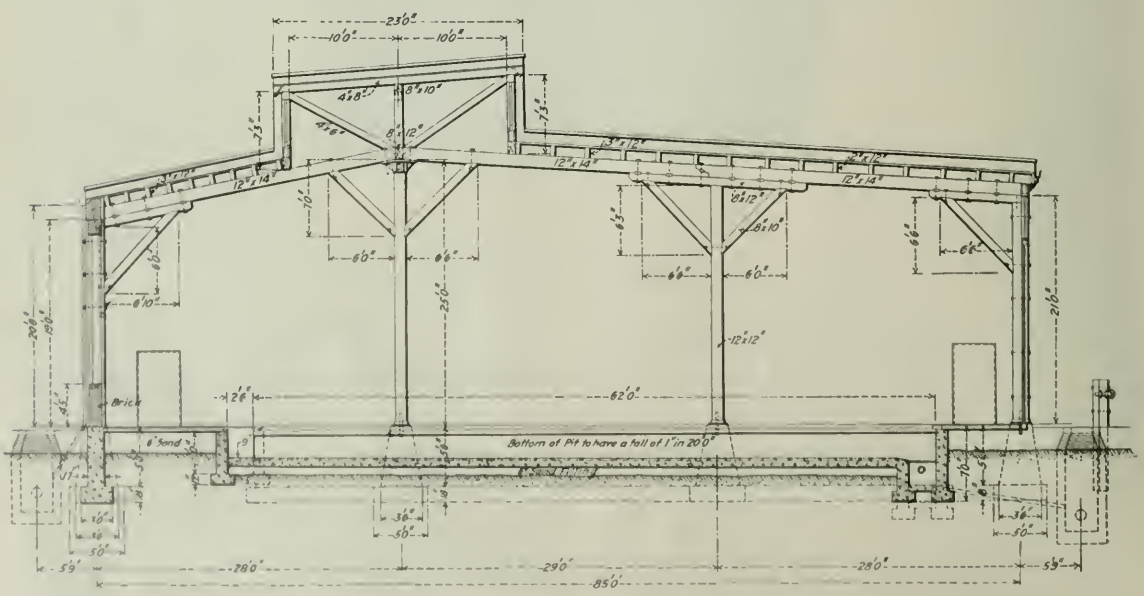
The Chicago Junction Railway is building a new locomotive terminal at 43d and Robey streets, Chicago, to replace the one at 49th and Halsted streets. The Chicago Junction is Chicago's inner belt road and does all of the switching for the Union Stockyards as well as for a large industrial section of the city. It has 45 locomotives. The facilities at 49th and Halsted had been outgrown; also changes were necessitated by the track elevation work. It was therefore decided to abandon the old terminal and build a complete new one in a more convenient location.

The new plant includes terminal and shop facilities to care for all of the locomotives. The roundhouse is planned for a full circle of 34 stalls. Twelve of the stalls were built last year and are being used. Construction is now under way on 12 more, and the remaining 10 will be added when needed. The radius of the inside circle is 80 ft. 3¾ in. and the stall depth is 85 ft. There is an 80-ft., 150-ton turntable at the center of the circle, built by the American Bridge Co. It works so smoothly that one man can turn an engine on it. It is intended to run it with an air motor later. The building foundations and the turntable and locomotive pits are concrete. The outer walls of the roundhouse are brick and the columns and roof framing are timber. The roof covering is four-ply "Roofrite," made by The Lehon Co., Chicago. The roof monitor is 20 ft. wide and has pivoted sash in both sides, except opposite the smoke jacks, where there are louvres. Each stall has three windows in the outer wall and the inner circles is glass for a height of 42 in. above the doors. Ample provision is thus made for admitting daylight. The smoke jacks are "Transite," made by the H. W. Johns-Manville Co. They are 14 ft. long at the bottom and 3 ft. 6 in. wide. The clearance above the rail is 16 ft.

The doors are wood. Their general features may be noted in the elevations included in the illustrations. They are 16 ft. 6 in.

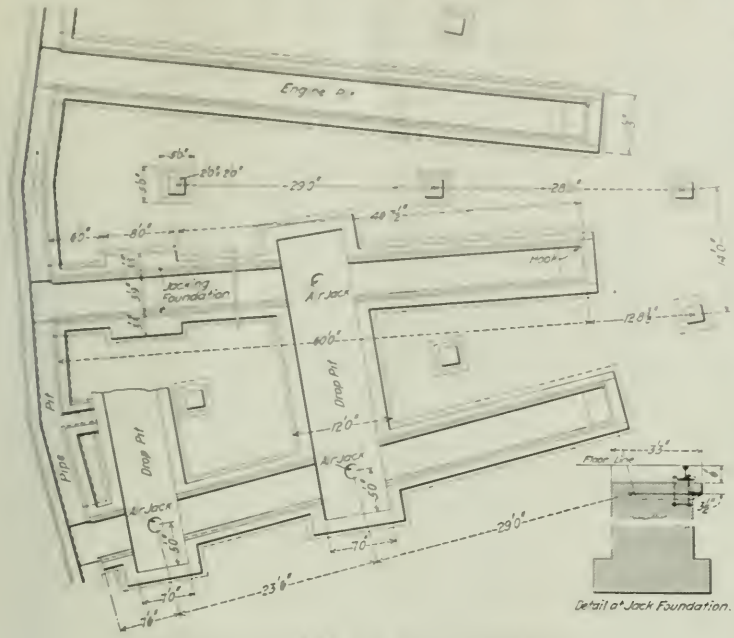


Elevations of Thirty-Four-Stall Round House for Chicago Junction Railway.

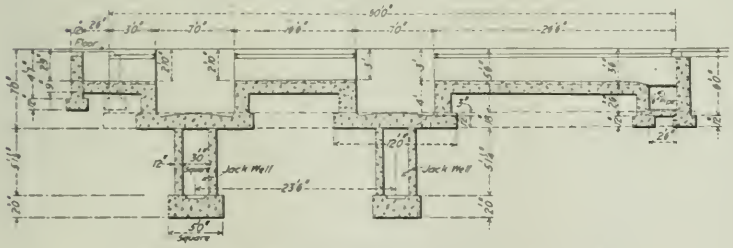


Cross Section Through Round House; Chicago Junction Railway.

high and 6 ft. 6 in. wide. The frame pieces are all 8 in. x 1⅝ in. material, except the top and bottom, which are respectively 10 in. x 1⅝ in. and 12 in. x 1⅝ in. The brace rods are ⅝ in. round, and the hinge straps to which they are secured are ⅝ in. x 3 in. One door in every other stall contains one of the small doors as shown, and in each end and fire wall are two sliding doors, 4 ft. x 7 ft., made of iron. These are adjacent to the inner and outer circles and slide on an inclined runway, making them self-closing.



Detail of Drop Pits and Jacking Foundations.



Longitudinal Section Through Engine Pit with Drop Pits.

The engine pits, which are made of concrete as already mentioned, are 60 ft. long and have a fall of 1 ft. in 20 toward the inner circle. A pipe pit 2 ft. 6 in. wide runs around the outer ends of the engine pits. The concrete pit-bottom is crowned, being 8 in. thick at the middle and 6 in. at the sides. There is a 6-in. sand filling under the concrete, and also under the wooden floor of the roundhouse. This floor is 3 in. yellow pine laid on 4-in. x 4-in. sleepers, 2 ft. centers.

The drop pits, which are the air-jack type, were built with the first section of the house last year. There are two, one each for truck and driving wheels, extending under two engine pits. They are 7 ft. wide and 5 ft. 6 in. deep. The four air jacks have a 1 ft. 3½-in. cylinder diameter and a 6-ft. 4½-in. stroke. The jacks are placed in special concrete-lined pits or wells.

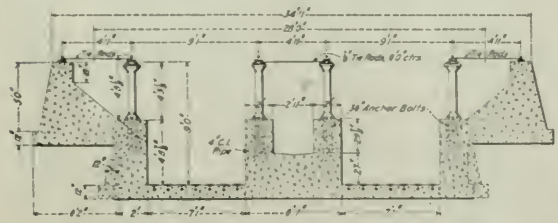
A hot-water washout and boiler-filling system will be installed. The details of this have not been definitely determined as yet. The house will be heated by hot water also, though this will be separate from the other installation.

On the east side of the roundhouse and only a few feet from it the locomotive repair shop is being built. The building is 100 ft. x 200 ft. and contains blacksmith machine, boiler and erecting shops, with small compartments for pattern and tin shops, and a good-sized store room at one end. Separate buildings are being put up for carpenter shop and boiler house. Two low-pressure boilers for heating will be put in this latter house. The locomotive shop tools and machines will all be motor driven. The electric power is to be obtained from the Union Stockyards station nearby.

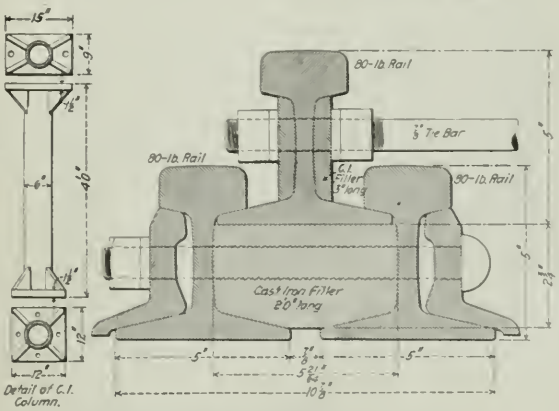
A 250-ton coal chute has been built. The coal is transferred from coal cars to storage bin by a crane with 35-ft. boom and 1½-yd. dipper. There is a locomotive track on each side of the coal chute and two locomotives on each side can be coaled at the same time. Next to the north locomotive track is the crane track and beyond this the coal car track. The crane-boom is long enough to take the coal from the cars and deposit it in the bin across the intervening track. The crane is self-propelling and can switch coal cars when necessary. The sand house is under the coal chute. The sand is shoveled from the cars, and after drying is blown to an overhead bin by compressed air.

Just east of and in line with the coal chute is a double ash pit, a cross-section of which is shown in the drawings. There are three tracks, the middle one being for ash cars and the other ones for engines, with room for six. The pit is of the submerged type and contains about 4 ft. of water at all times. The ash-pans are dumped into the water and the ashes are removed by the coaling crane and deposited in the cars on the center track. It will be observed that the rails of this track and the inner rails of the locomotive tracks are carried on cast-iron columns 4 ft. high, a detail of which is shown, together with the special girder construction employed with these rails. The cast-iron columns are anchored to the concrete by 36-in. anchor bolts. The central channel or trough under the ash-car track is for drainage. It has a drop of 1 ft. in 10 ft. toward one end, from which a 9-in. cast-iron pipe runs to a catch-basin. There are also 4-in. cast-iron pipes through both side walls at intervals. Inverted rails are embedded in the bottoms of the ash pits to protect the concrete from injury by the crane bucket.

A water tank of 100,000 gals. capacity supplies two water cranes.



Cross Section Through Engine Pits.



Detail of Column and Cross Section of Girder Rail.

The tank is wood on a steel framework and is supplied from the city mains. Because of the irregularity of the pressure an electric pump has been installed and operates automatically.

The plans were prepared and the work is being done under the supervision of J. B. Cox, Chief Engineer, to whom we are indebted for information.

1907 Cotton Crop.

The Crop Reporting Board of the Bureau of Statistics of the Department of Agriculture, from the reports of the correspondents and agents of the bureau, estimates that the total production of cotton in the United States for the year 1907-8 will amount to 5,581,968,000 lbs. (not including linters), equivalent to 11,678,000 bales of 500 lbs., gross weight.

The estimated production in 500-lb. bales, by states, is as follows:

Virginia	14,000	Texas	2,490,000
North Carolina	604,000	Arkansas	796,000
South Carolina	1,091,000	Tennessee	298,000
Georgia	1,898,000	Missouri	40,000
Florida	64,000	Oklahoma	919,000
Alabama	1,216,000		
Mississippi	1,536,000	United States	11,678,000
Louisiana	712,000		

Steel Rails; Their Mechanical Treatment; Past and Present.

BY S. T. FIEBO.
Inspecting Engineer.

In 1886, when I first began my experience as an inspector of rails, all mills used a greater number of passes in the rolling of their rails than at present. At that time the Joliet mills used 25 passes in the formation of the rails rolled by them. These rails were of 70-lb. pattern for the heavier sections, and down to 48 lbs. for the lighter ones, and I believe that a few 42-lb. sections were rolled.

An ingot of about 14 x 16 in. was used. There were three sets of rolls in the mill; blooming, roughing and finishing rolls. These rolls were divided into 13 passes in blooming rolls, seven passes in roughing rolls, and five passes in finishing rolls. This, with a small ingot of about 225 in. area. I believe that South Chicago was rolling rails with a couple of passes less than Joliet. Edgar Thomson was using 24 passes for rolling rails at that time, divided between four sets of rolls, blooming, roughing, intermediate or short rolls and finishing rolls. Twelve passes in blooming rolls, six in roughing, three in short and two in finishing. This in mill now known as number two. When Captain Jones built the new mill (now known as number one) he reduced the passes in blooming mill to 11, and built three stands of rolls in new addition, with five passes in roughing, five in the intermediate and one in the finishing rolls, a total of 22 passes for rolling rails that had increased to 80 lbs. per yard by that time, possibly 85 lbs. in several instances. I do not know the size of ingot used by him at that time.

Since then the blooming mill has lost four passes. The balance of the mill stands as built by Captain Jones, excepting that the rolls and roll housings have been strengthened, and larger engines have been installed, also a cooling bed has been built between the intermediate and finishing rolls, allowing a finish at a lower temperature than formerly. This has undoubtedly been a help to the quality of the rail produced, but not great enough to offset the detrimental effects of the fewer passes.

To-day mills are rolling rails with 18 passes to form their rails, with the exception of Edgar Thomson number two, the Pennsylvania Steel Company at Steelton, Pa., and the Maryland Steel Company at Sparrows Point, Md. This, with an ingot about 4 in. larger each way than was used with the greater number of passes, making a reduction per pass far beyond the limit of safety, and necessarily producing a great disturbance of the molecular structure of the steel, filling it with small interior cracks, that develop with a greater or lesser degree of rapidity (depending on the size and number of cracks, also on the amount of traffic over the rails), until they break and are entirely out of service. This heavy reduction leaves the rails with a very coarse granular structure, rendering them apparently soft, when possibly the analytical records show that the steel is unusually hard. The higher degree of heat necessary to allow for the heavy reduction is the cause of the coarse granular appearance of the steel, with the heavy reduction as a very good assistant. This is probably why steel with a carbon of 0.55 to 0.60 shows no harder than it showed 20 years ago, with carbon 15 points lower. The rails also show that they are a porous nature, that is full of small holes about the size of a small pea. This is caused, in my estimation, by the too rapid blowing of the metal during period of conversion, and the too rapid pouring of the steel into the ingot moulds at the time of casting the ingot.

Where mills formerly took from 15 to 18 minutes to blow a heat of steel, they now take from 10 to 12 minutes and are usually nearer the 10 than the 12 minute period. This, with a heavier burden in the vessel than in the earlier days of steel making. These small holes are a segregation of unconsumed gases, that would, under a longer period of blowing at a lower pressure of air, be consumed, or if not entirely consumed, would escape during the period of pouring of ingot, if poured at a slower rate of speed. They are the cause of the soft spots, or battered appearance of portions of the rail (when the balance is in good condition), and are not extremely dangerous.

When the partitions between these small holes disappear, or, in other words, when the gas segregates in one chamber, we have what is known as a pipe. This, of course, is extremely dangerous, and all rails showing pipe should be removed from track as soon as discovered. This pipe more frequently occurs at the top of ingot, but may, and does appear at other points of the ingot. The gases carry with them a great many of the detrimental elements. This is why an analysis of steel at point of pipe shows so badly as compared to the general analysis of the steel.

I would propose the following changes as a help to remedy these ills. Let the steel companies so regulate the pressure of air in their converting mills that it will take 15 minutes or more to convert a heat of steel. Let them take at least one minute in pouring each 2,000 lbs. of steel into ingot mould at the time of casting the ingot. At the present time steel companies take not more than one minute in pouring an ingot of approximately 5,000 lbs. weight, which is too fast pouring, if one desires a solid ingot, free from blow holes and gas pockets.

Then insist that the ingot be left in the soaking pit, or heating furnace, not less than 90 minutes before rolling. Nearly all mills conform to this time of heating of ingots, but there is more carelessness on this point than there should be.

Then let the rolling departments be remodeled so there will be at least 25 passes in the rolls for forming rail section. Let them still use the size ingot that is being used now.

If, at any time the mills find it necessary to increase the size of ingot, let them provide a corresponding increase in the number of passes.

Change the shape of the rail section so that it will be more nearly uniform as to division of metal in head and flange, reducing interior strain in the cooling, and needing less camber on hot bed.

Have another cambering machine at point of delivery of rails to finishing department, and run all rails through this machine, taking out all camber that is still in the rail when cool enough to straighten, thus reducing the number of blows needed to straighten rail to the least possible number. Every blow given a rail under a strengthening press is a bid for a break.

The steel rail question as it stands to-day is a serious one, and a few million dollars should not stand in the way of a number of mechanical changes that will do so much toward the improvement of the physical structure of the rail. It is a well-known fact that in the years spoken of, when rails gave the better service, there were from four to seven more passes in the rolls than at present, and the rails certainly showed better result from the extra work at the lower temperature at which they were finished, with the smaller percentage of reduction the steel had to stand per pass, than what it shows with present practice.

With 20 years experience as an expert rail inspector (during which time I received over four million tons of track material for some of the best roads in the country) to back my judgment, I believe that my suggestions, if acted upon, will go a long ways toward solving the problem now before the public and give the railroads the kind of rail (possibly a better one) that gave them such high satisfaction 20 to 30 years ago.

As a proof of the fact that rails are much more stiff and of a finer granular structure, under a greater number of passes, I give a few results of drop tests of rails made with 23 passes as against the same section made with 20 passes.

Eighty-lb. rail, rolled with 23 passes, receiving a blow of 2,000 lbs., falling free, 20 ft. Rail resting on supports three feet apart. Deflection measurements taken with three feet straight edge, and reading in inches and tenths of inches. These tests give an average deflection of 1.14 in. on 25 tests, representing about 3,000 tons of rails. The first 2,000 tons is represented by but one test every fifth heat. The balance shows a test for every heat rolled.

Eighty-lb. rail, rolled with 20 passes, receiving a blow of 2,000 lbs. falling freely, 20 ft. Rail resting on supports three feet apart. Deflection measurements taken with a three feet straight edge, measurements reading in inches, quarters, eighths and sixteenth inches. These tests gave an average deflection of 2.32 in. on 192 tests, representing about 1,500 tons of rails.

In conclusion, the tests show an average deflection of 0.72 in. greater on rails rolled in 20 passes, than on rails rolled in 23 passes, proving most conclusively that where the rails get the greater amount of work and are finished at a lower temperature, they are much finer grained and to a very great degree stiffer than where the steel is tortured into shape by insufficient passes.

I give the test and analytical reports verbatim herewith.

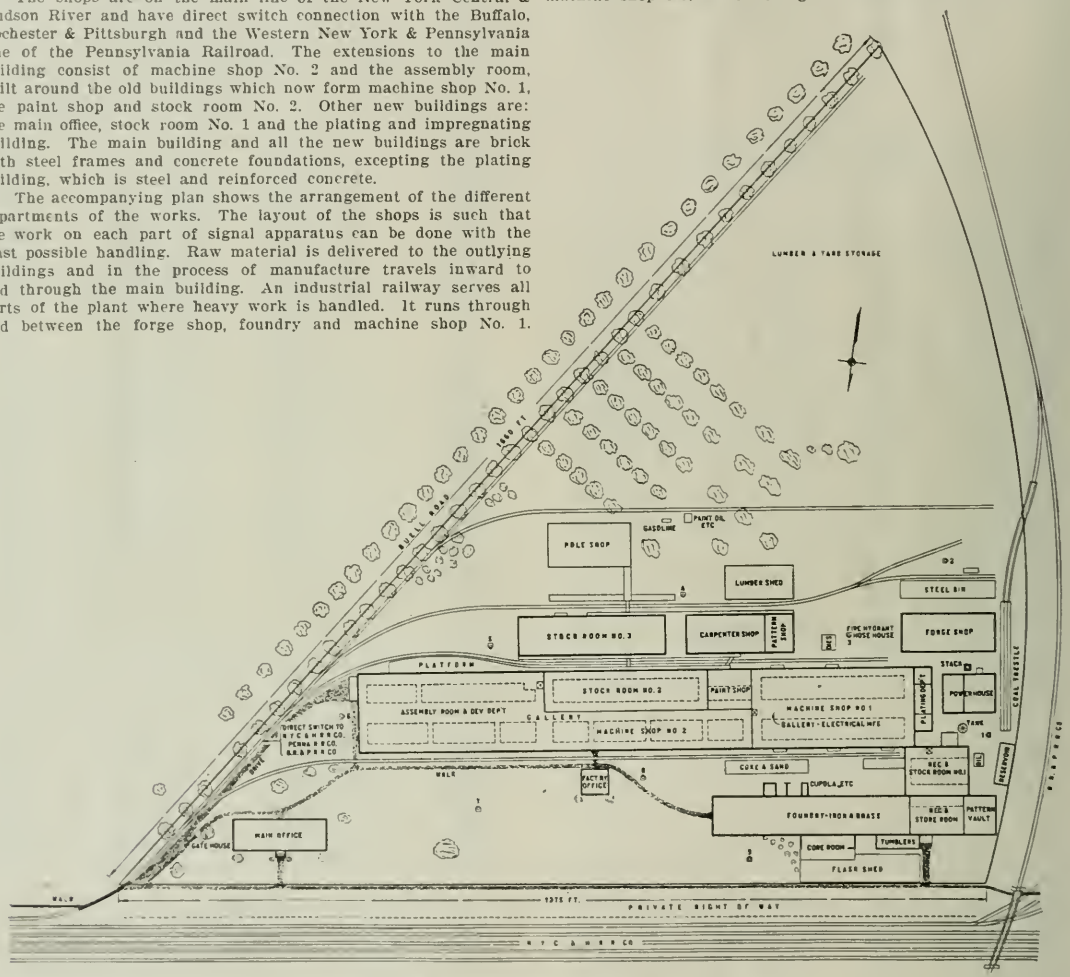
Results of Drop Tests of Rails Made in 23 Passes, Compared With 20 Passes.

The Enlarged Shops of the General Railway Signal Company.

The General Railway Signal Company was formed in 1904, and acquired the Taylor Signal Company, Buffalo, N. Y., and the Pneumatic Signal Company, Rochester, N. Y. A year ago the company decided to combine the two plants on the 25 acres of land owned at Rochester. Accordingly, the Buffalo property has been sold and the Rochester shops enlarged to make room for the machinery bought from Buffalo.

The shops are on the main line of the New York Central & Hudson River and have direct switch connection with the Buffalo, Rochester & Pittsburgh and the Western New York & Pennsylvania line of the Pennsylvania Railroad. The extensions to the main building consist of machine shop No. 2 and the assembly room, built around the old buildings which now form machine shop No. 1, the paint shop and stock room No. 2. Other new buildings are: the main office, stock room No. 1 and the plating and impregnating building. The main building and all the new buildings are brick with steel frames and concrete foundations, excepting the plating building, which is steel and reinforced concrete.

The accompanying plan shows the arrangement of the different departments of the works. The layout of the shops is such that the work on each part of signal apparatus can be done with the least possible handling. Raw material is delivered to the outlying buildings and in the process of manufacture travels inward to and through the main building. An industrial railway serves all parts of the plant where heavy work is handled. It runs through and between the forge shop, foundry and machine shop No. 1.



Rochester Shops of the General Railway Signal Company.

Material for foundry work and immediate use in the machine shop is brought in on the spur nearest the New York Central tracks. Metal for the foundry is delivered directly to that building, while steel bars and similar partly finished material goes into stock room No. 1. The store room adjoining the foundry is for rough castings. From these two rooms the work is carried into machine shop No. 1. Similarly, on the other side of the plant, lumber, and the steel for the forge shop are brought, respectively, to the carpenter shop and the steel bin. The rough forgings then also go into machine shop No. 1.

The main building is two stories high, the second story consisting of galleries running around the sides and down the middle. All heavy work remains on the ground floor throughout its progress toward the assembly room, while the lighter work remains in the galleries, thus no work has to be lifted to a higher level except at the start, when the material for lighter work coming from the forge, foundry and stock room No. 1 is raised to the gallery on an elevator in machine shop No. 1. On the ground floor of this shop the machinery is along two aisles; the planers and millers for work on heavy castings are on the side nearest the foundry and the heavy lathes used for forgings are on the opposite side, while the comparatively light work is done in the middle. The work in the galleries of this shop is mostly winding of armatures and magnets and machine work on small parts. At the rear of the large machine shop is the plating department. Electro plating is done on the first floor and on the second coils are impregnated with the insulating compound.

Before going to the assembly room, most of the work, particularly the castings, passes through the paint shop; those parts that are already finished go into stock room No. 2, while others go into machine shop No. 2. On the ground floor of this shop the heavy parts are finished. This work consists mostly of boring, reaming and tapping, so that everything is ready for the final assembling. Here, also, is the punching department, where laminated armature cores are made. The galleries of machine shop No. 2 are really the assembling department for the lighter parts which come from the galleries of machine shop No. 1. The final assembling of light parts is done in the galleries of the assembly room and these parts are then taken down to the first floor, where the heavy parts are being assembled, and there attached. The experimental and developing departments, the tool making department, and a testing department are also in the galleries of the assembly room. The finished machines and parts are taken from the ground floor of the assembly room into stock room No. 2 and stock room No. 3, or are loaded directly into the cars. Stock room No. 2 is also used as a store room for finished parts waiting to be assembled; No. 3 is particularly for finished repair parts. As shown in the plan, shipping platforms extend along almost the entire length of the main building and on the other side of the track along stock room No. 3 and the carpenter shop, so that there is room to load 27 freight cars simultaneously.

Motor drive is used throughout the shops, most of the tools

being driven in groups. The power house is equipped with four Babcock & Wilcox 200-h.p. boilers. A 200-k.w. generator is driven by a Skinner-Corliss engine, a 150-k.w. generator by a Westinghouse vertical compound engine and a 20-k.w. generator by a Buffalo Forge Co. vertical engine. A Chicago Pneumatic Tool Co. air compressor, with a capacity of 809 cu. ft. of free air per minute, supplies air for pneumatic tools. The old buildings were formerly heated with direct live steam, but direct exhaust steam is now used. In the new buildings the ventilation and heating are combined in a system developed by the contractors, the exhaust steam is carried from the power house to separate heating stacks for each building, the heated air being circulated by motor-driven fans.

Work on the improvements was started last January and the buildings were finished before the removal of machinery from Buffalo began. This transfer of machinery had to go on without interrupting production, so it was done piecemeal. The work done by each Buffalo machine was rushed for a few days before its removal so as to leave enough behind it for other machines to work on until it was in operation again at Rochester. In some cases, of course, other machines could be put on the work ordinarily done by the machine which was in transit. The last piece of machinery was transferred about three weeks ago.

The erection of the new buildings and the moving and reinstalment of the Buffalo equipment were carried out by Westinghouse, Church, Kerr & Co., New York. H. O. Pond was Engineer in Charge.

Rochester Shops of the General Railway Signal Company.

Ocean Rates on Grain.

The following table, from the *Monthly Summary of Commerce and Finance*, published by the Department of Commerce and Labor, shows the mean ocean freight rates on grain from the United States to six leading destinations in Europe for the three months ending November 30, 1905-1907.

(Cents per 100 lbs.)

*Mean, Sept. 1 to Nov. 20, 1907, inclusive.

The south island of New Zealand, which is about 500 miles long from northeast to southwest, is divided by a lofty range of mountains generally not far from the west coast, while the chief population is between the mountains and the east coast. Communication between sailing ports on the two coasts, only 140 miles apart, is now made by sailing half way around the island, some 600 miles, though the railroad termini on the two sides of the pass are not 40 miles apart. The colony has recently contracted with Murdoch McLean to make a tunnel 5¼ miles long through the range at Arthur Pass, through which the railroad will be extended. It is expected to be five or six years before the tunnel is finished. It will cost about $2,400,000.

The Organization and Working of Wrecking Outfits.*

The committee believes that the wrecking crews should be in charge of the mechanical and car department, as men employed in these departments are more able to handle derailed and wrecked engines and cars than other classes of railroad employees. The wrecking crews when out on the road and at wrecks should be under the authority of the superintendent of the division the wreck is on. Co-operation of the employees and heads of different departments are needed to facilitate the clearing of wrecks and repairing the damaged track, in order to reopen the road for traffic as quickly as existing conditions will permit.

At each division headquarters on busy lines where traffic is heavy and fast, a wrecking outfit and crew should be located. Such outfit should consist of a 50 to 100-ton steam wrecking derrick, a tool car to contain all necessary tools and blockings, a car for track material, a car for extra trucks, and a commissary car supplied with a cook stove.

The wrecking outfit should be in charge of a good wrecking master and 10 competent car repairers. The steam derrick should be in charge of a good engineer and fireman. At a wreck, in addition to these two men a good reliable man should be stationed on the steam derrick to take the orders and signals from the wrecking master and give them to the engineer, as the latter cannot hear the orders and see the signals given by the wrecking master and attend to the swinging of the boom and other work on the derrick.

The derrick and cars belonging to the wrecking outfit should be placed on a special track at division headquarters—a track that at no time will be blocked, but that can be approached at all times quickly with an engine, so there will be no delay caused at the starting point by not getting the wrecking outfit ready to start on short notice.

In order to always have the proper force ready for the wrecking crew, the master wrecking foreman, as well as the men needed for assistance, should be employed in the car department at their shops or repair yards. The engineer and fireman for the derrick should be employed either at the engine house or machine shop, in order that they can be called on short notice. During working hours the best method for calling wrecking crews is the shop whistle, which should be two long blasts, so it can be distinguished from any other use of the whistle. After working hours and at nights the crew should be called by telephone, electric bells or swift callers.

The wrecking train should be taken to the wreck by the first engine and train crew available.

For emergency use, a small supply of canned goods and coffee

*A committee report presented to the Chicago Convention of the Roadmasters' and Maintenance of Way Association.

should be kept in the commissary car, so that in serious wrecks the wrecking force can be supplied with lunch, until such time as the men can be conveniently spared to go to regular hotels for meals. If the roads are so located that hotels or eating houses are far apart, meals should be provided in the commissary cars for the wrecking crews.

The head of the track department and the section foreman of the division on which the wreck occurs should be advised by the train despatcher as promptly as possible of the nature of the wreck as reported to him by the train crew in charge of the wrecked train, so that the head of the track department can order to the wreck whatever track men may be needed to take care of the damaged track and give the wrecking crew what assistance they need.

The wrecking outfit should be provided with a good supply of different sized pine and oak blockings from 1 in. plank to 2, 3 and 6 in. thicknesses and from 24 to 36 in. long; also a supply of wooden wedges of different sizes. Four to six 20 to 50-ton jacks should be kept in the tool car. However, with a 75 to 100-ton steam wrecking derrick, jacks are not needed or used much, the derrick doing the work much quicker than jacks would.

Four ¾-in. x 15-ft. truck chains with a grab hook at each end and a ring in the center should be kept in the tool car. Two large and two small grab hooks to be used to turn over car frames and car bodies are a much needed article in connection with the steam wrecking derrick, since with a properly constructed grab hook attached to the cable of the steam wrecker and the hook properly placed, a box car body can be rolled over very quickly to clear obstructed tracks. At least 20 chains, including ⅝-in., ¾-in., ⅞-in. and 1-in. sizes, 15 ft. long, should be kept in the tool car to be used in chaining trucks to body of cars, and lifting and chaining cars together, where draft rigging and couplers are broken. In addition to these chains there should be at least six chains 1¼ in. in diameter and 20 ft. long for heavy lifts. There should be four wire cables 2 in. in diameter by 20 ft. long to roll and lift cars and engines. There should be at least four hemp ropes from 1 to 3 in. in diameter and from 200 to 300 ft. long, with the proper sized snatch blocks. There should be two guy anchors, four wrecking frogs, a good supply of tools such as sledges, chisels, hammers, wrenches, as may be needed to disconnect bent and twisted rods. There should be carried in the wrecking car a full set of track tools, such as claw bars, lining bars, spike mauls, track wrenches, track chisels, shovels, picks with handles and track gages for emergency cases. Scoop shovels and baskets and bags to handle and transfer grain.

The car with track material should be supplied with 20 rails, and the fastenings for same, of the pattern used on the main line, one switch complete, one right hand and one left hand spring frog of same angle used on main line, two guard rails, 100 to 150 ties, five kegs of spikes and two kegs of bolts.

The first aim in case of wrecks should be to clear the track and reopen it for traffic. After traffic is moving the wreck should be picked up, cars unfit for future use burned and scrap picked up as soon as possible, as portions of wrecked cars look very unsightly along railroad tracks.

Damaged freight should be reloaded and turned over to the claim department for adjustment. In serious accidents where a large amount of freight has been damaged or stock killed or injured, the claim department should be advised so they can have one of their agents at the wreck.

In passenger wrecks the first aim should be to take care of the injured persons. Medical assistance should be called from the nearest villages and cities, and every possible effort made to get physicians to the wreck as quickly as possible. The wrecking outfit should also be supplied with two or more stretchers and blankets to carry injured persons to a place of safety.

Two wrecks seldom occur alike. It therefore requires the best of judgment and mechanical skill to handle all wrecks with facility and promptness and reopen the blocked road with the least delay.

The report is signed by C. Buhrer, W. H. Kofmehl, A. Boydston and B. A. West.

William Bliss.

William Bliss, President of the Boston & Albany, died last Saturday at his home in Boston. Mr. Bliss was the active head of this corporation for over a quarter of a century, but since the lease of the road to the New York Central & Hudson River his office was only a formality. He was born in Springfield, Mass., in 1834. He worked in a store there and later went to New York. In 1865 he was made Assistant to President C. W. Chapin, of the Western Railroad, who was his father-in-law, and the next year he was made General Freight Agent. In 1872, the road having been consolidated with the Boston & Worcester, Mr. Bliss was made General Manager of the new company, the Boston & Albany. In 1878 Mr. Chapin retired and was succeeded by Vice-President D. W. Lincoln, and Mr. Bliss became Vice-President, retaining the office of General Manager. In 1880 Mr. Lincoln was killed in an accident and Mr. Bliss succeeded him. During the 20 years of his active work as President, he was always in close personal touch with every department of the road. He was just and considerate in his treatment of employees and they in turn were loyal to him and the road. During the panic of 1893 he insisted on paying wages in cash in spite of the example of many large roads which used checks or scrip. Like many railroad men of a quarter of a century ago, his jealousy of the independence of his road made him particularly conservative in establishing relations with connecting lines. The Boston & Albany was, however, always connected with the New York Central (of which Mr. Bliss was a director) and the lease, seven years ago, was a natural development. This spirit of independence in traffic relations was in large degree a concession to public sentiment, which, in Massachusetts, was almost synonymous with stockholders' sentiment. It by no means meant a paucity of the spirit of enterprise, however, and in some important respects the Boston & Albany was a leader. Its track was early put in the front rank, as Mr. Dudley's records, published in the *Railroad Gazette*, will show; and the company was one of the first to pay premiums to roadmasters and foremen. Structural economy and taste in design of passenger cars was a noticeable feature of the service of the road, and station buildings of real architectural character, surrounded by grounds laid out by competent landscape gardeners, in sympathy with the architect, were common on this road when few others had even begun to deal systematically with æsthetics. In all these features Mr. Bliss was the moving spirit.

William Bliss.

Railroads in Venezuela.

Venezuela has 13 railroads, the longest 111 miles long, and no other as much as 50. They are for the most part lines which climb the hills from the sea towards the interior, and have steep grades. On one line for 2½ miles there is a grade of 449 ft. per mile, worked by the cog-wheel system, and there are other grades of 213 ft., 185 ft. and 158 ft. Few of the lines connect with others, and there is a menagerie of gages. About half the mileage is of 42-in. gage, nearly a quarter of 36-in., a fifth of 24-in. and a little of meter gage and one of 25-in. The longest line is a German enterprise. Almost all the rolling stock was built in the United States. The aggregate length June 30, 1906, was 523 miles, and the gross earnings were at the average rate of $3,515 per mile; the net, one-third as much.

Proposed Rules for Interchange of Cars in Europe.*

At a meeting of the International Conference of the Union for the Standardizing of Railways held at Berne, Switzerland, May 6 to 18, 1907, a code of rules governing the interchange of cars between countries in Europe was drawn up to be submitted to the 17 states represented in the conference for adoption. A limited code of rules specifying the standard gage of track and a few requirements in the matter of construction of interchange rolling stock has been in force since 1886. A customs agreement covering the movement of goods in bond has also been in force since 1886. These two codes, somewhat modified, have been combined and expanded by the addition of rules dealing with the maintenance of cars and methods of loading. The Conference discussed the advisability of adopting automatic couplers and continuous train brakes on all freight cars but no action was taken. It concluded that as yet no existing pattern of automatic coupler had been proved, by sufficiently prolonged trial, to satisfy all requirements, and that, therefore, it was not yet necessary to propose that the European railroads should give up the coupling systems at present in use. It decided that the time had not yet come to arrive at any definite conclusion as regards any such coupler.

The proposed rules covering the maintenance of rolling stock and loading of cars are given below:

1. Cars used for international traffic must be kept in a proper state of maintenance so as in no manner to imperil the safety of the working. If that is not the case, more especially, if the cars do not satisfy the conditions specified under Secs. 2 to 4, or if they show one of the defects enumerated under Sec. 5, they can be refused.

2. When a car passes over on to the system of an adjoining country, the time which has elapsed since the last general overhaul must not exceed three years. All cars, however, whether loaded or not, still capable of running and returning to their home country, must be accepted by the management of intermediate lines, even if a longer time has elapsed.

3. The axle-boxes must be filled with suitable lubricating material. Cars with periodical lubrication, if the period of lubrication has elapsed, may not leave the railroad owning them without fresh lubrication.

4. Wagons used for the transportation of cattle must be returned perfectly cleaned and disinfected.

5. DEFECTS JUSTIFYING REFUSAL:

A.—Defects in the Wheels and Axles.—1. Wheels showing any signs of having shifted on their axle.

2. Wheels having their center cracked without being loose.

3. Wheels with their rims broken across and having tires less than $1^{3}/_{16}$-in. thick at the rolling circle. Any commencing fractures at the rim, are not causes for refusal.

4. Wheels having a spoke broken across, or more than one spoke cracked, and wheels with cast-iron centers in which the majority of the spokes are out of true.

5. Solid wheels having a circular crack extending over more than one-fifth of the circle in which they are located, or having more than two radial cracks.

6. Cast iron wheels without tires, showing any cracks. Slight lines on the tread, as well as unimportant defects in the body of the wheels resulting from the operation of casting, are not causes for refusal.

7. Wheels having flanges less than $^{25}/_{32}$-in. thick at the points where they touch the rails; wheels having a cutting flange, that is to say when there has been so much wear that a sharp edge has been formed. In the case of cars with three axles, the thickness of the flanges of the middle wheels is not taken into consideration.

8. Wheels with treads showing flats worn down more than $^{5}/_{16}$-in.

9. Wheels with tires which are crushed, broken, cracked across or cracked along the circumference.

10. Wheels with separate tires, when:

(*a*) The tires are loose or show signs of lateral displacement;

(*b*) More than two of the bolts, screws or rivets fixing the tire to the rim are broken, displaced or lost;

(*c*) If secured by means of Mansell rigs: When the sides or even the treads themselves show cracks more than $3^{15}/_{16}$-in. long, or when more than two of the bolts securing the rings are broken.

11. Axles out of true or showing cracks or commencing fractures.

12. Axles on which the draw-rods of brakes or other parts rub. If the rubbing pieces can be removed and if the wear does not extend deeper than $^{3}/_{32}$-in. ($^{3}/_{16}$-in. on the diameter) and there are no sharp corners, the car must be accepted.

B.—Defects in the Axle-Boxes and Bearings.—1. Axle-boxes so damaged that they cannot guide the axle properly or cannot hold the lubricating material.

2. Bearings which have become seriously heated.

C.—Defects in the Bearing Springs.—1. Displacement of more than $^{25}/_{32}$-in. of a spring or of its back plate relatively to the axle-box when the distance between the axles furthest apart does not exceed 14 ft. 9⅛ in., and of more than $^{3}/_{16}$-in. when that distance is greater.

2. Fracture of the back plate of a bearing spring.

3. Fracture of an intermediate plate near the middle, in the case of passenger cars; and fracture of two or more intermediate plates near the middle, in the case of freight cars.

4. Fracture of a helical spring not kept in position by a stop or a bolt passing through it.

5. Absence or fracture of the parts necessary to fix the springs.

6. Body or sole bars of underframe bearing on the buckles of the bearing spring rubbing against the wheels, or showing recent traces of such contacts. Old traces of former contacts or the contact of safety supports with the outer fourth of the length of the spring do not justify refusal.

N. B.—Cars in which the distance between the axles furthest apart does not exceed 14 ft. 9⅛ in. and returning empty to the system owning them must be accepted if they have the defects specified under paragraphs 2 to 6, provided that they are [illegible] and firmly secured.

D.—Defects in the Buffing Gear.—1. Rods or springs of buffers broken or damaged so as to prevent the buffers from working.

2. Absence of the parts which prevent the buffers from dropping.

3. Buffer boxes broken or missing. Buffer boxes which although damaged still support and guide the buffers sufficiently are not causes for refusal.

N. B.—Cars returning empty to the system owning them must be accepted if they have the defects specified under paragraphs 1 to 3 if they can run without danger at the tail end of a train.

E.—Defects in the Draw Gear.—1. Chief couplings or safety couplings or chains broken, draw hooks broken or showing signs of fracture when the regulation coupling up with other cars (including both the chief coupling and the safety coupling) becomes impossible.

2. Drawbars, pins and guides broken or showing signs of fracture.

3. Absence of safety chains or of safety couplings in the case of cars not equipped so that the two chief couplings of the two cars in contact can be used simultaneously.

4. Helical drawsprings broken, or plate drawsprings with the back plate broken at any point, or one of the other plates broken near the middle.

N. B.—Cars returning empty to the system owning them, must be accepted if they have the defects specified under paragraphs 1 to 4, if they can run without danger at the tail end of a train.

F.—Defects in the Underframe and Body of Cars.—1. Axle-guards broken or cracked through more than one-third of their section, also displaced axle-guards, if they cannot be adjusted by tightening the bolts.

2. Sole bars, headstocks and any intermediate cross-framing in connection with the draw gear, broken across.

3. Parts of the frame of the body broken right through, any damage at the doors, locks, sides of the body, flooring and roof, if such damage may result in the deterioration of the load or may endanger the safety of the working.

N. B.—Cars returning to the system owning them can only be refused on account of damage to the underframe, if running such cars would entail danger.

6. Cars with brakes which are damaged or do not act, cannot be refused, but they must bear conspicuous labels with very clear lettering stating that the car is not available for braking. Damaged or loose parts which might endanger the safety of working or cause other damage, must be taken off.

7. Empty returned cars must be accepted by the system owning them, no matter what their condition may be; in the case of cars which have been used for cattle, however, this acceptance is not compulsory until after the cars have been perfectly cleaned and disinfected.

LOADING OF WAGONS.

1. Wagons used for international traffic cannot be refused if the load is in a satisfactory condition which in no way can endanger the safety of working, and if it more particularly satisfies the following conditions:

2. The articles loaded on wagons must be arranged and stowed so that they cannot shift, even in case of shock or shaking.

3. The load must be distributed as equally as possible over all the wheels of the wagon, particularly as regards the end wheels. Wagons with the load so unequally distributed that the body or sole bars touch the buckles of the bearing springs, or that it makes them rub against the wheels can be refused.

4. The load in a wagon must not exceed the load limit. When no load limit is inscribed on the wagon, an overload of 5 per cent. in addition to the normal load inscribed on the wagon, is allowed.

5. The weight per wagon wheel (the wheel load) must not exceed the maximum allowed on each line. The regulations of the managements of each line must be communicated to the States participating.

6. The load on open wagons must not project beyond the loading gage used on the different systems. The width of long loads must be reduced so as to allow for running round curves of small radius. The regulations of the management of each line must be communicated to the States participating.

7. The load on open wagons must not project beyond the head stock unless there is, between the load and the places of the buffers not compressed, a space of at least 1 ft. 3¾ in. up to 6 ft. 6¾ in. above rail level, and of at least 7⅞ in. higher up. Moreover, in order to allow coupling up to be effected, there must be a completely clear space at least 7⅞ in. in height above the drawhook, and at least 7⅞ in. wide on each side of the center line of the hook. If the load projects further beyond the headstock than here specified, a safety truck must be added.

8. For loading up long articles which cannot be carried on one single wagon, two wagons equipped with swing bolsters must be used. The wagons may be connected by screw couplings, by an iron coupler bar, or a wooden coupler bar properly strengthened by iron, by an intermediate truck connected with the two carrying wagons by coupler bars or couplings; or finally by the load itself if it can be used for the purpose and if each swing bolster is supporting a weight of at least 7.5 tons. The load must rest on the swing bolsters only; it must project beyond them at least $11^{13}/_{16}$ in., and at least 3 ft. 3⅜ in. if the load alone connects the wagons.

When any improvements or modifications in the preceding articles appear desirable, new conferences can be held, at the request of one of the states participating, the notices calling the meeting being issued by the Swiss Federal Council.

The states which have not yet adopted the rules of the union for the Standardizing of Railroads are at liberty to join the union. If so, they must give notice to the Federal Council, and the latter will inform the other states represented at the conference of the

*Abstracted from the August *Bulletin* of the International Railway Congress.

fact. By doing so, they become fully bound to observe all the rules, and entitled to all the advantages specified in those rules.

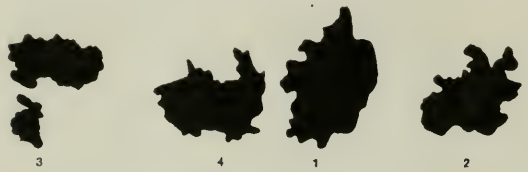
The governments concerned will inform the Federal Council before January 1, 1908, what determinations they have arrived at with reference to the present rules. When the states have notified their determinations, and at the latest on February 1, 1908, the Swiss Federal Council will propose to the governments participating a date when the present rules are to come into force. Each signatory state has the right to withdraw from the union, subject to notice given by its government, six months in advance, to the Swiss Federal Council.

Areas of Contact Between Wheels and Rails.*

BY GEO. L. FOWLER.

(Reprinted from a Volume of Reports made to the Schoen Steel Wheel Co.)

The mutual compression between the wheel and the rail when under a load has an important bearing on the durability of both and also on the adhesion of the wheels when used as drivers. The investigation was made with various types of cars and locomotives to determine the area of contact between the wheel and the rail; the average pressure exerted per square inch over this area; the



Contacts of 35-inch Steel Tired Wheel Under Cafe Car. Weight on Wheel, 6,075 lbs.

accumulated pressure at the center of this area; the yield of the metal in both the rail and the wheel under the imposed load; the relative action of the wheel and the rail under load; the comparative action of wheels of different diameters, and the comparative action of steel and cast-iron wheels.

Through the courtesy of Mr. J. F. Deems, General S. M. P. of the New York Central Lines, the preliminary work involving the use of cars and locomotives was done at the West Albany yards of the New York Central & Hudson River R. R. A concrete pier was built under one of the rails of a level piece of track to secure a firm foundation. A section about 10 in. long was cut out of the rail and a short piece with perfect contour was inserted on top of the pier. The car or locomotive, under which a wheel was to be examined, was run over this short section and one wheel allowed to rest upon it. The wheel was then raised with its mate so that the short section of rail could be removed and the top smeared with a thin coating of red lead. It was then replaced and the wheel lowered until it rested on the rail with its whole load. This made a spot on the red lead the size of the area of contact of the wheel and the rail. The wheel was again raised, the section of the rail removed, and the area of contact, as indicated by the spot on the red lead, transferred to tracing cloth. The rail was again smeared and replaced, and the wheel was turned through one-quarter of a revolution and the work repeated.

In the supplementary work in the laboratory, a section of a 78-in. tire, a section of a steel wheel and a section of a cast-iron wheel were used. One of these sections was fastened to the plunger of the testing machine and was raised and lowered on the heads of short sections of rails resting on the platen of the testing machine. The size and shape of the contact area was obtained

*Copyrighted by the Schoen Steel Wheel Co., and published by special permission.

Contacts of 33-inch Worn Cast Iron Wheel Under Gondola Car. Weight on Wheel 14,575 lbs.

by the interposition of a piece of white tissue paper resting on a sheet of carbon paper which made the imprint on the white paper.

The tests at West Albany were made with three cars and two locomotives. In all, 32 contacts were obtained, and plaster of Paris casts were taken of the treads of the wheels at all points at which the contact areas were obtained. Some of the wheels were new, while others were partly worn, a condition that evidently had much to do with the shape and size of the spot.

These areas were carefully measured with a planimeter and gave the following average results:

Wheels used under—	Total weight on wheels in lbs.	Average of area contact.	Average weight per sq. in. of area in lbs.
Café car (35 in.)	6,075	.2325	28,700
Gondola (33 in.)	14,575	.3775	40,100
Consolidation drivers (63 in.) .	17,325	.3350	52,080
Atlantic driver (78 in.)	19,995	.6325	31,820
Atlantic trailer (48⅜ in.) ...	19,210	.4725	44,400
Dining car (34½ in.)	9,415	.2600	37,870

In these tests, the influence of weight and diameter is partially illustrated. The two wheels of the Atlantic engine, for example, carry about the same weight. The areas of contact are nearly in an inverse ratio to the diameters. Comparing the wheels of the cafe and dining cars, the wheel with the heavier load has much the greater weight per square inch of area, showing that the metal

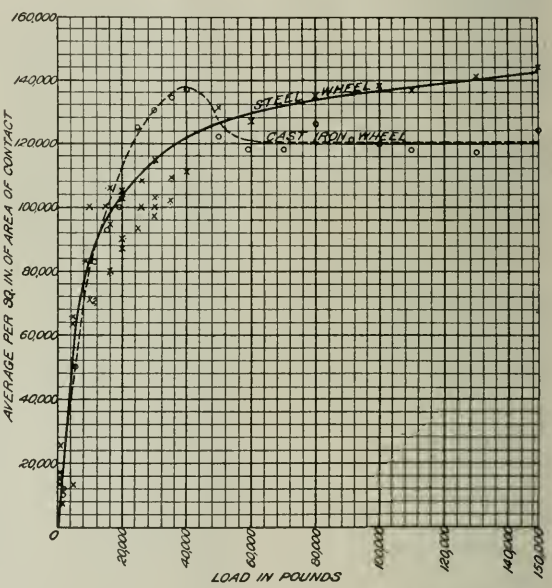


Diagram Showing the Relation Between Weights on Wheels and That on the Area of Contact Between the Wheel and the Rail.

does not yield in direct proportion to the weight, at least within the limits of the loads here imposed.

In the laboratory, the first series of tests made was to apply pressures, increasing by small increments, to the tread of a 36-in. steel wheel resting on an 80-lb. rail. The lowest load applied was 500 lbs. This was increased by increments of 500 lbs. up to 20,000 lbs.; then by increments of 1,000 lbs. up to 30,000 lbs.

The second series was made with the same wheel resting on a 100-lb. rail, starting at a load of 500 lbs. and increasing by increments of 500 lbs. up to 2,000 lbs.; then by increments of 1,000 lbs. up to 10,000 lbs.; then by increments of 2,000 lbs. up to 30,000 lbs.

The third series was made with a 78-in. tire on a 80-lb. rail, starting at 500 lbs. and then increasing by increments of 500 lbs. to 2,000 lbs.; then by increments of 1,000 lbs. to 8,000 lbs.; then by 2,000 lbs. to 30,000 lbs. and from that point by increments of 2,500 lbs. to 40,000 lbs.

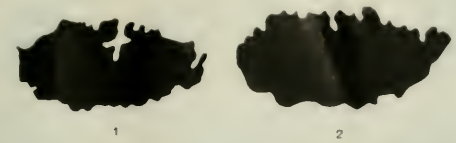
The fourth series was made with the 78-in. tire on a 100-lb. rail starting at 500 lbs. and increasing by increments of 500 lbs. to 2,000 lbs.; then by 1,000 lbs. to 8,000 lbs.; then by 2,000 lbs. to 30,000 lbs., and finally by 2,500 lbs. to 35,000 lbs.

The fifth series was made with the section of a cast-iron wheel 33 in. in diameter. This was tested on a 100-lb. rail only, starting at 500 lbs.; increasing by 500 lbs. increments to 20,000 lbs.; then by 1,000 lbs. to 30,000 lbs.; then by 2,500 lbs. to 40,000 lbs.; then by 5,000 lbs. to 150,000 lbs.

The sixth series was made with a 36-in. steel wheel on a 100-lb. rail and started at a load of 50,000 lbs. which was increased by increments of 10,000 lbs. to 150,000 lbs.

The results obtained from these tests have been plotted on the

accompanying diagram and average lines drawn which show the accumulated pressure per square inch of area under the actual loads imposed, the lines being an average of the results obtained. It will be seen, on comparing the lines of the 36-in. steel wheel and of the 33-in. cast-iron wheel, that there is comparatively little difference up to a load of 22,500 lbs. after which the load per square inch increases more rapidly with the cast iron wheel than with the steel wheel. At a load of 37,500 lbs. there is a marked breaking



Contacts of 78-inch Steel Tired Driving Wheel, Atlantic Locomotive. Weight on Wheel 19,995 lbs.

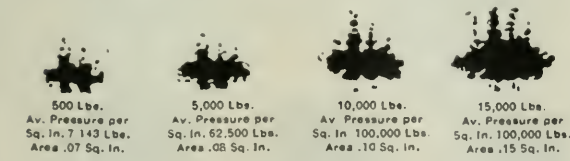
down of the metal in the cast-iron wheel showing that the crushing strength has been exceeded.

A tentative explanation of this phenomenon is that the hard chilled cast-iron wheel is practically unyielding and that, when the load is imposed, the whole of the compression takes place in the rail. The area of contact is small and the average pressure per square inch of area is high. The yield in the rail holds, for a time, against the increasing load, thus cutting down the size of the area between 22,500 lbs. and 40,000 lbs. The wheel itself then takes a permanent set, increasing the area of contact very rapidly and lowering the average. In the case of the steel wheel, yielding takes place in both the wheel and the rail, with the result that an equilibrium is established on a smaller area and the actual breaking down of the metal occurs under a higher pressure.

Contacts of 48-and-5-16-inch Steel Tired Trailer Truck Wheel, Atlantic Locomotive. Weight on Wheel 19,210 lbs.

In the case of the cast-iron wheel, it will be noted that the curve of average pressure shows a break and yield of the material at a load of 27,000 lbs. though it rises again and makes a second complete break at 37,500 lbs. from which there is no recovery. In the case of the steel wheel, the breakdown does not occur until a load of 50,000 lbs. is reached, and even then there is a gradual and practically uniform advance to 150,000 lbs.

In the tests of both the cast-iron wheel and the steel wheel, the permanent set was all in the rail. Both wheels were carefully examined with a microscope after the load of 150,000 lbs. had been imposed and the tests were completed and no appearance of yielding or cracking of either could be detected. The rail, on the other hand, showed signs of a permanent set under a load of 20,000 lbs., and this set increased with the increasing loads. The rail was

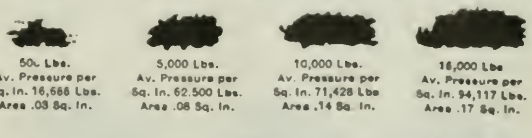


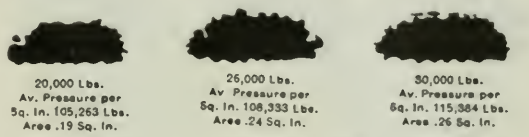
Contacts Between 36-inch Steel Tired Wheel and 80-lb. Rail.

examined immediately after applying loads of 12,000, 15,000, 25,000, 30,000, 35,000 and 40,000 lbs. The spot or depression left by the wheel could be seen after the 20,000 lbs. load had been imposed but not before.

The difference between the areas of contact of the wheels under cars and locomotives and the wheels tested in the laboratory, in which the area was larger, is probably due to the fact that the wheels under the cars and locomotives were worn somewhat hollow and so fitted the rail head to a greater extent. In service, however, the swinging of the wheels from one side of the track to the other brings the projections on the outer edge of the rim against the rail, undoubtedly causing a much higher load to be put on a smaller area of contact than was applied in the laboratory.

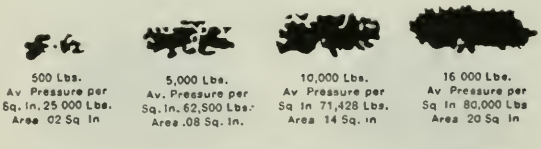
The permanent set taken by the rail at so low a load as 20,000 lbs. raised the question of the maximum pressure imposed at the center of the area of contact. It was assumed that, when the wheel first touched the rail, the area of contact would be a mathematical point if both surfaces were perfectly smooth and true. As the load is increased, the metal in both the wheel and rail yields and the area of contact increases. This increase is from the center out to the edge, and the pressure per unit of area is evidently at a maximum at the center and decreases to nothing at the edge. In order to estimate approximately the maximum pressure it was assumed that the metal in the area on which a load had once been

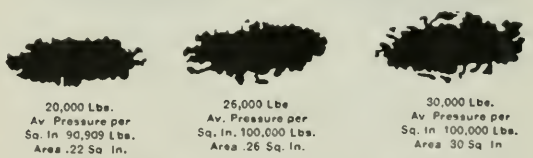




Contacts Between 36-inch Steel Tired Wheel and 100-lb. Rail.

imposed always sustained it, and by building up from the center by increments the final load was attained. Take the case of the 36-in. steel wheel on the 100-lb. rail. An area of .03 sq. in. sustained the initial load of 500 lbs., an average pressure of 16,666 lbs. per sq. in. By increasing this load to 5,000 lbs. the area is increased to .08 sq. in. If this extra 4,500 lbs. which was applied be considered as loaded uniformly over the whole area, there would be an average increase of pressure of 56,250 lbs. per sq. in., or $56,250 + 16,666 = 72,916$ lbs. per sq. in. on the original .03 sq. in. which carried the initial load of 500 lbs. This assumption runs the load up to an exceedingly high limit, possibly too high, as it

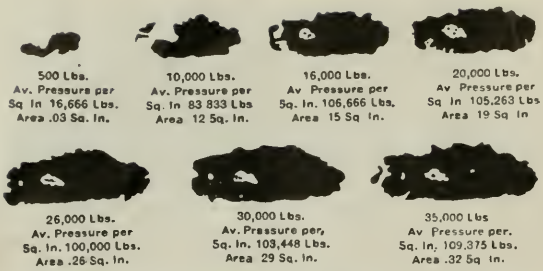




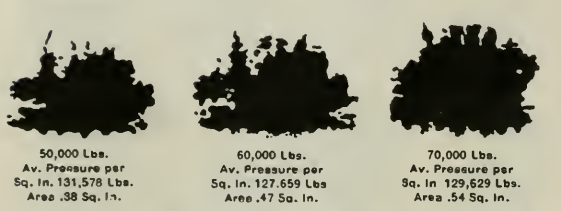
Contacts Between 78-inch Steel Tired Wheel and 80-lb. Rail.

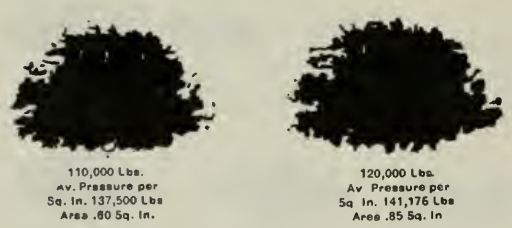
gives a pressure of more than 170,000 lbs. per sq. in. at the center of the area of contact, with a load of 20,000 lbs.

In considering the results obtained in this investigation, it must be borne in mind that the areas of contact were all obtained under static loads. Running conditions must necessarily be more severe and impose higher stresses. In an investigation conducted several years ago, it was found that the stresses in truck and body bolsters, while a car is in motion, are from 20 to 50 per cent. more than the stresses due to static loads alone. If this is true for parts located above the springs, there must certainly be an equal or greater increase at the point of contact between the wheel and the rail. Then, too, the blows received from passing over low joints or worn frogs, will raise the pressure between the wheel and the rail to a point which the tests under static loads have shown to be excessive. For example, the wheels, under a car of 100,000 lbs.

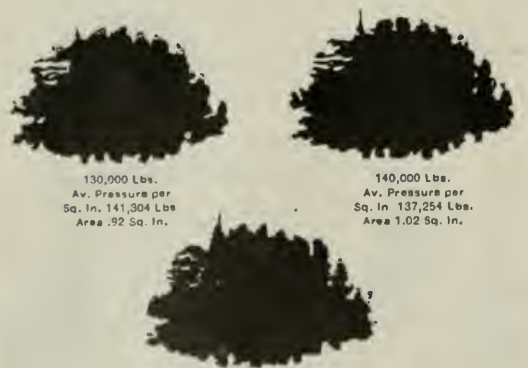


Contacts Between 78-inch Steel Tired Wheel and 100-lb. Rail.

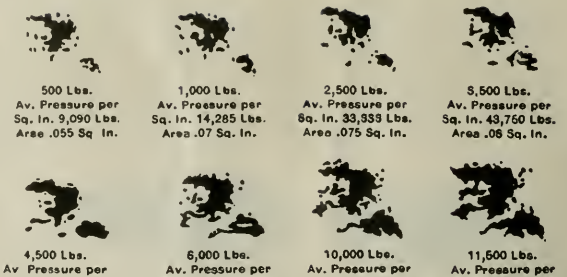


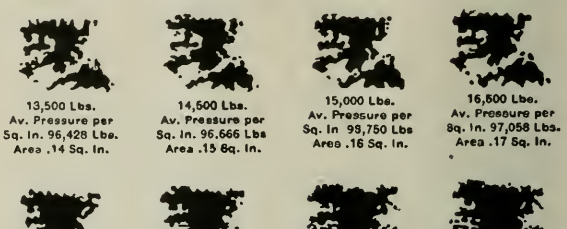


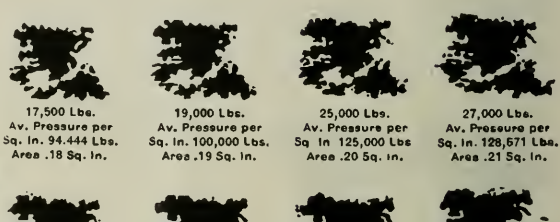
Contacts Between 36-inch Steel Wheel and 100-lb. Rail.

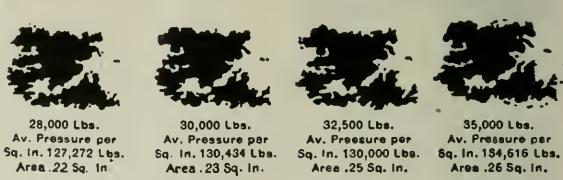


Contacts Between 36-inch Steel Wheel and 100-lb. Rail.









Contacts Between 33-inch Cast Iron Wheel and 100-lb. Rail.

capacity with a 10 per cent overload carry an approximate static load of 18,750 lbs. each. A drop of [illegible] in. is equivalent to a blow of about 37 foot lbs. If the drop is checked by a yield in the rail of three-eighths of the amount of the drop [illegible] the pressure on the rail will amount to 50,000 lbs. This is certainly excessive.

Comparing the steel and cast iron wheels, it appears that no damage was done to either wheel under a static load of 150,000 lbs. If the two wheels are subjected to the pounding action of service, however, the result cannot fail to be the earlier disintegration of the harder, more unyielding and more brittle material. Exact comparative data along this line are not yet available.

The conclusions to be drawn from this part of the work may be summed up as follows:

The average pressure imposed on the metal of the wheel and rail is within safe limits at low loads, but when a load of 20,000 lbs. is reached the elastic limit of the metal is passed and a permanent set appears in the rail.

The accumulated pressure at the center of the area of contact is excessive at comparatively small loads, and is only prevented from doing injury by the support of the surrounding metal. How

Contacts Between 33-inch Cast Iron Wheel and 100-lb. Rail.

far this compression extends into the body of the two pieces of metal in contact is not known but presumably it extends down to the base of the rail and into the hub of the wheel.

Under a static load the rail yields first, owing, probably, to the fact that the metal of the surface of the head of the rail is not as well supported by the metal below as in the case of the wheel.

The effect of difference of diameter in wheels carrying the same load is insignificant and is only appreciable when the difference is great. Hence, it is immaterial, so far as stresses on the wheel or rail are concerned, whether small or large wheels, within the limit of practice, are used.

A hard, unyielding cast-iron wheel inflicts more damage on the rail than a steel wheel and the wear of the rail will be greater with the cast-iron wheels than with the steel wheels.

It is probable that the reason why the damage that would be expected from heavy wheel loads in service does not immediately appear, is that the rail, by bending under the passing wheel, increases the area of contact and thus relieves the surface stresses.

Massachusetts Street Railways.

From the annual returns of the street railway companies of Massachusetts to the railroad commissioners for the year which ended September 30, 1907, it appears that the street and interurban railway development of that state is still in advance of the requirements of the population. There are 80 companies whose returns may be considered in a summary of the situation as a whole, omitting most of those which are leased and the few which make returns but have not begun to do business. Out of these 80 there are 47 which declared no dividend at all during the year, and the official year ended before the financial depression had begun.

The highest dividend paid was 10 per cent., which was declared by the Middlesex & Boston and by the East Middlesex. The following roads come next with 8 per cent.: Holyoke; Athol and Orange; Springfield; West End (in Boston) preferred, (West End common pays 3½); Union (in Fall River), and the Dartmouth & Westport. Some of these are strong companies. The Holyoke had a year's surplus, after the dividend, of $8,479, making its total surplus $69,816. The Athol & Orange has a total surplus of $29,450, which is strong for a rural district. The Springfield rises to the large figure of $367,530 in all, its surplus for the year having been $4,698. Largest of all is the West End which, though it made only $285 surplus this year, has a total surplus of $1,150,093. The Union, with $29,851 for this year, reaches a total surplus of $208,605, which is large for Fall River. The Dartmouth & Westport, with a surplus this year of $21,823, reaches $78,731 in all. This company gets the benefit of nearness to New Bedford and Fall River.

The Worcester & Shrewsbury declared a 7.22 per cent. dividend;

the Newton & Watertown 7.2 per cent., and the Northampton 7 per cent.

Six per cent. was paid by the Fitchburg & Leominster; Linwood; Mount Tom; Pittsfield; Somerville, Winnisimmet (In Chelsea); Boston elevated, and the Boston & Worcester. The B. & W. is the principal interurban line in the state, competing with the Boston & Albany. It carries express matter, baggage and freight. The Boston elevated had a year's surplus of $33,278, and a total surplus of $668,603. The Boston & Worcester had a year's surplus of $3,034 and a total surplus of $14,951.

The Worcester Consolidated paid 5½ per cent. Five per cent. was paid by the Hampshire; the Webster & Dudley; the Worcester & Shrewsbury; the Boston & Northern; the Boston & Revere, and the Citizens' electric (in Fall River). The Old Colony (which, by consolidation, covers a large territory south of Boston) paid 4 per cent.; the Springfield & Eastern, 4; the North End (in Worcester), 3¾; the Milford & Uxbridge, 3; Newton, 2½; Uxbridge & Blackstone, 2; Natick & Cochituate, 2.

The 20 which were so unprofitable as to pay no dividends at all and besides had to show a deficit from the operations of the year, were the Haverhill & Amesbury; the Haverhill & Plaistow (N. H.); the Haverhill & Southern New Hampshire; the Marlboro & Westboro; the Worcester & Holden; the Ware and Brookfield; the Templeton; the Medfield & Medway; the Lowell, Acton & Maynard; the Lowell & Fitchburg; the Lowell & Pelham (N. H.); the Norton & Taunton; the Norwood, Canton & Sharon; the Conway; the Cottage City & Edgartown Traction; the Springfield & Eastern; the Berkshire; the Dedham & Franklin. Some of these have surpluses from former years: the Haverhill & Plaistow, $15,095; the Haverhill & Southern New Hampshire, $1,483; the Worcester & Holden, $7,065; the Lowell, Acton & Maynard, $857; the Springfield & Eastern, $14,576, and the Berkshire, $78,997.

The largest total deficits in the list are the Worcester & Southbridge, $77,395 (in spite of a surplus for the year of $13,949); the Templeton, $69,670; the Norton & Taunton, $39,870; the Norwood, Canton & Sharon, $61,407; the Blue Hill, $55,623; the Norfolk & Bristol, $61,274; the North End, $18,742; the Providence & Fall River, $20,939; the Amesbury, $19,247; the Amherst & Sunderland, $26,176.

There is constant pressure on the part of the people for better accommodations, for larger privileges of transfers, for reduced fares, especially to 5 cents within the limits of any municipality, no matter how long the distance traveled, and for more cars for working people during the hours when they are going to and from work. The railroad commissioners have tried to grant the requests of the public whenever the companies were financially able; but there have been several recent cases in which the companies were held not justified by their financial condition in doing what the public wanted. The Commission adheres closely to the principle that private persons cannot be expected to invest their money in public service at a loss, though in a few cases it has required companies to run particular cars which are unprofitable, holding that the general business of the company could bear the loss.

Passenger Cars for Tropical Climates.

A train known as No. 7 of the local series has just been built at Parel Shops of the Great Indian Peninsula Railway, Bombay, from the designs of A. M. Bell, Carriage Superintendent, which possesses some novel features in construction. The train consists of seven open cars coupled together with open gangways for the free passage of the train staff, ticket collectors, etc. The front vehicle is a third-class brake, with a compartment for women, the next a first and second class composite, with a private compartment for women, the third a second and third class composite; the fourth, fifth and sixth vehicles are third class only, and the last a third-class brake like the front one. The cars are each 62 ft. long and 10 ft. wide with the doors, which open inward, set back to 9 ft, 6 in. over. There are lavatories for each class of passengers, and the total seating capacity is for 20 first class, 90 second class and 550 third class. There is a luggage compartment at each end of the train, provided with seats, as on each journey a certain number of fishwomen invariably take possession of the front compartment and persist in remaining there with their wares.

The carriages are built on steel underframes, each running on two four-wheel trucks, with 10-ft. wheel centers. The framing of the bodies is of teak braced with diagonals from end to end, and the lower portion is matchboarded with very narrow strips of teak taken from the waste of the sawmill. The employment of these very narrow strips overcomes the difficulty of splitting—an almost certain

Combination First and Second Class Car; Great Indian Peninsula Railway.

Third Class Car; Great Indian Peninsula Railway.

failing of any wide wood panels in Utica. In this difficulty is to be found the explanation for the use of so much steel panelling on car linings built for tropical climates. Steel, however, has disadvantages. It readily takes up heat from the outer air and then tends to warm up the interiors of the carriages rather than cool them. To counteract this and protect the interior, it has been the practice in all the newer cars built for the C. I. P. Railway without exception to provide a layer of non-conducting material behind the steel sheeting. A carriage body thus consisted of three shells—viz. the outer panelling of steel, the intermediate lining of non-conductor and the internal lining of wood. Obviously, if a suitable heat resisting material could be found for the outer panels impervious to moisture and sufficiently strong to resist the bad treatment the body of a railroad carriage is subject to in service the intermediate lining could be neglected. In the train described this has been done, the outer panels above the waist are of hard "Uralite" sheet—a material largely composed of asbestos and possessing very satisfactory heat resisting properties. This is screwed to the pillars and framing in such a manner that air-tight cells are secured between the inner and outer skins of the car body in which the stagnant air further ensures the non-conductivity of the sides. The roof is similarly treated, but covered with a thin teak wood casing to offer a continuous surface for the roof canvas. About 1,000 sq. ft. of "Uralite" is incorporated in the construction of each car. To save time in the finish the lower sheeting is varnished, while the upper is painted with a quick-drying paint enamel. There is no lining except along the upper mouldings, and the letters, etc., are on embossed plates attached by screws. This procedure makes it unnecessary for the cars to wait for days in the paint shops for sizing, gilding and varnishing of letters and stripes.

Interior of Third Class Car.

The cars have a center aisle between "turn-over" seats, plain slatted wooden ones in the third class, spring seats upholstered in leather cloth in the second class and smooth-cushioned buffalo hide in the first. This style of seat enables the passengers always to face the engine and the breeze. All doors open inwardly and a simple gravity "slam" lock is provided.

The train is lighted throughout by electric light, a large dynamo of 1,000 watts being mounted under each brake and a small 250 machine under the center coach, this being the spare vehicle in case of reduction or increase of the size of the train. Punkah fans are provided in the first and second class (ladies') compartments. Alarm signal apparatus is installed in each car with handles in convenient places.

To indicate the destination of the train, prominent scarlet boards lettered in gold are used. They are illuminated at night by the front light of the electric tail side lamps.

Consumption of Ties in 1906.*

The statements in this report are based on the number of ties bought rather than on the number actually used. For all practical purposes, however, the two are identical; because the purchases in 12 months are an accurate index of consumption for a corresponding period.

The purchases of ties by steam and street railroads of the United States during the year 1906 amounted to 102,834,042, valued at $48,819,124, an average of 17 cents per tie. This value represents the cost to the purchaser at the point of purchase. In many, perhaps most, cases this point of purchase is the point of production, near the road's right of way; but in others, and this is particularly true of sawed pine ties, long shipments are involved and the point of purchase is a local distributing market distant from the source of supply. The average value of 47 cents therefore probably represents a higher rate than that received by the producer. The steam railroads purchased 91,177,625 ties, or about nine-tenths of the whole number.

Street railways as a rule use a smaller lighter tie than that required by the steam roads, so their material is less difficult to obtain.

KINDS OF WOODS USED.

Table 1 summarizes, by kinds of wood, the quantities of hewed and sawed ties purchased in 1906. Approximately one-fourth were sawed and three-fourths hewed.

TABLE 1.—*Ties Purchased by Steam and Street Railroads in 1906.*

Kind of wood.	Total.	Hewed.	Sawed.
Oaks	45,357,874	38,269,030	7,088,844
Southern pines	18,841,210	13,745,716	5,095,494
Douglas fir	7,248,562	657,934	6,590,628
Cedar	7,083,442	5,429,305	1,654,137
Chestnut	6,588,975	5,450,920	1,138,055
Cypress	5,104,496	4,448,052	656,444
Western pine	3,969,605	1,884,696	2,085,509
Tamarack	2,576,859	2,360,873	215,986
Hemlock	2,058,198	1,928,726	129,472
Redwood	1,248,629	892,687	355,942
Lodgepole pine	554,738	554,738	.....
White pine	373,387	278,270	95,117
All others	1,828,067	1,593,647	234,420
Total	102,834,042	77,493,994	25,340,048

Table 2 shows the quantity and value of hewed and sawed ties of various woods purchased by steam and street railroad companies in 1906. The average value of the sawed tie is higher than that of the hewed tie.

Oak, the chief wood used for ties, furnishes more than 44 per cent., nearly one-half of the whole number, while the southern pines, which rank second, contribute about one-sixth. Douglas fir and cedar, the next two, with approximately equal quantities, supply less than one-fifteenth apiece. Chestnut, cypress, western pine, tamarack, hemlock and redwood are all of importance, but no one of them furnishes more than a small proportion.

Oak and southern pine stand highest in both total and average value; the average value of each is 51 cents. Chestnut ranks next followed by cedar. Hemlock, at 28 cents, is the cheapest tie reported.

More than three-fourths of all ties are hewed; and with every

All others	1,828,067	726,144	.40	1,575,699	587,162	.37	158,818	74,339	.47	17,948	8,437	.47	75,602	56,206	.74
Total	102,834,042	$48,819,124	$0.47	71,199,415	$32,960,077	$0.46	22,278,210	$11,260,455	$0.51	6,294,579	$3,022,511	$0.48	3,061,838	$1,576,081	$0.52

wood from which ties are made, except Douglas fir and western pine, the number of hewed ties is greater than the number sawed. About ten times as many Douglas fir ties are sawed as are hewed. Of the oak ties a little over one-sixth and of the southern pine ties less than one-third are sawed. In general, when lumber has a relatively low value the proportion of sawed ties increases, because the market for ties is always active, while that for lumber is frequently sluggish. All western species are affected by this condition, for stumpage is abundant and its value relatively low.

About one-third of the ties used by street railways are sawed, but not quite one-fourth of those used by steam roads. The greater proportion of sawed ties used by street lines is probably due to the fact that much of the trackage within city limits is on paved streets, where sawed ties are more satisfactory on account of their regular shape.

The average price of the sawed tie is, as a rule, higher than that of the hewed one, despite the fact that the hewed tie is more durable. This peculiar condition of an inferior commodity bringing a higher price is brought about by the difference in market conditions. Sawed ties, though admittedly less durable, represent a potential value equivalent to the amount of lumber into which they could be cut. Hewed ties, on the other hand, compete only with posts or fuel wood, both of which are of lower value.

CONSUMPTION IN 1905 AND IN 1906.

Table 3 shows the number and value of the different kinds of ties purchased by the steam and street railroad lines in the United States in 1906, and contrasts the purchases of steam railroad companies in 1905 and 1906. No statistics are available upon the purchases by street lines in 1905.

*No figures for street railways in 1905.
†For 1905 includes white pine, lodgepole pine, and western pine.
‡Included in southern pines.

The purchases of ties reported by the steam railroad companies in 1906 exceeded those of 1905 by more than 15,000,000. Nearly one-half of this excess was oak. The purchases of cedar ties showed a decrease of about one-half million, due possibly to the sharp demand for cedar poles, which operated against the production of ties. Douglas fir ties nearly doubled in quantity, and both cypress and hemlock increased by a large percentage, but tamarack purchases fell off more than one-fifth and chestnut about 1.5 per cent.

The street railways use about the same proportion of oak ties as the steam roads, a larger proportion of southern pine, cedar, chestnut, cypress and hemlock, but a smaller proportion of Douglas fir, western pine and tamarack. Comparing the consumption of ties by steam railroads and street railways, there is practically no difference between the average values per tie for all kinds of timber combined, but the average costs per tie for the individual kinds of wood show some wide variations. These cannot be attributed to any general condition, but are probably due to local influences which operate to increase or decrease the cost to users of certain kinds of ties in particular regions. Such local conditions in turn affect the general average for the kind of timber for the whole United States.

PRESERVATION.

The question of tie preservation is becoming more and more important as the demand for tie material increases and the traffic requirements become more exacting. So long as plenty of white oak ties could be secured the necessity for tie preservation was not felt; but with the constantly increasing use of pine and other less decay-resistant woods, it has become a vital economic question. The railroad companies have met the problem by establishing treating plants in various parts of the United States and by laying experimental tracks with treated ties to determine the efficiency of the several preservatives under varying conditions.

In 1906 the purchases of treated ties by steam and street railroad companies combined amounted to 5,289,435; in addition to this quantity the companies treated 6,190,203 at their own plants, a total of 11,779,630 treated ties during the year, or 11.5 per cent. of the whole number. Of this total the steam railroad companies purchased, during the year, 4,773,116 treated ties, and applied preservatives to 6,365,523 at their own plants. The street lines used 640,999 treated ties, 516,319 of them already prepared when they were bought, and 124,689 treated at their own plants.

State Control of Fast Interstate Trains.

The decision of the Supreme Court of the United States nullifying an order of the Railroad Commission of South Carolina directing the Atlantic Coast Line to stop a through fast train at Latta, a town of 453 inhabitants, was reported in the *Railroad Gazette* last week, page 727. Justice Peckham, in delivering the opinion, reviewed the defense of the road, in which it was shown that in addition to a number of daily local passenger trains there was also furnished the citizens of Latta the convenience of a daily passenger train each way for through travel north and south, and sustained the claim that the order of the commission was unreasonable and unnecessary; a direct burden upon interstate commerce, and therefore a violation of and in conflict with the authority given exclusively to Congress by the Constitution to regulate interstate commerce. Continuing Justice Peckham said:

"That any exercise of state authority, in whatever form manifested, which directly regulates interstate commerce, is repugnant to the commerce clause of the Constitution, is obvious. Any command of a state the necessary effect of which is to order the stopping of an interstate train at a named station or stations, if it directly regulates interstate commerce, is void. * * * But some orders which may cause the stoppage of interstate trains may be valid, if they do not directly regulate such commerce. The question of whether such order is void as a direct regulation of such commerce may be tested by considering the nature of the order and the character of the interstate commerce train to which it applies. It also may be tested by considering the adequacy of the local facilities. * * * "True, inherently considered, whether there be local facilities is not a Federal question, but in so far as the existence of such adequate local facilities is involved in the determination of the Federal question of whether the order concerning an interstate train does or does not directly regulate interstate commerce, that question for such purpose is open and may be considered by us."

Justice Peckham then proceeds to declare that local conditions do not necessitate the stopping of the trains in question at Latta. The railroad company has furnished such reasonable accommodations to the people of the place as it can be fairly and properly called upon to give. To stop these trains at Latta and other stations which could bring equally strong reasons for the stoppage of the trains at their stations, would wholly change the character of the trains, rendering them no better in regard to speed than the other trains and would result in the inability of what had been fast trains to make their schedule time, and a consequent loss of patronage, also the loss of compensation for carrying the mails, which would be withdrawn from them, and the end would be the withdrawal of the trains, because of their inability to pay expenses.

Foreign Railroad Notes.

The railroads of Siam were not increased in length during the last fiscal year, but their gross earnings increased 26 per cent. and their net earnings 21¾ per cent., the latter being 5.13 per cent. on the cost of the roads, which, however, has been only $27,240 per mile. The working expenses were only 36¾ per cent. of the gross earnings.

The Italian State Railroads have a new head, the late Minister of Public Works, Giantulco, having retired on account of serious illness. The new minister is Pietro Bertolini, who has been an under secretary in previous cabinets, and is regarded as a capable administrator, and a firm character, not likely to be bulldozed by the organized employees.

GENERAL NEWS SECTION

NOTES.

The New York New Haven & Hartford has modified its notice canceling through freight rates over the Central of New Jersey, making the date on which the notice will take effect March 31.

The United States District Court at Kansas City has issued a temporary injunction against the enforcement of the reduced express rates ordered by the Missouri State Railroad Commission.

The New York, New Haven & Hartford has announced at Boston that beginning December 28 a charge of 10 cents a ton will be made in all cases where carload freight is unloaded by the company into freight houses.

In the United States Circuit Court at Chicago December 14, a final decree was entered in the suits of 16 railroads against 52 ticket brokers, which, it is said, strikes a death blow at the business of ticket scalping in Chicago.

The pension plan for the employees of the Erie Railroad, which for some time has been under consideration by a committee representing the company and the employees, is based on rules under which the company will provide about one-half the funds necessary to pay the pensions, the other half to be contributed by the employees themselves.

The Supreme Court of Wisconsin has declared unconstitutional the law passed in that state this year permitting passengers in the lower berth of a sleeping car to require the upper berth, when unoccupied, to be pushed up, so as to give more room in the lower berth. The court decides that a law of this kind is not a reasonable exercise of the police power.

Mr. Walter P. Hall, the new Chairman of the Massachusetts State Railroad Commission, was promoted to that place from the office of Assistant Attorney General. He has had much experience in managing the interests of the state in connection with grade crossings and other railroad matters. He has practiced law in Fitchburg since 1892, and has been City Solicitor and Assistant District Attorney.

Reports from Ohio say that since the reduction of ticket fares to 2 cents a mile and the abolition of an extra charge in case of payment of fare in cash on trains, the number of cash fares collected has increased so largely that the work of the conductors has been made burdensome; and it is said that the railroads are going to try to secure legislation to suitably penalize passengers who do not buy tickets before boarding trains.

The Missouri Pacific has taken off a number of passenger trains from its secondary lines in Kansas. On one line of 85 miles and another of 42 miles the passenger service is discontinued and passengers will have to ride on mixed trains. A press despatch from Topeka states that, because of this action, the Kansas Railroad Commission has ordered the Attorney-General to sue for the revocation of the charter of the Missouri Pacific.

At a hearing before the Interstate Commerce Commission at Washington last Monday on the complaint of the Oregon and Washington lumber shippers, President James J. Hill, of the Great Northern, said that the increase in freight rates had been determined on simply because lumber was being carried at less than cost; there was an average loss of $80 a car. The revenue per car averaged $200, while the cost was $280. This estimate of cost apparently includes something for hauling the lumber cars westward empty.

The Montreal ice carnival is to be frozen out, so to speak. According to a press despatch from St. John, N. B., the holding of ice and snow sports and all kinds of winter carnival attractions in Canada is to be frowned upon systematically by the railroads, their reason being that the advertising of these things gives the idea that Canada is "a mere frozen fringe north of the states." The idea may have a bad effect upon immigration. The passenger traffic managers of the Canadian Pacific and Grand Trunk are reported as declaring that they will refuse to advertise the events and will grant no special rates.

From reports printed in New York City it would seem that claims received by railroads for damage to butter and eggs have recently become so numerous as to be a serious burden both to the railroads and to the tradesmen; and a committee, representing merchants, in a communication to the Pennsylvania Railroad, declares that the trouble is due to the general use of air-brakes and automatic couplers. This statement, interpreted, means, no doubt, that the trouble is due mostly to the rough handling of cars in switching, which has been made possible by the introduction of the improvements named.

An officer of the Pennsylvania is authority for the statement that in the month of October the passenger receipts of that road in the state of Pennsylvania were $64,000 less than in the same month a year ago, while outside the state of Pennsylvania they increased 8 per cent., and that but for the reduction to 2 cents a mile, ordered by the legislature, the receipts within the state apparently would have increased $140,000. The loss entailed by the law appears therefore to have been $204,000. The decrease is absolute and has not been offset by any increased business, the reduction has not stimulated travel.

It was announced at Raleigh, N. C., last week that Governor Glenn had come to an agreement with the Southern Railway under which the road would make all single ticket rates in the state 2½ cents a mile, both for intrastate and interstate trips, and sell mileage books of different classes at 2 cents. The Seaboard Air Line agreed to take the same action as that agreed to by the Southern. The next day, however, it was announced that the Atlantic Coast Line and others had rejected the proposition and, therefore, that the proposed agreement would fall through. To carry it out would have necessitated the calling of the legislature to rescind the rate laws now on the statute books, and the Governor declared that this would be useless unless all the roads would come in.

Between 6 a.m. and 12.10 night of every week-day there are 41 trains from New York to Philadelphia on the four-track line of the Pennsylvania Railroad, or an average of a train every 26 minutes. From 7 a.m. until 7 p.m. there are 33 trains, or an average of one in every 22 minutes. Seven of these trains make the run in two hours or less. Every one of these 41 trains, except four, has Pullman parlor or sleeping cars, and dining cars are attached to 17 of them. With one exception, all parlor cars have buffets except those on trains carrying dining cars. An equally complete service is maintained from Philadelphia to New York. The foregoing is from an advertisement of the Pennsylvania Railroad. The advertising agent believes that this is the most comprehensive and complete train service between any two cities in the world.

The New York State Public Service Commission for the First district (New York City) estimates that its expenses for the 1908 year will be $1,095,000, a figure which it is said was surprising to the Board of Estimate. The expenses of the Railroad Commission of Ohio for the last year were $37,305. The estimate of the New York commission contains the following: Office, telephone and rentals, $50,000; salaries, $850,000; furniture, $2,500; printing, stationery and supplies, $25,000; disbursements of employees and counsel, $15,000; maps, plans, prints and photographic apparatus, $5,000; engineering instruments and supplies, $10,000; compensation and expenses of special commissions, $10,000; advertising, $25,000; real estate searches and appraisals, $2,500; contingencies and rapid transit studies, $50,000, and special service and investigations, $50,000. The Board voted $71,000 to the Commission to pay the expenses until January 1, 1908.

At a hearing before the New York State Public Service Commission at Albany this week, on the question of making the fares on the New York Central more uniform, officers of that road announced their intention to make the rates on the Hudson division (New York to Albany) uniformly 2½ cents a mile. The short-distance rates on this division are now somewhat variable, though mostly not much above 2 cents a mile; but from New York to Albany, 142 miles, the fare through is $3.10, or nearly 2.2 cents a mile. Between Albany and Buffalo local fares are limited to 2 cents a mile by law, but the fare through to Buffalo is at a higher rate. It was stated that the tariff for the new increased rates on the Hudson division had already been printed, but it appears that no order has been issued fixing the day for putting it into effect. Under its charter the road may charge as high as 3 cents a mile on the Hudson division. Vice-President C. F. Daly said that the Central would abolish mileage tickets were it not for the competition of other roads.

The New York State Public Service Commission, Second district, has dismissed the complaint, made by a representative of a brotherhood against the Erie Railroad, alleging that not enough men were employed on certain passenger trains. On the trains in question there is in each case one brakeman, acting as rear flagman, and one porter. It appears that the porters are negroes. The railroad claimed that the porters were competent to act as rear flagmen in case of need, and the Commission sustains this position. The decision, by Chairman Stevens, declares that the complaint does not aver an insufficient number of trainmen and, therefore, that it can be entertained only as a complaint against the competency of the men. The only evidence supporting this charge is that one porter, last February, said that he had not passed an examination in flagging. But the General Manager of the road declares that now the colored trainmen-porters are competent to

discharge all of the duties of brakemen, and as this testimony is uncontradicted the Board dismisses the complaint.

Traffic Versus Main Line Mileage.

Chairman Knapp, of the Interstate Commerce Commission, had occasion to remark recently on the unequal increase this country is witnessing in the amount of traffic and the railroads' facilities for handling it. He estimated that whereas each of the past few years has seen an increase in the country's traffic of about 12 per cent., the railroads have grown in the same time at an average rate of only 2 per cent. It is freely predicted by authorities that the United States will find its industrial prosperity seriously retarded at no very distant date unless the transportation problem is given more liberal attention.

Below is a list of 14 important railroads whose tracks extend generally over all sections of the United States, with the amount of freight handled by each of them in the five years from 1902 to 1906 inclusive:

Number of tons, in thousands, of revenue freight carried:

	1906.	1905.	1904.	1903.	1902.
Southern Pacific	22,454	19,360	18,509	17,163	15,736
Union Pacific	13,048	11,204	10,264	9,657	8,590
Northern Pacific	15,356	13,036	13,283	12,791	11,080
Atchison	14,788	12,894	13,195	12,980	11,596
Rock Island	15,394	13,515	13,567	10,597	8,245
Erie	36,355	31,561	29,835	31,645	27,697
N. Y. Central	43,570	42,861	36,379	38,081	35,599
Pennsylvania	363,955	333,011	284,619	295,120	269,512
Baltimore & Ohio	65,216	56,322	50,964	52,249	49,476
Louisville & Nashville	24,553	21,041	21,429	20,677	18,320
Southern	23,518	20,973	20,733	19,197	16,811
Atlantic Coast Line	9,392	8,365	7,781	7,674	3,147
Illinois Central	25,641	23,148	22,420	21,881	19,096
New Haven	20,259	18,321	17,560	*17,350	17,145
Total	693,499	625,582	560,528	567,062	512,020

*Estimated.

The revenue freight hauled by these roads increased from 512,020,000 tons in 1902 to 693,499,000 tons in 1906, or about 181,479,000 tons. This is an increase of 35.4 per cent., or an average for each of the four years of nearly 9 per cent. A complete tabulation of every ton of freight carried by all roads, large and small, would probably show a larger percentage than this, owing to the new traffic originated by smaller systems in territory recently opened up.

How the railroads endeavored to keep pace with their growing business is shown by the two tables below. Operating a total mileage of 64,256 miles in 1902, they increased this in four years to 71,748, or 7,492 miles. This is an increase of 11.6 per cent., as compared with the growth of 35.4 per cent. in traffic.

Miles Operated.

	1906.	1905.	1904.	1903.	1902.
Southern Pacific	9,191	9,137	9,024	8,842	8,757
Union Pacific	5,403	5,357	5,352	5,762	5,710
Northern Pacific	5,401	5,314	5,262	5,111	5,019
Atchison	8,433	8,305	8,179	7,965	7,855
Rock Island	7,218	7,231	7,205	5,579	3,909
Erie	2,150	2,150	2,150	2,152	2,153
New York Central	3,783	3,774	3,490	3,422	3,319
Pennsylvania	3,756	3,695	3,670	3,663	3,663
Baltimore & Ohio	4,029	4,025	3,986	3,935	3,233
Louisville & Nashville	4,205	4,101	3,679	3,491	3,444
Southern	7,373	7,198	7,164	7,129	6,743
Atlantic Coast Line	4,327	4,306	4,192	4,138	4,138
Illinois Central	4,423	4,373	4,340	4,292	4,276
New Haven	2,056	2,087	2,057	*2,047	2,037
Total	71,748	71,053	69,759	67,528	64,256

*Estimated.

—*Wall Street Journal.*

Overhead Trolley on the Highland Division.

The line of the Highland division of the New York, New Haven & Hartford between East Hartford, Conn., and Vernon, 10 miles, is now traversed both by steam trains and by electric cars, the latter being those of the Connecticut Company. The principal termini of the electric company's line are Hartford and Rockville. The company will continue to operate the single-track electric line along the highway, parallel to the New Haven road, but the cars running over the New Haven tracks will furnish a faster service. Overhead trolley wires have been strung along the steam tracks, and this part of the road has been equipped with automatic block signals.

Old-Fashioned Interstate Commerce.

Charles W. Ellison, of Peekskill [N. Y.] sent his teams with five loads of furniture to Danbury, Conn., during the bad spell of weather a week or so ago. It was a tedious drive, as the roads were in bad condition. The furniture was taken in this way overland, because such freight is used so roughly on the cars that even at greater cost and the inconvenience of this mode of transportation, it was preferable to having it smashed to pieces on the cars. Nothing is handled with care any more on the New York Central. —*Highland Democrat.*

The distance between Peekskill and Danbury in an air line is 25 miles. The railroad route is rather roundabout, but even so, the engine ought to have a great advantage over the horses when it comes to a comparison of actual strain on the tender drawbar. From Peekskill north to Dutchess Junction by the New York Central the distance is 16 miles, and thence east by the New Haven to Danbury it is 46; total, 62 miles. The five teams were gone from home a week.

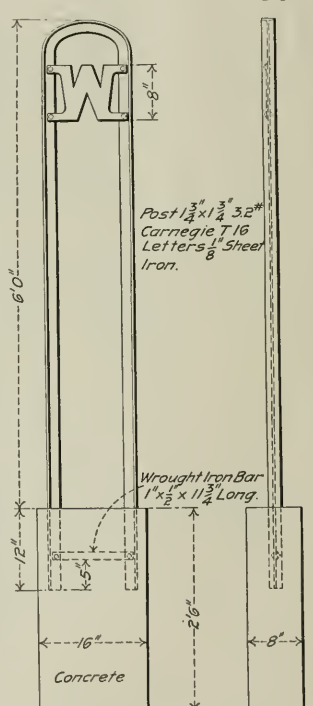
Reliable News.

We take no stock in the rumor that it is the South Manchester Railroad that is negotiating for the Boston & Maine.—*Hartford Courant.*

The "Continental" Whistling Post.

It is now possible to replace the familiar white tombstones with their black "W" and "R" that appear along our railroads at crossings and cuts by a durable, cheap and attractive steel whistling post.

The "Continental" whistling post has been designed to reduce the high cost of maintenance; to give longer life to the post and to keep the first cost as near that of the wooden post as possible. A light "T" iron is bent in an arch shape, the long ends of the "T" forming the legs of the post. The letters are stamped from sheet iron and riveted or bolted to the stems of the "T" near the top of the post. A bar riveted between the legs at the bottom of the post acts as an anchor when the post is set in concrete or in the ground.



The "Continental" Whistling Post.

The claims for this post are that being made of structural steel:

It will outlive the wooden post by many years.

It will reduce the amount of paint used to maintain the posts by at least 75 per cent.

It will reduce the amount of time necessary to properly maintain the posts by at least 75 per cent.

The letters will be silhouetted against any background in winter or summer.

Snow cannot drift against it.

Letters can be held in stock and new ones attached to a post at any time.

In all weather and under all conditions it will be efficient as a warning to the engineer.

This device is the invention of E. D. Hillman, Mechanical Engineer of the United States Metal & Manufacturing Company, New York, which is shortly to put the post on the market.

A Two-Cent Fare in Canada.

The Supreme Court of Canada has sustained the order of the Railway Commission made in July last directing the Grand Trunk Railway, as required by the terms of its charter, to run at least one train daily each way between Toronto and Montreal carrying passengers at a third class fare of 2 cents a mile.

Elaterite Car Roofing.

Elaterite car roofing consists of a solid body of elastic, non-drying "Elaterite" cement, reinforced in the middle with two layers of imported India burlap, and with an asphalt saturated wool-felt back. The top surface is finished with flake mica. It is put up in rolls of one square, 32 in. wide and 40 ft. long, or any length desired. No painting is required. The makers say that it is being used principally on western roads under severe conditions of torsion on curves and grades, where sudden, extreme changes in temperature occur and high winds and dry atmosphere prevail. An-

other advantage claimed is its resistance to fire. In lower altitudes and with greater humidity the results are correspondingly better. It is made by the Western Elaterite Roofing Co., Denver, Colo., whose product also includes high-grade roofings for roundhouses and for all other classes of railroad and general use; "Elaterite" paints for metal preservation and for heated surfaces; "Werco" cement for coating prepared roofing, and "Werco" waterproofing cement for masonry and concrete structures.

Driving It Home.

Bear in mind now that a stove factory in Atlanta made in 1906 over $47,000 of profits on an investment, as sworn to for taxation, of $46,475, and that Governor Smith tendered its president the position of railroad commissioner despite the fact that the legislature had disqualified him because he belonged to an association which raised the prices of stoves on the consumer. Bear in mind that a spring bed factory in Atlanta made in 1906 a profit of $41,000, on an investment, as sworn to for taxation, of $30,000, and that Governor Smith appointed its president a member of his staff. Bear in mind that he appointed to the position of railroad commissioner another gentleman who was the leading spirit in building and operating a cotton factory in La Grange which, in four years, on an investment of $251,000, made $370,000. Bear in mind that a great portion of the profits of the above three factories were secured by raising the prices of their products after the freight rates were reduced. And then read again Candidate Hoke Smith's declaration that "5 per cent. is a handsome return" for those who invest their money in railroad stocks and bonds, and that if he were elected Governor he would bring down the railroad rates sufficiently to place the income of railroad stockholders on the 5 per cent. basis.—*Ex-R. R. Comm. Joseph M. Brown, in Augusta Chronicle.*

INTERSTATE COMMERCE COMMISSION RULINGS.

Distribution of Cars to Shippers—No Fixed Rule.

The California Fruit Growers' Exchange and others attacked the reasonableness of a regulation of the Southern Pacific to the effect that in time of car shortage cars will be furnished to the various shippers in proportion to the amount of fruit picked and actually in the packing houses at the time of the demand for cars. Prior to April, 1907, cars were distributed in proportion to the season's business done by the various shippers. This so-called "crop-holding rule" is still in force over the Atchison, but in the case of the Southern Pacific has been displaced by the "house rule" to which objection is taken.

The Commission declares that the situation as described cannot be adequately covered by any fixed, inelastic regulation. Although the crop-holding rule appears to work more perfectly to the satisfaction of shippers and carriers, nevertheless the house rule does not appear to be unduly discriminatory. The complaint was dismissed.

Refusal to Reduce Transcontinental Rates.

In an opinion by Commissioner Clark in the case of the Railroad Commission of Oregon against the Chicago & Alton and others, the Commission has refused to make a low rate from the East to Oregon to compete with rates from California. The complainant asked for a reduction in the rates on denatured alcohol to Oregon points. These rates are already low. Denatured alcohol is manufactured in California and is sold in the north Pacific coast cities at a price which could be met by the eastern product only by reducing the transportation charges to nothing. An effort to place denatured alcohol on a parity with proof spirits would lead either to a large increase in the charges on the proof spirits of a practical wiping out of the charges on the denatured article.

Such increase in the charges on the proof spirits, in the opinion of the Commission, probably would render futile all effort to compete with the California product. The rates complained of were not shown to be unreasonable, unduly discriminatory or unjustly prejudicial. The Commission therefore dismissed the petition.

Private Siding Connection Ordered.

The Commission also, in an opinion rendered by Commissioner Prouty, announced its decision in the case of the McRae Terminal Railway, McRae, Ga., against the Southern and the Seaboard Air Line. This is a supplemental report involving the installation of a connecting track. The Commission decided that the complainant's application for physical connection to its line should be allowed as to the Seaboard Air Line, but not as to the Southern.

In its former report of this case the Commission left details to be agreed on, but no agreement could be reached and a further hearing was had. It is ordered that the Seaboard Air Line shall construct, by January 25, and maintain and operate for two years a "switch connection." • • • The switch used shall be of the value of not less than $50, rails 60-lb. and ties similar to those in a certain side-track near point of connection, but only on condition that by December 20 the McRae Terminal shall pay the Seaboard Air Line $150.

Minimum Carload Rates.

The Commission has announced its decision in the case of the Pacific Purchasing Company against the Chicago & North-Western and others. Complainant ordered several carloads of brass bedsteads to be delivered at Los Angeles from Kenosha, Wis. The initial road was unable to furnish a single car which would hold the minimum weight of brass beds provided for in the tariffs and instead thereof provided two small cars and this resulted in an excess charge of 55 cents per 100 lbs. The Commission holds that the complainant should be awarded reparation. Where three connecting roads publish a joint tariff under which they hold themselves out to the public as prepared to transport commodities in carload lots of a certain minimum magnitude at a certain specified rate such carriers are by their tariff allowed to charge no more than the rate on such carload no matter what cars they may provide for its transportation except as the tariff in specific terms provides certain minimum weights for carloads in cars of certain lengths or capacity.

Penalty for Misrouting—Innocent Carrier Forbidden to Participate

In an opinion by Commissioner Clements the Commission has ordered reparation in the case of the Hennepin Paper Company against the Northern Pacific and the Oregon Short Line, six carloads of paper having been misrouted by the carriers. The Commission says: It is the duty of a carrier, in the absence of routing instructions to the contrary, to forward shipments, having due regard to the interests of the shipper, ordinarily by that reasonable and practicable route over which the lowest charge for the transportation applies; and damage resulting to a shipper from a disregard of this obligation by the carrier can only be repaired by reparation to the extent of the difference between the higher rate applied over the line by which the traffic improperly moved and the lower rate which would have been applied had the freight been properly forwarded.

To require reparation in such a case is only to require the carrier to make just compensation for injury resulting from failure to perform its duty; but to require or permit any other carrier than the one responsible for the misrouting to participate in the making of such reparation would be to permit or require departure from established rates, which is expressly forbidden by law.

Trouble With Low Rates from Crowder City.

In an opinion by Commissioner Clark the Commission has decided 11 cases, most of them against the Missouri, Kansas & Texas concerning a special low rate made on live stock from Crowder City, Ind. T., to Kansas City. The rate was made temporarily, and because of competition, and the complainants ask to have the same reduction made on shipments which were made by themselves from points farther away than Crowder City. If they had paid local rates to that point and then shipped at the special reduced rate from there to Kansas City their total bill would have been smaller than at the regular through rate. The Commission, however, dismissed the complaints, holding that while a through rate that is higher than the sum of the local rates between the same points is prima facie unreasonable, it cannot be reduced to equal such sum of locals except through lawful change in tariff.

The Commission also held that a specific through rate is the lawful rate for a through shipment, even though some combination of rates may make lower, and carrier may not charge the higher through rate upon one shipment and the lower combination rate upon another shipment of the same kind between the same points at the same time.

The Commission further held from the facts disclosed in the record that while a shipper may consign his shipment to a given point, pay charges on same, assume custody and take possession of the property, and, later, reship to another point under rates lawfully applicable to such reshipment, neither a carrier nor an agent of a carrier may act as forwarding or reconsigning agent for a shipper in such manner as to evade or defeat the terms or intent or purpose of the law, and that as no complaint is made against the reasonableness of the specific through rates the demand for reparation is denied and the cases are dismissed.

TRADE CATALOGUES.

Eastward Through the Storied Northwest.—This booklet, which was written by Olin D. Wheeler, contains a description of the places and regions through which the traveler passes on an eastward trip from California over the Shasta Route of the Southern Pacific from San Francisco north to Portland, thence over the Northern Pacific from Portland, through Tacoma, Seattle and Spokane to Minneapolis and St. Paul, including a side trip to Yellowstone Park. There are many interesting photographs showing the mountains, the cities and the country traversed. One of the most striking shows a wall apparently 8 or 10 feet high of California geraniums, another a coasting party descending a glacier on Mt. Hood, and a third a sheep range in Montana. There are several photographs of the Columbia river, which the Northern Pacific will traverse on completion of the Portland & Seattle. On the outside cover are yellow California poppies. The book is issued by the passenger department of the Northern Pacific and contains a clear map of transcontinental territory with the route of the trip shown in heavy lines. It is an example of the best in railroad advertising.

Station Indicators.—The Boynton Indicator Co., Bridgeport, Conn., has issued a pamphlet describing its 1908 models of indicators used for showing in large stations the time and destination of departing trains. This company now makes three styles, the Terminal Sr., the Terminal Jr. and the Local. Patents have been applied for on improvements which are embodied in the 1908 models. In the largest indicators 216 station names can be displayed. In one style it is possible to show 25 station names. The Boynton indicators have been in service for 25 years and the pamphlet gives the names of a number of important roads to which they have been furnished.

Electric Locomotives.—Bulletin No. 4537, of the General Electric Company, Schenectady, N. Y., deals with electric locomotives in heavy passenger and freight work. The points taken up are: rating and capacity, motor cooling by forced ventilation, efficiency, maintenance, annual mileage and mechanical construction. An interesting table gives data on typical machines built by the company since 1894, showing the operating voltage, horse-power, maximum tractive effort, etc. The rest of the pamphlet consists of drawings and important figures and charts showing speed, horse-power and tractive effort of 11 engines in weight from 17 tons to 150 tons.

Santa Fe Employees' Magazine.—The second volume begins with the December number. This magazine appears to be growing in size and excellence. A history of the motive power of the Santa Fe constitutes the leading article. A Christmas at the Grand Canyon is an entertaining account, by Sharlot M. Hall, of a Christmas spent at this wonderful place in wilderness days, reprinted from *Out West*. Teamwork-Mail Department, The Gospel of Safety, The Alleged Rebate Case, Reporting Engine Failures, The "Thrack" Department, and Air-Brake Department are shorter articles.

New Orleans, the Gulf Coast and Florida.—The passenger department of the Louisville & Nashville publishes an exceedingly interesting and attractive pamphlet which contains descriptions and half-tone reproductions of New Orleans and the towns along the Gulf. The Mississippi Sound winter resorts are comparatively little known, and the illustrations in the pamphlet help convey an idea of their quaint charm.

Tie Plates.—"Economy" tie plates are shown in an 8½-in. x 11-in., 12-page pamphlet issued by the Spencer Otis Co., Chicago. There are eight styles, all of rolled steel. They differ in the style of ribbing or of corrugations on top, in the number and direction of flanges on the bottom, and in the presence or absence of shoulders. Suggestions for punching the different styles are made.

Mexico-St. Louis Special.—This semi-weekly solid through Pullman train between St. Louis and the City of Mexico is being advertised by a mailing card giving briefly the route, schedule and other facts. The interested lines are the St. Louis, Iron Mountain & Southern, the Texas & Pacific, the International & Great Northern and the National Lines of Mexico.

"Universal" Portland Cement.—Bulletin 43 of the Universal Portland Cement Co., Chicago, shows a number of important engineering works or structures in which this cement is used.

MANUFACTURING AND BUSINESS.

The Jeffrey Manufacturing Co., Columbus, Ohio, has opened a branch office at 924-925 Pierce building, St. Louis, Mo.

The Wisconsin Engine Co. Corliss, Wis., has been awarded the contract for a 20,000,000-gal. pumping engine by the city of Atlanta, Ga.

J. P. Jackson, Professor of Electrical Engineering at the Pennsylvania State College, has been appointed Dean of the School of Engineering of the college.

At a meeting on December 18 the directors of the New York Air Brake Co., New York, decided to defer action on the quarterly dividend, which has been 2 per cent. since 1899.

The Dominion Iron & Steel Company, Montreal, Que., has acquired control of the Cumberland Railway & Coal Company, which owns coal deposits said to amount to 150,000,000 tons.

The Westinghouse Air-Brake Co., Pittsburgh, Pa., has declared the usual quarterly dividends of 2½ per cent. regular and 2½ per cent. extra on the $11,000,000 capital stock. At the same time a stock dividend of 25 per cent. will be distributed.

The San Francisco, Cal., office and storeroom of the Independent Pneumatic Tool Co., Chicago, has been moved from 11 Front street to larger quarters at 61 Fremont street, where a full line of Thor pneumatic tools and parts will be carried in stock.

The Westinghouse Electric & Manufacturing Co., Pittsburgh, Pa., has been given the contract for electrifying a standard gage road running from El Ora, Mex., to mines nearby. The road will be operated by electric locomotives built by the Westinghouse company and the Baldwin Locomotive Works.

W. M. Lalor, Electrical Engineer and Assistant to Vice-President Dickinson, of the Bliss Electric Car Lighting Co., Milwaukee, Wis., has gone to Chili to supervise the installation of a number of Bliss axle light equipments to new passenger cars of the Chilian State Railroads and to secure additional business in South American countries.

The works of the Weston Electrical Instrument Co., Waverly Park, Newark, N. J., will be shut down from December 21, 1907, to January 2, 1908, for the annual stock taking and repairs to plant. Part of the office and shipping departments will, however, remain in operation and therefore urgent orders for standard goods can be promptly shipped during this period.

The Pantasote Co., New York, is putting on the market its new Agosote car head lining. This head lining is now made in England, but the company expects soon to be able to supply all orders from the products of its own mill in this country. It is made in sheets ⅛ in., 3/16 in. and ¼ in. thick, and is furnished shaped to conform to the curves of the upper and lower decks.

S. W. Midgley, formerly General Sales Representative of the National Car Coupler Co., Chicago, has been made Western Representative of the Curtain Supply Co., Chicago, with headquarters in Chicago. Mr. Midgley succeeds R. F. Hayes, who takes charge of the New York office, with the title of Eastern Manager, succeeding A. L. Whipple, who recently resigned to go to another company.

McCarthy racks, made by the Rostand Manufacturing Co., Milford, Conn., have been specified for the 100 coaches being built for the New York, New Haven & Hartford by the Bradley Car Works; the 20 coaches for the Boston & Maine being built by the Laconia Car Co.; the 25 coaches for the Chicago & North-Western being built by the Pullman Co., and the 30 coaches for the Central of New Jersey being built by Harlan & Hollingsworth. The company built a new factory at Milford about two years ago and since removal there from New Haven several additions to the new plant have been made. About a year ago a brass foundry was added. This branch of the business has also increased so rapidly as to require recent enlargement in facilities.

H. W. Clapp, special representative of the railroad engineering and construction departments of the General Electric Company, Schenectady, N. Y., is about to go to San Francisco, having been appointed to an office in the electrical department of the Southern Pacific. An informal luncheon was given him at the Engineers' Club, New York, on December 14, by officers of the General Electric Company, the New York Central & Hudson River, the Interborough Rapid Transit, the New York City Railway and members and officers of several engineering firms and supply companies. During the five and one-half years he has spent in New York, Mr. Clapp has been particularly concerned with the installation and operation of rolling stock for the electrified part of the New York Central, and the cars for the Interborough Rapid Transit. He also equipped the cars for the West Jersey & Seashore. He is a son of F. Boardman Clapp, Managing Director of the Melbourne (Australia) Tramway & Omnibus Co. Before coming to America Mr. Clapp was for four years Superintendent of Motive Power of the Brisbane Tramway Co., Brisbane, Australia.

Iron and Steel.

No large new orders of rails for 1908 delivery have yet been announced, although it is understood that negotiations are actively under way for a large tonnage. The Pennsylvania has replaced

orders for about 15,000 tons of rails the orders for which had been postponed. It is understood that this order was divided among a number of companies. The rails are to be made according to the Pennsylvania's new specifications which are about the same as those recommended by the American Society of Civil Engineers. The Union Pacific is said to have re-entered an order for 35,000 tons for which reservation had been made and it is understood that the Erie is in the market for 35,000 tons.

OBITUARY NOTICES.

Lord Kelvin died in Glasgow, Scotland, on December 17 after several weeks illness.

Luman F. Parker, General Solicitor of the St. Louis & San Francisco, died last Monday.

M. Hopkins, President and General Manager of the South Side Elevated Railroad, Chicago, died Dec. 7 of pneumonia. Prior to his connection with the elevated railroad he was with the Chicago & North-Western for 30 years, starting as brakeman in 1863 and working up to Superintendent of the Iowa division. He resigned this position in 1893 and became General Manager of the Chicago & South Side Rapid Transit Railroad the same year. The following year he was made President and continued as such until October, 1895, when he was appointed Receiver of the property. At the termination of the receivership he was made General Manager of the reorganized company, and in January, 1907, was elected also President. He was 63 years old.

MEETINGS AND ANNOUNCEMENTS.

(For dates of conventions and regular meetings of railroad conventions and engineering societies, etc., see advertising page 24.)

New York Railroad Club.

The next meeting of the New York Railroad Club will be held at the building of the Engineering Societies, 29 West 39th street, December 20. Instead of the usual paper, there will be a smoker, vaudeville entertainment and luncheon.

ELECTIONS AND APPOINTMENTS.

Executive, Financial and Legal Officers.

Georgia & Florida.—J. M. Wilkinson has been elected Third Vice-President.

Lehigh & New England.—W. A. Lathrop, President of the Lehigh Coal & Navigation Company and Vice-President of the Lehigh & New England, has been elected President of the Lehigh & New England, succeeding W. J. Turner, who will become Vice-President and General Counsel.

New York, New Haven & Hartford.—C. F. Choate has resigned from the Board of Directors.

Pere Marquette.—William Cotter, General Manager, has been elected President. The temporary Board of Directors of the reorganized company is as follows: George W. Perkins, H. F. Shoemaker, George W. Young, W. T. Cross, E. H. Harriman, Charles Steele, F. D. Underwood, G. A. Richardson, George F. Baker, Norman B. Ream, J. G. McCullough, Walter H. Horn, Allen Wardwell and Thomas W. Joyce, all of New York, and Frederick W. Stevens, of Detroit.

Portland & Seattle.—F. B. Clarke, formerly Traffic Manager of the Great Northern, has been appointed Assistant to the President of the Portland & Seattle.

Pullman Company.—George F. Brown, Treasurer, has been retired on pension after 36 years of service. K. Demmler, Assistant Secretary and Assistant Treasurer, succeeds Mr. Brown. C. S. Sweet, Secretary to the President, has been made Assistant to the President. R. C. Kelly has been appointed Assistant Treasurer. Mr. Brown began work with the company in 1871 as Assistant to the General Superintendent, following four years in railroad service as Secretary and Treasurer to the Receiver of the Memphis, Clarksville & Louisville, now part of the Louisville & Nashville, and then as agent in the freight department of the Illinois Central. He was successively Acting General Superintendent, General Superintendent and General Manager of the Pullman Company, and of late years he has been Treasurer. He is 64 years old.

Silver Peak.—The officers of this company are as follows: President, G. T. Oliver, and Vice-President, William Flinn, both with office at Pittsburgh, Pa. General Manager, M. L. Effinger, and General Freight and Passenger Agent, F. L. Voorhees, both with office at Blair, Nev. The road is 18 miles long, connecting with the Tonopah & Goldfield at Blair Junction.

Operating Officers.

Ann Arbor.—W. F. Bradley, Superintendent at Toledo, Ohio, has resigned.

Ashland & Western.—E. D. Taylor has been appointed General Manager.

Chicago & North Western.—See Peoria & Pekin Union.

Halifax & Southwestern.—James Bain, Superintendent of the Quebec & Lake St. John, has been appointed Superintendent of the Halifax & Southwestern with office at Bridgewater, N. S.

Lehigh Valley.—W. W. Abbott has been appointed Trainmaster at Jersey City, N. J., succeeding G. W. Hardcastle, resigned.

New York, New Haven & Hartford.—A. R. Horn, Assistant Superintendent of the Western division, has been appointed Assistant Superintendent of the New York division, succeeding Andrew Ross, transferred to the Harlem River terminal.

John B. Gallery, general yardmaster of the Northern Pacific at Duluth, Minn., has been appointed Assistant Superintendent of the Western division of the New York, New Haven & Hartford, with office at Providence, R. I.

Northern Alabama.—O. K. Cameron, chief train despatcher of the Memphis division of the Southern, has been appointed Trainmaster of the Northern Alabama, with office at Sheffield, Ala., succeeding J. Y. Hill, promoted. See Southern under engineering and rolling stock officers.

Pan-American.—H. A. McCulloch, Assistant General Manager, has resigned to become General Manager of the Guayaquil & Quito in Peru.

Peoria & Pekin Union.—R. H. Johnson, Superintendent of Freight Terminals of the Chicago & North-Western at Chicago, has been appointed General Manager of the Peoria & Pekin Union.

Quebec & Lake St. John.—See Halifax & Southwestern.

Southern.—R. E. Simpson, Superintendent of the Spartanburg division, has been appointed Superintendent of the Asheville division, with office at Asheville, N. C., succeeding A. Ramseur, resigned. The Spartanburg division will hereafter be operated as part of the Columbia division, of which H. A. Williams is Superintendent, with office at Columbia, S. C.

G. A. Bradley, Trainmaster at Atlanta, Ga., has been appointed Superintendent of Terminals at that place, succeeding W. M. Deuel, promoted.

Southern Pacific.—E. S. Luty, Trainmaster at Ogden, Utah, has been appointed Trainmaster of the First district, including Ogden yard, of the Salt Lake division of the Lines East of Sparks, with office at Ogden, Utah. John McCarty, Trainmaster at Mina, Nev., has been appointed Trainmaster of the Second district, including the Montello and Carlin yards, with office at Montello, Nev. B. A. Campbell, Trainmaster at Sparks, Nev., has been appointed Trainmaster of the Third and Fourth districts, including the Winnemucca, Hazen and Sparks yards, with office at Winnemucca, Nev. The office of Trainmaster at Mina, with authority over the Sixth, Seventh and Eighth districts, is now vacant.

Traffic Officers.

Chicago & Alton.—W. L. Ross, General Freight and Passenger Agent of the Toledo, St. Louis & Western, has been appointed General Traffic Manager of that road and of the Chicago & Alton. The authority of George J. Charlton, General Passenger and Ticket Agent of the Alton, and of C. A. King, General Freight Agent of the Alton, has been extended over the Toledo, St. Louis & Western.

Chicago, Rock Island & Pacific.—H. S. Ray, Assistant General Passenger Agent at St. Louis, has been transferred to the Chicago office, in charge of the Advertising Department, and his former office has been abolished, effective January 1. G. B. Albright, Assistant General Freight Agent at St. Louis, has been appointed Assistant General Freight Agent at Kansas City, Mo., succeeding K. M. Wharry, resigned to go to the Missouri Pacific. The authority of H. H. Embery, General Freight Agent of the lines west of Missouri, has been extended to cover the line from Kansas City, Mo., to St. Louis.

International & Great Northern.—George D. Hunter, Assistant General Passenger and Ticket Agent, has been appointed General Eastern Freight and Passenger Agent, with office at New York. R. E. Lee, chief clerk in the passenger department, succeeds Mr. Hunter, with office at Palestine, Tex.

Oregon Short Line.—E. E. Buckingham, General Superintendent,

has resigned to become General Manager of the South Omaha stock yards.

San Pedro, Los Angeles & Salt Lake.—Allen Walbauer, General Agent of the freight and passenger departments at Pittsburgh, Pa., has resigned, effective January 1.

Toledo, St. Louis & Western.—See Chicago & Alton.

Engineering and Rolling Stock Officers.

Canadian Northern.—G. S. McKinnon has been appointed Assistant Master Mechanic, with office at Winnipeg, Man.

Duluth & Iron Range.—Wayne A. Clark, Assistant Engineer, has been appointed Chief Engineer, succeeding Robert Angst, deceased.

Manistee & Northeastern.—E. H. O'Neil has been appointed to the new office of Assistant to the General Superintendent.

New York Central & Hudson River.—F. E. Paradis has been appointed to the new office of Engineer of the Western district, with office at Buffalo, N. Y., in charge of new construction west of Minoa, N. Y. B. A. Cunningham and F. F. Gordon have been appointed Assistant District Engineers at Buffalo, and D. K. Van Ingam, Assistant District Engineer at Syracuse. A. M. Holcomb, Resident Engineer at Syracuse, has been appointed Engineer of the Eastern district, in charge of the construction between Minoa and Richland, with office at Albany. R. P. Horton and R. E. Dougherty have been appointed Assistant Engineers of the Eastern district. Mr. Paradis and Mr. Holcomb will report to F. B. Freeman, Engineer of Construction, whose office is at New York. The appointments are effective January 1.

Southern.—J. Y. Hill, Trainmaster of the Northern Alabama, has been appointed Engineer of Maintenance of Way of the Southern, with office at Birmingham, Ala.

Special Officers.

Pennsylvania.—Ivy L. Lee, of the firm of Parker & Lee, New York, who have been acting as publicity agents of the Pennsylvania and other roads, is to go to the Pennsylvania on January 1 in charge of similar work.

LOCOMOTIVE BUILDING.

L. J. Smith, Kansas City, Mo., has ordered two four-wheel (0-4-0) switching engines, cylinders 15 in. x 20 in., with both saddle tank and trailing tank, from the Davenport Locomotive Works. These locomotives are equipped with two 9½-in. Westinghouse pumps, one on each side, and special air capacity for both automatic and straight air-brakes, as well as for pneumatic dumping device for dump cars.

The Porto Rico Railway Company, through J. G. White & Co., New York, have ordered three 10-wheel (4-6-0) locomotives from the Baldwin Locomotive Works.

General Dimensions.

Weight, total	90,000 lbs.
Weight on drivers	80,000 "
Cylinders	17 in. x 22 in.
Diameter of drivers	44 in.
Boiler, type	Straight top
" diameter	54 in.
" steam pressure	160 lbs.
Heating surface, total	1,050 sq. ft.
Gage	1 meter.

The Tehuantepec National has ordered eight simple consolidation (2-8-0) oil burning locomotives from the Baldwin Locomotive Works.

General Dimensions.

Type of locomotive	Consolidation
Weight, total	134,000 lbs.
Weight, on drivers	118,000 "
Cylinders	20 in. x 26 in.
Diameter of drivers	56 in.
Boiler, type	Belpaire
" working steam pressure	180 lbs.
" heating surface, total	1,847 sq. ft.
" number of tubes	239
" diameter of tubes	2 in.
" length of tubes	13 ft. 8 in.
Firebox, length	107⅝ "
Firebox, width	33⅝ "
Grate area	21.94 sq. ft.
Tank capacity	4,000 gals.
Oil capacity	2,000 gals.

Special Equipment.

Air brakes	Westinghouse
Couplers	Janney
Headlights	Pyle National electric
Injector	Sellers
Journal bearings	Phosphor bronze
Piston rod packings	Swain
Valve rod packings	Swain
Safety valve	Crosby
Sanding devices	Leach
Sight-feed lubricators	Michigan
Steam gages	Ashcroft
Tires, driving wheel	Latrobe

The Toronto, Hamilton & Buffalo, as reported in the *Railroad Gazette* of November 1, has ordered one simple six-wheel switching (0-6-0) locomotive, one simple ten-wheel passenger (4-6-0) locomotive, and one simple ten-wheel freight (4-6-0) locomotive from the Montreal Locomotive & Machine Company for March, 1908, delivery. The specifications are as follows:

General Dimensions.

	10-wheel freight.	10-whl. passenger.	6-whl. switching.
Type of locomotive	10-wheel freight.	10-whl. passenger.	6-whl. switching.
Weight, total	246,000 lbs.	294,000 lbs.	135,000 lbs.
Weight on drivers	141,000 "	183,000 "	121,000 "
Diameter of drivers	69 in.	73 in.	51 in.
Cylinders	19 in. x 26 in.	20 in. x 26 in.	19 in. x 26 in.
Boiler, type	Ext. wagon top.	Ext. wagon top.	Straight top.
" wkg stm press.	200 lbs.	200 lbs.	180 lbs.
" number tubes	279	336	250
" material tubes	Diamond.	Nat'l Diamond,	Nat'l Diamond.
" diam. tubes	2 in.	2 in.	2 in.
" length tubes	14 ft.	15 ft. ½ in.	11 ft.
" staybolts		*	
Firebox, length	96 in.	102 in.	102 in.
" width	41 in.	65¼ in.	33 in.
" maker	Carnegie Steel Co.	Carnegie Steel Co.	Carnegie Steel Co.
" grate area	27.3 sq. ft.	46.0 sq. ft.	23.4 sq. ft.
Heating surface, total	2,157.0 sq. ft.	2,791.0 sq. ft.	1,620.0 sq. ft.
Tank capacity	5,000 gals.	5,500 gals.	3,500 gals.
Coal capacity	9 tons.	9 tons.	5 tons.

Special Equipment.

Air-brakes	Westinghouse.	Westinghouse.	Westinghouse also straight air.
Axles	Hammond open-hearth steel.	Nova Scotia Steel Co.	Nova Scotia Steel Co.
Balance valve		Richardson.	
Bell ringer	Gollmar.	Gollmar.	Simplicity.
Boiler lagging	Sect'nal magnesia.	Sect'nal magnesia.	Asbestos.
Brake-beams	Monarch.	Monarch.	Monarch.
Brake-shoes	American Brake-Shoe & Foundry Co.		
Couplers	Climax.	Climax.	Climax.
Headlight	Buffalo.	Buffalo.	Buffalo.
Injector	Nathan.	Nathan.	Nathan.
Journal bearings	Canadian bronze.	Canadian bronze.	Canadian bronze.
Piston rod packings	Hayden.	Hayden.	Hayden.
Valve gear		Walschaert.	
Valve rod packings	Hayden.	Hayden.	Hayden.
Safety valves	Hayden.	Hayden.	Hayden.
Sanding devices	Wilson.	Wilson.	Wilson.
Sight feed lubricators	Nathan.	Nathan.	Nathan.
Springs	Montreal St'l Wks.	Montreal Sp'g Co.	Montreal Sp'g Co.
Steam gages	Star.	Star.	Star.
Steam heat equipment		Gold.	

*Four rows flexible staybolts in breaking zone.

CAR BUILDING.

The New York, New Haven & Hartford has ordered 100 passenger coaches from the Bradley Car Works.

The Havana Central is said to have ordered fifty 36-ft. box cars of 60,000 lbs. capacity from the McGuire-Cummings Manufacturing Co. Up to the time of going to press we have not been able to confirm this item.

The Barrett Manufacturing Company, Chicago, is said to have ordered 40 tank cars of 60,000 lbs. capacity from the Cambria Steel Company. Up to the time of going to press we have not been able to confirm this item.

The Tehuantepec National is said to have ordered three baggage cars, two first class passenger cars and five third class passenger cars from the Pullman Company. Up to the time of going to press we have not been able to confirm this item.

The Boston & Maine, as reported in our advance sheet of December 11, has ordered 20 vestibule coaches from the Laconia Car Company for May and June, 1908, delivery. These cars will have a seating capacity for 72 passengers, will weigh 80,000 lbs., and will measure 59 ft. 2 in. long and 9 ft. wide, inside measurements, and 68 ft. 2½ in. long over coupling line, 10 ft. 2¼ in. wide over eaves and 14 ft. 4 in. high over all. The bodies and underframes will be of wood. The special equipment includes:

Bolsters	Commonwealth
Brake-beams	Buffalo
Brake-shoes	American Brake-Shoe & Foundry Co.
Brakes	Westinghouse
Brasses	Boston & Maine standard
Couplers	Tower
Curtain fixtures	Forsyth
Curtain material	Pantasote
Door fastenings	Boston & Maine standard
Doors	Boston & Maine standard
Draft rigging	Gould
Dust guards	Flexible
Heating system	Chicago-Vapor
Light	Pintsch
Paint	Boston & Maine standard
Platforms	Gould
Seats	Haywood Bros. & Wakefield Co., Boston
Trucks	Commonwealth, four-wheel
Vestibules	Gould
Wheels	Midvale-Allen

RAILROAD STRUCTURES.

Alexandria, La.—Local reports say that work will be begun this month on the union passenger station here.

Atlanta, Ga.—The Georgia Railway & Electric Company has asked permission to replace the present bridge over the Western & Atlantic with a new structure.

PORT ARTHUR, ONT.—The Canadian Pacific will probably build a new dock in front of its passenger station here next year.

PORT HURON, MICH.—The Grand Trunk shops here are to be enlarged.

WINNIPEG, MAN.—The Canadian Northern, it is said, is to put up a power house at Fort Rouge, to cost $25,000, and a foundry to cost $30,000.

RAILROAD CONSTRUCTION.

New Incorporations, Surveys, Etc.

ASHLAND & WESTERN.—See Lorain, Ashland & Southern.

BOSTON ELEVATED.—This company during the year built two miles of line from Guild street to a point near Forest Hills, Boston. Surveys are under way from Sullivan square, Charlestown, to Malden, about three miles.

BRITISH COLUMBIA (ELECTRIC).—This company, it is said, has bought the charter for a proposed electric line to run from Vancouver, B. C., south to Blaine, Wash., about 40 miles. This is to form part of a proposed electric line from Vancouver south to Seattle, Wash. R. H. Sperling, Superintendent, Vancouver, B. C.

CANADIAN NORTHERN.—The connecting line from Brandon, Man., via a point on the Hartney Junction-Virden line south of Virden west to Regina, Sask., 175 miles, was officially opened on December 11.

CANADIAN PACIFIC.—An extension of the Pheasant Hills branch is now in operation from Strassburg, Assin., north and west to Saskatoon. The Canadian Pacific therefore now has a line from Winnipeg, Man., west via Kirkella, Assin., to Saskatoon.

CANANEA, YAQUI RIVER & PACIFIC.—See Southern Pacific.

CHESAPEAKE & OHIO.—Contracts have been let to Carpenter, Frazier, Haley & Co., of Clifton Forge, Va., and work is now under way extending the Coal River Railway from Peytona, W. Va., northeast to Racine, two miles; Madison southeast to Laurel, 12 miles; Laurel, southeast to Sang, five miles, and a branch from Laurel northeast five miles.

CHICAGO, MILWAUKEE & ST. PAUL.—Work, it is said, has been started by this company elevating its tracks in the south side of Milwaukee. The cost of the improvements will be between $500,000 and $750,000.

CHICAGO, ROCK ISLAND & PACIFIC.—Reports from Colorado Springs say that this company is preparing to build into Denver. At present its trains reach that city over the Denver & Rio Grande and the Union Pacific, using the track of the Rio Grande between Denver and Pueblo, 119.60 miles, and over the U. P. between Denver and Limon, 89.78 miles. It is said that between Denver and Colorado Springs preliminary surveys have been made, although the officers of the company refuse to confirm the report. Options are being secured on land in Denver for terminal grounds.

COAL RIVER.—See Chesapeake & Ohio.

DENVER, NORTH-WESTERN & PACIFIC.—This road has been extended from Kremmling, Colo., west to Yarmony, 19.7 miles. Work is under way by Orman & Crook, of Denver, Colo., extending the road from Yarmony to Steamboat Springs, 68 miles. Steamboat Springs is about 340 miles from Salt Lake City. The road is now built from Denver, 147 miles west.

GEORGIA ROADS (ELECTRIC).—According to reports from Atlanta, a number of residents of that place in conjunction with R. F. Yoakum are planning an electric line from Atlanta south to Albany, 180 miles.

INDIANA ROADS.—A number of St. Louis and eastern capitalists are planning to build a through line from Terre Haute, Ind., southwest via Chester, Ill., to a point in Missouri, 100 miles west of Chester, about 285 miles, through an oil and fruit and coal section in Illinois. The plans include securing control of existing lines from Mount Vernon, Ill., southwest to Chester, about 60 miles, also a line in Missouri about 60 miles long, and to build 125 miles from Mount Vernon northeast to Terre Haute, and about 40 miles in Missouri.

INDUSTRIAL OF LORAIN.—See Lorain, Ashland & Southern.

INTERBOROUGH RAPID TRANSIT (NEW YORK CITY).—This company during the past year, on its subway division, has added .375 miles of new line, from 221st street to 230th street, on Broadway. The company has under construction 3.51 miles, as follows: from 230th street on the Broadway division to Van Cortland Park, one mile; from Bowling Green in the Borough of Manhattan to Atlantic avenue in the Borough of Brooklyn, 2.51 miles. The work is being done by the Rapid Transit Subway Construction Company.

LORAIN & ASHLAND.—See Lorain, Ashland & Southern.

LORAIN, ASHLAND & SOUTHERN.—The Lorain & Ashland organized by Joseph Ramsey, Jr., and associates to build a line from Lorain, Ohio, south via Wellington to the Ohio river, of which 22 miles from Lorain was finished last year, is said to have secured control of the Ashland & Western, operating a road from Ashland, Ohio, southeast to Custaloga, 25 miles. This road is to be consolidated with the Industrial Railroad of Lorain and the Lorain & Ashland under the name of the Lorain, Ashland & Southern. The consolidated company will have $3,000,000 capital. About $1,000,000 is to be spent in extensions, terminals and equipment next spring. The new line is to form part of the proposed line from Lorain south to the Ohio river. (Oct. 4, p. 403.)

LOS ANGELES & REDONDO (ELECTRIC).—This company, which was formerly a steam railroad, during the last year has built 8.64 miles of road, as follows: from 48th street and Gardiner division to Arlington avenue, 1.74 miles; from Los Angeles to Strawberry Park, 6.9 miles.

MANISTIQUE RAILWAY.—This company, which operates 52 miles of railroad in Michigan, has during the past year added 32 miles of sidings and spurs.

MEXICAN-PACIFIC COAST.—See Southern Pacific.

MINNEAPOLIS & RAINY RIVER.—This company is building with its own forces an extension from Big Fork, Minn., north to Second Crossing, 11½ miles. Grading is finished for 9.2 miles.

MINNEAPOLIS, ST. PAUL & SAULT STE. MARIE.—Work is under way by Foley Bros., Larsen & Co., on the extension from Brooten, Minn., north to Duluth, 189 miles.

MINNESOTA TRANSFER RAILWAY.—This company, operating a terminal switching road of 67 miles for railroads entering St. Paul and Minneapolis, during the year added 11.89 miles of side tracks.

MORGAN'S LOUISIANA & TEXAS.—See Southern Pacific.

NEBRASKA, KANSAS & SOUTHERN.—Surveys are reported made by this company from Stockton, Kan., southwest to Garden City, 165 miles. Rights of way have been secured in Finney and Hodgeman counties and work will shortly be started in Ness county. Surveys are to be continued northeast to Superior, Neb., 80 miles. Construction work will be started on this end of the line when work is well under way on the section from Stockton to Garden City. F. T. Burnham, Secretary, Beloit, Kan. See Nebraska, Kansas & Southwestern. (March 15, p. 387.)

PACIFIC & IDAHO NORTHERN.—Surveys are being made for an extension from Evergreen, Idaho, east to Roseberry, 35 miles.

PORTLAND & SEATTLE.—Contract let to Siems & Shields, of St. Paul, Minn., for building a 10-mile section of this road from Vancouver, Wash., south to Portland, Ore. Work is now under way.

PORT SIMPSON & SKEENA RIVER.—Under this name a company is being formed by Colonel C. J. Prior, of Victoria, B. C., and associates to build a line from Port Simpson, B. C., east to a point on the Skeena river, about 200 miles.

SOUTHERN PACIFIC.—Morgan's Louisiana & Texas is building from Lafayette, La., to Baton Rouge, 52 miles; from Eunice to Mammau, 10 miles, and from Bayou Sale to South Bend, 10 miles.

An officer of the Cananea, Yaqui River & Pacific writes that this company during the year built about 102 miles in Sonora. Work is now under way from Cumuripa, Sonora, north to the international boundary, 345 miles; from a point on the Naco-Cananea line at Del Rio, Sonora, northwest to Nogales, 75 miles, and from Nacozari, Sonora, south to Rio Yaqui, 108 miles.

The Mexican-Pacific Coast Railway under a concession granted this company is building from San Blas, Sinaloa, southeast to Guadalajara, 650 miles.

The new double-track Bay Shore cut-off has been formally opened. The new line runs from San Bruno, Cal., north to San Francisco, 9.84 miles, and has easy grades.

WABASH.—This company has completed work changing the alinement and grading on its line over the Sangamon river east of Decatur, Ill., and the second-track has been put in use. The work, which was very heavy, included a fill requiring the moving of 700,000 cu. yards of earth; also a concrete bridge 654 ft. long and 84 ft. high with four arches. This work is part of the plan to double-track the entire line between St. Louis and Chicago.

RAILROAD CORPORATION NEWS.

ATLANTIC COAST LINE.—The directors have declared the regular semi-annual dividend of 3 per cent. on the $47,537,600 outstanding common stock. The dividend will be paid in certificates of indebtedness bearing 4 per cent. interest. Each holder of 33⅓ shares of common stock will receive $100 in 4 per cent. cer-

tificates of indebtedness. Non-interest-bearing certificates will be issued in fractional amounts, which will be exchangeable for 4 per cent. certificates of indebtedness when presented at the Safe Deposit & Trust Co. of Baltimore in amounts of $100. The trust company will, if notified before January 6, buy fractional amounts only, at 75 per cent. of their face value, or will sell at the same price sufficient fractional amounts to make up the required amount of $100.

Chicago, Peoria & St. Louis.—The July, 1907, interest on the $2,000,000 consolidated mortgage 5 per cent. 30-year bonds was paid on December 10. The two preceding semi-annual interest payments were similarly delayed.

Lake Erie & Western.—A dividend of 1 per cent. on the $11,840,000 6 per cent. non-cumulative preferred stock has been declared payable January 15, 1908. The company has been paying 3 per cent. annually on this stock for the last four years, paying 2 per cent. in January and 1 per cent. in July.

The income results, partly estimated, of the Lake Erie & Western, including the Northern Ohio, for the year ending December 31, 1907, are given below:

	Year Ending Dec. 31, 1907.		
Earnings	$5,112,400	Dec.	$100,400
Expenses (75.53 per cent.)	3,861,500	Inc.	1,200
Net earnings	$1,250,900	Dec.	$101,600
Other income	5,900	"	5,800
Gross income	$1,256,800	"	$107,400
First charges and taxes	975,200	"	25,300
Available for dividend	$281,600	"	$81,500
Dividend (2 per cent.)	236,800	"	118,400
Surplus.	$44,800	Inc.	$36,900

Lake Shore & Michigan Southern.—The regular semi-annual dividend of 6 per cent. and an extra dividend of 2 per cent. on the $49,466,500 stock have been declared, payable January 29.

The following are the income results, partly estimated, for the six months and the year ended December 31, 1907:

	Six Months Ending Dec. 31, 1907.		
Earnings	$23,428,700	Inc.	$1,491,400
Expenses (76.24 per cent.)	17,861,900	"	1,597,200
Net earnings	$5,566,800	Dec.	$105,800
Other income	3,150,000	Inc.	646,500
Gross income	$8,716,800	"	$540,700

First charges and taxes	1,351,200	"	391,700
Available for dividend	$1,618,300	"	630,500
Dividend (6 per cent.)	$1,124,200		
Extra dividend (2 per cent.)	374,800		
	1,499,000	"	562,100
Surplus	$119,300	Inc.	$68,100

Chicago, Rock Island & Pacific.—A quarterly dividend of 1 per cent. on the $74,854,100 capital stock has been declared payable January 2, 1908. In 1907 5½ per cent. was paid, in 1906 6 per cent., in 1905 6¼ per cent., and in 1904 8¼ per cent.

Illinois Central.—Arguments were heard this week before Judge Bull in the Superior Court of Illinois on dissolving the injunction preventing the voting of the Illinois Central held by the Railroad Securities Company and the Union Pacific. It was announced that Stuyvesant Fish has been given proxies for $180,500 of Illinois Central stock held by the Rothschilds.

New York Central & Hudson River.—The general balance sheet, as of September 30, 1907, shows loans and bills payable of $25,192,000, as compared with $8,154,000 at the same time in 1906, while in 1905 and in 1904 the amount was less than $3,000,000. The $25,000,000 three-year notes issued February 1, 1907, are probably included under this head. The special improvement fund was $1,282,488, which compares with $881,720 last year. The cost of road and equipment is given as $214,369,326, an increase of $11,914,431, and securities owned, $154,596,380, an increase of $4,733,654. The bonded debt remains the same while the capital stock outstanding amounts to $178,632,000, as compared with $149,197,800 last year. The surplus on hand was $14,707,483, a decrease of $2,140,979.

The following are statements of the income account, partly estimated, for the quarter and the year ending December 31, 1907:

	Quarter Ending Dec. 31, 1907.		
Earnings	$24,712,500	Inc.	$284,900
Expenses (79.49 per cent.)	19,644,600	"	1,452,700
Net earnings	$5,067,900	Dec.	$1,167,800
Other income	3,841,400	Inc.	948,700
Gross income	$8,909,300	Dec.	$219,100
First charges and taxes	5,944,900	"	47,100
Available for dividend	$2,964,400	"	$172,000
Dividend (1.50 per cent.)	2,679,500	Inc.	441,500
Surplus.	$284,900	Dec.	$613,500
	Year Ending Dec. 31, 1907.		
Earnings	$98,713,200	Inc.	$6,623,400
Expense (76.61 per cent.)	75,624,700	"	9,362,700
Net earnings	$23,088,500	Dec.	$2,739,300
Other income	11,276,000	Inc.	3,568,300
Gross income	$34,364,500	"	$829,000
First charges and taxes	23,318,300	"	750,400
Available for dividend	$11,046,200	"	$78,600
Dividend (6 per cent.)	16,717,900	"	2,885,000
Surplus.	$328,300	Dec.	$2,806,400

Norfolk & Southern.—This company, it is said, has sold $700,000 three-year 6 per cent. collateral trust notes dated October 1, 1907, and due November 1, 1910, subject to call on any interest day at 102½ and interest, being part of an authorized issue of $2,750,000. It is also said that a syndicate has agreed to take $1,000,000 more of these notes. The issue is secured on $1,000,000 first mortgage bonds; $2,040,000 first general mortgage bonds, and $1,200,000 10-year 5 per cent. equipment trust notes.

North American Company.—This company, through a subsidiary, has bought the Laclede Power Company and the Edison Electric & Illuminating Company, both of St. Louis, Mo. The North American Company now controls all the light, power and street railway companies of St. Louis.

Northern Pacific.—With an increase of 11 miles operated, freight earnings on the Northern Pacific (main system) decreased 1.3 per cent. in the month of October, as compared with October, 1906. Mail and express earnings decreased 15.8 per cent. Passenger earnings increased 15.9 per cent., and gross earnings, 2.2 per cent.

Pennsylvania.—See Pennsylvania Company.

Pennsylvania Company.—A semi-annual dividend of 4 per cent. on the $60,000,000 stock has been declared, payable December 31, making 7 per cent. for the year. In 1906, 6 per cent. was paid, and in 1905 and 1904, 5 per cent. The company controls the Pennsylvania Lines West of Pittsburgh and operates the Northwest System. All its stock is owned by the Pennsylvania Railroad.

St. Louis, Rocky Mountain & Pacific.—The semi-annual interest on the $7,000,000 5 per cent. first mortgage bonds of 1955, which is due on January 2, will be paid on and after December 20.

Southern Pacific.—In October the gross revenue of the Southern Pacific Company was $1,200,000 larger than in the corresponding month a year ago. Operating expenses and taxes increased $2,600,000, so that there was a decrease in net revenue of $1,400,000. In the four months ended October 31, gross revenue was $7,000,000 larger, and net $2,200,000 smaller than in the same period in 1906.

RAILROAD GAZETTE

ESTABLISHED IN APRIL, 1856.

PUBLISHED EVERY FRIDAY BY THE RAILROAD GAZETTE AT 83 FULTON STREET, NEW YORK
BRANCH OFFICES AT 870 OLD COLONY BUILDING CHICAGO, AND QUEEN ANNE'S CHAMBERS WESTMINSTER, LONDON

EDITORIAL ANNOUNCEMENTS.

THE BRITISH AND EASTERN CONTINENTS edition of the Railroad Gazette is published each Friday at Queen Anne's Chambers, Westminster, London. It contains selected reading pages from the Railroad Gazette, together with additional British and foreign matter, and is issued under the name Railway Gazette.

CONTRIBUTIONS—Subscribers and others will materially assist in making our news accurate and complete if they will send early information of events which take place under their observation. Discussions of subjects pertaining to all departments of railroad business by men practically acquainted with them are especially desired.

ADVERTISEMENTS.—We wish it distinctly understood that we will entertain no proposition to publish anything in this journal for pay, EXCEPT IN THE ADVERTISING COLUMNS. We give in our editorial columns OUR OWN opinions, and these only, and in our news columns present only such matter as we consider interesting and important to our readers. Those who wish to recommend their inventions, machinery, supplies, financial schemes, etc., to our readers, can do so fully in our advertising columns, but it is useless to ask us to recommend them editorially, either for money or in consideration of advertising patronage.

OFFICERS—In accordance with the law of the state of New York, the following announcement is made of the office of publication, at 83 Fulton St., New York, N.Y., and the names of the officers and editors of The Railroad Gazette:

OFFICERS:

W. H. BOARDMAN, *Presi. and Editor.* — RAY MORRIS, *Secretary* — R. S. CHILDS, *Treas.* — I. B. RIKER, *Cashier* — E. A. SIMMONS, *Vice-President.* — L. B. SHERMAN, *Western Manager*

EDITORS:

RAY MORRIS, *Man'g Editor* — BRAMAN B. ADAMS — CHARLES H. FRY — RODNEY HITT — GEORGE L. FOWLER — FRANK W. KRAEGER — HUGH RANKIN — BRADFORD BOARDMAN

CONTENTS

VOL. XLIII., No. 26. FRIDAY, DECEMBER 27, 1907.

CAR AND LOCOMOTIVE OUTPUT IN 1907.

Last year when the output of the car and locomotive builders in the United States and Canada was compiled, the returns indicated that in spite of the record breaking production of 1906 a still larger output would be recorded for 1907. Some of the companies reported last year that they had unfilled orders on their books for 1907 delivery for a greater number of cars than they had built during 1906 and orders were being placed for delivery from nine months to a year in advance. Last spring when the financial situation became acute and the railroads as well as the industrial corporations began to feel the effects of hard times, it was generally expected that many of the large orders for cars to be delivered during the last months of the year would be cancelled. New orders dropped off to very small figures, but few standing orders were actually cancelled and the car and locomotive builders have continued through the year working practically to their full capacity. In order to compare the business situation at this time with the business situation last year, the builders were asked this year to state the number of unfilled orders on their books as compared with the number of unfilled orders on their books a year ago. Almost without exception both the car and locomotive builders in the United States report a heavy falling off in orders and inquiries, and many of them are running now on orders placed last spring with no new work in prospect. One of the large locomotive building companies reported a falling off of 75 per cent. in orders, as compared with last year. The Canadian car and locomotive builders have not felt the effect of the disturbance in financial and business conditions to any extent. All of the companies report as many or more unfilled orders on their books now as they reported last year.

Official returns from 36 car building companies in the United States and Canada (estimating two small plants not heard from) give the total number of railroad cars built during 1907 as 289,645, an increase of 19 per cent. over the record breaking output of last year. This includes subway and elevated cars, but does not include electric street and interurban cars. No estimate has been made of the number of cars, both freight and passenger, built by the railroads in their own shops. Of the total number of cars built by manufacturers 284,188 were for freight service and 5,457 for passenger service; 280,216 were for domestic use and 9,429 for export. The number of passenger cars built during the year shows an increase of more than 70 per cent. over last year's output. About 72 per cent. of the freight cars built were of steel or steel underframe construction. Canada built 9,159 freight cars and 106 passenger cars, an increase of 30 per cent. over last year's output; all of these cars were for domestic use. The one company building cars in Mexico retired from business during the year and no returns were received from it. The following table shows the *Railroad Gazette's* compilation of the number of cars built during the last nine years:

Year.	Freight.	Passenger.	Total.
1899	119,886	1,305	121,191
1900	115,631	1,636	117,267
1901	136,950	2,055	139,005
1902	162,599	1,948	164,547
1903	153,195	2,007	155,202
1904	60,806	2,144	62,950
1905	165,455	2,551	*168,006
1906	240,503	3,167	*243,670
1907	284,188	5,457	*289,645

*Includes Canadian output.

The locomotive output shows a smaller increase over last year than the car building output. This is probably due to the fact that the locomotive builders worked their plants practically to their full capacity last year and were unable because of lack of manufacturing facilities to turn out any large increase over last year's figure. The 12 builders in the United States and Canada built 7,362 locomotives during the year, of which 6,564 were for domestic use and 798 for export. This is an increase of 6 per cent. in the total output; the export output increased 11 per cent., as against 5 per cent. for the domestic output. These figures, as in the case of the totals of cars built, do not include locomotives built in railroad shops or locomotives rebuilt or repaired. There were 330 electric locomotives and 240 compound locomotives built, as against 237 and 292 respectively last year. The Canadian output of locomotives was 264. The following table shows the number of locomotives built during the last 15 years:

Year.	No. built.	Year.	No. built.	Year.	No. built.	Year.	No. built.
1893	2,011	1897	1,251	1901	3,384	1905	*5,491
1894	695	1898	1,875	1902	4,070	1906	*6,952
1895	1,101	1899	2,475	1903	5,152	1907	*7,362
1896	1,175	1900	3,153	1904	3,141		

*Includes Canadian output.

The cost of cars and locomotives has increased slightly over last year. Estimating the average cost of freight cars at $1,100, the total spent for freight cars amounts to $312,607,000; for passenger cars at $8,500 the cost was $46,384,000, and for locomotives at $16,000 the cost was $117,792,000. The increase in the cost of locomotives is due largely to the increased average weight of modern

locomotives. The total amount spent by the railroads for new rolling stock and locomotive power approximates this year $477,000,000, an increase of about 25 per cent. over last year.

RAILROAD BUILT IN 1907.

The new mileage added during the past year, although somewhat less than that for the unusually prosperous year 1906 which was the largest since 1903, is as much as could be expected when the changing and adverse conditions that prevailed during this period are considered. Official returns from nearly all the railroads, supplemented by our own records and figures furnished by the State Railroad Commissions, show that approximately 5,212 miles of new railroad line were built in the United States during the calendar year 1907. These figures include 14 miles of new main track relocated, but do not include new second, third or fourth track, sidings or electric lines. The total is 7½ per cent. less than was built in 1906. Conditions at the close of last year indicated that the mileage for this year would exceed that of the previous year, as a large amount of grading had been finished ready for the track and many new projects were contemplated. During the early part of the year the railroads were not able to get all the labor and supplies necessary to carry out the authorized work. Soon the railroad legislation in various states and the difficulty of borrowing money, resulted in suspension of new work by a number of companies. Considerable progress was, however, made in permanent improvements to roadbed, particularly straightening the lines and reducing grades.

The joint low grade line of the Great Northern and the Northern Pacific, from Kennewick, Wash., west to Vancouver, 220 miles, constructed under the name of the Portland & Seattle, was the longest single stretch of new road built. Work is being pushed by the Chicago, Milwaukee & St. Paul on its Pacific extension. In 1906, there were 39 miles of track laid and 298 miles were added in 1907, leaving between 1,100 and 1,200 miles yet to be built to finish the line to Seattle. The Kansas City, Mexico & Orient built 47 miles in Oklahoma, 25 in Texas and 18 in Mexico. There are over 900 miles yet to be built to finish the line from Kansas City through to Topolebampo, on the west coast of Mexico. On the Western Pacific all of the road in Utah, 122 miles, has been finished, in Nevada 39 miles of track have been laid, and 102 in California, leaving 577 miles yet to be built.

In Canada, the Grand Trunk Pacific has made its full surveys from Moncton, N. B., west to Winnipeg, Man., 1,800 miles, and has let contracts for 852 miles of line on this section. In the West, contracts are let to the Rocky mountains, except for about 125 miles, for which contracts will shortly be let. It was definitely decided this year that the line would cross the main range of the Rockies through Yellowhead Pass. Up to April of this year only 36 miles of track had been laid, but track has been laid on 325 miles west of Winnipeg and on 100 miles of the Fort William branch. The Canadian Northern recently finished a connecting line from Brandon, Man., west to Regina, Sask., 175 miles, and has projected a large number of other extensions. The Canadian Pacific has built a long extension from the East to Saskatoon, Sask., which is being extended 325 miles beyond that point to Wetaskiwin, Alb., on the Edmonton branch. Beyond Saskatoon, 26 miles of track have been laid and the grading is 95 per cent. finished. Though not included in its total, one of the most important construction works carried out by this company has been the completion of the double track between Winnipeg and Fort William, a greatly congested section of its through line. In Mexico the Southern Pacific built 205 miles on the west coast during the year and is pushing work from San Blas, which is on the Kansas City, Mexico & Orient, down the west coast to Guadalajara, 650 miles.

New main track mileage is reported in 44 states and territories, including Alaska, where 90 miles of new track were built. Louisiana, which was third in 1906, was first this year with 384 miles. Texas, South Dakota and Washington came next in order, each with between 340 and 320 miles. In 1906 Texas was first with 635 miles, far ahead of the record of any state in 1907. Besides Texas with its decrease of nearly 300 miles, Arkansas, Illinois, Nebraska each show at least 100 miles less than last year. The largest decrease in 1906 was in North Dakota, where only 217 miles were built, as compared with 521 in 1905. In addition to the states already mentioned, which lead the list, Alabama, Arkansas, Georgia, Idaho, Indiana, Minnesota, Mississippi, Montana, North Carolina, North Dakota, Oklahoma, Pennsylvania, Virginia, West Virginia and Wisconsin, each built over 100 miles of main line in 1907. No new mileage was reported in Connecticut, Delaware, Iowa, Massachusetts, New Hampshire Rhode Island or Vermont.

The number of miles built in Canada was 977, a small decrease as compared with 1906, when 1,007 miles were built. The number of miles built in Mexico was 333 as against 297 in 1906.

The following table shows our figures for mileage built in the United States during the last 15 years:

1893.....3,024	1898.....3,265	1903.....5,652
1894.....1,760	1899.....4,569	1904.....3,892
1895.....1,428	1900.....4,894	1905.....4,388
1896.....1,692	1901.....5,388	1906.....5,623
1897.....2,109	1902.....6,026	1907.....5,212

RECEIVERSHIPS AND FORECLOSURE SALES IN 1907.

The receivership record of 1907, in spite of the great financial disturbances and the banking panic in the latter part of the year, is an unusually clear one. Only 349 miles of railroad went into the hands of receivers during 1907, which is the smallest mileage since 1903. It is to be hoped that the year 1908 will have an equally clear record, although there is no doubt that it will be a time of test and trial. The encouraging feature of the situation is that expenditures for additions and betterments during the last few years have generally been so large and so continuous that the average railroad is in a strong position to meet a curtailment of traffic. In 1906 there were 657 miles of road which suffered receivership. Up to December 26 of that year there were only 254 miles of road so affected, but on that day receivers were appointed for the Mobile, Jackson & Kansas City and its subsidiary, the Gulf & Chicago, adding 403 miles to the total. As the receivership of the parent road was terminated four days later, on December 31, 1906, these receiverships were in reality unimportant. In 1905 3,593 miles of railroad entered receivership, this large figure being the result of the Cincinnati, Hamilton & Dayton and Pere Marquette troubles. In 1904 there were 744 miles, of which the largest railroad was the Detroit Southern, now the Detroit, Toledo & Ironton. In 1903 there were 229 miles involved; in 1902, 278 miles, and in 1901, 73 miles. Back of this year as far as 1882 was a long period during which the annual mileage of new receiverships ran into the thousands, with the climax in 1893 with over 29,000 miles.

The largest railroad which went into the hands of receivers during 1907 was the Chattanooga Southern, which owns 99 miles from Chattanooga, Tenn., south through the northeastern corner of Georgia to Gadsden, Ala. This is said to have occurred because some of the stockholders were unwilling to agree to terms offered by the Louisville & Nashville for purchase of the securities of the road. The next largest road was the Apalachicola Northern, an 80-mile line from River Junction, Fla., to Apalachicola, for which receivers were appointed in September. The Colorado & Northwestern runs from Boulder, Colo., to Ward and from Sunset to Eudora, a total of 48 miles. It was previously sold under foreclosure in 1904. The Missouri River & Northwestern has 35 miles of line built from Rapid City, S. Dak., to Mystic in the Black Hills region. It also was reorganized in 1904, its predecessor company being the Dakota Pacific Railroad. Its road, however, was not opened throughout until 1906. There was no default of interest on its bonds, but the present receivership came as a result of difficulties among the stockholders, following damage done to the property during the severe weather of last winter. As soon as possible it is planned to extend the line 50 miles beyond Mystic to coal areas in Wyoming. The Council City & Solomon River is an Alaskan road which has been building a few miles each year until it now has 35 miles of line from Dickson, Alaska, to Penelope Creek. This receivership was due to the claims of construction companies; these have since been adjusted. The receivership of the North-East Texas, an 18-mile lumber road, from Red Water, Tex., to Munz, was due to the burning of a sawmill on which the road depended for most of its traffic. The Ione & Eastern has 13 miles of line from Ione, Cal., to Martell. The Medford & Crater Lake runs from Medford, Ore., to Eagle Point, 11 miles. It was in receiver's hands only a short time, for on May 11 it was sold under foreclosure, as shown below, to the Pacific & Eastern, the successor company. The Alabama Central runs from Booth, Ala., to Autaugaville, 9 miles.

The most important receiverships of the year are not included in the list because they were not of steam railroads, but of street railway companies. On September 24 Adrian H. Joline and Douglas Robinson were appointed, by the Federal court, receivers of the New York City Railway and on October 2 the Metropolitan Street Railway was also put in their hands as receivers. The New York City Railway is the lessee of the Metropolitan Street Railway and operates the surface lines in the boroughs of Manhattan and the Bronx, New York City, and also controls considerable trolley mileage north of the city limits. This receivership involved a clash of

jurisdiction, for on November 29 three receivers for each of these companies were appointed by the Attorney-General of the state of New York. These state receivers were, however on December 12 restrained by the United States court from taking possession.

The following table lists in the order of their occurrence the receiverships of the year:

Receiverships.

Name.	Mileage.	Bonds.	Stock.	Date of receivership.
Alabama Central	9			Jan. 21
Mo. River & Northwestern	56	$700,000	$1,000,000	Feb. 14
Medford & Crater Lake	11		200,000	April
North East Texas	18	80,000*	250,000	Apr. 13.
Chattanooga Southern	94		3,000,000	Apr. 23.
Colorado & Northwestern	54	1,000,000	1,000,000	June
Apalachicola Northern	80			Sept.
Ione & Eastern	13	360,000	50,000	Sept. 10
Council City & Solomon Rvr	35	347,000	895,460	Oct. 11
Total	349	$2,187,000	$6,395,460	

*About.

There were only six roads sold under foreclosure during 1907, with a total mileage of 175 miles. Of these the most important were two terminal railroads, both of which were among the roads which went into the hands of receivers during 1906. The Toledo Railway & Terminal had been taken over by the Cincinnati, Hamilton & Dayton-Pere Marquette combination and was dragged down into receivership by them on January 3, 1906. This company, the last of the three to go into receivership, was the first to come out of it. It was sold at foreclosure last May and is now reorganized as the Toledo Terminal Railroad, in whose ownership most of the railroads entering Toledo have a share. The other company is the Peoria & Pekin Terminal. This is a road operated by both steam and electricity, which has two lines of road between Peoria, Ill., and Pekin, and trackage rights over five miles of street railway in Peoria. This company was bought by the Peoria Railway Terminal, which is controlled by the Chicago, Rock Island & Pacific and the Chicago & Alton jointly. The Texas Western is a 52-mile road from Houston, Tex., to Sealy which has not been in operation for years. After having gone into receivership in 1873, it was sold in 1900 to the Houston, Brazos & Northern for $25,000 cash and a note for $125,000, whose payment was later defaulted. On October 2, 1907, it was sold for $10,000 to satisfy a judgment for $165,542, representing this note and interest. The Dayton, Lebanon & Cincinnati runs from Lebanon, Ohio, to Lebanon Junction, 30 miles, and has trackage arrangements with electric lines over which it reaches Cincinnati and Dayton. Its passenger service is operated by trolley and its freight service by steam. The Dayton, Lebanon & Cincinnati Railroad & Terminal is the successor company. The Traverse City, Leelanau & Manistique is a 30-mile branch of the Grand Rapids & Indiana, from Traverse City, Mich., to Northport, whose sale was a formality of fixing the parent company's control.

There is one more road more important than any of those included in the list of foreclosures which was advertised to be sold at foreclosure sale during the year. This is the Chicago Terminal Transfer, which owns the Grand Central Station and 84 miles of belt railroad in Chicago. Its troubles began in 1904, when the Lake Shore, the Rock Island, the New York, Chicago & St. Louis terminated their contracts with it and moved into the La Salle street station. Interest has been in default since 1905 and the foreclosure sale of the road was set for May 3, 1907, but before that time the Baltimore & Ohio, which has a valuable lease of the passenger and freight facilities of the Chicago Terminal Transfer, gained permission from the Federal court to assume the company's bonds. These bonds were paid off at par and accrued interest on the announced date of the foreclosure sale and the Baltimore & Ohio's lease of its Chicago terminals was protected. This explains the fact that these bonds for the two years that they were in default sold most of the time at a price near par. Another important foreclosure which apparently just missed getting in the year's record was that of the Pere Marquette, whose reorganization is now under way and soon to be completed by formal termination of the receivership. It is also probable that the Cincinnati, Hamilton & Dayton will before long be taken out of its receivership.

The following table shows the railroad foreclosure sales during 1907, listed in the order of the date on which the sale was made:

Foreclosures.

Name.	Mileage.	Bonds.	Stock.	Date of sale.	Selling price.
Peoria & Pekin Termnl	21	$977,000	$600,000	Feb. 9.	$600,000
Texas Western	52	.....	.....	Apr. 2.	10,000
Dayton, Leb. & Cin.	30	1,500,000	2,500,000	Apr. 16.	200,000
Traverse City, Leelanau & Manistique	30	300,000	500,000	Apr. 17.	339,229
Medford & Crater Lake	11	.....	200,000	May 11.	82,500
Toledo Ry. & Terminal	31	3,825,000	3,500,000	May 28.	2,000,000
Total	175	$6,602,000	$7,300,000		

FIVE PANICS

There have been five severe commercial panics in this country; four of them important and far reaching; the fifth, severe at the time but of short duration. The really first class panics occurred in 1837, 1857, 1873 and 1893; the lesser one, in 1884. The question which everybody would like to know the answer to, at the present time, is, which kind of panic and depression are we having now—the long kind or the short kind?

To begin with, let us separate ethics and economics, and keep them vigorously apart. Wickedness did not cause the 1907 panic; it never caused any panic, except as a secondary and minor cause groupable with a great many other secondary and minor causes. Every noteworthy panic that this country has had can count among its causes one constant—speculation and credit inflation—and a large number of variables. Wherever there has been heavy and continued speculation, some wickedness, some breaches of trusteeship have crept in, but the wickedness has always been rather an incident than a moving cause. The variables, not the constant, have, so to speak, brought out the symptoms of panic. Then, when the fever has run its course, the duration of the after drag has been governed principally by two things: the nature of the variables, and the soft spots which the panic has disclosed in the commercial structure. By attention to these things it is possible to see how causes and effects in previous panic years compare with the exhibit of 1907 thus far presented, and to deduce analogies, if not indications.

Without going at length into historical details that are more or less readily accessible, it should be noted that the panic of 1837 was immediately preceded by the very great success of the United States Bank. This central bank had become one of the richest institutions in the world, but its power was greatly distrusted, and the political party that elected Andrew Jackson President was strongly opposed to the renewal of the charter of the bank. Consequently, President Jackson, on constitutional grounds, refused to re-charter the bank, and a law was passed requiring the huge surplus which had been piled up after our entire war debt had been paid, to be distributed among the states. The sum of $28,101,645 was thus distributed among the states, in proportion to their population, and this distribution took place during the pinch. It was estimated that $10,000,000 was taken out of New York, and taken out at the very time when it was much needed.

This distribution act was quite generally blamed by the daily press of the time as the direct cause of disaster, but a glance at the general speculative situation which closed late in 1836, the year before the panic, casts a rather different light on the subject. In September, 1836, the United States was importing grain. The money market was growing tighter every day, all costs were rising and speculation in real estate was in progress. New York real estate, valued in 1835 at a total of $144,000,000, was valued in 1836 at $226,000,000. Meantime, a host of state banks were being opened, the most prominent of them all being the Pennsylvania State Bank, chartered by Nicholas Biddle, former President of the United States Bank, and these new banks were absorbing more and more of the scarce capital. In October, 1836, money was costing from ⅛ to ¼ per cent. per day in lots of $5,000 to $10,000, loaned on call, and during that month there were 10 or 12 failures in Wall street. Meantime, good money was getting scarcer and scarcer and bad money was becoming more and more plenty. "Wild-cat" currency, so-called, was issued not only by the state banks but by large commercial houses all over the country, and as soon as financial stringency began to be felt there were as many prices for money as there were kinds of money. People were accused of hoarding, especially in the West, but the more conservative critics of the time believed that this hoarding was over-estimated.

In March, 1837, gold was going out fast to England and much loose currency was in use in the United States. In April there were daily failures in New Orleans, where the banking facilities had been engrossed by speculators who were trying to corner the cotton crop. The *Evening Post* of April 6, 1837, referred to "the brood of incorporated banks that had treated credit like a Roman race-horse, hung it with spurs and goads and set it galloping off without a rider." Comment was also freely made to the effect that the merchant and the speculator had traded by the help of the banks on borrowed capital and had anticipated prices, and that their ruin had thrown the mechanic and the laborer out of employment. On May 4 there were crowds in Wall street and a run on the Mechanics' Bank. "New York never saw such a time." On May 5 there was panic. It was complained that southern and west-

ern money could not be sold anyhow and that the brokers "take nothing west of Albany and the banks take nothing, even for collection, on the South." The New York banks suspended specie payments on May 10 and comment was made that nothing whatever was done in country money.

Without going into the details of the gradual improvement which set in after the crash, it may be noted that dull times lasted in varying degrees of intensity for about four years. As regards stock prices; Delaware & Hudson Canal Company, which sold at 96 in the high period in the summer of 1836, was down to 87 January 4, 1837; to 73 March 24; to 69 April 6; to 64 April 27; to 53 May 4; to 50 May 8; then up again to 67 May 10, the day when specie payment was suspended; to 79 May 15; down to 75 in September; up to 78½ in November, and to 85 in June, 1838. This stock is selected as characteristic. The number of railroad stocks sold on the exchange in those days was naturally small and they all acted in a similar manner.

In the seven years ending with 1837 the country had increased its railroad mileage from 23 miles in operation to approximately 1,500 miles, and much of the new mileage was highly unprofitable at the time the crash came. The railroads had not been properly built or maintained and much of the mileage owed its existence to the great prosperity of the past few years and to the ready influx of money into all commercial opportunities, whether these were lands, mines, canals and railroads, or state banks.

1857.

Starting with the constant of speculation, we find in 1857 that there had been rapid railroad expansion, land jobbing and frauds in Congress, a high market and tight money, the railroads mostly not earning anything and everybody speculating in whatever presented itself. The new mileage built in 1856 amounted to some 3,650 miles, and the aggregate mileage built in 1857 and the six previous years exceeded that of the 10 years which followed. Again, just as in 1837, everybody was doing business on credit, and increasing expenses; with the difference, as recognized at the time, that the basis of inflation in 1837 was government specie to the extent of some 30 odd million dollars, while in 1857 there had been an enormous gold production in California and in Australia, and the basis of inflation amounted to hundreds of millions of dollars. The *Herald* complained that "our fictitious paper bubbles of all kinds have been inflated in proportion to this augmented specie basis and the crash in the same proportion brings with it its accumulated disasters. The states have created banks by the hundred and the thousand; they have issued their paper accommodations by millions; railroads and all sorts of speculative combinations have followed suit with their stocks and bonds; merchants have been enriched by credit purchases and sales upon promise to pay; speculators have become millionaires, and thus we have had a grand carnival of universal credits, universal extravagances and unbounded paper wealth." The *Herald* also said, earlier in the year, when it was preaching against the extravagance that was going to cause trouble, that "A fashionable lady cannot move abroad without a silk dress worth perhaps $50; laces, $50 more; sables, $50 more; a French hat almost $50 more, and with bracelets, watch and charms to match she moves along a capitalization of the floating funds of her husband. And this is but an item, compared with the costly contents of her boxes and bureaus at home."

In January, 1857, an investigating committee was appointed to report on the lobby corruption at Washington, which was alleged to have originated under the careless and lazy administration of President Fillmore five or six years before, and to have greatly increased under President Pierce. In February the railroads were sustaining their own stocks in the market and were borrowing short time money to pay their dividends. On February 20 the Corruption Investigation Committee reported amidst great excitement. The expulsion of Representatives Matteson, Gilbert and Edwards, of New York, and Welch, of Connecticut, was demanded, and it was testified that there were 20 or 30 members of the house associated and pledged to each other not to vote for any law or resolution granting lands or money unless they were paid for it. The *New York Herald* observed that Horace Greeley had been bought and sold to the service of the Des Moines Improvement Company at the low figure of $1,000—"the average price of a common Virginia nigger." In March the newspapers said drearily that railroad prosperity had seen its best days in the United States, that competitive construction, depreciation and destruction accounts had not as yet been properly considered in the financial movements of the railroad companies; that the country had just arrived in the point of the history of the railroads where it could not longer be overlooked that large reservations must be annually made to keep the property in working order before dividends could be paid out of net earnings. Meanwhile, President Buchanan was inaugurated and better feeling prevailed for a time, but imports were much in excess of exports, and when the crops came along, cotton was very backward. Grain was abundant, but there was no foreign market because of the good harvest all through Europe. The market for American railroad securities abroad had been spoiled by common understanding of the fact that a great many dividends were being paid which had not been earned. The output of California gold was smaller than in 1856, yet speculation, expansion of credits and extravagance went on unchecked.

On August 24, 1857, the Ohio Life & Trust Company suspended. The concern had been a large borrower, and it was subsequently developed that a trusted eastern agent had been shamefully misusing its funds and that the failure was going to be a very bad one. On September 21 the Mechanics' Bank, and Beebee & Company, specie brokers, suspended. There were runs on the Hanover Bank, the Metropolitan Bank and the Bank of Commerce, and runs and bank suspensions in Buffalo, Paterson, Detroit, etc. The Erie, the Michigan Southern, the Illinois Central, the Cleveland & Toledo, the New York Central and the Reading were all in a more or less insolvent condition. The Illinois Central assessed its stock $10 a share but was not able to stem the tide even with this assistance.

There was a slight upward turn of the stock market in September, 1857, but it did not have special significance. In the week ending Oct. 1 there were 100 commercial failures, and banks all over the country were in difficulties. On Oct. 9 the Erie and the Michigan Central were unable to meet the interest charges on their floating debts; on Oct. 10 the Illinois Central suspended, for the same reason. Up to Oct. 26, beginning with the suspension of the Ohio Life & Trust Co., there had been some 1,500 failures of merchants and traders, and about the same number of suspensions of banks and railroads, yet contemporary comment pointed out that the country as a whole had never been richer.

Better feeling in 1857 began in November; there was a steady influx of gold from Europe and from California, and in October and November together, over 11 millions of specie arrived in New York. The banks resumed specie payments in December, and had, in New York, double their usual reserve. Prospects were then considered bright, and in January, 1858, money was abundant in Wall street, although commercial money was extremely tight. In March, 1858, very dull business was reported everywhere except in Wall street, where transactions were brisk, but things were looking better ahead, and after a large number of commercial failures throughout the spring, prosperity began to reappear. The exact duration of the drag after the 1857 panic is rather hard to estimate because of the interference of the Civil War period, but it may be set down roughly at two years, during which industry, though by no means paralyzed, was clearly below normal.

1873.

The next first-class panic came in the year 1873 and it is curious to see how closely the speculative features of 1837 and 1857 were repeated. Again there were heavy railroad speculations. Following 1856, the year before the previous panic, the annual increase in railroad mileage did not exceed 2,500 miles until 1868, when almost 3,000 miles were built. In 1869 4,615 miles were built; in 1870, 6,078; in 1871, 7,379, and in 1872, 5,878. After the '73 panic, 5,000 miles of new road were not built in any single year again until 1880, but the over-extension in 1873 was very great; unproductive lines encumbered almost every system, and people began to realize that it would be a long time before some of these lines were worth anything. Extravagant and extended business were much in evidence in 1873, just as they had been in 1857 and in 1837. There was also inflated currency, much watering of stock and reckless management of trust companies and savings banks. The Chicago fire of 1871 was a very important contributory cause. The absolute loss to the country resulting from the Chicago fire is estimated at $150,000,000; a sum much larger in those days than it is now. Another moving cause of the panic, though a subsidiary one, was the passage of the severe Granger laws in the Northwest, and the rate wars between the railroads themselves, which did not give much hope of amicable settlement. The subsequent truce between the trunk lines dated from the Saratoga conference, in 1874, although there was much trouble after this prior to the formation of the Southern Railway and Steamship Association, in 1875, and of other kindred organ-

lizations. The operations of Gould, Fiske, Drew, Vanderbilt and Keep were fresh in everybody's mind, although the most notable corners in Erie, Chicago & North-Western and Milwaukee & St. Paul occurred in 1868. Manipulation of money and the attempt of Jay Gould to corner the gold market in 1869 were also remembered, consequently it took only the suspension of the Warehouse & Security Company, which had loaned money to a construction company to aid in building the Missouri, Kansas & Texas, to precipitate the 1873 panic.

In July, 1873, there was abundant money to be had at 3 and 4 per cent., and the stock market was strong. Prime discounts were at the rate of 5½ to 7 per cent. In August the government surplus was very low, trade was declining and there was a decreasing bank reserve in New York. Call money rose about 1 per cent. in the second week of August and advanced to 6 per cent. on August 19, though it slacked off somewhat in the next few days. Exports from Jan. 1 to Aug. 26 amounted to $185,000,000 in 1873, as against $147,000,000 in 1872; while imports had amounted to $275,000,000 in 1873, as against $296,000,000 for the same period in 1872. On Aug. 31 the contemporary press regarded the prospects as being very good, but early in September call money went up to 7 per cent. and, following a rather sharp speculation in Wall street, the suspensions of the New York Warehouse & Security Company and of Sheppard Gandy and Francis Skiddy were announced. On Sept. 9, prime discounts cost from 10 to 12 per cent. On Sept. 15, the Eclectic Mutual Life Insurance Company failed, and on Sept. 17 Jay Cooke & Company went under, involving the Northern Pacific and the Western Union directly, and a host of concerns and individuals indirectly. By the close of the exchange on the following day, 17 well-known stock exchange houses and a number of smaller ones had failed. The stock exchange was closed on Sept. 22, and there were runs on savings banks. So far as the solvency of banks was concerned, confidence was restored in 1873 very soon. President Grant courageously refused to sign a bill providing for a treasury loan and the feeling at once began to be better, although trade everywhere became greatly depressed and there was no real and substantial recovery until about 1878.

1884.

Measured by the retardation of business and the ensuing drag, the 1884 panic cannot be called a first-class one, yet this panic is in some respects so closely analogous to the conditions of 1907 that the principal facts of it should be recorded. Unlike 1907, there had been a period of great railroad construction; there had also been heavy inflation of securities. Along with this came the exposure of great financial frauds. On May 5 the Marine National Bank suspended in consequence of the speculations of its President, J. D. Fish, with the house of Grant & Ward, and Grant & Ward themselves failed May 14. The defalcation of John C. Eno, President of the Second National Bank, involving some $4,000,000, had occurred just before; then the Erie defaulted, as usual. But it is incorrect to describe 1884 as a year of real commercial crisis. The prime effects of the panic had disappeared by July and partial confidence was restored, while in June, 1885, there was substantial recovery upon the negotiations for a cessation of the war between the New York Central and the West Shore. The lease of the West Shore was effected in August, 1885, and prices advanced. The panic of 1884 has been described as an incident following the long drag-down of stock values from the culminating point in July, 1881, with the crisis precipitated by the events which have been mentioned, and in this drag-down it is closely comparable with 1907.

1893.

The panic of 1893 is so fresh in everybody's mind that only brief reference to it need be made. The silver bullion purchase act of 1890 depleted the gold reserve of the treasury in the Harrison administration; then came speculation, the inevitable precursor of panic. The business done in 1892 was very great, but depression was felt at the close of the year and people were afraid that the redemption of the 1890 treasury notes in gold would be suspended. Poor crops were also anticipated. The National Cordage Company suspended in May, five months after it had declared a stock dividend of 100 per cent., and the value of silver was unsettled by the June 27 cable announcing that the Indian government had suspended the public coinage of silver. Meanwhile bank reserves were fluctuating and then falling. Clearing house certificates were issued on June 21; bank reserves began to recover in August, following heavy imports of gold, while at the close of the year, in spite of the fact that it was the crop moving season, there was an abundance of money and rates for it were very low. The total bank clearings of the United States in 1893 were 54 billion dollars, as against 62 billion dollars in 1892. The total number of commercial failures in the country was placed at $114,000,000 in 1892 and at $347,000,000 in 1893, while imports of merchandise fell off from $811,000,000 in 1892 to $777,000,000 in 1893, exports of merchandise from $938,000,000 to $876,000,000 and the gross earnings of 124 railroads from $564,000,000 to $552,000,000. The wheat crop was very small, the corn crop not as good as that of 1892, pig iron production was about one-fifth less in 1893 than in 1892 and immigration to the country fell off from 543,000 to 180,000.* Meantime, railroad suspensions and receiverships had been continuous, and at the close of the year 25,375 miles of road were in receivers' hands, a total equal to about one-seventh of the entire railroad mileage in the country.

As is well-known, the drag after the 1893 panic lasted about four years. The part which speculation played in the panic is shown by the railroad receiverships. The record for new construction was made in 1887, when 12,876 miles were built, while in the next five years the additions to the mileage of the country totaled over 25,000 miles and equalled in amount all the mileage built between 1893 and 1903. This was the special form which the 1893 speculation took, and when the workings of the silver purchase act had sufficed to bring on a state of extreme fear, the railroads were the weak spot and they suffered, involving much of the general prosperity of the country with them.

1907.

In view of the facts outlined above it is extremely interesting to see if it is possible to match off events in such a way that a reasonable basis for a prediction of the length of the drag to follow this year's panic may be ascertained. Accepting the element of speculation as the constant, as has been mentioned before, its outworkings can, of course, be traced in the extraordinary stock exchange prices of the closing months of 1906; in the boom in mining stocks and, to a lesser extent, in suburban realty. But the speculation in real estate has been on a far less dangerous basis than in the other panics, excluding 1903, when it was not particularly apparent. In 1857, for example, town lots were being sold in localities all over the country where the towns have not yet come, after a lapse of 50 years, and suburban property located, say a mile from the center of New Haven, Conn., or even of Des Moines, Iowa, could be readily sold in New York City to purchasers who never saw it and never expected to see it, but relied on their profits for a quick turn to somebody else who had never seen it. This same feature had characterized 1837, and, in less degree, 1873; it was almost wholly absent in 1893 and in 1907. In 1837, direct loss of confidence was caused by distribution of the surplus and by the wild-cat currency; in 1857, by land jobbing, bad crop markets and the general feeling that railroad properties had seen their best days and that investments in them were subject to heavy depreciation. In 1873 there was a bad government surplus, paper money with gold at a high premium, the manipulations of Jay Gould and his clique, and the Chicago fire; in 1893, the silver purchase act and over-extension of railroads.

Now, we have had no over-extension of railroads in the last five years. On the contrary, the excess of traffic over facilities has occasioned great hardship, and it may be said, broadly, that there was no unprofitable mileage in the country whatever in 1906. Bad money, the fear of which was so potent a factor in 1837 and in 1893, and to a greater or less degree in all the other panics, has not been in evidence this year at all; our defective currency system may at times be an encumbrance upon prosperity and a drag upon recovery, but it is certainly not a moving cause of panic.

The speculation which preceded the 1907 panic covered a very large range of industries, but, as we see it, the really important difference between the speculation of 1907 and that of the other notable panics in our history is that the money of speculators has been spent in productive instead of non-productive enterprises. The difference in the railroad investments of the period prior to 1907 and the period prior to 1893 is that in the former period railroads were built where the demand for them was not real, while in the latter period, shares changed hands at higher and higher prices, but the new securities put out in this golden time were devoted rather to consolidating and bettering existing lines and recognized trade routes, than to exploring unknown territory. The difference in the outcome must necessarily be very great.

The defective trust company law in New York, which allowed

*We are indebted to the *Commercial and Financial Chronicle* for these figures.

these great institutions to indulge freely in the speculative fever and to so involve their affairs that their assets were not liquid at time of need, was doubtless an important moving cause of the panic, but it seems to us that the most important cause of all—always presupposing a general situation made unsound by a long speculative period—was the action of the government and particularly of the President of the United States. We are well aware that in each previous panic the President in office at the time has been attacked and subsequently exonerated; but there has been no previous instance where the President has so mixed with his duties as chief executive, his own personal ambitions and animosities, and gone on creating bugaboos and shrieking at them under conditions of intense publicity until he has succeeded in creating a condition of childish terror throughout the length and breadth of the country. Moreover, this sort of political success spreads, and when a self-seeking judge imposes a $29,000,000 fine on a technicality, Europe may well be pardoned for declining to continue her investment in American securities, and the American investor may feel doubtful of all his holdings. The question of wickedness is in no wise involved. Our courts have been neither more nor less efficient in administering the laws of the land than they were in previous times. The average of railroad and industrial management has not only been no lower than it used to be, in these years that President Roosevelt has known how to make political capital out of it; it has been infinitely higher.

Assuming that speculation was the fundamental cause and an unstable, socialist President the precipitating cause of the 1907 panic, the situation gains strength from the fact that the first of these causes is already spent, without disclosure of any important area of weakness, while the second will be remedied next fall. With sound currency and no important overproduction, the elements of a long drag appear to be lacking.

CONTRIBUTIONS

Accident Record—Correction.

An officer of the Chesapeake & Ohio informs us that the report of a derailment on that company's line, published in the *Railroad Gazette* of November 29, page 642, with a notation of one person killed, is erroneous; no persons were killed in the accident and none seriously injured.

Curve and Switch Tables.

Chicago, Dec. 16, 1907.

To the Editor of the Railroad Gazette:

In looking over the curve and switch tables published in your issue of November 8, which only recently came to my notice, I observe what appear to be two errors in the explanation of the tables as printed. The frog distance for crossovers between parallel tracks is given as $c\ c - 2\ g\ n$, where c c is the distance center to center of tracks, n the number of frog and g the gage. This is obviously a misprint, or an oversight by the author of the tables. An approximate formula for this frog distance would be $n \times c\ c - 2\ g\ n = n\ (c\ c - 2\ g)$.

In the explanation of the combined use of Tables I. and II., the example states that it is in explanation of a turnout from the inside of a curve, but the example covers a turnout from the outside of the curve, the word "inside" being used for "outside" as will be noted a little further along in the paragraph where it states that the location of the turnout from the inside of a curve would be obtained by subtracting the quantities before added.

S. S. Roberts,
Assistant Engineer, Illinois Central.

Reforming Careless Trainmen.

Montreal, Dec. 2, 1907

To the Editor of the Railroad Gazette:

In your issue of October 11 referring to the action of the Canadian Government in prosecuting conductors and enginemen in connection with railroad wrecks, you use the word "collisions." This does not cover the ground; neither does the word accident, so I prefer the word wreck, which means a total loss.

It seems to me you confuse the issue. You imply that the Canadian Government is likely to punish too severely men who are guilty of nothing more than errors of judgment. Would it not be fair to wait until such a thing has happened? As yet it has not.

In the judgments handed down in such cases as have so far been tried, there is nothing to find fault with, but they [the judges] do show a knowledge of the subject in hand, and a mastery of detail that would, I admit, have a tendency to get onto the nerves of reckless and careless trainmen.

Our Government has not gone too far. It has shown a perfect willingness to "go higher up" at any time, and punish the guilty whenever found. I do not agree with you that abundant experience has shown the futility of everything but careful instruction to make men careful and trustworthy. You forget that careful instruction has been tried for years, while prompt and effective prosecution by law has not. I have nothing to say against careful instruction. That will, and must go on as it always has, but there are men who cannot be made careful and trustworthy by this means, and it is high time that other and more drastic means be employed. Take the case of the conductor who had years of careful instruction, and was paid extra money by the railroad company to perform certain work and who deliberately lay down and went to sleep, thereby causing loss of life and heavy money loss to his company. Can anyone find fault with the judgment in his case?

Or the engineman who is paid much more money than he is worth, who is intrusted with an important train on a piece of road with which he is perfectly familiar, and who runs that train at a rate of speed that even people on the train, and men beside the track know is far beyond the limits of safety, (see evidence in recent case), and finally wrecks the train with loss of life. Is he anything else than criminal?

These are cases that have come to trial and are fresh in the minds of the public; but think of the many cases of which the public know nothing and where the railroad company are the only sufferers. Here is one: On a certain railroad there is a long grade where trains should be handled with judgment and care. The almost constant use of the brakes causes heating of shoes and wheels. The railroad officials fully recognize this and have standing orders that trainmen shall examine their train at water station at top of hill, and come to a full stop and examine again at water station at foot of grade. As I happen to know, the officials do not hope to have this examination made with any degree of thoroughness, but they hope by having the train brought to a full stop for a time to insure a decrease of speed, and at least give shoes and wheels time to cool. Now when an engineman runs past this point with a heavy freight train, at 60 miles an hour, so that people get out of bed and make bets as to how far he will go before he ditches his train, and he does ditch it inside of one mile, destroying $20,000 worth of cars without counting other loss, and then comes in with his crew and states he was running "20 miles an hour and struck a spread rail," what are you going to do with him? Condole with him for his error of judgment, and protect him from a Government that is likely to punish? Unfortunately the Government does not take up such cases, and the railroad company has no redress whatever. The discharging of the criminal from the employ is small satisfaction. I have no doubt "alarm and resentment" is felt by such men, but we want considerable more "alarm" and I think all decent people will feel that we can stand the "resentment."

I hold no brief for the soulless railroad company, but the world gains nothing by maudlin sentiment that would make a hero of the man who by criminal carelessness destroys property and lives.

For the past few days we have been reading the harrowing details of a wreck on one of our Canadian roads; and the facts at hand point to still one more case of this kind, where two men intrusted with moving a light engine over a division run on the time of an important passenger train until they meet her, killing several people, injuring many more, and destroying two engines and three cars with mail, baggage, etc. It is true these men were killed, but does that help? And we must not lose sight of the fact that the men responsible for these things are the men who by organization have the railroads by the throat, and are and have been for some time bleeding them of their last dollar.

There is no danger that the good and careful man will suffer at the hands of the Government prosecutor, and as a matter of fact he is just as much in need of protection as the public and the railroad company, for one sad feature of these wrecks is that the good man is often the greatest sufferer. It is most unfair that the railroads and their officers should bear the onus in these troubles. The superficial thinker may say at once, why should the railroads have such men in their employ; but you might as well ask why a bank will have in its employ a cashier who will run away with its funds.

It is a strange travesty that prosperity brings out the worst in men. You can do nothing with the man who cares nothing for his job. Twenty-five years ago you would find in the railroad service the reckless man, the liar, the drunkard and the thief. In fact, to be a "railroad man" was equivalent to being a little below the general standard, but that condition slowly passed away until the reverse was the case. But to-day we find that the wonderful and widespread prosperity has brought it back. It will disappear again more quickly than it did before, and while the public and the decent railroad man may suffer, as they have, it is after all the

railroad company that suffers most, and it is both right and proper that the law of the land should step in and protect all three.

E. J. M.

Our correspondent presents some fallacious arguments, which the cool-headed reader will readily answer without our assistance, but we print the letter because it voices grievances which we often hear from the mouths of railroad officers. His chief point against our note of October 11 is that we advocate education instead of imprisonment as a cure for carelessness on the part of enginemen, and he claims that punishment under criminal law is the true preventive of "wrecks." But if he admits that death is a punishment he must admit that fear of the penalty does not deter men from running trains to destruction, for surely enginemen know that when they neglect the rules of safety they imperil their own lives. Our correspondent will also agree that to prevent the "wrecks" we must take systematic measures to prevent lesser errors; yet he himself cites a case which the Government does not take up. No, the criminal law, however just its provisions, cannot be made to touch a tithe of the causes of railroad "wrecks." Our correspondent calls for drastic measures because "careful instruction" has been tried and has failed. The trouble is that usually it has been tried only in a desultory way. The wrecks cited in the letter seem to have been caused mostly by men who were reckless, as distinguished from careless. Moral delinquency is, indeed, often incurable, but men of that class can be weeded out. Adequate discipline exposes them. The railroad officer who keeps such men in the service because prosperity has overburdened him with traffic, deliberately takes upon his own shoulders the responsibility for the safety of his trains.—EDITOR.

Courts on Ticket Scalping.

The Federal Supreme Court has at last confirmed the long line of decisions against ticket scalping by affirming the injunction issued by the Supreme Court of Louisiana against the resale of limited tickets. It is now nearly 30 years since legislation was secured in Pennsylvania, followed by New Jersey, against the resale of railroad tickets. In 1897 legislation was secured in New York, but the statute was declared unconstitutional by the Court of Appeals in 1898, and the Everett act met the same fate in 1901. The New York courts, though with dissenting opinions, have held that a railroad ticket was property and that, once bought, its sale could not be interfered with. The Illinois Supreme Court reached a like conclusion, and it is the general drift of common law that a common carrier cannot limit contracts for transportation; but the Pennsylvania courts have held a different doctrine, as have those of Texas and other states; and the Federal courts have for years tended to regard it lawful to prohibit the resale of special rate, excursion or limited railroad ticket.

It is a settled doctrine of the Federal Courts that a contract for transportation can be limited to the original holder. Judge Wood, of the United States Circuit Court, confirmed this. Injunctions have been issued by the state courts, and one of them was sought in Louisiana. The lower court refused this summary redress. The Supreme Court of Louisiana granted the injunction. The case was carried to Washington and the Federal Supreme Court holds that "a non-transferable reduced rate ticket" can be protected by an injunction from resale, as the ownership gained by the purchase is only "limited and qualified" and the roads issuing "retain a subordinate interest in the ticket amounting to a right of property therein which a court of equity would protect." —*Philadelphia Press.*

The Sigl Locomotive Works in Austria took a number of contracts to supply foreign railroads last year, there being not enough Austrian orders to keep the works going. These foreign orders were executed at a considerable loss, and not only could no dividend be paid, but the face of the shares is to be reduced 10 per cent.

Lord Kelvin.

William Thomson First Lord Kelvin, died in London on December 17 after several weeks illness. Lord Kelvin was considered the foremost physicist in Great Britain and probably in the world. He was identified with the development of many theories now generally accepted. He took an important part in building up the doctrine of the conservation of energy and the theory of the dissipation of energy is almost entirely due to him. His most important book is his "Treatise on Natural Philosophy," written with Prof Tait. His other works include papers on mathematics, thermodynamics, magnetism and electrostatics. His greatest contributions to the application of science were in the field of electricity. He was electrician for the company which made the unsuccessful attempt to lay the Atlantic cable in 1857, and for the company which succeeded in laying it in 1866. He acted in similar capacity for several other lines laid between 1869 and 1879. He designed one of the first practicable alternating current dynamos and was chairman of the first advisory board which considered the development of electric power from Niagara Falls. Among his other inventions of immediate practical value are: the present form of the mariners' compass, the siphon recorder and other apparatus used with most submarine cables, and many instruments for measuring electric current.

Lord Kelvin.

He was born at Belfast, Ireland, on June 26, 1824, his father being Professor of Mathematics at Glasgow University. He was educated there and at Cambridge, and when 22 years old was made Professor of Natural Philosophy at Glasgow University. This chair he filled until 1899. He was knighted in 1866 and in 1892 was made Baron Kelvin of Netherall, Largs, Ayrshire. He held many other titles and honors, conferred on him by societies and universities in Europe and the United States. Lord Kelvin was married twice, but leaves no heir.

Sleeping Car Berths in Wisconsin.

The Supreme Court of Wisconsin has declared unconstitutional the act of the 1907 Legislature which assumed to give the occupant of a lower berth in a sleeping car the right to say whether the unoccupied upper berth shall be open or closed. The court declares that the act is an unwarranted interference with the right of dominion over property by the owner thereof, and an unlawful appropriation of property, not in the interests of the general public but for the convenience of a few. It is suggested that the Legislature could compel a railroad to give a passenger this right if he paid reasonably for it.

The main opinion was written by Justice R. D. Marshall, and Justice William H. Timlin filed a supplementary opinion, concurring in the result, but setting forth that he believes that the Legislature has a right to regulate the operation of sleeping cars.

The syllabus says: Police regulations which are reasonable are not inhibited by the constitution though invading its letter, since the exercise of the police power is so essential to the public welfare that it is presumed that such exercise within reasonable limits was not intended to be prohibited, but, on the contrary, guaranteed by the general declared purposes of civil government and the manifest purpose of the constitution.

It is a judicial function to determine the proper subjects for police regulations and a legislative function to determine, primarily, the expediency of regulation and the character thereof subject to judicial supervision to the extent of determining, in cases as they arise, whether the boundaries of reason have been so clearly exceeded as to violate some constitutional prohibition, express or implied; the judgment of the Legislature being controlling unless it appears beyond reasonable controversy that the interference is unreasonable.

The doctrine that the police power is a law of necessity may well be said to furnish the key to what is within and what is

without the boundaries of such power; not that a police regulation to be legitimate must be an absolute essential to the public welfare, but that the exigency to be met must so concern such welfare as to suggest reasonable necessity for a legislative remedy, the legislature to be the primary judge and the supreme judge as well except as to interference so unreasonable as to be excessive beyond reasonable controversy.

* * * Is the restraint or requirement in proportion to the danger? Is it possible to secure the object sought without impairing essential rights and principles? * * * A legislative declaration respecting the character of a law, as that its purposes is to promote public health, is not absolutely binding on the courts. It is their function to determine the real intent of the law and if its ostensible is not the real purpose, to give effect to the constitution by condemning the enactment.

A law providing that the upper berth in a sleeping car, when unoccupied, at the option of the occupant of the lower berth, be closed, is not for the promotion of the public health and comfort in that the option is given in each instance where the regulation is applicable to say whether it shall operate or not, manifestly suggesting that it is for private rather than for public interests.

The penalty for violating the law was imprisonment for six months or a fine of $100, or both. The Pullman Company instructed its porters to disobey the law. Stone, a passenger, filed a formal complaint with the District-Attorney of Brown county, at Green Bay, against a porter on the Northwestern road; the porter was arrested and convicted. The Pullman Company appealed to the Supreme Court, having backed the porter at all steps in the court procedure.

Vandalia Track Elevation and Improvement Work at Indianapolis.

In September, 1905, the city of Indianapolis, Ind., passed an ordinance requiring the elevation of all steam railroad tracks west of the Union Station as far as West street. Although the lineal distance covered by the ordinance was less than half a mile, some serious and puzzling problems were presented. The roads chiefly concerned were the Vandalia, the Big Four (C., C., C. & St. L.), and the Indianapolis Southern—the Illinois Central's recently completed line into Indianapolis, described in the *Railroad Gazette* of March 15, 1907. As mentioned in that article, the original construction of this line was made to conform to the elevation ordinance requirements and it is therefore built on an elevated steel structure for about three-quarters of a mile.

Of the other roads, the Vandalia had the heavier work to do. The accompanying map, Fig. 1, shows the district between Union Station and White river, with the lines as at present revised. The most serious problem of the Vandalia was to take care of its Vincennes division line to the best advantage. As the map shows, this line comes in from the southwest parallel to Kentucky avenue. There are two tracks, which for the last few hundred feet of their length occupy the west side of this street. Elevation of this portion of the line would have required the construction of a double-track steel viaduct and the raising of the various industry tracks connecting therewith, this being the solution offered by the city for this portion of the work. But the excessive cost of the work and the remonstrances of the owners of the industries affected caused the abandonment of the idea in favor of the one adopted. This was the construction of what is known as Eagle creek connection, a cut-off from the Vincennes division to the St. Louis division, west of the city, as shown in Fig. 2. The Vincennes division traffic is thus diverted to the St. Louis division outside the city. There was no necessity therefore for elevating the Vincennes division tracks, which, however, will be used as switching tracks to the industries adjacent thereto.

Just after crossing White river the old single-track main line of the St. Louis division passed through the city freight yard as shown in Fig. 1. To avoid elevating this yard it was decided to relocate the line to pass around the north side of it, crossing White river about 210 ft. north of the old bridge. The new line, which is double track, continues across the bottom west of the river and joins the old line near the Belt (Indianapolis Union Ry.) crossing about 1½ miles west of the station. The Vandalia already owned most of the necessary right-of-way for the new location. The additional land needed west of the river was secured by exchanges with the Big Four.

The map also shows the profile of both the old and new lines. In the city, on the elevation work, the greatest raise above the former grade is 10½ ft., which is at the Kentucky avenue crossing. From this point there is a 1 per cent. temporary run-off toward the station, and on the west, following 500 ft. of 0.1 per cent. down grade, there is a 0.25 down grade across the river and Parry avenue. From Parry avenue the line runs down to a grade crossing with the Belt, which is about 1,400 ft. west of the river.

When the Kentucky avenue crossing was begun the old main track of the Vandalia had to be abandoned and arrangements were made to run into the station over the Big Four tracks. The new

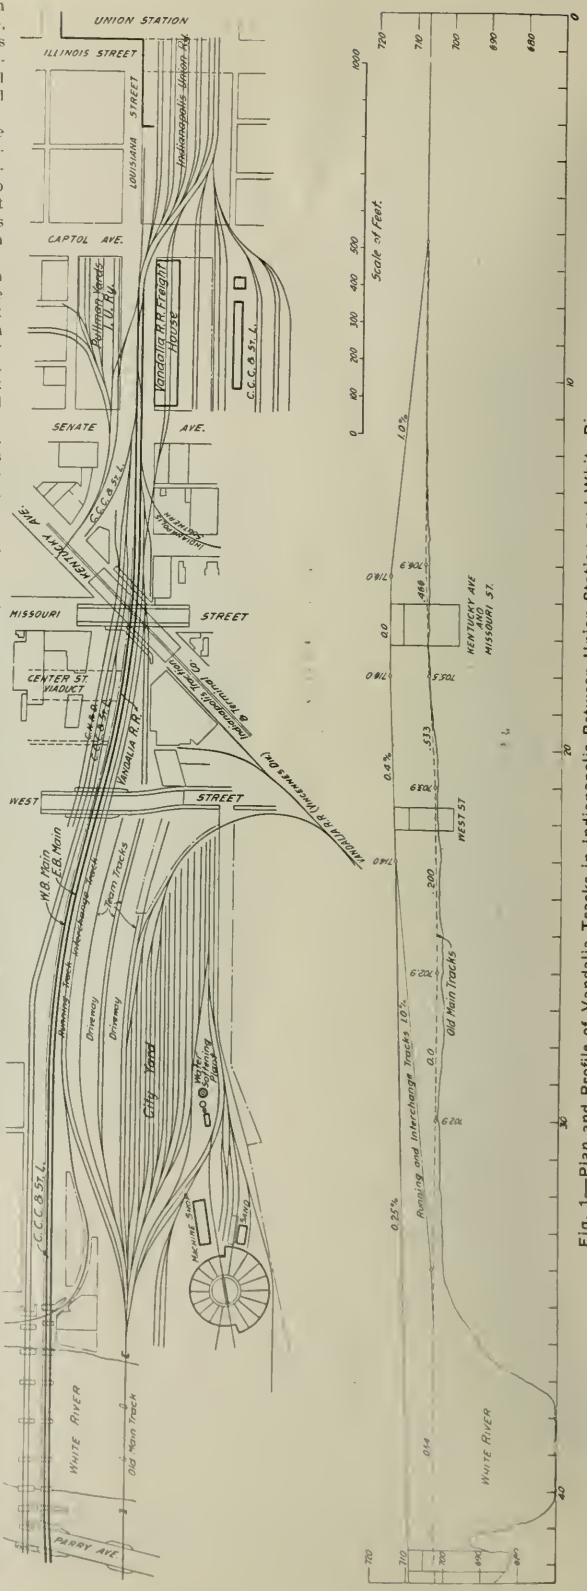

Fig. 1—Plan and Profile of Vandalia Tracks in Indianapolis Between Union Station and White River.

line west of the river had been completed and a temporary connection with the Big Four was therefore put in west of Parry avenue. As soon as the Vandalia was ready to use its new tracks, the arrangement was reversed in order to permit the Big Four to build its portion of the West street and Kentucky avenue crossings and raise its tracks to the new grade. The Big Four did not disturb its White river crossing and the temporary connection with the Vandalia tracks was therefore put in about 500 ft. east of the river. The Cincinnati, Hamilton & Dayton's Springfield, Ill., line enters Indianapolis over this division of the Big Four and the trains of

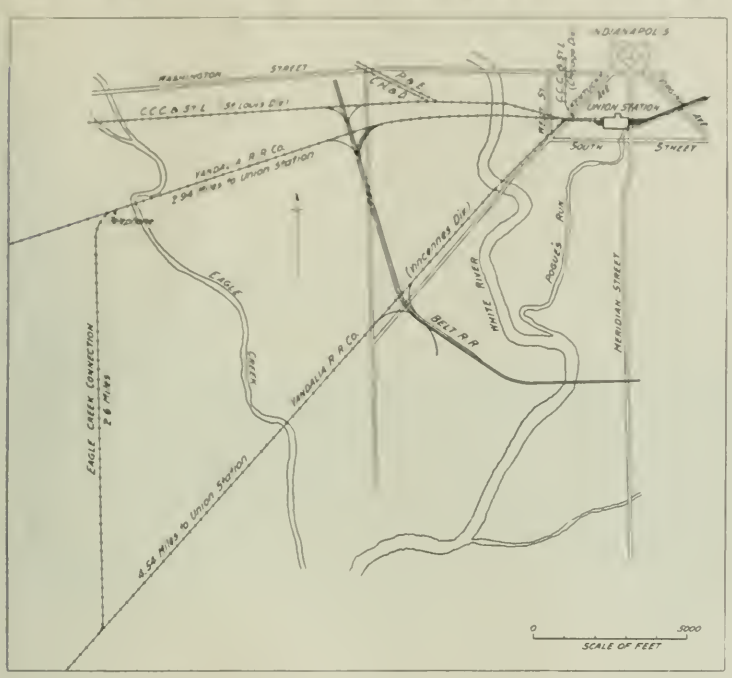

Fig. 2—Map of Vincennes Division Connection; Vandalia Railroad.

the two will continue to use the Vandalia tracks until the elevation work of the Big Four is completed enough for resumption of traffic on its own lines. This will probably be about the first of the year.

The most important single feature of the work is the White river bridge, in conjunction with which is the Parry avenue crossing immediately west. The two were built at the same time, under one contract. The river crossing is a deck plate girder structure on concrete masonry, the superstructure being independent for each track, except for sway bracing. The Parry avenue crossing is similar to the other street crossings, which will be referred to in detail later. White river bridge is 545 ft. long, made up of seven spans as follows, beginning at the east end: One 43 ft. 6 in. span, two 81 ft. spans, two 103 ft. 3 in. spans, one 81 ft. span and one 52-ft. span. The dimensions given are center to center of piers. Work was begun on the substructure early in April, 1906, and the bridge was finished late in December of that year. The masonry was to have been done in three months, but numerous unexpected obstacles delayed progress on the foundations. All masonry rests on piles except the east abutment, the piles being driven to gravel in all cases. In pulling down the foundations easy digging was impeded by the occurrence of large boulders, old trees, etc. United States interlocking steel piling was used on three of the piers and wooden sheathing on the rest, the wood sheathing being 6-in. x 8-in. yellow pine in one instance. Better progress would have been made had the steel piling been used throughout. This and most of the wooden sheathing was driven with a steam hammer. A drop hammer was used for the steel piling and in several cases the piles were driven completely through old logs. The bottoms of these piles, which were 12-in. wide, weighing 35 lbs. to the foot, were badly battered in several instances where large boulders were encountered. The steel piling made almost a water-tight cofferdam, but proved exceedingly hard to pull, requiring 90 tons to start some of the sections, and in some cases four or five sections would come up together.

The total weight of the superstructure of the bridge is 1,608,411 lbs. The contractor for the substructure was the Essex Construction Company, and for the superstructure the Pennsylvania Steel Company. A view of the two bridges—White river and Parry avenue—is shown in Fig. 3, the truss bridge back of the river crossing being that of the Big Four.

The most important subway is at Kentucky avenue. It will be observed from the map (Fig. 1) that this occurs at the intersection of Kentucky avenue with Missouri street, Kentucky avenue passing under the tracks at a skew of about 45 deg. A single structure serves the two elevating roads and also carries a switching track for the C., H. & D., making eight tracks in all. It is a solid ballasted floor bridge built up of columns, cross-girders and troughs. For Kentucky avenue the distance between abutments is 85 ft., and for Missouri street, 60 ft. Details of the concreting of the Vandalia's portion of the floor are shown in Fig. 4. The troughs are filled with 1:3:6 gravel concrete carried 3½ in. above the tops of the troughs. One inch below the surface is embedded electrically welded wire cloth of 3-in. x 8-in. mesh. Over this is a five-ply coat of felt and pitch applied according to the Barrett specifications. A layer of soft building brick on 1 in. of sand protects the waterproofing and over this the ballast is laid. The details show how the concrete

Fig. 3—Parry Avenue and White River Bridges, Showing Big Four Bridge in Background.

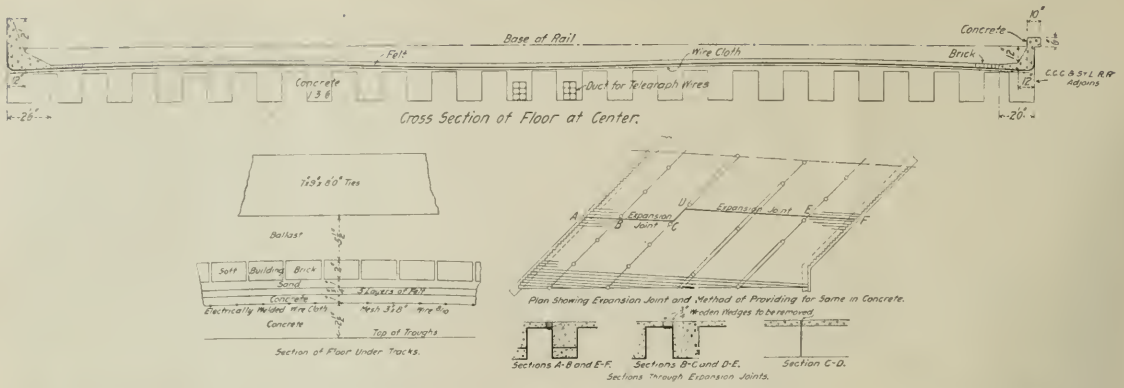

Fig. 4—Details of Concrete Floor; Kentucky Avenue Bridge.

Fig. 5—Kentucky Avenue Bridge; Indianapolis Track Elevation.

is carried up to the tops of the fascia girders. They also show the expansion joint placed longitudinally of the bridge and the method used in providing for same in the concrete. All telegraph wires are being put underground on the elevation work from the passenger station across Parry avenue. Two six-hole conduits are used, which are placed one above the other in the fill, and side by side on the bridges. Their position in two of the troughs is shown in the cross-section of Kentucky avenue bridge in Fig. 4. A manhole, for access to the wires, is placed at each end of each bridge. A photographic view of Kentucky avenue bridge is shown in Fig. 5.

In conjunction with the work in the city, and the changes necessitated thereby, a large amount of improvement work is under way immediately west of the city, including grade revision and second track work from the west end of the terminal freight yard, just west of the Belt crossing, to Ben Davis, about 6½ miles west of Union Station. As already mentioned, and as indicated in Figs. 2 and 6, the Eagle creek connection from the Vincennes division joins the St. Louis division about three miles west of Union Station. This line is continued as a third track across Eagle creek and into the terminal yard already referred to, about half a mile east of the junction. The old crossing of Eagle creek was a two-span single-track lattice girder bridge. This was replaced by the three-arch reinforced concrete bridge, shown in Fig. 7, the arches being 55 ft. clear span.

The construction of the Eagle creek connection also necessitated a considerable change in the grade and alinement of the electric interurban line paralleling the Vandalia—the Terre Haute, Indianapolis & Eastern. To avoid a grade crossing, the traction line was carried overhead by the railroad company. In order to do this it had to be swung to the south, as shown in Fig. 6, in order to have room for the fill. This is shown best in Fig. 8, which is a general view of the change, the proximity of the old location of the traction line to the Eagle creek connection being apparent. Another reason was a possible future connection toward the west from Eagle

Fig. 8—General View of Traction Line Change; Vandalia Track Elevation.

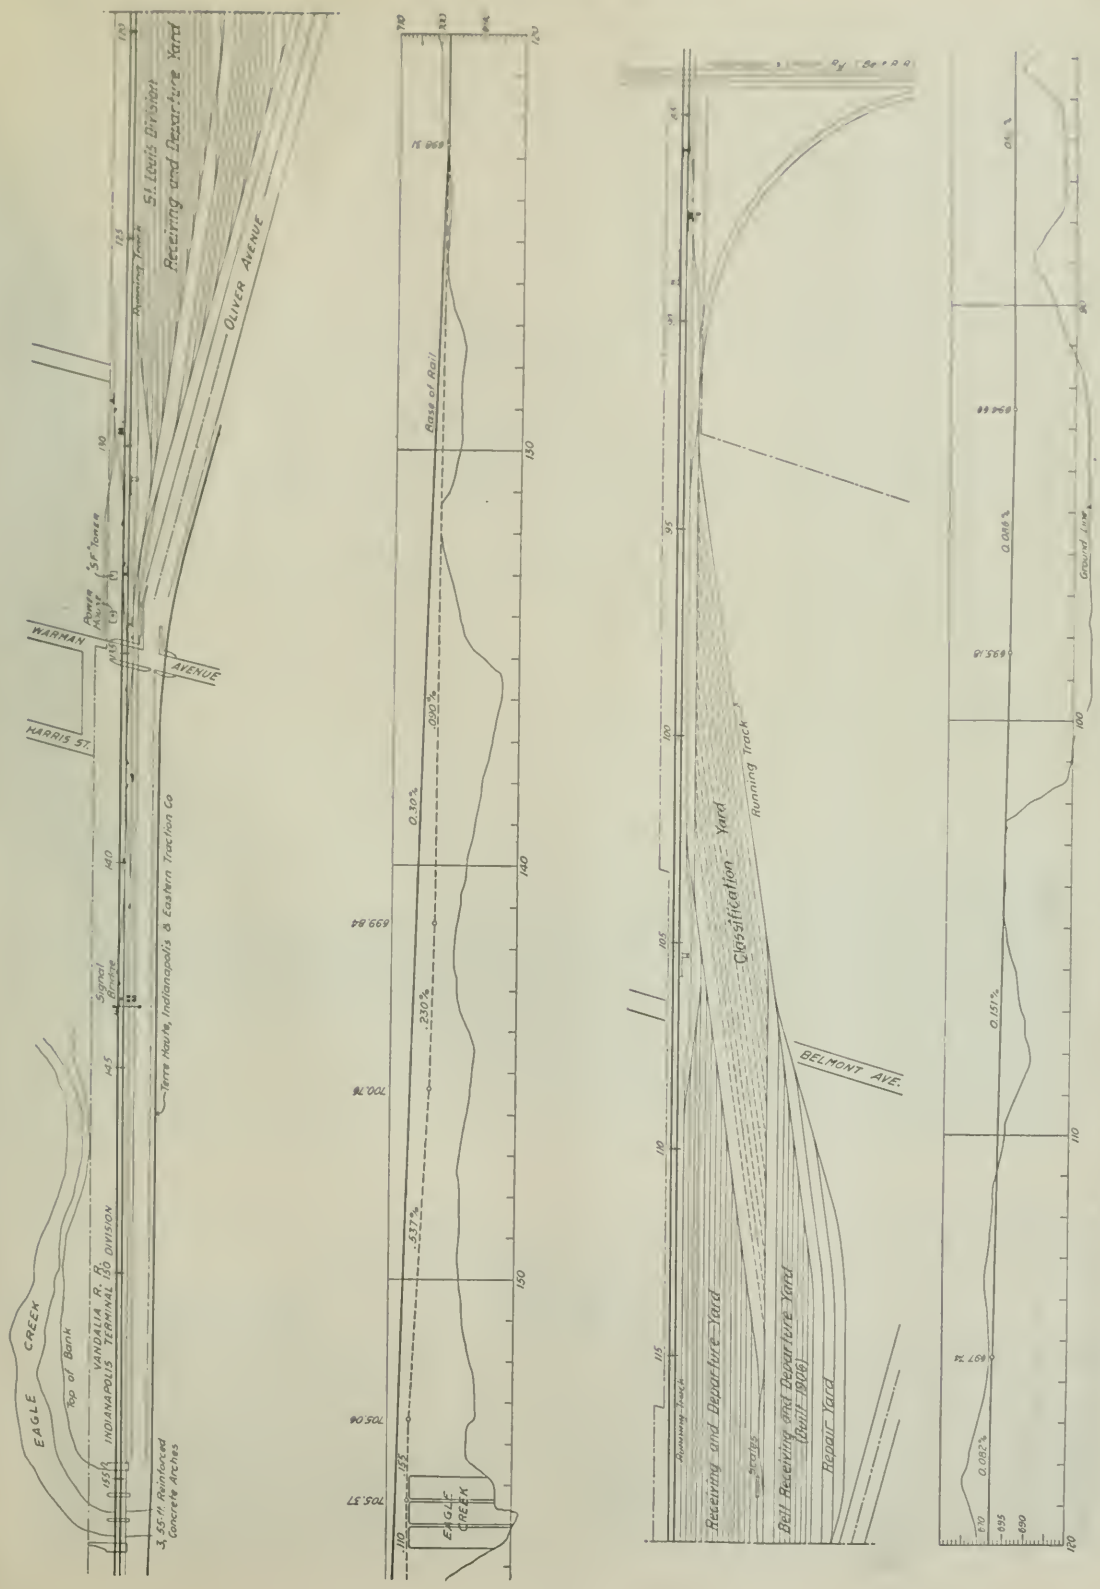

Fig. 6—Plan and Profile of Vandalia Tracks at Indianapolis from Belt Railroad Crossing to Eagle Creek.

creek connection to the St. Louis division. The change affected about 3,200 ft. of the traction line and, in addition to the heavy fill and the bridge over Eagle creek connection, required the construction of a double box subway for the highway near the east end of the change. A view of this subway and the fill at this point are shown in Fig. 9. The bridge over Eagle creek connection is 91 ft. between faces of abutments, on account of the sharp curvature at the point of crossing.

Enlargement of the terminal freight yard of Fig. 6 is part of the work. Indianapolis is the terminus of the Vandalia, which is controlled by the Pennsylvania Lines, but operated independently. Through freight traffic between the Vandalia and the Pan Handle (P., C., C. & St. L.) is interchanged by way of the Belt. The drawing shows the addition last year of trackage for a Belt receiving and departure yard and for repair tracks; also the contemplated addition of a classification yard at the east end. Entrance to the yard is at the west end, and an electric interlocking plant is being installed for the control of this entrance. The positions of this tower, called S F tower, the power house for the plant and the signal bridge are shown in Fig. 6. The signal bridge spans four tracks, the most southerly being a drill track for the yard. Electric automatic signals are being installed from Union Station to S F tower.

The heaviest work on the grade revision and second track work is Ben Davis cut at the western end of the work. This cut is 7,000 ft. long, 16 ft. deep at maximum point and contains about 226,000 yds. It has supplied a good part of the filling material for all of the work here described. However, a part of the work east of White river was filled with the strippings from a large gravel pit opened up a short distance west of Eagle Creek. The new work is being ballasted with gravel from this pit. With the exception of the masonry and bridges, all work is being done by company forces. The track elevation work is practically completed. This and the other improvement work is being done under the general supervision of F. T. Hatch, Chief Engineer of the Vandalia. R. K. Rochester, Principal Assistant Engineer, is in immediate charge, assisted by H. T. Sympson, Assistant Engineer. All steel work was designed in the office of J. C. Bland, Engineer of Bridges of the Pennsylvania Lines West of Pittsburgh.

MISSOURI.

Chester, Perryville & Ste. Genevieve—West Chester to Minnith	23.00
Mississippi River & Bonne Terre—Elvins south to Mitchell	4.00
Missouri & North Arkansas—Seligman northwest toward Joplin	15.00
Missouri Southern—Reynolds to Ohlman	4.00
Saline Valley (C., G. & C.)—Minnith to Klapek	5.00
Springfield Southwestern (Mo. Pac.)—Springfield to Crane	34.15
Versailles & Sedalia—to mines	1.00
	86.15

MONTANA.

Billings & Northern (Gt. Nor.)—Armington southeast towards Laurel	32.00
Butte, Anaconda & Pacific—Anaconda to Browns	6.00
Chicago, Milwaukee & St. Paul—Pacific Coast extension, between Ismay and Perry, 38.00 miles; Harlowton and Delphia, 92.30 miles; Whitehall west, 4.30 miles; Butte east 9.30 miles; total	143.90
Yellowstone Park (O. S. L.)—Idaho state line to Yellowstone	9.85
	191 75

NEBRASKA.

Chicago, St. Paul, Minneapolis & Omaha—New Castle to Wynot	18.44
South Omaha & Western (Mo. Pac.)—Lane toward South Omaha	4.07
Union Pacific—Hordville west to Central City, 4.96 miles; Belmar to Luther, 10.04 miles; total	15.00
	37.51

NEVADA.

Bullfrog Goldfield (Ton. & Goldf.)—Springdale south to Beatty and Gold Center, thence northwest to Rhyolite	26.00
Caliente & Pioche (S. P., L. A. & S. L.)—Caliente north to Pioche	32.49
Fallon Railway (So. Pac.)—Between Hazen and Fallon	1.11
Las Vegas & Tonopah—Rhyolite north to Goldfield	74.00
Silver Peak—Blair Junction to Blair	17.50
Tonopah & Tidewater—California state line north to Gold Center	28.00
Western Pacific—Utah state line west to Shafter	39.00
	218.30

NEW JERSEY.

West Jersey & Seashore (P. R. R.)—Wildwood branch extension, Wildwood to Wildwood Crest	0.56

NEW MEXICO.

Cimarron & Northwestern (St L., R. M. & P.)—Cimarron northwest to Van Bremmer Park	36.00
Eastern of New Mexico (A., T. & S. F.)—Between Texico and Belen 35.09 miles; Clovis to Cameo, 1.87 miles; Belen to Rio Puerco, 10.84 miles; total	47.80
	83.80

NEW YORK.

Adirondack & St. Lawrence—De Kalb Junction to Hermon	4.00
Delaware & Hudson—Rouses Point to connection with Napiersville Junction Railway	1.10
Erie & Jersey (Erie)—between Guymard and Ollsville	4.38
Genesee Valley Canal (P. R. R.)—Scottsville branch Scottsville to Garbutt	2.60
Glenfield & Western—Fish Creek to Menteola	2.84
Greenwich & Johnsonville—Greenwich to Salem Junction	11.00
Lehigh & Lake Erie (L. V.)—Tiffi Farm (Buffalo) to L. S. & M. S. at West Seneca	3.00
Nypano Railroad (Erie)—Between Pennsylvania state line and Lakewood	10.47
Pittsburg, Shawmut & Northern—Approaches to bridge at Stony Creek	1.00
	40.39

NORTH CAROLINA.

Carolina & Tennessee Southern (Southern)—West between Bushnell and Tenico state line	1.50
Carolina Valley—High Point north towards Greensboro	2.00
Carthage & Pinehurst—Pinehurst to Carthage	12.50
Durham & South Carolina—Farrington to Goshwell	3.75
East Carolina—Three miles south of Farmville to Hookerton	10.20
Norfolk & South—Raleigh to Pamlico Junction, 2.10 miles; Zebulon to Chocowinity, 75.77 miles; Chocowinity to Washington, 38 miles; Bayboro toward Oriental, 8.30 miles; Mackeys Ferry toward Columbia, 5.00 miles; Edenton toward Skinners Point, 2.00 miles; total	97.06
South & Western—Altapass to present end of track, 0.77 miles; Marion to North Cove in McDowell county, 14.05 miles; total	14.82
Tallulah Falls—Prentiss to Franklin	4.00
	148.83

NORTH DAKOTA.

Chicago, Milwaukee & St. Paul—Pacific Coast extension, South Dakota state line to Ives	89.10
Great Northern—Berthold-Crosby line northwest to Crosby, 61.72 miles; Walhalla north to International boundary, 5.36 miles; total	67.08
Minneapolis, St. Paul & Sault Ste. Marie—Dogden to Max	27.70
	183.88

OHIO.

Lake Erie, Alliance & Wheeling (L. S. & M. S.),—Piney Fork south to Dillonvale	5.00
Lorain & West Virginia (Wabash)—Between Wellington and Elyria, 15.79 miles; branch to quarries, 9.19 miles; total	24.98

Trainmen's Hours in Great Britain.

The British Board of Trade has issued its statement of overwork by railroad employees in the month of June last, as reported by the companies under an order issued by the Board July 31. The Board now requires such a record for one month in each quarter of each year. Under the terms of the order the record must show the number of employees of different classes—trainmen, signalmen and examiners—who, on one or more occasions during the month have been on duty more than 12 hours at a time, or who, after so working, have been allowed to resume work with less than nine hours' rest. A second table is given showing a summary of these same periods of duty as they appear, after deducting time spent in traveling home on being relieved. The number of employees embraced in the report now given is 112,442, and in the month under review they worked 2,865,309 days. The number of days on which these men worked over 12 hours was 2.65 per cent. of the total days worked. The percentage, after making the deductions for time spent in going home, was in most cases about 10 per cent. less, although in the case of freight trainmen it was 30 per cent. less.

In connection with this subject American readers will be interested in a report of the conditions on the Lancashire & Yorkshire as investigated last May by Lieutenant-Colonel Druitt, whose statement was published by the Board of Trade in its annual report on employees' hours of labor. Investigations were made of conditions on other roads also. In England, as in the United States, the labor unions and the government together have forced the reduction of working hours of trainmen and signalmen to rigid limits, with the important difference, however, that on the British roads, as is indicated in the report above referred to, the limit beyond which it is held to be more or less dangerous for a trainman to work is 12 hours. On American railroads this period, 12 hours, is the practical limit which superintendents and trainmen use as a basis in preparing their schedules, but the government has not yet undertaken to declare trainmen overworked until they have been on duty 16 hours continuously.

Lieutenant-Colonel Druitt's report deals with the pay of the men, their hours and their holidays, the question of the sufficiency of the forces at division points and all the conditions surrounding their work. We quote his general statement and his chapter on "relief":

CONDITIONS ON THE LANCASHIRE & YORKSHIRE.

To move a large amount of merchandise on this railroad under existing conditions of trade, and at the same time to keep the men's hours within reasonable limits, is a difficult problem. Owing to the line being crowded with passenger trains during the day, and the way business is carried on by merchants, all goods traffic has practically to be done at night. The merchandise is rushed to the goods yard at the last possible moment after business hours, and the owners expect it to be delivered at its destination, perhaps 20 or 30 miles away, by the time the shops open next morning, quite forgetting that the goods have to be weighed, labeled, packed into trucks at the receiving yard, and the trucks to be then taken to marshaling sidings and made up into trains for the various destinations. Owing to the exceptional boom in the cotton trade during the last six months or more, the unusually large amount of goods to be moved has sometimes made the trains start very late, perhaps two hours or more after scheduled time. And as the amount to be carried is not known till the last moment, the enginemen and guards have to be in attendance with the engine at the schedule time, and be on duty perhaps two hours before starting. Also, owing to the abnormal amount of traffic resulting from the great boom in trade, the various trains block each other, especially at yards and junctions where branch lines join the main line, and wagons have to be transferred from one train to another, while very often the branch line trains are late. The result is that a train often gets four or five hours behind time in a distance of 30 miles, and takes perhaps 12 hours or more doing that distance. In East Lancashire especially the traffic between Manchester and Colne, Burnley, Accrington, Haslingden and Ramsbottom has been heavier during the last winter than ever known before.

Relief.—This is a difficult question to adjust. The regulations are as definite as possible, but it has been found impossible to carry them out during last winter so as to relieve every man before he has worked long hours; and as regards goods guards, if they did get relieved after 12 hours with a train, the time spent traveling after-

ward brought up the hours very often to 13 or over. It is impossible to provide relief at fixed points, as it is quite uncertain when the trainmen requiring relief will arrive at that point, and if an average time is fixed the train may pass before the men require relief. Then, as shown above, the traffic is almost all at night, when no passenger trains are running, and if a man starts duty at 6 or 7 p.m. he will require relief at some point not known until he telegraphs from it at 4 or 5 a.m. So it is often impossible to get relief to him except perhaps by another goods train or light engine; and if the men are relieved they may have to wait an hour or two for a passenger train to take them home, or they may get part of the way by a goods train or light engine. Sometimes relief men just miss the men to be relieved, as trains cannot be kept waiting when they have the road, and so the relief men have to follow after the others the best way they can. Sometimes, also, a man who wishes to make long hours will wire for relief at a place which he knows the relief man cannot possibly reach in time. The company showed me particulars of a number of cases where men had not carried out the regulations in asking for relief in time or in the proper manner, and so had worked long hours in consequence. That this is done by a few young unmarried men, who wish to make long hours and earn extra wages, was admitted by men to me in private; but, as a rule, the best men are only too glad to get home as soon as possible. As a rule the men did get relieved, except during fog and bad weather, but after being in charge of a train for 12 hours and then traveling afterward made the hours excessive.

Lieutenant-Colonel Druitt finds that wipers only 18 or 19 years old are frequently employed as firemen where it is necessary to relieve the older men after they have worked 12 hours, and a large number of such lads are being taken into the service. The railroad companies, in their endeavors to meet the severe demands of the government, make much (in their reports) of the fact that men can rest while on their way home after ending a tour of duty, but it appears that on these trips the men often have to ride in a caboose or a locomotive, so that Colonel Druitt thinks they do not rest much.

The only definite recommendation made by the inspector is that there should be a minimum limit of rest time between tours of duty, exceptions to be allowed only under very special or urgent circumstances. It appears that last winter was exceptionally severe on the railroads. There was an unusually heavy movement of freight, there was much fog and snow and much sickness of the men. Under these conditions the number of trained men at the disposition of the company was not large enough.

Protecting Steel Bridges Against Brine from Refrigerator Cars.*

The committee is agreed on two points: That the proper remedy for the trouble is in so constructing the cars that the brine can be retained till it can be drawn off by the train hands without injury to structures; and that no paint has been found that is effective in protecting the metal.

Mr. Berg (L. V.) reports: "The Lehigh Valley has not adopted any special construction methods for the protection of bridges against the action of salt brine from refrigerator cars, except the ordinary protection of the steel work by paint. We have found no satisfactory paint thus far to withstand this action for any length of time, so that certain parts of the bridges, depending upon local conditions and class of construction, have to be painted every year."

Mr. Montzheimer (E., J. & E.) says: "The best way to obviate this trouble is to have the drips from the refrigerator cars piped to the center of the track and then protect our bridges so that water dipping on the center of the track will not go to the steel work."

Mr. Draper (Ill. Cent.) sends a sketch of a protection that is proposed to be tried on his road. He says: "The print shows the proposed method of protecting our floor system from salt water and from the weather. It is a galvanized iron box trough used as a spacing block between the ties, and made with a pitch in order to turn the water off very rapidly. This protects the floor system from the rust from the rails, which is as bad as salt brine in destroying the paint. We have used on this road all classes of paint, but have not found anything that will overcome salt water, and I think that in the future we will have to resort to this method of covering to keep off the dirt, rust and salt water from the steel.

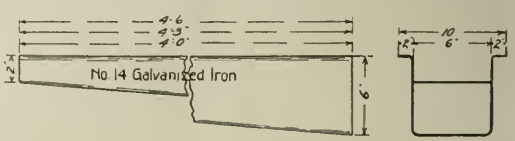
"Our estimated cost of putting an ordinary deck on a steel structure is $4.50 per foot for labor and material. This method of covering will add $1.65 per foot, making a total of $6.15 per running foot; and I am satisfied that we will receive better results by keeping our steel work properly covered with paint. This is to be used for deck and through plate girders and through truss spans. The girders and spans where we have the corrugated floor system and use a 6 in. x 8 in. yellow pine tie, should be covered on the outside of the rail with 1½-in. matched lumber. This will overcome the drip from falling direct on to the steel."

The committee recommends that all equipment which scatters salt brine along the line of tracks be provided with a copper tank on each car with sufficient capacity to hold all the salt brine that may be made from melting ice, and have it emptied at destination of car, or at points where such car is re-iced. The practice of scattering salt brine should be stopped; and it can be stopped much cheaper and with better results than to try to protect the structures from such action.

In 1898, at the Richmond meeting, a report on this subject estimated that one refrigerator car would produce about 200 gals. of brine in 24 hours. The suggestion was made that the cars be piped so that the brine be discharged at center of track and the structures provided with troughs to carry it clear of the metal work. In the discussion of this report, tanks were suggested and a method of filling between the ties with blocks bedded in paint somewhat similar in principle to Mr. Draper's scheme. President Berg stated that the Master Car Builders' Association had considered this matter and a committee had submitted two schemes, one of which, consisting of piping to center of track and discharging through a hose reaching nearly to the ground was adopted by the association as "Recommended Practice."

At the Quebec meeting, in 1903, Benjamin Douglas, of the Michigan Central, described his method of applying asphalt to floor plates by heating the iron and pouring on hot asphalt. This formed a sort of enamel, the asphalt adhering to the iron perfectly. A modification of this method could be applied to ordinary floors affected by brine drippings. It was also suggested at this meeting that tops of stringers and floor beams be covered with ready roofing or similar material as a protection from brine.

At the Pittsburg meeting, in 1905, Mr. Reid, of the Lake Shore, and Mr. Cartlidge, of the Chicago, Burlington & Quincy, reported on the use of roofing felt on stringers; the latter finding it satisfactory and the former stating that it soon cut through. Mr. Loweth, of the Chicago, Milwaukee & St. Paul, stated that he was trying "iron bark," a proprietary material consisting of canvas ducking saturated in a preparation of linoxyn and a resinous flux. A recent letter from Mr. Loweth states that on several spans of deck girders with creosoted timbers laid close and covered with ballast, the "iron bark"



ELEVATION

Proposed Method of Protecting Floors of Iron Bridges from Brine and Water; Illinois Central.

placed over the girder flanges under timber was in perfect condition after two years' wear. On several standard-floor bridges with 4-in. spaces between ties, the "iron bark" had cut through under the ties or crimped up between them. The material and its application is expensive and except in the case of solid continuous timbering does not seem to be entirely satisfactory. It is the material used for covering the cables of the Williamsburg bridge at New York.

The report is signed by R. P. Mills, chairman; A. Montzheimer, Walter G. Berg, F. O. Draper, Charles Carr.

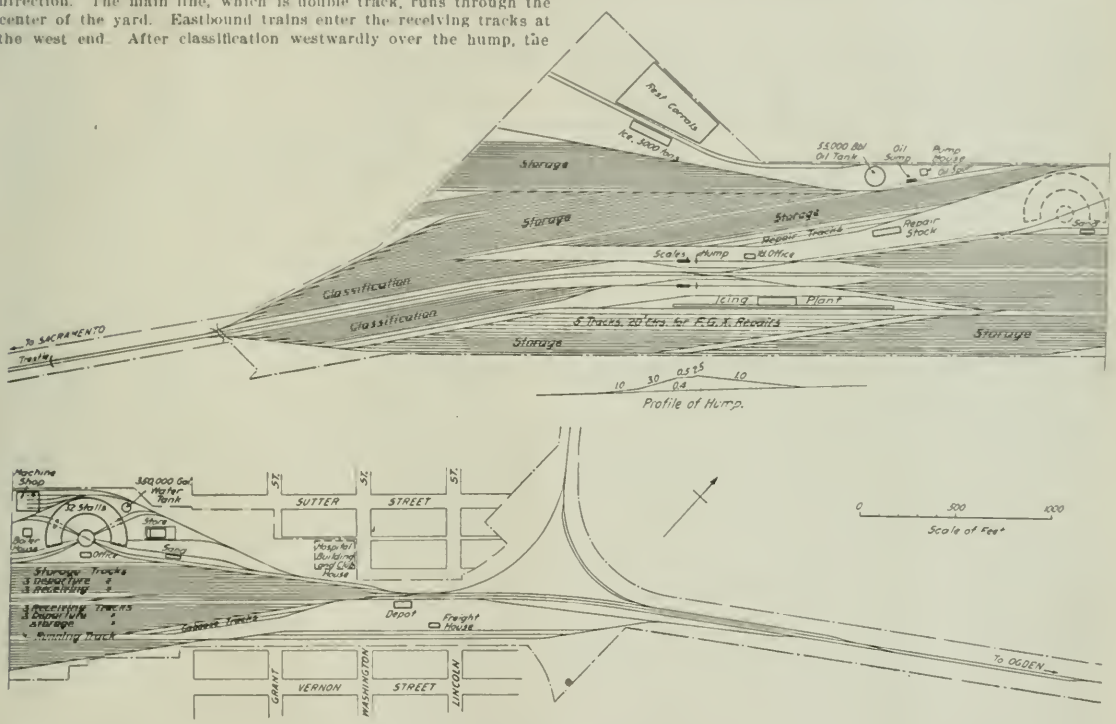
*Abstract of a report to the Milwaukee convention of the Superintendents of Bridges and Buildings.

The Roseville Yard of the Southern Pacific.

A plan of the yard lately completed by the Southern Pacific at Roseville, Cal., is shown herewith. The arrangement is somewhat peculiar, due to the physical condition of the site. Roseville is about 18 miles northeast of Sacramento, and is the junction of the line to Ogden and what is known as the east side line in the Sacramento valley. The San Francisco-Portland line follows the west side of the valley. The two join at Tahama, 105 miles north of Roseville.

The situation of Roseville with respect to Sacramento, and the proximity of the Sierra Nevada mountains on the east, made it necessary to have at this point a receiving, departure and classification yard. Freight coming into Sacramento from the west or south is forwarded north or east from Roseville, and vice versa. Trains coming over the mountains are made over at Roseville for the lighter grades of the Sacramento valley, while through trains bound east have to be broken up into sections for the heavy mountain grades.

The yard has two humps, but it will be observed from the plan that all of the classification tracks are at the western end. This is because the yard is on a 0.4 per cent. up-grade eastwardly, which would prevent switching and classifying cars by gravity in that direction. The main line, which is double track, runs through the center of the yard. Eastbound trains enter the receiving tracks at the west end. After classification westwardly over the hump, the cars are drawn back by way of the run-around tracks to the departure tracks. There is ample storage room, and provision is made for doubling the present engine house accommodations.



Roseville Yard of the Southern Pacific.

Electric Railways in Sparsely Settled Communities.

BY E. P. ROBERTS.*

There are three general classes of electric roads: the city, or urban; the suburban, and the interurban. The city line proper is one lying entirely within the limits of a city, and, in general, its receipts depend on the magnitude (population and area) of the city rather than on the population per mile of road, as in small cities the distance from residence centers to business centers is usually short, and people can and do walk. On the other hand, in the large city, the distance between residence and business centers is usually large, and people ride more frequently than in the other case. As a result there may be a smaller population per mile of road in a large city, and yet such road may have far greater receipts per mile mile of track is greater.

Suburban roads are usually an extension of the city system and operate on highways, frequently with cars of the city type. The schedule provides for rather frequent stops, though less in number than for an interurban road. Suburban roads may be classified as those connecting a terminal city with one or more outlying towns and villages, and those which serve a suburban residence district. Generaly speaking, the latter class will show greater earnings per capita for equal density of population, excluding the population of and per capita than in the smaller city, where the population per the terminal city from the population per mile of road.

Freight traffic on a city road is nearly always a negligible quantity, but in the case of a suburban or interurban road may reach a very respectable value. The electric roads doing the largest freight business are usually those which run through the most sparsely settled districts. This is frequently due to the fact that the steam freight service in such district is limited, or entirely absent. It is also a fact that such roads are generally built with the expectation of doing a considerable freight business, or are forced to develop such business because of the small passenger traffic. As the light passenger traffic can be taken care of by cars operating under considerable headway, the track is available for freight service. In most cases such roads have single track, with sidings of such length and location as may be required.

Not infrequently suburban roads, or those which should properly be designed as suburban roads, are equipped with large and heavy cars geared for high maximum speeds and attempt to make fast schedules, while at the same time doing a suburban business and making frequent stops. Such practice is almost always uneconomical, as it gives on the one hand, a poor suburban service, the cars being too large, the seating not best suited to the service, the headway infrequent; on the other hand, a wretched interurban service. A heavy car geared for high speed is very poorly adapted to suburban service with its frequent stops, and also results in an excessive amount of power for the service given. Where the number of stops is large, it is folly to gear a car for high schedule speed. In fact, with from six to eight stops per mile it is useless to gear a car for a higher speed than from 25 to 30 miles an hour, as no gain in schedule speed at all commensurate with the cost can thereby be obtained. Another difficulty arising from the use of large and fast cars for suburban service is the necessity for the high rates of acceleration which are required in order to make the time card when the traffic is heavy and the stops numerous. Such high rates of acceleration require large and expensive motors, and make heavy demands on the power house, sub-station and line.

The equipment on interurban roads should always be geared for the very lowest speed that will make the required schedule, plus a sufficient margin for delays. Any higher gearing results in an

*Abstract of a paper read by E. P. Roberts, of the Roberts & Abbott Company, Cleveland, Ohio, before the American Street & Interurban Railway Association.

unnecessary expense for car equipment, in some cases unnecessarily high repair bills, unnecessary expense for power, and also a larger power house and sub-station equipment than would otherwise be required. The motor equipment selected should always be of ample capacity for the work which it has to do. New equipments may be heavily loaded for a long time before the effect of such overloading becomes evident, and smaller overloads are slow to show their effect. But when the trouble once starts it comes all at once. It sometimes happens that a road will increase its schedule speed, making the necessary changes in gearing to secure the required maximum speed, and apparently everything is lovely, but in one to two years there comes a sudden epidemic of burnt out armature and field coils, and within a very short period it is necessary to rewind practically every motor on the road. This is the inevitable result of long continued overload.

The entire population directly on the route should always be considered in estimating probable earnings. When one city greatly preponderates it should be excluded, but its population noted. For sections a greater or less distance from the route we use a percentage based on local conditions, and take into account the character of the population, the reasons for travel and the comparative facilities, including accessibility. For example: Near the principal city a person residing three miles or less from the corporation limits of the city, and three miles from the proposed road, would seldom, if ever use it, whereas, if he were a considerably greater distance from the city, and three miles from the road, he would use it almost as much as if he lived directly on the route, provided that there was not another electric or a steam road nearer to him. If such road were a steam road consideration would be given to the service provided by it.

It is also evident that if the location of the proposed road is along a river, especially a wide river with few bridges, the population on the other side of the river from the road has lessened in value; it might not, geographically speaking, be a quarter of a mile distant, but from the standpoint of accessibility may actually be several miles away. In some cases and because of connection with steam or electric railroads, or river transportation, or existing stage routes, considerable value should be given to a population at a considerable distance from the route, whereas in other cases, and as above indicated, the population quite near the route may have little value. The population so obtained is what we term the "equivalent" population, by which is meant the population, which, if all of it were directly on the route, would equal in amount of travel the actual population as it is actually located. For example: a population of 1,000 may be considered as equal to 100 or 200 or more directly on the route.

Usually it makes little difference to the interurban road whether the principal city has 100,000 or 500,000 population, provided that it is the principal city in that general section of the country, and therefore the one to which all business tends. If the interurban road has a pleasure resort, it might seem fair to assume that it would receive more passenger traffic from a terminal city of 500,000 than it would from a smaller terminal city. On the other hand, the larger city will have more places of amusement, and it is a question whether such seeming probable result will prove to be a fact. The freight and express business *from* the principal city depends on the conditions along the route, and the same is true of travel for business reasons, and also largely for social reasons, and is not affected by the size of the principal terminus. The travel *into* the principal terminus is not affected by its population, provided, as before stated, it is the principal city in the general section of the country. The receipts per capita depend upon the reasons for travel, comparative facilities, habits of the people, character of population, comparative costs of travel, etc.

The following examples show on typical roads the relation between receipts per capita and population per mile of road, exclusive of the population of the terminal city.

Road No. 1 is a double-track interurban in the central west, with its terminal in a large city, but having no other towns of any considerable size. It has a rather large suburban resident population, especially during the summer, and the double-track main line of the road is paralleled by a third track operated by the same company, and two or three miles from the main line, but connecting with it at both ends. The earnings include both lines. The population of the principal city is excluded. Its data are:

	1904.	1905.
Population, total	20,402	20,692
Population, per mile	463	470
Earnings, total	225,751	245,809
" per mile	5,130	5,560
" per capita	11.06	11.84

Road No. 2 is a 42-mile road in the central west, having a medium-sized terminal city, the population of which is excluded from the total.

	1904.	1905.
Population, total	38,469	40,005
Population, per mile	915	952
Earnings, total	181,201	173,153
" per mile	4,311	4,123
" per capita	4.71	4.33

Road No. 3 is a 34-mile road having several small cities, whose population is included in the totals.

	1904.	1905.
Population, total	71,338	73,249
Population, per mile	2,100	2,150
Earnings, total	136,918	147,851
" per mile	4,000	4,330
" per capita	1.90	2.20

Road No. 4 is a 39-mile road having a large terminal city and one smaller terminal city. The larger city is excluded and the

Road No. 5 is an 80-mile road in the central west, having only

	1904.	1905.
Population, total	28,424	28,781
Population, per mile	730	740
Earnings, total	225,410	248,912
" per mile	57,880	6,300
" per capita	7.90	8.60
" per mile	2,572	2,885
" per capita	2.56	2.82

Road No. 6 is also a road in the central west, 30 miles in length, and having one medium-sized city, the population of which is excluded from the totals.

	1904.	1905.
Population, total	32,373	32,993
Population, per mile	1,079	1,100
Earnings, total	85,055	80,100
" per mile	2,835	2,770
" per capita	2.66	2.43

Road No. 7 is a road in the central west, having one large and one very large terminal city; both of these are excluded from the totals; miles of track, 160.

	1904.	1905.
Population, total	116,993	118,957
Population, per mile	731	743
Earnings, total	660,000	699,339
" per mile	4,125	4,370
" per capita	5.64	5.87

Road No. 8 is also in the central west, having 92 miles of track and one large terminal city, the population of which is excluded from the totals.

	Last half '04-first half '05.
Population, total	85,082
Population, per mile	924
Earnings, total	404,880
" per mile	4,400
" per capita	4.75

Road No. 9 has one large, one medium and one small terminal city. The large terminal city is excluded and the other is included in the total; miles of track, 45.

	1904.	1905.
Population, total	59,166	62,124
Population, per mile	1,315	1,353
Earnings, total	234,278	223,605
" per mile	5,205	5,000
" per capita	3.95	3.60

Road No. 10 is a large road in the central west, having 134 miles of track, and one very large terminal city, the population of which is excluded.

	1904.	1905.
Population, total	92,539	94,200
Population, per mile	692	702
Earnings, total	475,361	543,226
" per mile	3,547	4,054
" per capita	5.13	5.87

Road No. 11 is a 59-mile road in the central west, having three small cities, all of which are included in the totals.

	1905.
Population, total	52,032
Population, per mile	887
Earnings, total	197,934
" per mile	3,475
" per capita	3.80

Having obtained the "equivalent" population, as already described, the next and most important step is to determine the probable income per capita. Consideration must be given to the reasons for travel, comparative existing facilities, including railroad timetables and rates, and possibilities or probabilities of existing or of other proposed roads furnishing increased facilities. The habits of the people must be studied, the existing trend of traffic and every factor which may influence the situation. Some of these factors can be given an approximately definite value, and others are largely a matter of experience. The same method is followed in connection with freight, both package and box freight, including milk, garden truck, etc., also mail, although the latter is not generally of great financial value, but policy may make it desirable.

Express matter and so-called package freight can usually be carried either in a special compartment of a regular car or in a special express car similar in general make-up to the passenger car used on the road, and, in either case, can be handled without interfering with the regular schedule and without any extraordinary demands for power. Bulk freight, on the other hand, to be profitable must be handled in fairly large quantities, and this requires the operation of train units of several cars. If such trains are run in the daytime when the regular passenger traffic is on the road, it necessarily interferes more or less with the regularity of the passenger schedule, as they move at slower speeds than the passenger trains. In addition, freight trains demand a large amount of power, consequently require a considerable addition to the power house, and also make it necessary to install sub-stations of such capacity as are required for one or more freight trains in addi-

tion to the regular load due to passenger cars. If there are a sufficient number of freight trains on the road to keep the additional machinery in the sub-stations reasonably well loaded this is not objectionable, but, on the other hand, if but one or two trains are on the road at a time it necessitates the installation of large capacity sub-stations, and consequently light average load and power efficiency. Where it is possible to haul freight during the night when passenger service is partially or entirely discontinued, it may be possible to avoid the installation of additional sub-station machinery for freight service. Even in this case, however, the freight haulage may involve the operation of several sub-stations to handle one or two trains, with a resulting low factor and poor efficiency in the sub-station. Another difficulty which arises in the hauling of heavy freight trains on the average interurban road, is that of delivering sufficient power to the train by means of the ordinary trolley wire. This difficulty does not apply in the case of third-rail roads or the single-phase a.c. road. Where bulk freight is to be handled in quantities on an electric road, it is just as necessary to keep down to a low grade as in the case of a steam road. The co-efficient of tractive resistence in the case of a 10-car freight train at 15 miles per hour, and on level track is only some 7 or 8 lbs. per ton; where, on the other hand, each 1 per cent. of grade adds 20 lbs. per ton; that is, on a 1 per cent. grade the tractive resistance is perhaps 27 lbs. per ton, or nearly four times as great as that on a level track. Freight service, therefore, demands low grades so as to keep down the cost of locomotives, of power house, sub-stations, and line equipment.

The consideration of the route may start with the principal terminal city, and it is of great importance to have the terminal station in such city well located relative to the retail district, which is generally also the amusement center. Generally interurban roads entering a city of any considerable size use the tracks of the local street car system, but sometimes it is possible to obtain an independent entrance, and, when finances warrant it, this is preferable. It is, however, seldom warranted unless the anticipated travel is considerable, and, of course, is materially affected by the cost of construction required in the city, including the cost per mile and total mileage, which includes the first cost and the maintenance of street paving, sprinkling charges, if any, etc., and city taxes.

In a general way, the shorter the route in the city, or more correctly, the less the time of the run in the city, the better for the interurban railway. This materially depends on the frequency of service given by any competing steam road and by the time required between the station of the steam road and the retail center, not only in the principal terminal city, but also in the principal towns along the route. For example, on a new road which is being built a large amount is being spent in order to reduce the time required in the principal city, because the competitive steam railroad service is very frequent, there being two competitive steam roads, each operating trains hourly. In a case where the competition is four or five trains each way daily, most of which are through trains, generally one or two hours late and only stopping at two points along the route other than the principal city, it is not advisable to make large expenditures in order to save a small amount of time.

Another point is the location of the road in cities and towns along the route. The receipts of an interurban line depend largely on the accessibility of its cars and frequent service, but, on the other hand, accessibility in the cities and towns generally means somewhat increased first cost, also a longer time for the run. If freight cars are to be handled it means considerable additional trackage for the freight line. The recent development of the alternating current motor system makes it desirable for roads which use this system to keep on private right of way as much as possible, and when in cities and towns to use only such streets as will allow the use of high voltage trolley. As a matter of fact the high voltage trolley is now used in some towns of considerable size, but it is hardly probable that this will be permitted in all towns.

The number of stops made by a car has a very decided effect on the size of motor necessary to drive it, and with any given schedule and car the less the number of stops the smaller and cheaper the motor equipment. Taking a given car geared to a maximum speed of 40 m.p.h., with eight stops per mile, the possible schedule speed is less than 10 m.p.h. With four stops per mile the possible schedule is less than 15 m.p.h. With two stops per mile the schedule speed is about 20 m.p.h., and with one stop per mile the schedule speed is about 26 m.p.h. On the other hand, with one stop in eight miles a schedule speed of 34 m.p.h. can be made. This is on a level and straight road. Had the same car been equipped with motors geared to but 30 m.p.h., it would have been made with eight stops per mile a schedule speed of eight m.p.h., which is practically the same as before; with four stops per mile it would have made a schedule of 13 m.p.h.; with two stops per mile a schedule of 17 m.p.h. The schedule will not only be as good as that made with higher gearing, but also the motor equipment can be decidedly smaller and cheaper, and the fluctuation of load at the power house will be much smaller than that resulting from the higher speed car.

Unless grades are considerable, the advantage of grade reduction, as far as time is concerned, will generally be found small and not comparable with lessening the number of stops. For example: In one case we prepared a preliminary estimate of the cost of the grading required to obtain a maximum 1, 1½ and 2 per cent grade through a country rolling the entire distance and the time which would have been saved by reducing from 2 per cent. to 1 per cent. was not greater than a reasonable allowance for time lost in the principal city on account of delays in the congested district; whereas, the additional cost required for the reduction of grade would be very considerable.

Since the single-phase a.c. motor has become an accepted fact, it is in some cases advisable to consider plans and to make estimates of cost based both on d.c. and on a.c. equipment. The general characteristics of the single-phase a.c. road, as compared with d.c., are low first cost of line and substation equipment, high first cost of car motor equipment, and ability to deliver power either to many small units or to a few large units, and in either small or large blocks. The characteristics of the d.c. equipment are high first cost of equipment of substations and line, low cost of car equipment, and considerable cost for substation attendants, and ability to deliver power to a considerable number of units in small blocks, but requiring much greater investment than d.c., when required to deliver large quantities of power to a small number of units. As a result the a.c. system is more especially adapted to the interurban roads where first cost must be as low as possible and where the number of cars operating is comparatively small, and also to the operation of trunk lines, freight roads, etc., where there are a small number of heavy trains to be moved, and therefore, in a general way, for "interurban roads in sparsely settled districts." On the other hand, the d.c. equipment is preferable for the city road, the elevated road and the suburban roads with heavy traffic, where the number of trains is large. The interurban road which is equipped with the single-phase trolley is in a position to handle freight in large units to much better advantage than the road having d.c. equipment, as it is not limited as to the amount of power which a trolley wheel can take from the wire, but only as to the maximum load which the sub-station can carry; and in this case the sub-station equipment is comparatively cheap, it is possible to have a sufficient sub-station capacity to handle heavy freight in addition to the passenger service.

Some interurban electric railroads should never have been built, as under no conditions were they warranted. Others have been improperly designed. In some cases the construction has been too expensive and in other cases too cheap. Other roads have not been properly maintained, and still other roads have not been properly managed. Success depends on obtaining the best location, proper design under the special conditions, proper construction and competent operation. The first three are to a large extent unchangeable once the road is built.

Block Signal Costs on the Pennsylvania Railroad.

The block signal installations made by the Pennsylvania Railroad in the three years 1904-5-6 aggregate nearly 1,500 miles. The cost was $830,451 and $191,758 was added to the annual operating expenses. The Pennsylvania now has every mile of its main lines protected by block signals, and all but about 500 miles of the entire mileage (6,032 miles) east of Pittsburgh and Erie. The details by divisions are shown below (cents omitted).

BLOCK SIGNALS INSTALLED EAST OF PITTSBURGH AND ERIE, YEARS 1904-05-06.

Division.	Mileage of road.	Number of tracks.	Cost of installation.	Addition to annual op. expenses.
Automatic Block Signals.				
New Jersey	.....	..	.....	.....
Eastern Pennsylvania	14.9	4	$119,285	$12,786
Western Pennsylvania	29.83	4	126,240	5,764

Philadelphia Terminal	2.73	2	8,346	.....
West Jersey & Seashore R.R.	35.63	2 & 3	273,186	22,960
Total	108.29	..	$640,915	$51,411
Telegraph Block Signals.				
New Jersey	10.8	1 & 2	$3,396	$1,800
Eastern Pennsylvania	34.67	2	28,910	24,374
Western Pennsylvania	68.7	2	25,250	13,004
Buffalo & Allegheny Valley	350.0	1 & 2	55,421	28,489
Erie Division & N. C. Ry.	897.45	1 & 2	49,462	48,529
Phila., Baltimore & Washington	61.96	2	12,635	16,083
Philadelphia Terminal	.....	..	.....	.....
West Jersey & Seashore R.R.	28.91	2	14,449	8,066
Total	1,452.49	..	$189,535	$140,346
SUMMARY.				
Automatic Block Signals.				
Two-track sections	3.73	..	$10,468	.....
Four-track sections	44.73	..	245,525	$18,551
Mixed	59.83	..	384,922	32,860
Total	108.29	..	$640,915	$51,411
Telegraph Block Signals.				
Two-track sections	194.21	..	$81,255	$61,527
Mixed	1,258.25	..	108,279	78,819
Total	1,452.49	..	$189,535	$140,346
Total, automatic and telg.	.....	..	$830,451	$191,758

It will be noted that in the case of the automatic signals the

annual operating expenses equal only about one-twelfth of the cost of installation, while with the telegraph block system the yearly operating expenses equal about nine-twelfths of the first cost.

We do not know what items are included in operating expenses, but assuming that depreciation is included, and that capital is worth 6 per cent. per annum, a rough calculation of the yearly cost per mile may be made as follows: Automatic, expenses, $51,411; interest, $38,455; total, $89,866, or about $830 per mile of road. Telegraph block system, expenses, $140,346; interest, $11,372; total, $151,718, or about $104 per mile of road. It is to be borne in mind that about half of the automatic mileage consists of four-track line. The telegraph block system is largely single-track, and, by reason of the longer block sections provides only for a traffic far less dense than that carried by the lines equipped with automatic signals.

Co-efficients of Friction Between Wheels and Rails.*

BY GEO. L. FOWLER.

(Reprinted from a volume of reports made to the Schoen Steel Wheel Co.)

The resistance of a wheel to slipping on the rail depends upon two causes frequently confused, but which are to be considered separately. These are friction and abrasion.

Frictional resistance is due to the roughnesses of the two surfaces in contact, and may be compared to the lifting of the weight to be moved over the successive inequalities of the surface on which it rests. Abrasion, on the other hand, involves the removal or cutting away of the particles of the masses in contact. The slipping of a wheel, such as would produce a flat spot, involves both frictional resistance and abrasion. If there were no slipping of the wheel on the rail there would be no wear, provided the rolling action did not produce sufficient pressure on any one point to crush the metal or cause it to flow. But there is always more or less slip even on a straight line.

There are two kinds of slipping to which car wheels may be subjected. One is the skidding action due to the locking of the wheels by the brake-shoes. The other form occurs when the driving wheels of electric motor cars, for instance, are turned faster than the corresponding rate of motion of the car and the whole periphery of the wheel slides over the rail. In order to determine whether the resistances to these two kinds of slipping were the same, certain experiments were made.

The apparatus was designed to produce, as nearly as possible, the actual conditions of track work.

Two pieces of steel rails of 75 lbs. section, one of which had been worn smooth in service; the other, a piece of new rail, together with a section of a steel wheel and a section of a cast-iron wheel, with the treads of both smooth and free from imperfections, were used for the tests. The testing machines were made by Tinius Olsen & Company, one with a capacity of 100,000 lbs. and the other a capacity of 50,000 lbs.

The apparatus is shown in the accompanying illustrations for the skidding movement. The wheel section was set on the rail and loaded by the 100,000 lbs. capacity machine. It was then slipped over the rail by a pull on the connection rod reaching to the other machine which measured the amount of the pull required to slip the wheel on the rail.

In loading the wheel, the pressure was applied through a plate resting on two rollers. In this way the friction, except that between the wheel and the rail, was reduced to practically nothing.

For the spinning motion, the bearing plate above the rollers was made convex and the bottom plate resting on the top of the wheel was made concave; both surfaces being concentric with the tread of the wheel. A pull on the wheel, therefore, caused it to roll under the bearing plate as though it were revolving on its own center. The arrangement of this is clearly shown in the diagram.

The force required to move the wheel on the rail was weighed by a bell crank with a knife edge bearing, resting on a heavy casting attached to the bed plate of the small testing machine. The vertical arm was attached to the pull rod and the end of the horizontal arm had a bearing on a wedge or knife edge that was forced down by the platen of the machine.

The wheel section was placed in position on the rail and weighted with a predetermined load. Pressure was then applied to the wedge on the small machine. This pressure was transferred through the bell crank as a pull on the connecting rod. When slipping occurred, the event was marked instantly by the drop of the beam of the small machine. The movement of the wheel over the rail usually amounted to about 1/8 in. As the object of the investigation was to determine the friction at rest no attempt was made to measure the pull after the first slip occurred. This was markedly less than that required to start the movement from a state of rest.

Separate tests were made with steel and cast-iron wheels on the old and new rails, for both the skidding and spinning motions. In loading the wheels, the weights were increased by regular increments of 2,000 lbs. up to 30,000 lbs. Three tests were made with each loading and for each condition of wheel movement. The average of the three tests in each case is given in the accompanying table.

There was so little difference in the pull required to slip the wheels on the old and new rails that an average of the results obtained is given as the resistance to spinning and skidding of the two wheels on a steel rail.

Coefficients of Friction Between Wheels and Rails

Load on wheel.	Kind of motion—Spinning—Steel wheel.	Spinning—C.-I. wheel.	Skidding—Steel wheel.	Skidding—C.-I. wheel.

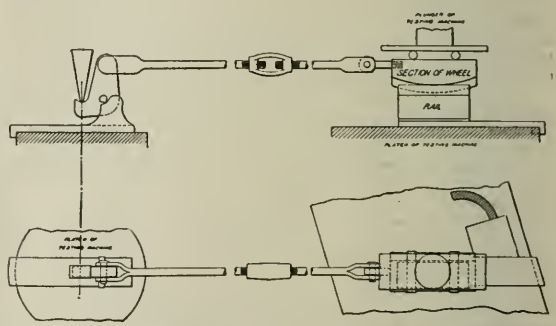
The table shows that the resistance to spinning of the steel wheel is somewhat greater than that of the cast-iron wheel, a fact which is brought out quite forcibly by the coefficients of friction, in which the coefficient of the steel wheel is invariably higher than that of the cast-iron.

It also appears from this table, that the coefficient of friction of the steel wheel decreases as the load is increased, up to a pressure of about 15,000 lbs., after which it is practically constant. The coefficient of friction of the cast-iron wheel decreases rather rapidly, like that of the steel wheel, up to a load of 15,000 lbs., after which it falls away slowly, though a tendency to decrease with the increase of load is manifest.



Arrangement of Apparatus to Test the Frictional Resistance of Car Wheels to Skidding.

As regards skidding, the values of the coefficients of the two wheels bear the same relation to each other as they do for spinning. The coefficient of resistance is greater for the steel wheel than for the cast-iron wheel; and there is the same falling off in the value of the coefficient as the load is increased up to about 15,000 lbs. after which that of the steel wheel is nearly constant, while that of the cast-iron wheel continues to fall away slowly. It would be difficult to explain these phenomena without the data obtained in the investigations previously described, made to determine the area of contact between the wheel and the rail, and the relative rate of abrasion of the steel and cast-iron wheels on the emery wheel. The results of those investigations also serve to explain why the coefficient for a skidding wheel is higher than the coefficient for a wheel that is spinning.

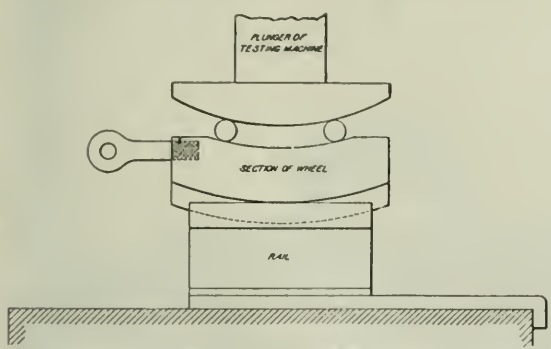
In the case of the cast-iron wheel, it was shown in the preceding chapter that the imposition of a heavy load caused a breaking down of the metal in the rail at a certain point, while no such failure occurred with the steel wheel under the same load. The cast-iron wheel being rigid, inelastic and incompressible on the tread, was forced down into the metal of the rail, causing the rail to do all of the yielding needed to produce the area of contact obtained; with the result that it was soon compressed beyond its elastic limit and given a permanent set. The steel wheel yielded as well as the rail, thus relieving the rail of a part of its compression and increasing the area of contact. This behavior of the two wheels explains, in part, the results obtained in these tests. In addition, it must be remembered that the normal coefficient of friction is greater between steel and steel, than it is between cast-iron and steel.

*Copyrighted by the Schoen Steel Wheel Co. and published by special permission.

When the cast-iron wheel is loaded on the rail, it indents the rail in proportion to the pressure applied, without being distorted itself. If, then, it is turned, as by a motor, it simply revolves in the concave depression in the rail, without undergoing any deformation itself and with no resistance other than that of overcoming the friction between the surfaces of the wheel and rail. The steel wheel, on the other hand, is itself compressed, as well as the rail, so that when it is turned a continuous progressive compression of the tread is set up, equal to the amount of the original compression. Hence, the resistance to turning will be equal to the frictional resistance plus that set up by this compression.

It was shown that the cast-iron wheel was cut away much more rapidly under the emery wheel than were the steel tires and wheels. In the tests for skidding, the loads were successively applied without readjusting the wheel on the rail, with the result that the steel wheel was skidded about 1¼ in. and the cast-iron wheel about 1 in. This was done under loads increasing from 2,000 lbs. up to 30,000 lbs. Under this treatment, the steel wheel developed a slid flat spot about 7/16 in. long, and the cast-iron wheel a spot about ⅞ in. long. In both cases the rail was spotted and the metal was rolled up in folds, indicating the direction of the motion of the wheel. The piece of rail used with the steel wheel was spotted for a distance of about 1¾ in. while the piece used with the cast-iron wheel was spotted for a length of about 1½ in. This abrasion of the cast-iron wheel probably accounts for the lower resistance to skidding as compared with the steel wheel. For the same weight and for the same distance of skidding, the amount of metal abraded from the cast-iron wheel was in almost exactly the same ratio to that removed from the steel wheel, as is shown in the diagram of abrasion tests.

It will be remembered that, for the lower wheel loads, the



Arrangement of Apparatus for Testing the Frictional Resistance of Car Wheels to Spinning.

investigation of contact areas showed that there was comparatively little difference between the areas obtained with cast-iron wheels and with steel wheels, and that it was inferred that the total compression of the metal was approximately the same in both cases. Under these circumstances it would be expected that, if the power required to distort the metal of a steel rail and tire were the same, the resistance to skidding of the steel wheel and the cast-iron wheel would also be the same. But, owing to the more rapid abrasion of the cast-iron wheel, as soon as it begins to skid it wears, and, by thus increasing the area of contact, it lessens the depression of the rail, decreases the amount of metal to be distorted, lowers the resistance to the motion, and makes the coefficient of friction of skidding less on the cast-iron wheel than on the steel wheel.

This depression of the rail due to the imposition of the wheel load accounts for the higher coefficient of friction obtained with a skidding wheel than with a spinning wheel. With a wheel spinning, there is no continuous deformation of the metal of the rail to be affected. In skidding, there is a depression of the rail to be carried forward like a wave, which naturally raises the resistance and makes the coefficient greater than where slipping over one spot alone takes place.

While it is not safe to draw rigid conclusions from the limited amount of data obtained, it does appear that inasmuch as the steel wheel offers greater resistance to spinning it is better adapted for use as the driving wheel of an electric car than the cast-iron wheel; and further, its higher coefficient of friction renders it less liable to skidding.

This matter of wheels skidding, with the consequent development of flat spots on the tread, was considered of enough importance to warrant further investigation.

It has been noted by many other investigators that steel wheels do not flatten as readily as cast iron wheels. By some this is attributed to the fact that small flat spots, once formed on the tread of a steel wheel may be rolled out, whereas they have a tendency to grow larger on cast iron wheels. The abrasion and skidding tests which have been made seem to show, however, that it is the lower resistance to grinding of the cast-iron wheel that accounts for the more rapid development of these flat spots.

To briefly recapitulate, these tests showed that the rate of grinding of the first ⅛ in. below the tread was about 4.64 times as fast in the cast-iron wheel as in the Schoen steel wheel. For the second ⅛ in. the ratio became 6.37, and for the third ⅛ in., 15.93, showing the rapid decrease of wearing resistance of the cast-iron wheel below the surface. In the skidding tests in the laboratory, the effects were confined to the metal close to the surface and it was found that, with the same amount of skidding, the amount of metal removed was about 5.12 times as great on the cast-iron wheel as on the steel wheel. A further check on these figures was afterwards obtained by taking the time required to remove approximately the same amount of material from the treads of cast-iron and steel wheels in a wheel grinding machine. It was found that it took from four to five times as long to grind down the steel wheels as it did to grind the cast-iron wheels. In all of the foregoing investigations, the metal of the wheel under test was kept cool, either by a stream of water or by doing the work so slowly that natural radiation counteracted the tendency to heat and the temperature of the metal was not raised above 100 deg. Fahr.

For the purpose of ascertaining whether the results of these investigations were comparable with the results obtained in actual railroad service, when the wheels were locked and skidded under a car, series of tests were made by skidding the wheels under a loaded car.

Through the courtesy of the New York, Ontario & Western a piece of track and a suitable box car were supplied for the tests. One pair of wheels and axle were removed from under the car, and replaced by an axle on which a Schoen steel wheel and a new cast-iron wheel had been pressed. These wheels were 33¼ in. and 33 in. in diameter, respectively. This pair of wheels was placed at the end of the car, and was fitted with two brake-beams, so that twice the usual brake-shoe pressure could be applied on the wheels. By this means, the wheels could be held in a fixed position throughout a run. But it was more difficult to hold the wheels at low speed than at high speed.

The car was loaded until the weight on the pair of wheels to be tested was exactly 24,000 lbs. The car was then hauled back and forth over a piece of track 1,850 ft. long. The brake was set and the wheels skidded for the whole distance. The car was hauled at two speeds, namely, three and 12 miles an hour.

When the car was hauled at a speed of three miles an hour, flat spots were made on the steel wheel in area about .30 in., while the spots formed on the cast-iron wheel were in area .80 in. These areas correspond to diameters of about ⅝ in. and 1 in. respectively, though the spots on the cast-iron wheel were elongated to about 1⅛ in., which indicated somewhat more metal removed. The volume of metal abraded from the cast-iron wheel was about 5¾ times greater than that from the steel wheel.

While the movement was slow the wheels remained cool. But when the speed was increased to 12 miles an hour, heating took place and the cutting was more rapid on the steel wheel.

For the first 1,850 ft. run the areas of the flat spots produced at a speed of 12 miles an hour averaged 8.125 sq. in. on the steel wheel and 4.445 sq. in. on the cast-iron wheel. The estimated amount of metal worn away was 4.63 times as much with the steel wheel as with the cast-iron wheel.

When the skidding was continued the rate of wear increased very rapidly with the cast-iron wheel, while there was little increase with the steel wheel. At the end of the run of 3,700 ft., the area of the flat spot on the steel wheel was 8.43 sq. in., an increase of .305 sq. in., while the area of the spot on the cast-iron wheel was 5.72 sq. in., an increase of 1.275 sq. in. From this it appears that the cast-iron wheel wore away more rapidly than the steel wheel after the hard surface metal had been broken through.

The indications are that in skidding a short distance at low speed a cast-iron wheel is more apt to develop a flat spot than is a steel wheel. On the other hand, if the skidding continues for some distance at a high speed, the wheel becomes heated and then the steel wheel is the first to yield, unless the surface chill of the cast-iron wheel has already been worn through.

The General Manager of the Swedish State Railroads, Sahlin, has resigned, and will retire at the end of the year. He had held the position only two years, during which the system of administration of the State Railroads was greatly changed. He is to be succeeded by F. W. H. Pegelow, who is now manager of a private railroad, but has been in the State Railroad service before. Sahlin had a legal education and his career has been in the government service, being telegraph manager when appointed railroad manager.

Pegelow is an engineer, and was for a long time locomotive superintendent of the State Railroads. He was for several years a member of Parliament. As Assistant General Manager V. Klemming has been appointed. He has been at the head of the State Railroad department of locomotives and shops, and is widely known on the continent as a mechanical engineer.

The Bush Terminal Company.

The cost of moving freight long distances has been steadily decreasing for many years, larger ships, locomotives and cars having cheapened the cost per ton of long-haul transportation. Methods of handling freight for short distances have not, however, been much improved. Labor costs more now than before and so the cost of cartage is higher than ever. The ideal terminal aims to do away with as much hand labor as possible. Freight is carried by land or water to a terminal; it is then unloaded and left in store until the consignee wants it. When that time comes, the consignee may have it carted direct from the storehouse to destination, which, as far as he is concerned, is his stock-room or any other point from which he delivers goods to the final purchaser. On the other hand, he may decide to reship the goods; in either case some one has to pay the cost of carrying them from the railroad or steamship terminal to the storehouse and from the storehouse to some other place. To avoid as much as possible this expensive handling, the terminal should provide in itself receiving facilities, storage room and shipping facilities. To perform these three functions is more and more difficult the larger the city which the terminal serves. In a small town reached by one railroad there is no problem. When a competing railroad builds through the other end of the town there results on a small scale, all the difficulty which large cities have to deal with. Some of the big interior cities have built union terminals having direct rail connection with all roads entering the city. Cupples Station, at St. Louis, is perhaps the best known example. This terminal consists of a system of warehouses each served by a spur track, the different merchants being tenants of the warehouses. A car is run into the proper building and lifted on an elevator to the floor where the consignee has storage room and there unloaded. If the freight is to be reshipped out of the city by railroad an empty car is brought up to the door and reloaded so that the whole process requires only two handlings of the freight.

Such a terminal is impossible in New York City. There is no spot where a terminal could be erected with all-rail connection with every railroad except at such enormous outlay of capital as to be prohibitive. Most of the railroads reaching the city have individual rail terminals on the west shore of the upper bay and freight terminals on the water front in Manhattan. Cars are carried to the freight terminals on car floats and there unloaded. The freight goes into storage, sometimes being carried on drays for long distances through congested streets, and when it is removed from the storehouse has to be carried in the same slow and expensive manner to another terminal or to destination.

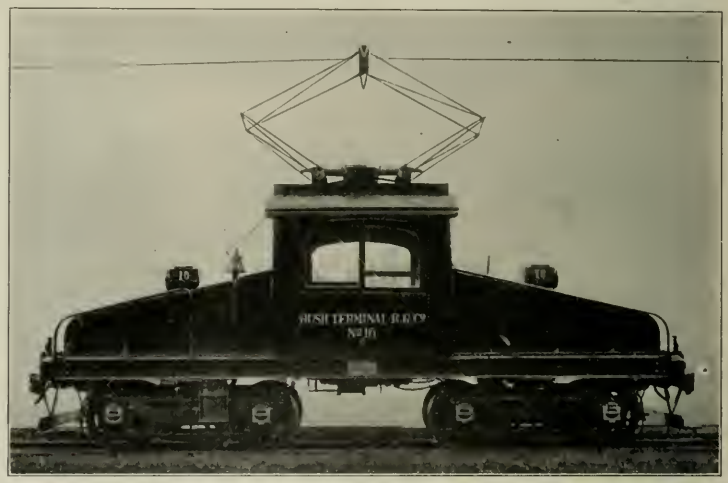
The Bush Terminal is in South Brooklyn on the east shore of the upper bay. It does three distinct kinds of business, but the operation of each of them is made more efficient by the proximity of the others. It is designed to decrease the cost of local handling by the economies possible through concentrating the different stages. It is a deepwater terminal for freight steamships. It stores freight and it operates a terminal railroad.

The company acts as terminal agent for the following roads: The Baltimore & Ohio, the Central of New Jersey, the Delaware, Lackawanna & Western, the Erie, the Lehigh Valley, the New York Central & Hudson River, the New York, Ontario & Western, and the West Shore. On lighterage business it is paid so much per ton, while on yard business it is paid various rates according to the classification of different kinds of freight. The net earnings from this business are comparatively small.

The Pennsylvania Railroad, in conjunction with the Long Island, will have its own complete system of terminals, but when the yard improvements of the Long Island at 65th street are finished, the Bush Terminal Railroad will connect with it and in that way, through the New York Connecting Railroad, have direct rail connection with New England roads.

For the accommodation of freight steamships, the company has six covered piers now, and is planning a seventh. These piers are all of the same general design. They are 1,340 ft. long and 150 ft. broad, with 270 ft. water space between piers. They are built on piles within which crib work is built, and the enclosed space filled with sand dredged in making the channel and deep water along the side. The framework is iron and is covered with wood. The system of fire protection is by sprinklers installed on the piers, though it is more carefully worked out in the warehouses. The piers are leased to steamship companies, and have been partitioned off according to the needs of the lessees, since often one company does not need the whole of the pier but only enough of its length to accommodate one or two boats. As the accompanying plan shows, each division of a pier is served by a separate spur track, which runs along the north side of the pier with a switch opening into each division. The partitions are of corrugated iron, and the openings in the partitions can be closed by a metal curtain in case of fire. The most northerly pier, No. 7, is to be remodeled, and pier No. 1 will be built soon.

The freight storing facilities are of three kinds. The most interesting are the lofts, which, as shown in the accompanying plan, are on Second avenue north of 37th street. So far two have been built and work is under way on the third. The first two lofts are entirely occupied and half of the space in the third has been contracted for by tenants; the rest is mostly under consideration. While these lofts may be used as factories, most tenants use their space as stock-rooms. Each building is six stories high and has 300,000 sq. ft. of floor space. Electric current for light and power is delivered to the lofts at 220 volts pressure. Steam for heating, and power in case the tenants install steam engines, is carried from the terminal company's power house in 12 in. x 8 in. mains. It is



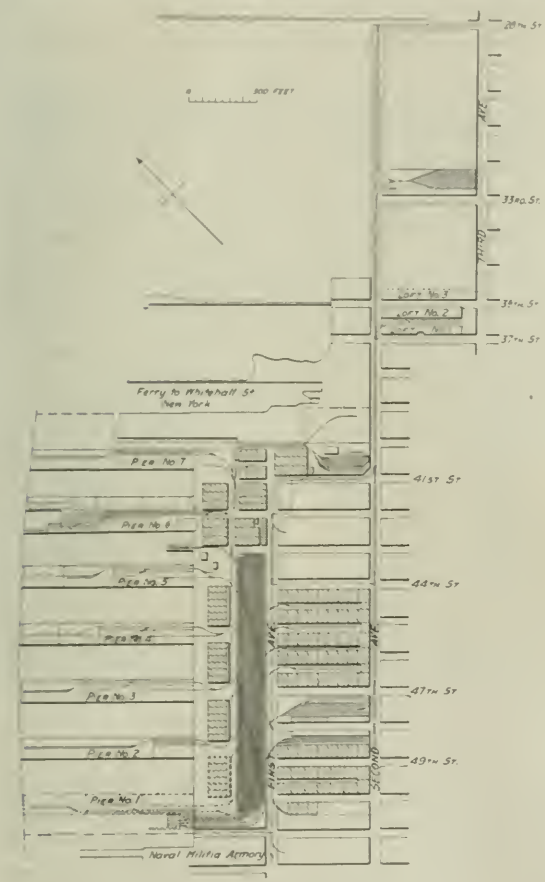
Electric Switching Locomotive; Bush Terminal Railroad.

delivered to each floor at 110 lbs. pressure. In each building are four electric elevators of three tons capacity. These buildings are also equipped with sprinklers. A shipping platform extends along the entire length, 600 ft., on one side of each building. When a freight car comes alongside, the floor of the car is on a level with this platform. On the other side of the building is a similar platform or doors to which the trucks come. All the space in the first two factories has been rented to tenants, who use the space either for storage or for manufacturing purposes. The company plans 18 buildings like these, which will take up all the space from 37th to 28th streets. They are being built at the rate of about one a year.

Directly behind the piers are 62 of the warehouses; these particular structures are for high grade freight. Each is six stories high, some are of mill construction and others are of reinforced concrete. The brick buildings are fireproof so far as such structures can be, and there is an automatic sprinkling system in each warehouse, so that the insurance rates are exceptionally low. A portable electric hoisting machine is used for slinging bales and cases up to the upper floors of these buildings. Behind this group of warehouses is the main yard, which has a capacity for 1,000 standard freight cars. As can be seen on the plan, tracks from the yard run behind each block of warehouses for loading, others run down to the factories, and a line of tracks runs to the present car-float transfer bridge between piers 5 and 6. A four-track transfer bridge is to be built, as indicated, just south of the proposed pier No. 1. About 200 cars a day are handled on the car floats. Behind the main yard are the rest of the 131 warehouses; these are for low grade traffic, mostly cotton, and are one-story structures. Concrete roadways run between every two blocks of

the houses for the use of trucks. Very little of the higher grade freight is distributed to destination or brought from destination by other means than railroad. One of the secondary freight yards is between 47th and 48th streets. This is used for local and less than car load business. The yard between 41st and 40th streets is a transfer yard only. Between 32d and 33d streets another local freight yard is being built. The freight house at this point is finished but will be used for storing construction material until the yard is in operation.

The company owns three tugs, five car floats, four covered lighters, three open lighters and two steam lighters. It has five steam locomotives and two electric locomotives. The first electric locomotive was built by the General Electric Company about three years ago. The second has just been finished by the General Electric Company and the American Locomotive Company jointly. The accompanying photograph shows this engine. The truck construction differs from that ordinarily used for electric motor trucks. It follows rather a type which has been used with success for tender



Plan of the Bush Terminal.

and leading trucks of steam locomotives. The bolsters are carried rigidly on the side frames, and the weight of the frame and bolster is transmitted to the equalizers through one semi-elliptic spring on each side instead of through bolster springs and helical side springs, as in the M. C. B. equalized truck. The driving axles are 6 in. in diameter and are of forged steel, with 36-in. fused steel-tired wheels. Each truck is equipped with two GE-55-A (90 h.p.) two-turn motors, with a gear ratio of 52 to 21. These motors with this gearing will give at their one hour rating a tractive effort of 3,000 lbs. per motor, or 12,000 lbs. per locomotive, at a speed of about 18 miles an hour.

The cab is built of sheet steel, supported by a framework of small angles. There is a main operating cab and sloping end cabs, with narrow side platforms extending from the main cab to the ends of the locomotive. The floor of the locomotive is 3/8-in. sheet steel, but in the main operating cab this is covered with a 3/4-in. wood flooring. The arrangement of apparatus in the cab is shown in another photograph. The locomotive is equipped for both straight and automatic air. In the center of the main cab is a Cp 25 air compressor having a capacity of 56 cu. ft. per minute. In the operating engineer's corner is located a U 6 master controller and the valves and handles for operating the combined straight and automatic air. In the end cabs are a sand box, air drum, contactors and rheostats. As the locomotive is to be used solely for switching service, it has a pantagraph trolley instead of the ordinary wheel trolley which has to be swung around when the direction of the engine is reversed.

The locomotive is equipped with bell, whistle and headlights. The headlights have 32 c.p. incandescent lamps, and lamps for illuminating gages are wired on the headlight circuit and controlled with the same switches. The locomotive is 29 ft. long over bumpers, 11 ft. 9 in. high over cab, the rigid wheel base is 6 ft. 6 in. long and the weight on drivers is 80,000 lbs.

M. H. Smith on Excess of Traffic Over Facilities in Alabama.*

Although the interests of the shipper and consignee seem to be identical, the two do not always co-operate. To illustrate, a lumber manufacturer ships to a customer, possibly a commission merchant, a car which is not unloaded, and for that reason the manufacturer is unable to secure additional cars and is oftentimes greatly embarrassed and suffers a heavy loss. This is no way seems to concern the party at fault, although he may be directly affected by the failure of the milliman to secure cars in which to make additional shipments. In cases where the shipper and consignee are the same, as in the case of a shipment of ore, limestone, coal or coke to a furnace, the carrier is in a position to enforce the prompt unloading because, if the owner fails to promptly unload, he does not secure cars in which to load additional material. This brings operations to a standstill, and he will, therefore, arrange to promptly unload the cars.

As an illustration of the difficulties under which the carrier labors, take the conditions that existed last winter at Mobile, which is a large export shipping port, especially of lumber. If lumber is sold for export to be reshipped at a somewhat indefinite date, depending upon the arrival of a vessel, the consignee, to avoid the expense of unloading and storing, desires to keep the property on cars until the vessel arrives. The accumulation during the month of July and August, 1906, was very great. This was aggravated by the storm in September, 1906, and conditions became desperate. The facilities of the Louisville & Nashville were so overtaxed that it became almost impossible to place cars to be unloaded for consignees who were prepared to promptly unload, and, in fact, the movement of through freight traffic was seriously interfered with and threatened with paralysis or stoppage. At the same time, the manufacturers of lumber were in great distress because of the inability of the company to furnish cars for other shipments, not only to Mobile, but to all other points.

A statement was prepared showing the numbers of the loaded cars on hand at 7 o'clock a.m. December 15, 1906, and the length of time they had been on hand. It was found that of the total of 193 cars of lumber, 52 had been on hand prior to December 1, 1906, some of which were received in October, or had been on hand 52 days. Of all classes of property, there were 524 carloads that had been held from 3 to 60 days. On December 29, 1906, another check was made of loaded cars that had been on hand December 15, 1906, which showed that 33 of such cars were still on hand undelivered. To relieve the situation, the management was compelled to adopt arbitrary measures—temporarily stop the shipment of some classes of property to Mobile, and, in some cases, to unload and store oil cake and lumber. During all this time, many shippers, especially manufacturers of lumber, were in distress because they could not get cars.

The conditions that have prevailed at Mobile are typical of those over the entire Louisville & Nashville system. The business of many consignees has outgrown their facilities for promptly receiving and handling all of the property the increased business requires, and thus renders it difficult for them to promptly relieve the cars.

The reasonableness of making a just and lawful charge for the storage of property in cars which the consignee fails to promptly unload is so manifestly in the interest, not only of the carrier, but of its patrons, that it is conceded—is not denied.

Let us now consider the relations between common carriers and shippers. It is the duty of a common carrier to transport property to the extent of its facilities, for all who may desire to have property transported, upon equal terms. It must provide facilities for receiving, caring for, and forwarding property to destination. When, by the terms of the transportation contract, the shipper is to load the property, cars must be furnished to enable him to do so; but

*From a statement to the committee of the Alabama legislature on Commerce and Common Carriers, in regard to reciprocal demurrage.

a carrier can only be equitably, and, I think, lawfully required to provide facilities for normal traffic—cannot be required or compelled to furnish facilities beyond its ability or capacity. A carrier having equipped himself with a vehicle moved by one horse for the movement of a limited traffic, cannot be required to handle traffic requiring a vehicle moved by four horses. A railroad constructed and equipped for handling a limited local traffic, with a single track, adverse grades and curves, cannot be required to furnish two, four, or more tracks, or the facilities furnished by railroads in some parts of the country operating four, and sometimes eight tracks, over grades where a single locomotive may move 3,000 tons against a load on the inferior single-track road of 300 tons.

Take the South & North Alabama Railroad as an illustration. It is a road originally built with limited capital, through a rugged country, across drainage, and when opened for traffic there was not a community of 100 persons on the line between Montgomery and Decatur. The alinement is crooked and the grades excessive, equivalent to more than 80 ft. to the mile. The heaviest locomotive in use, having a tractive power of 35,000 lbs., can move but 740 train tons.

A double track has been built from Black Creek to Oxmoor, a distance of 14.6 miles, from Decatur to Flint, 5.4 miles, from Calera to Hardy, 12.6 miles, and numerous passing tracks have been created. In addition, large expenditures have been made to provide increased terminal facilities at Decatur, Birmingham, (Boyles), Montgomery, etc. Nevertheless, the traffic now pressing is greater than can be moved, and if the present volume of traffic is to be continued and increase, it will be necessary to reconstruct the line, reduce grades and curvature, lay second tracks, increase the equipment, and construct shops and other facilities. The cost will be very great. The work of reducing grades and laying second track between Oxmoor, Ala., and Hardy, 14.41 miles, has been begun, at an estimated cost of $1,010,500. I roughly estimate that to reduce grades and curvature, and build second track over the entire line, Montgomery to Decatur, with the necessary increase in equipment, shops and terminal facilities, will cost not less than $15,000,000, and, under existing conditions, the work could not be completed in less than five years. Under the existing financial conditions, the money cannot be provided, and after the expenditure of the money already provided, and the work undertaken is completed, the remainder of the work cannot be entered upon unless there is a favorable change in financial conditions. At the present time, neither the South & North Alabama, nor the Louisville & Nashville can obtain the capital necessary to prosecute the work. It therefore follows that in this case the carrier must restrict its traffic to existing facilities; that is, must refuse to undertake to move traffic in excess of its facilities.

Foreign Railroad Notes.

A Russian company engaged in fishing on the Pacific coast asks for special car-load rates on salted herrings over the Siberian Railroad to Russian stations, where they will compete with herrings from the Caspian Sea.

The Province of Buenos Aires, Argentina, has authorized the government to contract with the firm of Otto Bemberg & Company to build a considerable mileage of railroad having its outlet at the port of La Plata, which is on the estuary of that name some 40 miles southeast of the city of Buenos Aires.

The Swiss seem to be a deliberate people. For some time there has been a great deal of discussion of plans to make an outlet to their railroads through the Eastern Alps. Now the general management of the State Railroads reports to the Parliament that to examine these plans and come to a conclusion will take eight years.

The Chinese are contemplating the building of a railroad from Hankow, the river terminus of the long railroad from Pekin southward, westward to a point on the Yang-tse-Kiang above the rapids which interpose between long stretches of navigable stream above and below. A preliminary survey of the most difficult part of the line has been made by Chinese engineers, assisted, or perhaps superintended, by some Japanese—which is an event in the history of China.

France also has its train robbery, with the latest modern improvement, namely, an automobile to escape on. The robbers, three in number, took a first class compartment, made their way on the foot-board of the cars to the baggage car, in which two mail agents had charge of money packages, wounded both of them with pistol shots, and threw out the money packages. The wounded agents succeeded in pulling the cord which signalled the engineman to stop; but when the train slowed down the robbers jumped out. Accomplices had picked up the money and followed the train on an automobile, the track there being alongside the highway, and it picked up the men when they left the train and rushed away without observing the legal speed limit.

Cylinders of Simple and Compound Locomotives of Equivalent Power.

The following table has been compiled and put into practice for proportioning the diameters of the cylinders of two and four-cylinder compound locomotives when designing them to generate a power equivalent to that of a given size of simple cylinder and of the same piston stroke.

It will be noticed that in the earlier list adopted in 1897, at the time when compound locomotives were being pushed to the front most strenuously, the average ratio of area of the simple cylinders and the high-pressure cylinders of the compound locomotives was 1 to 1.17 and 1.026 for two-cylinder and four-cylinder engines respectively. This has been found to be too low in practice with the result that new ratios of 1.25 for the two-cylinder and 1.10 for the four-cylinder have been proposed and are in use. The table gives the area of the simple cylinders from 12 in. to 22 in. in diameter with the corresponding diameters and areas of the high-pressure cylinders of the compound locomotives. In the case of the four-cylinder machines the area given is that of the sum of the two high-pressure cylinders.

Table Showing Actual and Relative Areas of Simple and of Two-Cylinder and Four-Cylinder Compound Locomotives.

Simple.			Sizes of compound cylinders, according to list in effect on and after July 20th, 1897. 2-cylinder compound.			4-cylinder compound.			Proposed sizes of compound cylinders— 2-cyl. compound; Ratio, 1.25.		4-cyl. compound; Ratio, 1.10.

Winter Wheat Crop.

The Crop Reporting Board of the Bureau of Statistics of the Department of Agriculture finds, from the reports of the correspondents and agents of the bureau, as follows: The newly seeded area of winter wheat is estimated as being 1.9 per cent. less than the area sown in the fall of 1906—equivalent to a decrease of 596,000 acres and a total acreage of 31,069,000. The condition of winter wheat on Dec. 1 was 91.1 as compared with 94.1 on December 1, 1906, 94.1 at the corresponding date in 1905, and a 10-year average of 93.0.

The following table shows for each of the principal states the percentage of acreage sown to winter wheat this fall as compared with that sown last year, the estimated acreage sown this fall, the average of condition on Dec. 1 of the present year, the corresponding average for 1906, and the mean of the December averages for 10 years:

States.	Acreage compared with last year.	Acres, 1907 '08, preliminary.	Avg. condit'n Dec. 1 1907.	1906.	10-year average.
Kansas	100	5,930,000	95	95	95
Indiana	100	2,779,000	91	95	90
Missouri	98	2,271,000	93	91	92
Ohio	96	2,126,000	84	97	94
Nebraska	105	2,359,000	93	98	88
Illinois	101	2,781,000	91	94	94
Pennsylvania	98	1,626,000	86	98	94
California	91	1,519,000	88	90	94
Oklahoma	95	1,379,000	94	93	93
Texas	78	988,000	93	94	93
Michigan	93	806,000	87	89	94
United States	98.1	31,069,000	91.1	94.1	93.0

GENERAL NEWS SECTION

NOTES.

On the El Paso & Southwestern an order has been issued for bidding the running of locomotives backward at night. Yard engines are excepted

The United States District Court for the Eastern district of Virginia has held that to make a ticket non-transferable, when the fact of non-transferability has not been shown in the tariff, is illegal

The Nebraska State Railroad Commission, acting on the complaint of the National Refining Company of Omaha and others, has voted to order the railroads to make a reduction of 30 per cent. in the rates for the transportation of oil

The Ontario Railway and Municipal Board, after repeated tests, has approved Quinn's automatic emergency air-brake and fender for electric cars, a device which, when any obstruction is touched, causes the fender to be lowered and the air-brakes applied.

A press despatch from Oklahoma City says that the railroads of Oklahoma will provide separate cars for negroes February 4, borrowing the necessary cars from their lines in other states. Separate acommodations are now being provided at the stations, but, according to the press despatch, "the two races are not compelled to separate."

The Committee on Car Efficiency of the American Railway Association, Arthur Hale, Chairman, has issued Bulletin No. 11, showing surpluses and shortages of freight cars November 13 and November 27. The shortages amounted to 57,000 on the earlier date and to 18,000 on the later date, indicating that the shortages (aggregating 90,000) which were reported October 30 have been nearly wiped out. The surpluses November 27 amounted to 40,000.

It is announced that early in January the New York, New Haven & Hartford will establish a freight steamship line between New York and Boston direct, putting on the line three new vessels, the Massachusetts, the Old Colony and the Bunker Hill. Boats will leave either city three times a week, starting at 5 p. m., and reaching destination at 1 p. m. the next day. These vessels are capable of making 20 knots an hour and are said to be faster than any other freight steamers in American waters.

It is again reported that the state of North Carolina and the railroads (except the Atlantic Coast Line) have agreed on a uniform basis of passenger rates and that Governor Glenn will call a special session of the Legislature. Governor Glenn says that the Legislatures of other states will probably be called together. This latest agreement is said to be based on the adoption by the railroads of a general rate on all passenger business, interstate and intrastate, of 2½ cents; 2,000-mile books to be furnished for the use of firms and their employees to the number of five persons at flat 2 cents a mile, interstate and interchangeable; 2,000-mile books for family use, a number unlimited, at 2 cents a mile, with 500-mile family books at 2¼ cents.

Congress is in session now and nearly everybody who wants to have anything done puts his desires in the shape of a proposition to enact a law. No branch of the Aduliam Club has yet been established in Washington, but there would seem to be a good field for one. The Texas cattle shippers have asked Congress to compel the railroads to furnish an adequate supply of stock cars. Judge Cowan, of Texas, has told President Roosevelt that Congress should declare the present railroad rates of the country the maximum legal rates, to be increased only on authority of the Interstate Commerce Commission. Evidently regarding this a mild measure, the Judge proposes also that the National Legislature shall compel the railroads to give adequate service. One Congressman has introduced a bill to require railroads to install automatic stops at "selected points" along all of their lines where the speed of trains is more than 30 miles an hour. Other Members of Congress have been asked by certain alleged locomotive engineers to provide for federal inspection of locomotives. Commissioner Lane favors a law empowering the Interstate Commerce Commission to summarily suspend any tariff increasing rates, if shippers complain; the old rates to remain in effect until the proposed increase can be investigated.

New York Railroad Club Entertainment.

On December 20, the New York Railroad Club instead of its usual program devoted the evening to a smoker and vaudeville entertainment at its usual meeting place, the Engineering Societies Building. The affair, which was the first of its kind which the club had given for 30 years, was a great success. More than two-thirds of the 1,400 members of the club were present. The entertainment committee succeeded in getting for the vaudeville especially satisfactory teams, all men, from theatres in and near New York. There were half a dozen numbers and the performers caught the crowd and amused them from the very first. After the vaudeville the club members spent the rest of the evening in the banquet hall, where refreshments were served.

Trains Under the Hudson River March 7.

The Hudson & Manhattan Railroad Company has asked for a two months' extension of time in which to begin the operation of its railroad under the Hudson river, between Manhattan and Jersey City, and the same has been granted by the New York State Public Service Commission. The company was required to operate its line under the river by January 7. In its application the company said:

"We are prepared to operate, as required by the franchise of the New York & Jersey Railroad Company, on or before the 7th day of January, 1908, that portion of the line extending from the center of the Hudson river to Christopher and Greenwich streets, but we do not believe that such operation would be of advantage to the public. If the time for such operation be extended to the 7th day of March, 1908, we shall be prepared to operate a through line from Hoboken to 14th street and Sixth avenue. We believe that the interests of the public will be better conserved by an extension of the time for 60 days. At all times the work has been prosecuted in good faith and with all possible diligence. The completion has been delayed by unexpected obstacles and natural causes beyond our control."

The Cement Products Exhibition.

The Cement Products Exhibition Company held its first exhibition in the Coliseum, Chicago, Dec. 17 to 21 inclusive. It was a success from every standpoint. All available space in the main section of the Coliseum was taken, and the attendance far exceeded expectations. The Northwestern Cement Products Association held its convention in conjunction with the exhibition, using the annex to the Coliseum for a meeting hall.

The total number of exhibitors at the exposition was 105. Among them were the following:

Allis-Chalmers Co., Milwaukee, Wis.
American Steel & Wire Co., Chicago.
American System of Reinforcing, Chicago.
Condron & Sinks Co., Chicago.
Expanded Metal & Corrugated Bar Co., St. Louis, Mo.
General Electric Co., New York.
Robert W. Hunt & Co., Chicago.
Inland Steel Co., Chicago.
Arthur Koppel Co., New York.
Lansing Wheelbarrow Co., Lansing, Mich.
McKelvey Machinery Co., Chicago.
Northwestern Expanded Metal Co., Chicago.
Thos. Prosser & Son, New York.
Universal Portland Cement Co., Chicago.
Western Electric Co., Chicago.

Steel Ties.

It is an important item of news that L. P. Friestedt of Chicago has bought from James E. York the United States patent rights covering the York cross rolling processes. Mr. York's process for making steel ties out of old rail was fully described and illustrated in the *Railroad Gazette*, November 24, 1905. Neither the process nor the plant necessary for it, is costly. It is evidently applicable to merchant steel of I-beam section as well as to old rail. The difficulty with the Carnegie longitudinally rolled steel tie is, primarily, that the width of either the upper or the lower face of the tie is limited to between 7 and 8 inches, while in the cross rolling process there is no width limit whatever. Moreover, in the cross rolling process any curvature can be made in the surfaces, to the end of making a section with a spring, or resiliency, somewhat corresponding to that of a wooden tie, provided the engineer can design such a form. Still further any indentation that the engineer may design can be made for the purpose of prevention of spreading of track—similar to the office of the shoulder tie plate. The sum of it is that by this process an all-steel tie can be economically made if the engineers can design a form of tie and clips which will make the long enduring steel tie safe for high speed traffic. The experience of the Bessemer & Lake Erie with the rigid Carnegie tie seems to have demonstrated that it is safe and economical for the extremely heavy

loads and comparatively low speeds of less than 40 miles an hour permitted on that road. But the safe steel tie for high speed, and especially in frozen ballast, does not yet seem to have been developed. The remarkable energy and skill shown by Mr. Friestedt in his invention and development of the channel bar steel piling makes the new undertaking hopeful.

Pig Iron Furnaces in Dull Times.

In previous periods of business depression and reduced demand for iron, resulting in the blowing out of blast furnaces, it has been noticeable that the number of furnaces out of blast has been a much larger proportion of the whole number than the reduction of the output. But now we see that while the number of furnaces in blast fell off 27½ per cent., from 304 to 226, from Nov. 1 to Dec. 1, their weekly output fell off 31½ per cent., from 491,436 to 347,372 tons. The average capacity of furnaces in blast was 1,617 tons per week Nov. 1 and only 1,537 tons Dec. 1. The explanation is, probably, that nearly the whole plant of the country at this time consists of modern furnaces of large capacity; while in earlier periods there have been many furnaces of small capacity which could produce at a profit only when the demand was great and prices high. Now, the situation of the furnace and the nature of its products are the chief determining factors.

Transatlantic Travel.

Up to Dec. 6, all records for transatlantic travel have this year been exceeded by a wide margin, and the steerage business, incomparably the most profitable of a modern steamship company's resources, is becoming more and more phenomenal every week. The streams of immigration and of emigration are now crossing one another; the inbound rush has not abated, while the outward movement is heavier than it has ever been before, doubtless because of the slackened demand for labor. The figures are as follows:

	Westbound. Jan. 1-Dec. 6			Eastbound. Jan. 1-Dec. 6		
	1907.	1906.	Inc.	1907.	1906.	Inc.
First-class	104,649	93,391	10,658	97,158	89,742	7,416
Second-class	220,125	187,260	38,865	101,048	84,461	16,587
Third-class	1,316,369	1,151,148	165,221	483,442	315,706	167,736
Totals	1,640,543	1,425,799	214,744	681,648	489,909	191,739

Abandonment of a Street Railway Justified.

The Railroad Commission of Ohio, acting on the complaint of Bickerstaff, has refused to call to account the Steubenville, Mingo & Ohio Valley and the Steubenville & Wheeling Traction companies for ceasing to operate a part of their line over the high summit known as Altamont, between Mingo and Steubenville. Certain persons had been induced to purchase lots on Altamont by reason of the promise that an electric line service would be afforded. After the line had been built the county authorities relocated the low-level highway along the river, and the company at great expense built a new track into Mingo. The commission holds that the change was warranted. According to the press despatches, it is said in the opinion that when the state charters a road to parallel and compete with another the first road may be justified in abandoning that portion of its line which suffers by reason of the competition allowed by the state. The chief reason assigned by the commission, however, for upholding the company in its abandonment of the Altamont line is that the line is hazardous to operate. It is unnecessary to operate it as the general public is provided for by the operation of the low-grade division.

Fairbanks-Morse Motor Inspection Car.

Our attention has been called to a typographical error which appeared in the description of this car printed in the *Railroad Gazette* Dec. 6. The statement about the consumption of lubricating oil should be that the car used 1 gallon of oil in 517 miles.

Prize Awarded M. Cuenot by French Academy.

The French Academy of Sciences has awarded M. Cuenot a prize for his study of Track Deformations, which was published in serial and in book form by the *Railroad Gazette*.

INTERSTATE COMMERCE COMMISSION RULINGS.

St. Louis-Little Rock Rates Reduced.

In an opinion rendered by Commissioner Prouty, the Commission has announced its decision in the case of the Merchants' Exchange of St. Louis against the Missouri Pacific. The rates on grain and grain products from St. Louis to Little Rock and other points in Arkansas, 18 cents on wheat and its products and 15 cents on coarse grains and their products, were declared unlawful, so far as applied to grain which has been carried to St. Louis by railroad from points outside that city. The 18-cent rate is ordered reduced 5 cents and the 15-cent rate 4 cents.

Time-Limit for Presentation of Claims.

An official interpretation of the two years limitation provision of the law of June, 1906, has been made by the Interstate Commerce Commission.

"Claims filed since August 28, 1907, must have accrued within two years prior to the date when they were filed, otherwise they are barred by the statute. Claims filed on or before August 28, 1907, are not affected by the two years' limitation in the act.

"The Commission will not take jurisdiction of, or recognize its jurisdiction over any claims for reparation or damages which are barred by the statute of limitations as interpreted by the Commission; and the Commission will not recognize the right of the carrier to waive the provisions of the statute.

"Commissioner Harlan, voting in the negative on the above interpretation of the limitation of the act, desires to be recorded as holding that the limitation in this act, like the limitations in other acts, does not affect the jurisdiction of the Commission, but is a personal privilege that may be waived by defendants in proceedings before the Commission. He expressed himself also as inclined to the view that a defendant who offered to waive the bar of the statute, as to one claimant, might be required by the Commission also to waive it as to all other claimants whose claims involved the same rate or issue, in order to avoid discriminations."

TRADE CATALOGUES.

West Shore Electrification.—Bulletin No. 4546 of the General Electric Company, Schenectady, N. Y., consists of a detailed description of the electrification of the West Shore Railroad between Utica, N. Y., and Syracuse. There are a number of illustrations from photographs of cars, roadway and substations and drawings showing plans of substations and the third rail construction. An interesting feature is the comparison of train sheets before and after electrification, indicating the great increase in train movement.

Boiler, Pipe and Roof Coverings.—The Philip Carey Co., Cincinnati, Ohio, is distributing a new descriptive catalogue of its coverings. These include 85 per cent. carbonate of magnesia, 85 per cent. magnesia, normal, magnet, standard asbestos moulded, air cell and felt pipe brands of coverings; magnesia flexible cement roofing, and asbestos materials, roofing paints and cements. These different coverings are illustrated and described, the illustrations being excellent half-tone engravings from wash drawings or photographs. The book is 6 in. x 9 in., printed on calendared paper, and has 70 pages.

MANUFACTURING AND BUSINESS.

W. R. Burrows, Eastern Sales Manager of The Buda Foundry & Manufacturing Co., Harvey, Ill., has resigned to go into other business.

J. W. Ager, electrical aide in the Bureau of Yards and Docks, United States Navy, has been appointed Manager of the Southern office at Birmingham, Ala., of Muralt & Co., engineers, 114 Liberty street, New York.

Robert H. Blackall, Assistant to the General Manager of the Westinghouse Air Brake Co., Pittsburgh, Pa., has been made Manager of the Railway Supplies Department of the Pittsburgh Lamp, Brass & Glass Co., Pittsburgh, Pa.

The additions which the Boston Elevated is making to its power stations are nearly finished. The improvements are in charge of the Stone & Webster Engineering corporation, Boston, Mass., and include two new 2,700 k.w. Allis-Chalmers direct current generators.

Alfred Lovell, Consulting Engineer, 819 Harrison building, Philadelphia, Pa., in addition to the lines of work recently mentioned in this column, will make a specialty of examinations, reports on, and specifications for, power plants, shops, machinery and mechanical facilities, and also questions of operation.

The firm of Parker & Lee, 20 Broad street, New York, will be dissolved on December 31, when Ivy L. Lee takes charge of the publicity department of the Pennsylvania Railroad. The business will be continued at the same address by the new firm of Parker & Bridge, consisting of George F. Parker and Charles A. Bridge, who was Manager for the old firm.

The firm, of Manning, Hanchett & Young, Consulting, Mechanical, Civil and Electrical Engineers, has been formed with office at 237 Fulton street, New York, and 824 Equitable building, Baltimore,

Md. W. T. Manning, Mem. Am. Soc. C. E., was on the Baltimore & Ohio for many years, resigning as Chief Engineer in 1899. G. T. Hanchett has for the last ten years been a consulting engineer in New York, his previous work having been mostly electrical. He is a member of several electrical societies. W. D. Young, Mem. Am. Soc. Mech. Eng., has been Electrical Engineer of the Baltimore & Ohio since 1896.

A report prepared for the receivers of the Westinghouse Electric & Manufacturing Co., Pittsburgh, Pa., by Hasklns & Sells, public accountants, shows the following assets and liabilities:

Assets	
Property and plant	$21,518,463
Investments	10,104,453
Working assets	17,942,005
Quick assets	10,317,612
Other accounts and notes receivable	5,274,092
Contingent assets	2,290,256
Total	$87,482,881
Liabilities	
Capital stock	$27,038,100
Funded debt	21,319,000
6 per cent. collateral notes, due August, 1910	6,000,000
5 per cent. collateral notes due October, 1917	2,702,702
Current liabilities	13,061,352
Subscriptions	1,559,514
Reserve for possible shortage in inventories	211,955
Contingent liabilities	2,290,256
Profit and loss, surplus	11,194,002
Total	$87,482,881

Iron and Steel.

The Baltimore & Ohio is said to be in the market for 35,000 tons of rails, and to be negotiating with the United States Steel Corporation and the Pennsylvania Steel Company.

OBITUARY NOTICES.

Luman F. Parker, General Solicitor of the St. Louis & San Francisco, died suddenly on December 16. He was born at Lexington, N. Y., on September 26, 1847, and was educated in common schools in Connecticut and at the New Britain, Conn., High School. When he was 22 years old, he went west, living first at St. Charles, Mo., and the next year moving to Union. There he taught school and studied law, being admitted to the bar in Franklin county in 1874. He moved to Rolla, Phelps county, the same year and practiced law there until 1889. He then went to Washington, where he was for some months on the legal staff of General John W. Noble, Secretary of the Interior. The same year he returned to Missouri as trial attorney for the St. Louis & San Francisco. He was appointed General Attorney in 1892 and in 1896 was promoted to be General Solicitor, which position he held at the time of his death.

L. F. Parker.

MEETINGS AND ANNOUNCEMENTS.

For dates of conventions and regular meetings of railroad conventions and engineering societies, etc., see advertising page 24.)

The Short Line Association.

"The Short Line Association" is the name of an organization which it is said has been formed by certain railroad companies operating each less than 200 miles of line, the primary object of the organization being to work for more satisfactory compensation for carrying the United States mails. The President of the association is S. F. Smith, President of the Pittsburgh, Shawmut & Northern. It is said that 40 railroads have already joined.

ELECTIONS AND APPOINTMENTS.

Executive, Financial and Legal Officers.

Ohio River & Columbus.—E. H. Blair, Vice-President, has been appointed also General Manager, with office at Ripley, Ohio. The office of Superintendent has been abolished.

Wisconsin Central.—The main office having been moved to Chicago, a general office has been established at 100 Wisconsin street, Milwaukee, Wis., to comply with the provisions of the company's charter.

Operating Officers.

Grand Trunk Pacific.—The changes in General Superintendents of the Ontario division and the Lake Superior division announced in these columns on December 13 are denied.

Chicago, Milwaukee & St. Paul.—E. W. Morrison, Trainmaster of the La Crosse division, and E. G. Allen, Trainmaster of the Wisconsin Valley division, have been made temporarily chief train despatchers of their respective divisions.

Lake Shore & Michigan Southern.—Dewitt C. Moon, who has succeeded the late E. A. Handy as General Manager of the Lake Shore, was born on July 24, 1856, in western New York. All his railroad service has been on the New York Central Lines. After a common school education he began in 1872 as agent and operator on the Dunkirk, Allegheny Valley & Pittsburgh, one of the lines leased by the New York Central & Hudson River but operated by the Lake Shore. He was made successively despatcher, Trainmaster and, in 1893, Assistant Superintendent. Three years later he was made Superintendent and in 1899 was transferred from the Dunkirk, Allegheny Valley & Pittsburgh to the Rome, Watertown & Ogdensburg division of the New York Central & Hudson River. He was Superintendent of this division for four years and was then appointed Assistant General Superintendent of the Lake Erie & Western. In the fall of 1903 he was made Assistant General Superintendent of the Lake Shore & Michigan Southern and in 1905 was appointed General Superintendent. The next year he was made Assistant General Manager. He is now General Manager of the Lake Shore & Michigan Southern, the Lake Erie & Western, the Dunkirk, Allegheny Valley & Pittsburgh and the Lake Erie, Alliance & Wheeling.

D. C. Moon.

Southern.—Eugene H. Coapman, who was recently appointed Manager of the Northern and Eastern districts, with office at Washington, D. C., was born on August 11, 1865, in Wisconsin. He began railroad work when he was 15 years old on the Chicago, Milwaukee & St. Paul. He was operator and train despatcher from 1880 to 1883 and then went to the Iowa Central as train despatcher. After serving as chief despatcher and Superintendent of Telegraph, he returned to the Chicago, Milwaukee & St. Paul, in 1887, as train despatcher. In 1890 he went to the Illinois Central in the same capacity, being later made chief train despatcher, Trainmaster and finally Terminal Freight Trainmaster. In 1900 he went to the Atchison, Topeka & Santa Fe as Trainmaster and two years later went to the Southern as Superintendent of the Danville division. In December, 1905, he was appointed Assistant General Superintendent of the Eastern district, and in November, 1906, was made General Superintendent of the Northern district, where he remained until appointed to his present position, succeeding the late J. N. Scale.

E. H. Coapman.

W. M. Deuel, who was recently appointed Superintendent of the Coster division, with office at Knoxville, Tenn., has been with the Southern for the last five years. He was yardmaster at Spencer, N. C., for four months and was then for six months Terminal Trainmaster at Birmingham, Ala. In 1903 he was made Assistant Superintendent of the Washington division,

being later transferred to the Knoxville division. He was Superintendent of the Birmingham division for a year and was then made Superintendent of Terminals at Atlanta, Ga., where he remained until his recent appointment.

Engineering and Rolling Stock Officers.

Buffalo, Rochester & Pittsburgh.—H. C. Woodbridge, heretofore Master Mechanic of the Buffalo and Rochester divisions, has been transferred to Du Bois, Pa., to do special work for the Superintendent of Motive Power.

Wisconsin Central.—Harvey Halverson, foreman of the coach department at Fond du Lac, Wis., has been appointed Master Car Builder, with office at that place, succeeding William Percy, resigned to go into other business.

LOCOMOTIVE BUILDING.

The New York, Chicago & St. Louis is said to be asking bids on 20 locomotives. Up to the time of going to press we have not been able to confirm this item.

CAR BUILDING.

The E. A. Bryan Company, Chicago, is asking prices on specialties for 30 cars.

The Porto Rico Railway, through J. G. White & Co., New York, is in the market for 10 box cars and 10 flat cars, all with steel underframes.

The New York, Chicago & St. Louis is said to have ordered 1,000 box cars from Haskell & Barker. We have not yet been able to confirm this item.

The W. C. Lawson Co., Chicago, is said to be considering the purchase of three freight cars. Up to the time of going to press we have not been able to confirm this item.

The Philippine Railways, through J. G. White & Co., New York, have ordered four combination baggage and passenger cars from the American Car & Foundry Company, for March delivery. These cars will be 3 ft. 6 in. gage and will measure 43 ft. 1½ in. long, over end sills, and 9 ft. 6 in. wide. Bodies will be of wood and underframes of steel.

The Missouri, Kansas & Texas has ordered 900 42-ft. gondola cars of 100,000 lbs. capacity and 100 42-ft. dump cars of 80,000 lbs. capacity from the American Car & Foundry Company. The special equipment includes:

Brake-beams	National Hollow, and Damascus
Brasses	Climax
Couplers	Major

The Barrett Manufacturing Co., Chicago, as reported in the *Railroad Gazette* of December 20, has ordered 40 tank cars of 10,000 gals. capacity from the Cambria Steel Co. The special equipment includes:

Brake-beams	Creco
Brasses	Standard Metal Mfg. Co.
Couplers	Climax
Draft rigging	Cardwell
Journal boxes	Symington

Light	Commercial Acetylene
Platforms	Standard Coupler Co.
Roofs	Canvas
Trucks	Four wheel
Vestibules	Buhoup
Wheels, make of	Paige plate, steel tires

RAILROAD CONSTRUCTION.

New Incorporations, Surveys, Etc.

Alberta & Northwestern.—Application will be made to the Dominion Parliament for a charter to build a line from a point on the Calgary & Edmonton between Olds and Red Deer northwest along the North Saskatchewan river to a point on the Kootenay plains in the Rocky mountains; also to build a branch to the Brazeau river. McGivern, Hayden & Greig, 19 Elgin street, Ottawa, Ont., are the attorneys.

Atlantic Coast Line.—An officer writes that this company has given contracts to Wade & Bell, Trinity, Fla.; Wade & Morrison, Washington, N. C., and Phillips & Allport, Richmond, Va., for building an extension from Wilcox, Fla., northwest to Perry, 55 miles, for a change of line at Goldsboro, N. C., four miles, and a change of line at St. Mary's River, Fla., 1.5 miles. Surveys are also being made for a change of line on four miles at Inverness, Fla.

Chesapeake & Ohio.—This company is planning to build a branch from Pemberton, W. Va., up Piney Creek, about two miles long.

Delaware & Hudson.—This company during the past year has laid third and fourth tracks to be used by electric cars between Boston Junction, N. Y., and Saratoga, 5.31 miles.

Gulf, Colorado & Santa Fe.—Contract is reported let to John Scott & Sons, of St. Louis, for work on 21 miles of the extension from Center, Tex., northwest to the Texas & Gulf at Zuber. The work is to be finished by April 1. (Oct. 18, p. 473.)

Illinois Traction (Electric).—Track laying has been finished on the Mackinaw-Lincoln branch, closing the last gap in the line from St. Louis via Bloomington to Peoria. The line has been in operation for some time between Lincoln and St. Louis and between Bloomington and Peoria. The overhead work between Lincoln and Mackinaw is to be finished this month and the line opened for traffic early next year. Regular service will then be inaugurated between Peoria and St. Louis, 165 miles.

Missouri & North Arkansas.—Contracts are reported recently let for bridging and track laying on the extension of this road between Kensett, Ark., and Cotton Plant. The grading contract from Kensett southeast to the White river has not yet been let. The road is being extended north from Seligman, Mo., to Neosho, and this work is expected to be finished this month. (Nov. 8, p. 573.)

New York, Pittsburgh & Chicago (Electric).—At a recent meeting of this company, organized to build a short trunk line through Pennsylvania, it was decided to make new surveys for the proposed line between Pittsburgh and the summit of the Allegheny mountains, preparatory to beginning actual work early next spring. Joseph Ramsey, Jr., is President. (Mar. 15, p. 388.)

Temiskamino & Northern Ontario.—Contract has been given to David Chalmers, of Charlton, Ont., for grading seven miles from Outlake Road to Earlton.

York Railways Company.—This company, which was formed by merging many of the electric lines in York county, Pa., has recently given a mortgage to secure funds to build new lines and to make other improvements.
